USDA United States Department of Agriculture

Cove-East Fork Virgin River Watershed Project
Kane and Washington County, Utah
Draft Plan-EIS Frequently Asked Questions (FAQs)

Unique Identification No.: EISX-005-53-049-1288324567 September 2026

Q: What is the Preferred Alternative?
A: The Preferred Alternative includes construction of a 6,000-acre-foot reservoir and dam with appurtenances, a recreation area, pipelines, and a booster pump station.

Q: What Alternatives were considered?
A: Several alternatives were considered during the planning process including alternative reservoir sites, alternative reservoir sizes, and non-structural measures (including water conservation). Three alternatives were carried forward for detailed analysis in the Watershed Plan Environmental Impact Statement: 1) A No Action Alternative (which includes existing and planned conservation measures), a 3,000-acre-foot reservoir, and a 6,000-acre-foot reservoir (the preferred alternative). Ten additional reservoir locations and/or sizes were eliminated from detailed study due to being infeasible, not meeting the project purpose and need, or being more environmentally impactful, dangerous, or costly.

Q: Where will the materials be sourced from?
A: Embankment materials for the proposed dam will be taken primarily from the reservoir basin. Three additional borrow pit sites will be used to supply riprap and gravel. Use of the borrow pit sites would result in a maximum of 5.7 acres of additional disturbance.

Q: Why is the project being proposed?
A: The project is being proposed to address annual water shortages experienced by local agricultural users served by the Glendale, Orderville, and Mt. Carmel irrigation companies. Additionally, Washington County is experiencing stressed Municipal and Industrial (M&I) water availability.

Q: Who benefits from the project?
A: The proposed project would provide the following long-term benefits:

- Increased water availability to local agricultural users in Kane and Washington Counties.
- Increased water availability to municipal users in Washington County.
- Increased water security for present and future residents in both Kane and Washington Counties.
- Added recreation opportunities for Kane County and the surrounding communities.

Q: What would the water be used for?
A: Water from the proposed reservoir would be made available to existing agricultural fields near Mt. Carmel and Hurricane, and for M&I uses in Washington County.

Q: How will the reservoir affect downstream flow?
A: The proposed reservoir would store excess water during high-flow periods and release it during low-flow periods to meet irrigation and water conservancy demands. Although the timing of flows would change, modeled flow alterations would be small compared to the natural seasonal variability of EFVR flows. Yearly monitoring would continue to be required to regulate flows on the EFVR.

Cove-East Fork Virgin River Watershed Project
Kane and Washington County, Utah
Draft Plan-EIS Frequently Asked Questions (FAQs)

Unique Identification No.: EISX-005-53-049-1288324567 September 2026

Q: When would water be diverted to the reservoir and released from the reservoir?
A: Water would be diverted from the East Fork Virgin River (EFVR) at the Orderville Diversion and delivered by pipeline to the proposed reservoir between November 1 and May 31, as required by the *Zion National Park Water Rights Settlement Agreement of 1996*. No diversions are allowed outside of this period. Releases from the reservoir would be timed to supplement low, natural flows. Water for Long Valley agricultural purposes would be released into existing and proposed irrigation pipelines during the summer months, when natural flows are lowest. Water committed to Washington County could be released any time during the year to meet demand but would most likely be during the summer months for agricultural needs and during the fall and winter months for M&I needs.

Q: How will the reservoir affect downstream habitat?
A: The EFVR riparian corridor is adapted to substantial natural variation in streamflow, including episodic flood events, spring runoff, and seasonal low flow periods. Modeled project-related changes in flow, depth, and width would remain small relative to the river's existing natural variability. As a result, the project is not expected to adversely affect existing downstream habitat.

Q: What measures will prevent non-native fish from entering the East Fork Virgin River?
A: The proposed reservoir intake would include a fish screen with a 1-inch maximum pore opening to prevent fish and debris from entering the pipeline to the Orderville Hydroelectric Power Plant. The hydroelectric facility utilizes two Turgo Impulse turbines, which focus water through small nozzles at high pressure and velocity into the turbines. The combination of the small nozzle size, high velocity, and sudden pressure drop would make it highly unlikely that any fish that might make it into the pipeline would survive. Additionally, prior to stocking the proposed reservoir with fish, a management plan will be developed to ensure that non-native fish species do not escape from the reservoir into the EFVR. The management plan would meet non-native stocking and control requirements.

Q: What is the likelihood of a dam failure and what protection would be in place for downstream properties?
A: The dam would be classified as a high-hazard structure to safeguard downstream infrastructure, and further detailed analyses would be conducted to include strategies for reducing the probability of a dam breach. However, like all dams, the risk of failure exists and would be mitigated by an Emergency Action Plan.

Q: What is the total project cost and benefits?
A: The total cost estimate for the preferred alternative is $39,730,000 with the NRCS contributing $24,889,000 and the sponsors contributing $14,841,000. The average annual benefit is projected to be $1,397,000, and the benefit-to-cost ratio is expected to be 1.03, which includes monetized and non-monetized benefits.

Draft

Cove Reservoir Watershed and

Environmental Impact Statement

for the Cove-East Fork Virgin River Project

Kane and Washington Counties, Utah

Lead Agency: U.S. Department of Agriculture, Natural Resources Conservation Service (NRCS)

Sponsoring Local Organization: Kane County Water Conservancy District; Washington County Water Conservancy District

Cooperating Agencies: National Park Service (Zion National Park), Utah Trust Lands Administration, Bureau of Land Management (BLM), U.S. Army Corps of Engineers (USACE), U.S. Environmental Protection Agency (EPA), and Utah Public Lands Policy and Coordinating Office

Congressional District: Utah Congressional District 2

Authority: This Watershed Plan and Environmental Impact Statement (Plan-EIS) for the Cove Reservoir Watershed has been prepared under the authority of the Watershed Protection and Flood Prevention Act of 1954 [Public Law 83-566 (PL 83-566) Stat. 666 as amended (and in accordance with the National Environmental Policy Act (NEPA) of 1969, PL 91-190, as amended (42 U.S.C. 4321 et seq.)). The Plan-EIS would be implemented under the PL 83-566 authorized purposes of agricultural water management, flood prevention, and public recreation.

This environmental document was initiated using the 40 CFR 1500-1508 (May 20, 2022) and 7 CFR 650 regulations. These regulations have recently been rescinded and replaced with U.S. Department of Agriculture (USDA) regulations found under 7 CFR 1b, published as a Final Rule in the Federal Register on April 3, 2026 (91 FR 17062). However, in a good-faith effort to fulfill NEPA's requirements, including Congressional timeline and considerations of fiscal restraints, the agency decided to continue to use 40 CFR 1500-1508 (July 31, 2023) and 1 CFR 650. This is permissible per the USDA policy guidance issued in the Final Rule's preamble. The Federal Register notice said: "if the NOI for an EIS [was] published more than 90 days prior to the publication of this final rule, the USDA subcomponent has discretion to continue applying the versions of NEPA regulations being applied before the publication of the NOI or to switch to applying 7 CFR 1b as published in this final rule."

Abstract: The Action Area for the Cove-East Fork Virgin River Project (Project) includes both Kane and Washington Counties. The proposed reservoir site Project is located near Orderville within the Upper Virgin Watershed in Kane County, Utah. Project implementation would enhance the reliability of agricultural water availability in the Orderville and Mt. Carmel areas of Kane County and the Hurricane area in Washington County, Utah.

Project development would also result in the creation of a public recreation opportunity at the proposed reservoir site and an increase of Municipal & Industrial (M&I) water to communities in Washington County. M&I water demand in the WCWCD service area is projected to exceed

existing capabilities as more municipal water providers join and receive water from the WCWCD system.

The need for this project is due to annual water shortages experienced by local agricultural users in the Orderville Mt. Carmel and Hurricane areas. Due to a difference in timing between the spring runoff within the watershed and the peak demand for agricultural water use, these users experience annual water shortages during the summer months. The NRCS preferred alternative (Alternative Two) for the Project is a 6,000-acre-foot reservoir. NRCS proposes constructing a 6,000-acre-foot reservoir and dam, along with principal and auxiliary spillways, recreational facilities, and necessary infrastructure. The dam would feature a 1,900-foot earthen embankment with a central clay core, at a maximum height of 90 feet. Two spillways would be installed. The total cost estimate for this alternative is $39,730,000 with NRCS contributing $24,889,000 and the Sponsors contributing $14,841,000. Water from the reservoir would be used by Orderville and Mt.

Carmel agricultural users in Kane County. Water would also be released downstream via the East Fork Virgin River for agricultural and M&I use in Washington County. The proposed action would comply with the Zion National Park Water Rights Settlement of 1996 (United States, Utah, Washington District, & Kane District).

Comments and Inquiries: Comments and inquiries must be received within 45 days of publication of the Notice of Availability (NOA) for the Draft Plan-EIS in the Federal Register (Regulations.gov). Submit comments and inquiries to: Ammon Boswell, Watershed Program Manager, USDA, NRCS, 1950 West Main Street, Tremonton, Utah, 84337; Telephone: (435) 459-1621; or email: ammon.boswell@usda.gov.

Non-Discrimination Statement

In accordance with federal civil rights law and U.S. Department of Agriculture (USDA) civil rights regulations and policies, the USDA, its Agencies, offices, and employees, and institutions participating in or administering USDA programs are prohibited from discriminating based on race, color, national origin, religion, sex, disability, age, marital status, family/parental status, income derived from a public assistance program, political beliefs, or reprisal or retaliation for prior civil rights activity, in any program or activity conducted or funded by USDA (not all bases apply to all programs). Remedies and complaint filing deadlines vary by program or incident.

Persons with disabilities who require alternative means of communication for program information (e.g., Braille, large print, audiotape, American Sign Language, etc.) should contact the responsible Agency or USDA's TARGET Center at (202) 720-2600 (voice and TTY) or contact USDA through the Federal Relay Service 711 (voice and TTY) at (800) 877-8339. Additionally, program information may be made available in languages other than English.

To file a program discrimination complaint, complete the USDA Program Discrimination Complaint Form, found online at https://www.usda.gov/oascr/how-to-file-a-program discrimination-complaint and at any USDA office or write a letter addressed to USDA and provide in the letter all of the information requested in the form. To request a copy of the complaint form, call (866) 632-9992. Submit your completed form or letter to USDA by:

Mail: U.S. Department of Agriculture, Office of the Assistant Secretary for Civil Rights, 1400 Independence Avenue, SW, Washington, D.C. 20250-9410;

Fax: (202) 690-7442; or

Email: program.intake@usda.gov.

USDA is an equal opportunity provider, employer, and lender.

Ancestral Land Acknowledgement

NRCS, through the review of the National Park Service Native American Graves Protection and Repatriation Act Native American Consultation Database (NACD), the U.S. Department of Housing and Urban Development Tribal Directory Assessment Tool (TDAT), the Bureau of Indian Affairs (BIA) website, and the Utah Division of Indian Affairs (UDIA) website, and previous National Environmental Policy Act (NEPA) and National Historic Preservation Act (NHPA) consultations, identified 11 Federally Recognized Tribes. The Hopi Tribe, Kaibab Band of Paiute Indians of the Kaibab Indian Reservation, Las Vegas Tribe of Paiute Indians of the Las Vegas Indian Colony, Moapa Band of Paiute Indians of the Moapa River Indian, Navajo Nation, Paiute Indian Tribe of Utah, Pueblo of Zuni, San Juan Southern Paiute Tribe of Arizona, Ute Indian Tribe of the Uintah & Ouray Reservation, Ute Mountain Ute Tribe, and White Mesa Ute Council have ancestral land, traditional use, and/or traditional cultural property claims within the project area and the immediate vicinities. Consultation with these 11 entities will continue throughout this plan's development. Refer to Appendix A for that correspondence.

WATERSHED PLAN AGREEMENT (TO BE INCLUDED IN FINAL PLAN–EIS)

Summary (Office of Management and Budget Fact Sheet)

Summary Watershed Plan-Environmental Impact Statement Document

For

Cove-East Fork Virgin River Watershed Project

Kane and Washington Counties Utah

Utah Congressional District 2

Authorization	Public Law 83-566 Stat. 666 as amended (16 U.S. Code Section 1001 et. Seq.) 1954
Sponsors	Kane County Water Conservancy District (KCWCD); Washington County Water Conservancy District (WCWCD)
Cooperating Agencies	National Park Service (Zion National Park); Utah Trust Lands Administration; Utah Public Lands Policy Coordinating Office; U.S. Army Corps of Engineers; U.S. Environmental Protection Agency; U.S. Bureau of Land Management
Purpose and Need	The project purpose is to sustain agriculture and improve recreation opportunities in Long Valley, Utah, and to provide agricultural and Municipal & Industrial (M&I) water to Washington County, Utah. There is an existing need to increase water availability during the summer irrigation months due to persistent water shortages and provide water for an additional water-based recreation site and the existing hydroelectric power plant
Description of the Preferred Alternative Plan	The Preferred Alternative would consist of developing a 6,000-acre-foot reservoir with appurtenances, a recreation area, pipelines, and a booster pump station. Water from the proposed reservoir would be made available to existing agricultural fields near Mt. Carmel and Hurricane, and for M&I uses in Washington County.
Resource Information	**Watershed Name:** East Fork Virgin River Watershed **Latitude and Longitude:** 37.2875 degrees/-112.628 degrees **Eight-digit Hydrologic Unit Number:** 15010008 **Climate and Topography:** July average high/low: 90/55 degrees Fahrenheit (F) January average high/low: 47/20 degrees F, Semi-desert, low hills, 5,449 feet above sea level, 16.81 inches average annual precipitation. **Watershed Size (Acres):** 152 square miles (97,449 acres)

Land Uses (Acres): Irrigated lands within the project area in Kane County: 1,100 acres.

Irrigated lands within the project area in Washington County: 770 acres

Private residences, out buildings, livestock grazing, and limited recreation opportunities are also present within the proposed project area.

Land Ownership:

Private: 99.92 percent

State–Local: 0.07 percent

Federal: 0.01 percent

Population and demographics (Kane County): 8,425 people

White—93.9 percent; African American—1.0 percent; American Indian—1.8 percent; Asian—0.9 percent; Native Hawaiian/Pacific Islander—0.1 percent; Hispanic/Latino—5.6 percent; Two or More Races—2.4 percent[1]

Relevant resource concerns that have been identified through scoping: East Fork Virgin River (EFVR) flow reductions, nonnative vegetation, recreation, traffic and other impacts associated with construction, soils, streambank erosion, water budget and water quality, rare fish and other aquatic species, endangered species, wild and scenic rivers (WSR), Areas of Critical Environmental Concern (ACEC), designated wilderness, Wilderness Study Areas (WSA), Research Natural Areas (RNA), climate variation, groundwater, wetlands, cultural resources and agricultural water efficiency improvements

Alternative Plans

Two Action Alternatives and a No Action Alternative are being considered in the Watershed Plan Environmental Impact Statement (Plan-EIS). After careful examination, 10 other potential alternative reservoir sites were considered and eliminated from detailed study as they were infeasible, did not adequately meet the purpose and need for the project, had a greater negative environmental impact, presented safety concerns, or were cost prohibitive. These sites are Swapp, Lower Swapp, Lower Lydia's Canyon, Upper Lydia's Canyon, Dry Wash, Orderville, Lower Muddy Creek, Upper Muddy Creek, Lower Stout Creek, and Upper Stout Creek Sites. A non-structural alternative was also considered; however, it would not meet the purpose and need of the Preferred Alternative and is not analyzed in detail in the Plan-EIS.

Alternative 1: No Action	Under the No Action Alternative, construction activities associated Alternative with the project would not occur, and the KCWCD and WCWCD would continue to operate and maintain their existing systems. The need for the project would still exist. The two Districts would address continuing agricultural water and M&I shortages as other sources of funding became available.
Alternative 2: 6,000-acre Alternative	Alternative 2 would consist of a 6,000-acre-foot reservoir and earthen dam, two pipelines, a booster pump station, an access road, principal and auxiliary spillways, recreational facilities, and all necessary infrastructure. Three borrow pits outside of the reservoir basin would supply materials for the dam construction. Embankment material would be taken from within the reservoir basin. The reservoir would be located near Orderville in western Kane County, Utah.
Alternative 3: 3,000-acre Alternative	Alternative 3 would consist of a 3,000-acre-foot reservoir and earthen dam, principal and auxiliary spillways, a recreation area, pipelines, and a booster pump station. Three borrow pits outside of the reservoir basin would supply materials for the dam construction. Embankment material would be taken from within the reservoir basin. The reservoir would be located at the same location as the 6,000-acre-foot reservoir near Orderville in western Kane County, Utah
Mitigation Measures	Implementation of the Preferred Alternative would comply with all applicable federal and state laws and regulations, as well as local zoning and building ordinances. Appropriate Best Management Practices (BMPs) would be used. Consultation between the Natural Resources Conservation Service (NRCS), Individual Tribal Nations, Utah State Historic Preservation Officer (SHPO) regarding compliance with Section 106 of the National Historic Preservation Act has occurred. Construction activities would be limited to the smallest extent practicable within the project area. Construction personnel would adhere to all state and NRCS fire prevention and suppression requirements. Disturbed areas (excluding the reservoir, dam, and borrow pit sites) would be restored to preconstruction conditions after construction completion. No ground disturbance would occur during or immediately following precipitation events or under any wet conditions that would create deep ruts. Disturbed areas would be recontoured. A Stormwater Pollution Prevention Plan that contains erosion and sediment control/pollutant prevention BMPs would be required and implemented. To resolve adverse effects to National Register of Historic Places (NRHP)–eligible sites, an inadvertent discovery plan will be prepared and supplied to construction crews, in addition to the preparation and execution of a Memorandum of Agreement.

The KCWCD would be responsible for compliance with applicable local, state, and federal regulations related to the use, handling, storing, transporting, and disposing of hazardous materials on non-federal lands.

All federal, state, and local laws/regulations pertaining to pollution and contamination of the environment would be followed to prevent pollution of surface water, groundwater, soil, and air with any hazardous materials.

Table S.1. Project Costs.

Project Costs	**Public Law 83-566 Funds**	**Other Funds**	**Total**
Construction	$20,320,000	$13,893,000	$34,213,000
Engineering	$4,200,000	$0	$4,200,000
Real Property Rights	$135,000	$705,000	$840,000
Project Administration	$233,000	$233,000	$467,000
Permits	$0	$10,000	$10,000
TOTAL COSTS	**$24,889,000**	**$14,841,000**	**$39,730,000**

Project Benefits

The primary benefit of implementing the proposed project would be improved availability and distribution of agricultural water for local agricultural users in Kane and Washington Counties. Additional water is needed to offset annual shortages that occur during the summer months primarily due to a lack of storage capability. Additionally, a reliable source of water supply would improve the effectiveness of fire protection systems. The project would further provide improved hydroelectric energy production for the town of Orderville. New recreation opportunities (camping, fishing, boating, day-use, etc.) would be made available. The reservoir and surrounding riparian zone would also provide limited habitat for waterfowl. Finally, the project would provide additional M&I water for Washington County.

Number of Direct Beneficiaries (Onsite–Offsite)	There are 110 agricultural users in Glendale, 144 in Orderville, 15 in Bench Lake, and 52 in Mt. Carmel that would benefit from the proposed action. In Washington County, approximately 2,800 agricultural users would benefit from the agricultural water supply and approximately 800 private residences in Washington County would benefit from the M&I water supply.
Describe Other Beneficial Effects in Physical Terms	The Preferred Alternative would have beneficial effects on irrigation water availability, water quality, riparian habitat, recreation, economy, and public health and safety.
Benefit to Cost Ratio	1.03
Net Economic Benefits	$38,000
Funding Schedule	2026–2029 (budget year plus 5): Federal Funds: $24,889,000 Non-Federal Funds: $14,841,000 Total: $39,730,000
Period of Analysis	The period of analysis is the time required for installation of the project plus the life of the project. All structural alternatives were evaluated with a period of analysis of 103 years (100-year project life plus 3 years for construction). The 2026 discount rate of 3.25 percent was used for economic cost and benefit calculations.
Project Life	The life of the project is estimated to be 100 years following 3 years of construction.
Environmental Impacts	Table S-2 lists the resources of concern and associated environmental consequences associated with the Preferred Alternative. Resources that would not be impacted by the Preferred Alternative are not listed on this table.

Table S.2. Environmental Impacts.

Resource Concern	Summary of Concern	Consequence
Soil Resources	Potential sediment yield within the new watershed and increased erosion potential during construction activities	Direct short-term impacts to erosion potential on disturbed areas during construction would occur. Impacts would be minimized through implementation of BMPs that would be installed during and after construction. The short-term impacts would be minor based on implementation of BMPs and restoration/stabilization of disturbed

Resource Concern	Summary of Concern	Consequence
		areas following project construction. Anticipated indirect, long-term benefits include reduced sediment deposition in developed areas and within EFVR that are no longer exposed to flooding.
Water Resources	Impacts to water resources from Construction and operation activities	The Preferred Alternative would have direct, positive benefits on water resources by making 2,148 acre-feet of existing water available for water users in Kane and Washington County annually. Minor downstream impacts to the EFVR would occur.
Water Quality	Impacts to surface water quality during project operation	Minor direct, and negative impacts to water quality would occur during construction while crossing the EFVR; however, long-term, beneficial impacts would occur through the capturing of sediment in the reservoir during flash flooding events.
Floodplain Management	Impacts on floodplain areas from construction activities	The Preferred Alternative would have long-term beneficial impacts on downstream flooding, and long-term minor impacts on floodplain management. The proposed reservoir would capture runoff produced by flash floods out of Cove Canyon, thereby decreasing the amount of water and sediment entering the river and reducing potential loss of riparian vegetation. However, the proposed dam would also create a new inundation area, causing potential changes to floodplains.
Waters of the U.S., Wetlands, and Special Aquatic Sites	Disturbance to jurisdictional Waters of the U.S. located within the study area	The Preferred Alternative would impact approximately 0.21 acres of aquatic features and 0.17 acres of wetlands.
Regional Water Resources	Compliance with KCWCD and WCWCD Water Conservation Plans	The Preferred Alternative would comply with Regional Water Resource Plans through supporting both Kane County and Washington County's Water Resource Plans.
Wild and Scenic Rivers	Impacts to the EFVR in Zion National Park (ZNP) from project operation activities	The Preferred Alternative would have no impacts on the WSR values of the EFVR within ZNP, as it would also adhere to the stipulations required in the ZNP Agreement (1996). Therefore, changes in

Resource Concern	Summary of Concern	Consequence
		flow in the EFVR through ZNP would be minor, particularly when the natural variation of the EFVR is approximately 100 times the range of effect from proposed reservoir releases (Alpha Engineering 2025). The NPS notified the NRCS that the NPS will not be completing a Section 7 analysis on this project.
Air Quality	Emissions and fugitive dust from construction activities	Construction activities and the use of the borrow sites would cause minor, short-term, and direct increases in emissions concentrated around the construction site. Construction activities would not violate air quality standards, and BMPs would be implemented.
Threatened and Endangered Species	Disturbance to Endangered Species Act-listed, BLM-listed, and state-listed species/habitat	The Preferred Alternative would have **No Effect** on the Western yellow billed cuckoo, desert tortoise, Suckley's cuckoo bumble bee, Jones cycladenia, Shivwits milk-vetch, Siler's pincushion cactus, and Ute ladies'-tresses. The Action Alternatives are **Not Likely to Jeopardize the Continued Existence** of the monarch butterfly or the California condor outside of ZNP. The Action Alternatives **May Affect, but Not Likely to Adversely Affect** the California condor (within ZNP), Mexican spotted owl, southwestern willow flycatcher, Virgin River chub, and woundfin. The Action Alternatives **May Affect, but Not Likely to Adversely Affect** designated critical habitat for the Mexican spotted owl, Virgin River chub, and woundfin. The Action Alternatives would have **No Effect** on designated critical habitat for the California condor or southwester willow flycatcher as none has been designated in the study area.
Migratory Birds	Disturbance to migratory bird habitat during construction	Construction disturbance would have minor, direct, and short-term impacts that would disturb suitable breeding/nesting or foraging habitat for migratory birds and foraging habitat for migratory birds. Conservation measures would be implemented to avoid and minimize impacts to these species and disturbed areas would be restored after

Resource Concern	Summary of Concern	Consequence
		construction completion. Potential impacts would be minor due to the ample surrounding habitat available. The Operation & Maintenance activities would have minor, beneficial, long-term impacts to migratory birds. The riparian habitat surrounding the reservoir would provide long-term habitat opportunities for migratory birds.
Bald and Golden Eagles	Disturbance to bald and golden eagle habitat during construction	Construction would cause temporary, minor impacts to bald and golden eagles; however, no significant loss of foraging grounds would be expected due to the availability of nearby suitable habitat. The new riparian area surrounding the reservoir would have long-term, beneficial impacts to bald and golden eagles by providing additional roosting opportunities.
Ecologically Critical Areas	Impacts to the Parunuweap Canyon WSA, Zion Wilderness, and Parunuweap RNA during operational activities	No direct or indirect impacts to designated wilderness, WSA's. or RNAs would occur under the Action Alternatives.
Invasive Species	Introduction of invasive plant and animal species during construction and operational activities.	The Preferred Alternative would have minor, temporary impacts on invasive species during and immediately following construction; however, BMPs would be implemented to prevent the spread or introduction of noxious weeds and invasive animals. A Post-Construction Rehabilitation Plan would be developed and include mechanisms for addressing weed establishment and treatment and the prevention of the establishment of invasive animals.
Fish and Wildlife	Disturbance to fish and wildlife species/habitat	Construction activities would cause temporary, minor impacts to fish and wildlife species, including Species of Greatest Conservation Need, due to an increase in human presence and noise. There is ample surrounding habitat, and therefore, long-term impacts are not anticipated. The creation of the riparian area surrounding the reservoir would have beneficial, long-term impacts by providing

Resource Concern	Summary of Concern	Consequence
		new additional habitat for wildlife. State e fish Species of Greatest Conservation Need, including the desert sucker, flannelmouth sucker, and Virgin spinedace are known to exist in the EFVR. Changes in water flow from implementation of Alternative 2 would be minor, particularly when the natural variation of EFVR flows are approximately 100 times the range of effect from proposed Cove Reservoir releases (Alpha Engineering 2025), and therefore these species and their habitat would not be impacted.
Riparian Areas	Impacts to downstream riparian areas from changes in water flow	The Preferred Alternative would have minor, positive impacts to riparian vegetation through the creation of additional riparian habitat at the reservoir site. No impacts to existing riparian habitat in the EFVR would occur.
Cultural Resources	Impacts on historic/cultural resources that are present within the study area	The Preferred Alternative would result in **Adverse Effect to Historic Properties**. Indirect effects to cultural resources could arise from the increase in human activity in the area.
Social Issues	Impacts on local social conditions from project implementation	**Population** The Preferred Alternative would have indirect, positive benefits to the population by providing an additional needed recreation area. **Demographics** The Preferred Alternative would have no impact on demographics. **Employment and Income** The Preferred Alternative would provide 67 short-term jobs, 9 long-term jobs, and water to support 430 acres of agricultural land. **Housing** An increased risk of flooding from dam failure would cause indirect impacts to up to 275 residential parcels. **Economy** The Preferred Alternative would have a direct, beneficial impacts on the economy by attracting more visitors and supporting an additional 430 acres of existing agricultural land.

Resource Concern	Summary of Concern	Consequence
Public Health and Safety	Increased risks to public safety from dam failure and increased risk for construction-related traffic while construction is occurring	Short-term, minor risks to public health and safety would occur during construction due to an increase in traffic. Long-term risks to approximately 10 to 15 people would occur with properties in the new inundation zone of the dam. Long-term benefits to public health and safety include the reduction of stress from reliable water and the increased effectiveness of the fire suppression systems.
Scenic Beauty	Changes to the visual character of the immediate area	Short-term visual impacts would occur from the presence of construction equipment. Direct, long-term impacts to scenic values would occur from the conversion of 235 acres of arid land to a reservoir.
Significant Scientific Resources	Impacts on paleontological resources from construction activities	No impacts to significant paleontological resources are expected. A paleontological monitor would be present during new surface-disturbing activities associated with the Mt. Carmel irrigation improvements. A preconstruction paleontological training course with the construction contractor would occur prior to construction.
Land Use	Changes to land use from project implementation	Approximately 253.4 acres of land would be converted from undeveloped to developed resulting in minor, long-term impacts to land use within the project area.

Major Conclusion

Implementation of the Preferred Alternative would meet the purpose and need of the project while providing the greatest economic benefits. No significant adverse impacts to the human environment are anticipated (See Chapter 5.0 of the Plan-EIS for a detailed analysis); however, impacts resulting from project implementation would be cumulative to other actions identified in Chapter 5.0 of the Plan-EIS. Adverse construction effects would be short-term (approximately 15 months) and partially offset by avoidance/minimization measures and implementation of BMPs. Improved water availability and distribution for agricultural purposes and M&I uses would result. Additional hydroelectric energy would be produced by the extended use of the existing Orderville hydroelectric power plant. The reservoir and associated facilities would provide a new recreation opportunity.

	The Preferred Alternative is the most environmentally friendly alternative and has the greatest net economic benefits of all alternatives analyzed. This alternative represents both the Preferred Alternative and the National Economic Efficiency (NEE) Alternative. No measurable long-term adverse impacts are anticipated, and long-term environmental, social, and economic benefits would be realized from implementation of the Preferred Alternative.
Areas of Controversy	The scoping process for the Plan-EIS resulted in the identification of several issues and concerns associated with the proposed project. These include project cost, reduced downstream flow, project economics, alternative reservoir sites, non-reservoir alternatives, dam safety, invasive species, WSR-status, rare species, cultural resources, water use, and climate variation.
Issues to be Resolved	None
Evidence of Unusual Congressional or Local Interest	There has been interest in the proposed project expressed by the public, government, and non-government entities. A total of 66 public documents containing 249 specific comments were submitted during the public scoping period. An additional 9 agency-specific comment documents containing 57 specific comments also were submitted during the public scoping.
Compliance	Is this report in compliance with executive orders, public laws, and other statues governing the formulation of water resource projects? Yes X No___

1.0 WATERSHED PLANNING BACKGROUND

As the lead federal agency for this proposed project, the Natural Resources Conservation Service (NRCS) is proposing to provide funding for project measures associated with Agricultural Water Management (AWM), Municipal & Industrial (M&I) Water Supply, and Public Recreation in the Cove-East Fork of the Virgin River. A Watershed Plan-Environmental Impact Statement (Plan-EIS) is required for NRCS to comply with the requirements of the National Environmental Policy Act (NEPA) of 1969, 42 U.S. Code (USC) 4321 et seq. and its implementing regulations, as set forth in 7 Code of Federal Regulations (CFR) 650. This environmental document was initiated using the 40 CFR 1500-1508 (May 20, 2022) and 7 CFR 650 regulations. These regulations have recently been rescinded and replaced with U.S. Department of Agriculture (USDA) regulations found under 7 CFR 1b, published as a Final Rule in the Federal Register on April 3, 2026 (91 FR 17062). However, in a good-faith effort to fulfill NEPA's requirements, including Congressional timeline and considerations of fiscal restraints, the agency decided to continue to use 40 CFR 1500-1508 (July 31, 2023) and 1 CFR 650. This is permissible per the USDA policy guidance issued in the Final Rule's preamble. The Federal Register notice said: "if the NOI for an EIS [was] published more than 90 days prior to the publication of this final rule, the USDA subcomponent has discretion to continue applying the versions of NEPA regulations being applied before the publication of the NOI or to switch to applying 7 CFR 1b as published in this final rule."

This chapter describes the general and specific planning backgrounds for NRCS Watershed Programs, and this proposed project.

1.1 Authority

This Plan-EIS has been prepared under the guidance of the NRCS Watershed Program, which authorizes fundings to help urban and rural communities protect, improve, and develop land resources in watersheds up to 250,000 acres in size. The Watershed Program is authorized under provisions of the Watershed Protection and Flood Prevention Act of 1954 (Public Law [PL] 83-566) Stat. 666 as amended (16 USC Section 1001 et seq.).

1.2 Sponsor

The proposed project Sponsoring Local Organizations (SLOs) are the Kane County Water Conservancy District (KCWCD) and the Washington County Water Conservancy District (WCWCD).

1.3 Cooperating Agencies

Cooperating agencies for this project include the U.S. Environmental Protection Agency (EPA), National Park Service (NPS) through Zion National Park (ZNP), U.S. Army Corps of Engineers (USACE), the Bureau of Land Management (BLM), Utah Trust Lands Administration (UTLA), and the Utah Public Lands Policy Coordinating Office (PLPCO).

1.3.1 Environmental Protection Agency

The EPA accepted Cooperating Agency status in a letter dated October 29, 2021 (Appendix A). The EPA is involved in this proposed project through their responsibilities under Section 102(2)(C) of the NEPA and Section 309 of the Clean Air Act (CAA) of 1970.

1.3.2 National Park Service

The portion of the East Fork Virgin River (EFVR) that traverses ZNP is designated as a Wild and Scenic River (WSR) (National Wild and Scenic Rivers System, 2024). ZNP also maintains water rights on the EFVR. As a result, the NPS and ZNP have an interest in the proposed project and accepted Cooperating Agency status by memorandum dated April 18, 2022.

1.3.3 U.S. Army Corps of Engineers

The USACE has jurisdiction over waters of the U.S. (WOTUS) under the authority of Section 404 of the Clean Water Act of 1972 (CWA) and accepted Cooperating Agency status in a letter dated November 15, 2021 (Appendix A).

1.3.4 Bureau of Land Management

The BLM's involvement in this project is limited as no surface disturbance would occur on public lands, and no BLM permits would be required. However, the EFVR flows through the BLM–managed Parunuweap Canyon WSA. As a result, the BLM signed an MOU accepting Cooperating Agency status on August 16, 2022 (Appendix A).

1.3.5 Utah Trust Lands Administration

The UTLA manages lands located within the proposed project area. The UTLA is the steward of Utah's trust lands and is responsible for generating revenue from them for the benefit of public schools and other state institutions now and for future generations. The UTLA accepted Cooperating Agency status by email correspondence dated October 25, 2021 (Appendix A).

1.3.6 Utah Public Lands Policy Coordinating Office

The PLPCO is the State agency responsible for coordinating, promoting, and implementing Utah's public land priorities. The PLPCO requested Cooperating Agency status by memorandum dated October 20, 2021 (Appendix A) Refer to the Memorandum of Understanding (MOU) included in Appendix A for the roles and responsibilities of each individual agency.

1.4 Planning Area

1.4.1 Selected Watershed

The proposed Watershed Area developed for this Watershed Plan consists of a compilation of three Hydrologic Unit Code (HUC) 12s (Table 1-1 and Figure B-1) totaling 97,449 acres that are intersected by the project area in Kane County, Utah (Figure B-1, Appendix B). The Watershed Area is comprised of all direct tributary drainageways and land from which, after project installation, water and sediment could adversely affect any proposed structural measure as defined in the National Watershed Program Handbook, Title 390 Part 606.80 (NRCS, 2014a).

Table 1.1. HUC 12s in the Watershed Area

Name	Hydrologic Unit Code Number	Acres
Headwaters East Fork Virgin River	150100080201	33,414
Lydias Canyon-East Fork Virgin River	150100080203	40,747
Muddy Creek	150100080202	23,287
Total	-	**97,449**

1.4.2 Study Area

The project area for the proposed project is approximately 712.46 acres in size and is located in the Long Valley area between the cities of Glendale and Mt. Carmel, Utah. The project area includes all areas where ground or surface disturbance would occur as a result of project implementation. Surface-disturbing activities would include construction of a reservoir, access roads, pipelines, spillways, staging areas, and borrow pits. A detailed description of the proposed project is included in Section 4.2.2.1. Although no surface disturbance would occur beyond the project area as defined above, water would be made available to Washington County users for agricultural and M&I purposes.

The study area for the proposed project includes the project area and the downstream areas in Washington County. The study area includes all areas where environmental impacts could potentially occur as a result of project implementation. Downstream areas include where water would be released from the new reservoir to the Quail Creek Reservoir Diversion site approximately 50 river-miles downstream via the EFVR and Virgin River. Water would then be diverted from the river for agricultural use by the Hurricane Canal Company and M&I use in Washington County. Washington County is approximately 2,430 square miles with an estimated population of 207,943 (Utah Demographics, 2026). Primary communities include the cities of St. George, Washington, Hurricane, Santa Clara, Ivins, Toquerville, La Verkin, and Virgin. Refer to Figure C-1 in Appendix C for a figure of the project area versus the study area.

Project alternatives considered for detailed analysis (No Action and 3,000-Acre-Feet Reservoir Alternatives) encompass the same study area as described above; however, both alternatives would entail a reduced construction footprint or surface disturbance area compared to the Preferred Alternative (6,000-Acre-Feet Reservoir).

1.4.3 Area of Potential Effects for National Historic Preservation Act Section 106 Compliance

The Area of Potential Effect (APE) has been refined throughout the watershed planning process. In December 2019, the APE was defined as 791.68 acres (152.18 acres BLM, 70.33 acres UTLA, and 569.17 acres of private land), which included the proposed reservoir area, hydroelectric plant locations, six proposed borrow pits, a pipeline, and powerline/utility corridors. In January 2023, an addendum APE of 68.83 acres of private land was added to include the addition of the Mt. Carmel pipeline. In February 2024, an addendum APE of 13.72 acres was added to include the Esplin Borrow Pit Site. Refer to Appendix C-2 for figures of the APE.

In August 2024, the project extents were further refined, removing three of the six borrow pit sites (keeping the Tait, Esplin, and Lamb Pits). The NRCS defined the final Direct area of the APE, in consultation with the EPA, USACE, BLM, NPS and applicable tribes as 712.46 acres, consisting of 0.23 acres BLM, 70.33 acres UTLA, and 641.9 acres of private land, encompassing all areas that may be disturbed or changed from their current conditions with potential to affect cultural resources (see Sections 1.4.2 and 5.5.1). This includes all construction sites, staging areas, access roads, borrow sources, inundation areas, and necessary buffer zones. The Indirect area of the APE was also defined in August 2024 with the above consulting parties as approximately 1,007.97 acres, including 17.05 acres of BLM, 0.51 acres of UTLA, and 990.41 acres of privately owned lands. In June 2026, an updated inundation area was provided, and an updated Indirect area of the APE Memo was sent for consultation on September 8, 2026, with the consulting parties listed above.

Additionally, the NRCS identified the Visual area of the APE as approximately 4,952.29 acres, including 245 acres of BLM, 1,698.01 acres of UTLA, and 3,009.28 acres of private lands (see Sections 3.2.5.1 and 5.5.1). These three sections under the APE partially overlap with each other.

Table 1.2. Total project Area of Potential Effect

Area of Potential Effect	BLM	USFS	UTLA	Tribal	Private	Total
Direct section of APE Acreage (Cove Reservoir with construction buffer, Pipes, Canals, Esplin Pit, Tait Pit, Lamb's Pit)	0.23	0.00	0.67	0.00	641.9	712.46
Indirect section of APE Acreage (Inundation Areas)	17.05	0.00	0.51	0.00	990.41	1,007.97
Visual section of APE Acreage (1 Mile Buffer of Cove Reservoir and Facilities)	245.00	0.00	1,698.01	0.00	3,009.28	4,952.29

1.5 Planning Process and Study Scope

The proposed project is authorized by the Watershed Protection and Flood Prevention Act of 1954 (PL 83-566). The area wide planning process is outlined in Title 390, Parts 500 – 506 Watershed Program Management Manual (NRCS, 2024a). Other applicable laws for this proposed project include NEPA, NHPA, Endangered Species Act of 1973 (ESA), CAA, the Wild and Scenic Rivers Act of 1968 (WSRA), and the CWA. Other laws, rules and regulations may also apply and are identified in the NRCS Watershed Program Manual (NWPM), Section 500.32 (NRCS, 2024a).

The geographic area for the proposed project is the Long Valley drainage, which is part of the EFVR Watershed. Washington County is included in the larger Upper Virgin Watershed. Planning policy for watershed plans requires consideration of all natural resources within the planning area, as well as social and economic considerations. The plan evaluation process (Departmental Manual [DM] 9500-013) involves the following:

- Identify problems and opportunities.

- Inventory existing resources and conditions.
- Forecast future conditions.
- Develop an array of alternatives.
- Evaluate effects of individual alternatives.
- Compare alternatives.
- Identify Recommended Alternative.
- Implement and evaluate.

The format of this document follows the plan process that must be followed for watershed project plans as outlined in the NWPM Parts 500 through 506 (NRCS, 2024a), National Watershed Program Handbook (NWPH), Parts 600 through 606 (NRCS, 2014a), and National Environmental Compliance Handbook, Part 610 (NRCS, 2016). The planning and decision-making process followed Principles, Requirements, and Guidelines (PR&G) for Federal Investments in Water Resources (CEQ, 2013), NRCS DM 95000-013 (USDA, 2017a), the PR&G eight-step evaluation process (refer to the PR&G Analysis Report included in Appendix E-1), and the nine-step planning procedures from the National Planning Procedures Handbook (NPPH) (NRCS, 2013). The nine-step planning process is defined in Section 1.5.1 below.

1.5.1 Stepwise Planning Process

The NRCS planning process consists of nine steps, divided into three phases covering 1) Collection and Analysis, 2) Decision Support, and 3) Application and Evaluation. The nine-step planning process, as presented in the NPPH (NRCS, 2013), was considered and incorporated into this Plan-EIS, as explained below.

1.6 Phase 1—Collection and Analysis

Step 1—Identify Problems and Opportunities: Problems and opportunities were identified during the project scoping process and are included in Chapter 2.2. Input from the sponsors, agencies, the public, organizations, and Tribes were solicited as described in Section 1.5.5 and Chapter 7.3 to help identify problems and opportunities. Engineering analysis was completed to further identify and evaluate problems, as documented in the Preliminary Design Report included in Appendix E-1.

Step 2—Determine Objectives: The purpose and need statement for the project was formulated with the problems and opportunities associated with the proposed project. Where the "purpose" identifies the fundamental reason why the action is being proposed, and the "need" describes the problem(s) that the proposed action is intended to address and explains the underlying causes of the problem(s). The Purpose and Need were prepared by the project proponents in cooperation with the NRCS, EPA, NPS, USACE, UTLA, PLPCO, ZNP, and SLOs. Chapter 2.0 identifies the purpose, objectives, and need to support Step 2.

Step 3—Inventory Resources: Resources and ecosystem services relevant to the alternative actions were determined during the scoping process and other resource evaluations, as described in Chapter 3.1. The resource conditions determined to be relevant are described in Chapter 3.0.

Step 4—Analyze Resource Data: The environmental baseline conditions for resources to be evaluated against alternative actions were identified and are included in Chapter 3.2. The best available data and science were used to inventory the existing resource conditions at the level and scale of analysis determined reasonable for evaluating alternatives and impacts during the planning stage.

1.7 Phase 2—Decision Support

Step 5—Formulate Alternatives: Project alternatives were formulated in consideration of the federal objective set forth in the Water Resources Development Act of 2007, the PL 83-566 general purposes, and the project purpose and need. Alternatives were formulated following procedures outlined in the NWPM, NWPH, DM 95000-013, and PR&G. Alternatives formulated are described in Chapter 4.0.

Step 6—Evaluate Alternatives: The effects of alternatives analyzed in detail were determined for each resource relevant to the alternative actions. The evaluation of alternatives is included in Chapter 5.0 and assesses the proposed alternatives against the baseline data presented in Chapter 3.2.

Step 7—Make Decisions: A National Economic Efficiency (NEE) Alternative, also identified as the Preferred Alternative, was selected based on the evaluation performed. The selection was made for the alternative that best maximized public benefits (environmental, economic, and social) with appropriate consideration of costs. Chapter 6.0 provides information on the decision-making process for selection of the Preferred Alternative. The Preferred Alternative was also agreed upon in cooperation with the project SLOs, NRCS, EPA, NPS, ZNP, USACE, BLM, UTLA, and PLPCO.

1.8 Phase 3—Application and Evaluation (Future Work)

Step 8—Implement the Plan: The Plan-EIS is the first phase of three phases to be completed for implementation of the preferred alternative. After the Final Plan-EIS is completed, Phase Two would consist of final design, and Phase Three would consist of installation of the project measures.

Step 9—Evaluate the Plan: After the installation of measures from Phase Three, NRCS and the SLOs would evaluate the effectiveness of the plan in solving the resource concerns. Adjustments to the plan would be made as needed.

1.8.1 Ecosystem Services Framework

An ecosystem services framework is required by the PR&G and provides for an integrated approach that allows consideration and transparent evaluation of the benefits (both tangible and intangible) and tradeoffs of potential alternatives (DM 9500-013). Four categories of ecosystem services are described in the PR&G and are included below for reference.

- **Provisioning services** are tangible goods provided for direct human use and consumption, such as food, fiber, water, timber, or biomass.

- **Regulating services** maintain a world in which it is possible for people to live, providing critical benefits that buffer against environmental catastrophe—examples include flood and disease control, water filtrations, climate stabilization, or crop pollination.

- **Supporting services** refer to the underlying processes maintaining conditions for life on earth, including nutrient cycling, soil formation, and primary production.

- **Culture services** make the world a place in which people want to live—recreational use, spiritual, aesthetic viewsheds, or Tribal values.

The scoping process identified resources relevant to the proposed action that were considered for the determination of applicable ecosystem services (see Chapter 3.1). Ecosystem service benefits can be both monetary and non-monetary. Appropriate metrics should be based on current methodology to quantify impacted services over time for determination of project and/or regional-specific effects. For reference, a list of ecosystem service categories and their subcategories from Earthwise Aware is provided as Figure 1-1 (Earthwise Aware, 2024). The ecosystem service categories/subcategories relevant to this proposed project and the applicable resources pertinent to each subcategory that were analyzed in this document are provided in Table 3.2 of Chapter 3.1.

Figure 1.1. Ecosystem Services.

The applicable ecosystem services were evaluated as part of the PR&G eight-step evaluation process. This process includes consideration of the federal objective, PL 83-566 general purposes, guiding principles, and ecosystem services to assist in decision-making. Refer to the PR&G Analysis Report included in Appendix E-1 for documentation of the PR&G eight-step evaluation process used for decision-making.

1.8.2 Period of Analysis

The NRCS period of analysis is the time required for project development (design and construction) plus the evaluated life of the project. The evaluated project life is the time over which implementation of an alternative is functional and would have significant beneficial or adverse effects when the project successfully functions with prescribed operations, maintenance, and replacement. The evaluated life is used for discounting and amortizing project benefits and costs. It is also used to determine the duration of operation and maintenance (O&M) agreements for the project works of improvement.

The NRCS period of analysis for this project is 103 years, which includes 100 years for the evaluated life and three years to construct the proposed project.

1.8.3 Project Scope

Section 1 of PL 83-566 sets forth three general purposes for Watershed Program projects:

- Flood prevention (including structural and land treatment measures).
- The conservation, development, utilization, and disposal of water.
- The conservation and proper utilization of land in watershed or sub-watershed areas not exceeding 250,000 acres for the primary purpose of flood prevention (including structural works of improvement and land treatment measures); The project may not include any single structure which provides more than 12,500 acre-feet of floodwater detention capacity, and more than 25,000 acre-feet of total capacity.

This proposed project scope falls under the second purpose; “the conservation, development, utilization, and disposal of water.” The proposed project is intended to increase the availability of water for AWM, M&I, and recreational water supply.

1.8.4 External Scoping

An external scoping process was conducted to provide opportunity for individuals, agencies, Tribes, and other organizations interested in or potentially affected by implementation of any of the proposed alternatives to share concerns and provide input. Details of the scoping process and results are provided in Chapter 7.0 of this document. Project scoping questions, comments, and concerns were requested from the public, SLOs, stakeholders, tribes, organizations, and agencies during the external scoping period, both orally at a public meeting and via written submittal of comments. Tribal Scoping letters were mailed to 17 representatives of 11 Tribes as part of the original Watershed Plan Environmental Assessment (Plan-EA) scoping outreach process on January 9, 2020. A Notice of Intent (NOI) to prepare the Plan-EIS was published in the *Federal Register* on March 29, 2022. The open comment period was 209 days beginning October 7, 2021, and ending Thursday, April 28, 2022. A scoping letter and project fact sheet were sent directly to landowners who own parcels adjacent to or within the project area. Scoping activities were initiated under 40 CFR 1500-1508 (May 20, 2022) and 7 CFR 650 regulations. These regulations have recently been rescinded and replaced with USDA regulations found under 7 CFR 1b, published as a Final Rule in the Federal Register on April 3, 2026 (91 FR 17062). However, in a good-faith effort to fulfill NEPA’s requirements, including Congressional timeline and considerations of fiscal restraints, the

agency decided to continue to use 40 CFR 1500-1508 (July 31, 2023) and 7 CFR 650. This is permissible per the USDA policy guidance issued in the Final Rule's preamble. The Federal Register notice said: "if the NOI for an EIS is published more than 90 days prior to the publication of this final rule, the USDA subcomponent has discretion to continue applying the versions of NEPA regulations being applied before publication of the NOI or to switch to applying 7 CFR 1b as published in this final rule." For a full summary of scoping activities, see the Scoping Report in Appendix A.

A notification was published in the *Southern Utah News* on October 7 and October 14, 2021 (Appendix A). Project press releases were sent to the *Salt Lake Tribune*, *The Spectrum*, and the *Desert Sun News*. Non-governmental organizations were also contacted.

A public meeting was held in Orderville along with a virtual meeting via Zoom Webinar on Wednesday, October 20, 2021, from 6:00 p.m. to 7:30 p.m. Approximately 41 members of the public attended, based on the number of unique names/emails contained in the Zoom attendee report. A list of attendees is included in Appendix A. A total of 66 public comment documents were received, which were categorized and organized into 249 specific comments. A total of nine agency comment documents were received, which were categorized and organized into 57 specific comments. A single comment letter was received from the Hopi Tribe during Plan-EA) scoping, and a Hopi and Navajo letter was received during EA Notice of Availability (NOA). The NRCS responded directly to Hopi via letter (Appendix A). These comments were considered in preparation of the Plan-EIS. A Scoping Report was prepared summarizing the scoping process and is included in Appendix A. The scoping report includes documentation of the scoping announcements and activities that occurred during the external scoping process. A Draft Plan-EA for this proposed project was prepared and published for public review in 2020. In 2021, NRCS determined that a Plan-EIS would be required for the proposed project. The external scoping process for the Plan-EIS is in addition to the scoping process conducted for the Plan-EA. Individuals, agencies, Tribes, and other organizations who participated in the scoping and public comment process for the Draft Plan-EA were included on an email and/or hard copy mailing list for the Plan-EIS. Comments received on the Draft Plan-EA were considered during preparation of the Draft Plan-EIS.

1.9 Related Projects and Studies

Related past, present, and reasonably foreseeable projects and studies within the project vicinity were identified to help define the scope of issues to be addressed in this watershed plan. Those issues found relevant to this project were used to describe the resources in Chapter 3.0 and to determine direct, indirect, and cumulative impacts addressed in Chapter 5.0. Studies are referenced, where applicable, throughout the Plan-EIS. Chapter 8.0 provides information on the references and where they can be found.

2.0 PURPOSE AND NEED

2.1 Purpose

Pursuant to PL 83-566, the purpose of this proposed project is to enhance the efficiency and reliability of the current AWM in Long Valley, Kane County and Hurricane, Washington County, Utah (part of the EFVR watershed) while complying with the Zion National Park Water Rights Settlement Agreement of 1996 (ZNP Agreement) (United States, Utah, Washington District, & Kane District, 1996). Effective irrigation systems and water management strategies, including construction of a water storage reservoir, would support agriculture profitability amid constraints posed by scarce and costly water resources.

The project would also provide a public recreation opportunity in Long Valley and increase M&I water supply to communities in Washington County. The water demand in the WCWCD service area is projected to increase as summer agricultural water shortages continue, and more M&I water providers join and receive water from the WCWCD system. The WCWCD manages reservoirs, pipelines, wells, water storage tanks, treatment plants, hydroelectric power plants, and diversion dams. The majority of the district's water is sold wholesale to its municipal customers including the Cities of St. George, Washington, Hurricane, Santa Clara, Ivins, Toquerville, La Verkin, and Virgin (WCWCD, 2025). A figure of the Service Areas is provided in Figure C-3 in Appendix C.

2.1.1 Federal Objective

Water resource investments, as defined by the NWPM, shall reflect national priorities, encourage economic development, and protect the environment by:

- Seeking to maximize sustainable economic development.
- Seeking to avoid the unwise use of floodplains and flood-prone areas and minimizing adverse impacts and vulnerabilities in any case in which a floodplain or flood-prone area must be used.
- Protecting and restoring the functions of natural systems and mitigating any unavoidable damage to natural systems.

2.1.2 Project Objectives

Project objectives were formulated at the beginning of the planning process by project SLOs and NRCS based on a documented need for water availability in Kane and Washington Counties. The project objective is to enhance the efficiency and reliability of the current AWM in Long Valley and Washington County, Utah, while complying with the ZNP Agreement (1996). The objectives listed below were identified by SLOs, cooperating agencies, organizations, and the public during development of this Plan-EIS:

- Provide a reliable source and long-term availability of agricultural water during the summer months in the Glendale, Orderville, and Mt. Carmel areas of Kane County and the Hurricane area of Washington County.
- Provide M&I water to Washington County.

- Provide an additional recreation opportunity in Kane County.
- Increase annual visitation in the communities of Orderville, Glendale, and Mt. Carmel by establishing an additional recreational hub that supports growth in local business revenues and employment opportunities.
- Provide for the maximum utilization of renewable energy for local communities, whose populations are projected to rise in the near term (Utah PLPCO, 2017); releases of excess water and water delivered to WCWCD would supplement energy provided by the existing Orderville hydroelectric plant.
- Comply with the ZNP Agreement (1996).

2.1.3 Constraints and Considerations

Constraints that influenced the alternatives analysis were identified for the planning area. These constraints limited the extent to which the objectives could be achieved. A description of the constraints is provided below, and further detail is provided in Chapter 4.0.

- **Siting limitations:** Topography in the Long Valley area limits the number of sites (seven) that potentially meet the necessary criteria for a reservoir. Issues with these sites are discussed in Chapter 4.0. A majority of the land in the area is not suitable for reservoir development.
- **Public safety:** The majority of the potential alternative sites would put residential property within the breach inundation zone of a dam.
- **Environmental resources:** Development of certain sites would involve the loss of existing agricultural land and residences.
- **Geotech restrictions:** Some of the available sites would not support construction due to geological structural limitations.
- **Engineering challenges:** Development of some potential sites would require extensive engineering, such as re-routing existing roads around dams and reservoirs. Some of this re-routing would be in steep topography. There would be differences in dam size depending on the site location.
- **Economic constraints:** An economic analysis was completed to find the alternative which best meets the proposed project's purpose and need while providing economic benefit. It was determined that development of some potential sites would be more expensive than others. Development of some sites would be cost prohibitive.

2.2 Need

The need for this project arises from annual water shortages experienced by local agricultural users served by the Glendale, Orderville, and Mt. Carmel irrigation companies. Due to a difference in timing between the melting of snowpack within the watershed and the peak demand for agricultural water use, these users experience water shortages during the summer months. Contributing factors include variable precipitation patterns, EFVR flow trends, absence of sufficient water storage facilities, and inefficiencies in current irrigation systems, such as unlined ditches in

Mt. Carmel. These factors combine to result in insufficient agricultural water during summer, causing inconsistent agricultural production and limiting the potential for cultivation of water-dependent crops.

Agricultural water users in Washington County, served by the Hurricane Canal Company, experience summer water shortages when Virgin River flows decrease. Additionally, the ongoing drought and historical population growth has stressed existing M&I water availability.

2.2.1 Water Usage Trends

A review of water usage in the area upstream of Mt. Carmel (over the last 20 years) shows that an average of 20 cubic feet per second (cfs) is needed during the irrigation season, which exceeds the river's average summer capacity by approximately 9 cfs (Figure 2-1). The Glendale, Orderville, and Mt. Carmel irrigation companies only had enough water to provide for full irrigation of 302 acres of their 1,124 acres during 90 percent of the record years.

2.2.2 Irrigation Infrastructure

The current irrigation infrastructure in Long Valley lacks sufficient capacity for storage during periods of non-use and high flow. Consequently, the water that could be stored remains largely inaccessible to local users. This could be achieved by enhancing water availability through the collection and storage of excess water that could be used during the irrigation season (June through August) during non-use periods. Figure 2-1 shows the river discharge available for diversion, including tributary flows between the U.S. Geological Survey (USGS) gauging station and Mt. Carmel, in comparison to the irrigation demand for the three irrigation companies (Alpha Engineering, 2026).

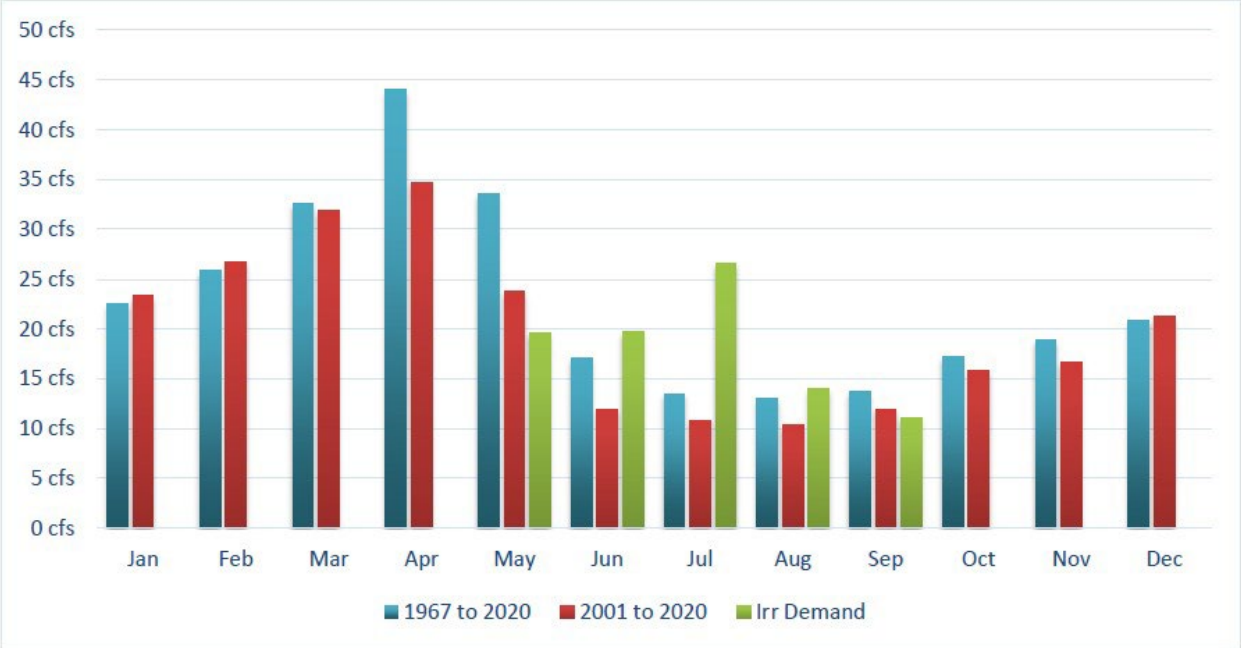

Figure 2.1. Average 09404450 Glendale USGS Gauge Data Compared to Irrigation Demand.

2.2.3 Problems

Despite using available water for irrigation with no new conveyance or storage, the EFVR's average flow is insufficient to meet annual crop demands in the critical months of June, July, and August. For example, to fully irrigate the existing agricultural acreage in Long Valley in July, an estimated flow of 26.9 cfs is required, which exceeds the river's average historic flow rates of approximately 10–14 cfs capacity (Figure 2-1).

There is a demand for new recreational facilities in Kane County and Utah in general. Frequently, recreational facilities exceed capacity with residents and non-resident tourists during peak travel seasons, particularly in the summer months. In 2023, the number of visitors to ZNP exceeded 5 million, which is an increase of 73.4 percent since 2010. Visitation at Bryce Canyon National Park (BCNP) to 2.5 million people in 2023, which is a 91.4 percent increase over 2010 visitation levels (NPS, 2024).

During the summer months, low flows in the Virgin River do not provide sufficient water to meet agricultural irrigation needs on land administered by the Hurricane Canal Company.

The extended drought has strained the existing M&I and agriculture water supply in Washington County resulting in implementation of enhanced conservation measures. Further, the historical increase in population for Washington County has increased demand for M&I water. Washington County is among the fastest-growing regions in the western U.S. and is located within an arid, hydrologically constrained basin. M&I water demand has increased substantially due to population growth, economic activity, and increases in equivalent residential connections, even under aggressive conservation implementation.

Despite implementing aggressive conservation measures, existing potable and secondary supplies are insufficient to meet the existing and future M&I demand. Local surface water sources within the Virgin River Basin are fully allocated, groundwater basins are closed to new appropriations, and supply diversification options are limited.

2.2.3.1 Agricultural Water Deficits of Long Valley Irrigation Companies

Although the Utah Division of Water Rights has revised the irrigation water duty from 6-acre-feet per acre to 5-acre-feet per acre, the analysis presented in this document uses the historical 6-acre-foot duty because it reflects the current water use under existing irrigation practices. The revised 5-acre-foot duty was negotiated between the Utah Division of Water Rights and the KCWCD for the Glendale, Orderville, and Mt. Carmel Irrigation Companies. Under this revision, the 5-acre-foot duty would only apply when irrigation rights are converted to another beneficial use. Accordingly, the historical 6-acre-foot duty was used throughout this document to evaluate existing agricultural demands and shortages because it represents current conditions.

Research, such as Utah State University Research Report 145, indicates that under certain technological applications, water usage could be optimized to 4-acre-feet per acre for crops like alfalfa in the Orderville area. With a conversion to pressurized systems and the current acreage, an average of 1,412 acre-feet of water is required to allow these irrigation companies to meet their full water right during the USGS period of record. Table 2.1 shows the water rights of the Glendale Irrigation Company, Orderville irrigation Company, and Mt. Carmel Irrigation Company. Refer to Appendix E-1 for more detail.

Table 2.1. Irrigation Company Acreage and Water Demand (Appendix E-1).

Irrigation Company	Total Combined Water Right (Acreage)	Maximum Allowable Diversion Rate (cfs)	Prescribed Water Duty (Acre-Feet per Year [afy])
Glendale Irrigation Company	434.0	7.2	2,170.0
Orderville Irrigation Company	286.0	4.7	1,430.0
Mt. Carmel Irrigation Company	404.0	6.7	2,020.0
Total	**1,124.0**	**18.5**	**5,620.0**

Note: The projected need for water in Washington County is 4.5 cfs or 1,350 afy.

2.2.3.2 Available Water within the EFVR Drainage Area

The portion of the EFVR drainage area extending above Mt. Carmel Junction to the Quail Creek Reservoir Diversion point is the primary focus of the water availability analysis. A water model, integrating historical USGS data, Utah Department of Water Rights records, and statistical inflow estimations from various drainage basins, was developed to assess water flow and diversions in the EFVR. This model, though not precise, is designed to reflect real-world water flow scenarios accurately.

Analysis of USGS gauge data over a 54-year period and a more recent 20-year period highlights the impact of persistent drought on river flows, especially during spring and summer. These data, along with statistical calculations for watershed drainage, help construct a comprehensive water budget for the area upstream of Mt. Carmel. Figure 2-2 illustrates the seasonal irrigation demands of the three irrigation companies versus the average river flow, translating crop water needs into equivalent cfs flow rates for comparison (Alpha Engineering, 2026).

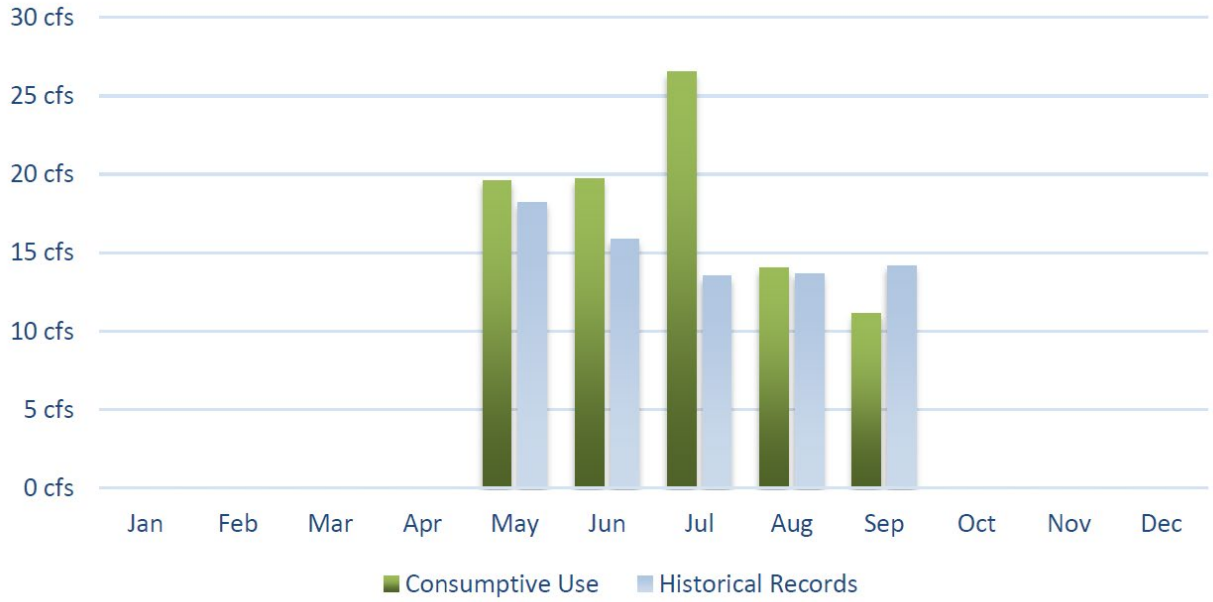

Figure 2.2. Modeled current average conditions of the EFVR drainage above Mt. Carmel Junction.

Despite converting all available water for irrigation with no conveyance or application losses, the EFVR's average flow is insufficient to meet the crop demands, particularly in the critical months of June, July, and August. To fully irrigate the necessary acreage in July, for instance, an estimated flow of 26.9 cfs is required, which nearly exceeds the river's average capacity.

A schematic representation of the EFVR drainage area (Figure 2.3) highlights the inflows from tributaries and outflows to irrigation diversions using data from USGS gauging station 09404450, located near Glendale, Utah (Alpha Engineering, 2026). This includes additional drainage areas (shown in blue) that contribute flow to the EFVR as the stream channel traverses between the various irrigation company diversion dams. Proposed connections to and from the Cove Reservoir are shown in red and green.

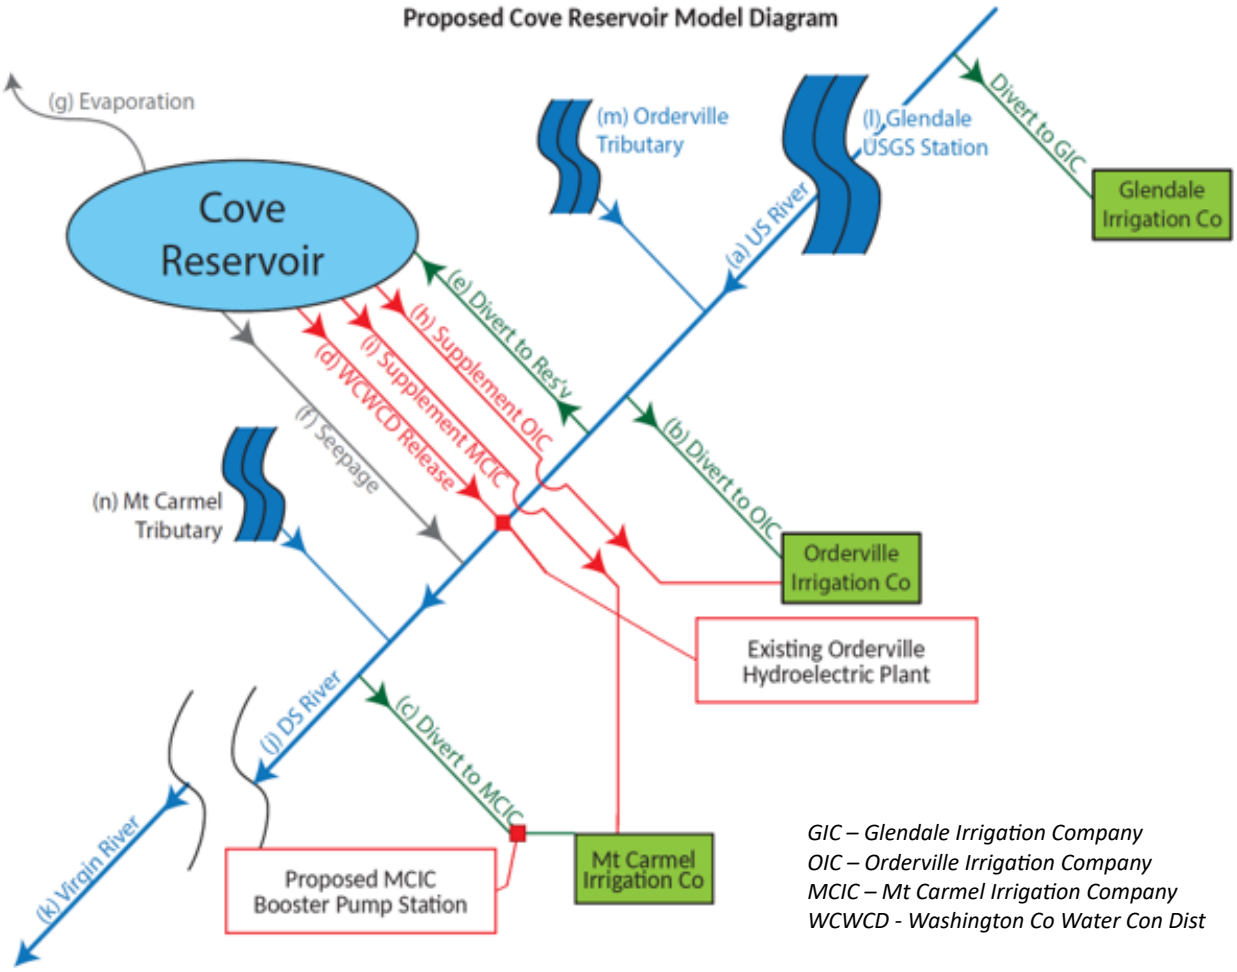

Figure 2.3. Proposed Cove Reservoir Model Diagram.

2.2.4 Opportunities

Project measures associated with AWM address deficiencies in drainage, ground water recharge, irrigation, water conservation, water quality and agricultural (including rural communities) water supply (NRCS, 2024a).

Project measures associated with M&I water supply provide storage capacity in reservoirs to increase the availability of water for present and future M&I use (NRCS, 2024a).

Project measures associated with Public Recreation provide a recreation opportunity in Kane County, addressing the currently overcrowded recreational facilities, particularly in the summer months.

This proposed project would provide the following long-term benefits:

- Increased water availability to local agricultural users in Kane and Washington Counties.
- Increased water availability for municipal users in Washington County.

- Increased water security for present and future residents in both Kane and Washington counties.
- Increased resilience to climate stressors, including potentially long-term extreme drought conditions.
- Added recreation opportunities for Kane County and the surrounding communities.

3.0 AFFECTED ENVIRONMENT: CURRENT AND FUTURE CONDITIONS

3.1 Resource Categories of Concern

A scoping process was completed to identify relevant resources, environmental concerns, and ecosystem services to be analyzed in detail and determine which items could be eliminated from the detailed study. These items were identified for the project based on required scoping concerns outlined in the 390 NWPM Section 501.24(B) (NRCS, 2024b), as well as additional concerns identified by the public, SLOs, stakeholders, Tribes, agencies, and cooperating agencies during the scoping process.

Table 3.1 provides a list of resources and their relevancy to the project. Items determined to be not relevant to the proposed action have been eliminated from the detailed study. Items determined to be relevant to the to the proposed action are detailed in Chapter 3.2 and Chapter 5.0.

Table 3.1. Resource Categories of Concern and Ecosystem Services Identified During Scoping.

Item/Concern	Relevant to the Proposed Action?	Rationale
Soil Resources **(Soil-Related Concerns)**	Yes	Soil resources are relevant for determining sediment yield and reservoir storage capacity within the watershed, and construction activities could increase erosion potential and change sediment transport conditions.
Prime and Unique Farmland, and Farmland of Statewide or Local Importance **(Soil-Related Concerns)**	No	No prime or unique farmland or farmland of statewide significance is located within the study area.
Water Resources **(Water-Related Concerns)**	Yes	Construction activities would occur in drainages and near water sources. Water would be made available for agricultural purposes during the summer months. The proposed action could affect downstream water flow.
Sole Source Aquifers **(Water-Related Concerns)**	No	There are no Sole Source Aquifer's in or near the study area according to the EPA Sole Source Aquifer interactive map (EPA, 2024a).
Water Quality **(Water-Related Concerns)**	Yes	Surface water quality could be affected. No measurable changes to groundwater quality are anticipated. Stream flow patterns could be altered.
Floodplain Management **(Water-Related Concerns)**	Yes	Construction activities could affect the floodplain in the project area.

Item/Concern	Relevant to the Proposed Action?	Rationale
Coastal Zone Management Areas **(Water-Related Concerns)**	No	There are no Coastal Zone Management Areas in the study area.
WOTUS, Wetlands, and Special Aquatic Sites **(Water-Related Concerns)**	Yes	Jurisdictional WOTUS are located within the study area. Two artificial wetlands were identified in the study area based on review of an aquatic resource survey conducted and included in Appendix E-1.
Coral Reefs **(Water-Related Concerns)**	No	There are no coastal reefs present in the study area.
Regional Water Resource Plans (including Coastal Plans) **(Water-Related Concerns)**	Yes	KCWCD and WCWCD have Water Conservation Plans for the study area. Coastal Plans are not applicable.
Wild and Scenic Rivers **(Water-Related Concerns)**	Yes	The EFVR has WSRs status for the portion that flows through ZNP that may be affected.
Air Quality **(Air-Related Concerns)**	Yes	Construction activities would produce emissions and fugitive dust. The proposed action would not generate long-term emissions (beyond the 15-month construction period). Permits would not be required.
Threatened and Endangered Species **(Plant and Animal-Related Concerns)**	Yes	Habitat for ESA-listed, BLM-listed, and state-listed Species of Greatest Conservation Need (SGCN) occur in the study area and may be affected.
Migratory Birds **(Plant and Animal-Related Concerns)**	Yes	Habitat for migratory birds is present within the study area and may be affected.
Bald and Golden Eagles **(Plant and Animal-Related Concerns)**	Yes	Habitat for bald and golden eagles is present within the study area and may be affected.
Essential Fish Habitat **(Plant and Animal-Related Concerns)**	No	There is no essential fish habitat located in the study area based on National Oceanic and Atmospheric Administration (NOAA) fisheries Essential Fish Habitat Mapper (NOAA, 2021)
Ecologically Critical Areas **(Plant and Animal-Related Concerns)**	Yes	The Parunuweap Canyon Wilderness Study Area (WSA), Zion Wilderness, and Parunuweap RNA are in the study area and may be

Item/Concern	Relevant to the Proposed Action?	Rationale
		impacted due to changes in water flows.
Invasive Species **(Plant and Animal-Related Concerns)**	Yes	The proposed action has potential for the introduction of invasive animal species. Construction disturbance increases the risk of invasive plant species becoming established.
Fish and Wildlife **(Plant and Animal-Related Concerns)**	Yes	The Utah Natural Heritage Program (UNHP) identified potential fish and wildlife habitat within the study area which may be affected.
Natural Areas **(Plant and Animal-Related Concerns)**	No	There are no protected natural areas or conservation areas located in the study area.
Riparian Areas **(Plant and Animal-Related Concerns)**	Yes	Changes in water flow may impact downstream riparian areas.
Forest Resources **(Plant and Animal-Related Concerns)**	No	There are no forest resources in or near the study area.
Cultural Resources and Tribal Consultation **(Human Use-Related Concerns)**	Yes	Historic/cultural resources are present within the study area and may be affected.
Social Issues **(Human Use-Related Concerns)**	Yes	The project is located near populated areas, and project implementation could impact local social conditions.
Local, Regional, and National Economy **(Human Use-Related Concerns)**	No	The project is not anticipated to have impact to the regional or national economy.
Public Health and Safety **(Human Use-Related Concerns)**	Yes	The proposed action has potential for increased risks to public safety due to dam failure and increased risk for construction-related traffic while construction is occurring.
Scenic Beauty **(Human Use-Related Concerns)**	Yes	The development of a reservoir and earthen dam would change the visual character of the immediate area. According to the National Trails System Map, there are no National Scenic and Historic Trails located in or near the study area (NPS, 2025)

Item/Concern	Relevant to the Proposed Action?	Rationale
Parklands (including National Parks, Monuments, and Historical Sites) **(Human Use-Related Concerns)**	No	According to the National Parks and Monuments Map (NPS, 2024), the Utah State Parks Map (Utah Department of Natural Resources, 2025) and the National Natural Landmarks Map (NPS, 2024), there are no parklands located within the project area. Zion National Park is located downstream of the project and is discussed throughout the document.
Significant Scientific Resources **(Human Use-Related Concerns)**	Yes	Paleontological resources exist near the project area and would not be disturbed. Resources found within the Project Area were determined to be invertebrate and non-significant
Land Use **(Human Use-Related Concerns)**	Yes	Alternative measures would affect land use.
Provisioning **(Scoped Ecosystem Services of Concern)**	Yes	Project measures could change flooding conditions on agricultural land that influence crop yield.
Regulating **(Scoped Ecosystem Services of Concern)**	Yes	Project measures include regulation for water, biology, and flooding that influence ecosystem processes. Climate variation also plays a role in flood conditions.
Supporting **(Scoped Ecosystem Services of Concern)**	Yes	Project measures could change surface water flow and water cycling.
Cultural **(Scoped Ecosystem Services of Concern)**	Yes	The project would improve the safety, wellbeing, and sustainability of the local community.

Consideration of ecosystem services that are relevant to the study area is required by the PR&G. This framework provides an integrated approach allowing consideration, transparent evaluation of the benefits (both tangible and intangible), and tradeoffs of potential alternatives. The four categories of ecosystem services are described in Section 1.8.1.

Ecosystem service categories overlap with resource concerns, and therefore, are not discussed separately from the resource concerns. The ecosystem service categories relevant to this project and the applicable resource concerns are provided in Table 3.2.

Table 3.2. Applicable Ecosystem Services and Related Resources.

Category	Service	Applicable Resources
Provisioning	Food/Biomass (crop yield)	Social Issues and Local Economy, Prime and Unique Farmland
Provisioning	Irrigation and livestock water	Water Resources, Social Issues and Local Economy
Regulating	Climate	Surface Water Quantity and Flow, Floodplain Management
Regulating	Water Regulation (quality and quantity)	WOTUS, Surface Water Quality, Surface Water Quantity and Flow, Floodplain Management
Regulating	Biological Regulation (plants and animals)	Plant and Animal Resources
Regulating	Natural Hazards Moderation (flood)	Floodplain Management, Public Health and Safety, Transportation Infrastructure
Supporting	Water Flow and Cycling	Surface Water Flow and Cumulative Affects
Cultural	Cultural/Historical Identity and Heritage	Historic/Cultural Resources/Native American Religious Concerns
Cultural	Peace and Sustainability	Social Issues and Local Economy, Public Health and Safety, Recreation, Visual Resources, Transportation Infrastructure, Noise and Vibration
Cultural	Well-Being and Safety	Floodplain Management, Public Health and Safety

The applicable ecosystem services were evaluated as part of the PR&G eight-step evaluation process. This process includes consideration of the federal objective, PL 83-566 general purposes, guiding principles, and ecosystem services to assist in decision making. Refer to the PR&G Analysis Report included in Appendix E-1 for documentation of the PR&G eight-step evaluation process used for decision-making.

3.2 Inventory of Existing Resources and Conditions

This chapter describes the resources that were determined to be relevant to the proposed action from Table 3.1 and the applicable ecosystem services from Table 3.2. Describing the affected environment defines the context in which the impacts could occur. The environmental analysis process has been conducted in compliance with applicable federal, state, and local regulations. Table S.1 (located in the Summary) provides a condensed overview of the resources that could potentially be influenced by consideration of the Alternatives. Further elaboration on these resources is provided within this chapter.

Each resource in this chapter includes the baseline environmental conditions in the project area and may extend beyond the project area, as applicable, to include the areas of potential impact (the study area). Refer to Section 1.4.2 for a description of the project area and study area.

Per requirements of the PR&G, where applicable, this chapter describes the ecosystem services associated with each resource. Refer to Section 1.8.1 for a definition of ecosystem services and service categories.

3.2.1 Soil

3.2.1.1 Soil Resources

The predominant soil types within the study area primarily consist of sand, sandy loams, upland clay loams, and shale. These soil types are classified by the NRCS Web Soil Survey as Bluesky family-Rock Outcrop complex, Catdraw-Quezcan-Vessilla complex, Marthaspeak-Ramps-Moonshine complex, Quezcan deep Sideshow-Orderville complex, Ramps-Modo-Kunz-Rock outcrop complex, Sili-Sideshow-Gypsic Haplustepts complex (upland clay loam), and Zigzag Family-Badland-Quezcan complex (upland clay loam and Naplene-Teromote-Arboles-Oxyaquic Ustifluvents complex) (NRCS, 2019).

The project area lies in an alluvial valley carved into Cretaceous and Tertiary sedimentary rocks, mainly comprising of sandstone and shale. Residual soils consist of silt and clay, with steep slopes adjacent to the site. Sediment rate studies conducted by Alpha Engineering and RB&G Engineering indicate that sediment volumes over the 100-year project lifespan would range from 253 acre-feet to 600 acre-feet, representing no more than 10 percent of the project reservoir's storage volume (Alpha Engineering and RB&G Engineering, 2020).

The project area is susceptible to occasional flash floods, leading to sheet, rill, and gully soil erosion following significant precipitation events. Although small retention dams have been constructed in the past, many are filled with sediment and provide minimal effectiveness.

Biological soil crusts are found in certain portions of the project area where surface disturbance is minimal. These crusts play an important role in retaining soil moisture and inhibiting the growth of certain annual weeds. They also contribute to reducing wind and water erosion, fixing atmospheric nitrogen into a form usable by plants, and enhancing soil organic matter. The absence of these crusts is a treatable resource concern and considered an indicator of physical disturbance (BLM, 2008)

The material at the three borrow sites that would be used for the proposed project contains either gravel (Lamb and Tait pits) or basalt (Esplin pit). All three pits have been previously used with topsoil removed and gravel or basalt removed on a total of approximately 24.7 acres (Tait pit 7.0 acres; Lamb pit 16.2 acres; Esplin pit 1.5 acres). The areas not disturbed at these sites have limited topsoil derived from sand/gravel or basalt sources. Source material for the embankment would be taken from the reservoir basin and would be covered by water once the reservoir is operational.

3.2.1.2 Ecosystem Services

Agricultural lands and associated soil resources in the study area provide ecosystem services categorized as provisioning services. Specifically, soil resources allow for the production of grasses (alfalfa and oats) and crops that feed cattle and humans. As described in Chapter 2.2, water from the EFVR is used by local agricultural users served by the KCWCD and WCWCD Service areas, including the Mt. Carmel, Orderville, Glendale, Washington, Hurricane, and La Verkin irrigation areas. Provision of this water allow lands to be maintained for agricultural production. Feed grasses,

including alfalfa and oats, contribute to the production of meat and dairy food; this water may also be used to grow food crops for people.

3.2.2 Water

3.2.2.1 Water Resources

Surface flows in the EFVR vary considerably, mainly in response to spring runoff or intense storm events, during which the river carries high sediment loads. From 1967 to 2020, the average monthly discharge of the river ranged from a high of 33.8 cfs in April to a low of 9.9 cfs in August. Gauge data (USGS gauging station 09404450) revealed that the last 20 years have exhibited drier hydrology and may be indicative of future conditions (Alpha Engineering, 2026).

A survey of the project area and surrounding land identified a total of two wetlands, 12 intermittent and/or perennial streams, five ephemeral streams, and three ephemeral ponds. Refer to the Aquatic Resource Delineation Report for more details (Appendix E-1).

The ZNP Agreement (1996) negotiates the settlement of reserved water right claims filed by ZNP (Appendix E-1). The agreement is signed by the U.S. Department of the Interior, the State of Utah, the KCWCD, and the WCWCD. Agreement stipulations include:

1. One or more new reservoirs with cumulative active storage capacity of up to but not exceeding 6,750 acre-feet may be constructed on Stout Creek, Lydia's Canyon, Muddy Creek or Cove Canyon (site of the proposed reservoir), East Fork above Stout Canyon, and on other tributaries of the East Fork upstream of Glendale.

2. New surface water diversions on the EFVR or its tributaries shall not cumulatively exceed 60 cfs.

3. The existing flow or 2 cfs, whichever is less, shall be maintained immediately below any new surface water diversions to reservoirs constructed.

4. The existing flow or 1 cfs (including seepage), whichever is less, shall be maintained immediately below any new reservoir constructed.

5. Cumulative releases from new reservoirs constructed on streams identified above shall not increase the flow measured at the USGS gage on the EFVR near Springdale (USGS No. 09404900), by more than 25 cfs during any 7-day period and shall not exceed the long-term monthly average at Springdale gage by more than 15 cfs. As measured at said gage, the maximum instantaneous flow attributable to releases from such reservoirs shall not exceed 50 cfs, except for matters involving dam safety.

6. Surface water diversions to new reservoirs described above shall not occur except during the period from November 1 to May 31, subject to the bypass flow requirements described above.

The use of EFVR water by the GIC, OIC, and the MCIC is monitored on a regular basis. The three companies divert water from the EFVR in different locations. A weir is present at each diversion site. Each weir has staff gages to read water elevation. Each weir is equipped with an electronic flow meter that sends information to a website to provide remote monitoring. The data collected

from these flow meters is used to determine the total amount of water diverted. Additionally, the Utah State Water engineer collects money from the GIC, OIC, and the MCIC to fund a water commissioner. The commissioner is responsible for monitoring the diversions and making certain that companies are using the correct amount of water according to their water right.

3.2.2.2 Water Quality

The State of Utah has designated the EFVR and its tributaries as High-Quality Waters (HQW) (BLM, 2008). Water quality standards are set by the State of Utah according to EPA guidelines and are reviewed and updated (if necessary) every three years. The water quality standards are intended to protect Utah's waters and improve the quality for beneficial uses (Utah Department of Environmental Quality, 2023). HQWs are protected against "new point source discharges of wastewater, treated or otherwise" (Utah Administrative Code Rule R317-2-3.2).

3.2.2.3 Floodplain Management

The portion of the EFVR within the study area is in a Federal Emergency Management Agency (FEMA) Zone A floodplain (Figure C-4, Appendix C). This designation signifies an area susceptible to inundation by the 1-percent-annual chance flood event, typically determined using approximate methodologies (FEMA, 2019).

The project area is prone to sporadic and occasionally intense flash floods. These floods, though brief, result in significant sediment movement, leading to localized sheet, rill, and gully erosion issues.

3.2.2.4 WOTUS, Wetlands, and Special Aquatic Sites

A desktop review of the study area was completed using National Wetlands Inventory (NWI) data provided by the U.S. Fish and Wildlife Service (USFWS) (USFWS, 2024). The review identified one wetland and sixteen riverine features. A full list of NWI feature types is included in Appendix E-1.

In 2018, qualified professionals with Eocene Environmental Group, Inc. (Eocene; formerly Transcon Environmental, Inc.,) conducted a survey of wetlands and other potentially jurisdictional WOTUS within the project area (Appendix E-1). Follow-up field visits to evaluate additional borrow pits were conducted in 2019, and a survey of the Mt. Carmel Improvement area was conducted in 2021.

Two small wetlands were documented on private land in the Long Valley portion of the project area. The first wetland (0.03 acres), located south of the proposed reservoir and access road, is an isolated, artificial structure consisting of cattail (*Typha latifoli*) and other hydrophytic vegetation. The second wetland (0.73 acres), also isolated and artificial, lies within the right-of-way (ROW) where the replacement of the existing irrigation pipeline would occur. This wetland supports willows and other hydrophytic species (Eocene, 2025). Refer to Appendix E-1 for a detailed description of aquatic resources. The field review also noted that prior anthropogenic disturbances had altered several streams that were identified by NWI, and these streams no longer exist or no longer exhibit connectivity to other aquatic features downstream.

The NRCS communicated with USACE (memorandum dated July 21, 2022, and updated February 18, 2026) requesting an Approved Jurisdictional Determination (AJD) for the project area. By

memorandum dated April 23, 2026, USACE concurred with the aquatic resources' delineation made for the project area. This includes approximately 7.43 acres of aquatic resources, consisting of 9,665 linear feet (3.43 acres) of ephemeral channels; 0.62 acres of irrigation/stock pond features; and 29,415 linear feet (3.38 acres) of irrigations ditches. The USACE memorandum also verified that the location and boundaries of wetlands were delineated consistent with the wetland definition at 33 CFR §328.3 §(16), the 1987 *Corps of Engineers Wetlands Delineation Manual* (Wetlands Research Program Technical Report Y-87-1) and the applicable regional supplements. The location and boundaries of non-tidal waters were found to conform with the ordinary high-water mark definition found at 33 CFR §328.3(c)(7), Regulatory Guidance Letter 05-05, and any applicable regional guides. The USACE AJD memorandum is included as Appendix A.

Flash floods in the EFVR drainage are a common occurrence during the summer monsoon season. While these events can be damaging, one effect of these high-pulse events (i.e., flash floods) is that benefits to the stream and associated riparian habitat also may occur. Willows are early successional plants that benefit from disturbances such as flash floods (PLPCO, 2026).

3.2.2.5 Regional Water Resource Plans

3.2.2.5.1 Colorado River Compact of 1922

The Colorado River Compact of 1922 is an agreement between the states of Arizona, California, Nevada, New Mexico, Utah, and Wyoming under the Act of the Congress of the U.S. of America. The major purposes of the compact are to "provide for the equitable division and appointment of the use of the waters of the Colorado River system; to establish the relative importance of different beneficial uses of water, to promote interstate comity; to remove causes of present and future controversies; and to secure the expeditious agricultural and industrial development of the Colorado River Basin, the storage of its waters, and the protection of life and property from floods" (43 USC 617l). The Virgin River is a Lower Basin tributary of the Colorado River, which connects at Lake Mead approximately 120 river miles away from the Quail Creek Reservoir Diversion site. Because the Virgin River is a Lower Basin tributary, Utah's water use on the Virgin River is not accounted for as part of the Upper Basin's non-depletion obligation. Water would be diverted to Cove Reservoir, then stored, released, conveyed, and applied to beneficial use in accordance with water rights and change applications approved by the Utah State Engineer's Office. Refer to Appendix E-1 for more information.

3.2.2.5.2 Kane County Resource Management Plan

As part of its overall General Plan, Kane County has adopted the Kane County Resource Management Plan to address the present and future needs of the county, as well as the growth and development of all or any part of the land within the unincorporated portions of the county (Kane County, 2018). As part of the Kane County Resource Management Plan, Kane County has addressed aspects of the health, general welfare, safety, transportation, prosperity, civic activities, recreational and cultural activities, natural resources, and the efficient economic use of the land within the unincorporated portions of the county. The plan outlines that Kane County "supports the development, adoption, and implementation of water collection, storage, and distribution" (Utah PLPCO, 2017). Kane County's water management goals include "cooperating with the State of Utah to achieve the provisions of the State of Utah water quality plan, while complying with Utah constitutional and statutory law as to vested water rights and control of in-stream flow. The

county will support efforts to maintain or improve riparian areas and aquatic habitat that represents a range of variability for functioning condition."

3.2.2.5.3 Washington County Water Conservancy District Water Conservation Plan

WCWCD has also adopted a Water Conservation Plan which outlines water conservation goals and programs to ensure the community has a safe, reliable water supply for current and future generations. Washington County is targeting a 14 percent reduction in per capita water use by 2030 (WCWCD, 2021). Key milestones to achieve the 2030 water conservation goal include:

- Continuing existing water conservation programs.
- Creating programs for residential landscape consultations, water audits for hotels/motels and a customized water-saving incentive program for high users.
- Developing rebate programs for turf removal, hot water on demand systems and leak devices/flow sensors.
- Working with municipal partners to pass and enforce new development standards.
- Hiring additional staff to promote, implement and track conservation programs.
- Increasing participation levels and conservation budgets.

3.2.2.6 Wild and Scenic Rivers

The EFVR enters ZNP approximately 20 river miles downstream and southwest of the project area. The river flows through ZNP from the east boundary to the west boundary. This portion of the river has been designated as wild under the WSRA (National Wild and Scenic Rivers System, 2024). This designation means that the river is free of impoundments and generally inaccessible, except by trail, and includes watersheds or shorelines that are essentially primitive as waters are unpolluted and represent vestiges of primitive America. Outstandingly remarkable values associated with this stretch of the river include cultural, geologic, ecological processes, wildlife, and fish. These designations were made possible by the Omnibus Public Land Management Act of 2009. The Omnibus Public Land Management Act also includes a savings clause in Section 1976 to ensure that the new wild and scenic river designations on the Virgin River would not conflict with the 1996 agreement. "SAVINGS CLAUSE—The amendment made by subsection (a) does not affect the agreement among the U.S., the State of Utah, the Washington County Water Conservancy District, and the Kane County Water Conservancy District entitled 'Zion National Park Water Rights Settlement Agreement' and dated December 4, 1996." Additionally, the EFVR was designated as a Research Natural Area in 2001. The area has been set aside for research purposes and is closed to recreation (NPS, 2013).

3.2.2.7 Ecosystem Services

Water flowing through the EFVR provides the following ecosystem services:

- **Provisioning Services**—As described in Chapter 2.2, the EFVR provides agricultural water for livestock feed and food as well as water for M&I purposes in Kane and Washington Counties.

- **Regulating Services**—The amount of water instream affects water qualities, including temperature, turbidity, sediment, and pollutants. Greater instream flow helps to regulate water temperature and decrease bank erosion/sedimentation in the water. Greater streamflow also helps to dilute pollutants. Section 3.2.2.2 describes surface water quality in the study area.

- **Supporting Services**—As described in Section 3.2.4, the EFVR provides fundamental ecosystem processes, such as providing habitat for plants and wildlife and maintaining genetic and biological diversity.

- **Cultural Services**—Water from the EFVR provides recreation opportunities for the local community.

3.2.3 Air

3.2.3.1 Air Quality

The CAA requires the EPA to set National Ambient Air Quality Standards (NAAQS) (40 CFR part 50) for six principal pollutants (known as criteria air pollutants) with potential to be harmful to public health and the environment. The CAA identifies two types of NAAQS: primary standards and secondary standards. Primary standards provide public health protection, including protecting the health of sensitive populations such as asthmatics, children, and the elderly. Secondary standards provide public welfare protection, including protection against decreased visibility and damage to animals, crops, vegetation, and buildings.

Any county within the U.S. classified as a nonattainment area (an area not meeting the national primary or secondary ambient air quality standards for NAAQS) is listed in the EPA Greenbook. Neither Kane County nor Washington County are classified as nonattainment areas (EPA, 2024b).

Air quality in the project area is typical of undeveloped regions of southern Utah and is generally very good. This is primarily due to the project's remote location and lack of any nearby large-scale developments or urban centers (EPA and Partners, 2024).

3.2.3.2 Ecosystem Services

Air quality provides the following ecosystem services:

- **Regulating Services**—Maintaining air quality standards promotes climate regulation as many sources of air pollutants are also greenhouse gases.

- **Supporting Services**—Nutrient cycling in the air involves abiotic components such as carbon, hydrogen, nitrogen, and oxygen. These elements are transferred to living organisms through the air when they breathe.

- **Cultural Services**—Air quality directly relates to the health of the local population. Air pollution can affect lung development and is associated with respiratory diseases such as emphysema, asthma, stroke, and heart disease.

3.2.4 Plants and Animals

3.2.4.1 Threatened and Endangered Species

The ESA was established to protect threatened and endangered species and their habitats. Section 7 of the ESA requires federal agencies to ensure that federal actions do not jeopardize the existence of any listed species. This is accomplished through Section 7 consultation with USFWS. A list of threatened, endangered, and candidate species for the study area was obtained from the USFWS Information for Planning and Conservation (IPaC) database. The USFWS list includes specific threatened and endangered species and designated/proposed critical habitat that may occur within or near the study area (Appendix E-1 and E-2). Table 3.3 presents federally listed species with the potential to occur in the project area, along with their preferred habitat and the potential for each species to occur (Eocene, 2025).

Table 3.3. Federally Listed Species Potentially Occurring in the Study Area.

Species and Scientific Name	Federal Listing Status	Range or Habitat and Potential for Species Occurrence
Birds California condor (*Gymnogyps californianus*)	Experimental Non-Essential; (Threatened in ZNP)	The California condor utilizes a variety of habitats for foraging and nesting, including caves and ledges of steep rocky terrain. The study area is located within the experimental non-essential range of the California condor (FR, 1996). Experimental non-essential species are treated as threatened within ZNP. The species is present in ZNP and may visit other parts of the study area (ZNP, 2025a). However, no surface disturbance would occur within known occupied California condor habitat. UNHP data did not identify any known occurrences of the species in the study area (UNHP, 2024).
Birds Mexican spotted owl (MSO) (*Strix occidentalis lucida*)	Threatened	In Utah, the Mexican spotted owl (MSO) inhabits isolated mountain ranges and narrow canyons (USFWS, 2013; ZNP, 2025b). Occupied designated critical habitat is present in the Parunuweap Canyon WSA and ZNP, within the study area (FR, 2004). Protected Activity Centers (PACs) for the MSO are also present in the ZNP portion of the study area. No surface disturbance would occur within MSO habitat, and minor streamflow changes would not negatively affect riparian habitat. UNHP data did not identify any known occurrences of the species in the study area (UNHP, 2024).
Birds Southwestern willow flycatcher (*Empidonax traillii extimus*)	Endangered	The southwestern willow flycatcher (SWFL) breeds in riparian vegetation and nests where willows or tamarisk are present. Occupied habitat exists downstream in the Parunuweap Canyon WSA and ZNP within the study area (USFWS, 2002b). However, no surface disturbance would occur within SWFL habitat, and minor streamflow changes would not negatively affect riparian habitat. UNHP data identified the presence of the SWFL within 2 miles of the study area (UNHP, 2024).

Species and Scientific Name	Federal Listing Status	Range or Habitat and Potential for Species Occurrence
Birds Western yellow-billed cuckoo (WYBC) (*Coccyzus americanus*)	Threatened	The western yellow-billed cuckoo (WYBC) breeds in riparian habitat with wide floodplains and dense willow-cottonwood or mesquite forests. They rarely occupy areas less than 325 feet wide. No suitable breeding habitat is present in the Parunuweap Canyon WSA and ZNP areas within the study area (FR, 2014). Potential suitable stop-over habitat for migrating WYBC may be present in these areas. No surface disturbance would occur within WYBC habitat, and minor streamflow changes would not negatively affect riparian habitat. UNHP data did not identify any known occurrences of the species in the study area (UNHP, 2024).
Reptiles Desert tortoise (*Gopherus agassizii*)	Threatened	The desert tortoise inhabits deserts, grasslands, and rocky hillsides, typically in desert shrub areas below 5,500 feet. The Upper Virgin River Recovery Unit extends from the Quail Creek Reservoir diversion to Springdale, Utah, outside of the study area (USFWS, 2011). UNHP data identified the presence of the desert tortoise within 2 miles of the study area (UNHP, 2024).
Fish Virgin River chub (*Gila seminuda*)	Endangered	The Virgin River chub is found below 4,500 feet in deep runs or pools with low to medium velocities, and in-stream cover over sandy substrate (USFWS, 1995a). In Utah, the Virgin River from the Arizona state line to the La Verkin Creek confluence, supports Virgin River chub populations. Virgin River chub has also colonized habitat upstream of the La Verkin Creek confluence following the establishment of population maintenance flows below Quail Creek Diversion. Virgin River chub distribution currently extends upstream to the old diversion structure in Timpoweap Canyon (2 miles upstream from Pah Tempe Springs, and 4 miles upstream from the La Verkin Creek confluence (PLPCO, 2025). In Utah, designated critical habitat extends from approximately 4.8 miles downstream from the Quail Creek Diversion, at the confluence of La Verkin Creek and the Virgin River, to the Utah-Arizona state line (USFWS, 2000). UNHP data did not identify any known occurrences of the species in the study area (UNHP, 2024).

Species and Scientific Name	Federal Listing Status	Range or Habitat and Potential for Species Occurrence
Fish Woundfin (*Plagopterus argentissimus*)	Endangered	The woundfin is found in swift, turbid, warm streams over sand. Adult woundfin prefer depths of 8 to 18 inches and avoid quieter pools (USFWS, 1995a). Occupied habitat exists below the Quail Creek Reservoir Diversion. In Utah, designated critical habitat exists approximately 4.8 river miles downstream from the Diversion, beginning at the confluence of La Verkin Creek and the Virgin River to the Utah-Arizona state line (FR, 2000). UNHP data did not identify any known occurrences of the species in the study area (UNHP, 2024).
Insects Monarch butterfly (*Danaus plexippus*)	Proposed Threatened	Adult monarch butterflies feed on various flowers but only breed where milkweed is present. Monarch caterpillars have been observed within portions of the proposed study area, primarily in ZNP; however, breeding is unlikely within the Long Valley portion of the study area due to a lack of milkweed presence. UNHP data did not identify any known occurrences of the species in the study area (UNHP, 2024). The Cove Reservoir area is likely a flyover area for migrating monarch butterflies but is not an over-wintering site.
Insects Suckley's cuckoo bumble bee (*Bombus suckleyi*)	Proposed Endangered	Suckley's cuckoo bumble bee is an obligate social parasite, dependent on host bumble bees for much of its life cycle. The species has a broad historical distribution across North America, and it has been found in various habitat types, including prairies, grasslands, meadows, and woodlands. Occurrence records were found at elevations ranging from approximately 6,000 to 10,500 feet. In the western portion of the range, Suckley's cuckoo bumble bee observations extend from the Yukon, to Arizona, and east to Minnesota. However, the species has not been observed within the western U.S. since 2016 (USFWS, 2024a). It is unlikely that the species is found within the study area. UNHP data did not identify any known occurrences of the species in the study area (UNHP, 2024).
Plants Jones cycladenia (*Cycladenia humilis* var. *jonesii*)	Threatened	Jones cycladenia is found in sparsely vegetated desert scrub between 4,000 to 6,660 feet, typically on steep slopes with gypsiferous, saline soils of the Wasatch, Cutler, Summerville, and Chinle formations (USFWS, 2021). No suitable habitat exists in the study area. UNHP data did not identify any known occurrences of the species in the study area (UNHP, 2024).

Species and Scientific Name	Federal Listing Status	Range or Habitat and Potential for Species Occurrence
Plants Shivwits milk-vetch (*Astragalus ampullariodies*)	Endangered	Shivwits milk-vetch grows at elevations of 3,018 to 4,367 feet on soft clay soils linked to the Petrified Forest member of the Chinle Formation. Occupied habitat is restricted to six isolated populations in Washington County, none of which are near the study area (USFWS, 2006). UNHP data did not identify any known occurrences of the species in the study area (UNHP, 2024).
Plants Siler's pincushion cactus (*Pediocactus sileri*)	Threatened	Siler pincushion is endemic to the Arizona/Utah border in Kane and Washington County, Utah, and grows in gypsiferous and calcareous soils from the Moenkopi, Chinle, and Kaibab Formations (USFWS, 2008). No occupied habitat exists in the study area. UNHP data did not identify any known occurrences of the species in the study area (UNHP 2024).
Plants Ute ladies'-tresses (*Spiranthes diluvialis*)	Threatened	The Ute ladies-tresses is found in wet meadows near springs, lakes, or streams at elevations of 4,300 to 7,000 feet (USFWS, 1995b). While the study area is in a Ute ladies'-tresses Analytical Unit, habitat as described above is not present (USFWS, 2023). Further, no surface disturbance would occur within any riparian habitat. UNHP data did not identify any known occurrences of the species in the study area (UNHP, 2024). A general habitat assessment was conducted in the vicinity of the proposed reservoir and borrow pits. No Ute ladies-tresses suitable habitat was located. The proposed reservoir site in located in dry, terrestrial habitat. Nearby riparian areas along the EFVR are generally woody, lack understory, and are often dry during summer low flow.

3.2.4.2 Migratory Birds

The protection of migratory birds is regulated by the Migratory Bird Treaty Act (MBTA [16 USC 703-711]). The MBTA prohibits the take of any migratory bird, part, nest, egg, or product thereof, with "take" being defined as to pursue, hunt, shoot, wound, kill, trap, capture, or collect; or to attempt any of these activities. Most species of birds in the U.S. are legally protected under the MBTA. Exceptions to this statute include game and non-native species. A complete list of protected species is found in 50 CFR 10.13. All of the migratory bird species with potential to occur within the study area, with the exception of bald and golden eagles, are also considered to be Birds of Conservation Concern. These are migratory and non-migratory bird species (beyond those already designated as federally threatened or endangered) that represent the highest conservation priorities of the USFWS.

The USFWS IPaC identified 16 migratory bird species, including bald and golden eagles as potentially occurring within the study area (USFWS, 2025) (Table 3.4).

Table 3.4. Migratory Bird Species with Potential to Occur in the Study Area Identified by IPaC.

Common Name (*Scientific Name*)	**Highest Probability of Presence in Study Area**	**Breeding Season***
Bald eagle (*Haliaeetus leucocephalus*)	December–March, May	December–August
Black-chinned sparrow (*Spizella atogularis*)	March–September	April–July
Broad-tailed hummingbird (*Selasphorus Platycercus*)	April–September	May–August
California gull (*Larus californicus)*	February–March, August	March–July
Cassins's finch (*Haemorhous cassinii*)	October–April, July	May–July
Clark's nutcracker (*Nucifraga Columbiana*)	April-June, September–October	January–July
Evening grosbeak (*Coccothraustes vespertinus*)	April–May, September–November	May–August
Golden eagle (*Aquila chrysaetos*)	January–December	December–August
Grace's warbler (*Setophaga graciae*)	April–June	May–July
Lesser yellowlegs (*Triga flavipes*)	April, October	None

Common Name (*Scientific Name*)	Highest Probability of Presence in Study Area	Breeding Season*
Lewis's woodpecker (*Melanerpes lewis*)	January–February, April, September	April–September
Long-eared owl (*Asio otus*)	March, May–June, October	March–July
Olive-sided flycatcher (*Contopus cooperi*)	May, July, September	May–August
Pinyon jay (*Gymnorhinus cyanocephalus*)	November–August	February–July
Virginia's warbler (*Vermivora virginiae*)	April–June, August–September	May–July
Western grebe (*Aechmophorus occidentalis*)	May, July	June–August

*Breeding season may differ from actual exclusion periods that may be required should nesting birds inhabit the project area during construction.

3.2.4.3 Bald and Golden Eagles

Bald and golden eagles are protected under the Bald and Golden Eagle Protect Act (BGEPA) (16 USC 668). The act makes it illegal to take, possess, sell, purchase, barter, or transport any bald or golden eagle, alive or dead, or any part, nest, or egg thereof. Under the BGEPA, the term "take" includes pursuing, shooting, shooting at, poisoning, wounding, killing, capturing, trapping, collecting, molesting, or disturbing species. Bald eagles (*Haliaeetus leucocephalus*) are listed on the IPaC report, and golden eagles (*Aquila chrysaetos*) are listed on the UNHP Report, indicating they have potential to occur within or near the study area (USFWS, 2025; UNHP, 2024).

3.2.4.4 Ecologically Critical Areas

WSAs are places that have wilderness characteristics, are of a minimum size, and contain naturalness and outstanding opportunities for recreation which make them eligible for designation as wilderness (BLM, n.d.) The 30,800-acre Parunuweap Canyon WSA is located immediately east of and adjoins ZNP. It contains recreation opportunities such as hiking, wildlife viewing, and landmark sight-seeing. Stunning canyon vistas and unique hiking opportunities are present. Landmarks in the WSA include Harris Mountain and Elephant Butte. Wildlife, including mule deer, mountain lions, rattlesnakes, and birds are common. The EFVR flows through the WSA. By following the EFVR, hikers can traverse over 10 miles through the canyon to the east side of ZNP (BLM, 2008; BLM, 2025).

The Zion Wilderness was designated by Congress in 2009 and comprises approximately 83 percent of ZNP. It is composed of a labyrinth of multicolored canyons carved out of the Markagunt Plateau. The wilderness area is located on the Colorado Plateau but borders the Great Basin and Mojave Desert provinces and is home to plants and animals from each of the three regions. A ribbon of

green marks the EFVR's approximately 7-mile course through the arid southernmost portion of the Zion Wilderness (ZNP, 2025).

The 4,625-acre ZNP Parunuweap Research Natural Area (RNA) was established in 2001 and includes Parunuweap and Shunes Canyons. The EFVR flows through the Parunuweap Canyon portion of the RNA. Surrounding lands include slickrock and old-growth pinyon-juniper woodlands. Ecological units present within the RNA include rock crevice and slickrock communities; riparian, fluvial, and aquatic habitats; springs and seeps; hanging gardens; hanging canyons; eolian landscapes; and riverine ancestral Puebloan people habitation sites (Lauren DeGennaro ZNP, 2025).

3.2.4.5 Invasive Species

Plant species listed under the Utah Noxious Weed Act known to be within or are likely to inhabit the project area include Russian olive (*Elaeagnus angustifolia*), tamarisk (*tamarisk*), wild morning glory (*Calystegia sepium*), puncture vine (*Tribulus terrestris*), tall whitetop (*Lepidium latifolium*), Scotch thistle (*Onopordum acanthium*), purple loosestrife (*Lythrum salicaria*), spotted knapweed (*Centaurea stoebe*), and Canada thistle (*Cirsium arvense*). Other invasive species not specified under the Utah Noxious Weed Act, such as cheatgrass (*Bromus tectorum*) and Russian thistle (*Salsola* spp.), have been observed within the project area.

These invasive species typically proliferate in disturbed areas where native vegetation has been substantially or entirely removed, including locations such as roadsides, livestock trails, and areas damaged by floods. Noxious weeds and invasive plant species often outcompete native vegetation, leading to reduced species diversity and ecosystem instability.

Invasive animal species that may inhabit the project area include bullfrog (*Rana catesbeiana*), European starling (*Sturnus vulgaris*), fathead/rosy red minnow (*Pimephales promelas*), mosquitofish (*Gambusia affinis*), muskrat (*Ondatra zibethicus)*, New Zealand mudsnail (*Potamopyrgus antipodarum*), nutria (*Myocastor coypus*), quagga mussel (*Dreissena rostiformis bugensis*), red fox (*Vulpes vulpes*), raccoon (*Procyon lotor*), red shiner (*Cyprinella lutrensis*), red swamp crayfish (*Procambrus clarkia*), signal crayfish (*Procambrus leniusculus*), white-tailed deer (*Odocoileus virginianus*), Zebra mussel (*Dreissena polymorpha*), and non-native non-sport fish (NRCS, 2012). Administrative Rule R657-60 identifies regulations and procedures designed to prevent and control the spread of aquatic invasive species in Utah. No surveys have been conducted for invasive animal species within the project area, but it can be assumed that some of these species are likely present.

3.2.4.6 Fish and Wildlife

Terrestrial wildlife species likely to inhabit or frequent the proposed project areas are typical of the Colorado Plateau physiographic province. Mammalian species include mule deer (*Odocoileus hemionus*), coyote (*Canis latrans*), jackrabbit (*Lepus californicus*), cottontail rabbit (*Sylvilagus* spp.), bobcat (*Lynx rufus*), raccoon (*Procyon lotor*), badger (*Taxidea taxus*), and weasel (*Mustela frenata*). Additionally, various species of small mammals such as voles, squirrels, chipmunks, mice, and bats are expected to be present (Eocene, 2025).

Upland game species likely to inhabit the project area include mourning dove (*Zenaida macroura*), band-tailed pigeon (*Patagioenas fasciata*), and chukar (*Alectoris chukar*). Other species are likely to inhabit the area. Fisheries and aquatic habitat are limited.

Habitat for greater sage-grouse extends into Kane County and is present within the Panguitch Priority Habitat Management Area (PHMA) (BLM, 2018). A project-related survey determined that no portion of the PHMA is located within the project area and that there is no sage-grouse habitat located outside of the PHMA.

Utah has developed a Wildlife Action Plan with the purpose of managing native wildlife species and their habitats to prevent additional ESA listings (UDWR, 2015). The Wildlife Action Plan identifies SGCN that are considered jurisdictional wildlife. A UNHP Online Species Search Report was completed for the study area, and SGCN or habitat within a 0.5- and 2.0-mile radius of the study area was identified (UNHP, 2024). Data from the UNHP site are summarized in Table 3.4.

The Virgin River Program (VRP) is a collaborative effort between local, state, and federal partners and was established to reconcile and avoid potential conflicts between water development and wildlife conservation. Actions implemented under the VRP help recover, conserve, enhance, and protect native species in the Virgin River Basin (such as the Virgin spinedace) while providing adequate water supplies for sustaining human needs. The Program simplifies regulatory processes for water users and landowners while ensuring that future generations can enjoy Utah's natural heritage (Virgin River Program, 2025).

Table 3.5. Species of Greatest Conservation Need Potentially Occurring in the Study Area.

Species and Scientific Name	State Status	Range or Habitat and Potential for Species Occurrence
Bird Bald eagle (*Haliaeetus leucocephalus*)	SGCN	Nests near coastlines, rivers, large lakes, or streams that support an adequate food supply. Nesting substrates often include mature or old-growth trees, snags, cliffs, rock promontories, on the ground (rarely), and on human-made structures (more frequently). Bald eagles occasionally nest in southern Utah but are more typically present during their winter migration. Suitable foraging habitat located within and adjacent to the project area supports a variety of raptors, including bald eagles. Bald eagles may utilize cottonwood trees adjacent to the EFVR for winter roosting and stopover habitat during migration periods. Historical records exist of eagle occurrence within 0.5 miles of the project area. The BGEPA prohibits the "taking" of the eagle without a special permit issued by the U.S. Department of the Interior.
Bird Band-tailed pigeon (*Patagioenas fasciata*)	SGCN	Typical habitat is coniferous forest. Primary concentrations in Utah are in the southern pine forests from the Pine Valley Mountains in the west to the La Sal and Blue Mountains in the east. Nesting in Utah takes place in May, June, and July. Normally only one egg is laid. The nest is usually a frail platform of dead twigs 8–20 feet above the ground in a coniferous tree. Food of the band-tailed pigeon consists mainly of acorns, berries, pine buds, seeds, and needles. Only a small portion of the diet is insects, although a few grasshoppers and other large insects may be taken. The band-tailed pigeon is migratory, and only limited breeding populations occur in southern Utah. Potential habitat is limited in the project area. The last occurrence record for the pigeon in the project area was in 1971.
Bird Burrowing owl (*Athene cunicularia*)	SGCN	Uncommon during the summer in proper habitat throughout Utah. Habitats are open grassland and prairies, as well as other open situations, such as golf courses, cemeteries, and airports. The nest is in a mammal burrow, usually that of a prairie dog, ground squirrel, badger, or armadillo; if a mammal burrow is not available, the owls will sometimes excavate their own nest burrow. Confirmed breeding occurrences are known in at least 17 counties, including Kane and Washington Counties. It eats mainly terrestrial invertebrates, but also consumes a variety of small vertebrates, including small mammals, birds, frogs, toads, lizards, and snakes. Habitat is limited within the project area; however, a historic occurrence was documented in 1987.

Species and Scientific Name	State Status	Range or Habitat and Potential for Species Occurrence
Bird Ferruginous hawk (*Buteo regalis*)	SGCN	Occurs throughout Utah in proper habitat. The hawk is found primarily in open lowland desert country. Pinyon-juniper woodland, barren cliffs and bluffs, sagebrush-rabbitbrush, and cold desert shrub (including saltbush and greasewood) are habitats utilized by this species in Utah during the breeding season. Mammals are the primary prey during the breeding season, although birds, amphibians, reptiles, and insects also are taken. Suitable habitats near agricultural lands and adjacent to pinyon-juniper woodland exist within the Cove Reservoir portion of the project area. However, occurrence of the ferruginous hawks would be expected to be very low and only migratory in nature. No occurrences of the ferruginous hawk have been documented within the project area.
Bird Flammulated owl (*Psiloscops flammeolus*)	SGCN	A common raptor in montane pine forests (especially ponderosa pine and aspen forests) in the western U.S. and Utah. Flammulated owls are strictly nocturnal and eat insects and other terrestrial invertebrates, such as spiders, centipedes, and scorpions. It is known to nest in woodpecker holes. Montane pine habitat is lacking within the project area; however, an occurrence was documented in 2020.
Bird Golden eagle (*Aquila chrysaetos*)	SGCN	Breeds across western North America, from southern Alaska to northern Mexico. Populations in the northern parts of the breeding range migrate south for winter, but most populations in the western U.S. are year-round residents of the same area. Typically found in open country and semi-open prairies, sagebrush, savannah or sparse woodland, and barren areas. Commonly found in Utah. It feeds mainly on small mammals, especially rabbits, marmots, and ground squirrels, but also eats insects, snakes, birds, juvenile ungulates, and carrion. Nests are most often found on rock ledges but sometimes in large trees. It is common in Utah and habitat is present within the project area. A historical record located the golden eagle within the project area in 2008. The BGEPA prohibits the “taking” of an eagle without a special permit issued by the U.S. Department of the Interior.

Species and Scientific Name	State Status	Range or Habitat and Potential for Species Occurrence
Bird Lewis's woodpecker (*Melanerpes lewis*)	SGCN	This species is widespread but is generally uncommon in Utah. The population may be declining. It is a cavity nester, excavating a hole in tall trees that are often dead or blackened by fire. It will also nest in utility poles or stumps, but prefers ponderosa pine, cottonwood, or sycamore trees. The major breeding habitat consists of open park-like ponderosa pine forests. The woodpecker is also attracted to burned-over Douglas-fir, mixed conifer, pinyon-juniper woodland, and riparian vegetation, especially riparian cottonwoods. Habitat for this species is present in the project area but has not been documented since 1985.
Bird Peregrine falcon (*Falco peregrinus*)	SGCN	Although the peregrine falcon is still rare in Utah, it has become more abundant throughout its range in recent years. In Utah, this species breeds mainly on the Colorado Plateau, and to a lesser extent, along the Wasatch Front. Breeding habitat is characterized as cliffs, bluffs, caves, and rock pockets (often near water). Habitat during migration includes water-based croplands; orchards; cold desert shrub (including saltbush and greasewood); and sagebrush-rabbitbrush (at lower elevations). Its wintering habitats in Utah include desert riparian woodlands (including Fremont cottonwood, willows, etc., at lower elevations), marshes and wet hummocks. Potential habitat is found within the project area, but the species has not been documented since 1985.
Bird Pinyon Jay (*Gymnorhinus cyanocephalus*)	SGCN	The pinyon jay occurs throughout much of the western U.S. and is a common bird of the pinyon-juniper woodland forests of Utah. Their diet consists primarily of pinyon and other pine seeds, but also includes berries, small seeds, grains, and insects. Nests are located in trees (usually conifers) 5–30 feet off the ground in the pinyon-juniper woodland but less frequently pine. Nests also occur in scrub oak and sagebrush. Habitat is found within the project area, and the jay is likely present.

Species and Scientific Name	State Status	Range or Habitat and Potential for Species Occurrence
Bird Yuma myotis (*Myotis yumanensis*)	SGCN	Uncommon to rare in in the state. The species is not overly abundant in Utah but occurs in the southwestern, central, and northeastern parts of the state. Records of this species occur in eight counties, including Washington and Kane counties. The Yuma myotis can be found in a variety of habitats but is almost always found near open water. Old buildings, caves, and bridges are used as roosting and nursery colony sites. It is also found in a wide variety of upland and lowland habitats, including riparian, desert scrub, moist woodlands, and forests near open water. Habitat is present in the project area, and a historical occurrence of the species was recorded in 2004.
Mammal Kit fox (*Vulpes macrotis*)	SGCN	Although the species is not overly abundant in Utah, it does occur in the western, east central, and southeastern areas of the state. Habitat is primarily open desert as well as shrubby and shrub-grass ecosystems, including creosote bush, shadscale, greasewood and sagebrush. Prey abundance and interference competition by coyotes may regulate fox populations. Habitat is present in the project area, and a historical occurrence of the species was recorded in 1975.
Reptile Arizona toad (*Anaxyrus microscaphus*)	SGCN	Found only in the southwestern portion of Utah. Common to streams, washes, irrigated crop lands, reservoirs, and uplands adjacent to water. Inactive in cold weather, adults are known to be primarily nocturnal; however, young are active during daylight hours. Eggs are laid on the bottoms of shallow, slow-moving streams. Suitable habitat exists within the project area. This habitat is found within washes in the Cove Reservoir portion of the project. Uplands within the project area adjacent to these aquatic features may also provide suitable habitat. Historical records identify an occurrence of the species in the project area in 2023.
Reptile Gila monster (*Heloderma suspectum*)	SGCN	Occurs in Utah only in southern Washington County, where urban expansion and collecting are the main threats to the species Utah provides the northern-most range for the gila monster. Preferred habitats include large rocky shelves, sandy areas, and creosote-sagebrush areas. Gila monsters in Utah are most active during the spring and summer months, although they do spend about 95 percent of the active season in burrows or under rocks. Populations usually occur in rocky areas, using cavities in basalt and sandstone formations for shelters. Very limited habitat is present in the project area, although a historical occurrence of the species was recorded in 2021.

Species and Scientific Name	State Status	Range or Habitat and Potential for Species Occurrence
Reptile Northern leopard frog (*Lithobates pipiens*)	SGCN	The northern leopard frog is common in Utah, but some reports indicate that its numbers may be declining. The species occurs in a variety of aquatic habitats, particularly near cattails and other aquatic vegetation, but it may be found foraging relatively far from water. During cold winter months, this species is inactive and takes cover underwater or in damp burrows. Suitable habitat may be found within the portion of the EFVR located within the project area. A historical occurrence of the species was recorded in 1982.
Reptile Western toad (*Anaxyrus boreas*)	SGCN	Occurs throughout most of Utah, and is found in a variety of habitats, including slow moving streams, wetlands, desert springs, ponds, lakes, meadows, and woodlands. Adults feed on numerous types of small invertebrates, such as ants, beetles, and grasshoppers, whereas larvae (tadpoles) filter algae from the water or feed on detritus. In Utah, the toad is known to occur from areas of high elevation, mainly the Wasatch Mountains and central high plateaus, from Rich and Daggett counties in the northeast to Washington and Kane counties in the southwest portion of the state. Habitat loss is a widely recognized contributing factor, and has played a role in population losses, especially populations formerly occupying what are now urban areas. Limited habitat may be present in the project area. A historical occurrence of the species was recorded in 2021.
Fish Desert sucker (*Catostomus clarkia*)	SGCN	Native to parts of the Colorado River system. Limited distribution occurs only in the Virgin River system in southwestern Utah. They are bottom dwellers (benthic); primarily eat algae, and occasionally insects and other invertebrates. Spawning occurs in riffles during winter and spring. Historical records of occurrence within 0.5 miles of the project area. Suitable habitat is found within the portion of the EFVR located within the project area.
Fish Flannelmouth sucker (*Catostomus latipinnis*)	SGCN	In Utah, the species occurs in the main-stem Colorado River, as well as in many of the Colorado River's large tributaries, including the Virgin River. Flannelmouth suckers are usually absent from impoundments. In recent times, Utah flannelmouth sucker populations have been reduced in both numbers and distribution, primarily due to flow alteration, habitat loss/alteration, and the introduction of nonnative fishes. Limited habitat is present in the project area, although a historical occurrence of the species was recorded in 2012.

Species and Scientific Name	State Status	Range or Habitat and Potential for Species Occurrence
Fish Virgin spinedace (*Lepidomeda mollispinis*)	SGCN	This species is endemic to the Virgin River system in a small area of Utah, Nevada, and Arizona; in Utah, it occurs only in Washington County. Most often associated with clear, cool, relatively swift streams comprised of [sic] pools, runs, and riffles. Feeds seasonally on insects, insect larvae, and plant material. Virgin spinedace populations have been reduced in recent times, and the species is now found only in portions of its historic range. The spinedace has been recovered to 90 percent of its historically occupied habitat (Virgin River Program 2026. Additionally, the species has been introduced into areas not previously occupied. The species known occupied habitat includes the EFVR within ZNP.
Insect Lyrate mountainsnail (*Oreohelix haydeni*)	SGCN	The distribution of this species in Utah is somewhat patchy and scattered through Cache, Rich, Weber, Morgan, Salt Lake, and Tooele counties. A 1921 report identified the species as occurring in Washington County. It is widely considered to be erroneous. It is highly unlikely that this species of snail occurs within the project area.
Insect Mitered Vertigo (*Vertigo Modesta concinnula*)	SGCN	This species has been reported historically, from montane habitat in four Utah counties: Salt Lake, Sevier, Box Elder, and San Juan. The Utah Division of Wildlife Resources (UDWR) website does not recognize this species as occurring in either Kane or Washington Counties even though the UNHP website notes a 1942 occurrence. It is highly unlikely that this species occurs within the project area.

Source: (UNHP, 2024)

3.2.4.7 Riparian Areas

Riparian areas exist in the transitional zone between aquatic and terrestrial ecosystems. They feature different vegetative species than the adjoining ecosystems and exhibit more vigorous growth due to shallow groundwater interaction. They generally consist of long strips of vegetation adjacent to streams, rivers, lakes, reservoirs, and other inland aquatic systems that affect or are affected by the presence of water (Fischer, Martin, Ratti, & Guidice, 2001) These areas typically harbor many wildlife species and perform numerous ecological functions. In Washington County, riparian species along the Virgin River include a dense layer of willow (*Salix* spp.), common reed grass (*Phragmites* spp.), cottonwood trees (*Populus* spp.), and invasive species, such as tamarisk (*Tamarix* spp.) and Russian olive (*Elaeagnus angustifolia*), as well as various grasses/forbs. Riparian vegetation along the EFVR in Long Valley is mature and consists of cottonwoods, Russian olive trees, tamarisk, willows, and various shrubs and forbs. This vegetation is spotty and lacking in some areas due to repeated disturbances, such as flooding.

3.2.4.8 Ecosystem Services

Plants and animals in the study area provide the following ecosystem services:

- **Provisioning services**: The EVFR provides fishing opportunities for various species of trout. Rainbow trout (*Oncorhynchus mykiss*), cutthroat trout (*Oncorhynchus clarki*), brown trout (*Salmo trutta*), and brook trout (*Salvelinus fontinalis*) have all been documented in portions of the EFVR.

- **Regulating services**: Riparian zones play an important role in water filtration, nutrient cycling, and providing habitat for fish and wildlife.

- **Cultural services**: Peoples values for species conservation may arise from personal use, personal beliefs and moral ethics, altruism, and/or a desire to preserve the resource for future generations.

3.2.5 Human

3.2.5.1 Cultural Resources and Tribal Consultation

Cultural resources encompass various elements such as archaeological sites, historic structures, sacred sites, and traditional cultural places (TCPs), which are all integral to a community's traditions, beliefs, and preserving its cultural identity. The NHPA of 1966, as amended (54 USC 300101), mandates that federal agencies consider the effects of their actions on historic properties. "Historic properties" denote cultural resources deemed significant to history by meeting specific criteria outlined in 36 CFR Part 60.4, and described below, for inclusion on the NRHP.

The quality of significance in American history, architecture, archaeology, and culture is present in districts, sites, buildings, structures, and objects of state and local importance that possesses integrity of location, design, setting, material, workmanship, feeling, and association, and that they:

- Criterion A—Are associated with events that have made a significant contribution to the broad patterns of our history.

- Criterion B—Are associated with the lives of significant persons in or past.

- Criterion C—Have distinctive characteristics of a type, period, or methods of construction, or that represent a significant and distinguishable entity whose components may lack individual distinction.

- Criterion D—Yielded or may be likely to yield information important in prehistory or history.

Section 106 of the NHPA requires federal agencies to consider the effect, including visual effects, of authorized undertakings on the ability of historic properties to convey their historic significance.

The APE for Section 106 of the National Historic Preservation Act of 1966 (NHPA) is the geographic area or areas where an undertaking may directly or indirectly cause alterations in the character or use of historic properties, as defined in 36 CFR Part 800.16(d). The APE for the proposed project was defined by the NRCS, as lead federal agency, and consulting parties, per 36 CFR 800.4. The NRCS established the project's APE to include all potential direct and indirect effects. The project APE consists of three sections; the Direct section of the APE (712.46 acres), Indirect section of the APE (1,007.97 acres), and Visual section of the APE (4,952.29 acres). The three APE sections partially overlap with each other. The Direct section of the APE consists of the proposed reservoir (buffered), pipelines, and three borrow pits. The Indirect section of the APE consists of the proposed reservoir and the unbuffered breach inundation zone below the reservoir. The Visual section of the APE consists of a 1-mile buffer around the proposed reservoir (Eocene, 2025). The Direct section of the APE consisted of a total of 874.23 acres, including an original Direct APE of 791.68 acres (identified in 2018), and addendum of 68.83 acres (identified in 2021) and 13.72-acres acres (identified in 2023). In 2024, the project extent changed to remove 3 borrow pits, reducing the Direct APE to 712.46 acres. This Direct section of the APE encompasses all areas that may be disturbed or changed from their current conditions with potential to affect cultural resources. See Section 1.4.3 for a detailed description of the APE development process and Figure C-2 in Appendix C for the APE figure.

Eocene archaeologists, meeting 36 CFR 61 Secretary of the Interior (SOI) qualification standards in archaeology, conducted Class II (reconnaissance) and III (intensive) cultural resources inventories of the original project Direct section of the APE. In October 2018, a comprehensive Class III cultural resources survey was conducted of the initial 791.68-acre APE. In November 2021, a Class III and Class II cultural resources inventory was conducted of the 68.83-acre Direct section of the APE addendum (Mt. Carmel pipeline). In October 2023, a Class III and Class II cultural resources inventory was conducted of the 13.72-acre Direct section of the APE addendum (Esplin Borrow Source Location). The total area surveyed was 874.23 acres.

All three surveys were conducted in 15-meter-wide transects, except for the Lambs pit, which is located on private property and was spot checked for any potential areas that may be previously undisturbed and may contain significant cultural resources. A total of 848.81 acres were surveyed to Class III standards. The remaining 25.42 acres were surveyed to Class II standards due to being in inaccessible areas.

The surveys revealed 17 cultural resource sites and 19 isolated occurrences (IOs) within the project Direct section of the APE. Additionally, two sites that were previously determined Not Eligible for the NRHP were previously mapped within but relocated outside of the project Direct section of the APE. Cultural Resources Inventory Reports (CRIRs) for each survey have been prepared, and

redacted copies are found in Appendix E-2. Table 3.6 summarizes the cultural resource findings and the NRCS' determination of site eligibility. Per 36 CFR 800.4, the NRCS consulted with the Utah State Historic Preservation Officer (SHPO), and the BLM, UTLA, and USACE as land managing agencies. Letters requesting concurrence on site eligibility were sent on January 9, 2020, January 23, 2023, and May 20, 2024. The SHPO concurred with site eligibility in letters dated January 17, 2020, February 6, 2023, and June 2, 2024 (Appendix A). No responses were received from the land managing agencies.

The NRCS also consulted with 12 Native American Tribes on the determination of site eligibility. The Kaibab Band of Paiute Indians of the Kaibab Indian Reservation responded with a statement of no comments on site eligibility on May 24, 2024. No other responses were received. Follow-up with the Tribes has been ongoing throughout the life of the project. Refer to Section 7.1.10 for a detailed description of all Tribal consultations conducted and Appendix A for a Tribal Consultation Summary Table.

In April 2025, Eocene submitted a Cultural Resources Review Memorandum to the NRCS addressing the Indirect and Visual section of the APE within the project area (Eocene, 2025). This desktop review identified 26 cultural resources and nine historic structures within the overlapping APEs. Of these cultural resources, the NRCS determined that 14 are eligible for the NRHP. Of the nine historic structures, five are eligible for the NRHP. Within the Visual section of the APE, there are three eligible buildings/structures (Property ID Nos., 32819, 50442, and 33219). Within the Indirect section of the APE breach inundation zone, there are three historic properties: Mt. Carmel School and Church (Property ID No. 37252); Dixon, Maynard, House and Studio (Property ID No. 40479); and Steven's Barn (Property ID No. 31786). Steven's Barn (Property ID NO. 31786) has likely been demolished. The NRCS consulted on the Indirect, Visual, and revised Direct section of the APE with SHPO via letter and with the cooperating agencies and 11 Tribes via email on June 4, 2025. SHPO responded by letter on June 6, 2025, stating concurrence with the findings. The Moapa Band of Paiute Indians Tribe responded on June 5, 2025, with an email regarding potential auditory effects. Resolution of these concerns are included in Section 5.5.1.2. No other responses were received. A copy of these correspondences is included in Appendix A.

A review of these previously recorded sites and structures within the Indirect and Visual section of the APE indicates that none would require a formal Visual Effects Analysis as they would not be subject to adverse visual or indirect impacts (Eocene, 2025). Refer to Appendix E-2 for the Redacted Cultural Resources Review Memorandum.

Table 3.6. Cultural Resources in the Direct section of the APE.

Survey Date	Site No.	Temporal Affiliation	Site Description	Eligibility

3.2.5.2 Social Issues

Socioeconomic baseline is characterized by population, demographics, employment, income, and housing. Socioeconomic baseline conditions of Kane County and Washington County are identified in the subsections below. For comparative purposes, baseline socioeconomic conditions for Utah are also provided.

3.2.5.2.1 Population

Table 3.7 shows the population trends from 2018–2022 for Kane County, Washington County, and the State of Utah. Growth rates are high in Washington County with an approximate 15 percent increase from 2018 to 2022 compared to an approximate 6 percent growth in Kane County and 7 percent in the State of Utah.

Table 3.7. Population Trends.

Year	Kane County	Washington County	Utah
2018	7,350	171,700	3,161,105
2019	7,484	177,556	3,205,958
2020	7,658	172,127	3,151,239
2021	7,635	191,226	3,337,975
2022	7,814	197,680	3,380,800
Percent change	6.3%	15.1%	6.9%

Source: (USCB, 2022)

3.2.5.2.2 Demographics

Demographic data from Table 3.8 shows that the percentage of minority populations in Kane County (6.8 percent) and Washington County (15.3 percent) are less than that of the State of Utah's (20.8 percent).

Table 3.8. Demographics.

-	Kane County	Washington County	Utah
Total Population	7,814	197,680	3,380,800
Percent White	93.2%	84.7%	79.2%
Percent Minority	6.8%	15.3%	20.8%

Source: (USCB, 2022)

3.2.5.2.3 Employment and Income

Low-income population include those making less than or equal to twice the federal poverty level. The median household income for the project study area is $84,861, which is higher than Kane County but comparable to the State of Utah. Limited English speakers in the study area represent less than 3 percent of the population, which is comparable to Kane County and much lower than in the State of Utah. The percentage of the population 65 years of age and older represent approximately 17 percent within the study area, which is comparable to Kane County and the U.S.

Table 3.9. Employment and Income.

-	Kane County	Washington County	Utah
Median Household Income	$70,327	$74,543	$89,168
Low Income/Poverty	12.9%	10.3%	8.2%

Source: (USCB, 2022)

3.2.5.2.4 Housing

Housing characteristics data shows Kane County and Washington County have more owner-occupied units than the State of Utah (Table 3.10).

Table 3.10. Employment and Income.

-	Kane County	Washington County	Utah
Total Households	3,225	71,891	1,129,660
Average household size	2.34	2.71	2.95
Percent Owner-occupied	78.0%	76.1%	71.2%
Percent Renter-occupied	22.0%	23.9%	28.8%

Source: (USCB, 2022)

3.2.5.2.5 Economy

The small communities of Glendale, Orderville, and Mt. Carmel, which are situated in western Kane County, make up the proposed project area. Livestock, farming, and tourism serve as the primary economic drivers for these communities. While livestock and farming have traditionally been the backbone of Kane County's economy, agricultural activities have faced challenges due to costly and limited agricultural water (Utah PLPCO, 2017). Irrigated lands within the study area primarily cultivate alfalfa with an oat cover crop planted every 7–9 years.

The study area includes communities within Washington County, primarily the towns of La Verkin, Hurricane, Washington, and St. George. Construction, retail trade, and healthcare/social services make up most of the labor profile in Washington County (EDCUtah, 2021).

Kane and Washington County's allure as a tourist destination stems from its abundant recreation opportunities. Well-known attractions like the Grand Canyon, ZNP, BCNP, Glen Canyon National Recreation Area, Grand Staircase-Escalante and Cedar Breaks National Monuments, and Coral Pink Sand Dunes State Park draw numerous visitors. However, many of these sites exceed capacity, particularly during the peak summer tourist season (Simmonds, et al., 2018). To help address visitor use, Secretarial Order 3424, *Strengthening Coordination with Gateway Communities*, was issued to improve coordination between the NPS and gateway communities such as Orderville, Mt. Carmel, Kanab, Rockville, Springdale, and other locations (USDI, 2025).

According to DWRe's water-related land-use data, crop acreage in the project area has declined by about 300 acres since 2009. The data show the urban area has increased by about that same acreage. Using average net crop ET, the resulting water requirement is roughly 1,000 acre-feet lower than the value shown in Table 2.1 due to the area's high elevation (5,460 feet above sea level), lower temperatures, and higher evapotranspiration demand. While irrigated agriculture is slowly declining, the population during that same period increased by roughly 10 percent, according to the Utah Division of Water Rights' public water supply data. The area's beauty and proximity to national parks drive that increase (PLPCO, 2026).

3.2.5.3 Public Health and Safety

The Long Valley area within Kane County relies heavily on agriculture to support local livelihoods and provide forage and feed for livestock operations. Existing limitations in water storage and delivery infrastructure results in reduced water availability during peak summer irrigation periods, leading to recurring agricultural water shortages. These shortages can reduce crop yields and forage production, resulting in financial losses for agricultural producers and ranching operations. For many local residents, agricultural production represents a primary source of household income, and uncertainty regarding water availability can create significant financial stress and anxiety. Research has shown that water shortages, drought conditions, and agricultural financial instability can contribute to increased stress, depression, and other mental health challenges among farming and ranching communities, particularly in rural areas where access to health services may be limited (RHIhub, 2026) (Elliott, n.d.).

Existing water supply limitations also affect operation of the Orderville hydroelectric facility during periods of peak summer demand. Available water flows are insufficient to fully meet hydropower generation needs during certain summer periods, reducing the amount of renewable electricity that can be generated (Alpha Engineering, 2026). While electrical service is provided through the broader regional power grid, reliable energy infrastructure is important for maintaining community services, communications systems, and emergency response capabilities.

The nearest hazardous or petroleum waste facility to the Project area is the Jenkins Oil Company Orderville Bulk Plant. This facility is located 0.72 miles north of Orderville and would not be affected by construction or operation of the proposed project (EPA 2026).

3.2.5.4 Scenic Beauty

The landscape in the study area is primarily desert shrub and pinyon-juniper woodland vegetation intersected with fences, unpaved roads, trails, and pastures. The EFVR runs through the east portion of the project area and is accompanied by mature riparian vegetation. However, no dominant artificial structures are present. U.S. Highway 89 (US-89) is approximately 0.5 mile east of the project area. The small towns of Glendale, Orderville, Mt. Carmel, and Mount Carmel Junction are present in the study area and provide a quiet, rural human-induced element to the general landscape. Pastures located along the EFVR also provide a human aspect to the landscape.

Though the project area is not located on BLM-administered public land, the BLM visual resource management (VRM) process was used to determine the landscape character of the area and the visual impact of the proposed project. Visual management objectives are developed through the BLM land-use planning process. BLM-administered public lands near the project area are currently identified as VRM Class IV which allows for major modifications to the existing landscape character (BLM, 2026; BLM, 2008). Under Class IV, the degree of visual change may be high, and modifications may attract attention, dominate the view, and become a major focus of viewer attention. Class IV is typically applied where land-use plans anticipate infrastructure development, resource use, or other activities that substantially alter landscape character, while still requiring consideration of visual design measures to support applicable land use objectives. For this project, the Area of Visual Effect includes areas from which the dam and reservoir may generally be visible, including portions of U.S. Highway 89, local roads, and downstream canyon viewpoints. Although the project would introduce a visible dam and reservoir in localized areas, these changes would be

consistent with the BLM VRM Class IV management intent, as they would be limited by topography and distance (Appendix E-2).

3.2.5.5 Significant Scientific Resources

A preliminary desktop review of potential paleontological resources near the project area was conducted by a qualified paleontologist to assess the potential number of resources that may exist. Paleontological resources are classified using the Potential Fossil Yield Classification (PFYC) system, which helps determine the likelihood of resource presence in the area. The PFYC classifications are as follows:

- PFYC 1—Very low potential.
- PFYC 2—Low potential.
- PFYC 3—Moderate potential.
- PFYC 4—High potential.
- PFYC 5—Very high potential.

The preliminary review indicated that areas classified as PFYC 3, PFYC 4, and of Unknown potential may exist near the project area (Figure C-5, Appendix C).

In Utah, the Utah Geological Survey (UGS) is responsible for managing all paleontological locality information. A paleontological record search was conducted with UGS on November 12, 2024. On November 21 and 22, 2024, and February 10, 2025, Eocene paleontologists conducted field surveys of the PFYC 4 to 5 geologic formations within the proposed project area. Although 12 new paleontological localities were documented during the survey, they were determined to be invertebrate and non-significant due to their commonality and poor preservation, and none were collected. (Eocene, 2025b). The survey results report was accepted and approved by NRCS Utah State Geologist Todd Sieber and is included in Appendix E-2.

3.2.5.6 Land Use

The project area is in Kane County, Utah. Kane County is a rural county in Southwestern Utah. The total land area of Kane County is approximately 2,629,760 acres (4,109 square miles). Kane County is sparsely populated with most of its 7,667 residents (United States Census Bureau [USCB], 2020) spread out among the various mountains, plateaus, and canyon lands that surround the City of Kanab, the largest city and county seat within Kane County. Kane County land is used predominantly for tourism, services, and agriculture with most of the land being federally owned. Other land uses include forest land, residential, light industrial, and commercial (Kane County, 2024).

The study area includes both Kane County and Washington County, Utah. The total land area of Washington County is 1,555,200 acres (2,430 square miles). Washington County is the fifth most populous county in Utah with 52 percent of the County's population (197,680 people) located in the City of St. George. Washington County land is used predominantly for grazing with much of the land managed by the BLM. Other land uses include residential and industrial development (Washington County, 2012).

Irrigated lands (6,896 acres in Kane County and 12,984 acres in Washington County) within the study area are primarily alfalfa fields and oats, which are used as a cover crop every 7–9 years (USDA, 2017b). Private residences, out buildings, livestock grazing, and limited recreation opportunities are also present.

3.2.5.7 Ecosystem Services

The human environment provides Cultural Services. Cultural resources, social status, public health and safety, scenic beaty, and land use all relate directly to non-material benefits such as spiritual enrichment, aesthetic experiences, recreation, sense of place, heritage, and development.

3.3 Forecast Future Conditions

The resource conditions were projected into the future, where applicable, to establish a baseline against which alternatives will be evaluated. This baseline is known as the No Action Alternative condition. This No Action Alternative forecast of future conditions is compared to the Action Alternative forecast of future conditions. Chapter 5.0 includes the No Action Alternative forecast of future conditions for each resource.

4.0 FORMATION OF ALTERNATIVES

4.1 Alternative Formulation Process

The alternative formulation process followed the eight-step watershed planning process for PR&G and the NRCS nine-step planning process, as described in Chapter 1.5. The PR&G eight-step evaluation process includes consideration of the federal objective (Section 2.1.1), PL 83-566 general purposes (Section 2.2.2), guiding principles (Section 4.11), and ecosystem services (Chapter 3.1). A framework was developed that included comparison of alternatives against guiding principles, ecosystem services, and economic benefits to select the alternative that maximizes public benefits (environmental, economic, and social goals). A PR&G analysis was completed to document the alternative formulation process and framework comparison for project decision-making (Appendix E-1).

4.1.1 Guiding Principles

Guiding principles were used to assist in decision-making and weighing tradeoffs of project alternatives. The guiding principles were included in a comparison framework, as documented in the PR&G Analysis (Appendix E-1), and are listed below:

1. Healthy and Resilient Ecosystems.
2. Sustainable Economic Development.
3. Floodplains (avoiding unwise use of floodplains).
4. Public Safety (reducing public health and safety risks).
5. Watershed Approach.

4.1.2 Alternative Formulation Criteria

The process of formulating alternatives for the project followed procedures outlined in the NRCS NWPM Parts 500 through 506; NRCS NWPH Parts 600 through 606; PR&G (DM 9500-013); and other NRCS watershed planning policy (NRCS, 2024a; NRCS, 2014a; NRCS, 2014b; USDA, 2017). Numerous alternatives were developed to meet the project Purpose and Need by the project team. The alternatives were developed considering problems and opportunities, as presented in Chapter **2.2.**, and objectives and constraints as presented in Chapter 2.1. Alternatives were formulated in consideration of four criteria: completeness, effectiveness, efficiency, and acceptability.

4.1.3 Risk and Uncertainty

During the planning process, decisions are made with information that is uncertain, including errors in measurements and climatic changes that could alter rainfall storm events. Assumptions made during the planning process are based on the best available science, technology, and information. Extended delays between the planning process and construction increase the degree of risk and uncertainty. Estimated alternative costs are based on computed work quantities multiplied by the appropriate unit cost for that type of work. Unit costs are based on current market prices from similar projects. Costs can be influenced by economic factors that cannot be predicted between

the planning process and construction that could increase the actual cost and decrease the availability of materials.

Additional risks and uncertainties associated with the project decision-making include the following:

- Erosion and Sedimentation: Erosion and sedimentation are dependent upon several unpredictable factors. Sedimentation could vary based on conditions in the drainage area, including construction activity, wildfires, storm events, climate variation, and off-highway vehicle/pedestrian traffic, among others. Erosion can vary based on climactic, hydrological, topographic, soil, geological, and vegetation conditions.

- Costs and Benefits: As with all projections of future costs and benefits, there is a degree of uncertainty assumed. Installation costs, O&M costs, crop yields, housing markets, labor markets, and commodity and input prices will all fluctuate.

- Flood Protection: Flood frequencies and magnitudes used in the analysis carry a degree of uncertainty. Economic estimates of flood control measures are not precise. The intention is that they are reasonably accurate and can assist in decision making.

- Recreation: Impacts associated with recreation-related projects can be uncertain and are dependent on external factors, including gas prices and availability, weather, construction, political status of other counties, etc. It can be assumed that recreation-related visitations would provide local economic benefits, but it is difficult to determine the extent.

4.2 Alternatives Considered

The project team considered two action alternatives and one no action alternative in detailed study. Multiple additional alternatives were formulated but eliminated from further study, as described in Chapter 4.3. The cooperating agencies were included in the alternative's formulation process described below.

The cost estimates for the alternatives provide an appropriate level of detail for the purpose of identifying the NRCS NEE Alternative among the alternatives considered. Project costs for alternatives selected for detailed study incorporate installation and O&M costs. Installation costs are those costs to be incurred for installing the works of improvement after the project is authorized. Installation costs include, as applicable, construction, engineering, real property rights, natural resource rights, permitting, replacement in-kind relocation payments, and project administration costs. Detailed construction cost estimates are provided in the PR&G Analysis Report included in Appendix E-1.

An analysis of feasible alternatives is required to determine potential actions that would meet the purpose and need of the proposed project (Chapter 2.0). After careful consideration, it was determined that two action alternatives would meet the purpose and need and would be analyzed in detail throughout the Plan-EIS. While the No Action Alternative does not meet the purpose and need of the project, it is also evaluated in detail to serve as a baseline for comparison and to meet NEPA requirements.

4.2.1 Alternative 1—No Action Alternative (Future Without Federal Investment)

The No Action Alternative considers the actions that would take place if no federal action or federal funding were provided for the project. Current irrigation facilities and existing environmental conditions in the project area would remain the same. Irrigation demand during summer months would continue to exceed water availability. Deficiencies in crop production would continue for the foreseeable future. Recreation and socioeconomic opportunities associated with the Preferred Alternative would not be realized. Due to the extended drought and historical population growth, current M&I water availability would continue to be stressed despite implementation of aggressive conservation measures. M&I water deficiencies would be exacerbated in the foreseeable future.

4.2.2 Action Alternatives

The action alternatives include measures to enhance the efficiency and reliability of the current AWM and to increase public recreation opportunities for Kane County, Utah, while increasing agricultural water, and M&I water supply for Washington County, Utah. Water need was calculated in the Cove Reservoir Water Model as part of the alternative formulation (Appendix E-1); several alternatives were developed to meet this water need. Based on the amount of water needed, alternatives for a 6,000-acre-foot and a 3,000-acre-foot reservoir were developed in detail and are described below.

4.2.2.1 Alternative 2—6,000-Acre-Foot Reservoir Alternative (Preferred Alternative)

4.2.2.1.1 Project Components

Alternative 2 consists of construction of a 6,000-acre-foot reservoir and earthen dam, principal and auxiliary spillways, recreation area, pipelines, and booster pump station (Figure B-2 through B-6, Appendix B). Access road improvements would be included as part of Alternative 2, and three borrow pit sites in addition to the reservoir basin were identified to supply material for dam construction (Figure B-1, Appendix B). Embankment material would be taken from the reservoir basin. The individual project components are discussed in detail in the following sections and in the Investigation and Analysis Report (Appendix D).

4.2.2.1.1.1 Reservoir and Dam

The proposed dam would be designed to meet current NRCS and Utah Dam Safety regulations (Utah Code Chapter 73-5a) and engineering standards. The structure, located near Orderville, Utah, would consist of a homogeneous earth-fill dam with an internal filter/drain. The length of the dam would be approximately 1,900 feet with a maximum dam height of 90 feet and a crest elevation of 5,552 feet above mean sea level (amsl). The reservoir would have a maximum capacity of approximately 6,000 acre-feet. The dam would be situated 0.6 miles from US-89 southwest of downtown Orderville (Figure B-1, Appendix B). This site was identified in the mid- to late- 1980s during a reconnaissance level inventory of potential dam sites associated with tributaries of the Virgin River.

4.2.2.1.1.2 Principal and Auxiliary Spillways

Two spillways, one principal, and one auxiliary would be constructed as part of the reservoir development. The principal spillway would be located at a lower elevation, and it would be

designed to route the principal spillway hydrograph and 100-year 24-hour average moisture condition flood through the reservoir without the use of the auxiliary spillway. The auxiliary spillway would also be designed to route larger flood events through the reservoir without overtopping the dam (Alpha Engineering and RB&G Engineering, 2024).

The principal spillway would be a 30-inch-diameter pipeline that is approximately 870 linear feet and would include a structure with an intake screen as well as an energy dissipater structure at the outfall. The pipeline would be located near the left abutment of the dam.

The auxiliary spillway would be approximately 1,070 linear feet and 30 feet wide. It would consist of a trapezoidal, earthen channel with a concrete weir structure near the reservoir. The auxiliary spillway would extend from the left abutment of the dam near the principal spillway, down the hillside, and enter an existing downstream drainage channel. Additional armoring or riprap would be installed to prevent erosion of the spillway or adjacent grades, as needed. See Figure B-3 in Appendix B for details on the principal and auxiliary spillways associated with Alternative 2.

4.2.2.1.1.3 Recreation Area and Boat Ramp

The Preferred Alternative would include the development of an approximately 4.1-acre outdoor recreation area. The recreation area would include a non-motorized boat ramp, two pit toilets, a pavilion, and 20 recreational vehicle site facilities (including a barbecue grill, table, and fire pit). No utilities would be extended to the recreation facilities. See Figure B-4 in Appendix B for details on the recreation area for Alternative 2.

4.2.2.1.1.4 Pipelines and Mt. Carmel Booster Pump Station

The installation of three water pipelines, the Reservoir Outlet Pipeline, the Glendale Irrigation Pipeline, the Mt. Carmel Irrigation Pipeline, and Booster Pump Station would be completed as part of the Preferred Alternative. The purpose of the Glendale Pipeline is to provide the additional capacity needed for the Glendale irrigation Company service area. This pipeline can also be used to convey water to the inlet of the Orderville Diversion by gravity flow which, with the extension of the Reservoir Outlet Pipeline, will convey water by gravity flow to the Cove Reservoir. The purpose of the Mt. Carmel Pipeline and booster pump station would be to pipe areas which are currently open canals and to provide pressurization to the existing and proposed piping. Water that is supplemented from the reservoir will have adequate pressure for the Mt. Carmel irrigation system without the need for the booster pump. The existing Mt. Carmel diversion dam does not provide enough elevation to service the system without the aid of a booster pump.

All pipelines would be bedded and buried to a minimum depth of 3 feet to the top of pipe and deeper under streambed crossings. The trench width and depth would vary depending upon the size of the pipe being installed; however, the trench would generally be 2 feet wider than the pipeline. It is anticipated that the material for the pipelines would be HDPE or PVC, depending on pipe size and cost of materials at the time the project is constructed. These materials have been found to be cost effective and durable for pressurized irrigation systems. The advantage of HDPE is that it can follow meandering canal alignments without the need for many fittings and thrust restraint. However, it is sometimes more difficult to repair. PVC has been found to also be a durable material and is used in many canal piping systems and has readily available repair couplings.

4.2.2.1.1.4.1 Reservoir Outlet Pipeline

The Reservoir Outlet Pipeline would include approximately 700 linear feet (0.13-mile) of new, large-diameter, concrete-encased, steel pipe. This new line would connect to the existing pipeline running from the Orderville irrigation diversion dam to just below the proposed dam site. The new line would access the proposed reservoir through the base of the dam. This new extension would provide water from the EFVR to fill the reservoir in the spring during high runoff. It would also be used to provide water from the reservoir to local irrigation users, as needed, during the summer months. Short-term surface disturbance would occur within the dam footprint. An inlet/outlet structure would be placed near the upstream toe of the dam with a control gate.

4.2.2.1.1.4.2 Glendale Irrigation Pipeline

The existing Glendale Irrigation Pipeline is a 4- to 8-inch pipeline that comprises the primary portion of the Glendale irrigation system. A new 8- to 16-inch pipeline would replace approximately 1.7 miles of the Glendale Irrigation Pipeline installed from the existing Glendale hydroelectric power plant to the Orderville Diversion Dam. Excess water from this pipeline would be combined with water diverted from the Orderville Diversion Dam to fill the proposed reservoir. The pipeline servicing Orderville's irrigation system was oversized by the KCWCD in agreement with the Orderville Irrigation Company in anticipation of the construction of the new reservoir. The existing irrigation pipeline would be used to fill the new reservoir during the non-irrigation season.

4.2.2.1.1.4.3 Mt. Carmel Pipeline and Mt. Carmel Booster Pump Station

The Mt. Carmel Pipeline would include the addition of approximately 24,000 linear feet of HDPE or PVC piping, varying in size from 8- to 16-inch diameters, to provide pressurized agricultural water to areas within the Mt. Carmel area. The proposed pipeline would be located entirely within existing roadways, open canals, or through existing fields and would not create permanent disturbance or require additional ROW.

The water demand for the Mt. Carmel Irrigation System varies from a low of 4 cfs to a high of 9.7 cfs. Depending on the year, this water is available from their diversion dam. The head of the proposed reservoir provides adequate pressure for pressurized irrigation in the Mt. Carmel area when supplemental water is required. However, when water is diverted from the existing Mt. Carmel Diversion Dam, it does not provide adequate pressure for sprinkler irrigation. In order to provide for pressurized irrigation, water diverted from the existing Mt. Carmel diversion dam needs to be boosted approximately 100 feet to provide the minimum pressure required for the irrigation system. It is proposed to install three pumps with variable frequency drives with approximate capacities of 1,450 gallons per minute per pump. Each pump would require approximately 50 HP or a total of 150 HP for the pump station. The pump station would be housed in a building approximately 25 feet by 25 feet and be constructed near the existing Orderville Hydroelectric Power Plant where an existing electrical transmission and substation are located.

Details regarding pipeline construction are presented in Appendix E-2 and E-3, and figures of the proposed pipelines and Mt. Carmel Booster Pump Station are presented as figures B-2, B-5, and B-6 in Appendix B.

4.2.2.1.2 Access Roads

Approximately 3.2 miles of new and existing access roads would be constructed and/or improved to provide access around the reservoir and to maintain access to properties surrounding the reservoir. See Figure B-3 in Appendix B for details on the access roads for Alternative 2.

- Approximately 1.2 miles of existing gravel roadway would be widened to 28 feet (currently 12–16 feet wide).
- Approximately 2.0 miles of new 2-lane roadway would be constructed at 28 feet wide.
- The access road would be covered with a graded and compacted road base material (gravel).

4.2.2.1.3 Borrow Material

Three existing borrow pit sites outside of the reservoir basin have been identified to provide gravel and riprap material: the Tait (29 acres), Lamb (17 acres), and Esplin (13.8 acres) pits. The project would use two of these three sites—the Esplin for riprap and either the Tait or Lamb pit for gravel. Because the final selection between the Tait and Lamb pits has not yet been determined, all three pits are analyzed as part of the project.

Use of the borrow pits would result in a maximum of 5.7 acres of disturbance, consisting of approximately 5 acres at the Esplin pit and either 0.5 acres at the Lamb pit or 0.7 acres at the Tait pit. Although only a portion of the pits would be disturbed, the entire area of each pit was included in the project area as the exact location of disturbance is unknown.

The Tait and Esplin pits contain avoidance areas for cultural and/or paleontological resources which are mapped in Figures C-6 and C-7 in Appendix C. Any disturbance within these pits would occur outside of these avoidance areas. The Tait and Lamb sites, located on private land near US-89 close to Mt. Carmel, Utah, would supply gravel while the Esplin site, located on private land east of Glendale near Glendale Bench Road, would supply riprap. Transportation to and from the three borrow pits would be on existing roads. See Figure B-1 in Appendix B for details on the borrow pit sites for Alternative 2.

4.2.2.1.4 Construction Staging and Access

Staging areas for the construction of the dam would be located within the footprint of the reservoir and would eventually be covered with water. An additional 200- to 300-foot buffer downstream of the dam would be used for instrumentation and additional staging. Construction would require staging large, earth-moving machinery, a portable gravel pit operation, water, and multiple personnel.

4.2.2.1.5 Schedule

Construction would begin after all necessary permits are obtained and plans are finalized. Construction of the reservoir, pipelines, associated recreation facilities, and access roads is estimated to take up to 15 months to complete. The spillway will be constructed simultaneously with the dam, as needed, for additional access to the left abutment. This will allow easier access during construction of the dam. The spillway ROW will be staked and cleared of all vegetation (Appendix E-2).

4.2.2.1.6 Operation and Maintenance

4.2.2.1.6.1 Water Diversions

Per the ZNP Agreement, water would be diverted from the EFVR at the Orderville Diversion and delivered by pipeline to the proposed reservoir between November 1 and May 31. No diversions are allowed outside of this period. During the summer months, up to 4.7 cfs would be diverted for OIC agricultural use, while MCIC would continue to divert up to 6.58 cfs (United States, Utah, Washington District, & Kane District, 1996).

The use of EFVR water by the GIC, OIC, and the MCIC is monitored on a regular basis. The three companies divert water from the EFVR at different locations. A weir is present at each diversion site with gages to read water elevation. Additionally, each weir is equipped with an electronic flow meter that sends information to a website to provide remote monitoring. The data collected from these flow meters are used to determine the total amount of water diverted. Additionally, the Utah State Water engineer collects money from the GIC, OIC, and the MCIC to fund a water commissioner. The commissioner is responsible for monitoring the diversions and making certain that companies are using the correct amount of water according to their water right.

4.2.2.1.6.2 Water Releases

Releases from the reservoir would be timed to supplement low, natural flows. Water for Long Valley agricultural purposes would be released into existing and proposed irrigation pipelines during the summer months, when natural flows are lowest. Water committed to Washington County for agricultural and M&I purposes could be released any time during the year to meet demand but would most likely be during the summer months for agricultural needs and during the fall and winter months for M&I needs.

The ZNP Agreement allows releases of up to 25 cfs for a 1-week period or 15 cfs continually (United States, Utah, Washington District, & Kane District, 1996). Releases would be managed to optimize irrigation efficiency and to meet M&I demands.

4.2.2.1.6.3 Monitoring

The use of EFVR water by the GIC, OIC, and the MCIC would continue to be monitored on a regular basis. The three companies divert water from the EFVR in different locations. A weir is present at each diversion site. Each weir has staff gages to read water elevation and an electronic flow meter that sends information to a website to provide remote monitoring. The data collected from these flow meters are used to determine the total amount of water diverted. A commissioner funded by the GIC, OIC, and MCIC is responsible for monitoring the diversions and making certain that companies are using the correct amount of water according to their water right.

Additional measuring devices would be installed to record flows into and out of the Cove Reservoir. Metering devices would be installed to record flows through the existing Orderville hydroelectric power plant that will release water rights owned by the WCWCD back into the EFVR, as well as water-right shortages being delivered from the reservoir to the Mt. Carmel and Orderville irrigation companies. These meter records would also be filed annually with the Utah State Division of Water Rights.

Water for Long Valley irrigation purposes would be used during the summer months. Water committed to Washington County for irrigation and M&I purposes could be released any time during the year to meet demand but would most likely be used during the fall and winter months. Releases to Washington County would be in compliance with the Zion Agreement (1996).

4.2.2.1.6.4 Maintenance

Routine maintenance and replacement actions would be required for the life of the proposed project. O&M measures that would be implemented through a signed O&M Agreement between the NRCS and the sponsor include:

- Regular inspection and maintenance of the dam and associated components.
- Grading of the spillways, as necessary, to maintain access and functionality.
- Annual inspection of the pipeline air valves to ensure that they are functioning properly.
- Annual cleaning of the pipelines with a polyurethane pig.
- Regular inspection and maintenance of the recreation area and non-motorized boat ramp to ensure hard surfaces and erosional protection and to keep the site free of debris.
- Regular O&M of the reservoir levels by agreement between the WCWCD and the KCWCD.

4.2.2.1.7 Costs

The average annual cost of implementing Alternative 2 is estimated to be approximately $1,359,000 and the total cost of implementing Alternative 2 is estimated to be approximately $39,730,000. The PR&G Analysis in Appendix E-1 describes how costs were calculated.

4.2.2.2 Alternative 3—3,000-Acre-Foot Reservoir Alternative

4.2.2.2.1 Project Components

Alternative 3 consists of a 3,000-acre-foot reservoir and dam, principal and auxiliary spillways, recreation area, pipelines, and booster pump station (Figure B-8, Appendix B). Access road improvements would be included under Alternative 3, and three borrow pit sites outside of the reservoir basin were identified to supply necessary materials for the dam construction (Figure B-1, Appendix B). Material for the embankment would be taken from within the reservoir basin. The individual project components are discussed in detail in the following sections below and in the Investigation and Analysis Report (Appendix D).

4.2.2.2.1.1 Reservoir and Dam

The proposed dam would be designed to meet current NRCS and Utah Dam Safety regulations and engineering standards. The structure would consist of a homogeneous earth fill dam with an internal filter/drain. The length of the dam would be approximately 1,700 feet with a maximum dam height of 70 feet and a crest elevation of 5,530 feet amsl. The reservoir would have a maximum capacity of approximately 3,000 acre-feet. The location for the reservoir and dam would be the same as described in Alternative 2 (Section 4.2.2.1.1.1).

4.2.2.2.1.2 Principal and Auxiliary Spillway

Two spillways, one principal, and one auxiliary would be constructed as part of the reservoir development. The principal spillway length would be the same as in Alternative 2; however, the auxiliary spillway would be slightly wider for Alternative 3 as there would be less surface area to attenuate storm water flows. See Figure B-8 in Appendix B for details on the principal and auxiliary spillways associated with Alternative 3.

4.2.2.2.1.3 Recreation Area and Boat Ramp

Alternative 3 would include the development of an approximately 2-acre outdoor recreation area. The recreation area would include a non-motorized boat ramp, one pit toilet, a pavilion, and 12 recreational vehicle site facilities (including a barbecue grill, table, and fire pit). No utilities would be extended to the recreation facilities.

4.2.2.2.1.4 Pipelines and Mt. Carmel Booster Pump Station

The installation of the three water pipelines (HDPE or PVC) and a booster pump station would be the same as described for Alternative 2 (Section 4.2.2.1.1.4). See Figures B-2, B-5, and B-6 in Appendix B for details on the pipelines associated with Alternative 3.

4.2.2.2.2 Access Roads

Access roads developed/improved for Alternative 3 would be the same as described for Alternative 2 (Section 4.2.2.1.2). See Figure B-8 in Appendix B for details on the access roads for Alternative 3.

4.2.2.2.3 Borrow Material

The same three existing borrow pit sites described for Alternative 2 would be used for Alternative 3 (Section 4.2.2.1.3). Embankment material would be taken from the reservoir basin. See Figure B-1 in Appendix B for details on the borrow pit sites for Alternative 3.

4.2.2.2.4 Construction Staging and Access

Staging areas for the construction of the dam would be located within the footprint of the reservoir and will eventually be covered with water. An additional 200- to 300-foot buffer downstream of the dam will be used for instrumentation and additional staging. Construction of the dam would require staging for large, earth-moving machinery; a portable gravel pit operation; water; and multiple personnel.

4.2.2.2.5 Schedule

Construction would begin after all necessary permits are obtained and plans are finalized. Construction of the reservoir, pipelines, associated recreation facilities, and access roads is estimated to take up to 15 months to complete. The spillway will be constructed simultaneously with the dam, as needed, for additional access to the left abutment. This will allow easier access for the construction of the dam. The spillway ROW will be staked and cleared of all vegetation (Appendix E-2 and E-3).

4.2.2.2.6 Operation and Maintenance

Operation and maintenance for Alternative 3 would be the same as those discussed for Alternative 2 under Section 4.2.2.1.6.

4.2.2.2.7 Costs

The average annual cost of implementing Alternative 3 is estimated to be approximately $1,017,000 and includes amortization of installation cost ($1,004,022) and OM&R ($13,000). The PR&G Analysis in Appendix E-1 describes how costs were calculated.

4.2.3 Nonstructural Alternative

Nonstructural alternatives, such as water conservation, water recycling, high pressure irrigation systems, replacing open irrigation ditches with pipelines, and other sources of water were considered. The KCWCD and WCWCD have implemented and continue to implement several conservation measures for water use in Kane and Washington counties, Utah. However, continued implementation of these conservation measures alone would not be sufficient to meet the purpose and need of the proposed project; therefore, the nonstructural alternatives were determined not feasible. The No Action Alternative, which would not include any structural measures, is considered the nonstructural alternative for the purposes of this Plan-EIS.

4.3 Alternatives Considered but Eliminated from Detailed Study

A full range of alternatives and options were considered for detailed study during project formulation and scoping, including alternative reservoir sites, alternative reservoir size, and non-structural measures. After careful examination, several alternatives were eliminated from detailed study as they were considered infeasible, did not adequately meet the purpose and need for the project, were environmentally more impactful, presented safety concerns, or were cost prohibitive (Appendix E-3).

The ZNP Agreement (1996) identifies allowable water use and depletion in the EFVR Basin east of ZNP (United States, Utah, Washington District, & Kane District, 1996). The Agreement establishes that new diversions or depletions of surface and ground water sources in the EFVR would not exceed a total depletion of 5,000 afy. It was also stipulated that one or more reservoirs constructed in the Basin could not exceed 6,750 acre-feet. For the purposes of this analysis and in addition to the Cove Reservoir site, seven other potential dam sites have been identified in the general vicinity of the project area and are discussed below.

4.3.1 Alternative Reservoir Sites

A 1988 publication titled “Inventory of Reservoirs and Potential Damsites in the Virgin River Basin” from the Utah Division of Water Resources (UDWRe) identified several potential reservoir sites in the Upper and Lower EFVR Subareas (UDWRe, 1988). These were cursory reviews, and the exact Cove Reservoir site was not identified in this document; however, two nearby sites (Orderville and Dry Wash) were located and reviewed. The report also identifies several sites downstream of the Cove (UDWRe, 1988). These sites are not considered feasible to meet the needs of the Preferred Alternative due to environmental and logistical concerns, including the distance of these sites from

the Glendale, Orderville, and Mt. Carmel agricultural fields, and the need to pump water upstream to access the fields.

Six sites from the UDWRe report and four sites from the ZNP Agreement (1996) were reviewed as potential alternatives and are described below.

4.3.1.1 Sites identified from the UDWRe Report

4.3.1.1.1 Swapp and Lower Swapp Sites

The Swapp and Lower Swapp sites partially overlap each other at the junction of US-89 and the paved Alton County Road, approximately 13 miles north of the proposed Cove Reservoir site. Of the potential sites reviewed, the Swapp site and Lower Swapp site are furthest from the proposed project site. Two small reservoirs exist in the area and would be inundated if this site were to be selected. A maximum dam height of about 97 feet would be required to store 6,000 acre-feet of water. This would be slightly higher than the height required for Alternative 2. Additionally, realignment between 0.8 and 1.0 mile of Alton Road, the primary access road to the town of Alton and surrounding area, would be required.

The required realignment of Alton Road would make the development of either of these sites more expensive, more environmental impacts, and less effective than the proposed Cove Reservoir site. Therefore, neither site was developed in further detail.

4.3.1.1.2 Lower and Upper Lydia's Canyon Sites

4.3.1.1.2.1 Lower Lydia Canyon

The lower Lydia's Canyon site is located approximately 0.33 miles up the canyon from US-89 and the upper site is located approximately 2.0 miles up the canyon from the highway. Both sites are located entirely on private land. Lydia's Canyon contains several private developments, including business, residential homes, ponds, and agricultural fields, which would all be inundated if a reservoir was developed at this site. The estimated required earthwork would be roughly 1.5 times the amount required to develop the Preferred Alternative. A 6,000-acre-foot reservoir would require a dam approximately 162 feet in height, 72 feet higher than the Preferred Alternative.

4.3.1.1.2.2 Upper Lydia Canyon

At the upper Lydia's Canyon site, development of a reservoir would result in inundation of one residential structure and agricultural land. The estimated required earthwork would be roughly twice the amount required to develop the Preferred Alternative as a 6,000-acre-foot reservoir would require a dam approximately 185 feet in height, more than twice the height of the proposed Cove Reservoir site.

Both reservoirs would be located on-stream to the perennial Lydia's Creek and would result in the loss of riparian and wetland habitat. This loss would likely be replaced by new habitat that would surround either reservoir. Both reservoirs would inundate the only access road in Lydia's Canyon, a maintained gravel county road. Re-routing would necessitate a major road realignment as the road would need to be cut into the side of the adjoining hillside.

No detailed cost evaluation has been completed for either of these two sites. However, development of either site would require the purchase of private land, including occupied residences and other structures, ponds, and developed agricultural lands. There would be additional costs resulting from rerouting the existing access road. These costs would be exacerbated by the need to construct the road on a hillside. These estimated additional costs would make the development of either of these sites prohibitive. The additional earthwork associated with either dam site would result in additional undetermined costs.

Based on the estimated high cost of additional earthwork for the dams, the cost of the purchase of private property, loss of existing agricultural fields, existing homes and other structures, the rerouting of the Lydia's Canyon Road, and environmental impacts from an on-stream reservoir, these sites were eliminated from detailed study and are not discussed further in this document.

4.3.1.1.3 Dry Wash Site

The Dry Wash site is located approximately 0.5 miles above Glendale in Dry Wash, a tributary to the EFVR. Two possible drawbacks to this site were identified in the 1988 report. The first drawback is that the site lies "…just west of the main Sevier fault and lies on at least two faults that might promote seepage from the reservoir." The second drawback was "…steep and narrow topography which would require a high and probably expensive dam" (UDWRe, 1988). A follow-up evaluation determined that the dam site would be founded on Cretaceous age Straight Cliffs formation or Tropic Shale bedrock. Multiple fault traces have been mapped within the Dry Wash area. Based on available information, these faults are inactive, and their presence would not necessarily preclude this site as a feasible location for a dam and water storage reservoir. However, it is likely that the bedrock formations in the area are fractured due to past faulting, and the faulting would increase the risk that seepage from the reservoir would be greater at this site compared to other sites (RB&G Engineering, 2021). A dam approximately 139 feet high would be required to store 6,000-acre-feet of water. This would be 49 feet higher than what would be required for the Preferred Alternative. Due to the cost and environmental concerns, this site was eliminated from detailed study and not considered further in this document.

4.3.1.1.4 Orderville Site

The Orderville site is located approximately 0.5 mile north of Orderville on the EFVR. However, the UDWRe determined that this site lies on a complex fault structure in the middle of the Sevier Fault zone. One major and two minor faults converge at the potential dam site axis and as a result, the site was determined to be a very unfavorable geologic setting for a dam. Additionally, the depth to bedrock was determined to be excessive (UDWRe, 1988). No additional studies have been conducted at this site due to unfavorable environmental conditions. Therefore, the site was eliminated from detailed study and not considered further in this document.

4.3.1.2 Sites identified from the ZNP Agreement (1996)

4.3.1.2.1 Lower and Upper Stout Creek Sites

The Lower Stout Creek reservoir site is located approximately 0.3 miles up Stout Canyon from US-89. The Upper Stout Creek site would overlap the upper portion of the lower reservoir and is located approximately 1.1 miles up the canyon from US-89. These sites are located on private and U.S. Forest Service (USFS) Dixie National Forest-administered lands, approximately 9.8 road miles

north of the proposed Cove Reservoir site. The dams at these sites would be off stream to the EFVR but would be on stream to the small, perennial tributary creek that flows down Stout Canyon into the EFVR. A review of topography at both sites indicates that a dam with a maximum height between 152 (upper site) and 158 feet (lower site) would need to be constructed to store 6,000 acre-feet of water (RB&G Engineering, 2021). Realignment of the Lower Stout Creek Rd and the Upper Stout Creek would be required to get around each reservoir. Given the steep topography surrounding the reservoir sites, this would be a substantial undertaking. Additionally, maintenance of this stretch of road would be difficult due to potential slope failures resulting from cutting into the steep canyon wall. The affected road runs through the Stout Canyon from US-89 to State Highway 14 and is a popular route for local users accessing ranches or recreating in the canyon. Sedimentation within the reservoirs would be a design concern as well, with an estimated average sedimentation rate of 1 acre-foot/yr/mi^2 (Appendix D) (Alpha Engineering and RB&G Engineering, 2024). Since these reservoirs are on stream there would be a loss of riverine and/or wetland habitat. This loss would likely be replaced by new habitat that would surround either reservoir. Since both sites are located primarily on private land, additional costs would be incurred to purchase the land for the reservoirs. Due to the increased costs and environmental impacts that would be associated with the road relocation and additional earthwork necessary to construct the dams as described above, these sites were eliminated from further study and are not discussed further in this document.

4.3.1.2.2 Lower Muddy Creek Site

The Lower Muddy Creek site is located approximately 2.5 miles south of the proposed Cove Reservoir site, approximately 0.16 miles up the cove from US-89. It would be situated on private, agricultural land. A review of topography at this site indicates that a dam with a maximum height of about 115 feet would need to be constructed to store 6,000 acre-feet of water. This is approximately 25 feet higher than that planned for the proposed Cove Reservoir dam (RB&G Engineering, 2021).

Geologic descriptions indicate that gypsum deposits within the upper portion of the Winsor member and lower portion of the Paria River member are present at this site (RB&G Engineering, 2021). A gypsum deposit with an exposed thickness of approximately 5 feet was observed near the base of the right abutment of the dam alignment (lower portion of Winsor member/upper portion of Paria River member). Additional gypsum deposits, several feet thick, were observed along the right side of the possible reservoir site and within the erosion channel near the center of the basin, particularly near the location of a historic flume. Defining the lateral and vertical limits of the gypsum deposits will require detailed foundation investigations. Depending on the extents of the gypsum deposits, it may not be feasible to construct a safe dam at the lower Muddy Creek site.

There are additional concerns with this site. An erosion channel visually estimated to be 20– 30 feet deep was observed within the center of the basin at this location. It is likely that a cutoff would need to be excavated to a depth of at least 30 feet to expose the bedrock formation prior to treating the foundation bedrock. Considering the availability of other potential reservoir sites, this site is not the preferred alternative for the project. Development of a reservoir at this site would result in the loss of active agriculture fields and would require the purchase of private property (RB&G Engineering, 2021).

The Lower Muddy Creek site is located at a lower elevation than most of the target agriculture fields within the project area; therefore, active pumping rather than gravity flow would be required to transport the water to the fields. Up to 1.8 miles of additional new pipeline beyond that needed for the Cove Reservoir site would be required to access the Glendale and Orderville fields. Additionally, studies conducted by Eocene cultural resource specialists determined that construction of a reservoir at this location would potentially result in the loss of historic cultural resources.

Due to safety concerns, engineering feasibility issues, the loss of agricultural land, additional costs associated with the purchase of private property, pipeline construction and maintenance, and cultural resource concerns, this site was eliminated from further study and is not discussed further in this document.

4.3.1.2.3 Upper Muddy Creek Site

The Upper Muddy Creek site is located approximately 1.8 miles up Muddy Creek from the lower site and 2.0 miles from US-89. Should a reservoir be constructed here, no irrigated agricultural land would be lost. However, the site is located on private land, and it would be necessary to purchase the property. Sedimentation would also be a concern, as an estimated 1,300 acre-feet of a reservoir at the upper Muddy Creek location would be filled with sediment after 50 years, resulting in a considerable loss of capacity (RB&G Engineering, 2021). The reservoir would also be on-stream to intermittent Muddy Creek. Approximately 3.6 miles of additional new pipeline would also be required to access the target agricultural fields.

The geology at the upper Muddy Creek site is believed to be like the lower Muddy Creek site. No gypsum surface deposits were observed during a field review, and a detailed geotechnical investigation would be required to determine if a dam could be safely constructed at this location. Gypsum deposits may be present at relatively shallow depths within the dam foundation area (RB&G Engineering, 2021). A review of topography at this site indicates that a dam with a maximum height of approximately 115 feet would need to be constructed to store 6,000 acre-feet of water. This would be approximately 25 feet higher than that planned for the Cove Reservoir site.

Due to potential safety concerns, engineering feasibility concerns, and additional environmental issues (e.g. larger dam, pipeline construction and maintenance), this site was eliminated from further study and is not discussed further in this document.

4.4 Final Array of Alternatives

Fourteen action alternatives were explored during the scoping process, including a nonstructural alternative. In accordance with NEPA (7 CFR 650), some initial alternatives were eliminated from further analysis due to exorbitant costs, logistics, environmental reasons, or other critical factors (see Chapter 4.3).

The feasibility of implementing the measures was assessed by evaluating various alternatives. This assessment involved examining each alternative's capacity to:

- Address the project's purpose and needs.
- Provide positive economic benefits.

- Ensure manageable land acquisition.
- Handle logistical requirements.
- Utilize existing technology.
- Avoid excessive costs.

Refer to the PR&G Analysis Report included in Appendix E-1 for further information.

The feasible alternatives determined from the screening process are being carried forward in detailed study. These include the 6,000-acre-foot reservoir and the 3,000-acre-foot reservoir. The No Action Alternative is also required to be evaluated in the Plan-EIS to provide a baseline comparison.

Table 4.1. Summary of Alternatives Preliminary Screening Evaluation

Plan Description	Purpose	Alternative 1 (No Action)	Alternative 2 (6,000-Acre-Foot Reservoir)	Alternative 3 (3,000-Acre-Foot Reservoir)
NEPA Purpose and Need	-	Alternative 1 would not meet the NEPA primary or secondary purpose and need to enhance the efficiency and reliability of the current AWM and recreation water in Long Valley, or increase agricultural and M&I water supply to communities in Washington County	Alternative 2 would meet the primary and secondary NEPA purpose and need by providing a reliable source of 6,000 acre-feet of water to be used for agricultural and recreation purposes in the Long Valley area, and agricultural and M&I purposes in Washington County.	Alternative 3 would meet the primary and secondary NEPA purpose and need by providing a reliable source of 3,000 acre-feet of water to be used for agricultural and recreation purposes in the Long Valley area, and agricultural and M&I purposes in Washington County.
Objective 1: Provide reliable source and long-term availability of agricultural water during the summer months in the Glendale, Orderville, and Mt. Carmel agricultural areas in Kane County and the Hurricane area in Washington County	Contribution to Planning Objectives	Alternative 1 would not provide a reliable and long-term available source of agricultural water.	Alternative 2 would provide agricultural water for up to 1,109.06 acres in Kane County and 67 acres in Washington County (Appendix E-3).	Alternative 3 would provide agricultural water for up to 750 acres in Kane County and 45 acres in Washington County (Appendix E-3).
Objective 2: Provide M&I water for Washington County	Contribution to Planning Objectives	Alternative 1 would not provide M&I water for Washington County.	Alternative 2 would provide up to 300 acre-feet of M&I water in Washington County (Appendix E-3).	Alternative 3 would provide up to 200 acre-feet of M&I water in Washington County (Appendix E-3).

Plan Description	Purpose	Alternative 1 (No Action)	Alternative 2 (6,000-Acre-Foot Reservoir)	Alternative 3 (3,000-Acre-Foot Reservoir)
Objective 3: Provide a recreation opportunity in Kane County	Contribution to Planning Objectives	Alternative 1 would not provide an additional recreation opportunity in Kane County.	Alternative 2 would provide a 6,000-acre-foot reservoir for non-motorized water-related enjoyment, a 4.1-acre recreation area with a non-motorized boat ramp, pavilion, and 20 RV sites at the reservoir site.	Alternative 3 would provide a 3,000-acre-foot reservoir for non-motorized water related enjoyment, a 2-acre recreation area with a non-motorized boat ramp, pavilion, and 12 RV sites in Kane County.
Objective 4: Present economic prospects for the communities of Orderville, Glendale, and Mt. Carmel by offering an extra recreational hub during the summer season	Contribution to Planning Objectives	Alternative 1 would not provide an additional recreational hub during the summer season and would therefore not increase economic prospects for the communities of Orderville, Glendale, and Mt. Carmel.	Alternative 2 would provide a reliable source of water for approximately 1,176.06 acres of farmland to support economic prospects.	Alternative 3 would provide a reliable source of water for approximately 795 acres of farmland to support economic prospects.
Objective 5: Provide for the maximum utilization of renewable energy for local communities whose populations are projected to rise	Contribution to Planning Objectives	Alternative 1 would not meet Objective 5 as no change in the utilization of renewable energy would occur.	Releases of excess water and water delivered to WCWCD would supplement the energy provided by the existing Orderville hydroelectric plant.	Releases of excess water and water delivered to WCWCD would supplement the energy provided by the existing Orderville hydroelectric plant.
Objective 6: Comply with the ZNP Agreement (1996)	Contribution to Planning Objectives	Alternative 1 would comply with the ZNP Agreement (1996)	Alternative 2 would comply with the ZNP Agreement (1996).	Alternative 3 would comply with the ZNP Agreement (1996).

Plan Description	Purpose	Alternative 1 (No Action)	Alternative 2 (6,000-Acre-Foot Reservoir)	Alternative 3 (3,000-Acre-Foot Reservoir)
Constraint 1: Siting limitations	Response to Planning Constraints	Alternative 1 has no siting limitations.	Alternative 2 would address siting limitation by using one of the limited number of sites that meet the necessary criteria for a reservoir.	Alternative 3 would address siting limitations by using one of the limited number of sites that meet the necessary criteria for a reservoir.
Constraint 2: Public safety	Response to Planning Constraints	Alternative 1 would put no additional risk to public safety.	Alternative 2 would minimize the risk put on residential property within the breach inundation zone at the Cove Reservoir site.	Alternative 3 would minimize the risk put on residential property within the breach inundation zone at the Cove Reservoir site.
Constraint 3: Environmental resources	Response to Planning Constraint	Alternative 1 would not cause the direct loss of existing agricultural land or residences.	The Cove Reservoir site would not require the direct loss of existing agricultural land or residences.	The Cove Reservoir site would not require the direct loss of existing agricultural land or residences.
Constraint 4: Geotechnical restrictions	Response to Planning Constraint	Alternative 1 has no geotechnical restrictions.	Alternative 2 has no geological structural limitations and would support construction.	Alternative 3 has no geological structural limitations and would support construction.
Constraint 5: Engineering Challenges	Response to Planning Constraint	Alternative 1 would have no engineering involved.	Alternative 2 would minimize the engineering requirements needed compared to the other reservoir sites evaluated.	Alternative 3 would minimize the engineering requirements needed compared to the other reservoir sites evaluated.
Constraint 6: Economic constraints	Response to Planning Constraint	Alternative 1 would have no construction costs.	Alternative 2 would have $39,730,000 in costs.	Alternative 3 would have $32,345,000 in costs.

Plan Description	Purpose	Alternative 1 (No Action)	Alternative 2 (6,000-Acre-Foot Reservoir)	Alternative 3 (3,000-Acre-Foot Reservoir)
Acceptability	Response to Evaluation Criteria	Alternative 1 would be consistent with existing federal and state laws, authorities, and public policies.	Alternative 2 would be consistent with existing federal and state laws, authorities, and public policies.	Alternative 3 would be consistent with existing federal and state laws, authorities, and public policies.
Completeness	Response to Evaluation Criteria	Alternative 1 would have no change to the current investments in Kane and Washington Counties.	Alternative 2 evaluates all necessary investments needed by Kane and Washington Counties to achieve the project.	Alternative 3 evaluates all necessary investments needed by Kane and Washington Counties to achieve the project.
Efficiency	Response to Evaluation Criteria	Alternative 1 would not address the water deficiencies or demand for recreational areas in Kane County, or the demand for M&I water in Washington County	Alternative 2 would have a cost of $6,622 per acre-foot in 2026 dollars.	Alternative 3 would have a cost of $10,782 per acre-foot in 2026 dollars.
Effectiveness	Response to Evaluation Criteria	Alternative 1 would not address the water deficiencies or demand for recreational areas in Kane County, or the demand for M&I water in Washington County.	Alternative 2 would effectively alleviate the specified problems and achieve the specified opportunities while providing minor impacts to the environment.	Alternative 3 would effectively alleviate the specified problems and achieve the specified opportunities while providing minor impacts to the environment.

Prepared: September 2026

5.0 ENVIRONMENTAL CONSEQUENCES

A final array of alternatives was evaluated to compare the economic, environmental, and social effects that may result from each alternative. The final array of alternatives includes Alternative 1—No Action Alternative, Alternative 2—6,000-Acre-Foot Reservoir Alternative, and Alternative 3—3,000-Acre-Foot Reservoir Alternative. Refer to Chapter 4.0 for a detailed description of each alternative.

This chapter describes the potential effects of the alternatives within each resource category, as defined in Chapter 3.0. Ecosystem service categories are discussed for each resource category. For reference, the ecosystem service categories relevant to this project and the applicable resource concerns that discuss these categories are provided in Table 3.2 of Chapter 3.1. A summary and comparison of resource concerns for alternatives is provided as Table 5.11 in Section 5.7.2. A summary of ecosystem services is also provided as Table 5.6 in Section 5.7.3 to identify the ecosystem services tradeoffs between alternatives. The PR&G Analysis in Appendix E-1 also provides a detailed ecosystem services tradeoff analysis.

The following lists the specific terminology used to describe impacts associated with alternative measures, consistent with 7 CFR 650.

Type

- Direct Effect: Impacts caused by a proposed action occurring at the same time and place.
- Indirect Effect: Impacts caused by an action that are later in time or farther removed in distance but are still reasonably foreseeable.
- Cumulative Effect: The impact on the environment that results from the incremental impact of the action when added to other past, present, and reasonably foreseeable future actions, regardless of what agency (federal or non-federal) or person(s) is undertaking such other action, which may include both beneficial and detrimental effects.

Duration

- Temporary and Permanent Impacts: Temporary impacts are impacts that are not lasting and the affected resource will return or be restored to its previous (pre-project) state. Permanent impacts are those in which the affected resource will not return to its previous state within one's lifetime.
- Short- and Long-Term Impacts: Short-term impacts are those that last through the duration of construction and shortly after (duration of impact is approximately 3 to 4 years). Long-term impacts are those that last for an extended duration of time. For this evaluation, long-term impacts extend beyond Year 4 and up to the end of the 100-year project life.

Intensity

- No effect: Resource conditions would not change.

- Negligible: Resource condition changes would be so slight there would be no measurable or perceptible consequence to the resource.

- Minor: A measurable effect to the resource, but localized, small, and of little consequence to the resource. Mitigation measures, if needed to offset adverse effects, would be easily implemented and successful.

- Moderate: A measurable effect on the resource from the alternative actions. Mitigation measures would be needed to offset adverse effects and could be extensive and moderately complicated to implement but would be successful.

- Major: A large, measurable effect to the resource from the alternative actions. Mitigation measures would be needed to offset adverse effects and could be extensive and complicated to implement.

5.1 Soil

Refer to Section 3.2.1 for existing soil resource conditions within the study area.

5.1.1 Soil Resources

5.1.1.1 Alternative 1—No Action Alternative

The drainage area in the project area would remain vulnerable to occasional flash floods, that transport sediments into the EFVR. This risk is heightened by the limited effectiveness of existing small flood control structures. Without additional flood risk management, the area could continue to experience channel scour, erosion, sedimentation, short-term disruptions to agricultural production, long-term degradation of soil health, and agricultural viability.

During dry periods, wind erosion within the project area would persist on disturbed and cleared areas, leading to soil loss into the foreseeable future. Under Alternative 1, no surface disturbance would occur; however, this alternative would not provide long-term soil stabilization benefits.

5.1.1.2 Alternative 2—6,000-Acre-Foot Reservoir Alternative

Approximately 259 acres of permanent disturbance and 64 acres of temporary disturbance would occur from implementation of Alternative 2 (Table 5.1). This disturbed area would be vulnerable to an indeterminate degree of soil erosion, mainly in the form of airborne dust, particularly on windy days or during heavy rainfall events. Direct impacts to soil resources would result from excavation and earthwork to build a dam, spillways, and access roads. It is anticipated that any soil needed for construction of the dam would be sourced from the reservoir footprint. If characteristics of excavated soils do not fully meet the specifications of design for the embankment upon the beginning of construction, additional soil resources would need to be taken from a nearby source.

Table 5.1. Permanent and Temporary Disturbance Under Alternative 2

Project Component	Permanent Disturbance (acres)	Temporary Disturbance (acres)
Reservoir	235	0
Principal Spillway	0.1	0.8
Auxiliary Spillway	0.2	0.6
Pipelines	0	37.9
Access Road	14	24.8
Borrow Area	5.7	0
Recreation Area	4.1	0
Total	259.1	64

The implementation of conservation and protective measures by the applicant, along with best management practices (BMPs) as detailed in Chapter 6.0, would mitigate but not entirely prevent this potential soil degradation. Once the planned reservoir is fully filled, approximately 190 acres of the affected land would be submerged, effectively preventing further soil erosion in that area, so long as the reservoir remains full. Thus, most of the soil loss at the reservoir site would be temporary and minor in extent. Given the relatively low amount of permanent soil disturbance for the execution of construction of the spillways, access roads, pipelines, and recreation area would likely lead to minor soil loss (18.4 acres, Table 5.1). The prolonged use of the newly constructed access road around the proposed reservoir would result in an unquantified amount of soil erosion caused by vehicle traffic, wind, and significant rainfall events. This would add to the soil loss already caused by existing roadways in the vicinity. However, this potential erosion would be partially mitigated by graveling and routine maintenance of the road.

While the exact amount of soil loss due to erosion is uncertain, all disturbed areas would remain susceptible to erosion as long as they remain barren or are not submerged, as in the case of the reservoir. Over time, soil erosion would likely decrease as vegetation gradually regrows or reclamation efforts take effect (i.e., the pipeline). The implementation of mitigation measures and BMPs (including revegetation and long-term weed control) committed to by the applicant would lessen, but not eliminate, the amount of soil lost. However, as the proposed project is in a region with limited summer rainfall, revegetation efforts would likely take several growing seasons to be fully successful.

Surface disturbance could cause a reduction in the biological soil crusts that exist in the project area. As mentioned in Section 3.2.1.1, this is a treatable resource concern. Treatment measures include artificial soil stabilization, cover crops, over-seeding, supplemental watering, shading, and wind erosion reduction. The implementation of mitigation measures and BMPS discussed in Chapter 6.0 would lessen the impacts biological soil crusts.

Use of the three existing borrow pits for construction of the earthen-fill dam is expected to result in the surface disturbance of an estimated 5.7 acres. Use of the Lamb Pit and Tait Pit would result in permanent disturbance of approximately 0.5 acres or 0.7 acres, respectively. Approximately 5 acres of permanent disturbance would result from use of the Esplin Pit (See Table 5.1). Embankment material would be taken from the reservoir basin. The basin would be covered by water when the reservoir is operational.

Direct impacts would include soil erosion through wind and water (dust and runoff) and the loss of native vegetation, which helps prevent erosion. Fugitive dust generated from borrow pit operations would be visible, particularly during windy conditions. While soil loss would be minor, it would be long term, lasting for the duration of the pits' operational period. Adherence to the BMPs outlined in Chapter 6.6 and the Standard BMPs and Standard Operating Procedures in Appendix E-3 would ensure that these effects are minimized.

Sediment would gradually accumulate in the proposed reservoir over time, primarily due to occasional flash floods in the area. If not removed, this sediment could reduce the reservoir's effectiveness for water storage or recreational use. Periodic maintenance, including dredging, may be necessary to maintain the reservoir's overall functionality. However, as stated in Appendix D, Section D.2.4 of the Plan-EIS, the estimated 100-year reservoir sedimentation is 418 acre-feet, which is less than 10 percent of the planned reservoir volume. The average depth of sediment within the reservoir after 100 years is expected to be 2.1 feet. The total estimated sediment volume equates to an average erosion of 1.7 inches of soil over the 4.7 square mile drainage area over a period of 100 years. Standard NRCS practice is to evaluate methods to reduce sedimentation if the sediment yield is greater than 2 inches in 50 years (4 inches in 100 years). The estimated sediment yield for Cove Dam site is less than 50 percent of the NRCS threshold for evaluation of sediment reduction. For the relatively low volume of expected sediment, storing the sediment in the reservoir is expected to be more cost efficient than implementing sediment reduction, particularly because sediment reduction would need to be combined with sediment storage since it is not practical to completely eliminate sediment transport into the reservoir. While this impact would be long-lasting, its overall effect would be negligible in scale.

Soil would be disturbed, vegetation would be cleared, and backfilling and grading would also be required during the short-term construction period. There is increased erosion and sedimentation potential during construction activities, which would be managed using BMPs during and immediately after construction. Post-construction monitoring would also be used to ensure successful reclamation of vegetated areas. No significant adverse impacts on soil would be anticipated with the implementation of BMPs.

5.1.1.3 Alternative 3—3,000-Acre-Foot Reservoir Alternative

Earthwork quantities for the construction of the dam and reservoir in Alternative 3 would be reduced by approximately 40 percent; however, the excavation required for the spillway would be doubled due to the smaller surface area in the reservoir. Approximately 165.3 acres of permanent disturbance and 64.7 acres of temporary disturbance would occur from implementation of Alternative 3 (Table 5.2). Direct impacts to soil resources would be the same as those evaluated in Alternative 2, with a slightly smaller disturbance footprint for the reduced reservoir area. The disturbance area for the principal spillway, pipelines, access roads, borrow areas, and recreation area would be the same as Alternative 2.

Table 5.2. Permanent and Temporary Disturbance Under Alternative 3

Project Component	Permanent Disturbance (acres)	Temporary Disturbance (acres)
Reservoir	141	0
Principal Spillway	0.1	0.8
Auxiliary Spillway	0.4	1.2
Pipelines	0	37.9
Access Roads	14	24.8
Borrow Areas	5.7	0
Recreation Area	4.1	0
Total	165.3	64.7

The same BMPs described for Alternative 2 would be used for Alternative 3 to prevent impacts to soil resources (Chapter 6.6). Under Alternative 3, negligible long-term impacts to soil resources are anticipated.

5.1.2 Ecosystem Services

5.1.2.1 Alternative 1—No Action Alternative

Provisioning service, agricultural land—Under Alternative 1, Agricultural land users in the project area would continue to experience water shortages during summer months at an increasing rate.

5.1.2.2 Alternative 2—6,000-Acre-Foot Reservoir Alternative

Provisioning service, agricultural land—Water from Alternative 2 would provide agricultural water the Hurricane Bench Lake area for maintaining agricultural production. Water could also be used to provide urban agricultural benefits to water users in St. George for personal food production through gardening or other enterprises that produce local food.

5.1.2.3 Alternative 3—3,000-Acre-Foot Reservoir Alternative

Provisioning service, agricultural land—Implementation of Alternative 3 would have the same impacts on ecosystem services for soil resources as Alternative 2 (Section 5.1.2.2).

5.2 Water

Refer to Section 3.2.2 for existing water resource conditions within the study area.

5.2.1 Water Resources

5.2.1.1 Alternative 1—No Action Alternative

No direct or indirect effects to water resources would occur from implementation of Alternative 1. Surface flows in the EFVR would continue to vary considerably in response to spring runoff or intense storm events.

5.2.1.2 Alternative 2—6,000-Acre-Foot Reservoir Alternative

Alternative 2 would have direct, positive benefits on water resources by making 2,148 acre-feet of existing water available for agricultural water users in Kane and Washington County annually. Additional water would be made available for M&I use in Washington County.

Because the proposed reservoir location is located away from the EFVR, construction of the proposed project is not anticipated to negatively affect the river. There are no permanent pools or streams located within the proposed reservoir footprint.

A water modeling analysis was completed by Alpha Engineering to determine the downstream effects of Alternative 2 on the EFVR. The changes in river flow, width, and depth on an annual and average monthly basis are described below.

5.2.1.2.1 Water Modeling Results

5.2.1.2.1.1 Annual Changes

Modeling shows that reservoir operations would cause minor changes to EFVR flows. On an annual basis, modeled changes in EFVR flows were small, ranging from a decrease of 1.8 cfs under low-flow conditions to an increase of 0.9 cfs under high flow conditions (Table 5.3). Larger short-term operational changes may occur during specific release or diversion periods, as discussed in section 5.2.1.2.1.2.

Current seasonal EFVR flows can vary from less than 40 cfs to more than 2,000 cfs, representing a range of more than 1,960 cfs, or approximately a 4,900 percent increase from 40 cfs. By comparison, modeled project-related annual average changes are less than 2 cfs (Alpha Engineering, 2026).

Tables 5.3 through 5.5 summarize the modeled changes in flow, depth, and width (Alpha Engineering, 2026).

Table 5.3. Annual Changes to EFVR Flow

Scenario	Low-Flow Condition	High-Flow Condition
Pre-Project Flow	34.8 cfs	82.2 cfs
Post-Project Flow	33.0 cfs	83.1 cfs
Change	-1.7 cfs	+1.9 cfs
Percent Change	5.17% decrease	1.09% increase

Table 5.4. Annual Changes to EFVR Depth

Scenario	Low-Flow Condition	High-Flow Condition
Pre-Project Depth	1.13 ft	1.71 ft
Post-Project Depth	1.10 ft	1.72 ft
Change	-0.03 ft	+0.01 ft
Percent Change	2.65% decrease	0.5% increase

Table 5.5. Annual Changes to EFVR Width

Scenario	Low-Flow Condition	High-Flow Condition
Pre-Project Width	19.32 ft	22.31 ft
Post-Project Width	19.37 ft	22.36 ft
Change	+0.05 ft	+0.05 ft
Percent Change	0.25% increase	0.22% increase

These results show that changes in flow (-5.17% to +1.09%), depth (-2.65% to +0.5%), and width (+0.25% to +0.22%) would be minor. Downstream tributaries such as Meadow Creek in Mineral Gulch would not be affected, because they are hydrologically independent of EFVR baseflow and the project would not alter tributary inflow, sediment supply, or confluence hydraulics (UDWRe, 2000). Because the project would not include construction, diversion, or flow modifications within the Meadow Creek watershed, and because modeled changes are limited to EFVR mainstream flows, no effect to Meadow Creek inflow, sediment supply, or confluence hydraulics is anticipated.

5.2.1.2.1.2 Monthly Changes

An analysis was completed by Alpha to evaluate anticipated changes in river flow on a monthly basis associated with the Project. The analysis evaluated river flows at the Mount Carmel and Springdale gauges during average, driest, and wettest hydrologic conditions for each month of the year. Detailed results of the analysis are provided in the Water Model Report in Appendix E-1. A summary of findings at each gauge is provided in the following sections.

At the Mount Carmel Gauge, flow is projected to increase by approximately 35 to 97 percent during average conditions. Driest conditions exhibit the largest relative increases, with several months exceeding 75 percent and some low-flow periods exceeding 200 percent due to the relatively small existing flows.

Because of additional watershed inflows between Mount Carmel and Springdale, the relative changes at the Springdale gauge are generally smaller. Average monthly flows at the Springdale gauge increase approximately 7 to 41 percent. Driest conditions increase approximately 7 to 60 percent, while wettest conditions generally increase approximately 4 to 78 percent.

Modeled decreases occur primarily during the authorized diversion season, when flows are generally higher and ecological water stress is lower. Modeled increases occur primarily during

summer low-flow periods, when surface water availability and riparian vegetation stress are more limiting. This seasonal redistribution is the basis for concluding that the project would have only minor impacts on downstream flows.

The percent change in flows is higher when looking at the monthly change compared to the annual change because the Project would shift water timing from naturally low-demand seasons to periods when ecological needs are higher. Although some monthly percent changes appear large, particularly during dry low-flow periods, these percentages reflect small baseline flows; the absolute change in cfs remains within the modeled operational range and does not exceed authorized release limits.

5.2.1.2.2 Downstream Flow Impact Analysis

The proposed reservoir would store excess water during high-flow periods and release it during low-flow periods to meet irrigation and water conservancy demands. Although the timing of flows would change, modeled flow alterations would be small compared to natural seasonal variability of EFVR flows (Alpha Engineering, 2026). Yearly monitoring would continue to be required to regulate water flows on the EFVR as discussed in Sections 3.2.2.1, 4.2.2.1.6.3 and 5.2.6.2.1.1. and. Because of the small annual changes in flow and the positive benefits of seasonally adjusting water timing to align with ecological needs, impacts on downstream EFVR flow would be minor.

5.2.1.3 Alternative 3—3,000-Acre-Foot Reservoir Alternative

Alternative 3 would have direct, positive benefits on water resources by making 1,453 acre-feet of existing water available for agricultural water users in Kane County and Washington County annually. Additional water would be available for M&I use in Washington County. Downstream impacts to water resources under Alternative 3 would be similar to those of Alternative 2. Construction of the proposed project would require crossing the EFVR along existing roadway, resulting in temporary and minimal soil bank erosion and causing minor sediment deposition into the stream. Increases and decreases in downstream river flow and sediment loading would be negligible (Refer to Section 5.2.1.2.1 for more detail).

5.2.2 Water Quality

5.2.2.1 Alternative 1—No Action Alternative

There would be no direct or indirect effects to water quality from the implementation of Alternative 1. The existing water quality of the EFVR would not change, and the EFVR and its tributaries would continue to be designated as HQW.

5.2.2.2 Alternative 2—6,000-Acre-Foot Reservoir Alternative

Construction activities associated with Alternative 2 are not expected to directly affect the water quality of the EFVR as no construction would occur within the river. Accessing the Lamb and Tait borrow pits would require crossing the EFVR along existing roadways, which could result in temporary, minimal and unquantifiable soil bank erosion and cause minor sediment deposition into the stream during construction. As discussed in the Investigation and Analysis Report in Appendix D, the proposed cove reservoir site is situated in an alluvial valley, which likely produces large sediment volumes during intense storm events. Water storage in the reservoir would allow

sediment to settle before leaving the reservoir, thereby improving downstream water quality conditions. A Site Erosion Analysis and Sediment Report were completed for the proposed reservoir (Appendix E-3), indicating that a sediment accumulation of approximately 6 afy would occur, of which 100 percent is expected to be contained in the reservoir.

Releases from the reservoir would regulate stream flow in the EFVR, which would also improve water quality for municipal and agricultural users, as well as improve aquatic habitat.

Through implementation of the BMPs listed in Chapter 6.6, Alternative 2 would have negligible temporary direct impacts on water quality and positive long-term impacts on water quality. Project design elements, including standard BMPs, would be implemented to reduce the quantity of sediment entering drainages, flowing downstream, and potentially violating any federal or state water quality rules and regulations. Under Alternative 2, the EFVR's designation as an HQW would not change.

The increase or decrease in streamflow during the summer months is expected to result in negligible changes to water quality in the EFVR. Flow regimes would continue to replicate natural variability to prevent alterations to sediment, channel morphology, and habitat structure, which are necessary for maintaining the "wild" character of the EFVR in ZNP, as designated by the NPS.

The ZNP Agreement (1996) ensures that water quality would benefit by maintaining controlled flow rates that prevent excessive sedimentation, nutrient loading, or changes in water temperature that could degrade the river's water quality and aquatic habitats. The change in water flow would not introduce pollutants or alter the river's chemistry in a way that would impact its designation as "wild". Water quality and the existing streamside vegetation would remain unchanged.

5.2.2.3 Alternative 3—3,000-Acre-Foot Reservoir Alternative

Under Alternative 3, impacts to water quality would be similar to those described for Alternative 2. Accessing the Lamb and Tait borrow pits during construction would cause temporary and minor soil bank erosion along the EFVR; however, only existing roadways would be used to cross the river.

The proposed reservoir would capture sediment during storm events, which would prevent it from entering the EFVR, which would have beneficial impacts to water quality within the EFVR. Alternative 3 would have a smaller drainage area compared to Alternative 2, therefore collecting less sediment per year.

5.2.3 Floodplain Management

5.2.3.1 Alternative 1—No Action Alternative

Alternative 1 would result in no changes to floodplains.

5.2.3.2 Alternative 2—6,000-Acre-Foot Reservoir Alternative

Alternative 2 would have long-term beneficial impacts on downstream flooding, and long-term, minor impacts on floodplain management. The proposed reservoir would capture runoff generated by flash floods out of Cove Canyon, reducing the amount of water and sediment entering the EFVR and decreasing the potential for flood-related damage and loss of riparian vegetation. High-pulse

events (i.e., flash floods) originating from other tributaries and watershed within the EFVR basin would continue to occur under existing conditions. Although flash floods can cause localized damage, these disturbances can also provide ecological benefit to stream and associated riparian habitats. For example, willows are early successional species that benefit from periodic flood-related disturbances (PLPCO, 2026).

In the unlikely event of a dam breach, the project would create a projected breach inundation area of approximately 3,123 acres under sunny-day conditions or 3,893 acres under rainy-day conditions (Appendix E-3). The breach inundation area itself would not be expected to result in revisions to FEMA floodplains. However, the reservoir's attenuation of flood flows during larger storm events, including the 100-year flood event, could reduce downstream flood elevations and floodplain extents.

Portions of the new Glendale Irrigation Pipeline would be located within a FEMA-designated Zone A floodplain, which is periodically subject to flash flooding.

Construction and maintenance activities would have the potential to affect floodplain resources through accidental releases of hazardous materials or localized erosion. However, the applicant has committed to conservation measures and BMPs designed to minimize floodplain disturbance, reduce erosion, and prevent project-related pollutants from reaching the EFVR (Chapter 6.6).

5.2.3.3 Alternative 3—3,000-Acre-Foot Reservoir Alternative

Alternative 3 would have similar effects to floodplain and floodplain management as Alternative 2. The proposed reservoir would capture runoff produced by flash floods, causing a beneficial impact to downstream flooding. The construction of the reservoir and dam would create a new inundation area, which could cause changes to FEMA floodplains. Portions of the new Glendale Irrigation Pipeline would be constructed within a FEMA-designated Zone A floodplain, and potential risks to floodplains could occur during construction due to an accidental release of hazardous materials. BMPs would be followed to reduce these potential risks.

5.2.4 WOTUS, Wetlands, and Special Aquatic Sites

5.2.4.1 Alternative 1—No Action Alternative

There would be no impacts to WOTUS, wetlands, or other resource in the project area under Alternative 1. Intensity and frequency of precipitation events and snowmelt would continue to influence these water bodies throughout the project and planning areas.

5.2.4.2 Alternative 2—6,000-Acre-Foot Reservoir Alternative

Alternative 2 would temporarily impact 0.253 acres and permanently impact 0.021 acre of potentially jurisdictional intermittent and perennial streams, including the EFVR, and 3.056 acres of non-jurisdictional ephemeral streams. Additionally, Alternative 2 would impact wetland 2 where the ROW of the Glendale Pipeline portion of the survey area crosses through the wetland. However, after coordination with the USACE following initial review of the October 2018 survey results, it was determined that wetland 2 would not be considered jurisdictional or be included in the overall impact calculation for Alternative 2.

Therefore, the total possible temporary and permanent impacts to potentially jurisdictional WOTUS delineated in the survey area may be approximately 0.274 acres. Impacts to each potential WOTUS are summarized in Appendix E-1.

5.2.4.3 Alternative 3—3,000-Acre-Foot Reservoir Alternative

Alternative 3 would likely result in the same or very similar aquatic resource impacts and 404 permitting requirements as Alternative 2. The temporary impacts to aquatic features and wetlands from construction of the Glendale pipeline would be the same as described in Alternative 2.

5.2.5 Regional Water Resource Plans

5.2.5.1 Alternative 1—No Action Alternative

No changes to Kane County or Washington County's Water Resource Plans would occur under Alternative 1. Both counties would continue to seek water conservation goals and practices to enhance the efficiency and reliability of the current AWM.

5.2.5.2 Alternative 2—6,000-Acre-Foot Reservoir Alternative

5.2.5.2.1 Colorado River Compact of 1922

The Virgin River is a tributary of the Colorado River, which connects at Lake Mead approximately 120 river miles away from the Quail Creek Reservoir Diversion site. Refer to Appendix E-1 for the details of the Colorado River Compact. Alternative 2 would comply with the Colorado River Compact, as changes to the EFVR would not result in any reduction of flow to the Colorado River.

The requirements of the Compact, including "the equitable division and appointment of the use of the waters of the Colorado River system; establishment of the relative importance of different beneficial uses of water; promotion of interstate comity; the removal of causes of present and future controversies; the secure and expeditious agricultural and industrial development of the Colorado River Basin, the storage of its waters, and the protection of life and property from floods" (43 USC 617l), would continue to be met.

5.2.5.2.2 Regional and State Water Plans

Alternative 2 would support both Kane County and Washington County's Water Resource Plans by addressing the present and future water needs of the area while cooperating with the State of Utah water quality plan and Utah constitutional and statutory law, in regard to vested water rights and control of in-stream flow. Both the WCWCD and KCWCD have identified Alternative 2 as a key water development opportunity to serve as a buffer against droughts and climate variability.

5.2.5.2.3 Water Rights

Water-rights holders are encouraged to stay informed about the project and monitor their allocations closely. The State Engineer administers distribution systems in both the East Fork and Main Stem of the Virgin River to assure that water rights are delivered in priority and would continue to do the same after construction of the reservoir. Any potential changes to water rights are evaluated by the State Engineer and administered through their legislated authority.

5.2.5.2.4 Overall Impacts

Alternative 2 would be consistent with both regional water plans; therefore, long-term minor beneficial impacts would occur. Alternative 2 would comply with the Colorado River Compact because the Virgin River is a lower basin tributary.

5.2.5.3 Alternative 3—3,000-Acre-Foot Reservoir Alternative

Alternative 3 would have beneficial impacts on Regional Water Resource Plans for the reasons described in Section 5.2.5.2.

5.2.6 Wild and Scenic Rivers

5.2.6.1 Alternative 1—No Action Alternative

There would be no direct or indirect impacts to WSRs under Alternative 1. No changes to identified WSRs would occur.

5.2.6.2 Alternative 2—6,000-Acre-Foot Reservoir Alternative

Congress created the National Wild and Scenic Rivers system in 1968 to preserve certain rivers with outstanding natural, cultural, and recreational values in a free-flowing condition for the enjoyment of present and future generations (rivers.gov). To preserve these values, an analysis of the proposed projects' impacts to water quantity, quality, and habitat is described below.

5.2.6.2.1 Water Quantity and Quality

Under Alternative 2, up to 5.7 cfs of water would be released from the proposed Cove Reservoir into the EFVR during wet years. During dry years, approximately 11.6 cfs of water would be removed from the EFVR to supplement the reservoir as shown in Table 5.6. Dry and wet years were identified as the driest or wettest August and December on record (Alpha Engineering, 2024).

Table 5.6. Anticipated Streamflow Changes.

Scenario	Water Diverted From the EFVR[1]	Water Released into the EFVR[2]
Dry Year	11.6 cfs (Maximum)	0 cfs (Minimum)
Wet Year	0 cfs (Minimum)	5.7 cfs (Maximum)

[1]Water would be diverted from the EFVR during the winter months.

[2]Water would generally be released back into the EFVR during wet summer months.

Water modeling shows these streamflow changes would be minor, particularly when the natural variation of EFVR flows are approximately 100 times the range of effect from proposed Cove Reservoir releases (Alpha Engineering, 2025) on river depth and channel width and, therefore, no impacts to downstream river values would be anticipated (Refer to Section 5.2.1.2.1 and Appendix E-1). Additionally, the ZNP Agreement (1996) stipulates that water releases from a new reservoir

cannot exceed 25 cfs over any 7-day period, with a long-term monthly average of no more than 15 cfs. The proposed project would comply with these stipulations, and these controlled releases are designed to mimic natural flow patterns, minimizing potential disruptions to the EFVR's hydrology and ecological functions.

5.2.6.2.1.1 Monitoring Requirements

The current monitoring system, as described in Section 3.2.2.1, would continue to be used. A weir at each diversion site would continue to electronically send information to a website to provide remote monitoring data. The data collected from these flow meters would continue to be used to determine the total amount of water diverted. A water commissioner would continue to monitor the diversions to ensure that companies are using the correct amount of water according to their water right.

Additional measuring devices would be installed to record flows into and out of the Cove Reservoir. Metering devices would be installed to record flows through the existing Orderville hydroelectric power plant that will release water rights owned by the WCWCD back into the EFVR, as well as water-right shortages being delivered from the reservoir to the Mt. Carmel and Orderville irrigation companies. These meter records would also be filed annually with the Utah State Division of Water Rights.

The change in water flow would not disrupt the ongoing research activities within the Research Natural Area. The ZNP agreement (1996) stipulations would protect natural hydrological cycles, ensuring that the area's research value remains intact, and no research plots or sites would be affected. Research activities permitted by the ZNP would continue as usual, with no loss of research value.

Overall, Alternative 2 would have negligible impacts on the EFVR's WSR values within the ZNP. By adhering to the strict flow release guidelines set forth in the ZNP Agreement (1996) and implementing appropriate mitigation measures, the project would not impact the free-flowing character, water quality, or ecological integrity of the EFVR in its designated wild section.

The NPS evaluates impacts on designated rivers in accordance with Section 7 of the WSRA. On August 29, 2025, via email, the NPS stated that they will not be conducting a Section 7 analysis for this project (Appendix A). Coordination with the ZNP as a cooperating agency has been ongoing throughout the life of the project and is summarized in Chapter 7.0 (Consultation).

5.2.6.3 Alternative 3—3,000-Acre-Foot Reservoir Alternative

Similarly to Alternative 2, Alternative 3 would have no impact on the WSR values of the EFVR within the ZNP, as it would also adhere to the stipulations required in the ZNP Agreement (1996). Therefore, the changes in flow to the EFVR would be minor, particularly when the natural variation of the EFVR is approximately 100 times greater than the releases associated with both Alternative 2 and Alternative 3 (Alpha Engineering, 2025).

5.2.7 Ecosystem Services

5.2.7.1 Alternative 1—No Action Alternative

Negative impacts to ecosystem services from water would occur under Alternative 1.

Provisioning services, agricultural water—In the summer months, water from the EFVR would continue to provide insufficient quantities of water for crop and feed irrigation, maintenance of agricultural lands in Kane County, and M&I purposes in Washington County.

Regulating services, water quality and quantity—No changes to water quality or quantity would occur under Alternative 1, and therefore, no changes to temperature, turbidity, sediment, or pollutants within the EFVR would occur. Instream flow would continue to regulate water temperature, decrease bank erosion/sedimentation, and dilute potential pollutants.

Supporting services, wildlife habitat—The EFVR would continue to provide habitat for plants and wildlife.

Cultural services, recreation—Water from the EFVR would continue to provide recreational opportunities to the public, including fishing, swimming, and intrinsic value from the natural scenic beauty.

5.2.7.2 Alternative 2—6,000-Acre-Foot Reservoir Alternative

Alternative 2 would provide positive benefits to ecosystem services from water.

Provisioning services, agricultural water—Alternative 2 would increase the available amount of irrigation and M&I water for Kane County and Washington County by approximately 2,148 acre-feet.

Provisioning services, livestock water—Alternative 2 would increase the available amount of livestock water for Kane and Washington County by approximately 2,148 acre-feet.

Regulating services, water quality and quantity—Alternative 2 would increase water quality in the EFVR by containing sediment within the reservoir during flash flooding events.

Supporting services, wildlife habitat—Alternative 2 would continue to provide habitat for plants and wildlife within the EFVR with the addition of new habitat within the Cove Reservoir.

Cultural services, recreation—Alternative 2 would have no impact on the recreational value of the EFVR while also providing new recreational opportunities at the Cove Reservoir site.

5.2.7.3 Alternative 3—3,000-Acre-Foot Reservoir Alternative

Alternative 3 would provide positive benefits to ecosystem services from water.

Provisioning services, agricultural water—Alternative 3 would increase the available amount of irrigation and M&I water for Kane County and Washington County by approximately 1,453 acre-feet.

Provisioning services, livestock water—Alternative 2 would increase the available amount of livestock water for Kane and Washington County by approximately 2,148 acre-feet.

Regulating services, water quality and quantity—Alternative 3 would increase water quality in the EFVR by containing sediment within the reservoir during flash flooding events.

Supporting services, wildlife habitat—Alternative 3 would continue to provide habitat for plants and wildlife within the EFVR with the addition of new habitat within the Cove Reservoir.

Cultural services, recreation—Alternative 3 would have no impact on the recreational value of the EFVR while also providing new recreational opportunities at the Cove Reservoir site.

5.3 Air

5.3.1 Air Quality

Refer to Section 3.2.3 for existing air quality conditions in the study area.

5.3.1.1 Alternative 1—No Action Alternative

Under Alternative 1, no direct or indirect effects to air quality would occur.

5.3.1.2 Alternative 2—6,000-Acre-Foot Reservoir Alternative

On-site construction activities and equipment traveling to and from the project area on gravel or dirt roads would generate localized fugitive dust. This impact would be short-term, lasting only during the estimated 15-month construction period. Conservation and protection measures, along with the BMPs outlined in Chapter 6.6 and Appendix E-3, would help minimize fugitive dust during the construction phase. Emissions from trucks and heavy-duty diesel-powered construction equipment would also be temporary and confined to the construction site. Beyond the 15-month construction period, there would be no long-term effects on local air quality from implementation of Alternative 2.

Similarly, the use of the three borrow pit sites would result in temporary, localized reductions in air quality due to fugitive dust and equipment emissions. However, these effects would be short-lived and limited to the 15-month construction period. Borrow pit use for unrelated activities may continue over the long term, but adherence to conservation measures and BMPs would ensure that air quality standards are not violated.

An estimation of fugitive dust was completed by the NRCS for the recently proposed Gould Wash project (Washington County) and shows the increase in fugitive dust from construction would be minor (NRCS, 2026). The calculations estimated a total increase in 48.85 tons of PM10 and 7.18 tons of PM2.5 for all construction (estimated 2 years). This is well under the threshold for violating air quality standards. The EPA classifies a “major source” of emissions from construction activities to be emitting more than 250 tons per year for PM10, and 10 tons per year for PM2.5 (EPA, 2024c). The Gould Wash project consists of a larger dam, larger surface disturbance, and longer construction timeline than that anticipated for the proposed Cove Reservoir. Additionally, the soils in the Gould Wash project consist of basalt (low erosion potential), alluvial stream deposits, and other loose and non-cohesive that are highly erosive (NRCS, 2026). The alluvial stream deposits and non-cohesive soils are similar to that found at the proposed Cove Reservoir site and would be

expected to emit similar rates of fugitive dust. Therefore, since the Cove Reservoir site would have a smaller surface disturbance area and a shorter construction period than the Gould Wash project, it is projected that Alternative 2 would have even less fugitive dust emissions, resulting in minor impacts. No air quality standards would be violated.

The construction activities are not expected to violate ambient air quality standards, contribute to any ongoing or future air quality violations, or expose sensitive species or humans to harmful pollutants. The project would fully comply with all relevant federal, state, and local air quality regulations. As a result, any short-term, localized impacts on air quality are expected to be minimal.

5.3.1.3 Alternative 3—3,000-Acre-Foot Reservoir Alternative

Construction activities under Alternative 3 would result in impacts like those described for Alternative 2. Construction activities would cause a minor and temporary increase in localized fugitive dust for the 15-month construction period. Alternative 3 would fully comply with all relevant federal, state, and local air quality regulations, and BMPs would be followed to decrease the production of fugitive dust.

5.3.2 Ecosystem Services

5.3.2.1 Alternative 1—No Action Alternative

Under Alternative 1, no changes to ecosystem services for air would occur.

Regulating Services, climate regulation—All air quality standards would be maintained at current levels. Air quality standards directly impact climate regulation, as many sources of air pollutants are also greenhouse gases.

Supporting service, nutrient cycling—Nutrient cycling would continue to occur, as living organisms breathe in the abiotic components in the air.

Cultural Services, health—No impacts to air quality would occur, and therefore, no changes in human health from air quality would occur.

5.3.2.2 Alternative 2—6,000-Acre-Foot Reservoir Alternative

Alternative 2 would have no changes to ecosystems services provided by air quality.

Regulating Services, climate regulation—All air quality standards would be maintained at current levels. Air quality standards directly impact climate regulation, as many sources of air pollutants are also greenhouse gases.

Supporting service, nutrient cycling—Nutrient cycling would continue to occur, as living organisms breathe in the abiotic components in the air.

Cultural Services, health—The use of BMPs during construction would ensure no negative impacts to human health are caused from air quality changes.

5.3.2.3 Alternative 3—3,000-Acre-Foot Reservoir Alternative

Alternative 3 would have no changes to ecosystems services provided by air quality.

Regulating Services, climate regulation—All air quality standards would be maintained at current levels. Air quality standards directly impact climate regulation, as many sources of air pollutants are also greenhouse gases.

Supporting service, nutrient cycling—Nutrient cycling would continue to occur, as living organisms breathe in the abiotic components in the air.

Cultural Services, health—The use of BMPs during construction would ensure no negative impacts to human health are caused from air quality changes.

5.4 Plants and Animals

Refer to Section 3.2.4 for information regarding the existing plants and animals in the study area.

5.4.1 Threatened and Endangered Species

5.4.1.1 Alternative 1—No Action Alternative

Implementing Alternative 1 would not directly or indirectly affect any federally listed or candidate plant or animal species. No changes to the current conditions would occur.

5.4.1.2 Alternative 2—6,000-Acre-Foot Reservoir Alternative

A Biological Assessment (BA) was completed for Alternative 2 to document the potential effects to federally listed and proposed listed species and designated critical habitat. A draft BA was initially submitted to the USFWS for informal review on July 1, 2021, and their comments were incorporated into the BA and draft Plan-EA. An updated Final BA was submitted to the USFWS for informal Section 7 consultation on September 3, 2026. USFWS concurred with the determinations described in Table 5.7 in a letter signed September 9, 2026. Refer to Appendix A for copies of all consultations with USFWS. For more information on how these determinations were made, refer to the BA in Appendix E-1 and E-2.

Table 5.7. Effects Determinations of Listed Threatened and Endangered Species.

Species	Species Effect Determination	Designated Critical Habitat Effect Determination
Bird California condor	Not Likely to Jeopardize the Continued Existence outside of ZNP; May Affect, but is Not Likely to Adversely Affect within ZNP	Critical habitat has not been designated
Bird MSO	May Affect, but is Not Likely to Adversely Affect	May Affect, but is Not Likely to Adversely Affect
Bird Southwestern willow flycatcher	May Affect, but is Not Likely to Adversely Affect	No designated critical habitat is located within the study area

Species	Species Effect Determination	Designated Critical Habitat Effect Determination
Bird Western yellow billed cuckoo	No Effect	No designated critical habitat is located within the study area
Reptile Desert tortoise	No Effect	No designated critical habitat is located within the study area
Fish Virgin River chub	May Affect, but is Not Likely to Adversely Affect	May Affect, but is Not Likely to Adversely Affect.
Fish Woundfin	May Affect, but is Not Likely to Adversely Affect	May Affect, but is Not Likely to Adversely Affect
Insect Monarch butterfly	Not Likely to Jeopardize the Continued Existence	Critical habitat has not been designated
Insect Suckley's cuckoo bumble bee	No Effect	Critical habitat has not been designated
Plant Jones cycladenia	No Effect	Critical habitat has not been designated
Plant Shivwits milk-vetch	No Effect	No designated critical habitat is located within the study area
Plant Siler's pincushion cactus	No Effect	Critical habitat has not been designated
Plant Ute ladies'-tresses	No Effect	Critical habitat has not been designated

5.4.1.2.1 Determination of Effects

An analysis of potential impacts to listed threatened, endangered, or proposed listed species resulting from project development is required by the ESA. Surveys conducted for this project revealed that six Threatened, Endangered, and Proposed listed species occur within the project area (See Table 5.7). Additional detail regarding the presence/absence of these species and potential effects arising from project development are found in the BA included in Appendices E-1 and E-2.

5.4.1.2.1.1 California Condor

Alternative 2 (construction, operations, and maintenance activities) would not result in any surface disturbance in occupied California condor habitat. California condors are known to inhabit Parunuweap Canyon and surrounding area in ZNP. No surface disturbance would occur beyond the reservoir site, and no surface disturbance would occur within the EFVR or occupied condor habitat. Changes in EFVR flows below the proposed reservoir site would be minor (Alpha Engineering, 2025). Based on these factors, implementation of Alternative 2 **May Affect, but is Not Likely to Adversely Affect** the California condor within ZNP and is **Not Likely to Jeopardize the Continued Existence** of the species outside of ZNP due to insignificant or discountable effects (Appendices E-1 and E-2). No critical habitat has been designated for the California condor.

5.4.1.2.1.2 Mexican Spotted Owl

Alternative 2 (construction, operations, and maintenance activities) would not result in any surface disturbance in MSO occupied habitat, including designated critical habitat and PACs. The nearest habitat within the project area is located approximately 16 river-miles downstream from the proposed reservoir site. No surface disturbance would occur beyond the reservoir site, and no surface disturbance would occur within the EFVR. Minor changes in EFVR flows below the proposed reservoir site would be minor (Alpha Engineering, 2025). These minor changes in flows would not be sufficient enough to affect riparian areas, including overstory (cottonwoods, etc. used by the MSO). Potential increases in flow from the proposed reservoir during the summer could benefit stressed downstream riparian areas. No changes in habitat would occur beyond a 100-foot buffer from the EFVR. Based on these factors, it has been determined that Alternative 2 **May Affect, but is Not Likely to Adversely Affect** the MSO or designated critical habitat including PACs.

5.4.1.2.1.3 Southwestern Willow Flycatcher

Alternative 2 would not result in destruction or damage to SWFL habitat in Parunuweap Canyon. Surface-disturbing activities would only occur in the Long Valley portion of the study area. Based upon EVFR streamflow data, minor changes in stream flow resulting from project development would not result in a significant adverse effect to or loss of SWFL habitat, including riparian vegetation and overstory (cottonwoods, willows, etc.) No changes in habitat would occur beyond a 100-foot buffer from the EFVR. No harm or harassment would occur to SWFL because of reservoir-related streamflow changes; therefore, it has been determined that the Proposed Action **May Affect, but is Not Likely to Adversely Affect** SWFL due to insignificant or discountable impacts. No SWFL designated critical habitat is located within the project area.

5.4.1.2.1.4 Virgin River Chub/Woundfin

Alternative 2 would not result in any surface disturbance in Virgin River chub and/or woundfin occupied habitat as it is located approximately 4.8 miles below the project area in Washington County. The nearest surface disturbance would be more than 50 miles upstream, in the Long Valley area. Furthermore, no surface disturbance would occur within the EFVR in Long Valley. Changes in Virgin River flows below the Quail Creek Reservoir Diversion are not anticipated as diversions would not exceed releases from the proposed reservoir. Any unanticipated flow changes would be short-term and negligible and would not affect any habitat characteristics. Based on these factors, the implementation of Alternative 2 **May Affect, but Not Likely to Adversely Affect** the Virgin River Chub and woundfin or their habitats due to insignificant or discountable effects. Furthermore, it has been determined that Alternative 2 **May Affect, but is Not Likely to Adversely Affect** designated critical habitat based on negligible impacts on water flow below the Quail Hollow Reservoir Diversion (Appendix E).

5.4.1.2.1.5 Monarch Butterfly

The Study Area is located within the monarch butterfly's migrating fly zone and native flowering plants are present in the area. Therefore, it is possible that the species could be found migrating through the area. The potential for effect is negligible due to the considerable size of the monarch butterfly habitat and the limited duration of construction activities (15 months). Development of the proposed reservoir could provide a small amount of habitat for the monarch butterflies.

Therefore, a determination of **Not Likely to Jeopardize the Continued Existence of the species** has been made for this species due to insignificant effects (Appendix E-1 and E-2).

5.4.1.2.1.6 Other Species

Alternative 2 would have ***No Effect*** on the following species due to lack of suitable habitat in the project area or the species-specific buffers identified within the study area (Appendix E-1 and E-2):

- Western yellow-billed cuckoo.
- Desert tortoise.
- Suckley's cuckoo bumble bee.
- Jones cycladenia.
- Shivwits milk-vetch.
- Siler's pincushion cactus.
- Ute ladies'-tresses.

Implementation of Alternative 2 would also have **No Effect** on designated critical habitat for any of these species due to the reasons as stated above.

5.4.1.3 Alternative 3—3,000-Acre-Foot Reservoir Alternative

The effects determinations made for Alternative 3 would be the same as identified in Alternative 2 (Table 5.7), as the location of the project is the same.

5.4.2 Migratory Birds

5.4.2.1 Alternative 1—No Action Alternative

Alternative 1 would have no direct or indirect impacts to migratory birds.

5.4.2.2 Alternative 2—6,000-Acre-Foot Reservoir Alternative

Construction activities would temporarily and directly disturb suitable breeding/nesting or foraging habitat for migratory birds. If present, foraging birds may be disturbed and displaced to adjacent foraging habitats during construction activities. See Chapter 6.6 for conservation measures and BMPs that would be implemented to avoid and minimize impacts.

Construction may overlap the nesting season for all 16 migratory birds potentially found in the project area, which could lead to nest abandonment and the loss of eggs or young. While it is difficult to quantify this impact, it is expected to be minimal given the project's limited scope (259.1 acres of permanent surface disturbance; 64 acres temporary disturbance) and the availability of abundant and adjacent alternative habitats. If construction occurs during the extended migratory bird breeding season (generally January 1 to August 31), site-specific surveys would be conducted within 5 days prior to any vegetation removal. Should active or occupied nests be found, buffer

zones would be established in consultation with the USFWS and UDWR. Nests containing eggs or young would remain undisturbed until fledglings have left, and follow-up surveys by a qualified, NRCS-approved biologist would confirm fledging before construction resumes in that area.

Similarly, the development and use of the three borrow pit sites are expected to have minor impacts on migratory birds. Birds may be displaced due to ongoing activity at these sites during the 15-month construction period or through long-term use. However, there is sufficient surrounding habitat to accommodate displaced birds, ensuring that the overall impact would remain localized and minor.

The long-term O&M activities for the reservoir, recreation area, and other facilities could disrupt foraging, nesting, and roosting habitats, potentially forcing birds to relocate to nearby areas. This impact is expected to be minor due to the limited extent of the disturbance and the amount of suitable habitat nearby.

Over time, the riparian vegetation surrounding the proposed reservoir is expected to provide a limited amount of additional cover and nesting opportunities for migratory birds and other wildlife. This new habitat could become a critical long-term refuge in the otherwise arid landscape of southern Utah.

5.4.2.3 Alternative 3—3,000-Acre-Foot Reservoir Alternative

Impacts under this alternative would be like those described under Alternative 2. Construction activities would cause minor, temporary effects to migratory birds, while the increased traffic and human presence at the reservoir may cause minor, permanent effects to migratory birds. The creation of the riparian area surrounding the reservoir would provide permanent, beneficial impacts to migratory birds through the creation of new habitat.

5.4.3 Bald and Golden Eagles

5.4.3.1 Alternative 1—No Action Alternative

Alternative 1 would have no direct or indirect impacts to bald and golden eagles.

5.4.3.2 Alternative 2—6,000-Acre-Foot Reservoir Alternative

Golden eagles have been observed foraging in and around the proposed project area. Due to the abundance of suitable foraging habitats, such as sagebrush, desert shrub, and agricultural fields, no significant loss of foraging grounds would be expected. Bald eagles pass through the area during migration and are likely to use the riparian zone of the EFVR as a winter roosting habitat. While construction activities may cause temporary disturbances to both species, the increased human presence in the area could result in longer-term disruption. However, the creation of the reservoir and surrounding riparian vegetation would offer new roosting opportunities for both bald and golden eagles.

5.4.3.3 Alternative 3—3,000-Acre-Foot Reservoir Alternative

Impacts under this alternative would be like those described under Alternative 2. Construction activities may temporarily affect bald and golden eagles; however, no significant loss of foraging grounds would occur.

5.4.4 Ecologically Critical Areas

5.4.4.1 Alternative 1

No direct or indirect impacts to designated wilderness, WSAs, or RNAs would occur under Alternative 1, as no changes to the existing environment would occur.

5.4.4.2 Alternative 2

Minor, beneficial, indirect impacts to designated wilderness, WSAs, or RNAs would occur under Alternative 2 due to the minor changes in downstream flows which would more closely align with the natural seasons (Section 5.2.1).

Water timing that is more closely aligned with the natural season would generally benefit the Parunuweap Canyon WSA, the Zion Wilderness, and the ZNP Parunuweap RNA by supporting more natural hydrologic and ecological processes along the EFVR. Seasonal flow patterns that better reflect natural runoff timing would help maintain riparian, fluvial, and aquatic habitats; sustain vegetation along the EFVR; and support moisture dependent communities within the Canyons.

5.4.4.3 Alternative 3

Similarly to Alternative 2, minor and beneficial indirect impacts to the designated wilderness, WSAs, or RNAs would occur under Alternative 3.

5.4.5 Invasive Species

5.4.5.1 Alternative 1—No Action Alternative

As no changes would take place under this alternative, no impacts involving invasive species would occur under Alternative 1.

5.4.5.2 Alternative 2—6,000-Acre-Foot Reservoir Alternative

Alternative 2 would have minor, temporary impacts due to invasive plant species during and immediately following construction. The creation of a new reservoir would potentially provide habitat for invasive animal species, such as quagga mussels. While unlikely, some species could potentially migrate from the reservoir to the EFVR. BMPs would be implemented during the construction and operational phases to prevent the spread of invasive species and comply with Executive Order 13112. During construction and until restoration areas are fully established, invasive plant species would be monitored on a regular basis to prevent the establishment. Non-desirable plant species would be controlled by cleaning equipment prior to delivery to the project site and eradicating these species before the start and during construction, as discovered. In addition, a Post Construction Rehabilitation Plan (PCRP) would be developed and would include mechanisms for addressing weed establishment and treatment. Following the completion of construction, disturbed areas would be restored to preconstructions conditions or better. The increased risk for invasion of noxious and invasive weeds is anticipated to be short term and minor. Compliance with Administrative Rule R657-60 would prevent and control the spread of any aquatic invasive species in the project area. To further reduce the potential for invasive aquatic species from entering the reservoir or the EFVR, prior to stocking the proposed reservoir with fish, a

management plan would be developed to ensure that non-native fish species do not escape from the reservoir into the EFVR. Any fish stocking would adhere to state and federal regulations and would be the responsibility of the UDWR. Cooperating Agencies would have an opportunity to review this plan prior to its implementation. Additionally, the proposed reservoir intake would include a fish screen with a 1-inch maximum pore opening to prevent fish and debris from entering the pipeline to the Orderville Hydroelectric Power Plant. The hydroelectric facility utilizes two Turgo Impulse turbines, which focus water through small nozzles at high pressure and velocity into the turbines. The combination of the small nozzle size, high velocity, and sudden pressure drop would make it highly unlikely that any fish that might make it to the pipeline would survive.

Should BMPS and the developed PCRP be implemented, no long-term adverse impacts are anticipated from the alternative actions.

5.4.5.3 Alternative 3—3,000-Acre-Foot Reservoir Alternative

This alternative would have similar direct impacts as Alternative 2, which would put the project area at risk for future invasion of invasive plant and animal species. BMPs would be implemented during construction and operational phases to prevent the spread of invasive species and comply with Executive Order 13112 (Chapter 6.6). During construction and until restoration areas are fully established, invasive plants and animals would be monitored on a regular basis to prevent the establishment. Prior to delivery to the project sites, non-desirable plant species would be controlled by cleaning equipment and eradicating these species before the start and during construction, as discovered. In addition, a PCRP would be developed and include mechanisms for addressing weed establishment and treatment. Following the completion of construction, disturbed areas would be restored to preconstructions conditions. Should BMPS and a developed PCRP be implemented no long-term adverse impacts are anticipated from alternative actions.

5.4.6 Fish and Wildlife

5.4.6.1 Alternative 1—No Action Alternative

No changes to fish and wildlife resources would occur under Alternative 1.

5.4.6.2 Alternative 2–6,000-Acre-Foot Reservoir Alternative

During the 15-month construction period, there would be an increase in noise and human activity, which is likely to drive local wildlife, including Species of Greatest Conservation Need, away from the project area. The long-term increase in human presence and activities following the development of the reservoir and adjacent recreation area could prevent some wildlife from returning. However, there is ample habitat adjacent to the project area, and both short- and long-term activities associated with Alternative 2 would cause minor impacts. The creation of a riparian zone around the reservoir would provide a small amount of new habitat for species dependent on riparian environments.

Direct, short-term impacts on the EFVR or intermittent streams would be limited to construction activities for the Glendale Irrigation Pipeline. Any temporary increase in sediment in the river would be minimal and unlikely to affect wildlife, including the Species of Greatest Conservation Need identified in Table 3.5 in Section 3.2.4.6. Species of Greatest Conservation Need (fish), including the desert sucker, flannelmouth sucker, and Virgin spinedace, are known to exist in the EFVR.

Changes in water flow from implementation of Alternative 2 would be minor, and therefore these species and their habitat would not be impacted (Refer to Section 5.2.1.2.1 for more detail).

5.4.6.3 Alternative 3—3,000-Acre-Foot Reservoir Alternative

Under Alternative 3, similar impacts to fish and wildlife species would occur as those identified in Alternative 2. Construction activities would cause temporary, minor impacts due to the increased human presence and noise. However, there is ample habitat surrounding the project area, and therefore, no long-term impacts are anticipated. Alternative 3 would also create a small riparian area surrounding the reservoir, providing additional habitat.

Species of Greatest Conservation Need may exist within the project area, and construction of the reservoir and pipelines may have temporary, minor, impacts on these species. For a full list of Species of Greatest Conservation Need that may exist in the project area, refer to Table 3.5. Species of Greatest Conservation Need (fish), including the desert sucker, flannelmouth sucker, and Virgin spinedace are known to exist in the EFVR. Changes in water flow from implementation of Alternative 3 would be minor, and therefore these species and their habitat would not be impacted (Refer to Section 5.2.1.2.1 for more detail).

5.4.7 Riparian Areas

5.4.7.1 Alternative 1—No Action Alternative

No direct or indirect effects to existing riparian areas in the study area would occur.

5.4.7.2 Alternative 2—6,000-Acre-Foot Reservoir Alternative

Alternative 2 would create additional riparian habitat surrounding the reservoir. No construction would occur in existing riparian habitats, and the seasonal changes to downstream flows could benefit existing riparian habitat surrounding the EFVR, as discussed in detail below.

5.4.7.2.1 Impacts on Riparian Vegetation

The EFVR riparian corridor is adapted to substantial natural variation in streamflow, including episodic flood events, spring runoff, and seasonal low flow periods. As described in Section 5.2.1.2.1, modeled project-related changes in flow, depth, and width would remain small relative to the river's existing natural variability, and no downstream reach of the EFVR would be dewatered as a result of the proposed project.

Reservoir operations would primarily change the timing of water availability rather than altering overall flow magnitude. Water would generally be diverted when flows are higher and released during lower-flow periods when irrigation demand and ecological water stress are greatest. Modeled summer releases would increase baseflows during the period when riparian vegetation is most vulnerable to drought stress and high evapotranspiration demand. Research indicates that increasing summer flows can support riparian vegetation (Holler, et al., 2025). Even small increases in summer flow can disproportionately improve riparian conditions by extending soil moisture availability and reducing drought stress (Stromberg, Beauchamp, Dixon, Lite, & Paradzick, 2007) (Rood, et al., 2005).

Mature overstory species, such as cottonwood and Russian olive, are generally supported by alluvial groundwater rather than direct uptake from short-term surface flows. Their deep root systems would not be affected by the minor changes in streamflow (Zimmerman, Pearce, Woodmnan, Rood, & Flanagan, 2023). Because the project would not dewater the EFVR and modeled changes in surface flow would be minor, the project is not expected to alter groundwater conditions supporting mature riparian vegetation. As a result, the project is not expected to adversely affect existing riparian overstory structure or associated habitat functions.

No new agricultural development is proposed as part of the project, and the project would not involve direct disturbance or vegetation removal within existing EFVR riparian habitat. Project effects would be limited to modeled changes in EFVR flow timing and magnitude. Because those changes would remain within the natural range of variability, would not cause dewatering, and would not decrease summer baseflows during low-flow conditions, adverse effects to riparian vegetation and riparian habitat are not anticipated.

5.4.7.3 Alternative 3—3,000-Acre-Foot Reservoir Alternative

Alternative 3 would create additional riparian habitat surrounding the reservoir. No construction would occur in existing riparian habitat, and the project would not impact downstream flows; therefore, no impacts on downstream riparian habitat would occur.

5.4.8 Ecosystem Services

5.4.8.1 Alternative 1—No Action Alternative

No changes to ecosystem services from plants and animals would occur under Alternative 1.

Provisioning Services, fishing—Alternative 1 would have no impact in aquatic habitat or species within the EFVR, and therefore, would have no impact on fishing opportunities within the EFVR.

Regulating services, Riparian zones—No impacts to riparian zones would occur under Alternative 1.

Cultural services, species conservation—Alternative 1 would have no impact on species habitat or existence.

5.4.8.2 Alternative 2—6,000-Acre-Foot Reservoir Alternative

Positive changes to ecosystem services from plants and animals would occur under Alternative 2.

Provisioning Services, fishing—Alternative 2 would have no impact in aquatic habitat or species within the EFVR, and therefore, would have no impact on fishing opportunities within the EFVR. The reservoir would provide an additional but minor sport fishing opportunity.

Regulating services, Riparian zones—The creation of riparian vegetation under Alternative 2 would positively impact the ecosystem services, as riparian vegetation provides benefits like water filtration, nutrient cycling, and wildlife habitat.

Cultural services, species conservation—Alternative 2 would have no impact on species conservation. Minor, temporary impacts may occur during construction but would not result in the loss of species existence or abundance of suitable habitat.

5.4.8.3 Alternative 3—3,000-Acre-Foot Reservoir Alternative

Positive changes to ecosystem services from plants and animals would occur under Alternative 3.

Provisioning Services, fishing—Alternative 3 would have no impact in aquatic habitat or species within the EFVR, and therefore, would have no impact on fishing opportunities within the EFVR.

Regulating services, Riparian zones—The creation of riparian vegetation under Alternative 3 would positively impact the ecosystem services, as riparian vegetation provides benefits like water filtration, nutrient cycling, and wildlife habitat.

Cultural services, species conservation—Alternative 3 would have no impact on species conservation. Minor, temporary impacts may occur during construction but would not result in the loss of species existence or abundance of suitable habitat.

5.5 Human

Refer to Section 3.2.5 for existing resources in the study area.

5.5.1 Cultural Resources and Tribal Consultation

5.5.1.1 Alternative 1—No Action Alternative

As no changes to the existing environment would occur, Alternative 1 would have no impacts on historic or cultural resources.

5.5.1.2 Alternative 2—6,000-Acre-Foot Reservoir Alternative

The three surveys of the Direct area of the APE identified 19 cultural resource sites and 19 IOs. The NRCS and SHPO concurrence on site eligibility are described in Table 3-6 in Section 3.2.5.1. Under Alternative 2, two historic ditches (Mt. Carmel East and West Ditches), both eligible for listing on the NRHP, would be converted from open ditch to buried pipe. The NRCS, in consultation with SHPO and Tribes/Tribal Historic Preservation Officers (THPOs), have determined that the conversion of the open ditch to pipe would result in an *Adverse Effect* to historic properties, per 36 CFR 800.5 (Table 5.8). An adverse effect is found when an undertaking may alter, directly or indirectly, any of the characteristics of a historic property that qualify the property for inclusion in the NRHP in a manner that would diminish the integrity of the property's location, design, setting, materials, workmanship, feeling, or association (36 CFR 800.5).

Pursuant to 36 CFR 800.5 of the NHPA (1966, as amended in 2000) and regulations of the Advisory Council on Historic Preservation (ACHP) implementing Section 106 of the NHPA (54 USC 306108), federal agencies must consider the potential effect of an undertaking on "historic properties," which refers to cultural resources listed in, or eligible for listing in, the NRHP. Consultation with SHPO, THPO, and other consulting parties including tribes to fulfill Section 106 obligations were completed. The CRIR, and subsequent addendums, were submitted to the Utah SHPO on January 9, 2020, January 23, 2023, and May 20, 2024, for concurrence with the determinations of site

eligibility and project effects. The Utah SHPO concurred in letters dated January 17, 2020, February 6, 2023, and June 2, 2024. The CRIR and addendum for the Esplin Pit were sent to THPOs and Tribal representatives on January 23, 2023, and May 22, 2024. Refer to Section 7.1.10 for a summary of NRCS consultation on the determination of effects with the SHPO, Tribes, and agencies and their received responses.

Historic properties within the Tait and Esplin Pit sites, as well as near the reservoir site, would be fenced off with buffers of at least 50 feet and avoided, and no cultural monitor would be required. Figures showing the avoidance areas within the Tait and Esplin Pit sites and reservoir site are included as Figures C-6 through C-8 in Appendix C.

The ACHP was also notified of the finding of *Adverse Effect* in an email dated March 28, 2024 (Appendix A). A letter response was received by email on April 12, 2024, stating that the ACHP does not believe their participation in the consultation to resolve adverse effects is needed per 36 CFR 800 (Appendix A).

Indirect and cumulative effects could arise from the projected increase in visitor activity at the reservoir recreation area. Visitors might access nearby private lands in search of viewpoints or other recreational opportunities. This concern was raised by a Kaibab Paiute representative, and a site visit was completed on January 25, 2019. A summary of this site visit is included in Appendix A. During this site visit, the Tait Pit was also visited due to its proximity to a cultural site. The NRCS and Kaibab Paiute discussed avoidance options. A figure of the Tait Pit avoidance locations is included in Figure C-6 in Appendix C.

On June 5, 2025, concerns about effects to the acoustic characteristics of site 42KA7537 were also raised by the Moapa Band of Paiute Indian Tribe's THPO. Consultation to address these potential effects continued throughout 2026. Voicemails were left on June 10 and June 20, 2025, and on February 12, 2026. The NRCS followed up via email on June 18, 2025, with additional background information and proposed avoidance measures, and the email was read on June 18, 2025. A third email was sent on July 15, 2025, and read by the THPO on July 15, 2025. NRCS emailed and left a voicemail for the THPO on August 24, 2026. In this email, the NRCS presented the extended avoidance measures that have been incorporated into the project to ensure acoustics coming from the site remain undisturbed, and that any noise from construction equipment reaching the site would be minimized. See Appendix A for redacted consultation and Appendix C for avoidance maps.

The redacted CRIRs can be found in Appendix E-2. Table 5.8 summarizes the effects findings and protective measures to all eligible sites in the APE.

Table 5.8. Summary of Effect Findings and Protective Measures to Eligible Cultural Sites.

Site Number	NRHP Eligibility*	Effects	Site Protective or Avoidance Measures
42KA6331	Eligible–D	No Adverse Effect to Historic Properties	Site would be avoided by at least 50 feet by all project activities. Should any future project-related activities occur within 15 meters of the site, a cultural resources monitor must be present.

Site Number	NRHP Eligibility*	Effects	Site Protective or Avoidance Measures
42KA8785	Eligible–D	No Adverse Effect to Historic Properties	Site would be avoided by at least 50 feet by all project activities. Should any future project-related activities occur within 15 meters of the site, a cultural resources monitor must be present.
42KA8904	Eligible–D	No Adverse Effect to Historic Properties	Site would be avoided by at least 50 feet by all project activities. Should any future project-related activities occur within 15 meters of the site, a cultural resources monitor must be present.
42KA8974	Eligible–D	No Adverse Effect to Historic Properties if the site is avoided	Should any future project-related activities occur within 15 meters of the site, a cultural resources monitor must be present.
42KA1157	Eligible–D	No Adverse Effect to Historic Properties	The portion of the site within the project APE is heavily disturbed by previous road construction/maintenance, plowing, livestock, and one sewer line. It has also been previously tested and is non-contributing to the overall eligibility of the site.
42KA9490	Eligible–A, C, D	Adverse Effect to Historic Properties	An inadvertent discovery plan would be prepared, as well as a Memorandum of Agreement (MOA) to mitigate the adverse effects to the site.
42KA9491	Eligible–A, D	Adverse Effect to Historic Properties	An inadvertent discovery plan would be prepared, as well as a MOA to mitigate the adverse effects to the site.
42KA7537	Eligible–D	No Adverse Effect to Historic Properties	Avoid all ground disturbing activities within 15 meters of the site boundary; a cultural monitor must be present during all ground disturbance within 15 meters of the site boundary, and avoidance flagging must be placed 15 meters from the site boundary prior to any construction activities near the site area.
42KA9789	Eligible–D	No Adverse Effect to Historic Properties	Avoid all ground disturbing activities within 15 meters of the site boundary; a cultural monitor must be present during all ground disturbance within 15 meters of the site boundary, and avoidance flagging must be placed 15 meters from the site boundary prior to any construction activities near the site area.

*See Section 3.2.5.1

Twenty-six cultural resources and nine historic structures have been identified within the partially overlapping The Direct, Indirect, and Visual sections of the project APE. Some sites overlap more than one section within the APE. Two sites are overlapped by the Direct section of the APE. Four

sites are overlapped by the Indirect section of the APE. Two sites are overlapped by both the Direct and Visual sections of the APE. And two sites are overlapped by the Indirect and Visual sections of the APE. Only one site (a prehistoric cave and lithic scatter) meets the site type criteria for inclusion in a visual impact assessment. Since it is located in the Direct section of the APE, potential impacts to this site have been analyzed, and it was determined that no effect to the site would occur as it would be avoided by project development. Therefore, project implementation would not impact the character defining characteristics of any sites that would prevent them from conveying their significance since visual components are not the character defining feature that makes sites eligible. Three historic structures within the Indirect section of the APE (Mt. Carmel School and Church; Dixon Maynard house and studio; and Steven's barn) are unlikely to be affected due to distance from the proposed reservoir, elevation, and implementation of safety features that would be implemented as part of the project (Eocene, 2025).

Per 36 CFR 800.6, the NRCS would resolve these adverse effects through the preparation and execution of a MOA. To avoid effects to cultural resources during construction, the NRCS would also prepare an inadvertent discovery plan to be supplied to construction crews. A draft MOA has been prepared by the NRCS, in consultation with the Utah SHPO, tribes, and cooperating agencies (Appendix A).

If any previously undiscovered cultural features or deposits are encountered during project activities, work must immediately stop in the affected area, and an NRCS archaeologist (and BLM or UTLA, if applicable) must be contacted and the applicable agencies post-review discovery procedures followed (Chapter 6.6 for a list of BMPs to be used to protect Cultural and Tribal resources).

5.5.1.3 Alternative 3—3,000-Acre-Foot Reservoir Alternative

Alternative 3 would implement the same proposed components, except with a smaller reservoir size than Alternative 2 and, therefore, would result in the same Adverse Effect to Historic Properties, mitigated with the execution of an associated MOA. Consultation was completed on the larger reservoir footprint, and therefore, the smaller reservoir footprint of Alternative 3 was included in that consultation. Refer to Section 5.5.1.2 for a summary of all consultations completed. Like Alternative 2, indirect and cumulative effects could arise from the increase in human activity at the reservoir site and recreation area.

5.5.2 Social Issues

5.5.2.1 Alternative 1—No Action Alternative

5.5.2.1.1 Population

Alternative 1 would have no immediate impacts on population in the study area; however, as water availability continues to decrease, community members who rely on farming and agriculture may move out of the study area, as they would eventually be unable to maintain farming operations.

5.5.2.1.2 Demographics

Alternative 1 would have no impact on demographics.

5.5.2.1.3 Employment and Income

Alternative 1 would have long-term negative impacts to employment and income. As water availability continues to decrease, farmers and agricultural water users would have to decrease crop production, which much of the population of the communities of Glendale, Orderville, and Mt. Carmel rely on for employment and income. The WCWCD projects that water demand will outstrip supply by 2060 (WCWCD, 2023; WCWCD, 2025). The WCWCD's 40-year plan submitted to the Division of Water Rights indicates that, even with water reuse, its demand is projected to outstrip supply. The 2023 WCWCD 40-year plan projects a shortage of 61,625 to 96,722 acre-feet per year by 2060, depending on the success of conservation efforts (PLPCO, 2026).

5.5.2.1.4 Housing

Alternative 1 would have no impact on housing availability or costs.

5.5.2.1.5 Economy

Alternative 1 would have long-term negative impacts to the economy in the study area, as livestock and farming consists of much of the economy for the communities of Glendale, Orderville, and Mt. Carmel. Due to the high costs of the limited amount of agricultural water in the area, the agricultural challenges currently faced by the communities would continue. If no project were to occur, the limited water is expected to decrease over time, as described in the Cove Water Model (Appendix E-1).

5.5.2.2 Alternative 2—6,000-Acre-Foot Reservoir Alternative

5.5.2.2.1 Population

Alternative 2 would have no direct impacts on population in the study area. An increase in recreation-based users would visit the area but would likely not stay long term. The proposed reservoir would indirectly provide an alternative recreation site for the increased population, as the existing recreation sites are becoming overcrowded (Section 2.2.1). The recreation area would support approximately 20 RV’s a night (Appendices E-2 and E-3).

5.5.2.2.2 Demographics

Alternative 2 would have no impact on the demographic breakdown within the project area, as all populations would be affected equally (whether negatively or positively) by the implementation of Alternative 2.

5.5.2.2.3 Employment and Income

Construction under Alternative 2 would create job opportunities for approximately 67 people, as described in the Plan of Development (Appendices E-2 and E-3). Development of the reservoir and recreation area would also provide long-term employment opportunities to the local communities. O&M activities would require regular inspection to maintain the equipment and keep the site free of debris and excessive vegetation. Approximately nine people would be needed for O&M activities. The increase in available water would support local farmers and other agricultural water users who rely on farming as their main source of income. Under Alternative 2, A yield of approximately 2,148 acre-feet could be met during each of the 54 years of record. The agricultural

fields in the study area are primarily alfalfa, which require 5 acre-feet of water per acre per growing season. Therefore, Alternative 2 would support approximately 430 additional acres per growing season. The proposed reservoir would provide needed water to Washington County for M&I uses. Studies project that demand will exceed availability in the future and that additional water sources are needed (WCWCD, 2023; WCWCD, 2025; PLPCO, 2026).

5.5.2.2.4 Housing

Housing within the inundation zone of the dam would be at an increased risk for inundation if a dam failure were to occur. A high-level review of parcel data that would be affected by a dam breach on a rainy day and sunny day are shown in Table 5.9. Up to 275 residential parcels could be impacted by a dam breach.

Table 5.9. Parcels Touching the Modeled Inundation Zones

Parcel Type	Rainy Day Count	Sunny Day Count
Vacant	393	261
Residential	275	249
Unknown	98	55
Commercial	65	60
Agricultural	32	17
Mixed Use	30	30
Other (tax exempt)	12	12
Personal	8	8
Total	913	692

5.5.2.2.5 Economy

The reservoir and its accompanying recreational facilities would attract more visitors to the area, leading to increased local spending and long-term revenue growth for businesses. Agricultural water users in Kane County would also be able to support more crops (approximately 430 additional acres) with the increased water supply, which would further increase the local economy. Additionally, releases from the reservoir would supplement energy provided by the existing Orderville hydroelectric plant during the summer months when it is normally inactive. It is anticipated that the Orderville plant would produce approximately 440,000 kilowatt hours per year resulting in an average gross revenue of $19,000.

5.5.2.3 Alternative 3—3,000-Acre-Foot Reservoir Alternative

5.5.2.3.1 Population

Alternative 3 would have no direct impacts on population. Recreation-based users visiting the area would likely increase due to implementation of the project, however they would not stay long-term. Indirectly, the proposed reservoir would provide an alternative recreation site for the

increased population, as the existing recreation sites are exceeding capacity (Section 2.2.1). The recreation area would support approximately 12 RVs a night.

The Utah Government Office of Planning and Budget estimates that the population of the Orderville and Mt. Carmel service area will increase by 26 percent by 2050. In 2023, the area reported 303 acre-feet of M&I water use to the Division of Water Rights. The two water providers in the area, Orderville and Glendale, have rights to 2,241 acre-feet per year from wells and springs. The Division of Water Rights data also indicates that none of the municipal supplies in that area depend on the EFVR, suggesting that the proposed reservoir would not benefit local municipal water providers in Long Valley (PLPCO, 2026).

5.5.2.3.2 Demographics

Alternative 3 would have no impact on demographics. Whether negative or positive, impacts from the project would impact all demographics in the study area equally.

5.5.2.3.3 Employment and Income

Construction under Alternative 3 would create job opportunities for approximately 40 people. Development of the reservoir and recreation area would also provide long-term employment opportunities for the local communities. O&M activities would require regular inspection to maintain the equipment and keep the site free of debris and excessive vegetation. Approximately nine people would be needed for O&M activities. The increase in available water would support local farmers and other agricultural water users who rely on farming as their main source of income. A yield of approximately 1,453 acre-feet could be met during each of the 54 years of record under Alternative 3. The agricultural fields in the study area are primarily alfalfa, which require 5 acre-feet of water per acre per growing season for full crop yield. However, there is insufficient water available to support the full crop yield on properties already under cultivation. Alternative 2 would provide additional water to support approximately 290 additional acres per growing season.

5.5.2.3.4 Housing

Housing within the inundation zone of the dam would be at an increased risk for inundation if a dam failure were to occur. Up to 275 residential parcels could be impacted by a dam breach.

5.5.2.3.5 Economy

The reservoir and its accompanying recreational facilities would attract more visitors to the area, leading to increased local spending and long-term revenue growth for businesses. The recreational facilities would provide an additional and needed water-based source of recreation in the area. Agricultural water users in Kane County would also be able to support more crops (approximately 290 more acres) with the increased water supply, which would further increase the local economy. Additionally, releases from the reservoir would supplement energy provided by the existing Orderville hydroelectric plant during the summer months when it is normally inactive. It is anticipated that the Orderville plant would produce approximately 300,000 kilowatt hours per year, resulting in an average gross revenue of approximately $13,000.

5.5.3 Public Health and Safety

5.5.3.1 Alternative 1—No Action Alternative

Residents in Long Valley would continue to have adverse, indirect impacts to their health and safety from the stress of water shortages, loss of income, and threat to electricity production. Additionally, unreliable water systems can drastically decrease the effectiveness of fire protection systems, posing a greater risk to public health and safety in the study area.

5.5.3.2 Alternative 2—6,000-Acre-Foot Reservoir Alternative

Under Alternative 2, short-term risks to public health and safety would occur during construction due to the increase in construction related traffic. However, BMPs to reduce impacts would be used and the increased risk would be minor.

Long-term risks to the residences within the proposed dam inundation zone would also occur. Private residences and other infrastructures, including crop fields and roads, are situated downstream of the proposed reservoir dam site and lie within the breach inundation zone (see Appendix E-1). Additionally, US-89 passes through the project area between the proposed dam site and the EFVR. The dam would be classified as a high-hazard structure to safeguard downstream infrastructure. Further detailed analyses would be conducted beyond the preliminary design phase, which would include strategies for improving downstream flood attenuation for 100- and 500-year flood events. Additional maps and information are provided in the Preliminary Design Report (Appendix E-1). However, like all dams, the risk of failure exists and would be mitigated by an Emergency Action Plan (EAP), as required by the Utah Dam Safety office. The inundation zone encompasses up to 275 residential parcels on a rainy day. If a dam breach were to occur, up to 3,893 acres would be inundated. Most of this area would be habitat surrounding the EFVR, identified as vacant parcels. A feasibility study for the proposed reservoir dam site concluded that the site is appropriate for a dam and reservoir (RB&G, 2004). Refer to Appendix E-1 for more information.

Long-term benefits to human health and safety would also occur for the agricultural water users in Long Valley and those serviced by the Hurricane Canal Company, and the M&I water users in Washington County. Improving the reliability of agricultural water supplies would help reduce economic hardship and associated public health concerns related to mental and emotional well-being for those who rely on water usage for agricultural income. Additionally, increasing water storage capacity would improve operational flexibility and support more consistent hydropower generation, thereby contributing to the overall resilience and reliability of local infrastructure that supports public safety.

The new recreation area may also provide direct, positive benefits to mental health by enhancing quality of life and offering visitors opportunities to enjoy scenic views, engage in recreational activities, and experience nature.

5.5.3.3 Alternative 3—3,000-Acre-Foot Reservoir Alternative

Under Alternative 3, short-term risks to public health and safety would occur during construction due to the increase in construction related traffic. However, BMPs to reduce impacts would be used and the increased risk would be minor.

Long-term risks to the residences within the proposed dam inundation zone (approximately 15) would also occur. Additionally, US-89 passes through the project area between the proposed dam site and the EFVR. The dam would be classified as a high-hazard structure to safeguard downstream infrastructure. Additional maps and information are provided in the Preliminary Design Report (Appendix E-1). However, like all dams, the risk of failure exists and would be mitigated by an EAP, as required by the Utah Dam Safety office. A feasibility study for the proposed reservoir dam site concluded that the site is appropriate for a dam and reservoir (RB&G, 2004)

Long-term benefits to human health and safety would also occur for the agricultural water users in Long Valley and those serviced by the Hurricane Canal Company, and the M&I water users in Washington County. Improving the reliability of agricultural water supplies would help reduce economic hardship and associated public health concerns related to mental and emotional well-being for those who rely on water usage for agricultural income. Additionally, increasing water storage capacity would improve operational flexibility and support more consistent hydropower generation, thereby contributing to the overall resilience and reliability of local infrastructure that supports public safety.

The additional recreation area may also provide direct, positive benefits to mental health by enhancing quality of life and offering visitors opportunities to enjoy scenic views, engage in recreational activities, and experience nature.

5.5.4 Scenic Beauty

5.5.4.1 Alternative 1—No Action Alternative

There would be no change to visual resources and scenic beauty under implementation of Alternative 1.

5.5.4.2 Alternative 2—6,000-Acre-Foot Reservoir Alternative

Alternative 2 would have a direct, long-term impact on scenic values. The construction of the reservoir and its associated facilities would significantly alter the visual character of the proposed project area. Currently, the landscape is arid, dominated by pinyon-juniper woodlands, sagebrush, rabbitbrush, desert forbs, and grasses. Ephemeral washes and unimproved dirt roads run through the area. The development of the reservoir would introduce a long-term transformation, converting 235 acres of dry, arid land into a water-dominated landscape. Additionally, riparian vegetation surrounding the reservoir would create a contrasting visual environment compared to the surrounding arid upland vegetation. The proposed dam, approximately 1,900 feet in length and 90 feet in height (Appendix E-1), would become a prominent new feature in the landscape. The adjacent recreation area, including a non-motorized boat ramp, campsites, and related facilities, would also result in a notable but localized change to the current landscape (4.1 acres). Other project facilities, such as pipelines, would be placed along existing roads/ROWs and would not significantly impact the visual character of the surrounding area. Even though no BLM-administered public lands are located within the project area, the BLM VRM rating system was used to determine the visual quality of the project area. A VRM study conducted for this proposed project determined the project area was a VRM Class IV which allowed for major modifications to the existing landscape character (BLM, 2026). Implementation of the Proposed Action would introduce a reservoir, dam, recreation facilities, and roads resulting in moderate, localized, and long-term visual change. Although the project would be visible in localized areas, these changes would

be consistent with the BLM VRM Class IV management intent and as they would be limited by topography and distance. Therefore, project implementation would comply with any VRM guidelines that may apply to the area. During the 15-month construction period, short-term visual impacts would occur due to the presence of construction equipment and materials. However, once construction is completed, areas not occupied by permanent structures or roads would be restored, and the temporary visual impacts would not result in a lasting or significant change to the overall landscape. Refer to the VRM in Appendix E-1 for more detail.

5.5.4.3 Alternative 3—3,000-Acre-Foot Reservoir Alternative

Alternative 3 would have a direct, long-term impact on scenic values. The reservoir and associated facilities would convert approximately 141 acres of dry, arid, land into a water dominated landscape. Additionally, riparian vegetation surrounding the reservoir would create a contrasting visual environment compared to the surrounding arid upland vegetation. The proposed dam, approximately 2,900 feet in length and 70 feet in height, would become a prominent new feature in the landscape. The adjacent recreation area, including a non-motorized boat ramp, campsites, and related facilities, would also result in a localized change to the current landscape (4.1 acres). Other project facilities, such as pipelines, would be placed along existing roads/ROWs and would not significantly impact the visual character of the surrounding area.

During the 15-month construction period, short-term visual impacts would occur due to the presence of construction equipment and materials. However, once construction is completed, the temporary visual impacts would not result in a lasting or significant change to the overall landscape.

5.5.5 Significant Scientific Resources

5.5.5.1 Alternative 1—No Action Alternative

Under Alternative 1, no impacts to paleontological or other significant scientific resources would occur.

5.5.5.2 Alternative 2—6,000-Acre-Foot Reservoir Alternative

Eocene paleontologists conducted a desktop review and subsequent paleontological field surveys for the EFVR Watershed Project. The desktop review identified PFYC 1–5 and Unknown potential geologic units within the project area. In coordination with the UGS and NRCS, it was determined that PFYC 4 to 5 (high to very high potential) units would be surveyed. The survey area included the Tropic Shale Formation (PFYC 4) and Naturita Formation (PFYC 5). A locality search was conducted with the UGS and there were no previously known paleontological localities within the project area, but there were known localities within 2 miles. Surveys were completed in the Tropic Shale Formation on November 21 and 22, 2024 and the Naturita Formation on February 10, 2025. While mapped within the Tait Pit area, there did not seem to be bedrock of the Naturita Formation present in the project area during the field survey. The paleontological survey documented 12 new localities in the survey area consisting of clams, oysters, gastropods, ammonites, petrified wood, and invertebrate burrows. These are all common invertebrates and plant fossils that are not considered scientifically significant. From what was observed during the field survey, no impacts to scientifically significant paleontological resources would occur from this project, but there is always the potential for underground paleontological resources to be unearthed during ground disturbing activities. If construction for the Mt. Carmel irrigation improvements stay within

previously disturbed areas, paleontological monitoring is not needed. If new disturbance is required outside of these boundaries, a paleontological monitor would be present. A preconstruction paleontological training course would occur prior to any construction activities within these areas.

5.5.5.3 Alternative 3—3,000-Acre-Foot Reservoir Alternative

Alternative 3 would implement the same proposed components, apart from the smaller reservoir size as Alternative 2, and therefore, would not result in any impacts to scientifically significant paleontological resources, as described in Section 5.5.5.2. Similarly to Alternative 2, the potential to unearth underground paleontological resources during ground disturbing activities exist, and therefore a paleontological monitor would present during ground disturbing activities in the Tropic Shale Formation and Naturita Formation. A preconstruction paleontological training course would occur prior to any construction activities within these areas.

5.5.6 Land Use

5.5.6.1 Alternative 1—No Action Alternative

There would be no change to land use under Alternative 1.

5.5.6.2 Alternative 2—6,000-Acre-Foot Reservoir Alternative

There would be no effect on land use designations under the implementation of Alternative 2, as the project would not affect how land use types are classified in Kane or Washington Counties. KCWCD is in the process of purchasing additional land, and property ownership for the properties downstream of the dam may occur, but there would be no change in downstream land use types. There would be minor, long-term changes to land use in the project footprint due to the development of the reservoir, dam embankment, recreation area, and access roads. Approximately 253.4 acres of undeveloped land would become developed.

5.5.6.3 Alternative 3—3,000-Acre-Foot Reservoir Alternative

There would be no effect on land use designations under implementation of Alternative 3, as the project would not affect how land use types are classified in Kane or Washington Counties. KCWCD is in the process of purchasing additional land, and property ownership for the properties downstream of the dam may occur; however, there would be no changes to downstream land use types. Alternative 3 would result in minor, long-term changes to land use in the project footprint due to the development of the reservoir, dam embankment, recreation area, and access roads. Approximately 159.6 acres of undeveloped land would become developed.

5.5.7 Ecosystem Services

5.5.7.1 Alternative 1—No Action Alternative

Cultural Services, non-material benefits—These include mental health, spiritual enrichment, aesthetic experiences, recreation, sense of place, heritage, and development. Alternative 1 would have negative impacts on mental health and recreation due to missed opportunities, such as the lack of an additional recreation opportunity, as they relate to ecosystem services as described in detail in Sections 5.5.2 and 5.5.3.

5.5.7.2 Alternative 2—6,000-Acre-Foot Alternative

Cultural Services, non-material benefits—Alternative 2 would benefit non-material ecosystem services such as mental health, aesthetic experiences, and recreation. The increase in available water would support the mental health of agricultural farmers in the Long Valley area who rely on agriculture for income. The reservoir and recreation area would provide a scenic landscape and recreation opportunities (fishing, boating, swimming) for visitors and residents to enjoy.

5.5.7.3 Alternative 3—3,000-Acre-Foot Alternative

Cultural Services, non-material benefits—Alternative 3 would benefit non-material ecosystem services such as mental health, aesthetic experiences, and recreation. The increase in available water would support the mental health of agricultural farmers in the Long Valley area who rely on agriculture for income. The reservoir and recreation area would provide a scenic landscape and recreation opportunities (fishing, boating, swimming) for visitors and residents to enjoy.

5.6 Cumulative Effects

A list of known past, present, or reasonably foreseeable future actions in the vicinity of the project area is provided below.

Cumulative effects result from "the incremental impact of an action when added to other past, present, or reasonably foreseeable actions regardless of what agency (federal or non-federal) or person undertakes such other actions" (7 CFR 650). This chapter of the Plan-EIS evaluates potential impacts to the environment that may result from implementation of the proposed project when added to other past, present, and reasonably foreseeable future actions. The following projects in the area are currently occurring or have recently been completed and may result in cumulative effects when combined with the proposed project.

5.6.1 Past and Present Actions

5.6.1.1 Lake Powell Pipeline

The proposed Lake Powell Pipeline would transport water through an approximately 140-mile-long, buried pipeline from Lake Powell to Washington and Kane counties, Utah. At full capacity, the project would deliver 82,249 acre-feet of water per year to Washington County. While not directly connected to the proposed Cove Reservoir project, the pipeline construction could result in an increased demand for materials, fuel, and labor. However, due to delays in projected development it is unlikely that the Lake Powell Pipeline would be constructed at the same time as the proposed Cove Reservoir; therefore, competition for materials, fuel, and labor would not occur.

5.6.1.2 US-89 Rehabilitation Project from Mt. Carmel Junction to Glendale, Utah

This project involved maintenance of bridge structures and a new layer of asphalt and road shoulder improvement on approximately 8.6 miles of US-89 roads. New curbs and gutters were installed in Orderville, and new sidewalks and pedestrian ramps were installed in Glendale. These activities resulted in improved highway conditions and safety for residents. The improved highway would increase traffic efficiency during project development. The features installed in Orderville and Glendale would increase safety conditions. The need for materials for the proposed reservoir would be additive to those used for this project.

5.6.1.3 Jackson Flat Reservoir near Kanab, Utah

The Jackson Flat Reservoir was completed in 2012. Its purpose was, like that of the proposed Cove Reservoir, to provide additional irrigation and agriculture water for agricultural users in the Kanab area and local recreation opportunities. The existing Jackson Flat Reservoir is a 4,228-acre-foot reservoir located near Kanab in Kane County, Utah.

5.6.1.4 Local Population Growth

Continued future growth has been projected for southern Utah, especially for portions of Washington County in the study area. Population growth in Kane County is also expected to continue to grow at a slower rate. No direct cumulative impact from construction and use of the proposed reservoir is anticipated. Recreation-based visitors would likely increase due to implementation of the proposed project; however, they would not stay long-term. Indirectly, the proposed reservoir would provide an alternative recreation site for the projected increased population, as existing sites are becoming overcrowded as described in Section 2.2.1.

5.6.1.5 Other Tourism-Related Projects

Construction of the proposed Cove Reservoir would result in an additional recreation site for western Kane County. Kane County's economy largely depends on the tourism brought in by the national and state parks in the area, many of which are often at or exceed visitor capacity. For example, the nearby Coral Pink Sand Dunes State Park recorded over 279,979 visitors in Fiscal Year (FY) 2024, representing a 303 percent increase from the 69,553 visitors in 2014 (State of Utah, 2024). Development of sites such as the existing Jackson Flat Reservoir and the proposed Cove Reservoir would provide additional areas for visitors to visit and enjoy. These tourists would also likely purchase local goods and services, thus benefiting the local economy even further.

5.6.1.6 Borrow Pit Use

Three borrow pits could be used to provide gravel and riprap for the proposed project. All sites are existing private pits. These pits would continue to be used for the long term on other local projects not associated with the proposed reservoir. Impacts associated with the use of these pits on other projects (including dust, loss of native vegetation, increased traffic, etc.) would be cumulative to those that would result from the extraction of gravel and riprap for the proposed project. The Esplin and Tait pits contain cultural resources that are eligible on the NRHP. These areas of the borrow pits would not be used for this project; however, the continued use of these pits for borrow material for future projects would risk destroying these cultural sites. Embankment material would be taken from within the reservoir basin.

5.6.2 Cumulative Effects Summary

5.6.2.1 Alternative 1—No Action Alternative

Implementation of Alternative 1 would not result in any cumulative effects to natural or human resources above those currently occurring within the project area, as previously described. Several actions would continue to occur under Alternative 1. Local water users would continue to experience shortages during summer months. As a result, agriculture production would continue to decrease. An additional recreation area would not be constructed, and potential users would

need to continue to look to other areas for water-based recreation and camping opportunities. This may result in a cumulative recreation demand in nearby areas, such as the existing Jackson Flat Reservoir. The potential for the proposed reservoir to capture flash floodwater and sediment also would not be realized. As a result, intermittent increases in flows and sediment load in the EFVR would continue.

5.6.2.2 Alternative 2—6,000-Acre-Foot Reservoir Alternative

Eight resources would most likely experience cumulative effects from the totality of the reasonably foreseeable actions discussed here. Impacts resulting from the proposed Cove Reservoir project would be cumulative to these projects.

5.6.2.2.1 Soils

The implementation of Alternative 2 would result in an increase in soil disturbance. As a result, the potential for an undetermined, but likely minor, amount of soil loss would occur. The proposed Cove Reservoir project would contribute an additional approximately 259.1 acres of surface disturbance to the cumulative total of disturbance currently occurring or projected to occur in western Kane County.

5.6.2.2.2 Water Resources

The existing Jackson Flat Reservoir provides irrigation water for agricultural use near Kanab while the proposed Cove Reservoir would provide additional water for local irrigation and agriculture water use in the Orderville, Mt. Carmel and in Hurricane area. Shortages in water availability during summer months is a common occurrence in Kane County and the two reservoirs, while not connected, would provide a needed and reliable source of water for local agricultural water users.

5.6.2.2.3 Air Quality

Emissions resulting from construction of the proposed project would be cumulative to other activities currently affecting air quality in southern Utah. Substantial future growth has been projected for this area, especially in Washington County, which is located immediately west of Kane County. Emissions from outside sources could continue to increase and affect the air quality of Kane County. Work during the 15-month construction period would be cumulative to these existing sources.

5.6.2.2.4 Migratory Birds

Migratory birds would be affected by the loss of habitat through clearing of vegetation and noise due to construction activities associated with the proposed project activities previously described. If these actions occur during the nesting season, some nest abandonment is expected. This disturbance would be cumulative to activities currently occurring or those that may occur in the foreseeable future. New migratory bird habitat would result from the development of riparian areas surrounding the new reservoirs.

5.6.2.2.5 Invasive Species

Invasive and noxious weeds are an ongoing resource management concern in Kane County. The disturbance of approximately 259.1 acres resulting from implementation of the Cove Reservoir

project would contribute to number of disturbed acres being potentially susceptible to invasive and noxious weed establishment. Once established, these species become difficult to eradicate.

5.6.2.2.6 Cultural Resources

Cultural resources are widespread in this portion of Kane County. The use of the existing Jackson Flat Reservoir and the proposed reservoir would bring additional recreational sites to the county and potentially expose cultural resources to vandalism and looting. Over time, this could result in a loss of cultural knowledge and context. Any potential losses that would result from the proposed Cove Reservoir project would be cumulative to those resulting from other recreation-related projects in the area.

5.6.2.2.7 Social Issues

Project developments in western Kane County would result in additional workers and visitors frequenting the area. The economies of local towns, such as Glendale, Orderville, Mt. Carmel, Mount Carmel Junction, and Kanab, would benefit from increased purchasing of services and goods. The existing Jackson Flat Reservoir near Kanab, Utah is currently experiencing approximately 1,200 visitors per month. Visitation at the proposed Cove Reservoir could approach that number. Some of these visitors would purchase goods and services in the local communities. These purchases would be cumulative to those from other recreation sites in the region.

The cumulative demand for materials, such as gravel and riprap, could contribute to increased prices for these materials, resulting in projects becoming more expensive to complete. The need to open new areas to access these materials would increase. Opening new areas would result in increased traffic on local highways and roads, resulting in occasional traffic congestion and increased repair needs.

Use of the existing Jackson Flat Reservoir and proposed Cove Reservoir would provide much needed, additional recreation opportunities for western Kane County. Current recreation sites in the county consistently reach or exceed capacity, especially during the summer months. These sites would provide important water-based recreation opportunities.

5.6.2.2.8 Scenic Beauty

The presence of the proposed Cove Reservoir and associated facilities would contribute to a visual alteration of the landscape, changing it from an upland, semi-desert to a water-based landscape. This landscape change would be cumulative to the existing water-based landscape at the Jackson Flat Reservoir located near Kanab, Utah.

As vegetation and borrow materials are removed, the use of the three borrow pits would result in visual resource changes up to 5.7 acres, altering the local landscape.

5.6.2.3 Alternative 3—3,000-Acre-Foot Reservoir Alternative

Alternative 3 would have similar cumulative impacts to Alternative 2, at a smaller scale. Many of the construction related impacts would be lessened under Alternative 3 due to the smaller scale of the project; however, the benefits to increased water would also be lessened with a smaller yearly production (approximately 48 percent less water). The smaller reservoir would also provide less

opportunity for recreation, with half the number of RV sites and a smaller surface area (122 acres versus 187 acres) available for water-based activities.

5.7 Summary and Comparison of Alternative Plans

The alternatives proposed for consideration and analyzed in detail in this Plan-EIS have been compared against each other to discern the merits and disadvantages of each alternative. This includes a side-by-side comparison of environmental, social, and economic effects.

Alternatives were compared to select one alternative that best maximized public benefits (environmental, economic, and social goals) with appropriate consideration of costs, guiding principles, the federal objective, PL 83-566 general purposes, and ecosystem services. This alternative is known as the NRCS NEE Alternative. Based on the performed alternative analysis, the NEE Alternative for the project was determined to be the 6,000-Acre-Foot Reservoir Alternative. A PR&G Analysis was completed in support of decision-making for the NEE Alternative and is included in Appendix E-1.

5.7.1 Evaluation of Alternatives through the Planning Process

Table 5.10 compares the alternatives on how well they resolve the problems identified, performance against the project objectives, their constraints, and evaluation criteria of completeness, acceptability, efficiency, and effectiveness.

Table 5.10. Summary and Comparison of Alternatives.

Item or Concern	Alternative 1—No Action Alternative	Alternative 2—6,000-Acre-Foot Reservoir Alternative	Alternative 3—3,000-Acre-Foot Reservoir Alternative
Public Recreation Reservoir	-	Alternative 2 would provide 187 acres of surface area for water recreation on the reservoir.	Alternative 3 would provide 122 acres of surface area for water recreation on the reservoir.
Public Recreation Recreation Site	-	Alternative 2 would provide a non-motorized boat ramp, 2 pit toilets, a pavilion, and 20 RV sites (including a barbecue grill, table, and fire pit). No utilities would be extended to these facilities	Alternative 3 would provide a non-motorized boat ramp, a pit toilet, a pavilion, and 12 RV sites (including a barbecue grill, table, and fire pit). No utilities would be extended to these facilities
AWM Reservoir	-	The proposed reservoir would provide an additional 2,148 acre-feet of water a year	The proposed reservoir would provide an additional 1,453 acre-feet of water a year

Item or Concern	Alternative 1—No Action Alternative	Alternative 2—6,000-Acre-Foot Reservoir Alternative	Alternative 3—3,000-Acre-Foot Reservoir Alternative
M&I Water Supply Reservoir	-	The proposed reservoir would provide an additional 2,148 acre-feet of water a year	The proposed reservoir would provide an additional 1,453 acre-feet of water a year
Project Objectives Provide reliable source and long-term availability of agricultural water	Alternative 1 would not meet this project objective	Alternative 2 would provide 2,148 acre-feet of water for the 54 years evaluated	Alternative 3 would provide 1,453 acre-feet of water for the 54 years evaluated
Project Objectives Provide M&I water for Washington County	Alternative 1 would not meet this project objective	Alternative 2 would provide 2,148 acre-feet of water for the 54 years evaluated	Alternative 3 would provide 1,453 acre-feet of water for the 54 years evaluated
Project Objectives Provide a recreation opportunity for Kane County	Alternative 1 would not meet this project objective	Alternative 2 would provide a non-motorized boat ramp, pavilion, and 20 RV sites	Alternative 3 would provide a non-motorized boat ramp, pavilion, and 12 RV sites
Project Objectives Present economic prospects for the communities of Orderville, Glendale, and Mt. Carmel	Alternative 1 would not meet this project objective	Alternative 2 would support approximately 430 additional acres of farmland to support economic prospects	Alternative 3 would support approximately 290 additional acres of farmland to support economic prospects
Project Objectives Provide for maximum utilization of renewable energy for local communities	Alternative 1 would not meet this project objective	Releases of excess water and water delivered to WCWCD would supplement the energy provided by the existing Orderville hydroelectric plant	Releases of excess water and water delivered to WCWCD would supplement the energy provided by the existing Orderville hydroelectric plant

Item or Concern	Alternative 1—No Action Alternative	Alternative 2—6,000-Acre-Foot Reservoir Alternative	Alternative 3—3,000-Acre-Foot Reservoir Alternative
Project Objectives Comply with the ZNP Water Right Settlement of 1996	Alternative 1 would not meet this project objective	Alternative 2 would meet this project objective	Alternative 3 would meet this project objective
Constraints Siting limitations	N/A	The Cove Reservoir area is suitable for development	The Cove Reservoir area is suitable for development
Constraints Public safety	N/A	Alternative 2 would put up to 275 residential parcels in the breach inundation zone of the dam	Alternative 3 would put up to 275 residential parcels in the breach inundation zone of the dam
Constraints Environmental resources	N/A	The Cove Reservoir site would not require the direct loss of existing agricultural land or residences	The Cove Reservoir site would not require the direct loss of existing agricultural land or residences
Constraints Geotech restrictions	N/A	The Cove Reservoir site does not have geological structural limitations	The Cove Reservoir site does not have geological structural limitations
Constraints Engineering Challenges	N/A	Alternative 2 would not require extensive engineering	Alternative 3 would not require extensive engineering
Constraints Economic constraints	N/A	Construction of Alternative 2 would be approximately $39,730,000	Construction of Alternative 3 would be approximately $32,345,000
Evaluation Criteria Completeness	Evaluation criteria met	Evaluation criteria met	Evaluation criteria met
Evaluation Criteria Efficiency	Evaluation criteria met	Evaluation criteria met	Evaluation criteria met
Evaluation Criteria Effectiveness	Evaluation criteria met	Evaluation criteria met	Evaluation criteria met
Evaluation Criteria Acceptability	Evaluation criteria met	Evaluation criteria met	Evaluation criteria met

Prepared: September 2026

5.7.2 Summary of Effects on Resource Concerns

A summary of effects for the resource concerns for the final array of alternatives is provided in Table 5.11. Those effects that are same across alternatives are grouped together; those that have different effects are separated. Impacts that were determined to be negligible, not measurable, or would not occur are not included in Table 5.11. Please refer to the detailed analysis in Chapters 5.1 through 5.6 for more detailed information on effects to resources.

Table 5.11. Summary and Comparison of Alternatives–Effects on Resource Concerns.

Resource Concern/Item	Alternative 1—No Action Alternative	Alternative 2—6,000-Acre-Foot Reservoir Alternative	Alternative 3—3,000-Acre-Foot Reservoir Alternative
Soil Resources	Upland erosion conditions would not change from existing conditions, and erosion would continue at the same rate it has historically occurred. Indirect long-term adverse impacts would occur from sediment deposition in the EFVR after flash flooding events.	Direct short-term impacts to erosion potential on disturbed areas during construction would occur. Impacts would be minimized through implementation of BMPs that would be installed during and after construction. The short-term impacts would be minor based on implementation of BMPs and restoration/stabilization of disturbed areas following project construction. Indirect long-term benefits are anticipated that would reduce sediment deposition in developed areas and the EFVR that are no longer exposed to flooding.	Direct short-term impacts to erosion potential on disturbed areas during construction would occur. Impacts would be minimized through implementation of BMPs that would be installed during and after construction. The short-term impacts would be minor based on implementation of BMPs and restoration/stabilization of disturbed areas following project construction. Indirect long-term benefits are anticipated that would reduce sediment deposition in developed areas and the EFVR that are no longer exposed to flooding.
Water Resources	No direct or indirect effects to water resources would occur from implementation of Alternative 1. Surface flows in the EFVR would continue to vary considerably as a response to spring runoff or intense storm events.	Alternative 2 would have direct, positive benefits on water resources by making 2,148 acre-feet of existing water available for water users in Kane and Washington County annually. Minor downstream impacts to the EFVR would occur due to changes in water timing.	Alternative 3 would have direct, positive benefits on water resources by making 1,453 acre-feet of existing water available for water users in Kane and Washington County annually. Minor downstream impacts to the EFVR would occur due to changes in water timing.
Water Quality	There would be no direct or indirect effects to water quality from implementation of Alternative 1. The existing water quality of the EFVR would not change, and the EFVR and its tributaries would continue to be designated as HQW.	Minor, direct, and negative impacts to water quality would occur during construction while crossing the EFVR; however, long-term, beneficial impacts would occur through the capturing of sediment in the reservoir during flash flooding events.	Minor, direct, and negative impacts to water quality would occur during construction while crossing the EFVR; however, long-term, beneficial impacts would occur through the capturing of sediment in the reservoir during flash flooding events.
Floodplain Management	No impacts to floodplains or floodplain management would occur.	The Action Alternatives would have long-term beneficial impacts on downstream flooding, and long-term minor impacts on floodplain management. The proposed reservoir would capture runoff produced by flash floods, thereby decreasing the amount of water and sediment entering the river and reducing potential loss of riparian vegetation. However, the proposed dam would also create a new inundation area, causing potential changes to FEMA floodplains.	The Action Alternatives would have long-term beneficial impacts on downstream flooding, and long-term minor impacts on floodplain management. The proposed reservoir would capture runoff produced by flash floods, thereby decreasing the amount of water and sediment entering the river and reducing potential loss of riparian vegetation. However, the proposed dam would also create a new inundation area, causing potential changes to FEMA floodplains.
WOTUS., Wetlands, and Special Aquatic Sites	There would be no impacts to WOTUS, wetlands, or other resource in the project area under Alternative 1.	Alternative 2 would impact approximately 0.21 acre of aquatic features and 0.17 acres of wetlands.	Alternative 3 would have the same or very similar impacts to aquatic features as Alternative 2.

Resource Concern/Item	Alternative 1—No Action Alternative	Alternative 2—6,000-Acre-Foot Reservoir Alternative	Alternative 3—3,000-Acre-Foot Reservoir Alternative
Regional Water Resource Plans	No changes to Kane County's or Washington County's Water Resource Plans would occur under Alternative 1. Both counties would continue to seek water conservation goals and practices to enhance the efficiency and reliability of the current AWM.	The Action Alternatives would comply with Regional Water Resource Plans through supporting both Kane County and Washington County's Water Resource Plans.	The Action Alternatives would comply with Regional Water Resource Plans through supporting both Kane County and Washington County's Water Resource Plans.
WSRs	There would be no direct or indirect impacts to WSRs under Alternative 1. No changes to identified WSRs would occur.	The Action Alternatives would have no impacts on the WSR values of the EFVR within ZNP, as it would also adhere to the stipulations required in the ZNP Agreement (1996). Therefore, changes in flow in the EFVR through ZNP would be minor, particularly when the natural variation of the EFVR is approximately 100 times the range of effect from proposed reservoir releases (Alpha Engineering 2025).	The Action Alternatives would have no impact on the WSR values of the EFVR within the ZNP, as it would also adhere to the stipulations required in the ZNP Agreement (1996). Therefore, changes in flow in the EFVR through ZNP would be minor, particularly when the natural variation of EFVR flows is approximately 100 times the range of effect from proposed reservoir releases (Alpha Engineering 2025).
Air Quality	There would be no change to air quality conditions.	Construction activities and the use of the borrow sites would cause minor, short-term, and direct increases in emissions concentrated around the construction site. Construction activities would not violate air quality standards, and BMPs would be implemented.	Construction activities and the use of the borrow sites would cause minor, short-term, and direct increases in emissions concentrated around the construction site. Construction activities would not violate air quality standards, and BMPs would be implemented.
Threatened and Endangered Species	No direct or indirect impacts to federally listed or candidate plant or animal species would occur.	The Action Alternatives would have **No Effect** on the WYBC, desert tortoise, Suckley's cuckoo bumble bee, Jones cycladenia, Shivwits milk-vetch, Siler's pincushion cactus, and Ute ladies'-tresses. The Action Alternatives are **Not Likely to Jeopardize the Continued Existence** of the monarch butterfly or the California condor outside of ZNP. The Action Alternatives **May Affect, but Not Likely to Adversely Affect** the California condor (within ZNP), MSO, SWFL, Virgin River chub, and woundfin. The Action Alternatives **May Affect, but Not Likely to Adversely Affect** designated critical habitat for the MSO, Virgin River chub, and woundfin. The Action Alternatives would have **No Effect** on designated critical habitat for the California condor or SWFL as none has been designated in the study area.	The Action Alternatives would have **No Effect** on the WYBC, desert tortoise, Suckley's cuckoo bumble bee, Jones cycladenia, Shivwits milk-vetch, Siler's pincushion cactus, and Ute ladies'-tresses. The Action Alternatives are **Not Likely to Jeopardize the Continued Existence** of the monarch butterfly or the California condor outside of ZNP. The Action Alternatives **May Affect, but Not Likely to Adversely Affect** the California condor (within ZNP), MSO, SWFL, Virgin River chub, and woundfin. The Action Alternatives **May Affect, but Not Likely to Adversely Affect** designated critical habitat for the MSO, Virgin River chub, and woundfin. The Action Alternatives would have **No Effect** on designated critical habitat for the California condor or SWFL as none has been designated in the study area.
Migratory Birds	Alternative 1 would have no direct or indirect impacts to migratory birds.	Construction disturbance would have minor, direct, and short-term impacts that would disturb suitable breeding/nesting or foraging habitat for migratory birds and foraging habitat for migratory birds. Conservation measures would be implemented to avoid and minimize impacts to these species and disturbed areas would be restored after construction completion. Potential impacts would be minor due to the ample surrounding habitat available. The O&M activities would have minor, beneficial, long-term impacts to migratory birds. The riparian habitat surrounding the reservoir would provide long-term habitat opportunities for migratory birds.	Construction disturbance would have minor, direct, and short-term impacts that would disturb suitable breeding/nesting or foraging habitat for migratory birds and foraging habitat for migratory birds. Conservation measures would be implemented to avoid and minimize impacts to these species and disturbed areas would be restored after construction completion. Potential impacts would be minor due to the ample surrounding habitat available. The O&M activities would have minor, beneficial, long-term impacts to migratory birds. The riparian habitat surrounding the reservoir would provide long-term habitat opportunities for migratory birds.

Resource Concern/Item	Alternative 1—No Action Alternative	Alternative 2—6,000-Acre-Foot Reservoir Alternative	Alternative 3—3,000-Acre-Foot Reservoir Alternative
Bald and Golden Eagles	Alternative 1 would have no direct or indirect impacts to bald and golden eagles.	Construction would cause temporary, minor impacts to bald and golden eagles; however, no significant loss of foraging grounds would be expected due to the availability of nearby suitable habitat. The new riparian area surrounding the reservoir would have long-term, beneficial impacts to bald and golden eagles by providing additional roosting opportunities.	Construction would cause temporary, minor impacts to bald and golden eagles; however, no significant loss of foraging grounds would be expected due to the availability of nearby suitable habitat. The new riparian area surrounding the reservoir would have long-term, beneficial impacts to bald and golden eagles by providing additional roosting opportunities.
Ecologically Critical Areas	No direct or indirect impacts to designated wilderness or WSA's would occur under Alternative 1, as no changes to the existing environment would occur.	Minor, beneficial, indirect impacts to ecologically critical areas would occur under the Action Alternatives.	Minor, beneficial, indirect impacts to ecologically critical areas would occur under the Action Alternatives.
Invasive Species	No impacts to invasive species would occur under Alternative 1, as no changes would take place under this alternative.	The Action Alternatives would have minor, temporary impacts on invasive plant species during and immediately following construction. Development of a new water source would potentially provide habitat for invasive aquatic species such as quagga mussels. However, BMPs would be implemented to prevent the spread of noxious weeds. A PCRP would be developed and include mechanisms for addressing weed establishment and treatment.	The Action Alternatives would have minor, temporary impacts to invasive plant and animal species during and immediately following construction; however, BMPs would be implemented to prevent the spread of noxious weeds. A PCRP would be developed and include mechanisms for addressing weed establishment and treatment.
Fish and Wildlife	No changes to fish and wildlife resources would occur under Alternative 1.	Construction activities would cause temporary, minor impacts to fish and wildlife species, including Species of Greatest Conservation Need, due to an increase in human presence and noise. There is ample surrounding habitat, and therefore, long-term impacts are not anticipated. The creation of the riparian area surrounding the reservoir would have beneficial, long-term impacts by providing new additional habitat for wildlife. State fish Species of Greatest Conservation Need, including the desert sucker, flannelmouth sucker, and Virgin spinedace are known to exist in the EFVR. Changes in water flow from implementation of Alternative 2 would be minor, particularly when the natural variation of EFVR flows are approximately 100 times the range of effect from proposed Cove Reservoir releases (Alpha Engineering 2025), and therefore these species and their habitat would not be impacted.	Construction activities would cause temporary, minor impacts to fish and wildlife species, including Species of Greatest Conservation Need, due to an increase in human presence and noise. There is ample surrounding habitat, and therefore, long-term impacts are not anticipated. The creation of the riparian area surrounding the reservoir would have beneficial, long-term impacts by providing new additional habitat for wildlife. State fish Species of Greatest Conservation Need, including the desert sucker, flannelmouth sucker, and Virgin spinedace are known to exist in the EFVR. Changes in water flow from implementation of Alternative 2 would be minor, particularly when the natural variation of EFVR flows are approximately 100 times the range of effect from proposed Cove Reservoir releases (Alpha Engineering 2025) and therefore these species and their habitat would not be impacted.
Riparian Areas	No direct or indirect effects to existing riparian areas in the study area would occur.	The Action Alternatives would have minor, positive impacts to riparian vegetation through the creation of additional riparian habitat. No impacts to existing riparian habitat would occur.	The Action Alternatives would have minor, positive impacts to riparian vegetation through the creation of additional riparian habitat. No impacts to existing riparian habitat would occur.
Cultural Resources and Tribal Consultation	Alternative 1 would have no impact on historic or cultural resources, as no changes to the existing environment would occur.	The Action Alternatives would result in **Adverse Effect to Historic Properties**. Indirect effects to cultural resources could also arise from the increase in human activity in the area.	The Action Alternatives would result in **Adverse Effect to Historic Properties**. Indirect effects to cultural resources could also arise from the increase in human activity in the area.

Resource Concern/Item	Alternative 1—No Action Alternative	Alternative 2—6,000-Acre-Foot Reservoir Alternative	Alternative 3—3,000-Acre-Foot Reservoir Alternative
Social Issues	Population Alternative 1 would have indirect, negative impacts on population, as farmers relocate due to the decreasing water availability. Demographics Alternative 1 would have no impact on demographics. Employment and Income Long-term, negative impacts to employment and income would occur, as water availability continues to decrease for agricultural farmers. Housing Alternative 1 would have no impact on housing. Economy Alternative 1 would have long-term, negative impacts to the economy, as water availability continues to decrease for agricultural farmers.	Population Alternative 2 would have indirect, positive benefits to the population by providing an additional needed recreation area. Demographics Alternative 2 would have no impact on demographics. Employment and Income Alternative 2 would provide 67 short-term jobs, 9 long-term jobs, and water to support 430 acres of agricultural land. Housing Direct impacts on up to 275 residential parcels would occur due to an increased risk of flooding from a dam breach. Economy Alternative 2 would have a direct, beneficial impacts on the economy by attracting more visitors and supporting an additional 430 acres of existing agricultural land.	Population Alternative 3 would have indirect, positive benefits to the population by providing an additional needed recreation area. Demographics Alternative 3 would have no impact on demographics. Employment and Income Alternative 3 would provide 40 short-term jobs, 9 long-term jobs, and water to support 290 acres of agricultural land. Housing Direct impacts on up to 275 residential parcels would occur due to an increased risk of flooding from a dam breach. Economy Alternative 3 would have direct, beneficial impacts on the economy by attracting more visitors and supporting 290 acres of agricultural land.
Public Health and Safety	Adverse, indirect impacts to public health and safety would occur from the stress of water shortages, loss of income, and threat to electricity production.	Short-term, minor risks to public health and safety would occur during construction due to an increase in traffic. Long-term risks to approximately 10 to 15 people would occur with properties in the new inundation zone of the dam. Long-term benefits to public health and safety include the reduction of stress from reliable water and the increased effectiveness of the fire suppression systems.	Short-term, minor risks to public health and safety would occur during construction due to an increase in traffic. Long-term risks to approximately 10 to 15 people would occur with properties in the new inundation zone of the dam. Long-term benefits to public health and safety include the reduction of stress from reliable water and the increased effectiveness of the fire suppression systems.
Scenic Beauty	There would be no change to visual resources and scenic beauty under Alternative 1.	Short-term visual impacts would occur from the presence of construction equipment. Direct, long-term impacts to scenic values would occur from the conversion of 235 acres of arid land to a reservoir.	Short-term visual impacts would occur from the presence of construction equipment. Direct, long-term impacts to scenic values would occur from the conversion of 141 acres of land to a reservoir.
Significant Scientific Resources	Under Alternative 1, no impacts to paleontological or other significant scientific resources would occur.	No impacts to significant paleontological resources are expected. A paleontological monitor would be present during new surface disturbing activities associated with the Mt. Carmel irrigation improvements. Preconstruction paleontological training with the construction contractor would occur prior to construction.	No impacts to significant paleontological resources are expected. A paleontological monitor would be present during new surface-disturbing activities associated with the Mt. Carmel irrigation improvements. Preconstruction paleontological training with the construction contractor would occur prior to construction.
Land Use	There would be no change to land use for this alternative.	Approximately 253.4 acres of land would be converted from undeveloped to developed resulting in minor, long-term impacts to land use within the project area.	Approximately 159.6 acres of land would be converted from undeveloped to developed resulting in minor, long-term impacts to land use within the project area.

5.7.3 Ecosystem Services Tradeoff

A comparison of ecosystem services covering long-term effects was performed for the final array of alternatives and is provided in Table 5.12. Ecosystem service effects overlap with the resource concerns effects. Refer to Table 3.2 of Chapter 3.1 for information on overlapping resource concerns used in determination of ecosystem service effects. Refer to Chapters 5.1 through 5.5 for detailed effects to resource concerns that include ecosystem services.

Table 5.12. Summary and Comparison of Alternatives - Ecosystem Services Tradeoff.

Resource Concern/Item	Alternative 1—No Action Alternative	Alternative 2—6,000-Acre-Foot Reservoir Alternative	Alternative 3—3,000-Acre-Foot Reservoir Alternative
Locally Preferred Alternative*	-	X	-
Non-structural Alternative*	X	-	-
Environmentally Preferred Alternative*	X	-	-
Maximum Net Monetized Benefits Plan Alternative*	-	X	-
Socially Preferred Alternative*		X	
Preferred Alternative (Maximum Net public benefits identified through tradeoff analysis)*	-	X	-
Healthy and Resilient Ecosystems	Alternative 1 would protect the functions of ecosystems by providing no change to current conditions	Alternatives 2 and 3 would protect and restore the functions of ecosystems by allowing water timing delivery to more naturally match the ecological needs of the seasons by storing water in the winter and releasing water in the summer	Alternatives 2 and 3 would protect and restore the functions of ecosystems by allowing water timing delivery to more naturally match the ecological needs of the seasons by storing water in the winter and releasing water in the summer
Sustainable Economic Development	Alternative 1 would not improve the economic well-being of the nation for current and future generations because agricultural users would continue to lose income due to the current water shortage and the monetized benefits from the recreation area would not be realized.	Alternative 2 would provide the highest economic well-being of the nation for current and future generations by providing job security for local agricultural users and by providing monetized benefits from the recreation area.	Alternative 3 would not improve the economic well-being of the nation for current and future generations because the smaller reservoir size would provide less water than is needed for the agricultural users and would provide less monetized benefits than costs ass discussed in Appendix D
Floodplains	Alternative 1 would not adversely affect self-sustaining floodplain function	Alternative 2 would not adversely affect self-sustaining floodplain function	Alternative 3 would not adversely affect self-sustaining floodplain function
Public Safety	Alternative 1 would not reduce the risks to public safety as the current local agricultural water users would continue to have stress and mental health problems from the uncertainty of the water availability and its impacts on income and food security	Alternative 2 would reduce the risks to public safety by providing water storage for agriculture, reducing stress related to income uncertainty.	Alternative 3 would reduce the risks to public safety by providing water storage for agriculture, reducing stress related to income uncertainty.

Resource Concern/Item	Alternative 1—No Action Alternative	Alternative 2—6,000-Acre-Foot Reservoir Alternative	Alternative 3—3,000-Acre-Foot Reservoir Alternative
Watershed Approach	Alternative 1 would have no impact on upstream or downstream impacts	Alternative 2 recognizes the potential upstream and downstream impacts as discussed throughout the Plan-EIS	Alternative 3 recognizes the potential upstream and downstream impacts as discussed throughout the Plan-EIS
Provisioning Services Agricultural land	Agricultural land users in the project area would continue to experience water shortages during the summer months at an increasing rate.	Approximately 430 acres of land would benefit from the increased water availability provided by the reservoir.	Approximately 290 acres of land would benefit from the increased water availability provided by the reservoir.
Provisioning Services Agricultural water	Water from the EFVR would continue to provide insufficient quantities of water in the summer for agricultural lands in Kane and Washington Counties and M&I purposes in Washington County.	Alternative 2 would increase the available amount of irrigation and M&I water by approximately 2,148 afy.	Alternative 3 would increase the available amount of irrigation and M&I water by approximately 1,453afy.
Provisioning Services Fishing	Alternative 1 would have no impact on aquatic habitat or species within the EFVR and, therefore, have no impact on fishing opportunities within the EFVR.	Alternative 2 would have no impact on aquatic habitat or species within the EFVR. The reservoir would provide a new fishing opportunity.	Alternative 3 would have no impact on aquatic habitat or species within the EFVR and, therefore, no impact on fishing opportunities within the EFVR. The reservoir would provide a new fishing opportunity.
Regulating Services Water quality and quantity	No changes to temperature, turbidity, sediment, or pollutants within the EFVR would occur. Instream flow would continue to regulate water temperature, decrease bank erosion/sedimentation, and dilute potential pollutants. No additional water would be available for agricultural use in Kane and Washington Counties or recreation use in Kane County.	Alternative 2 would improve water quality in the EFVR by containing sediment within the reservoir during flash flooding events. Additional water would be made available for agricultural use in Kane and Washington Counties and recreation use in Kane county.	Alternative 3 would improve water quality in the EFVR by containing sediment within the reservoir during flash flooding events. Additional water would be made available for agricultural use in Kane and Washington Counties and recreation use in Kane county.
Regulating Services Climate Regulation	All air quality standards would be maintained at current levels. Air quality standards directly impact climate regulation, as many sources of air pollutants are also greenhouse gases.	All air quality standards would be maintained at current levels. Air quality standards directly impact climate regulation, as many sources of air pollutants are also greenhouse gases.	All air quality standards would be maintained at current levels. Air quality standards directly impact climate regulation, as many sources of air pollutants are also greenhouse gases.
Regulating Services Riparian zones	No impacts to riparian zones would occur under Alternative 1.	The creation of riparian vegetation under Alternative 2 would benefit the ecosystem services that riparian habitat provides like water filtration, nutrient cycling, and wildlife habitat.	The creation of riparian vegetation under Alternative 3 would benefit the ecosystem services that riparian habitat provides like water filtration, nutrient cycling, and wildlife habitat.
Supporting Services Wildlife habitat	The EFVR would continue to provide habitat for plants and wildlife.	Alternative 2 would continue to provide habitat for plants and wildlife within the EFVR, while providing additional habitat within the Cove Reservoir.	Alternative 3 would continue to provide habitat for plants and wildlife within the EFVR, while providing additional habitat within the Cove Reservoir.

Resource Concern/Item	Alternative 1—No Action Alternative	Alternative 2—6,000-Acre-Foot Reservoir Alternative	Alternative 3—3,000-Acre-Foot Reservoir Alternative
Supporting Services Nutrient cycling	Nutrient cycling would continue to occur as living organisms breathe in the abiotic components in the air.	Nutrient cycling would continue to occur as living organisms breathe in the abiotic components in the air.	Nutrient cycling would continue to occur as living organisms breathe in the abiotic components in the air.
Cultural Services Recreation	Water from the EFVR would continue to provide recreational opportunities to the public, including fishing, swimming, and intrinsic value from the natural scenic beauty.	Alternative 2 would have no impact on the recreational value of the EFVR while providing new recreational opportunities at the Cove Reservoir site.	Alternative 3 would have no impact on the recreational value of the EFVR while providing new recreational opportunities at the Cove Reservoir site.
Cultural Services Health	No changes in human health from air quality would occur	The use of BMPs during construction would ensure no negative impacts to human health are caused from air quality changes. The additional recreation area may provide direct, positive benefits to mental health by enhancing quality of life and offering visitors opportunities to enjoy scenic views, engage in recreational activities, and experience nature.	The use of BMPs during construction would ensure no negative impacts to human health are caused from air quality changes. The additional recreation area may provide direct, positive benefits to mental health by enhancing quality of life and offering visitors opportunities to enjoy scenic views, engage in recreational activities, and experience nature.
Cultural Services Species conservation	Alternative 1 would have no impact on species' habitat or existence.	Alternative 2 would have no impact on species conservation. Minor, temporary impacts may occur during construction but would not result in the loss of species existence or abundance of suitable habitat.	Alternative 3 would have no impact on species conservation. Minor, temporary impacts may occur during construction but would not result in the loss of species existence or abundance of suitable habitat.
Cultural Services Non-material benefits	Alternative 1 would have negative impacts on mental health and recreation as they relate to ecosystem services, as described in detail in Sections 5.5.2 and 5.5.3.	Alternative 2 would benefit non-material ecosystem services such as mental health, aesthetic experiences, and recreation, as described in detail in Sections 5.5.2 and 5.5.3.	Alternative 3 would benefit non-material ecosystem services such as mental health, aesthetic experiences, and recreation, as described in detail in Sections 5.5.2 and 5.5.3.
Economic Analysis Costs Total Project Investment	-	$39,730,000	$32,345,000

*The alternative which best meets each identified criterion is indicated by an 'X'

Prepared: September 2026

6.0 PREFERRED ALTERNATIVE

6.1 Rationale for Preferred Alternative

Alternative 2—6,000-Acre-Foot Reservoir is the Preferred Alternative based on its ability to meet the project purpose and need, meet the federal objective, and provide the most beneficial effects on environmental, social, and economic resources. While both action alternatives meet the project purpose and need and funding requirements, the Preferred Alternative is the only alternative that meets the NEE benefit-cost ratio requirements (Appendix E-1). The Preferred Alternative is the alternative that would maximize net economic benefits. Refer to Figure B-7 in Appendix B for a figure showing the benefitted areas from the Preferred Alternative. The Cooperating Agencies and project sponsors support Alternative 2 as the Preferred Alternative. Refer to Appendix E-3 for Alternatives Memo prepared by Alpha.

Although the Preferred Alternative would have minor effects on various resources, those effects would be minimized or mitigated through implementation of BMPs and other compliance measures. As a tradeoff to those effects, the Preferred Alternative would permanently enhance the efficiency and reliability of AWM in Kane and Washington County. Additionally, as analyzed in the PR&G Analysis (Appendix E-1), there would be positive economic benefits to AWM, recreation, and M&I water supply. When compared to the No Action Alternative, which considers current conditions and future environmental changes, the Preferred Alternative would provide a more reliable and sustainable source of water for agricultural and M&I needs over the long term.

The UDWRe estimates that the proposed Cove Reservoir's average net evaporation (potential evaporation minus precipitation) would be 19.7 inches per year, as opposed to Quail Creek Reservoir’s 39.0 inches and Sand Hollow’s 40.5 inches net evaporation. This makes the proposed Cove Reservoir storage an efficient site for downstream and local uses (PLPCO, 2026).

6.2 Measures to be Installed

Alternative 2 consists of constructing a 6,000-acre-foot reservoir and dam, along with principal spillway with inlet structure and auxiliary spillway with control structure, a gated inlet/outlet control structure at the upstream toe of the dam with concrete encased outlet pipe, recreational facilities, and necessary infrastructure. The dam would feature a 1,900-foot earthen embankment with a central clay core, at a maximum height of 90 feet. Two spillways would be installed: a principal spillway to route the PSH and 100-year flood events through the reservoir without the use of the auxiliary spillway, and an auxiliary spillway to route larger design storm events through the reservoir without overtopping the dam (See Section 4.2.2.1.1.2 for details). The principal spillway pipeline would be 30 inches in diameter. The auxiliary spillway would comprise a trapezoidal, earthen channel, including a concrete weir structure. The project also includes the development of a 4.1-acre recreation area with amenities such as a non-motorized boat ramp, picnic facilities, and RV sites.

To support water conveyance, two pipelines would be constructed: the Reservoir Outlet Pipeline, extending approximately 700 feet, to facilitate water transfer from an existing irrigation system, and the Glendale Irrigation Pipeline, including 1.7 miles of new pipeline to replace old infrastructure. Additionally, the Mt. Carmel Irrigation Pipeline would be developed to provide pressurized agricultural water to areas within the Mt. Carmel area and would include approximately 24,000 linear feet of piping.

Approximately 3.2 miles of access roads would be constructed or improved to ensure mobility and connectivity around the reservoir. Material for construction would be sourced from three designated borrow pits. Refer to Appendices E-2 and E-3 for details on the access road construction.

More details on construction and O&M for the Preferred Alternative are provided in Section 4.2.2.1.

The proposed reservoir would be constructed in compliance with Title 210-TR-60. TR-60 identifies minimum design criteria for dams, with the exception of low-hazard potential dams and appurtenances (USDA, 1990).

Table 6.1. Alternative 2 Measures to be Installed

Project Measures	Description
Reservoir & Dam	Construct a 6,000-acre-foot reservoir and a 1,900-foot earthen embankment dam with a central clay core, max height 90 feet.
Spillways	Install two spillways: (1) principal spillway with 30-inch pipeline for excess flow, (2) auxiliary trapezoidal earthen channel with concrete weir.
Recreation Area	Develop a 4.1-acre recreation area with non-motorized boat ramp, picnic facilities, and RV sites.
Pipelines	Construct multiple pipelines: 700-foot Reservoir Outlet Pipeline; 1.7-mile Glendale Irrigation Pipeline replacement; 24,000-foot Mt Carmel Irrigation pipeline.
Access Roads	Construct or improve 3.2 miles of access roads for connectivity.
Borrow Pits	Source construction material from three designated borrow pits.
Design Standards	Construct in compliance with title 210-TR-60 dam criteria (USDA 1990).

6.3 Irreversible or Irretrievable Commitment of Resources

NEPA requires that environmental analyses include identification of any "…irreversible and irretrievable commitments of resource which would be involved in the Preferred Alternative should it be implemented" (7 CFR 650). Such commitments pertain to situations where environmental resources are dedicated to a specific use that cannot be reversed or recovered once the action is taken. Irreversible effects mainly arise from the use or destruction of specific resources that once used for a project or purpose are an irretrievable commitment and cannot be recovered for future use (e.g., fossil fuels or minerals). Irretrievable resource commitments refer to the loss of value in a

resource that cannot be restored due to an action taken (e.g., the extinction of a threatened species or the disturbance of a cultural site).

Choosing to implement the Preferred Alternative would entail a commitment to various natural, physical, human, and financial resources. Fossil fuels, labor, and construction materials would be consumed. Furthermore, labor and natural resources would be required for the production and preparation of construction materials, which are generally not recoverable. However, these materials are not in short supply, and their use is not expected to negatively impact their continued availability for other uses. Additionally, construction would necessitate a one-time expenditure of federal and cost-share funds that would also be non-recoverable. The commitment of these resources is predicated on the expectation that residents in the local area, state, and region would benefit from the improved conditions post-construction. These anticipated benefits are generally expected to outweigh the permanent commitment of resources described as irreversible or irretrievable. Refer to figure B-7 for a figure showing the benefitted areas from the Preferred Alternative.

6.4 Areas of Controversy

Implementation of the Preferred Alternative is not expected to result in any significant issues or controversies.

During the Plan-EA process, several areas of controversy were identified by the public and have been addressed throughout this Plan-EIS. They are summarized below.

- **Concern**: Plan-EA Adequacy - A more thorough analysis is required.
    - This Plan-EIS has been developed to further analyze the potential effects of the Preferred Alternative. Updates are found throughout the document.
- **Concern**: Purpose and Need - There is no need for a reservoir.
    - A water model was completed for the Preferred Alternative that shows the lack of available water in the summer months to meet the documented needs. Reference Chapter 2.0 and the Cove Water Model in Appendix E-1 for supporting information.
- **Concern**: Recreation - Necessity of recreational opportunities.
    - Current local recreational facilities often become overcrowded with tourists. Reference Section 2.2.1 and Section 3.2.5.2.5 for supporting information.
- **Concern**: Water Rights - Concern with water right ownership.
    - The combined water rights of the Glendale, Orderville, and Mt. Carmel Irrigation Companies allows for the diversion of water year-round. Refer to the Cove Water Model for details on water rights ownerships and consumptive use history. Reference the Cove Water Model in Appendix E-1 for supporting information.

- **Concern**: Dam Safety - Downstream home and property safety.
    - The Cove Reservoir site provides the least amount of damage to downstream properties as evaluated in the alternatives analysis. KCWCD is also in the process of purchasing downstream properties to mitigate public safety impacts. These purchased properties would not be affected by any project development. Reference Chapter 4.3 and Section 5.5.3 for supporting information.
- **Concern**: Downstream Impacts.
    - A water model was completed for the Preferred Alternative which shows minor impacts to downstream river flows. Reference Chapter 5.0, the BA. and the Cove Water Model in Appendix E-1 for supporting information.
- **Concern**: Water Availability - There is not enough water available for a reservoir.
    - A water model was completed for the Preferred Alternative which shows minor impacts to EFVR flows. Reference Chapter 5.0 and the Cove Water Model in Appendix E-1 for supporting information.
- **Concern**: Borrow Pits - Sedimentation in the EFVR from driving to the borrow pits.
    - Access to the existing borrow pits would be along existing roadways and would cause minor, temporary fugitive dust and sediment deposition during construction. Reference Section 5.2.2 and the Cove Plan of Development in Appendix E-1 for supporting information.
- **Concern**: WSR Values - Concern with effects to the W&S status of the river.
    - An analysis on impacts to the wild and scenic values of the EFVR are included in Section 5.2.6.
- **Concern**: Public Values of designated wilderness, WSA, or RNAs areas.
    - No impacts to designated wilderness, WSA's, or RNAs would occur from implementation of the Preferred Alternative. Reference Section 5.4.4 for supporting information.
- **Concern**: Riparian/Ecological Values - Changes to river flow may impact the downstream ecosystem.
    - The Preferred Alternative is anticipated to have positive benefits on riparian values due to the creation of new habitat surrounding the reservoir. Reference Section 5.4.7 and the Cove Water Model in Appendix E-1 for supporting information.
- **Concern**: Economic Issues - The costs outweigh the benefits.
    - A full cost-benefit analysis was completed per the DM 9500-013 and resulted in a cost-benefit ratio of greater than 1. Reference the PR&G in Appendix E-1 for supporting information.

- **Concern**: Threatened and Endangered Species and Species of Greatest Conservation Need - Damage to the Virgin spinedace.

    - The Virgin spinedace is a State fish Species of Greatest Conservation Need with potential to occur within the ZNP portion of the project area. Changes in water flow within the EFVR would be minor, particularly when the natural variation of EFVR flows are approximately 100 times the range of effect from proposed Cove Reservoir releases (Alpha Engineering 2025), and therefore, no long-term impacts are anticipated. Reference Section 5.4.6 for supporting information.

- **Concern**: Crop Production - Alfalfa uses too much water.

    - Alfalfa is a critical rotation crop in the U.S. as a major animal feed source and has numerous environmental benefits including high water use efficiency, low chemical inputs, high resiliency, crop rotation benefits, reduction in soil erosion, and agro-ecosystem benefits. Refer to the Importance of Alfalfa Hay memo in Appendix E-3 for supporting information. Alfalfa was selected to determine the benefits for this project because of its importance as a major feed source, its economic value, and its suitability to Utah's local climate and growing season.

- **Concern**: Climate Variation - Water flow in relation to climate variation.

    - Water availability is anticipated to continue to decrease over time as climate variation occurs. The Preferred Alternative would provide a reliable source of water for agriculture and M&I benefits and would not contribute to variations in climate. Reference the Cove Water Model in Appendix E-1 for supporting information.

6.5 Permits and Compliance

The federal, state, and local permits and compliance actions described in this chapter would be required for construction of the Preferred Alternative.

6.5.1 Federal

6.5.1.1 USFWS

The project area has been evaluated for the potential occurrence of federally listed threatened, endangered, or candidate plant and animal species or their habitat. The USFWS IPaC site was accessed, and a BA has been completed for the study area (Appendices E-1 and E-2). Thirteen federally listed species were identified as potentially occurring within or near the project area. Based on the analysis conducted in the BA, a determination of **May Affect, but is Not Likely to Adversely Affect** was made for five federally listed species from implementation of the Preferred Alternative (Appendices E-1 and E-2). A determination of **No Effect** was made for the remaining federally listed species and their habitat. Finally, a determination of **May Affect, but Not Likely to Adversely Affect** was made for designated critical habitat for three species. Informal consultation for Section 7 of the ESA was completed on September 9, 2026, with a concurrence from USFWS received (Appendix A). No permits from USFWS would be required.

6.5.1.2 USACE

Under Section 404 of the CWA, a USACE permit would be required for discharge of dredge or fill materials in WOTUS, including wetlands. Consultation with the USACE has determined that a Nationwide Permit and a Utah Stream Alteration Permit would be required for this project.

6.5.1.3 NPS

As a water resources project requiring federal assistance located upstream of a designated WSR, this project must be evaluated in accordance with Section 7 of the WSRs Act, to determine if it would invade the river area or unreasonably diminish the river's scenic, recreational, fish, or wildlife values. On August 29, 2025, via email, the NPS stated that they will not be conducting a Section 7 analysis for this project (Appendix A). Coordination with the ZNP as a cooperating agency has been ongoing throughout the life of the project and is summarized in Chapter 7.0 (Consultation).

6.5.2 State of Utah

6.5.2.1 Utah Division of Water Rights and Dam Safety

Approval would be required for the final design report, construction drawings, and specifications by the Utah State Assistant Engineer.

6.5.2.2 Utah Division of Water Quality

Under Section 401 of the CWA, approval would be required from the UDWQ so that the project does not violate state water quality standards. Additionally, certification is obtained as part of the Section 404 Permit review process with USACE. Under Section 402 of the CWA, a Utah Pollutant Discharge Elimination System (UPDES) Storm Water General Permit for Construction Activities is required for construction activities that disturb more than 1.0 acre and discharge pollutants to surface waters. A Stormwater Pollution Prevention Plan (SWPPP) would be developed, including submitting an NOI to the Utah Division of Water Quality.

6.5.2.3 Utah State Historic Preservation Office

Consultation has been performed with the Utah SHPO during this Plan-EIS process, and the results are summarized in Section 7.1.10. If, during construction, previously unevaluated cultural resources are discovered, work would be stopped, the area of discovery would be given adequate protection, and the NRCS and SHPO would be notified immediately. Procedures for discoveries outlined in the cultural resources USDA NRCS State Level Agreement (NRCS Agreement No. A-8D43-15-15) would be followed (Appendix E-3).

6.5.2.4 Utah Division of Oil, Gas, and Mining

If riprap for dam and spillway construction would be obtained from a source that does not have an existing mining permit, then a mining operations permit would be required to mine the riprap.

6.5.3 Local

A Watershed Agreement and an MOU would be completed and signed by the NRCS and SLOs prior to the obligation of construction funds for the Preferred Alternative. Any additional county and local permits that would be required for this project would be obtained prior to construction.

6.6 Mitigation of Potential Effects

The following are applicant-committed mitigation and protection measures that would be implemented as part of the Preferred Alternative. Additional BMPs and Standard Operating Procedures are identified in Appendix E-3. The impact analysis in Chapter 5.0 assumes that all these measures would be fully implemented during construction and maintenance of the Preferred Alternative.

6.6.1 General Measures

- Implementation of the Preferred Alternative would comply with all applicable federal and state laws and regulations, as well as local zoning and building ordinances during all phases of the project.
- Construction activities would be limited to the smallest extent practicable within the project area.
- During construction activities, vehicle parking and material stockpiles would be located within designated staging areas.
- Construction personnel would adhere to state and NRCS fire prevention and suppression requirements; construction personnel will always have fire tools and extinguishers available.
- Disturbed areas not used as part of the reservoir dam, recreation site, road or dam infrastructure would be restored to preconstruction conditions after construction was completed.
- Borrow sites would be cleaned, recontoured, and any debris removed, per instructions of the owner.
- An Emergency Action Plan would be developed prior to construction of the Proposed Action.

6.6.2 Soil

- No ground disturbance would occur during or immediately following precipitation events or under any wet conditions that would create deep ruts.
- Upon completion of construction activities, the disturbed areas would be recontoured to:
    - Minimize erosion and compaction.
    - Restore natural ground cover.

  - Reestablish plant growth.
  - Allow natural surface drainage.

- Silt fences, straw bales, and/or other appropriate BMPs (Appendix E-3) would be used to minimize erosion of disturbed areas, as needed.

6.6.3 Water

- A SWPPP that contains erosion and sediment control/pollutant prevention BMPs would be required and implemented. The BMPs would include, but are not limited to:
  - Silt fences.
  - Fiber wattles.
  - Earth berms.
- Construction and staging areas would be assessed to determine the feasibility of appropriate sediment control BMPs to prevent entry of sediment and other contaminants into downstream drainages.
- Petroleum-based fuels and other hazardous materials (including fuel for construction machinery) would be restricted to approved, designated staging/batch plant areas to ensure that accidental spills do not enter waters.
- Federal and state water quality standards and toxic effluent standards would be implemented to minimize potential adverse effects from discharges into WOTUS.
- Fueling of vehicles and equipment would be prohibited within 100 feet of any riparian area.
- The amount of waste material would be minimized to the furthest extent possible. Any excess material would be transported to an approved landfill at the earliest opportunity.
- Additional measuring devices would be installed to record flows into and out of the Cove Reservoir. Metering devices would be installed to record flows through the existing Orderville hydroelectric power plant that will release water rights owned by the WCWCD back into the EFVR, as well as water-right shortages being delivered from the reservoir to the Mt. Carmel and Orderville irrigation companies. These meter records would also be filed annually with the Utah State Division of Water Rights.

6.6.4 Air Quality

- Water or an approved dust suppression/soil binder would be applied to areas disturbed during construction activities, as necessary, to reduce fugitive dust and to limit visual and air quality impacts.
- Adequate freeboard in all trucks transporting material would be maintained to reduce dust during transportation/handling. Additionally, watering or covering loads to reduce emissions during material transportation/handling would be used, as necessary.

- A stabilized construction entrance (track-out pad), wheel washers, and/or other similar BMPs at construction site access points would be provided to reduce track-out of site materials onto the adjacent roadway network.

- Material stockpiles would be watered, as necessary, to prevent windblown dust.

- Vegetation cover would be established in disturbed areas as soon as possible to reduce windblown dust.

- Appropriate emission control devices on all construction equipment would be required.

- Use of clean burning fuels would be required.

- Only properly operating, well-maintained, construction equipment would be used.

6.6.5 Plants and Animals

- The minimum vegetation necessary would be removed for construction or maintenance activities.

- An NRCS-approved, weed-free, native seed mix would be used where seeding is required.

- Established cottonwood trees in riparian areas would be left in place for fish and wildlife habitat.

- A detailed weed control plan would be provided by the NRCS for approval before construction.

- All equipment would be cleaned of soil, seeds, vegetation matter, and other debris prior to entering or reentering the project area to avoid any introduction of non-native plants and weeds.

- Vegetation would be monitored periodically for the potential establishment of noxious weeds.

- Use of herbicides would comply with NRCS requirements.

- A post-construction period weed control plan would be developed by KCWCD.

- Any use of herbicides would comply with all federal and state requirements.

- Prior to stocking the proposed reservoir with fish, a management plan will be developed to ensure that non-native fish species do not escape from the reservoir into the EFVR. The management plan would meet nonnative stocking and control requirements. Cooperating Agencies would have an opportunity to review this plan prior to its implementation.

- Any fish stocking would adhere to state and federal regulations and would be the responsibility of the Utah Division of Wildlife Resources.

- Any unexpected encounters with a protected species would be immediately reported to UDWR, USFWS, and NRCS.

- Coordination would be maintained with WCWCD regarding construction activities and potential impacts to downstream Virgin River habitat.

- Native milkweed (*Asclepias* spp.) and other monarch butterfly (*Danaus plexippus*) pollinator-friendly native plant species would be included in reclamation seed mixes per NRCS and USFWS guidance.

- Disturbance of any encountered milkweed habitat would be avoided to the extent possible.

- All open pits or trenches would be monitored throughout construction to prevent entrapment of wildlife.

- Excavated holes more than 2 feet deep would be covered at the close of each day or provided with one or more escape ramps. Alternatively, fencing may be erected around open pits or trenches.

- Before pits or trenches are filled, they would be inspected for trapped animals. If found, they would be moved by a qualified biologist approved by the UDWR and NRCS.

- No rodenticides would be used on the project site.

- Where possible, construction activities, including habitat alteration and noise, would be conducted outside of Utah's migratory bird primary nesting season (April 1 to July 15). In Utah, the migratory bird nesting season can extend from January 1 to August 31 (especially for raptors). Therefore, a preconstruction survey for nesting birds would be conducted by a qualified biologist approved by the UDWR and NRCS no more than 5 days prior to the beginning of on-site work. If an active nest is identified, a no-activity buffer, as approved by the UDWR and NRCS, would be established around the nest site and would remain in place until the young have fledged and/or the nest becomes non-active (USFWS 2002a). Follow-up surveys to confirm that all young have successfully fledged would be conducted by a qualified biologist prior to construction in that area.

- After such surveys are performed and disturbance occurs, no additional disturbance during the avian breeding season would occur without first conducting an additional avian survey.

- If the existing topography limits line-of-sight between an active nest and construction activities, spatial and seasonal buffers may be reduced.

- Should an active migratory bird nest be discovered, the appropriate UDWR and NRCS agency biologist would be notified, and an appropriate buffer would be established around the nest until the migratory bird nesting period is over or young have fledged.

- No mature riparian trees would be removed during construction activities unless approved by UDWR and NRCS.

- No machinery would be permitted in the EFVR except for along existing roadways.

- Refuse and trash, including stakes and flags, would be removed and properly disposed of on a regular basis.

6.6.6 Human

- To resolve adverse effects to NRHP eligible sites, an inadvertent discovery plan will be prepared and supplied to construction crews, in addition to the preparation and execution of a MOA.

- If cultural resources are discovered during construction activities, all ground disturbing activities within 50 feet of the discovery shall cease and the NRCS and/or BLM or UTLA archaeologist would be notified.

- Avoidance fencing will be installed using a 50-foot buffer around existing sites.

- If the location of any ground disturbing activities changes be beyond those previously surveyed/analyzed, a new cultural resources evaluation would be conducted, and the NRCS and/or BLM or UTLA archaeologist would be consulted.

- If human remains are discovered under any circumstances, all work in the immediate vicinity (100 feet) would immediately halt, and the Kane County Sheriff, the NRCS and/or BLM or UTLA archaeologist, and the Utah State History's Human Remains Program would be contacted. The location of the discovery would be secured and monitored to prevent further impacts, and the location would be kept confidential. The remains would be treated in accordance with the requirements of the Native American Graves Protection and Repatriation Act (25 USC 3001 et seq.) and its implementing regulations (43 CFR 10). The NRCS and/or BLM or UTLA shall consult, pursuant to 43 CFR 10.5, to develop a written plan of action to manage the discovery. After approval of the plan by the consulting parties, mitigation would proceed. Construction near the remains may need to be halted throughout the review process. Continuation of work following a discovery would be contingent upon approval by the NRCS archaeologist in consultation with the Utah SHPO, Native American Tribes, and other consulting parties. Construction at this location would not resume until NRCS and/or BLM or UTLA consultation has been completed and approval to proceed has been given.

- Construction personnel would be instructed to be observant for cultural/historic objects. Training would be conducted by a qualified archaeologist approved by the NCRS.

- Visible structures (including metal structures) would be painted or otherwise treated to not be shiny or reflective. Facilities would be of a color that blends into the surrounding landscape (no bright colors such as red, yellow, or orange would be used).

- Areas disturbed during construction activities would be restored to preconstruction conditions. This would be accomplished by grading to match natural contours and stabilizing through establishment of ground cover. These areas would be reestablished by seeding with an herbaceous plant seed mixture and revegetation with NRCS-approved plant species to match the surrounding native plant community.

- Signs would be posted in local communities regarding the schedule for construction in the project area.
- Construction haul trucks would use caution and maintain safe travel speeds and distances.
- Construction noise levels would be minimized to the extent possible with proper maintenance of construction equipment and the use of approved noise mufflers.
- All federal, state, and local laws/regulations pertaining to pollution and contamination of the environment would be followed to prevent pollution of surface water, groundwater, soil, and air with any hazardous materials.
- Construction sites, staging areas, and access roads would be kept orderly during construction.
- Refuse and trash, including stakes and flags, would be removed and properly disposed of on a regular basis.
- Portable toilets would be used on-site and maintained on a regular schedule.
- No equipment oil or fuel would be drained on the ground; oils or chemicals would be hauled to an approved site for disposal.
- Diesel fuel, hydraulic fluids, and engine oil products would be the only hazardous material liquids used on site.
- All toxic substances (e.g., oil, gas, antifreeze) would be always stored in closed containers.
- Accidental spills would be cleaned immediately.
- NRCS and other regulatory agencies would be immediately notified in the event of a fuel/oil or hazardous material spill. Actions would be taken to minimize the amount of, and spread of, the spill material including straw bale plugs, earthen berms, and the use of absorbent materials. If necessary, soil remediation would be conducted including the removal of contaminated soils to an approved facility and soil sampling to verify successful site remediation.
- The KCWCD would be responsible for compliance with applicable local, state, and federal regulations related to the use, handling, storing, transporting, and disposing of hazardous materials on non-federal lands.
- During construction, all personnel would be required to conform to contractor safety procedures.
- All personnel would be adequately trained to perform their tasks.
- Heavy equipment would be outfitted with Occupational Safety and Health Administration-required safety devices such as backup warnings and seat belts.

- Hard hats, safety boots, ear/eye protection, and other personal protective equipment would be used on-site.

- All accidents and injuries would be reported to the appropriate contractor safety officer.

- The KCWCD would work with the Southwest Utah Public Health Department and Southwest Mosquito Abatement District regarding the testing of waters or habitat areas for presence of disease vectors. The KCWCD would notify the public regarding any such concerns.

- If significant scientific resources are discovered during construction activities, all ground-disturbing activities within 100 feet of the discovery shall cease, and the project paleontologist would be notified.

- Construction personnel would be instructed to observe for fossils. Training would be conducted by the project paleontologist.

6.7 Costs and Cost-Sharing

Table 6.3 presents the total project cost of $39,730,000 for the Preferred Alternative. The PL 83-566 funds would support $24,889,000 (62.6%) of the total project cost, whereas the remaining $14,841,000 (37.4%) amount would be contributed by other, non-federal funds. Table 6.4 itemizes the costs for each project measure and the distribution of how the costs would be shared by the sponsors and NRCS for each cost item.

- Construction costs account for all material, labor, and equipment necessary for the installation of piping associated with the Preferred Alternative. These costs were estimated based on similar installations at irrigation districts in Southern Utah. The planning construction costs are estimated using the best available information about the project without having detailed design information.

- Engineering costs were estimated as a percentage of construction costs.

- The costs presented are planning level estimates and do not reflect final costs. Detailed designs and construction cost estimates would be completed prior to initiating the project. Final construction costs would only reflect the time and materials to perform the work.

6.8 Ecosystem Services Benefits

The Preferred Alternative would provide the following ecosystem services benefits:

- **Provisioning services, agricultural land**—Approximately 430 acres of land would benefit from the increased water availability provided by the reservoir.

- **Provisioning services, agricultural water**—The Preferred Alternative would increase the available amount of agricultural, and M&I water by a maximum of approximately 2,148 afy.

- **Regulating services, water quality and quantity**—The Preferred Alternative would improve water quality in the EFVR indirectly by containing sediment within the reservoir during flash flooding events.

- **Regulating services, riparian zones**—The creation of riparian vegetation under Alternative 2 would benefit the ecosystem services that riparian habitat provides like water filtration, nutrient cycling, and wildlife habitat.

- **Supporting services, wildlife habitat**—The Preferred Alternative would continue to provide habitat for plants and wildlife within the EFVR while providing additional habitat within the Cove Reservoir.

- **Cultural services, recreation**—The Preferred Alternative would provide new recreational opportunities at the Cove Reservoir site.

- **Cultural services, non-material benefits**—The Preferred Alternative would benefit non-material ecosystem services such as mental health, aesthetic experiences, and recreation.

See Chapter 5.0 for detail on ecosystem service benefits from the Preferred Alternative.

6.9 Installation and Financing

This chapter provides further details regarding installation and financing for the Preferred Alternative.

6.9.1 Installation

The Preferred Alternative would be implemented in a planned sequence as discussed in the Cove Reservoir Plan of Development (Appendices E-2 and E-3). The NRCS and sponsor responsibilities of the project are outlined in Section 6.9.2. No preconditions are anticipated for installing the project.

6.9.2 Responsibilities

The NRCS is responsible for leading the planning efforts, providing engineering design and construction oversight assistance, and certifying project completion. The KCWCD along with the WCWCD are responsible for engineering design, project administration, environmental permitting, contracting, and construction implementation. The KCWCD and WCWCD have the needed authority as water irrigation districts, governed by Utah Code 17B-2A-1002, and has agreed to exercise those authorities to implement the actions described in this Plan-EIS.

6.9.3 Contracting

The water delivery pipelines would be completed using NRCS funding mechanisms. The KCWCD and WCWCD would be primarily responsible for overseeing and administering project construction in coordination with NRCS.

6.9.4 Real Property Rights

Approximately $840,000 would be spent on real property rights, with 16 percent of funding covered by PL 83-566 and the remaining 84 percent covered by other funds. Real property acquisition or relocations would be required for the Preferred Alternative. All construction would be completed within existing ROWs or easements.

6.9.5 Financing

The NRCS would provide 62.6 percent of the total project cost for the Preferred Alternative through PL 83-566. The KCWCD along with WCWCD are responsible for the remaining 37.4 percent of the costs, including funds that are not eligible under the National Watershed Program (e.g., administration and technical assistance). Table 6.1 includes annual installation costs and the proportion of funding through PL 83-566.

The required match funding would be expected to be provided through a mix of grants, loans, and patron assessments. For financing, the project sponsor would apply for funding. The KCWCD and WCWCD do not anticipate changing per-acre annual rates or the overall base assessment fee because of any capital improvement project that is fully funded through grants.

The O&M costs after project completion would be provided through the revenues of Cove Reservoir. The O&M costs would not increase due to the project and would be budgeted on an annual basis.

The NRCS reserves the authority and right to discontinue or reduce program benefits based on changes in agency priorities, funding availability, or the failure of the irrigation districts to fulfill the provisions of their agreement.

6.10 Operation, Maintenance, and Replacement

Operation includes the administration, management, and performance of other actions needed to keep the proposed Cove Reservoir and associated facilities safe and functioning as planned. Maintenance includes performance of work, preventing deterioration, and repairing damage or replacement of structures if one or more of their components fail. Damage to any of the completed structures caused by normal deterioration, droughts, flooding, or vandalism, is considered maintenance.

Measures in this Plan-EIS would be operated and maintained by the KCWCD with technical assistance from appropriate federal, state, and local agencies in accordance with their delegated authority. A specific O&M Plan would be prepared using the NRCS National O&M Manual. The KCWCD's liability for O&M would extend throughout the actual life of the structure.

A separate O&M Agreement would be developed before construction that would provide inspections, reports, and procedures for performing the maintenance items. The agreement would include specific provisions for retention, use, and disposal of property acquired or improved with PL 83-566 assistance. The term of this new O&M Agreement would be for a period of 100 years, which is the life expectancy of the project. The overall average amortization and O&M costs after initial construction would be approximately $13,000 annually.

The structures would be inspected by the KCWCD on a regularly scheduled basis and during, or immediately following, major storms, earthquakes, or other occurrences that may adversely affect the structures and appurtenant works.

6.11 Emergency Action Plan

Due to the high-hazard classification of the proposed dam, an EAP would be developed by the sponsor and other local groups before initiating construction.

6.12 Economic Tables and Structural Tables

The installation cost estimate for the Preferred Alternative is $39,730,000 as indicated in Table 6.2 (Economic Table 1). The following economic and structural tables include information relevant to the costs and benefits that would result from the implementation of the Preferred Alternative. Total costs are rounded to the nearest $1,000.

Table 6.2. (Economic Table 1) Estimated Installation Cost—East Fork Virgin Watershed, Utah, 2026 Dollars.

Works of Improvement	Units	Number of Federal Land	Number of Non-Federal Land	Number Total	PL 83-566 Funds Federal Land (Dollars)	PL 83-566 Funds Non-Federal Land (Dollars)	PL 83-566 Funds Total (Dollars)	Other Funds Federal Land (Dollars)	Other Funds Non-Federal Land (Dollars)	Other Funds Total (Dollars)	Grand Total (Dollars)
Reservoir and Dam[1]	Cubic Yards	-	1	1	-	$20,889,301	$20,889,301	-	$13,206,200	$13,206,200	**$34,096,000**

Prepared: September 2026

The Estimated Cost Distribution (Table 6.3 Economic Table 2) shows the estimated costs to be charged to the PL 83-566 funds along with other costs. These costs include those that would be associated with the reservoir and dam, Glendale Irrigation Pipeline, Mt. Carmel Irrigation Pipeline, recreational facilities, and access roads. No cost would be associated with the Washington County portion of the project. Total costs are rounded to the nearest $1,000.

[1] Includes Dam Construction and Land Rights ($840,000)

Prepared: September 2026

Cost allocation and cost sharing summary for the Preferred Alternative are presented in Table 6.4 (Economic Table 2a). The proposed dam and associated recreation facilities are included.

[2] Includes $175,000 of PL 83-566 funds and $0 of other funds for cultural resource protection and mitigation measures.
[3] Engineering services contract cost to be borne: $4,200,000 by PL 83-566 funds and $0 by other funds.

Item	Unit	Total
Class of structure	-	High
Peak Ground acceleration	G	0.41
Uncontrolled drainage area	$Mile^2$	4.7
Controlled drainage area	$Mile^2$	0
Total drainage area	$Mile^2$	4.7
Runoff curve no. (1-day) (AMC II)	-	78
Time of concentration	Hours	1.58
Elevation top dam	Feet	5,552.0
Elevation crest auxiliary spillway	Feet	5,549.0
Elevation crest high stage inlet	Feet	5,545.5
Elevation crest low stage inlet	Feet	N/A
Auxiliary spillway type	-	Earth, trapezoidal
Auxiliary spillway bottom width	Feet	30
Auxiliary spillway exit slope	Percent	15
Maximum height of dam	Feet	90
Volume of fill	$Yard^3$	1,806,900
Total capacity[9]	Acre-feet	6,775
Sediment submerged	Acre-feet	403
Sediment aerated	Acre-feet	15
Beneficial use Irrigation	Acre-feet	4,618 (1,360 Yield)
Beneficial use M&I	Acre-feet	1,019 (300 Yield)
Beneficial use Recreation	Acre-feet	300
Floodwater retarding	Acre-feet	720
Between high and low stage	Acre-feet	n/a
Surface Area–Sediment pool[10]	Acre	39
Surface Area–Beneficial use pool Irrigation, M&I, Recreation	Acre	90
Surface Area–Floodwater retarding	Acre	201
Principal Spillway Design–Rainfall volume (1-day)	Inches	3.5
Principal Spillway Design–Rainfall volume (10-day)	Inches	6.8
Principal Spillway Design–Runoff volume (10-day)	Inches	2.9

[9] Crest of auxiliary spillway

[10] If reservoir contains beneficial storage or if sediment capacity will not store water, show area in parenthesis and footnote accordingly.

Item	Unit	Total
Principal Spillway Design–Capacity of low stage (maximum)	Cubic feet/second	N/A
Principal Spillway Design–Capacity of high stage (maximum)	Cubic feet/second	127
Principal Spillway Design–Dimensions of conduit	Feet/inch	30
Principal Spillway Design–Type of conduit	-	Concrete encased welded steel
Principal Spillway Design–Frequency operation-auxiliary spillway	Percent chance	0.2% annually
Auxiliary Spillway Hydrograph–Rainfall volume	Inches	5.8
Auxiliary Spillway Hydrograph–Runoff volume	Inches	3.4
Auxiliary Spillway Hydrograph–Storm duration	Hours	24
Auxiliary Spillway Hydrograph–Velocity of flow	Feet/second	6.5
Auxiliary Spillway Hydrograph–Max. reservoir water surface elevation	Feet	5,549.6
Freeboard Hydrograph–Rainfall volume	Inches	10.2
Freeboard Hydrograph–Runoff volume	Inches	7.4
Freeboard Hydrograph–Storm duration	Hours	72
Freeboard Hydrograph–Max. reservoir water surface elevation	Feet	5,551.8
Capacity Equivalents–Sediment volume	Inches	1.7
Capacity Equivalents–Floodwater retarding volume	Inches	2.9
Capacity Equivalents–Beneficial volume (identify use)	Inches	6.5

Prepared: September 2026

The estimated Average Annual National Economic Development Costs in Table 6.7 (Economic Table 4) are the anticipated annual costs of the Preferred Alternative facilities.

Table 6.7 (Economic Table 4). Estimated Average Preferred Alternative Annual Costs—East Fork Virgin Watershed, Utah, 2026 Dollars.[11]

Works of Improvement	Amortization of Installation Costs	O&M and Replacement Cost[12]	Other Direct Costs	Total
AWM Proportion of Reservoir and Dam	$367,999	$367	-	**$368,000**
AWM Mt. Carmel Pipeline	$95,030	-	-	**$95,000**
AWM Glendale Irrigation Pipeline	$26,158	-	-	**$26,000**

7.0 CONSULTATION, COORDINATION, AND PUBLIC PARTICIPATION

This chapter describes the coordination efforts with the public, agencies, Tribes, stakeholders, and the SLO for the proposed project. Communication with these agencies and groups has been ongoing since 2018 when early coordination was initiated by the NRCS for the project Plan-EA. Input from these agencies and organizations has been incorporated into the Plan-EIS analysis. All consultations, comments, and responses, including a Scoping Summary Report and the Cooperating Agency MOU are included in Appendix A. A summary of consultation, key action, and dates is provided in Table 7.1. A summary of consultation efforts specific to the NHPA Section 106 process is included as Table 7.2.

Table 7.1. Summary of Consultation Efforts.

Key Action	Date
USACE Cooperating Agency Plan-EA Request and Acceptance	February 12, 2018; June 7, 2018
USACE Cooperating Agency Plan-EIS Request and Acceptance	October 15, 2021; November 15, 2021
USACE Request submitted for concurrence with jurisdictional determinations	Memorandum dated July 21, 2022, and updated February 18, 2026
USACE Site Visit	September 28, 2022
USACE Agency Scoping Meeting Attendance	May 24, 2018
USACE Preliminary Aquatic Resource Report Submittal	October 2020
USACE Coordinated EFVR water flow aspects; comments addressed pre-Draft Plan-EIS	July 2026
USACE Draft 404(b)(1) Alternatives Analysis Submittal	July 11, 2025
USACE Concurrence with aquatic resources' delineation for the Project area.	Memorandum dated April 23, 2026
USFWS Cooperating Agency Plan-EA Request (no response received)	February 12, 2018; no response
USFWS Cooperating Agency Plan-EIS Request (no response received)	October 15, 2021; no response
USFWS Informal consultation initiated	February 2018
USFWS Initial IPaC list received	2018

Key Action	Date
USFWS Threatened, endangered and migratory species letter from the USFWS	December 13, 2018
USFWS Meeting between USFWS, NRCS, and Eocene to discuss potential effects	April 2019
USFWS Biological Evaluation for Plan-EA	February 2020
USFWS IPaC list updated	July 2022
USFWS Site visit	September 28, 2022
USFWS BA for Plan-EIS submitted (Informal Section 7 Consultation)	September 3, 2026
USFWS Concurrence with BA Determinations Issued	September 9, 2026
WCWCD Cooperating Agency Plan-EA Request and Acceptance	February 4, 2019; February 8, 2019 (MOU)
WCWCD Cooperating Agency Plan-EIS Request and Acceptance	January 27, 2022; August 16, 2022 (MOU)
WCWCD Site visit	September 28, 2022
WCWCD Coordinated EFVR water flow aspects; comments addressed pre-Draft Plan-EIS	July 2026
EPA Cooperating Agency Plan-EIS Request and Acceptance	October 15, 2021; October 29, 2021
EPA Site visit	September 28, 2022
EPA Comments addressed pre-Draft Plan-EIS issuance	July 2026
BLM Cooperating Agency Plan-EA Request and Acceptance	February 11, 2019; February 27, 2019 (MOU)
BLM Cooperating Agency Plan-EIS Request and Acceptance	October 15, 2021; August 16, 2022 (MOU)
BLM Site visit	September 28, 2022
BLM Interdisciplinary Team Analysis Record Checklist prepared	September 24, 2019

Key Action	Date
BLM Borrow site evaluation completed for Plan-EA; removed for Plan-EIS	2019 through 2024
NPS Cooperating Agency Plan-EA Request and Acceptance	February 12, 2019; February 12, 2019 (MOU)
NPS Cooperating Agency Plan-EIS Request and Acceptance	October 15, 2021; April 18, 2022 (MOU)
NPS Site visit	September 28, 2022
NPS Comments addressed pre-Draft Plan-EIS issuance	July 2026
NPS Cooperating Agency Coordination	Ongoing
USFS Cooperating Agency Plan-EIS Request (no response received)	October 15, 2021; no response
USFS Coordination throughout planning	Ongoing
PLPCO Cooperating Agency Plan-EIS Requests and Acceptance	October 20, 2021, and February 2, 2022; April 18, 2022 (MOU)
PLPCO Site visit	September 28, 2022
PLPCO Comments addressed pre-Draft Plan-EIS issuance	July 2026
UTLA Cooperating Agency Plan-EIS Request and Acceptance	October 15, 2021; October 25, 2021
UTLA Site visit	September 28, 2022
UTLA Comments addressed pre-Draft Plan-EIS issuance	July 2026

7.1 Consultation

7.1.1 U.S. Army Corp of Engineers

The NRCS sent a formal request to be a Cooperating Agency for the project Plan-EA to the USACE on February 12, 2018 (Appendix A). The agency accepted Cooperating Agency status on the project Plan-EA in a letter dated June 7, 2018 (Appendix A).

A formal request to be a Cooperating Agency for the project Plan-EIS was sent on October 15, 2021 (Appendix A). The USACE accepted Cooperating Agency status in a letter dated November 15, 2021 (Appendix A). This letter also requested consultation on the study area for the purposes of Section 106 and Section 7 determination. USACE was provided with an opportunity to conduct a site visit on September 28, 2022, along with NRCS project staff, KCWCD, project consultants,

and other cooperating agencies. Resource concerns, project purpose and need, alternatives for detailed study, and selection of the Preferred Alternative were coordinated with input and approval from the USACE. The USACE was provided with copies of the preliminary Plan-EIS for review prior to the issuance of the Draft Plan-EIS to the public. The USACE's report comments or concerns were addressed prior to the issuance of the Draft Plan-EIS to the public.

The USACE representatives attended the agency scoping meeting held on May 24, 2018, in Kanab, Utah. The agency indicated the presence of intermittent and ephemeral streams within the footprint of the proposed project, which likely holds jurisdictional status as WOTUS. Eocene confirmed this finding during a desktop and subsequent field study conducted in fall 2018 to delineate all potential WOTUS. Following the completion of field studies, Eocene and the NRCS personnel attended a meeting at the USACE Bountiful Field Office on November 15, 2018, with USACE to discuss the preliminary findings and to inquire about expected permitting and reporting requirements. Following agency guidance and using all data gathered, Eocene wetland specialists developed a Preliminary Aquatic Resource Delineation Report (Appendix E-1). The NRCS submitted the report to the USACE Bountiful Field Office in October 2020.

It is anticipated that a Nationwide Permit would be required for potential impacts that could occur to jurisdictional features which traverse the project area. A revised version of the Aquatic Resource Delineation Report with updated determinations of impacts was submitted to the USACE on July 3, 2025, and a request for an Approved Jurisdictional Determination was submitted on August 21, 2025. Consultation with the USACE for the Nationwide Permit and Approved Jurisdictional Determination is ongoing.

Under Section 404 of the CWA, the USACE must identify the Least Environmentally Damaging Practicable Alternative which represents the alternative with the least adverse impact on the aquatic ecosystem, while still fulfilling the project Purpose and Need. A Draft 404(b)(1) Alternatives Analysis was submitted to the USACE on July 11, 2025. The USACE responded August 13, 2025, stating that no additional detailed alternatives analysis would be necessary for the project. This email is included in Appendix A.

USACE has concurred with the aquatic resources' delineation made for the project area and has verified that the location and boundaries of wetlands were delineated consistent with agency manuals and guidance (See Section 4.2.2.4 WOTUS, Wetlands, ad Special Aquatic Sites).

7.1.2 U.S. Fish and Wildlife Service

The NRCS sent a formal request to be a Cooperating Agency to USFWS on February 12, 2018, for the project Plan-EA (Appendix A), and October 15, 2021 (Appendix A), for the project Plan-EIS, but no responses were received. Informal consultation with USFWS was initiated in February 2018 for the Plan-EA. On December 13, 2018, the USFWS submitted a letter regarding the project containing a list of threatened and endangered species and migratory bird species that may occur in the project area or may be affected by the implementation of the project (USFWS, 2018a). This letter confirmed the findings of a desktop review previously conducted using the USFWS IPaC web site (USFWS, 2018b). As part of continuing consultation efforts, an updated IPaC list was accessed in July 2022. In April 2019, a follow-up meeting between USFWS, NRCS, and Eocene biologists provided additional information regarding potential impacts to federally listed species within and downstream of the project area. Using this information, a Biological Evaluation was compiled to support the analysis for the project Plan-EA in February 2020. This information has been included

in Chapter 3.0 of the Plan-EIS, refer to Section 3.2.4 and Chapter 5.4 for a detailed analysis. The USFWS was provided with an opportunity to conduct a site visit on September 28, 2022, along with NRCS project staff, KCWCD, project consultants, and other cooperating agencies.

Section 7 consultation under the ESA has continued during Plan-EA and Plan-EIS development. A letter dated June 26, 2025, containing a list of threatened and endangered species that may occur in the proposed project area was submitted to the team preparing the Plan-EIS. The data contained in this letter has formed the basis of the development of the project BA. The BA was completed for the project Plan-EIS and was submitted for informal consultation to the USFWS in compliance with Section 7 of the ESA on September 3, 2026, with concurrence received in a letter signed September 9, 2026 (Appendix A).

7.1.3 Washington County Water Conservancy District

The WCWCD was sent a formal request to be a Cooperating Agency for the project Plan-EA via letter on February 4, 2019 (Appendix A), and the Cooperating Agency MOU was signed on February 8, 2019 (Appendix A). On January 27, 2022, the WCWCD requested Cooperating Agency Status for the Plan-EIS via email (Appendix A), and the Cooperating Agency MOU was signed in August 2022 (Appendix A). The WCWCD was provided with an opportunity to conduct a site visit on September 28, 2022, along with NRCS project staff, KCWCD, project consultants, and other cooperating agencies. Coordination has been maintained with WCWCD personnel regarding aspects of the project that could affect the EFVR water flow in Washington County. WCWCD's report comments or concerns were addressed prior to the issuance of the Draft Plan-EIS to the public.

7.1.4 U.S. Environmental Protection Agency

The NRCS sent a formal request to the EPA for Cooperating Agency status for the project Plan-EIS on October 15, 2021 (Appendix A). The EPA accepted Cooperating Agency status in a letter dated October 29, 2021 (Appendix A). The EPA was provided with an opportunity to conduct a site visit on September 28, 2022, along with NRCS project staff, KCWCD, project consultants, and other cooperating agencies. Resource concerns, project purpose and need, alternatives for detailed study, and selection of the preferred alternative were coordinated with input and approval from the EPA. The EPA was provided with copies of the preliminary Plan-EIS for review prior to the issuance of the Draft Plan-EIS to the public. The EPA's report comments or concerns were addressed prior to the issuance of the Draft Plan-EIS to the public.

7.1.5 U.S. Bureau of Land Management

The NRCS submitted a letter to the BLM Kanab Field Office Manager to formally request Cooperating Agency status for the Plan-EA on February 11, 2019 (Appendix A). On February 27, 2019, the BLM Kanab Field Office Manager signed an MOU, formalizing Cooperating Agency status for the project (Appendix A). A formal request to be a Cooperating Agency for the project Plan-EIS was submitted to the BLM on October 15, 2021 (Appendix A). On August 16, 2022, the BLM signed an MOU accepting Cooperating Agency status for the Plan-EIS (Appendix A). The BLM was provided with an opportunity to conduct a site visit on September 28, 2022, along with NRCS project staff, KCWCD, project consultants, and other cooperating agencies.

Three of the six potential borrow sites that were identified during preliminary development to supply aggregate material for project construction are located on BLM-administered public lands, two existing pits (Elbow and Bald Knoll) and one new pit (Black Knoll). A Kanab Field Office BLM Interdisciplinary Team Analysis Record Checklist was prepared for the BLM portion of the project during the Plan-EA (Appendix E-3). The use of the borrow sites on BLM lands was eliminated from the project for the Plan-EIS; however, the BLM has remained a Cooperating Agency. Resource concerns, project purpose and need, alternatives for detailed study, and selection of the preferred alternative were coordinated with input and approval from the BLM. The BLM was provided with copies of the preliminary Plan-EIS for review prior to issuance of the Draft Plan-EIS to the public. The BLM's report comments or concerns were addressed prior to issuance of the Draft Plan-EIS to the public. During the Plan-EA process, a Kanab Field Office BLM Interdisciplinary Team Analysis Record Checklist was prepared for the BLM portion of the project on September 24, 2019. The Plan-EIS no longer includes a BLM portion of the project, and therefore an updated Interdisciplinary Team Analysis Record Checklist was not required.

7.1.6 National Park Service through Zion National Park

The EFVR is a designated WSR where it flows through ZNP. The river enters the Park approximately 20 river miles downstream from the proposed reservoir site. Because of potential changes in streamflow, a formal request to be a Cooperating Agency for the project Plan-EA was submitted to the NPS on February 12, 2019 (Appendix A); the NPS signed the Cooperating Agency MOU on the same date (Appendix A). The NRCS sent a formal request to be a Cooperating Agency for the project Plan-EIS on October 15, 2021 (Appendix A). The NPS accepted Cooperating Agency status in a letter dated April 18, 2022 (Appendix A). The NPS also provided comments on the NOI for the Plan-EIS in that same letter. The NPS was provided with an opportunity to conduct a site visit on September 28, 2022, along with NRCS project staff, KCWCD, project consultants, and other cooperating agencies. Resource concerns, project purpose and need, alternatives for detailed study, and selection of the Preferred Alternative were coordinated with input and approval from the NPS.

The NPS was provided with copies of the preliminary Plan-EIS for review prior to issuance of the Draft Plan-EIS to the public. In a letter dated March 6, 2026, the NPS provided comments on the preliminary Plan-EIS. The NPS Western Region submitted an updated comment letter dated June 12, 2026, which superseded previous correspondence. On August 18, 2026, via email, the NRCS provided a comment response table and updated preliminary Plan-EIS to the NPS. On August 31, 2026, NPS acknowledged receipt and stated that they had no further comments. See Appendix A for all consultations between NRCS and the NPS.

The NPS evaluates impacts on designated rivers in accordance with Section 7 of the WSRA. On August 29, 2025, via email, the NPS stated that they will not be conducting a Section 7 analysis for this project (Appendix A). Coordination with the ZNP as a cooperating agency has been ongoing throughout the life of the project.

7.1.7 U.S. Forest Service

A formal request to be a Cooperating Agency for the project Plan-EIS was submitted to the USFS on October 15, 2021, and no response was received. Although the USFS did not elect to accept the request to participate as a Cooperating Agency, coordination with the USFS has been ongoing throughout the planning process for the project.

7.1.8 Utah Public Lands Policy Coordinating Office

The PLPCO is the state agency responsible for coordinating, promoting, and implementing Utah's public land priorities. The PLPCO requested Cooperating Agency status on the Plan-EIS by two memoranda, the first dated October 20, 2021 (Appendix A), and the second dated February 2, 2022 (Appendix A). The PLPCO was provided with an opportunity to conduct a site visit on September 28, 2022, along with NRCS project staff, KCWCD, project consultants, and other cooperating agencies. Resource concerns, project purpose and need, alternatives for detailed study, and selection of the Preferred Alternative were coordinated with input and approval from the PLPCO. The PLPCO was provided copies of the preliminary Plan-EIS for review prior to issuance of the Draft Plan-EIS to the public. The PLPCO's report comments or concerns were addressed prior to the issuance of the Draft Plan-EIS to the public.

7.1.9 Utah Trust Lands Administration

UTLA manages lands located within the proposed project area. UTLA is the steward of Utah's trust lands and is responsible for generating revenue from them for the benefit of public schools and other state institutions now and for future generations. A formal request to be a Cooperating Agency for the project Plan-EIS was submitted to the UTLA on October 15, 2021 (Appendix A), and the UTLA accepted Cooperating Agency status on the Plan-EIS by email correspondence dated October 25, 2021 (Appendix A). The UTLA was provided with an opportunity to conduct a site visit on September 28, 2022, along with NRCS project staff, KCWCD, project consultants, and other cooperating agencies. Resource concerns, project purpose and need, alternatives for detailed study, and selection of the Preferred Alternative were coordinated with input and approval from UTLA. UTLA was provided copies of the preliminary Plan-EIS for review prior to the issuance of the Draft Plan-EIS to the public. UTLA's report comments or concerns were addressed prior to the issuance of the Draft Plan-EIS to the public.

7.1.10 NHPA Section 106 Consultation

Consultation with various agencies, including Utah SHPO, the ACHP, USACE, BLM, Utah Department of Transportation (UDOT), and Tribes was completed to comply with 36 CFR 800 – Protection of Historic Properties. Consultation is ongoing throughout the life of the Plan-EIS, and this section will be updated as consultation occurs. The following sections detail the efforts completed for each section of 36 CFR 800. Table 7.2 summarizes all Section 106 consultations for the Plan-EA and Plan-EIS. All consultation letters and responses are included in Appendix A.

Table 7.2. Summary of Section 106 Consultation.

Agency/Tribe	Date	Type of Consultation
Ute Indian Tribe of the Uintah & Ourary Reservation	May 23, 2018	Tribal Scoping Letter for Plan-EA
Paiute Indian Tribe of Utah	May 23, 2018	Tribal Scoping Letter for Plan-EA
Kaibab band of Paiute Indians of the Kaibab Indian Reservation	May 23, 2018	Tribal Scoping Letter for Plan-EA
Moapa Band of Paiute Indians of the Moapa River Indian Reservation	May 23, 2018	Tribal Scoping Letter for Plan-EA

Agency/Tribe	Date	Type of Consultation
Las Vegas Tribe of Paiute Indians of the Las Vegas Indian Colony	May 23, 2018	Tribal Scoping Letter for Plan-EA
Navajo Nation	May 23, 2018	Tribal Scoping Letter for Plan-EA
Ute Mountain Ute Tribe	May 23, 2018	Tribal Scoping Letter for Plan-EA
Councilwoman, White Mesa	May 23, 2018	Tribal Scoping Letter for Plan-EA
San Juan Southern Paiute Tribe of Arizona	May 23, 2018	Tribal Scoping Letter for Plan-EA
Pueblo of Zuni	May 23, 2018	Tribal Scoping Letter for Plan-EA
Hopi Tribe	May 23, 2018	Tribal Scoping Letter for Plan-EA
Hualapai Tribe	May 23, 2018	Tribal Scoping Letter for Plan-EA
Hopi Tribe	June 11, 2018	Response to Plan-EA Scoping Letter requesting hard copies of the Plan-EA
SHPO	January 9, 2020	First CRIR and finding of effect
BLM	January 9, 2020	First CRIR and finding of effect
USACE	January 9, 2020	First CRIR and finding of effect
Pueblo of Zuni	January 9, 2020	First CRIR and finding of effect
Kaibab band of Paiute Indians of the Kaibab Indian Reservation	January 9, 2020	First CRIR and finding of effect
Las Vegas Tribe of Paiute Indians of the Las Vegas Indian Colony	January 9, 2020	First CRIR and finding of effect
San Juan Southern Paiute Tribe of Arizona	January 9, 2020	First CRIR and finding of effect
Moapa Band of Paiute Indians of the Moapa River Indian Reservation	January 9, 2020	First CRIR and finding of effect
Navajo Nation	January 9, 2020	First CRIR and finding of effect
Councilwoman, White Mesa (Ute Council)	January 9, 2020	First CRIR and finding of effect
Ute Indian Tribe of the Uintah & Ourary Reservation	January 9, 2020	First CRIR and finding of effect
Hualapai Tribe	January 9, 2020	First CRIR and finding of effect
Ute Mountain Ute Tribe	January 9, 2020	First CRIR and finding of effect
Hopi Tribe	January 9, 2020	First CRIR and finding of effect
Paiute Indian Tribe of Utah	January 9, 2020	First CRIR and finding of effect
SHPO	January 17, 2020	SHPO Concurrence with the First CRIR and finding of effect
Paiute Indian Tribe of Utah	January 21, 2020	Paiute Concurrence with the First CRIR and finding of effect
Hopi Tribe	January 28, 2020	Hopi Tribe Concurrence with the First CRIR and finding of effect
Moapa Band of Paiute Indians of the Moapa River Indian Reservation	November 20, 2020	NOA of Plan-EA
Navajo Nation	November 20, 2020	NOA of Plan-EA
Councilwoman, White Mesa (Ute Council)	November 20, 2020	NOA of Plan-EA

Agency/Tribe	Date	Type of Consultation
Ute Indian Tribe of the Uintah & Ourary Reservation	November 20, 2020	NOA of Plan-EA
Hualapai Tribe	November 20, 2020	NOA of Plan-EA
Ute Mountain Ute Tribe	November 20, 2020	NOA of Plan-EA
Pueblo of Zuni	November 20, 2020	NOA of Plan-EA
Hopi Tribe	November 20, 2020	NOA of Plan-EA
Paiute Indian Tribe of Utah	November 20, 2020	NOA of Plan-EA
Kaibab band of Paiute Indians of the Kaibab Indian Reservation	November 20, 2020	NOA of Plan-EA
Las Vegas Tribe of Paiute Indians of the Las Vegas Indian Colony	November 20, 2020	NOA of Plan-EA
San Juan Southern Paiute Tribe of Arizona	November 20, 2020	NOA of Plan-EA
Kaibab band of Paiute Indians of the Kaibab Indian Reservation	December 1, 2020	NRCS email to Tribe with NOA of Plan-EA and invitation to the public meeting on December 9, 2020
Navajo Nation	December 4, 2020	Response to NOA stating no concern with the project
Hopi Tribe	December 7, 2020	Response to NOA requesting hard copies of the Plan-EA and a request for a Plan-EIS to be prepared
Hopi Tribe	December 15, 2020	NRCS delivery of hard copies per request
Hopi Tribe	January 4, 2021	Tribal concern with riprap from Bald Knoll borrow pit site and request for the preparation of a Plan-EIS
Hualapai Tribe	March 1, 2021	Hualapai Tribe stated this project is outside of their area of interest and requested to be removed from project consultation
Kaibab band of Paiute Indians of the Kaibab Indian Reservation	January 14, 2022	Tribal Scoping Letter for Plan-EIS
Las Vegas Tribe of Paiute Indians of the Las Vegas Indian Colony	January 14, 2022	Tribal Scoping Letter for Plan-EIS
Ute Indian Tribe of the Uintah & Ourary Reservation	January 14, 2022	Tribal Scoping Letter for Plan-EIS
Pueblo of Zuni	January 14, 2022	Tribal Scoping Letter for Plan-EIS
Ute Mountain Ute Tribe	January 14, 2022	Tribal Scoping Letter for Plan-EIS
Hopi Tribe of Arizona	January 14, 2022	Tribal Scoping Letter for Plan-EIS
White Mesa Ute Council	January 14, 2022	Tribal Scoping Letter for Plan-EIS
Paiute Indian Tribe of Utah	January 14, 2022	Tribal Scoping Letter for Plan-EIS

Agency/Tribe	Date	Type of Consultation
Navajo Nation	January 14, 2022	Tribal Scoping Letter for Plan-EIS
Moapa Band of Paiute Indians of the Moapa River Indian Reservation	January 14, 2022	Tribal Scoping Letter for Plan-EIS
San Juan Southern Paiute Tribe of Arizona	January 14, 2022	Tribal Scoping Letter for Plan-EIS
Hopi Tribe	February 7, 2022	Response to Plan-EIS Scoping requesting hard-copies
Moapa Band of Paiutes	March 31, 2022	Response to Plan-EIS Scoping stating no comments
Ute Indian Tribe of the Uintah & Ourary Reservation	May 3, 2022	NOI for the Plan-EIS
San Juan Southern Paiute Tribe of Arizona	May 3, 2022	NOI for the Plan-EIS
Las Vegas Tribe of Paiute Indians of the Las Vegas Indian Colony	May 3, 2022	NOI for the Plan-EIS
Paiute Indian Tribe of Utah	May 3, 2022	NOI for the Plan-EIS
Kaibab band of Paiute Indians of the Kaibab Indian Reservation	May 3, 2022	NOI for the Plan-EIS
Moapa Band of Paiutes	May 3, 2022	NOI for the Plan-EIS
Navajo Nation	May 3, 2022	NOI for the Plan-EIS
Pueblo of Zuni	May 3, 2022	NOI for the Plan-EIS
White Mesa Ute Council	May 3, 2022	NOI for the Plan-EIS
Ute Mountain Ute Tribe	May 3, 2022	NOI for the Plan-EIS
Hopi Tribe of Arizona	May 3, 2022	NOI for the Plan-EIS
BLM	May 5, 2022	Draft SHPO Package review for the second CRIR and finding of effect
UTLA	May 5, 2022	Draft SHPO Package review for the second CRIR and finding of effect
UDOT	May 5, 2022	Draft SHPO Package review for the second CRIR and finding of effect
UDOT	June 1, 2022	Cultural and Paleo clearance with Tier 1 screening form
SHPO	January 23, 2023	Second CRIR and finding of effect with preparation of an MOA
Navajo Nation	January 23, 2023	Second CRIR and finding of effect with preparation of an MOA
Ute Indian Tribe of the Uintah & Ourary Reservation	January 23, 2023	Second CRIR and finding of effect with preparation of an MOA
Moapa Band of Paiutes	January 23, 2023	Second CRIR and finding of effect with preparation of an MOA
Pueblo of Zuni	January 23, 2023	Second CRIR and finding of effect with preparation of an MOA
Hopi Tribe of Arizona	January 23, 2023	Second CRIR and finding of effect with preparation of an MOA
Ute Mountain Ute Tribe	January 23, 2023	Second CRIR and finding of effect with preparation of an MOA

Agency/Tribe	Date	Type of Consultation
Kaibab band of Paiute Indians of the Kaibab Indian Reservation	January 23, 2023	Second CRIR and finding of effect with preparation of an MOA
White Mesa Ute Council	January 23, 2023	Second CRIR and finding of effect with preparation of an MOA

SHPO	February 6, 2023	SHPO Concurrence with Second CRIR and finding of effect with preparation of an MOA
ACHP	March 28, 2024	Section 106 consultation and notification of Adverse Effect to Historic Properties
ACHP	April 12, 2024	Email response declining interest in consultation
SHPO	May 20, 2024	Third CRIR with finding of effect
Navajo Nation	May 22, 2024	Third CRIR with finding of effect
Kaibab band of Paiute Indians of the Kaibab Indian Reservation	May 22, 2024	Third CRIR with finding of effect
Ute Indian Tribe of the Uintah & Ourary Reservation	May 22, 2024	Third CRIR with finding of effect
Moapa Band of Paiute Indians of the Moapa River Indian Reservation	May 22, 2024	Third CRIR with finding of effect
Pueblo of Zuni	May 22, 2024	Third CRIR with finding of effect
Paiute Indian Tribe of Utah	May 22, 2024	Third CRIR with finding of effect
Ute Mountain Ute Tribe	May 22, 2024	Third CRIR with finding of effect
Hopi Tribe of Arizona	May 22, 2024	Third CRIR with finding of effect
White Mesa Ute Council	May 22, 2024	Third CRIR with finding of effect
Las Vegas Tribe of Paiute Indians of the Las Vegas Indian Colony	May 22, 2024	Third CRIR with finding of effect
San Juan Southern Paiute Tribe of Arizona	May 22, 2024	Third CRIR with finding of effect
Kaibab band of Paiute Indians of the Kaibab Indian Reservation	May 24, 2024	Response to Third CRIR stating no comments
SHPO	June 2, 2024	SHPO Concurrence with Third CRIR and finding of effect
Hopi Tribe of Arizona	June 4, 2025	Indirect/Visual Memorandum with finding of no effect
Kaibab Band of Paiute Indians of the Kaibab Indian Reservation	June 4, 2025	Indirect/Visual Memorandum with finding of no effect
Las Vegas Tribe of Paiute Indians of the Las Vegas Indian Colony	June 4, 2025	Indirect/Visual Memorandum with finding of no effect

Agency/Tribe	Date	Type of Consultation
Moapa Band of Paiute Indians of the Moapa River Indian Reservation	June 4, 2025	Indirect/Visual Memorandum with finding of no effect
White Mesa Ute Council	June 4, 2025	Indirect/Visual Memorandum with finding of no effect
Navajo Nation	June 4, 2025	Indirect/Visual Memorandum with finding of no effect
Paiute Indian Tribe of Utah	June 4, 2025	Indirect/Visual Memorandum with finding of no effect
Pueblo of Zuni	June 4, 2025	Indirect/Visual Memorandum with finding of no effect
San Juan Southern Paiute Tribe of Arizona	June 4, 2025	Indirect/Visual Memorandum with finding of no effect
Utah Division of Indian Affairs	June 4, 2025	Indirect/Visual Memorandum with finding of no effect
Ute Indian Tribe of the Uintah & Ouray Reservation	June 4, 2025	Indirect/Visual Memorandum with finding of no effect
Ute mountain Ute Tribe	June 4, 2025	Indirect/Visual Memorandum with finding of no effect
USACE	June 4, 2025	Indirect/Visual Memorandum with finding of no effect
U.S. EPA	June 4, 2025	Indirect/Visual Memorandum with finding of no effect
ZNP	June 4, 2025	Indirect/Visual Memorandum with finding of no effect
SHPO	June 4, 2025	Indirect/Visual Memorandum with finding of no effect
UTLA	June 4, 2025	Indirect/Visual Memorandum with finding of no effect
Navajo Nation	June 5, 2025	Response to Indirect/Visual Memorandum stating no comments and request to proceed with the project without further consultation with the Navajo Nation
Moapa Band of Paiute Indians of the Moapa River Indian Reservation	June 5, 2025	Response to Indirect/Visual Memorandum stating concern about the effects to the acoustic characteristics of site 42KA7537
Moapa Band of Paiute Indians of the Moapa River Indian Reservation	June 10, 2025	A voicemail was left by the NRCS to the Moapa Band of Paiute Indian Tribe's THPO proposing avoidance measures for site 42KA7537
Moapa Band of Paiute Indians of the Moapa River Indian Reservation	June 18, 2025	An email was sent by the NRCS to the Moapa Band of Paiute Indian Tribe's THPO proposing avoidance measures for site 42KA7537

Agency/Tribe	Date	Type of Consultation
Moapa Band of Paiute Indians of the Moapa River Indian Reservation	June 20, 2025	A second voicemail was left by the NRCS to the Moapa Band of Paiute Indian Tribe's THPO proposing avoidance measures for site 42KA7537
Moapa Band of Paiute Indians of the Moapa River Indian Reservation	July 15, 2025	A second email was sent by the NRCS to the Moapa Band of Paiute Indian Tribe's THPO proposing avoidance measures for site 42KA7537
Moapa Band of Paiute Indians of the Moapa River Indian Reservation	February 12, 2026	A third voicemail was left by the NRCS to the Moapa Band of Paiute Indian Tribe's THPO proposing avoidance measures for site 42KA7537
Moapa Band of Paiute Indians of the Moapa River Indian Reservation	August 24, 2026	A final email and voicemail were left by the NRCS to the Moapa Band of Paiute Indian Tribe's THPO presenting the extended avoidance measures that have been incorporated into the project to ensure acoustics coming from the site remain undisturbed

7.1.10.1 Initiation of the Section 106 process

As part of the project's initial planning for both the Plan-EA and Plan-EIS, NRCS initiated consultation with appropriate Tribal representatives/THPOs during the scoping process (Appendix A). Tribes who hold ancestral land, traditional use, and/or TCP claims in and near the project area were identified using the Native American Graves Protection and Repatriation Act, Native American Consultation Database, a database through which any federally recognized Tribe could identify those counties in Utah where they have consultation interests. The BLM Kanab Field Office Tribal Consultation List, the U.S. Department of Housing and Urban Development Tribal Directory Assessment Tool, the U.S. Bureau of Indian Affairs, and the Utah Division of Indian Affairs websites were also used as supplemental sources to identify Tribes with consultation interests. The assembled list of Tribes is included in Table 7.2 and individual THPOs consulted with are included in Appendix A.

Tribes were consulted to comply with EO 13007 (American Indian Religious Freedom Act) (May 24, 1996), EO 13175 (Consultation and Coordination with Indian Tribal Governments) (November 6, 2000), the American Indian Religious Freedom Act of 1978, and the NHPA. A reasonable and good faith effort was made per 36 CFR pt. 800(f)(2) to consult with these Tribes via letter, email, and telephone. During the scoping process, the NRCS communicated with the Tribes regarding known historic properties or places of traditional religious and cultural importance near the project area.

Tribes were invited to comment on the project during the Plan-EA scoping period in letters dated May 23, 2018, and one response was received from the Hopi Tribe on June 11, 2018, requesting

hard copies of the Plan-EA and requesting the preparation of a Plan-EIS for the project (Appendix A). The Hopi Tribe re-requested their preference for a Plan-EIS in letters dated December 7, 2020 (Appendix A), and January 4, 2021 (Appendix A). A list of specific Tribes and THPOs consulted with, and the dates letters were sent and received is included in Appendix A.

On January 18, 2019, the Kaibab Paiute indicated concern about the effects of the increase in visitors to nearby private lands, and a site visit was completed on January 25, 2019, by a representative from the Kaibab Paiute, NRCS, and Eocene. The group examined site 42KA8904 near the proposed project activities, and the Kaibab Paiute stated that they were not concerned about the effects to the site from the proposed project. The group also visited site 42KA8785 due to its proximity to a proposed gravel source. A summary of this site visit is included in Appendix A, and a figure of the gravel pit avoidance area is included in Figure C-6 in Appendix C.

Tribes were also invited to comment on the project during the Plan-EIS scoping period in letters dated January 14, 2022, and responses from the Hopi and Moapa Tribes were received (Appendix A). The Hopi Tribe responded by letter dated February 7, 2022, requesting consultation on the project, including being provided with a copy of any proposed treatment plans for review and comment (Appendix A). The Moapa Band of Paiutes responded by email dated March 31, 2022, stating that they do not have any questions or comments concerning the project (Appendix A).

As part of compliance with 36 CFR 800, a Cultural and Paleo Clearance with Tier 1 Screening Form was completed on June 1, 2022, by the UDOT and to keep them informed of proposed project activities that may take place within the UDOT ROW or affect its transportation facilities through the NHPA Section 106 notification process.

7.1.10.2 Identification of historic properties

Per 36 CFR 800.16(d), the NCRS established the project's APE to include all potential direct and indirect effects. During the Plan-EA planning, the original project APE consisted of a total of 791.68 acres. A survey of this area was completed in October 2018 with supplemental field work completed in June, July, and September of 2019. The Class III (intensive pedestrian) survey was conducted by Eocene archaeologists, meeting 36 CFR 61 SOI qualification standards and was conducted in 15- meter-wide transects. This survey identified a total of 9 new cultural resource sites, 1 previous cultural resource site, and 15 IOs in the project APE (Appendix E-2). Four of these cultural resource sites are eligible for listing on the NRHP. As part of NHPA Section 106 compliance, this CRIR was submitted to the Utah SHPO, Tribes, THPOs, and other stakeholders for concurrence with the determinations of site eligibility (Table 7.2). SHPO, Tribes, THPOs, and other stakeholders were consulted with in a letter dated January 9, 2020. SHPO concurred in a letter dated January 17, 2020, the Paiute Tribe concurred in a letter dated January 21, 2020, and the Hopi Tribe concurred in a letter dated January 28, 2020.

In 2021, as part of the EIS, an Addendum project APE of 68.83 acres was added to include the addition of the Mt. Carmel pipeline. A Class III (intensive) and Class II (reconnaissance) inventory of the Addendum project APE was conducted in November 2021 and March 2022 by Eocene archaeologists, meeting 36 CFR 61 SOI qualification standards. This survey identified a total of 1 previously identified and 4 newly recorded cultural resource sites, and 3 IOs located within the Addendum project APE (Appendix E-2). Three of these cultural resource sites are eligible for listing on the NRHP. As part of NHPA Section 106 compliance, this CRIR was submitted to the Utah SHPO, Tribes, THPOs, and other stakeholders for concurrence with the determinations of site

eligibility (Table 7.2). SHPO, Tribes, THPOs, and other stakeholders were consulted with in a letter dated January 23, 2023. SHPO concurred in a letter dated February 6, 2023.

In 2023, a second Addendum project APE of 13.72 acres was identified to include the addition of the Esplin Pit. A Class III (intensive) and Class II (reconnaissance) inventory of the second Addendum project APE was conducted in October 2023 by Eocene archaeologists, meeting 36 CFR 61 SOI qualification standards. This survey identified a total of one previously identified and one newly recorded cultural resource site, and 1 IO was identified within the second Addendum project APE (Appendix E-2). Both cultural resource sites are eligible for listing on the NRHP. As part of NHPA Section 106 compliance, this CRIR was submitted to the Utah SHPO, Tribes, THPOs, and other stakeholders for concurrence with the determinations of site eligibility (Table 7.2). SHPO, Tribes, THPOs, and other stakeholders were consulted with in a letter dated May 20, 2024. The Kaibab Band of Paiute Indians of the Kaibab Indian Reservation responded with no comments in a letter dated May 24, 2024, and SHPO concurred in a letter dated June 2, 2024.

Table 3.6 summarizes the cultural resource findings and the NRCS' determination of site eligibility for all three surveys, and Table 7.2 summarizes the consultation that was completed for all three surveys.

A total of 874.23 acres was surveyed for the Project APE. In 2024, the project extent changed to remove 3 borrow pits, reducing the total Direct section of the APE to 712.46 acres. Figure C-2 in Appendix C shows the areas surveyed and the current Direct section of the APE. This section of the APE encompasses all areas under the current project extents that may be disturbed or changed from their current conditions with potential to affect cultural resources. See Section 1.4.3 for a detailed description of the APE development process, Appendix E-2 for the redacted CRIRs, and Figure C-2 in Appendix C for the APE figure.

In April 2025, Eocene completed a Cultural Resources Review Memorandum to identify potential impacts to the Indirect and Visual sections of the APE within the project area. This desktop review identified 26 cultural resources and nine historic structures within the overlapping sections. The NRCS determined that none of these resources would require a formal Visual Effects Analysis, as they would not be subject to adverse visual or indirect impacts (Eocene, 2025). Refer to Appendix E-2 for the Redacted Cultural Resources Review Memorandum.

Consultation was completed with the applicable Tribes, agencies, and the SHPO on June 4, 2025. Copies of the letters sent, and concurrences received are included in Appendix A. Consultation with the Moapa Band of Paiutes is ongoing.

7.1.10.3 Assessment of adverse effects

The 3 cultural resource surveys revealed a total of 9 historic properties within the original project APE. CRIRs for each survey have been prepared and redacted versions are included in Appendix E-2. Table 5.4 summarizes the effects findings and protective measures on all eligible sites in the APE. Implementation of the proposed project would result in Adverse Effect to Historic Properties. As part of NHPA Section 106 compliance, the CRIR, and subsequent addendums, were submitted to the Utah SHPO, Tribes, THPOs, and other stakeholders for concurrence with the project effects (Table 7.2).

The proposed project would have an Adverse Effect to historic properties, as concurred with by SHPO on February 6, 2023, and June 2, 2024. The ACHP was notified of the finding of Adverse Effect to historic properties in an email dated March 28, 2024 (Appendix A). A letter response was received via email on April 12, 2024, stating that the ACHP does not believe participation in the consultation to resolve adverse effects is needed per 36 CFR 800 (Appendix A).

7.1.10.4 Resolution of adverse effects

To resolve adverse effects, a draft MOA was prepared in July of 2026 and a final MOA will be executed following the public comment period for this project. The draft MOA was prepared in consultation with the Utah SHPO, KCWCD, WCWCD, interested THPOs, Tribes, and other organizations, and is included in Appendix A.

On private land, the NRCSs inadvertent discovery procedures, as described in the Prototype Programmatic Agreement with the Utah SHPO, would be followed. For non-private land, the applicable land managing agency's inadvertent discovery plan would be followed. If undocumented cultural/archaeological resources are found during construction activities, construction would stop, and the appropriate agency officials would be notified, per procedures described in the NRCS Prototype Programmatic Agreement (Appendix E-3).

7.2 Coordination

7.2.1 Stakeholders

Coordination was conducted with private landowners having a stake in the project. These include landowners of parcels where temporary and permanent easements are required to install alternative measures, Non-Government Organizations (NGOs) with interest in the project Area, and National, state, and local agencies who may be impacted by the project. A list of all stakeholders coordinated with for the project is included in Appendix A. Coordination included invitation to comment on the scoping process for both the Plan-EA and the Plan-EIS, public scoping meetings held on December 5, 2019, and October 20, 2021.

Contact has been ongoing with local private landowners and NGOs throughout the Plan-EA and Plan-EIS development process. The gravel would come from the Lamb and Tait borrow sites located on private lands. The KCWCD has been negotiating with the owners of these sites for use of this material. During the public scoping process for the Plan-EIS, letters were sent to 35 agency representatives, 8 NGOs, 212 private landowners, and 24 Tribal representatives. See Chapter 1.5 and the Scoping Summary Report for details (Appendix A).

7.2.2 Sponsoring Local Organizations

The SLOs for the proposed project are KCWCD and WCWCD. Financial assistance for the project was requested by the SLOs from NRCS through Standard Form 424-Application for Federal Assistance. Initial coordination was conducted with the SLOs regarding the project and the proposed measures. Meetings were conducted throughout the planning and engineering process to discuss the project measures and identify potential concerns. The SLOs were provided copies of the preliminary Plan-EIS for review prior to issuance of the Draft Plan-EIS to the public. The SLOs report comments or concerns were addressed prior to issuance of the Draft Plan-EIS to the public.

7.2.3 Utah Department of Transportation

The UDOT was notified during early coordination for the project Plan-EA in June 2018 and for the project Plan-EIS in June 2021. As part of compliance with 36 CFR 800, a Cultural and Paleo Clearance with Tier 1 Screening Form was completed on June 1, 2022, for the UDOT to keep them informed of proposed project activities that may take place within the UDOT ROW or affect its transportation facilities through the NHPA Section 106 notification process.

7.2.4 Utah Division of Wildlife Resources

During the Plan-EA analysis, the UDWR was consulted regarding a proposed conservation pool and fishery at the proposed reservoir. Additionally, negotiations with UDWR resulted in the maintenance of a continuous streamflow between existing Glendale hydroelectric power plant site and the return flow site near the existing Orderville hydroelectric power plant (KCWCD, 2001). Neither of these two project components are included in the current proposed project, and their discussion is not included in this Draft Plan-EIS.

Coordination with the UDWR was conducted in 2018 to identify state-sensitive species of concern relevant to the Plan-EA analysis for the project. The UDWR did not have any immediate concerns for species or habitat for the project. The UDWR was also invited to review the project purpose and need on October 4, 2024, via email. A virtual agency meeting was held on October 17, 2024, to discuss comments on the project purpose and need. Any comments received were addressed prior to the issuance of the Draft Plan-EIS to the public.

7.2.5 Utah Division of Emergency Management

Coordination with the Utah Division of Emergency Management (UDEM) was conducted throughout the planning process of the Plan-EA and Plan-EIS. The UDEM provided comments during the scoping period that a Letter of Map Revision or Conditional Letter of Map Revision may be required for the project and that it should be reviewed by Washington County and Hurricane City floodplain administrators. Project information and floodplain modeling data was shared with the UDEM for their coordination with Hurricane City. The UDEM was also invited to review the project purpose and need on October 4, 2024, via email. A virtual agency meeting was held on October 17, 2024, to discuss comments on the project purpose and need. Any comments received were addressed prior to the issuance of the Draft Plan-EIS to the public.

7.2.6 U.S. Bureau of Reclamation

Coordination with the U.S. Bureau of Reclamation (BOR) was conducted throughout the planning process of the Plan-EA and Plan-EIS. The BOR requested copies of the draft Plan-EA via email on June 22, 2018. The BOR was also invited to review the Plan-EIS purpose and need on October 4, 2024, via email. A virtual agency meeting was held on October 17, 2024, to discuss comments on the project purpose and need. Any comments received were addressed prior to the issuance of the Draft Plan-EIS to the public.

7.2.7 Utah Natural Heritage Program

A letter was sent to UNHP on September 25, 2018, requesting a list of species of special concern for the project Plan-EA. A letter was received from the UNHP on October 1, 2018, confirming that

no federally listed species were documented as potentially occurring within 0.5-2.0 miles of the Long Valley portion of the project area. An online species search report was obtained from the UNHP on July 21, 2022, that identified three state species of concern that have been documented within a 0.5–2.0-mile radius of the project area, including the Arizona toad, bald and golden eagles, band-tailed pigeon, desert sucker, and northern leopard frog (UNHP, 2024). These species are analyzed in Section 5.4.1 and 5.4.6. The UNHP was also invited to review the purpose and need of the project on October 4, 2024, via email. A virtual agency meeting was held on October 17, 2024, to discuss comments on the project purpose and need. Any comments received were addressed prior to the issuance of the Draft Plan-EIS to the public.

7.2.8 Utah Department of Natural Resources, Utah Geological Survey

A Paleontological Resources Locality Search was requested from the Utah Department of Natural Resources, UGS on September 25, 2024, to identify potential paleontological resources in the project area. The request was completed on September 26, 2024, via email and a recommendation to complete surveying/monitoring of the PFYC areas was given. Surveying was completed in November 2024 and February 2025 and a summary of findings is included in Section 5.5.5.

7.2.9 Federal Emergency Management Agency

Coordination with FEMA was conducted throughout the planning process of the Plan-EA and Plan-EIS. FEMA was also invited to review the project purpose and need on October 4, 2024, via email. A virtual agency meeting was held on October 17, 2024, to discuss comments on the project purpose and need. Any comments received were addressed prior to the issuance of the Draft Plan-EIS to the public.

7.2.10 Utah State Clearinghouse

Coordination with the Utah State Clearinghouse was conducted throughout the planning process of the Plan-EA and Plan-EIS. State Notification per Executive Order 12372 – Funding for start of PL 566 Planning was posted on November 17, 2017. The Utah State clearinghouse was also invited to review the purpose and need of the project on October 4, 2024, via email. A virtual agency meeting was held on October 17, 2024, to discuss comments on the project purpose and need. Any comments received were addressed prior to the issuance of the Draft Plan-EIS to the public.

7.2.11 Utah Division of Water Resources

Coordination with UDWRe was conducted throughout the planning process of the Plan-EA and Plan-EIS. UDWRe was invited to review the project purpose and need on October 4, 2024, via email. A virtual agency meeting was held on October 17, 2024, to discuss comments on the project purpose and need. Any comments received were addressed prior to the issuance of the Draft Plan-EIS to the public.

7.2.12 Utah Department of Environmental Quality

Coordination with Utah Department of Environmental Quality (UDEQ) was conducted throughout the planning process of the Plan-EA and Plan-EIS. UDEQ was invited to review the purpose and need of the project on October 4, 2024, via email. A virtual agency meeting was held on October

17, 2024, to discuss comments on the project purpose and need. Any comments received were addressed prior to the issuance of the Draft Plan-EIS to the public.

7.2.13 Utah Division of Water Quality

Under Section 401 of the CWA, approval would be required so that the project does not violate state water quality standards. Certification is obtained as part of the USACE Section 404 Permit review process. Under Section 402 of the CWA, a UPDES Storm Water General Permit for Construction Activities is required for construction activities that disturb more than 1 acre and discharge pollutants to surface waters. A SWPPP will be developed, including submitting an NOI to the Utah Division of Water Quality.

Coordination with the UDWQ was conducted throughout the planning process of the Plan-EA and Plan-EIS. UDWQ was invited to review the project purpose and need on October 4, 2024, via email. A virtual agency meeting was held on October 17, 2024, to discuss comments on the project purpose and need. Any comments received were addressed prior to the issuance of the Draft Plan-EIS to the public.

7.2.14 Utah Division of Water Rights

Coordination with the Utah Division of Water Rights was conducted throughout the planning process of the Plan-EA and Plan-EIS. Utah Division of Water Rights was invited to review the project purpose and need on October 4, 2024, via email. A virtual agency meeting was held on October 17, 2024, to discuss comments on the project purpose and need. Any comments received were addressed prior to the issuance of the Draft Plan-EIS to the public.

Approval will also be required for the final design report, construction drawings, and specifications by the Utah State Assistant Engineer.

7.2.15 Utah Department of Cultural and Community Engagement

The Utah Department of Cultural & Community Engagement was invited to review the project purpose and need on October 4, 2024, via email. A virtual agency meeting was held on October 17, 2024, to discuss comments on the project purpose and need. Any comments received were addressed prior to the issuance of the Draft Plan-EIS to the public.

7.2.16 Utah Department of Agriculture and Food

The Utah Department of Agriculture and Food was invited to review the project purpose and need on October 4, 2024, via email. A virtual agency meeting was held on October 17, 2024, to discuss comments on the project purpose and need. Any comments received were addressed prior to the issuance of the Draft Plan-EIS to the public.

7.2.17 Utah Department of Public Safety

Coordination with the Utah Department of Public Safety was conducted throughout the planning process of the Plan-EA and Plan-EIS. The Utah Department of Public Safety was invited to review the purpose and need of the project on October 4, 2024, via email. A virtual agency meeting was held on October 17, 2024, to discuss comments on the project purpose and need. Any comments received were addressed prior to the issuance of the Draft Plan-EIS to the public.

7.3 Public Involvement

7.3.1 Public Outreach Plan

A Public Outreach Plan was prepared to outline effective procedures for engaging with the public, recreationists, Tribes, local businesses and associations, stakeholders, affected landowners, and affected government agencies. The main goal of public participation is to involve a diverse group of public and government agency participants to solicit input and provide timely information throughout the NEPA review process. As part of the public participation process, the plan seeks to meaningfully engage minority, low-income, and traditionally under-represented populations during the NEPA review process.

7.3.2 Project Scoping

Public participation is a vital component of the project that provides those who are interested in or potentially affected by proposed alternatives with an opportunity to share their concerns and provide input regarding the project during the planning stages of the Plan-EIS.

Project scoping questions, comments, and concerns were requested from the public and government agencies during the preliminary scoping period, both orally at public meetings, and via written submittal of comments. The project Scoping Summary Report outlines the efforts and comments received from the agencies and public during the scoping process. Refer to Chapter 1.5 for a description of the projects planning process.

7.3.3 Public Outreach

Table 7.3 lists the project's public outreach activities. The public, Tribes, agencies, and organizations were notified of activities as described below and provided with opportunities to comment on the project. See Appendix A for a copy of all public outreach activities

Table 7.3. Public Outreach Activities.

Date	Item
November 21, 2017	Utah State Clearinghouse Notification
October 29, 2019	Project Kickoff Meeting
February 12, 2018	NRCS sent formal requests to be a Cooperating Agency for the project Plan-EA to agencies (Appendix A)
May 23, 2018	Tribal Scoping Letter mailed to 21 representatives of 12 Tribes (Appendix A)
May 24, 2018	Public and Agency Scoping Letters mailed (sent to 21 private landowners and 31 agency reps)
May 24, 2018, and May 31, 2018	Scoping Notice, Meeting Announcements, and Scoping Notice Posted in the Southern Utah News
May 24, 2018	Scoping – Public Comment Period Open

Date	Item
May 24, 2018	Agency Scoping Meeting #1 held in Kanab, Utah

November 2026	Final Plan-EIS and NOA
November 2026	Record of Decision (ROD)

7.4 Plan Development and Review

7.4.1 Cooperating Agencies

The Cooperating Agencies, consisting of the EPA, NPS, USACE, UTLA, PLPCO, and BLM, were involved in the development of the Plan-EIS and provided technical expertise where appropriate. Concurrence was received from Cooperating Agencies during the scoping process and Plan-EIS development on the project purpose and need, resource concerns, alternatives included/eliminated from detailed study, and selection of the preferred alternative. A preliminary Plan-EIS was provided to Cooperating Agencies for review, and all comments or concerns were addressed prior to issuance of the Draft Plan-EIS to the public.

7.4.2 NRCS Plan-EIS Reviews

The following NRCS reviews occurred prior to issuance of the Draft Plan-EIS to the public, in accordance with the NWPM process.

1) NRCS Utah review.
2) NRCS National Water Management Center review.
3) NRCS Headquarters review.
4) Issue the Draft Plan-EIS for public review.

7.4.3 Draft Plan-EIS Public Comment

This portion will be completed in the Final Plan-EIS to document the Draft Plan-EIS public comment process. Comments and responses on the Draft Plan-EIS will be included in Appendix A of the Final Plan-EIS.

7.4.4 Final Plan-EIS and Record of Decision Public Comment

When the Final Plan-EIS and ROD are issued, an NOA will be published in the *Federal Register* and locally to notify the public of the finding and copies made available on the project website.

7.4.5 Distribution List

Table 7.4 lists the government agencies and organizations that are included on the project distribution list for scoping notice and/or NOA for the Draft Plan-EIS. Private parties are not listed to maintain privacy for those individuals.

Table 7.4. Distribution List–Federal Government

USDA-NRCS	USACE
USFWS	EPA
BLM	NPS/ZNP
USFS	BOR
FEMA	Utah U.S. House of Representatives
U.S. Senators Mike Lee and John Curtis	-

Table 7.5. Distribution List–State Government

Utah PLPCO	UTLA

Appendix D. Comment Summary Table D-1

1.0 Introduction and Background

The U.S. Department of Agriculture Natural Resources Conservation Service (USDA-NRCS), with assistance of the Kane County Water Conservancy District (KCWCD) as the project sponsor, in conjunction with the Washington County Water Conservancy District (WCWCD) as co-sponsor, is considering proposed improvements within the East Fork Virgin River Watershed. The proposed improvements include the construction of a new reservoir as well as other improvements within the existing Glendale and Orderville irrigation systems as needed or identified. Improvements under consideration will address agricultural water demands, water conservation, and increasing opportunities for public recreation.

The National Environmental Policy Act (NEPA) and the Council on Environmental Quality's regulations at 40 CFR Parts 1500–1508 require an evaluation of potential environmental impacts associated with federal projects and actions with input from the public. As the lead agency under NEPA, USDA-NRCS will collect and consider input from the public, agencies, and Tribes. This Scoping Report will describe comments received and issues identified during the outreach and scoping process.

1.1 Purpose of Scoping Process

Scoping is an integral part of the NEPA process; it provides an early opportunity to determine the scope and significance of issues to be addressed in the proposed action (40 CFR 1501.7). The objectives of scoping include:

- Identify significant issues related to the proposed project
- Identify social, environmental, and economic review and consultation requirements
- Define the environmental analysis process and technical studies necessary to address the impacts of the proposed project
- Identify and notify interested and affected parties
- Provide information to agencies, Tribes, and the public regarding the proposed project

1.2 Organizational Involvement

Roles and responsibilities for the scoping process included:

- USDA-NRCS: Lead Federal Agency
- KCWCD: Project Sponsor
- WCWCD: Project Co-sponsor
- Alpha Engineering: Third-party Engineering Consultant
- Transcon Environmental: Third-party Environmental Consultant

2.0 Public Scoping Overview

The public was notified of the project through multiple channels, including:

- Notice of Intent published on March 29, 2022, in the Federal Register
- Mailed letter
- Email notice
- Web page information
- Newspaper publication
- Press release

Each of these outreach methods are summarized below. Public scoping officially lasted 204 days, beginning Thursday, October 7, 2021, and ending Thursday, April 28, 2022. The public was initially notified at the beginning of scoping and re-notified (mail and email only) once the project Notice of Intent was published.

2.1 Public Outreach

A scoping letter (**Appendix A.1**) and project fact sheet (**Appendix A.2**) were sent directly to select landowners who own parcels that are directly adjacent to or within the project area Additional individuals who participated in the scoping and public comment process for the Draft Plan-Environmental Assessment (EA) were also included on an email and/or hard copy mailing list. The mailing list will be updated as the project progresses, and individuals request to be informed of project updates. As part of scoping, 127 members of the public were mailed hard copies of the fact sheet on October 7 or October 8, 2021, commencing the comment period. Furthermore, an additional 120 individuals received scoping notices by email (some addresses returned as undeliverable). This outreach was timed in conjunction with the publication of a scoping notification in a local newspaper.

A notification was published in the *Southern Utah News* on October 7 and October 14, 2021 (**Appendix A.3**) to notify the public about the project meeting, including the date, time, and location. The notification also included instructions for submitting comments. Project press releases were sent to the following individuals and outlets:

- Brian Maffly, Salt Lake Tribune
- Joan Meiners, The Spectrum
- Desert Sun News

Specific non-government organizations contacted for scoping included:

- Utah Rivers Council
- Trout Unlimited
- American Rivers
- Grand Canyon Trust

- Conserve Southwest Utah
- National Parks Conservation Association
- American Whitewater

The fact sheet was also posted on the USDA-NRCS project website: https://www.nrcs.usda.gov/wps/portal/nrcs/detail/ut/programs/planning/wpfp/?cid=nrcseprd1403022

A virtual public meeting was held via Zoom Webinar on Wednesday, October 20, 2021, from 6:00 p.m. to 7:30 p.m. Approximately 41 members of the public attended, based on the number of unique names/emails contained in the Zoom attendee report. A list of attendees is included (**Appendix A.4.)** The meeting included a PowerPoint presentation that provided background, project details, NRCS PL-566 program overview, maps of the watershed, and details on how to comment. Participants were encouraged to provide written comments regarding the project. Following the presentation, the project team hosted a question-and-answer period where written questions were responded to verbally by project leadership.

Project leadership from USDA-NRCS, KCWCD, WCWCD, Alpha Engineering, and Transcon Environmental were present to discuss the project with the public.

Following the meeting, a recording of the public meeting and the presentation slides used during the meeting were both posted to the USDA-NRCS project website. The presentation slides are also included in **Appendix A.5**.

2.2 Public Comments Received

A total of 66 public comment documents were received via email, via hard copy letter, and via the Federal Register page which were categorized and organized into 249 specific comments. 118 identical or virtually equivalent versions of a single email were consolidated into a single comment. A comment summary table is included as **Appendix D** and all public comments received are included in the Administrative Record and available upon request. A summary of all issues identified during scoping can be found in Section 5.0.

3.0 Agency Scoping

Federal, state, and local agencies were sent scoping letters and invited to attend an agency scoping meeting, as summarized below. Agency scoping officially lasted 204 days, beginning Thursday, October 7, 2021, and ending Thursday, April 28, 2022. Agencies were re-notified of the scoping end date once the Notice of Intent was published for the project and the scoping end date was determined.

3.1 Agency Outreach

A total of 32 agency scoping fact sheets were sent to elected officials and individuals at federal, state, and local agencies on October 7, 2021. To ensure consistent messaging, the fact sheet was identical to the public scoping fact sheet, except for the meeting details.

Local governments and elected officials contacted for scoping included:

- Glendale Irrigation Company
- Kane County Commission
- Kane County Conservation District
- Mt. Carmel Irrigation Company
- Orderville Irrigation Company
- Town of Glendale
- Town of Orderville
- U.S. Congressional Representatives

Federal and state agencies contacted for scoping included:

- Bureau of Land Management (BLM), Kanab Field Office
- National Park Service (NPS), Zion National Park
- U.S. Army Corps of Engineers (USACE), St. George Field Office
- USACE, Nevada/Utah Regulatory Branch
- U.S. Bureau of Reclamation (BOR)
- U.S. Environmental Protection Agency
- U.S. Fish and Wildlife Service
- Utah Department of Agriculture
- Utah Department of Cultural and Community Engagement
- Utah Department of Environmental Quality
- Utah Department of Public Safety
- Utah Department of Water Rights
- Utah Division of Wildlife Resources
- Utah Public Lands Policy Coordination Office
- Utah School and Institutional Trust Lands Administration
- Utah State Clearinghouse

Agencies were also invited to attend a virtual agency scoping meeting held online via Zoom on Monday, October 18, 2021, from 2:30 p.m. to 3:30 p.m. Two individuals attended the agency scoping meeting, representing the Division of Wildlife Resources Southern Region Office and USACE St. George Regulatory Office.

3.2 Agency Comments Received

A total of 9 agency comment documents were received which were categorized and organized into 57 specific comments. A comment summary table is included as **Appendix D** and all agency comments received are included in the Administrative Record and available upon request. A summary of issues identified during both public and agency scoping is included below.

4.0 Tribal Scoping

Scoping letters were mailed to 17 representatives of the 11 tribes as part of the outreach process. A single comment letter was received from the Hopi Tribe requesting hard copies of the cultural resource reports once these are prepared. All tribal comments received are included in the Administrative Record and available upon request.

- Las Vegas Tribe of Paiute Indians of the Las Vegas Indian Colony
- Ute Indian Tribe of the Uintah & Ouray Reservation
- Ute Mountain Ute Tribe
- Hopi Tribe of Arizona
- White Mesa, Ute Council
- Paiute Indian Tribe of Utah
- Navajo Nation Office of the President
- Pueblo of Zuni
- Moapa Band of Paiute Indians of the Moapa River Indian Reservation
- Kaibab Band of Paiute Indians of the Kaibab Indian Reservation
- San Juan Southern Paiute Tribe of Arizona

5.0 Summary of Issues

Based on the agency and public comments received, the primary project issues are listed below. All comments will be reviewed and responded to, as necessary, by the project team, and relevant comments will be considered and incorporated in the Draft Plan-Environmental Impact Statement (EIS). Multiple commenters requested that comments from the Draft Plan-EA process be included for consideration.

Summary of issues raised during scoping is included below.

General Comments

- Will the comments on the Draft Plan-EA be carried forward as issues to address in the Draft Plan-EIS?
- Comments contained requests to include other agencies and entities in the planning process: NPS, BLM, BOR, Colorado River Compact Signers.
- The Draft Plan-EIS should clearly disclose that the KCWCD already owns the land where the proposed Cove Reservoir would be located.
- The Draft Plan-EA discusses that the Jackson Flat Reservoir and the proposed project would both provide water to meet irrigation needs in the County. However, the two systems are separate, and water would not be shared between reservoirs. This should be clarified.

- The project needs to be shown to be consistent with the Washington County Resource Management Plan, specifically its irrigation policy, and the Kane County Resource Management Plan.

NEPA/Purpose and Need/Other Laws

- The Plan-EIS needs to be developed under current, applicable executive orders.
- The KCWCD and WCWCD should propose separate reservoir projects. The two water conservancy districts' needs and funding are different and the WCWCD does not need to be subsidized by the federal government.
- The purpose and need for the Draft Plan-EIS should clearly specify the water need and be broad enough to allow for a sufficient range of feasible and practicable alternatives.
- The Draft Plan-EIS should consider whether the water will ultimately be used for housing developments.

Water Resources

- The Plan-EIS needs to investigate the reduction in flow resulting from reservoir diversions on a seasonal basis, and any accompanying effects (e.g., increasing water temperature, loss of fish habitat, other ecological effects).
- The Draft Plan-EIS must analyze the project effects on groundwater resources and how any effects will be minimized or mitigated.
- The Draft Plan-EIS must address any potential impacts to wetlands, documenting these in a Waters of the U.S. Report, and detailing any necessary mitigation.

Invasive Species

- The Draft Plan-EIS needs to address non-native invasive species issues, including quagga mussels, Tamarisk, Russian olive, red shiner, and non-native game fish stocking in reservoir, among others.

Health and Safety

- The potential failure of the dam is extremely concerning for risk to downstream residents. The NRCS needs to assess all project risks to human health and safety and consider compensation for life and property loss in the event of a dam failure. A dam failure response plan should be included.
- The Draft Plan-EIS must address construction worker health and safety.

Economics

- All operating costs, water exchange agreements, and other economic incentives need to be clearly disclosed in the EIS to show the parties primarily benefitting from the reservoir.

- The NRCS must accurately assess the cost/benefit ratio of any and all project improvements constructed. Identified costs: reservoir operation, recreational facility operation, invasive species management need to be included. Identified benefits: agricultural increase, recreational reservoir use. Some comments claim the economic benefits are overstated and the project should be abandoned because of this.
- The Draft Plan-EIS must consider all the effects, costs, and benefits of any proposed hydropower facilities and should analyze a run-of-the-river hydropower alternative. Hydropower facilities must be shown to be economically viable.

Effects Analysis

- A full water budget and water quality analysis for the proposed reservoir needs to be included in the analysis, including inflow, outflow, evaporation, and seepage losses. Timing and location of diversions and releases need to be disclosed and effects analyzed.
- The Draft Plan-EIS must show conformance with the BLM Kanab Field Office Resource Management Plan.
- The Draft Plan-EIS should identify and explain mitigation measures to avoid or minimize negative effects of the project.
- The Draft Plan-EIS needs to analyze downstream recreational impacts, ecological impacts, and geomorphological impacts due to changes in the flow regime due to project diversions and releases.
- The Draft Plan-EIS should quantify the stationary, mobile, and non-road source emission activities associated with construction, and quantify any air quality impacts from operation and maintenance, including methane emissions from the reservoir.
- The Draft Plan-EIS needs to analyze traffic impacts during construction and design/detail appropriate Best Management Practices or mitigation measures.
- The Draft Plan-EIS must detail how all aspects of the Zion National Park Water Rights Settlement Agreement will be met.
- The Draft Plan-EIS needs to consider the effects of the East Zion Growth Initiatives on multiple resources, including recreation, economics, and water resources and rights.
- The Draft Plan-EIS must analyze project impacts on highly erodible soils, erosion and sediment deposition, and riparian resources.
- The Draft Plan-EIS must address changes to agricultural runoff, including chemical and pesticide loads, resulting from the project.

Alternatives

- The project should be expanded to include a comprehensive Watershed Plan for the entire East Fork Virgin River. This could have multiple sub-project components. Inclusion of a Beaver management plan is suggested.
- The Draft Plan-EIS should analyze additional reservoir sites beyond the Cove Reservoir location. A reservoir further upstream could more easily benefit water users.
- Additional recreational facilities within the watershed, not necessarily co-located with the reservoir, should be considered as part of project alternatives.
- The project purpose and need is too narrow and biased toward reservoir development. It needs to be broadened to include other alternatives.
- The project must consider non-structural/management alternatives to the proposed reservoir.
- The Draft Plan-EIS must consider agricultural water efficiency improvements as an alternative to the proposed reservoir.
- The NRCS should allocate funds to smaller, more economically viable projects instead of the proposed project.

Sensitive Species

- The Draft Plan-EIS must consider impacts to the Virgin Spinedace, managed under a conservation agreement, and petitioned to be listed as a threatened and endangered (T&E) species.
- The Draft Plan-EIS must clearly describe and disclose effects to aquatic species, whether positive or negative.
- The Draft Plan-EIS must address impacts to T&E species and habitat, including Mexican Spotted Owl, Southwestern Willow Flycatcher, Yellow-Billed Cuckoo, T&E fish species, and other state and federal sensitive species.

Recreation

- The project should consider a conservation pool for a water allocation for sport fisheries and development of sport fisheries as part of the recreation plan.

Watershed Protection

- The project should address erosion and bank stabilization in the Mt. Carmel area.

Wild and Scenic Rivers

- The Draft Plan-EIS must address the project impacts on the Wild and Scenic River designation of a section of the East Fork Virgin River downstream of the project. The NPS will require a Section 7 determination.

- The hydropower facilities must be Federal Energy Regulatory Commission (FERC) permitted and compliant with FERC regulations that limit licensing of dam and hydropower facilities above Wild and Scenic River designated segments.

Cumulative Effects

- The Draft Plan-EIS must consider cumulative effects of the following projects: the Lake Powell Pipeline project, the Ash Creek Reservoir and pipeline project, a new flood control project in the Virgin River watershed, and other past projects in the area.

Areas of Critical Environmental Concern

- The Draft Plan-EIS must address project impacts on downstream Areas of Critical Environmental Concern, wilderness areas, Wilderness Study Areas, and research natural areas.

Biological Resources

- The project should make a clear commitment to a minimum amount of water to be released during the summer months to benefit fish and wildlife habitat.

Climate Change

- The Draft Plan-EIS must address the impact of climate change on the project and water supply reliability.

Environmental Justice

- The Draft Plan-EIS must address Environmental Justice effects.

Legal

- A discussion of why the proposed project is so large compared to most NRCS watershed projects should be included in the Draft Plan-EIS.

Tribal and Cultural Resources

- The Draft Plan-EIS must comply with the National Historic Preservation Act.
- The Draft Plan-EIS needs to include input from sovereign tribes in the Lower Colorado River Basin and State of Utah who are not receiving their full water allocation.

RE: Cove-East Fork Virgin River Watershed Plan EIS Project
Parcel No.:

<Salutation>:

The United States Department of Agriculture Natural Resources Conservation Service (USDA-NRCS), in coordination with the Kane County Water Conservancy District (KCWCD) as the project sponsor and Washinton County Water Conservancy District (WCWCD) as the co-sponsor, is considering proposed improvements within the East Fork Virgin River Watershed. The proposed improvements include the construction of a new, up to 6,055-acre-foot capacity reservoir (Cove Reservoir), as well as other improvements within the existing Mt. Carmel, Glendale and Orderville Irrigation Systems. Improvements under consideration will address water conservation concerns, agricultural and municipal demands, public safety risks, and will increase opportunities for public recreation. See the enclosed Project Fact Sheet for information about project features.

This proposed action is prepared under the authority of the Watershed Prevention and Flood Protection Act (Public Law 83–566). This action is needed because agriculture users in the Upper Virgin Watershed routinely experience water shortages during late summer months when East Fork Virgin River flows are depleted. Existing irrigation facilities have limited capabilities to divert water from the river, and there is currently no capacity for storage during non-use and high-flow periods. As a result, adequate water is not available to local users; therefore, the purpose of the action is to provide enhanced conservation and beneficial use of water by increasing water availability through collection and storage during non-use periods to provide adequate flows during the irrigation season.

In compliance with the National Environmental Policy Act (NEPA), USDA-NRCS will develop an Environmental Impact Statement to analyze potential impacts to the natural and human environment from the proposed project. As the project sponsor, KCWCD, and WCWCD as the co-sponsor, in coordination with USDA-NRCS, has retained Transcon Environmental, a third-party environmental consultant, to assist with NEPA compliance activities and resource studies.

This letter is to notify you of the project, request comments, and invite you to a public scoping meeting, to be held virtually via Zoom on Wednesday, October 6 from 6:00pm—7:30pm. The Zoom details are below:

USDA is an equal opportunity provider, employer, and lender.

The purpose of the meeting is for the project team to better understand potential alternatives and issues to be considered during environmental analysis. The meeting will consist of a brief presentation about the proposed project followed by a question-and-answer session. Written comments about the project may be submitted during the scoping meeting, or sent to the address below. All comments must be post-marked by **October 21, 2021**. Please send or email comments to:

Transcon Environmental, Inc.
Attn: Brian Parker

We look forward to receiving your comments and discussing this project further.

Sincerely,

Emily Fife

Commented [IS1]: NRCS, please update sender and title, if needed

A.2. Project Fact Sheet

USDA United States Department of Agriculture

Cove-East Fork Virgin River Watershed Project – Kane County, Utah

Agency Scoping Notice

Project Information

The U.S. Department of Agriculture Natural Resources Conservation Service (NRCS), with assistance of the Kane County Water Conservancy District as the project sponsor and Washington County Water Conservancy District as the co-sponsor, is considering proposed improvements within the East Fork Virgin River Watershed. The proposed improvements include a new water storage facility (Cove Reservoir), or an alternate reservoir site, as well as other improvements associated with the Mt. Carmel, Glendale, and Orderville irrigation systems.

NRCS is holding a virtual agency meeting, via Zoom to provide information about the proposed project and to collect comments. Supplemental technical studies are scheduled to take place during fall 2021, with a Draft Watershed Plan – Environmental Impact Statement (Plan-EIS) circulated to the public and agencies for review in mid-2022. The Plan-EIS will further evaluate the proposed project along with any viable project alternatives in accordance with the rules and guidelines of the National Environmental Policy Act (NEPA) and Council on Environmental Quality (CEQ).

The Plan-EIS is being funded under the NRCS Watershed Flood Prevention and Protection Program (PL83-566), which provides both technical and financial assistance to help communities protect, improve, and develop water and land resource in watersheds up to 250,000 acres.

Project Background

Initially known as the "Cove Reservoir Watershed" project, alternatives and associated impacts were analyzed in a Watershed Plan-Environmental Assessment (Plan-EA); however, after careful project review and consideration of comments received on the Draft Plan-EA presented in winter 2020/2021, the NRCS has initiated the preparation of a Plan-EIS.

Improvements under consideration include water conservation, water storage, agricultural and municipal demands, public safety risks, and increased opportunities for public recreation in the East Fork Virgin River watershed.

Project Website

Additional information can be found at the NRCS project website:

https://www.nrcs.usda.gov/wps/portal/nrcs/detail/ut/programs/planning/wpfp/?cid=nrcseprd1403022

Agency Meeting

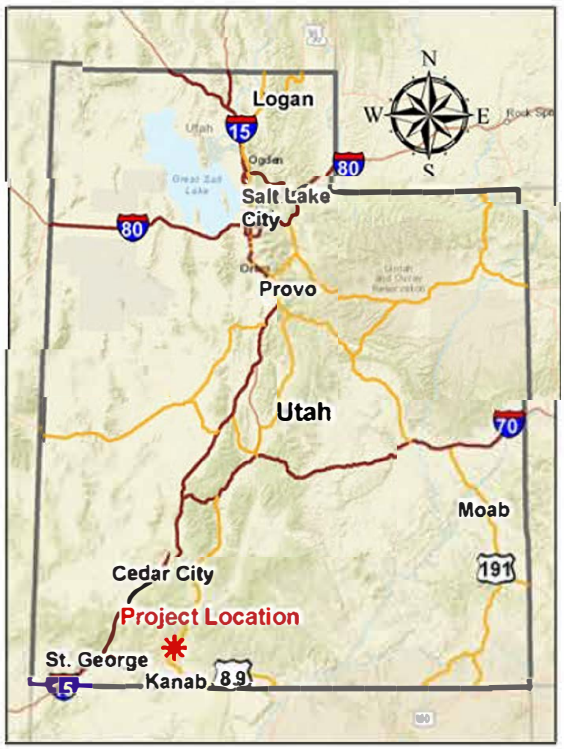
Agencies are invited to attend a project scoping presentation, discuss project details, and submit comments during the online meeting:

Virtual Meeting
Monday, October 18, 2021
2:30 P.M. – 3:30 P.M. (MST)

How to Join the Virtual Agency Meeting

Log-in via Zoom: zoom.us/join
Enter Meeting ID: 886 6521 8321
Passcode: 992578
Note: This meeting will be recorded. A copy can be made available upon request.

Project Location Map



At this time, the NRCS is requesting comments on the project to identify opportunities, issues, and resource concerns.

How to Provide Official Comment

All comments should be directed to Brian Parker:

Transcon Environmental
Attn: Brian Parker
1745 South Alma School Rd., Suite 220
Phoenix, AZ 85210
480-807-0095
bparker@transcon.com

Comments must be received or post-marked no later than 30 days after the NOI is published in the Federal Register.

How to Be Added to Mailing List

Provide your email address when logging into the Zoom meeting or send a letter or email request to Brian Parker using the contact information provided above.

A.3. Newspaper Notification

ATTENTION
Kane County Voters
General Election
November 02, 2021
7:00 a.m. to 8:00 p.m.

Last day a voter can register to vote for the General Election by mailing a registration form, Online or in-person is October. 22, 2021
The Kane County Clerk's Office is open from 8:00 a.m. to 5:00 p.m.
Public Logic & Accuracy Testing will take place on October. 08, 2021 at 10:00 a.m.
Board of Canvassers will meet on Nov. 16, 2021 at 10:00 a.m.

****

Early Voting will begin on Oct. 19, and ends on Oct. 29, 2021, from 8:00 a.m. to 5:00 p.m. at the County Clerk's Office, 76 North Main Street.
All Voters will need a photo ID

****

All of Kane County is now a "Vote by Mail" County. This means you will receive a *"PAPER BALLOT"* in the mail. PLEASE DO NOT THROW IT AWAY!

If you choose not to vote your "Absentee/By Mail" Ballot you may vote in person at the "Kanab Election Center" located at the "Kane County Courthouse" 76 North Main on Election Day or at the "Valley Vote Center" located at the "Kane County North Event Center" located at 475 East State Street on Election Day. You will need to bring in your "By Mail Ballot" to the election center with you where your original ballot will be spoiled, you will be issued a *"NEW PAPER BALLOT."*

You can also choose to vote early in person at the Kane County Clerk/Auditor's Office by bringing in your "By Mail Ballot" where your original ballot will be spoiled, to cast your vote in person on a *"NEW PAPER BALLOT."*

Ballot Drop Box will be available beginning Oct. 12, 2021 at 8:00 A.M and Closing Nov. 02, 2021 at 8:00 P.M.

****

SAMPLE BALLOTS
Races that will be on the General Municipal Election

2021 WATER RESOURCES PLAN PUBLIC COMMENT PERIOD
Wednesday, September 29, 2021 – Monday, November 15, 2021

The Utah Division of Water Resources (Division) is pleased to announce the draft 2021 Water Resources Plan (2021 Plan) is available for review. The 2021 Plan identifies action the Division will take over the next five years. It focuses on reliable data, supply security, and a healthy environment.

A public comment period is open from Wednesday, September 29, 2021, through Monday, November 15, 2021. The draft 2021 Plan is posted on the Water Plan page of the Division's website water.utah.gov/2021waterplan for review. Comments may be submitted using the comment form link found on the Water Plan page.

A virtual open house will be held on Wednesday, October 20, 2021, from 7:00 PM – 8:00 PM. During the open house, a short presentation about the 2021 Plan will be followed by a question and answer session. Written questions will be accepted throughout the virtual open house session using the Question and Answer feature of the meeting software. To join the open house, use the link found on the Water Plan page.

Proposed Cove-East Fork Virgin River Watershed Project – Kane Co, Utah Scoping Notice and Public Scoping Meeting Announcement Wednesday, October 20, 2021, 6:00-7:30 P.M.

Project Information:
The U.S. Department of Agriculture Natural Resources Conservation Service (NRCS), with assistance of the Kane County Water Conservancy District as the project sponsor and Washington County Water Conservancy District as the cosponsor, is considering proposed improvements within the East Fork Virgin River Watershed. The proposed improvements include a new water storage facility (Cove Reservoir), or an alternate reservoir site, as well as other improvements associated with the Mt. Carmel, Glendale, and Orderville irrigation systems.
NRCS is holding a virtual public meeting, via Zoom to provide information about the proposed project and to collect comments. Supplemental technical studies are scheduled to take place during fall 2021, with a Draft Watershed Plan – Environmental Impact Statement (Plan-EIS) circulated to the public and agencies for review in mid-2022. The Plan-EIS will further evaluate the proposed project along with any viable project alternatives in accordance with the rules and guidelines of the National Environmental Policy Act (NEPA) and Council on Environmental Quality (CEQ).
The Plan-EIS is being funded under the NRCS Watershed Flood Prevention and Protection Program (PL83-566), which provides both technical and financial assistance to help communities protect, improve, and develop water and land resource in watersheds up to 250,000 acres.
Project Background:
Initially known as the "Cove Reservoir Watershed" project, alternatives and associated impacts were analyzed in a Watershed Plan-Environmental Assessment (Plan-EA); however, after careful project review and consideration of comments received on the Draft Plan-EA presented in winter 2020/2021, the NRCS has initiated the preparation of a Plan-EIS.
Improvements under consideration include water conservation, water storage, agricultural and municipal demands, public safety risks, and increased opportunities for public recreation in the East Fork Virgin River watershed.
At this time, NRCS is requesting comments on the project to identify issues and resource concerns. NRCS will hold a virtual public meeting to provide information about the proposed project and to collect comments.

Attend the virtual public scoping meeting via Zoom:
The public is invited to attend, discuss, and submit a comment during the public meeting:
Wednesday, October 20, 2021
6:00 P.M. – 7:30 P.M.

Notice of Public Hearing

Proposed Rate adjustment for Garkane members

Scheduled for Monday, Oct. 25th, 2021 at Garkane's Hatch office at 1:00 p.m.

A public hearing is scheduled on Monday, Oct. 25, 2021, in Garkane's Hatch office at 1:00 P.M. The Hatch office is located at 468 N. Hwy 89, in Hatch, UT. Comments or questions may be submitted via email at **neal.brown@garkane.com** or you can mail your comments or questions to: Garkane Energy, Attn: Public Hearing, 1802 s. Hwy 89a, Kanab, UT 84741. All written, or emailed comments submitted by Friday, October 22, 2021 will be distributed to the Board of Directors for review.

The purpose of the public hearing will be to discuss the proposed rate adjustments brought upon by wholesale power cost increases imposed on Garkane Energy Cooperative by Deseret Power.

A copy of the full proposed draft will be available at **www.garkaneenergy.com** under "**Your Co-op**" in the rates section of the website.

Written comments can be directed to:

COVE – EAST FORK VIRGIN RIVER WATERSHED PROJECT

PUBLIC SCOPING MEETING

October 20, 2021

MEETING PURPOSE

- Introduce the Project Sponsor and Team
- Provide an overview of the NRCS PL-566 Program
- Review the background and history of the Cove – East Fork Virgin River Watershed Project
    - Formerly the Cove Reservoir Project
- Present the purpose and preliminary alternatives being considered
- Inform the public how to provide scoping comments on the project
- Answer questions and collect comments from the public

LEAD AGENCY / SPONSORS

LEAD FEDERAL AGENCY

- U.S. DEPARTMENT OF AGRICULTURE - NATURAL RESOURCES CONSERVATION SERVICE

SPONSORING LOCAL ORGANIZATIONS

- KANE COUNTY WATER CONSERVANCY DISTRICT (PRIMARY SPONSOR)
- WASHINGTON COUNTY WATER CONSERVANCY DISTRICT (CO-SPONSOR)

IN COOPERATION WITH

- ENVIRONMENTAL PROTECTION AGENCY
- BUREAU OF LAND MANAGEMENT
- NATIONAL PARK SERVICE

PROJECT TEAM

NRCS UTAH

Norm Evenstad, *Assistant State Conservationist*

Derek Hamilton, *Water Resources Coordinator*

Leslie Warta, *Environmental Compliance Specialist*

Lance Smith, *Project Engineer*

Marcel Corbeil, *Cultural Resources Specialist*

KCWCD - SPONSOR

Mike Noel, *Executive Director*

Dirk Clayson, *Private Consultant Lands and Real Estate*

WCWCD – CO-SPONSOR

Zach Renstrom, *General Manager*

Corey Cram, *Associate General Manager*

ECONOMIC ANALYSIS

Scott Hoag Jr., *Economic Analyst*

PROJECT AUTHORITY

- **Authority**: Public Law 83-566, the Watershed Protection and Flood Prevention Act of 1954, as amended
- **Policy**: National Watershed Program Manual and Handbook sets plan policy
- **Project Sponsors**: Local organizations that have legal authority and resources to install, operate, and maintain improvements.
- **Authorized Purposes**: Flood prevention; watershed protection (erosion/sediment control); public recreation; fish and wildlife habitat; agricultural water; M&I water; water quality; watershed structure rehab; hydropower sources
- **NEPA**: The Plan-EIS is being prepared in accordance with Section 102(2)(c) of the National Environmental Policy Act of 1969 (NEPA), PL 91-190, as amended.

PL-566 OVERVIEW

- The Watershed Protection and Flood Prevention Act (PL-566) authorizes the NRCS to help local organizations and governments plan and implement physically, environmentally, socially and economically sound watershed project plans for the benefit of the public.
- Provides technical and financial assistance to project sponsors for planning and installing watershed projects (e.g., dams, debris basins, pipelines, etc.)
- Locally led NRCS teams. Local leadership is key.
- Up to a 250,000-acre watershed per project

PL-566 ELIGIBLE PURPOSES

- Flood Prevention
- Watershed Protection
- Agricultural Water Management
- Municipal and Industrial Water Supply
- Fish and Wildlife Habitat and Public Recreation Development

PL-566 PROJECTS

STRUCTURAL MEASURES

- **Dams**
- **Channel restoration**
- **Diversions**
- **Floodwalls**
- **Dikes**

NON-STRUCTURAL MEASURES

- **Upland conservation and erosion protection**
- **Wetland restoration**

PROJECT NEPA BACKGROUND

- Initially known as the "*Cove Reservoir Watershed*" Project
- Development of alternatives, resource studies, and impacts analyses were conducted from spring 2018 to fall 2020.
- Documented in a Draft Watershed Plan Environmental Assessment (Plan-EA)
- Preferred Alternative identified in the Plan-EA was the Cove Reservoir
- Draft Plan-EA published for public review and comment in December 2020
- Following review and consideration of comments, the Draft Plan-EA was not approved, but informed the NRCS to move to an EIS to analyze any viable alternatives in further detail

PROJECT BACKGROUND

- Initial planning for the proposed project began over 25 years ago
- Numerous agencies and irrigation companies involved in the planning including the Bureau of Land Management, National Park Service, U.S. Fish and Wildlife Service, Utah Department of Natural Resources, KCWCD, WCWCD, Orderville Irrigation Co., etc.
- Guidelines and limitations for potential projects in the East Fork Virgin River Watershed, including several specific reservoir alternatives, were identified and agreed upon in the *Zion National Park Agreement* (1996)
- *East Fork Virgin River Instream Flow MOU* (2000) regulates water flows on the East Fork Virgin River within the watershed being analyzed for this project

PROJECT PURPOSE

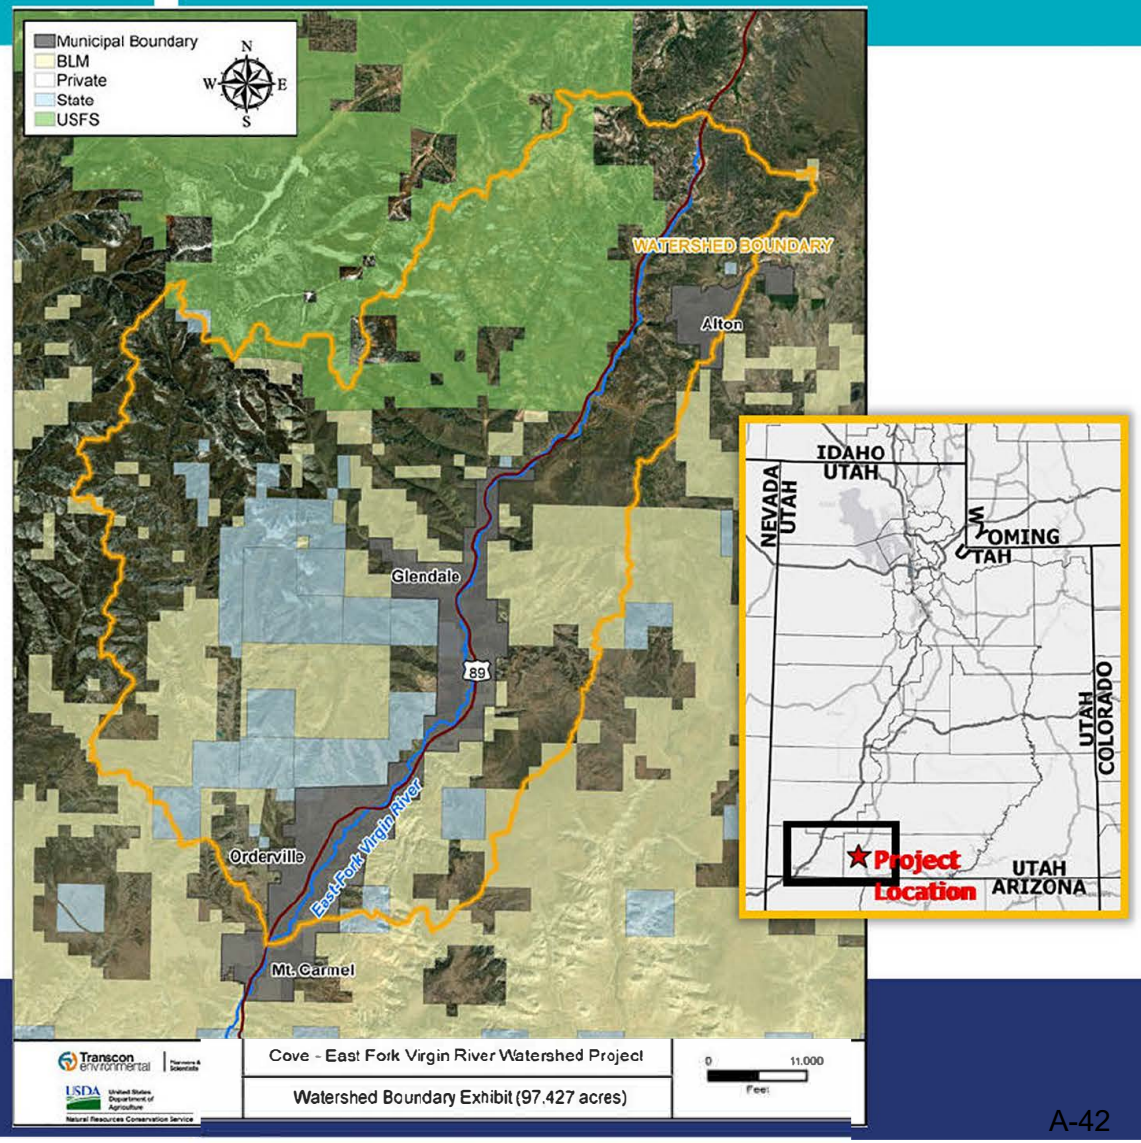
- Currently no critical water storage capacity or reliable irrigation water delivery to local agricultural users during the dry summer months
- Local water users in Kane County continue to experience water shortages
- Limited capability of existing irrigation system to utilize flows from the East Fork Virgin River
- Need for additional water reliability in Washington County
- Additional water-based recreation opportunities for locals and tourists

PROJECT PURPOSE

Project Response to the Needs:

- Identify a viable alternative which once implemented would:
  - Increase water availability and reliability for current and future users
  - Improve irrigation efficiency
  - Increase the availability of recreational opportunities (e.g., fishing, non-motorized boating, hiking, camping, etc.)
- Additional benefit: increase in hydroelectric energy supply to the community

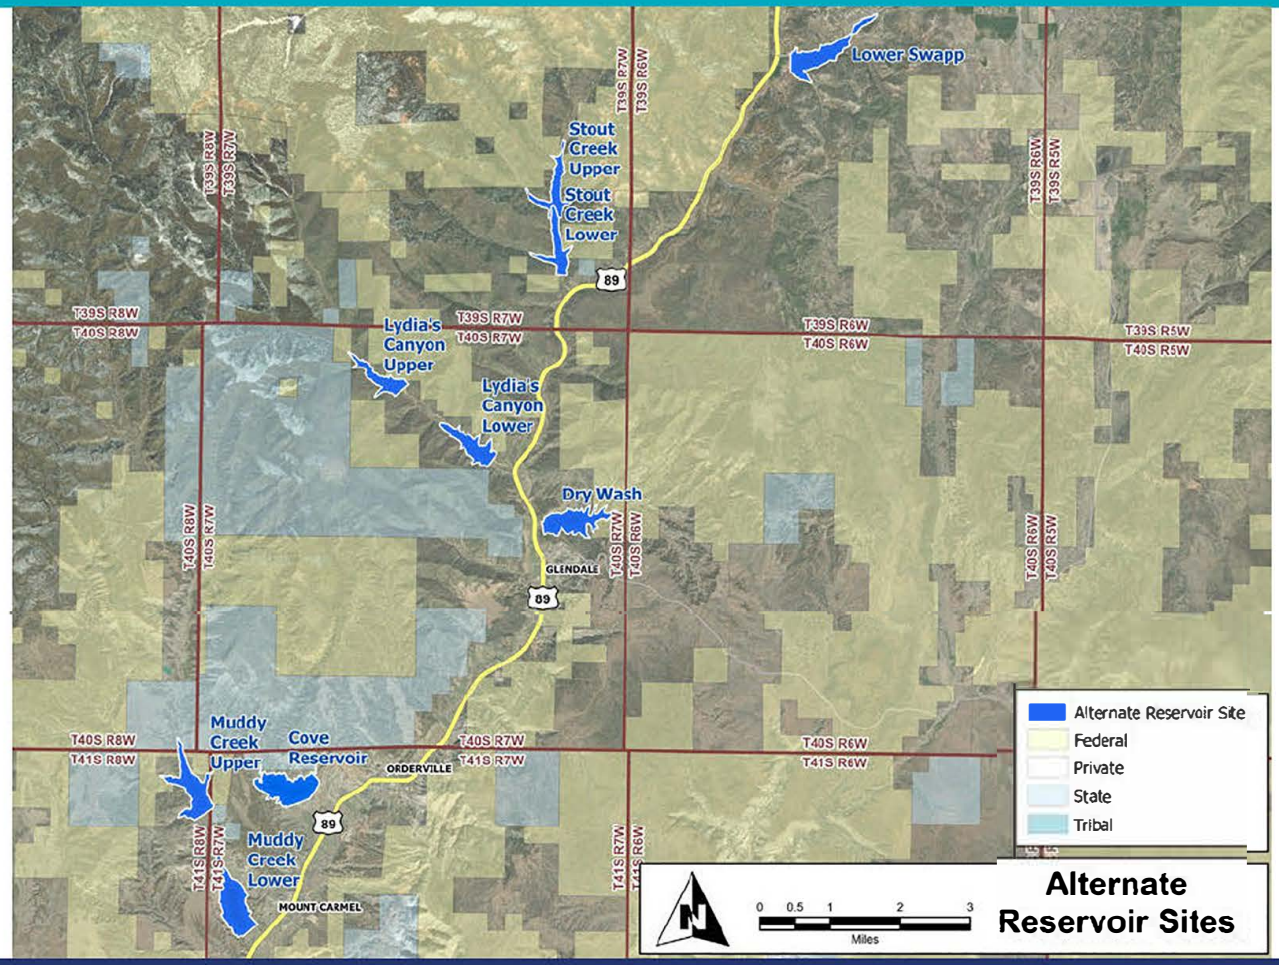
WATERSHED OVERVIEW



East Fork Virgin River Watershed

- Includes 3 HUC-6 Watersheds within the overall Upper Virgin Watershed
  - Lydia's Canyon-East Fork Virgin River (150100080203)
  - Muddy Creek (150100080202)
  - Headwaters East Fork Virgin River (150100080201)
- Overall watershed area - 97,427 acres
- Land Ownership
  - BLM
  - USFS
  - SITLA
  - Private

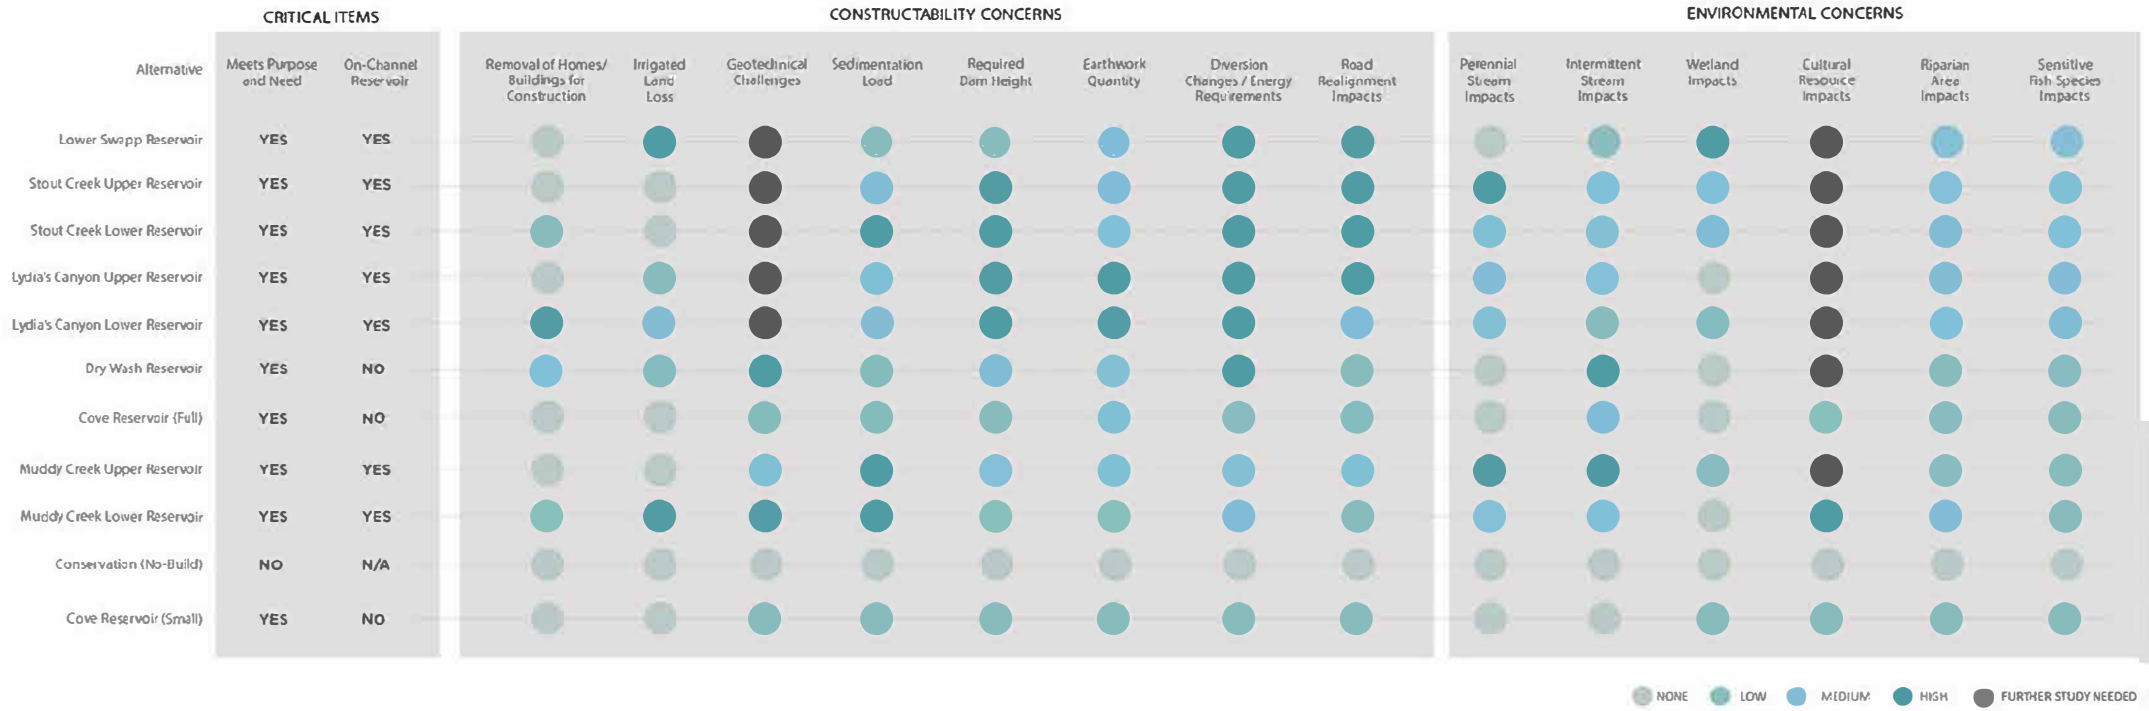
ALTERNATIVES BEING CONSIDERED



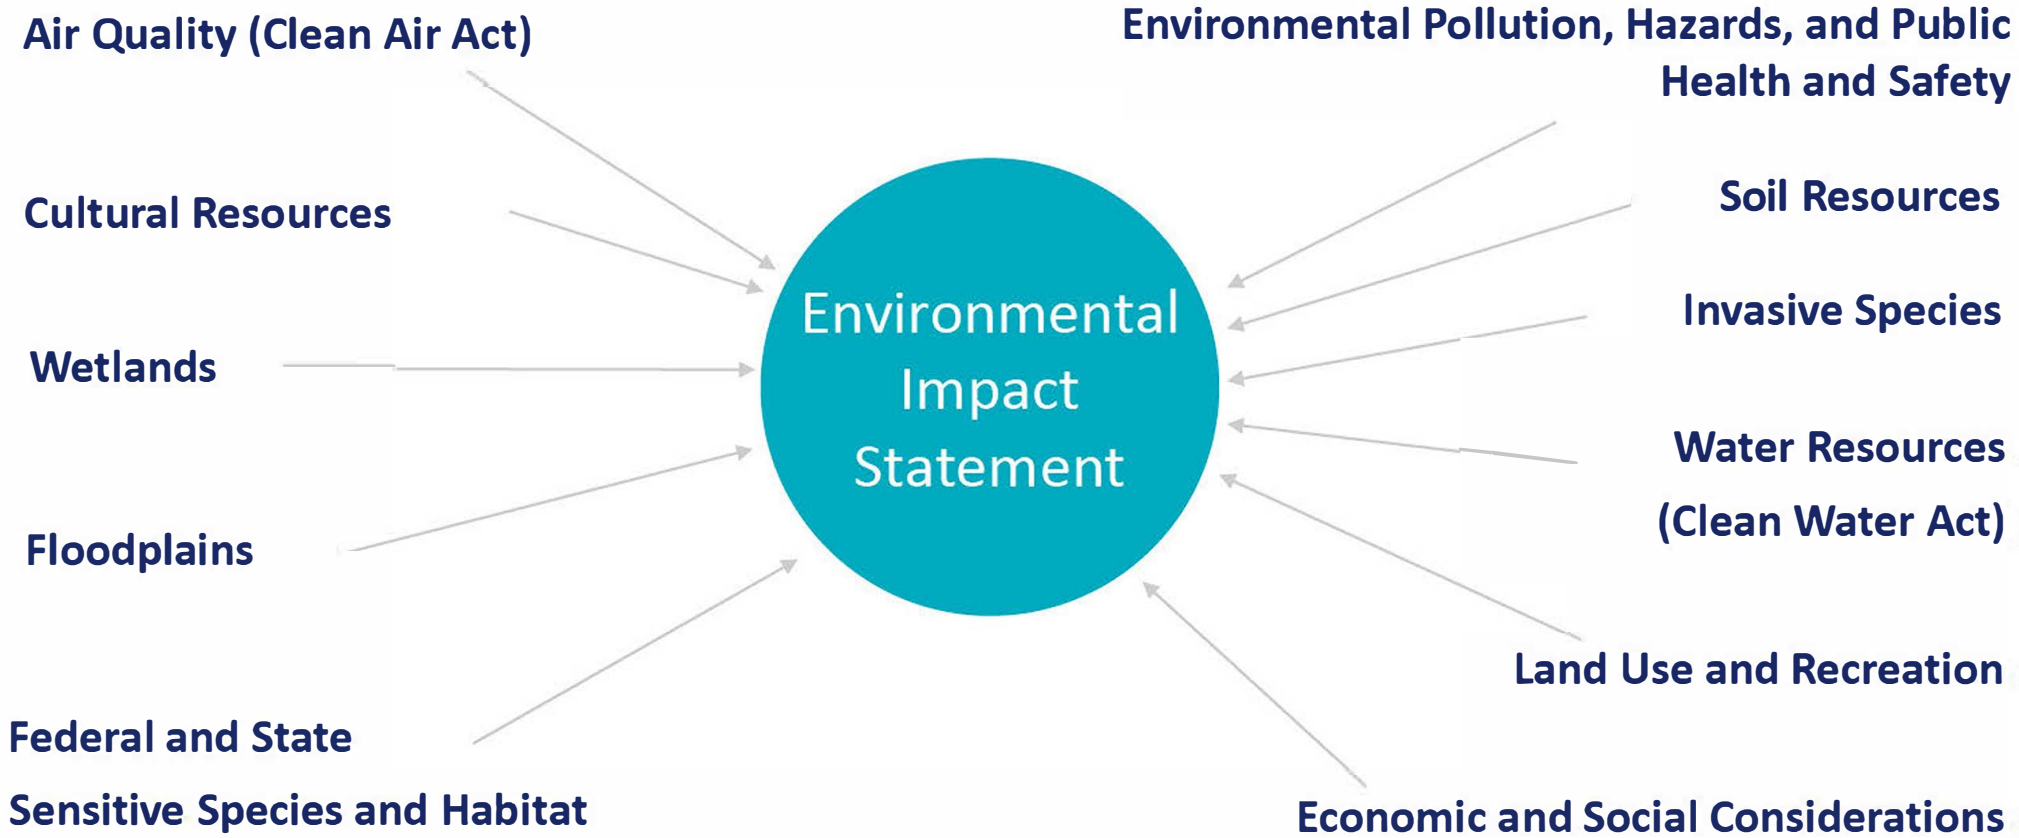
OTHER ITEMS BEING CONSIDERED

- Recreational facilities and access for the sites
- Water conservation
- Channel stabilization to reduce sediment loads.
- No Action Alternative

ALTERNATIVES MATRIX



RESOURCES TO BE CONSIDERED



NEPA PROCESS / TIMELINE

PROJECT TIMELINE

1. WE ARE HERE
   Resource Evaluation / Prepare Draft EIS
   FALL 2021– SUMMER 2022
2. Agency Review / Public Comment Period / Final EIS / Decision Document
   FALL 2022– SPRING 2023
3. Final Design*
   *(pending environmental approval and funding)
   2023 – 2024
4. Begin Project Construction*
   *(pending environmental approval and funding)
   2025

NEPA PROCESS

WE ARE HERE

Initiate Environmental Impact Statement
- Develop project purpose & need
- Conduct agency & public scoping
- Collect baseline data
- Develop project alternatives

Collect Data
- Analyze existing conditions
- Identify data gaps from existing Plan-EA
- Conduct additional needed resource surveys
- Agency consultation & coordination

Analyze Alternatives
- Analyze alternatives
- Evaluate potential impacts to environmental resources

Draft Environmental Impact Statement
- Release Draft EIS to public for review and comment
- Review all public and agency comments
- Prepare Final EIS

Decision Document
- NRCS will prepare a Record of Decision and post a Notice of Availability of the Final EIS in the Federal Register

HOW TO COMMENT

Official comments for the Cove – East Fork Virgin River Watershed Project can be submitted via comment card, letter, or email to the following:

Brian Parker
Transcon Environmental
1745 South Alma School Road, Suite 220
Phoenix, Arizona 85210
480-807-0095
bparker@transcon.com

Pre-addressed comment cards can be downloaded from the NRCS project planning website. Comment cards are also available for your convenience at the Kane County Water Conservancy District Office in Kanab, Utah.

Comments may also be provided during the virtual Q&A session following this presentation.

THANK YOU!

USDA United States Department of Agriculture

Cove-East Fork Virgin River Watershed Project – Kane County, Utah

Agency Scoping Notice

Project Information

The U.S. Department of Agriculture Natural Resources Conservation Service (NRCS), with assistance of the Kane County Water Conservancy District as the project sponsor and Washington County Water Conservancy District as the co-sponsor, is considering proposed improvements within the East Fork Virgin River Watershed. The proposed improvements include a new water storage facility (Cove Reservoir), or an alternate reservoir site, as well as other improvements associated with the Mt. Carmel, Glendale, and Orderville irrigation systems.

NRCS is holding a virtual agency meeting, via Zoom to provide information about the proposed project and to collect comments. Supplemental technical studies are scheduled to take place during fall 2021, with a Draft Watershed Plan – Environmental Impact Statement (Plan-EIS) circulated to the public and agencies for review in mid-2022. The Plan-EIS will further evaluate the proposed project along with any viable project alternatives in accordance with the rules and guidelines of the National Environmental Policy Act (NEPA) and Council on Environmental Quality (CEQ).

The Plan-EIS is being funded under the NRCS Watershed Flood Prevention and Protection Program (PL83-566), which provides both technical and financial assistance to help communities protect, improve, and develop water and land resource in watersheds up to 250,000 acres.

Project Background

Initially known as the "Cove Reservoir Watershed" project, alternatives and associated impacts were analyzed in a Watershed Plan-Environmental Assessment (Plan-EA); however, after careful project review and consideration of comments received on the Draft Plan-EA presented in winter 2020/2021, the NRCS has initiated the preparation of a Plan-EIS.

Improvements under consideration include water conservation, water storage, agricultural and municipal demands, public safety risks, and increased opportunities for public recreation in the East Fork Virgin River watershed.

Project Website

Additional information can be found at the NRCS project website:

https://www.nrcs.usda.gov/wps/portal/nrcs/detail/ut/programs/planning/wpfp/?cid=nrcseprd1403022

Agency Meeting

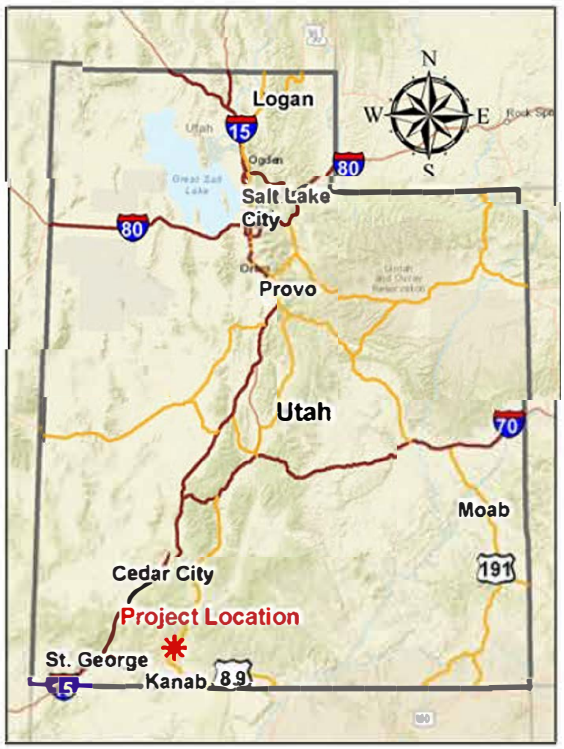
Agencies are invited to attend a project scoping presentation, discuss project details, and submit comments during the online meeting:

Virtual Meeting
Monday, October 18, 2021
2:30 P.M. – 3:30 P.M. (MST)

How to Join the Virtual Agency Meeting

Log-in via Zoom: zoom.us/join
Enter Meeting ID: 886 6521 8321
Passcode: 992578
Note: This meeting will be recorded. A copy can be made available upon request.

Project Location Map



At this time, the NRCS is requesting comments on the project to identify opportunities, issues, and resource concerns.

How to Provide Official Comment

All comments should be directed to Brian Parker:

Transcon Environmental
Attn: Brian Parker
1745 South Alma School Rd., Suite 220
Phoenix, AZ 85210
480-807-0095
bparker@transcon.com

Comments must be received or post-marked no later than 30 days after the NOI is published in the Federal Register.

How to Be Added to Mailing List

Provide your email address when logging into the Zoom meeting or send a letter or email request to Brian Parker using the contact information provided above.

Mr. Whit Bunting
Field Manager, Kanab Field Office
Bureau of Land Management

RE: Formal request to be a Cooperating Agency in the development of the Cove-East Fork Virgin River Watershed Plan-Environmental Impact Statement (Plan-EIS) for proposed improvements in Kane County, Utah.

Dear Mr. Bunting:

In accordance with the Council on Environmental Quality regulations implementing the National Environmental Policy Act (NEPA) at 40 CFR Part 1501.8, the Natural Resources Conservation Service (NRCS) is formally requesting that the Bureau of Land Management become a cooperating agency in the planning and development of the Cove-East Fork Virgin River Watershed Plan-EIS. Please visit the project website at https://bit.ly/cove-eastforkvirginriver-EIS for information on the Plan-EIS.

This request is made since your agency is identified as having special expertise or jurisdiction by law related to this project. The Plan-EIS is being prepared to fulfill our NEPA compliance responsibilities pertaining to our federal financial assistance through the Watershed Protection and Flood Prevention Program as authorized through Public Law 83-566. Upon acceptance of this invitation, roles can be defined in an informal agreement or a memorandum of understanding. If your agency is unable to participate as a cooperating agency, please return a written explanation indicating that your agency cannot participate.

Please send notification confirming your decision to: Emily Fife, State Conservationist, NRCS, Wallace F Bennett Federal Building,

Thank you for your timely response and assistance with these efforts. If you have any questions, please contact Derek Hamilton, Water Resources Coordinator, at

Sincerely,

Norm Evenstad

C.3. Tribal Scoping Letter

November 20, 2020

Mr. Greg Anderson
Chairman
Moapa Band of Paiute Indians of the Moapa Indian Reservation, Nevada

Reference: Cove Reservoir Watershed Plan-EA Project, Kane County, Utah

Dear Mr. Anderson:

The United States Department of Agriculture Natural Resources Conservation Service (NRCS) in coordination with the Kane County Water Conservancy District (KCWCD) announce the availability of the Draft Watershed Plan and Environmental Assessment (Plan-EA) for the Cove Reservoir Watershed Project within the East Fork Virgin River Watershed in Kane County, Utah. The project would improve agricultural and municipal water supply, provide for more water-based recreational opportunities and provide benefits to habitat for sensitive wildlife species downstream.

As designed, the project will involve the construction of a new, approximately 6,055-acre-foot reservoir east of Orderville, Utah. Project components associated with the reservoir include an earthen dam, principal and auxiliary spillways, reservoir outlet works and emergency drain, an access road around the reservoir, camping and recreation area, and a boat ramp to allow for non-motorized boating. The project would also involve the replacement of approximately 1.7-miles of pipeline in Glendale, Utah and the relocation and upgrade of the existing Glendale Hydroelectric Plant.

An electronic copy of the Draft Plan-EA can be downloaded from the NRCS Cove Reservoir Watershed planning webpage, accessed from the web address below. A hard copy of the Draft Plan-EA can also be made available to you upon request.

https://www.nrcs.usda.gov/wps/portal/nrcs/detail/ut/programs/planning/wpfp

NRCS invites you to submit comments anytime during the open comment period starting November 25, 2020 and ending on December 31, 2020. Please refer to the enclosed flyer for instructions on submitting comments. **Comments must be received by December 31, 2020 to become part of the public record.**

We look forward to hearing from and working with you on this important project. We welcome your call if you have questions on the proposed project or if you wish to arrange a meeting. If you have any questions, comments or concerns, please contact State Cultural Resources Specialist Tara S. Hoffmann at at your earliest convenience.

As designed, the project will involve the construction of a new, approximately 6,055-acre-foot reservoir east of Orderville, Utah. Project components associated with the reservoir include an earthen dam, principal and auxiliary spillways, reservoir outlet works and emergency drain, an access road around the reservoir, camping and recreation area, and a boat ramp to allow for non-motorized boating. The project would also involve the replacement of approximately 1.7-miles of pipeline in Glendale, Utah and the relocation and upgrade of the existing Glendale Hydroelectric Plant.

An electronic copy of the Draft Plan-EA can be downloaded from the NRCS Cove Reservoir Watershed planning webpage, accessed from the web address below. A hard copy of the Draft Plan-EA can also be made available to you upon request.

Dear Dr. Dongoske:

The United States Department of Agriculture Natural Resources Conservation Service (NRCS) in coordination with the Kane County Water Conservancy District (KCWCD) announce the availability of the Draft Watershed Plan and Environmental Assessment (Plan-EA) for the Cove Reservoir Watershed Project within the East Fork Virgin River Watershed in Kane County, Utah. The project would improve agricultural and municipal water supply, provide for more water-based recreational opportunities and provide benefits to habitat for sensitive wildlife species downstream.

As designed, the project will involve the construction of a new, approximately 6,055-acre-foot reservoir east of Orderville, Utah. Project components associated with the reservoir include an earthen dam, principal and auxiliary spillways, reservoir outlet works and emergency drain, an access road around the reservoir, camping and recreation area, and a boat ramp to allow for non-motorized boating. The project would also involve the replacement of approximately 1.7-miles of pipeline in Glendale, Utah and the relocation and upgrade of the existing Glendale Hydroelectric Plant.

November 20, 2020

Mr. Clint Wagon
Chairman
Eastern Shoshone Tribe of the Wind River Reservation, Wyoming

Reference: Cove Reservoir Watershed Plan-EA Project, Kane County, Utah

Dear Mr. Wagon:

The United States Department of Agriculture Natural Resources Conservation Service (NRCS) in coordination with the Kane County Water Conservancy District (KCWCD) announce the availability of the Draft Watershed Plan and Environmental Assessment (Plan-EA) for the Cove Reservoir Watershed Project within the East Fork Virgin River Watershed in Kane County, Utah. The project would improve agricultural and municipal water supply, provide for more water-based recreational opportunities and provide benefits to habitat for sensitive wildlife species downstream.

As designed, the project will involve the construction of a new, approximately 6,055-acre-foot reservoir east of Orderville, Utah. Project components associated with the reservoir include an earthen dam, principal and auxiliary spillways, reservoir outlet works and emergency drain, an access road around the reservoir, camping and recreation area, and a boat ramp to allow for non-motorized boating. The project would also involve the replacement of approximately 1.7-miles of pipeline in Glendale, Utah and the relocation and upgrade of the existing Glendale Hydroelectric Plant.

An electronic copy of the Draft Plan-EA can be downloaded from the NRCS Cove Reservoir Watershed planning webpage, accessed from the web address below. A hard copy of the Draft Plan-EA can also be made available to you upon request.

C.4. Agency Scoping Meeting Materials

THANK YOU FOR JOINING!

THIS MEETING WILL BEGIN AT APPROXIMATELY 6:05 P.M. TO ALLOW FOR ALL ATTENDEES TO SIGN IN.

WE APPRECIATE YOUR PATIENCE!

WELCOME

COVE – EAST FORK VIRGIN RIVER WATERSHED PROJECT

PUBLIC SCOPING MEETING

October 20, 2021

MEETING PURPOSE

- Introduce the Project Sponsor and Team
- Provide an overview of the NRCS PL-566 Program
- Review the background and history of the Cove – East Fork Virgin River Watershed Project
    - Formerly the Cove Reservoir Project
- Present the purpose and preliminary alternatives being considered
- Inform the public how to provide scoping comments on the project
- Answer questions and collect comments from the public

LEAD AGENCY / SPONSORS

LEAD FEDERAL AGENCY

- U.S. DEPARTMENT OF AGRICULTURE - NATURAL RESOURCES CONSERVATION SERVICE

SPONSORING LOCAL ORGANIZATIONS

- KANE COUNTY WATER CONSERVANCY DISTRICT (PRIMARY SPONSOR)
- WASHINGTON COUNTY WATER CONSERVANCY DISTRICT (CO-SPONSOR)

IN COOPERATION WITH

- ENVIRONMENTAL PROTECTION AGENCY
- BUREAU OF LAND MANAGEMENT
- NATIONAL PARK SERVICE

PROJECT TEAM

NRCS UTAH

Norm Evenstad, *Assistant State Conservationist*

Derek Hamilton, *Water Resources Coordinator*

Leslie Warta, *Environmental Compliance Specialist*

Lance Smith, *Project Engineer*

Marcel Corbeil, *Cultural Resources Specialist*

KCWCD - SPONSOR

Mike Noel, *Executive Director*

Dirk Clayson, *Private Consultant Lands and Real Estate*

WCWCD – CO-SPONSOR

Zach Renstrom, *General Manager*

Corey Cram, *Associate General Manager*

ENGINEERING AND DESIGN

Alpha Engineering - Brent Gardner, *Project Manager/Principal Engineer*

RB&G Engineering – Brad Price, *Geotechnical Analysis*

RB&G Engineering – Brandon Horrocks, *Geotechnical Analysis*

ENVIRONMENTAL

Transcon Environmental – Tim Green, *Environmental Program Manager*

Transcon Environmental – Brian Parker, *Environmental Project Manager*

Transcon Environmental – Ian Snyder, *Coordinator and NEPA Planner*

Transcon Environmental – Ron Bolander, *NEPA Specialist*

ECONOMIC ANALYSIS

Scott Hoag Jr., *Economic Analyst*

PROJECT AUTHORITY

- **Authority**: Public Law 83-566, the Watershed Protection and Flood Prevention Act of 1954, as amended
- **Policy**: National Watershed Program Manual and Handbook sets plan policy
- **Project Sponsors**: Local organizations that have legal authority and resources to install, operate, and maintain improvements.
- **Authorized Purposes**: Flood prevention; watershed protection (erosion/sediment control); public recreation; fish and wildlife habitat; agricultural water; M&I water; water quality; watershed structure rehab; hydropower sources
- **NEPA**: The Plan-EIS is being prepared in accordance with Section 102(2)(c) of the National Environmental Policy Act of 1969 (NEPA), PL 91-190, as amended.

PL-566 OVERVIEW

- The Watershed Protection and Flood Prevention Act (PL-566) authorizes the NRCS to help local organizations and governments plan and implement physically, environmentally, socially and economically sound watershed project plans for the benefit of the public.
- Provides technical and financial assistance to project sponsors for planning and installing watershed projects (e.g., dams, debris basins, pipelines, etc.)
- Locally led NRCS teams. Local leadership is key.
- Up to a 250,000-acre watershed per project

PL-566 ELIGIBLE PURPOSES

- Flood Prevention
- Watershed Protection
- Agricultural Water Management
- Municipal and Industrial Water Supply
- Fish and Wildlife Habitat and Public Recreation Development

PL-566 PROJECTS

STRUCTURAL MEASURES

- **Dams**
- **Channel restoration**
- **Diversions**
- **Floodwalls**
- **Dikes**

NON-STRUCTURAL MEASURES

- **Upland conservation and erosion protection**
- **Wetland restoration**

PROJECT NEPA BACKGROUND

- Initially known as the "*Cove Reservoir Watershed*" Project
- Development of alternatives, resource studies, and impacts analyses were conducted from spring 2018 to fall 2020.
- Documented in a Draft Watershed Plan Environmental Assessment (Plan-EA)
- Preferred Alternative identified in the Plan-EA was the Cove Reservoir
- Draft Plan-EA published for public review and comment in December 2020
- Following review and consideration of comments, the Draft Plan-EA was not approved, but informed the NRCS to move to an EIS to analyze any viable alternatives in further detail

PROJECT BACKGROUND

- Initial planning for the proposed project began over 25 years ago
- Numerous agencies and irrigation companies involved in the planning including the Bureau of Land Management, National Park Service, U.S. Fish and Wildlife Service, Utah Department of Natural Resources, KCWCD, WCWCD, Orderville Irrigation Co., etc.
- Guidelines and limitations for potential projects in the East Fork Virgin River Watershed, including several specific reservoir alternatives, were identified and agreed upon in the *Zion National Park Agreement* (1996)
- *East Fork Virgin River Instream Flow MOU* (2000) regulates water flows on the East Fork Virgin River within the watershed being analyzed for this project

PROJECT PURPOSE

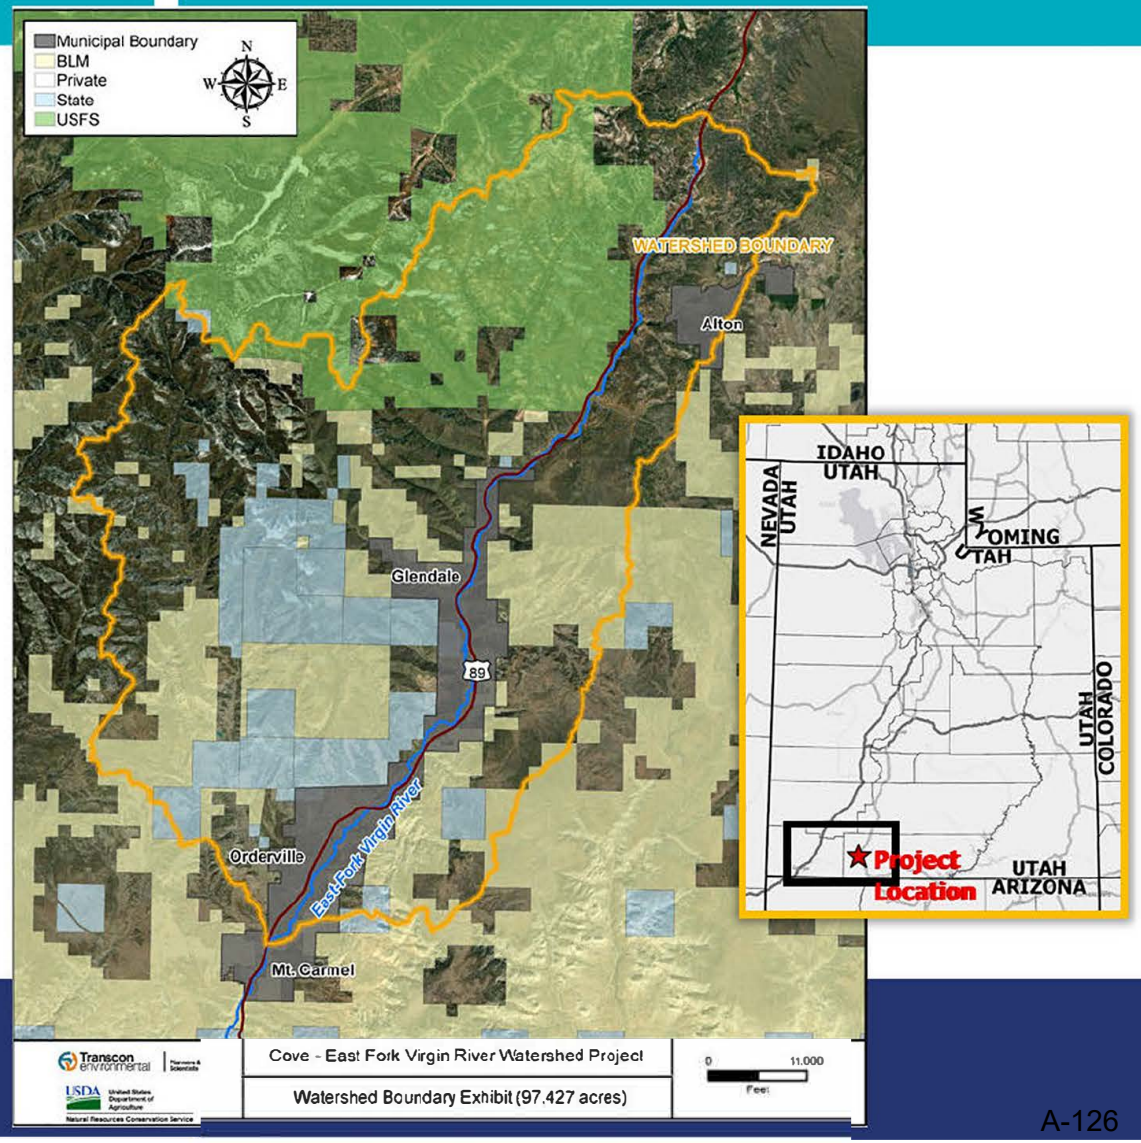
- Currently no critical water storage capacity or reliable irrigation water delivery to local agricultural users during the dry summer months
- Local water users in Kane County continue to experience water shortages
- Limited capability of existing irrigation system to utilize flows from the East Fork Virgin River
- Need for additional water reliability in Washington County
- Additional water-based recreation opportunities for locals and tourists

PROJECT PURPOSE

Project Response to the Needs:

- Identify a viable alternative which once implemented would:
  - Increase water availability and reliability for current and future users
  - Improve irrigation efficiency
  - Increase the availability of recreational opportunities (e.g., fishing, non-motorized boating, hiking, camping, etc.)
- Additional benefit: increase in hydroelectric energy supply to the community

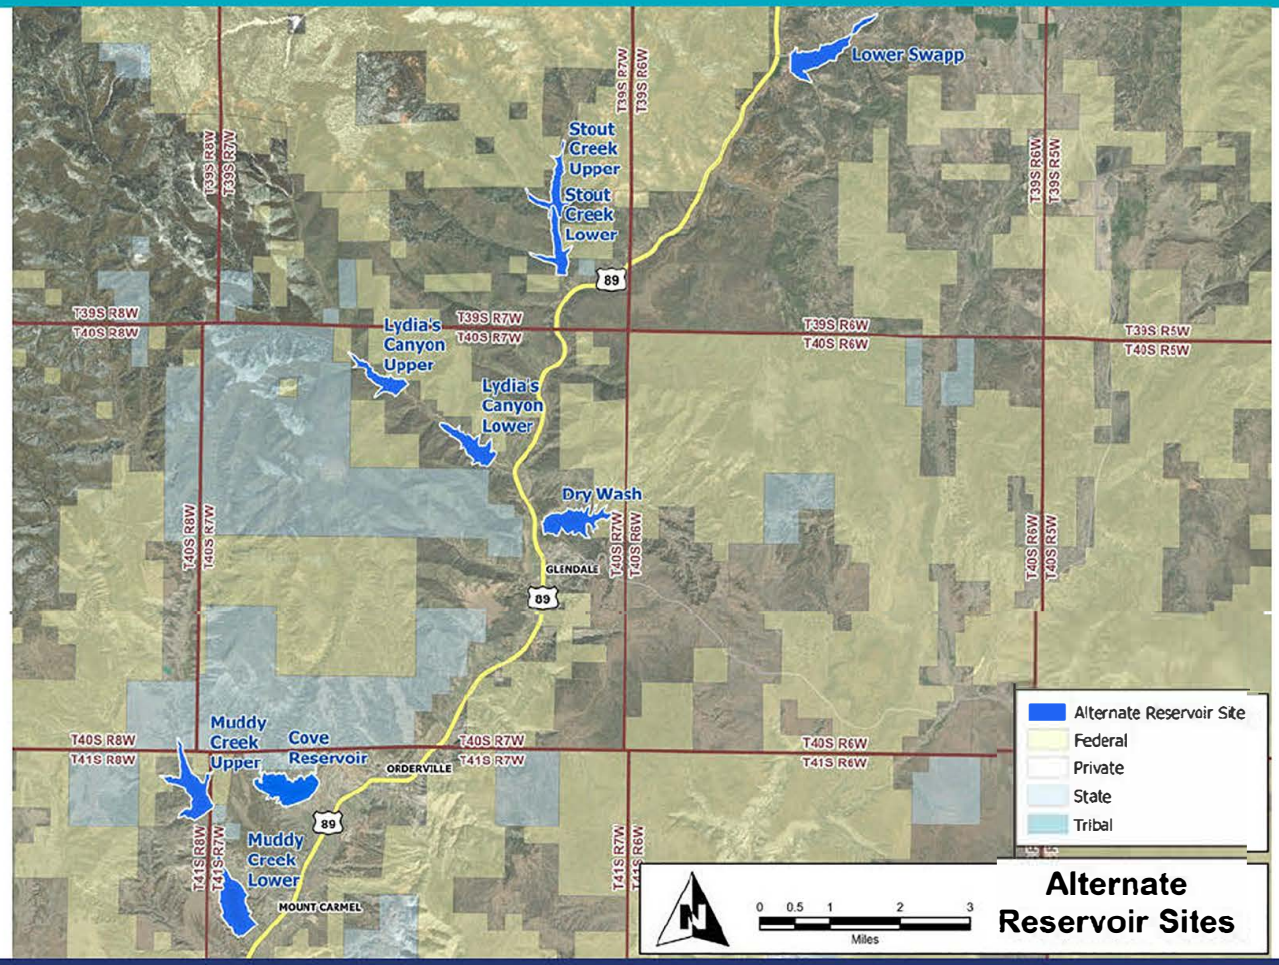
WATERSHED OVERVIEW



East Fork Virgin River Watershed

- Includes 3 HUC-6 Watersheds within the overall Upper Virgin Watershed
  - Lydia's Canyon-East Fork Virgin River (150100080203)
  - Muddy Creek (150100080202)
  - Headwaters East Fork Virgin River (150100080201)
- Overall watershed area - 97,427 acres
- Land Ownership
  - BLM
  - USFS
  - SITLA
  - Private

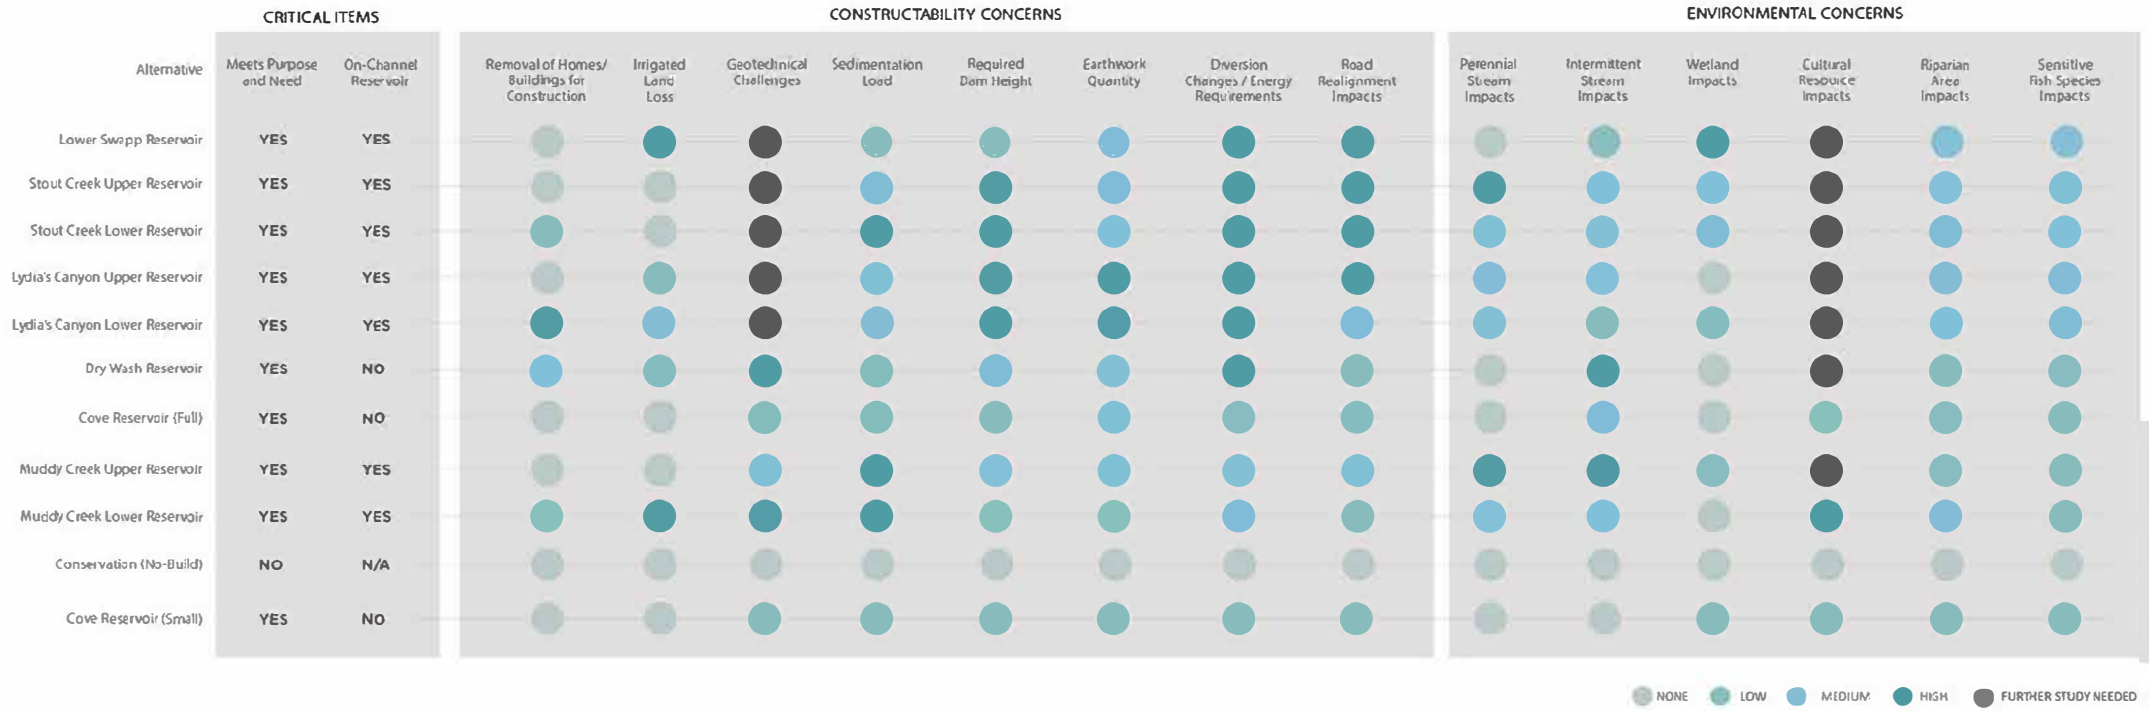
ALTERNATIVES BEING CONSIDERED



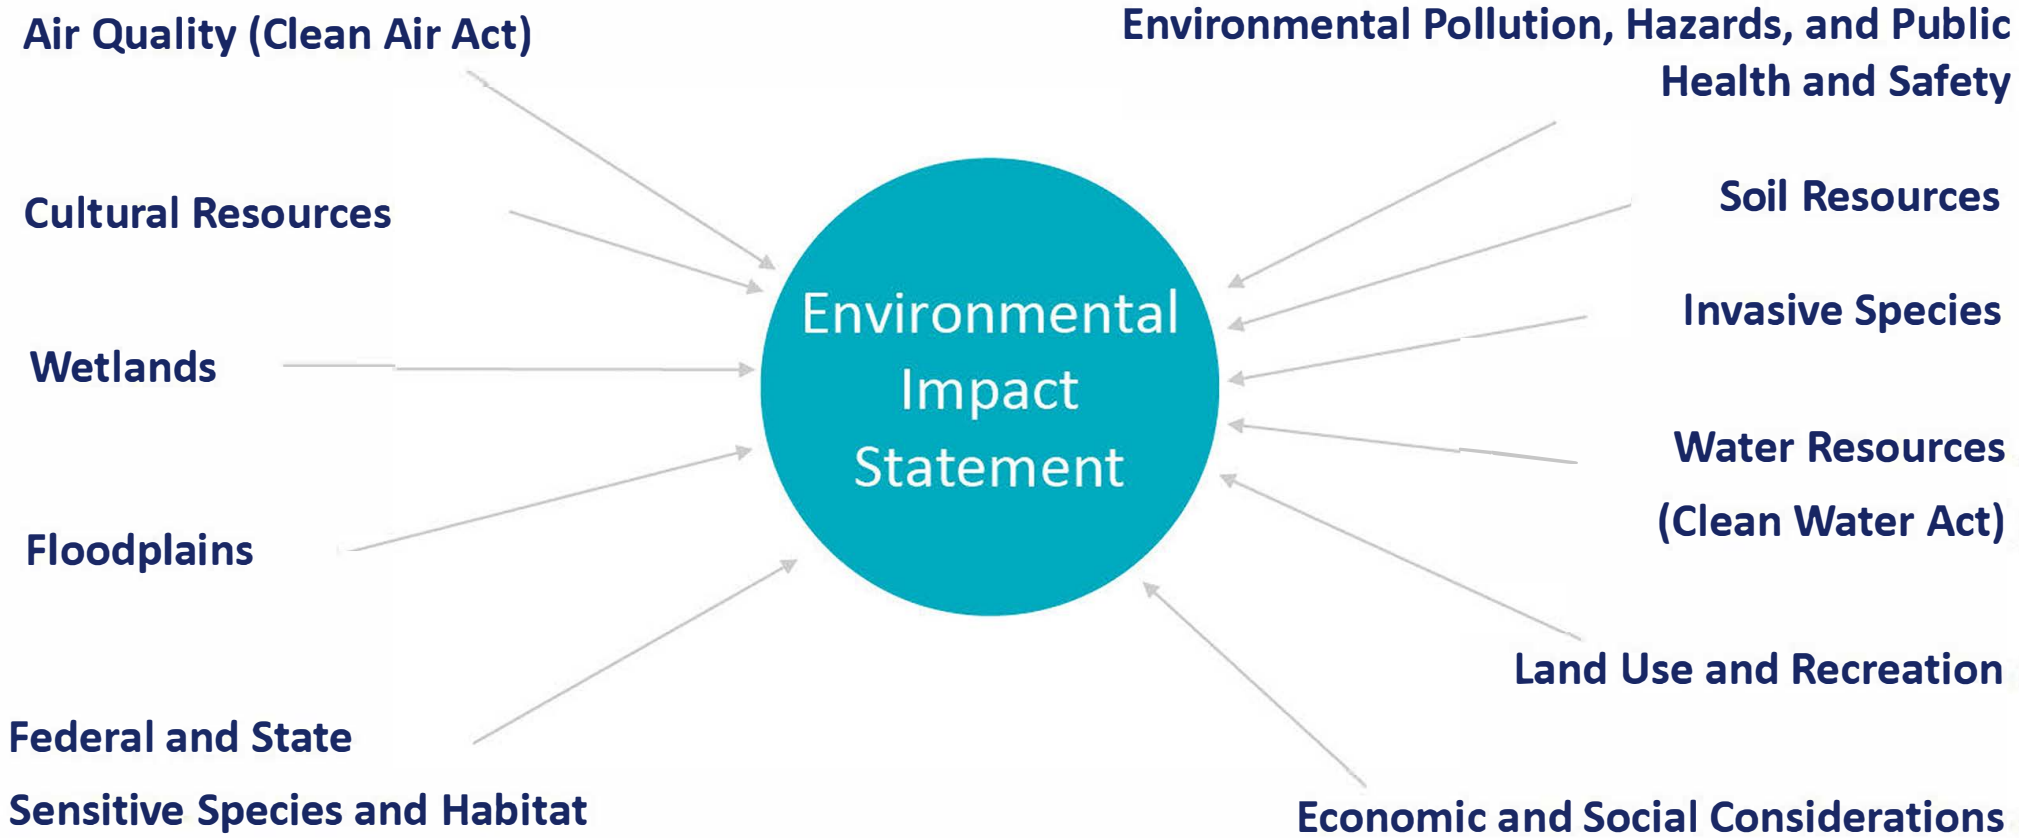
OTHER ITEMS BEING CONSIDERED

- Recreational facilities and access for the sites
- Water conservation
- Channel stabilization to reduce sediment loads.
- No Action Alternative

ALTERNATIVES MATRIX



RESOURCES TO BE CONSIDERED



NEPA PROCESS / TIMELINE

PROJECT TIMELINE

1. WE ARE HERE
   Resource Evaluation / Prepare Draft EIS
   FALL 2021– SUMMER 2022
2. Agency Review / Public Comment Period / Final EIS / Decision Document
   FALL 2022– SPRING 2023
3. Final Design*
   *(pending environmental approval and funding)
   2023 – 2024
4. Begin Project Construction*
   *(pending environmental approval and funding)
   2025

NEPA PROCESS

WE ARE HERE

Initiate Environmental Impact Statement
- Develop project purpose & need
- Conduct agency & public scoping
- Collect baseline data
- Develop project alternatives

Collect Data
- Analyze existing conditions
- Identify data gaps from existing Plan-EA
- Conduct additional needed resource surveys
- Agency consultation & coordination

Analyze Alternatives
- Analyze alternatives
- Evaluate potential impacts to environmental resources

Draft Environmental Impact Statement
- Release Draft EIS to public for review and comment
- Review all public and agency comments
- Prepare Final EIS

Decision Document
- NRCS will prepare a Record of Decision and post a Notice of Availability of the Final EIS in the Federal Register

HOW TO COMMENT

Official comments for the Cove – East Fork Virgin River Watershed Project can be submitted via comment card, letter, or email to the following:

Brian Parker
Transcon Environmental

Pre-addressed comment cards can be downloaded from the NRCS project planning website. Comment cards are also available for your convenience at the Kane County Water Conservancy District Office in Kanab, Utah.

Comments may also be provided during the virtual Q&A session following this presentation.

THANK YOU!

or

COMMENTS?

Appendix D. Comment Summary Table

CID	Doc ID	Received	Type	Group	Entity	Commenter	Commenter ID	Category	Comment
1	1	10/10/2021	Email	Public		Richard Spotts	1	NEPA Process	When do you expect or estimate that the required Notice of Intent (NOI) may be published in the Federal Register which normally officially starts the scoping comment period and process under NEPA?
2	1	10/10/2021	Email	Public		Richard Spotts	1	NEPA Process	Why did you open an early scoping period on the NRCS project web page on October 7 rather than wait for the NOI to be published?
3	1	10/10/2021	Email	Public		Richard Spotts	1	NEPA Process	Did you release a news release or media notice on October 7 and/or will you do so when the NOI is published?
4	1	10/10/2021	Email	Public		Richard Spotts	1	NEPA Process	Will the previous extensive comments that I and others submitted on the Cove Reservoir EA be carried forward as part of this EIS level analysis and administrative record, or will those comments be excluded going forward such that this is a *de novo* NEPA process and that previous comments would need to be re-submitted now to be considered in preparing the DEIS and to be included in the EIS level administrative record?
5	1	10/10/2021	Email	Public		Richard Spotts	1	NEPA Process	Can I and other members of the public participate in the "agency" virtual meeting on October 18th or only at the October 20th virtual meeting?
6	1	10/10/2021	Email	Public		Richard Spotts	1	NEPA Process	As with the previous EA, will the National Park Service and/or Bureau of Land Managementbe official "cooperating agencies" on this EIS level analysis process, and should the Bureau of Reclamation be included given their "special expertise" relating to water development projects?
7	1	10/10/2021	Email	Public		Richard Spotts	1	NEPA Process	Since this proposed project and previous EA were developed during the Trump administration, were these NRCS decisions investigated under President Biden's Executive Order 13990, and, if so, what were the findings?
8	1	10/10/2021	Email	Public		Richard Spotts	1	Water Resources	Was your "agency scoping notice" or another notification of this new scoping process sent to the official state representatives under the Colorado River Compact (especially those for Arizona, Nevada, and California as they may be directly affected by future diversions or reductions in Virgin River flows)?
9	1	10/10/2021	Email	Public		Richard Spotts	1	NEPA Process	What is the specific source and amount of public funding that NRCS is using for this new EIS level analysis and public involvement process, and is any of this funding contingent upon future Congressional appropriations or USDA/NRCS administrative allocations?
10	2	10/11/2021	Email	Public	Southern Utah News	Helene Jorgensen	2	General	Hi Brian; I am a reporter with the Southern Utah News and talked to your last year about the CoveReservoir project. Would you have time to talk to me this morning (if you don't haveColumbus Day off? I have some questions about what the EIS will entail and what the proposed purposes of the project are?
11	3	10/11/2021	Email	Public		Jane Whalen	3	General	Please put me on the mailing list. Is the project the same as the EA? Will all comments from the EA be answered?
12	4	10/12/2021	Email	Agency	Resource Development Coordinating Committee	Sindy Smith	4	NEPA Process	Has the NOI been published in the Federal Register yet? If not, when do you anticipate that will happen?
13	5	10/12/2021	Email	Public		Bryan Dixon	5	NEPA Process	I would also like to observe the agency meeting to see what kinds of questions NRCS poses and what positions might be expressed, even in preliminary form. It should be a public open meeting. Please send me the necessary login information.
14	6	10/12/2021	Email	Agency		Robert Lacey	6	NEPA Process	Which local agencies will be invited to the meeting on the 18th? I represent the Town of Orderville as a council member.
15	7	10/13/2021	Email	Public		Jane Whalen	3	NEPA Process	Will the new description of the Project be available for upcoming meetings? Thus far, there is little information on the new project plan so that will make it hard to write and constructive scoping comments. Thanks so much for taking the time to respond.
16	8	10/18/2021	Email	Public		Barry Sochat	7	Water Resources	Dear Mr Parker, I am a long time resident of Rockville and shareholder and officeholder of the Hall & Grafton Ditch Company. Please include these comments into your formal record. I have serious concerns about any upstream water project that could reduce the stream flow of the North Fork Virgin River through Rockville. Given the threats from Cyanobacteria outbreaks in the Virgin River due to the ongoing drought's low flow and increased water temperature, I think a further reduction in stream flow could prove detrimental to our town.
17	9	10/20/2021	Mail	Public		John Carpenter	8	Health and Safety	I have studied disasters around around our country as preparation for a previous occuparion. Johnstown comes to mind. Our most destructive dam failure in the past. The circumstances here are quite different until you get down to our home. Even a sturdy concrete dam would not seem safe in our land configuration. Many American dam failures have resulted in hundreds of fatalities. Nothing in our area at this time calls for such water storage. We presently pump from a deep spring. Is there a possibility that projects above us could do the same? The lake formed in this project is too small to be effectively or widely used for recreation. Turning "East Zion" into mecca of homes, electric busses, and great wealth for the developers is a hopeless idea. Entrance to Zion Park from here is via a twisting narrow road and a small mile long tunnel presently crowded and slow all summer. For very practical reasons, such a dam here is irresponsable, is a harbinger of a failed resort idea, and benefits only the developer.
18	10	10/20/2021	Mail	Public		Kelly Wilson	9	Health and Safety	We who live below the proposed dam have serious concerns about the long term safety of the dam when we hear that it is going to be a "high risk earthern dam". I have read extensively on earthern dams and in certain applications they are perfectly fine. We have a problem when it is proposed to hold 6,000 acre feet of water and be 90 feet high and I have property, as do many others, right in the path of a potential failure. 1.) Can you detail the precautions and safety measures that are in place? 2.) Who is going to compensate for property loss when there is a disaster and the dam fails?

CID	Doc ID	Received	Type	Group	Entity	Commenter	Commenter ID	Category	Comment
19	11	10/20/2021	Email	Public		Laura Wilson	10	Health and Safety	Downsteamers bear a life threatening risk and the notion that more water is needed for our fields is not an honest assessment according to the Utah River Council and my own observation after living below the fields for 40 years.. Let Washington County build their own risky dam. According to the internet Earthen dams break all over the US. Sooner or later this dam will break. I have seen it in a dream and two others I know of have had the same experience. This Dam Will break! Unusually heavy rains, rodents, tree root seepage, earthquakes and even terrorism are all dangers that can't be controlled. The Utah Geological Survey says Utah has a 50% chance of damaging earthquakes. We've known that. I am assuming the Virgin River will be at a high level from time to time all year round, taking up the gap from the dam. This will put our children at risk who play in the river. It will cause cottonwood trees to become waterlogged and fall over causing dangerous log jams. The Cottonwood Lane bridge will choke with logs causing further flooding and damage up stream.. In the early stages of this Cove Reservoir plan, residents were not notified. Only 17 letters were sent out in 2018 and those letters only went to field owners who naturally want more water. Yes, a nice lake and recreational area and housing development will be an asset but our Water Conservancy District and the Town of Orderville should be protecting its citizens from a dam that could take lives, erode fields, rip out water and electrical and sewer lines, highway and cause citizen deaths. This is my "COMMENT FORM" filled out and send email to bparker prior to the Public Scoping which has not done a good job of letting the public know of this meeting and presented in the papers too close to the actual meeting to get comments in time. I request time to present my feelings at the Public Meeting.on Oct 20, 2021.
20	12	10/31/2021	Email	Public	N/A	Craig Wallentine	11	Purpose and Need	Include an accurate accounting of the actual Long Valley farm beneficiaries is needed to define achievable Cove project goals and meet NRCS requirements. The original Cove Environmental Assessment (EA) claimed to be for the benefit of the upstream Long Valley farmers. However, the EA failed to explain exactly how many upstream farmers would benefit and by how much. The EA was also based on inaccurate demand information since half of the proposed agricultural service acreage had already been developed for municipal and industrial uses. The failure to accurately define the purposes of the Cove Reservoir project has not been remedied as shown during the public comment scoping session on October 20th, 2021. During that public meeting, the two Cove Project sponsors; the Kane County Water Conservation District (KCWCD) and the Washington County Water Conservation District (WCWCD) directly contradicted each other about who is actually going to benefit from this taxpayer subsidized project. At the October session, Mr. Mike Noel of the KCWCD stated that 90% percent of the water in the Cove reservoir would be for Long Valley farmers.Mr. Noel was then contradicted by the WCWCD representative who stated that 50% of the water in the Cove reservoir would be for Washington County farmers. This fundamental confusion would not be tolerated in a corporate capital project discussion.
21	12	10/31/2021	Email	Public	N/A	Craig Wallentine	11	Economics	The DEIS must accurately detail the number of the upstream farmers and the amount of acreage in the Long Valley that will benefit with special attention paid to identified senior water rights and to which water rights are currently being contested so that NRCS Federal taxpayer dollars are not wasted.
22	12	10/31/2021	Email	Public	N/A	Craig Wallentine	11	Alternatives	The DEIS should include the alternative of splitting the proposed project into two separate projects with the Washington County Water Conservancy District managing their own downstream water storage project with or without NRCS funding. The Gardner Policy Institute and other local development agencies have produced well documented projections for the increased municipal and commercial water demand (at higher prices than typical agricultural water prices) in Washington County, Utah for at least the next 50 years. Rather than misrepresenting that the proposed Cove project is for long term agricultural use in Washington County, the WCWCD should submit an alternative project that splits out its municipal and commercial water storage project from the upstream EFVR project. Based on the actual facts of long term Washington County water use, the WCWCD storage project may or may qualify for some form of NRCS support. The two water districts could establish a Memorandum of Understanding between the two entities to allow water conservation programs and to reduce capital costs while saving federal taxpayers a significant amount of money. At a minimum, having a separate WCWCD project alternative will lead to a more open, honest discussion of the benefit of NRCS projects in Southern Utah.

CID	Doc ID	Received	Type	Group	Entity	Commenter	Commenter ID	Category	Comment
23	12	10/31/2021	Email	Public	N/A	Craig Wallentine	11	Economics	As discussed extensively in the comments to the original Cove Environmental Assessment, WCWCD owns the majority of the water rights involved and desires to best serve its changing customer base in the future. The DEIS should honestly and openly address this long-term shift in Washington County water demand to more municipal and commercial water use away from agricultural use. The WCWCD has the right to act in its economic best interest to facilitate the transition of agricultural water rights to municipal and commercial use in their service area, thus allowing all parties to maximize their economic value – whether as farmers selling their water rights or developers buying them. However, it should not be using federal taxpayer subsidies for private gain. The 2020 WCWCD Annual report shows that the District is very well funded with a net reserve of over a quarter of a billion dollars. In the past year alone, the WCWCD increased net reserves by multiples of the Federal taxpayer subsidy they are seeking in the Cove project (increase of $50MM in 2020 over 2019). So clearly there is no reason for WCWCD to seek an unjustified federal taxpayer subsidy.
24	12	10/31/2021	Email	Public	N/A	Craig Wallentine	11	Alternatives	The DEIS should address the specifics alternative of a separate WCWCD municipal and commercial water storage project. The DEIS should include an analysis of the financial benefits of a separate and alternative WCWCD managed reservoir project. The alternative project would be sized to fit within the scope of the existing WCWCD diversion and storage facilities along the Virgin River which would save money upfront. The DEIS should include a written statement from the Board of the WCWCD as to their alternative plans if the current Cove Reservoir proposal fails to meet NRCS guidelines. Their next-best plan should be the basis of the alternative project design so it will directly address the needs of Washington County in a cost effective manner without taxpayer subsidies. It is highly likely that a privately financed WCWCD water storage project would succeed because of the many associated benefits that will accrue to Washington County private interests (e.g. increase land value, increased commercial and residential development, increased water right value, etc). The DEIS alternative would encourage the well-capitalized WCWCD to use its own private resources to develop its commercial goals in Washington County in the 21st century without federal taxpayer subsidies. As a privately funded project, the ongoing conversion of agricultural water rights to municipal and commercial use by WCWCD stakeholders will not violate any NRCS Federal taxpayer funding rules.
25	12	10/31/2021	Email	Public	N/A	Craig Wallentine	11	Economics	The DEIS Should Include a detailed explanation of downstream reservoir operating costs and water exchange agreements. In order to qualify for NRCS funding, the Long Valley agricultural water use needs to be detailed and documented. The original Cove Environmental Assessment (EA) failed to explain how Long Valley farmers upstream would benefit from the Cove reservoir downstream of their properties. If Long Valley farmer water is to be stored downstream then either the water will need to be pumped back upstream (but pumping costs were not disclosed in the EA) and the costs included in project economics or a number of complex water exchange agreements to reallocate stream flows water must be created and registered in the public domain. The DEIS should include copies of all Water Exchange Agreements associated with the proposed Cove reservoir project and their associated economics to be sure that Federal taxpayers are not being taken advantage of by non-agricultural water users.
26	12	10/31/2021	Email	Public	N/A	Craig Wallentine	11	Water Resources	The DEIS should include a clear and accurate calculation on probable evaporation rates and net losses for the proposed Cove reservoir during an era of aridification. The original Cove project financials depended upon an opaque and non-publicly accessible study by the Utah Division of Water Resources referenced in appendices as the "project analyses". The EA documents stated that the evaporation rates would be at least 2.22 feet per year (per acre). During the 12/9/2020 public hearing, the WCWCD project manager stated that the expected evaporation rate at the Orderville elevation would be 30 inches or 2.5 feet per year per acre. Unfortunately, the Cove EA documentation went on to claim, in contradiction to its own numbers, that Cove Reservoir evaporation losses would be less than half of the actual expected losses, conveniently inflating the value of the project. This type of internal inconsistency would not be tolerated in a corporate capital project review. The DEIS must include current and accurate evaporation and net loss calculations for the Cove project. The calculations should specifically address the increase in local temperature since the historical evaporation rates were originally determined. The DEIS should also account for the projected increase in evaporation rates caused by further temperature rise and decreased local humidity over the 100 year life of the project. Building a project in an arid environment using out of date evaporation factors would be bad engineering practice.

CID	Doc ID	Received	Type	Group	Entity	Commenter	Commenter ID	Category	Comment
27	12	10/31/2021	Email	Public	N/A	Craig Wallentine	11	Invasive Species	The DEIS should address the actual cost of quagga mussel contamination of the proposed Cove reservoir project in detail. The original Cove EA contained minimal facts about the operation of the Cove reservoir project and managing quagga mussels. The project sponsor KCWCD has been actively promoting boating on the proposed reservoir while not addressing the cost of quagga mussel control. When asked about this issue at the project public hearing on 10/20/2021 Mr. Noel of KCWCD stated that “bald eagles spread quagga mussels”. Per the National Oceanic and Atmospheric Administration, bald eagles are actually likely to be poisoned by avian botulism propagated by the quagga mussels. The DEIS should include the scientific data supporting Mr. Noel’s claim about the danger from bald eagles to Cove Reservoir users and his plan for managing bald eagle risks at the Cove Reservoir. The DEIS project economics should also include a realistic estimate of the costs of doing effective boat inspections at the private county reservoir that KCWCD will be operating in a region of contaminated local reservoirs.
28	12	10/31/2021	Email	Public		Craig Wallentine	11	Health and Safety	DEIS should include a detailed Occupational Health & Safety Plan for each project alternative. The best way to ensure worker health and safety is through good project design. A strategic project worker safety risk assessment should be included in the DEIS. A separate upstream low risk, high return NRCS project would carry greatly reduced worker exposures to protect the EFVR watershed, help Long Valley farmers and accelerate the growth of the East side Zion National Park outdoor recreation economy. A downstream WCWCD reservoir project alternative with massive earth moving and construction components should be assessed carefully on its own because of the major worker safety issues involved. Regardless of the final project alternative selected, the DEIS should also include a list of potential construction contractors and their demonstrated OSHA safety track record. Using only the safest contractors is an excellent start to protecting workers. Requiring this reporting will encourage contractors to make safe operations a condition of employment with poor performing contractors being weeded out before they facilitate increased worker deaths, injuries and illnesses.
29	13	10/31/2021	Email	Public		Craig Wallentine	11	Water Resources	The DEIS Should Include a full Watershed Management Plan for the East Fork of the Virgin River. The Cove EIS Scoping plan should include a comprehensive water management plan for the East Fork Virgin River (EFVR) watershed beginning at the headwaters of the EFVR watershed as shown on the Cove project map. The watershed management plan should include a clear analysis of how aridification will impact the EFVR watershed over the 100-year project life. The water management plan should include best available and best practicable conservation management processes, tailored for each elevation level across the 100,000 acre EFVR watershed. The primary NRCS project goal is that total and seasonal water flow be managed more effectively upstream of the Cove Reservoir project thus greatly reducing the cost of this project. Upstream watershed management would benefit more Long Valley farmers, native fish, local wildlife and flora at a much lower cost than a single high cost downstream project without any watershed management component. Focusing on the EFVR as a priority is consistent with PL-566 requirements “that local sponsors help ensure adequate conservation treatment measures on at least 50% of the watershed area above retention reservoirs”. A comprehensive EFVR watershed management plan will be cheaper to implement as it will be tailored to current and future water flows while taking advantage of smart water management practices upstream where they will be of the most value to Long Valley users. This critical watershed information should be included in the NEPA DEIS documents for public comment.

CID	Doc ID	Received	Type	Group	Entity	Commenter	Commenter ID	Category	Comment
30	13	10/31/2021	Email	Public		Craig Wallentine	11	Alternatives	The DEIS should include the alternative of two separate projects with a priority on the upstream watershed and agricultural project. The upstream NRCS project would be focused on a cost effective project that would benefit (a) the EFVR watershed and natural environment during a period of long term aridification; (b) benefit Long Valley farmers with federal cost sharing up to 75%; (c)provide increased outdoor recreational activities and local tourism; while (d) greatly reducing the cost of capital construction. The upstream NRCS project would take advantage of best practical watershed management technology and efficient agricultural practices so that a large reservoir would not be needed downstream for Long Valley farmers. Eliminating the proposed reservoir from the upstream proposal would make more money available for smart, local water conservation programs and also meet the fundamental requirements of PL-566 by eliminating a flood risk that does not need to be created by a large expenditure of federal taxpayer dollars. The second, downstream project alternative should be developed by WCWCD on behalf of its private water rights stakeholders. The WCWCD project would help private interests obtain the maximum value for their water rights in Washington County by supplying the high demand growth in municipal and commercial water use in St. George and surrounding communities without inappropriate federal taxpayer subsidies.
31	13	10/31/2021	Email	Public		Craig Wallentine	11	Alternatives	Natural restoration programs should be given priority in the EFVR Watershed DEIS. The Utah Division of Wildlife Resources (UDWR) has written a beaver management plan that has been shown to effectively protect upland Utah watersheds and counter the long-term impacts of aridification. The original Cove Environmental Assessment (EA) made no mention of this low cost alternative to restore natural water management practices to the East Fork Virgin River watershed. Nearby Beaver, Utah was named for the great number of beaver dams present in early pioneer days and reintroduced beavers are doing a good job of stream restoration in the adjacent Escalante River watershed. The successful restoration of beaver habitats in the Intermountain West is well documented in "Eager: The Surprising, Secret Life of Beavers and Why They Matter" by Ben Goldfarb and "Saving the Dammed - Why We Need Beaver-Modified Ecosystems" by Ellen Wohl. The UDWR Beaver Management Plan shows that there are “substantial opportunities” for watershed restoration and improvement in the 100,000 acre watershed that feeds directly into Long Valley. As stated in the Cove project design basis, slowing the flow of water through natural means will reduce excess storm runoff and erosion and smooth out irrigation water flows. The Cove DEIS should include a detailed discussion of how reintroduction of beavers in the EVFR watershed could be a low cost and natural restoration project.
32	13	10/31/2021	Email	Public		Craig Wallentine	11	Water Resources	The DEIS documentation should include detailed hydrological information on the Long Valley farm beneficiaries of this project. The original Cove Environmental Assessment (EA) contained almost no information on the actual farm users for the project especially in Long Valley. The DEIS should include a tabulation of the number of farmers, the amount of irrigated land at each elevation in Long Valley, the historical water usage time series (e.g. how much water is needed each month) for alfalfa production by these farmers in Long Valley and the increased water demand based on the project projections. The original Cove EA appeared to be based on a few emails between KCWCD board members that were then extrapolated into the justification for the largest NRCS project in the United States. An investment of this magnitude deserves better and more quantitative water use analysis in the DEIS.
33	13	10/31/2021	Email	Public		Craig Wallentine	11	Alternatives	The DEIS should give priority to natural and low cost EVFR stream management and restoration projects versus high cost downstream capital investments. The DEIS should include a detailed EFVR river management plan upstream of the proposed Cove reservoir site with common sense water management projects that would benefit the upstream farmers such as: (1) inclusion of water efficient programs from the USDA and Utah Farm Bureau to reduce water usage in current farm operations and increase water retention on local properties; (2) removal of invasive species like tamarisk and Russian olive trees and replacement with native flora that use less water (3) use of natural flora along the EFVR to trap and release more water for local users along with natural stream management (4) natural stream restoration programs as discussed on the NRCS website and in the literature on renewing river corridors in dry-land regions; (5) consideration of a long term agricultural strategy for Long Valley with a view to what crops are going to be economically viable at that elevation as aridification continues and water prices increase (6) consideration of the relative benefit for federal taxpayers of purchasing a certain amount of water conservation easements rather than funding expensive capital projects. The original Cove Environmental Assessment (EA) discussed none of these critical alternatives and this critical watershed information should be included in the DEIS documents for public comment.

CID	Doc ID	Received	Type	Group	Entity	Commenter	Commenter ID	Category	Comment
34	13	10/31/2021	Email	Public		Craig Wallentine	11	Alternatives	The DEIS should include discussion of other potential water storage sites and structures that would benefit Long Valley farmers upstream of the proposed Cove reservoir site. The project sponsors claim that the proposed reservoir site is optimal. However, common sense suggests that placing an agricultural water reservoir downstream of the farmers it is intended to benefit is not logical. In addition, it does not appear that the proposed Cove reservoir will function as designed. During the October 21, 2021 public comment session, Mr. Mike Noel of the KCWCD stated that (1) the inlet to the proposed reservoir would not handle either high spring runoff flows nor (2) monsoon storm-water flows. He then went on to say (3) that essentially only “clear” water would be allowed into the reservoir so that dam silting would not be an issue and that fish stocked in the proposed reservoir would have clearer water. The DEIS should contain tabulations showing exactly how the proposed reservoir will function; e.g. use historical and projected water flows as constrained by Mr. Noel with the resulting time series on how the reservoir water level and water quality will fluctuate. It may be that the reservoir will not be functional given existing water usage and the constraints that Mr. Noel has described. If the EFVR water supply is fully allocated and the reservoir cannot function as claimed per the limitations outlined by Mr. Noel, then there is no logical reason to build an oversized reservoir downstream of the Long Valley farmers since there will be no “excess” water flow to capture. Please discuss alternative water retention sites across the EFVR watershed that could actually capture “excess” water flows while managing the sedimentation issue at much lower capital cost. It would seem that smaller upstream dams and diversion areas could (1) capture “excess” flows when and as needed; (2) slow down water flow to allow sedimentation to occur in manageable locations so that clearer water can flow out and on downstream and (3) identifying locations above and in Long Valley for placing water management structures upstream of the actual farmers who can then use the water. In essence, this would be a continuation of the upstream EFVR watershed management program in the agricultural area above the proposed dam site per NRCS best practices.
35	13	10/31/2021	Email	Public		Craig Wallentine	11	Recreation	The DEIS should include an accurate assessment of the impact of East Zion Growth Initiatives on agricultural land use in Long Valley. The proposed new East Entrance Visitor Center at Applecross Station along with the major new trail network and the proposed subsidized shuttle systems with Kanab and Springdale will dramatically increase the number of visitor days on the east side of Zion National Park to the benefit of visitors, locals and the environment. The original Cove environmental assessment failed to fully discuss this anticipated tourism associated growth in Long Valley. At the public hearing on 10/20/21, the KCWCD representative stated that there are already many vacation rental units in the Mount Carmel to Glendale area. Utah congressional representatives are also on record as saying that they will not support any caps on total visitors to Zion National Park which means a long term increase in East Zion visitor days. Taken all together, this indicates that pressure for tourist accommodations on the east side of Zion Park will result in gradual conversion of agricultural lands in Long Valley to higher profit commercial and municipal uses such as outdoor activity companies, automobile service stations, food stores, coffee shops, retail stores, restaurants, hotels/motels and private lodging. The EIS should take account of impending development activities that will inevitably reduce the amount of agricultural land in use in Long Valley thus reducing the scope of and claimed benefits of the proposed Cove reservoir project.
36	13	10/31/2021	Email	Public		Craig Wallentine	11	Recreation	The DEIS should include a more accurate assessment of the actual potential recreational benefits of the proposed Cove reservoir . The DEIS should not use Federal or Utah state parks with high interest features as the benchmarks for the Cove Reservoir project which lacks such distinguishing features. Accurate benchmarking will prevent overstatement of the actual number of increased visitor days generated by the project. The DEIS should also not be comparing the private, seasonal Cove reservoir with much larger, year round reservoirs like Quail Creek State Park which is deeper, twice the size and much closer to local population centers or Sand Hollow Utah State park which is six times the size with steady sources of inflows. The DEIS should use smaller, privately owned/county owned recreational facility benchmarks for this project. As the KCWCD representative stated at the public hearing on 10/20/2021, local usage of the reservoir will be encouraged thru subsidized use for local residents who will not bring new dollars to the area and higher fees will be assessed for out of county/out of state users which will suppress demand. These two management decisions will result in both reduced visitor days and lower per person economic benefit per user day than outlined in the original environmental assessment. Further, the EIS should include realistic costs for maintaining visitor support facilities and dealing with invasive species if it is to be anything more than a glorified rest stop with minimal incremental recreational benefits. The EIS needs accurate recreational benchmarks, discussion of management practices/income and honest cost accounting in order to produce a trustworthy estimate of recreational benefits.

CID	Doc ID	Received	Type	Group	Entity	Commenter	Commenter ID	Category	Comment
37	13	10/31/2021	Email	Public		Craig Wallentine	11	Alternatives	The DEIS should address an alternative of a larger Valley camping and recreational site on the East side of Zion National Park with easy access to the Applecross Station Entry Station and Kanab. The original Cove environmental assessment correctly identified the critical fact that outdoor recreational facilities generate significantly higher return on investment than one additional cutting of hay. While the recreational benefits of the original Environmental Assessment were overstated for the ridiculously undersized campground with its minimal amenities, a properly sized outdoor recreational alternative should be considered for the East side of Zion National Park as part of an upstream NRCS project focused on improving the upper EFVR watershed and the economy of Long Valley. A full-scale campground of 200 campsites (10X the EA proposal) with room for both motorized and tent campers would generate significant financial benefit from extended stay visitors and accelerate the growth in the tourist economy of Long Valley and nearby Kanab. Inclusion of this new site in the Utah State Park system would generate far more financial benefit than currently contemplated in the Cove project design. The impact of such an alternative should be included when considering the future land use in Long Valley both not only because it will generate higher project returns but also because the expanded East side recreational opportunity this type of growth will likely free up water resources and reduce irrigation needs and prevent the creation of a dam that creates significant flood risk where none exists.
38	13	10/31/2021	Email	Public		Craig Wallentine	11	Water Resources	The DEIS should include an assessment of the cumulative impact of East Zion Growth Initiatives on water rights usage as agricultural land use is converted to commercial and municipal use in Long Valley. The EIS should discuss the change in water rights ownership as commercial development is promoted on the East side of Zion National Park in the coming decades. While this change will not be the same order of magnitude as in Washington County and would not threaten NRCS support, the actual number of irrigated acres in Long Valley will steadily decline over the project time horizon and should be accounted for in the upstream project design basis especially the acreage of irrigated fields adjacent to logical commercial and residential development sites.
39	14	11/9/2021	Email	Agency	Office of the Govorner	Redge Johnson (Executive Director)	12	Biological Resources	The state of Utah (State) appreciates the opportunity to provide scoping comments on the Cove-East Fork Virgin River Watershed Project Environmental Impact Statement (EIS). The State provided comments on the project's Environmental Assessment on December 31, 2020, and in collaboration with the Division of Wildlife Resources (DWR), the State restates these comments for the EIS project your consideration. Additionally, the State would like to take this opportunity to highlight that the Kane County Resource Management Plan1 states that one of the purposes for the county land use plan is to "provide for sustainable productive watersheds for a continued supply of waters for Kane County's irrigated agriculture, sector which is dependent on both stream flows and water storage" (page 264).
40	14	11/9/2021	Email	Agency	Office of the Govorner	Redge Johnson (Executive Director)	12	Biological Resources	The Draft EA claims potential benefits for three Threatened and Endangered (T&E) species: the Southwest willow flycatcher, woundfin, and Virgin River chub. Another species of particular concern for this project area is the Virgin spinedace, which is managed under a Conservation Agreement and Strategy and has been petitioned for listing as a T&E species. The U.S. Fish and Wildlife Service is currently determining whether listing is warranted for the Virgin spinedace, and yet impacts to that species are not included in the EA. The State recommends that impacts for this species, in addition to the others listed above, be considered, and included in the draft EIS. Prior to claiming a benefit to the species listed above, DWR recommends the following points be carefully considered: • The term "summer months" should be defined, and the low end of the stream flow delivery range should be included, in relation to the high end of 882 acre-feet • The claimed benefits these flows could have for T&E species are undemonstrated. There is reference to a water budget for the project which includes evaporative losses (193 acre-feet), but it is unclear how much water will still be in the stream channel 50 miles downstream from the project, at different levels of release. • When water is diverted to Cove Reservoir, spring runoff flows would decrease. T&E fish and Virgin spinedace require higher spring flushing flows to cue spawning and clean necessary spawning habitat. A reduction in spring flows could limit available spawning habitat, thus impacting existing spawning, ultimately reducing population levels. The EA should express what percentage of the total flow in the East Fork Virgin River would be diverted. The extent and effect of decreased spring runoff flows should be analyzed and reported as a potential impact in Table S-4. • The Draft EA does not analyze how much of an increase in flow would be required to reduce temperatures and salinity below Pah Tempe Hot Springs. It is not possible to determine from the document whether the proposed releases from Cove Reservoir would be sufficient to deliver native fish benefits in that reach.

CID	Doc ID	Received	Type	Group	Entity	Commenter	Commenter ID	Category	Comment
41	14	11/9/2021	Email	Agency	Office of the Govorner	Redge Johnson (Executive Director)	12	Biological Resources	Cove Reservoir has the potential to become an important recreation offering in a part of the state with limited opportunities for cold water sport fisheries. The State recommends the following points be carefully considered regarding potential recreational benefits associated with the creation of a cold-water sport fishery: • The proposed location of Cove Reservoir is at an elevation where frequent and largedrawdowns would occur, which would negatively impact a sport fishery. A conservation pool will be an extremely important component if the fishery andrecreation plan is to be successful. Additional analysis is needed to determine the appropriate size for a conservation pool and what the extent and timing of drawdowns should be to produce the desired cold-water fishery. • It is currently unclear if DWR would be interested in contributing financially to a conservation pool at the reservoir. That determination would be made in the future based on the analysis of the necessary conservation pool size and cost and weighed in terms of benefits gained. Additionally, if DWR elected to contribute, DWR would not be able to pay more than the appraised value of the water. It is not clear presently whether the benefits of such a conservation pool would justify the costs. • More detail is needed on the plans for recreational facilities including a boat ramp, such as when would these actions take place, how far into the reservoir the ramp would go, and how many days of the year the boat ramp would be accessible. These details are important for the cost/benefit analysis. • There will also be stocking limitations in this system due to existing agreements. Kane County Water Conservancy District should coordinate with DWR in developing any stocking plans for the reservoir.
42	14	11/9/2021	Email	Agency	Office of the Govorner	Redge Johnson (Executive Director)	12	Biological Resources	In summary, the State finds additional analysis is needed to determine impacts to the Virgin spinedace, as well as the claimed benefits to the three T&E species that inhabit the project area. Additional analysis on the requirements needed to establish a conservation pool that would create a sustainable cold water sport fishery would also strengthen the draft EA. For questions regarding these recommendations or any others related to the project, please contact Gary Bezzant, Habitat Program Manager, DWR, via The State appreciates the opportunity to provide scoping comments on the proposed Cove-East Fork Virgin River Watershed Project EIS.
43	15	12/21/2021	Email	Agency	Utah State University	Justin Stout	13	Water Resources	I was born and raised in Southern Utah. My family settled Shunesburg, Grafton, Cane Beds Arizona and Hurricane. I do see that CSU is committed to "attempting" to conserve southern Utah. I agree with most of the comments made in your comment document Re: the Cove Reservoir. However, your comments lack actual scientific rigour.- which is EXACTLY - the issue. How can a group from Phoenix give you guidance on where your'e to go when they have Zero knowledge in the area. From my reading, the majority of their/your evidence appears to be a misinterpreted set of data for the Colorado River Basin. The papers you cite do not explicitly apply to So. Utah. Your comms people should check you on this before you try this... Again I strongly feel that CSU are focusing on the wrong part of conservation. While I agree with forcing the Cove Reservoir into an EIA, You all have sat silent on the development of property (EXAMPLE: HOUSING AND CAMPING DEVELOPMENTS.) next to the national park boundaries.These developments have worse implications for the Virgin River and the surrounding economy than a 6 thousand acre foot Reservoir on the East Creek. A very specific example is what has happened in Star Vally Wyoming. Is that what you want? Private Development on the edge of protected land should be your priority. Again. YOU ALL ARE MISSING THE POINT! I hope that the CSU can actually become a TRUE members of conservation of Southern Utah. Not just another problem. Please contact me so you can do better to serve the true conservationists in So Ut. We are many!
44	16	2/12/2022	Email	Public		Laura Wilson	10	Health and Safety	I have had several dreams showing me in detail how a complete failure of this dam will affect my property below the Cove Reservoir. I would like to add that others have had similar dreams. The devastation, not only to me, but all citizens along the Southern Virgin River, would be deadly and catastrophic. How it will break, I did not see, only that it broke completely and all at once. Perhaps a very large earthquake, or terrorism. If what we recently read in “Come Follow Me” about the continents coming together and the Isles of the Sea coming together indicates a serious shaking of the earth, maybe all dams will break and all men will fall to the ground. Most of us have felt resigned to this project with the feeling that there is nothing we can do to stop it. However, it might be something of a compromise if you built a smaller dam, letting other cities share the risk by getting their own systems. Just thought I would comment one last time before the public comment period is over.

45	17	2/7/2022	Email	Tribe	Hopi Tribe	Stewart B. Koyiyumptewa	14	Tribal and Cultural Resources	Thank you for your correspondences dated January 14, 2022, regarding the National Resources Conservation Service (NRCS) proposing the Cove Reservoir-EA. The Hopi Cultural Preservation Office appreaciates the NRCS's continuing solicitation of our input and your efforts to address our concerns. The Hopi Tribe claims cultural affiliation to prehistoric cultural groups in Utah. The Hopi Cultural Preservation Office supports the identification and avoidence of prehistoric archaeological sites and we consider the prehistoric archaeological sites of our ancestors to be "footprints" and Traditional Cultural Properties. We request consultation of any proposal in Utah that has the potential to effect prehistoric cultural resources. We undersatand environmental analyses will be prepared, and thereore we look forward to being provided with hard copies of the cultural resources reports and draft environmental assessment for review and comment. If prehistoric cultural resources are identified that will be adversely affected by the proposed project, we request continuing consultation including being provided with a copy of any proposed treatment plans for review and comment. Thank you for your consideration.
46	18	4/15/2022	Email	Public		Dave and Jolene Clark	15	Watershed Protection	The Clarks called Norm Evenstad regarding an issue of debris depositing on the East Fork Virgin River and its impact on their property adjacent to the river. They sent him a photo by email. The property is located in the Mt. Carmel area. The photo shows a lot of debris, but lateral bank erosion that could benefit from bank stabilization is not observed. The NRCS can respond to erosion issues that threaten life and property under the Emergency Watershed Protection Program (EWP). Norm mentioned this to the Clarks, and also that it is past the event date to qualify for a EWP. Photo included in printed comment.
47	19	4/18/2022	Email	Public		Hayden Forbes	16	Water Resources	Thank you for the opportunity to provide comments on the Cove Reservoir - East Fork Virgin Environmental Impact Statement. As a river enthusiast who cherishes wild and free-flowing rivers, I implore the National Resources Conservation Service and other project partners to abandon the proposed project as described in both the previous Environmental Assessment and the EIS scoping notice by choosing the No Action Alternative. If the project proceeds, the NRCS needs to fully assess all downstream impacts of the project, including impacts to recreational, ecological, and other values. This should include a complete review of different annual hydrograph scenarios. Naturally varying river flows support a myriad of important ecological attributes, including sediment transport and vegetation management., On the East Fork of the Virgin River’s spring peak flows provide the only possible time of year to go boating. Downstream reaches on the mainstem of the Virgin are very well-known amongst recreators and flows are dependent upon high spring streamflows in the East Fork Virgin River. The project as proposed would have severe environmental and recreational impacts, is not economically feasible and is a misuse of taxpayer money. Thank you for considering my comments on this project.
48	20	4/19/2022	Email	Public		Michael Greenburg	17	Water Resources	I can't believe that in the 21st century we still have to fight against dams in a desert that should never have been cultivated in the first place, but here we are. Cove Reservoir doesn't make sense outside the narrow interests of alfalfa farmers, who shouldn't be farming such a water-intensive crop in the Colorado river basin anyway--the fact that you are even considering using our money to subsidize them is insulting. We need only to look to the diminished ecosystem of the Grand Canyon to see why this is a bad idea; our desert rivers need heavy spring runoff and occasional flash floods to remain healthy, and as somebody who lives in and loves Utah I don't want to see yet another one diminished for foolish ends.
49	21	4/19/2022	Email	Public		Samuel Cramer	18	Water Resources	Thank you for the opportunity to provide comments on the Cove Reservoir - East Fork Virgin Environmental Impact Statement. 52	24	3/29/2022	Email	Public		Richard Spotts	1	Purpose and Need	Dear USDA and DOI Secretaries Vilsack and Haaland: Please review the Natural Resources Conservation Service's (NRCS) published Federal Register Notice of Intent (NOI) today at the web link below and attached, and challenge this proposed wasteful diversion of Virgin River water in the Lower Colorado River Basin before it could reach Lake Mead. Former Utah Republican legislative leader Mike Noel's controversial proposed Cove Reservoir project, actively promoted during the Trump era, unfortunately remains alive under a misrepresented Trojan horse "watershed plan" title under the Biden administration. In reviewing this NOI, it is appallingly clear that the NRCS office in Utah ignored virtually all of the previous public comments on their earlier defective and biased Environmental Assessment (EA). For example, the two action alternatives described in today's NOI are substantially similar to what was originally proposed in the EA. Both would divert Virgin River water that would otherwise flow downriver to Lake Mead. Both would facilitate more water-wasting alfalfa farming during the hot summers, and likely provide for potential future water sales and transfer to expand sprawl developments in Washington County. In a nutshell, if approved and implemented, this project would use federal funds to facilitate further unsustainable private water use and development instead of advancing feasible and bona fide methods to actually improve watershed health during this mega drought. In addition, the NRCS continues to refuse to answer basic questions such as how or whether this proposed Virgin River diversion would comply with the Colorado River Compact (Law of the River). Lake Mead is already dangerously low, but the NRCS and other Utah promoters of this Cove Reservoir seek this harmful Virgin River diversion without regard for the added negative impacts on other Lower Colorado River Basin water users.

53	24	3/29/2022	Email	Public		Richard Spotts	1	Purpose and Need	Cont… This NOI is supposed to start a broad scoping process under the National Environmental Policy Act (NEPA) where the public may provide comments on the proper purpose and need for action, feasible alternatives to the proposed action, and resources/issues of concern. Sadly, based on the arbitrary narrowness of this NOI, NRCS appears to remain highly biased toward what Mike Noel and other development interests want. The Cove Reservoir could apparently not be built unless the Bureau of Land Management (BLM) approves needed borrow pits. So NRCS and BLM are each responsible for this NEPA compliance prior to any final decisions. Given the high level of public controversy and conflicts with the Biden administration's executive orders and professed environmental policies, the ultimate fate of this proposal may be with high-level Agriculture (NRCS) and Interior (BLM) Department Biden administration officials. However, there is no indication that these officials are even aware of nor perhaps care about what is going on in Utah. Just like with their ridiculous proposed Lake Powell Pipeline, Utah's regressive officials continue to arrogantly ignore the two-decade-long mega drought and foolishly believe that they can create water by building more storage structures. Strong accountability is needed to stop federal subsidizing of this unsustainable insanity. Please help change this status quo by challenging the NRCS' improper bias toward the Cove Reservoir and by ensuring that any subsequent DEIS provides a positive purpose and need statement that enables a broader and objective analysis of genuine watershed health alternatives without any proposed Virgin River diversions. For more relevant background information, please see the additional attachments and second web link below. Thank you very much for your consideration. ATTACHMENT - Copy of Publication in Federal Register
54	24	3/29/2022	Email	Public		Richard Spotts	1	General	Please accept, carefully consider, respond to, and include in the relevant project file my following comments on the above-referenced Draft Watershed Plan (DWP) and Environmental Assessment (EA) for the proposed Cove Reservoir Project. I reviewed this DWP and EA and I attended the Zoom EA public meeting on December 9, 2020. I asked many questions during that virtual meeting; some of which were at least partially answered, while others were deflected or ignored. By way of brief background, I have been a Washington County Utah resident for over eighteen years, and I have a strong and longstanding interest in environmental, public lands, wildlife, and water issues. I also have extensive professional and volunteer experience with implementation of the National Environmental Policy Act (NEPA) and the associated Council on Environmental Quality (CEQ) regulations. I deeply care about the proper conservation and management of water and other natural resources.
55	24	3/29/2022	Email	Public		Richard Spotts	1	Purpose and Need	At the outset, I do not believe that this EA is adequate under NEPA because of a biased and narrow purpose and need, deficient evaluation of possible lessdamaging alternatives, and a superficial cumulative effects analysis. Instead, I believe that this DWP and EA are a type of “Trojan horse” propaganda piece whereby private and county water rights holders want the federal government to largely pay for a local project that would primarily benefit those holders’ potential future profits from speculative water sales. The purported recreational and listed fish species benefits are merely window dressing to make this boondoggle appear more reasonable. Indeed, I believe that this proposed project is another cynical example of Utah public officials who consistently slap Uncle Sam in the face with one hand while grabbing his wallet with the other hand. These types of highly questionable projects have flourished during the Trump administration because greed for the few with political connections currently supersedes fidelity to law, science, and the overall public interest.
56	24	3/29/2022	Email	Public		Richard Spotts	1	Water Resources	It seems clear that the overwhelming driver of this DWP and EA is to primarily use federal funds for a local project to divert water to a reservoir to increase surface water supplies to private and county water rights holders. In the near term, these additional supplies would be used to increase alfalfa production and associated profits on private lands. Alfalfa production is obviously one of most wasteful uses of water, especially given the prolonged drought caused by climate change. There are already severe water shortages in much of the West, including in the Colorado River Basin. Lakes Mead and Powell are at historically low levels, and some states have already had supply reductions under the Colorado River Compact and Drought Contingency Plan. The demand for water continues to increase while the supply continues to decrease. Some municipal water districts are literally paying people to convert lawns into natural xeriscape to reduce water use. And tiered water pricing rates are being instituted to properly promote water conservation.
57	24	3/29/2022	Email	Public		Richard Spotts	1	General	The DWP and EA say that this Virgin River water would be “lost” if this diversion is not allowed. That alone demonstrates fundamental bias and myopia. If not diverted, this spring runoff water simply travels down the Virgin River and ends up in Lake Mead. The Virgin River system is part of the Lower Basin under the Colorado River Compact.
58	24	3/29/2022	Email	Public		Richard Spotts	1	General	On the controversial proposed Lake Powell Pipeline (LPP), all Compact states (save Utah) asked that the environmental review process be halted until all Compact states could come to a consensus on future Colorado River water management and possible additional diversions. Although the EA is silent on this key point, I believe that this proposed Cove Reservoir diversion of Lower Basin water should fall under the same Compact states’ request. The amount of water here may be much less than the LPP, but a new diversion of any amount would have a cumulative effect and establish a potentially dangerous precedent.

CID	Doc ID	Received	Type	Group	Entity	Commenter	Commenter ID	Category	Comment
59	24	3/29/2022	Email	Public		Richard Spotts	1	Economics	During the December 9 Zoom EA meeting, the leading project proponent, Mr. Mike Noel, acknowledged in response to a question that the Cove Reservoir water could be used for municipal and industrial purposes. I believe that this was a pivotal admission about the likely true dominant motivation of project proponents. The short-term wasteful agricultural water use for alfalfa would be converted to much more lucrative water sales for these higher M&I value uses. Out of necessity and growing scarcity, water marketing is rapidly gaining ground in the West. Like the old adage that "water flows uphill toward money in the West." I generally support water marketing because it reflects the true value of this increasingly precious commodity and encourages more efficient use of water. However, as a taxpayer, I do not believe that the federal government should interfere with this free market by rewarding or subsidizing some water rights holders at the competitive disadvantage of other such holders. The proposed Cove Reservoir would constitute such an unfair subsidy to a few private and county water rights holders. These federal funds would be much better spent on providing projects and incentives that facilitate greater water conservation and reclamation by the general public. It is unfair to have the American people pay for most of a capital improvement while a few private and county water rights holders gain the appreciated profits. The EA basically ignores these realistic cost-benefit and social equity issues. For example, the EA analysis does not provide for reimbursement of federal funds if the original justification (alfalfa water augmentation) is changed to municipal and industrial water sales. The EA also fails to address to what extent the private and county water rights holders could market their rights for profit without the need for an off-river diversion and reservoir. The Southern Nevada Water District might be willing to pay top dollar for these Virgin River water rights without the need for a federally-subsidized reservoir project. Indeed, such market-driven water transfers might have the greatest public benefits at little or no cost to the taxpayers.
60	24	3/29/2022	Email	Public		Richard Spotts	1	Purpose and Need	The EA's stated purpose and need boils down to four components: agricultural (and future M&I) water; reservoir recreation; hydroelectric power; and Virgin River Endangered Species Act (ESA) species. On the water purpose, the EA admits that no non-structural alternatives were carried forward and analyzed. Much of this watershed suffered from excessive historic overgrazing and other land uses that resulted in serious soil erosion and the unnatural downcutting of gullies and ravines. There are many existing and feasible watershed restoration methods to reverse this current erosive trajectory and begin to heal the watershed. For example, small check dams can be constructed in deep gullies and ravines to slow storm flows, capture sediment, and gradually elevate the gradient. Where they are absent and sufficient riparian vegetation does or could exist (with livestock exclusion fencing), beavers can be reintroduced to serve as nature's premier watershed restoration experts. By implementing these positive and much less expensive and energy-intensive methods, heavy runoff during severe storm events would be cumulatively slowed across the watershed, with less soil erosion and sediment transport and greater soil infiltration and groundwater recharge. These watershed restoration outcomes would have much greater environmental, economic, and social benefits and would serve the American people instead of a few water rights holders. These outcomes would also help to restore the Virgin River's natural ecological and hydrologic processes. It is appalling that the NRCS did not analyze any of these types of alternatives, and instead this EA only compares the proposed reservoir and no reservoir. NRCS has an affirmative legal duty to not only consider the applicant's purpose and need but also the federal agency's broader purpose and need in terms of fulfilling its statutory mission and serving the public interest. NRCS failed to fulfill this duty by limiting the EA purpose and need to essentially what Mr. Noel and other proponents wanted. NRCS is supposed to advance watershed restoration and soil conservation, not promote narrow reservoir projects. And the Bureau of Reclamation and Army Corps of Engineers are supposed to be the federal agencies with dam building jurisdiction and expertise.
61	24	3/29/2022	Email	Public		Richard Spotts	1	Economics	On the reservoir recreation purpose, this is another example of biased tunnel-vision. There is indeed growing public demand for recreational opportunities in this region and excessive tourism is already causing problems in some popular locations. However, much of this tourism is drawn by relatively unique scenic beauty combined with opportunities for experiencing pristine natural areas. Reservoirs are common throughout most of the United States, and there are many existing reservoirs (Jackson Flat, Sand Hollow, Quail Creek, Kolob, Gunlock, etc.) in this region. Most visitors do not come here to camp by a small reservoir. Instead, most visitors come here to camp in spectacularly beautiful areas and to have a chance to hike, mountain bike, or otherwise explore wildlands. As such, the Cove Reservoir is unlikely to be a tourist draw and its EA projected recreational value may be greatly overestimated. The federal funds would be much better spent on providing more mountain biking, equestrian, and hiking trails and primitive camp sites along loops of those trails. That approach would fit with what most tourists to this area desire. As such, I believe that reservoir recreation is largely a potential illusory or nominal benefit that proponents seek to exploit to advance their water project.
62	24	3/29/2022	Email	Public		Richard Spotts	1	Purpose and Need	On the hydroelectric power purpose, the EA is predictably myopic on the subject of energy. First, the EA basically ignores climate change, and does not analyze the significant need to use and burn fossil fuels to build this reservoir and excavate and transport the substantial borrow materials from distant pits. There is no comparison of how much of the hydroelectric energy would be offset or superseded by this significant burning of fossil fuels (that cumulatively contribute to climate change and associated drought). Second, without this diversion, this water could run into Lake Mead, where it may be converted to hydroelectricity when released at Hoover Dam. Third, modern "run-of-the river" hydro was not analyzed as an alternative. Fourth, there was no consideration of using these federal funds to augment solar or wind power generation. In short, hydro power seems to be a minor potential benefit to help sell this reservoir project.

63	24	3/29/2022	Email	Public		Richard Spotts	1	Purpose and Need	On the Virgin River ESA listed species issue, the EA analysis essentially relies on a vague and potentially illusory commitment. On EA page 28 (and elsewhere), it says that "The proposed reservoir would provide up to 882 acre-feet of water annually during the summer months to augment endangered fish and flycatcher habitat." The conditional text of "up to" indicates that 882 acre-feet is the ceiling or greatest amount of water that may be used for this ESA listed species purpose. However, the EA does not disclose whether there is any floor or minimum amount of water that must be released each summer. The EA is also unclear about who would decide how much water should be released each summer, including during severe droughts when the reservoir may be at or near its minimum conservation pool. In short, it appears that the U.S. Fish and Wildlife Service (FWS) and Utah Division of Wildlife Resources (UDWR) were improperly willing to rely on this "up to" commitment without any guarantees about the actual amount of future summer water releases. Absent a clear contractual commitment or firm permit condition enforceable by outside entities, I am skeptical that these promised benefits to ESA listed species may occur, especially in drought years. For example, in a similar situation, I understand that the Washington County Water Conservancy District (WCWCD) may not have fulfilled such a water release requirement when it acquired federal approval for another reservoir or pipeline project. Utah public officials have a history of not keeping their conservation promises. And too many federal and state public officials have backbones of jello and a history of being successfully intimidated by bullying local Utah officials.
64	24	3/29/2022	Email	Public		Richard Spotts	1	Biological Resources	In terms of whether this water diversion and proposed reservoir could benefit these ESA listed species, the EA makes several dubious and unproven assumptions. For example, it says that the summer releases (if they actually occur) would benefit downstream riparian habitats used by southwestern willow flycatchers. This ignores the reality of how the Virgin River watershed has operated ecologically and hydrologically over the past thousands of years. Heavy spring and summer (monsoonal) flows are natural and healthy. The ESA listed species evolved with them. These large flows cause natural sediment transport, bank erosion, and channel migration processes that create and maintain a diversity of natural habitat conditions. They bring woody debris into the system as an important source of carbon. They recharge the river bed sediments and shallow groundwater to sustain riparian vegetation over the dry periods. The scouring flows help to establish new native cottonwoods and willows. They expose gravel beds and create riffles that some fish need. The EA acknowledges that past disruptions in natural Virgin River flow patterns caused significant adverse impacts, yet the EA then hypocritically goes on to promote the new Cove Reservoir diversion as a purported benefit. The EA assumes but does not explain how the reservoir releases would add to these natural benefits, nor increase the quality or quantity of riparian habitats along the river. Speaking of riparian habitats, the EA assumes that the new reservoir would enable the establishment of new riparian habitat around it that would benefit associated species. I seriously question this assumption. Depending on the amount of annual average draw down and the soil substrate, many existing reservoirs tend to exhibit a "bathtub ring" around most of their edges, not healthy and persistent riparian vegetation. As such, there is no guarantee that the professed reservoir riparian habitat benefit would be fully or partially realized.
65	24	3/29/2022	Email	Public		Richard Spotts	1	Purpose and Need	Under NEPA, the applicant and federal agency's purposes and needs are used to determine the overall scope of the environmental analysis and which alternatives should be carried forward for detailed analysis. In this case, as previously described, the EA's purpose and need are improperly too narrow, biased, and myopic. That results in this ridiculous "take it or leave it" EA that only takes a "hard look" at the proposed action/preferred alternative Cove Reservoir and the obligatory no action (status quo) alternative. The alternatives analysis is the "heart" of the NEPA process but sadly this EA has no heart. A whole spectrum of alternatives that would be much less costly, less energy intensive, and less environmentally destructive were basically given short shrift or entirely ignored. Relevant modern issues of growing public concern, like climate change, environmental justice, landscape ecology, and aquatic nuisance/invasive species were neglected.
66	24	3/29/2022	Email	Public		Richard Spotts	1	Cumulative Effects	Under NEPA, the required cumulative effects analysis must evaluate all past, present, and reasonably foreseeable future actions that may affect any of the resources or uses carried forward for analysis. The cumulative effects analysis in this EA is patently inadequate. It is superficial, conclusory, and ignores many relevant projects. For example, it omits the WCWCD's proposed Ash Creek reservoir and pipeline project in the same Virgin River watershed. It omits the recent funding of a new flood control project along the Virgin River. It omits many past and proposed future projects that would affect the same vegetative communities and species in this watershed, such as BLM mastication and chaining efforts in these same sagebrush and pinyon-juniper habitats. It omits consideration of aquatic invasive species that have seriously harmed aquatic ecosystems and could do the same in Cove Reservoir (and, from releases, be carried down river). (At the December 9th virtual meeting, on this issue, it was answered that only nonmotorized boating would occur. However, the EA says that "small motors" could also be used, and these boats may transport harmful aquatic invasive species).

CID	Doc ID	Received	Type	Group	Entity	Commenter	Commenter ID	Category	Comment
67	24	3/29/2022	Email	Public		Richard Spotts	1	NEPA Process	The Trump administration's CEQ recently adopted weakening changes to the NEPA regulations in mid-September. These changes are now subject to several court challenges and they may be overturned in the next session of Congress or by the incoming Biden administration. In any case, these changes should not apply to this EA. The policy is that the applicable CEQ regulations are those in legal effect when the relevant NEPA process was initiated. In this case, the official scoping for this EA occurred in mid 2018, and the BE and other relevant documents were done in 2019. It is clear that this EA was not only initiated but also much of the background analysis was done prior to September of this year. As such, the previous or original CEQ NEPA regulations apply to this EA. The Bureau of Land Management (BLM) and National Park Service (NPS) are cooperating agencies on this EA. It is not clear to what extent these agencies may adopt or supplement this EA for the purpose of NEPA compliance for any authorizations that they execute which may allow, facilitate, or be connected to this proposed Cove Reservoir project. I generally follow the BLM and NPS NEPA notification web sites, and I am not aware of any notice on either site that the agency may use this NRCS EA for the purpose of achieving that agency's NEPA compliance for an authorization. As such, people like me who follow BLM and NPS NEPA may not be aware of this current opportunity to review and comment on this pending NRCS EA. Similarly, I am not aware of any such notice for the previous EA scoping period in the summer of 2018. As such, I do not believe that the NPS and BLM may have provided adequate public notice of this EA process and associated "connected actions" involving BLM and NPS managed lands and resources.
68	24	3/29/2022	Email	Public		Richard Spotts	1	Wild and Scenic Rivers	I understand that there was a Zion National Park NPS negotiated reserved federal water right agreement for in-river flows from the 1990s. I also understand that there was a subsequent Wild and Scenic River designation for this same Zion river segment. It is not clear in the EA how these two things (an administrative agreement versus a statutory designation) are or should be reconciled, and whether there is a potential conflict that may need resolution. In my mind, a wild river segment should include the allowance and continuation of natural hydrological flow patterns through that segment. As such, an unnatural diversion up-river may be harmful to that conservation purpose.
69	24	3/29/2022	Email	Public		Richard Spotts	1	ACEC	In addition, BLM has down-river designated Areas of Critical Environmental Concern (ACECs) in Arizona and Nevada intended to protect riparian habitats and ESA listed species dependent upon natural flow regimes. The EA does not acknowledge these ACECs nor whether they have or should have any dedicated reserved federal water rights to maintain essential river flows. I believe that BLM has an affirmative obligation to assert such reserved federal water rights when necessary to protect and maintain the resource values that they manage and have designated for such protection. I am concerned that BLM may have failed to do so in connection with the now constructed Jackson Flat Reservoir. Any diversion of water that would otherwise flow down Kanab Creek could reduce or harm the riparian habitats and associated species intended for protection in BLM's Kanab Creek ACEC.
70	24	3/29/2022	Email	Public		Richard Spotts	1	Effects Analysis	The EA acknowledges the "connected actions" of needing BLM approval for use of two existing and one new borrow pit for construction of the dam and reservoir. However, except for Visual Resource Management (VRM), the EA is missing information that BLM would need as part of its required NEPA analysis. For example, as previously described, BLM should not rely on this NRCS EA's improperly narrow purpose and need, myopic alternatives, and deficient cumulative effects analysis. This NRCS EA also does not describe all of the relevant BLM Kanab Field Office (KFO) Resource Management Plan (RMP) decisions and how the proposed action would conform to those decisions. As such, BLM should not adopt this NRCS EA for the purpose of NEPA compliance for authorization to use or expand these BLM borrow pits. If BLM nevertheless proceeds to do so, I hereby request actual notice when BLM approves any such authorization so that I may pursue any appropriate administrative remedies.
71	24	3/29/2022	Email	Public		Richard Spotts	1	NEPA Process	The EA acknowledges that, prior to project construction, one or more permits would be necessary from the Army Corps of Engineers (ACOE) under Section 404 of the Clean Water Act. However, the ACOE is not a cooperating agency for this EA and it is unclear how they would achieve their NEPA compliance prior to permit issuance. I believe that the ACOE has an obligation to consider feasible alternatives, which this NRCS EA does not do.
72	24	3/29/2022	Email	Public		Richard Spotts	1	Economics	On EA pages 60 and 61, under Public Health and Safety, the EA acknowledges that this proposed dam and reservoir have a "high" hazard classification and that 10 to 15 people would be at mortal risk from dam failure. The EA also acknowledges that construction related traffic would increase the risk of traffic accidents and damage up to 20 miles of existing dirt and gravel roads. I did not see how or whether the EA factored these risks and potential damages into the cost-benefit calculations. Water marketing or other feasible alternatives would not pose these risks or potential damages, but sadly the EA ignores those options.
73	24	3/29/2022	Email	Public		Richard Spotts	1	Effects Analysis	On EA page 63, in describing the proposed Lake Powell Pipeline and Cove Reservoir, it says that "Both projects would result in a combined increase in water scarcity in Kane County." Please explain this sentence as it makes no sense in this context.
74	24	3/29/2022	Email	Public		Richard Spotts	1	Economics	And the EA Cost Benefit Summary is biased and confusing. In one place, it says the cost benefit ratio is 1.19 to 1. In another place, it says that ratio is 1.03 to 4.4. The estimated agricultural benefit from increased alfalfa production is $826,000 and the recreational benefit is $176,000. These relatively minor estimated benefits do not come close to justifying NRCS in spending over $20,000,000 in federal funds. This funding could be much better and more efficiently and equitably spent on genuine watershed restoration and water conservation measures in the public interest.

CID	Doc ID	Received	Type	Group	Entity	Commenter	Commenter ID	Category	Comment
75	24	3/29/2022	Email	Public		Richard Spotts	1	General	For the preceding and other reasons, I strongly oppose the EA proposed action/preferred alternative to build and operate the Cove Reservoir project. This proposed boondoggle is wasteful, ridiculous, and politically driven for the benefit of the few at the expense of the many. The various public officials at NRCS, BLM, NPS, FWS, and ACOE who have apparently been cooperative and supportive of this boondoggle should be ashamed. These officials should realize that times have changed, progressive and creative reforms are long overdue, and more status quo dam building is regressive and foolish. In light of my comments, I believe that NRCS and the other cooperating federal agencies have only two choices. On the one hand, they can support and approve the EA No Action Alternative and deny the associated funding requests and permit applications. On the other hand, they can prepare a supplemental EA that remedies or corrects all the current EA's many deficiencies and omissions. This supplemental EA should then be made available for another round of public review and comment and posted on the NPS and BLM NEPA web sites as well as the NRCS site. At minimum, NRCS and Congress should not provide any funds for this project until adequate public notice and NEPA compliance have occurred. I reserve the opportunity to add to these comments if new issues or information come to my attention prior to the EA comment deadline. Please add me to the relevant mailing list for this proposed project and send me all notifications relating to it. Please also let me know if you have any questions about my comments. Thank you very much for your consideration.
76	24	3/29/2022	Email	Public		Richard Spotts	1	General	Reference to Utah Rivers Council Comments submitted on December 31, 2020.
77	25	4/18/2022	Email	Agency	NPS	Michael Reynolds	21	General	Dear Ms. Fife, The National Park Service (NPS) appreciates the opportunity to provide comments during the scoping period of the Watershed Plan and Environmental Impact Statement for the Cove-East Fork Virgin River Watershed Project and accepts the request to become a formal cooperating agency with the United States Department of Agriculture, Natural Resource Conservation Service (NRCS). The NPS within Zion National Park (ZION) manages a portion of the East Fork of the Virgin River within the park and holds special expertise regarding Wild and Scenic River, Endangered Species Act, Migratory Bird Treaty Act and Wilderness management. At your earliest convenience, please send ZION a draft of the proposed Memorandum of Understanding for NPS review. In addition to the comments and information requests outlined below, we strongly encourage NRCS to provide information related to impacts this project may have on regional dark night skies and mitigations planned to reduce those impacts.
78	25	4/18/2022	Email	Agency	NPS	Michael Reynolds	21	Water Resources	**1. 1996 Zion National Park Water Rights Settlement Agreement** Notably, in 1996 the NPS, State of Utah, Washington County Water Conservancy District, and Kane County Water Conservancy District entered into a historic agreement to establish federal reserved water rights memorialized in the Zion National Park Water Rights Settlement Agreement (SA). In the SA, the NPS agreed to subordinate its senior water rights to limited future water development in the East Fork of the Virgin River. This includes a cap on cumulative storage capacity in one or more reservoirs not to exceed 6,750 acre-feet and a limitation of individual new reservoirs with total storage capacities greater than 20 acre-feet not to exceed 10 (SA Article II.D.1.a&b). With this limitation on new reservoir development addressed in the SA, restrictions on flow were also established for any new diversion structures constructed for new, large reservoirs (SA Article II.D.3), as well as the timing of diversion for any diversions associated with the new reservoirs with a storage capacity greater than 20 acre-feet (SA Article II.D.6). In addition, limits were set on the bypass flows below any new reservoirs (SA Article II.D.4) and reservoir discharge (SA Article II.D.5). We respectfully request the following information to determine if this proposed project is in compliance with the terms of the SA: **1.A.** The location of any diversions associated with this proposed reservoir and the flow planned to be maintained below any new surface water diversions associated with the proposed reservoir. **1.B.** The planned timing and diversion rate on all diversions associated with the proposed reservoir. **1.C.** The proposed location, timing, and volumetric flow rate of releases and any return flow associated with the proposed reservoir. The NPS anticipated development of this proposed reservoir whose terms were outlined in the SA. In addition, the NPS is required to evaluate the proposed development for compliance with other federal laws as described below. Therefore, the NPS requests additional information in order to complete the required analyses.
79	25	4/18/2022	Email	Agency	NPS	Michael Reynolds	21	Wild and Scenic Rivers	**2. Wild and Scenic River Act** As a water resources project requiring federal assistance located upstream of a designated Wild and Scenic River, the East Fork of the Virgin River, this project is required to be evaluated using Section 7 of the Wild and Scenic Rivers Act, to determine if it will invade the river area or unreasonably diminish the river's scenic, recreational, fish, or wildlife values. This evaluation will be completed by the NPS as the river administering agency. The NPS will use information available in the project's National Environmental Policy Act (NEPA) documents to complete the Section 7 Determination. The NPS requests specific information and analysis to be completed in the Watershed Plan and Environmental Impact Statement to inform its Section 7 Determination. The East Fork of the Virgin River designated Wild and Scenic River provides habitat for four native fish species: desert sucker (Catostomus clarkia), flannelmouth sucker (Catostomus latipinnis), virgin spinedace (Lepidomeda mollispinis) and speckled dace (Rhinichthys osculus). The desert sucker, flannelmouth sucker and Virgin spinedace are each listed as a Utah Species of Greatest Conservation Need by the Utah Department of Natural Resources. Flow depletion and dewatering caused by stream diversions for agricultural, municipal, and industrial uses are among the primary threats to the desert sucker, flannelmouth sucker, and Virgin spinedace. Prolonged periods of drought and increasing stream temperatures are compounding threat factors that are further exacerbated by flow depletion from stream diversions. Other threat factors listed for fish species native to the East Fork Virgin River include pesticides and other pollutants introduced by return flows from municipal and agricultural drains and runoff, invasive wildlife species, invasive plant species, and the introduction of aquatic invasive parasites and diseases. We respectfully request the following information to help inform the Section 7 Determination:

CID	Doc ID	Received	Type	Group	Entity	Commenter	Commenter ID	Category	Comment
80	25	4/18/2022	Email	Agency	NPS	Michael Reynolds	21	Biological Resources	**2.A.** The effects this water development project may have on Virgin spinedace, desert sucker, and flannelmouth sucker population and habitat maintenance in the East Fork of the Virgin River must be assessed in the EIS. The 2002 Conservation Agreement and Strategy for Virgin spinedace placed management of the recovery and conservation of Virgin spinedace with the Virgin River Resource Management and Recovery Program (VRRMRP), a multi-agency cooperative program. Please work with the VRRMRP to assess potential impacts and develop mitigations to reduce negative impacts on Virgin spinedace population and habitat in the East Fork of the Virgin River which may include the establishment of population maintenance flows or minimum flow requirements.
81	25	4/18/2022	Email	Agency	NPS	Michael Reynolds	21	Wild and Scenic Rivers	**2.B.** Analysis of how this proposed project will impact natural flow regimes (including the magnitude, frequency, and timing of flood flows) and flow-related habitat variables (including water temperature, turbidity, and sediment transport) under a variety of scenarios including low, normal, and high-water years through the East Fork of the Virgin River Wild and Scenic River.
82	25	4/18/2022	Email	Agency	NPS	Michael Reynolds	21	Invasive Species	**2.C.** Mitigation(s) to prevent non-native fish and aquatic invasive species from escaping into the East Fork of the Virgin River from the proposed reservoir associated with this project.
83	25	4/18/2022	Email	Agency	NPS	Michael Reynolds	21	Water Resources	**2.D.** Analysis of how municipal and agricultural runoff as well as chemical and pesticide loads will be altered as a result of this proposed project. If increased runoff is expected, please provide information regarding mitigation measures to reduce runoff into the East Fork of the Virgin River.
84	25	4/18/2022	Email	Agency	NPS	Michael Reynolds	21	Climate Change	**2.E.** Analysis, including any mitigation measures, on the anticipated effects climate change may have on this proposed project, including a reduction in snowpack in the East Fork of the Virgin River Watershed and spring runoff as well as increased air temperatures.
85	25	4/18/2022	Email	Agency	NPS	Michael Reynolds	21	Sensitive Species	**3. Endangered Species Act and Other Sensitive Species** Mexican Spotted Owl (MSO) and MSO Critical Habitat: The East Fork of the Virgin River and its tributaries are inhabited by MSO and the entirety of ZION is designated critical habitat for MSO. Two breeding territories have been confirmed near the East Fork of the Virgin River. Inventory surveys have not been conducted in the majority of potential breeding habitat that exist along the East Fork, and it is likely more territories exist. Water development, including water diversion and reservoirs can degrade, reduce, and/or fragment MSO habitat and/or disrupt migration corridors, inhibit gene flow, alter prey habitat and/or alter grazing patterns by wild ungulates. Data on the timing of the discharges from the reservoir and how these discharges will alter the natural hydrological cycles and flow rates of the East Fork of the Virgin River (as requested in 2.B) will be needed to evaluate impacts to this protected species and habitat and consult with the U.S. Fish and Wildlife Service under Section 7 of the Endangered Species Act.
86	25	4/18/2022	Email	Agency	NPS	Michael Reynolds	21	Sensitive Species	**Southwestern Willow Flycatcher (SWFL) and Yellow-Billed Cuckoo (YBCU):** The riparian habitat along the East Fork of the Virgin River provides migratory stop-over habitat and marginal breeding habitat for SWFL and YBCU. Both species have been detected along the Virgin River in ZION or Springdale, UT during migration. Water development can modify, degrade, or reduce SWFL and YBCU habitat especially if water in riparian ecosystems and associated subsurface water tables are reduced. Reduced flows during spring runoff may degrade/alter the quantity of prey (insects) available to migrating SWFL and YBCU. An increase in upstream establishment of non-native vegetation, such as tamarisk and Russian olive, will increase the rate of establishment of these species downstream which can negatively alter SWFL and YBCU habitat. Data on the timing of the discharges from the reservoir and how these discharges will alter the natural hydrological cycles and flow rates of the East Fork of the Virgin River (as requested in 2.B) will be needed to evaluate impacts to these protected species and consult with the U.S. Fish and Wildlife Service under Section 7 of the Endangered Species Act.
87	25	4/18/2022	Email	Agency	NPS	Michael Reynolds	21	Invasive Species	**3.A.** Provide information on how non-native vegetation will be controlled near the proposed reservoir.
88	25	4/18/2022	Email	Agency	NPS	Michael Reynolds	21	Sensitive Species	**Sensitive and State-listed Species/Other Native Wildlife:** The East Fork of the Virgin River provides habitat for numerous native wildlife species, including State-listed species such as the Arizona toad. Water development projects have the potential to negatively affect wildlife if riparian habitat, fish communities, or aquatic invertebrate populations are negatively altered. Ecologically, if one functional group of wildlife is negatively impacted those effects will cascade to other wildlife species (e.g., if aquatic invertebrates are negatively affected numerous species of bats, birds, amphibians, and reptiles will also be affected). Data on the timing of the discharges from the reservoir and how these discharges will alter the water temperature, natural hydrological cycles and events and flow rates including the magnitude, frequency, and timing of flood flows (as requested in 2.B) will be needed to evaluate impacts on these species.
89	25	4/18/2022	Email	Agency	NPS	Michael Reynolds	21	Migratory Birds	**4. Migratory Bird Treaty Act** The riparian habitat along the East Fork provides breeding, stop-over, and/or winter habitat for many species of migratory birds. Water development projects can negatively impact the quality and quantity of various habitat components (food, shelter, etc) which can reduce their breeding success or survival. An increase in upstream establishment of non-native vegetation, such as tamarisk and Russian olive, will increase the rate of establishment of these species downstream which can negatively affect migratory birds. Data on timing of the discharges from the reservoir and how these discharges will alter the natural hydrological cycles and flow rates of the East Fork (as requested in 2.B) will be needed to evaluate impacts on these species. Data (as requested in 3.A) on how non-native vegetation will be controlled near the proposed reservoir will also be important to identify.

CID	Doc ID	Received	Type	Group	Entity	Commenter	Commenter ID	Category	Comment
90	25	4/18/2022	Email	Agency	NPS	Michael Reynolds	21	ACEC	**5. Wilderness Act and Research Natural Areas** The East Fork of the Virgin River flows within congressionally designated Wilderness at ZION and is a primary feature that defines the Wilderness Character of the park. Three characteristics of Wilderness have the potential to be adversely impacted by the proposed water development project: Natural, Untrammeled, and Other Features of Value. NPS management focuses on maintaining this ecological system as substantially free from the effects of modern civilization (Natural) and unhindered and free from initial actions of modern human control or manipulation (Untrammeled). This area also holds unique features of ecological, geological, scientific, educational, scenic, and historical values (Other Features of Value). The presence of human civilization has long resided within Parunuweap Canyon which was only made possible by the river. This area is also managed by ZION as a Research Natural Area (RNA). In accordance with the NPS Natural Resource Management Reference Manual (DO-77), RNAs are areas designated to be permanently protected and maintained in natural conditions. The ZION General Management Plan specifically calls out Parunuweap Canyon to be managed as an, “undisturbed watershed and riparian corridor.” The East Fork of the Virgin River is a critical component of the Parunuweap RNA which contains a unique ecosystem, ecological features, rare and sensitive species of plants, animals, and their habitats, and provides a high-quality example of a natural ecosystem. ZION manages the East Fork as an RNA to protect the area as a prime example of natural resources and processes, including significant genetic resources that have value for long-term observational studies or as control areas for manipulative research taking place outside of NPS lands. Again, this aspect of the river emphasizes the need to establish a firm understanding of natural streamflow rates and how these might be altered with any water development infrastructure upstream within the drainage. Data on the timing of the discharges from the reservoir and how these discharges will alter the natural hydrological cycles and flow rates of the East Fork of the Virgin River (as requested in 2.C) will be needed to evaluate impacts to wilderness and the RNA. Identifying and communicating strategies for managing flows, to include anticipated discharge schedules and pulse volumes, will be of critical importance in order for the NPS to remain involved in for the life of the project. Any impacts or changes to winter, scouring flows may alter the riparian corridor and how flow rates would be managed to address low water years when pulses cannot be released will be essential for the NPS to understand.
91	25	4/18/2022	Email	Agency	NPS	Michael Reynolds	21	ACEC	**5.A.** Please provide an analysis of impacts this project may have on Wilderness characteristics within the East Fork of the Virgin River in Zion National Park.
92	25	4/18/2022	Email	Agency	NPS	Michael Reynolds	21	General	We appreciate the opportunity to identify information needs, important needed analyses and to provide comments during the scoping period of the Watershed Plan and Environmental Impact Statement for the Cove-East Fork Virgin River Watershed Project. Further, we request the information and analyses discussed above be initiated in consultation with all cooperating agencies. Please work directly with ZION staff to advance the responsibilities and expectations that will be assigned in the memorandum of understanding for cooperating agencies. If you have any questions, please contact Jeff Bradybaugh, ZION Superintendent, as the primary point of contact by phone at
93	26	4/26/2022	Email	Agency	EPA	Matthew Hubner	22	General	The U.S. Environmental Protection Agency Region 8 has completed a review of the Notice of Intent (NOI) for the Cove-East Fork Virgin River Watershed Plan Project Environmental Impact Statement (EIS) prepared by the USDA Natural Resources Conservation Service (NRCS). The following scoping comments were prepared in accordance with our responsibilities under the National Environmental Policy Act (NEPA). The Project purpose is identified “to increase and maintain a reliable supply of water for local agricultural use and existing storage needs, increase water conservation, and improve water delivery efficiency in the Upper Virgin Watershed…” in Kane and Washington Counties, Utah. The Project proposes three alternatives, including the No Action Alternative. The other Proposed Alternatives include the construction of Cove Reservoir and construction of an alternative reservoir site. EPA has identified the following key topics we recommend evaluating in the Draft EIS to fully understand the potential impacts to public health and the environment: (1) purpose and need, (2) alternatives, (3) water resources, (4) air resources, (5) mitigation, (6) threatened and endangered species, (7) construction and failure response, and (8) environmental justice and NHPA. We appreciate your consideration of the enclosed comments. We are providing a copy of our December 22, 2020, Cove Reservoir Environmental Assessment (EA) comment letter. These comments remain valid for the NRCS to consider as it develops the Draft EIS with Cove Reservoir construction identified as the Preferred Alternative. We value the opportunity to review and provide comments on the NOI. We look forward to working with you and will continue to provide Project assistance on the NEPA process and Clean Water Act (CWA) Section 404 guidelines related to the development of the Draft EIS. If further explanation of our comments is desired, please contact me at or Philip Strobel, Branch Chief, at .

CID	Doc ID	Received	Type	Group	Entity	Commenter	Commenter ID	Category	Comment
94	26	4/26/2022	Email	Agency	EPA	Matthew Hubner	22	Purpose and Need	**(1) Purpose and Need** We are pleased to see a better-defined purpose and need statement and the inclusion of an additional alternative in the NOI. We reiterate some of the following information to aid the NRCS in development of the EIS. The previous Cove Reservoir Environmental Assessment (EA) and current NOI documents indicate this Project will require a Clean Water Act Section 404 permit for impacts to aquatic resources. For the purpose of complying with both the CWA and NEPA, EPA recommends ensuring that the purpose and need statement is broad enough to encompass an appropriate range of both "reasonable" (per NEPA) and "practicable" (per CWA Section 404) alternatives to meet the basic (i.e., underlying) project purpose, including the proposed action and other available water supply and management options. A broad purpose and need statement allows for the analysis of a range of water supply alternatives without eliminating less environmentally damaging alternatives that may be considered practicable under the CWA Section 404 implementing regulations (e.g., water conservation and identification of existing nearby water supply sources). Developing an agency-coordinated purpose and need statement is critical prior to establishing subsequent screening criteria or identification of alternatives. Efforts to develop a purpose and need statement that meets the requirements of both NEPA and CWA Section 404 can provide for a more efficient regulatory process, while the use of a narrow project purpose to determine the scope of studies has the potential to result in the need to prepare additional NEPA documentation to meet NEPA and CWA Section 404 requirements. When creating the Project purpose and need statement, we recommend that the Draft EIS describe the quantity of water that is needed above the current supply and the reasoning behind the need. The NOI Preferred Alternative identifies two different volumes for Cove Reservoir, which could be considered two independent alternatives should the impacts vary. Important considerations further include identifying project participants and recent growth projections (e.g., per State Demographer information) in the demand analysis and documenting existing use by each entity utilizing consistent methodology (e.g., gallons per day or gallons per capita). It is informative to describe current community master planning build-out scenarios (i.e., recreational, industrial, residential, or agricultural development plans) and boundaries and estimate demand for these scenarios. If available, it is also helpful to provide similar community-type demand estimates or ranges for comparison purposes. We also recommend quantifying potential reductions to current demand through the implementation of water resource infrastructure improvements and conservation measures within both the description of need and the proposed Project alternatives.
95	26	4/26/2022	Email	Agency	EPA	Matthew Hubner	22	Alternatives	**(2) Project Alternatives** For an alternative to be practicable, it must be reasonably available or obtainable and may include options beyond the authority of the lead agency. To assure that an alternative is permittable, it is essential that the Draft EIS include a range of alternatives with the goal of avoiding and minimizing impacts to waters of the U.S. while meeting the basic purpose of the action. We recommend that the Draft EIS summarize the regulatory criteria and processes utilized to develop the reasonable and practicable alternatives, including any environmental, logistical, technological, and cost criteria applied to identify and screen potential alternatives. Details of the reasoning used to screen or eliminate alternatives is valuable for understanding the decision process. As required by regulation, the rationale must be consistent with the practicability definition and criteria outlined in the preamble language of the CWA 404(b)(1) Guidelines (40 CFR § 230.10). EPA recommends exploring a suite of structural and non-structural options to meet the underlying project purpose when considering a range of alternatives. A combination of non-structural and structural components could serve to meet the basic project purpose, and together may reflect a practicable alternative that is potentially less damaging than a single larger structural option. For example, assess to what extent the need for supplemental water supply could be reduced or resolved through conservation and for any remaining need, if it could be partially or fully met through temporary or permanent agreements for use of agricultural water rights, drought time water use restrictions, water reuse, conjunctive use of groundwater and surface water supplies, alternative development of additional storage, alternative storage sites within the basin, purchase of other water rights that may be less damaging to aquatic resources, blending raw water, regulating development in a service area, or a combination of these ideas. Because non-structural options (e.g., conservation, water rights leasing) may individually contribute less towards meeting the Project purpose than structural options (e.g., new or expanded reservoir storage), we recommend designing screening criteria so that these non-structural components are not eliminated solely on the basis of their potentially smaller individual contributions to meeting the Project purpose and need.
96	26	4/26/2022	Email	Agency	EPA	Matthew Hubner	22	Affected Environment	**Baseline Environmental Conditions** When evaluating effects of alternatives, we recommend using existing environmental conditions as the baseline for comparison of impacts across all alternatives, including the No-action Alternative. Comparing the alternatives to existing conditions is important for understanding and quantifying each Alternative's impacts and potential benefits. This is especially true when there are environmental protections in place that are based on current conditions or special designations of downstream waterbodies such as the Wild and Scenic designation of the Virgin River in Zion National Park. EPA recommends that the NEPA analysis compare and present impacts to resources against the existing conditions baseline using a consistent method to measure project impacts on these critical resources for all alternatives. We recommend that NRCS consider the following when defining baseline conditions: • Verify whether historical data (e.g., data 5 years or older) are representative of current conditions. • Provide a detailed hydrologic analysis in diverted waterways and storage areas to adequately assess the Project's potential biological and geomorphic impacts. At a minimum, include wet, average, and dry year analyses at a daily time-step. Also consider potential influences of temperature and precipitation trends on future hydrology. • Include resources directly impacted by the Project footprint within the geographic scope of analysis (i.e., reservoir locations and pipeline, canal and road routes), as well as the resources indirectly (or secondarily) impacted by the Project. These indirectly impacted areas may include downstream segments, source streams where water diversions will occur and any other resource areas which may be affected by changes in water management or operations.

CID	Doc ID	Received	Type	Group	Entity	Commenter	Commenter ID	Category	Comment
97	26	4/26/2022	Email	Agency	EPA	Matthew Hubner	22	Water Resources	**(3) Water Resources** Analysis of Water Supply Reliability We recommend including information on safe yields from streams and groundwater, water demand, and drought management. Reviewing previously conducted studies by the Institute for Water Resources of the Corps of Engineers may be useful (See "An Evaluation of the Risk of Water Shortages in the Lower Peninsula, Virginia," Revised Report, August 15, 2001, IWR Special Study, U.S. Army Corps of Engineers). An evaluation of potential influences of climate change on the proposed Project is also a valuable component for assessing water supply reliability. The Utah Department of Natural Resources has made projections on climate change attributed changes to annual temperatures and precipitation over the next century that would apply to the Project area (Khatri, K.B. and Strong, C., 2020 Climate Change, Water Resources, and Potential Adaptation Strategies in Utah. Utah Department of Natural Resources, https://water.utah.gov/water-data/water-reports/). Climate change influences on the Project may translate into modified design and operational assumptions for determining resource supplies, system demands, system performance requirements, and operational constraints (Brekke, L.D., Kiang, J.E., Olsen, J.R., Pulwarty, R.S., Raff, D.A., Turnipseed, D.P., Webb, R.S., and White, K.D., 2009 Climate change and water resources management – A federal perspective: U.S. Geological Survey Circular 1331, p.65). We recommend including an analysis of how climate change vulnerabilities have been incorporated into alternative selection and design in the Draft EIS and if or what additional work may be needed to address these points in the future within the watershed.
98	26	4/26/2022	Email	Agency	EPA	Matthew Hubner	22	Water Resources	**Water Quality Impacts** Should the Project modify water resources through operational changes, construction activities, placement of new infrastructure, increased diversion of water, or introduction of new water sources, we recommend the Draft EIS include an analysis of water quality that evaluates the following areas: • Current and post-project water quality at a critical flow condition and expected changes to assimilative capacity or permit limits for any National Pollutant Discharge Elimination System (NPDES) or state discharge permits downstream of the diversion or impoundment. This analysis should include: o A comparison of current water quality, post-project water quality, and the applicable water quality standard (i.e., nutrient loads and temperature changes downstream in the East Fork Virgin River); o The utilization of state methods to assess water quality and determine water quality-based effluent limits; o An account of changes in background water quality for water quality modeling and determinations of assimilative capacity; o Water quality impairments per State CWA Section 303(d) lists, draft or established Total Maximum Daily Loads (TMDLs) and potentially affected dischargers; o Details of any water quality-limited segments within the affected area; o Source Water Protection Areas and an explanation of how the Project will be consistent with Source Water Protection planning measures; o Direct or indirect effects from the proposed borrow pit(s) on BLM land; and o Potentially affected water treatment providers and possible changes to treatment processes.
99	26	4/26/2022	Email	Agency	EPA	Matthew Hubner	22	Water Resources	**Groundwater** In assessing the potential impacts of an alternative on groundwater systems in the region of the Project site, EPA recommends that the Draft EIS examine the potential for changes in the volume, storage, flow and quality of ground water through data obtained from ground water resource characterization efforts and ground water use. Projected construction, operation, or maintenance of a project and its associated infrastructure may have significant impact on groundwater resources. EPA therefore recommends highlighting potential impacts to: • Spring and seep emergences and their associated discharge rates and quality; • Regional subsidence associated with groundwater withdrawal; • Sensitive aquifers, sole source aquifers, drinking water well yield and quality; and • Regional aquifer quality, aquifer quality near potential underground storage areas, and areas of groundwater/surface water exchange. EPA recommends the NEPA analysis identify and discuss how groundwater will be protected or impacted by project activities and any changes in the system that may result from the implementation of an alternative. If the Project will impact groundwater, we recommend the analysis consider mitigation measures that: • Avoid impacts on groundwater; • Limit the degree or magnitude of impacts on groundwater; • Reduce impacts by long-term maintenance operations; • Repair or restore groundwater resources; and/or • Compensate for groundwater impacts by replacement or substitution. The EPA recommends the NEPA analysis include: • A list of Best Management Practices (BMPs) that will be required to protect water resources; • A discussion of the circumstances under which the BMPs would be applied (e.g., proximity to surface water resources, presence of erosive soils, slope, sensitive aquifers, spring emergences, etc.); and • An explanation of how NRCS or another government entity would ensure that the BMPs would be monitored to ensure timely and correct implementation.

CID	Doc ID	Received	Type	Group	Entity	Commenter	Commenter ID	Category	Comment
100	26	4/26/2022	Email	Agency	EPA	Matthew Hubner	22	Water Resources	**Streamflow** EPA recommends that the analysis of each alternative, with respect to the affected stream system(s), account for alterations of streamflow quantity and subsequent impacts to aquatic life. In order to understand Project effects on streams, include in the analysis any stream resources in the immediate Project area, downstream of the Project area, and any areas that would be affected by inundation, diversions, or operational modifications within the scope of the impact analysis. For the impact analysis we recommend selecting reaches based upon their representativeness of geographic scope and the type of modification. To ensure that critical resources are considered and the scope of analysis is appropriate, we recommend conducting interagency coordination when selecting stream reaches. For example, it would be valuable to include consideration of species recovery areas, recreational areas, critical habitat for threatened or endangered species, Wild and Scenic designated segments, segments impaired per Section 303(d) of the CWA, segments for which TMDLs have been established, receiving waters for permitted dischargers, and source water protection areas for surface water intakes. We also recommend considering stream impacts regionally within the context of the cumulative analysis portion of the review. If an alternative will alter in-stream flow quantity, we recommend that the Draft EIS include analysis of the following: • Quantify any existing diversions diversions into or out of the water sources affected by the Project; • Present and compare pre- and post-project flows as characterized in Table 1 on the next page. • Assess impacts to the flow regime with an emphasis on the implications of changes to channel complexity, channel maintenance, aquatic habitat availability, and life history adaptations which includes; and, • Assess the cumulative effect to streams of past diversions, project diversions, and any reasonably foreseeable future diversions.
101	26	4/26/2022	Email	Agency	EPA	Matthew Hubner	22	Water Resources	Include analysis of the following: - SEE TABLE OF FLOW METRICS • Impacts to stream morphology and sediment transport due to reservoir construction/expansion, changes in stream flow, or changes in land use including: o Identify affected riffle-pool complexes; and o Assess impacts from pre- and post-project flows to sediment transport, channel maintenance and channel complexity. • Impacts to resident fish species and invertebrate assemblages which includes: o Baseline data regarding functional species composition, diversity, evenness, abundance, and, for macroinvertebrates, %EPT (Ephemeroptera, Plecoptera, and Trichoptera) and some characterization of flow preference. EPA's rapid bioassessment protocol, or a statespecific method, may be used to describe baseline habitat quality; o Characterization of shifts in species composition, impacts to less tolerant species, and changes in functional composition between current baseline and post-project environment; o Impacts to physical habitat, including availability, heterogeneity, connectivity, and longterm habitat maintenance; o Consideration of multiple metrics or factors that influence habitat such as loss of flushing flows, reduced floodplain connectivity, temperature, and changes to ecologically significant flows; o Analysis of aquatic resource impacts, which integrate any results from flow, stream morphology and water quality analyses; • Impacts associated with reservoir construction/expansion and subsequent inundation and include quantification of lost aquatic and riparian habitat areas and impacts of conversion from lotic to lentic habitat types; and • A description of mitigation measures for potentially adverse impacts to stream resources and aquatic life.

CID	Doc ID	Received	Type	Group	Entity	Commenter	Commenter ID	Category	Comment
102	26	4/26/2022	Email	Agency	EPA	Matthew Hubner	22	Wetlands	The protection and restoration of wetlands and riparian areas is a high priority. These resources increase landscape and species diversity, support many species of wildlife, and are critical to the protection of water quality and designated beneficial water uses. To illustrate effects to wetlands in the area, we recommend that the Draft EIS specifically include the following analyses or descriptions: • Description of impacts under individual or nationwide permits authorizing the discharge of fill or dredge materials to waters of the U.S.; • Clear maps, including wetland delineation and regional water features; • Wetland delineation and descriptions, including ecological function analysis if there is any potential that an alternative will cause impacts; • Analysis of the direct, indirect, and cumulative impacts to all wetlands in the geographic scope, including impacts to wetlands from changes in hydrology even if these wetlands are spatially removed from the construction footprint. Include in the analysis the indirect impacts to wetlands from loss of hydrology from water diversion/transfers and the cumulative impacts to wetlands from future development scenarios based on population and growth estimates; • Detailed analysis of potentially adverse impacts to aquatic resources from reasonably foreseeable development; • Impacts associated with infrastructure and reservoir construction/expansion and subsequent inundation with a quantification of lost aquatic and riparian habitat areas • Specific and scientifically-derived evidence to support downstream increases to riparian habitat resulting from reservoir development as described in the EA; and • An evaluation of specific mitigation requirements and BMPs applicable for construction, maintenance, and reclamation activities to prevent adverse impacts to aquatic resources downslope of the Project site. We recommend that the Draft EIS demonstrate that the destruction, degradation, and modification of all wetlands, both jurisdictional and non-jurisdictional, is being avoided and minimized on federal land as outlined in EO 11990. It is the responsibility of NRCS to comply with EO 11990 for impacts on federal lands if any of the project alternatives cross into the surrounding BLM lands. This would involve mapping all wetlands within the project site, including springs and seeps, and assuring all avoidance measures are incorporated into the Project. If non-jurisdictional wetlands on federal lands are going to be impacted, offsetting mitigation efforts will also need to be incorporated.
103	26	4/26/2022	Email	Agency	EPA	Matthew Hubner	22	Air Quality	**(4) Air Resources** Protection of air quality is important to address in the Draft EIS. We recommend that the amount of stationary, mobile, and non-road source emission activities associated with construction, including hazardous air pollutants, be quantified and disclosed. We recommend evaluating and disclosing any air quality impacts and if necessary, identifying mitigation steps that will be taken to minimize associated adverse impacts. Components to be presented in the documentation include the existing air quality conditions in the Project vicinity, and an assessment of any impacts on National Ambient Air Quality Standards, Prevention of Significant Deterioration standards, and air quality related values or Air Quality Related Values. Also, to be addressed are particulate emissions from construction and ongoing operation of maintenance or access roadways.
104	26	4/26/2022	Email	Agency	EPA	Matthew Hubner	22	Monitoring and Mitigation	**(5) Mitigation** EPA recommends that each alternative in the Draft EIS identify appropriate mitigation where impacts to water quality, air quality, stream morphology, or aquatic life are expected. The higher the uncertainty surrounding project impacts, the more emphasis there should be on providing mitigation details (including adaptive management) to assure protection of resources. At a minimum, include the following mitigation information in the Draft EIS: • Identify the entity responsible for implementing each mitigation commitment; • Define a mitigation effectiveness monitoring plan, including baseline monitoring if data are lacking; • Define specific management decision points based upon protecting the minimum desired environmental conditions (thresholds) in the Project area which would trigger modification or improvement actions; • Identify funding sources to sustain mitigation commitments. • Establish mechanisms for public disclosure of the analysis and management decisions; and • Ensure that mitigation details presented are consistent with the 2008 Rule on Compensatory Mitigation for Losses to Aquatic Resources for related impacts if a CWA 404 permit will be required.
105	26	4/26/2022	Email	Agency	EPA	Matthew Hubner	22	Sensitive Species	**(6) Special-Status and Threatened and Endangered Species** The Project area contains special status species, including the Virgin River chub and woundfin species at Pah Tempe Hot Springs, as well as the southwestern willow flycatcher. EPA recommends engaging the U.S. Fish and Wildlife Service (FWS) as early in the analysis as possible to assure that the proposed alternatives responsibly account for or are in compliance with the following: • River restoration, flow and channel modifications, wetlands, and habitat fragmentation regarding species' habitat requirements; • Migratory Bird Treaty Act; • A management plan for surrounding land uses (e.g., pesticide, nutrient, weed, and recreation management), for new reservoir construction alternatives; and To best inform decision-makers and the public, we recommend the Draft EIS: • Summarize the status and trends of the Project area for threatened, endangered, and sensitive (TES) species and potential suitable habitat acreage; • Disclose of any impacts to TES species and habitat resources (including habitat fragmentation) associated with the proposed Project; • Include design criteria, mitigation, and monitoring measures developed in coordination with the FWS and State to ensure the proposed Project and resulting development do not negatively impact habitat for migratory birds, bald eagles, or other species; and • Any FWS recommendations to reduce potential impacts to TES species from the proposed Project.

CID	Doc ID	Received	Type	Group	Entity	Commenter	Commenter ID	Category	Comment
106	26	4/26/2022	Email	Agency	EPA	Matthew Hubner	22	Invasive Species	**Invasive species** The EPA recommends that the Draft EIS analyze the Project's potential to increase the spread of invasive species. Invasive species in aquatic environments [i.e., zebra (Dreissena polymorpha) and quagga (Dreissena bugensis) mussels, tamarisk (Tamarix spp.), New Zealand mudsnail (Potamopyrgus antipodarum), and rusty crayfish (Orconectes rusticus)] have been documented across the United States and may apply to any new lands being converted into additional water storage. If the Project has the potential to facilitate spread of invasive species, we recommend evaluation of the impacts to Special-Status and TES species as well as incorporating measures to prevent or mitigate those effects.
107	26	4/26/2022	Email	Agency	EPA	Matthew Hubner	22	Alternatives	**Proposed Alternative Construction** We recommend including specific information about water resource storage construction so that anticipated impacts can be considered when selecting between alternatives. These details include a description of the following factors: • Structural specifications, materials, and locations; • Anticipated support facilities including pipelines, canals, structural yards, maintenance buildings and roads, construction camps and materials sites; • Anticipated temporary land use locations; • Sensitive plant and animal life in the construction area; and • Topography, geology, and surficial hydrology in the vicinity of each structure. Based on these criteria, we recommend choosing structure locations and aesthetics for each alternative in cooperation with the municipalities of Kane and Washington Counties and any other relevant state or federal land managers.
108	26	4/26/2022	Email	Agency	EPA	Matthew Hubner	22	Health and Safety	**Failure Response** We recommend the Draft EIS include an evaluation of potential adverse impacts from the structural failure of the potential constructed water storage alternatives. This evaluation should include potential adverse impacts to surface waters, public or private water supplies, human health, economics, vegetation, and wildlife. In this part of the analysis, it would be useful to discuss the probabilities and likely frequencies of different types and volumes of potential failure events over the life of each alternative and we expect that this information will be useful in determining future emergency transportation corridor locations.
109	26	4/26/2022	Email	Agency	EPA	Matthew Hubner	22	Environmental Justice	**(8) Environmental Justice and National Historic Preservation Act (NHPA)** According to our review of EJScreen data (https://www.epa.gov/ejscreen), there are people of color, low-income and indigenous communities within the geographic scope of the planning area. Executive Order 12898 – Federal Actions to Address Environmental Justice in Minority Populations and Low-Income Populations – applies to federal agencies that conduct activities that substantially affect human health or the environment. In addition, Executive Order 13985 – Advancing Racial Equity and Support for Underserved Communities Through the Federal Government – sets expectations for a whole government approach to advancing equity for all. Consistent with these executive orders and CEQ's Environmental Justice Guidance Under NEPA (available along with other environmental justice resources at https://www.epa.gov/environmentaljustice/environmental-justice-and-national-environmental-policy-act), the EPA recommends the Draft EIS: • Identify communities described above within the geographic scope of the impact area, including the sources of data and a description of the methodology and criteria utilized; and • Document meaningful engagement of such communities with respect to NRCS's decisions on the reservoir selection and Watershed Plan. In particular, and consistent with the Memorandum on Tribal Consultation and Strengthening Nation-to-Nation Relationships, we recommend initiating Tribal Consultation. We also recommend discussing the role in the decision-making process of the tribes and individuals in whose beneficial interest the land is held in trust and notifying the Tribal Historic Preservation Officer if cultural or historical artifacts are found in the Project area (see comment below for more information). • Assess environmental justice and other socioeconomic concerns for any people of color, low-income, and indigenous communities, including: o A discussion of the potential direct, indirect and cumulative environmental impacts of the proposed Project on the health of these communities, with consideration of any existing disproportionate impacts being experienced (e.g., if this Project would adversely impact water quality, aquatic ecosystem functions or air quality); o An evaluation of the socioeconomic impacts to the local communities, including the potential for any additional burden placed on local communities' abilities to provide necessary public services and amenities (e.g., reservoir construction affecting existing recreational, spiritual or small business uses for communities and individuals that utilize the East Fork Virgin River. Further, creation of a new major recreation area may place a financial burden on marginalized communities if costs to use the lake are prohibitive to their use by these populations); and o A determination of whether and how there may be disproportionately high and adverse human health or environmental effects, including cumulative impacts, associated with the proposed Project on the identified communities. • Identify mitigation measures or alternatives to avoid or reduce any disproportionate adverse impacts. We recommend involving the affected communities in developing the measures. The EPA recognizes the need for early involvement of the local communities and supports the meaningful participation of community representatives in the NEPA process.
110	26	4/26/2022	Email	Agency	EPA	Matthew Hubner	22	Tribal and Cultural Resources	**NHPA Consultation** We recommend the USFS conduct consultation under the NHPA with the Tribes, as well as the Tribal and State Historical Preservation Offices. It has been our experience that these contacts change frequently and must be verified with each action. To ensure that consultation requirements are met, provided below are two resources which are updated and maintained online: • The National Association of Tribal Historic preservation Officers – Find a THPO https://www.nathpo.org/thpos/find-a-thpo/; and • The National Conference of State Historic Preservation Offices – Directory https://ncshpo.org/directory/ We recommend that an updated contact list for THPOs and SHPOs be cited in the Draft EIS to provide the public with full disclosure on the consultation requirements under the NHPA.

CID	Doc ID	Received	Type	Group	Entity	Commenter	Commenter ID	Category	Comment
111	26	4/26/2022	Email	Agency	EPA	Matthew Hubner	22	General	**Enclosure 2. EPA Comments on Cove Reservoir Draft Plan EA** We are enclosing a copy of our December 22, 2020, letter providing EPA's comments on the Draft Plan EA for Cove Reservoir. The purpose for including this letter is to reiterate comments that may continue to be applicable for the NRCS to evaluate during Draft EIS development considering the NOI identification of Cove Reservoir construction as the Preferred Alternative. The U.S. Environmental Protection Agency Region 8 has reviewed the USDA Natural Resource Conservation Service's November 25, 2020, Draft Plan Environmental Assessment (EA) for the Cover Reservoir Watershed Project. The NRCS has prepared a Draft Plan EA primarily to address summer agricultural irrigation shortages for nearby farms in the watershed. The Draft Plan EA identifies two alternatives for consideration; the Preferred Alternative to construct a dam at the Cove Reservoir site with a 6,055 acre-feet storage capacity and the No Action alternative. In accordance with our responsibilities under the National Environmental Policy Act (NEPA), we are providing the following comments on purpose and need, water quality and aquatic resources, as well as general feedback for consideration as you move into the next phase of NEPA development.
112	26	4/26/2022	Email	Agency	EPA	Matthew Hubner	22	Purpose and Need	**Project Purpose and Need:** The Draft Plan EA identifies that the primary purpose of the project is to capture high winter flows in storage in order to fulfill the need to provide additional water to irrigators during low-flow summer months. The ancillary purposes of this project based on the preferred alternative selection are to create recreation opportunities, relocate and upgrade the Glendale hydroelectric power plant, and generate consistent summer flows to enhance downstream habitat for threatened and endangered species. The Draft Plan EA discusses alternatives that were considered but screened out, leaving construction of a new dam at the Cove Reservoir site as the single preferred action. Because the Draft Pan EA identifies that Cove Reservoir will likely require a Clean Water Act (CWA) Section 404 individual permit for impacts to waterbodies in the proposed reservoir footprint, we recommend that 404 processes and NEPA be merged to increase efficiency. As such, 404 permitting requires that all feasible alternatives be evaluated to determine that the selected alternative is the least environmentally damaging practicable alternative (LEDPA). Our review indicates at least one feasible alternative that would provide approximately 3,000 acre-feet of storage was screened out from evaluation in the Draft Plan EA due to cost, and other alternatives, including non-construction actions (e.g. conservation and modified irrigation practices), were not considered as they did not meet water storage requirements of the purpose and need. We recognize that some alternatives were screened out due to unfavorable conditions, but we recommend that all feasible alternatives be evaluated if they can meet the primary goal of providing additional water needs for existing agriculture activity in the project area. Providing this information will increase the efficiency of CWA 404 permitting in addition to completing a robust analysis for NEPA purposes. We recommend that discussions on purpose and need clearly indicate that the Cove Reservoir location has already been purchased by the Kane County Water Conservation District (proponent). It is not immediately clear in the documentation how the existing land acquisition is factored in the alternatives screening cost evaluation. This information will be relevant for CWA 404 permitting and determining if the preferred alternative is the LEDPA.
113	26	4/26/2022	Email	Agency	EPA	Matthew Hubner	22	Water Resources	**Water Quality and Aquatic Resources:** Cove Reservoir would utilize diversion of peak flows from the East Fork Virgin River (East Fork) during winter to fill the pool. The East Fork is classified by the State of Utah as a Category 1 high functioning surface waterbody under its antidegradation policy and is currently assessed as unimpaired. As such, activities in or near the waterbody that could result in degradation should be scrutinized and avoided. The Draft Plan EA determines that no change in water quality would occur as a result of Cove Reservoir. Our review of the Draft Plan EA resulted in the following observations that we recommend be addressed to evaluate that determination: •The Draft Plan EA identifies that the diversion and retention of water in Cove Reservoirwill provide a beneficial use due to annual releases of up to 882 acre-feet downstream toprotect federally-listed Virgin River chub and woundfin species at Pah Tempe HotSprings. Additionally, the Draft Plan EA identifies the potential for increased riparianhabitat growth to benefit the listed southwestern willow flycatcher. The Draft Plan EAstates that "up to" 882 acre-feet will be discharged but does not elaborate on what criteriawill be established to determine flows aside from the agreement between the proponentand Zion National Park to not exceed certain flows rates. We recommend the documentanalyze and discuss the potential for adverse effects on listed (state and federal) and non-listed species. We further recommend the document outline whether beneficial flowswould be curtailed due to a priority to meet irrigation needs should there be a droughtyear (or years) and the reservoir does not fill to capacity. As both irrigation and storageand beneficial flows are identified as project purposes, we recommend that the documentidentify if they will have equal weight. Recreation is also a project purpose, and thedocument should address ability to meet recreational needs under similar conditions andidentify if specific purposes will outweigh others should conditions occur where the poolcannot be filled during the high flows season. •The Draft Plan EA does not analyze or discuss the possibility of nutrients or other potential constituents that could accumulate in the reservoir and be released downstream.We recommend evaluating soils and land uses upgradient of the reservoir location to assist in anticipating potential water quality issues. Due to the sensitive and protected nature of the East Fork, we recommend that identification and anticipation of any potential impairments in the East Fork resulting from the reservoir be evaluated so they can be fully disclosed, mitigated or avoided.

CID	Doc ID	Received	Type	Group	Entity	Commenter	Commenter ID	Category	Comment
114	26	4/26/2022	Email	Agency	EPA	Matthew Hubner	22	Cumulative Effects	•The Cumulative Effects section (4.4.2.2.) identifies that Jackson Flat Reservoir and theproposed Cove Reservoir would collectively provide irrigation water for Kane Countyagriculture. The Draft Plan EA introduction identifies in section 1.4 that there is currentlyno water storage structure available for irrigators in the area, but this information appearsto contradict that. It is unclear from this section how the water from both sources will becollectively utilized. For clarity, we recommend the document elaborate on this collectiveuse and how it is factored in the water needs projections. If there are plans to combineand convey water from both reservoirs, we recommend the document analyze thepotential in-reservoir and downstream water quality effects that could occur if water is shared between reservoirs. If the reservoirs are independently utilized, that clarificationwill be beneficial to avoid confusion.
115	26	4/26/2022	Email	Agency	EPA	Matthew Hubner	22	Water Resources	•The Draft Plan EA highlights that the reservoir will increase water quality in the EastFork by retaining some sediments from high water or flash flood events. It is unclear inthe Draft Plan EA if there are anthropogenic sources of increased sediment or if thesediment is part of the natural regime of the watershed. For clarification, we recommendthat the document identify if the capturing of sediments will alleviate anthropogenicinfluences on sediment loads in the watershed and East Fork or if the capture ofsediments may alter the natural sediment regime.
116	26	4/26/2022	Email	Agency	EPA	Matthew Hubner	22	Invasive Species	•Recreation is identified as one of the project purposes. We note that the project area is inproximity to Lake Powell and other state reservoirs that provide recreation opportunities.These reservoirs, especially Lake Powell, provide education, inspections, andrequirements to prevent introduction of quagga and zebra mussel invasive species into thereservoirs. We recommend that the proponent identify and commit to measures to avoidintroduction of invasive species by recreational watercraft usage of the reservoir. This isespecially important due to the high quality of the downstream water and federally-listedspecies in addition to the maintenance of the irrigation and power-generatinginfrastructure associated with the project.
117	26	4/26/2022	Email	Agency	EPA	Matthew Hubner	22	Sensitive Species	•The Draft Plan EA identifies that the beneficial summer flows would increase riparianhabitat for the southwestern willow flycatcher. This statement implies certainty of abenefit. Due to the flash flood regime of the watershed, the document would benefit thereader with an analysis and discussion as to whether potentially new habitat growthwould remain established in the downstream environment. If the habitat is not sustainablethe beneficial impact may not be as effective as the Draft Plan EA proposes
118	26	4/26/2022	Email	Agency	EPA	Matthew Hubner	22	Effects Analysis	•The Draft Plan EA identifies that construction activity will require traffic at crossings ofthe East Fork. We appreciate the proponent's construction BMPs to mitigate impacts tothe waterbody, and strongly encourage investigation of any alternate routes that couldfurther minimize or avoid, if possible, directly impacting the East Fork.
119	26	4/26/2022	Email	Agency	EPA	Matthew Hubner	22	General	The Draft Plan EA identifies the development of an approximately 4.1-acre recreation area. We recommend that BMPs be incorporated to prevent water quality impacts from disturbance and impacts to the watershed, reservoir and surrounding are by increased recreational activity. The maps (Figures 1-2 and 1-3) would benefit from the inclusion of the jurisdictional waterbodies in relationship to the proposed infrastructure. If any of the comments above warrant additional analysis and discussion (i.e. collective use of Jackson Flat and Cove Reservoirs), maps of the involved infrastructure and waterbodies would be useful for the reviewers. Lastly, due to the general unknowns regarding the impacts (positive and negative) to the East Fork immediately downstream of the reservoir project infrastructure, the waterbody Category 1 designation, downstream federally-listed species, and proximity to the Wild and Scenic designated segment of the Virgin River in Zion National Park, we recommend that the NRCS work with the proponent and other stakeholders (particularly ZNP, USFWS and the State of Utah) to develop a monitoring plan to ensure the high functioning nature of the East Fork and Virgin River is maintained should the Preferred Alternative be selected.
120	27	4/28/2022	Email	Agency	BLM	Jamie Pool, Natural Resources Litigation Advisor	23	General	The BLM Utah State Office does not have specific comments on the NOI. Our understanding is that we will be a cooperating agency on the development of this EIS. The instructions provided by our HQ office/DOI are a little vague – do I also need to submit a no comment response via the Federal eRulemaking Portal (docket ID NRCS-2022-0002)?
121	28	4/28/2022	Email	Public		Tracy Hiscock	24	General	It is 11:10pm on April 28, 2022. I just attempted to submit my written comments for the Cove Reservoir project. The portal rejected my comments, stating that " We were unable to successfully submit your comment at this time due to a submission error at Regulations.gov: NRCS-2022-0002-0001 is not open for comment. " I am shocked by this, as there are still 45 minutes or so left in April 28. I will attach my comments below and request that you accept them into the EIS as sent in a timely manner.

CID	Doc ID	Received	Type	Group	Entity	Commenter	Commenter ID	Category	Comment
122	28	4/28/2022	Email	Public		Tracy Hiscock	24	General	Docket No. NRCS-2022-0002 I am a long term resident, attorney and taxpayer in Kane County, Utah. I am an avid hiker of Zion National Park and nearby public lands. As such, and as a taxpayer and local citizen, I appreciate the opportunity to provide input "into the scope of the analysis and identification of relevant information" for the Environmental Impact Statement (EIS) for the proposed Cove-East Fork Virgin River Watershed Plan EIS Project as required under the National Environmental Policy Act (NEPA). This proposed Cove Reservoir project has huge potential impacts on downstream Zion National Park, the spectacular public treasure of southern Utah, through which flows the Virgin River, a federally designated Wild and Scenic River, and in which live several Endangered Species of fish, as well as the Parunaweap Wilderness Study Area. The proposed dam to create the reservoir would permanently change the river's natural flow and disrupt the already fragile riparian ecosystems in these areas. It would alter water flows and change flow rates, affecting the wild qualities of the river. It could negatively impact the plants, soils, fish, wildlife and interconnected ecosystems they rely on. Each of these issues must be addressed in an EIS. Significant scientific data is required to adequately analyze all of the potential environmental impacts of this proposal, as required by NEPA in an EIS.
123	28	4/28/2022	Email	Public		Tracy Hiscock	24	Climate Change	And the issue which cannot be ignored- the megadrought that the area has been experiencing for the last 22 years- yes, climate change, must be addressed in the EIS. A project such as this, at this time, seems ill advised. It could greatly exacerbate the changes already happening in the timing, amount, and natural flow of the river that would negatively impact the trees, soils, plants, fish, wildlife, and interconnected ecosystems of the Virgin River, Zion National Park and the Parunaweap Wilderness Study Area. Indeed, an EIS must examine and analyze cumulative impacts as well. A related issue to be considered when proposing the building of a dam is that they worsen the impact of climate change. They release greenhouse gases, destroy carbon sinks in wetlands, deprive ecosystems of nutrients, destroy soils and habitats. Additionally, significant amounts of water are wasted by evaporation in a reservoir. These issues should be analyzed in light of the megadrought and climate change.
124	28	4/28/2022	Email	Public		Tracy Hiscock	24	Economics	An important social issue which should be addressed is the uneven and limited economic benefit of the proposal. If built, this water project will benefit a small number of "local agricultural users," ranchers who grow alfalfa, further subsidizing their agricultural activity, as well as several real estate developers; at taxpayer expense. The proposal primarily serves private interest at public cost. The proposal proponents claim that the annual shortages that occur during the summer months are " primarily due to a lack of storage capability, " are not entirely true. The recent annual shortages in the summer are happening because there is less snow every recent winter to feed the watershed and because the area is no longer seeing the summer rainy season that used to be. Climate change is drying up the west and proposals to build dams ignore these facts and science. Ranchers are not guaranteed that there will be water to use to water their alfalfa. They are not guaranteed infrastructure at public expense to use their water rights. The needs of these few should not be prioritized at the expense of taxpayers. There is no demonstrable public purpose or documented need for the project, no public problem to be solved. This economic justice issue must be analyzed in the EIS.
125	28	4/28/2022	Email	Public		Tracy Hiscock	24	Recreation	The stated need for recreation as a public benefit must be based on facts. I am a regular user of Jackson Flat Reservoir in Kanab. It is not overused by any stretch of the imagination. I have not observed that "water-based recreation activities are in high demand in Kane County" as is stated in the notice document. The fact that nearby national parks have become overcrowded will not be alleviated by another small reservoir in the area. Tourists who are coming to visit Zion National Park, Bryce Canyon National Park or Lake Powell National Recreation Area are unlikely to visit Cove Reservoir instead. Lake Powell is huge and not overcrowded for those who seek and enjoy water recreation. This proposed project, again, does not serve a strong public interest, but benefits a few fortunate, land owning, agricultural users. Please include the issues I have raised in the upcoming EIS for the Cove Reservoir proposal. Thank you for consideration of my comments.

CID	Doc ID	Received	Type	Group	Entity	Commenter	Commenter ID	Category	Comment
126	29	4/29/2022	Email	NGO	American Whitewater	Kestrel Kunz	25	General	Thank you for the opportunity to provide scoping comments on the Cove Reservoir Environmental Impact Statement (EIS). American Whitewater is a national non-profit 501(c)(3) river conservation organization founded in 1954. We have over 6,200 members and 100 local-based affiliate clubs, representing approximately 80,000 whitewater paddlers across the nation. American Whitewater's mission is to protect and restore America's whitewater rivers and to enhance opportunities to enjoy them safely. As leaders and partners in river management nationwide and as representatives of the paddling community, American Whitewater has an interest in the exemplary management of the East Fork of the Virgin River as well as the main stem of the Virgin River. A significant percentage of American Whitewater members travel to the Virgin River downstream of the proposed project for recreation and the paddling community enjoys the outstanding packrafting opportunities in Parunuweap Canyon on the East Fork. American Whitewater has actively participated in this project, providing substantial comments on the Environmental Assessment (EA) in 2020 (American Whitewater letter dated December 23, 2020) and participating in multiple public scoping meetings on the EA and EIS. In response to extensive concern from stakeholders, the Natural Resources Conservation Service (NRCS) made the appropriate decision to conduct a full EIS instead of an EA. Now, the NRCS needs to ensure all of the outstanding issues raised in the EA are addressed in the EIS process. The scoping document suggests that the proposed alternative is very similar to the proposed action in the EA, indicating that significant public comment and identified issues with the proposed action are still being overlooked. Our comments request more diligence and transparency on the project's purpose and need, and go into further detail on what must be analyzed in the EIS.
127	29	4/29/2022	Email	NGO	American Whitewater	Kestrel Kunz	25	General	The EA for this project was severely deficient in its explanation, analysis, and findings regarding the project impacts on downstream ecological and recreational values and details of project benefits. In addition, it is apparent that the project's purpose and need are misleading and should be clarified. Prior to addressing the deficiencies of the original EA, the NRCS and project partners need to accurately define the project area and project purposes and financials. It is unclear how much water will be used for M&I water versus agriculture water and this needs to be more transparent in the purpose and need for the project's Scoping Notice. While the EIS scoping materials mention the use of water demands in Washington County, M&I water is not listed as a primary project objective which is contradictory based on the number of times that M&I water needs are referenced in the EIS purpose and need section and previously mentioned throughout the EA. The EIS needs to clearly delineate the amount of water for present and future M&I use, agricultural use, and any other anticipated uses. Regardless of the project's purpose and need, there are still serious deficiencies with the proposed alternatives that need to be addressed. Core to the project is the diversion of significant flows outside of the summer season. The EIS needs to provide a detailed report on the impacts of diminishing or eliminating the seasonal high flows experienced by the river downstream that play important roles in riparian vegetation, geomorphology, biological cues, fish habitat, and recreation. In addition, the stated benefits to hydropower and recreation are grossly exaggerated and the purported benefits either need to be removed or more appropriately described in the EIS. Given the obvious deficiencies in the project purpose and claimed benefits, and the clear impacts to the downstream river segments, we request that the project be abandoned entirely. If the project is not abandoned, we request that the following analyses and information is explicitly included in the EIS.
128	29	4/29/2022	Email	NGO	American Whitewater	Kestrel Kunz	25	Water Resources	**1. The impacts of instream flow diversions must be fully considered.** The EA made it unclear how much water will be withdrawn and when from the East Fork of the Virgin River under this proposal. The EA and supporting documents suggested in piecemeal that annual diversions of up to 30% of flow volume would be diverted into the reservoir between November 1 and May 31. If this were true however, the originally proposed 6,055 acre-foot reservoir would have filled barely halfway in two of the past ten water years, and more typically filled a third or less of its volume based on an analysis of the Glendale USGS Gage. It seems that the project is actually scaled to divert all of the flow in the East Fork of the Virgin River from November 1 to May 31 each year. Only then would the reservoir be likely to fill. We request that a supplemental analysis be produced that models and depicts proposed daily flow diversions and releases associated with both sub-alternatives (6,055 and 4,000 AF reservoir) using stream flow data from the past 10-year period.
129	29	4/29/2022	Email	NGO	American Whitewater	Kestrel Kunz	25	Recreation	**a. The EIS must consider diversion impacts to downstream recreation.** Downstream of the proposed project there are numerous beneficial and existing uses of the East Fork of the Virgin River and the Virgin River itself that were erroneously left out of the EA. Nowhere does the EA or the EIS scoping materials mention the whitewater boating that occurs downstream on the Virgin River. At least three whitewater runs are downstream of the project that rely on high spring flows to support recreational use: ● Zion National Park to Virgin1 ● Timpoweap Canyon2 ● La Verkin to Hurricane3 Given the extremely short and stochastic season that paddling on the Virgin River provides, even small reductions in spring run-off could have deleterious effects, making these reaches unrunnable due to flow reduction from reservoir operations.

CID	Doc ID	Received	Type	Group	Entity	Commenter	Commenter ID	Category	Comment
130	29	4/29/2022	Email	NGO	American Whitewater	Kestrel Kunz	25	Recreation	In addition, Parunuweap Canyon lies downstream of the proposed project on the East Fork of the Virgin River. Parunuweap Canyon offers relatively popular hiking and canyoneering opportunities within the BLM boundary and the lower section is a Natural Research Area managed by Zion National Park. Traveling through Parunuweap Canyon is considered by many to be more spectacular than the Zion Narrows.4 There have also been packrafting descents of Parunuweap upstream of the Park and it has been called a “new 5 star packrafting run”.5 Packrafting is an increasingly popular recreational activity that allows paddlers to explore remote, low volume streams. With already minimal flows on the East Fork of the Virgin, slight reductions to stream flows could make packrafting through Parunuweap Canyon impossible. The proposed artificial increases in summer flows, and elimination of winter and spring flows, could impact these uses. “Parunuweap” means roaring water, and this proposed project would silence the river in most years. The Wilderness character would be greatly diminished by the removal of variable and high flows and the unique geomorphologic and ecological characteristics that are attributed to natural flooding events would deteriorate.
131	29	4/29/2022	Email	NGO	American Whitewater	Kestrel Kunz	25	Water Resources	**b. The EIS must consider diversion impacts to downstream riparian vegetation and geomorphology.** In an egregious oversight, the EA failed to seriously explore or disclose the likely severe impacts on riparian vegetation and geomorphology associated with the proposed diversion. Winter and Spring high flows play critical roles in maintaining channel width, pool depth, and other key geomorphological variables. Elimination of high flows in other rivers has proven that without these flows riparian vegetation encroaches into the stream channel, and fine sediment builds up in what little channel is left. The Final EPA-USGS Technical Report: Protecting Aquatic Life from Effects of Hydrologic Alteration summarizes this well-understood and predictable impact as follows: *“It is critically important to maintain extremes (floods and droughts) within the bounds of the natural flow regime to support the ecological structure and function of streams and rivers. However, alterations in low or high flows that are human-induced, affect and can control many ecosystem patterns, such as habitat extent and condition, water quality, connectivity, and material and energy exchange. These patterns can in turn affect many ecosystem processes, including biological composition, distribution, recruitment of biota, and ecosystem production (Rolls and others, 2012).* *Although low flows serve a critical role in ecosystem function, current scientific research indicates that flow criteria ideally should support the natural flow regime as a whole, and that criteria for minimum flow alone (that is, a single minimum discharge value or a minimum passing flow) are not sufficient for maintaining ecosystem integrity (Annear and others, 2004; Bunn and Arthington, 2002; Poff and others, 1997). Minimum flow criteria do not address the full range of seasonal and interannual variability of the natural flow regime in most rivers and streams.* *The natural fluctuation of water volume and levels in rivers and streams is critical for maintaining aquatic ecosystems because aquatic biota have developed life-history strategies in response to these fluctuations (Hill and others, 1991; Lytle and Poff, 2004; Mims and Olden, 2012, 2013; Postel and Richter, 2003; Stalnaker, 1990). Comprehensive flow criteria not only identify flow needs (that is, magnitude) but may also address the rate, frequency, timing, and duration of streamflow required to support ecosystem health (Poff and others, 2010). The Instream Flow Council (a non-profit organization working to improve the effectiveness of instream flow programs and activities: http://www.instreamflowcouncil.org/) recommends developing criteria that incorporate natural patterns of intra- and interannual variability in a manner that maintains and (or) restores riverine form and function to effectively maintain ecological integrity (Annear and others, 2004). Therefore, narrative hydrologic criteria and their implementation ideally should address several flow-regime components (frequency, duration, timing, rate of change) in addition to flow magnitude. The components necessary are determined on a case-by-case basis, depending on which values are most ecologically relevant.”6*
132	29	4/29/2022	Email	NGO	American Whitewater	Kestrel Kunz	25	Water Resources	American Whitewater has significant organizational experience with the elimination of high flows, and their restoration. On rivers like the North Fork Feather (CA), Dolores (CO), and Cheoah (NC) we’ve struggled to restore dewatered rivers overtaken with overstory trees and shrubs. On rivers like the Bear (ID) we’ve seen sediment build up in the river channel each year when high flows do not flush it downstream and move it out of the channel laterally, and the effects that has had on macroinvertebrate communities and habitat are severe. The proposed project’s impacts to the frequency, magnitude, duration, season, and rate of change of the high flow regime would cause significant sediment build up, channel geomorphology impacts, vegetation encroachment, and eliminate important biological cues for plant and animal species for many miles downstream. Failing to disclose, explore, and weigh these impacts is a critical law in the project, and needs to be addressed in the EIS. The high flow regime was not the only oversight in the EA. The EA states that evaporation will remove 193 acre feet from the annual flow regime. This is 10% of the flow regime in most years. Also quite clear is that the 6,055 AF sub-alternative will eliminate another 4,500 acre feet or more as irrigation diversions. Together these losses appear to account for over half of the volume of annual flow in the river. The cumulative flow reductions for both all alternatives and sub-alternatives need to be explicitly described in the EIS. Lastly, the proposed summer releases of the 882 acre feet for the 6,055 AF alternative are likely to be released as peaking flows that could further destabilize and unravel the downstream ecosystem. The EIS needs to provide an analysis of the full picture of proposed flow regime alteration. The flow alterations associated with the preferred alternative would have significant and unacceptable impacts on the existing and beneficial uses protected under the Clean Water Act downstream.

CID	Doc ID	Received	Type	Group	Entity	Commenter	Commenter ID	Category	Comment
133	29	4/29/2022	Email	NGO	American Whitewater	Kestrel Kunz	25	Economics	**2. The benefits of the proposed hydropower projects are overstated and moot.** The EA and EIS scoping materials seek to include the benefits of the proposed hydropower projects in the decision to build the reservoir, however those benefits are both misrepresented and uncertain, the costs undisclosed, and the hydroprojects are unrelated to this project in terms of permitting. The EA estimated that the Orderville plant would yield gross revenue of $19,000, and based on generation estimates the Glendale plant would yield $8,600 to $23,300. It defies logic that these projects will pay for themselves, ever, and the baseload power they generate has little value to the grid. We request that the project costs in EA Table S-2 be broken out in the EIS to reveal the construction, annual operation, and annual maintenance costs of the proposed hydropower projects. Given the undisclosed and likely uneconomical cost-benefit analysis of the hydropower projects, we do not feel that it is likely these projects will actually be built and thus their benefits should not be included in this proposal or analysis. Regardless, they would require an entirely separate permitting process through the Federal Energy Regulatory Commission, so it would be appropriate to remove the hydropower projects from this proposal and EIS. The EIS scoping materials fail to list FERC as one of the required project permitters, which will be necessary if any of the proposed modifications to hydropower are pursued in this project, and as previously mentioned is an entirely separate permitting process. This is a gross oversight and needs to be addressed in the EIS or hydropower needs to be entirely removed from the project design.
134	29	4/29/2022	Email	NGO	American Whitewater	Kestrel Kunz	25	Economics	**3. The project is woefully uneconomic and should be rejected as such.** Using the annual net economic benefits of $163,900 in the EA, the preferred alternative as described in the EA would take 182 years to make any returns; the reservoir has a 100 year life expectancy.7 This is not a responsible use of public funds and merits the complete abandonment of the project.
135	29	4/29/2022	Email	NGO	American Whitewater	Kestrel Kunz	25	Recreation	4. The project's recreational benefits are overstated and pale in comparison with its impacts. The EA's recreational analysis was one-sided and unclear. First and foremost, as we stated in Section 1 the proposed project is likely to have significant deleterious recreational impacts on hiking and packrafting in Parunuweap Canyon which is an incomparable Wilderness Study Area setting, and also on paddling at least three sections of the Virgin River downstream. In addition, vegetation encroachment and habitat failure associated with the proposed flow diversion is likely to negatively impact riverine angling downstream. Regardless of the recreational benefits, the EIS must also disclose and consider these negative recreational impacts. As to the purported benefits, we have questions. The proposal for the 6,055 AF reservoir would create a reservoir that each Spring and Summer gradually drops from 188 acres8 to the 34 acre conservation pool.9 Over the course of the recreation season the usable reservoir would shrink dramatically and the unsightly varial zone would grow. The boat ramp depicted in EA Figure 3-1 would appear to not reach the water early in the season, preventing trailered boat access. It is unclear that the shrinking and warming reservoir would be cold enough to support trout at the end of the season as claimed, or if stocking presumably non-native trout upstream of the wild portions of the river could have unintended ecological impacts. From a recreational point of view, the proposed project would severely impact a wild river system with significant and high quality recreational experiences in order to create a small reservoir with unproven and questionable value. We appreciate the consideration and inclusion of recreational infrastructure in the project proposal, but the recreation cost/benefit analysis provided in the EA is a reason not to build the project rather than a reason to build it. The EIS will need to provide an accurate assessment of the recreation opportunities that are lost and gained due to the project.

CID	Doc ID	Received	Type	Group	Entity	Commenter	Commenter ID	Category	Comment
136	29	4/29/2022	Email	NGO	American Whitewater	Kestrel Kunz	25	Wild and Scenic Rivers	5. The project is incompatible with downstream Wild and Scenic River protections. A 7.53 mile section of the East Fork of the Virgin River downstream of the proposed project is a federally designated Wild and Scenic River, with the most protective classification of “Wild.” The Outstanding Remarkable Values (ORVs) protected under the designation are cultural, geological, ecological, wildlife, and fish values, with the management and values of the river described in the 2013 Comprehensive River Management Plan (CRMP) for the Virgin River system.10 The Winter and Spring high flows, which the proposed project would greatly diminish or more likely eliminate entirely, are directly responsible for the creation and maintenance of the protected ORV’s of the river. The Wild and Scenic Rivers Act will require a Section 7 determination by the National Park Service because the proposed project is upstream of the designated reach, requires a Federal permit and funding, and is likely to affect the river’s fish, wildlife, and scenic values. We appreciate that the required Section 7 analysis is correctly listed as one of the necessary permits in the EIS scoping materials. Once the preliminary alternatives are determined, the NRCS should work with the NPS to carry out the Section 7 analysis before millions of dollars are invested in the remaining EIS process. We acknowledge that the CRMP claims that the 1996 Zion National Park Water Rights Settlement Agreement protects the ORVs of the river, but this is false. This 24-year old agreement pre-dates the Wild and Scenic designation and represents an outdated and erroneous depiction of the instream flow needs of a river, ignoring the essential effects that high flows have on ORVs and the impacts that hydropower peaking flows could have in the summer. While the 1996 agreement may yield certain water rights that could be exploited by the proposed project, it does not preemptively waive Section 7 of the WSRA and allow the use of public funds to create a water resources project that will damage the downstream Wild and Scenic River reach. While the 1996 agreement may appear to require the NPS to allow the proposed reservoir, Section 7 of the WSRA clearly prohibits use of public funds for its creation, if not also certain federal permits. Simply put, the Section 7 determination will be a finding that the proposed project will have a direct and adverse effect on the values for which the river was added to the system. This determination will block the use of public funds for the project and is again why the Section 7 analysis should be done now, before more public money is spent.
137	29	4/29/2022	Email	NGO	American Whitewater	Kestrel Kunz	25	General	The EIS must address the deficiencies outlined in these comments, including but not limited to a detailed analysis of proposed streamflow changes and their impacts on recreation, aquatic organisms, riparian vegetation, and geomorphology downstream at least as far as Hurricane, UT. We request that this analysis inform and integrate the Section 7 of the Wild and Scenic River Act analysis that must and will prohibit federal funding of the proposed project. Based on the EA and EIS scoping materials, it is clear that the proposed project would have significant and unacceptable negative impacts on the East Fork of the Virgin River and the mainstem of the Virgin River, and that the project is uneconomical and illegal to fund with Federal dollars. For these reasons we oppose the project, and request the selection of the No Action alternative.
138	30	4/28/2022	Email	Public		Many		General	Dear Brian Parker, Thank you for the opportunity to provide comments on the Cove Reservoir - East Fork Virgin Environmental Impact Statement. As a river enthusiast who cherishes wild and free-flowing rivers, I implore the National Resources Conservation Service and other project partners to abandon the proposed project as described in both the previous Environmental Assessment and the EIS scoping notice by choosing the No Action Alternative. If the project proceeds, the NRCS needs to fully assess all downstream impacts of the project, including impacts to recreational, ecological, and other values. This should include a complete review of different annual hydrograph scenarios. Naturally varying river flows support a myriad of important ecological attributes, including sediment transport and vegetation management., On the East Fork of the Virgin River’s spring peak flows provide the only possible time of year to go boating. Downstream reaches on the mainstem of the Virgin are very well-known amongst recreators and flows are dependent upon high spring streamflows in the East Fork Virgin River. The project as proposed would have severe environmental and recreational impacts, is not economically feasible and is a misuse of taxpayer money. Thank you for considering my comments on this project.
139	31	4/25/2022	Email	Agency	PLPCO	Sindy Smith	4	Land Use	The State of Utah (State) appreciates the opportunity to provide additional scoping comments on the Cove-East Fork Virgin River Watershed Project Environmental Impact Statement (EIS). The State submitted comments on the project’s Environmental Assessment on December 31, 2020 and scoping comments on the Environmental Impact Statement November 9, 2021. The State incorporates these comments by reference. The State provides the following scoping comments for your consideration. The State restates that the proposed action be consistent to the fullest extent with Kane County’s Resource Management Plan,1 specifically to “provide for sustainable productive watersheds for a continued supply of waters for Kane County's irrigated agriculture, sector which is dependent on both stream flows and water storage” (page 264).

CID	Doc ID	Received	Type	Group	Entity	Commenter	Commenter ID	Category	Comment
140	31	4/25/2022	Email	Agency	PLPCO	Sindy Smith	4	Land Use	The State recommends that the proposed action be consistent to the fullest extent with Washington County Resource Management Plan,2 in particular, Washington County's Irrigation policy: a. County Policy: vi. Washington County supports and encourages the development of dams (diversions and storage), canals, piping and other related water projects to develop and utilize water sources. b. Desired Future Conditions/Objectives: i. The county works cooperatively with partners, including the water conservancy district, irrigation companies, the conservation districts, and municipalities, to plan for future water needs. c. Management Actions: i. The county will seek cooperating agency status on all federal resource management plans within or affecting Washington County.
141	32	11/9/2021	Email	Agency	PLPCO	Sindy Smith	4	Land Use	The state of Utah (State) appreciates the opportunity to provide scoping comments on the Cove-East Fork Virgin River Watershed Project Environmental Impact Statement (EIS). The State provided comments on the project's Environmental Assessment on December 31, 2020, and in collaboration with the Division of Wildlife Resources (DWR), the State restates these comments for the EIS project your consideration. Additionally, the State would like to take this opportunity to highlight that the Kane County Resource Management Plan1 states that one of the purposes for the county land use plan is to "provide for sustainable productive watersheds for a continued supply of waters for Kane County's irrigated agriculture, sector which is dependent on both stream flows and water storage" (page 264).
142	32	11/9/2021	Email	Agency	PLPCO	Sindy Smith	4	Sensitive Species	**Native Species** The Draft EA claims potential benefits for three Threatened and Endangered (T&E) species: the Southwest willow flycatcher, woundfin, and Virgin River chub. Another species of particular concern for this project area is the Virgin spinedace, which is managed under a Conservation Agreement and Strategy and has been petitioned for listing as a T&E species. The U.S. Fish and Wildlife Service is currently determining whether listing is warranted for the Virgin spinedace, and yet impacts to that species are not included in the EA. The State recommends that impacts for this species, in addition to the others listed above, be considered, and included in the draft EIS. Prior to claiming a benefit to the species listed above, DWR recommends the following points be carefully considered: • The term "summer months" should be defined, and the low end of the stream flow delivery range should be included, in relation to the high end of 882 acre-feet. • The claimed benefits these flows could have for T&E species are undemonstrated. There is reference to a water budget for the project which includes evaporative losses (193 acre-feet), but it is unclear how much water will still be in the stream channel 50 miles downstream from the project, at different levels of release. • When water is diverted to Cove Reservoir, spring runoff flows would decrease. T&E fish and Virgin spinedace require higher spring flushing flows to cue spawning and clean necessary spawning habitat. A reduction in spring flows could limit available spawning habitat, thus impacting existing spawning, ultimately reducing population levels. The EA should express what percentage of the total flow in the East Fork Virgin River would be diverted. The extent and effect of decreased spring runoff flows should be analyzed and reported as a potential impact in Table S-4. • The Draft EA does not analyze how much of an increase in flow would be required to reduce temperatures and salinity below Pah Tempe Hot Springs. It is not possible to determine from the document whether the proposed releases from Cove Reservoir would be sufficient to deliver native fish benefits in that reach.

CID	Doc ID	Received	Type	Group	Entity	Commenter	Commenter ID	Category	Comment
143	32	11/9/2021	Email	Agency	PLPCO	Sindy Smith	4	Recreation	Sport Fish Cove Reservoir has the potential to become an important recreation offering in a part of the state with limited opportunities for cold water sport fisheries. The State recommends the following points be carefully considered regarding potential recreational benefits associated with the creation of a cold-water sport fishery: • The proposed location of Cove Reservoir is at an elevation where frequent and large drawdowns would occur, which would negatively impact a sport fishery. A conservation pool will be an extremely important component if the fishery and recreation plan is to be successful. Additional analysis is needed to determine the appropriate size for a conservation pool and what the extent and timing of drawdowns should be to produce the desired cold-water fishery. • It is currently unclear if DWR would be interested in contributing financially to a conservation pool at the reservoir. That determination would be made in the future based on the analysis of the necessary conservation pool size and cost and weighed in terms of benefits gained. Additionally, if DWR elected to contribute, DWR would not be able to pay more than the appraised value of the water. It is not clear presently whether the benefits of such a conservation pool would justify the costs. • More detail is needed on the plans for recreational facilities including a boat ramp, such as when would these actions take place, how far into the reservoir the ramp would go, and how many days of the year the boat ramp would be accessible. These details are important for the cost/benefit analysis. • There will also be stocking limitations in this system due to existing agreements. Kane County Water Conservancy District should coordinate with DWR in developing any stocking plans for the reservoir. In summary, the State finds additional analysis is needed to determine impacts to the Virgin spinedace, as well as the claimed benefits to the three T&E species that inhabit the project area. Additional analysis on the requirements needed to establish a conservation pool that would create a sustainable cold water sport fishery would also strengthen the draft EA. For questions regarding these recommendations or any others related to the project, please contact Gary Bezzant, Habitat Program Manager, DWR, via email at .
144	33	4/27/2022	Email	Public		Lauren Nickell	26	Water Resources	I am grateful that the potential decision surrounding Cove Reservoir is open to public comment, as this matter is incredibly dear to me. Years of my life have been spent dedicated to learning about the environment across southwest Utah as a student in hydrology and geology out of nearby SUU. My interest throughout that time has been on the water resources across the four corners region, including the Virgin River. Currently my studies and research are related to understanding how sedimentation impacts downstream reservoir capacity and water quality. It is with this background in mind, in addition to my profound love of this landscape and its various communities, that I ask the National Resources Conservation Service and other project partners to abandon the proposed project as described in both the previous Environmental Assessment and the EIS scoping notice by choosing the No Action Alternative. Further assessment by NRCS is necessary to provide a more robust understanding of the projects downstream impacts. The diminished capacity of the rivers flow for any period of time, in addition to the lack of sedementation, could significantly impact ecological and recreational values downstream of the reservoir. This should include a complete review of different annual hydrograph scenarios, and consider the rivers rate of sedementation in regards to the proposed lifespan of the reservoir. It must also consider what this lack of sedimentation will mean for downstream morphology and the impact on both aquatic populations and vegetation. The project must also consider the long-term feasability of such a costly project. Utah relies heavily on the 130+ reservoirs already established across the state, and the threat that these water bodies face have become increasingly apparent over the prior two decades. Trends towards rainfall over snowfall and a longer window for transitional seasons have resulted in diminished snowpack in many years, and ultimately undermine waterlevels at many reservoirs. Considering another reservoir in the midst of Utah's State of Emergency and record lows at nearby reservoirs, such as the Glen Canyon Dam, blatantly disregards the current trends that have resulted in the southwest's water crisis.
145	33	4/27/2022	Email	Public		Lauren Nickell	26	Health and Safety	In addition to this, an understanding of the proposed threat of upstream disturbance, such as wildfire, must be studied. Fire suppression efforts made throughout the area have resulted in high amounts of fuel in the area, increasing the threat of large, high severity fires occurring. The Stout Creek Fire, which occurred in a watershed nearby the East Fork Virgin River's headwaters, is an example of the threat that fire will continue to present to any reservoir made in this region. In Stout Canyon, the loss of bank stability in a highly erosive canyon primarily composed of sediments from the Claron Formation resulted in rapid channel incision. Any fire that may ignite within, or cross into, the watershed upstream of the proposed Cove Reservoir will likely result in similar rates of sedimentation that can rapidly decrease the carrying capacity of the reservoir. It may also degrade its water quality through nurtrient loading and algal outbreaks, rendering the water inaccessible for many.
146	33	4/27/2022	Email	Public		Lauren Nickell	26	Recreation	In addition to the potential ecological consequences, the varying river flows support the robust recreation of the region that has cemented Utah as an international vacation destination. On the East Fork of the Virgin River’s spring peak flows provide the only possible time of year to go boating. Downstream reaches on the mainstem of the Virgin are very well-known amongst recreators and flows are dependent upon high spring streamflows in the East Fork Virgin River. The project as proposed would have severe environmental and recreational impacts, carries an extreme risk of disturbance, is not economically feasible, and is a misuse of taxpayer money. Thank you for considering my comments on this project.

CID	Doc ID	Received	Type	Group	Entity	Commenter	Commenter ID	Category	Comment
147	34	10/31/2021	Email	Public		Craig Wallentine	11	Economics	EIS PROJECT COMMENT #1 - NEPA SCOPING COMMENT FORM – The DEIS should include a provision for the KCWCD and WCWCD project sponsors to absorb at least 50% of all expected cost increases for project construction. The Cove reservoir project has been steadily increasing in cost at each project evaluation. In 2017, the Cove project sponsors were requesting approximately $14MM. Three years later, KCWCD and WCWCD increased their request by 50% to $21MM+ in NRCS Federal taxpayer funds. The DEIS should show a range of future project construction cost scenarios in light of the return of general inflation in the US economy and especially in the material and labor costs in the construction industry. Clearly the Cove project cost is going to increase yet again. The DEIS should include a cost sharing agreement with the project sponsors to be fair to both (a) NRCS Federal taxpayers and (b) to other national NRCS project stakeholders who are seeing over 15%+ of the national NRCS budget consumed by this one Southern Utah proposal. The situation is only going to get worse as the project costs escalate and the project sponsors should share in the burden in order to treat other NRCS stakeholders fairly.
148	34	10/31/2021	Email	Public		Craig Wallentine	11	NEPA Process	EIS PROJECT COMMENT #2 - NEPA SCOPING COMMENT FORM – The DEIS should address why the proposed Cove Reservoir project is so large in comparison to normal NRCS projects and why it should be allocated over 15% of the national budget for the PL 83-566 Watershed Protection and Flood Protection projects. The average size of an NRCS project is approximately $5MM. The DEIS should explain why this project is 4X larger than average NRCS especially since it creates major flood risks where none existed before. The DEIS should also include a listing of the national NRCS projects displaced by funding the proposed Cove project which would absorb more than 15% of the entire national budget for Watershed Protection and Flood Protection. This is critical since the original Cove Environmental Assessment did not achieve breakeven financial return since half of the claimed agricultural land in Washington County had already been converted from agricultural to municipal and commercial use. With less Washington County agricultural land available in the future and with the expected cost escalation, the future Cove project cost benefit ratio will likely be even more negative making alternative and less expensive NRCS projects more attractive to NRCS and federal taxpayers. The DEIS listing should include the respective cost benefit ratios for the displaced NRCS projects around the United States. A simple calculation will likely show that more value is created for American farmers and taxpayers if the NRCS funds smaller, high return agricultural projects versus oversized projects with low or negative returns. The DEIS should also include comments from any Congressional representatives whose constituent's higher return NRCS projects were sacrificed for the Cove project.
149	34	10/31/2021	Email	Public		Craig Wallentine	11	Water Resources	EIS PROJECT COMMENT #3 - NEPA SCOPING COMMENT FORM – The Project EIS should include a detailed discussion of how aridification will impact the Wild and Scenic Virgin River that flows through Zion National Park The original Cove proposal contained minimal facts about the protection of threatened and endangered species in the Virgin River and made essentially no mention of the ongoing aridification of Southern Utah. To avoid preventable errors, the DEIS should include up to date and detailed hydrological data showing the range of water flows across a calendar year in the Wild & Scenic portions of the Virgin River with and without the Cove Project. The DEIS should also discuss the impact of the projected water flows on natural habitat and endangered species and demonstrate that the proposed project will not harm the Virgin River or Zion National Park. Given the increasingly severe impact of aridification, it does not seem likely that there is enough water to meet current water allocations in the first place nor that new water diversions can be done without serious damage to the Virgin River ecosystem.

CID	Doc ID	Received	Type	Group	Entity	Commenter	Commenter ID	Category	Comment
150	34	10/31/2021	Email	Public		Craig Wallentine	11	Water Resources	EIS PROJECT COMMENT #4 - NEPA SCOPING COMMENT FORM – The DEIS should include a discussion of the current and future water resources available to meet the 1996 Zion National Park Water Rights Agreement. The entire Colorado River Basin is currently suffering a water crisis because prior water rights agreements either intentionally or inadvertently overstated the amount of water actually available given climatic conditions. The DEIS should address the probability that aridification since 1990 has already reduced the amount of water available in the East Fork Virgin River such that the 1996 Zion National Park Water Rights commitments cannot be met consistently. The DEIS should also assess how aridification of East Fork Virgin River watershed will impact water availability over the 100-year life span of the proposed project. Most scientific estimates of aridification anticipate at least a 5% long term reduction of average water runoff which will reduce supply for current water right holders while eliminating the prospect of diversions for any new projects. If future water flows are only sufficient for current senior water users then water negotiations should be restarted with regards to the actual sustainable diversions in the EFVR watershed in an era of aridification rather than pretending that climatic conditions from 30 years ago will hold 100 years into the future.
151	34	10/31/2021	Email	Public		Craig Wallentine	11	Water Resources	EIS PROJECT COMMENT #5 - NEPA SCOPING COMMENT FORM – The DEIS should include responses from all Colorado River Compact member State Water Engineers with respect to the Cove project diversion of water in the Lower Basin of the Colorado River Compact. The EIS should include comments from State Water engineers in the Colorado River Compact especially Nevada, Arizona and California as the Virgin River is part of the Lower River Basin. The DEIS should also include written input from the other Upper State Water Engineers with respect to this project. It would be useful to outline how many Congressional approvals will be required for this project.
152	34	10/31/2021	Email	Public		Craig Wallentine	11	Tribal and Cultural Resources	EIS PROJECT COMMENT #6 - NEPA SCOPING COMMENT FORM – DEIS should include written input from the sovereign tribes in the Lower Basin of the Colorado River and the State of Utah who have not been receiving their senior water allotments from the Colorado River and who are not receiving the state funds necessary to allow delivery of their senior water rights. The DEIS should include comments from sovereign tribes in the Lower Basin and in the State of Utah as to how the Cove project impacts their senior water rights. The DEIS should also include an official explanation of why federal taxpayer dollars are being used to develop private water rights in the Lower Basin while senior water rights held by the sovereign tribes are not being honored nor serviced by the same Utah state agencies supporting the Cove project.
153	34	10/31/2021	Email	Public		Craig Wallentine	11	Environmental Justice	EIS PROJECT COMMENT #7 - NEPA SCOPING COMMENT FORM – The DEIS should include an Environmental Justice analysis per the National Environmental Policy Act – specifically for the non-privileged and minority residents of Kane County and Washington County, Utah The DEIS should include a comparative financial analysis of who benefits from the Cove project per the White House Council on Environmental Justice principles for environmental justice. Based on information available to date, the Cove project proposes spending $20MM+ of NRCS Federal taxpayer funds almost exclusively for the benefit of wealthy special interests in Kane County and Washington County. The increased asset values for the existing land and water rights owners benefiting from the project will not be shared with the non-privileged/minority/lower income communities. The Cove project appears to provide essentially no new benefits to non-privileged/minority/lower income communities in the project service area. This would not be an equitable or acceptable use of NRCS Federal taxpayer funds The DEIS should include a detailed long-term study of the direct beneficiaries of the NRCS Federal tax- payer subsidy to see how Cove project benefits are actually going to be distributed across all member groups within the greater Kane County and Washington County community. The DEIS should also include a socio-economic analysis of the contractors used during the project construction and how many are owned by non-privileged/minority/lower income principals. Based on the data, the DEIS should include a discussion of how the Cove project could be better designed to deliver the benefits of Environmental Justice to all Kane County and Washington County community members.

CID	Doc ID	Received	Type	Group	Entity	Commenter	Commenter ID	Category	Comment
154	34	10/31/2021	Email	Public		Craig Wallentine	11	Economics	EIS PROJECT COMMENT #8 - NEPA SCOPING COMMENT FORM – The DEIS should contain project details on the proposed Garkane Energy hydropower relocation/modernization project as claimed by project sponsors. Such data would allow an accurate public assessment of the feasibility of an EFVR hydropower project to determine if it should actually be part of the NRCS Cove project in the first place. The original Cove proposal contained minimal facts about a proposed hydropower expansion on the EFVR. The DEIS should include the actual project economics, the amount of project funding and sources, the power line routing plans and approvals, outline of the FERC approval process and the project timing commitments directly from Garkane Energy Co-op (named by KCWCD as the project sponsor). In particular, DEIS discussion should include the actual financial benefits of the claimed hydropower generated net of project financing costs with a detailed explanation of how the Garkane Energy hydropower project is connected with NCRS Federal taxpayer spending for agricultural users. This DEIS data is critical because the de-minimis value of the electrical power generation claimed in the original Cove Environmental Assessment could never justify the proposed hydropower project and inclusion in the Cove Project appears to add nothing of value to the NRCS assessment of this project.
155	34	10/31/2021	Email	Public		Craig Wallentine	11	Economics	EIS PROJECT COMMENT #9 - NEPA SCOPING COMMENT FORM – If the Garkane Energy hydropower is to be included in the DEIS, then the DEIS should include an independent study of the most economic power generation options available to Garkane Energy ratepayers over the 100 year life span of the project. NRCS Federal taxpayer funds should not be used to subsidize incidental projects that are not economically feasible in the first place. The original Cove proposal contained minimal facts about the economic competitiveness of a proposed hydropower project on the EFVR. Due to the rapid learning curve as cumulative sustainable energy production increases, there is a steady decrease in the cost of sustainable energy from wind power (available year round not just seasonally); from solar power (also available year round not just seasonally); and potentially, even regional geothermal power from the Milford Utah FORGE project (Frontier Observatory for Research in Geothermal Energy) which would not have diurnal or seasonal time constraints. Over the 100-year Cove project life span, it is almost certain that the incremental cost of energy from these renewable sources will be lower than the proposed, remotely located Garkane Energy hydropower project if they are not already. The value of the DEIS would be greatly increased by comparing the independent long term power cost outlook with that of the strategic energy supply planners at Touchstone Energy, the parent energy co-op for Garkane Energy and discussing any differences of interpretation. If remote hydropower is not cost competitive with alternative sustainable energy sources in the region today or in the future, then there is no value to include a hydropower project as part of the NRCS assessment of the Cove project.

156	35	4/28/2022	Email	NGO	American Rivers	Michael Fiebig	27	General	American Rivers appreciates the decision that was made to analyze this project through a full EIS. In the letter below, we reiterate and elaborate on the concerns that we conveyed to both Transcon Environmental and NRCS in our previous comments. We respectfully submit the following set of concerns and concerns regarding the proposed Cove Reservoir Project, which could adversely affect the Wild and Scenic East Fork Virgin River, Zion National Park, and the fish and wildlife species that rely on the river. We oppose the proposed reservoir based upon a perceived mischaracterization of the purpose and need of the project as an "agricultural" water supply project, as well as the likely future impacts to flow regime, water quality and quantity, sediment transport, and invasive species proliferation that would result from the project. Such impacts would negatively impact fish and bird species protected under the Endangered Species Act (ESA), and adversely impact the values of two important and iconic protected areas: The Wild and Scenic Virgin River and Zion National Park. We outline these objections below. All of these likely and foreseeable impacts must be analyzed in the EIS. **Introduction** American Rivers is a leading conservation organization working to protect and restore the nation's rivers and streams. Our mission is to protect wild rivers, restore damaged rivers, and conserve clean water for people and nature. Since 1973, we have conserved more than 150,000 miles of rivers through Wild and Scenic River (WSR) designations, dam removals, on-the-ground projects, and advocacy efforts. Our Southwest Regional Program is headquartered in Denver, CO, while our Southwest River Protection Program is located in Durango, CO, Flagstaff, AZ, and Moab, UT. American Rivers' mission is integrally tied to ecosystem health and the protection of Wild and Scenic rivers such as the East Fork of the Virgin River where the Cove Reservoir project is proposed. **Project Overview** The proposed Cove Reservoir Project aims to build a 6,055-acre reservoir on the East Fork of the Virgin River in Kane County, UT, upstream of Zion National Park and the Wild and Scenic Virgin River system. The project proposal claims that it would irrigate an additional 6,068 acres in Kane and Washington counties, using nearly $30 million of taxpayer funds, $22 million (75%) of which would come from the USDA Natural Resources Conservation Service (NRCS). In addition, the project proposes providing reservoir-based fishing, camping and boating recreation, a small hydropower project, and an augmentation of flows for endangered fish and bird species downstream. Concerns with the Proposed Project Which Must be Analyzed in the EIS This proposed project raises a number of concerns for us, enumerated below.
157	35	4/28/2022	Email	NGO	American Rivers	Michael Fiebig	27	General	**1. The proposed project may violate the law, as most of the identified project lands are not agricultural properties, but instead new residential and commercial properties.** Under the proposal, NRCS would provide $22 million of the $29,982,000.00 cost of the project, or approximately 75% of the required funding. The project identifies 6,068 acres of "agricultural" land in Washington and Kane Counties. Closer research of the project area on Google Earth, and then through on-the-ground site visits by a local partner, shows that only 1600 acres of the project area are in fact still agricultural lands. The other 4,468 acres (64% of the project area) are composed of new residential and commercial developments, making this a municipal water project. The Watershed Protection and Flood Prevention Act of 1954 directs the NRCS to not pay more than 30% of project costs for municipal projects,1 yet the NRCS is proposing to pay 75% of the Cove Reservoir project. This must be analyzed in detail and reviewed by NRCS. A municipal project would presumably require a flattened annual hydrograph in order to provide consistent water for homes and businesses, which is contraindicated for native ecosystem health. In addition to the agency taking a close look at the project area, we ask that it undertake a robust flow analysis for the East Fork Virgin River, accounting for both pre-project flows and post-project flows on a month-by-month, annual basis. Since municipal water is in question, we request that subsequent analysis in an EIS also consider conservation measures to meet municipal demands analyzing potential environmental harms and likely economic costs in a least-cost methodology. The fact that the Cove Reservoir Project area has been so drastically raises significant doubts and concerns with the rest of the unsubstantiated ecosystem benefit claims for which the project is purportedly proposed, warranting a hard in the EIS or abandonment of the project altogether.

CID	Doc ID	Received	Type	Group	Entity	Commenter	Commenter ID	Category	Comment
158	35	4/28/2022	Email	NGO	American Rivers	Michael Fiebig	27	Sensitive Species	**2. The proposed project would likely adversely impact two federally listed fish species, the woundfin and Virgin River chub, and one federally listed bird species, the Southwest willow flycatcher.** In 2000, the U.S. Fish and Wildlife Service (USFWS) designated 87.5 miles of the Virgin River, including the East Fork Virgin River confluence, as critical habitat for the woundfin and Virgin River chub, protected under the Endangered Species Act (ESA) in 1970 and 1989, respectively.2 *"Both species have declined in numbers because of loss or degradation of habitat, including channelization, impoundments, loss of water due to diversion projects, and alterations to natural stream flow, temperature, and sediment processes. The introduction and proliferation of nonnative fishes, such as the red shiner, have also contributed to the species' decline."3* Reservoirs have been proven to exacerbate all of the direct causes of native fish species decline listed by USFWS, and Transcom Environmental and the Natural Resources conservation Service (NRCS) must address these issues in the EIS. The claim that the reservoir would "benefit" listed species4 is unsupported and contrary to the proven negative impacts that dams have on the native fish in the Colorado River system. Furthermore, the project proposes the addition of "boating, fishing and camping" facilities at the reservoir,5 but fails to note whether or not the reservoir will be stocked with non-native game-fish species (as is typical), which would be detrimental to the woundfin and Virgin River chub. The project proposal also fails to address the detrimental impacts of severing of fish and wildlife habitat that the physical dam and reservoir themselves would cause in the river system. Drastically altered flows, invasive species and habitat modifications at reservoir sites and along impacted river corridors are precisely the factors that led to the listing of the southwestern willow flycatcher in 1995. A riparian nesting species, the southwestern willow flycatcher, "has declined because of removing, thinning, or destroying riparian vegetation; water diversions and groundwater pumping which alter riparian vegetation; overstocking or other mismanagement of livestock; and recreational development," according the USFWS.6 The EA fails to address how the more managed, altered flow regime from the proposed Cove Reservoir, also directly associated with habitat loss due to non-native species encroachment in riparian areas, could possibly improve the habitat of the southwest willow flycatcher. By all estimation, such a project would further impair its habitat. Due to the potential, adverse impacts to ESA-listed species, we request that the NRCS address the issues above in a full EIS, find that none of the potential harms listed above would occur, or cancel the project.
159	35	4/28/2022	Email	NGO	American Rivers	Michael Fiebig	27	Wild and Scenic Rivers	**3. The proposed project would adversely impact the Wild and Scenic East Fork Virgin River and Zion National Park.** American Rivers is highly concerned about the potential impacts that the proposed Cove Reservoir would have on the Wild and Scenic East Fork Virgin River, the mainstem of the Virgin River, and Zion National Park – all downstream of the proposed project, and not adequately addressed thus far. The East Fork Virgin River was protected under the Wild and Scenic Rivers Act as a "Wild" classified river for its "Cultural, Fish, Geologic, Wildlife and Ecologic" outstandingly remarkable values (ORVs) in 2009.7 The East Fork is an essential part of the 165-mile Virgin River system protected within Zion National Park and an adjacent Bureau of Land Management (BLM) Wilderness Area. The canyons of the Virgin were carved and shaped by the river over the course of 13 million years, essentially tying the habitat and cultural values of these protected areas to the natural flows of rivers such as the East Fork Virgin River. Under Section 7 of the Wild and Scenic Rivers Act (WSRA), projects proposed outside of the Wild and Scenic corridor must not "invade or unreasonably diminish" the outstandingly remarkable values (ORVs), free-flowing character, or water quality of the designated reach, in this case downstream. Considering that 145 miles of the Virgin River system downstream of the proposed project was designated as a National Wild and Scenic River in 2009, NRCS must require a detailed analysis of the proposed Cove Reservoir project under Section 7 of the WSRA. The Virgin River and its tributaries also provide a unique and intact habitat for a number of native fish and wildlife species, including the woundfin, Virgin River chub, Virgin spinedace, flannelmouth sucker, desert sucker, speckled dace, southwestern willow flycatcher, desert bighorn sheep, Mexican spotted owl and the endemic Zion snail. The geologic setting, high flows, large sediment loads, unique water quality and frequent disturbance are effective deterrents to exotic species. Other factors contributing to the productivity of native fish are connectivity to tributary systems and habitat diversity for spawning, rearing and supporting adult fish. Additionally, the Zion stonefly, an important component of the food web and directly linked to both flow regimes and water quality, is found along the Virgin River and its tributaries.8 Potential adverse impacts to these species and values must be addressed in the EIS. The proposed project fails to address the likely negative impacts that Cove Reservoir could have on the ORVs of the Wild and Scenic Virgin River system, Zion National Park, and the fish and wildlife species important to such protected areas. Due to the serious, potential adverse impacts of the project, we request that the NRCS require analyses under the Wild and Scenic Rivers Act and the Endangered Species Act in coordination with the National Park Service and the U.S. Fish and Wildlife Service in the Environmental Impact Statement (EIS) or cancel the project altogether.

CID	Doc ID	Received	Type	Group	Entity	Commenter	Commenter ID	Category	Comment
160	35	4/28/2022	Email	NGO	American Rivers	Michael Fiebig	27	NEPA Process	**4. A full Environmental Impact Statement (EIS) is required by the scope and magnitude of the potential impacts of the proposed project.** This controversial project with substantial potential impacts to currently protected landscapes and ESA-listed species on federal public lands, requires the preparation of a full Environmental Impact Statement, including robust coordination and consultation with indigenous Tribes, the National Park Service, and U.S. Fish and Wildlife Service. The National Environmental Policy Act (NEPA) requires federal agencies to prepare a full Environmental Impact Statement before undertaking "major Federal actions significantly affecting the quality of the human environment." CEQ regulations provide direction about evaluating the context and intensity of significant aspects of the project.9 One measure is whether there are "unique characteristics of the geographic area such as proximity to historic or cultural resources, park lands, prime farmlands, wetlands, wild and scenic rivers, or ecologically critical areas."10 In this case, the proposed dam and reservoir project envisions trading impacts to three ESA-listed species, a Congressionally designated Wild and Scenic River, and Zion National Park for an increase in irrigated agriculture, municipal water with unproven need, and reservoirbased recreation, costing nearly $30 million. The project fails to provide evidence of the need for more irrigated agriculture, more municipal water, or increased reservoir-based recreation in the region, and fails to address potential impacts to the three ESA-listed species and two protected areas. The Cove Reservoir Project clearly requires analyses of these issues under the criteria provided by NEPA. We thank the NRCS for requiring this analysis, and the hard look into the issues that we list here that it requires.
161	35	4/28/2022	Email	NGO	American Rivers	Michael Fiebig	27	Climate Change	**5. Aquatic resources and climate adaptation.** The protection of aquatic resources, including wetlands, riparian areas, and water quality and quantity, rank among the most critical issues to be addressed in any NEPA analysis for potential development, particularly in the Colorado River Basin, where so few free-flowing rivers remain and climate change is expected to decrease river flows 20-30% by 2050.11 Activities resulting from the proposed Cove Reservoir Project have the potential to adversely impact aquatic resources, including wetlands, streams, riparian areas, and their supporting hydrology. Since the proposed project may ultimately result in adverse impacts to aquatic resources, the NRCS must pay particular attention to ensuring a robust treatment of the issues in the EIS, including an assessment of cumulative impacts. Our rapidly warming climate is causing dramatic changes in the landscapes, habitats, and hydrology of the Colorado River Basin. Retaining intact river corridors and unfragmented habitat is crucial to any adaptation strategy in the face of climate change. The EIS must analyze potential impacts to the ability of species that use the public lands and rivers upstream and downstream of the proposed project to adapt to future shifts in hydrology and habitat owing to climate change if the construction of Cove Reservoir is allowed to go forward. Likewise, The EIS must take into consideration the 100-year projected hydrology of the East Fork Virgin River under climate change, how much water is projected to occur in the river, and what potential future depletions could do to the values and natural resources of the Virgin River downstream, many of which are protected under federal law.
162	35	4/28/2022	Email	NGO	American Rivers	Michael Fiebig	27	General	**6. Documentation of FERC hydropower exemption needed.** Finally, the original project briefly mentioned an off-site hydropower project, which may be exempt from permitting and regulation under the Federal Energy Regulatory Commission (FERC) due to its size, though details of the project were slim. If such an exemption has been received from FERC, the analysis should both cite it and provide the documentation in an appendix. If this hydropower component is still a part of the project proposal, it must also be analyzed for potential impacts in the EIS.
163	35	4/28/2022	Email	NGO	American Rivers	Michael Fiebig	27	General	**Conclusion** Reiterating many of the points from our previous letter and due to the reasons articulated above, American Rivers supports the "no action" alternative for the proposed Cove Reservoir Project in the EIS, requiring the project to be abandoned altogether. The proposed project would have myriad adverse effects on fish, wildlife, cultural sites, and federally protected areas. In addition to analyzing the issues we have discussed here, we expect the NRCS to require documentation of robust consultation and coordination with potentially effected indigenous Tribes, the National Park Service, and the U.S. Fish and Wildlife Service.
164	36	4/23/2022	Email	Public		Barry Sochat	7	General	As a long time resident of Rockville, Utah, I am reliant on waters from the Virgin River for both culinary and agricultural usage. I am particularly alarmed by the frequent outbreaks of deadly bacterial algae during the low river flows and how any upstream diminution of flow will further worsen the water quality of the North fork of the Virgin River. Please enter all concerns into the official record for the Cove Reservoir Project DEIS, to wit:
165	36	4/23/2022	Email	Public		Barry Sochat	7	Climate Change	1. Study existing megadrought conditions and the current modeling for the future of water supplies in the region driven by climate change and determine if this project is sustainable.
166	36	4/23/2022	Email	Public		Barry Sochat	7	Alternatives	2. Suggest that federal agricultural funding might best be used to help farmers in Kane and Washington counties transition to climate and sustainable smart agriculture. There are a variety of new agricultural technologies including remote sensing technology that can result in using less water and increasing yield. These are practices that are beginning to be used world-wide. A cost-effective study should be completed comparing the cost of arming farmers with new technologies vs. the cost and environmental impact of constructing and maintaining the Cove Reservoir.

167	36	4/23/2022	Email	Public		Barry Sochat	7	Cumulative Effects	3. Analyze the direct, indirect, and cumulative impacts of eliminating high flows on both the East Fork and the Main Virgin as it relates to the hydrologic connection of both ground and surface water. Changing river flow levels forever could hinder how the aquifer is recharged along with permanently decreasing the flow of surface water downstream of the project area.
168	36	4/23/2022	Email	Public		Barry Sochat	7	Sensitive Species	4. Study the history of what caused the endangered fish in the Virgin to become imperiled in the first place and evaluate how further reducing perennial flows will further complicate the effort to save these species. Changing the historical flows are likely to have an impact as well on the entire riparian zone along the river. This must be carefully evaluated.
169	36	4/23/2022	Email	Public		Barry Sochat	7	Water Resources	5. Complete an analysis of ecosystem health of the Virgin River watershed with attention to how using more fertilizer for agriculture affects downstream water quality.
170	36	4/23/2022	Email	Public		Barry Sochat	7	Water Resources	6. Complete an analysis of the complete Virgin River watershed and how water supplies and quality may be affected in Arizona and Nevada as the Virgin River watershed is technically in the Lower Basin drainage.
171	36	4/23/2022	Email	Public		Barry Sochat	7	Water Resources	7. Analyze and evaluate the water rights that the irrigation companies are using to build the project. Current records show these water rights are being protested by other water users.
172	36	4/23/2022	Email	Public		Barry Sochat	7	Economics	8. Calculate the cost/benefit ratios for the 100-year life of the project.
173	37	2/4/2022	Email	Public		Martha Ham	28	General	I am following the Cove-East Fork Virgin Watershed Project-Kane County, Utah. I received the public scoping notice in the Fall of 2021 and was notified of several meetings. I never saw the scoping comment period open. What can you tell me about the status of this project?
174	38	10/14/2022	Email	Public		Jane Whalen	3	NEPA Process	Is the Cove reservoir project the same as the design in the EA? Will the new description of the project be available for the up coming meetings? Thus far, there is little information on the new project plan so that will make it hard to write any constructive scoping comments. Thanks so much for taking the time to respond.
175	39	4/13/2022	Email	Public	The Spectrum	Sean Hemmersmeier	29	NEPA Process	My name is Sean Hemmersmeier, I'm a reporter for The Spectrum in St. George. I'm following any updates that happen with the Cove Reservoir project. I recently got sent an email about the public scooping period for the project is closing soon and I've visited the NRCS project website and am a little confused by the timeline for the project so I'm one of you can answer some questions I have. On the NRCS website it says the scoping public comment period opens on Apr. 28 and will close 30 days after a NOI is published but the email I got today says the Apr. 28 is the deadline for comments. So I just wanted to clarify when the comment period for the scoping portion of the project would end, is it Apr. 28? When this comment period ends what are the next steps for the Environmental Impact Statement for the Cove Reservoir project to be completed? How long will it take finish the EIS and when would you expect the EIS to be made public?
176	40	4/26/2022	Email	NGO	Conserve Southwest Utah	Jane Whalen	3	General	Please accept and fully consider these comments from Conserve Southwest Utah (CSU). CSU is a nonprofit 501(c)(3) organization based in St. George, Utah, advocating for the conservation of Southwest Utah's natural resources and was established in 2006. CSU worked hard to help pass the Omnibus Public Lands Management Act of 2009 (P.L. 111-11). It designated the Red Cliff and Beaver Dam Wash National Conservation Areas and Wilderness Areas in Washington County. It also designated approximately 165.5 miles of the Virgin River and its tributaries across federal land within Zion National Park (28 segments) and adjacent Bureau of Land Management Wilderness (11 segments) as part of the National Wild and Scenic Rivers System. Many CSU members and supporters live near, recreate in, and value Zion National Park. CSU's supporters include more than 2,500 individuals. These lands provide critical habitat and unique opportunities for sightseeing, hiking, camping, trail running, mountain biking, appreciation of archaeological resources, natural quiet, journaling, birdwatching, ecosystem research, photography, and more. These lands are the traditional homelands of Native Americans, including the Paiute Tribe. Our vision is that Southwest Utah grows in a manner that enables the conservation and restoration of its natural and cultural resources. Our mission is to advocate for conservation and stewardship of our area's natural and cultural resources and implement the Smart Growth policies that enable conservation for the benefit of present and future generations.

177	40	4/26/2022	Email	NGO	Conserve Southwest Utah	Jane Whalen	3	General	I. Introduction The East Fork Virgin River is a small stream of critical significance. Conserve Southwest Utah (CSU) is concerned that the Cove Reservoir Project (Project) will permanently change the river's natural flow and disrupt this already fragile riparian ecosystem. In the face of rapid climate change, and in megadrought conditions, the Project would cause and greatly exacerbate changes in the timing, amount, and natural flow of the East Fork that would, in turn, negatively impact the plants, fish, wildlife, and interconnected ecosystems they all depend on to survive. There are only two rivers designated as Wild and Scenic in Utah: Sections of the Green River and the Virgin River that runs through Zion National Park. The East Fork of the Virgin River is designated as Wild under the Wild and Scenic Rivers Act, where it flows through Zion National Park. Protecting and preserving this Wild designation has both practical and legal significance. The Project would likely alter water flows in this area, and changes in flow rates will adversely affect the values that underlie the Wild qualities of this delicate river. Changes in the natural flow patterns, particularly during the summer months, may negatively impact the visitor use in the famous slot canyons of the Bureau of Land Management's Parunuweap Canyon Wilderness Area (WSA) of 30,800 acres. The WSA boundary is located near the project area, and downstream of the gravel pits needed to build the 90-foot-high earthen dam. The East Fork Virgin River runs through the proposed Wilderness Study Area—an area that should remain wild. Unfortunately, the NOI lacked detailed and essential information regarding the proposed Cove Reservoir Project. We contacted the applicable agencies to verify whether the Project design was the same as in the 2020 Plan-EA, because some water would be diverted to agricultural fields in Hurricane. We received no clear answer and concluded that the scoping period should have been postponed until the details of the Project were determined. Therefore, we relied on the Project's description in the 2020 Plan-EA to make scoping comments on this Project. CSU will include sections from our previous comments on the 2020 Cove Reservoir Plan-EA for our scoping comments. Where applicable, the section from the Plan-EA receiving a comment is identified by the section number and title. The quoted text is italicized and indented. CSU's comments follow.
178	40	4/26/2022	Email	NGO	Conserve Southwest Utah	Jane Whalen	3	Purpose and Need	II. Purpose and Need The Draft Environmental Impact Statement (DEIS) must include an evaluation of the validity of water rights for the 100-year life of the Project in the purpose and need. The water availability for the reservoir would undermine the Project's ability to supply water to agricultural uses and generate power. Therefore, the availability of water supply is directly related to the Project's purpose and must be disclosed. The ability of the Kane County Water Conservancy District (KCWCD) to capture the water from the eleven subbasins above the dam to fill the reservoir must be verified. Due to increasing temperatures and less precipitation, it is unclear whether there would be enough physical water in East Fork Virgin River to sustain the reservoir over the 100-year life span of the Project. A study needs to be conducted regarding how much physical water there is flowing in the East Fork and from the drainage up-gradient to the dam. As water supplies decline as expected, the DEIS must determine who has the priority water right to use it over the Project's 100-year life span. The DEIS must also calculate how much water would remain in the Virgin River between the diversions and withdrawals for the Project and where the critical aquatic species need it. These species include macroinvertebrates, which are the basis of the aquatic food chain. This is a critical analysis to include in the DEIS. From: 40 CFR 1500.1 Purpose and Policy (b): NEPA procedures are intended… "…to ensure that relevant environmental information is identified and considered early in the process in order to ensure informed decision making by Federal agencies. The regulations in this subchapter are also intended to ensure that Federal agencies conduct environmental reviews in a coordinated, consistent, predictable and timely manner, and to reduce unnecessary burdens and delays." The DEIS must provide the public and decision makers with adequate, clear, and high-quality scientific analysis of the impacts of the Project on the environment.

CID	Doc ID	Received	Type	Group	Entity	Commenter	Commenter ID	Category	Comment
179	40	4/26/2022	Email	NGO	Conserve Southwest Utah	Jane Whalen	3	Wild and Scenic Rivers	III. East Fork Virgin River Designated Under Wild and Scenic Act The East Fork of the Virgin River corridor shelters one of only two designated Wild and Scenic Rivers in the state. It is not only congressionally designated as a Wild and Scenic River but is also designated as a Research Natural Area. The DEIS must analyze the direct, indirect, and cumulative impacts of the Project's water diversions and withdrawals on the ecosystem health and hydrologically connected flows applicable to this designated wild segment of the East Fork of the Virgin River. CSU is concerned that flows will be altered and adversely affect the wild character of the river, in violation of the Wild and Scenic Rivers Act (WSRA). Plan-EA, 2.6 Wild and Scenic Rivers, page 17: *"The East Fork Virgin River enters Zion National Park approximately 20 river miles downstream and southwest of the proposed project area. The river flows through the Park from the east boundary to the west boundary. This portion of the river has been designated as wild under the Wild and Scenic Rivers Act (National Wild and Scenic Rivers System 2018). This designation means that the river is free of impoundments and generally inaccessible, except by trail, and includes watersheds or shorelines that are essentially primitive with waters unpolluted, representing vestiges of primitive America. Outstandingly remarkable values (ORV) associated with this stretch of the river include cultural, geologic, ecological processes, wildlife, and fish. Additionally, the East Fork Virgin River was designated as a Research Natural Area in 2001. The area has been set aside for research purposes and is closed to recreation (NPS and BLM 2013)." (Emphasis added)* The DEIS must include the East Fork Virgin River's Outstandingly Remarkable Values (ORV). Federal agencies' are obliged to protect these values in a designated Wild and Scenic River.
180	40	4/26/2022	Email	NGO	Conserve Southwest Utah	Jane Whalen	3	Wild and Scenic Rivers	IV. FERC Restrictions on Hydropower Plants above a Wild and Scenic River *"In addition to using reserved water rights to protect the flows of designated rivers, the WSRA provides protection for a designated river by limiting the licensing of dams, reservoirs, and other water project works on, or adversely affecting, protected segments. The WSRA prohibits the Federal Energy Regulatory Commission (FERC) from licensing "the construction of any dam, water conduit, reservoir, powerhouse, transmission line, or other project works under the Federal Power Act ... on or directly affecting any river" designated as part of the national wild and scenic rivers system. Likewise, no other federal agency may "assist by loan, grant, license, or otherwise in the construction of any water resources project that would have a direct and adverse effect on the values for which [a designated] river was established." The prohibitions on water and power projects are very broad in the WSRA. The prohibitions generally limit federal agencies from recommending authorization of such projects, or appropriations to begin construction on such projects, that would have an adverse effect [sic] on the purpose of the designation". (Emphasis added)*
181	40	4/26/2022	Email	NGO	Conserve Southwest Utah	Jane Whalen	3	ACEC	V. East Fork Virgin River Designation as Parunuweap Canyon Wilderness Study Area The Bureau of Land Management has designated 30,800 acres of the East Fork Virgin River watershed as part of the Parunuweap Canyon Wilderness Study Area.1 This designation holds both historic and legal significance. The historic significance includes honoring the explorations of the East Fork Virgin River by John Wesley Powell, Stephen Jones, and Joseph Young in 1872. The DEIS must take a hard look at the direct, indirect, and cumulative impacts of the proposed projects altering hydrologically connected flows through this designated area. With that, the DEIS must determine the impact of the proposed Project on this designation. This includes, among other things, analyzing the impact of the Project's release of more water in the summer for downstream irrigation on visitor use in the slot canyons.
182	40	4/26/2022	Email	NGO	Conserve Southwest Utah	Jane Whalen	3	Water Resources	VI. Analyze Water Rights for Proposed 100-year Project In the DEIS, the agencies must holistically evaluate the water rights in the Virgin River Watershed. It must disclose all water rights to the East Fork Virgin River and identify those which can depend on those rights over the long term as water supplies decline. The KCWCD claimed in the 2020 Plan-EA that the only water being stored in the reservoir would be from the irrigation water rights of Orderville, Mount Carmel, and Glendale irrigation companies. However, the proposed reservoir has a 6,055 acre-feet capacity, much more water than the canal companies have water rights to. Table 1 shows water rights held by the three irrigation companies that would receive water from the reservoir. Table 1 also shows that each of these irrigation companies' water rights is being protested. An analysis of the potential impact of possible results of the protests on the amount of that water for or from the reservoir needs to be addressed and disclosed in the DEIS. Further, the 2020 Plan-EA didn't describe how much water would be counted as depletion and how much water would be counted as a return flow. These issues must be analyzed and disclosed in the DEIS. SEE TABLE OF RIGHTS CSU notes that the river's average flow between November and March is 17 CFS at the Glendale USGS gage # 9404450. Table 1 points to the problem of the over-allocation of diminishing resource water; new binding agreements would be needed to protect the ecosystem health for the imperiled Virgin River fishes of the East Fork of the Virgin River and still provide water to the irrigation companies. The planned reservoir requires too much water from a small stream; it would diminish the river's natural flow and negatively affect the fragile natural ecosystem of the East Fork.

CID	Doc ID	Received	Type	Group	Entity	Commenter	Commenter ID	Category	Comment
183	40	4/26/2022	Email	NGO	Conserve Southwest Utah	Jane Whalen	3	Water Resources	The KCWCD also wants to capture runoff from the 4.7 square miles of watershed behind the dam. However, Utah's water law does not allow the enlargement of the existing water rights of the canal companies. The Plan-EA failed to determine the amount of surface flows that the reservoir and dam would block. The amount of water use allowed in this region is limited. Based on how many water use depletions are accruing in the region, none of this critical information on depletions and return flows was in the 2020 Plan-EA; therefore, it should be in the DEIS. CSU is concerned that the project diverts water from the East Fork in two ways; building a dam to contain runoff from 4.7 square miles in eleven subbasins that would normally flow to the East Fork plus the diversion of mainstem East Fork flows into the reservoir. Both of these withdrawals from the East Fork watershed disrupt the river's natural flow, and neither is adequately analyzed in the Plan-EA and must be evaluated in the DEIS. The DEIS should complete a water rights assessment mentioned in a Washington County Water Conservancy District (WCWCD) letter of June 20, 2018, requesting a study to determine whether the Project would harm WCWCD's water rights. They wrote: "the Project must evaluate the proposed reservoir and its function on the district's ability to capture and store water within its existing rights. Any negative impacts to existing rights and uses in the basin must be addressed to the satisfaction of the district." The DEIS should disclose what WCWCD's water rights would be used for the Project and how much water from the Project they will receive. The DEIS must analyze: 1. whether the irrigation companies have a right to store the water up-gradient from the proposed dam at a different diversion point; and 2. whose water rights will be used to fill the reservoir; and 3. what will be the amount of runoff water expected per year; and 4. who has rights to this water (if anyone)
184	40	4/26/2022	Email	NGO	Conserve Southwest Utah	Jane Whalen	3	Water Resources	VII. Analyze Whether Utah has Adequate Water for the Project Utah's Colorado River water right is not fixed; it is a percentage. Under the Colorado Compact, it is 23% of 15-million-acre feet a year (MAFY) after other senior water rights are met, including abiding by the compact agreements with the Lower Basin States and the treaty with Mexico. But due to a warming climate, water supplies are declining, and Utah no longer has as much water left to use. The DEIS must analyze how many water use depletions remain undeveloped in this region that the Project can use. The problem is the state estimates it could still develop 1.4 MAFY of depletions in its compact allocation, but they are basing this on a higher flow of 15 MAFY, whereas the annual flow has been much less at about 12.5 MAFY or less. Consequently, the state will have to use less water and there may not be water left for this Project. The DEIS must comprehensively analyze this issue to determine whether this proposed diversion complies with the Colorado River Compact. The States of Arizona and Nevada also hold water rights in the Virgin River watershed downstream of the Project that needs to be included in the DEIS's water availability analysis for the Project.
185	40	4/26/2022	Email	NGO	Conserve Southwest Utah	Jane Whalen	3	Climate Change	VIII. Evaluate Critically the Impact of Climate Change on the Project CSU has mentioned in these comments that the Project may not be viable in a few years. The DEIS must use the best available science to assess the East Fork Virgin River's existing and future conditions after climate change impacts on the Project. The DEIS should determine what the flows in the East Fork of the Virgin River need to be to keep it functioning for the 100-year life span of the Project. One study on climate impacts on reducing Colorado River flows concluded a significant risk of permanent flow reduction in the Colorado River Basin of 30% by midcentury.2 Similarly, another study explains the impact of "unprecedented basin-wide warming" températures on increased precipitation and plant water use, decreasing runoff, reduced snowpack, and the overall reduction of Colorado River flows.3 In that context, CSU is concerned with the prudence, viability, and sustainability of this Project and requests that the DEIS research and disclose all pertinent evidence. Further, the DEIS must consider other studies that forecast lower flows in the East Fork of the Virgin River predicted by 2050, ranging from -7 percent to -27 percent4 and -14 percent to -31 percent.5 Courts characterize NEPA's procedural requirement as obliging agencies to take a "hard look" at the environmental consequences and alternatives.6 This information must be rational and disclosed to the public before final decisions are made. NEPA emphasizes informed decision-making based on the best science available. Thus, the DEIS must provide a thorough climate change impact analysis that "presents the environmental impacts of the proposal and the alternatives in the comparative form [and] sharply define the issues and provide a clear basis for choice among options by the decision-maker and the public."7 Moreover, the DEIS must follow NEPA regulations 40 CFR § 1500.1(b).

CID	Doc ID	Received	Type	Group	Entity	Commenter	Commenter ID	Category	Comment
186	40	4/26/2022	Email	NGO	Conserve Southwest Utah	Jane Whalen	3	Sensitive Species	IX. Analyze Impacts Regarding Imperiled Virgin River Fishes The DEIS must include an analysis of the proposed Project on native fishes, including the Virgin spinedace, desert sucker, and speckled dace. The Virgin spinedace Conservation Agreement was not considered in the 2020 Plan-EA, though it is part of the Virgin River Resource Management and Recovery Program (Program). The Virgin River Resource Management and Recovery Program (Program) establishes a multi-agency cooperative program of the United States Fish and Wildlife Service (USFWS), Bureau of Land Management (BLM), National Park Service (NPS), Utah Department of Natural Resources (UDNR), and the Washington County Water Conservancy District (WCWCD). Two goals have been defined for the Program. These goals have been developed from the objectives, actions, and tasks outlined in the Virgin River Fishes Recovery Plan (VRFRP), the Virgin Spinedace Conservation Agreement and Strategy (VSCAS), and the Virgin River Management Plan (VRMP). These goals include Goal 1: Implement actions to recover, conserve, enhance, and protect native species; and Goal 2: Enhance the ability to provide adequate water supplies for sustaining human needs. The Virgin spinedace, desert sucker, and speckled dace, were considered imperiled aquatic species and are in the river reach of East Fork Virgin River. The Spinedace Conservation Agreement was developed to expedite measures that have been identified by the USFWS and the Utah Division of Wildlife Resources for the continued existence and conservation of Virgin spinedace (Lepidomeda mollispinis mollispinis), flannelmouth sucker (Catostomus latipinnis), desert sucker (Catostomus clarki), speckled dace (Rhinichthys osculus), and the southwestern toad (Bufo microscaphus). Implementation of the Program will also reduce threats to these species that might otherwise warrant listing as a sensitive, threatened, or endangered species. NRCS must consider the Virgin Spinedace Agreement in the DEIS. The 2020 Plan-EA included a reference to the "East Fork Virgin River Instream Flow Memorandum of Understanding (MOU)" between Kane County Water Conservancy District, Orderville Irrigation Company, UDWR, and USFWS. This MOU discusses an agreement between the parties regulating water flows on the East Fork Virgin River (KCWCD 2001; Appendix E). The DEIS must analyze and update this MOU. It should be updated as an agreement of the proposed operation of the Project and include protection to flows for the Virgin spinedace, desert sucker, and speckled dace, the imperiled Virgin River fishes. CSU requests a copy of "The East Fork Virgin River Instream Flow Study March 2001" by Watershed Systems Group of Logan, Utah, which was the basis of the study. The DEIS must include: 1. Hydrological analyses of the water for the fishes needs to be based on the best available science; and 2. A direct assessment of the reliability of the Project to protect the flows for the benefit of imperiled Virgin River fishes for the life of the project; and 3. An analysis detailing how the lower flows will directly affect the natural resources of ecosystems that the fish rely on to survive; and 4. Incorporate the cumulative effect of the Quail Lake Diversion withdrawals from the Virgin River on the imperiled Virgin River fishes.
187	40	4/26/2022	Email	NGO	Conserve Southwest Utah	Jane Whalen	3	Effects Analysis	X. Analyze Impacts Regarding Highly Erodible Soils in Project Sites The DEIS must assess the direct, indirect, and cumulative impacts of discharge on water quality and the impact to fish and water quality from sediment. The dry drainages above the proposed Cove Reservoir dam are very deep and show evidence of substantial erosion, presumably because of the geology and the topography. Further, it mush analyze how much water could be lost to seepage beneath the reservoir. The DEIS must include essential information on how the Waters of the United States will be protected and managed and who holds the water rights from these drainages. Given the highly erodible soils above the reservoir, the DEIS must include an analysis of how fast the reservoir's storage will be diminished by silt. Further, the DEIS must contemplate the risks of, since these soils are highly erodible, making an earthen dam out of these soils and the associated risk of failure in a heavy rainstorm. Additionally, the DEIS must analyze whether the proposed secondary spillway will survive an overflow event, as it is an earthen structure (trapezoidal earthen channel 1,070 feet long and 30 feet wide).
188	40	4/26/2022	Email	NGO	Conserve Southwest Utah	Jane Whalen	3	Water Resources	XI. Analyze Impacts Regarding Riparian Water Resources The DEIS must analyze the degree in which the Project will reduce high water flows away from the current riparian zone, significantly changing the existing ecosystem. The DEIS must document the existing conditions of the baseline health of the watershed's ecosystem and determine whether its current state is deemed healthy or distressed. The North Fork Virgin River fails to meet healthy water quality standards because of over-grazing. More agriculture, coupled with increased use of fertilizers, will likely worsen the East Fork watershed exacerbating water quality problems. The Virgin River watershed is shared by two other states, Arizona and Nevada, and each state depends on return flows and values water quality. This watershed analysis must also consider the direct, indirect, and cumulative impacts on downstream water rights holders. Further, the DEIS must include floodplain models and analyze how they would be affected by reduced winter flows.

CID	Doc ID	Received	Type	Group	Entity	Commenter	Commenter ID	Category	Comment
189	40	4/26/2022	Email	NGO	Conserve Southwest Utah	Jane Whalen	3	Water Resources	XII. Analyze Impacts Regarding the Hydrologic Connection of Ground and Surface Water Groundwater is the foundation on which all surface water rests, including the East Fork Virgin River. Water flow toward the discharge area can take days, weeks, months, years, decades, centuries, or millenia depending on the distance of flow from recharge to discharge area. Understanding how, when, and where discharge and recharge occurs is essential information to ensure that all hydrologically connected withdrawal and diversion are conducted in a sustainable manner to maintain this precious resource over time. The DEIS must include the exploration, monitoring, and analysis of the East Fork Virgin River groundwater resources to understand the hydrologic connection of ground and surface water and, in that context, detail and disclose the direct, indirect, and cumulative impacts of the proposed Cove Reservoir Project. The DEIS must include information essential to make a reasoned choice among alternatives—including, but not limited to, hydrologic connection models. A conceptual model must reflect the physical system and the operational or management features. With that, the information must disclose existing data for the system, including how many years data was available. The modeling experts must reduce the conceptual model into a numerical and computer model by either using 1) field data; and 2) the establishment of dimensions of time and space units. The information must consider whether the model adequately describes the system and disclose the levels of uncertainty related to predictions quantified and attributed to various sources beyond simply the error rate of calibration data.8
190	40	4/26/2022	Email	NGO	Conserve Southwest Utah	Jane Whalen	3	Effects Analysis	XIII. Analyze Impacts Regarding Borrow Pits The Plan-EA, Table S-4, provides context for this section under; Summary of Resource Concerns and Potential Environmental Impacts, page S-5, et seq. Water Resources, Water Resources (surface water quality and quantity: *"Construction activities would occur in drainages and near water sources. Two potential borrow pit sites would be accessed by crossing the East Fork Virgin River on existing dirt roads. Use of the third borrow site would not affect any water resources. Storage of surface water would provide additional water for summer irrigation and recreation. Interception of ephemeral floodwater could occur. Construction activities near water areas could result in short-term water quality reduction…"* It will take three years to build the proposed Project, and the Plan-EA described reductions in reservoir volume resulting from sedimentation. Still, the Plan-EA did not consider the impacts of the heavy equipment that will have to cross the East Fork Virgin River and gather material on the other side of the river from two existing borrow sites to provide gravel and riprap for the proposed project 90-foot high earthen dam. The sentiment load in the East Fork will likely be significantly increased. The amount of material to build the dam and reservoir is estimated to be 4,360,000 cubic yards—which is about the same as the volume of concrete used to build the Hoover Dam and power plant.9 The roads and materials are also located in an area with highly erodible soils that could degrade water quality downstream. The DEIS must analyze how this Project affects the wilderness values of the Bureau of Land Management's Parunuweap Canyon Wilderness Study Area (WSA) (30,800 acres) downstream of the Project. The Plan-EA revealed that the trucks must drive through the East Fork of the Virgin River to access Lamb's Pit and Tait Pit, two of the gravel pits it relies on, but it fails to assess the sedimentation associated with that disturbance. Consequently, if it takes three years to build the Project, the impact on the river's water quality will likely be significant. The DEIS must analyze Borrow pit impacts by: 1. estimating the amount of material from each pit. Table 11 in the Plan EA only gives amounts of types of material; and 2. describing how to minimize dust when accessing borrow pits, p. 32 et seq. (total disturbance ~75 ac, total 4,319,000 cu yd removed), and over 7 miles of dirt road along Glendale Bench Road; and 3. analyzing the impact of sedimentation from extracting material from the borrow pits on the values of the Bureau of Land Management's Parunuweap Canyon
191	40	4/26/2022	Email	NGO	Conserve Southwest Utah	Jane Whalen	3	Economics	XIV. Analyze KCWCD and WCWCD Potentially Misleading for Better Funding The DEIS must analyze whether the proponents are misleading the public and whether the Districts' misuse of these funds is allowed under the NRCS Watershed Flood Prevention and Protection Program (PL83-566). According to an article in the Spectrum newspaper,10 the project proponents admit they do not have to continue to use the water for agriculture if they just declare that they are using it now for agriculture. It seems the proponents want to get the better terms for funding an agricultural project, all the while intending to use the water for municipal purposes. For example, the DEIS must include the information that KCWCD anticipates rezoning along the access roads around the reservoir to allow property sales and homes to be constructed along the access road to help finance the Project. The Plan-EA said, "The pipeline would be an 8-inch line with fire hydrants located every 500 feet." This is a requirement under the fire code for building homes. Thus, NRCS funding would be used for municipal development, not agricultural development. Further, KCWCD claims they have already spent $2 million building the Project piecemeal without environmental review of being a part of a larger project. The property for the reservoir was purchased, a pipeline was built double its original size from the proposed reservoir to the Orderville diversion, and they participated in the Orderville diversion. They applied for the NRCS grant in 2017, and three years later, in 2020, the Project completed a watershed plan and an environmental assessment omitting this key information. They left these vital components out of the environmental review of the 2020 Plan-EA, and they must be evaluated in the DEIS.

192	40	4/26/2022	Email	NGO	Conserve Southwest Utah	Jane Whalen	3	Alternatives	XV. CSU Proposes Another Alternative to be Studied in the DEIS The other alternatives proposed to be studied in the DEIS were only about different dam sites and not the proposed purpose of the Project being the need for water for growing more alfalfa on the farmers' existing fields. As mentioned in our comments, CSU is concerned that the proposed Project is not viable over the long term due to the foreseeable reduction of future water supplies because of a warming climate. This Project was envisioned many years ago, and since then, circumstances have changed significantly due to the ongoing and projected diminishing water supplies. CSU proposes another alternative that should be studied in the DEIS that could focus precious funds on better agricultural practices to conserve water in preparation for expected changes in precipitation patterns, such as, but not limited to, using smart technologies such as metering all agricultural water use and using satellite technologies. For instance, Alfalfa and Forage Specialist at UC Davis Dan Putman concluded that: *"While alfalfa holds some important advantages in terms of water use efficiency and water management, there is no question that the alfalfa industry needs to envision improvements in irrigation management and WUE [water use efficiency] for a water-scarce future. These long-term strategies include 1) improving yields through genetic and crop management methodologies, 2) Changing irrigation technology where appropriate and optimizing system performance in all systems, and 3) Improving water management monitoring systems to more closely estimate and match crop water demand with applied water."* He continued, "[e]nvisioning more water-use efficient systems is critical to meeting future needs for forage crops in a more water-limited future."11 CSU shares Dan Putnam's vision for improvements in irrigation management for water conservation in the face of a water-scarce future. The proposed Project draws serious concerns. The DEIS must take a hard look at this feasible and reasonable conservation alternative—using the best available science to assess the East Fork Virgin River's existing and future conditions and closely consider climate change impacts. In considering this and other alternatives, all essential information must be rational and disclosed to the public before final decisions are made. Additionally, the No Action alternative should describe existing conditions in detail and how they will be improved or impacted by the proposed alternative.
193	40	4/26/2022	Email	NGO	Conserve Southwest Utah	Jane Whalen	3	Effects Analysis	XVI. Conclusion The DEIS must complete the analyses begun in the prior Plan-EA to address the in-depth and long-term impacts of this project on the environment. That analysis must include additional reasonable alternatives such as that suggested above.
194	41	4/20/2022	Email	Public		Brian Behle	30	General	As an outdoor enthusiast and native Utahn I ask you support the no action alternative regarding the Cove Reservoir proposal. Farming is important, however, this planned reservoir for irrigation is deeply flawed. It risks degrading the amazing attraction of the Virgin River, so important to local tourist dollars and all Americans' enjoyment of our national treasures. We have thousands of better alternatives to grow more crops in the U.S. Thank You, Brian Behle
195	42	4/22/2022	Email	Public		Jason Costa	31	General	I grew up in Utah, fishing and paddling the rivers across the state. This project threatens delicate ecology and ecosystems, and puts natural resources at risk. It is also a tremendous waste of taxpayer money. Please keep the Virgin River wild and scenic, and select the NO ACTION option on Cove Reservior.
196	43	3/4/2022	Email	Public		Richard Spotts	1	NEPA Process	I would appreciate answers to the following questions related to the above-referenced proposed NRCS project. 1) Will or may this proposed project receive any of the recently approved USDA infrastructure funding for new flood control projects? Please see the related article at this web link: https://www.eenews.net/articles/usda-emphasizes-flood-control-in-face-of-climate-disasters/ 2) Why has the required Notice of Intent (NOI) for this forthcoming Environmental Impact Statement (EIS) not yet been published in the Federal Register (it was announced last October), and what is the NOI's current status or expected date of publication? 3) When it is published, will the NRCS NOI include a description of the draft agency purpose and need statement that would be subsequently used to determine which alternatives should be carried forward for detailed EIS analysis? If so, would this statement be consistent with and help advance the Biden administration's executive orders and policies relating to responding to the climate and extinction crises, and encouraging more sustainable and efficient uses of water? I look forward to your answers.
197	44	4/15/2022	Email	Public		Dave and Jolene Clark	15	Watershed Protection	*Norm Evenstad had a phone conversation with Jolene Clark regarding flood protection improvements at their property as part of the project proposal. She sent over a photo during a flood last year.* Response: I have forwarded to the Cove Reservoir-East Fork Virgin EIS Planning team to capture your concern. Per our phone conversation March 31, 2022, I am not sure our specific proposed project can do much for your particular scenario, but the team will consider your comment/concern.

CID	Doc ID	Received	Type	Group	Entity	Commenter	Commenter ID	Category	Comment
198	45	4/28/2022	Email	Public		Mike Crane	32	General	I appreciate the hard work the NRCS does every day. The agency does much to help protect America's rivers. However, in the case of the Cove Reservoir on the East Fork Virgin, based on your Environmental Impact Statement, the agency is making a grave mistake that can damage the environmental integrity of the Virgin River ecosystem. The current EIS is remiss on several important considerations and therefore I respectfully request the National Resources Conservation Service and other project partners to abandon the proposed project as described in both the previous Environmental Assessment and the EIS scoping notice by choosing the No Action Alternative. The EIS did not fully assess all downstream impacts of the project, including impacts to recreational, ecological, and other values. This should include a complete review of different annual hydrograph scenarios. Naturally varying river flows support a myriad of important ecological attributes, including sediment transport and vegetation management., On the East Fork of the Virgin River's spring peak flows provide the only possible time of year to go boating. Downstream reaches on the mainstem of the Virgin are very well-known amongst recreators and flows are dependent upon high spring streamflows in the East Fork Virgin River. The project as proposed would have severe environmental and recreational impacts, is not economically feasible, and is a misuse of taxpayer money. Thank you for considering my comments on this project.
199	46	4/19/2022	Email	Public		Doug Tally	33	General	RE: Cove Reservoir (rhetorical) What is the project lifetime expense to taxpayers v proposed water diversion uses? What are reasonable unintended consequences and their costs? I kayak and raft rivers in the Northern Rockies to Michigan and Florida and I cherish wild and free-flowing rivers. No Action Alternative is the reasonable decisiin based on prior publications. Detractors: - Environmental - Recreation use - Financial... especially in current harsh realities and uncertain future taxpayer overload.
200	47	4/19/2022	Email	Public		Daniel Cottam	34	General	Thank you for the opportunity to provide comments on the Cove Reservoir - East Fork Virgin Environmental Impact Statement. As a river enthusiast who cherishes wild and free-flowing rivers, I hope the National Resources Conservation Service and other project partners abandon the proposed project as described in both the previous Environmental Assessment and the EIS scoping notice by choosing the No Action Alternative. If the project proceeds, the NRCS needs to fully assess all downstream impacts of the project, including impacts to recreational, ecological, and other values. This should include a complete review of different annual hydrograph scenarios. Naturally varying river flows support a myriad of important ecological attributes, including sediment transport and vegetation management., On the East Fork of the Virgin River's spring peak flows provide the only possible time of year to go kayaking and rafting. Downstream reaches on the mainstem of the Virgin are very well-known amongst recreators and flows are dependent upon high spring streamflows in the East Fork Virgin River. Having personally kayaked the much of the virgins entire length it amazes me that they want to take away this opportunity from me. I have valued these runs and they are truly some of the most unique in the entire world from the narrows in the NP to the hurricane gorge and the virgin gorge. Timpoweap canyon is not to be missed. And all these runs happened without any government help. Imagine how many boaters there would be if the was an approved put in and take out and they held releases of known amounts and times in timpoweap canyon. Instead there is nothing and we are left guessing as to what is going to happen. I would certainly donate time and money for put and take out places for boaters. The project as proposed would have severe environmental and recreational impacts, is not economically feasible and is a misuse of taxpayer money. This is especially gauling as SE Utah has more water use per person than any other place in the whole country. I have a house in St George and the amount of grass they have down there in a desert is awful. At least Las Vegas pays you to pull up your turf. St George does nothing then wants to steal water without considering recreation. There is at least one commercial company with a permit on the virgin river and they can't run it because so many people are taking water out. We need viable river flows and reliable river flows. We already have two reservoirs that don't consider kayakers/rafters we don't need a third. These runs could be as famous as the Grand Canyon but we take so much water out we depend on high flow in spring as our only chance to run them.

201	48	4/20/2022	Email	Public		Sam Carter	35	General	I am writing you today about the proposed water storage project of Cove Reservoir on the East Fork of the Virgin River. My request is that you cancel this project. Why? Damning rivers in the southwest USA does not work well for the downstream river environment. I live at the Dolores Project where McPhee dammed the Dolores River. McPhee is at historic lows and there have not been adequate downstream releases as "advertised" when the storage project was proposed. And now that downstream environment is struggling. Cottonwoods are not repopulating the riparian reach. Willows are encroaching on the river bed more and more. And the native fish are in steep decline. Come for a visit. I'll take on a dry river tour. And then just southwest of here is Lake Powell and its mess of a project. There is not enough water in the SW to store in a reservoir and to sustain flows out of said reservoir. The Cove Reservoir will crush the riparian habitat of the EF Virgin River. While you may believe otherwise, you are being duped. It doesn't work. Thank you for your time.
202	49	4/27/2022	Email	Public		Stanford Pitcher	36	General	The East Fork of the Virgin is such a small river which rarely flows except for a short time in the spring. It is ridiculous to consider to put a dam on it. The water is needed downstream to give the Virgin enough water to allow floating between Springdale and the Virgin Gorge. I'm sure the fish on the river appreciate it too! The Virigin River is a magnificent part of the Zion area and Utah - please don't change its wilderness character to grow alfalpha!
203	50	4/20/2022	FR	Public		Robert Figgins	37	General	As a resident of orderville it is my opinion that the reservoir will only improve our beautiful town. This project will provide much needed recreational options for all of Kane county. The new reservoir will also benefit the agricultural community. More water better crops. For the residents of orderville mt caramel and glendale this reservoir will improve the ability to have good old fashioned family fun without breaking the bank. Please move forward on this project
204	51	4/20/2022	FR	Public		Kurt Brinkerhoff	38	General	We in Glendale (irrigation company) are in dyer need of water that could be used if/when the Cove Reservoir project is completed.
205	52	3/30/2022	FR	Public		Richard Spotts	1	General	Dear NRCS officials: Please accept, carefully review, respond to in the forthcoming DEIS, and include in the NEPA project file my following scoping comments in response to this NOI. At the outset, I live near the Virgin River in Washington County Utah. As a twenty-year Utah resident, I am continually disappointed by the unsustainable, regressive decisions and actions by most Utah officials. For example, they constantly support risky and expensive boondoggle water projects instead of much more reliable and less costly water conservation and reclamation methods. They refuse to implement already-proven-effective water conservation and reclamation measures in a county with an obscenely excessive per capita water use rate. This NRCS NOI is another example of this pattern of moving backward when we desperately need to be moving forward. Former Utah Republican legislative leader Mike Noel's controversial proposed Cove Reservoir project, actively promoted during the Trump era, unfortunately remains alive under this NOI's misrepresented Trojan horse "watershed plan" title under the Biden administration.
206	52	3/30/2022	FR	Public		Richard Spotts	1	Purpose and Need	In reviewing this NOI, it is appallingly clear that the NRCS office in Utah ignored virtually all of the previous public comments on their earlier defective and biased Cove Reservoir Environmental Assessment (EA). For example, the two action alternatives described in today's NOI are substantially similar to what was originally proposed in the EA. Both would improperly divert Virgin River water that would otherwise flow downriver to Lake Mead. Both would facilitate more water-wasting alfalfa farming during the hot summers, and likely provide for potential future water sales and transfer to expand sprawl developments in Washington County. Both ignore cheaper and more reliable watershed health measures proposed during the previous round of EA comments. In a nutshell, if approved and implemented, this project would use federal funds to facilitate further unsustainable private water use and development instead of advancing feasible and bona fide methods to actually improve watershed health during this mega drought. In addition, the NRCS continues to refuse to answer basic questions such as how or whether this proposed Virgin River diversion would comply with the Colorado River Compact (Law of the River). Lake Mead is already dangerously low, but the NRCS and other Utah promoters of this Cove Reservoir seek this harmful Virgin River diversion without regard for the added negative impacts on other Lower Colorado River Basin water users. This NOI is supposed to start a broad scoping process under the National Environmental Policy Act (NEPA) where the public may provide comments on the proper purpose and need for action, feasible alternatives to the proposed action, and resources/issues of concern. Sadly, based on the arbitrary narrowness of this NOI, NRCS appears to remain highly biased toward what Mike Noel and other development interests want. The Cove Reservoir could apparently not be built unless the Bureau of Land Management (BLM) approves needed borrow pits. So NRCS and BLM are each responsible for this NEPA compliance prior to any final decisions.

CID	Doc ID	Received	Type	Group	Entity	Commenter	Commenter ID	Category	Comment
207	52	3/30/2022	FR	Public		Richard Spotts	1	General	Given the Cove Reservoir's high level of public controversy and conflicts with the Biden administration's executive orders and professed environmental policies, it is shameful that NRCS was allowed to publish such a misleading and truncated NOI. Just like with their ridiculous proposed Lake Powell Pipeline, Utah's regressive officials continue to arrogantly ignore the two-decade-long mega drought and foolishly believe that they can create water by building more storage structures. It is tragic that NRCS officials who should know better are nevertheless willing to partner with these Utah officials. As President Biden has noted, the climate and extinction crises are real, connected, getting worse, and require bold and innovative solutions. The proposed Cove Reservoir would add to these problems and take precious funds away from implementing positive solutions. NRCS should not waste its limited resources to subsidize Utah's unsustainable insanity. For scoping purposes, I hereby wish to fully incorporate by reference as part of my scoping comments the relevant attachments provided (including my previous Cove Reservoir EA comments) and the information at the web link below. This information provides pertinent input on the DEIS purpose and need statement, a reasonable range of feasible alternatives that should be carried forward for detailed analysis, and many resources, uses, and issues that should be addressed. I may supplement my comments by the April 28th deadline.
208	52	3/30/2022	FR	Public		Richard Spotts	1	General	SEE ATTACHED COMMENTS to FR
209	53	3/30/2022	FR	Public		Robert Lacey	6	General	As a resident of Orderville, shareholder in the Orderville Irrigation Company, and member of the Orderville Town Council, I am excited to see this project moving forward. Many residents, and particularly farmers and ranchers in our area, have been anticipating the construction of this reservoir for many years. It will be a major benefit to our small community as water availability is stabilized throughout the summer. With climate change affecting our weather patterns, storage capacity like this is invaluable for an agricultural community like ours. Additionally, the increased recreational opportunities will benefit residents directly, along with the potential growth in tourism. The improvement in clean hydropower capacity will also be welcome. In my view, this project is a win for all involved. The reservoir is off-river, using a diversion and pipeline that is already in place, so the impact to the river ecosystem should be minimal. Having increased river flow later in the summer should return the river to a more historic state, since water that is currently diverted may not need to be to the same extent. I recognize that there are others who don't share these same views, including a few who live downstream from the proposed Cove location. I anticipate that the floodplain permit will account for any of their concerns as it moves forward. I, for one, have spent a fair amount of time exploring and utilizing the area that will be inundated. While it is a quiet area with some dirt roads and brush, there is nothing particularly interesting there, and I feel that the benefits of the water storage project outweigh the loss of the area for ground-level recreation. I look forward to seeing the EIS move forward and for the project to advance into construction and completion.
210	54	4/4/2022	FR	Public		Anonymous	N/A	General	I recommend this project be ended. The area is desert and we are in a mega drought. There is no water resources available for development and we must stop and begin reversing growth in the counties. The only good option is to live within our means and retreat if necessary. We must downsize our families and consumption.
211	55	4/10/2022	FR	Public		Carolyn Borg	39	General	As a long-time Utah and Washington County resident, I vigorously oppose this misleadingly titled "watershed plan" because it is a ridiculous contrivance for the controversial proposed Cove Reservoir. NRCS did a previous Environmental Assessment (EA) for the Cove Reservoir that was clearly biased and defective. Strong public comments and questions were submitted to NRCS in response to this EA. To the best of my knowledge, NRCS has never responded to these comments nor answered these questions. Instead, NRCS has simply fraudulently re-packaged this proposed reservoir as a watershed plan. Diverting Virgin River water for wasteful summer alfalfa growing and for speculative future sales to developers are not legitimate watershed plan purposes. This is a shameful attempt to fool the public and to cloak a boondoggle as a plan. Mike Noel and the other Cove Reservoir proponents tend to hate the federal government except when they can obtain public federal subsidies to increase their private profits. It is like they figuratively slap Uncle Sam in the face with one hand while trying to steal his wallet with the other hand. I am appalled that something as unnecessary and wasteful as the proposed Cove Reservoir would even be allowed to proceed under the Biden administration. There are much more important and legitimate projects that should be the focus for using limited federal funds and staff. We are in the midst of the worst drought in apparently 1,200 years and Lakes Mead and Powell are already dangerously low. The Colorado River Compact states are struggling to develop an updated drought contingency plan and painful reductions in water deliveries are already occurring. In this context, diverting Virgin River water into the Cove Reservoir would exacerbate these worsening problems and reduce the flows into Lake Mead. The water in Lake Mead is far more valuable for existing human uses, whereas the Cove Reservoir water would be largely wasted for summer alfalfa irrigation and to stimulate further sprawl developments. There may be a need for some legitimate watershed health projects in this area to slow erosive runoff, reduce soil loss, increase soil water infiltration, recharge depleted groundwater aquifers, and restore degraded riparian habitats. These are the types of projects that should constitute a reasonable range of feasible alternatives for objective analysis in a Draft Environmental Impact Statement (DEIS). Unfortunately, NRCS is clearly not interested in pursuing these types of bona fide watershed projects in the public interest, nor fairly considering alternatives to the Cove Reservoir. NRCS is merely going through the NEPA motions with this required scoping process.
212	56	4/13/2022	FR	Public		Edward Bolander	40	General	Given the difficulties of maintaining sufficient water in the area, this project should proceed ASAP

CID	Doc ID	Received	Type	Group	Entity	Commenter	Commenter ID	Category	Comment
213	57	4/20/2022	FR	Public		Chris Gorzalski	41	General	Please accept my comments on the proposed Cove-East Fork Virgin River Watershed Plan NRCS-2022-0002. I am a resident of St George, Utah and have been a frequent recreational user of the Parunuweap Canyon WSA and the Zion National Park Wilderness area including the East Fork of the Virgin River. I am concerned that the development of the proposed reservoir will effect the flow of the East Fork Virgin River to the extent that irreparable damage will occur to the Wilderness characteristics of the WSA and Wilderness Area. I am aware that seeps do feed into the river but the initial water flow will be reduced during the summer months when we have already been seeing low flows occurring due to the drought. Has a full study of the effect this flow reduction will have on the species in the canyon? Parunuweap canyon is a wild and beautiful area which has not been overrun due to its relative inaccessibility. Petroglyphs show that this area has been important to mankind for a long time. It is an area worth saving.
214	58	4/20/2022	FR	Public		M. Honer-Orton	42	General	At a time when we are in Extraordinary drought, this proposal ignores all cautionary concepts with regard to conserving water and instead creates an additional reservoir to store water for growing alfalfa, a water intensive crop. Utah officials arrogantly ignore the two-decade-long mega drought and foolishly believe that they can create water by building more storage structures. In addition there do not seem to be any specifics as to who or what will determine when and how much water will be released to downstream water users including water that should rightfully be going to Lake Mead. Also, the ultimate plan for this water seems to be a residential development and not agricultural/recreational uses. We oppose this water grab project that can only reduce supply to down river users and right-holders.
215	59	4/20/2022	FR	Public		John Horel	43	General	As an Orderville home owner, there seems to be little justifiable need for this project to have moved to the point of requiring an EIS. Having participated in the earliler EA, there seemed to be little recognition of the limited value of this project and overstatements of its benefits. I hope Option #1 becomes the preferred outcome.
216	60	4/20/2022	FR	Public		Merlin Esplin	44	General	Thank you for receiving comments on the proposed Cove Reservoir. I am a resident of Orderville and own property near the proposed reservoir site. I am not excited about some aspects of having a reservoir adjacent to my property, but I understand the great benefits that such a project would create for Orderville, and Kane County. First - there is a diversion already in place and a pipeline already delivers East Fork Virgin River water to the reservoir site. Farm land is currently irrigated right to the proposed reservoir site. This will not entail a new diversion. Water will be stored beyond currently irrigated property on dry range land. Second - the reservoir would allow water users in this part of Kane County to better use the water they have rights to buy providing storage and releasing water during times when the river does not provide the full right granted. A reservoir would also allow farmers to choose to cultivate various types of crops. Most farms now grow alfalfa as feed for livestock. Alfalfa is deep rooted and produces well when it receives enough water, but has the ability to go dormant when the soil dries out. It can then green up again when water is available. This makes alfalfa a great crop that does not have to be replanted after every dry spell. Water storage in a reservoir would allow farmers to grow other types of crops, including vegetables, because there would be a more reliable expectation of water delivery at more dependable intervals. Also, greater production of alfalfa and forage could be expected with water storage on the system. Third - a reservoir would bring business opportunities, especially in the form of recreation, to our area. Fourth - Washington County's involvement in the Cove Reservoir makes sense because they could store water at higher elevations and reduce evaporation. Whether they used the water for culinary or irrigation - it could help meet their water needs. This is not an attempt to capture a complete list of opportunities and benefits, but a quick glimpse showing there is good reason to proceed.
217	61	4/21/2022	FR	Public		Tina Esplin	45	General	Because of the continuing drought, we are learning and seeing the importance of storage reservoirs to secure water and water rights for the residents of southern Utah. This reservoir is critical for water storage, farming, recreation, the local economies and the beauty and overall enhancement of this area, and Action 1 Alternative is the only alternative that provides for all of these important matters, and the building of the reservoir should proceed as soon as possible. Thank you.
218	62	4/23/2022	FR	Public		Shauna Archer	46	Climate Change	We live in an arid state and adding a reservoir does not seem to be an appropriate action to counteract water demands. There are so many other alternatives to pursue that are more sustainable including types of crops being planted, how water is used including watering times, and how to best manage water without creating reservoirs which cause damage to ecosystems and of which much of the water is evaporated in our arid climate. In a day and age in which we are beginning to understand how important it is to humans to have intact ecosystems and sustainable practices this solution does not seem to be viable long term. Other options have been proposed and a formal in-depth study has been suggested. Bottom line we have too many people living in an arid climate and making demands on the land that are not appropriate for this climate and ecosystem. Solutions should be long term and sustainable. If not for this generation we owe it to be considered for future generations. Please consider the following steps that were submitted by Utah Water Conservation Organizations. 1. Study existing megadrought conditions and the current modeling for the future of water supplies in the region driven by climate change and determine if this project is sustainable.
219	62	4/23/2022	FR	Public		Shauna Archer	46	Economics	2. Suggest that federal agricultural funding might best be used to help farmers in Kane and Washington counties transition to climate and sustainable smart agriculture. There are a variety of new agricultural technologies including remote sensing technology that can result in using less water and increasing yield. These are practices that are beginning to be used world-wide. A cost-effective study should be completed comparing the cost of arming farmers with new technologies vs. the cost and environmental impact of constructing and maintaining the Cove Reservoir.
220	62	4/23/2022	FR	Public		Shauna Archer	46	Water Resources	3. Analyze the direct, indirect, and cumulative impacts of eliminating high flows on both the East Fork and the Main Virgin as it relates to the hydrologic connection of both ground and surface water. Changing river flow levels forever could hinder how the aquifer is recharged along with permanently decreasing the flow of surface water downstream of the project area.

CID	Doc ID	Received	Type	Group	Entity	Commenter	Commenter ID	Category	Comment
221	62	4/23/2022	FR	Public		Shauna Archer	46	Sensitive Species	4. Study the history of what caused the endangered fish in the Virgin to become imperiled in the first place and evaluate how further reducing perennial flows will further complicate the effort to save these species. Changing the historical flows are likely to have an impact as well on the entire riparian zone along the river. This must be carefully evaluated.
222	62	4/23/2022	FR	Public		Shauna Archer	46	Water Resources	5. Complete an analysis of ecosystem health of the Virgin River watershed with attention to how using more fertilizer for agriculture affects downstream water quality.
223	62	4/23/2022	FR	Public		Shauna Archer	46	Water Resources	6. Complete an analysis of the complete Virgin River watershed and how water supplies and quality may be affected in Arizona and Nevada as the Virgin River watershed is technically in the Lower Basin drainage.
224	62	4/23/2022	FR	Public		Shauna Archer	46	Water Resources	7. Analyze and evaluate the water rights that the irrigation companies are using to build the project. Current records show these water rights are being protested by other water users.
225	62	4/23/2022	FR	Public		Shauna Archer	46	Economics	8. Calculate the cost/benefit ratios for the 100-year life of the project.
226	63	4/25/2022	FR	Public		Arthur Haines	47	Climate Change	I have two comments on the scope of the EIS for the Cove-East Fork Virgin Riven Watershed Plan. First the, impact on this fragile water shed of the current mega drought and the impact of climate change must be assessed. This assess must be thorough and objective.
227	63	4/25/2022	FR	Public		Arthur Haines	47	Purpose and Need	Secondly, the project is built on the assumption that Kane and Washington County farmers need additional water to support their (alfalfa) fields. This assumption must fully evaluated. The assessment must determine the beneficial impact of new water saving project. Moreover, in Washington count these fields are likely to transition to residential develpment early in the life cycle of the Cover Reservoir. This implications of this highly probable future on the rationale for the Cover Reservoir must be evaluated.
228	64	4/26/2022	FR	Public		Ingrid Akerblom	48	Purpose and Need	I am providing this comment in opposition to the proposed Cove-East Fork Virgin River Watershed Plan Project. I have provided a comment on this project during the EA phase. I appreciate that a full environmental analysis will be performed before proceeding with this project. My concerns remain relevant. From the NOI: “ The primary purpose for watershed planning…is to increase and maintain a reliable supply of water for local agricultural use….agricultural users routinely experience water shortages in the late summer months…” This project is a government hand-out to specifically benefit the alfalfa farmers in the local area who are refusing to face up to climate change and the increasing drought conditions that will spell the end of their businesses in the coming years. This reality is harsh and I understand that no one wants to give up on their history and their livelihood. However, building a new reservoir for water that likely will not be there in even the near-term future is irresponsible and a waste of taxpayer money. It is pertinent to note here almost all of UTAH and particularly Southern Utah is in exceptional drought status currently with no relief in sight. The drought emergency has now become even more extreme since the conception of the project in 2020 or earlier – the megadrought we are facing now is unprecedented and there is no relief in sight. •The EIS must include studying existing megadrought conditions and the current modeling for the future of water supplies in this region due to climate change. Whether or not this project is sustainable in light of what will be considerable expense must be determined In addition, the initial projections showed the net economic cost/ benefit in the best of circumstance was barely above break even annually with nearly all the benefit going to a select few farmers through increased agricultural production. It was not clear if the cost/ benefit included the investment needed to do the project or just operating expenses. As for the ongoing operating expenses, I was not able to determine who would be paying for those; I am assuming not the primary beneficiaries. As a Utah and federal taxpayer, I see no justification for using my money to support this project in order to subsidize this small group.
229	64	4/26/2022	FR	Public		Ingrid Akerblom	48	Alternatives	•The EIS under the NO ACTION Alternative must include reviewing the impact on water use of adopting new agricultural technologies such as remote sensing technologies that can reduce water use and increase yield. A cost benefit study should be included that compares the use of the newer agriculture sustainable and water-saving technologies with that of the total cost of this project including operating expense. •The EIS under the NO ACTION alternative must consider buy out costs for farmers and developing alternative revenue sources vs moving forward with this project. NO matter what is done it is likely that there won’t be enough water to sustain agriculture and hydroelectric power generation due to the increasing desertification of Southwest UTAH.
230	64	4/26/2022	FR	Public		Ingrid Akerblom	48	Sensitive Species	As an avid hiker and outdoor enthusiast, I have great concern on the impact of this diversion to ecological habitats downstream both within and outside Zion National Park. The park belongs to all Americans and the health of its extended ecosystem should not be endangered for the benefit of a very few. The NRCS should leave the existing river and the wildlife and human recreation downstream intact by maintaining the natural flow of the river. It is critical that the Wild and Scenic values of the Virgin River and Zion National Park designations remain intact. •The EIS must include analyses of how the diversions from the East Fork of the Virgin River will affect the downstream ecosystem directly, indirectly, or cumulatively by eliminating high flows on both the East Fork and the Main Virgin. How will the changing river flows affect recharging the aquifer in the watershed? How will further reducing perennial flows complicate the efforts to save endangered species that are already struggling for low water due to drought?

CID	Doc ID	Received	Type	Group	Entity	Commenter	Commenter ID	Category	Comment
231	64	4/26/2022	FR	Public		Ingrid Akerblom	48	Water Resources	•The EIS must also include an analysis of the complete Virgin River Watershed and how water supplies and quality may be affected in Arizona and Nevada as the Virgin River Basin is in the Lower Basin drainage. The EIS must address water rights for the watershed - what are the rights of the irrigation companies involved in this project? Finally, having driven Route 89 many times to view the scenic beauty there, I would be heartbroken to see this wild river become yet another casualty of a short-sighted effort to retain a way of life that has no future – the folly of continuing to grow crops not suited for the desert environment.
232	65	4/27/2022	FR	Public		Stephanie Kilcher	49	Climate Change	1. Study existing megadrought conditions and the current modeling for the future of water supplies in the region driven by climate change and determine if this project is sustainable.
233	65	4/27/2022	FR	Public		Stephanie Kilcher	49	Economics	2. Suggest that federal agricultural funding might best be used to help farmers in Kane and Washington counties transition to climate and sustainable smart agriculture. There are a variety of new agricultural technologies including remote sensing technology that can result in using less water and increasing yield. These are practices that are beginning to be used world-wide. A cost-effective study should be completed comparing the cost of arming farmers with new technologies vs. the cost and environmental impact of constructing and maintaining the Cove Reservoir.
234	65	4/27/2022	FR	Public		Stephanie Kilcher	49	Water Resources	3. Analyze the direct, indirect, and cumulative impacts of eliminating high flows on both the East Fork and the Main Virgin as it relates to the hydrologic connection of both ground and surface water. Changing river flow levels forever could hinder how the aquifer is recharged along with permanently decreasing the flow of surface water downstream of the project area.
235	65	4/27/2022	FR	Public		Stephanie Kilcher	49	Sensitive Species	4. Study the history of what caused the endangered fish in the Virgin to become imperiled in the first place and evaluate how further reducing perennial flows will further complicate the effort to save these species. Changing the historical flows are likely to have an impact as well on the entire riparian zone along the river. This must be carefully evaluated.
236	65	4/27/2022	FR	Public		Stephanie Kilcher	49	Water Resources	5. Complete an analysis of ecosystem health of the Virgin River watershed with attention to how using more fertilizer for agriculture affects downstream water quality.
237	65	4/27/2022	FR	Public		Stephanie Kilcher	49	Water Resources	6. Complete an analysis of the complete Virgin River watershed and how water supplies and quality may be affected in Arizona and Nevada as the Virgin River watershed is technically in the Lower Basin drainage.
238	65	4/27/2022	FR	Public		Stephanie Kilcher	49	Water Resources	7. Analyze and evaluate the water rights that the irrigation companies are using to build the project. Current records show these water rights are being protested by other water users.
239	65	4/27/2022	FR	Public		Stephanie Kilcher	49	Economics	8. Calculate the cost/benefit ratios for the 100-year life of the project.
240	66	4/27/2022	FR	Public		McKay Williams	50	General	The virgin river is one of our last untouched natural recourses here in Utah and we need to protect it as such. Please consider the recreational and environmental opportunities we will loose out on forever if we do not consider protecting this waterway for generations to come.
241	67	4/28/2022	FR	Public		Christian Felger	51	Wild and Scenic Rivers	Much of the E. Fork of the Virgin River is protected wilderness study area. This change could heavily impact the ecosystem in this area.
242	68	4/28/2022	FR	Public		Helene Jorgensen	2	Water Resources	Please accept and include in the relevant public record my scoping comments on the Cove-East Fork Virgin River Watershed Plan, Kane County, Utah in preparation of the Draft Environmental Impact Statement (DEIS). I am a Kane County UT resident. I deeply care about reliable water supply and the future management of our water resources. I strongly believe that water resources should be managed in the long-term public interest. I am concerned that there is insufficient water, both water rights and wet water, to fill and operate a reservoir at the East Fork Virgin River in Kane County. The U.S. Bureau of Reclamation needs to analyze and evaluate the water rights used for this project. The Bureau of Reclamation also needs to study and develop projections for future precipitation and water flows in the East Fork Virgin River.
243	68	4/28/2022	FR	Public		Helene Jorgensen	2	Purpose and Need	The Notice of Intent (NOI) for the project, published on 3/29/2022, provided limited information about the project itself, the location of the reservoir, the beneficiaries, and potential environmental impacts. This makes it challenging to provide specific public scoping comments. The fact that the public information meeting was held in October 2021, almost 6 months before the NOI was published, also has contributed to the scarcity of information provided to the public. The NOI states that the primary purpose of the project is “to increase and maintain a reliable supply of water for local agricultural use and existing storage needs, increase water conservation, and improve water delivery efficiency in the Upper Virgin Watershed in Kane County, Utah, and for existing and future water demands in Washington County, Utah.” Due to rapid development in Kane County and Washington County, alfalfa fields and other agricultural activities are disappearing. It is not clear which future agricultural uses the U.S. Bureau of Reclamation envisions that Cove reservoir would benefit.
244	68	4/28/2022	FR	Public		Helene Jorgensen	2	Economics	The NOI states that “the project proposes a new Glendale [power generating] facility and would make water available during the summer months at the Orderville site that could help meet energy needs.” The Glendale facility was not mentioned in the scoping notice published in October 2021 or at the public meeting in October 2021. This component of the project needs to described and cost estimates for building the power plant should be included in the DEIS.

CID	Doc ID	Received	Type	Group	Entity	Commenter	Commenter ID	Category	Comment
245	69	4/28/2022	FR	Public		Carolyn Borg	39	Wild and Scenic Rivers	As a Washington County Utah resident, I concur with the scoping comments submitted by Conserve Southwest Utah. The East Fork of the Virgin River is a small stream of critical significance. The proposed Cove Reservoir would permanently change the river's natural flow and disrupt this already fragile riparian ecosystem. In the face of rapid climate change, in megadrought conditions, the project would cause and greatly exacerbate changes in the timing, amount, and natural flow of the river that would negatively impact the plants, fish, wildlife, and interconnected ecosystems they depend on to survive. The East Fork of the Virgin River is designated as Wild under the Wild and Scenic Rivers Act, where it flows through Zion National Park. The project will likely alter water flows in this area, and changes in flow rates will likely affect the wild qualities of the river. The change in the natural flow patterns in the summer may also negatively impact the famous slot canyons of the Bureau of Land Management's Parunuweap Canyon Wilderness Area (WSA) of 30,800 acres. The WSA boundary is near the project area along the East Fork and downstream of the gravel pits needed to build the 90-foot-high earthen dam. The East Fork runs through the proposed wilderness area—an area that should remain wild. There are many important issues, resources, and concerns that should be fully analyzed in the NRCS DEIS, including the following:
246	69	4/28/2022	FR	Public		Carolyn Borg	39	Climate Change	1. Study existing megadrought conditions and the current modeling for the future of water supplies in the region driven by climate change and determine if this project is sustainable.
247	69	4/28/2022	FR	Public		Carolyn Borg	39	Water Resources	2. Federal agricultural funding might best be used to help farmers in Kane and Washington counties transition to climate and sustainable smart agriculture. There are a variety of new agricultural technologies including remote sensing technology that can result in using less water and increasing yield. These are practices that are beginning to be used world-wide. A cost-effective study should be completed comparing the cost of arming farmers with new technologies vs. the cost and environmental impact of constructing and maintaining the Cove Reservoir.
248	69	4/28/2022	FR	Public		Carolyn Borg	39	Economics	3. Analyze the direct, indirect, and cumulative impacts of eliminating high flows on both the East Fork and the Main Virgin as it relates to the hydrologic connection of both ground and surface water. Changing river flow levels forever could hinder how the aquifer is recharged along with permanently decreasing the flow of surface water downstream of the project area.
249	69	4/28/2022	FR	Public		Carolyn Borg	39	Sensitive Species	4. Study the history of what caused the endangered fish in the Virgin to become imperiled in the first place and evaluate how further reducing perennial flows will further complicate the effort to save these species. Changing the historical flows are likely to have an impact as well on the entire riparian zone along the river. This must be carefully evaluated.
250	69	4/28/2022	FR	Public		Carolyn Borg	39	Water Resources	5. Complete an analysis of ecosystem health of the Virgin River watershed with attention to how using more fertilizer for agriculture affects downstream water quality.
251	69	4/28/2022	FR	Public		Carolyn Borg	39	Water Resources	6. Complete an analysis of the complete Virgin River watershed and how water supplies and quality may be affected in Arizona and Nevada as the Virgin River watershed is technically in the Lower Basin drainage. Determine how this proposed diversion of Virgin River water may affect compliance with the Colorado River Compact (Law of the River) and future water availability for the Lower Basin Compact states.
252	69	4/28/2022	FR	Public		Carolyn Borg	39	Water Resources	7. Analyze and evaluate the water rights that the irrigation companies are using to build the project. Current records show these water rights are being protested by other water users.
253	69	4/28/2022	FR	Public		Carolyn Borg	39	Economics	8. Calculate the cost/benefit ratios for the 100-year life of the project. Analyze whether other watershed health and storm water retention projects would provide cheaper and more reliable benefits than the proposed Cove Reservoir.
254	69	4/28/2022	FR	Public		Carolyn Borg	39	Economics	9. Confirm whether this proposed watershed project would ultimately lead to water transfers to benefit additional sprawl developments.
255	70	4/29/2022	FR	Public		Kyle Roerink	52	NEPA Process	RE: COVE RESERVOIR SCOPING COMMENTS, NRCS-2022-0002 The Great Basin Water Network, the Center for Biological Diversity, and Living Rivers submit scoping comments on the Natural Resource Conservation Service (NRCS) proposal on Cove-East Fork Virgin River Watershed, Docket No. NRCS-2022-0002. COUNCIL ON ENVIRONMENTAL QUALITY (CEQ) REGULATIONS NRCS must specify under what authority it will be issuing the EIS as it relates to the National Environmental Policy Act guidance from CEQ. At the least, we believe that the project must be reviewed in accordance with the Council on Environmental Quality's proposed rule via docket CEQ-2021-0002. It would not be a hardship to put forth an EIS under this CEQ guidance, considering that this "Phase 1" approach from CEQ had been in effect since 1978 prior to the Trump Administration. If NRCS is not issuing this NEPA under the 1978 standard, we would need a significant explanation. On the scoping call, NRCS said that it would "follow what is current, which is basically the reinstated." Therefore, we believe that what officials during scoping actually meant were that NRCS will follow CEQ guidance and requirements as outlined in CEQ-2021-0002. But due to the uncertainty, we would like to confirm.
256	70	4/29/2022	FR	Public		Kyle Roerink	52	General	VALIDITY OF CONDUIT PERMIT NRCS must detail the additional permits and applications that the project proponent will need in order to generate power. In the public scoping meeting presentation in October 2021, Mike Noell mentioned that no permit would be required from FERC. He also mentioned one or two other necessary permits for electricity generation and exemptions from FERC. The public needs a complete listing of all applications/exemptions related to the project.
257	70	4/29/2022	FR	Public		Kyle Roerink	52	Air Quality	METHANE: NRCS must provide a detailed analysis for how it will account for methane emissions from the reservoir.

CID	Doc ID	Received	Type	Group	Entity	Commenter	Commenter ID	Category	Comment
258	70	4/29/2022	FR	Public		Kyle Roerink	52	Water Resources	WATER RIGHTS, DELIVERY AND CAPTURE • The applicant must demonstrate how the project will affect groundwater and surface water rights in the East Fork of the Virgin River and the associated hydrographic areas upstream and downstream. • The applicant must analyze how this project will affect flows on the main stem of the Virgin River and the Colorado River. • The applicant must provide legal justification for how this project complies with the Drought Contingency Plan, the 2007 Interim Guidelines for Lower Basin Shortages and Coordinated Operations for Lake Mead, and other reservoir management practices on the Colorado River. • NRCS must list the associated water rights numbers as issued by the Utah Division of Water Rights associated with the project. • NRCS must outline delivery schedules. • NRCS must outline what happens if water rights owners file for change applications that would change the place of use of the water rights associated with this proposal.
259	70	4/29/2022	FR	Public		Kyle Roerink	52	Legal	PROJECT FUNDING If the preceding Environmental Assessment for the Cove Reservoir project is any indicator, this is a municipal effort masquerading as an agricultural project. Taxpayer dollars from the Watershed Protection and Flood Prevention Act, PL 83-566, are slated to fund this effort. The mandate associated with those funds require that the project be predominantly for agriculture. In 2020, the signatories of this letter and other NGOs expressed concerns about the funding source during the project's previous NEPA review.1 During the pre-scoping comments for this iteration of Cove Reservoir, the project proponent and federal officials did not provide any meaningful details about the legal justification for the project while knowing that the intent is for urban development. The EIS must include solicitor analysis relating to the legality of the project. Mike Noell described the project as being almost "100 percent" for agricultural water in the pre-scoping meeting on October 20, 2021. NRCS must list what would happen if water were used for non-ag uses.
260	70	4/29/2022	FR	Public		Kyle Roerink	52	Sensitive Species	ENDANGERED SPECIES The Virgin River, its forks, and its tributaries are important ecosystems that have been highly altered by human activities, resulting in a loss of native biodiversity. Two species of fish in the Virgin River are listed as endangered under the Endangered Species Act: the Virgin River chub (Gila robusta seminuda) and the woundfin (Plagopterus argentissimus). There is a third fish, the Virgin River spinedace (Lepidomeda mollispinis mollispinis) which was petitioned for listing in 2012 and was found not warranted for listing by the US Fish and Wildlife Service in 2021. These species are perilously close to extinction, and one of the main drivers of their endangered status is the precarious nature of the water supply in the Virgin River. [E]ndangered species," such as the Virgin River chub and the woundfin, are "any species which is in danger of extinction throughout all or a significant portion of its range."2 The Endangered Species Act ("the Act") prohibits the "take" of listed species.3 Section 9 of the ESA prohibits all "persons" from "taking" any endangered fish or wildlife species.4 "Take" encompasses a broad spectrum of conduct; it is defined as "to harass, harm, pursue, hunt, shoot, wound, kill, trap, capture, or collect, or to attempt to engage in any such conduct."5 "Harm" has further been defined in regulation to mean "an act which actually kills or injures wildlife [including] significant habitat modification or degradation where it actually kills or injures wildlife by significantly impairing essential behavioral patterns, including breeding, feeding, or sheltering."6 The term "person," is broadly defined to include: [A]n individual, corporation, partnership, trust, association, or any other private entity; or any officer, employee, agent, department, or instrumentality of the Federal Government, of any State, municipality, or political subdivision of a State, or of any foreign government; any State, municipality, or political subdivision of a State; or any entity subject to the jurisdiction of the United States.7
261	70	4/29/2022	FR	Public		Kyle Roerink	52	Sensitive Species	Courts have repeatedly held that government regulations authorizing third parties to engage in harmful actions can constitute an illegal taking under Section 9 of the ESA.8 Courts have found that habitat modification conducted or carried out by a State agency, which injures or kills listed species, may amount to an unlawful taking.9 And at least one court has expressly held that State water rights do not prevail over the restrictions on habitat codification set forth in the ESA.10 This holding, combined with the "proximate cause" view of causation expressed in cases such as Cascadia Wildlands v. Kitzhaber, 911 F. Supp. 2d 1075 (D. Or. 2012), and Strahan v. Coxe, 127 F.3d 155 (1st Cir. 1997), indicates that States may incur liability under the ESA based on the issuance of water rights. An entity, such as NRCS, permitting the damming of surface water resources to the point where habitat for a listed species is degraded (i.e. permitting pumping which affects flows in the Virgin River) would be responsible for an unlawful taking under Section 9 of the Act, and vulnerable to litigation by the US Fish and Wildlife Service, or private parties, seeking to enforce the Act. Additionally, permitting a dam sufficient to diminish Virgin River flows poses a new, previously unanticipated risk of extinction to the Virgin River spinedace, and as such may precipitate a new listing petition for the fish. The US Fish and Wildlife Service would then be required to reexamine their assessment that listing for the spinedace was not warranted, and should NRCS permit these water rights applications, it may trigger a new Endangered Species Act listing.
262	70	4/29/2022	FR	Public		Kyle Roerink	52	Health and Safety	WE'RE NOT PLANNING FOR A DAM FAILURE Mike Noell said multiple times that his agency is "not planning" for a dam failure. Depending on the context of his words, that statement could be of great concern to downstream residents.
263	70	4/29/2022	FR	Public		Kyle Roerink	52	Alternatives	ALTERNATIVES Considering the well known intent of this project, federal officials and the project applicant must develop proposed alternatives that include municipal conservation independent of damming and diverting new sources.

CID	Doc ID	Received	Type	Group	Entity	Commenter	Commenter ID	Category	Comment
264	71	4/29/2022	FR	Public		John Hiscock	53	General	I hereby re-submit my previous comments (December 30, 2020) on the Cove Reservoir Environmental Assessment for consideration during the current EIS scoping. My previous comments should be considered and addressed as the EIS is developed. Thank you for your consideration. The following comments are submitted in regard to the Draft Watershed Plan and Environmental Assessment for the Proposed Cove Reservoir Project – Kane County, Utah (EA). My basis for submitting comments is as follows: - I am a United States citizen and taxpayer, and this project is proposed to be funded primarily by federal funds. - I am a resident and property owner of Kane County, Utah, subject to taxes and fees paid to the Kane County Water Conservancy District (KCWCD) – the primary sponsor of this project. - I am an avid and regular user of federal public lands that will arguably be affected by this project, such as Bureau of Land Management lands in the Kanab Field Office Area, and Zion National Park.
265	71	4/29/2022	FR	Public		John Hiscock	53	Legal	Legal Basis for Federal – Natural Resource Conservation Service – Project Funding The EA states that the total project cost is estimated at $29,982,000.00 and that $21,426,000.00 will be federally funded from Natural Resource Conservation Service (NRCS), PL 83-566, allocations. See EA, §6.9, p. 79. PL 83-566, 16 USC §1001, et. seq., authorizes the Department of Agriculture (DOA) and NRCS to: *cooperate with States and their political subdivisions, soil or water conservation districts, flood prevention or control districts, and other local public agencies for the purpose of preventing such damages, of furthering the conservation, development, utilization, and disposal of water, and the conservation and utilization of land and thereby of preserving, protecting, and improving the Nation's land and water resources and the quality of the environment.* 16 USC §1001. The law continues to state: *In order to assist local organizations in preparing and carrying out plans for works of improvement, the Secretary [of DOA] is authorized . . .to enter into agreements with landowners, operators, and occupiers, individually or collectively, based on conservation plans of such landowners, operators, and occupiers which are developed in cooperation with and approved by the soil and water conservation district in which the land described in the agreement is situated, to be carried out on such land during a period of not to exceed ten years . . .* and that, *In return for such agreements by landowners, operators, and occupiers the Secretary shall agree to share the costs of carrying out those practices and measures set forth in the agreement for which he determines that cost sharing is appropriate and in the public interest. The portion of such costs, including labor, to be shared shall be that part which the Secretary determines is appropriate and in the public interest for the carrying out of the practices and measures set forth in the agreement, except that the Federal assistance shall not exceed the rate of assistance for similar practices and measures under existing national programs.* 16 USC §1003(a). Certain limitations on the DOA's cost sharing apply, including most pertinent, a limitation on funding applicability based on the size of the watershed within which the project is located. The statute states "works of improvement" that may be funded only include those "in watershed or subwatershed area not exceeding two hundred and fifty thousand acres . . .." 16 USC §1002.
266	71	4/29/2022	FR	Public		John Hiscock	53	Legal	The watershed relevant to this project is the watershed of the East Fork Virgin River. The EA states that the size of said watershed is 152.2 square miles, equivalent to 97,408 acres. EA, §S-6.0, p. S-3. However, at least one other federal agency is on record as measuring the watershed acreage as substantially larger. The National Park Service has recorded the East Fork Virgin River watershed at 1,051.2 square kilometers, or 405.87 square miles, equivalent to 259,757.177 acres. See https://www.researchgate.net/figure/1-Watershed-area-East-Fork-Virgin-River_fig1_283516483 , from Riparian Monitoring of Wadeable Streams, East Fork Virgin River, Zion National Park, Summary Report, 2008–2012, Northern Colorado Plateau Inventory and Monitoring Network, NPS (September 2015). This acreage exceeds the maximum which the NRCS, the DOA, and the federal government are authorized to provide project funds for pursuant to 16 USC §1002. This discrepancy in federally measured watershed size, and allowable federal, DOA/NRCS funding, must be explained. If the watershed is in excess of the statutorily mandated watershed acreage limitation, the project cannot be funded by DOA and NRCS.

CID	Doc ID	Received	Type	Group	Entity	Commenter	Commenter ID	Category	Comment
267	71	4/29/2022	FR	Public		John Hiscock	53	Effects Analysis	The EA Analysis of Potential Impacts to Downstream Watershed Values and Resources of Public Lands, Zion National Park, and the East Fork Virgin River Wild and Scenic River Is Inadequate The Cove Reservoir project is upstream of Zion National Park, and the East Fork Virgin River Wild and Scenic River on NPS lands, and Bureau of Land Management, Kanab Field Office area public lands, including specifically, the Parunuweap Wilderness Study Area. The analysis of potential impacts of the proposed project on these public lands, resources, and values, and congressionally designated protected lands is woefully inadequate. Although the EA touches on the Zion National Park Water Rights Settlement Agreement entered into by the NPS, the State of Utah, the KCWCD, and others, the NRCS fails to recognize that this agreement is not comprehensive in assuring the federally mandated protection of NPS resources and values. While the agreement does assure quantifiable flows to and through the Park, it does not override federally mandated protection of park resources and values which may be affected by other considerations than water rights quantities. Most importantly, and as readily asserted by the project proponents, the construction and operation of Cove Reservoir will purposely alter seasonal and high and low flows of the East Fork of the Virgin River. Many natural resources and values of Zion National Park are dependent upon continuation of varying seasonal and high and low flows of the river. These include geologic riverine deposition and erosion processes, maintenance of aquatic and riparian flora and fauna of all types and adjacent plant and wildlife species, unacceptable establishment and spread of exotic species, etc. Many examples of protected park resources and values should be considered. One example, and only an example, that comes to mind is the continued establishment and maintenance of cottonwood seedlings and trees along the river corridor. Will the natural processes that contribute to the protection of this natural species be assured with further alteration of seasonal and high and low flows of the East Fork as envisioned by the Cove Reservoir project? A multitude of these kind of consequences must be thoroughly analyzed and assessed in a truly comprehensive EA, or arguably a complete EIS given the potential impact of the project on Zion National Park.
268	71	4/29/2022	FR	Public		John Hiscock	53	Wild and Scenic Rivers	The EA contains little or no reference to, or consideration of, the guidance of important NPS documents related to general and specific park purposes, resources, values, plans, and research. Examples of such guiding documents include: Foundation Document – Zion National Park – Utah, National Park Service / U.S. Department of the Interior (October, 2013). This planning document sets forth the significance of the park and its fundamental resources and values. The document explains that park "Significance statements express why a park's resources and values are important enough to merit designation as a unit of the national park system. These statements are linked to the purpose of Zion National Park, and are supported by data, research, and consensus." (p.5). The Foundation Document includes the following park significance statements: Geologic processes continue today as the free-flowing Virgin River rapidly cuts into the margin of the Colorado Plateau, incising a multitude of deep, narrow canyons. An abundance of canyon springs, fed by groundwater, create hanging gardens and grottos that support endemic varieties of flora and fauna. These exceptional features and processes contribute to the outstanding scenery and scientific value of the park. (p.5, emphasis added) Utah's first designated wild and scenic rivers flow through the park carving a colorful labyrinth of canyons across layers of time. These rivers, fed by natural undiminished spring flows from the Navajo sandstone aquifers and sculpted by unimpeded torrents of flood waters, have an ecological value that far exceeds their spatial extent in the park. (p.5, emphasis added).
269	71	4/29/2022	FR	Public		John Hiscock	53	Wild and Scenic Rivers	The document also identifies the park's fundamental resources and values (FRVs) which "are those features, systems, processes, experiences, stories, scenes, sounds, smells, or other attributes determined to warrant primary consideration during planning and management processes because they are essential to achieving the purpose of the park and maintaining its significance. Fundamental resources and values are closely related to a park's legislative purpose and are more specific than significance statements." (p.6) In regard to those FRVs the document explains: "One of the most important responsibilities of NPS managers is to ensure the conservation and public enjoyment of those qualities that are essential (fundamental) to achieving the purpose of the park and maintaining its significance. If fundamental resources and values are allowed to deteriorate, the park purpose and/or significance could be jeopardized." (p.6). The Foundation Document includes the following FRVs: Water Shapes the Landscape. The park's many free-flowing rivers carry powerful flash floods and tremendous sediment loads, which act together as the primary agents of erosion. These rivers continue to carve into the edge of the Colorado Plateau, shaping Zion's dramatic scenery. By virtue of rivers cutting through the water-bearing Navajo sandstone, numerous canyon springs, fed by groundwater, create hanging gardens and seeping alcoves that form moist oases in a desert environment and sustain perennial river flows. Natural Resource Quality and Function. The quality of air, water, vegetation, and wildlife resources in Zion National Park are generally preserved, in some cases by allowing natural processes and natural disturbance regimes (such as fires, floods, and rockfalls) to exist, thereby promoting an environment predominated by natural processes. Wild and Scenic Rivers. Zion's wild and scenic rivers provide for a wide range of river values and are composed of more than 140 miles of free-flowing, largely undeveloped water courses that provide habitat for six native fish species. In recent geologic time, the rivers have sliced though rock layers thousands of feet thick. The carved canyons provide habitat for the threatened Mexican spotted owl and cool canyon microclimates are home to hanging gardens where the endemic Zion snail resides. (pp. 6-7)

CID	Doc ID	Received	Type	Group	Entity	Commenter	Commenter ID	Category	Comment
270	71	4/29/2022	FR	Public		John Hiscock	53	Effects Analysis	The EA or EIS must consider the project's potential impact on the maintenance of the significant and fundamental natural processes of unimpeded and unaltered river flow through Zion National Park. The NPS has long recognized the importance of monitoring and research related to the significance, resources, and values of the natural flow regimes of the East Fork of the Virgin River. This is evidenced by its research and monitoring studies such as: Riparian monitoring of wadeable streams, East Fork Virgin River, Zion National Park: Summary report, 2008–2012. Natural Resource Report - Witwicki, D. L., and R. Weissinger - NPS/Northern Colorado Plateau Network/NRR—2015/1021. National Park Service, Fort Collins, Colorado. The purpose of such studies, and this one in particular is stated as: "The goal of Northern Colorado Plateau Network (NCPN) riparian monitoring of wadeable streams is to provide park managers with status and trend information about integrated attributes of hydrology, vegetation, and geomorphology on those streams. This information is intended to provide early warning of resource degradation and determine natural variability of wadeable streams." Valuable information which should be critical to the NRCS NEPA process, but heretofore ignored, is contained in such studies.
271	71	4/29/2022	FR	Public		John Hiscock	53	Land Use	The Bureau of Land Management is also mandated to protect special natural resources and values in the Parunaweap Wilderness Study Area (PWSA), downstream of the Cove Reservoir project and potentially affected by river flow changes related to that project. BLM and the federal government are mandated to manage said WSA to protect wilderness values identified in the Wilderness Act and "administered for the use and enjoyment of the American people in such manner as will leave them unimpaired for future use and enjoyment as wilderness and so as to provide for the protection of these areas, the preservation of their wilderness character." 16 USC §1131(a). The Wilderness Act guides federal management of said wilderness and defines wilderness as: A wilderness, in contrast with those areas where man and his own works dominate the landscape, is hereby recognized as an area where the earth and its community of life are untrammeled by man, where man himself is a visitor who does not remain. An area of wilderness is further defined to mean in this chapter an area of undeveloped Federal land retaining its primeval character and influence, without permanent improvements or human habitation, which is protected and managed so as to preserve its natural conditions and which (1) generally appears to have been affected primarily by the forces of nature, with the imprint of man's work substantially unnoticeable; (2) has outstanding opportunities for solitude or a primitive and unconfined type of recreation; (3) has at least five thousand acres of land or is of sufficient size as to make practicable its preservation and use in an unimpaired condition; and (4) may also contain ecological, geological, or other features of scientific, educational, scenic, or historical value. Id. at §1131(c) (emphasis added). The NRCS EA has failed to evaluate any impacts on the PWSA, and its resources and values protected under the Wilderness Act.
272	71	4/29/2022	FR	Public		John Hiscock	53	Effects Analysis	In fact, overall, in the section "1.5.1 Resources/Issues Studied in Detail or Eliminated from Further Study" the NRCS EA categorizes many evaluation categories critical to the protection of special areas, such as Zion National Park and the Parunaweap WSA, as non-existent or irrelevant to its NEPA analysis, including: - "Hydrology" – irrelevant to analysis, stating that lower, yet natural flood flows downstream will be lowered in direct contradiction to value of maintaining natural flow regimes; - "Ecological Critical Areas" – listed as irrelevant and, therefore, not analyzed; - "Essential Fish Habitat" – listed as irrelevant and, therefore, not analyzed; - "Natural Resources" - listed as irrelevant and, therefore, not analyzed; - "Scenic Beauty and Parklands" - listed as irrelevant and, therefore, not analyzed; - "National Parks, Monuments, and Historical Areas" - listed as irrelevant and, therefore, not analyzed. Again, as previously noted the NRCS EA is woefully inadequate in evaluating the consequences of the Cove Reservoir project on the qualities, resources, and values of Zion National Park, and the Parunaweap WSA. The assessment of potential impacts on these congressionally designated, and/or protected areas should be comprehensively included in a revised draft EA, or arguably an EIS, given the importance of such considerations.
273	72	4/29/2022	FR	Public	National Parks Conservation Assosciation	Cory McNulty	54	General	On behalf of the National Parks Conservation Association (NPCA), thank you for the opportunity to submit the attached scoping comments for the Environmental Impact Statement (EIS) for the proposed Cove-East Fork Virgin River Watershed Project in Kane County, Utah. Since our founding in 1919, NPCA has been the independent, nonpartisan voice working to strengthen and protect America's national parks. Our 1.6 million members and supporters, including thousands in Utah, care deeply about the national parks and their surrounding landscapes including decisions made on the broader landscape that affect park resources and quality visitor experiences. See attached file(s)

274	72	4/29/2022	FR	Public	National Parks Conservation Assosciation	Cory McNulty	54	General	On behalf of the National Parks Conservation Association (NPCA), thank you for the opportunity to submit scoping comments for the Environmental Impact Statement (EIS) for the proposed Cove-East Fork Virgin River Watershed Project in Kane County, Utah. Since our founding in 1919, NPCA has been the independent, nonpartisan voice working to strengthen and protect America's national parks. Our 1.6 million members and supporters, including thousands in Utah, care deeply about the national parks and their surrounding landscapes including decisions made on the broader landscape that affect park resources and quality visitor experiences. NPCA submitted comments on the 2020 Cove Reservoir Plan Environmental Assessment (EA), and in the absence of more detailed and updated information in the Notice of Intent for the Cove-East Fork Virgin River Watershed Plan EIS Project, we have based the following scoping comments on the project's previous description in the 2020 Plan-EA. NPCA remains extremely concerned about potential impacts from proposed construction of the Cove (or alternate) Reservoir, Black Knoll borrow pit and expansion of the Bald Knoll borrow pit upstream from Zion National Park on the park's resources, particularly the Outstandingly Remarkable Values (ORV) associated with the Wild and Scenic River Designation for the East Fork of the Virgin River through the park. NPCA strongly encourages open communication and a close working relationship between the United States Department of Agriculture Natural Resources Conservation Service (NRCS) and the National Park Service (NPS) to ensure park resources are not adversely impacted by the reservoir proposal. We request that the EIS carefully identify and address potential impacts to the park resources listed below as well as other concerns raised by NPS during the planning process
275	72	4/29/2022	FR	Public	National Parks Conservation Assosciation	Cory McNulty	54	Effects Analysis	The NPS has strong authority to protect its resources from harmful impacts on nearby lands. The significance of park resources at our national parks and the responsibility of NPS to protect them was clearly articulated in the Organic Act of 1916, "… to the fundamental purpose of the said parks, monuments, and reservations, which purpose is to conserve the scenery and the natural and historic objects and the wild life therein and to provide for the enjoyment of the same in such manner and by such means as will leave them unimpaired for the enjoyment of future generations." Further, because national parks are not islands of protection, and their scenery and fundamental resources are more often at risk from adverse impacts originating outside national park boundaries, the NPS Management Policies 2006 (§ 4.1.4) outline the responsibility of NPS to engage with other agencies and decision-makers. "... the Service will seek the cooperation of others in minimizing the impacts of influences originating outside parks by controlling noise and artificial lighting, maintaining water quality and quantity, eliminating toxic substances, preserving scenic views, improving air quality, preserving wetlands, protecting threatened or endangered species, eliminating exotic species, managing the use of pesticides, protecting shoreline processes, managing fires, managing boundary influences, and using other means of preserving and protecting natural resources." National Park Resources of Concern The National Environmental Policy Act requires the NRCS to analyze and disclose any direct, indirect and cumulative impacts of the proposed Cove Reservoir project on park resources. The EIS must supply sufficient information and key analyses, particularly regarding flow rates, flow regimes and approved water rights, to assess potential impacts to park resources and nationally significant river segments and fish species.
276	72	4/29/2022	FR	Public	National Parks Conservation Assosciation	Cory McNulty	54	Wild and Scenic Rivers	Virgin River Wild and Scenic River Designation More than 140 miles of free flowing, largely undeveloped wild and scenic rivers flow through Zion National Park and are at the heart of its national significance, Wilderness Character of the park's designated Wilderness and contribute to its merit for designation as a unit of the national park system. The Zion National Park Foundation Document1 provides basic guidance for planning and management decisions and includes the following: "In 2009, the Omnibus Public Land Management Act (PL 111-11, 123 Stat. 1081) designated 144 miles (35,146 acres) of the Virgin River and its tributaries as a wild and scenic river. The Wild and Scenic Rivers Act (PL 90-542) requires the National Park Service to protect and enhance the water quality, free-flowing condition, and outstandingly remarkable values of the Virgin River and its tributaries. The river is to be managed with the goal of nondegradation and the enhancement of the values for which it was established. Section 4.3.4 of NPS Management Policies 2006 states that no management actions may be taken that could adversely affect the values that qualify a river for inclusion in the national wild and scenic rivers system." (Foundation Document, pg 10) The Foundation document identifies fundamental resources and values determined to warrant primary consideration during planning and management processes because they are essential to achieving the purpose of the park and maintaining its significance. The list of fundamental resources includes: "Wild and Scenic Rivers. Zion's wild and scenic rivers provide for a wide range of river values and are composed of more than 140 miles of free-flowing, largely undeveloped water courses that provide habitat for six native fish species. In recent geologic time, the rivers have sliced though rock layers thousands of feet thick. The carved canyons provide habitat for the threatened Mexican spotted owl and cool canyon microclimates are home to hanging gardens where the endemic Zion snail resides." (Foundation Document, pg 7)

CID	Doc ID	Received	Type	Group	Entity	Commenter	Commenter ID	Category	Comment
277	72	4/29/2022	FR	Public	National Parks Conservation Association	Cory McNulty	54	Wild and Scenic Rivers	Action Alternative 1, the proposed action, would construct Cove Reservoir within the East Fork Virgin River Watershed approximately 20 river miles upstream of the park's east boundary. Action Alternative 2 would construct a reservoir at an alternate location within the East Fork Virgin River Watershed. The stretch of the East Fork of the Virgin River that runs through Zion National Park is designated "Wild" under the Wild and Scenic Rivers Act. "Wild" rivers are "Those rivers or sections of rivers that are free of impoundments and generally inaccessible except by trail, with watersheds or shorelines essentially primitive and waters unpolluted. These represent vestiges of primitive America." (Foundation Document, pg 59) The foundation for wild and scenic river management is a clearly defined set of outstandingly remarkable values, free-flowing condition, and water quality. The outstandingly remarkable values for the East Fork of the Virgin River through Zion National Park include cultural, geologic, ecological processes, wildlife and fish. (Foundation Document, pg 62). In 2001, this same section of the river was designated by the park as a Research Natural Area, set aside for research purposes and closed to recreation. Zion manages the river corridor with an emphasis on resource protection. (Plan-EA, pg S-6)
278	72	4/29/2022	FR	Public	National Parks Conservation Association	Cory McNulty	54	Sensitive Species	Virgin Spinedace and other Species of Concern The East Fork of the Virgin River is important habitat for the Virgin spinedace (Lepidomeda mollispinis), managed under a Conservation Agreement (CA)2 among US Fish and Wildlife Service, Utah Division of Wildlife Resources, NPS, and several other local, state, and federal organizations. The objectives stated in the CA purpose are to 1) eliminate threats where possible and reduce threats to the greatest extent possible that cannot be eliminated entirely and 2) enhance and/or stabilize instream flows in specific reaches of occupied and unoccupied habitat. The East Fork of the Virgin River also provides habitat for: • Four native fish species: In addition to the Virgin spinedace (Lepidomeda mollispinis), desert sucker (Catostomus clarkia), flannelmouth sucker (Catostomus latipinnis), and speckled dace (Rhinichthys osculus). The desert sucker, flannelmouth sucker and Virgin spinedace are each listed as a Utah Species of Greatest Conservation Need by the Utah Department of Natural Resources. • Mexican Spotted Owl, which inhabit the East Fork of the Virgin River, part of designated critical habitat • Southwestern Willow Flycatcher and Yellow-Billed Cuckoo • State-listed Arizona Toad
279	72	4/29/2022	FR	Public	National Parks Conservation Association	Cory McNulty	54	Water Resources	Zion National Park Water Rights Settlement Agreement (1996) "The Department of the Interior entered into the Zion National Park Water Rights Settlement Agreement in 1996 with the State of Utah and water conservancy districts from Washington and Kane counties. This negotiated agreement resolved uncertainties in the water rights held by the United States under the 1909 proclamation designating Zion as a national monument. The 1996 agreement determined that "the United States has a reserved right to all water underlying, originating within or flowing through Zion National Park, including perennial, intermittent and ephemeral, streams, springs, seeps, lakes, ponds, ground water, and other natural sources of water" that was unappropriated when the park was established. It also asserts that these "waters are to remain in a free flowing condition." While very inclusive, this protection is not absolute because…(4) the agreement allows for some additional appropriation of water upstream of the park. These new appropriations are not to exceed a total of 6,000 acre-feet per year with no more than 2,500 of that coming from diversion of surface waters. The magnitude of this last provision is minimized by the fact that the state engineer manages the Virgin River Basin as fully appropriated, so no new water rights are permitted." (Foundation Document, pg 11)
280	72	4/29/2022	FR	Public	National Parks Conservation Association	Cory McNulty	54	Water Resources	NPCA concerns include but are not limited to: • The EIS must articulate how requirements of the Zion National Park Water Rights Settlement Agreement (1996) will be met and analyze anticipated impacts to the agreement, including the locations, timing and rate of actual diversions associated with the reservoir in each of the proposed action alternatives and how the flow will be sustained below any new surface water diversions. It must also include the location, flow rate and timing of releases and any return flow to the East Fork of the Virgin River. • The EIS must identify acre-feet of downstream water that will be available annually during the summer months for endangered fish species and Southwest Willow Flycatcher, and include a detailed flow schedule to back up any claims or an updated memorandum of understanding or other commitment that ecological flows will be met. • The approved water right(s) used to fill a reservoir of the sizes proposed must be disclosed in the EIS, particularly because the state engineer manages the Virgin River Basin as fully appropriated, so no new water rights are permitted. The over allocation of water in the Virgin River Basin is exacerbated by warming temperatures and shorter winters and must be fully addressed in the EIS. A study is needed to determine baseline flow in the East Fork of the Virgin River, and as water supplies decline as expected, who has the right to use it over the next 100 years, the life of the project.
281	72	4/29/2022	FR	Public	National Parks Conservation Association	Cory McNulty	54	Wild and Scenic Rivers	• The EIS must provide adequate information and analysis to determine how the proposed action alternatives will change the flow rates and timing, and downstream temperature, and how those factors might affect the Virgin spinedace, desert sucker, and speckled dace's habitat as well as the outstandingly remarkable values (ORVs) and "Wild" designation of the East Fork of the Virgin River. NRCS must determine the impact of the proposed project on the ORVs, freeflowing condition and water quality that underpin the "Wild" designation for the East Fork of the Virgin River through Zion National Park.

CID	Doc ID	Received	Type	Group	Entity	Commenter	Commenter ID	Category	Comment
282	72	4/29/2022	FR	Public	National Parks Conservation Assosciation	Cory McNulty	54	Sensitive Species	• To fulfill the Spinedace Conservation Agreement, the EIS must provide an analysis on how changes in the flow (timing, rate) downstream of the proposed reservoir and its diversion points may impact Virgin spinedace or their habitat and identify mitigation measures, where appropriate. • If stocking non-native salmonids or other game fish species is still proposed under the action alternatives, the EIS must include analyses to address whether the reservoir conservation pool could support a sport fishery, and if that sport fishery would result in introductions of nonnative species that could threaten the Virgin spinedace in Zion National Park or the threatened fish species downstream. The Virgin spinedace CA states, “Stocking of salmonids is to be restricted to areas in association with existing salmonid populations OR made in new areas only where they will not conflict with native species of special concern.” (CA, pg 13)
283	72	4/29/2022	FR	Public	National Parks Conservation Assosciation	Cory McNulty	54	Health and Safety	• The EIS must fully analyze the consequences of dam failure on stream flows, including flows through the protected portion of the river and its ORVs in Zion National Park, downstream infrastructure, or park visitors. The geologic seismic hazard classification for the Cove Reservoir dam in the Plan-EA was “high hazard” due to potential loss of life and serious damage to homes, public utilities and highway 89. (Plan-EA, Appendix D pg 6) If the dam fails, an extraordinary surge of water would flow across highway 89, the major road connecting Bryce Canyon and Zion National Parks and the primary access route to the east entrance of Zion National Park. Visitors accessing Zion National Park from Kane County will likely increase if the East Zion Initiative is successful in creating an East Zion visitor contact station and trail network as anticipated, thereby increasing the number of visitors who would be negatively impacted by a dam breach. Nearly all of the water from a dam failure would likely flow down the East Fork of the Virgin River and through the “Wild” section in Zion National Park where there could be catastrophic damage to the river ecosystem and ORVs.
284	72	4/29/2022	FR	Public	National Parks Conservation Assosciation	Cory McNulty	54	Recreation	• While we recognize the potential for outdoor recreation and national park tourism to contribute to economic sustainability of small rural communities such as Orderville, Mt. Carmel and Glendale, methods used previously to calculate potential recreation benefits of the Cove Reservoir in Appendix E-46 of the 2020 Plan-EA were flawed. Given the importance of calculating accurate economic benefits to justify the high cost of constructing a reservoir under the action alternatives, the EIS should use accepted social science techniques for estimating outdoor recreation visitation.
285	72	4/29/2022	FR	Public	National Parks Conservation Assosciation	Cory McNulty	54	General	Thank you for the opportunity to provide scoping comments for the Cove-East Fork Virgin River Watershed Project EIS to fully assess the impacts of the proposed action alternatives on the resources of Zion National Park, the Virgin River system and the surrounding landscape. Please include me in future correspondence or public engagement opportunities regarding this project: We look forward to participating in the process as the plan evolves.
286	73	4/29/2022	FR	Public		April Johnson	55	General	Locals don't want this and don't trust Mike Noel. Jackson Flat Reservoir is already gross and low most of the year. We live in a desert - if tourists need water recreation, they can migrate to northern latitudes. This project doesn't make sense and in my opinion, is wasting NRCS's valuable expertise and money. I imagine a fair amount of our tax money is also being wasted on this project. Why does the burden of proof that this project is unwanted, unmerited, and unnecessary require the entire NEPA process? Shouldn't it suffice that only about a dozen people want this? The system is broken. You should've turned down this application long ago. But because I have no power to change anything, I will simply say.....
287	73	4/29/2022	FR	Public		April Johnson	55	Climate Change	This EIS needs to include: 1. Study existing megadrought conditions and the current modeling for the future of water supplies in the region driven by climate change and determine if this project is sustainable.
288	73	4/29/2022	FR	Public		April Johnson	55	Economics	2. Suggest that federal agricultural funding might best be used to help farmers in Kane and Washington counties transition to climate and sustainable smart agriculture. There are a variety of new agricultural technologies including remote sensing technology that can result in using less water and increasing yield. These are practices that are beginning to be used world-wide. A cost-effective study should be completed comparing the cost of arming farmers with new technologies vs. the cost and environmental impact of constructing and maintaining the Cove Reservoir.
289	73	4/29/2022	FR	Public		April Johnson	55	Water Resources	3. Analyze the direct, indirect, and cumulative impacts of eliminating high flows on both the East Fork and the Main Virgin as it relates to the hydrologic connection of both ground and surface water. Changing river flow levels forever could hinder how the aquifer is recharged along with permanently decreasing the flow of surface water downstream of the project area.
290	73	4/29/2022	FR	Public		April Johnson	55	Sensitive Species	4. Study the history of what caused the endangered fish in the Virgin to become imperiled in the first place and evaluate how further reducing perennial flows will further complicate the effort to save these species. Changing the historical flows are likely to have an impact as well on the entire riparian zone along the river. This must be carefully evaluated.
291	73	4/29/2022	FR	Public		April Johnson	55	Water Resources	5. Complete an analysis of ecosystem health of the Virgin River watershed with attention to how using more fertilizer for agriculture affects downstream water quality.
292	73	4/29/2022	FR	Public		April Johnson	55	Water Resources	6. Complete an analysis of the complete Virgin River watershed and how water supplies and quality may be affected in Arizona and Nevada as the Virgin River watershed is technically in the Lower Basin drainage.
293	73	4/29/2022	FR	Public		April Johnson	55	Water Resources	7. Analyze and evaluate the water rights that the irrigation companies are using to build the project. Current records show these water rights are being protested by other water users.
294	73	4/29/2022	FR	Public		April Johnson	55	Economics	8. Calculate the cost/benefit ratios for the 100-year life of the project.
295	74	4/29/202	FR	Public		Michael Lerner	56	Alternatives	I urge the EIS to consider an alternative of no reservoir but only improved irrigation with federal assistance. Rather than building an expensive dam and continue the county’s relatively quite high average per capita water usage, how about the federal government providing some of the cost for installing vastly more efficient drip irrigation systems? The net cost would be far less, and if alfalfa proves too water-intensive, then other, climate-smart crops should be grown in this arid region. The government could provide assistance or incentives to switch to less water-intensive crops there. Water conservation would be the best outcome, and it could be done to every party’s satisfaction. So please make that an option besides the no action alternative or building a reservoir in several possible locations. Thank you.

CID	Doc ID	Received	Type	Group	Entity	Commenter	Commenter ID	Category	Comment
296	75	4/29/2022	FR	Public		Richard Spotts	1	Purpose and Need	Please carefully consider, respond to in the DEIS, and include in the NEPA project file my following supplemental scoping comments. The Council on Environmental Quality (CEQ) is responsible for NEPA oversight and effective implementation. CEQ recently adopted their "Phase 1" NEPA regulations which go into legal effect very soon. Because there would be no hardship or substantial delay in doing so, NRCS should prepare the DEIS under these "Phase 1" regulations. Prior to the corrupt, weakening Trump CEQ regulations (which remain under pending litigation), these "new" CEQ regulations are actually reinstating the previous regulations that were in effect for decades. These regulations are well-settled and have had significant judicial interpretations over many years. It would be foolish for NRCS to attempt to use the Trump era CEQ regulations because of the pending litigation and the high potential for public and agency confusion. In applying these "Phase 1" CEQ regulations, it is especially important that NRCS use a balanced purpose and need statement that is broad enough to capture what the applicant wants as well as what NRCS should evaluate as bona fide watershed restoration projects. It will be an enormous travesty if NRCS uses an arbitrarily narrow purpose and need statement so that it can improperly limit the alternatives carried forward for detailed DEIS comparison and analysis.
297	75	4/29/2022	FR	Public		Richard Spotts	1	Alternatives	The DEIS alternatives should include proposed projects that would increase the capture of storm water, slow runoff, reduce gully downcutting, prevent further soil erosion, restore riparian habitats, and increase water infiltration for groundwater recharge. These are legitimate watershed health and restoration projects that would benefit the public interest. I strongly oppose the proposed Cove Reservoir because it would improperly divert Virgin River water for wasteful purposes: growing summer alfalfa and stimulating unsustainable urban sprawl. I support the previous request for an objective investigation into whether this proposed "watershed plan" is a fraudulent Trojan horse for the Cove Reservoir, and whether the purported agricultural benefits are a smokescreen for likely future lucrative water transfers to add to urban sprawl. In the midst of the worst reported drought in 1,200 years, and with the Colorado and Virgin River waters fully appropriated with cutbacks and conflicts already underway, it is crazy for NRCS to be moving forward with such a wasteful, controversial, and potentially illegal venture. Ideally, NRCS should publish a Federal Register notice to withdraw this NOI and terminate this senseless NEPA process. Otherwise, if NRCS proceeds with this DEIS, it should be fair, honest, and comprehensive. Thank you very much for your consideration.
298	76	4/29/2022	FR	Public		Latimer Smith	57	General	Thank you for providing this opportunity for concerned citizens like myself to comment on this scoping process. I'll be brief and add more to what I've written here once the DRAFT EIS becomes available. My name is Latimer Smith and I live in Kane County in the town of Kanab. Over the past few years, I have spent a significant amount of time exploring the East Fork of the Virgin River with my two children. Any time we have a chance during the spring, summer, and fall months we use the river as a place of refuge; a place to swim, a place to catch frogs and snakes, and a place to relax in the shade near running water. It seems all for this would be threatened with the construction of the Cove Reservoir. It has been said by members of the NRCS and other supporters that the reservoir and the "steady" downstream flows it would bring would benefit the fish and other aquatic life that inhabit the river. This notion seems completely nonsensical to me. Free-flowing rivers tend to be much more beneficial to fish and other life. The river is currently irrigated and, in some cases, diverted from its natural course and flow. These factors have caused stress to the river and these realities are evident during the late summer when some flows have dwindled and algae colonies -undoubtedly enhanced by upstream agricultural runoff- abound. The health and future of a wild and beautiful East Fork of the Virgin is important to me, but the larger picture is the Megadrought we are currently in, intensified by global climate change. Peer reviewed analysis of our climate has shown that the decreased overall snow and rainfall, hotter than normal temperatures, and long periods without any precipitation whatsoever, are happening because of climate change. The scientific information we have is telling us that these conditions will continue to worsen, especially as humans continue to put fossil fuel emissions into the atmosphere. In light of the realities we are facing, and that will continue to intensify, it seems completely reckless to me that this proposed reservoir is on the table for consideration. Because of the reasons I have listed above, I do not support the diversion of the East Fork of the Virgin River or the construction of Cove Reservoir. Instead, I would like all of us to tread lighter on the earth and find ways to conserve the water and the natural beauty that we are so fortunate to have. I am a big supporter of Conserve Southwest Utah. They have come up with 8 points that I would like to share here with my comments. I look forward to remaining engaged and submitting more comments in the future.
299	76	4/29/2022	FR	Public		Latimer Smith	57	Climate Change	Conserve Southwest Comments (below) 1. Study existing megadrought conditions and the current modeling for the future of water supplies in the region driven by climate change and determine if this project is sustainable.
300	76	4/29/2022	FR	Public		Latimer Smith	57	Economics	2. Section 106 Consultation

First Cultural Resource Inventory Report

SHPO Consultation

January 9, 2020

Dr. Christopher Merritt, PhD
State Historic Preservation Officer
Utah Division of State History
300 Rio Grande Avenue
Salt Lake City, Utah 84101-1182

Reference: Cultural Resources Inventory Report, Kane County Water Conservancy District's Cove Reservoir Project, Kane County, Utah (UDSH Project No. U18TN0544)

Dear Dr. Merritt:

Included in this submission are a cultural resources report titled *Cultural Resources Inventory Report, Kane County Water Conservancy District's Cove Reservoir Project, Kane County, Utah,* and accompanying data. The Natural Resources Conservation Service (NRCS) is providing technical and financial assistance through the Watershed Protection and Flood Prevention Act (Public Law [PL] 83-566 Stat. 666 as amended [16 U.S.C. Section 1001 et. Seq.]) 1954, as amended, to the Kane County Water Conservancy District (KCWCD), as the project sponsor, to construct a new dam and improve water management infrastructure within the East Fork Virgin River Watershed, located north of Orderville, Utah. Specific improvements include the construction of a 6,055-acre foot reservoir (Cove Reservoir) that would provide enhanced conservation and a reliable water source for local agricultural users and maintain pressure through the local irrigation system. In addition, the existing Glendale hydroelectric power plant would be relocated and upgraded, which would double the amount of green energy created. Furthermore, the water from Cove Reservoir would be released during the summer months, providing additional water flow and reducing high water temperatures for the endangered Virging River chub and woundfin. To assess the environmental impacts of the project, a Watershed Plan and Environmental Assessment is being prepared by Transcon Environmental, on behalf of the NRCS, in cooperation with the Washington County Water Conservancy District, the Bureau of Land Management (BLM), and the National Park Service.

The Area of Potential Effects (APE) for the project encompasses a total of 791.68 acres, which includes the proposed reservoir area, the hyrdroelectric plant locations, four borrow pits, a linear survey of a new water pipeline, powerline, and utility corridor locations, and a spot check/survey of two borrow pit locations. Of the total acreage, 152.18 acres are on BLM Kanab Field-Office-managed land, 70.33 acres are on State of Utah, School and Institutional Trust Lands Administration (SITLA)-managed lands, and 569.17 are on privately-owned lands. The NRCS is acting as the lead Federal agency for the purposes of Section 106 consultation, which will also cover SITLA's responsibilities under Utah Code Annotated Section 9-8-404. The BLM and the U.S. Army Corps of Engineers are cooperating agencies.

A pedestrian cultural resource inventory of the undertaking was completed by Transcon Environmental on October 1 through 8 and October 10 through 13, 2018; supplemental surveys of the project occurred between June 12 through 14. A total of 9 new cultural resource sites (42KA8785, 42KA8900, 42KA8901, 42KA8902, 42KA8903, 42KA8904, 42KA8972, 42KA8973, and 42KA8974), 1 previous cultural resource site (42KA6331), and 15 isolated occurrences (IOs) were identified and recorded within the Project APE. Five archaeological sites and two historic structures were identified as a result of the inventory. Table 1 summarizes the sites identified and the NRCS' National Register of Historic Places (NRHP) eligibility determinations.

Table 1. Summary of sites and structures in the survey area

Site Number/ Land Status	Site Type	NRHP Eligibility	Effects
42KA6331/ BLM	Prehistoric lithic scatter	Eligible—D (previously determined)	*No Adverse Effect to Historic Properties.* Site will be avoided by at least 50 feet by all project activities. Should any future project-related activities occur within 15 meters of the site, a cultural resources monitor must be present.
42KA8785/ Private	Prehistoric artifact scatter	Eligible – D	*No Adverse Effect to Historic Properties*. Site will be avoided by at least 50 feet by all project activities. Should any future project-related activities occur within 15 meters of the site, a cultural resources monitor must be present.
42KA8900/ Private	Historic artifact scatter	Not Eligible	No Effects
42KA8901/ Private	Multicomponent: prehistoric lithic scatter, historic artifact scatters	Not Eligible	No Effects
42KA8902/ Private	Historic artifact scatter	Not Eligible	No Effects
42KA8903/ Private	Historic artifact scatter	Not Eligible	No Effects
42KA8904/ Private	Prehistoric ceramic, lithic, and FCR scatter	Eligible—D	*No Adverse Effect to Historic Properties.* Site will be avoided by at least 50 feet by all project activities. Should any future project-related activities occur within 15 meters of the site, a cultural resources monitor must be present.
42KA8972/ BLM	Prehistoric lithic scatter	Not Eligible	No Effects
42KA8973/ BLM	Prehistoric artifact scatter	Not Eligible	No Effects
42KA8974/ Private	Prehistoric artifact scatter	Eligible—D	*No Adverse Effect to Historic Properties* if the site is avoided. Should any future project-related activities occur within 15 meters of the site, a cultural resources monitor must be present.

Based on the results of the cultural resources survey and adherence to the avoidance stipulations described above, the NRCS recommends that the project proceed as planned with a determination of ***no adverse effect to historic properties***. The NRCS requests concurrence for the determination of project effects and site eligibility. If you have any questions, comments, or concerns, please contact Tara S. Hoffmann, State Cultural Resources Specialist, at 801-524-4556 at your convenience.

Sincerely,

Emily Fife

RE: Cultural Resources Inventory Report, Kane County Water Conservancy District's Cove Reservoir Project, Kane County, Utah

For future correspondence, please reference Case No. 20-0121

Dear Emily,

The Utah State Historic Preservation Office received your request for our comment on the above-referenced undertaking on January 10, 2020.

We concur with your determinations of eligibility and effect for this undertaking.

This letter serves as our comment on the determinations you have made within the consultation process specified in §36CFR800.4. If you have questions, please contact me at 801-245-7263 or by email at cmerritt@utah.gov.

Sincerely,

Christopher W. Merritt, Ph.D.
State Historic Preservation Officer

Utah Department of Heritage & Arts

Tribal Consultation

January 9, 2020

Mr. Val Panteah Sr.
Governor
Pueblo of Zuni
P.O. Box 339
Zuni, New Mexico 87327

Reference: Cultural Resources Inventory Report, Kane County Water Conservancy District's Cove Reservoir Project, Kane County, Utah (UDSH Project No. U18TN0544)

Dear Mr. Panteah:

Enclosed is a cultural resources report titled *Cultural Resources Inventory Report, Kane County Water Conservancy District's Cove Reservoir Project, Kane County, Utah.* The Natural Resources Conservation Service (NRCS) is providing technical and financial assistance through the Watershed Protection and Flood Prevention Act (Public Law [PL] 83-566 Stat. 666 as amended [16 U.S.C. Section 1001 et. Seq.]) 1954, as amended, to the Kane County Water Conservancy District (KCWCD), as the project sponsor, to construct a new dam and improve water management infrastructure within the East Fork Virgin River Watershed, located north of Orderville, Utah. Specific improvements include the construction of a 6,055-acre foot reservoir (Cove Reservoir) that would provide enhanced conservation and a reliable water source for local agricultural users and maintain pressure through the local irrigation system. In addition, the existing Glendale hydroelectric power plant would be relocated and upgraded, which would double the amount of green energy created. Furthermore, the water from Cove Reservoir would be released during the summer months, providing additional water flow and reducing high water temperatures for the endangered Virging River chub and woundfin. To assess the environmental impacts of the project, a Watershed Plan and Environmental Assessment is being prepared by Transcon Environmental, on behalf of the NRCS, in cooperation with the Washington County Water Conservancy District, the Bureau of Land Management (BLM), and the National Park Service.

The Area of Potential Effects (APE) for the project encompasses a total of 791.68 acres, which includes the proposed reservoir area, the hyrdroelectric plant locations, four borrow pits, a linear survey of a new water pipeline, powerline, and utility corridor locations, and a spot check/survey of two borrow pit locations. Of the total acreage, 152.18 acres are on BLM Kanab Field-Office-managed land, 70.33 acres are on State of Utah, School and Institutional Trust Lands Administration (SITLA)-managed lands, and 569.17 are on privately-owned lands. The NRCS is acting as the lead Federal agency for the purposes of Section 106 consultation, which will also cover SITLA's responsibilities under Utah Code Annotated Section 9-8-404. The BLM and the U.S. Army Corps of Engineers are cooperating agencies.

A pedestrian cultural resource inventory of the undertaking was completed by Transcon Environmental on October 1 through 8 and October 10 through 13, 2018; supplemental surveys of the project occurred between June 12 through 14. A total of 9 new cultural resource sites (42KA8785, 42KA8900, 42KA8901, 42KA8902, 42KA8903, 42KA8904, 42KA8972, 42KA8973, and 42KA8974), 1 previous cultural resource site (42KA6331), and 15 isolated occurrences (IOs) were identified and recorded within the Project APE. Five archaeological sites and two historic structures were identified as a result of the inventory. Table 1 summarizes the sites identified and the NRCS' National Register of Historic Places (NRHP) eligibility determinations.

Table 1. Summary of sites and structures in the survey area

Site Number/ Land Status	Site Type	NRHP Eligibility	Effects
42KA6331/ BLM	Prehistoric lithic scatter	Eligible—D (previously determined)	*No Adverse Effect to Historic Properties.* Site will be avoided by at least 50 feet by all project activities. Should any future project-related activities occur within 15 meters of the site, a cultural resources monitor must be present.
42KA8785/ Private	Prehistoric artifact scatter	Eligible – D	*No Adverse Effect to Historic Properties*. Site will be avoided by at least 50 feet by all project activities. Should any future project-related activities occur within 15 meters of the site, a cultural resources monitor must be present.
42KA8900/ Private	Historic artifact scatter	Not Eligible	No Effects
42KA8901/ Private	Multicomponent: prehistoric lithic scatter, historic artifact scatters	Not Eligible	No Effects
42KA8902/ Private	Historic artifact scatter	Not Eligible	No Effects
42KA8903/ Private	Historic artifact scatter	Not Eligible	No Effects
42KA8904/ Private	Prehistoric ceramic, lithic, and FCR scatter	Eligible—D	*No Adverse Effect to Historic Properties.* Site will be avoided by at least 50 feet by all project activities. Should any future project-related activities occur within 15 meters of the site, a cultural resources monitor must be present.
42KA8972/ BLM	Prehistoric lithic scatter	Not Eligible	No Effects
42KA8973/ BLM	Prehistoric artifact scatter	Not Eligible	No Effects
42KA8974/ Private	Prehistoric artifact scatter	Eligible—D	*No Adverse Effect to Historic Properties* if the site is avoided. Should any future project-related activities occur within 15 meters of the site, a cultural resources monitor must be present.

Based on the results of the cultural resources survey and adherence to the avoidance stipulations described above, the NRCS recommends that the project proceed as planned with a determination

of ***no adverse effect to historic properties***. The NRCS requests concurrence for the determination of project effects and site eligibility. Dear Mr. Begaye:

Enclosed is a cultural resources report titled *Cultural Resources Inventory Report, Kane County Water Conservancy District's Cove Reservoir Project, Kane County, Utah.* The Natural Resources Conservation Service (NRCS) is providing technical and financial assistance through the Watershed Protection and Flood Prevention Act (Public Law [PL] 83-566 Stat. 666 as amended [16 U.S.C. Section 1001 et. Seq.]) 1954, as amended, to the Kane County Water Conservancy District (KCWCD), as the project sponsor, to construct a new dam and improve water management infrastructure within the East Fork Virgin River Watershed, located north of Orderville, Utah. Specific improvements include the construction of a 6,055-acre foot reservoir (Cove Reservoir) that would provide enhanced conservation and a reliable water source for local agricultural users and maintain pressure through the local irrigation system. In addition, the existing Glendale hydroelectric power plant would be relocated and upgraded, which would double the amount of green energy created. Furthermore, the water from Cove Reservoir would be released during the summer months, providing additional water flow and reducing high water temperatures for the endangered Virging River chub and woundfin. To assess the environmental impacts of the project, a Watershed Plan and Environmental Assessment is being prepared by Transcon Environmental, on behalf of the NRCS, in cooperation with the Washington County Water Conservancy District, the Bureau of Land Management (BLM), and the National Park Service.

The Area of Potential Effects (APE) for the project encompasses a total of 791.68 acres, which includes the proposed reservoir area, the hyrdroelectric plant locations, four borrow pits, a linear survey of a new water pipeline, powerline, and utility corridor locations, and a spot check/survey of two borrow pit locations. Of the total acreage, 152.18 acres are on BLM Kanab Field-Office-managed land, 70.33 acres are on State of Utah, School and Institutional Trust Lands Administration (SITLA)-managed lands, and 569.17 are on privately-owned lands. The NRCS is acting as the lead Federal agency for the purposes of Section 106 consultation, which will also cover SITLA's responsibilities under Utah Code Annotated Section 9-8-404. The BLM and the U.S. Army Corps of Engineers are cooperating agencies.

A pedestrian cultural resource inventory of the undertaking was completed by Transcon Environmental on October 1 through 8 and October 10 through 13, 2018; supplemental surveys of the project occurred between June 12 through 14. A total of 9 new cultural resource sites (42KA8785, 42KA8900, 42KA8901, 42KA8902, 42KA8903, 42KA8904, 42KA8972, 42KA8973, and 42KA8974), 1 previous cultural resource site (42KA6331), and 15 isolated occurrences (IOs) were identified and recorded within the Project APE. Five archaeological sites and two historic structures were identified as a result of the inventory. Table 1 summarizes the sites identified and the NRCS' National Register of Historic Places (NRHP) eligibility determinations.

Table 1. Summary of sites and structures in the survey area

Site Number/ Land Status	Site Type	NRHP Eligibility	Effects
42KA6331/ BLM	Prehistoric lithic scatter	Eligible—D (previously determined)	*No Adverse Effect to Historic Properties.* Site will be avoided by at least 50 feet by all project activities. Should any future project-related activities occur within 15 meters of the site, a cultural resources monitor must be present.
42KA8785/ Private	Prehistoric artifact scatter	Eligible – D	*No Adverse Effect to Historic Properties*. Site will be avoided by at least 50 feet by all project activities. Should any future project-related activities occur within 15 meters of the site, a cultural resources monitor must be present.
42KA8900/ Private	Historic artifact scatter	Not Eligible	No Effects
42KA8901/ Private	Multicomponent: prehistoric lithic scatter, historic artifact scatters	Not Eligible	No Effects
42KA8902/ Private	Historic artifact scatter	Not Eligible	No Effects
42KA8903/ Private	Historic artifact scatter	Not Eligible	No Effects
42KA8904/ Private	Prehistoric ceramic, lithic, and FCR scatter	Eligible—D	*No Adverse Effect to Historic Properties.* Site will be avoided by at least 50 feet by all project activities. Should any future project-related activities occur within 15 meters of the site, a cultural resources monitor must be present.
42KA8972/ BLM	Prehistoric lithic scatter	Not Eligible	No Effects
42KA8973/ BLM	Prehistoric artifact scatter	Not Eligible	No Effects
42KA8974/ Private	Prehistoric artifact scatter	Eligible—D	*No Adverse Effect to Historic Properties* if the site is avoided. Should any future project-related activities occur within 15 meters of the site, a cultural resources monitor must be present.

Based on the results of the cultural resources survey and adherence to the avoidance stipulations described above, the NRCS recommends that the project proceed as planned with a determination of ***no adverse effect to historic properties***. The NRCS requests concurrence for the determination of project effects and site eligibility. If you have any questions, comments, or concerns, please contact Tara S. Dear Mr. Cuthair:

Enclosed is a cultural resources report titled *Cultural Resources Inventory Report, Kane County Water Conservancy District's Cove Reservoir Project, Kane County, Utah.* The Natural Resources Conservation Service (NRCS) is providing technical and financial assistance through the Watershed Protection and Flood Prevention Act (Public Law [PL] 83-566 Stat. 666 as amended [16 U.S.C. Section 1001 et. Seq.]) 1954, as amended, to the Kane County Water Conservancy District (KCWCD), as the project sponsor, to construct a new dam and improve water management infrastructure within the East Fork Virgin River Watershed, located north of Orderville, Utah. Specific improvements include the construction of a 6,055-acre foot reservoir (Cove Reservoir) that would provide enhanced conservation and a reliable water source for local agricultural users and maintain pressure through the local irrigation system. In addition, the existing Glendale hydroelectric power plant would be relocated and upgraded, which would double the amount of green energy created. Furthermore, the water from Cove Reservoir would be released during the summer months, providing additional water flow and reducing high water temperatures for the endangered Virging River chub and woundfin. To assess the environmental impacts of the project, a Watershed Plan and Environmental Assessment is being prepared by Transcon Environmental, on behalf of the NRCS, in cooperation with the Washington County Water Conservancy District, the Bureau of Land Management (BLM), and the National Park Service.

The Area of Potential Effects (APE) for the project encompasses a total of 791.68 acres, which includes the proposed reservoir area, the hyrdroelectric plant locations, four borrow pits, a linear survey of a new water pipeline, powerline, and utility corridor locations, and a spot check/survey of two borrow pit locations. Of the total acreage, 152.18 acres are on BLM Kanab Field-Office-managed land, 70.33 acres are on State of Utah, School and Institutional Trust Lands Administration (SITLA)-managed lands, and 569.17 are on privately-owned lands. The NRCS is acting as the lead Federal agency for the purposes of Section 106 consultation, which will also cover SITLA's responsibilities under Utah Code Annotated Section 9-8-404. The BLM and the U.S. Army Corps of Engineers are cooperating agencies.

A pedestrian cultural resource inventory of the undertaking was completed by Transcon Environmental on October 1 through 8 and October 10 through 13, 2018; supplemental surveys of the project occurred between June 12 through 14. A total of 9 new cultural resource sites (42KA8785, 42KA8900, 42KA8901, 42KA8902, 42KA8903, 42KA8904, 42KA8972, 42KA8973, and 42KA8974), 1 previous cultural resource site (42KA6331), and 15 isolated occurrences (IOs) were identified and recorded within the Project APE. Five archaeological sites and two historic structures were identified as a result of the inventory. Table 1 summarizes the sites identified and the NRCS' National Register of Historic Places (NRHP) eligibility determinations.

Table 1. Summary of sites and structures in the survey area

Site Number/ Land Status	Site Type	NRHP Eligibility	Effects
42KA6331/ BLM	Prehistoric lithic scatter	Eligible—D (previously determined)	*No Adverse Effect to Historic Properties.* Site will be avoided by at least 50 feet by all project activities. Should any future project-related activities occur within 15 meters of the site, a cultural resources monitor must be present.
42KA8785/ Private	Prehistoric artifact scatter	Eligible – D	*No Adverse Effect to Historic Properties*. Site will be avoided by at least 50 feet by all project activities. Should any future project-related activities occur within 15 meters of the site, a cultural resources monitor must be present.
42KA8900/ Private	Historic artifact scatter	Not Eligible	No Effects
42KA8901/ Private	Multicomponent: prehistoric lithic scatter, historic artifact scatters	Not Eligible	No Effects
42KA8902/ Private	Historic artifact scatter	Not Eligible	No Effects
42KA8903/ Private	Historic artifact scatter	Not Eligible	No Effects
42KA8904/ Private	Prehistoric ceramic, lithic, and FCR scatter	Eligible—D	*No Adverse Effect to Historic Properties.* Site will be avoided by at least 50 feet by all project activities. Should any future project-related activities occur within 15 meters of the site, a cultural resources monitor must be present.
42KA8972/ BLM	Prehistoric lithic scatter	Not Eligible	No Effects
42KA8973/ BLM	Prehistoric artifact scatter	Not Eligible	No Effects
42KA8974/ Private	Prehistoric artifact scatter	Eligible—D	*No Adverse Effect to Historic Properties* if the site is avoided. Should any future project-related activities occur within 15 meters of the site, a cultural resources monitor must be present.

Based on the results of the cultural resources survey and adherence to the avoidance stipulations described above, the NRCS recommends that the project proceed as planned with a determination of ***no adverse effect to historic properties***. The NRCS requests concurrence for the determination of project effects and site eligibility. If you have any questions, comments, or concerns, please contact Tara S. Hoffmann, State Cultural Resources Specialist, at 801-524-4556 at your convenience.

Section 1001 et. Seq.]) 1954, as amended, to the Kane County Water Conservancy District (KCWCD), as the project sponsor, to construct a new dam and improve water management infrastructure within the East Fork Virgin River Watershed, located north of Orderville, Utah. Specific improvements include the construction of a 6,055-acre foot reservoir (Cove Reservoir) that would provide enhanced conservation and a reliable water source for local agricultural users and maintain pressure through the local irrigation system. In addition, the existing Glendale hydroelectric power plant would be relocated and upgraded, which would double the amount of green energy created. Furthermore, the water from Cove Reservoir would be released during the summer months, providing additional water flow and reducing high water temperatures for the endangered Virging River chub and woundfin. To assess the environmental impacts of the project, a Watershed Plan and Environmental Assessment is being prepared by Transcon Environmental, on behalf of the NRCS, in cooperation with the Washington County Water Conservancy District, the Bureau of Land Management (BLM), and the National Park Service.

The Area of Potential Effects (APE) for the project encompasses a total of 791.68 acres, which includes the proposed reservoir area, the hyrdroelectric plant locations, four borrow pits, a linear survey of a new water pipeline, powerline, and utility corridor locations, and a spot check/survey of two borrow pit locations. Of the total acreage, 152.18 acres are on BLM Kanab Field-Office-managed land, 70.33 acres are on State of Utah, School and Institutional Trust Lands Administration (SITLA)-managed lands, and 569.17 are on privately-owned lands. The NRCS is acting as the lead Federal agency for the purposes of Section 106 consultation, which will also cover SITLA's responsibilities under Utah Code Annotated Section 9-8-404. The BLM and the U.S. Army Corps of Engineers are cooperating agencies.

A pedestrian cultural resource inventory of the undertaking was completed by Transcon Environmental on October 1 through 8 and October 10 through 13, 2018; supplemental surveys of the project occurred between June 12 through 14. A total of 9 new cultural resource sites (42KA8785, 42KA8900, 42KA8901, 42KA8902, 42KA8903, 42KA8904, 42KA8972, 42KA8973, and 42KA8974), 1 previous cultural resource site (42KA6331), and 15 isolated occurrences (IOs) were identified and recorded within the Project APE. Five archaeological sites and two historic structures were identified as a result of the inventory. Table 1 summarizes the sites identified and the NRCS' National Register of Historic Places (NRHP) eligibility determinations.

Table 1. Summary of sites and structures in the survey area

Site Number/ Land Status	Site Type	NRHP Eligibility	Effects
42KA6331/ BLM	Prehistoric lithic scatter	Eligible—D (previously determined)	*No Adverse Effect to Historic Properties.* Site will be avoided by at least 50 feet by all project activities. Should any future project-related activities occur within 15 meters of the site, a cultural resources monitor must be present.
42KA8785/ Private	Prehistoric artifact scatter	Eligible – D	*No Adverse Effect to Historic Properties*. Site will be avoided by at least 50 feet by all project activities. Should any future project-related activities occur within 15 meters of the site, a cultural resources monitor must be present.
42KA8900/ Private	Historic artifact scatter	Not Eligible	No Effects
42KA8901/ Private	Multicomponent: prehistoric lithic scatter, historic artifact scatters	Not Eligible	No Effects
42KA8902/ Private	Historic artifact scatter	Not Eligible	No Effects
42KA8903/ Private	Historic artifact scatter	Not Eligible	No Effects
42KA8904/ Private	Prehistoric ceramic, lithic, and FCR scatter	Eligible—D	*No Adverse Effect to Historic Properties.* Site will be avoided by at least 50 feet by all project activities. Should any future project-related activities occur within 15 meters of the site, a cultural resources monitor must be present.
42KA8972/ BLM	Prehistoric lithic scatter	Not Eligible	No Effects
42KA8973/ BLM	Prehistoric artifact scatter	Not Eligible	No Effects
42KA8974/ Private	Prehistoric artifact scatter	Eligible—D	*No Adverse Effect to Historic Properties* if the site is avoided. Should any future project-related activities occur within 15 meters of the site, a cultural resources monitor must be present.

Based on the results of the cultural resources survey and adherence to the avoidance stipulations described above, the NRCS recommends that the project proceed as planned with a determination of ***no adverse effect to historic properties***. The NRCS requests concurrence for the determination of project effects and site eligibility. If you have any questions, comments, or concerns, please contact Tara S. Hoffmann, State Cultural Resources Specialist, at 801-524-4556 at your convenience.

Sites Visited:	42KA8904 and 42KA8785 (prehistoric artifact scatters)	Project:	Cove EFVR EA
Attendees:	Tara Hoffmann (NRCS Water Resources CRS) Charley Bulletts (Cultural Resources Director, Kaibab Paiute) Lindsey Evenson (Cultural Resources Director, Transcon)		
Date:	January 25, 2019		
Subject:	Site visit request by Charley Bulletts for 42KA8904		

Charley Bulletts asked to have a site visit to 42KA8904 (prehistoric artifact scatter) to see its proximity to the proposed project activities. Tara Hoffmann, Lindsey Evenson and Charley visited the site on January 25, 2019, where Charley briefly examined artifacts and we spoke about project activities that would occur near the site and potential effects from off road vehicle or pedestrian traffic. Charley said that he was not concerned about effects to the site from the reservoir and that things could move forward. Ms. Hoffmann informed Mr. Bulletts that she would be seeing the project through construction and that the site would be avoided (as currently planned).

Charley asked if there were any additional sites that would be beneficial to visit, and Ms. Hoffmann informed him of 42KA8785, due to its proximity to a proposed Tait Pit gravel source. Ms. Hoffmann and Mr. Bulletts visited the site and discussed avoidance options. It was agreed that the entire site would be avoided by the proposed gravel source and noted on designs as an avoidance area. Ms. Hoffmann conveyed this information to Transcon for incorporation into the environmental document.

*** Note: all confidential information discussed between NRCS and the Kaibab Paiute regarding specific site location information has been redacted from this document.

Hello Tara
I thought you was off, could I call you this week at your office.
I have been very busy with some Jackson Flats stuff, but would like to get your feed back about
This report I only skimed through it a few times. Sorry for not getting back to you sooner.
Hope your year is starting off well.

>
> There were also a total of **five new cultural resource sites** identified within the project APE: 42KA8900--42KA8904. The fifth site, 42KA8904, is a large prehistoric temporary camp with artifact (lithic, ceramic, and FCR) scatters; we have decided to recommend this site Eligible for listing on the NRHP under Criterion D, for possible subsurface cultural deposits and information potential. The remaining four sites are recommended Not Eligible for NRHP listing under any Criteria.
>
> Additionally, there are a total of **two previously identified cultural resource sites** within the project area, within the Bald Knolls Community Pit: 42KA6331 and 42KA6332. Both of these sites are prehistoric lithic scatters, and both are recommended Eligible for NRHP listing under Criterion D. These sites were not revisited or reevaluated for their resources, per request of the BLM Kanab Field Office archaeologist.

NEWLY IDENTIFIED CULTURAL RESOURCE SITES WITHIN THE PROJECT APE				
Site No.	**Field No.**	**Description**	**Jurisdiction**	**Eligibility Recommendation**
42KA8900	BFS-01	Historic artifact scatter	Private	Not Eligible
42KA8901	BFS-02	Multi-component: prehistoric lithic scatter; historic artifact scatters	BLM	Not Eligible
42KA8902	BFS-03	Historic artifact scatter	Private	Not Eligible
42KA8903	BFS-04	Historic artifact scatter	Private	Not Eligible
42KA8904	BFS-05	Prehistoric temporary camp and artifact (lithic, ceramic, and FCR) scatter	Private	Eligible - D

NEWLY IDENTIFIED ISOLATED OCCURRENCES WITHIN THE PROJECT APE				
IO No.	**Temporal Affiliation**	**Description**	**UTMs (NAD '83, Zone 12)**	
			Easting	**Northing**
IO-01	Historic	Two historic coal/wood-burning stoves	356826	4129653
IO-02	Prehistoric	Two prehistoric whiteware ceramic sherds	351662	4126634
IO-03	Historic	One historic Chevy vehicle trunk lid (1966 Florida license plate)	352635	4126505
IO-04	Prehistoric	One prehistoric white ware sherd	351823	4126323
IO-05	Prehistoric	Five prehistoric obsidian shatter pieces (three snowflake obsidian, one mahogany, and one black)	353290	4126227

Let me know if you have any questions on this. I will know more about the sites and their locations once I read the draft report, probably later this week since I am going to be in Richfield doing fieldwork for the next few days.

Cheers,

Tara

Dear Ms. Fife

Subject: ***CRI Report, Kane County Water Conservancy District's Cove Reservoir Project, Kane County, Utah (UDSH Project No. U18TN0544)***

The Paiute Indian Tribe of Utah is in receipt of your letter dated January 9, 2020 and has reviewed the material and do not have any objections. Currently, we are not aware of any cultural resource sites, practices, or locations of importance in the Tribe's traditional, religious or culture. We concur with your determination of eligibility and effort for this undertaking. This letter serves as our comment on the determinations you have made.

As you are aware the tribes support the identification and avoidance of prehistoric archaeological sites and traditional cultural properties.

The Paiute Tribe sincerely appreciates your accomplishments and consideration you and your staff have made to consult with the Tribes.

Sincerely,

Dorena Martineau

Reference: Cultural Resources Inventory Report, Kane County Water Conservancy District's Cove Reservoir Project, Kane County, Utah (UDSH Project No. U18TN0544)

Dear Mr. Kuwanwisiwma:

Enclosed is a cultural resources report titled *Cultural Resources Inventory Report, Kane County Water Conservancy District's Cove Reservoir Project, Kane County, Utah.* The Natural Resources Conservation Service (NRCS) is providing technical and financial assistance through the Watershed Protection and Flood Prevention Act (Public Law [PL] 83-566 Stat. 666 as amended [16 U.S.C. Section 1001 et. Seq.]) 1954, as amended, to the Kane County Water Conservancy District (KCWCD), as the project sponsor, to construct a new dam and improve water management infrastructure within the East Fork Virgin River Watershed, located north of Orderville, Utah. Specific improvements include the construction of a 6,055-acre foot reservoir (Cove Reservoir) that would provide enhanced conservation and a reliable water source for local agricultural users and maintain pressure through the local irrigation system. In addition, the existing Glendale hydroelectric power plant would be relocated and upgraded, which would double the amount of green energy created. Furthermore, the water from Cove Reservoir would be released during the summer months, providing additional water flow and reducing high water temperatures for the endangered Virging River chub and woundfin. To assess the environmental impacts of the project, a Watershed Plan and Environmental Assessment is being prepared by Transcon Environmental, on behalf of the NRCS, in cooperation with the Washington County Water Conservancy District, the Bureau of Land Management (BLM), and the National Park Service.

The Area of Potential Effects (APE) for the project encompasses a total of 791.68 acres, which includes the proposed reservoir area, the hyrdroelectric plant locations, four borrow pits, a linear survey of a new water pipeline, powerline, and utility corridor locations, and a spot check/survey of two borrow pit locations. Of the total acreage, 152.18 acres are on BLM Kanab Field-Office-managed land, 70.33 acres are on State of Utah, School and Institutional Trust Lands Administration (SITLA)-managed lands, and 569.17 are on privately-owned lands. The NRCS is acting as the lead Federal agency for the purposes of Section 106 consultation, which will also cover SITLA's responsibilities under Utah Code Annotated Section 9-8-404. The BLM and the U.S. Army Corps of Engineers are cooperating agencies.

Natural Resources Conservation Service 125 South State Street, Room 4010, Salt Lake City, UT 84138
www.ut.nrcs.usda.gov 801-524-4550 Fax 844-715-4928
USDA is an equal opportunity provider, employer, and lender.

Based on the results of the cultural resources survey and adherence to the avoidance stipulations described above, the NRCS recommends that the project proceed as planned with a determination of ***no adverse effect to historic properties***. The NRCS requests concurrence for the determination of project effects and site eligibility. If you have any questions, comments, or concerns, please contact Tara S. Hoffmann, State Cultural Resources Specialist, at 801-524-4556 at your convenience.

Agency Consultation

January 9, 2020

Mr. Brian Storm
Archeologist
Bureau of Land Management
Kanab Field Office
669 S Hwy 89A
Kanab, Utah 84741

Reference: Cultural Resources Inventory Report, Kane County Water Conservancy District's Cove Reservoir Project, Kane County, Utah (UDSH Project No. U18TN0544)

Dear Mr. Storm:

Enclosed is a cultural resources report titled *Cultural Resources Inventory Report, Kane County Water Conservancy District's Cove Reservoir Project, Kane County, Utah.* The Natural Resources Conservation Service (NRCS) is providing technical and financial assistance through the Watershed Protection and Flood Prevention Act (Public Law [PL] 83-566 Stat. 666 as amended [16 U.S.C. Section 1001 et. Seq.]) 1954, as amended, to the Kane County Water Conservancy District (KCWCD), as the project sponsor, to construct a new dam and improve water management infrastructure within the East Fork Virgin River Watershed, located north of Orderville, Utah. Specific improvements include the construction of a 6,055-acre foot reservoir (Cove Reservoir) that would provide enhanced conservation and a reliable water source for local agricultural users and maintain pressure through the local irrigation system. In addition, the existing Glendale hydroelectric power plant would be relocated and upgraded, which would double the amount of green energy created. Furthermore, the water from Cove Reservoir would be released during the summer months, providing additional water flow and reducing high water temperatures for the endangered Virging River chub and woundfin. To assess the environmental impacts of the project, a Watershed Plan and Environmental Assessment is being prepared by Transcon Environmental, on behalf of the NRCS, in cooperation with the Washington County Water Conservancy District, the Bureau of Land Management (BLM), and the National Park Service.

The Area of Potential Effects (APE) for the project encompasses a total of 791.68 acres, which includes the proposed reservoir area, the hyrdroelectric plant locations, four borrow pits, a linear survey of a new water pipeline, powerline, and utility corridor locations, and a spot check/survey of two borrow pit locations. Of the total acreage, 152.18 acres are on BLM Kanab Field-Office-managed land, 70.33 acres are on State of Utah, School and Institutional Trust Lands Administration (SITLA)-managed lands, and 569.17 are on privately-owned lands. The NRCS is acting as the lead Federal agency for the purposes of Section 106 consultation, which will also cover SITLA's responsibilities under Utah Code Annotated Section 9-8-404. The BLM and the U.S. Army Corps of Engineers are cooperating agencies.

A pedestrian cultural resource inventory of the undertaking was completed by Transcon Environmental on October 1 through 8 and October 10 through 13, 2018; supplemental surveys of the project occurred between June 12 through 14. A total of 9 new cultural resource sites (42KA8785, 42KA8900, 42KA8901, 42KA8902, 42KA8903, 42KA8904, 42KA8972, 42KA8973, and 42KA8974), 1 previous cultural resource site (42KA6331), and 15 isolated occurrences (IOs) were identified and recorded within the Project APE. Five archaeological sites and two historic structures were identified as a result of the inventory. Table 1 summarizes the sites identified and the NRCS' National Register of Historic Places (NRHP) eligibility determinations.

Table 1. Summary of sites and structures in the survey area

Site Number/ Land Status	Site Type	NRHP Eligibility	Effects
42KA6331/ BLM	Prehistoric lithic scatter	Eligible—D (previously determined)	*No Adverse Effect to Historic Properties.* Site will be avoided by at least 50 feet by all project activities. Should any future project-related activities occur within 15 meters of the site, a cultural resources monitor must be present.
42KA8785/ Private	Prehistoric artifact scatter	Eligible – D	*No Adverse Effect to Historic Properties*. Site will be avoided by at least 50 feet by all project activities. Should any future project-related activities occur within 15 meters of the site, a cultural resources monitor must be present.
42KA8900/ Private	Historic artifact scatter	Not Eligible	No Effects
42KA8901/ Private	Multicomponent: prehistoric lithic scatter, historic artifact scatters	Not Eligible	No Effects
42KA8902/ Private	Historic artifact scatter	Not Eligible	No Effects
42KA8903/ Private	Historic artifact scatter	Not Eligible	No Effects
42KA8904/ Private	Prehistoric ceramic, lithic, and FCR scatter	Eligible—D	*No Adverse Effect to Historic Properties.* Site will be avoided by at least 50 feet by all project activities. Should any future project-related activities occur within 15 meters of the site, a cultural resources monitor must be present.
42KA8972/ BLM	Prehistoric lithic scatter	Not Eligible	No Effects
42KA8973/ BLM	Prehistoric artifact scatter	Not Eligible	No Effects
42KA8974/ Private	Prehistoric artifact scatter	Eligible—D	*No Adverse Effect to Historic Properties* if the site is avoided. Should any future project-related activities occur within 15 meters of the site, a cultural resources monitor must be present.

Based on the results of the cultural resources survey and adherence to the avoidance stipulations described above, the NRCS recommends that the project proceed as planned with a determination of ***no adverse effect to historic properties***. The NRCS requests concurrence for the determination of project effects and site eligibility. If you have any questions, comments, or concerns, please contact Tara S. Hoffmann, State Cultural Resources Specialist, at 801-524-4556 at your convenience.

Sincerely,

Emily Fife

Bountiful, UT 84010-7744

Reference: Cultural Resources Inventory Report, Kane County Water Conservancy District's Cove Reservoir Project, Kane County, Utah (UDSH Project No. U18TN0544)

Dear Mr. Jencks:

Enclosed is a cultural resources report titled *Cultural Resources Inventory Report, Kane County Water Conservancy District's Cove Reservoir Project, Kane County, Utah.* The Natural Resources Conservation Service (NRCS) is providing technical and financial assistance through the Watershed Protection and Flood Prevention Act (Public Law [PL] 83-566 Stat. 666 as amended [16 U.S.C. Section 1001 et. Seq.]) 1954, as amended, to the Kane County Water Conservancy District (KCWCD), as the project sponsor, to construct a new dam and improve water management infrastructure within the East Fork Virgin River Watershed, located north of Orderville, Utah. Specific improvements include the construction of a 6,055-acre foot reservoir (Cove Reservoir) that would provide enhanced conservation and a reliable water source for local agricultural users and maintain pressure through the local irrigation system. In addition, the existing Glendale hydroelectric power plant would be relocated and upgraded, which would double the amount of green energy created. Furthermore, the water from Cove Reservoir would be released during the summer months, providing additional water flow and reducing high water temperatures for the endangered Virging River chub and woundfin. To assess the environmental impacts of the project, a Watershed Plan and Environmental Assessment is being prepared by Transcon Environmental, on behalf of the NRCS, in cooperation with the Washington County Water Conservancy District, the Bureau of Land Management (BLM), and the National Park Service.

The Area of Potential Effects (APE) for the project encompasses a total of 791.68 acres, which includes the proposed reservoir area, the hyrdroelectric plant locations, four borrow pits, a linear survey of a new water pipeline, powerline, and utility corridor locations, and a spot check/survey of two borrow pit locations. Of the total acreage, 152.18 acres are on BLM Kanab Field-Office-managed land, 70.33 acres are on State of Utah, School and Institutional Trust Lands Administration (SITLA)-managed lands, and 569.17 are on privately-owned lands. The NRCS is acting as the lead Federal agency for the purposes of Section 106 consultation, which will also cover SITLA's responsibilities under Utah Code Annotated Section 9-8-404. The BLM and the U.S. Army Corps of Engineers are cooperating agencies.

A pedestrian cultural resource inventory of the undertaking was completed by Transcon Environmental on October 1 through 8 and October 10 through 13, 2018; supplemental surveys of the project occurred between June 12 through 14. A total of 9 new cultural resource sites (42KA8785, 42KA8900, 42KA8901, 42KA8902, 42KA8903, 42KA8904, 42KA8972, 42KA8973, and 42KA8974), 1 previous cultural resource site (42KA6331), and 15 isolated occurrences (IOs) were identified and recorded within the Project APE. Five archaeological sites and two historic structures were identified as a result of the inventory. Table 1 summarizes the sites identified and the NRCS' National Register of Historic Places (NRHP) eligibility determinations.

Table 1. Summary of sites and structures in the survey area

Site Number/ Land Status	Site Type	NRHP Eligibility	Effects
42KA6331/ BLM	Prehistoric lithic scatter	Eligible—D (previously determined)	*No Adverse Effect to Historic Properties.* Site will be avoided by at least 50 feet by all project activities. Should any future project-related activities occur within 15 meters of the site, a cultural resources monitor must be present.
42KA8785/ Private	Prehistoric artifact scatter	Eligible – D	*No Adverse Effect to Historic Properties*. Site will be avoided by at least 50 feet by all project activities. Should any future project-related activities occur within 15 meters of the site, a cultural resources monitor must be present.
42KA8900/ Private	Historic artifact scatter	Not Eligible	No Effects
42KA8901/ Private	Multicomponent: prehistoric lithic scatter, historic artifact scatters	Not Eligible	No Effects
42KA8902/ Private	Historic artifact scatter	Not Eligible	No Effects
42KA8903/ Private	Historic artifact scatter	Not Eligible	No Effects
42KA8904/ Private	Prehistoric ceramic, lithic, and FCR scatter	Eligible—D	*No Adverse Effect to Historic Properties.* Site will be avoided by at least 50 feet by all project activities. Should any future project-related activities occur within 15 meters of the site, a cultural resources monitor must be present.
42KA8972/ BLM	Prehistoric lithic scatter	Not Eligible	No Effects
42KA8973/ BLM	Prehistoric artifact scatter	Not Eligible	No Effects
42KA8974/ Private	Prehistoric artifact scatter	Eligible—D	*No Adverse Effect to Historic Properties* if the site is avoided. Should any future project-related activities occur within 15 meters of the site, a cultural resources monitor must be present.

Based on the results of the cultural resources survey and adherence to the avoidance stipulations described above, the NRCS recommends that the project proceed as planned with a determination of ***no adverse effect to historic properties***. The NRCS requests concurrence for the determination of project effects and site eligibility. If you have any questions, comments, or concerns, please contact Tara S. Hoffmann, State Cultural Resources Specialist, at 801-524-4556 at your convenience.

Sincerely,

Emily Fife

Second Cultural Resource Inventory Report

SHPO Consultation

January 23, 2023

Christopher Merritt, PhD
State Historic Preservation Officer
Utah Division of State History
300 Rio Grande Avenue
Salt Lake City, Utah 84101-1182

Reference: *Cultural Resources Inventory Report, Kane County Water Conservancy District's Cove East Fork Virgin River Plan-Environmental Impact Statement (EIS), Kane County, Utah—Addendum to Cultural Resources Inventory Report, Kane County Water Conservancy District's Cove Reservoir Project (U18TN0544), Kane County, Utah* (Addendum Project; Utah Antiquities Project Number U21TN0840)

Dear Dr. Merritt:

Included in this submission is a cultural resources report titled *Cultural Resources Inventory Report, Kane County Water Conservancy District's Cove East Fork Virgin River Plan-Environmental Impact Statement (EIS), Kane County, Utah—Addendum to Cultural Resources Inventory Report, Kane County Water Conservancy District's Cove Reservoir Project (U18TN0544), Kane County, Utah*, and associated data. The Natural Resources Conservation Service (NRCS) and Kane County Water Conservancy District (KCWCD) are proposing the addition of a pipeline to their Cove Reservoir Project (U18TN0544), which originally consisted of a reservoir and associated facilities. The original U18TN0544 Class III inventory was conducted in October of 2018. The additional pipeline is being completed as *Cultural Resources Inventory Report, Kane County Water Conservancy District's Cove East Fork Virgin River Plan-Environmental Impact Statement (EIS), Kane County, Utah—Addendum to Cultural Resources Inventory Report, Kane County Water Conservancy District's Cove Reservoir Project (U18TN0544), Kane County, Utah* (Addendum Project; Utah Antiquities Project Number U21TN0840). This addendum and supplemental inventory area are the result of a change in project complexity, changing from an Environmental Assessment to an EIS.

The Addendum Project Area of Potential Effects (APE) totals 9.06 miles (68.83 acres) in length in Kane County, Utah. Throughout the addendum Project area, for a total of 9.06 miles (47,836 feet), a new pipeline will be placed within or parallel to existing irrigation ditches as part of the Cove East Fork Virgin River Plan-EIS Project improvements located immediately southwest of the town of Orderville, Utah. To account for flexibility in design, a survey corridor of 15 meters (approximately 50 feet) was evaluated. This resulted in a total APE of 68.83 acres. Of this, the APE is comprised of 68.71 acres of Private land, 0.11 acres of land administered by the Bureau of Land Management, Kanab Field Office, and 0.01 acres of lands managed by the Utah School and Institutional Trust Lands Administration. The NRCS is acting as the lead federal agency for the purposes of Section 106 consultation, which will also cover SITLA's responsibilities under Utah Code Annotated Section 9-8-404. The BLM is a cooperating agency.

Class III (intensive pedestrian) and Class II (reconnaissance) cultural resources inventory were conducted between November 15 to 19, 2021 and on March 20, 2022 by Transcon Environmental. A total of five cultural resource sites (one previously identified and four newly recorded) were identified within the APE (42KA1157, 42KA9490, 42KA9491, 42KA9492, 42KA9493). Two previously recorded site that were mapped within the current APE but relocated outside of the APE (42KA4538 and 42KA4539) were also revisited and updated.

Table 1 summarizes the sites identified, the NRCS' eligibility determinations, project effects, project designs measures, and proposed mitigation measures.

TABLE 4 PROJECT SUMMARY AND CONCLUSIONS						
Site No.	**Temporal Affiliation**	**Site Description**	**Eligibility**	**Effects**	**Project Design Impacts**	**Site Protective or Avoidance Measures**
42KA1157	Prehistoric	Prehistoric artifact scatter	Eligible—D	*No Adverse Effect*	Installation of new buried pipe along the northeast portion of the site.	None; the portion of the site within the Project APE is heavily disturbed by previous road construction/maintenance, plowing, livestock and a sewer line, it has also been previously tested and is non-contributing to the overall eligibility of the site.
42KA4538	Historic	Historic bridge abutment	Not Eligible	No effect	N/A; also, outside of the current Project APE.	N/A; also, outside of the current Project APE.
42KA4539	Historic	Historic ditch/ flume	Not Eligible	No effect	N/A; also, outside of the current Project APE.	N/A; also, outside of the current Project APE.
42KA9490 (FS-01)	Historic	Historic ditch (*Mount Carmel Irrigation Ditch–West Ditch*)	Eligible—A, C, D	*Adverse Effect*	The open ditch will be converted to buried pipe.	An inadvertent discovery plan will be prepared, as well as a MOA with associated Historic Properties Treatment Plan to mitigate the adverse effects to the site.
42KA9491 (FS-02)	Historic	Historic ditch (*Mount Carmel Irrigation Ditch–East Ditch*)	Eligible—A, D	*Adverse Effect*	The open ditch will be converted to buried pipe.	An inadvertent discovery plan will be prepared, as well as a MOA with associated Historic Properties Treatment Plan to mitigate the adverse effects to the site.
42KA9492 (FS-03)	Historic	Historic road (*Lamb's Lane*)	Not Eligible	No effect	N/A	N/A
42KA9493 (FS-04)	Historic	Historic road (*Tait Lane*)	Not Eligible	No effect	N/A	N/A

To summarize, as a result of the proposed project, two historic ditches (42KA9490 and 42KA9491), the Mount Carmel Irrigation West and East Ditches, will be converted from open ditch to buried pipe. Given that both sites are eligible for the NRHP under multiple criteria, the piping will result in adverse effects to both sites. To resolve the adverse effects, an inadvertent discovery plan will be prepared and supplied to construction crews, in additional to the preparation and execution of a Memorandum of Agreement with associated Treatment Plan. The MOA will be prepared in consultation with the Utah SHPO, KCWCD, interested THPOs, tribes, and other organizations.

Thus, the NRCS recommends that the project proceed as planned with a determination of ***adverse effect to historic properties***. The NRCS requests concurrence for the determination of project effects and site eligibility. If you have any questions, comments, or concerns, please contact Tara S. Hoffmann, State Cultural Resources Specialist, at 801-524-4556 at your convenience.

Sincerely,

TRISHA CRACROFT
Acting State Conservationist

RE: Cultural Resources Inventory Report, Kane County Water Conservancy District's Cove East Fork Virgin River Plan-Environmental Impact Statement (EIS), Kane County, Utah—Addendum to Cultural Resources Inventory Report, Kane County Water Conservancy District's Cove Reservoir Project (U18TN0544), Kane County, Utah

For future correspondence, please reference Case No. 23-0280

Dear Trisha,

The Utah State Historic Preservation Office received your submission and request for our comment on the above-referenced undertaking on February 03, 2023.

We concur with your determinations of eligibility and finding of "Adverse effect" for this undertaking.

This letter serves as our comment on the determinations you have made within the consultation process specified in §36CFR800.4. If you have questions, please contact me at 801-245-7263 or by email at cmerritt@utah.gov.

Sincerely,

Christopher W. Merritt
State Historic Preservation Officer

Tribal Consultation

January 23, 2023

Mr. Richard M. Begay
THPO and Department Manager
Navajo Nation Historic Preservation Department
P.O. Box 4950
Window Rock, Arizona 86515

Reference: *Cultural Resources Inventory Report, Kane County Water Conservancy District's Cove East Fork Virgin River Plan-Environmental Impact Statement (EIS), Kane County, Utah—Addendum to Cultural Resources Inventory Report, Kane County Water Conservancy District's Cove Reservoir Project (U18TN0544), Kane County, Utah* (Addendum Project; Utah Antiquities Project Number U21TN0840)

Dear Mr. Begay:

Included in this submission is a cultural resources report titled *Cultural Resources Inventory Report, Kane County Water Conservancy District's Cove East Fork Virgin River Plan-Environmental Impact Statement (EIS), Kane County, Utah—Addendum to Cultural Resources Inventory Report, Kane County Water Conservancy District's Cove Reservoir Project (U18TN0544), Kane County, Utah*, and associated data. The Natural Resources Conservation Service (NRCS) and Kane County Water Conservancy District (KCWCD) are proposing the addition of a pipeline to their Cove Reservoir Project (U18TN0544), which originally consisted of a reservoir and associated facilities. The original U18TN0544 Class III inventory was conducted in October of 2018. The additional pipeline is being completed as *Cultural Resources Inventory Report, Kane County Water Conservancy District's Cove East Fork Virgin River Plan-Environmental Impact Statement (EIS), Kane County, Utah—Addendum to Cultural Resources Inventory Report, Kane County Water Conservancy District's Cove Reservoir Project (U18TN0544), Kane County, Utah* (Addendum Project; Utah Antiquities Project Number U21TN0840). This addendum and supplemental inventory area are the result of a change in project complexity, changing from an Environmental Assessment to an EIS.

The Addendum Project Area of Potential Effects (APE) totals 9.06 miles (68.83 acres) in length in Kane County, Utah. Throughout the addendum Project area, for a total of 9.06 miles (47,836 feet), a new pipeline will be placed within or parallel to existing irrigation ditches as part of the Cove East Fork Virgin River Plan-EIS Project improvements located immediately southwest of the town of Orderville, Utah. To account for flexibility in design, a survey corridor of 15 meters (approximately 50 feet) was evaluated. This resulted in a total APE of 68.83 acres. Of this, the APE is comprised of 68.71 acres of Private land, 0.11 acres of land administered by the Bureau of Land Management, Kanab Field Office, and 0.01 acres of lands managed by the Utah School and Institutional Trust Lands Administration. The NRCS is acting as the lead federal agency for the purposes of Section 106 consultation, which will also cover SITLA's responsibilities under Utah Code Annotated Section 9-8-404. The BLM is a cooperating agency.

Class III (intensive pedestrian) and Class II (reconnaissance) cultural resources inventory were conducted between November 15 to 19, 2021 and on March 20, 2022 by Transcon Environmental. A total of five cultural resource sites (one previously identified and four newly recorded) were identified within the APE (42KA1157, 42KA9490, 42KA9491, 42KA9492, 42KA9493). Two previously recorded site that were mapped within the current APE but relocated outside of the APE (42KA4538 and 42KA4539) were also revisited and updated.

42KA9490 (FS-01)	Historic	Historic ditch (*Mount Carmel Irrigation Ditch–West Ditch*)	Eligible—A, C, D	*Adverse Effect*	The open ditch will be converted to buried pipe.	An inadvertent discovery plan will be prepared, as well as a MOA with associated Historic Properties Treatment Plan to mitigate the adverse effects to the site.
42KA9491 (FS-02)	Historic	Historic ditch (*Mount Carmel Irrigation Ditch–East Ditch*)	Eligible—A, D	*Adverse Effect*	The open ditch will be converted to buried pipe.	An inadvertent discovery plan will be prepared, as well as a MOA with associated Historic Properties Treatment Plan to mitigate the adverse effects to the site.
42KA9492 (FS-03)	Historic	Historic road (*Lamb's Lane*)	Not Eligible	No effect	N/A	N/A
42KA9493 (FS-04)	Historic	Historic road (*Tait Lane*)	Not Eligible	No effect	N/A	N/A

To summarize, as a result of the proposed project, two historic ditches (42KA9490 and 42KA9491), the Mount Carmel Irrigation West and East Ditches, will be converted from open ditch to buried pipe. Given that both sites are eligible for the NRHP under multiple criteria, the piping will result in adverse effects to both sites. To resolve the adverse effects, an inadvertent discovery plan will be prepared and supplied to construction crews, in additional to the preparation and execution of a Memorandum of Agreement with associated Treatment Plan. The MOA will be prepared in consultation with the Utah SHPO, KCWCD, interested THPOs, tribes, and other organizations.

Moapa, Nevada 89025

Reference: *Cultural Resources Inventory Report, Kane County Water Conservancy District's Cove East Fork Virgin River Plan-Environmental Impact Statement (EIS), Kane County, Utah—Addendum to Cultural Resources Inventory Report, Kane County Water Conservancy District's Cove Reservoir Project (U18TN0544), Kane County, Utah* (Addendum Project; Utah Antiquities Project Number U21TN0840)

Dear Mr. Daboda:

Included in this submission is a cultural resources report titled *Cultural Resources Inventory Report, Kane County Water Conservancy District's Cove East Fork Virgin River Plan-Environmental Impact Statement (EIS), Kane County, Utah—Addendum to Cultural Resources Inventory Report, Kane County Water Conservancy District's Cove Reservoir Project (U18TN0544), Kane County, Utah*, and associated data. The Natural Resources Conservation Service (NRCS) and Kane County Water Conservancy District (KCWCD) are proposing the addition of a pipeline to their Cove Reservoir Project (U18TN0544), which originally consisted of a reservoir and associated facilities. The original U18TN0544 Class III inventory was conducted in October of 2018. The additional pipeline is being completed as *Cultural Resources Inventory Report, Kane County Water Conservancy District's Cove East Fork Virgin River Plan-Environmental Impact Statement (EIS), Kane County, Utah—Addendum to Cultural Resources Inventory Report, Kane County Water Conservancy District's Cove Reservoir Project (U18TN0544), Kane County, Utah* (Addendum Project; Utah Antiquities Project Number U21TN0840). This addendum and supplemental inventory area are the result of a change in project complexity, changing from an Environmental Assessment to an EIS.

The Addendum Project Area of Potential Effects (APE) totals 9.06 miles (68.83 acres) in length in Kane County, Utah. Throughout the addendum Project area, for a total of 9.06 miles (47,836 feet), a new pipeline will be placed within or parallel to existing irrigation ditches as part of the Cove East Fork Virgin River Plan-EIS Project improvements located immediately southwest of the town of Orderville, Utah. To account for flexibility in design, a survey corridor of 15 meters (approximately 50 feet) was evaluated. This resulted in a total APE of 68.83 acres. Of this, the APE is comprised of 68.71 acres of Private land, 0.11 acres of land administered by the Bureau of Land Management, Kanab Field Office, and 0.01 acres of lands managed by the Utah School and Institutional Trust Lands Administration. The NRCS is acting as the lead federal agency for the purposes of Section 106 consultation, which will also cover SITLA's responsibilities under Utah Code Annotated Section 9-8-404. The BLM is a cooperating agency.

Class III (intensive pedestrian) and Class II (reconnaissance) cultural resources inventory were conducted between November 15 to 19, 2021 and on March 20, 2022 by Transcon Environmental. A total of five cultural resource sites (one previously identified and four newly recorded) were identified within the APE (42KA1157, 42KA9490, 42KA9491, 42KA9492, 42KA9493). Two previously recorded site that were mapped within the current APE but relocated outside of the APE (42KA4538 and 42KA4539) were also revisited and updated.

Table 1 summarizes the sites identified, the NRCS' eligibility determinations, project effects, project designs measures, and proposed mitigation measures.

TABLE 4

PROJECT SUMMARY AND CONCLUSIONS

Site No.	Temporal Affiliation	Site Description	Eligibility	Effects	Project Design Impacts	Site Protective or Avoidance Measures
42KA1157	Prehistoric	Prehistoric artifact scatter	Eligible—D	*No Adverse Effect*	Installation of new buried pipe along the northeast portion of the site.	None; the portion of the site within the Project APE is heavily disturbed by previous road construction/maintenance, plowing, livestock and a sewer line, it has also been previously tested and is non-contributing to the overall eligibility of the site.
42KA4538	Historic	Historic bridge abutment	Not Eligible	No effect	N/A; also, outside of the current Project APE.	N/A; also, outside of the current Project APE.
42KA4539	Historic	Historic ditch/ flume	Not Eligible	No effect	N/A; also, outside of the current Project APE.	N/A; also, outside of the current Project APE.
42KA9490 (FS-01)	Historic	Historic ditch (*Mount Carmel Irrigation Ditch– West Ditch*)	Eligible—A, C, D	*Adverse Effect*	The open ditch will be converted to buried pipe.	An inadvertent discovery plan will be prepared, as well as a MOA with associated Historic Properties Treatment Plan to mitigate the adverse effects to the site.
42KA9491 (FS-02)	Historic	Historic ditch (*Mount Carmel Irrigation Ditch– East Ditch*)	Eligible—A, D	*Adverse Effect*	The open ditch will be converted to buried pipe.	An inadvertent discovery plan will be prepared, as well as a MOA with associated Historic Properties Treatment Plan to mitigate the adverse effects to the site.
42KA9492 (FS-03)	Historic	Historic road (*Lamb's Lane*)	Not Eligible	No effect	N/A	N/A

Dear Mr. Koyiyumptewa :

Included in this submission is a cultural resources report titled *Cultural Resources Inventory Report, Kane County Water Conservancy District's Cove East Fork Virgin River Plan-Environmental Impact Statement (EIS), Kane County, Utah—Addendum to Cultural Resources Inventory Report, Kane County Water Conservancy District's Cove Reservoir Project (U18TN0544), Kane County, Utah*, and associated data. The Natural Resources Conservation Service (NRCS) and Kane County Water Conservancy District (KCWCD) are proposing the addition of a pipeline to their Cove Reservoir Project (U18TN0544), which originally consisted of a reservoir and associated facilities. The original U18TN0544 Class III inventory was conducted in October of 2018. The additional pipeline is being completed as *Cultural Resources Inventory Report, Kane County Water Conservancy District's Cove East Fork Virgin River Plan-Environmental Impact Statement (EIS), Kane County, Utah—Addendum to Cultural Resources Inventory Report, Kane County Water Conservancy District's Cove Reservoir Project (U18TN0544), Kane County, Utah* (Addendum Project; Utah Antiquities Project Number U21TN0840). This addendum and supplemental inventory area are the result of a change in project complexity, changing from an Environmental Assessment to an EIS.

The Addendum Project Area of Potential Effects (APE) totals 9.06 miles (68.83 acres) in length in Kane County, Utah. Throughout the addendum Project area, for a total of 9.06 miles (47,836 feet), a new pipeline will be placed within or parallel to existing irrigation ditches as part of the Cove East Fork Virgin River Plan-EIS Project improvements located immediately southwest of the town of Orderville, Utah. To account for flexibility in design, a survey corridor of 15 meters (approximately 50 feet) was evaluated. This resulted in a total APE of 68.83 acres. Of this, the APE is comprised of 68.71 acres of Private land, 0.11 acres of land administered by the Bureau of Land Management, Kanab Field Office, and 0.01 acres of lands managed by the Utah School and Institutional Trust Lands Administration. The NRCS is acting as the lead federal agency for the purposes of Section 106 consultation, which will also cover SITLA's responsibilities under Utah Code Annotated Section 9-8-404. The BLM is a cooperating agency.

Class III (intensive pedestrian) and Class II (reconnaissance) cultural resources inventory were conducted between November 15 to 19, 2021 and on March 20, 2022 by Transcon Environmental. A total of five cultural resource sites (one previously identified and four newly recorded) were identified within the APE (42KA1157, 42KA9490, 42KA9491, 42KA9492, 42KA9493). Two previously recorded site that were mapped within the current APE but relocated outside of the APE (42KA4538 and 42KA4539) were also revisited and updated.

Table 1 summarizes the sites identified, the NRCS' eligibility determinations, project effects, project designs measures, and proposed mitigation measures.

TABLE 4						
PROJECT SUMMARY AND CONCLUSIONS						
Site No.	**Temporal Affiliation**	**Site Description**	**Eligibility**	**Effects**	**Project Design Impacts**	**Site Protective or Avoidance Measures**
42KA1157	Prehistoric	Prehistoric artifact scatter	Eligible—D	*No Adverse Effect*	Installation of new buried pipe along the northeast portion of the site.	None; the portion of the site within the Project APE is heavily disturbed by previous road construction/maintenance, plowing, livestock and a sewer line, it has also been previously tested and is non-contributing to the overall eligibility of the site.
42KA4538	Historic	Historic bridge abutment	Not Eligible	No effect	N/A; also, outside of the current Project APE.	N/A; also, outside of the current Project APE.
42KA4539	Historic	Historic ditch/ flume	Not Eligible	No effect	N/A; also, outside of the current Project APE.	N/A; also, outside of the current Project APE.
42KA9490 (FS-01)	Historic	Historic ditch (*Mount Carmel Irrigation Ditch–West Ditch*)	Eligible—A, C, D	*Adverse Effect*	The open ditch will be converted to buried pipe.	An inadvertent discovery plan will be prepared, as well as a MOA with associated Historic Properties Treatment Plan to mitigate the adverse effects to the site.
42KA9491 (FS-02)	Historic	Historic ditch (*Mount Carmel Irrigation Ditch–East Ditch*)	Eligible—A, D	*Adverse Effect*	The open ditch will be converted to buried pipe.	An inadvertent discovery plan will be prepared, as well as a MOA with associated Historic Properties Treatment Plan to mitigate the adverse effects to the site.
42KA9492 (FS-03)	Historic	Historic road (*Lamb's Lane*)	Not Eligible	No effect	N/A	N/A
42KA9493 (FS-04)	Historic	Historic road (*Tait Lane*)	Not Eligible	No effect	N/A	N/A

To summarize, as a result of the proposed project, two historic ditches (42KA9490 and 42KA9491), the Mount Carmel Irrigation West and East Ditches, will be converted from open ditch to buried pipe. Given that both sites are eligible for the NRHP under multiple criteria, the piping will result in adverse effects to both sites. To resolve the adverse effects, an inadvertent discovery plan will be prepared and supplied to construction crews, in additional to the preparation and execution of a Memorandum of Agreement with associated Treatment Plan. The MOA will be prepared in consultation with the Utah SHPO, KCWCD, interested THPOs, tribes, and other organizations.

Thus, the NRCS recommends that the project proceed as planned with a determination of ***adverse effect to historic properties***. The NRCS requests concurrence for the determination of project effects and site eligibility. If you have any questions, comments, or concerns, please contact Tara S. Hoffmann, State Cultural Resources Specialist, at 801-524-4556 at your convenience.

Sincerely,

Dear Mr. Knight:

Included in this submission is a cultural resources report titled *Cultural Resources Inventory Report, Kane County Water Conservancy District's Cove East Fork Virgin River Plan-Environmental Impact Statement (EIS), Kane County, Utah—Addendum to Cultural Resources Inventory Report, Kane County Water Conservancy District's Cove Reservoir Project (U18TN0544), Kane County, Utah*, and associated data. The Natural Resources Conservation Service (NRCS) and Kane County Water Conservancy District (KCWCD) are proposing the addition of a pipeline to their Cove Reservoir Project (U18TN0544), which originally consisted of a reservoir and associated facilities. The original U18TN0544 Class III inventory was conducted in October of 2018. The additional pipeline is being completed as *Cultural Resources Inventory Report, Kane County Water Conservancy District's Cove East Fork Virgin River Plan-Environmental Impact Statement (EIS), Kane County, Utah—Addendum to Cultural Resources Inventory Report, Kane County Water Conservancy District's Cove Reservoir Project (U18TN0544), Kane County, Utah* (Addendum Project; Utah Antiquities Project Number U21TN0840). This addendum and supplemental inventory area are the result of a change in project complexity, changing from an Environmental Assessment to an EIS.

The Addendum Project Area of Potential Effects (APE) totals 9.06 miles (68.83 acres) in length in Kane County, Utah. Throughout the addendum Project area, for a total of 9.06 miles (47,836 feet), a new pipeline will be placed within or parallel to existing irrigation ditches as part of the Cove East Fork Virgin River Plan-EIS Project improvements located immediately southwest of the town of Orderville, Utah. To account for flexibility in design, a survey corridor of 15 meters (approximately 50 feet) was evaluated. This resulted in a total APE of 68.83 acres. Of this, the APE is comprised of 68.71 acres of Private land, 0.11 acres of land administered by the Bureau of Land Management, Kanab Field Office, and 0.01 acres of lands managed by the Utah School and Institutional Trust Lands Administration. The NRCS is acting as the lead federal agency for the purposes of Section 106 consultation, which will also cover SITLA's responsibilities under Utah Code Annotated Section 9-8-404. The BLM is a cooperating agency.

Class III (intensive pedestrian) and Class II (reconnaissance) cultural resources inventory were conducted between November 15 to 19, 2021 and on March 20, 2022 by Transcon Environmental. A total of five cultural resource sites (one previously identified and four newly recorded) were identified within the APE (42KA1157, 42KA9490, 42KA9491, 42KA9492, 42KA9493). Two previously recorded site that were mapped within the current APE but relocated outside of the APE (42KA4538 and 42KA4539) were also revisited and updated.

Table 1 summarizes the sites identified, the NRCS' eligibility determinations, project effects, project designs measures, and proposed mitigation measures.

Dear Mr. Anderson:

Included in this submission is a cultural resources report titled *Cultural Resources Inventory Report, Kane County Water Conservancy District's Cove East Fork Virgin River Plan-Environmental Impact Statement (EIS), Kane County, Utah—Addendum to Cultural Resources Inventory Report, Kane County Water Conservancy District's Cove Reservoir Project (U18TN0544), Kane County, Utah.* The Natural Resources Conservation Service (NRCS) and Kane County Water Conservancy District (KCWCD) are proposing the addition of a pipeline to their Cove Reservoir Project (U18TN0544), which originally consisted of a reservoir and associated facilities. The original U18TN0544 Class III inventory was conducted in October of 2018. The additional pipeline is being completed as *Cultural Resources Inventory Report, Kane County Water Conservancy District's Cove East Fork Virgin River Plan-Environmental Impact Statement (EIS), Kane County, Utah—Addendum to Cultural Resources Inventory Report, Kane County Water Conservancy District's Cove Reservoir Project (U18TN0544), Kane County, Utah* (Addendum Project; Utah Antiquities Project Number U21TN0840). This addendum and supplemental inventory area are the result of a change in project complexity, changing from an Environmental Assessment to an EIS.

The Addendum Project Area of Potential Effects (APE) totals 9.06 miles (68.83 acres) in length in Kane County, Utah. Throughout the addendum Project area, for a total of 9.06 miles (47,836 feet), a new pipeline will be placed within or parallel to existing irrigation ditches as part of the Cove East Fork Virgin River Plan-EIS Project improvements located immediately southwest of the town of Orderville, Utah. To account for flexibility in design, a survey corridor of 15 meters (approximately 50 feet) was evaluated. This resulted in a total APE of 68.83 acres. Of this, the APE is comprised of 68.71 acres of Private land, 0.11 acres of land administered by the Bureau of Land Management, Kanab Field Office, and 0.01 acres of lands managed by the Utah School and Institutional Trust Lands Administration. The NRCS is acting as the lead federal agency for the purposes of Section 106 consultation, which will also cover SITLA's responsibilities under Utah Code Annotated Section 9-8-404. The BLM is a cooperating agency.

Class III (intensive pedestrian) and Class II (reconnaissance) cultural resources inventory were conducted between November 15 to 19, 2021 and on March 20, 2022 by Transcon Environmental. A total of five cultural resource sites (one previously identified and four newly recorded) were identified within the APE (42KA1157, 42KA9490, 42KA9491, 42KA9492, 42KA9493). Two previously recorded site that were mapped within the current APE but relocated outside of the APE (42KA4538 and 42KA4539) were also revisited and updated.

Table 1 summarizes the sites identified, the NRCS' eligibility determinations, project effects, project designs measures, and proposed mitigation measures.

TABLE 4

An inadvertent discovery plan will be prepared, as well as a MOA with associated Historic Properties Treatment Plan to mitigate the adverse effects to the site.
42KA9491 (FS-02)	Historic	Historic ditch (*Mount Carmel Irrigation Ditch–East Ditch*)	Eligible—A, D	*Adverse Effect*	The open ditch will be converted to buried pipe.	An inadvertent discovery plan will be prepared, as well as a MOA with associated Historic Properties Treatment Plan to mitigate the adverse effects to the site.
42KA9492 (FS-03)	Historic	Historic road (*Lamb's Lane*)	Not Eligible	No effect	N/A	N/A
42KA9493 (FS-04)	Historic	Historic road (*Tait Lane*)	Not Eligible	No effect	N/A	N/A

To summarize, as a result of the proposed project, two historic ditches (42KA9490 and 42KA9491), the Mount Carmel Irrigation West and East Ditches, will be converted from open ditch to buried pipe. Given that both sites are eligible for the NRHP under multiple criteria, the piping will result in adverse effects to both sites. To resolve the adverse effects, an inadvertent discovery plan will be prepared and supplied to construction crews, in additional to the preparation and execution of a Memorandum of Agreement with associated Treatment Plan. The MOA will be prepared in consultation with the Utah SHPO, KCWCD, interested THPOs, tribes, and other organizations.

Fredonia, Arizona 86022

Reference: *Cultural Resources Inventory Report, Kane County Water Conservancy District's Cove East Fork Virgin River Plan-Environmental Impact Statement (EIS), Kane County, Utah—Addendum to Cultural Resources Inventory Report, Kane County Water Conservancy District's Cove Reservoir Project (U18TN0544), Kane County, Utah* (Addendum Project; Utah Antiquities Project Number U21TN0840)

Dear Mr. Bullets:

Included in this submission is a cultural resources report titled *Cultural Resources Inventory Report, Kane County Water Conservancy District's Cove East Fork Virgin River Plan-Environmental Impact Statement (EIS), Kane County, Utah—Addendum to Cultural Resources Inventory Report, Kane County Water Conservancy District's Cove Reservoir Project (U18TN0544), Kane County, Utah.* The Natural Resources Conservation Service (NRCS) and Kane County Water Conservancy District (KCWCD) are proposing the addition of a pipeline to their Cove Reservoir Project (U18TN0544), which originally consisted of a reservoir and associated facilities. The original U18TN0544 Class III inventory was conducted in October of 2018. The additional pipeline is being completed as *Cultural Resources Inventory Report, Kane County Water Conservancy District's Cove East Fork Virgin River Plan-Environmental Impact Statement (EIS), Kane County, Utah—Addendum to Cultural Resources Inventory Report, Kane County Water Conservancy District's Cove Reservoir Project (U18TN0544), Kane County, Utah* (Addendum Project; Utah Antiquities Project Number U21TN0840). This addendum and supplemental inventory area are the result of a change in project complexity, changing from an Environmental Assessment to an EIS.

The Addendum Project Area of Potential Effects (APE) totals 9.06 miles (68.83 acres) in length in Kane County, Utah. Throughout the addendum Project area, for a total of 9.06 miles (47,836 feet), a new pipeline will be placed within or parallel to existing irrigation ditches as part of the Cove East Fork Virgin River Plan-EIS Project improvements located immediately southwest of the town of Orderville, Utah. To account for flexibility in design, a survey corridor of 15 meters (approximately 50 feet) was evaluated. This resulted in a total APE of 68.83 acres. Of this, the APE is comprised of 68.71 acres of Private land, 0.11 acres of land administered by the Bureau of Land Management, Kanab Field Office, and 0.01 acres of lands managed by the Utah School and Institutional Trust Lands Administration. The NRCS is acting as the lead federal agency for the purposes of Section 106 consultation, which will also cover SITLA's responsibilities under Utah Code Annotated Section 9-8-404. The BLM is a cooperating agency.

Class III (intensive pedestrian) and Class II (reconnaissance) cultural resources inventory were conducted between November 15 to 19, 2021 and on March 20, 2022 by Transcon Environmental. A total of five cultural resource sites (one previously identified and four newly recorded) were identified within the APE (42KA1157, 42KA9490, 42KA9491, 42KA9492, 42KA9493). Two previously recorded site that were mapped within the current APE but relocated outside of the APE (42KA4538 and 42KA4539) were also revisited and updated.

Table 1 summarizes the sites identified, the NRCS' eligibility determinations, project effects, project designs measures, and proposed mitigation measures.

TABLE 4						
PROJECT SUMMARY AND CONCLUSIONS						
Site No.	**Temporal Affiliation**	**Site Description**	**Eligibility**	**Effects**	**Project Design Impacts**	**Site Protective or Avoidance Measures**
42KA1157	Prehistoric	Prehistoric artifact scatter	Eligible—D	*No Adverse Effect*	Installation of new buried pipe along the northeast portion of the site.	None; the portion of the site within the Project APE is heavily disturbed by previous road construction/maintenance, plowing, livestock and a sewer line, it has also been previously tested and is non-contributing to the overall eligibility of the site.
42KA4538	Historic	Historic bridge abutment	Not Eligible	No effect	N/A; also, outside of the current Project APE.	N/A; also, outside of the current Project APE.
42KA4539	Historic	Historic ditch/ flume	Not Eligible	No effect	N/A; also, outside of the current Project APE.	N/A; also, outside of the current Project APE.
42KA9490 (FS-01)	Historic	Historic ditch (*Mount Carmel Irrigation Ditch–West Ditch*)	Eligible—A, C, D	*Adverse Effect*	The open ditch will be converted to buried pipe.	An inadvertent discovery plan will be prepared, as well as a MOA with associated Historic Properties Treatment Plan to mitigate the adverse effects to the site.
42KA9491 (FS-02)	Historic	Historic ditch (*Mount Carmel Irrigation Ditch–East Ditch*)	Eligible—A, D	*Adverse Effect*	The open ditch will be converted to buried pipe.	An inadvertent discovery plan will be prepared, as well as a MOA with associated Historic Properties Treatment Plan to mitigate the adverse effects to the site.
42KA9492 (FS-03)	Historic	Historic road (*Lamb's Lane*)	Not Eligible	No effect	N/A	N/A
42KA9493 (FS-04)	Historic	Historic road (*Tait Lane*)	Not Eligible	No effect	N/A	N/A

To summarize, as a result of the proposed project, two historic ditches (42KA9490 and 42KA9491), the Mount Carmel Irrigation West and East Ditches, will be converted from open ditch to buried pipe. Given that both sites are eligible for the NRHP under multiple criteria, the piping will result in adverse effects to both sites. To resolve the adverse effects, an inadvertent discovery plan will be prepared and supplied to construction crews, in additional to the preparation and execution of a Memorandum of Agreement with associated Treatment Plan. The MOA will be prepared in consultation with the Utah SHPO, KCWCD, interested THPOs, tribes, and other organizations.

Reference: *Cultural Resources Inventory Report, Kane County Water Conservancy District's Cove East Fork Virgin River Plan-Environmental Impact Statement (EIS), Kane County, Utah—Addendum to Cultural Resources Inventory Report, Kane County Water Conservancy District's Cove Reservoir Project (U18TN0544), Kane County, Utah* (Addendum Project; Utah Antiquities Project Number U21TN0840)

Dear Ms. Martineau:

Included in this submission is a cultural resources report titled *Cultural Resources Inventory Report, Kane County Water Conservancy District's Cove East Fork Virgin River Plan-Environmental Impact Statement (EIS), Kane County, Utah—Addendum to Cultural Resources Inventory Report, Kane County Water Conservancy District's Cove Reservoir Project (U18TN0544), Kane County, Utah.* The Natural Resources Conservation Service (NRCS) and Kane County Water Conservancy District (KCWCD) are proposing the addition of a pipeline to their Cove Reservoir Project (U18TN0544), which originally consisted of a reservoir and associated facilities. The original U18TN0544 Class III inventory was conducted in October of 2018. The additional pipeline is being completed as *Cultural Resources Inventory Report, Kane County Water Conservancy District's Cove East Fork Virgin River Plan-Environmental Impact Statement (EIS), Kane County, Utah—Addendum to Cultural Resources Inventory Report, Kane County Water Conservancy District's Cove Reservoir Project (U18TN0544), Kane County, Utah* (Addendum Project; Utah Antiquities Project Number U21TN0840). This addendum and supplemental inventory area are the result of a change in project complexity, changing from an Environmental Assessment to an EIS.

The Addendum Project Area of Potential Effects (APE) totals 9.06 miles (68.83 acres) in length in Kane County, Utah. Throughout the addendum Project area, for a total of 9.06 miles (47,836 feet), a new pipeline will be placed within or parallel to existing irrigation ditches as part of the Cove East Fork Virgin River Plan-EIS Project improvements located immediately southwest of the town of Orderville, Utah. To account for flexibility in design, a survey corridor of 15 meters (approximately 50 feet) was evaluated. This resulted in a total APE of 68.83 acres. Of this, the APE is comprised of 68.71 acres of Private land, 0.11 acres of land administered by the Bureau of Land Management, Kanab Field Office, and 0.01 acres of lands managed by the Utah School and Institutional Trust Lands Administration. The NRCS is acting as the lead federal agency for the purposes of Section 106 consultation, which will also cover SITLA's responsibilities under Utah Code Annotated Section 9-8-404. The BLM is a cooperating agency.

Class III (intensive pedestrian) and Class II (reconnaissance) cultural resources inventory were conducted between November 15 to 19, 2021 and on March 20, 2022 by Transcon Environmental. A total of five cultural resource sites (one previously identified and four newly recorded) were identified within the APE (42KA1157, 42KA9490, 42KA9491, 42KA9492, 42KA9493). Two previously recorded site that were mapped within the current APE but relocated outside of the APE (42KA4538 and 42KA4539) were also revisited and updated.

Table 1 summarizes the sites identified, the NRCS' eligibility determinations, project effects, project designs measures, and proposed mitigation measures.

TABLE 4						
PROJECT SUMMARY AND CONCLUSIONS						
Site No.	**Temporal Affiliation**	**Site Description**	**Eligibility**	**Effects**	**Project Design Impacts**	**Site Protective or Avoidance Measures**
42KA1157	Prehistoric	Prehistoric artifact scatter	Eligible—D	*No Adverse Effect*	Installation of new buried pipe along the northeast portion of the site.	None; the portion of the site within the Project APE is heavily disturbed by previous road construction/maintenance, plowing, livestock and a sewer line, it has also been previously tested and is non-contributing to the overall eligibility of the site.
42KA4538	Historic	Historic bridge abutment	Not Eligible	No effect	N/A; also, outside of the current Project APE.	N/A; also, outside of the current Project APE.
42KA4539	Historic	Historic ditch/ flume	Not Eligible	No effect	N/A; also, outside of the current Project APE.	N/A; also, outside of the current Project APE.
42KA9490 (FS-01)	Historic	Historic ditch (*Mount Carmel Irrigation Ditch–West Ditch*)	Eligible—A, C, D	*Adverse Effect*	The open ditch will be converted to buried pipe.	An inadvertent discovery plan will be prepared, as well as a MOA with associated Historic Properties Treatment Plan to mitigate the adverse effects to the site.
42KA9491 (FS-02)	Historic	Historic ditch (*Mount Carmel Irrigation Ditch–East Ditch*)	Eligible—A, D	*Adverse Effect*	The open ditch will be converted to buried pipe.	An inadvertent discovery plan will be prepared, as well as a MOA with associated Historic Properties Treatment Plan to mitigate the adverse effects to the site.
42KA9492 (FS-03)	Historic	Historic road (*Lamb's Lane*)	Not Eligible	No effect	N/A	N/A
42KA9493 (FS-04)	Historic	Historic road (*Tait Lane*)	Not Eligible	No effect	N/A	N/A

To summarize, as a result of the proposed project, two historic ditches (42KA9490 and 42KA9491), the Mount Carmel Irrigation West and East Ditches, will be converted from open ditch to buried pipe. Given that both sites are eligible for the NRHP under multiple criteria, the piping will result in adverse effects to both sites. To resolve the adverse effects, an inadvertent discovery plan will be prepared and supplied to construction crews, in additional to the preparation and execution of a Memorandum of Agreement with associated Treatment Plan. The MOA will be prepared in consultation with the Utah SHPO, KCWCD, interested THPOs, tribes, and other organizations.

Dear President Lehi:

Included in this submission is a cultural resources report titled *Cultural Resources Inventory Report, Kane County Water Conservancy District's Cove East Fork Virgin River Plan-Environmental Impact Statement (EIS), Kane County, Utah—Addendum to Cultural Resources Inventory Report, Kane County Water Conservancy District's Cove Reservoir Project (U18TN0544), Kane County, Utah.* The Natural Resources Conservation Service (NRCS) and Kane County Water Conservancy District (KCWCD) are proposing the addition of a pipeline to their Cove Reservoir Project (U18TN0544), which originally consisted of a reservoir and associated facilities. The original U18TN0544 Class III inventory was conducted in October of 2018. The additional pipeline is being completed as *Cultural Resources Inventory Report, Kane County Water Conservancy District's Cove East Fork Virgin River Plan-Environmental Impact Statement (EIS), Kane County, Utah—Addendum to Cultural Resources Inventory Report, Kane County Water Conservancy District's Cove Reservoir Project (U18TN0544), Kane County, Utah* (Addendum Project; Utah Antiquities Project Number U21TN0840). This addendum and supplemental inventory area are the result of a change in project complexity, changing from an Environmental Assessment to an EIS.

The Addendum Project Area of Potential Effects (APE) totals 9.06 miles (68.83 acres) in length in Kane County, Utah. Throughout the addendum Project area, for a total of 9.06 miles (47,836 feet), a new pipeline will be placed within or parallel to existing irrigation ditches as part of the Cove East Fork Virgin River Plan-EIS Project improvements located immediately southwest of the town of Orderville, Utah. To account for flexibility in design, a survey corridor of 15 meters (approximately 50 feet) was evaluated. This resulted in a total APE of 68.83 acres. Of this, the APE is comprised of 68.71 acres of Private land, 0.11 acres of land administered by the Bureau of Land Management, Kanab Field Office, and 0.01 acres of lands managed by the Utah School and Institutional Trust Lands Administration. The NRCS is acting as the lead federal agency for the purposes of Section 106 consultation, which will also cover SITLA's responsibilities under Utah Code Annotated Section 9-8-404. The BLM is a cooperating agency.

Class III (intensive pedestrian) and Class II (reconnaissance) cultural resources inventory were conducted between November 15 to 19, 2021 and on March 20, 2022 by Transcon Environmental. A total of five cultural resource sites (one previously identified and four newly recorded) were identified within the APE (42KA1157, 42KA9490, 42KA9491, 42KA9492, 42KA9493). Two previously recorded site that were mapped within the current APE but relocated outside of the APE (42KA4538 and 42KA4539) were also revisited and updated.

Table 1 summarizes the sites identified, the NRCS' eligibility determinations, project effects, project designs measures, and proposed mitigation measures.

TABLE 4						
PROJECT SUMMARY AND CONCLUSIONS						
Site No.	**Temporal Affiliation**	**Site Description**	**Eligibility**	**Effects**	**Project Design Impacts**	**Site Protective or Avoidance Measures**
42KA1157	Prehistoric	Prehistoric artifact scatter	Eligible—D	*No Adverse Effect*	Installation of new buried pipe along the northeast portion of the site.	None; the portion of the site within the Project APE is heavily disturbed by previous road construction/maintenance, plowing, livestock and a sewer line, it has also been previously tested and is non-contributing to the overall eligibility of the site.
42KA4538	Historic	Historic bridge abutment	Not Eligible	No effect	N/A; also, outside of the current Project APE.	N/A; also, outside of the current Project APE.
42KA4539	Historic	Historic ditch/ flume	Not Eligible	No effect	N/A; also, outside of the current Project APE.	N/A; also, outside of the current Project APE.
42KA9490 (FS-01)	Historic	Historic ditch (*Mount Carmel Irrigation Ditch–West Ditch*)	Eligible—A, C, D	*Adverse Effect*	The open ditch will be converted to buried pipe.	An inadvertent discovery plan will be prepared, as well as a MOA with associated Historic Properties Treatment Plan to mitigate the adverse effects to the site.
42KA9491 (FS-02)	Historic	Historic ditch (*Mount Carmel Irrigation Ditch–East Ditch*)	Eligible—A, D	*Adverse Effect*	The open ditch will be converted to buried pipe.	An inadvertent discovery plan will be prepared, as well as a MOA with associated Historic Properties Treatment Plan to mitigate the adverse effects to the site.
42KA9492 (FS-03)	Historic	Historic road (*Lamb's Lane*)	Not Eligible	No effect	N/A	N/A
42KA9493 (FS-04)	Historic	Historic road (*Tait Lane*)	Not Eligible	No effect	N/A	N/A

To summarize, as a result of the proposed project, two historic ditches (42KA9490 and 42KA9491), the Mount Carmel Irrigation West and East Ditches, will be converted from open ditch to buried pipe. Given that both sites are eligible for the NRHP under multiple criteria, the piping will result in adverse effects to both sites. To resolve the adverse effects, an inadvertent discovery plan will be prepared and supplied to construction crews, in additional to the preparation and execution of a Memorandum of Agreement with associated Treatment Plan. The MOA will be prepared in consultation with the Utah SHPO, KCWCD, interested THPOs, tribes, and other organizations.

Reference: *Cultural Resources Inventory Report, Kane County Water Conservancy District's Cove East Fork Virgin River Plan-Environmental Impact Statement (EIS), Kane County, Utah—Addendum to Cultural Resources Inventory Report, Kane County Water Conservancy District's Cove Reservoir Project (U18TN0544), Kane County, Utah* (Addendum Project; Utah Antiquities Project Number U21TN0840)

Dear Ms. Segundo:

Included in this submission is a cultural resources report titled *Cultural Resources Inventory Report, Kane County Water Conservancy District's Cove East Fork Virgin River Plan-Environmental Impact Statement (EIS), Kane County, Utah—Addendum to Cultural Resources Inventory Report, Kane County Water Conservancy District's Cove Reservoir Project (U18TN0544), Kane County, Utah.* The Natural Resources Conservation Service (NRCS) and Kane County Water Conservancy District (KCWCD) are proposing the addition of a pipeline to their Cove Reservoir Project (U18TN0544), which originally consisted of a reservoir and associated facilities. The original U18TN0544 Class III inventory was conducted in October of 2018. The additional pipeline is being completed as *Cultural Resources Inventory Report, Kane County Water Conservancy District's Cove East Fork Virgin River Plan-Environmental Impact Statement (EIS), Kane County, Utah—Addendum to Cultural Resources Inventory Report, Kane County Water Conservancy District's Cove Reservoir Project (U18TN0544), Kane County, Utah* (Addendum Project; Utah Antiquities Project Number U21TN0840). This addendum and supplemental inventory area are the result of a change in project complexity, changing from an Environmental Assessment to an EIS.

The Addendum Project Area of Potential Effects (APE) totals 9.06 miles (68.83 acres) in length in Kane County, Utah. Throughout the addendum Project area, for a total of 9.06 miles (47,836 feet), a new pipeline will be placed within or parallel to existing irrigation ditches as part of the Cove East Fork Virgin River Plan-EIS Project improvements located immediately southwest of the town of Orderville, Utah. To account for flexibility in design, a survey corridor of 15 meters (approximately 50 feet) was evaluated. This resulted in a total APE of 68.83 acres. Of this, the APE is comprised of 68.71 acres of Private land, 0.11 acres of land administered by the Bureau of Land Management, Kanab Field Office, and 0.01 acres of lands managed by the Utah School and Institutional Trust Lands Administration. The NRCS is acting as the lead federal agency for the purposes of Section 106 consultation, which will also cover SITLA's responsibilities under Utah Code Annotated Section 9-8-404. The BLM is a cooperating agency.

Class III (intensive pedestrian) and Class II (reconnaissance) cultural resources inventory were conducted between November 15 to 19, 2021 and on March 20, 2022 by Transcon Environmental. A total of five cultural resource sites (one previously identified and four newly recorded) were identified within the APE (42KA1157, 42KA9490, 42KA9491, 42KA9492, 42KA9493). Two previously recorded site that were mapped within the current APE but relocated outside of the APE (42KA4538 and 42KA4539) were also revisited and updated.

Table 1 summarizes the sites identified, the NRCS' eligibility determinations, project effects, project designs measures, and proposed mitigation measures.

TABLE 4						
PROJECT SUMMARY AND CONCLUSIONS						
Site No.	**Temporal Affiliation**	**Site Description**	**Eligibility**	**Effects**	**Project Design Impacts**	**Site Protective or Avoidance Measures**
42KA1157	Prehistoric	Prehistoric artifact scatter	Eligible—D	*No Adverse Effect*	Installation of new buried pipe along the northeast portion of the site.	None; the portion of the site within the Project APE is heavily disturbed by previous road construction/maintenance, plowing, livestock and a sewer line, it has also been previously tested and is non-contributing to the overall eligibility of the site.
42KA4538	Historic	Historic bridge abutment	Not Eligible	No effect	N/A; also, outside of the current Project APE.	N/A; also, outside of the current Project APE.
42KA4539	Historic	Historic ditch/ flume	Not Eligible	No effect	N/A; also, outside of the current Project APE.	N/A; also, outside of the current Project APE.
42KA9490 (FS-01)	Historic	Historic ditch (*Mount Carmel Irrigation Ditch–West Ditch*)	Eligible—A, C, D	*Adverse Effect*	The open ditch will be converted to buried pipe.	An inadvertent discovery plan will be prepared, as well as a MOA with associated Historic Properties Treatment Plan to mitigate the adverse effects to the site.
42KA9491 (FS-02)	Historic	Historic ditch (*Mount Carmel Irrigation Ditch–East Ditch*)	Eligible—A, D	*Adverse Effect*	The open ditch will be converted to buried pipe.	An inadvertent discovery plan will be prepared, as well as a MOA with associated Historic Properties Treatment Plan to mitigate the adverse effects to the site.
42KA9492 (FS-03)	Historic	Historic road (*Lamb's Lane*)	Not Eligible	No effect	N/A	N/A
42KA9493 (FS-04)	Historic	Historic road (*Tait Lane*)	Not Eligible	No effect	N/A	N/A

To summarize, as a result of the proposed project, two historic ditches (42KA9490 and 42KA9491), the Mount Carmel Irrigation West and East Ditches, will be converted from open ditch to buried pipe. Given that both sites are eligible for the NRHP under multiple criteria, the piping will result in adverse effects to both sites. To resolve the adverse effects, an inadvertent discovery plan will be prepared and supplied to construction crews, in additional to the preparation and execution of a Memorandum of Agreement with associated Treatment Plan. The MOA will be prepared in consultation with the Utah SHPO, KCWCD, interested THPOs, tribes, and other organizations.

Reference: *Cultural Resources Inventory Report, Kane County Water Conservancy District's Cove East Fork Virgin River Plan-Environmental Impact Statement (EIS), Kane County, Utah—Addendum to Cultural Resources Inventory Report, Kane County Water Conservancy District's Cove Reservoir Project (U18TN0544), Kane County, Utah* (Addendum Project; Utah Antiquities Project Number U21TN0840)

Dear Mr. Tso:

Included in this submission is a cultural resources report titled *Cultural Resources Inventory Report, Kane County Water Conservancy District's Cove East Fork Virgin River Plan-Environmental Impact Statement (EIS), Kane County, Utah—Addendum to Cultural Resources Inventory Report, Kane County Water Conservancy District's Cove Reservoir Project (U18TN0544), Kane County, Utah.* The Natural Resources Conservation Service (NRCS) and Kane County Water Conservancy District (KCWCD) are proposing the addition of a pipeline to their Cove Reservoir Project (U18TN0544), which originally consisted of a reservoir and associated facilities. The original U18TN0544 Class III inventory was conducted in October of 2018. The additional pipeline is being completed as *Cultural Resources Inventory Report, Kane County Water Conservancy District's Cove East Fork Virgin River Plan-Environmental Impact Statement (EIS), Kane County, Utah—Addendum to Cultural Resources Inventory Report, Kane County Water Conservancy District's Cove Reservoir Project (U18TN0544), Kane County, Utah* (Addendum Project; Utah Antiquities Project Number U21TN0840). This addendum and supplemental inventory area are the result of a change in project complexity, changing from an Environmental Assessment to an EIS.

The Addendum Project Area of Potential Effects (APE) totals 9.06 miles (68.83 acres) in length in Kane County, Utah. Throughout the addendum Project area, for a total of 9.06 miles (47,836 feet), a new pipeline will be placed within or parallel to existing irrigation ditches as part of the Cove East Fork Virgin River Plan-EIS Project improvements located immediately southwest of the town of Orderville, Utah. To account for flexibility in design, a survey corridor of 15 meters (approximately 50 feet) was evaluated. This resulted in a total APE of 68.83 acres. Of this, the APE is comprised of 68.71 acres of Private land, 0.11 acres of land administered by the Bureau of Land Management, Kanab Field Office, and 0.01 acres of lands managed by the Utah School and Institutional Trust Lands Administration. The NRCS is acting as the lead federal agency for the purposes of Section 106 consultation, which will also cover SITLA's responsibilities under Utah Code Annotated Section 9-8-404. The BLM is a cooperating agency.

Class III (intensive pedestrian) and Class II (reconnaissance) cultural resources inventory were conducted between November 15 to 19, 2021 and on March 20, 2022 by Transcon Environmental. A total of five cultural resource sites (one previously identified and four newly recorded) were identified within the APE (42KA1157, 42KA9490, 42KA9491, 42KA9492, 42KA9493). Two previously recorded site that were mapped within the current APE but relocated outside of the APE (42KA4538 and 42KA4539) were also revisited and updated.

Table 1 summarizes the sites identified, the NRCS' eligibility determinations, project effects, project designs measures, and proposed mitigation measures.

TABLE 4						
PROJECT SUMMARY AND CONCLUSIONS						
Site No.	**Temporal Affiliation**	**Site Description**	**Eligibility**	**Effects**	**Project Design Impacts**	**Site Protective or Avoidance Measures**
42KA1157	Prehistoric	Prehistoric artifact scatter	Eligible—D	*No Adverse Effect*	Installation of new buried pipe along the northeast portion of the site.	None; the portion of the site within the Project APE is heavily disturbed by previous road construction/maintenance, plowing, livestock and a sewer line, it has also been previously tested and is non-contributing to the overall eligibility of the site.
42KA4538	Historic	Historic bridge abutment	Not Eligible	No effect	N/A; also, outside of the current Project APE.	N/A; also, outside of the current Project APE.
42KA4539	Historic	Historic ditch/ flume	Not Eligible	No effect	N/A; also, outside of the current Project APE.	N/A; also, outside of the current Project APE.
42KA9490 (FS-01)	Historic	Historic ditch (*Mount Carmel Irrigation Ditch–West Ditch*)	Eligible—A, C, D	*Adverse Effect*	The open ditch will be converted to buried pipe.	An inadvertent discovery plan will be prepared, as well as a MOA with associated Historic Properties Treatment Plan to mitigate the adverse effects to the site.
42KA9491 (FS-02)	Historic	Historic ditch (*Mount Carmel Irrigation Ditch–East Ditch*)	Eligible—A, D	*Adverse Effect*	The open ditch will be converted to buried pipe.	An inadvertent discovery plan will be prepared, as well as a MOA with associated Historic Properties Treatment Plan to mitigate the adverse effects to the site.
42KA9492 (FS-03)	Historic	Historic road (*Lamb's Lane*)	Not Eligible	No effect	N/A	N/A
42KA9493 (FS-04)	Historic	Historic road (*Tait Lane*)	Not Eligible	No effect	N/A	N/A

To summarize, as a result of the proposed project, two historic ditches (42KA9490 and 42KA9491), the Mount Carmel Irrigation West and East Ditches, will be converted from open ditch to buried pipe. Given that both sites are eligible for the NRHP under multiple criteria, the piping will result in adverse effects to both sites. To resolve the adverse effects, an inadvertent discovery plan will be prepared and supplied to construction crews, in additional to the preparation and execution of a Memorandum of Agreement with associated Treatment Plan. The MOA will be prepared in consultation with the Utah SHPO, KCWCD, interested THPOs, tribes, and other organizations.

Thus, the NRCS recommends that the project proceed as planned with a determination of ***adverse effect to historic properties***. The NRCS requests concurrence for the determination of project effects and site eligibility. If you have any questions, comments, or concerns, please contact Tara S. Hoffmann, State Cultural Resources Specialist, at 801-524-4556 at your convenience.

Sincerely,

Cultural and Paleo Clearance with Tier 1 Screening Form

Pursuant to the *Programmatic Agreement between the UDOT and the Utah SHPO Regarding Implementation of U.C.A. 9-8-404 for State Funded Transportation Projects in Utah*, UDOT has taken into account the effects of this undertaking on historic properties and has determined that the finding of effect is **No Historic Properties Affected**.

Pursuant to the *Memorandum of Understanding between the UDOT and the Utah Geological Survey Concerning Agency Responsibilities Pursuant to U.C.A. 79-3-508,* the UDOT has taken into account the effects of this undertaking on paleontological resources. If applicable, consultation letter from UGS is included in the environmental document.

PROJECT: Cove East Fork Virgin River Plan-EIS, Kane County, Utah – Addendum to Cultural Resources Inventory Report, Alpha Engineering's Cove Reservoir Project

DATE: June 1, 2022
PREPARER: Ellis B. Powelson
CONTACT: epowelson@utah.gov (801)362-9108

PROJECT STIPULATIONS

1) Clearance is contingent upon the contractor adhering to the proposed scope of work and remaining within cleared areas. **Notify Region Environmental of any scope changes.**
2) *UDOT Standard Specification 01355 Part 3.7, Environmental Clearances by Contractor*
3) *UDOT Standard Specification 01355 Part 3.8, Discovery of Historical Archaeological, or Paleontological Objects, Features, Sites or Human Remains*. **Notify Region Environmental immediately of any discoveries during construction.**

PROJECT DESCRIPTION

This is an addendum in support of Kane County Water Conservancy District's Cove Reservoir Project (U18TN0544). The original Class III survey was conducted in October of 2018. The addendum and supplemental inventory area are the result of a change in project complexity, changing from an Environmental Assessment (EA) to an Environmental Impact Statement (EIS).

The Addendum project area measures a total of 68.30 acres (9.06 miles) and is located on lands managed by the Bureau of Land Management (BLM) Kanab Field Office (0.11 acre), SITLA (0.01 acre), and on privately-owned lands (68.18 acres). Class III (intensive pedestrian) supplemental survey will be conducted on 11.41 miles within the project APE (9.06 miles) with 0.02 mile on BLM Kanab Field Office-managed lands, 0.01 mile on SITLA-managed land, and 11.39 miles on privately owned lands. The supplemental inventory area is generally located within an existing UDOT highway right-of-way (ROW) on the eastern side of US-89 (State Street), along portions of Center Street and Cottonwood Lane to the east of US-89, and within agricultural fields and unnamed dirt roads that cross sections of Tait Lane, West 2500 South (Lambs Lane), Stevens Lane, and Muddy Creek Road on the western side of US-89 (State Street) within the town of Mount Carmel in Long Valley, Kane County, Utah. The survey will be linear and will be conducted in 15-meter wide transects throughout the project area. No portion of the project will be left unsurveyed due to prior survey efforts.

SCREENING PROCESS

Screened undertakings have the potential to affect historic properties, but have been determined by UDOT to require no further review or consultation under the Agreements. Screening may include any the following tasks and should be appropriate to the complexity, scale, and location of the undertaking. Documentation of the screening will be included in the project files, quarterly report submitted to SHPO, and environmental document.

Antiquities Project Number: U21TN0840

Literature Review

- ☐ Class I literature search (date completed and by whom):
- ☒ Records review (i.e. UDSH, UDOT, BLM, etc.): UDSH Sego database
- ☐ Project plans

☐ As-built project plans
☒ Aerial photographs: UGS Aerial Imagery Collection
☒ Historic Maps: BLM GLO records
☒ Topographic Maps: USGS TopoView
☒ ROW/Ownership/Parcel Data: UDOT ROW, BLM-Kanab, SITLA
☒ Other: Utah SHPO historic contexts, BLM field office predictive models and Class I documents, water rights, Sanborn maps, Utah Division of Water Rights (UDWR) records

Description of search results: A review of records available through the UDSH Sego database revealed that 6 previous surveys and 4 previously identified sites were mapped as overlapping, being immediately adjacent, or being crossed by some portion of the current Project APE. These sites consist of two prehistoric artifact scatters (42KA1157 and 42KA1965), a historic bridge abutment (42KA4538), and a historic ditch (42KA4539). GLO maps indicate a few historic improvements near the Project area including historic roads, ditches, transmission lines, ditches, fences, structures, agricultural fields, and a coal mine. Historic aerial imagery in the vicinity of the Project indicates a few visible historic developments, including established roads/highways, ditches, and cultivated fields. Historic land patent records indicate 22 land patents near the Project area, with dates ranging from 1880 to 1980. Historic grazing allotment records indicated seven active grazing allotments surrounding the Project area; however, none cross into or overlap any portion of the Project APE. Historic water rights records indicate that there are 10 historic water rights within 0.5 mile of the Project APE consisting of underground water sources, and surface water rights with sources from springs, and the East Fork Virgin River.

Field Review

☒ Pedestrian survey (Class III) (survey interval): 15m
☐ Field review other than Class III (reconnaissance, windshield, etc.):
☐ Other:
☐ None

Description of survey results (If no field survey was conducted, explain why not): The survey was conducted in 15-meter-wide transects throughout the entire Project APE. This resulted in a total of approximately 68.83 acres evaluated for cultural resources. No portion of the current Project was left unsurveyed due to prior survey efforts. A total of 48.66 acres were surveyed to Class III standards; some fenced off and inaccessible areas on private property with posted no trespassing signs within the APE (20.17 acres) were surveyed to Class II standards due to safety and trespassing concerns.

As a result of the survey, it was determined that a total of five cultural resource sites are located within the Project APE. Of the five sites identified within the Project APE, one previously recorded site (42KA1157 [also 42KA1965/42KA1958]) is recommended Eligible for listing on the NRHP under Criterion D for information potential; two sites are recommended Eligible for the NRHP under Criteria A and D (42KA9490 and 42KA9491) for their association with significant regional events and for information potential; site 42KA9490 is also recommended to be Eligible for listing on the NRHP under Criterion C as it embodies the distinctive characteristics of a type, period, and method of construction in the region; the remaining sites (42KA9492 and 42KA9493) are recommended Not Eligible for the NRHP under any Criteria. Three IOs (IO-01to IO-03) were also identified and recorded within the Project APE as a result of new survey.

Supporting Documentation

Reports and/or forms generated from any cultural resource inventories shall be submitted quarterly to the Utah Division of State History (UDSH) for filing.

Title of report: *Cultural Resources Inventory Report, Kane County Water Conservancy District's Cove East Fork Virgin River Plan-Environmental Impact Statement, Kane County, Utah—Addendum to Cultural Resources Inventory Report, Kane County Water Conservancy District's Cove Reservoir Project (U18TN0544), Kane County, Utah*

Consultation

☐ Utah SHPO (including APE consultation):

☐ Certified Local Government (CLG):
☒ Tribes:
☒ State/Federal Agencies: NRCS, BLM-Kanab, SITLA
☐ Knowledgeable Informants:
☐ Other:
☐ None:

Description of consultation efforts (If no consultation was done, explain why not):
As the lead agency for this project, Native American consultation is the responsibility of the NRCS.

☐ Controversy based on historic preservation issues? If yes, consultation with SHPO and UDOT Central Environmental is required. Additional consultation with FHWA may be required.

Finding of Effect

The undertaking will result in the following finding of effect:

☐ No Historic Properties Affected: no cultural resources present
☐ No Historic Properties Affected: cultural resources present but none eligible
☒ No Historic Properties Affected: historic properties present, but are completely avoided by the undertaking and the potential for substantial indirect effects is very low

Description of impacts: For information on site eligibility and effects, please see Table 1 below:

TABLE 1. PROJECT SUMMARY and CONCLUSIONS

Site No.	Temporal Affiliation	Site Description	Eligibility	Effects	Site Protective or Avoidance Measures
42KA1157	Prehistoric	Prehistoric artifact scatter	Eligible—D	*No Adverse Effect*	None; the portion of the site within the Project APE is heavily disturbed by previous road construction/maintenance, plowing, livestock and a sewer line, it has also been previously tested and is non-contributing to the overall eligibility of the site.
42KA4538	Historic	Historic bridge abutment	Not Eligible	No effect	N/A; also, outside of the current Project APE.
42KA4539	Historic	Historic ditch/ flume	Not Eligible	No effect	N/A; also, outside of the current Project APE.
42KA9490 (FS-01)	Historic	Historic ditch (*Mount Carmel Irrigation Ditch–West Ditch*)	Eligible—A, C, D	*No Adverse Effect*	An inadvertent discovery plan should be prepared, and a HPTP should be developed to mitigate adverse effects to the site.
42KA9491 (FS-02)	Historic	Historic ditch (*Mount Carmel Irrigation Ditch–East Ditch*)	Eligible—A, D	*No Adverse Effect*	An inadvertent discovery plan should be prepared, and a HPTP should be developed to mitigate adverse effects to the site.
42KA9492 (FS-03)	Historic	Historic road (*Lamb's Lane*)	Not Eligible	No effect	N/A
42KA9493 (FS-04)	Historic	Historic road (*Tait Lane*)	Not Eligible	No effect	N/A

Additional Information

Third Cultural Resource Inventory Report

SHPO Consultation

May 20, 2024

Dr. Christopher Merritt, PhD
State Historic Preservation Officer
Utah Division of State History
300 Rio Grande Avenue
Salt Lake City, Utah 84101-1182

Reference: *Cultural Resources Inventory Report, Kane County Water Conservancy District's Cove East Fork Virgin River Plan-Environmental Impact Statement, Kane County, Utah: Esplin Pit Evaluation* (Addendum Project; Utah Antiquities Project Number U23TN0682)

Dear Dr. Merritt:

Included in this submission is a cultural resources report titled *Cultural Resources Inventory Report, Kane County Water Conservancy District's Cove East Fork Virgin River Plan-Environmental Impact Statement (EIS), Kane County, Utah: Esplin Pit Evaluation.* The Natural Resources Conservation Service (NRCS) and Kane County Water Conservancy District (KCWCD) are proposing the addition of a borrow source to their Cove Reservoir Plan-EIS (U18TN0544, U21TN0840), which consists of a reservoir, irrigation pipeline, and associated facilities. Two previous Class III inventories, encompassing two alternative reservoir locations, pipelines, staging areas, construction access, borrow sources, and all other proposed ground disturbance, were completed under Project Numbers U18TN0544 and U21TN0840. The NRCS consulted with your office regarding those project numbers in letters dated January 9, 2020, and January 23, 2023, respectively. Concurrence on site eligibility and a determination of "adverse effect to historic properties" for the undertaking as a whole, was received on January 17, 2020, and February 6, 2023, respectively (Case Nos. 20-0121 and 23-0280). The additional borrow source, located east of Glendale, Utah, adjacent to Kanab Creek on the Glendale Bench has been evaluated under *Cultural Resources Inventory Report, Kane County Water Conservancy District's Cove East Fork Virgin River Plan-Environmental Impact Statement, Kane County, Utah: Esplin Pit Evaluation.* The NRCS is serving as the lead Federal agency.

Per 36 CFR 800.16(d), the supplemental Area of Potential Effects (APE) totals 13.72 acres of private land. The APE is the site of a former borrow pit (Esplin Glendale Bench Pit or Esplin Pit) where basalt bedrock has previously been quarried for use as riprap for a previous NRCS Emergency Watershed Protection project (U12SH0189, U13SH0167; Case Nos. 12-0762 and 13-0512). The project proposes to reopen the borrow pit to procure riprap for construction and armoring of the planned Cove Reservoir Dam. Observed basalt exposures in the project area measure 10 to 20 feet thick, and procurement activities to fulfill the dam construction needs (approximately 29,000 cubic yards of riprap) would require quarrying 1.8 acres of basalt to a thickness of 10 feet.

Per 36 CFR 800.4, a desktop review of know cultural resources, followed by a Class III (intensive pedestrian) and Class II (reconnaissance) cultural resources inventory were conducted on October 10 and 11, 2023 by Secretary of the Interior -qualified archaeologists with Transcon Environmental (now Eocene Environmental Group). Due to slope steepness, 5.25 acres were inventoried at a Class II (reconnaissance) level. Two cultural resource sites (42KA7537 [Kanab Creek Cave], and 42KA9789), were identified and documented. Site 42KA7537 had previously been determined eligible for the National Register of Historic

Places (NRHP) under Criterion D (Case No. 13-0512). The NRCS has also determined that Site 42KA9789, a prehistoric campsite, is eligible for the NRHP under Criterion D.

Table 1 summarizes the avoidance and monitoring requirements during implementation. If requested during consultation, a tribal monitor can also be present.

TABLE 1
PROJECT SUMMARY AND CONCLUSIONS

Site Number	Site Description	Eligibility	Protective Measures
42KA7537	Prehistoric cave and artifact scatter (*Kanab Creek Cave*)	Eligible—D	Avoid all ground disturbing activities within 15 meters of the site boundary; a cultural monitor must be present during all ground disturbance within 15 meters of the site boundary, and avoidance flagging must be placed 15 meters from the site boundary prior to any construction activities near the site area.
42KA9789	Prehistoric artifact scatter	Eligible—D	Avoid all ground disturbing activities within 15 meters of the site boundary; a cultural monitor must be present during all ground disturbance within 15 meters of the site boundary, and avoidance flagging must be placed 15 meters from the site boundary prior to any construction activities near the site area.

With the implementation of the aforementioned avoidance and minimization measures, the NRCS has determined that use of the proposed borrow source will result in **No Adverse Effect to Historic Properties**, per 36 CFR 800.5(b). The NRCS requests concurrence for the delineation of the APE, determinations of site eligibility and project effect. If you have any questions, comments, or concerns, please contact Tara S. Hoffmann, State Watershed Cultural Resources Specialist, at 801-524-4556 or tara.hoffmann@usda.gov, at your convenience.

Sincerely,

TRAVIS MOTE
Acting State Conservationist

RE: Cultural Resources Inventory Report, Kane County Water Conservancy District's Cove East Fork Virgin River Plan-Environmental Impact Statement, Kane County, Utah: Esplin Pit Evaluation

For future correspondence, please reference Case No. 24-1261

Dear Travis Mote,

The Utah State Historic Preservation Office received your submission and request for our comment on the above-referenced undertaking on May 20, 2024.

We concur with your determinations of eligibility and effect for this undertaking.

This letter serves as our comment on the determinations you have made within the consultation process specified in §36CFR800.4. If you have questions, please contact me at (801) 535-2502 or by email at rmcgrath@utah.gov.

Sincerely,

Ryan P McGrath

Tribal Consultation

May 22, 2024

Mr. Richard M. Begay
THPO and Department Manager
Navajo Nation Historic Preservation Department
P.O. Box 4950
Window Rock, Arizona 86515

Reference: *Cultural Resources Inventory Report, Kane County Water Conservancy District's Cove East Fork Virgin River Plan-Environmental Impact Statement, Kane County, Utah: Esplin Pit Evaluation* (Addendum Project; Utah Antiquities Project Number U23TN0682)

Dear Manager Begay:

Enclosed is a cultural resources report titled *Cultural Resources Inventory Report, Kane County Water Conservancy District's Cove East Fork Virgin River Plan-Environmental Impact Statement (EIS), Kane County, Utah: Esplin Pit Evaluation.* The Natural Resources Conservation Service (NRCS) and Kane County Water Conservancy District (KCWCD) are proposing the addition of a borrow source to their Cove Reservoir Plan-EIS (U18TN0544, U21TN0840), which consists of a reservoir, irrigation pipeline, and associated facilities. Two previous Class III inventories, encompassing two alternative reservoir locations, pipelines, staging areas, construction access, borrow sources, and all other proposed ground disturbance, were completed under Project Numbers U18TN0544 and U21TN0840. The NRCS consulted with your office regarding those project numbers in letters dated January 9, 2020, and January 23, 2023, respectively. Concurrence on site eligibility and a determination of "adverse effect to historic properties" for the undertaking as a whole, was received on January 17, 2020, and February 6, 2023, respectively (Case Nos. 20-0121 and 23-0280). The additional borrow source, located east of Glendale, Utah, adjacent to Kanab Creek on the Glendale Bench has been evaluated under *Cultural Resources Inventory Report, Kane County Water Conservancy District's Cove East Fork Virgin River Plan-Environmental Impact Statement, Kane County, Utah: Esplin Pit Evaluation.* The NRCS is serving as the lead Federal agency.

Per 36 CFR 800.16(d), the supplemental Area of Potential Effects (APE) totals 13.72 acres of private land. The APE is the site of a former borrow pit (Esplin Glendale Bench Pit or Esplin Pit) where basalt bedrock has previously been quarried for use as riprap for a previous NRCS Emergency Watershed Protection project (U12SH0189, U13SH0167; Case Nos. 12-0762 and 13-0512). The project proposes to reopen the borrow pit to procure riprap for construction and armoring of the planned Cove Reservoir Dam. Observed basalt exposures in the project area measure 10 to 20 feet thick, and procurement activities to fulfill the dam construction needs (approximately 29,000 cubic yards of riprap) would require quarrying 1.8 acres of basalt to a thickness of 10 feet.

Per 36 CFR 800.4, a desktop review of know cultural resources, followed by a Class III (intensive pedestrian) and Class II (reconnaissance) cultural resources inventory were conducted on October 10 and 11, 2023 by Secretary of the Interior -qualified archaeologists with Transcon Environmental (now Eocene Environmental Group). Due to slope steepness, 5.25 acres were inventoried at a Class II (reconnaissance) level. Two cultural resource sites (42KA7537 [Kanab Creek Cave], and 42KA9789), were identified and documented. Site 42KA7537 had previously been determined eligible for the National Register of Historic

Places (NRHP) under Criterion D (Case No. 13-0512). The NRCS has also determined that Site 42KA9789, a prehistoric campsite, is eligible for the NRHP under Criterion D.

Table 1 summarizes the avoidance and monitoring requirements during implementation. If requested during consultation, a tribal monitor can also be present.

TABLE 1
PROJECT SUMMARY AND CONCLUSIONS

Site Number	Site Description	Eligibility	Protective Measures
42KA7537	Prehistoric cave and artifact scatter (*Kanab Creek Cave*)	Eligible—D	Avoid all ground disturbing activities within 15 meters of the site boundary; a cultural monitor must be present during all ground disturbance within 15 meters of the site boundary, and avoidance flagging must be placed 15 meters from the site boundary prior to any construction activities near the site area.
42KA9789	Prehistoric artifact scatter	Eligible—D	Avoid all ground disturbing activities within 15 meters of the site boundary; a cultural monitor must be present during all ground disturbance within 15 meters of the site boundary, and avoidance flagging must be placed 15 meters from the site boundary prior to any construction activities near the site area.

With the implementation of the aforementioned avoidance and minimization measures, the NRCS has determined that use of the proposed borrow source will result in **No Adverse Effect to Historic Properties**, per 36 CFR 800.5(b). The NRCS requests concurrence for the delineation of the APE, determinations of site eligibility and project effect. If you have any questions, comments, or concerns, please contact Tara S. Reference: *Cultural Resources Inventory Report, Kane County Water Conservancy District's Cove East Fork Virgin River Plan-Environmental Impact Statement, Kane County, Utah: Esplin Pit Evaluation* (Addendum Project; Utah Antiquities Project Number U23TN0682)

Dear Director Dongoske:

Enclosed is a cultural resources report titled *Cultural Resources Inventory Report, Kane County Water Conservancy District's Cove East Fork Virgin River Plan-Environmental Impact Statement (EIS), Kane County, Utah: Esplin Pit Evaluation.* The Natural Resources Conservation Service (NRCS) and Kane County Water Conservancy District (KCWCD) are proposing the addition of a borrow source to their Cove Reservoir Plan-EIS (U18TN0544, U21TN0840), which consists of a reservoir, irrigation pipeline, and associated facilities. Two previous Class III inventories, encompassing two alternative reservoir locations, pipelines, staging areas, construction access, borrow sources, and all other proposed ground disturbance, were completed under Project Numbers U18TN0544 and U21TN0840. The NRCS consulted with your office regarding those project numbers in letters dated January 9, 2020, and January 23, 2023, respectively. Concurrence on site eligibility and a determination of "adverse effect to historic properties" for the undertaking as a whole, was received on January 17, 2020, and February 6, 2023, respectively (Case Nos. 20-0121 and 23-0280). The additional borrow source, located east of Glendale, Utah, adjacent to Kanab Creek on the Glendale Bench has been evaluated under *Cultural Resources Inventory Report, Kane County Water Conservancy District's Cove East Fork Virgin River Plan-Environmental Impact Statement, Kane County, Utah: Esplin Pit Evaluation.* The NRCS is serving as the lead Federal agency.

Per 36 CFR 800.16(d), the supplemental Area of Potential Effects (APE) totals 13.72 acres of private land. The APE is the site of a former borrow pit (Esplin Glendale Bench Pit or Esplin Pit) where basalt bedrock has previously been quarried for use as riprap for a previous NRCS Emergency Watershed Protection project (U12SH0189, U13SH0167; Case Nos. 12-0762 and 13-0512). The project proposes to reopen the borrow pit to procure riprap for construction and armoring of the planned Cove Reservoir Dam. Observed basalt exposures in the project area measure 10 to 20 feet thick, and procurement activities to fulfill the dam construction needs (approximately 29,000 cubic yards of riprap) would require quarrying 1.8 acres of basalt to a thickness of 10 feet.

Per 36 CFR 800.4, a desktop review of know cultural resources, followed by a Class III (intensive pedestrian) and Class II (reconnaissance) cultural resources inventory were conducted on October 10 and 11, 2023 by Secretary of the Interior -qualified archaeologists with Transcon Environmental (now Eocene Environmental Group). Due to slope steepness, 5.25 acres were inventoried at a Class II (reconnaissance) level. Two cultural resource sites (42KA7537 [Kanab Creek Cave], and 42KA9789), were identified and documented. Site 42KA7537 had previously been determined eligible for the National Register of Historic

Places (NRHP) under Criterion D (Case No. 13-0512). The NRCS has also determined that Site 42KA9789, a prehistoric campsite, is eligible for the NRHP under Criterion D.

Table 1 summarizes the avoidance and monitoring requirements during implementation. If requested during consultation, a tribal monitor can also be present.

TABLE 1
PROJECT SUMMARY AND CONCLUSIONS

Site Number	Site Description	Eligibility	Protective Measures
42KA7537	Prehistoric cave and artifact scatter (*Kanab Creek Cave*)	Eligible—D	Avoid all ground disturbing activities within 15 meters of the site boundary; a cultural monitor must be present during all ground disturbance within 15 meters of the site boundary, and avoidance flagging must be placed 15 meters from the site boundary prior to any construction activities near the site area.
42KA9789	Prehistoric artifact scatter	Eligible—D	Avoid all ground disturbing activities within 15 meters of the site boundary; a cultural monitor must be present during all ground disturbance within 15 meters of the site boundary, and avoidance flagging must be placed 15 meters from the site boundary prior to any construction activities near the site area.

With the implementation of the aforementioned avoidance and minimization measures, the NRCS has determined that use of the proposed borrow source will result in **No Adverse Effect to Historic Properties**, per 36 CFR 800.5(b). The NRCS requests concurrence for the delineation of the APE, determinations of site eligibility and project effect. If you have any questions, comments, or concerns, please contact Tara S. Hoffmann, State Watershed Cultural Resources Specialist, at 801-524-4556 or tara.hoffmann@usda.gov, at your convenience.

Sincerely,

TRAVIS MOTE
Acting State Conservationist

Dear Governor Kucate:

Enclosed is a cultural resources report titled *Cultural Resources Inventory Report, Kane County Water Conservancy District's Cove East Fork Virgin River Plan-Environmental Impact Statement (EIS), Kane County, Utah: Esplin Pit Evaluation.* The Natural Resources Conservation Service (NRCS) and Kane County Water Conservancy District (KCWCD) are proposing the addition of a borrow source to their Cove Reservoir Plan-EIS (U18TN0544, U21TN0840), which consists of a reservoir, irrigation pipeline, and associated facilities. Two previous Class III inventories, encompassing two alternative reservoir locations, pipelines, staging areas, construction access, borrow sources, and all other proposed ground disturbance, were completed under Project Numbers U18TN0544 and U21TN0840. The NRCS consulted with your office regarding those project numbers in letters dated January 9, 2020, and January 23, 2023, respectively. Concurrence on site eligibility and a determination of "adverse effect to historic properties" for the undertaking as a whole, was received on January 17, 2020, and February 6, 2023, respectively (Case Nos. 20-0121 and 23-0280). The additional borrow source, located east of Glendale, Utah, adjacent to Kanab Creek on the Glendale Bench has been evaluated under *Cultural Resources Inventory Report, Kane County Water Conservancy District's Cove East Fork Virgin River Plan-Environmental Impact Statement, Kane County, Utah: Esplin Pit Evaluation.* The NRCS is serving as the lead Federal agency.

Per 36 CFR 800.16(d), the supplemental Area of Potential Effects (APE) totals 13.72 acres of private land. The APE is the site of a former borrow pit (Esplin Glendale Bench Pit or Esplin Pit) where basalt bedrock has previously been quarried for use as riprap for a previous NRCS Emergency Watershed Protection project (U12SH0189, U13SH0167; Case Nos. 12-0762 and 13-0512). The project proposes to reopen the borrow pit to procure riprap for construction and armoring of the planned Cove Reservoir Dam. Observed basalt exposures in the project area measure 10 to 20 feet thick, and procurement activities to fulfill the dam construction needs (approximately 29,000 cubic yards of riprap) would require quarrying 1.8 acres of basalt to a thickness of 10 feet.

Per 36 CFR 800.4, a desktop review of know cultural resources, followed by a Class III (intensive pedestrian) and Class II (reconnaissance) cultural resources inventory were conducted on October 10 and 11, 2023 by Secretary of the Interior -qualified archaeologists with Transcon Environmental (now Eocene Environmental Group). Due to slope steepness, 5.25 acres were inventoried at a Class II (reconnaissance) level. Two cultural resource sites (42KA7537 [Kanab Creek Cave], and 42KA9789), were identified and documented. Site 42KA7537 had previously been determined eligible for the National Register of Historic Places (NRHP) under Criterion D (Case No. 13-0512). The NRCS has also determined that Site 42KA9789, a prehistoric campsite, is eligible for the NRHP under Criterion D.

Table 1 summarizes the avoidance and monitoring requirements during implementation. If requested during consultation, a tribal monitor can also be present.

TABLE 1
PROJECT SUMMARY AND CONCLUSIONS

Site Number	Site Description	Eligibility	Protective Measures
42KA7537	Prehistoric cave and artifact scatter (*Kanab Creek Cave*)	Eligible—D	Avoid all ground disturbing activities within 15 meters of the site boundary; a cultural monitor must be present during all ground disturbance within 15 meters of the site boundary, and avoidance flagging must be placed 15 meters from the site boundary prior to any construction activities near the site area.
42KA9789	Prehistoric artifact scatter	Eligible—D	Avoid all ground disturbing activities within 15 meters of the site boundary; a cultural monitor must be present during all ground disturbance within 15 meters of the site boundary, and avoidance flagging must be placed 15 meters from the site boundary prior to any construction activities near the site area.

With the implementation of the aforementioned avoidance and minimization measures, the NRCS has determined that use of the proposed borrow source will result in **No Adverse Effect to Historic Properties**, per 36 CFR 800.5(b). The NRCS requests concurrence for the delineation of the APE, determinations of site eligibility and project effect. If you have any questions, comments, or concerns, please contact Tara S. Hoffmann, State Watershed Cultural Resources Specialist, at 801-524-4556 or tara.hoffmann@usda.gov, at your convenience.

Sincerely,

TRAVIS MOTE
Acting State Conservationist

Malcolm Lehi
Council Representative
White Mesa, Ute Council
P.O. Box 7096
White Mesa, Utah 84511

Reference: *Cultural Resources Inventory Report, Kane County Water Conservancy District's Cove East Fork Virgin River Plan-Environmental Impact Statement, Kane County, Utah: Esplin Pit Evaluation* (Addendum Project; Utah Antiquities Project Number U23TN0682)

Dear Representative Lehi:

Enclosed is a cultural resources report titled *Cultural Resources Inventory Report, Kane County Water Conservancy District's Cove East Fork Virgin River Plan-Environmental Impact Statement (EIS), Kane County, Utah: Esplin Pit Evaluation.* The Natural Resources Conservation Service (NRCS) and Kane County Water Conservancy District (KCWCD) are proposing the addition of a borrow source to their Cove Reservoir Plan-EIS (U18TN0544, U21TN0840), which consists of a reservoir, irrigation pipeline, and associated facilities. Two previous Class III inventories, encompassing two alternative reservoir locations, pipelines, staging areas, construction access, borrow sources, and all other proposed ground disturbance, were completed under Project Numbers U18TN0544 and U21TN0840. The NRCS consulted with your office regarding those project numbers in letters dated January 9, 2020, and January 23, 2023, respectively. Concurrence on site eligibility and a determination of "adverse effect to historic properties" for the undertaking as a whole, was received on January 17, 2020, and February 6, 2023, respectively (Case Nos. 20-0121 and 23-0280). The additional borrow source, located east of Glendale, Utah, adjacent to Kanab Creek on the Glendale Bench has been evaluated under *Cultural Resources Inventory Report, Kane County Water Conservancy District's Cove East Fork Virgin River Plan-Environmental Impact Statement, Kane County, Utah: Esplin Pit Evaluation.* The NRCS is serving as the lead Federal agency.

Per 36 CFR 800.16(d), the supplemental Area of Potential Effects (APE) totals 13.72 acres of private land. The APE is the site of a former borrow pit (Esplin Glendale Bench Pit or Esplin Pit) where basalt bedrock has previously been quarried for use as riprap for a previous NRCS Emergency Watershed Protection project (U12SH0189, U13SH0167; Case Nos. 12-0762 and 13-0512). The project proposes to reopen the borrow pit to procure riprap for construction and armoring of the planned Cove Reservoir Dam. Observed basalt exposures in the project area measure 10 to 20 feet thick, and procurement activities to fulfill the dam construction needs (approximately 29,000 cubic yards of riprap) would require quarrying 1.8 acres of basalt to a thickness of 10 feet.

Per 36 CFR 800.4, a desktop review of know cultural resources, followed by a Class III (intensive pedestrian) and Class II (reconnaissance) cultural resources inventory were conducted on October 10 and 11, 2023 by Secretary of the Interior -qualified archaeologists with Transcon Environmental (now Eocene Environmental Group). Due to slope steepness, 5.25 acres were inventoried at a Class II (reconnaissance) level. Two cultural resource sites (42KA7537 [Kanab Creek Cave], and 42KA9789), were identified and documented. Site 42KA7537 had previously been determined eligible for the National Register of Historic

Places (NRHP) under Criterion D (Case No. 13-0512). The NRCS has also determined that Site 42KA9789, a prehistoric campsite, is eligible for the NRHP under Criterion D.

Table 1 summarizes the avoidance and monitoring requirements during implementation. If requested during consultation, a tribal monitor can also be present.

TABLE 1
PROJECT SUMMARY AND CONCLUSIONS

Site Number	Site Description	Eligibility	Protective Measures
42KA7537	Prehistoric cave and artifact scatter (*Kanab Creek Cave*)	Eligible—D	Avoid all ground disturbing activities within 15 meters of the site boundary; a cultural monitor must be present during all ground disturbance within 15 meters of the site boundary, and avoidance flagging must be placed 15 meters from the site boundary prior to any construction activities near the site area.
42KA9789	Prehistoric artifact scatter	Eligible—D	Avoid all ground disturbing activities within 15 meters of the site boundary; a cultural monitor must be present during all ground disturbance within 15 meters of the site boundary, and avoidance flagging must be placed 15 meters from the site boundary prior to any construction activities near the site area.

With the implementation of the aforementioned avoidance and minimization measures, the NRCS has determined that use of the proposed borrow source will result in **No Adverse Effect to Historic Properties**, per 36 CFR 800.5(b). The NRCS requests concurrence for the delineation of the APE, determinations of site eligibility and project effect. If you have any questions, comments, or concerns, please contact Tara S. Hoffmann, State Watershed Cultural Resources Specialist, at 801-524-4556 or tara.hoffmann@usda.gov, at your convenience.

Dear President Nygren:

Enclosed is a cultural resources report titled *Cultural Resources Inventory Report, Kane County Water Conservancy District's Cove East Fork Virgin River Plan-Environmental Impact Statement (EIS), Kane County, Utah: Esplin Pit Evaluation.* The Natural Resources Conservation Service (NRCS) and Kane County Water Conservancy District (KCWCD) are proposing the addition of a borrow source to their Cove Reservoir Plan-EIS (U18TN0544, U21TN0840), which consists of a reservoir, irrigation pipeline, and associated facilities. Two previous Class III inventories, encompassing two alternative reservoir locations, pipelines, staging areas, construction access, borrow sources, and all other proposed ground disturbance, were completed under Project Numbers U18TN0544 and U21TN0840. The NRCS consulted with your office regarding those project numbers in letters dated January 9, 2020, and January 23, 2023, respectively. Concurrence on site eligibility and a determination of "adverse effect to historic properties" for the undertaking as a whole, was received on January 17, 2020, and February 6, 2023, respectively (Case Nos. 20-0121 and 23-0280). The additional borrow source, located east of Glendale, Utah, adjacent to Kanab Creek on the Glendale Bench has been evaluated under *Cultural Resources Inventory Report, Kane County Water Conservancy District's Cove East Fork Virgin River Plan-Environmental Impact Statement, Kane County, Utah: Esplin Pit Evaluation.* The NRCS is serving as the lead Federal agency.

Per 36 CFR 800.16(d), the supplemental Area of Potential Effects (APE) totals 13.72 acres of private land. The APE is the site of a former borrow pit (Esplin Glendale Bench Pit or Esplin Pit) where basalt bedrock has previously been quarried for use as riprap for a previous NRCS Emergency Watershed Protection project (U12SH0189, U13SH0167; Case Nos. 12-0762 and 13-0512). The project proposes to reopen the borrow pit to procure riprap for construction and armoring of the planned Cove Reservoir Dam. Observed basalt exposures in the project area measure 10 to 20 feet thick, and procurement activities to fulfill the dam construction needs (approximately 29,000 cubic yards of riprap) would require quarrying 1.8 acres of basalt to a thickness of 10 feet.

Per 36 CFR 800.4, a desktop review of know cultural resources, followed by a Class III (intensive pedestrian) and Class II (reconnaissance) cultural resources inventory were conducted on October 10 and 11, 2023 by Secretary of the Interior -qualified archaeologists with Transcon Environmental (now Eocene Environmental Group). Due to slope steepness, 5.25 acres were inventoried at a Class II (reconnaissance) level. Two cultural resource sites (42KA7537 [Kanab Creek Cave], and 42KA9789), were identified and documented. Site 42KA7537 had previously been determined eligible for the National Register of Historic Places (NRHP) under Criterion D (Case No. 13-0512). The NRCS has also determined that Site 42KA9789, a prehistoric campsite, is eligible for the NRHP under Criterion D.

Table 1 summarizes the avoidance and monitoring requirements during implementation. If requested during consultation, a tribal monitor can also be present.

TABLE 1
PROJECT SUMMARY AND CONCLUSIONS

Site Number	Site Description	Eligibility	Protective Measures
42KA7537	Prehistoric cave and artifact scatter (*Kanab Creek Cave*)	Eligible—D	Avoid all ground disturbing activities within 15 meters of the site boundary; a cultural monitor must be present during all ground disturbance within 15 meters of the site boundary, and avoidance flagging must be placed 15 meters from the site boundary prior to any construction activities near the site area.
42KA9789	Prehistoric artifact scatter	Eligible—D	Avoid all ground disturbing activities within 15 meters of the site boundary; a cultural monitor must be present during all ground disturbance within 15 meters of the site boundary, and avoidance flagging must be placed 15 meters from the site boundary prior to any construction activities near the site area.

With the implementation of the aforementioned avoidance and minimization measures, the NRCS has determined that use of the proposed borrow source will result in **No Adverse Effect to Historic Properties**, per 36 CFR 800.5(b). The NRCS requests concurrence for the delineation of the APE, determinations of site eligibility and project effect. If you have any questions, comments, or concerns, please contact Tara S. Hoffmann, State Watershed Cultural Resources Specialist, at 801-524-4556 or tara.hoffmann@usda.gov, at your convenience.

Sincerely,

TRAVIS MOTE
Acting State Conservationist

Dear Chairwoman Pete:

Enclosed is a cultural resources report titled *Cultural Resources Inventory Report, Kane County Water Conservancy District's Cove East Fork Virgin River Plan-Environmental Impact Statement (EIS), Kane County, Utah: Esplin Pit Evaluation.* The Natural Resources Conservation Service (NRCS) and Kane County Water Conservancy District (KCWCD) are proposing the addition of a borrow source to their Cove Reservoir Plan-EIS (U18TN0544, U21TN0840), which consists of a reservoir, irrigation pipeline, and associated facilities. Two previous Class III inventories, encompassing two alternative reservoir locations, pipelines, staging areas, construction access, borrow sources, and all other proposed ground disturbance, were completed under Project Numbers U18TN0544 and U21TN0840. The NRCS consulted with your office regarding those project numbers in letters dated January 9, 2020, and January 23, 2023, respectively. Concurrence on site eligibility and a determination of "adverse effect to historic properties" for the undertaking as a whole, was received on January 17, 2020, and February 6, 2023, respectively (Case Nos. 20-0121 and 23-0280). The additional borrow source, located east of Glendale, Utah, adjacent to Kanab Creek on the Glendale Bench has been evaluated under *Cultural Resources Inventory Report, Kane County Water Conservancy District's Cove East Fork Virgin River Plan-Environmental Impact Statement, Kane County, Utah: Esplin Pit Evaluation.* The NRCS is serving as the lead Federal agency.

Per 36 CFR 800.16(d), the supplemental Area of Potential Effects (APE) totals 13.72 acres of private land. The APE is the site of a former borrow pit (Esplin Glendale Bench Pit or Esplin Pit) where basalt bedrock has previously been quarried for use as riprap for a previous NRCS Emergency Watershed Protection project (U12SH0189, U13SH0167; Case Nos. 12-0762 and 13-0512). The project proposes to reopen the borrow pit to procure riprap for construction and armoring of the planned Cove Reservoir Dam. Observed basalt exposures in the project area measure 10 to 20 feet thick, and procurement activities to fulfill the dam construction needs (approximately 29,000 cubic yards of riprap) would require quarrying 1.8 acres of basalt to a thickness of 10 feet.

Per 36 CFR 800.4, a desktop review of know cultural resources, followed by a Class III (intensive pedestrian) and Class II (reconnaissance) cultural resources inventory were conducted on October 10 and 11, 2023 by Secretary of the Interior -qualified archaeologists with Transcon Environmental (now Eocene Environmental Group). Due to slope steepness, 5.25 acres were inventoried at a Class II (reconnaissance) level. Two cultural resource sites (42KA7537 [Kanab Creek Cave], and 42KA9789), were identified and documented. Site 42KA7537 had previously been determined eligible for the National Register of Historic

Dear Vice Chairwoman Yazzie:

Enclosed is a cultural resources report titled *Cultural Resources Inventory Report, Kane County Water Conservancy District's Cove East Fork Virgin River Plan-Environmental Impact Statement (EIS), Kane County, Utah: Esplin Pit Evaluation.* The Natural Resources Conservation Service (NRCS) and Kane County Water Conservancy District (KCWCD) are proposing the addition of a borrow source to their Cove Reservoir Plan-EIS (U18TN0544, U21TN0840), which consists of a reservoir, irrigation pipeline, and associated facilities. Two previous Class III inventories, encompassing two alternative reservoir locations, pipelines, staging areas, construction access, borrow sources, and all other proposed ground disturbance, were completed under Project Numbers U18TN0544 and U21TN0840. The NRCS consulted with your office regarding those project numbers in letters dated January 9, 2020, and January 23, 2023, respectively. Concurrence on site eligibility and a determination of "adverse effect to historic properties" for the undertaking as a whole, was received on January 17, 2020, and February 6, 2023, respectively (Case Nos. 20-0121 and 23-0280). The additional borrow source, located east of Glendale, Utah, adjacent to Kanab Creek on the Glendale Bench has been evaluated under *Cultural Resources Inventory Report, Kane County Water Conservancy District's Cove East Fork Virgin River Plan-Environmental Impact Statement, Kane County, Utah: Esplin Pit Evaluation.* The NRCS is serving as the lead Federal agency.

Per 36 CFR 800.16(d), the supplemental Area of Potential Effects (APE) totals 13.72 acres of private land. The APE is the site of a former borrow pit (Esplin Glendale Bench Pit or Esplin Pit) where basalt bedrock has previously been quarried for use as riprap for a previous NRCS Emergency Watershed Protection project (U12SH0189, U13SH0167; Case Nos. 12-0762 and 13-0512). The project proposes to reopen the borrow pit to procure riprap for construction and armoring of the planned Cove Reservoir Dam. Observed basalt exposures in the project area measure 10 to 20 feet thick, and procurement activities to fulfill the dam construction needs (approximately 29,000 cubic yards of riprap) would require quarrying 1.8 acres of basalt to a thickness of 10 feet.

Per 36 CFR 800.4, a desktop review of know cultural resources, followed by a Class III (intensive pedestrian) and Class II (reconnaissance) cultural resources inventory were conducted on October 10 and 11, 2023 by Secretary of the Interior -qualified archaeologists with Transcon Environmental (now Eocene Environmental Group). Due to slope steepness, 5.25 acres were inventoried at a Class II (reconnaissance) level. Two cultural resource sites (42KA7537 [Kanab Creek Cave], and 42KA9789), were identified and documented. Site 42KA7537 had previously been determined eligible for the National Register of Historic

Places (NRHP) under Criterion D (Case No. 13-0512). The NRCS has also determined that Site 42KA9789, a prehistoric campsite, is eligible for the NRHP under Criterion D.

Table 1 summarizes the avoidance and monitoring requirements during implementation. If requested during consultation, a tribal monitor can also be present.

TABLE 1
PROJECT SUMMARY AND CONCLUSIONS

Site Number	Site Description	Eligibility	Protective Measures
42KA7537	Prehistoric cave and artifact scatter (*Kanab Creek Cave*)	Eligible—D	Avoid all ground disturbing activities within 15 meters of the site boundary; a cultural monitor must be present during all ground disturbance within 15 meters of the site boundary, and avoidance flagging must be placed 15 meters from the site boundary prior to any construction activities near the site area.
42KA9789	Prehistoric artifact scatter	Eligible—D	Avoid all ground disturbing activities within 15 meters of the site boundary; a cultural monitor must be present during all ground disturbance within 15 meters of the site boundary, and avoidance flagging must be placed 15 meters from the site boundary prior to any construction activities near the site area.

With the implementation of the aforementioned avoidance and minimization measures, the NRCS has determined that use of the proposed borrow source will result in **No Adverse Effect to Historic Properties**, per 36 CFR 800.5(b). The NRCS requests concurrence for the delineation of the APE, determinations of site eligibility and project effect. If you have any questions, comments, or concerns, please contact Tara S. Subject: Re: [Take care when opening attachments] rock source on Glendale Bench - two prehistoric sites
Date: Friday, May 24, 2024 2:23:43 PM

Hello,
Thank you for the update and keeping the Kaibab Band of Paiute Indians Cultural Resource department in the loop on this project. It's so good to hear that your organization is making a heartfelt effort into preserving these sites. What you have recommended sounds good to me and I have no further questions or comments about this project site protection.

Thank you again and please keep in touch,

> I wanted to bring to your attention new consultation for the proposed Cove Reservoir Watershed Plan and EIS (Kane County Water Conservancy District is the Sponsor, with NRCS providing partial funding). The overall project, which we previously consulted on, consists of a reservoir, irrigation pipelines, and associated components near Orderville. One of the rip rap sources for the project is located at a previously used borrow source out on the Glendale Bench along Kanab Creek. Charley and an elder visited this rock source back in 2013/14 with me and SHPO to see a prehistoric cave site where the artifact scatter in front of the cave was adversely affected by heavy equipment. We mitigated those effects with an MOA. During the recent cultural survey of the rock source, another eligible artifact scatter site was identified.
>
> To ensure avoidance of these two sites, we will be avoiding each site by 15 meters, installing fencing around the site boundaries (with the 15-m buffer), and having an archaeological monitor present during all ground disturbance within 15-m of the sites. Does this approach sound reasonable to you? Are there any other concerns with getting rock from around these two sites?
>
> I've attached the cultural report, site forms, avoidance area map, and a kmz file of the APE. We mailed a formal consultation letter to you and Chairman Maldonado on May 20, 2024 (attached).

RE: Cove Reservoir APE Memo, Kane County, Utah

For future correspondence, please reference Case No. 25-1097

Dear Ms. Hoffmann,

The Utah State Historic Preservation Office received your submission and request for our comment on the above-referenced project on June 4, 2025. Based on the information provided to our office, we concur with your determinations of eligibility and with the finding that the visual/indirect APE is no adverse effect, and that the effect for the overall undertaking is still an adverse effect.

This information is provided to assist with Section 106 responsibilities as per §36CFR800. If you have questions, please contact me at (801) 245-7239 or by email at clhansen@utah.gov.

Sincerely,

Christopher Hansen
Preservation Planner/Deputy SHPO

Reference: Continuation of Consultation for the Kane County Water Conservancy District's Cove Reservoir Project— Direct/Indirect/Visual Areas of Potential Effect

Dear Mr. Koyiyumptewa,

The NRCS is continuing Section 106 consultation for the proposed Kane County Water Conservancy District's Cove East Fork Virgin River Plan-Environmental Impact Statement (aka Cove Reservoir Project), in Kane County, Utah. Included in this submission are a literature review cultural resources memo titled *Kane County Water Conservancy District's Cove Reservoir Project—Cultural Resources Review Memo, Indirect/Visual Areas of Potential Effect (APEs)*. The United States Department of Agriculture's Natural Resources Conservation Service (NRCS), with the and Kane County Water Conservancy District (KCWCD) are proposing to construct the new Cove Reservoir within the existing Glendale, Mt. Carmel, and Orderville irrigation systems. This proposed reservoir would be located immediately southwest of Orderville, Utah, off Cove Road. Additional improvements would include the construction of approximately 1.5 miles of new pipeline, the Glendale hydroelectric power plant, and 0.2 mile of new power line and 0.7 acre of utility corridor along U.S. Highway 89 (US-89) and Cove Road; these improvements would be located west of US-89 and the East Fork of the Virgin River in Glendale, Utah. The Project also proposes the potential use of three previously disturbed borrow pits—Lambs Pit, Tait Pit, and Esplin Pit—for Project-related construction needs. These proposed actions constitute an undertaking under Section 106.

The NRCS is serving as the lead federal agency pursuant to 36 CFR 800.2. The Bureau of Land Management-Kanab Field Office (BLM), U.S. Army Corps of Engineers, Sacramento District (Corps), Environmental Protection Agency (EPA), National Park Service (NPS), and Utah Trust Land Administration (TLA) have been identified as cooperating agencies. The NRCS shall act on behalf of all agencies in fulfilling our collective responsibilities under Section 106, including delineation of the APE, identification of historic properties, and finding of effect. The NRCS will inform all cooperating agencies of Section 106 consultation. This consultation will also cover TLA's responsibilities under Utah Annotated Code Section 9-8-404.

NRCS initially consulted with your office in letters sent January 9, 2020 (U18TN0844), and again on January 23, 2023 (U21TN0840). Concurrence on site eligibility and a determination of ***adverse effect to historic properties*** for the undertaking was received on January 17, 2020, and February 6, 2023, respectively (Case Nos. 20-0121 and 23-0280). Additional consultation occurred for an expansion of the APE for a borrow source in a letter dated May 20, 2024 (U23TN0682). Concurrence was received on May 20, 2024 (Case No. 24-1261). Following these consultations, the NRCS has revised the Area of Potential Effects (APE) to include the Direct (Physical), Visual, and Indirect APEs.

State Office Natural Resources Conservation Service

Salt Lake City, Utah 84138
Phone: 801-524-4550

Area of Potential Effects (APE) (36 CFR 800.4)

Table 1 summarizes the Direct, Visual, and Indirect APEs.

TABLE 1
TOTAL Area of Potential Effects (APE)

Area of Potential Effect	BLM	State	Private	Total
Indirect APE Acreage (Inundation Areas)	17.05	0.51	990.41	**1,007.97**
Visual APE Acreage (1 Mile Buffer of Cove Reservoir and Facilities)	245.00	1,698.01	3,009.28	**4,952.29**
Direct (Physical) APE Acreage (Cove Reservoir, Pipes, Canals, Esplin Pit, Tait Pit, Lamb's Pit)	0.23	70.33	641.9	**712.46**

- **Direct (Physical) APE**: Includes all potential physical ground disturbance, including construction, staging, access roads, borrow sources, and necessary buffers. It has been refined to a total of 712.46 acres.
- **Visual APE**: A radius of 1 mile around the periphery of the proposed Cove Reservoir was evaluated for potential visual resources that could be impacted by the current construction of the reservoir. GIS viewshed analysis was used to refine the final boundaries of the Visual APE, and areas without potential visibility of the project were removed from the Visual APE.
- **Indirect APE:** Includes the breach inundation zones (Sunny-Day and Rainy-Day) in the unlikely event of a dam breach.

Identification of Historic Properties (36 CFR 800.4)

To identify historic properties within the APEs, a literature review was completed by Eocene Environmental. Personnel meet or exceed the Secretary of the Interior Standards in Archeology. The literature review identified 26 cultural resources, 14 of which are eligible for the National Register of Historic Place (NRHP), and one unevaluated, but treated as eligible, within the partially overlapping Direct, Indirect, and Visual APEs. Of the 15 historic properties, only one historic property 42KA7537 (prehistoric cave and artifact scatter) meets the site type criteria for inclusion in the visual impact assessment and therefore do not require a formal visual effects assessment. Site 42KA7537 is only located in the Direct APE and will be avoided (see Case No. 24-1261).

Within the overlapping APEs, there are nine historic buildings/structures of which five are eligible for the NRHP, two are undetermined (treated as eligible), one has been demolished, and the final is ineligible/non-contributing. Within the Visual APE there are three eligible buildings/structures (Property ID Nos., 32819, 50442, and 33219). These historic properties are in Orderville, and the proposed Cove Reservoir would be obstructed from view by means of several ridges southwest of Gardner Hollow.

Within the Indirect APE breach inundation zone, there are three historic properties: Mt. Carmel School and Church (Property ID No. 37252); Dixon, Maynard, House and Studio (Property ID No. 40479); and Steven's Barn

State Office Natural Resources Conservation Service
125 South State Street, Room 6416
Salt Lake City, Utah 84138
Phone: 801-524-4550

(Property ID No. 31786). Steven's Barn (Property ID NO. 31786) has likely been demolished. Due to distance, elevation, and the proposed reservoir safety features, these historic properties are unlikely to be adversely affected by the highly improbable failure of the proposed Cove Reservoir dam.

Finding of Effect (36 CFR 800.5)

The implementation of the undertaking will not alter the character-defining characteristics of the aforementioned historic properties that allow them to convey their significance since visual component is not the character-defining feature that makes the sites eligible. Therefore, the NRCS finding of effect for the Visual and Indirect APEs is No Adverse Effect. This results in no change to the finding of effect for the entirety of the undertaking, where the NRCS retains our previous determination of ***Adverse Effect to Historic Properties*** (Case No. 20-0121).

In an electronical transmittal on March 28, 2024, the NRCS notified the Advisory Council on Historic Preservation (Council) of the adverse effect determination by providing documentation specified in 36 CFR 800.11(e). The Council declined to participate in consultation in a letter dated April 20, 2024. Per 36 CFR 800.6, the NRCS is continuing consultation with your office, the Sponsors, agencies, applicable Native American tribes, and other consulting parties, to develop mitigation stipulations that will be executed in a Memorandum of Agreement. As the lead federal agency, the NRCS is informing the BLM, Corps, NPS, TLA, and EPA of ongoing Section 106 consultations. Per 36 CFR 800.4-800.5, the NRCS requests concurrence for the delineation of the APEs, identification of historic properties, and finding of effect. If you have any questions, comments, or concerns, please contact Tara S. Hoffmann, Water and Cultural Resources Specialist, at (385)-258-1266 at your convenience.

Sincerely,

Emily Fife

June 4, 2025

Reference: Continuation of Consultation for the Kane County Water Conservancy District's Cove Reservoir Project— Direct/Indirect/Visual Areas of Potential Effect

Dear Chairman Nuvangyaoma,

The NRCS is continuing Section 106 consultation for the proposed Kane County Water Conservancy District's Cove East Fork Virgin River Plan-Environmental Impact Statement (aka Cove Reservoir Project), in Kane County, Utah. Included in this submission are a literature review cultural resources memo titled *Kane County Water Conservancy District's Cove Reservoir Project—Cultural Resources Review Memo, Indirect/Visual Areas of Potential Effect (APEs)*. The United States Department of Agriculture's Natural Resources Conservation Service (NRCS), with the and Kane County Water Conservancy District (KCWCD) are proposing to construct the new Cove Reservoir within the existing Glendale, Mt. Carmel, and Orderville irrigation systems. This proposed reservoir would be located immediately southwest of Orderville, Utah, off Cove Road. Additional improvements would include the construction of approximately 1.5 miles of new pipeline, the Glendale hydroelectric power plant, and 0.2 mile of new power line and 0.7 acre of utility corridor along U.S. Highway 89 (US-89) and Cove Road; these improvements would be located west of US-89 and the East Fork of the Virgin River in Glendale, Utah. The Project also proposes the potential use of three previously disturbed borrow pits—Lambs Pit, Tait Pit, and Esplin Pit—for Project-related construction needs. These proposed actions constitute an undertaking under Section 106.

The NRCS is serving as the lead federal agency pursuant to 36 CFR 800.2. The Bureau of Land Management-Kanab Field Office (BLM), U.S. Army Corps of Engineers, Sacramento District (Corps), Environmental Protection Agency (EPA), National Park Service (NPS), and Utah Trust Land Administration (TLA) have been identified as cooperating agencies. The NRCS shall act on behalf of all agencies in fulfilling our collective responsibilities under Section 106, including delineation of the APE, identification of historic properties, and finding of effect. The NRCS will inform all cooperating agencies of Section 106 consultation. This consultation will also cover TLA's responsibilities under Utah Annotated Code Section 9-8-404.

NRCS initially consulted with your office in letters sent January 9, 2020 (U18TN0844), and again on January 23, 2023 (U21TN0840). Concurrence on site eligibility and a determination of ***adverse effect to historic properties*** for the undertaking was received on January 17, 2020, and February 6, 2023, respectively (Case Nos. 20-0121 and 23-0280). Additional consultation occurred for an expansion of the APE for a borrow source in a letter dated May 20, 2024 (U23TN0682). Concurrence was received on May 20, 2024 (Case No. 24-1261). Following these consultations, the NRCS has revised the Area of Potential Effects (APE) to include the Direct (Physical), Visual, and Indirect APEs.

USDA is an equal opportunity provider, employer, and lender.

Phone: 801-524-4550

Area of Potential Effects (APE) (36 CFR 800.4)

Table 1 summarizes the Direct, Visual, and Indirect APEs.

TABLE 1
TOTAL Area of Potential Effects (APE)

Area of Potential Effect	BLM	State	Private	Total
Indirect APE Acreage (Inundation Areas)	17.05	0.51	990.41	**1,007.97**
Visual APE Acreage (1 Mile Buffer of Cove Reservoir and Facilities)	245.00	1,698.01	3,009.28	**4,952.29**
Direct (Physical) APE Acreage (Cove Reservoir, Pipes, Canals, Esplin Pit, Tait Pit, Lamb's Pit)	0.23	70.33	641.9	**712.46**

- **Direct (Physical) APE**: Includes all potential physical ground disturbance, including construction, staging, access roads, borrow sources, and necessary buffers. It has been refined to a total of 712.46 acres.
- **Visual APE**: A radius of 1 mile around the periphery of the proposed Cove Reservoir was evaluated for potential visual resources that could be impacted by the current construction of the reservoir. GIS viewshed analysis was used to refine the final boundaries of the Visual APE, and areas without potential visibility of the project were removed from the Visual APE.
- **Indirect APE:** Includes the breach inundation zones (Sunny-Day and Rainy-Day) in the unlikely event of a dam breach.

Identification of Historic Properties (36 CFR 800.4)

To identify historic properties within the APEs, a literature review was completed by Eocene Environmental. Personnel meet or exceed the Secretary of the Interior Standards in Archeology. The literature review identified 26 cultural resources, 14 of which are eligible for the National Register of Historic Place (NRHP), and one unevaluated, but treated as eligible, within the partially overlapping Direct, Indirect, and Visual APEs. Of the 15 historic properties, only one historic property 42KA7537 (prehistoric cave and artifact scatter) meets the site type criteria for inclusion in the visual impact assessment and therefore do not require a formal visual effects assessment. Site 42KA7537 is only located in the Direct APE and will be avoided (see Case No. 24-1261).

Within the overlapping APEs, there are nine historic buildings/structures of which five are eligible for the NRHP, two are undetermined (treated as eligible), one has been demolished, and the final is ineligible/non-contributing. Within the Visual APE there are three eligible buildings/structures (Property ID Nos., 32819, 50442, and 33219). These historic properties are in Orderville, and the proposed Cove Reservoir would be obstructed from view by means of several ridges southwest of Gardner Hollow.

Within the Indirect APE breach inundation zone, there are three historic properties: Mt. Carmel School and Church (Property ID No. 37252); Dixon, Maynard, House and Studio (Property ID No. 40479); and Steven's Barn

State Office Natural Resources Conservation Service
125 South State Street, Room 6416
Salt Lake City, Utah 84138
Phone: 801-524-4550

(Property ID No. 31786). Steven's Barn (Property ID NO. 31786) has likely been demolished. Due to distance, elevation, and the proposed reservoir safety features, these historic properties are unlikely to be adversely affected by the highly improbable failure of the proposed Cove Reservoir dam.

Finding of Effect (36 CFR 800.5)

The implementation of the undertaking will not alter the character-defining characteristics of the aforementioned historic properties that allow them to convey their significance since visual component is not the character-defining feature that makes the sites eligible. Therefore, the NRCS finding of effect for the Visual and Indirect APEs is No Adverse Effect. This results in no change to the finding of effect for the entirety of the undertaking, where the NRCS retains our previous determination of ***Adverse Effect to Historic Properties*** (Case No. 20-0121).

In an electronical transmittal on March 28, 2024, the NRCS notified the Advisory Council on Historic Preservation (Council) of the adverse effect determination by providing documentation specified in 36 CFR 800.11(e). The Council declined to participate in consultation in a letter dated April 20, 2024. Per 36 CFR 800.6, the NRCS is continuing consultation with your office, the Sponsors, agencies, applicable Native American tribes, and other consulting parties, to develop mitigation stipulations that will be executed in a Memorandum of Agreement. As the lead federal agency, the NRCS is informing the BLM, Corps, NPS, TLA, and EPA of ongoing Section 106 consultations. Per 36 CFR 800.4-800.5, the NRCS requests concurrence for the delineation of the APEs, identification of historic properties, and finding of effect. If you have any questions, comments, or concerns, please contact Tara S. Hoffmann, Water and Cultural Resources Specialist, at (385)-258-1266 at your convenience.

Sincerely,

Emily Fife

Reference: Continuation of Consultation for the Kane County Water Conservancy District's Cove Reservoir Project— Direct/Indirect/Visual Areas of Potential Effect

Dear Chairman Maldonado,

The NRCS is continuing Section 106 consultation for the proposed Kane County Water Conservancy District's Cove East Fork Virgin River Plan-Environmental Impact Statement (aka Cove Reservoir Project), in Kane County, Utah. Included in this submission are a literature review cultural resources memo titled *Kane County Water Conservancy District's Cove Reservoir Project—Cultural Resources Review Memo, Indirect/Visual Areas of Potential Effect (APEs)*. The United States Department of Agriculture's Natural Resources Conservation Service (NRCS), with the and Kane County Water Conservancy District (KCWCD) are proposing to construct the new Cove Reservoir within the existing Glendale, Mt. Carmel, and Orderville irrigation systems. This proposed reservoir would be located immediately southwest of Orderville, Utah, off Cove Road. Additional improvements would include the construction of approximately 1.5 miles of new pipeline, the Glendale hydroelectric power plant, and 0.2 mile of new power line and 0.7 acre of utility corridor along U.S. Highway 89 (US-89) and Cove Road; these improvements would be located west of US-89 and the East Fork of the Virgin River in Glendale, Utah. The Project also proposes the potential use of three previously disturbed borrow pits—Lambs Pit, Tait Pit, and Esplin Pit—for Project-related construction needs. These proposed actions constitute an undertaking under Section 106.

The NRCS is serving as the lead federal agency pursuant to 36 CFR 800.2. The Bureau of Land Management-Kanab Field Office (BLM), U.S. Army Corps of Engineers, Sacramento District (Corps), Environmental Protection Agency (EPA), National Park Service (NPS), and Utah Trust Land Administration (TLA) have been identified as cooperating agencies. The NRCS shall act on behalf of all agencies in fulfilling our collective responsibilities under Section 106, including delineation of the APE, identification of historic properties, and finding of effect. The NRCS will inform all cooperating agencies of Section 106 consultation. This consultation will also cover TLA's responsibilities under Utah Annotated Code Section 9-8-404.

NRCS initially consulted with your office in letters sent January 9, 2020 (U18TN0844), and again on January 23, 2023 (U21TN0840). Concurrence on site eligibility and a determination of ***adverse effect to historic properties*** for the undertaking was received on January 17, 2020, and February 6, 2023, respectively (Case Nos. 20-0121 and 23-0280). Additional consultation occurred for an expansion of the APE for a borrow source in a letter dated May 20, 2024 (U23TN0682). Concurrence was received on May 20, 2024 (Case No. 24-1261). Following these consultations, the NRCS has revised the Area of Potential Effects (APE) to include the Direct (Physical), Visual, and Indirect APEs.

USDA is an equal opportunity provider, employer, and lender.

State Office Natural Resources Conservation Service

Phone: 801-524-4550

Area of Potential Effects (APE) (36 CFR 800.4)

Table 1 summarizes the Direct, Visual, and Indirect APEs.

TABLE 1
TOTAL Area of Potential Effects (APE)

Area of Potential Effect	BLM	State	Private	Total
Indirect APE Acreage (Inundation Areas)	17.05	0.51	990.41	**1,007.97**
Visual APE Acreage (1 Mile Buffer of Cove Reservoir and Facilities)	245.00	1,698.01	3,009.28	**4,952.29**
Direct (Physical) APE Acreage (Cove Reservoir, Pipes, Canals, Esplin Pit, Tait Pit, Lamb's Pit)	0.23	70.33	641.9	**712.46**

- **Direct (Physical) APE**: Includes all potential physical ground disturbance, including construction, staging, access roads, borrow sources, and necessary buffers. It has been refined to a total of 712.46 acres.
- **Visual APE**: A radius of 1 mile around the periphery of the proposed Cove Reservoir was evaluated for potential visual resources that could be impacted by the current construction of the reservoir. GIS viewshed analysis was used to refine the final boundaries of the Visual APE, and areas without potential visibility of the project were removed from the Visual APE.
- **Indirect APE:** Includes the breach inundation zones (Sunny-Day and Rainy-Day) in the unlikely event of a dam breach.

Identification of Historic Properties (36 CFR 800.4)

To identify historic properties within the APEs, a literature review was completed by Eocene Environmental. Personnel meet or exceed the Secretary of the Interior Standards in Archeology. The literature review identified 26 cultural resources, 14 of which are eligible for the National Register of Historic Place (NRHP), and one unevaluated, but treated as eligible, within the partially overlapping Direct, Indirect, and Visual APEs. Of the 15 historic properties, only one historic property 42KA7537 (prehistoric cave and artifact scatter) meets the site type criteria for inclusion in the visual impact assessment and therefore do not require a formal visual effects assessment. Site 42KA7537 is only located in the Direct APE and will be avoided (see Case No. 24-1261).

Within the overlapping APEs, there are nine historic buildings/structures of which five are eligible for the NRHP, two are undetermined (treated as eligible), one has been demolished, and the final is ineligible/non-contributing. Within the Visual APE there are three eligible buildings/structures (Property ID Nos., 32819, 50442, and 33219). These historic properties are in Orderville, and the proposed Cove Reservoir would be obstructed from view by means of several ridges southwest of Gardner Hollow.

State Office Natural Resources Conservation Service
125 South State Street, Room 6416
Salt Lake City, Utah 84138
Phone: 801-524-4550

Within the Indirect APE breach inundation zone, there are three historic properties: Mt. Carmel School and Church (Property ID No. 37252); Dixon, Maynard, House and Studio (Property ID No. 40479); and Steven's Barn (Property ID No. 31786). Steven's Barn (Property ID NO. 31786) has likely been demolished. Due to distance, elevation, and the proposed reservoir safety features, these historic properties are unlikely to be adversely affected by the highly improbable failure of the proposed Cove Reservoir dam.

Finding of Effect (36 CFR 800.5)

The implementation of the undertaking will not alter the character-defining characteristics of the aforementioned historic properties that allow them to convey their significance since visual component is not the character-defining feature that makes the sites eligible. Therefore, the NRCS finding of effect for the Visual and Indirect APEs is No Adverse Effect. This results in no change to the finding of effect for the entirety of the undertaking, where the NRCS retains our previous determination of ***Adverse Effect to Historic Properties*** (Case No. 20-0121).

In an electronical transmittal on March 28, 2024, the NRCS notified the Advisory Council on Historic Preservation (Council) of the adverse effect determination by providing documentation specified in 36 CFR 800.11(e). The Council declined to participate in consultation in a letter dated April 20, 2024. Per 36 CFR 800.6, the NRCS is continuing consultation with your office, the Sponsors, agencies, applicable Native American tribes, and other consulting parties, to develop mitigation stipulations that will be executed in a Memorandum of Agreement. As the lead federal agency, the NRCS is informing the BLM, Corps, NPS, TLA, and EPA of ongoing Section 106 consultations. Per 36 CFR 800.4-800.5, the NRCS requests concurrence for the delineation of the APEs, identification of historic properties, and finding of effect. If you have any questions, comments, or concerns, please contact Tara S. Hoffmann, Water and Cultural Resources Specialist, at (385)-258-1266 at your convenience.

Sincerely,

Emily Fife

Reference: Continuation of Consultation for the Kane County Water Conservancy District's Cove Reservoir Project— Direct/Indirect/Visual Areas of Potential Effect

Dear Vice Chairwoman Bradley,

The NRCS is continuing Section 106 consultation for the proposed Kane County Water Conservancy District's Cove East Fork Virgin River Plan-Environmental Impact Statement (aka Cove Reservoir Project), in Kane County, Utah. Included in this submission are a literature review cultural resources memo titled *Kane County Water Conservancy District's Cove Reservoir Project—Cultural Resources Review Memo, Indirect/Visual Areas of Potential Effect (APEs)*. The United States Department of Agriculture's Natural Resources Conservation Service (NRCS), with the and Kane County Water Conservancy District (KCWCD) are proposing to construct the new Cove Reservoir within the existing Glendale, Mt. Carmel, and Orderville irrigation systems. This proposed reservoir would be located immediately southwest of Orderville, Utah, off Cove Road. Additional improvements would include the construction of approximately 1.5 miles of new pipeline, the Glendale hydroelectric power plant, and 0.2 mile of new power line and 0.7 acre of utility corridor along U.S. Highway 89 (US-89) and Cove Road; these improvements would be located west of US-89 and the East Fork of the Virgin River in Glendale, Utah. The Project also proposes the potential use of three previously disturbed borrow pits—Lambs Pit, Tait Pit, and Esplin Pit—for Project-related construction needs. These proposed actions constitute an undertaking under Section 106.

The NRCS is serving as the lead federal agency pursuant to 36 CFR 800.2. The Bureau of Land Management-Kanab Field Office (BLM), U.S. Army Corps of Engineers, Sacramento District (Corps), Environmental Protection Agency (EPA), National Park Service (NPS), and Utah Trust Land Administration (TLA) have been identified as cooperating agencies. The NRCS shall act on behalf of all agencies in fulfilling our collective responsibilities under Section 106, including delineation of the APE, identification of historic properties, and finding of effect. The NRCS will inform all cooperating agencies of Section 106 consultation. This consultation will also cover TLA's responsibilities under Utah Annotated Code Section 9-8-404.

NRCS initially consulted with your office in letters sent January 9, 2020 (U18TN0844), and again on January 23, 2023 (U21TN0840). Concurrence on site eligibility and a determination of ***adverse effect to historic properties*** for the undertaking was received on January 17, 2020, and February 6, 2023, respectively (Case Nos. 20-0121 and 23-0280). Additional consultation occurred for an expansion of the APE for a borrow source in a letter dated May 20, 2024 (U23TN0682). Concurrence was received on May 20, 2024 (Case No. 24-1261). Following these consultations, the NRCS has revised the Area of Potential Effects (APE) to include the Direct (Physical), Visual, and Indirect APEs.

Area of Potential Effects (APE) (36 CFR 800.4)

Table 1 summarizes the Direct, Visual, and Indirect APEs.

TABLE 1
TOTAL Area of Potential Effects (APE)

Area of Potential Effect	BLM	State	Private	Total
Indirect APE Acreage (Inundation Areas)	17.05	0.51	990.41	**1,007.97**
Visual APE Acreage (1 Mile Buffer of Cove Reservoir and Facilities)	245.00	1,698.01	3,009.28	**4,952.29**
Direct (Physical) APE Acreage (Cove Reservoir, Pipes, Canals, Esplin Pit, Tait Pit, Lamb's Pit)	0.23	70.33	641.9	**712.46**

- **Direct (Physical) APE**: Includes all potential physical ground disturbance, including construction, staging, access roads, borrow sources, and necessary buffers. It has been refined to a total of 712.46 acres.
- **Visual APE**: A radius of 1 mile around the periphery of the proposed Cove Reservoir was evaluated for potential visual resources that could be impacted by the current construction of the reservoir. GIS viewshed analysis was used to refine the final boundaries of the Visual APE, and areas without potential visibility of the project were removed from the Visual APE.
- **Indirect APE:** Includes the breach inundation zones (Sunny-Day and Rainy-Day) in the unlikely event of a dam breach.

Identification of Historic Properties (36 CFR 800.4)

To identify historic properties within the APEs, a literature review was completed by Eocene Environmental. Personnel meet or exceed the Secretary of the Interior Standards in Archeology. The literature review identified 26 cultural resources, 14 of which are eligible for the National Register of Historic Place (NRHP), and one unevaluated, but treated as eligible, within the partially overlapping Direct, Indirect, and Visual APEs. Of the 15 historic properties, only one historic property 42KA7537 (prehistoric cave and artifact scatter) meets the site type criteria for inclusion in the visual impact assessment and therefore do not require a formal visual effects assessment. Site 42KA7537 is only located in the Direct APE and will be avoided (see Case No. 24-1261).

Within the overlapping APEs, there are nine historic buildings/structures of which five are eligible for the NRHP, two are undetermined (treated as eligible), one has been demolished, and the final is ineligible/non-contributing. Within the Visual APE there are three eligible buildings/structures (Property ID Nos., 32819, 50442, and 33219). These historic properties are in Orderville, and the proposed Cove Reservoir would be obstructed from view by means of several ridges southwest of Gardner Hollow.

State Office Natural Resources Conservation Service
125 South State Street, Room 6416
Salt Lake City, Utah 84138
Phone: 801-524-4550

Within the Indirect APE breach inundation zone, there are three historic properties: Mt. Carmel School and Church (Property ID No. 37252); Dixon, Maynard, House and Studio (Property ID No. 40479); and Steven's Barn (Property ID No. 31786). Steven's Barn (Property ID NO. 31786) has likely been demolished. Due to distance, elevation, and the proposed reservoir safety features, these historic properties are unlikely to be adversely affected by the highly improbable failure of the proposed Cove Reservoir dam.

Finding of Effect (36 CFR 800.5)

The implementation of the undertaking will not alter the character-defining characteristics of the aforementioned historic properties that allow them to convey their significance since visual component is not the character-defining feature that makes the sites eligible. Therefore, the NRCS finding of effect for the Visual and Indirect APEs is No Adverse Effect. This results in no change to the finding of effect for the entirety of the undertaking, where the NRCS retains our previous determination of ***Adverse Effect to Historic Properties*** (Case No. 20-0121).

In an electronical transmittal on March 28, 2024, the NRCS notified the Advisory Council on Historic Preservation (Council) of the adverse effect determination by providing documentation specified in 36 CFR 800.11(e). The Council declined to participate in consultation in a letter dated April 20, 2024. Per 36 CFR 800.6, the NRCS is continuing consultation with your office, the Sponsors, agencies, applicable Native American tribes, and other consulting parties, to develop mitigation stipulations that will be executed in a Memorandum of Agreement. As the lead federal agency, the NRCS is informing the BLM, Corps, NPS, TLA, and EPA of ongoing Section 106 consultations. Per 36 CFR 800.4-800.5, the NRCS requests concurrence for the delineation of the APEs, identification of historic properties, and finding of effect. If you have any questions, comments, or concerns, please contact Tara S. Hoffmann, Water and Cultural Resources Specialist, at (385)-258-1266 at your convenience.

Sincerely,

Emily Fife

June 4, 2025

Reference: Continuation of Consultation for the Kane County Water Conservancy District's Cove Reservoir Project— Direct/Indirect/Visual Areas of Potential Effect

Dear Mr. Bullets,

The NRCS is continuing Section 106 consultation for the proposed Kane County Water Conservancy District's Cove East Fork Virgin River Plan-Environmental Impact Statement (aka Cove Reservoir Project), in Kane County, Utah. Included in this submission are a literature review cultural resources memo titled *Kane County Water Conservancy District's Cove Reservoir Project—Cultural Resources Review Memo, Indirect/Visual Areas of Potential Effect (APEs)*. The United States Department of Agriculture's Natural Resources Conservation Service (NRCS), with the and Kane County Water Conservancy District (KCWCD) are proposing to construct the new Cove Reservoir within the existing Glendale, Mt. Carmel, and Orderville irrigation systems. This proposed reservoir would be located immediately southwest of Orderville, Utah, off Cove Road. Additional improvements would include the construction of approximately 1.5 miles of new pipeline, the Glendale hydroelectric power plant, and 0.2 mile of new power line and 0.7 acre of utility corridor along U.S. Highway 89 (US-89) and Cove Road; these improvements would be located west of US-89 and the East Fork of the Virgin River in Glendale, Utah. The Project also proposes the potential use of three previously disturbed borrow pits—Lambs Pit, Tait Pit, and Esplin Pit—for Project-related construction needs. These proposed actions constitute an undertaking under Section 106.

The NRCS is serving as the lead federal agency pursuant to 36 CFR 800.2. The Bureau of Land Management-Kanab Field Office (BLM), U.S. Army Corps of Engineers, Sacramento District (Corps), Environmental Protection Agency (EPA), National Park Service (NPS), and Utah Trust Land Administration (TLA) have been identified as cooperating agencies. The NRCS shall act on behalf of all agencies in fulfilling our collective responsibilities under Section 106, including delineation of the APE, identification of historic properties, and finding of effect. The NRCS will inform all cooperating agencies of Section 106 consultation. This consultation will also cover TLA's responsibilities under Utah Annotated Code Section 9-8-404.

NRCS initially consulted with your office in letters sent January 9, 2020 (U18TN0844), and again on January 23, 2023 (U21TN0840). Concurrence on site eligibility and a determination of ***adverse effect to historic properties*** for the undertaking was received on January 17, 2020, and February 6, 2023, respectively (Case Nos. 20-0121 and 23-0280). Additional consultation occurred for an expansion of the APE for a borrow source in a letter dated May 20, 2024 (U23TN0682). Concurrence was received on May 20, 2024 (Case No. 24-1261). Following these consultations, the NRCS has revised the Area of Potential Effects (APE) to include the Direct (Physical), Visual, and Indirect APEs.

State Office Natural Resources Conservation Service
125 South State Street, Room 6416
Salt Lake City, Utah 84138
Phone: 801-524-4550

Area of Potential Effects (APE) (36 CFR 800.4)

Table 1 summarizes the Direct, Visual, and Indirect APEs.

TABLE 1
TOTAL Area of Potential Effects (APE)

Area of Potential Effect	BLM	State	Private	Total
Indirect APE Acreage (Inundation Areas)	17.05	0.51	990.41	**1,007.97**
Visual APE Acreage (1 Mile Buffer of Cove Reservoir and Facilities)	245.00	1,698.01	3,009.28	**4,952.29**
Direct (Physical) APE Acreage (Cove Reservoir, Pipes, Canals, Esplin Pit, Tait Pit, Lamb's Pit)	0.23	70.33	641.9	**712.46**

- **Direct (Physical) APE**: Includes all potential physical ground disturbance, including construction, staging, access roads, borrow sources, and necessary buffers. It has been refined to a total of 712.46 acres.
- **Visual APE**: A radius of 1 mile around the periphery of the proposed Cove Reservoir was evaluated for potential visual resources that could be impacted by the current construction of the reservoir. GIS viewshed analysis was used to refine the final boundaries of the Visual APE, and areas without potential visibility of the project were removed from the Visual APE.
- **Indirect APE:** Includes the breach inundation zones (Sunny-Day and Rainy-Day) in the unlikely event of a dam breach.

Identification of Historic Properties (36 CFR 800.4)

To identify historic properties within the APEs, a literature review was completed by Eocene Environmental. Personnel meet or exceed the Secretary of the Interior Standards in Archeology. The literature review identified 26 cultural resources, 14 of which are eligible for the National Register of Historic Place (NRHP), and one unevaluated, but treated as eligible, within the partially overlapping Direct, Indirect, and Visual APEs. Of the 15 historic properties, only one historic property 42KA7537 (prehistoric cave and artifact scatter) meets the site type criteria for inclusion in the visual impact assessment and therefore do not require a formal visual effects assessment. Site 42KA7537 is only located in the Direct APE and will be avoided (see Case No. 24-1261).

Within the overlapping APEs, there are nine historic buildings/structures of which five are eligible for the NRHP, two are undetermined (treated as eligible), one has been demolished, and the final is ineligible/non-contributing. Within the Visual APE there are three eligible buildings/structures (Property ID Nos., 32819, 50442, and 33219). These historic properties are in Orderville, and the proposed Cove Reservoir would be obstructed from view by means of several ridges southwest of Gardner Hollow.

Within the Indirect APE breach inundation zone, there are three historic properties: Mt. Carmel School and Church (Property ID No. 37252); Dixon, Maynard, House and Studio (Property ID No. 40479); and Steven's Barn

State Office Natural Resources Conservation Service
125 South State Street, Room 6416
Salt Lake City, Utah 84138
Phone: 801-524-4550

(Property ID No. 31786). Steven's Barn (Property ID NO. 31786) has likely been demolished. Due to distance, elevation, and the proposed reservoir safety features, these historic properties are unlikely to be adversely affected by the highly improbable failure of the proposed Cove Reservoir dam.

Finding of Effect (36 CFR 800.5)

The implementation of the undertaking will not alter the character-defining characteristics of the aforementioned historic properties that allow them to convey their significance since visual component is not the character-defining feature that makes the sites eligible. Therefore, the NRCS finding of effect for the Visual and Indirect APEs is No Adverse Effect. This results in no change to the finding of effect for the entirety of the undertaking, where the NRCS retains our previous determination of ***Adverse Effect to Historic Properties*** (Case No. 20-0121).

In an electronical transmittal on March 28, 2024, the NRCS notified the Advisory Council on Historic Preservation (Council) of the adverse effect determination by providing documentation specified in 36 CFR 800.11(e). The Council declined to participate in consultation in a letter dated April 20, 2024. Per 36 CFR 800.6, the NRCS is continuing consultation with your office, the Sponsors, agencies, applicable Native American tribes, and other consulting parties, to develop mitigation stipulations that will be executed in a Memorandum of Agreement. As the lead federal agency, the NRCS is informing the BLM, Corps, NPS, TLA, and EPA of ongoing Section 106 consultations. Per 36 CFR 800.4-800.5, the NRCS requests concurrence for the delineation of the APEs, identification of historic properties, and finding of effect. If you have any questions, comments, or concerns, please contact Tara S. Hoffmann, Water and Cultural Resources Specialist, at (385)-258-1266 at your convenience.

Sincerely,

Emily Fife

Reference: Continuation of Consultation for the Kane County Water Conservancy District's Cove Reservoir Project— Direct/Indirect/Visual Areas of Potential Effect

Dear Vice Chairman Spotted Eagle,

The NRCS is continuing Section 106 consultation for the proposed Kane County Water Conservancy District's Cove East Fork Virgin River Plan-Environmental Impact Statement (aka Cove Reservoir Project), in Kane County, Utah. Included in this submission are a literature review cultural resources memo titled *Kane County Water Conservancy District's Cove Reservoir Project—Cultural Resources Review Memo, Indirect/Visual Areas of Potential Effect (APEs)*. The United States Department of Agriculture's Natural Resources Conservation Service (NRCS), with the and Kane County Water Conservancy District (KCWCD) are proposing to construct the new Cove Reservoir within the existing Glendale, Mt. Carmel, and Orderville irrigation systems. This proposed reservoir would be located immediately southwest of Orderville, Utah, off Cove Road. Additional improvements would include the construction of approximately 1.5 miles of new pipeline, the Glendale hydroelectric power plant, and 0.2 mile of new power line and 0.7 acre of utility corridor along U.S. Highway 89 (US-89) and Cove Road; these improvements would be located west of US-89 and the East Fork of the Virgin River in Glendale, Utah. The Project also proposes the potential use of three previously disturbed borrow pits—Lambs Pit, Tait Pit, and Esplin Pit—for Project-related construction needs. These proposed actions constitute an undertaking under Section 106.

The NRCS is serving as the lead federal agency pursuant to 36 CFR 800.2. The Bureau of Land Management-Kanab Field Office (BLM), U.S. Army Corps of Engineers, Sacramento District (Corps), Environmental Protection Agency (EPA), National Park Service (NPS), and Utah Trust Land Administration (TLA) have been identified as cooperating agencies. The NRCS shall act on behalf of all agencies in fulfilling our collective responsibilities under Section 106, including delineation of the APE, identification of historic properties, and finding of effect. The NRCS will inform all cooperating agencies of Section 106 consultation. This consultation will also cover TLA's responsibilities under Utah Annotated Code Section 9-8-404.

NRCS initially consulted with your office in letters sent January 9, 2020 (U18TN0844), and again on January 23, 2023 (U21TN0840). Concurrence on site eligibility and a determination of ***adverse effect to historic properties*** for the undertaking was received on January 17, 2020, and February 6, 2023, respectively (Case Nos. 20-0121 and 23-0280). Additional consultation occurred for an expansion of the APE for a borrow source in a letter dated May 20, 2024 (U23TN0682). Concurrence was received on May 20, 2024 (Case No. 24-1261). Following these consultations, the NRCS has revised the Area of Potential Effects (APE) to include the Direct (Physical), Visual, and Indirect APEs.

USDA is an equal opportunity provider, employer, and lender.

Salt Lake City, Utah 84138
Phone: 801-524-4550

Area of Potential Effects (APE) (36 CFR 800.4)

Table 1 summarizes the Direct, Visual, and Indirect APEs.

TABLE 1
TOTAL Area of Potential Effects (APE)

Area of Potential Effect	BLM	State	Private	Total
Indirect APE Acreage (Inundation Areas)	17.05	0.51	990.41	**1,007.97**
Visual APE Acreage (1 Mile Buffer of Cove Reservoir and Facilities)	245.00	1,698.01	3,009.28	**4,952.29**
Direct (Physical) APE Acreage (Cove Reservoir, Pipes, Canals, Esplin Pit, Tait Pit, Lamb's Pit)	0.23	70.33	641.9	**712.46**

- **Direct (Physical) APE**: Includes all potential physical ground disturbance, including construction, staging, access roads, borrow sources, and necessary buffers. It has been refined to a total of 712.46 acres.
- **Visual APE**: A radius of 1 mile around the periphery of the proposed Cove Reservoir was evaluated for potential visual resources that could be impacted by the current construction of the reservoir. GIS viewshed analysis was used to refine the final boundaries of the Visual APE, and areas without potential visibility of the project were removed from the Visual APE.
- **Indirect APE:** Includes the breach inundation zones (Sunny-Day and Rainy-Day) in the unlikely event of a dam breach.

Identification of Historic Properties (36 CFR 800.4)

To identify historic properties within the APEs, a literature review was completed by Eocene Environmental. Personnel meet or exceed the Secretary of the Interior Standards in Archeology. The literature review identified 26 cultural resources, 14 of which are eligible for the National Register of Historic Place (NRHP), and one unevaluated, but treated as eligible, within the partially overlapping Direct, Indirect, and Visual APEs. Of the 15 historic properties, only one historic property 42KA7537 (prehistoric cave and artifact scatter) meets the site type criteria for inclusion in the visual impact assessment and therefore do not require a formal visual effects assessment. Site 42KA7537 is only located in the Direct APE and will be avoided (see Case No. 24-1261).

Within the overlapping APEs, there are nine historic buildings/structures of which five are eligible for the NRHP, two are undetermined (treated as eligible), one has been demolished, and the final is ineligible/non-contributing. Within the Visual APE there are three eligible buildings/structures (Property ID Nos., 32819, 50442, and 33219). These historic properties are in Orderville, and the proposed Cove Reservoir would be obstructed from view by means of several ridges southwest of Gardner Hollow.

Within the Indirect APE breach inundation zone, there are three historic properties: Mt. Carmel School and Church (Property ID No. 37252); Dixon, Maynard, House and Studio (Property ID No. 40479); and Steven's Barn

State Office Natural Resources Conservation Service
125 South State Street, Room 6416
Salt Lake City, Utah 84138
Phone: 801-524-4550

(Property ID No. 31786). Steven's Barn (Property ID NO. 31786) has likely been demolished. Due to distance, elevation, and the proposed reservoir safety features, these historic properties are unlikely to be adversely affected by the highly improbable failure of the proposed Cove Reservoir dam.

Finding of Effect (36 CFR 800.5)

The implementation of the undertaking will not alter the character-defining characteristics of the aforementioned historic properties that allow them to convey their significance since visual component is not the character-defining feature that makes the sites eligible. Therefore, the NRCS finding of effect for the Visual and Indirect APEs is No Adverse Effect. This results in no change to the finding of effect for the entirety of the undertaking, where the NRCS retains our previous determination of ***Adverse Effect to Historic Properties*** (Case No. 20-0121).

In an electronical transmittal on March 28, 2024, the NRCS notified the Advisory Council on Historic Preservation (Council) of the adverse effect determination by providing documentation specified in 36 CFR 800.11(e). The Council declined to participate in consultation in a letter dated April 20, 2024. Per 36 CFR 800.6, the NRCS is continuing consultation with your office, the Sponsors, agencies, applicable Native American tribes, and other consulting parties, to develop mitigation stipulations that will be executed in a Memorandum of Agreement. As the lead federal agency, the NRCS is informing the BLM, Corps, NPS, TLA, and EPA of ongoing Section 106 consultations. Per 36 CFR 800.4-800.5, the NRCS requests concurrence for the delineation of the APEs, identification of historic properties, and finding of effect. If you have any questions, comments, or concerns, please contact Tara S. Hoffmann, Water and Cultural Resources Specialist, at (385)-258-1266 at your convenience.

Sincerely,

Emily Fife

Reference: Continuation of Consultation for the Kane County Water Conservancy District's Cove Reservoir Project— Direct/Indirect/Visual Areas of Potential Effect

Dear Chairman Tso,

The NRCS is continuing Section 106 consultation for the proposed Kane County Water Conservancy District's Cove East Fork Virgin River Plan-Environmental Impact Statement (aka Cove Reservoir Project), in Kane County, Utah. Included in this submission are a literature review cultural resources memo titled *Kane County Water Conservancy District's Cove Reservoir Project—Cultural Resources Review Memo, Indirect/Visual Areas of Potential Effect (APEs)*. The United States Department of Agriculture's Natural Resources Conservation Service (NRCS), with the and Kane County Water Conservancy District (KCWCD) are proposing to construct the new Cove Reservoir within the existing Glendale, Mt. Carmel, and Orderville irrigation systems. This proposed reservoir would be located immediately southwest of Orderville, Utah, off Cove Road. Additional improvements would include the construction of approximately 1.5 miles of new pipeline, the Glendale hydroelectric power plant, and 0.2 mile of new power line and 0.7 acre of utility corridor along U.S. Highway 89 (US-89) and Cove Road; these improvements would be located west of US-89 and the East Fork of the Virgin River in Glendale, Utah. The Project also proposes the potential use of three previously disturbed borrow pits—Lambs Pit, Tait Pit, and Esplin Pit—for Project-related construction needs. These proposed actions constitute an undertaking under Section 106.

The NRCS is serving as the lead federal agency pursuant to 36 CFR 800.2. The Bureau of Land Management-Kanab Field Office (BLM), U.S. Army Corps of Engineers, Sacramento District (Corps), Environmental Protection Agency (EPA), National Park Service (NPS), and Utah Trust Land Administration (TLA) have been identified as cooperating agencies. The NRCS shall act on behalf of all agencies in fulfilling our collective responsibilities under Section 106, including delineation of the APE, identification of historic properties, and finding of effect. The NRCS will inform all cooperating agencies of Section 106 consultation. This consultation will also cover TLA's responsibilities under Utah Annotated Code Section 9-8-404.

NRCS initially consulted with your office in letters sent January 9, 2020 (U18TN0844), and again on January 23, 2023 (U21TN0840). Concurrence on site eligibility and a determination of ***adverse effect to historic properties*** for the undertaking was received on January 17, 2020, and February 6, 2023, respectively (Case Nos. 20-0121 and 23-0280). Additional consultation occurred for an expansion of the APE for a borrow source in a letter dated May 20, 2024 (U23TN0682). Concurrence was received on May 20, 2024 (Case No. 24-1261). Following these consultations, the NRCS has revised the Area of Potential Effects (APE) to include the Direct (Physical), Visual, and Indirect APEs.

USDA is an equal opportunity provider, employer, and lender.

Area of Potential Effects (APE) (36 CFR 800.4)

Table 1 summarizes the Direct, Visual, and Indirect APEs.

TABLE 1
TOTAL Area of Potential Effects (APE)

Area of Potential Effect	BLM	State	Private	Total
Indirect APE Acreage (Inundation Areas)	17.05	0.51	990.41	**1,007.97**
Visual APE Acreage (1 Mile Buffer of Cove Reservoir and Facilities)	245.00	1,698.01	3,009.28	**4,952.29**
Direct (Physical) APE Acreage (Cove Reservoir, Pipes, Canals, Esplin Pit, Tait Pit, Lamb's Pit)	0.23	70.33	641.9	**712.46**

- **Direct (Physical) APE**: Includes all potential physical ground disturbance, including construction, staging, access roads, borrow sources, and necessary buffers. It has been refined to a total of 712.46 acres.
- **Visual APE**: A radius of 1 mile around the periphery of the proposed Cove Reservoir was evaluated for potential visual resources that could be impacted by the current construction of the reservoir. GIS viewshed analysis was used to refine the final boundaries of the Visual APE, and areas without potential visibility of the project were removed from the Visual APE.
- **Indirect APE:** Includes the breach inundation zones (Sunny-Day and Rainy-Day) in the unlikely event of a dam breach.

Identification of Historic Properties (36 CFR 800.4)

To identify historic properties within the APEs, a literature review was completed by Eocene Environmental. Personnel meet or exceed the Secretary of the Interior Standards in Archeology. The literature review identified 26 cultural resources, 14 of which are eligible for the National Register of Historic Place (NRHP), and one unevaluated, but treated as eligible, within the partially overlapping Direct, Indirect, and Visual APEs. Of the 15 historic properties, only one historic property 42KA7537 (prehistoric cave and artifact scatter) meets the site type criteria for inclusion in the visual impact assessment and therefore do not require a formal visual effects assessment. Site 42KA7537 is only located in the Direct APE and will be avoided (see Case No. 24-1261).

Within the overlapping APEs, there are nine historic buildings/structures of which five are eligible for the NRHP, two are undetermined (treated as eligible), one has been demolished, and the final is ineligible/non-contributing. Within the Visual APE there are three eligible buildings/structures (Property ID Nos., 32819, 50442, and 33219). These historic properties are in Orderville, and the proposed Cove Reservoir would be obstructed from view by means of several ridges southwest of Gardner Hollow.

Within the Indirect APE breach inundation zone, there are three historic properties: Mt. Carmel School and Church (Property ID No. 37252); Dixon, Maynard, House and Studio (Property ID No. 40479); and Steven's Barn

State Office Natural Resources Conservation Service
125 South State Street, Room 6416
Salt Lake City, Utah 84138
Phone: 801-524-4550

(Property ID No. 31786). Steven's Barn (Property ID NO. 31786) has likely been demolished. Due to distance, elevation, and the proposed reservoir safety features, these historic properties are unlikely to be adversely affected by the highly improbable failure of the proposed Cove Reservoir dam.

Finding of Effect (36 CFR 800.5)

The implementation of the undertaking will not alter the character-defining characteristics of the aforementioned historic properties that allow them to convey their significance since visual component is not the character-defining feature that makes the sites eligible. Therefore, the NRCS finding of effect for the Visual and Indirect APEs is No Adverse Effect. This results in no change to the finding of effect for the entirety of the undertaking, where the NRCS retains our previous determination of ***Adverse Effect to Historic Properties*** (Case No. 20-0121).

In an electronical transmittal on March 28, 2024, the NRCS notified the Advisory Council on Historic Preservation (Council) of the adverse effect determination by providing documentation specified in 36 CFR 800.11(e). The Council declined to participate in consultation in a letter dated April 20, 2024. Per 36 CFR 800.6, the NRCS is continuing consultation with your office, the Sponsors, agencies, applicable Native American tribes, and other consulting parties, to develop mitigation stipulations that will be executed in a Memorandum of Agreement. As the lead federal agency, the NRCS is informing the BLM, Corps, NPS, TLA, and EPA of ongoing Section 106 consultations. Per 36 CFR 800.4-800.5, the NRCS requests concurrence for the delineation of the APEs, identification of historic properties, and finding of effect. If you have any questions, comments, or concerns, please contact Tara S. Hoffmann, Water and Cultural Resources Specialist, at (385)-258-1266 at your convenience.

Sincerely,

Emily Fife

Reference: Continuation of Consultation for the Kane County Water Conservancy District's Cove Reservoir Project— Direct/Indirect/Visual Areas of Potential Effect

Dear Chairman Monroe,

The NRCS is continuing Section 106 consultation for the proposed Kane County Water Conservancy District's Cove East Fork Virgin River Plan-Environmental Impact Statement (aka Cove Reservoir Project), in Kane County, Utah. Included in this submission are a literature review cultural resources memo titled *Kane County Water Conservancy District's Cove Reservoir Project—Cultural Resources Review Memo, Indirect/Visual Areas of Potential Effect (APEs)*. The United States Department of Agriculture's Natural Resources Conservation Service (NRCS), with the and Kane County Water Conservancy District (KCWCD) are proposing to construct the new Cove Reservoir within the existing Glendale, Mt. Carmel, and Orderville irrigation systems. This proposed reservoir would be located immediately southwest of Orderville, Utah, off Cove Road. Additional improvements would include the construction of approximately 1.5 miles of new pipeline, the Glendale hydroelectric power plant, and 0.2 mile of new power line and 0.7 acre of utility corridor along U.S. Highway 89 (US-89) and Cove Road; these improvements would be located west of US-89 and the East Fork of the Virgin River in Glendale, Utah. The Project also proposes the potential use of three previously disturbed borrow pits—Lambs Pit, Tait Pit, and Esplin Pit—for Project-related construction needs. These proposed actions constitute an undertaking under Section 106.

The NRCS is serving as the lead federal agency pursuant to 36 CFR 800.2. The Bureau of Land Management-Kanab Field Office (BLM), U.S. Army Corps of Engineers, Sacramento District (Corps), Environmental Protection Agency (EPA), National Park Service (NPS), and Utah Trust Land Administration (TLA) have been identified as cooperating agencies. The NRCS shall act on behalf of all agencies in fulfilling our collective responsibilities under Section 106, including delineation of the APE, identification of historic properties, and finding of effect. The NRCS will inform all cooperating agencies of Section 106 consultation. This consultation will also cover TLA's responsibilities under Utah Annotated Code Section 9-8-404.

NRCS initially consulted with your office in letters sent January 9, 2020 (U18TN0844), and again on January 23, 2023 (U21TN0840). Concurrence on site eligibility and a determination of ***adverse effect to historic properties*** for the undertaking was received on January 17, 2020, and February 6, 2023, respectively (Case Nos. 20-0121 and 23-0280). Additional consultation occurred for an expansion of the APE for a borrow source in a letter dated May 20, 2024 (U23TN0682). Concurrence was received on May 20, 2024 (Case No. 24-1261). Following these consultations, the NRCS has revised the Area of Potential Effects (APE) to include the Direct (Physical), Visual, and Indirect APEs.

USDA is an equal opportunity provider, employer, and lender.

State Office Natural Resources Conservation Service

Salt Lake City, Utah 84138
Phone: 801-524-4550

Area of Potential Effects (APE) (36 CFR 800.4)

Table 1 summarizes the Direct, Visual, and Indirect APEs.

TABLE 1
TOTAL Area of Potential Effects (APE)

Area of Potential Effect	BLM	State	Private	Total
Indirect APE Acreage (Inundation Areas)	17.05	0.51	990.41	**1,007.97**
Visual APE Acreage (1 Mile Buffer of Cove Reservoir and Facilities)	245.00	1,698.01	3,009.28	**4,952.29**
Direct (Physical) APE Acreage (Cove Reservoir, Pipes, Canals, Esplin Pit, Tait Pit, Lamb's Pit)	0.23	70.33	641.9	**712.46**

- **Direct (Physical) APE**: Includes all potential physical ground disturbance, including construction, staging, access roads, borrow sources, and necessary buffers. It has been refined to a total of 712.46 acres.
- **Visual APE**: A radius of 1 mile around the periphery of the proposed Cove Reservoir was evaluated for potential visual resources that could be impacted by the current construction of the reservoir. GIS viewshed analysis was used to refine the final boundaries of the Visual APE, and areas without potential visibility of the project were removed from the Visual APE.
- **Indirect APE:** Includes the breach inundation zones (Sunny-Day and Rainy-Day) in the unlikely event of a dam breach.

Identification of Historic Properties (36 CFR 800.4)

To identify historic properties within the APEs, a literature review was completed by Eocene Environmental. Personnel meet or exceed the Secretary of the Interior Standards in Archeology. The literature review identified 26 cultural resources, 14 of which are eligible for the National Register of Historic Place (NRHP), and one unevaluated, but treated as eligible, within the partially overlapping Direct, Indirect, and Visual APEs. Of the 15 historic properties, only one historic property 42KA7537 (prehistoric cave and artifact scatter) meets the site type criteria for inclusion in the visual impact assessment and therefore do not require a formal visual effects assessment. Site 42KA7537 is only located in the Direct APE and will be avoided (see Case No. 24-1261).

Within the overlapping APEs, there are nine historic buildings/structures of which five are eligible for the NRHP, two are undetermined (treated as eligible), one has been demolished, and the final is ineligible/non-contributing. Within the Visual APE there are three eligible buildings/structures (Property ID Nos., 32819, 50442, and 33219). These historic properties are in Orderville, and the proposed Cove Reservoir would be obstructed from view by means of several ridges southwest of Gardner Hollow.

Within the Indirect APE breach inundation zone, there are three historic properties: Mt. Carmel School and Church (Property ID No. 37252); Dixon, Maynard, House and Studio (Property ID No. 40479); and Steven's Barn

State Office Natural Resources Conservation Service
125 South State Street, Room 6416
Salt Lake City, Utah 84138
Phone: 801-524-4550

(Property ID No. 31786). Steven's Barn (Property ID NO. 31786) has likely been demolished. Due to distance, elevation, and the proposed reservoir safety features, these historic properties are unlikely to be adversely affected by the highly improbable failure of the proposed Cove Reservoir dam.

Finding of Effect (36 CFR 800.5)

The implementation of the undertaking will not alter the character-defining characteristics of the aforementioned historic properties that allow them to convey their significance since visual component is not the character-defining feature that makes the sites eligible. Therefore, the NRCS finding of effect for the Visual and Indirect APEs is No Adverse Effect. This results in no change to the finding of effect for the entirety of the undertaking, where the NRCS retains our previous determination of ***Adverse Effect to Historic Properties*** (Case No. 20-0121).

In an electronical transmittal on March 28, 2024, the NRCS notified the Advisory Council on Historic Preservation (Council) of the adverse effect determination by providing documentation specified in 36 CFR 800.11(e). The Council declined to participate in consultation in a letter dated April 20, 2024. Per 36 CFR 800.6, the NRCS is continuing consultation with your office, the Sponsors, agencies, applicable Native American tribes, and other consulting parties, to develop mitigation stipulations that will be executed in a Memorandum of Agreement. As the lead federal agency, the NRCS is informing the BLM, Corps, NPS, TLA, and EPA of ongoing Section 106 consultations. Per 36 CFR 800.4-800.5, the NRCS requests concurrence for the delineation of the APEs, identification of historic properties, and finding of effect. If you have any questions, comments, or concerns, please contact Tara S. Hoffmann, Water and Cultural Resources Specialist, at (385)-258-1266 at your convenience.

Sincerely,

Emily Fife

Reference: Continuation of Consultation for the Kane County Water Conservancy District's Cove Reservoir Project— Direct/Indirect/Visual Areas of Potential Effect

Dear Cultural Manager,

The NRCS is continuing Section 106 consultation for the proposed Kane County Water Conservancy District's Cove East Fork Virgin River Plan-Environmental Impact Statement (aka Cove Reservoir Project), in Kane County, Utah. Included in this submission are a literature review cultural resources memo titled *Kane County Water Conservancy District's Cove Reservoir Project—Cultural Resources Review Memo, Indirect/Visual Areas of Potential Effect (APEs)*. The United States Department of Agriculture's Natural Resources Conservation Service (NRCS), with the and Kane County Water Conservancy District (KCWCD) are proposing to construct the new Cove Reservoir within the existing Glendale, Mt. Carmel, and Orderville irrigation systems. This proposed reservoir would be located immediately southwest of Orderville, Utah, off Cove Road. Additional improvements would include the construction of approximately 1.5 miles of new pipeline, the Glendale hydroelectric power plant, and 0.2 mile of new power line and 0.7 acre of utility corridor along U.S. Highway 89 (US-89) and Cove Road; these improvements would be located west of US-89 and the East Fork of the Virgin River in Glendale, Utah. The Project also proposes the potential use of three previously disturbed borrow pits—Lambs Pit, Tait Pit, and Esplin Pit—for Project-related construction needs. These proposed actions constitute an undertaking under Section 106.

The NRCS is serving as the lead federal agency pursuant to 36 CFR 800.2. The Bureau of Land Management-Kanab Field Office (BLM), U.S. Army Corps of Engineers, Sacramento District (Corps), Environmental Protection Agency (EPA), National Park Service (NPS), and Utah Trust Land Administration (TLA) have been identified as cooperating agencies. The NRCS shall act on behalf of all agencies in fulfilling our collective responsibilities under Section 106, including delineation of the APE, identification of historic properties, and finding of effect. The NRCS will inform all cooperating agencies of Section 106 consultation. This consultation will also cover TLA's responsibilities under Utah Annotated Code Section 9-8-404.

NRCS initially consulted with your office in letters sent January 9, 2020 (U18TN0844), and again on January 23, 2023 (U21TN0840). Concurrence on site eligibility and a determination of ***adverse effect to historic properties*** for the undertaking was received on January 17, 2020, and February 6, 2023, respectively (Case Nos. 20-0121 and 23-0280). Additional consultation occurred for an expansion of the APE for a borrow source in a letter dated May 20, 2024 (U23TN0682). Concurrence was received on May 20, 2024 (Case No. 24-1261). Following these consultations, the NRCS has revised the Area of Potential Effects (APE) to include the Direct (Physical), Visual, and Indirect APEs.

USDA is an equal opportunity provider, employer, and lender.

Visual APE Acreage (1 Mile Buffer of Cove Reservoir and Facilities)	245.00	1,698.01	3,009.28	**4,952.29**
Direct (Physical) APE Acreage (Cove Reservoir, Pipes, Canals, Esplin Pit, Tait Pit, Lamb's Pit)	0.23	70.33	641.9	**712.46**

- **Direct (Physical) APE**: Includes all potential physical ground disturbance, including construction, staging, access roads, borrow sources, and necessary buffers. It has been refined to a total of 712.46 acres.
- **Visual APE**: A radius of 1 mile around the periphery of the proposed Cove Reservoir was evaluated for potential visual resources that could be impacted by the current construction of the reservoir. GIS viewshed analysis was used to refine the final boundaries of the Visual APE, and areas without potential visibility of the project were removed from the Visual APE.
- **Indirect APE:** Includes the breach inundation zones (Sunny-Day and Rainy-Day) in the unlikely event of a dam breach.

Identification of Historic Properties (36 CFR 800.4)

To identify historic properties within the APEs, a literature review was completed by Eocene Environmental. Personnel meet or exceed the Secretary of the Interior Standards in Archeology. The literature review identified 26 cultural resources, 14 of which are eligible for the National Register of Historic Place (NRHP), and one unevaluated, but treated as eligible, within the partially overlapping Direct, Indirect, and Visual APEs. Of the 15 historic properties, only one historic property 42KA7537 (prehistoric cave and artifact scatter) meets the site type criteria for inclusion in the visual impact assessment and therefore do not require a formal visual effects assessment. Site 42KA7537 is only located in the Direct APE and will be avoided (see Case No. 24-1261).

Within the overlapping APEs, there are nine historic buildings/structures of which five are eligible for the NRHP, two are undetermined (treated as eligible), one has been demolished, and the final is ineligible/non-contributing. Within the Visual APE there are three eligible buildings/structures (Property ID Nos., 32819, 50442, and 33219). These historic properties are in Orderville, and the proposed Cove Reservoir would be obstructed from view by means of several ridges southwest of Gardner Hollow.

Within the Indirect APE breach inundation zone, there are three historic properties: Mt. Carmel School and Church (Property ID No. 37252); Dixon, Maynard, House and Studio (Property ID No. 40479); and Steven's Barn

State Office Natural Resources Conservation Service
125 South State Street, Room 6416
Salt Lake City, Utah 84138
Phone: 801-524-4550

(Property ID No. 31786). Steven's Barn (Property ID NO. 31786) has likely been demolished. Due to distance, elevation, and the proposed reservoir safety features, these historic properties are unlikely to be adversely affected by the highly improbable failure of the proposed Cove Reservoir dam.

Finding of Effect (36 CFR 800.5)

The implementation of the undertaking will not alter the character-defining characteristics of the aforementioned historic properties that allow them to convey their significance since visual component is not the character-defining feature that makes the sites eligible. Therefore, the NRCS finding of effect for the Visual and Indirect APEs is No Adverse Effect. This results in no change to the finding of effect for the entirety of the undertaking, where the NRCS retains our previous determination of ***Adverse Effect to Historic Properties*** (Case No. 20-0121).

In an electronical transmittal on March 28, 2024, the NRCS notified the Advisory Council on Historic Preservation (Council) of the adverse effect determination by providing documentation specified in 36 CFR 800.11(e). The Council declined to participate in consultation in a letter dated April 20, 2024. Per 36 CFR 800.6, the NRCS is continuing consultation with your office, the Sponsors, agencies, applicable Native American tribes, and other consulting parties, to develop mitigation stipulations that will be executed in a Memorandum of Agreement. As the lead federal agency, the NRCS is informing the BLM, Corps, NPS, TLA, and EPA of ongoing Section 106 consultations. Per 36 CFR 800.4-800.5, the NRCS requests concurrence for the delineation of the APEs, identification of historic properties, and finding of effect. If you have any questions, comments, or concerns, please contact Tara S. Hoffmann, Water and Cultural Resources Specialist, at (385)-258-1266 at your convenience.

Sincerely,

Emily Fife

Reference: Continuation of Consultation for the Kane County Water Conservancy District's Cove Reservoir Project— Direct/Indirect/Visual Areas of Potential Effect

Dear Councilman Lehi,

The NRCS is continuing Section 106 consultation for the proposed Kane County Water Conservancy District's Cove East Fork Virgin River Plan-Environmental Impact Statement (aka Cove Reservoir Project), in Kane County, Utah. Included in this submission are a literature review cultural resources memo titled *Kane County Water Conservancy District's Cove Reservoir Project—Cultural Resources Review Memo, Indirect/Visual Areas of Potential Effect (APEs)*. The United States Department of Agriculture's Natural Resources Conservation Service (NRCS), with the and Kane County Water Conservancy District (KCWCD) are proposing to construct the new Cove Reservoir within the existing Glendale, Mt. Carmel, and Orderville irrigation systems. This proposed reservoir would be located immediately southwest of Orderville, Utah, off Cove Road. Additional improvements would include the construction of approximately 1.5 miles of new pipeline, the Glendale hydroelectric power plant, and 0.2 mile of new power line and 0.7 acre of utility corridor along U.S. Highway 89 (US-89) and Cove Road; these improvements would be located west of US-89 and the East Fork of the Virgin River in Glendale, Utah. The Project also proposes the potential use of three previously disturbed borrow pits—Lambs Pit, Tait Pit, and Esplin Pit—for Project-related construction needs. These proposed actions constitute an undertaking under Section 106.

The NRCS is serving as the lead federal agency pursuant to 36 CFR 800.2. The Bureau of Land Management-Kanab Field Office (BLM), U.S. Army Corps of Engineers, Sacramento District (Corps), Environmental Protection Agency (EPA), National Park Service (NPS), and Utah Trust Land Administration (TLA) have been identified as cooperating agencies. The NRCS shall act on behalf of all agencies in fulfilling our collective responsibilities under Section 106, including delineation of the APE, identification of historic properties, and finding of effect. The NRCS will inform all cooperating agencies of Section 106 consultation. This consultation will also cover TLA's responsibilities under Utah Annotated Code Section 9-8-404.

NRCS initially consulted with your office in letters sent January 9, 2020 (U18TN0844), and again on January 23, 2023 (U21TN0840). Concurrence on site eligibility and a determination of ***adverse effect to historic properties*** for the undertaking was received on January 17, 2020, and February 6, 2023, respectively (Case Nos. 20-0121 and 23-0280). Additional consultation occurred for an expansion of the APE for a borrow source in a letter dated May 20, 2024 (U23TN0682). Concurrence was received on May 20, 2024 (Case No. 24-1261). Following these consultations, the NRCS has revised the Area of Potential Effects (APE) to include the Direct (Physical), Visual, and Indirect APEs.

USDA is an equal opportunity provider, employer, and lender.

Area of Potential Effects (APE) (36 CFR 800.4)

Table 1 summarizes the Direct, Visual, and Indirect APEs.

TABLE 1
TOTAL Area of Potential Effects (APE)

Area of Potential Effect	BLM	State	Private	Total
Indirect APE Acreage (Inundation Areas)	17.05	0.51	990.41	**1,007.97**
Visual APE Acreage (1 Mile Buffer of Cove Reservoir and Facilities)	245.00	1,698.01	3,009.28	**4,952.29**
Direct (Physical) APE Acreage (Cove Reservoir, Pipes, Canals, Esplin Pit, Tait Pit, Lamb's Pit)	0.23	70.33	641.9	**712.46**

- **Direct (Physical) APE**: Includes all potential physical ground disturbance, including construction, staging, access roads, borrow sources, and necessary buffers. It has been refined to a total of 712.46 acres.
- **Visual APE**: A radius of 1 mile around the periphery of the proposed Cove Reservoir was evaluated for potential visual resources that could be impacted by the current construction of the reservoir. GIS viewshed analysis was used to refine the final boundaries of the Visual APE, and areas without potential visibility of the project were removed from the Visual APE.
- **Indirect APE:** Includes the breach inundation zones (Sunny-Day and Rainy-Day) in the unlikely event of a dam breach.

Identification of Historic Properties (36 CFR 800.4)

To identify historic properties within the APEs, a literature review was completed by Eocene Environmental. Personnel meet or exceed the Secretary of the Interior Standards in Archeology. The literature review identified 26 cultural resources, 14 of which are eligible for the National Register of Historic Place (NRHP), and one unevaluated, but treated as eligible, within the partially overlapping Direct, Indirect, and Visual APEs. Of the 15 historic properties, only one historic property 42KA7537 (prehistoric cave and artifact scatter) meets the site type criteria for inclusion in the visual impact assessment and therefore do not require a formal visual effects assessment. Site 42KA7537 is only located in the Direct APE and will be avoided (see Case No. 24-1261).

Within the overlapping APEs, there are nine historic buildings/structures of which five are eligible for the NRHP, two are undetermined (treated as eligible), one has been demolished, and the final is ineligible/non-contributing. Within the Visual APE there are three eligible buildings/structures (Property ID Nos., 32819, 50442, and 33219). These historic properties are in Orderville, and the proposed Cove Reservoir would be obstructed from view by means of several ridges southwest of Gardner Hollow.

Within the Indirect APE breach inundation zone, there are three historic properties: Mt. Carmel School and Church (Property ID No. 37252); Dixon, Maynard, House and Studio (Property ID No. 40479); and Steven's Barn

State Office Natural Resources Conservation Service
125 South State Street, Room 6416
Salt Lake City, Utah 84138
Phone: 801-524-4550

(Property ID No. 31786). Steven's Barn (Property ID NO. 31786) has likely been demolished. Due to distance, elevation, and the proposed reservoir safety features, these historic properties are unlikely to be adversely affected by the highly improbable failure of the proposed Cove Reservoir dam.

Finding of Effect (36 CFR 800.5)

The implementation of the undertaking will not alter the character-defining characteristics of the aforementioned historic properties that allow them to convey their significance since visual component is not the character-defining feature that makes the sites eligible. Therefore, the NRCS finding of effect for the Visual and Indirect APEs is No Adverse Effect. This results in no change to the finding of effect for the entirety of the undertaking, where the NRCS retains our previous determination of ***Adverse Effect to Historic Properties*** (Case No. 20-0121).

In an electronical transmittal on March 28, 2024, the NRCS notified the Advisory Council on Historic Preservation (Council) of the adverse effect determination by providing documentation specified in 36 CFR 800.11(e). The Council declined to participate in consultation in a letter dated April 20, 2024. Per 36 CFR 800.6, the NRCS is continuing consultation with your office, the Sponsors, agencies, applicable Native American tribes, and other consulting parties, to develop mitigation stipulations that will be executed in a Memorandum of Agreement. As the lead federal agency, the NRCS is informing the BLM, Corps, NPS, TLA, and EPA of ongoing Section 106 consultations. Per 36 CFR 800.4-800.5, the NRCS requests concurrence for the delineation of the APEs, identification of historic properties, and finding of effect. If you have any questions, comments, or concerns, please contact Tara S. Hoffmann, Water and Cultural Resources Specialist, at (385)-258-1266 at your convenience.

Sincerely,

Emily Fife

Reference: Continuation of Consultation for the Kane County Water Conservancy District's Cove Reservoir Project— Direct/Indirect/Visual Areas of Potential Effect

Dear Mr. Begay,

The NRCS is continuing Section 106 consultation for the proposed Kane County Water Conservancy District's Cove East Fork Virgin River Plan-Environmental Impact Statement (aka Cove Reservoir Project), in Kane County, Utah. Included in this submission are a literature review cultural resources memo titled *Kane County Water Conservancy District's Cove Reservoir Project—Cultural Resources Review Memo, Indirect/Visual Areas of Potential Effect (APEs)*. The United States Department of Agriculture's Natural Resources Conservation Service (NRCS), with the and Kane County Water Conservancy District (KCWCD) are proposing to construct the new Cove Reservoir within the existing Glendale, Mt. Carmel, and Orderville irrigation systems. This proposed reservoir would be located immediately southwest of Orderville, Utah, off Cove Road. Additional improvements would include the construction of approximately 1.5 miles of new pipeline, the Glendale hydroelectric power plant, and 0.2 mile of new power line and 0.7 acre of utility corridor along U.S. Highway 89 (US-89) and Cove Road; these improvements would be located west of US-89 and the East Fork of the Virgin River in Glendale, Utah. The Project also proposes the potential use of three previously disturbed borrow pits—Lambs Pit, Tait Pit, and Esplin Pit—for Project-related construction needs. These proposed actions constitute an undertaking under Section 106.

The NRCS is serving as the lead federal agency pursuant to 36 CFR 800.2. The Bureau of Land Management-Kanab Field Office (BLM), U.S. Army Corps of Engineers, Sacramento District (Corps), Environmental Protection Agency (EPA), National Park Service (NPS), and Utah Trust Land Administration (TLA) have been identified as cooperating agencies. The NRCS shall act on behalf of all agencies in fulfilling our collective responsibilities under Section 106, including delineation of the APE, identification of historic properties, and finding of effect. The NRCS will inform all cooperating agencies of Section 106 consultation. This consultation will also cover TLA's responsibilities under Utah Annotated Code Section 9-8-404.

NRCS initially consulted with your office in letters sent January 9, 2020 (U18TN0844), and again on January 23, 2023 (U21TN0840). Concurrence on site eligibility and a determination of ***adverse effect to historic properties*** for the undertaking was received on January 17, 2020, and February 6, 2023, respectively (Case Nos. 20-0121 and 23-0280). Additional consultation occurred for an expansion of the APE for a borrow source in a letter dated May 20, 2024 (U23TN0682). Concurrence was received on May 20, 2024 (Case No. 24-1261). Following these consultations, the NRCS has revised the Area of Potential Effects (APE) to include the Direct (Physical), Visual, and Indirect APEs.

USDA is an equal opportunity provider, employer, and lender.

Area of Potential Effects (APE) (36 CFR 800.4)

Table 1 summarizes the Direct, Visual, and Indirect APEs.

TABLE 1
TOTAL Area of Potential Effects (APE)

Area of Potential Effect	BLM	State	Private	Total
Indirect APE Acreage (Inundation Areas)	17.05	0.51	990.41	**1,007.97**
Visual APE Acreage (1 Mile Buffer of Cove Reservoir and Facilities)	245.00	1,698.01	3,009.28	**4,952.29**
Direct (Physical) APE Acreage (Cove Reservoir, Pipes, Canals, Esplin Pit, Tait Pit, Lamb's Pit)	0.23	70.33	641.9	**712.46**

- **Direct (Physical) APE**: Includes all potential physical ground disturbance, including construction, staging, access roads, borrow sources, and necessary buffers. It has been refined to a total of 712.46 acres.
- **Visual APE**: A radius of 1 mile around the periphery of the proposed Cove Reservoir was evaluated for potential visual resources that could be impacted by the current construction of the reservoir. GIS viewshed analysis was used to refine the final boundaries of the Visual APE, and areas without potential visibility of the project were removed from the Visual APE.
- **Indirect APE:** Includes the breach inundation zones (Sunny-Day and Rainy-Day) in the unlikely event of a dam breach.

Identification of Historic Properties (36 CFR 800.4)

To identify historic properties within the APEs, a literature review was completed by Eocene Environmental. Personnel meet or exceed the Secretary of the Interior Standards in Archeology. The literature review identified 26 cultural resources, 14 of which are eligible for the National Register of Historic Place (NRHP), and one unevaluated, but treated as eligible, within the partially overlapping Direct, Indirect, and Visual APEs. Of the 15 historic properties, only one historic property 42KA7537 (prehistoric cave and artifact scatter) meets the site type criteria for inclusion in the visual impact assessment and therefore do not require a formal visual effects assessment. Site 42KA7537 is only located in the Direct APE and will be avoided (see Case No. 24-1261).

Within the overlapping APEs, there are nine historic buildings/structures of which five are eligible for the NRHP, two are undetermined (treated as eligible), one has been demolished, and the final is ineligible/non-contributing. Within the Visual APE there are three eligible buildings/structures (Property ID Nos., 32819, 50442, and 33219). These historic properties are in Orderville, and the proposed Cove Reservoir would be obstructed from view by means of several ridges southwest of Gardner Hollow.

Within the Indirect APE breach inundation zone, there are three historic properties: Mt. Carmel School and Church (Property ID No. 37252); Dixon, Maynard, House and Studio (Property ID No. 40479); and Steven's Barn

State Office Natural Resources Conservation Service
125 South State Street, Room 6416
Salt Lake City, Utah 84138
Phone: 801-524-4550

(Property ID No. 31786). Steven's Barn (Property ID NO. 31786) has likely been demolished. Due to distance, elevation, and the proposed reservoir safety features, these historic properties are unlikely to be adversely affected by the highly improbable failure of the proposed Cove Reservoir dam.

Finding of Effect (36 CFR 800.5)

The implementation of the undertaking will not alter the character-defining characteristics of the aforementioned historic properties that allow them to convey their significance since visual component is not the character-defining feature that makes the sites eligible. Therefore, the NRCS finding of effect for the Visual and Indirect APEs is No Adverse Effect. This results in no change to the finding of effect for the entirety of the undertaking, where the NRCS retains our previous determination of ***Adverse Effect to Historic Properties*** (Case No. 20-0121).

In an electronical transmittal on March 28, 2024, the NRCS notified the Advisory Council on Historic Preservation (Council) of the adverse effect determination by providing documentation specified in 36 CFR 800.11(e). The Council declined to participate in consultation in a letter dated April 20, 2024. Per 36 CFR 800.6, the NRCS is continuing consultation with your office, the Sponsors, agencies, applicable Native American tribes, and other consulting parties, to develop mitigation stipulations that will be executed in a Memorandum of Agreement. As the lead federal agency, the NRCS is informing the BLM, Corps, NPS, TLA, and EPA of ongoing Section 106 consultations. Per 36 CFR 800.4-800.5, the NRCS requests concurrence for the delineation of the APEs, identification of historic properties, and finding of effect. If you have any questions, comments, or concerns, please contact Tara S. Hoffmann, Water and Cultural Resources Specialist, at (385)-258-1266 at your convenience.

Sincerely,

Emily Fife

Reference: Continuation of Consultation for the Kane County Water Conservancy District's Cove Reservoir Project— Direct/Indirect/Visual Areas of Potential Effect

Dear President Nygren,

The NRCS is continuing Section 106 consultation for the proposed Kane County Water Conservancy District's Cove East Fork Virgin River Plan-Environmental Impact Statement (aka Cove Reservoir Project), in Kane County, Utah. Included in this submission are a literature review cultural resources memo titled *Kane County Water Conservancy District's Cove Reservoir Project—Cultural Resources Review Memo, Indirect/Visual Areas of Potential Effect (APEs)*. The United States Department of Agriculture's Natural Resources Conservation Service (NRCS), with the and Kane County Water Conservancy District (KCWCD) are proposing to construct the new Cove Reservoir within the existing Glendale, Mt. Carmel, and Orderville irrigation systems. This proposed reservoir would be located immediately southwest of Orderville, Utah, off Cove Road. Additional improvements would include the construction of approximately 1.5 miles of new pipeline, the Glendale hydroelectric power plant, and 0.2 mile of new power line and 0.7 acre of utility corridor along U.S. Highway 89 (US-89) and Cove Road; these improvements would be located west of US-89 and the East Fork of the Virgin River in Glendale, Utah. The Project also proposes the potential use of three previously disturbed borrow pits—Lambs Pit, Tait Pit, and Esplin Pit—for Project-related construction needs. These proposed actions constitute an undertaking under Section 106.

The NRCS is serving as the lead federal agency pursuant to 36 CFR 800.2. The Bureau of Land Management-Kanab Field Office (BLM), U.S. Army Corps of Engineers, Sacramento District (Corps), Environmental Protection Agency (EPA), National Park Service (NPS), and Utah Trust Land Administration (TLA) have been identified as cooperating agencies. The NRCS shall act on behalf of all agencies in fulfilling our collective responsibilities under Section 106, including delineation of the APE, identification of historic properties, and finding of effect. The NRCS will inform all cooperating agencies of Section 106 consultation. This consultation will also cover TLA's responsibilities under Utah Annotated Code Section 9-8-404.

NRCS initially consulted with your office in letters sent January 9, 2020 (U18TN0844), and again on January 23, 2023 (U21TN0840). Concurrence on site eligibility and a determination of ***adverse effect to historic properties*** for the undertaking was received on January 17, 2020, and February 6, 2023, respectively (Case Nos. 20-0121 and 23-0280). Additional consultation occurred for an expansion of the APE for a borrow source in a letter dated May 20, 2024 (U23TN0682). Concurrence was received on May 20, 2024 (Case No. 24-1261). Following these consultations, the NRCS has revised the Area of Potential Effects (APE) to include the Direct (Physical), Visual, and Indirect APEs.

State Office Natural Resources Conservation Service
125 South State Street, Room 6416

Phone: 801-524-4550

Area of Potential Effects (APE) (36 CFR 800.4)

Table 1 summarizes the Direct, Visual, and Indirect APEs.

TABLE 1
TOTAL Area of Potential Effects (APE)

Area of Potential Effect	BLM	State	Private	Total
Indirect APE Acreage (Inundation Areas)	17.05	0.51	990.41	**1,007.97**
Visual APE Acreage (1 Mile Buffer of Cove Reservoir and Facilities)	245.00	1,698.01	3,009.28	**4,952.29**
Direct (Physical) APE Acreage (Cove Reservoir, Pipes, Canals, Esplin Pit, Tait Pit, Lamb's Pit)	0.23	70.33	641.9	**712.46**

- **Direct (Physical) APE**: Includes all potential physical ground disturbance, including construction, staging, access roads, borrow sources, and necessary buffers. It has been refined to a total of 712.46 acres.
- **Visual APE**: A radius of 1 mile around the periphery of the proposed Cove Reservoir was evaluated for potential visual resources that could be impacted by the current construction of the reservoir. GIS viewshed analysis was used to refine the final boundaries of the Visual APE, and areas without potential visibility of the project were removed from the Visual APE.
- **Indirect APE:** Includes the breach inundation zones (Sunny-Day and Rainy-Day) in the unlikely event of a dam breach.

Identification of Historic Properties (36 CFR 800.4)

To identify historic properties within the APEs, a literature review was completed by Eocene Environmental. Personnel meet or exceed the Secretary of the Interior Standards in Archeology. The literature review identified 26 cultural resources, 14 of which are eligible for the National Register of Historic Place (NRHP), and one unevaluated, but treated as eligible, within the partially overlapping Direct, Indirect, and Visual APEs. Of the 15 historic properties, only one historic property 42KA7537 (prehistoric cave and artifact scatter) meets the site type criteria for inclusion in the visual impact assessment and therefore do not require a formal visual effects assessment. Site 42KA7537 is only located in the Direct APE and will be avoided (see Case No. 24-1261).

Within the overlapping APEs, there are nine historic buildings/structures of which five are eligible for the NRHP, two are undetermined (treated as eligible), one has been demolished, and the final is ineligible/non-contributing. Within the Visual APE there are three eligible buildings/structures (Property ID Nos., 32819, 50442, and 33219). These historic properties are in Orderville, and the proposed Cove Reservoir would be obstructed from view by means of several ridges southwest of Gardner Hollow.

Within the Indirect APE breach inundation zone, there are three historic properties: Mt. Carmel School and Church (Property ID No. 37252); Dixon, Maynard, House and Studio (Property ID No. 40479); and Steven's Barn

State Office Natural Resources Conservation Service
125 South State Street, Room 6416
Salt Lake City, Utah 84138
Phone: 801-524-4550

(Property ID No. 31786). Steven's Barn (Property ID NO. 31786) has likely been demolished. Due to distance, elevation, and the proposed reservoir safety features, these historic properties are unlikely to be adversely affected by the highly improbable failure of the proposed Cove Reservoir dam.

Finding of Effect (36 CFR 800.5)

The implementation of the undertaking will not alter the character-defining characteristics of the aforementioned historic properties that allow them to convey their significance since visual component is not the character-defining feature that makes the sites eligible. Therefore, the NRCS finding of effect for the Visual and Indirect APEs is No Adverse Effect. This results in no change to the finding of effect for the entirety of the undertaking, where the NRCS retains our previous determination of ***Adverse Effect to Historic Properties*** (Case No. 20-0121).

In an electronical transmittal on March 28, 2024, the NRCS notified the Advisory Council on Historic Preservation (Council) of the adverse effect determination by providing documentation specified in 36 CFR 800.11(e). The Council declined to participate in consultation in a letter dated April 20, 2024. Per 36 CFR 800.6, the NRCS is continuing consultation with your office, the Sponsors, agencies, applicable Native American tribes, and other consulting parties, to develop mitigation stipulations that will be executed in a Memorandum of Agreement. As the lead federal agency, the NRCS is informing the BLM, Corps, NPS, TLA, and EPA of ongoing Section 106 consultations. Per 36 CFR 800.4-800.5, the NRCS requests concurrence for the delineation of the APEs, identification of historic properties, and finding of effect. If you have any questions, comments, or concerns, please contact Tara S. Hoffmann, Water and Cultural Resources Specialist, at (385)-258-1266 at your convenience.

Sincerely,

Emily Fife

Reference: Continuation of Consultation for the Kane County Water Conservancy District's Cove Reservoir Project— Direct/Indirect/Visual Areas of Potential Effect

Dear Mr. Rockwell,

The NRCS is continuing Section 106 consultation for the proposed Kane County Water Conservancy District's Cove East Fork Virgin River Plan-Environmental Impact Statement (aka Cove Reservoir Project), in Kane County, Utah. Included in this submission are a literature review cultural resources memo titled *Kane County Water Conservancy District's Cove Reservoir Project—Cultural Resources Review Memo, Indirect/Visual Areas of Potential Effect (APEs)*. The United States Department of Agriculture's Natural Resources Conservation Service (NRCS), with the and Kane County Water Conservancy District (KCWCD) are proposing to construct the new Cove Reservoir within the existing Glendale, Mt. Carmel, and Orderville irrigation systems. This proposed reservoir would be located immediately southwest of Orderville, Utah, off Cove Road. Additional improvements would include the construction of approximately 1.5 miles of new pipeline, the Glendale hydroelectric power plant, and 0.2 mile of new power line and 0.7 acre of utility corridor along U.S. Highway 89 (US-89) and Cove Road; these improvements would be located west of US-89 and the East Fork of the Virgin River in Glendale, Utah. The Project also proposes the potential use of three previously disturbed borrow pits—Lambs Pit, Tait Pit, and Esplin Pit—for Project-related construction needs. These proposed actions constitute an undertaking under Section 106.

The NRCS is serving as the lead federal agency pursuant to 36 CFR 800.2. The Bureau of Land Management-Kanab Field Office (BLM), U.S. Army Corps of Engineers, Sacramento District (Corps), Environmental Protection Agency (EPA), National Park Service (NPS), and Utah Trust Land Administration (TLA) have been identified as cooperating agencies. The NRCS shall act on behalf of all agencies in fulfilling our collective responsibilities under Section 106, including delineation of the APE, identification of historic properties, and finding of effect. The NRCS will inform all cooperating agencies of Section 106 consultation. This consultation will also cover TLA's responsibilities under Utah Annotated Code Section 9-8-404.

NRCS initially consulted with your office in letters sent January 9, 2020 (U18TN0844), and again on January 23, 2023 (U21TN0840). Concurrence on site eligibility and a determination of ***adverse effect to historic properties*** for the undertaking was received on January 17, 2020, and February 6, 2023, respectively (Case Nos. 20-0121 and 23-0280). Additional consultation occurred for an expansion of the APE for a borrow source in a letter dated May 20, 2024 (U23TN0682). Concurrence was received on May 20, 2024 (Case No. 24-1261). Following these consultations, the NRCS has revised the Area of Potential Effects (APE) to include the Direct (Physical), Visual, and Indirect APEs.

USDA is an equal opportunity provider, employer, and lender.

State Office Natural Resources Conservation Service
125 South State Street, Room 6416
Salt Lake City, Utah 84138
Phone: 801-524-4550

Area of Potential Effects (APE) (36 CFR 800.4)

Table 1 summarizes the Direct, Visual, and Indirect APEs.

TABLE 1
TOTAL Area of Potential Effects (APE)

Area of Potential Effect	BLM	State	Private	Total
Indirect APE Acreage (Inundation Areas)	17.05	0.51	990.41	**1,007.97**
Visual APE Acreage (1 Mile Buffer of Cove Reservoir and Facilities)	245.00	1,698.01	3,009.28	**4,952.29**
Direct (Physical) APE Acreage (Cove Reservoir, Pipes, Canals, Esplin Pit, Tait Pit, Lamb's Pit)	0.23	70.33	641.9	**712.46**

- **Direct (Physical) APE**: Includes all potential physical ground disturbance, including construction, staging, access roads, borrow sources, and necessary buffers. It has been refined to a total of 712.46 acres.
- **Visual APE**: A radius of 1 mile around the periphery of the proposed Cove Reservoir was evaluated for potential visual resources that could be impacted by the current construction of the reservoir. GIS viewshed analysis was used to refine the final boundaries of the Visual APE, and areas without potential visibility of the project were removed from the Visual APE.
- **Indirect APE:** Includes the breach inundation zones (Sunny-Day and Rainy-Day) in the unlikely event of a dam breach.

Identification of Historic Properties (36 CFR 800.4)

To identify historic properties within the APEs, a literature review was completed by Eocene Environmental. Personnel meet or exceed the Secretary of the Interior Standards in Archeology. The literature review identified 26 cultural resources, 14 of which are eligible for the National Register of Historic Place (NRHP), and one unevaluated, but treated as eligible, within the partially overlapping Direct, Indirect, and Visual APEs. Of the 15 historic properties, only one historic property 42KA7537 (prehistoric cave and artifact scatter) meets the site type criteria for inclusion in the visual impact assessment and therefore do not require a formal visual effects assessment. Site 42KA7537 is only located in the Direct APE and will be avoided (see Case No. 24-1261).

Within the overlapping APEs, there are nine historic buildings/structures of which five are eligible for the NRHP, two are undetermined (treated as eligible), one has been demolished, and the final is ineligible/non-contributing. Within the Visual APE there are three eligible buildings/structures (Property ID Nos., 32819, 50442, and 33219). These historic properties are in Orderville, and the proposed Cove Reservoir would be obstructed from view by means of several ridges southwest of Gardner Hollow.

Within the Indirect APE breach inundation zone, there are three historic properties: Mt. Carmel School and Church (Property ID No. 37252); Dixon, Maynard, House and Studio (Property ID No. 40479); and Steven's Barn

State Office Natural Resources Conservation Service
125 South State Street, Room 6416
Salt Lake City, Utah 84138
Phone: 801-524-4550

(Property ID No. 31786). Steven's Barn (Property ID NO. 31786) has likely been demolished. Due to distance, elevation, and the proposed reservoir safety features, these historic properties are unlikely to be adversely affected by the highly improbable failure of the proposed Cove Reservoir dam.

Finding of Effect (36 CFR 800.5)

The implementation of the undertaking will not alter the character-defining characteristics of the aforementioned historic properties that allow them to convey their significance since visual component is not the character-defining feature that makes the sites eligible. Therefore, the NRCS finding of effect for the Visual and Indirect APEs is No Adverse Effect. This results in no change to the finding of effect for the entirety of the undertaking, where the NRCS retains our previous determination of ***Adverse Effect to Historic Properties*** (Case No. 20-0121).

In an electronical transmittal on March 28, 2024, the NRCS notified the Advisory Council on Historic Preservation (Council) of the adverse effect determination by providing documentation specified in 36 CFR 800.11(e). The Council declined to participate in consultation in a letter dated April 20, 2024. Per 36 CFR 800.6, the NRCS is continuing consultation with your office, the Sponsors, agencies, applicable Native American tribes, and other consulting parties, to develop mitigation stipulations that will be executed in a Memorandum of Agreement. As the lead federal agency, the NRCS is informing the BLM, Corps, NPS, TLA, and EPA of ongoing Section 106 consultations. Per 36 CFR 800.4-800.5, the NRCS requests concurrence for the delineation of the APEs, identification of historic properties, and finding of effect. If you have any questions, comments, or concerns, please contact Tara S. Hoffmann, Water and Cultural Resources Specialist, at (385)-258-1266 at your convenience.

Sincerely,

Emily Fife

Reference: Continuation of Consultation for the Kane County Water Conservancy District's Cove Reservoir Project— Direct/Indirect/Visual Areas of Potential Effect

Dear Ms. Holly,

The NRCS is continuing Section 106 consultation for the proposed Kane County Water Conservancy District's Cove East Fork Virgin River Plan-Environmental Impact Statement (aka Cove Reservoir Project), in Kane County, Utah. Included in this submission are a literature review cultural resources memo titled *Kane County Water Conservancy District's Cove Reservoir Project—Cultural Resources Review Memo, Indirect/Visual Areas of Potential Effect (APEs)*. The United States Department of Agriculture's Natural Resources Conservation Service (NRCS), with the and Kane County Water Conservancy District (KCWCD) are proposing to construct the new Cove Reservoir within the existing Glendale, Mt. Carmel, and Orderville irrigation systems. This proposed reservoir would be located immediately southwest of Orderville, Utah, off Cove Road. Additional improvements would include the construction of approximately 1.5 miles of new pipeline, the Glendale hydroelectric power plant, and 0.2 mile of new power line and 0.7 acre of utility corridor along U.S. Highway 89 (US-89) and Cove Road; these improvements would be located west of US-89 and the East Fork of the Virgin River in Glendale, Utah. The Project also proposes the potential use of three previously disturbed borrow pits—Lambs Pit, Tait Pit, and Esplin Pit—for Project-related construction needs. These proposed actions constitute an undertaking under Section 106.

The NRCS is serving as the lead federal agency pursuant to 36 CFR 800.2. The Bureau of Land Management-Kanab Field Office (BLM), U.S. Army Corps of Engineers, Sacramento District (Corps), Environmental Protection Agency (EPA), National Park Service (NPS), and Utah Trust Land Administration (TLA) have been identified as cooperating agencies. The NRCS shall act on behalf of all agencies in fulfilling our collective responsibilities under Section 106, including delineation of the APE, identification of historic properties, and finding of effect. The NRCS will inform all cooperating agencies of Section 106 consultation. This consultation will also cover TLA's responsibilities under Utah Annotated Code Section 9-8-404.

NRCS initially consulted with your office in letters sent January 9, 2020 (U18TN0844), and again on January 23, 2023 (U21TN0840). Concurrence on site eligibility and a determination of ***adverse effect to historic properties*** for the undertaking was received on January 17, 2020, and February 6, 2023, respectively (Case Nos. 20-0121 and 23-0280). Additional consultation occurred for an expansion of the APE for a borrow source in a letter dated May 20, 2024 (U23TN0682). Concurrence was received on May 20, 2024 (Case No. 24-1261). Following these consultations, the NRCS has revised the Area of Potential Effects (APE) to include the Direct (Physical), Visual, and Indirect APEs.

State Office Natural Resources Conservation Service

Area of Potential Effects (APE) (36 CFR 800.4)

Table 1 summarizes the Direct, Visual, and Indirect APEs.

TABLE 1
TOTAL Area of Potential Effects (APE)

Area of Potential Effect	BLM	State	Private	Total
Indirect APE Acreage (Inundation Areas)	17.05	0.51	990.41	**1,007.97**
Visual APE Acreage (1 Mile Buffer of Cove Reservoir and Facilities)	245.00	1,698.01	3,009.28	**4,952.29**
Direct (Physical) APE Acreage (Cove Reservoir, Pipes, Canals, Esplin Pit, Tait Pit, Lamb's Pit)	0.23	70.33	641.9	**712.46**

- **Direct (Physical) APE**: Includes all potential physical ground disturbance, including construction, staging, access roads, borrow sources, and necessary buffers. It has been refined to a total of 712.46 acres.
- **Visual APE**: A radius of 1 mile around the periphery of the proposed Cove Reservoir was evaluated for potential visual resources that could be impacted by the current construction of the reservoir. GIS viewshed analysis was used to refine the final boundaries of the Visual APE, and areas without potential visibility of the project were removed from the Visual APE.
- **Indirect APE:** Includes the breach inundation zones (Sunny-Day and Rainy-Day) in the unlikely event of a dam breach.

Identification of Historic Properties (36 CFR 800.4)

To identify historic properties within the APEs, a literature review was completed by Eocene Environmental. Personnel meet or exceed the Secretary of the Interior Standards in Archeology. The literature review identified 26 cultural resources, 14 of which are eligible for the National Register of Historic Place (NRHP), and one unevaluated, but treated as eligible, within the partially overlapping Direct, Indirect, and Visual APEs. Of the 15 historic properties, only one historic property 42KA7537 (prehistoric cave and artifact scatter) meets the site type criteria for inclusion in the visual impact assessment and therefore do not require a formal visual effects assessment. Site 42KA7537 is only located in the Direct APE and will be avoided (see Case No. 24-1261).

Within the overlapping APEs, there are nine historic buildings/structures of which five are eligible for the NRHP, two are undetermined (treated as eligible), one has been demolished, and the final is ineligible/non-contributing. Within the Visual APE there are three eligible buildings/structures (Property ID Nos., 32819, 50442, and 33219). These historic properties are in Orderville, and the proposed Cove Reservoir would be obstructed from view by means of several ridges southwest of Gardner Hollow.

Within the Indirect APE breach inundation zone, there are three historic properties: Mt. Carmel School and Church (Property ID No. 37252); Dixon, Maynard, House and Studio (Property ID No. 40479); and Steven's Barn

State Office Natural Resources Conservation Service
125 South State Street, Room 6416
Salt Lake City, Utah 84138
Phone: 801-524-4550

(Property ID No. 31786). Steven's Barn (Property ID NO. 31786) has likely been demolished. Due to distance, elevation, and the proposed reservoir safety features, these historic properties are unlikely to be adversely affected by the highly improbable failure of the proposed Cove Reservoir dam.

Finding of Effect (36 CFR 800.5)

The implementation of the undertaking will not alter the character-defining characteristics of the aforementioned historic properties that allow them to convey their significance since visual component is not the character-defining feature that makes the sites eligible. Therefore, the NRCS finding of effect for the Visual and Indirect APEs is No Adverse Effect. This results in no change to the finding of effect for the entirety of the undertaking, where the NRCS retains our previous determination of ***Adverse Effect to Historic Properties*** (Case No. 20-0121).

In an electronical transmittal on March 28, 2024, the NRCS notified the Advisory Council on Historic Preservation (Council) of the adverse effect determination by providing documentation specified in 36 CFR 800.11(e). The Council declined to participate in consultation in a letter dated April 20, 2024. Per 36 CFR 800.6, the NRCS is continuing consultation with your office, the Sponsors, agencies, applicable Native American tribes, and other consulting parties, to develop mitigation stipulations that will be executed in a Memorandum of Agreement. As the lead federal agency, the NRCS is informing the BLM, Corps, NPS, TLA, and EPA of ongoing Section 106 consultations. Per 36 CFR 800.4-800.5, the NRCS requests concurrence for the delineation of the APEs, identification of historic properties, and finding of effect. If you have any questions, comments, or concerns, please contact Tara S. Hoffmann, Water and Cultural Resources Specialist, at (385)-258-1266 at your convenience.

Sincerely,

Emily Fife

Reference: Continuation of Consultation for the Kane County Water Conservancy District's Cove Reservoir Project— Direct/Indirect/Visual Areas of Potential Effect

Dear Chairperson Yellowhorse,

The NRCS is continuing Section 106 consultation for the proposed Kane County Water Conservancy District's Cove East Fork Virgin River Plan-Environmental Impact Statement (aka Cove Reservoir Project), in Kane County, Utah. Included in this submission are a literature review cultural resources memo titled *Kane County Water Conservancy District's Cove Reservoir Project—Cultural Resources Review Memo, Indirect/Visual Areas of Potential Effect (APEs)*. The United States Department of Agriculture's Natural Resources Conservation Service (NRCS), with the and Kane County Water Conservancy District (KCWCD) are proposing to construct the new Cove Reservoir within the existing Glendale, Mt. Carmel, and Orderville irrigation systems. This proposed reservoir would be located immediately southwest of Orderville, Utah, off Cove Road. Additional improvements would include the construction of approximately 1.5 miles of new pipeline, the Glendale hydroelectric power plant, and 0.2 mile of new power line and 0.7 acre of utility corridor along U.S. Highway 89 (US-89) and Cove Road; these improvements would be located west of US-89 and the East Fork of the Virgin River in Glendale, Utah. The Project also proposes the potential use of three previously disturbed borrow pits—Lambs Pit, Tait Pit, and Esplin Pit—for Project-related construction needs. These proposed actions constitute an undertaking under Section 106.

The NRCS is serving as the lead federal agency pursuant to 36 CFR 800.2. The Bureau of Land Management-Kanab Field Office (BLM), U.S. Army Corps of Engineers, Sacramento District (Corps), Environmental Protection Agency (EPA), National Park Service (NPS), and Utah Trust Land Administration (TLA) have been identified as cooperating agencies. The NRCS shall act on behalf of all agencies in fulfilling our collective responsibilities under Section 106, including delineation of the APE, identification of historic properties, and finding of effect. The NRCS will inform all cooperating agencies of Section 106 consultation. This consultation will also cover TLA's responsibilities under Utah Annotated Code Section 9-8-404.

NRCS initially consulted with your office in letters sent January 9, 2020 (U18TN0844), and again on January 23, 2023 (U21TN0840). Concurrence on site eligibility and a determination of ***adverse effect to historic properties*** for the undertaking was received on January 17, 2020, and February 6, 2023, respectively (Case Nos. 20-0121 and 23-0280). Additional consultation occurred for an expansion of the APE for a borrow source in a letter dated May 20, 2024 (U23TN0682). Concurrence was received on May 20, 2024 (Case No. 24-1261). Following these consultations, the NRCS has revised the Area of Potential Effects (APE) to include the Direct (Physical), Visual, and Indirect APEs.

USDA is an equal opportunity provider, employer, and lender.

State Office Natural Resources Conservation Service

Phone: 801-524-4550

Area of Potential Effects (APE) (36 CFR 800.4)

Table 1 summarizes the Direct, Visual, and Indirect APEs.

TABLE 1
TOTAL Area of Potential Effects (APE)

Area of Potential Effect	BLM	State	Private	Total
Indirect APE Acreage (Inundation Areas)	17.05	0.51	990.41	**1,007.97**
Visual APE Acreage (1 Mile Buffer of Cove Reservoir and Facilities)	245.00	1,698.01	3,009.28	**4,952.29**
Direct (Physical) APE Acreage (Cove Reservoir, Pipes, Canals, Esplin Pit, Tait Pit, Lamb's Pit)	0.23	70.33	641.9	**712.46**

- **Direct (Physical) APE**: Includes all potential physical ground disturbance, including construction, staging, access roads, borrow sources, and necessary buffers. It has been refined to a total of 712.46 acres.
- **Visual APE**: A radius of 1 mile around the periphery of the proposed Cove Reservoir was evaluated for potential visual resources that could be impacted by the current construction of the reservoir. GIS viewshed analysis was used to refine the final boundaries of the Visual APE, and areas without potential visibility of the project were removed from the Visual APE.
- **Indirect APE:** Includes the breach inundation zones (Sunny-Day and Rainy-Day) in the unlikely event of a dam breach.

Identification of Historic Properties (36 CFR 800.4)

To identify historic properties within the APEs, a literature review was completed by Eocene Environmental. Personnel meet or exceed the Secretary of the Interior Standards in Archeology. The literature review identified 26 cultural resources, 14 of which are eligible for the National Register of Historic Place (NRHP), and one unevaluated, but treated as eligible, within the partially overlapping Direct, Indirect, and Visual APEs. Of the 15 historic properties, only one historic property 42KA7537 (prehistoric cave and artifact scatter) meets the site type criteria for inclusion in the visual impact assessment and therefore do not require a formal visual effects assessment. Site 42KA7537 is only located in the Direct APE and will be avoided (see Case No. 24-1261).

Within the overlapping APEs, there are nine historic buildings/structures of which five are eligible for the NRHP, two are undetermined (treated as eligible), one has been demolished, and the final is ineligible/non-contributing. Within the Visual APE there are three eligible buildings/structures (Property ID Nos., 32819, 50442, and 33219). These historic properties are in Orderville, and the proposed Cove Reservoir would be obstructed from view by means of several ridges southwest of Gardner Hollow.

Within the Indirect APE breach inundation zone, there are three historic properties: Mt. Carmel School and Church (Property ID No. 37252); Dixon, Maynard, House and Studio (Property ID No. 40479); and Steven's Barn

State Office Natural Resources Conservation Service
125 South State Street, Room 6416
Salt Lake City, Utah 84138
Phone: 801-524-4550

(Property ID No. 31786). Steven's Barn (Property ID NO. 31786) has likely been demolished. Due to distance, elevation, and the proposed reservoir safety features, these historic properties are unlikely to be adversely affected by the highly improbable failure of the proposed Cove Reservoir dam.

Finding of Effect (36 CFR 800.5)

The implementation of the undertaking will not alter the character-defining characteristics of the aforementioned historic properties that allow them to convey their significance since visual component is not the character-defining feature that makes the sites eligible. Therefore, the NRCS finding of effect for the Visual and Indirect APEs is No Adverse Effect. This results in no change to the finding of effect for the entirety of the undertaking, where the NRCS retains our previous determination of ***Adverse Effect to Historic Properties*** (Case No. 20-0121).

In an electronical transmittal on March 28, 2024, the NRCS notified the Advisory Council on Historic Preservation (Council) of the adverse effect determination by providing documentation specified in 36 CFR 800.11(e). The Council declined to participate in consultation in a letter dated April 20, 2024. Per 36 CFR 800.6, the NRCS is continuing consultation with your office, the Sponsors, agencies, applicable Native American tribes, and other consulting parties, to develop mitigation stipulations that will be executed in a Memorandum of Agreement. As the lead federal agency, the NRCS is informing the BLM, Corps, NPS, TLA, and EPA of ongoing Section 106 consultations. Per 36 CFR 800.4-800.5, the NRCS requests concurrence for the delineation of the APEs, identification of historic properties, and finding of effect. If you have any questions, comments, or concerns, please contact Tara S. Hoffmann, Water and Cultural Resources Specialist, at (385)-258-1266 at your convenience.

Sincerely,

Emily Fife

June 4, 2025

Reference: Continuation of Consultation for the Kane County Water Conservancy District's Cove Reservoir Project— Direct/Indirect/Visual Areas of Potential Effect

Dear Ms. Gillard,

The NRCS is continuing Section 106 consultation for the proposed Kane County Water Conservancy District's Cove East Fork Virgin River Plan-Environmental Impact Statement (aka Cove Reservoir Project), in Kane County, Utah. Included in this submission are a literature review cultural resources memo titled *Kane County Water Conservancy District's Cove Reservoir Project—Cultural Resources Review Memo, Indirect/Visual Areas of Potential Effect (APEs)*. The United States Department of Agriculture's Natural Resources Conservation Service (NRCS), with the and Kane County Water Conservancy District (KCWCD) are proposing to construct the new Cove Reservoir within the existing Glendale, Mt. Carmel, and Orderville irrigation systems. This proposed reservoir would be located immediately southwest of Orderville, Utah, off Cove Road. Additional improvements would include the construction of approximately 1.5 miles of new pipeline, the Glendale hydroelectric power plant, and 0.2 mile of new power line and 0.7 acre of utility corridor along U.S. Highway 89 (US-89) and Cove Road; these improvements would be located west of US-89 and the East Fork of the Virgin River in Glendale, Utah. The Project also proposes the potential use of three previously disturbed borrow pits—Lambs Pit, Tait Pit, and Esplin Pit—for Project-related construction needs. These proposed actions constitute an undertaking under Section 106.

The NRCS is serving as the lead federal agency pursuant to 36 CFR 800.2. The Bureau of Land Management-Kanab Field Office (BLM), U.S. Army Corps of Engineers, Sacramento District (Corps), Environmental Protection Agency (EPA), National Park Service (NPS), and Utah Trust Land Administration (TLA) have been identified as cooperating agencies. The NRCS shall act on behalf of all agencies in fulfilling our collective responsibilities under Section 106, including delineation of the APE, identification of historic properties, and finding of effect. The NRCS will inform all cooperating agencies of Section 106 consultation. This consultation will also cover TLA's responsibilities under Utah Annotated Code Section 9-8-404.

NRCS initially consulted with your office in letters sent January 9, 2020 (U18TN0844), and again on January 23, 2023 (U21TN0840). Concurrence on site eligibility and a determination of ***adverse effect to historic properties*** for the undertaking was received on January 17, 2020, and February 6, 2023, respectively (Case Nos. 20-0121 and 23-0280). Additional consultation occurred for an expansion of the APE for a borrow source in a letter dated May 20, 2024 (U23TN0682). Concurrence was received on May 20, 2024 (Case No. 24-1261). Following these consultations, the NRCS has revised the Area of Potential Effects (APE) to include the Direct (Physical), Visual, and Indirect APEs.

USDA is an equal opportunity provider, employer, and lender.

State Office Natural Resources Conservation Service

Phone: 801-524-4550

Area of Potential Effects (APE) (36 CFR 800.4)

Table 1 summarizes the Direct, Visual, and Indirect APEs.

TABLE 1
TOTAL Area of Potential Effects (APE)

Area of Potential Effect	BLM	State	Private	Total
Indirect APE Acreage (Inundation Areas)	17.05	0.51	990.41	**1,007.97**
Visual APE Acreage (1 Mile Buffer of Cove Reservoir and Facilities)	245.00	1,698.01	3,009.28	**4,952.29**
Direct (Physical) APE Acreage (Cove Reservoir, Pipes, Canals, Esplin Pit, Tait Pit, Lamb's Pit)	0.23	70.33	641.9	**712.46**

- **Direct (Physical) APE**: Includes all potential physical ground disturbance, including construction, staging, access roads, borrow sources, and necessary buffers. It has been refined to a total of 712.46 acres.
- **Visual APE**: A radius of 1 mile around the periphery of the proposed Cove Reservoir was evaluated for potential visual resources that could be impacted by the current construction of the reservoir. GIS viewshed analysis was used to refine the final boundaries of the Visual APE, and areas without potential visibility of the project were removed from the Visual APE.
- **Indirect APE:** Includes the breach inundation zones (Sunny-Day and Rainy-Day) in the unlikely event of a dam breach.

Identification of Historic Properties (36 CFR 800.4)

To identify historic properties within the APEs, a literature review was completed by Eocene Environmental. Personnel meet or exceed the Secretary of the Interior Standards in Archeology. The literature review identified 26 cultural resources, 14 of which are eligible for the National Register of Historic Place (NRHP), and one unevaluated, but treated as eligible, within the partially overlapping Direct, Indirect, and Visual APEs. Of the 15 historic properties, only one historic property 42KA7537 (prehistoric cave and artifact scatter) meets the site type criteria for inclusion in the visual impact assessment and therefore do not require a formal visual effects assessment. Site 42KA7537 is only located in the Direct APE and will be avoided (see Case No. 24-1261).

Within the overlapping APEs, there are nine historic buildings/structures of which five are eligible for the NRHP, two are undetermined (treated as eligible), one has been demolished, and the final is ineligible/non-contributing. Within the Visual APE there are three eligible buildings/structures (Property ID Nos., 32819, 50442, and 33219). These historic properties are in Orderville, and the proposed Cove Reservoir would be obstructed from view by means of several ridges southwest of Gardner Hollow.

Within the Indirect APE breach inundation zone, there are three historic properties: Mt. Carmel School and Church (Property ID No. 37252); Dixon, Maynard, House and Studio (Property ID No. 40479); and Steven's Barn

State Office Natural Resources Conservation Service
125 South State Street, Room 6416
Salt Lake City, Utah 84138
Phone: 801-524-4550

(Property ID No. 31786). Steven's Barn (Property ID NO. 31786) has likely been demolished. Due to distance, elevation, and the proposed reservoir safety features, these historic properties are unlikely to be adversely affected by the highly improbable failure of the proposed Cove Reservoir dam.

Finding of Effect (36 CFR 800.5)

The implementation of the undertaking will not alter the character-defining characteristics of the aforementioned historic properties that allow them to convey their significance since visual component is not the character-defining feature that makes the sites eligible. Therefore, the NRCS finding of effect for the Visual and Indirect APEs is No Adverse Effect. This results in no change to the finding of effect for the entirety of the undertaking, where the NRCS retains our previous determination of ***Adverse Effect to Historic Properties*** (Case No. 20-0121).

In an electronical transmittal on March 28, 2024, the NRCS notified the Advisory Council on Historic Preservation (Council) of the adverse effect determination by providing documentation specified in 36 CFR 800.11(e). The Council declined to participate in consultation in a letter dated April 20, 2024. Per 36 CFR 800.6, the NRCS is continuing consultation with your office, the Sponsors, agencies, applicable Native American tribes, and other consulting parties, to develop mitigation stipulations that will be executed in a Memorandum of Agreement. As the lead federal agency, the NRCS is informing the BLM, Corps, NPS, TLA, and EPA of ongoing Section 106 consultations. Per 36 CFR 800.4-800.5, the NRCS requests concurrence for the delineation of the APEs, identification of historic properties, and finding of effect. If you have any questions, comments, or concerns, please contact Tara S. Hoffmann, Water and Cultural Resources Specialist, at (385)-258-1266 at your convenience.

Sincerely,

Emily Fife

Reference: Continuation of Consultation for the Kane County Water Conservancy District's Cove Reservoir Project— Direct/Indirect/Visual Areas of Potential Effect

Dear Governor Kucate,

The NRCS is continuing Section 106 consultation for the proposed Kane County Water Conservancy District's Cove East Fork Virgin River Plan-Environmental Impact Statement (aka Cove Reservoir Project), in Kane County, Utah. Included in this submission are a literature review cultural resources memo titled *Kane County Water Conservancy District's Cove Reservoir Project—Cultural Resources Review Memo, Indirect/Visual Areas of Potential Effect (APEs)*. The United States Department of Agriculture's Natural Resources Conservation Service (NRCS), with the and Kane County Water Conservancy District (KCWCD) are proposing to construct the new Cove Reservoir within the existing Glendale, Mt. Carmel, and Orderville irrigation systems. This proposed reservoir would be located immediately southwest of Orderville, Utah, off Cove Road. Additional improvements would include the construction of approximately 1.5 miles of new pipeline, the Glendale hydroelectric power plant, and 0.2 mile of new power line and 0.7 acre of utility corridor along U.S. Highway 89 (US-89) and Cove Road; these improvements would be located west of US-89 and the East Fork of the Virgin River in Glendale, Utah. The Project also proposes the potential use of three previously disturbed borrow pits—Lambs Pit, Tait Pit, and Esplin Pit—for Project-related construction needs. These proposed actions constitute an undertaking under Section 106.

The NRCS is serving as the lead federal agency pursuant to 36 CFR 800.2. The Bureau of Land Management-Kanab Field Office (BLM), U.S. Army Corps of Engineers, Sacramento District (Corps), Environmental Protection Agency (EPA), National Park Service (NPS), and Utah Trust Land Administration (TLA) have been identified as cooperating agencies. The NRCS shall act on behalf of all agencies in fulfilling our collective responsibilities under Section 106, including delineation of the APE, identification of historic properties, and finding of effect. The NRCS will inform all cooperating agencies of Section 106 consultation. This consultation will also cover TLA's responsibilities under Utah Annotated Code Section 9-8-404.

NRCS initially consulted with your office in letters sent January 9, 2020 (U18TN0844), and again on January 23, 2023 (U21TN0840). Concurrence on site eligibility and a determination of ***adverse effect to historic properties*** for the undertaking was received on January 17, 2020, and February 6, 2023, respectively (Case Nos. 20-0121 and 23-0280). Additional consultation occurred for an expansion of the APE for a borrow source in a letter dated May 20, 2024 (U23TN0682). Concurrence was received on May 20, 2024 (Case No. 24-1261). Following these consultations, the NRCS has revised the Area of Potential Effects (APE) to include the Direct (Physical), Visual, and Indirect APEs.

USDA is an equal opportunity provider, employer, and lender.

State Office Natural Resources Conservation Service

Phone: 801-524-4550

Area of Potential Effects (APE) (36 CFR 800.4)

Table 1 summarizes the Direct, Visual, and Indirect APEs.

TABLE 1
TOTAL Area of Potential Effects (APE)

Area of Potential Effect	BLM	State	Private	Total
Indirect APE Acreage (Inundation Areas)	17.05	0.51	990.41	**1,007.97**
Visual APE Acreage (1 Mile Buffer of Cove Reservoir and Facilities)	245.00	1,698.01	3,009.28	**4,952.29**
Direct (Physical) APE Acreage (Cove Reservoir, Pipes, Canals, Esplin Pit, Tait Pit, Lamb's Pit)	0.23	70.33	641.9	**712.46**

- **Direct (Physical) APE**: Includes all potential physical ground disturbance, including construction, staging, access roads, borrow sources, and necessary buffers. It has been refined to a total of 712.46 acres.
- **Visual APE**: A radius of 1 mile around the periphery of the proposed Cove Reservoir was evaluated for potential visual resources that could be impacted by the current construction of the reservoir. GIS viewshed analysis was used to refine the final boundaries of the Visual APE, and areas without potential visibility of the project were removed from the Visual APE.
- **Indirect APE:** Includes the breach inundation zones (Sunny-Day and Rainy-Day) in the unlikely event of a dam breach.

Identification of Historic Properties (36 CFR 800.4)

To identify historic properties within the APEs, a literature review was completed by Eocene Environmental. Personnel meet or exceed the Secretary of the Interior Standards in Archeology. The literature review identified 26 cultural resources, 14 of which are eligible for the National Register of Historic Place (NRHP), and one unevaluated, but treated as eligible, within the partially overlapping Direct, Indirect, and Visual APEs. Of the 15 historic properties, only one historic property 42KA7537 (prehistoric cave and artifact scatter) meets the site type criteria for inclusion in the visual impact assessment and therefore do not require a formal visual effects assessment. Site 42KA7537 is only located in the Direct APE and will be avoided (see Case No. 24-1261).

Within the overlapping APEs, there are nine historic buildings/structures of which five are eligible for the NRHP, two are undetermined (treated as eligible), one has been demolished, and the final is ineligible/non-contributing. Within the Visual APE there are three eligible buildings/structures (Property ID Nos., 32819, 50442, and 33219). These historic properties are in Orderville, and the proposed Cove Reservoir would be obstructed from view by means of several ridges southwest of Gardner Hollow.

Within the Indirect APE breach inundation zone, there are three historic properties: Mt. Carmel School and Church (Property ID No. 37252); Dixon, Maynard, House and Studio (Property ID No. 40479); and Steven's Barn

State Office Natural Resources Conservation Service
125 South State Street, Room 6416
Salt Lake City, Utah 84138
Phone: 801-524-4550

(Property ID No. 31786). Steven's Barn (Property ID NO. 31786) has likely been demolished. Due to distance, elevation, and the proposed reservoir safety features, these historic properties are unlikely to be adversely affected by the highly improbable failure of the proposed Cove Reservoir dam.

Finding of Effect (36 CFR 800.5)

The implementation of the undertaking will not alter the character-defining characteristics of the aforementioned historic properties that allow them to convey their significance since visual component is not the character-defining feature that makes the sites eligible. Therefore, the NRCS finding of effect for the Visual and Indirect APEs is No Adverse Effect. This results in no change to the finding of effect for the entirety of the undertaking, where the NRCS retains our previous determination of ***Adverse Effect to Historic Properties*** (Case No. 20-0121).

In an electronical transmittal on March 28, 2024, the NRCS notified the Advisory Council on Historic Preservation (Council) of the adverse effect determination by providing documentation specified in 36 CFR 800.11(e). The Council declined to participate in consultation in a letter dated April 20, 2024. Per 36 CFR 800.6, the NRCS is continuing consultation with your office, the Sponsors, agencies, applicable Native American tribes, and other consulting parties, to develop mitigation stipulations that will be executed in a Memorandum of Agreement. As the lead federal agency, the NRCS is informing the BLM, Corps, NPS, TLA, and EPA of ongoing Section 106 consultations. Per 36 CFR 800.4-800.5, the NRCS requests concurrence for the delineation of the APEs, identification of historic properties, and finding of effect. If you have any questions, comments, or concerns, please contact Tara S. Hoffmann, Water and Cultural Resources Specialist, at (385)-258-1266 at your convenience.

Sincerely,

Emily Fife

Reference: Continuation of Consultation for the Kane County Water Conservancy District's Cove Reservoir Project— Direct/Indirect/Visual Areas of Potential Effect

Dear Mr. Dongoske,

The NRCS is continuing Section 106 consultation for the proposed Kane County Water Conservancy District's Cove East Fork Virgin River Plan-Environmental Impact Statement (aka Cove Reservoir Project), in Kane County, Utah. Included in this submission are a literature review cultural resources memo titled *Kane County Water Conservancy District's Cove Reservoir Project—Cultural Resources Review Memo, Indirect/Visual Areas of Potential Effect (APEs)*. The United States Department of Agriculture's Natural Resources Conservation Service (NRCS), with the and Kane County Water Conservancy District (KCWCD) are proposing to construct the new Cove Reservoir within the existing Glendale, Mt. Carmel, and Orderville irrigation systems. This proposed reservoir would be located immediately southwest of Orderville, Utah, off Cove Road. Additional improvements would include the construction of approximately 1.5 miles of new pipeline, the Glendale hydroelectric power plant, and 0.2 mile of new power line and 0.7 acre of utility corridor along U.S. Highway 89 (US-89) and Cove Road; these improvements would be located west of US-89 and the East Fork of the Virgin River in Glendale, Utah. The Project also proposes the potential use of three previously disturbed borrow pits—Lambs Pit, Tait Pit, and Esplin Pit—for Project-related construction needs. These proposed actions constitute an undertaking under Section 106.

The NRCS is serving as the lead federal agency pursuant to 36 CFR 800.2. The Bureau of Land Management-Kanab Field Office (BLM), U.S. Army Corps of Engineers, Sacramento District (Corps), Environmental Protection Agency (EPA), National Park Service (NPS), and Utah Trust Land Administration (TLA) have been identified as cooperating agencies. The NRCS shall act on behalf of all agencies in fulfilling our collective responsibilities under Section 106, including delineation of the APE, identification of historic properties, and finding of effect. The NRCS will inform all cooperating agencies of Section 106 consultation. This consultation will also cover TLA's responsibilities under Utah Annotated Code Section 9-8-404.

NRCS initially consulted with your office in letters sent January 9, 2020 (U18TN0844), and again on January 23, 2023 (U21TN0840). Concurrence on site eligibility and a determination of ***adverse effect to historic properties*** for the undertaking was received on January 17, 2020, and February 6, 2023, respectively (Case Nos. 20-0121 and 23-0280). Additional consultation occurred for an expansion of the APE for a borrow source in a letter dated May 20, 2024 (U23TN0682). Concurrence was received on May 20, 2024 (Case No. 24-1261). Following these consultations, the NRCS has revised the Area of Potential Effects (APE) to include the Direct (Physical), Visual, and Indirect APEs.

USDA is an equal opportunity provider, employer, and lender.

State Office Natural Resources Conservation Service

Salt Lake City, Utah 84138
Phone: 801-524-4550

Area of Potential Effects (APE) (36 CFR 800.4)

Table 1 summarizes the Direct, Visual, and Indirect APEs.

TABLE 1
TOTAL Area of Potential Effects (APE)

Area of Potential Effect	BLM	State	Private	Total
Indirect APE Acreage (Inundation Areas)	17.05	0.51	990.41	**1,007.97**
Visual APE Acreage (1 Mile Buffer of Cove Reservoir and Facilities)	245.00	1,698.01	3,009.28	**4,952.29**
Direct (Physical) APE Acreage (Cove Reservoir, Pipes, Canals, Esplin Pit, Tait Pit, Lamb's Pit)	0.23	70.33	641.9	**712.46**

- **Direct (Physical) APE**: Includes all potential physical ground disturbance, including construction, staging, access roads, borrow sources, and necessary buffers. It has been refined to a total of 712.46 acres.
- **Visual APE**: A radius of 1 mile around the periphery of the proposed Cove Reservoir was evaluated for potential visual resources that could be impacted by the current construction of the reservoir. GIS viewshed analysis was used to refine the final boundaries of the Visual APE, and areas without potential visibility of the project were removed from the Visual APE.
- **Indirect APE:** Includes the breach inundation zones (Sunny-Day and Rainy-Day) in the unlikely event of a dam breach.

Identification of Historic Properties (36 CFR 800.4)

To identify historic properties within the APEs, a literature review was completed by Eocene Environmental. Personnel meet or exceed the Secretary of the Interior Standards in Archeology. The literature review identified 26 cultural resources, 14 of which are eligible for the National Register of Historic Place (NRHP), and one unevaluated, but treated as eligible, within the partially overlapping Direct, Indirect, and Visual APEs. Of the 15 historic properties, only one historic property 42KA7537 (prehistoric cave and artifact scatter) meets the site type criteria for inclusion in the visual impact assessment and therefore do not require a formal visual effects assessment. Site 42KA7537 is only located in the Direct APE and will be avoided (see Case No. 24-1261).

Within the overlapping APEs, there are nine historic buildings/structures of which five are eligible for the NRHP, two are undetermined (treated as eligible), one has been demolished, and the final is ineligible/non-contributing. Within the Visual APE there are three eligible buildings/structures (Property ID Nos., 32819, 50442, and 33219). These historic properties are in Orderville, and the proposed Cove Reservoir would be obstructed from view by means of several ridges southwest of Gardner Hollow.

Within the Indirect APE breach inundation zone, there are three historic properties: Mt. Carmel School and Church (Property ID No. 37252); Dixon, Maynard, House and Studio (Property ID No. 40479); and Steven's Barn

State Office Natural Resources Conservation Service
125 South State Street, Room 6416
Salt Lake City, Utah 84138
Phone: 801-524-4550

(Property ID No. 31786). Steven's Barn (Property ID NO. 31786) has likely been demolished. Due to distance, elevation, and the proposed reservoir safety features, these historic properties are unlikely to be adversely affected by the highly improbable failure of the proposed Cove Reservoir dam.

Finding of Effect (36 CFR 800.5)

The implementation of the undertaking will not alter the character-defining characteristics of the aforementioned historic properties that allow them to convey their significance since visual component is not the character-defining feature that makes the sites eligible. Therefore, the NRCS finding of effect for the Visual and Indirect APEs is No Adverse Effect. This results in no change to the finding of effect for the entirety of the undertaking, where the NRCS retains our previous determination of ***Adverse Effect to Historic Properties*** (Case No. 20-0121).

In an electronical transmittal on March 28, 2024, the NRCS notified the Advisory Council on Historic Preservation (Council) of the adverse effect determination by providing documentation specified in 36 CFR 800.11(e). The Council declined to participate in consultation in a letter dated April 20, 2024. Per 36 CFR 800.6, the NRCS is continuing consultation with your office, the Sponsors, agencies, applicable Native American tribes, and other consulting parties, to develop mitigation stipulations that will be executed in a Memorandum of Agreement. As the lead federal agency, the NRCS is informing the BLM, Corps, NPS, TLA, and EPA of ongoing Section 106 consultations. Per 36 CFR 800.4-800.5, the NRCS requests concurrence for the delineation of the APEs, identification of historic properties, and finding of effect. If you have any questions, comments, or concerns, please contact Tara S. Hoffmann, Water and Cultural Resources Specialist, at (385)-258-1266 at your convenience.

Sincerely,

Emily Fife

Reference: Continuation of Consultation for the Kane County Water Conservancy District's Cove Reservoir Project— Direct/Indirect/Visual Areas of Potential Effect

Dear President Yellowhair,

The NRCS is continuing Section 106 consultation for the proposed Kane County Water Conservancy District's Cove East Fork Virgin River Plan-Environmental Impact Statement (aka Cove Reservoir Project), in Kane County, Utah. Included in this submission are a literature review cultural resources memo titled *Kane County Water Conservancy District's Cove Reservoir Project—Cultural Resources Review Memo, Indirect/Visual Areas of Potential Effect (APEs)*. The United States Department of Agriculture's Natural Resources Conservation Service (NRCS), with the and Kane County Water Conservancy District (KCWCD) are proposing to construct the new Cove Reservoir within the existing Glendale, Mt. Carmel, and Orderville irrigation systems. This proposed reservoir would be located immediately southwest of Orderville, Utah, off Cove Road. Additional improvements would include the construction of approximately 1.5 miles of new pipeline, the Glendale hydroelectric power plant, and 0.2 mile of new power line and 0.7 acre of utility corridor along U.S. Highway 89 (US-89) and Cove Road; these improvements would be located west of US-89 and the East Fork of the Virgin River in Glendale, Utah. The Project also proposes the potential use of three previously disturbed borrow pits—Lambs Pit, Tait Pit, and Esplin Pit—for Project-related construction needs. These proposed actions constitute an undertaking under Section 106.

The NRCS is serving as the lead federal agency pursuant to 36 CFR 800.2. The Bureau of Land Management-Kanab Field Office (BLM), U.S. Army Corps of Engineers, Sacramento District (Corps), Environmental Protection Agency (EPA), National Park Service (NPS), and Utah Trust Land Administration (TLA) have been identified as cooperating agencies. The NRCS shall act on behalf of all agencies in fulfilling our collective responsibilities under Section 106, including delineation of the APE, identification of historic properties, and finding of effect. The NRCS will inform all cooperating agencies of Section 106 consultation. This consultation will also cover TLA's responsibilities under Utah Annotated Code Section 9-8-404.

NRCS initially consulted with your office in letters sent January 9, 2020 (U18TN0844), and again on January 23, 2023 (U21TN0840). Concurrence on site eligibility and a determination of ***adverse effect to historic properties*** for the undertaking was received on January 17, 2020, and February 6, 2023, respectively (Case Nos. 20-0121 and 23-0280). Additional consultation occurred for an expansion of the APE for a borrow source in a letter dated May 20, 2024 (U23TN0682). Concurrence was received on May 20, 2024 (Case No. 24-1261). Following these consultations, the NRCS has revised the Area of Potential Effects (APE) to include the Direct (Physical), Visual, and Indirect APEs.

USDA is an equal opportunity provider, employer, and lender.

State Office Natural Resources Conservation Service

Phone: 801-524-4550

Area of Potential Effects (APE) (36 CFR 800.4)

Table 1 summarizes the Direct, Visual, and Indirect APEs.

TABLE 1
TOTAL Area of Potential Effects (APE)

Area of Potential Effect	BLM	State	Private	Total
Indirect APE Acreage (Inundation Areas)	17.05	0.51	990.41	**1,007.97**
Visual APE Acreage (1 Mile Buffer of Cove Reservoir and Facilities)	245.00	1,698.01	3,009.28	**4,952.29**
Direct (Physical) APE Acreage (Cove Reservoir, Pipes, Canals, Esplin Pit, Tait Pit, Lamb's Pit)	0.23	70.33	641.9	**712.46**

- **Direct (Physical) APE**: Includes all potential physical ground disturbance, including construction, staging, access roads, borrow sources, and necessary buffers. It has been refined to a total of 712.46 acres.
- **Visual APE**: A radius of 1 mile around the periphery of the proposed Cove Reservoir was evaluated for potential visual resources that could be impacted by the current construction of the reservoir. GIS viewshed analysis was used to refine the final boundaries of the Visual APE, and areas without potential visibility of the project were removed from the Visual APE.
- **Indirect APE:** Includes the breach inundation zones (Sunny-Day and Rainy-Day) in the unlikely event of a dam breach.

Identification of Historic Properties (36 CFR 800.4)

To identify historic properties within the APEs, a literature review was completed by Eocene Environmental. Personnel meet or exceed the Secretary of the Interior Standards in Archeology. The literature review identified 26 cultural resources, 14 of which are eligible for the National Register of Historic Place (NRHP), and one unevaluated, but treated as eligible, within the partially overlapping Direct, Indirect, and Visual APEs. Of the 15 historic properties, only one historic property 42KA7537 (prehistoric cave and artifact scatter) meets the site type criteria for inclusion in the visual impact assessment and therefore do not require a formal visual effects assessment. Site 42KA7537 is only located in the Direct APE and will be avoided (see Case No. 24-1261).

Within the overlapping APEs, there are nine historic buildings/structures of which five are eligible for the NRHP, two are undetermined (treated as eligible), one has been demolished, and the final is ineligible/non-contributing. Within the Visual APE there are three eligible buildings/structures (Property ID Nos., 32819, 50442, and 33219). These historic properties are in Orderville, and the proposed Cove Reservoir would be obstructed from view by means of several ridges southwest of Gardner Hollow.

Within the Indirect APE breach inundation zone, there are three historic properties: Mt. Carmel School and Church (Property ID No. 37252); Dixon, Maynard, House and Studio (Property ID No. 40479); and Steven's Barn

State Office Natural Resources Conservation Service
125 South State Street, Room 6416
Salt Lake City, Utah 84138
Phone: 801-524-4550

(Property ID No. 31786). Steven's Barn (Property ID NO. 31786) has likely been demolished. Due to distance, elevation, and the proposed reservoir safety features, these historic properties are unlikely to be adversely affected by the highly improbable failure of the proposed Cove Reservoir dam.

Finding of Effect (36 CFR 800.5)

The implementation of the undertaking will not alter the character-defining characteristics of the aforementioned historic properties that allow them to convey their significance since visual component is not the character-defining feature that makes the sites eligible. Therefore, the NRCS finding of effect for the Visual and Indirect APEs is No Adverse Effect. This results in no change to the finding of effect for the entirety of the undertaking, where the NRCS retains our previous determination of ***Adverse Effect to Historic Properties*** (Case No. 20-0121).

In an electronical transmittal on March 28, 2024, the NRCS notified the Advisory Council on Historic Preservation (Council) of the adverse effect determination by providing documentation specified in 36 CFR 800.11(e). The Council declined to participate in consultation in a letter dated April 20, 2024. Per 36 CFR 800.6, the NRCS is continuing consultation with your office, the Sponsors, agencies, applicable Native American tribes, and other consulting parties, to develop mitigation stipulations that will be executed in a Memorandum of Agreement. As the lead federal agency, the NRCS is informing the BLM, Corps, NPS, TLA, and EPA of ongoing Section 106 consultations. Per 36 CFR 800.4-800.5, the NRCS requests concurrence for the delineation of the APEs, identification of historic properties, and finding of effect. If you have any questions, comments, or concerns, please contact Tara S. Hoffmann, Water and Cultural Resources Specialist, at (385)-258-1266 at your convenience.

Sincerely,

Emily Fife

Reference: Continuation of Consultation for the Kane County Water Conservancy District's Cove Reservoir Project— Direct/Indirect/Visual Areas of Potential Effect

Dear Vice President Lehi,

The NRCS is continuing Section 106 consultation for the proposed Kane County Water Conservancy District's Cove East Fork Virgin River Plan-Environmental Impact Statement (aka Cove Reservoir Project), in Kane County, Utah. Included in this submission are a literature review cultural resources memo titled *Kane County Water Conservancy District's Cove Reservoir Project—Cultural Resources Review Memo, Indirect/Visual Areas of Potential Effect (APEs)*. The United States Department of Agriculture's Natural Resources Conservation Service (NRCS), with the and Kane County Water Conservancy District (KCWCD) are proposing to construct the new Cove Reservoir within the existing Glendale, Mt. Carmel, and Orderville irrigation systems. This proposed reservoir would be located immediately southwest of Orderville, Utah, off Cove Road. Additional improvements would include the construction of approximately 1.5 miles of new pipeline, the Glendale hydroelectric power plant, and 0.2 mile of new power line and 0.7 acre of utility corridor along U.S. Highway 89 (US-89) and Cove Road; these improvements would be located west of US-89 and the East Fork of the Virgin River in Glendale, Utah. The Project also proposes the potential use of three previously disturbed borrow pits—Lambs Pit, Tait Pit, and Esplin Pit—for Project-related construction needs. These proposed actions constitute an undertaking under Section 106.

The NRCS is serving as the lead federal agency pursuant to 36 CFR 800.2. The Bureau of Land Management-Kanab Field Office (BLM), U.S. Army Corps of Engineers, Sacramento District (Corps), Environmental Protection Agency (EPA), National Park Service (NPS), and Utah Trust Land Administration (TLA) have been identified as cooperating agencies. The NRCS shall act on behalf of all agencies in fulfilling our collective responsibilities under Section 106, including delineation of the APE, identification of historic properties, and finding of effect. The NRCS will inform all cooperating agencies of Section 106 consultation. This consultation will also cover TLA's responsibilities under Utah Annotated Code Section 9-8-404.

NRCS initially consulted with your office in letters sent January 9, 2020 (U18TN0844), and again on January 23, 2023 (U21TN0840). Concurrence on site eligibility and a determination of ***adverse effect to historic properties*** for the undertaking was received on January 17, 2020, and February 6, 2023, respectively (Case Nos. 20-0121 and 23-0280). Additional consultation occurred for an expansion of the APE for a borrow source in a letter dated May 20, 2024 (U23TN0682). Concurrence was received on May 20, 2024 (Case No. 24-1261). Following these consultations, the NRCS has revised the Area of Potential Effects (APE) to include the Direct (Physical), Visual, and Indirect APEs.

USDA is an equal opportunity provider, employer, and lender.

State Office Natural Resources Conservation Service
125 South State Street, Room 6416
Salt Lake City, Utah 84138
Phone: 801-524-4550

Area of Potential Effects (APE) (36 CFR 800.4)

Table 1 summarizes the Direct, Visual, and Indirect APEs.

TABLE 1
TOTAL Area of Potential Effects (APE)

Area of Potential Effect	BLM	State	Private	Total
Indirect APE Acreage (Inundation Areas)	17.05	0.51	990.41	**1,007.97**
Visual APE Acreage (1 Mile Buffer of Cove Reservoir and Facilities)	245.00	1,698.01	3,009.28	**4,952.29**
Direct (Physical) APE Acreage (Cove Reservoir, Pipes, Canals, Esplin Pit, Tait Pit, Lamb's Pit)	0.23	70.33	641.9	**712.46**

- **Direct (Physical) APE**: Includes all potential physical ground disturbance, including construction, staging, access roads, borrow sources, and necessary buffers. It has been refined to a total of 712.46 acres.
- **Visual APE**: A radius of 1 mile around the periphery of the proposed Cove Reservoir was evaluated for potential visual resources that could be impacted by the current construction of the reservoir. GIS viewshed analysis was used to refine the final boundaries of the Visual APE, and areas without potential visibility of the project were removed from the Visual APE.
- **Indirect APE:** Includes the breach inundation zones (Sunny-Day and Rainy-Day) in the unlikely event of a dam breach.

Identification of Historic Properties (36 CFR 800.4)

To identify historic properties within the APEs, a literature review was completed by Eocene Environmental. Personnel meet or exceed the Secretary of the Interior Standards in Archeology. The literature review identified 26 cultural resources, 14 of which are eligible for the National Register of Historic Place (NRHP), and one unevaluated, but treated as eligible, within the partially overlapping Direct, Indirect, and Visual APEs. Of the 15 historic properties, only one historic property 42KA7537 (prehistoric cave and artifact scatter) meets the site type criteria for inclusion in the visual impact assessment and therefore do not require a formal visual effects assessment. Site 42KA7537 is only located in the Direct APE and will be avoided (see Case No. 24-1261).

Within the overlapping APEs, there are nine historic buildings/structures of which five are eligible for the NRHP, two are undetermined (treated as eligible), one has been demolished, and the final is ineligible/non-contributing. Within the Visual APE there are three eligible buildings/structures (Property ID Nos., 32819, 50442, and 33219). These historic properties are in Orderville, and the proposed Cove Reservoir would be obstructed from view by means of several ridges southwest of Gardner Hollow.

Within the Indirect APE breach inundation zone, there are three historic properties: Mt. Carmel School and Church (Property ID No. 37252); Dixon, Maynard, House and Studio (Property ID No. 40479); and Steven's Barn

State Office Natural Resources Conservation Service
125 South State Street, Room 6416
Salt Lake City, Utah 84138
Phone: 801-524-4550

(Property ID No. 31786). Steven's Barn (Property ID NO. 31786) has likely been demolished. Due to distance, elevation, and the proposed reservoir safety features, these historic properties are unlikely to be adversely affected by the highly improbable failure of the proposed Cove Reservoir dam.

Finding of Effect (36 CFR 800.5)

The implementation of the undertaking will not alter the character-defining characteristics of the aforementioned historic properties that allow them to convey their significance since visual component is not the character-defining feature that makes the sites eligible. Therefore, the NRCS finding of effect for the Visual and Indirect APEs is No Adverse Effect. This results in no change to the finding of effect for the entirety of the undertaking, where the NRCS retains our previous determination of ***Adverse Effect to Historic Properties*** (Case No. 20-0121).

In an electronical transmittal on March 28, 2024, the NRCS notified the Advisory Council on Historic Preservation (Council) of the adverse effect determination by providing documentation specified in 36 CFR 800.11(e). The Council declined to participate in consultation in a letter dated April 20, 2024. Per 36 CFR 800.6, the NRCS is continuing consultation with your office, the Sponsors, agencies, applicable Native American tribes, and other consulting parties, to develop mitigation stipulations that will be executed in a Memorandum of Agreement. As the lead federal agency, the NRCS is informing the BLM, Corps, NPS, TLA, and EPA of ongoing Section 106 consultations. Per 36 CFR 800.4-800.5, the NRCS requests concurrence for the delineation of the APEs, identification of historic properties, and finding of effect. If you have any questions, comments, or concerns, please contact Tara S. Hoffmann, Water and Cultural Resources Specialist, at (385)-258-1266 at your convenience.

Sincerely,

Emily Fife

Mr. Dustin Jansen
Division Director
Utah Division of Indian Affairs

June 4, 2025

Reference: Continuation of Consultation for the Kane County Water Conservancy District's Cove Reservoir Project— Direct/Indirect/Visual Areas of Potential Effect

Dear Mr. Jansen,

The NRCS is continuing Section 106 consultation for the proposed Kane County Water Conservancy District's Cove East Fork Virgin River Plan-Environmental Impact Statement (aka Cove Reservoir Project), in Kane County, Utah. Included in this submission are a literature review cultural resources memo titled *Kane County Water Conservancy District's Cove Reservoir Project—Cultural Resources Review Memo, Indirect/Visual Areas of Potential Effect (APEs).* The United States Department of Agriculture's Natural Resources Conservation Service (NRCS), with the and Kane County Water Conservancy District (KCWCD) are proposing to construct the new Cove Reservoir within the existing Glendale, Mt. Carmel, and Orderville irrigation systems. This proposed reservoir would be located immediately southwest of Orderville, Utah, off Cove Road. Additional improvements would include the construction of approximately 1.5 miles of new pipeline, the Glendale hydroelectric power plant, and 0.2 mile of new power line and 0.7 acre of utility corridor along U.S. Highway 89 (US-89) and Cove Road; these improvements would be located west of US-89 and the East Fork of the Virgin River in Glendale, Utah. The Project also proposes the potential use of three previously disturbed borrow pits—Lambs Pit, Tait Pit, and Esplin Pit—for Project-related construction needs. These proposed actions constitute an undertaking under Section 106.

The NRCS is serving as the lead federal agency pursuant to 36 CFR 800.2. The Bureau of Land Management-Kanab Field Office (BLM), U.S. Army Corps of Engineers, Sacramento District (Corps), Environmental Protection Agency (EPA), National Park Service (NPS), and Utah Trust Land Administration (TLA) have been identified as cooperating agencies. The NRCS shall act on behalf of all agencies in fulfilling our collective responsibilities under Section 106, including delineation of the APE, identification of historic properties, and finding of effect. The NRCS will inform all cooperating agencies of Section 106 consultation. This consultation will also cover TLA's responsibilities under Utah Annotated Code Section 9-8-404.

NRCS initially consulted with your office in letters sent January 9, 2020 (U18TN0844), and again on January 23, 2023 (U21TN0840). Concurrence on site eligibility and a determination of ***adverse effect to historic properties*** for the undertaking was received on January 17, 2020, and February 6, 2023, respectively (Case Nos. 20-0121 and 23-0280). Additional consultation occurred for an expansion of the APE for a borrow source in a letter dated May 20, 2024 (U23TN0682). Concurrence was received on May 20, 2024 (Case No. 24-1261). Following these consultations, the NRCS has revised the Area of Potential Effects (APE) to include the Direct (Physical), Visual, and Indirect APEs.

<u>Area of Potential Effects (APE) (36 CFR 800.4)</u>

State Office Natural Resources Conservation Service
125 South State Street, Room 6416
Salt Lake City, Utah 84138
Phone: 801-524-4550

Table 1 summarizes the Direct, Visual, and Indirect APEs.

TABLE 1 TOTAL Area of Potential Effects (APE)				
Area of Potential Effect	**BLM**	**State**	**Private**	**Total**
Indirect APE Acreage (Inundation Areas)	17.05	0.51	990.41	**1,007.97**
Visual APE Acreage (1 Mile Buffer of Cove Reservoir and Facilities)	245.00	1,698.01	3,009.28	**4,952.29**
Direct (Physical) APE Acreage (Cove Reservoir, Pipes, Canals, Esplin Pit, Tait Pit, Lamb's Pit)	0.23	70.33	641.9	**712.46**

- **Direct (Physical) APE**: Includes all potential physical ground disturbance, including construction, staging, access roads, borrow sources, and necessary buffers. It has been refined to a total of 712.46 acres.
- **Visual APE**: A radius of 1 mile around the periphery of the proposed Cove Reservoir was evaluated for potential visual resources that could be impacted by the current construction of the reservoir. GIS viewshed analysis was used to refine the final boundaries of the Visual APE, and areas without potential visibility of the project were removed from the Visual APE.
- **Indirect APE:** Includes the breach inundation zones (Sunny-Day and Rainy-Day) in the unlikely event of a dam breach.

Identification of Historic Properties (36 CFR 800.4)

To identify historic properties within the APEs, a literature review was completed by Eocene Environmental. Personnel meet or exceed the Secretary of the Interior Standards in Archeology. The literature review identified 26 cultural resources, 14 of which are eligible for the National Register of Historic Place (NRHP), and one unevaluated, but treated as eligible, within the partially overlapping Direct, Indirect, and Visual APEs. Of the 15 historic properties, only one historic property 42KA7537 (prehistoric cave and artifact scatter) meets the site type criteria for inclusion in the visual impact assessment and therefore do not require a formal visual effects assessment. Site 42KA7537 is only located in the Direct APE and will be avoided (see Case No. 24-1261).

Within the overlapping APEs, there are nine historic buildings/structures of which five are eligible for the NRHP, two are undetermined (treated as eligible), one has been demolished, and the final is ineligible/non-contributing. Within the Visual APE there are three eligible buildings/structures (Property ID Nos., 32819, 50442, and 33219). These historic properties are in Orderville, and the proposed Cove Reservoir would be obstructed from view by means of several ridges southwest of Gardner Hollow.

Within the Indirect APE breach inundation zone, there are three historic properties: Mt. Carmel School and Church (Property ID No. 37252); Dixon, Maynard, House and Studio (Property ID No. 40479); and Steven's Barn (Property ID No. 31786). Steven's Barn (Property ID NO. 31786) has likely been demolished. Due to distance,

State Office Natural Resources Conservation Service
125 South State Street, Room 6416
Salt Lake City, Utah 84138
Phone: 801-524-4550

elevation, and the proposed reservoir safety features, these historic properties are unlikely to be adversely affected by the highly improbable failure of the proposed Cove Reservoir dam.

Finding of Effect (36 CFR 800.5)

The implementation of the undertaking will not alter the character-defining characteristics of the aforementioned historic properties that allow them to convey their significance since visual component is not the character-defining feature that makes the sites eligible. Therefore, the NRCS finding of effect for the Visual and Indirect APEs is No Adverse Effect. This results in no change to the finding of effect for the entirety of the undertaking, where the NRCS retains our previous determination of ***Adverse Effect to Historic Properties*** (Case No. 20-0121).

In an electronical transmittal on March 28, 2024, the NRCS notified the Advisory Council on Historic Preservation (Council) of the adverse effect determination by providing documentation specified in 36 CFR 800.11(e). The Council declined to participate in consultation in a letter dated April 20, 2024. Per 36 CFR 800.6, the NRCS is continuing consultation with your office, the Sponsors, agencies, applicable Native American tribes, and other consulting parties, to develop mitigation stipulations that will be executed in a Memorandum of Agreement. As the lead federal agency, the NRCS is informing the BLM, Corps, NPS, TLA, and EPA of ongoing Section 106 consultations. Per 36 CFR 800.4-800.5, the NRCS requests concurrence for the delineation of the APEs, identification of historic properties, and finding of effect. If you have any questions, comments, or concerns, please contact Tara S. Hoffmann, Water and Cultural Resources Specialist, at (385)-258-1266 at your convenience.

Sincerely,

Emily Fife

June 4, 2025

Reference: Continuation of Consultation for the Kane County Water Conservancy District's Cove Reservoir Project— Direct/Indirect/Visual Areas of Potential Effect

Dear Chairman Murray,

The NRCS is continuing Section 106 consultation for the proposed Kane County Water Conservancy District's Cove East Fork Virgin River Plan-Environmental Impact Statement (aka Cove Reservoir Project), in Kane County, Utah. Included in this submission are a literature review cultural resources memo titled *Kane County Water Conservancy District's Cove Reservoir Project—Cultural Resources Review Memo, Indirect/Visual Areas of Potential Effect (APEs)*. The United States Department of Agriculture's Natural Resources Conservation Service (NRCS), with the and Kane County Water Conservancy District (KCWCD) are proposing to construct the new Cove Reservoir within the existing Glendale, Mt. Carmel, and Orderville irrigation systems. This proposed reservoir would be located immediately southwest of Orderville, Utah, off Cove Road. Additional improvements would include the construction of approximately 1.5 miles of new pipeline, the Glendale hydroelectric power plant, and 0.2 mile of new power line and 0.7 acre of utility corridor along U.S. Highway 89 (US-89) and Cove Road; these improvements would be located west of US-89 and the East Fork of the Virgin River in Glendale, Utah. The Project also proposes the potential use of three previously disturbed borrow pits—Lambs Pit, Tait Pit, and Esplin Pit—for Project-related construction needs. These proposed actions constitute an undertaking under Section 106.

The NRCS is serving as the lead federal agency pursuant to 36 CFR 800.2. The Bureau of Land Management-Kanab Field Office (BLM), U.S. Army Corps of Engineers, Sacramento District (Corps), Environmental Protection Agency (EPA), National Park Service (NPS), and Utah Trust Land Administration (TLA) have been identified as cooperating agencies. The NRCS shall act on behalf of all agencies in fulfilling our collective responsibilities under Section 106, including delineation of the APE, identification of historic properties, and finding of effect. The NRCS will inform all cooperating agencies of Section 106 consultation. This consultation will also cover TLA's responsibilities under Utah Annotated Code Section 9-8-404.

NRCS initially consulted with your office in letters sent January 9, 2020 (U18TN0844), and again on January 23, 2023 (U21TN0840). Concurrence on site eligibility and a determination of ***adverse effect to historic properties*** for the undertaking was received on January 17, 2020, and February 6, 2023, respectively (Case Nos. 20-0121 and 23-0280). Additional consultation occurred for an expansion of the APE for a borrow source in a letter dated May 20, 2024 (U23TN0682). Concurrence was received on May 20, 2024 (Case No. 24-1261). Following these consultations, the NRCS has revised the Area of Potential Effects (APE) to include the Direct (Physical), Visual, and Indirect APEs.

USDA is an equal opportunity provider, employer, and lender.

State Office Natural Resources Conservation Service
125 South State Street, Room 6416

Phone: 801-524-4550

Area of Potential Effects (APE) (36 CFR 800.4)

Table 1 summarizes the Direct, Visual, and Indirect APEs.

TABLE 1
TOTAL Area of Potential Effects (APE)

Area of Potential Effect	BLM	State	Private	Total
Indirect APE Acreage (Inundation Areas)	17.05	0.51	990.41	**1,007.97**
Visual APE Acreage (1 Mile Buffer of Cove Reservoir and Facilities)	245.00	1,698.01	3,009.28	**4,952.29**
Direct (Physical) APE Acreage (Cove Reservoir, Pipes, Canals, Esplin Pit, Tait Pit, Lamb's Pit)	0.23	70.33	641.9	**712.46**

- **Direct (Physical) APE**: Includes all potential physical ground disturbance, including construction, staging, access roads, borrow sources, and necessary buffers. It has been refined to a total of 712.46 acres.
- **Visual APE**: A radius of 1 mile around the periphery of the proposed Cove Reservoir was evaluated for potential visual resources that could be impacted by the current construction of the reservoir. GIS viewshed analysis was used to refine the final boundaries of the Visual APE, and areas without potential visibility of the project were removed from the Visual APE.
- **Indirect APE:** Includes the breach inundation zones (Sunny-Day and Rainy-Day) in the unlikely event of a dam breach.

Identification of Historic Properties (36 CFR 800.4)

To identify historic properties within the APEs, a literature review was completed by Eocene Environmental. Personnel meet or exceed the Secretary of the Interior Standards in Archeology. The literature review identified 26 cultural resources, 14 of which are eligible for the National Register of Historic Place (NRHP), and one unevaluated, but treated as eligible, within the partially overlapping Direct, Indirect, and Visual APEs. Of the 15 historic properties, only one historic property 42KA7537 (prehistoric cave and artifact scatter) meets the site type criteria for inclusion in the visual impact assessment and therefore do not require a formal visual effects assessment. Site 42KA7537 is only located in the Direct APE and will be avoided (see Case No. 24-1261).

Within the overlapping APEs, there are nine historic buildings/structures of which five are eligible for the NRHP, two are undetermined (treated as eligible), one has been demolished, and the final is ineligible/non-contributing. Within the Visual APE there are three eligible buildings/structures (Property ID Nos., 32819, 50442, and 33219). These historic properties are in Orderville, and the proposed Cove Reservoir would be obstructed from view by means of several ridges southwest of Gardner Hollow.

Within the Indirect APE breach inundation zone, there are three historic properties: Mt. Carmel School and Church (Property ID No. 37252); Dixon, Maynard, House and Studio (Property ID No. 40479); and Steven's Barn

State Office Natural Resources Conservation Service
125 South State Street, Room 6416
Salt Lake City, Utah 84138
Phone: 801-524-4550

(Property ID No. 31786). Steven's Barn (Property ID NO. 31786) has likely been demolished. Due to distance, elevation, and the proposed reservoir safety features, these historic properties are unlikely to be adversely affected by the highly improbable failure of the proposed Cove Reservoir dam.

Finding of Effect (36 CFR 800.5)

The implementation of the undertaking will not alter the character-defining characteristics of the aforementioned historic properties that allow them to convey their significance since visual component is not the character-defining feature that makes the sites eligible. Therefore, the NRCS finding of effect for the Visual and Indirect APEs is No Adverse Effect. This results in no change to the finding of effect for the entirety of the undertaking, where the NRCS retains our previous determination of ***Adverse Effect to Historic Properties*** (Case No. 20-0121).

In an electronical transmittal on March 28, 2024, the NRCS notified the Advisory Council on Historic Preservation (Council) of the adverse effect determination by providing documentation specified in 36 CFR 800.11(e). The Council declined to participate in consultation in a letter dated April 20, 2024. Per 36 CFR 800.6, the NRCS is continuing consultation with your office, the Sponsors, agencies, applicable Native American tribes, and other consulting parties, to develop mitigation stipulations that will be executed in a Memorandum of Agreement. As the lead federal agency, the NRCS is informing the BLM, Corps, NPS, TLA, and EPA of ongoing Section 106 consultations. Per 36 CFR 800.4-800.5, the NRCS requests concurrence for the delineation of the APEs, identification of historic properties, and finding of effect. If you have any questions, comments, or concerns, please contact Tara S. Hoffmann, Water and Cultural Resources Specialist, at (385)-258-1266 at your convenience.

Sincerely,

Emily Fife

Reference: Continuation of Consultation for the Kane County Water Conservancy District's Cove Reservoir Project— Direct/Indirect/Visual Areas of Potential Effect

Dear Ms. Chapoose,

The NRCS is continuing Section 106 consultation for the proposed Kane County Water Conservancy District's Cove East Fork Virgin River Plan-Environmental Impact Statement (aka Cove Reservoir Project), in Kane County, Utah. Included in this submission are a literature review cultural resources memo titled *Kane County Water Conservancy District's Cove Reservoir Project—Cultural Resources Review Memo, Indirect/Visual Areas of Potential Effect (APEs)*. The United States Department of Agriculture's Natural Resources Conservation Service (NRCS), with the and Kane County Water Conservancy District (KCWCD) are proposing to construct the new Cove Reservoir within the existing Glendale, Mt. Carmel, and Orderville irrigation systems. This proposed reservoir would be located immediately southwest of Orderville, Utah, off Cove Road. Additional improvements would include the construction of approximately 1.5 miles of new pipeline, the Glendale hydroelectric power plant, and 0.2 mile of new power line and 0.7 acre of utility corridor along U.S. Highway 89 (US-89) and Cove Road; these improvements would be located west of US-89 and the East Fork of the Virgin River in Glendale, Utah. The Project also proposes the potential use of three previously disturbed borrow pits—Lambs Pit, Tait Pit, and Esplin Pit—for Project-related construction needs. These proposed actions constitute an undertaking under Section 106.

The NRCS is serving as the lead federal agency pursuant to 36 CFR 800.2. The Bureau of Land Management-Kanab Field Office (BLM), U.S. Army Corps of Engineers, Sacramento District (Corps), Environmental Protection Agency (EPA), National Park Service (NPS), and Utah Trust Land Administration (TLA) have been identified as cooperating agencies. The NRCS shall act on behalf of all agencies in fulfilling our collective responsibilities under Section 106, including delineation of the APE, identification of historic properties, and finding of effect. The NRCS will inform all cooperating agencies of Section 106 consultation. This consultation will also cover TLA's responsibilities under Utah Annotated Code Section 9-8-404.

NRCS initially consulted with your office in letters sent January 9, 2020 (U18TN0844), and again on January 23, 2023 (U21TN0840). Concurrence on site eligibility and a determination of ***adverse effect to historic properties*** for the undertaking was received on January 17, 2020, and February 6, 2023, respectively (Case Nos. 20-0121 and 23-0280). Additional consultation occurred for an expansion of the APE for a borrow source in a letter dated May 20, 2024 (U23TN0682). Concurrence was received on May 20, 2024 (Case No. 24-1261). Following these consultations, the NRCS has revised the Area of Potential Effects (APE) to include the Direct (Physical), Visual, and Indirect APEs.

USDA is an equal opportunity provider, employer, and lender.

State Office Natural Resources Conservation Service

Salt Lake City, Utah 84138
Phone: 801-524-4550

Area of Potential Effects (APE) (36 CFR 800.4)

Table 1 summarizes the Direct, Visual, and Indirect APEs.

TABLE 1
TOTAL Area of Potential Effects (APE)

Area of Potential Effect	BLM	State	Private	Total
Indirect APE Acreage (Inundation Areas)	17.05	0.51	990.41	**1,007.97**
Visual APE Acreage (1 Mile Buffer of Cove Reservoir and Facilities)	245.00	1,698.01	3,009.28	**4,952.29**
Direct (Physical) APE Acreage (Cove Reservoir, Pipes, Canals, Esplin Pit, Tait Pit, Lamb's Pit)	0.23	70.33	641.9	**712.46**

- **Direct (Physical) APE**: Includes all potential physical ground disturbance, including construction, staging, access roads, borrow sources, and necessary buffers. It has been refined to a total of 712.46 acres.
- **Visual APE**: A radius of 1 mile around the periphery of the proposed Cove Reservoir was evaluated for potential visual resources that could be impacted by the current construction of the reservoir. GIS viewshed analysis was used to refine the final boundaries of the Visual APE, and areas without potential visibility of the project were removed from the Visual APE.
- **Indirect APE:** Includes the breach inundation zones (Sunny-Day and Rainy-Day) in the unlikely event of a dam breach.

Identification of Historic Properties (36 CFR 800.4)

To identify historic properties within the APEs, a literature review was completed by Eocene Environmental. Personnel meet or exceed the Secretary of the Interior Standards in Archeology. The literature review identified 26 cultural resources, 14 of which are eligible for the National Register of Historic Place (NRHP), and one unevaluated, but treated as eligible, within the partially overlapping Direct, Indirect, and Visual APEs. Of the 15 historic properties, only one historic property 42KA7537 (prehistoric cave and artifact scatter) meets the site type criteria for inclusion in the visual impact assessment and therefore do not require a formal visual effects assessment. Site 42KA7537 is only located in the Direct APE and will be avoided (see Case No. 24-1261).

Within the overlapping APEs, there are nine historic buildings/structures of which five are eligible for the NRHP, two are undetermined (treated as eligible), one has been demolished, and the final is ineligible/non-contributing. Within the Visual APE there are three eligible buildings/structures (Property ID Nos., 32819, 50442, and 33219). These historic properties are in Orderville, and the proposed Cove Reservoir would be obstructed from view by means of several ridges southwest of Gardner Hollow.

Within the Indirect APE breach inundation zone, there are three historic properties: Mt. Carmel School and Church (Property ID No. 37252); Dixon, Maynard, House and Studio (Property ID No. 40479); and Steven's Barn

State Office Natural Resources Conservation Service
125 South State Street, Room 6416
Salt Lake City, Utah 84138
Phone: 801-524-4550

(Property ID No. 31786). Steven's Barn (Property ID NO. 31786) has likely been demolished. Due to distance, elevation, and the proposed reservoir safety features, these historic properties are unlikely to be adversely affected by the highly improbable failure of the proposed Cove Reservoir dam.

Finding of Effect (36 CFR 800.5)

The implementation of the undertaking will not alter the character-defining characteristics of the aforementioned historic properties that allow them to convey their significance since visual component is not the character-defining feature that makes the sites eligible. Therefore, the NRCS finding of effect for the Visual and Indirect APEs is No Adverse Effect. This results in no change to the finding of effect for the entirety of the undertaking, where the NRCS retains our previous determination of ***Adverse Effect to Historic Properties*** (Case No. 20-0121).

In an electronical transmittal on March 28, 2024, the NRCS notified the Advisory Council on Historic Preservation (Council) of the adverse effect determination by providing documentation specified in 36 CFR 800.11(e). The Council declined to participate in consultation in a letter dated April 20, 2024. Per 36 CFR 800.6, the NRCS is continuing consultation with your office, the Sponsors, agencies, applicable Native American tribes, and other consulting parties, to develop mitigation stipulations that will be executed in a Memorandum of Agreement. As the lead federal agency, the NRCS is informing the BLM, Corps, NPS, TLA, and EPA of ongoing Section 106 consultations. Per 36 CFR 800.4-800.5, the NRCS requests concurrence for the delineation of the APEs, identification of historic properties, and finding of effect. If you have any questions, comments, or concerns, please contact Tara S. Hoffmann, Water and Cultural Resources Specialist, at (385)-258-1266 at your convenience.

Sincerely,

Emily Fife

Reference: Continuation of Consultation for the Kane County Water Conservancy District's Cove Reservoir Project— Direct/Indirect/Visual Areas of Potential Effect

Dear Ms. Thompson,

The NRCS is continuing Section 106 consultation for the proposed Kane County Water Conservancy District's Cove East Fork Virgin River Plan-Environmental Impact Statement (aka Cove Reservoir Project), in Kane County, Utah. Included in this submission are a literature review cultural resources memo titled *Kane County Water Conservancy District's Cove Reservoir Project—Cultural Resources Review Memo, Indirect/Visual Areas of Potential Effect (APEs)*. The United States Department of Agriculture's Natural Resources Conservation Service (NRCS), with the and Kane County Water Conservancy District (KCWCD) are proposing to construct the new Cove Reservoir within the existing Glendale, Mt. Carmel, and Orderville irrigation systems. This proposed reservoir would be located immediately southwest of Orderville, Utah, off Cove Road. Additional improvements would include the construction of approximately 1.5 miles of new pipeline, the Glendale hydroelectric power plant, and 0.2 mile of new power line and 0.7 acre of utility corridor along U.S. Highway 89 (US-89) and Cove Road; these improvements would be located west of US-89 and the East Fork of the Virgin River in Glendale, Utah. The Project also proposes the potential use of three previously disturbed borrow pits—Lambs Pit, Tait Pit, and Esplin Pit—for Project-related construction needs. These proposed actions constitute an undertaking under Section 106.

The NRCS is serving as the lead federal agency pursuant to 36 CFR 800.2. The Bureau of Land Management-Kanab Field Office (BLM), U.S. Army Corps of Engineers, Sacramento District (Corps), Environmental Protection Agency (EPA), National Park Service (NPS), and Utah Trust Land Administration (TLA) have been identified as cooperating agencies. The NRCS shall act on behalf of all agencies in fulfilling our collective responsibilities under Section 106, including delineation of the APE, identification of historic properties, and finding of effect. The NRCS will inform all cooperating agencies of Section 106 consultation. This consultation will also cover TLA's responsibilities under Utah Annotated Code Section 9-8-404.

NRCS initially consulted with your office in letters sent January 9, 2020 (U18TN0844), and again on January 23, 2023 (U21TN0840). Concurrence on site eligibility and a determination of ***adverse effect to historic properties*** for the undertaking was received on January 17, 2020, and February 6, 2023, respectively (Case Nos. 20-0121 and 23-0280). Additional consultation occurred for an expansion of the APE for a borrow source in a letter dated May 20, 2024 (U23TN0682). Concurrence was received on May 20, 2024 (Case No. 24-1261). Following these consultations, the NRCS has revised the Area of Potential Effects (APE) to include the Direct (Physical), Visual, and Indirect APEs.

USDA is an equal opportunity provider, employer, and lender.

Phone: 801-524-4550

Area of Potential Effects (APE) (36 CFR 800.4)

Table 1 summarizes the Direct, Visual, and Indirect APEs.

TABLE 1
TOTAL Area of Potential Effects (APE)

Area of Potential Effect	BLM	State	Private	Total
Indirect APE Acreage (Inundation Areas)	17.05	0.51	990.41	**1,007.97**
Visual APE Acreage (1 Mile Buffer of Cove Reservoir and Facilities)	245.00	1,698.01	3,009.28	**4,952.29**
Direct (Physical) APE Acreage (Cove Reservoir, Pipes, Canals, Esplin Pit, Tait Pit, Lamb's Pit)	0.23	70.33	641.9	**712.46**

- **Direct (Physical) APE**: Includes all potential physical ground disturbance, including construction, staging, access roads, borrow sources, and necessary buffers. It has been refined to a total of 712.46 acres.
- **Visual APE**: A radius of 1 mile around the periphery of the proposed Cove Reservoir was evaluated for potential visual resources that could be impacted by the current construction of the reservoir. GIS viewshed analysis was used to refine the final boundaries of the Visual APE, and areas without potential visibility of the project were removed from the Visual APE.
- **Indirect APE:** Includes the breach inundation zones (Sunny-Day and Rainy-Day) in the unlikely event of a dam breach.

Identification of Historic Properties (36 CFR 800.4)

To identify historic properties within the APEs, a literature review was completed by Eocene Environmental. Personnel meet or exceed the Secretary of the Interior Standards in Archeology. The literature review identified 26 cultural resources, 14 of which are eligible for the National Register of Historic Place (NRHP), and one unevaluated, but treated as eligible, within the partially overlapping Direct, Indirect, and Visual APEs. Of the 15 historic properties, only one historic property 42KA7537 (prehistoric cave and artifact scatter) meets the site type criteria for inclusion in the visual impact assessment and therefore do not require a formal visual effects assessment. Site 42KA7537 is only located in the Direct APE and will be avoided (see Case No. 24-1261).

Within the overlapping APEs, there are nine historic buildings/structures of which five are eligible for the NRHP, two are undetermined (treated as eligible), one has been demolished, and the final is ineligible/non-contributing. Within the Visual APE there are three eligible buildings/structures (Property ID Nos., 32819, 50442, and 33219). These historic properties are in Orderville, and the proposed Cove Reservoir would be obstructed from view by means of several ridges southwest of Gardner Hollow.

Within the Indirect APE breach inundation zone, there are three historic properties: Mt. Carmel School and Church (Property ID No. 37252); Dixon, Maynard, House and Studio (Property ID No. 40479); and Steven's Barn

State Office Natural Resources Conservation Service
125 South State Street, Room 6416
Salt Lake City, Utah 84138
Phone: 801-524-4550

(Property ID No. 31786). Steven's Barn (Property ID NO. 31786) has likely been demolished. Due to distance, elevation, and the proposed reservoir safety features, these historic properties are unlikely to be adversely affected by the highly improbable failure of the proposed Cove Reservoir dam.

Finding of Effect (36 CFR 800.5)

The implementation of the undertaking will not alter the character-defining characteristics of the aforementioned historic properties that allow them to convey their significance since visual component is not the character-defining feature that makes the sites eligible. Therefore, the NRCS finding of effect for the Visual and Indirect APEs is No Adverse Effect. This results in no change to the finding of effect for the entirety of the undertaking, where the NRCS retains our previous determination of ***Adverse Effect to Historic Properties*** (Case No. 20-0121).

In an electronical transmittal on March 28, 2024, the NRCS notified the Advisory Council on Historic Preservation (Council) of the adverse effect determination by providing documentation specified in 36 CFR 800.11(e). The Council declined to participate in consultation in a letter dated April 20, 2024. Per 36 CFR 800.6, the NRCS is continuing consultation with your office, the Sponsors, agencies, applicable Native American tribes, and other consulting parties, to develop mitigation stipulations that will be executed in a Memorandum of Agreement. As the lead federal agency, the NRCS is informing the BLM, Corps, NPS, TLA, and EPA of ongoing Section 106 consultations. Per 36 CFR 800.4-800.5, the NRCS requests concurrence for the delineation of the APEs, identification of historic properties, and finding of effect. If you have any questions, comments, or concerns, please contact Tara S. Hoffmann, Water and Cultural Resources Specialist, at (385)-258-1266 at your convenience.

Sincerely,

Emily Fife

Reference: Continuation of Consultation for the Kane County Water Conservancy District's Cove Reservoir Project— Direct/Indirect/Visual Areas of Potential Effect

Dear Ms. Messier,

The NRCS is continuing Section 106 consultation for the proposed Kane County Water Conservancy District's Cove East Fork Virgin River Plan-Environmental Impact Statement (aka Cove Reservoir Project), in Kane County, Utah. Included in this submission are a literature review cultural resources memo titled *Kane County Water Conservancy District's Cove Reservoir Project—Cultural Resources Review Memo, Indirect/Visual Areas of Potential Effect (APEs)*. The United States Department of Agriculture's Natural Resources Conservation Service (NRCS), with the and Kane County Water Conservancy District (KCWCD) are proposing to construct the new Cove Reservoir within the existing Glendale, Mt. Carmel, and Orderville irrigation systems. This proposed reservoir would be located immediately southwest of Orderville, Utah, off Cove Road. Additional improvements would include the construction of approximately 1.5 miles of new pipeline, the Glendale hydroelectric power plant, and 0.2 mile of new power line and 0.7 acre of utility corridor along U.S. Highway 89 (US-89) and Cove Road; these improvements would be located west of US-89 and the East Fork of the Virgin River in Glendale, Utah. The Project also proposes the potential use of three previously disturbed borrow pits—Lambs Pit, Tait Pit, and Esplin Pit—for Project-related construction needs. These proposed actions constitute an undertaking under Section 106.

The NRCS is serving as the lead federal agency pursuant to 36 CFR 800.2. The Bureau of Land Management-Kanab Field Office (BLM), U.S. Army Corps of Engineers, Sacramento District (Corps), Environmental Protection Agency (EPA), National Park Service (NPS), and Utah Trust Land Administration (TLA) have been identified as cooperating agencies. The NRCS shall act on behalf of all agencies in fulfilling our collective responsibilities under Section 106, including delineation of the APE, identification of historic properties, and finding of effect. The NRCS will inform all cooperating agencies of Section 106 consultation. This consultation will also cover TLA's responsibilities under Utah Annotated Code Section 9-8-404.

NRCS initially consulted with your office in letters sent January 9, 2020 (U18TN0844), and again on January 23, 2023 (U21TN0840). Concurrence on site eligibility and a determination of ***adverse effect to historic properties*** for the undertaking was received on January 17, 2020, and February 6, 2023, respectively (Case Nos. 20-0121 and 23-0280). Additional consultation occurred for an expansion of the APE for a borrow source in a letter dated May 20, 2024 (U23TN0682). Concurrence was received on May 20, 2024 (Case No. 24-1261). Following these consultations, the NRCS has revised the Area of Potential Effects (APE) to include the Direct (Physical), Visual, and Indirect APEs.

USDA is an equal opportunity provider, employer, and lender.

State Office Natural Resources Conservation Service

Salt Lake City, Utah 84138
Phone: 801-524-4550

Area of Potential Effects (APE) (36 CFR 800.4)

Table 1 summarizes the Direct, Visual, and Indirect APEs.

TABLE 1
TOTAL Area of Potential Effects (APE)

Area of Potential Effect	BLM	State	Private	Total
Indirect APE Acreage (Inundation Areas)	17.05	0.51	990.41	**1,007.97**
Visual APE Acreage (1 Mile Buffer of Cove Reservoir and Facilities)	245.00	1,698.01	3,009.28	**4,952.29**
Direct (Physical) APE Acreage (Cove Reservoir, Pipes, Canals, Esplin Pit, Tait Pit, Lamb's Pit)	0.23	70.33	641.9	**712.46**

- **Direct (Physical) APE**: Includes all potential physical ground disturbance, including construction, staging, access roads, borrow sources, and necessary buffers. It has been refined to a total of 712.46 acres.
- **Visual APE**: A radius of 1 mile around the periphery of the proposed Cove Reservoir was evaluated for potential visual resources that could be impacted by the current construction of the reservoir. GIS viewshed analysis was used to refine the final boundaries of the Visual APE, and areas without potential visibility of the project were removed from the Visual APE.
- **Indirect APE:** Includes the breach inundation zones (Sunny-Day and Rainy-Day) in the unlikely event of a dam breach.

Identification of Historic Properties (36 CFR 800.4)

To identify historic properties within the APEs, a literature review was completed by Eocene Environmental. Personnel meet or exceed the Secretary of the Interior Standards in Archeology. The literature review identified 26 cultural resources, 14 of which are eligible for the National Register of Historic Place (NRHP), and one unevaluated, but treated as eligible, within the partially overlapping Direct, Indirect, and Visual APEs. Of the 15 historic properties, only one historic property 42KA7537 (prehistoric cave and artifact scatter) meets the site type criteria for inclusion in the visual impact assessment and therefore do not require a formal visual effects assessment. Site 42KA7537 is only located in the Direct APE and will be avoided (see Case No. 24-1261).

Within the overlapping APEs, there are nine historic buildings/structures of which five are eligible for the NRHP, two are undetermined (treated as eligible), one has been demolished, and the final is ineligible/non-contributing. Within the Visual APE there are three eligible buildings/structures (Property ID Nos., 32819, 50442, and 33219). These historic properties are in Orderville, and the proposed Cove Reservoir would be obstructed from view by means of several ridges southwest of Gardner Hollow.

Within the Indirect APE breach inundation zone, there are three historic properties: Mt. Carmel School and Church (Property ID No. 37252); Dixon, Maynard, House and Studio (Property ID No. 40479); and Steven's Barn

State Office Natural Resources Conservation Service
125 South State Street, Room 6416
Salt Lake City, Utah 84138
Phone: 801-524-4550

(Property ID No. 31786). Steven's Barn (Property ID NO. 31786) has likely been demolished. Due to distance, elevation, and the proposed reservoir safety features, these historic properties are unlikely to be adversely affected by the highly improbable failure of the proposed Cove Reservoir dam.

Finding of Effect (36 CFR 800.5)

The implementation of the undertaking will not alter the character-defining characteristics of the aforementioned historic properties that allow them to convey their significance since visual component is not the character-defining feature that makes the sites eligible. Therefore, the NRCS finding of effect for the Visual and Indirect APEs is No Adverse Effect. This results in no change to the finding of effect for the entirety of the undertaking, where the NRCS retains our previous determination of ***Adverse Effect to Historic Properties*** (Case No. 20-0121).

In an electronical transmittal on March 28, 2024, the NRCS notified the Advisory Council on Historic Preservation (Council) of the adverse effect determination by providing documentation specified in 36 CFR 800.11(e). The Council declined to participate in consultation in a letter dated April 20, 2024. Per 36 CFR 800.6, the NRCS is continuing consultation with your office, the Sponsors, agencies, applicable Native American tribes, and other consulting parties, to develop mitigation stipulations that will be executed in a Memorandum of Agreement. As the lead federal agency, the NRCS is informing the BLM, Corps, NPS, TLA, and EPA of ongoing Section 106 consultations. Per 36 CFR 800.4-800.5, the NRCS requests concurrence for the delineation of the APEs, identification of historic properties, and finding of effect. If you have any questions, comments, or concerns, please contact Tara S. Hoffmann, Water and Cultural Resources Specialist, at (385)-258-1266 at your convenience.

Sincerely,

Emily Fife

Reference: Continuation of Consultation for the Kane County Water Conservancy District's Cove Reservoir Project— Direct/Indirect/Visual Areas of Potential Effect

Dear Chairman Heart,

The NRCS is continuing Section 106 consultation for the proposed Kane County Water Conservancy District's Cove East Fork Virgin River Plan-Environmental Impact Statement (aka Cove Reservoir Project), in Kane County, Utah. Included in this submission are a literature review cultural resources memo titled *Kane County Water Conservancy District's Cove Reservoir Project—Cultural Resources Review Memo, Indirect/Visual Areas of Potential Effect (APEs)*. The United States Department of Agriculture's Natural Resources Conservation Service (NRCS), with the and Kane County Water Conservancy District (KCWCD) are proposing to construct the new Cove Reservoir within the existing Glendale, Mt. Carmel, and Orderville irrigation systems. This proposed reservoir would be located immediately southwest of Orderville, Utah, off Cove Road. Additional improvements would include the construction of approximately 1.5 miles of new pipeline, the Glendale hydroelectric power plant, and 0.2 mile of new power line and 0.7 acre of utility corridor along U.S. Highway 89 (US-89) and Cove Road; these improvements would be located west of US-89 and the East Fork of the Virgin River in Glendale, Utah. The Project also proposes the potential use of three previously disturbed borrow pits—Lambs Pit, Tait Pit, and Esplin Pit—for Project-related construction needs. These proposed actions constitute an undertaking under Section 106.

The NRCS is serving as the lead federal agency pursuant to 36 CFR 800.2. The Bureau of Land Management-Kanab Field Office (BLM), U.S. Army Corps of Engineers, Sacramento District (Corps), Environmental Protection Agency (EPA), National Park Service (NPS), and Utah Trust Land Administration (TLA) have been identified as cooperating agencies. The NRCS shall act on behalf of all agencies in fulfilling our collective responsibilities under Section 106, including delineation of the APE, identification of historic properties, and finding of effect. The NRCS will inform all cooperating agencies of Section 106 consultation. This consultation will also cover TLA's responsibilities under Utah Annotated Code Section 9-8-404.

NRCS initially consulted with your office in letters sent January 9, 2020 (U18TN0844), and again on January 23, 2023 (U21TN0840). Concurrence on site eligibility and a determination of ***adverse effect to historic properties*** for the undertaking was received on January 17, 2020, and February 6, 2023, respectively (Case Nos. 20-0121 and 23-0280). Additional consultation occurred for an expansion of the APE for a borrow source in a letter dated May 20, 2024 (U23TN0682). Concurrence was received on May 20, 2024 (Case No. 24-1261). Following these consultations, the NRCS has revised the Area of Potential Effects (APE) to include the Direct (Physical), Visual, and Indirect APEs.

USDA is an equal opportunity provider, employer, and lender.

State Office Natural Resources Conservation Service

Area of Potential Effects (APE) (36 CFR 800.4)

Table 1 summarizes the Direct, Visual, and Indirect APEs.

TABLE 1
TOTAL Area of Potential Effects (APE)

Area of Potential Effect	BLM	State	Private	Total
Indirect APE Acreage (Inundation Areas)	17.05	0.51	990.41	**1,007.97**
Visual APE Acreage (1 Mile Buffer of Cove Reservoir and Facilities)	245.00	1,698.01	3,009.28	**4,952.29**
Direct (Physical) APE Acreage (Cove Reservoir, Pipes, Canals, Esplin Pit, Tait Pit, Lamb's Pit)	0.23	70.33	641.9	**712.46**

- **Direct (Physical) APE**: Includes all potential physical ground disturbance, including construction, staging, access roads, borrow sources, and necessary buffers. It has been refined to a total of 712.46 acres.
- **Visual APE**: A radius of 1 mile around the periphery of the proposed Cove Reservoir was evaluated for potential visual resources that could be impacted by the current construction of the reservoir. GIS viewshed analysis was used to refine the final boundaries of the Visual APE, and areas without potential visibility of the project were removed from the Visual APE.
- **Indirect APE:** Includes the breach inundation zones (Sunny-Day and Rainy-Day) in the unlikely event of a dam breach.

Identification of Historic Properties (36 CFR 800.4)

To identify historic properties within the APEs, a literature review was completed by Eocene Environmental. Personnel meet or exceed the Secretary of the Interior Standards in Archeology. The literature review identified 26 cultural resources, 14 of which are eligible for the National Register of Historic Place (NRHP), and one unevaluated, but treated as eligible, within the partially overlapping Direct, Indirect, and Visual APEs. Of the 15 historic properties, only one historic property 42KA7537 (prehistoric cave and artifact scatter) meets the site type criteria for inclusion in the visual impact assessment and therefore do not require a formal visual effects assessment. Site 42KA7537 is only located in the Direct APE and will be avoided (see Case No. 24-1261).

Within the overlapping APEs, there are nine historic buildings/structures of which five are eligible for the NRHP, two are undetermined (treated as eligible), one has been demolished, and the final is ineligible/non-contributing. Within the Visual APE there are three eligible buildings/structures (Property ID Nos., 32819, 50442, and 33219). These historic properties are in Orderville, and the proposed Cove Reservoir would be obstructed from view by means of several ridges southwest of Gardner Hollow.

Within the Indirect APE breach inundation zone, there are three historic properties: Mt. Carmel School and Church (Property ID No. 37252); Dixon, Maynard, House and Studio (Property ID No. 40479); and Steven's Barn

State Office Natural Resources Conservation Service
125 South State Street, Room 6416
Salt Lake City, Utah 84138
Phone: 801-524-4550

(Property ID No. 31786). Steven's Barn (Property ID NO. 31786) has likely been demolished. Due to distance, elevation, and the proposed reservoir safety features, these historic properties are unlikely to be adversely affected by the highly improbable failure of the proposed Cove Reservoir dam.

Finding of Effect (36 CFR 800.5)

The implementation of the undertaking will not alter the character-defining characteristics of the aforementioned historic properties that allow them to convey their significance since visual component is not the character-defining feature that makes the sites eligible. Therefore, the NRCS finding of effect for the Visual and Indirect APEs is No Adverse Effect. This results in no change to the finding of effect for the entirety of the undertaking, where the NRCS retains our previous determination of ***Adverse Effect to Historic Properties*** (Case No. 20-0121).

In an electronical transmittal on March 28, 2024, the NRCS notified the Advisory Council on Historic Preservation (Council) of the adverse effect determination by providing documentation specified in 36 CFR 800.11(e). The Council declined to participate in consultation in a letter dated April 20, 2024. Per 36 CFR 800.6, the NRCS is continuing consultation with your office, the Sponsors, agencies, applicable Native American tribes, and other consulting parties, to develop mitigation stipulations that will be executed in a Memorandum of Agreement. As the lead federal agency, the NRCS is informing the BLM, Corps, NPS, TLA, and EPA of ongoing Section 106 consultations. Per 36 CFR 800.4-800.5, the NRCS requests concurrence for the delineation of the APEs, identification of historic properties, and finding of effect. If you have any questions, comments, or concerns, please contact Tara S. Hoffmann, Water and Cultural Resources Specialist, at (385)-258-1266 at your convenience.

Sincerely,

Emily Fife

Importance:	High

Mr. Daboda,

In follow-up to my voicemail earlier today, I'm also sending an email for more information. NRCS is following up to ensure we have considered the Moapa Band of Paiutes comments on the proposed Cove Reservoir Watershed Plan-EIS under Section 106 of the NHPA. One of the comments was in regards acoustic effect concerns at Site 42KA7537, . In response to those concerns, the NRCS has extended the avoidance area around the site to ensure that acoustic noise from machinery is minimal. We have extended the avoidance area to the north and east, around a natural rock outcropping, which would block noise from extending towards the site. See image below. In addition, the rock quarry will only be used during construction and then reclaimed afterwards, so effects would be temporary. For a little background on this site and previous NRCS involvement,

, back in 2012, the entire area in front and to the north was accidentally quarried for rock, but it was stopped . When the rock quarry area was reclaimed, we placed geotextile fabric down along a cutbank and then backfilled along it to ensure any archaeological deposits remaining were kept undisturbed. The acoustics also remained intact. At that time, I worked closely with Charley Bullets and elders from the Kaibab Paiute, all of whom visited the site. Please let us know if this will quell concerns regarding acoustic effects.

The avoidance area shown below would be fenced off on the eastern boundary, connecting to existing fencelines, so it is clear where construction crews cannot go.

I did want to discuss the recommendation for a tribal monitor. We will take this under consideration, and on Private land NRCS will follow our inadvertent discovery plan, as outline in our Prototype Programmatic Agreement with the Utah SHPO (see attached).

Once construction starts, in approximately two years, we will keep the Moapa Band informed of any findings of cultural significance, following NRCS protocols per our PPA, and of any unforeseen adverse effects.

Thank you again, for your active participation in NRCSs' watershed program Section 106 consultation process.

Best,
Tara

Importance: High

Mr. Daboda,

Thank you for comments on the proposed Cove Reservoir Project. NRCS and KCWCD are currently working on the Draft Watershed Plan and Environmental Impact Statement and if funding for construction is obtained, construction would likely occur in 2027 at the earliest.

For acoustic effects related to Site 42KA7537, is there mitigation/minimization you would recommend? There are no trees to leave as a buffer to sound,
I first visited this site with Charley Bullets and an elder from the Kaibab Paiute many years ago.

I am open to any ideas and can also reach out to Daniel

Bullets to see if he has recommendations.

We are planning to physically avoid the larger area , and heavy equipment would only operate in the borrow source to the east (see attached "Cove_Prev_Surveys" map and screenshot below). We could increase that avoidance area to be located where the outcropping protrudes out

I will also reach out to local tribes to see if they have monitors that could be present during construction.

Let me know your thoughts and feel free to call if you would like to discuss more.

Thanks again,
Tara

---

See attached continuation of formal Section 106 consultation letter with an updated Indirect Area of Potential Effects (APE) memo, identification of historic properties, and finding of no adverse effect, for the proposed Cove-East Fork of the Virgin River Draft Watershed Plan-EIS near Orderville, Utah (Memo attached). We initially consulted with your offices regarding the Indirect APE in emails dated June 4, 2025 (see attached). This updated memo discusses the revised Sunny Day and Rainy Day Breach Inundation Zones in the improbable event of a dam breach. The likelihood of a dam breach occurring is not a reasonably foreseeable effect given the adherence to Utah and NRCS Dam Safety Standards. However, in a good faith effort to consider all potential effects, the NRCS is including the breach inundation zones as part of the Indirect APE, and this analysis has been incorporated into the Draft Plan-EIS.

The updated memo retains our previous finding of No Adverse Effect for the Indirect APE.

Please let us know if you concur with the updated Indirect APE, identification of historic properties and finding of effect within 15 days of receipt. Feel free to reach out with any questions, comments, or concerns.

Bountiful, UT 84010-7744

June 4, 2025

Reference: SPK-2020-00507 Continuation of Consultation for the Kane County Water Conservancy District's Cove Reservoir Project— Direct/Indirect/Visual Areas of Potential Effect

Dear Mr. Jencks:

The NRCS is continuing Section 106 consultation for the proposed Kane County Water Conservancy District's Cove East Fork Virgin River Plan-Environmental Impact Statement (aka Cove Reservoir Project), in Kane County, Utah. Included in this submission are a literature review cultural resources memo titled *Kane County Water Conservancy District's Cove Reservoir Project—Cultural Resources Review Memo*, *Indirect/Visual Areas of Potential Effect (APEs)*. The United States Department of Agriculture's Natural Resources Conservation Service (NRCS), with the and Kane County Water Conservancy District (KCWCD) are proposing to construct the new Cove Reservoir within the existing Glendale, Mt. Carmel, and Orderville irrigation systems. This proposed reservoir would be located immediately southwest of Orderville, Utah, off Cove Road. Additional improvements would include the construction of approximately 1.5 miles of new pipeline, the Glendale hydroelectric power plant, and 0.2 mile of new power line and 0.7 acre of utility corridor along U.S. Highway 89 (US-89) and Cove Road; these improvements would be located west of US-89 and the East Fork of the Virgin River in Glendale, Utah. The Project also proposes the potential use of three previously disturbed borrow pits—Lambs Pit, Tait Pit, and Esplin Pit—for Project-related construction needs. These proposed actions constitute an undertaking under Section 106.

The NRCS is serving as the lead federal agency pursuant to 36 CFR 800.2. The Bureau of Land Management-Kanab Field Office (BLM), U.S. Army Corps of Engineers, Sacramento District (Corps), Environmental Protection Agency (EPA), National Park Service (NPS), and Utah Trust Land Administration (TLA) have been identified as cooperating agencies. The NRCS shall act on behalf of all agencies in fulfilling our collective responsibilities under Section 106, including delineation of the APE, identification of historic properties, and finding of effect. The NRCS will inform all cooperating agencies of Section 106 consultation. This consultation will also cover TLA's responsibilities under Utah Annotated Code Section 9-8-404.

NRCS initially consulted with your office in letters sent January 9, 2020 (U18TN0844), and again on January 23, 2023 (U21TN0840). Concurrence on site eligibility and a determination of ***adverse effect to historic properties*** for the undertaking was received on January 17, 2020, and February 6, 2023, respectively (Case Nos. 20-0121 and 23-0280). Additional consultation occurred for an expansion of the APE for a borrow source in a letter dated May 20, 2024 (U23TN0682). Concurrence was received on May 20, 2024 (Case No. 24-1261). Following these consultations, the NRCS has revised the Area of Potential Effects (APE) to include the Direct (Physical), Visual, and Indirect APEs.

Area of Potential Effects (APE) (36 CFR 800.4)

Table 1 summarizes the Direct, Visual, and Indirect APEs.

TABLE 1 TOTAL Area of Potential Effects (APE)				
Area of Potential Effect	**BLM**	**State**	**Private**	**Total**
Indirect APE Acreage (Inundation Areas)	17.05	0.51	990.41	**1,007.97**
Visual APE Acreage (1 Mile Buffer of Cove Reservoir and Facilities)	245.00	1,698.01	3,009.28	**4,952.29**
Direct (Physical) APE Acreage (Cove Reservoir, Pipes, Canals, Esplin Pit, Tait Pit, Lamb's Pit)	0.23	70.33	641.9	**712.46**

- **Direct (Physical) APE**: Includes all potential physical ground disturbance, including construction, staging, access roads, borrow sources, and necessary buffers. It has been refined to a total of 712.46 acres.
- **Visual APE**: A radius of 1 mile around the periphery of the proposed Cove Reservoir was evaluated for potential visual resources that could be impacted by the current construction of the reservoir. GIS viewshed analysis was used to refine the final boundaries of the Visual APE, and areas without potential visibility of the project were removed from the Visual APE.
- **Indirect APE:** Includes the breach inundation zones (Sunny-Day and Rainy-Day) in the unlikely event of a dam breach.

Identification of Historic Properties (36 CFR 800.4)

To identify historic properties within the APEs, a literature review was completed by Eocene Environmental. Personnel meet or exceed the Secretary of the Interior Standards in Archeology. The literature review identified 26 cultural resources, 14 of which are eligible for the National Register of Historic Place (NRHP), and one unevaluated, but treated as eligible, within the partially overlapping Direct, Indirect, and Visual APEs. Of the 15 historic properties, only one historic property 42KA7537 (prehistoric cave and artifact scatter) meets the site type criteria for inclusion in the visual impact assessment and therefore do not require a formal visual effects assessment. Site 42KA7537 is only located in the Direct APE and will be avoided (see Case No. 24-1261).

Within the overlapping APEs, there are nine historic buildings/structures of which five are eligible for the NRHP, two are undetermined (treated as eligible), one has been demolished, and the final is ineligible/non-contributing. Within the Visual APE there are three eligible buildings/structures (Property ID Nos., 32819, 50442, and 33219). These historic properties are in Orderville, and the proposed Cove Reservoir would be obstructed from view by means of several ridges southwest of Gardner Hollow.

Within the Indirect APE breach inundation zone, there are three historic properties: Mt. Carmel School and Church (Property ID No. 37252); Dixon, Maynard, House and Studio (Property ID No. 40479); and Steven's Barn

(Property ID No. 31786). Steven's Barn (Property ID NO. 31786) has likely been demolished. Due to distance, elevation, and the proposed reservoir safety features, these historic properties are unlikely to be adversely affected by the highly improbable failure of the proposed Cove Reservoir dam.

Finding of Effect (36 CFR 800.5)

The implementation of the undertaking will not alter the character-defining characteristics of the aforementioned historic properties that allow them to convey their significance since visual component is not the character-defining feature that makes the sites eligible. Therefore, the NRCS finding of effect for the Visual and Indirect APEs is No Adverse Effect. This results in no change to the finding of effect for the entirety of the undertaking, where the NRCS retains our previous determination of ***Adverse Effect to Historic Properties*** (Case No. 20-0121).

In an electronical transmittal on March 28, 2024, the NRCS notified the Advisory Council on Historic Preservation (Council) of the adverse effect determination by providing documentation specified in 36 CFR 800.11(e). The Council declined to participate in consultation in a letter dated April 20, 2024. Per 36 CFR 800.6, the NRCS is continuing consultation with your office, the Sponsors, agencies, applicable Native American tribes, and other consulting parties, to develop mitigation stipulations that will be executed in a Memorandum of Agreement. As the lead federal agency, the NRCS is informing the BLM, Corps, NPS, TLA, and EPA of ongoing Section 106 consultations. Per 36 CFR 800.4-800.5, the NRCS requests concurrence for the delineation of the APEs, identification of historic properties, and finding of effect. If you have any questions, comments, or concerns, please contact Tara S. Hoffmann, Water and Cultural Resources Specialist, at (385)-258-1266 at your convenience.

Sincerely,

Emily Fife

Reference: Continuation of Consultation for the Kane County Water Conservancy District's Cove Reservoir Project— Direct/Indirect/Visual Areas of Potential Effect

Dear Ms. Hubner:

The NRCS is continuing Section 106 consultation for the proposed Kane County Water Conservancy District's Cove East Fork Virgin River Plan-Environmental Impact Statement (aka Cove Reservoir Project), in Kane County, Utah. Included in this submission are a literature review cultural resources memo titled *Kane County Water Conservancy District's Cove Reservoir Project—Cultural Resources Review Memo, Indirect/Visual Areas of Potential Effect (APEs)*. The United States Department of Agriculture's Natural Resources Conservation Service (NRCS), with the and Kane County Water Conservancy District (KCWCD) are proposing to construct the new Cove Reservoir within the existing Glendale, Mt. Carmel, and Orderville irrigation systems. This proposed reservoir would be located immediately southwest of Orderville, Utah, off Cove Road. Additional improvements would include the construction of approximately 1.5 miles of new pipeline, the Glendale hydroelectric power plant, and 0.2 mile of new power line and 0.7 acre of utility corridor along U.S. Highway 89 (US-89) and Cove Road; these improvements would be located west of US-89 and the East Fork of the Virgin River in Glendale, Utah. The Project also proposes the potential use of three previously disturbed borrow pits—Lambs Pit, Tait Pit, and Esplin Pit—for Project-related construction needs. These proposed actions constitute an undertaking under Section 106.

The NRCS is serving as the lead federal agency pursuant to 36 CFR 800.2. The Bureau of Land Management-Kanab Field Office (BLM), U.S. Army Corps of Engineers, Sacramento District (Corps), Environmental Protection Agency (EPA), National Park Service (NPS), and Utah Trust Land Administration (TLA) have been identified as cooperating agencies. The NRCS shall act on behalf of all agencies in fulfilling our collective responsibilities under Section 106, including delineation of the APE, identification of historic properties, and finding of effect. The NRCS will inform all cooperating agencies of Section 106 consultation. This consultation will also cover TLA's responsibilities under Utah Annotated Code Section 9-8-404.

NRCS initially consulted with your office in letters sent January 9, 2020 (U18TN0844), and again on January 23, 2023 (U21TN0840). Concurrence on site eligibility and a determination of ***adverse effect to historic properties*** for the undertaking was received on January 17, 2020, and February 6, 2023, respectively (Case Nos. 20-0121 and 23-0280). Additional consultation occurred for an expansion of the APE for a borrow source in a letter dated May 20, 2024 (U23TN0682). Concurrence was received on May 20, 2024 (Case No. 24-1261). Following these consultations, the NRCS has revised the Area of Potential Effects (APE) to include the Direct (Physical), Visual, and Indirect APEs.

Area of Potential Effects (APE) (36 CFR 800.4)

Table 1 summarizes the Direct, Visual, and Indirect APEs.

TABLE 1 TOTAL Area of Potential Effects (APE)				
Area of Potential Effect	**BLM**	**State**	**Private**	**Total**
Indirect APE Acreage (Inundation Areas)	17.05	0.51	990.41	**1,007.97**
Visual APE Acreage (1 Mile Buffer of Cove Reservoir and Facilities)	245.00	1,698.01	3,009.28	**4,952.29**
Direct (Physical) APE Acreage (Cove Reservoir, Pipes, Canals, Esplin Pit, Tait Pit, Lamb's Pit)	0.23	70.33	641.9	**712.46**

- **Direct (Physical) APE**: Includes all potential physical ground disturbance, including construction, staging, access roads, borrow sources, and necessary buffers. It has been refined to a total of 712.46 acres.
- **Visual APE**: A radius of 1 mile around the periphery of the proposed Cove Reservoir was evaluated for potential visual resources that could be impacted by the current construction of the reservoir. GIS viewshed analysis was used to refine the final boundaries of the Visual APE, and areas without potential visibility of the project were removed from the Visual APE.
- **Indirect APE:** Includes the breach inundation zones (Sunny-Day and Rainy-Day) in the unlikely event of a dam breach.

Identification of Historic Properties (36 CFR 800.4)

To identify historic properties within the APEs, a literature review was completed by Eocene Environmental. Personnel meet or exceed the Secretary of the Interior Standards in Archeology. The literature review identified 26 cultural resources, 14 of which are eligible for the National Register of Historic Place (NRHP), and one unevaluated, but treated as eligible, within the partially overlapping Direct, Indirect, and Visual APEs. Of the 15 historic properties, only one historic property 42KA7537 (prehistoric cave and artifact scatter) meets the site type criteria for inclusion in the visual impact assessment and therefore do not require a formal visual effects assessment. Site 42KA7537 is only located in the Direct APE and will be avoided (see Case No. 24-1261).

Within the overlapping APEs, there are nine historic buildings/structures of which five are eligible for the NRHP, two are undetermined (treated as eligible), one has been demolished, and the final is ineligible/non-contributing. Within the Visual APE there are three eligible buildings/structures (Property ID Nos., 32819, 50442, and 33219). These historic properties are in Orderville, and the proposed Cove Reservoir would be obstructed from view by means of several ridges southwest of Gardner Hollow.

Within the Indirect APE breach inundation zone, there are three historic properties: Mt. Carmel School and Church (Property ID No. 37252); Dixon, Maynard, House and Studio (Property ID No. 40479); and Steven's Barn

(Property ID No. 31786). Steven's Barn (Property ID NO. 31786) has likely been demolished. Due to distance, elevation, and the proposed reservoir safety features, these historic properties are unlikely to be adversely affected by the highly improbable failure of the proposed Cove Reservoir dam.

Finding of Effect (36 CFR 800.5)

The implementation of the undertaking will not alter the character-defining characteristics of the aforementioned historic properties that allow them to convey their significance since visual component is not the character-defining feature that makes the sites eligible. Therefore, the NRCS finding of effect for the Visual and Indirect APEs is No Adverse Effect. This results in no change to the finding of effect for the entirety of the undertaking, where the NRCS retains our previous determination of ***Adverse Effect to Historic Properties*** (Case No. 20-0121).

In an electronical transmittal on March 28, 2024, the NRCS notified the Advisory Council on Historic Preservation (Council) of the adverse effect determination by providing documentation specified in 36 CFR 800.11(e). The Council declined to participate in consultation in a letter dated April 20, 2024. Per 36 CFR 800.6, the NRCS is continuing consultation with your office, the Sponsors, agencies, applicable Native American tribes, and other consulting parties, to develop mitigation stipulations that will be executed in a Memorandum of Agreement. As the lead federal agency, the NRCS is informing the BLM, Corps, NPS, TLA, and EPA of ongoing Section 106 consultations. Per 36 CFR 800.4-800.5, the NRCS requests concurrence for the delineation of the APEs, identification of historic properties, and finding of effect. If you have any questions, comments, or concerns, please contact Tara S. Hoffmann, Water and Cultural Resources Specialist, at (385)-258-1266 at your convenience.

Sincerely,

Emily Fife

Reference: Continuation of Consultation for the Kane County Water Conservancy District's Cove Reservoir Project— Direct/Indirect/Visual Areas of Potential Effect

Dear Ms. Mackay:

The NRCS is continuing Section 106 consultation for the proposed Kane County Water Conservancy District's Cove East Fork Virgin River Plan-Environmental Impact Statement (aka Cove Reservoir Project), in Kane County, Utah. Included in this submission are a literature review cultural resources memo titled *Kane County Water Conservancy District's Cove Reservoir Project—Cultural Resources Review Memo, Indirect/Visual Areas of Potential Effect (APEs).* The United States Department of Agriculture's Natural Resources Conservation Service (NRCS), with the and Kane County Water Conservancy District (KCWCD) are proposing to construct the new Cove Reservoir within the existing Glendale, Mt. Carmel, and Orderville irrigation systems. This proposed reservoir would be located immediately southwest of Orderville, Utah, off Cove Road. Additional improvements would include the construction of approximately 1.5 miles of new pipeline, the Glendale hydroelectric power plant, and 0.2 mile of new power line and 0.7 acre of utility corridor along U.S. Highway 89 (US-89) and Cove Road; these improvements would be located west of US-89 and the East Fork of the Virgin River in Glendale, Utah. The Project also proposes the potential use of three previously disturbed borrow pits—Lambs Pit, Tait Pit, and Esplin Pit—for Project-related construction needs. These proposed actions constitute an undertaking under Section 106.

The NRCS is serving as the lead federal agency pursuant to 36 CFR 800.2. The Bureau of Land Management-Kanab Field Office (BLM), U.S. Army Corps of Engineers, Sacramento District (Corps), Environmental Protection Agency (EPA), National Park Service (NPS), and Utah Trust Land Administration (TLA) have been identified as cooperating agencies. The NRCS shall act on behalf of all agencies in fulfilling our collective responsibilities under Section 106, including delineation of the APE, identification of historic properties, and finding of effect. The NRCS will inform all cooperating agencies of Section 106 consultation. This consultation will also cover TLA's responsibilities under Utah Annotated Code Section 9-8-404.

NRCS initially consulted with your office in letters sent January 9, 2020 (U18TN0844), and again on January 23, 2023 (U21TN0840). Concurrence on site eligibility and a determination of ***adverse effect to historic properties*** for the undertaking was received on January 17, 2020, and February 6, 2023, respectively (Case Nos. 20-0121 and 23-0280). Additional consultation occurred for an expansion of the APE for a borrow source in a letter dated May 20, 2024 (U23TN0682). Concurrence was received on May 20, 2024 (Case No. 24-1261). Following these consultations, the NRCS has revised the Area of Potential Effects (APE) to include the Direct (Physical), Visual, and Indirect APEs.

Area of Potential Effects (APE) (36 CFR 800.4)

Table 1 summarizes the Direct, Visual, and Indirect APEs.

TABLE 1 TOTAL Area of Potential Effects (APE)				
Area of Potential Effect	**BLM**	**State**	**Private**	**Total**
Indirect APE Acreage (Inundation Areas)	17.05	0.51	990.41	**1,007.97**
Visual APE Acreage (1 Mile Buffer of Cove Reservoir and Facilities)	245.00	1,698.01	3,009.28	**4,952.29**
Direct (Physical) APE Acreage (Cove Reservoir, Pipes, Canals, Esplin Pit, Tait Pit, Lamb's Pit)	0.23	70.33	641.9	**712.46**

- **Direct (Physical) APE**: Includes all potential physical ground disturbance, including construction, staging, access roads, borrow sources, and necessary buffers. It has been refined to a total of 712.46 acres.
- **Visual APE**: A radius of 1 mile around the periphery of the proposed Cove Reservoir was evaluated for potential visual resources that could be impacted by the current construction of the reservoir. GIS viewshed analysis was used to refine the final boundaries of the Visual APE, and areas without potential visibility of the project were removed from the Visual APE.
- **Indirect APE:** Includes the breach inundation zones (Sunny-Day and Rainy-Day) in the unlikely event of a dam breach.

Identification of Historic Properties (36 CFR 800.4)

To identify historic properties within the APEs, a literature review was completed by Eocene Environmental. Personnel meet or exceed the Secretary of the Interior Standards in Archeology. The literature review identified 26 cultural resources, 14 of which are eligible for the National Register of Historic Place (NRHP), and one unevaluated, but treated as eligible, within the partially overlapping Direct, Indirect, and Visual APEs. Of the 15 historic properties, only one historic property 42KA7537 (prehistoric cave and artifact scatter) meets the site type criteria for inclusion in the visual impact assessment and therefore do not require a formal visual effects assessment. Site 42KA7537 is only located in the Direct APE and will be avoided (see Case No. 24-1261).

Within the overlapping APEs, there are nine historic buildings/structures of which five are eligible for the NRHP, two are undetermined (treated as eligible), one has been demolished, and the final is ineligible/non-contributing. Within the Visual APE there are three eligible buildings/structures (Property ID Nos., 32819, 50442, and 33219). These historic properties are in Orderville, and the proposed Cove Reservoir would be obstructed from view by means of several ridges southwest of Gardner Hollow.

Within the Indirect APE breach inundation zone, there are three historic properties: Mt. Carmel School and Church (Property ID No. 37252); Dixon, Maynard, House and Studio (Property ID No. 40479); and Steven's Barn

(Property ID No. 31786). Steven's Barn (Property ID NO. 31786) has likely been demolished. Due to distance, elevation, and the proposed reservoir safety features, these historic properties are unlikely to be adversely affected by the highly improbable failure of the proposed Cove Reservoir dam.

Finding of Effect (36 CFR 800.5)

The implementation of the undertaking will not alter the character-defining characteristics of the aforementioned historic properties that allow them to convey their significance since visual component is not the character-defining feature that makes the sites eligible. Therefore, the NRCS finding of effect for the Visual and Indirect APEs is No Adverse Effect. This results in no change to the finding of effect for the entirety of the undertaking, where the NRCS retains our previous determination of ***Adverse Effect to Historic Properties*** (Case No. 20-0121).

In an electronical transmittal on March 28, 2024, the NRCS notified the Advisory Council on Historic Preservation (Council) of the adverse effect determination by providing documentation specified in 36 CFR 800.11(e). The Council declined to participate in consultation in a letter dated April 20, 2024. Per 36 CFR 800.6, the NRCS is continuing consultation with your office, the Sponsors, agencies, applicable Native American tribes, and other consulting parties, to develop mitigation stipulations that will be executed in a Memorandum of Agreement. As the lead federal agency, the NRCS is informing the BLM, Corps, NPS, TLA, and EPA of ongoing Section 106 consultations. Per 36 CFR 800.4-800.5, the NRCS requests concurrence for the delineation of the APEs, identification of historic properties, and finding of effect. If you have any questions, comments, or concerns, please contact Tara S. Hoffmann, Water and Cultural Resources Specialist, at (385)-258-1266 at your convenience.

Reference: Continuation of Consultation for the Kane County Water Conservancy District's Cove Reservoir Project— Direct/Indirect/Visual Areas of Potential Effect

Dear Dr. Merritt:

The NRCS is continuing Section 106 consultation for the proposed Kane County Water Conservancy District's Cove East Fork Virgin River Plan-Environmental Impact Statement (aka Cove Reservoir Project), in Kane County, Utah. Included in this submission are a literature review cultural resources memo titled *Kane County Water Conservancy District's Cove Reservoir Project—Cultural Resources Review Memo, Indirect/Visual Areas of Potential Effect (APEs)*. The United States Department of Agriculture's Natural Resources Conservation Service (NRCS), with the and Kane County Water Conservancy District (KCWCD) are proposing to construct the new Cove Reservoir within the existing Glendale, Mt. Carmel, and Orderville irrigation systems. This proposed reservoir would be located immediately southwest of Orderville, Utah, off Cove Road. Additional improvements would include the construction of approximately 1.5 miles of new pipeline, the Glendale hydroelectric power plant, and 0.2 mile of new power line and 0.7 acre of utility corridor along U.S. Highway 89 (US-89) and Cove Road; these improvements would be located west of US-89 and the East Fork of the Virgin River in Glendale, Utah. The Project also proposes the potential use of three previously disturbed borrow pits—Lambs Pit, Tait Pit, and Esplin Pit—for Project-related construction needs. These proposed actions constitute an undertaking under Section 106.

The NRCS is serving as the lead federal agency pursuant to 36 CFR 800.2. The Bureau of Land Management-Kanab Field Office (BLM), U.S. Army Corps of Engineers, Sacramento District (Corps), Environmental Protection Agency (EPA), National Park Service (NPS), and Utah Trust Land Administration (TLA) have been identified as cooperating agencies. The NRCS shall act on behalf of all agencies in fulfilling our collective responsibilities under Section 106, including delineation of the APE, identification of historic properties, and finding of effect. The NRCS will inform all cooperating agencies of Section 106 consultation. This consultation will also cover TLA's responsibilities under Utah Annotated Code Section 9-8-404.

NRCS initially consulted with your office in letters sent January 9, 2020 (U18TN0844), and again on January 23, 2023 (U21TN0840). Concurrence on site eligibility and a determination of ***adverse effect to historic properties*** for the undertaking was received on January 17, 2020, and February 6, 2023, respectively (Case Nos. 20-0121 and 23-0280). Additional consultation occurred for an expansion of the APE for a borrow source in a letter dated May 20, 2024 (U23TN0682). Concurrence was received on May 20, 2024 (Case No. 24-1261). Following these consultations, the NRCS has revised the Area of Potential Effects (APE) to include the Direct (Physical), Visual, and Indirect APEs.

Area of Potential Effects (APE) (36 CFR 800.4)

Table 1 summarizes the Direct, Visual, and Indirect APEs.

TABLE 1 TOTAL Area of Potential Effects (APE)				
Area of Potential Effect	**BLM**	**State**	**Private**	**Total**
Indirect APE Acreage (Inundation Areas)	17.05	0.51	990.41	**1,007.97**
Visual APE Acreage (1 Mile Buffer of Cove Reservoir and Facilities)	245.00	1,698.01	3,009.28	**4,952.29**
Direct (Physical) APE Acreage (Cove Reservoir, Pipes, Canals, Esplin Pit, Tait Pit, Lamb's Pit)	0.23	70.33	641.9	**712.46**

- **Direct (Physical) APE**: Includes all potential physical ground disturbance, including construction, staging, access roads, borrow sources, and necessary buffers. It has been refined to a total of 712.46 acres.
- **Visual APE**: A radius of 1 mile around the periphery of the proposed Cove Reservoir was evaluated for potential visual resources that could be impacted by the current construction of the reservoir. GIS viewshed analysis was used to refine the final boundaries of the Visual APE, and areas without potential visibility of the project were removed from the Visual APE.
- **Indirect APE:** Includes the breach inundation zones (Sunny-Day and Rainy-Day) in the unlikely event of a dam breach.

Identification of Historic Properties (36 CFR 800.4)

To identify historic properties within the APEs, a literature review was completed by Eocene Environmental. Personnel meet or exceed the Secretary of the Interior Standards in Archeology. The literature review identified 26 cultural resources, 14 of which are eligible for the National Register of Historic Place (NRHP), and one unevaluated, but treated as eligible, within the partially overlapping Direct, Indirect, and Visual APEs. Of the 15 historic properties, only one historic property 42KA7537 (prehistoric cave and artifact scatter) meets the site type criteria for inclusion in the visual impact assessment and therefore do not require a formal visual effects assessment. Site 42KA7537 is only located in the Direct APE and will be avoided (see Case No. 24-1261).

Within the overlapping APEs, there are nine historic buildings/structures of which five are eligible for the NRHP, two are undetermined (treated as eligible), one has been demolished, and the final is ineligible/non-contributing. Within the Visual APE there are three eligible buildings/structures (Property ID Nos., 32819, 50442, and 33219). These historic properties are in Orderville, and the proposed Cove Reservoir would be obstructed from view by means of several ridges southwest of Gardner Hollow.

Within the Indirect APE breach inundation zone, there are three historic properties: Mt. Carmel School and Church (Property ID No. 37252); Dixon, Maynard, House and Studio (Property ID No. 40479); and Steven's Barn

(Property ID No. 31786). Steven's Barn (Property ID NO. 31786) has likely been demolished. Due to distance, elevation, and the proposed reservoir safety features, these historic properties are unlikely to be adversely affected by the highly improbable failure of the proposed Cove Reservoir dam.

Finding of Effect (36 CFR 800.5)

The implementation of the undertaking will not alter the character-defining characteristics of the aforementioned historic properties that allow them to convey their significance since visual component is not the character-defining feature that makes the sites eligible. Therefore, the NRCS finding of effect for the Visual and Indirect APEs is No Adverse Effect. This results in no change to the finding of effect for the entirety of the undertaking, where the NRCS retains our previous determination of ***Adverse Effect to Historic Properties*** (Case No. 20-0121).

In an electronical transmittal on March 28, 2024, the NRCS notified the Advisory Council on Historic Preservation (Council) of the adverse effect determination by providing documentation specified in 36 CFR 800.11(e). The Council declined to participate in consultation in a letter dated April 20, 2024. Per 36 CFR 800.6, the NRCS is continuing consultation with your office, the Sponsors, agencies, applicable Native American tribes, and other consulting parties, to develop mitigation stipulations that will be executed in a Memorandum of Agreement. As the lead federal agency, the NRCS is informing the BLM, Corps, NPS, TLA, and EPA of ongoing Section 106 consultations. Per 36 CFR 800.4-800.5, the NRCS requests concurrence for the delineation of the APEs, identification of historic properties, and finding of effect. If you have any questions, comments, or concerns, please contact Tara S. Hoffmann, Water and Cultural Resources Specialist, at (385)-258-1266 at your convenience.

Sincerely,

EMILY FIFE

Dear Ms. Curry:

The NRCS is continuing Section 106 consultation for the proposed Kane County Water Conservancy District's Cove East Fork Virgin River Plan-Environmental Impact Statement (aka Cove Reservoir Project), in Kane County, Utah. Included in this submission are a literature review cultural resources memo titled *Kane County Water Conservancy District's Cove Reservoir Project—Cultural Resources Review Memo, Indirect/Visual Areas of Potential Effect (APEs)*. The United States Department of Agriculture's Natural Resources Conservation Service (NRCS), with the and Kane County Water Conservancy District (KCWCD) are proposing to construct the new Cove Reservoir within the existing Glendale, Mt. Carmel, and Orderville irrigation systems. This proposed reservoir would be located immediately southwest of Orderville, Utah, off Cove Road. Additional improvements would include the construction of approximately 1.5 miles of new pipeline, the Glendale hydroelectric power plant, and 0.2 mile of new power line and 0.7 acre of utility corridor along U.S. Highway 89 (US-89) and Cove Road; these improvements would be located west of US-89 and the East Fork of the Virgin River in Glendale, Utah. The Project also proposes the potential use of three previously disturbed borrow pits—Lambs Pit, Tait Pit, and Esplin Pit—for Project-related construction needs. These proposed actions constitute an undertaking under Section 106.

The NRCS is serving as the lead federal agency pursuant to 36 CFR 800.2. The Bureau of Land Management-Kanab Field Office (BLM), U.S. Army Corps of Engineers, Sacramento District (Corps), Environmental Protection Agency (EPA), National Park Service (NPS), and Utah Trust Land Administration (TLA) have been identified as cooperating agencies. The NRCS shall act on behalf of all agencies in fulfilling our collective responsibilities under Section 106, including delineation of the APE, identification of historic properties, and finding of effect. The NRCS will inform all cooperating agencies of Section 106 consultation. This consultation will also cover TLA's responsibilities under Utah Annotated Code Section 9-8-404.

NRCS initially consulted with your office in letters sent January 9, 2020 (U18TN0844), and again on January 23, 2023 (U21TN0840). Concurrence on site eligibility and a determination of ***adverse effect to historic properties*** for the undertaking was received on January 17, 2020, and February 6, 2023, respectively (Case Nos. 20-0121 and 23-0280). Additional consultation occurred for an expansion of the APE for a borrow source in a letter dated May 20, 2024 (U23TN0682). Concurrence was received on May 20, 2024 (Case No. 24-1261). Following these consultations, the NRCS has revised the Area of Potential Effects (APE) to include the Direct (Physical), Visual, and Indirect APEs.

Area of Potential Effects (APE) (36 CFR 800.4)

Table 1 summarizes the Direct, Visual, and Indirect APEs.

TABLE 1 TOTAL Area of Potential Effects (APE)				
Area of Potential Effect	**BLM**	**State**	**Private**	**Total**
Indirect APE Acreage (Inundation Areas)	17.05	0.51	990.41	**1,007.97**
Visual APE Acreage (1 Mile Buffer of Cove Reservoir and Facilities)	245.00	1,698.01	3,009.28	**4,952.29**
Direct (Physical) APE Acreage (Cove Reservoir, Pipes, Canals, Esplin Pit, Tait Pit, Lamb's Pit)	0.23	70.33	641.9	**712.46**

- **Direct (Physical) APE**: Includes all potential physical ground disturbance, including construction, staging, access roads, borrow sources, and necessary buffers. It has been refined to a total of 712.46 acres.
- **Visual APE**: A radius of 1 mile around the periphery of the proposed Cove Reservoir was evaluated for potential visual resources that could be impacted by the current construction of the reservoir. GIS viewshed analysis was used to refine the final boundaries of the Visual APE, and areas without potential visibility of the project were removed from the Visual APE.
- **Indirect APE:** Includes the breach inundation zones (Sunny-Day and Rainy-Day) in the unlikely event of a dam breach.

Identification of Historic Properties (36 CFR 800.4)

To identify historic properties within the APEs, a literature review was completed by Eocene Environmental. Personnel meet or exceed the Secretary of the Interior Standards in Archeology. The literature review identified 26 cultural resources, 14 of which are eligible for the National Register of Historic Place (NRHP), and one unevaluated, but treated as eligible, within the partially overlapping Direct, Indirect, and Visual APEs. Of the 15 historic properties, only one historic property 42KA7537 (prehistoric cave and artifact scatter) meets the site type criteria for inclusion in the visual impact assessment and therefore do not require a formal visual effects assessment. Site 42KA7537 is only located in the Direct APE and will be avoided (see Case No. 24-1261).

Within the overlapping APEs, there are nine historic buildings/structures of which five are eligible for the NRHP, two are undetermined (treated as eligible), one has been demolished, and the final is ineligible/non-contributing. Within the Visual APE there are three eligible buildings/structures (Property ID Nos., 32819, 50442, and 33219). These historic properties are in Orderville, and the proposed Cove Reservoir would be obstructed from view by means of several ridges southwest of Gardner Hollow.

Within the Indirect APE breach inundation zone, there are three historic properties: Mt. Carmel School and Church (Property ID No. 37252); Dixon, Maynard, House and Studio (Property ID No. 40479); and Steven's Barn

(Property ID No. 31786). Steven's Barn (Property ID NO. 31786) has likely been demolished. Due to distance, elevation, and the proposed reservoir safety features, these historic properties are unlikely to be adversely affected by the highly improbable failure of the proposed Cove Reservoir dam.

Finding of Effect (36 CFR 800.5)

The implementation of the undertaking will not alter the character-defining characteristics of the aforementioned historic properties that allow them to convey their significance since visual component is not the character-defining feature that makes the sites eligible. Therefore, the NRCS finding of effect for the Visual and Indirect APEs is No Adverse Effect. This results in no change to the finding of effect for the entirety of the undertaking, where the NRCS retains our previous determination of ***Adverse Effect to Historic Properties*** (Case No. 20-0121).

In an electronical transmittal on March 28, 2024, the NRCS notified the Advisory Council on Historic Preservation (Council) of the adverse effect determination by providing documentation specified in 36 CFR 800.11(e). The Council declined to participate in consultation in a letter dated April 20, 2024. Per 36 CFR 800.6, the NRCS is continuing consultation with your office, the Sponsors, agencies, applicable Native American tribes, and other consulting parties, to develop mitigation stipulations that will be executed in a Memorandum of Agreement. As the lead federal agency, the NRCS is informing the BLM, Corps, NPS, TLA, and EPA of ongoing Section 106 consultations. Per 36 CFR 800.4-800.5, the NRCS requests concurrence for the delineation of the APEs, identification of historic properties, and finding of effect. If you have any questions, comments, or concerns, please contact Tara S. Hoffmann, Water and Cultural Resources Specialist, at (385)-258-1266 at your convenience.

Sincerely,

Emily Fife

Hi Tara,

Thank you for sending over the updated information and memo regarding the Indirect APE and the recent revisions to the breach inundation zones. After reviewing the materials, I wanted to let you know that we do not have a specific action to take regarding Section 106 at this time, and we don't have particular feedback on the APE. Please keep us informed of any further updates or if additional input is needed down the line.

Thanks again for sharing these details and for your continued coordination.

Best regards,

Matt

Subject: [Non-DoD Source] NRCS Cove East Fork Virgin River Draft Plan-EIS, updated Indirect APE Consultation

Matt, Winston, and Brian,

The NRCS is continuing Section 106 consultation for the proposed Cove - East Fork of the Virgin River Draft Watershed Plan-EIS near Orderville, Utah (SPK-2020-00507). As part of the proposed project, the Cove Reservoir and dam would be constructed off channel near Orderville. The likelihood of a dam breach occurring is not a reasonably foreseeable effect given the adherence to Utah and NRCS Dam Safety Standards. However, in a good faith effort to consider all potential effects, the NRCS is including both breach inundation zones as part of the Indirect APE, and this analysis has been incorporated into the Draft Plan-EIS.

During the watershed planning process, the Sunny Day and Rainy-Day Breach Inundation Zones have recently been updated, and as such, NRCS has revised the Indirect APE, and identification of historic properties. See attached Memo. We initially consulted with your offices and 11 federally-recognized tribes regarding the original Indirect APE in emails dated June 4, 2025 (see attached). This updated Memo describes the revised Sunny Day and Rainy-Day Breach Inundation Zones in the improbable event of a dam breach, and the identification of historic properties. All other APEs remain unchanged. I have attached shapefiles of the breach inundation zones.

The NRCS retains our previous finding of No Adverse Effect for the Indirect APE given that the likelihood of a breach is not reasonably foreseeable and the historic properties present within the Indirect APE are far enough in distance from the dam that the depth and velocity of water is within the limits of a current 100-year flood event. Of note, we are also in consultation with Zion National Park regarding the updated Indirect APE.

Please let us know if you concur with the updated Indirect APE, identification of historic properties and finding of effect within 15 days of receipt. Feel free to reach out with any questions, comments, or concerns.

Thanks,
Tara

Hi Tara,

Thanks for following up on our questions so quickly. We like to take you up on the offer of depth and velocity GIS data. That will help us with one of our questions about discharge calculations throughout the East Fork corridor in Zion. Also, could you tell us what data was used to create the base layers in the model? (3DEP, USGS topos, etc.).

Thanks again,
Erin

This email has been received from outside of DOI - Use caution before clicking on links, opening attachments, or responding.

Jeff,

In follow-up to my previous email, both the rainy day and sunny day inundation boundaries are at or below the typical 100-year floodplain boundary, and the likelihood of a dam breach is not a reasonably foresee. I've re-attached the rainy day boundary in case you have issues with the previous attachment.

If you'd like more detail in terms of depth/velocity, the engineers said they can pull together a shapefile with that information by the end of the week. Let me know ASAP and we can gather that data.

Best,
Tara

Subject: RE: Cove Reservoir EIS-Parunuweap Canyon Archaeological District GIS layer

Hi Jeff,

The public wouldn't have any access to a map of the Parunuweap Archeological District. The memo will be included in Appendix E of the Draft Plan-EIS but without any sensitive locational information. We really only need the GIS data for analysis purposes, and no map would be added to the memo. We'd share the GIS data with Jennifer Bannick at Eocene, she'd add a brief discussion of the district to the memo, and then the GIS data can be deleted.

I've reached out to the engineers to get the water depths within Parunuweap Canyon in the unlikely event of a dam failure. I'm also attaching shapefiles that show the inundation areas on a sunny-day and rainy-day breach. Let me know if you have any issues opening these. Maps of these inundation areas are also located in Appendix E of the updated Preliminary Draft Plan-EIS, though less informative given the scale. I'd recommend starting on page E-51.

Best,
Tara

Hello Tara,

Thank you for sharing the Cove Reservoir Cultural Resources Review Memo with us. We appreciate that the analysis takes into account potential impact to NPS resources.

Could you tell us what level of public access, if at all, the Parunuweap Archeological District map would have? For example, would this memo be included as an appendix to the EIS that is released for public comment? We are open to sharing a GIS shapefile for NRCS analysis purposes, but archeological site data is protected on Federal lands, and we have concerns with it becoming public information.

Also, to concur with NRCS's finding of No Adverse Effect, we need to understand the potential impacts on our resources from a dam failure. Do you have documentation/mapping showing potential water levels in Parunuweap Canyon?

Subject: [EXTERNAL] Cove Reservoir EIS-Parunuweap Canyon Archaeological District GIS layer

This email has been received from outside of DOI - Use caution before clicking on links, opening attachments, or responding.

Hello Courtney,

The NRCS, in partnership with the Kane County Water Conservancy District is has drafted the Cove Reservoir East Fork of the Virgin River Watershed Plan-EIS in Kane and Washington Counties. As part of this Watershed Plan-EIS, a recently updated Cultural Resources desktop review (see attached memo, with comments) of the Rainy/Sunny Day breach analyses of the proposed earthen dam have been completed, and the indirect breach inundation zones pass through Zion National Park. The dam itself would be in Orderville, and the likelihood of a dam breach is extremely low; given the distance from the dam to the park, the increase water levels and water velocity through Parunuweap Canyon would have dissipated drastically.

As a result of the desktop review, Eocene identified 9 historic properties (42WS1158, 1160, 1793, 2795, 2796, 2799, 2809, 3344, 6242 (in progress recording)) within the Sunny and/or Rainy Day breach inundation APEs that are within the park. I have attached the draft cultural report memo. Of these, 1158, 1160, and 1793 are within the Parunuweap Canyon Archaeological District.

After reviewing the memo, I realized it failed to mention the Archaeological District since it isn't in Sego- do you have a GIS shapefile of it that I can share with Eocene?

NRCS, as lead federal agency, has conducted previous consultations, but this is the first instance the indirect APE crosses the park. Given the distance of the dam to the historic properties in the park, the high unlikelihood of a breach due to NRCS and Utah Dam Safety Requirements, we are proposing a *No Adverse Effect determination*. Please let me know if the NPS concurs with this determination for the Indirect Breach Inundation Zone APEs **by August 31, 2026.** Eocene also sent the complete updated Preliminary Draft Watershed Plan-EIS to Jeff Bradybaugh, Robyn Henderek, and Erin Dempsey (minus this cultural resources memo) on 8/18/2026.

Thank you!
Tara

Matt, Winston, and Brian,

The NRCS is continuing Section 106 consultation for the proposed Cove - East Fork of the Virgin River Draft Watershed Plan-EIS near Orderville, Utah (SPK-2020-00507). As part of the proposed project, the Cove Reservoir and dam would be constructed off channel near Orderville. The likelihood of a dam breach occurring is not a reasonably foreseeable effect given the adherence to Utah and NRCS Dam Safety Standards. However, in a good faith effort to consider all potential effects, the NRCS is including both breach inundation zones as part of the Indirect APE, and this analysis has been incorporated into the Draft Plan-EIS.

During the watershed planning process, the Sunny Day and Rainy-Day Breach Inundation Zones have recently been updated, and as such, NRCS has revised the Indirect APE, and identification of historic properties. See attached Memo. We initially consulted with your offices and 11 federally-recognized tribes regarding the original Indirect APE in emails dated June 4, 2025 (see attached). This updated Memo describes the revised Sunny Day and Rainy-Day Breach Inundation Zones in the improbable event of a dam breach, and the identification of historic properties. All other APEs remain unchanged. I have attached shapefiles of the breach inundation zones.

The NRCS retains our previous finding of No Adverse Effect for the Indirect APE given that the likelihood of a breach is not reasonably foreseeable and the historic properties present within the Indirect APE are far enough in distance from the dam that the depth and velocity of water is within the limits of a current 100-year flood event. Of note, we are also in consultation with Zion National Park regarding the updated Indirect APE.

Please let us know if you concur with the updated Indirect APE, identification of historic properties and finding of effect within 15 days of receipt. Feel free to reach out with any questions, comments, or concerns.

Thanks,
Tara

- Hualapai Tribe notified the NRCS via phone on March 1, 2021, that they no longer want to be consulted on undertakings in southern Utah.

ACHP Correspondence

From:	Hoffmann, Tara - FPAC-NRCS, UT
To:	e106
Cc:	Seibert, Erika - FPAC-NRCS, DC; Carrig, Charles - FPAC-NRCS, AR; Alexis Clark
Subject:	Utah NRCS Notification of Adverse Effects- Cove Reservoir
Date:	Thursday, March 28, 2024 12:08:00 PM
Attachments:	e106_CoveReservoir_Utah.docx CoveReservoir_Consultation.pdf U18TN0544.pdf U21TN0840.pdf U23TN0682.pdf

Good Afternoon,

Per 36 CFR 800.6(a)(1), attached is notification of adverse effects to two historic properties as a result of the proposed Cove-East Fork Virgin River Supplemental Watershed Plan-EIS, Kane County, Utah. Also included is current Section 106 consultation between NRCS, SHPO, cooperating agencies, and applicable tribes, and cultural resources reports.

Thank you,
Tara

Tara S. Hoffmann, MA
State Watershed Cultural Resources Specialist/Tribal Liaison
Natural Resources Conservation Service
Salt Lake City, UT
O: 801-524-4556 C: 385-258-1266

Advisory Council on Historic Preservation
Electronic Section 106 Documentation Submittal System (e106) Form
MS Word format

Send to: *e106@achp.gov*

Please review the instructions at www.achp.gov/e106-email-form prior to completing this form. Questions about whether to use the e106 form should be directed to the assigned ACHP staff member in the Office of Federal Agency Programs.

I. Basic information

1. **Purpose of notification.** Indicate whether this documentation is to:
   - ☒ Notify the ACHP of a finding that an undertaking may adversely affect historic properties
   - ☐ Invite the ACHP to participate in a Section 106 consultation
   - ☐ Propose to develop a project Programmatic Agreement (project PA) for complex or multiple undertakings in accordance with 36 C.F.R. 800.14(b)(3)
   - ☐ Supply additional documentation for a case already entered into the ACHP record system
   - ☐ File an executed MOA or PA with the ACHP in accordance with 800.6(b)(iv) (where the ACHP did not participate in consultation)
   - ☐ Other, please describe
     Click here to enter text.

2. ACHP Project Number (If the ACHP was previously notified of the undertaking and an ACHP Project Number has been provided, enter project number here and skip to Item 7 below): Click here to enter text.

3. **Name of federal agency** (If multiple agencies, list them all and indicate whether one is the lead agency):

   Natural Resources Conservation Service (NRCS) is the lead agency. The Bureau of Land Management (BLM), Kanab Field Office is a cooperating agency.

4. **Name of undertaking/project** (Include project/permit/application number if applicable):

   Cove-East Fork Virgin River Supplemental Watershed Plan-EIS, Kane County, UT

5. **Location of undertaking** (Indicate city(s), county(s), state(s), land ownership, and whether it would occur on or affect historic properties located on tribal lands):

   Near Orderville in Kane County, Utah. Located on private lands and public lands administered by the, Bureau of Land Management (BLM), Kanab Field Office, the Utah School and Institutional Trust Lands Administration (SITLA), and Utah Department of Transportation. No tribal land is involved.

6. **Name and title of federal agency official and contact person for this undertaking**, including email address and phone number:

Tara Hoffmann, MA
State Watershed Cultural Resources Specialist
Salt Lake City, Utah
Tara.hoffmann@usda.gov
385-258-1266

II. Information on the Undertaking*

7. Describe the undertaking and nature of federal involvement (if multiple federal agencies are involved, specify involvement of each):

The Natural Resources Conservation Service (NRCS) is providing technical and financial assistance through the Watershed Protection and Flood Prevention Act (Public Law [PL] 83-566 Stat. 666 as amended [16 U.S.C. Section 1001 et. Seq.]) 1954, as amended, to the Kane County Water Conservancy District (KCWCD), as the Project Sponsor, to is to increase and maintain a reliable supply of water for local agricultural use and existing storage needs, increase water conservation, and improve water delivery efficiency in the Upper Virgin Watershed in Kane County, Utah, and for existing and future water demands in Washington County, Utah. As part of the NEPA process, project alternatives are currently being analyzed. Proposed improvements within the two action alternatives include constructing a reservoir, installation of a pipeline to carry water, the Glendale, Utah hydroelectric plant the piping of the Mt. Carmel irrigation ditches to increase efficiency, and seven borrow sources.

To evaluate the potential project alternatives and assess the environmental impacts of the project, a Watershed Plan and Environmental Impact Statement (EIS) is being prepared by Jones and DeMille Engineering, on behalf of the NRCS, in cooperation with KCWCD and the BLM.

8. Describe the Area of Potential Effects (APE):

Per 36 CFR 800.16(d), the APE encompasses a total of 868.98, which includes multiple discontiguous parcels. The APE includes all proposed construction locations, staging, access roads, borrow sources, and necessary buffers around each element. The parcels occur on public lands administered by the BLM (152.29 acres) and SITLA (70.34 acres). The remaining 646.35 acres of the project area occurs on private land.

9. Describe steps taken to identify historic properties:

Per 36 CFR 800.4, three intensive cultural resources inventoried were conducted by Transcon Environmental to identify historic properties that could be affected by the undertaking (U18TH0544, U21TN0840, and U23TN0682). Please refer to the attached reports for detailed information on these inventories. Survey methodology accepted by the Utah State Historic Preservation Officer (SHPO), the BLM and NRCS was followed. The surveys were completed between 2018 and 2023 under the auspices of State of Utah Public Lands Policy Archaeological Survey Permit No. 167, and State of Utah Antiquities Permit (Survey) Nos. U18TN0544, U21TN0840, and U23TN0682. The APE was surveyed by the archaeologists walking parallel transects spaced no more than 15 m (49 ft) apart.

10. Describe the historic property (or properties) and any National Historic Landmarks within the APE (or attach documentation or provide specific link to this information):

See attached cultural resources reports for detailed historic property information. Summary is below.

As part of the cultural resources inventory for U18TN0544, Table 1 summarizes the historic properties identified.

TABLE 1
U18TN0544 Historic Properties

Site Number	Site Description	Eligibility	Effects
42KA6331	Prehistoric lithic scatter	Eligible—D	*No Adverse Effect to Historic Properties* if the site is avoided. Should any future project-related activities occur within 15 meters of the site, a cultural resources monitor must be present.
42KA8785	Prehistoric artifact scatter	Eligible – D	*No Adverse Effect to Historic Properties* if the site is avoided. Should any future project-related activities occur within 15 meters of the site, a cultural resources monitor must be present.
42KA8904	Prehistoric ceramic, lithic, and FCR scatter	Eligible—D	*No Adverse Effect to Historic Properties* if the site is avoided. Should any future project-related activities occur within 15 meters of the site, a cultural resources monitor must be present.
42KA8974	Prehistoric artifact scatter	Eligible—D	*No Adverse Effect to Historic Properties* if the site is avoided. Should any future project-related activities occur within 15 meters of the site, a cultural resources monitor must be present.

Table 2 summarizes the historic properties identified during the U21TN0840 inventory.

TABLE 2
U21TN0840 Historic Properties

Site No.	Site Description	Eligibility	Effects	Project Design Impacts	Site Protective or Avoidance Measures
42KA1157	Prehistoric artifact scatter	Eligible—D	*No Adverse Effect*	Installation of new buried pipe along the northeast portion of the site.	None; the portion of the site within the Project APE is heavily disturbed by previous road construction/maintenance, plowing, livestock and a sewer line, it has also been previously tested and is non-contributing to the overall eligibility of the site.
42KA9490 (FS-01)	Historic ditch (*Mount Carmel Irrigation Ditch– West Ditch*)	Eligible—A, C, D	***Adverse Effect***	The open ditch will be converted to buried pipe.	An inadvertent discovery plan will be prepared, as well as a MOA with associated Historic Properties Treatment Plan to mitigate the adverse effects to the site.
42KA9491 (FS-02)	Historic ditch (*Mount Carmel Irrigation Ditch– East Ditch*)	Eligible—A, D	***Adverse Effect***	The open ditch will be converted to buried pipe.	An inadvertent discovery plan will be prepared, as well as a MOA with associated Historic Properties Treatment Plan to mitigate the adverse effects to the site.

Continued.

Table 3 summarizes the historic properties identified as a result of the U23TN0682 inventory.

TABLE 3
U23TN0682 Historic Properties

Site Number	Site Description	Eligibility	Protective Measures
42KA7537	Prehistoric cave and artifact scatter (*Kanab Creek Cave*)	Eligible—D	Avoid all ground disturbing activities within 15 meters of the site boundary; a cultural monitor must be present during all ground disturbance within 15 meters of the site boundary, and avoidance flagging must be placed 15 meters from the site boundary prior to any construction activities near the site area.
42KA9789	Prehistoric artifact scatter	Eligible—D	Avoid all ground disturbing activities within 15 meters of the site boundary; a cultural monitor must be present during all ground disturbance within 15 meters of the site boundary, and avoidance flagging must be placed 15 meters from the site boundary prior to any construction activities near the site area.

11. Describe the undertaking's effects on historic properties:

Per Table 2, the Mt. Carmel East and West Irrigation Ditches (Sites 42KA9490 and 9491) will be converted from open ditch to pipe as part of the proposed undertaking. The NRCS, in consultation with the Utah SHPO and consulting tribes, determined that this would result in an Adverse Effect, per 36CFR800.5. All other project components will result in No Adverse Effect to Historic Properties. Refer to attached consultation letters and cultural resources reports for detailed information.

12. Explain how this undertaking would adversely affect historic properties (include information on any conditions or future actions known to date to avoid, minimize, or mitigate adverse effects):

Per Table 2, Mt. Carmel East and West Irrigation Ditches (Sites 42KA9490 and 9491) will be converted from open ditch to pipe as part of the proposed undertaking. The piping of the ditches will result in direct damage to those aspects of integrity that contribute to each site's NRHP eligibility. As such, the NRCS, in consultation with the Utah SHPO and consulting tribes, determined that this would result in an Adverse Effect, per 36CFR800.5.

The NRCS is currently developing mitigation stipulations and is in consultation with the Utah SHPO, the project Sponsor, and other consulting parties in drafting mitigation strategies and developing a Memorandum of Agreement (MOA).

13. Provide copies or summaries of the views provided to date by any consulting parties, Indian tribes or Native Hawai'ian organizations, or the public, including any correspondence from the SHPO and/or THPO.

See attached consultation correspondence between the NRCS, SHPO, BLM, and Tribes, documenting all consultation to date. Due to tribal and public feedback, the project was elevated from a Supplemental Plan-EA to a Plan-EIS in 2022. Consultation for U23TN0682 is forthcoming. The Plan-EIS is still in development.

III. Additional Information

14. Please indicate the status of any consultation that has occurred to date, including whether there are any unresolved concerns or issues the ACHP should know about in deciding whether to

participate in consultation. Providing a list of consulting parties, including email addresses and phone numbers if known, can facilitate the ACHP's review response.

Concurrent with the National Environmental Policy Act scoping period for the Supplemental Plan-EA, and as part of Section 106 of the NHPA, Executive Order 13007, 13175, and the AIRFA, the NRCS reached out to the Ute Tribe of the Uintah and Ouray Reservation, Paiute Indian Tribe of Utah, Kaibab Band of Paiute Indians, Moapa Band of Paiute Indians of the Moapa River Indian Nation, the Las Vegas Tribe of Paiute Indians of the Las Vegas Indian Colony, the Hopi Tribe, Navajo Nation, Pueblo of Zuni, San Juan Southern Paiute Tribe of Arizona, White Mesa, Ute Council, Hualapai Tribe, and the Ute Mountain Ute. The tribal scoping letters were sent in letters dated May 23, 2018. No responses were received.

Tribal consultation was also conducted to announce the Notice of Availability of the Draft Supplemental Plan-EA in letters dated November 20, 2020. The Navajo Nation responded in an email on December 4, 2020 indicating no presence of TCPs and that NRCS may proceed without further consultation. The Hopi Tribe responded in a letter dated December 8, 2020 with concerns regarding preparation of an EA, and a request to conduct a full EIS. The NRCS spoke off-the-record with the Hopi Tribe on December 14, 2020 via telephone regarding the project. The NRCS formally responded to the Hopi Tribe in a letter dated December 15, 2020 indicating that if deemed necessary after additional environmental review, an EIS would be prepared in accordance with the Council on Environmental Quality regulations implementing the National Environmental Policy Act (NEPA) at 40 CFR Part 1501.3. The Hopi Tribe responded to the NRCS in a letter dated January 4, 2021 acknowledging receipt of cultural resources report U18TN0544, and reiterating the necessity of an EIS analysis.

Consultation letters for U18TN0544, with a determination of No Adverse Effect, were sent on January 9, 2020 to the Utah SHPO, the BLM, the US Army Corps of Engineers, and the aforementioned tribes. Concurrence on site eligibility and project effects was received from the Paiute Tribe on January 28, 2020, and from the Hopi Tribe on February 3, 2020. The Utah SHPO concurred on project effects and site eligibility in a letter dated January 17, 2020. The Hopi Tribe concurred with the determination of effect in a letter dated January 4, 2021.

Based on tribal and other public controversy, the NRCS determined that an EIS was necessary in 2022. A Notice of Intent (NOI) for the preparation of the Plan-EIS was sent to the same tribes in a letter dated January 11, 2022. The NOI letter requested any information tribes would like to share with NRCS regarding historic properties or places of traditional religious and cultural importance near the proposed project area that we should consider as part of our analysis. The Hopi Tribe responded in a letter dated February 7, 2022 with no objection to the Plan-EIS, and requesting hard copies of cultural resources report and draft-EIS for review and comment.

The NRCS consulted with the Utah SHPO and the aforementioned tribes on U21TN0840 in a letter dated January 23, 2023. U21TN0840 resulted in a determination of Adverse Effects to Historic Properties, as a result of the proposed conversion from open ditch to pipe for historic properties 42KA9490 and 9491. The Utah SHPO concurred with the Adverse Effect determination and site eligibility in a letter dated February 6, 2023. No tribal responses were received.

U23TN0682 covered a supplemental survey area for an additional borrow source. Consultation for that report is forthcoming.

To resolve the adverse effects to 42KA9490 and 42KA9491, the NRCS is currently drafting mitigation stipulations and is in active consultation with the Utah SHPO. Draft mitigation stipulations proposed include drone flyovers, aerial photographs, a Story Map, and interpretive brochure. There are no unresolved concerns in relation to the proposed undertaking.

15. Does your agency have a website or website link where the interested public can find out about this project and/or provide comments? Please provide relevant links:

This is the general project information website. We are currently not in a public comment period. The draft Plan-EIS is scheduled to be available for public comment in winter 2024.

Cove-East Fork Virgin River Watershed

16. Is this undertaking considered a "major" or "covered" project listed on the Federal Infrastructure Projects Permitting Dashboard? If so, please provide the link:

No.

DRAFT

MEMORANDUM OF AGREEMENT
AMONG
THE UTAH NATURAL RESOURCES CONSERVATION SERVICE,
UTAH STATE HISTORIC PRESERVATION OFFICER,
THE KANE COUNTY WATER CONSERVANCY DISTRICT,
MOUNT PLEASANT IRRIGATION COMPANY,
AND U.S. ARMY CORPS OF ENGINEERS, SACRAMENTO DISTRICT
REGARDING
MITIGATION OF ADVERSE EFFECTS TO
THE MOUNT CARMEL IRRIGATION COMPANY- WEST AND EAST DITCHES
(42KA9490 and 42KA9491)
KANE COUNTY, UTAH

WHEREAS, the Utah Natural Resources Conservation Service (NRCS) is providing technical and financial assistance to the Kane County Water Conservancy District (Sponsor) through the Watershed Protection and Flood Prevention Act (Public Law [PL] 83-566 Stat. 666 as amended [16 U.S.C. Section 1001 et. Seq.]) 1954 to construct a new dam and improve water management infrastructure within the East Fork Virgin River Watershed, located north of Orderville, Utah (hereafter referred to as the "Project"); and

WHEREAS, the NRCS has determined that the Project is an undertaking subject to review under Section 106 of the National Historic Preservation Act (NHPA), 54 U.S.C. §305108, and its implementing regulations, 36 C.F.R. 800; and

WHEREAS, the Sponsor will apply for, and the United States Army Corps of Engineers, Sacramento District (Corps), proposes to issue a permit pursuant to Section 404 of the Clean Water Act (33 U.S.C. § 1344) for the Project; and

WHEREAS, the NRCS, as the lead Federal agency under Section 106 of the National Historic Preservation Act, as amended (54 U.S.C. § 306108) will consult on the Corps behalf; and

WHEREAS, the Sponsor is supporting the Mount Carmel Irrigation Company in their efforts to manage agricultural water; and

WHEREAS, the NRCS has defined the Project's Direct Area of Potential Effects (APE) as 375.1-acres, consisting of 0.23 acres of lands administered by the Bureau of Land Management (BLM)-Kanab Field Office, 0.67 acres of Utah Trust Lands Administration (TLA) lands, and 374.2 acres of private land composed of multiple polygons, which encompasses all potential ground disturbance including construction areas, access roads, staging areas, borrow sources, and necessary buffers; and

WHEREAS, three intensive cultural resources inventories to identify historic properties within the APE have been completed, as required by 36 C.F.R. 800, by Eocene Environmental Group (Utah Division of State Historic Project Nos U18TN0554, U21TN0840, and U23TN0682); and

WHEREAS, the NRCS and the Utah State Historic Preservation Office (SHPO) agree that the historic Mt. Carmel Irrigation Company- West Ditch (42KA9490), and the Mt. Carmel Irrigation Company- East Ditch (42KA9491), located on private land, are eligible for inclusion in the National Register of Historic Places (NRHP) under Criteria A,C, and D (42KA9490 and Criteria A and D (42KA9491) ; and

WHEREAS, the NRCS has determined that the Project will result in adverse effects to the two historic ditches due to the conversion from open earthen ditch to enclosed pressurized pipe; and

WHEREAS, the NRCS has consulted with the Utah State Historic Preservation Office (SHPO), BLM, TLA, the Corps, Utah Department of Transportation, Kaibab Band of Paiute Indians, Moapa Band of Paiute Indians, Las Vegas Tribe of Paiute Indians, Navajo Nation, Paiute Indian Tribe of Utah, Pueblo of Zuni, San Juan Southern Paiute Tribe, Hopi Tribe, Ute Mountain Ute Tribe, Ute Indian Tribe of the Uintah and Ouray Reservation, regarding the effects of the Project on historic properties; and

WHEREAS, the BLM, TLA, the Corps, Kaibab Band of Paiute Indians, Moapa Band of Paiute Indians, Las Vegas Tribe of Paiute Indians, Navajo Nation, Paiute Indian Tribe of Utah, Pueblo of Zuni, San Juan Southern Paiute Tribe, Hopi Tribe, Ute Mountain Ute Tribe, Ute Indian Tribe of the Uintah and Ouray Reservation declined or failed to respond to further participation in the development of this MOA; and

WHEREAS, the SHPO, Corps, the Sponsor, and the Mount Carmel Irrigation Company have agreed to participate in the development of the MOA; and

WHEREAS, in accordance with 36 CFR § 800.6(a)(1), the NRCS notified the Advisory Council on Historic Preservation (ACHP) of its adverse effect determination, with specified documentation, in a letter dated March 28, 2024, and the ACHP responded in a letter dated April 12, 2024, stating they have chosen not to participate in the consultation pursuant to 36 CFR § 800.6(a)(1)(iii; and

WHEREAS, "Signatories" hereafter collectively refers to the required (NRCS and SHPO), invited (Mount Carmel Irrigation Company), and concurring party (Corps); and

WHEREAS, other parties may be invited to become signatories to this MOA if such a party agrees to these terms; and

NOW, THEREFORE, the Signatories agree that upon NRCS's decision to proceed with the Project, the NRCS shall ensure that the following stipulations are implemented in order to resolve the adverse effects of the Project on historic properties, and that these stipulations shall govern the Project and all of its parts until this MOA expires or is terminated.

DRAFT

STIPULATIONS

The NRCS shall ensure that the following measures are carried out:

I. PROFESSIONAL QUALIFICATIONS

A. All tasks will be completed by personnel meeting the Secretary of the Interior's Standards and Guidelines for Archeology and Architectural History as stated in 36 C.F.R. 61.

B. All tasks will be completed according to specifications consistent with the Secretary of Interior's *Standards and Guidelines for Archeological and Historical Documentation* and, where appropriate, guidelines required by the SHPO and NRCS.

II. MITIGATION OF ARCHAEOLOGICAL RESOURCES

A. The NRCS shall ensure the mitigation measures outlined below are completed. Draft and final documentation shall be submitted to the NRCS for review and approval.

1. Historical context of the East and West Mount Carmel Irrigation Ditches in relation to their involvement in the early settlement of the region; and

2. Prior to Project construction, an aerial video recording of the entire length of the canals, where permitted, including aerial photos at select structures; and

3. Updated Utah Archaeology Site Forms, including re-evaluation of the canals' eligibility to the NRHP after completion of Project construction, submitted to SHPO with formal determinations; and

4. ArcGIS Story Map website to be hosted by the SHPO.

B. When all required pre-construction mitigation measures are complete and approved by the NRCS and SHPO, the NRCS shall notify the Sponsor in writing that the Project may be implemented.

III. DURATION

This MOA will expire if its terms are not carried out within five (5) years from the date of its execution. Prior to such time, the NRCS may consult with the other signatories to reconsider the terms of the MOA and amend it in accordance with Stipulation VI below.

IV. UNANTICIPATED DISCOVERIES

A. In the event of an unanticipated archaeological discovery during construction, the NRCS shall follow procedures outlined in the Prototype Programmatic Agreement with the Utah SHPO. If significant discoveries requiring longer-term work stoppage for consultation and mitigation are encountered, the NRCS will consult per 36 C.F.R.

DRAFT

800.6 to develop a plan to further mitigate the adverse effect.

B. If human remains are discovered on private land, the remains will be treated in accordance with Utah Code Title 9 Chapter 8a Part 3, Section 309 (UT Code 9-8a-309). All activity shall cease in the area, immediately notify local law enforcement and the landowner. If human remains are discovered on BLM-administered land, they will be treated in accordance with the requirements of the Native American Graves Protection and Repatriation Act (NAGPRA) (25 U.S.C. 3001 et seq.) and its implementing regulations (43 C.F.R. 10 All construction activities within 100 feet of the remains shall cease immediately and the NRCS shall consult pursuant to 43 C.F.R. 10.5, to develop a written plan of action to manage the discovery. Construction in the area of the remains may need to be halted throughout the review process. Continuation of work following a discovery will be contingent upon approval by the NRCS in consultation with the SHPO, applicable tribes, and other consulting parties that the approved plan has been satisfactorily completed.

V. DISPUTE RESOLUTION

A. Should any Signatory or concurring party to this MOA object at any time to any actions proposed or the manner in which the terms of this MOA are implemented, the NRCS shall consult with such party to resolve the objection. If the NRCS determines that such objection cannot be resolved, the NRCS will:

1. Forward all documentation relevant to the dispute, including the NRCS's proposed resolution, to the ACHP. The ACHP shall provide the NRCS with its advice on the resolution of the objection within thirty (30) days of receiving adequate documentation. Prior to reaching a final decision on the dispute, the NRCS shall prepare a written response that takes into account any timely advice or comments regarding the dispute from the ACHP and the Signatories and provide them with a copy of this written response. The NRCS will then proceed according to its final decision.

2. If the ACHP does not provide its advice regarding the dispute within the thirty (30) day-time-period, the NRCS may make a final decision on the dispute and proceed accordingly. Prior to reaching such a final decision, the NRCS shall prepare a written response that takes into account any timely comments regarding the dispute from the Signatories to the MOA and provide them and the ACHP with a copy of such written response.

3. It will be the responsibility of the NRCS to carry out all other actions subject to the terms of this MOA that are not the subject of the dispute.

VI. AMENDMENTS

This MOA may be amended when such an amendment is agreed to in writing by all Signatories. The amendment will be effective on the date a copy signed by all of the Signatories is filed with the ACHP.

DRAFT

VII. COORDINATION WITH OTHER ACTIONS

Other state or federal agencies that provide permitting or financial assistance to an undertaking covered by this MOA may satisfy their own compliance responsibilities under Section 106 of the NHPA by accepting and complying with the terms of this MOA. Other parties may have their actions covered by this MOA if they agree to its terms. Agencies shall notify the NRCS and the Utah SHPO in writing of the intent to adhere to this MOA.

VIII. TERMINATION

A. If any signatory to this MOA determines that its terms will not or cannot be carried out, that party shall immediately consult with the other signatories to attempt to develop an amendment per Stipulation VIII, above. If within thirty (30) days (or another time period agreed to by all signatories) an amendment cannot be reached, any signatory may terminate the MOA upon written notification to the other signatories.

B. Once the MOA is terminated, and prior to work continuing on the undertaking, NRCS must either (a) execute an MOA pursuant to 36 CFR § 800.6 or (b) request, take into account, and respond to the comments of the ACHP under 36 CFR § 800.7. The NRCS shall notify the signatories as to the course of action it will pursue.

VIII. USDA STIPULATIONS

A. The signatories to this agreement and their respective agencies will handle their own activities and utilize their own resources, including the expenditure of their own funds, in pursuing these objectives. Each party will carry out its separate activities in a coordinated and mutually beneficial manner.

B. Any transfer of funds from one party to another shall be done via a separate instrument as appropriate. Specific work projects or activities that involve the transfer of funds, services, or property among the signatories, and their respective agencies will require execution of separate agreements and be contingent upon the availability of appropriated funds. Negotiation, execution, and administration of each such agreement must comply with all applicable statutes and regulations.

Execution of this MOA by the NRCS and Signatories, and its submission to the ACHP in accordance with 36 C.F.R. 800.6(b)(1)(iv), shall, pursuant to 36 C.F.R. 800.6(c), be considered to be an agreement with the ACHP for the purposes of Section 110(l) of the NHPA. Execution and submission of this MOA, and implementation of its terms, evidence that the NRCS has afforded the ACHP an opportunity to comment on the Project and its effects on historic properties, and that the NRCS has taken into account the effects of the Project on historic properties.

May 23, 2018

Luke Duncan
Chairman
Ute Indian Tribe of the Uintah & Ouray Reservation, Utah
P.O. Box 190
Fort Duchesne, UT 84026

RE: Cove Reservoir Watershed Plan-EA Project

Dear Mr. / Ms. Luke Duncan:

The United States Department of Agriculture Natural Resources Conservation Service (USDA-NRCS), in coordination with the Kane County Water Conservancy District (KCWCD) as the project sponsor, is considering proposed improvements within the East Fork Virgin River Watershed in Kane County, Utah. Improvements under consideration will address water conservation concerns, agricultural and municipal demands, public safety risks, and will enhance aquatic species habitat and increase opportunities for public recreation. See the enclosed Project Fact Sheet for information about project features.

In cooperation with KCWCD, USDA-NRCS is in the very early planning stages of preparing an Environmental Assessment (EA) under the National Environmental Policy Act (NEPA) to consider and analyze potential impacts from the action. For the purposes of compliance with NEPA and Section 106 of the NHPA, USDA-NRCS is the designated lead agency. Pursuant to Section 106 of the National Historic Preservation Act (NHPA), Executive Order 13007, the American Indian Religious Freedom Act, we write to you at this time regarding the project and we welcome any information you would like to share with us regarding historic properties or places of traditional religious and cultural importance near the proposed project area that we should consider as part of our analysis. We would also appreciate your assistance in identifying any other tribes with whom we should consult on this project.

We look forward to hearing from and working with you on this important project. We welcome your call if you have questions on the proposed project or if you wish to arrange a meeting or initiate government-to-government consultation regarding this project. Please respond to our request within 30 days of receipt of this letter.

If you have any questions, comments, or concerns please contact Tara S. Hoffmann, Acting State Cultural Resources Specialist at 720-591-8051 or email at tara.hoffmann@co.usda.gov or Shelley A. Szeghi, Area Cultural Resources Specialist, at 801-629-0575 ext. 104 or email at shelley.szeghi@ut.usda.gov.

We look forward to receiving your comments and discussing this project further.

Sincerely,

TIMOTHY WILSON
NRCS State Conservationist

RE: Cove Reservoir Watershed Plan-EA Project

Dear Mr. / Ms. Ona Segundo:

The United States Department of Agriculture Natural Resources Conservation Service (USDA-NRCS), in coordination with the Kane County Water Conservancy District (KCWCD) as the project sponsor, is considering proposed improvements within the East Fork Virgin River Watershed in Kane County, Utah. Improvements under consideration will address water conservation concerns, agricultural and municipal demands, public safety risks, and will enhance aquatic species habitat and increase opportunities for public recreation. See the enclosed Project Fact Sheet for information about project features.

In cooperation with KCWCD, USDA-NRCS is in the very early planning stages of preparing an Environmental Assessment (EA) under the National Environmental Policy Act (NEPA) to consider and analyze potential impacts from the action. For the purposes of compliance with NEPA and Section 106 of the NHPA, USDA-NRCS is the designated lead agency. Pursuant to Section 106 of the National Historic Preservation Act (NHPA), Executive Order 13007, the American Indian Religious Freedom Act, we write to you at this time regarding the project and we welcome any information you would like to share with us regarding historic properties or places of traditional religious and cultural importance near the proposed project area that we should consider as part of our analysis. We would also appreciate your assistance in identifying any other tribes with whom we should consult on this project.

We look forward to hearing from and working with you on this important project. We welcome your call if you have questions on the proposed project or if you wish to arrange a meeting or initiate government-to-government consultation regarding this project. Please respond to our request within 30 days of receipt of this letter.

If you have any questions, comments, or concerns please contact Tara S. Hoffmann, Acting State Cultural Resources Specialist at 720-591-8051 or email at tara.hoffmann@co.usda.gov or Shelley A. RE: Cove Reservoir Watershed Plan-EA Project

Dear Mr. / Ms. Val Panteah Sr.:

The United States Department of Agriculture Natural Resources Conservation Service (USDA-NRCS), in coordination with the Kane County Water Conservancy District (KCWCD) as the project sponsor, is considering proposed improvements within the East Fork Virgin River Watershed in Kane County, Utah. Improvements under consideration will address water conservation concerns, agricultural and municipal demands, public safety risks, and will enhance aquatic species habitat and increase opportunities for public recreation. See the enclosed Project Fact Sheet for information about project features.

In cooperation with KCWCD, USDA-NRCS is in the very early planning stages of preparing an Environmental Assessment (EA) under the National Environmental Policy Act (NEPA) to consider and analyze potential impacts from the action. For the purposes of compliance with NEPA and Section 106 of the NHPA, USDA-NRCS is the designated lead agency. Pursuant to Section 106 of the National Historic Preservation Act (NHPA), Executive Order 13007, the American Indian Religious Freedom Act, we write to you at this time regarding the project and we welcome any information you would like to share with us regarding historic properties or places of traditional religious and cultural importance near the proposed project area that we should consider as part of our analysis. We would also appreciate your assistance in identifying any other tribes with whom we should consult on this project.

We look forward to hearing from and working with you on this important project. We welcome your call if you have questions on the proposed project or if you wish to arrange a meeting or initiate government-to-government consultation regarding this project. Please respond to our request within 30 days of receipt of this letter.

If you have any questions, comments, or concerns please contact Tara S. Hoffmann, Acting State Cultural Resources Specialist at 720-591-8051 or email at tara.hoffmann@co.usda.gov or Shelley A. Szeghi, Area Cultural Resources Specialist, at 801-629-0575 ext. 104 or email at shelley.szeghi@ut.usda.gov.

We look forward to receiving your comments and discussing this project further.

Sincerely,

TIMOTHY WILSON
NRCS State Conservationist

Re: Cove Reservoir Watershed Plan

Dear Mr. Wilson,

Thank you for your correspondence dated May 23, 2018, regarding the National Resources Conservation Service (NRCS) and Kane County Water Conservancy District proposing improvements within the East Fork Virgin River Watershed in Kane County.

The Hopi Tribe claims cultural affiliation to prehistoric cultural groups in Utah. The Hopi Cultural Preservation Office supports the identification and avoidance of prehistoric archaeological sites and we consider the prehistoric archaeological sites of our ancestors to be "footprints" and Traditional Cultural Properties. Therefore, we appreciate the NRCS's continuing solicitation of our input and your efforts to address our concerns.

The Hopi Cultural Preservation Office requests consultation on any proposal in Utah that has the potential to effect prehistoric cultural resources. We are aware of the Jackson Flat Reservoir sponsored by the Kane County Water Conservancy District that adversely affected numerous sites and resulted in the disturbance of many human remains. We understand the project proposes improvements including the construction of a new 6,032 acre-foot reservoir, Cove Reservoir, as well as other improvements within the existing Glendale and Orderville irrigation systems.

We also understand an environmental analysis will be prepared, and therefore we look forward to being provided with copies of the cultural resources report and draft environmental assessment for review and comment. If prehistoric cultural resources are identified that will be adversely affected by the proposed project, we will request continuing consultation including being provided with a copy of any proposed treatment plans for review and comment.

If you have any questions or need additional information, please contact Terry Morgart at 928-734-3619 or tmorgart@hopi.nsn.us. Thank you for your consideration.

Respectfully,

Stewart B. Koyiyumptewa, Interim Manager
Hopi Cultural Preservation Office

Draft Plan-EA Notice of Availability - Tribes

November 20, 2020

Mr. Greg Anderson
Chairman
Moapa Band of Paiute Indians of the Moapa Indian Reservation, Nevada
P.O. Box 340
Moapa, Nevada 89025

Reference: Cove Reservoir Watershed Plan-EA Project, Kane County, Utah

Dear Mr. Anderson:

The United States Department of Agriculture Natural Resources Conservation Service (NRCS) in coordination with the Kane County Water Conservancy District (KCWCD) announce the availability of the Draft Watershed Plan and Environmental Assessment (Plan-EA) for the Cove Reservoir Watershed Project within the East Fork Virgin River Watershed in Kane County, Utah. The project would improve agricultural and municipal water supply, provide for more water-based recreational opportunities and provide benefits to habitat for sensitive wildlife species downstream.

As designed, the project will involve the construction of a new, approximately 6,055-acre-foot reservoir east of Orderville, Utah. Project components associated with the reservoir include an earthen dam, principal and auxiliary spillways, reservoir outlet works and emergency drain, an access road around the reservoir, camping and recreation area, and a boat ramp to allow for non-motorized boating. The project would also involve the replacement of approximately 1.7-miles of pipeline in Glendale, Utah and the relocation and upgrade of the existing Glendale Hydroelectric Plant.

An electronic copy of the Draft Plan-EA can be downloaded from the NRCS Cove Reservoir Watershed planning webpage, accessed from the web address below. A hard copy of the Draft Plan-EA can also be made available to you upon request.

The project would improve agricultural and municipal water supply, provide for more water-based recreational opportunities and provide benefits to habitat for sensitive wildlife species downstream.

As designed, the project will involve the construction of a new, approximately 6,055-acre-foot reservoir east of Orderville, Utah. Project components associated with the reservoir include an earthen dam, principal and auxiliary spillways, reservoir outlet works and emergency drain, an access road around the reservoir, camping and recreation area, and a boat ramp to allow for non-motorized boating. The project would also involve the replacement of approximately 1.7-miles of pipeline in Glendale, Utah and the relocation and upgrade of the existing Glendale Hydroelectric Plant.

An electronic copy of the Draft Plan-EA can be downloaded from the NRCS Cove Reservoir Watershed planning webpage, accessed from the web address below. A hard copy of the Draft Plan-EA can also be made available to you upon request.

Reference: Cove Reservoir Watershed Plan-EA Project, Kane County, Utah

Dear Mr. Tso:

The United States Department of Agriculture Natural Resources Conservation Service (NRCS) in coordination with the Kane County Water Conservancy District (KCWCD) announce the availability of the Draft Watershed Plan and Environmental Assessment (Plan-EA) for the Cove Reservoir Watershed Project within the East Fork Virgin River Watershed in Kane County, Utah. The project would improve agricultural and municipal water supply, provide for more water-based recreational opportunities and provide benefits to habitat for sensitive wildlife species downstream.

As designed, the project will involve the construction of a new, approximately 6,055-acre-foot reservoir east of Orderville, Utah. Project components associated with the reservoir include an earthen dam, principal and auxiliary spillways, reservoir outlet works and emergency drain, an access road around the reservoir, camping and recreation area, and a boat ramp to allow for non-motorized boating. The project would also involve the replacement of approximately 1.7-miles of pipeline in Glendale, Utah and the relocation and upgrade of the existing Glendale Hydroelectric Plant.

An electronic copy of the Draft Plan-EA can be downloaded from the NRCS Cove Reservoir Watershed planning webpage, accessed from the web address below. A hard copy of the Draft Plan-EA can also be made available to you upon request.

https://www.nrcs.usda.gov/wps/portal/nrcs/detail/ut/programs/planning/wpfp

NRCS invites you to submit comments anytime during the open comment period starting November 25, 2020 and ending on December 31, 2020. Please refer to the enclosed flyer for instructions on submitting comments. **Comments must be received by December 31, 2020 to become part of the public record.**

We look forward to hearing from and working with you on this important project. We welcome your call if you have questions on the proposed project or if you wish to arrange a meeting. If you have any questions, comments or concerns, please contact State Cultural Resources Specialist Tara S. Hoffmann at 801-524-4556 or tara.hoffmann@usda.gov, at your earliest convenience.

Sincerely,

EMILY FIFE

Re: Draft Watershed Plan and Environmental Assessment (Plan-EA) for the proposed Cove Reservoir Watershed Project within the East Fork Virgin River Watershed

Dear Ms. Fife,

Thank you for your correspondence dated November 20, 2020, regarding the National Resources Conservation Service (NRCS) and Kane County Water Conservancy District announcing the availability of the Draft Watershed Plan and Environmental Assessment (Plan-EA) for the proposed Cove Reservoir Watershed Project within the East Fork Virgin River Watershed in Kane County, Utah.

The Hopi Tribe claims cultural affiliation to prehistoric cultural groups in Utah. The Hopi Cultural Preservation Office supports the identification and avoidance of prehistoric archaeological sites and we consider the prehistoric archaeological sites of our ancestors to be "footprints" and Traditional Cultural Properties. Therefore, we appreciate the NRCS's continuing solicitation of our input and your efforts to address our concerns.

In the enclosed letter dated June 11, 2018, the Hopi Cultural Preservation Office reiterated we request consultation on any proposal in Utah that has the potential to effect prehistoric cultural resources. We stated we are aware of the Jackson Flat Reservoir sponsored by the Kane County Water Conservancy District that adversely affected numerous sites and resulted in the disturbance of many human remains. We also stated we understand the project proposes improvements including the construction of a new 6,032 acre-foot reservoir, Cove Reservoir, as well as other improvements within the existing Glendale and Orderville irrigation systems.

We further stated we also understand an environmental analysis will be prepared, and therefore we looked forward to being provided with copies of the cultural resources report and draft environmental assessment for review and comment. We finally stated that if prehistoric cultural resources are identified that will be adversely affected by the proposed project, we request continuing consultation including being provided with a copy of any proposed treatment plans for review and comment.

We value American public lands that include our ancestral lands. Hopi People see our ancestral lands as part of being Hopi, and we expect them passed intact to the next generation. Therefore, we hereby reiterate our request to be provided with hard copies for review and comment of the cultural resources survey report of the area of potential effect and Draft Watershed Plan and Environmental Assessment (Plan-EA) for the proposed Cove Reservoir Watershed Project within the East Fork Virgin River Watershed in Kane County.

Your decision to accept this application at this time appears to be based in the current administration. The current administration will not be current in 2021 and we anticipate the new administration will have new orders reversing current administration orders. The acceptance of this proposal at this time also ignores the current pandemic and heath crisis facing the Hopi Tribe and the World. Furthermore, December is a traditional and ceremonial quiet time for Hopisenom.

Therefore, at this time, we request you withdraw and defer the draft environmental assessment and conduct a full environmental impact statement under the new administration in 2021. If you have any questions or need additional information, please contact the Hopi Cultural Preservation Office. Thank you for your consideration.

Respectfully,

Stewart B. Koyiyumptewa, Program Manager/THPO
Hopi Cultural Preservation Office

Re: Draft Watershed Plan and Environmental Assessment (Plan-EA) for the proposed Cove Reservoir Watershed Project within the East Fork Virgin River Watershed

Dear Mr. Koyiyumptewa,

Thank you for your letter dated December 8, 2020 regarding the Draft Watershed Plan and Environmental Assessment (Plan-EA) for the proposed Cove Reservoir Watershed Project within the East Fork Virgin River Watershed (Cove Reservoir Watershed Project). As requested, enclosed is an additional hard copy of the cultural resources inventory report and the Draft Watershed Plan and Environmental Assessment. An initial copy of the cultural resources report was provided to your office on January 9, 2020 as part of the initial National Historic Preservation Act (NHPA) Section 106 consultation process, and concurrence was received with a determination of no adverse effect to historic properties on February 3, 2020. The consultation letter with concurrence is enclosed for reference. Utah State Historic Preservation Office (SHPO) concurrence was also received on January 17, 2020 and is enclosed with this letter.

The Natural Resources Conservation Service (NRCS) places great value on cultural resources and the need for their preservation for future generations. We recognize the deep connection of the Hopi Tribe to prehistoric archaeological sites, as well as all other Tribes that may claim affiliation to them, and NRCS Utah takes that to heart with all our projects. Because of this, it is the NRCS' default policy to avoid cultural resources sites whenever possible, and in the case of the Cove Reservoir Watershed Project, all eligible cultural resources sites will be avoided by a minimum of 50 feet. In addition, construction personnel will receive training in recognizing cultural/historic objects by an NRCS-approved archaeologist prior to project implementation. In the event that cultural resources or human remains are discovered during construction, procedures will be followed as defined in the NRCS' Prototype Programmatic Agreement with the Utah SHPO.

The NRCS' approval to provide funding to this project proposal evaluated its alignment with the PL-566 Watershed Protection and Flood Prevention Program and agency priority's. We fully grasp the magnitude of the current pandemic, its impact on our families, and especially the health crisis facing the Hopi Tribe, Indian Country, and the World. We also understand that December is a traditional and ceremonial quiet time for the Hopisenom and as such providing comment on this project is much appreciated.

The NRCS has continued planning activities at this time, and as such, has continued the environmental review of the Cove Reservoir Watershed Project. If after compiling and reviewing comments received during the public comment period, it is deemed necessary to prepare an Environmental Impact Statement, we shall do such in accordance with the Council on Environmental Quality regulations implementing the National Environmental Policy Act (NEPA) at 40 CFR Part 1501.3.

Again, thank you for your response, and we look forward to working with you further on the Cove Reservoir Watershed Project. If you have any additional questions or comments, or would like to discuss the project further, please contact State Cultural Resources Specialist Tara S. Hoffmann at 385-258-1266 or tara.hoffmann@usda.gov.

Sincerely,

EMILY FIFE
State Conservationist

Re: Draft Watershed Plan and Environmental Assessment (Plan-EA) for the proposed Cove Reservoir Watershed Project within the East Fork Virgin River Watershed

Dear Ms. Fife,

Thank you for your correspondence dated December 15, 2020, in response to our December 8, 2020 letter, regarding the National Resources Conservation Service (NRCS) and Kane County Water Conservancy District announcing the availability of the Draft Watershed Plan and Environmental Assessment (Plan-EA) for the proposed Cove Reservoir Watershed Project within the East Fork Virgin River Watershed in Kane County, Utah.

The Hopi Tribe claims cultural affiliation to prehistoric cultural groups in Utah. The Hopi Cultural Preservation Office supports the identification and avoidance of prehistoric archaeological sites. We consider the prehistoric archaeological sites of our ancestors to be "footprints" and Traditional Cultural Properties. Therefore, we appreciate the NRCS's continuing solicitation of our input and your efforts to address our concerns.

The Hopi Cultural Preservation Office previously stated we understand the project proposes improvements, including the construction of a new 6,032 acre-foot reservoir, Cove Reservoir, and other improvements within the existing Glendale Orderville irrigation systems. We also stated we understand an environmental analysis will be prepared. Therefore we looked forward to being provided with copies of the cultural resources report and draft environmental assessment for review and comment.

We now acknowledge having received a copy of the cultural resources survey of the area of potential effect and concurring with the determination of no adverse effect. We also understand the State Historic Preservation Office has concurred with the determination. However, when we attempted to review the draft environmental assessment online in response to your November 20, 2020 correspondence, we discovered a Salt Lake City Tribune article entitled "Kane County looking to dam the Virgin River in latest major project."

P.O. Box 123 - Kykotsmovi, AZ 86039 - Phone: 938-734-3000

Concerns expressed in our December 8, 2020 letter in part reflect our experience in light of the incomplete and ongoing Jackson Flat project, and the Tribune article that states:

> After spending tens of millions on water development projects, Kane County water officials are looking to spend millions more, mostly from federal sources, in their latest plan to dam the Virgin River upstream of Zion National Park for the benefit of alfalfa growers.

We have not been consulted on the 4.3 million cubic yards of fill and riprap that would come from borrow pits on federal land or a new 50-acre pit at Black Knoll on the Glendale Bench.

We also listened in to the December 9, 2020, Public Meeting where it was acknowledged this proposal is "much larger" in funding than other NRCS projects under its program and benefits a small number of users.

At this time, in light of the pandemic, the Hopi Tribe's inability to adequately review and consult on this proposal, we appreciate your consideration to conduct a full environmental impact statement under the new administration in 2021. Thank you for your consideration.

Respectfully,

Stewart B. Koyiyumptewa, Program Manager/THPO
Hopi Cultural Preservation Office

Subject: Hualapai Tribe consultation update
Date: Monday, March 1, 2021 10:49:13 AM

I spoke to Mr. Peter Bungart today, he called and left a message late afternoon on Friday, and updated our Tribal Consultation Contact 2021 document to remove the Hualapai Tribe from all consultations for southern Utah. He stated that the Hualapai Tribe identifies with lands south of the Colorado River but considers all of the southern Utah Counties outside of their area of interest. If we have large multi-state projects that span lands south of the Colorado River or projects in the Glen Canyon Dam surrounding Page AZ, we can reach out to see if they are interested in consultations.

I crossed out references to the Hualapai Tribe where they are mentioned in the Counties list and put the text below beneath their contact info.

~~**Hualapai Tribe**~~
~~Dr. Damon R. Clarke (updated 5/2018)~~
~~Chairman~~
~~Hualapai Tribe~~
~~P.O. Box 179~~
~~941 Hualapai Way~~
~~Peach Springs Arizona 86434~~
~~(928) 769-2216~~
-
~~Ms. Dawn Hubbs (updated 5/2018)~~
~~Tribal Historic Preservation Officer~~
~~Hualapai Tribe~~
~~P.O. Box 310~~
~~941 Hualapai Way~~
~~Peach Springs Arizona 86434~~
~~(928) 769-2223~~

Marcel Corbeil update (phone call with Mr. Peter Bungart on 3-1-2021):
peter.bungart@hualpai.nsn.gov is the THPO (928-769-2223)

- Ms. Dawn Hubbs is one of his predecessors but has not been in the position since 2018.
- He was the Tribal archaeologist and became THPO in 2018.
- Dr. Damon Clarke is the Chairman until the 2022 election where he will term-out and be replaced
- He appreciates the effort to reach out but considers it a waste of time and paper for us to reach out to them for project is Utah, specifically mentioning the projects in Garfield and Grand Counties.
- Typically, the Hualapai Tribe identified with all area south of the Colorado River, but all of the counties in Utah are outside their area of interest.
- The Tribe will have interest if we have project surrounding Glen Canyon Dam around Page, AZ, but otherwise can be left out of consultations for counties in Southern Utah.

Draft Plan-EIS Tribal Scoping

January 14, 2022

Mr. Daniel Bullets
Kaibab Band of Paiute Indians of the Kaibab Indian Reservation
Cultural Preservation Office
HC65, Box 2
Fredonia, Arizona 86022

Reference: Cove-East Fork Virgin River Watershed Plan EIS Project

Dear Mr. Bullets:

The United States Department of Agriculture Natural Resources Conservation Service (USDA-NRCS), in coordination with Kane County Water Conservancy District (KCWCD), as the project sponsor and Washington County Water Conservancy District (WCWCD) as the co-sponsor, is considering proposed improvements within the East Fork Virgin River Watershed. The proposed improvements include the construction of a new, approximately 6,055-acre-foot capacity reservoir (Cove Reservoir), as well as other improvements within the existing Mt. Carmel, Glendale and Orderville Irrigation Systems, as needed or identified. Improvements under consideration will address water conservation, agricultural and municipal demands, and public safety risks, while enhancing aquatic species habitat and increasing opportunities for public recreation. Alternative reservoir locations are being examined as well.

This proposed action is prepared under the authority of the Watershed Prevention and Flood Protection Act (Public Law 83–566). This action is needed because agriculture users in the Upper Virgin Watershed routinely experience water shortages during late summer months when East Fork Virgin River flows are depleted. Existing irrigation facilities have limited capabilities to divert water from the river, and there is currently no capacity for storage during non-use and high-flow periods. As a result, adequate water is not available to local users; therefore, the purpose of the action is to provide enhanced conservation and beneficial use of water by increasing water availability through collection and storage during non-use periods to provide adequate flows during the irrigation season.

In cooperation with the KCWCD and WCWCD, USDA-NRCS is in the very early planning stages of preparing an Environmental Impact Statement (EIS) under the National Environmental Policy Act (NEPA) to consider and analyze potential impacts from the action. For the purposes of compliance with NEPA and Section 106 of the National Historic Preservation Act (NHPA), USDA-NRCS is the designated lead agency. Pursuant to Section 106 of the NHPA, Executive Order 13007, the American Indian Religious Freedom Act, we write to you at this time regarding the project and we welcome any information you would like to share with us regarding historic properties or places of traditional religious and cultural importance near the proposed project area

that we should consider as part of our analysis. We would also appreciate your assistance in identifying any other tribes with whom we should consult on this project.

We look forward to hearing from and working with you on this important project. We welcome your call if you have questions on the proposed project or if you wish to arrange a meeting or initiate government-to-government consultation regarding this project. Please respond to our request within 30 days of receipt of this letter.

If you have any questions, comments or concerns, please contact State Cultural Resources Specialist Tara S. Hoffmann at 385-258-1266 or tara.hoffmann@usda.gov, at your earliest convenience.

Sincerely,

Emily Fife

This proposed action is prepared under the authority of the Watershed Prevention and Flood Protection Act (Public Law 83–566). This action is needed because agriculture users in the Upper Virgin Watershed routinely experience water shortages during late summer months when East Fork Virgin River flows are depleted. Existing irrigation facilities have limited capabilities to divert water from the river, and there is currently no capacity for storage during non-use and high-flow periods. As a result, adequate water is not available to local users; therefore, the purpose of the action is to provide enhanced conservation and beneficial use of water by increasing water availability through collection and storage during non-use periods to provide adequate flows during the irrigation season.

In cooperation with the KCWCD and WCWCD, USDA-NRCS is in the very early planning stages of preparing an Environmental Impact Statement (EIS) under the National Environmental Policy Act (NEPA) to consider and analyze potential impacts from the action. For the purposes of compliance with NEPA and Section 106 of the National Historic Preservation Act (NHPA), USDA-NRCS is the designated lead agency. Pursuant to Section 106 of the NHPA, Executive Order 13007, the American Indian Religious Freedom Act, we write to you at this time regarding the project and we welcome any information you would like to share with us regarding historic properties or places of traditional religious and cultural importance near the proposed project area

that we should consider as part of our analysis. We would also appreciate your assistance in identifying any other tribes with whom we should consult on this project.

We look forward to hearing from and working with you on this important project. We welcome your call if you have questions on the proposed project or if you wish to arrange a meeting or initiate government-to-government consultation regarding this project. Please respond to our request within 30 days of receipt of this letter.

If you have any questions, comments or concerns, please contact State Cultural Resources Specialist Tara S. Hoffmann at 385-258-1266 or tara.hoffmann@usda.gov, at your earliest convenience.

Sincerely,

Emily Fife

Dear Ms. Chapoose:

The United States Department of Agriculture Natural Resources Conservation Service (USDA-NRCS), in coordination with Kane County Water Conservancy District (KCWCD), as the project sponsor and Washington County Water Conservancy District (WCWCD) as the co-sponsor, is considering proposed improvements within the East Fork Virgin River Watershed. The proposed improvements include the construction of a new, approximately 6,055-acre-foot capacity reservoir (Cove Reservoir), as well as other improvements within the existing Mt. Carmel, Glendale and Orderville Irrigation Systems, as needed or identified. Improvements under consideration will address water conservation, agricultural and municipal demands, and public safety risks, while enhancing aquatic species habitat and increasing opportunities for public recreation. Alternative reservoir locations are being examined as well.

This proposed action is prepared under the authority of the Watershed Prevention and Flood Protection Act (Public Law 83–566). This action is needed because agriculture users in the Upper Virgin Watershed routinely experience water shortages during late summer months when East Fork Virgin River flows are depleted. Existing irrigation facilities have limited capabilities to divert water from the river, and there is currently no capacity for storage during non-use and high-flow periods. As a result, adequate water is not available to local users; therefore, the purpose of the action is to provide enhanced conservation and beneficial use of water by increasing water availability through collection and storage during non-use periods to provide adequate flows during the irrigation season.

In cooperation with the KCWCD and WCWCD, USDA-NRCS is in the very early planning stages of preparing an Environmental Impact Statement (EIS) under the National Environmental Policy Act (NEPA) to consider and analyze potential impacts from the action. For the purposes of compliance with NEPA and Section 106 of the National Historic Preservation Act (NHPA), USDA-NRCS is the designated lead agency. Pursuant to Section 106 of the NHPA, Executive Order 13007, the American Indian Religious Freedom Act, we write to you at this time regarding the project and we welcome any information you would like to share with us regarding historic properties or places of traditional religious and cultural importance near the proposed project area

that we should consider as part of our analysis. We would also appreciate your assistance in identifying any other tribes with whom we should consult on this project.
