CHAPTER II

COLORADO RIVER STORAGE PROJECT

PLAN OF DEVELOPMENT

In addition to 100 potential in-basin projects and several major water exportation projects outlined in the Colorado River Report (H.D. 419, 80th Congress), other potential projects using upper basin water no doubt remain to be discovered. The water requirements of all possibilities far exceed the consumptive use apportioned to the upper basin. From the many potentialities, projects must be segregated that have consumptive use requirements compatible with the uses apportioned the respective States of the upper division. Since this selection must be preceded by extensive investigation and detailed study, it is not practical at this time to designate features and projects for inclusion in the ultimate plan of basin development.

The presently constructed and authorized projects are considered the first stage of basin development. Sufficient information is available to permit the selection of a small group of projects to be included in a second stage of basin development. The group would consist of a number of individual irrigation and multiple-use projects and one unit of the Colorado River Storage project. Included in the second stage of basin development, but independent of the plan proposed herein, would be private projects and Federal reclamation projects not requiring financial assistance of the plan. Initiation of the Colorado River Storage project and the river regulation afforded by its operation would permit subsequent stages in the ultimate development of Colorado River resources in the States of the upper division.

Under the Colorado River Storage project large regulatory reservoirs would be constructed along the Colorado River and its principal tributaries above Lee Ferry, Arizona. The hold-over storage thus provided would be a necessary addition to more than 5 million acre-feet of new storage, as shown in the chart on the following page, which would be required on tributary streams for individual water-use projects in the States of the upper division.

The necessity for hold-over storage arises from the provision of the Colorado River Compact apportioning in perpetuity to each the upper basin and the lower basin the consumptive use of 7,500,000 acre-feet of water annually and from the provision specifying that States of the upper division will not cause the flow of the river at Lee Ferry to be depleted below an aggregate of 75,000,000 acre-feet for any period of 10 consecutive water years.

After the signing of the Colorado River Compact, the upper basin suffered a protracted drouth far more severe than experienced during the periods of previous water supply records. During the 10-year period from October 1931 through September 1940 the flow at Lee Ferry averaged only 10,151,000 acre-feet. This would be equivalent to an estimated virgin or undepleted average annual 10-year flow of about 11,832,000 acre-feet. Without a reservoir system with sufficient capacity to carry over into the drouth period excess flows from years of high run-off, recurrence of such drouth conditions would permit in the States of the upper division man-made depletions averaging only about 4,332,000 acre-feet annually as measured at Lee Ferry. Reductions would be made in the permissible depletions as necessary for the States

the upper division, under provisions of the Colorado River Compact, assist in meeting deficiencies in Mexico. During protracted dry periods under the Colorado River Storage project, sufficient water would be released to the States of the lower division from hold-over storage to permit upstream flows to be utilized in the States of the upper division up to their apportioned beneficial consumptive use.

Use of water on upstream tributaries would affect the operation of Colorado River Storage project facilities. As more complete information on upstream water uses becomes available, further analysis of residual flows may dictate changes in the capacities and locations of some regulatory reservoirs now being considered. Some potential units of the Colorado River Storage project must be further investigated before their relative water conservation efficiencies and economic limitations may be determined. More careful consideration must be given to the storage capacity needed to fulfill other beneficial functions of multiple-purpose developments such as sediment retention, power production, recreation, flood control, and conservation of fish and wildlife.

It is imperative that the reservoirs providing storage capacity be located at sites collectively capable of permitting, through storage water replacements, the greatest possible yield from the waters of the Upper Colorado River Basin within the consumptive use apportioned annually to the States of the upper division consistent with the production of electric energy in the substantial amount necessary for the economic development of the water and other related natural resources of the States of the upper division.

Reservoir Sites

Comparative water supply and economic studies have been made for ght potential storage sites within the upper basin, six of which, es- ially adaptable for hold-over purposes, have been included in the n. Three other sites in the upper basin, where power facilities uld benefit from upstream hold-over storage, have also been included. racteristics of the sites considered are summarized in the table on following page.

Studies to date indicate that compliance with Lee Ferry flow obli- ions during future drouth periods equal in severity to the 1931-1940 iod would require at least 23 million acre-feet of active hold-over rage capacity if maximum utilization of the water apportioned the es of the upper division were to be attained.

To protect the exclusive use of storage for hold-over purposes, space be provided in the regulatory reservoirs for the storage of encroach- sediment. Regulatory reservoir evaporation, recognized in the Upper orado River Basin Compact as a legitimate charge against the apportioned sumptive use of the States of the upper division, limits the extent to such protection might be justified. The mean annual sediment load ported by the Colorado River past Lees Ferry has been estimated at ,000 acre-feet. For the purpose of this report, complete sediment tion was planned for a period of 200 years. Over this period roximately 18 million acre-feet of sediment would be retained, of an estimated 12 million acre-feet would be retained in the active

storage sections of the reservoirs above Lee Ferry. Succeeding generations could maintain the protection by controlling some sediment at its source and by developing remaining upstream sediment storage sites. Little, if any, reduction in the sediment volume entering the main channels of the river is anticipated for future years because of the great extent of the sediment-contributing areas and their physical characteristics.

The release of water from the regulatory reservoirs would provide an excellent opportunity for the production of firm electric energy. Active storage pools containing about 12 million acre-feet would be necessary, however, to provide the minimum heads required for operation of the various hydroelectric plants. These pools would also retain, in 50 years, about 6 million acre-feet of the sediment entering the reservoirs. In addition to the losses incurred during the initial filling of the inactive storage pools, there would be a consumptive use directly attributable to inactive storage. This use would amount only to the incremental evaporation losses entailed by superimposing the active storage capacities upon the inactive storage pools. The States of the upper division could well afford to include these inactive storages in their apportioned use in view of the necessity for sediprovisions and the tremendous benefits which would be derived from generation and sale of electric energy.

Under average stream flow conditions, sufficient unused water would be available for rapid filling of all project storage facilities. The

reservoirs would remain nearly full as long as the river flow was sufficient to meet the 10-year 75,000,000 acre-foot Lee Ferry flow obligation and to supply any flow required from the States of the upper division to meet deficiencies in Mexico. During periods of critically low flow the States of the upper division, in order to utilize their full apportionment of consumptive use (7,500,000 acre-feet annually minus 50,000 acre-feet to Arizona), would release water from hold-over storage reserves to meet their Lee Ferry obligation. Following such a release of regulatory storage water in exchange for upstream uses within the apportioned amount of 7,450,000 acre-feet annually, the States of the upper division would replenish their reserves during years of favorable water supply.

Of the eight reservoirs considered, the Bluff and Dewey would be the least desirable from the standpoint of reservoir evaporation losses and are not included in the plan. Both reservoirs would have large exposed water surface areas at appropriate capacities. Despite the disadvantage of excessive evaporation, storage at either or both sites may eventually become desirable inasmuch as these reservoirs would intercept sediment originating upstream and thus protect active capacity at the strategic Glen Canyon site.

Reservoirs at the Echo Park, Flaming Gorge, Cross Mountain, Rattlesnake, and Curecanti sites, all of which are included in the proj- ect plan, would have low evaporation losses. These reservoirs would be principally confined within narrow canyon sections and thus would not

have large exposed water surfaces or would be located on the headwater reaches of the river where evaporation rates would be low. Besides providing river regulation, all of these developments would produce considerable quantities of electric power.

The Glen Canyon site, located about 15 miles upstream from Lees Ferry, is the lowest possible point for regulation in the upper basin. It is also the only site where both the physical features and the water supply justify storage of more than 10,000,000 acre-feet. Physically the site will permit construction of a dam to impound more than 30,000,000 acre-feet. Present detailed studies have shown an economic justification for a total capacity of at least 26,000,000 acre-feet under the Colorado River Storage project.

Large-scale storage in Glen Canyon would be comparatively efficient even though the reservoir would have a rather high water surface evaporation rate. The large flow at the site and the high dam would combine to produce more than 4 billion kilowatt-hours of firm energy annually. Existing and potential downstream developments would benefit materially from the stream flow regulation at Glen Canyon. The useful lives of these developments would be extended with sediment retention in the upper basin.

The Split Mountain, Black Canyon, and Bridgeport sites have limited storage possibilities. Development of the sites is included in the plan, however, as they are located below large potential regulatory reservoirs and thus offer opportunities for extensive power production. Releases from Curecanti Reservoir would pass

through the Black Canyon power plant, operating under an average head of nearly 1,600 feet, and then through the Bridgeport power plant, operating under an average head of nearly 250 feet. More than 300 feet of head at the Split Mountain Dam and power plant would utilize releases from Echo Park Reservoir.

Besides providing river regulation, storage reservoirs at Bridgeport and Flaming Gorge sites are expected to serve irrigation needs. A gravity diversion from Flaming Gorge Reservoir could supply replacement water to lands in the Uinta Basin under the Central Utah project. Water from Bridgeport Reservoir could be used to supply replacements for Grand Valley lands prior to maximum upstream depletions for future developments.

Possibilities also exist for irrigation developments in connection with project storage facilities at the Cross Mountain, Curecanti, and Split Mountain sites. Water from Cross Mountain Reservoir could be used for irrigation of new lands in Colorado and Utah north of the White River. Curecanti storage water could be used to provide replacement water for Uncompahgre Valley lands after ultimate development of projects diverting water from the Colorado River Basin into the drainage basins of the South Platte and Arkansas Rivers. Split Mountain Reservoir could supply lands near the mouths of White and Duchesne Rivers by gravity and thus avoid pumping of a supply direct from the Green River. These possibilities, however, must be further investigated before they can be incorporated as a part of the project plan.

To supply the anticipated power requirements, all of the power facilities at the sites tabulated in the table on page 17 should be in operation by 1980. Development of all the sites, except Bluff and Dewey, would be necessary to provide the 23,000,000 acre-feet of active hold-over storage necessary to assure maximum water utilization in the States of the upper division and to maintain this capacity against the encroachment of sediment during the next 200 years. Early construction would permit rapid filling of hold-over reservoirs with unused water and would allow the greatest use of undepleted flows for immediate power generation.

Echo Park Unit

A curved, concrete, gravity dam at the Echo Park site would be constructed as the first unit of the Colorado River Storage project. This dam would rise 525 feet above the present river level to a maximum elevation of 5,575 feet. It would impound 6,460,000 acre-feet of water for hold-over purposes, power production, sediment control, and other beneficial uses. Storage so located could be compatibly integrated with any future combination of potential hold-over storage developments.

Echo Park was named by Major J. W. Powell during his expedition through the canyons of the Green and Colorado Rivers in 1869. The park was formed by the Green River as it leaves Ladore Canyon at the Yampa River confluence and reverses its southern direction around the peculiar geological formation named "Steamboat Rock." The dam site is located near the entrance to Whirlpool Canyon about 2 miles downstream from Echo Park.

The reservoir formed by the dam would extend 63 miles upstream on the Green River and 44 miles up the Yampa River. The mean annual inflow from the two rivers would be nearly 3,500,000 acre-feet with extremes ranging from a high of nearly 5,500,000 acre-feet to a low of less than 1,000,000 acre-feet.

Present stream flow regulated at this site would produce more than 1 billion kilowatt-hours of firm energy annually. With additional beneficial consumptive use upstream from Echo Park, the firm power would be reduced by about 20 percent in 50 years. The reduced power output, however, would be integrated into the over-all system.

The physical characteristics of the reservoir basin insure a very high storage efficiency. The basin is confined by narrow canyon walls, except for the Browns Park area on the Green River and two smaller areas near the mouth of the Yampa River. The evaporation rate is comparatively low. Salvage of present losses, particularly at Browns Park, would be credited against the losses of Echo Park Reservoir.

Sediment originating upstream from Echo Park would not seriously impair the efficiency of the reservoir. With the construction of the Flaming Gorge Reservoir as planned, about 450,000 acre-feet of sediment would enter Echo Park Reservoir in 100 years. Since about one-third of the sediment would find its way to the dead storage pool only a 300,000 acre-foot reduction in the 5,000,000 acre-feet of active storage would result.

The Echo Park unit would include facilities necessary to deliver electric energy to load centers in Utah, Colorado, and Wyoming.

Construction and maintenance of the 30-mile access highway from the dam to transcontinental Highway U. S. 40 would open up an area of unexcelled scenic beauty now practically inaccessible.

WATER RESOURCES

The first lands to be developed within the Upper Colorado River [illegible] were situated along tributary channels where a sufficient water supply was easily obtained at relatively low cost. Subsequent expansion and settlement have been limited to lands located successively farther from the streams. These have required more costly developments to obtain an irrigation supply, including works to store early season surplus flows for use in the late season when the flow in most streams fails to meet the rights of even the earlier appropriators.

The pattern of precipitation in the basin is characteristic of most areas in the western United States. The precipitation contributing the greatest portion of the stream flow in the Colorado River and its tributaries falls as snow during the winter months in the high mountain ranges. With the higher temperatures of the late spring and early summer months, this snow cover melts and pours an uncontrolled torrent into the channels. Run-off in the river during the months of April, May, June, and early July comprises more than two-thirds of the annual flow at Lee Ferry. Normally these high flows subside by late July to near the base or minimum flow, which consists of the flow from spring-fed headwater streams and return flows from irrigation. The large areas below the mountain reaches of the basin contribute very little to the flow and then only during early spring snow melt or subsequent rain floods of short duration. The variations in temperature, precipitation, and evaporation between the headwater areas and the lower reaches of the basin are presented in the drawing on the following page.

COLORADO RIVER STORAGE PROJECT

PRECIPITATION, TEMPERATURE AND EVAPORATION

DRAWN . . . HRS. . SUBMITTED	
TRACED . . . HRS. . RECOMMENDED	
CHECKED W.B.H. . APPROVED	
289-P-122	SALT LAKE AREA OFFICE JAN. 1949

The period of high stream flow does not coincide with the period of high irrigation demands. The high flows of April, May, and June pass unused into the main drainage channels while the reduced flows during the remaining months of the irrigation season are insufficient to meet the full demands of the presently irrigated lands. An increased supply for these lands and a full supply for irrigable new lands can be obtained by providing project storage.

The problem of seasonal regulation, while costly, is secondary to the need for providing the long-term regulation required to insure maximum beneficial consumptive uses and meet downstream compact and treaty obligations. Without the long-term regulation in a system of large-capacity reservoirs, the States of the upper division cannot fully consummate the consumptive uses apportioned them and meet the Lee Ferry flow obligations imposed by the Colorado River Compact. With construction of the proposed system of hold-over storage reservoirs and coordination of their operation to include all possible functions of multiple-purpose use, the States of the upper division can be assured the maximum use of their apportioned water supply and the financial assistance from power revenues necessary to accomplish this use.

Water Rights

Water for the various units of the Colorado River Storage project must be appropriated in accordance with the law of the State in which the point of diversion is located. Although the water law in each

State is fundamentally the same, the procedure for acquisition of rights is largely statutory and the law in one State differs in minor details from the law of other States. In all of the Upper Basin States, the law of appropriation obtains. Water is considered the property of the public and rights to its use can be acquired only by actual diversion and application to beneficial use. The priority of a right is determined by the date of its initiation and "first in time is first in right."

Under State law, the only water available for the Colorado River Storage project is the quantity left in a stream after all prior rights are fully satisfied. Further limitations are imposed by the Colorado River Compact, the Mexican Water Treaty, and the Upper Colorado River Basin Compact. A determination of the adequacy of the water rights for any unit of the project will thus require a finding as to the (1) quantity of water available at the proposed point of diversion and the (2) extent of existing rights.

Significance of Existing and Proposed Legislation

From the standpoint of water rights, no existing Federal laws would impede the development of the Upper Colorado River Storage project as herein outlined. The only limitations upon rights acquired in accordance with State law are (a) the paramount right of the

United States to control navigation and project navigability under the commerce clause of the Constitution of the United States; (b) limitations imposed by treaty; and (c) limitations imposed by compacts.

Water Rights for Echo Park Unit

Approval of the Upper Colorado River Basin Compact assured for the Echo Park unit rights to the waters of the Yampa River and the Green River above the Yampa. The compact provides in Article XIII (a) that:

"The State of Colorado will not cause the flow of the Yampa River at the Maybell Gaging Station to be depleted below an aggregate of 5,000,000 acre-feet for any period of

ten consecutive years reckoned in continuing progressive series beginning with the first day of October next succeeding the ratification and approval of this Compact. In the event any diversion is made from the Yampa River or from tributaries entering the Yampa River above the Maybell Gaging Station for the benefit of any water use project in the State of Utah, then the gross amount of all such diversions for use in the State of Utah, less any returns from such diversions to the river above Maybell, shall be added to the actual flow at the Maybell Gaging Station to determine the total flow at the Maybell Gaging Station."

Other compact provisions previously mentioned, relating to diversion of water in one State for use in another State, sharing of reservoir losses, and administrative control of regulatory reservoirs effectively permit the acquisition of the necessary water rights under Colorado law for the Echo Park unit and the orderly administration of the unit.

Available Supply

The flow of the Colorado River at Lee Ferry, a point 1 mile below the mouth of the Paria River, is the total amount contributed to the Colorado River system by the upper basin. Significant stream flow

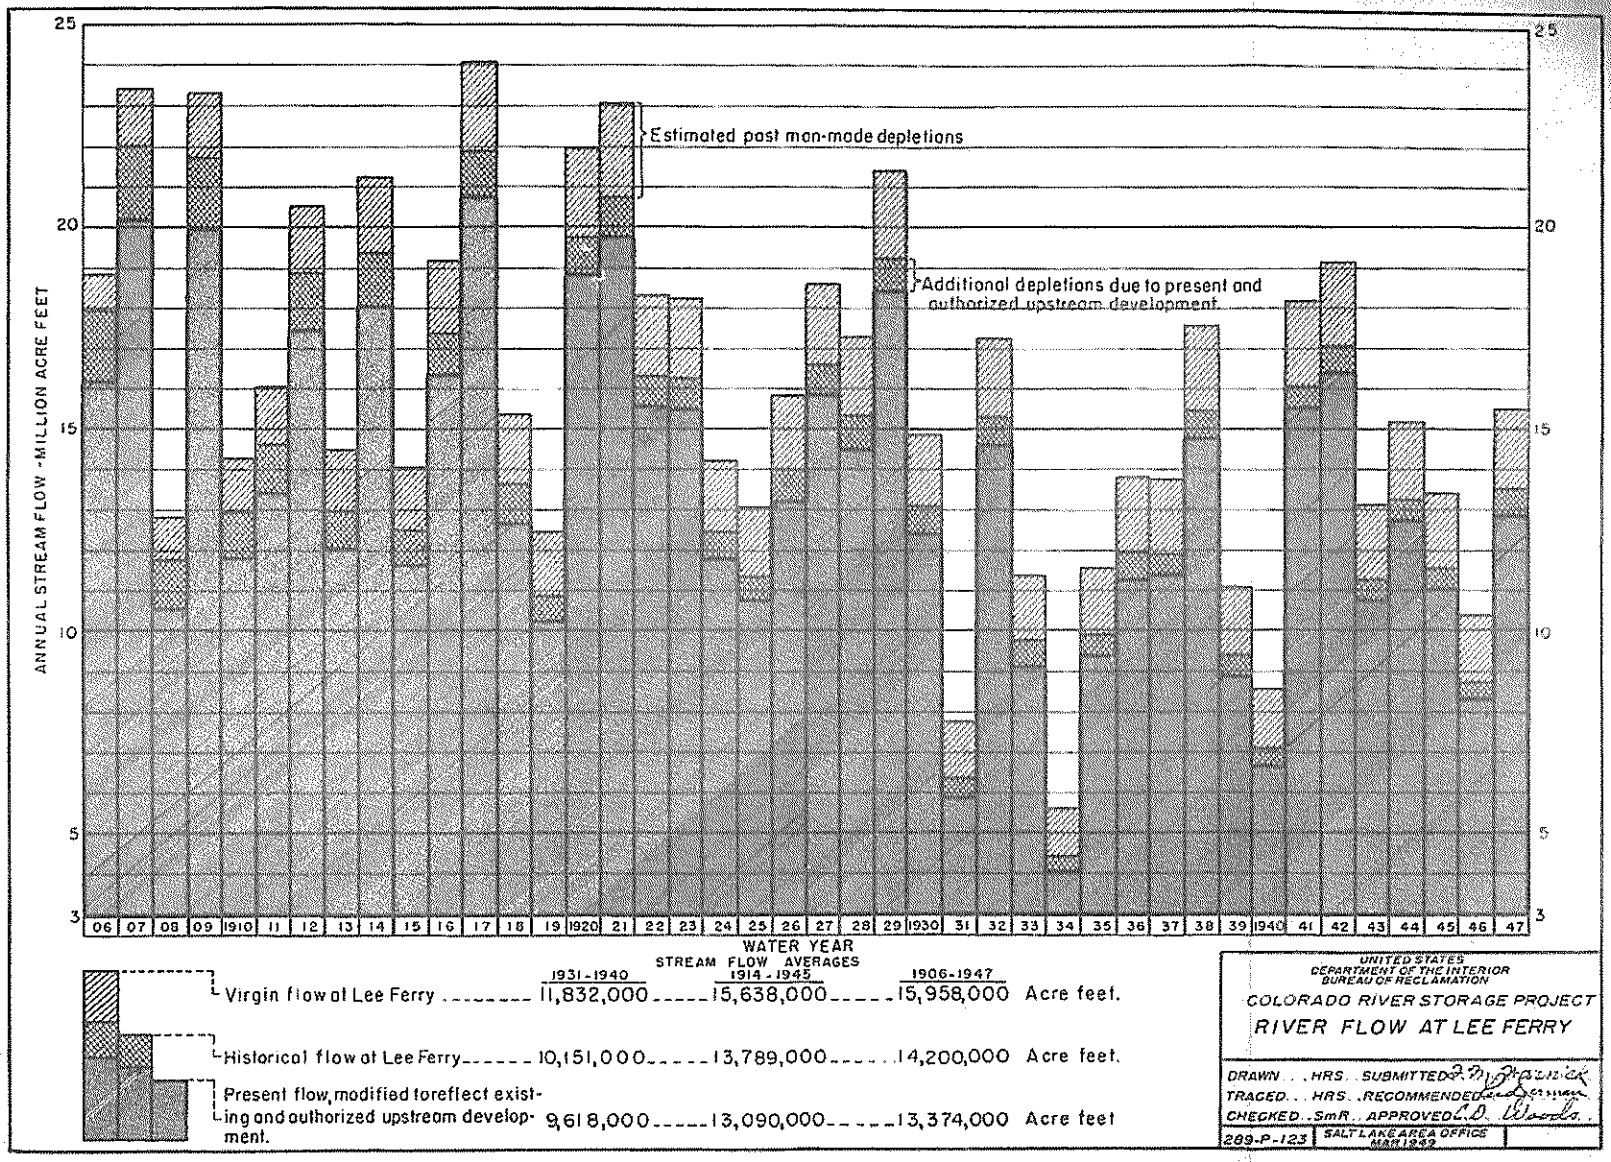
data at Lee Ferry for the period 1906-1947 are shown in chart form on the following page and in the table on page 32.

Historical Flow

The historical flow at Lee Ferry is computed by adding to the flow of the Colorado River at Lees Ferry (which is above the mouth of the Paria River) the flow of the Paria River. The run-off of the Colorado River has been measured at Lees Ferry since June 1921. The run-off of the Paria River has been measured since November 1923. The monthly historical flows at both stations were extended by correlation with upstream recorded flows to cover important periods required in water supply studies. The Engineering Advisory Committee of the Upper Colorado River Basin Compact Commission extended the monthly records to cover the period 1914 to 1945 for use in their studies. For this interim report the Bureau of Reclamation extended the Engineering Advisory Committee's data to cover the period 1906 to 1947.

Past Man-Made Depletions

The Engineering Advisory Committee determined the 1914-1945 average annual man-made depletion of the flow at Lee Ferry to be 1,849,800 acre-feet. This depletion includes consumptive use by irrigation and also uses incident to irrigation, exports from the basin, evaporation from storage reservoirs, and domestic use--all reduced by the estimated salvage of channel losses. Estimated average depletions above Lee Ferry at the sites of use and the corrections for estimated channel salvage are shown in the following table.



STREAM FLOW AVERAGES

	1931-1940	1914-1945	1906-1947

289-P-123 | SALT LAKE AREA OFFICE MAR 1948

PAST MAN-MADE DEPLETIONS IN UPPER BASIN
(Annual Averages for 1914-1945, Inclusive)

Unit--acre-feet

Effect on stream flow	Total upper basin	States of upper division
Man-made depletions at sites of use		
Cropped lands	1,449,000	1,445,200
Incidental areas	315,400	315,400
Transmountain diversions	122,700	122,700
Reservoir evaporation losses	25,900	25,700
Domestic use	14,100	14,100
Total depletions at sites of use	1,927,100	1,923,100
Credits from importation and channel salvage		
Water supplied by importation	4,000	4,000
Channel loss salvaged for use upstream	73,300	73,300
Total credits	77,300	77,300
Net depletion at Lee Ferry	1,849,800	1,845,800

The average depletion determined by the Engineering Advisory Committee was modified and extended by the Bureau to show annual depletions for the period 1906-1947. This was accomplished by giving proper consideration to estimated and recorded exports from the basin and to in-basin uses for irrigation consummated during the period not included in the committee's studies. Depletions resulting from irrigation in the basin were estimated by multiplying the past irrigated acreage by the rate established by the Engineering Advisory Committee as an average per acre depletion rate measured at Lee Ferry. Appropriate adjustments were made to account for the annual variations in water supply.

Virgin Flow

The estimated virgin run-off at Lee Ferry for the 1906-1947 period was determined by adding the estimated consumptive use in the upper

*1906-23 period for Paria River and 1906-21 period for Colorado River were estimated by correlation with upstream gaged records.

**Column 4 obtained from the following formula: Column 4 = $\frac{1}{\left(1 + \frac{\text{Annual Virgin Flow}}{\text{1914-45 Mean Virgin Flow}}\right)}$.

Note: Successive approximations of virgin flow were made in order to compute Column 4 as shown. First approximation was made using annual and mean historical flows.

basin in terms of depletions at Lee Ferry to the computed historical flow at Lee Ferry. This flow and the factors considered in its computation are shown in the table on page 32.

Present Modified Flow

The present modified flow constitutes the basic water supply for all future developments in the upper basin. It represents the flow which could be expected at Lee Ferry should a run-off period similar to the 1906-1947 period recur with all present and authorized developments under operation. The present modified flow was estimated by effecting appropriate adjustments in the historical flow at Lee Ferry to reflect progressive changes of consumptive uses since 1906. These adjustments reflect actual changes in irrigation, transbasin exports, reservoir evaporation and domestic uses, and also similar uses anticipated under new projects now authorized for construction. The adjustments made in the historical flow and the resulting modified flow are shown in the table on the following page.

Future Man-Made Depletions

In studying the problems of river regulation it was necessary to assume a distribution of apportioned consumptive use in each of the upper basin States. Reflected in this distribution were the uses at existing developments and roughly estimated uses of potential projects. An appropriate allowance was also made in each State's apportionment for evaporation from regulatory reservoirs. Several upper basin project possibilities were considered in detail in connection with the

distribution. The probable future uses were primarily determined, however, from a broad consideration of tributaries or subbasins. Adjustments in the distribution of uses assumed among the States may become necessary after future detailed project investigations, but no substantial variation is anticipated in the assumed effects at Lee Ferry.

Uses contemplated in the upper basin demand a more or less uniform annual delivery of water at the sites of final utilization. Shortages of material consequence could be tolerated only under conditions of extreme drouth. Therefore, because of variations in stream flow, storage reservoirs would be required at the sources of supply or at intermediate points. As a rule these reservoirs would carry water over into years of low run-off and would refill during years of favorable water supply. Opportunities are limited for storage regulation at the headings of some of the major projects that contemplate diversions across the basin's natural boundaries for use within the States of the upper division. Thus these projects would require regulation outside the natural boundaries of the upper basin. Diversions under the projects would vary in amount from year to year according to the availability of natural water supply. Likewise in-basin projects relying only on direct stream flow diversions would entail varying annual uses. For some of the potential projects which have been studied in detail variations in use were estimated from operational studies. In other instances departures from mean annual use were arbitrarily assumed to follow to some degree the variations of natural water supplies.

The policy of the States of the upper basin is reflected in Article VI of the Upper Colorado River Basin Compact which states that the quantity of consumptive use of water apportioned for the upper basin and for each State of the upper basin shall be determined by the inflow-outflow method in terms of man-made depletions of virgin flow at Lee Ferry. It follows, therefore, that any changes in the regimen of the system above Lee Ferry resulting from storage operations or direct diversions would be reflected to a large degree as man-made depletions at Lee Ferry.

When water is diverted and consumed upstream, changes in natural losses in downstream channels are to be expected. Stream depletions at the sites of use are, therefore, not necessarily reflected in equal magnitude at Lee Ferry. The States of the upper division, in measuring consumptive use in terms of man-made depletions at Lee Ferry, will automatically account for these differences in depletions. The differences, however, are extremely difficult to appraise at this time. The Bureau in its studies considered only the reaches of regulatory reservoirs in determining possible salvage of natural channel losses. The salvage will be further considered in future Bureau studies. Man-made depletions at Lee Ferry have been estimated over the period 1914 to 1945, inclusive, which has been selected by the Engineering Advisory Committee as a representative long-time period. A long-time period was used as the States of the upper basin contend the depletions are to be reckoned as long-time averages.

Upon completion of authorized developments, the estimated consumptive use in the upper basin would approximate 2,549,000 acre-feet annually. Thus an estimated 4,951,000 acre-feet annually would remain for future use in the upper basin. Present and authorized consumptive use and the use remaining for future development, all estimated in terms of long-time averages, are given by States in the following table.

ANNUAL CONSUMPTIVE USE MEASURED IN TERMS OF LONG-TIME AVERAGE DEPLETIONS AT LEE FERRY

Unit--acre-feet

State	Apportioned use	Present and authorized use	Use remaining for future development
Arizona	50,000	11,000	39,000
States of the Upper Division			
Colorado	3,855,000	1,592,000	2,263,000
New Mexico	838,000	79,000	759,000
Utah 23%	1,714,000	628,000	1,086,000
Wyoming	1,043,000	239,000	804,000
Subtotal States of Upper Division*	7,450,000	2,538,000	4,912,000
Total Upper Basin	7,500,000	2,549,000	4,951,000

*Subject to Lee Ferry flow obligations

Limitation on future Man-Made Depletions

Without a reservoir system of sufficient capacity to carry over into a drouth period excess flows from years of high run-off, only a partial consummation of the use (7,450,000 acre-feet annually) apportioned the States of the upper division would be possible. Limitations

could be imposed during drouth periods in order that States of the upper division could conform with Article III (d) of the Colorado River Compact specifying that the States of the upper division will not cause the flow of the river at Lee Ferry to be depleted below an aggregate of 75,000,000 acre-feet for any period of 10 consecutive years.

The severity of possible limitations on consumptive use can best be demonstrated by a study of flow conditions during the drouth period 1931 to 1940, the most severe drouth period of record. The estimated virgin flow of the river during this period amounted to approximately 118,320,000 acre-feet. Thus, to meet their Lee Ferry obligations, the States could have depleted the river flow during the 10-year drouth period by only 43,320,000 acre-feet in terms of man-made depletions at Lee Ferry. Such a depletion indicates an average use of 4,332,000 acre-feet annually. The annual use, however, would have varied greatly over the 10-year period and would have been below the average in several years. The use would have been particularly curtailed in 1931, 1934, and 1940, extremely low run-off years.

Under sound engineering practices, water-use projects would be expected to absorb major shortages such as occurred in the extremely low run-off years. Appropriate allowance for over-all shortages during the 10-year period of study would permit maximum use possibly 10 per-cent greater than the average use of the period. Thus, without river regulation plans could proceed for projects which would annually consume, in terms of man-made depletion at Lee Ferry, a maximum of only about 4,750,000 acre-feet of Upper Colorado River Basin water in the States

of the upper division. Present and authorized projects in the States of the upper basin (including a very minor use in Arizona) would cause a 10-year average annual depletion of 2,214,000 acre-feet. This is the difference in the 10-year mean virgin and the present modified flows shown on the following chart. Without river regulation an average annual depletion of 2,118,000 acre-feet would be permissible for new development in the upper division, neglecting the minor use in Arizona. Should the States of the upper division be required to assist in meeting deficiencies in Mexico during a critical 10-year period of low run-off, such as occurred in the 1931-1940 period, a corresponding reduction would be required in the permissible uses outlined above.

Storage Requirements

The Colorado River Storage project would provide and maintain sufficient hold-over storage capacity to permit the States of the upper division to meet Lee Ferry flow obligations and utilize the full consumptive use apportioned them under the terms of the Colorado River Compact.

Irrigation Storage Requirement

In a broad sense all Colorado River water-use projects in the States of the upper division initiated subsequent to the signing of the Colorado River Compact in 1922 would participate in the regulatory benefits afforded by the Colorado River Storage project. Most of the benefits would result from water replacements at storage sites considerably below the actual points of use. Some irrigation projects,

owever, would require joint use of certain storage sites that would be veloped by the Colorado River Storage project.

Under the provisions of rticle IX of the Upper Colorado River Basin mpact, any signatory State can fully utilize, or participate in the ilization of, any storage site, including the sites being considered der the Colorado River Storage plan, if such utilization is necessary for the purpose of diverting, conveying, storing, or regulating water or consumptive use within the apportionment of that State.

There are two fairly well defined instances where individual projects ould share in the use of Colorado Storage project facilities. A direct flow diversion to the Central Utah project would require 1,000,000 acre-et of inactive storage in the potential Flaming Gorge Reservoir at Red anyon Dam site. Ultimately the project would also need to participate the active capacity to the extent of 300,000 acre-feet to assure iversion of a constant annual supply from the depleted flows of the een River. When upstream developments in the State of Colorado deplete stream flow below the established irrigation rights of Grand Valley nds, the Bridgeport Reservoir would function as a replacement unit quiring approximately 500,000 acre-feet of capacity for that purpose.

Other possibilities for joint use of Colorado River Storage cilities are recognized but are not included in the plan described rein. Water from Cross Mountain Reservoir could be used for irriga-n of new lands in Colorado and Utah north of the White River. esanti storage water could be used to provide replacement water for Uncompahgre Valley lands after ultimate development of projects diverting

water from the Colorado River Basin into the drainage basins of the South Platte and Arkansas Rivers. Split Mountain Reservoir could supply lands near the mouths of White and Duchesne Rivers by gravity and thus avoid pumping of a supply direct from the Green River. These possibilities, however, must be further investigated before they can be incorporated as a part of the project plan. Prior to starting the ultimate development of the Central Utah project, it may also be found desirable to make irrigation replacements by pumping from Echo Park Reservoir rather than by a gravity diversion from Flaming Gorge Reservoir. The plan of ultimate development of the Colorado River Storage project is flexible enough to accommodate any or all of these developments if the need for them should arise. Should it be found necessary to utilize Colorado River Storage project facilities further for water uses of any signatory State, proper adjustments could be effected under the terms of Upper Colorado River Basin Compact.

why? on what ground?

Active Hold-Over Requirements for River Regulation

The time and magnitude of deficiencies at Lee Ferry which must be satisfied by water released from the active hold-over reserves of the Colorado River Storage project can best be demonstrated by disregarding for the moment the 75,000,000 acre-foot 10-year Lee Ferry flow obligation (Article III (d) Colorado River Compact) and by visualizing what might be termed ultimate depleted unregulated flow at Lee Ferry. This flow is the unregulated residual flow that would occur at Lee Ferry with unrestricted consummation of the use apportioned to the upper basin.

Ultimately man-made depletions at Lee Ferry would of necessity exceed 7,500,000 acre-feet in some years and would likewise fall short of 7,500,000 acre-feet in some years if the use apportioned to the upper basin (7,500,000 acre-feet annually) were fully realized. An estimate of ultimate man-made depletions in the upper basin averaging 7,500,000 acre-feet annually at Lee Ferry over the long-time period 1914-1945 is shown on the table on page 43. Also shown on the table is the ultimate depleted unregulated flow at Lee Ferry which is equivalent to the difference between virgin flow and ultimate man-made depletions.

Arizona, being a State of the lower division, is not restricted by Article III (d) of the Colorado River Compact with regard to the utilization of her apportioned use in the upper basin. Arizona, in using her apportioned upper basin water, amounting to 50,000 acre-feet annually measured in terms of long-time average man-made depletions at Lee Ferry, could thus cause the flow of the river at Lee Ferry to be depleted below an aggregate of 75,000,000 acre-feet for any period of 10 consecutive years.

Suppose, for example, Arizona were not using any of her apportionment of upper basin water and, because of uses in the States of the upper division within their apportionment, the flow of the river at Lee Ferry were being caused to be depleted below an aggregate of 75,000,000 acre-feet in a period of 10 consecutive years. Then the States of the upper division would either be required to curtail their uses or release water from hold-over storage for satisfaction of their obligation not

*Use (apportioned by Colorado River Compact) measured in terms of man-made depletions at Lee Ferry.
**Use (apportioned by Upper Colorado River Basin Compact) measured in terms of man-made depletions at Lee Ferry.

to deplete the flow at Lee Ferry below 75,000,000 acre-feet. However, under similar conditions, should Arizona come in with a use of upper basin water within her apportionment, she would further deplete the flow at Lee Ferry to the extent of her man-made depletions as measured at Lee Ferry. With full realization in Arizona of her upper basin apportioned consumptive use of 50,000 acre-feet annually measured in terms of average long-time depletions at Lee Ferry, it can be demonstrated that, while the States of the upper division would be fully complying with their 75,000,000 10-year Lee Ferry flow obligation, the residual 10-year flow at Lee Ferry could be as low as 74,500,000 acre-feet because of nonobligated uses in Arizona.

In the last column of the table on page 43 are indicated the deficiencies or minus quantities that would have required satisfaction at Lee Ferry by the States of the upper division from 1914 to 1947 if their apportioned consumptive uses were fully consummated. Also given are the excesses or positive quantities that would have been available for storage in the regulatory reservoirs before the deficiencies occurred.

The greatest demand for storage, requiring 21,340,000 acre-feet of capacity, occurred during the 10-year period 1931-1940. It must be noted, however, that data in the table are based on annual flows. The deficiencies indicate, for illustrative purposes only, the storage that would have been required if concentrated at one site. Estimated evaporation losses at the single site are included in the 7,500,000 acre-foot average man-made depletion. More detailed studies conducted on a monthly

flow basis with storage and evaporation distributed at several sites indicate that 23,000,000 acre-feet of active hold-over capacity would actually be needed.

The 23,000,000 acre-feet of capacity would be required of the Colorado River Storage project alone for active hold-over storage. This is in addition to some 5,000,000 acre-feet of active capacity that would be provided by upstream water-use projects for their own use. The operations of water-use projects are reflected in the ultimate man-made depletions at Lee Ferry in column 2 of the table on page 43.

Sediment Storage Requirement

In view of climatic conditions, geologic structures, and other influencing factors which limit erosion control, provisions must be made for storage of sediment flow in the upper basin. Incomplete surveys conducted at the time the Colorado River Report was written indicated an average annual sediment inflow at Lake Mead of 137,000 acre-feet. Approximately 93,000 acre-feet of this inflow originated above the reservoirs of the Colorado River Storage project.

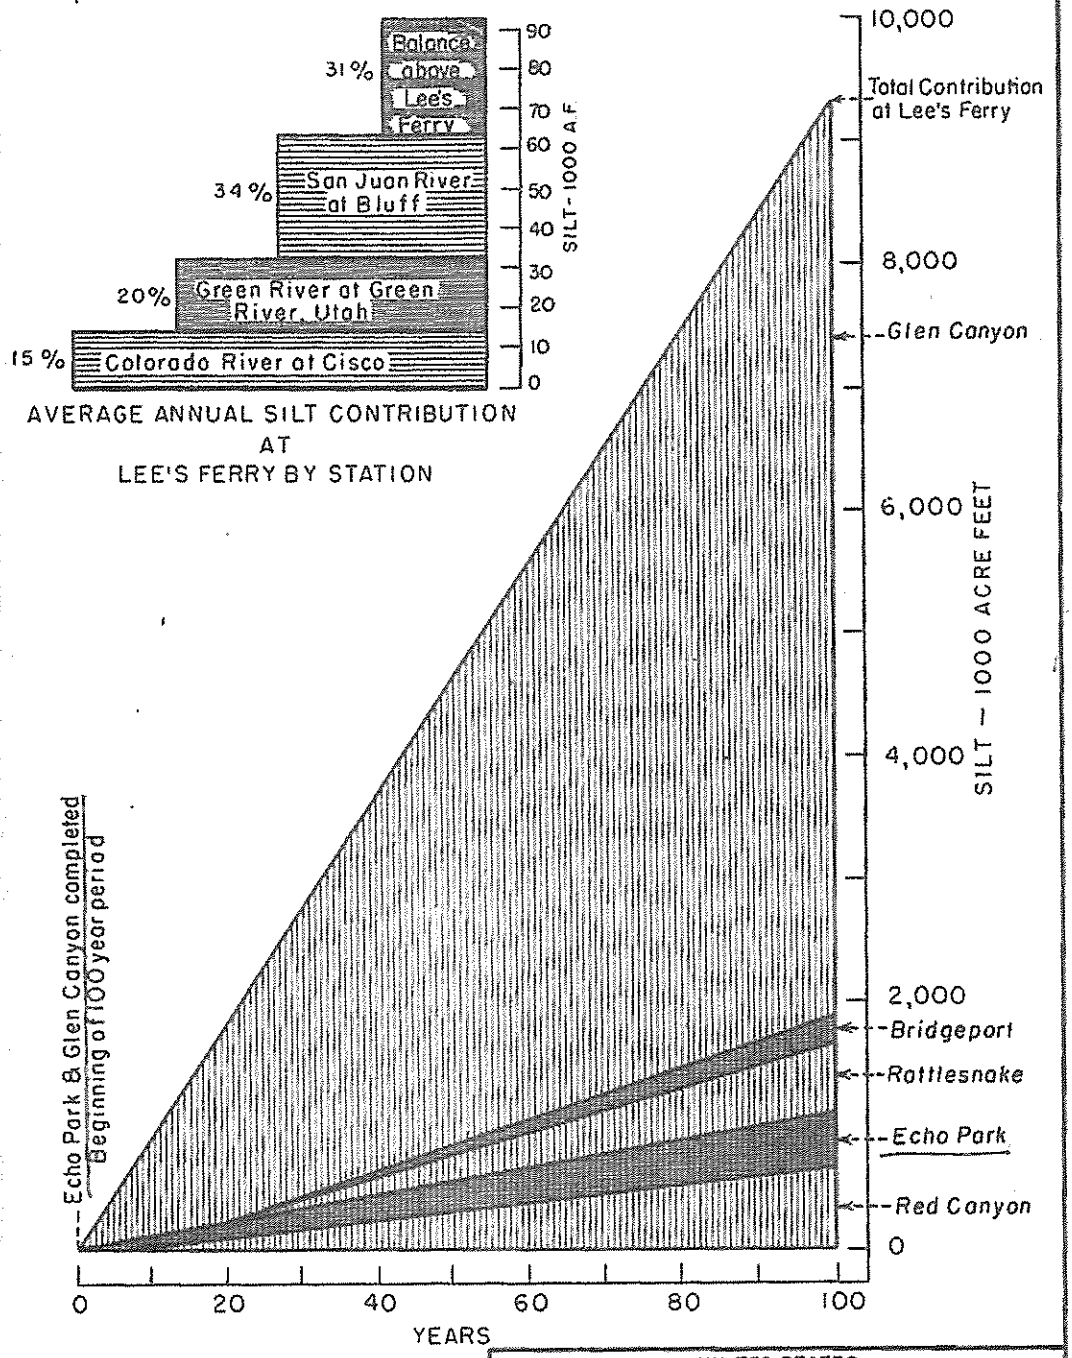
The period for which sediment storage would be provided in the reservoirs of the Colorado River Storage project is dependent upon the extent to which the States of the upper division can afford to include as part of their regulatory reservoir evaporation losses the losses that would result from larger exposed water surfaces incident to provisions for the storage of sediment. Regulatory reservoir losses are recognized in the Upper Colorado River Basin Compact as a legitimate charge against

the States' apportioned consumptive uses. For the purpose of this report the Bureau of Reclamation planned for complete sediment storage for a period of 200 years. The sediment retained over this period would be approximately 18,000,000 acre-feet. Of this amount about 12,000,000 acre-feet would be deposited in the active storage sections of the reservoirs and 6,000,000 acre-feet would be accumulated in the inactive storage pools. Succeeding generations could maintain this protection by developing remaining upstream sediment storage sites. The chart on the following page shows the reservoir capacity that would be filled with sediment deposits during the first hundred years of project operation.

Without upstream sediment retention, the useful life of Bridge Canyon Reservoir, a potential development in the lower basin above Lake Mead, would be less than 50 years. With upstream sediment retention, the reservoir would have a useful life of indefinite length. This is typical of the extensive benefit that upper basin sediment storage would bring to lower basin developments. Only limited information is now available on this major problem of sediment control in both the upper and lower basins. After a complete appraisal of the situation, lower basin interests may desire to participate in the plans for upstream sediment control and also share the evaporation losses resulting from increased reservoir capacity for sediment control.

Power Storage Requirement

The release of water from regulatory reservoirs to meet Lee Ferry flow obligations offers an excellent opportunity for the production of



UNITED STATES
DEPARTMENT OF THE INTERIOR
BUREAU OF RECLAMATION

COLORADO RIVER STORAGE PROJECT

EFFECT OF SILT CONTRIBUTION ON PROJECT RESERVOIRS

DRAWN...HRS...SUBMITTED J. McYannick

firm electric energy. Inactive storage pools would be necessary, however, to provide minimum heads required for economical operation of the various hydroelectric plants.

A study of the operations and characteristics of the Colorado River Storage project reservoirs indicates the need for inactive storage pools with an aggregate capacity of approximately 12,000,000 acre-feet. In addition to the losses incurred during the initial filling of the inactive storage pools, there would be a consumptive use directly attributable to inactive storage. This would amount to the incremental evaporation losses incurred by superimposing the active storage capacities upon the inactive storage pools. The States of the upper division could well afford to include the inactive storage losses in their apportioned use in view of the necessity for protection against sediment encroachment and the tremendous benefits which would be derived from the generation and sale of electric energy.

Project Operations

The Colorado River Storage project would be operated primarily to regulate the Colorado River in the upper basin in order that the States of the upper division might fully realize their apportioned use and comply with the obligations established by interstate compacts and the international treaty governing the present and future operation of the river. Satisfaction of the 10-year minimum depleted flow obligation at Lee Ferry would call for a more or less uniform controlled delivery at Lee Ferry. A complete equation of the flow, however, would be neither

economical nor necessary in effecting a full realization of the use apportioned the States of the upper division. Thus the regulated flow at Lee Ferry, although fairly uniform in most years, would vary considerably in some years because of spills beyond the control of the Colorado River Storage project. The operation of the integrated reservoir system of the Colorado River project, however, lends itself extremely well to the production of firm electric energy.

It has been demonstrated that the States of the upper division could expand their consumptive uses to approximately 4,750,000 acre-feet annually, measured in terms of man-made depletions at Lee Ferry, without the assistance of river regulation. Assuming a reasonable rate of development, such a use would be attained in about 21 years. Several advantages, however, justify early construction of reservoirs on the river before the primary need exists for river regulation. Foremost advantage would be the early generation of electric energy for sale to power-deficient areas. Revenues from the sale of this power would permit the early retirement of the cost of the joint facilities. Another advantage of early construction would be that unused water would be available for rapid filling of the reservoirs. Therefore, with early construction of the project, operation of the reservoirs would first be governed largely by the energy demands of power market areas and by the process of initial reservoir filling. As river regulation assumed control of project operation, a closer integration of power facilities would be required in order to sustain as far as possible a maximum power output under depleted flow conditions. Explains problems of providing stream flows in Upper Basin Rivers when CRSP development was planned around use of all but 6,500 a/f allowed by Compton!

The table on page 50 is a summarization of detailed monthly studies for the various sites of power production based on a recurrence of conditions exhibited by the long-time period 1914-1945. In the summary year 1 represents the year (approximately 1956) when the first unit (Echo Park) would start producing power. Power that would be produced at the various sites is shown for each subsequent year until year 20 (1975) when the maximum power output would be attained. By 1956 water-use projects now authorized should be in full operation resulting in stream flow depletions previously described under present modified flow conditions. For subsequent years adjustments were made for progressive water-use project development and increased consumptive use in the upper basin States.

Increases in remaining apportioned consumptive uses, exclusive of regulatory reservoir evaporation, have been assumed to progress uniformly from present and authorized uses in year 1 to 80 percent in year 50 and to 100 percent in year 75. With respect to requirements for river regulation, initial operation of the Colorado River project would begin 2 years after construction of the final unit. The summary table on page 50 sets out the firm power generation, average consumptive uses, and average Lee Ferry flows for the 19 years of construction; for year 20, the year of initial operation for river regulation; and for year 75, the year when apportioned use in the upper basin would be fully realized.

Also shown in the table on page 50 are the estimated net evaporation losses that would be incurred by the regulatory reservoirs. Evaporation rates are only sparsely distributed in the Upper Colorado River Basin

(Based on Recurrence of 1914-1943 Long-Time Period)

Development year	Water year	Annual firm power generation (million kilowatt-hours)										Consumptive use in terms of average man-made depletions at Lee Ferry (1,000 acre-feet)				Average annual depleted flow at Lee Ferry (1,000,000 a.f.)	Minimum 10-year Lee Ferry flow (1,000,000 a.f.)

and offer very little data directly applicable to the water surfaces of the remote reservoirs of the Colorado River Storage project. Using the available pan data as a base, the Bureau established relationships with recorded meteorologic data from which curves were projected to indicate the gross evaporation to be expected from free water surfaces at various elevations on the Colorado River and its tributaries in the upper basin. In its studies the Engineering Advisory Committee to the Upper Colorado River Compact Commission accepted the Bureau's analysis of gross reservoir water surface evaporation. The Bureau, in computing net evaporation losses, allowed a credit for present river channel losses and natural consumptive uses in areas to be inundated. As an example, the gross evaporation rate from the free water surface of Glen Canyon Reservoir is expected to be 63 inches a year. With adjustments for present channel losses and natural consumptive uses, the net rate of evaporation at the maximum water surface level is estimated at about 54 inches a year.

Operation During Construction

A construction schedule has been planned to meet the energy requirements of areas which could reasonably be serviced by the power system of the Colorado River Storage project. The schedule allows for energy requirements to be supplied first from potential local power developments not included in the project system. Power load areas within the States of the upper division would be given preference to the use of project energy. Early relief would also be furnished power-deficient areas in

the lower basin. A substantial portion of the energy supplied the lower basin would be withdrawn, however, as demands in the States of the upper division required. These withdrawals could be replaced from potential power developments in the lower basin, such as the Bridge Canyon, Kanab Creek, and Marble Canyon.

The Echo Park unit, selected for construction as the first unit of the Colorado River Storage project, would be little affected by sediment flow and would be ideally situated with respect to supplying the immediate upper basin power market needs. The Glen Canyon unit is also of substantial initial importance as it would be located at the lowest possible point for control of sediment and river discharge in the upper basin and within reach of the existing power shortage areas in the lower basin and lower part of the upper basin.

To meet estimated power market needs the construction of the last unit of the Colorado River Storage project would be required 19 years after the first unit was placed in operation. After that time the power market demands would continue to increase. Power production of the Colorado River Storage project would be limited, however, to that possible with the 23,000,000 acre-feet of active hold-over capacity required for ultimate river regulation and unoccupied sediment capacity.

Operation during the 19-year construction period, as summarized in the table on page 50, would not be concerned with river regulation. Particular attention would be devoted during this period to power production and the initial filling of the reservoir. As previously pointed out,

unused water in excess of the obligated Lee Ferry flow would permit the rapid initial filling of the reservoirs. At no time, however, would the obligation at Lee Ferry be violated.

During the 19-year construction period depletions in the flow at various sites would be continuously increased because of progressive consumptive uses upstream. These uses, as well as the beneficial effects of upstream regulation, were properly considered in the detailed studies regarding the power generation possibilities at each site.

Initial Operation for River Regulation

All power units of the Colorado River Storage project would be in full operation 20 years after the first unit was placed in operation. Up to that time the regulation afforded by the newly constructed project reservoirs would fully overcome the depletory effect of increasing upstream uses and would permit progressive gains in power generation corresponding to the growing market demands. In year 20 maximum coordinated output of firm power would be attained. After that time the output would decrease as sufficient capacity would be attained for ultimate river regulation and no additional storage would be provided to offset upstream depletions. In year 21 project operation for river regulation would be started. The operations for this year are summarized in the table on the following page.

Ultimate Operation for River Regulation

In year 75, the year of ultimate operation for river regulation when apportioned use in the upper basin would be fully realized,

INITIAL OPERATION FOR RIVER REGULATION--YEAR 21
(Final Point of Control at Glen Canyon)

Unit--1,000,000 acre-feet

*Release to satisfy minimum 10-year flow requirement at Lee Ferry--75,000,000 acre-feet less man-made depletion by Arizona in the upper basin.

**Capacity reduced by sediment deposits over 75 years.

PLANS AND ESTIMATES

Sufficient data have been obtained to permit preparation of rough preliminary cost estimates for all units in the Colorado River Storage project. Investigations have been essentially completed for the Echo Park unit, and preliminary designs and estimates have been prepared for the dam and appurtenant works.

Detailed geologic investigations, including construction material investigations, have been practically completed for the Echo Park and Glen Canyon units. Enough field data have been obtained from the investigations of other units to show that there are no obvious geologic features that would prohibit construction of the works contemplated. Only preliminary reservoir area and capacity data are available for all project units, and minor differences are to be expected with future detailed surveys.

Necessary new investigations consist primarily of foundation and abutment exploratory drilling, access road surveys, detailed topographic surveys of dam sites, right-of-way surveys, and construction material surveys and testing.

Project Costs

The capital cost of the Colorado River Storage project is estimated at 1,160 million dollars, based on prices prevailing on July 1, 1948. This includes the cost of dams, power plants, transmission facilities, access facilities, construction camps, rights-of-way, relocation of transportation and communication facilities, engineering and overhead, and investigations. Annual operation, maintenance, and replacement costs

are estimated at about 10 million dollars for the total project.

Investigation Costs

Present project investigations have been largely financed with non-reimbursable money from the Colorado River Development Fund, a fund that was established by the Boulder Canyon Adjustment Act of July 19, 1940, for investigation of basin plans and project developments in the Colorado River system. A small amount of reimbursable money was also used for the investigations as sufficient money was not available from the development fund. Greater expenditures of reimbursable money, estimated to amount to 5 million dollars, will be required for completion of the Colorado River Storage project investigations.

Construction Costs

Each project unit would include a dam, reservoir, and power plant. A transmission system with power plant interconnections is included. The Split Mountain, Black Canyon, and Cross Mountain power plants would be located downstream from the respective dams. Pressure tunnels would be provided from these three reservoirs to the respective plants for the development of additional power head. Power plants in the other project units would be located at the base of the respective dams. Estimated construction costs of the various units, based on July 1948 prices, are summarized in the table on the following page.

ESTIMATED PROJECT CONSTRUCTION COSTS

Project unit	Costs (July 1948 price base)		
	Dam and reservoir	Power features	Total
Echo Park	$ 96,800,000	$ 42,600,000	$139,400,000
Glen Canyon	182,000,000	165,000,000	347,000,000
Flaming Gorge (Red Canyon Dam)	74,500,000*	16,500,000	91,000,000*
Curecanti (Cottonwood Dam)	95,000,000	16,500,000	111,500,000
Split Mountain	31,300,000	36,400,000	67,700,000
Black Canyon (Crystal Dam and power tunnel)	72,900,000	84,600,000	157,500,000
Cross Mountain	29,100,000	20,000,000	49,100,000
Rattlesnake	113,500,000	42,600,000	156,100,000
Whitewater (Bridgeport Dam)	25,800,000**	9,500,000	35,300,000**
Total	$720,900,000	$433,700,000	$1,154,600,000
Total (rounded)	$721,000,000	$434,000,000	$1,155,000,000

*Including costs assigned to Central Utah project (15 million dollars).

**Including costs assigned to irrigation replacements for western Colorado lands (14 million dollars).

The estimate for the Echo Park unit was prepared by the office of the Chief Engineer. Estimates for the other units of the project are of rough preliminary nature, but all have been prepared in a uniform and consistent manner. They were made by computing quantities for all major items of excavation, concrete, and metal work, with percentage allowances made for the other items from comparisons with similar estimates recently prepared by the Bureau of Reclamation in the office of the Chief Engineer. If basic data were incomplete, estimates were increased to accommodate unforeseen contingencies.

A straight, gravity type, concrete dam was assumed for each site, except the Bridgeport, where an earth-fill structure was assumed. For the concrete dams the following design criteria were used: crest width of 40 feet, downstream face slope of 0.8:1 with the upper projection of the downstream face intersecting the axis at the crest elevation, upper 0.4 of the upstream face vertical, and lower 0.6 with slope of 0.2:1. If geological data were available on the depth of river fill and condition of abutment walls, the excavation quantities for the dam were computed accordingly. If no specific data were available, an allowance was made for about a 100-foot depth of river fill and a 12-foot depth of rock stripping throughout the entire area of contact between the dam and the walls and foundation.

The power plant costs were taken from hydroelectric power plant cost estimating curves compiled in the office of the Chief Engineer. Transmission system costs were based on a unit cost of $125 per kilowatt of installed capacity. This cost is representative of the cost of large transmission grids including switchyards and substations.

Operation, Maintenance, and Replacement Costs

Annual operation, maintenance, and replacement costs for each project unit were estimated in accordance with specific instructions outlined by the Branch of Design and Construction and the Branch of Power Utilization of the Bureau of Reclamation. Provisions were made for replacement of project works that would require replacement during the project repayment period.

Annual operation, maintenance, and replacement costs of each project unit are summarized below.

Project unit	Annual operation and maintenance costs	Annual provision for replacements	Total annual costs
Echo Park	$ 643,000	$ 527,000	$ 1,170,000
Glen Canyon	2,443,000	2,054,000	4,497,000
Flaming Gorge	264,000	207,000	471,000
Curecanti	260,000	206,000	466,000
Split Mountain	388,000	323,000	711,000
Black Canyon	664,000	577,000	1,241,000
Cross Mountain	226,000	160,000	386,000
Rattlesnake	632,000	532,000	1,164,000
Whitewater	151,000	112,000	263,000
Total	$5,671,000	$4,698,000	$10,369,000

Echo Park Unit

Accessibility

The Echo Park Dam site is in an isolated area as shown on the drawing on the following page. Therefore, an access road and a construction camp with complete utility service would be required.

The Island Park area, about 8 miles downstream from the dam site, has been assumed as the location of the camp. The access road would head on U. S. Highway 40 at either Jensen or Vernal. It would extend to Island Park and then continue about 8 miles up the canyon along the Green River to the dam site. A considerable amount of rock excavation would be required because of the steepness of the canyon walls. The entire route would be located above the highwater surface of the potential Split Mountain Reservoir. A road to the top of the dam would branch from the canyon road about 1-1/2 miles downstream from the dam and would

ascend on a 6 percent grade. The road could be used for hauling aggregate as well as for access to the dam and camp sites. Any other route to the dam site would be subjected to more severe operating conditions during the winter months.

The nearest railhead to the dam site is at Craig, Colorado, approximately 135 miles to the east, on U. S. Highway 40. Heber, Utah, on the same highway, 140 miles to the west, could also be used as a railhead.

Rights-of-way

The Echo Park Reservoir at maximum water surface would occupy a portion of the Yampa and Green River channels extending through the Dinosaur National Monument. The upper end of the reservoir on the Green River would extend about 14 miles into the Ashley National Forest. The reservoir area would include approximately 17,000 acres of privately or State-owned lands, all of which have only minor farm improvements. Five mining claims in the area have been renewed since 1940 and are therefore classed as active although they are not operating at present. No producing oil wells are located in the area.

Geology

The canyon at the Echo Park Dam site is composed of two formations of sandstone. These have a distinct horizontal line of separation approximately halfway up the canyon walls at an elevation of about 5,400 feet. The upper formation, called the Ladore sandstone, is white in color. The lower formation, called Uinta quartzitic sandstone, is

dark red in color. Laboratory tests made on 6-inch diameter cores have shown that both types of sandstone have sufficient ultimate strength to form suitable foundations for any type of dam. Extreme differences in physical properties do exist, however. The modulus of elasticity for the Ladore sandstone is 98,000 psi while that for the Uinta is 2,673,000 psi. The coefficient of thermal expansion is 11 percent greater in the Ladore than in the Uinta sandstone. These and other differences will require special consideration in the final design of the dam. Thrust blocks have been tentatively included in the dam design pending later detailed studies.

Foundation exploration was accomplished by drilling 13 holes into the abutments and river bed to sufficient depths to reveal the necessary structural information. The holes drilled totaled 2,495 lineal feet. The depth of river fill material was found to be 148 feet.

There are no faults in the vicinity of the dam site although there is considerable jointing. Surface cracks and seams do not extend far back into the abutments. A grout program should prove entirely effective in sealing any paths of seepage.

Aggregate is available at Island Park, where a large gravel and sand deposit has been laid down by the river. Tests of samples taken from this deposit confirm its suitability for use as concrete aggregate. Tests were also made on samples of Uinta quartzitic sandstone and of a limestone formation quarried at points near the dam site; only the limestone was found suitable for use as concrete aggregate.

Project Works

Echo Park Dam would be a concrete, curved, gravity type structure, as shown in the design drawing on the following page. It would rise 525 feet above the river and would have a crest elevation of 5,575 feet. It would form a reservoir with a total storage capacity of 6,460,000 acre-feet, 1,500,000 acre-feet of which would be inactive. Both maximum and normal water surface elevations would be 5,570 feet.

The spillway would have a capacity of 81,500 second-feet. It would consist of a discharge tunnel below a concrete crest at elevation 5,515 feet. Two 30- by 55-foot fixed wheel gates would be installed for control. The discharge tunnel, 35 feet in diameter, would join the diversion tunnel, used during construction, at a point approximately 1,400 feet from its outlet. Permanent outlet works have been designed for a discharge capacity of 20,000 second-feet with the reservoir water surface at its maximum elevation of 5,570 feet. A single intake tower of the type constructed at Hoover Dam would control the flow into a 30-foot inside diameter steel pipe imbedded in the concrete lining of the outlet tunnel.

The power plant would be located at the base of the dam and would consist of five equal-sized hydroelectric units with a total installed capacity of 200,000 kilowatts. This plant would have an initial generation of 1,006,000,000 kilowatt-hours annually. Transformers and switchyards would be located at the dam.

A transmission system, including the main transformers, switchyards at the power plant, transmission lines, intermediate switching stations,

d substations, would deliver electric energy to load centers in north-
stern Colorado, southwestern Colorado, southwestern Wyoming, and
thern Utah.

Construction Period

Four to five years is required for the construction of a dam the
ze of the Echo Park. The progress of construction would depend upon
e rate at which funds were appropriated by Congress and upon conditions
the labor and materials markets at the time of construction. The
ccess road to the site of the construction camp would be built first.
rk could then commence on the construction camp and extension of the
ccess road to the dam site. While the first section of the access road
s being constructed, preconstruction surveys and investigations could
e made at the dam site. Driving of the diversion tunnel and construction
f the coffer dams should be started in July after the high run-off.
hese works should be sufficiently completed 9 months later to permit
iversion of the full spring flow. Two generating units would be in
eration the first year after completion of the dam. Four would be in
eration the second year, and the fifth or final unit would be in oper-
ion the third year.

st Estimates

Investigation Costs. Money for Echo Park unit investigations has
o date been supplied from the nonreimbursable Colorado River Develop-
ent Fund. Estimated costs of further preconstruction activities have
en included as construction costs.

Construction costs. Estimated construction costs for the Echo Park
it are summarized in the following tabulation. Costs of the dam

were based on data depicted on the drawing on the following page.

Dam, spillway, and outlet works	$87,487,000
Construction camp	2,000,000
Access road	
Unit 1--Highway U.S. 40 to Island Park	2,600,000
Unit 2--Island Park to dam site	4,562,000
Rights-of-way	175,000
Subtotal, exclusive of power features	$96,824,000
Power plant structures and improvements	$ 3,850,000
Equipment	10,800,000
Features in and adjacent to dam	2,930,000
Transmission system	25,000,000
Subtotal, power features	$42,580,000
Total	$139,380,000
Total (rounded)	$139,400,000

Annual operation, maintenance, and replacement costs. Annual operation, maintenance, and replacement costs would include costs of operating and maintaining the power plant, transmission system, dam, and reservoir. They would also include costs of providing necessary replacements during the project repayment period in the power plant and related works, transmission system, dam, and waterways. These costs are shown below.

	Operation and maintenance	Replacement	Total
Power Plant			
Structures		$ 13,000	
Equipment		149,000	
Features in dam		15,000	
Subtotal	$293,000	$177,000	$ 470,000
Transmission system	320,000	332,000	652,000
Dams and reservoir	30,000	18,000	48,000
Total	$643,000	$527,000	$1,170,000

POWER

Region 4 of the Bureau of Reclamation has studied the power market area in the States of the upper division that would be served with power from the Colorado River Storage project. The studies were based on information compiled by the Federal Power Commission and information obtained by the Bureau of Reclamation from its several regions. Results of the studies are presented in a report entitled Power Market Survey--Colorado River Storage Project, dated February 1949. Information from that report is included in this chapter.

The market area that could be served power generated by the Colorado River Storage project is shown in the map on the following page. It includes as its principal portion the Colorado River Basin above Lee Ferry and the Bonneville Basin. This area, which is divided into seven subareas or divisions, lies within the boundaries of the Bureau of Reclamation's Region 4. The market area also includes three fringe areas. These include the portions of the Upper Colorado River Basin States of Wyoming, Colorado, and New Mexico that are outside the natural boundaries of the Colorado River drainage basin. The fringe areas are included in the Bureau of Reclamation's Regions 1, 5, 6, and 7.

Present Development

Present Power Resources

Power resources available to the Region 4 area as of December 31, 1947, the most recent date for which such data are available, are summarized in the table on page 68. Some of the energy

presently available to Divisions I and II is imported from Montana and Idaho. This energy, however, is needed to meet power shortages in the Pacific Northwest. In the future the importations to Region 4 are expected to be so reduced that they will be of little consequence.

The total net assured capacity available to the fringe areas for the year 1947 is shown in the following tabulation.

Fringe area	Net assured capacity (kilowatts) 1947
A—Wyoming	85,000
B—Colorado	247,000
C—New Mexico	71,018
Total	403,018

Present Energy Requirements

Energy requirements in the market area for the year 1947 are shown below.

Subarea	Energy requirements (million kilowatt-hours) 1947
Division I	1,733
Division II	67
Division III	108
Division IV	5
Division V	75
Division VI	105
Division VII	85
Subtotal—Region 4 area	2,178
Fringe Area A	354
Fringe Area B	1,206
Fringe Area C	425
Subtotal— Fringe areas	1,985
Total—Project market area	4,163

Anticipated Energy Requirements

Energy requirements are rapidly increasing throughout the market areas. The growing industrialization of the West and the accelerated development of natural resources, both mineral and agricultural, have resulted in such an increased use of electric energy that existing generating facilities have been taxed to capacity. Practically every utility in the market area has plans to increase its generating capacity to meet the requirements of the immediate future.

Estimated energy requirements for the years 1950, 1960, 1970, 1980, and 1990, as given in the Power Market Survey are summarized below.

	Energy requirements (million kilowatt-hours)				
	1950	1960	1970	1980	1990
Division I	1,925	3,113	4,450	5,667	6,837
Division II	80	156	239	280	350
Division III	124	356	710	1,075	1,430
Division IV	9	18	28	50	75
Division V	84	235	403	560	710
Division VI	93	174	243	310	390
Division VII	88	155	220	300	370
Subtotal--Region 4 area	2,403	4,207	6,293	8,242	10,162
Fringe Area A	499	1,289	2,448	3,734	5,075

Additional Power and Energy Needed

In arriving at the additional amounts of power and energy needed to meet the demands, careful consideration was given to the capabilities of all existing facilities and of facilities scheduled by other agencies for the forecast period. Scheduled facilities considered included probable Bureau of Reclamation works in the fringe areas outside of Region 4. Consideration was also given to reductions in capabilities that would result from the aging and retirement of equipment and from reductions in power importations. The resulting estimates, amounting to the additional power and energy that would be needed in the market area from Bureau of Reclamation plants in Region 4, are shown in table on the following page.

The needs to be satisfied by the Colorado River Storage project were determined by deducting the capabilities of all potential Bureau of Reclamation plants in Region 4, except Colorado River Storage project plants, from the estimates of additional power and energy required in the region from Bureau plants. The estimated amounts of energy and power required from the project are summarized below.

Year	Power and energy needed from project (kilowatts)	(million kilowatt-hours)
1950	0	0
1960	262,600	563
1970	934,300	3,787
1980	1,682,300	8,170
1990	2,742,300	13,595

Project Power Development

As outlined in the plan of development, several large dams would be built on the Colorado River and its principal tributaries in the upper basin in order that States of the upper division might fulfill their Lee Ferry flow obligations and still consummate their full apportionment of consumptive use. A substantial power head would be made available at each dam. The charts on the two following pages indicate the contemplated schedule of construction for the project power facilities, the capacity of the facilities, and their ability to supply the power needed from the project.

Under the plan of development, a substantial amount of energy from the Glen Canyon unit would be available to the States of the lower division for a number of years. The power would be gradually withdrawn, however, as needed for use in the States of the upper division. A total of 160,000 kilowatts from the Glen Canyon unit would be permanently available to the States of the lower division. New power developments in the lower basin, made possible through upstream regulation and sediment control in the upper basin, would be expected to replace the withdrawn energy. These developments would include the potential Bridge Canyon, Kanab Creek, and Marble Canyon projects. Construction of regulatory reservoirs by the States of the upper division would incidentally result in immediate benefits to major Federal power facilities in the States of the lower division whose functions are being limited by the lack of upstream sediment control.

JANUARY 1949

Investigations so far conducted on projects in the basin indicate that some projects would require electric energy for irrigation pumping purposes. Investigations have not progressed far enough to determine the amount of energy that would be required for this purpose nor the exact places where it would be used. These questions will be answered as detailed studies for water-use projects are completed.

A substantial amount of energy would be produced by the Colorado River Storage project in advance of the market for firm energy. This energy would be produced while new generating units were being tested and contract negotiations being carried on for the delivery of firm energy. The energy thus produced would be salable at a nonfirm rate. An amount of nonfirm energy would also be available while Glen Canyon capacity was being withdrawn from use in the lower basin. It is anticipated that all nonfirm energy would be easily absorbed in both the upper and lower basins as fuel replacement energy and for sales to industries using secondary energy.

The following tabulation shows the estimated annual production from the Colorado River storage project that would be possible in 1980 with all units of the project in operation. The estimates are based on 1980 stream flow conditions that would result from the development of water-use projects in the States of the upper basin and from the river regulation of the Colorado River Storage project.

	Project installed capacity (kilowatts) 1980	Annual project generation (million kilowatt-hours) 1980
Red Canyon	75,000	385
Cross Mountain	60,000	335
Echo Park	200,000	1,062
Split Mountain	120,000	637
Rattlesnake	200,000	1,018
Curecanti	75,000	298
Black Canyon	210,000	1,175
Bridgeport	40,000	228
Glen Canyon	800,000	3,950
Total	1,780,000	9,088

Under conditions expected to exist in 1980 the capabilities of all the plants listed above would just supply the energy and power required from the Colorado River Storage project for that year. By 1990 estimated energy requirements of the market area would be considerably above the capabilities of all production facilities.

Power could also be produced at the Dewey, Moab, Bluff, Goose Necks, and Slick Horn Canyon sites. It is doubtful, however, whether these sites should be developed because of the high reservoir evaporation losses which would result. The sites selected for the Colorado River Storage project would provide sufficient river regulation as

far as the Lee Ferry flow obligation is concerned. Development of additional sites for the purpose of power production would leave a smaller amount of apportioned water available for water-use projects in the States of the upper division.

Steam-electric generating equipment may be desirable as a supplementary source of power. In some cases power for the construction of project works may also be obtained from present or new steam-electric plants. Integration of steam-electric plants and the proposed hydroelectric developments would be particularly desirable for stand-by service, peaking purposes, and fuel conservation.

The Echo Park unit would be the first undertaken because of its strategic location near areas critically short of energy in northwestern Colorado, southwestern Wyoming, and northern Utah. An installed capacity of 200,000 kilowatts is planned at the site. Initial annual production is estimated at 1,006 million kilowatt-hours. With additional regulation brought about by construction of the Flaming Gorge unit, the production at Echo Park would be increased to a maximum of 1,140 million kilowatt-hours annually. Subsequent depletions by upstream water-use projects would reduce the annual generation until the Cross Mountain unit was constructed. With construction of this unit the output would show a slight increase. Under ultimate stream flow conditions, the annual power output at Echo Park would be reduced to a minimum of 702 million kilowatt-hours.

The map on the following page shows a tentative plan for a "backbone" high voltage transmission system to transmit the energy from the various project power plants to the probable load centers within the basin and to points of interconnection with other power systems at or near the basin boundary. The map does not show the number of lines needed for complete development nor the final routing of the lines. Marketing lines to serve small communities, rural distribution systems, and other power systems would be added as needed.

Power Revenues

A preliminary financial study for project repayment has been prepared, based on data presented under the section, Financial Analysis. For the study it was assumed all facilities would be completed 19 years after completion of the first unit, with construction of the facilities undertaken in accordance with the energy requirements of the project power market area. On this basis, power revenues could repay the costs of all project facilities in 60 years after the 19-year construction period. The costs allocated to power, however, would be repaid at 3 percent interest in 46 years following the installation of the last generating unit. Power revenues that would accrue after payment of all project costs, together with revenues from interest payments, could be applied on costs of potential Federal reclamation projects using Colorado River water in the States of the upper division that are beyond the repayment ability of irrigation water users.

289-P-7 | SALT LAKE AREA OFFICE MAR. 1949

The repayment, as summarized below, is based on the sale of firm energy at an average rate of 5.2 mills per kilowatt-hour and on the sale of nonfirm energy at an average rate of 3.0 mills per kilowatt-hour. The summary is based on a 100-year period of analysis.

Total net power revenues for 100 years		$2,521,185,400
Distribution of revenues		
Repayment of power investment	860,305,000	
Repayment of river regulation costs	191,750,000	
Repayment of sediment storage costs	74,028,000	
Repayment of investigation costs	5,000,000	
Excess power revenues (interest component)	592,216,782	
Earned surplus	797,885,618	
Total of distributed net revenues		2,521,185,400

Value of Power

The value of power in the several subareas of the project power market area was computed by the Federal Power Commission's method. Steam-electric coal- and gas-burning plants at the principal load centers in the subareas were considered to be competitive with the project hydroelectric plants. The values were based on the combined use of gas and coal for fuel in Fringe Areas A and B, the use of gas in Fringe Area C, and the use of coal in all divisions of the Region 4 area.

The values of power at the high voltage sides of the plant substations, based on a 60 percent plant factor, are summarized below for the several subareas.

	Plant considered (kilowatts)	Value (mills per kilowatt-hour)
Divisions I and III	60,000	7.35
Division II	10,000	8.69
Division IV	2,500	11.54
Division V	5,000	9.30
Division VI	10,000	8.80
Division VII	10,000	7.46
Fringe Area A	20,000	7.88
Fringe Area B	40,000	7.22
Fringe Area C	10,000	7.66

Conservation of Natural Resources

Supplies of falling water, which are being constantly renewed, must be used for power production wherever possible to save the limited fuel resources for other uses. If burned unnecessarily for power production, our fuel resources will be prematurely depleted without rendering the greatest benefit to the Nation.

With integration of hydroelectric and fuel-electric plants use could be made of existing and new fuel-burning plants for supplemental power, firming up, standby service, and for peaking purposes. Even with maximum development of hydroelectric resources, the fuels—coal, oil, and gas—would be required for production of power in possibly greater quantities than are being used at present. As industrialization of the West progresses, hydroelectric developments would relieve the need for consumption of fuel for power and would allow the fuel resources to be used for other industrial purposes. Coal, the most abundant fuel, is especially needed for its many important derivatives.

FINANCIAL ANALYSIS

Annual Benefits and Costs

To determine the economic justification of a project, the tangible National benefits are compared with the related costs. Both benefits and costs are considered as annual equivalents over a common time period.

Estimated benefits and costs of the Colorado River Storage project were considered over a 100-year period. All estimates were based on current price levels. Under project operation changes may result in the benefit-cost ratio now indicated as the actual costs of construction would be incurred during a limited period while benefits would be realized through the long useful life of the project during which different price levels would probably prevail.

Annual Benefits

Tangible benefits from the Colorado River Storage project would result from irrigation developments, made possible through water replacements from project storage; sediment storage; power generation; fish and wildlife conservation; recreation; and flood control. Only power benefits have been measured and considered in the benefit-cost analysis. All other tangible benefits should be measured and considered, but they cannot be properly analyzed until investigations now in progress are completed. Benefits from river regulation have been assumed to accrue to individual water-use projects as preliminary studies have not evolved a suitable method for prorating these National benefits between the individual projects and the Colorado River Storage project.

Tangible power benefits, both direct and indirect, would have a total annual value of $71,100,000. The value of the direct power benefit is estimated at $34,800,000. This value is measured by the gross power revenues expected from the sale of electric energy produced by the project. The value of indirect power benefits is estimated at $36,260,000 annually. This value is measured from the following items:

Savings in costs of energy from cheapest alternative source	$16,080,000
Proportionate share of retailing utilities benefits arising from resale of power at a higher rate	17,580,000
Proportionate share of commercial and industrial benefits arising from use of power	2,600,000
Total	$36,260,000

In addition to the tangible benefits, real and valuable benefits of an intangible nature would result from the project. These intangible benefits, while not measurable in monetary terms, would definitely contribute to the public welfare and National security.

Annual Costs

The annual equivalent project costs are estimated at $41,146,000, including $31,522,000 as the annual construction cost and $9,624,000 as the average annual cost for operation, maintenance, and replacements. The construction cost is based on amortization of the total project cost (1,131 million dollars, exclusive of costs allocated to Central Utah project and to irrigation of western Colorado lands) over a 100-year period at 2.5 percent interest. Allowance was made in this estimate for interest during construction and salvage values of structures that would be useful beyond the 100-year period considered in the analysis.

Benefit-Cost Ratio

The estimated annual benefits would compare with the annual equivalent costs in a ratio of 1.73 to 1.00. Thus, for each dollar spent for project development $1.73 in National benefits would result from electric energy sales alone.

Cost Allocations

A modified "use of facilities" method was considered the most suitable basis for allocating the joint costs of this multiple-purpose project. This method is sound, practicable in application, and is considered equitable for a tentative distribution of the costs of jointly used facilities. Each purpose would share in the economy of the joint use of project storage facilities.

The table on the following page shows the estimated portion of the storage capacity at each reservoir site that would be utilized for each project purpose after ultimate upstream depletions. River regulation was assumed to use the capacity reserved for hold-over storage, and sediment storage was assumed to use the capacity that sediment deposits would fill in 100 years. Power was assumed to use all inactive capacity and all active capacity unoccupied by sediment in 100 years. Participation of water-use projects was based on the estimated capacity that would be required at the Flaming Gorge Reservoir for irrigation of Central Utah project lands and at Bridgeport Reservoir (Whitewater unit) for irrigation of western Colorado lands.

ULTIMATE USE OF RESERVOIR STORAGE CAPACITY

Unit--acre-feet

Project unit	River regulation	Sediment storage (100 years)	Power production	Water-use projects
Echo Park	4,400,000	439,000	6,170,000	--
Glen Canyon	10,300,000	7,310,000	21,130,000	--
Flaming Gorge	1,960,000	670,000	2,430,000	1,300,000
Curecanti	2,000,000	0	2,500,000	--
Split Mountain	0	0	335,000	--
Cross Mountain	4,200,000	0	5,200,000	--
Rattlesnake	641,000	588,000	1,610,000	--
Black Canyon	0	0	510,000	--
Whitewater	0	219,000	234,000	500,000
Total	23,500,000	9,230,000	40,100,000	1,800,000

The costs of jointly used facilities at each site were allocated to each project purpose in proportion to the use of reservoir storage capacity. These allocations for individual units, together with the total amounts allocated to each purpose, are shown in the table on page 84.

Project Repayment

The schedule of project repayment is presented in detail in the table on page 85. As shown by the repayment schedule, the power revenues, averaging approximately $34,800,000 annually over the 100 years of study, would repay the annual operation, maintenance, and replacement costs of the entire project, could pay all construction costs of the project, and would provide approximately 1,390 million dollars in excess of project needs. The excess revenues would be applied toward repayment of costs of Federal reclamation projects utilizing Upper Colorado River Basin water in the States of the upper division that are beyond the repayment ability of the irrigators.

Project unit	Joint Costs					Direct costs	
	River regulation	Sediment storage	Power production	Water use projects	Total joint costs	Power production	Total costs
Echo Park	$ 38,700,000	$ 3,960,000	$ 54,240,000		$ 96,800,000	$ 42,560,000	$ 139,360,000

Notes:

1. Column 4. The non-firm energy considered in this column represents that energy that is not salable as "firm" under the estimated load curve at time of production. This results from the planned installation of generating units in advance of market requirements.

2. Column 13. Interest at 3 percent on power investment for determination of average firm energy rate.

3. Column 19. Each unit of power investment considered to be repaid within 50 years after that unit is placed in operation.

4. Column 20. Each item of investment considered to be repaid within 60 years after the investment is made.

CHAPTER III

U P P E R D I V I S I O N D E V E L O P M E N T A C C O U N T

Because of the river regulation it would afford, the Colorado River Storage project would possess many of the attributes of simpler reclamation projects now utilizing project power revenues to assist users of irrigation water in paying project irrigation costs. If a complete appraisal had been possible at this time of all potential uses of the water of the Colorado River system in the upper basin within the States of the upper division, a single project plan encompassing all such uses may have been appropriate. Extensive investigations over many years, however, will be necessary to assure a complete and systematic development of the system's water. Progressive future development prompts a slight departure from usual reclamation financial concepts. In the States of the upper division a need will exist for substantial financial assistance for Federal reclamation projects utilizing Upper Colorado River Basin waters. This assistance could be provided by establishment of an account known as the Upper Division Development Account.

To the Upper Division Development Account would be credited all revenues from the sale of electric energy generated or to be generated by the Colorado River Storage project in excess of revenues required to pay project operation, maintenance, and replacement costs.

All construction costs of the Colorado River Storage project which are assigned for repayment from power revenues would be charged against the Upper Division Development Account in accordance with an established project payout schedule.

UPPER DIVISION DEVELOPMENT ACCOUNT

Net credits, being the difference between aggregate credits and aggregate charges in the account, would be used for the purpose of showing complete reimbursement of the reimbursable costs of irrigation projects or units thereof utilizing Upper Colorado River Basin water in the States of the upper division which would not produce sufficient revenues to repay construction costs allocated to irrigation. The annual net credits that would accrue in the Upper Division Development Account under the Colorado River Storage project development plan are shown in column 23 of the tabulation on page 85.

In 100 years the net credits would amount to approximately 1,390 million dollars. Of this amount 592 million dollars would accrue as excess power revenues (interest component) during the period of repayment of power construction costs. The remaining 798 million dollars would accrue as earned surplus during the balance of the 100-year period.

Qualifying criteria for participation in the privileges of the account are suggested herein in an attempt to assure orderly development and equitable participtation of projects of all States of the upper division. Participation of projects or units thereof would be brought about by action of the Congress. The Secretary would recommend to the Congress a project or unit thereof to participate in the privileges of the account if all sources of estimated revenues available to such project or unit thereof over a period of 60 years were insufficient to return the reimbursable costs of the project or unit thereof. A project could participate in the account if it had a benefit-cost ratio of at least unity and could pay its own operation, maintenance, and replacement costs and a part of its construction cost. Projects qualifying for assistance have been designated participating projects.

CHAPTER IV

P A R T I C I P A T I N G P R O J E C T S

In addition to the 100 potential in-basin projects and several major water exportation projects outlined in the Colorado River Report, other potential uses of Upper Colorado River Basin water no doubt remain to be discovered. The consumptive use requirements of all possibilities far exceed the uses apportioned to the upper basin. From the many potentialities projects must be segregated that have consumptive use requirements compatible with the uses apportioned the respective States of the upper division. This, however, will require considerable investigation and detailed study. Thus, to designate features and projects constituting the ultimate plan of development is not practical at this time.

Existing and authorized projects are considered as a first stage of basin development. Construction could now proceed on the second stage of basin development. Included in this second stage would be private undertakings and Federal reclamation projects. Most of the Federal projects would require special financial assistance.

In a broad sense all water-use projects in the States of the upper division beyond the first stage of development would participate indirectly in the regulatory benefits that would be afforded by the Colorado River Storage project through storage water replacements permitting the greatest possible upstream use of apportioned water. Most of these projects, although highly desirable from the National standpoint, would be unable to meet annual operation and maintenance charges and fully repay project construction costs

as the least expensive sites and most convenient water supplies were utilized by earlier developments. Therefore, they would require special financial assistance of the type that could be provided by the Upper Division Development Account.

The plan suggested herein would fit in with comprehensive development of the Upper Colorado River Basin. Construction could proceed concurrently with, independently of, this plan on private undertakings and also on Federal reclamation projects not requiring special financial assistance.

In 60 years net credits of approximately 70 million dollars would accrue to the Upper Division Development Account from the Echo Park unit of the Colorado River Storage project. These credits would allow initial participation of a substantial group of Federal reclamation projects utilizing Upper Colorado River Basin water in the States of the upper division. Construction of other units of the storage project would allow additional Federal reclamation projects to participate in the privileges of the account to the extent of accrued net credits. In this connection the Upper Division Development Account would offer an opportunity for complete development of Upper Colorado River Basin water in the States of the upper division.

The group of projects selected in cooperation with the States of the upper division for initial participation in the development account are as follows:

(tabulation)

PARTICIPATING PROJECTS

All the projects selected for initial participation are in Region 4 except _____ which are in Regions ___ and ____. The latter projects are covered by project reports entitled _____.

The projects selected for initial participation are briefly described as follows:

FOREWORD

As the Nation's principal conservation agency, the Department of the Interior has responsibility for most of our nationally owned public lands and natural resources. This includes fostering the wisest use of our land and water resources, protecting our fish and wildlife, preserving the environmental and cultural values of our national parks and historical places, and providing for the enjoyment of life through outdoor recreation. The Department assesses our energy and mineral resoures and works to assure that their development is in the best interests of all our people.

The importance of this Nation's water resources is more evident than ever before; it is the purpose of this edition of *Project Data* to add to the understanding of the effort which is being made to conserve and use beneficially this most vital national asset.

Although this book contains considerable statistical and technical material, it is also intended to inform the increasing number of persons in all walks of life who realize that reclamation and conservation of our natural resources such as water is a job for everyone.

PREFACE

This 1981 edition of Water and Power's *Project Data* introduces the change in organization name, announced on November 6, 1979, from the Bureau of Reclamation to the Water and Power Resources Service. The new name more closely identifies the agency with its principal functions—supplying water and power. As the text and drawings used in this publication were prepared prior to the adoption of the new name, all references to the Bureau of Reclamation, or any derivative thereof, are to be considered synonomous with the Water and Power Resources Service.

Compilations of this kind of information have been published beginning in 1941 under the title *Summarized Data on Federal Reclamation Projects* to 1966 as *Reclamation Project Data* (Supplemental). These publications have served the continuing need for historical, statistical, and technical information on the projects of the Water and Power Resources Service by legislators, State and Federal officials, water users, engineers, educators, students, and others, in foreign countries as well as the United States, who are concerned about water resource development.

As you read about these individual projects, most of which are located west of the 100th Meridian, you will quickly realize that the original statement by the Congress in the Reclamation Act of 1902, " . . . . the construction and maintenance of irrigation works for the storage, diversion, and development of waters for reclamation of arid and semiarid lands. . . . . ," has been expanded by the concept of multiple-purpose development. By applying this concept, the Service assures the Nation that maximum benefits are being derived today and will be in the future as we manage our water resources.

Today attention is focused on the Nation's energy needs and concern for the quality of our environment. These factors have become major considerations in the making of decisions on how our water resources are allocated to agriculture, municipalities and industries, the development of hydroelectric power, fish and wildlife enhancement, and recreation.

In this publication, Service projects, substantially complete and in operation, are reviewed in detail with considerable attention to history, costs, beneficiaries, engineering, and productivity. Newer projects in the early stages of construction, and projects which are authorized but not yet started, have been treated briefly and can be expected to be covered more fully in a future edition.

The names of projects and their chief features are sometimes changed. Names used during the planning and development stages of projects may later be changed by action of the Congress or upon review by the Board on Geographic Names. Statistical data are also subject to change. Dimensions of structures may change because of structural alterations. Reservoir capacities are subject to revision as a result of siltation studies. Changes are sometimes introduced because of different methods of measurement, or because of revised definitions.

The contributions of the individual projects to the Nation's economic strength and recreation resource, when combined, are of major importance. As of September 30, 1978, the Water and Power Resources Service had constructed storage and distribution facilities to serve 11.4 million acres of land with irrigation water.

Crops harvested on farms receiving water from the Service in 1978 were valued at $4,993 million, and cumulative harvest values since the first project crop report was made in 1906 total in excess of $63,061 million.

Municipal and industrial water, 524,000 million gallons of it from Service projects, was delivered to areas populated by 16.6 million people in 1978.

The 50 hydroelectric powerplants constructed and operated by the Service in 1978 had an installed capacity of 10.4 million kilowatts. Within the next 5 years, it is planned that uprating units at existing plants will provide an additional 1-million-kilowatt capacity. The hydroelectric energy totaling 40.6 billion kilowatt-hours generated in the 1978 fiscal year was sufficient to supply the residential needs of over 14 million people.

There were 281 recreation areas, including reservoirs and other facilities, on Service projects at the end of 1978. Recreational use of these areas increased during 1978 to a new record of 69.9 million visitor days. Copies of reprints of individual projects presented in this edition can be obtained by writing to: Water and Power Resources Service, Attn D-922, P O Box 25007, Denver CO 80225.

The Water and Power Resources Service also produces nontechnical and technical publications and maps on its work which are available to the public. These are included in two listings, "Publications for Distribution Without Charge" and "Publications for Sale" which may be obtained by writing to this same address.

We invite your request for these materials. Increasing the public concern and awareness on the role of the Nation's natural resources in our future prosperity and well-being is a responsibility of the Department of the Interior.

Commissioner,
Water and Power Resources Service

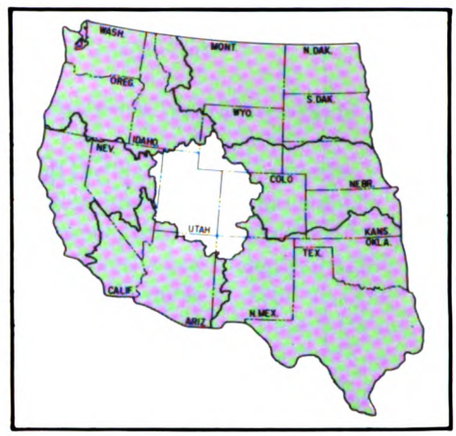
Colorado River Storage Project
(Under Construction)

Arizona, New Mexico, Colorado, Utah, and Wyoming

Upper Colorado Region
Water and Power Resources Service



Glen Canyon Unit

The Colorado River Storage Project (CRSP) provides for the comprehensive development of the Upper Colorado River Basin. The project furnishes the long-time regulatory storage needed to permit States in the upper basin to meet their flow obligation at Lees Ferry, Wyoming, as defined in the Colorado River Compact, and still utilize their apportioned water.

Water stored by the project provides a portion for direct use in the upper basin. Sediment and flooding are better controlled and recreation development and fish and wildlife conservation have benefited. Because of project development, a significant amount of electrical energy is produced to meet the needs of the upper basin and adjacent areas.

The project includes four storage units: Glen Canyon on the Colorado River in Arizona near the Utah border; Flaming Gorge on the Green River in Utah near the Wyoming border; Navajo on the San Juan River in New Mexico near the Colorado border; and Curecanti on the Gunnison River in west-central Colorado. Authorized with, but not part of, are a number of participating projects which will share in the power revenues of the larger project to help pay for irrigation construction costs. These participating projects are listed in the authorization paragraphs.

PLAN

The reservoirs formed by four units of the CRSP have a total capacity of nearly 34 million acre-feet. During periods of low streamflow, the stored water in the upper basin is released to meet the Lees Ferry obligation. Powerplants and other facilities are provided at each dam except Navajo, and a complex transmission system also has been provided. This transmission system carries CRSP power to key load points in the marketing area. The system is integrated with preference-user and private-company transmission lines to form the CRSP Interconnected Transmission System. CRSP hydropower is delivered to preference-user organizations for distribution to their consumers as required by Federal Reclamation Law.

Glen Canyon Dam, Lake Powell, and Glen Canyon Powerplant

Glen Canyon Dam, 15 miles upstream from Lees Ferry, is the key feature of the CRSP. This 710-foot-high structure provides more storage capacity than all other storage features of the project combined. The concrete arch dam has a crest length of 1,560 feet and contains 4,901,000 cubic yards of concrete. Thickness of the dam at the crest is 25 feet, and the maximum base thickness is 300 feet.

A separate spillway is constructed in each abutment. Each spillway consists of an intake structure with two

40- by 52.5-foot radial gates and a lined spillway tunnel. The downstream portions of the spillway tunnel were used during construction as diversion tunnels. Each spillway tunnel reduces in size from 48 to 41 feet in diameter. The combined spillway discharge capacity is 208,000 cubic feet per second at elevation 3700.

The outlet works near the left abutment of the dam consists of four 96-inch-diameter pipes. Each outlet is controlled by one 96-inch-ring follower gate and one 96-inch hollow-jet valve. The combined river outlet works capacity is 15,000 cubic feet per second.

Total capacity for Lake Powell is 27 million acre-feet, and the active capacity is 20,876,000 acre-feet. At normal water surface elevation, the reservoir has a length of 186 miles and a surface area of 161,390 acres.

The powerplant at the toe of the dam consists of eight 118,750-kilowatt generators, driven by eight 155,500-horsepower turbines. Total nameplate generating capacity for the powerplant is 950,000 kilowatts. Eight penstocks through the dam convey water to the turbines. Each penstock reduces in size from 15 to 14 feet in diameter.

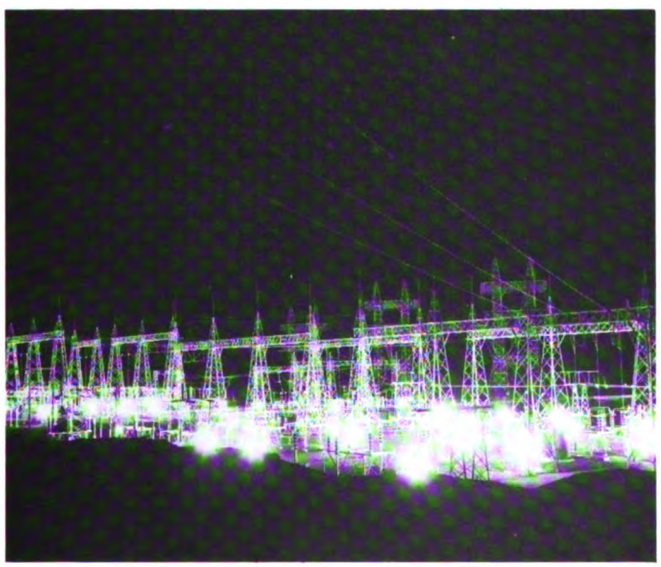
Glen Canyon Dam and Bridge

Glen Canyon Bridge

The absence of rail facilities near the construction site of Glen Canyon Dam necessitated construction of Glen Canyon Bridge for the transportation of construction materials and equipment from railheads to the site. A single-span, steel-arch structure, the bridge has an overall length of 1,271 feet. At its completion in 1959, it was the highest arch bridge in the world and the second longest of its type in the United States. The bridge spans the Colorado River 865 feet downstream from the dam. The deck of the bridge is 700 feet above river level.



Glen Canyon Powerplant Switchyard

Flaming Gorge Unit

Flaming Gorge Dam, Reservoir, and Powerplant

Flaming Gorge Dam is on the Green River in northeastern Utah about 32 miles downstream from the Utah-Wyoming border. The concrete thin-arch structure has a maximum height of 502 feet and a crest length of 1,285 feet, and contains 987,000 cubic yards of concrete. The top thickness is 27 feet, and the maximum base thickness is 131 feet.

Floodwaters are spilled through a 675-foot-long tunnel spillway extending through the left abutment. The concrete-lined tunnel has a maximum capacity of 28,800 cubic feet per second and reduces in size from 26.5 feet in diameter at the upstream portal to 18 feet in diameter at the downstream portal. The spillway intake structure is controlled by two 16.75- by 34-foot hydraulically operated fixed-wheel gates.

Flaming Gorge Dam

The outlet works consist of two 72-inch steel pipes through the dam, reducing to 66 inches at the toe of the dam and continuing downstream to a valve structure on the left riverbank where discharge is directed into the river channel. Each outlet is controlled by a 66-inch hydraulically operated ring-follower gate at the downstream toe of the dam and a 66-inch hydraulically operated hollow-jet valve at the valve structure. Discharge capacity at elevation 6045.0 feet is 4,000 cubic feet per second.

The Flaming Gorge Reservoir has a total capacity of 3,788,900 acre-feet and an active capacity of 3,515,700 acre-feet. At normal water surface elevation, the reservoir has a surface area of 42,020 acres.

Original from UNIVERSITY OF CALIFORNIA

Three 10-foot-diameter penstock pipes near the center of the dam convey water to the powerplant. The powerplant is at the downstream toe of the dam and houses three 36,000-kilowatt generators driven by three 50,000-horsepower Francis-type turbines.

Navajo Unit

Navajo Dam and Reservoir

Navajo Dam is on the San Juan River in northwestern New Mexico about 34 miles east of Farmington. The dam is a rolled earthfill embankment with a structural height of 402 feet and a crest length of 3,648 feet. The dam contains 26,840,863 cubic yards of materials. The top width of the dam is 30 feet, and the maximum base width is 2,566 feet.

The spillway, on the right abutment, consists of an approach channel, concrete crest structure without gates, spillway bridge, concrete chute and stilling basin, and outlet channel. The width of the spillway ranges from 138 feet in the chute section to 195 feet in the stilling basin. The design capacity at maximum water surface elevation is 34,000 cubic feet per second.

Releases of water for downstream requirements are made through the outlet works, consisting of a concrete tower intake structure, an 18.75-foot-diameter concrete-lined tunnel, and valve house. Control is by one 6- by 13-foot fixed-wheel gate, two 72-inch ring-follower gates, and two 72-inch hollow-jet valves. The outlet works tunnel, located in the right abutment, is 1,603 feet long. Discharge capacity is 4,200 cubic feet per second at elevation 6101.5.

An auxiliary outlet works consisting of a concrete intake structure and a concrete-lined tunnel with gate chamber for two 4-foot-square gates also is located in the right abutment. Discharge is into the spillway stilling basin.

Navajo Reservoir extends 35 miles up the San Juan River, 13 miles up the Pine River, and 4 miles up the Piedra River in southern Colorado. When filled, the reservoir occupies 15,610 acres, with a total capacity of 1,708,600 acre-feet and an active capacity of 1,036,100 acre-feet.

Curecanti Unit

The Curecanti Unit developed the water storage and hydroelectric power generating potential along a 40-mile section of the Gunnison River in Colorado by the construction of three dams and powerplants: Blue Mesa, Morrow Point, and Crystal.

Blue Mesa Dam, Reservoir, and Powerplant

Blue Mesa Dam is on the Gunnison River about 30 miles below Gunnison, and 1.5 miles below Sapinero, Colo. The zoned earthfill embankment has a structural height of 390 feet, a crest length of 785 feet, and a volume of 3,093,000 cubic yards of materials.

The spillway consists of a concrete intake structure with two 25- by 33.5-foot radial gates, concrete-lined tunnel, concrete flip bucket structure, and stilling basin. Maximum discharge of the spillway is 34,000 cubic feet per second.

The outlet works consists of an intake structure, tunnel, and manifold anchor block. The outlet works is control-

Original from UNIVERSITY OF CALIFORNIA

led by one 16- by 18-foot fixed-wheel gate in the intake structure and by two 84-inch ring-follower gates and two 84-inch hollow-jet valves in a gate house at the terminus of the outlet conduits. Maximum discharge from the outlet works is 5,000 cubic feet per second at maximum water surface elevation, with two 84-inch hollow-jet valves 62 percent open.

Blue Mesa Reservoir has a total capacity of 940,800 acre-feet and an active capacity of 748,500 acre-feet. At maximum water surface elevation, the reservoir occupies 9,180 acres.

The Blue Mesa Powerplant consists of two 30,000-kilowatt generators, driven by two 41,500-horsepower turbines. Each turbine is designed to operate at a maximum head of about 360 feet.

One 16-foot-diameter penstock conveys water to the two turbines and also carries water for the outlet works. After branching from the main penstock, each of the penstock laterals is controlled by 156-inch butterfly valves. The main penstock is reduced by a wye branch to the outlet works control valves.

Morrow Point Dam, Reservoir, and Powerplant

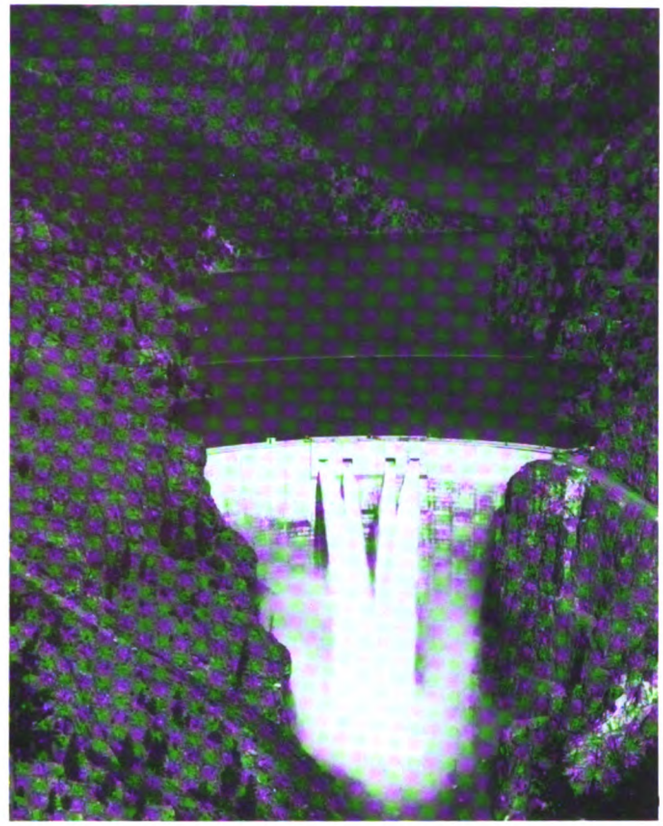
Morrow Point Dam, 12 miles downstream from Blue Mesa Dam, is Reclamation's first thin-arch, double-curvature dam. It is 468 feet high, 52 feet thick at the base, and 12 feet thick at the crest. The dam has a crest length of 724 feet and a volume of 365,180 cubic yards of concrete.

The spillway consists of four orifice-type openings in the top central part of the dam, providing a free-fall discharge higher than 350 feet to the concrete stilling basin at the toe of the dam. Each of the four spillway openings is controlled by a 15- by 16.83-foot fixed-wheel gate. Maximum capacity of the spillway is 41,000 cubic feet per second.

The outlet works consists of one stainless-steel lined 4-foot-square conduit through the dam. Control is by two 3.5-foot-square slide gates. Discharge capacity of the outlet works is 1,500 cubic feet per second.

Reservoir capacity behind Morrow Point Dam is 117,190 acre-feet at maximum water surface. The active capacity is 42,120 acre-feet. Surface area for Morrow Point Reservoir is 817 acres at elevation 7160.

The powerplant chamber is tunnelled into the canyon wall in the left abutment about 400 feet below the ground surface. The powerplant chamber is 231 feet long and 57 feet wide with a height ranging from 65 to 134 feet. There are two 60,000-kilowatt generators driven by two 83,000-horsepower turbines. The power penstocks consist of 13.5-foot-diameter steel liners in 18-foot-diameter tunnels.



Morrow Point Dam and Reservoir

Crystal Dam, Reservoir, and Powerplant

Crystal Dam is located 6 miles downstream from Morrow Point Dam and approximately 20 miles east of Montrose, Colo. The dam is a double-curvature thin-arch type, 323 feet high, with a crest length of 635 feet, and a volume of 147,000 cubic yards of materials.

The spillway consists of an ungated ogee crest on the right side of the dam and a plunge pool at the toe of the dam. The crest is at elevation 6756.0 feet, 1 foot above normal water surface. The plunge pool is unlined except for a downstream retaining wall to contain the river fill material.

Water is conveyed from the reservoir to the hydraulic turbine by an 11.5-foot-diameter concrete penstock, the lower portion of which is steel lined. The intake structure consists of a metal trashrack, a 10.58- by 17.27-foot bulkhead gate, an 8.33- by 13.58-foot fixed-wheel gate, and a transition. The fixed-wheel gate is provided for emergency closure and for inspection and maintenance of the penstock. Water from the turbine exits through the draft tube to the tailrace.

The river outlets consist of an intake structure on the upstream face of the dam and two 54-inch pipes through the dam and powerplant. The 54-inch ring-follower

Crystal Dam and Powerplant

emergency gates and 48-inch jet-flow regulating gates in the powerplant control outlet flows. The intake structure includes a metal trashrack, a concrete arch conduit to convey water to the 54-inch pipes, and provisions for installing a bulkhead gate. The Morrow Point Dam river outlet bulkhead gate can be used to close off the outlet pipes for inspection or maintenance.

The reservoir has a total capacity of 26,000 acre-feet and an active capacity of 13,000 acre-feet at above elevation 6700, with a surface area of 340 acres.

The powerplant, completed in 1978, has a generating capacity of 28,000 kilowatts from one unit driven by a 39,000-horsepower hydraulic turbine. It is connected to the main CRSP transmission system at the Curecanti substation by a 115-kilovolt line.

DEVELOPMENT

Early History

Settlement of the upper drainage basin began in 1854 when the early pioneers established Fort Supply in Wyoming on the Emigrant Trail and diverted water from Blacks Fork to the adjacent lands. Breckenridge, Colo., on the basin's eastern rim, was settled in 1859 by miners and prospectors pushing over the mountains from older mining districts on the eastern slope of the Continental Divide. Within the next decade, other mining camps were established nearby. Unsuccessful miners turned to farming and supplied agricultural products to the mining communities. Settlements grew downward from the mountains to the valleys, the advance being slowed somewhat by conflicts with the Indians who occupied the territory. Grand Junction, Colo., now the largest community in the upper drainage basin, was not settled until 1882. The greater part of the Uinta Basin in northeastern Utah was established as an Indian reservation in 1861, and lands unoccupied by Indians were not open to settlement until 1905. Numerous tributary streams in the upper drainage basin have been diverted to irrigate mountain meadows and valleys, farmlands, and broader valleys at the base of the mountains.

Investigations

Investigations of means to develop the waters of the Upper Colorado River system were started by the Reclamation Service in 1902, the year of its organization. Since that year, many of the larger irrigation projects within the basin have been undertaken with Federal assistance, and the Bureau of Reclamation has constructed, or is now constructing, 25 projects to utilize water in the upper basin. The need for the Colorado River Storage Project was envisioned at the time of the Colorado River Compact of 1922. In dividing Colorado River water between the Upper and Lower Colorado River Basins, the compact set aside for consumption in the upper basin 7,500,000 acre-feet of water each year. However, this allocation is contingent upon the upper basin's delivering to the lower basin not less than 75 million acre-feet of water in any period of 10 consecutive years and delivering additional water for use in Mexico under certain circumstances. The dividing point between the two basins is at Lees Ferry, near the northern border of Arizona.

Water allocated to the upper basin was further apportioned to the individual States of Arizona, Colorado, New Mexico, Utah, and Wyoming by the Upper Colorado River Basin Compact of 1948. This compact also created the Upper Colorado River Commission, consisting of representatives of the Federal Government and each contracting State except Arizona.

The flow of the Colorado River is extremely erratic, varying from 4 to 22 million acre-feet annually at Lees Ferry. There is a tendency for the high years or the low years to be grouped, thus accentuating problems of river regulation and use. In prolonged dry periods, there is not enough water to permit the upper basin to increase its use of water under the 1922 compact and, at the same time, make the required deliveries to the lower basin. In wetter periods, however, flows are more than sufficient for these purposes. Large storage reservoirs, that can be

Digitized by Google
Original from UNIVERSITY OF CALIFORNIA

filled when flows are high and can provide additional water when needed for compact fulfillment, are required. Favorable sites for such reservoirs are found in the deep canyons of the Colorado River and its principal tributaries in the upper basin. A plan for the CRSP, including a series of dams and reservoirs to provide storage capacity in combination with power development and other services, was presented in a Bureau of Reclamation report in 1950, which was subsequently printed as House Document 364, 83d Congress, 2d session. The report was formulated in cooperation with other Federal agencies and with the Upper Colorado River Commission. An initial group of participating projects that would develop water for irrigation and other purposes in the upper basin and would be linked financially with the storage project also was described in the 1950 report.

Authorization

Construction of four storage units of the Colorado River Storage Project and 11 participating projects was authorized by the act of April 11, 1956 (Public Law 485, 84th Cong., 70 Stat. 105). Additional projects have been added since the original legislation was adopted.

Authorized developments are:
Glen Canyon Unit on the Colorado River in Arizona and Utah,
Flaming Gorge Unit on the Green River in Utah and Wyoming,
Navajo Unit on the San Juan River in New Mexico and Colorado, and
Curecanti Unit, consisting of three dams on the Gunnison River in Colorado.

Participating projects originally authorized are:
Central Utah (initial phase), Utah,
Emery County, Utah,
Florida, Colorado,
Hammond, New Mexico,
La Barge, Wyoming,[1]
Lyman, Wyoming and Utah,
Paonia, Colorado (works additional to existing project),
Pine River Extension, Colorado and New Mexico,[1]
Seedskadee, Wyoming,
Silt, Colorado, and
Smith Fork, Colorado.

The Eden Project in Wyoming, by terms of its authorizing act of June 28, 1949, became financially related to the Colorado River Storage Project as a participating project. In 1962, authorizing legislation named the following two as participating projects:

San Juan-Chama, Colorado and New Mexico, and Navajo Indian Irrigation (being constructed for the Bureau of Indian Affairs by the Bureau of Reclamation).

[1]Later found to be infeasible and deleted from the plan.

In 1964, the following three projects also were named:
Bostwick Park, Colorado,
Fruitland Mesa, Colorado, and
Savery-Pot Hook, Colorado and Wyoming.

The Colorado River Basin Project Act of September 30, 1968, authorized five additional projects as participating projects:
Animas-La Plata, Colorado and New Mexico,
Dallas Creek, Colorado,
Dolores, Colorado,
San Miguel, Colorado, and
West Divide, Colorado.

CONSTRUCTION

Construction of the Glen Canyon and Flaming Gorge Units began in October 1956. Glen Canyon Dam was topped out in 1963. Hydroelectric power from the powerplant started on line in 1964. Flaming Gorge Dam was topped out in late 1962, and the powerplant began commercial operation in 1963. Navajo Dam was commenced in 1957 and completed in 1963. Construction of the Curecanti Unit began with the start of Blue Mesa Dam in 1962. Blue Mesa was completed in 1966. Morrow Point Dam was started in 1963 and was completed in 1968. Power generation was initiated in September 1967 at the Blue Mesa Powerplant, and in December 1970 at Morrow Point. Construction on Crystal Dam commenced in June 1973 and was completed in 1976. The powerplant, completed in 1978, started power generation in July 1978.

Operating Agency

The Bureau of Reclamation operates and maintains the storage units of the CRSP.

BENEFITS

The Upper Colorado River Basin has a scarcely tapped potential of agricultural, industrial, and recreational assets. It contains tremendous quantities of uranium, coal, and other minerals. Realization of the potential in economic growth and contribution to the national welfare are dependent on maximum utilization of limited water supplies. The Colorado River Storage Project and participating projects conserve the very limited precipitation which falls principally in the form of snow in the high mountains and use it for municipal, industrial, and agricultural growth. Project development provides municipal and industrial water supplies, flood control, extensive recreation, and fish and wildlife preservation.

Morrow Point Powerplant

Recreation

Construction and completion of these major units of the CRSP with subsequent filling of the reservoirs have created scenic and recreational attractions of unique national significance. Visitors come from every State in the union as well as from many foreign countries. The Congress has officially designated Glen Canyon, Flaming Gorge, and the Curecanti Unit as National Recreation Areas. Glen Canyon National Recreation Area is administered by the National Park Service, where visitation during 1977 totaled 2,127,419. Flaming Gorge, administered by the Forest Service, had a visitation during 1977 of 680,870. Blue Mesa, Morrow Point, and Crystal recreation areas are administered by the National Park Service. Attendance there during 1977 totaled 869,895. Navajo Unit recreation areas are administered by Colorado Division of Parks and Outdoor Recreation, and the New Mexico State Parks and Recreation Commission; visitation during 1977 totaled 486,743.

Facilities in Operation or Under Construction

Storage dams	6
Powerplants	5

ENGINEERING DATA

Water Supply

COLORADO RIVER

Drainage area at Glen Canyon Dam	108,335	mi²
Annual discharge:		
Maximum (1917)	21,859,000	acre-ft
Minimum (1934)	4,377,000	acre-ft
Average	11,724,000	acre-ft

GUNNISON RIVER—CRSP

Drainage area at Blue Mesa Dam	3,500	mi²
Annual discharge:		
Maximum (1957)	1,715,000	acre-ft
Minimum (1934)	537,000	acre-ft
Average	1,108,000	acre-ft

SAN JUAN RIVER

Drainage area at Navajo Dam[2]	3,558	mi²
Annual discharge:		
Maximum (1932)	1,856,000	acre-ft
Minimum (1934)	364,000	acre-ft
Average	928,000	acre-ft

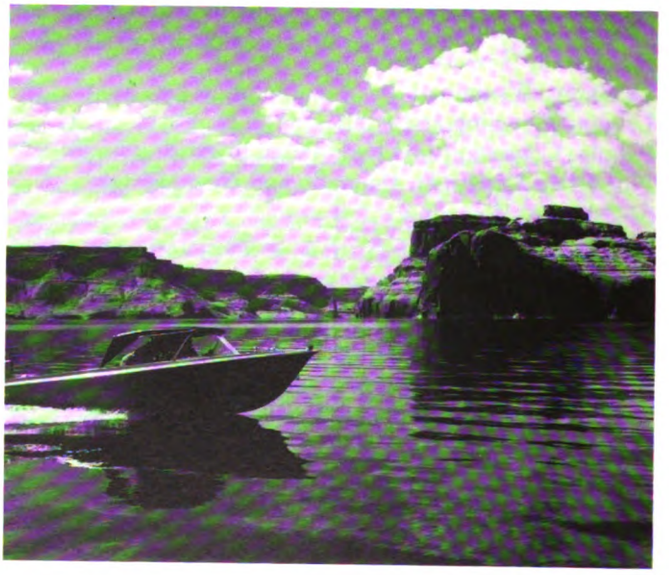
[2]Gage station near Blanco, N. Mex., used as streamflow at Navajo Dam.

Storage Facilities

GLEN CANYON DAM

Type: Concrete arch
Location: On the Colorado River, 15 mi upstream from Lees Ferry, Ariz.
Construction period: 1957-64
Reservoir, Lake Powell:

Total capacity at El. 3700	27,000,000	acre-ft
Active capacity	20,876,000	acre-ft
Surface area	161,390	acres



Boating on Lake Powell

Dimensions:		
Structural height	710	ft
Hydraulic height	583	ft
Top thickness	25	ft
Maximum base thickness	300	ft
Crest length	1,560	ft
Crest elevation	3715.0	ft
Total volume	4,901,000	yd^3
Spillways: One concrete-lined tunnel spillway in each abutment, controlled by two 40- by 52.5-ft radial gates.		
Elevation top of gates	3700.0	ft
Crest elevation	3648.0	ft
Combined capacity at El. 3700	208,000	ft^3/s
Outlet works: Four 96-in-diameter pipes, each controlled by one 96-in ring-follower gate and one 96-in hollow-jet valve.		
Capacity of all outlets at El. 3648	15,000	ft^3/s

Flaming Gorge Dam

Type: Concrete thin arch		
Location: On the Green River, 32 mi downstream from the Utah-Wyoming border.		
Construction period: 1956-64		
Reservoir, Flaming Gorge:		
Total capacity at El. 6040	3,788,700	acre-ft
Active capacity	3,515,700	acre-ft
Surface area	42,020	acres
Dimensions:		
Structural height	502	ft
Hydraulic height	455	ft
Top thickness	27	ft
Maximum base thickness	131	ft
Crest length	1,285	ft
Crest elevation	6047.0	ft
Total volume	987,000	yd^3
Spillway: Concrete-lined tunnel through left abutment, controlled by two 16.75- by 34-ft hydraulically operated fixed-wheel gates.		
Crest elevation	6006.0	ft
Capacity at El. 6046	28,800	ft^3/s
Outlet works: Two 72-in steel pipes reducing to 66-in, each controlled by a 66-in ring-follower gate and a 66-in hollow-jet valve.		
Capacity at El. 6045	4,000	ft^3/s

Navajo Dam

Type: Zoned earthfill		
Location: On the San Juan River, about 34 mi east of Farmington, N. Mex.		
Construction period: 1957-63		
Reservoir, Navajo:		
Total capacity at El. 6085	1,708,600	acre-ft
Active capacity	1,036,100	acre-ft
Surface area	15,610	acres
Dimensions:		
Structural height	402	ft
Hydraulic height	388	ft
Top width	30	ft
Maximum base width	2,566	ft
Crest length	3,648	ft
Crest elevation	6108.0	ft
Total volume	26,840,863	yd^3
Spillway: Uncontrolled concrete crest and concrete-lined chute at right abutment.		
Crest length	138	ft
Crest elevation	6085.0	ft
Capacity at El. 6101.5	34,000	ft^3/s
Outlet works: Concrete-lined tunnel, controlled by one 6- by 13-ft fixed-wheel gate, two 72-in ring-follower gates, and two 72-in hollow-jet valves.		
Capacity at El. 6101.5	4,200	ft^3/s
Auxiliary outlet works: Concrete-lined tunnel in right abutment, controlled by two 4-ft-square tandem outlet gates.		
Capacity at El. 6085	1,700	ft^3/s

Blue Mesa Dam

Type: Zoned earthfill		
Location: On the Gunnison River, 30 mi below Gunnison, Colo.		
Construction period: 1962-66		
Reservoir, Blue Mesa:		
Total capacity at El. 7519.4	940,800	acre-ft
Active capacity	748,500	acre-ft
Surface area	9,180	acres
Dimensions:		
Structural height	390	ft
Hydraulic height	342	ft
Top width	30	ft
Maximum base width	1,550	ft
Crest length	785	ft
Crest elevation	7528.0	ft
Total volume	3,093,000	yd^3
Spillway: Concrete-lined tunnel, controlled by two 25- by 33.5-ft radial gates.		
Elevation top of gates	7528.0	ft
Crest elevation	7487.9	ft
Capacity at El. 7519.4	34,000	ft^3/s
Outlet works: Concrete-lined tunnel, controlled by one 16- by 18-ft fixed-wheel gate, two 84-in ring-follower gates, and two 84-in hollow-jet valves.		
Capacity at El. 7519.4 with hollow-jet valves 62 percent open	5,000	ft^3/s

Morrow Point Dam

Type: Double-curvature, thin-arch concrete		
Location: On the Gunnison River, 12 mi downstream from Blue Mesa Dam.		
Construction period: 1963-68		
Reservoir, Morrow Point:		
Total capacity at El. 7160	117,190	acre-ft
Active capacity	42,120	acre-ft
Surface area	817	acres
Dimensions:		
Structural height	468	ft
Hydraulic height	400	ft
Top thickness	12	ft
Maximum base thickness	52	ft
Crest length	724	ft
Crest elevation	7165.0	ft
Total volume	365,180	yd^3
Spillway: Four orifice-type free-fall spillways at the top center of the dam, each controlled by 15- by 16.83-ft fixed-wheel gates.		
Elevation top gates	7140.0	ft
Crest elevation	7123.0	ft
Capacity at El. 7165	41,000	ft^3/s
Outlet works: One stainless steel-lined 4-ft-square conduit through the center of the dam near the base, controlled by two 3.5-ft-square slide gates.		
Capacity at El. 7165	1,500	ft^3/s

Crystal Dam

Type: Double-curvature, thin-arch concrete		
Location: On the Gunnison River, 6 mi downstream from Morrow Point Dam.		
Construction period: 1973-76		
Reservoir, Crystal:		
Total capacity at El. 6755	26,000	acre-ft

Generated on 2025-06-26 15:34 GMT / https://hdl.handle.net/2027/uc1.31210024716563

Active capacity	13,000	acre-ft
Surface area	340	acres
Dimensions:		
Structural height	323	ft
Hydraulic height	227	ft
Top width	10	ft
Maximum base width	29	ft
Crest length	635	ft
Crest elevation	6772.0	ft
Total volume	147,000	yd^3

Spillway: Ungated ogee crest on the right side of the dam and a plunge pool at the toe of the dam. Crest is at El. 6756 ft, 1 ft above normal water surface. Plunge pool is unlined except for downstream retaining wall to contain river fill material.

Outlet works: Two 54-in pipes through the dam and powerplant controlled by two 54-in ring-follower emergency gates and two 48-in jet-flow regulating gates.

Power Facilities

Glen Canyon Powerplant

Location: At the toe of Glen Canyon Dam.

Year of initial operation: 1964		
Nameplate capacity	950,000	kW
Number and capacity of generators (8)	118,750	kW
Maximum head	560	ft

Flaming Gorge Powerplant

Location: At the toe of Flaming Gorge Dam.

Year of initial operation: 1963		
Nameplate capacity	108,000	kW
Number and capacity of generators (3)	36,000	kW
Maximum head	440	ft

Blue Mesa Powerplant

Location: At the toe of Blue Mesa Dam.

Year of initial operation: 1967		
Nameplate capacity	60,000	kW
Number and capacity of generators (2)	30,000	kW
Maximum head	360	ft

Morrow Point Powerplant

Location: Underground tunnel below left abutment of Morrow Point Dam.

Year of initial operation: 1970		
Nameplate capacity	120,000	kW
Number and capacity of generators (2)	60,000	kW
Maximum head	405	ft

Crystal Powerplant

Location: At the toe of Crystal Dam.

Year of initial operation: 1978		
Nameplate capacity	28,000	kW
Number and capacity of generators (1)	28,000	kW
Maximum head	224	ft

DROUGHTS OF 1930-34

By JOHN C. HOYT

INTRODUCTION

During the 5-year period 1930–34 a serious drought occurred over some broad region of the United States in each year except 1932. The humid States were seriously affected in 1930 and to a lesser extent in 1931 and 1934. The semiarid States underwent minor droughts in 1931 and 1933, which added to the catastrophe of 1934. Drought conditions during these years are of more than academic interest. They stand out as a limiting basis in the availability of surface and ground waters in works involving many millions of capital outlay. If future water supplies are to be unfailing, sufficient storage must be provided to withstand the recurrence of similar shortages at any time.

This report summarizes, as an aid to the more detailed analyses that will arise in the consideration of specific projects, some of the more outstanding questions related to droughts, both physical and economic. It outlines the nature and extent of the droughts of 1930–34; compares them with past dry periods in terms of precipitation, run-off, ground water, evaporation, and transpiration; and sketches the effects of droughts on water supplies as related to a variety of human purposes, including agriculture, domestic and industrial uses, health, power, navigation, and recreation and wild life; it also touches upon the relief, political, and economic elements.

This report is based on information collected in the various States under the direction of the 36 district engineers of the United States Geological Survey, supplemented by data made available through the United States Weather Bureau, Bureau of Agricultural Economics, Bureau of Public Health Service, Office of the Chief of Engineers, Bureau of Reclamation, Emergency Relief Administration, American National Red Cross, and various State agencies. The assistance and suggestions of Geological Survey engineers and geologists and of the personnel of the other organizations listed above is hereby acknowledged. In the arrangement and preparation of the tables and graphs special assistance has been given by Lloyd L. Harrold, Francis M. Bell, and Arthur H. Frazier, assistant engineers, United States Geological Survey. The suggestions of J. B. Kincer, chief of the Division of Climate and Crop Weather, United States Weather Bureau;

Edward T. Kotok, director California Forest and Range Experiment Station, United States Forest Service; and Guy C. Stevens, hydraulic engineer, United States Geological Survey, have been especially helpful.

When in an area that is ordinarily classed as humid natural vegetation becomes desiccated or defoliates unseasonably and crops fail to mature owing to lack of precipitation, or when precipitation is insufficient to meet the needs of established human activities, drought conditions may be said to prevail. Although water for irrigation or other uses in arid areas is always limited, special shortages in such areas are also regarded as droughts. Unsatisfactory distribution of precipitation throughout the year may be as effective a factor in causing a drought as a shortage in the total amount. Temperature and wind may also play an important part, especially in relation to the damage done.

As interest in droughts may relate either to their physical characteristics, as determined by the phenomena that cause them, or to their economic effects, as reflected by damage, they may be considered either as a natural phenomenon or as an economic phenomenon—usually both—and it is therefore essential to take into account in drought studies not only physical data but also information as to the extent and nature of human activities in the area affected.

Although a deficiency in precipitation is the prime cause of droughts it is not possible to set for any region an exact limit of the total annual precipitation above which a drought does not exist and below which a drought may be produced. In general, however, in the humid and semiarid States serious drought effects do not result unless the annual precipitation is as low as 85 percent of the mean—that is, an annual deficiency of 15 percent or more. This limit is here used in defining a drought year and will serve for many drought studies. Although no definite limit can be set for the arid States on account of the wide variations in distribution of precipitation within these States, the same criterion has been used for certain comparisons in this report.

Under the definition given above there have been 38 droughts in the humid States during the period 1881–1934, and in 12 of these droughts over 23 percent of the area of the States was affected. In the semiarid States there were 28 droughts during the same period, and in 11 of these droughts over 44 percent of the area was affected. The years in which these droughts occurred are shown by the black portions of the squares on figure 1. Each square represents a year. The one in the upper left corner represents the year 1880; the next to the right is 1881, then 1882, etc. The horizontal dimension of the black portion of a square indicates the percentage of the area in which there was a drought. If the entire width of the square is black 100 percent of the area was affected. The vertical dimension indicates the deficiency in precipitation, expressed in percentage of the mean annual.

Records of precipitation and stream flow give an index for studying droughts and generally will serve to answer questions relative to the area covered, the severity, the frequency, and the duration. Additional facts, however, are needed in considering the nature and extent

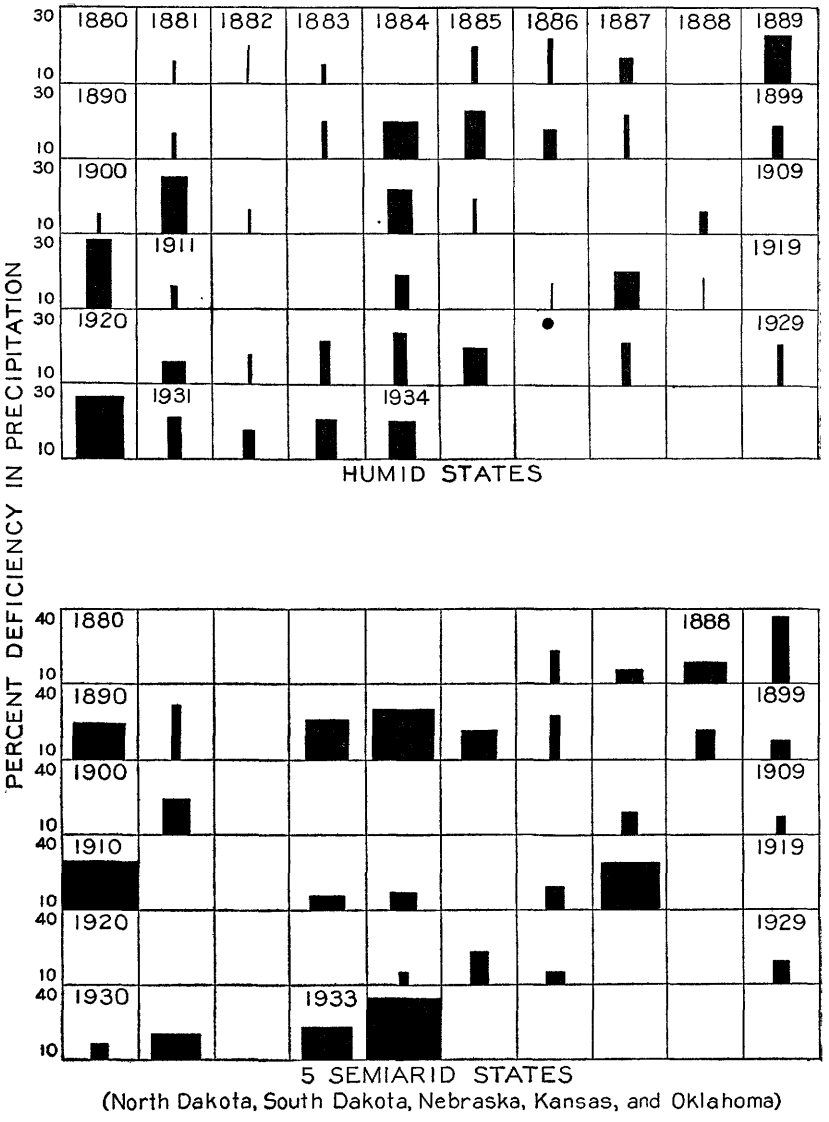

FIGURE 1.—Drought years, 1881–1934.

of resulting damages. Press statements relative to droughts that appear before full physical and other information have been made available and analyzed are generally exaggerated and should be used with caution.

The records of precipitation and stream flow used in this study were made available through the United States Weather Bureau and the United States Geological Survey. Unfortunately, neither of these sets of records extends over a period long enough to enable adequate consideration of drought conditions. Precipitation data are incomplete and scattering for years prior to 1889, and records of monthly precipitation by States were not generally made until about 1890. The annual precipitation for each State [1] has been compiled by the Weather Bureau on a comparable basis, beginning with 1881, and is given in table 1. In the years prior to 1895 the number and distribution of precipitation stations in many States were inadequate, and as a result it was necessary to make adjustments in order to bring the records on a comparable basis. The annual precipitation for each State is indicated graphically in figures 21 to 69 (pp. 75–103), which show also the monthly precipitation for each State from June 1929 to December 1931. Records of annual precipitation are indicative only of general drought conditions: to be of value for detailed drought studies they must be supplemented by monthly records, and even then care must be taken in their use. Systematic records of stream flow on a country-wide basis were started in 1895, and there are but few continuous records that began prior to that date.

The climatic character of an area—that is, whether it is humid, arid, or semiarid—is a major factor in determining the effects of droughts. The one hundredth meridian is commonly considered the approximate border line between the humid and arid sections of the United States. There is, however, no well-defined line, as a wide belt extending on both sides of this meridian may be either humid or arid, depending upon the weather conditions in any particular year. This belt, which includes North Dakota, South Dakota, Nebraska, Kansas, Oklahoma, and western Texas, is sometimes called the "Great Plains" and is the principal semiarid section of the country. The 31 States east of this belt and eastern Texas can all be classed as humid, and the 11 States to the west can be classed in the main as arid with the exception of the Pacific Northwest, which is humid.

Agricultural and many other activities are conducted so differently in these three groups of States that for the consideration of droughts on a comparable basis each group must be treated separately. The precipitation, stream flow, and other data used in this report are included for all three groups. The discussion based on these data, however, applies primarily to the humid and semiarid States unless otherwise stated.

There are alternating periods in which precipitation and resulting ground and surface water supplies are successively above or below

[1] This report follows the Weather Bureau publications in treating Delaware and Maryland as a unit.

TABLE 1.—*Annual precipitation, in inches, by States, 1881–1934*

normal. The records, however, do not disclose—at least on the basis of present interpretation—that these periods conform to fixed cycles or that their occurrence is affected by any acts of man. Man's relation to drought has to do with damages and not causes. In the main, droughts result from climatic conditions immediately before or during the drought period, and the only effect of climatic conditions of previous years relates to any excess of precipitation that may have accrued to surface- and ground-water storage. Such accretion aids in alleviating damages during drought years, especially in the arid sections.

Attention has usually been drawn to droughts by their economic, social, and political aspects, as related to human activities, and not by their physical side. In earlier years they were judged largely by the extent of their damage to vegetation, especially agricultural crops. In recent years, however, as demands and uses of water have increased, more consideration is directed to the effect of droughts on surface and ground water supplies as related to normal activities. Therefore, in determining the damages and losses caused by a drought in a given area many factors must be considered. Among these are the climatic conditions, geology, topography, character and extent of agriculture and other activities, and facilities for the conservation and storage of water. The whole drought problem is so complex that it is difficult to compare those that occur in different areas or in different years. A drought in a certain locality may be detrimental to vegetation and not to water supply, or vice versa.

Water-supply conditions for the 5-year period 1930–34 fully indicate that we have now reached a point in the development of the country when serious consequences will result unless much more careful consideration is given to droughts than has been given in the past. Modern needs and uses for water are rapidly exceeding the limits of free natural supplies. Cities and industries are not only undertaking the full utilization of local supplies but are seeking remote sources. Provision of adequate supplies during low-water periods is becoming more and more of a problem. The economic losses that will result from interruption of service, on the one hand, or from overdevelopment, on the other, can be reduced only through accurate knowledge of frequency, duration, and quantity of minimum surface-water flows and ground-water yields during periods of drought.

DROUGHTS OF 1930 AND 1931

Unfavorable crop reports and low stream flow early in the summer of 1930 first called attention to the approaching seriousness of the drought. These were followed by reports from many localities of the shortage of water supplies for domestic and other uses. The principal drought area was in the north Atlantic, Ohio River, and Great Lakes

drainage basins. By the middle of the summer the effects of the drought were receiving general attention by the press of the country, and the situation was referred to as "the great drought of 1930." At the end of the summer it became evident that in many localities relief measures would be necessary, and steps were taken by both private and governmental agencies to meet needs as they arose. Differences of opinion as to methods of providing the relief created marked political issues and resulted in much emotional publicity, in which great emphasis was given to conditions in certain localities where the effects of the drought were most severe. All this tended to magnify the unfavorable aspects of the situation.

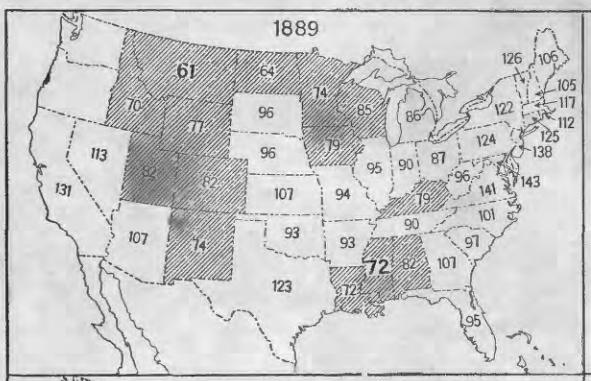
CAUSES

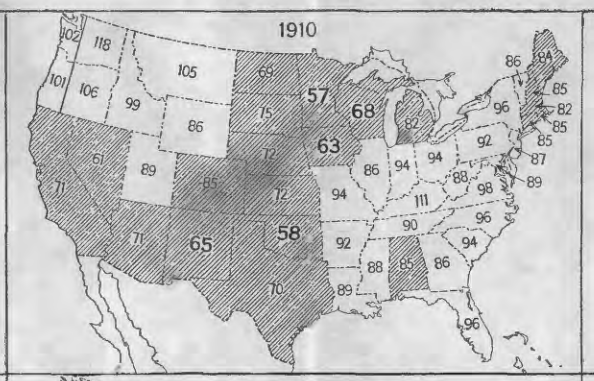
The climatic conditions—deficient and poorly distributed precipitation, high temperatures, and hot winds—which are the basic cause of all droughts, have been summarized from Weather Bureau statistics in table 2 and on plate 1 and figures 3, 4, 13, and 14. These tables and figures, with graphs on figures 21 to 69, provide a basis for studying the progress of the droughts of 1930 and 1931 in each State and for making comparisons between other States. During 1928–29 the annual precipitation was generally in excess of normal, and although deficiency in monthly precipitation appeared in later months of 1929 the records indicate that at the beginning of 1930 water conditions were practically normal and that the droughts of 1930 and 1931 cannot in any large measure be attributed to conditions that occurred in preceding years.

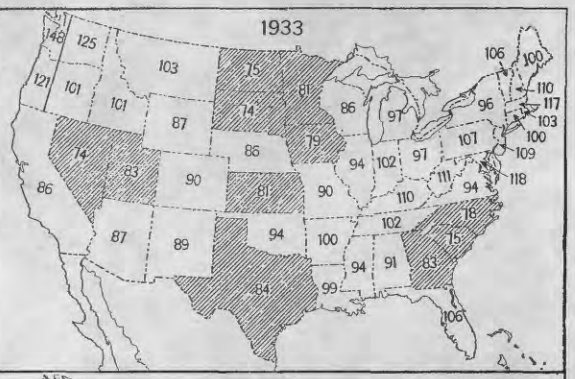
PRECIPITATION

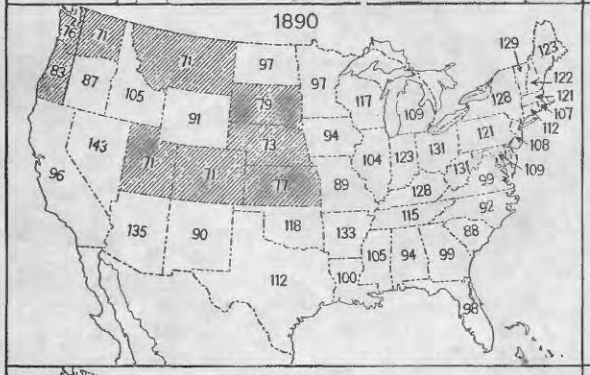
During 1930 precipitation was 85 percent of the mean or less in 27 States. This deficiency was rather uniformly distributed throughout the year, as indicated on the monthly graphs in figures 21 to 69, and was accompanied by excessive heat and warm winds, which resulted in wide-spread droughts varying in severity in different localities.

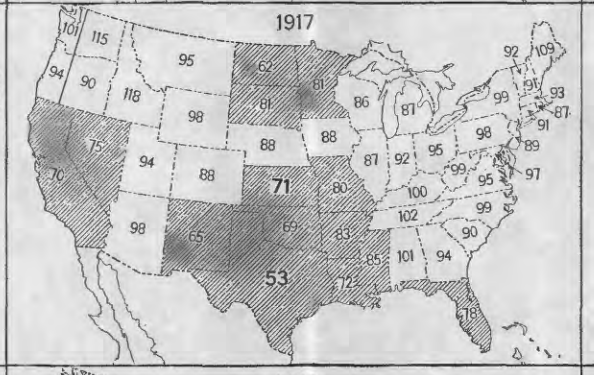
The precipitation in 1930 exceeded 85 percent of the mean in only 9 of the 31 humid States. It was above normal in only 1, Florida, and in 12 it was the lowest on record. These 12 States were in the North Atlantic, Ohio River, and Great Lakes drainage basins, and the deficiency was greatest in Maryland and Delaware, West Virginia, Virginia, and Kentucky, where the precipitation ranged from 57 to 61 percent of the mean. In the 6 semiarid States precipitation was below 94 percent of the mean in only 2—North Dakota, 84 percent; South Dakota, 87 percent—and no previous records of minima were broken. In the 11 arid States the precipitation was above normal except in Montana, Idaho, Washington,

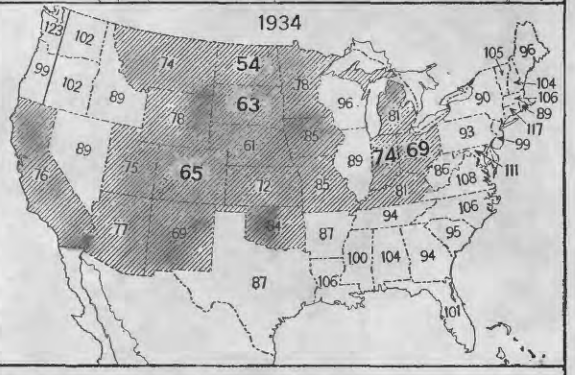


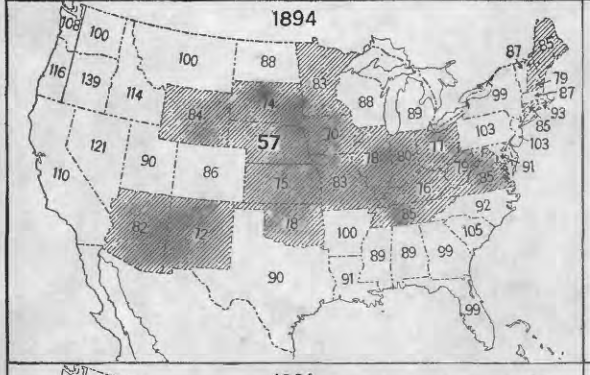


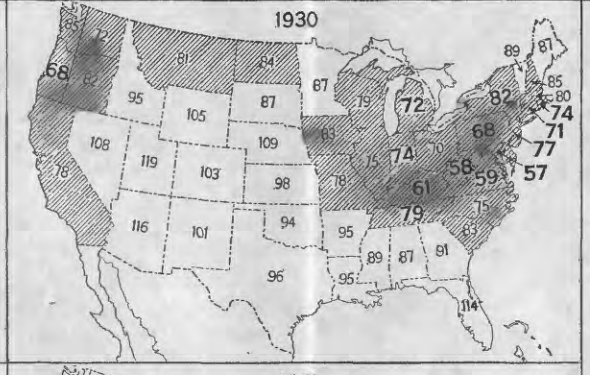


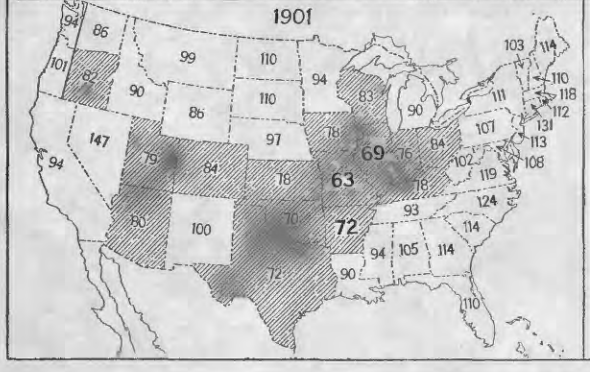


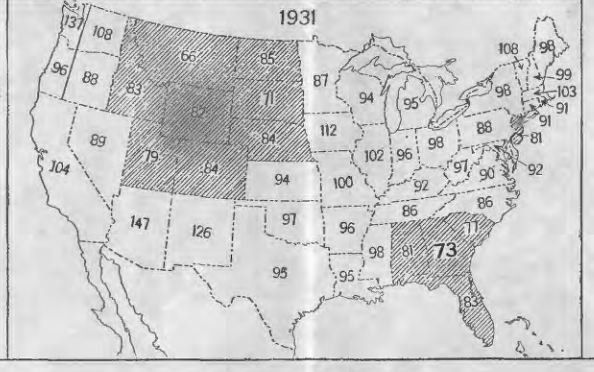












PRECIPITATION BY STATES FOR MAJOR DROUGHT YEARS

All figures indicate percentage of mean. Large figures indicate minimum recorded. When annual precipitation falls to 85 percent of the mean, a deficiency of 15 percent, a drought may be said to exist. Shaded areas show the States having droughts under this definition. The percentages are for the calendar year, and in the arid States precipitation on that basis is not a true index of the water supply available for vegetation

Oregon, and California, and in these 5 States it was below 85 percent except in Idaho (95 percent). In western Oregon it was only 68 percent of the mean, breaking all records of previous lows.

Deficiencies in precipitation continued during the first 10 months of 1931, but they were not as great or wide-spread as during the corresponding period in 1930, and the distribution of precipitation was much better. November and December 1931 were months of high precipitation, which made up for the deficiencies earlier in the year and brought the annual precipitation to more than 85 percent of the mean in 35 States.

In 1931 the precipitation was 85 percent or less in only 5 of the humid States—Alabama, Florida, Georgia, South Carolina, and New Jersey. It was lowest in Georgia, with 73 percent, which broke all records of previous lows. There were only 2 semiarid States in which the precipitation was below 85 percent—Nebraska, 84 percent, and South Dakota, 71 percent, the latter breaking previous records. Precipitation in all the arid States was 82 percent or more, except Montana, 66 percent, and Utah, 79 percent, and no previous records were broken, but there were areas where water supplies for irrigation were short, owing largely to unfavorable distribution of precipitation and inadequate storage. An example is California, where, although the annual precipitation was 104 percent of the mean, agriculture was seriously affected by water shortages.

Although in 1931 deficiency in the precipitation was not extreme in most States, it was sufficient, with the possible carry-over effects from the drought of 1930, to cause many localities to suffer from shortages in both surface-water and ground-water supplies. Vegetation, however, was not materially affected, as there was ample precipitation during the growing season to supply both natural growth and agricultural crops.

A comparison of the 1930–31 drought with other droughts is given on pages 65–69.

TABLE 2.—*Precipitation and composite yields of crops per acre, 1929–34, by States*

* For 50-year period 1881–1930, except for eastern and western Washington and Oregon, which are for period of record.

[b] June to December.

The mean precipitation for each State for the years 1881–1930 is given in table 2. The table also gives for the years 1929–34 the precipitation expressed in percent of the 50-year mean, the number of months for each year when the average precipitation was below the mean for the respective months, the total precipitation for the growing months, June, July, and August, and the crop yields in percent of normal. In most States the deficiency in monthly precipitation started in the later months of 1929 and persisted throughout 1930 and the first 10 months of 1931, as shown in figures 21 to 69. During this 31-month period the number of months when the precipitation was below the mean ranged in the various humid and semiarid States from 16 to 25.

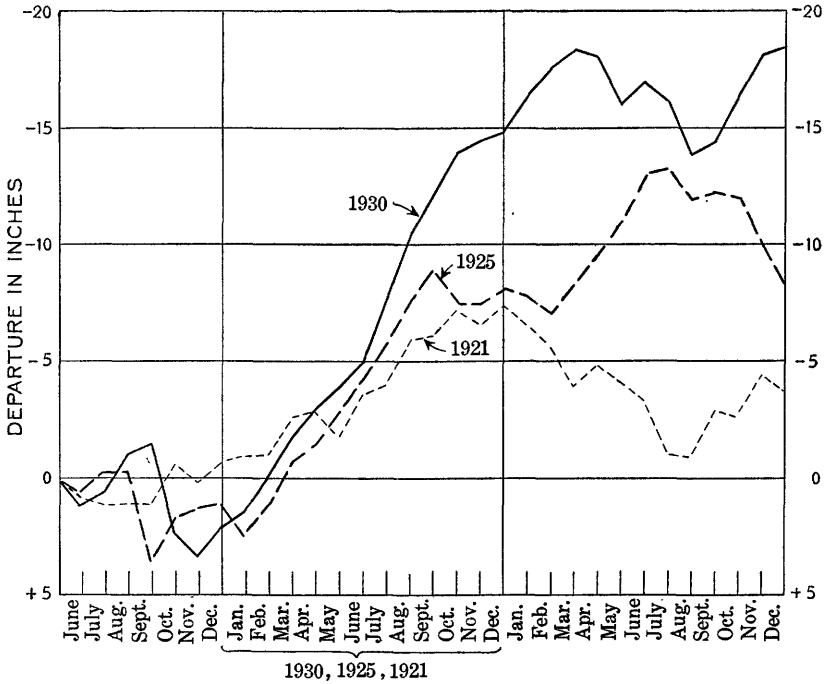

FIGURE 2.—Accumulated departures from the mean of the monthly precipitation for the periods of 31 months including the 3 years of lowest precipitation in Virginia.

In Virginia the three most severe drought years of record were 1921, 1925, and 1930. The graphs in figure 2 indicate the accumulated departures from the mean of the monthly precipitation for three 31-month periods that include these three droughts, thus affording a means of comparing them.

The intensity of each drought is revealed by the steepness of its graph, the duration by the length of time the deficiencies continued to accumulate, and the severity by a combination of the two. For example, the graph from February to September 1925 is almost as

steep as that for the corresponding period in 1930, indicating that the intensity of the drought was nearly the same for that period during both years. In the drought of 1930, however, the deficiencies in precipitation continued to accumulate for 6 months longer, and for that reason this drought is classed as the most severe experienced in Virginia.

Records of stream flow (see pp. 26–32 and table 17) give an even better picture of the drought of 1930–31 and also another means for comparing it with other major droughts.

TEMPERATURE

During 1930 and 1931 temperatures in the drought area were unusually high, as indicated in figures 3 and 4. In 1930 previous recorded maxima were broken in Indiana, Kentucky, Tennessee, Virginia, West Virginia, Maryland, Florida, Alabama, and Mississippi, and they were equaled in Pennsylvania, Louisiana, and New Mexico. In July 1931 previous maxima were broken only in Florida and Idaho and equaled only in Georgia and South Dakota.

WIND

Warm winds, both in 1930 and in 1931, contributed in a large measure to the effects of the drought on vegetation. In many areas warm winds persisted both night and day and in a large measure may have accounted for low humidity, high evaporation, and absence of the usual dews, which are of great benefit to vegetation.

EFFECT ON GROUND AND SURFACE WATER

GENERAL EFFECT

The quantity and distribution of both surface and subsurface water, and also their relation to each other, are determined by a combination of factors, including climate, vegetation, topography, geology, geographic location, and the works of man.

The relation between droughts and water supplies and between water supplies and vegetation depends upon the basic principles of hydrology, and these three subjects are so closely related that it is difficult to consider or discuss any one of them independently of the others.

Of the water that reaches the earth by precipitation, a part is promptly returned to the atmosphere by evaporation; another part remains on the surface, either as snow or impounded water, or in flowing streams, as surface water; and the remainder enters the ground and becomes subsurface water.

With respect to the occurrence of subsurface water [2] the earth's crust may be divided into the zone of saturation and the zone of

[2] See Meinzer, O. E., Occurrence of ground water in the United States: U. S. Geol. Survey Water-Supply Paper 489, 1923; Outline of ground-water hydrology: U. S. Geol. Survey Water-Supply Paper 494, 1923.

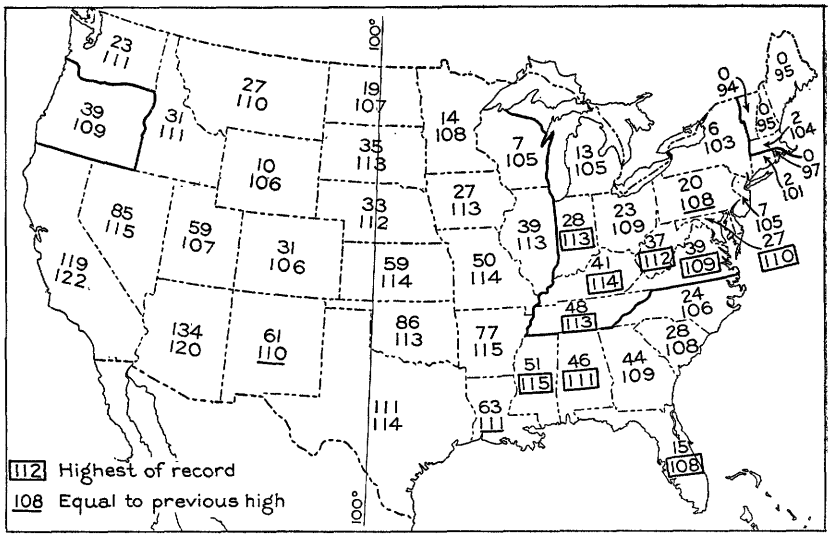

FIGURE 3.—Temperatures, 1930. Upper figure, number of days with maximum of 100° F. or more. Lower figure, maximum temperature during June, July, and August. In areas indicated by heavy outline the precipitation in 1930 was lowest of record.

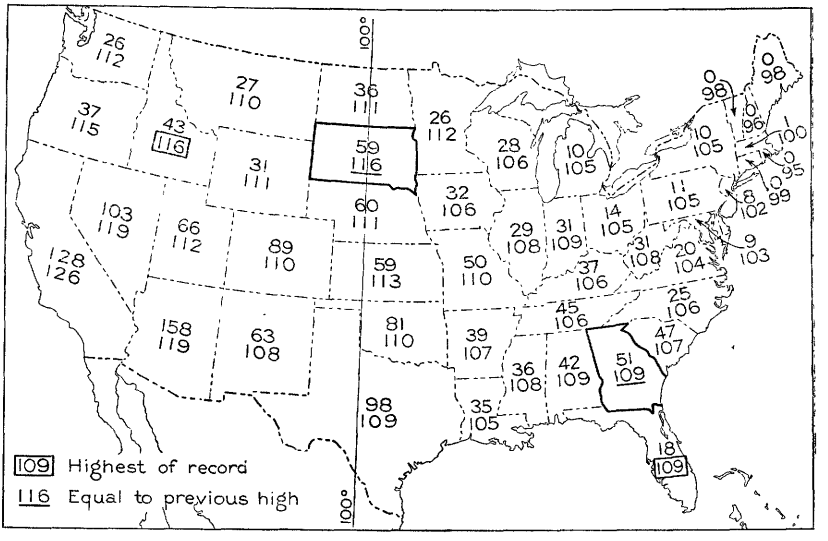

FIGURE 4.—Temperatures, 1931. Upper figure, number of days with maximum of 100° F. or more. Lower figure, maximum temperature during June, July, and August. In areas indicated by heavy outline the precipitation in 1931 was lowest of record.

aeration, as indicated in figure 5. In the zone of saturation the interstices are filled with water under hydrostatic pressure. This zone constitutes the great reservoir from which stream flow is maintained and deep-rooted plants are, in part, fed during the periods of slight rainfall. The water in this zone is commonly called "ground water." In the zone of aeration the interstices are largely filled with air. Many of the interstices in this zone contain water, and at times some of them may be completely filled. This water is not, except temporarily, under hydrostatic pressure and is, for the most part, held by molecular attraction. This zone acts as a distributing reservoir, and its water content is subject to rapid fluctuations.

The depth to the water table or upper surface of the zone of saturation varies in different localities, depending on topography and the geologic formation. It also has seasonal variations, which depend on the differences in the rate at which water enters and leaves the zone of

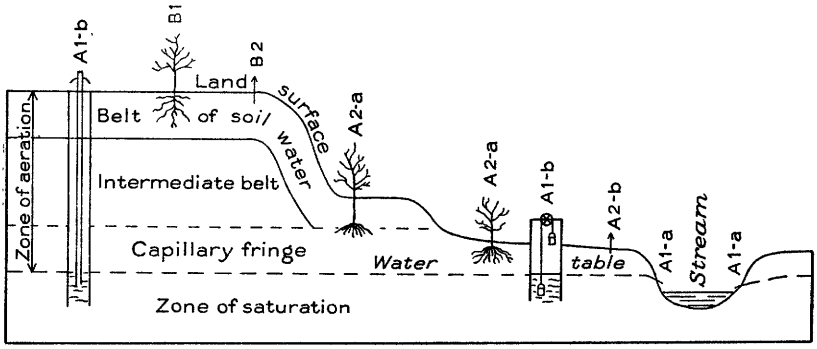

FIGURE 5.—Diagrammatic section showing different kinds of discharge of subsurface water. *A*, Groundwater or phreatic-water discharge: *A1-a*, spring; *A1-b*, well; *A2-a*, phreatophyte; *A2-b*, soil which is acting like the wick of a lamp in drawing water from the zone of saturation. *B*, Vadose-water discharge: *B-1*, ordinary plant, the roots of which do not extend to the capillary fringe; *B-2*, soil above the capillary fringe, which is losing moisture by evaporation. (After Meinzer.)

saturation. These variations indicate and determine the gradient of the water table. This gradient is important, because its fluctuations correspond to the amount of water that is released from the zone of saturation.

The zone of aeration may be divided, as indicated in figure 5, with respect to the occurrence and circulation of its water, into the belt of soil water, the capillary fringe, and the intermediate belt.

The belt of soil water is the part of the earth's crust immediately below the surface, from which water is discharged into the atmosphere in perceptible quantities by evaporation from the soil or transpiration from plants. Its thickness is limited by the character of the vegetation and the texture of the soil. It is essentially the same as the so-called "root zone." The capillary fringe is the belt that overlies the zone of saturation and contains interstices, some or all of which contain water

that is continuous with the zone of saturation but is held above that zone by capillary action against gravity. Its thickness is determined by the texture of the material in which it occurs.

The intermediate belt is the residual part of the zone of aeration. It varies in thickness and will be missing entirely when the belt of soil moisture joins the capillary fringe. In general, the intermediate belt is of but little importance in connection with water supplies.

The precipitation that passes below the surface first enters the belt of soil water, from which it is discharged in four ways—(1) to the atmosphere by evaporation directly from the soil; (2) to plants, which return a large portion of it to the atmosphere by transpiration; (3) to the surface water by shallow subsurface flow; (4) to the intermediate belt, through which it percolates and ultimately reaches the water table, where it enters the zone of saturation.

Where the water table meets the earth's surface, springs occur and water flows from the zone of saturation upon the land surface or into a body of surface water. Where the water table is near the surface, water may be withdrawn from the zone of saturation by evaporation directly through the soil or by plants, mostly by transpiration. Water is also withdrawn from the zone of saturation through wells, filtration ditches, and tunnels.

The precipitation reaches the surface streams either directly by flow over the surface of the ground or indirectly through the ground, either as suspended water or as ground water. Low-water flows are derived largely from ground water; when this is supplemented by water from the zone of aeration, medium flows exist; and if there is a large contribution from the surface, flood flows are produced.

The relation between vegetation and water is not fully understood, it is not readily susceptible of laboratory study, and there are varying opinions relative to the many phases that enter into it. Certain principles, however, have been usually agreed to by many students of the subject. Plants draw their moisture through their root systems from the earth's zone in which they are embedded and give it off by transpiration through their leaves. Root systems are particularly susceptible to the influence of changes in soil texture and moisture and are more or less modified by environment. There are wide variations in their character. Some penetrate deeply into the soil; others lie near the surface. The root systems reach out and take the water which is most readily available. Their principal source of supply is the belt of soil water, and not the zone of saturation, for with the exception of certain trees, the roots of most plants do not extend

deeply into the ground and, in general, do not reach the water table. Hence, there appears to be but little direct relation between most vegetation, other than deep-rooted trees, and the ground-water table. The principal draft on the zone of saturation by vegetation is that from growth on lands adjacent to watercourses.

During the average growing season practically all the precipitation is lost through evaporation or utilized in plant growth, so that stream flow during the growing period is largely dependent upon ground water. Low flows, therefore, generally prevail except when the precipitation is intense or excessive.

Water in the belt of soil water fluctuates in quantity with precipitation and is continually being lost either by evaporation and transpiration or by percolation laterally to the surface or downward to the zone of saturation. The capacity of the belt of soil water for holding water is comparatively small; therefore the quantity of water available in it is not greatly affected by long-time carry-over derived from previous precipitation. In general this belt contains sufficient water to supply vegetation for only a few weeks, and during the growing season of June, July, and August ample replenishment is required or most plant life will suffer. Crop-yield statistics for the humid and semiarid sections (see pp. 32–35) indicate that, in general, after germination, from 7 to 8 inches of favorably distributed precipitation is the minimum requirement for the production of average yields, unless temperatures are abnormally low or high, or there are excessively hot winds.

A comparison of available records of precipitation and run-off in the northeastern United States prior to 1906 [3] as given in table 3 indicates that in the humid areas during the growing period evaporation and plant growth will consume as much as 3½ inches of precipitation a month. Therefore, unless the monthly precipitation during the growing season exceeds that amount or comes so rapidly that it cannot all be consumed, there will be little water available for replenishing either the surface or the ground water.

Surface and subsurface water supplies are usually at a minimum at the end of the growing season, which for most sections of the United States is about October 1. From that time until the beginning of the next growing season, about April 1, the losses through evaporation and plant life are comparatively small, and the precipitation is mostly available for replenishing surface and subsurface waters. For this reason October 1 may be used as the beginning of the water year in presenting stream-flow records. The major part of stream flow depends on the precipitation during the nongrowing season.

In the humid areas, where cultivated crops depend wholly on rain, there will obviously be a drought when an absence of rain occurs in the growing season. In the semiarid regions dependence on rain also makes a dry period a drought period. In the true arid country, however, where crops depend for their moisture largely on impounded water, a drought is not caused by absence of precipitation during the growing season but rather by absence of precipitation during the nongrowing seasons, as precipitation during these seasons furnishes a larger part of the water for storage.

The demand for water for natural vegetation is different from that for cultivated crops. Through the centuries the natural vegetation

has adapted itself to its environment, so that it can withstand to a large degree absence of moisture for long periods, extremes in temperatures, and high desiccating winds. Ecologists state that this is a part of the process of "edaphic adaptation." Therefore, in a sense, natural vegetation, including arborescent flora, can survive droughts that would affect cultivated crops. The effect of a drought on such vegetation, however, may consist in lessening cellulose produced, reducing the growing season, and as a corollary increasing the dormant season.

As related to agriculture, a drought depends largely on the extent to which man has entered into the picture.

In ordinary years the humid areas have adequate precipitation to supply the needs of vegetation. Nevertheless, there may be in any year small areas in which vegetation is affected by shortages of water, and at intervals ranging from 15 to 20 years there may be major shortages that may seriously affect vegetation over large areas. The correction of these effects is largely outside the control of man, and to be successful, agricultural activities in the humid section should be so planned as to provide for carrying over these lean years.

The precipitation in the semiarid sections of the country is so small that vegetation is affected in a large measure not only by fluctuations in the total annual precipitation but also by unsatisfactory distribution throughout the year. These areas, which may be for alternate years either humid or arid, according to the precipitation, were originally natural range and produced, in the main, only vegetation for stock raising, which was successfully carried on for many years. In 1873 the Director of the United States Geological Survey, in testifying before a congressional committee on public lands, indicated that most of the country lying west of Minnesota was an arid region and in the main could not be used for agriculture except by irrigation. Five years later he reiterated this statement before another committee. While irrigation has been successfully carried on in the arid sections, unfortunately it has not been found economically feasible in most semiarid sections. The United States Weather Bureau has repeatedly expressed cautions against any great extension of agriculture in the semiarid States.

The reason for the failure to heed these warnings is shown in figures 1 and 19, which indicate that since 1880 drought years in the semiarid States have been more or less bunched, with several years of no drought between each group. The periods of no drought were 1880 to 1885, 1902 to 1906, and 1918 to 1923. With adequate precipitation, these semiarid areas are especially adapted to the growing of wheat, and during nondrought years large areas were converted from range to wheat culture. It was this section that suffered so greatly during the drought period 1930–34, which again called attention to the ever-present danger to many types of agriculture that

have been undertaken in the semiarid regions and have not fully succeeded. If the future is to be judged by the past, there is no indication that such activities can be continued in these areas with any assurance of success under the present methods of farming.

In the arid regions vegetation is limited both in character and in extent, except in subirrigated bottom lands and artificially irrigated areas. Successful irrigation depends primarily upon the way in which available water supplies are developed, the character of the land, and the methods of distribution and application of water. Detrimental effects of droughts on agriculture in these regions depend largely on the character and extent of farming activities.

In most irrigated areas ample water is usually available to meet present requirements if it is wisely developed and used. This fact was clearly shown during the period 1930–34, when on projects that had been properly developed and were scientifically operated losses due to inadequate water were generally not serious.

The marked effect that vegetation has on surface and ground water was clearly shown during the droughts of 1930 and 1931, as after light precipitation there was a noticeable increase in the flow of springs and small streams, even though no great amount of water could have been contributed. This effect was also indicated on cloudy days and during nights, when there was a slowing up of plant growth. At the end of the growing season the flow of springs and small streams increased, even though there was no precipitation, and water appeared in many springs and small streams that had been dry during the growing season.

Examples of the effect of the consumptive use of water by vegetation on water supplies in Maryland and Virginia are given in the Monthly Weather Review for October 1930. Among these observations were those of the flow of a small stream at Cabin John, Md., a suburb of Washington. The behavior of this stream, which has a drainage area of only a few acres and is in effect a spring, was typical of that of numerous other springs and small streams in Maryland and Virginia. During the summer there was a diurnal fluctuation in which the low flow was at times only one-sixth of the high flow. In September the stream became intermittent each day, but in October, although there had been no appreciable precipitation, the flow became continuous again, with diurnal fluctuations similar to those that existed before the intermittent period.

The gage-height graph (fig. 6) of the South Fork of the Mills River at The Pink Beds, N. C., which has a drainage area of 9.87 square miles, mostly wooded, indicates how diurnal fluctuations in stream flow due to transpiration and evaporation vary throughout the year. In the winter the flow is steady, the graph being almost a straight line. Through the growing season the graph shows regular diurnal fluctuations as transpiration takes its share of the supply

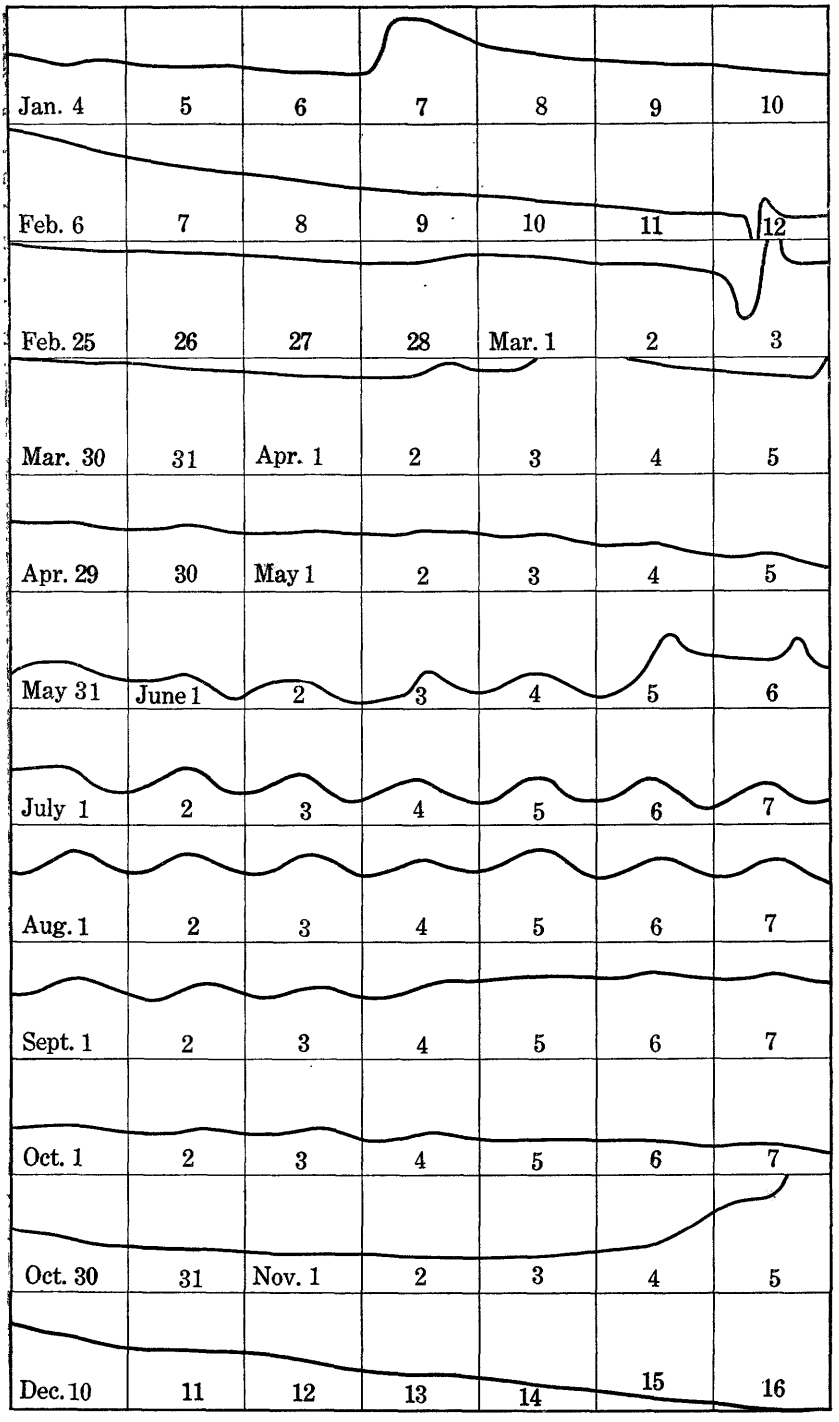

FIGURE 6.—Gage-height graph of South Fork of Mills River at The Pink Beds, N. C., showing diurnal and seasonal effect of evaporation and transpiration.

during daylight and diminishes during the night, with a lag before the effect appears in stream flow. Translated into flow, the daily variations are as large as 30 percent.

The magnitude of losses through transpiration and evaporation is illustrated by variations of flow for Owens Creek at Lantz, Md. This stream has a drainage area of 5.99 square miles, located in a wooded mountain region at an altitude of about 1,500 feet. Figure 7 shows the diurnal fluctuations in the gage height of this stream from June 1 to 5, 1932. These fluctuations, as indicated on the graph, correspond to a daily variation of flow that averages over 20 percent and aggregates about 820,000 gallons a day, enough to furnish an average municipal supply for 8,000 people.

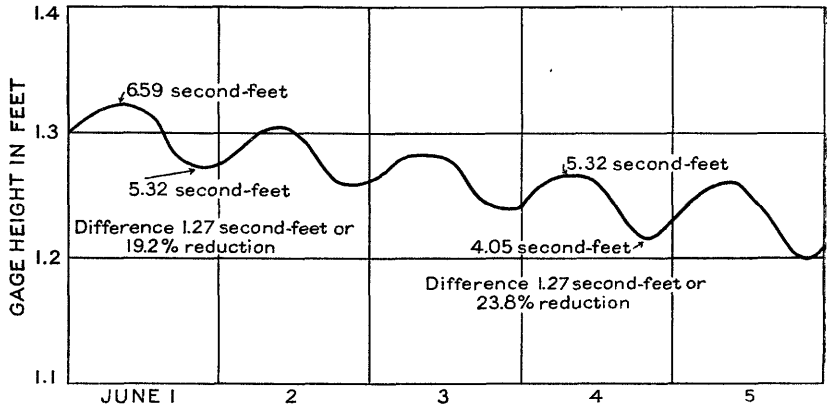

FIGURE 7.—Gage-height graph of Owens Creek at Lantz, Md., June 1–5, 1932, showing effect of transpiration and evaporation on stream flow.

Diurnal fluctuations in low-water flow of streams caused by daily evaporation and transpiration apparently vary inversely as the depth to the water table, as indicated in figure 8, a graph of hourly discharge over a weir on Piney Run near Sykesville, Md. (drainage area, 11 square miles), for two similar 2-day periods, both of which are representative of the low-water flow for their respective years. Prior to each 2-day period there had been no rainfall for a considerable length of time, so that all of the direct surface run-off from the last rains had passed out of the basin, and the stream flow as shown in the figure was derived mostly from the ground-water reservoir and therefore gives a fair indication of the depth of the water table in this small basin. The graphs indicate a marked fluctuation in flow, the high flow resulting from hours of little or no evaporation and transpiration, and the minimum flow showing the effects of the hours when transpiration and evaporation are greatest. The difference between the high and low rate of discharge for the day indicates the maximum rate at which evaporation and transpiration were depriving the stream.

The areas in figure 8 which are enclosed between the dashed line and the graph provide a measure of the daily loss to the stream, which has been computed, as shown in the figure, in million gallons a day. No records of ground-water levels are available, but it was observed that the precipitation in 1933 was ample to maintain a higher ground-water table than in 1932, when there was less precipitation. In 1933, a year of ample rainfall and correspondingly high ground water, the low flow was about 150 percent greater on June 3 and 4 than for the same 2 days in 1932, which was a year of low rainfall and correspondingly low ground water. The estimated evaporation and transpira-

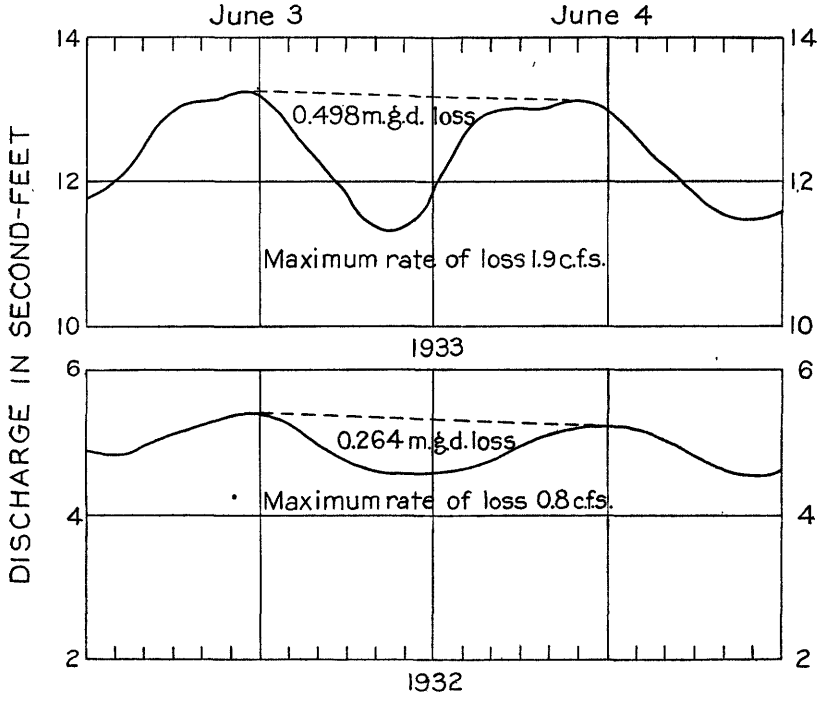

FIGURE 8.—Discharge graph of Piney Run near Sykesville, Md., showing effect of transpiration, evaporation, and altitude of water table on stream flow.

tion losses producing diurnal fluctuations in the low stream flow were about 90 percent greater in 1933 than in 1932. The indications are that this difference was largely due to the fact that less evaporation and transpiration from ground water takes place when the water table is at a greater depth.

Evaporation from surfaces of impounded water and of flowing streams is an important factor in connection with the effect of drought on both surface and ground water. During the summer of 1930 measurements of flow of the Potomac River at Point of Rocks, Md., indicated less discharge than the combined flow as recorded at river-

measurement stations at Shepherdstown, Millville, and other points on tributary streams above Harpers Ferry. The distance between Point of Rocks and the upper measurement stations is about 28½ miles. The area of water surface in this stretch of the river is about 5.75 square miles. An evaporation of 0.01 foot for 24 hours from this area of water surface would be equivalent to a flow of 18.6 second-feet. There were many days during the summer of 1930 when the humidity was extremely low, with brisk winds, on which the evaporation probably approached 0.1 foot a day. The loss due to this evaporation was sufficient to account for apparent discrepancies in the discharge as measured at Point of Rocks, where the minimum daily flow in 1930 was 594 second-feet, and at points on tributary streams above.

GROUND WATER

Comparatively few systematic records of fluctuations of ground-water levels have been collected, and most of these cover only short periods. Therefore any statement relative to the effect of the drought on ground water is more qualitative than quantitative. In general, however, it is known that during 1930 and 1931 there were marked lowerings of ground-water levels, which severely affected many communities that depend on ground water for domestic and other uses, and in many localities flowing springs and wells either became intermittent or ceased to flow until the end of the drought.

An example of the effect of the drought on the ground-water table is indicated in figure 9, which shows the precipitation at Washington, D. C., and corresponding fluctuations of the water surface of the Ross well, in nearby Virginia.[4] This graph, produced by a water-stage recorder, shows that in the winter of 1928–29 replenishment of the ground-water supply began late in January, and in the winter of 1929–30 it began about the middle of January, whereas in the winter of 1930–31 it did not begin until near the end of March. In the winter of 1931–32 it began about the first of January. The winter replenishment raised the ground-water table somewhat over 2 feet in 1928–29 and in 1929–30, over 4 feet in 1931–32, and over 6 feet in 1932–33, but less than 1 foot in 1930–31.

On account of the great draw-down caused by the drought of 1930, the water table at the site of the Ross well dropped to an extreme low stage and reached its greatest depression in March 1931. The summer of 1931 was unusually favorable for replenishment, however, and hence at the well site there was a small net rise in the water table, which was in striking contrast to the decline of about 3 feet in the summer and autumn of 1930. A rise of nearly half a foot was produced by the heavy rains that occurred at the end of May and the be-

[4] Cady, R. C., Investigations of the fluctuations of water levels in observation wells in Virginia: Am. Geophys. Union Trans., 1932, pp. 370–373.

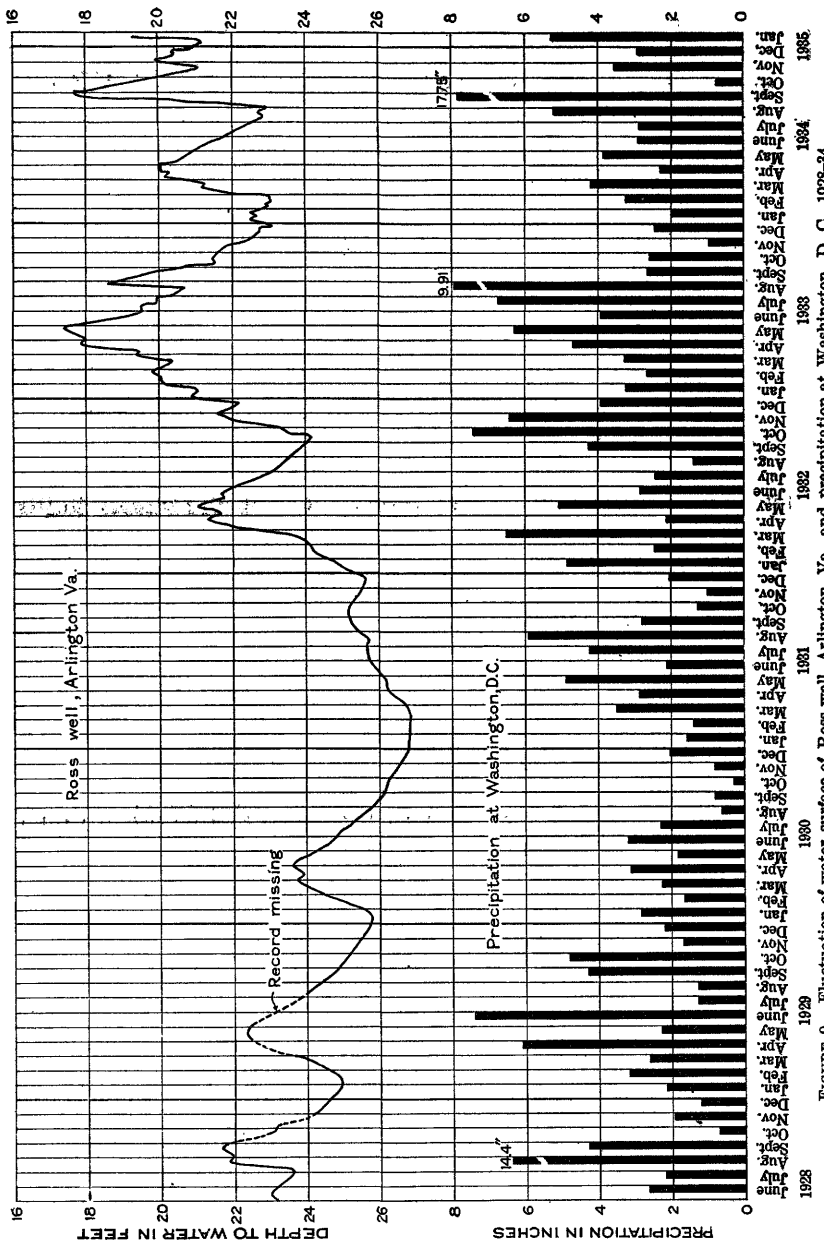

FIGURE 9.—Fluctuation of water surface of Ross well, Arlington, Va., and precipitation at Washington, D. C., 1928–34.

ginning of June 1931, and a further rise of about the same amount was produced by the combined effect of heavy rains in July and August. Later in the season the water level declined about to the July level. The most notable summer replenishments within the period of record occurred in August 1928, August 1933, and September 1934; in August 1928 the precipitation amounted to 14.4 inches, and the water table rose about 2 feet; in August 1933 the precipitation amounted to 9.91 inches, and the water table rose about the same amount; in September 1934, however, the precipitation was 17.45 inches, and the water table rose 5 feet.

It should be explained that in the summer of 1931 there was more replenishment at this observation well than at several other wells in Arlington and Fairfax Counties, in which measurements of the water level were made. For example, in one of these other wells the water level dropped slightly more than 1 foot from August 22 to December 26, whereas during this period the water level in the observation well first rose and then fell, with almost no net change. This was probably due to geologic conditions that were favorable to percolation.

Comparison of the Ross well records with the barograph observations at Washington indicates that the ground-water table fluctuates in response to variations in atmospheric pressure. These fluctuations have only a small range. They can, however, readily be distinguished from any rise produced by replenishment. Apparently when the soil is dry changes in atmospheric pressure are transmitted through the air-filled interstices in the soil almost as easily as through the air column in the well. Hence the changes in pressure on the water table are essentially equal to the changes in pressure on the water surface in the well. On the other hand, when the pore spaces in the soil contain more water, the barometric changes cannot be transmitted so readily to the water table as to the water surface in the well, and hence the water surface is depressed when the barometer rises and recovers when the barometer falls. In some wells that extend into water-bearing formations overlain by impervious confining beds the barometric fluctuations have been found to be nearly 100 percent of the fluctuations of a water barometer. As the locality of the observation well near Washington has a water table without any competent confining bed, the barometric fluctuations are much smaller. Thus they amounted to only about 15 percent from April 27 to May 4, 1930, when the soil moisture was fully replenished, and to a much smaller percentage from November 22 to 29, 1930, when the soil was very dry.[5]

[5] Meinzer, O. E., Methods of estimating ground-water supplies: U. S. Geol. Survey Water-Supply Paper 638, pp. 140–142, 1932.

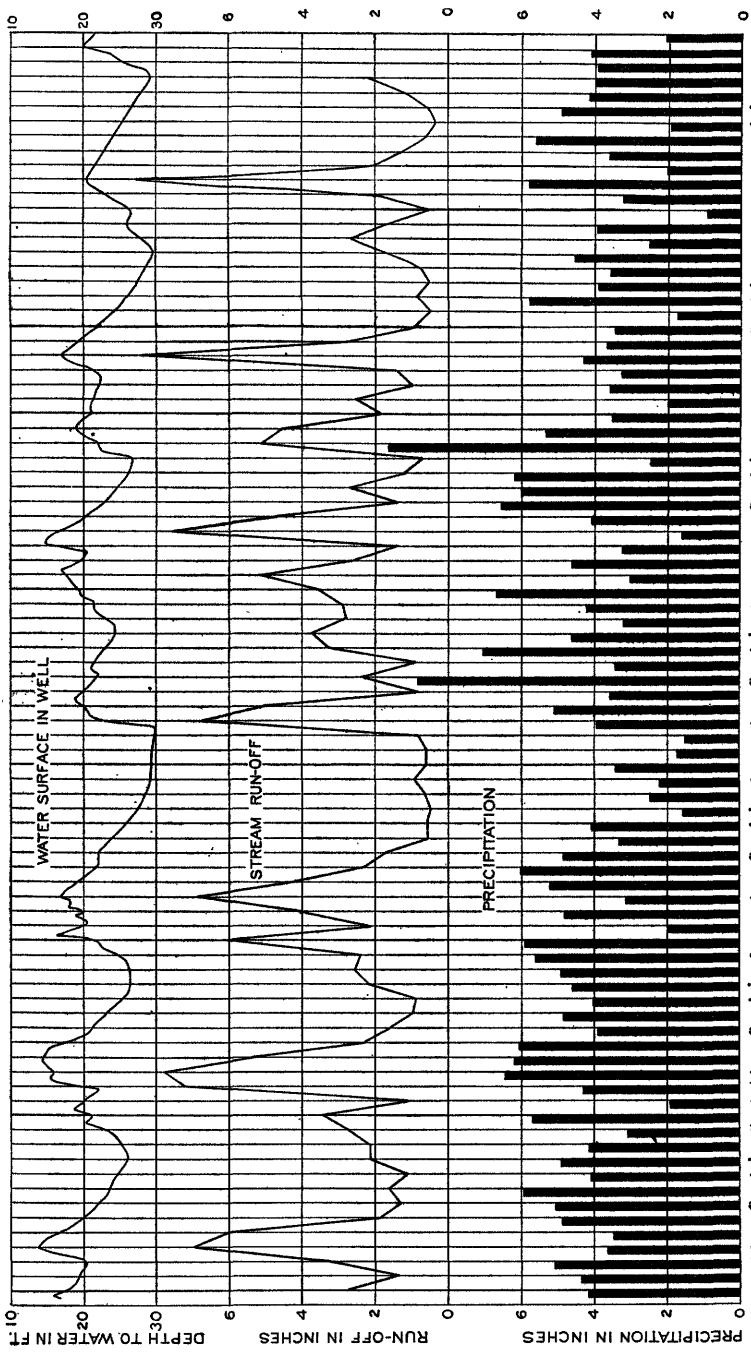

FIGURE 10.—Fluctuations of water surface of a well, run-off, and precipitation on South Branch of Moose River in New York, 1928–34.

Ground-water levels recorded at White Lake Corners, Oneida County, N. Y., since 1928, are shown in figure 10.[6] The same diagram also shows the run-off from the South Branch of the Moose River, a nearby stream with a drainage area of 216 square miles, and the average rainfall over this area as obtained from rain gages at McKeever, North Lake, and Raquette Lake. These records, like others, show that in the main the fluctuation of both ground water and stream flow follow closely the precipitation, and there is no indication of large carry-over effects from either high or low precipitation.

The general trend of the ground-water fluctuations starting with the end of the growing season is a rise in level until January or February, when, apparently owing to frost conditions, the level falls until the spring break-up; then it rises again until the beginning of the growing season; and then, owing to the demands for water by vegetation, it drops until the end of the growing season.

Prior to the beginning of the drought of 1930 the precipitation and corresponding ground-water level and also the stream flow were average or above. In spite of the severity of the drought both the stream flow and the ground-water levels responded almost immediately to the increased precipitation late in 1931, and continued on an upward trend until the beginning of the growing season of 1932, when they were not materially lower than at the corresponding dates in 1928 and 1929.

SURFACE WATER

Surface waters in lakes, ponds, reservoirs, and flowing streams were severely depleted as a result of the droughts of 1930 and 1931. There was a material lowering of the surface of bodies of impounded water. Many reservoirs were drained entirely, the surfaces of larger lakes and ponds were materially lowered, and many of the smaller ones practically dried up. Many new minima for the flow of streams were established during the calendar years 1930 and 1931. In general, however, the minimum daily flows did not fall much below those previously recorded. On the other hand, the weekly and monthly flows for many streams reached new minima, and many records of long-continued low flows were broken.

During 1930 minimum flows for the period of record were reached on many streams as early as July, and the flow did not go much lower while the drought lasted. The drought continued long enough in most drainage basins to test available ground-water supplies thoroughly, and the records indicated that the available ground-water supply for some basins may be so great that it is adequate to maintain the stream flow above a fixed minimum for a considerable length of time and probably through most droughts.

[6] Unpublished data furnished by Edwin S. Cullings, member Am. Soc. Civil Eng., Watertown, N. Y.

The records of stream flow indicate that the small variations in flow during low-water periods, caused by occasional rains, are of short duration, as shown in table 4, which gives the daily flow of the Potomac River at Shepherdstown, W. Va., during the last 7 months of 1930. The effect of the drought on stream flow started late in June, was well established by July 11, and continued until December 27. A minimum flow of 300 second-feet was recorded on one day each in July and August. In September the flow was between 330 and 340 second-feet on several days, in October it was 307 second-feet on 4 days, in November it was 325 second-feet on 2 days, and in December it was 371 second-feet on 3 days.

The combined flow from the Tennessee and Cumberland River drainage basins [7] as compared with the precipitation in the same area for the 30-year period 1900–29 is shown in figure 11. For this 30-year period the average run-off was 45 percent of the precipitation. In wet years it exceeded 50 percent, and in dry years it dropped to 35 percent or less, indicating that the losses through evaporation and

[7] See King, W. R., Surface waters of Tennessee: Tennessee Dept. Education Bull. 40, p. 56, 1931.

transpiration do not vary materially between wet and dry years as long as there is sufficient precipitation to satisfy the evaporation and transpiration demands, and that deficiency in rainfall may mean a relatively greater deficiency in stream flow. This is important in planning municipal water supplies.

A wide variation in the unit run-off of different areas is found, even in areas adjacent to each other. Observations in 1930 showed that some streams became dry while others of comparable size in adjacent basins continued through the drought with a fair discharge. As conditions in different drainage basins vary, estimates of low flow

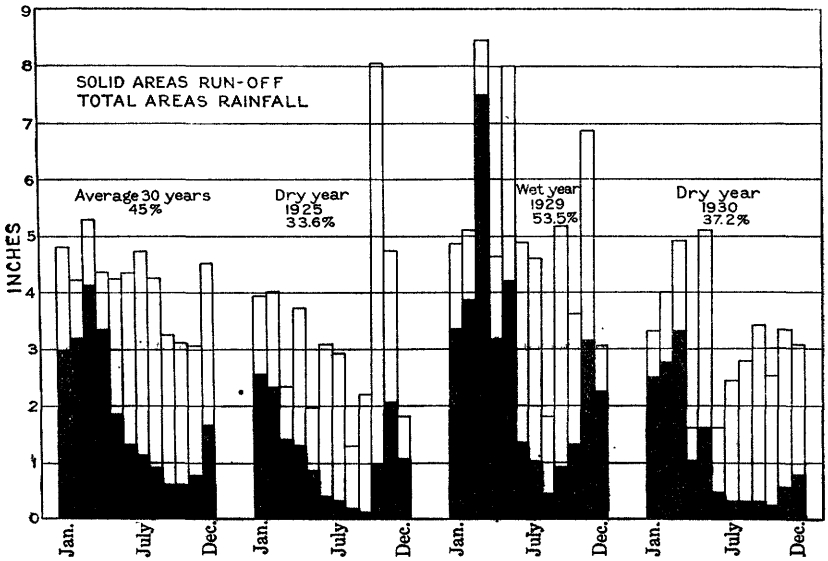

FIGURE 11.—Rainfall and run-off for combined drainage basins of Tennessee and Cumberland Rivers, by months, showing variation between wet and dry years. Ratio of run-off to rainfall is indicated in percent on diagram.

based on comparison with adjacent areas or on precipitation data cannot be made with any degree of certainty. Records of flow on the stream that is to be utilized afford the only safe basis for making studies in connection with a given development. Records of daily flow are essential for detailed studies, but for general comparative studies records of mean monthly flow and deficiency tables will serve many needs. Such data for the Potomac River at Point of Rocks, Md., are presented in tables 5 and 6 as typical records showing the general effect of the droughts of 1930 and 1931 on stream flow.

NOTE.—Minimum monthly discharge for all months except April occurred in the 11 consecutive months May 1930 to March 1931.

The conditions on the Potomac River apply in general to the areas which were most severely affected by the droughts of 1930 and 1931. At Point of Rocks, Md., the drainage area is 9,650 square miles, and the mean flow for the calendar years 1897 to 1931 was 9,350 second-feet. The mean flow for 1930 was 3,790 second-feet, or only 69 percent of the previous lowest annual flow, which was 5,530 second-feet, in 1923.

Prior to 1930 there were only 2 months when the mean flow was below 1,000 second-feet—September 1925, 952 second-feet, and November 1922, 989 second-feet. During the calendar year 1930 the mean flow was below 1,000 second-feet for 4 months—August, 771; September, 834; October, 706; November, 840. The minimum daily flow for 1930 was 594 second-feet. Previous minima below 700 second-feet were recorded in 1911, 1914, 1917, and 1923. In 1923

the flow was below 1,000 second-feet consecutively for 18 days, in 1925 for 15 days, and in 1930 for 116 days except on 2 days when it did not exceed 1,100 second-feet. During the period of record the minimum monthly discharge for all months except April occurred in the 11 consecutive months, May 1930 to March 1931.

TABLE 6.—*Deficiency table for Potomac River at Point of Rocks, Md., 1897–1931*

1931					33	65	88	122	149	186	218

A typical illustration of the persistence in trend of deficient stream flow after a trend of excess precipitation has begun is presented in figure 12, which gives for the period 1922 to 1931 the accumulated departures from the average (1897–1932) of the monthly discharge of the Potomac River at Point of Rocks, Md., and the precipitation recorded at two representative stations, Westernport and Frederick, Md., within this drainage basin. The deficiency of precipitation during 1922 and 1923 was followed by 6 months of excessive precipita-

tion. The discharge graph shows a corresponding general trend, but the stream flow did not increase materially until nearly 4 months after the precipitation had begun to exceed the normal. An example

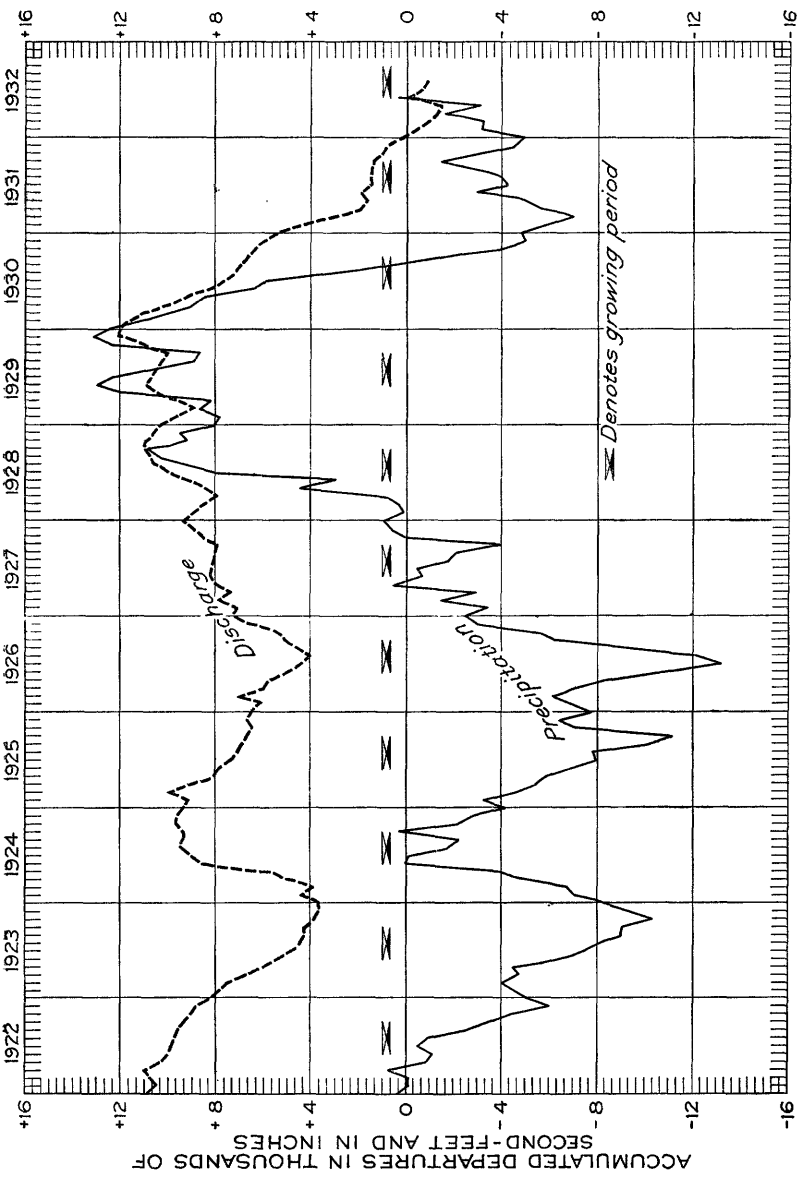

FIGURE 12.—Accumulated departures from the average of the monthly discharge of Potomac River at Point of Rocks, Md., and of the precipitation recorded at Westernport and Frederick, Md.

of this lag or carry-over is shown by the downward trend of the discharge graph that persisted 17 months after general excesses of precipitation began, in March 1931. The recovery of the stream flow

undoubtedly depends to a considerable degree on the way in which the precipitation occurs—that is, if moderate and well-distributed excesses in precipitation occur during the growing season, vegetation utilizes so much of the supply that there is little left to feed the streams. On the other hand, streams usually respond promptly to deficiencies in precipitation, for the run-off is the residual of the available supply remaining after the deduction of that consumed by transpiration and evaporation. Figure 12 shows several periods that illustrate this condition.

DAMAGE

Drought damages may be considered as affecting vegetation, domestic and industrial water supplies, health, power, navigation, and recreation and wild life. The droughts of 1930 and 1931 greatly interfered with many activities under each head, and the resulting losses in 1930 were probably greater than those sustained during any previous drought, owing partly to the fact that the uses and demands for water have vastly increased, even in the past few years.

VEGETATION

A general discussion of the relation of water supplies to vegetation is given on pages 14–21. The crop reports of the United States Bureau of Agricultural Economics afford a means for studying and comparing the effects of droughts on vegetation as related to agriculture. No systematic statistical information, however, is available in regard to the effects of droughts on natural vegetation, and the only bases for a statement relative to such effects are miscellaneous reports based upon personal observation.

During 1930 the detrimental effect of the drought on vegetation, both natural and cultivated, was marked. In 1931, however, the precipitation was adequate and sufficiently well distributed to supply the needs of vegetation in most parts of the country, and no detrimental effects of the drought appeared, except in a few localities, principally in North Dakota, South Dakota, Montana, and adjacent areas in Minnesota, Nebraska, and Wyoming. In fact, it was observed that in most parts of the country vegetation was especially vigorous in 1931. This may have been due to the lessened demands on the fertility of the soil that had been made by the stunted vegetation in 1930.

Although in 1930 the drought undoubtedly caused much damage to natural growth, no definite data are available to show its extent. Its effect on agriculture is indicated in table 2 and figures 13 and 14, which give for each State the composite yields of crops and the total precipitation during the principal growing months. The reports concerning the effect of the drought on crops indicate that as the yields

for the country as a whole do not indicate conditions in individual States, neither do the yields for individual States indicate the extreme conditions that prevailed in certain localities.

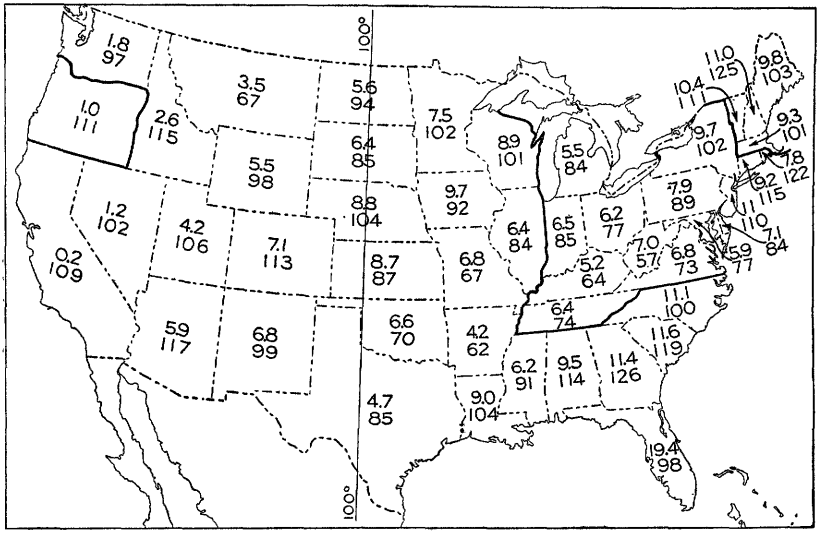

FIGURE 13.—Total precipitation for June, July, and August, in inches (upper figure), and composite yields of crops per acre, expressed as percentage of average yields (lower figure), 1930. In areas indicated by heavy outline the precipitation in 1930 was the lowest of record.

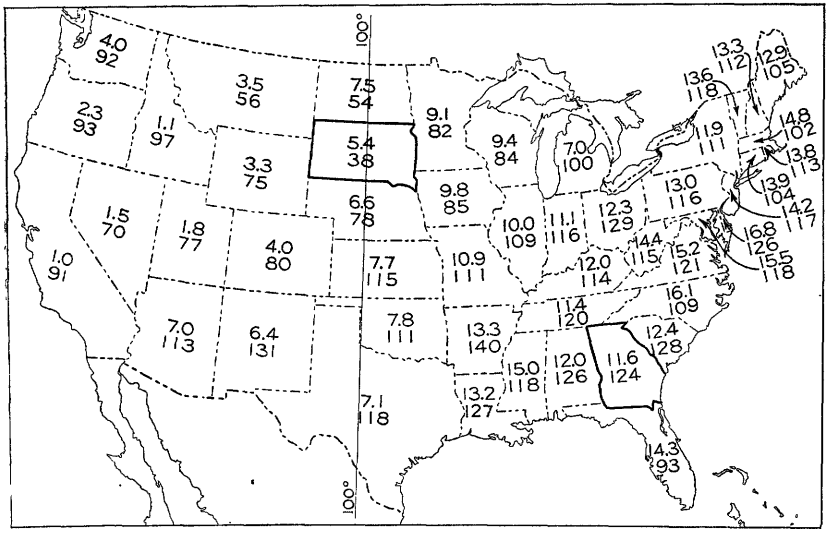

FIGURE 14.—Total precipitation for June, July, and August, in inches (upper figure), and composite yields of crops per acre, expressed as percentage of average yields (lower figure), 1931. In areas indicated by heavy outline the precipitation in 1931 was the lowest of record.

In humid sections of the country the growth of crops depends primarily on the quantity and distribution of rainfall during the grow-

ing period. Temperature, humidity, and wind also have a marked effect. During the growing months of 1930 not only was the precipitation low but temperatures were unusually high, as indicated in figure 3, and hot winds prevailed. The humidity was low, the evaporation was high, and the usual dews were lacking. Plant growth was unable to withstand this combination of unfavorable climatic conditions.

Comparison of the precipitation for June, July, and August with the composite yields of crops in the humid and semiarid States for 1930 and 1931 as given in table 2 and shown in figure 15 indicates that in States where the rainfall during the three growing months was 7½ inches or more the yields were nearly average or above and

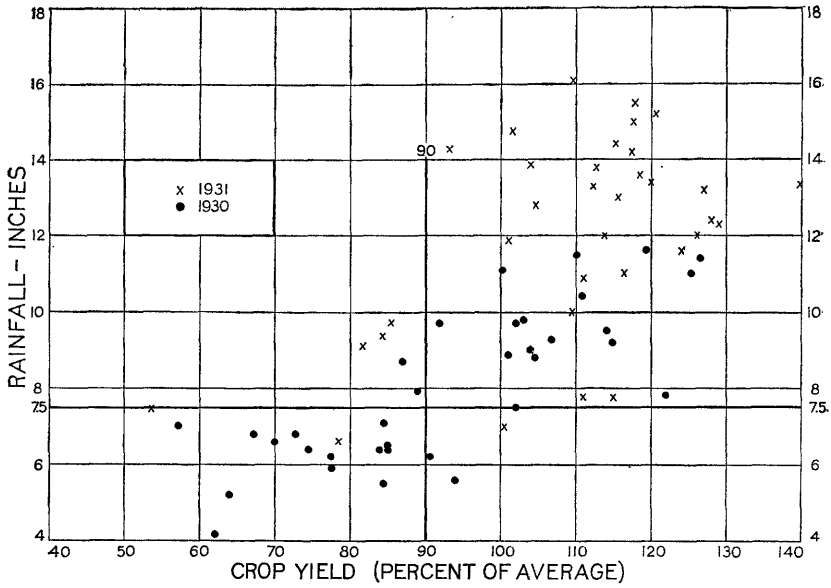

FIGURE 15.—Relation of composite yields of crops per acre in 1930 and 1931 to total precipitation in June, July, and August for the 36 humid and semiarid States.

that in States where the rainfall during those months was less than 7½ inches the yields were below average. Most of the exceptions to this general rule can be explained by the character of the vegetal growth, the distribution of precipitation, abnormally low or high temperature, or excessively hot winds.

The data on composite yields of crops and precipitation for 1930 show that the annual rainfall may not always be an indication of yields. The precipitation in Arkansas in 1930 was 95 percent of the mean, but the crop yields per acre were only 62 percent of the 10-year average, owing to the fact that conditions were not favorable for germination and that there was only 4.2 inches of rain during the 3 growing months. On the other hand, in New York the precipitation

was only 82 percent of the normal, but the crop yield was 102 percent, as conditions were favorable for germination and there was adequate precipitation during the growing season. In Rhode Island, Connecticut, and New Jersey the precipitation in 1930 was also lower than in any other year of record, yet yields of crops for all these States were above normal.

Care must be taken in using precipitation records expressed as percentage of the mean to show the effect of droughts on agriculture or other activities, as a certain percentage of deficiency may not have the same effect in an area of high precipitation as it will in an area of low precipitation. This is illustrated by the data given in table 7.

TABLE 7.—*Composite yields of crops per acre and precipitation in North Carolina, Missouri, and Illinois, 1930*

	North Carolina	Missouri	Illinois
Yields—percent of 10-year mean	100	67	84
Precipitation:			
Annual:			
Mean—inches	50.44	40.17	37.26
1930—do	38.04	31.27	27.89
1930—percent of mean	75	78	75
June, July, and August:			
Mean—inches	16.2	12.7	10.6
1930—do	11.1	6.8	6.4
1930—percent of mean	69	54	60

In North Carolina a deficiency of 50 percent in the growing months would still leave over 8 inches of rainfall, which is adequate for the needs of vegetation, but in Missouri or Illinois a similar percentage of deficiency would reduce the precipitation to less than 7 inches, which is insufficient for the normal needs of vegetation.

The effect of the drought in the irrigated sections of the country was reduced to a minimum in both 1930 and 1931, because stored water was available to make up for deficiencies in the current supply, and also because it was possible to limit crop acreage to conform to the probable available water supply, as indicated by water in storage, snow surveys, and other information. The importance of adequate storage systems in connection with all irrigation projects as insurance against loss during years of low water was fully emphasized during 1930 and 1931. As indicated in table 13, in 24 reservoirs of the United States Bureau of Reclamation having a total capacity of 12,000,000 acre-feet there was a net reduction in storage of 710,000 acre-feet in 1930 and of 1,500,000 acre-feet in 1931.

DOMESTIC AND INDUSTRIAL WATER SUPPLIES

In most States in 1930 there were marked and long-continued deficiencies in the flow of streams and the yields from ground water. These deficiencies persisted in many areas through 1931 and in some areas into 1932, resulting in a shortage of water for both domestic and industrial uses. The localities supplied by the natural flow of medium and small streams or by shallow wells were most seriously affected. In localities where facilities were available for storage, the total stream flow for the year was in general ample for usual activities. Communities that obtained their supplies from deeper wells that tapped productive water-bearing formations were also not much affected by the drought.

Indications of scarcity of water appeared early in the summer of 1930. In many localities usual supplies failed, so that for several months, especially in the larger towns and cities where municipal supplies were not provided with adequate reserves, it was necessary to curtail use and to provide additional supplies by drilling wells, laying temporary pipe lines, or hauling water in tank cars.

The effect of the drought on domestic water supplies, both rural and urban, in New York, Ohio, and Kentucky is indicative of conditions that prevailed in other major drought areas.

In New York the State department of health reported that 65 municipalities were seriously affected in 1930. Of these, 29 derived their supplies from surface-water sources and 36 from ground-water sources. In 1931 the effect of the drought continued in 32 of these municipalities, and in addition 3 others were affected. In 13 others that had been affected in 1930 shortage was averted in 1931 by the development of additional supplies. Hundreds of private wells and springs failed, and it became common practice for farmers to haul water several miles for stock and domestic purposes.

In Ohio the State department of health made surveys of 115 public water supplies, of which 94 depended on wells and 21 on surface sources. Considerable difficulty in respect to both quantity and quality was experienced in cities supplied from surface water, but little in cities served by wells, as their supplies had been adequately developed to provide for the contingency. In a few cities it was necessary to drill to deeper levels. Private wells in the southern part of the State failed almost entirely, and hauling water for many miles was necessary. In April 1931 the State legislature appropriated funds for use by the department of health to drill and install pumps in so-called "seal of safety" wells in southern and southeastern Ohio. The result was 48 successful wells out of 69 that were attempted.

In Kentucky the State board of health investigated 110 public water supplies and found that 33 cities had been on water rations. Conditions in Lexington, with a water-consuming population of about

60,000, supplied from four reservoirs with a small tributary drainage area, illustrate the seriousness of the situation. Restriction in the use of water became necessary in September 1930, and in October the city began the construction of a pumping plant with a 20-inch pipe line to a point 8 miles away on the Kentucky River. This supplementary supply was made available in December and relieved the shortage. There were noticeable shortages in most rural sections.

Many industries were handicapped by an inadequate supply of water for process use and for the disposal of wastes. In numerous localities the provision of enough water for cooling and condensing in steam-power plants was a serious problem.

The rainfall during 1931 was greater and better distributed than that of 1930, and many localities that had suffered from shortage of water during 1930 had enlarged their systems of supply. As a result comparatively few localities experienced any serious difficulty in 1931 from shortage of water for either domestic or industrial use.

HEALTH

In addition to shortage of water for municipal and industrial uses, considerable difficulty was encountered in many localities owing to the effect of the drought on the quality of the water, in regard to both mineral content and pollution. During the drought period the streams were almost wholly supplied from ground water, which normally has a higher mineral content than surface run-off. The lack of diluting run-off caused considerable difficulty and necessitated modifications in treatment at many filter plants. The serving of water of excessive hardness led to many complaints, both on account of trouble in the use of the water and on account of deposits in heaters and in pipe lines, where no difficulty had been experienced with the water normally supplied. A menace to health was created in many localities because the streams fell so low that they were unable to carry sewage and other wastes.

Owing to the efforts and watchfulness of the health, water, and sanitation authorities, no widespread epidemic of communicable diseases occurred during the drought and there was comparatively little illness. Although a few cases of diphtheria, smallpox, scarlet fever, measles, and typhoid were reported by health officers in different sections, they were limited to small areas and were not a serious menace.

Pellagra, a disease due to certain deficiencies in diet and usually present in many Southern sections, caused the most concern. Its remedy lies in foods that supply these deficiencies, and such foods were issued to pellagra sufferers in addition to the staple rations. These foods consisted of milk, canned salmon, canned tomatoes, fresh fruit and vegetables, and powdered yeast. In the drought

period prior to June 30, 1931, more than 30 tons of powdered yeast had been distributed to 18,302 persons in the drought area. The generous donations of hundreds of carloads of citrus fruits and fresh vegetables, especially from Florida and California, and of potatoes, cabbage, and other vegetables and foodstuffs from northern, central, western, and other States aided materially in maintaining standards of health.

School lunches were served for a period to more than 3,500 schools, attended by over 184,000 children. These no doubt aided considerably in maintaining satisfactory health conditions.

As an aid to the situation Congress provided, by an act approved February 6, 1931, $2,000,000, to be administered through the United States Bureau of Public Health Service, to aid local health departments in the drought-affected areas. The Public Health Service reports as follows [8] relative to the effect of drought on health conditions:

> The years 1930 and 1931 were among the best years of which records have been kept, so far as the general health of the people is shown by mortality statistics and by reports of the prevalence of notifiable diseases.
>
> The effect of the drought on the health of the people of the United States cannot at this time be measured with any degree of accuracy. This does not mean that it has not had an effect, but merely that, whatever the effects may have been, they cannot be segregated from the many other factors which, taken together, cause high or low sickness and death rates in the population as a whole.
>
> Serious outbreaks of such diseases as dysentery and typhoid fever, which might have resulted from interference with the usual water supplies in many places, have been avoided by scientific examination and treatment of the supplies. Epidemics of some other diseases have been prevented by immunization campaigns and other means. It may be, if food supplies have been deficient, that the consequent weakening effects will result in increases in the causes of illness and in the death rates in subsequent years. This cannot be definitely predicted, however.

POWER[9]

Practically all important hydroelectric power plants generating electricity for public use are interconnected with steam plants in large systems. Water power and steam power are thus no longer competitors but have become partners, united to produce electric power as economically as possible. As the cost of operating a water-power plant is considerably less than that of operating a steam plant, water-power plants are kept in operation as long as water is available—that is, the supply of water instead of the demand for power is in general the controlling factor in the utilization of water-power plants.

The effect of the drought on hydroelectric power plants in the humid and semiarid States during 1930 and 1931 is probably best indicated by a comparison of the changes in the production of elec-

[8] Personal communication.

[9] Statement by A. H. Horton, chief, division of power resources, U. S. Geological Survey.

tricity by the use of water power from 1929 to 1930 and from 1930 to 1931 with the corresponding changes in the total production of electricity. The business depression lessened the demand for electricity during these periods, and this factor tends to disguise the effect of the drought on the production of electricity at hydroelectric plants. However, a comparison of the change in total production of electricity in the humid and semiarid States with the change in output by water power will indicate in a general way the effect of the drought on water-power plants, because a decrease in the production of electricity by the use of water power, especially if the change is relatively greater than that in the total production of electricity, will indicate a lack of water for the generation of power.

Table 8 shows that in 1930 the production of electricity by water-power plants in all sections of the humid and semiarid portions of the United States was reduced as a result of the drought, and also that in 1931 the output by water power was reduced by the same cause in all sections except New England. There was no extended drought in New England in 1931.

TABLE 8.—*Percentage change in production of electricity for public use in the humid and semiarid sections of the United States, 1929–31*

Division	1929 to 1930		1930 to 1931	
	Total output	Output by water power [a]	Total output	Output by water power [a]
New England	−3	−20	0	+16

East North Central	−5	−15	−7	−19
West North Central	+6	−10	−2	−33
South Atlantic	−8	−29	−6	−13
East South Central	+6	−3	+1	−1

[a] Figures for output by water power are adjusted for increase in capacity of water-power plants.

NAVIGATION

The Chief of Engineers, United States Army,[10] reports on the effect of the drought on navigation on the inland-waterway system of the Mississippi Valley as follows:

The more important components of the inland-waterway system of the Mississippi Valley are the lower Mississippi, below the mouth of the Ohio, where a depth of 9 feet is maintained by dredging through the river bars; the Ohio River, where a depth of 9 feet is secured by locks and dams; feeder tributaries of the Ohio, including the Monongahela, the Allegheny, the Kanawha, the Cumberland, the Tennessee, and others, the most used of which are also improved by locks and dams; the middle Mississippi to above St. Louis, where a depth of 9 feet is to be provided by contraction works and dredging; the upper Mississippi from St. Louis to St. Paul and Minneapolis, the immediate status of which is a project for a 6-foot channel obtained principally by contraction works and by dredging

[10] Personal communication.

but where a 9-foot channel is to be provided by locks and dams; the Missouri, in process of improvement by contraction works to afford a depth of 6 feet; and the Illinois, in course of improvement to afford a 9-foot connection with the Great Lakes.

The 1930 drought brought about a prolonged low-water season on these rivers, the effect of which was mitigated to some extent by the stabilized condition of low water. On the more important parts of the system navigation was kept in motion without serious interruption. Channel dredges had to be kept in operation for a much longer period than normal. On the upper reaches of some of the tributaries of the Ohio, with limited drainage areas, the evaporation, leakage, and lockage losses at the navigation dams exceeded the inflow, and the pool depths could not be maintained; but by using special effort in preventing leakage at the dams throughout the system, supplemented by channel dredging, the navigable capacity of the Ohio and its most important feeders was well maintained. Despite heavy drafts on the reservoirs at the headwaters of the Mississippi, the deficient flow in the upper Mississippi reduced the limiting channel depth to about 4½ feet.

In summary, the effect of the 1930 drought was felt by navigation, but the consequences were not highly serious as far as navigation was concerned.

In the lower Mississippi River the maintenance of the 9-foot channel was rather less difficult in 1931 than in 1930, even though lower river stages were reached. On this river bars occasionally form which delay navigation until they can be reached by the dredges and a channel provided. The time lost from this cause during 1931 did not exceed that occurring during an average year, and the amount of material dredged in channel maintenance during 1931 was 12 percent less than in 1930. The prolonged and continuous low stages resulted in a condition of stability favorable to channel maintenance.

On the Ohio River the project depth of 9 feet was maintained throughout the year. The shortage of water to fill the pools on the Monongahela River, which had been experienced in 1930, was relieved by rainfall in December 1930, and navigation on that stream experienced no difficulties from water shortage in 1931. The water supply on the other tributaries of the Ohio was also adequate for navigation purposes.

On the middle Mississippi, from the mouth of the Ohio to the mouth of the Illinois, above St. Louis, the extremely low stages reached in 1931 required the execution of intensive maintenance dredging, but satisfactory navigation conditions were maintained on this reach, as well as up the completed portion of the Illinois.

Serious effects of the drought were experienced in 1931 in the upper Mississippi between the mouth of the Illinois and St. Paul and Minneapolis. The storage reservoirs on the headwaters of this stream were depleted by the preceding deficient run-off, and their supply was completely exhausted at the end of 1930. The storage recovered in the winter and spring of 1931 was too small to be utilized in increasing the low-water flow below St. Paul. New low-water stages were attained, and the navigation depth was reduced to as little as 4 feet. Navigation was seriously impaired. The construction of the locks and dams provided in the project now authorized for the improvement of this reach, when completed, will make this section of the river independent of drought conditions.

Since the Missouri River was not completed to an extent sufficient for commercial navigation, the low-water conditions had no serious effect. They produced a favorable situation for the prosecution of the regulating works. Since, however, these works become effective in correcting the channel through their influence on high flows, the lack of high water deferred the completion of the project.

The drought in the South Atlantic States in 1931 had an injurious effect upon the navigation of some of the upper reaches of streams still used for that purpose. The packet-boat service on the Savannah River between Augusta and Savannah began carrying partial loads in the latter part of May 1931 and suspended operations from the latter part of August to the middle of December because of low stages resulting from the drought. Navigation was also suspended for a period of about 6 weeks on the Alabama River. In general, however, the lack of high flows during the year materially reduced the sediment deposits in the lower reaches of the stream, to the advantage of navigation conditions, and with a reduction in necessary maintenance dredging.

In general, while drought conditions in 1931, as in 1930, called for increased activities of the department in the maintenance of navigable channels on nontidal rivers, the consequences were not serious so far as navigation is concerned.

RECREATION AND WILD LIFE

During the last few years the use of water for recreation has greatly increased, and this use is recognized as a factor in the consideration of questions relating to water supply. The low water during 1930–31 interfered with fishing, bathing, and boating, both on account of inadequate water supply and on account of increased pollution. Water supplies of many refuges and breeding grounds were so reduced that adequate feed was not available for migratory birds.

RELIEF

In many rural localities the droughts of 1930 and 1931 caused hardship through the failure of food, forage, and cash crops and through scarcity of water for both human beings and stock. The effect throughout the country, however, was not severe enough to prevent the building up of heavy surpluses of almost every agricultural product. The resultant low price levels, already beaten down by the economic depression, greatly reduced the ability of those in the drought areas to meet the situation adequately without outside relief. Such relief was provided by Federal appropriations and by gifts through the American Red Cross. Because the drought effects were spotty, varying widely even between adjacent counties, it is difficult to generalize. Without question, however, the drought caused much hardship, with corresponding needs for relief, especially among the "marginal" farmers, who are none too well off in the most prosperous times.

In its effect on water supplies the drought made haulage of water, sometimes in tank cars over long distances, necessary to keep stock alive. Transportation of fodder was also necessary, with the alternative of moving stock out of the area or else selling at a heavy loss.

Failure and low price of cash products, whether in cotton, cattle, wheat, or corn, was a principal cause for need of drought relief. Many families dependent on cash crops, with no vegetable gardens whereby they might live directly off the land, found that low prices

142748—36——4

and depleted yields left them without sufficient means to buy the bare necessities.

Enough relief needs were traceable to the drought to bring the American National Red Cross into action under its policy of functioning to prevent suffering due to an "act of God." Relief measures were started in several States late in the summer of 1930 by local Red Cross chapters, and early in the fall it became evident that outside help would be needed. Accordingly, the Red Cross took up the work and appropriated $5,000,000 from its reserve. In addition, $10,589,780.19 was raised by a special campaign for the period ending June 30, 1931. Notwithstanding this, many believed that the situation was so serious that it could be adequately handled only by aid from the Federal Government. As a result Congress passed four measures for drought relief.

Federal aid to drought sufferers was first made in the fall of 1930 from the balance in a loan fund which Congress had provided in the preceding March under the Department of Agriculture for aid in certain States that had suffered from storms and other causes. From this fund $230,350 was distributed in small loans for sowing pasturage crops in Alabama, Missouri, Oklahoma, and Virginia. The terms under which this fund was made available prohibited its use in other States, and to meet the situation Congress made available $67,000,000, to be administered by the Secretary of Agriculture, for loans and advances to drought sufferers, by the acts of December 20, 1930 ($45,000,000), February 14, 1931 ($20,000,000), and February 23, 1931 ($2,000,000). In addition $2,000,000, to be administered by the United States Public Health Service, was made available by the act of February 6, 1931.

The areas that suffered the most are shown in figure 16, which indicates where relief measures under the Red Cross were necessary.

From August 1930 through June 1931 direct expenditures for relief amounted to $10,894,835.62, and aid was given to 614,504 families, aggregating 2,765,000 persons[11] in 1,057 counties in 23 States. In addition to the direct expenditures, food, clothing, etc., having an estimated value of $990,000 were distributed. The services of relief agents were in the main contributed. The peak of the relief was reached the last of February 1931, when assistance was being given to 460,240 families aggregating 2,081,000 persons.

Conditions improved so greatly during the spring and early summer of 1931 that after June 30 the only States in which extensive drought relief was necessary were Iowa, North Dakota, South Dakota, Nebraska, Montana, and Washington. An additional expenditure of $2,266,860.73 was required to cover the needs of these States after June 30, 1931, and aid was given to 243,368 persons.

[11] The total number of persons receiving aid was arrived at by using an esimate of 4½ persons to the average family, and no family that received several types of assistance was counted more than once.

In all the counties where drought relief was given, the recipients of aid were strongly urged to plant the garden seeds being given to them, as a further safeguard to the health of their families. Reports during 1931 from various States indicate that the garden-planting plan was generally followed in the areas that had suffered during 1930. This was a large factor in eliminating food shortage in 1931. During 1931, 611,000 seed collections were distributed. The seeds in each of these collections were sufficient to plant about a one-fourth-acre garden plot and included from 13 to 18 varieties of vegetables selected by the United States Department of Agriculture with respect to their suitability to the areas in which they were to be used. An important

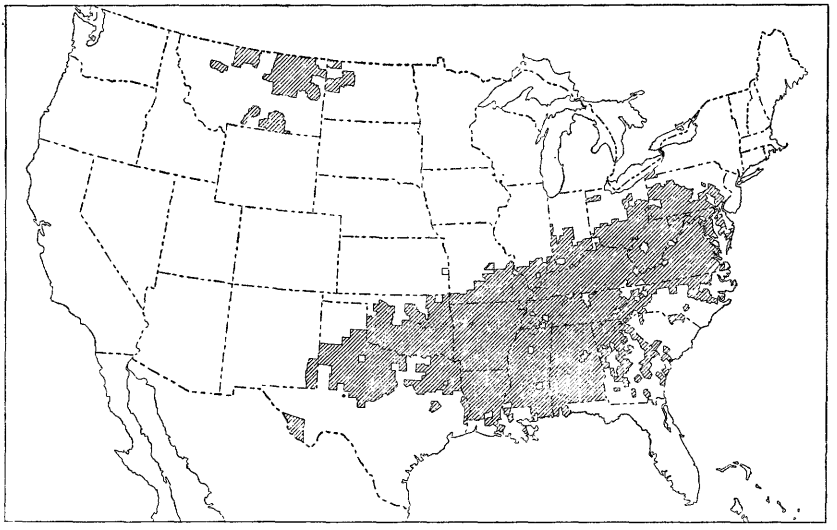

FIGURE 16.—Areas where Red Cross gave drought relief, August 1930 to June 1931.

indirect benefit from the drought has been that it has taught people in the areas affected to grow sufficient food crops for family needs. It is estimated that the retail money value of vegetables produced from Red Cross garden seeds in 1931 amounted to $20,000,000.

More than 600 freight carloads of foodstuffs were donated to the Red Cross for the drought sufferers. These were distributed in the most severly affected regions. Quantities of clothing for children were made by Red Cross women volunteers, and used clothing was reconditioned for adults. School attendance everywhere in the drought sections was materially improved by the Red Cross school-lunch program and by the distribution of warm clothing to the children.

One type of relief given extensively by the Red Cross was stock feed. Feed was given to 61,841 families in all but 4 of the 23 affected States. Reports indicated that thousands of cattle, horses, mules, hogs, and

chickens were saved through this feed. In Arkansas alone 34,018 families received free feed for livestock from the Red Cross.

This huge relief task was conducted by 1,225 chapter-paid and 517 nationally paid workers with the aid of 37,762 volunteers. The areas in which Red Cross relief was necessary were in general those of marginal production and lack of diversification, both in agriculture and in other activities. This largely accounted for the inability of the people to handle the situation locally. There were other areas where the drought was fully as severe in which outside relief was not necessary.

Tables 9 and 10, from a report entitled "Relief work in the drought of 1930–31", indicate the extent and type of the aid given by the Red Cross from August 1, 1930, to June 30, 1931.

TABLE 9.—*American National Red Cross drought relief, financial statement June 30, 1931*

Available funds:		
American National Red Cross		$5, 000, 000. 00
Contributions to drought relief fund		10, 589, 780. 19
		15, 589, 780. 19
Expenditures:		
Food	$7, 229, 104. 79	
Clothing	488, 668. 85	
School lunches	165, 599. 52	
Feed for livestock	346, 415. 60	
1930 garden and pasturage seed	276, 122. 51	
1931 garden seed	492, 119. 52	
Yeast for pellagra control	15, 903. 06	
Other medical aid	91, 906. 95	
Family service	109, 052. 30	
Field supervision, accounting, and other field expenses	835, 095. 72	
Cash grants to chapters, final distribution of which was not reported by June 30, 1931	582, 130. 96	
Provision for chapter continuation of service and relief	146, 979. 04	
Other relief expenditures including fuel, bedding, miscellaneous supplies, etc	115, 736. 80	
		10, 894, 835. 62
Balance available for completion of drought relief program		4, 694, 944. 57

DROUGHT OF 1934

During much of 1934 for most sections of the country the major weather phenomena—precipitation, temperature, and wind movements—were in some respects abnormal. As a result, noticeable drought conditions in varying degrees of severity prevailed, as indicated on plate 1, in all the arid States except Washington, Oregon, California, Nevada, northern Idaho, and western Montana; in all the semiarid States except most of Texas; and in portions of the humid States in the upper Mississippi, Ohio River, and Great Lakes drainage basins. Drought conditions were most severe in the semiarid States, especially in the Dakotas, Nebraska, and Kansas, and in the adjoining States on both the east and the west, and it was in this area that the damage effect of the drought was the greatest. In California, although the annual precipitation was only 76 percent of the mean, it was so well distributed during the rainy season that with the available storage agriculture did not suffer seriously except in Imperial Valley, which obtains its water supply from the Colorado River. The extremely low run-off of the Colorado River was due to drought conditions in the upper basin States.

In 1931 the annual precipitation in California was 104 percent of the mean, but its distribution during the rainy season was so unfavorable that the irrigation supply, including storage, was insufficient to meet the needs of agriculture. As a result there were severe economic effects due to deficient water supply. Conditions in California during 1931 and 1934 illustrate the errors that are liable to enter into any conclusions as to droughts in the arid and semiarid States based upon annual records of precipitation.

CAUSES

Although in certain areas climatic conditions in previous years contributed in some degree, the drought of 1934 resulted primarily from deficient and unfavorably distributed precipitation, excessive heat, and warm winds, which in general prevailed in that year in all States except those bordering on the Atlantic seaboard, eastern Gulf of Mexico, and northern Pacific coast. These climatic conditions are indicated in table 11, plate 1, and figures 17 and 18, and are summarized in general on pages 47–52.

PRECIPITATION

In 7 of the 31 humid States the precipitation for 1934 was 85 percent of the mean or less. These 7 States were in the Ohio River, Great Lakes, and upper Mississippi River drainage basins. In Ohio precipitation was 69 percent of the mean, breaking the previous record. In Indiana it was 74 percent of the mean, which equaled the low point of 1930. Precipitation in all the semiarid States except Texas was below 85 percent of the mean. Previous minima were broken in North Dakota, with 54 percent, and South Dakota, with 63 percent. In all the arid States it was below 85 percent of the mean, except in Washington and Oregon, where it was above the mean, and in Idaho and Nevada, where it was 89 percent of the mean. In the remaining arid States Wyoming had the least deficiency, with the precipitation 78 percent of the mean. Colorado broke previous records with 65 percent.

The serious effects of the drought resulted as much from unfavorable distribution of precipitation as from the deficiency for the year. During the 3 winter months, starting with December 1933, 25 States had noticeable deficiencies in precipitation, receiving less than 85 percent of the normal. These included all the humid States except Louisiana, Arkansas, West Virginia, Maryland and Delaware, New York, and the New England States. In the semiarid region the shortage was limited to the Dakotas; in the arid region, to Wyoming, Nevada, Arizona, and New Mexico. The States where major shortages occurred were in the Missouri, upper Mississippi, Ohio, and Great Lakes drainage basins.

During the spring (March through May) shortages in precipitation were greater and more widespread than during the winter, 27 States having noticeable deficiencies. These included the humid States in the upper Mississippi, Ohio, and Great Lakes drainage basins, all the arid States except Washington, and all the semiarid States except Texas. In these areas there were only 5 States in which the precipitation was as great as 70 percent of the normal, and in 9 States it was less than 50 percent. In the critical areas, especially in the Dakotas, Nebraska, Minnesota, and Iowa, the total precipitation ranged from only 29 to 44 percent of normal. Conditions were better in the southern and eastern humid regions, where precipitation was almost normal or above in all the Atlantic coast and Gulf States and in Arkansas and Tennessee.

During the summer (June through August) major shortages in precipitation disappeared in all but 17 States—those in the semiarid region and the States bordering it on the east and west except Louisiana, also New York, Washington, Idaho, and Utah. In no State, however, was the deficiency as great as during the two preceding quarters, and the effects would probably not have been especially serious if it had not been for the shortage in the winter and spring.

[a] For 50-year period 1881–1930, except for eastern and western Washington and Oregon, which are for period of record.
[b] Also in other years.

During the fall (September through November) precipitation was normal or above in 34 States. It was less than 85 percent of normal in only 8 States—New Jersey 82 percent, Ohio 76, Florida 73, North Dakota 68, Colorado 62, Arizona 54, New Mexico 66, Montana 82.

TEMPERATURE

During 1934, especially in the first 8 months, unusual temperatures were noticeable in most sections of the country. The winter in the Northeastern States was much colder than usual, and in February most previous records as to both severity and duration were broken in this area as far south as Virginia. On the other hand, States west of the Mississippi River had a mild winter. The spring, in general, was late in the Northeastern States and early in the Northwestern States.

The summer was unusually warm in all parts of the country, and the year's accumulated temperatures in practically all sections were above normal, as indicated in table 11 and by the lines on figure 17. The number of days during June, July, and August in each State on which temperatures of 100° or more were recorded and the maximum temperature for the same months are also indicated in figure 17. Previously recorded maxima were equaled or exceeded in 10 States. Temperatures of 100° or more occurred in 7 States on 75 days or more, and in 14 States on 50 days or more. Kansas City, Mo., had temperatures of over 100° on 14 consecutive days. All States west of the Mississippi had maximum temperatures of 112° or more except Louisiana, Oregon, and Wyoming, where the maxima were 109°, 110°, and 111°, respectively. East of the Mississippi, and exclusive of New England, there were only 3 States in which maximum temperatures did not exceed 102°, and in 3 States 110° was exceeded.

The fall and early winter temperatures were generally above normal except for a short cold spell in December in the Southeastern States.

WIND

Except for their warmth and accompanying dust, wind conditions were not unusual during 1934. Dust storms were so frequent during the period November 1933 to May 1934 that the Weather Bureau circularized its stations east of the Rocky Mountains for reports relative to their character. A summary of these reports [12] indicates that there were five major storms, considering only those that overspread a considerable section of the country. In addition to these major storms, there were many others confined to portions of the Great Plains and adjacent sections.

[12] Mattice, W. A., Dust storms, November 1933 to May 1934; Monthly Weather Rev., February 1935, pp. 53.

The principal causes of the disastrous soil blowing in 1933 and 1934 were continuous high winds, intensive cultivation, the practices of burning stubble, low rainfall, and lack of organic matter and soil moisture to hold the soil in place. At the beginning of the plowing and planting season of 1934 there was a marked shortage of soil moisture. This, combined with deficient precipitation during the spring, resulted in the ground becoming too dry to withstand wind action.

The surface material over large areas of the country, especially in the arid and semiarid regions, consists in part of loess—that is, wind-blown material that has been deposited throughout the ages and has always been more or less subject to movement by winds when it becomes dry. The close cropping of vegetation due to overgrazing, the unwise breaking up of lands that are valuable chiefly for

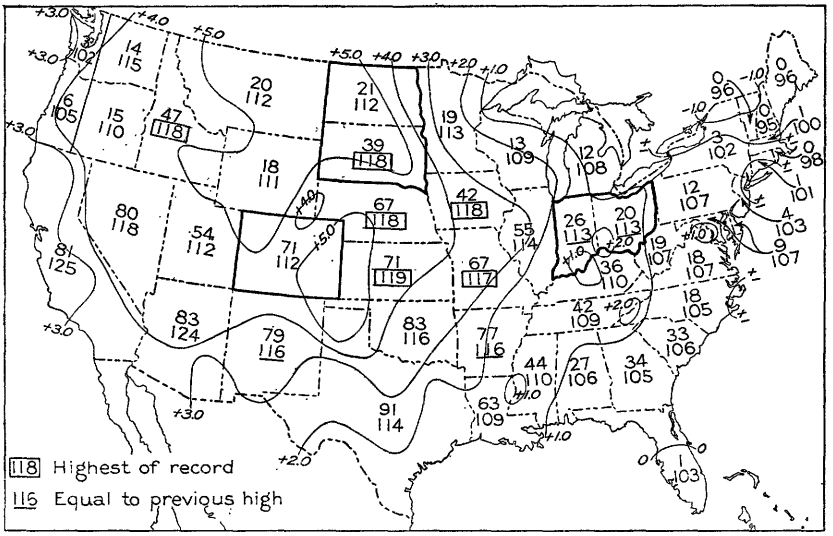

FIGURE 17.—Temperatures, 1934. Upper figure, number of days with maximum of 100° F. or more. Lower figure, maximum temperature during June, July, and August. In areas indicated by heavy outline the precipitation in 1934 was lowest of record. Lines denote variation in average temperature from normal.

grazing, and the drying of the surface, especially in years of drought, have greatly reduced the ability of this material to resist movement by the winds. Although the effects have been serious in many localities, they were probably not as bad as would be indicated by the photographs and descriptions that appeared in press statements.

The great mantle of wind-blown silt that covers a large part of the interior of the country indicates that dust storms have been a common occurrence in the geologic past. Although we are now chiefly concerned with the damage done by wind erosion in the recent dust storms, it is interesting to note that to these ancient silt deposits, called loess, is largely due the productivity of the great farming regions

included in the Mississippi Valley, and there are many who believe that though the effects in the areas in which the dust originates may be detrimental, there may be counterbalancing benefits in areas in which it is deposited.

Of the major dust storms that of May 9–12, 1934, created much widespread interest as to both its extent and its intensity. Following are reports from various weather bureau stations in regard to this and other storms:

Bismarck, N. Dak.: Although frequent dust storms have visited North Dakota this spring, those on 11 days warrant special mention. The most severe of these storms occurred on April 21 and 22. The velocity of the wind was greater on the 21st, but the volume and density of the dust were greater on the 22d. The latter storm caused the most comment, because of the fact that the 22d fell upon a Sunday, and travel by both automobile and by plane was hazardous and difficult. Several aviators have reported that dust was encountered at all levels up to 14,000 feet. A report on the storm of April 22 follows: A severe dust storm began 11 a. m. and continued all day, ending the night following. Visibility at the station was as low as 200 yards at various times. * * * This was the most severe dust storm experienced at the Bismarck station during the 28 years that I have been in charge.

Milwaukee, Wis.: Dust reported on about 19 dates previous to May. The storm on May 9–10, the worst dust storm of which there is any recollection in Wisconsin, covered the entire State. There were fresh to strong winds, which drifted the soil in the fields and in places uncovered newly sown grains. By the morning of the 10th dense dust clouds covered the sky, and this condition continued all day.

Cincinnati, Ohio: First evidence of the western dust storm reached Cincinnati shortly after noon on May 10. It was first observed on the hilltops at about 12:15 p. m. and at the Lunken Airport at 12:30 p. m. Visibility was greatly reduced, being only 3.4 miles from 2:30 p. m. to after 3 p. m.

Pittsburgh, Pa.: The dust storm that was reported at several western stations on the morning of May 10, 1934, was first observed in the vicinity of Pittsburgh as a peculiar pale-yellow haze in the upper air about 6:15 p. m. of the 10th. At the airport station the dust was most dense at the 6 and 7 a. m. observations on the 11th, when the visibility was reduced to 1 mile.

Boston, Mass.: A veil of dust appeared in the air shortly after daybreak on May 11 in New England and undoubtedly moved eastward over the ocean during that day. The dust was so fine that it appeared much as a high haze and was at an altitude of some 500 feet or more, where visibility was reduced to a fraction of a mile, whereas visibility on the ground was up to 2 miles.

Baltimore, Md.: The dust was in the lower and upper atmosphere, within 2 to 3 miles of the earth's surface. In the lower atmosphere the density thickened after 8 a. m. May 11, at which time visibility was between 6 and 8 miles, decreasing to 1 and 2 miles between 10:30 a. m. and 2:30 p. m.

Charleston, S. C.: Southerly winds on May 10 and 11 prevented the dust in the air over the central sections of the country from reaching this station, but on the 12th there was a sudden shift to northerly at 4:20 a. m. By 5:45 a. m. our airport station was reporting dust, and dustiness increased until 7:40 a. m., when the visibility had decreased to 4 miles.

Vicksburg, Miss.: May 11, sunset yellow due to dust. Visibility 2½ miles in the west. Continued until 9 a. m. of the 13th.

EFFECT ON GROUND AND SURFACE WATER

GENERAL EFFECT

A brief discussion of the general effect of droughts on ground and surface water is given on pages 11–22 and may be summarized as follows: That part of the precipitation which is not taken up directly by plant growth or by evaporation passes as surface flow into streams and lakes or goes to make up soil moisture and to replenish the ground water. In an ordinary year the ground-water table reaches its low point at the end of the growing season and is built up during the winter and early spring, following closely the precipitation. It recedes during the late spring, summer, and fall, unless there is excessive precipitation. Both medium and high stream flow result, in the main, from surface run-off following soon after precipitation. Low stream flow and also the flow in springs and wells largely result from seepage from ground water. Reductions in ground-water yield occur in the main when the ground-water table approaches closer and closer to the level at which the water from it enters a stream, spring, or well. In areas where the topography has a pronounced relief the volume of the terrane above a plane through the outlet affords storage capacity for a considerable supply of water, and the water table in the higher tracts may attain a considerable altitude above the point of outlet. Therefore, in many areas the reductions in ground-water yield over long periods of drought may be comparatively small, as discussed on page 27 with reference to the Potomac River at Shepherdstown, W. Va.

Unfortunately, there are comparatively few long-time records of fluctuations of the water table, and most statements in regard to ground water in hydraulic studies are based more on generalized impressions than on observed data. False impressions of depletion may be gained by the necessity of deepening wells in periods of drought, by increased needs for water which require additional or deeper wells, and by leakage from casings, clogging of intakes, or filling of old wells.

In many sections of the country during the last few years precipitation and water-supply trends have been downward. Similar downward trends in the past have been followed by upward trends, and there is nothing to indicate that this will not apply to the present downward trend.

GROUND WATER

Owing to the deficiency in precipitation during the replenishment period of 1934 there was little or no recharge in the main drought areas, so that the available ground water was in a large measure that carried over from the preceding year. Consequently in large areas the ground-water table fell below the outlets of springs and

the bottoms of streams and wells, thus materially cutting off its contribution to surface waters and to springs and wells.

Adequate data to indicate the extent to which the ground-water table was lowered in 1934 or whether there has been a progressive lowering during the past few years are not available, and any statements in this regard are largely conjecture. Although there may have been a progressive fall in some areas, there are no records to indicate that this is true to any great extent except where there has been heavy pumping for municipal or industrial supplies or for irrigation. The ground-water table in humid areas in general responds very quickly to fluctuations in rainfall (see pp. 22–26), and in most years there is enough rainfall to supply the normal recharge. The lowering of the ground-water table and the shortage in precipitation in the drought areas resulted in a noticeable lowering effect on stream flow, lakes, ponds, and reservoirs.

SURFACE WATER

The effect of the drought on stream flow was most noticeable in the upper Mississippi, Hudson Bay, Missouri, Colorado, and Great Basin drainage areas. In these areas many previous records of minimum flow were broken, both as to total annual flow and as to flow for shorter periods. Shortages in flow were also noticeable in the Great Lakes drainage basin, the Ohio River tributaries from the north, and the lower Mississippi River tributaries from the west, but comparatively few previous minima on these streams were exceeded. In the Atlantic coast and Gulf of Mexico drainage basins and also in the Pacific coast basins with the exception of portions of the Snake River, stream flow was in general normal. A few examples showing the effect of the drought of 1934 on stream flow in the principal drought areas are given in table 12.

TABLE 12.—*Effect of the drought of 1934 on stream flow in the principal drought areas*

Stream and station	Drainage area (square miles)	Period of record (years)	Discharge for year ending Sept. 30

As Missouri was one of the States in which drought conditions in 1934 were severe, a summary of low-water conditions in this State is indicative of conditions in other major drought areas. At 9 of the 24 river-measurement stations maintained in that section of the State lying north of the Missouri River the flow ceased entirely for the first time since the beginning of records in 1921. New low-water records were established at 10 other stations. In the area south of the Missouri River conditions were not so critical, as the streams are largely spring-fed. Nevertheless, of the 43 stations in this area, 3 became dry, 23 established new minimum records, and at only 17 did the flow remain above the previous minimum.

In Idaho the year 1934 was characterized by the lowest run-off ever recorded on the Snake River. At Heise, above the upper-valley canals, the river run-off was 54 percent of normal, and at Neeley, below the American Falls Reservoir, it was 43 percent of normal. During 1931, when the next lowest flow on record occurred, the run-off was 58 percent of normal at Heise and 55 percent of normal at Neeley. Jackson Lake bottom storage rights were 52.6 percent filled, and American Falls rights 51.5 percent filled exclusive of hold-overs from the previous year and stored normal flow.

Great Salt Lake reached an altitude of 4,194.85 feet on September 30, 1934, the lowest recorded since observations were begun in 1851. The next lowest level was recorded in 1902 and 1905, when the lake stood at 4,195.7 feet. The maximum recorded stage was 4,212.5 feet in 1868.

In the arid and semiarid parts of the country the lowering of lakes, ponds, and reservoirs was so great that in many localities they dried up entirely or were exhausted by excessive demands for irrigation and other uses. During the year 1934 the net reduction in storage in 24 reservoirs of the United States Bureau of Reclamation with an aggregate capacity of 12,000,000 acre-feet was 2,170,000 acre-feet, as indicated in table 13.

TABLE 13.—*Water in storage in 24 reservoirs of U. S. Bureau of Reclamation on Dec. 31, 1929–34*

	Acre-feet in storage	Change from previous year		Acre-feet in storage	Change from previous year
1929	4,590,000		1932	5,160,000	+2,780,000
1930	3,880,000	−710,000	1933	4,640,000	−520,000
1931	2,380,000	−1,500,000	1934	2,470,000	−2,170,000

DAMAGE

The drought of 1934 covered one of the principal agricultural areas of the country, and in the main the damage it caused relates to agriculture. In the area in which the drought was most severe, precipitation and resulting water supplies are meager, and therefore shortages are much more noticeable and their effects more serious than in the humid areas. Much of the drought damage would not have resulted if there had been a proper coordination between available supplies and the activities that depend upon water. Complete information in regard to damages is not available, but the following paragraphs give a general idea of their extent.

VEGETATION

Miscellaneous reports based on personal observation indicate that during 1934 in the major drought area most types of natural vegetation, especially trees that have deep roots and draw their water from levels near the ground-water table, suffered in varying degrees. It was also observed in the semiarid sections that natural perennial grasses, which were the basis for stock raising in the early days, were in considerable measure drought-resistant. This emphasizes the fact that natural vegetation adjusts itself through the centuries to extremes of climate.

The effects of the drought of 1934 on cultivated vegetation were widespread and in many areas were serious.

In the humid areas the sections affected were limited, in the main, to States in the upper Mississippi, Ohio, and Great Lakes drainage basins, and to Arkansas. The effects were very spotted and were most severe in Minnesota, Iowa, Illinois, Missouri, and Arkansas. In many sections there was sufficient precipitation to mature late-planted forage crops, which greatly relieved the shortage of stock feed.

The effects of the drought were most serious in the semiarid States, where all known conditions unfavorable to vegetable growth existed—deficient total precipitation with unfavorable distribution, extremes in temperature, and hot winds. As indicated in table 11, precipitation during the first two quarters of the year was deficient. As a result the growing season started with too little soil moisture for proper crop germination. This was followed in many areas by deficient precipitation during the growing season, which, combined with excessive temperature and hot winds, was disastrous to much vegetation, especially in the Dakotas.

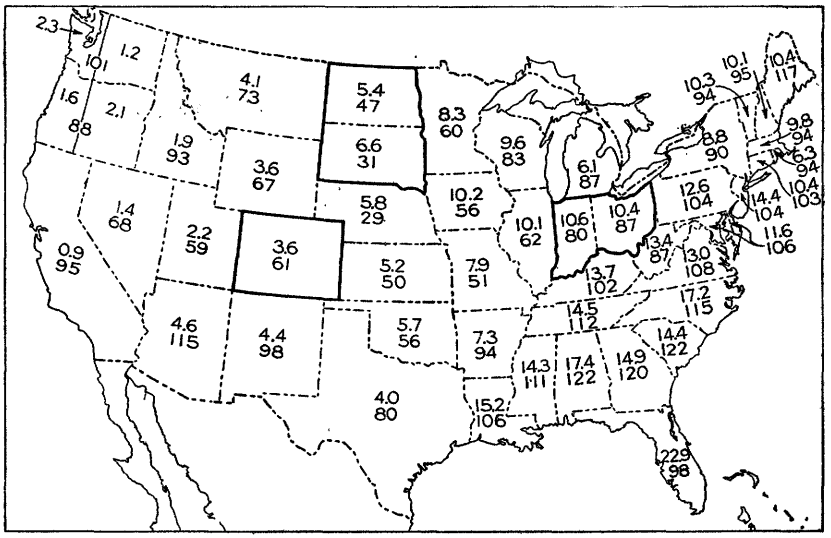

FIGURE 18.—Total precipitation for June, July, and August (upper figures) and composite yields of crops per acre expressed as percentage of average yields (lower figures), 1934. In areas indicated by heavy outline the precipitation in 1934 was the lowest of record.

The conditions that prevailed in the arid sections during 1934 are described in the November report of the Bureau of Reclamation as follows:

The crop results have been surprisingly favorable in view of the widespread shortage of water and the early predictions of crop losses. Well-organized plans of conservation have in a great measure alleviated the threatened losses on projects with limited supplies on hand. On the Carlsbad project, in New Mexico, and in the Imperial Valley, Calif., however, heavy crop losses were experienced by lack of water. Moderate crop losses occurred on the Truckee division of the Newlands project in Nevada, the Strawberry project in Utah, the Minidoka and Boise projects in Idaho, and the North Platte project in Wyoming, where the storage during the past year was very low and summer flows were far below normal. Except on those projects mentioned above, where water has been extremely deficient, crop returns have been excellent.

These results were duplicated on many non-Federal projects and illustrate what can be accomplished with adequate storage and wise

use of water. Many smaller projects that had insufficient storage or did not reduce their acreage or irrigate under the demand system suffered severely in 1934. The areas most affected were in the Great Basin and in areas supplied by water from the Colorado River drainage basin.

Although it is difficult to differentiate the relative magnitude of the effects of the many complex factors entering into the status of agriculture of which drought is only one, crop statistics give an indication of drought effect. The United States general crop report of December 1934 estimated the combined yield per acre of 33 important crops as 81.2 percent of the 10-year average yield (1921–30).

The crop yields by States and the precipitation for the growing months, June, July, and August, are indicated in table 11 and figure 18. The lower numbers in figure 18 show that in 17 States the yield per acre was more than 100 percent of the 10-year average, in 9 between 90 and 100 percent, in 7 between 80 and 90 percent, and in 15 below 80 percent. These figures do not reflect the total loss due to the drought, because acreage entirely abandoned is not included in the computation. Except in Wisconsin, Indiana, and Illinois there were no serious effects on yields in the humid States east of the Mississippi River. Noticeable shortages occurred in the humid States west of the Mississippi except Louisiana and Arkansas and in all the arid and semiarid States except New Mexico, Arizona, Idaho, Washington, Oregon, and California. The lowest yields were in the semiarid States, except Texas, and in Minnesota, Iowa, Missouri, and Illinois on the east, and Montana, Wyoming, Colorado, Utah, and Nevada on the west. The drought area included much of the corn belt, and the yield of corn for the country as a whole was only 60.5 percent of the 10-year average. The other staple crops most affected were small grains and hay. The yield of winter wheat was 83.7 percent of the average, and of spring wheat 79.1 percent, but for cotton, potatoes, and tobacco, three other important money crops, yields were above normal. These figures represent the yields per acre and not the total crop production, which for the more staple crops was unusually low for the country as a whole. The low total production resulted both from low yields due to unfavorable growing conditions and from reduction in acreage, which was about 20 percent less than in 1932 and 12 percent less than in 1933. The shortages, however, were not great enough to have a serious effect on the country's total food supply, and the total returns for crops were the highest since 1929, being estimated at $4,764,507,000, or about 70 percent more than in 1932 and 19 percent more than in 1933.

Attention has been called by the Division of Grazing, Department of the Interior, to the importance of the grass crop in the land eco-

nomics of the country. The value of this crop is not included in the statistics given above, except as a very small percentage is allowed for dry and harvested hay. Reports indicate that in the United States 1,055,000,000 acres, or 55 percent of the entire country, is in grass land. Grass produces half of all the feed for all livestock and is the greatest single crop in area, value, and tonnage. More than half of the above-stated acreage of pasture land is in the arid and semiarid States. Only one-tenth of our pasture land is arable, but that one-tenth has a carrying capacity five times as great as the natural pasture.

The effect of drought on pasture land is threefold—to the grass, to the stock, and to the land itself. Less precipitation means less feed, but as the number of stock is more or less constant, overgrazing is the result and may be carried to a point where the vegetable species most palatable to stock are either partly or wholly destroyed. The drying up of water supplies used by stock means a decreased area of grazing and results in intensified grazing adjacent to the remaining water supplies. This aggravates damage to stock, vegetation, and land.

DOMESTIC AND INDUSTRIAL WATER SUPPLIES

The experience gained during the drought of 1930 and 1931 led to a material extension throughout the country of facilities for conserving and providing water. As a result, the shortages of water for domestic and industrial uses during the drought of 1934 were in most areas much less than during previous droughts.

In the humid regions there were practically no serious shortages except in States bordering on the Mississippi River—especially Missouri and Iowa. The shortages were primarily in the rural section and smaller towns, as most cities and larger towns are now provided with adequate water supplies. In most sections the situation was helped by deepening wells and clearing streams, but in some sections hauling of water was necessary.

In the early stages of the drought the State geologist of Missouri foresaw the possibility of water shortages in the rural sections and directed the necessary geologic surveys for determining the possibilities of the development of underground water throughout the State. These surveys indicated the most favorable locations for wells, and as a result additional supplies were provided throughout the State, so that serious shortages were, in the main, averted. The surveys will also be of great value in the development of adequate water supplies for the future, and they indicate what can be done in other sections.

In the rural portions of the semiarid regions serious shortages were experienced on account of the failure of shallow wells and the drying up of ponds, lakes, and small streams. The urban supplies of these regions, which in the main come from deep wells and the larger streams, were adequate in most localities, although in some areas it

was necessary to curtail consumption and develop additional supplies. Shortages were especially noticeable in the Red River drainage basin of Minnesota and North Dakota.

In the irrigated areas of the arid regions water supplies for domestic, stock, and industrial uses are often developed in connection with irrigation systems. During 1934 shortages of suitable water for these uses were common and caused considerable inconvenience, especially on the smaller irrigation projects. In many localities it was necessary to curtail the use of the water and in some sections to develop supplementary supplies. On most of the larger irrigation projects there were no serious shortages for nonirrigation uses, although supplying the requirements for such uses necessitated an uneconomical operation of the ditches and thus resulted in considerable waste.

The shortage of irrigation water on the Snake River in southern Idaho during 1934 has resulted in a study, now under way, for eliminating winter diversions of water for domestic purposes in that area. It is suggested that wells be drilled to furnish domestic water under all canals, at a cost of $2,250,000. This expenditure will result in adding about 450,000 acre-feet annually to the winter supply available for storage in existing reservoirs that do not fill in the dry years.

Curtailment of the use of water was necessary in most of the larger towns of the arid regions. In some towns deficiencies were overcome by the development of additional supplies. In Salt Lake City, which has a normal summer demand of about 60 second-feet, shortages developed early in the summer. A detailed ground-water investigation under way by the United States Geological Survey in cooperation with the city was utilized to determine the possibilities of obtaining an additional supply, and as a result wells were drilled which yielded 52 second-feet of water. These wells were pumped as needed to take care of exchange agreements by the city and to furnish a direct supply to city consumers. As a result of careful use the city consumption during September amounted to only 44 second-feet, of which 26 second-feet was well water.

HEALTH

According to the following statement of the Surgeon General of the Bureau of Public Health Service,[13] the drought during 1934 had no large effect upon general health.

> It may be that the drought had an effect on the health of persons who were subjected to unusual conditions, but figures that will prove or disprove this are not now available. Even when detailed figures for all States have been compiled it will probably be impossible to separate the effect of the drought from the results of numerous other causes which affect health. Data on deaths for the year 1934 have not yet been collected.

[13] Personal communication.

During the summer of 1934 there was an increase in the reported prevalence of typhoid fever in some of the drought-stricken States. It is probable that some of the increase shown is due to contamination of water supplies, but in some States the apparent increase in number of cases may have been the result of efforts to secure more nearly complete reporting of cases, which have been carried on for several years.

POWER

A comparison of the amount of electricity produced in 1933 and 1934 for public use in the West North Central States (Minnesota, Iowa, North Dakota, South Dakota, Nebraska, and Missouri) indicates that the drought of 1934 had considerable effect on the production of electricity by the use of water power in that area. Although there was an increase of 4 percent in the total production of electricity from 1933 to 1934 in these States, the amount of electricity produced by water power decreased 21 percent.

NAVIGATION

The Chief of Engineers, United States Army,[14] has furnished the following statement in regard to the effect of the drought on navigation:

It would be extremely difficult to evaluate the additional expenditures necessitated by the low-water conditions during the season of 1934, although it is certain that there was some increased dredging necessary in maintaining project depths in the affected region. The low water was particularly felt in the movement of traffic on the upper Mississippi River, as it made it impossible to maintain the project depth of 6 feet at Horse Island, even by release of an additional water supply from pool 15, at Rock Island, Ill.

As a result of the low-water conditions on the upper Mississippi River, the Inland Waterways Corporation, on August 31, 1934, issued an embargo against all freight to and from or via points located on the Mississippi River north of the mouth of the Illinois River, except on cement destined to Guttenberg, Iowa, via Dubuque, Iowa. This embargo was maintained until improved flow conditions permitted its lifting on October 4.

RECREATION AND WILD LIFE

Recreational activities in the drought States were much interfered with during 1934 by the drying up of both natural and artificial lakes. This also had a detrimental effect on wild life, and as a relief measure many lakes ranging in size from about 80 to 10,000 acres were developed in the drought States for recreational use and for bird refuges. The bird refuges were developed on public land entirely at public expense. In the development of the recreational lakes the local people contributed by furnishing the site and all or part of the material and equipment required for the work. Work of this type not only provided effective relief but appealed especially to residents of the semiarid States, where there are few if any bodies of water available for recreational use or for migratory birds.

[14] Personal communication.

RELIEF

For several years there have been demands for relief in many areas due to unfavorable agricultural and other conditions; therefore it is difficult to differentiate the part of the demands in 1934 that were directly traceable to the drought.

In June 1934 Congress made available to the Federal Emergency Relief Administration the sum of $525,000,000 to be expended on drought relief in areas designated by the United States Department of Agriculture as suffering from drought, the funds to remain available until March 31, 1935. The Federal Emergency Relief Administration allotted these funds to the various State emergency relief administrations in the drought area, to be expended by these agencies under general policies established by the Federal Administration.

The program as carried out has included all types of relief, such as direct payment of funds to distressed families, the purchase of livestock that could not be maintained in the drought area because of shortage of feed and water, the furnishing of seed for late forage crops, etc., and work projects, such as the processing and canning of meats for distribution to people on relief rolls and the development of water supplies in the drought areas.

That part of the drought relief program which relates to the development of water supplies included the following items:

Cleaning of springs
Wells for domestic use
Wells for stock water
Wells for municipal water supply
Pumping for stock or domestic use
Pumping for irrigation
Dam for stock water
Dam for irrigation water
Dam for recreational lake
Dam for wild-life refuge
Maintenance ditches
Reservoir outlet
Reservoir repair work
Tapping or lowering a lake
Draining a slough, etc.
Hauling water for stock
Hauling water for domestic use

The work under these items is described in a paper by Lewis A. Jones, staff engineer, F. E. R. A., presented at the meeting of the Engineering Institute of Canada, Toronto, February 7, 1935, in part as follows:

> Because of the comparatively short time the drought relief funds would be available and the urgent need in many areas for immediate water supplies, it was decided in planning the water program to limit the work to projects that would promptly make water available and that could be completed within the limited time during which drought funds would be available. In other words, the object was to meet the existing drought situation rather than to start on a long-time water-conservation program.
>
> On the national-forest ranges and public grazing land the work has been confined largely to the cleaning out and improvement of springs, the digging of wells, the furnishing of windmills and tanks, and the construction of dams to form stock water holes. The improvements are more or less of a permanent nature, and the increased carrying capacity of the range resulting from the work will ultimately pay the cost.

On privately owned land, both in the range and dry-farming areas, the same types of projects have been carried on, but in every case, before construction work has been started, the landowner has been required to sign an easement granting the general public access to the water developed during periods of drought.

In the irrigated areas ditches have been cleaned out and lined to reduce seepage losses, reservoirs and other irrigation structures have been repaired, small reservoirs have been constructed, and pumping from streams has been carried on to furnish supplemental water for crops. This work has resulted in the saving of large areas of crops that would have otherwise been killed by the drought and has enabled the landowners to take care of themselves during this winter instead of being dependent upon the relief rolls. The cost of carrying the benefited people over the winter on the relief rolls would have in most cases exceeded very materially the cost of the work, and the landowners have been able to maintain their self-respect.

In some instances the water supplies for towns and villages have been supplemented by the digging of wells, the improvement of reservoirs, the construction of pipe lines, and the pumping of water from nearby streams, etc. In practically all cases where assistance has been rendered to incorporated towns the local communities have been required to furnish most of the materials required for the work, and the drought funds have been expended in the employment of labor that would otherwise have been on the relief rolls.

In a few of the drought States bird refuges and recreational lakes have been developed as a phase of the relief work, the size of the lakes varying in area from about 80 to 10,000 acres. The bird refuges have been developed on public lands and entirely at public expense. In developing the recreational lakes the local people have been required to furnish the lake site and all or part of the materials and equipment required for the work. The relief funds have been devoted primarily to the employment of labor from the relief rolls. In visiting the field the writer has been impressed with the popularity of such developments. They appeal especially to the residents of the semiarid States, where bodies of water for recreational uses are nonexistent.

In addition to the construction projects outlined above a number of the State relief administrations have conducted ground- and surface-water surveys to determine the extent of such resources. Such projects have furnished employment to engineers and geologists in need, and the results obtained will be of great value in planning long-time programs of water conservation. Several of the States have established water-conservation boards, and the State relief administrations have cooperated with these boards by furnishing technical personnel to assist in developing State-wide plans for water development. If a general public-works program should be undertaken the plans that have been prepared will be of great value in expediting the work.

In Montana the water program has been limited primarily to the development of water supplies on the range lands. Numerous springs have been cleaned out and equipped with suitable water troughs; wells have been dug; and small dams constructed to form stock water ponds. As a result of the work it has been possible to retain a large amount of livestock in the State that would otherwise had to have been sacrificed. In some instances supplemental water has been made available to irrigated lands and repairs made to irrigation systems to reduce seepage losses. Assistance has also been rendered to the State Conservation Board by furnishing employment to technical employees engaged in developing a long-time plan of water development and conservation for the State.

In North Dakota work in the rural region has been limited primarily to the construction of dams for stock water ponds. It is expected that more than 400

such dams will be completed before the end of next March. In addition to the stock water ponds a considerable number of small recreational lakes and municipal reservoirs have been completed ranging in size from 30 to 40 acres up to 600 or 700 acres. Five large bird refuges are also under construction covering a total of more than 150,000 acres. The refuges on the Des Lacs Lakes and the Souris River, located north of Minot, are expected, when completed, to be the most valuable wildlife refuges in the United States. In localities where municipalities and rural communities have suffered from shortage of water, wells have been dug to relieve the situation.

The State has organized a water conservation board, and the Emergency Relief Administration has cooperated with the board by furnishing technical personnel from the unemployed lists to conduct a State-wide survey of ground-water conditions which will be of value in planning a water-development program for the State.

The Federal Emergency Relief Administration feels that the water development and conservation projects carried on under the drought-relief program have not only been of great value in relieving the immediate drought situation but that much of the work is of such permanent character that benefits will continue to be derived for years to come. The value of the crops and livestock saved during the past season have enabled large numbers of farmers to maintain themselves who otherwise would have had to appeal for relief during the present winter. The reduction thus obtained in the relief load will go a long way toward paying the cost of the work. The program has also provided an opportunity for work to large numbers on the relief rolls, thus enabling them to maintain their self-respect by working instead of accepting a dole.

Several projects were undertaken in Idaho by drought-relief agencies set up by the Government. About 17,000 acre-feet of water was made available by the draining of several lakes and by pumping and was distributed by a local committee to water users on Henrys Fork and its tributaries. A section of an old power dam near Woodville was torn out, reducing the size of a ponded area and decreasing losses that were occurring. Several wells were drilled by drought-relief funds in the Blackfoot-Aberdeen section and furnished small supplies for local irrigation. Money from the same source was used to drill wells and build cisterns in the Jerome-Twin Falls area, to assist in providing domestic water, so that use of winter water from irrigation ditches may eventually be abandoned in that area. The Utah Power & Light Co. made available to Henrys Fork canals, without cost, 1,000 acre-feet of water by reducing the operating head in the forebay at its Ashton plant.

The funds allocated to the various States from the $525,000,000 authorized by Congress through March 19, 1935, are indicated below. These amounts include the allocations to the Federal Surplus Relief Corporation for activities in connection with the drought, and in some States they extend to nondrought areas. They do not, however, include allotments to the Farm Credit Association, Civilian Conservation Corps, Agricultural Adjustment Administration, or land purchase program for their activities as related to the drought.

COMPARISON OF DROUGHTS DURING PERIOD 1881 TO 1934

Records of precipitation and stream flow give an index for comparing droughts in their physical aspects and will generally serve to answer questions relative to frequency, duration, extent of area covered, and severity. Additional facts, however, which are usually lacking, are needed in considering the nature and extent of the economic effects.

Precipitation records of the United States Weather Bureau, which are on a comparable basis by States since 1880, are given in tables 1 and 14.

They indicate that in the humid States annual fluctuations are relatively large in amount but comparatively small in percentage of the mean, seldom exceeding 15 percent. In the semiarid and arid States, however, fluctuations in percent of mean are wider and annual deficiencies ranging from 20 to 45 percent are not unusual. Any comparisons based on State annuals for the arid States may be misleading, because of the wide range of precipitation in various parts of the individual States. In the humid and semiarid States, except Texas, the State distribution is more uniform.

The number of years in the period 1881 to 1934 when the precipitation did not exceed 85, 80, 75 and 70 percent of the mean—that is, a deficiency of 15, 20, 25, and 30 percent or more—are given for each State in table 15, which also gives the precipitation for the 6 years during the same period when it was lowest in each State, arranged in order of magnitude of deficiency from lowest to highest. In a few States there were less than 6 years in which precipitation was as low as 85 percent.

Under the criterion that a drought exists when the precipitation falls to 85 percent of the mean, since 1880 there have been 38 drought years in the humid States and 28 in the semiarid States, as indicated in figure 19 and table 14, which also give for the various years in both groups of States the percentage of the area in which there was this deficiency, and the precipitation in percentage of the mean for that area. Table 16 lists for both the humid and semiarid States the 14 worst drought years, arranged both according to magnitude of area affected and chronologically. Plate 1 indicates the States that were affected during the 7 worst drought years for the humid and semiarid States. In some years droughts were common for both groups of States, and in other years only one group was affected.

TABLE 16.—*Years when large areas of the humid and semiarid States had deficiency in precipitation of 15 percent or more*

Humid States

No.	In order of extent			In chronological order

[a] Means for Oregon and Washington are for period of record, 1890–1934.

In the 31 humid States the time interval between specially noticeable droughts has ranged from 3 to 7 years. During the 7 most severe drought years the area affected ranged from 30 to 63 percent of the total. Deficiencies in precipitation were as high as 28 percent. In extent of the area affected and deficiency of precipitation, 1930 was the most severe drought year of record. The next 2 were 1894 and 1901.

In 5 semiarid States (North Dakota, South Dakota, Nebraska, Kansas, and Oklahoma) the time interval between droughts has

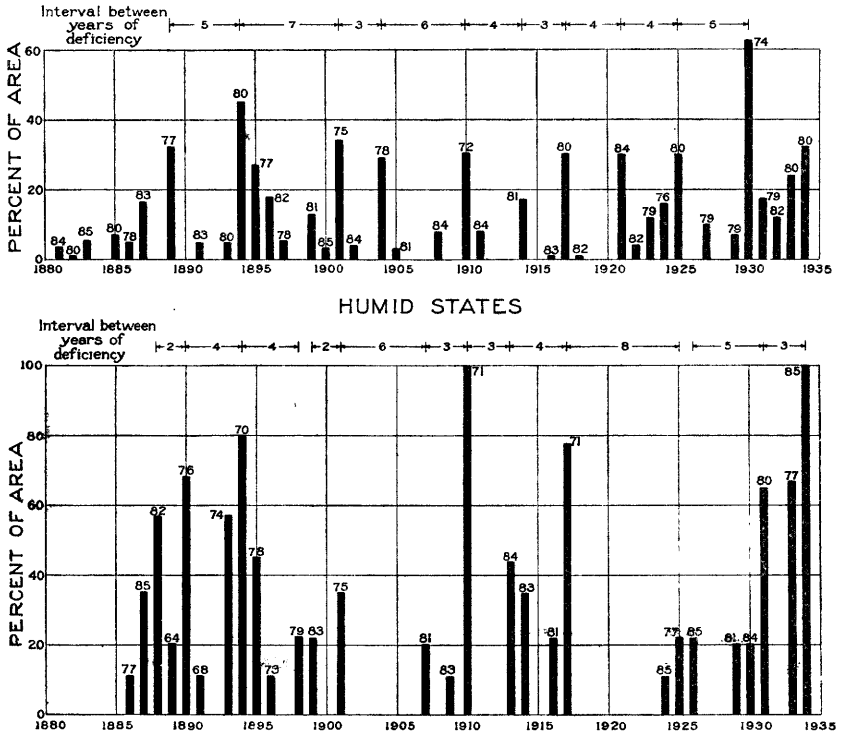

FIGURE 19.—Percentage of area having deficiencies in precipitation of 15 percent or more, 1881–1934, for 31 humid States and 5 semiarid States. Small figures on graph indicate precipitation in percent of mean in the area of deficiency.

ranged from 2 to 8 years. During each of the 7 most severe drought years over 64 percent of their area was affected, and there were 2 years, 1910 and 1934, when the deficiency in precipitation over the whole area was 29 and 35 percent, respectively. In extent of the area affected and deficiency of precipitation, therefore, 1934 was the most severe drought year of record in these States. The next 2 were 1894 and 1910. In general, drought damages in the semiarid States have been more severe than in the humid States.

Although definite data as to damage are not available, 1930 probably ranks highest in humid States, and 1934 in semiarid States.

In 1906 the United States Weather Bureau reported [15] that

> The greatest drought this country has experienced in the last 100 years, both as to intensity and extent of territory covered, culminated in the middle Mississippi and Missouri Valleys in 1894 and in the Lake region and Atlantic coast districts in 1895. * * *
>
> The next serious drought was in 1881. It affected practically the whole of the country east of the Mississippi and lasted from July to September. * * * The most striking characteristic of this drought was its duration and attendant high temperatures. Vegetation and staple crops were seriously damaged, and in the latter stages of the drought there was a scarcity of water for domestic use and for manufacturing purposes. In many places scores of shops and factories were obliged to shut down for lack of water.

Later Weather Bureau reports briefly referred to marked drought conditions during 1910.

The drought of 1881 was evidently of short duration and slight extent. There were but few localities where records indicated precipitation below the mean for more than 2 consecutive months, and these low months, were either preceded or followed by months of excessive precipitation, so that for most States the average precipitation for the year was almost equal to or above the mean. In fact, out of the 36 nonarid States, precipitation for the year was below the mean in only 11. In none of these States was the precipitation below 84 percent of the mean. In the Ohio Valley, July and August were extremely deficient in precipitation, but the Lake region had normal rainfall. Western New York, Pennsylvania, Maryland, Delaware, and Virginia as a whole had only 1 summer month of major deficiency in precipitation. These deficient months, accompanied by high temperatures that severely affected vegetation, probably led to the classification of the drought of 1881, although short in duration, with the major drought period of 1894–95.

An indication of drought conditions since 1769 in southern California is given in the following summary [16] of precipitation trends, taken from statements in letters and reports of the mission padres:

1. There has been no material change in the mean climatic conditions of southern California in the past 162 years.
2. There have been earlier fluctuations from average rainfall conditions, however, both excesses and deficiencies, of greater magnitude than any which have occurred in the past 40 years.
3. The 28-year period of rainfall deficiency which ended in 1810 was about as severe as has been the present one to date, and much more protracted.
4. The period of rainfall surplus from 1810 to 1821 was more intense than anything in the past 40 years. It seems to have been about as intense as was that between 1883 and 1893.

[15] Henry, A. J., Climatology of the United States; U. S. Weather Bur., Bull. Q, p. 51, 1906.

[16] Lynch, H. B., Rainfall and stream run-off in southern California since 1769, Metropolitan Water District of southern California, August 1931.

5. The period of rainfall deficiency which lasted from about 1822 to 1832 was more severe than has been any occurring since.

6. The period of rainfall deficiency which commenced in 1842 and lasted until 1883 was much longer than any other of which we have record. It was not so acute, however, as some others, both earlier and later. It was broken by a period of normal rainfall but was without any period of excess rainfall to balance the deficiency.

7. In comparison with several periods of rainfall shortage which have occurred in past years, the present rainfall deficiency to date cannot be considered a major shortage.

8. For all practical purposes the useful water yield of the areas under consideration closely approximates the run-off from the principal streams of these areas, except in times of heavy floods.

9. The run-off from southern California streams has in general shown fluctuations from the normal similar in character to those of the rainfall, but larger in relative percentage.

10. By reason of these fluctuations, the useful water yield has at various times been reduced from the average by considerably more than one-half for a period of 10 years, and by 30 percent for a period of 28 years.

DROUGHT AND LOW-WATER STREAM FLOW

Figure 20 shows the location of 47 river-measurement stations that have been selected to indicate the relation of droughts to stream flow in various sections of the country. No stations have been included for streams where the regimen appears to have been changed by diversion or storage works. Minimum discharges and other data for these selected stations are given in table 17.

The minimum flows for the various months as determined from the records available indicate that similar low flows may be expected in the future and their combination may be assumed to represent a possible composite (built up) low-water year. A year having even lower flow must also be considered a possibility. For example, such a composite year for the Potomac River at Point of Rocks, Md., indicates that a minimum annual flow of 2,160 second-feet or less is possible and even probable. For the period of record the consecutive 12 months of minimum flow started with April 1930, and during these 12 months the mean flow was 2,450 second-feet, or only 290 second-feet greater than in the composite minimum year. With the exception of February and April, the minimum discharge for all months occurred in the 12-month period beginning May 1930. The minimum for February occurred in 1934; for April, in 1915.

The minimum monthly discharge of many streams for most of the months occurred during the drought periods of 1930–34. The probability of other sequences of so many months of minimum flow is remote, and therefore for the drought areas of 1930–34 these figures will probably serve for some time as a basis for estimating low-water flows. Records of daily and monthly flow in connection with

deficiency tables as given for the Potomac River on pages 29–30 are necessary to determine the frequency of the effects of drought on low-water flows.

CARRY-OVER EFFECT AS RELATED TO DROUGHT

The carry-over effect of water supplies as related to drought periods may pertain to vegetation, to surface water, to soil moisture, and to ground water. On account of the counterbalancing influences that follow drought periods the subject is not readily understood, and a study of available information indicates that some phases of the carry-over effects have probably been overemphasized in hydraulic studies.

In the humid and semiarid States vegetation depends primarily upon the accumulated soil moisture at the time of planting and a

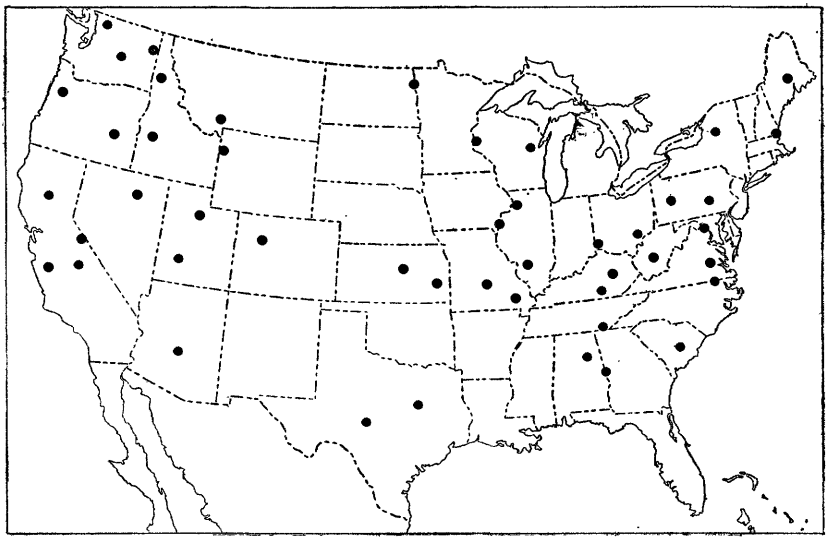

FIGURE 20.—Location of river-measurement stations used to show the relation of drought and stream flow.

favorably distributed precipitation during the growing season. Therefore, the principal carry-over effect on vegetation is in connection with soil moisture. In the arid regions successful agriculture depends in a large measure on stored water. Therefore, if adequate storage facilities are available, shortages of water due to drought may in a large measure be overcome from accumulations in storage of excesses in supplies during previous years.

It has been noted that the vegetable growth in years following droughts is especially vigorous. This may perhaps be accounted for by the fact that during the excessive drought years the land is dormant on account of lack of sufficient moisture to sustain vegetable growth. There is nothing to indicate any large detrimental carry-over effect on vegetation due to drought during the period 1930–34.

NOTE.—Discharge records for 1934 are provisional and may be subject to slight change.

142748—36. (Face p. 70.)

During drought periods surface waters stored in lakes, ponds, and reservoirs are usually heavily drawn upon and may be depleted entirely. The replenishment of these stored supplies in years following drought may draw so heavily on the precipitation as to cause noticeable shortages for various uses. Replenishment of ground-water storage may result in the same effect.

ALLEVIATION OF DROUGHT DAMAGE

Droughts are natural phenomena brought about by deficient and poorly distributed precipitation, high temperatures, and hot winds, which in turn depend upon other natural phenomena over which man has no control. There is nothing, therefore, that man can do to modify their occurrence. However, the economic losses resulting from shortages of water caused by droughts relate to activities that man can control, and it is possible for man to do much toward the alleviation of such losses by the conservation of available water supplies by storage, by efficiency in all uses of water, and by the adjustment of activities that depend upon water to available supplies and to variations in supplies.

In order to exercise either of these three controls, it is necessary to have complete information in regard to all available supplies, their fluctuations, and the possibilities for their conservation. This information should include climatic records, especially of precipitation; records of stream flow from which both the total flow and the distribution of flow that may be expected can be estimated; and records of fluctuations of the ground-water table, with other information relative to ground-water supplies. Topographic maps of watercourses, indicating reservoir sites and possibilities for diversion, will also be required.

Drought damages depend in a large measure on the climate of the area affected—that is, whether it is humid, semiarid, or arid—and on the type of activities in the area. Therefore, a full knowledge of the water requirements for agriculture and other activities in each area is also important in combating drought damages.

Although far from adequate, records of precipitation, temperature, stream flow, and other natural phenomena relating to water supplies are now of sufficient length to give an indication as to how far activities depending upon water can be extended without serious loss on account of deficient supplies. The extent to which economic losses due to droughts are eliminated will depend on the continuation and extension of these records and their use both in planning and in operation.

The humid areas in general have adequate precipitation to meet the needs of vegetation, both natural and agricultural, to supply adequate surface and ground waters to meet present demands for various other

needs, and also in most sections for additional demands if expansion is wisely planned. In any year there may be small areas that have shortages of water, and at intervals varying from 15 to 20 years there may be major shortages. In general, however, if due consideration is given to the character and extent of development, there should be no serious inconvenience due to water shortages in the humid areas, except at long intervals. If agriculture and other activities are properly planned and the facilities for utilizing available supplies are provided, damage due to these shortages can be minimized.

In the arid sections special caution should be exercised in the expansion of activities that will increase water-supply demands, until more information is available in regard to the amount of water that can reasonably be depended upon. Although there have been shortages of supply in many localities during drought years, the indications are that these shortages can, in the main, be overcome if all available sources are developed and if facilities are provided for their economic use. If, however, the present climatic trends in the arid sections continue, the development of additional water needs in many localities may result in serious loss.

The most pressing water-supply problems of the country are in the semiarid areas, which since their early settlement have had more or less trouble on account of deficient water supplies, especially as related to agriculture, the principal activity in these areas. The indications are that much readjustment must be made in these areas before they can be placed upon a secure basis in respect to water demands, and this will require much careful study not only of the available supplies that can be expected but of the types of agriculture and other activities that can be successfully carried on as limited by these supplies.

At the present time much water is made unavailable for use, especially in the vicinity of centers of population, by pollution from sewage and other wastes, and the conditions may eventually become so acute that large expenditures for elimination of pollution will be justified. Governmental agencies, Federal, State, and local, should give this question careful study with the idea of setting up sufficient regulatory measures to avoid disaster from pollution in times of drought. No section of the country is free from this danger.

The people who live on the land may be divided into three groups—first, the agricultural industrialist, who is primarily interested in money crops and does not attempt to supply his own food needs; second, the farmer who raises both food for his subsistence needs and money crops and who is thus self-contained on the farm; third, the subsistence agriculturist, who raises only food crops and depends on outside work for his money.

As a large percentage of the people who live on the land fall in the last two classes, the bulk of the food supply that enters into the commerce of the country is produced by a comparatively small percentage of the rural population. Drought effects are more serious to the group of agricultural industrialists than to the subsistence groups, as it is an exceptional drought in which there is not sufficient production of crops for subsistence, although supplies may at times be meager. In fact, during all drought years suffering has been largely confined to areas which have been devoted primarily to commercial agriculture and in which no special attention is given to subsistence needs. One of the outstanding results of the drought of 1930 was the large extension of subsistence agriculture in areas that had heretofore depended wholly upon money crops.

The Arkansas "live-at-home program" [17] developed as a result of the drought of 1930 indicates that a real solution to the problem of the alleviation of drought damages in rural sections is to eliminate the marginal producer and to insure that each farm unit raise sufficient food for its own needs. Under this program Arkansas officials are working to lift the one-crop curse and persuade farmers to plant food as well as money crops, so that they may be at least partly self-sustaining in time of drought. The principles of this constructive program are as follows:

To raise enough grain and hay to feed all livestock.

To produce enough meat to supply the family's needs.

To keep enough milk cows to supply the family with an abundance of milk and butter.

To provide health insurance in the form of a year-round garden, and to preserve any surplus of home-raised vegetables.

To maintain a flock of at least 30 laying hens.

To give increased care to home orchards, and in areas where no fruit is grown at present to plant enough fruit trees to supply the family's needs.

To rebuild soil fertility by planting at least half the present corn and cotton acreage to legumes and pasture crops.

To reduce tilled acreage and apply the surplus labor to terracing and drainage.

To install at least one home convenience and to beautify each homestead by painting all buildings, improving farm lawns, and planting flowering trees and shrubs.

One of the obstacles in the alleviation of drought damages is conservatism and the difficulty in changing established practices. This applies especially to the arid West and is illustrated by conditions outlined in the annual report dated March 4, 1935 (unpublished), of the committee of nine to the water users of district 36, Idaho, which comprises the Snake River drainage basin, as follows:

During a long series of years up to 1923 Snake River had an abundant run-off during 4 out of every 5 years. The streams remained at high stage until well

[17] How to live at home: Arkansas Univ. Coll. Agr. Extension Circ. 255, 1931.

into July and discharged in ordinary years 5,000,000 acre-feet annually past Milner to the ocean. During the past decade, however, the stream flow has greatly decreased. During the past 6 years, for example, the amount of water discharged past American Falls was only 50 percent of the amount during the 6 years from 1909 to 1914. The continuation of the present low discharge for so long a period, taken in conjunction with tree-ring and geologic studies, indicates that it is not unlikely that the period from the early settlement of the valley up to 1923 was one of overabundant water supply and that the present situation more nearly represents the normal condition.

If this proves to be the case, the water users on Snake River will be forced by necessity to eliminate certain pioneer habits and practices in the use of water that they acquired during the years of abundance and learn to adopt all available methods of conservation or else abandon part of the acreage now irrigated.

As a practical matter, however, in view of the established rights, viewpoint, and habits of the various water users, it is difficult to propose any plan to improve the present water supply that does not meet with the opposition of some section which feels that its rights and needs, either real or imaginary, are being infringed upon. As one studies the situation and comes to appreciate the difficulties involved in accomplishing the full conservation and efficient use of the waters of Snake River he feels a certain sympathy with that Persian poet who, 500 years ago, was moved to exclaim:

> "Ah! would that I could grasp
> This sorry scheme of things entire
> And mold a world anew
> Nearer to my heart's desire!"

In all countries and at all times water has been the limiting factor in social and other development. We have now reached a time in the development of this country when much more careful consideration must be given to water supply than has been given in the past, or serious consequences will result. The disastrous effects of recent droughts in the arid and semiarid States have in a large measure been due to failure to give adequate study to the relation of water supply to development. With the growth of the country detrimental effects of droughts increase, and they will continue to increase unless a proper relation between water supplies and requirements is established and maintained. It is not safe to assume that droughts of greater severity than those which have been recorded will not occur, and even if they are not more severe, as measured by deficiency in water and length, their economic effects will be greater as utilization of and demands for water are increased. The maximum development and successful use of all natural resources can be accomplished only on the basis of full and reliable information as to water supplies, with special emphasis on drought periods, and, in order that this information may be available, it is essential that adequate provision be made for the collection of systematic records of the Nation's water resources on a continuing basis.

NOT FOR RELEASE

Vernal, Utah
July 7, 1948

To Upper Colorado River Basin Compact Commission

Gentlemen:

On December 1, 1947, there was submitted to you a progress report of the Engineering Advisory Committee. Since that time the Committee has completed the work assigned to it on September 17, 1946, at the Santa Fe meeting of the Commission. The purpose of this letter is to present a brief summary of the results and conclusions of the work of the Engineering Advisory Committee.

Assignment

The work assigned to the Engineering Committee was:

(a) Preparation of base maps to show the locations of present and potential irrigation developments within the limit of the Colorado River system upstream from Lee Ferry and stream gaging stations and drainage areas.

(b) Determination of water contributions by States, involving the tabulation of stream flow records at key gaging stations, the extension of records by estimates, and estimation of runoff from unmeasured areas.

(c) Estimation of present depletions above key gaging stations, State Lines and Lee Ferry.

(d) Estimation of channel losses along the main Colorado River and principal tributaries above Lee Ferry.

(e) Determination of the extent to which the Upper Basin can make its apportioned water uses during drought cycles and still meet its compact obligation at Lee Ferry.

Maps

The progress report transmitted to you on December 1, 1947 contains copies of maps of the states of Arizona, Colorado, New Mexico, Utah and Wyoming prepared by the Bureau of Reclamation and published as part of the report on "The Colorado River" (House Document 419, 80th Congress, first session). These maps show the locations of present irrigated areas and potential irrigation projects, as envisioned by the Bureau of Reclamation, within the Colorado River Basin. The progress report of the Engineering Advisory Committee also contains a general map, prepared by the Colorado Water Conservation Board, showing drainage areas and the locations of gaging stations.

Drainage Areas

The table of drainage areas previously submitted has been revised to correct a few minor errors. The total drainage area above the Lee Ferry compact point is 109,889 square miles (instead of 108,989 square miles, previously reported). The drainage areas are shown on the attached Table 1.

Historic Stream Flows

The progress report of December 1947 contains tables showing the recorded and estimated stream flows at key gaging stations for the years 1914-1945, inclusive. That report also contains an explanation of the methods used to estimate stream flows at the various gaging stations during the period of non-record. The average annual stream flows at key gaging stations for the period 1914-1945, inclusive, are shown on the attached Table 1.

Historic Runoff at State Lines

The runoff per square mile from ungaged drainage areas within each state was determined by computing the net gain between gaging stations, adding the estimated channel losses and dividing by the drainage areas. The average annual flows (period 1914 to 1945, inclusive) at State Lines are estimated to be as follows:

AVERAGE ANNUAL HISTORIC FLOWS
AT STATE LINES (1914-1945, incl.)

Arizona	1000 A.F.
Ungaged area tributary to San Juan River	86.5
Ungaged area tributary to Colorado River	46.8
Arizona share of main stem channel losses within State	-0.1
Net flow at State Line	133.2

Colorado	
Little Snake River (at mouth)	226.9
Yampa River (exclusive of Little Snake River)	1,172.5
White River	576.2
Ungaged area tributary to Green River	27.4
Colorado River including Gunnison River	5,469.9
Dolores River	762.3
San Juan River above Rosa	929.9
Pine River	294.7
Animas River	807.2
LaPlata River	30.9
Mancos River	48.2
McElmo Creek	51.1
Ungaged area tributary to San Juan River	13.5
Colorado share of main stem channel losses within State	-2.3
Net Flow at State Line	10,408.4

New Mexico	1000 A.F.
Ungaged area tributary to San Juan River	192.1
New Mexico share of main stem channel losses within State	-6.0
Net Flow at State Line	186.1
Utah	
Tributaries of Green River above Linwood	158.8
Henry's Fork	66.8
Brush Creek near Jensen	36.0
Ashley Creek near Vernal	78.0
Duchesne River near Randlett	653.3
Price River at Mouth	87.6
Ungaged area tributary to Green River	127.4
Dolores River	23.2
Ungaged area tributary to Colorado River above Cisco	17.7
Paria River	18.1
Ungaged area tributary to Colorado River below Green River, Bluff and Cisco	777.3
Ungaged area tributary to San Juan River at Bluff	29.2
Utah share of main stem channel losses within State	-50.6
Net Flow at State Line	2,022.8
Wyoming	
Green River above Linwood	1,364.4
Little Snake River (at State Line)	249.8
Ungaged area tributary to Green River below Linwood	15.1
Wyoming share of main stem channel losses within State	-18.7
Net Flow at State Line	1,610.6
Sum of Flows at State Lines	14,361.1

Channel Losses

Average annual channel losses used in the studies reported herein were estimated by the application of appropriate evaporation and consumptive use rates to areas of channel exposed, such areas being estimated from available maps. Channel losses were computed for reaches from Lees Ferry, Arizona, to Granby, Colorado, on the Colorado River; from the mouth to Rosa, New Mexico, on the San Juan River; from the mouth to Green River, Wyoming, on the Green River; and on major tributaries to state lines or to headwater areas. This method of computing channel losses was deviated from only on the Colorado River between the gaging stations at Cisco, Utah, and Cameo, Colorado. These gaging stations indicate a depletion of the river greater than the sum of the calculated irrigation depletions and evaporation channel losses reduced by a nominal inflow from the intervening drainage area. Since the records of

streamflow, calculated irrigation depletions, and inflow estimates are believed to be reasonable, the additional depletion was charged to channel loss in that reach of river.

The channel losses adopted by the Committee were compared with those calculated by hydrographic analysis and other methods were applicable, and are believed to be reasonable.

A comparison of the annual streamflows, with the annual channel losses, estimated by means of differential hydrographs at Lees Ferry and the combined flows of Colorado River at Cisco, Utah; Green River at Green River, Utah, and San Juan River at Bluff, Utah, shows that the channel losses are not uniform each year, but that they vary with the streamflow, being smaller than average in years of less than average streamflows. Similar variations in annual channel losses were found in the studies of the various reaches of the San Juan River. It is assumed that on the other tributaries annual channel losses similarly will vary with the annual runoff.

Historic Contributions at Lee Ferry

Estimated channel losses and unmeasured inflows between state lines and key gaging stations were used to compute the contributions at state lines. The channel losses on water conveyed out of the state to Lee Ferry were proportioned to the state on the basis of the proportionate part of the total quantities of water carried through the channels. The aggregate amounts of such out-of-state channel losses and the estimated contributions by states of the historic flow (average 1914-45, inclusive) at Lee Ferry are as follows:

State	Historic Flow at State Lines acre-feet	Out of state losses acre-feet	Historic Contribution to Flow at Lee Ferry Acre-Feet	% of total
Arizona	133,200	1,000	132,200	0.96
Colorado	10,408,400	455,600	9,952,800	72.18
New Mexico	186,100	7,700	178,400	1.29
Utah	2,022,800	6,000	2,016,800	14.63
Wyoming	1,610,600	102,200	1,508,400	10.94
Total	14,361,100	572,500	13,788,600	100.00

Streamflow depletions

To determine the virgin (or reconstructed) streamflow at state lines and at Lee Ferry, it is necessary to add to the historic flows the effect at these points of the past upstream depletions caused by the activities of man. The principal cause of such past depletions is irrigation development within the

Colorado River Basin. Other causes of streamflow depletion are transmountain diversions outside of the basin, evaporation losses from reservoirs, and consumptive use of water by cities, towns, etc.

The depletion at Lee Ferry was estimated as follows:

(1) The man-made depletions at the sites of use were estimated. For irrigation this involved the determination of (a) the irrigated area; (b) the crop distribution; (c) the areas and character of lands in addition to crop lands, such as canals, drainage ways and incidental seeped areas adjacent to irrigated crop lands which consume water because of man's activities; (d) the estimation from climatic data, irrigation practices and experimental data of rates of consumptive use of irrigation water.

(2) The man-made depletions at the sites of use by cropped land and by incidental water consuming areas were routed downstream through the appropriate channel sections to determine the reduction in channel losses which have taken place due to the decrease in streamflow caused by such depletions between the sites of use and Lee Ferry.

Irrigated Areas

The following tabulation shows the average irrigated areas for the study period, 1914-1945, inclusive, and the present irrigated areas adopted by the Engineering Committee. The figures presented herein supersede those shown in the progress report of December 1, 1947.

State	Irrigated Areas - Acres: Average for 1914-1945, incl.	Present
Arizona	3,770	9,840
Colorado	790,606	790,600*
New Mexico	39,000	43,620
Utah	288,520	303,977
Wyoming	228,700	236,675
Total	1,350,596	1,384,712

*Assumed to be same as average for period, 1914-1945.

Incidental Areas

The areas of non-cropped land adjacent to and consuming irrigation water incidental to the irrigation of the crop lands were estimated by inspection of the Bureau of Reclamation land classification sheets, field inspection,

available aerial surveys and other detail and general maps of the irrigated areas. The incidental areas adopted by the Committee are as follows:

(Average for Study Period, 1914-1945, inclusive)

Arizona	Negligible
Colorado	106,812 Acres
New Mexico	6,482 "
Utah	48,625 "
Wyoming	28,600 "
Total	190,519 "

Rates of Depletion

Field experimental data within the Colorado River Basin to determine unit rates of consumptive use are available for the New Fork Area, Wyoming, and Uncompahgre Project, Colorado. Similar data are available at other experimental plots outside of the Colorado River Basin. To transfer the consumptive use data to various sites of use within the Colorado River Basin, empirical relationships between the experimental data and climatological data were used. The method developed by H. F. Blaney of the Department of Agriculture, who is an authority on consumptive use, was adopted. Arrangements were made to secure the services of Mr. Blaney and Wayne Criddle of the Department of Agriculture to study the problem. A field inspection trip over the Colorado River Basin was arranged so they could inspect the various areas and interview local water masters, water commissioners, water users, personnel of the Soil Conservation Service and the Bureau of Reclamation, and others regarding data on irrigation practices and adequacy of water supply in the various areas of the basin. With these data appropriate rates of consumptive use of irrigation water at the sites of use were selected.

Past Man-made Depletions at Sites of Use

The rates of consumptive use of irrigation water for various crops and types of native vegetation were applied by the Engineering Advisory Committee to the irrigated and incidental areas to secure the past man-made depletions at sites of use. The past man-made depletions at sites of use are summarized in the following table:

Man-made Depletions at Sites of Use
Averages for 1914-1945, incl.
Acre-Feet

Type of Use	Arizona	Colorado	New Mex.	Utah	Wyoming
Cropped Lands	3,790	821,378	56,174	384,043	183,620
Incidental Areas	--	178,662	14,993	81,001	40,750
Transmountain Diversion	--	43,713	--	79,000	
Res. Evap. Losses	200	10,000	--	13,500	2,200
Domestic Use	--	9,000	1,000	3,000	1,100
Less Water Supplied from Importations	--	--	--	4,000	--
Totals at Sites of Use	3,990	1,062,753	72,167	556,544	227,670
Total for Basin					1,923,124

"Salvaged" Channel Losses

The depletions at the sites of use were routed downstream to Lee Ferry to determine the change in channel losses resulting from man-made depletions. The differences between average past channel losses and the channel losses as they would have been had the depletions not been made represent "salvaged" channel losses as follows:

Average 1914-1945

State	Salvaged Channel Losses (acre-feet)		
	Within state	Out of state	Total
Arizona	0	0	0
Colorado	20,000	26,700	46,700
New Mexico	900	1,800	2,700
Utah	11,700	500	12,200
Wyoming	1,300	10,400	11,700
Totals	33,900	39,400	73,300

Estimate of Man-made Depletions at State Lines and at Lee Ferry

Deducting the salvaged channel losses from the man-made depletions at the sites of use results in depletions at state lines and at Lee Ferry as shown in the following table. For convenience this table also shows the estimated depletions at the sites of use.

Man-made Depletions
(Units Acre-feet) Rounded to Nearest 100 AF
Averages for 1914-1945, incl.

State	At Sites of Use	At State Lines	At Lee Ferry
Arizona	4,000	4,000	4,000
Colorado	1,062,800	1,042,800	1,016,100
New Mexico	72,200	71,300	69,500
Utah	556,500	544,800	544,300
Wyoming	227,700	226,400	216,000
Total	1,923,200	1,889,300	1,849,900

For convenient reference there is attached hereto a tabulation showing the past depletions at state lines by tributaries.

Virgin Flow at Lee Ferry

Virgin streamflow contributions at state lines and at Lee Ferry were obtained by adding to the historic contributions the man-made stream depletions estimated at these sites. The following table shows the virgin contributions at state lines and Lee Ferry and also the out of state channel losses which were estimated for average undepleted flow conditions.

Virgin Flows at State Lines and Lee Ferry

State	Virgin flow at state lines acre-feet	Out of state losses acre-feet	Contribution to virgin flow at Lee Ferry acre-feet	Contribution to virgin flow at Lee Ferry % of total
Arizona	137,200	1,000	136,200	0.87
Colorado	11,451,200	482,300	10,968,900	70.14
New Mexico	257,400	9,500	247,900	1.58
Utah	2,567,600	6,500	2,561,100	16.38
Wyoming	1,837,000	112,600	1,724,400	11.03
Total	16,250,400	611,900	15,638,500	100.00

Main Stem Reservoir Operations

The flow of the Colorado River is not uniform but varies from year to year. At Lee Ferry the historic flow has ranged between a minimum of about 4,400,000 acre-feet in 1934 to a maximum of about 21,900,000 acre-feet in 1917. The average historic flow for 1914-1945, inclusive, was 13,788,600 acre-feet. In the 10-year period of lowest historic flow, 1931-40, inclusive, the average annual flow at Lee Ferry was 10,151,000 acre-feet.

In the absence of replacement reservoirs the Upper Basin, under the terms of the Colorado River Compact, during such a period as 1931 to 1940, inclusive, could deplete the virgin flow of the Colorado River at Lee Ferry by only about 4,300,000 acre-feet. To permit full use of the Upper Basin allocation of 7,500,000 acre-feet annually during drought cycles, holdover reservoirs must be constructed in the Upper Colorado River Basin to impound water in years of high runoff and to release such stored water in critical periods of low runoff, such as 1931-40, to help meet the Upper Basin obligation at Lee Ferry.

Such reservoirs will deplete the flow at Lee Ferry by reason of evaporation losses. The amount of holdover storage capacity required to regulate the streamflow and the depletion of flows at Lee Ferry due to reservoir evaporation losses can only be approximated until alternative storage sites have been studied in detail and the locations and capacities of reservoirs selected. One important factor, which cannot now be precisely evaluated, but which will have a marked influence on the holdover storage capacity

needed is the effect of upstream development of future irrigation projects and storage reservoirs. Such projects will furnish some equation of stream-flows and will decrease the storage capacity needed in the holdover reservoirs, shown in the studies reported herein.

Operation studies were made, assuming that all holdover storage would be provided at the Glen Canyon site on the Colorado River. For simplification in operation it was assumed that the flow at Lee Ferry would be maintained at an annual rate of 7,500,000 acre-feet during the period of drawdown and refilling of the reservoir and that increased upstream depletions would be at a uniform rate of 5,174,100 (7,500,000 minus 1,849,900 minus 476,000) acre-feet annually. It was also assumed that 5,000,000 acre-feet of storage capacity would be reserved as dead storage for power head and sediment.

These studies show a required storage capacity of 34,200,000 acre-feet (live capacity 29,200,000 acre-feet) to regulate the flow of the Colorado River in the manner indicated. The average annual stream depletions due to reservoir losses are estimated to be about 476,000 acre-feet.

During a closed cycle operation for the 32-year period such a reservoir would perform in the following manner:

(a) Be at dead storage level at the end of 1940.
(b) Refill during the period from 1941 to 1945 and from 1914 to 1920.
(c) Be generally full and spilling from 1920 to 1929, inclusive.
(d) Be drawn down during the period, 1930 to 1940, inclusive.

The reservoir operation studies described herein show the average annual use of the virgin flow at Lee Ferry as follows: (average 1914-1945)

Depletion of flow at Lee Ferry by irrigation, etc. in Upper Colorado River Basin	7,024,000 AF
Depletion of flow at Lee Ferry by evaporation losses from holdover reservoirs	476,000 AF
Sustained flow at Lee Ferry for Lower Basin	7,500,000 AF
Spill from reservoir (would largely occur in 7 years)	638,500 AF
Total average virgin flow	15,638,500 AF

Respectfully submitted,
Engineering Advisory Committee

APPEARANCES
UPPER COLORADO RIVER BASIN COMPACT COMMISSION

HARRY W. BASHORE, CHAIRMAN
Federal Representative
Mitchell, Nebraska

GROVER A. GILES, SECRETARY
Attorney General of Utah
State Capitol
Salt Lake City, Utah

COMMISSIONER FOR THE STATE OF ARIZONA:

Charles A. Carson	419 Title & Trust Building, Phoenix, Arizona.

COMMISSIONER FOR THE STATE OF COLORADO:

Clifford H. Stone	Director, Colorado Water Conservation Board, State Office Building, Denver, Colorado.

COMMISSIONER FOR THE STATE OF NEW MEXICO:

Fred E. Wilson	806 First National Bank Building, Albuquerque, New Mexico.

COMMISSIONER FOR THE STATE OF UTAH:

Edward H. Watson	State Engineer, State Capitol, Salt Lake City, Utah.

COMMISSIONER FOR THE STATE OF WYOMING:

L. C. Bishop	State Engineer, Cheyenne, Wyoming.

ADVISERS

ARIZONA:

J. H. Moeur	Attorney, Central Arizona Project, Phoenix, Arizona.
R. Gail Baker	State Reclamation Engineer, Phoenix, Arizona.
Wayne M. Akin	Chairman, Arizona Interstate Stream Commission, 309 Security Building, Phoenix, Arizona.
R. H. McElhaney	Vice-Chairman, Arizona Interstate Stream Commission, P.O. Box 267, Wellton, Arizona.
Barry M. Goldwater	Member, Arizona Interstate Stream Commission, 31 No. 1st Street, Phoenix, Arizona.
Jay M. Gates	Member, Arizona Interstate Stream Commission, 7th & Oak Streets, Kingman, Arizona.
Ben Avery	Reporter, "Arizona Republic," Phoenix, Arizona.

COLORADO:

Jean S. Breitenstein	Attorney for the Colorado Water Conservation Board, Denver, Colorado.
F. C. Merriell	Member, Colorado River Water Conservancy District, Grand Junction, Colorado.
Dan B. Hunter	Member, Colorado State Water Board, Dove Creek, Colorado.
A. P. Gumlick	Chairman, Denver Water Board, Denver, Colorado.

Glenn Saunders	Attorney, Denver Water Board, Denver, Colorado.
Harry L. Potts	Engineer, Denver Water Board, Denver, Colorado.
A. W. McHendrie	Arkansas Valley Ditch Association, Thatcher Bldg., Pueblo, Colorado.
Chas. J. Beise	Southeastern Colorado Water Users Association, First National Bank Bldg., Denver, Colorado.
Archie B. Toner	Director, Southwestern Water Conservation District, 1407 So. College Ave., Ft. Collins, Colorado.
Ralph L. Carr	Gunnison Water Users Association, Antonito, Colorado.
J. R. Barkley	Northern Colorado Water Conservancy District, Greeley, Colorado.
E. L. Nichols	Steamboat Springs Lions Club, Steamboat Springs, Colorado.
Vaughn Mechau	Reporter, "The Denver Post," Denver, Colorado.
Tom Aden	Reporter, "Associated Press," Denver, Colorado.

NEW MEXICO:

John H. Bliss	State Engineer, State Capitol Bldg., Santa Fe, New Mexico.
Martin A. Threet	Attorney, Interstate Streams Commission, 302½ W. Central, Albuquerque, New Mexico.
I. J. Coury	Member, Interstate Streams Commission, Farmington, New Mexico.
Rufus H. Carter, Jr.	Exe. Sec'y., Middle Rio Grande Flood Control Assn., Albuquerque, New Mexico.

UTAH:

J. A. Howell	Attorney, 625 Eccles Building, Ogden, Utah.
Edward W. Clyde	Attorney, State Engineer's Office, State Capitol, Salt Lake City, Utah.
C. O. Roskelley	State Engineer's Office, State Capitol, Salt Lake City, Utah.
William R. Wallace	Chairman, Utah Water and Power Board, Salt Lake City, Utah.
Thomas W. Jensen	Utah Water and Power Board, Mt. Pleasant, Utah.
B. H. Stringham	Mayor of Vernal, Vernal, Utah.
Francis Feltch	State Representative, Vernal, Utah.
C. R. Henderson	Jr. Chamber of Commerce, Vernal, Utah.
G. E. Untermann	Echo Park Dam Committee, Vernal, Utah.
Leon P. Christensen	Uintah Co. & Vernal Lions Club, Vernal, Utah.
J. H. Ratliff	V. P. Humphreys Phosphate Co., Vernal, Utah.
Forrest Goodrich	Uintah County, County Commissioner, Vernal, Utah.
Gerald Irvine	Attorney, Utah Power & Light Co., 612 Kearns Bldg., Salt Lake City, Utah.

WYOMING:

Norman B. Gray	Attorney General of Wyoming, Cheyenne, Wyoming.
W. J. Wehrli	Legal Consultant, Casper, Wyoming.
H. T. Person	Consulting Engineer, Laramie, Wyoming.
H. Melvin Rollins	Assist. Compact Commissioner, Cheyenne, Wyoming.
David P. Miller	Assist. Compact Commissioner; Green River Basin Development Co., Rock Springs, Wyoming.
Norman W. Barlow	Assist. Compact Commissioner, Cora, Wyoming.
Joe L. Budd	Assist. Compact Commissioner, Big Piney, Wyoming.

Ernest B. Hitchcock	Assist. Compact Commissioner, Rock Springs, Wyoming.
Platt Wilson	Assist. Compact Commissioner, Kemmerer, Wyoming.
J. A. Cole	Assist. Compact Commissioner, Wheatland, Wyoming.
Frank J. Trelease	Assist. Compact Commissioner, Laramie, Wyoming.
E. S. Halsey	Wyoming Law School Student, 304 Doolittle St., Laramie, Wyoming.
Chas. G. Kepler	Wyoming Law School Student, 620 So. 9th St., Laramie, Wyoming.

BUREAU OF RECLAMATION:

N. B. Bennett, Jr.	Assist. Director, Branch of Project Planning, Washington, D. C.
J. G. Will	Assistant Chief Counsel, Washington, D. C.
E. O. Larson	Regional Director Region 4, Salt Lake City, Utah.
J. A. Keimig	Planning Engineer Region 7, Denver, Colorado.
John R. Riter	Chief, Hydrology Division, Denver, Colorado.
H. P. Dugan	Engineer, Hydrology Division, Denver, Colorado.
E. J. Skeen	Attorney Region 4, Salt Lake City, Utah.
C. H. Jex	Grand Junction, Colorado.

UNITED STATES GEOLOGICAL SURVEY:

M. T. Wilson	District Engineer, Salt Lake City, Utah.

PROCEEDINGS

The meeting was called to order by Chairman Bashore at ten o'clock a.m., Tuesday, February 17, 1948, in the Colorado Room of the Shirley-Savoy Hotel, Denver, Colorado.

THE CHAIRMAN: Gentlemen, the meeting will come to order. The Chair observes that the members of the Arizona Interstate Stream Commission are present with us and as it is my understanding that it is a relatively new group, I would like Mr. Carson to introduce these gentlemen.

COM. CARSON: Mr. Chairman, Arizona has recently created an Interstate Stream Commission composed of seven members. Four of them are here. I want to introduce Mr. Wayne M. Akin, Chairman; Mr. R. H. McElhaney, Vice-Chairman; Mr. Barry M. Goldwater, Member; and Mr. Jay M. Gates, Member.

THE CHAIRMAN: Thanks, Mr. Carson.

(Com. Stone distributes, "Suggested Agenda, Meeting No. 6, Upper Colorado River Basin Compact Commission," which is as follows:)

1. Determination of schedule of session of Commission for Meeting No. 6.

2. Consideration of agenda for Meeting No. 6.

3. Consideration of report of Engineering Committee.

4. Consideration of report of Legal Advisory Committee.
   (a) Administrative provisions.

(b) Provisions relative to projects constructed in one state for the benefit of another state or for the common benefit of all states.

(c) Provisions relative to apportionment of losses of water incidental to reservoir operations.

(d) Provisions relative to preferential uses of water.

(e) Method of treatment of water uses by Indians.

5. Consideration of factors suggested by states at Meeting No. 5 and not heretofore discussed by Commission.

Group I.

(a) Shall the compact operate for a fixed term of years or for perpetuity.

(b) Shall the allocation of beneficial consumptive use be subject to future adjustment in the event that any state does not make full beneficial consumptive use of its allotted share within a stated period.

(c) Provisions for periodic review of compact terms and conditions.

Group II.

(a) What provisions shall be incorporated in the compact to define the rights and obligations of the United States.

(b) How shall water uses made by the United States or any of its agencies be charged.

(c) Provisions relative to uses of water by Indians.

(d) Provisions relative to navigation.

(e) Provisions relative to flood control.

(f) Provisions relative to silt control.

(g) Provisions relative to cooperation with such United States agencies as Bureau of Reclamation, United States Geological Survey, International Boundary and Water Commission, and possibly others.

Group III.

(a) Shall compact contain any provision relating to the delivery of water at Lee Ferry for the use of Mexico in the event there is not sufficient surplus water to supply the Mexican share.

(b) Should the compact contain any provision relative to extraordinary drought in order to take advantage of the applicable provisions of the Mexican Water Treaty.

Group IV.

(a) What general provision should be incorporated in the

Upper Basin Compact to recognize the validity and applicability of the Colorado River Compact.

(b) Should the definitions contained in Article II of the Colorado River Compact be incorporated without change in the Upper Basin Compact.

(c) Should paragraphs (f) and (g) of Article III of the Colorado River Compact relating to the apportionment of unapportioned water be carried over into the Upper Basin Compact.

(d) What if anything, should be done with relation to Article VI of the Colorado River Compact pertaining to controversies between two or more states.

. . . . . .

Group V.

(a) Should the compact endeavor to encompass rights and obligations arising out of or affecting interstate tributaries.

(b) What provision shall be made with relation to the existing La Plata River Compact.

(c) What adjustment must be made between Colorado and New Mexico in connection with the use of San Juan River water.

(d) What adjustment must be made between Colorado and Wyoming with relation to the uses of the water of Little Snake River.

(e) What adjustment must be made between Wyoming and Utah with respect to the uses of the water of Green River tributaries arising in Utah.

(f) What adjustment must be made between Colorado and Utah with respect to uses of water on the main stream of the Colorado River, the Yampa River, the White River and the Dolores River, and other interstate streams tributary to either the Green River or the Colorado River.

(g) In the allocation of beneficial consumptive use of water shall there be specific allocations to tributary drainage basins in each state.

(h) Shall an upper state be required to deliver to a lower state any specific amount of water from any tributary.

Group VI.

(a) Definition of the term "beneficial consumptive use".

(b) Method of measuring beneficial consumptive use.

(c) Consideration of the method of treatment of conveyance losses.

(d) Consideration of the method of treatment of so-called salvage water.

(e) The determination of general type of formula for defining obligations of states to make Lee Ferry deliveries.

6. Discussion of means of correlating the work of the Engineering and Legal Committees.

7. Discussion of a time schedule for the preparation and completion of a draft of the compact.

8. Determination of time and place of next meeting.

THE CHAIRMAN: We shall first take up Item No. 4 on the agenda as laid before the Chairman and that is, "Consideration of report of Legal Advisory Committee." Is the Chairman of that Committee prepared to report?

COM. CARSON: Yes, Mr. Chairman. The Legal Advisory Committee met all day Sunday and Monday of this week and arrived at a report which will be mimeographed today and ready for presentation to this Compact Commission as soon as it is completed. We have prepared a report on all matters referred to the Legal Advisory Committee but we prefer to wait until that mimeographed copy is available to all Commissioners and its being offered for consideration of the Commission.

THE CHAIRMAN: Thank you, Mr. Carson. We are glad to hear that the Legal Advisory Committee has made progress, and of course in the absence of the written report we will have to pass over that matter.

At the last meeting the Commission instructed the Chairman to communicate with the various Federal agencies and ascertain the answers to two questions. The Chairman carried out those instructions and communicated with the various interested agencies and has received replies from the International Boundary and Water Commission, the Federal Power Commission, the Bureau of the Budget, and an acknowledgment from the Department of the Interior. Those letters have been turned over to Mr. Ray E. Peterson of the Colorado Water Conservation Board and he is now having copies prepared--about 35 copies I believe--and they will be distributed when they become available so that you may study them.

Generally speaking, the communication from the International Boundary and Water Commission I think is quite satisfactory, and the communication from the Federal Power Commission was rather helpful.

I mention that at this time so you may know that the matter will receive attention before we get through here with this Meeting No. 6.

Judge Stone, at this juncture would you like to make a statement in regard to Item No. 5 on the agenda, which is: "Consideration of factors suggested by states at Meeting No. 5 and not heretofore discussed by Commission."

COM. STONE: Mr. Chairman, Colorado in anticipation of what might be considered at this meeting, prepared a suggested agenda. We have copies available for all members of the Commission and their advisers. It is a mere suggestion and designed to expedite the work of the Commission and to bring to the attention of the Commission many matters which in our judgment will have to be considered. It is Colorado's position that pending a final engineering report, we should dispose of many questions which in the judgment of Colorado must be considered

before a compact is negotiated. If it is agreeable with the Chairman and the members of the Commission we are prepared to pass out this suggested agenda.

THE CHAIRMAN: Please do that, Judge.

(Suggested Agenda distributed generally to advisers and others present.)

THE CHAIRMAN: Does Colorado wish to make an opening statement in regard to the question of whether the compact shall operate for a fixed term of years or for perpetuity? Item (a) under Group I.

COM. STONE: Do I understand that this agenda is acceptable to the Commission, that we proceed under it?

THE CHAIRMAN: I haven't heard any objection. Is this agenda satisfactory to the members of the Commission?

COM. STONE: I might make this explanation, Mr. Chairman: We have made an attempt on page 1 under Paragraph 5 to pick up from the statements of all of the states items which were submitted by the various states but which were not discussed at the last Compact meeting. We reviewed the statements submitted by each and all of the states at Meeting No. 5 and incorporated here those items which had not been discussed at Meeting No. 5, placing them here on the proposed agenda for discussion. There have been added other items which were not submitted at the last meeting.

It is evident that there are items toward the last of the suggested agenda which cannot be discussed, fully at least, until the engineering report is in; but there is a big program of work here if the Commission wishes to proceed with these items or any other items which any state may have to suggest in addition to those suggested by the states at the last meeting. Colorado does not wish to be in the position of proceeding with any agenda that isn't acceptable to all of the states.

THE CHAIRMAN: Well, it seems to the Chairman, Judge Stone, that Colorado has done exactly what you relate and that it was to bring all these factors that have been thrown into the hopper together here and placed them on the agenda. They have been talked about and it is time to make some disposition of them, either decide they have a place in the compact or not, and why not or why they should be in. Is there any objection from any member of the Commission in regard to proceeding on the basis of the agenda prepared by Colorado? The Chair hears no objection.

COM. WATSON: This outline should be followed, we should complete it as soon as we can within reason, and that will lead to the main question we are here for, namely, dividing the water.

THE CHAIRMAN: Very well. Thank you, Mr. Watson. Are there any further remarks on this agenda? (No response.) Are we ready to proceed with the discussion of the items on the agenda? (No response.) Apparently there are no fixed opinions on this matter one way or the other. Do I hear a motion to proceed with the agenda?

COM. CARSON: I move we proceed with the agenda.

COM. WILSON: Second the motion.

THE CHAIRMAN: You have heard the motion and the second. Is there

further discussion? (No response.) (Thereupon a vote was taken and Com. Carson's motion carried unanimously.)

Now, will Colorado discuss subitem (a) of Item 5, Group I: "Shall the compact operate for a fixed term of years or for perpetuity."

COM. STONE: In accordance with the method followed at the last meeting I shall call upon Mr. Breitenstein to open the discussion on behalf of Colorado on subitem (a) of Item 5, Group I, of the agenda.

MR. BREITENSTEIN: Mr. Chairman, that raises a question of the length of term of the compact. Shall it be a compact which operates in perpetuity? Or shall it have a fixed term of years? We feel that that is a problem which should be decided now rather than to wait until the end of the compact negotiations. We have at times run up against the proposition that after everything else is determined, somebody has the idea that perhaps the compact should operate for a fixed term of years rather than perpetuity.

Speaking personally, it seems to me that what we are trying to do here is to make a permanent allocation of the waters of the Colorado River between the Upper Basin States which shall be good for all times.

We have had presented to us a plan or a report of the Bureau of Reclamation. As I understand it the Bureau says that carrying out that plan or that report is dependent upon the allocation of water between the states. It would seem obvious to me that if that allocation is not permanent but is one which is good for only a fixed term, then further questions can be raised as to whether or not a water supply is available for particular projects.

The only argument that I can think of in favor of having it operative for a fixed term of years is that none of us can foresee what will happen in the future and conditions might change so as to make the allocation unwise under future conditions. It would seem to me that can be taken care of by some provisions of the compact which would not disturb its permanent character.

THE CHAIRMAN: Thank you, Mr. Breitenstein.

COM. STONE: Supplementing what Mr. Breitenstein has said and as Colorado's Compact Commissioner, it is the view of Colorado that this compact should operate in perpetuity.

COM. WATSON: I move that this compact shall operate in perpetuity

COM. BISHOP: I second the motion.

THE CHAIRMAN: Are there any remarks on the motion as made and seconded? (No response.) Question is called for. Thereupon a vote is taken on Com. Watson's motion.)

THE CHAIRMAN: It seems everyone is very reluctant about raising his voice this morning on these votes so the Chair, in order to make sure he hasn't failed to hear the vote, is going to call the roll by states on this motion on Item (a). Utah?

COM. WATSON: Yes.

THE CHAIRMAN: Arizona?

COM. CARSON: Yes.

THE CHAIRMAN: New Mexico?

COM. WILSON: I vote yes on the motion. I would like to make this explanation: I think it is obvious that any compact that is negotiated should be in perpetuity; but there will be suggestions made, as has been discussed in the Legal Advisory Committee, that provision should be inserted that on the request of two or more states signatory to the compact, they may either make a new one or amend an old one to iron out any inequities that may be found to exist. On that basis I would like to have a final, perpetual compact.

COM. STONE: I might say that the suggestion made by Mr. Wilson is well taken and that item is covered under subsection (c) in this list.

THE CHAIRMAN: Colorado?

COM. STONE: Aye.

THE CHAIRMAN: Wyoming?

COM. BISHOP: Aye.

THE CHAIRMAN: Will Colorado now open the discussion on subitem (b), Article 5, Group I: "Shall the allocation of beneficial consumptive use be subject to future adjustment in the event that any state does not make full beneficial consumptive use of its allotted share within a stated period."

COM. STONE: I again ask Mr. Breitenstein to open the discussion on subitem (b) of Item 5, Group I.

MR. BREITENSTEIN: Of course that is tied in with (a) on which the Commission has just acted. While it is well for the compact to operate in perpetuity, nevertheless there may be a situation whereby or wherein it is necessary to change some of the allocations of water. We do not know whether or not any one of the states may in the future completely use the water which is allocated to it. Now, in the event conditions arise which result in a state being unable for some reason to utilize its full share of the water, then it would seem reasonable that that water be available for use in some other Upper Basin State.

You all recall that in the Colorado River Compact there is a provision that the Upper Basin shall not withhold and the Lower Basin shall not demand water which cannot be beneficially used in the Basin. It seems to me that we should take advantage of that here and if within a fixed time or whatever condition you want to place on it, it is found that the water allocated to one state is not going to be used in that state, then the water ought to be available for another state because there is no need of letting this water run down to the Gulf of California unused. We want to utilize every bit of it that we can.

It would seem to me that there should be some flexible provision in the compact which would take care of a situation resulting from the failure or inability of one state to utilize its share of the water. We do not know now in whose favor such a provision might operate or to the detriment of what state it might operate. But it seems to me, having regard to the complete utilization of the water, it is essential that there be some such provision in the compact.

Judge Stone suggests that in considering (b) we might at the same time

consider (c). That is a provision for periodic review of compact terms and conditions.

In the Rio Grande Compact there is a provision for periodic review of compact terms and conditions which are not of a substantive nature. That provision permits review at the end of each five-year period after the effective date of the compact. At the end of the first five-year period, New Mexico made a request for review of the provision of the compact relating to the schedule of water deliveries at San Marcial, New Mexico. That matter has been considered for a year and a half or two years by an engineering committee. They made a report and their report is going to be considered by the Rio Grande Commission at its meeting this month. What will come of that I do not know. But that illustrates the method in which the Rio Grande Compact provision has operated.

It is possible, as we all realize I am sure, that no matter how hard we work on this, some inequities may develop in the passage of the years. Now we all want to iron out those inequities I am sure. We don't want one state to have an unfair advantage over another state. It would seem to me that careful consideration should be given to some compact provision which would take care of the matters referred to in (b) and (c).

COM. WATSON: Mr. Chairman, wouldn't it be well to refer to the Colorado River Compact and see what language is used in the Colorado River Compact and ascertain whether we can go along with that language or whether we have to modify it, because the same idea is covered in the Colorado River Compact.

MR. BREITENSTEIN: May I answer that, Mr. Chairman?

THE CHAIRMAN: Certainly.

MR. BREITENSTEIN: I have given that consideration and it is my judgment at the present time that we cannot utilize the same scheme as is found in the Colorado River Compact.

COM. STONE: I should like to make the further remark that we ought to use experience and not necessarily be bound by provisions made over twenty years ago. Conditions have changed. I think we ought to apply to this subject a fresh outlook and not permit ourselves merely to fall back on conclusions of twenty years ago.

I should like to add one other thing which I believe ought to be kept in mind in considering (b) and (c). I believe there would be no difference of opinion on this proposition that provisions of a substantive nature in a compact cannot be changed except that such changes are effectuated in the same manner that the original compact is made, that is, by ratification of the states and approval by Congress. Provisions under (c) contemplate terms and conditions which are not of a substantive nature and which may be reviewed and adjustments made by an administrative body set up under the compact.

That general principle it seems to me must be kept in mind in considering (b) and (c). We must recognize that there is a distinction there which is fundamental. Yet the mere fact that substantive provisions can be changed only in the same manner that the compact is made does not foreclose this Commission from incorporating flexible provisions for adjustment to meet conditions in the future which we do not foresee now.

MR. BREITENSTEIN: The matter covered by subdivision (c) here was

discussed by the Legal Advisory Committee. My view of the work of the Legal Advisory Committee is that it merely puts down in appropriate language decisions which are made by the Compact Commission. I think it is not proper for the Legal Advisory Committee to make the decisions. The lawyers are just the working boys who prepare the language to carry out the wishes of your Commission.

Now, when we discussed a matter, which is the same as (c) here, I believe we all came to the conclusion that it would be presumptive on our part to try to work out anything in advance of having a specific direction from the Commission itself. In my mind it is not proper to merely refer a matter such as (b) and (c) to the Legal Advisory Committee and say, "You come in here and show us something to cover these items." I think that the policy decisions as to what will be encompassed by a compact provision must be made in the first instance, not in the second instance, by the Commission itself.

Referring specifically to (c), in the Rio Grande Compact the provisions for periodic review are strictly confined to those that are not of a substantive nature. One thing that has arisen to cause differences of opinion is, what is meant by a substantive provision? What provisions are substantive and what are not?

Now it seemed to me that the Commission should decide in the first instance whether or not it wants to confine periodic review to substantive provisions or nonsubstantive provisions or both and you should tell the Legal Committee what you want to say on that, and of course the same remarks are applicable to (b). In other words, I think it is unfair to the Legal Committee to expect it in the first instance to make the decisions for subsequent criticism by the Commission.

MR. GILES: Mr. Chairman, I am not a member of the Commission but I would like to make this observation, that it is rather difficult for me to conceive of a state binding itself at this time in this compact to release any of its allocated water within a stated period. It is rather difficult to foresee conditions that would make a state come to that conclusion. It seems to me it would be a dangerous procedure to bind yourself to a re-allocation of water to another state if you don't use it within a stated period yourself. If it can be done it would probably be a good thing to do but I wouldn't want to be a party to that myself.

COM. STONE: I think Mr. Giles raises a very pertinent question here. The question is: In making allocations do you want to make those permanent so that they could not be changed except in the same way the original compact is made? Or, do you want to put into the compact agreements whereby under such conditions it could be made?

That raises the question of policy which Mr. Breitenstein refers to. That points up the question. There could be put into this compact provisions which would initiate procedure whereby recommendations could be made to the respective legislatures and for the approval of Congress for any change; or we could make it more flexible and permit future adjustments as to allocations of water. Mr. Giles points up the question and says that that should not be done. Well, that is just one of the questions which this Commission should decide here.

MR. GILES: Well, Judge, I don't go that far. I think it is possible to make your compact flexible enough to re-allocate under conditions that point the way for re-allocation. But what I had in mind was, at this time to have a provision in your compact that within a given number of years if a state hasn't used its allocated water it shall give it up--

COM. STONE: You can always re-allocate under a compact, under another compact that could be made the same as this one.

MR. GILES: That is right.

COM. STONE: The point is whether we shall lay the basis for review and the procedure for that.

MR. ROLLINS: Mr. Chairman, may I say a word?

THE CHAIRMAN: Yes, sir.

MR. ROLLINS: What I say may not be the opinion of our Commissioner and may not be the opinion of his advisers but it seems to me that inasmuch as the 7,500,000 acre feet is allocated to the Upper Basin States in perpetuity, that this Commission should take a similar stand and all allocations that are made in this compact should be in perpetuity. If we do determine here that a review can be taken at some future date, it should be so far ahead that it would give every state ample opportunity to get all of its projects completed.

I can remember back a long time and we in Wyoming have been talking about projects for the last fifty years and yet we haven't any. It may be fifty years before we will have all our projects; it may be longer than that. I for one certainly wouldn't want to bind Wyoming to any compact which could be reviewed again in a few years even if it was done in the manner in which we are negotiating at this particular time. I would want a hundred years if we are going to make any decision on it.

COM. BISHOP: Mr. Chairman, we would like to see the allocation in perpetuity the same as the allocation to the Upper Basin is in perpetuity. We are at a higher elevation than the states lower down and naturally will be longer developing our water resources. I would like to have all the time that is necessary. I wouldn't want any change ever to be made except with our consent.

COM. WATSON: Do you mean, Mr. Bishop, by that that the entire 7,500,000 acre feet will be divided, or a major portion of the 7,500,000 and a surplus left to allocate at some future date as was provided for in the Colorado River Compact?

COM. BISHOP: I believe, Mr. Watson, we agreed at the last meeting that we would make the division of 7,500,000 acre feet of water on a percentage basis, in which case if there isn't that much available we will get our percentage. If there is more than that, of course we will come under the terms of the Colorado River Compact which provides at a certain time we can ask for allocation of the surplus water. I don't think we should try to divide the surplus in this compact.

MR. BLISS: Mr. Chairman, it would seem to me that Mr. Bishop has more or less answered his own question. Any action that the Commission would take would necessarily have to be unanimous and no state would have to give up any right unless they were convinced in their own mind they could not use their allocated share of the water. It seems to me that would take care of itself in any substantial change in the compact.

COM. CARSON: Mr. Chairman, it seems to me it should be in perpetuity and that this (b) and (c) are not necessary now to go into any compact but should be covered by a provision that we discussed in the Legal Advisory Committee--but we didn't feel justified in proceeding with it--and that would

simply be a provision that on the request, as Judge Wilson said, of two states, or some other number, whatever the Commission should decide, the governors of the signatory states would appoint members of the Commission to review, and let it go at that. Then it would be decided in the light of the then condition instead of now as to all of these readjustments.

COM. WATSON: Mr. Chairman, may I ask Mr. Carson a question? That review would have to be unanimous?

COM. CARSON: That would have to be made in the same way this compact would be made. In other words, the same power that made it could alter it, ratified by the legislatures of the various states and approved by the Congress.

MR. CLYDE: I would like to make just one comment. Under Article III, Section (e), of the Colorado River Compact, the Upper Division has already bound itself not to withhold water that it cannot use, using the word "cannot." If the Upper Basin in dividing the water among the states of the Upper Basin allocated water to one state in a quantity above that which it can use, then under our already existing contract with the Lower Basin they are going to get that water because we say we will not withhold it if we cannot use it.

I think that the Upper Basin States ought to leave--and I think the method ought to be somewhat as Mr. Carson suggests--should leave the matter open so that if we do through insufficient data now make allocation beyond that which can be used by any Upper Basin States, it can be reconsidered. Otherwise, under Article III, Section (e), of the existing compact, it is going to go to the Lower Basin because all that we cannot use we agree we will not withhold. And if we allocate to Utah more than it can use, then under the existing compact it will go to the Lower Basin unless we have some method of readjusting it and letting the Upper Basin come into the picture. The method I think, however, ought to be that suggested by Mr. Carson, which is, leave the matter open for renegotiation when that fact becomes known.

COM. STONE: Mr. Chairman, all of the other states have commented; Mr. Breitenstein merely presented the problem. Colorado's position on (b) and (c) is this: First I shall take up (c). We believe that the compact should contain a clause which would permit under the conditions set forth, whatever they may be, a periodic review of nonsubstantive terms, that is, matters which do not affect the substance of the compact, matters which do not change or affect the apportionment to the states, but nonsubstantive terms which are designed and will be helpful in making the compact more effective and operative. We believe in that connection the clause specifying a review should define what constitutes substantive provisions.

As to (b), "Shall the allocation of beneficial consumptive use be subject to future adjustment in the event that any state does not make full beneficial consumptive use of its allotted share within a stated period," Colorado is not in favor of such a provision. Our reason is this: We should make the apportionment in an equitable fashion under the conditions as we know them today. If in the future it appears that some state cannot use its portion of the water, there is nothing to prevent the making of a supplemental compact under the conditions as we shall know them in that day. I am inclined to believe that Grover Giles and Mr. Rollins are right in saying that we cannot now appraise that condition and no state in the interest of future generations would want to appraise it, and there really is no need of doing it because if the thing should happen for Colorado which Mr. Watson mentions, the door is open for the making of a supplemental compact.

So to sum up, Colorado favors a provision suggested by Subsection (c) with the suggestion that that provision must be carefully drawn and should

clearly define what constitutes nonsubstantive matters. Colorado is opposed to anything being included in the compact as suggested under Subsection (b).

MR. CLYDE: Mr. Chairman, may I ask Judge Stone a question?

THE CHAIRMAN: Yes, sir.

MR. CLYDE: Do you, Judge Stone, fear legally that California might be able to argue that we have relinquished our rights to readjust our apportionment if we at this time in perpetuity and with no reservation whatsoever in the compact, allocate more water to an Upper Basin State than it can use and then California come forward and say, "Well, by that now you under Article III, Subsection (e), of the Colorado River Compact have relinquished that water to the Lower Basin"?

COM. STONE: You have raised I think an important question and one I haven't thought of; but offhand I believe we should incorporate in the compact an appropriate reservation to make it clear that the Upper Basin proposes to use its water even though it may require some future reapportionment among the states of the Upper Basin.

MR. CLYDE: That was the point of my comments before, that we ought to reserve that some way so that by an allocation today on the basis of existing data we don't allocate to one state more than it can use.

COM. STONE: I think you have a very important point there and I agree with your thinking; however, that is a different point from that raised by these two suggestions.

MR. CLYDE: It is different but it is related.

COM. STONE: It is related. I do think we must be very careful that we do not leave the door open for a lower basin state to make a claim such as you mention. I believe that can be done and still carry out sound principles as to (b) and (c). That is a different but a related subject to the one raised by (b) and (c).

THE CHAIRMAN: Well, the Chairman hopes that in the drafting of this compact there will be no provision written into it which will invite competition between the Upper Basin States in the furtherance of their development. You might in the future have a division of opinion between the Upper Basin States and two or three states gang up on another one and get right in the way of their appropriations and delay their work.

Of course we are all talking about this compact in good faith but we will all pass out of the picture one of these days, new faces will appear. How they will look at it remains to be seen. But I would advise extreme caution in leaving the matter open so there would be competition invited between the Upper Basin States themselves in the development.

COM. STONE: I believe, Mr. Chairman, we recognize that and that is one of the reasons why we believe there should be no provision as to (b) but I think that in the interest of the most effective compact there should be some carefully phrased provision under (c), and we will tentatively go along with the suggestion made by Utah that we must have that reservation.

MR. WEHRLI: Mr. Chairman, may I make a comment?

THE CHAIRMAN: Mr. Wehrli.

MR. WEHRLI: It seems to me unimportant whether provisions of this character are included in the compact because the compact can be changed only by the making of a new compact, which would require the concurrence of all of the states, and with or without provisions of this kind the states certainly would have the right at any time in the future to make a new compact. So as far as we are concerned, we think that these matters are unimportant and I am inclined to agree with Mr. Carson in the matter. I am also a little bit apprehensive about the extending of an invitation, which provisions of this kind impliedly do.

COM. STONE: May I reply to that, Mr. Chairman?

THE CHAIRMAN: Certainly.

COM. STONE: I agree with Mr. Wehrli as to (b), but as to (c), he says we can change the compact. Yes, we can change the compact as to nonsubstantive matters, but we all know the turmoils that the machinery of negotiating a new compact mean. We know it means delay even though we are all in agreement. As to nonsubstantive matters which do not affect a state's apportionment of water or which do not affect a state's obligation to deliver water at Lee Ferry but which go to mere details of administration, we shouldn't lose the opportunity of leaving some flexibility on administration if it is properly surrounded with conditions which will protect a state's substantive rights. I believe that that provision in the Rio Grande Compact was carefully considered and experience has demonstrated that it was wise.

COM. WATSON: Can you, Judge Stone, as a lawyer define what is substantive and what is not substantive?

COM. STONE: I believe it can be defined. I wouldn't want to attempt it right at the moment. The question was raised in this state and with other states in connection with compacts which we have had under consideration as to what constitutes substantive matters and what are nonsubstantive matters, and the principles I think are pretty well understood. You cannot change substantive matters without the consent of all of the states and without a compact being made in the same manner as the original compact was made, that is, by ratification of the legislatures and approved by Congress. But I don't believe we should put ourselves in a straightjacket with respect to nonsubstantive matters and that we ought to explore the possibilities of writing a clause under (c) which would be satisfactory to all of the states. I believe that is what Mr. Carson suggested.

THE CHAIRMAN: Judge, just to bring the point out, what is meant by "periodic review of compact terms"? Does that mean every five years, every ten years, every fifty years or every one hundred years, or what does it mean?

COM. STONE: We don't say there. That is a matter for the Commission to agree upon if we have a clause of that kind. You may wish to approach it in a different manner. You may not want to have periodic reviews. You may want to leave it up to a review at the instance or suggestion of, let us say, two states, and such nonsubstantive changes would have to be agreed upon by all of the states.

THE CHAIRMAN: Well, would it be your idea that the year after this compact is written somebody could have a review of it?

COM. STONE: The Rio Grande Compact fixed it at every five years.

THE CHAIRMAN: Was that done on a percentage basis of allocation or actual acre feet?

COM. STONE: It didn't have anything to do with allocation because allocation is a substantive matter; it had to do with nonsubstantive matters. I will ask Mr. Breitenstein, who has had this matter before him, to give some suggestion as to what has been considered substantive and matters which are of nonsubstantive nature.

THE CHAIRMAN: Mr. Breitenstein.

MR. BREITENSTEIN: I can give a curbstone opinion in answer to Mr. Watson's inquiry and probably none of the other lawyers present would agree with me.

THE CHAIRMAN: We appreciate that.

MR. BREITENSTEIN: A substantive matter goes to a right or the definition of a right. A nonsubstantive matter is one which goes entirely to procedure. That is over-simplified but I think it gets the overall idea.

On the periodic review my thought was that it should be permissible to review nonsubstantive matters at fixed intervals and I am inclined to think the five-year period set up in the Rio Grande Compact is as fair as you can get. That is five years after the compact is effective and every five years thereafter. I believe the experience of New Mexico has shown the wisdom of such a provision.

THE CHAIRMAN: Mr. Breitenstein, it is your idea then that this provision (c) would not relate to re-allocation of water?

MR. BREITENSTEIN: Absolutely not.

COM. STONE: It is our position that that could not be done without ratification by the legislatures and approval by Congress.

MR. HOWELL: May I ask you this question? Assuming now you do attempt to define what shall be nonsubstantive matters, who will have the determination as to whether it is of nonsubstantive matter or whether it is not.

COM. STONE: It is my suggestion, Judge, that we should define what constitutes nonsubstantive matters so it would be clear in the compact and it wouldn't be necessary for anybody to determine it except this Commission in making the compact.

MR. HOWELL: The only difficulty about that that I have in mind is that my experience teaches me that two lawyers having desires in opposite ways can very plausibly argue no matter how you define it, the matter is a substantive matter or is a nonsubstantive matter according to what you want.

MR. BREITENSTEIN: May I make a suggestion?

MR. HOWELL: Yes.

MR. BREITENSTEIN: Your definition as to what is nonsubstantive might be by specific reference to paragraphs in the compact.

MR. WEHRLI: May I ask a couple of questions?

THE CHAIRMAN: Surely.

MR. WEHRLI: Did I understand you to say, Judge Stone, that you

were opposed to (b) and favored (c)?

COM. STONE: That is correct. Colorado opposes (b) for the very reason which you gave, that if we want to make any changes of a substantive nature the door is open to renegotiate a compact, or, to put it the other way, to negotiate a supplemental compact. We believe that we are not in a position today to commit any state to a different apportionment from that which is made by this compact and that each state must reserve that for the future.

But as to (c), we sincerely believe we should attempt to draft a clause which will permit some flexibility in the administration of the compact and in the handling of nonsubstantive matters without having to go through the process of negotiating a supplemental compact.

So we oppose (b). We do not submit at this time the exact provision as to (c) but we believe that the Commission should consider (c) and some of the terms that might be set up under (c) and submit it to the Legal Advisory Committee to draft.

MR. WEHRLI: My second question is this: Under (c) if you have such provision in the compact, wouldn't it nevertheless require the action of all the states to make any change?

COM. STONE: The answer to that is this: that if you have periodic review you could not change nonsubstantive matters without the consent and agreement of all the states.

MR. WEHRLI: Well, could you make any change except as to matters of administration, which after all are not defined particularly in the compact, without the concurrence of all of the states?

COM. STONE: If I understand your question right, our position is that you could not change any substantive matter without a supplemental compact. You could change a nonsubstantive matter under an appropriate clause in the compact with the consent of all of the states.

MR. CLYDE: Expressed how, Judge Stone? By the legislature ratifying it or just by the Commission?

COM. STONE: Under the Rio Grande Compact the administrative commission is authorized to make periodic reviews and there are representatives on that commission of all the states. They cannot review and suggest changes of a substantive nature because that requires the action of the states.

MR. HOWELL: Under your view would it require unanimous action on the part of the commission?

COM. STONE: Why certainly. We don't think you can change anything without unanimous action. You can't change nonsubstantive matters without an agreement of all the members, let us say, of the administrative commission. You certainly can't change substantive matters without a new or supplemental compact ratified by the legislatures of the states and approved by Congress.

THE CHAIRMAN: Gentlemen, we have had considerable discussion on subitem (b) of Article 5, Group I. Will somebody submit a motion in regard to it?

COM. BISHOP: I will make a motion that we go on record as against (b).

THE CHAIRMAN: Do I hear a second to Mr. Bishop's motion?

COM. WILSON: Mr. Chairman, I would like to speak on that motion but it has no second.

COM. WATSON: I will second the motion.

THE CHAIRMAN: Mr. Watson has seconded Mr. Bishop's motion. It is now open for discussion.

COM. WILSON: In the first place I would like to say, Mr. Chairman, I don't see what we are accomplishing by voting yes or no on some of these sentences. Reference has been made in discussing points (b) and (c) to the provisions of the Rio Grande Compact, to which Colorado, Texas, and New Mexico are parties, and it does have a provision in Article 13 which provides for a review. What do you mean by providing in a compact for a review? A review by whom? By the commission or the administrative body to be created by the compact?

In the Rio Grande Compact there is authorization for a review by the Commissioners themselves of any matter that is not substantive. I take it that the compact commission that is set up in the compact cannot review a substantive matter. In other words, they can't talk about it. It would do no good. So that would leave only nonsubstantive matters for the commission to review. If there are any nonsubstantive matters in the compact and you have a clause like this in it, the commission presumably can review those nonsubstantive matters. They are precluded, however, from reviewing substantive matters.

Now what is the purpose of permitting the commission to review nonsubstantive matters unless it is to make recommendations that they be changed or unless they have the power to change them themselves? Are you going to give the body that you create here the power to change nonsubstant matters without going back to the state legislatures?

I think some provision for review ought to be put in the compact but it should be made to mean something. If you are going to give a body the right to review, give them a right to act on the thing or make recommendations. I see no objection to giving them the right to review substantive or nonsubstantive matters even if they can't do anything about either one, except to make recommendations to the legislatures. It seems to me that we can't decide anything by voting yes or no on either one of these, (b) or (c).

As far as (b) is concerned I will say this, that I think we all recognize the principle that if any state does have allotted to it water that it cannot use consumptively and beneficially, that state ought to give some of the other states the opportunity of using it.

THE CHAIRMAN: When?

COM. WILSON: We can't say now.

THE CHAIRMAN: When?

COM. WILSON: That is it. I would be opposed to saying now any stated period of time even though we put it one hundred years. So I think everybody is opposed to (b). But as to (c), it depends a great deal upon the administrative body that you create and the power you confer upon it whether the review amounts to anything or not.

COM. STONE: I understand, Mr. Chairman, that the motion goes only to (b).

THE CHAIRMAN: That is correct, Judge Stone. Are there any further comments on the motion as made and seconded?

COM. STONE: May I ask Mr. Bishop and Mr. Watson if we are correct in our interpretation of the motion that the motion goes only to (b)?

COM. BISHOP: That is right.

COM. WATSON: That is right.

THE CHAIRMAN: That is correct.

COM. WATSON: Question.

THE CHAIRMAN: Question has been called for. Wyoming?

COM. BISHOP: Yes.

THE CHAIRMAN: Arizona?

COM. CARSON: Yes.

THE CHAIRMAN: New Mexico?

COM. WILSON: Yes.

THE CHAIRMAN: Utah?

COM. WATSON: Yes.

THE CHAIRMAN: Colorado?

COM. STONE: Yes.

THE CHAIRMAN: Now we have before us the disposition of subitem (c) under Article 5, Group I. Is there further discussion of subitem (c)? The two subitems (b) and (c) have been considered together and some of the comments refer to (c); (b) has been disposed of.

COM. CARSON: Mr. Chairman, I think it would be well if we passed (c) without any action until we see what terms are in this compact. To my mind it is not very likely there will be any nonsubstantive terms in this compact and the action of whatever commission is here set up will be in the matter of interpretation, which can not vary the language of the compact itself.

THE CHAIRMAN: The Chair is not sure he understands your thought there, Com. Carson. We must assume that somebody is going to attempt to put into this draft of the compact, the wishes of the Commission; and whether something is in or out on Item (c), the boys that draft it, and I presume that will be the lawyers, will have to have some indication as to what the Commission wants.

COM. CARSON: I move we defer consideration of Subsection (c) of this agenda to a later time.

COM. BISHOP: I will second that motion.

THE CHAIRMAN: The motion is seconded. Is there a discussion of the motion?

COM. WATSON: Question.

THE CHAIRMAN: Question has been called for. Arizona?

COM. CARSON: Aye.

THE CHAIRMAN: New Mexico?

COM. WILSON: Aye.

THE CHAIRMAN: Colorado?

COM. STONE: Aye.

THE CHAIRMAN: Wyoming?

COM. BISHOP: Aye.

THE CHAIRMAN: Utah?

COM. WATSON: Aye.

THE CHAIRMAN: The motion is carried. The next item on the agenda is a consideration of the subitems under Group II on page 2. Now it occurs to your Chairman that in connection with the discussion of the subitems under Group II you should have before you the views of the Federal Power Commission and the International Boundary and Water Commission, but as those copies are not available before you perhaps we may go ahead in a consideration of that item and await final disposition of it to the time when you can consider the views which have been expressed by the Federal agencies. Mr. Watson?

COM. WATSON: What shall we do with the reservation suggested by Mr. Clyde? Shall we refer that to the Legal Advisory Committee so that they may draw the appropriate language as to that reservation made protecting the rights of the Upper Basin against the Lower Basin on water that might go down?

MR. BREITENSTEIN: Group IV, which is set up here on page 2 of the suggested agenda, contains matters referring to the Colorado River Compact. As I understand the suggestion it is to have in the Upper Basin Compact some provision which would take care of the Colorado River Compact as Mr. Clyde has suggested. If that is correct it seems to me the discussion properly comes up under Group IV.

COM. WATSON: That is right.

COM. STONE: Mr. Chairman, I move that we defer consideration of Group II on page 2 until the statements from the Federal agencies to which you have referred are before the Commission.

THE CHAIRMAN: Is there a second to that motion?

COM. CARSON: I will second the motion.

THE CHAIRMAN: Any discussion of the motion? (No response. Thereupon a vote was taken and Com. Stone's motion carried unanimously.)

COM. STONE: Now, Mr. Chairman, we get to Group III, which will precipitate considerable discussion. It is about twelve o'clock. It seems to me we ought to start in there tomorrow with either Group II if those Federal matters are before us, or Group III if they are not.

THE CHAIRMAN: Off the record. (Discussion off the record.)

COM. WATSON: Mr. Chairman, I move we adjourn until tomorrow afternoon at a time to be determined by the adjournment of the Colorado River Basin States Committee.

COM. STONE: The meeting this afternoon is at the Cosmopolitan Hotel at two o'clock.

THE CHAIRMAN: Is there a second to the motion to adjourn?

COM. WILSON: Second the motion.

(Thereupon a vote was taken and Com. Watson's motion carried unanimously.)

(12:00 noon, Recess.)

Denver, Colorado
February 18, 1948
4:00 o'clock p.m.

(All Commissioners present.)

THE CHAIRMAN: Gentlemen, we had gotten down to Group II of the agenda and then decided to pass it up in view of the non-availability of the letters from the Federal agencies. Now those letters have been mimeographed and are available here and we will pass them out to the members of the Commission and others. Mr. Giles, will you take care of that? Then if there is no objection the communications from the Federal agencies will be incorporated in the minutes.

(Mr. Giles distributes copies of communications from Federal agencies.)

THE CHAIRMAN: Gentlemen, is it your desire now to have these made a part of the record or incorporated in the minutes? Apparently the first communications that were received by your Chairman were made a part of your record but were not incorporated in the minutes. You may express your ideas on how you want these handled.

COM. STONE: Mr. Chairman, I move that in accordance with the procedure followed with respect to the other communications from the Federal agencies, these letters be made a part of the record.

COM. WATSON: Second the motion.

THE CHAIRMAN: Any discussion? (No response. Thereupon a vote was taken and Com. Stone's motion carried unanimously.)

(The communications above referred to are as follows:)

"INTERNATIONAL BOUNDARY AND WATER COMMISSION
UNITED STATES AND MEXICO
FIRST NATIONAL BANK BUILDING
EL PASO, TEXAS

Office of the Commissioner
United States Section

December 18, 1947

My dear Mr. Bashore:

This will acknowledge receipt of your letter of December 15, 1947, in which you request a statement in response to the questions propounded by the Upper Colorado River Basin Compact Commission at its meeting in Denver, Colorado, on December 2, 1947. These questions are: 'What right if any, to the use of Upper Colorado River water does the agency have or claim on behalf of the United States? What particular provision and what particular language should be incorporated in any Upper Colorado River Basin Compact to protect the right, if any, to the use of Upper Colorado River water held or claimed by an agency on behalf of the United States?'

This agency, representing the United States in boundary and water treaty matters with Mexico, claims only such right in waters of the Colorado River system as may be necessary to satisfy the provisions of the Mexican Water Treaty of February 3, 1944, with which you are familiar.

In response to the second question I believe that the rights of the United States, in so far as the particular interests of this agency are concerned, will be adequately protected by a provision in any Upper Colorado River Basin Compact substantially as follows:

> 'Nothing in this Compact shall be construed as affecting the obligations of the United States of America to the United Mexican States under existing treaties.'

This provision is substantially taken from Article XVI of the Rio Grande Basin Compact.

Sincerely yours,

(Signed) L. M. Lawson
Commissioner

- - - - - - -

Honorable Harry W. Bashore
Federal Representative and Chairman
Upper Colorado River Basin Compact Commission
Mitchell, Nebraska."

"THE SECRETARY OF THE INTERIOR
WASHINGTON 25, D. C.

January 9, 1948

My dear Mr. Bashore:

I have received your letter of December 15.

The questions raised in your letter will be duly considered and responses thereto will be forthcoming as soon as possible. Your invitation to the Office of Indian Affairs will be transmitted to that agency.

No doubt the Office of Indian Affairs will contact you directly.

Sincerely yours,

(Signed) William E. Warne
Assistant Secretary of the
Interior

Hon. Harry W. Bashore
Federal Representative and Chairman

"FEDERAL POWER COMMISSION
Washington 25

Upper Colorado River
Basin Compact Commission January 30, 1948

Mr. Harry W. Bashore
Federal Representative and Chairman
Upper Colorado River Basin Compact Commission
Mitchell, Nebraska

Dear Mr. Bashore:

In your letter of December 15 you ask two questions on behalf of the Upper Colorado River Basin Compact Commission with regard to the proposed compact for distribution of the waters of the Upper Colorado River Basin.

The first question is: What right, if any, to the use of the Upper Colorado River water does the Federal Power Commission have or claim on behalf of the United States?

If this question has reference to appropriation rights to the use of the Upper Colorado River Basin water, the answer is that the Federal Power Commission does not have or claim any such rights on behalf of the United States to the use of the Upper Colorado River Basin water. Under the Federal Power Act this Commission is not an operating agency, exercising, on behalf of the United States, any proprietary rights. It is authorized to issue and supervise licenses under that Act for non-Federal water power projects. Licenses have been issued for water power developments having an installed capacity of more than 100 horsepower on the following streams within the Upper Colorado River Basin:

Project No. 190,	Uinta River and Pole Creek, Utah;
Project No. 400,	Animas and Lake Fork on San Miguel River, Colorado;
Project No. 662,	Pine Creek, Wyoming;
Project No. 1773,	East Fork of Lake Fork of Duchesne River (Yellowstone Creek), Utah;
Project No. 1901,	Cunningham Creek, Colorado.

There are also a number of water power plants having less than 100 horsepower capacity in this river basin which are operating under Federal Power Commission licenses. Presumably, all of the projects operated under such licenses have acquired water power rights under State law and would not be affected by the proposed compact. However, it is felt that the proposed compact should not contain any provisions which would inequitably

deprive any of these licenses of their water power rights or prevent the acquisition of such projects by the United States in accordance with the terms of the Federal Power Act. If the compact follows the usual form of other interstate river compacts, it is believed that such rights will not be prejudiced.

However, the United States has other rights and responsibilities with respect to water use than those of a proprietary nature, and Congress has entrusted some of those other rights and responsibilities to the Federal Power Commission. In the Federal Power Act Congress requires that licenses for projects of over 100 horsepower capacity shall be issued only for projects which are best adapted to comprehensive plans for improving or developing a waterway or waterways for the use or benefit of interstate or foreign commerce, for the improvement and utilization of water power development, and for other beneficial public uses, including recreational purposes. This requirement of conformance by non-Federal water power projects with comprehensive plans represents a policy of long standing and of fundamental importance and has been made equally applicabl to Federal developments authorized under other statutes.

Therefore, the compact should recognize the desirability of comprehensive development of water resources in the Upper Colorado River Basin, including power development, to the end that the economic conditions of the area may be improved and the wealth of the nation increased. The rights and responsibilities of the United States should be recognized and the compact should not prevent full development of water power in accordance with State and Federal laws relative to beneficial consumptive use of the waters.

The second question which you ask reads: What particular provision and what particular language should be incorporated in any Upper Colorado River Basin compact in order to protect the rights, if any, to the use of Upper Colorado River water held or claimed by an agency on behalf of the United States?

The following language is suggested for the Upper Colorado River Basin compact:

Article _____

Nothing in this compact shall be deemed:

(a) To impair or affect any rights, powers, or jurisdiction of the United States, or those acting by or under its authority, in, over and to the waters of the Upper Colorado and its tributaries, as now provided by law; nor to impair or affect the right of the United States or those acting by or under its authority, to acquire rights in and to the use of waters of said river and its tributaries, as now provided by law;

(b) To subject any property of the United States, its agencies or instrumentalities, to taxation by any State, or subdivision thereof, nor to create an obligation on the part of the Unite States, its agencies or instrumentalities, by reason of the acquisition, construction, or operation of any property or works of whatsoever kind, to make any payments to any State or political subdivision thereof, state agency, municipality, or entity whatsoever in reimbursement for the loss of taxes;

(c) To subject any property of the United States, its agencies or

instrumentalities, to the laws of any State to any extent other than the extent these laws would apply without regard to this compact.

When other specific provisions of the compact have been formulated, it will be appreciated if the Federal Power Commission may have an opportunity of studying and commenting upon them before they are finally adopted by the Compact Commission.

Sincerely yours,

(Signed) Nelson Lee Smith,
Chairman."

"EXECUTIVE OFFICE OF THE PRESIDENT
BUREAU OF THE BUDGET
WASHINGTON 25, D. C.

Jaunary 21, 1948

Mr. Harry W. Bashore
Federal Representative and Chairman
of the Upper Colorado River Basin
Compact Commission
Mitchell, Nebraska

Dear Mr. Bashore:

This will acknowledge receipt of your letter dated December 15, 1947, setting forth two questions which you have submitted to various Federal agencies concerning the rights of the United States to the waters of the Upper Colorado River.

I appreciate your advising me of these requests and am sure that the agencies concerned will consider the matter and make appropriate replies directly to you. I am requesting these agencies to furnish us with copies of their replies for the information of the Executive Offices.

Sincerely yours,

(Signed) James E. Webb
Director."

- - - - -

THE CHAIRMAN: You will recall at our meeting yesterday morning the Legal Advisory Committee indicated that it wasn't ready to report but today there is available the mimeographed report and perhaps Mr. Carson, the chairman of that committee, wishes to submit the report. There are plenty of copies of the report available and perhaps they should be passed around for the perusal of those who haven't seen it.

COM. CARSON: I think everybody has a copy who is a member of the Commission.

("Report of Legal Advisory Committee on Matters referred by Compact Commission at Meeting No. 5" distributed.)

COM. CARSON: The mimeographed copy of the report of the Legal Advisory Committee I think is self-explanatory and I don't know whether there is any desire that the provisions of it be read or not. The Committee considered all the questions that have been submitted to it by the Compact Commission and here in the report detailed the questions that were submitted and the Committee's suggestion of the provision referred to for the consideration of the Compact Commission.

We found that there were some matters that we have tentatively reported on that are of substance rather than mere phraseology. There are some other matters which we think should be decided by the Commission rather than recommended by the Legal Advisory Committee. There were two matters in which there was a divergence of views among the Committee itself, so all of the Committee does not wish--I am sure that is true of each member of the Committee--to be considered as committed to this and this only. We are the servant of this Commission and if anything in here is not acceptable or wrong and if you desire to change the base, we will try to put it in appropriate language.

There are two matters of policy which really require consideration by the Commission, one relating to the administrative provision as to whether or not that should be, as we have here reported, the minimum requirement of an administrative agency to construe reports in the light of this compact and make findings of fact. One school of thought was that perhaps it should be in the nature of an authority set up by compact among the states. The Legal Committee was of the opinion that that was neither necessary nor desirable. So this is explanatory in its terms as to our recommendations of the composition and the powers of the commission and the effect of its findings.

One other question related to that matter which is a matter for the Commission itself, as well as the consideration of the whole thing, but one particular matter is how the expenses of the commission here proposed to administer the compact should be paid. One idea was that it should be borne equally by the four states of the Upper Division; the other was that it should be according to the percentage of water allocated to each. And I might add as a Commissioner now, that in my view this commission here set up should not be participated in by Arizona, both from the Arizona viewpoint and from the viewpoint of the States of the Upper Division, but should be composed of one member from each of the States of the Upper Division and one Federal Representative.

On the matter of the facilities in one state for the benefit of another, which is the second question referred on page 5 of the report, we have there gone into the question of eminent domain and payment in lieu of taxes and other things which seemed to us to be proper for the consideration of the Commission.

On the third question which was presented to us on the charging of reservoir losses, appearing on page 8 of the report, we have suggested langua which it seems to us properly handles that proposition but that again for the consideration of the Commission.

On the question of preferential uses of water, we have gone into it and recommend that the language of the Colorado River Compact in that respect be incorporated in this compact.

You also referred to this committee the question of what should be done concerning Indian rights and we recommend that a similar clause to that in the Colorado River Compact be incorporated herein. We did not believe

that this Commission or this compact could authoritatively settle or attempt to settle the question of Indian rights as may be raised by the United States Government or the Indian Service. We do believe that the question of Indian rights should be kept in mind by this Commission whenever it goes to apportioning the water under the belief that the water apportioned to each state must be utilized to satisfy the rights of Indians and whites alike, and that should be taken into account in the apportionments made. We did not believe that any specific language other than that suggested relating to Indians should be incorporated in the compact but we did think that some general clause to the effect that all uses of water within the borders of the state should be charged against the apportionment of that state.

We got along very well and the members of the Committee worked diligently to prepare this report. We suggest it for your consideration.

THE CHAIRMAN: Thank you.

REPORT OF LEGAL ADVISORY COMMITTEE ON MATTERS REFERRED BY COMPACT COMMISSION AT MEETING NO. 5

The Upper Colorado River Compact Commission at its meeting No. 5 referred five matters to the Legal Advisory Committee. In this report the committee sets forth its recommendations in regard to each of the matters so referred.

In considering this report the Commission must realize that the compact provisions proposed are necessarily in tentative form. Decisions yet to be made by the Commission on both substantive and procedural matters will affect the proposals here made. It must be understood that the committee and the individual members thereof may desire to make further or different recommendations after further progress has been made in forming a compact.

I.
ADMINISTRATIVE PROVISIONS

Motion of Commission

The principle of creating an administrative agency is accepted by the Commission and a clause shall be incorporated in the compact adopting the principle. The matter is referred to the Legal Advisory Committee to work out the details and report back to the Commission.

Recommendation

ARTICLE _____
ADMINISTRATIVE PROVISIONS

There is hereby created an interstate administrative agency to be known as "Upper Colorado River Commission."

The Commission shall be composed of one representative of each of the states of the Upper Division, namely, Colorado, New Mexico, Utah and Wyoming, and if designated by the President of the United States, one representative of the United States. The Commissioner for Colorado shall be appointed by the Governor of Colorado with the advice and consent of the Colorado Water Conservation Board. The State Engineer of New Mexico shall be ex-officio commissioner for New Mexico. The commissioner for Utah shall be appointed

by the Governor of Utah with the advice and consent of the State Water and Power Board. The State Engineer of Wyoming shall be ex-officio commissioner for Wyoming. If any state desires to provide for the selection of its commissioner in a different manner, the commissioner, selected as so determined by such state, shall be the commissioner for such state. The President of the United States shall be requested to designate a commissioner for the United States. If a commissioner is so designated for the United States he shall be the presiding officer of the Commission and shall be entitled to the same powers and rights as the commissioner of any state.

Any four members of the Commission shall constitute a quorum.

Expenses. The salaries and personal expenses of each commissioner shall be paid by the government which he represents. All other expenses which are incident to the administration of this compact and which are not paid by the United States shall be borne (equally by the four states) (prorata by the four states according to the percentage of water allocated to each). On or before November 1st of each year the Commission shall adopt and transmit to the governors of the four states and to the President a budget covering an estimate of its expenses for the following year and of the amount thereof payable by each state. Each state shall pay the amount due by it to the Commission on or before April 1st of the year following. The payment of the expenses of the Commission and of its employees shall not be subject to the audit and accounting procedure of any of the four states or of the United States.

Employees. The Commission shall appoint a secretary who shall not be a member of the Commission and who shall serve for such term and receive such salary and perform such duties as the Commission may direct. The Commission may employ such engineering, legal, clerical and other aid as may in its judgment be necessary for the performance of its functions under this compact. In the hiring of employees the Commission shall not be bound by the civil service laws of any state or of the Federal Government.

Powers. The Commission shall have the power to

1. Adopt rules and regulations not inconsistent with this compact.

2. Locate, establish, construct, abandon, operate and maintain water gaging stations;

3. Make estimates to forecast water run-off on the Colorado River or any of its tributaries;

4. Engage in cooperative studies of water supplies of the Colorado River and its tributaries;

5. Collect, analyze, correlate, preserve and report on data as to stream flows, water storage, water diversions and water use of the waters of Colorado River or any of its tributaries;

6. Make findings as to the amount of and report on the beneficial consumptive use of water each year in the Upper Colorado River Basin and in that portion of each state lying within this basin.

7. Make findings as to the amount of and report on the water deliveries at Lee Ferry each year and the amount of such water supplied by

each state of the Upper division;

8. Make findings as to the amount of and report on the share of reservoir losses chargeable against the apportionment made to each of the four states;

9. Make findings as to the amount of and report on the obligation of each state to make water deliveries at Lee Ferry;

10. Perform all functions and do all things required of it by this compact and do all things proper and convenient in the performance of its duties hereunder. Provided, however, that the concurrence of four members of the Commission shall be necessary in any action taken by the Commission;

11. Make and transmit annually to the Governors of each of the four states and the President of the United States with the estimated budget a report covering the activities of the Commission for the preceding year.

Records Open to Inspection. The Commission and its secretary shall make available to the Governor of each of the signatory states any information within its possession at any time and shall always provide free access to its records by the governors of each of the states or their representatives or authorized representatives of the Federal Government.

Findings of fact. Findings of fact made by the Commission shall not be conclusive in any court or before any agency or tribunal but shall be admissible and shall constitute prima facie evidence of the facts found.

Comments.

1. The committee considered that the apportionment of the expenses of administering the compact is a substantive matter for determination by the Commission. Two methods of apportionment were suggested in meetings of the committee, viz., an equal division by the states or a division proportional to the percentage of water allocated to each state. These alternative methods are set out in brackets in provision on expenses.

2. The Commission is not given the express power to own real and personal property. The committee believes that under paragraph 10 of the powers the Commission would have the right to acquire, hold and dispose of any property, real or personal, necessary to the performance of any of the powers granted. This would mean, by way of example, that the Commission could acquire land necessary for gaging stations.

3. The committee directs the attention of the Commission to the fact that consideration might as well be given to the matter of tort liability of the Commission, its members and employees.

4. The proposal permits action upon a vote of four commissioners. Findings of fact by the Commission are not conclusive and may be rebutted by a dissatisfied state.

II.

FACILITIES IN ONE STATE FOR THE USE OR BENEFIT OF ANOTHER STATE

Motion of Commission.

There is referred to the Legal Advisory Committee consideration of compact provisions relative to the use of eminent domain, reimbursement of

taxes, control of diversions, storage and release of water, compliance with state requirements as to the filing of maps and plans, all in connection with the construction of a project in one state for the benefit of another state or states.

Recommendation

ARTICLE ____

FACILITIES IN ONE STATE FOR THE USE OR BENEFIT OF ANOTHER STATE

No state shall deny the right of the United States, another signatory state, any person or entity to construct or participate in the construction and use of diversion works and storage reservoirs with appurtenant works, canals, and conduits in one state for the purpose of diverting conveying, storing, regulating and releasing water to satisfy the provisions of the Colorado River Compact relating to the obligation of the state of the Upper Division to make deliveries of water at Lee Ferry, or for the purpose of diverting, conveying, storing, or regulating water in an upper state for beneficial consumptive use in a lower signatory state when such is within the allocation of such lower state herein made. Such rights shall be subject to the rights in a state in which such reservoir or works are located to have and receive the water allocated to it herein for beneficial consumptive use.

Any signatory state, any person or any entity of any signatory state shall have the right to acquire necessary property rights in any other signatory state by donation, purchase or through the exercise of the power of eminent domain.

Any signatory state upon the written request of the Governor of another signatory state for the benefit of whose water-users property is to be acquired in the state to which such written request is made shall proceed expeditiously to acquire the desired property through the exercise of its power of eminent domain, and shall convey such property to the requesting state or such entity as may be designated by the requesting state. Provided however, that all costs and expenses of every kind and nature whatsoever incurred in the acquisition of the requested property shall be paid by the requesting state at the time and in the manner prescribed by the state requested to acquire the property.

Should any facility be constructed in a signatory state for the benefit of another state or states or the water users thereof as above provided, the construction, repair, replacement, maintenance and operation of such facility shall be subject to the laws of the state in which the facility is located, except that in the case of a reservoir constructed in one state for the benefit of another state the water administration officials of the state in which the facility is located shall permit the storage and release of any water which, as determined by the finding of the Commission, falls within the share of the state for whose benefit the facility is constructed, and in the case of a regulating reservoir for the joint benefit of all states in making Lee Ferry deliveries the water administration officials of the state in which the facility is located shall in permitting the storage and release of water, comply with the findings and orders of the Upper Colorado River Commission.

In the event property is acquired in one state for the use and benefit of another the users of water made available by such facilities shall pay to the political subdivisions of the state in which such works

are located each and every year during which such rights are enjoyed for such purposes a sum of money equivalent to the average amount of taxes levied and assessed against the land and improvements during the ten years preceding the acquisition of such land in full reimbursement for the loss of taxes in such political subdivisions of the state, said payments to be in lieu of any and all taxes on said property, improvements and rights.

The signatory states further agree to recommend to the President and to the Congress that in the event the United States shall acquire property in one of the signatory states for the benefit of another signatory state or its water users, provision be made for like payment in reimbursement of loss of taxes.

Comments.

1. The point was raised in the committee that there are constitutional questions as to whether a state or water user of that state could go into another state and exercise the right of eminent domain. Attention is directed to Grover Irrigation Company v. Lovella District, 21 Wyoming 204, 255. To take care of this situation provision has been made for condemnation by the state in which the facility is located.

2. In subjecting a facility in one state to the laws in the state in which the facility is located, it is not the intent to subject the United States to the police regulations of a state to an extent greater than that provided for in Section 8 of the Reclamation Act of 1902.

3. In the provision on reimbursement for loss of taxes the point was raised that the United States could not be compelled to make the required payments. For this reason a provision was added that a recommendation be made to the United States that when it acquired such property provision be made for reimbursement of taxes.

4. No provision is made for the potential loss of taxes.

III.
CHARGING OF RESERVOIR LOSSES

Motion of Commission.

The Legal Advisory Committee is requested to draft a provision to effectuate the principle that losses of water incidental to reservoir operations be apportioned between the states upon the basis of the benefits received from such reservoir operations.

Recommendation.

"Water losses resulting from reservoir operations shall be charged to the state or states receiving benefit from such reservoir operations in proportion to the beneficial consumptive use of water made available to each state by the reservoir except that in the case of regulating reservoirs for the joint benefit of all states in making Lee Ferry deliveries the charge shall be proportionate to the beneficial consumptive use of water in each state during the year for which the charge is made."

Comments.

1. The formula for charging reservoir operation losses should be carefully worked out by a joint engineering and legal committee after the Commission has determined the substantive provisions of the compact.

2. The committee felt that no consideration should be given to power benefits for the reasons that (1) power uses are subordinate to domestic and irrigation uses, (2) any formula based on power uses is impossible of ascertainment at this time, (3) power uses would probably be through a transmission grid which will make it difficult to determine the source or place of use of the power, and (4) some of the power may be used outside of the basin.

IV.
PREFERENTIAL USES OF WATER

Motion of Commission.

The Upper Colorado River Basin Compact shall contain provisions relative to the preferential use of water in conformity with such provisions of the Colorado River Compact and the Legal Advisory Committee is requested to draft the necessary language.

Recommendation.

"Inasmuch as the Upper Colorado River has ceased to be navigable for commerce and the reservation of its waters for navigation would seriously limit the development of the Upper Colorado River basin, the use of its waters for the purposes of navigation shall be subservient to the uses of such waters for domestic, agricultural, and power purposes. If the Congress shall not consent to this paragraph, the other provisions of this compact shall nevertheless remain binding.

Subject to the provisions of this compact, water of the Upper Colorado River System may be impounded and used for the generation of electrical power, but such impounding and use shall be subservient to the use and consumption of such water for agricultural and domestic purposes and shall not interfere with or prevent use for such dominant purposes.

The provisions of this article shall not apply to or interfere with the regulation and control by any state within its boundaries of the appropriation, use, and distribution of water."

Comments.

The committee thought that the provision on preferential uses of water should be taken word for word from the Colorado River Compact except for the change to "Upper Colorado River."

V.
INDIAN RIGHTS

Motion of Commission.

The legal question of the rights and interests of the Indians in

Colorado River water is referred to the Legal Advisory Committee for study and recommendations.

Recommendation.

ARTICLE ____

INDIANS

Nothing in this compact shall be construed as affecting the obligations of the United States of America to Indian tribes.

Comments.

The committee felt that the wise procedure in regard to the Indian subject is to incorporate in the Upper Basin Compact the same language as is contained in the Colorado River Compact. The question of the charging of Indian uses against the basin or against the state in which the uses occur is a substantive matter for the Commission. The Legal Advisory Committee feels that the charge should be against the state in which the uses occur.

Respectuflly submitted,

LEGAL ADVISORY COMMITTEE

By: Charles A. Carson, Chairman.

COM. CARSON: If there is any other member of the Committee who has anything to add to that I wish they would be given an opportunity.

THE CHAIRMAN: Thank you.

COM. STONE: May I ask a question, Mr. Carson? You said there were two matters on which the Committee disagreed. Did I understand those two matters were, first, the policy relating to the provision for the administration of the compact; and, second, the question of the apportionment of the expense? Is that correct?

COM. CARSON: Except I didn't want to be understood as saying there was any particular disagreement among the members of the Committee in what we are now submitting. There were two schools of thought: one that it should be authoritative like a river authority; the other that it should be administrative. This Commission had made no indication of its desire although, as you will recall, I asked you to do so. We concluded the best thing to do at this point was to recommend the minimum administrative body and then if you desire to change that in any way, we would try to put whatever the decision was in the appropriate language. But from our viewpoint the administrative provisions of this compact are preferable to any authoritative body.

The other was on the apportionment of the expense and on that there were two schools of thought so we didn't think we should attempt to resolve that but rather, as you will note in the report on page 2 relating to expenses, we put them both in there in parentheses so the Commission could strike out whichever one it wanted.

THE CHAIRMAN: Are there further comments or questions or suggestions in regard to the report of the Legal Advisory Committee?

MR. WALLACE: Mr. Chairman--

COM. CARSON: I believe if you would call on the other members of the

Legal Advisory Committee they might want to add to what I have said before the questions.

THE CHAIRMAN: Very well. Judge Wilson, you were on that Committee.

COM. WILSON: Yes, Mr. Chairman, I was on the Legal Committee and also a member of the Commission, and it was understood that in making this report, no member of the Commission was necessarily bound by these recommendations. In other words, as I understand the report it is merely a suggestion to the Commission so that the Commission may determine these questions upon which there may be a difference of opinion.

As Mr. Carson stated, when we began it wasn't known what the Commission desired as to the administrative body that would administer and carry out the functions of a compact when one is made. We had to consider that the Commission might desire purely an administrative body with no judicial or quasi-judicial functions whatever, simply to carry out the administrative features of the compact that might be agreed to.

On the other hand it was suggested that the administrative body should be given more power, quasi-judicial functions or even judicial functions. There was even a suggestion by some that the Commission might desire to create a corporation and empower it with many powers and duties, not only to administer the compact but to make binding conclusions of fact. The majority of the Committee seemed to believe an administrative body with no judicial function should be created, and I think you will find that is what has been done in this instance. We did not want to foreclose the Commission from going back behind this and setting up a real corporation if that is what the Commission wants.

Now with that understanding, as a member of the Legal Committee, we make this report as suggested. As a member of the Commission, I reserve the right to vote on any controversial subject that may arise as and when it does arise.

THE CHAIRMAN: Do the legal advisers for Wyoming have anything to say?

MR. WEHRLI: Mr. Chairman, I want first to refer to a couple of formal matters that I have observed in this draft that escaped my attention and perhaps the attention of others in its preparation.

On the first page there is set up:

"ARTICLE _____

ADMINISTRATIVE PROVISIONS"

What is dealt with in that article is the administrative agency. I assume there may and probably will be other administrative provisions in the compact aside from those that appear in this article. I am inclined to think that through inadvertence that heading came in that way and probably should be "ADMINISTRATIVE AGENCY" rather than "ADMINISTRATIVE PROVISIONS." It is just a formal matter but I think the heading is a little bit misleading because there will be no doubt some other administrative provisions in the compact.

Then on page 5 there is an "ARTICLE" and a place for a number, and I am inclined to think that heading ought to be, "FACILITIES IN ONE STATE FOR THE USE OR BENEFIT OF ANOTHER STATE OR STATES." We had some

discussion about that but I believe the matter was lost in the arduous duties that we attempted to perform in a comparatively short time because as I understand it, that article does relate not only to the construction of a reservoir in one state for the benefit of another state but the construction of a reservoir in one state that might benefit two or perhaps more than two states. Those are merely formal matters that I think should be given some consideration.

With reference to the voting power on the commission, Judge Wilson I believe has correctly said that the Commissioners may disagree with the Committee that prepared this. I find myself in that position so far as Wyoming is concerned. Our Wyoming Commissioner is not entirely agreed upon the question of the voting power. That is a matter of course that probably will come up at a later time.

There is one other point that I would like to refer to and that's the recommendation on page 8 under III about the charging of reservoir losses. I am not sure that I understand exactly what was meant in the last part of that and maybe if I understood I would agree with it, but it says--I am referring to the recommendation:

> ". .in making Lee Ferry deliveries the charge shall be proportionate to the beneficial consumptive use of water in each state during the year for which the charge is made."

I am wondering if the Committee meant that or whether the Committee meant that the charge should be in proportion to the beneficial consumptive use of water allotted to each state under the compact regardless of the amount that might be used in a particular year. I am in doubt about the matter. I think something might be considered there too as to whether that charge should be related to the consumptive use of water allocated to each state under the compact or whether it should be related to the respective obligations of the Upper States to supply the delivery at Lee Ferry. At least I wish to point out that we are not entirely satisfied with the phraseology used which relates it to the consumptive use of water that is made in each year regardless of the apportionment by the compact, and I think that is a matter that we would want to have given some consideration before passing on it.

I believe those are the only things that we have in mind at this time that we wish to call to the attention of the Commissioners.

THE CHAIRMAN: Thank you, Mr. Wehrli. General Gray, do you have any further comments?

MR. GRAY: No, Mr. Chairman, I do not. Thank you.

THE CHAIRMAN: The member of the committee from Utah. Mr. Clyde.

MR. CLYDE: In attempting to write an administrative provision to administer a compact not yet written we are somewhat handicapped because we are working in the abstract; and we are handicapped somewhat in knowing what administrative provisions to put in because we do not and did not know what would be administered. And for that reason I at least feel that after the compact itself is written and many of the substantive decisions are made, there will of necessity be additions and changes in the administrative provision that we have set up. You can't completely cover the administration of something when you don't know what it is that you are administering. And so the report as far as I am concerned ought to be submitted with the idea that as those substantive decisions are made, changes and additions may of necessity have to be made in what has been submitted.

I think Mr. Carson and Judge Wilson correctly reflect the attitude of the various schools of thought that came forward in the meeting and I concur in their statements of it.

In addition I would like to point out that, in addition to the administrative provisions that are contained in the report denominated subdivision I, there are administrative provisions also contained in that part which is denominated subdivision II, "Facilities in one state for the use or benefit of another state." It is that provision that I interpret to provide the watermaster for the stream. On page 6, releases from reservoirs, both main stem and reservoirs in one state for the use and benefit of another--the release and storage of water in those reservoirs are to be governed by the decisions of the commission and the findings it makes. I think those are equally related to the administrative part as those we have classified in paragraph I and that that is an additional administrative provision and ought to be read together with it.

THE CHAIRMAN: Thank you, Mr. Clyde. Judge Howell.

MR. HOWELL: I don't think I have anything to add to what has been said except perhaps I should say that I was the one I think that was willing to go as far as anybody, perhaps even further, in creating an administrative body which would be vested with full power and authority to carry out the provisions of this compact whether it involved the exercise by the commission of what we commonly call quasi-judicial powers. I think Mr. Clyde was inclined to favor such provisions, perhaps not going as far as I did in the draft which I proposed which created the body politic of this commission or corporation, but substantially I think he was in agreement with me that the commission should be vested with complete power to administer the compact in the same way as a watermaster would be under judicial decree. However, the other members of the Committee were inclined to the view that such provisions could not be finally ratified by the various states and for that reason we acquiesced in giving the commission less power so that it only has the right to make findings of fact, which are prima facie but not conclusive evidence before any court and therefore gives to any state that is dissatisfied with the findings of the commission the right to go into court and have them reviewed.

It does not go so far as I should like to have seen it go but at the same time I would like to say as far as I am personally concerned, I am reasonably satisfied with the administrative provisions.

THE CHAIRMAN: Thank you, Judge Howell. Mr. Breitenstein.

MR. BREITENSTEIN: It seems to me, Mr. Chairman, that what has been said already illustrates the danger, and what I have pointed out on numerous occasions, of the Commission referring to the Legal Advisory Committee the drafting of certain language without telling that Committee what principles you have in mind. It seems to me it is unfair to the Legal Advisory Committee and unfair to the Commission itself to expect your Legal Advisory Committee to draw up any provisions unless you tell us first what general principles you have in mind. Now I think what has been said this afternoon illustrates that point.

The next thing I want to say is this: I disagree one hundred percent with both Mr. Clyde and Judge Howell that anything in the administrative provisions sets up a watermaster on a stream.

MR. HOWELL: I didn't say it did.

MR. BREITENSTEIN: Mr. Clyde did.

MR. HOWELL: I know but I didn't say that. In your present provisions I don't think it does.

MR. BREITENSTEIN: I said during meetings of the Legal Advisory Committee Colorado would not agree to any provisions which had the effect of setting up a watermaster on the stream; and I requested, I thought, so it was understood that that matter would not be brought up at the Commission meeting. As I construe the administrative provisions they do not in any way set up a watermaster on the stream. The commission is given powers solely with regard to facilities in one state for use of water in another state, or for facilities in one state for the common benefit of another state.

The next thing I went to say is in regard to what Mr. Wehrli said on page 8, Article III, "Charging of Reservoir Losses." Now I prepared that recommendation myself. Before it went around to the Legal Advisory Committee I submitted it to lawyers and engineers in Colorado and I got no suggestions of a change. I submitted it to the Legal Advisory Committee and brought it up several times and no one suggested a change.

Now perhaps my language isn't clear--I thought it was--but speaking only personally, my intent in the language which Mr. Wehrli read--and I believe it is as clearly stated as it can be--is that the charge is proportionate to the beneficial consumptive use of water during the year in which the charge is made and that is not proportionate to the allocation of each state, and if it can be said any more clearly I would like to know how it should be said.

THE CHAIRMAN: Thank you, Mr. Breitenstein.

MR. WEHRLI: Mr. Chairman, I will enter my apologies to Mr. Breitenstein. I misread Mr. Breitenstein's language on page 8 or read it with the assumption in my mind that it related to the allocation of beneficial consumptive use in the compact. I still have the question whether that is a proper provision because it would make a determination each year necessary and in addition to that it occurs to me that perhaps the correct thing or the right thing would be to relate it to the right of the state even though the state had not fully exercised its right.

MR. CLYDE: Mr. Chairman, may I clear the record on my remark?

THE CHAIRMAN: Yes.

MR. CLYDE: I didn't mean to imply--and if I said it it was a mischoice of words--that this set up a watermaster. What I did mean was that the subject matter in this dealing with that problem is contained in the joint facilities and I agree with Mr. Breitenstein's interpretation. The facility for one state located in another is under the control of the administrative officer of that state to release or store water according to the findings of the commission. I didn't mean to imply that it was a watermaster we had attempted to create here but the subject matter of how these reservoirs would function was not covered in the administrative part, part I, but in the facilities part in part II.

MR. HOWELL: I would like to say this too because there was sort of an implication in what Mr. Breitenstein said of some sort of bad faith on my part. What I said or what I thought I was saying was that I was in favor of creating a watermaster.

MR. BREITENSTEIN: Yes, I concede that, Judge.

MR. HOWELL: And the majority of you didn't agree with me.

MR. BREITENSTEIN: Yes, sir.

MR. HOWELL: And I gave way on it. So I don't say this creates any watermaster. I don't think it does.

MR. WALLACE: Doesn't it create a watermaster and some sort of commission?

MR. HOWELL: A fact finding board.

MR. WALLACE: A fact finding board. And he reports to the officer in the various states what is going on on the river?

MR. BREITENSTEIN: In two cases: in case of a facility in one state for use in another state; or a facility in one state for the common benefit of all states--in only those two instances.

MR. WALLACE: So if there is a shortage of water at Lee Ferry, what is the action?

MR. BREITENSTEIN: Neither the Commission nor the Legal Advisory Committee has reached that point yet.

THE CHAIRMAN: Apparently we have heard from the lawyers. Are there any further questions or comments on the report of the Legal Advisory Committee?

COM. STONE: Mr. Chairman, I should like to make a suggestion. I anticipate that the action of the Commission on this report will require considerable discussion and I am of the opinion that each Commissioner ought to very carefully study this report before speaking or taking a position. I should like to suggest since it is nearly five o'clock, that we have the evening or some time between now and the convening of the Commission tomorrow to study this report a little more carefully.

THE CHAIRMAN: Judge Stone, would you also suggest that the report of the Committee be studied in connection with the communications received from the Federal agencies which are available?

COM. STONE: Yes.

THE CHAIRMAN: I think that is a pretty good idea.

COM. CARSON: Mr. Chairman, speaking for myself now, I don't belie that this Commission should undertake to adopt these specific provisions her stated until we have gone further in the drafting of the compact as a whole. I think we should just keep these and study them for reference and keep them in mind. But I don't think any formal action should be taken approving them at this time.

COM. STONE: Mr. Carson, perhaps you misunderstood my statement. I don't think so either. Someone suggested--I believe it was Mr. Clyde--the fact that the administration provision or the provision for the creation of an administrative commission should be left open for review when other provisions of the compact are agreed upon, and yet I do believe we ought to make some progress in discussing this report, and I believe that it's been the policy of this Commission to adopt other measures for incorporation in the compact on a tentative basis.

COM. CARSON: I didn't read this first part of this report but that is what I am speaking of now:

"In considering this report the Commission must realize that the compact provisions proposed are necessarily in tentative form. Decisions yet to be made by the Commission on both substantive and procedural matters will affect the proposals here made. It must be understood that the committee and the individual members thereof may desire to make further or different recommendations after further progress has been made in forming a compact."

COM. STONE: That is correct, I understand that, and yet we ought to attempt to make some decisions as far as we can make them on a tentative basis.

MR. HOWELL: I would like to ask you a question, Mr. Carson, and the other members of the Committee, if they would be willing to have the report amended in the particulars suggested by Mr. Wehrli with reference to the designation of the articles.

COM. CARSON: I would.

MR. HOWELL: So far as I am concerned I think they should be.

COM. STONE: I would too except instead of "agency", "commission". Administrative Commission.

COM. CARSON: Administrative Commission would be better.

MR. WEHRLI: That would be agreeable.

COM. CARSON: I would agree. The other members of the Committee are here and if any of the other members of the Committee disagree they had better speak up.

MR. WEHRLI: Judge Stone, the reason I used that word was because it was used down here.

MR. BREITENSTEIN: I would just call it "Administration" if I was doing it.

THE CHAIRMAN: Gentlemen, it seems to the Chairman that it is evident that changes will have to be made as you proceed along. What you are trying to do at this time is fit a suit of clothes on a ghost. You don't know anything about the body of the matter, and then as you determine that, this will have to be fit to it. I think the lawyers did an excellent job in the work that was assigned to them but I believe they would have had more heart in the thing if they knew the shape of the body they were going to put these clothes on. That is my view of the situation. Of course you will have to make changes as you go along.

COM. WATSON: Mr. Chairman, inasmuch as there will be a lot of changes made I move that we accept this report of the Legal Advisory Committee and file it for further study and consideration.

COM. STONE: Mr. Chairman, I would oppose that motion for the reason that that means no progress, that simply accepts it and files it. There are decisions which we can possibly make at this time and we should make them, but we should leave it open for review as to all provisions which should be changed when other measures in the compact are agreed upon.

THE CHAIRMAN: Gentlemen, your Chairman likes to proceed somewhat in order. The motion has received no second. Is there a second to the motion? If there is it is open for discussion. Is there a second to Mr. Watson's motion?

COM. WATSON: Mr. Chairman, since I am in the unfortunate position of not getting a second to my motion, I will comment on my own motion if I may.

THE CHAIRMAN: You may do that.

COM. WATSON: We have so many details here, we can't see the forest for the trees. All of us are confused in a mass of detail.

COM. WILSON: May I interrupt?

COM. WATSON: Yes, sir.

COM. WILSON: I would like to second the motion for this reason: I don't believe there is any conflict in his motion and what Judge Stone has in mind. If this board will accept it and file it for study, if Judge Stone wants to call it up in the morning for discussion, there is nothing inappropriate about that.

COM. STONE: That is all right, Judge, if that is understood. I got the impression from Mr. Watson's motion that we would not consider it any further at this time.

COM. WILSON: I don't think he intended that. Let it be filed for study and we will call it up in the morning and discuss it.

COM. STONE: That is all right. I would agree if that is understood.

THE CHAIRMAN: You heard the motion that the report of the Legal Advisory Committee be accepted and that it can be taken up at any time for further consideration. Any further discussion? (No response. Thereupon a vote was taken and Com. Watson's motion carried unanimously.)

THE CHAIRMAN: Mr. Wehrli.

MR. WEHRLI: Mr. Chairman, we are of the opinion that some tentative decisions at least will have to be made as we go along and in that regard I agree with Judge Stone. I believe that it is understood that any decision that is made now is tentative and that before any compact is finally arrived at would be subject to change.

In order to make easier progress than we otherwise might, and having in mind the agenda that Colorado has presented and the matters that are included in the report of the Legal Advisory Committee, Wyoming has prepared a motion which is written and which we will present at some appropriate time tomorrow, and I would like to give copies of it to the Commissioners for their consideration along with this report.

The main purpose of it is to obviate, as far as we can, the difficulty that Mr. Breitenstein mentions of not having very specific instructions for this Legal Advisory Committee. We think this will be a start along that line. In this motion we have attempted to deal with matters that we think are not of the extremely controversial type, matters upon which we may be able to reach tentative agreements at this session.

I would like at this time to give each of the Commissioners a copy of the motion and also the Chairman for such consideration as they may want to give it and we will bring it up at some time tomorrow if it is believed that it will serve any purpose in expediting the proceedings of this Commission.

THE CHAIRMAN: Very well, Mr. Wehrli.

("Motion by L. C. Bishop, Commissioner for Wyoming," distributed.)

THE CHAIRMAN: Gentlemen, is there a motion for adjournment? It is now ten minutes to five. Or do you wish to continue?

COM. STONE: I move we adjourn to reconvene at 9:30 tomorrow morning.

MR. GILES: Before that motion is put, Judge Stone, I find it necessary to ask for leave of absence from the rest of this meeting.

MR. WALLACE: Mr. Chairman, let Mr. Clyde act in his place.

THE CHAIRMAN: Very well. That is Utah's prerogative. Gentlemen, you have heard Mr. Giles' statement that he must leave tomorrow morning and will not be present at the Commission meeting. I am sure we all regret his departure but we will submit to his wishes.

MR. GILES: Thank you, Mr. Chairman.

THE CHAIRMAN: Is there a second to Judge Stone's motion for adjournment?

COM. WATSON: Second the motion.

(Thereupon a vote was taken and Com. Stone's motion carried unanimously.)

THE CHAIRMAN: We are now adjourned.

(4:55 p.m., Wednesday, February 18, 1948, recess until 9:30 a.m., Thursday, February 19, 1948.)

- - - - -

Denver, Colorado
February 19, 1948
9:30 o'clock a.m.

(All Commissioners present.)

THE CHAIRMAN: The Commission will please come to order. The Chairman observes that the Chairman of the Engineering Advisory Committee is present and on page 1 of the suggested agenda is a place for consideration of the report of the Engineering Advisory Committee. Mr. Riter, are you ready to render your report?

MR. RITER: Mr. Chairman, the Engineering Committee has no formal report to present at this time. I would like to report however, verbally, that the Engineering Committee are still active. We have held two meetings since the December 1st, 1947 meeting of the Compact Commission, and at these meetings we have discussed remaining engineering problems to be studied by the Engineering Committee.

We find that before we can make further progress on determination of streamflows originating from various states, it is necessary for us to determine the present depletions of streamflows at state lines and at Lee Ferry. You will

recall that this is one of the items we were unable to report on on December 1st, 1947 because there isn't unanimous agreement among the members of this Committee on what the present uses are in the Colorado River Basin. Progress is being made. Studies are being conducted to determine the present depletion

We have taken advantage of the action by the Commission at the last meeting volunteering to pay the expenses of Harry Blaney, who is with the Department of Agriculture and who has performed considerable work determining irrigation uses. He attended our meeting in Cheyenne during the month of January and then late in January and early in February we had a special meeting of a subcommittee in Mr. Blaney's office to further study the subject of present uses.

I don't know exactly when we will be prepared to report our conclusions or recommendations on this subject to the Commission. I feel in my own mind, however, in view of the important nature and the controversial nature of present stream uses, the Engineering Advisory Committee is not going to be satisfied until we ourselves make an inspection tour of the whole Colorado River Basin in company with Mr. Blaney. So I can't look for any conclusive determination of this problem before the end of June.

There are a few members of the Engineering Advisory Committee here, Mr. Merriell--I don't see John Bliss.

COM. WILSON: He left this morning.

MR. RITER: Mr. Baker. They may wish to supplement what I have to say.

THE CHAIRMAN: Before calling on these other men, Mr. Riter, is your Committee able at this time to furnish the Commission an estimate which might be considered 85 or 95 percent correct, of the yield of the tributary streams entering the Colorado from the various states either at the state line or at Lee Ferry?

MR. RITER: If the Commission desires me to, I think I could sit down and from the information we have in the progress report give you an estimate within the indicated percentage that you wish for. I do not know, however, that that estimate would be accepted by all members of the Engineering Advisory Committee.

THE CHAIRMAN: Thank you for the answer, Mr. Riter. I think you have answered my question. Now, Mr. Baker, do you have anything to add?

MR. BAKER: No, I have nothing of value to add.

THE CHAIRMAN: Mr. Merriell?

MR. MERRIELL: Mr. Chairman, I hesitate somewhat to say what I am about to say but I believe it is needed. The Engineering Committee embarked on the job of finding out what is the water resource of the Upper Colorado River. What I now say is not said in derogation of the Bureau of Reclamation but I will say that everything that the Engineering Committee has so far derived is not in the report of the Bureau of Reclamation. That report was properly, as itself says, not intended to operate as a solution of the problems of the division of water in the Upper Basin. There are still to be derived very large amounts of information which I feel are essential to the solution of this problem.

I should like to point out that we people in Western Colorado--and

I am speaking now primarily as a Western Colorado man--have never been under any illusions as to what is involved in a compact between the States of the Upper Basin or Division. It is water that arises in Colorado that is going to pay the bill. The people in New Mexico will agree with me I think that their desires for water exceed the yield of water from New Mexico. The plans for the State of Utah included in the Colorado River Basin report indicate that we can't look for a proportional delivery of water by the State of Utah at Lee Ferry. Our friends in Wyoming are in the same case we are in in Colorado. No matter what is done in Wyoming there will be water continue to flow out of that state for the purpose of making deliveries at Lee Ferry. But what the gentlemen of this Commission are doing is dividing up the water that comes from about twenty thousand square miles in Western Colorado.

Now speaking again as a person from Western Colorado, when we undertake in the final language of this compact to pay that bill for delivery of water at Lee Ferry, we want to be very sure what the bill is going to be. I think it is desirable to say this, although as I say, I say it with some hesitation. I think it is desirable to say this because Colorado has been accused of a desire to prolong this thing, to evade it and to avoid it. It isn't that at all, gentlemen. You are about to get up from the table and leave a check for us to pick up and we would like to know just as nearly as we can know about any future thing, just what the size of that check is going to be.

That is all I have to say, Mr. Chairman.

THE CHAIRMAN: Thank you, Mr. Merriell.

MR. WALLACE: Mr. Merriell, what additional information are you now seeking and in your opinion how much time will it require?

MR. MERRIELL: I hesitate to take over the functions of the Engineering Advisory Committee but my understanding, Mr. Wallace, is this: We have still to get through the services of Mr. Blaney a final figure upon which we can agree as to the present depletions.

MR. WALLACE: Does that mean an analysis of the consumptive use in the various sections of the entire Upper Basin?

MR. MERRIELL: That is well along, Mr. Wallace. That will not take too much longer. Then we have one other matter which enters into this thing and that is the determination of the channel losses which have occurred in the past and will occur in the future in the conveyance of the water from the various states, principally through Eastern Utah, to Lee Ferry. When we have determined those two things we shall be in a position I take it to say definitely what each state contributes not only at its state border but at Lee Ferry.

Then we have been under the necessity of considering the desires of states for future ultimate development, and that of course will involve the extension of the process we have already worked out for past uses to those future uses. And I can say--speaking again for Western Colorado--that our principal desire all through these years has been that the original Colorado River Compact be strictly carried out and that the deliveries at Lee Ferry should never become a matter of controversy with the Lower Basin.

Now then, if the Upper Basin is going to make a compact for the division of water among its states, the primary consideration in my mind is that that thing that we believed in all these years in Western Colorado should be as definitely determined and as definitely assured as it is possible for humans to do it.

MR. WALLACE: What is your opinion of the duty of the entire Upper Basin to deliver water at Lee Ferry?

MR. MERRIELL: With the information we have at present it appears, Mr. Wallace, that we should not be able to deliver that water consistently according to the terms of the original Colorado River Compact without the middle river reservoirs in Eastern Utah to produce regulation and long carryover.

MR. WALLACE: The point I am trying to get is this: Are you permitted under the compact to store water for purposes of equalization and limit your delivery to 75,000,000 acre feet over a period of ten years, or must you deliver there all of the water that is not under the 7,500,000 acre feet consumptive use limitation?

MR. MERRIELL: The only consideration that moves me in that matter at all is the requirement of the original Colorado River Compact that we shall deliver in consecutive ten-year periods 75,000,000 acre feet of water at Lee Ferry.

MR. WALLACE: Then you have a right to use everything in excess of that in the Upper Basin?

MR. MERRIELL: That is a question that I have never given any consideration to at all, what we had a right to use. Whatever is left we do have a right to use if we can substantiate the use above 7,500,000 acre feet.

MR. WALLACE: In other words you are claiming that you have a right to use a part of the surplus?

MR. MERRIELL: Certainly if we can substantiate that use and if there is any surplus.

THE CHAIRMAN: Are there any further remarks or questions in regard to the report of the Engineering Advisory Committee?

COM. WATSON: Mr. Riter, what were the results of your recent visit with Mr. Blaney in Los Angeles in regard to the question of determining the consumptive use of water?

MR. RITER: I think Mr. Roskelley from your state, Mr. Erickson from New Mexico, Mr. Patterson from Colorado, Mr. Dugan from the Bureau of Reclamation, were selected as a special subcommittee to meet with Harry Blaney at Los Angeles and to work out unit rates of depletion using a method devised by Mr. Blaney, based on tank experiments and information on various types of vegetation, unit rates of depletion. The committee met with Mr. Blaney, furnished him with all of the available information that we had compiled regarding types of crops grown in various portions of the Upper Basin, and climatic conditions. By climatic conditions I mean average monthly temperatures and information on percentage of possible sunlight, and information on length of growing season. The committee worked with Mr. Blaney and derived some tentative figures for unit rates of consumptive use for various portions of the Basin.

Now, after the committee returned we examined the data and we have some supplemental information. We have found some unpublished Weather Bureau data that were not available to us previously. We had a brief meeting of the available members of the Engineering Committee here in Denver yesterday morning and we decided we would resubmit the new climatic data to Harry Blaney and then ask him if there are any changes he wishes to recommend to us in the consumptive rates that he had tentatively derived.

Bearing in mind that the information Harry Blaney will furnish us

is consumptive use at various points within the Basin for various types of vegetation, then the Engineering Committee will have to apply that to the information we have on crops to arrive at the final answer on consumptive uses. Does that fully answer your question, Mr. Watson?

MR. WALLACE: Wherein does your study with Mr. Blaney differ from the study on the Lowry-Johnson method?

MR. RITER: The Lowry-Johnson formula is a different approach. We used some of the results that Mr. Blaney gave us on four of the field test areas used in deriving the Lowry-Johnson approach and we found a very close check. Three of the areas I think checked within one or two percent; one of them there was a difference of ten percent. I think that difference of ten percent can be rationalized in that we had an unusually high water table. The tank experiments by Blaney were average water table conditions. When we get the information from Blaney and coordinate it with the Lowry-Johnson approach, we will apply it and we will determine the consumptive use at the point of use.

Now I don't think there will be too much controversy on that item. The principal criticism of the studies made by the Bureau of Reclamation is that the Bureau failed to allow for salvage of water. The Bureau failed to deduct natural consumptive uses on certain areas of land before they were irrigated. I can cite you some examples.

Mr. Merriell in Colorado pointed to some areas along the Gunnison River which were naturally irrigated by Nature before man came; and after man came in and constructed a ditch on that land, the lands received a small amount of additional irrigation. In the studies made by the Bureau of Reclamation we took the total area under the ditch and applied a unit rate of use to it; we called that consumptive use.

The Bureau was criticized by the members of the Engineering Committee because in determining the depletion, caused by irrigation, the Bureau should have deducted the natural consumptive use that took place before the activities of man. Some of us call it salvage and some of us call it natural depletion which should have been subtracted from the total present use.

The net result is that it indicates we may be--I think I gave you a figure at the last meeting--as much as 30 percent too high on our estimate of present depletions.

Of course there are other factors, factors on the high side and factors on the low side. One example: When you irrigate a piece of land you also irrigate additional land besides the particular tract to which you apply water. You irrigate the barrow pits, you irrigate adjacent lands, drainage channels, etc. To allow for such uses the Bureau of Reclamation adopted rates of use high enough to make allowances for these so-called incidental uses.

Is that correct, Mr. Merriell? Do you care to supplement what I said on that particular point?

MR. MERRIELL: I think, Mr. Riter, you covered it except possibly to mention this: People who customarily work with the questions of the consumptive use of water or depletion are accustomed to thinking of a long growing season and a median altitude and conditions which are more or less uniform in the various areas considered. I should like to point out that one thing that has cost us time is the fact that in Colorado irrigation is practiced over a vertical interval of 4,000 feet and with growing seasons which extend from only a few weeks to 200 days; and that in Wyoming and in Utah, to a certain extent, the same condition exists. So that it is a case of tearing the area apart and

getting it into its component parts where conditions can be set up as they actually are.

MR. WALLACE: Mr. Merriell, is it your opinion that you have got to have a definition of consumptive use as the term occurs in the Compact in its relationship to the virgin conditions of the Basin, both land and water? In other words, there was a lot of irrigation going on in the Basin before the white-man came here.

MR. MERRIELL: Oh, yes.

MR. WALLACE: Have you got to establish that relationship before you are satisfied?

MR. MERRIELL: That is one of the things we are attempting to establish along with the general question of consumptive use.

COM. WATSON: Mr. Merriell, did some of that land referred to by Mr. Riter that was partially irrigated by Nature, when it had water applied to it, go out of production because of becoming sour and having too much water applied to it?

MR. MERRIELL: The pre-irrigated land in the Colorado River Basin--and I think this statement can safely be made not only for such land in Colorado but in Wyoming and Utah as well--the pre-irrigated land seldom sours. It is land which almost universally is at high altitudes and is now devoted to the raising of grass hay. And I am hopeful--and I would recommend to any of you so you may understand what is involved--but I am hopeful that when Mr. Blaney makes a trip here this spring I can take him into some of those areas when the melt of the snow is occurring. I think he will see quite clearly and quite quickly that the pre-irrigation is an actual fact.

MR. RITER: May I supplement the question, Mr. Chairman? If I understood Mr. Wallace's question correctly it may have some legal implications. We in the Engineering Advisory Committee are trying to stay with engineering matters and not trying to determine legal matters. I think it may be necessary to have a legal definition of beneficial consumptive use. The Engineering Committee is trying to determine the engineering facts with regard to streamflow depletion.

I observe that Mr. Roskelley has come in since I made my verbal report. I don't know whether he cares to make any comments.

MR. ROSKELLEY: From what I have heard I would say no, Mr. Riter.

THE CHAIRMAN: Mr. Riter, it seems evident to the Chairman that the work of your Committee is now handicapped by the resignation on account of ill health by Mr. Patterson, a very able, intelligent and painstaking engineer. It is the hope of the Chairman that Mr. Patterson will be able to resume his work with your Committee and with the Colorado River Board at an early date. But in the interim, what arrangements are being made to fill the gap caused by Mr. Patterson's resignation?

COM. STONE: Mr. Chairman, is that a question Mr. Riter should answer? Isn't that Colorado's problem?

THE CHAIRMAN: I don't know that it is entirely but it is certainly a question interesting to the Commission--it certainly is interesting to the Chairman.

COM. STONE: Colorado will say we are not going to delay any of the work of the Engineering Committee because of the resignation of Mr. Patterson. Mr. Patterson has resigned as Chief Engineer of the Colorado Water Conservation Board and has resigned as a member of this Committee, is leaving Colorado on the 28th of this month as I am informed, but Colorado is not helpless because of this situation. Mr. Patterson was a very able engineer and did a splendid job, not only on this Committee but on other matters. We regret his resignation. It is a situation which we must face but we don't propose to delay this work because of that unfortunate occurrence.

THE CHAIRMAN: In other words then, Judge, steps will be taken by Colorado to see that the absence of Mr. Patterson will not handicap the work of the Committee?

COM. STONE: I wish to remind you too, Mr. Chairman, that Colorado had three engineers on that Engineering Committee, Mr. Patterson, Mr. Tipton, and Mr. Merriell. Both Mr. Merriell and Mr. Tipton are still with us and expect to function. It is going to be difficult for our state to replace Charlie Patterson. A man like that is not easily replaced. But we are taking every step to secure a man to take his place.

In the meantime, Mr. Tipton and Mr. Merriell will carry on and I don't believe there will be any delay whatsoever because of that occurrence. We just lose the services of a very capable and well-informed engineer, that is true; but that can't be helped.

COM. WATSON: Mr. Chairman, may I ask if these studies that are being made by the Engineering Committee are necessary as prerequisites to writing a compact or could they go on contemporaneously with negotiating the compact.

COM. STONE: I will answer that "no" so far as Colorado is concerned.

COM. WATSON: What do you think, Mr. Riter?

MR. RITER: Well, I prefer not to answer the question. I feel this: The studies are absolutely necessary. Now after all I am only an engineer. I am not a lawyer. I do know that compacts have been negotiated with less engineering information than we now have before you. Whether those compacts are desirable compacts will have to be the responsibility of the Commission to decide. We are just an engineering advisory committee. We can advise you what studies you have to have. Certainly before a compact can be operated you will certainly want information on the water. The water is the thing you are dividing.

Now it may be that some smart lawyer can write some language without knowing what the facts are. I don't know. They did a pretty good job here yesterday writing some language without knowing anything about the nature of the compact. Maybe they can do the same thing without any engineering information. I really don't know.

MR. BREITENSTEIN: Mr. Riter, do you think the Engineering Committee or any member of it can furnish to the Legal Committee now a formula for measuring beneficial consumptive use of water?

MR. RITER: I don't think it is up to the engineers to do that.

MR. WALLACE: Mr. Chairman, off the record.

(Discussion off the record.)

COM. WATSON: Mr. Chairman, do these facts go merely to the administration of the water after a compact shall have been written or are they necessary to a division of the water and consequently a part of the compact?

MR. RITER: Now, Mr. Watson, let's get back and find out what these facts are that we are supposed to report on. What the Engineering Committee is attempting to ascertain is how much of the undepleted flow of the Colorado River originates in each of the five Upper Basin States. That is one of the facts we are attempting to ascertain. When we presented our report to you a year ago it was the opinion of the Commission that those facts were necessary for negotiation of a compact. I presume the Commission is still of that opinion.

One other important study we are making is to analyze the extent of channel losses. We are trying also to analyze the amount of reservoir capacity needed to equate the streamflow.

Now let's keep this fact in mind--I am sure that you have it well in mind--historically in a period from 1931 to 1940, the flow at Lee Ferry averaged about 10,000,000 acre feet per year. Over a longer period of time from 1914 to 1945, the average flow at Lee Ferry was in the neighborhood of 14,000,000 acre feet per year. Of course that is only part of the story.

The present uses are an unknown quantity precisely. For the purpose of illustration let us say they amount to 2,000,000 acre feet per year. That means then that over a long period of time the undepleted flow at Lee Ferry is approximately 16,000,000 acre feet annually. On a short period of time the undepleted flow is approximately 12,000,000 acre feet annually.

The Lower Basin has a bottom right--we might as well say a bottom right because that is exactly what it is--to 7,500,000 acre feet. The Mexican Treaty is an obligation that must be met. The Upper Basin has to meet part of that obligation. There isn't uniform opinion among engineers and lawyers as to how much the Upper Basin will have to release at Lee Ferry for the benefit of the Mexican Treaty. Opinions differ on that. It is my personal opinion that in a critical year of low runoff the Upper Basin is going to have to release at least half of a million and a half acre feet. Other engineers don't agree with me. There are other engineers who say that the Upper Basin will not have to release anything. But in any event if we are going to restrict the Upper Basin development by the flow that is available in a low ten-year period, there will be something less than 5,000,000 acre feet for use in the Upper Basin--probably 4,000,000 acre feet. That is only half of the water that is allocated to the Upper Basin on a long-term basis. On a long-term basis there is approximately 7,500,000 acre feet available. So it seems to me that we have got to make studies of reservoir operation to know and decide how much water can be actually applied to the land.

We do know this, that reservoir losses are going to be charged against the Basin. We do know it is physically possible to put in so many reservoirs that they might use up 1,000,000 acre feet of water just in reservoir losses. It may not be economical to do that. If we can put in another capacity of reservoirs that only evaporate 500,000 acre feet and still meet our obligation at Lee Ferry, then we can get that much more additional water to apply to the land.

Then of course, Mr. Watson, there is also the question of power development and the question of financing these projects. Power development is absolutely essential in my opinion to secure revenues to finance the irrigation developments.

Now these are problems that must be considered. Whether they are problems which should be deferred to the future or whether they are problems that should be looked into at this time, I say the Commission has to determine what should be done. We are engineers. Our primary job is to serve you, to bring to your attention all the facts we can assemble.

MR. ROLLINS: You say that up to date it has been impossible for the engineers to agree on these various items?

MR. RITER: No, we have partial agreement. We have a progress report. The information contained in the progress report was agreed upon.

MR. ROLLINS: I understood you to say you had recently been disillusioned because you couldn't get together on these things. The question I want to ask you is this: After you are through with your studies in your opinion how nearly 100 percent accurate will you be?

MR. RITER: We will be just as accurate as it is humanly possible to do it. There is one matter of principle involved, not only facts, but the principle of salvage of water, that we must resolve. Various states have criticized the Bureau for not allowing for salvage of water. At our last meeting in Cheyenne, Mr. Tipton, a very competent engineer who represents Colorado, who has done a lot of thinking on this matter and has made more studies on this matter than I have, presented some illustrations based on other streams which he studied. Those streams were the Rio Grande, the South Platte, and the Arkansas Rivers. Mr. Tipton demonstrated from those streams that the formula used by the Bureau of Reclamation of consumptive use times area irrigated is not the proper rate of depletion. He demonstrated from those streams that some of the depletion was met from salvage of natural losses.

The members of the Engineering Committee do not know to date how much water can be salvaged from the Colorado River. It is our intention, however, to give the matter further study and to try to arrive at a satisfactory answer.

As to the magnitude of the error, it now appears from the tentative studies we have that the Bureau of Reclamation estimates may be off as much as a half million acre feet. Now that is not a final figure but I will say that is just an indication of what we are running into. If the Commission feels we are wasting our time by trying to eliminate an error of half a million acre feet, all you have to do is tell us so and we will cease work.

COM. WATSON: Mr. Chairman, I think these studies are all very important. Many of them will pertain to the administration of the River after a compact has been written, but whether or not we are precluded from dividing the water until these studies shall have been made is another question. The writing of a compact will include the administration of the River, the dividing of the water, and other factors.

MR. RITER: Well, Mr. Watson, I would hesitate to pass judgment on your opinion. You are a Commissioner and if you are very strong in your opinion I would suggest you get the Commission together and present that matter to the Commission for discussion.

As I said before, compacts have been made with less information than we now have. That is a matter that I know can be proven because we have records of other compacts. Take for example the 1922 compact on the Colorado River. We did not even have a gaging station at Lee Ferry when that compact was negotiated. Now then, whether or not you want to repeat a compact on that basis is for you to say, not for me to tell you.

COM. WATSON: Mr. Riter, I am not intending to put you on the spot. I think the Commission is on the spot.

COM. BISHOP: Mr. Chairman, I am glad to see Mr. Watson finally come over to the stand that has been maintained by Wyoming all along. And I am going to repeat for the benefit of some of those that haven't been here before that it seems to me it doesn't make very much difference whether it is a half million more or less. We will divide the water on a percentage basis--we have agreed to that already--and if there is less and we have to take less, we will take our percentage.

I have great appreciation for the work the Engineering Committee has done and I think we ought to have them do that work and get all the information they can. I don't think it is anything we should hold the compact up for.

MR. BREITENSTEIN: Mr. Chairman, the Colorado Commissioner has gone out of the room but I think the statements of Mr. Watson and Mr. Bishop should be answered by Colorado. I should just like to say two things:

First, Colorado deems it necessary both to allocate the water, the beneficial consumptive use of water; and, second, to determine the obligation to maintain the flows at Lee Ferry. I feel confident in asserting that Colorado would not do one without the other. I would like to know if anybody has any suggestions to make now or tomorrow or the next day on two things: First, what sort of a formula or a method or whatever you want to call it, can be devised so that each state knows its obligations to maintain the Lee Ferry flows; and, second, how you are going to measure beneficial consumptive use.

It doesn't do any good to divide between these states the beneficial consumptive use of any amount of water unless and until you know how you are going to measure that beneficial consumptive use.

COM. WATSON: Mr. Chairman, certainly the obligations at Lee Ferry will not be determined by the amount of water that any state produces. In other words, the amount of water that that state should have in the division is certainly not based on the amount of water that it contributes to the river. There are other factors to be considered and the obligation at Lee Ferry will be determined by them.

MR. WALLACE: Of course I am not a lawyer--I am following the suggestion by Mr. Riter--I am not a lawyer but I can't see a bit of difficulty in the matter of delivery of water at Lee Ferry.

In the first place, Mr. Breitenstein, we need a watermaster. The 7,500,000 acre feet allocated to the Upper Basin States are in common ownership. The priority of use of that water attaches to every acre foot of water. As a result they are all on the same priority excepting those projects that were builded prior to the ratification of the compact. All of the other projects will be built having an equal priority. And it is up to the states if they want to change that priority within the state, they may do so; but so far as the watermaster is concerned, the delivery at Lee Ferry will be in proportion to the water they use in those projects that are built after the ratification of the compact--repeating again that those buil prior to the ratification of the compact have a priority that cannot be disturbed.

Now if there is any difficulty about that, all you have got to do-

well, there is no difficulty so far as I can see. I thought I was intelligent enough to understand it and the only problem about that is, Mr. Breitenstein, you have got to have a watermaster who will tell you in Colorado what your share is.

MR. BREITENSTEIN: Well, Mr. Wallace, if that is the only solution I am afraid that we are just wasting our time here talking about this because we in Colorado are not going to have a watermaster that is going to come up to our state and tell us what diversions to shut down. That is a state obligation.

MR. WALLACE: Your state will be told what your share of the water delivery at Lee Ferry is by the watermaster.

MR. BREITENSTEIN: We will not be told by the watermaster; we will be told by the compact that is entered into here.

MR. WALLACE: I will go a step further. If you are going to have the privilege of storing the water in the Upper Basin States, you have got to so insist upon the priority of irrigation and municipal use above power that you control by a watermaster the operation of every reservoir on the whole river from source to mouth.

COM. WATSON: Mr. Breitenstein, inasmuch as you asked for a formula to determine these things, wouldn't it be well for us to talk about the formula? Wouldn't it be well for us to have an agenda that would contain matters that are germane to the issue and are substantive and not be shadow-boxing on a lot of issues that are not germane?

MR. BREITENSTEIN: We are willing to consider any formula, any scheme, any device, which any state, the Federal Government, any engineer or any lawyer of any of the states or the Federal Government, has to suggest. We do not have sufficient facts in Colorado to submit such a formula ourselves. We will consider any one that anybody else suggests.

We are not willing to proceed on the basis of allocating so much beneficial consumptive use of water for two reasons: First, that does not define our obligations at Lee Ferry; and, second, that furnishes no method whatsoever of measuring beneficial consumptive use, and if you cannot measure something, what good does it do you to divide it?

COM. WATSON: I take it then that Colorado is not able or willing at the present time to say how much water she thinks she is entitled to in the Upper Basin?

MR. BREITENSTEIN: Oh, I am not going to go that far, Mr. Watson. But I am going to say that any figure which we might give would be utterly valueless unless you have some method of measuring it.

MR. RITER: Mr. Chairman, may I be permitted to indulge a legal question?

THE CHAIRMAN: At your own risk.

MR. RITER: Mr. Breitenstein, I fully understand the implication you made to Mr. Watson when you say if you can't measure beneficial consumptive use, you can't divide it. Of course I am ignorant on legal matters but it seemed kind of funny to me that we already have a compact for beneficial consumptive use, the measure of use between the Upper Basin and Lower Basin despite the fact that you and I personally do not know the formula for measuring it.

MR. BREITENSTEIN: One of the weaknesses of your Colorado River Compact is that there is no method of measurement. There is no standard set up. That is one of the weaknesses. Why should we make another compact with the same weakness. You say you give us the beneficial consumptive use of any amount of water, say 1,000,000 acre feet; what good does that do us unless we know how you are going to measure that million acre feet?

MR. RITER: May I call your attention to this fact: That was apparently good enough in 1922 to permit some of our competitiors to go ahead and use that water.

MR. BREITENSTEIN: They are down at the bottom of the stream where they get everything the law of gravitation takes down to them.

MR. RITER: Of course maybe I don't fully appreciate the implication there. I will admit that I can't measure it; I don't know what it means. I have my own personal opinion of it. There are lawyers who tell me I am wrong. Now is it necessary to know that precisely before you try to make another compact? That is the only question I am asking you.

MR. WALLACE: These gentlemen have just advised you they have the Lowry-Johnson report. They have worked over that formula and in many instances it doesn't differ more than one percent and the maximum it differs is 10 percent. When they coordinate the studies of the Lowry-Johnson report together with the studies they are now making and give you a report that the consumptive use is so and so, are you prepared to accept it?

MR. BREITENSTEIN: I can't answer that question, Mr. Wallace.

MR. WALLACE: You are making a very strong plea you don't know what consumptive use is and here you have a proposition where these gentlemen are going to present it to you in a little while.

MR. BREITENSTEIN: I didn't say I didn't know what consumptive use was; I said I didn't know how to measure beneficial consumptive use.

MR. WALLACE: I assume that you include in that difficulty the question of salvage?

MR. BREITENSTEIN: Well, I include a number of things.

MR. WALLACE: Repeat them for us so we may understand them.

MR. BREITENSTEIN: Studies of beneficial consumptive use have been made many times. Maybe you know of a definition of beneficial consumptive use. I don't right now. And if I knew of a definition of beneficial consumptive use I wouldn't as a lawyer know how to prepare a definition which I would expect an engineer to go out in the field and put to practical application. Maybe somebody else does. And I say we are willing to consider any suggestions any of you have to make along that line. The mere inability of Colorado to do that should not prevent the rest of you from coming up with whatever ideas you have.

We are not measuring consumptive use; we are measuring beneficial consumptive use. That brings in another term. And how are we going to measure it?

MR. WALLACE: What I am trying to learn are the factors that are necessary on which to base that conclusion. Now we have the Lowry-Johnson report. We have the study of the engineers. You have a study going on as

to salvage. Now what else do you want?

MR. BREITENSTEIN: Well, I want some concrete recommendation. We are talking about generalities here. We are engaging in the most glittering generalities there ever were. Let's get done with sparring. If somebody has something to suggest in black and white let's bring it out and see it.

MR. WALLACE: What I am trying to find out is what you want to know before we can base this conclusion.

MR. BREITENSTEIN: I would like to know two things: First, a definition of beneficial consumptive use; and, second, a method of measuring it.

COM. WATSON: Mr. Breitenstein, if you divide the water on a percentage basis, which has been passed upon by this Commission, would not the variable be not in the percentage but in the amount; and therefore if the amount were small or large it wouldn't make any difference if the percentage were the same.

MR. BREITENSTEIN: It doesn't mean anything because you don't know against what your percentage applies.

MR. WEHRLI: Mr. Chairman, may I ask a question? You have a definition of beneficial consumptive use in the Republican River Compact.

MR. BREITENSTEIN: That is consumptive use as I recall. I am not sure.

MR. WEHRLI: I believe it says beneficial consumptive use. I want to be clear in making reference to that I do not believe that definition would be adequate for the purposes of this compact------ because of a different factor in our determination here relating to transmountain diversions, which was not involved in the Republican River Compact.

COM. STONE: I think Mr. Wehrli's remarks are apropos. It demonstrates the difficulties. Mr. Chairman, I was out when this discussion was going on.

Somebody yesterday joked about my using the word "realistic"; I am going to use it again. I think we have got to get out of the realm of speculation and look at the situation realistically.

I want to announce here and now that it is Colorado's fervent hope and expectation that we shall arrive at a compact for submission at the next session of the legislatures in January. We have a very deep appreciation in this State because of the topographical condition of the State, because of the large amount of water supplies which arise in this State, because of obligations which may be placed on this State for deliveries at Lee Ferry, that we must negotiate a compact which we can recommend to our leglislature and have a reasonable chance of having it ratified. When we make a compact we expect to do everything possible to get it ratified by the legislature. A compact which we make cutting the pattern for future generations must be one which we can support, not on the basis of a lot of wild guesses or speculation over formulas, but one which we can support on the basis of the facts.

Let us assume you could drive Colorado into a position of taking hasty action. That doesn't mean you have got a compact. We have sincerely approached this matter on the basis, not of obtaining all of the engineering refinements that engineers might quarrel about for the next fifty years, but on the basis of getting certain salient facts which we believe are necessary for making a compact which we have a reasonable chance of getting ratified.

We have always proceeded on the basis that there were two elements involved here: one, the determination of the respective obligations of the states to make deliveries at Lee Ferry; and, second, the apportionment of water. And unless I change my ideas through the engineering studies or the expression of wisdom on the part of you gentlemen, I think that it is reasonable that a state in the position of Colorado should not agree upon apportionment without a concurrent agreement upon a determination of respective obligations. Those things run concurrently.

This Commission has appointed by unanimous consent an Engineering Advisory Committee. I sincerely believe that that Engineering Committee is doing a good job. I anticipate that there will be a report here in ample time for us to approach with intelligence and with the facts in mind, a consideration of the apportionment of the water and the determination of the deliveries at Lee Ferry, and do that well in advance of the next sessions of the legislatures.

In the meantime, it has been our hope that we would consider other matters which must be considered and agreed upon and made a part of any compact, and we have been proceeding as diligently as we could to present to you gentlemen some of those factors which we believe should be considered. I thought we were making progress last time and if we would get at it, I think we could make progress this time. We can be doing that and get that behind us so there will be no delay on the meat and cocoanut of the compact when this Engineering Committee reports, we hope, sometime this spring or early summer.

COM. WATSON: Judge Stone, wouldn't it be well to have a group, appointed by this Commission, studying some of these fundamental factors that will be the basis of making a compact?

In other words, we are studying certain factors here but we have persistently evaded the main things that will determine the apportionment of the water. Wouldn't it be well for us to have a committee from the Commission that should make these studies concurrently and be able to come to a conclusion at an early date rather than wait for the Engineering Committee to make its report?

MR. WALLACE: I will say this much, Judge, we are now wandering all over the place. We have one subject we are discussing now; that is beneficial consumptive use. If we will stick to one thing at a time we will make progress. We compliment all the things you have done. You have done the greatest job in the world, we appreciate that. But the subject before us at this moment is beneficial consumptive use and what I would like to ask Colorado for is--you are the experienced people in this business, you have made many compacts. We have made none except we agreed to the Colorado River Compact. We have Judge Howell with us and I don't believe he has ever worked on a compact in his life, but he is certainly a very capable man. But we can't understand why with all of your experience you are not willing to say just exactly what you want, what the facts are you want to know before you will agree on the definition of beneficial consumptive use. I confess I am puzzled.

Let me get out of Mr. Breitenstein why he can't tell us what he wants to know before we can agree on a definition of beneficial consumptive use and apply that definition.

COM. STONE: Thank you, Mr. Wallace, and I will answer Mr. Watson's question and I want to reciprocate your statement about Judge Howell. We certainly think you have got a very able man advising you on the legal side

together with Mr. Clyde.

Mr. Watson, we assumed that we were doing just what you suggest in this agenda which we have submitted to you here. We believed we were submitting some of those fundamental questions. I think as we go through them you will finally agree that we have submitted some of those fundamental questions which we can be working on while the engineers are completing their studies.

Now Mr. Wallace brings up the question of a suggestion about this factor of beneficial consumptive use or what is the definition of it. I should like to reiterate what Mr. Breitenstein has said that it is not limited to a mere definition of beneficial consumptive use. A very important factor is the measure of that beneficial consumptive use and that is in my judgment--for what it is worth--a factor which must be determined before we make a compact.

Now Mr. Blaney has been brought in and a very able subcommittee has been established to study and make recommendations from an engineering viewpoint on what should be the basis of this Commission's consideration in determining and agreeing upon the measure of beneficial consumptive use. My point was--and this is partly in answer to Mr. Wallace--that if we do have a committee made up of as competent men as there is in the western half of the United States or anywhere, attempting to arrive at engineering factors upon which we can determine that, is it not wise before anyone attempts to deal with generalities on the subject for us to have the benefit of that? And in the meantime there are other important factors which as you suggest we should be working on and that was our program--I mean--that was our suggested program. That is mere suggestion from one state.

Mr. Wallace, that may not be a full answer but Mr. Wehrli brought out something here which I think demonstrates the situation. He points out a thing which I have always thought, that the definition in the Republican River Compact would not be applicable to the Colorado River because of its situation and because of the potential developments on that River, uses within the Basin and uses without the Basin. Now the difference between two rivers is a factual matter, and it is the factual matter which this committee is studying. It seems to me that we can--and I want to say for Colorado we will meet just as often and as long every time as you want to--and I think we can put in our time in studying this basic material which has been submitted to the Commission. By that time the Engineering Committee can come out.

MR. BREITENSTEIN: Judge, Mr. Wallace made reference to some of the things I have said and I hate to use up any time of the Commission in making a speech but if you would like to have a lawyer talk for a few minutes on engineering matters I will be glad to tell Mr. Wallace what bothers me.

MR. WALLACE: All I am trying to find out is what are the factors to be considered in the definition of the words, beneficial consumptive use; and when that definition is agreed upon, some explanation of the application thereof. Now if that has been referred to this Committee and we are going to wait for this Committee and you are going to wait for the report of this Committee, I personally don't see anything else to do.

MR. BREITENSTEIN: It seems to me there is a lack of understanding of a problem around here. There is either a lack of understanding or we are completely off base in Colorado, one or the other. You have said, Mr. Wallace, that we in Colorado have had perhaps more experience in making compacts--and also in interstate litigation--than the other states. Unfortunately that is true. I am not so concerned with a definition of beneficial consumptive use as I am concerned with the method of measuring beneficial consumptive use. The Colorado River Compact does not divide water; it divides the beneficial

consumptive use of water.

Now when you get into a dispute like this, what are the methods which have been used for measuring it? At times the method employed has been headgate measurements. The Laramie River decision of the United States Supreme Court is an example of that and I think we all know enough of that decision and of the facts there to agree--and I think even Wyoming will agree--that measuring on the basis of headgate diversions is utterly unfair.

Another method which has been employed is to determine beneficial consumptive use by the extent of irrigated acreage. That just does not work and the thing that Mr. Riter referred to when he told of Mr. Tipton's explanation, is the best example of that.

Along the Arkansas River we have had a lot of litigation with Kansas. Kansas claimed in a suit brought in 1928 that Colorado was injuring her because the irrigated acreage had increased almost double since the decree of the Supreme Court in 1907, and we were able to establish by engineering testimony, which was accepted without qualifications by the United States Supreme Court, that that increase in irrigated acreage had not resulted in any increase in consumptive use of water. We showed that the usable state-line flows had increased in the thirty years that had elapsed. So acreage is not a measure.

If there is any doubt on that Mr. Wehrli's experience on the North Platte should be indicative. There the engineers testified without contradiction that when an area is opened up to irrigation, considerable amounts of water are used to fill up the ground water table, and when your water table comes in balance, then the return flows from the project increase and more water is available downstream. We here in Colorado have had the same experience on the South Platte.

Now, with those factors, things that we know about that cannot be denied, what method--and I say it is an engineering rather than a legal question, Randy, with all due regard--what engineering formula are we going to devise to measure this beneficial consumptive use?

And I say you cannot charge Colorado with any neglect or any dilatoriness in that matter. I venture to say that long before any of the other states thought of this we in Colorado requested our engineering advisers to try to work out some formula for doing this. I know myself I talked to engineers about it in the summer of 1945 when this thing first came up, and I have had numerous schemes advanced to me as to the system which might be followed. I didn't see why we couldn't write them out in language and use them. But unfortunately in each instance when the engineers made further investigations they found that each scheme, each plan, whatever you want to call it, was unworkable and thus far no engineer has come to either Judge Stone or me with a workable method of measuring beneficial consumptive use of water.

Now we are not all-wise; we are just working boys like the rest of you. And if anybody, anybody at all, has a plan for doing this, we are most ready, willing and able to consider it.

THE CHAIRMAN: The Chair recognizes Mr. Wehrli.

MR. WEHRLI: Wyoming will offer to give you a definition of beneficial consumptive use and we will do that this afternoon in writing.

Now that will not be a formula for dividing the water between

these states but it will represent at least our conception of how beneficial consumptive use ought to be defined as it relates to the use to be allocated to each of the states, not as it relates to the amount of beneficial consumptive use that may be available to the Upper Basin States under the terms of the Colorado River Compact. The two are not the same. But if it will make anyone happy or accomplish any good purpose, I have worked on that problem a little bit and I will be glad to present it in writing this afternoon.

I recognize what Mr. Breitenstein so clearly brings out about the difficulty of making an allocation of water. You at first think that perhaps an amount of diversions in acre feet would be the better plan. I am inclined to agree with Mr. Breitenstein that that has its very serious objections.

In the North Platte case to which Mr. Breitenstein has referred some allocation was made upon the basis of acreage irrigated. I doubt if that could be applied in making a compact here as it was in the North Platte case because here we have some rather complicating factors which we didn't have in the particular areas there where that sort of formula was used.

I observe that in the Republican River Compact, with which I am not familiar except having read it, and of course it is Colorado's compact, a division was made on the basis of beneficial consumptive use.

We do have confronting us in this case the fact that in the Colorado River Compact the term, beneficial consumptive use, is employed. It seems to me that the greatest difficulty that will arise if you base a division of water upon percentage and beneficial consumptive use--and if I read the record of the proceedings of the last meeting of this Commission correctly, which I did not attend of course, there was a motion to that effect--the greatest difficulty you are going to be confronted with is finding out every year how much each state used under a definition of that kind. Obviously it is easier each year to measure the amount of headgate diversions in a particular state. It is likewise easier to measure the amount of acreage irrigated, and of course some other diversions, let us say, for power and the amount of reservoir losses, and so forth.

But when you come to a determination under whatever definition you employ--let's assume we get the best definition we can--when you come to a determination each year, as you may have to ultimately under the administration of a compact, of the amount of water that the state has beneficially consumptively used, I think it is a very difficult problem. That in my mind does not preclude the making of such an allocation because that may be--and I am inclined to think it is--the best method that can be employed.

So much for that. As I say, we will be glad to present something for the consideration of the other states on a definition of beneficial consumptive use as it relates only to the use that may be made in the respective states and with the assumption that the compact ultimately will apportion the water in terms of beneficial consumptive use. Of course if it doesn't then the definition is unimportant.

COM. STONE: Mr. Wehrli, may I ask you a question at that point?

MR. WEHRLI: Yes, sir.

COM. STONE: As I understand that merely goes to the definition of beneficial consumptive use and you don't propose at this time--of course you have a right to do it and if you have a formula we certainly would like to have it--but I assume that doesn't go to the measurement of the beneficial consumptive use, merely the definition of it.

MR. WEHRLI: Well, when we get through defining it we might find a way to measure it. As long as we don't know what it is I don't know that we can.

By "formula" do you mean some percentage allocation between the states?

COM. STONE: No, where and how the beneficial consumptive use is to be measured, whether by depletions or by beneficial consumptive use at the point of use.

MR. WEHRLI: My definition will have some bearing upon that question, Judge Stone, and might answer your question. I am not sure as to that.

We came here this morning rather with the assumption that we were going to pick up where we left off yesterday in consideration of the Legal Advisory Committee report, and of course we had the engineering report, which I think was entirely appropriate. We did not expect to have before us at this time this question of beneficial consumptive use although it is on the agenda. We would suggest that orderly procedure at this time would be to return to the consideration of the Legal Advisory Committee's report and take up this other subject of beneficial consumptive use at whatever time someone desires to take it up.

THE CHAIRMAN: We will convene at two o'clock.

(2:00 p.m. Meeting resumed.)

THE CHAIRMAN: The Commission will please come to order.

MR. WALLACE: Mr. Breitenstein, what is the difference between facts and factors?

MR. BREITENSTEIN: Well, you want me to get into a discussion now of the differences between findings of facts and conclusions of law? You have got the same thing there. I take it a fact is a fact. A factor is something in which an element of judgment is involved. It isn't the ultimate fact.

MR. WALLACE: I have been trying to get you to name the factor concerning which we seem to be puzzled.

MR. BREITENSTEIN: I don't know what you are all trying to get out of me because I do not have the ability to devise this formula. I will say that flatly. I haven't the training or the experience to do it.

But now just start up at the headwaters of the stream, if we are going to continue the discussion, you have got the Green River in Wyoming into which flow some tributaries from Utah. On those tributaries is Utah going to be required to deliver any water to the Wyoming Line and if so, how much and how is that amount of water to be measured? The Green River then flows down into Utah, back into Colorado, and then out into Utah. Now simplifying it to some extent, when it gets down to the Colorado-Utah Line, are Wyoming and Colorado because the Yampa River comes in ahead of that going to be required to maintain any flows at that point and if so how much and how are they to be determined?

Next downstream is the White River rising in Colorado. Is Colorado going to be required to deliver any specific amount of water at the

Utah Line, and if so, how much and how is it to be determined? And the same, going on downstream, is true for the main stem of the Colorado River, the Dolores, the San Juan and all of its tributaries.

I do not see how we can enter into a fair compact unless all those situations are considered.

Judge Stone suggests that I have left out one thing in my attempt to simplify it, and that is that we must consider the losses in Utah in transporting the water from the Colorado Boundary down to Lee Ferry. I believe that you in Utah will agree that it would not be fair to charge Utah with all those losses. If you are willing to assume them, why, just tell us so and we will deal on that basis, but it does not seem to me that Utah in fairness should be charged with those.

When the water gets to the Utah Line it flows for a considerable distance before it passes into Arizona. Going down those hundreds of miles, water is lost through evaporation, bank storage, and all those things. How are those losses to be charged? Does Colorado's obligation end when it delivers the water at the Utah Line? Are we to have no concern over those transportation losses or over the evaporation losses in the main stem reservoirs? Is Utah going to bear the entire burden of those? From the standpoint of fairness it seems to me that Colorado and Wyoming should bear part of that because the mere fact that we deliver the water to the Utah Line doesn't mean it gets down to Lee Ferry.

Frankly, rather than overstating the problem I have understated it. I have been guilty of oversimplification. It seems to me that the physical facts should be so apparent to all of you that you should recognize that we are not here concerned merely with cutting the pie.

COM. WATSON: Mr. Breitenstein, am I correct in saying that the Engineering Advisory Committee have been properly authorized by this Commission to make these studies in our assignment to them?

MR. BREITENSTEIN: I am not going to answer that one, no, sir. I am not on the Commission and I am not on the Engineering Advisory Committee and I am not going to construe your authorization to them.

COM. STONE: I didn't get that question.

COM. WATSON: Am I correct in assuming that the Engineering Advisory Committee has been properly authorized by this Commission to make these studies and report back?

COM. STONE: I think all we have to do is look back at the minutes of this Commission to ascertain what they have been authorized to do.

COM. WATSON: As I remember it, Judge Stone, the Engineering Advisory Committee was given a very limited assignment that would not involve many of the problems that will come up in this matter that are fundamental in negotiating a compact. And one of the objections that some of us have had is that the assignment for study of these various fundamental problems was not extensive enough.

COM. STONE: Mr. Watson, the only comment I would have to make on that--and I think it is in line with the constructive procedure you have in mind--is that if the assignment to the Engineering Advisory Committee is not broad enough and any state feels it should be broadened it would be perfectly proper for that state to suggest such broadening of the assignment. It has

been our thought in Colorado that the broadening of such an assignment may become necessary as we proceed but that the Engineering Committee had a sufficient assignment at the moment. But we would not resist the wishes of any state that desired to suggest a broadening of the assignment at this or any other time.

MR. CLYDE: Mr. Chairman, it seems to me in listening to the discussion that there is a certain amount of buck-passing going around between the Commission, the Legal Advisory Committee and the Engineering Advisory Committee. Utah has indicated that it feels that the data now available is sufficient to permit a division of water on a percentage basis. If I correctly interpret Colorado, they indicate that they don't think so, that they have to have some more engineering facts.

I haven't clear in my mind what additional engineering facts they have got to have and whether or not the Engineering Committee understands what additional engineering facts they have got to get. If somebody could specifically state what is lacking and what is yet needed so that we can get to that subject, then the Engineering Committee could be told to get them, those specific things, and could concentrate on getting them. Then as soon as they are here we would be in a position to turn to the discussion of the particular thing that Utah has been urging that we turn the discussion to, that is, to-wit, the division of the water.

I don't think it has been stated what additional engineering facts are necessary so the Engineering Committee can get them for us, and in talking to individual Committee members I am convinced that they don't know exactly what it is the Commission wants them to get.

COM. STONE: Mr. Clyde, were you through?

MR. CLYDE: Yes.

COM. STONE: There is one thing that worries me a lot and your statement just made indicates or points up that matter. You refer in your statement to necessary information regarding the division of the water---as Mr. Breitenstein put it a few moments ago, the division of the pie. None of you seem to be concerned and apparently never mention that engineering facts are probably needed more to determine the respective obligations to deliver water under the Colorado River Compact than for the apportionment of the water granted to the Upper Basin under the Colorado River Compact.

It was, I think, quite pointedly stated here by Mr. Merriell this morning that because of Colorado's position, our topographic position as a state, we will be compelled to assume, probably justly so, a large measure of obligation. Colorado does not propose to end up these compact negotiations and have the obligations of the Colorado River Compact to deliver water placed solely on her shoulders and have only such water for use in our state as remains after that obligation is met by Colorado for all the other states. That is a joint obligation. That is not an obligation of one state.

We can never forget that we have two jobs to do here: one, to determine the respective obligations to deliver water at Lee Ferry; and, secondly, to apportion the water allotted to the Upper Basin for Upper beneficial consumptive use. And we cannot confine this discussion with respect to engineering facts to the mere matter of securing the necessary data to apportion the water.

MR. CLYDE: I appreciate, Judge Stone, the position of Colorado and speaking personally I think the position is reasonable that Colorado should desire to tie in the division of the water with the division of the obligation at Lee Ferry. If I were representing the State of Colorado I would insist that those two things be decided and discussed together.

I wasn't attempting to give a solution to the problem, I was attempting to state it as it appears to me. We had it in the Legal Committee when we were attempting to function. In talking to some individual members of the Engineering Committee I think I see the same problem. I am willing to take it for granted that Colorado on the present basis of existing facts is not willing to discuss either of those two questions. We are confronted then with a theory. We are confronted with a situation where you feel that the protection of your state requires more inquiry and more facts than you have at your disposal this morning.

COM. STONE: That is a very fair statement, Mr. Clyde.

MR. CLYDE: Now, that being so, it would seem to me taking that as the position with which we are confronted, can we not clarify for the Legal Committee and the Engineering Committee and others who might be working on this, the line or the lines along which you feel further inquiry is necessary so that the further study by the peoples working on it can be concentrated to the end of getting for you the data which you feel is yet necessary for you to have.

Maybe the Engineering Committee sees clearly where it is supposed to go and what the Commission wants, but I have gathered from the comments of those who have spoken that they don't clearly understand what the Commission yet wants so we can get to a discussion of that. And I think our work would be greatly facilitated if that could be spelled out better for those who are working on it.

MR. RITER: Mr. Chairman, the Engineering Committee has a specific task to do. Briefly the assignment given us consists of the following elements:

1. Preparation of base maps for use by the Commission in its deliberations. We have completed that assignment. We have made available to each state, maps prepared by the Bureau of Reclamation--

THE CHAIRMAN: Mr. Riter, pardon me. I would suggest that you are repeating what you have told this Commission three or four times before. Let's get more to the point on this thing.

MR. RITER: I am trying to be helpful by trying to reiterate briefly the assignment the Engineering Committee has and with that assignment in front of it, the Commission can decide if they want to give us more assignment.

THE CHAIRMAN: Very well.

MR. RITER: Item No. 2 is determine the water supply available from each state. That assignment has not been completed. It is partially complete but it is not completed.

Item No. 3 concerns studies of river and reservoir operations to determine the extent to which the Upper Basin can make use of its allocated water supply during drought cycles and still meet its compact obligations at Lee Ferry. That assignment has not been completed.

Those three items constitute our present assignment.

COM. WATSON: Mr. Chairman.

THE CHAIRMAN: The Chair recognizes Mr. Watson.

COM. WATSON: In defense of Mr. Riter I wish to say that his statement was very definite. I was present at that Engineering Advisory Committee meeting in Cheyenne, September 1946, and that Committee was definitely assigned the work Mr. Riter and his Committee performed.

Now, as far as I can remember there has been no other definite assignment by this Commission to that Engineering Advisory Committee. Therefore, I think it is the duty of this Commission to state definitely and emphatically what other factors the Commission should take up for study.

The objection that some of us have had to the procedure is that many of these problems that should be considered contemporaneously with the study that the Engineering Committee has made.

I therefore think that this Commission should make assignments to Mr. Riter's Committee. I think he has done a fine job. I don't think he is in any way subject to criticism from this Commission.

COM. STONE: I don't imply criticism. I am speaking plainly. But, Mr. Watson, you have those ideas and they are no doubt appropriate, and there are certain matters which you say are worrying you; can you put down and submit under the a, b, c, the further assignments which should be given to this Committee? If you can, Colorado is not going to stand in the way of any reasonable assignment.

COM. WATSON: Judge Stone, I would be glad to do that and will give it to this Commission tomorrow morning.

MR. CLYDE: The discussion that has just ensued since my last remarks demonstrates to me that perhaps each is waiting for someone else to go forward. The Engineering Committee is waiting for a further assignment from the Commission. It is proceeding with all its energies to study the things assigned to it but it hasn't gone into some of the things that Colorado has indicated she feels are indispensable to reaching a discussion of this. The Legal Committee had the same problem.

I haven't sufficient information and knowledge and experience in these things so that I can say what we now need and haven't got so I can tell anybody how to do it. But I certainly feel that it might be very helpful if the group could get together informally, the engineers, the lawyers, and the Commission, and discuss what they haven't got yet that they need so that each can then start upon an enterprise of getting it. Maybe we can't set it down definitely but it would seem to me we could do it more definitely than we have given anybody the word yet on it.

MR. RITER: Mr. Chairman, Mr. Watson is correct. He and Mr. Bishop were both present when the engineers discussed our assignment. There was a great deal of controversy over one item, namely, potential uses. Some of us on the Engineering Committee felt that that was the most important single factor to be used as the basis for negotiating a compact. After discussing the matter pro and con we felt it was entirely beyond the capacity of the Engineering Committee to determine potential uses.

The Bureau of Reclamation spent close to a million and a half dollars preparing the report that discusses project potentialities. The Engineering Committee recognizes the potentialities are a very important

factor. It is so stated in our report. But we did not recommend that we be given the job of studying the project potentialities. We felt that was a job that should be reserved for the Commissioner of each state. The Engineering Committee stands ready to serve in any way the Commission sees fit that we can help serve to advance this cause.

COM. WATSON: Mr. Chairman, at that meeting these various factors explained by Mr. Riter were approved by the Engineering Advisory Committee. The representative from Colorado, for whom I have a very great deal of respect, stated that he would not be able under his commission as agent to go any further than the assignment described by Mr. Riter. For that reason nothing else was done.

COM. STONE: Who was that made that statement?

COM. WATSON: Mr. Patterson.

MR. RITER: This report was signed by the representative of each state: Riter, Baker, Patterson, Bliss, Cottrell, and Person.

COM. STONE: I would suggest that as a help on this situation, in addition to Mr. Watson attempting to set down some matters which he thinks should be further studies by the Engineering Committee, it might be helpful if Mr. Riter would aid in that and make a suggestion as to further assignments that should be given to them.

COM. WATSON: I suggest also, Mr. Chairman, that Colorado do the same thing, along with each of the other states.

THE CHAIRMAN: Well, gentlemen, it seems to your Chairman that we have had rather an exhaustive discussion of the report of the Engineering Advisory Committee, and the Chair is a little bit hopeful that we may proceed. However, if the discussion has not been completed, I don't want to appear arbitrary about the matter, but these matters are all inter-related and unless you have an objection and further discussion, we might take up again, if any of the Commission members so desire, a further consideration of the report of the Legal Advisory Committee, particularly since mimeographed copies of the report of the Legal Advisory Committee were furnished all members last evening, together with the letters which your Chairman received from the Federal agencies.

Does anyone have anything further to suggest in regard to a more detailed consideration of the report of the Legal Advisory Committee?

MR. HOWELL: At the expense of being criticized for prolonging this matter it appears to me that this is the situation now that confronts us. The Governor of Colorado last night in a very good speech as I thought, said that he hoped certainly that we would be able to present this compact to the next meeting of the legislature. I don't know when your legislature meets but I know ours meets in January.

Now it is indicated so far that until June, at least, we can't expect a final report from the engineers' assignment as they construe it at the present moment. It is indicated that there are other matters which will also be necessary to refer to them. Judge Stone says that probably that can't be done until the next meeting, which it certainly wouldn't be any use to have before June as I figure it when the final report upon what has been assigned to the Engineering Committee is ready. If at that time and waiting until that time you make these other suggestions, being now only seven months away at least from our legislature, you will then be still nearer to it and you diminish the

possibility of presenting this matter to the next legislature, at least as far as our state is concerned.

So it seems to me--and of course I am not a member of this Commission, I am merely making the suggestion--that it would be a good idea if a motion were made that each state designate a representative to meet with Mr. Riter and determine as far as they are able at this time at least, the matters which should be referred to this Engineering Committee and have a report.

COM. WATSON: Mr. Chairman, I so move.

COM. STONE: Wait a minute. You so move what?

COM. WATSON: I move that this Commission appoint one member from each state to meet with Mr. Riter to discuss any additional factors that should be considered now in order to acquire data that will lead to the making of a compact.

THE CHAIRMAN: The Chairman is not clear as to when these appointees are to meet with Mr. Riter.

MR. HOWELL: Right now.

THE CHAIRMAN: Very well.

COM. BISHOP: Second the motion.

THE CHAIRMAN: You have heard the motion and the second. Now, Judge Stone, it is up for discussion. The Chair recognizes Judge Stone.

COM. STONE: I am not prepared to discuss that motion now. I wish to clarify a statement made by Mr. Howell.

THE CHAIRMAN: Let's dispose of the motion and then you can clarify the statement.

COM. STONE: We will be compelled to vote "no" on the motion--

THE CHAIRMAN: That is certain.

COM. WATSON: Question.

COM. STONE: --if we are not permitted to clarify that statement, and we dislike doing that because we do have some belief that the motion is well taken. But if this is arbitrary and we are not permitted to keep this record straight on the part of a state that is compacting here, we must take a position of that kind.

MR. HOWELL: I ask as a matter of personal privilege, Mr. Chairman, that Judge Stone, if I have made any statement that he thinks misrepresents him, be permitted to state what it is.

THE CHAIRMAN: Very well. We will now hear from Judge Stone on the matter of clarifying the motion.

COM. STONE: Not to clarify the motion, no.

THE CHAIRMAN: Very well, anything you want to say. Let's have a little harmony.

COM. STONE: The statement was made that Colorado suggested that this whole matter be deferred to June, Mr. Howell.

MR. HOWELL: No, no.

COM. STONE: I wanted you to know that I said perhaps we could do this better at the next meeting. I hope we are not going to wait until June to have another meeting. I also wish to say that what the Governor stated yesterday is my position. I do want to get this compact done for the next legislature.

MR. HOWELL: Well, but the only reason I said there probably wouldn't be any use for you to have a meeting until June was because as I understood--I might be wrong--the Chairman of the Engineering Advisory Committee stated that they wouldn't be ready to make their final report on what has already been assigned to them until June. Now, if you can't go ahead without that report and then you indicate that there are certain other things you want to know, what would be the use of having a meeting before they are able to make that report?

COM. STONE: I have never gone that far in any statement I have made. Furthermore, I think there is some substance in the agenda which Colorado suggested and it does include matters which Colorado will insist upon being settled before a compact is written, and I think we can be making more time than has been made here today if we go to those matters. That is all.

MR. HOWELL: Mr. Chairman, it won't interfere with the agenda as far as that is concerned if we do have this meeting.

COM. STONE: I am not opposing that meeting.

THE CHAIRMAN: The Chairman has proceeded in a very unparliamentary manner and we are now ready for discussion of the motion. (Question is called for.) (Thereupon a vote was taken and Com. Watson's motion carries unanimously.)

THE CHAIRMAN: Now do you at this time wish to appoint in accordance with the motion?

COM. WATSON: Mr. Chairman, may I suggest one other matter and that is that when this committee has been appointed, they proceed immediately to go to work.

THE CHAIRMAN: That was incorporated in your motion, I think. I understood it that way.

COM. STONE: May I make this inquiry: The motion is limited to one person from each state?

COM. WATSON: I would yield to that, Judge.

COM. STONE: It involves legal and engineering matters and it seems to me that perhaps no state is prepared to fully set forth its suggestions by the attendance of only one person.

COM. WATSON: I think your objection is well taken.

THE CHAIRMAN: As the Chair understands it then, each state can designate any number to confer with the Chairman of the Engineering Advisory Committee.

COM. WATSON: At least one engineer and one lawyer.

THE CHAIRMAN: Oh, that is the understanding. Very well, the Chair stands corrected. The Chair will now ask the State of Arizona to designate its representatives if you will.

COM. CARSON: R. Gail Baker.

COM. WATSON: What lawyer?

COM. CARSON: We don't need a lawyer on that. He is both.

THE CHAIRMAN: Colorado?

COM. STONE: Designate Jean Breitenstein and Frank Merriell.

THE CHAIRMAN: New Mexico?

COM. WILSON: Designate Rufus Carter and I. J. Coury.

THE CHAIRMAN: Utah?

COM. WATSON: C. R. Roskelley and J. A. Howell.

THE CHAIRMAN: Wyoming?

COM. BISHOP: Mr. Wehrli and Mr. Rollins for Wyoming.

COM. STONE: Mr. Chairman, I move the Commission adjourn to reconvene this evening in order that this special committee that has been appointed may proceed with its work.

THE CHAIRMAN: Is there a second to Judge Stone's motion?

COM. BISHOP: Second.

THE CHAIRMAN: Is there a discussion of the motion?

COM. WATSON: Question.

(Thereupon a vote was taken and Com. Stone's motion carried unanimously.)

(3:05 p.m. Recess.)

- - - - - -

(7:30 p.m. Meeting resumed.)

THE CHAIRMAN: Will the Commission please come to order. In line with the wishes of the Commission prior to recess, the states appointed their advisers to confer and consult with the Chairman of the Engineering Advisory Committee for the purpose of determining what if any additional studies should be undertaken in order to assist the Commission in writing a compact.

Mr. Riter, as Chairman of the Committee are you ready to submit a report?

MR. RITER: Yes, sir.

THE CHAIRMAN: Mr. Riter, you may proceed to make your report.

MR. RITER: The special committee assumed that its function was to determine whether it was necessary to vest in the Engineering Advisory Committee any additional authority to that already given it to furnish any additional factual data to enable the Commission to make a division of the water of the Upper Basin and to fix the obligation of the respective states at Lee Ferry.

Opportunity was therefore given by the committee to the representatives of each state to suggest what additional factual data those representatives deemed necessary. No state suggested any additional factual data that was deemed necessary, although the committee has not yet completed its present assignment.

Accordingly, the committee decided unanimously that it was not necessary to vest the Engineering Advisory Committee with any additional authority and that it was for the Commission to determine whether it could make a hypothetical division of the water to which it is entitled under the Colorado River Compact among the respective states and to determine whether it should make any hypothetical determination of the obligation of the respective states at Lee Ferry prior to the final report of the Engineering Advisory Committee; that if and when such hypothetical decisions are made, either prior to or after such final report, it may be necessary to have the Engineering Advisory Committee make additional studies to determine how such tentative decisions of the Commission will operate.

COM. BISHOP: I move the adoption of the report.

COM. WATSON: Second the motion.

THE CHAIRMAN: The motion is now open for discussion.

COM. STONE: May I inquire, does an adoption of that report mean that a vote in favor of it is in agreement to a hypothetical division or a hypothetical determination of obligations at Lee Ferry agreed upon--does that carry that implication?

MR. WEHRLI: Mr. Chairman, I would think not. I would think that the report of the committee simply means that if a hypothetical situation is presented to the Engineering Committee and there is further action desired, then a further report would be made without obligation to present such hypothetical situation.

COM. STONE: Thank you, Mr. Wehrli. I assumed that was it but I wanted to be clear on it.

MR. WEHRLI: I think we ought to be clear on it and I think that is the purpose of it and the intent of it.

THE CHAIRMAN: As the Chairman understands it, it is not incumbent upon the Commission or any member of the Commission to make a hypothetical or tentative allocation until the original assignment of this Committee has been completed. Then at that time I believe the report of the Committee implies that before it can continue and make further studies, a hypothetical allocation should be made and then they will proceed to see how that allocation works out and will present that then to the Commission for further consideration of any member. If he feels that it is not acceptable to his state he can raise his objection. Is that correct, Mr. Riter?

MR. RITER: That is my understanding.

COM. WILSON: Mr. Chairman, would it be understood also that any hypothetical allocation or determination would not be binding on anybody and be merely for the purposes of demonstration?

THE CHAIRMAN: Yes, Judge Wilson. That is my understanding of it because the Engineering Committee will have to study any assumed allocation to determine if the Commission has gotten its foot in it here and there and done an injustice to any particular state. That is the purpose of this study after the assumption is made.

COM. CARSON: Mr. Chairman, what was that motion, to adopt or to accept?

(Motion read as follows: COM. BISHOP: I move the adoption of the report.)

COM. CARSON: Mr. Chairman, I would like to make an amendment to that motion, that the report be accepted for the consideration of the Commission, or a substitute motion.

THE CHAIRMAN: Is the amendment accepted?

MR. WEHRLI: We have no objection to the change in terminology.

THE CHAIRMAN: Is that satisfactory to the second to the motion?

COM. WATSON: Yes.

THE CHAIRMAN: Are you ready for the question?

COM. WATSON: Question.

THE CHAIRMAN: The question has been called for. (Thereupon a vote was taken and Com. Bishop's motion as amended carried unanimously.)

MR. CLYDE: Mr. Chairman, I would like to ask Mr. Riter a question. If I correctly heard the report it contemplated that this Commission might either before the engineers complete the report or after it, depending on what they decide--

MR. RITER: That is right.

MR. CLYDE: --make this hypothetical allocation.

MR. RITER: That is right.

MR. CLYDE: And that the question would be for the Commission perhaps now to decide whether they want to try it now or after.

MR. RITER: It is entirely up to the Commission, yes.

THE CHAIRMAN: Are there further remarks on the subject mentioned by Mr. Clyde?

COM. STONE: I might say, Mr. Chairman, Colorado voted favorably on the motion on the explanation that was made before the vote was taken. The explanation now made is not the explanation that was made by Mr. Riter or the Chairman when the motion was put.

MR. HOWELL: The report itself definitely stated either before or after the final report of the Engineering Advisory Committee.

COM. WILSON: It can't be made after unless the Commission so votes.

COM. STONE: I might say, gentlemen, that Mr. Breitenstein tells me that the explanation now made by Riter is the correct intention of the committee. If it is, although I misunderstood the interpretation of that report or the intent of it as put by the Chairman and concurred in by Mr. Riter, we shall not quarrel about that. If that is the intent of the committee we are willing to abide by the intent even though I as Colorado's Commissioner voted upon a different interpretation of the report.

MR. WEHRLI: Mr. Chairman, I don't believe there can be any misunderstanding that would have any serious consequences, because if any one state represented on this Commission is opposed to presenting a hypothetical situation prior to obtaining the report of the Engineering Committee, I can't very well see how such a hypothetical situation could be presented. Consequently I think there is no substantial disagreement about it. And if Colorado objects, as I understand it does, to the presentation of any hypothetical or tentative formula until after receiving the report, it seems to me that such a situation cannot be presented until after the report is received.

I think that is the situation we are in and that there isn't any real disagreement about it or can be any real disagreement about it because as I understand it Colorado says they are not prepared to enter into the presentation of a hypothetical or tentative figure until after the report is received.

COM. STONE: Mr. Wehrli's statement I think is entirely correct. There is no reason to delay this matter because the outcome would be the same apparently.

COM. WILSON: Mr. Chairman, I would like to say this, that I attended the meeting of the engineering committee and I thought this would be a very splendid idea. In fact, I think the committee agreed that there is a great deal of information that they have been asked to furnish that they can't furnish unless they do assume an allocation of water and I believe that is the situation. However, in view of Colorado's position I don't want to be put in the position of trying to force this on Colorado, since they have expressed themselves as they have, and I am not going to press the point. I still think it would be a good idea and wouldn't hurt anybody and would facilitate the work of the Engineering Committee. But I am not going to insist and I don't think the Commission should force Colorado into accepting this plan. Let's wait until the report is in and then determine it.

COM. WATSON: The solution is hypothetical.

COM. WILSON: That was my idea. You could take two or three hypothetical figures assuming each state got this much and assuming each state got that much. If we don't authorize the Committee to do that I don't see why they can not on their own motion juggle some figures around so they can tell us what this obligation at Lee Ferry spells.

THE CHAIRMAN: Mr. Riter, since we have come to an agreement in regard to the work that your Committee is to do, the Chairman would like to ask you how long in your opinion will it take to complete your work? By that I don't mean to include a study of a hypothetical allocation of benefits and responsibilities.

MR. RITER: Mr. Chairman, I think the record will show this morning I

stated we could have a final report before June. My reason for saying that is that the subject we are having the most difficulty reconciling is the matter of present uses. I feel from the studies that we have made and the discussions we have had that the Engineering Committee will not agree upon final figures on present use until we have had an opportunity to go in the field with Mr. Blaney and inspect typical areas in various states in order to verify the judgment of the representatives of the various states regarding type and character of agricultural practice and to visualize areas of pre-irrigated land.

COM. CARSON: Mr. Chairman, I would like to move that we proceed with this agenda.

COM. STONE: I second the motion. (No vote taken.)

COM. BISHOP: Mr. Chairman, if we are ready to consider this report I would like to move that this under "Expenses" on the second page where it says in parenthesis, "(equally by the four states)" and then in parenthesis, "(prorata by the four states according to the percentage of water allocated to each)", that the last one be approved by this group, "prorata by the four states according to the percentage of water allocated to each."

COM. WATSON: Second the motion.

THE CHAIRMAN: Any discussion of the motion as made and seconded?

COM. STONE: Mr. Chairman, just a moment and I will have a comment to make. (Confers.) Mr. Chairman, I understand that any vote at this time on this or other matters is in accordance with the agreement at the last meeting that all favorable or unfavorable votes are tentative until the final vote is taken on all of the terms of the compact.

THE CHAIRMAN: The Chair would feel that that is a reasonable interpretation because some of these matters I think need a little consideration more than we can afford to give at these meetings by the individual states.

COM. STONE: That is our understanding. I just wanted to be sure that that was the understanding of the Commission. It was at the last meeting.

MR. WEHRLI: Mr. Chairman, as far as Wyoming is concerned that is our understanding that these matters are approved tentatively.

COM. STONE: Colorado has no comments to make on the motion at this time.

COM. WATSON: Question.

THE CHAIRMAN: Question has been called for. Those in favor of the motion will please say "Aye."

COM. WILSON: I suggest you call it by states.

THE CHAIRMAN: That is the procedure we followed the other day. Perhaps we should do that. Wyoming?

COM. BISHOP: Yes.

THE CHAIRMAN: Colorado?

COM. STONE: Yes.

THE CHAIRMAN: Utah?

COM. WATSON: Yes.

THE CHAIRMAN: Arizona?

COM. CARSON: I will pass on that. We are not concerned with that.

THE CHAIRMAN: New Mexico?

COM. WILSON: New Mexico declines to vote on that until there has been an allocation.

COM. BISHOP: Mr. Chairman, on page 3, Item 10, I would like to amend the third line where it says "that the concurrence of four members of the Commission shall be necessary"--I would like to amend that to read "that the concurrence of a majority of the members of the Commission shall be necessary in any action taken by the Commission."

COM. WATSON: You make that as a motion, Mr. Bishop?

COM. BISHOP: Yes.

COM. WATSON: I second the motion.

THE CHAIRMAN: Is there a discussion of the motion as made by Com. Bishop? It would occur to the Chairman at this point that one of the members of the Legal Advisory Committee should give his reason for stating four members.

COM. CARSON: Mr. Chairman, in the beginning in the Legal Advisory Committee there was an opinion expressed that all actions taken by the Commission should be by unanimous vote, but it was also the suggestion that it be made by majority vote. The Legal Advisory Committee discussed the matter pro and con and then set up this provision for the five members, one from each of the four states of the Upper Division and a Federal Representative, and in order to not completely stymie the action of the commission by the veto power of any one state, we finally worked out a compromise of ideas sufficiently to report to this Commission on the basis here set up. That is a four-fifths vote.

Then we made these other provisions limited to the findings of fact and provided that those findings should "not be conclusive in any court or before any agency or tribunal but shall be admissible and shall constitute prima facie evidence of the facts found."

It seemed to us that that was about as good as you could go here and it would make it then so that if four members of the commission agreed on a finding of fact it would be prima facie evidence of the facts found but still if one state disagreed it could contest it and go into the matter before any court or tribunal it desired. That was our best judgment as to the possibility of working out a compromise in view of the contrasting points of view.

But here again I want to point out that Arizona is not directly concerned in this because we don't participate on this commission.

THE CHAIRMAN: Is it understood that the Federal member of this board

would have voting power?

COM. CARSON: Yes, sir. That is, it is set up in this report that he would have voting power.

THE CHAIRMAN: Are you ready for the question?

COM. WATSON: Question.

THE CHAIRMAN: Those in favor of the motion will say "Aye."

COM. STONE: May I suggest you call the roll of states.

THE CHAIRMAN: Oh, yes, thank you. Wyoming?

COM. BISHOP: Yes.

THE CHAIRMAN: Colorado?

COM. STONE: No.

THE CHAIRMAN: Arizona?

COM. CARSON: I think I should vote "No" on that because I want to assist in arriving at a compact and if it is made that way you won't get a compact, so I vote "No."

THE CHAIRMAN: New Mexico?

COM. WILSON: No.

THE CHAIRMAN: Utah?

COM. WATSON: Yes.

THE CHAIRMAN: The motion fails to carry by three to two. Gentlemen, let's stick to the agenda. Have you finished with page 3 under the item of "Powers"? If so, we will proceed to page 4. Are there any comments or objections to the paragraph entitled, "Records Open to Inspection"?

COM. STONE: Mr. Chairman, if there are no further motions with respect to particular sections of the article, "Administrative Commission", I move, subject to the rule that a vote at this time is tentative, that the article as amended and changed be approved.

COM. BISHOP: Second the motion.

THE CHAIRMAN: That would include, then, Judge, bottom of page 1, all of page 2, page 3, and part of page 4 as amended and corrected. All of page 4?

COM. STONE: Down to the word, "Comments".

THE CHAIRMAN: Yes. Ready for the question? (Question is called for.) Wyoming?

COM. BISHOP: Yes.

THE CHAIRMAN: Colorado?

COM. STONE: Yes.

THE CHAIRMAN: Arizona?

COM. CARSON: Yes.

THE CHAIRMAN: Utah?

COM. WATSON: Yes.

THE CHAIRMAN: New Mexico?

COM. WILSON: Yes.

(The article, "Administrative Commission", as amended and corrected, above referred to, is as follows:)

"ADMINISTRATIVE COMMISSION

"There is hereby created an interstate administrative agency to be known as 'Upper Colorado River Commission.'

"The Commission shall be composed of one representative of each of the states of the Upper Division, namely, Colorado, New Mexico, Utah and Wyoming, and if designated by the President of the United States, one representative of the United States. The Commissioner for Colorado shall be appointed by the Governor of Colorado with the advice and consent of the Colorado Water Conservation Board. The State Engineer of New Mexico shall be ex-officio commissioner for New Mexico. The State Engineer of Utah shall be ex-officio commissioner for Utah. The State Engineer of Wyoming shall be ex-officio commissioner for Wyoming. If any state desires to provide for the selection of its commissioner in a different manner, the commissioner, selected as so determined by such state, shall be the commissioner for such state. The President of the United States shall be requested to designate a commissioner for the United States. If a commissioner is so designated for the United States he shall be the presiding officer of the Commission and shall be entitled to the same powers and rights as the commissioner of any state.

"Any four members of the Commission shall constitute a quorum.

"Expenses. The salaries and personal expenses of each commissioner shall be paid by the government which he represents. All other expenses which are incident to the administration of this compact and which are not paid by the United States shall be borne prorata by the four states according to the percentage of water allocated to each. On or before November 1st of each year the Commission shall adopt and transmit to the governors of the four states and to the President a budget covering an estimate of its expenses for the following year and of the amount thereof payable by each state. Each state shall pay the amount due by it to the Commission on or before April 1st of the year following. The payment of the expenses of the Commission and of its employees shall not be subject to the audit and accounting procedure of any of the four states or of the United States.

"Employees. The Commission shall appoint a secretary who shall not be a member of the Commission and who shall serve for such term and receive such salary and perform such duties as the Commission may direct. The Commission may employ such engineering, legal, clerical and other aid as may in its judgment be necessary for the performance of its functions under this

compact. In the hiring of employees the Commission shall not be bound by the civil service laws of any state or of the Federal Government.

"Powers. The Commission shall have the power to:

"1. Adopt rules and regulations not inconsistent with this compact;

"2. Locate, establish, construct, abandon, operate and maintain water gaging stations;

"3. Make estimates to forecast water run-off on the Colorado River or any of its tributaries;

"4. Engage in cooperative studies of water supplies of the Colorado River and its tributaries;

"5. Collect, analyze, correlate, preserve and report on data as to stream flows, water storage, water diversions and water use of the waters of Colorado River or any of its tributaries;

"6. Make findings as to the amount of and report on the beneficial consumptive use of water each year in the Upper Colorado River Basin and in that portion of each state lying within this basin;

"7. Make findings as to the amount of and report on the water deliveries at Lee Ferry each year and the amount of such water supplied by each state of the Upper Division;

"8. Make findings as to the amount of and report on the share of reservoir losses chargeable against the apportionment made to each of the four states;

"9. Make findings as to the amount of and report on the obligation of each state to make water deliveries at Lee Ferry;

"10. Perform all functions and do all things required of it by this compact and do all things proper and convenient in the performance of its duties hereunder. Provided, however, that the concurrence of four members of the Commission shall be necessary in any action taken by the Commission;

"11. Make and transmit annually to the Governors of each of the four states and the President of the United States with the estimated budget a report covering the activities of the Commission for the preceding year.

"Records Open to Inspection. The Commission and its secretary shall make available to the Governor of each of the signatory states any information within its possession at any time and shall always provide free access to its records by the governors of each of the states or their representatives or authorized representatives of the Federal Government.

"Findings of Fact. Findings of fact made by the Commission shall not be conclusive in any court or before any agency or tribunal but shall be admissible and shall constitute prima facie evidence of the facts found."

THE CHAIRMAN: It appears now we are ready to consider Article II.

COM. WILSON: Mr. Chairman, before you go to Article II I would just like to suggest that the matter under "Comments" through this report should probably be taken by the members of the Commission and their legal advisers and considered. I don't think it is necessary to discuss them now but there are some things there that ought to be given some thought. That is why the comments were put in there, to call it to the attention of the Commission.

THE CHAIRMAN: The Chair is assuming that the comments are there for the benefit of the present consideration. They certainly should be used for what they are worth and presumably have been read and considered prior to the adoption of the motion.

Are you ready now for the consideration of Article II? And in line with Judge Wilson's suggestion, it is assumed that on page 7 the comments have been studied by the members of the Commission.

MR. BREITENSTEIN: I think it should show in the record that the interpretation placed on the article which you have just adopted is that the commission, the agency you set up, may acquire, hold and dispose of any property, either real or personal, necessary for the performance of any of its powers. I think the record should show that is the intent of the Commission in adopting it.

THE CHAIRMAN: Without objection, the record will so show.

COM. STONE: Mr. Chairman, may I make a further suggestion? It appears to me that it would be good practice if the article be read here rather than rely on our previous reading of it or hasty reading here.

THE CHAIRMAN: That might be a very good suggestion, Judge Stone, and assuming that there is no objection, we will impose on Mr. Breitenstein to read the article.

MR. BREITENSTEIN:

"No state shall deny the right of the United States, another signatory state, any person or entity to construct or participate in the construction and use of diversion works and storage reservoirs with appurtenant works, canals, and conduits in one state for the purpose of diverting, conveying, storing, regulating and releasing water to satisfy the provisions of the Colorado River Compact relating to the obligation of the states of the Upper Division to make deliveries of water at Lee Ferry, or for the purpose of diverting, conveying, storing, or regulating water in an upper state for beneficial consumptive use in a lower signatory state when such use is within the allocation of such lower state herein made. Such rights shall be subject to the rights in a state in which such reservoir or works are located to have and receive the water allocated to it herein for beneficial consumptive use.

"Any signatory state, any person or any entity of any signatory state shall have the right to acquire necessary property rights in any other signatory state by donation, purchase or through the exercise of the power of eminent domain.

"Any signatory state upon the written request of the Governor of any other signatory state for the benefit of whose water users property is to be acquired in the state to which such written request is made shall proceed expeditiously to acquire the desired property through the exercise of its power of eminent domain, and shall convey such property to the requesting state or such entity as may be designated by the requesting state. Provided

however, that all costs and expenses of every kind and nature whatsoever incurred in the acquisition of the requested property shall be paid by the requesting state at the time and in the manner prescribed by the state requested to acquire the property.

"Should any facility be constructed in a signatory state for the benefit of another state or states or the water users thereof as above provided, the construction, repair, replacement, maintenance and operation of such facility shall be subject to the laws of the state in which the facility is located, except that in the case of a reservoir constructed in one state for the benefit of another state the water administration officials of the state in which the facility is located shall permit the storage and release of any water which, as determined by the finding of the Commission, falls within the share of the state for whose benefit the facility is constructed, and in the case of a regulating reservoir for the joint benefit of all states in making Lee Ferry deliveries the water administration officials of the state in which the facility is located shall, in permitting the storage and release of water, comply with the findings and orders of the Upper Colorado River Commission.

"In the event property is acquired in one state for the use and benefit of another the users of water made available by such facilities shall pay to the political subdivisions of the state in which such works are located each and every year during which such rights are enjoyed for such purposes a sum of money equivalent to the average amount of taxes levied and assessed against the land and improvements during the ten years preceding the acquisition of such land in full reimbursement for the loss of taxes in such political subdivisions of the state, said payments to be in lieu of any and all taxes on said property, improvements and rights.

"The signatory states further agree to recommend to the President and to the Congress that in the event the United States shall acquire property in one of the signatory states for the benefit of another signatory state or its water users, provision be made for like payment in reimbursement of loss of taxes."

THE CHAIRMAN: Now, gentlemen, the Chair would like to call your attention to the letter from the Federal Power Commission which has been handed to you and I believe that perhaps you should consider that in connection with Article II. Mr. Breitenstein, will you read the letter?

MR. BREITENSTEIN: "Dear Mr. Bashore"--it is dated January 30, 1948.

THE CHAIRMAN: Pardon me, just a moment. I am just wondering if you need to read the entire letter.

MR. RITER: It is Item (b) on page 2.

MR. BREITENSTEIN: Here is what you want:

"The following language is suggested for the Upper Colorado River Basin Compact:

"Article _____

"Nothing in this compact shall be deemed:

"(a) To impair or affect any rights, powers, or jurisdiction of the United States, or those acting by or under its authority, in, over, and to the waters of the Upper Colorado River and its tributaries, as now provided by law; nor to impair or affect the right of the United States or those acting by or under its authority, to acquire rights in and to the use of waters of said river and its tributaries, as now provided by law;"

The next one I think is the one the Chairman thought was important:

"(b) To subject any property of the United States, it agencies or instrumentalities, to taxation by any State, or subdivision thereof, nor to create any obligation on the part of the United States, its agencies or instrumentalities, by reason of the acquisition, construction, or operation of any property or works of whatsoever kind, to make any payments to any State or political subdivision thereof, state agency, municipality, or entity whatsoever in reimbursement for the loss of taxes;

"(c) To subject any property of the United States, its agencies or instrumentalities, to the laws of any State to any extent other than the extent these laws would apply without regard to this compact."

COM. STONE: As I understand this provision, the last paragraph of the proposed article is not in conflict with that statement made by the Federal Power Commission. It simply says the signatory states agree to recommend to the President and to the Congress in the event the United States shall acquire property in one state and so forth. The Congress may not be willing to carry out that provision. All we say here is that the states agree to attempt to induce the Congress to recognize that provision in the event of the building of any of these works.

MR. WEHRLI: Mr. Chairman, I would like to point out that in the mimeographed copy of the 9th line of the first paragraph after the word "such", which is the second word appearing in that line, the word "use" doesn't appear. I think it is intended to be in there and it was read that way by Mr. Breitenstein, and I believe it should be in.

MR. BREITENSTEIN: I wasn't reading from the mimeographed copy; I was reading from my copy of the copy I gave to the girls to copy.

COM. STONE: The word "use" is eliminated and should be inserted.

COM. CARSON: That is on page 5 of the Legal Advisory Committee report.

COM. STONE: Mr. Chairman, at the risk of being accused of being too technical I should like to raise a point, I don't insist on it, and yet it seems to me that the first paragraph of this article is somewhat in conflict with the following paragraphs. The first paragraph says that, "No state shall deny the right of the United States, another signatory state, any person or entity to construct or participate in the construction and use of diversion works"--and so forth; and the remaining part of the article sets forth the conditions under which another state may acquire and use property in one state for use in another.

Now it seems to me that there is a semblance of a denial by the subsequent provisions. There is a denial unless those provisions are complied with. It seems to me that "no state shall deny" is the intent but it is not

entirely clear--that there shall be no denial--but if a state fails to comply with subsequent provisions, then it seems to me that a denial would follow.

MR. BREITENSTEIN: Judge, you thought of a new one that wasn't suggested in the Legal Advisory Committee meetings.

COM. STONE: Isn't that good?

MR. BREITENSTEIN: I think that is highly technical because I think the rights are fully protected. If you want to grant any validity to that technicality, you can of course put a qualifying phrase in your first couple lines of your opening paragraph.

COM. STONE: That is my suggestion, that for fear some lawyer in the future may also be highly technical or some state I think it would be well to insert that.

MR. BREITENSTEIN: "Upon the compliance with this article no state shall deny the right"--something like that. That wouldn't quite do it. Something like that would take care of what you have in mind. "Subject to the conditions hereinafter stated"--begin that way.

COM. STONE: To get this matter before the Commission, I move at the beginning of the first paragraph of the article on page 5 there be inserted the words, "Subject to the conditions hereinafter stated".

COM. WATSON: Second the motion.

THE CHAIRMAN: Is there discussion of the motion: Are you ready for the question?

COM. WATSON: Question.

MR. SAUNDERS: One thing I would like to ask, in the second sentence of the same paragraph, "Such rights shall be subject to the rights in a state in which such reservoir or works are located to have and receive the water allocated to it herein for beneficial consumptive use"--don't you mean, "shall be limited by" rather than "subject to"?

MR. BREITENSTEIN: No, I didn't mean that, Mr. Saunders. The idea is that the exercise of these rights, whatever they are, shall be subject--just the plain meaning of the word "subject"--to the rights of the state in which the reservoir is located--inferior and superior, paramount and subordinate, primary and secondary, "a" and "b", one and two.

MR. SAUNDERS: You have just nullified all the rest of your section.

MR. BREITENSTEIN: No. It was not the intent to nullify it, but it was an attempt to make it subordinate.

MR. SAUNDERS: I will have to sleep over it to see that you haven't just practically abolished the rest of the language of that section.

MR. BREITENSTEIN: All right, how would you suggest we change it?

MR. SAUNDERS: As I say, I will sleep over it. I want to see what I think about it tomorrow morning. I stumbled over that language when I read it first and I stumbled again.

MR. BREITENSTEIN: That language there is not new to the Legal

Advisory Committee. That is from the Republican River Compact. Maybe for that reason it should be changed.

MR. SAUNDERS: That hasn't gone very far yet either.

MR. BREITENSTEIN: I just wanted to show you the source of the language.

THE CHAIRMAN: We will call the roll. Wyoming?

COM. BISHOP: Yes.

THE CHAIRMAN: Colorado?

COM. STONE: Yes.

THE CHAIRMAN: Utah?

COM. WATSON: Yes.

THE CHAIRMAN: New Mexico?

COM. WILSON: Yes.

THE CHAIRMAN: Arizona?

COM. CARSON: Yes.

MR. WEHRLI: Mr. Chairman, the matter I have in mind, which may be hypertechnical, relates to the last sentence in that first paragraph where it says that, "Such rights shall be subject to the rights in a state in which such reservoir or works are located to have and receive the water allocated to it herein for beneficial consumptive use." I believe a better use of language would be to say that "are located to receive and use the water." Of course, the language used may mean that but it may not.

MR. BREITENSTEIN: I would agree with you on that.

MR. WEHRLI: I think it would be a better use of language--"are located to receive and use the water."

COM. STONE: That is unquestionably better. I think we ought to have a motion and make the correction.

COM. BISHOP: I move the correction be made as has just been stated by Mr. Wehrli.

COM. WATSON: Second the motion.

COM. CARSON: Let's get it exact. Which one do you mean?

MR. WEHRLI: I would strike out "have and" just before "receive" and say, "receive and use."

MR. HOWELL: Would you mind repeating that once more? I didn't get it yet.

MR. WEHRLI: In the next to the last line of that first paragraph of that article, strike out the words, "have and", and after the word "receive" insert the words "and use".

MR. HOWELL: So it now reads, ". .or works are located to receive and use the water allocated to it. ."

MR. WEHRLI: That is right.

THE CHAIRMAN: Is there further discussion of the motion?

COM. STONE: Question.

THE CHAIRMAN: Question has been called for. Wyoming?

COM. BISHOP: Yes.

THE CHAIRMAN: Colorado?

COM. STONE: Yes.

THE CHAIRMAN: Utah?

COM. WATSON: Yes.

THE CHAIRMAN: Arizona?

COM. CARSON: Yes.

THE CHAIRMAN: New Mexico?

COM. WILSON: Yes.

THE CHAIRMAN: Motion carries unanimously.

COM. BISHOP: Mr. Chairman, I move that the article as amended be approved.

COM. WATSON: Second the motion.

MR. CLYDE: Mr. Chairman, before you vote on that motion I have one other comment to make that was raised by the Federal Representative to the Legal Advisory Committee. On page 6 of the mimeographed report, second paragraph, beginning, "Should any facility be constructed in a signatory state for the benefit of another state. .", as you go on with that language it subjects such construction in another state to the laws of the state in which the project is constructed.

I think that, unless the United States is excepted from it by a later provision, is inconsistent with the letter of the Federal Power Commission; and we discussed that pro and con in the Legal Committee. Some were of the opinion that if it is inconsistent with their position it could be taken care of by a later general provision excluding the United States. I think if that were not done it would be inconsistent with the letter written by the Federal Power Commission and that the Commission in voting on it should have that fact in mind and be aware of the necessity for some general language in addition to this to cover the thing covered by the Federal Power Commission letter.

MR. BREITENSTEIN: The matter which Mr. Clyde has just mentioned is the reason for the inclusion of Comment No. 2. If Comment No. 2 is put in as the interpretation of the clause of the Commission in adopting it, it seems to me you have the matter taken care of.

MR. HOWELL: Does the motion now made include the adoption of the comments under this article?

COM. STONE: I do not believe it does and for the sake of making the legislative history clear, it might be well in moving the tentative adoption of this article that particular attention be called to Comment No. 2 and that it be written into the record here as a part of the motion.

COM. WATSON: Do you make that in the form of a motion?

MR. WEHRLI: I think that Wyoming made the motion. We will accept that, Judge Stone.

COM. STONE: Very well. May we ask then that Mr. Wehrli restate the motion carrying out that idea so the record will be clear.

MR. WEHRLI: Well, the motion made then is that the article proposed by the Legal Advisory Committee entitled, "Facilities in one State for the Use or Benefit of Another State or States," be approved as amended and carrying with it the comments of Paragraph 2 on page 7 of the report wherein it is stated: "In subjecting a facility in one state to the laws in the state in which the facility is located, it is not the intent to subject the United States to the police regulations of a state to an extent greater than that provided for in Section 8 of the Reclamation Act of 1902."

THE CHAIRMAN: Is that agreeable to the second?

COM. WATSON: I will accept that and second the motion.

THE CHAIRMAN: Are you ready for the question?

COM. WATSON: Question.

THE CHAIRMAN: Question has been called for and we will vote on the motion. Wyoming?

COM. BISHOP: Yes.

THE CHAIRMAN: Colorado?

COM. STONE: Yes.

THE CHAIRMAN: Utah?

COM. WATSON: Yes.

THE CHAIRMAN: New Mexico?

COM. WILSON: Yes.

THE CHAIRMAN: Arizona?

COM. CARSON: Yes.

(The article above referred to reads as follows as amended:)

"FACILITIES IN ONE STATE FOR THE USE OR
BENEFIT OF ANOTHER STATE OR STATES

"Subject to the conditions hereinafter stated no state shall deny the

right of the United States, another signatory state, any person or entity to construct or participate in the construction and use of diversion works and storage reservoirs with appurtenant works, canals, and conduits in one state for the purpose of diverting, conveying, storing, regulating and releasing water to satisfy the provisions of the Colorado River Compact relating to the obligation of the states of the Upper Division to make deliveries of water at Lee Ferry, or for the purpose of diverting, conveying, storing, or regulating water in an upper state for beneficial consumptive use in a lower signatory state when such use is within the allocation of such lower state herein made. Such rights shall be subject to the rights in a state in which such reservoir or works are located to receive and use the water allocated to it herein for beneficial consumptive use."

(The remaining five paragraphs of the above article were not amended.)

THE CHAIRMAN: Apparently the Commission is now ready for the consideration of Article III entitled, "Charging of Reservoir Losses."

The Chairman requests that Mr. Breitenstein read Article III.

MR. BREITENSTEIN:

"Water losses resulting from reservoir operations shall be charged to the state or states receiving benefit from such reservoir operations in proportion to the beneficial consumptive use of water made available to each state by the reservoir except that in the case of regulating reservoirs for the joint benefit of all states in making Lee Ferry deliveries the charge shall be proportionate to the beneficial consumptive use of water in each state during the year for which the charge is made."

COM. BISHOP: I make a motion that Article III on page 8 be adopted.

THE CHAIRMAN: Does the Chair hear a second to the motion?

COM. WATSON: Second the motion.

THE CHAIRMAN: Are there comments or discussion of the motion as made and seconded?

MR. BREITENSTEIN: I want to warn you against that. I think that is one that may cause you difficulty when you come finally to apportion the consumptive use of water and obligations at Lee Ferry among the states, but nobody yet has come up with a better idea than this. This is certainly a case where your adoption should be tentative and the formula should be given careful consideration both by the engineers and lawyers.

MR. HOWELL: In any event, the adoption is only tentative here at this time, or hypothetical.

THE CHAIRMAN: The Chairman would like to ask Mr. Carson if he sees any embarrassment arising in the interpretation of the original Compact if this motion is adopted?

COM. CARSON: No. No, I don't see any embarrassment but I agree that this should be tentative. My own engineer just suggested to me he didn't know whether this would work. So we have to consider this tentative and have engineers and lawyers go over it again before it is finally written

into the final compact. But I think it does embody in that the principle that reservoir losses should be charged in proportion to the benefits received from storage in the reservoir, which I think is not in any way inconsistent with or in dereliction of the original Compact.

MR. WALLACE: Would you begin the paragraph with the words, "Within the Upper Basin"?

MR. BREITENSTEIN: My thought in connection with that is that if you are going to preface this paragraph with any such language you are going to have to preface pretty nearly every paragraph in your compact with the same language and it is unnecessary to do that. There should be a clear, general statement near the front of the compact which should take care of not only this provision but every provision of the compact and it shouldn't be necessary to repeat or reassert that language when you write the compact.

COM. STONE: Mr. Chairman, I think Mr. Breitenstein's suggestion there would take care of this and other matters more appropriately. It carries out the same idea. It would be better to make that clear right at the beginning of the compact.

COM. CARSON: That is what I thought.

Well, Mr. Chairman, I think both of those points of view can be reconciled by inserting this language, after the words "reservoir operations" in the first line, the words, "in the Upper Basin".

MR. WEHRLI: I think that is a good suggestion.

MR. BREITENSTEIN: I won't object to that, Charlie.

COM. CARSON: But then wait a minute, I have got another one. I don't want to be charged with them either as a Lower Basin State. (Laughter.)

MR. BREITENSTEIN: I thought you wouldn't bring that up.

COM. CARSON: Then also after the word "states" in the second line, you would say "of the Upper Basin".

THE CHAIRMAN: Gentlemen, we will recess for five minutes in order to give our reporter a chance to stretch her arm.

(9:45 p.m. Recess.)

(9:55 p.m. Meeting resumed.)

THE CHAIRMAN: Will you come to order.

COM. STONE: Mr. Chairman, I offer a substitute motion. It appearing that the clause dealing with charging of reservoir losses involves engineering as well as legal considerations, I move that action on that clause be deferred at this time and that the clause be referred to the Engineering Advisory Committee, who shall consult with the Legal Advisory Committee, and advise the Commission which will consider the clause at a later time.

COM. CARSON: I second the motion.

THE CHAIRMAN: Are there any comments on the substitute motion?

COM. WATSON: Question.

THE CHAIRMAN: We will now vote on the substitute motion. Those in favor will say "Aye" and I will call on Wyoming first.

COM. BISHOP: Aye.

THE CHAIRMAN: Colorado?

COM. STONE: Aye.

THE CHAIRMAN: Utah?

COM. WATSON: Aye.

THE CHAIRMAN: New Mexico?

COM. WILSON: Aye.

THE CHAIRMAN: Arizona?

COM. CARSON: Aye.

COM. STONE: Mr. Chairman, I move we adjourn to reconvene at ten o'clock in the morning.

COM. WATSON: Second the motion.

(Thereupon a vote was taken and Com. Stone's motion carried unanimously.)

(10:00 p.m., Thursday, February 19, 1948, recess until 10:00 a.m., Friday, February 20, 1948.)

- - - - -

Denver, Colorado
February 20, 1948
10:00 o'clock a.m.

(All Commissioners present.)

THE CHAIRMAN: The Commission will come to order. Apparently the Commission is now ready to consider Article IV of the report of the Legal Advisory Committee, and following the procedure of yesterday, we will request Mr. Breitenstein to read the Article.

MR. BREITENSTEIN:

"Inasmuch as the Upper Colorado River has ceased to be navigable for commerce and the reservation of its waters for navigation would seriously limit the development of the Upper Colorado River basin, the use of its waters for the purposes of navigation shall be subservient to the uses of such waters for domestic, agricultural, and power purposes. If the Congress shall not consent to this paragraph, the other provisions of this compact shall nevertheless remain binding.

"Subject to the provisions of this compact, water of the Upper Colorado River System may be impounded and used for the generation of electrical power, but such impounding and use shall be subservient to the use and consumption of such water for agricultural and domestic purposes and shall not interfere with or prevent use for such dominant purposes.

"The provisions of this article shall not apply to or interfere with the regulation and control by any state within its boundaries of the appropriation, use, and distribution of water."

THE CHAIRMAN: Thank you, sir.

COM. STONE: Mr. Chairman, in order that we carefully consider this article and not for the purpose of necessarily expressing an opinion at this time, I should like to raise a question with respect to Paragraph 1 of this article.

There has been a lot of history on this question of navigation as it relates to utilization of waters since the Colorado River Compact was adopted. The matter has received considerable attention in Congress. It has also been the subject of much controversy in making other compacts between the states and such agencies as the Federal Power Commission. The Federal Power Commission Act of 1936 delegated certain powers to the Federal Power Commission by the Congress.

Fortunately, the Congress in 1938 when it approved the Colorado River Compact was not subject to pressures on that question which exist today. The Upper Basin even after the negotiation of this compact will still be subject to all of the provisions of the Colorado River Compact. On this particular subject the Colorado River Compact is the law of the river and will continue to be the law of the river. Then, too, the physical conditions, the construction of many dams, the existence of such dams as Hoover Dam, eliminate any fear on this subject. Some of the great projects have been authorized and others will be authorized and built among other things for the production of power, which stems back to the commerce clause. Since the question is covered by the Colorado River Compact I suggest we eliminate the first paragraph of this Article.

Colorado moves that the question which has been raised regarding Article IV be re-referred to the Legal Committee for further consideration.

COM. WATSON: Second the motion.

THE CHAIRMAN: Any discussion of the motion? (Question is called for.) Wyoming?

COM. BISHOP: Yes.

THE CHAIRMAN: Colorado?

COM. STONE: Yes.

THE CHAIRMAN: Utah?

COM. WATSON: Yes.
THE CHAIRMAN: New Mexico?
COM. WILSON: Yes.
THE CHAIRMAN: Arizona?
COM. CARSON: Yes.
THE CHAIRMAN: Motion carries.

COM. STONE: Mr. Chairman, Mr. Merriell has a point on that article which I should like to have him state for the benefit of the Legal Committee when it reconsiders this motion.

MR. MERRIELL: In the second paragraph of Article IV that appears

here, there is no reference to the use to which certain large reservoirs in the middle river are going to be put. It strikes me that the Legal Committee ought to give consideration to the regulatory effect of the reservoirs, so that the latter part of that paragraph should read, "subservient to the use and consumption of such water for agricultural and domestic purposes"--and then a statement--"as to the regulating reservoirs." Otherwise there is no recognition of the regulatory effect of those reservoirs.

THE CHAIRMAN: Well, does Colorado have some language which it is proposed to insert or substitute?

COM. STONE: We have Mr. Breitenstein, and we would possibly have language to suggest when the matter comes up before the Legal Advisory Committee.

THE CHAIRMAN: Gentlemen, are you ready for the consideration of Article V? Mr. Breitenstein, will you please read Article V so we may have it before us for consideration?

MR. BREITENSTEIN:

"Nothing in this compact shall be construed as affecting the obligations of the United States of America to Indian tribes."

That is all there is.

COM. BISHOP: Mr. Chairman, I move the adoption of that article.

COM. WATSON: Second the motion.

THE CHAIRMAN: Is there any discussion of that motion? Ready for the question? (Question is called for.) Wyoming?

COM. BISHOP: Yes.

THE CHAIRMAN: Colorado?

COM. STONE: Yes.

THE CHAIRMAN: Utah?

COM. WATSON: Yes.

THE CHAIRMAN: New Mexico?

COM. WILSON: Yes.

THE CHAIRMAN: Arizona?

COM. CARSON: Yes.

THE CHAIRMAN: It occurs to me that before we get through we will have to include pretty near the entire transcript because as we go along with this discussion there are going to be more things referred. Isn't it going to be the entire transcript? Am I wrong?

COM. STONE: No.

Colorado moves that the reporter be asked to prepare: 1. Copies

of all articles contained in the report of the Legal Advisory Committee which have been tentatively approved by the Commission; 2. Copies of Article III relating to reservoir evaporation losses which has been referred for consideration by the Engineering Advisory Committee; 3. Copies of Article IV which has been re-referred to the Legal Advisory Committee; and that such copies be made available to the members of the Commission, the members of the Legal Advisory Committee, and the members of the Engineering Advisory Committee.

Does that now cover all the suggestions?

COM. WATSON: Second the motion.

MR. WEHRLI: I presume that the reporter in preparing that would reflect whatever changes have been made, I don't recall very many, or what would be the thought on that?

COM. STONE: I thought that would carry the changes and that was the principal reason for doing it. You might put that in there. Instead of saying the articles that have been tentatively approved, the articles as revised and tentatively approved. That was the purpose, some here wanted to get these articles as revised.

MR. WEHRLI: Very well.

COM. STONE: Otherwise there would be no need. We would just make extra copies of this.

THE CHAIRMAN: Do you have any further comments? (No response. Question is called for.) Wyoming?

COM. BISHOP: Yes.

THE CHAIRMAN: Colorado?

COM. STONE: Yes.

THE CHAIRMAN: Utah?

COM. WATSON: Yes.

THE CHAIRMAN: New Mexico?

COM. WILSON: Yes.

THE CHAIRMAN: Arizona?

COM. CARSON: Yes.

(Discussion off the record.)

THE CHAIRMAN: Judge Stone, yesterday you indicated that you had a matter which you wished to lay before the Commission in regard to the services of Mr. Blaney, I believe.

COM. STONE: I can bring that up now.

THE CHAIRMAN: It occurs to the Chairman that now is a good time for that because it will fit in anywhere and we have completed consideration of the Legal Advisory Committee report.

COM. STONE: I am sorry Mr. Giles is not here. I made that suggestion because of the fact that Mr. Giles, Secretary of the Commission, reminded me that we had voted to make a fund available in his hands to pay the expense vouchers of Mr. Blaney. He now has a bill for $135.00. He suggested that appropriate action be taken to make funds available in his hands to comply with previous action of the Commission in that matter.

MR. WALLACE: Off the record. (Discussion off the record.)

COM. STONE: Mr. Chairman, I move that pursuant to resolution adopted at the last meeting of the Commission, the Secretary of the Commission bill each of the four states, Colorado, New Mexico, Utah, and Wyoming for $250.00 each.

COM. WATSON: Second the motion.

THE CHAIRMAN: Are there any comments on the motion as made and seconded?

COM. WATSON: Question.

THE CHAIRMAN: Question has been called for. Wyoming?

COM. BISHOP: Yes.

THE CHAIRMAN: Colorado?

COM. STONE: Yes.

THE CHAIRMAN: Utah?

COM. WATSON: Yes.

THE CHAIRMAN: New Mexico?

COM. WILSON: Yes.

COM. CARSON: Arizona can't vote.

THE CHAIRMAN: Arizona declines to vote. The motion carries.

We may now proceed with the consideration of the remaining articles on the agenda, which are somewhat numerous.

COM. CARSON: I move that it be deferred for later consideration.

COM. WILSON: And the Legal Advisory Committee can give such further consideration to it as is desired.

COM. STONE: I second the motion.

THE CHAIRMAN: Any discussion of the motion as made by Mr. Carson and seconded by Judge Stone? Are you ready for the question?

COM. BISHOP: Question.

THE CHAIRMAN: Wyoming?

COM. BISHOP: Yes.

THE CHAIRMAN: Colorado?

COM. STONE: Yes.

THE CHAIRMAN: Utah?

COM. WATSON: Yes.

THE CHAIRMAN: New Mexico?

COM. WILSON: Yes.

THE CHAIRMAN: Arizona?

COM. CARSON: Yes.

THE CHAIRMAN: It appears the Commission is ready to consider the items in Group II on page 2 of the mimeographed copy of the agenda, subitem (a): "What provisions shall be incorporated in the compact to define the rights and obligations of the United States."

COM. STONE: Mr. Chairman, may I inquire, don't you have a letter from the Federal Power Commission that makes suggestions on the provisions?

THE CHAIRMAN: Yes, indeed, and the letter was passed out to the members of the Commission and are available for consideration.

THE CHAIRMAN: We don't like to impose on Mr. Breitenstein but we would be very glad to have him read it.

MR. BREITENSTEIN: This is a letter from the Federal Power Commission dated January 30, 1948, to Mr. Bashore.

(Letter referred to and read.)

COM. STONE: Mr. Chairman, this clause has been considered by Colorado as one state, no doubt by other states. I happen to know that it has been considered by Wyoming in some other compacts, and this has come to be rather common language on this particular subject. We do not see any objection to it. It leaves the rights and the jurisdictions of the Federal and State Governments just where they are, and those rights are not changed by the compact.

In considering this subject I believe we should keep in mind that the Federal Government is not a party to the compact in the absence of ancillary administration. I don't believe we are trying to define the rights between the Federal and State Governments in this compact. We leave them just where they are and that is all this clause does. We don't attempt or could we legally impose any taxation or claims against the Federal Government to pay money in lieu of taxes. Colorado would approve tentatively acceptance of this suggested language.

THE CHAIRMAN: The Chair wonders if the Commission wants to take any action whatsoever on these suggestions by the Federal agencies until you get them all before us. We haven't heard from the Interior Department or the Department of Agriculture. That is merely a suggestion for consideration.

COM. STONE: I have not moved for its tentative acceptance.

THE CHAIRMAN: I understand that.

COM. STONE: I say we would have no objection to it and experience has demonstrated that probably all the Federal agencies will ask for such language.

COM. BISHOP: Judge Stone, if we don't have it in there we will have an argument with the Federal Power Commission and will have to put it in before we can get it through Congress.

COM. STONE: Mr. Chairman, to dispose of this matter without delay, and in view of the fact that suggested language by other Federal agencies has not yet been received, Colorado moves that this matter be deferred for future consideration.

COM. WATSON: Second the motion.

THE CHAIRMAN: Are there any remarks or discussion of the motion made and seconded?

COM. WATSON: Question.

THE CHAIRMAN: Question has been called for. Wyoming?

COM. BISHOP: Yes.

THE CHAIRMAN: Colorado?

COM. STONE: Yes.

THE CHAIRMAN: Utah?

COM. WATSON: Yes.

THE CHAIRMAN: New Mexico?

COM. WILSON: Yes.

THE CHAIRMAN: Arizona?

COM. CARSON: Yes.

THE CHAIRMAN: Perhaps we are now ready for the consideration of subitem (b) of Group II which reads: "How shall water uses made by the United States or any of its agencies be charged."

MR. BREITENSTEIN: Mr. Chairman, since Colorado prepared this agenda, may I say what we had in mind there?

THE CHAIRMAN: Yes.

MR. BREITENSTEIN: That is tied in, of course, with subdivisions (c), (d), (e) and (f) under Group II. Those relate to the Indians, navigation, flood control and silt control, and the question is whether or not it is desirable to have in the compact any provision relative to the charging of water uses by the United States. It would seem to me that unless there are specific provisions relating to that matter, the water uses would then be charged against the state in which the use is made of the water.

Consider first the question of the Indians; I apprehend that unless

there is some particular provision taking care of the Indians, the uses by the Indians would be a charge against the allocation made to the state in which the uses occur. Now, is there any reason for incorporating in the compact any provision which would make charges for any of these Federal uses, requiring charges to be made in any different way than are other uses of water?

I might say that the question of the charging of Indian uses was considered to some extent by the Legal Advisory Committee and as I understand it, the consensus of opinion in that Committee was that the uses should be charged against the share of the state in which the uses occur. So far as the Indians are concerned, the point was raised that it would be very difficult from an administrative standpoint to differentiate between Indian uses and white uses, and that any provision which attempted to charge Indian uses against the Basin as a whole would not be possible of practical operation.

THE CHAIRMAN: Gentlemen, you have heard Mr. Breitenstein's explanation. Are there further comments?

MR. WEHRLI: Mr. Chairman, it appears to us at this time that no provision should be incorporated in the compact upon the subject designated under subparagraph (b) of Group II. I don't know hardly how you could frame a provision properly in any event without the states recognizing at least impliedly, some rights that I presume most of the states, if not all of them, deny that the United States has. In other words, I think the position of the states probably is that whatever use is made by any agency of the United States is only as an appropriator of the particular state in which the use is made.

COM. STONE: This question of Indian rights came up before and there was submitted in accordance with the request of the Commission, a brief prepared by Mr. Breitenstein on that subject. I assume that the Legal Committee studied that brief.

MR. WEHRLI: We have partially disposed of the item under (c), not completely, however. It seems to me that (b) and (c) ought to be disposed of together by a general provision in the compact to the effect, generally, that all beneficial use of waters in any state shall be supplied from the water apportioned to that state. That is roughly the language in Article VIII of the Colorado River Compact. I refer more particularly to the second paragraph of Article VIII.

MR. RITER: Mr. Chairman, I note all the Federal agencies have not submitted reports on what rights they might claim. May I suggest that maybe the Commission will probably have to defer action on (b) till they find out what claims, if any, are going to be submitted under (a).

I know we have given quite a little thought to that in the Bureau. We haven't made up our mind fully what rights if any we should claim. We recognize that under Section 8 of the Reclamation Act, the United States gets its water rights through the states; however, it is possible that there may be other rights that might be claimed.

For example, I refer you to Commissioner Lawson's letter of the International Boundary and Water Commission of December 18th, and he suggests brief language to allow for the Mexican Treaty obligation. Then I would like to raise at this time also a possible question about power reservoirs the Federal Government may build, recognizing of course that the Commission has already indicated that power should be subservient to other uses; but none the less, there is also a question about evaporation losses from power reservoirs.

In view of all these complications and in view of the fact that we

don't know what other rights might be claimed--it might be conceivable, for example, that there might be some right claimed for Fish and Wildlife purposes --I am merely throwing that out as a possibility--in view of the uncertainty it just seems to me that as a suggestion to the Commission, you might want to defer action on (b) until you have in front of you the rest of the claims the Federal agencies may wish to make.

MR. CLYDE: Mr. Chairman, it seems to me that in view of the discussion that the Legal Committee had, for example, about Indian rights and the difficulties that will be encountered if they are attempted to be fixed on a basin rather than a state basis, and that if they are fixed on a state basis, that that factor will be one of the factors that will have to be considered in allocating the water, those states having large Indian rights, if they also have the obligation of taking care of the Indians from their allocated share, must have that factor considered in allocating the water; and therefore it seems to me undesirable to attempt to dispose of the basis upon which you are going to divide Indian rights until you allocate the water, find out what weight you give to that factor in the allocation. If you disregard that factor in allocation, it would seem to me you would have to put it on a basin basis. If you give states credit because they have got Indian rights, then that determination it would seem to me would dictate that you go on a state basis. It seems premature to try to dispose of it now.

COM. WATSON: Mr. Chairman, I think that subdivision (c) should be treated similarly to subdivision (b), that we are not ready to make a decision and we should defer action on it. Speaking for Utah, there are about 70,000 acres in the Uinta Basin that are watered from the Uinta Mountains. Three acre-feet per acre are diverted to those 70,000 acres.

I don't think we are ready to make any decision on that one way or the other, so I suggest that Item (c) be deferred for further consideration.

COM. STONE: Why pick out one item? If you are going to defer it, defer them all because they are all related.

THE CHAIRMAN: It occurs to your Chairman that the War Department hasn't notified the Commission in regard to navigation except in its first letter and we have asked the War Department for a reply to those two questions propounded by the Commission. In the absence of that information today it appears doubtful whether you can take intelligent action on subitem (d).

COM. WILSON: I move that action on Group II, page 2, of the agenda, designated as Paragraphs (a), (b), (c), (d), (e), (f), and (g), be deferred with this provision, that as to subdivisions (d), (e), (f), and (g), it does not foreclose discussion at this time.

COM. BISHOP: Second the motion.

THE CHAIRMAN: Are there comments on the motion as made by Judge Wilson and seconded by Mr. Bishop?

COM. WATSON: Question.

THE CHAIRMAN: Wyoming?

COM. BISHOP: Yes.

THE CHAIRMAN: Colorado?

COM. STONE: Yes.

THE CHAIRMAN: Utah?

COM. WATSON: Yes.

THE CHAIRMAN: New Mexico?

COM. WILSON: Yes.

THE CHAIRMAN: Arizona?

COM. CARSON: Yes.

THE CHAIRMAN: We have now reached Group III on the agenda and are ready for the consideration of the subitems under Group III. Subitem (a) reads: "Shall compact contain any provision relating to the delivery of water at Lee Ferry for the use of Mexico in the event there is not sufficient surplus water to supply the Mexican share."

MR. WEHRLI: Mr. Chairman, I think that it is obvious that some provision will have to be made to recognize the potential obligation in the Colorado River Compact, and I hope it is only potential, and to apportion that obligation among the States of the Upper Basin, that is to say, to apportion such obligation as may arise against the States of the Upper Basin between or among those States. We would be of the opinion that that obligation, whatever it may be, ought to be apportioned upon the same basis as the obligation to make the required deliveries at Lee Ferry. It hardly seems possible that you can deal in terms of quantities of water in connection with this potential obligation and that we will likely have to deal with the distribution of it among the states upon a percentage basis. And as I say, we would be of the opinion that that obligation should be borne percentage-wise in the same way as the obligation to make deliveries at Lee Ferry.

THE CHAIRMAN: Well, let's have a free discussion of that item and then dispose of the matter with a motion.

COM. WILSON: Mr. Chairman, I am inclined to agree with what Wyoming said but we have already deferred action on determining the exact obligation at Lee Ferry among the states. It seems to me that the two go together and we couldn't make any actual determination of any provision in the compact relative to the Mexican Treaty or otherwise until that question has also been considered.

MR. RITER: Mr. Chairman, with regard to Mr. Wehrli's comments may I suggest this, that the Mexican Treaty obligation is a real obligation. Under the original 1922 compact, we did not know what the obligation would be to Mexico. In the meantime, however, a Treaty has been consummated and the Mexican obligation is now known and is real.

THE CHAIRMAN: Mr. Riter, I think maybe you misunderstood Mr. Wehrli. I think he recognizes that part of it but his remarks were directed to the occasion of an extraordinary drought.

MR. BREITENSTEIN: No.

THE CHAIRMAN: Isn't that true?

COM. STONE: No, his remarks went to (a).

MR. WEHRLI: My thought about it was that it is a real obligation,

Mr. Riter; but I merely was trying to express the hope that while it was a real obligation, the water supplies would be such that the Upper Basin would not be called upon to have to supply any water. That is the thought I had in mind.

MR. RITER: Well, of course, we can all live in hopes.

MR. WEHRLI: I don't disagree with you. It is an obligation that is placed on the Upper States.

MR. RITER: I may have misunderstood your remarks. I rather gathered from your remarks that it wasn't a definite obligation, potential obligation.

MR. WEHRLI: It provides that we must respond to the supplying of a deficiency. I was merely trying to express the hope that there wouldn' be a deficiency.

THE CHAIRMAN: Mr. Riter, you were interrupted. Have you complete your statement?

MR. RITER: Yes. Apparently I misunderstood the intent of Mr. Wehrli's remarks.

COM. STONE: This liability might be better described as a contingent liability and it certainly is one which the states cannot overlook, particularly because of the provision of the Colorado River Compact and because of the fact that the total obligation of the United States has been determined.

COM. WATSON: Mr. Chairman, I move that we defer this Group III, Items (a) and (b), until the obligation is determined and further action concerning our obligation at Lee Ferry is decided.

COM. STONE: Mr. Chairman, has that motion been seconded?

THE CHAIRMAN: No, it has not. You have heard Com. Watson's motion. Is there a second?

COM. WILSON: To get it before the house I will second it.

THE CHAIRMAN: The motion has been made and seconded by Judge Wilson. Is there discussion on the motion?

COM. WATSON: Mr. Chairman, I would like to modify my motion. I intended to include (b) also.

THE CHAIRMAN: You did.

COM. STONE: Mr. Chairman, I would like to make a substitute motion. I don't know why we should just defer everything. Some things we must defer but why can't we make some progress here.

My remarks go solely to Subsection (a) and for that reason I move that the Commission recognizes the contingent liability for deliveries of water at Lee Ferry in the event there is not sufficient water supply to comply with the obligations of the United States under the Mexican Treaty, and that the matter be referred to the Legal Advisory Committee.

COM. BISHOP: I second the motion.

THE CHAIRMAN: Substitute motion has been made by Judge Stone and seconded. Com. Watson, do you care to withdraw your motion?

COM. WATSON: If it is necessary. I would like to comment.

I think that what Judge Stone stated is already the law of the river and we all understand it so we are just simply stating something that is self-evident. Therefore we refer something that is selfevident to the Legal Committee.

COM. STONE: My purpose, Mr. Watson, is this: The Legal Committee is a drafting committee and we could make some progress by an instruction to the Legal Committee to prepare language. Now the apportionment is another matter which need not necessarily be included in such language, but we ought to make some progress, not just put everything off, when there are some things that the Legal Committee can be working on.

COM. WATSON: I yield, Judge Stone. If you say refer it to the Legal Committee, that is the thing to do.

MR. CLYDE: Mr. Chairman, it seems to me that about the only thing the Legal Committee could do at this point would be to recognize that this is the law of the river. As far as making the apportionment of that obligation, the Legal Committee can do nothing to draft language there until you decide how you are going to apportion the obligation at Lee Ferry, (a) to the Lower Basin and, (b) to Mexico.

COM. STONE: Mr. Clyde, that is exactly what I said. The Legal Committee is not authorized to incorporate it but certainly they could leave that part blank and we could get some language without taking some time in the future to do it and to have it before the Commission. That is my only purpose in it.

MR. WEHRLI: Judge Stone, I agree with what you say. It occurs to me that the language in relation to this obligation may necessarily have to be coupled with the language in relation to the apportionment of the obligation for delivery at Lee Ferry, or at least that it might be desirable.

COM. STONE: I recognize that, Mr. Wehrli. I think that is true and that is a matter which the Legal Committee could report back on.

MR. WEHRLI: I would merely want to make this further suggestion that while the Legal Committee would have no authority and no business trying to allocate either obligation, I would favor at this time referring to the Legal Committee the task of preparing such language as the Legal Committee would deem appropriate for apportioning these obligations. Perhaps you wouldn't want to go that far but I think the Legal Committee could be doing something in attempting to draft some language on both subjects.

COM. STONE: That is the apportioning of the obligation at Lee Ferry. I wouldn't oppose that; I think that is all right. I would go as far as Mr. Wehrli suggests.

COM. CARSON: Mr. Chairman, it seems to me that whatever language is prepared along that line that would in any way differ from that suggested by the International Boundary and Water Commission would require substantive decision by this Commission.

Speaking now as Arizona, a Lower Basin State, we are not directly concerned in the division of the obligation of the Upper Division to make deliveries at Lee Ferry. But the obligation of the Upper Division to make deliveries at Lee Ferry for use in Mexico is not limited to a deficiency of the

surplus, but includes the delivery at Lee Ferry of the surplus to help suppl the burden to Mexico in a very large quantity.

The Colorado River Compact apportioned water to Mexico in an indeterminate amount until fixed by the United States but provided that it should first be supplied out of the surplus. So then it seems to me that the obligation of the States of the Upper Division to deliver water at Lee Ferry is not limited to the 75,000,000 acre feet every ten-year period as set out in the Colorado River Compact, but in addition to that 75,000,000 acre feet every ten-year period, some surplus would have to be delivered there for Mexico.

Now, according to our engineer's figures, and I believe they are the Bureau figures, the virgin flow of the River at the Mexican Boundary, with the allocation to Mexico and the apportionment to the Upper and Lower Basins, reduces the surplus in the whole river to some 220,000 acre feet on the average above all of our rights. That necessarily then includes the obligation of the States of the Upper Division to make delivery at Lee Ferry in addition to the 75,000,000 acre feet every ten years for use in the Lower Basin, approximately a million acre feet a year on the average to discharge the obligation to Mexico in the absence or the disappearance of surplus, at which time if there was any deficiency in the surplus to Mexico, then the Lower Basin would supply half the deficiency and the Upper Division half.

So it is a very complicated affair right in there that I think would require the additional engineering information that I understand you feel you have to have before you could make or begin to get down to the question of the apportionment of the beneficial consumptive use of the 7,500,000 acre feet apportioned to the Upper Basin, or an apportionment of the obligations to deliver at Lee Ferry. So that the Legal Committee now would not be able to do much in addition to what the Boundary Commission suggests, which is that: "Nothing in this Compact shall be construed as affecting the obligations of the United States of America to the United Mexican States under existing treaties." That is about as far as the Legal Committee could now go until further substantive decisions are made.

COM. STONE: Mr. Carson, I don't quite follow you. I have always contended for engineering data when it is necessary; but I don't quite see why you need any engineering data on this subject. We must recognize, of course, the obligation on that surplus to make deliveries at Lee Ferry. That is a legal matter.

COM. CARSON: Yes.

COM. STONE: We don't know what that is and I doubt whether the Engineering Committee can lend any light on it; and if they did, the obligation would remain the same no matter what it is. I think your statement demonstrates the advisability of the Legal Committee considering the languag submitted by the International Boundary Commission and the suggestions which have been made here and make some progress by working on it.

COM. CARSON: Well, if you refer it we will do the best we can wit it, but I wanted to call your attention to those other things.

COM. STONE: Whether the Engineering Committee said it was 1,500,000 acre feet or 500,000 acre feet, it is still an obligation. And then added to that is the additional obligation imposed by the Colorado River Compact for each state to share equally if the surplus defined in the olorado River Compact is deficient to meet Mexican obligations.

THE CHAIRMAN: For each basin to share, you mean.

COM. STONE: Each basin, I mean. So that the discussion here does indicate that inherent to this question are legal matters. I still insist that this is a matter which should in the interest of progress and can well be referred to the Legal Committee for consideration.

COM. WILSON: Mr. Chairman, as I understand, the only thing before the Commission is Judge Stone's substitute motion, which requires that this be referred to the Legal Committee for further consideration?

COM. STONE: That is right.

COM. WILSON: Mr. Watson's motion was that action on it be deferred. Now, I don't think it makes a bit of difference. If you read the question here, the question that is asked is: "Shall compact contain any provision relating to the delivery of water at Lee Ferry for the use of Mexico in the event there is not sufficient surplus water to supply the Mexican share." If you answer that "yes", it means simply that the compact will have some language in it to cover that. Whether you defer action or whether you refer it to the Legal Committee, it may be determined not to say anything about it, while we all recognize the obligation. The only point I can see there is to determine whether you are going to say anything or nothing. In either event we recognize the obligation of the Mexican Treaty. Now I will vote on either motion, "yes."

COM. STONE: Mr. Wilson, I think you have got a point there and I believe my motion should be to the effect that tentatively the compact should contain language and that the matter be referred to the Legal Committee.

COM. WILSON: I am not sure yet that we can all agree that it should contain any reference at all. I think perhaps it should. But why make up our minds now that you are going to say something about it when we can change our minds later and decide not to?

COM. STONE: We have a lot of confidence in the Legal Committee and if we refer it to the Legal Committee we will be making progress.

MR. HOWELL: For the purpose of determining how extensive this motion should be, I would like to ask Mr. Riter a question. If I understood him rightly yesterday in making his report, with that modesty so characteristic of engineers, he stated the Engineering Committee was unable to determine the exact obligations of the Upper Basin under the Mexican Treaty. Did I misunderstand you?

MR. RITER: Well, I don't remember exactly what I said yesterday. I did quite a bit of talking, more talking than I should. But I have heard conflicting legal philosophies regarding the obligation of the Upper Basin to deliver water to Mexico. In my own mind there is no question about it. In my own mind the Upper Basin unquestionably has an obligation to supply the Mexican Treaty. There are people present in this room who do not agree with me.

COM. STONE: You don't mean to supply the Mexican Treaty. We don't have it all.

COM. BISHOP: Supply the shortage would be enough, wouldn't it, Mr. Riter?

MR. RITER: There are some people in this room who believe we don't

have to deliver anything at Lee Ferry to help meet the obligation imposed by the Mexican Treaty. I don't share that view.

MR. HOWELL: Well, the only reason I made this inquiry, Mr. Chairman, is to determine whether or not it wouldn't be a good thing in view of the statement of the Chairman of the Engineering Advisory Committee that this matter or the obligation under the Treaty of the Upper Basin States be referred to both the Engineering and the Legal Committee.

MR. ROLLINS: I was wondering about the wording of Paragraph (a); I am wondering if our obligation ends as Upper Basin States in connection with the Mexican Treaty, if a shortage should develop which would require our furnishing water to Mexico--if our obligation ends if we deliver it at Lee Ferry. Wouldn't we have to be responsible for our portion of the deliver at the International Boundary?

CCM. STONE: No, the Compact makes that clear.

THE CHAIRMAN: Well, the Chairman is a little bit confused about the intent of the Commission on this. It seems that the Commission should decide, first, whether or not it wants to have language referring to this matter, and if so the lawyers presumably are to work it out. And apparently that is the intent of the motion, to indicate, maybe very cautiously, that the Commission has a notion there should be a provision and hopes that the lawyers will work something out.

CCM. STONE: Mr. Chairman, Mr. Wehrli says that he has some suggestion to make to clarify the motion. Maybe he has got something that will solve it. What is it?

MR. WEHRLI: I didn't have any suggestion, Judge Stone, but Mr. Watson's motion having been withdrawn and you having made a substitute motion and then having sort of rephrased your substitute motion, I was wondering if you wouldn't start over on your motion and make such motion as you feel ought to be made. I thought that might clarify the record on it.

CCM. STONE: Very well. I withdraw my former motion and now make this motion: that with reference to the question appearing as Subsection (a) under Group III appearing on the agenda, the Commission, subject to review and reconsideration, believes that the compact should contain language relating to the deliveries of water at Lee Ferry for the use of Mexico in the event there is not sufficient surplus water as defined by the Colorado River Compact to supply the Mexican share; and also language which will consider the obligations under the Mexican Treaty for delivery of water from the surplus; and that the matter be referred to the Legal Advisory Committee.

Now, my thought in submitting this motion is that the discussion here indicates that there are legal questions. The record shows that the International Boundary and Water Commission has made a proposal. That proposal should be considered along with any language which the Legal Committee might have in mind. I also call attention to the fact that my motion specifies that it is a subject for further review and consideration. We will be better able to consider this if some specific recommendation comes from the Legal Committee.

CCM. BISHOP: Second the motion.

MR. WALLACE: Mr. Chairman, a question.

THE CHAIRMAN: Mr. Wallace.

MR. WALLACE: What about drought?

COM. STONE: My motion doesn't cover Subsection (b) on drought, just (a). That is reserved for further action.

THE CHAIRMAN: Is there further discussion of the motion?

COM. WATSON: Question.

THE CHAIRMAN: Question has been called for. Wyoming?

COM. BISHOP: Yes.

THE CHAIRMAN: Colorado?

COM. STONE: Yes.

THE CHAIRMAN: New Mexico?

COM. WILSON: Yes.

THE CHAIRMAN: Arizona?

COM. CARSON: Yes.

THE CHAIRMAN: Do you now wish to consider Item (b) of Group III on page 2 of the agenda which reads: "Should the compact contain any provision relative to extraordinary drought in order to take advantage of the applicable provisions of the Mexican Water Treaty."

COM. WATSON: Mr. Chairman, it is very apparent that we should, if we do have the obligation. Therefore, we should answer this item in the affirmative and refer it to the Legal Advisory Committee. I so move.

THE CHAIRMAN: Is there a second to Mr. Watson's motion?

COM. BISHOP: Second the motion.

THE CHAIRMAN: Is there a discussion of the motion?

COM. WILSON: On that same thing, I am not sure the affirmative answer is yes. It may be but it appears to me that we answer (a) up there and say we recognize the obligation in some appropriate language. Then under (b), in case of extraordinary drought, that obligation may be limited. If we answer (a) yes and use appropriate language, it may be entirely unnecessary to say anything about extraordinary drought, which is a matter the International Boundary and Water Commission will enforce against Mexico if appropriate.

MR. BREITENSTEIN: Mr. Wilson, my thought in submitting that was that there is no provision in the Mexican Treaty which really places into effect the provision on extraordinary drought. As I understand it, the matter is left for determination by the United States but no agency is really designated to make the determination. It seems to me that we ought to have something in here which would recognize the right of the administrative agency which we set up to say to the United States Section that we have got an extraordinary drought and so the share of water delivery to Mexico should be scaled down. In my own mind, there should be some specific direction to the agency which we set up which would cover this subject.

COM. WILSON: Yes.

THE CHAIRMAN: Arizona?

COM. CARSON: Yes.

THE CHAIRMAN: Then the understanding is that we will try to get through by four o'clock tomorrow afternoon but whether we do or not, we will call it a day.

COM. STONE: What time do we meet this afternoon?

THE CHAIRMAN: That hasn't been disposed of. We shall recess now. What time shall we come together?

MR. ROLLINS: One-thirty.

THE CHAIRMAN: Is one-thirty satisfactory? (No response.) Let it be understood then we will convene at one-thirty today.

(12:00 Noon, Recess.)

- - - - -

(1:30 p.m. Meeting reconvened.)

THE CHAIRMAN: Gentlemen, will you come to order, please. It appears now that the Commission is ready to consider Item (a) of Group IV, which reads: "What general provision should be incorporated in the Upper Basin Compact to recognize the validity and applicability of the Colorado River Compact."

COM. BISHOP: Mr. Chairman, I move that a provision be incorporated in the compact recognizing the validity and applicability of the Colorado River Compact, and that the drafting of such a provision be referred to the Legal Advisory Committee.

COM. STONE: Second the motion.

THE CHAIRMAN: Any discussion of the motion? Are you ready for the question?

COM. WATSON: Question.

THE CHAIRMAN: Wyoming?

COM. BISHOP: Yes.

THE CHAIRMAN: Colorado?

COM. STONE: Yes.

THE CHAIRMAN: Utah?

COM. WATSON: Yes.

THE CHAIRMAN: New Mexico?

COM. WILSON: Yes.

THE CHAIRMAN: Arizona?

COM. CARSON: Yes.

THE CHAIRMAN: We will now consider Item (b) of Group IV, which reads: "Should the definitions contained in Article II of the Colorado River Compact be incorporated without change in the Upper Basin Compact." Gentlemen, the Chair would suggest now that you discuss this matter freely and then finally let's get a motion to dispose of it which you can all agree to.

MR. BREITENSTEIN: I suggest that before any action is taken on that those definitions should be read to the Commission here.

THE CHAIRMAN: That is a very good suggestion. Mr. Wehrli, will you read the provisions referred to?

MR. WEHRLI:

"ARTICLE II. As used in this compact--

"(a) The term 'Colorado River system' means that portion of the Colorado River and its tributaries within the United States of America.

"(b) The term 'Colorado River Basin' means all of the drainage area of the Colorado River system and all other territory within the United States of America to which the waters of the Colorado River system shall be beneficially applied.

"(c) The term 'States of the upper division' means the States of Colorado, New Mexico, Utah, and Wyoming.

"(d) The term 'States of the lower division' means the States of Arizona, California, and Nevada.

"(e) The term 'Lee Ferry' means a point in the main stream of the Colorado River 1 mile below the mouth of the Paria River.

"(f) The term 'Upper Basin' means those parts of the States of Arizona, Colorado, New Mexico, Utah, and Wyoming within and from which waters naturally drain into the Colorado River system above Lee Ferry, and also all parts of said States located without the drainage area of the Colorado River system which are now or shall hereafter be beneficially served by waters diverted from the system above Lee Ferry.

"(g) The term 'Lower Basin' means those parts of the States of Arizona, California, Nevada, New Mexico, and Utah within and from which waters naturally drain into the Colorado River system below Lee Ferry, and also all parts of said States located without the drainage area of the Colorado River system which are now or shall hereafter be beneficially served by waters diverted from the system below Lee Ferry.

"(h) The term 'domestic use' shall include the use of water for household, stock, municipal, mining, milling, industrial, and other like purposes, but shall exclude the generation of electrical power."

THE CHAIRMAN: You have heard the definitions as read by Mr. Wehrli. What are the wishes of the members of the Commission?

MR. WEHRLI: Mr. Chairman, I think we are of the opinion that these definitions should be included in the compact but that this is not necessarily

an exhaustive list of definitions that you will need in the compact on the Upper Basin. We would favor inclusion of these definitions but with the understanding that it may be necessary to add some others.

COM. STONE: Mr. Chairman, Colorado concurs in the statement made by Mr. Wehrli for Wyoming. And we would suggest that the Legal Committee be instructed to give consideration to such other definitions as may be needed and desirable in the compact now under negotiation.

THE CHAIRMAN: Do you suggest that as a motion, Judge Stone?

COM. STONE: I am just discussing it is all.

THE CHAIRMAN: All right. Are there any other suggestions?

COM. WILSON: Mr. Chairman, I agree in substance with what has been said but I understand the Legal Committee wants some authority from this Commission before they bring something back. Now it seems to me that there ought to be a little discussion somewhere as to whether each one of these definitions shall be copied verbatim into our compact. Obviously there are a few of them that don't fit our compact. Some of them are of such a substantial nature that we want to put them in our compact word for word whether all of them go in or not, and I think that the Committee ought to have further suggestions from the Commission.

The general provision that you adopted there under (a), the language of that, would in effect cover the definitions. Then it is a question of which ones you want to specify, or does the Commission want to say, "Now, without regard to applicability or whether they fit, copy each definition word for word", and then add some more. There should be some discretion it seems to me in the Legal Committee to come back and suggest that maybe some of the definitions shouldn't be set out verbatim in our compact.

COM. STONE: Mr. Wilson, do you think we might make progress now--it isn't a difficult matter--if we would go over each definition and determine here whether in the judgment of the Commission such a definition may not be applicable and unnecessary or whether any change in definition should be made?

COM. WILSON: I think that might be all right, Judge Stone.

COM. STONE: I think we might be making some progress that way, and yet I am wondering whether we could legally change a definition, if we use it at all, that is contained in the Colorado River Compact.

COM. WILSON: I am assuming that the Committee will write out a general provision recognizing the validity and applicability of the whole compact. Now, when that language has been decided upon, is it then necessary to follow that up and put every definition in the new compact word for word?

COM. CARSON: Mr. Chairman, in accordance with the suggestion of Mr. Wehrli that it may be advisable to define terms in this compact in addition to the terms that were defined in the Colorado River Compact, it would seem to me that article relating to definitions probably should be the last one considered by this Commission after the other articles are in and we determine whether any of the terms there used appear to require specific definition. The Legal Committee could be instructed here to consider and recommend to the Commission any specific definitions of terms, either included in the Colorado River Compact or in the Upper Basin Compact, as it would deem advisable to have specifically defined when the whole compact is completed.

MR. WEHRLI: If that is a motion, we would join in it, Mr. Carson.

COM. CARSON: I would like to make that as a motion.

COM. BISHOP: Second the motion.

THE CHAIRMAN: Motion has been made and seconded. Is there a discussion of the motion as presented by Com. Carson? (Question is called for.) The question has been called for. Wyoming?

COM. BISHOP: Yes.

THE CHAIRMAN: Colorado?

MR. BREITENSTEIN: Yes.

THE CHAIRMAN: Utah?

COM. WATSON: Yes.

THE CHAIRMAN: New Mexico?

COM. WILSON: Yes.

THE CHAIRMAN: Arizona?

COM. CARSON: Yes.

THE CHAIRMAN: We now come to Item (c) of Group IV of the agenda which reads: "Should paragraphs (f) and (g) of Article III of the Colorado River Compact relating to the apportionment of unapportioned water be carried over into the Upper Basin Compact."

Mr. Wehrli, can we borrow your voice to read the paragraphs (f) and (g) of Article III of the Colorado River Compact so the Commissioners may know what they are directing their attention to?

MR. WEHRLI: (f) of Article III provides:

"Further equitable apportionment of the beneficial uses of the waters of the Colorado River system unapportioned by paragraphs (a), (b), and (c) may be made in the manner provided in paragraph (g) at any time after October 1, 1963, if and when either basin shall have reached its total beneficial consumptive use as set out in paragraphs (a) and (b).

"(g) In the event of a desire for a further apportionment as provided in paragraph (f) any two signatory States, acting through their governors, may give joint notice of such desire to the governors of the other signatory States and to the President of the United States of America, and it shall be the duty of the governors of the signatory States and of the President of the United States of America forthwith to appoint representatives, whose duty it shall be to divide and apportion equitably between the upper basin and lower basin the beneficial use of the unapportioned water of the Colorado River system as mentioned in paragraph (f), subject to the legislative ratification of the signatory States and the Congress of the United States of America."

MR. BREITENSTEIN: Since Colorado suggested that I might say one of the things we had in mind was: If there is any surplus water in the

Colorado River which is subject to allocation, of course the Upper Basin doesn't want to give away the right to participate in some of that surplus water. It seems to me there should be in an Upper Basin Compact some provision for allocation among the States of the Upper Basin of that portion of surplus water which may be allocated to the Upper Basin in accordance with these provisions of the Colorado River Compact which have just been read.

THE CHAIRMAN: Mr. Breitenstein, is it your idea that the final allocation which may be made on a percentage basis would be limited to the unapportioned water or would it include the surplus?

MR. BREITENSTEIN: Well, my idea, speaking only personally, is that whatever allocation we make among the States of the Upper Basin at this time is an allocation of III (a) water and not of surplus.

THE CHAIRMAN: Then when the matter of surplus water is determined you would proceed under the provisions of the Colorado River Compact in order to make a further apportionment?

MR. BREITENSTEIN: It would seem to me that further apportionment would be desirable. It may be that apportionment shouldn't be on the same basis as the apportionment of the III (a) water. Now I don't know; it is just a possibility.

THE CHAIRMAN: Of course, that would afford an opportunity at that time, then, to rectify any inequities which might pop up in the compact we are talking about.

MR. BREITENSTEIN: That is a possibility. I would be surprised if any of the states here were willing to make an allocation among the States of the Upper Basin of surplus water. Maybe they are; I don't know.

THE CHAIRMAN: Mr. Breitenstein, let me ask you this: Could they really do that without violation of the existing compact?

MR. BREITENSTEIN: Oh, I think it is possible. You could say when, as and if the Upper Basin is determined to be entitled to any surplus water, then that water shall be allocated in a certain way.

THE CHAIRMAN: Thanks, Mr. Breitenstein.

Com. Carson, do you have any remarks on this item?

COM. CARSON: Well, Mr. Chairman, I agree with Mr. Breitenstein that you probably ought to have some reference in there so as to preserve the right of the Upper Basin to participate in that further apportionment between the Upper and the Lower Basin, preserve that so there will be no question about it. But I don't believe it would be proper now to undertake to apportion it until that apportionment is made between basins.

THE CHAIRMAN: Com. Wilson?

COM. WILSON: Well, my present thought on it is in line with what Mr. Breitenstein says. However, I don't know whether the Commission, when it comes to making the allocation, is going to specify III (a) water. I don't know. That is a matter I think that would have to be given some very serious consideration. But I am perfectly willing to use language that will preserve our right to participate in the apportionment of surplus water when it is available under the terms of the Colorado River Compact.

THE CHAIRMAN: It would seem to the Chairman--I don't know how you would term it--but that notice should be taken of the possibility of the availability of unapportioned water in this compact and it should be definitely understood what this compact allocates.

Com. Stone, do you have any further comments?

COM. STONE: I do not believe it is good policy, and irrespective of what Mr. Breitenstein said, I still question the possibility of making any apportionment of surplus water. At least it isn't good policy in this compact to attempt any apportionment of the surplus water. I believe that the paragraph should be referred to in appropriate language.

The states of the Upper Colorado River Basin may not apportion surplus water defined in the Colorado River Compact in the absence of the other two states of the Colorado River Basin. As Mr. Breitenstein suggests, we might agree among ourselves that if an apportionment is made, the apportionment shall be in accordance with the agreement contained in this compact, but after all that is an agreement reached in a meeting or in a negotiation at which the other states are not parties. I think it would be very bad policy.

COM. WILSON: I would like to call your attention to the provisions of that Paragraph (f), that it isn't necessarily true that this apportionment will be made in 1963.

COM. STONE: It isn't, certainly; you are right about that.

COM. WILSON: In 1963, if either basin shall have reached its total beneficial consumptive use, and that might be fifty years after 1963.

COM. STONE: That is what I said. They could apportion it under certain conditions and that is a definite condition.

MR. BREITENSTEIN: I didn't say as a matter of policy I favored making apportionment of any surplus water. In answer to the Commissioner's question I said it was a possibility. I think that is right. But the Boulder Canyon Project Act states, so much III (a) water plus not more than half the surplus to California; and the Arizona contract states so much water plus not more than one-half of the surplus.

COM. CARSON: Of course, that means surplus available in the Lower Basin.

MR. BREITENSTEIN: That is right. You could do the same thing up here but I think it is bad policy to do it.

COM. STONE: In my opinion, whether it is possible or not possible, it is clearly a bad policy.

THE CHAIRMAN: Off the record. (Discussion off the record.) Does the Commissioner for Wyoming or Mr. Wehrli have anything to offer on this item?

MR. WEHRLI: We are willing to leave it to the future, but if that is done I believe the Legal Advisory Committee ought to be given the task of drafting the necessary language that would have to go into the compact. I don't believe it is a subject that you can ignore. I think you have got to make some reference to it in the compact and that the Legal Committee

ought to draft such a provision if it is agreed by the Commissioners that no apportionment should be made in the compact at this time.

COM. WILSON: Mr. Chairman, I move that the question set out in the agenda under IV (c) be referred to the Legal Advisory Committee with instructions to that Committee to put in appropriate language such provision dealing with paragraphs (f) and (g) of Article III of the Colorado River Compact which they deem necessary to protect the rights of the Upper Basin in any water that may be unapportioned. Of course they report back to the Commission.

COM. STONE: Second the motion.

THE CHAIRMAN: Are there any further comments on the motion by Judge Wilson? (Question is called for.) Wyoming?

COM. BISHOP: Yes.

THE CHAIRMAN: Colorado?

COM. STONE: Yes.

THE CHAIRMAN: Utah?

COM. WATSON: Yes.

THE CHAIRMAN: New Mexico?

COM. WILSON: Yes.

THE CHAIRMAN: Arizona?

COM. CARSON: Yes.

THE CHAIRMAN: The next item on the agenda is Item (d), Group IV, which reads: "What, if anything, should be done with relation to Article VI of the Colorado River Compact pertaining to controversies between two or more states."

Will you please read Article VI of the Colorado River Compact, Mr. Wehrli?

MR. WEHRLI:

"Should any claim or controversy arise between any two or more of the signatory States: (a) With respect to the waters of the Colorado River system not covered by the terms of this compact; (b) over the meaning or performance of any of the terms of this compact; (c) as to the allocation of the burdens incident to the performance of any article of this compact or the delivery of waters as herein provided; (d) as to the construction or operation of works within the Colorado River Basin to be situated in two or more States, or to be constructed in one State for the benefit of another State; or (e) as to the diversion of water in one State for the benefit of another State, the governors of the States affected upon the request of one of them, shall forthwith appoint commissioners with power to consider and adjust such claim or controversy, subject to ratification by the legislatures of the States so affected.

"Nothing herein contained shall prevent the adjustment of any such claim or controversy by any present method or by direct future legislative action of the interested States."

THE CHAIRMAN: The Chairman would like to ask a question as to what effect any action taken on this item would have on the administrative setup which you tentatively discussed and approved a day or so ago.

COM. STONE: Mr. Chairman, Mr. Breitenstein has a statement to make on this Item (d), page 3 of the agenda. Perhaps he will clarify your question.

THE CHAIRMAN: Would be very glad to hear from Mr. Breitenstein.

MR. BREITENSTEIN: My thought was that the Commission should give consideration to this article of the Colorado River Compact but I do not mean to imply that I think there is any reason for incorporating a similar provision in the Upper Basin Compact. Frankly, I don't like the way that Article VI of the Colorado River Compact reads at all. I see no reason whatsoever for incorporating it in an Upper Basin Compact. You noticed in the reading, of course, that one of the articles mentioned was facilities in one state for use in another state. We are doing here what that provision contemplates. We have made arrangements, in what has been tentatively adopted, for the operation of facilities in one state for the benefit of another state. In my opinion that is perfectly proper under Article VI and is in accord with it.

My recommendation is that we do not carry over into the Upper Basin Compact Article VI of the Colorado River Compact.

THE CHAIRMAN: Com. Carson, do you have anything to offer on this item?

COM. CARSON: Mr. Chairman, I agree with Mr. Breitenstein that it is not necessary that this article come over as it is written here. I don't think it would be completely applicable. I thought it might be covered in that other clause that we have referred to that we haven't yet been instructed to write, that is, at the request of one or more states, the other states would appoint commissioners to consider any matter.

MR. BREITENSTEIN: Mr. Carson, I didn't mean to imply that I wasn't in favor of what you just mentioned. My point was that there was no necessity to carry Article VI over into the Upper Basin Compact. Something such as you suggest I think might be well done.

COM. CARSON: That is the same thought that we both had. As it is written here it would not be proper to be brought over as is.

MR. WEHRLI: Mr. Breitenstein, are you talking now about the same thing or something different than what we discussed in the Legal Advisory Committee about review by the commissioners, or would the two go together in some way?

MR. BREITENSTEIN: They are probably two things. I had in mind the possibility of having a provision for review and also that the Commission might desire to set up some machinery for ironing out disputes. I don't know whether they would or not. But regardless of what action is taken on those two my recommendation is that Article VI should not be carried over.

MR. WEHRLI: My thought about the matter is that if you don't carry over Article VI--I think we can agree with you on that--nevertheless this might be the appropriate time to make some request of the Legal Advisory Committee to prepare something on the subject.

MR. BREITENSTEIN: I agree. It might be a good idea.

COM. STONE: Mr. Wehrli, are we not here though considering provisions of the Colorado River Compact, what provisions should be carried over, under this group? Can't we dispose of this matter as a matter of policy and then revert to those questions which you raise?

MR. WEHRLI: That will be agreeable.

COM. BISHOP: Mr. Chairman, I move that Article VI of the Colorado River Compact not be included in the Upper Basin Compact.

COM. WATSON: Second the motion.

THE CHAIRMAN: The motion has been made and seconded. Do you wish to discuss the motion? (Question is called for.) Wyoming?

COM. BISHOP: Yes.

THE CHAIRMAN: Colorado?

COM. STONE: Yes.

THE CHAIRMAN: Utah?

COM. WATSON: Yes.

THE CHAIRMAN: New Mexico?

COM. WILSON: Yes.

THE CHAIRMAN: Arizona?

COM. CARSON: Yes.

(Discussion off the record.)

COM. STONE: Mr. Chairman, Colorado makes this motion: That the following suggested language be referred to the Legal Committee for its consideration, such language being suggested for incorporation in an Upper Colorado River Basin Compact, namely: "The failure of any state to use the water allocated to it for beneficial consumptive use shall not constitute any relinquishment of such water to the Lower Basin or any state thereof." Further that the Legal Committee be asked to study this language and feel free to substitute therefor any other language which in its judgment would be more appropriate for such purpose or enlarge on it if it sees fit.

COM. WILSON: Second the motion.

THE CHAIRMAN: Are there any further comments on the motion as offered by Judge Stone?

COM. WATSON: Question.

THE CHAIRMAN: Wyoming?

COM. BISHOP: Yes.

THE CHAIRMAN: Colorado?

COM. STONE: Yes.

THE CHAIRMAN: Utah?

COM. WATSON: Yes.

THE CHAIRMAN: New Mexico?

COM. WILSON: Yes.

THE CHAIRMAN: Arizona?

COM. CARSON: Yes.

THE CHAIRMAN: Off the record. (Discussion off the record.)

(3:05 p.m. Recess.)

(3:15 p.m. Meeting resumed.)

THE CHAIRMAN: Now, gentlemen, I believe we are ready to consider the items under Group V as shown on the agenda. Item (a) of Group V reads: "Should the compact endeavor to encompass rights and obligations arising out of or affecting interstate tributaries."

MR. BREITENSTEIN: May I state the thought I had in mind in putting that down?

THE CHAIRMAN: We shall be very glad to have you state it.

MR. BREITENSTEIN: Everything under Group V is related and to me the basic question for decision by the Commission is whether or not these matters pertaining to the tributaries should all be settled and concluded by one general overall basin compact or whether the idea is to have separate compacts between the states affected on particular tributaries. That general proposition is involved in everything which is under Group V. There is only one small item which is different; that is in connection with the existing La Plata River Compact.

MR. WALLACE: What is your suggestion?

MR. WEHRLI: I would suggest, Mr. Chairman, that subparagraph (b), having some different aspects than the others in that group, be considered first, or else consider (a), (c), (d), (e) and (f) together. It seems to me that (a), (c), (d), (e) and (f) are entirely germane, (b) is a little bit different, and (g) and (h) are somewhat different.

COM. STONE: I have somewhat the same opinion, that we can't settle anything under (a) because it requires separate treatment as evidenced by (c), (d) and so forth.

MR. WEHRLI: I think we should take up either (b) or else--

MR. BREITENSTEIN: I agree with you, Mr. Wehrli. I think the most appropriate thing is to take up (b) first. I think that can be disposed of very simply.

THE CHAIRMAN: We will consider Item (b), which reads: "What provision shall be made with relation to the existing La Plata River Compact.

MR. WALLACE: What is the---off the record. (Discussion off the record.)

COM. STONE: It seems to me we should have a provision recognizing that compact and the validity of its terms and that nothing in this compact which is under negotiation shall be construed as having the effect of invalidating any of the terms of that existing compact.

COM. WILSON: Judge Stone, I will say so far as I know the water users in both Colorado and New Mexico have indicated that they desire that the La Plata Compact be continued in force and effect so far as their individual rights are concerned.

COM. STONE: That is my understanding.

COM. WILSON: If that is true, it seems to me it might be desirable to put something in the compact to show that it is to continue in force and effect.

COM. STONE: Mr. Chairman, as representing one of the states party signatory to the existing La Plata Compact, I move that the continuance and the validity of such La Plata Compact be adequately protected by appropriate language in an Upper Colorado River Basin Compact; and that the matter be referred to the Legal Committee to draft appropriate language.

COM. WILSON: Second the motion.

MR. WEHRLI: Mr. Chairman, we agree that the validity of that compact must be recognized but it seems that whenever an apportionment of water is made to the respective states under the compact, of course as to each state it would have to be subject to the provisions of the compact we are now endeavoring to negotiate, that is to say, subject to the percentage allocation of beneficial consumptive use and subject to the provisions relating to the obligations of delivery at Lee Ferry. I think that probably would be implicit but I think it is a matter which should be mentioned and understood.

COM. STONE: Colorado doesn't question that.

COM. WILSON: Neither does New Mexico.

COM. STONE: That matter will be considered in making the apportionment.

MR. WEHRLI: I would merely suggest then that in referring the matter to the Legal Advisory Committee that Committee ought to consider perhaps a little bit more than your motion might indicate and that a provision merely recognizing the validity of the compact is not quite enough. I think we may have to have some other provisos in connection with it.

COM. STONE: I might say, Mr. Wehrli, that my motion set forth the idea and included the statement that the Legal Committee use appropriate language to carry that out. So to the extent that the question you mentioned should be incorporated, I assume it would be incorporated in appropriate language. I have in mind the matter you mention.

COM. CARSON: Mr. Wehrli, it would seem to me that would be covered by a general clause that would go in there that all rights to beneficial consumptive use of water in any state be satisfied from the water apportioned to that state, including the La Plata water or whatever it is.

MR. WEHRLI: I am not quite prepared to agree with you on that but I think the record is clear enough as to this reference to the Legal Advisory Committee and it would be up to that Committee to attempt to use such language as it feels necessary. So I have no disagreement with the motion that has been made.

COM. WILSON: I assume the water that is used in New Mexico and also in Colorado by individual water users is capable of measurement. It is a peculiar compact. It provides for alternate use, so many dates in one state, so many days in another. But I assume we can find some way to measure it so as to make it come within the allotment of each state.

MR. WEHRLI: To make my position entirely clear, I am assuming that a condition might arise when Colorado would have to respond to the supplying of some water to meet the obligation at Lee Ferry. Obviously, of course, Colorado might use its own discretion presumably as to where that water comes from, but this particular water in the La Plata River as we view it wouldn't be free from the general obligation of the State of Colorado any more than any other portion of its supply.

COM. STONE: I might say this off the record--(Discussion off the record.)

THE CHAIRMAN: Are there any further comments on the motion as made and seconded? Are you ready for the question?

COM. BISHOP: Question.

THE CHAIRMAN: Question has been called for. Wyoming?

COM. BISHOP: Yes.

THE CHAIRMAN: Colorado?

COM. STONE: Yes.

THE CHAIRMAN: Utah?

COM. WATSON: Yes.

THE CHAIRMAN: New Mexico?

COM. WILSON: Yes.

THE CHAIRMAN: Arizona?

COM. CARSON: Yes.

THE CHAIRMAN: Now, gentlemen, as pointed out by Mr. Breitenstein, these items are related. What are the suggestions for a combination of items for consideration?

COM. STONE: I suggest we go to Item (c) of Group V.

THE CHAIRMAN: Off the record. (Discussion off the record.) Gentlemen, you have before you the consideration of Item (c), which reads: "What adjustment must be made between Colorado and New Mexico in connection with the use of San Juan River water."

COM. WILSON: I yield to Judge Stone on that point.

COM. STONE: I might yield to Mr. Wilson. However, I think we must approach these subjects frankly and realistically. It is very obvious because of the topography of the country that any water apportioned to New Mexico has to come out of the San Juan Basin. It therefore creates a problem requiring special treatment and adjustment in the compact now under negotiation.

COM. WILSON: I agree that is an adjustment that must be made and perhaps it can be made in this compact. I realize that out of any allotment that is made to New Mexico, the only source where we can obtain the water is the San Juan and its tributaries. And if by chance we got enough water to affect Colorado's potential future uses on the San Juan, that is a matter that Colorado and New Mexico will have to come to agreement on, if ever it should become necessary for Colorado to forego some future uses on the San Juan in order for New Mexico to have its allotment. That is a matter that will have to be agreed upon and determined. As I visualize it from whatever allotments are made to Colorado, Colorado will have to choose from which tributaries she is going to take that water.

MR. WALLACE: You have one choice.

COM. WILSON: And I am assuming you wouldn't want to take it all from the San Juan. I am assuming that Colorado--I will use the word arbitrarily--would not arbitrarily choose to take a large portion of her percentage of allotted water out of the San Juan if the result would be to prevent New Mexico having any source to go to at all to get the water allotted to her. I assume you won't agree to an allotment to New Mexico that you felt would deprive you of San Juan water that you just had to have. I don't know where that line is. I do know your present uses on the San Juan are comparatively small and I do know that your potential possibilities are comparatively small so far as the Colorado River report goes, but that is a matter we will have to adjust. I don't know that there can be an adjustment today. I am willing to listen to a discussion on it.

COM. STONE: There are two questions which Colorado must keep in mind: One is that the development of the land and water resources in the San Juan Basin in Colorado are dependent solely upon waters of that tributary. I know of no possibilities for Colorado to take any surplus waters out of another tributary for use within that basin.

The other question involved here relates to deliveries at Lee Ferry. It can be assumed for the present at least, that when New Mexico's desires and apportionments are taken care of out of this basin, that it will greatly reduce water remaining with which to aid in making deliveries at Lee Ferry. That may place a heavier draft so far as Colorado is concerned on other tributaries within the state. So that it does become a rather involved problem.

In a real sense, this San Juan River constitutes a separate river in which two states are primarily interested and which could, and in the absence of an Upper Basin Compact probably would, ultimately mean a separate compact. It is Colorado's present view that we should attempt to adjust these problems within the framework of the compact now under negotiation. We hope that that can be accomplished. I can't see now what we can do about it unless it is the subject for separate discussions between the two states.

MR. WALLACE: Does the Dolores have any relationship there? Can you take any water out of the Dolores down in the San Juan Basin?

COM. STONE: It is physically possible but I don't think there is

enough surplus water in the Dolores that would make that likely. I imagine that there might be--from a physical point of view--more likelihood of taking some water out of the San Juan into the Dolores. But it is one of these problems which points up the proposition that the blanket apportionment of "X" amount of water to Colorado--no doubt the same thing is true as to other states--does not answer the question.

MR. WEHRLI: Maybe you can't answer this or don't feel like answering it, but is your present view of the matter that the making of an agreement with New Mexico on the San Juan River would be the necessary prerequisite to the conclusion of the compact we are negotiating on, or what is your view of that?

COM. STONE: My view about it is that I think it would be well for the two states to have some discussions on that matter in order to complement the making of this compact. Does that answer your question?

MR. WEHRLI: Well, not entirely. Suppose that you and New Mexico are unable to agree; can we still go ahead and make this compact we are engaged in attempting to negotiate here?

COM. STONE: Well, I think probably that your question would go to New Mexico more appropriately than Colorado. New Mexico is wholly dependent upon the San Juan River.

MR. WEHRLI: May I ask the question then of Judge Wilson to see what his view is, if he cares to express himself.

COM. WILSON: Naturally I would say, Mr. Wehrli, if we can't arrive at an agreement in this compact that whatever water is allotted to us can be obtained by us, we won't agree to the compact. In other words, I don't see how you could draw a compact that would allot the right to use so much water to New Mexico unless there were provisions in the compact that made that possible of accomplishment, and to that extent I would say that the main compact is in a measure dependent upon our being able to make some agreement.

COM. STONE: For Colorado I want to say I appreciate fully Mr. Wilson's statement. I hardly see how he could take any different position.

It seems to me, gentlemen, frankly, that this San Juan matter is an important one as disclosed by the discussion that must be taken care of in this compact now under negotiation.

THE CHAIRMAN: Gentlemen, is it not possible that this matter will have to be taken care of in the allotment, the allotment itself would indicate that?

COM. STONE: That isn't enough. That is what we are just trying to point out.

THE CHAIRMAN: Let me ask a little further then if that isn't enough. I haven't been able to determine yet whether the Commission intends to specify percentages on tributaries or a lump sum percentage which will cover all the tributaries.

MR. BREITENSTEIN: Those questions are posed later on.

COM. STONE: Those questions come later. But certainly, Mr.

Chairman, as to the San Juan River, I will say this, frankly it would be very unfair to New Mexico and I don't see how New Mexico could ever accept a blanket allotment to Colorado without some adjustment with Colorado on the San Juan.

THE CHAIRMAN: In other words you feel, Judge Stone, that the percentage would have to be specified in the compact on that stream.

COM. STONE: Certainly some appropriate arrangement.

COM. WATSON: The question I would like to ask is: Will it be necessary for us to make a compact in the future dividing certain waters between Wyoming and Utah, and will this compact that we are now making just simply say that that compact will be made and we will acquiesce in the terms?

COM. STONE: Mr. Watson, in answer to that--I thought I covered it in my other statement--you can't do it that way. No lower state such as New Mexico could accept such a provision--that is for Mr. Wilson to say, this is just my view.

I think we should all try to be equitable in these matters. We could leave New Mexico high and dry almost so far as their possibilities for the utilization of Colorado River water is concerned. They must get their water from the San Juan. If we simply say we are including within the blanket apportionment to New Mexico and to Colorado the waters of this stream or a proportion or amount of water of this stream and that will be determined by future compact, then if Colorado said, "Well, that is fine. We just won't make a compact"--and we are the upper state, it isn't right and it won't settle the Upper Colorado River Basin problems if we leave those things in that condition. We can't do it.

COM. WATSON: Judge, may I add this in explanation of the condition: There is ample water rising in the Uinta Mountains to cover the land that exists in Wyoming and there is a willingness on the part of the State of Utah to make a compact with Wyoming to apportion the water, we will say, of Henry's Fork. Now, my question relates to this: Shall we go ahead this summer and make the compact as soon as we can and then let it be a part of this compact that we are writing at the present time, that is, in the nature of the La Plata Compact that already exists?

COM. STONE: Sure that can be done if it is done before this compact is closed.

COM. WATSON: But we don't divide water between Wyoming and Utah in this compact; we make a separate compact and accept this compact, is that it?

COM. STONE: That is a matter for those states to determine.

There are two possibilities: You can do it within the framework of this compact; or you as a matter of policy may desire to do it by a separate compact which would be consummated prior to the making of this compact. However, I can see possibilities where that procedure might hold up this compact because both of them may come before the Congress at the same time, one ahead of the other.

THE CHAIRMAN: Well, it seems to me that in simple language, the compact which is made first governs.

COM. STONE: That is correct.

MR. BARLOW: Mr. Chairman, I would like to ask this question with

that thought in mind, would it be well that Wyoming and Utah have an agreement on the Henry's Fork, included in this compact the same as New Mexico and Colorado on the San Juan and not figure on negotiating anything after this compact?

THE CHAIRMAN: Well, Mr. Barlow, if you negotiated after this compact it would have to be with due recognition of the provisions in this compact. Whichever compact is negotiated first governs.

COM. STONE: Whichever one is approved first.

THE CHAIRMAN: Approved first, yes, correct.

COM. BISHOP: Mr. Chairman, we wouldn't like to go to the trouble and expense of negotiating a compact on the Henry's Fork or on the Little Snake River when it can be taken care of by a paragraph in this compact. We had a meeting in Craig, Colorado, to get together on this and each state has appointed an attorney and they are supposed to draft the language. I believe we tentatively agreed that it could be done and our attorney it seems hasn't been able to get together with Mr. Breitenstein, who represents Colorado. If it is all right with Mr. Breitenstein, I would like to have Mr. Wehrli serve on that so we can get it done. Let's get it done and over with. If that is the right way to do it, let's do it.

MR. BREITENSTEIN: You are getting down now to Item (d). I think we should make every effort possible to adjust our differences on the Little Snake and incorporate appropriate provisions in this Upper Basin Compact. I assure you Colorado is willing to do everything possible.

THE CHAIRMAN: Whatever work you did do it seems to the Chairman would be helpful. You would have to use your own judgment whether you would get your compact ahead of this one or not, but certainly you will not be wasting your efforts, if you work out the situation on that stream.

MR. WALLACE: Why not confine the discussion to the San Juan until we get that behind us.

COM. WILSON: I move that the Commission refer Paragraph (c) of Group V on the agenda to the representatives of the States of Colorado and New Mexico and that they report back to this Commission at a subsequent meeting what adjustments they have arrived at and which they think can be incorporated in this compact.

COM. WATSON: Second the motion.

THE CHAIRMAN: Is there a discussion of the motion? Are you ready for the question?

COM. WATSON: Question.

THE CHAIRMAN: The question has been called for. Wyoming?

COM. BISHOP: Yes.

THE CHAIRMAN: Colorado?

COM. STONE: Yes.

THE CHAIRMAN: Utah?

COM. WATSON: Yes.

THE CHAIRMAN: New Mexico?

COM. WILSON: Yes.

THE CHAIRMAN: Arizona?

COM. CARSON: Yes.

THE CHAIRMAN: Now, Mr. Breitenstein, as you prepared this agenda, what item do you suggest be taken up at this juncture?

MR. BREITENSTEIN: (d), the one with relation to the Little Snake River.

THE CHAIRMAN: Very well, we will consider Item (d), which reads: "What adjustment must be made between Colorado and Wyoming with relation to the uses of the water of Little Snake River."

COM. BISHOP: I move that the States of Colorado and Wyoming be requested to confer on an apportionment on the Little Snake River and report such agreement as they may be able to arrive at back to this Commission as soon as may conveniently be done.

COM. STONE: Colorado will second that motion.

COM. WATSON: Question.

THE CHAIRMAN: Wyoming?

COM. BISHOP: Yes.

THE CHAIRMAN: Colorado?

COM. STONE: Yes.

THE CHAIRMAN: Utah?

COM. WATSON: Yes.

THE CHAIRMAN: New Mexico?

COM. WILSON: Yes.

THE CHAIRMAN: Arizona?

COM. CARSON: Yes.

COM. BISHOP: For the record, Wyoming appoints Mr. Wehrli as the attorney to represent Wyoming in the drafting of that compact.

THE CHAIRMAN: Gentlemen, are you now ready to consider Item (e): "What adjustment must be made between Wyoming and Utah with respect to the uses of the water of Green River tributaries arising in Utah."

COM. WATSON: Mr. Chairman, I move that the States of Utah and Wyoming appoint their representatives to confer on the apportionment and report back to this Commission.

COM. BISHOP: I will second the motion.

COM. WATSON: Question.

THE CHAIRMAN: Question has been called for. Wyoming?

COM. BISHOP: Yes.

THE CHAIRMAN: Colorado?

COM. STONE: Yes.

THE CHAIRMAN: Utah?

COM. WATSON: Yes.

THE CHAIRMAN: New Mexico?

COM. WILSON: Yes.

THE CHAIRMAN: Arizona?

COM. CARSON: Yes.

COM. BISHOP: Mr. Chairman, I appoint on that committee Mr. Wehrli, the legal adviser, and Mr. Person, the engineering adviser.

COM. WATSON: As for Utah, I will appoint the adviser to the State Engineer, Mr. Clyde, and Mr. C. O. Roskelley.

THE CHAIRMAN: Gentlemen, Item (f) is the next on the agenda under Group V; do you wish to consider that item at this time: The item reads: "What adjustment must be made between Colorado and Utah with respect to uses of water on the main stream of the Colorado River, the Yampa River, the White River and the Dolores River, and other interstate streams tributary to either the Green River or the Colorado River."

MR. WALLACE: How shall we handle that, Judge Stone?

COM. STONE: We felt that that was a matter which concerns principally the rights of Utah and we would like in the first instance to have your suggestions.

COM. WATSON: Mr. Chaiman, in reading this item, as far as I can recall the diversions from the Yampa are largely in Colorado. I don't know of any lands in Utah. Are there any, Mr. Breitenstein?

MR. BREITENSTEIN: It joins the Green in Colorado.

MR. MERRIELL: The Echo Park reservoir will be very largely supplied by the Yampa.

MR. WALLACE: The Deadman's Bench is how large?

MR. BREITENSTEIN: I don't recall the exact area but it lies between the White and Yampa in both Utah and Colorado.

MR. WALLACE: It is a large area and there is a report on it.

MR. BREITENSTEIN: It is described in the Colorado River Basin report.

MR. WALLACE: It is described in the Green or somebody else's.

MR. BREITENSTEIN: Yes, there is an old report on it.

MR. WALLACE: Are you familiar with that situation, Mr. Merriell?

COM. STONE: Mr. Merriell is familiar with it. I will ask him--Deadman's Bench.

MR. MERRIELL: Quite a little of that land is in Utah.

MR. WALLACE: The major part is in Colorado, though.

MR. MERRIELL: It will be supplied with water from White River.

COM. WATSON: The land in Utah lies west of Artesia, Colorado, which is near the State Line.

MR. MERRIELL: A good deal of that Deadman's Bench project is in Utah.

MR. WALLACE: Hadn't that better go to a committee to see whether you should make separate allocations there on those streams or whether the allocations should remain in the mass?

COM. STONE: Such action is agreeable to Colorado, Mr. Wallace.

COM. WATSON: I move that the States of Colorado and Utah each appoint representatives to meet and confer on these rivers, the Yampa, the White and the Dolores, consider all the facts and report back to this Commission.

COM. STONE: Colorado seconds the motion.

COM. CARSON: Mr. Chairman, may I ask a question there?

THE CHAIRMAN: Yes.

COM. CARSON: In this you left out the main stream of the Colorado River and also the main stream of the Green River.

COM. WATSON: Include everything in Subsection (f).

COM. CARSON: Doesn't the Green River flow out of Utah into Colorado and back?

MR. MERRIELL: Practically no development, though.

COM. WATSON: Include all matters under (f).

COM. CARSON: The Green isn't mentioned on that.

MR. BREITENSTEIN: I didn't think there would be any problem over the main stem of the Green.

COM. CARSON: As a member of the Commission I would like to know there wasn't.

MR. BREITENSTEIN: Maybe I am not right, I don't know. That was my guess when I drew this up.

COM. STONE: What do you say about that?

MR. MERRIELL: I don't anticipate any development on the Green River in Colorado except possibly reservoirs, no.

COM. CARSON: When we meet again I would like to know that Colorado and Utah are agreed on all those matters if possible.

COM. WATSON: Question, Mr. Chairman.

THE CHAIRMAN: Question has been called for. Wyoming?

COM. BISHOP: Yes.

THE CHAIRMAN: Colorado?

COM. STONE: Yes.

THE CHAIRMAN: Utah?

COM. WATSON: Yes.

THE CHAIRMAN: New Mexico?

COM. WILSON: Yes.

THE CHAIRMAN: Arizona?

COM. CARSON: Yes.

THE CHAIRMAN: Does Colorado wish to announce the appointment of any conferees?

COM. STONE: May Colorado reserve the appointment of these conferees on Item (f) of Group V of the agenda?

MR. WALLACE: For how long?

COM. STONE: We will try to do it expeditiously, within a matter of two or three weeks.

COM. WATSON: Utah will agree to that and will appoint its commissioners.

THE CHAIRMAN: Presumably you will communicate with each other as to time of the meeting.

COM. STONE: That is right.

THE CHAIRMAN: Now we come to a very interesting item, Item (g), which reads: "In the allocation of beneficial consumptive use of water shall there be specific allocations to tributary drainage basins in each state."

COM. WILSON: Mr. Chairman, just to get this started I would like to make a motion.

THE CHAIRMAN: Very well, Judge Wilson.

COM. WILSON: In reference to Paragraph (g) of Group V, I move that any allocation made under the terms of this compact be made to the states as such and not to any basin so that each state may determine for

itself the source from which it will take its allotted portion of the water, subject of course to the understanding that as to New Mexico and Colorado on the San Juan, it will be necessary to specify in the compact what portion of Colorado's allotment shall come from the San Juan Basin.

COM. BISHOP: Second the motion.

MR. MERRIELL: Mr. Chairman, I concur in Mr. Wilson's suggestion. The way it will have to be worked out will be by tributary basin but I think the compact should make the allocation only by states.

COM. STONE: I dislike to disagree with my colleague, Mr. Merriell, but I do to a certain extent, and with Fred Wilson. I am at a loss to know how we can answer that one until we have some report and some action on what has been done with respect to (c), (d), (e) and (f).

MR. MERRIELL: That is the way it will have to be worked out, no question about that.

COM. WILSON: The Engineering Committee as I understand is working on that very problem.

MR. MERRIELL: But in the final language in the compact, I agree with Mr. Wilson that it should be an allocation purely by state.

COM. STONE: Such allocation to a state would have to be subject to the special provisions of the compact with respect to certain tributaries.

COM. WILSON: I understand the Engineering Committee will furnish facts and data as to the tributaries so as to enable each state to determine how it can get its water out of any particular tributary.

THE CHAIRMAN: The Chairman would like to ask Judge Stone a question: Do you make allocation to tributary basins in the Republican River Compact?

COM. STONE: That is correct, sir.

THE CHAIRMAN: The Chair recognizes Mr. Riter.

MR. RITER: The Engineering Advisory Committee will determine the facts with regard to streamflow and present uses by tributaries. The report of the Bureau of Reclamation is the only document that I know of which compiles all the project potentialities by tributaries.

It seems to me from an engineering viewpoint, bearing in mind the discussion we had with Mr. Clyde before our recess, that the final allocation should be by states. I have this in mind that there are project potentialities within each state that are presumably larger than the water which will be allocated to each state, and I feel that each state should not tie its hands by coming out in a formal document and subdividing its own allocation among its tributaries. It seems to me that each state should preserve a certain amount of flexibility where its water will be used within the state.

THE CHAIRMAN: Mr. Riter, the Chairman would like to ask you a question: If you were in the position of some of these commissioners or the state engineers, in supporting this compact before the various legislatures, how would you answer the question propounded by a legislator in a certain tributary basin as to what he would get out of this compact and his people in the way of irrigation development unless you specify how much of the allotment to the state comes out of a certain tributary?

MR. RITER: Well, I couldn't answer the question.

MR. HOWELL: It would surely have the fellow that wasn't going to get any against you.

THE CHAIRMAN: I realize that.

MR. WEHRLI: I don't know whether you heard it or the reporter got it but Mr. Bishop seconded the motion made by Mr. Wilson.

THE CHAIRMAN: I certainly didn't hear it. Pardon me for my neglect.

MR. WEHRLI: He didn't speak very loud.

MR. WALLACE: From your experience, what is the wise thing to do, Judge Stone?

COM. STONE: I might remark that (g) and (h) are interrelated. Before we reach any conclusion we might consider (h).

THE CHAIRMAN: That is entirely satisfactory to the Chairman. (h) reads: "Shall an upper state be required to deliver to a lower state any specific amount of water from any tributary."

MR. WEHRLI: I can see that those two are interrelated but I don't apprehend that even though you might decide under (h) that a certain amount of water would have to be delivered to a lower state upon a particular tributary, that would necessarily mean that the allocation of beneficial consumptive use in each state would not be made to the state itself rather than to drainage basins within the state.

THE CHAIRMAN: I think this discussion of (h) is pertinent to the discussion of (g) and it is permissible in spite of the fact that a motion is before us in regard to (g).

COM. CARSON: Mr. Chairman, it seems to me that if you limited the discussion to (g), to be specific, allocations to tributary drainage basins in each state, that would only be in case of interstate tributaries I take it. It wouldn't tie in with (h). In other words, I think that when any of these interstate tributaries are involved, the allocation will be made to the state in a percentage of use. Still, there would have to be a provision to protect the lower state as well as the upper state. What percentage would come out of the interstate tributary and how much of that interstate tributary flow would be deliverable at the state line for use in the other state?

As I understood Judge Wilson's motion, I don't think it quite encompassed everything it should insofar as these interstate tributaries are concerned. We are not directly concerned for Arizona, but I don't see how you can make an apportionment blanket to a state without specifying what quantity of that apportionment shall come out of one of these interstate tributaries or what part of the flow of the interstate tributary would be delivered at the line.

COM. WILSON: Mr. Chairman, I agree that these questions are interrelated but I call your attention to the fact that (g) goes to the point of whether allocation shall be made in the compact to a basin or to a state. That is the point that my motion went to.

Now then, if you assume that the allocations are to be made to a state and not to a basin, then take up Paragraph (h): "Shall an upper state be required to deliver to a lower state any specific amount of water from any tributary." The obvious answer would be, yes, if necessary to effectuate the allotments that are made in the compact. I don't know whether the two can be decided together or not.

COM. STONE: Mr. Chairman, with respect to both (g) and (h) and in answer further to Mr. Wallace's question, it occurs to me that there are many factors and decisions that should be made before any decision should be attempted on these two paragraphs. I understand that the engineers are making depletion studies, making certain studies as to all of these tributaries. We have already agreed that some of these states shall meet and discuss the matter of apportionment of water and use of water on certain tributaries. It seems to me that those two matters are clearly subjects which should be deferred for future action.

MR. WALLACE: Until the report of the Engineering Committee?

COM. STONE: Or until the Engineering Committee can give us the data we need for the consideration of it, and also until these special committees dealing with different tributaries have been able to make some report.

COM. WILSON: I didn't expect either one of these to be settled definitely here today. I made the motion, and I don't know whether I want to withdraw it, but it is obvious that these things can't be worked out until the Engineering Committee report and until we determine just how the allocation should be made and the amount of it.

THE CHAIRMAN: Well, the Chairman is certainly confused on it. I don't see why you need to wait for any engineering data to determine whether you want to make the allocation in a lump sum or to tributaries. I can't see how further information would help. Mr. Riter, I would like to have your comment on that.

MR. RITER: I don't know whether I can add much more, Mr. Bashore. I do not know what is going to be used as a basis of the compact. I presume that the Commissioners will certainly consider project potentialities. The information the Bureau of Reclamation has is already available to the Commission on that basis.

Now, the engineers have furnished you factual information on streamflow at key gaging stations. We have not yet furnished you information on present uses or flows at state lines.

I still feel in my own mind that the compact itself should be somewhat along the line that Mr. Wilson has in mind, the allocation should be to the state. I feel that it is entirely within the state's own business after the water is allocated to it how it is going to use such allocated water.

COM. CARSON: Except on interstate tributaries.

MR. RITER: Yes, there will have to be some agreement on that. I recognize that.

COM. STONE: I for the life of me can't get Mr. Riter's reasoning on that. How in the world can Colorado and New Mexico on the San Juan make an equitable adjustment and still say that you make a blanket apportionment to each state? Certainly if it is a blanket apportionment there have got to be some special provisions to take care of such situations.

MR. RITER: Well, Judge, I excepted that tributary.

MR. WEHRLI: Isn't the situation this: that if you made a blanket apportionment to each state percentage-wise and then required, let us say, certain state line flows, that blanket apportionment would be indirectly affected by those required flows. But I am wondering if you have in mind that instead of making a blanket apportionment to each state in percentages, you contemplate making an apportionment to a tributary basin in percentages. It seems to me that the apportionment should be to the states in percentage, if we are assuming that we are to make a percentage apportionment. Of course the use of that water will be affected indirectly by the required state line flows, but I don't think that that necessarily means or requires any attempt to divide up within the State of Colorado, or any other state, the total amount of use of that state as to all of the tributary basins.

COM. STONE: Perhaps I can clarify what I have said somewhat. I agree with Mr. Riter's general principle that it should be the business of a state to use the water wherever it sees fit and can obtain projects for such utilization, but we can't disregard the situation with respect to interstate tributaries. If those tributaries were in one state, the question would be simple and could be answered by that general principle. But where you do have an interstate tributary such as the San Juan and one state dependent wholly upon that tributary, then you cannot cover the situation by a blanket apportionment to each state unless such apportionment is subject to special provisions of the compact with respect to such interstate tributaries.

MR. RITER: I don't disagree with you.

MR. WEHRLI: I don't believe, Judge Stone, the views you have just expressed conflict with Judge Wilson's motion--at least they don't in my mind.

COM. WILSON: I don't think what Judge Stone says conflicts with what I have in mind but I can give you an illustration if the figures I use are not taken as having any implication. Let's assume there is an allocation to Colorado to use 40 percent of the total of 7,500,000. Now then, as Mr. Riter said, it is up to Colorado to determine where she is going to get that water. If you say you are going to take 25 percent of that out of the San Juan you are going to forego the right to take it out of some other stream, either the main stem or some other tributary, and I think that is a question for Colorado to determine, what the interests of her state require her to do, where you are going to get the water. And obviously if you decide to take 25 or 30 percent of your allotment out of the San Juan, assuming it is there, you might make it impossible for New Mexico to get a smaller allotment from that same source.

I take it that Colorado would have to say, "Now how much of this are we going to take out of the San Juan?" It might have to be spelled out in the compact. And I don't believe that contradicts what Judge Stone said nor what Mr. Riter said. Somebody in Colorado under this particular circumstance would have to determine that and it might be difficult to determine. It might be the people on the tributary that you want to give the least water to might be there clamoring for more, I don't know.

THE CHAIRMAN: Gentlemen, this has been a rather interesting discussion. It is now about 4:40 and you have all worked pretty well on this today and this is a very, very important question. Perhaps you would like to adjourn and think about it a little bit and come at it with

a fresh view tomorrow morning at say about 9:30. Do I hear a motion to that effect?

COM. WATSON: I move we recess until 9:30 tomorrow morning to continue this agenda and that this evening this Commission meet to correct the minutes of the last meeting.

THE CHAIRMAN: Is there a second?

COM. STONE: Second the motion.

(Thereupon a vote was taken and Com. Watson's motion carried unanimously.)

(4:40 p.m., Friday, February 20, 1948, recess until 9:30 a.m., Saturday, February 21, 1948.)

- - - - -

Denver, Colorado
February 21, 1948
9:30 a.m.

(All Commissioners present.)

THE CHAIRMAN: The Commission will please come to order. Last evening we were considering the items under Group V, Items (g) and (h). There was quite a bit of discussion on those items and apparently some uncertainty as to the disposition of them, and apparently we adjourned with the idea of having more time to think about them and perhaps this morning the ideas may be more clarified.

COM. WILSON: As I recall, sometime yesterday afternoon we got down to that portion of the agenda under Group V designated as (g) and (h) and I made a motion. I am not sure right now what the motion was and I would like to withdraw that motion and have it deleted from the record.

I want to say this: When I read (g) I thought the answer to it was so obvious that everybody could agree that the allocation should be made to the states as sovereign states. That is what I saw in that (g). Apparently there is more in it than that. When you tie (h) into it, obviously my motion was not sufficient to cover all the elements that enter into both of those questions.

What I have in mind now is that, without being technical at all, sometime, somewhere in the compact there is going to be language that will allocate to each state the right to use a definite portion of the water allocated to the Upper Basin States by the Colorado River Compact. To my mind, and I don't believe anybody will disagree, that language should allocate that water or grant it or whatever term you want to use, to each sovereign state. I think I am clear up to that point and that is what I had in mind in moving yesterday that the answer to (g) should be to the states and not to the tributary drainage basin because I couldn't conceive of an allotment being made to a drainage basin. The allotment should be made to the state and adjustment in each drainage basin might be necessary.

I am not going to make another motion but I do want to say this, that this language would carry out the idea I had combining (g) and (h).

COM. STONE: Will you put that in the form of a motion? Colorado will agree to that.

COM. WILSON: I so move.

COM. WATSON: I will second that motion.

MR. WEHRLI: Mr. Wilson, I don't know that we necessarily disagree with that proposal but I don't believe we are able to say at this time or to agree at this time that there must necessarily be on each interstate tributary a minimum flow fixed or a flow of some kind fixed. There may be cases in which that may be necessary. If the motion means that we are agreeing, even tentatively, to the proposition that this must necessarily be true on all interstate tributaries, I don't think we would feel like going along on it.

COM. WILSON: I am not familiar enough with the upper tributaries to say whether it is or is not. As to the San Juan I think it is necessary obviously.

COM. STONE: I don't understand that implies all tributaries; that is, where necessary, was your idea, wasn't it, Mr. Wilson?

COM. WILSON: Well, interstate tributary, if it is necessary. I think it wouldn't be necessary to making the allotment but I apprehend after it is made, each state will want to know where its water comes from and how much water is taken from each tributary and these interstate flows, that is, the gaging stations at the state line, would have to be kept either for the benefit of the Commission or of the state itself. I am not sure that it would be absolutely necessary on every tributary.

COM. WATSON: The facts can be easily ironed out with any state concerned on any tributary that Utah might be interested in. That would be particularly true with the Henry's Fork area that rises on the north side of the Uintas and flows into Wyoming and back into the Green.

In the case of the tributaries in Colorado except the Yampa the acreage lying in Utah is small and therefore we think that arrangement could be made with Colorado for an agreement between Utah and Colorado.

THE CHAIRMAN: Well, gentlemen, you mustn't forget it seems to the Chairman in the consideration of Items (g) and (h) that it is just as important to consider the obligation the tributary drainage basin has in meeting the collective obligation at Lee Ferry as to think about what benefit that basin is going to get.

COM. STONE: Mr. Chairman, it is our interpretation of Mr. Wilson's motion that that very item is covered. I think he made it quite specific. And assuming he did that, could not the question raised by Mr. Wehrli be covered by letting the record show that the motion made by Mr. Wilson does not necessarily imply application to all tributaries, but to such tributaries where the general principle contained in his motion is necessary. If that is put in the record to cover Mr. Wehrli's position, I am certain the question raised by the Chairman is covered by Mr. Wilson's motion.

MR. WEHRLI: May I ask a question? Maybe this is premature, but in considering this matter as to tributary basins are you thinking about fixing a certain amount of beneficial consumptive use for a particular tributary basin, or are you thinking only of fixing the use in that basin by requiring an outflow from the basin of a certain amount?

COM. STONE: As we conceive that motion it is difficult to state whether one or the other would apply--perhaps both. In other cases it may

be accomplished by a requirement of a minimum delivery on a tributary at a state line. I think that gets into details which would have to be spelled out and worked out in these arrangements which were suggested yesterday, arrangements between states on particular tributaries such as the San Juan. I don't see that Mr. Wilson's motion applies any hard and fast rule as to that, but it is obviously necessary on some of the tributaries.

COM. BISHOP: Mr. Chairman, at this point I would like to explain what my conception of the situation on the Green River might be. Wyoming might be compelled to deliver a certain percentage or a certain number of acre feet of water at the Utah Line. But I can't see how that is going to affect or prevent Utah and Wyoming, for instance, up here on a tributary that happens to head in Utah--several tributaries head in Utah and flow into Wyoming--having an agreement that we will administer the water on a priority basis in that basin in accordance with the laws of the two states, recognizing the priorities and amount in the two states. I can't see we should go on each one of those several tributaries and see that Utah delivers a certain amount of water at the state line. Utah will automatically deliver that water at the state line if they go according to priority on those tributaries.

I just want to make that explanation so you see what we have in mind. Just how they are going to work, if they say we have got to deliver a certain percentage of water in the Green River at the state line, maybe that is the way to do it. But I don't see where this agreement on the tributaries needs to take into consideration the amount of water that Utah has to deliver at the Wyoming State Line. That is automatically taken care of by an agreement that we will have a commissioner administer the water on that stream just like it was all in one state, the recognition of the rights in those two states.

COM. STONE: Mr. Bishop, that may be an appropriate arrangement there, but we shouldn't defeat a general principle which may have to be applied on others.

COM. BISHOP: Judge Stone, I don't think there is any argument between us there. I agree with the motion of Mr. Wilson that it covers that situation and if it doesn't I would like to have Mr. Wilson tell me why.

COM. WILSON: There may be tributaries up in Utah and Wyoming that I am not sufficiently familiar with that you probably might adjust by interstate agreement and not have to account for each tributary outflow. But as a general rule--I know it is applicable to the San Juan--there must be specified in the compact these things that are mentioned in the motion.

COM. BISHOP: I think that is all right.

COM. STONE: Question.

THE CHAIRMAN: Question has been called for. Wyoming?

COM. BISHOP: Yes.

THE CHAIRMAN: Colorado?

COM. STONE: Yes.

THE CHAIRMAN: Utah?

COM. WATSON: Yes.

THE CHAIRMAN: New Mexico?

COM. WILSON: Yes.

THE CHAIRMAN: Arizona?

COM. CARSON: Yes.

THE CHAIRMAN: Now, gentlemen, do you wish to proceed with the consideration of Group VI or go back to the consideration of Item (a) under Group V?

COM. STONE: Mr. Breitenstein suggests that there should be an indication as to whether the states attempt to take care of these matters in one compact, namely, the compact under negotiation. It could be argued that such indication is evidenced by the action on the other subdivisions; however, he suggests that such an indication might be more specifically covered and in order to make progress I would suggest to him that he make on behalf of Colorado the motion that he has in mind in order to get the matter before the Commission.

MR. BREITENSTEIN: I thought the Commission should take action to the effect that the states will attempt in this Upper Basin Compact to determine the rights and obligations of the various states arising out of or affecting interstate tributaries of the Upper Colorado River.

COM. BISHOP: I will second the motion.

THE CHAIRMAN: Motion is made and seconded. Do you wish to discuss the motion?

COM. WATSON: Question.

THE CHAIRMAN: The question has been called for. Wyoming?

COM. BISHOP: Yes.

THE CHAIRMAN: Colorado?

COM. STONE: Yes.

THE CHAIRMAN: Utah?

COM. WATSON: Yes.

THE CHAIRMAN: New Mexico?

COM. WILSON: Yes.

THE CHAIRMAN: Arizona?

COM. CARSON: Yes.

THE CHAIRMAN: Apparently we have covered Group V and we now proceed to the consideration of Group VI. Is it your wish to consider Item (a) first as shown on the agenda or to proceed in some other manner? Which item do you wish to take up first regardless of its position on the agenda?

COM. STONE: Mr. Chairman, it seems to me that Item (a) under Group VI, "Definition of the term 'beneficial consumptive use'." could be disposed of rather expeditiously. Mr. Wehrli suggested that he had a

definition that he may wish to submit later. It appears to Colorado that that is a matter which ought to be worked out between the Engineering and Legal Committees. It is understood by all to be a definition which should be carefully considered. It is very obvious it has both legal and engineering implications.

For those reasons, Colorado moves that the drafting of such a definition be worked out by the Legal and Engineering Committees and be referred to those Committees for that purpose.

COM. WATSON: Second the motion.

MR. WEHRLI: Mr. Chairman, I don't wish to be in default on any promise that I made. I have worked out what I think would be an appropriate definition of beneficial consumptive use as related only to the apportionment that we hope to make between the states. I will distribute that definition if it is desired as I said I would do, but if it isn't, it doesn't make any difference.

COM. STONE: You would be willing to distribute that to the Engineering and Legal Committees, would you not, Mr. Wehrli, for their consideration?

MR. WEHRLI: I would distribute it now or at any time you wish.

COM. WATSON: I suggest you distribute it now.

MR. WEHRLI: It is something that can be considered and if you don't wish the thing to go into the record, that doesn't make any difference either. I think it is a very difficult problem in this compact.

THE CHAIRMAN: Off the record. (Discussion off the record.)

COM. STONE: Question.

THE CHAIRMAN: Wyoming?

COM. BISHOP: Yes.

THE CHAIRMAN: Colorado?

COM. STONE: Yes.

THE CHAIRMAN: Utah?

COM. WATSON: Yes.

THE CHAIRMAN: New Mexico?

COM. WILSON: Yes.

THE CHAIRMAN: Arizona?

COM. CARSON: Yes.

THE CHAIRMAN: We now come to Item (b) of Group VI which reads, "Method of measuring beneficial consumptive use."

COM. STONE: To expedite the matter I might state that it is Colorado's position that (b), (c), (d), and (e) cannot now be determined until more information is made available by the Engineering Committee and discussion at this time would merely result in waste of time.

COM. WATSON: I so move.

THE CHAIRMAN: Who seconds the motion? Is there a second to the motion?

COM. STONE: Second.

THE CHAIRMAN: Are you ready for the question?

COM. WATSON: Question.

THE CHAIRMAN: Wyoming?

COM. BISHOP: Yes.

THE CHAIRMAN: Colorado?

COM. STONE: Yes.

THE CHAIRMAN: Utah?

COM. WATSON: Yes.

THE CHAIRMAN: New Mexico?

COM. WILSON: Yes.

THE CHAIRMAN: Arizona?

COM. CARSON: Yes.

MR. WEHRLI: I didn't hear that motion. Was it a reference to both the Engineering and Legal Committees?

COM. STONE: That referred those items (b), (c), (d), and (e).

MR. WEHRLI: Was it a reference to both of the committees or one or the other?

COM. STONE: It was a reference to the Engineering Committee, that we could not make any progress on those items until further data and information was made available by the Engineering Committee.

THE CHAIRMAN: We now come to Article 6 which is entitled, "Discussion of means of correlating the work of the Engineering and Legal Committees."

COM. STONE: Mr. Chairman, that whole matter could be handled quickly by direction from you as chairman that the chairmen of the two committees make appropriate arrangements to work together where it is required.

THE CHAIRMAN: Yes, I think that is a good suggestion. Let the record show that the chairmen of the two committees are to correlate their work and meet according to their best judgment. Does that dispose of Article 6 to the complete satisfaction of all the members of the Commission? If so, we will now consider Article 7 which reads: "Discussion of a time schedule for the preparation and completion of a draft of the compact."

MR. WEHRLI: Perhaps you would have to discuss 7 and 8 together.

THE CHAIRMAN: It appears to the Chairman that the two articles are very closely related and if you wish to discuss them both together, certainly there is no objection. Article 8 reads: "Determination of time and place of next meeting."

COM. WATSON: You wish to discuss the matter of the next meeting place first?

COM. STONE: I move that the next meeting of this Commission be held at Vernal, Utah, on July 7th at ten o'clock a.m. and continuing for such time as may be required.

COM. WATSON: I second your motion.

COM. WATSON: Question.

THE CHAIRMAN: Question has been called for to vote on the motion fixing the time and place of the next meeting. Wyoming?

COM. BISHOP: Yes.

THE CHAIRMAN: Colorado?

COM. STONE: Yes.

THE CHAIRMAN: Utah?

COM. WATSON: Yes.

THE CHAIRMAN: New Mexico?

COM. WILSON: Yes.

THE CHAIRMAN: Arizona?

COM. CARSON: Yes.

MR. WALLACE: I have enjoyed this meeting and I appreciate the spirit that has been displayed and I am very happy to recognize the experience and wisdom displayed by the delegation from Colorado and thank them for preparing the agenda, which has been very useful in the deliberations of this conference. Further, I would like to say for my old friend--not my old friend, my young friend Mr. Carson from Arizona, that in spite of the comparatively small interest that Arizona has in the result of this conference--what can I say nice about you, Charlie?

COM. CARSON: I can't imagine.

MR. WALLACE: Whatever it is I would like to say it as I regard you an extremely useful member of this organization. I would like to go right down the line but I think maybe that is enough to say because for these two groups I have a very, very high regard.

COM. CARSON: Thank you.

COM. STONE: Thank you, Mr. Wallace; we appreciate that. Mr. Chairman, on the record the Chairman has been referring to and for about three days we have been referring to specific items on the agenda. In order that the record may be intelligible, may I suggest that at the beginning of this meeting the entire agenda be placed in the record.

THE CHAIRMAN: Yes, that is a good idea.

MR. BREITENSTEIN: Off the record. (Discussion off the record.)

THE CHAIRMAN: That is with the exception of Item (e), Group III on page 3 of the agenda.

COM. STONE: That is correct. Item (e) of Group III appearing on page 3 would not appear on the agenda as appearing in the record.

(Pursuant to the foregoing, agenda was copied into the record.)

MR. WEHRLI: Mr. Chairman, I don't know that my ideas exactly coincide with those of the Chairman of the Legal Advisory Committee or with those expressed by others present, but it doesn't seem to me quite essential for the Legal Advisory Committee to be entirely bound and limited by the instructions given to it by the Commissioners in session here. I would like to move that the Legal Advisory Committee, in addition to the matters specifically referred to it, prepare such additional introductory and formal provisions as the Committee believes should properly become a part of the compact; and that the Committee also give attention to a skeleton outline placing the different provisions in what the Committee deems to be a proper sequence.

Let me explain that I don't have in mind that the Committee will deal with any substantive matters except as same have been referred to the Committee. But I believe it would be helpful if the Legal Committee would correlate to some extent the different matters that have been assigned to it and come back with a report putting those in some proper relation to each other, leaving appropriate places for other things to be inserted, and also giving some attention to preparation of introductory statements that usually appear in these compacts and other formal matters that have not been specifically assigned to the Committee.

COM. STONE: Did you make that in the form of a motion, Mr. Wehrli?

MR. WEHRLI: Yes, I did.

COM. STONE: If that is a motion, I second it.

MR. WEHRLI: Of course, Mr. Bishop makes the motion.

THE CHAIRMAN: Yes, that is understood, seconded by Colorado. Is there a discussion of the motion as made by Mr. Bishop?

COM. WATSON: Question.

THE CHAIRMAN: Wyoming?

COM. BISHOP: Yes.

THE CHAIRMAN: Colorado?

COM. STONE: Yes.

THE CHAIRMAN: Utah?

COM. WATSON: Yes.

THE CHAIRMAN: New Mexico?

COM. WILSON: Yes.

THE CHAIRMAN: Arizona?

COM. CARSON: Yes.

THE CHAIRMAN: Now, the Chair will not insist on his suggestion if you all understand what is to be done in the meantime, but the Chairman probably is a little more dense than some of you and I don't understand it and I still think a clear statement and concise statement should be made by someone on the work to be done in the interim and the correlation of that work so there will be no misunderstanding about it. We have about 45 minutes until twelve o'clock.

MR. WEHRLI: Mr. Chairman, as we understand it, there will be a preliminary meeting--

COM. STONE: Pardon me. I was going to suggest, Mr. Wehrli, that since the specific procedure which has been discussed and apparently approved was submitted by Mr. Breitenstein as a member of the Legal Committee from Colorado, I should be glad to ask Mr. Breitenstein on behalf of Colorado to place that procedure in the form of a motion in compliance with the suggestion of the Chair.

MR. WEHRLI: That is very agreeable.

THE CHAIRMAN: Mr. Breitenstein.

MR. BREITENSTEIN: The motion is that in the period between now and the next meeting of the Commission on July 7, the committees which have been authorized between the states affecting tributary basins, and the Legal Advisory Committee and the Engineering Advisory Committee, should be so correlated that prior to the meeting on July 7, there is presented to the Commission in the event of agreement between the states, recommendations as to the method of treatment of the tributaries and as to all other matters which have been discussed and referred to the Legal Advisory Committee and the Engineering Advisory Committee; and that it shall be the obligation of the representatives of the various states on those committees under the overall control and direction of the Chairmen of the Engineering Committee and the Legal Committee to so coordinate their efforts that this may be accomplished.

THE CHAIRMAN: Thank you, Mr. Breitenstein. That is a very clear statement I think.

COM. WATSON: Second the motion.

THE CHAIRMAN: Is there discussion of the motion as submitted by Mr. Breitenstein? Are there any questions concerning the motion? Mr. Riter?

MR. RITER: I can't remember all that he said. I would appreciate it, if the motion passes, if I might have a copy of it for my guidance in advance of the complete transcript of the whole meeting.

THE CHAIRMAN: And also for Mr. Carson, I believe, too.

MR. WALLACE: Question.

THE CHAIRMAN: Wyoming?

COM. BISHOP: Yes.

THE CHAIRMAN: Colorado?

COM. STONE: Yes.

THE CHAIRMAN: Utah?

COM. WATSON: Yes.

THE CHAIRMAN: New Mexico?

COM. WILSON: Yes.

THE CHAIRMAN: Arizona?

COM. CARSON: Yes.

THE CHAIRMAN: The Chairman at this time would like to express his appreciation of the intelligent manner in which the press has reported the progress of the Commission meetings. I find no fault whatever with the articles which I have read and I think the press is to be commended for its intelligent handling of this complex matter.

COM. CARSON: I move that the Commission meet at two o'clock to edit these minutes.

THE CHAIRMAN: Is there a second to the motion?

COM. STONE: I second the motion.

THE CHAIRMAN: Is there a discussion of the motion?

COM. WATSON: Question.

(Thereupon a vote was taken and Com. Carson's motion carried unanimously.)

COM. STONE: Move we adjourn.

(Motion is seconded, a vote is taken and the motion carries unanimously.)

(11:30 a.m., Saturday, February 21, 1948, Commission adjourned until 10:00 a.m., Wednesday, July 7, 1948, at Vernal, Utah.)

CARD

J. R. RITER'S MEMORANDUM

POWER POSSIBILITIES AT BOULDER DAM

BOULDER CANYON PROJECT

OCTOBER 25, 1940

* * * * *

UNITED STATES
DEPARTMENT OF THE INTERIOR
BUREAU OF RECLAMATION
COMMISSIONER'S OFFICE
BUILDING 53, DENVER FEDERAL CENTER
DENVER 25, COLORADO

IN REPLY
REFER TO: D-700

NOV 10 1959

RECEIVED
NOV 12 1959
UPPER COLORADO
RIVER COMMISSION
Salt Lake City, Utah

Mr. Ival V. Goslin, Engineer-Secretary
Upper Colorado River Commission
Ray Building, Room 103
366 South Fifth East Street
Salt Lake City 2, Utah

Dear Ival:

In response to your request of November 9, 1959, I am sending you my copy of a memo dated October 25, 1940, subject "Power Possibilities at Boulder Dam, Boulder Canyon Project."

I do not have any extra copies of the transmitted memo; hence, I would appreciate it if you would return it to me after you have had an opportunity to review it and extract therefrom data useful in your current considerations.

In my reference to Table 5, you will note that the minimum 10-year inflow under 1988 conditions was less than 75,000,000 acre-feet. It was the awareness of that situation in making the 1940 studies that prompted me to realize the necessity for holdover storage capacity in the Upper Basin to permit the Upper Basin to meet its Compact obligation at Lee Ferry and to concurrently utilize water allocated to it under the terms of the Compact.

The computations underlying the study were in computation books. I recently had occasion to search for the books but have been unable to locate them. However, I believe that the memo and the accompanying charts will probably give you the information you desire.

Sincerely yours

J. R. Riter

J. R. Riter
Chief Development Engineer

Under separate cover (71823)

Denver, Colorado, October 25, 1940.

MEMORANDUM TO HYDRAULIC ENGINEER
(J. R. Riter)

Subject: Power possibilities at Boulder Dam - Boulder Canyon Project.

This memorandum presents the results of Lake Mead operation studies to determine the firm and secondary power output possibilities at Boulder Dam, with upstream irrigation development as of 1938 and 1988 respectively.

Some revisions have been found desirable in the 1929 studies, which are presented on your report of January 31, 1930, "Hydrology of the Boulder Canyon Reservoir, with reference especially to the height of dam to be adopted." The reasons for the revisions in the study are enumerated as follows:

(a) Results of a detail reservoir survey, made by aerial cartographic methods, for the Soil Conservation Service, show about 1,800,000 acre-feet more storage capacity in Lake Mead than formerly determined.

(b) Stream flow records have been secured of the Colorado River, at a point just below the Boulder Dam, since 1931, enabling a closer estimate of the run-off relations with stations having longer record.

(c) Census data for 1929 and surveys made by the Bureau of Reclamation in 1935 permit a closer estimate of the extent of irrigation development in the Colorado River watershed under 1938 conditions of development.

(d) Provision is made for the installation of a greater power output capacity at Boulder Dam, than contemplated in the 1929 report.

(e) Operating experience since 1935 has demonstrated that the flood inflow to the reservoir cannot be reliably predicted prior to April 1. This necessitates a revision of operating plans in the winter months.

(f) Overall power plant efficiencies for generation of firm power have been less than the 83%, used in our 1929 studies.

(g) Dredging operations in the channel below the Boulder Canyon Power Plant are expected to lower the tailwater elevation to 642 feet, thereby increasing the power head by 5 feet.

(h) Observations of evaporation from pans adjacent to the reservoir indicate that evaporation losses are 6 feet per year, instead of 5 feet used in the 1929 studies.

Two sets of studies have been conducted for the 44-year period, 1897 to 1940 inclusive, using overall power plant efficiencies for firm power of 83% and 78%, respectively. The results thereof are shown in tables 6 and 7. Reservoir operations are shown on the 4 charts which accompany this memorandum. Study has also been made to determine the firm power output which can be maintained through the 1934 critical period with an overall power plant efficiency of 80%.

Storage Capacity

The original area and capacity curves for Lake Mead were determined from topographic surveys made in 1919-1921 on a scale of 2 inches per mile, with a contour interval of 50 feet. In 1934, the Soil Conservation Service made a detail topographic map on a scale of 1000 feet per inch with 5 and 10-foot contour intervals, using aerial cartographic methods. The capacity table prepared in 1940 from the latter survey has been used in the study of 1938 conditions. It is estimated that silting between 1938 and 1988, will reduce the reservoir capacity by 3,000,000 acre-feet. The following table shows the storage capacity at various elevations:

Table 1

Contour Elevation Feet	Storage Capacity - 1000 A. F. Old Capacity Table (1)	1938 Conditions (2)	1988 Conditions (2)	Remarks
650	0	0	0	
700	78	74	25	
750	381	336	250	
800	967	907	700	
850	1,980	1,903	1,500	
900	3,501	3,376	2,700	
950	5,504	5,390	4,300	
1000	8,048	8,036	6,700	
1050	11,325	11,475	9,600	
1100	15,438	15,868	13,700	
1150	20,444	21,284	18,500	
1200	26,470	27,898	24,900	
1221.4	29,406	31,142	28,100	Top of spillway gates*
1229	30,504	32,359	29,300	Maximum ws. elevation

* Gates closed (in raised position)
(1) Capacity data used in 1929 studies.
(2) Adopted for these studies.

The flood control storage capacities shown in the 1929 report are retained in the present study as follows:

1938 Conditions - 9,500,000 acre-feet, between contents of 22,800,000 and 32,300,000 acre-feet.

1988 Conditions - 4,000,000 acre-feet between contents of 25,300,000 and 29,300,000 acre-feet.

Comparison of the inflow to Lake Mead, with the outflow and measured changes in storage content during the initial filling period of 1935 to 1938 inclusive, shows unaccounted for losses of about 2,400,000 acre-feet. Large losses are not observed in 1939 and 1940, when the reservoir stage was fairly constant; hence it is concluded that the unaccounted for loss in 1935 to 1938 represents water stored in the ground adjacent to the reservoir, i.e. bank storage. It is possible with a series of years

of low run-off and continuous drawdown of the reservoir that as much as 1,500,000 acre-feet of such bank storage may be recovered. Over such a series of years the total bank storage return would be but a small percent of the total inflow; in view thereof and to be conservative, the reservoir operation studies reported herein have neglected the ebb and flow of bank storage. However, the water lost to bank storage during the initial filling period (1935 to 1938 inclusive) has been included in the estimate of reservoir inflow.

Inflow to Lake Mead

Derivation of the past flows at Boulder Canyon and determination of corrections to reflect stream flows with 1938 conditions of upstream development are presented in Exhibit B (Pages 64 to 80 inclusive) of report by E. B. Debler, dated December 1934, "Stream Flow of Lower Colorado River and Its Tributaries." Annual flows are taken as derived in the 1934 report for the years 1897 to 1931 inclusive; for the years since 1931, the inflow to Lake Mead has been estimated as described herein.

1932 to 1934 Inclusive

Taken from Bureau of Reclamation records below Boulder Dam.

1935 to 1938 Inclusive

Closure of diversion tunnels at Boulder Dam was made in February 1935 and the storing of water started in Lake Mead. Table 2 is a comparison of discharges at Boulder Dam and at Grand Canyon for recent years. This table also shows the storage changes in Lake Mead during the years since 1934.

Table 2

Unit - 1000 Acre-Feet

Calendar Year	Flow-Colorado River: Grand Canyon	Flow-Colorado River: Boulder Dam (1)	Indicated Gain Grand Canyon to Boulder Dam	Net Change in Lake Mead Storage During Year

1936 #	12,469	12,151	-318	+5,873
1937 #	12,540	12,465	-75	+5,914
1938 #	15,861	15,746	-115	+8,148
1939	9,089	9,760	671	+168
1940 *	6,441	6,861	420	+575
# Averages:	12,452	12,803	351	

* For 9 months, January to September only.
\# Years 1935, 1936, 1937 and 1938 excluded from averages

(1) Flows 1923 to 1931 inclusive estimated from Topock. Flows 1932 to 1934 recorded at dam. For 1935 to 1940 flow equals sum of outflow at dam, increase in storage and evaporation loss at 6' over mean area.

The large losses, experienced during the filling period between Grand Canyon and Boulder Dam, can reasonably be accounted for by filling of bank storage. The outflow in these years corrected by visual storage changes and evaporation loss does not give a true measure of the inflow in view of the relatively large amounts of water lost in bank storage. In view thereof inflow to

the reservoir in the years 1935 to 1938, inclusive, is estimated to equal the flow at Grand Canyon plus 350,000 acre-feet per year. This figure represents the average net gain between Grand Canyon and Boulder Dam with similar average run-offs at Grand Canyon.

1939 and 1940

In these years the inflow to Lake Mead is estimated to equal the outflow corrected for visual changes in storage and evaporation losses. Inflow for the months October to December 1940 were estimated from advance records to October 13 and comparison with other recent years, to complete the record for the year.

Table 5 shows the past annual flows and the estimated depleted flows to reflect conditions with development as of 1938 and 1988 respectively.

Past Upstream Development

Past flows reflect the results of varying upstream irrigation development. Table 3, taken from census data, and surveys made by the Bureau of Reclamation in 1935 indicates the progress of irrigation development in the Colorado River Basin.

Table 3
Irrigated Area - Acres*

Year	Upper Basin (Above Lees Ferry)	Lower Basin (Above Boulder Dam)	Total Above Boulder Dam
1899	515,000	28,000	543,000
1902	638,000	37,000	675,000
1909	1,011,000	41,000	1,052,000
1919	1,355,000	64,000	1,419,000
1929	1,450,000	57,000	1,507,000
1935	1,291,000	40,000	1,331,000

*Rounded to nearest 1000 acres.

Irrigated areas have been assumed to have increased uniformly from 1899 to 1902, from 1902 to 1909 and from 1909 to 1919. The data indicate a relatively uniform increase for these years. A

continuation of the growth in these years would have resulted in an area in 1929 far in excess of that reported. This situation is not unexpected as the urge for development generated by war conditions was definitely checked by economic conditions in 1921. While some new lands have been placed in cultivation since 1921, these have been offset by the suspension of irrigation in other lands. The growth assumed to continue until 1922, when the 1929 area was reached; thereafter the area has been assumed as constant. The differences in the 1929 and 1935 areas are due largely to differences in determining irrigated areas. The 1935 figures are based on actual field surveys, while census figures reflect statements of irrigators.

Normal average annual stream depletion due to irrigation development above the Boulder Dam watershed is estimated to average 1.5 acre-feet per acre irrigated. This figure is adequate to allow for evaporation losses from irrigation reservoirs.

Depletions vary with run-off conditions. In years of high run-off these are increased diversions for immediate uses and storage is replenished in both surface and underground reservoirs. The reverse is true in low years. Allowance has been made for this by assuming depletions for any year to depart from the normal by a percentage equal to one-half the departure of the stream flow from normal. The percent of deviation is based on the average virgin flow of the Colorado at Lees Ferry for the years 1897 to 1934 inclusive, shown in the 1934 report. Transmountain diversions to other watersheds are assumed to vary from the normal each year in a manner similar to that assumed for irrigation depletions.

Data on transmountain diversions from the Colorado River watershed above Boulder Dam are presented in Table 4.

Table 4

Name of Diversion	Diversion From	Present Normal Annual Diversion-Acre-Feet	Year Completed
Grand River Ditch	Colorado River	14,000	1903
Busk-Ivanhoe Tunnel	Frying Pan Creek	5,000	1925
Erwing	Eagle River	2,000	1880
Tarbell	Cochetopa Creek	2,000	1914
Berthoud (Church)	Fraser River	1,000	1909
Boreas Pass	Blue River	1,000	1909
Strawberry	Duchesne	90,000	1913
San Pete	San Rafael	8,000	1935
Twin Lakes Tunnel	Roaring Fork	40,000	1935
Moffatt Tunnel	Fraser River	40,000	1936
Miscellaneous	Various	6,000	Various
Total		209,000	

Depletion as of 1938

Normal depletions (anticipated in 1934) with 1938 conditions are summarized on pages 76 and 77 of the 1934 report as follows:

Irrigation Within Basin	
1929 area above Lees Ferry	2,175,000 acre-feet
1929 area between Lees Ferry and Boulder Dam	85,000 " "
Resumption of irrigation on dormant lands	150,000 " "
Increased use by reason of Taylor Park Reservoir	25,000 " "
Transmountain Diversions	209,000 " "
Total	2,644,000 acre-feet

Due to the generally low run-off which has prevailed since 1934, much of the anticipated "Resumption of irrigation on dormant lands has not been experienced." However, the depletions as shown in the 1934 report for 1897 to 1933 inclusive have been adopted. Past flows for the years 1935 to 1940 inclusive have been taken as representative of 1938 conditions.

Corrections to past flows and flows with 1938 conditions of development as shown in table 5.

Depletions as of 1988

Total normal depletions (of the virgin flow of Colorado River) with anticipated 1988 conditions of development, are shown in the 1929 Hydrology Report to be as follows:

Upper Basin above Lees Ferry	
Irrigation	4,850,000 Acre-feet
Transmountain Diversions	601,000 " "
Evaporation losses from Reservoir	768,000 " "
Subtotal Upper Basin	6,219,000 Acre-feet
Lower Basin above Boulder Dam	
Irrigation	202,000 Acre-feet
Transmountain Diversions	20,000 " "
Evaporation from Reservoirs	152,000 " "
Subtotal Lower Basin	374,000 " "
Total above Boulder Dam	6,593,000 Acre-feet

While the individual items of the 1988 estimated depletions may be changed somewhat, it is believed that the total is reasonably correct. To obtain the stream flows with 1988 conditions a normal increased depletion of 6,593,000 minus 2,644,000 or 3,949,000 acre-feet was deducted from the stream flows which represent 1938 conditions. The actual depletion for any individual year was varied from the normal by a percentage which is equal to 1/2 of the percent of deviation of the virgin flow at Lees Ferry from normal.

The depletions and 1988 stream flows at Boulder Dam are shown in Table 5.

Power Output Capacity

Space has been provided in the power house for the ultimate installation of the following power units (exclusive of station service units):

15 - Each with capacity of 82,500 kw. = 1,235,500 kw.
2 - Each with capacity of 40,000 kw. = 80,000 kw.

Total 1,317,500 kw.

It is contemplated that output capacity will be available at various dates as follows:

Year	Number of 82,500 kw. Units	Number of 40,000 kw. Units	Total Output Capacity kw.
1942	11	1	947,500
1956	12	1	1,030,000
1971	13	1	1,112,500
1988	15	2	1,317,500

For the purpose of determining the amount of secondary output available with 1938 run-off conditions, output capacity of 947,500 kw. was assumed.

Overall Power Plant Efficiency

Results of study of power plant efficiency made by the electrical section are presented in the following memorandum of October 18, 1940 by Chief Electrical Engineer L. N. McClellan:

"1. The original hydrology studies of the Boulder Canyon Project were based on an average overall operating efficiency of 83%. In actual practice, however, the overall operating efficiency has averaged about 75% thus far, as shown by the graph attached hereto. This low efficiency has been due to several factors:

"(a) The efficiency of the turbines of units N-1, 2, 3, and 4, is about 3% lower than the efficiency of the other turbines in the power plant, and these original four turbines have produced the major part of the output thus far. The original four turbines were designed for 50

cycle operation and they are now being operated at 60 cycles. The 60-cycle runners in these units are necessarily larger in diameter than they should be for most efficient performance, since they had to be installed in the turbine casings, the diameter of which is large enough for 50-cycle runners. This larger diameter of the runners increases the skin friction and reduces the efficiency.

"(b) The turbines were operated at heads considerably below those for which they were designed for some time while the reservoir was filling. This resulted in low operating efficiency during this period.

"(c) It has been necessary most of the time to release more water than could be utilized for generation of power, and consequently there has been no incentive for high operating efficiency.

"(d) The lessees of the power plant, particularly the City of Los Angeles, have operated all available generating units most of the time in order to provide "spinning reserve" for their power system. Much of the time these generating units have been operated at only partial capacity and the efficiency is considerably lower when the units are operated below half rated output.

"(e) Unit A-8 has been operated at half output or less much of the time, which has reduced the operating efficiency of this unit.

"2. If the generating units are operated in a range of from about three-quarter to full load, the following average overall operating efficiency can be attained:

Penstocks	98%
Turbines	88%
Generators	97%
Transformers	99%
Overall operating efficiency	83%

This indicates that the basis used in the original hydrology studies was appropriate for a plant operated so as to secure the maximum kilowatt-hour output.

"3. The overall operating efficiency actually obtained in practice will depend upon the extent to which the operating agents insist upon operating the Boulder generating units as "spinning standby." An overall operating efficiency of 78% would appear about right to assume, based on the operating performance to date. If the "spinning standby" is reduced to a reasonable amount, it should be readily possible for the operating agents to secure an average overall operating efficiency of 80%."

Studies have been made for both 1938 and 1988 conditions for the years 1897 to 1940 inclusive, using overall power plant efficiencies as follows:

Firm Power	Secondary Power
78%	83%
83%	83%

Study has also been made of the years since 1932 to determine the firm power output which can be produced, with an overall efficiency of 80%. A maximum allowable shortage of 10% is assumed for any one month.

Operation of Reservoir

An operating plan has been evolved to satisfy the requirements for flood control, irrigation and power development. Studies of the 1884 flood (largest historic flood) and of the 1909 flood (largest of record) show that storage space of 9,500,000 acre-feet with 1938 run-off conditions and 4,000,000 acre-feet with 1988 run-off conditions is required to be available on April 1 to control these floods to the following discharges:

Month	1884 Flood	1909 Flood
April	55,000 second-feet	35,000 second-feet
May	65,000 " "	35,000 " "
June	75,000 " "	35,000 " "
July	75,000 " "	35,000 " "
August	50,000 " "	35,000 " "

Floods of large volume occur in the months of May to July as a result of snow melt augmented in some years by heavy rains on the watershed. To secure joint use for flood control and power development of the storage capacity reserved for flood control purposes, and to permit the use for flood control if needed, of part of the power storage, it is anticipated that predictions will be made of the magnitude of flood inflow by the use of snow surveys and data on accumulated winter precipitation on the watershed to March 1, April 1 and May 1, respectively.

Winter precipitation in percent of normal is shown on page 204 of the 1929 Hydrology Report. For the purpose of the present studies, the data on accumulated winter precipitation were also compiled for the years 1930 to 1940 inclusive.

To control "flash" floods caused by cloudbursts in the late summer or winter storms on the lower elevations of the watershed, storage capacity of 2,500,000 acre-feet is reserved with 1938 conditions, and 1,000,000 acre-feet with 1988 conditions.

Demands at Boulder Dam for irrigation and domestic use in the lower basin are estimated to be as follows (these are same as shown on page 201 of the ~~1929~~ Hydrology Report):

1930

Month	Demand - 1000 Acre-Feet 1938	1988
January	260	380
February	305	455
March	440	680
April	530	830
May	585	915
June	630	990
July	630	990
August	585	915
September	530	830
October	440	680
November	305	455
December	260	380
Totals	5,500	8,500

Releases at Boulder Dam for power purposes will more than meet the 1938 irrigation requirements. It is expected that by 1988 regulatory storage will be provided at the Bullshead site or elsewhere to regulate the power releases to conform to irrigation demands.

The firm power output, assuming a maximum allowable shortage in any one month of 10%, was determined in the 1929 studies to be as follows:

With 1938 run-off conditions - 4,330,000,000 kw-hr. annually.
With 1988 run-off conditions - 3,880,000,000 kw-hr. annually.

The operating studies shown herein are based on the assumption that these firm power outputs will be maintained so far as possible. It is further assumed that 1/12 of the annual firm power will be produced each month.

Water released from the reservoir in excess of that required for firm power production is assumed to be used (to the extent of the power plant capacity) for the production of secondary energy.

Plan of Releases

The following operating rules (which are largely empirical and based on recorded conditions) have been applied to govern the release of water from the reservoir:

(A) On March 1, if the accumulated winter precipitation from October 1 to February 28 is greatly in excess of normal (125% of normal used with 1938 conditions and 110% of normal with 1988 conditions) up to 35,000 second-feet will be released, if necessary to lower the reservoir content to the flood control level (22,800,000 acre-feet with 1938 conditions and 25,300,000 acre-feet with 1988 conditions) by March 31. If the accumulated winter precipitation to February 28 is less than normal, firm power only will be produced in March.

On April 1, a forecast of probable flood inflow is made using the data on accumulated winter precipitation to March 31. With the normal expected inflow to the following March 1, a rate of release is calculated such that the storage content on the following March 1 will be 1,200,000 acre-feet above the flood control level. This rate of release is applied during April unless greater releases are found necessary: (1) to maintain the firm power output or (2) to clear the reservoir for flood control purposes. The rate of release for flood control is such that the "Maximum Probable Flood Inflow" to July 31 will not exceed elevation 1229 feet (content of 32,300,000 acre-feet with 1938 conditions or 29,300,000 acre-feet with 1988 conditions).

On May 1. The process, described for April 1, is repeated. The rate of release determined on the May 1 forecast is applied to the months of May and June.

On July 1. It will be possible with conditions then existing in the watershed to make a fairly reliable advance estimate of the magnitude of the July run-off. Assuming that the predicted July run-off will equal the actual run-off a rate of release is determined, such that the average run-off from August to February inclusive the reservoir will be drawn to a content of 1,200,000 acre-feet above the flood control level on the following March 1. This rate of release is adopted unless greater releases are found necessary for flood control purposes or to produce firm power.

From August 1 to February 1. Rates of release are calculated each month such that the average run-off conditions the reservoir will be drawn to a content of 1,200,000 acre-feet above the flood control level by the following March 1. Greater releases are made, if necessary, to produce firm power.

To avoid undue waste of water for power purposes when the reservoir is drawn to low levels and to facilitate recovery of storage, releases are cut when the storage content drops to 17,000,000 acre-feet to the following amounts:

With 1938 conditions - 900,000 acre-feet per month.

With 1988 conditions - 700,000 acre-feet per month. This rate of release, together with storage released from Bullshead Reservoir, will meet the annual irrigation requirements of 8,500,000 acre-feet.

Reservoir Content at End of 1896

Studies of the virgin inflow to Great Salt Lake in Utah presented in the Weymouth Report of 1924, show excessive run-off in 1884, followed by two years of normal run-off in 1885 and 1886. From 1887 to 1896 inclusive run-off averages about 85 percent of normal. Rough reservoir studies from 1884 to 1896 assuming that the inflow to Lake Mead is proportional to the computed virgin inflow to Great Salt Lake show reservoir contents on December 31, 1896 as follows:

1938 conditions - At flood control level (22,800,000 acre-feet)

1988 conditions - 20,000,000 acre-feet.

These reservoir contents were assumed at the beginning of the study on January 1, 1897.

Firm Power Available with 80 Efficiency

The studies reported herein show minimum monthly power outputs in comparison with that required for 100% supply of firm energy as follows:

Units - Million Kw-Hrs.

Stream Flow Conditions	Required Monthly Output for Full Firm Power	Overall Efficiency 78% for Firm Power: Minimum Monthly Output	Overall Efficiency 78% for Firm Power: % Shortage	Overall Efficiency 83% for Firm Power: Minimum Monthly Output	Overall Efficiency 83% for Firm Power: % Shortage
1938	361	322	11	344	5
1988	323	210	35	237	27

If an overall efficiency of 80% were maintained for firm power, it would be possible to produce 4,330,000,000 kw-hrs. annually under 1938 conditions with a maximum shortage in any one month of 9%.

Studies shown in the 1930 Hydrology Report for 1988 conditions of development limited the maximum rate of release for firm power to 14,000 second-feet (average of 845,000 acre-feet per month). With these limitations applied in the critical period of 1900 to 1906 inclusive, the minimum monthly power output with 83% overall efficiency and 3,880,000,000 kw-hrs. annual firm power was determined (in the 1929 studies) to be 291,000,000 kw-hrs. The firm power shortage in the month of minimum output was limited to 10%.

If the firm power releases from the reservoir in the years 1930 to 1940 inclusive were permitted to continue at a maximum rate of 14,000 second-feet, the live storage capacity of the reservoir would be exhausted. Irrigation shortages would be experienced and maximum monthly power shortages would be greater than indicated herein. The operating rules were accordingly modified to limit releases from the reservoir to that required to meet annual irrigation requirements, when the storage contents are less than 17,000,000 acre-feet.

A preliminary study to determine the effect of limiting releases to 700,000 acre-feet per month (which is estimated to be required to meet annual irrigation requirements) when the storage

(11,600 cfs

content is less than 20,000,000 acre-feet, shows minimum monthly power output and shortages in firm power as follows:

Efficiency	Output in Minimum Month	Percent Shortage of Firm Power (1)
78%	217,000,000 kw-hrs.	33
80%	228,000,000 kw-hrs.	29
83%	245,000,000 kw-hrs.	24

(1) 323,000,000 kw-hrs. required for full firm output.

Preliminary studies through the critical period from 1930 to 1940, inclusive, with the operating plan modified as described herein, show that the firm power output which can be sustained with a maximum allowable shortage of 10% in any one month is about 3,200,000,000 kw-hrs. annually with 1988 run-off conditions. The operating plan described herein would be modified to the following:

(a) Overall efficiency for firm power - 80%.

(b) Maximum release for firm power - 700,000 acre-feet per month.

BRANCH OF PROJECT PLANNING
Customhouse
Denver 2, Colorado.

April 12, 1944.

From Acting Director

AIR MAIL

To Commissioner

Subject: Total depletions above Lees Ferry under 1988 conditions - Upper Colorado River Basin.

1. Reference is made to your teletype, WA 3172, of April 10, 1944, which reads:

"FURNISH TOTAL DEPLETIONS BY YEARS 1931 TO 1940 INCLUSIVE UNDER 1988 CONDITIONS IN UPPER COLORADO RIVER BASIN ABOVE LEES FERRY USED IN PREPARATION OF TABLE FIVE EXHIBIT THIRTY-FIVE A BOULDER CANYON ADJUSTMENT ACT HEARINGS SUBMITTED OCTOBER 25, 1940 AT LOS ANGELES WRIGHT PRESIDING."

2. This office replied, by teletype, to your teletype on April 11, 1944, as follows:

"Reurteletype W 3172. Total depletions above Lees Ferry in thousands acre-feet are:

1931	4,630
1932	6,432
1933	5,338
1934	3,575
1935	5,436
1936	5,810
1937	5,735
1938	6,458
1939	5,236
1940	5,063 "

3. The total depletions in the Colorado River Basin above Lees Ferry under 1988 conditions were computed by the methods used in the report of December 1934 by E. B. Debler, "Streamflow of Lower Colorado River and Its Tributaries." The computed virgin streamflow of the Colorado River at Lees Ferry for the 10-year period 1931-1940 totals 124,618,000 acre-feet. The computed total depletion above Lees Ferry under 1988 conditions totals 53,763,000 acre-feet. It was recognized, when the October 25, 1940, studies were made, that such depletions exceeded those allowable

under section (d), Article III of the Colorado River Compact, which reads as follows:

> "The States of the upper division will not cause the flow of the river at Lee Ferry to be depleted below an aggregate of 75,000,000 acre-feet for any period of 10 consecutive years reckoned in continuing progressive series beginning with the 1st day of October next succeeding the ratification of this compact."

4. Adjustments were not made in the depletions computed for the October 25, 1940, memorandum (exhibit 35-A, Boulder Canyon Adjustment Act hearings) because it was anticipated that by 1988 some adjustments might be made in the compact requirements to permit upstream depletions as indicated.

5. In making current hydrologic studies for the Bridge Canyon Project, it is assumed that holdover storage would be provided above Lees Ferry to permit an ultimate average annual depletion of 7,500,000 acre-feet in the upper basin and also insure an average annual flow of 7,500,000 acre-feet at Lees Ferry in the 10-year critical period 1931 to 1940, inclusive.

MEETING OF THE COMMITTEES OF FOURTEEN AND SIXTEEN

OF THE SEVEN STATES OF THE COLORADO RIVER BASIN

AND THE POWER ALLOTTEES

November 10 and 11, 1944

Shirley-Savoy Hotel, Denver, Colorado

The meeting was called to order by Chairman Stone at 10:20 o'clock a. m., on Friday, November 10, 1944.

JUDGE STONE: The meeting will please come to order.

We first should determine the procedure to follow in this meeting. We have a lot to do and it must be completed in two days.

The Bureau of Reclamation expects at this meeting to present the tentative report on the plan of comprehensive development. The presentation by the Bureau will then be followed by the comments from the various states. When you see that in a major way you are cutting the pattern of future development for one of the largest rivers in the United States, you will realize that there is before us a sizable task.

It is obvious that in two days' time we cannot accomplish the work that we hope to get done unless we have some very well defined procedure. The Chair suggests a procedure, and that is subject to determination or final fixing by the members of the Committee. The procedure suggested is this: That the report will first be presented; that then we will take up one of the basins, either the Lower or the Upper Basin. The Chair suggests that we commence with the Lower Basin; that each state within the Lower Basin will be allotted time within which to make its presentation. And I believe that it will be necessary to fix the time if we are to hear from all the states and get through.

After we dispose of each state in the Lower Basin, if that is what the Committee finally decides, then we shall take up the Upper Basin States and proceed in the Upper Basin with each of the four states, allowing each state a given length of time.

It should be understood in this meeting that those who are here as advisers and consultants appear for various sections in various states, and when it comes to the comments from each state, the representative from that state will be expected to call upon the advisers and consultants, those appearing from various sections of the state, to secure such comments as those thus appearing may wish to make.

We must keep also in mind that there are other federal agencies here, and following the comments of the states, or prior to those comments, those agencies will be given an opportunity to make such statements as their representatives wish to make.

I believe that we must very carefully follow some procedure like that if we are to do the work here.

Now, the suggestion has been made as to the procedure. I should also like to call your attention to the fact that the report of the Bureau of Reclamation is a tentative, confidential report to be discussed with this group, and it is not for publication. Therefore, if there are any newspaper reporters here, or anyone here conducting any publicity, he should keep in mind that anything released to the public through the press, or given publicity otherwise, should first have a clearance--anything appearing in this report or any statements from the federal agencies--should be obtained through the federal agency making the report. The same rule should apply to the various states.

In a meeting of this kind it is probably clear that certain states will make statements for the purpose of this meeting which those states do not desire to make public, and any statement coming from any state should be cleared through that state.

This room is large and there is quite a sizable attendance. We keep the proceedings, and those who speak should speak loudly. When anyone wishes to speak he should give his name in order that the Reporter may get it for the record.

I have made arrangements to have Jeannette Klein here so that if there is anyone who wishes any stenographic help or assistance, she will be available at any time so that you may dictate any statements or any other material which you may wish to put in writing and present. She will be available here at this table to help you.

May I ask the Committee whether the procedure suggested by the Chair is acceptable? If not, suggest any change in the procedure you think advisable.

MR. SMITH: Chairman Stone, I wonder if it would not be more logical and a better procedure to begin at the beginning and have the upstream states make their statements first rather than the downstream states? I just throw that out as a suggestion.

JUDGE STONE: Are there any further comments?

MR. SCATTERGOOD: I have the same feeling, gentlemen. We cannot very well make our comments on water coming down below until we hear from the Upper States. And I would like to offer the suggestion that the other federal departments follow the presentation, which will enable the states more intelligently to make comments.

JUDGE STONE: The suggestion has been made by Mr. Smith and Mr. Scattergood that the procedure be followed by starting with the upstream or Upper Basin States, and that the other federal agencies follow the Bureau before this is done.

Does Arizona have any comment on that?

I believe that we must very carefully follow some procedure like that if we are to do the work here.

Now, the suggestion has been made as to the procedure. I should also like to call your attention to the fact that the report of the Bureau of Reclamation is a tentative, confidential report to be discussed with this group, and it is not for publication. Therefore, if there are any newspaper reporters here, or anyone here conducting any publicity, he should keep in mind that anything released to the public through the press, or given publicity otherwise, should first have a clearance--anything appearing in this report or any statements from the federal agencies--should be obtained through the federal agency making the report. The same rule should apply to the various states.

In a meeting of this kind it is probably clear that certain states will make statements for the purpose of this meeting which those states do not desire to make public, and any statement coming from any state should be cleared through that state.

This room is large and there is quite a sizable attendance. We keep the proceedings, and those who speak should speak loudly. When anyone wishes to speak he should give his name in order that the Reporter may get it for the record.

I have made arrangements to have Jeannette Klein here so that if there is anyone who wishes any stenographic help or assistance, she will be available at any time so that you may dictate any statements or any other material which you may wish to put in writing and present. She will be available here at this table to help you.

May I ask the Committee whether the procedure suggested by the Chair is acceptable? If not, suggest any change in the procedure you think advisable.

MR. SMITH: Chairman Stone, I wonder if it would not be more logical and a better procedure to begin at the beginning and have the upstream states make their statements first rather than the downstream states? I just throw that out as a suggestion.

JUDGE STONE: Are there any further comments?

MR. SCATTERGOOD: I have the same feeling, gentlemen. We cannot very well make our comments on water coming down below until we hear from the Upper States. And I would like to offer the suggestion that the other federal departments follow the presentation, which will enable the states more intelligently to make comments.

JUDGE STONE: The suggestion has been made by Mr. Smith and Mr. Scattergood that the procedure be followed by starting with the upstream or Upper Basin States, and that the other federal agencies follow the Bureau before this is done.

Does Arizona have any comment on that?

MRS. BUSH: No. We are satisfied either way.

JUDGE STONE: New Mexico?

MR. WILSON: I do not see that it makes much difference.

JUDGE STONE: Mr. Delaney?

MR. DELANEY: I do not see as it makes much difference.

JUDGE STONE: Mr. Wallace?

MR. WALLACE: Normally, I follow my leader. I move, Mr. Chairman, that the suggestion made by the Chair be approved.

JUDGE STONE: Do you make that as a motion?

MR. WALLACE: Yes, sir.

GENERAL GILES: I will second it.

JUDGE STONE: Motion has been made by Mr. Wallace, seconded by General Giles, that the procedure suggested by the Chair be followed. Is there any further discussion?

Mr. Scattergood?

MR. SCATTERGOOD: Mr. Chairman, I do not think it is clear as to what your statement was as between the states and the other federal departments.

JUDGE STONE: Mr. Wallace, does your suggestion cover the other federal agencies or does it apply just to the states?

MR. WALLACE: Wouldn't it be wise for the Chairman to repeat his suggestion?

JUDGE STONE: The suggestion first made was that we start with the report by the Bureau of Reclamation, followed by comments of the states; the states in the Lower Basin make their comments first, to be followed by comments of the states in the Upper Basin, and then the other federal agencies offer their comments. The two changes suggested were that we change the order of the Basins and that the other federal agencies follow the Bureau.

My inquiry was, your motion goes to the order of the states and not to the federal agencies.

JUDGE O'ROURKE: Mr. Chairman, it seems to me you are tying yourself down to a program that is too rigid and too definite. It seems to me we should take this a little at a time. A great many of us here have little or no information concerning this report, or concerning the reports or the connection of the other agencies in connection with this report.

It is my idea that we should first hear the report of the Bureau of

Reclamation. After we have heard that we may be in a position then to adopt some definite idea of a pro ram to follow in handling this situation.

As far as I am concerned, and as far as the group from Southwestern Colorado is concerned, we have no information whereby we could intelligently vote on the program proposed by the Chair at this time, or on the motion, rather. You certainly cannot vote intelligently on a motion unless you understand what is back of it and the reasons for the motion. We certainly don't know about that at this time.

JUDGE STONE: I appreciate Judge O'Rourke's comments. However, I want to emphasize that we have to have some definite procedure or we will never get through. We just can't throw it open.

The suggestion was that we would hear from the Bureau. Now, if a member of the Committee wishes to make a motion that we hear from the Bureau and then decide the other afterwards, that would be appropriate.

GENERAL GILES: Mr. Chairman, we do not have any secrets about this. The reason why I think it would be better to have the Lower Basin States first is that the development is so much farther ahead down there; they have a great deal more to talk about than we have in the Upper Basin States. If we could hear from them first, that seems to be the logical thing to do. But other than that, it does not make any difference to me.

MR. WALLACE: Mr. Chairman, with the consent of my second, I will withdraw my motion and make another motion.

GENERAL GILES: I consent.

MR. WALLACE: I ove that we hear from the Bureau of Reclamation and other federal agencies, and at the conclusion of that, we decide on further procedure.

(The motion was seconded from the floor.)

JUDGE STONE: Motion has been made and seconded that we hear from the Bureau of Reclamation and the other federal agencies, and as soon as those statements are in, then we shall decide upon further procedure. This motion is to be voted upon by the members of the Committee. Those who are in favor indicate the same by saying "aye." Opposed? (After voting.) The motion is carried.

Now, we are faced with another situation; Mr. Hewes and Mr. Hauser, who are the two members of the Committee representing the water interests of California, will arrive on a train this morning and they have not yet arrived. The Wyoming representatives have not yet arrived. I am advised that Mr. James Howard is appearing for Mr. Gaylord for the Power Allottees, and that he is on the same train. Therefore, we have two of the members of the Committee from two of the states, and one of the Power Allottees' representatives not here. It is obvious that we should not proceed with hearing this report with the representatives of two of the states not yet here.

Mr. Robinson, you have taken that matter up with your California group, have you?

MR. ROBINSON: Yes, with some of them.

JUDGE STONE: What suggestion do you have?

MR. ROBINSON: I discussed it with a portion of the California representation. Some have not arrived in time to be in that discussion. Among those who were present the feeling was that possibly some matters could proceed, but so far as the actual discussion of the report which has now been made the first order of business, the presentation of the report, the preference of those who participated in this partial group discussion was that we prefer that the ones who, unfortunately, are not yet here should be present, particularly, because that includes two representatives of the water interests in California.

Those who are present from California are mostly from the power interests. Mr. Simpson, of San Diego, I think I am right in saying, is the only one representing the water interests. Excuse me, Mr. Elder and Mr. Simpson. The men from Los Angeles are indirectly just as much interested in water, because we constitute the biggest potential customer of the Metropolitan Water District. But, primarily, the delegation so far here represents the power interests rather than the water interests. So far as the membership on the Committee is concerned, there is no representation.

JUDGE STONE: I think it is clear that it is not fair to proceed until these two states' representatives are here. The train, I understand, Mr. Robinson, is on time and is scheduled to arrive at 10:30.

MR. ROBINSON: That is our best information. We are not positive that they are on that train, but that is our best information.

JUDGE STONE: The Wyoming people are driving.

MR. SCATTERGOOD: Mr. Chairman, it seems to me we would save time, because of the work needed to be done in the preparation of the comments, if we adjourn until after lunch so we will know just where we are to go ahead and work. I regret that is the situation, and to have to make such a suggestion, I am perfectly willing to come to the meeting at night later on, after dinner, to get the work done. I believe it would save time, and I would move that we adjourn to lunch.

(The motion was seconded from the floor.)

JUDGE STONE: Before the Chair entertains that motion, there are some preliminaries we might take up.

JUDGE O'ROURKE: Mr. Chairman, some of us are getting a little old. We don't hear quite as well as we used to. And for the benefit of us who are incapacitated that way I wish some of the people who talk would speak up, because we would like to hear what is going on. We have a little difficulty in hearing.

MR. SCATTERGOOD: Mr. Chairman, the suggestion was that in the long run we would save time if we adjourned until after lunch so that preparations could be made in the meantime. But that motion will be held in abeyance until the Chair has mentioned what else he has in mind.

JUDGE STONE: Yes, may we hold that in abeyance for the moment, Mr. Scattergood?

MR. SCATTERGOOD: Yes, certainly.

JUDGE STONE: Colorado has not arranged for addresses of welcome and that sort of thing because we had a lot to do, and this is a working conference. So we are not taking up time for that.

GOVERNOR CARR: They are welcome just the same, aren't they, Judge? (Laughter.)

JUDGE STONE: I was going to say that in the days gone by and not so long ago our good friend, Ralph Carr, used to welcome this Committee. I am sure he could say a few words of welcome since we have a little time on our hands. We did not arrange it because we didn't want to take the time.

GOVERNOR CARR: Welcome, Gentlemen. (Laughter.)

JUDGE STONE: You know, Ralph spoke up at the wrong time. (Laughter.)

We have with us today a new man in our group who represents one of the large interests in the Colorado River Basin, a man whom we have heard of, or some of us have, for many years. Many of you have not, perhaps, had an opportunity to meet him. I refer to Mr. Samuel B. Morris, who is the new Manager of the Department of Water and Power in Los Angeles.

Mr. Morris, we should be glad to have you say a few words. (Applause.)

MR. MORRIS: I might say I just came up here to Denver for the opportunity of listening and seeing, and not of speaking. I have been on the job for about six weeks in Los Angeles, and while I have known something of the proceedings which have gone on in prior years--in fact, I attended some of the meetings of the original Colorado River Commission when the allocation was made between the Upper and Lower Basins, at that time being with the City of Pasadena,--but for the past nine years I have been in academic circles at Stanford. I resigned my work there the first of October to accept the position with the City of Los Angeles in the Department of Water and Power.

I am here to meet you all, many of you I have known in the past. I have known the engineers of the Bureau of Reclamation and held them in high regard for many years. I have known a good many of you.

I carry no statement for Los Angeles because I do not know anything about it, really. I am here to learn as much as I can. I hope to gain information from all of your views individually so that from those views I may learn your position better before I build up any prejudices on my own part.

I think it is a very opportune time for me to come here and learn. I am entirely in the learning stage, Mr. Chairman. (Applause.)

JUDGE STONE: We have a new man sitting on the Committee from Nevada, Mr. Shaver. We have all known and admired Tom Smith. He has been with us since the beginning. He stays with us always but occasionally he brings someone else with him. Mr. Shaver, may we hear from you, from Nevada?

MR. SHAVER: Mr. Chairman, this, of course, is a little sudden. I did not come here to make any speeches at all. As you say, I am a newcomer in the Committee. I visited the Committee at the July meeting in Reno.

I agree with you that Tom Smith is the big man of our Committee in more ways than one. I feel a little small when I stand alongside of Tom. I am like Mr. Morris. I am here to listen today and see if I can intelligently gather a little information we might need on our Nevada side. I will leave all of the speaking to Tom Smith. I thank you. (Applause.)

A PARTICIPANT: Mr. Warne is now here.

JUDGE STONE: Mr. Warne, will you come up here, please?

Gentlemen, I should like to introduce Mr. William Warne who is the Assistant Commissioner of the Bureau of Reclamation. Mr. Warne has stepped up his time in coming to Denver so as to meet with this Committee. He is going to sit here with this group from the Bureau of Reclamation.

Mr. Warne, we will be glad to have just a word from you now.

MR. WARNE: I am very glad to be here. Like most of the rest of you, I think I probably have not had sufficient time to skim through the report which will be the principal subject of the discussion here.

I feel confident that this is going to be a fruitful meeting. We will see more of each other during this meeting and during the other meetings that I have to attend.

I am very happy to be here, Judge, and will be at your disposal as long as your meeting is in session. (Applause.)

JUDGE STONE: I am so glad you are here.

(Pause while press photographs are taken.)

JUDGE STONE: The Wyoming representatives of our Committee have arrived, and we will take their appearances. Will you stand and give your names, gentlemen, please.

MR. ROLLINS: H. Melvin Rollins, Member of the Committee.

JUDGE STONE: Do you have any consultants with you?

I think it is a very opportune time for me to come here and learn. I am entirely in the learning stage, Mr. Chairman. (Applause.)

JUDGE STONE: We have a new man sitting on the Committee from Nevada, Mr. Shaver. We have all known and admired Tom Smith. He has been with us since the beginning. He stays with us always but occasionally he brings someone else with him. Mr. Shaver, may we hear from you, from Nevada?

MR. SHAVER: Mr. Chairman, this, of course, is a little sudden. I did not come here to make any speeches at all. As you say, I am a newcomer in the Committee. I visited the Committee at the July meeting in Reno.

I agree with you that Tom Smith is the big man of our Committee in more ways than one. I feel a little small when I stand alongside of Tom. I am like Mr. Morris. I am here to listen today and see if I can intelligently gather a little information we might need on our Nevada side. I will leave all of the speaking to Tom Smith. I thank you. (Applause.)

A PARTICIPANT: Mr. Warne is now here.

JUDGE STONE: Mr. Warne, will you come up here, please?

Gentlemen, I should like to introduce Mr. William Warne who is the Assistant Commissioner of the Bureau of Reclamation. Mr. Warne has stepped up his time in coming to Denver so as to meet with this Committee. He is going to sit here with this group from the Bureau of Reclamation.

Mr. Warne, we will be glad to have just a word from you now.

MR. WARNE: I am very glad to be here. Like most of the rest of you, I think I probably have not had sufficient time to skim through the report which will be the principal subject of the discussion here.

I feel confident that this is going to be a fruitful meeting. We will see more of each other during this meeting and during the other meetings that I have to attend.

I am very happy to be here, Judge, and will be at your disposal as long as your meeting is in session. (Applause.)

JUDGE STONE: I am so glad you are here.

(Pause while press photographs are taken.)

JUDGE STONE: The Wyoming representatives of our Committee have arrived, and we will take their appearances. Will you stand and give your names, gentlemen, please.

MR. ROLLINS: H. Melvin Rollins, Member of the Committee.

JUDGE STONE: Do you have any consultants with you?

MR. ROLLINS: No.

JUDGE STONE: Another consultant from Utah has come in, Mr. Skeen. Will you stand up, please, Mr. Skeen?

MR. SKEEN: Edwin Skeen.

JUDGE STONE: We have some other newcomers to this group, including the men representing certain areas who have not met with us before. I should like to introduce Mr. Dutcher, who is the President of the Gunnison Watershed Association. We would be glad to have a word from you, Mr. Dutcher. (Applause.)

MR. DUTCHER: Thank you, Judge Stone. I came here to listen. I am going to be a good listener. I do not know much of what this meeting is about. I came here to find out. After that I can tell you more as to what our group is going to do. I thank you. (Applause.)

(At this point the remaining California representatives arrived.)

MR. SCATTERGOOD: Mr. Chairman, in view of our recent arrivals, I withdraw my motion, with the consent of my second.

JUDGE STONE: Very well.

The two California representatives have arrived, and we will take their appearances. Will you stand, so we may know who you are?

MR. HEWES: Evan T. Hewes, Committee of Fourteen, California.

MR. HAUSER: Lew s A. Hauser, Committee of Fourteen, California.

JUDGE STONE: May we take the appearances of those from California who have just come in with Mr. Hauser and Mr. Hewes?

MR. DOWD: M. J. Dowd, Imperial Irrigation District, El Centro, California.

MR. SHAW: Arvin B. Shaw, Jr., Assistant Attorney General, Los Angeles.

MR. JENSEN: N. H. Jensen, Metropolitan Water District, Los Angeles.

JUDGE STONE: There are some others who have come here, I believe some of the Army Engineers. May we have those, please?

COLONEL PUTNAM: R. W. Putnam, United States District Engineer, Los Angeles.

JUDGE STONE: I understand some newspaper reporters have come in since I made the announcement that the meetings of this group are of an executive nature. Anything released with respect to this report of the Bureau of Reclamation, or report by any other agency, should be cleared through that agency. Any statements made by the states should be cleared through these states in order that the states may be able to control the question of the release of any matter which may be of a confidential nature.

We are glad to have the press here and for them to know what is going on. We will appreciate it if that arrangement will be carried out.

Now, since all of the members of the Committee are here, I think we should take advantage of all of the time that we have and proceed with the submission of such statements as the Bureau of Reclamation desires to make with respect to this report.

MR. ROBINSON: Mr. Chairman, there is still one vacancy on the Power representation.

JUDGE STONE: Yes, there is one vacancy. I understand Mr. Elder will sit on the Committee for Mr. Gaylord until Mr. Howard arrives. Is that right?

MR. ROBINSON: Yes.

JUDGE STONE: Will you come up here, please, Mr. Elder?

Mr. Warne, may we now proceed with the submission of the report by the Bureau? You may proceed in such way as you wish to direct.

MR. WARNE: This report has been prepared through the good offices of the Regional Directors of Regions 3 and 4, Commissioner Page and Acting Director of the Branch of Project Planning, Mr. "Randy" Riter.

I came in only a few moments ago and have not had time nor opportunity to discuss the matter of the procedure with you gentlemen. I assume that they have a procedure outlined among them and I shall therefore turn the meeting over to Mr. Riter for procedure in presenting the report to you.

JUDGE STONE: Mr. Riter.

MR. RITER: This report has been prepared, primarily, in the Salt Lake City and Boulder City offices. As you know, we divide the Basin into the Upper Basin and Lower Basin. Mr. Larson is responsible for the preparation of the material concerning the Upper Basin portion of the report. Mr. Moritz prepared the material for the Lower Basin portion. It is their report. They are the prime movers in bringing this document together.

Mr. Page was special consultant, to give them the benefit of the background of his long years of experience in building Boulder Dam, and back in the earlier days, in his younger days, working on the Grand Valley Project; and then, his experience as Commissioner of Reclamation. He acted in a consulting capacity.

Some of the technical phases of the report were thrashed out by our office. We were responsible for the conduct of the details.

As a matter of procedure, I would like first to hear from Mr. Page for a brief statement, because he is responsible for the introductory portion of the report. Then, I think it would be appropriate to call on Mr. Larson for presentation of the material in the Upper Basin. The supporting staff of the Bureau will be available to assist these two Directors in their presentation.

In case questions should come up on some of the details that they may want to follow, we will be available to assist. As a matter of procedure, we will hear first from Mr. Page.

MR. PAGE: I have very few remarks to make, as the printed document is the report of the Bureau of Reclamation. I have only these few comments to suggest: In the first place, it is not a comprehensive plan. It is a tabulation or summation of the things which the Bureau has found in its studies and investigations in the Basin, and we are presenting it to this Committee for help.

We are rather proud of the form in which it appears, but we also realize that there are a good many controversial questions among the different peoples and this is a good place to improve this report by receiving suggestions from the various people who are the most interested. I do not want the states to get the idea from that that every suggestion will be brought into this report because, in the final analysis, it must be a Bureau report, and we hope to lay the ground work for the states.

No comprehensive report can at this time be prepared, with the uncertainties that exist, first, between the states and, second, between the United States and Mexico. Both of those matters have to be straightened out before anyone can make a comprehensive story of the water use in the Colorado River.

I just want to repeat that we are asking you and your Committee for help to improve this report. And may I make one other request? That is that the suggestions we have be confirmed in writing so that we may have the confirmations before us in order that we will know just what you have to say. That will make more clear just what your ideas are for these improvements, if it is possible to do so. I will have some further comment to make in the course of the meeting.

JUDGE STONE: All right, Mr. Riter.

MR. RITER: I think we should proceed with the Regional Directors first, and let them handle their respective basins in the manner they see best, calling on those of the Bureau whom they wish to call on for specific questions.

If it is agreeable, then, in line with the thought suggested by Mr. Scattergood, we might start with the top basin, and call on Mr. E. O. Larson, Director of Region 4, Salt Lake City, for a presentation of the Upper Basin portion of the report, the portion above Lee Ferry.

MR. LARSON: About four months ago--

JUDGE STONE: Pardon me, Mr. Larson, please. Will you speak as loudly as you can so everybody can hear?

MR. LARSON: I will try to do that.

About four months ago the responsibility was placed on the Field Office of the Bureau to get out a comprehensive report or a resumé of all of the potential irrigation and multi-use projects in the Colorado River Basin, and describe them briefly in the report, with the report being, I assume, for several purposes:

One of those purposes being to bring the Committee of Sixteen up to date on everything that has been covered. And I assume it is also to be used by the Bureau of Reclamation in enabling it to submit the report to the Post-War Planning Committee of the Senate. It certainly will be used as a guide to know where we are headed in preparing detailed project reports and basin reports in the future.

A mass of information has been gathered by the Bureau in the past, and the thing that impressed me is the large amount of work done in many years in the matter of making soil classification records covering millions of acres. We have tried from that to summarize the areas where it is possible to build reservoirs and canals, and give a brief description of such in this report.

To get the report together we have called upon our Field Offices. We have sub-offices in various places in the region, one in Cheyenne that works on the Green River Basin; one at Vernal, one at San Juan, and others at Grand Junction, Durango and Salt Lake. By using all of those field men and calling them in, we tried as quickly as possible to get this report, and we did succeed in finishing it twenty-four hours ahead of the deadline.

There are corrections in this report that will have to be made that we have found already, and some changes and some additions. These will be explained as we go along. There is also a set of maps to be added which will show the location of the potential reservoirs and canals and irrigated areas for each project that is included. All of the maps are glued together on the board at this end of the room (indicating.) They are too small to be seen from here in detail, but they may be examined. We are sorry that the finished map is not yet available, but it will be.

In the final report there will be a pocket of maps for each state involved.

We have divided the Upper Basin into divisions, the Green Division, being the Green River to its mouth joining with the Colorado; the Grand Division, being the Colorado River proper, and everything below the junction of the Colorado and the Green is the San Juan Division. We have discussed all of the potential projects in these three divisions in the Upper Basin. We have also tried to show in the report the summation of the present irrigated land and the number of acres of new land, both by divisions and by states.

Now, it is not possible at this meeting, I do not believe, to describe each project. We have 76 potential irrigation projects that we have covered in the Upper Basin and some 32 power projects. If we were to spend 15 minutes on each one it would require more than 25 hours of constant explanation without any questions. So that does not look feasible. I might suggest, Judge Stone, possibly we might list the projects as we take them up with each state, or in some other way, because the statement will take 24 hours or so if we try to describe each project using 15 minutes for each; or 12 hours if we use seven minutes or so on each project. So it is a large task if we explain each one.

I should make one further observation, that in covering the projects in some cases we have detailed reports either completed or near completion. We have in a few cases reports on the sub-basins or smaller drainage basins, like

the Green River Basin or Sub-basin. In some cases we have those reports completed. They will show what will be necessary as time goes on, and what we will have to do.

I need instructions from here on as to whether you want me to read--

JUDGE STONE: May I suggest, Mr. Larson, that if possible, you or someone else from the Bureau discuss and give an overall explanation of the manner in which the water supply was appraised, and the manner which, in an overall way, you have applied it for use in the Basin.

MR. LARSON: I would suggest that after Mr. Moritz gets through with his portion, perhaps Mr. Riter, who has worked on both sides of the problem explain the general theory of the water supply, and how we set that up.

JUDGE STONE: I am just wondering this, Mr. Riter and Mr. Larson, if we are not in a way getting the cart before the horse? In other words, we are dealing with the overall water supply in the first instance. You have taken that water supply and attempted to show, in a general way, at least, how it will be utilized or may be utilized in the future, and it would seem to me logical that that statement would precede any statement as to projects.

Do you agree with me, Mr. Riter?

MR. RITER: Mr. Chairman, Members of the Committee of Sixteen, and Gentlemen: The Colorado River Water Supply has been a subject that has been studied for a good many years. In formulating our plans for the report, we had in mind the limitations. We had in mind the Colorado River Compact which apportions seven and a half million acre feet for beneficial consumptive use to the Upper Basin States, and it was our plan in formulating projects to bear this in mind.

Now, when you speak of water supply, there are two phases, one general overall phase from the standpoint of the basin. A gauging station has been maintained at Lee Ferry, which is the dividing point between the Upper and Lower Basins and has been since about 1902. Gauging stations have been maintained at Yuma since 1922. And then there have been gauging stations at the principal tributaries, so that by means of estimating and correlating we have been able to build up a record since 1897 to 1943. That was the basic period we used for the so-called overall water supply studies.

During this period from 1897 to 1943, irrigation in the Upper Basin has not been steady. It has changed very materially. In some cases there has been a gradual and in other cases an accelerated increase. So that as we have estimated, we have tried to estimate the use each year in applying a correction factor.

So we start out with the stream flow at Lee Ferry, if no developments were made, and we find for the long-time period of 1897 to 1943, the average figures of 16,271,000 acre feet a year. With that as a starting point, we then tried to determine how much the conaumptive use now is in the Upper Basin, that is with conditions as reflected for the period 1931 to 1940. The reason we selected the period 1931 to 1940, is that that is the lowest consecutive ten-year

period of run-off on the stream. We felt if we used that as a yardstick in measuring the water supply available for individual projects, that we would be on a sound basis. In other words, new projects that must be developed would have to live through this drought period in order to be sound.

Therefore, we adopted that ten-year period as the basis on which to make the water supply studies for the individual projects.

On page 128 of the report there is a summary which gives an estimate of the present and potential stream depletions from irrigation, development, evaporation losses from reservoirs and from transmountain diversions during the ten-year period.

This table shows that in the Upper Basin the total depletion was around 2,440,000 acre feet. That includes one or two projects which have not yet progressed to completion. We feel since reviewing the preliminary report that that table is inadequate. That covered just a ten-year period. We feel we should present a table, and that table is now in the process of being prepared, to present the total depletion and average depletions projected back through the period of 1897 to 1943. That table shows approximately 2,600,000 acre feet. I am having that table mimeographed today and I hope before the day is over to have copies to pass out for you. That is a table which we will insert after the one on page 128.

That was the starting point for analysis.

Mr. Larson has told you in previous investigations that were carried on since the passage of the Boulder Canyon Project Act in 1928, that the Bureau has been engaged in classifying land. At the Reno meeting that was the only information we had to present on lands classified as being suitable for irrigation if a water supply could be made available.

In preparing this report we used the available short-term records on the tributaries and expanded these by correlation with other records which extended over a longer period of time, and tried to analyze the water supply, and tried to formulate the actual projects that could be served within the Basin.

We then tabulated these projects and made calculations to determine the acreage that could be served, and the amount of water that they would use, bearing in mind that these are the roughest kind of figures. They are not detailed estimates. Time would not permit us to make detailed studies. But we have carried those sufficiently far so we feel the pattern of development is fairly sound.

As you people found out from the testimony of the states at the Reno meeting, the project potentialities, including irrigation within the Basin, potential transmountain diversions to the portion of the states located outside of the boundaries of the Basin, and so forth, would exceed the allotment of 7,500,000 acre feet.

Mr. Larson has attempted to present here for the Bureau a sort of a plan.

It is open for your consideration. We had to make decisions as to which projects to leave out and, in some cases, we found out we would have to leave out some irrigable land because local water was not available. The mere fact that water was available at Lee Ferry was not proof that there would be water at the storage dam, so we had to eliminate some of those lands on account of an inadequate water supply at the point where it could be diverted.

In the final windup for the Upper Basin, we found we could irrigate an additional 1,100,000 acres and furnish a supplemental water supply to about 470,000 acres which are now inadequately supplied and which now suffer shortages. At the present time, on the basis of the long-time average, our estimate shows the exportations from the Upper Basin average 639,000 acre feet. That does not include the exchange of water. That includes water physically taken out of the Basin, and does not include the transfer of water from the Dolores Basin to the San Juan Basin, which we consider is an intra-basin use.

We found out we would have enough water to support additional transmountain diversions of about 2,100,000 acre feet.

In the revised table, the Upper Basin potential use adds up to a little more than 7,500,000 acre feet. This includes reservoir evaporation losses, and averages around 7,656,000 acre feet. So that in order for this plan to be sound and to be within the limits of water supply the development possibilities that our report now shows will need to be pared down a little bit by process of elimination so we do not exceed the seven and a half million acre foot use of the water. I think I am safe in saying that. Some may disagree with me.

There were some projects described in the report but not tabulated. For instance, from Utah. We want your reaction on those. You have two large projects of which we describe the possibilities. Tentatively, we have assumed that they should not be in the pattern of development, but we are open to discussion. That is one of the questions we wish to bring up with you.

Your Colorado River--Great Basin Diversion which proposes to bring one million acre feet of water through a long aqueduct and tunnel which would serve something like 350,000 acres of new land in Central Utah, when we analyzed it we felt it was just too costly; we felt it would take too much power to support that project. We have eliminated that tentatively, and we do not have it listed in the total of the 7,656,000 acre feet.

There is the large body of land near Cisco, Utah, part of it in Colorado, most of it in Utah, as I recall the acreage is around 100,000. To serve that land would require a pumping lift of greater than 600 feet. I know it is greater than that because it is about 600 feet to the top of the reservoir. If we do serve it by pumping, the plan we have described is a gravity plan which would involve a 35-mile tunnel from the Colorado River, beginning at Grand Valley up above Grand Junction, and would involve a very extensive canal system. Then, it would involve replacement storage for the existing irrigation of Grand Valley. The lands are not first-class lands. The bulk of the lands are so-called class 2. We feel it would cost, as I recall the figure, in excess of $400 per acre. How much, I do not know. But we carried that study sufficiently

far that we feel probably that project would be eliminated.

If you disagree with us and want that put in, we would like to listen to your reasons for it, so we may have the information. It may be that our figures do not appeal to some of you on the possible transmountain diversions but we tried to be realistic on those things.

Our figures are not and cannot be final because they were, necessarily, estimated in many cases. But we feel that the pattern of development that was evolved by the boys working from Region 4 office is, probably, somewhere close to the final pattern of development in the Upper Colorado Basin.

Now, then, the Upper Basin has another obligation under the compact besides having the privilege of using seven and a half million acre feet of III (a) water. They are also under the obligation of delivery at Lee Ferry of a total of seventy-five million acre feet of water each ten years. In order to do that we found it would need main stem reservoirs of total capacity in the neighborhood of thirty-five million acre feet. In the low ten-year period we would probably use only twenty-five million acre feet. It would be impounded in years of high run-off and released in years of low run-off by delivering an average of seven and a half million acre feet of water in the low period. This would also make possible a production of large quantities of hydroelectric power. We feel that a market will develop in time, both in the Basin and outside the Basin where the hydroelectric energy could be sold and help finance the development of the reservoirs.

At this time we cannot go into the details as to how much will be paid by water and how much will be paid by power. At this stage of the game we are trying to lay a pattern of development.

In summary, then, there are more than enough projects in the Upper Colorado Basin, including the present and potential transmountain diversions, including the developments within the Basin, furnishing a supplemental supply to those areas that are short, and expanding the area by a little over a million acres, to utilize all waters allotted the Upper Basin.

Mr. Larson has told you there are a number of projects listed. We have tried to give a brief description of the projects, and have tried to give an estimate of the costs. It is impossible to estimate prices under present-day conditions. From the study of past trends of prices we felt that prices of January, 1940 might be considered as normal construction cost. We do not know what the future construction costs will be. Judging from the past they will no doubt go down after the war. On those projects, of course, we do not have finished specifications, either. These estimates are based upon experience. We estimate canals by so much per mile, based upon experience, constructing canals of similar types elsewhere. As to the costs of our dams, in some cases we had detailed estimates, yes, but in many cases we had to use rough approximations based only on a cross-section and profile of the damsite, estimates of yardage, and applying judgments. But we tried to conform them all to the same standards, so that in comparing projects you have some kind of a yardstick.

I do not know what else I can contribute at this time, Judge, without going into the details of the projects. Our map is on a small scale and you have to get close to it to see it. I am sorry we do not have copies of it available to pass around as yet. The printer has his troubles also. We had hoped to have maps available today to pass out, and I am sorry we do not have. We promised Judge Stone we would have them, but we have to get along the best we can with the one map we have on the wall.

There is a description of the individual projects in that report. Some of the people interested in their particular divisions might want this, and Mr. Larson may decide to read it. I think it would be a good idea to do that. Our highlights are, primarily, irrigation and power. They are the two principal products of our water. In formulating the plans, we are not unmindful of the fact that water is also used to preserve fish and wildlife. We are not unmindful of the recreational values of a stream of water or pool of water for fish and wildlife purposes. We are not unmindful of the municipal requirements of water, or the requirements for industrial purposes. We did not add in the consumptive use for industrial purposes. That is a detail we will probably have to discuss with you where the areas are located, so you can decide where you want to use that water and how.

We know there are other uses. We know the Colorado River Basin--and I am speaking now generally of the Upper Basin--is rich in undeveloped mineral resources. We have hopes that the hydroelectric energy made available and the water made available will be an aid in developing this country. We know that irrigated lands mean farms. Farms mean trade centers and commercial centers, and the expansion of all of the mineral resources as to which I, myself, by training, am not able to tell you the process, the intricacies necessary to develop. But we know from the experts of the other branches of the federal government that the development must go hand in hand.

I have stressed the millions of acres of land that we have to consider. I think I will turn this back to Mr. Larson again.

JUDGE STONE: Mr. Riter, may I make this suggestion? And I trust it may be approved by the Committee. That while we are on this question of overall water supply, before we go into details as to developments, that we have a statement respecting the overall application of the water supply and utilization, now, in the Lower Basin?

MR. WALLACE: May I ask a question before you leave the Upper Basin?

JUDGE STONE: Yes. After Mr. Wallace asks his question.

MR. WALLACE: You will have the Bonneville report out in a very little while?

MR. RITER: That is next on the schedule.

MR. WALLACE: That will be out when?

MR. RITER: I will let Mr. Larson make his own promises.

MR. WALLACE: There is a rivalry between the development in the Bonneville Basin and the Colorado River Basin, and we should have that report before we make a detailed statement on behalf of the State of Utah.

MR. RITER: Mr. Wallace, I don't know whether you have read all of the details. Mr. Mathews here from the Power Utilization Branch, I think, in writing his chapter on power markets, he had available the results of the Bonneville Basin survey of power markets, and used the figures used in that report, and quoted them in this report as part of a justification for the statements regarding a market for hydroelectric energy that will be developed in the Upper Basin.

If you wish to go into that, Mr. Mathews is here to answer those questions.

MR. WALLACE: We will have some notions if Mr. Mathews will speak of them, before we get through with that matter. But this is not the time.

JUDGE STONE: May we now proceed with the water supply and the manner in which you propose to utilize it in the Lower Basin, in the same manner as you have gone over it with the Upper Basin?

MR. RITER: With your permission, I will call on Mr. Moritz. He is the prime mover and he has had the responsibility for that. He is the spokesman for the Bureau of Reclamation in that regard and I would like to call on Mr. Moritz, the Regional Director, at this time.

MR. MORITZ: Mr. Chairman, Members of the Committee and Gentlemen: Mr. Riter stated the Regional Director is the prime mover. But he needs a lot of help. And he has had a lot of help in making up this report. I propose to take very little time because time is going to be very, very short. I shall confine my remarks to just some general statements.

The statement made by Mr. Larson in regard to the Upper Basin and as to the phases we are going through, applies to the Lower Basin. The Lower Basin is divided into the Little Colorado Basin, which is more or less self-distributive; the Virgin Basin, including the Muddy, the Gila Basin, which includes most of the Arizona territory adjacent to the lower Gila, and the Boulder Basin, which includes everything along the main stem of the River.

When we began this report my region was practically totally devoid of any project planning operations and also, naturally, all assistants, so we had to get together a group very quickly. By our high-pressure operations for the past four months we produced something--and we think it is pretty good--as painting a total picture of what the problem is and its general elements. We have blended the colors pretty well so they can be unscrambled and intensified in one spot and reduced in another. And that is the thing that we hope will be developed here today, unless everybody agrees with what we have said here--which we do not anticipate--because that would indicate that we had done a poor job.

We do not expect that everyone will agree with any part of this, or that any one part will be agreeable to everybody. But the attempt has been to paint a general picture in the Lower Basin, and I think that is similarly true of the Upper Basin, thereby covering the whole picture. As Mr. Page has said, what we

desire here today from the standpoint of the Bureau of Reclamation is to get the views of the Committee of Sixteen on what they do not like about this report. We are not concerned so much about any statements as to what you do like because that takes care of itself.

If I can get any further light on developing a better picture than we have so that we may proceed with our detailed investigations with some confidence that the results that we finally obtain will be generally acceptable, that is what we hope will develop from this meeting.

I want to say, finally, in connection with Mr. Page's remarks as stated, that we want your views. We hope that no major changes will be requested that will involve a complete rewriting of very much because there just is not time to do it. This report has to be submitted to Congress, as I understand it, on the first of January. We have had every available man in my Region who could be pulled off of projects working on it up until the first of November, and we would very much like to get back to our regular business, immediately, if possible.

Now, we do not expect there will not be some changes. We have already found some that need to be made. But any major changes, it strikes me--and I think my colleagues will agree--any major changes would consume too much time. So I hope that everyone will take the view of this entire matter that this is a preliminary report. It is an unfinished picture, and nothing final is going to develop from it now.

I think that is all I have to say at the present time.

JUDGE STONE: Mr. Moritz, may I ask this: Would you care to state just how you took the water supply available for the Lower Basin, considering the compact and the terms for the use of that water under the compact, how you applied that in the Lower Basin to work out a pattern or picture for the present use and the potential development?

MR. MORITZ: If you will permit me, I will ask Mr. Vaud Larson who handled the overall calculations in the preparation of the report.

JUDGE STONE: Very well.

MR. MORITZ: This is Mr. Vaud Larson, not to be confused with Mr. E. O. Larson.

JUDGE STONE: Cousins, aren't they? (Laughter.)

MR. MORITZ: They are both good men. Mr. Vaud Larson has had the full responsibility of making this Lower Basin report, and has had only my administrative assistance.

MR. VAUD LARSON: Mr. Chairman, Members of the Committee, Ladies and Gentlemen: In the Lower Basin we have an idea or an estimate on the amount of water available, and to some extent that water has been allocated among the

states. There are many questions yet, and it is impossible to determine at this time just how much water could be made available to the various states. Therefore, in outlining our projects we have made an attempt to list them as an inventory. The depletions, as we have shown them, exceed the available water supply. Therefore, it will be necessary that some of these projects be reduced in size, or possibly some of them eliminated.

In starting out, we started with the virgin flow at Lee Ferry of 16,271,000 acre feet. Allowing seven and a half million to the Upper Basin States, that leaves 8,771,000 acre feet at Lee Ferry. The net inflow or increase between Lee Ferry and Boulder Dam is estimated at 1,060,000 acre feet.

The net river channel losses, in addition to the gains, result in a depletion of possibly 500,000 acre feet between Boulder Dam and Lee Ferry--Boulder to Laguna Dam,--which would leave the virgin flow at Laguna Dam 9,331,000 acre feet.

The projects as we have outlined in the report show a depletion of 120,300 acre feet in the Little Colorado River Division; in the Virgin Division, 179,500 acre feet; in the Boulder Division, 7,156,000 acre feet. The reservoir losses on the main stem, 774,000 acre feet. The depletion by diversion to Central Arizona from the Colorado, as we have outlined, is approximately two million acre feet. 1,990,000 acre feet, to be more exact. With the result a negative depletion or, in other words, we exceed the available water supply by 890,000 acre feet, which does not include any water that would be allocated to Mexico. Therefore, the projects, as we have them outlined, will have to be reduced and possibly some of them eliminated.

JUDGE STONE: They cannot hear. Will you speak a little louder, please? Will you make that statement again?

MR. VAUD LARSON: I will repeat the last statement: The projects we have outlined in the report show that we have exceeded the available water supply by 890,000 acre feet, which is in addition to whatever water may be allocated to Mexico.

I think that covers in general the water situation in the Lower Basin.

MR. ARLEDGE: That is on the long-time average, I take it, 40-years?

MR. VAUD LARSON: Yes.

JUDGE STONE: That would be worse on the ten-year average than on the long-time average, would it not?

MR. VAUD LARSON: Yes.

Other than going into the various projects, I think that probably covers the situation.

JUDGE STONE: It is now 12 o'clock, and it would seem that we would just as well recess now and reconvene at 1:30.

May I make this suggestion again? We have a lot of work. Please be on time and take the seats you had this morning.

We will stand adjourned until 1:30 this afternoon.

(Thereupon, at 12 o'clock noon a recess was taken until 1:30 o'clock p.m.)

Afternoon Session

The meeting was called to order by Chairman Stone at 1:50 o'clock p.m.

JUDGE STONE: The meeting will come to order, please. Since we convened this morning there are some additional appearances. I believe Mr. Feast is here from the Colorado Game and Fish Department. Is Mr. Feast here?

MR. FEAST: Yes.

JUDGE STONE: Give your name for the record, please.

MR. FEAST: C. N. Feast, Director of the Colorado Game and Fish Department.

JUDGE STONE: Are there any others who have come in this afternoon whose appearances are not noted as yet?

MR. JOHNSON: Ed. Johnson, from Sheridan, Wyoming.

JUDGE STONE: We will proceed now with the further presentation by the Bureau of Reclamation. Mr. Larson, were you through with your presentation of the Lower Basin?

MR. VAUD LARSON: Yes, sir.

JUDGE STONE: Was there anything further to offer on the overall water supply matter?

MR. RITER: Mr. Chairman, during the lunch hour one or two people asked me some more questions about the Lower Basin, and with the permission of the group assembled, I would like to take a few minutes to supplement the statement by Vaud Larson.

On page 19 of the report is a tabulation which gives the long-time averages of the Lower Basin. From that tabulation, we find at Yuma, which is the lower station which is above the diversions for the Imperial Valley, and also above the mouth of the Gila River, there is a long-time average of 16,451,000 acre feet. The Gila River, which drains the extreme western part of New Mexico and most of Arizona, has an estimated long-time average flow, an undepleted flow, of 1,271,000 acre feet. If we add those two together, the undepleted flow of the Colorado River, at the Mexican boundary, would be 17,722,000 acre feet. We assume that the Upper Basin will deplete that by seven and a half million acre feet. That will leave a virgin supply of 10,222,000 acre feet.

In its natural state we know the river overflows its channels and loses

May I make this suggestion again? We have a lot of work. Please be on time and take the seats you had this morning.

We will stand adjourned until 1:30 this afternoon.

(Thereupon, at 12 o'clock noon a recess was taken until 1:30 o'clock p.m.)

Afternoon Session

The meeting was called to order by Chairman Stone at 1:50 o'clock p.m.

JUDGE STONE: The meeting will come to order, please. Since we convened this morning there are some additional appearances. I believe Mr. Feast is here from the Colorado Game and Fish Department. Is Mr. Feast here?

MR. FEAST: Yes.

JUDGE STONE: Give your name for the record, please.

MR. FEAST: C. N. Feast, Director of the Colorado Game and Fish Department.

JUDGE STONE: Are there any others who have come in this afternoon whose appearances are not noted as yet?

MR. JOHNSON: Ed. Johnson, from Sheridan, Wyoming.

JUDGE STONE: We will proceed now with the further presentation by the Bureau of Reclamation. Mr. Larson, were you through with your presentation of the Lower Basin?

MR. VAUD LARSON: Yes, sir.

JUDGE STONE: Was there anything further to offer on the overall water supply matter?

MR. RITER: Mr. Chairman, during the lunch hour one or two people asked me some more questions about the Lower Basin, and with the permission of the group assembled, I would like to take a few minutes to supplement the statement by Vaud Larson.

On page 19 of the report is a tabulation which gives the long-time averages of the Lower Basin. From that tabulation, we find at Yuma, which is the lower station which is above the diversions for the Imperial Valley, and also above the mouth of the Gila River, there is a long-time average of 16,451,000 acre feet. The Gila River, which drains the extreme western part of New Mexico and most of Arizona, has an estimated long-time average flow, an undepleted flow, of 1,271,000 acre feet. If we add those two together, the undepleted flow of the Colorado River, at the Mexican boundary, would be 17,722,000 acre feet. We assume that the Upper Basin will deplete that by seven and a half million acre feet. That will leave a virgin supply of 10,222,000 acre feet.

In its natural state we know the river overflows its channels and loses

much water trapped in sloughs, and we estimate that upon control some of the natural losses would be reduced. These figures I am giving you are estimates. We feel that there will be around 380,000 acre feet of channel losses that could be conserved in the Lower Basin, so that the Lower Basin supply will be in the neighborhood of 10,602,000 acre feet.

The Lower Basin is peculiar, in that the development has progressed more rapidly than it has in the Upper Basin. There are projects initiated to serve in the neighborhood of two million acres. As of 1943, the area actually irrigated in the Lower Basin was approximately 1,350,000 and that leaves roughly 600,000 acres of unirrigated land under existing projects. Now, that figure, 600,000 is a tentative figure. That is the best estimate we can make on the basis of our present land classifications on some of these initiated projects.

The 1,350,000 acres now irrigated, plus the reservoirs necessary to regulate the water, we estimate will deplete the stream by about four and a half million acre feet. This four and a half million acre feet includes the water now exported to the Metropolitan Water District. I do not have the exact figures of what are included in that. Mr. Larson says it was only 32,000 in 1943. That is what we estimate the 1943 use. In the future, then, in selecting projects for future development, there are lots of questions, there are lots of alternate opportunities to use this water.

You people in Arizona know that there is to be a compromise as to how much water you use in Central Arizona and how much you use on the Gila Project, which is an initiated project. The people in California will probably have to make some adjustments as to where their water can be used.

In treating the subject in the Lower Basin, at the present moment we do not feel on a very secure footing in setting forth a definite plan. So we have tried to make the Lower Basin presentation in the nature of what we might call a selective inventory. We do not include the full 585,000 acres in the Gila Project. We tried to restrict the Gila Project to what we felt was the full development of the initial unit.

Hearings held down in Arizona in September indicate a very definite need for additional water in order to save lands now in cultivation. There are something like 700,000 acres in the Gila Basin. That is a highly developed area, and if water is not brought into it, we feel there is going to have to be some abandonment of land.

So in forming this inventory we have tried to split the water where we felt it would be needed, so we have included here a plan for bringing water into Central Arizona. We have included the Gila Project in part. Now, the projects we describe on the map and the projects we describe on the report will include about 600,000 acres of land that are not now irrigated under initiated projects.

MR. WALLACE: Where is that land?

MR. RITER: The biggest part of it, of course, is in the Imperial Valley,

and some in the Gila Project. Those projects have been initiated. There are 610,000 acres of projects of lands that are now irrigated but badly in need of a supplemental supply. Tentatively, then, we figured there will be about 234,000 acres of new lands, lands for which works have not yet been provided. By the time we figure the additional reservoir loss, and figure the consumptive use for those lands, and figure the more complete utilization of the Metropolitan Aqueduct, and the exportations of water to San Diego, that increased use will be 6,595,000 acre feet. This means, then a requirement for the projects we have described in the Lower Basin of 11,092,000 acre feet.

I do not know how far we should go in this report in treating the Mexican Treaty. The agreement, as you know,--and which has not yet been ratified by the Senate,--provides for delivery to Mexico of a million and a half acre feet of water. If we add that to the use that we have set up in the United States, that would mean a total requirement of approximately 12,600,000 acre feet. Compare that with an available supply of about 10,600,000 acre feet. There is roughly, 2,000,000 acre feet short.

That is one reason we need your cooperation in writing this report. There are problems, very definite problems. I think the problems are more acute in the Lower Basin than they are in the Upper Basin. There are a number of reasons for that. The principal one, I think, is you are further advanced, from the standpoint of the use of the water. The Lower Basin is very close to its ultimate from the standpoint of water supply.

Later on there will be a discussion of the projects. You will have an opportunity to question. You will have an opportunity to find out exactly where the acres are located that we are planning on.

No doubt, some of your engineers in the Lower Basin will want to question our unit rates on the use of water. We would like to get your best judgment on that. In trying to find out the unit rate on the use of water, we have applied all of the information available to us, figured on projects located in Colorado drainage available for use downstream--we have taken the unit rate. In other words, we have used as consumptive use figures the total diversions for the projects that take water physically out of the watershed and will not return it. And this includes the Imperial Valley area. This includes the Metropolitan Water District area; your San Diego area. We have set as stream depletion the total diversion.

Our engineers in making this report have to be bold. We know we are here as targets. The things we say you people are going to shoot at and tear to pieces. We welcome your criticism. We hope in criticizing the figures we have suggested in our tentative report that you will be helpful and be constructive in your criticisms because we want things in the report that will truly be a pattern of development to which the states and this Committee will subscribe.

That is about all I have to offer at this time.

MR. SHAW: May I ask a general question of Mr. Riter?

JUDGE STONE: Mr. Shaw, before you do that I have in mind that if the

statements on water supply are concluded, we should now invite those here present to ask any questions on those matters which have thus far been discussed by the Bureau. And may we have it understood on the part of everyone that at this time it will be limited to questions? Comments will come later. If there is nothing further, Mr. Shaw has a question. And if there are others may we have them now?

MR. SHAW: Mr. Riter, do I understand correctly from the statements you made this morning that in the Upper Basin the yardstick or the measurement on which the inventory is shown was the period of scarcity of 1931 to 1940?

MR. RITER: We used the period of 1931 to 1940 as a yardstick to gauge the projects to be constructed.

MR. SHAW: Do I understand in the Lower Basin you used the long-time period 1897 to 1943, giving the result of water supply 10,600,000?

MR. RITER: I described the long-time periods on the flow in the presentation of the Lower Basin. I used the long-time period.

MR. SHAW: That gave the result of 10,600,000 that you just gave us?

MR. RITER: 10,600,000 is the average water available in the long-time period, yes, sir.

MR. SHAW: Would you be kind enough to give us the figures for the period of scarcity, for 1931 to 1940, in the Lower Basin so we will know when the pinch comes what we have to deal with?

MR. RITER: That can be figured, yes, sir. We would start out on the assumption that the Upper Basin used seven and a half million acre feet a year. And that could be figured out, Mr. Shaw. I do not happen to have the figures with me at my finger tips.

MR. SHAW: We will be glad to have the figures.

MR. FOWLER: Mr. Riter, going a little bit further than Mr. Shaw has outlined there, you have shown on page 19 the flow at various points, Lee Ferry down to Laguna Dam for the long-time period. Would it be possible for you to have the reconstructed flows at those points for that period?

MR. RITER: Some of this we already have in the Upper Basin. For instance, we have the Green River at the mouth. We have the Colorado River above the Green River, and we can present the others, if you think desirable to make the report complete.

MR. FOWLER: As I understand your table, the flows for 1931 to 1940 on the Little Colorado, which appear at page 190, and a similar table for the Virgin appearing at page 210, and for the Colorado River Basin at page 226, and the Gila on page 251--those are flows for all those lands not reconstructed, but--

MR. RITER: They were recorded--in other words, we tried to make the report explicit. If we could use recorded flows, we attempted to do so. If we could use reconstructed flows or estimated virgin flows, we tried to do so.

MR. FOWLER: Have you made any reconstruction of those various stages?

MR. RITER: I don't recall that we have.

MR. FOWLER: If they are available, I would like to have them put in.

MR. RITER: In other words, what you wish to have in the Lower Basin is information for the ten-year period, 1931 to 1940, to show so-called estimated virgin flow at the points shown on page 19, and also the key stations on each one of the divisions of the Lower Basin.

MR. FOWLER: To appear at pages 190, 210, 226 and 251.

MR. TIPTON: Mr. Chairman, one question of Mr. Riter: In this period of 1930 to 1941, in using the yardstick for development of the Upper Basin, as I understood you, you took the water that would be available during that period to each of the individual, we will say, large projects, and assumed that the project could not very well exist, with a ten-year period of shortage. But you assumed in that sort of an analysis whatever holdover storage might be available to the individual project, did you not? In other words, it is not based exactly on the run-off of the streams for that low ten-year period. It is based upon the kind of water supply that can be made available to the project with the storage facilities that would be practicable to construct for that project--

MR. RITER: Yes, that's right, Mr. Tipton.

MR. TIPTON: Then, going a little further, there would be another limitation on upstream development other than the water supply available to the individual project; that would be the water supply available to the entire Upper Basin on account of the limitation of the compact, to deliver 75 million acre feet in that ten-year period. So there again you assume a release of water from holdover reservoirs, do you not?

I wanted to get that plain so as to give a comparable figure for the Lower Basin, the usable supply during the ten-year period of low run-off--you would bring into the picture the amount of holdover water that would naturally be released during that low water period. That would be the use of the water for the Lower Basin during the low ten-year period, and would not be the actual reconstructed flow during the low-water period, minus the Upper Basin uses.

MR. RITER: On this ten-year period, Mr. Tipton, we made all the studies on the tributaries on the basis of the ten-year period. We analyzed each one of these projects separately, but we used the ten-year period we selected as the basis of analysis, with reasonable allowable shortages.

Now, then, your other statement about the overall picture, we assume holdover storage reservoirs, which I term replacement reservoirs, would be constructed on the main stem of the Colorado and the Green to release storage

impounded during previous years of high run-off, so that the Upper Basin would deliver at Lee Ferry an average of seven and a half million acre feet during the ten-year period. So that the only limitation, so far as the upstream development is concerned, would be the water physically available at storage or diversion sites. Is that clear?

MR. TIPTON: The point I was making, the comparable figure you give respecting the Lower Basin would involve water which could be released from the reservoirs in the Lower Basin that had been impounded during your flush years. It would not be just on the basis of the reconstructed river during the low-water period, minus the use in the Upper Basin.

MR. RITER: I have in mind, Mr. Tipton, that we start out with the flow of at least seven and a half million acre feet.

MR. TIPTON: I do not think you get the point.

MR. RITER: What you mean is in addition to that, they would have holdover storage in Lake Mead?

MR. TIPTON: That would put it on a comparable basis with the treatment of the Upper Basin development, and during the low water period. I think we need not discuss this any further for the record here. I can explain more fully what I mean.

MR. RITER: I know the point you are driving at. In other words, one of the elements of supply in the Lower Basin would be the storage released from the reservoirs in the Lower Basin, the principal one being Lake Mead. Is that the point you are trying to make?

MR. TIPTON: Yes.

MR. SHAW: May I clarify my question? It was directed--I think Mr. Tipton has come close to it--to the usable supply in the Lower Basin during the ten-year period, 1931-1940.

MR. RITER: Yes, that is correct.

JUDGE STONE: I believe Mr. Scattergood has a question.

MR. SCATTERGOOD: Well, I should like to ask Mr. Riter, if I understand correctly, if the figure 7,656,000 in the Upper Basin is for an average year, and that shown in the report of 6,908,000 is the result during the low period? Is that understanding correct?

MR. RITER: Yes, sir. For the projects that we have shown in the report?

MR. SCATTERGOOD: That is what I mean.

MR. RITER: We analyzed the depletion--bear in mind, they are estimates. We found in the low ten-year period this depletion. But there is one correction:

To make that table strictly comparable we must add another factor. Storage released from holdover reservoirs. If you take the virgin flow from Lee's Ferry and subtract 6,900,000 acre feet, you would get below seven million acre feet. So the net replacement would be less than 6,900,000 acre feet, by virtue of storage they would release from the holdover reservoirs in the Upper Basin.

Now, the 7,656,000 acre feet is my estimate for the same projects for the long-time average. Does that clarify your question, Mr. Scattergood?

MR. SCATTERGOOD: Yes. Simply released to the particular projects selected.

MR. RITER: That's right.

MR. SCATTERGOOD: I wanted to ask you if you can give us an approximation of what the shortage in the Lower Basin would be instead of the Mexican water plus 800,000 acre feet a year during the low period. Have you any approximation of that?

MR. RITER: I have not figured the low period in the report. I think that is the point Mr. Shaw wanted. In other words, he felt the report was incomplete unless we also discussed what would happen in the Lower Basin during the low ten-year period.

MR. SCATTERGOOD: I just wanted to know if you had tentatively arrived at an approximation.

MR. RITER: No, we hadn't.

JUDGE STONE: Are there other questions now?

(No response.)

If there are no other questions on this matter, we will proceed with the further statement by the two Regional Directors as to the project development. I am inclined to think that Mr. Larson ought to treat the projects a little more extensively than he indicated, but not as extensively as would be required to give a fifteen-minute explanation of each. At least, there should be reference to the list of projects for the various areas in each Basin. And if you can do that, any particular comment on a project where it is required, that might be given. Can you proceed on that basis, Mr. Larson?

MR. LARSON: I can proceed by reading the name of the project, how many acres of new land and supplemental land, the total estimated construction costs by Basins, and come on down the river. That is on page 74. That would be of particular benefit to those who do not have the report, and they will at least know the names of the projects we have in mind.

We start with the Upper Green River right at the top. The first is the West Side Project. Before I go on with that, I might say that Kendall Reservoir, the large reservoir in the Upper Green, will serve both the West Side Project and the individual projects on the East Side of Green River. If you have that in mind, I will go ahead.

Now, on the West Side of the Kendall Reservoir, the first covers 29,050 acres of new land; 37,000 acres of supplemental land, land on which additional water supply can be used, a total of 66,050 acres.

The Daniel Unit or project, 5,160 acres of new land; no supplemental lands, a total of 5,160 acres.

The Elkhorn Project, 134,030 acres of new land; no supplemental lands; total, 134,030.

The total cost of those three, which all depend on the Kendall Reservoir, is $27,500,000. This is based upon 1940 costs.

Going on, the Paradise Unit, 4,490 acres of new land; no supplemental lands. Cost, $400,00[illegible].

The Eden Unit, 20,250 acres of new land; no supplemental lands. Cost, $1,100,000.

The Lower Big Sandy, 11,850 acres of new land; no supplemental lands, Cost $900,000.

The LaBarge Project, 3,370 acres of new land; 5,540 acres of supplemental land, or a total of 8,910 acres, costing $700,000.

The Fontenelle Project, 2,050 acres of new land; 3,720 acres of supplemental land, a total of 5,770 acres. Estimated cost $800,000.

The Seedskadee Project, 40,830 acres of new land; no supplemental lands. Cost $4,600,000.

The Opal Project, 16,020 acres of new land; 5,400 acres of supplemental lands. Total, 21,420 acres. Cost $3,600,000.

The next two projects are listed as one, so far as cost is concerned. That is the Lyman Project, 3,100 acres of new land and 20,910 acres of supplemental lands. Total, 24,010 acres. And the Henrys Fork Project, 17,140 acres of new land and 21,090 acres of supplemental lands, total 38,230 acres. The cost for both of these projects is $5,800,000.

Now, the total for the Upper Green is 287,340 acres of new land; 93,660 acres of supplemental lands, or a total of 381,000 acres. The total estimated cost is $45,400,000.

The next on the list, the Yampa and White River. The Little Snake River, 92,110 acres of new land; 15,710 acres of supplemental lands, or a total of 107,820 acres. Total estimated cost of $20,500,000. Upper Yampa Project, 3,460 acres of new land; 11,140 acres of supplemental lands. Total, 14,600 acres. Total estimated cost, $2,300,000.

Wessels Project, 6,010 acres of new land; 380 acres of supplemental lands, total 6,390 acres, the estimated cost being $1,100,000.

Mount Harris, 16,600 acres of new land; 1,450 acres of supplemental lands, total 18,050. Estimated cost $3,300,000.

The Great Northern project, 16,010 acres of new land; 3,260 acres of supplemental lands, total 19,270 acres. Estimated cost $2,700,000

The Yellow Jacket Project, 31,820 acres of new land; 5,950 acres of supplemental, total 37,770 acres. Estimated cost, $4,700,000.

Deadman Bench Project, which covers land both in Colorado and Utah, 89,720 acres of new land; no supplemental lands, total 89,720 acres. Cost $17,000,000.

The Maybell Project, 8,540 acres of new land; no supplemental lands, total 8,540 acres. Cost $700,000.

Josephine Basin Project, 2,400 acres of new land; no supplemental lands. Total 2,400 acres. Estimated cost $300,000.

Piceance Creek Project, 610 acres of new land; 2,380 acres of supplemental lands. Total, 2,990 acres. Estimated cost, $800,000.

Miscellaneous and small areas, 8,910 acres of new land; no supplemental lands. Total, 8,910 acres, at a cost of $700,000.

The totals of Yampa and White River, 276,190 acres of new lands; 40,270 acres of supplemental lands. Total, 316,460 acres, at an estimated cost of $54,100,000.

Going down to the Uinta Basin, we have the Moon Lake Project Extension. Moon Lake is a reclamation project. 26,300 acres of new land; 86,200 acres of supplemental lands, and that includes some Indian lands also, a total of 112,-500 acres. Cost $7,900,000.

The Castle Peak Project, 21,700 acres of new land; 2,100 acres of supplemental lands. Total, 23,800 acres, costing $5,300,000.

The Mosby Project, 3,800 acres of new land; 400 acres of supplemental lands, total 4,200 acres. Cost, $1,100,000.

The Vernal Project, 1,900 acres of new land; 22,300 acres of supplemental lands, total 24,200 acres. Cost, $1,500,000.

The Jensen Project, 800 acres of new land; 3,600 acres of supplemental lands. Total, 4,400 acres. Cost, $300,000.

The Fruitland Project, 1,600 acres of new land; 400 acres of supplemental lands. Total, 2,000 acres. Cost, $400,000.

Minnie Maud Project, no new land; 800 acres of supplemental lands, total 800. Cost, $100,000.

The Green River Project, 11,000 acres of new land; 1,000 acres of

supplemental lands. Total, 12,000 acres. Cost, $400,000.

The total in the so-called Uinta Basin is 67,100 acres of new land; 116,800 acres of supplemental lands. Total, 183,900 acres. Cost, $17,000,000.

On the Price and San Rafael Rivers, in Utah, Emery County Project, 3,300 acres of new land; 20,000 acres of supplemental lands. Total, 23,300 acres. Cost, two and a half million.

The Buckhorn Project, 3,800 acres of new land; no supplemental lands. Total, 3,800 acres. Cost, $1,200,000.

The total for the Price and San Rafael Rivers is 7,100 acres of new land; 20,000 acres of supplemental lands. Total, 27,100 acres. Cost, $3,700,000.

Under Miscellaneous Areas, there is the Gunnison Valley Project, 10,830 acres of new land; no supplemental lands. Total, 10,830 acres. Cost, $1,100,-000.

That is the total of what we term the Green Division. Everything above the mouth of the Green is 648,560 acres of new land; 270,730 acres of supplemental lands, or a total of 919,290 acres. The total estimated cost of all those projects is $121,300,000.

Before going on to the Grand Division, I will read the figures on the possible transmountain diversions. That appears on page 75.

On the Upper Green River, the South Pass Diversion, in Wyoming, the estimated annual diversion there is 46,600 acre feet. Estimated construction cost is $1,203,000.

The Hams Fork Diversion, also in Wyoming, 33,000 acre feet of estimated annual diversion, average, cost, $5,600,000.

The Green River-Bear Diversion, from Green River to Bear River, Utah, is 290,000 acre feet. Cost, $38,000,000.

The Yampa and White River Basin, Little Snake-North Platte Diversion, Colorado, 47,000 acre feet, at a cost of $1,304,000.

The Uinta Basin, Rock Creek Tunnel Diversion--that is to the Green River Project of the Salt Lake Basin, 48,000 acre feet, at a cost of $4,900,000.

The Price and San Rafael Basins, Gooseberry Diversion, the Gooseberry Project, 11,500 acre feet estimated average annual diversion, at an estimated cost of $1,200,000. Those costs are exclusive of storage.

The Ferron-Manti Creek Diversion, Utah, 15,000 acre feet. Cost $360,000.

The White River Diversion, Strawberry Project, 4,200 acre feet of annual diversion. Cost, $320,000.

The total of those transmountain diversions, 495,300 acre feet. Cost, $53,247,000.

MR. RITER: I want to call your attention to the fact that the figures Mr. Larson quoted on amount of water divertible were the averages during the ten-year low period. On a long-time basis, these diversions will probably be about 20% more. In other words, that is something you have to figure out.

In connection with the Little Snake-North Platte, I would like to record that for the benefit of Wyoming rather than Colorado, there again is another point you may want to get together on and decide what plan you want shown tentatively.

I want also to call your attention to the fact that those figures are lower than the low year figures. On a long-time basis you get more water out of them.

MR. E. O. LARSON: Going to the Grand Division, which includes everything from the Colorado to the Junction of the Green River, upstream: The Colorado River above the Gunnison River, the Troublesome Project, new land 6,800 acres; supplemental lands, 3,600 acres. Total, 10,400 acres. Estimated construction cost, $2,210,000.

The Muddy Creek Project, 3,620 acres of new land; 2,520 acres of supplemental lands. Total, 6,140 acres. Cost, $500,000.

The Fourmile Project, 500 acres of new land; 1,400 acres of supplemental lands. Total, 1,900 acres. Estimated cost, $600,000.

The Cattle Creek Project, 900 acres of new land; 5,500 acres of supplemental lands. Total, 6,400 acres. Cost, $430,000.

The Capitol Creek Project. No new land; 2,000 acres of supplemental lands. Total, 2,000 acres. Cost, $130,000.

Woody Creek Project. Also no new land; 2,000 acres of supplemental lands. Total, 2,000 acres. Cost, $170,000.

The Silt Project, 1,100 acres of new land; 5,200 acres of supplemental lands; total, 6,300 acres. Cost, $1,320,000.

MR. WALLACE: Those are all within the Basin?

MR. LARSON: What is it?

MR. WALLACE: Are those all within the Basin?

MR. RITER: Yes, those are within the Basin.

MR. LARSON: Yes, those are within the Basin.

MR. WALLACE: You are reading the transmountain diversions?

The total of those transmountain diversions, 495,300 acre feet. Cost, $53,247,000.

MR. RITER: I want to call your attention to the fact that the figures Mr. Larson quoted on amount of water divertible were the averages during the ten-year low period. On a long-time basis, these diversions will probably be about 20% more. In other words, that is something you have to figure out.

In connection with the Little Snake-North Platte, I would like to record that for the benefit of Wyoming rather than Colorado, there again is another point you may want to get together on and decide what plan you want shown tentatively.

I want also to call your attention to the fact that those figures are lower than the low year figures. On a long-time basis you get more water out of them.

MR. E. O. LARSON: Going to the Grand Division, which includes everything from the Colorado to the Junction of the Green River, upstream: The Colorado River above the Gunnison River, the Troublesome Project, new land 6,800 acres; supplemental lands, 3,600 acres. Total, 10,400 acres. Estimated construction cost, $2,210,000.

The Muddy Creek Project, 3,620 acres of new land; 2,520 acres of supplemental lands. Total, 6,140 acres. Cost, $500,000.

The Fourmile Project, 500 acres of new land; 1,400 acres of supplemental lands. Total, 1,900 acres. Estimated cost, $600,000.

The Cattle Creek Project, 900 acres of new land; 5,500 acres of supplemental lands. Total, 6,400 acres. Cost, $430,000.

The Capitol Creek Project. No new land; 2,000 acres of supplemental lands. Total, 2,000 acres. Cost, $130,000.

Woody Creek Project. Also no new land; 2,000 acres of supplemental lands. Total, 2,000 acres. Cost, $170,000.

The Silt Project, 1,100 acres of new land; 5,200 acres of supplemental lands; total, 6,300 acres. Cost, $1,320,000.

MR. WALLACE: Those are all within the Basin?

MR. LARSON: What is it?

MR. WALLACE: Are those all within the Basin?

MR. RITER: Yes, those are within the Basin.

MR. LARSON: Yes, those are within the Basin.

MR. WALLACE: You are reading the transmountain diversions?

MR. LARSON: That was before I took up the Grand Division, yes. I should explain that we are now on page 102. The West Divide Project, 400 acres of new land; 7,700 acres of supplemental lands. Total, 8,100 acres. Estimated cost, $1,300,000.

Hunter Mesa Project, 4,700 acres of new land; 2,300 acres of supplemental lands. Total, 7,000 acres. Cost, $1,500,000.

Roan Creek Project. No new land; 3,100 acres of supplemental lands. Total, 3,100 acres. Cost, $610,000.

The Collbran Project, 7,100 acres of new land; 18,900 acres of supplemental lands; total, 26,000 acres. Cost, $1,940,000.

The Grand Valley Extension Project, 5,000 acres of new land. No supplemental lands. Total, 5,000 acres. Cost, $415,000.

Miscellaneous areas, 20,480 acres of new land; no supplemental lands. Total, 20,480 acres. Cost, $1,320,000.

The subtotal for the Colorado River above the Gunnison River is 50,600 acres of new land; 54,220 acres of supplemental land. Total, 104,820 acres. The total cost, $12,445,000. Now, we will take next the Gunnison River;

The Ohio Creek Project, 3,470 acres of new land; 11,300 acres of supplemental lands; total, 14,770 acres. Cost, $1,080,000.

Tomichi Creek Project, 3,100 acres of new land; 8,300 acres of supplemental lands; total, 11,400 acres. Cost $1,860,000.

Cochetopa Creek, 3,900 acres of new land; 4,700 acres of supplemental lands. Total, 8,600 acres. Cost, $1,150,000.

The Minnesota Project, 200 acres of new land; 2,600 acres of supplemental land. Total, 2,800 acres, Cost, $820,000.

Leroux Creek Project, 3,900 acres of new land; no supplemental lands. Total, 3,900 acres. Cost, $2,800,000.

The Grand Mesa Project, 5,200 acres of new land; 18,200 acres of supplemental lands; total, 23,400 acres. Cost, $1,920,000.

Miscellaneous areas on the Gunnison, 26,660 acres of new land; no supplemental lands. Total, 26,660. Cost, $1,190,000.

The subtotals for the Gunnison River are, 46,430 acres of new land; 45,100 acres of supplemental lands. Total, 91,530. Cost, $10,820,000.

Now, on the Colorado River between the Gunnison and the Green Rivers, we have the Saucer Valley Project, 5,000 acres of new land; 1,300 acres of supplemental. Total, 6,300 acres. Cost $940,000.

The Nucla Project, 5,700 acres of new land; 5,800 acres of supplemental lands. Total, 11,500 acres. Cost, $1,500,000.

The San Miguel Project, 40,900 acres of new land; 14,100 acres of supplemental lands. Total, 55,000 acres. Cost, $6,590,000.

The West Paradox Project, 5,500 acres of new land; 3,900 acres of supplemental lands. Total, 9,400 acres. Cost, $640,000.

The Moab Project, 1,200 acres of new land; 1,950 acres of supplemental lands. Total, 3,150 acres. Cost, $775,000.

The Hatch Creek Project, 4,000 acres of new land. No supplemental lands. Total, 4,000 acres. Cost, $400,000.

Subtotal for the Colorado River between the Gunnison and Green Rivers, 62,300 acres of new land; 27,050 acres of supplemental lands. Cost, $10,845,000.

The total for the Grand Division, to its mouth in the Colorado, 159,330 acres of new land; 126,370 acres of supplemental lands. Total, 285,700 acres. Cost, $34,110,000.

Now, the potential export diversions from the Grand Division;

First, is the Colorado River above the Gunnison--at page 103.

The Blue River-South Platte Diversion, Colorado, 466,000 acre feet (estimated annual diversion), cost, $148,000,000.

The Frying Pan-Arkansas Diversion, Colorado, 53,000 acre feet. Cost, $2,500,000.

The Twin Lakes Tunnel Diversion, Colorado, 6,600 acre feet. Cost, $300,000.

The Gunnison River;

The Gunnison-Arkansas Diversion, Colorado, 410,000 acre feet. Cost, $84,000,000.

The Gunnison-Rio Grande Diversion, Colorado, 10,000 acre feet. Cost, $200,000.

The Colorado River between Gunnison and Green Rivers;

Montezuma Valley Enlargement Diversion, Colorado, 28,000 acre feet. Cost, $1,300,000.

The Dolores Diversion, also Colorado, 116,000 acre feet. Cost, $12,200,000.

The Blanding Diversion, Utah, 1,800 acre feet. Cost, $135,000.

The total potential export diversion from the Grand Division is 1,091,400 acre feet, at a cost of $248,635,000. This is all export diversion.

Now, we go to the San Juan Basin, the San Juan Division, next. That is everything between Lee Ferry and the Junction of the Green and the Colorado. You will find it on page 123.

San Juan Basin: Pulce-Chama-Navajo Project, 15,900 acres of new land; 1,950 acres of supplemental lands. Total, 17,850 acres. Cost, $1,627,000.

The Carracas Project, 840 acres of new land; 190 acres of supplemental lands. Total, 1,030 acres. Cost, $36,000.

The O'Neal Park Project, 5,820 acres of new land; 1,780 acres of supplemental lands. Total, 7,600 acres. Cost, $880,000.

The Hammond Project, New Mexico 3,700 acres of new land; no supplemental lands. Total, 3,700 acres. Cost, $725,000.

The Shiprock Project, 70,000 acres of new land; no supplemental lands. Total, 70,000 acres. Cost, $21,141,000.

The Pine River Project, 15,100 acres of new land; 1,200 acres of supplemental lands. Total, 16,300 acres. Cost, $1,835,000.

The Florida Project, 6,300 acres of new land; 13,800 acres of supplemental lands. Total, 20,100 acres. Cost, $2,290,000.

The Animas-La Plata Project, which includes all of the Animas-La Plata, new lands in that project, 86,300 acres; supplemental lands, 24,700 acres. Total, 111,000 acres. Cost $35,534,000.

The Montezuma Valley Extension, 10,000 new lands; no supplemental lands. Total, 10,000 acres. Cost, $1,300,000.

The McElmo Project, no new lands; 1,000 acres supplemental lands, total, 1,000 acres. $390,000.

The Dolores Project, 40,000 acres of new lands. No supplemental lands. Total, 40,000 acres. Cost, $12,200,000.

The Blanding Project. No new lands; 3,800 acres of supplemental lands. Total, 3,800 acres. Cost, $567,000.

The Navajo Indian Projects, 34,200 acres of new land; 14,600 acres of supplemental lands. Total, 48,800 acres. Cost, $2,910,000.

The last, the Navajo Indian Projects, includes a list of a lot of Indian projects given by the Indian Bureau to put in here.

The Western Tributaries:

The Fremont River 100 acres of new land; 9,000 acres of supplemental lands. Total, 10,000 acres. Cost, $800,000.

The Torrey Project. No new land; 1,200 acres of supplemental lands. Total, $200,000.

The Escalante Project, 3,000 acres of new land, costing $900,000.

The total of the San Juan Division, 292,160 acres of new land; 73,220 acres of supplemental lands. Total cost, $83,335,000.

The potential export diversions from the San Juan Division, San Juan River:

The Weminuche Pass Project, Colorado, 21,000 acre feet, $265,000.

The Piedra-Rio Grande, Colorado, 70,000 acre feet, $8,200,000.

The San Juan-Chama Project, New Mexico it should be, instead of Colorado, as on page 124 of the report, 247,000 acre feet at a cost of $19,968,000.

Western Tributaries of the Muddy-Creek Diversion, Utah, 7,000 acre feet at an estimated cost of $600,000.

This makes a total of 345,000 acre feet potential export diversions, at a cost of $29,033,000.

JUDGE STONE: That is a list of the potential irrigation projects?

MR. WALLACE: Will you mention the transfer of water from the Sevier Valley into the Colorado River Basin?

MR. LARSON: I can't find it here.

MR. WALLACE: Is it in the book?

MR. LARSON: Yes. That is the list of all the potential irrigation projects.

JUDGE STONE: That does not include the power or regulatory reservoirs?

MR. LARSON: The power is in another list.

JUDGE STONE: I think it would be well to include, now, the power reservoirs in the Upper Basin. Then we will go to the Lower Basin.

JUDGE O'ROURKE: Before going to that, will you read the last exportation from the Grand Division? That, strictly speaking, is not an exportation, in the sense it is taken out of the Colorado River Basin. Is that right?

MR. RITER: Yes, that is right. We have kept the books by these divisions. That is a transfer of water from one stream of the Colorado Basin to another stream of the Colorado River Basin. In other words, a change or transfer of

water from the Dolores River to the San Juan Basin.

MR. SHAW: That was not taken into account in your final tables of water exported from the Basin?

MR. RITER: I do not remember how the table is set up. I do not recall whether we added that in as a transmountain diversion, giving you credit for return flow, or whether we didn't.

MR. SHAW: Will you refer to the table at page 128 and tell me what the three-star item is?

MR. RITER: In preparing the summary on page 128, we did not add into the transmountain diversions the water which was transferred from one Colorado River stream to another.

MR. SHAW: Thank you.

MR. RITER: But we did include the consumptive use on that water in the Colorado River Basin. Is that clear now, Mr. Shaw?

MR. SHAW: That is clear.

JUDGE STONE: Pardon me just a moment. Mr. Howard, will you come up, please? Gentlemen, Mr. James Howard, representing the Power Allottees is now here.

Very well. Proceed.

MR. RITER: Mr. Nielsen will continue with the report.

MR. NIELSEN: I will give you the names of the project, the stream, the installed capacity. I don't know whether you want the kilowatt hours, or not; or the estimated construction costs.

JUDGE STONE: Yes, please.

MR. NIELSEN: On the Green River, proceeding downstream--

JUDGE STONE: Pardon me, but is that the installed capacity which you mentioned?

MR. NIELSEN: The installed capacity; annual firm generation, and the estimated construction cost. This is shown on page 151 of the report.

The first is Burnt Lake, on Fall Creek. Installed capacity, 1,500 kilowatts; generation, 9,000,000 kilowatt hours; cost, $350,000.

Flaming Gorge, on the Green River, just above the Wyoming-Utah line, 30,000 kilowatts installed capacity; 158,000,000 kilowatt hours; ten million dollars.

Red Canyon, on the Green River, 12,000 kilowatts; 68,000,000 kilowatt hours; cost, $4,100,000.

Echo Park, on the Green River, just below the mouth of the Yampa, 120,000 kilowatts installed capacity; 668,000,000 kilowatt hours, generation, cost $43,000,000.

Split Mountain, on the Green River, 90,000 kilowatts; 486,000,000 kilowatt hours; $23,000,000

Desolation, on the Green River, below the White River, 78,000 kilowatts; 433,000 kilowatt hours; cost, $21,000,000.

Rattlesnake, on the Green River, just above the Price River, 78,000 kilowatts; 434,000,000 kilowatt hours; cost, $23,000,000.

On the Yampa River:

Juniper, 15,000 kilowatts; 87,000,000 kilowatt hours; cost, $5,800,000.

Cross Mountain, on the Yampa River, 18,000 kilowatts; 99,000,000 kilowatt hours; Cost, $5,000,000.

Slater Falls, on Slater Creek, which is in the Yampa River Basin, 7,500 kilowatts; 43,000,000 kilowatt hours; $3,100,000.

Lily Park, on the Yampa River, 10,000 kilowatts; 47,000,000 kilowatt hours, cost $1,900,000.

On the Colorado River:

Gorge Canyon, on the Colorado River, 30,000 kilowatts; 177,000,000 kilowatt hours; cost, $3,800,000.

Dewey, on the Colorado River, just below the Dolores, 140,000 kilowatts; 797,000,000 kilowatt hours; cost, $38,000,000.

Moab Project, on the Colorado River, 60,000 kilowatts; 344,000,000 kilowatt hours; cost, $9,900,000.

Dark Canyon, on the Colorado River below the Green, 350,000 kilowatts; 1,843,000,000 kilowatt hours; cost, $105,000,000.

Glen Canyon, on the Colorado River, 400,000 kilowatts; 2,188,000,000 kilowatt hours; cost, $64,000,000.

On the Gunnison River:

Sapinero, 18,000 kilowatts; 100,000,000 kilowatt hours; cost, $7,800,000.

Lake Fork, on the Gunnison River, 6,000 kilowatts; 12,000,000 kilowatt hours, cost, $1,300,000.

Ouray Project, three plants, on the Uncompahgre, 16,000 kilowatts; 64,000,000 kilowatt hours; cost, $3,200,000.

On the San Juan River;

Animas, two plants, on the Animas River, 52,000 kilowatts; 192,000,000 kilowatt hours; cost, $28,000,000.

Emerald Lake, on the Pine River, 15,000 kilowatts; 72,000,000 kilowatt hours; cost, $6,200,000.

Bluff Project, on the San Juan River, 52,000 kilowatts; 289,000,000 kilowatt hours; cost, $19,000,000.

Gooseneck, on the San Juan River, 30,000 kilowatts; 152,000,000 kilowatt hours; cost, $5,200,000.

Slick Horn Canyon, on the San Juan River, 30,000 kilowatts; 176,000,000 kilowatt hours; cost, $6,300,000.

Great Bend, San Juan River, 36,000 kilowatts; 203,000,000 kilowatt hours; cost, $10,000,000.

The total in the Upper Basin, installed capacity, 1,695,000 kilowatts; annual firm generation, 9,141,000,000; cost, $47,950,000. This is exclusive of transmission grid.

JUDGE STONE: Now, Mr. Moritz, may we proceed with the projects in the Lower Basin, and give the page, please?

MR. MORITZ: Page 202 in the book.

The Little Colorado Division potential developments are listed as;

Snowflake Project, 6,700 acres of new land; no supplemental lands; total, 6,700 acres; estimated cost, based on 1940 prices, $2,600,000.

The Holbrook Project, 1,800 acres of new land; 600 acres of supplemental lands; total acreage, 2,400; estimated cost, $1,300,000.

Right there, I wish to call attention to those who have the books that there is an error in this table. The figures were transposed in the book, and the figures I am reading are the correct figures.

JUDGE STONE: Will you read those again, please?

MR. MORITZ: Yes. The first one is correct, as shown in the table. But Holbrook is $1,300,000.

The next project is Black Creek, 4,000 acres of new land; no supplemental lands; total, 4,000 acres; estimated cost, $1,800,000, instead of the $1,300,000 as shown in that table on page 202.

The Winslow Project, 19,750 acres of new lands; no supplemental lands; total, 19,750 acres; estimated cost, $19,000,000.

On the San Juan River;

Animas, two plants, on the Animas River, 52,000 kilowatts; 192,000,000 kilowatt hours; cost, $28,000,000.

Emerald Lake, on the Pine River, 15,000 kilowatts; 72,000,000 kilowatt hours; cost, $6,200,000.

Bluff Project, on the San Juan River, 52,000 kilowatts; 289,000,000 kilowatt hours; cost, $19,000,000.

Gooseneck, on the San Juan River, 30,000 kilowatts; 152,000,000 kilowatt hours; cost, $5,200,000.

Slick Horn Canyon, on the San Juan River, 30,000 kilowatts; 176,000,000 kilowatt hours; cost, $6,300,000.

Great Bend, San Juan River, 36,000 kilowatts; 203,000,000 kilowatt hours; cost, $10,000,000.

The total in the Upper Basin, installed capacity, 1,695,000 kilowatts; annual firm generation, 9,141,000,000; cost, $47,950,000. This is exclusive of transmission grid.

JUDGE STONE: Now, Mr. Moritz, may we proceed with the projects in the Lower Basin, and give the page, please?

MR. MORITZ: Page 202 in the book.

The Little Colorado Division potential developments are listed as;

Snowflake Project, 6,700 acres of new land; no supplemental lands; total, 6,700 acres; estimated cost, based on 1940 prices, $2,600,000.

The Holbrook Project, 1,800 acres of new land; 600 acres of supplemental lands; total acreage, 2,400; estimated cost, $1,300,000.

Right there, I wish to call attention to those who have the books that there is an error in this table. The figures were transposed in the book, and the figures I am reading are the correct figures.

JUDGE STONE: Will you read those again, please?

MR. MORITZ: Yes. The first one is correct, as shown in the table. But Holbrook is $1,300,000.

The next project is Black Creek, 4,000 acres of new land; no supplemental lands; total, 4,000 acres; estimated cost, $1,800,000, instead of the $1,300,000 as shown in that table on page 202.

The Winslow Project, 19,750 acres of new lands; no supplemental lands; total, 19,750 acres; estimated cost, $19,000,000.

The total of all, 32,250 acres of new land; 600 acres of supplemental lands; total, 32,850 acres; estimated cost, $24,700,000.

That is all in the Little Colorado River Division.

The Virgin Division, on page 218;

The Kanab Creek Project. No new land; 1,000 supplemental acres, estimated construction cost, $200,000.

The Hurricane Project. 14,000 acres of new land; 6,500 acres of supplemental lands. Total, 20,500 acres. Estimated cost, $9,200,000.

The Santa Clara Project. 2,000 acres of new land; 1,700 acres of supplemental lands. Total, 3,700 acres. Estimated cost, $1,700,000.

Panaca Valley Project, 2,000 acres of new land; 2,000 acres of supplemental lands. Total, 4,000 acres. Estimated cost, $1,300,000.

Moapa Valley Project, 1,500 acres of new land; 2,500 acres of supplemental lands; total, 4,000 acres. Estimated cost, $700,000.

Moapa Valley Pumping, new land, 6,000 acres, no supplemental lands; total, 6,000 acres. Estimated cost, $2,800,000.

The grand total for the Virgin Division, new land, 25,500 acres; 13,700 acres of supplemental lands; total, 39,200 acres, at an estimated cost of $15,900,000.

That is the Virgin Division.

The Boulder Division, at page 242;

Virgin Bay Pumping Project, 2,800 acres of new land; no supplemental lands; total, 2,800 acres. Estimated cost of $1,300,000.

There are no supplemental lands in any of these, so I will not read them.

Las Vegas Pumping Project, 20,000 acres of new land; total, 20,000 acres; estimated construction cost, $8,400,000.

The Davis Reservoir Pumping Project, 2,000 acres of new land; total the same acreage; estimated construction cost, $500,000.

Big Bend Pumping, total acreage, 3,700. Cost, $700,000.

Fort Mohave, 5,100 acres; $800,000.

Mohave Valley, 10,000 acres of new land; $1,900,000.

Palo Verde Mesa, 16,000 acres of new land; total the same; estimated cost, $3,100,000.

In the same tabulation we have the Marble Canyon-Kanab Creek Power Development. No acreages are involved in the rest of this statement. Perhaps I better read these, anyhow:

The Marble Canyon-Kanab Creek Power Development, total estimated cost, $382,000,000.

The Coconino Flood and Silt Retention Project, the Coconino Dam for flood and silt retention, $3,200,000. There is an asterisk there which indicates that this includes power, and flood and silt control developments.

The Bridge Canyon Power Development, $117,200,000, with a similar asterisk.

The Alamo Reservoir, flood control, $3,200,000.

The San Diego Project, Water Supply, estimated at $25,300,000.

The Sentinel Reservoir, on the Gila, flood control, estimated, $15,000,000.

The total estimated new land, 59,600 acres, at an estimate of $562,600,000. When we get that, we will have a lot of power.

That is a list of the Boulder Division.

At page 267, potential developments in Gila Division, Colorado River-Central Arizona development, includes the following:

Paradise Valley Unit, 85,000 acres of new land; total, 85,000 acres.

Salt River Unit, 20,000 acres of new land; 384,900 acres of supplemental lands; total, 404,900 acres benefited.

San Carlos Unit, no new land; 157,400 acres of supplemental lands, total the same.

The costs are all added up here in one figure for the entire Central Arizona Potential Development. I will read them later.

The Charleston Unit, no new land, 2,600 acres of supplemental lands, total, 2,600 acres.

Safford Valley Unit, no new land; 32,460 acres of supplemental lands; total the same.

San Francisco Unit, 2,000 acres of new land; 2,500 acres of supplemental lands; total, 4,500 acres.

Duncan Valley Unit, no new land; 8,100 acres of supplemental lands; total the same.

New Mexico Unit, no new land; 5,500 acres of supplemental lands; total the same.

A summation of those separate units that have just been read, in the Colorado River-Central Arizona Project, total estimate is $462,900,000. This includes that portion of the cost of Bridge Canyon and Coconino projects for irrigation for the purposes of this report.

MR. SHAW: How much, Mr. Moritz?

MR. MORITZ: I will have to go to another part of the report to find that.

The Chino Valley Project, no new land; 2,540 acres of supplemental lands, estimated construction cost, $150,000.

The Hassayampa Project, 8,800 acres of new land; no supplemental water; total, 8,800 acres. Estimated cost, $6,650,000.

This makes a total for the Gila Division of 115,800 acres of new land; 596,000 acres of supplemental lands; total, 711,800 acres, at an estimated cost of $469,700,000.

I might summarize all of those figures. Those who have books have the table on page 270, listed there by Divisions and States and by estimated construction costs.

The Little Colorado Division, in Arizona, $24,700,000; the Virgin Division, Virgin River, $2,000,000; the Boulder Division, $522,500,000; the Gila Division, $456,400,000, all in Arizona, or a grand total for the four divisions in Arizona of $1,005,600,000.

For California, $28,400,000; for Nevada, $16,500,000; for New Mexico, $13,300,000; for Utah, $9,100,000.

In the same table, we show the estimated transmission grid, being $192,100,000, or a total estimated cost of $1,265,000,000. Those are all potential projects.

Some of the projects in California are not reflected in any of those figures, and it might be of interest to read from another table on page 237, covering the Boulder Division, irrigated and irrigable area under present developments, but not fully developed.

The Colorado River Indian Reservation, 5,000 acres of land now irrigated; the additional irrigable area would be 95,000 or a total of 100,000 acres.

The Palo Verde Irrigation District irrigated in 1943, 38,000 acres; additional irrigable lands, 37,000, or a total of 75,000 acres.

These figures are all for 1943.

The All-American Canal, began in 1943. The Imperial Irrigation District, irrigated 400,400 acres; there were 122,600 additional irrigable acres, or a total of 523,000.

Coachella Valley, 16,000 acres irrigated in 1943; there were 69,000 additional irrigable acres, or a total of 85,000.

East Mesa, additional irrigable area only, 40,000; total, 40,000.

West Mesa, total, 50,000--all additional irrigable.

Pilot Knob Mesa, 15,000 acres additional irrigable, total.

Yuma Project, irrigated in 1943, 58,800 acres; additional irrigable area, 8,500 acres, or a total of 67,300 acres,

The Gila Project, in Arizona, the North Gila Valley irrigated in 1943, 4,400 acres; additional irrigable area, 1,000; total, 5,400 acres.

Yuma Mesa irrigated in 1943, 100 acres; additional irrigable area, 69,900 acres, total 70,000 acres.

Wellton-Mohawk irrigated 7,800 acres in 1943; additional irrigable area, 70,000 acres, or a total of 77,800 acres.

The South Gila Valley, 6,600 acres irrigated in 1943; 1,000 additional irrigable acres in area, by pumping, or a total of 7,600.

The Las Vegas area, in the immediate vicinity of Las Vegas, 1,200 acres irrigated in 1943; no area additional irrigable; total, 1,200 acres.

The Williams River, irrigated in 1943, 1,700; no additional irrigable area; total, 1,700 acres.

The total of that table of irrigated and irrigable area under present developments; irrigated in 1943, 540,000 acres. Additional irrigable area, 579,000 acres, or a total of 1,119,000 acres.

On page 289 of the book, potential hydroelectric development in the Lower Basin. Development Plants;

Marble Canyon, Main River, 22,000 kilowatts ultimate installed capacity; 164,000,000 kilowatt-hours annual firm energy; estimated construction cost, $32,000,000.

Kanab Creek, also on the Main River, water diverted from the Main River back into the Canyon Reservoir, ultimate installed capacity, 1,250,000 kilowatts; annual firm energy, 6,570,000,000 kilowatt hours; estimated construction cost, $350,000,000.

Bridge Canyon, also on the Main River, ultimate installed capacity, 650,000 kilowatts; annual firm energy, 3,440,000,000 kilowatt hours; estimated construction cost, $120,400,000.

That represents only that portion of the total cost allotted to power for the purposes of this report. It includes Coconino Dam,

The Buttes Plant. That is on the Gila. Ultimate installed capacity 5,800 kilowatts; annual firm energy, 8,000,000 kilowatt hours.

The Horseshoe Plant, ultimate installed capacity, 10,000 kilowatts, at an estimated construction cost of $900,000. This is to be used for replacement power.

The Hooker Plant, on the Gila, New Mexico, ultimate installed capacity 3,000 kilowatts; annual firm energy, 8,000,000 kilowatt hours; estimated construction cost, $16,000,000. That includes the irrigation features.

The Virgin Plant, on the Virgin River, 2,000 kilowatts; annual firm energy, 3,000,000 kilowatt hours. The cost is summarized for three units here and I will read that later. Under the same list, Bench Lake, installed capacity, 800 kilowatts; annual firm energy, 2,000,000 kilowatt hours. The Warner Valley Plant, 1,800 kilowatts ultimate installed capacity; 10,000,000 kilowatt hours annual firm energy.

Those three Virgin Plants are on the Virgin River, and the three are assembled into a total cost of $9,200,000, which includes the irrigation features.

Subtotal for power plants, ultimate installed capacity, 1,927,800 kilowatts; annual firm energy, 10,182,000,000 kilowatt hours; estimated construction cost, $528,500,000. In the same table are shown transmission lines at an estimated construction cost of $192,100,000, to transmit all of this energy. That is the story.

JUDGE STONE: Thank you.

MR. WALLACE: What are the main items in the Central Arizona Irrigation Project?

MR. MORITZ: The main items?

MR. WALLACE: Yes. How much power is there in there?

MR. MORITZ: You mean, in the project itself?

MR. WALLACE: Yes.

MR. MORITZ: They would probably use more power than produced, so far as the average is concerned.

MR. WALLACE: The cost of the main River dam.

MR. MORITZ: The development, in the overall cost, would be allocated to power and irrigation. Practically all power development for all practical purposes is on the main River.

MR. WALLACE: So in order to make it operative, you will have to have an additional cost of some $400,000,000?

MR. MORITZ: No. That is the cost of the irrigation development.

JUDGE STONE: We must take a recess in the interest of the Reporter. May I ask that Mr. Shaw, Governor Carr, Mr. Wallace, Mr. Warne and Mr. Page come here at this table immediately after we take a recess? We will take a recess of about ten minutes.

(A recess was taken until 3:50 p. m.)

GENERAL GILES: Gentlemen, we are interested in having a complete roll of the appearances. Is there anyone in this group who has not signed this roll?

JUDGE STONE: I see that there are two representatives from agencies of the Department of Agriculture here. May we have those appearances, please?

MR. McGINNIES: Mr. Chairman, representing the United States Forest Service, my name is W. G. McGinnies, Director of the Intermountain Forest Service, Fort Collins.

MR. WILM: Harold G. Wilm, in charge of Watershed Research, Fort Collins.

CHAIRMAN STONE: Gentlemen, we have had the statements from two Regional Directors representing the Upper and Lower Basins of the Colorado River. I think, now, we should afford opportunity for any questions which anyone may wish to ask Mr. Larson or Mr. Moritz, respecting the projects which they have read to you. Are there any questions?

MR. SCATTERGOOD: I have one question of Mr. Moritz as to the amount of diversions above the established Boulder Project. I have in mind the statement in the report contemplating some diversion from Bridge Canyon of water from the river which would be above the established Boulder Regulating and Storage Project. I wonder if the Reclamation Bureau, Mr. Moritz, or his assistants in this matter, have determined upon any amount of water contemplated that is tangible enough to justify advising us at this time? If not, all right.

MR. MORITZ: Mr. Scattergood, and Members: For the purposes of this report we had to assume something, so we assumed there would be two million acre feet diverted above Bridge Canyon. That is not fixed, but merely for the purposes of the report. What it is going to be will depend upon further investigations, and very extensive investigations that are necessary to determine what is the most practicable, feasible diversion of water to Central Arizona. Does that answer your question?

MR. SCATTERGOOD: Yes.

JUDGE STONE: May I ask this question, please? Is that below Lee Ferry and above Boulder?

MR. MORITZ: Yes. At Bridge Canyon Reservoir.

MR. SCATTERGOOD: Otherwise, it might be below Boulder.

MR. MORITZ: It could be below Boulder or above Bridge Canyon.

MR. SCATTERGOOD: From your answer I do not know whether it is worth while to ask the second question, as to whether you have in any tangible way given a thought to relating that to the established Boulder project, in case water is diverted above Boulder. I would judge from what you said now that you have not done that.

MR. MORITZ: That is correct. We have not done that.

JUDGE STONE: Are those all of your questions, Mr. Scattergood?

MR. SCATTERGOOD: Yes, sir.

JUDGE STONE: Are there any other questions?

MR. ROLLINS: I would like to ask if all the Indian lands proposed to be irrigated, as were given us in our last meeting in Reno, were included in this report?

MR. MORITZ: We included in the Lower Basin 100,000 acres of Indian lands in the Boulder division. That is, the Colorado River Indian Reservation, which is 95,000 acres more than were irrigated in 1943.

JUDGE STONE: Mr. Arledge has a question.

MR. ARLEDGE: One further question of Mr. Moritz: If I remember correctly, this does not have to be accurate for the purposes of the question,--there were something like a million acres of land shown by Larson. I wonder if you had taken that amount into account in your additional potential diversions?

MR. MORITZ: Acres?

MR. ARLEDGE: Yes.

MR. MORITZ: The figures I just gave you were 100,000 acres, or some 95,000 acres of the lands in the Indian Reservation.

MR. WALLACE: What are the potential irrigable acres of Indian lands? They have a sort of a prior right, haven't they?

MR. MORITZ: 233,000 acres in the Lower Basin.

JUDGE STONE: Mr. Page?

MR. PAGE: As I remember, at the Reno meeting, they said they would have a diversion of about three million acre feet. That probably includes both diversions, I think Mr. Larson also should report on that, to see whether they are all in here now.

MR. LARSON: I remember mentioning the figure of 86,000 acres receiving a supplemental water supply. That included any lands that needed water. If you will remember, from the San Juan Division, I read figures 34,200 acres of new

lands; 14,600 acres of supplemental lands on the Indian Projects down there, and we included it in the summary. There are not so many Indian Projects in the Upper Basin, but I believe they are all included.

JUDGE STONE: Are there any other questions?

MR. SMITH: In order to make this clear, I think it was stated at the Reno meeting by the representative of the Indian Service that it would be 294,160 acres, for which he estimated the requirements will be 1,671,980 acre feet diversion. The question I wanted clear, is that amount of water included in the total amount of water subject to use in the Lower Basin?

MR. SHAW: May I supply some other figures? I do not know what page Mr. Smith was reading from, but Mr. Wathen stated at page 149 of the Reno Report, "Our proposed expansion is to 600,545 acres, and our total estimated diversions will then be 3,129,790 acre feet, or 2,117,870 acre feet in excess of our present diversions."

MR. WALLACE: Is that divided between basins?

MR. SHAW: No, sir.

MR. WALLACE: May I ask, Mr. Larson, in your statement, have you covered all of the arable land in the Upper Basin that belongs to the Indians?

MR. LARSON: That is my understanding. On page 383 of the report you will find the statement submitted by the Indian Bureau. Our data has been taken from that table. That is my remembrance of it, anyway. I think we should also mention, Mr. Chairman, the fact that we are talking about "depletions," not about "diversions." The statement at Reno was the total "diversions." They ought not to be confused. "Depletions" and "diversions" are two different things.

MR. WALLACE: Will you read that portion you mentioned, Mr. Shaw?

MR. SHAW: At Mr. Wallace's request, I will read from Mr. Wathen's statement: Mr. Wathen stated: "I think it is all in the Lower Basin, except 87,500 acre feet in Colorado, 935,000 acre feet in New Mexico, and 298,510 acre feet in Utah. The balance is in the Lower Basin."

JUDGE STONE: Those of you who have asked questions concerning the Indian Lands, has that been cleared up? Are there any further answers to the statements made by Mr. Shaw, or questions asked by others? Mr. Riter?

MR. HEWES: I would like to know if the figures used by the Bureau here as depletions are to be considered against the figures used by the Indian Service at the Reno meeting for diversions. In other words, do the figures used by the Bureau in the report you have read here today cover the entire diversions as used by the Indian Service in the Reno meeting?

MR. RITER: I do not know as I can give a correct answer to your question. I am not familiar with every detail of the report. Generally speaking, the

diversions are greatly in excess of the depletions. I think in the statement I gave before, when I discussed how we set out the depletions, I said we took the diversions and subtracted the return flow we estimated came back from the stream. Mr. Larson stated that he included the Indian lands. He explained that. In other words, he said, in the San Juan Basin, they speak of a lot of small projects which the Indian Service desired to serve with water.

I am not prepared to state exactly what was done in the Lower Basin in that regard. I know that we allowed for an expansion in the Parker Indian Project, and in the smaller ones in the Little Colorado. I know we allowed for some expansion in the Little Colorado Basin. I know a large part of the Indian Projects are small, served from springs which do not contribute to the general supply of the Colorado River. Beyond that, I shall have to rely on Mr. Moritz and his staff to tell you what happened in the Lower Basin. I do not have all of the detailed information with me. Wehther they are prepared to answer at this time, I do not know.

JUDGE STONE: Mr. Moritz, are you prepared to answer that?

MR. MORITZ: I am not prepared to answer that, unless Mr. Larson can.

MR. VAUD LARSON: I might state that in the Little Colorado they included some 5,000 acres of Colorado land on the Virgin River. We provided for supplemental water on the Parker Project. The Indians have land there on the Colorado River Indian Reservation. We allowed 95,000 acres. And also the Indian Reservation at Fort Mohave.

MR. WALLACE: Will you add that in?

MR. VAUD LARSON: The project runs 95,000 acres. Also in the Gila Project for the Central Arizona Diversion, we have provided for supplemental water for the Indians, on the San Carlos Project. To go beyond that, there are many of the small Indian Projects. I could not give you any more data than that at the present time.

JUDGE STONE: Are there any further questions on this matter?

MR. HEWES: I would like to ask one more question.

JUDGE STONE: Mr. Hewes?

MR. HEWES: Mr. Larson, do I understand you correctly that the Indian Service did give you a list of the projects that are included in the report, and the entire list that was furnished you was included in the report?

MR. VAUD LARSON: This list that they have furnished for this report is not the one they gave you. This was sent in and just arrived in time to be included in it.

JUDGE STONE: Are there other questions?

MR. LARKIN: Mr. Chairman, I would like to ask one question.

JUDGE STONE: Mr. Larkin?

MR. LARKIN: Not having seen the report, I am rather handicapped, but what I would like to know, is there in the report anything which shows the net power that will be available to power contractors from these various projects after all the pumping loads have been taken care of?

MR. VAUD LARSON: Yes. The table Mr. Moritz read gives the power available at each one of the power developments. I do not know what page that was on.

MR. LARKIN: As I understand it, you did not take out the power to be used for irrigation, so we are unable to determine what net will be available.

GENERAL GILES: It is on page 289, Mr. Larson.

MR. VAUD LARSON: Not entirely, because it will be impossible to determine the power developments at this time. Generally, we have excluded the same. We are able to determine, for instance, on the Virgin River, there will be some pumping requirements, and those have been excluded. Power developments that are for pumping have not been included. The replacement power has not been included, but we do not have the pumping requirements at this time.

MR. RITER: Might I add that we must bear in mind the scope of this report. The report is not a detailed project report. It does not purport to go into that detail. The report is an effort to present a pattern for development. Our power output is figured on the averages, average run-off during the low ten-year period. In the market studies, in the main, they have tried to make allowances for some irrigation pumping. In other words, where irrigation pumping is not a direct project use, they have tried to allow for that as being part of the market demands. Before we are in position to talk with power contractors, there must, of necessity, be a great many detailed studies made.

We have tried to represent in here in round numbers our appraisal of the firm power costs to builders on the stream. In that connection, you have, as in Boulder Canyon, a diminution each year. The figures presented in our tables are the average between present conditions and ultimate conditions.

If a project should be authorized early in the game, the power output would be more than our table shows. Conversely, if a power project we have described should be authorized and constructed 80 years from now--I presume irrigation development will develop that fast--then the power cost to builders would be less. In other words, we have tried to base this on the average between the so-called "1950," which we call the immediate future, and the "ultimate."

I do not know whether that answers your question to your satisfaction.

MR. WALLACE: Is there an estimate anywhere as to the amount of power that will be required in the Central Arizona Project for pumping purposes?

MR. RITER: The Central Arizona Project, as it is described in the report, will, in the main, be a gravity project. In other words, to bring the water

from Bridge Canyon to the McDowell Dam, there will be no pumping ... that. However, as I understand it, there will be some pumping, some large amount of groundwater pumping, in order to utilize some of that water. I do not think that detail has been worked out, as yet.

JUDGE STONE: Are there other questions?

MR. PYLE: Mr. Chairman, I would like to ask the Reclamation Service in regard to the Dolores-Dove Creek Project. I see there are 40,000 acres, estimated cost of $12,200,000. We would like to know how that figure was arrived at. It is pretty definitely known, I believe, by the reclamation men in our country, that there is available water and land for around 100,000 acres on a ten-year minimum average. That is our impression. We are not making the positive statement, but we believe an investigation will pretty nearly bear that out. I would like to know how they arrived at that? If it is because these waters were appropriated somewhere else, that might be justifiable, but it would eliminate the Dolores Irrigation Project from the picture as too expensive, because we do not think they will find much power there.

The reason I am asking this question is because if that report, in its present condition, were to go in before Congress, it would, naturally, be detrimental to, or destroy, our program. So I would like to have that clarified, if possible, before we present that program. There is no question but what there is a great discrepancy in regard to water and land that can be put together. It may be said they are taking this water from one basin to another. But it is not taken from one basin to another. It is taken from the Dolores River and put in the Colorado Watershed. After it reaches the Colorado River it is not reclaimed anymore, and goes on to Boulder Dam.

You understand, there is no criticism and we could be wrong, but as far as we see that situation there is a discrepancy there of 80,000 acre feet that would immediately destroy our program. We would like to see if it can be clarified before this report is presented.

MR. RITER: Our study shows 40,000 acres are all we can now serve, with an adequate supply during the ten-year period. We have a record on the Dolores River, I think the McPhee Reservoir Site. There are some lands irrigated on the Dolores River downstream from McPhee.

As you recall, the present Montezuma Project takes water out above McPhee Site. We have negotiated with those people and found out how much they plan to expand their area. I do not recall the exact figures, but we have an agreement with them on some 10,000 acres included in their plan, and we have allowed for the additional water that they would take, to serve that extra 10,000 acres. We have allowed for the water that must be by-passed to serve the few thousand acres downstream--not very many, they are small acreages--and then we have computed the remaining surplus water, the water that actually flows into the McPhee Reservoir Site.

The McPhee Reservoir Site was planned to be built as large as we possibly could make it without interfering with the Montezuma Canal. Then the water that is left is the water that would be diverted. According to the calculations we

have made, that would be adequate for 40,000 acres. In other words, I think, if I remember the figures, it is about 120,000 acre feet a year we take over there. If we have made a mistake in the figures, I don't believe it likely. I have reviewed those several times, and that is as far as we can stretch it to give you a full supply.

MR. PYLE: I would say, if that is the final decision of the Reclamation Service, to do what they can do for that proposition, of course, we from the outside happen to know that average flow is around a minimum of from 375 to 575,000 acre feet over quite a period. I am a little familiar with the situation. Of course, the measurements they have are at the McPhee, and that is 585,000 for a high period. I do not think your measurements show as low as 375. Assuming the Montezuma Irrigation District takes out for 10,000 acres, that would reduce it by 30,000 acre feet and subject to a thousand acre feet below the McPhee, I do not believe they are using over 400 acres. It would seem it is too conservative, and if it is not further investigated, naturally, it would destroy our proposition. We are not disputing the Government in any way, but we know there is too much of a stretch there somewhere, and we would like to know about it.

MR. RITER: I do not have the figures here today, but if you wish I will try to bring them to you tomorrow, so we can get together. It is our intention, in developing these projects, to stretch the water supply as far as it will go, and cover the most land. I do not recall whether the figures you mentioned as run-off figures were after the present Montezuma Project. You remember, the present project is around 40,000 acres.

MR. PYLE: They abandoned a lot of that when they came up to their full capacity.

MR. RITER: Those figures that you quoted, are they run-off figures above their diversions?

MR. PYLE: Yes. The highest was 585,000 acre feet for everything, after they took all of the records. That is, your McPhee situation is 10 or 12 miles below the intake of the irrigation district.

MR. RITER: I do not have those figures with me today, but while you are in town I will be very happy to show those to you. After all, we are human. We may have made a mistake. If we made a mistake, we want to rectify it. That is the purpose in coming to this meeting. Those figures are down at our office, and if you will see me afterwards I will be glad to show them to you.

MR. PYLE: I will be glad to do that. You can see that $300 an acre for water without any power puts us out. We believe that the water and the land are both there, and that the waters are not appropriated farther down the river, and are still there.

MR. RITER: I cannot answer definitely. The only rights we allowed for on that stream are the Montezuma District, with expansion which they told us they would take. And we allowed for the people along the Dolores River. One thing to remember, you may get 585,000 in one year, but every year is not the same.

MR. PYLE: We can come back to that same figure of 375 to 500. There is still a big margin som where.

MR. RITER: I think the best way to go into that is if you will come down to the office and we will figure that out.

JUDGE STONE: I wonder, Mr. Riter, if you will get those figures and take that up with Mr. Pyle and his group before the meeting adjourns? Will that be satisfactory?

MR. RITER: I will try to.

MR. PYLE: Any time. We don't care when. But if the report goes into Washington the way it is on that proposition, it puts us out.

JUDGE STONE: Those are the things we want to bring out.

MR. PYLE: You have been over the country yourself and you know the water and the land is there.

JUDGE STONE: In the Colorado report this is exclusive of an additional 8,800 acres, about 120,000 acres of arable lands there.

MR. PYLE: With supplemental or additional water it runs around 115 or 125,000. That is a reasonable report. If that is covered in there, that would justify this construction. But as it is now, if that goes in that way, it would be too bad for us. If they investigated thoroughly on the minimum run-off, they would find those figures in there would not be justified.

MR. RITER: I am sure that we did not intentionally short-change you. Our report showed 40,000 acres are all you can irrigate. I am sorry I do not have the figures with me, but I will be very happy to go over that situation with you. I am confident we can convince you that we are right. And if we are wrong, we shall repay our confidence the other way.

JUDGE STONE: Are there other questions?

MR. LAKE: There is one point in which I am so very much interested, and that is the evaporation loss from the reservoirs. I understand, of course, we all do, that the evaporation losses will depend upon the altitude, the coolness, the depth of the reservoir, and things of that kind. But in this blue book, there at the bottom of page 5, "Present and potential depletions (of described projects) in the Lower Basin are estimated at 11,092,000 acre feet, of which 870,000 are charged to main stream reservoir losses." Now, that is eight percent.

I can readily see that the evaporation loss on one reservoir shall not be over a certain percent in two months. It might be very much less. If any reservoir was depleted by standing around, with evaporation a few inches or a hundred inches a year, but as the reservoir stood there it would get warmer and the evaporation percentage would be greater.

MR. PYLE: We can come back to that same figure of 375 to 500. There is still a big margin som where.

MR. RITER: I think the best way to go into that is if you will come down to the office and we will figure that out.

JUDGE STONE: I wonder, Mr. Riter, if you will get those figures and take that up with Mr. Pyle and his group before the meeting adjourns? Will that be satisfactory?

MR. RITER: I will try to.

MR. PYLE: Any time. We don't care when. But if the report goes into Washington the way it is on that proposition, it puts us out.

JUDGE STONE: Those are the things we want to bring out.

MR. PYLE: You have been over the country yourself and you know the water and the land is there.

JUDGE STONE: In the Colorado report this is exclusive of an additional 8,800 acres, about 120,000 acres of arable lands there.

MR. PYLE: With supplemental or additional water it runs around 115 or 125,000. That is a reasonable report. If that is covered in there, that would justify this construction. But as it is now, if that goes in that way, it would be too bad for us. If they investigated thoroughly on the minimum run-off, they would find those figures in there would not be justified.

MR. RITER: I am sure that we did not intentionally short-change you. Our report showed 40,000 acres are all you can irrigate. I am sorry I do not have the figures with me, but I will be very happy to go over that situation with you. I am confident we can convince you that we are right. And if we are wrong, we shall repay our confidence the other way.

JUDGE STONE: Are there other questions?

MR. LAKE: There is one point in which I am so very much interested, and that is the evaporation loss from the reservoirs. I understand, of course, we all do, that the evaporation losses will depend upon the altitude, the coolness, the depth of the reservoir, and things of that kind. But in this blue book, there at the bottom of page 5, "Present and potential depletions (of described projects) in the Lower Basin are estimated at 11,092,000 acre feet, of which 870,000 are charged to main stream reservoir losses." Now, that is eight percent.

I can readily see that the evaporation loss on one reservoir shall not be over a certain percent in two months. It might be very much less. If any reservoir was depleted by standing around, with evaporation a few inches or a hundred inches a year, but as the reservoir stood there it would get warmer and the evaporation percentage would be greater.

I do not know what the evaporation loss is, figured in percentage of a large number of projects, but in the statements made here on page 4 of this same book, it says, in this period of drouth for ten years the record flow is 10,142,000 acre feet which was used to arrive at the virgin flow which is given as 12,234,000. That is against 16,000,000, the estimated overall of the 46 year period. Now, there is a difference there of 4,000,000 acre feet short, an average of 4,000,000 acre feet. Whom is that chargeable against? The Upper Basin States or the Lower Basin States?

Then, another question comes up: If it is true that the evaporation loss in these lower altitudes, say, Utah, Arizona, Western Colorado, approaches eight percent, should we go in another ten-year period where we have gone into this ten-year period of 27,000,000 acre feet that were supposed to be a reserve to supplement the Upper Basin States' share, 27,000,000 acre feet to be distributed in a new reservoir and the loss in that is eight percent a year? Where are you going to come out at the end of 10 years? That is eighty percent loss in evaporation alone. I wonder if you can explain to us about this evaporation loss?

MR. RITER: Mr. Chairman and Mr. Lake, the figure on evaporation loss varies, depending on climatic conditions, as you have indicated. Up in the higher mountains, I dare say evaporation loss will probably be less than one foot a year on the exposed water area--I mean, the net loss. You know, under natural conditions if you put a reservoir there you will have losses. You might have a marshy area. Down in the lower altitudes, the experiments indicate they might be as high as six or seven feet a year. That is trying to answer your question academically.

The total depletions, the way we have calculated them, include the losses from reservoirs; they include losses from reservoirs used both for irrigation and for transmountain diversion. Those figures have been included in the figures of depletion. I cannot give you evaporation losses here. I do not have the information handy.

Your second question, concerning the dry period, as I recall, in round numbers you put the question something like this: In the long-time period you have something like 16,000,000 acre feet. In the ten-year period it is nearer 12,000,000, taking the average. If the Upper Basin takes out, for instance, 7,000,000, that would only leave about 5,000,000.

In the reservoirs on the main stem, the Colorado and the Green Rivers, it is the plan that during this drougth period the storage will be released from those reservoirs to make up the difference, so that the Upper Basin would continue to enjoy the use of the water on the projects in the Upper Basin, but it would release storage from the replacement reservoirs on the main stem, so the Upper Basin would satisfy and deliver an average of seven and a half million acre feet.

I do not exactly understand your third question, as I recall it. Are you trying to get a breakdown in evaporation?

MR. LAKE: The report on evaporation shows eight percent on the Lower Basin

States. If we had this period of dry years, the evaporation loss alone would be tremendous in depleting the store of water to carry us over.

MR. RITER: In our estimates for all the main stem storage, we figured around 800,000 acre feet loss. That is an offhand figure. I do not remember the exact figure. We figured we would provide enough storage capacity so as to meet evaporation losses on the replacement reservoirs, and in addition to release enough water to meet the obligations of the compact. Our calculations have been based to take that evaporation loss into account. I do not know whether that fully answers you or not.

JUDGE STONE: Does that answer your questions, Mr. Lake?

MR. LAKE: Regardless of how much more reservoirs you provide or attempt to fill, the evaporation percentage continues, and it will seriously endanger the water that you hope to impound to make up the difference.

MR. RITER: In our studies, we did take account of the evaporation. In our studies we have allowed for that.

JUDGE STONE: Are there any other questions? (No response.)

If there are no other questions, following the procedure outlined, and on which we have agreed thus far, may we now have any statements or comments which the Corps of Engineers wish to make at this time? May I call upon Colonel Putnam?

COLONEL PUTNAM: Mr. Chairman and Members of the Committee, Members of the Bureau, and Others: I am here like most of you, to get some information which will be beneficial in working out certain programs entrusted to the War Department and the Corps of Engineers.

As explained at your Reno meeting, we have, under instructions from Congress, certain examinations and surveys to make in regard to flood control on some of the tributaries on the Colorado River. These examinations and surveys are under way, as far as war activities will permit. They are not so far along but what we can and will change them and our conclusions in respect to the development of these streams, if the overall program for the Colorado River in any way indicates they should be changed.

I wish to assure you that I am glad to be here and keep my ears open, and bring back something to help me to do our work. I thank you.

JUDGE STONE: Mr. Gardiner, of the United States Geological Survey, is there anything to add in addition to what was given at the Reno meeting?

MR. GARDINER: Mr. Chairman, I haven't anything to add. I am glad to be here and to learn what I can, and how we can aid in your work.

JUDGE STONE: For those who are not familiar with it, may I call your attention to the fact that the Proceedings of the Committee meeting at Reno contain quite complete statements, and some maps submitted by the United States

Geological Survey, submitted through Mr. Woolley and Mr. Gardiner.

Mr. Beebe, of the Federal Power Commission?

MR. BEEBE: Mr. Chairman, as usual I haven't anything particular to say, but I do want to compliment the Bureau because I think they have gotten out a wonderfully good job in a short time. I am sorry that I have not had a chance to much more than look at the cover, and I cannot comment on it further. But I, like Colonel Putnam, am here to listen and will take back a great deal of information. I thank you.

JUDGE STONE: The Fish and Wildlife are represented here. May we hear from the representative of that agency, please?

MR. BENNETT: Mr. Chairman, Members of the Committee, and Gentlemen: In deference to the tremendous job which you have in covering this exceptionally large inter-Basin area, I will be very brief.

Basically, any of these impoundments are beneficial to wildlife. That is a pretty broad statement. The amount of benefit, and it may be negative, depends primarily on the method of operation. We recognize that a dam or a reservoir constructed for a particular purpose primarily should be used for that purpose. But we also feel that the methods of operation can be so regulated that fish and other wildlife reserves will obtain the maximum benefits. In any of these areas there are a few items which have a particular bearing on wildlife. The amount of permanent storage or dead storage area below which water will never be drawn. Shallow areas, as a rule, are of much more benefit to fish and wildlife than the deeper areas. With the exception of your higher tributaries, which are primarily adapted to trout and cold-water fish, I will make a broader statement still: Anything which the Reclamation Service and the Corps of Engineers do, with the exception of these high mountain areas, is of great benefit to wildlife, regardless of operations.

If the gentlemen from Utah, Arizona and California will pardon me, I would say that the Colorado River and portions of the Green in the lower reaches, as I have observed, have been practically a biological desert in the past, and anything you can do to reduce and stabilize the water flow will be extremely beneficial.

I am here to answer any questions that anybody cares to ask, but primarily to listen. I thank you.

JUDGE STONE: We have two representatives from the Department of Agriculture. Do you gentlemen have anything to say?

MR. McGINNIES: Mr. Chairman, Members of the Committee, and Friends: Like some of the others, out of deference to the long program that we have I will keep my remarks very brief. But I just would like to inject here the thought that although most of you people are primarily interested in water after it flows down the stream, there is also some water in the same relationship that has to be considered on the watershed. This may not all be a negative relationship. There are some new things that are coming out of research that indicate

that the amount of water from these watersheds can be regulated by management. So that not only is it possible to consider the needs of the watershed, the estimated grazing, wildlife, recreation, and the many other things that enter into making the country livable, there is also the possibility that the folks who are working on the watershed, Forest Service, and our land owners in the great areas are going to be in position to assist you in some of your problems.

I am here primarily to listen. I would like to learn more about it, but I hope all of you will have at least some little thought for the water on the watershed. I thank you.

JUDGE STONE: Mr. Wilm?

MR. WILM: I think Mr. McGinnies has covered the subject.

JUDGE STONE: In view of the large figures we have heard presented, I presume that all of this should be very interesting to the Budget Bureau, and that Bureau is represented here. May we hear from Mr. Vawter who is representing the Bureau of the Budget?

MR. VAWTER: Mr. Chairman, Ladies and Gentlemen; I am here to listen, observe and learn. Right now, as I see it, the Bureau of the Budget has no immediate or direct interest in this report. However, eventually, either as a whole or piecemeal, I believe it will come to their attention. At that time in Washington, they may see fit to call upon our office here for some information factual, or some statement as to inter-agency relationship. I am sure this meeting is very beneficial to me, and I hope eventually to help the Bureau by being here.

JUDGE STONE: Are there any other federal agencies here who have any statements to make? (No response.) Are there any questions anyone wishes to ask any of the federal agency representatives? You have asked questions of the Bureau of Reclamation. Are there questions you wish to ask any of the others? (No response.)

If there are no questions, we have come to the point, then, when we will start in with the comments and statements of the representatives of the various states. In handling that, I will ask each member of the Committee of Sixteen, or the members of the Committee of Sixteen to inquire of those groups or agencies from their own states in handling the program for each state.

It is fifteen minutes to five. We must relinquish this room for another meeting at 5:00 o'clock. But before we adjourn, we should agree upon the procedure with respect to the statements from the states, and in that regard I wish to say that the two representatives of the Power Allottees will be given an equal time with the representatives or each of the two representatives from the states. So that means the seven states and the Power Allottees, or eight units to hear from. We must, if we are to get through within the allotted time, keep this in mind.

The Chair, after having made the recommendation, will be glad to entertain a motion as to the procedure to be adopted tomorrow.

Does anyone on the Committee have a suggestion to make as to that? This will probably be the most interesting part of the program, after we have received all of this information.

GENERAL GILES: Mr. Chairman, unless I hear a real good reason why we should not call the states alphabetically, I move that we call them in the usual manner that we have called for reports from the states, alphabetically.

MR. DELANEY: Second the motion.

JUDGE STONE: Motion has been made and seconded that we call upon the states alphabetically, irrespective of where they or any of them are located within the Basin. That motion has been seconded. Are there any remarks? (No response.) Are you ready for the question?

MR. SHAW: Mr. Chairman, this subject-matter that we have before us is divided into two grand divisions, the Upper Basin and the Lower Basin. The states, as such, in some instances overlap the boundaries between the two divisions. The report has been made up, however, generally speaking, respecting the boundaries of the two divisions. It would seem to me a little more orderly if the discussion were to follow the order of the report, rather than the artificial state boundaries.

Let me point out the effect of calling the states alphabetically: You start with the Lower Basin; you jump to the Upper Basin and back again, and the result is a hodgepodge of discussion which, it seems to me, could be more clarified and simple if each division were to have its allotted time, and deal with one subject at a time.

With that in mind, Mr. Chairman, I present, on behalf of the California delegation a substitute motion that the Upper Basin be allotted tomorrow morning as a group to select their own time, and devote it as they please, to be followed by the Lower Basin tomorrow afternoon.

And I would like, not as a matter of personal privilege at all, but just as a matter of explanation, to say that some of us have received copies of this report only last Saturday, and we have spent a part of the time since last Saturday traveling here. We would like to have the opportunity of taking the rear position in the discussion tomorrow afternoon rather than tomorrow morning. I therefore present the substitute motion, Mr. Chairman.

JUDGE STONE: Is there a second to the substitute motion?

(The motion was seconded from the floor.)

JUDGE STONE: The motion has been seconded. Before you vote on this, I would like to call Mr. Shaw's attention to this: That under your motion and suggestion, you divide the entire day tomorrow. It seems to me it is very obvious that after the presentation by the two Basins, the states of the two Basins, we must reserve time for general discussion of action or recommendations of the Committee. If we divide the entire day between the two Basins we have

no time left for that purpose.

MR. SHAW: Without making it a part of the motion, that, of course, wants to be taken into account. I assume the meeting will convene at 9:00 o'clock in the morning.

JUDGE STONE: Yes.

MR. SHAW: That allows three hours for each Basin, and reserves a part of the afternoon for that discussion.

JUDGE STONE: Then is your motion amended in that respect?

MR. SHAW: I do not think that calls for an amendment, but call it so if you like.

JUDGE STONE: Is there any discussion on the substitute motion? (No response.) Are you ready for the question? Those in favor of the motion, indicate the same by---

A PARTICIPANT: A point of order, Mr. Chairman: Are we voting on the substitute motion?

JUDGE STONE: Yes. I will call that again. Those in favor indicate the same by saying "aye." (Pause.) Those opposed? (After voting.) Call the roll, Mr. Secretary.

GENERAL GILES: Arizona?

(Answer "No.")

California?

(Answer "Yes.")

Colorado? (No response.)

JUDGE STONE: I can't be the Chairman and vote also.

MR. DELANEY: I will vote "No."

Nevada?

(Answer "Yes.")

New Mexico?

(Answer "No.")

Utah?

MR. WALLACE: You made the motion (addressing Secretary Giles.)

no time left for that purpose.

MR. SHAW: Without making it a part of the motion, that, of course, wants to be taken into account. I assume the meeting will convene at 9:00 o'clock in the morning.

JUDGE STONE: Yes.

MR. SHAW: That allows three hours for each Basin, and reserves a part of the afternoon for that discussion.

JUDGE STONE: Then is your motion amended in that respect?

MR. SHAW: I do not think that calls for an amendment, but call it so if you like.

JUDGE STONE: Is there any discussion on the substitute motion? (No response.) Are you ready for the question? Those in favor of the motion, indicate the same by---

A PARTICIPANT: A point of order, Mr. Chairman; Are we voting on the substitute motion?

JUDGE STONE: Yes. I will call that again. Those in favor indicate the same by saying "aye." (Pause.) Those opposed? (After voting.) Call the roll, Mr. Secretary.

GENERAL GILES: Arizona?

(Answer "No.")

California?

(Answer "Yes.")

Colorado? (No response.)

JUDGE STONE: I can't be the Chairman and vote also.

MR. DELANEY: I will vote "No."

Nevada?

(Answer "Yes.")

New Mexico?

(Answer "No.")

Utah?

MR. WALLACE: You made the motion (addressing Secretary Giles.)

GENERAL GILES: I am always ready to support my motion. I vote "No."

Wyoming?

(Answer "Yes.")

Power Allottees?

(Answer "Yes.")

GENERAL GILES: That is a tie!

JUDGE STONE: Gentlemen, if there is no objection, I will call into the picture an umpire. Since the Bureau has been so overly overworked this afternoon, and they have had a hard job on their hands all day, may I suggest, since this is a tie vote, that we ask the Bureau to indicate to us how this shall be presented as to Basins? Do not be afraid of offending anyone, either.

MR. WARNE: Why don't you flip a coin?

MR. RITER: If it comes heads we go with your motion; if it comes tails, we go by states. (Flips coin.) It came tails, so we go by states, I presume.

JUDGE STONE: It was whether the Upper Basin should be first, or the Lower Basin.

MR. TIPTON: Before anybody makes another motion, I want to support what Mr. Shaw said. I think it is much more logical to present this by Basins. To my mind, I can't see any difference whether it is the Upper Basin first or the Lower Basin first. After each Basin's representatives present what they have to present, there will be plenty of time for further discussion.

MR. WALLACE: Mr. Chairman, I move a substitute motion: That the time be limited to two hours each, and that the Upper Basin be first. If that is the desire of the gentlemen, I am perfectly willing. And if there is additional time required, we can discuss that at the end of these two-hour periods.

GENERAL GILES: Mr. Chairman, if that is the way these boys feel, I will withdraw my motion with the consent of my second.

MR. DELANEY: I will withdraw my second.

JUDGE STONE: There is a substitute motion, that the time be limited to two hours for each Basin, and that we have first the Upper Basin, to be followed by the Lower Basin. Are there any remarks? (No response.) Are you ready for the question? Those in favor indicate the same by saying "aye." (Pause.) Those opposed?

The motion is carried, and the procedure tomorrow will be two hours for each Basin, starting out with the Upper Basin. Each Basin will arrange its own time.

I understand that there are certain of the states that wish to caucus or have separate meetings this evening. Are there any announcements as to that? (No response.) If not, I wish to make an announcement on behalf of Colorado, that all of those here from Colorado meet on the mezzanine floor of this hotel at 8 o'clock, and that must be promptly at 8:00.

GOVERNOR CARR: Can't we do that now instead of at 8:00? I cannot be here tonight.

JUDGE STONE: It has been suggested that the Colorado group remain now, or that we go to the mezzanine floor. We cannot remain here, Governor, because we have to relinquish this room. It is suggested that we go there now and dispose of the caucus at this time. Is there any objection to that? (No response) If not, we will follow that procedure.

I want to ask California--I understood you had a caucus?

MR. HEWES: I wish to announce to the California group that I would like for them to meet in rooms 271 and 272 at 7:00 o'clock, in this hotel.

JUDGE STONE: The meeting, then, will stand recessed, to reconvene at 9 o'clock in the morning. May we be on time.

(Recess at 5:00 o'clock p. m.)

SATURDAY, 9:00 A. M. - NOVEMBER 11, 1944

JUDGE STONE: The meeting will come to order, please. Apparently some of the members of the Committee are absent.

(Chairman Stone thereupon called the roll, as follows:)

Arizona	Here	
California	Here	
Power Allottees	Here	
Nevada	Here	
New Mexico	Here	
Colorado	Here	(Except Frank Delaney)
Utah	Here	
Wyoming	Here	

JUDGE STONE: Are there any new appearances on the part of the consultants or advisers? Is anyone here that was not here yesterday?

MR. GUEST: A. L. Guest, Paonia, Colorado, Delta County, representing the North Fork Water Conservancy District.

JUDGE STONE: Mr. Guest comes into the meeting immediately with one real virtue. He talks loudly so everybody can hear him. I hope everybody will follow his example here today so we can hear.

In accordance with the procedure outlined yesterday and approved by the Committee, we are to proceed with the comments of the states, with two hours on each side. That means a half an hour for each state and a half an hour for the Power Allottees. We will take in each group the states in alphabetical order. That means that the first presentation will be made by Colorado, and I am going to ask Mr. Delaney to call on these men in order.

MR. FRED JENSEN: Mr. Chairman, I am here representing a stockmen's association, and am also a member of that committee. The stockman seems to have been the forgotten man in this project to a very large extent over in the Gunnison Valley, and we are harder hit there than any other industry. We would like to have a little time for Governor Carr on rebuttal to represent the stockmen's interests.

JUDGE STONE: We will proceed now with Colorado.

MR. DELANEY: Colorado will call on R. J. Tipton to make certain suggestions.

MR. TIPTON: Mr. Chairman, and Ladies and Gentlemen of the Committee: I will get around here so I can see the Bureau representatives. I have a cold and have difficulty in talking.

The Committee and its advisers have been confronted with a physically impossible task. They have been confronted with the obligation of reviewing a report 400 pages in length, with two representatives to each state and numerous advisers here, and that to be done in a very short time. Well, it could not be done; it could not be done adequately. That is unfair to the states, it is unfair to the Bureau. I have had the report one day, a bare day, and I glanced through it the best I could in a very objective way, observing the form, style, and substance. I have some very definite ideas about the style and form, which I shall not take the time to discuss at this time. We can do that with fewer people. I have some definite ideas about the substance, and I will only cover the ones that are general in character. Most of my suggestions will be suggestions that would come probably from the Upper Basin States rather than from Colorado alone, and I hope that the suggestions will be considered in the proper light and that th y are made for constructive purposes.

In 1930 the Upper Basin States met to start compact negotiations. Those negotiations ended in August of 1931, when our good friend, Mr. Wallace, said Utah did not have sufficient information to carry on compact negotiations, and it would have to await the result of the Bureau's investigations. It has taken all this time for any sort of a report to be gotten out.

Now, this report does have considerable material in it that would be useful to the Upper Basin States in compact negotiations. It does lack one thing, that there should be put in the report the source of water supply by states in the Upper Basin, and it would be well to carry that down to the Lower Basin. That would round it out.

Another item that may be of some assistance to the Upper Basin States I think in the treatment of the Upper Basin has not been made quite plain in the

report. I may be incorrect in this, because, as I said, I did not have time to read the report carefully, but I think it is not made quite plain how the low water period was handled. Mr. Riter explained very well yesterday that the low use in the Upper Basin during the low water period was not on account of the obligation at Lee Ferry to deliver 75,000,000 acre feet, that 75,000,000 acre feet being held over from water which Mr. Riter called replacement reservoirs, but was primarily due to lack of water at points of diversion for various projects that were chosen for the Upper Basin framework. I think that should be made a little bit clearer in the report. I think it is also quite important not only to show the low water period of use in the Upper Basin, but also the average. I think that would be quite helpful to everyone, and I think it should be done.

Now, the most important item that I have to discuss--and I consider it quite important--is the difference in the method of treatment of the Upper Basin and the Lower Basin largely with respect to Compact allocations. I think the Director of the Upper Basin and his staff did a very good job. I agree 100 percent with his methods. As to the details, some of my studies are somewhat different. For example, in the amount of storage capacity, by his method he got 75,000,000 acre feet in the ten-year period. I got a somewhat different answer. But that is not here nor there. I am not going to discuss those details. According to the allocation of the compact, 7,500,000 is what has been allocated to the Upper Basin. The Director of this region, the Upper Basin region, made an attempt and a good attempt to cut the cloth to the pattern. I think he did a good job so far as major projects are concerned. There are numerous variations made by you of minor projects. Those selections cannot be made at this time. The final selection will be made years and years and years in the future, but so far as it went, I think the selection was good.

I have absolutely no quarrel with the water supply studies, either the Upper Basin or the Lower Basin or overall. There might be some modification of the methods, which would modify somewhat the water supply. A different method was used in the Lower Basin. It is my impression that the Compact provisions were ignored.

The water supply available to the Lower Basin for use at the present time under the allocation of the Compact is 8,500,000 acre feet. My remarks now are directed largely at page 272 of the report. The statement is made that after the Upper Basin uses its seven and one-half million, there will be 9,331,000 acre feet of available supply for the Lower Basin. Now, I am paraphrasing. It does not exactly say the Lower Basin. That is not the available supply for the Lower Basin. The available supply for the Lower Basin is 8,500,000 acre feet. Just as the Upper Basin Director assumed that the available supply for the Upper Basin was 7,500,000, he now says 9,922,600 acre feet of potential uses, "exclusive of the Gila River and any allocation to Mexico by international agreement." It is therefore evident that the projects discussed will need to be modified to conform with the available water supply. What available water supply? I maintain the available water supply is not 9,331,000 acre feet, the available water supply is 8,500,000 acre feet at the present time. The Bureau report indicates that on the Gila there is being consumed 1,135,000 from the main stream, after deducting 1,135,000 acre feet. That is what is There would be left from the main stream, after deducting 1,135,000 acre feet. That is what is eight and one-half million available, 7,365,000 acre feet.

available for the Lower Basin, not one acre foot more or one acre foot less.

MR. WALLACE: What is that figure?

MR. TIPTON: Well, assuming the Bureau's estimate of consumption on the Gila to be correct, 1,135,000, taking that off the total allocation, would leave 7,365,000 acre feet from the main stream. The total water supply available, as estimated by the Bureau, including the Gila is 18,102,000, with an increase of 380,000 acre feet of recovered losses. Incidentally, as I say, I cannot quarrel with that, because my estimate was 18,096,000 allocated by the Colorado River Compact, no more and no less. That leaves 2,102,000 acre feet for allocation under III (c) and III (f) of the Compact. III (c) takes care of Mexican water and III (f) is water to be allocated sometime after 1963, but not before one of the Basins has consumed all its allocations made by Article III (a) and III (b) of the Compact. The Mexican water comes out of the 2,203,000, or whatever it might be. I am not talking about the pending treaty at all or some other treaty, or what not. If any water is left over, that is not available to either Basin until sometime after 1963, and the procedure is definitely set up how it should be allocated, not allocated to the Lower Basin, but between the two Basins. I want it plainly understood that the Upper Basin has not foregone whatever its equitable share might be of what I choose to call III (f) water. It may be said that Section 4 of the Boulder Canyon Project Act provides otherwise. It suggests possible terms. Among those terms was the division of surplus, which I call III (f) water, to the extent of a half. First, a compact was never entered into, and second, that apportioning of it would not have been likely, because the Compact does say that it is the states that divide this water. Congress can not do it; the states did not say that. The states said by compact this III (f) water shall be allocated sometime after 1963 to the two Basins. We have not foregone the use of that, it is very meticulous in this report that the Upper Basin is out to 7,500,000.

Mr. Riter said yesterday the average would be 7,350,000 which would mean a little more paring. All the projects they set up come to seven and a half million. I agree with that. It is correct, it is proper. Also the proper available supply in the Lower Basin shall be considered 8,500,000 acre feet, and not one acre foot more.

Now, whatever allocation is made in the future will have to take care of itself, but we are still in the picture. I don't want that to be misunderstood in any way. Now, just because for the available projects we have more than enough water supply does not mean anything. All of our projects we want in the South Platte Basin here add up to more than the water supply. We have over-developed. We have more projects than available water. What of it? If we in the Upper Rio Grande take the water supply in that river, so we are going to have the use of that water supply, we can irrigate more than we are irrigating. But we can't. We have got an equitable share in that, so much. The Lower Basin has an equitable share, and it is no more than eight and a half million acre feet.

We have a tunnel in the Rooky Mountain region, we have thirsty lands in the South Platte. We can use considerably more water than is set up here for trans-mountain diversion, but it would not be equitable. We need to figure it out,

So summarizing--and I think I can speak for the Upper Basin--we respectfully suggest that the water supply, or that the consumption of these projects you had set up be shown in the report, both on the short time drought period and the long time period. We suggest that the sources of the water by states be given. I would suggest further that some summary of your operation study of the main stream reservoirs be put in, some engineering information. I think many things could be put in to round this out as an engineering report.

We suggest these things, the Upper Basin respectfully insists that the Lower Basin treatment be exactly in accordance with the provisions of the Colorado River Compact. That is the law of the River, that is what the states decided, and we respectfully insist that that be done. That is all.

MR. DELANEY: I will now call on C. L. Patterson, Chief Engineer for the Colorado State Water Board.

MR. PATTERSON: By permission of Wyoming, my remarks, together with those of Mr. Tipton, may run slightly over the half hour allotted to Colorado, but I will try to make them very brief.

First, as far as Colorado is concerned, we have hoped for a report from the Reclamation Bureau concerned primarily with reclamation. We find upon examination of the report that it is principally power. For example, in the State of Colorado, the total cost, exclusive of transmission grids in the Basin is given as $380,000,000. I added up all of the irrigation projects and I find a total of $107,262,000. I assumed that the transmountain projects mentioned in the report were included in the Colorado total. They amounted to $243,465,000, and that balance of $129,273,000 would cover the amount of river reservoirs and power projects.

I was told then yesterday, after Mr. Riter had explained the report, that the transmountain costs were not included. If that be true, then of the $480,000,000 proposed for expenditure in connection with Colorado projects, we have this relation, irrigation, $107,262,000, and power, $372,738,000.

The report on its face shows that the power generated by these potential Upper Basin power projects cannot be sold within that Basin, that same must be transmitted to adjacent areas. Realizing that there is a difference between The Salt Lake and the Denver situation, that perhaps Colorado River power can beneficially be transmitted to the Bonneville Basin for use there, the reverse situation prevails in the State of Colorado.

We cannot analyze this report until we have heard from the South Platte Basin director and the Arkansas Valley director as to the power features of these transmountain projects.

Now, in a primary way we are told, because I have been working with representatives of the Bureau and the Federal Power Commission upon a power report for this area, that Western Slope features of three transmountain projects were going to develop maximum amounts of power, roughly half as much as the interior Basin. The question is are those power plants to be built along the Colorado

River, and in that way devote the development of power to those projects. We say no, that should not be done. Therefore, we cannot analyze fully the Upper Basin phase of this report until we have reports on the Arkansas and reports on the South Platte that will cover those projects.

Now, a second point I would like to make has to do with the treatment of one loss in the Upper Basin. The report says that the Colorado River is a gaining river to the Black Canyon and thereafter it is a losing river, due to evaporation losses in desert regions. More accurately it should say that there are evaporation losses and natural losses, both in the Upper Basin and in the Lower Basin, that the tributary contributions in the Upper Basin happen to be greater than the natural channel losses, whereas in the Lower Basin the reverse is true, the tributary contributions, except in times of flood, are less than the natural losses. This has an important bearing upon the manner in which the Bureau has interpreted and applied the Colorado River Compact.

If in the use of the virgin flow, the Lee Ferry virgin flow basis, the Upper Basin can beneficially consumptively use seven and a half million acre feet, that necessarily means that the total supply of water, measured as original runoff or production was more than at Lee Ferry by whatever way the channel loss from points of production to the place where it was measured, that that loss was there under natural conditions and will be there after irrigation development has taken place.

However, we come to this interesting thing; After we convert that river to a long series of reservoirs, then we are charged with the losses of these reservoirs, estimated at something over 800,000 acre feet during the years of drought cycle, as though we had caused it or as though it was of benefit to us. I think it is going to mean that the Bureau must come to estimates of water resources as they are originally produced in the places where they are produced, and must estimate the natural channel losses in order to evaluate against the points of measurement such as Lee Ferry. Now, I have not time to go into the details of the analysis we have made in that regard. I will have to leave that out.

I do want to call attention to the fact that the report does break down costs, present and potential depletions, and other matters by state boundaries within the Upper Basin, but it does not give us any information, as Mr. Tipton suggested, as to the source of this water. I think it is very apparent that until we know that we cannot very well proceed with any discussions such as are requested in the report as to a compact among the Upper Basin States.

To put it more bluntly, and in line with the suggestion of Mr. Tipton, I have a note in here, you will recall, Note 6 on page 6, "From a hurried inspection of the report, no statement was found comparing the allocations of the Colorado River Compact for the Lower Basin with the present and future depletions of the described projects." I won't go into that because Mr. Tipton covered that very carefully.

I might also say the report, while it analyses or interprets the Compact, in a great many of its phases is entirely silent on the question of surplus as

that word is used in the Compact. That also was covered pretty well by Mr. Tipton. There is one point I think that should be mentioned. I believe it is necessary for a more complete and accurate picture. The Bureau makes allowance for what they call present depletions on projects that are recently constructed, under construction, or authorized but not yet in operation. They allow for the depletions, for example, of the Colorado-Big Thompson project and for projects in Utah and Wyoming, as though we are dealing with some time in the future after these projects come into the picture, come into operation. Previously the Bureau has made estimates of upstream depletions, and based on those estimates they corrected the recorded flows at Lee Ferry. And so we find now that the allowance made for so-called present depletions differs some 300,000 acre feet from the allowance previously made by the Bureau for crediting recorded flows at Lee Ferry or converting them to virgin flows.

I do not need to go into the list of projects for which allowances of that kind have been made, but I do offer this thought that the Bureau has ignored a similar effect upon projects now authorized or under construction by agencies other than the Reclamation Bureau. I do not need to mention but two to illustrate that. One is the City of Denver, which has built the water bore of the Moffat Tunnel. They built the tunnel at Jones Pass. Though not completed, the collection systems have allowances for they are down to the average they were diverting during the 1931-1940 period, or perhaps what they diverted in 1940, I am not sure which, but certainly those constructed projects upon completion of their collection works are going to divert more water than you have allowed for. The same is true with respect to a lot of individually constructed ditches in Western Colorado. They have under them considerable areas of irrigable land, and in the future may be expected, as is their right, to irrigate more than the Bureau found that they were irrigating during the drought period of 1931 to 1940. It is a natural process of development. No allowance is made for them whatever in Colorado and Utah in estimates for the Upper Basin.

There is one item of 571,000 acres of land not now irrigated for which allowance was made for these future depletions.

I want to mention just briefly the element of cost. I think we should all realize that now that some figures of cost have been added to projects that have not been investigated in detail that this question does develop very concretely that the estimated costs of the irrigation projects in the Upper Basin, if evaluated in terms of total benefited acreages, will probably average around $200 an acre, and if evaluated in terms of new land, something over $150 an acre, and if evaluated in terms of new land, some costs ranging from $160 and some dollars, if evaluated on the total benefited acreage, to more than $210 an acre, if evaluated on the basis of new land. I think the fact is they are relatively high costs, considering that that region as a whole is a livestock country. While there may be limited areas that can afford such costs, the mass of the projects cannot. So I think the report should more carefully distinguish between projects that may be feasible from a financial standpoint and those which manifestly must have large measures of federal subsidy if they are to be built.

One final word: We have no way of checking the estimates as to consumptive uses in other states. Within Colorado we do feel that the estimates

made by the Reclamation Bureau are as good as can be made at this time, so far as the present and potential depletions of irrigated land in Western Colorado are concerned. We have no suggested revisions in that category at all.

But we do want to mention one thing that perhaps has been overlooked or ignored, and I believe a specific illustration rises out of the study made generally between our Board and the Bureau on the Uncompahgre project in Western Colorado. To boil that down to a final conclusion means this; During the development of that project large bodies of water were stored in the ground. So far as the recorded flows at Lee Ferry were concerned, it resulted in seepage conditions. Water continued to be lost from evaporation, from seeped areas. Drainage now under way year by year is progressing in that area. This consumptive use study we made in cooperation with the Reclamation Bureau shows conclusively by elimination of these evaporation pans in that seeped land, 20,000 acres can be added to the irrigated area on the Uncompahgre project, without increasing the depletions of the Colorado River one acre foot.

I believe, gentlemen, in the analysis of this question of depletions you should make allowance for what will be a declining rate in the future, and that unless you do, you are going to distort the picture of what this water supply of the Colorado River will ultimately be.

I believe, Mr. Chairman, that is all the time allotted to us.

JUDGE STONE: Wyoming has relinquished ten minutes of its time to Colorado, and Utah says that another ten minutes may be allotted from their time, if it is needed.

I will ask Mr. Delaney to call on the next speaker.

MR. DELANEY: I will now call on Frank Merriell, and present him as the engineer for the Colorado River Water Conservation District.

MR. MERRIELL: Mr. Chairman, Ladies and Gentlemen of the Committee, and Visitors: I do not think any of us realize how great a body of fact and of study is embodied in this report which has been assembled in such a short time. As Mr. Tipton intimated, work was in progress on it several years ago. Probably things that were studied twenty years ago are embodied in this report, and in spite of that fact, the job is not nearly completed, and it will be necessary to spend a great many more years before the final answer is achieved. However, this report is now before you for your suggestions and your criticism, and I think properly before such a body as this, because it is the answer of the whole Bureau or the whole region, and you are the people who must pass upon it, not only for your purposes, but for the other purposes for which this report is necessary.

I believe we should give serious consideration to the fact that this report, while it is an inventory of the things we hope to see or to accomplish, is also a very necessary thing to be done from the national point of view. We must get our picture into the state of affairs along with all the other basins in the West.

There are, however, two men more interested perhaps in this report than all the rest of us, who are not represented here. Those two men are, first, the man who is going to sign repayment contracts for irrigation projects, and, next, the man who is going to buy some part of the billions of kilowatt hours of energy with which the report deals; and I believe that the reaction of those men, their ability to carry out their end of the bargain which you are setting up for them, and their willingness to carry out that bargain are perhaps the most important things to be considered in the final form of this report.

As to the report itself and its engineering features, let me say this: We have in Colorado two rivers which are practically completely developed, the South Platte River and the Arkansas River. In the process of the development of those two rivers certain relations or interrelations between water supply and its use have developed, which could not have been foreseen, and if vaguely foreseen, could not have been evaluated. It may be that in the total development of the Colorado River the same kind of relations and interrelations will not be so completely developed. But, as Mr. Patterson suggested, it is very probable that as time goes on we shall find that the best estimates that we can make of the availability of the water supply are immensely affected by these relations and interrelations between use and supply.

So we cannot hope at this time, in my judgment, to write a conclusive report on the Colorado River, but that need not, in my judgment, greatly influence us for this reason: I wish you all a long life and happiness, but I do not believe that anybody here will live long enough to see one-half of the things contained in this report realized, and I do believe that during the course of that development factors will enter in which none of us can foresee. Those factors, if experience is any guide, will demonstrate to us that the availability of water in the Colorado River is probably underestimated now, and cannot be estimated except upon the basis of actual experience.

MR. DELANEY: I will now call on Ed Dutcher, as a representative of the Gunnison River Water Users Association.

MR. DUTCHER: Mr. Chairman, first of all, on behalf of the group that I represent, I want to say that we are indeed grateful to have the opportunity to appear at this meeting. It has been extremely informative.

Now, most of the members of our Committee have not even seen this report. A few of us have had it for about thirty minutes to an hour. We are not in a position at this time to approve or disapprove the items that are contained in this report. We feel because of the importance of the matters involved that these projects should not only be studied but investigated and analyzed, and approved or disapproved, independently of each other project.

A cursory examination of the report has disclosed to us that in making the report those people had in mind two uses of water primarily, first the use of water for irrigation, and second the use of water for power. We are not unmindful of the importance of those uses of water. Experience has taught us that there are other important uses of water, especially in Western Colorado. They are becoming more and more important as time goes on. I have in mind particularly the use of water for recreational purposes. Recreation in Colorado is

now becoming one of the large businesses. We foresee that in the future it might become the biggest business. Although we do not deny, we question whether sufficient consideration has been given to these other important uses of water. We question whether there has been a way devised to protect the waters in the upper reaches of the rivers for fish life, and other recreational purposes.

As I said before, we feel that each project should be analyzed and studied, and then approved or disapproved on its own merits. At the present time we are not in a position to make any recommendation to this group as to those matters contained in the report. However, we do feel from our casual observation that not a sufficient amount of projects have been included. They have been omitted, maybe intentionally or maybe unintentionally, we don't know. But we feel that the people in each respective locality should be considered and they should be consulted with reference to the projects which are to be seriously considered in that respective locality.

We ask this Committee for a sufficient length of time to make our own study, with the cooperation of the Bureau of Reclamation, and then determine what other projects, if any, should be included, and what projects we feel are not economically sound. We would also recommend that these other uses of water be considered of vital importance. We feel that is particularly important to the section of the state that we live in.

MR. DELANEY: John B. O'Rourke, from Southwestern Colorado.

JUDGE O'ROURKE: Mr. Chairman and Ladies and Gentlemen, as a member of the Colorado Water Conservation Board, and speaking now for the Southwestern Water Conservation District, which embraces the eight counties in Southwestern Colorado, I want first to point out that I think that the Bureau has accumulated a mass of valuable information. They are getting now along to the point that we have been aiming at for some time. However, we have not had an opportunity to examine this report, and we have quite a vital interest in the waters of the Colorado River. Our section, or the eight counties from which I come, produce something in excess of 40 percent of the water that is furnished the Colorado River by the State of Colorado. We are not in a position to comment on this report either one way or the other, to approve or to disapprove any of the projects.

This Committee, or the members of the Committee from Colorado, are not in a position, I take it, to bind the State of Colorado or any section of the State of Colorado by approving or disapproving this report. Under the statutory setup which we have in this state, the handling of the water problems of the State of Colorado rests in the Colorado Water Conservation Board. This Committee is set up merely for the convenience of these groups from the various states, meeting together and ironing out our difficulties and carrying out the Compact of the Colorado River.

I think there is an obligation on the Colorado Water Conservation Board to take these matters up with their various sections, the various areas of the state. Each area of the state presents different problems, and as I say, we are not in a position now to either approve or disapprove it.

I do want to commend the Bureau for the magnificent job they have done. They have expended a lot of work and accumulated a lot of valuable information, I think information that is going to be helpful to us in developing the Colorado River Basin.

JUDGE STONE: That concludes Colorado's presentation. We shall next call upon New Mexico.

MR. WILSON: Mr. Chairman, I don't know just how much time has been allotted. As a matter of fact, it will take me only a few minutes to say what I have to say.

So far as New Mexico is concerned, of course, we are in the same position that all the rest of the states are in, in reference to this report. Our State Engineer, Tom McClure, did not see this report until this morning. Obviously our engineering department has had no opportunity whatever to examine any of the engineering phases of the report. For that reason nothing anyone from New Mexico at this time could say would be helpful to the Bureau.

However, I will say this: From what cursory examination I have made of the report, it will be very valuable to this Committee and to the states on account of the information it contains. But so far as being binding on any state, of course, I assume the Bureau does not intend to do that, and nobody here would have the power or authority to bind any state in reference to any of these projects.

Now, in the report I see that the few projects that affect New Mexico are the San Juan-Chama Transmountain Diversion and the so-called Shiprock projects, and some projects on the Gila. It is apparent, I think, from examining the report, that the Bureau has made no intensive investigation on the ground, especially with reference to the Shiprock and the Gila.

Many of you know Mr. McClure, our State Engineer, very well. I am sure if he were here he would want to convey to you this message which he has conveyed before, and that is that he, representing New Mexico, would like for the Bureau to spend some of this money in the State of New Mexico, especially on these two projects. I realize the fact that the detailed information so that the people of the state can select, if selection should become necessary, must come later.

Take the Shiprock project set up in here as a 70,000 acre project on the Navajo Reservation. The statement is made that it might be enlarged to 200,000 acres, but if enlarged, it might prevent the construction of the San Juan-Chama Diversion Project and perhaps some other projects. It is very obvious that before the people of New Mexico can consent to that or make a choice, there must be a detailed study made as to the cost and the feasibility of these projects. We hope the Bureau is in a position to make that detailed study. If the Bureau is not, some time or other the state at its own expense will have to find ways and means perhaps to make the study before an intelligent selection can be made.

Now, obviously I should not have said, perhaps, as much as I have said, because we are all in the dark as to what we should do about this report.

I want to congratulate the Bureau on the vast amount of work that has been done. I know you have worked under difficulties, but in common with some of the other gentlemen who have spoken, we do not want to be bound in the future by any statement made in this report on the theory that we acquiesced in it or consented to it or that this is a precedent. I realize these things have to be worked out in the future, and I do not know why the Bureau finds it necessary to submit this to Congress at this time. Maybe you have a good reason, and so long as the report is submitted to Congress, as you have described it here in the report itself, as tentative, incomplete, unconclusive, I don't know that it could hurt anybody, and I am sure that it has been very helpful.

JUDGE STONE: Any further statements from New Mexico? Is that all from New Mexico?

MR. WILSON: Yes, that is all.

JUDGE STONE: I will now call upon Utah.

MR. WALLACE: Way back yonder in 1928 the Boulder Canyon Project Act was written, and we of Utah succeeded in putting into the Act originally a proposition for the comprehensive development of the River, providing for a fund of $250,000. We certainly expected that within five years we would have some opportunity to review what might look then as a comprehensive development. We have waited from 1928, sixteen years. The suggestion was made then that we might make some sort of a compact between the Upper Basin States, but in discussion with Dr. Mead we came to the conclusion that it was wise to write a compact based on the facts, and up to now we have not had all the facts.

Now, we are ambitious in our state. We have an area, Southern Wyoming, Western Colorado, and Eastern Utah that is probably the richest mineral section on the face of the earth. There is said to be at least 10 percent of the known coal deposits of the earth within that area, and enough shales, sands, and that sort of thing to provide the United States with gasoline for many many years. Further, we have in nearby regions potassium, phosphorus, and plenty of nitrogen in the air so that we can provide fertilizer in the West for many years to come.

In order to do that we will need enormous amounts of cheap electric power. We lost a great electrolitic zinc plant, it went to Montana, because of the situation that we did not have the power and the water to take care of it.

Salt Lake City is the greatest smelting section in the United States, and I don't know but what in the world. We need a tremendous amount of power, and we need power rates upon the same basis that they will be given to other sections in the Colorado River Basin.

I may say to you gentlemen, because we would like to make as rapid development in our community as we can, it has been recognized before that we have been one of the regions of slow development within the Basin. That was one of the

Now, obviously I should not have said, perhaps, as much as I have said, because we are all in the dark as to what we should do about this report.

I want to congratulate the Bureau on the vast amount of work that has been done. I know you have worked under difficulties, but in common with some of the other gentlemen who have spoken, we do not want to be bound in the future by any statement made in this report on the theory that we acquiesced in it or consented to it or that this is a precedent. I realize these things have to be worked out in the future, and I do not know why the Bureau finds it necessary to submit this to Congress at this time. Maybe you have a good reason, and so long as the report is submitted to Congress, as you have described it here in the report itself, as tentative, incomplete, unconclusive, I don't know that it could hurt anybody, and I am sure that it has been very helpful.

JUDGE STONE: Any further statements from New Mexico? Is that all from New Mexico?

MR. WILSON: Yes, that is all.

JUDGE STONE: I will now call upon Utah.

MR. WALLACE: Way back yonder in 1928 the Boulder Canyon Project Act was written, and we of Utah succeeded in putting into the Act originally a proposition for the comprehensive development of the River, providing for a fund of $250,000. We certainly expected that within five years we would have some opportunity to review what might look then as a comprehensive development. We have waited from 1928, sixteen years. The suggestion was made then that we might make some sort of a compact between the Upper Basin States, but in discussion with Dr. Mead we came to the conclusion that it was wise to write a compact based on the facts, and up to now we have not had all the facts.

Now, we are ambitious in our state. We have an area, Southern Wyoming, Western Colorado, and Eastern Utah that is probably the richest mineral section on the face of the earth. There is said to be at least 10 percent of the known coal deposits of the earth within that area, and enough shales, sands, and that sort of thing to provide the United States with gasoline for many many years. Further, we have in nearby regions potassium, phosphorus, and plenty of nitrogen in the air so that we can provide fertilizer in the West for many years to come.

In order to do that we will need enormous amounts of cheap electric power. We lost a great electrolitic zinc plant, it went to Montana, because of the situation that we did not have the power and the water to take care of it.

Salt Lake City is the greatest smelting section in the United States, and I don't know but what in the world. We need a tremendous amount of power, and we need power rates upon the same basis that they will be given to other sections in the Colorado River Basin.

I may say to you gentlemen, because we would like to make as rapid development in our community as we can, it has been recognized before that we have been one of the regions of slow development within the Basin. That was one of the

reasons why we had the Colorado River Compact written originally, because we recognized so far as development was concerned, we could not equal the rate of Southern California.

Of course, we have all had the report but a very few days. I spent about three days going through it the best I could, and of course we recognize the fact that the gentlemen who have written the report have so far made no recommendations, so, of course, we are not able to pass upon the report in its completed state. There will be ready for us in Utah, so I am given to understand, the Bonneville Basin report by the first of the month. There is a very intimate relationship between the development of the Colorado River Basin and the development of the Bonneville River Basin. We have a great deal of undeveloped water in the Bonneville Basin, but again we need the greatest amount of power to put it to the highest beneficial use. I only say what our ambitions are. We want our people to pay for development to the best of their ability. We feel every locality, state and nation benefits in the development of this River. My understanding is that this report is written upon the basis of containing benefits to the entire United States, and there are many, many projects set up in this report that cannot be paid for by the people that receive the immediate benefits, but must be spread out and paid for, as I say to you, locally and nationally.

We are very anxious, of course, as far as we are concerned about some other matters. We want to retain the control of our waters within the state. We do not want the United States to take possession of this great asset and develop it upon the basis that it will permit the control to go to Washington.

I was very much interested in the remarks of Mr. Tipton in which he spoke of years and years and years. We would like to have this river developed upon a concurrent basis; we would like to have these great projects in the Upper Basin built at the same time you are building the great projects in the Lower Basin. We will be able to develop and use all of the waters allocated to the Upper Basin within a reasonable length of time. I think we can say frankly to you people of the Lower Basin that we can develop them and use them just as rapidly as you can, but of course we have got to appeal to the United States for aid, as you have had to do. Utah, as you know, has an interest in both Basins.

Now, as to Utah's position in the matter: We are grateful to these men for the great mass of information they have gathered together. There is no possibility for us at this time to say exactly what Utah would like to do. It is our purpose to go home. You understand, all of you I assume, that the members of the Committee of Fourteen are simply advisers. We have not any authority to act on behalf of our states. We have been appointed by the Governors and must report to the Governors. It is the purpose of the Utah delegation, I assume, to return home, call a conference as the Governor may ask for, analyze the situation as best we can, and make a report to the Department of the Interior in writing, setting forth exactly what we would like to do now, or what we would like to have done.

I think, gentlemen, that is about all I can say, but I would like to repeat to you that we feel that we have one of the richest sections on the face

of the earth that we want developed not only for our benefit but for the benefit of the United States. We want it developed concurrently with the development of the Lower Basin, and we want it developed just as rapidly. We particularly want to hold back the water in the Upper Basin in the reservoirs during periods of excess flow, so that we can faithfully fulfill our obligation to you people, so that we can deliver the amount of water set out to you in the Compact.

I would like to call on Mr. Giles for his comments.

GENERAL GILES: Mr. Chairman and Ladies and Gentlemen of the Committee: There is not a great deal that I can add to what has been said by my colleague, Mr. Wallace, and by my associates that have already spoken for the other states.

I have been working on this Committee along with Mr. Wallace and the other people from my state and our colleagues who represent the respective states of the system since 1937, when the Committee was first suggested.

We, of course, as Judge O'Rourke pointed out, cannot bind our states. I think the Committee has well justified its existence. Many difficult controversies and problems have been worked out around the table, and I think much litigation has been avoided.

As pointed out by Mr. Wallace, the Project Act calls for the investigation that we are now having from the Bureau. We asked for it. We have been anxiously looking forward to it, and now it is here in a tentative form. It was very significant to me what Commissioner Page had to say in his opening remarks. He said, "We are here for suggestions, we are here to listen to you men of the Committee, what you have to say, and to your criticisms. We may incorporate your criticisms and your suggestions in the report, but we may not. There is no certainty that anything you say" -- now, I am paraphrasing what Commissioner Page had to say -- "there is no certainty that what you have to say will be incorporated in the report."

From what I have heard of the criticism this morning, in my opinion the Bureau had better incorporate some of these suggestions. Obviously we cannot put the stamp of approval on the report as it now stands.

With my associates I want to congratulate the Bureau on the splendid job of the Bureau, and the Committee, as far as we can bind our states, are speaking for generations yet unborn. A comprehensive development means a development of the river in perpetuity in keeping with the Compact provisions.

I want to go back to my state and call the interested parties together and go over this report and show them what the Bureau proposes for us. We would not want to add to this report or subtract from it. We have no authority to do that. When we speak for Utah and when the Bureau speaks for Utah and the rest of us, let us have a picture generally that everybody can happily approve. Let us not let it get us into litigation and trouble. Let us try to work together as we have done and iron out our differences as gentlemen should.

As Mr. Wallace suggested, if the seven states of this region cannot divide this great asset among us that is to satisfy the needs, may I say, in

every walk of life perhaps for generations yet unborn, how can you expect the world to settle its differences?

So I would say to the Bureau, you had better give us a little more time. I don't know what the urgency is. Maybe there is a real reason for this to be in the hands of Congress on January first. I would like to have that answered. There is not much time between now and January first for all of us to go back to our respective constituents and people and iron out such an important problem as this, and I would like to have somebody tell me why this thing must be in the hands of Congress on January first. If it must, it must, but it seems to me, gentlemen, we had better sit down a little more soberly about the division of these waters and where these projects are going to be, because, as I said, we are speaking for boys and girls that will come 200 years from now into this great region, and I think the Bureau too wants that kind of consideration.

I thank you.

MR. WALLACE: Mr. Bundy, Director of Water Development of the State of Utah.

MR. BUNDY: Mr. Chairman, I just wanted to say I have nothing further to offer. I might just make this one observation; due to the defense plant that was brought in there we are now at the crossroads, where we must decide what we are going to do, whether we are going to have agricultural expansion or industrial expansion and to what extent. Therefore, we feel that we want to go back to the people who are users of water for industries and talk to them and see if we cannot make some sort of determination as to where we will go from here, what our desires and requirements will be, before we can make any final decision which would help the Reclamation Bureau in determining Utah's use in the allocation of water.

I think myself I would like to see, as Mr. Giles has said--I believe with discussions that have been had, in view of the fact that the present report does not contain any recommendations by the Bureau, but left that vacant, it would be well for them to consider, and I believe they will in their recommendations if the report must go in immediately, the thoughts that have been brought out here.

MR. WALLACE: Mr. Watson, State Engineer.

MR. WATSON: Gentlemen, I did not expect to be called upon, but I wish to say I think the Bureau has done a very excellent job in the states. The reason that they have had to work under such difficulties in such a short time is because there is a demand that our Congress know the facts from us in order to set out a post-war program.

I confirm what Mr. Wallace has said, namely, that we are living, over in that country, in an area of great natural undeveloped resources, and if we say nothing more about the potash, the oil shales, and the coal, there is one thing we do have in that area that does not exist in other parts of the United States in the same proportion. That is the great deposits of phosphate, commercial fertilizer, which needs cheap electricity for its development, I would say, therefore, that our prime project in that area, aside from irrigation needs, is

the cheap electricity that we must have.

MR. WALLACE: Mr. Skeen, Assistant Attorney General.

MR. SKEEN: I have nothing to add.

MR. WALLACE: I would like to say just a word or two in compliment of the Bureau for the excellent report, certainly a comprehensive report so far as the list of projects is concerned, and to say to them that it will be of great value to us in making our decision as to what should be done for Utah. I would like to remind you that we have had tremendous development in our Salt Lake Basin. The greatest salt plant of the world owns its own lime, coal, and iron ores, and has a value of over $2,000,000.

We are grateful to one gentleman from California, Mr. Scattergood, for his study on the question of power throughout the entire West. He has done a magnificent job for you people of California. I have a notion he has an ambition to see that all of us throughout the West have great iron and power plants that will give us in Utah the same power rates as in California. I would like to express my gratitude for the studies Mr. Scattergood has made. He has even talked on the subject in Washington, and I only hope there will be great blessings, not only in the development of the resources of iron and coal, but in the bringing into every home the blessings of cheap electricity which will permit the housewife to manage her affairs with the least possible hard work.

I again express to you, Mr. Scattergood, our gratitude for that action.

JUDGE STONE: The statement on behalf of Wyoming will be given by Mr. Bishop, or Mr. Rollins.

MR. BISHOP: Mr. Chairman, and Ladies and Gentlemen: Mr. Rollins and I have not had an opportunity to study this report. We are not in a position to comment on it. I think it is a very good report as far as they have gone, I don't see how the Bureau of Reclamation can complete a comprehensive report of the Upper Basin until they know how the Upper Basin feels about the development. To me that is the most important item and the least talked about.

MR. ROLLINS: Mr. Chairman and Ladies and Gentlemen: I, of course, have been on this Committee only a short time, and none of you are expecting much from me. I would not for the world try to disappoint you.

I am neither a lawyer nor an engineer, by the way, and my chief interest in Reclamation is seeing two blades of grass grow where one grew before. I take pride in seeing the desert blossom into a rose. For many years my heart has been in this work.

I have learned this morning from remarks that have been made that it is not expected of us that we go into detail on this report or try to bind ourselves one way or the other as to its contents. However, there is one thing that has heartened me, and that is the fact that the Bureau of Reclamation when it was under stress really went into high. That pleased me very much, because

I remember that they started surveys about thirty-two years ago, and over in the lime country where I used to live years ago, I had looked forward as a boy when I got old enough to get on some land, we would have a project up there. I am just wondering now whether my grandchildren will have an opportunity to live under a project there.

However, this war has taught us, if it has taught us anything, that we can perform miracles in this country of ours. We have performed miracles of production. Things unheard of and unthought of a few years ago, almost unbelievable a few years ago, have been accomplished. If the same energy can be turned toward the construction of these great projects we would not have to wait as long as some of us feel this morning to get the country developed. If we really turn on the heat in getting out this report, it seems to me we can get this whole area developed much faster, in a much shorter time than we had ever dreamed of. Maybe that very thing will take place.

If I were to give any criticism at all of the report in the short time I have had to survey its contents, it would be that perhaps they have left out thousands and thousands of acres of land, at least in Wyoming, classed as second-class land, which some day may make homes for thousands of people if the water could be provided, but it may seem now in that high elevation and short seasons that we could not possibly produce crops that would justify the expenditure that some of these projects will necessarily cost, yet who knows but what in the future some new type of crops can be produced on that land that will far exceed in value anything we are growing now?

May I mention just one example on some of that second-class land? Only a few years ago some of the dairy men over there conceived the idea that inasmuch as you could not grow corn on that land, sunflowers could be profitably grown on that land that has been rejected by the Bureau, some of that second-class land. That is potentially a great dairy country. Already the Sequoia Valley has become a little Switzerland of America, and in the Bridger Valley the dairy industry is developing rapidly. So that I think that perhaps we may have not gone quite far enough, as far as Wyoming is concerned, and maybe before the report is finally accepted by Wyoming we will yet have to adjust our sights upward a little bit.

I don't know as I have any more to say. I am really grateful to the men who have spent the time and the effort they have to get this report in the condition that it is. It seems to me a firm foundation has been laid upon which may be built from this a great development of the Upper and the Lower Basin States. Thank you.

MR. WALLACE: Mr. Chairman, Utah has a minute or two. I would just like to say this word to Wyoming, we will be very pleased if Wyoming will develop every possible acre she can, using their water, so that we will know how much we have in Utah. We would like to see you build the Kendall Reservoir and other projects just as rapidly as you can. If there is anything we can do to help you, we shall be glad to. We think it is time to get together around the table and settle this thing we are talking about.

GENERAL GILES: If the Bureau is under a deadline stress, we want to be as helpful to you gentlemen as we can. I am wondering whether it is going to be possible for us to get our people together and make you a written report between now and the middle of December, say. When do you have to have this in? It seems to me we are all talking about no opportunity to examine the report and we cannot make any final suggestions to you. That is one thing I wanted to say before we got through, because I think we could be helpful to you.

JUDGE STONE: I think those are matters, Mr. Giles, that we should take up in the discussion as to any action the Committee may think advisable, after the statements from the various states are made.

GENERAL GILES: Yes.

JUDGE STONE: Does that conclude the statements on the part of the representatives of the Upper Basin States? The Upper Basin States have made their statements in an hour and thirty-five minutes. Under the procedure adopted there now remains two hours for the presentation on the part of the Lower Basin States. Those states will be called on in alphabetical order. Before we do that, however, we will take a short recess.

(Thereupon a short recess was taken.)

JUDGE STONE: The meeting will come to order, please. According to the time which I have, it is 11:20. Mr. Wallace says my watch is wrong and that it is 11:25, so it is probably 11:25. Now, the question has been raised with the Chairman whether we want to work straight through and conclude the two hours on the Lower Basin presentation, or whether it will be split for the noon hour. The Chair is making no arbitrary rulings on that. I am leaving it to the Committee.

MR. WALLACE: What do you want, California? An hour before luncheon and an hour after?

MR. SHAW: Mr. Chairman, I seriously doubt that the Lower Basin will consume two hours. From what I learned from discussions with representatives of other interests than California, my suggestion is that it now being close to half past eleven, we proceed to hear from the States of Arizona, Nevada, and the power contractors, and that such observations as California has to present be reserved until after lunch, say at one o'clock.

JUDGE STONE: Is that agreeable to the Committee? If there is no objection that will be the procedure. Is that agreeable to Arizona?

MRS. BUSH: O. K.

JUDGE STONE: Is it agreeable to Nevada?

MR. SMITH: Yes.

JUDGE STONE: Is it agreeable to the Power Allottees?

MR. SCATTERGOOD: Yes.

JUDGE STONE: Very well. We will proceed with Arizona.

MR. WILLIAMS: Mr. Chairman, Members of the Committee and Friends: We won't consume a lot of time in presenting what we have to say.

We do feel seriously that the Bureau has done a good job in the time they have had in filing this report, and we accept it as an inventory of the projects and as a starting point, something as a guide to work on and to work to. We realize we will have to have some time to eliminate the projects that are not feasible, and to decide on the ones in Arizona that are feasible and that can ultimately be presented to Congress for appropriations and construction, etc. So we accept the report for what it is purported to be. We are not in a position to bind Arizona, and we do not think it was ever intended by the Bureau that the report should be final or should bind any of the states or make it necessary for them to commit themselves.

We have several members here and consultants that we would like to hear from, and I think we will call first on Mrs. Nellie Bush, who is the senior member of our Board.

MRS. BUSH: Mr. Chairman and Gentlemen: I want to prove to you two things, first, that a lawyer does not always talk very long, and second, that a woman does not have to have the last word to be happy. At any rate, I want to say this: that of all the states that are against delay in any program, I think Arizona has the right, from the lessons she has learned in delay, to be the most skeptical of delay.

Personally since 1922 I have been interested in this and then as a member of the Legislature of Arizona. As you know and as I know, all the way through Arizona has lost, and lost a lot by delay. But I know too from legislative experience that if we go to a legislature or to any legislative body with an incomplete program and one that we do not know about ourselves and one that we cannot back up ourselves, we very often lose precious time. In other words, instead of facilitating it, it has the reverse effect, because when they say, well, look at this enormous thing, this mass thing you have in your report, then we have to admit it, and then it must go back to be studied, and those who are against any development, as Members of Congress may be in Western development, will say, "You didn't know what you were talking about before, and we don't know why we should take any of it."

So I am rather of the opinion that we of Arizona and the southern states should know something of the things we are really headed for, and have definite things in mind before we stamp it with our O. K. as the Committee of Fourteen or as a state.

Now, I think there may be some possibilities in this report. I do not think this meeting should break up with nothing done, as sometimes meetings have that I have attended in the last twenty years--not speaking of this, particularly, but of other meetings that were very essential to progress.

Some of us have been talking during this brief interim that we had just

now. There may be some projects that might get the green light and that might be even set aside for definite action, and might come out of this thing as an O. K. and a green light for the Bureau to present to Congress and therefore go ahead and give us some estimate on some that we did not yet know about. It seems to me that others may give you more on that, a more conclusive talk on it than I can. But I am not of the opinion that we should leave the whole thing up in the air. I think, however, every meeting must have some starting point, and if there are feasible projects we might start on, then I am for that. I don't know whether that is feasible here or not, but to my mind it is.

I just want to say this, we want to work with the Bureau. I think the Bureau knows that. We want to work with everybody who is getting ready for the postwar period.

We think Arizona is one state in the Union that has as many, or more, possibilities than any other state, for several reasons; we have a lot of good lands that are very thirsty. We have a lot of boys returning who want to be farmers. We want those people to have a place to light. We think we have an ideal place for them from a health view point and from development possibilities; and from a report of what has gone on in other developments of an acre of land in very similar land to ours, in our neighboring state California, that has proved just a beginning. You see the initial cost of land is so much and when we go into the ramifications, to someone passing by it looks on its face not at all feasible, perhaps. But taking all these things into consideration, we think we have the garden spot in the world for the returning soldiers.

So Arizona is very anxious that we have something definite, that we have something constructive, and that we have something that will not burden the future generations. So with these few remarks, I am going to turn the meeting over again to our other members and let them give the hope of Arizona. Thank you.

MR. WILLIAMS: As I say, we do not know all the answers in Arizona. In an endeavor to learn them, we have cooperative agreement with the Bureau, making our investigations generally with them on our projects.

Our engineer, who has devoted all of his time to this, is with us today, Mr. R. Gail Baker, and I will now call on him.

MR. BAKER: Mr. Chairman and gentlemen: After listening to the discussion so far I am quite confused as to the uses the report is to be put to. My understanding is that the report is more or less of an outline of the projects that we have before us to work out, cooperating not only between the Upper and Lower Basins, but also between the states within the different basins. If that is the right interpretation of the report, we of Arizona are certainly very much in favor of the report as it is written and presented. On the other hand, if the report is more than that, and is to be used as something more or less binding, I would say that the January first deadline is certainly one year, and possibly two years ahead of the time that it will actually take to work these problems out so that it can be handled in that way. Assuming, though, that the report is just an outline and there are problems to be worked out in the future, we of Arizona accept it almost as it is written, word for word.

Along that line, the State of Arizona has put up $200,000 to be matched by the Bureau, $400,000 to be used by the Bureau to work out these problems in Arizona. Certainly until we spend that $400,000, and maybe more beyond that, a comprehensive report that is at all binding cannot be written.

MR. WILLIAMS: You all know Mr. Carson, our legal adviser for Arizona. We would like to hear from him.

MR. CARSON: Mr. Chairman, I think the Bureau has done an excellent job in the way of making a kind of overall catalogue of possible projects in the Basin. I take it this report is to be binding on nobody, not even the Bureau or any man in the Bureau. I think there is no commitment on the part of the Bureau in favor of any project listed in the report, nor any commitment against any project not listed in the report. I think all of these specific projects depend upon future investigations and surveys.

The question, therefore, arises in my mind as to the value and the immediate urgency of this report. I understand that the Bureau is under positive orders for a deadline of January first, and I understand that the reason for that is that the President and the administration requested that they prepare and have ready for postwar construction at the conclusion of the war a three billion dollar program for permanent construction and to help absorb unemployment.

There are some things in the report that I am not sure would be conducive to favorable consideration by Congress of specific bills for specific projects when they come. I am thinking now particularly of some of these estimates of cost which are necessarily, and stated to be, merely rough estimates. We have heard this discussed by quite a few of these people who say that the acreage set out and the cost set out is prohibitive. I think that is true, and it may be true in other matters. So I would like to suggest to the Bureau that if possible, where there are no direct estimates of costs, perhaps it might be well in some of those instances to leave estimates of cost out entirely, unless it is somewhere within the realm of what you think it probably would cost, because I think when a midwestern Congressman or an eastern Congressman, who is inclined to oppose irrigation development anyway, would see some of those estimates of costs in relation particularly to some of those projects in the Upper Basin at a cost of $300 an acre where the annual crop return probably would not exceed $10, $20, or $30 an acre, would be immediately prejudiced against irrigation and development of the West.

But, accepting, as I think we must, that the Bureau is under a positive deadline, and that this is not our report and that they are not requesting that we adopt it or approve it or agree to be bound by it, then I think the question is for them as to whether or not it is possible to get more time for these states to consider this report, and if it is, I think it would be very much worth while; and then when the report was finally submitted, it would be of greater value in Congress and to all of these states. I don't know how much time that would take, but I would not think that it would take too much time.

I don't know whether that would be possible. If it is possible, I would say that I would recommend that that be done. If it just is not possible, why,

then we have not been of very great assistance, because we could not be under the circumstances.

All of us here representing all of these states desire in every way possible to cooperate with and support the Bureau of Reclamation. We consider the Bureau to be very essential to our development and to be the agency to which we all look, and we regret that in the time given us that we have had this report we are not able to be more helpful.

MR. WILLIAMS: That is all, Mr. Chairman.

JUDGE STONE: That concludes for Arizona?

MR. WILLIAMS: Yes, sir.

JUDGE STONE: Under the arrangement we are to hear before lunch from the Power Allottees, or the power interests, and from Nevada. We will first hear from Nevada. Mr. Smith, will you conduct that?

MR. SMITH: Chairman Stone, and Ladies and Gentlemen of the Committee of Fourteen and Sixteen, and Advisers: I express the same thought that several of the delegates here have expressed, that we have not had sufficient time to review and study this report prepared by the Bureau. I myself received it only on the eve of my departure for Denver, and such attention as I have been able to give it has just been piecemeal on the train, and such discussion as has been had here. Admittedly that is no grounds on which to pass upon a report so comprehensive, covering so much ground as this one.

So far as I have gone, it seems to be a most excellent report. It contains a great deal of compiled factual data, also more or less original work apparently on the part of the Bureau.

My thought is that if that is to go before Congress by January first, though, admittedly it will contain some errors and there will be a difference of opinion as to various features and data in the report. The danger is that it might be considered that once it goes before Congress and becomes a Senate document, it will be considered more or less an oracle, It will be the alpha and omega of everything, really, of the Colorado River, whereas it is not intended that way. At this time it is more or less preliminary in its nature. I would like to see more time given to the study of this report by the states before it is submitted, if that is possible, before it goes before Congress, so that changes may be made where they seem necessary.

With respect to Nevada, there may be some areas that were not considered by the Bureau. The report on page 7 gives the total acreage of new land as 43,100 acres. The area to be furnished with supplemental water as 4,500 acres, total 47,600 acres. We believe from our studies that there is considerably more land susceptible of development from the Colorado River in Nevada, somewhere between 50,000 and 60,000 acres. Also there were water uses that were not considered.

Assuming that 47,600 acres, taking that as the base figure, and using 5

acre feet duty, we would use 238,000 acre feet. If you take 6 acre feet duty, we would use 285,600 acre feet. Six acre feet duty may be a better figure to use in estimates of Nevada's use than 5, and has been used by the Bureau in some of the areas, notably the Las Vegas Pumping Project, where 20,000 acres is considered to have a duty of 6 acre feet.

Now, knowing that our tentative allotment, at least, is only 300,000 acre feet, you see immediately that from the Bureau's own figures just from irrigation alone our entire allotment would be practically used up.

Nevada may have been shortsighted prior to the passage of the Boulder Canyon Project Act on May 25, 1928, quite a while ago, in allowing the state to be limited to only 300,000 acre feet under the proposed tri-state compact authorized by that Act, but the Bureau of Reclamation had represented that we could not beneficially use that much for irrigation of suitable or available land, and by means of soil surveys and additional examinations made in later years it has maintained the same position.

These conclusions do not seem to sufficiently consider in the present study--I admit I have not had time enough to study it fully--there may be something there that I have over-looked--do not seem to consider the extremely important new potential water uses in addition to irrigation that existed, other than to point out on page 180 under the title "Other Economic Activities" that such uses may become important.

Perhaps some attempt should be made to evaluate this additional water use. Mr. Dutcher here has brought out that point, with which I fully agree. Mr. Rollins also brought out the point that there may be a great deal of land not now classified at all as agricultural land, that may not be agricultural land today, but tomorrow may be very much in that field, in that classification.

Nevada now uses in this respect about 15,000 acre feet per year in the manufacture of magnesium. Ultimately manufacturing, based on the use of cheap power there, may consume more than 50,000 acre feet of water, domestic and industrial uses, and not agricultural uses.

Another growing potential use, at present supplied from underground waters which may be already nearing exhaustion in the Las Vegas area, is for the irrigation of fine new home estates of from 5 to 50 acres, being built by men of wealth who are not primarily interested in the economics of agriculture. They come for the climate, and the high cost of water does not hold them back. Large tourist hotels also use much water.

These statements are made to emphasize Nevada's need to conserve every bit of Colorado River water she can now obtain. If these uncomputable uses eventually total 75,000 acre feet, our remaining 225,000 acre feet will not be enough to irrigate the 47,600 acres the Bureau now believes we have, not even at 5 acre feet per acre, which may be too low a duty, as I have said. In times of water shortage we would be very bad off.

Our position in regard to power from the Boulder Dam plant is much the same as that of California, and so it will remain until new hydro plants

are built on the lower river. When new plants are constructed Nevada may take power from them if costs of Boulder power become excessive for standby and generating facilities. Until then we are utterly dependent upon Boulder power, and if there is a shortage we must take our cut. The Californians must take Boulder power to the extent of their heavy contracts. We have some advantage, in that California must take our allotment if we do not, but that is more than evened up and offset by rigid long-term notices Nevada must give before withdrawing or relinquishing any power. The point is that we are entirely dependent on Boulder Dam power to fulfill our contracts with Nevada users for around 300,000,000 kilowatt hours per year, for which we pay Uncle Sam nearly $500,000 per year, and shortages of power there may seriously affect us.

Power and irrigation come from the available water, and regardless of arguments regarding the interpretations of the Compact, the Boulder Canyon Project Act, etc., when there is a shortage of runoff somebody must do without water. We do not think Nevada will have enough under her allotment. There will be periods of drought, and this country will be short-sighted indeed to grant to the Republic of Mexico a needlessly excessive amount. It is clearly evident now that ultimately the average amount of water will not be enough for our own needs. The Bureau's report shows this. A revised report will in all probability show more water needed than they have shown, and the time we may not have water enough for our own needs may not be so far in the future as some of you think.

I thank you.

JUDGE STONE: Are there other presentations from Nevada, Mr. Smith?

MR. SMITH: No, that is all.

JUDGE STONE: That concludes Nevada's statement.

Mr. Scattergood is going to be the ringmaster for the power outfit.

MR. SCATTERGOOD: Mr. Howard wishes to make a short statement.

JUDGE STONE: Very well.

MR. HOWARD: Mr. Chairman, I have been asked to make a statement for the Boulder power contractors. For the purpose of keeping faith with my associates I am making this statement, and in the interest of brevity I have reduced the matter to writing, and with your permission I will read it.

The report under consideration relates primarily to present and prospective uses of water for irrigation and, to a lesser degree, for municipal and domestic uses. While mention is made of power development, no detailed figures are given as to the specific sources of such power, nor the net power available for sale or for commercial uses, after application of energy to pumping in aid of the water projects mentioned.

Particularly it does not appear in the report that study has been given to the effect, upon production of power at Boulder, of proposed upstream diversions,

There is no factual discussion or data in connection with the relation of Glen Canyon or Bridge Canyon developments, and the diversion of water made possible by such dams, upon power production at Boulder.

The suggested developments upstream from Boulder are not in the report related to or integrated with the production of power at Boulder, although obviously in point of fact such relationship must ultimately be given consideration.

While under the scale of priorities set up in the Santa Fe Compact and in the Boulder Canyon Project Act power production is required to yield to certain other uses of water, nevertheless power is destined to carry a major part of the financial load. At Boulder (with the exception of a relatively small amount of revenue from storage and delivery of water for municipal and domestic use) the entire financial load is assigned to power. Certainly the Boulder power contractors who have made vast expenditures under their contracts are among the interests that should be considered.

As the development of the river progresses and specific projects are undertaken, it will be necessary to study each project in relation to existing projects and the development dependent on existing projects, to the end that to the greatest extent consistent with priorities the development of irrigation and power projects may be so integrated as to produce the best overall result.

The pending report, however, is apparently not intended to and does not offer a basis of discussion of power either as to future development or with respect to the effect upon present investments and development. For that reason the Boulder power contractors will not enter upon a discussion of details, but do not intend that failure to do so shall constitute an estoppel or prevent or limit consideration of the power situation, as the facts upon which such discussion must be based are disclosed.

Mr. Chairman, that is all that is to be presented, I think, on behalf of the power contractors.

If I may, I would like to change the subject for a moment. I take it we are about to adjourn for the noon recess.

Twenty-six years ago many of the men in this room were in uniform under orders. Today many of our sons are in the same state. When we adjourn, I move that we adjourn in honor of the men and women of 1918, many of whom did not come back, and in honor of the men who are now in the service.

VOICE: I second the motion.

JUDGE STONE: Thank you, Mr. Howard, for that most splendid suggestion, and may we carry out that suggestion. When we adjourn we will stand for a moment before we leave the room. Under the schedule we are not to adjourn, but to recess, to reconvene, as we did yesterday, at 1:30.

May we now stand and carry out the suggestion made by Mr. Howard.

(The assembly rose and stood in silence.)

(Thereupon a recess was taken until 1:30 o'clock p.m.)

Afternoon Session

CHAIRMAN STONE: The meeting will come to order, please. Are all the members of the Committee present?

GENERAL GILES: They all seem to be here, Judge.

JUDGE STONE: We have completed the presentation of the states and the Power Allottees, except for California. Who is to handle the California presentation?

MR. HEWES: Mr. Chairman, Ladies and Gentlemen of the Committee, and Guests: I wish to call on Assistant Attorney General Arvin B. Shaw, Jr, to make the California water contractors' presentation. I would like, Mr. Chairman, if Mr. Shaw does not use all of the time allotted to the water contractors, to reserve the privilege, with your consent, of making a few concluding remarks on the completion of his presentation.

MR. WALLACE: How much time would that be?

MR. HEWES: What is the status of the time now?

JUDGE STONE: I believe Nevada and the Power Contractors used only about a half hour. Is that not right?

MR. HEWES: I do not know, Mr. Chairman. I did not keep the time.

JUDGE STONE: Well, we are not going to be arbitrary about those things.

MR. SHAW: It won't be necessary. I will guarantee to you that I won't use an hour and a half.

We have a very momentous document before us, gentlemen, of course, and yet one which, I think we all understand, from the frank explanations that have been given by the Bureau, is not to be taken for something that it is not. It is apparently an inventory and not a plan of action, and must be so received.

Nevertheless, such a great and concentrated effort as has been put on this document is going to be misconstrued. Undoubtedly an effort like this is not accomplished every day or every ten years, This document may be taken by people who have not attended this meeting, and it will have very general circulation, I am sure, as more or less a Bible of the Colorado River, and as setting forth things that are immutable, even though it is apparent on its face it presents very many alternatives, and that it is not a thing frozen beyond change.

I anticipate that in the letter of transmittal, or in the foreword, the Bureau officers will probably take occasion to emphasize what they have told us

as to the nature of the document, so as to minimize that misconception which is certainly going to be indulged in by people who do not study deeply, but take such an official government publication as the last word, instead of being the first word.

We have appreciated very much, we are very much gratified at, the attitude expressed by Commissioner Page and Mr. Riter yesterday in asking for help and expressions of views and comments on correction of details, and so on. Time has not permitted any of us to do a fair job, or anything approaching a fair job in that direction. We have had this report in our hands one week, and I think Mr. Wallace is just about right in saying that it takes about three days to read it, without doing any thinking--I am not questioning Mr. Wallace's processes, but I am just talking about my own.

MR. WALLACE: I will agree with you.

MR. SHAW: So we come here unprepared to give you the kind of detailed criticism which the job deserves, which should assist, we think, in perfecting it. Unquestionably a document of this importance should be as near perfect as human effort will permit. It should not have factual inaccuracies in it. There are a few factual errors that we have noted in reading the report, most of them minor, still they should not be incorrect. I want to mention one which is decidedly major.

We will give the Bureau in writing as promptly as possible--that means within the next few days, if possible--a list of these details which we have hit upon, that is, which have hit our attention, as being flatly incorrect in fact, and we will submit also a list in writing of certain details of apparent misinterpretation of fundamental documents, such as the Compact and the Boulder Canyon Project Act, which we are bold to present, because we sense that what impresses us as a misinterpretation may largely be due to the kind of wrong inference, you might say, which arises from excessive condensation of very bulky material.

There are in a few places in the report references to the Compact or Compact provisions, and I may mention one or two which impress us as being, in an effort toward brevity, a little bit misleading. On these subjects generally we rather feel that even at the expense of a few more words it may be best, or you may find it advisable, to quote instead of characterizing or attempting to paraphrase. I feel that you may come to that conclusion, because otherwise you may, in the statement, be differing from what the Supreme Court of the United States some day decides the law is, and I hardly imagine that you would want to be preguessing the court too much.

One item which we think is major as to factual matter may or may not have attracted the attention of any of you. In a table setting out by states, I believe, the uses of water in the Lower Basin as of 1922--I can furnish the citation if you wish--there is a statement that in 1922 Mexico had under irrigation 200,000 acres. The next column states that there was additional irrigable land in Mexico amounting to 800,000 acres.

I realize that those figures have been reflected in previous government

reports, and I do not mean this discussion to be in any way unkind or as reflecting upon the authors of this document, or the prior reports.

I have in mind that in this document, at the top of page 3, you have given a specific definition of "irrigable land," which indicates that such lands must be within an established project or be reasonably probable of irrigation. Now, what may have been meant in Senate Document 142 by "irrigable land" in Mexico we do not exactly know. It was probably a general indication that there was some land in Mexico which, if everything was favorable to it, instead, as we now know, clearly being unfavorable to it, might have been irrigated.

But taking the present new and specific definition of irrigable land which you have used, we think it might be wise for you to consider eliminating or modifying the figure of 800,000, having in mind, if you please, that the 800,000 acres, if irrigable, would require 4,000,000 acre feet of water a year, which 4,000,000 acre feet, under natural flow conditions in 1922, did not exist. There was not that much water in the river available for Mexico. Second, that there were no works established to feed that 4,000,000 acre feet to the 800,000 acres, and there were works for the 200,000 acres. And finally, that Mexico could not, in point of fact, have developed, under 1922 conditions, the 800,000 acres of land.

And I may here note that at another point in the report in discussing the Mexican treaty it is said that some engineers are of the opinion that without Boulder Dam Mexico might have used up to but probably not in excess of 2,000,000 acre feet, that 2,000,000 acre feet reflecting a possible irrigation of 400,000 acres, and not a million acres.

Now, there is that inconsistency and contradiction in the text. We feel that the subject matter has enough significance that it deserves this much comment.

One general subject was brought out in very clear fashion yesterday in the discussion with representatives of the Bureau. That is that the authors of the report, as respects the Upper Basin, dealt with the period of scarcity of water supply, 1931 to 1940, and in the Lower Basin with the period of long term average, 1897 to 1943. Mr. Riter indicated, and we are very much interested in that, that there would be added to the Upper Basin division a statement or a summary using, instead of the ten-year period, the long term period. We will be very glad to have this comparable material to study, of course.

We believe in this discussion--and I won't ask the question directly now of Bureau representatives, but I will hope to be corrected if my statement is incorrect--we believe that the difference in the treatment of the two Basins in the two reports prepared in the two separate offices at Salt Lake City and at Boulder was more or less accidental, and the result of the fact that different forces of men, without the opportunity of comparing notes as they went along, were having to work under pressure to get out a heavy job in a very short time. If I am not correct in assuming that the difference between the two is as I have stated, the result of the difference in two forces of trained men who were working with a slightly different background, but if there was a material reason

for the difference in the treatment of the two divisions, we would be very much interested to know it.

We would also be very much interested, as was indicated yesterday, to see that the Lower Basin material is summarized in both fashions, the same as was indicated by Mr. Riter would be done with the Upper Basin, that is, showing the results of the water supply on the ten-year basis, 1931-1940, in addition to the showing on the long-term basis, because we believe those figures are of very high importance to us in the period in to which we are now proceeding.

One thing which has impressed us in dealing with the entire report may sound at the first impression as a quibbling over words, but I do not think, if you can bear with me for a few minutes, it really is. The word "depletion" is used throughout the report as a gage or index to what the states should be charged with, the depletion of water supply. That is not a term used in the Colorado River Compact or in any legislation with which we are familiar. Depletion may or may not equal the thing which the Colorado River Compact is based on, which is "beneficial consumptive use." It may or may not equal the provision of the California Limitation Act, which is "diversion less returns to the river." While there is an implication in the definition of depletion on page 3, qualifying the interpretation of the word as being diversions less returns to the river, it may not be so understood.

In two substantial respects in this Basin beneficial consumptive use is not the equivalent of depletion. One has been hinted at this morning. Suppose a marshy condition exists on or near the Colorado River, fed by water of the river. Suppose, that by channelization or drainage, water is salvaged and made usable from the main stream or from the tributary which it happens to be on, and is beneficially consumptively used. That water is chargeable against the Basin in question and against the state in which it is used. The use of this water may not affect the total of the stream flow at Lee Ferry or at any other point on the main stream, nevertheless the Compact charges against the user the amount of his consumptive use.

One still more definite and important, much more important, illustration exists in the Basin. The Gila and Salt Rivers rise in the mountains in Arizona and discharge into the Phoenix area amounts of water in excess of, we will say, 2,000,000 acre feet. As the report shows, those water supplies are almost completely used up in the Phoenix Area. On the theory, however, that the Gila in a state of nature is a wasting stream and in its lower reaches loses water to the sands and to the air and to plant transpiration, with the result that only, we will say, 1,300,000 acre feet, roughly, in a state of nature, would on an average reach the main stream of the Colorado, this report indicates that the depletion chargeable to Arizona would be only the 1,300,000--I mean Arizona and New Mexico, to be precise about it.

Now, that is odd. The two states have the benefit of 2,000,000 acre feet of water, and use it up. Still, on a theory which is not expressed in or in any way to be drawn from, the Compact or the Project Act, the result seems to be that in the Bureau's opinion, at least, Arizona is only chargeable and the Lower Basin is only chargeable with 1,300,000. I suggest to you it is quite possible that a court might apply the language of the Compact literally, and in

its decision say that beneficial use means beneficial use, and if it is consumptive, it is consumptive, and that is the end of it, without indulgence in engineering calculations as to what the virgin flow was or what the contribution to the main stem was, or what the depletion was; and although it is a basic thing, and although Mr. Moritz cautioned us yesterday that on account of the time factor it would be nice if we did not suggest any basic propositions to you, we feel that it is worth your giving attention to the language of the Compact, rather than developing a theory which a court may hereafter entirely correct.

Going to another subject, there is just an intimation in the report by a word or two--and I do not want to be critical of words in this statement at all, because we have not the time--but just an intimation of a theory that the Upper Basin is entitled to use water on an average of seven and one-half million acre feet a year under its apportionment under Article III (a) of the Compact. The language of Article III (a), of course, is that each Basin is apportioned seven and one-half million acre feet "per annum," which means obviously, of course, if you take it literally, each year, not an average over ten, twenty, or fifty years, not cumulative so that you may use 3,000,000 one year and 10,000,000 the next. I am not at all sure that the implication which has been mentioned is really anyone's opinion, but it may be, since it is rather basic, worth mentioning.

We come to a subject which I do not want to treat aggressively or belligerently, but very soberly and with all the earnestness at my command. At pages 41 to 44 of the report there is a very condensed statement, first, of the background for the Mexican treaty, and, second, of the terms of the treaty. Both parts of the statement are, of course, much condensed. A condensation of such vast and important subjects does sometimes lead us to implications which are not intended. But I state this to you, the subject mentioned is one of an extremely controversial nature. It is one upon which, for example, six members of this Committee of Sixteen have publicly announced their position as opposed to the treaty, and ten members have announced themselves for the treaty. With that kind of division, if you please, it is hardly to be gainsaid that there must be important and serious factors justifying, probably, the arguments which are made on both sides. I am trying to state this as impartially as I can.

There must be, if you please, some rational things which have persuaded men of serious character and standing to their positions. This treaty is a treaty, which, as the statement in the report shows, would upset the existing law of the United States, since Section 1 of the Project Act says that the benefits of flood waters--I am paraphrasing now--to be conserved by Boulder Dam shall be used "exclusively within the United States." That is the law today. We don't know whether it will continue to be the law forever, but that is the law which binds the United States as well as the states today. It may be that this treaty will be ratified by the Senate and it may be that it will not, and both possibilities are undoubtedly in the minds of the authors of this report and of the officers of the Department.

It seems to be wholly unnecessary to use in this report any statement referring to the Mexican treaty, for this reason, that in the first place the document is an inventory of projects within the United States, and is limited

to that, as is evidenced by the fact that the Mexican allowance which is one and one-half million acre feet, plus whatever more that allowance may be, is not carried into the final computations in this report at all. It is apparently a sort of a fifth wheel and does not affect the results arrived at by the Bureau in its summaries.

That being true, I will make a suggestion in a moment as to what might be done. We feel, gentlemen, very seriously that it is unfair and is out of line for this Department, which is not charged with responsibility for the Mexican treaty, to embody in an official government report material which may appear to the reader to be an argument for or against the adoption of the treaty. It is the business of the State Department to formulate and support such treaties as it sees fit. This Department's duties are to carry out the mandate of Congress from year to year as Congress lays it down. At present the mandate of Congress is clear. We think it is unfair to state in such a document as this such things as the statements appearing at the bottom of page 42, as to what many people fear and as to what is the opinion of some engineers, without naming them. It may be said that many more people do not fear than fear. If you want to count people you are at liberty to do so.

It may be said that there are engineers as fully qualified as those referred to who are not of the opinion expressed in the report. I suggest to you, therefore, that if any such statements should be made it would be at least fair to say that there are as many people or twice as many people who do not fear as those who fear, and that as many engineers are not of the opinion as those who are of the opinion. But I doubt very much if that kind of statement is worth anything to anybody, I mean such a balanced statement, because it does not lead to anything.

In the same paragraph of which I was speaking, some engineers are stated as being of the opinion that Mexico could have used, without Boulder Dam, 2,000,000 acre feet. There is no disclosure that they could not have used it without diversion from the United States side of the line; could not have used it without flood control which they did not have; that they were using all the land they had which was protected from floods. There is no statement that a water supply did not exist to provide the 2,000,000 acre feet. And going on from that, there is the further statement that it is probably possible--whatever that means--probably possible that under the conditions with Boulder Dam controlling the river Mexico might increase her use to 5,000,000 acre feet. That is not in accord with the opinions of the engineers upon whom we, with some justice, rely.

It is in our opinion a false quantity, in that the statute of the United States protects us against any such right being acquired as is intimated. I suggest to you that in view of the possibility that this treaty may not be ratified by the United States Senate, it is perhaps well that government agencies should not aid the Mexican negotiators of the next treaty, if there should happen to be one, with arguments which support their side of the case.

That is a thing which has not been done in the past. It is a thing on which Dr. Mead expressed himself during his life time. In his massive report in the treaty negotiations of 1930 there is positively and plainly set out the limit of Mexican use which he and other able men at that time believed was then

the condition.

We believe, and we very respectfully suggest to you that the whole statement with respect to the Mexican treaty is not only unnecessary but does not advance the purpose for which the report is made, that is, to inform Congress at this time as to what the possible pattern of development in the Basin may be.

For that reason we very respectfully ask that you reflect upon this subject and consider whether the section or the division stating the background of the Mexican treaty and its terms may not be eliminated without doing damage. It is a highly speculative thing at best, and we feel that if you would come to the conclusion to eliminate that chapter, it would eliminate some phases of friction that need not be cultivated.

I come to comment on--I might say to correct, two statements which were put in the record this morning by the able spokesmen from Colorado, as to matters we feel have been misapprehended by them. It is only because they are important that we feel they should be corrected.

First, the one very vigorously made by Mr. Tipton to the effect that the Lower Basin had no right to,--that it was wrong for the Bureau to include in the statement of possible uses in the Lower Basin, more than 8,500,000 acre feet. If I remember his statement correctly, it was to the effect that no use of surplus beyond 16,000,000 acre feet could be lawfully made in the United States until October 1, 1963, and only then when the states have by supplemental compact so agreed. I do not think Mr. Tipton fully considered the statement or meant it to be taken as literally as it was made, because that statement obviously means whatever surplus there is over 16,000,000 acre feet has got to go to Mexico until October 1, 1963. I refer you to a contrary opinion, contemporaneous with the execution of the Compact, expressed within sixty days after the Compact was signed, as contained in the Hoover-Hayden questions and answers in the Congressional Record, which you are all familiar with. This controverts Mr. Tipton's theory, which was not, in our view, the intent of the Compact. It was the intent of the Compact, as Mr. Hoover stated to Congressman Hayden, that there should be no impediment upon anyone's using in the United States what water was needed within or without the apportionments, or within or without the 16,000,000, and there was no intent to force into Mexico's hands the surplus beyond 16,000,000. But that is not all of it.

We respect the Colorado River Compact as a part of the law of the river, but it is not all of the law of the river. The Boulder Canyon Project Act is another important part, and it contains a provision requiring California to adopt, in consideration of the passage of the Project Act, a certain suggested act limiting California's use of water to 4,400,000 acre feet of water, plus one-half of the excess or surplus unapportioned by the Compact.

Now, that is the law. California did adopt the act, specifically in consideration of the Project Act. As we have stated to you before, we consider that that results in a compact between the United States and the State of California, evidenced by these two statutes. The Limitation Act was adopted,

and all of the Upper States and the Lower States, other than California, knew of it and I say approved of it, because the State of Utah shortly thereafter, knowing of these facts, was the sixth state to ratify the six-state compact, and the other states, the other four, which had previously in 1925 adopted resolutions approving the six-state compact, had six months after the adoption of the Project Act on December 21, 1928, to disaffirm, if they so chose, under the conditions prescribed by the Project Act. But they did not do so, and in June, 1929, the President declared the Project Act effective.

I suggest to you gentlemen, so far as California is concerned,--I am only speaking for California--it is too late in the day for you to say that California is not entitled to one-half of the surplus. I suspect very strongly that if the matter were considered sufficiently important by the other Lower Basin States they would affirm that the provisions of the second paragraph of Section 4 (a) of the Project Act, referring to the proposed Tri-State Compact, constituted a similar estoppel against the Upper Basin States. But I do not speak for them, of course.

We stand squarely on the proposition that the Bureau is correct in assuming that the Lower Basin States, which are the only ones at present likely to go into surplus, are entitled to go into surplus, and that the consideration of that surplus as part of their water supply is justified. We feel that the Bureau has correctly and clearly analyzed that situation. It could only be otherwise, if you please, on the assumption that, as Mr. Tipton said to you, until October 1, 1963 that water must go to Mexico. I do not believe you will accept that theory.

A second statement was made this morning regarding which I am less positive. I refer to the statement of Mr. Patterson, which, if I understand it correctly, was that, at least he intimated that, the Upper Basin should not be chargeable with reservoir evaporation loss. Now, I may have misunderstood Mr. Patterson's statement. It may have contained some refined qualification that I did not understand. If, however, that was his intent, it should be corrected.

Ever since the first negotiations on the Compact took place, I believe, reservoir losses in the Upper Basin have universally and uniformly been treated as a part of consumptive use, just as reservoir losses, I think, in every jurisdiction are considered a part of the consumptive use of the project to which they are attached.

So we feel that the Bureau has beyond question followed the accurate line in charging the Upper Basin with such reservoir loss as occurs from evaporation or otherwise.

Now, I said I was a little hesitant about making this statement as to what Mr. Patterson presented to you, because I understood some reference to come into that statement with respect to some natural losses, which might be absorbed in a way which might magnify or which might offset evaporation losses. If I am wrong, then please disregard this statement.

We have, in the very hurried time in which we have approached this matter --may I say that we have worked on it diligently--within the very few days we have had this report, we have obtained certain general reactions which I have tried to present to you in part. We have not gotten to the point where we can say that we understand the report. There is too vast an amount of detail to correlate and get in our heads in the time there has been, and much as others have expressed themselves here today, we cannot either exhaustively or accurately treat the subject.

Some things have occurred to us which might be done to this report by way of very brief amplification, and I will make the requests in order, if you please. They may or may not directly relate to modification of the report.

First, we were very much disturbed in reading the paragraph on page 53, which relates to the acquisition of salt by Green River, in its lower stretches. The description of that condition is not, of course in sufficient detail so that the scope of it can be understood very well. But we are sufficiently disturbed to ask that the Bureau, not necessarily in connection with this report, but in such time as may be available in the future, direct its studies toward the effect of that and other saline conditions in the Upper Basin which may affect the water supply for the Lower Basin.

As you know, we are at the bottom of the river, subject to all the uses of the Upper Basin, and we feel that such study as you may be able to give the subject will be justified in allowing the states of the Lower Basin to understand what conditions we will be confronted with in the future and to what extent we should go to a tremendous expense in order to build works for the use of that water.

A MEMBER: What page is that?

MR. SHAW: Page 53. The next point, we observe that there are overlapping alternative projects reported on throughout the Basin. The only projects reported on in California are the 16,000 acre Palo Verde Mesa Project and the San Diego Municipal Project. There has been under consideration by the Bureau the Chucawalla Project lying between Blythe and Indio, comprising 160,000 acres, I believe. We feel that the project should be at least mentioned in the report with enough description to characterize it, and that if that project is by reason of excessive cost or a deficient water supply, or one which cannot be expected, within the present views of the Bureau, to be constructed, that it may be so mentioned and kept out of the summaries, as was done in the case of the Colorado Great Basin Project and the project near Cisco, Utah. But we do not, if you please, like a fairly substantial sized project to be omitted, and have to say to our people, "Well, we don't know why the Bureau, which has had this project before it for many years in one way or another, does not choose now to name it."

We ask that the third table on page 242 be slightly explained by a footnote. That is the table headed "Potential Developments in Boulder Division by States." It shows Arizona, new land 10,000 acres. This, by the way, is the concluding schedule in the Boulder Division of the report. Arizona, 10,000

acres of new land, no supplemental water, total 10,000, estimated construction cost, $522,500,000; the next item, California, 16,000 acres new land, no supplemental water, total 16,000, estimated construction cost, $28,400,000.

Now, we know from a comparison with other parts of the report that the California estimated construction cost is supposed to cover $3,000,000 for the Palo Verde Mesa Project, and $25,000,000 for the San Diego Project. However, the use of the 16,000 acre figure in this schedule may attract the attention of some eastern Congressman, who will say to himself, "What on earth is the Bureau presenting to us?" It can be, of course, explained in a two-line footnote so that you won't be prejudiced to that extent.

I asked at the opening of this discussion that there be added to the report, as to the Lower Basin, the computation of the water supply under the 1931-1940 conditions, and we trust you will find that a reasonable request.

I have been asked also by several engineers to suggest that you consider the publication as an appendix of all the supporting hydrologic data, on the major stream systems at least, involved in the report, because this report when printed will for a good many years be referred to by engineers, who would like to have, I am sure, the detail which will enable them to comprehend just what the estimates are based on, and how they can properly be interpreted and applied.

Only one more thought, if you please; At the Reno meeting Mr. Riter told us--and I am speaking now from having recently read the transcript--that the Bureau intended, expected or some such expression, to discuss with each of the states the section or portion of the report applying to that state. Now, we have not been consulted. We gather that none of the other states have been consulted, and we quite understand that the time factor has not permitted it, and we do not feel at all hurt. We would very much appreciate it, however, if at the time we furnish you the written statements that we have mentioned, or even before, we might have an opportunity for conference with the officers of the Bureau who have this matter in charge, so that we may get our feet squarely on the ground toward understanding the subject matter and so that we may express in a more detailed fashion than is possible today some thoughts which you may be willing to accept in the way of improving the report. If in the next couple of days there should happen to be any time available, we will be very grateful for the opportunity of sitting down and talking the matter over.

We feel that the Bureau--and this is one thing which has been said many times today--the Bureau has done a magnificent job, a very heavy job in a short space of time, which indicates that sometimes we do our best work under pressure. We feel that the defects of the report are minor, in the main, as compared with the very great and massive accumulation of information contained in it.

(Thereupon a short recess was taken.)

JUDGE STONE: The meeting will come to order, please.

In order to expedite some of the details before we proceed further with

acres of new land, no supplemental water, total 10,000, estimated construction cost, $522,500,000; the next item, California, 16,000 acres new land, no supplemental water, total 16,000, estimated construction cost, $28,400,000.

Now, we know from a comparison with other parts of the report that the California estimated construction cost is supposed to cover $3,000,000 for the Palo Verde Mesa Project, and $25,000,000 for the San Diego Project. However, the use of the 16,000 acre figure in this schedule may attract the attention of some eastern Congressman, who will say to himself, "What on earth is the Bureau presenting to us?" It can be, of course, explained in a two-line footnote so that you won't be prejudiced to that extent.

I asked at the opening of this discussion that there be added to the report, as to the Lower Basin, the computation of the water supply under the 1931-1940 conditions, and we trust you will find that a reasonable request.

I have been asked also by several engineers to suggest that you consider the publication as an appendix of all the supporting hydrologic data, on the major stream systems at least, involved in the report, because this report when printed will for a good many years be referred to by engineers, who would like to have, I am sure, the detail which will enable them to comprehend just what the estimates are based on, and how they can properly be interpreted and applied.

Only one more thought, if you please. At the Reno meeting Mr. Riter told us--and I am speaking now from having recently read the transcript--that the Bureau intended, expected or some such expression, to discuss with each of the states the section or portion of the report applying to that state. Now, we have not been consulted. We gather that none of the other states have been consulted, and we quite understand that the time factor has not permitted it, and we do not feel at all hurt. We would very much appreciate it, however, if at the time we furnish you the written statements that we have mentioned, or even before, we might have an opportunity for conference with the officers of the Bureau who have this matter in charge, so that we may get our feet squarely on the ground toward understanding the subject matter and so that we may express in a more detailed fashion than is possible today some thoughts which you may be willing to accept in the way of improving the report. If in the next couple of days there should happen to be any time available, we will be very grateful for the opportunity of sitting down and talking the matter over.

We feel that the Bureau--and this is one thing which has been said many times today--the Bureau has done a magnificent job, a very heavy job in a short space of time, which indicates that sometimes we do our best work under pressure. We feel that the defects of the report are minor, in the main, as compared with the very great and massive accumulation of information contained in it.

(Thereupon a short recess was taken.)

JUDGE STONE: The meeting will come to order, please.

In order to expedite some of the details before we proceed further with

acres of new land, no supplemental water, total 10,000, estimated construction cost, $522,500,000; the next item, California, 16,000 acres new land, no supplemental water, total 16,000, estimated construction cost, $28,400,000.

Now, we know from a comparison with other parts of the report that the California estimated construction cost is supposed to cover $3,000,000 for the Palo Verde Mesa Project, and $25,000,000 for the San Diego Project. However, the use of the 16,000 acre figure in this schedule may attract the attention of some eastern Congressman, who will say to himself, "What on earth is the Bureau presenting to us?" It can be, of course, explained in a two-line footnote so that you won't be prejudiced to that extent.

I asked at the opening of this discussion that there be added to the report, as to the Lower Basin, the computation of the water supply under the 1931-1940 conditions, and we trust you will find that a reasonable request.

I have been asked also by several engineers to suggest that you consider the publication as an appendix of all the supporting hydrologic data, on the major stream systems at least, involved in the report, because this report when printed will for a good many years be referred to by engineers, who would like to have, I am sure, the detail which will enable them to comprehend just what the estimates are based on, and how they can properly be interpreted and applied.

Only one more thought, if you please; At the Reno meeting Mr. Riter told us--and I am speaking now from having recently read the transcript--that the Bureau intended, expected or some such expression, to discuss with each of the states the section or portion of the report applying to that state. Now, we have not been consulted. We gather that none of the other states have been consulted, and we quite understand that the time factor has not permitted it, and we do not feel at all hurt. If in the next couple of days there should happen to be any time available, we will be very grateful for the opportunity of sitting down and talking the matter over.

We feel that the Bureau--and this is one thing which has been said many times today--the Bureau has done a magnificent job, a very heavy job in a short space of time, which indicates that sometimes we do our best work under pressure. We feel that the defects of the report are minor, in the main, as compared with the very great and massive accumulation of information contained in it.

(Thereupon a short recess was taken.)

JUDGE STONE; The meeting will come to order, please.

In order to expedite some of the details before we proceed further with

the discussion of the report, details which must be taken care of before the Committee of Sixteen adjourns, we have here the financial statement for the past year. The Chair will appoint a committee to go over it so that when we reach this there will not be that delay. If there is no objection on the part of the Committee, I wish to appoint General Giles, Mr. Fred Wilson, and Mr. Shaw.

There is one explanation. There is an item of $20.00 for mimeographing financial statement, which should not be included, and that should be deducted from the items of expenditures. I will ask the committee to keep that in mind, and I will hand to the members of that committee copies, so that we will save time. I am not taking it up now. I am giving it to you so that you can be going over it. I will just pass a copy out to all the members of the Committee. That item of $20.00 should not be included. It is charged in favor of Colorado, and it should not be included. Have all the members of the Committee a copy?

Mr. Hewes requested after Mr. Shaw got through with California, that the power group, I believe, be given further time, if desired. Was that not your request?

MR. HEWES: Mr. Chairman, I think the Power Allottees have completed their presentation, and I just wish to make a few remarks in closing.

I wish to express California's appreciation for the opportunity and the courtesy and consideration that was given to her in presenting her case. I wish also to emphasize that I do not believe it is possible for anyone to listen in on the sessions here the last day and a half without being additionally impressed with the many complexities and complications in the economic development of the Colorado River Basin. Certainly we must realize, more so than ever before, the necessity for cool, deliberate, intensive studies and analyses of how we are going to use these great natural resources before arriving at decisions and conclusions as to disposing of them.

To our friends in the Bureau of Reclamation and the authors of this document I wish to ask that they accept California's friendly suggestions and criticisms, as asked for by them, in the spirit that they have been given.

Thank you again for your tolerance and courtesy, Mr. Chairman and Ladies and Gentlemen.

JUDGE STONE: Except for details which will be taken up immediately preceding the close of the meeting, the balance of the time, such time as needed, will be devoted to a further general discussion, in order, if possible to arrive at some definite action or statement or position by the Committee of Sixteen. Whether that will be attained or not I do not know. We will find out, then. Whether that will be attained or not I do not know. We will find out.

You must also keep in mind that we must afford to the Bureau of Reclamation sufficient time, after it has had the benefit of any further discussion it may occur, to make such comments as Mr. Warne or his associates may care to make with respect to any recommendations or comments which have been made

the discussion of the report, details which must be taken care of before the Committee of Sixteen adjourns, we have here the financial statement for the past year. Thank you again for your tolerance and courtesy, Mr. Chairman and Ladies and Gentlemen.

JUDGE STONE: Except for details which will be taken up immediately preceding the close of the meeting, the balance of the time, such time as needed, will be devoted to a further general discussion, in order, if possible to arrive at some definite action or statement or position by the Committee of Sixteen. Whether that will be attained or not I do not know. We will find out.

You must also keep in mind that we must afford to the Bureau of Reclamation sufficient time, after it has had the benefit of any further discussion that may occur, to make such comments as Mr. Warne or his associates may care to make with respect to any recommendations or comments which have been made

during the past two days by the representatives of the states, and we will afford ample time for that, Mr. Warne, if it seems necessary.

MR. WARNE: Thank you.

JUDGE STONE: And I believe you would prefer that that be reserved until we conclude further discussion and before any action is taken.

MR. WARNE: Yes, sir, at the close of your discussion or thereabouts.

JUDGE STONE: And before any action is taken.

MR. WARNE: Yes, sir.

JUDGE STONE: Very well.

JUDGE STONE: Now, we should pursue further discussion as expeditiously as possible and I hope without unnecessary controversy. The whole effort of this Committee has been to avoid it, but on the other hand, we have found that it has been healthy for representatives of the interested groups to clearly and plainly state their positions, and that has been evidenced this morning and this afternoon.

Before we do conclude this discussion, the Chair has a brief statement which he wishes to make, and I will reserve that until after we hear the other discussion.

In order to save time, I believe we had better proceed on the basis, unless there is an objection to it, of having anyone wishing to discuss it, to have him announced by a member of the Committee from his state. So if you have anything to discuss you should get in touch with or communicate that to a member of the Committee. I am doing that because there are nearly one hundred people here, and if we just throw it wide open, we may get into endless discussion.

I will now start with the states, and ask if there is further discussion on the part of Arizona.

MRS. BUSH: Not any.

JUDGE STONE: Nothing on the part of Arizona?

MRS. BUSH: No.

JUDGE STONE: California?

MR. HEWES: California passes, Mr. Chairman.

JUDGE STONE: The next state is Colorado. I will ask Mr. Delaney to call on anyone who wishes to speak.

MR. DELANEY: I understand Mr. Tipton has some further remarks to make, Mr. Chairman. Mr. Tipton.

MR. TIPTON: Mr. Chairman, Gentlemen, and Mrs. Bush: My remarks will be very brief. As usual, I can agree with a good deal of what my good friend, Mr. Shaw, says, but not all of it, and these remarks will be directed squarely at the subject matter, suggestions to the Bureau.

Mr. Shaw spent some time discussing the section of the report which had to deal with the Mexican treaty. I think that several points Mr. Shaw brought out require serious consideration.

I do not believe that the presentation in the report should be in any way unfair. As Mr. Shaw stated, if there is a discussion of the treaty, I think certainly it should show that there are two sides to the question as far as the United States interests are concerned.

And then I want to make this statement: Everybody in this room, I think, has the same objective in so far as the Mexican situation is concerned, and that is to hold any allocation to Mexico of waters of the Colorado River down to the lowest possible quantity. I think the only difference in the interests is in the appraisal of the situation. One group appraises the situation one way and another group appraises the situation another way, and it leads to a difference of opinion as to whether the pending treaty does apportion to Mexico the lowest amount of water possible.

Now, since we do have this common objective, I agree with Mr. Shaw that it would be unwise and rather dangerous to have in a published report anything that could be used by Mexico for ammunition in the future if this treaty fails of ratification. The treaty may fail of ratification. If this report comes out as a Senate document or a House report it becomes permanent, and we do not want anything in that that Mexico could use in the future to her advantage, some statement by a federal agency of the United States.

I do not know how that can be handled. I do not agree entirely with Mr. Shaw that the entire situation on the pending treaty should be eliminated. If it is eliminated, I would strongly urge that it be incumbent upon the Bureau to mention that the Colorado River Compact and the Boulder Canyon Project Act recognize that a treaty may be negotiated with Mexico apportioning water to her, and the Compact sets up a certain class of water for that purpose. Not only does it do that, but it states that if that is not sufficient, the deficiency must come out of the 16,000,000 acre feet apportioned by Articles III (a) and (b) of the Compact.

So the Bureau is attempting to paint a picture here, and in doing that it must consider the available water supplies, and in considering the available water supplies it must recognize that there may be some allocation of water to Mexico; it must recognize that the states themselves have agreed to that by Compact, agreed to an allocation, agreed that if there is an allocation that a certain kind of water be used for that purpose, it even might take all the surplus and cut down into the 16,000,000 acre feet. So the Bureau would be very remiss in its duty if it does not bring those matters clearly out in the event that this chapter on the pending treaty is eliminated. I think it would be well to bring that out anyway.

I will not say anything about the question of surplus, I think that has been covered by someone else.

I want to endorse what Mr. Shaw has said about the data included in the report which is quite helpful. I want to endorse what he said about the water supply available to the Lower Basin in the ten-year period. Repeating what I said yesterday, it should not be based upon just the average of the stream flow as of that time, but should take into consideration, of course, whatever water there is available from reservoirs, stored waters from flush years, the same way you treated the delivery at Lee Ferry.

I feel it would be helpful and only fair that the Bureau discuss a little more the quality of the water. I agree with Mr. Shaw on that. I don't know whether the Bureau is in a position to do that under the existing data. It is only fair to the Lower Basin that that should be done. It is not so much of a problem in the Upper Basin. It might be in some sections. In sections where it is or might be a problem that should be pointed out.

I want to clear up one thing, Mr. Shaw, Mr. Patterson's suggestion about reservoir evaporation. I think you probably did misinterpret that. The Upper Basin assumes, and interprets the Compact in such a way that reservoir evaporation shall be charged against its allocation. Mr. Patterson's point was that only new losses on the river occasioned by reservoirs should be charged; in other words, natural losses that had already taken place should not be charged to evaporation, but that there should be deducted whatever loss formerly took place in the Basin from transpiration and water loss in the stream.

That is about all I have to say. I could say something about California's claimed surplus, but I think somebody else can do that.

MR. DELANEY: I wish to call on Jean S. Breitenstein, the attorney for the Colorado Water Conservation Board.

MR. BREITENSTEIN: Mr. Chairman and Ladies and Gentlemen: I have just two things I want to mention. They both arise from Mr. Shaw's presentation. In saying what I have to say I realize this is not the place to make any legal arguments whatsoever.

The first has to do with Mr. Shaw's statement that the figure of 7,500,000 acre feet as used in III (a) of the Compact is an annual figure and not an average figure. Of course, Mr. Shaw and all the rest of you realize that the same language applies to the Upper Basin as applies to the Lower Basin. If 7,500,000 acre feet is an annual figure for the Upper Basin, it is likewise an annual figure for the Lower Basin, not an average figure. Also the same language is used in paragraph III (b) of the Compact with reference to the allocation of an additional 1,000,000 acre feet to the Lower Basin. There again the language is the same, and if the Upper Basin is to be treated as entitled to seven and one-half million acre feet on an annual basis, the whole eight and one-half million acre feet to the Lower Basin is on an annual basis.

The other thing I wish to mention has to do with surplus. Mr. Shaw was critical of Mr. Tipton's presentation this morning when he criticized the method

which was followed by the Bureau in the treatment of the water supply in the Lower Basin. He stated, as I understood it, that California, at least, of the Lower Basin, took the position that under the Boulder Canyon Project Act and under its contracts it was entitled to at least half the surplus. I merely wish to direct your attention to some of the other language in the Project Act, Section 4, the one which mentions the limitation upon California. The first paragraph winds up this way, after referring to the 4,400,000 acre feet, "plus not more than one-half of any excess or surplus water unapportioned by said Compact, such uses always to be subject to the terms of said Compact." And then again I believe it is Section 8 of the Project Act that refers to the Colorado River Compact generally, and it has this language, after referring to the united States, its permittees, licensees, contracts and uses, requiring the observation of the Colorado River Compact, and then it says, "Nothing in this Act to the contrary notwithstanding," therefore the Compact must be complied with, anything in the Act to the contrary notwithstanding.

Now, we all know that under III (f) of the Compact the surplus is not subject to apportionment until 1963, and then only if one of the Basins has attained full use of its water. The point, as I understand from Mr. Tipton's statement this morning, is that California and the Lower Basin do not have any firm right, under any provisions of the Compact, to that water, which is not subject to apportionment between the states before 1963. If it is subject to apportionment, no state and no individual or group of individuals within a state can claim or assert a firm right to that water.

MR. DELANEY: That is all for Colorado, as far as I know.

JUDGE STONE: Nevada. Mr. Smith.

MR. SMITH: No further statement from Nevada.

JUDGE STONE: New Mexico.

MR. WILSON: Mr. Chairman, I notice some of the states have intimated that they are going to file with the Bureau of Reclamation written statements sometime within the next few days. If that is done--perhaps some of the states do not intend to do that--I wonder if they would send copies to the Chairman, so that the other states may have copies of whatever each state submits. Is that agreeable, Mr. Shaw?

MR. SHAW: Certainly.

MR. WILSON: I believe I have nothing further on behalf of New Mexico, except I would like to take advantage of the opportunity to compliment Mr. Shaw on the very fair manner in which he presented California's case, and I am sure his remarks were directed to the Bureau. It will be up to the Bureau to weigh these suggestions and comply with them or not comply with them, as the Bureau feels best.

Insofar as the controversial matter with reference to the treaty is concerned, I feel sure the Bureau will and should give careful consideration to

the suggestions made by Mr. Shaw and Mr. Tipton.

Now, may I say in closing, it is obvious that some reference will have to be made to the treaty and the obligations to the United States and to Mexico. So offhand I make a suggestion, and may I say facetiously that this suggestion might be handed to you for what it is worth, that you might set up the Compact or the provisions of the Compact or the treaty or the Boulder Canyon Project Act, and then copy the custom of the radio stations and put in a footnote and say something like this: that any expressions of opinion as to any interpretation of the Compact or the Boulder Canyon Project Act in reference to the treaty are purely co-incidental and do not reflect the opinion of the Bureau. (Laughter.)

JUDGE STONE: Utah.

GENERAL GILES: Mr. Chairman, in looking over what the Bureau has said about dividing the water with reference to the treaty between the United States and Mexico, or the proposed treaty, it seems to me that they are almost compelled at least to say this; "Irrigation has now been developed to such an extent that all interested people should know with reasonable certainty the ultimate limit and respective rights to divert and use water of the river in order that existing developments may be made secure and sound plans may be formulated for the utilization of additional water of the river." I cannot see anything wrong with that paragraph. The only paragraph I see anything wrong with, which may be interpreted as proof that the Bureau has taken a definite stand on this matter, is that last paragraph on page 42; and I believe Mr. Shaw would concede that there is nothing else on that page, except that paragraph, that could jeopardize the Lower Basin or the Upper Basin, or anyone else interested in this matter.

VOICE: What is the last paragraph?

GENERAL GILES: "There is pressure for an international agreement because many people fear that time now runs against the interest of the Basin States."

Do you want me to read it all?

VOICE: Yes.

GENERAL GILES: "It is reported that Mexico has over 1,000,000 acres of land which could be irrigated with water from the River. If this land were fully developed about 5,000,000 acre-feet of water could be diverted annually from the River. Mexico has been rapidly increasing her use of the water of the River. In 1943 she diverted in excess of 1,800,000 acre feet. Prior to the regulation of the River by Boulder Dam, Mexico had used approximately 750,000 acre feet of water a year on her lands. Some engineers are of the opinion that without regulation of Boulder Dam, Mexico's use could possibly have approached but very probably could not have exceeded 2,000,000 acre feet of water annually. With the River regulated by Boulder Dam it is probably possible for Mexico to increase her use to approximately 5,000,000 acre feet annually."

Then it goes on with the provisions from the treaty itself. I do not know, Mr. Shaw, I think that the comments in this report are all right except for that paragraph, if we are going to make any decision on that question.

JUDGE STONE: Any further statement from Utah?

MR. WALLACE: The only statement I would care to make is that the Compact is the law of the river and the Compact and the provisions thereof cannot be changed without the consent of the State of Utah.

JUDGE STONE: Any further statement from Utah? If not, we come now to Wyoming. Mr. Bishop.

MR. BISHOP: Mr. Rollins would like to say a word.

MR. ROLLINS: I don't care to say anything particularly. However, reference was made to the condition of the water when it reaches California. I wanted to say for Mr. Shaw's benefit and others that when it left Wyoming it started out just as clean and white and pure as possible, and we are not going to be responsible for what happens to it as it goes through the other states. (Laughter.) I think that is about all.

JUDGE STONE: I trust that the Chairman may be excused for taking just a few moments to comment upon the procedure principally with respect to this report and what may be the procedure hereafter. I take it that the Bureau will desire some further expression from the Committee, and I also assume that the Committee would not wish to take any definite action or suggestions in that respect until we hear some further remarks on the part of Mr. Warne and his associates.

There are, however, some broad, over-all matters involved in this consideration, which I feel have either not been mentioned or in some cases, perhaps, not fully enough expressed.

First, I should like to emphasize the long and involved history of the Colorado River. Someone has remarked that the Colorado River is peculiar in that it lies wholly in an arid region, and that we do not have on the Colorado River, perhaps, the involved and complicated problems of such rivers as the Missouri, that river flowing through arid and semi-arid regions and a humid region and where there are conflicts between uses of water. That in a sense may be true. In another sense, those who have been engaged in attempting to settle the Colorado River water problems over the many years may realize that perhaps there are more involved and more complicated problems in the Colorado River Basin.

In the first place, we have been fortunate in that we have had a compact, even though we began to see signs and have seen signs for some time of a difference in the interpretation, and yet we have, as the Legislature and Congress have sometimes established, a law of the river.

It seems to me that we cannot overlook one outstanding matter which is not peculiar to the Colorado River but is peculiar to the whole West. There is

nothing which comes so closely to the people of the West as anything which has to do with the utilization of the water resources. When we get into a state we find that there are often intrastate problems which are difficult. Therefore, that is the great reason why meetings of this kind should be held with these interests, and these situations should be fully reviewed and considered by the Bureau of Reclamation and any other agency, not that the states wish to be unduly obstreperous or unduly concerned over their rights, but in my judgment in the interests also of the Bureau of Reclamation, because, after all, the Bureau of Reclamation is the agency that serves the West, and the welfare of that agency is very closely related to the welfare and the interests of the states.

And so when we consider what should be done with respect to this report, we must keep in mind what we do here and should not do here have not only a bearing upon the states, but in my judgment, upon the welfare and the progress that the Bureau of Reclamation may be able to make in the future.

There have been expressions made here today with respect to delay that may in the minds of the Bureau sound a rather sour note, namely, that we have said we have not had time to adequately study this report, and that we can neither agree with it nor disagree with it. It might then be concluded that we are, gentlemen, willing to listen to your report. We have our own ideas. We are not going to tell you whether we agree to it, and we are not going to tell you whether we disagree. That flat impression, of course, has been overcome in a measure by the definite suggestions made on the part of some of the states.

Now, that brings me to one other overall consideration of the matter of overall policy. It seems to me the states have been clamoring for a long time that when project developments are undertaken, either in the investigational stage or farther along, the states' rights and interests be considered by the interested federal agency. We cannot sustain that position, if when we are given an opportunity to offer our comments we do not proceed in a constructive manner. It seems to me that if the states do not take a constructive, helpful attitude the time may well come when the existing federal agencies will find out it is quite impossible to make progress, and the only solution is the creation of a dictatorship on these river basins, and thus far we have said that we are opposed to that sort of thing. We like too well and we believe too much in the existing federal agencies.

However, there runs a corollary to that proposition. The corollary is that even though we may seem sometimes to unduly ask for a delay, to be too vociferous in expressing our views, there is a very definite obligation on the part of the federal agency to afford the interests directly affected an ample and full opportunity to be prepared to express any views of a few groups in a state and all the interested groups in a state, and when a state attempts to do that it takes time.

I do not wish to review the situation in the State of Colorado, but I do know that it is the policy of the State Water Board, of which I am the Director, to be mindful of all of the interests within the State of Colorado. We cannot act wisely or constructively unless there is afforded an ample opportunity to go into these matters, and to understand these reports and the procedure which

is ahead of us.

I just make that statement to come to the final conclusion, that in connection with this we should mention the functions of this Committee. This Committee has been functioning since 1937. We have had our days when we were all, perhaps, together and agreed very decidedly. We have had other times when we have disagreed, and I think it should be said that when we have disagreed it has been an honest disagreement, and that such disagreement has not occurred until ample effort was made to work out those disagreements.

When this Committee started out we had in mind the provisions of the Project Act providing for a plan of comprehensive development, as we viewed it. Then we thought that as this plan went along an opportunity would be afforded to discuss and consider proposed project development, and in that way prevent a lopsided, inequitable or unfair development so far as the relative interests of the states were concerned.

In recent times, however, there has arisen the policy, apparently, of developing basin-wide reports and as far as possible comprehensive basin plans of development. Anyone will agree, I am sure, that we should cut the pattern and attempt to reach a time when a comprehensive plan of development may be realized, but that cannot be done without a full understanding, not only of the national interests, but also of the state interests and the interests within the states, and that is no small job. It is particularly involved in the Colorado River Basin, and just as fully involved within some of the individual states, perhaps all of them.

So it seems that upon this policy of developing a report for the entire Basin the Bureau has come here and presented one. As someone said, we have asked for it. It is what we have stated in the past was ultimately needed. We did not know when it could be accomplished.

The question before this Committee, it seems to me, is primarily this: Is this the type of report which will adequately protect the interests among the various states, the interests within the states, and is it the type of report which will expedite development? We all desire that development. This report has been variously described by the Bureau itself and it has been variously interpreted by some of the representatives of the states. It has been referred to as a tentative plan of comprehensive development. It has been referred to as a pattern of development. It has been referred to as nothing more than an inventory of projects. Now, I profess that the Bureau had a very difficult matter to consider when it decided upon what type of report should be gotten out.

I can see two possible plans; first, that it should be only an appraisal of the water resources within the Basin, including present uses and what is available for future use, and that in connection with that it would include an inventory of possible development; and that the purpose of such a report would be to indicate to Congress, to the Budget Bureau, and to all interested federal agencies the desire and the need for expediting the completion of investigations and obtaining the money for the construction of projects found to be feasible. That sort of procedure would be clear and would not be difficult. However, I

presume that in determining the nature of this report some had in mind a plan and a pattern of future development and the framework of the resources for future development.

Now, it is quite unnecessary for me to again reflect our high regard for the splendid job the Bureau has done in the short period of time. I do not question that in the least. But it seems to me that neither objective has been attained. It is neither a mere inventory of projects, together with an appraisal of the water supply and the present uses of the water, nor is it a complete nor can it be a complete pattern or plan of comprehensive development.

However, as evidenced by the remarks here made on the part of Mr. Tipton and Mr. Shaw and those from other states, there are involved in this report unmistakable principles and questions of a framework of future development, and there are serious implications and questions as to that framework. If that is true, then, it seems that not only would it be inadvisable for the Bureau, but it would be inadvisable for the states to proceed with encouraging a hasty completion of this report to Congress in January, 1945. I know, I think we know, how things proceed in Washington. If such a report is made, and if major questions of future ultimate development are not fully understood and in a substantial way agreed to rather implicitly in such a report, then when it comes before Senatorial or Congressional committees we are apt to find from one state or another disagreements with that report, indicating that it is something that the Congress could not safely proceed with.

Now, we want a report which can be a basis upon which we can proceed, and proceed expeditiously. It seems that if this report could be an appraisal of the water resources, a statement of the present development and an indication of the great need for future development, and if then periodically we could revise and change or develop it gradually, may I put it, into a plan of development, we would be proceeding in a way which is in keeping with the problems and questions which we can work out today.

Mr. Page or someone has said to us, "Do not indicate to us an entire change in policy in the form of this report, because we do not have enough time to do it." I am violating that injunction, but I am trying to do it in order to be helpful.

Now, there is one other thing which I think should be mentioned. We all of us know that in a large part of the Colorado River Basin States we have attained practically the limit of development under private financing, and that any extensive development in the future must be through some form of federal financing. We further know that on the basis of these figures that are presented in this report and on the present basis of the 1939 Reclamation Act and on the basis of the present policy in Congress, so far as we know it, most of what is in this report, or a large portion, at least, of what is in it--and it is true of my own state--could not be built, because it could not stand up under the present policy of justification. We have no evidence yet that that policy is to be changed by Congress. It is quite apparent that if we are to proceed in the West as we hope to and develop many millions of acres of new land and create new farms and new homes, there must be some change in policy. This report is

written upon the basis of the present policy, and I think we all know that even our present policy, sound as it is, is not fully subscribed to by Eastern interests, and this report with the figures of the large costs and the estimates based upon present unit costs, etc., may well result in deterring rather than influencing increased reclamation development in the Colorado River Basin.

All of the wealth of these states, new wealth, has got to come from a natural resource, and that resource is the water in the Colorado River. There is a tremendous problem here when it comes to cutting the cloth, cutting the pattern of future resource development.

The fact that the Bureau has gotten into it is clearly indicated by the matters of somewhat controversial nature discussed here this afternoon. I feel that we should be as helpful as possible, but I do not think that the states have had the time nor the opportunity to fully understand and analyze this report, to be as helpful as we should be. I further feel that if adequate time were allowed, or if the type of this report could be changed, that it would put the Bureau and the Reclamation program in the Colorado River Basin on a much sounder basis.

I am making these statements as an overall proposition, with the idea of thinking out loud in an effort to suggest that we want to be as helpful as we can, but I sincerely believe that we ought to allow--I am not thinking in terms of years, I am thinking in terms of months, possibly, but I believe that further time must be allowed if we are to be helpful and if we are to accomplish the purpose which is intended by this report.

This report should not be a matter of expediency in getting money. Badly as we need appropriations, we should not get ourselves into a bad situation in the future, and we should not amplify and increase controversies in the states merely because we want to get money for a project. There are other considerations which are basic and more important, realizing as we do that the best protection of water is the utilization of it.

I probably have made my statement too long.

MR. HEWES: May I have the privilege of the floor for a few minutes for Mr. Howard?

MR. HOWARD: Mr. Chairman, I fully agree with Mr. Breitenstein that this is not a forum in which to discuss purely legal matters. The time will probably come when we will have to settle some of these basic differences of opinion. We could argue all night and not get anywhere.

However, inasmuch as the record here shows in outline form, at least, the theory upon which the Upper Basin group has applied what is called the law of the river, it seems to me appropriate that in similar sketchy and outline form the theory presented by the California interests should appear in the same volume, and with your indulgence I will attempt to outline it as briefly as may be.

It has been stated that the Colorado River Compact is the law of the river. With that we can agree.

There is, however, another compact brought about by reciprocal legislation between the United States and the State of California. That compact has been fairly consistently ignored and not in any way recognized in discussions that have been had with respect to the river.

It is, I think, a well recognized principle of law that every document will be given effect so long as there is no inconsistency, and in the event of inconsistency the question arises which shall prevail. There is no inconsistency between these two compacts. One of them, the Colorado River Compact, measures the rights of the subscribers to that compact. It is a contract, and is determinative of the rights of the parties with respect to the subject matter.

To illustrate what I mean, if the United States says through treaty they have to allocate water to Mexico in the amount of 1,500,000 acre feet or any other amount, as between the states, I have no doubt the Colorado River Compact will control the method by which that water shall be supplied. So that so far as the relations between the parties to that agreement--and that is all it is--are concerned, it is the controlling document. However, there is this other document or reciprocal legislation. There is ample case law to support such a compact between the United States and one of the states of the union, evidenced by reciprocal legislation in that manner. It is evidenced by the Boulder Canyon Project Act, and the California Water Limitation Act. A certain agreement was made in the language of the acts. The Project Act says that California must, in consideration of the passage of the Project Act, limit itself in a certain manner. California on its part says, in consideration of the passage of the Project Act, we agree to certain limitations. This is not made for the benefit of Mexico, it is made for the benefit of the other states of the Basin. In that second compact words are used which indicate that the benefits of the Boulder Project shall be exclusively for the United States. There is nothing inconsistent with the Colorado River Compact in that language. There is no language in the Colorado River Compact which reserves to the United States the right to take any part of the Colorado River water and apportion it to a foreign country. All the Colorado River Compact says is in the event that shall be done, certain results will flow therefrom, so that the United States was at perfect liberty to contract and agree with the State of California. So far as the Boulder Act is concerned, the benefits of that project should not extend to the Sister Republic. Water rights and other contract rights are relative, that is, a man may have a preferred right against "A" and a defeasible right against "B". Looking at our rights, I think we must consider relative rights as between California and the states of the Upper Basin. The Colorado River Compact will no doubt control as between the states. As between the United States and the State of California, the statutory compact to which I refer will no doubt control, there being no inconsistency.

I say these things in a fairly dogmatic fashion. I think Mr. Breitenstein, Judge Stone, and the other legal lights of the Upper Basin and the Bureau of Reclamation will agree that no opinion with respect to the water rights of the Colorado River is so divinely inspired as to be unassailable. I do not think anyone can say that the position I have asserted is so out of line or so unreasonable as to be unsupportable, I believe, when the law of the river is stated. Mr. Tipton suggested that it would be proper for the Bureau of Reclamation to state that the Colorado River Compact is the law of the river. I

think if that be done it is only fair and right that the Bureau of Reclamation should also state the other compact, which is also the law of the river, and so long as they are not inconsistent, they both should be given effect.

Thank you very much, Mr. Chairman for the opportunity to say this. I hope I have not incited an argument. I am merely making the statement in a very sketchy manner. I think the record should show at least a hint as to the theory on which California has proceeded. I hope the representatives of the Bureau of Reclamation will give some consideration to that second compact.

I thank you.

JUDGE STONE: If there is no further discussion, I think now we should call upon --

MR. HEWES: May I ask Mr. Shaw if he has any comments?

MR. SHAW: General Giles has told you what I would concede with respect to the statement about the Mexican treaty. Unfortunately the subject matter requires such close analysis that I cannot accede to the statement which he has made for me, and it will take a little time for anyone to receive an analysis of the details of these three or four pages of the report intelligibly enough to get any real conclusion.

I rather incline to accepting Mr. Tipton's idea that there should be a plain statement in this document of the provision of the Colorado River Compact with reference to Mexico, not in Mr. Tipton's words, though. Mr. Tipton inserted words in the statement of the Compact provision which aren't in the Compact. Unfortunately there is something there which would take too long to argue out. If we could have a comparatively brief time in discussion of this subject, I think a statement could be arrived at which would fully comply with Mr. Tipton's expression, with my own, and probably satisfy General Giles too.

One further remark while I am on my feet, with the risk of injecting a sour note into the proceedings, and still with the utmost good humor. The Chairman has made one remark that I think must be noted. That is that we have had an opportunity to study this document. Respectfully I say that we have not had a genuine opportunity to study it. Perhaps a dozen of us in this room have had a chance to read it. Most of us have had nothing but a chance to look at the cover or a few words inside, perhaps. That is not a thing I blame anybody for. I understand the time element, and unfortunately we cannot, in the manner the Bureau has requested, be of the service which we should.

As I believe Judge Stone has said, we are obliged, therefore, to disavow, and ask that we never be charged with any genuine examination of this document prior to today. We hope we will get further time to consider it.

MR. TIPTON: Just to keep the record straight, I think, Mr. Shaw, my position was that I would prefer to have in this report some discussion of the pending treaty. I think the present one should be modified, but if the Bureau chooses to eliminate it, then I suggest the other alternative.

MR. SHAW: If it is done in the words of the Compact I think we will all be happy about it.

MR. WILLIAMS: Mr. Carson has a few remarks.

MR. CARSON: I have listened to this discussion about the inclusion or the exclusion of the Mexican treaty from this report. I am inclined to agree with Mr. Giles that there should be a statement in this report at least indicating the provisions of the Compact which provide for the delivery to Mexico, in the event of a treaty, and call attention to the fact that there is, and we must concede, some obligation to Mexico, although it might not yet be measured. I think Mr. Giles' suggestion of the elimination of that paragraph might answer the purpose. I agree that there should be nothing in this report that could ever be used to give any comfort to Mexico in the event this treaty now pending should not be ratified. We must at all times, I think, be very careful to give no publicity to any official statement that would give any comfort to Mexico for any greater quantity of water, because we are all trying to hold down the allotment to Mexico to the smallest quantity.

One other comment on the question of surplus water now included by the Bureau in its calculations of the available supply in the Lower Basin. I take it from Mr. Breitenstein's statement that he would not contend that nobody can use that surplus water until 1963. The statement is that nobody can acquire a firm right to it until 1963. In the meantime it can be used in the Lower Basin, subject to reapportionment in 1963, whether or not the California contention of a legislative compact has settled the question, because Paragraph III (e) of the Colorado River Compact provides that the states of the Upper Division shall not withhold water, and the states of the Lower Division shall not require delivery of water which can not be reasonably applied to domestic and agricultural uses. In other words, this compact was devised for the reservation of the rights and the protection of the rights of the Upper Basin States in order to permit developments to proceed in the Lower Basin and in the Upper Basin, and there is not in this compact any implied prohibition against the use of surplus water prior to 1963. It is, however, subject to reapportionment, unless California's contention as to a legislative compact should prevail. That is a question we do not now need to face, because under the language of the compact, water available in the Lower Basin is available for use in the Lower Basin.

MR. BREITENSTEIN: I did not say the Lower Basin could not use the water. My position was it had no firm right to use it. Arizona might be entitled to the surplus, California or the Upper Basin might be entitled to the surplus, and we certainly are not giving away our rights to it now.

MR. CARSON: That is right.

JUDGE STONE: Mr. Warne, at this point have you some comments to make?

MR. WARNE: Well, I hate to think what would happen if you gentlemen had had time to read this report. (Laughter.)

Let me say, not because of any particular statement that was made, but

because of the tenor of a number of them, not all of them, that we are not attempting to put any of you on the spot by sending you a report a few days before the scheduled meeting. I want to say that we are not trying to put you gentlemen on the spot by presenting the report to you so short a time before this meeting. We are not asking you to endorse or approve the report or commit yourselves to it, or to commit yourselves to be bound by it. As a matter of fact, we ourselves are not bound by the report in the form that it has been presented to you. Every one of these copies has stamped upon it on the front cover this note: "Confidential. This report is in tentative form and is not to be published or given general circulation. It may be materially revised in the final form to be issued." That note applies equally to the paragraphs of the report that various ones of you have read into your record here.

The purpose of making available to you the report in its existing form was to seek your aid, your comments, and your discussion for the guidance of the Bureau in its attempts to bring the report into a final form. We have had many very, very helpful suggestions both yesterday and today, and I think we have a good deal of work yet to be done on the report itself.

Now, I should like to talk from a series of notes that I made at random during the various discussions, and therefore the presentation will not be orderly, and it will not have any particular sequence.

First, we would be glad to discuss the details that the individual states propose here, with the representatives of anyone who would like to discuss them. Mr. Riter and the rest of us will be available around here for several days to come. We had planned to hold a meeting ourselves tomorrow beginning at ten, and probably these discussions would have to wait until Monday or some later time.

The suggestions that have been made with regard to the discussion of the treaty in the report I think are very pertinent, and I assure you they will be given the utmost consideration before the report is completed and issued in final form.

Many questions were raised bearing on the different angles of the problem of why issue a report at this time, ranging all the way from couldn't we wait until January 5, to why issue a report at all. This report may have been compiled hurridly and in the space of a few months, but the report has been in preparation for a great many years, as you know. Information that has been gathered at great expense and over a period of more than a decade has been summarized and set down here for the consideration of the peoples of the Basin. Some say, "How can you issue a report before we have completed an Upper Basin Compact?" Another speaker will and did say, "How can we reach an Upper Basin Compact until you have issued a report?" We are confronted with the problem here of which came first, the hen or the egg. We have this information. I do not see how we can expect the states of the Colorado River Basin ever to solve their problems until we make this information available to them. That is one very cogent reason, in my opinion, for the issuance of the report. We had set, and have been shooting for January first as the date of the completion of this report. The date has obvious connotations. It is anticipated that the new Congress will be preparing very soon in its sessions for the consideration of postwar activities. The scope of those are not within our power determinable. Those

activities will be based on the needs, as they develop, and it is our responsibility to prepare programs as near as we can to suit such needs as may develop. We have tried to do this.

In many drainage basins of the West we have various reports in different stages of preparation at the present time. One, in fact, has been issued, the Missouri Basin report. If it were true that the use of a large figure would operate against the development of the Colorado River Basin, I think it would have been appropriate to ask, did it operate against the proposals made in the Missouri Basin report, and I believe it can be fairly stated that the use of the cost of $1,257,000,000 for the projects in the Missouri Basin report has not operated against serious consideration of that document, and I believe it will not operate against serious consideration of sections of that report to be brought forward for consideration in the postwar period.

Mind you, this report is not a report to be used to propel a construction program that would encompass all the projects and plans that are included in this report. Neither was the Missouri Basin report for that purpose. Distilled from the Missouri Basin report was a group of projects costing approximately $400,000,000 and those are moving forward in a way which justifies my confidence that they will be authorized in the relatively near future.

I should think that out of this Colorado River report if we can get it completed and before the Congress, will come a reasonable construction program, reasonable by comparison with construction programs that will be undertaken in other basins in the West, reasonable in regard to size and scope and the critical character of the water problems of the Basin and of the individual states of the Basin, and reasonable in the cost and benefits of the balance sheets.

Now, it is certain that any relatively large construction program in the Colorado River Basin cannot be expected, unless reports are made to the Congress upon which we can base recommendations for them. The problems of thi Basin may not be as complex, in the sense of running the gamut of so many shadings, as those of some other basins, but perhaps they have been with us longer and have gathered about them more soreness than the problems in some of the other basins. No matter, I believe we must proceed in a manner which will lead us eventually to their solution. I cannot see how that can be done in the courts of law or negotiations that run without termination, or perhaps by legislation, but I believe we can make a definite approach towards these solutions with a reasonable and fair and just construction program that will bring all sections of the Basin closely to what we hope eventually to see, and that is the complete utilization of these resources beneficially within the region for the creation of homes and for their contribution, on the scale that they can contribute, to the welfare of the nation at large.

This Colorado River is the greatest resource, and it is a tremendous thing. We cannot be afraid of it, we cannot avoid it. We have got it here, and we know a lot about it now. We know a lot about the lands, something of the mineral resources, something of the characteristics of the people of the Basin, and all of these things are parts of the required knowledge to go forward in

the construction of works that will lead to the utilization of the Colorado River.

If you gentlemen would like time to present in writing more detailed and somewhat more specific suggestions with regard to the report, I would be glad to discuss with you what you think would be a reasonable time. We have got a big job on our hands to get this report done. It is of no use to us to prepare any report that will not have the support of the people of the area; it would be foolish; it would be better never to have started the investigations than to present something that results only in a dog fight that ranges from one end of the Basin to the other, with the Bureau of Reclamation in the middle. We want your help; we want your assistance. We will not attempt to bind you in the final report in any way. We will present something that we think is sane and reasonable and just, and through the help of you gentlemen to pass on it, that can go forward at once, can be selected and brought forward and constructed, and then we can move on to the next stage, perhaps rewriting this report at intervals and eliminating some field of controversy here, and perhaps a larger one there, as we go along, until in the end this document will be one of a series of documents that will make up the story of the development of the Colorado River Basin.

MR. WALLACE: It is your purpose to proceed in the immediate future?

MR. WARNE: It is our purpose to lay the groundwork, so that recommendations can be made for projects that can proceed in the immediate future.

There may be some other of the gentlemen here from the Bureau who would like to make a few remarks.

JUDGE STONE: Are there any others from the Bureau who wish to make statements?

MR. RITER: I would like to say this, from a technical phase of the report, my particular responsibility, I too have had a short time to read this report. Since Mr. Debler left the branch to take on his new responsibilities, I find I did not keep in as close touch with the report as I wanted to during its preparation.

Probably I am the one to blame for the Upper Basin going one way and the Lower Basin going another way in figuring the depletion. I have read the report clear through. I have had some time to think about it. I have discussed it with others of the Bureau's staff who have read it. I have discussed it with Mr. Debler, who was also given an opportunity to read it. The Bureau's review of this report is incomplete without his views. He has lived with the river for ten years longer than I have.

We recognize that the report as it now stands is not a perfect document. We recognize that in your brief reading of it you gentlemen have also found weaknesses. We appreciate very much your frank and fair comments on it.

I have had one thing instilled into me in my sixteen years of service with the Bureau, namely, that the fundamental purpose of the Bureau is to serve the

the construction of works that will lead to the utilization of the Colorado River.

If you gentlemen would like time to present in writing more detailed and somewhat more specific suggestions with regard to the report, I would be glad to discuss with you what you think would be a reasonable time. We have got a big job on our hands to get this report done. It is of no use to us to prepare any report that will not have the support of the people of the area; it would be foolish; it would be better never to have started the investigations than to present something that results only in a dog fight that ranges from one end of the Basin to the other, with the Bureau of Reclamation in the middle. We want your help; we want your assistance. We will not attempt to bind you in the final report in any way. We will present something that we think is sane and reasonable and just, and through the help of you gentlemen to pass on it, that can go forward at once, can be selected and brought forward and constructed, and then we can move on to the next stage, perhaps rewriting this report at intervals and eliminating some field of controversy here, and perhaps a larger one there, as we go along, until in the end this document will be one of a series of documents that will make up the story of the development of the Colorado River Basin.

MR. WALLACE: It is your purpose to proceed in the immediate future?

MR. WARNE: It is our purpose to lay the groundwork, so that recommendations can be made for projects that can proceed in the immediate future.

There may be some other of the gentlemen here from the Bureau who would like to make a few remarks.

JUDGE STONE: Are there any others from the Bureau who wish to make statements?

MR. RITER: I would like to say this, from a technical phase of the report, my particular responsibility, I too have had a short time to read this report. Since Mr. Debler left the branch to take on his new responsibilities, I find I did not keep in as close touch with the report as I wanted to during its preparation.

Probably I am the one to blame for the Upper Basin going one way and the Lower Basin going another way in figuring the depletion. I have read the report clear through. I have had some time to think about it. I have discussed it with with others of the Bureau's staff who have read it. The Bureau's review of this report is incomplete without his views. He has lived with the river for ten years longer than I have.

We recognize that the report as it now stands is not a perfect document. We recognize that in your brief reading of it you gentlemen have also found weaknesses. We appreciate very much your frank and fair comments on it.

I have had one thing instilled into me in my sixteen years of service with the Bureau, namely, that the fundamental purpose of the Bureau is to serve the

West, and we want and we solicit the views and the criticisms of the states concerned with the Colorado River Basin, and we will not leave out of consideration this Committee. We want the views of this Committee, as was told you at Reno. One of the original purposes of our report was to try and write a pattern of development, a Bible, if you please, of the river. It was very apparent to me from the Reno meeting, and Mr. Debler claims it was apparent to him before we even started that that was impossible. My education was further extended at Reno, when for the first time I had ever been brought squarely face to face with controversial problems that had crystallized in my own mind.

So what we are attempting to present in this report, I think was described quite adequately, to bring together the information we have now tried to present, the picture as we now see it. As we receive additional information we will try to bring this up to date.

It is not my desire to make an oration, but I do want to thank all of you gentlemen, every one of you, who have criticized this report. I appreciate your frankness, I appreciate your fairness, which is a thing that is basic in this game. We are not bureaucratic. I want all the help I can get, I need it urgently. After all, we don't know everything. It is a problem that is too big for one individual to handle. Through the united and joint effort of everyone this problem can be solved.

MR. SHAW: I think it was intimated by Mr. Larson that some revision had been made by the Bureau already. I wonder if there are any items of sufficient importance to be worth mentioning at this time.

MR. RITER: Mr. Larson tried to pick up some of these mistakes as he went through it. For instance, the San Juan-Chama Diversion was charged to Colorado, and on revision to New Mexico. On the document I have penciled notes. Some one else has criticized the treatment of the Mexican treaty, we want to consider that more carefully. We want to consider all of these problems carefully I don't have anything pertinent, Mr. Shaw, that would upset any comments that you people have made.

MR. SHAW: Thank you.

MR. RITER: Incidentally, I think I distributed the first thing this morning Table 128-A, which is a summary that was presented yesterday on the long-time depletion of the Upper Basin. I think all you people have copies of it. If you have not, I have a few copies to make the report complete. It has not been checked by Mr. Larson, so take that tentatively too.

JUDGE STONE: May I ask Mr. Warne this question: You suggested the possibility of written comments, and that time might possibly be allowed to do that. What do you have in mind with respect to time and when that should be done?

Also it has been suggested that the members of the Bureau's staff would contact the various states. I believe that was called to your attention by Mr. Shaw, and it was agreed that that was advisable and you expected to do it. What do you have in mind as to the time when all those things could be done?

MR. WARNE: Well, I don't want to say anything that would indicate that we are trying to fix impossible conditions. I wish as many of you as can, if not, in fact all, would discuss your individual state's matters with these gentlemen, starting tomorrow afternoon, and running on until it is completed.

Now, with regard to the written comments, I would like to ask some of them how long they think it would take to prepare an adequate statement. Mr. Shaw?

MR. SHAW: It probably won't be adequate, Mr. Commissioner, but all we could expect to ask for would be, say, one week.

MR. WARNE: Can the rest of you do it in a week?

JUDGE STONE: Mr. Warne, that brings up very sharply a situation in Colorado. We produce a lot of this water. We have a lot of involved problems. We have many interests, some of them not fully worked out. We do have in this state an agency that is supposed to help to work out these problems. Mr. Delaney and I on this Committee are not in a position to make written statements. We certainly should not make an effort to make comments in writing except upon more study and review of the report, and except after the matter has been considered by our State Water Board, and the State Water Board has the responsibility of listening to all of the views and the judgment of all of these various interests. For us to present in a week's time a written statement without following that procedure would merely mean that we might give you the impression that what we say is correct, whereas what we say might merely bring over our heads a lot of criticism, objections and views quite adverse to what might be submitted by us. It is not the right procedure.

I realize that the Bureau of Reclamation cannot study and analyze and review all of the various and divers interests in a state such as Colorado. You must ask some agency or some group to do it. We want to do it, but we have got to do that with adequate study, and after an opportunity to discuss it with those different groups.

I do not think that we are in the fortunate position as Mr. Shaw says of California, that after a week's time we can sit down and give you something.

MR. WARNE: What do you think, Judge Stone, would be the minimum?

MR. WALLACE: When do you expect to go to the printers?

MR. WARNE: I had not expected to make a decision on that until after tomorrow.

(Discussion off the record.)

JUDGE STONE: Mr. Warne, in attempting to answer the question which you asked me, may I ask another question? Is this an ironbound rule that this all must be completed so that the Bureau may be in a position to print and release a report on January first?

MR. WARNE: At the risk of having the ship sink without a trace right here, I will say no, it is not an ironbound rule. I will have plenty of explanations

to make if we are not prepared by then to do it, but I think we probably could extend that date, if it was not an indeterminate extension, without causing anyone to get fired.

JUDGE STONE: What I had in mind, Mr. Delaney has talked to some of the interests here in Colorado, Mr. Patterson, and I believe Mr. Tipton and Governor Carr, and I want to assure you that we want to do it just as fast as it is humanly possible, but I think if we do it in the right way it would be more helpful to you than if we go half-cocked on something. It is the judgment of these men that it would run probably in the order of sixty days before we could do it, maybe a little longer, not to exceed ninety days, because here is what we have to do: we have to call in all these interests with the Water Board and just sit down and iron these things out, and it is going to be a tough job.

MR. WARNE: Could you do it in thirty days?

JUDGE STONE: Some of you folks are talking, and I don't know whether you have heard the discussion here. Have you heard the discussion, Governor Carr and Mr. Breitenstein and Mr. Tipton and Mr. Patterson and Judge O'Rourke and Mr. Dille and Mr. Vidal? Suggestions have been made as to time, and what time would be required in Colorado, and Mr. Warne has made inquiry as to whether we could do it in thirty days. I would like to have the comments of some of you.

MR. TIPTON: How many copies of the report would be available?

MR. WARNE: Well, we could have more copies run. It is going to take a few more days to do that.

MR. BREITENSTEIN: Judge Stone, I can say frankly I don't think thirty days would be enough time. As you well know, we have some other rivers in Colorado we have to consider on one of those, at least, we are going to have to do a lot of work, thirty to sixty days. I think we will want to have thirty to sixty days. I think we will want to have thirty days too for sure to compose all of our interests here in Colorado to give the Bureau a statement that is worth while.

JUDGE STONE: Mr. Merriell?

MR. MERRIELL: I have nothing to add.

JUDGE STONE: What do you think about the time?

MR. MERRIELL: I have nothing to add to that.

JUDGE STONE: Governor Carr?

GOVERNOR CARR: I represent just one organization in just a small part of the state. I have not been permitted to read this. I am anxious to do so. I could not attempt to do anything within thirty days which would be just to the people I represent. I think ninety days is closer. May I say this: I do not feel that the Bureau is justified in trying to hold us to any shorter time than that, because of the size of the proposition, because of the interests which are involved.

We are going to have to go over to the Gunnison and hold meetings with our Board. That takes time. We can't drive any more, we have got to hitch hike, I think ninety days is fair. If we can do it in ninety days we will perform miracles.

JUDGE STONE: Mr. Saunders?

MR. SAUNDERS: We can act more quickly than any other interests. I should say six weeks would be the minimum, and we undoubtedly are as quick as anybody you will run into.

JUDGE STONE: Judge O'Rourke?

JUDGE O'ROURKE: Of course, I do not need to tell you our situation down there. There are eight counties. I say with an area of eight counties it is going to be rather difficult to get over that in a short time. It is going to be necessary for us to consult with our people down there, and it not only involves southwestern Colorado but other sections as well. There are certain obligations, questions in connection with our sister states joining us in the Basin over as far as the San Juan Basin in New Mexico. Some of their problems have to be considered along with any suggestions that we might make in connection with this report. I doubt very much if we can do it in less time than Governor Carr has suggested. Certainly if it is goirg to take Governor Carr ninety days in the Gunnison area, it is going to take us at least that much time in the San Juan Basin. I do not think there is any possibility of touching this before ninety days.

JUDGE STONE: Now, I hope the members of the Committee will pardon me for trying to explore this Colorado situation, but it was quite necessary to do it, in view of the question. I don't know whether any others here want to add anything. If so, I trust we will hear from them. Mr. Tipton, do you have anything?

MR. TIPTON: I have nothing.

JUDGE STONE: I think now we should inquire of these other states. They are indeed fortunate if they can do this as quickly as California can, namely, a week's time.

I would like to ask Arizona how long they think they will require.

MRS. BUSH: I think we can do all that Arizona can get together--we don't ever hope to get everybody to believe the way we do, but the state has placed some confidence in the members whom it has sent. Therefore, I think the majority of Arizona will say, let's get the best we can. So I rather think Mr. Carson has stated Arizona's position. We will do it while we are here with the members of the Bureau.

JUDGE STONE: I did not mean to imply that the State of Colorado does not have confidence in Mr. Delaney and me, Mrs. Bush. However, I want to say this: We do have a big program and a lot of problems. I just have too much respect for the views of my people to rush this thing.

New Mexico.

MR. WILSON: Judge Stone, so far as we are concerned, I don't know what would be accomplished in ninety days or in six months. Of course, we expect to talk to the Bureau while we are here, and our problem is simply to get additional information on the projects already mentioned. Certainly we can't get that information in ninety days nor assurance of the Bureau in helping us get the information. So far as I am concerned, there is no written statement that we expect to make.

JUDGE STONE: Utah?

MR. WALLACE: Gentlemen, we will be here another week, and during that time, of course, we can have meetings. At home it will take us sometime, but if Colorado gets ninety days, we are all set.

JUDGE STONE: Nevada?

MR. SMITH: Nevada's comments will not be very extensive. We will be here for the Western States Engineers Association. During that period we will probably be so well occupied that we would not have time to do much with this. If we make any written presentation at all, I think we should have time to get home and look into it. It would probably take us about a month.

MR. WALLACE: I would like to say, Judge Stone, we can go home and within a very short period of time we can make a list of projects we hope can be constructed in the immediate future. I assume that is the sort of thing you would like to have, Mr. Warne.

MR. WARNE: We would like to have you express your views.

JUDGE STONE: Wyoming?

MR. ROLLINS: We might go over this report on the Green River Basin and get our report in within thirty days.

JUDGE STONE: May we have quiet in the room, please? There is so much discussion going on we cannot hear.

MR. ROLLINS: Within thirty days.

JUDGE STONE: Mr. Howard or Mr. Scattergood, anything about the power angle of it?

MR. HOWARD: Speaking for the power contractors, we can abide by Mr. Shaw's statement.

MR. WALLACE: I wonder if Mr. Scattergood will say a word or two about the power matter before we adjourn.

JUDGE STONE: Well, the Chair is going to ask that we dispose of this first.

MR. LARKIN: May I ask a question in connection with the power contractors? Do I understand the policy of the Bureau is to eliminate from consideration in this report the development of the power resources by what might be determined private capital or the states and municipalities? In other words, are they desirous of any suggestion from the power contractors as to the development of the Lower Colorado and the taking of power by other than federal agencies?

MR. ROLLINS: Mr. Chairman, --

JUDGE STONE: I believe there was a question. Let us have that answered.

MR. WARNE: I did not quite get the question. The taking of power or the development of power--

MR. LARKIN: The report, as I look at it, provides $192,000,000 for a grid system, to be built by the federal government. That is quite different than the Lower Colorado Basin. If the Bureau is interested in ideas which the power contractors might have with respect to development of the Lower Colorado as to power, it might take sometime to prepare such a report, and we could not agree with Mr. Shaw that we would have any report within a week; and I asked the question whether determination had been made by the Bureau that all power was to be taken into load centers by the Bureau, and if they were interested in ideas some of us might have with respect to power development.

MR. WARNE: Why, we are interested in any helpful ideas in connection with this development. The grid system is included here because we must be prepared to take this power away from the plants. We are dealing in quite large sums here.

MR. HOWARD: In making the statement I did I was operating on the theory that this document was to become an inventory of potential water developments, and that no attempt would be made to completely work out the power angle. If this is to be done, of course we have a different problem, but if it is merely an inventory of potential water developments, so far as my interests are concerned--I cannot speak for Mr. Larkin, except to hear him across the table--we can come within that time. There is to be no attempt, as I understand it, to work out the quantity of energy available from each source or what shall become of it, where it is to be transmitted, or how.

MR. WARNE: That is right. The study has got to go on from here.

MR. WILSON: In connection with what Mr. Howard said, I would like to ask the Bureau a question: Is it understood and is it true that this report is to be merely an inventory of possible projects, or is this in any way going to fix a plan of development? I would like to have that cleared up.

MR. WARNE: Why, I do not believe if each and every one of us spent the rest of our natural lifetimes on this report we could fix a plan of development on the Colorado River Basin in the sense of having an immutable plan. It can not be done. This report is an inventory, as we can present it, of a class of projects that are worthy of some consideration by the people of the Basin and by the people of the United States, from which it is anticipated that certain

projects can from time to time be selected for further refinement, brought to the construction stage, and the inventory itself undoubtedly will be reappraised at intervals, and I don't know when the final plan for the Colorado River Basin will be written, except, perhaps, in concrete and canals and transmission lines 200 years from now.

MR. WILSON: That answers the question. It is fully understood here among us that this is an inventory of possible developments. I am just wondering if you are going to present the plan to Congress and other people who might be vitally interested.

MR. WARNE: It is certain that Congress is not going to take the report and adopt it, approving it the very next day, and assume that it is an amendment to the Boulder Canyon Project Act or something that freezes it into the Project Act. We would not even recommend the report for authorization. What we hope to do is to lay out something that can be another stepping stone in the progress of the development of this Basin.

MR. ROLLINS: As I understand it, the Bureau has compiled this massive report in about five months. In view of the fact that after all this is not going to be the final word, I can't for the life of me see why it is going to take so much time to set forth the views of our states as to that report. I think, Governor Carr, even as slow as I am, I could crawl on my hands and knees to the Gunnison in ninety days and consult these people. (Laughter.)

GOVERNOR CARR: You see, I have two or three other clients. (Laughter.)

MR. ROLLINS: I know, but you can talk to each one personally in that time. I think it is unfair to ask the Bureau, in view of the fact that they have gone all-out, so to speak, in their efforts to have this report ready when asked for by their superiors. It seems to me it is hardly fair to ask them now to delay another ninety days. I think thirty days, if we can agree, something like that, or even forty-five days, should be fair to all of us.

JUDGE STONE: Mr. Rollins, Colorado has never taken a dog-in-the-manger attitude. I don't think another state has been as cooperative as our state. If you understood the problems in Colorado you would not talk about crawling on your hands and knees. We do have obligations to some of our people. We are called upon to act, and we don't propose to act without consulting with them, and without our knowing and understanding more about this report.

This state produces 74 percent of the water of the Colorado River Basin. We have the Continental Divide running through the middle of this state. We have taken constructive action in the past, and we are just as anxious as any state, or as the Bureau of Reclamation, to get these projects built as quickly as possible, but we do not want to be a party to creating turmoil in the Colorado River Basin that in the end will mean more delay than some reasonable time for consideration and reasonable time for this state to work out what appears to be our legitimate problems.

I am sure Mr. Rollins did not understand the position here, or otherwise

he would not intimate that we are asking anything unreasonable. We do not propose to ask anything unreasonable of the Bureau, but we would much rather have the report considered by Colorado after consultation than to have the report go to Washington and have everybody object to it. We should not, since we produce so much water, be controlled by Wyoming or any other state. I think you perhaps misunderstood my statement.

MR. ROLLINS: If this were going to be the final word, I could agree with you. You will have ample opportunity. Each project will be taken up by Congress, as you know so well, on its own merits. For that reason I cannot agree with you. If, as I see it, this was going to be the end of the thing, if we had to do the whole thing up now once and for all, I would look at it as you do, but it does not seem to me it is that important, because you will have plenty of time, when necessary, to make your statements before the proper people.

GOVERNOR CARR: The question of Colorado's fairness has been raised. I think in justice to Colorado people, because I am the one at whom this remark was aimed, that I should say this: Colorado in my contacts with this thing--and they started in 1926, and have kept up except for a short spell when I was out of the picture--Colorado has been at the forefront of the activities in connection with the Colorado River, this beginning with the writing of the Compact, as some of you may know.

There are those of us in Colorado who have had something to do with irrigation and have had to do with projects. We know that there are men and women in the hills and valleys of Colorado and on tributaries of the Colorado who are going to be called upon to answer the question of whether or not they are going to sign these contracts for the payment of a certain portion of the amounts of money that will be demanded in order to put the projects over. In fairness to those people, there are those of us who believe we should go and talk to them and present this proposition.

I do not want to charge the Bureau with unfairness. I have been trying to protect this Bureau time and time again from certain people who I thought would encroach upon them. Personally, I love them, and I claim the right to curse them.

Here is our proposition. This is something that has been in preparation over a period of more than ten years, according to the statement of the Assistant Commissioner. This is something that involves the lives of a great number of people of the United States of America. We, the representatives of those people, have never had a look at this report. We had a statement yesterday that it was involved, that the representatives of the Bureau would not take the time to go into detail and tell us about it.

Today the states have been talking. Questions have been shouted at the Bureau time and time again in those statements which have not yet been answered. Now we are asked to make a statement regarding a report, which up until now we have not seen, which is going to require not only the reading by the lawyers, but advice from the engineers, and although we do not know about it now, when we want more than thirty days we are charged with unfairness.

I don't think, Mr. Rollins, you meant that, and I am going to accept your silent apology on behalf of those who are here.

I like to fight when there is something to fight about. We are trying to cooperate. When I asked for ninety days I wasn't talking about cooling my heels. These people employed me, and there are people at this table who could probably tell you that I spend all of my waking hours working for and representing these people.

The Commissioner said it will be useless--futile, I think, was the word, to adopt it unless they have the support of the states. They want the support of the states to the extent that they can say the Colorado River States are in favor of this thing. If that is what they want, they have got to give us time to make an intelligent study of it.

We are going to Gunnison, we want the Board to get together with the people, we have got to talk to them. If you are going to get any support from people you have got to have these people talking.

Now, don't talk about us being unfair. We reason that we want to cooperate with you. We will give you the answers. You have never had a difficult time getting answers from us up to now. If we are for you, we will say it; if not, you will understand what we say, but we don't intend--and I am speaking now for the people I represent--we don't intend to answer--1928--it was, sixteen years ago--we are not going to answer that or commit ourselves to answer it until such time as may be needed to give an intelligent answer. If we can under ninety days we will do it. I said I think it would be a miracle if we did it under ninety days.

Investigations which were supposed to be made in connection with the Gunnison River where I am representing the people have not yet been made with sufficient detail to enable the representatives of the Bureau to answer questions. What the reservoirs over there--we won't talk about more than 400,000 acre feet of water you will take out of that river to be used in transmountain diversion. There isn't any way of knowing about what that means.

This morning my colleague asked the Bureau about what their attitude would be toward the propagation of fish, the protection of wildlife, and the increase of recreation. We have a river over there which needs development along those lines.

Mr. Whinnery told you he wanted me to talk about the forgotten man, the cattle man. Every man in the world has been forgotten, but there are some of those projects, as we see them, that may defeat the greatest industry in that part of the state, if carried out. The second greatest industry is our tourists, our fishing, our recreational life.

I did not intend to raise these questions, but now that it has come up, I think it is necessary to tell you that that is a great industry of that county in spite of raising cattle and raising feed for cattle. I think we are entitled to it.

Is there any reason why the Bureau should not say to me and say to the representatives from Gunnison now, so that they can say to their people what your attitude is, we are not going to be unfair?

MR. WARNE: I think you will find an answer to the question of recreation in the report.

GOVERNOR CARR: Well, I have not had the report, nor have my people nor my colleagues.

MR. WARNE: I know you haven't. You will find a discussion in there, I believe to be pretty high class, on that matter. You will also find a complete discussion, I think, on the aquatic uses of the water for fish life. There will be such a statement in the report. The Fish and Wildlife Service has been working on it.

GOVERNOR CARR: That is what I am asking for, what these men want. That is what Mr. Dutcher asked for this morning. I am talking from ignorance because I have not opened the report, I have not seen it. Maybe many of my questions will be answered if I can read the report. We would like to have a number of copies. Unless and until we do have, we are not going any farther.

MR. HOWARD: I think Governor Carr misinterprets, as far as California is concerned. I am sure Colorado may take all the time it needs for the purpose of studying the report. The thing I do want to comment on is the use of the word "commitment." In my understanding neither the Bureau of Reclamation nor the states are in any way committed by anything in this report. I don't want the record to be silent on that point, inasmuch as Governor Carr had indicated that he thought possibly Colorado interests might be committed by something contained in this report. If I am incorrect in my conception, if it does constitute a commitment on anybody else's part, I want to know it.

GOVERNOR CARR: Will you agree that the Commissioner made the statement that it would be futile unless they have the support of the states?

MR. WARNE: I think I said if the result simply caused a dog fight that ranged from one end of the Basin to the other. I do not anticipate that anyone will be committed to the support of all the details in this report, or any detail in the report, but I think, in the light of having spent two days of discussing the matter here, we should have some indication from you gentlemen as to specifically how we can improve this report to avoid as many as possible of the objections.

JUDGE STONE: Mr. Warne, you are entirely right about that. You are entitled to it. That is what we want to do, give you constructively and wisely those points we are raising.

MR. WARNE: I asked a question the better part of thirty minutes ago, what is the minimum time for Colorado?

JUDGE STONE: I think, Mr. Warne, it is only fair to state, and I am judging my statement from what I know of the situation and what has been said by

some of my colleagues, that we could do an adequate job, that we can explore the various interests of the state, and give you a statement which would be helpful and would be the kind of statement that you desire, a constructive statement, within the ninety days which has been mentioned.

MR. WARNE: That is, February 11, roughly calculated?

JUDGE STONE: Yes.

MR. WILSON: I would like to ask the Commissioner a question, if I may. Is it possible, Mr. Commissioner, in one district not mentioned in the report, investigations not having been made, that an inadequate report may be made and left open for a supplemental report to be prepared at a later date after the investigation has been made?

MR. WARNE: Surely.

MR. WILSON: If so, I would like at this time to request your men to do that in the Gila. State Engineer McClure some time past made efforts to get an investigation both of the San Juan and the Gila. Some years back in making a limited and brief report on the Gila and the San Juan, they prepared what data they had. They had biennial reports put out by Mr. McClure ten or twelve years ago, just a partial report, before the litigation with the Indian Service, before the entry of the Gila Decree involving New Mexico land and much Arizona land, before any of our problems arose. Supplemented by one telephone call of Mr. McClure that he made since that time, that is the extent of the investigation.

I would like to have a paragraph written on the Gila that will be submitted by letter dated after this investigation has been made, after supporting data is available, so that that could be added at a later time.

MR. WALLACE: Mr. Chairman, I don't like to tell a story, but once a man wanted to hire an office boy. He got a room full of boys and began to tell a story. He went to the basement and started after a rat, he wandered all over the place. Fianlly, he said, "Boys, what do you think of that?" A little boy in the southeast corner said, "Say, Mister, what became of that rat?" That is the boy that got the job.

The rat we have is the immediate construction of projects to put people to work.

I hope to go back to Utah and suggest to the Bureau certain other investigations we want. I think we can go home and in a comparatively short space of time say to the Bureau, "When you make recommendation to Congress for immediate construction, please include these projects." We certainly can not develop the whole river to begin with. We can work on half a dozen projects and people will go to work just as soon as we get the money from Congress.

I take it that what Mr. Warne wants is certain recommendations, that Congress immediately appropriate money for certain projects that will not interfere with the whole comprehensive plan of construction of other projects.

I think, with the consent of my colleagues, that is about what we will attempt to do.

MR. ROLLINS: I just wanted one final word. I guess I got my foot into it, but I want for the information of Mr. Carr to read from page 2, the third paragraph, to present what I was trying to make clear in my remarks that this is not final, that for that reason it is not so serious a matter. "This report does not present a final plan." It says that in that many words. "Many intrastate, interstate and international problems must be solved before a final pattern of development can be evolved. Extensive investigations have been made of certain projects. Much data have been assembled. Supporting data are to be found in the files of the Bureau of Reclamation. Before many of the projects can be authorized and construction undertaken, additional detailed investigations and studies must be made."

That is the thing I was trying to say. For that reason, maybe, I should not have used the word "unfair," however, I do not propose to make any signed statement retracting it. I do think, however, at least it would be far more helpful--maybe I had better put it that way--far more helpful to the Bureau to get some sort of a statement. I don't know whether a statement is necessary.

Mr. Carr said they asked for statements. I think we asked to make statements. The Bureau, of course, would be happy to get our viewpoints, but I really cannot see why it is going to take so much time. However, if Colorado's convenience is going to take ninety days or six months, we have gone along with them for quite a while. If that is their position, we are quite willing that they have all the time they want, but if Wyoming can't make up their minds in the Green River Basin in less time than that, then I am badly mistaken.

In view of the fact, as I said before, that there will be an opportunity later to make statements, it seems to me it would be helpful to these people to get what information we can give them as soon as possible, so that at least they can get within the deadline they are put under.

JUDGE STONE: Mr. Rollins, if we had only the Green River Basin, we could do it too, but we have got a number of them.

I want to call your attention to the fact I tried to make plain a while ago, we do not believe that when the report gets to Congress to consider it will be nothing but an inventory of projects. The arguments in the last two days indicate important principles which may be affected by this plan. We do not believe it is as harmless a document as has been indicated. If it is that harmless a document then it is not worth making. I can see the Bureau attempting to do a constructive job at the start, cutting the pattern for development of the river basin. Let's do it as well as we can at the start and not have a lot of mistakes.

MR. SCATTERGOOD: Mr. Chairman, Ladies and Gentlemen: The Power Contractors present, and their representatives on the Committee of Sixteen, are in full harmony respecting the report read into the record by Mr. Howard by way of comments and suggestions on the tentative report presented to us by the Bureau of Reclamation. Mr. Warne's talk here was very comforting and allayed much of the

fear or uncertainty in our minds. Speaking on my part, I shall endeavor to express briefly what have been and are my conceptions that have led to our report.

There are in the Colorado River Basin a great many projects that would pass all three tests that may be required thus ready for approval by the Congress, if not already approved, and therefore ready for construction and development immediately following the war. From this it follows that it is not necessary that all projects suggested in the tentative report before us shall be completely agreed to at this time in order that there may be a great construction program put into effect immediately following the war.

The three tests referred to are (a) that there has been sufficient engineering investigation to determine whether or not, in the judgment of the Department, it is feasible, or reasonably feasible and it can be so declared by the Secretary, thus bringing it within the realm of possible appropriations for construction under the present law; (b) whether or not the project is desired by the immediate section within which it lies, that is whether or not they would want to pay for it. It would seem plausible that such a project as is shown to be feasible would be desired but this may not be necessarily conclusive and (c) it is my understanding that a third test would be wanted by the Bureau of Reclamation and quite naturally so it would seem the test being as to whether the project is subject to or free from controversy as between states or between sections of a state.

I said "feasible, or reasonably feasible," because we do want construction in the West, even though there is some doubt about the 100 percent financial feasibility, thus giving the project the benefit of doubt.

My conception is, from expressions in the report, and by representatives of the Bureau of Reclamation at this conference, that as to the many projects about which there may be some question with respect to any of the tests, particularly the second or third test, there will be negotiations which should lead to the ultimate determination on some satisfactory basis with respect to those projects, or other projects, of which there are a great many as yet lacking in engineering study, which will prove feasible and may take the place of those in dispute or undesired for any reason.

With these conceptions and understandings in mind it would seem this report, setting out the hydrology of the Basin and suggestions outlining projects for a comprehensive plan in a preliminary confidential advanced form, should be of great value to all of us and of value as a basis of information for the Congress provided it is made clear to the Congress (a) that many of the projects are subject to further consideration and negotiation, (b) that the possible projects as a whole would require more water than will be available from the River System, (c) that other projects not included may prove more desirable and ultimately may be substituted for some of those mentioned in the plan as tentatively outlined, and (d) that many possible projects will have to be combed out for want of sufficient water.

Now, as to the power contractors: I understand from answers by representatives of the Bureau of Reclamation to questions asked here, that there is

no certainty about, for example, a diversion above the Boulder Project in the Lower Basin for irrigation purposes, and that no studies have been made for consideration given to the way such an undertaking might be related to the Boulder Project; which is an established project, with its power output, both primary and secondary power, contracted for under firm contracts for fifty years, which in turn carry guarantees of repayment of the cost of the project with interest. Also, contracts for conserved waters, such power and water contracts having resulted in expenditures of hundreds of millions by the contractors for transmission and utilization and in communities depending on water and power supplies from the Boulder Project. Communities have been and are being built up, in substantial part, based on such contracts which means a tremendous lot requiring consideration both economically and otherwise.

The power contractors presume that these things have been and must be given full consideration in conjunction with any such possible diversion above Boulder. We have had our relations with the other six states and with the water users in California; and this Committee of Sixteen was brought about that understandings might be worked out with respect, particularly to the Boulder Project but also other power projects, and Boulder Power revenue set aside for the Development Fund in the Basin. The Committee of Fourteen being confined to consideration of water problems strictly.

As previously indicated, this tentative inventory of water and power projects should be of great value to us all in our efforts toward bringing about an understanding between us and the Bureau of Reclamation and among ourselves, where necessary, and by the Congress; also showing the status with respect to the future availability of water in the river system versus the need for water for a more complete ultimate development. It seems, however, a large portion of these projects, especially some of the larger ones, are not ready to go to Congressional Committees with recommendation for appropriations under the three tests enumerated.

If my conceptions are correct, such of the projects will not be so regarded or recommended at this time. As I understand Mr. Warne, these things will be determined as best they may be in the future. We power contractors cannot very well take a definite position unless there is serious consideration, and we are not now so informed, of diversion above the Boulder Project and, in such case, we understand that the Bureau of Reclamation--from what has been said here--would, in conjunction with and concurrently with any such serious consideration, discuss the same with us as to how it may be related to the Boulder Project and the interests of those who have contracted for power and water and are paying for the project. Also that questions and plans relative to other power projects will be considered and developed in like manner.

With respect to power: Mr. Larkin has made reference to the fact that there may be conceived two classes of power users or contractors, broadly speaking, of which the existing power contractors of the Boulder Project are in one class, and there will be more of that class as more power is developed at other projects on the Lower River; and I should think the same will be true in the Upper River or Basin. Those of the first class are, generally speaking, large electric utilities with existing diversified power sources and distribution systems that can more economically build their own transmission lines

connected directly with the generating equipment, installed by the Bureau, but required for generation of power for such a contractor or contractors and so operated. The other class of smaller individual contractors of communities would constitute those to which delivery of power service over circuits installed and operated by the government would be more valuable.

There is nothing inconsistent between the idea well brought out here that the Bureau of Reclamation is sincerely interested in finding out the wishes of water users in connection with reclamation projects as a matter of procedure in the development and utilization of water, and the idea of like procedure in development of power projects and its utilization through negotiations with power contractors or users for the purpose of bringing out the most economical development and transmission plans satisfactory to the contractors, particularly from the economical standpoint affecting the wholesale cost of the power delivered at points of distribution. My understanding is, from what has been said here, that this will be followed by the Bureau of Reclamation with respect to power.

There is a great difference between these two classes of power consumers, that is a great difference in the economics and the worth of the power to the communities as the ultimate users. Similar procedure will be essential with respect to all important power development on the Lower River, and I should think on the Upper River also; including storage, affecting both power and water, at the Glen Canyon site. Storage is needed there with respect to development in the Lower Basin in addition to capacity required for the purposes indicated in the report affecting the Upper Basin. As already indicated, the power contractors are not in a position to make any very specific suggestions for the reason that the report is in an altogether preliminary stage being that of a mere inventory of suggested projects, subject to modifications, of course, in the words of the report.

It seems not necessary to suggest that the power contractors could make a report in 30, 60, or 90 days. We cannot make a report at all except as it is worked out as specific plans are developed, between the Bureau and the people interested.

I have felt, under the circumstances, it is necessary to make this statement of our conceptions and understandings that the report of the power contractors' representatives, which was read into the record yesterday by Mr. Howard, may be understood. I judge these conceptions as to the status of power are entirely in line with what Mr. Warne has said to us.

I thank you very much.

MR. RITER: All the problems Mr. Scattergood mentioned, of course, have to be met, have to be solved. He recommends they are beyond the scope of the immediate report. He recommends that, I judge from the tone of his talk.

I am afraid some of the questions Mr. Carr wants to ask us likewise will be found to be beyond the scope of this report.

The primary thing I am interested in in this report is to make sure that

we have not overlooked any projects, real honest to goodness projects. An awful lot of the details have not been worked out, an awful lot of the details we have not attempted to work out. We recognize the- must be worked out before the projects are sponsored for construction.

For my part I would like to get across the conception that the report is an inventory.

Mr. Carr, I am going to recommend that you do not wade through 394 pages. I know you won't be interested in all of it. After you read it over, come back and we will answer a lot of questions that we are not in a position to answer at this stage of the game, but when we get the detail of the projects you are interested in, then I think we can answer you; but we are concerned in including in the report some projects we may have overlooked, which you know about, which your Water Board knows about. With that in mind, I wonder if you still need your ninety days?

MR. WARNE: Why don't we settle it in this manner, that the Bureau will accede to the request of those here--some of those here, that they be permitted to make additional statements, and will hold the report open until February 10 if we can. If we can't, we will so advise you as much in advance of the closing date as we can, to give you any warning of it, and we ask you not to take the ninety days or any material part of it if you can avoid taking it and to advise us as soon as you can what period less than the ninety days will be sufficient.

Thank you.

JUDGE STONE: I think, Mr. Warne, your statement is very fair, and we simply wanted to let you know our problem. And I want to say to the other states that Colorado does not want to be in the position of breaking down what the others wish, but we are just trying to indicate our problem, and we want to comply with the suggestion made by Mr. Warne. We will survey this situation and advise you just as soon as we can. I think that is very fair, and I hope that if it does take us a little longer than seems reasonable to others it will be understood, because we are perfectly sincere in our desire to cooperate. We simply want to get into our situation further and be able to do that in a more constructive way.

GOVERNOR CARR: We will not take a minute longer than we need. I tell you, Mr. Warne, I will be on my hands and knees inside of a few days. (Laughter.)

MR. SCATTERGOOD: May I ask you whether or not my understanding of the procedure so far as it affects power, at least, is substantially correct?

MR. WARNE: It is. Nothing I said is intended to, and I think it does not negative anything anybody has said at this meeting. I was just attempting to clarify the situation.

MR. RITER: Those of us who have the heat on us again to get the report in final shape surely will appreciate any suggestions or statements you may get by reading it quickly. We would like to have them because we are working on it in the meantime.

JUDGE O'ROURKE: In view of Mr. Riter's statement he just made, it seems to me we of the San Juan Basin are not going to require as much time as we had anticipated, and I can assure him we will get our report in just as promptly as possible. We had a little different conception of the subject up until we heard your statement.

JUDGE STONE: You are referring particularly to what statement?

JUDGE O'ROURKE: The statement that Mr. Riter had just made about the nature of the report, the purposes.

JUDGE STONE: Now, I understand--if I am wrong, may I be corrected--each and all of the states expect to submit written statements to the Bureau of Reclamation.

MR. CARSON: No, we don't intend to submit any for Arizona. We think Mr. Baker can talk with Mr. Larson while he is here, and we will have no necessity to file any written statement. We want the Bureau to know, however, we do appreciate very much the work it has done, and we are behind its report.

MR. WARNE: I did not mean to ask, Judge Stone, that they necessarily submit them, but those that do wish to submit them, submit them on the schedule that we had stated. Several times during the discussion here, before the general discussion closed, requests were made that additional time be given to submit statements. Now, I did not mean to be understood that Arizona should submit a statement if she did not care to do so, or that anyone else should.

JUDGE STONE: I understood everybody had stated that they desired to submit statements. It stands this way: Those desiring to submit a statement will do so, and will do so as quickly as possible. Colorado will comply with the suggestion made by you.

Will it also be understood that where any statement is submitted by any states, that the other states be given a copy of it? Is that not the desire of the Committee?

GENERAL GILES: I so move.

JUDGE STONE: I do not think we need a motion on it.

GENERAL GILES: You have to have something in the record.

JUDGE STONE: All right.

GENERAL GILES: I move that that be the order of the Committee.

JUDGE STONE: Very well. Is there a second to that motion?

A MEMBER: I second the motion.

MR. SHAW: Does the motion provide for the distribution of copies among the representatives of the states on the Committee, or to furnish copies to

the Chairman for mimeographing and distribution? I don't understand which.

GENERAL GILES: Well, I think the latter is more expeditious.

(The motion was put to a vote, and declared by Chairman Stone to be carried.)

JUDGE STONE: Now, may I make this further inquiry, Mr. Warne? Several have asked if other reports will be available.

MR. WARNE: You mean other copies of this report?

JUDGE STONE: Yes.

MR. WARNE: Yes, sir. I hesitate to make a promise on that without consulting with Mr. Larson. I believe the mimeographing is done in Salt Lake City. How long will it take you to run another 150 or 200 copies?

MR. LARSON: Well, I don't know. The cutting of the stencils has been reserved, so that we can go ahead and make corrections, etc.

MR. WARNE: Can you get it done next week?

MR. LARSON: They are all distributed, the last two today.

MR. WARNE: Can you get it done next week, do you think?

MR. LARSON: We will make every effort to. We worked three shifts a day to get this out.

MR. WARNE: All of you who wish additional copies, please present your requests for the additional copies to Mr. Larson, and we will make each individual responsible. Each copy of the report will carry the confidential note.

MR. LARSON: And should we have something from the states as to who is going to get the copies?

MR. WARNE: I suggest we charge them out to the representatives of the states.

JUDGE STONE: That request is to be made to Mr. Larson?

MR. WARNE: To Mr. Larson, the first thing Monday morning.

MR. LARSON: By states.

MR. HOWARD: Will they be revised, or will they be identical, including the errors?

MR. WARNE: They will include all errors. We will make another copy some of these days that will not have errors.

MR. HOWARD: For practical reasons it would be better to have the new edition identical, although in some particulars you want to revise it.

MR. LARSON: It will be that way.

JUDGE STONE: Let us have an understanding. Mr. Warne, as I understand it, it is contemplated that all reports which have been distributed and those that will be distributed through the members of the states on this Committee are to be returned, and that those are to be returned, as I take it, after the statements have been submitted, is that correct?

MR. LARSON: That should apply to your reports too, that have been distributed. They have a lot of the factual data.

MR. WARNE: The purpose of that is to avoid some five years from now a half dozen versions of this report being in circulation. I think you gentlemen understand.

JUDGE STONE: I think we do. It is perfectly reasonable, and Colorado has gotten out some reports here which contain a resume. We will apply the same rule on that, as far as we can get them.

MR. WARNE: If you will give to Mr. Larson, who will be here Monday morning, the minimum number of copies you want, we will have the mimeograph machines running over in Salt Lake City as quickly as we can, and the copies should be ready in a few days.

JUDGE STONE: Very well. Now, gentlemen, there are a few other details to be disposed of.

The Chair has distributed this expense account. Is that committee ready to report?

GENERAL GILES: We are, Your Honor. The Committee has approved your report, with the revision made by the Chair with respect to that $20 item. The committee members have had the report in their hands and I assume you have examined it.

I now move the adoption and approval of the financial report.

MR. WALLACE: Without having read it, I second the motion.

(The motion was put to a vote and declared by Chairman Stone to be carried.)

JUDGE STONE: Now, I think you will note from this report that another year has gone by since an assessment was made the last time, and we have $2.72 in the bank. Are you ready to consider making the usual annual assessment?

MR. WALLACE: Is the usual one satisfactory?

JUDGE STONE: Yes, I think it should be adequate.

MR. WALLACE: I so move.

(The motion was duly seconded.)

JUDGE STONE: Motion has been made that the assessment heretofore made of $200 for each state be made. May I ask, Mr. Scattergood, does that apply to the Power Contractors?

MR. SCATTERGOOD: Yes, it does.

JUDGE STONE: Further discussion?

(The motion was put to a vote, and declared by Chairman Stone to be carried.)

MR. HAUSER: I assume, Mr. Chairman, we will get three bills, triplicate bills?

JUDGE STONE: One for the Power Contractors and one for the state?

MR. HAUSER: I want copies in triplicate.

JUDGE STONE: Now, there is another item. I assume that the Bureau of Reclamation would like to have the comments that were made orally as soon as possible. Would it be helpful to the Bureau if we secure from the reporter an additional copy of the minutes of the proceedings and submit it to you? Usually we need three copies for the Editing Committee. If that will be helpful, we can obtain an extra copy for your use.

MR. WARNE: That is, of your rough draft?

JUDGE STONE: That will be the stenographic report of these proceedings.

MR. WARNE: We would like to have a copy of that.

JUDGE STONE: Before it is edited? One copy will serve your purpose, will it?

MR. WARNE: Of the preliminary draft, yes.

JUDGE STONE: Mr. Shaw is the Chairman of the Editing Committee. Do you have any announcement to make about that, Mr. Shaw?

MR. SHAW: I will be glad to communicate with Mr. Carson and General Giles as soon as I receive the transcript, and we will arrange the date of meeting.

MR. WARNE: I said one copy would be sufficient of the preliminary draft.

JUDGE STONE: Now, before we adjourn, may I say on behalf of Colorado, we appreciate having you folks here, and we appreciate having this large group of interested people from the various states. It is very helpful to the Committee of Sixteen, and it is quite necessary that we have those who are interested in these matters meet with us.

I want to say to the Bureau of Reclamation that for seven years, Mr. Warne, we have had the finest cooperation on the part of the Bureau. Mr. Debler--you can look back in some of the proceedings and you will find that he outlined something of a plan some years ago, and he has kept us up to date. Mr. Riter has been pitching since he has taken the office over, and the others have given us splendid cooperation, and on behalf of the Committee I want to express our appreciation.

MR. WARNE: The Bureau appreciates very much the cooperation of the Committee of Sixteen and the Committee of Fourteen, and the people of each state. It is a relationship that we prize very much.

JUDGE STONE: Are there any other matters to come before the Committee? Do you have something, Mr. Larson?

MR. RITER: It might be helpful if we could get the numbers today, if the states are prepared today to tell us how many copies of the report they need.

JUDGE STONE: Arizona.

MR. CARSON: Arizona won't need any more copies.

JUDGE STONE: New Mexico.

MR. WILSON: Five for New Mexico.

JUDGE STONE: You have it for California?

MR. RITER: I have it for California.

JUDGE STONE: Nevada.

MR. SMITH: One.

JUDGE STONE: Wyoming.

MR. ROLLINS: Four for Wyoming.

MR. RITER: How many for Colorado, Judge?

MR. WALLACE: Utah desires three additional copies.

JUDGE STONE: Mr. Merriell, do you know how many additional copies it will take for Western Colorado?

MR. MERRIELL: No, I haven't one available.

JUDGE STONE: Mr. Larson, may I hand that to you sometime before Monday?

MR. LARSON: Yes. I want to get it over there so that they can get started mimeographing Monday morning.

(On motion, duly seconded and carried, the meeting adjourned at 5:50 p. m.)

UPPER COLORADO RIVER COMPACT COMMISSION

OFFICIAL RECORD OF MEETING NO. 3

SERIES OF PUBLIC HEARINGS

Sessions At

Rock Springs, Wyoming	October 28, 1946
Grand Junction, Colorado	October 30, 1946
Price, Utah	October 31, 1946
Farmington, New Mexico	November 2, 1946

MEETING NO. 3
Rock Springs, Wyoming
(First in Series of Four Public Hearings)
October 28, 1946

	Vol.	Mtg.	Page
Appearances	1	3	1
Opening Statement by Chairman Bashore	1	3	3
Com. Bishop to Preside for Wyoming Hearing	1	3	3
General Discussion; Remarks by Attending Individuals	1	3	3
Norman W. Barlow (Green River Valley)	1	3	3
David P. Miller (Green River Valley)	1	3	3
Resolution Urging Early Compact	1	3	4
Resolution to Slow Pre-Compact Constructions	1	3	5
E. R. Hamblin (Lyman Project)	1	3	5
Carl P. Dahlquist (Lyman Project)	1	3	6
Oscar W. Dahlquist	1	3	8
John W. Field	1	3	8
Palmer B. DeLong (Bureau of Reclamation)	1	3	8
William McGinnis (Burntfork)	1	3	8
Orson N. Behunin (Burntfork)	1	3	10
Melroy Luke	1	3	12
DeLong's Comments re Henrys Fork Project, Big Basin Reservoir, and Eden Project	1	3	12
Joe L. Budd (Kendall Reservoir)	1	3	13
Carl Jorgensen	1	3	14
Leeland U. Grieve (Little Snake)	1	3	15
Platt Wilson (Hams Fork)	1	3	15
John A. Reed (Green River Basin)	1	3	16
J. H. Jacobucci (Green River Basin)	1	3	16
Perry W. Jenkins (Green River Basin)	1	3	17
Marshall Smith (Eden Valley)	1	3	19
Ernest B. Hitchcock (Green River Basin)	1	3	21
Remarks by Com. Bishop of Wyoming	1	3	22
Figures, Estimates on Suggested Wyoming Projects	1	3	23
Remarks by Com. Stone of Colorado re Need for Basic Data and Records	1	3	23
Comments on Small Projects Construction	1	3	26
Remarks by Com. McClure of New Mexico, Supporting Views of Com. Stone	1	3	28
Remarks by Com. Watson of Utah	1	3	29
Remarks by J. R. Riter, Outlining Program of Work of Engineering Advisory Committee	1	3	29
General Summary by Chairman Bashore	1	3	31
Motion by Com. Stone for Commission to Edit Record of Santa Fe Meeting; and Have Secretary Prepare Corrected Copies in Final Form	1	3	33
Seconded by Com. Watson (Carried)	1	3	35
Meeting Adjourned	1	3	35

MEETING NO. 3
Grand Junction, Colorado
(Second in Series of Four Public Hearings)
October 30, 1946

	Vol.	Mtg.	Page
Appearances	1	3	37
Opening Statement by Chairman Bashore	1	3	39
Com. Stone to Preside for Colorado Hearing	1	3	39
Remarks by Com. Stone	1	3	39
Introduction of Compact Commissioners, Advisers and Assistants	1	3	39
Comments on Compact Negotiations Procedure	1	3	40
Comments by Frank C. Merriell (Western Colorado Engineer)	1	3	43
Silmon Smith to Serve as Meeting Moderator	1	3	45
Remarks by Mr. Smith	1	3	45
General Discussion: Remarks by Attending Individuals	1	3	48
Ed L. Dutcher (Western Colorado)	1	3	48
Judge Hume S. White (Western Colorado)	1	3	49
Dan B. Hunter (Southwestern Colorado)	1	3	52
Congressman Robert F. Rockwell of Paonia	1	3	52
J. M. Dille (Northern Colorado)	1	3	54
Glenn G. Saunders (Denver Water Board)	1	3	56
H. L. Potts (Denver Water Board)	1	3	57
C. J. McCormick (Western Colorado)	1	3	58

Harry W. Gueno (Paonia Project)	1	3	61
Observations by Chairman Bashore	1	3	62
Noon Recess	1	3	62

Afternoon Session

Charles R. Neill (Paonia Project)	1	3	63
Carl R. Smith (Paonia Project)	1	3	64
Archie B. Toner (Southwestern Colorado)	1	3	64
D. L. Williams (San Miguel Basin)	1	3	65
T. L. Sundquist (Bureau of Reclamation)	1	3	65
Charles J. Beise (Southeastern Colorado)	1	3	66
John Heuschkel (Western Colorado)	1	3	67
Judge Paul L. Littler (Western Colorado)	1	3	68
Comments by Com. Stone	1	3	68
Comments by J. R. Riter re Engineer Committee Assignment	1	3	69
Introduction of Engineer Advisers	1	3	69
Explanation of Gauging Stations Set-up	1	3	70
Assignment Completion Time Not Predicted	1	3	73
Comments by Compact Commissioners	1	3	73
Com. McClure (New Mexico)	1	3	73
Com. Carson (Arizona)	1	3	74
Com. Bishop (Wyoming)	1	3	74
Remarks re Water Use Priorities	1	3	75
Remarks re Project Construction; Transmountain Diversions	1	3	75
Com. Watson (Utah)	1	3	75
Com. Stone (Colorado)	1	3	76
Early Construction of Smaller Projects	1	3	77

	Vol.	Mtg.	Page
Announcement of Arrangements for Public Hearing at Price, Utah (Com. Watson)	1	3	78
Remarks by William R. Wallace	1	3	79
Introduction of R. J. Tipton, Carl M. Bennett, Herbert Fritz.	1	3	80
Remarks by Mr. Pitz, Grand Junction City Manager	1	3	80
Motion by Com. McClure to Thank Silmon Smith and Others Participating in Presentations	1	3	81
Seconded by Com. Carson (Carried)	1	3	81
Motion by Com. Bishop to Adjourn	1	3	81
Seconded by Com. McClure (Carried)	1	3	81

MEETING NO. 3
Price, Utah
(Third in Series of Four Public Hearings)
October 31, 1946

	Vol.	Mtg.	Page
Appearances	1	3	83
Opening Statement by Chairman Bashore	1	3	86
Introduction of Compact Commissioners	1	3	86
Com. Watson to Preside for Utah Hearing	1	3	86
Preliminary Remarks by Com. Watson	1	3	86
Historical Background and Resume of Compact Problem	1	3	87
General Discussion; Remarks by Attending Individuals	1	3	90
Mayor J. Bracken Lee of Price	1	3	90
Leon P. Christensen (Echo Park Project)	1	3	91
Mayor B. H. Stringham of Vernal	1	3	91
H. L. Allred	1	3	92
John P. Madsen (Uintah Basin)	1	3	92
Leo Calder (Uintah Basin)	1	3	93
Alma Preece (Uintah County)	1	3	94
Byron Howard (Wasatch Range)	1	3	94
E. E. Peirce (Price River)	1	3	95
Sen. Mitchell Melich of Moab	1	3	96
Recess	1	3	97
Blair Richardson (Metropolitan Water)	1	3	97
J. W. Gillman (Provo District)	1	3	97
Mayor Mark Anderson of Provo	1	3	98
Remarks by E. O. Larson, Region 4	1	3	99
Elmer A. Jacob (Provo Utilities)	1	3	99
Dr. John A. Widtsoe	1	3	100

APPEARANCES
UPPER COLORADO RIVER BASIN COMPACT COMMISSION

HARRY W. BASHORE, CHAIRMAN
Federal Representative
Mitchell, Nebraska

A. W. WATSON, ACTING SECRETARY
Salt Lake City, Utah

COMMISSIONER FOR THE STATE OF ARIZONA:

Charles A. Carson	Special Attorney for Arizona, 419 Title & Trust Building, Phoenix, Arizona.

COMMISSIONER FOR THE STATE OF COLORADO:

Clifford H. Stone	Director, Colorado Water Conservation Board, State Office Building, Denver, Colorado.

COMMISSIONER FOR THE STATE OF NEW MEXICO:

Thomas M. McClure	State Engineer, Capitol Building, Santa Fe, New Mexico.

COMMISSIONER FOR THE STATE OF UTAH:

Edward H. Watson	State Engineer, State Capitol, Salt Lake City, Utah.

COMMISSIONER FOR THE STATE OF WYOMING:

L. C. Bishop	State Engineer, Cheyenne, Wyoming.

ADVISERS AND OTHER PERSONS PRESENT

COLORADO:

Jean S. Breitenstein	Attorney, Colorado Water Conservation Board, 718 Symes Building, Denver, Colorado.

NEW MEXICO:

Fred E. Wilson	Special Assistant Attorney General and Attorney for New Mexico Interstate Stream Commission, Albuquerque, New Mexico.

UTAH:

Edward W. Clyde	Special Assistant Attorney General, Salt Lake City, Utah.
C. S. Jarvis	State Engineer's Office, Salt Lake City, Utah.
Wm. R. Wallace	President, Utah Water Users Association, Salt Lake City, Utah.
Thos. W. Jensen	Utah Water Users Association, Mt. Pleasant, Utah.

WYOMING:

Louis J. O'Marr	Attorney General of Wyoming, Cheyenne, Wyoming.
Ernest B. Hitchcock	Wyoming State Planning & Water Conservation Board, Rock Springs, Wyoming.
Emil C. Gradert	Compact Commissioner, Fort Bridger, Wyoming.
Norman W. Barlow	President, Green River Basin Development Company, Cora, Wyoming.
David P. Miller	Secretary, Green River Basin Development Company, Rock Springs, Wyoming.
Perry W. Jenkins	Executive Manager, Green River Basin Development Company, Cora, Wyoming and Salt Lake City, Utah.

Carroll R. Noble	Cora, Wyoming.
H. B. Carlisle	Sage, Wyoming.
Leoland U. Grieve	Asst. Inter-State Streams Comm., Savery, Wyoming.
John A. Reed	Asst. Inter-State Streams Comm., Kemmerer, Wyoming.
Platt Wilson	Asst. Inter-State Streams Comm., Kemmerer, Wyoming.
Orson N. Behunin	Burntfork, Wyoming.
Wm. McGinnis	Burntfork, Wyoming.
Joe L. Budd	Big Piney, Wyoming.
Don W. Jewett	Big Piney, Wyoming.
F. W. Tanner	Big Piney, Wyoming.
Carl Jorgensen	Pinedale, Wyoming
Melroy Luke	McKinnon, Wyoming.
Edward Davidson	Blacks Fork P. & I. District, Mt. View, Wyoming.
Roy C. Taylor	Mt. View, Wyoming.
Jesse Graham	Mt. View, Wyoming.
W. S. Tanner	Mt. View, Wyoming.
Oscar W. Dahlquist	Mt. View, Wyoming.
Orlen P. Packrell	Blacks Fork Canal Board, Lyman, Wyoming.
John W. Field	Lyman, Wyoming.
Van A. Rupe	Lyman, Wyoming.
Charles F. Guild	Piedmont, Wyoming.
Victor Fillen	Fort Bridger, Wyoming.
John J. Segar	Fort Bridger, Wyoming.
Felix Aimone	Fort Bridger, Wyoming.
Carl P. Dahlquist	Fort Bridger, Wyoming.
Milton L. Clifford	Fort Bridger, Wyoming.
E. R. Hamblin	Blacks Forks Canal, Fort Bridger, Wyoming.
J. H. Jacobucci	Green River, Wyoming.
Marshall Smith	

BUREAU OF RECLAMATION:

J. G. Will	Assistant Chief Counsel, Washington, D. C.
J. R. Riter	Hydrology Division, Denver, Colorado.
N. B. Bennett, Jr.	Branch of Project Planning, Washington, D. C.
J. Stuart McMaster	Counsel, Region 4, Salt Lake City, Utah.
Reid Jerman	Engineer, Region 4, Salt Lake City, Utah.
Palmer B. DeLong	Kemmerer, Wyoming.
Paul E. Morine	Salt Lake City, Utah.
A. A. Batson	Denver, Colorado.
E. H. George	North Platte District, Casper, Wyoming.

DIVISION OF LANDS, FOREST SERVICE:

Ralph V. Minges	Denver, Colorado.

SESSION AT ROCK SPRINGS, WYOMING
MONDAY, OCTOBER 28, 1946

The meeting was called to order by Chairman Bashore at 1:45 p.m., Monday, October 28, 1946.

THE CHAIRMAN: The meeting will now come to order. It is now a quarter to two. This is the third regular meeting of the Upper Colorado River Basin Compact Commission. At the last meeting at Santa Fe, New Mexico, the Commission decided that the third meeting should consist of a series of field hearings at points in the Upper Division States. This is the first of the series. The next one will be at Grand Junction, Colorado; the next one at Price, Utah; and the last one at Farmington, New Mexico.

The purpose of these meetings is to acquaint the people in the various states with the work of the Commission and to afford them the opportunity of expressing their opinions and ideas to the Commissioners in regard to the proposed Compact. It is the opinion of the Chairman that these meetings are very important because it gives an opportunity for an expression of ditch-bank opinion about this water allocation. If you don't understand what the Commission is doing you may ask all the questions you like. There are experts here who will try to answer those questions and I am sure the Commission will appreciate your advice and counsel in regard to these deliberations and negotiations.

Now as this meeting is in Wyoming, the Chairman now requests that Com. Bishop take charge of the meeting and explain the work of the Commission and call on anyone that he thinks might contribute something. So, Mr. Bishop, the meeting is now in your hands.

COM. BISHOP: Mr. Chairman and gentlemen, we have a Compact Commission that has been set up for the purpose of dividing 7,500,000 acre feet of water allocated to the Upper Basin States by the terms of the Colorado River Compact.

Is Mr. Norman Barlow here?

MR. BARLOW: Yes.

COM. BISHOP: Mr. Barlow, I am going to call on you first to make a statement of your understanding of the situation and all for the Basin here as President of the Green River Basin Development Company.

MR. BARLOW: Mr. Chairman, we had our annual meeting this morning of our Green River Development Company. I might say at the outset that this company is an organization that was formed several years ago to promote the development of the resources here in the Green River Valley in Wyoming. It comprises five of our southwest counties. We have a directorate of fifteen, three directors from each county, our officers and an executive committee.

We feel that our work in the past has been very beneficial, particularly in that we have been educating, we hope, the people in the Basin to reclamation and the needs of reclamation as we see it. Our meetings are becoming better attended and our meetings throughout the Basin that we have held during the years carrying on an educational program have been most beneficial to our company and to the people who are directly interested in the use of the water within our Basin here in Wyoming.

It was about two years ago, I think, that our Basin Company took official action in calling on our Governor to start a meeting for the negotiation of the water of the Upper Basin States. Our State Engineer advised the

Governor and the Governor notified the other Governors of the four Upper Basin States with not too much success. There seemed to be reasons why they didn't care to commit themselves at that particular time or there was no particular need or rush in getting started in this negotiation. We insisted and I think there was a follow-up letter. At any rate over the period of months we did get to where the four governors decided that they would officially start to negotiate and they had their first meeting last July, as you know, in Cheyenne.

We feel here in the Green River Basin in Wyoming that this is a most important thing to allocate our water particularly because we are anxious to develop, naturally, our resources here in the Basin. We want to develop them with Wyoming water. We want to develop them with Wyoming's share of this Colorado River water. We want to insure our future posterity throughout the coming ages that there will be water here for any resources that we may have to develop.

We know this, that until we decide among the four Upper Basin States what our liability is at Lee Ferry, that no one knows exactly what development may take place.

We had a meeting with the new Secretary Krug and Commissioner Straus at Laramie in June, our Basin Company, and we were encouraged at that time with the statement that Mr. Krug made in regard to the allocation of the water stating that while he was new in the Department, he was of the mind at that time to feel inclined not to urge further development until the four Upper Basin States did get together and allocate the water. It was something that we have been stressing and we were encouraged to have him make that statement.

We have had, as you have been told, preliminary meetings of the Compact Commission; and Wyoming's delegates on that Commission, I am sure, are willing to meet in a friendly attitude, in fairness to all the other states involved in getting this matter settled. We hope this afternoon in the discussion that may take place that we will do it in a sense of fairness, fair play for everyone.

We only want what belongs to Wyoming and we would like to get it negotiated at the earliest possible date.

COM. BISHOP: Thank you, Mr. Barlow. Mr. Miller, would you like to make a statement in addition to what Mr. Barlow has made?

MR. DAVID P. MILLER: I am the Secretary of the Green River Basin Development Company of which Mr. Barlow is the President. This organization has been in existence since 1938. We felt the need of some centralized organization which would help conserve the water of the Green River so far as Wyoming is concerned. To that end we organized this company, which is a non-profit organization with a representation from all the five counties of the Green River Basin in Wyoming.

We feel that we have a large interest at stake in this matter. It involves the irrigation of several hundred thousand acres of new land. It involves several large power sites. And it involves the use of a large amount of water for industrial purposes. There is just beginning to be developed in our area a new industry. A company has come in to a location which is about fifteen miles west of the town of Green River. They are developing the mineral they call trona. They are at present engaged in sinking a large shaft and they are going to make a large development. These people have told me that they intend if everything works out to have the largest

chemical plant west of the Mississippi River. This is a comparatively new development here in our community and one in which we have intense interest.

We feel that we are all on a sort of an uncertain ground pending the allocation of the water among the four Upper Basin States and as stated by Mr. Barlow, we favor that this allocation be made at the earliest possible time.

Now this morning we had a meeting of our company and we adopted two resolutions which I would like to present to the Commission. If it is appropriate I would present them at this time. Do you wish to have me read them, Mr. Bashore, and then they will be presented?

COM. BISHOP: I think you had better read them because a lot of the people would like to hear them. There are some people that weren't here at the meeting this morning. I suggest that you read them and give the secretary a copy.

MR. MILLER: There are six copies there and we will prepare others if necessary. The first resolution is a generalized one and I will read it as follows:

"WHEREAS: Negotiations have been commenced concerning the allocation of the waters of the Colorado River under the terms of the Compact, by the formation of the Upper Colorado River Basin Compact Commission.

"THEREFORE: Be it resolved that the Green River Basin Development Company is in entire accord with the aims of the Commission and urges that a Compact be ratified at the earliest possible time."

The second one:

"WHEREAS: The Secretary of the Interior has publicly stated that he is opposed to further construction and development in the Colorado River Basin until such time as agreement has been reached among the upper basin states concerning the division of the water under the terms of the Colorado River Compact.

"THEREFORE: Be it resolved that the Green River Basin Development Company in annual meeting assembled hereby endorses the position taken by the Secretary and hereby opposes all construction and development and in addition in order to make the recommendation equitable, resolves that whenever possible that disbursements of funds on existing projects be withheld until such time as a Compact is ratified by the upper basin states."

In other words, we are anxious to see this thing proceed and to this end our company has adopted this resolution.

COM. WATSON: Mr. Bishop, is a question in order?

COM. BISHOP: Yes.

COM. WATSON: Will Mr. Miller please explain to this Commission what the mineral trona is?

MR. MILLER: As I understand, Mr. Watson, it is a double carbonate; it is sodium carbonate and sodium bicarbonate mixed and in what proportion I am not able to say at the moment. Just to explain that a little further, we have another material in this area which is the mineral they call leucite and leucite is a silicate of aluminum and potassium; and without going into the details of this proposed process, I think it is contemplated that by the

combination of this material, leucite, with the trona, profitable development can be made in the chemical industry in this area.

COM. BISHOP: Are there any questions? We would be glad to have any of you ask questions. I wonder if there is someone here from the Lyman project who can tell us why it is going to be beneficial. Will one of you gentlemen do that? These gentlemen here would like to know some of the needs of you people in the Basin.

MR. E. R. HAMBLIN, FORT BRIDGER, WYO.: My name is E. R. Hamblin.

COM. BISHOP: You are a water user under the Lyman Project, are you?

MR. HAMBLIN: Yes, sir. I don't know what I could say. Most of us delegates down here represent quite a farming district up there, that is, a ranching district. Most of those are old ranches. They were originally farms and found out it was better to use them as ranches so they have been growing grass and steers since, and as the years go by, why, the water is being taken away from us.

I remember along about 1920 we went up with teams and scrapers and started some little reservoirs and started a rather large one and we had it completed to a certain extent. But it seems as though that was a nuisance to some of the bigger companies, that is, the railroad and the Standard Timber Company, and it interfered with their ties and they blew that up. So there were some small reservoirs built and we are using those, but they are not adequate.

Now we got our stock in off of the range and this year and other years we raised a fairly good hay crop, but our carrying capacity would have been almost double if we had had pastures to turn them in on. I think we should have had one more irrigation.

Now in asking for another irrigation for our land we don't feel that it is going to take a lot of water out of the Green River Basin because the run-off in recent years is getting bigger and bigger all the time out of the Valley back into the Blacks Fork. It increases every year. Well, if we just have one or two waterings, that will dry up and Blacks Fork will dry up, too, in a certain part of the year, dry up completely. That is just a natural consequence. Water seeks its own level and when we spread it out over that land, it isn't destroyed. It isn't gone. It keeps on coming down and finally gets down to Lee Ferry even if we do use a little of it.

Now most of those farms have long standing; they have been used a long time. My father came into that country because he thought that there was a plentiful supply of water, which there was at that time. But as the people began moving in and began to allocate the water, the water was being cut down all the time until finally his land wasn't worth so much as it was.

Now myself, for instance--this is just a little incident but it applies to a lot of the rest of my neighbors--I developed a ranch in the center of the Bridger Valley, not a very large ranch but a ranch just the same. When I started that ranch I did have a plentiful supply of water for my requirements at that time but they have been cutting me down all the time. So we saw the need of reservoirs. There were plenty of good sites. We started those reservoirs, but it seems as though the Government stepped in and says, "We will develop these for you." Well, that was fine with us, so we sort of let the Government take hold.

Well, there was so much red tape we formed a little group up there and made applications and the applications were approved, and now the water is being taken down to develop countries in the Lower Basin. We don't feel that is fair. We moved into that country in the early stage of development, spent our lives there with our families.

Now myself, for instance, I raised a rather large family and we contributed to the development of that land very sincerely. We made our home there. I raised some boys. The war came along. The Government took the boys, and of course those boys were really ranch raised. They were well educated. The people in that valley are education minded, and we, along with the rest of them--that was our main aim, to educate those boys. While they were in the University they took them away from us. It was all very well. We thought that was good. Now those boys have had a lot of experience, they had a good education and they have been practically all over the world, I might say, but their minds are still on the ranch and that is home to them.

Now if those boys have to come back to a dry country, what are you leaders going to say? How are you going to answer if they are taking their water away from them? We feel that that is our water and somebody, if it is taken away, has got to answer for it. You can make all the records you want but you have got to answer to those boys, and all we are asking is just our share of what really belongs to us.

COM. BISHOP: Would you mind telling us what this 160-acre limitation might do to the people over there?

MR. HAMBLIN: Yes, sir, I certainly would like to answer that. Our district is a rather high elevation, and true, we can raise lettuce and we can raise radishes, too, just as good as they can in Imperial Valley or any place else, but we don't feel it is profitable.

Now take one of my boys, for instance. He can operate a ranch of 320 acres most of the year around--most of the year--and he can develop a lot of good beefsteak and a lot of wool, more wool and beefsteak than the value of any radishes down in Imperial Valley, more value, and the Nation would gather more taxes, too.

And so we know that--you know too--that 160 acres for a ranching country is just out of the question for us. We contend all the time that that water isn't lost because we spread it out on those meadows. It isn't gone. And just 160 acres, why, if you confine us to 160 acres, you will kill the Bridger Valley. We might have a little oil later on but it will kill the beef and the wool.

COM. BISHOP: I believe I should explain for your information that the people of the lower valley haven't taken your water. The Colorado River Compact allocates 7,500,000 acre feet of water per year to the Upper Basin and to divide this water is what this Compact Commission was formed for. It is their business to divide this water and see that Wyoming gets its share. To date there is no one taking any of Wyoming's water. We have used all we can and they have used all they can in the Lower Basin and some 12,000,000 acre feet runs on into the Pacific Ocean.

MR. HAMBLIN: I grant you that but I understood from the conversation this morning it is also a fact that if we deliver 7,500--is it?

JUDGE FRED E. WILSON, NEW MEXICO: Seven million five hundred thousand acre feet.

MR. HAMBLIN: Well, anyway, it is more than we can deliver every year. We guarantee that? Is that a fact, we guarantee that much down there?

COM. BISHOP: We guarantee 75,000,000 in each continuing ten-year period.

MR. HAMBLIN: I don't believe we can do it.

MR. THOS. W. JENSEN, UTAH: Have you got that much in the Blacks Fork?

MR. HAMBLIN: Well, if we spread it out and were conservative we might have. (Laughter.)

COM. BISHOP: Would any of the rest of you from over at Lyman like to have something to say?

MR. CARL P. DAHLQUIST, FORT BRIDGER, WYOMING: I might add to Mr. Hamblin's statement concerning our water over there. It is a case over there of early runoffs. At the time we need our waters they are gone; and our only means of staying in that valley is to have some place to store the water so that we may use it when we need it. I believe that would be about all.

COM. BISHOP: Do you have something you want to say?

MR. OSCAR W. DAHLQUIST, MOUNTAINVIEW, WYOMING: Yes. I am like these other men; I think we need to conserve our water. Our water runs off too early in the spring and at the time of the growing season we haven't got any. We should have a place for it to be stored. And furthermore, if we have our water there, it gives our young men a chance to stay in the Valley and gives them something to build to.

MR. JOHN W. FIELD, LYMAN, WYOMING: I have had a little experience up there with the water and I would just like to say this: that when we first came there, as Mr. Hamblin said, there was water enough for the users that were there; but since that time appropriations have amounted to enough now that there is only half of the season or a fourth of the season that anyone draws water.

Of course there isn't any storage and as the water falls in the River, it runs off. This year there are somewhere around 600 feet in Blacks Fork appropriated and the River hardly supplied 300 feet, and a foot for every 70 acres in that sandy, gravelly country there will not irrigate it. It's just insufficient.

That's all I have to say. That's the condition, that there are only half of the people in that Valley now drawing water sufficient to make a crop. This year the crop fell down 50 per cent or better due to the early rise; of course, part of the crop was saved.

COM. BISHOP: I believe at this time it would be well for Mr. DeLong to explain what the plans of the Bureau are for this particular project.

MR. PALMER B. DeLONG, BUREAU OF RECLAMATION, KEMMERER, WYOMING: The plans for the Lyman Project as outlined in the Colorado River Report include the furnishing of supplemental water to nearly 21,000 acres of what we call Class 1 and 2 land. We have decided that a capacity of 30,000 acre feet in the Bridger Reservoir on Willow Creek would furnish enough water for this purpose. However, since the writing of the Colorado River Report, we have

continued our studies further on the Lyman Project and we hope this winter to come up with the detailed project report which may change that plan a little bit.

For example, we have since the Colorado River Report completed a detailed classification which will change the acreage of what we call Class 1 and 2 land and may change the setup a little bit. However, in considering the Lyman Project, we are considering it from the standpoint of a livestock economy and not from the standpoint of growing cash crops or lettuce or radishes, as Mr. Hamblin suggested.

I feel quite encouraged about the Lyman Project and I think that we are going to be able to work something out that will be satisfactory to the Lyman people as well as everyone else.

Are there any questions? Is there anything that you would like to discuss further, Mr. Bishop?

MR. HAMBLIN: Mr. DeLong, there has been some confusion about this classification of the land. Of course a lot of that valley is cobble rock, but it is growing good crops; and some of those meadows have been growing since 1822 and are still growing good crops.

COM. BISHOP: 1822?

MR. HAMBLIN: 1822.

MR. DeLONG: I believe according to our records that the first irrigation was in about 1860, Mr. Hamblin.

MR. HAMBLIN: What about the fort at Bridger, and Fort Supply? Of course, Supply was later.

MR. DeLONG: 1822 was pretty early.

MR. HAMBLIN: You will have to prove I am wrong.

MR. DeLONG: We agree that your meadow land, your pasture land there, has some very good soil. However, as I mentioned to you this morning, there is a restriction on that kind of land that forces us to throw it out of what we call Class 1 and 2, the lands that can be cultivated. For example, as you mentioned, it is full of cobbles on the surface and it is not possible to plow it.

However, we do recognize the fact that it is good soil other than that and can grow very good grass crops, and it is our responsibility to recognize the value of that grass, as you mentioned--your livestock, beef and sheep, and one thing and another--and we recognize the problem there in that way.

COM. WATSON: Mr. DeLong, the return flow on that type of land would be very large, would it not?

MR. DeLONG: Well, as they mentioned, the soil is fairly sandy and gravelly, and it requires a good diversion. However, the consumption is low, as you recognize from the altitude and the type of crop. The return flow is good, yes--some irrecoverable losses, but not many.

MR. VAN A. RUPE, LYMAN, WYOMING: You spoke about a revision; did you mean downward or upward in the acreage?

MR. DeLONG: If there is any revision in the Lyman Project it will be upward.

COM. BISHOP: You want to ask a question?

MR. HAMBLIN: Maybe I could give you an illustration. I don't like to take your valuable time, but I would like to give a little illustration.

I was President of the Uinta County Farm Bureau for sometime and at that time there was a lady who came from down in the lower Colorado River district, and of course she and her husband looked me up and stopped there over night. He was rather a livestock-minded man although he had been growing row crops. He had an investment of about $40,000 down there in that country in land besides his machinery, an enormous lot of machinery--I don't just remember how much.

But anyway, he helped me feed my cattle and do my chores. Then we went out the next morning on Farm Bureau business, and that night he was comparing my means of income with his. I didn't have quite that big an investment in my layout there, but he was pretty good at figures and he sat down and he figured for an hour or two. He figured all my income, what little I had off my ewes and how much I had off my cattle; of course at that time my wife and I weren't milking very many cows but we did have a little income on cows. And of course we had our chickens, too--my wife always has to have chickens whether we go behind on them or not. (Laughter.)

And so he was figuring on the income off of my investment. "Why," he says, "I have got almost double the investment you have got and my wife put in over two months hoeing beans." Well, my wife never did hoe beans. It is very few times she has milked. Anyway, he was comparing his efforts he put in, he and his wife, and the efforts of me and my wife, and then their income. He was a lettuce man and so on. "Why," he says, "you can produce more for the money invested than I can besides the effort we have to put in." So why send that water down to them? (Laughter.)

COM. BISHOP: Is there someone here from some of the other projects that would like to be heard? How about the Eden Project? Mr. McGinnis, would you like to be heard? Come up here where we can look at you and hear you.

MR. WM. McGINNIS, BURNTFORK, WYOMING: I am a very poor orator. I have lived in the Bridger Valley that I have heard Mr. Hamblin talking about here. I lived in Bridger Valley for several years. I moved from Bridger Valley to the Burntfork district and I have lived there 34 years. When I first went to the Burntfork district there was an abundance of water for the entire land but there was a new settlement that soon consumed the water and we have been more or less shy of water for a good many years.

I had a family of small children, worked various ways, and wanted to get out of it and my wife says, "No, we can't go with these children to a different place." I said, "We have got to get water." She says, "Go get it." I said, "How are we going to get it?" I began studying and spent a good many nights without sleep. Finally I decided to see what could be done so I go to Green River and see Mr. Evers. Bill Evers was Commissioner there.

I was getting poorer and poorer every year. Our altitude out there is 7,125. We raise wonderful stock. When we have moisture, the grass is good and the range is good. If we have water enough we raise an abundance of hay; we raise any amount of small grain. But when we haven't any water, our

holdings are absolutely worthless. Consequently I got in so I couldn't move away, bringing about almost separation with my family moving, so I began to hunt for water.

Mr. Evers and I talked together and he said, "I will help you out." He would do what he could. He takes me and we go to Cheyenne. We look around. At that time I don't believe there was scarcely any reclamation; such things as that were just getting started in places, but at least he stayed with me. He is a good Indian. And we worked that out and finally we have no place to build a reservoir, but eventually we found one where we could build one, but it is quite expensive. So we worked around until we got Government aid and we built a reservoir and we have had quite a little bit of trouble getting the amount of water that would suffice us to the reservoir. We are a poor lot of people and we couldn't quite finance those things.

But as to our location, we haven't water enough as there is more and more development and more land to be developed, that should be developed. We have the one reservoir now. That is a wonderful thing; there is no question about it. It is a wonderful thing. It has been quite expensive but then at the same time it is worth while, and yet we haven't water enough. We are shy on water.

But there is what they call the Big Basin, it is in Utah, and it will hold an awful lot of water; and through the development of that water from Henry's Fork, the Beaver Creeks and other tributaries, why, there could be a wonderful reservoir made and it would supply that country together with much arid land in the lower country, down towards the Manila country and in that country down there, and also a lot of it can be carried over to benefit those people in the Bridger Valley or around the arid lands in that country near Granger, and so on. If I am not mistaken, it has been allocated for 122,000 acre feet or something like that. Well no doubt it would take some time to fill all that but the runoff in the spring as a rule is immense.

Well this water goes down, it gets to where it goes to Lee Ferry or wherever somebody must get the benefit of it. But at the same time, the way I look at it, all stored waters in these upper regions, when they are utilized and used, they help to maintain and supply the demand at Lee Ferry and all lower areas.

Our country for raising stock, sheep and cattle, is hard to beat if you put the moisture on the ground, but without that that country isn't worth very much. Now I don't think that any other is as far as I am interested. I believe that if we could get the right support and get this into a reservoir that it would assist the people over in the Lyman area. It would irrigate an awful lot of arid land and supplement a lot of already water users. They would be successful. It would be a great country.

We have had some awful droughts out there. It was almost impossible to live through them unless you were pretty well financed, which I have never been. I have gone through it all, know just about how it is, and I think the entire community out there will bear me out that if we can get the amount of water that is needed it will also help maintain the resources and also build up a wonderful country. In dry years our arid grounds were no good. When we can put the water on them, we can raise grasses, hay, or anything. It doesn't make any difference whether it is a rock pile, where you can get the moisture you can get production in that country. I don't know about these lower countries. I have been down there, too, but I didn't live down there and cultivate them and so on.

I think a lot of our country and I want to see it supported. We have

additions there on both sides that I think should be supported. A reservoir like that would not only support that but it would make a wonderful difference in our building up of our wonderful West, which would give us all more land. The boys, the G.I.'s and so on, could many, many, many of them have homes and places to live where today, with the housing situation, it seems to me they are taking them all to the cities. What are they going to do when the cities are filled up? Where are they going to get their production from?

I am kind of lost; I am wondering what they are going to do. In all these cities they have plans going on but nothing doing to make production. I think the production is first and then we might have something to rely upon because we have got to have something to eat and wear.

COM. BISHOP: Thank you, Mr. McGinnis. Mr. McGinnis has been in a part of the country where he is very close to the Utah State Line where the Utah fellows have the "highority", not the priority, where they help themselves. Mr. McGinnis was water commissioner for a few years and he knows the situation over there.

MR. ORSON N. BEHUNIN, BURNTFORK, WYOMING: There is just a little I would like to add to that about our climate out there. We are 7100 feet and our country nestles under the leeward of the Uinta Mountains. We have one of the nicest climates in the world for that elevation. Very, very seldom in winter-time does our temperature reach ten below zero at night, and even those few nights that we get ten below zero weather, in the daytime the sun comes out warm and you can go out about your chores and feed your cattle without your coat on. Of course there are storms and we do get some cold weather, but it is very rare.

Therefore, our livestock doesn't require the feed that they do in some lower areas where they get the cold weather. The fog will settle down over this country and the temperature will run down to 30 below zero while we are sitting out there above the clouds without any cold weather, and we do have a very fine climate out there and we do produce some very good crops.

I think that we do need water awful bad. There is once in a while that one of us will get so mad we will strap on our gun and go up the river. We don't find our neighbor stealing water and we go home and put the gun away. We haven't killed anyone.

COM. BISHOP: You don't go over to Utah any, do you?

MR. BEHUNIN: We put one of those guys in the ditch, dumped him in three times in one day. (Laughter.)

MR. MELROY LUKE, McKINNON, WYOMING: There is just one more thing I would like to add; I don't know whether it will be beneficial or not.

Our country out there has an awful lot of slope from two ways into the Henry's Fork Creek part and although we have a lot of rocky formation underneath the surface in places and it takes a lot per acre for the surface, it sub-irrigates below, and as it goes on down the country, I don't believe it draws or holds back too much water out of the lower country or the Green River regular stream.

We have three reservoirs out there at the present time and all those reservoirs combined don't furnish enough water to irrigate the ground that is already under cultivation. As we get on down to this sub-irrigation, those fellows are getting more irrigation water through their lower streams than we people on the upper streams, so I don't believe that your irrigation c...

the upper part will deprive the people in the lower valley.

COM. BISHOP: Thank you, Mr. Luke. Mr. DeLong, I wonder if you would mind giving a short description of the Henry's Fork Project and the Big Basin Reservoir.

MR. DeLONG: The Henry's Fork Project as set up in the Colorado River Basin report includes 21,090 acres presently irrigated land to receive supplemental water, and 9,190 acres new land to receive a full supply. The regulation for this plan will come from the Big Basin Reservoir, as Mr. McGinnis mentioned, built to a capacity of 107,000 acre feet.

This reservoir is filled by a collection canal that picks up water from Henry's Fork, Beaver Creeks, and Burntfork, and delivers it to the Big Basin Reservoir. There are outlets in turn which come from the Big Basin Reservoir and return the water back to where these lands can be served.

In addition to that under our plan for ultimate development it is possible to construct a service canal 30 miles in length and about 300 second feet in capacity from the Big Basin Reservoir to the Lyman area in Bridger Valley to irrigate an additional acreage over there of about 7,160 acres of new land.

COM. BISHOP: Thank you, Mr. DeLong.

COM. STONE: Mr. Bishop, may I ask Mr. DeLong a question?

COM. BISHOP: Yes.

COM. STONE: Mr. DeLong, you are familiar with the Eden Project?

MR. DeLONG: Well, yes, somewhat.

COM. STONE: That is a W.C.U. project, is it not?

MR. DeLONG: That is right, as originally set up.

COM. STONE: What is the percentage of completion on that project?

MR. DeLONG: I believe they estimate officially about 16 percent complete.

COM. STONE: Is that the project for which an appropriation was made by the last Congress for its completion?

MR. DeLONG: I understand that is correct; however, perhaps Mr. McMaster can answer that definitely. Was there not an appropriation made in the last Congress for the Eden Project?

MR. J. STUART McMASTER, BUREAU OF RECLAMATION, SALT LAKE CITY, UTAH: There was some money made available for W.C.U. and some of it I understand was earmarked for the Eden.

COM. STONE: There were two projects?

MR. McMASTER: The Mancos and Eden.

COM. STONE: And as I understand it--I want to ascertain whether I am right in my understanding--the amount of money made available was available for the completion of that project and Mancos, is that correct?

MR. McMASTER: That is correct.

COM. STONE: And as I understand it, it is not yet decided whether that money will be made available under the executive restriction orders?

MR. McMASTER: That is correct.

COM. STONE: But the Eden Project will go forward this next fiscal year or the present fiscal year if that money is released?

MR. McMASTER: If the money is released and construction work is permitted.

COM. McCLURE: Mancos is a Wyoming or a Colorado project?

COM. STONE: Colorado.

COM. BISHOP: Are there any questions from any of those from other parts of the country? Joe Budd, can you tell us what might be done to help your part of the country?

MR. JOE L. BUDD, BIG PINEY, WYOMING: Mr. Chairman, Members of the Compact Commission, gentlemen: I am from up in the Big Piney area west of the Green River. Our primary interest at this time is construction of the Kendall Reservoir. We have holdings on the western slope of the Green River.

At the present time and for many years we have been very short of water for the irrigation of the land which we now have. There are also thousands of acres of land in that area that under reclamation can be put into production. At the present time this land is capable of grazing about one cow for each 20 acres. This same land through the application of water can be made to produce three to four tons of alfalfa per year, or any of the small grains, oats, wheat or barley.

We are very concerned. We have felt all through these years that the development of the Colorado River has sort of been in reverse. In developing our ranches we have always felt it is beneficial to apply our water on the upper reaches so that water can be reused on the lower reaches. We would like very much to see the Kendall Reservoir constructed. As that is at the head of the River, the water can be used many times by the people in all the different states.

One of our major concerns in that area is the 160-acre limitation. Our economy in the Sublette County area is based on much greater acreages. There seems to be a misunderstanding, a feeling that water shouldn't be given for greater acreage because it isn't supporting enough people. Regardless of whether the land is in one man's name or ten men's names this land is still supporting the same number of people. Families must be employed to take care of the land in either situation. I might mention at this time that most of the hired men are making more than the owners themselves so perhaps it would be better if it was in larger holdings.

We feel very fortunate that we people of the Upper Basin have been given the representation on the Commission that we have. We have great faith in the Commissioners and feel that you will recognize the difference in our climate, the necessity of more land, and also the benefits which will be derived in the Lower Basin through use of the water in the Upper Basin. Thank you.

COM. BISHOP: Thank you, Mr. Budd. Carl Jorgensen, how about you?

Can you tell us what the development might do for your part of the country?

MR. CARL JORGENSEN, PINEDALE, WYOMING: Mr. Chairman, ladies and gentlemen: The way I look at this development it should begin at the head of the River like Joe Budd stated and work down stream. If this development is made, the return flow in the high altitude will be enormous and other development can go on down stream.

I feel that with this development it will add a great lot of wealth not only to our state but to the Nation, and our economists say, the way I understand it, that where there is one dollar invested in land or agriculture, it will support seven dollars invested in other businesses, and with that it is certainly a big thing to our state. And I feel that those other businesses that this original investment is supporting should help pay for the original cost of construction, which I think is necessary on most of these large projects.

Now the 160-acre limitation--I have seen many men trying to make a living and they did exist on 160 acres. They raised a family but couldn't afford to educate them, at least not very well. They never could afford an automobile, and if they bought a piece of machinery they usually picked up something secondhand. You went to their homes; most of them just had an old camp bed they slept in, and coal oil lights. They never had running water; they never enjoyed a good bath tub. I think we should try to get that limitation increased so they could have decent homes and a decent living in this high altitude.

I think that is about all I have to say at the present time.

COM. BISHOP: Thank you, Mr. Jorgensen. Senator Grieve, will you tell us about the Little Snake River and what it might do for your part of the State?

MR. LEELAND U. GRIEVE, SAVERY, WYOMING: Mr. Chairman, our development seems to be pretty slow on the Little Snake River, but for a long time I have asked for exactly what is happening here today. I think I wrote the resolution asking for the division of the water, and of course the reason I did that was the fact that I live down on the Colorado Line where the River crosses that line sixteen times in eighteen miles, and I felt that if the West was going to develop its water, we ought to break down this attitude of indifference.

I think that now that this fine group of men have gotten together that we have broken down that attitude of indifference and that we are going to go a long ways in developing not only my valley but the other valleys and the other states of this western country of ours.

I am very happy to be here today. I haven't any interest in water; I have all the water I want. I am only here in the public interest and I am glad to see the rest of you gentlemen here and I know that your work will be successful.

COM. BISHOP: Thank you, Mr. Grieve. Anyone else that represents some other project now? I don't know all of you gentlemen.

MR. GRIEVE: Mr. Chairman, some of you gentlemen say, "Why don't you sell that place?" I built those reservoirs a long time ago with my own money and that's the reason I have got the water. (laughter.)

COM. BISHOP: Platt Wilson, how about telling us what the development would do to the Hams Fork area around Kemmerer?

MR. PLATT WILSON, KEMMERER, WYOMING: I might say our position over there is a good deal the same as with your other ranches, we have plenty of water in the spring and it peters out in the summer. You have heard that story and it is pretty much the same all over the country. I happen to come from the west part of the Valley. The creeks in our vicinity are the Labarge, Fontenelle, and Hams Fork.

We of course are interested in the development of the areas that can be irrigated in that vicinity. But as a businessman, I might say that I can speak for other businessmen as well as for the ranchers in my community in saying that we not only in our town but in Rock Springs and in Green River are interested in the development of the whole valley, the whole system as a whole. We want to see the development of the Seedskadee, the West Side, the East Side, the Lyman. We also want to see the Big Reservoir at the head of the River built so that we will have an economy out here in our country that will be stable and something that we can depend upon.

Now to get that, we have got to get together with the Commissioners of the other states and get an agreement as to the division of the water, and if we can hasten that agreement, we want to do that very thing.

We are not only interested in the development from an agricultural standpoint but we are interested from an industrial standpoint. My town happens to be a coal town as well as this town. We are interested in the future of coal, what can be made from coal not only as a fuel. We are interested in liquification plants. To have those things we must have water. If we are going to have industry in this part of the country to develop our natural resources, we must have water. So whatever we can do to hasten the division of water we want to do.

Now I don't know whether just telling you what our ills and our needs are helps you fellows to get together on the division, but that is what we want. The quicker you can get at it the quicker we will be getting some place, because as Mr. Krug has said and the Commissioner of Reclamation that they do not favor any further development in the Colorado River Basin until we agree, it is up to us to get together and agree on a division.

Now, you not only have to agree on a division among yourselves as commissioners, as representatives of the states, but the Compact has to be ratified by the legislatures of the different states. So I say that time is an essential element here. We want to get together quickly because it is going to take a long time at best. Most of our legislatures meet this next winter. I doubt very much if you gentlemen can form a compact that can be brought before the legislatures of the states in time for their meeting.

COM. BISHOP: Thank you, Mr. Wilson. How about you, Mr. Reed; would you like to say a few words about that same part of the country?

MR. JOHN A. REED, KEMMERER, WYOMING: I think, Mr. Chairman and Members of the Commission, that our ills have been pretty well aired. I think those of us who are primarily interested, perhaps, in the Green River Basin have a much deeper interest to the people of the State as a whole.

As you know, Wyoming has been pretty good to her sister states in the distribution of water. The Green River is about the only stream we have left with suitable area for development where we feel that we do have some water. And I think that we feel very deeply, I know I do, and my friends in this particular area likewise feel that we must have an equitable distribution of the Green River water.

Wyoming needs some development. Most of you are familiar with the area around Douglas, Wyoming, along the Platte River. There isn't a better agricultural area in the entire intermountain area, Colorado, Utah, or any other section, and yet look at it today. That is because we were perhaps asleep sometime or other with our development and lost our water or gave it away.

Now I don't think we want that to happen in this particular Green River area. I think there is enough water. Maybe we have been a little too liberal thus far below, which at this particular time makes it necessary for us to get busy and work out an equitable distribution of the water of the Green River. And that's all I think we are interested in and I think we have waited long enough because some of you have some development pretty well on its way and we in Wyoming feel that we are ready now, we want to go.

I don't agree with Platt Wilson. I think there can be an agreement reached between now and January when most of these legislatures meet so this can be taken care of. I think it should be. Two years, unless we go to the expense of calling a special session, is entirely too long to wait.

COM. BISHOP: Thank you, Mr. Reed. Mr. Jacobucci, would you like to say something about the Seedskadee Project? That is near your town.

MR. J. H. JACOBUCCI, GREEN RIVER, WYOMING: Mr. Chairman, thank you for the opportunity of saying something. I couldn't say anything new. I would like to emphasize more what Mr. Reed and Mr. Platt Wilson said about the necessity of hurrying up the division of water. As a farmer I can't give all the information Mr. Hamblin and these other fellows gave us.

I have a farm in Colorado and to that extent I kind of favor Judge Stone's activities in getting most of the water for Colorado. (Laughter.) However, I have been a resident of Wyoming for nearly forty years now and my principal interest outside of the electric utility and water utility business I am in has been in trying to get something for this valley outside of the railroading and coal mining we have, and we must try to develop something in the way of agriculture.

Since about 1916, our senators and congressmen every election come along and tell us how bad we needed the development of the Green River Basin and our lands up the River, how much useful land there was that could be irrigated and how soon we were going to get it. But after election it died down for another two years, and that has happened for more than thirty years.

I think we have come to the point where we just must assert ourselves with these Colorado and Utah and New Mexico people and must ask that some action be taken on the division of the water, and that's been the subject that we have discussed here at least the last four or five years. We have gotten in jams about it. We have gotten in a good many arguments with our state people and others, but we are still rather slow in trying to get at this division.

If I can give my opinion in front of these Colorado and Utah people, I think there has just been pretty much of a deliberate action on their part to defer the division of the water because fortunately, their good congressmen and senators and judges that they have have succeeded in getting nice appropriations of water and more water and appropriations of money to develop them; the nice, large Colorado-Big Thompson Project in Colorado, which Judge Stone has great credit for developing, is a credit to them and to Colorado, but we have nothing here in Wyoming yet.

They went along on the argument that they had to develop something when these soldiers came back. When they come back we have to have some land for them. We showed them we have 45,000 acres of the finest Class 1 land in this valley only a few miles up the River. It is lower than what these other people have spoken of, although I don't try to hold back their development, but the development we have on the Seedskadee Project is a development of forty-five or fifty thousand acres of first class land that can be irrigated at a cheaper cost per acre, can be developed and put in the hands of these soldiers we talk about.

You know all this lip service to the soldiers, what we were going to do with them when they came back, it was all beautiful. They just took all that to heart as if it were true. They have been back a year or year and a half and no soldier has much of an idea whether the Seedskadee Project is going to be developed in the next six months or next 75 years. It is a project that with a very small diversion dam can be developed and 400 families put on the project and make a living. There are soldiers and there are other people waiting to develop that land.

Now why all that delay I never have been able to see. One has one reason and one has another, but most of the reasons are just a matter of delay and delay. Let's get these Colorado and Utah people--and I don't know how much resistance there is in the New Mexico people--but let's get them together. Let's impress upon the people we have here today that the urgent thing is to divide this water among the states so we can go ahead with some development.

I didn't particularly like the resolution this morning. I think they are fooling the Wyoming people. I want to call that to the attention of the group here because we as a Green River Valley association were trying to expedite this division of water. I don't think we did that. I think the resolution that we passed approving Mr. Krug's idea of delaying things, delaying these developments until the division is made, is just all in favor of Utah and Colorado.

I think that the delay is only with these projects that haven't started. While we did put in the resolution that we favored stopping all projects, we know those projects that have appropriations, like Big Thompson and some of these others which have appropriations made to go on, they aren't going to stop. They are going on with that development. And naturally the more they go on with that development, the better it is to their interest in dividing the water of the Colorado among the four states.

So I would like to impress on our people here and the Commission that the urgent thing is to divide the Colorado River water among the four states so we can start in with our own development. Six months after this division is made and they let us go ahead we can have a project going on with just a small diversion dam and that 45,000 acres waiting to be developed and 400 families to get on there.

COM. BISHOP: Thank you, Mr. Jacobucci.

MR. W. R. WALLACE, SALT LAKE CITY, UTAH: I very much dislike that reference to the State of Utah inasmuch as I think the records will show that Utah proceeded and urged the division of this water before Wyoming did.

COM. BISHOP: Mr. Wallace, I don't want to argue with you on that point but I do disagree with you; but we won't argue that point. Anyone else?

MR. NORMAN W. BARLOW: Our Basin Company has an Executive Manager; I don't know whether you have overlooked him or not. I wish Mr. Jenkins would state his position as manager of our company.

COM. BISHOP: All right, Mr. Jenkins.

MR. PERRY M. JENKINS, EXECUTIVE MANAGER, GREEN RIVER BASIN DEVELOPMENT COMPANY, SALT LAKE CITY, UTAH: Gentlemen, I don't know just how to begin on this matter. I wish to say that I probably can speak for our people more or less as I have been here for 41 years and helped to bring upward of 15,000 acres under water and have seen this country grow.

Now with reference to the economy of the situation I will say that of the first 300,000 acres that have been watered in the State of Wyoming it has cost less than $10.00 an acre, and the returns upon that has been so much greater than any of these other places where the high cost per acre is accountable, that it just isn't worthy of mention.

Some years ago I was instrumental in creating a county that occupies the whole upper end of this valley. The border of that county runs right around the top of the catchment basin, so it is a very large, integral part of the Green River Valley. That was made a county in about 1922 and in the first ten years the valuation of that county grew until it was the richest county per capita in the whole Rocky Mountain area. I say that without dispute because you can look over the tax rolls. The per capita valuation for every man, woman and child in that county was $3,700. Can you beat it?

It didn't cost much to irrigate this land. We have thousands and thousands of acres that can be irrigated so cheaply that the returns are out of all comparison of these high costing properties. That is what these boys have been trying to tell you. It hasn't cost much and therefore we believe that we can take what water belongs to this state and we can create bigger returns on that than any other place in the Valley.

Now you people that sat in that old convention that adopted the Colorado River Compact, you don't know what it was done for. The states down in the lower reaches of the stream were being developed more rapidly and what did we have to do? We had to adopt a compact so we could stop priority. Why, if we could have developed up in this country of ours up here, these four upper states, as rapidly or more rapidly than they developed in California or Arizona, there wouldn't have been a drop of water go down the Colorado River because it would all have been used by prior appropriation. But we knew that California and those Lower Basin States had the jump on us; they had the power in Congress. They had climate. They had settlement. They had everything and Colorado, Wyoming, Utah and New Mexico had to wait its turn for power.

Now we cut off all priorities in the lower reaches of the stream by giving them a block sum as payment, not for claims--they didn't have a claim--but in payment to keep still.

Now we are coming up to another condition up here. We have some states that are perhaps more populous and are growing more rapidly than others. The same inequality is brewing right here and we have to appeal somewhere in order to save the development of Wyoming for the future.

Why, some fellow said, "Why don't they pick up the people from some of these projects and move them to a more favorable place?" Let me tell you, gentlemen, the time is coming when this whole state will be settled just like Sweden. We are not living in Finland, we are not living in Iceland, but there are people living there and the time will come when every acre up here will be

used to make homes for the people and then when that time comes, can they live there without water?

Now we have got to look into the future a little bit, gentlemen. We can't say that simply because we have got power to get the appropriation to transfer this water over to a given area where the power is, that we are going to take the water and forever stunt the state.

Do you people believe in the rights of states or do you want to monopolize this River? If you make it so impossible that we can get development in some near future, we will have to call upon the Federal Government to take a hand, that looks forward a hundred years in the development. I don't believe in that. I believe in the rights of states.

We have got a Constitution that says the water of the State being of easy diversion and necessary for the development of the State belongs to the State. I asked Dr. Mead, "What did you mean by that when you penned that?" He said, "I meant just exactly what I said here for every drop that falls upon the State of Wyoming, for every bit of snow that melts, that water belongs to the State and they have the right to use it forever and then if there is any more, they will pass it on to their neighbors." That was what Mead meant by the right of the State to the water.

But why is it that we lost that? Because of priority. Somebody away down used it first and then the courts decided it must go down there. Now if we adopt a compact that divides this water and Congress acts upon that compact, priority no longer will exist. It will be a state priority, and that is what we want. We want the priorities in the states.

I don't want to take anything from you people that belongs to you. All we ask is that we have our own, and don't point a finger of scorn and say, "In frozen Wyoming they don't need it," and so on. Oh, I have lived around in some of the other states; they have their drawbacks. Up in Wyoming we can produce more money for the investment than any other state that I know of. We don't have any poor. Why up there in Sublette County we only had three people--before the W.P.A. came in and brought people in from all over the country and dumped them on us--we only had three that were supported in any way by the County. We believe in letting each one have a little bit to live on and that is what we ask. Don't look upon us as grasping.

Here is a thing for you to understand: We can't ask for more water than is produced in this state. How would we get it here? We are just out on a limb. You fellows are going to shake it? Oh, no, you have a bigger heart than that. If we were to say that we needed more than so much to develop our state, we couldn't run a canal up in here and carry the water from way down there. We have to be content with what water our state produces, and so we feel that you ought to have a heart and not steal our ewe lamb--I won't explain that story, you all remember that Biblical story, the ewe lamb.

Gentlemen, I want to say that what we want first--now I am talking for the water users--what we want first is storage capacity in each of the states to be able to supply in case of deficiency our obligation at Lee Ferry. I can't say how much water we want because I don't know how much you are going to say we have to deliver at Lee Ferry. I can't say that we will be satisfied with a million acre feet of water and then find out that in the turmoil and in the end you have taken it all and Wyoming has to furnish 8,250,000 acre feet. We can't tell how much water we need until you have settled the question. It is going to be up to you to settle the question, on what basis shall we divide the obligation.

We are all alike in this. We have signed a promissory note. Wyoming, Colorado, New Mexico and Utah have signed a promissory note that we will deliver 8,250,000 acre feet of water at Lee Ferry. And John Reed will tell you what a promissory note is without any trouble: The fellow that defaults, he doesn't pay anything; the next fellow that defaults, he doesn't pay anything; but the last fellow that has anything, he foots the bill.

We don't want any promissory note of that kind, so, gentlemen, let's first decide upon how much we have to pay at Lee Ferry: How much New Mexico will have to deliver and how much Colorado will have to deliver and how much Utah will have to deliver down there, and then we will begin to talk to you how much more water we can use up here.

Now I don't want to talk longer. I just wanted to say that I felt I really had a right to present some of these facts. But here is a thing that startles me, and I don't know, possibly you. I waited rather impatiently until the first ten years of the delivery of water was measured at Lee Ferry. Up to date the Federal Government hasn't provided a bit of water in the State of Wyoming. We don't have any projects, none at all.

We have got up there in the Cora county where my neighbors live a project which I superintended. It impounds 30,000 acre feet of water. It costs us $2.00 per acre foot. And we built it ourselves. The Government didn't help us. We taxed our own people and built a dam that impounds 30,000 acre feet for $22,700, and we paid for the cost of the dam when we got through with the contract. You see what we can get out of the water. We can get an acre foot of water for an acre for $2.00. Can you imagine?

Now don't say that water is useless in this high altitude. That is at 7,000 feet above the sea. Joe Budd just talked to you. I just happen to know that he contracted the sale of four steers--oh, they will weigh possibly a thousand pounds--at 25 cents a pound. Just think of it! Four steers raised up there in that God-forsaken country, he gets 25 cents a pound and they weigh a thousand pounds apiece. I say you people can't match it. Tom, you can't match that.

COM. McCLURE: What did he get for them in 1933?

MR. JENKINS: Why, we have a way among these ranchers, we have a way that we spread our profits and losses over a period of years. We will have our lean years and we will have our flush years. If Joe can spead his sales over the lean years when we had W.P.A., P.C.A., and all that sort of thing--if he will spread that over you will find that Joe makes just a fine profit every year.

Now I am not going to say any more.

COM. BISHOP: Thank you, Mr. Jenkins.

MR. MARSHALL SMITH, WYOMING: I would like to direct your attention to the samples of grain grown in Eden Valley at higher altitudes than any other development in the Green River Basin. We had plenty of water.

COM. BISHOP: Anyone else like to tell about what development might do to their part of the State? This is the time to speak up, gentlemen.

MR. DAVID P. MILLER: I don't like to take up a lot of time but I wish to call the attention of the Commission to certain remarks that have been made about the Burntfork and Bridger Valley. I have been an administrative official for the State of Wyoming for quite a number of years and I am rather in

a position to know where these shortages exist and how it affects the economy of these people.

This northern slope of the Uinta Mountains from whence these streams arise is rather deficient in snowfall and these people are short of water almost every year. We have made a determined effort through the Bureau of Reclamation to develop work on the Lyman Project and to a smaller extent on the Burntfork Project. But I wish to impress once again the urgent necessity of early development upon this particular area because these people have suffered more and suffered longer than any comparable area in this part of the State of Wyoming.

COM. BISHOP: Thank you, Mr. Miller. Anyone else?

MR. DeLONG: In regard to the Lyman Project, we are just completing some water supply studies that are quite revealing; I would like to mention them for your information. In the period from 1925 to 1945, the average shortage for 40,000 acres at Lyman is about 45,000 acre feet. Some years, for example 1934, that went up as high as 80,000. There is possibly a 12-,000 acre-foot diversion requirement.

COM. BISHOP: Thank you, Mr. DeLong. Mr. Hitchcock, would you like to say something? You have been active in trying to promote these projects.

MR. ERNEST B. HITCHCOCK, ROCK SPRINGS, WYOMING: Mr. Chairman, I don't have a great deal to say. I have attended all these Compact meetings to date. I feel as John Reed from Kemmerer does, we want development in Wyoming and the quicker we can hurry up the Compact the better off we will be.

I know when we started off the meetings, the goal was to be to have something to deliver by the 1st of January so the state legislatures could take it under consideration. Progress hasn't been too fast. We are hoping there will still be a possibility. Nobody knows, of course.

But the main thing we are interested in in the Green River Basin is to get this Compact formulated so we can get some authorization and eventually some construction. That is about all I have to say, Mr. Chairman.

COM. BISHOP: Anyone else?

MR. PLATT WILSON, KEMMERER, WYOMING: I have been to a number of water meetings and they nearly always wind up in a fight, a disagreement. I think the main reason is because every other fellow mistrusts the other. He is afraid he is going to get away with something he is not going to get.

Now what water meetings I have attended in the Basin have been small ones along individual streams among ourselves. This is probably the biggest one I have ever been to but I imagine the same trend of thought is in our minds here that would be in our minds if it was out on Fontenelle to divide up that water.

Let me say this, that while we are in a hurry to get a compact, I think we want to do it as quickly as possible, but it is absolutely necessary to get a fair compact because if you don't get a fair compact it will never be a compact because each legislature has to pass on the compact before it becomes a compact. Now if it is unfair to Colorado, the Colorado legislature will not ratify it, and so it is true with all the rest of the states.

I urge you fellows to get together and put your cards on the table

and be as fair as possible so you can prepare a compact that will pass.

COM. BISHOP: Thank you, Mr. Wilson. Anyone else? If none of the rest of you have anything to offer I would like to read a portion of my last memorandum to the Governor with reference to the Bureau of Reclamation report. I am quoting from this memorandum:

"We desire to emphasize our remarks with reference to the Initial Construction Program proposed in the 1945 Draft of the Colorado River Report; Pages 13 to 17 inclusive mentioned in our Memo of December 14, 1945.

"We believe this program is sound and that it should be included in the final draft of March 1946. In any event we endorse the Initial Construction Program mentioned therein as our definite recommendations for Initial Projects for Wyoming. Specifically these projects and the ultimate depletion contemplated by them are:

"SUBLETTE PROJECT:

West Side Unit - 29,050 acres of new land.	
Estimated depletion at 1.4 acre feet per acre	40,670 AF
37,000 acres supplemental supply	
Estimated depletion at 0.7 acre feet per acre	25,900 AF
Daniel Unit - 5,160 acres of new land.	
Estimated depletion at 1.4 acre feet per acre	7,224 AF
Elkhorn Unit - 134,030 acres of new land.	
Estimated depletion at 1.4 acre feet per acre	187,642 AF
Seedskadee Unit - 40,830 acres of new land.	
Estimated depletion at 1.4 acre feet per acre	57,162 AF
Total Estimated Depletion for Sublette	318,598 AF

Kendall Reservoir - We also recommend construction of Kendall Reservoir in the initial program as its storage will be needed for some of the Units of the Sublette Project.

"EDEN PROJECT: - 20,250 acres new lands.	
Estimated depletion at 1.4 acre feet per acre	28,350 AF
"LYMAN PROJECT: - 3,100 acres new land.	
Estimated depletion at 1.4 acre feet per acre	4,340 AF
20,910 acres supplemental supply at 0.7 acre feet per acre	14,637 AF
"LITTLE SNAKE PROJECT: - 8,240 acres.	
Estimated depletion at 1.4 acre feet per acre	11,536 AF
10,320 acres supplemental supply estimated at 0.7 acre feet per acre	7,224 AF
"Total estimated depletion - new lands	336,924 AF
Total estimated depletion - supplemental supply	47,761 AF
Total estimated present depletion	374,000 AF
Total estimated depletion to include Initial Program	758,685 AF."

(That amounts to 10.1 per cent of 7,500,000 acre feet.)

"A Committee of Representatives of Water Appropriators from the Green River Basin approved the first draft wherein it pertained to the Initial Construction Program, and we want the proper officials in Washington to know that this proposed program meets our approval; and at this time we respectfully urge that you call attention of the Bureau of Reclamation through the Secretary of Interior to this Memo and our other Memos mentioned herein.

"All of these Memos should receive their consideration in connection with the Comments of Wyoming on their report."

That's all I am going to read of that.

I didn't hear anything from the Bureau officials and I don't know whether they have incorporated that and the 149,000 acres of land that they didn't consider at all. I don't think they have given us very much consideration on that.

Here are some figures that I would like to read just for the benefit and information of the people of the Green River Basin present here. It is information that most of these gentlemen on the Commission are acquainted with because they have studied these problems. This information was taken from the report of the Bureau of Reclamation.

The virgin flow of the Colorado River at the Mexican Boundary, 17,720,000 acre feet. Now, gentlemen, that is the amount of water we have to play with. Used in the United States according to the Bureau's estimate, 7,120,000 acre feet. Used in Mexico, 1,500,000 acre feet. Left for use in the United States, 9,100,000 acre feet.

The virgin flow of the Colorado River at Lee Ferry, 16,270,000 acre feet.

That is all of the important information that I care to read into the record.

Are there any more of you fellows who have something to say?

MR. WM. McGINNIS, BURNTFORK, WYOMING: Mr. Chairman, has there been anything done or any appropriation, any exhibition of any kind, estimate--anything on the Big Basin in the southwest part of the Valley here? It is just over the Line in Utah and benefits Utah and Wyoming both. Is there anything that has been done? I didn't hear you mention anything of that kind. I would just like to know if there is anything pertaining to that.

COM. BISHOP: Mr. Miller, would you care to answer that?

MR. DAVID P. MILLER, ROCK SPRINGS, WYOMING: Well, Mr. DeLong answered that partially. It is within the Bureau's plan that a development will be made in the Big Basin. Isn't that true, Mr. DeLong?

MR. DeLONG: That is right. There is a provision for Hams Fork in the plan and there is a cost estimate.

MR. MILLER: The way I understand that, the Big Basin contemplates a storage of about a hundred and some thousand acre feet of water which partially may be used on the Lyman and also may be used for new lands in the Henry's Fork Basin. It is within the Bureau's plan.

Incidentally, in this area in which Mr. McGinnis is interested there have been two small reservoirs built within the State of Utah with the fine cooperation of Mr. Watson's office. One is the Beaver Meadows Reservoir which serves the people around Mr. McGinnis, and Hoop Lake Reservoir, which Mr. McGinnis was instrumental in, which stores 3900 acre feet for the lands around Burntfork. Those reservoirs have done signal service saving the crops from total loss in that area, showing what can be done with an assured water supply in an area such as exists in the southwest corner of our county.

COM. WATSON: Mr. DeLong, you spoke of shortages on the north side of the Uinta Mountains, especially in the Lyman area. Do you recall what the total average runoff is of Black's Fork and Henry's Fork over, say, a 20-year period?

MR. DeLONG: I couldn't tell you over a 20-year period--perhaps Mr. Riter can. In a 10-year period, Henry's Fork had 84,000 runoff--if I am wrong Mr. Riter can correct me there. That is all included, I believe, in the Report. The total runoff of Black's Fork, as I recall, for that same period, including Hams Fork, is about 100,000. I am quoting those figures from memory and they might not be correct. I would be glad to look them up for you.

MR. PERRY W. JENKINS: Mr. Chairman, I was a little surprised that our State Engineer didn't tell something of what a little cost and a little water carried across South Pass could do in that valley. The Platte Valley is lacking so much water. We can very easily use in Wyoming all the water that you let us have. We have got thousands of acres of splendid land that can be taken out in gravity flow and carried to that land although we feel that it's cheaper to turn it out on adjacent lands, but it can be carried over there with gravity flow.

By topping all these streams of Green River and storing in the lakes that you see on the map there, they could carry over at least one third of the water that is flowing in Green River. I don't like to mention that; that sounds bad. But other states are talking about it. They are thinking about it, and our engineer should have said, "We have got use for all the water you will let us have."

COM. BISHOP: Mr. Jenkins, of course the Chairman here, Mr. Bashore, cautioned me to not get off the beam and talk about anything outside the Basin. I don't hesitate to talk about the proposed transmountain diversion and the fact of the matter is very little transmountain water will be needed in the long run over there, and if it is ever taken out it will probably be taken out the first years of development when it is not needed over here, and if it is taken out there will be plenty of protection to the people in the Basin.

I didn't see any particular reason for bringing that up as the Chairman asked me to stay within the Basin and I have been trying to do as he requested.

The proposition of the development of the land at such cheap prices, you know as well as I do the time is long since past when we can develop these $2.00 per acre-foot reservoirs.

I notice the gentlemen from the Bureau of Reclamation very cleverly or cautiously or something avoided talking about the cost. It runs up into hundreds of dollars per acre for supplemental supply; yet we consider it is practical and necessary.

MR. PERRY W. JENKINS: There are a great many acres that can be developed for $10.00 an acre. It is a long call between $2.00 and $400.00.

COM. BISHOP: I don't believe there are any $10.00 ones.

MR. PERRY W. JENKINS: I can show them to you.

COM. BISHOP: I really don't think you can.

MR. CARL JORGENSEN, PINEDALE, WYOMING: I would like to ask where the Reclamation got the figures you quoted. Was that one year's measurement of the stream, 16,000,000 acre feet at Lee Ferry, or was that an average of ten years?

COM. BISHOP: That is the long-time average, isn't that right, Mr. Riter?

MR. J. R. RITER, BUREAU OF RECLAMATION, DENVER, COLORADO: Forty-four years' average.

MR. JORGENSEN: Forty-four years. Thank you.

COM. BISHOP: Well, gentlemen, if none of you have anything more I thought I would ask Judge Stone to make a little talk for us and tell us his ideas about what we should do. He has had a lot of experience in compacts, and with your permission I will call on Judge Stone. Judge, do you mind giving us a little talk about the Compact and your idea of what we should do?

COM. STONE: Mr. Bishop and Chairman Bashore, I didn't come here to express my views. I came here to listen to the people from the Green River Valley. I happen to be a member of this Commission representing Colorado and as such Commissioner, I feel that it is my duty as well as the duty of the other Commissioners, to inform ourselves as much as possible concerning the facts and conditions pertaining to a compact in every part of the Basin.

I had the pleasure and the opportunity a number of years ago to learn something of the Green River Basin. Some years ago I went over that Basin with Mr. Jenkins. In later years I have had the opportunity of discussing it many times with Mr. Bishop.

There is one point which has been emphasized here today on which I fully agree--not that I didn't agree with many others, too. You speak of the possibilities of the livestock development, the livestock type of agriculture, in a basin such as that of the Green River. I happen to have grown up in a valley just like that and I know something about the livestock business. I am fully appreciative of the great possibilities of the livestock type of agriculture. That is what it has got to be in this area. You aren't going to grow row crops; that wouldn't be the profitable thing to do.

But after all, if it is a mere question of where this water can be most economically used, then California, for instance, might have an advantage over these Upper Basin States. It isn't so much a question of the economics of where you can raise the cheapest crops; the question is: What is each state's equitable share of this water? That is the question this Compact Commission has got to determine as I see it.

Perhaps in some state, in some area in the Upper Basin, it could be shown that the water is worth more per acre than in the Green River Basin, but in my judgment that is not an argument. You are entitled to your equitable share of this water here in Wyoming, and then after that is determined, it is for you and Wyoming to determine what you are going to do with it. It

seems to me that is no business of this Commission and these hearings which we are conducting now are not to arrive at any conclusions as to internal affairs in any one state. That is the affair and the concern of the State of Wyoming, cooperating and working with the Federal agency engaged in designing a plan for the utilization of your water supplies.

Now there are just one or two other matters. Mr. Wilson, I think, made a very wise remark when he said, "Much as we desire to get a compact as soon as possible, we must be sure that we get a compact that is fair and equitable and one which can be ratified by the legislatures of five states." We may feel that we have got a compact that is ever so good and yet if any one legislature decides that it is not fair to the state that that legislature is speaking for, then it may refuse to ratify and our labors will be in vain. Accordingly, it indicates at least, we should proceed cautiously and understand the facts with respect to the Colorado River. These facts go into many avenues, sometimes avenues of speculation, and we must eliminate as much as possible speculation and make our negotiations on the basis of the facts as near as we can find them to be. No good lawsuit was ever tried without first ascertaining the facts and acting and agreeing upon the facts if possible.

Now that is one thing that this Commission has done. It has appointed an Engineer Committee made up of the best minds we could find in each state. The purpose of that Engineer Committee is to make a study of the facts and to agree as far as possible on those facts in order that the Commission in attempting to arrive at an equitable apportionment of the water may be acting upon facts and not upon speculation. That will require considerable time.

Another matter we should not forget. This Commission and you, who are the people for whom we are working trying to do a good job, must remember we are not doing this job for next year or the next ten years; perhaps we are doing it for all time. Therefore, we and the legislatures that act upon our work must remember that we are setting the pattern for years to come, perhaps for the next generations. That indicates, too, we cannot act too carefully or too cautiously if we are to write an instrument that does not breed further trouble.

Another point which this Commission I feel must keep in mind--some of you have mentioned it briefly: We have two phases to our work. One is to apportion the 7,500,000 acre feet of water allocated under the Colorado River Compact to the Upper Basin. We, of course, must seek to apportion that water among the Upper Basin States. But there is another phase which is just as important and maybe even more important, and that is to determine the respective obligations of these states of the Upper Division to deliver water at Lee Ferry in accordance with the terms of the Colorado River Compact.

There is one other thing which was mentioned here, the fears of some --sometimes it seems to be almost a suspicion--over the activities of other states. In this Compact Commission it seems that we ought to work in unanimity and in fairness all the way through. If we begin to cast suspicions, if we in one state cast suspicions against another state, we will not get very far. One thing we do need to preserve the highest utilization of water in the Upper Basin is a solidarity of action on the part of all of these states. We must not forget that we have a common interest. It is not an interest of one state; it is a common interest.

I note the reference in your resolution to no development until a compact is made. I think you ought to weigh that pretty carefully. We, all of us--and I will pledge that for Colorado, too--Colorado will do its utmost to aid in securing a compact at the earliest possible date. There will be no disposition on the part of my state to delay this compact, but we will strive to

arrive at one cautiously and carefully based upon the facts. However, no one here today knows how soon we may have a compact which can be ratified by the legislatures of the five states.

In the meantime, for one, I do not want to see a project in the Green River Basin or any place else held up if that project clearly would fall within the equitable apportionment of water to that state until a compact is signed. The first thing we know we will make a record we will use as an excuse to do nothing in the Upper Basin until we get a compact. I am certain there are projects in the Green River Basin that are clearly within Wyoming's share of the water. I would venture to guess that most of them are And if you get a project of that type there authorized and ready to go--most of them are comparatively small, we have a number of those small projects in Colorado--why in the name of heaven should you wait and speculate on when we are going to get a compact done? That project should go forward.

You have the Eden Project. Your representatives in Congress this last year obtained an appropriation to complete that project. If this Executive freeze order which has been made is released so you can complete that project, certainly you ought to complete it at the earliest possible date, and we in Colorado would want to help you to get it completed. Why should any state in the Upper Colorado River Basin object to the completion of these small projects? It is entirely different as to the large projects which have not been authorized and where their construction may exceed the state's share of the water.

And as I understand the report that is submitted by the Bureau of Reclamation it does not say that no project can go forward until a compact is made. It specifically says on the contrary that any project that is clearly within a state's equitable share of the water may proceed if the Congress authorizes it.

I want to say on behalf of my state that we have no designs on any of your water. We are striving desparately to utilize our own water and what we believe to be our share of the water. I wish that we could carry out what our friend Mr. Jenkins said, that all of the water which arises in a state belongs to that state and we should be able to use it. I think it is generally understood that on the basis of records available Colorado produces on the average 11,700,000 acre feet of water a year at Lee Ferry. I wish to call your attention to the fact that thus far my state has beneficially, consumptively used about 1,000,000 acre feet of that 11,700,000 acre feet. In addition we now export from the Basin an average of 136,000 acre feet each year. The Colorado-Big Thompson Project when completed will export from the Basin each year an additional 310,000 acre feet. And after all of the projects which are authorized are constructed in Colorado--and there aren't many of them, but including the Colorado-Big Thompson--we will have utilized only 1,738,300 acre feet, leaving 9,961,700 acre feet of water. That is on the long-time average.

So, gentlemen, don't be suspicious that Colorado is trying to grab this water. We desire to recognize your equitable interest. We recognize there are many factors to be considered in determining equitable apportionment and we want to be fair and we expect to be fair.

I can't see any reason why the large majority, if not all these comparatively small projects in the Green River Basin--and we have a lot of them in our river basins within the Basin--can't be built.

Now there is just one other thing. I didn't expect to say very much but Mr. Bishop has called on me to mention some of these things. There

is one thing I should like for all of the Upper Basin States to understand with respect to Colorado. The large amount of irrigable land in Colorado is in eastern Colorado and the water supplies, the supplies that are now available and not over-appropriated, are in western Colorado. Colorado, I think is the only state that has established by law, and such policy has been accepted by the Bureau of Reclamation, a definite procedure and policy with respect to transmountain diversion. No other state so far as I know--someone may contradict me if I am wrong--has definitely established such a procedure by law or as a definite state policy. We have done it in this way: The Colorado-Big Thompson Project and any future transmountain projects must be so designed and operated so as to protect the present and prospective uses of water within the natural basin. Necessary replacement storage and other provisions must be made to accomplish that purpose.

I think, Mr. Bishop, that's all that I have to say, but I want to emphasize the necessity of a united action and a solidarity of interest and a lack of suspicion among these Upper Basin States because we cannot protect our common interest unless we fully appreciate that interest and that we are all in this game together to try to do a fair and honest job for each and all of the states. (Applause.)

COM. BISHOP: Thank you, Judge Stone. I might tell you at this time that our Basin Development Company has established a policy similar to yours and we figure on following that same policy if and when any water is taken out of the Green River Basin.

The State Engineer of New Mexico is here. He is quite a bashful fellow and he said if I called on him that he wouldn't talk over thirty minutes. Tom McClure.

COM. McCLURE: Mr. Bishop, Mr. Chairman, gentlemen, I am going to give back a whole lot of the time Mr. Bishop has given me to talk. I think Judge Stone has outlined the Commission's duties in the Basin and so on, how they plan to try to allocate this water.

The only comment I have is that the discussions that have taken place today have been of deep interest. I am always glad to hear the troubles of someone else because we have plenty of them in New Mexico. Our dear friend there, Perry Jenkins, says there have been no projects developed in Wyoming. He is a little bit ahead of us; we haven't even got the investigations on them down there yet!

But there is one thing that that brings up. It has been mentioned here and we have been accused of the same in New Mexico, that we have given away water rights in the past under compact or under agreement or court decisions or what have you. Now that statement, I think, goes back to the early days--oh, not so early, 15, 20, maybe 25 years ago--and they did not have the facts at the time these cases were tried or at the time these agreements were reached. Now this Commission sits here in negotiations with a report but no seer can determine what the needs will be in a hundred years from now.

Mr. Jenkins made the statement that Wyoming would be settled like Sweden. Now if it is, it is the duty of this Commission to allocate water that will take care of a condition like that. We are going to have to look into the crystal ball or something and arrive at a compact and an allocation in that compact of something that is going to last in perpetuity. We are not planning for the next ten years or the next fifteen years. If we were, it would be simple. We could sit down here and say, "Well, we will split this four ways," and I think probably we would be pretty well satisfied for the next ten-year development, but I don't think Colorado would be satisfied. I am doubtful if some of the other states would.

COM. BISHOP: We will be satisfied.

COM. McCLURE: Well, I think we might be, too. We are not talking about the other states. And that is the thing, that regardless of how expedient it is to reach a compact--I would like to sit down here and write one this afternoon if it was possible, I realize that--but on the other hand, if we don't base it on the facts and if we don't get these facts before us to base this compact on, twenty years from now you are going to hear your boy or somebody else up here complaining that we got all your rights down the River. So the people probably thought they were arriving at an equitable distribution on the facts placed before them, and no doubt the courts thought they were giving equitable decisions based on the facts presented.

That is the thing we have got to be cautious about. In other words, I want to reiterate the statement that Judge Stone made that we do want the facts and we want to base this allocation on facts so that 20, 25, 30, or 50 years from now, based on those facts it will still be an equitable distribution among the states. That is about all I have to say. (Applause.)

COM. BISHOP: Thank you, Tom. Now, Mr. Ed. Watson, State Engineer of Utah. We have some problems with Utah on the Burntfork River, which Mr. Watson doesn't want to talk about because our Chairman has cautioned us to stay on the beam, but we do have some problems on the Burntfork. They help themselves to our water and dry up our people and all that. We have a compact commission over there that is not very active, I am sorry to say. The activity has to come from the people and the people don't seem to be calling on the Water Commissioner and our office. Mr. Watson, will you say a few words?

COM. WATSON: Regarding the Burntfork country, I know that there is difficulty there in administering the water. It's an interstate proposition. We have had some little difficulty there with the handling of the reservoirs, but I think that matter can be ironed out all right.

At the present time serious effort is being given to determining stream flows on the north side of the Uintas in order that we may properly distribute them, and also ascertain the various states' contributions to the Green River Basin.

I believe that every concerted effort will be used to carry out the equitable method of distributing that water. I am especially pleased with the goodwill that has been expressed here by the various commissioners, that we are all willing to cooperate and do the best that we can in arriving at a proper conclusion. I feel that we must get the facts but I am particularly pleased with Judge Stone's attitude in this way, I think it is very constructive and very statesmanlike.

I have nothing more to say, Mr. Bishop. (Applause.)

COM. BISHOP: Thank you, Mr. Watson. There isn't any representative here from Arizona, is there?

THE CHAIRMAN: No.

COM. BISHOP: Now you gentlemen have heard these fellows from the other states and if any of you would like to ask some questions, I am sure they will be glad to have you do so and they will try to answer them.

MR. DAVID P. MILLER, ROCK SPRINGS, WYOMING: I want to mention one further thing about the compact. It is out of line but I would suggest we

have a number of people here, and with reference to the statement that the activity has to emanate from the people, I think the people have done the best they could with it.

COM. BISHOP: Is there anything else, gentlemen, that you would like to bring up at this time? This is your meeting. I am doing the best I can to give you all a word if you want it.

MR. EMIL C. GRADERT, FORT BRIDGER, WYOMING: Has the committee of engineers handed in a report as to the division of the water?

COM. BISHOP: No, they haven't. Mr. Gradert, wouldn't you like to say something about this?

MR. GRADERT: No, I think it has been pretty well thrashed out. I would just like to see the report.

COM. McCLURE: I would like to comment on that, Mr. Gradert. The impression may be that the engineer advisers are going to submit a recommendation. Now that I don't think is the idea of your engineer advisers. The engineer advisers have certain studies of certain basic fundamentals they are to assess on the River and they are going to try to compile and correlate all of that information so that we can sit down then and take that information and try to arrive at some equitable allocation. All they are to do is to furnish us the information. They won't make the recommendations or anything to the Commission. I think that is right.

COM. STONE: I would like to back up what Mr. McClure has brought out. It certainly is not the purpose of this Engineer Committee to recommend the division of the water. They are furnishing basic facts upon which the Commission will act in arriving at a compact.

You asked whether they have made a report. This Engineer Committee is working hard. Mr. Riter, who sits over in the corner, is the chairman of that committee. Since the committee was set up on the 17th of September, they have had three meetings. They had one just day before yesterday.

The committee is doing, I believe, an excellent job and they are working hard at it, but the report is not now available and so far as I know no one knows yet just how soon they will be able to complete their work. They are going to complete it as soon as possible. There is another meeting--when is it?

MR. RITER: November 21st.

COM. STONE: Their next meeting is November 21st. They aren't going to tell us, "We recommend you divide the water so-and-so." They are going to give us the basic facts and it is the job of the Commission to decide on the division, and I might add also, the deliveries at Lee Ferry.

COM. BISHOP: Mr. Riter, will you say a few words?

MR. J. R. RITER, BUREAU OF RECLAMATION, DENVER, COLORADO: Mr. Chairman, the Engineer Committee felt that since we are dividing up water that one of the first things the Commissioners would want to know would be where that water comes from. Then another job we are going to try to thrash out is how we can level off or how we can regulate the stream to make the water available to us.

Now Mr. Bishop has quoted some figures which the Bureau put in the

report which was on the long-time average. Over a period of better than 44 years, the average undepleted flow at Lee Ferry has been something in excess of 16,000,000 acre feet. Well now we know that in a ten-year period, from 1931 to 1940, there has not been anywhere near 16,000,000 acre feet at Lee Ferry. So that if the Upper Basin is going to realize the use of 7,500,000 acre feet of water, some schemes have got to be devised so that water will be available to us and still meet the obligation at Lee Ferry.

Now they are the two principal objectives. Of course, there are other matters involved. For example, water that Wyoming releases at the State Line will not all arrive at Lee Ferry. The committee is trying to analyze the losses along the main stems. Similarly, we assume that Colorado will have some share of the obligation to deliver water at Lee Ferry. That means if a given quantity of water is delivered at the Colorado Line, that is going to be reduced in transit through Utah along the main stem to Lee Ferry and also along the San Juan River to Lee Ferry. And similarly, any obligation that New Mexico will have to meet, her share at Lee Ferry will be reduced in the channels.

Now in the past there has been very little information available on those main stem channel losses. The committee is trying to evaluate those losses because we feel that is one of the facts the Commission should have in front of them before they divide the water up.

Getting back again to this origin of water we find there are many tributaries that aren't measured. We have good records at the key stations, that is, the main stem of the Green River near its mouth. We also have good records up here at Green River, Wyoming, good records near the State Line between Wyoming and Utah.

We have good records on the Colorado River near Cisco, Utah, which is very close to where the Colorado River discharges from Colorado. We also have records along the San Juan, the main stem, and we have records on many tributaries but there are also many tributaries which are not measured. For example, the southern tributaries of the San Juan River in New Mexico we know practically nothing about. We are trying to analyze and make estimates as best we can, using the information we have available, so that Tom McClure, for example, and also Ed. Watson over in Utah can know what their contributions are to the stream.

Now I very foolishly at Santa Fe stuck my neck out and said we could do that in 36 man months. I don't know whether we can or not. Where we have to make estimates, we have to apply judgment, but engineers also differ. The fellows who are working with me, the representatives of the states, have ideas and they are all very cooperative. They all have an attitude of trying to get at the facts.

I don't want to promise at this time when that report is going to be submitted. I personally made one study which I submitted to the Engineer Committee at the meeting we held Friday of last week. Well, that study was rejected, I was thrown for a loss, and it has got to be done over again, and the reasons for rejection are fair and reasonable. I was willing to back up and reconsider.

I feel that when the study is completed that the particular phase of it which I promised to work out will be acceptable to all concerned. After all we have got to agree on the facts we are going to use for the basis of the compact.

That is about all I have to say, Mr. Chairman. (Applause.)

COM. BISHOP: Gentlemen, would any of you like to ask Mr. Riter questions? He has made a study of the details of this project probably more than anyone else and if he can't answer them, I believe Mr. Delong can. Norm, how about it? Wouldn't you like to ask some questions about the water supplies or anything?

MR. NORMAN W. BARLOW, CCRA, WYOMING: I don't think so. I will be very interested when they get the report and I think we ought to give them an opportunity to assemble that data and then make their report.

COM. BISHOP: Gentlemen, anything else that any of you have on your mind? (No response.) If not, I am going to turn this meeting back to the Chairman and let him give us a talk. You heard what has been going on and so I will just turn the meeting back to you, Mr. Bashore, the Federal Representative of the Upper Colorado River Basin Compact Commission and the Chairman of the Commission.

THE CHAIRMAN: The Chairman wishes to thank you, Mr. Bishop, for your able conduct of this meeting; and on behalf of the Commissioners, the Chairman extends his thanks and appreciation to all of you for your attendance at this meeting, for your participation in the discussion and your remarks.

There was one question brought up here which I wish to touch on just a little bit because I believe some of you have the wrong idea concerning it, and that is the matter of the 160-acre land limitation. That land limitation is a perplexing question to the Bureau of Reclamation. A year ago at a National Reclamation Association convention at Denver we had a hot time discussing it. We got into a big argument about it. My friend Judge Stone, Judge Sturrock of Texas, Roland Curran of California, and others were on one side of the question and the then Commissioner of Reclamation, your present Chairman, was on the other side of the question and I had some help from some of the people in Wyoming.

The question was: Should the Association go on record for the complete elimination of the 160-acre limitation? We had a good time arguing it. I am very thankful to say that I am no longer an official of the Bureau of Reclamation and don't have to worry about that question, but it is a perplexing question. At the last meeting of the National Reclamation Association in Omaha the matter was again considered and I think a very intelligent resolution was passed in regard to it which provided for a committee to work with the Bureau of Reclamation in an attempt to work out a solution for the 160-acre limitation.

Now that doesn't bother you folks so much in Wyoming, in my opinion, as it does people interested in irrigation in Texas and in California where there are real large land holdings. I believe some of you have the idea that the 160 acres applies to land whether it is irrigated or not. It applies only to the lands that receive water. You can have 5,000 acres of range land under the Reclamation Law or any other law but if you got 160 acres of irrigated land, that is all you can receive water for under the Reclamation Law.

Now just one word more on that subject and I am through with that. You naturally want to have land for your sons to farm, but you must remember that this is Federal money that is being used for the benefit of all the people and you must not lose sight of the fact that it is necessary to provide opportunities for other men's sons who may wish to farm irrigated land.

I am very hopeful a sensible solution will be worked out, and don't forget this, that that limitation has been reiterated all through reclamation laws and your own Senator from Wyoming in the Warren Act had that same

provision inserted in regard to land limitation. That is for the disposal of supplemental water from reservoirs which were built that had excess capacity. So I don't think you need to worry about that.

I wanted to mention that to clear the atmosphere just a little and to assure you the officials of the National Reclamation Association and the Bureau of Reclamation will attempt in the coming year to work out something that will be sensible and at the same time not destroy the basic principles in the Reclamation Law.

Now I want to call the attention of the Commissioners to the fact that they have some work to do and I think they should start on it this evening, and that is the correction of the transcript of the Santa Fe meeting. The Chairman has had opportunity to scan it hurriedly and certainly it needs a lot of polishing up.

Before we conclude this series of meetings it will be necessary for the Commissioners to decide on the place of the next meeting, and in the opinion of your Chairman, leaving open the time of the next meeting, which is contingent on the availability of the report of the Engineer Committee.

The Chairman would like to have an expression from the Commission as to working on this transcript this evening.

COM. BISHOP: Mr. Chairman, I will volunteer for one to work with you or anyone else.

COM. STONE: Mr. Chairman, wouldn't it be advisable for each Commissioner to use this evening or such other time as the Commissioner may have to review the transcript and then have another meeting before we get through with this series of meetings to make the corrections? It seems to me we will save time that way.

THE CHAIRMAN: Judge Stone, ordinarily that would be a very sensible procedure but it seems doubtful to your Chairman that that can be successfully done with this transcript. Unfortunately Miss Price didn't report the last meeting.

MR. WM. McGINNIS, BURNTFORK, WYOMING: Mr. Chairman, gentlemen, I would like some information on this 160 acres of land. I have a perfect right--

THE CHAIRMAN: Wait a minute. You want this on the record or not?

MR. McGINNIS: I would like to.

THE CHAIRMAN: On the record?

MR. McGINNIS: Yes.

THE CHAIRMAN: All right.

MR. McGINNIS: I would like and I am able to show the fact that different localities and different portions of land require more for the support of one family or one man even than others. Our country is a stock-raising country principally and I doubt very much that very many stock, enough to support a family, can be raised on 160 acres in this country.

THE CHAIRMAN: Irrigated land?

MR. McGINNIS: Irrigated land. I have tried it pretty successfully, and it's a very poor living at least if they do, a very poor way to provide. There are portions of land and places that less than 160 acres would provide a substantial income for any one family, but there are portions of it that would not. And as far as the arid lands that have no water, there are years when they are absolutely worthless.

So I would like some information on that 160 acres and I would like to get facts regarding the establishment of that. I don't take it as a very sound fact unless it would be in accordance with the ground to which it was applied.

THE CHAIRMAN: Well, Mr. McGinnis, that is a question which is entirely beyond the purview of this Commission. That will not come into consideration by the Commission in its deliberations. And about all I can say about all I can say about that at this time is that the committee which will study the matter will probably come out with some sort of an alternative to the present Reclamation Law. Now there is nothing wrong, Mr. McGinnis, if you have four or five boys, if each one of those boys has 160 acres of irrigated land, but it is limited to 160 acres in one ownership.

MR. McGINNIS: Well, we will see after the committee thrashes it out.

THE CHAIRMAN: All right.

COM. STONE: Mr. Chairman, may I correct the impression that the place of the next meeting of the Commission has not been fixed? On page 23* of the record of the Santa Fe meeting a resolution was adopted authorizing the calling of the meeting when the engineers were ready to report at Denver, Colorado.

THE CHAIRMAN: Thank you, Judge Stone. The Chairman is glad to be corrected.

COM. STONE: Mr. Chairman, I move that the Commissioners together with the Acting Secretary convene in Room 114, which is the room of the Chairman, tonight at eight o'clock for the purpose of reviewing and editing the record of the meeting held at Santa Fe, New Mexico, on September 17 and 18, 1946; and that after the transcript is thus edited, whether completed tonight or later, the Secretary of the Commission, as was true with the other transcripts, be authorized to put it in final form as corrected.

COM. WATSON: Second the motion.

THE CHAIRMAN: Any discussion? (No response.) (Thereupon a vote was taken and the motion of Com. Stone carried unanimously.)

THE CHAIRMAN: The meeting is adjourned.

(4:40 p.m., Monday, October 28, 1946, meeting adjourned until 10:00 a.m., Wednesday, October 30, 1946, at Grand Junction, Colorado.)

UPPER COLORADO RIVER BASIN COMPACT COMMISSION

Official Record of Meeting No. 3

Session Held

October 30, 1946

at

Federal Building

Grand Junction

Colorado

APPEARANCES
UPPER COLORADO RIVER BASIN COMPACT COMMISSION

Membership as listed at Rock Springs, Wyoming, Session (Page 1)
Chairman, Acting Secretary, and all Commissioners present.

COLORADO:

Jean S. Breitenstein	Attorney, Colorado Water Conservation Board, 716 Symes Building, Denver, Colorado.
R. J. Tipton	Consulting Engineer, Colorado Water Conservation Board, Denver, Colorado.
H. L. Potts	Engineer, Denver Water Board, Denver, Colorado.
Glenn G. Saunders	Attorney, Denver Water Board, Denver, Colorado.
Charles J. Beise	Southeastern Colorado Water Users Ass'n., First National Bank Bldg., Denver, Colorado.
Frank C. Merriell	Secy-Engr. Colorado Water Conservation Board, Grand Junction, Colorado.
Silmon Smith	Colorado Water Conservation Board, Grand Junction, Colorado.
Paul L. Littler	District Judge, Grand Junction, Colorado.
Herbert W. Fritz	City Manager, Grand Junction, Colorado.
Carl M. Bennett	City Engineer, Grand Junction, Colorado.
C. J. McCormick	Colorado River Water Conservation Dist., Grand Junction, Colorado.
James D. Bradley	Grand Valley Irrigation Company, Grand Junction, Colorado.
Wm. J. Sullivan	Grand Valley Irrigation Company, Grand Junction, Colorado.
Percy J. Gates	Grand Valley Irrigation Company, Grand Junction, Colorado.
Robert F. Rockwell	Congressional Representative, 4th District, Paonia, Colorado.
Archie B. Toner	Southwestern Water Conservation District, Fort Collins, Colorado.
Dan B. Hunter	Southwestern Water Conservation District, Dove Creek, Colorado.
Carl R. Smith	North Fork Water Conservation District, Hotchkiss, Colorado.
Charles R. Neill	North Fork Water Conservation District, Hotchkiss, Colorado.
Harry W. Gueno	Attorney, Paonia Project, Delta, Colorado.
D. L. Williams	Southwestern Water Conservation District, Norwood, Colorado.
Wm. J. Dodd	Uncompahgre Valley Water Users Association, Delta, Colorado.
B. H. Jorgensen	Colorado River Water Conservation District, Gunnison, Colorado.
E. L. Dutcher	Gunnison Watershed Conservation Committee, Gunnison, Colorado.
Manny Diel	Arkansas Valley Water Users, Pueblo, Colorado.
J. M. Dille	Northern Colorado Water Conservation District, Greeley, Colorado.

Hume S. White	Colorado River Water Conservation District, Eagle, Colorado.
John Henschkel	Pres., Colorado River Water Conservation District, Glenwood Springs, Colorado.
Mrs. Wakefield	

NEW MEXICO:

Fred E. Wilson	Special Assistant Attorney General and Attorney for New Mexico Interstate Stream Commission, Albuquerque, New Mexico.

UTAH:

Wm. R. Wallace	President, Utah Water Users Association, Salt Lake City, Utah.
Thos. W. Jensen	Utah Water Users Association, Mt. Pleasant, Utah.
C. S. Jarvis	C. E. with State Engineer, Salt Lake City, Utah.

WYOMING:

Emil C. Gradert	Assistant Compact Commissioner, Fort Bridger, Wyoming.

BUREAU OF RECLAMATION:

J. G. Will	Assistant Chief Counsel, Washington, D. C.
J. R. Riter	Chief, Hydrology Division, Denver, Colorado.
N. B. Bennett, Jr.	Branch of Project Planning, Washington, D.C.
E. O. Larson	Regional Director, Region 4, Salt Lake City, Utah.
J. Stuart McMaster	Counsel, Region 4, Salt Lake City, Utah.
F. M. Warnick	Gunnison, Colorado.
C. H. Jex	Grand Junction, Colorado.
T. L. Sundquist	Grand Junction, Colorado.
Alan McDermitt	Grand Junction, Colorado.
George T. Finlinson	Gunnison, Colorado.
John C. Shepherd	Gunnison, Colorado.
John J. Hedderman	Durango, Colorado.
Ben F. Powell	Pueblo, Colorado.
A. A. Batson	Denver, Colorado.
J. H. Knights	Denver, Colorado.
A. N. Thompson	Amarillo, Texas.

SESSION AT GRAND JUNCTION, COLORADO
WEDNESDAY, OCTOBER 30, 1946

The meeting was called to order by Chairman Bashore at 10:20 a.m., Wednesday, October 30, 1946.

THE CHAIRMAN: It is now 10:20, all the Commissioners are present, our Acting Secretary, Mr. Alonzo Watson, and our reporter.

At the last meeting of the Commission held at Santa Fe, New Mexico, the Commissioners of the Upper Colorado River Basin Compact Commission decided that the next regular meeting, Meeting No 3, of the Upper Colorado River Basin Compact Commission would consist in part of a series of field meetings or hearings to be held within the watershed of the Colorado and within the Upper Basin States. This is the second meeting of the series. The first one was held at Rock Springs day before yesterday. The next one will be at Price, Utah, and the last one, Meeting No. 4, will be held at Farmington, New Mexico.

The purposes of these field meetings or hearings are to allow the people to become acquainted with the Commissioners, the work of the Commission, and to offer suggestions and criticisms which may be helpful to the Commissioners in their consideration of this compact. The Chairman hopes that you will all feel free to say whatever you may have on your minds.

Following the practice which we followed at Rock Springs, the Chairman will now ask Com. Clifford H. Stone of Denver to take charge of the meeting here at Grand Junction, Colorado. Judge Stone.

COM. STONE: Mr. Chairman, Members of the Commission, it seemed to me appropriate to introduce the Members of the Commission to our Colorado people.

The Chairman of our Commission--he has already spoken but I wish the privilege of introducing him to those of you who have not met him--Harry Bashore, was appointed by the President of the United States to represent the Federal Government in the negotiation of an Upper Colorado River Basin Compact and is Chairman of the Commission. Mr. Bashore formerly was Commissioner of the Bureau of Reclamation. He is very much a Western man, having spent most of his active years in the Reclamation Service in the West. We were all pleased that he was selected as the Federal Representative.

Thomas M. McClure, Commissioner for New Mexico. Mr. McClure has long been engaged in Colorado River matters.

The next man is Charles A. Carson, Commissioner for the State of Arizona. Charlie Carson likewise has long been engaged in Colorado River matters. He is one of those men in the Lower Basin who works for the entire Basin and has a broad viewpoint for the best interests of the entire Basin.

The next gentleman is L. C. Bishop, Commissioner for the State of Wyoming. He is the State Engineer of that State, who likewise has had many years of experience in Colorado River matters.

The next gentleman is Ed. H. Watson, Commissioner for the State of Utah. He is the State Engineer and for many years has been functioning in the interests of Colorado River matters.

Now I should like to introduce some of those who are helping us in this work. The Commission at its last meeting selected Miss Price from Utah to serve as its reporter. It is her function to put down what we say in these meetings and it isn't too easy a task. However we found that she did her work

so well at our organization meeting in Salt Lake City that we have selected her to do this work.

The Secretary of the Commission is the Attorney General of Utah, Grover A. Giles. Someone tells me on the side that Grover finds himself in the midst of a busy election campaign. The man who is pinch-hitting for him is Mr. Watson from Utah. He is the Acting Secretary.

Then we have other men here who have been selected to function in various capacities in this work. Mr. Riter is the Chairman of the Engineer Committee. He is of the Bureau of Reclamation. You will hear from him later on.

We have a man here who has come all the way from Washington. He is the Legal Adviser to the Federal Representative, Mr. J. G. Will.

There are some others who have been prominent in Colorado River matters and who are serving in various capacities in connection with their respective states. I should like to introduce some of them.

Mr. Fred Wilson of Albuquerque, New Mexico, is the attorney for the Interstate Stream Commission of that State and is the legal adviser to Mr. Thomas McClure.

Then I think all of you know that no work on the Colorado River could be properly accomplished without the advice and the assistance of a man who for many years has been identified with the Colorado River. He participated in the original Colorado River Compact. I feel quite certain most of you know him. I should like to introduce him, William R. Wallace of Salt Lake City. (Applause.)

We have here a number of representatives of the Federal Government. I assume later Mr. Bashore may have the opportunity of introducing them. I should like to introduce my legal adviser, a man who has been accompanying me on this trip and who is the attorney for the Colorado Water Conservation Board, Mr. Jean S. Breitenstein.

We are here in Western Colorado where there is one man who conducted the hearing in Western Colorado on the Colorado River Compact and who through all these years has been working for the best interests of the development of Western Colorado. He will speak to you later but I should like to introduce him. Mr. Frank C. Merriell.

Now there are of course others but they will speak later.

As the Chairman explained to you, as the Commission holds these meetings in various states, it is the job of the Commissioner from the particular state to conduct a hearing with the aid and assistance of those representing the local people. We have prepared a definite program for this Colorado meeting. Later we shall introduce Mr. Silmon Smith, a member of the Colorado Water Conservation Board from Western Colorado, who will act as moderator for the Colorado presentation. We shall introduce him later but I think he ought to stand up for a moment.

The Chairman said it would be my function, first, to explain the reason for the compact negotiations in the Upper Colorado River Basin; and to also review briefly the manner in which the Commission is proceeding. These meetings have a two-fold purpose: to make the explanation which I have mentioned; and, second, to afford the local interests, people from Colorado in this instance, to make such statements and offer such comments as seem advisable.

First, as to the reason for these negotiations: It has been suggested for some years that the time would soon arrive when it would be necessary for the states of the Upper Colorado River Basin to negotiate a compact for two purposes: First, to apportion the water allotted to the Upper Basin by the Colorado River Compact among those states; and, second, to determine the respective obligations of those states to make deliveries of water at Lee Ferry in accordance with the Colorado River Compact.

Now this thought was implemented by the recent report of the Bureau of Reclamation. That report sets forth an inventory of proposed project development and contains pertinent data for a plan of comprehensive development of the Colorado River Basin. The report reveals the fact that before we can proceed much further in the development of the Basin, the states must assume certain obligations and must accomplish certain things, and among them is the determination of each state's share of Colorado River water.

That conclusion is obvious. We are now proceeding to a stage of development wherein the projects are large in many instances and will require a lot of water. It is the conclusion of the Bureau that until each state's share is determined, such projects should not be authorized for construction.

It is the view--my view at least--and I believe is, if I may say so, the correct view, and it is supported by the report of the Bureau itself, that does not mean that no project may proceed prior to the making of a compact. It means that large projects may not go ahead. But if a project is clearly within a state's share or what may be a state's share of the water, it may go ahead even prior to the consummation of a compact.

Now I think it should be said, although perhaps most of you know it, that the Colorado River Compact apportions to the states of the Upper Colorado River Basin 7,500,000 acre feet of water. That means that much water for consumptive use, burning it up, if you please, within a period of one year.

The states of the Upper Basin are five in number. Often we think of the four Upper Basin States. Arizona has a comparatively small area in the Upper Basin and therefore participates in these negotiations. The term, "the States of the Upper Basin," must be distinguished from "the States of the Upper Division." The Colorado River Compact provides that the States of the Upper Division are Colorado, New Mexico, Utah, and Wyoming. Arizona, which is also a Lower Basin State, is entitled to its equitable share of Upper Basin water but it is not required to make deliveries at Lee Ferry under the Colorado River Compact. The four states of the Upper Division are required by the Colorado River Compact to deliver 75,000,000 acre feet of water at Lee Ferry in succeeding ten-year periods. Therefore it is obvious the job that we have is to take care of the apportionment of that 7,500,000 and the obligations to deliver water at Lee Ferry in accordance with the Compact.

At a meeting at Cheyenne held on the 22nd day of July of this year, the five governors of the states of the Upper Basin agreed to initiate compact negotiations. There was created at that time what is known as the Upper Colorado River Basin Compact Commission. This Commission organized at Salt Lake City, Utah, on July 31st of this year. Prior to that time these Commissioners who have been introduced to you were officially designated by their respective governors as the representatives of the participating states.

At the Salt Lake meeting we determined the basis upon which we were proceeding to compact. We appointed a temporary committee to set up a program of engineering studies. The reason for that is obvious. In compact-making as in the trial of a case before a court, it is first necessary to understand and know the basic facts with which we are dealing; and it is also advisable that

so far as possible we agree as states upon those facts. That saves a lot of time and often much argument.

At Santa Fe, New Mexico, on September 17th and 18th we held the second meeting of the Commission. At that time the Engineer Committee brought in a program of study which was accepted by the Commission. The Commission then set up a permanent Engineering Advisory Committee to conduct and carry out these studies. That Committee is headed by J. R. Riter, who was selected by the Commission as the Chairman. That Committee has been very active since that time, having held three or four meetings. It has a big job to do. Before we conclude today we have on the program a statement from Mr. Riter respecting the nature and the work of that Committee.

Much has been said about expediting the negotiation of a compact. All of the Commissioners I believe desire, and it is certainly the position of Colorado, that we should expedite as much as possible the negotiation of a compact. On the other hand, we fully recognize that we have a big job to do and that we must proceed cautiously. After all, if we allocate all of the 7,500,000 acre feet of water in the Upper Colorado River Basin, we are setting the pattern of development not only for this generation but for generations to come.

The compact cannot be too carefully made. If it is made without an adequate appraisal and understanding of the facts and if it is not made fairly and justly, considering the rights and interests of all of those states, then in the end we may be breeding trouble rather than establishing peace on the River; and the compact should establish peace for all time to come.

It should be understood in this hearing, and I believe it was explained at the Rock Springs meeting, that here today we are not concerned with internal questions within any particular state; we are concerned with the rights and the interests of each state on a state unit basis. When this water is finally apportioned it will be a mass appropriation to each state and each state will then proceed together with the Government, and with the advice and cooperation of the Government, I am sure, to determine the best use of the share of water apportioned to each state. This is no place to air, either in this meeting or the other meetings, any internal matters within a state. As has often been expressed by Mr. Merriell, we shall do that in our own backyard.

This Commission cannot say at this time how soon we will conclude our work, but we are going to work as hard as possible while at the same time as cautiously as possible to do the job.

There is one other thing which should be understood. The Commission is not engaged in perfecting a compact which has, as the product of the Commission, binding effect. The Commission has been asked to negotiate a compact. That compact will not become binding on all of the states or any one of the states until it has been ratified by the legislatures of all of the states and approved by the Congress of the United States. It is clear, then, that in negotiating this compact in each state, we must be very careful that we keep in close touch with our own people and that we act in such a way that we may have reasonable assurance that after we have completed our task, the state legislatures will ratify it and the Congress of the United States will approve it.

I can only call your attention to the Republican River Compact in this state when we worked a long time to get such a compact with Kansas and Nebraska and then although it was approved by Congress, it was vetoed by the

President. We had to do the job over. There are other instances where states have worked hard and the negotiators brought forth a compact where it was not ratified by the legislatures.

So it is a big undertaking and one where in our processes of government the people, acting through the legislatures and finally through the Congress of the United States, must finally put their approval on whatever this Commission does.

Now that I have explained the task we have to perform and the method by which we are proceeding, I wish next to call upon Frank C. Merriell. He has a statement to make and will introduce Silmon Smith, who will act as moderator for the State of Colorado in this meeting. Mr. Merriell.

MR. FRANK C. MERRIELL, GRAND JUNCTION, COLORADO: Mr. Chairman and Members of the Upper Colorado River Basin Compact Commission:

If we were standing on ceremony it would have been attempted to invite the Governor of Colorado here to welcome you, but he, like yourselves, is a busy man, and we hope that you will accept your welcome from us, with the assurance that while less official it is none the less sincere. We are sorry that the urgency of your business will not permit you to see more of our country and of the uses we make of the Colorado River just as we are sorry that we cannot in the ordinary courses of our affairs see more of the uses you make in your states. Your trip from Rock Springs, the trip you will make to Price tomorrow morning and your later trip across the San Juan Basin will, however, afford you some idea of Colorado's lack of development and of the need for irrigation projects in the more sparsely settled parts of our state. You will recognize that the greater part of our development lies east of the route you will follow, is directly connected with the livestock industry, and raises such specialty crops as late potatoes and sugar beets.

We are glad to welcome you, not only to Western Colorado, but to Grand Junction, its largest city, and to this meeting place as well. Twenty-four years and seven months ago yesterday, on March 29, 1922, the Colorado River Compact Commission held a meeting in this same room. It was the only hearing that commission did hold on the River and it held only one other in the Colorado River Basin, at Phoenix, Arizona. It seems to us that you are making a much more realistic approach to your task in the series of hearings on which you are now engaged, by getting first, the views of the people actually so vitally concerned in the work you are to do.

It is hard for any of us to appreciate the difficulties that first Commission faced. It was the beginning of new thinking on interstate problems, and the idea was not cheerfully received by anyone in the Upper Basin with whom the Commission came in contact. In those days the information, such as stream flow records, records of areas irrigated, estimates of consumptive use and all the particulars so greatly needed in making a compact were almost entirely non-existent. The lack was so great that the original intention to allot water by states had to be abandoned and the allotment of water by basins was the best that could be accomplished. You are here today, as part of your mission, to carry forward the work then so ably begun. In the light of the information they had, it has seemed to many of us, over the intervening years, that the first commission did a very remarkable piece of business, and we predict that your work, since you have a more complete knowledge of the facts, coupled with a better understanding by those affected of the purposes of a compact, will bring forth a more specific and usable result.

Two points of view regarding the Colorado River Compact which were original with Delph Carpenter, the Coloradoan who first advanced the compact

idea, have remained with many of us in Colorado who have tried to follow in his footsteps. He strongly felt that the terms of the Colorado River Compact applying to matters other than the actual division of water between the basins were the greatest assurance of fair dealing between the states that could be obtained by the states of the Upper Basin. The waiving of priority of power rights, the making of actual use the measure of demand, the provisions that a large reservoir on the lower river would automatically liquidate lower river claims into it, such provisions as these were, in Delph Carpenter's mind, the essence of that Compact.

He foresaw much of the difficulty that would be made by one of the Lower Basin states over its fancied large needs, but since his idea was founded on the doctrine already announced by the Supreme Court of the United States that rivers must be used under an equitable apportionment between the states affected he felt sure that the Compact would endure, because it was the expression of the states themselves as to what equitable apportionment should be. Much has been said over the years about the possibility that the Compact may not endure. Those who say this and those who hope it may not, seem to forget that behind the Colorado River Compact is the essentially fair idea of the Supreme Court that equitable apportionment of water must govern, whether that apportionment is made by the states themselves, as the Court prefers, or whether it is made by the Court. Certainly in the making of the present Compact, which is an extension of the original one, we owe it to ourselves so to plan that the states of the Upper Basin and of the Upper Division cannot be accused of any act that would tend to weaken, or fail to comply with the terms of the original Compact.

Following that original compact hearing in this room, at which I conducted the local appearances, I have attended many Colorado River meetings. This one seems typical in that it appears to have drawn irresistably, so many people from outside the Colorado River Basin. When the seven states have met it was usually true in most meetings that all the representatives of the states taken together were generally outnumbered by those from one California city -- Los Angeles. Here today we people from Western Colorado are almost in a minority as compared with the delegations of our friends from Salt Lake and from Eastern Colorado. However, we welcome them and the representatives of all the Federal agencies to Western Colorado and to this meeting. Mr. Chairman, we find the solicitude on the part of our out-of-basin friends touching--in fact, it seems to us a foretaste that because of their anxiety over our problem we shall be deeply touched in the future. We can only hope that their interest goes along with ours in the preservation of the original compact and in its being made more workable and strengthened by the compact upon which you are engaged. We bespeak from them the same earnest intention to carry out the terms of the original compact that have been our aim through all the years. If all the Upper Basin States have this first consideration as their aim we expect a very valuable compact to result from your deliberations.

Mr. Chairman and Members of the Commission, we ask that you feel free to call upon any of those present whom you feel can contribute to explain the ideas of Western Colorado regarding this compact. In order, however, to conserve the time we have designated a local moderator who in addition to what he may contribute will call upon those who have indicated that they have anything to say to you. He is, I think, known to you all, not only as a prominent member of the Colorado Bar, but as one who has taken for many years a strong interest and a leading part in Colorado River matters. Mr. Silmon Smith was prominent in the first organized effort to bring about understanding between Eastern and Western Colorado, that of the Western Colorado Protective Association. He was an influential member of the body from both parts of the State that drafted the famous Senate Document 80 of the 75th

Congress, relating to the Colorado-Big Thompson Project. He has almost since its inception served as a member of the Colorado Water Conservation Board, which has set up the policies of Colorado with relation to all its water problems. I am sure he can inform you how Western Colorado regards this proposed Upper Basin Compact and I bespeak for him and those upon whom he may call your kind and considerate attention. Thank you. Mr. Smith.

MR. SIMON SMITH, GRAND JUNCTION, COLORADO: Mr. Merriell, Mr. Chairman, gentlemen of the Commission, friends: I am very proud that that passive word, "moderator", has been bestowed upon me. I think that I have attended sessions where "referee" or "umpire" would be much more appropriate, but let's leave it at "moderator."

I remember some ten or fifteen years ago attending a meeting on the Colorado River in Salt Lake City. It was fashionable during that period to ride the State of Arizona. The riding was rough that day and I remember as a last resort, one of the representatives of Arizona got up and said, "Now you boys from the Upper Basin States be kind to me. This isn't anything to what you are going to get when you start dividing the water in the four Upper Basin States."

We become a little more peaceable as the years go on, I think, because we have been getting a little better acquainted and it is this lack of acquaintance with each other's problems that accounts for most of the difficulties.

Now in order that these people of Colorado for whom I am acting as a sort of liaison officer may know that probably these gentlemen on the Commission are human beings, I want to say first that my friend, Charlie Carson, has given most of his life's effort to the study of the Colorado River, but he was an ordinary human being once and he attended college at the same place and at the same time I did, and he is a very fine fellow. He has represented the State of Arizona most admirably for many, many years. But Charlie Carson is a reasonable human being and you ought to be proud that he is a member of this Commission.

Now of course, Tom McClure over here, I don't know so much about McClure. The only intimate detail is that he and Dan Hughes of Montrose used to occupy the same jail at the same time when they were in the first World War, and during the years I have learned he is a very fine, sensible gentleman.

I don't know anything about Mr. Bishop or Mr. Watson except they stand high in their own states. I hope to get better acquainted with them.

We might refer for just a moment to the lack of understanding that existed in a couple of places even in Colorado. Eastern Colorado craved some Western water. Western people were a little jealous of that idea and eventually it got so we could mingle in the same room. And finally they got so friendly that one of these Eastern people came over and said to the Western people, "How are your cherries this year?" He wanted to be very friendly; he wanted to know about our cherries. We were cold to him; we didn't have any cherries. We told him, "We don't raise cherries; we have peaches." He didn't know that. But when he found out about us and we found out about him we found out we were all fine people.

In the division of this water we are going to confront primarily two problems, the fact that there isn't enough water to take care of all those plans which have been made by the Bureau of Reclamation--and that doesn't purport to be all of the plans either; and we are too prone, probably, to think about the amount of water that we are going to use and are perhaps not sufficiently advised of the fact that we are going to have to be responsible to this Lower Basin.

Judge Stone referred to this 7,500,000 acre feet--which is more accurately 75,000,000 acre feet distributed over each succeeding ten-year period--as though we had that water. Not so. That is the second 7,500,000 acre feet out of the River. The first 7,500,000 acre feet is allotted to the Lower Basin. Now if there is 7,500,000 acre feet left and if we aren't required to use some of the 7,500,000 acre feet to supply the Treaty obligation to the Republic of Mexico, then we can talk about this 7,500,000 acre feet that we are going to divide up. We have it only secondarily.

I am under the impression that when this Colorado River Compact was first made it contemplated considerably more water than we have subsequently found out flows down this river. Now whether this is a temporary situation or whether it is more water than we are going to have in the future or whether it is less water than we are going to have in the future, nobody knows.

But the obligation to deliver the first 7,500,000 acre feet, on an average, is a real obligation in the eyes of those of us persons here who live along this branch of the Colorado River--which we like to think is the main branch of the Colorado River--and when we can walk across it up here below Palisade without getting our low shoes wet, we wonder whether or not that obligation isn't a serious proposition. There used to be a time in the pioneer days here when nobody ever thought of all the water in that river being used. Now we wonder if there is going to be enough water for the immediate future.

So that in the division which will be worked out by this Commission they are going to be confronted with an equitable, I take it, division. The same kind of a principle that would apply if a court were dividing the water will probably apply to the division made by the Compact Commission.

They are also going to be confronted with the division of this obligation. After deciding how much water each state will be entitled to they will have a complementary question, how much water will that state be obligated to furnish to the Lower Basin?

In working out this consecutive ten-year rule, it will undoubtedly be necessary to build certain mid-river reservoirs for the purpose of impounding water during the lush years to carry over during the dry years. Now those reservoirs are not without disadvantages because every impoundment of water that is made is going to result in so much evaporation. Before those mid-river reservoirs are constructed there is going to be necessarily a lot of study as to the amount of water that those rivers flow during the lush period as well as the lean periods and the amount of water that is evaporated while this storage is being carried on to bring us over the low point.

In Colorado we have enacted a few rules which we believe are good rules for us as well as for other people. For example, we now have a law to the effect that any irrigation district or conservancy district which may be formed for the purpose of entering into a construction contract with the Bureau of Reclamation must provide, first, that it is subject to obligations of the Colorado River Compact and the Boulder Canyon Project Act, and also that it must protect not only the present but the future uses of the water in the basin from which it may be taken--that is to say, the future use of the water that that basin may in the future need for its development. We feel that that rule, which is also incorporated in the Senate Document No. 80, would be a proper rule for the other Upper Basin States to inculcate in their thought.

We have another rule in Colorado to the effect that no water may be taken from the State of Colorado, that is, the diversion may not be made in the State of Colorado for the use in some other state. That is a statute which will undoubtedly be overridden by this Compact Commission when our compact is drawn up and after it has been ratified by the various states that law will probably go into limbo. We feel in Colorado that those sister states who may find occasion to make their diversion in Colorado for use in their state must charge themselves with that water as a part of their division or part of their use of the River. The mere fact that the diversion may be made in Colorado should be no charge against the State of Colorado.

That is going to present difficulties because we are going to have power developed at the point of the reservoir, at the point of the dam. That dam may be in one state and the irrigation part of the water may be used in another state.

We are going to be confronted with another thing and which in my opinion is one of the most serious. Up to this present time, the projects that have been built have been constructed with the idea that they would be repayable, that they are economically feasible. Now if you enter into an obligation to repay everything that you spend, you enter into that with serious thought and consideration. We have a couple of pioneer projects in this area, two or three of them--including Mr. Dodd's who came in here a moment ago--as the primary, original projects. We are paying the cost of those projects.

Now then, the Reclamation Act has been amended on the theory that most of the economically feasible projects have already been constructed, has been amended to take in certain other elements. First they took the revenues from power and then the benefits from flood prevention. And then the idea has been growing on the other hand, that even though the projects may not be repayable on that theory, they are of eventual benefit to the country at large and that they will be subsidized to a certain extent. That brings us into the proposition where we get something for nothing.

Now everybody is anxious to get something for nothing. That is going to make the deliberations of this Board more difficult than it otherwise would be. If we build only the projects in these four Upper Basin States that we can pay for, possibly there will be enough water if the Lord is a little more generous than he has been in the past few years and we may not meet this 25 per cent deficiency of water that the Bureau study now indicates.

This Bureau study, of course, is not a complete study. It is a very fine analysis of the situation and it contemplates that there will be other appropriations made--probably small ones but in the aggregate they may be considerable--from this River in addition to these projects that have been set out in the Bureau report.

Colorado expects to carry out its obligation under this Colorado River Compact and its compact and Treaty with the Republic of Mexico. It also recognizes its obligation to the Indian tribes. And we assume that the other states are going to be just as anxious to do that as Colorado.

One other thing we believe will be worthy of mention, it will probably be the idea of Colorado that after a certain amount of this water has been allotted to it by this Commission this water then will be administered by the State of Colorado. Our water we expect to administer. I am not sure that that will be a unanimous idea on the part of the four Upper Basin States, but it seems to us that upon the theory upon which we have always appropriated water that we will undoubtedly expect to administer that portion of the water which will be allotted to Colorado.

We think that it will be contemplated by this Commission that perhaps in the immediate future or as rapidly as possible, some division will be made of this water between the states so that the projects most feasible, most necessary, can go ahead. But it may not result that all of the 7,500,000 acre feet will be divided at this time. That may go into sometime in the future, but we do feel that the Compact Commissioners should divide up the responsibility of furnishing the first 7,500,000 acre feet.

My province is going to be in this meeting to ask those persons from Colorado to make such expressions to the Commission as seem to them appropriate. I think a little bit later probably we will call upon our Western Colorado Congressman, the Honorable Bob Rockwell, but I think in justice to him we should let him have a chance to get his feet on the ground and perhaps call on him after some of you people have expressed your opinions. If we call upon him now, I think I would be deeply grieved if someone had done that to me when I came in.

You people who live in the Colorado area are met here today in order that the Commission may get acquainted with you and you get acquainted with the Commission. This Commission is going to try to do justice between these four Upper Basin states. They don't know you too well. They want to hear what you think about this. And when one of you gets up, a good many of you are going to be at a great disadvantage because unless you have lived with this river fifteen, twenty, thirty years like Mr. Wallace has, there is a lot of past history--water that has gone over the dam--that you are not familiar with. But don't be afraid to express yourself nevertheless because this Commission is only made up of human beings. They don't think there isn't any chance you are going to overlook something. You may have the rights and equities of this situation and the necessities of the case that may be of help. In other instances you may express something they have heard a thousand times. Don't let that worry you.

We have men here from Southwestern Colorado, Western Colorado and Eastern Colorado. You all recognize that under the terms of the Colorado River Compact it was contemplated not that this water should be divided between the natural basins of the seven states, but that it should be divided between the seven states in order that it might be used in and out of the Basin. If it wasn't for the fact that the transmountain diversions, transbasin diversions, had become so simple and apparently practicable, we would not have this deficiency of water problem, but we have it, had it since 1922 when this Compact was first drawn up and we are not expressing any thoughts between basins today. This is just in order that the Commission may have the thoughts of the Colorado people in the division of this water between these five states. Arizona takes advantage of a portion of this water; primarily it is four Upper Basin States.

With that explanation, Mr. Chairman, may I call on some of these people, or would you prefer they act spontaneously?

THE CHAIRMAN: Just as you like, Mr. Smith.

MR. SMITH: I don't know whom to call on first but the closest man to me, who is a good exponent of his position, is Mr. Ed Dutcher. Ed Dutcher is a member of the Colorado Water Conservation Board. He is an attorney in the City of Gunnison. He will have some ideas with reference to this River and we might just as well start with him at the top of the mountain.

MR. E. L. DUTCHER, GUNNISON, COLORADO: Mr. Smith, Mr. Chairman, Members of the Commission, I hardly knew that I was going to be called on to start out this morning. I don't know that there is anything particularly

to be said on behalf of the Gunnison watershed.

We of the Gunnison area have been watching the proceedings of this Commission very carefully. We are much impressed with the manner in which they have proceeded and are going to proceed in the future. I want to say this with emphasis, and that is that we have implicit confidence in the Commissioner of Colorado, Judge Stone, who happens to be a representative of our area. We know that with Judge Stone sitting on the Commission the Western Colorado people are not going to be sold short when it comes to the drafting of this Compact.

I think I can conclude these few remarks with this one suggestion, and that is that in dividing the water among the various states in the Upper Basin, we should keep in mind and always be mindful not only of the present and the prospective uses, but I feel as though we should take into consideration, at least, prospective uses that are not now known in the division of this water.

In other words, we have projects that have been planned for us by the Bureau of Reclamation and other agencies which are classed in the category of known projects which are potential users of water. There are, however, certain projects that might come up ten to twenty to thirty years from now that are not known to any of us at the present time. I remember approximately a year ago we presented to the group in Denver at the time the first Colorado River Report was presented by the Bureau of Reclamation this one suggestion, and that is: Because of the fact that the Forest Service and other grazing agencies have been curtailing the allotments on the range, that some of the cattle users and the stockmen felt that the time was ripe to ask for water for pasture purposes on the hillsides. Now that is a new use of water. It's a new use because it has never been done before. That suggestion met with very favorable response.

I feel that there may be other uses in the future for this water in the various states, and particularly in Western Colorado, that are not now known to any individual or any group of individuals. And in dividing this water, I think that we should try to agree upon an arbitrary figure and percentages of water for the various states which might cover these potential uses which are not known by mankind at the present time.

After all, this compact is going to affect our grandchildren. It is going to affect our children in future generations and we want to try to protect them as well as protecting ourselves.

MR. SMITH: I am going to spot around this River more or less and I think we might well hear next from a man who lives pretty well up what we like to call the main branch of the Colorado River, Judge Hume White of Eagle, who is a member of the Colorado River Conservation District. Judge Hume White of Eagle on the main stem of the upper river.

JUDGE HUME S. WHITE, EAGLE, COLORADO: Mr. Moderator, Chairman, Members of the Commission: I might say that our moderator has told you a good deal about the members of this Commission that he knows, particularly Tom McClure and his time with Dan Hughes, but I think he forgot to mention State Judge Hannett, Tom, and he isn't here. We miss him. I won't go into details on that because that was when we were trying to get together and know each other to find out whether we had cherries or what we raised.

You gentlemen have got a job before you and you know it. Nobody has to tell you that. It is a big job. First you have to agree among yourselves and that has got to be referred back to the states. Then it has got to be ratified in the state legislatures and then I believe by Congress, is that right, Judge?

COM. STONE: Yes.

JUDGE WHITE: And finally signed by the President of the United States, is that right?

COM. STONE: Yes, approved.

JUDGE WHITE: Approved, not vetoed. Now it occurs to me that this Commission first will have to determine the facts and there are many, many facts. I think that is largely an engineering question. I don't think it is a question for a layman; it certainly isn't a question for me.

And speaking of that I want to say that I have had a great many years now, in and out, trying as well as I could and still making a living, studying water and water conditions in the Western States, the Upper Basin particularly. Occasionally I have had a good deal to do with the Lower Basin.

I remember many, many years ago when I was first admitted to the Bar in the State of Colorado. I was studying water law. A lawyer came up to me, a good one, and says, "Why are you reading that? Why," he says, "it's all codified. You have got a code," he says, "all the water law, that is there. All you have got to do is read your code and a little procedure and you have gotten all the water law." That was a good many years ago, about 1913.

Since that time with all my studies and attending meetings and trying to remember as much as I could, I find now that I know practically nothing about water or water law or anything else. It is changing. And I think this Commission will have to realize that and understand that; and then secondly, get the facts, the known facts, and if they can, as much of the unknown facts as they can.

That is going to be a big job. It can't be done over night. It can't be done, perhaps, as quickly as the Commission would like to have it done and the United States Government. Now you can do a thing and do it fast and get something through, but after you have done all that work if it isn't ratified by the state legislatures and the different powers that be, you have wasted your time and you have wasted your work, haven't you?

Now I am a believer in state rights, and I think the water laws and the rules and regulations of the different states it should be understood by this Commission are not in harmony in each state. I think each state's code and the rules and regulations and the things they have set up for their own protection should be understood and thoroughly understood, and before any compact is finally prepared by this Commission for the ratification of the different states, you should have that in mind. I think that is essential.

There are many uses, as Mr. Dutcher has told you, that are now a there are going to be others discovered and used for the use of water. It isn't all the little irrigation ditch that we have now. There are many oth uses for it.

I don't think we understand the value of this water to the state and to the basin and to the Nation and to the Republic of Mexico. Nobody can put a value on it.

Now we have years of drouth and then we have years that we seem to have more water. Delph Carpenter was mentioned here today. I knew De

Carpenter very well in 1922, particularly in the year 1923. He assured me at that time, and he meant it, that we were certainly protected in the Upper Basin States by agreeing to furnish only 7,500,000 acre feet at Lee Ferry. With the figures today, I think the engineers will find that maybe Delph Carpenter was mistaken at that time and it is going to be a job to furnish that amount of water or ten times that amount of water averaged in the ten-year period.

If that is true, we have got that compact, we have got to carry that out, we have agreed to it, that is done, that's true. I think this Commission should think very seriously where that water is coming from, who is going to deliver it down there, and how it is going to be delivered. That is a serious question. How you are going to do it, I don't know.

But Silmon Smith has outlined this thing to you most thoroughly and Dutcher and others and you people I know know more about it, Mr. Chairman, than I do. I am just calling attention to the few facts that occur to me.

I do think that an equitable--and when I say that I mean "equitable" --agreement can be arrived at because you are reasonable men, you are going to use reason, and you are going to meet around the table when you haven't got a crowd and you are going to try to work these things out. Each one of you have a lot to learn; you know that. If you will do that and work hard and get your facts, I believe an equitable agreement can be arrived at with the advice of your engineering staff and the advice of your legal counsel and with your good common-sense as Commissioners, arrive at an agreement that will be equitable to all of the states--not any one taking it all, being the hog, the dog in the manger.

If that can be worked out you have taken a step forward that will make history not only for our generation but for our children and our children's children and their children--goes down the line--unless in the meantime we have a revolution in this country and everything is thrown up and gone. And unless these things are worked out that way that very thing could happen and it is a serious question.

We have every confidence in Judge Stone. He knows this problem better than anyone I know and the problems generally. I know Tom McClure has had a great deal of experience and you other gentlemen I am not so well acquainted with. But I do believe that you can work out such a compact and I believe you will but it must be just, it must be equitable and the rights of the states must be safeguarded, and unless those things are done, state laws recognized, Senate Document 80--unless those things are done, you can prepare a compact but watch out when you meet your state legislatures and try to get it confirmed.

Now I thank you and I have taken up more time than I intended.

MR. SMITH: Thank you very much, Judge White, and I hope you will permit me to correct one thing you said. You mentioned beginning the study of irrigation law in 1913; if I recall it correctly, you started about 1911 because I think I was doing it with you.

JUDGE WHITE: That is right. I graduated in 1911.

MR. SMITH: And I would like to correct the Commissioner speaking of our friend, Judge Stone, as from Denver. I intended to enlarge on that sometime ago. We have never admitted Judge Stone belongs in Denver. He is a resident of the City of Gunnison, temporarily messing around over in Denver and Boulder. That is one reason that we like this Commission so well, because Colorado has such a good representative on it.

Now in dodging around this group I want next to call on Mr. Dan Hunter. Mr. Dan Hunter lives down in the southwestern part of Colorado. He and some of his friends are here and unfortunately Judge O'Rourke was unable to attend. Judge O'Rourke represents that part of Colorado on the Colorado Water Conservation Board. He isn't here but he has a splendid understudy in Mr. Dan Hunter.

Mr. Hunter, will you come up here and express yourself, please?

MR. DAN B. HUNTER, DOVE CREEK, COLORADO: Mr. Moderator, I feel that I am not equal to the occasion to stand before this august assembly and offer advice to the gentlemen who have gathered around this festive board this morning. But I represent the Southwestern Water Conservation District and we people of the eight counties of Southwestern Colorado feel a deep interest in the waters of the Colorado River from the fact that we supply practically 40 percent of this water from the streams that arise in the southwestern part of our state and flow into the Colorado River.

My people say I have "water on the brain" and I presume that's right. But this morning, in my little town of Dove Creek, we have begun the installation of a water system. Necessarily we have to have water in order to supply our users at Dove Creek, and I am vitally interested in an equitable and a fair division of the waters of the Colorado River. I feel perfectly sure that the gentlemen gathered around this table will be fair and will give us an equitable distribution of this water among the four Upper Basin States and Arizona included. With the advice of the Chairman and the engineering forces, Mr. Bier and others, and the consultations of the various attorneys within the five states, I feel sure that you gentlemen can and will work out an equitable and a fair distribution of the waters of the River of the Colorado in such a way and in such a manner that it will meet with the approval of the legislatures of the various states that are represented.

I feel perfectly sure that you Commissioners will work toward that aim and I feel that you have a sufficient amount of intellect and intelligence to the effect that you will not introduce anything toward the allocation of these waters that you have a doubt would not comply with the free and full consent of the legislatures of the various states represented. Thank you.

MR. SMITH: I think I would be remiss and inappropriate if I postponed any longer calling upon the Honorable Robert F. Rockwell, Congressman from the Fourth District of the State of Colorado, a resident for many, many years of the area up on the North Fork of the Gunnison. I think he claims Paonia as his post office address in case you want to write for some seeds or something.

Bob Rockwell is probably as familiar with water in Colorado as any man in the room. The Honorable Robert F. Rockwell, Congressman from Colorado.

CONGRESSMAN ROBERT F. ROCKWELL, PAONIA, COLORADO: Moderator Smith, Former Commissioner Bashore, Members of the Commission, I am deeply interested in the success of this series of meetings that you gentlemen are holding. I have happened to have followed this program almost since its inception because I happen to have been the Lieutenant-Governor of the State presiding over the Senate at the time that Colorado approved the Colorado River Compact in 1922.

As I recall, at that time Secretary of Commerce Hoover sent a special Secretary out and he met with a group of us in Denver and we went over this problem very carefully. I knew Delph Carpenter very well--his name has been mentioned a number of times. We thought at that time that

this 7,500,000 acre feet of water that was set aside for the use of the four Upper Basin States would be all that we could possibly use.

Time has shown us many problems, many reasons why that was not correct--probably as fair as could be agreed upon--but is not protecting these Upper Basin States; however, we thought they would be protected. As Mr. Will I see over there recalls, and Mr. Carson--I think Commissioner Bashore had withdrawn at that time--and I may say it was with deep regret that the members of the Irrigation and Reclamation Committee in the House of Representatives, of which committee I have been a member the last five years, saw him resign. He was a man who understood the position of Director of Reclamation and a man with whom we worked very carefully, and it was with great regret we saw him withdraw from that, although he has taken this very important position of Commissioner in charge of the division between the states.

But as a result of these hearings that were held there--Mr. Carson attended representing the State of Arizona and a group from California--it became very apparent that in the last sixteen years we have had a considerably lesser flow of water down the Colorado River than anybody ever thought possible. If I remember correctly we only had a flow of a little over three and a half million acre feet of water whereas we have guaranteed seven and a half million acre feet. And it also became apparent when the Reclamation Service went around to decide upon the potential projects in these Upper Basin States that there were several million acre feet of water less than we needed for feasible projects. It leaves a problem here before you gentlemen that is going to require a great deal of careful thought and attention.

I realize as I didn't before these hearings that we are going to have to agree on something pretty soon in the division of these waters. As Mr. Carson knows, California is objecting to Arizona using any more water until there is a division between the states as to how much water each of these seven states is going to be allowed and while, as Mr. Dutcher said, no one knows at this time what the future demand of water is going to be.

Up in the territory that he speaks of, in Gunnison, where I run cattle, they have found that the irrigating of pasture land maybe gives ten times the amount of feed on those pastures that we get just from natural rainfall. It is feasible and up until shortly before 1920 we thought that we could develop that as we wished. If I remember correctly, 70 percent of the water of the Colorado River comes out of the State of Colorado and we thought that all of these hundreds of thousands of acres of land that we have, we could use this water as we saw fit as long as it was within our borders.

Now as a result of this Supreme Court decision which changed the rights of states to the water within their borders, we realize the difficulty of how we are going to develop in Colorado and Western Colorado as we feel is feasible and necessary and still be fair with the other states of the Upper Basin and the Lower Basin.

As a member of the Irrigation and Reclamation Committee in the House of Representatives I want to say that this is a matter that is of the utmost importance. It means the future welfare of all of our Upper States as well as the Lower Basin States because, as Dan Hunter mentioned, in the southwest part of Colorado we have an empire down there that needs development. Potential projects for dams are in the making. But we want to know how much can be done under this compact.

So I just want to present that little picture to you because this situation has changed greatly from 1922, the viewpoint, due to the fact that we realize there is not enough water in that river to satisfy all the development

that we want to make in these upper states, and I urge you to be, as I know you will be, very careful.

I want to say just this in conclusion, that I very much approve of this way of getting at the division of this water. I do not think that any one agency of the Government, even though it may be the Reclamation Service, can come in and divide this water to the satisfaction of all these states. You representing these upper states should agree on what should be done and then it will go before your legislatures and finally before the Irrigation Committee in Congress, and then after that we can hope to get the appropriations to build these dams and development.

But this is probably the most important job that you men ever undertook and I know you will do it as Judge Hume White said, with great care and consideration and fairness. But it is a problem that I don't envy you your responsibility and I hope that you will be able to work something out that will be satisfactory to both the Upper and the Lower Basin States. Thank you.

MR. SMITH: Thank you, Mr. Congressman. Up to this time I have called, I think, upon four men who get their rights from Western Colorado. In order that we don't show any favoritism or distinction between the various parts of Colorado, I am going to call on some gentlemen from Eastern Colorado. I have a number of others that I want to call on later from Western Colorado.

I hope that as these various representatives from the State of Colorado give their talks they try to be of assistance to the Commission. If you have any idea as to how this water should be divided between these four states, express that idea. The Commission doesn't have to adopt it but they would be glad to listen to it.

Now in Eastern Colorado--we used to hate all those birds but we have learned that there are some very fine people up there. I have been astonished what a nice country they have and what good people they have in it, and the man I have been in closest touch with and admired the most and respected greatly--don't get excited, I just picked out one man--this man is a very able person. He is a member of the Colorado Water Conservation Board. He sits right next to me. I am always proud to vote the way he does and always hope he will vote the way I do.

I want to call on Mr. John Dille of the Colorado-Big Thompson Project in Northeastern Colorado. I think he is a member of that project.

MR. J. M. DILLE, GREELEY, COLORADO: Mr. Moderator, Chairman, Members of the Commission: Thank you very much, Silmon, for your remarks.

I don't know I have anything to say that will help this board yet. I am not certain in my own mind the problems you will have to meet in deciding how this water should be divided. Perhaps the best thing I can contribute just now is going back to the days when I first met Mr. Smith, Mr. Merriell, Mr. Delaney, Judge White, and others, when we people from Northern Colorado first began to dream about bringing water over to take care of our shortages in Northern Colorado.

As you all know, this Colorado-Big Thompson Project, which is now under construction by the Bureau of Reclamation, is the largest transmountain diversion--not yet in existence but it is apparently pretty well along in construction after eleven or twelve years. But sitting here this morning I was thinking about some of those meetings we had over here when we were

trying to get acquainted with each other as Mr. Smith spoke. I want to say that we in Colorado over in there feel very proud of the friendships we have worked out among those over here. We want to do everything we can to work along with them and help work out these problems on the Colorado River for the development of the part of Western Colorado here which they are interested in.

I might explain a little bit perhaps--I could to those of you who don't exactly know how that was--what our setup is. But of course, as Mr. Smith mentioned, they were quite perturbed at least when we first proposed taking some of their water, which we hope will be an average of 310,000 acre feet annually out of the 7,500,000 that we may possibly have.

But out of all the meetings and conferences we had and getting acquainted and learning each other's problems and trying to see the picture from the other man's side, we worked out the Delaney Resolution first at the meeting in Denver, I remember, and then it was all finally incorporated in the Senate Document 80--Mr. Merriell speaks of it being a famous piece of paper--and later on incorporated in the Conservancy District Act, which was passed by the Legislature of Colorado, primarily for the purpose of setting up the Northern Colorado Water Conservancy District, which, as you know, contracted with the Government for the construction of the Colorado-Big Thompson Project.

But in the whole plan there I think that we can say that our people in Northern Colorado tried to do anything we reasonably could to be fair and work the thing out on a mutually beneficial basis.

As some of you know, one of the main features of the project is the replacement reservoir, we call it, on the Blue River which has a capacity of 152,000 acre feet of which 52,000 acre feet is dedicated to replacement and protection of the irrigation along the main part of the Colorado River. That feature the Bureau of Reclamation have completed. It has been in operation and the power plants there have been producing power for about three and a half years now. It has worked out very well during the war period in taking care of the power around Denver.

We took over other obligations--I mean, the Senate Document 80 and all the other official documents set up the principle that this diversion is to be attained without any interference with present or future uses of the water of the Colorado River. Furthermore, we took over the obligation of compensating Grand County to the extent of $100,000 for the interference that there might be with their tax revenues on account of using some of their branches up there for reservoir sites.

Beyond that there is another clause in a paragraph of Senate Document 80--I just happen to remember--which provides if it should ever develop--which we hope it won't--the Upper Colorado River States are called upon to take care of a deficiency in the delivery of water at Lee Ferry, the diversion of the water to the Eastern slope will have to be shut off before any of the present or future uses on the Colorado River will be affected.

So I just mention those things to indicate to you what the situation is about these transmountain diversion projects which we are trying to work out in Colorado on a mutually beneficial basis such as our Colorado-Big Thompson in Northern Colorado. I think the Bureau of Reclamation, the people here, Mr. Larson, this district along with our district, are trying to work the whole thing out to get the best thing we can for Colorado, of what we are entitled to as the uses of Colorado.

Beyond that, as to the problem of how this water will be divided, we want to keep informed as to how the matter is working out, and we of course

depend largely on Judge Stone of our Water Board to guide us on these things. and we will try to keep posted ourselves and give the best that we are able to in helping the Commission work out these problems. Thank you.

MR. SMITH: Thank you, Mr. Dille. I like to think of this Colorado-Big Thompson as an example of what can be done when folks get around the table and try to work out something to their mutual advantage. I think the same principles can be applied to the division of this water in the four states.

I made one terrible mistake in the early stages of the Colorado-Big Thompson Project. They had not yet made up their mind they could do this when Mr. Dille came over one day and I showed him a little country. I used to have a ranch by Palisade across the river on a high promontory that looks down on the river. It happened to be early spring when there was a high flood. I took him over there and let him look at the river. He didn't know there was that much water in the river. It was a mistake; I shouldn't have let him know about it. Unfortunately it doesn't run very long.

I am going to call on Mr. Glenn Saunders, who is the Assistant District Attorney for the City and County of Denver, who is very much interested in water, attends all meetings. I have never seen him when he didn't have an idea to express. Mr. Saunders.

MR. GLENN G. SAUNDERS, DENVER, COLORADO: Mr. Moderator, Gentlemen, the City and County of Denver of course has a very large stake in the development of Colorado, the whole state. It is the capitol city and the welfare of Denver is intimately tied with the welfare of every section of the State. In a sense, Denver is, we may say, a parasite as all cities are. Cities do not produce the wealth upon which we live; cities distribute that wealth. And unless the portions of the State which produce wealth prosper, Denver as a distributor will not prosper either. Therefore we are anxious that the welfare of the whole state be conserved.

When the appointment of a commissioner for Colorado for this work was up, a number of names were suggested as we all know. The thought that there might need to be several commissioners was brought out. The people in Denver had so much confidence in Judge Stone, knowing full well his antecedence, the possible bias on behalf of the Western slope, we had so much confidence in his honesty and fairness, we joined with others in recommending that he be made the Commissioner from Colorado. We have full confidence in his integrity and his intelligence and ability to execute that integrity by fairly representing Colorado here. Therefore I believe that the large population centers which are in Eastern Colorado, represented by Mr. Dille's group, the group from which I come, will back the actions of this Commission recommended by Judge Stone because we have great confidence in him.

Now their confidence in Judge Stone might also be an indicator to you on the Western slope that we have confidence in your fairness, too. As Silmon Smith has said, we have gotten better acquainted in more recent years and some of the antagonism that used to exist we are dissipating because the Western slope will prosper, too, as Denver prospers and the Eastern slope prospers. We all win or lose together.

Now as to this particular meeting here, I would only emphasize this fact: The pre-existing rights to water, which I haven't heard yet mentioned, must be protected at all hazards. The City and County of Denver is utterly dependent not only for its future growth but the continuation of its present existence upon the diversions of water it makes from the Colorado River. Approximately one-third of our present uses come from this river.

From the standpoint of the national defence, Denver is becoming a more and more important military center. Because of our inland condition it is recognized that the Arms Plant, the Chemical Warfare Plant, and the West Point of the Air which is being developed at Denver, the Air School, are permanent military installations essential to the protection of this country. I think none of us is so naive as to believe that the millennium is yet here. We are talking about working for international peace. It hasn't yet arrived. For many years to come our greatest protection we all know is going to be in our ability to defend ourselves against aggression. Denver is a key unit in that.

A great plant has been built for chemical warfare at Denver. That plant alone when operating to its fullest extent will require one-third of all the water that Denver uses. Now it has never operated to full capacity. It means that the demands on our Denver water system for national defense may be greatly multiplied at sometime. These are not theories; they are actually existing conditions.

These waters that we now use must be protected. We have no other source of water than the Colorado River. We expect to develop this water and use it in a manner which will not be injurious to the Western slope of Colorado. Mr. Potts, our water rights engineer who is present here, jokingly told Mr. Merriell he still had 300,000 acre feet in his reservoir. The reason is that that is water Denver has impounded for use when demanded by the Western slope and not a credit, which will bring the greatest possible benefit to the Western slope.

We wish to point out to the Commission that we in Colorado in the case of the Grand Lake Project and in the case of Denver's present diversions are quite able to work out our internal problems satisfactorily and will do so. We have great need of water for not only present uses but our future development. We have fullest confidence in our Commissioner, will back him to the fullest extent, so we hope you will listen to him and realize that he is truly our representative and expresses our wishes.

MR. SMITH: Thank you, Mr. Saunders. Mr. Commissioner, may I call upon one man before you adjourn for lunch? I think it would be appropriate at this time to call on Mr. Harry Potts, Water Rights Engineer--did you say, Mr. Saunders? I think that is the official title. Mr. Potts and I used to view each other with alarm--at least I viewed him with alarm. I don't know whether he was responsible for the whole idea that Denver would require a lot of Western slope water, but we couldn't agree. However as time goes on we have seen more of each other and I would like to hear Mr. Potts' expression.

MR. H. L. POTTS, DENVER, COLORADO: Mr. Moderator, I am surprised to be called upon to make any remarks.

MR. SMITH: I am paying you an honor.

MR. POTTS: Thank you. An engineer is naturally more or less at a disadvantage when he attempts to speak before a collection of attorneys and judges and other representatives of the profession.

I have had the pleasure, I will say, of meeting with many of the Western slope men since the City of Denver began diversion of water through the Moffatt Tunnel in 1936 and our associations have been very pleasant. For many years I have known that you didn't raise cherries down here in the Grand Junction District although I have lived over on the other side of the Hump most of my life. I know that you raise peaches down here and the only thing that I might say is that I wish we could get more of the first grade peaches in Denver

and you didn't ship so many of them East. I think they send us most of the cuts.

The last two or three years through Mr. Merriell and your Division Water Engineer, we have been fortunate enough to be able to make some substantial deliveries of water to the Colorado River to help top out and furnish some supplemental water to the orchards in this district. And as Mr. Saunders told you, we feel perfectly safe in having a resident, I believe you said, Mr. Smith, of the City of Gunnison, as a representative of the entire State of Colorado. We feel that in approaching this division of the Colorado River it must be done with a full spirit of cooperation, and I can assure you that we are ready at all times to cooperate in any way possible.

I think that I might say that there is no real necessity for viewing with alarm the river flows in the last few years. If we can believe the studies which some of us have carried on we find that on the Eastern slope at least, we entered into a drouth cycle in the year 1923 and we have yet to come out of it. I know by comparison of my tree ring studies with those of more competent men down at the University of Arizona, that the records of the South Platte follow very closely the records of the Rio Grande and also the records on the Colorado River. We now have a record over there of some 650 years where there have been various periods of drouth during that time. But the old law of averages is bound to bring the other extreme at some time or other, and I do not feel that we are facing any calamity because we have had a few years of drouth.

MR. SMITH: Mr. Commissioner, at what time do you wish to adjourn? Shall we proceed now or--(Confers.) Suppose we proceed for another half hour if that is agreeable. You are too late to get to the first table now anyhow.

I would like to call on Mr. C. J. McCormick at this time. Mr. McCormick has for some ten, fifteen, twenty years had the Orchard Mesa Irrigation District on his soul and conscience. He has been secretary during that period. He is one of these people who know what it is like when the water runs out because that District feels a water shortage. It is easier for him to look to the time when the well runs dry than it is for you fellows to where it is only high water. Mr. McCormick.

MR. C. J. McCORMICK, GRAND JUNCTION, COLORADO: Mr. Moderator, unfortunately I am not like Mr. Smith and some of the others. He tells about his friends who were in school with him and various things of that kind. My mother was rather old-fashioned and she had the idea that only the weaker ones, the ones who couldn't do very much manual work, should be sent to school. My brother was kind of delicate so he got the schooling. But one day he was sick and Mother had the idea that school was like a threshing machine crew, you had to have a full crew or else you couldn't do any work, so she sent me to school that day.

Being brought up on a farm, when I came to Colorado I thought maybe I could reform, but I wasn't able to do it. I had to still stay on the farm. However, the neighbors over there sort of concluded that I was a good goat, so they put me on the Irrigation District Board because the District was bankrupt and they knew it and I didn't. So like a chump, you know, I started to straighten it out. My hair was pretty dark then and I had a lot more of it than I have now. But I found out we were bankrupt after a while when we couldn't get money to pay our bills. So eventually we prevailed upon the Bureau of Reclamation to come in and take away some of the things we had in order to give us a little water.

Now I can't give you very much advice. Being a farmer I diversify the farm. I plant some corn, some sugarbeets and some onions and a number of other things that grow very successfully here. But it seems to me that our problem might be similar to the farmer's problem.

The farmer has a definite expense. He must pay his taxes and he must pay for his help. We have a definite charge or expense in delivering so much water at Lee Ferry.

Now if the farmer can produce money from his different crops, he naturally is going to take from those crops a percentage to pay his definite expenses. If he had four fields it would seem to me that he would figure that the products from those four fields should share in the definite expense that he has to bear. So that as I look at this, the products of these Upper Basin States should share in this definite debt which they have on some basis which probably is proportionately or something of that kind.

In my farming experience I try to have left a little money over my definite expenses. I am just like the rainfall; I have those periods of drouth. I had them a few years ago. Just recently I have had the other kind. I don't know how long it will last; of course we hope it will last indefinitely, but they haven't in the past and I don't look for it in the future.

But one thing that I would just like to leave with these Commissioners is that we produce water. My fields produce crops that I sell and I take a proportion of those crops to pay my definite expenses. What I have left over I divide up among the family. Of course the wife gets the most of it because she does the most of the work. But that's the only problem that I see for these Commissioners is to determine how much water each one of these states must deliver at Lee Ferry. Thank you.

MR. SMITH: Before going up into the Montrose and Delta area I am going to call upon Mr. William Sullivan at this time. Mr. Sullivan is Superintendent of the Grand Valley Irrigation Company, which used to be written up in the books as the most successful irrigation project in the West. It is a pioneer. Ever since it went through its first bankruptcy it has been one of the best systems anyone has ever known of.

Mr. Sullivan has worked upon that from the beginning and has directed it during the last few years and is more familiar with the peculiarities of the Colorado River, I imagine, than any of the rest of us. He has seen this river when it was so big you couldn't do anything with it, and he has seen it when there wasn't any of it. And it is those thoughts that impress upon us this obligation which correlates this division of water. I am sure Mr. Sullivan can give us some worthwhile thoughts.

MR. WILLIAM J. SULLIVAN, GRAND JUNCTION, COLORADO: Mr. Commissioner, I have been on the Grand Valley ditch some forty years--I am not going to take up much of your time--but on this dry circuit of the water, up until some fifteen years ago we weren't bothered at all about getting water out of the River. Some fifteen years ago we had to put in a diversion dam and since that time every year, I believe, there has been no water going down the River below our headgate.

I think Mr. Merriell would be in a better position to tell you of our water troubles than anybody as he is our consulting engineer. I think that is all I have.

MR. SMITH: Thank you, Mr. Sullivan. I am going to call on Mr. Bill Dodd at this time. Mr. Dodd--William Dodd I think they call him--is the

President, I believe of the Uncompahgre Water Users Association, is that correct?

MR. DODD: Yes.

MR. SMITH: He is very much a citizen in the upper middle Gunnison River. He attends all the important meetings. I have sometimes thought he was a New Dealer--I am not sure he is. I have learned better. But wherever they need a man of ability they generally call on Bill Dodd. He demonstrated that beyond any peradventure of doubt by putting all his farm equipment on rubber, the first man to do it.

MR. WILLIAM J. DODD, DELTA, COLORADO: Moderator Smith, gentlemen of the Commission, and gentlemen: I am not very much elated over that introduction. After all, when I heard Mr. McCormick called on, I rather thought that I wasn't entirely alone. I am only a farmer and a stockfeeder. I very rarely attend such gatherings as this and so thought a while ago that I was only a farmer amongst judges, attorneys, and engineers. I thought I was out of place and I am still pretty much out of place.

I talked to Dan Hughes this morning. He probably could have assisted this Commission and given some advice which they might have carried into their deliberations with some effect. But I spend most of my time in the fields and around the corrals. I am sorry to say that while I have read much concerning the problem of the uses of the Colorado River water among the seven states, I haven't studied it very carefully. When Mr. Merriell wrote me concerning this meeting, I had thought only of coming down here and learning what was in the offing.

While sitting here during the past few moments--having gotten here a little late and missed some of the earlier talks that may have been of benefit to me--I am impressed that this is probably a greater problem for these gentlemen than I had in my mind anticipated before as things were brought up. Of course, this obligation to deliver so much and take what is left makes your problem greater than it would have been if you were dividing the water in the river only. Of course, assuming that our existing rights in all these states under our water laws will be protected, then of course you are dealing with a problem for future uses only.

While I can't give any advice, I could just picture that probably in going at that, in the solution of the matter between the states of its division of what remains, is rather a visionary thing in that you haven't too much tangible stuff except what has been worked up by the engineers and the imagination of what uses will be in the future. That contemplates, of course, not only probably our irrigation and domestic uses as we see the same today, but you get the picture of twenty-five, fifty, a hundred years from now, other uses that will develop, will come about. Probably then you will be consulting these visionary fellows who are necessary to us, such as architects, of the future in any field.

So while it is very clear to me that we should get at this thing and, since it is important to our states here that we know to what extent we each share within the bounds of the water above what we must deliver below and current uses depleted, we shouldn't delay this matter any longer than is necessary to get the job accomplished. However, I can believe it will probably take some two or three years or more.

It is very important because there are two factors that in my mind are somewhat conflicting, that will ever more be in your minds, or will be when it gets back to the states for consideration. That is, of course, the

uses that you will ascertain that the different states have of whatever apportionment is made to that state. And on the other hand, of course, the developed communities in each state are interested in their maintenance and increased use, as mentioned by the gentlemen from Denver, because of our interest in the community. Each one of us back in our separate areas are interested in its development. Our total expense, taxes and all, is thus tied up and either decreased or levelled somewhat by its enlargement and better development. There is always that human element amongst us, the consideration that the all-important thing is our relationship among peoples, their status in the states interested.

I don't know that there is any advice that I could give; only such rambling present thought ideas. I haven't prepared for any remarks on the subject.

MR. SMITH: Mr. Commissioner, may I at this time call upon Mr. Harry Gueno, a prominent attorney of the Delta-Gunnison River area, and an attorney, I think, for the Hotchkiss Project, is that right?

MR. GUENO: The Paonia Project.

MR. SMITH: Mr. Gueno, Mr. Dodd was complaining a little because we weren't putting in enough lawyers. I am going to change that now by calling on Mr. Gueno, who customarily deals in "fairness and equity", and perhaps he can tell us how we can equitably divide this river among the four states.

MR. HARRY W. GUENO, DELTA, COLORADO: Thank you, Mr. Smith. Gentlemen of the Commission: I am impressed today and I think some of us should voice the debt of gratitude we have to the lot of the gentlemen here who have done the pioneer work in carrying out these projects and in preserving the rights of the State of Colorado and the other states in the division of the water of the Colorado.

I think I, like most of the citizens, have just let it rock along believing that the water was there and we had it. We all know that that is not the case and that there must be some equitable distribution of this water to the different states involved. And in that connection I believe the people of the Western slope are perfectly willing to carry out their contract to furnish at Lee Ferry their proportionate part of their water. In fact, the agreement is made and the Compact entered into and I don't believe that the people here will crab about carrying out their obligations.

It seems to me that the most concrete advice that has been given this Commission today is by the man who claims that he doesn't have much education, Mr. McCormick. When he says that he apportions a part of his revenue from his farm for the payment of taxes, for water assessments and overhead expenses, why, we all know that. Those are things he has got to do.

And it would seem to me that this Commission in apportioning the water to the states, the representatives of the several states, will realize that obligation and will apportion or contribute their proportionate share of the water that arises in the several states to the Lower Basin States. What your job is going to be, of course, is to determine what is equitable apportionment.

I am wondering, listening to this problem, hearing the comments on this problem, whether Cliff Stone here is not going to be up against a kind of a proposition that Secretary Byrnes is with the United Nations. Now I hope, Cliff, your job won't be quite as tough or that you won't have any Molotovs to deal with.

But in conclusion I just want to say that I am sure the Western slope approves of the work of this Commission and we are all behind Judge Stone one hundred percent. Thank you.

MR. SMITH: Thank you. Mr. Commissioner, I think that it might be advisable to adjourn at this time until two o'clock. There are a number of gentlemen whom I wish to call upon and I hope you will all come back and bring others with you.

During the noon hour, Members of the Commission, undoubtedly some of these men will figure out whether to tell you to divide this 7,500,000 acre feet by four as equitable or whether to divide this 7,500,000 acre feet by the share each state produces of this water or by the share that each state wants to assume to supply the 7,500,000 acre feet at Lee Ferry. After dinner they probably will enlighten you.

THE CHAIRMAN: Gentlemen, before we adjourn the Chairman would like to make one or two observations.

I believe the speakers pointed out the hurdles this compact will have to jump. As I recall it, it was not mentioned that after it is ratified by the legislatures of the states it will have to be signed by the governors and any governor can veto.

Mention has been made of a shortage in the Colorado River and I believe Congressman Rockwell intimated that he and Delph Carpenter and others overestimated the capacity of the River at that time. We must bear in mind that the projects which were contemplated by those men at that time were projects feasible under the then existing reclamation laws. It makes a vast difference when you consider a project that is feasible under the Reclamation Law as it existed at that time and projects that we are talking about today. We are talking about Basin-wide developments of large magnitude not necessarily feasible under the Reclamation Law, similar to those in the Missouri River Basin.

Just one other thought and I am through: You have heard and read a lot about the authority idea in the United States. I don't suppose many of you people here in this room are in favor of the authority idea; perhaps some of you are. One of the best arguments used in favor of the authority idea is something like this: that the states are very jealous of their water rights, they are very proud of their jurisdiction over their water rights; but that when any forward movement takes place for the development of those rights and they get together, they don't do anything but squabble and bellow and kick up the dust and fight and don't agree on anything. As a consequence of that fact the only way you can get these large river basin developments is to have an authority which does not have to pay any attention to state lines but can go right ahead and develop.

You say that isn't going to happen in this Colorado River Basin, people are not going to accept such a theory as that; but in the humble opinion of your Chairman, not as Federal Representative but simply as Chairman of this Commission, the sentiment of the people can eventually turn to that unless these compacts are equitably worked out.

We will now adjourn.

(12:32 p.m. Noon recess.)

(2:10 p.m. Hearing resumed.)

THE CHAIRMAN: The meeting will now come to order. Mr. Stone, you may proceed with the hearing.

COM. STONE: Mr. Smith will proceed as Moderator.

MR. SMITH: Mr. Commissioner, gentlemen, with your permission we will proceed where we left off at lunch. I think we might hear with advantage at this time from Mr. Charles R. Neill of the Paonia Project. I believe he is the secretary of the--you tell them, Charlie, what you are secretary of.

MR. CHARLES R. NEILL, HOTCHKISS, COLORADO: Mr. Moderator, Mr. Chairman, Gentlemen of the Commission: I think I have a fair comprehension of the magnitude of this job that you are confronted with from two angles: One, it was revealed at the Omaha meeting of the Reclamation Association; the other, it was my privilege as a reserve officer to be called up on active duty in 1942 and assist in the developing of the largest army the United States has ever had and an army the size and magnitude of which had never been visualized. I want to say that it was a job.

I have for the past twenty-two years been Secretary-Treasurer of the Fire Mountain Canal and Reservoir Company of the so-called Paonia Project; for the last ten years, Secretary-Treasurer of the Overland Ditch and Reservoir Company also in the so-called Paonia Project.

To digress slightly, last summer a brother-in-law of mine who lives in Philadelphia was out for a visit. After he left my wife related this incident: She said Emerson asked what this country needed most and said she laconically replied, "Water." I guess I have had water on my brain--mind, what have you--for a number of years, and to me water is more than H_2O.

Our primary problem in the north part of the valley of the Gunnison River is supplemental water. These twenty-five years, twenty-two of which I have been definitely connected with them in the matter of developing, preserving the rights, the financing, liquidating the obligations--they have had and do experience many years in which the natural flow has been insufficient to produce a crop the proceeds of which were sufficient to pay operating costs, debt retirement, and such items. With us supplemental water is the thing that will--shall we say--make or continue to hold down to our present level our particular area.

I think perhaps it is known that we have a project before the Reclamation Bureau in the making. This particular year has cost us in our crops a tremendous sum of money, not merely by reason of the--shall we say--fabulous prices received this year, but on a normal yield, a tremendous percent of our apples have not made size by reason of the lack of water. A large area of our hay land did not yield the usual or a normal amount of hay by reason of the lack of supplemental or late water. That to us is the thing that is going to hold us as is or permit our going forward.

We have a large area under either of the two projects of just as fertile land as there is in the State of Colorado or in the West. Much of it is in a raw state yet. Much of it is suitable for the production of grain crops that can be matured with one irrigation in the spring, flood water. Flood water we normally have plenty of, but it is the late stored water that is essential to a further development.

Someone mentioned cherries this morning. I might say that in our valley we produce cherries second to none in the United States, as we do all

other fruit crops. Water is the one thing that is now necessary for the further development of our immediate area.

I have a very clear concept of the magnitude of the job you gentlemen of the Commission are confronted with. To restate some of those statements made this morning, I feel very confident of your impartial ability to arrive at a conclusion that will be written into a compact sustained by the various states, governors, Congress, and the President. Thank you very much.

MR. SMITH: Thank you, Mr. Neill. Your colleague, Mr. Carl Smith, President of your District, asked me not to call upon him for a speech; he said he preferred to listen. But, Mr. Smith, if there is something you subsequently want to say, let it be known and we will listen.

MR. CARL R. SMITH, HOTCHKISS, COLORADO: Mr. Smith and Members of the Commission, I don't believe I have anything to say. I am really interested in learning what is going on here and I don't feel that anything I could say would be worth the time.

MR. SMITH: If you change you mind, let us know.

MR. CARL R. SMITH: Oh, I will, thank you.

MR. SMITH: I would like to call on Mr. Archie Toner at this time. Mr. Toner is Director of the Southwestern Colorado Water Conservation District, is that right, Mr. Toner?

MR. ARCHIE B. TONER, FT. COLLINS, COLORADO: That is right.

It has been a great privilege and pleasure to me the past fourteen months to travel the State of Colorado; and in my travels, while it wasn't in line with the work I have been doing, because of my interest in water and the various problems it may bring up, I have been spending a lot of my own time and maybe a little of somebody else's time in going over these different reclamation projects and the areas that they service.

I have been over every section of the State regardless of how small. I have been up all your valleys and all of the remote areas, been over those, and some of those I was over twenty years ago when they were deserts. Today they have water on them and some of our best farm lands are in those desert lands that I have seen in the past.

There is one thing, though, that I would like to take issue with some of the speakers here that have been trying to claim our State Director, Judge Stone. I don't like to think of him as having a home anywhere except in Colorado. He is a Colorado man. We all believe in him and we all trust his judgment because in our long acquaintance with him we have learned to know that he is fair and just in all his decisions and he is working for the State of Colorado.

In the Southwest, as Dan Hunter said this morning, we produce 40 percent of the water that flows down the Colorado River, and we have guarded it, some of us rather religiously, and perhaps sometimes a little bit biased and narrow-minded. After traveling the entire state as I have done the last few months I have taken a different viewpoint.

The turn of world affairs has brought us together. We have learned through our world conflict that the world is small. We must live together and here in the United States we must learn to live together as one unit. We cannot be biased as far as our own states are concerned. We like to see our

states develop and all that but we have got to think in terms of mankind and what developments are going to mean the most to the United States a hundred or two hundred years from now.

We want to see our Colorado State develop to its utmost, but if I am talking to some of the people in my own home town, they see a large amount of water flowing down that river there and they can probably never believe that there ever will be a shortage of water. After this compact is ratified by the legislatures and the governors and the United States Congress, if I can say to those people, "That river only belongs so many percent to you," it will mean a lot to me and to everyone else that is interested in water.

Now you fellows here, the Commission has got one of the greatest problems or perhaps the greatest problem that you have ever had confront you against you right today and God be with you. We all trust you and we know that out of this Commission here will come something that will go down in history as the solving of one of the greatest problems we have had. I thank you.

MR. SMITH: Thank you very much, Mr. Toner. At this time I would like very much to hear from Senator Lou Williams, Montrose County--former County Commissioner as well as State Senator. He is very much interested in Colorado water. Senator Williams.

MR. D. L. WILLIAMS, NORWOOD, COLORADO: Mr. Smith, the Commission, gentlemen: I don't believe that anything that I can say can add anything to what has already been said. I doubt if anything has been brought out here that the Commission didn't already know, and I prefer to just stop there and let them go ahead at whatever they are doing. I believe they know everything that has been brought out.

I come from the River Basin over there, the only one in the Colorado River Basin, I believe, that hasn't had a survey, the San Miguel River Basin. We are in need of quite a bit of development there but it is very small in comparison with a lot of the other developments, and there isn't much you can talk about in the San Miguel area until there has been a basin report made on that river. That is all I have got to say.

MR. SMITH: Thank you, Mr. Williams. We have with us Mr. Sundquist, the manager of the Grand Valley Reclamation Project. I wish you would come up here and tell us how this Commission should divide this water among the four states.

MR. T. L. SUNDQUIST, BUREAU OF RECLAMATION, GRAND JUNCTION, COLORADO: If I could I would be glad to tell them.

MR. SMITH: That is fine. You go ahead.

MR. SUNDQUIST: I haven't anything particular to say. I haven't studied this too much. I can kind of compare my job with the job you gentlemen on the Commission have. We happen to carry water for three or four projects through our canal, and I know when the water is scarce how each project thinks they ought to have so much water. What a job you fellows are going to have in allotting this water to the various states!

Mr. Smith said he could step across the Colorado without getting his feet too wet. I think this summer for about a month you could have sat on the apron of our diversion dam and taken a sunbath without getting wet at all. At times we are pretty short of water.

I can see the importance of allotting this water and the importance

of knowing how much water we need for the projects we have already. When the years are dry our farms are dry and demand more water, they need more water. I have nothing further that I can give.

MR. SMITH: Thank you, Mr. Sundquist. I think said just the right thing because I was next going to call on Charlie Beise. Charlie Beise is the attorney for the Arkansas Diversion Project and I wanted him to hear what you said about that dry river before I called on him. Charlie, can we hear from you? Mr. Charles Beise, attorney for what?--the Arkansas Transmountain Diversion?

MR. CHARLES J. BEISE, DENVER, COLORADO: You name it, Silmon. It is a long-winded name. The name is Water Development Association of Southeastern Colorado--not that that means anything because there isn't too much in a name. I might give you a little bit of an idea of what that project is all about. You see the name in the paper, Gunnison-Arkansas, frequently, and I think maybe it wouldn't be amiss to give the Commission and yourself just a little idea of what we are trying to accomplish.

The association for which I am attorney represents the water users between Leadville and the Kansas Line on the Arkansas River. The proposed project if constructed to the scope and size of the report released by Region 7 to date would mean it was about three times the size of the Big Thompson, roughly twice the size of Denver, perhaps half again the size of the Central Utah, three times as big as the San Juan-Chama. It is roughly 900,000 acre feet of water. That goes into an area in which there is now irrigated in excess of 300,000 acres of irrigated land, one of the richest farming sections--I won't get in an argument with John Dille--but it is one of the richest farming sections of the State of Colorado in which there are critical shortages of water for irrigation.

In that same valley are the second and third largest cities in the State, Pueblo and Colorado Springs. Colorado Springs may potentially get water, possibly, from the City of Denver's project. But Pueblo at times in years past has gotten down as low as a 24-hour water supply. They are in desperate need of water and there remains no water to be developed on the Eastern slope. So this association represents the attempt to encourage the investigation of that project.

Mr. Ben Powell here is the man who has charge of that work on the Eastern slope, and Cliff Jex has been doing the work on the Western slope for Mr. Larson.

Aside from that I think I have a little bit unique position here, Mr. Smith, in that I cu' my teeth over in the San Juan. My position was attorney for the Pine River, Mancos and La Plata projects. Then I was with Stu McMaster over in Salt Lake City four years and he taught me what I know about the Government's position in these matters. Now you see I am on the Eastern slope and probably Bob Rockwell will tell you I am a little bit out of line.

MR. ROCKWELL: I do.

MR. BEISE: Yes, sir. Then I heard Taylor's position and it is hard for him to take any other position. So I see this thing in a number of different lights. I see them from the Western slope viewpoint. The Eastern slope wants your water; you want to protect ample water for your now need and what you think you are going to need in the future.

That future equation--I wasn't here this morning to hear any

discussions but it all seems to me that the uses of water are pretty well established. If there are future developments on the Western slope beyond what can be now seen, the same thing is true of the Eastern slope. If there is going to be a future need on the Eastern slope that we don't know about, there will also be on the Western slope, but we are anxious to speed the work of your Commiscion.

I think that the only comment I can make in passing that would be of any assistance is that in the Colorado River report itself, while it was none of the immediate worries of this Commission as such, transmountain projects seem to be neither visionary nor factual in that report. I think your Commission here, you men, should take into consideration that probably the largest projects in all of the states of the Upper Basin will be transmountain or transbasin or some other type of project taking water out of the watershed. I think that is true in Utah, Arizona, New Mexico, and Colorado, and I think it is, Mr. Bishop, probably in Wyoming even.

So you do have a difficult problem, indeed, and you must consider not just the Basin itself but the states as a whole. You probably are going to have to take a semi-judicial attitude and not the attitude of an advocate before you men are able to agree between yourselves on any semblance of a decree in one sense that can be entered for the use of water.

I am sure all people here wish you every success and I am sure they are all willing to cooperate in any way possible. Thank you very kindly.

MR. SMITH: Thank you, Mr. Beise. If you hadn't told us how many times you had been fired we never would have known part of it. The way he speaks about 900,000 acre feet of water so casually I think we should get back from fancy to fact and I am going to call on Mr. John Heuschkel, who lives on the River. Mr. Heuschkel is a member of the Colorado River Water Conservation District, a former County Commissioner, and for many, many years interested in the water of the Colorado.

MR. JOHN HEUSCHKEL, GLENWOOD SPRINGS, COLORADO: Mr. Chairman, Gentlemen of the Commission, as I understand this it is the division of water among the Upper Basin States. And I feel--I wish to state that--that each state should contribute their fair share towards the water furnished to the Lower Basin States in its division.

I came into Western Colorado, or my folks brought me here, almost 59 years ago in a basket, before the railroad. I made my home here in Western Colorado, and all I have heard and a big part of what I have tried to do is protect the use of water.

One thing we mustn't overlook: There is going to be a lot of individual development along the rivers and creeks in Western Colorado and I think those should come first. While the reclamation projects are a wonderful thing and are going to be a great thing, but the number that are listed in the report --I wonder sometimes where all the water is coming from. I think that is going to be our greatest problem, to find water for all these projects.

There is a good deal of lost water through seepage in the different rivers and sometimes there will be projects, probably, to take care of that. Another thing, there is a good deal of water wasted through all of our states which will have to be overcome. But I do believe that the individual development should be protected first and then the reclamation projects as they come in the various states should be taken care of. I think need and demand possibly should govern a great deal of that.

I don't know as I have a lot more to say, only I know you gentlemen have a real job on your hands and you have my sympathy. Thank you.

MR. SMITH: Thank you, Mr. Heuschkel. Mr. Commissioner, I would like to make a short explanation. Judge Paul Littler, Judge of the Seventh Judicial District, who is with us and came in only a few moments ago--may I explain, Judge Littler, that we are endeavoring to be of assistance from the standpoint of Colorado in this Colorado hearing on the division of the Colorado River between the four Upper States and that portion of Arizona coming within the Upper Basin. Judge Littler has been familiar with water matters in Colorado for many years, a keen student of water. I hope you will be able to give the Commission some suggestions, Judge Littler, that will be helpful to them. This is one of the few times I can tell the Judge what I want him to do and get the best of it.

JUDGE PAUL L. LITTLER, GRAND JUNCTION, COLORADO: Mr. Smith, I have lived in Colorado most of my life and have been more or less interested in farming and irrigation. I didn't expect to be called on here. I haven't anything particular to add except what we all know, that water is the life of our country and Colorado produces much of that vater.

We in Colorado feel that we have some priority in our claims, while we also realize that all of the states below likevise depend upon that water and we must be broadminded enough to share that water with the Lower States. We feel that all vator should be put to beneficial use so far as possible and no water that can be put to beneficial use should be allowed to go to waste. I think that will be agreed on by everyone. I assume that it is the problem for the gentlemen here to provide some equitable apportionment between the states which can use the water from these streams.

There is a great acreage in Colorado that is not irrigated that is subject to irrigation by irrigation projects and developments, and we believe that we should look somewhat to the future and allot a certain portion of the water to future development. Thank you.

MR. SMITH: Thank you. Now I am about to give up this job as moderator but before doing so, is there anyone here from Colorado, East, West, or otherwise, who has not had the opportunity to express himself? (No response.) Mrs. Wakefield, would you care to make a talk to this Commission? You have listened very diligently.

MRS. WAKEFIELD: I came only to listen and to learn.

MR. SMITH: Is there anyone that I have overlooked? (No response.) Judge Stone, I have the honor to turn the meeting back to you.

COM. STONE: Silmon, I first wish to express on behalf of the Commission our appreciation of the manner in which you have handled the presentation for Colorado and also to express to all who have spoken our appreciation of those statements. As was said in the beginning, it is the effort of the Commission at these open hearings to ascertain the views of the people within the five states--in this case it is the four states since we are holding no meeting in Arizona--with respect to matters which have to do with the making of a compact. As I sat here listening to your words of sympathy for the Commission and the job we have to do, I became somewhat apprehensive, and yet I believe that we shall be able to do a job--at least we are willing to attempt it.

At the Rock Springs meeting it appeared to me that one of the most helpful presentations, helpful I am sure to those who came to the meeting, was

the explanation of the work of the special Engineer Committee. That Committee is made up of representatives appointed by the Commission and the Federal Representative, Mr. Bashore. The Chairman of that Committee is J. R. Riter.

I should think, Mr. Chairman, it would be appropriate at this time to call on Mr. Riter for an explanation of the task which that Committee is attempting and the manner in which the work is being done, and if that is agreeable, Mr. Chairman, I should like to have Mr. Riter do that at this time.

MR. J. R. RITER, BUREAU OF RECLAMATION, DENVER, COLORADO: Mr. Chairman, ladies and gentlemen: The Engineer Committee was appointed by the Compact Commission and we work under their direction. As has been explained, a representative from each of the states met in Cheyenne, Wyoming, late in August and worked up a program of work to be performed and then our report was presented at the last meeting of the Commission, which was held at Santa Fe on September 17. The Commission adopted the report and told us to get to work.

You might be interested in some of the members who are on that committee. Representing the Federal Government as the adviser to the Federal Representative of the Compact Commission, I was appointed to be his adviser and the Committee saw fit to ask me to be Chairman of the Engineer Committee. The member from Arizona is R. Gail Baker. Mr. Baker is not present today. Mr. Baker is of the staff of the State Land and Water Commissioner of Arizona.

From Colorado, your Commissioner felt that due to the vast interest which Colorado has in the development of the water resources of this state Colorado should have three engineering members and these are: Mr. C. L. Patterson, who is Chief Engineer of the Colorado Water Conservation Board; Mr. R. J. Tipton, who is a consultant for the Colorado Water Conservation Board; and Mr. F. C. Merriell, who is Secretary-Manager of your Colorado River Water Conservation District, who lives in Grand Junction and who in my opinion has more intimate knowledge of the Colorado River than any one of us, that is, from the standpoint of Colorado.

From New Mexico the engineer is John H. Bliss, who is the engineer adviser to the Interstate Streams Commission.

From Utah the member of the Committee is Fred Cottrell, Deputy State Engineer.

From Wyoming is Mr. H. T. Person. Mr. Person during nine months of the year teaches school at the University of Wyoming. He is also consultant for the Wyoming Compact Commission.

Now we don't limit ourselves to these members. There are other people working with us. For example, in the Denver office of the Bureau of Reclamation pursuant to instructions from our Commissioner, we have one engineer full time and then we have as many assistants as he can use officially. Our Regional Office at Salt Lake City, which has charge of planning and investigations in the Upper Colorado River Basin, has assigned some of their men to work with us on this problem. Through the cooperation of the Salt Lake City Office we also draw upon the services and experience and the records of Mr. Jex, who is located at Grand Junction; Mr. Heiderman, who is located at Durango; Mr. DeLong, who has offices at Kemmerer, Wyoming; and such other help as they are able to give us.

There is present with us today Mr. Jarvis, who has been employed by the State of Utah to assist in carrying out the studies, and there are other engineers assigned by the states as they can make their services available to us. Now so much for the personnel.

One of the first studies to be undertaken is to determine the origin of the water by states. The Engineer Committee felt and the Commission agreed that before the Commission could start dividing up water they must first have factual information on the water that is available and where it comes from.

There have been several discussions here today about the work of the Commission which negotiated the Santa Fe Compact about 1922 and it was stated that they were hampered by lack of records. As a result of the work of that Commission, many key gauging stations have been established on the Colorado River. For example, records were initiated at Lee Ferry on the Colorado River, which is the point of division between the Upper Basin and Lower Basin, in 1922, and those records have been collected continuously since that date.

As a minor detail you might be interested to know that the gauge itself is called Lee's Ferry, which is above the mouth of the Paria River, and then there is also a gauge at the mouth of the Paria River. To determine the flow at the Compact point called Lee Ferry we have to add the discharge record of the Colorado River at Lee's Ferry with the discharge of the Paria River.

The gauging stations have been maintained for a number of years by the Geological Survey at certain key points along the Colorado River and its tributaries. For example, we have a long record of the Green River at Green River, Wyoming, which goes back to the beginning of the century. We have a record on the Green River near the Green River, Utah State Line, which does not extend back quite as far as the Green River, Wyoming record does, but there is a fairly long record there. There is a long record at Green River, Utah, which is near the mouth of the Green River.

The Yampa River, which is one of the principal tributaries of the Green River, which drains a large proportion of Colorado and also some area in Wyoming, has been measured for a good many years.

We have the record on the Colorado River at Grand Junction, that is, near Grand Junction, since sometime in 1890 as I recall--it is about 1895. Of course that measures runoff from the Colorado River which is entirely a Colorado stream at that point.

We also have records of the Gunnison River near Grand Junction for a long period of time. We have a record down at Cisco, Utah, which is one of the key stations on the Colorado River, which has been maintained since about 1922, with several scattered years of earlier record.

On the San Juan, which is a very important stream both from the standpoint of Colorado and New Mexico, we have records, not continuously, however, except in recent years, at Farmington, at Shiprock, and at Bluff.

There are in addition to the main stem stations, so-called key stations, records of varying lengths of time on the tributaries of the Colorado, the Green, and the San Juan.

It seems in more recent years since the states have been thinking about compacting and looking forward to compacting, effort has been made to establish gauging stations near the State Lines. Apparently the States had in mind at sometime a compact would be formulated and as a basis of that compact they wanted to ascertain the runoff from each of the states. However, there are still a large number of important tributaries which are not gauged.

For example, some of the southern tributaries of the San Juan River which drain from New Mexico into the San Juan have not been measured. Many of the tributaries which enter the Green River and the Colorado River from Utah have not been measured. So our job then of determining the origin of water involves a number of studies.

In the first place, we will have to assemble and tabulate all the available discharge records at key gauging stations and on the tributaries near the State Lines. Then the next job will be to extend those records by estimates, that is, we will have to compare them with other stations which have a longer period of record and prepare an estimate.

As has been explained here today, the River is not a constant stream. It does not run the same year in and year out. Some years when we have had high floods we have had as much as 25,000,000 acre feet down at this point of Lee Ferry, which is the outlet of the Basin. And then as has also been pointed out, there have been years when it drops down to less than one-fifth, in other words, less than 5,000,000 acre feet in one year. Therefore, to get a representative sample, we desire to base our study on as long a period as is possible to do so. We are attempting to extend all records back to about 1914.

In the Bureau of Reclamation report which you people have discussed and will have opportunity to discuss and submit your comments on, we attempted to extend the Lee's Ferry record back to 1897. But after examining the records that are available, we felt if we could extend them back to 1914 we could get a fairly reliable period of study. That will be a long-time period. That will be over thirty years, and generally speaking we feel we can make fairly reliable estimates back for that period of time.

Then after we have extended the records at the gauging stations we have, it will then be necessary to make estimates for the unmeasured tributaries. While we don't know precisely how much came from each individual tributary in Utah, we do have records on the main stem above those tributaries and we also have records at Lee's Ferry. Making use of those control points and comparing records at the tributary gauging stations and at Lee's Ferry, it will be possible to have some measure of control on the estimate.

In making those estimates we are planning to attack the problem from a number of approaches. We know basically the runoff originates from rainfall. We are compiling all of the rainfall records available within the Basin and will attempt to find a relationship between rainfall and runoff, or an indication of a relationship. Mr. Jarvis, who has been working in Utah where that problem is particularly acute, has developed some preliminary relationships which indicate that there is an indication. That is one approach.

Another approach, we will attempt to estimate the runoff from the unmeasured tributaries by comparing with other tributaries which are measured, and we will attempt to compare the physical characteristics of the two watersheds.

Then after we have the records built up as to the amount of water there historically, we will have to correct that to determine the amount of water that would have been there before irrigation development was made. In other words, we do know from experience that as you irrigate land, regardless of where it is in the Basin, part of the water that is used to grow those crops is consumed, is used up consumptively by transpiration losses from the plants.

The Bureau of Reclamation in our studies for the purposes of that Colorado River Basin Report has made some estimates of what the present and past uses have been. That is an estimate which is based on the opinion of the Bureau

which is based on our judgment and our observations from carrying other similar projects. The Committee before they adopt that, if they adopt it, wish to investigate further the method used by the Bureau in determining present uses and past uses.

Once we have agreed among ourselves on what we will use we will then apply those past uses to the historical flows and determine how much water on the average and by years flows past, for example, the Colorado-Wyoming Line; how much discharge past the Wyoming-Utah Line; and how much water came out of Colorado into Utah and into New Mexico at the State Line, and also the amount of water that originated in New Mexico and the amount of water that originated in Utah.

After we have determined that we still haven't completed our job because we know, for example, that if a certain quantity of water should be in the stream at the Wyoming-Utah Line, that all of that water will not get down to Lee Ferry. We know that there are heavy losses on those stream channels due to evaporation, due to consumptive use of vegetation growing along those streams--I think those are the principal sources of losses. During times of flood also we have reason to believe that some of the water will be entrapped in channels or some of it will sink into the ground and then after the flood has receded and the streams come down to a low level, some of that water will not return and be evaporated from the ground.

Work has been under way on these studies following the Santa Fe meeting when we received the assignment from the Commission to go ahead. We arranged a meeting in Denver early in October and divided up the work. The job of determining the runoff at the respective State Lines was assigned to the representative of each of the states. We thought that would be the best and fairest way to arrive at that, with all the work to be reviewed, of course, by the Committee as a whole.

There is one job that we have not yet assigned which involves a study which must be made. Reference has been made here, and it has been emphasized in this meeting, about the necessity of meeting our obligation at Lee Ferry under the Compact and Mexican Treaty. As I recall the obligation under the Compact requires 75,000,000 acre feet in any ten-year period of consecutive years to discharge at Lee Ferry. How much of the obligation the Upper Basin will have to bear in connection with the Mexican Treaty I don't think we know precisely, but we recognize the possibility that additional water may have to be released. That is a matter we will have to study and determine.

But in any event, the point I am trying to make is this: On the long-time average nearly as we can estimate at this time, approximately 16,000,000 acre feet on the average pass Lee Ferry under virgin flow conditions, that is, 16,000,000 acre feet before any depletion was made in the Upper Basin. We know we have depleted the stream flow to a certain extent as of present day conditions. So that under present day conditions, the long-time average probably would be in the neighborhood of 14,000,000 acre feet.

In a series of years such as we have actually experienced from 1931 to 1940, inclusive, there was only 10,000,000 acre feet at Lee Ferry--that is an average, a rounded figure. Well, now, 10,000,000 acre feet recorded flow, say we are using 2,000,000 of it now, that represents what is left after using 2,000,000; and then if we have to pass away 8,000,000 down the River to meet the requirements in the Lower Basin and the Mexican Treaty, it doesn't leave us much water because that is all the water we had.

To my mind it doesn't seem fair that the Upper Basin would be restricted to the amount of water we can get in that ten-year period without regulation. I believe that all states will agree that in order for the Upper Basin to meet its obligation at Lee Ferry and still have for its use 7,500,000 acre feet annually, there must be huge reservoirs constructed on the main stem and a number of those have been investigated and shown in the Bureau's report. The primary function of those reservoirs will be to impound excess water in years of high runoff and hold it over for release during periods of low flow such as 1931 to 1940.

We also know that the minute you construct reservoirs there is going to be a heavy toll on that water due to evaporation losses. So the Committee has undertaken the job of conducting a reservoir study of the main stem holdover reservoirs to determine the extent to which we feel, from an engineering viewpoint, it would be practicable to construct holdover storage and utilize it for the purpose of permitting use of the water in the Upper Basin and still meet the obligation at Lee Ferry.

Work is under way on these studies. We had a meeting Friday of last week in Denver at which progress was reported. Additional assignments were made and some of the studies that had been completed were passed out for each of the Commissioners to review and then we will meet again on the 21st of November in Denver to again check up the status.

I can't predict the time limit on this work. I attempted to do it at Santa Fe, but after all we have got to be fair and we have got to consider the viewpoints of everybody. All states are represented. And while it is true that we are working with facts, some of those facts are measured but some of them we have to apply judgment. We have to draw upon the experience of the engineers. And we find that in this group of eight engineers plus the helpers that we have, our judgments don't always jive. There aren't serious conflicts because we do have actual measurements to tie us down, so we don't go far afield. Nevertheless it is our intention and it is our aim and desire to give the Commission the very best facts and as a result the very best engineering judgment we can in carrying forward these studies.

COM. STONE: Thank you, Mr. Riter. I believe that is a very good explanation of the task which the Engineer Committee has on its hands. These Commissioners are indeed fortunate in having men capable of doing this work and of conducting the study for the advice of the Commission. We only hope as Commissioners that they will agree quite largely so we won't have much to quarrel about so far as the facts are concerned.

Mr. Chairman, it would seem to me at this time quite appropriate to call on the Commissioners from the other states for such statements or remarks as they care to make. May I first call upon Mr. McClure, the Commissioner for New Mexico?

COM. McCLURE: Judge Stone, you gave a very detailed analysis of what we hope to accomplish and I don't know that I can extend it any or add to it. I know the importance of the job that we have to do and I also realize that the time element is imperative and I think the other Commissioners feel the same way. However, we do have to approach this problem cautiously. There are worlds of complications to it.

We have to keep in mind that projects will be brought forward in years to come after we have passed the present phase of development on the River, of the feasible and easy to construct projects. Any compact that is negotiated, ratified by the legislatures, and approved by Congress will become the law of the land and presumably will be an agreement in perpetuity. I don't believe

any of us have any crystal ball gazing facilities so we can look into the future with any degree of certainty. We can only review the past, and be guided by experience.

There were statements made back in the early days when we first made surveys on this river predicting that anybody who took a look at it would forget it and have nothing to do with it. Well, of course time proved that statement extremely false.

It is a big job, and, as I say, we must approach it cautiously if we plan to take care of the states in their present, prospective and future uses. It's a problem that must be given full consideration and long consideration as I see it.

I don't believe there is anything else that I can add to what Judge Stone said this morning. We realize the problems that we have and it is in meetings like this that we get what you might call a ditch-bank view of the line of thought the people who are the actual users have in mind, so that in our deliberations we can keep those facts and problems in mind.

COM. STONE: Mr. Charles Carson, Commissioner for Arizona.

COM. CARSON: Judge Stone, gentlemen, I think we realize the seriousness of the task we are undertaking and the responsibility which rests on us. As I see it, the Colorado River Compact did divide the water between the Upper and the Lower Basins, and all of us desire to live up to in all respects and respect the Colorado River Compact, but that Compact did not undertake to divide the water between the states of the Upper Basin nor between the states of the Lower Basin. However, through the years by a series of acts of Congress and the California Limitation Act and contracts, the water allocated to the Lower Basin has in my judgment been effectively divided as between the states of the Lower Basin. That leaves then this task which this Commission undertakes to apportion the water between the states of the Upper Basin.

The Upper Basin, of course, has not used its apportionment or anywhere near used its apportionment. I would like to emphasize that the Upper Basin States altogether have now used somewhere in the neighborhood of 2,000,000 to 2,500,000 acre feet of the apportionment to them of 7,500,000 acre feet. So that when and if apportionments are completed between the Upper Basin States and projects developed, we of the Upper Basin--and we are part of the Upper Basin in Arizona, a small part of Arizona is in the Upper Basin---can look to an expansion of use in the Upper Basin of probably three times the present use.

Now taking the Basin as a whole, it is one area, interrelated, and what is good for part of it is good for all. If we can work out fairly this Upper Basin Compact so that the development of the use of water in the Upper Basin as well as in the Lower Basin will go forward, this area of the Colorado River Basin can use, as I say, nearly three times the water it is now using and support three times the population and three times the wealth. We can bring it about if we work together and that is the spirit with which this Commission is going to work, trying to work together for the benefit of all to apportion water equitably and fairly with injury to none and benefit to all.

COM. STONE: Mr. L. C. Bishop, Commissioner for Wyoming.

COM. BISHOP: Mr. Chairman, Judge Stone, I prepared my statement and had it written so I won't have to ramble around so much.

To date Wyoming has received no allocation for construction of irrigation works in the Colorado River Basin. We have only received a minor portion of our share of investigational work by the U. S. Bureau of Reclamation. We are on record as advocating the stoppage of all construction work in the Upper Colorado River Basin until a compact is agreed upon for division of the 7,500,000 acre feet of water allocated by the Colorado River Compact to the states of the Upper Basin. We have reason to believe that the percentages of water produced by each state as being compiled by our engineering committee is not a fair basis for equitable division of the water and of consequence we favor division of the water by this Commission with the factual information contained in the Colorado River Report of the U. S. Bureau of Reclamation and other available information. We object to states with much larger congressional delegations than we have securing allocation of funds and with these funds building projects that use water for which they establish a priority by use. This plan, if continued, will result in our State receiving no water at all.

Being located on the extreme headwaters of a principal tributary of the Colorado River we have priority of position but we know how the courts rule on prior use as against position and we are quite anxious to establish a priority by compact to use our share of this water at such time as we can secure funds to build the projects.

In all, we have more than a million acres of irrigable lands in the Colorado River Basin in Wyoming and about half of it is suitable for development. If potential development is used as a basis for the division of the water we should have more water than it is physically possible for us to use. We are not going to be unreasonable in our demands for water and we do hope the other states will also be reasonable and that this Commission can complete the negotiations within a reasonable time. Under our Constitution we are entitled to all the water within our borders but we are willing to divide with our neighbors on an equitable basis.

Frankly, we are deeply concerned about the large transmountain diversions being built in Colorado and proposed in Utah. We propose some in Wyoming but are very willing to agree to discontinue their use in case of a shortage at Lee Ferry. I believe Colorado has agreed to this with the people of the Western slope in that state and in the legislation authorizing and making appropriation of funds for construction of these transmountain projects. If the other states will subscribe to such a proposition I predict that there will never be a call for other water to supply any of the obligations of the Upper Basin States at Lee Ferry.

According to tree ring studies made on the entire Colorado River watershed by the University of Arizona the Green River Basin in Wyoming is the only part of the entire Colorado River watershed that has not experienced an exceptional drouth in the past 400 years. We do not intend to assume any obligation for delivery of water at Lee Ferry that we cannot meet under any and all conditions.

In conclusion, we sincerely urge this Commission to complete these negotiations at the earliest possible date in order that the compact may be placed before the legislatures of our respective states at the 1947 regular session.

Thank you, Judge Stone.

COM. STONE: Mr. Ed. Watson, Commissioner for Utah.

COM. WATSON: Mr. Chairman, ladies and gentlemen, it is with a sense of responsibility that I assume the burden to do my share in serving on this

Commission. I realize that the job will be long and that it will make decisions that will last for many years.

I am particularly impressed, however, with the caliber of men that I have been asked to work with, both the Commissioners and the advisers. I am pleased with the corps of experts that have been assembled to analyze the engineering data. I believe that we cannot go far afield with such men at the helm.

I am impressed with the fairness of expression of many of the individuals here this day at this hearing, and feel that there has been present the real true spirit of democracy that we think we have. I believe that in the long run we must arrive at a conclusion that will give each state a fair opportunity to develop itself. In other words, as one of our exponents of the Colorado River has said, ". . .to develop the River concurrently as far as each state is concerned." I believe that justice will be meted out by that method.

I realize also that the compact that will be entered into will supersede all state laws. It will be of the order of a treaty, which is the supreme law of the land.

I feel that much has been said here to enlighten the Commission and much has been expounded by experts to inform the water users. I feel that we have a big job before us and that we will all work constantly and assiduously to perform it.

COM. STONE: I appreciate the remarks of my brother Commissioners. This presentation constitutes the program except I feel that in all fairness to our Colorado people I should explain that at Rock Springs, Wyoming, I, as Colorado Commissioner, took the position that none of us know at this time how long it is going to take to consummate a compact. It is the desire and intention, I am sure, to expedite the work and to accomplish the job as soon as it can be done under all the circumstances. And in that effort, Colorado, I am sure, will not shirk its duty because we realize as well as anyone else that we shall all be in a better position to accomplish the development in our respective states when each state knows the size of the block of water which we have to deal with in the future.

However, I am firmly convinced that none of us should take the position that no development of any kind can proceed within the Colorado River Basin until we arrive at a compact. If we do that we are going to stalemate unnecessarily Upper Colorado River Basin development and we know that in the past the Lower Basin has gone forward much faster than the Upper Basin.

Our Colorado representatives have attempted to express here the idea, and as Colorado Commissioner I appreciate it, that we want to be fair and recognize the rights and the interests in all of the other states, but it goes even farther than that. We must recognize a solidarity among these Upper Basin States. We must recognize a common interest. We must fully appreciate that only insofar as we can act as a unit may we do the best job in providing for the effective utilization of that share of Colorado River water which has been apportioned by the Colorado River states to the Upper Colorado River Basin.

We in Colorado do have some projects under construction. We have other projects authorized for construction. None of those projects, in my judgment or by any possible stretch of the imagination, can exceed what will prove to be Colorado's equitable share of the water.

As an example, in this very area where we are now meeting today we have an authorized project known as the Paonia Project, storing 18,000 acre feet of water. When you consider that Colorado produces 11,700,000 acre feet of water and that we are now utilizing only approximately 1,500,000 acre feet of that water, that little Paonia Project is not going to hurt anyone and I can't see any reason why the position should be taken by anyone that that project should be put on the shelf until we arrive at a compact.

And I want to say to the other Commissioners and do it frankly in the spirit of cooperation that the threat or proposal for stopping of development is not going to bring about our agreeing on a compact. We are not going to agree on that basis. We are going to agree on the basis of what is fair and right and what constitutes in our judgment an equitable apportionment, and we are going to be willing to recognize the rights and interests of other states.

When we have completed in this state every project which is either authorized or under construction we shall be using then only about 1,700,000 acre feet of the 11,700,000 acre feet that this state produces. We know, too, that the amount of water produced by a state is not the sole criterion or factor in determining a state's equitable apportionment. That is only one factor. There are many factors.

It seems to me that we must proceed here on the basis of arriving at a compact at the earliest possible date consistent with all of the--you might say--difficulties that are ahead of us. We must attempt to surmount those difficulties. I think that nothing would please the Lower Basin--and I am not referring to Arizona--any more than for us to say to the Congress and to the Lower Basin that we do not propose to do anything in the Upper Basin until we arrive at a compact.

I should like also to get in the record again that the report of the Bureau of Reclamation did not place a stop order on the development within the Colorado River Basin. It said that any development during the time that a compact was being made must be clearly within what would prove to be a state's share of the water.

It is also true that very many projects which will require a large amount of Colorado River water are under investigation. Obviously with respect to large projects which would divert a large amount of water, we must await the time until we do have a compact because they might well exceed the state's share of the water.

I have always been impressed that if there is one thing which we should do in the Colorado River Basin that is to recognize the many small projects and get them built as soon as possible. I had the privilege as I have often had, and also the pleasure, of working with Senator O'Mahoney of Wyoming in urging appropriations for project development. Just this last spring we found that he had a project in his own state in the Colorado River Basin which was in the same category as one in Colorado. His project was the Eden Project; ours was the Mancos Project. Both of them were under construction, construction which was delayed during the war. Those appropriations are now available subject to the Executive Order of the President.

I certainly do not want to see the Eden Project put on the shelf with an appropriation available to complete it; neither do I want to see our project put on the shelf with an appropriation available to complete it. If those little projects are going to interfere with Wyoming's share or Colorado's share of the water, then we are a long ways from the right attitude if we are to consummate a compact. We cannot afford to pull the curtain down on Colorado River

development where such development is clearly within a state's share of water.

If we knew that we could arrive at a compact this fall or next summer it might be different. I hope we can and I pledge myself to work toward the earliest possible date of completion of such a compact. But we are looking into the crystal ball, certainly, if we say that we are going to accomplish something immediately. All we can do is to express the desire and work toward that end and do it conscientiously and that Colorado will do.

Mr. Chairman, I thought that ought to be said in fairness to the position which I took at Rock Springs, Wyoming, and in order that our people may be informed of that situation. Unless there is someone else from Colorado, and Mr. Smith has asked if there are others who have anything to say respecting this matter, we now turn the meeting back to you.

COM. BISHOP: Judge Stone, could I have just a word at this point? You may be right in all you say and still the fact remains that Wyoming produces 1,700,000 acre feet per year and has got nothing.

COM. STONE: Whenever you have a project, Mr. Bishop, we are going to be behind you to get it.

COM. BISHOP: I am not saying you won't.

COM. STONE: It is my guess that every project that you have mentioned can be built and still be within your share of the water. But we don't feel that it is approaching this problem on the right basis to pull down the curtain on every project, particularly if a project is clearly within a state's share of the water.

COM. BISHOP: You know quite well, Judge, our position isn't going to stop the projects.

COM. CARSON: Mr. Chairman, may I say just one other word? I thought I understood here this morning that there might have been some misapprehension that any compact made would override state water law or would affect state water law.

I think it is clear in all our minds that any compact made if one is made by this Commission would merely apportion to the states specific quantities of water, and that the administration of that water and the water rights and the priority of those rights would then be determined by the respective state laws. So that nothing this Commission can do will at all disturb the respective water laws of the respective states.

Then I want to say further that I agree with Judge Stone that if any projects are clearly within the prospective share of water to be apportioned to any one state, they should not be stopped and should proceed. And I say that for this further reason, that it seems to me that the chance for the development of the Colorado River Basin and appropriations and authorizations by Congress is now, and we don't know whether or not that condition will continue.

COM. WATSON: I should like to announce to those present here that the hearing to be held in Price tomorrow at two p.m. will be held as scheduled and those who desire hotel accommodations for that tomorrow night may have them at the Mission Auto Courts.

THE CHAIRMAN: Gentlemen, some of you may have the notion that the

work of this Commission is all engineering work. So far not much has been said about the legal end of this work. But as you will observe, we have two lawyers on the Commission and four engineers including the Federal Representative, and so far as conversation is concerned, I think it just takes about that much to balance it. (Laughter.)

Don't be uneasy. We will have our lawyers at work we hope soon to use the proper words to make this compact understandable or otherwise.

We have a gentleman with us today who attends all these water meetings; in fact, he has been attending water meetings since some of us were boys. He is a retired, successful businessman. I will not make the mistake of saying that he is from Salt Lake City and subject myself to a verbal chastisement like I did in the case of Judge Stone, but will say that he is the foremost conservationist in the West and has been preaching the value of water for Western development regardless of whether it is in the State of Utah or in any state.

I now call on the Honorable William Wallace to give us a few words. Mr. Wallace has all these years of experience but he still does not live in the past but in the present and in the future. Mr. Wallace. (Applause.)

MR. WILLIAM R. WALLACE, SALT LAKE CITY, UTAH: I like that phrase, "in the future."

Mr. Chairman, ladies and gentlemen, I would like to make just one or two remarks and one of them is that all of this water is in the United States of America.

In my opinion we can agree upon a division of this water now for submission to the next session of the legislature upon a basis in which no state will be seriously hurt and certainly upon the basis that all of it will be used in the United States of America.

Thank you very much, Chairman Bashore. (Applause.)

THE CHAIRMAN: Do any of the Commissioners have any further business which should be transacted at this time? The Chair feels that before we finally disperse at Farmington the Commission should go into executive session on some matters and you will please bear that in mind.

Mr. Carson, do you have any further business for the Commission's consideration?

COM. CARSON: No, sir.

THE CHAIRMAN: Mr. McClure?

COM. McCLURE: No, sir.

THE CHAIRMAN: Mr. Bishop?

COM. BISHOP: Nothing.

THE CHAIRMAN: Mr. Watson?

COM. WATSON: No.

THE CHAIRMAN: Judge Stone?

COM. STONE: Nothing, unless--I think we ought to inquire of our

moderator whether he has anything further.

MR. SMITH: No.

COM. STONE: Frank Merriell?

MR. MERRIELL: No.

THE CHAIRMAN: The Chair neglected to thank you, Judge Stone, and you, Mr. Smith, for your masterly conduct of this meeting and to thank all of you who have attended this meeting and participated in the discussion and those of you who have only come here to listen.

MR. SMITH: Might we introduce the three gentlemen who just came in so everyone will know them?

THE CHAIRMAN: Yes, indeed.

MR. SMITH: If I may have the privilege, Mr. R. J. Tipton, Consulting Engineer of the Colorado Water Conservation Board and practicing engineer.

I have only known this boy since he was born--Mr. Carl M. Bennett, City Engineer of Grand Junction.

And Mr. Herbert Fritz, City Manager of the City of Grand Junction. Thank you.

COM. STONE: I think we ought to hear from Mr. Fritz before we get through.

THE CHAIRMAN: Mr. Fritz, would you like to make a few remarks for the benefit of the Commission?

MR. HERBERT W. FRITZ, GRAND JUNCTION, COLORADO: It was somewhat less than a year ago, Commissioner and friends, my friend Silmon Smith made a facetious remark about my coming from the Middle West where the per capita consumption of water is more than it is here, and in the intervening period I have learned the wisdom if not the facetiousness of that remark. I won't say that ninety percent of our thinking is water here in Grand Junction, but a substantial percentage of it is.

We are trying to solve our local problem that conforms as completely as possible, and I would like to say completely, with the program of the Colorado Water Conversation Board, in a manner that will best serve the interests of the Grand Valley, the City of Grand Junction foremost of course, and at the same time will fit into the overall program of the Colorado River.

I have nothing to contribute to this meeting other than to say the City of Grand Junction is making every effort to fit the pattern that is being set up now and I can assure you that we will continue to work in that direction. I can say that unwittingly we selected an engineer who does take seriously those principles you people are setting up, first for the Colorado Conservation Plan, and second, for the whole Colorado River. We are happy we are able with that ground work to go on from there and plan our own work and it will tie in. We will take fullest advantage of the water used and leave enough for the fellow downstream too. We think it will work out.

THE CHAIRMAN: Off the record. (Remarks off the record.)

COM. McCLURE: Mr. Chairman, I move the Commission thank Mr. Silmon Smith and all these gentlemen who have appeared before us and the other interested parties attending this hearing.

COM. CARSON: Second the motion.

THE CHAIRMAN: Any discussion of the motion?

(The question is called for. Thereupon a vote was taken and the motion of Com. McClure carried unanimously.)

COM. BISHOP: Mr. Chairman, I move that we adjourn until two o'clock tomorrow at Price, Utah.

COM. McCLURE: Second the motion.

THE CHAIRMAN: Motion has been made and seconded--you heard the motion. Any discussion?

(Thereupon a vote was taken and the motion of Com. Bishop carried unanimously.)

(3:38 p.m., Wednesday, October 30, 1946, meeting adjourned until 2:00 p.m., Thursday, October 31, 1946, at Price, Utah.)

UPPER COLORADO RIVER BASIN COMPACT COMMISSION

Official Record of Meeting No. 3

Session Held

October 31, 1946

at

City Hall

Price

Utah

APPEARANCES
UPPER COLORADO RIVER BASIN COMPACT COMMISSION

Membership as listed at Rock Springs, Wyoming, Session (Page 1)
Chairman, Acting Secretary, and all Commissioners present.

COLORADO:

Jean S. Breitenstein	Attorney, Colorado Water Conservation Board, 718 Symes Building, Denver, Colorado.

NEW MEXICO:

Fred E. Wilson	Special Assistant Attorney General and Attorney for New Mexico Interstate Stream Commission, Albuquerque, New Mexico.

UTAH:

William R. Wallace	President, Utah Water Users Ass'n., Salt Lake City, Utah.
John A. Widtsoe	Utah Water Users Ass'n., Salt Lake City, Utah.
Thomas W. Jensen	Utah Water Users Ass'n., Mt. Pleasant, Utah.
C. S. Jarvis	C.E. with State Engineer, Salt Lake City, Utah.
Blair Richardson	Metropolitan Water Board of Salt Lake City, Salt Lake City, Utah.
Gerald Irvine	Utah Power and Light Company, Salt Lake City, Utah.
Raymond Hammond	Tooele County Water Users Ass'n., Grantsville, Utah.
J. Bracken Lee	Mayor, Price, Utah.
Wallace G. Grange	Price, Utah.
Robert Sundwall	Tribune-Telegram Publishing Co., Price, Utah.
William Campbell	Carbon County Commissioner, Price, Utah.
George M. Miller	Price, Utah.
H. F. Putnam	Price Div. Utah Coal Prod. Corp., Price, Utah.
Irvin Gerber	Price River Cons. District, Wellington, Utah.
Rex Mathis	Price River Cons. District, Price, Utah.
E. E. Peirce	Price River Cons. District, R.F.D. No. 1, Price, Utah.
Therald N. Jensen	Price River Cons. District--Carbon Water Cons. District, Price, Utah.
Wm. P. Maack	Independent Coal & Coke Co., Kenilworth, Utah.
C. E. Beveridge	Utah Railway Company, Helper, Utah.
J. A. Theobald	Secretary, Carbon County Associated Industries, Price, Utah.
Dr. F. R. King	Price, Utah.
Byron Howard	State Senator, Huntington, Utah.
Russell Allred	Cleveland Canal Company, Huntington, Utah.
L. E. Thorderson	Cleveland Canal Company, Huntington, Utah.
Bert J. Stillman	Grand County Water Users, Green River, Utah.
C. N. Wakefield	Emery County Commissioner, Huntington, Utah.

Frank Robbins	Emery County Rancher, Huntington, Utah.
E. S. Larsen	Board Member, Cotton Wood Creek Irrigation Co., Emery County, Utah.
O. W. Sitterud	Secretary, Cotton Wood Creek Irrigation Co., Orangeville, Utah.
Joseph J. Jensen	Muddy Creek, Utah.
Ervin Wimber	Emery County Commissioner, Castle Dale, Utah.
Edward G. Geery	Emery County Water Users Ass'n., Huntington, Utah.
Peter McElprang	Huntington, Utah.
Mrs. Mayme Jameson	Deseret Lake, Utah.
Frank J. Hatt	Green River, Utah.
Wilford J. Humphrey	Orangeville, Utah.
J. W. Gillman	Provo River Water Users Ass'n., Orem, Utah.
Mark Anderson	Mayor, Provo, Utah.
Elmer A. Jacob	Provo Utilities, Provo, Utah.
Vasco M. Tanner	Provo City Utilities, Provo, Utah.
Thomas H. Latimer, Jr.,	City Engineer, Provo, Utah.
J. Earl Lewis	Provo City Commissioner, Provo, Utah.
B. H. Stringham	Mayor, Vernal, Utah.
Robert F. Livsey	Deseret News, Vernal, Utah.
H. L. Allred	Roosevelt, Utah.
Francis Feltch	Vernal Lions Club, Vernal, Utah.
Alma Preece	County Commissioner, Uintah County, Utah.
Leon P. Christensen	Uintah Basin Water Users Ass'n., Vernal, Utah.
Leo Calder	State Representative, Uintah County, Vernal, Utah.
Jos. C. Price	Ashley Upper Irrigation Co., Vernal, Utah.
Ronald Preece	Rock Point Canal Company, Uintah County, Utah.
John Madsen	State Representative, Duchesne, Utah.
Mitchell Melich	State Senator, Moab, Utah.
J. F. Harrington	Moab, Utah.
M. C. Cole	Delta, Utah.
Dudley Craft	Delta, Utah.
Archie O. Gardner	Millard County Water Users Ass'n., Delta, Utah.
Harold R. Morris	Delta, Utah.
W. C. Andrews	Chairman, County Commission, Juab County, Utah.
Reeve G. Richardson	Nephi Irrigation Company, Nephi, Utah.
Tom McCoy	Municipal League, Salt Lake City, Utah.

WYOMING:

Emil C. Gradert	Compact Commissioner, Fort Bridger, Wyoming.

BUREAU OF RECLAMATION:

J. G. Will	Assistant Chief Counsel, Washington, D. C.
J. R. Riter	Chief, Hydrology Division, Denver, Colorado.
N. B. Bennett, Jr.	Branch of Project Planning, Washington, D. C.
E. O. Larson	Regional Director, Region 4, Salt Lake City, Utah.

A. A. Batson	Acting Regional Director, Region 7, Denver, Colorado.
A. N. Thompson	Assistant Regional Director, Region 5, Amarillo, Texas.
J. Stuart McMaster	Counsel, Region 4, Salt Lake City, Utah.
L. E. Mathews	Salt Lake City, Utah.

UNITED STATES GEOLOGICAL SURVEY:

M. T. Wilson	District Engineer, Salt Lake City, Utah.

SESSION AT PRICE, UTAH
THURSDAY, OCTOBER 31, 1946

The meeting was called to order by Chairman Bashore at 2:00 p.m., Thursday, October 31, 1946.

THE CHAIRMAN: The meeting will now come to order as it is two o'clock and all of the Commissioners are present. Our Acting Secretary, Mr. Lon Watson, is just appearing on the scene.

At the last regular meeting of the Upper Colorado River Basin Compact Commission, Meeting No. 2, at Santa Fe, New Mexico, the Commissioners decided that in connection with the next regular meeting, Meeting No. 3, a series of field hearings should be held, one in each state of the Upper Division. That means four meetings. These meetings were to be held in Rock Springs, Wyoming; Grand Junction, Colorado; Price, Utah; and Farmington, New Mexico. The two meetings at Rock Springs and Grand Junction have been held and this is the third of the series.

The purpose of these meetings is to acquaint the people within the Upper Basin with the work of the Upper Colorado River Basin Compact Commission and to give you an opportunity to express your ideas and offer suggestions which may be helpful to the Commissioners in their deliberations in connection with this proposed compact. Every one of you should feel free to say what you have to say. It is not expected that you will deliver a finished oration but your suggestions and remarks are welcomed.

The Chair believes that at this time he should introduce the members of the Commission and I will start with the gentleman on my left, Mr. Charles Carson, Commissioner for Arizona. (Applause.)

On my right, Mr. Ed. Watson, Commissioner for Utah. (Applause.)

Next to Mr. Watson is Mr. Thomas M. McClure, Commissioner for New Mexico. (Applause.)

The next is Judge Clifford H. Stone, Commissioner for Colorado. (Applause.)

The next is L. C. Bishop, Commissioner for Wyoming. (Applause.)

Then Mr. Lon Watson, our Acting Secretary today. (Applause.) Mr. Watson is acting in the absence of Attorney General Grover Giles.

And the efficient young lady who reports our meetings is Miss Price of Utah. (Applause.)

Following the procedure which we have used in the two previous hearings, the Chair is now pleased to turn over the meeting to the Commissioner for Utah, Mr. Watson. Mr. Watson will conduct the meeting from this point on and will call on anyone and run the meeting according to his own ideas. The only thing that the Chair would have to offer is that we hope that the remarks will be directed toward the work of the Commission, that is, let's keep within the Basin if we can because that is a subject that is plenty large. Mr. Watson.

COM. WATSON: Ladies and gentlemen, a few remarks introductory to your various reports may be in place in order for you to have an understanding of what we are trying to do and why we are trying to do it.

In midsummer of 1946 the Governor of Wyoming called the Governors of the Upper Colorado River Basin States together and laid the foundation at Cheyenne for the organization of a compact commission so that ultimately a compact could be negotiated for the division of the water of the Colorado River that was apportioned to the Upper Basin by the Colorado River Compact. This was a preliminary meeting and was followed about ten days later by one held in Salt Lake City at which the Upper Basin States were all represented. So it was that the Upper Colorado River Basin Compact Commission was organized. A resolution was also passed for the appointment of a subcommittee of engineers to investigate basic data and make certain recommendations to the Commission.

The next meeting of the Commission was held about the middle of September in Santa Fe, New Mexico, where a preliminary report by the Engineer Subcommittee was made. This subcommittee is composed of competent men. Mr. J. R. Riter of the Bureau of Reclamation is Chairman and each state is ably represented. The assignment of the subcommittee comprises a study of streamflow, reservoir operation, evaporation and channel losses, and other engineering data that may be necessary to determine what the Colorado River does and what it is capable of doing.

As Chairman Bashore has said, the third meeting of the Commission consists of a series of public hearings now being held in the states of the Upper Basin.

I believe that since there are some here who may not understand the general principles underlying the Colorado River Compact and who may have some mistaken ideas about it, a short discussion of historical events may not be out of place. I shall attempt to do that very briefly for your benefit and for my own as well.

You all know that at the beginning of this present century--I think it was 1906--there were floods on the Lower Colorado River and that parts of the Imperial Valley were inundated with great property loss. The people of California cried out for help, but it took a long time for constructive forces to get organized. Finally the United States Government said to the states of the Colorado River Basin, "You get together, compose your differences, agree upon a plan to divide the water, and we shall try to get some action." The people of California were entitled to flood control. They were also anxious to have Boulder Dam but before the Boulder Dam could be built an agreement or compact had to be entered into by the States of the Colorado River Basin. After much discussion and long delays the Colorado River Compact was finally signed by six states of the Colorado River Basin, Arizona, the seventh state, preferring not to sign the document.

We in the Upper Basin have seen the Colorado River at its flood and also when it runs dry. We know something of its habits. We knew that we were not prepared to utilize the River's water and that through our failure to use it, we might lose our rights and forfeit them to the Lower Basin States who could put the water to use before we could do so. It was, therefore, to our advantage to have an agreement to protect us against our nonuse. On the other hand the Lower Basin States wanted flood control, storage for irrigation development and hydroelectric power.

The men who were in charge of the work at that time--President Hoover, then Secretary of Commerce, was the Chairman representing the United States Government--were sincere men and they did the best job they were capable of doing. They didn't have as complete records of streamflow as we have at the present time. They had records of rather abundant years to refer to, but they didn't know that the lean years that commenced in 1931 were just ahead. They assumed that the River produced about 16,000,000 acre feet annually that could

be safely apportioned and about 5,000,000 acre feet surplus subject to division at some later date. So, on the basis of the information they had they negotiated a compact. It is doubtful if at that time the amount of water to be divided between the Basins was given very serious consideration inasmuch as the River was considered amply large.

The Upper Basin States gained the advantage of being protected against their nonuse of the water, and in having navigation and power made subservient to irrigation. The Compact was advantageous to the States of the Lower Basin because it gave them adequate flood control, converted their primary flow rights to guaranteed storage rights and provided hydroelectric power, the revenue from which would pay for the dam.

Previous to the writing of the compact some of the states had spent large sums of money in lawsuits with surrounding states over interstate water rights with results that were not satisfactory to any of the parties. You all know if you win a lawsuit you are the loser. It was therefore decided for the benefit of the people the best thing that could be done was to settle interstate difficulties by compact and not in the courts.

Boulder Dam was completed in about 1935. In 1931 the lean years commenced and there were ten of them that followed consecutively. We now have evidence that causes us to believe that the River is not as large as these gentlemen thought it was. It's a case of hindsight versus foresight. True, we have better instruments to work with and we have the advantage of accumulated knowledge. For instance, this last water year, ending October 1st, the Colorado River flowed at Lee Ferry somewhere around 8,000,000 acre feet. Assuming about 2,000,000 acre feet consumptive use, the virgin flow of the River would be about 10,000,000 acre feet at the Ferry.

Before entering into the Compact the States first tried to divide the water among themselves as individual states; however, they soon found that was impossible. A gentleman from Colorado by the name of Delph Carpenter conceived the idea of establishing a point midway in the course of the River and dividing the water between the Lower group and the Upper group. This point was chosen near Lee's Ferry. Lee's Ferry is the old Ferry we know of, a geographical location. Lee Ferry is a point just below the mouth of the Paria, below Lee's Ferry, at which the waters are divided. It is merely a point established by an agreement but is known as Lee Ferry in contradistinction to Lee's Ferry.

In drafting the original Compact the drafters knew that the Colorado River didn't terminate in the United States, that it flowed into Mexico and traversed about fifty miles of that state before entering the Bay of California. Mexico had rights to the water of the River and she also had large tracts of good land. Down there the River flows along a ridge and the good land slopes off to the north into the Salton Sea, 240 feet below sea level. It was possible for Mexico to utilize the River's water on her own lands--either the Mexicans themselves or Americans from the States. The original Compact provided that in case a treaty should be made with Mexico, the Upper and Lower Basin States should divide equally the responsibility of providing Mexico with the amount of water that might be agreed upon.

During the last few years efforts were made to negotiate a treaty with Mexico. As I remember, Mexico asked as her portion 3,500,000 or 3,600,000 acre feet of water. Finally the State Department got the figure down to 1,500,000 acre feet from any and all sources. That means that the return flow is included in the 1,500,000 acre feet. Hydrographers who have studied the Colorado River assert that in a developed river there will be a

substantial return flow, 900,000 to 1,000,000 acre feet. It is estimated that a total of 600,000 acre feet may have to be provided equally by the Upper Basin and the Lower Basin.

And let me say to you here, gentlemen, that if the Colorado River Basin States had not negotiated the Mexican Treaty that sovereign powers across the boundary could have put the water to use and worlds without end we never would have got it back--it would have been Utah's, Colorado's, New Mexico's, Wyoming's and Arizona's water. I stood on the diversion dam of the All-American Canal a year or so ago and saw the Canal running 15,000 second feet of water, its total capacity. But in spite of this diversion there was a great river running over the spillway down the river and into the sea. And whose water was it? It was largely Upper Basin water. If that water could be put to beneficial use in Mexico, we would never have a chance to develop the Upper Basin. So, in the signing of the Mexican Treaty the old adage probably runs true, "better a half loaf than no bread". The amount of water given them amounted to placing a ceiling on their use and saved for the Upper Basin its future development.

Ladies and gentlemen, we must face the facts. This Commission has been authorized by the states of the Upper Basin to negotiate a compact for the division of the water apportioned by the Colorado River Compact to the states of the Upper Basin.

Now the Upper Basin agrees not to deplete the River at Lee Ferry more than 75,000,000 acre feet in any consecutive ten-year period. In other words the Upper Basin guaranteed an average yearly flow of 7,500,000 acre feet at Lee Ferry. It was considered that inasmuch as rights to the primary flow of the River had been established in the Lower River that these primary rights would have to be changed to storage rights and guaranteed. The Compact apportioned 7,500,000 acre feet to the Upper Basin for exclusive beneficial consumptive use and 7,500,000 to the Lower Basin for the same purpose and under like conditions.

I believe when the River is regulated that we will have a substantial portion and perhaps, over a long period of time, our share--our just share--of the water. However, at the present time we must bear in mind that we are dealing with a river that is not as large as it was once thought to be.

In dividing these waters among the States of the Upper Basin there are two schools of thought: One is to divide the water on a minimum basis and the other is on a total basis. Shall we consider the River as it now is and take an absolute minimum at Lee Ferry that we are sure we can divide without any question and leave the balance for future division? Or, shall we divide it all at the present time? Those are burning questions and there is difference of opinion on them.

Utah, according to figures that have been recently worked out by one of our competent engineers, produces about, we think, 18 percent of the River. And we also have in addition to what we produce, the storage reservoirs in the main stem of the River to hold that water. If you should go into a restaurant and ask for a cup of coffee and they tried to deliver it to you without a cup or container the chances are you wouldn't get any coffee. So these containers, these great reservoir sites down at Dark Canyon, Rattlesnake, Split Mountain, and even Glen Canyon, although the damsite is over in Arizona, just over the line--these sites are all great factors to be considered in saving this water so we can deliver our share to the Lower Basin States and still retain enough for ourselves.

I wish to mention one or two projects that we would like to have in

Utah and then I shall turn the meeting over to you gentlemen and you will be entitled to express yourselves freely. There is a project that we have here in this state that is a very desirable one. At the present time there is a reservoir northerly from here known as the Strawberry Reservoir. Its elevation is 7,600 feet. It is as high as Yellowstone Lake and that is considered one of the highest lakes in the country. That reservoir produces water for some excellent farms, and it produces power that pays the cost of the operation of the water system. In fact, I am told that a year or two ago this project, known as the Strawberry Project, made a profit of $50,000, which paid all of the O. and M. and put money in reserve. Now Utah would like to build a feeder canal out along the south flank of the Uinta Mountains in order to pick up the surplus water and store it in that reservoir which could be enlarged by building a higher dam and finally utilizing the water on more land. That is an important and desirable project where we could use our share of the Colorado River water without hurting anybody. Then there is the Gooseberry Project which deals with transmountain diversion of water in small amounts into Sanpete County where it could irrigate some very rich land. Some of you will explain this as we go farther.

In the Lower Basin there is the Virgin River area where the land is very rich and the elevation is only 2,500 feet. Semi-tropical crops can be grown there. The Virgin River yields surplus water to the Lower Basin and we are informed by the Commissioner from Arizona they will cooperate with us in the development of the Virgin River Basin by means of the Hurricane Reservoir site and the site on the Santa Clara.

Then we have over in the Uinta country the sites of Stanacker Draw and Tyzack, which are desirable. Most of these could be constructed in a reasonably short time, as a great deal of the engineering data has already been collected.

I think Utah's viewpoint will develop in our discussion and I now wish to call on you people here. We have the Mayor of this fine little city with us and we would like to hear a few words from Mayor Bracken Lee. (Applause.)

MAYOR J. BRACKEN LEE, PRICE, UTAH: Mr. Chairman and visitors, I don't feel as though I ought to say very much at this time, Ed. I came here, I think like a great number of these gentlemen, to learn, and I am sure I am going to learn something.

But inasmuch as you have asked me to say a few words I would like to say that the City of Price is flattered to have such a fine, distinguished group of visitors, and we certainly welcome every one of you. I would like to compliment the Commission on deciding to hold public hearings because certainly no harm can come from letting the public in on what we are doing and a lot of good, I am sure, will come from it.

I notice from looking around this group that we have representatives here from all over this end of the State. I don't think there is a county that is not represented. I see even Mark Anderson, who is the Mayor of Provo, over here. I can't understand what he is here for unless he wants some of Carbon County's water. (Laughter.)

I am sure the Commission is trying to do the right thing and, of course, Ed., if they fail, I hope you put some Republicans in to help straighten it out.

COM. WATSON: We have some very good Republicans that are working with us and they are doing excellent work.

MAYOR LEE: I couldn't resist that little dig at Ed., forgive me for it. Anyway, I think you ought to get on with your meeting and perhaps by the time I learn a little bit more about this water business I can say more about it. The experience I have had here in Price is that the more I know the less I know. It is certainly complicated, and even a little irrigation ditch here in Price involves a lot of complications.

So I in a way feel sorry for you gentlemen who are endeavoring to try to straighten out the Colorado River with all its complications.

I believe you had better proceed with your meeting and we will see if we can't bring something up that will really be of benefit to everyone. (Applause.)

COM. WATSON: We would like to hear from Leon Christensen, an engineer who lives over in Ashley Valley and who is well acquainted with the problems of that Valley.

MR. LEON P. CHRISTENSEN, VERNAL, UTAH: Mr. Chairman, ladies and gentlemen, I like Mayor Lee came here to listen and not to talk.

Of course we are over in Uintah County. We live right on the banks of the Green River, which of course is the largest tributary of the Colorado River, and are naturally extremely interested in any development there is in the Colorado River Basin and especially in our section.

We have a number of projects in that district. We have just outside of Vernal the Echo Park Project which, of course, would have to be a regulatory reservoir. It holds under its present plans, 5,500,000 acre feet, and would be in our estimation one of the first projects that should be constructed on the Colorado River for the reason that it is near the head and has the water supply available.

The Bureau of Reclamation we feel has done an exceptionally good job of listing our projects and working them up. As was stated by Mr. Watson, most of the projects in that vicinity have been investigated and a great deal of the engineering work has been completed on the Echo Park, the Vernal Project, the Jensen Project, and several of the other small projects.

We feel that about all we could say at this time is that we approve the projects as they have been listed by the Bureau of Reclamation and are willing to abide by their report and hope that work can be commenced on some of the projects in the near future. (Applause.)

COM. WATSON: From that same area we have Mayor Brient Stringham of Vernal. We would like to hear a few words from him.

MAYOR B. H. STRINGHAM, VERNAL, UTAH: Mr. Watson, distinguished people, I will only take a minute of your time. All I can do is verify what Mr. Christensen said. I might inject one more thought into that and I hope I don't offend our fine neighbors who live right next door to us. But we have in mind one other thing--you told us to unload anything we might have?

COM. WATSON: Get it off your chest.

MAYOR STRINGHAM: That is the fact that we over in the Basin--excuse me, Bracken--live in a potential wonderland. We have potential resources surrounding us on all sides such as gilsonite, asphaltum, and we are keenly interested in this from another angle. We believe we should take care of the Basin first with these waters and then if there is surplus water, let these other

valleys have it. And in transferring this water across to the other basin, this diversion canal, there will be power sites which we need badly to develop these potential resources we have just over the ridge from our good friends here at Price.

Now we think, you people of the Commission, that should be a consideration in dividing the water and that is what you are here for, is to try to get on a basis for dividing the water. The fact that Utah has all these resources and that they can be developed not only for the State's good but the National good, that should be one of the considerations, industrial development, when you are dividing this water up.

And so coming back selfishly to our little basin over there we certainly stand first for the Echo Park Dam so that we may get busy there and develop those resources that lie within that area. (Applause.)

COM. WATSON: We have Mr. Horace Allred who lives out in that area, Uinta Basin. He is a director of the Utah Water Users, and has been very active in our water development. Mr. Allred, will you say a few words?

MR. H. L. ALLRED, ROOSEVELT, UTAH: Mr. Chairman, gentlemen, after Briant and Leon Christensen got through--I have been telling them all day what to say--I don't think I have very much left to say.

I think Mr. Stringham touched on a point that will interest us all in the State whether we live in the Colorado River Basin or any one of these four Upper Basin States. I believe you men are all interested in making this Colorado River water do the best job possible, and the type of lands we have, cost of developing, water charges for these lands, will exclude a lot of our lands if we think only of irrigation, which a lot of us have been thinking about in the past.

In line with Mr. Stringham's thought, I think in arriving at an allotment of water out of the Colorado River for Utah that that should be given some consideration, a lot of consideration, the value of the water that we might use for the development not only of our agriculture but of our great industries which we hope to be able to develop in Utah. These things will take some transmountain diversions. These people here that live in the Colorado River Basin are naturally jealous of the water that we in the Basin say is ours, and we want to develop all the good irrigation projects we have. I think there is water here for all the projects we will have and there will be a lot to go over the mountain to help build these industrial units that will be over there. I believe that you men when you get this allocation problem far enough along will agree with me that they should be worthy of a lot of consideration in allocating water to the State of Utah. Thanks, Ed. (Applause.)

COM. WATSON: We have with us Mr. John P. Madsen from Duchesne out in the Uinta Basin country. Mr. Madsen is a representative in the Legislature and also a member of the Colorado River Committee in the Legislature formed to study the potentialities of the River. Mr. Madsen, will you say something?

MR. JOHN P. MADSEN, DUCHESNE, UTAH: Mr. Chairman, gentlemen, I come from a country where we have water to spare and we are sparing it down the Duchesne River every year. We are very anxious out there to get the Duchesne and its tributaries so set up that we can appropriate and put that water onto our lands. It is going to require a good many reservoirs which when built can water the entire Basin and then have plenty for Central Utah, that is, when you put the Green back of it, to push it over into the Strawberry Reservoir.

There is one beautiful thought that comes from my section of the country: It will act as a natural reservoir for the return flow into the Colorado River. Every bit of that country drains right back into your Colorado River system and all the water you put there that doesn't evaporate will come back some day into your Colorado River. We are very anxious and very concerned about the return flow because we feel that should be taken seriously into consideration when division of this great and mighty Colorado is taken into consideration.

We have a lot of valuable land out there, some of the finest in the State of Utah. So say your Government agencies and also your state agencies that have gone over that land--it should be under cultivation. There are 15,000 acres in one tract. Four hundred or five hundred returned veterans could go onto that land and make themselves a good living because it is productive soil.

The State Engineer sometime ago cancelled our water filings to that land. We feel it was unfair to us and we are going to fight to get those filings reinstated because we feel we are entitled to those filings.

I made a statement on the floor of the House in the last session that the Colorado River was already overappropriated and if we weren't careful, some day California would come up here and regulate our headgates. They smiled at me but I believe they say now I am right because there is not water enough in the Colorado River to go around if they want to take that into consideration.

So the Upper Basin States must get busy and see that we have our portion of that water and furthermore, as Mr. Krug, Secretary of the Interior, said, those who make beneficial use of that water are the ones who are going to hold it. Our State law tells us the same thing. So I think we here in Utah have a problem to solve and that is to get busy right now and see to it just as fast as we possibly can we make beneficial use of this water.

I don't feel we should go out and take advantage of the other states. I think we should work harmoniously together with every state interested in the Colorado River, each one to receive his proportion. To do that I feel it would be wise and wisdom for each state now to set up a certain project they want to put over, one certain project, and then all go to work. If we try to outdo each other, outrun each other, outflank each other, there is going to be a lot of confusion, a lot of disagreement, a lot of contention. Therefore, let's work harmoniously together. For after all, the mighty Colorado belongs to us, that is, what is left of it, and let's make use of it. I thank you. (Applause.)

COM. WATSON: Mr. Leo Calder is here, is he not, State Representative from Uintah County? Mr. Calder, will you come up and say a few words?

MR. LEO CALDER, VERNAL, UTAH: Mr. Chairman, ladies and gentlemen, I guess you will begin to think now that everyone that is interested in the Colorado River comes from the Uinta Basin. Well, maybe that is not so, but so far all of us have been from the Uinta Basin.

We are vitally interested in this Uinta Basin water and in the water that we can spare for somebody else because all this water runs through our Basin. We would like to see particularly the Echo Park Dam put in, which is on the Green River east of Vernal. It will mean in power alone much to Utah and the development of our industrial resources, our natural resources that are lying right there in the hills. For instance, the phosphate that is there north of Vernal would be developed today if the proper power was available. There are companies waiting right now to establish plants there that would absorb a good

share of the power that would be available from that source. No doubt it would bring into Utah so much more development along an industrial line that the taxes and everything else would increase in proportion to the population, which undoubtedly could increase a whole lot.

Mr. Stringham mentioned some of the great resources that are around there close and he left out oil. Some day we are going to develop a lot of oil and that too will be a great source of industry. Already our town, through the Colorado development that is just across the line and is coming closer to Utah hourly--our town has more than doubled in population in the last year or two.

It only shows that if you have the stuff you can get the people and you can get the money and we can live together and utilize those natural things that we have right here in our state and utilize the water, or our share of the water, that is here flowing down to California. It is our purpose to push this thing and get it to going as soon as possible. Thank you. (Applause.)

COM. WATSON: Mr. Alma Preece, County Commissioner from Uintah County, is he present?

MR. ALMA PREECE, UINTAH COUNTY, UTAH: Mr. Chairman, ladies and gentlemen, as County Commissioner my thought along this line has been a little different. Without giving you the background like the other men have, it has been along the line of organization. Here a few years ago it was the responsibility of the County Commissioners to perfect an organization and we have worked in Duchesne and the neighboring counties along this line, and Carbon, in placing such men as Mr. Allred and some of the other men here, working along in this organization. We think that we have selected some very good help and we as Commissioners are working together harmoniously without any conflict in any way in selecting the help for this work.

Speaking of transmountain diversion, I don't think anyone could be opposed to it if their needs are supplied. We have a lot of water, as has been mentioned, over here in the Uinta Mountains Basin, and if we could be supplied there and better, which we could be, by an exchange of water, it would be a big benefit to us. We have a lot of water go by us there in the flood--not this last year but ordinarily--and then we dry out the rest of the year. We can't grow proper row crops and we could add to our wealth in that section.

I think we are all on the right track. I think there is a great deal of development being done in the State organization and I compliment these men that are working hard along these lines, and I think success will crown their efforts in the future. Thank you. (Applause.)

COM. WATSON: Is Mr. Joe Price of the Vernal Drug present? (No response.) We have with us from Huntington a former Senator who is a great student of water and a booster for this country. We would like to hear from him, Mr. Byron Howard. (Applause.)

MR. BYRON HOWARD, HUNTINGTON, UTAH: Mr. Chairman, ladies and gentlemen, I am certainly glad to hear from that Uinta Basin that they have got lots of water and got lots to spare because, brother, we are plenty short in our country and all the water that is in our country we have potential places to put it. Along the Wasatch Range here, running south along this Valley for sixty, seventy-five miles here, every drop of water there that originates in those mountains we have places to put if we just had a few more storage facilities to take care of it.

We are absolutely against, gentlemen, any transmountain diversion from this part of the country and south of here, transmountain diversion anywhere, because we have places to put all that water and we need it all. Not only that, all the water that is used, as Mr. Madsen so adequately stated--all the water that is used in the Basin is a potential chance of a return flow to be taken into consideration when we produce our water at Lee Ferry for the Lower Basin. That is one of the greatest reasons why in our part of this section of the country we are absolutely against transmountain diversion of any water.

Now I feel and all of our people feel that this Bureau of Reclamation in their Comprehensive Report have made a very good job of it. They have made an impartial report, I think, of the matters as far as we are concerned. The only thing we object to in their report is that on every one of our streams over there they claim there is a chance for tunnels to be built and take that water over to the Great Basin, and we certainly object to that because we know we can use and handle and need every drop of water that is over there.

When this matter is taken into consideration of the allocation to the different states, the four Upper Basin States, we wish you to take that into consideration, gentlemen, that this water along the Wasatch Plateau from here south is all adequately needed for our own use and will be a benefit to you if it is left on this side because there will be a return flow for Mexico and California and the Lower Basin.

Now around the Green River and on the lower part of the Green River, I feel that there is plenty of good land down there, gentlemen; there is just as good land down there as any one part of the state. You people talk about the good land in the Great Basin; there is a lot of good land over there but there is a lot of good land over here, too. It might not be in as nice a valley and there might not be as many bankers over there and politicians, but there is some good land there and we feel where water is the civilization will be.

You people are pretty well built up there; you have about as much as you can have without more water. Give us a chance over here and lay off the transmountain diversion until we get ours built up over here a little. Thank you. (Applause.)

COM. WATSON: Is Mr. E. E. Peirce, President of the Price River Water Conservation District, Price, Utah, present?

MR. E. E. PEIRCE, PRICE, UTAH: Mr. Chairman, gentlemen, this is a surprise to me. I didn't expect they would be so far down the line as to call on me to talk.

We are maybe more fortunate than some of you people. Our project is complete, we have our dam built, but we are willing to get behind the wheel and give the rest of you a boost. If we can help somebody else get their project over we will be glad to do it.

But I believe Mr. Howard touched on a very vital point and it concerns us here as well as it does the people in Emery County. We have a place for all the water we can find. This last year we got by by a pretty close squeak. Of course it was the first year we used our new dam and we didn't have the advantage of much of a runoff last winter. But we second Mr. Howard's speech, and I thank you. (Applause.)

COM. WATSON: We will hear from one other individual and then we will take a few moments' recess to give our reporter a little rest. Senator Mitchell Melich from Moab is here and we would like to hear a few words from

him. He has made a study of the Colorado River.

MR. MITCHELL MELICH, MOAB, UTAH: Chairman and Members of the Commission, the thing that is so vital to me in connection with the development of this River is this:

When I settled on the River some twelve years ago down at Moab I had heard about all of these projects. I grew up in an area where we weren't so concerned about irrigation because I was born in a mining town and all we were interested in there was mining copper, lead, and zinc. And I was told that these projects were to be built in the near future. But I have been down there some twelve years now and to my knowledge we have built hardly any in the State except some of the large projects which I guess they have been fighting for for forty or fifty years.

Now the thing that I have found in my study and in travelling around the country on projects is that the only way we are going to develop them is to push this Compact that these Commissioners are now trying to arrive at. That Compact is the first thing that must be prepared and submitted to our respective legislators and legislatures that meet in January or shortly thereafter. Whether this Compact can be prepared by then and ratified by the states within the next few months, of course, is a matter which this Commission will have to decide. But the one great problem to me is this Compact because we were told that the projects on the River will not be constructed, that is, any projects of any size, until the Compact is ratified or the waters at least upon some basis are allocated among the various states.

I am going to appeal to our people of Utah to cooperate in a complete development of the River. We cannot be selfish in this thing because we have in our small section of Southeastern Utah here some projects which we know must be built if we are to survive in this area. There are other large projects in the State which must be built. The question of transmountain diversions, of course, has got to enter into this picture.

I have found that the cost of these small projects is prohibitive upon the average farmer. He can't afford to pay for them and the only way they can be paid is by tying them into larger projects which can assume the largest burden of the cost. In other words, you can't saddle upon a "mill creek" project in Moab $2,500,000, which is the estimated cost, and expect the people down there of a population of 2,000 to pay for it under the present Reclamation Law. It just can't be done. We must work out some system in this State either through our Legislature or the Federal Government, how these projects will be paid for because somebody has to pay for them; they aren't going to be given to us.

So I appeal to our people in Utah, let's look at this thing not from a purely selfish standpoint, but let's look at it from the standpoint, "How are we going to develop our State?" We are told now, due to the influx of industry in Utah and because of the tremendous growth on the Coast, we might expect 1,300,000 within five years in this State. If that is going to come, we must all work together and not work apart, and I think that has been one of our weaknesses in the past.

I am also going to say to our sister states, the Compact Commissioners here, you face the same problem we do. We ought to work out our projects in all the states together and see if we can't convince the Eastern Congressmen we need some money out here to build them. Otherwise we are going to be travelling along and I am going to be so old, like Rip Van Winkle, that I won't see any built, and my little boy is going to have to wait to see

them built like I have for the last fifteen-twenty years. I want to see them and I know a number of you do. They haven't been built.

I think this is the first move I have seen toward the construction of these projects, the Compact we are attempting to work at now. If you gentlemen will go out and see some of the projects you will find that there must be in some instances multiple purpose projects because the cost must be divided up, and you certainly can't saddle it onto the farmer because if you do he can't pay for it. (Applause.)

COM. WATSON: We will take a five minute recess.

(3:05 p.m. Recess.)

(3:10 p.m. Hearing resumed.)

COM. WATSON: Ladies and gentlemen, it was my original intention to call on all of the water users in the Colorado River Basin first, but I think I will depart from that and call on many of them later. We would now like to hear from a member of the Metropolitan Water Board in Salt Lake City, Mr. Blair Richardson. (Applause.)

MR. BLAIR RICHARDSON, SALT LAKE CITY, UTAH: Mr. Chairman, gentlemen, I am sorry you didn't call on Mr. Gillman, President of the Provo River Water Users Association--

COM. WATSON: He will get it next time.

MR. RICHARDSON: --of which Metropolitan is a subsidiary--we are a stockholder.

I want to call the attention of the Commissioners to the fact that in building the Deer Creek Project and the aqueduct that goes into Salt Lake, about a third of the supply necessary to make that a success will have to come over from the Colorado side, and we hope you will give that full consideration in making water allocations to the various units that you will have to.

I have nothing else to add at all. If there is anything we can help you on, you will ask for us of course. But frankly, Mr. Watson, I don't know of anything else to offer at this time. (Applause.)

COM. WATSON: Mr. J. W. Gillman, President of the Provo River Water Users Association.

MR. J. W. GILLMAN, OREM, UTAH: Mr. Chairman, Members of the Commission, first I am from Utah, not any particular spot. I am interested in the entire State and its development. I have had water on the brain for a long, long time. Some folks tell me if I don't get some of it off I will be headed for the State Mental Hospital, and that applies to my family.

I am interested in transmountain diversions. Utah can't go without some transmountain diversions. We haven't sufficient water within the confines of our little state to do the job. If we are given a portion of the Colorado River, we only want our fair share of it, but we must have that if Utah goes where it ought to go.

That little project, the Provo River Project, will serve when completed more than 50 percent of the population of this State with a supplemental supply of water, especially for culinary purposes. The Bureau of Reclamation has that tunnel into the Duchesne River about half completed and the war came

on and the stop order was issued and it is dead. The balance of the project is going forward.

Now I am interested in bringing the water into the Strawberry Reservoir. I hale from Utah County and I live neighbors to Juab and Sanpete Counties and what not, and they all need some water and if our population is taken care of, water is the life's blood of it. We began to talk about it in my early days and such men as William R. Wallace--

MR. WILLIAM R. WALLACE: Before you were born.

MR. GILLMAN: --Joseph R. Murdock, Dr. John A. Widtsoe, and I could mention others, with whom I served on the Storage Commission of this State some years ago, spent hours and days around the table devising ways and means to develop this State as far as water supply was concerned. We ought to pay tribute to them and never forget their efforts in our behalf.

So I say I am from Utah first. I am a director in the Echo Project in Weber, have been for about fifteen years, and I have seen what that project has done for us. We are already reaping our benefits from our Deer Creek Project on the Provo River and we appreciate them very much.

Gentlemen, if there is anything that the men on our Board can do to assist our State Engineer in this matter, I am sure they would be glad to do it. I realize you have a job on your hands. I would hate to be a member of this Commission. I wonder in my own mind what the basis for dividing the River will be, if it is contribution from our watershed, if it is on a proportionate basis, and then when you get that all done, I wonder, as Mark Anderson said, after that is done how are we going to divide it among ourselves. Thank you.

COM. WATSON: Mayor Mark Anderson of Provo, we would like to hear from you.

MAYOR MARK ANDERSON, PROVO, UTAH: Mr. Watson, Members of the Commission, ladies and gentlemen: This is a rather big subject for me to have anything to say about. I knew it was complicated and the more I listen the more complicated it becomes.

We over in Utah Valley have always felt that we were going to be on the receiving end of this Central Utah Project, but it diminishes a little bit when I listen to the possibilities of using this water over in the Uinta Basin. I thought out there in the Uinta Basin, after I went on a pheasant hunt, that the Indians had most of the good land out there, practically all of it, but they didn't have a great need for additional water, but I will admit I only covered a small area around White Rock.

I was just thinking here, it seems that we are talking about acre feet and second feet; I wonder why this division couldn't be made on the basis of percentage or proportion. It looks like that would be better. That is the way we do with our irrigation water, as I understand, throughout the State in most cases. It is a proportionate thing.

I wanted to say just a word in praise, though, of the Reclamation Service in spite of all the opposition to Bureaus. I think we have some that have made a great contribution to this State and the Reclamation Service is one of those bureaus. They have been very thorough. They have been plugging away for forty years. They have gathered information and they have followed a continuous policy in a way I think that no state or group of states could, and now we are waiting for them to give us the word on this Central

Utah Project. We all seem to be for it but the Reclamation Service hasn't said yet, I don't believe, whether the project is feasible or not feasible.

Now we would really be embarrassed if the Reclamation Service comes out after we have boosted for this thing and tells us that the project is not feasible. I don't know. Have they given us any answer on that?

MR. WILLIAM R. WALLACE: It's feasible.

COM. WATSON: Was that a question?

MAYOR ANDERSON: If it isn't all feasible, is a part of it feasible?

COM. WATSON: Did you wish that question answered?

MAYOR ANDERSON: Yes.

COM. WATSON: Mr. Larson, have you or Mr. Riter anything to say about that?

MR. J. R. RITER, BUREAU OF RECLAMATION, DENVER, COLO.: That is for Mr. Larson.

MR. E. O. LARSON, REGIONAL DIRECTOR, REGION 4, BUREAU OF RECLAMATION, SALT LAKE CITY, UTAH: We are just completing the Bonneville Basin Report the same as the Colorado River Basin Report for submission to the Commissioner of Reclamation, the Secretary of the Interior, and later to the states and to Congress. That report isn't available to the states yet, probably soon will be. And because of the project being in the Bonneville Basin, its feasibility and everything is discussed in that report and not in the Colorado River Basin Report.

As to feasibility, it is like a number of other projects. We give the cost, present day cost, power that will be produced, lands that would be irrigated, and then the feasibility depends on what law you are talking about or what law you are trying to get passed, and so on. So I don't think that is a matter that needs to come up yet.

It is in about the same category as a large number of other projects that are not one hundred percent repayable by the lands on which the water is being used. It is a multiple purpose project and it depends on how it is set up, just like a number of projects in the Colorado River Basin.

MAYOR ANDERSON: Thank you. We feel, of course, in Utah Valley--no doubt it will affect the entire State--that this project will aid us greatly, not only to help agriculture but to contribute also to the industrial development that is taking place in our locality, and we hope that that same development, of course, will be throughout the State.

I do hope that the Commission can work out a Compact at the earliest possible date because I read sometime ago in the paper that any development of any consequence would be impossible prior to reaching an agreement between the Upper Basin States. Thank you. (Applause.)

COM. WATSON: While we are over on the other side of the watershed, we have Mr. Elmer Jacob here, an engineer with Provo Utilities. Come up, Mr. Jacob, and say a few words.

MR. ELMER A. JACOB, PROVO, UTAH: I came to listen today and to learn rather than to try to instruct anybody about what I happen to know. As a matter

of fact, the more I study the water question--I am like one of the other speakers--the less I know about it because it is very complicated.

There is one thing, though, that I think we should agree on here today, if we can agree, in the presence of the Commissioners and the men who are studying the projects in the various states of the Upper Basin, and that is to be together in our idea of developing all of these areas, that we may go together. One project may come ahead of the other if it is feasible, seems more attractive, but I don't think we ought to have any hammers out in the way of limiting full development of any of these projects that are determined to be feasible.

The purpose of water development is to increase both development of agriculture and the development of our power resources. And the white water, the white power, is generally the cheapest power that we can develop. Now in this coal area here at Price, I realize there is a point of view that you men have that are mining coal. I would just like to say one word with reference to that.

There always will be coal-burning equipment in any industrial plant or fuel-burning equipment as auxiliary to any development of hydro power; I think, in this area that would be true. Our population increase is roughly proportional to industrial development. The maximum industrial development in the area here will be realized when we make the maximum use of our water resources, both for industrial and irrigation purposes, and with the development of that increased population, we will have concomitant development of our coal uses through use of the population, through use of standby power, ultimately through extraction of fuel oil and gasoline and gas from our coal products in this area.

That will be the ultimate end of the coal business and there isn't any question in my mind that the development of that population and our industry going along with it we are going to have a development of the coal resources and more intensive mining in the future than we have had in the past. (Applause.)

CHM. WATSON: We would like to hear from a member of the Utah Water Users Association and one who was present at the writing of the Colorado River Compact, Dr. John A. Widtsoe. (Applause.)

DR. JOHN A. WIDTSOE, SALT LAKE CITY, UTAH: I have been listening with a great deal of interest to the remarks made today. So many problems have been set up for us to think about. I have been trying to think them through. Like all the rest of you I am somewhat baffled.

However, I believe attacking every problem mentioned today is of secondary importance. That whether we have a transmountain diversion or not is not a primary question. Whether the water originated in Utah, Colorado, or New Mexico is a secondary question; whether the water has to be lifted or flowed by gravity to the farms is not really vital. I think the question that is of most importance hasn't really been touched upon and I want to give you my point of view.

I believe in the development of this country uniformly. Are we going to give every state a chance, an equal chance? Shall we make this Western country one country? Colorado would be in a very unhappy condition if she were surrounded by deserts; Utah would be equally unhappy.

This Commission, if I sense the proposition properly, is up against that problem. It may involve the elimination of a certain amount of human

selfishness, but this body should rise above selfishness. It takes courage--not easy to do.

So if I would express my feeling it is simply this: that at this time we stand before one of the most important problems of the West, the effects of the solution of which will be felt in the years to come as we know, that is of making one whole West. State Lines are made by man. Nature made the real lines for us. And while we are composed in this country of a number of states, we are one.

I believe that is a big problem. If you settle transmountain diversions in terms of that problem and origin of waters in terms of that problem, we will come to a solution that we will all be happy about and it will bless us and bless our children.

I had the privilege of sitting through all the meetings and all the hearings of the original Colorado River Commission, and I saw selfishness, saw it and heard it paraded before the people. There was no peace in that Commission. There was no possible solution until the Commission began to understand they were working for one great country, a great Western Empire. It would have been very easy in those days for the Upper Basin States to have said to California, "You can't have all this water." But at last they thought in terms of the development of the West.

I am not here to tell the Commissioners how to solve that problem but that is a problem that has to be solved. I hope they may solve it well. (Applause.)

COM. WATSON: The gentleman who is President of the Utah Water Users Association and who himself has had many years of actual experience in water matters and who is the Dean of our group, Mr. William R. Wallace. (Applause.)

MR. WILLIAM R. WALLACE, SALT LAKE CITY, UTAH: Mr. Chairman, ladies and gentlemen: The tremendous amount of wealth that can be made from the application of our waters is well illustrated by the experience of the project on the Weber River. When the Echo Project was built, this condition had existed: Prior to that building of that reservoir, the gross income from that area was two million dollars. Last year it was thirteen million dollars. And the making of wealth, curiously enough, is probably almost the most important earthly job that a man can be engaged in.

If you go back to the ancient times, the time of Pericles in Greece, or the time of the Roman Empire or the time of the Renaissance in Italy, or England under Elizabeth or under Victoria, or the United States of America, what is the first thing you have got to have? It's wealth, because upon wealth is based leisure and upon leisure is based education, culture, and refinement.

So if we can take these waters and put them to the highest possible beneficial use, we will reach a civilization such as the world has never seen. That is a great objective.

People go very far in order to protect a water right. We have all heard about California, the very earnest efforts they are making to protect their situation for their future growth. I recently had a luncheon engagement with some important men in San Francisco who were insistent upon the statement of their belief that California by 1960 will have thirty million people. I agreed to give them twenty million but I couldn't stand the thirty million. Some of the people in Los Angeles estimate that California will have twenty million people by 1953.

Now changing the subject for a minute I would like to say a word or two about coal. The thing that built the German Empire and that permitted them to make the tremendous strength that they have exhibited for a long time is the Ruhr Basin and that is based on the coal. The thing that built the British Empire was the fact that they could establish their great industries there and that the British Empire practically was built on coal.

We have in this area or within not many miles of where I stand probably ten percent of all the coal known on earth. That is a pretty big statement, but the amount of coal is tremendous. Now as the years go by, you are not only going to use coal in the ordinary way for fuel, but you are going to produce gasoline and all the various elements that can be taken from coal, and they are countless in number--even the finest of medicines. So we certainly have an opportunity in this country that I think is almost beyond compare on the face of the earth.

I spoke of the fact that communities will pay tremendous sums to protect a water right and I don't think it would be amiss to tell you about the Metropolitan Water District of Southern California. Those people spent $190,000,000 to bring the water from the River into Los Angeles and associated communities, but they had to borrow that money. By the time that plant was built to part capacity, they spent $34,000,000 in interest, so the cost was $224,000,000. They have a right on the River to 1,100,000 acre feet of water and the capacity of their plant as now built is 495,000 acre feet. The tunnels, however, are large enough for the entire capacity of 1,100,000 acre feet.

Their last report I have seen was up to June 1945. That year their operations went behind $671,000. In addition to that they paid $9,000,000 in interest. Now the interest had accumulated until at that time the cost was $267,000,000. It isn't likely that they will use the entire capacity or get it in balance so their income is as much as their outgo for ten or fifteen years, so it is entirely likely that Los Angeles and the associated municipalities will have a total cost of more than $300,000,000 before their income and outgo in any year are in balance.

I am just saying that to you because it is illustrative of the importance with which California looks upon having what might be called a standby water supply, a water supply that will protect them in their future growth.

I would like to go back to this Compact with which Dr. Widtsoe worked in 1922. The decision was made to divide the waters between the Upper and the Lower Basin States, giving to the Upper Basin the right to 7,500,000 acre feet consumptive use, the Lower Basin 7,500,000 acre feet of consumptive use plus the right to use an additional 1,000,000 acre feet, leaving what was supposed to be a surplus. At that time Representative Hayden--now Senator Hayden--of Arizona addressed a number of questions in writing to Secretary Hoover, and one of the questions was concerning the amount of the runoff, the annual runoff, of the River. Mr. Hoover replied that there were four to six million acre feet surplus, and the suggestion was that we might call it 5,000,000 acre feet. Sixteen million acre feet allocated would make the suggestion that the River contained 21,000,000 acre feet.

Take the two decades, 1922 back to 1912 and 1912 back to 1902, and in those two periods it is probable that Mr. Hoover was about right. But the estimate now is that the virgin flow at the Mexican Boundary is a little more than 17,000,000 acre feet, the virgin flow at Lee Ferry a little more than 16,000,000 acre feet.

What happened after the signing of that compact and the ratification of the compact and the contracts were made for the building of Boulder Dam? There was an attempt to tie up that surplus. The surplus, if any, in the River was supposed to be set aside and in 1963 an analysis be made of that and by the consent of all the states it could be divided. But an attempt was made to tie up that surplus and I think I may say without fear of successful contradiction, Mr. Arizona, that the Lower Basin States now feel that they are going to obtain all of that surplus and that there will be no possibility of the states of the Upper Basin dividing that surplus in 1963.

What I am arriving at is this: Our Chairman suggested that there are two thoughts concerning the division of this River, one of them being that this 7,500,000 acre feet should be divided now in part and leave a surplus to be talked about in the future. I object to that as strongly as it is possible for me to object to anything. Utah cannot wisely and efficiently plan her use of her share of that water until the basis of ownership is absolutely set, until it is definitely established, a certain amount of water or a proportion of that water in perpetuity.

If we don't do that we will have the same condition existing in this Basin that is existing in the Lower Basin, that somebody, some state, will do everything possible to put up a plan that will call for the use of that what we might term a surplus and will have the contention in this Upper Basin that they are now having in the Lower Basin.

When you come to the matter of getting in detail all the data influencing the division of this water you are asking for something that is impossible to obtain. Time will change data. And, Dr. Widtsoe, it is a delight to me to hear the statement you made that this is the United States of America. In the statement I made yesterday I made exactly that same statement, that this is the United States of America and that all of this water will be used in the United States of America.

Therefore, I am making this plea, and I believe in this I have the support of my associates, that this organization having in charge the making of a plan for the division of this water will agree upon the wisdom of dividing it upon a basis that we may go to the next session of the legislature with the understanding that we are to receive a certain amount of that water.

I have heard the suggestion that it be divided in percentages. Well, we had that matter up when we divided with Mexico, giving them a percentage. How would you like Mexican officials to be coming in each year to see if they got their percentage? It just simply will not work.

Now it's a fact that this is the greatest country in the world and I think there is no wisdom anywhere greater than that in the minds of the American people. But we can see what they are quarreling about, great things, all over the world, and surely we ought to set an example and this matter of ours ought to be placed on the table in such a way that all of these gentlemen in their wisdom can study it carefully and bring forward for consideration of the legislature a plan that will be acceptable.

We are not by any means upon an equity in the development in the Upper Basin. I speak very frankly about it. I think Mr. Bishop makes the statement that they have had no great project in the State of Wyoming. I know Mr. McClure of New Mexico has great project difficulties down there because he has a lot of Indians and the Indians apparently have a first right. The State of Colorado has been fortunate in this that they have one great project that is being constructed now. Our other three states have no such projects.

Now we would like to go ahead upon this kind of a basis: Granting that we have agreed upon the division of this water, what do we want to do next? In my opinion we should have an organization so strong and so influential that it can go to the Congress of the United States and say: "Here are four states. Each of these states wants a great project, the controlling project in the development of its water. We ask that these projects be approved at the same time and that the money be appropriated so that they may be builded at the same time." And if we have the water divided and our great construction works are builded at the same time, I am sure we will avoid much trouble and our relationship between and among these four states and the United States will be as nearly the right kind of relationship as it is possible for us to have.

I don't know there is anything else I have to say. I am proud we have in the State of Utah a group of men working cooperatively and as earnestly as they can. They recognize absolutely the rights of every other state and want to work just as harmoniously as it is possible for them to.

One other thing I went to say and that is this: We are peculiarly located in the State of Utah. The United States Government spent $500,000,000 on the Wasatch front because of its relationship to the Pacific Coast and the defense of the United States. In addition to the coal which I have spoken of we have tremendous iron deposits, and because of the coal and iron deposits we have a $200,000,000 steel plant. Based upon that steel plant we are going to have many, many subsidiary industries and we are going to have a tremendous growth. That growth is dependent upon water supply.

Incidentally, it might interest you speaking again of the Ruhr, with all the tremendous destruction over there, the coal mines were not destroyed and right at this moment the change in the Ruhr district is said to be almost a marvel, that there are right now a thousand industries working in the Ruhr district.

Gentlemen, we are looking forward in Utah to a development of that kind and we would like to say to this Commission that we would like to have every share of water to which we are entitled, but we don't want any more, and we feel very confident that wisdom dictates that the division of this water should be agreed upon now.

Let me stop to say I appreciate the value of water. There isn't any question about it, 50,000 acre feet of water is worth at least one hundred thousand dollars a year, and I would hate to give up 50,000 acre feet of water to any other state. But I do recognize the fact so emphatically referred to by Dr. Widtsoe that this is the United States of America and we can go ahead and divide this water and so far as the United States is concerned, it can be put to the highest beneficial use to the benefit of all. Thank you, gentlemen. (Applause.)

COM. WATSON: Mr. Thomas W. Jensen of Mt. Pleasant, Utah, Field Representative for the Utah Water Users Association and for the Civic Clubs of Southern Utah.

MR. THOMAS W. JENSEN, MT. PLEASANT, UTAH: Mr. Chairman, ladies and gentlemen, all I want to say is "Amen" to what Mr. Wallace has so ably presented here. Getting speedy action on the division of these waters within these states and a fair and equitable division is what we are interested in.

I also represent the water users of Sanpete County, a little county in the center of this State that used to be known for many years, Dr. Widtsoe,

as the granery of Utah. But the last few years, on account of drouth, freezing and a few other obstacles to the producing of crops, Sanpete County has been forced to ship in annually millions of bushels of wheat and corn from other states and other parts of the State of Utah. We have had a project there which we are anxiously waiting to get built which will help supply supplemental water for some 25,000 acres of land. Our project will be held up. It has been passed, the engineering data, the reports and all, are complete. At one time prior to the war it was placed on the desk of the President under the Case-Wheeler Act to be constructed. The war came along and stopped that.

We are praying for some immediate help in Sanpete County. The farmers there have built up a civilization, they have their homes there, and we need water. Even though Senator Howard has stated that they don't want to see any transmountain diversion, I want to say to Senator Howard we don't want one drop of water in Sanpete that they can use beneficially in his area, but we do want it used in Utah.

I appreciate the job that you gentlemen are confronted with. I have listened to the hearings in Rock Springs and Grand Junction. I know the other states' problems are parallel to our problems, but let's get the job done and get it done so that we can present something to our several legislatures this coming session and get this River going under control so that we can use the water for our valuable lands. I thank you. (Applause.)

COM. WATSON: We wish to give everybody a chance to speak that chooses to speak. We should, however, I think at the present time have an engineering report from one of the members of the Bureau of Reclamation so that we can bring a lot of these facts together and understand them. I will call now on Mr. J. R. Riter, who is Chairman of the engineers of the various states that have been chosen to analyze this problem for the benefit of this Commission. Mr. Riter. (Applause.)

MR. J. R. RITER, BUREAU OF RECLAMATION, DENVER, COLORADO: The Engineering Committee of which I am a member works under the direction of the Commission. At the Salt Lake meeting late in July when the Compact Commission was organized, they directed that a representative of the Federal Government with a representative of each of the five compacting states meet together and formulate an engineering plan of study, the study that should be made to give the Commissioners factual information on which they can work. In other words, when you go to divide up a river, you just don't go arbitrarily and say, "You take so much, you take so much, and you take so much." We don't know what we are dividing.

One of the starting points is water, its origin, how much, what becomes of it. Pursuant to the instructions received at the Salt Lake meeting, the Engineer Committee met at Cheyenne, Wyoming, the last two days in August and prepared a report which was submitted at the Santa Fe meeting of the Commission in September of this year. The Commission adopted the recommendations and appointed a permanent Engineer Committee to work out the problems.

You people have met the Commissioners and you might be interested in knowing the members of the Engineer Committee. I was asked to be Chairman by the Federal Adviser and the Commission appointed me in that capacity. From Arizona Mr. R. Gail Baker is the engineer representative on the Committee. Mr. Baker has had considerable experience in analyzing water in Arizona. His position in that state is one of the engineers on the State Board, Land and Water Commission.

From Colorado we have three members on the Committee. Colorado produces a considerably great share of the water of the Colorado River and they have

many diverse problems so they asked for three members on the Engineer Committee. We have Mr. C. L. Patterson, who is Chief Engineer of the Colorado Water Conservation Board; Mr. Royce J. Tipton, who is a Consulting Engineer and who has had considerable experience in analyzing water and has studied the Colorado River for a good many years. Mr. Tipton was at one time employed by the Bureau of Reclamation. At the present time he is consultant for the Colorado Water Conservation Board. At one time he was consultant for the International Boundary Commission, and Mr. Tipton has had considerable experience in analyzing the Colorado River. The third member from Colorado is Mr. Frank C. Merriell, who lives at Grand Junction. Mr. Merriell worked with the Bureau of Reclamation at one time during the construction of the Grand Valley Project near Grand Junction, and he has had considerable experience and is intimately acquainted with problems on the Colorado River.

In New Mexico the representative is John H. Bliss, who is the Engineer Adviser to the Interstate Streams Commission.

In Utah the official representative is Fred Cottrell, the Deputy State Engineer. Most of you know Mr. Cottrell and know his work and his ability.

From Wyoming the engineer representative is H. T. Person. Mr. Person is professor of engineering at the University of Wyoming and is consultant for the Wyoming Compact Commission.

I won't attempt to try to tell you all the problems but the chief problem that we felt the Commissioners would want to know is the total amount of water. During the presentation that has been given here today I think the statement was made that in 1922 the original Compact Commission didn't have too much information on the flow of the Colorado River. It is true, of course, that there was a gauging station near Yuma, Arizona, which had been maintained since the early part of the century.

There were also gauging stations on the Green River at Green River, Wyoming; on the Green River at Green River, Utah; on the Colorado River near Cisco, Utah; on the Colorado River near Grand Junction, Colorado; and on the Gunnison River near Grand Junction, Colorado. They were the stations on the main tributaries. There were also some available records on the San Juan River.

The original commission used such information as they had but they were unable to divide the water among the states. They did recommend that Lee Ferry be the point of division. As a result of their work, the Geological Survey now operates a station on the Colorado River at Lee's Ferry and on the Paria at the mouth. Those stations have been operating since 1922. The sum of the two stations represents the flow at the compact point, Lee Ferry. I think Mr. Watson has explained that to you.

Now we do have fairly good records. As the states became water conscious, arrangements have been made to measure the streams. Many of the streams have been measured for varying lengths of time. All of them don't have thirty or forty years of record; some of them only have one or two years of record.

So in determining where the water comes from, our job is to try to find out the amount of water that originates in each state. Of course that involves a number of processes. The first thing we have to do is to tabulate the water at the existing gauging stations and then extend those records by comparison with other points in the watershed where measurements have been maintained for longer periods of time.

We will next have to estimate the runoff from various unmeasured tributaries. In Utah you have a number of tributaries which enter the Colorado River and the Green River which have not been measured. In some cases we might have a very few years of record. We will have to estimate the total runoff from those tributaries in order that the Commissioners can determine the amount of water that originates in each state.

Well, now, we know that irrigation development has been underway for a number of years. At the present time there are over a million and a quarter acres irrigated in the Upper Basin. We also know that water is used in transmountain diversion out of the Basin. In Utah you are all familiar with the Strawberry Project, you are familiar with the Sanpete Project, both of which were built by the Bureau of Reclamation. And you are also familiar with other transmountain diversions, small ditches that have been privately constructed.

So the next job then, we will have to analyze how much of the water is now being used and how much has been used historically in order to correct the flow to determine how much water would have originated from each state and how much water would have been at Lee Ferry under virgin conditions. After all, the 7,500,000 acre feet which has been allocated for use in the Upper Basin must include present uses.

We have another problem after we have determined where the water comes from, and that is what becomes of it. For example, in these main channels there are tremendous losses. So far no one has attempted to analyze how much those losses are along the main channels. That is important because the Upper Basin has an obligation imposed on it by the 1922 Compact of delivering at Lee Ferry for use by the Lower Basin 75,000,000 acre feet of water in any ten-year period. Naturally Wyoming wants to know how much water--that is, we presume that one of the terms of the Compact would be that each state will have an obligation to share in the delivery of that water at Lee Ferry. In order that they may know how much their obligation is they must know how much water is going to be lost from the time it turns it out at the State Line until it arrives at Lee Ferry.

Another question that will have to be answered and will have to be studied is the matter of reservoirs along the main stem. Mr. Watson mentioned in his opening speech that you have the coffee cup--I think he referred to; I don't know why he mentions your coffee cup in Utah, I think he should have said the milk bottle--but in any event you have to have the containers to hold this water.

The studies that the Bureau of Reclamation have made as the basis of our Basin Report which was recently submitted show that over a long period of years the so-called undepleted flow at Lee Ferry will average about 16,000,000 acre feet. Well, now, you people who are familiar with rivers know that a river is not constant every year.

For example, in a year such as 1909 you had in the neighborhood of 25,000,000 acre feet at Lee Ferry. On the other hand, you take a year like 1934 or 1940, the flow is less than 5,000,000 acre feet. Then if you take a ten-year period balancing your obligations against the water that you have, you take a ten-year period such as 1931 to 1940, the historical flow at Lee Ferry averaged 10,000,000 acre feet in that ten-year period. That is what actually happened with present-day uses.

Well, now, if we try to analyze, if we are going to restrict ourselves to the water we get in the lowest ten-year period, there isn't much room for future development. Projects have been started in the Upper Basin. Take the Colorado-Big Thompson in Colorado, the Provo River Project that has been referred to in Utah, those projects have been started. We know they are going to

take some water out of the stream.

By the time you subtract from the 10,000,000 acre feet which was there historically the uses that have been what you might say already encumbered, we have already obligated ourselves to make those additional uses; then we subtract the obligation of the 1922 Compact to deliver water to the Lower Basin at Lee Ferry; and also subtract the Upper Basin share of the obligation to deliver our share of the water to the Mexican obligation, there won't be very much water left if we restrict ourselves to the flow available in ten years such as 1931 to 1940, bearing in mind that over a longer period the average original supply is in the neighborhood of 16,000,000 acre feet.

That simply means, as I see it and as the engineers of the Committee see it, huge reservoirs must be constructed in order that those reservoirs will impound the flood water, the surplus water in years of high runoff, and then release those waters in years of low runoff. By that means the Upper Basin will be permitted to expand its development and at the same time meet our obligation to the Lower Basin and to the Republic of Mexico.

Immediately when you start building reservoirs you lose water by evaporation. So one of the problems that we must study is the reservoir capacities we need, and that involves also consideration of silt. These streams by the time they get down to where the reservoir sites are, particularly down at the end, are not clear mountain streams as you well know. They are heavily laden with sediment. We have to make an analysis of the extent the reservoirs will be impaired by sediment in the future. All these studies are necessary in order to determine the capacity of the reservoirs. We don't know the answers but it is a problem we must study.

Since the engineers received the assignment we have held two meetings--one in Santa Fe in August which I don't count; that was just merely to spread out some of the assignment. Early in October we had a meeting in Denver to report on the progress and receive additional assignments. We had another meeting last Friday in Denver. At that time we had received reports from some of the engineers who had been given assignments and they were passed out so the other engineers of the Committee could review the work of each other.

In other words, in this Engineer Committee we are trying to be absolutely honest and aboveboard to analyze the facts. One man can't do the job; it is going to take the united effort of all of us.

I don't know how technical this discussion has been, Mr. Watson, but those in brief are the problems that the engineers are working on, they are the facts that we are trying to dig up and the engineering opinions that we are trying to arrive at in order to give the Commissioners some factual information that you may have in your deliberations on how you are going to divide the water up in the stream. (Applause.)

COM. WATSON: Mr. Raymond Hammond, Utah Water Users Association Board Member from Tooele County, Utah. Will you say a few words, Mr. Hammond?

MR. RAYMOND HAMMOND, GRANTSVILLE, UTAH: Mr. Chairman, Members of the Commission, ladies and gentlemen, I and some others came here today for the purpose of learning. Up to the moment I have learned a lot.

I come from and live in a section of the country directly west from Salt Lake City. I heard one gentleman make a statement here this

afternoon that in his particular locality there was a tract of land comprising 15,000 acres that was badly in need of water. I would like to take this group into Tooele County, Rush Valley, Cedar Valley, Skull Valley, and show them 200,000 acres of the finest land that ever could lie outdoors waiting for water.

And I remember, Pres. Wallace, some twenty, twenty-five years ago there was a little land boom in that section of the country. It was reported--and some surveys were made--the waters of the Colorado River were going to be brought into that section of the county. Of course, it wasn't long before that bubble burst because it was found that there were no waters to be brought in because the State of Utah had no title. Those lands are lying there at the present time and we people from Tooele County are, first, as has been remarked here today, Utahns. We are for the development of this State.

We are on the last leg, perhaps, of that great project down there. There may be some water in the final for us; there might not. That isn't going to hold back our effort to promote the interests of the State of Utah.

I want to say this that if there isn't enough water and we don't get any--we know where this water is going to be applied or feel we do--perhaps you can prevail upon a Kind Providence to give us a little more rain because we only get nine inches of that. (Applause.)

COM. WATSON: Five minutes' recess--have a chance to stretch a little --and then we will start again.

(4:15 p.m. Recess.)

(4:20 p.m. Hearing resumed.)

COM. WATSON: Gentlemen, we have some water users here that have travelled a long ways to get over here and we will not hold them any longer. Let us give them a chance to say a few words. A group from Millard County is here. We would like to hear from Archie Gardner, County Commissioner and President of the Millard County Water Users Association. Mr. Gardner.

MR. ARCHIE O. GARDNER, DELTA, UTAH: Mr. Chairman, ladies and gentlemen, I came here like a lot of the rest of you, to hear something and learn something. I am just a dirt farmer from Millard County.

I am like the man from Tooele; we have at least 150,000 acres of very fertile land if we had the water on it. And we are willing to cooperate any way we can to get this water over into our State and some of it down into our county, we hope. Thank you. (Applause.)

COM. WATSON: Mr. W. C. Cole, Water Commissioner on the Sevier River. Will you make a few remarks, Mr. Cole?

MR. W. C. COLE, DELTA, UTAH: Mr. Chairman, ladies and gentlemen, I have learned considerable here today and I am very glad that I came. I am from the same area that Mr. Gardner is from. We are from over in Millard County where we have lots of land, some years lots of water.

We have 150,000 acres of land that could be supplemented by water if it comes to us. We have another fifty, seventy-five thousand acres of land that are now idle that could be put under cultivation. A lot of it would be very productive land, fruit land, orchards, and so forth, along on the benches.

I hope this Commission goes ahead and does what it can do. I think the Millard County people are willing to take what we can get, and we hope that

they solve these problems as they come to them and everything works out all right. Thank you. (Applause.)

COM. WATSON: Mr. Dudley Craft, prominent water attorney living in Delta.

MR. DUDLEY CRAFT, DELTA, UTAH: Mr. Chairman, ladies and gentlemen, those of us from Millard County of course, are greatly interested in the development of any of the resources that can be made here in Utah, and particularly the water resources.

Every time we get out there in that big flat, which is the biggest valley in Utah, and look across the prairie of thousands and thousands of acres of good land that is not under cultivation or in development, it hurts us to hear Mr. Watson say he was down there and saw those thousands of second feet of water running into the Pacific Ocean not doing anyone any good. If there is any feasible way to utilize that water for the development of our country or any other part of Utah we would like to see it done.

We are down there where we are water conscious. Those people in that valley have done something that probably no other people in Utah have done; by their own efforts and their own development they have utilized all of the water resources down there. They built the largest artificial reservoir by far in the State of Utah. They capture and utilize every drop of water that comes down there. The thing is there is that vast amount of land that could be put under cultivation if additional water was available. (Applause.)

COM. WATSON: Prior to hearing from the Juab delegation, which has come a long distance, we would like to hear from Mr. J. A. Theobald from Price. He is Secretary of the Carbon County Associated Industries. Mr. Theobald.

MR. J. A. THEOBALD, PRICE, UTAH: Mr. Watson, Members of the Commission, ladies and gentlemen, coming from Price and representing the Carbon County Associated Industries, naturally we represent one of the big industrial sections of the State. Primarily we are interested in water. I think the more water we can get the better business we are going to enjoy and the better our industry is going to be.

I think when Senator Howard spoke earlier this afternoon with reference to diversion his thought was that we people in this area, on account of the geographical situation of Carbon and Emery Counties, cannot hope to lose any of the water we have. We really need every bit of the water that is originated in this particular section. True, we are losing a lot of it now, and if our neighbors feel that they would want the water we are losing, we are losing it because we don't have the facilities for saving it. If we would have the developments of reservoirs in this section that have been promised to us for years and years, we would be using that water and would have plenty of chance to use it. In any allocation of water Utah may get, we need much more water than we are getting at the present time.

Getting back to the other question that our good friend Mr. Wallace spoke of--and I am certain there is not a person in that part of the State or any other part who doesn't appreciate the wonderful efforts that Mr. Wallace has put forth for water. The argument that comes in all the time, the cost of the development of power--one of the reasons we can't develop power with the big beds of coal that we have is the fact that we don't have water for condensation. We have to have water with this, got to prepare it where the water is. If we had more water we could develop power, cheap power.

Another thing, our counties down here are unfortunate because they are in the area that carries the great part of the water we are talking about today. The Colorado River runs through Grand and part through Emery County. The tributaries that furnish some of that water come through Carbon County, and still with all of that water, we have not a chance to use any part of it.

We heard a lot about the return flow of the water. We could benefit by the return flow of the water if we had the opportunity of doing it. But we are situated right in here between two ranges so that no matter what is developed on the other side, we are not going to benefit by it.

True, as Mayor Stringham said, they have industries over there. We recognize those industries, and they are important to our own industry in this part of the country, and we want the development in that section. But in doing that we don't want to see a development brought out that may be injurious to any other section. But as has been said here from time to time, the prime purpose of this meeting is to go to work and allocate this water, allocate to Utah her just proportion and allocate to all the other states.

When this Board gets through with those studies, the thing they are going to have to determine, then when that is done, it is time enough for us people to find out and argue and quarrel how we are going to use that water here. But just keep in mind that the central part of this State, Carbon County, Emery County, and Grand County can use four or five times as much water as we have right now if they take away the water that is flowing down past us in the other part of the country. (Applause.)

COM. WATSON: Mr. Reeve G. Richardson, Nephi Irrigation Company, Nephi, Utah.

MR. REEVE G. RICHARDSON, NEPHI, UTAH: Mr. Chairman, ladies and gentlemen, I represent an area of Utah--I don't suppose it is particularly peculiar to that one county, we are not asking for water to create any large development to create an influx of population--what we need is additional water to serve the population we have there and their project. We reached our economic limit of development about fifty or sixty years ago because we were utilizing all the water that was available. We made reservoirs and did work to increase that supply and have been unable to. The only source of supply we would have would be transmountain diversions from the Green River.

At the time our resources were limited and our development stopped, our children whom we raised and educated left our country and followed the Colorado River water to California. There they have had to go to get a living.

Now we are asking for enough water to utilize the lands we have under cultivation to their full economic limit and to increase or give us an opportunity for industrial development, which is finally started there. You people have probably heard that the Thermoid Rubber Company is building there. We are having one awful time to stretch the water to give those people the acre foot and a half of water they will need. And with that in mind, when they are built and that acre foot is supplied, we have no room for further development unless we can get a little more water. And as I say, the Green or the Colorado is the source of that water and we want some of it. (Applause.)

COM. WATSON: Mr. W. C. Andrews, County Commissioner, Juab County.

MR. W. C. ANDREWS, JUAB COUNTY, UTAH: Mr. Chairman, Commissioners, ladies and gentlemen, Mr. Richardson has very vividly spoken in regard to our location. We have all the troubles of Tooele County and Millard County, and we are between those two counties. We have practically the same arid country to be developed.

As Mr. Richardson said, we have now come in on the industrial side of it. I was just informed the other day that they are now attempting to expand the Thermoid Company to two shifts of 600 men on the two shifts. Now they contemplate a city of 2500 growing to 6000 people within the next three years. I will just illustrate.

They thought the great thing was power with them and we fought it out against other cities and at last we got the Utah Power in there. They never thought of the water until they asked us to send a stream of water down so they could settle the dirt in order to put in their cement. Well, water--we couldn't furnish water to them. They come from New Jersey and Atlantic City, from the Atlantic Coast, and they couldn't understand why we couldn't furnish the water to settle the dirt before putting their cement in. That is the condition we are in.

The City has built a million gallon reservoir there. We have simply got to take the water from the farmers for culinary purposes. Water has raised from $50 a share capital stock up to $300 and we haven't any water to deliver for $300 and yet people are coming in that have heard of the Thermoid plant. A number of people are coming back from California, and there we are. We must have water, ladies and gentlemen. We must have water in Juab County. (Applause.)

COM. WATSON: Bert J. Sillman, Grand County Water Users, Green River, Utah.

MR. BERT J. SILLMAN, GREEN RIVER, UTAH: Mr. Chairman and gentlemen, I want to speak briefly on account of the lack of time. The people in the other counties have no monopoly on a lot of land that could be irrigated profitably.

The project I want to speak of is located in the Green River Valley on both sides of the river at Green River town and has been surveyed by the Reclamation Service. There are 15,000 acres readily available which could by a higher lift be increased. We are greatly interested in that. It is primarily a hydroelectric proposition.

We are greatly interested in the Dark Canyon Project about 85 or 90 miles south. It would seem that would not be a project in controversy between the Upper and Lower States. It would be mainly storage and power and a place to deposit silt.

Mr. Melich represents the eastern part of Grand County and he has told about Mill Creek above and what projects those people desire greatly. (Applause.)

COM. WATSON: Mr. Peter McElprang, Emery County, President of the Huntington Canal Company, Huntington, Utah.

MR. PETER McELPRANG, HUNTINGTON, UTAH: Ladies and gentlemen, Mr. Watson, I didn't come here to speak. I am a poor speaker. There is no use me telling you Commissioners anything.

We are over there in a little place, a bunch of poor people. We have got plenty of water in the spring of the year but in the fall, people are burning up. All we ask is a little assistance to let us build a few little reservoirs there to take care of what water we have got. People, we need it. We are all paying taxes now but if we can't store this water, it will be impossible and we will have to go on relief or something else. Thank you. (Applause.)

COM. WATSON: Mr. Clifton Wakefield, County Commissioner, Huntington, Utah. Is Mr. Wakefield here?

MR. C. N. WAKEFIELD, HUNTINGTON, UTAH: I haven't happened to listen in on the last two or three speeches that have been made here, but we in the Emery section, we have four rivers running through Emery County and each river has quite a runoff in the spring of the year but in the late summer, our streams dry up and we are terribly in need of water for the late crops. We can't raise anything in Emery County but hay and grain--row crops are impossible--because of the late water. It has been proven that we could raise sugarbeets, potatoes, crops of that kind if we had the late water.

Some of the associations are trying to build reservoirs themselves, spent a little money, not asking for any help, but we definitely need reservoirs on every creek in Emery County. If we can get that we will be satisfied. (Applause.)

COM. WATSON: We will now hear from County Commissioner Will Campbell, Carbon County.

MR. WILLIAM CAMPBELL, PRICE, UTAH: Mr. Chairman, gentlemen, I haven't made much of a study of this. I have today gotten more information than I have altogether in the years that I have been here. I don't believe I have anything to say that will be of any value or interest to you people here. Thank you. (Applause.)

COM. WATSON: We would like to hear from Attorney Gerald Irvine of the Utah Power and Light Company, who is here. (Applause.)

MR. GERALD IRVINE, SALT LAKE CITY, UTAH: We can't develop the State of Utah with the waters of the Colorado River flowing down into the Pacific Ocean. To develop the State and bring new industries into the State and develop our cities we have got to find some way to put the water to work, and the only way we can put it to work, as Mr. Wallace has said, is to obtain title to the water so that the Federal Government will be willing to assist us.

Naturally we are, as all of the rest of you are, very much interested in development of the State of Utah. We have watched Mr. Wallace for a number of years and Dr. Widtsoe in their very fine effort in this behalf, and we are very much interested in the projects and of course endorse what has been done here today. (Applause.)

COM. WATSON: We would like to hear a few words from Tom McCoy of the Municipal League.

MR. TOM McCOY, SALT LAKE CITY, UTAH: Mr. Chairman, my purpose in being here is to learn what your problems are and I am very happy to be here but I don't believe I can add anything to the meeting at this time. Thank you. (Applause.)

COM. WATSON: I would like to introduce one gentleman who has done excellent work and is known nationally, one of our engineering advisers who has contributed considerable to our engineering work, Mr. Clarence S. Jarvis. (Applause.)

MR. C. S. JARVIS, SALT LAKE CITY, UTAH: I heard somebody say that his friends had accused him of having water on the brain. Well, I was associated with Joseph R. Murdock and they used to say that about him. He is a grand old man. He would go after water wherever he found any trace of it and I was his engineer for some years on the Provo Reservoir, Utah Lake irrigation, Union

Reservoir--that is a development of the lakes at the head of the Provo River. And finally I had something to do with the enlargement of the Sevier Bridge Dam.

I have had practical experience with the Chief of Engineers in Washington and especially in the last unpleasantness. And I should say that it will take the application of all the experience that has ever been stacked up in trying to find the way to solve this Colorado River problem, and I am with you on that. (Applause.)

COM. WATSON: I had overlooked one name that I was just reminded of, Mr. Ervin Wimber of Castle Dale.

MR. ERVIN WIMBER, CASTLE DALE, UTAH: Mr. Chairman, Members of the Commission, ladies and gentlemen, I have been very interested in water development throughout Southeastern Utah for many years. I feel like a good many other gentlemen expressed themselves here today, that these waters in this State of Utah are the life blood of the State.

Before we can carry on or go on for any future developments in industry and agriculture and all the way through, I think we have got to have this water developed. As far as transmountain diversion is concerned I feel that it would be a fine thing inasmuch as power developments I think would go along hand in hand with coal developments. I don't feel that the power interests would hamper the development of coal in this section at all, although I feel that our small reservoir projects throughout this Southeastern Utah should be guaranteed and that we should have a right to develop this water along with the rest of the waters of this State. (Applause.)

COM. WATSON: I should like to hear a few words from Dr. F.R. King.

DR. F. R. KING, PRICE, UTAH: Mr. Chairman, ladies and gentlemen, I came in a little bit late but I will venture to say there was quite a little accurate information distributed before I came in if we are to judge from what I have heard since I did come in.

And nothwithstanding the fact that I have been living in this state a good many years, I learned a few things today. The title of the water is paramount, as our friend Wallace advises, and of course that is the object of this meeting, to get an equitable division of that water. After that the problems that arise can be settled as they come along.

I don't think I could add a thing to what has already been said and I don't think I have any information in addition to the information that you gentlemen have. Thank you. (Applause.)

COM. WATSON: Ladies and gentlemen, I wish to compliment you on making your remarks brief and to the point. You know words are like the rays of the sun: When they are dispersed they don't burn but when they are focused they have power.

Now there may be a few I have overlooked and I wish you to forgive me for overlooking you personally, but if you are here and wish to say anything, you now have the opportunity to volunteer.

MR. WILLIAM R. WALLACE, SALT LAKE CITY, UTAH: Mr. Chairman, I am afraid you might overlook me. There is just one little statement that I would like to put in that record for the benefit of your group. The State of Utah covers 54,000,000 acres; 300,000 acres is the limit of the watered

lands in the State of Utah that have a full season water. We have 1,300,000 or in that neighborhood that we are trying to irrigate, but 1,000,000 acres of this 1,300,000 have a deficient water right.

Nothing could be more impressive than that statement in proving to you the necessity for our having our full and equitable share of the waters of the Colorado River. (Applause.)

COM. WATSON: Are there further remarks anyone wishes to make?

MAYOR B. H. STRINGHAM, VERNAL, UTAH: Mr. Watson, if you are about to close I think we should go on record as giving the Commission a vote of thanks for this fine, democratic opportunity for expressing ourselves. May I so move? (Second.)

COM. WATSON: It has been moved and seconded that we thank the Commission for this democratic opportunity of expression. (Thereupon a vote was taken and the motion of Mayor Stringham carried unanimously.)

MR. WALLACE: Off the record. (Remarks off the record.) I think every man here ought to have a word to say.

COM. WATSON: Every men has an opportunity.

MR. J. EARL LEWIS, PROVO, UTAH: I have been intensely interested in this fine opportunity that we have been extended by the Commission this afternoon. It is needless for me to say that we are interested in getting more water in Provo and in Utah County; that has been previously said. But we are not the only county in the State. Every county in the State and every vicinity in the State has the same problem and should have an equal opportunity for development.

Last week I had the privilege of attending a convention in San Francisco, a water works convention. At this convention there were representatives from California, Southern California especially, and Arizona. And I came here with a firm conviction that unless we in the Upper Basin States work unitedly and work now we are going to lose some of our water to California and to Arizona. It is time for us to move and to move rapidly right now.

In this State we are a large, homogeneous lot. We don't have selfish interests of any particular area in the State. We can't isolate ourselves. But we are so knit and united together that we should ever act jointly for the benefit of this State and for the good of this State expend united efforts to obtain for Utah its just share of the water.

And we urge this Commission to be fair in what they do and give us just our just share. We are not asking for any more, not a drop more, only our just share. Then we who sit here strategically located in a fine spot where agricultural development may be had and industrial development may be had, then we will have the means for that development and it will accrue to the benefit of the United States. (Applause.)

COM. WATSON: I understand that Vasco Tanner of Provo is here. We would like to have a few words from him.

MR. VASCO M. TANNER, PROVO, UTAH: Vasco M. Tanner, Vice President of the Public Utility Board, Provo City; also connected with Brigham Young University.

We in Provo feel keenly the need of additional water as has been said

by our Mayor and Commissioner and Mr. Jacob, who is the Superintendent of our Utilities. We are especially anxious to have water for one reason, that of developing hydro power. We have great need for cheap power in Utah County and we believe that by bringing water from the Green River or some tributary of the Colorado River, bringing it over the Wasatch and developing power from it, and then diverting it into agricultural areas, that we can greatly enhance that part of the State of Utah and in turn enhance this Western area. Thank you. (Applause.)

COM. WATSON: We wish to hear from Mr. Harold R. Morris of Delta. (No response.) We have a lady present, Mrs. Mayme Jameson; it would be a shame to adjourn without calling on her for a few words. Mrs. Jameson. (Applause.)

MRS. MAYME JAMESON, DESERET LAKE, UTAH: Mr. Watson and Commissioners, I am very interested in water. I found out last summer that my land wasn't worth two bits an acre without any water on it. We had 125 acres of beans planted and in the early part of the season we could put on 30 or 40 rows of water; it went down to 20, then 10, then one or two, and I went up the creek and there wasn't a drop of water and we went the rest of the summer without any water.

We want to have Emery County water developed. We feel that we have water there if we can take care of it, but we don't want Sanpete to tunnel through the mountain and take our water that is up around the mountain. (Applause.) If you can take it from the Colorado River and up through Provo and scatter it through Sanpete we will be glad to see it. Any water that runs from Emery County down into the Colorado River, they may have that. And we will appreciate anything you folks can do for us. Thank you. (Applause.)

MR. WILFORD J. HUMPHREY, ORANGEVILLE, UTAH: Some of the gentlemen from Delta and down in that country say their boys go to California. You saw Mr. Wimber going by. For lack of water he went to the coal mines and he lost his leg; most of our boys lose their lives. If we don't get more water through Emery our boys have got to go to the coal mines. We haven't asked for much water but we would like what water goes by stored in our reservoirs. (Applause.)

COM. WATSON: We are going to get everybody. Who else hasn't spoken? Mr. Thomas Latimer, City Engineer from Provo, is here. He and I used to go to school together. I believe he will say a few words.

MR. THOMAS H. LATIMER, JR., PROVO, UTAH: You have got me on the spot, Ed. As it has been stated, Provo's interest is very much in the way of production of power and we want to get what we can but we don't want to get it to the detriment of anyone else. We are Utahns and we also are Americans. Thank you. (Applause.)

COM. WATSON: Mr. Feltch.

MR. FRANCIS FELTCH, VERNAL, UTAH: We would like to have our first say and get in toward the end also.

There is just one point that I think the boys from our section didn't mention. No doubt you people know all about it but in the Echo Park Project, which we feel is the key to the Central Utah Project, there is just a little bit in Colorado and we would like to have our Commissioner from Colorado know that there is going to be a lot of surplus power and water for their section of the state. (Applause.)

MR. C. S. JARVIS, SALT LAKE CITY, UTAH: Wouldn't it be in order to have introduced to this assembly Mr. Wilson, who is in charge of water measurements, which is so important as we develop this project?

COM. WATSON: Mr. Wilson in charge of the U. S. Geological Survey stream measurement. Mr. Wilson.

MR. M. T. WILSON, U.S.G.S., SALT LAKE CITY, UTAH: You want me to say a few words?

COM. WATSON: Yes.

MR. WILSON: There isn't much that I could add that wouldn't be a duplication of or supplemental to the report that Mr. Riter has just made. Some of you may not be entirely familiar with the place of the Geological Survey in this water development. Geological Survey is responsible for collecting the basic information, for operating these gauging stations which Mr. Riter has explained to you in working up the water supply for the different sections. He has covered in considerable detail the water supply in the Colorado River Basin and some of the difficulties. You may be interested in some of the recent work that the Geological Survey has been doing.

He mentioned the fact that our streamflow measurements are lacking in many localities--I am speaking principally for the Utah section because the work we handle out of Salt Lake City covers Utah and Nevada and our work is in cooperation with Mr. Watson, the State Engineer, and the other Federal agencies in collecting this basic information.

Prior to 1941 we were operating in cooperation with the State of Utah only 20 gauging stations in the Colorado River Basin. That of course has been greatly increased since that time in Utah. At this time we are operating 60 gauging stations in Utah and many of those have been installed at the request of the Bureau of Reclamation.

Some very recent work that we have been doing, a boat trip was just completed on the Colorado and Green Rivers. A party of four with two boats left Linwood, Utah, at the Wyoming-Utah State Line and travelled down the River all the way to Lee's Ferry, measuring all the tributary inflow to the Colorado and Green Rivers. In addition we measured the main stem at strategic points between 50 and 100 miles apart. When this boat party reached Green River, Utah, one boat was taken overland to the Colorado-Utah State Line and continued from there down to the junction meeting the first boat and then continued on down to Cataract Canyon and Lee's Ferry.

Those measurements have just been tabulated but they have not been analyzed. To give you a brief picture of some of the possibilities of this work: In a section of the River Linwood to Taylor Ranch, for a distance of 50 miles, the tributary inflow measured was 60 second feet. The measurement of the River at the State Line and the measurement of the River at Taylor Ranch showed a difference of 11 second feet. In other words, we lost by evaporation, probably by evaporation and transpiration, 49½ second feet in that reach of the River. That is a solution to some of the problems that will be faced in this Commission.

In the next reach of the River down to the mouth of the Lampa there was an apparent loss of 7.6 second feet. That is some of the work that the Survey is doing at the present time in cooperation with the State of Utah.

It has been mentioned here that the silt problem in the Colorado River Basin is a very serious one. The Geological Survey is maintaining base gauging

stations on the Green River at Green River, Utah, and on the Colorado River below Cisco and on the San Juan River at Bluff, where in addition to the streamflow measurements we are obtaining considerable information as to the silt carried in the Colorado River, and that work is also being accomplished in the Lower Basin.

The silt suspended in the Colorado River passing Lee's Ferry is really surprising. The average silt is one-half million tons passing the Lee's Ferry gauging station! The silt records kept on the Green River, Colorado River, and San Juan River accounts for 60 percent of that silt. The other silt contributed comes primarily from the area between these stations and Lee's Ferry, which we know very little about. Last fall in cooperation with the State Engineer we established gauging stations on the lower Price River, on the San Rafael, on the Dirty Devil, and we are now starting to collect silt samples at those stations which will help us determine where our silt is coming from.

UNIDENTIFIED VOICE: Half a million tons for how long?

MR. WILSON: The average silt passing Lee's Ferry is a half million tons each day. Thank you. (Applause.)

COM. WATSON: I wish to say this, ladies and gentlemen, that the State Engineer's office cooperates with practically all Government agencies and that cooperation has been very, very profitable and very pleasant. There has been no evidence of this so-called bureaucracy we read of in the papers at all. Everything has been thoroughly cooperative and the state laws have all been kept. So as far as I am concerned in the State of Utah, I know nothing about this claim that the newspapers make of bureaucracy. In fact, I think the bureaucrat is a job that someone has that a guy on the outside doesn't have and wants to get. Our association with the Bureau of Reclamation, the U.S.G.S. and all the agencies have been very pleasant.

Now, Mr. Larson, have you or anyone in your group anything to say?

MR. LARSON: No.

COM. WATSON: The Chairman will call upon the Commissioners so I will now turn the meeting over to the Chairmen of the Commission.

THE CHAIRMAN: On behalf of the Commission the Chairman extends thanks to each and every one of you that has appeared here today and for the contributions that you have made in the way of suggestions. I want to compliment those who have spoken on the brevity and yet to-the-point remarks. These meetings seem to become more interesting the farther we go. Tom, we are expecting great things at Farmington.

Before I call on the Commissioners to make a few remarks I want to refer to the matter of feasibility of projects which was brought up here today by several speakers and very well explained by Mr. Larson. It is a very difficult thing today to say what is a feasible project. Your Chairman is speaking now as an individual and not as Federal Representative or even as Chairman. But costs have risen on these projects and I am wondering if there is a project that is feasible at all under the present Reclamation laws in the Colorado River Basin.

So it would seem that if you expect to have development in the Colorado River Basin it will be necessary for complete unanimity and agreement and to secure something like the authorization and approval that was obtained in connection with the Missouri Basin development on which Commissioner Stone,

Commissioner Bishop, and my legal adviser, Jeff Will--and I would like to have him stand up at this time (Mr. Will stands)--worked with me in securing authorization. I think we are all rather proud of our accomplishments on that but it took great effort and great work and a united front, and the Missouri Basin was authorized as a result of that.

The fundamental principle of reclamation was kept in that authorization in that the farmers are required to pay what they are able to pay.

That is a special authorization and in my humble opinion you will not get these great developments on the Colorado until this Compact is consummated and until you can present a united front for concurrent construction in these various states. You will all have to be agreed on it and go forward together.

At this time the Chairman wishes to call on Commissioner Carson of Arizona to make any remarks that he wishes to make.

COM. CARSON: Mr. Chairman, gentlemen, I think that I should explain, perhaps, briefly why Arizona is represented on this Upper Colorado River Basin Compact Commission. You have thought of Arizona always as a Lower Basin State, which is our primary interest. But we also under the definition of the Upper Colorado River Basin made by the Colorado River Compact are an Upper Basin State.

We have some 6600 square miles of Arizona which is in the Upper Basin so that in the apportionment of the Upper Basin water, that 6600 square miles is entitled to a share. It will not require much water for that. Most of it is on the Indian reservation and our engineers say that it is not possible to divert water from the San Juan River or the main stream of the Colorado back up onto that Indian reservation land. So that it will share in any compact negotiated only to the extent of the water that falls on it which cannot be used in any other Upper Basin State, which will be small in quantity; and there will be a very small quantity from the Paria River and that will be the extent of our participation in the water of the Upper Basin.

But now on account of some other remarks that were made I would like to speak briefly for Arizona as a Lower Basin State. Arizona is a part of the Lower Basin. The division of water of the Colorado River system between the Upper Basin and Lower Basin is made by the Colorado River Compact. Arizona is a party to that Compact and Arizona respects her commitments and agreements, and Arizona does not now or at any time in the future intend to infringe in any way upon the water of the Upper Basin which we have agreed that you may beneficially consume. We are not a party to any of the California attempt to block any development in the Upper Basin or to claim any part of the Upper Basin water. We are in fact ourselves in a fight with California in our attempt to utilize our share of the water apportioned to the Lower Basin, which California is apparently determined to block if possible.

So our battle is not with the Upper Basin at all. We have agreed with the Upper Basin as to their use and as to our use in the Lower Basin, but we do have a battle with certain California interests who propose, apparently, to block our effort to use our share of the Lower Basin water, and I believe also to block any effort of the Upper Basin to use its share of the Colorado River water.

It seems to me that insofar as that situation is concerned, we and the Upper Basin have a common interest to promote the development of the use of water in the Upper Basin which is apportioned to the Upper Basin and that part of the water of the Lower Basin which by California Limitation Act is effectively apportioned to the State of Arizona.

In approaching the Upper Colorado River Basin Compact I want you to know that I, and I think all of these Commissioners, realize fully the tremendous task and responsibility which we are undertaking. We are approaching it as carefully and as painstakingly as possible because we know that the thing that we do must be ratified by the legislatures of the various states and when and if so ratified will affect the development and progress of every state of the Colorado River Basin for many years to come. So we want to be careful. We want to be as careful as we know and as fair as we know.

The function of the Commission, however, is merely to apportion water between states as states. It cannot apportion water between projects within states. As I view it when the apportionment is made and becomes effective, then the state law will take charge of the share of the state water and will govern its utilization and administration. Thank you. (Applause.)

THE CHAIRMAN: Commissioner Bishop, do you have a few remarks to make?

COM. BISHOP: Yes, Mr. Chairman, I might make a few remarks. Ordinarily I come last on account of "W" being the last letter of the group. I appreciate being called on ahead of my turn.

First, ladies and gentlemen, I want to say that I am glad to be with you and I am glad to go to these meetings and listen to the problems of the people of the other states. Your problems in all of the other states are much the same as our problem. In Wyoming we have over a million acres of land that can be irrigated from the Colorado River. More than half of that land is desirable, irrigable land. We too have great industrial possibilities and we need lots of water. We probably need more water than our equitable share. I realize that is one of the problems this Commission has got to solve. I for one am glad to sit in and help to solve that problem. I know it is a difficult problem to solve. The record of yesterday shows concerning matters that I wished to go in the record and I will not go as far today as I did yesterday.

Regardless of the basis used by this Commission for dividing this water, we believe our needs will be fairly considered. As I stated yesterday at Grand Junction, I hope to see this Commission go ahead and complete the negotiations and not wait for completion of the work of the Engineer Committee. Regardless of the accuracy of their work it is agreed by most of us that their findings will not be used as a basis for division of the water; it will merely be a factor among its considerations.

I will conclude by saying that I believe in all of the states the supplemental needs in the Basin should come first in the Basin--I want to stress that. This is a matter to be considered in each state and is of no concern to the Commission once the water is divided; but as a member of the Commission I pledge first consideration to these supplemental needs whenever called to my attention. I thank you. (Applause.)

THE CHAIRMAN: Commissioner Stone of Colorado.

COM. STONE: Mr. Chairman, ladies and gentlemen, the principal purpose of our appearing here today is to obtain the views of those who are primarily and directly interested in the utilization of the Colorado River waters. It is therefore a privilege and a pleasure to come and meet and hear so many speak and so many explain the great need of and their interest in the development of the Colorado River.

I enjoy always coming to Utah where you have an outstanding citizen, not only of Utah but of the entire Colorado River Basin, a man who for many years, ever since the Colorado River Compact, has worked not alone for Utah--although he has done a good job there--but for the interests of the Colorado River Basin and particularly for the interests of the Upper Basin. I refer to our good friend, William R. Wallace. (Applause.)

I had not known personally another gentleman in Utah but perhaps he does not know how well we know of his work in Colorado. Some of it was almost pioneering work in developing some of the details of water utilization. We had the pleasure of meeting him this morning, Dr. Widtsoe, and we were so glad to have him with us. (Applause.)

Here today, as is perfectly natural, we have heard much about the apportionment among the states of that block of water which was allocated to the Upper Basin by the Colorado River Compact. That allocation to us for beneficial consumptive use carried with it an obligation and, if you please, it was an obligation under a solemn compact. I refer to the obligation of making deliveries from the Upper Basin of water at Lee Ferry. That must indicate to you clearly that difficult as the tasks may be for this Commission to allocate water, it becomes even more difficult when we must determine the respective obligations of these four states of the Upper Division to meet our requirements under the Colorado River Compact at Lee Ferry.

We became signatory to that Compact and I believe that I speak for all of the states when I say that we mean to carry out the agreements which we made under the Compact. If we make a compact here--and I sincerely trust that we shall--then it must be a compact which will be not only ratified by the states but one which the states will sincerely as sovereign states carry out after it is ratified and approved by Congress. We cannot emphasize too much in approaching and carrying out the job we have assigned to us, the importance of determining the just and equitable obligations of these states which are placed upon us under the Colorado River Compact. When we think of the benefits through allocation of the waters we cannot in this Commission forget the obligations.

Some of the other speakers have emphasized this point but I wish to touch upon it briefly, namely, the primary obligation in making allocations to the respective states of the Upper Basin. Our job is tough enough in determining what is equitable and fair so far as each state is concerned. I might say that we should thank God that we don't have to determine the internal problems within each state. That is the job which you of Utah and which we of Colorado must determine ourselves when we know how much water constitutes our share of the Colorado River.

We heard some remarks here today about transmountain diversions. That too is your problem. I might only remark that we have the same problem in Colorado. However, we have established in Colorado by common agreement a definite formula upon which we believe transmountain diversion can be carried out and without injury to the basin from which the water is taken. It is the established policy in Colorado that no water shall be taken from the natural basin for exportation to another basin except that we protect in such exportation the present and the prospective uses, if you please, within the basin. Where there is additional water supplies over and above what can be used beneficially within the basin, then we believe that to the extent that it is within the state's equitable share, we would rather use it without the basin in Colorado than permit it to flow down the river for the use of some other state. In that way only can we accomplish the use of all of our share of the water.

Just one other question: You were presented here an explanation of

of the work of the Engineer Committee. For one I deem that of extreme importance. It has been said here today, and in other meetings, that those pioneers who wrote the Colorado River Compact did not have as much information as we have today. It has been intimated perhaps the compact would have been different as approved by the states if that information were available. Likewise it has been said here today that we are more fortunate, we have more studies, we have more data, we should do a better job. However, we shall be derelict in our duty if we do not make full use of that data through the engineering committee which the Commission has set up. We may even breed trouble in the future unless in determining the allocations we have the basic data not only available but fully understood and analyzed.

It has also been my observation in making other compacts that in working out the basic data, in appraising the physical facts, we resolve amicably many questions which otherwise would lead to controversy. It is just like anything else, no man wants to proceed and speak with respect to the rights and interest of his neighbor or a neighbor state unless he knows whereof he speaks; particularly is that true when we are looking so far into the future.

I think it was so well brought out here that we have a common interest. These five states constitute an empire. We must grow together. We must develop together. Likewise we must be fair and fully recognize each other's interest in making an equitable apportionment. That word "equitable" is the important thing. Sometimes we call upon the courts to determine "equitable apportionment." Here we are attempting to do it as has been done in other cases, by amicable relations and the working out of amicable adjustments, and determine just what is equitable. It is easy to use the term but it is not so easy to apply it.

But we must keep in mind that we have a common interest and if we show our capacity to take care of our common interests, to that extent we retain some of those rights for which as states we have been fighting for so many years. We cannot enjoy those rights without assuming at the same time the obligation of showing that we can use those rights and exercise them in an equitable and fair way on interstate streams.

It has been mentioned here that this compact must be ratified. That cannot be too fully emphasized. The Commission does not make a compact. It is engaged in negotiating a compact. That compact is made by our respective legislatures when they ratify it and even then it must be approved by Congress. If we proceed cautiously, if we can go before our legislatures and sustain our action by the facts, if we proceed with a full knowledge of the far-reaching effect of what we do, then I think we have a reasonable chance of obtaining ratification by our several legislatures. That is the democratic way, That is the way by which our people through the legislatures appraise our work; and a careless job I fear will not be appreciated. We should proceed cautiously and we want to do a fair and equitable job.

I assure you that within those limits the State of Colorado will attempt to expedite the making of a compact. (Applause.)

THE CHAIRMAN: Commissioner McClure of New Mexico.

COM. McCLURE: Mr. Chairman, ladies and gentlemen, I don't believe there is much I can add to what has been said by Com. Carson and Judge Stone. I think we all fully realize the problems that we are going to have to meet in these negotiations.

The only thing I wish to do is to thank the people of Price and the various counties who have appeared here. Their observations and views in regard to their various projects have given us a better viewpoint from which we can realize each state's needs, which will help us in arriving at an equitable allocation of these waters, which is our duty. I believe that is all. Thank you. (Applause.)

THE CHAIRMAN: Commissioner Watson, as you gave such an interesting historical recital and conducted this meeting so ably, I will not impose upon you by requesting any further remarks unless you wish to make them.

COM. WATSON: Thank you very much.

THE CHAIRMAN: Now you all realize that this Commission has a tremendous job, but your Chairman is very happy to say that we feel we can work the matter out.

Your Chairman is not a complete stranger to Utah. In fact, there is one man here that I think I have known longer than I have any of you. Consulting Engineer Jarvis and I were in the University together and I always looked upon him with great admiration and respect because as I recall he was the honor man of our class. I am very happy that we are going to have his assistance in working out this problem.

Another man, Dr. Widtsoe, I think I have known for about twenty-two years, and I knew of him before that by reading his articles and his books. I am very happy to have Dr. Widtsoe here today. We have kept up our acquaintance from time to time. He used to visit the Commissioner of Reclamation in Washington and I was always happy to see him.

Mr. Wallace is another old acquaintance of mine and I have known of his works longer than I have known him; but the longer I have known him the more I have admired him for his wisdom and his counsel.

With that same spirit of cooperation in all of these states and with the best technical help and experience I am sure that this can be worked out. Your Chairman realizes it is a tremendous job as well as anyone else. The President appointed me Federal Representative in July 1946. That was after I had retired from the position of Commissioner of Reclamation and I had made up my mind I was through with Government work. I didn't want anything more to do with it, I thought. But when Commissioner Straus called me up on the telephone one day and said the President was thinking about making the appointment and wanted to know if I would accept it, I just couldn't resist it because I thought here was an opportunity to render a real public service.

I have followed this reclamation work for about forty years and I am thoroughly sold on the benefits of reclamation. I assure you that I am going to do all I can to ride herd on the Commissioners, crowd them along, help them if I can, and work out the job in a thorough, fair manner.

I don't know if there is any further business to come before the meeting today. If anything has been overlooked we will be glad to have our attention called to it. (No response.)

If not, a motion for adjournment is in order.

COM. STONE: I so move.

COM. WATSON: Second the motion.

of the work of the Engineer Committee. For one I deem that of extreme importance. It has been said here today, and in other meetings, that those pioneers who wrote the Colorado River Compact did not have as much information as we have today. Farmington,

New Mexico

APPEARANCES

UPPER COLORADO RIVER BASIN COMPACT COMMISSION

Membership as listed at Rock Springs, Wyoming, Session (page 1)

Chairman, Acting Secretary, and all Commissioners present except Thomas M. McClure, Commissioner for the State of New Mexico, Commissioner McClure appearing by Fred E. Wilson

---

ADVISERS

TO THE CHAIRMAN:

J. G. Will — Assistant Chief Counsel, Bureau of Reclamation, Washington, D. C.

J. Stuart McMaster — Counsel, Bureau of Reclamation, Salt Lake City, Utah.

TO THE COMMISSIONER FOR COLORADO:

Jean S. Breitenstein — Attorney for Colorado Water Conservation Board, 718 Symes Bldg., Denver, Colorado.

TO THE COMMISSIONER FOR WYOMING:

Emil C. Gradert — Compact Commissioner, Fort Bridger, Wyoming.

EXECUTIVE SESSION AT FARMINGTON, NEW MEXICO
SATURDAY, NOVEMBER 2, 1946

The meeting was called to order by Chairman Bashore at 8:00 a.m., and discussion was had off the record.

COM. STONE: Mr. Chairman, I move that the Commission create a Legal Advisory Committee consisting of one member designated by the Commissioner for each signatory state and one designated by the Federal Representative; that Charles A. Carson, the Commissioner for Arizona, be the member for Arizona and the Chairman of the Committee; and that the Legal Advisory Committee be authorized and directed to make studies respecting the necessary clauses of the compact now being negotiated and all legal questions that may be referred to it by the Commission.

COM. WATSON: Second the motion.

THE CHAIRMAN: Any discussion? (No response.)
Whereupon a vote was taken and the motion of Com. Stone carried unanimously.)

THE CHAIRMAN: Com. Stone, will you designate the Legal Adviser for Colorado?

COM. STONE: Jean S. Breitenstein for Colorado.

THE CHAIRMAN: Com. Bishop?

COM. BISHOP: Louis J. O'Marr for Wyoming.

THE CHAIRMAN: Com. Watson?

COM. WATSON: Mr. Chairman, I would like to take this matter under consideration and report at an early date to Mr. Carson, the Chairman of the Legal Advisory Committee, and to the Secretary of the Upper Colorado River Basin Compact Commission the name of the Legal Adviser to the Commissioner for Utah.

THE CHAIRMAN: It is the understanding of the Chair that the Commissioner for New Mexico desires to confer further with his prospective appointee to the Legal Advisory Committee and after so doing will notify the Chairman of the Legal Advisory Committee and the Secretary of the Commission.

The Chairman suggests that Mr. Carson, the Chairman of the Legal Advisory Committee, correspond directly with Mr. Will, the Assistant Chief Counsel of the Bureau of Reclamation, who will see to it that a Legal Adviser of the Federal Representative will participate in such studies.

Is there anything further?

COM. WATSON: Move we adjourn.

THE CHAIRMAN: Do I hear a second?

COM. STONE: Second.

THE CHAIRMAN: Any discussion of the motion? (No response.)
Whereupon a vote was taken and the motion of Com. Watson carried unanimously.)

(9:40 a.m., November 2, 1946, meeting adjourned to 10:00 a.m., November 2, 1946, at the Masonic Hall, Farmington, New Mexico.)

Membership as listed at Rock
Springs, Wyoming, Session
(Page 1)

Chairman, Acting Secretary, and all Commissioners present except Thomas M. McClure, Commissioner for the State of New Mexico; Commissioner McClure appearing by Fred E. Wilson, Special Assistant Attorney General and Attorney for New Mexico Interstate Stream Commission, Albuquerque, New Mexico.

COLORADO:

Jean S. Breitenstein	Attorney for Colorado Water Conservation Board, 718 Symes Bldg., Denver, Colorado.
D. W. Sexton	Secretary, S. W. Water Conservation District, Durango, Colorado.
J. R. Williams	Deputy State Engineer, Durango, Colorado.
Archie B. Toner	Southwestern Water Conservation District, 1407 South College, Fort Collins, Colorado.

NEW MEXICO:

I. J. Coury	N.M. Interstate Streams Commission, Farmington, N. M.
Ed H. Foster	New Mexico Reclamation Director, Farmington, N. M.
A. J. Neff	Farmington, New Mexico.
Paul B. Palmer	Hammond Project and Navajo Indian Rights, Farmington, N. M.
Wm. P. Longhurst	Hammond Project, Farmington, N. M.
Lui Casazza	Animas Project, Farmington, N. M.
N. H. Knight	Farmington, N. M.
J. R. Cunningham	Farmington, N. M.
Orval Ricketts	Press, Farmington, N. M.
Joe B. Christy	S. C. S., Farmington, N. M.
Mather M. Fakes	LaPlata Conservancy District, Farmington, N. M.
Robert L. Maddox	Natural Gas Producer, Aztec, N. M.
Johnston Jeffries	Attorney, Aztec, N. M.
C. A. Ransom	Retired Real Estate Dealer, Aztec, N. M.
Joe Mangum	Hammond Project, Bloomfield, N. M.
M. L. Feverino	Bloomfield Irrigation District, Bloomfield, N. M.
John C. Bergin	Bloomfield, N. M.
Dave A. Martin	Secretary, Bloomfield Irrigation District, Bloomfield, N. M.
N. W. Strand	La Plata, N. M.
A. H. Greenwood	La Plata, N. M.
John E. Harris, Jr.	La Plata, N. M.
W. Carlos Powell	La Plata Conservancy District, Santa Fe, N. M.
H. F. Thatcher	Farmington Lions Club, Farmington, N. M.

UTAH:	
William R. Wallace	Pres., Utah Water Users Ass'n., Salt Lake City, Utah.
Thos. W. Jensen	Utah Water Users Ass'n., Mt. Pleasant, Utah.
C. S. Jarvis	C. E. with State Engineer's Office, Salt Lake City, Utah.
WYOMING:	
E. C. Gradert	Assistant Compact Commissioner, Fort Bridger, Wyoming.
BUREAU OF RECLAMATION:	
J. G. Will	Assistant Chief Counsel, Washington, D. C.
J. R. Riter	Chief, Hydrology Division, Denver, Colorado.
N. B. Bennett, Jr.	Branch of Project Planning, Washington, D. C.
E. O. Larson	Regional Director, Region 4, Salt Lake City, Utah.
A. A. Batson	Acting Regional Director, Region 7, Denver, Colorado.
A. N. Thompson	Assist. Regional Director, Region 5, Amarillo, Texas.
J. Stuart McMaster	Counsel, Region 4, Salt Lake City, Utah.
John J. Hedderman	Durango, Colorado.
A. I. Gabardi	Durango, Colorado.
F. A. Anesi	Durango, Colorado.
R. C. Brown	Monte Vista, Colorado.
D. M. Forester	Monte Vista, Colorado.
John L. Mutz	Albuquerque, N. M.
U. S. GEOLOGICAL SURVEY:	
Berkeley Johnson	Santa Fe, N. M.

SESSION AT FARMINGTON, NEW MEXICO
SATURDAY, NOVEMBER 2, 1946

The meeting was called to order by Chairman Bashore at 10:10 a.m., Saturday, November 2, 1946.

THE CHAIRMAN: The meeting will now come to order. It is now ten minutes after ten and we would like to proceed with the work of the Commission.

At the Santa Fe meeting, Meeting No. 2, of the Upper Colorado River Basin Compact Commission, the Commissioners decided that in connection with the next meeting, Meeting No. 3, there should be held a series of field hearings or meetings within the Upper Colorado River Basin States, one meeting to be held in each state. The Commission has held three meetings, one at Rock Springs, one at Grand Junction, one at Price, Utah, and this is the fourth meeting, and so far as the Chairman is aware, it will be the last field meeting to be held by the Commission.

This field meeting is first and last and primarily to give the people that are interested in the development of the Upper Basin an opportunity to have their say, to give the Commission any advice that they may feel should be given and to furnish any information that they think would be valuable. And so if you don't take part in these meetings, it's your own fault; you are afforded the opportunity. Any remarks that you make will be welcomed by the Commission because we are here to learn the wishes of the people. I don't know of any better way to do it than to just go right out in the field and hear what the people have to say.

The Commission is working as expeditiously as possible. This morning the Commission decided to put the lawyers to work. So far it has been all engineers getting data together and the lawyers have had a relatively easy time. But the Commission decided this morning that it would put the legal advisers to work so that no time would be lost in the negotiations in the formulation of the Compact.

Following the procedure that has been followed at the other meetings, the Chairman desires to turn the meeting over to the gentleman who is this morning acting for Commissioner McClure from New Mexico. We now call on Judge Fred E. Wilson to take charge of this meeting. Judge Wilson is better acquainted with you folks than I am, some of you at least, and he will call on you and we hope you will feel free to say whatever you have to say. We don't expect finished orations. Express what you have to say in your own language and it will be welcome. Judge Wilson.

JUDGE FRED E. WILSON: Mr. Chairman, Members of the Upper Colorado River Basin Compact Commission, and gentlemen: At the request of the Chairman of the Commission and also at the request of Mr. McClure, Commissioner from New Mexico, I have agreed to act as chairman of this meeting. As all of you know, I assume, Mr. McClure is in Farmington quite ill in the hospital and can't be here today.

The Chairman has made a very clear statement to you as to the purpose the Commission had in mind in calling these field meetings within the Basin. As he explained to you, the first meeting was held at Rock Springs, Wyoming, last Monday; followed by a meeting at Grand Junction, Colorado, Wednesday; and a meeting at Price, Utah, Thursday; and this is the last of the series the Commission decided to hold in the field.

I think that the people of New Mexico and of San Juan County in particular, appreciate the fact that the Commission decided to hold these

meetings. As stated by the Chairman, the Commission desires to hear first-hand from some of the citizens of New Mexico and San Juan County just what your interests are in the San Juan River, and to make whatever suggestions you may have on your mind as to the solution of the problems of an equitable allocation of the use of the water among the five states.

I am not going to take much time but briefly I want to say that as most of you gentlemen know, our rights to participate in any allocation of the waters of the Colorado River system are based upon the Colorado River Compact which was signed in Santa Fe in 1922. In that Compact there was an allocation made as between the states of the Lower Basin and the states of the Upper Basin.

Roughly, there were 7,500,000 acre feet per annum allocated to the Upper Basin and 7,500,000 acre feet allocated to the Lower Basin with the right of the Lower Basin to appropriate an additional million acre feet later. In other words, they contemplated and understood and believed at the time that there were about 16,000,000 acre feet of water to be dealt with, and that a quantity of water of 7,500,000 acre feet per annum could be divided equitably among the Upper Basin States.

As stated last night, the State of Arizona, although a Lower Basin State, participates in these negotiations because it has an interest in a portion of the Upper Basin along the northern part of the State of Arizona where the San Juan flows out of New Mexico. Under the same circumstances, New Mexico and Utah are both Upper and Lower Basin States. New Mexico has an interest in the allocation made to the Lower Basin on account of the Gila and its tributaries; and Utah on account of the Virgin River.

There are many problems involved in making this allocation--it is no easy matter. But it is a job that must be done and under the leadership of Chairman Bashore an earnest and sincere effort is being made to arrive at a conclusion at the earliest possible time.

Now, of course, New Mexico is vitally interested in whatever allocation may be made. If an allocation is made, this Commission doesn't make it finally. The members of this Commission will come to some conclusion as to their opinion of what a fair and equitable allocation among the four states and Arizona is. They will put that in the form of a compact and it will be submitted to the legislatures of each of the five states, and it will not become effective as an agreement binding upon the states until each legislature has ratified it, the governors have approved it, and Congress has also approved it. So there will be ample time for any people who are interested to inform themselves as to the provisions of any compact or agreement that may be reached and it will be our problem then. If the Commission thinks that they have arrived at an equitable apportionment, the people in New Mexico, in San Juan County, will be informed and you in turn, if satisfied, will have to inform the Legislature. If you are dissatisfied, you will make your objections to it. So it has quite a road to travel.

So far as Mr. McClure is concerned, I am sure his purpose and object has been to join in these negotiations in good faith and expedite them as much as possible. However, he has had in mind that if a permanent compact is made and the division and allocation is made to last in perpetuity, it's a matter we must approach with a great deal of care and thought and consideration and not agree upon until we know all the basic facts. And with that attitude, we are thoroughly willing to cooperate and arrive at a conclusion at the earliest date possible.

Now just another word or two: Most of you have seen the report that has been made by the Bureau of Reclamation on the Colorado River. It has been variously referred to as an inventory of projects or a report or a plan of development. We appreciate very much the splendid work the Bureau has done in making this study of the Colorado River and we appreciate the value of that report. But this Commission itself will not be bound by any suggested allocation of water that is contained in that report although the facts set out in the report will be, I am sure, carefully considered by the Commission. I say that because if a permanent compact is to be negotiated at a very early date, we in New Mexico are entitled, I believe, to consider not only our present uses of water but our potential uses. And so far as the facts in the report the Bureau of Reclamation has put out affect New Mexico, they are incomplete.

I feel that Mr. McClure and I or anybody representing New Mexico would be derelict in his duty if he just agreed to an allocation that didn't fully consider the full potential possibilities for the use of the waters of the Colorado River in the State of New Mexico.

I believe it is unnecessary to go further. As the Chairman said, he wants you gentlemen here to talk and express your own ideas, primarily going to the point of an allocation of the water among the four states. But also if you desire, I am sure the Commission would like to hear any description you may desire to make of the projects you have in your own mind, how you think water can be used in San Juan County and New Mexico, and what our future dreams and ambitions are. And when you have done that, I am sure that we have done all that we can do and we appreciate the opportunity to do that.

Now I would like to introduce Mr. I. J. Coury, who is a member of the New Mexico Interstate Streams Commission, a man who has attended many meetings in the Colorado River Basin States where water problems have been discussed and a man who has always been zealous in advocating and contending for the rights of San Juan County particularly and the rights of the State of New Mexico in general. Mr. Coury, will you take charge of the meeting and call on various individuals whom you have in mind?

MR. I. J. COURY, FARMINGTON, NEW MEXICO: Thank you, Mr. Wilson. Mr. Chairman, Members of the Commission, I guess probably to start this meeting off it may be well to have Mr. Hedderman, the Area Engineer of the Bureau of Reclamation at Durango, briefly give us a report on what his findings have been up to date, and after we hear from him, we will carry it on from there. Mr. Hedderman, will you give us a report on your findings?

MR. JOHN J. HEDDERMAN, BUREAU OF RECLAMATION, DURANGO, COLORADO: Mr. Chairman and Members of the Commission and friends, we have been working quite some time on the various projects in the San Juan Basin, which of course involves New Mexico and Colorado. About April, or the latter part of April, this year, we started surveys on what you folks call the South San Juan Project. We started field surveys from the vicinity of Dulce. That would be a canal line or conduit running toward Cuba, which would service the area south from Bloomfield to Cuba. We have a survey party working in that vicinity. We have one working in the vicinity of Cuba toward the other party.

We also have been classifying the lands south from Bloomfield in the vicinity and we have covered since about the middle of May up to date, about 400 sections or some 250,000 acres of land. We hope to finish that classification of that area by mid-December if the weather holds out. Until such time as we have that work finished and have the canal surveyed, we can't do much more on the project or tell you anything about what may develop.

Now you folks know that we have completed a report on the La Plata units of the Animas-La Plata Project. The La Plata units, as you know, are one in Colorado and one in New Mexico; and that involves, of the first unit, some 3500 acres in New Mexico and about 10,000 acres in Colorado. The Animas-La Plata Project as a whole consists of about seven units totalling some 110,000 acres, of which about half lies in New Mexico and half in Colorado.

We have completed the report on the Hammond Project, which lies up the River here between Farmington and Bloomfield; and that would involve the development of about 3700 acres.

We have been working quite some time on a water supply study of the entire San Juan River Basin. The preliminary report on those studies was completed just prior to October 15th and that was submitted to our Regional Office. Now that report will be the basis of our determining the available water for these several projects that I have mentioned and of course for the surplus waters in this Basin.

The Pine River Project involves some lands in New Mexico on the Pine River along the San Juan River in the vicinity of Arboles. There is not a great acreage in that but it is involved in that project and they are included. The lands in New Mexico are included in our Pine River report.

Also involved in the studies in the Basin is what we call the Dulce-Chama-Navajo Project, and that involves lands in Colorado and New Mexico. There are approximately 15,000 acres in that project of which about 12,000 acres lie in the State of New Mexico. We haven't done any actual field surveys on that project as yet because we had to defer that until such time as we completed this basin water supply study that I just mentioned.

Except for the Shiprock Project, which we have done some preliminary work on, which involved in our studies about 70,000 acres, and I believe now the Indian Service is continuing that investigation, I think that's all the work that we are doing now in this area.

If there are any questions I would be glad to try to answer them.

MR. COURY: Thank you, Mr. Headerman. Would anyone like to ask Mr. Headerman any questions? If you have any questions now is the time to ask them. (No response.)

COM. BISHOP: I would like to ask how much water you propose to consume if these projects for New Mexico are completed; how much will be the ultimate consumption for New Mexico? Can you tell me that?

MR. HEDDERMAN: No, we couldn't tell you that. We are investigating these various projects and their potentialities. Of course that will be up to the State of New Mexico to determine or say which projects they wish to have constructed if they are constructed, and of course those various projects will have to fall within the water allocated to the State.

COM. BISHOP: The Commission ought to know something about the needs-

MR. HEDDERMAN: How is that?

COM. BISHOP: The Commission would like to know about the needs of the State. We really haven't very much on New Mexico and the Commission would like to know about the needs for New Mexico in order to be fair in the allocation of the water to New Mexico.

JUDGE WILSON: That is what some of these other gentlemen will tell you, Mr. Bishop. We need all the water we can get. There are so many places to put it.

MR. HEDDERMAN: Now this development to the south of Bloomfield known as the South San Juan Project, that project would be limited by available water, not by available lands.

MR. J. R. RITER, BUREAU OF RECLAMATION, DENVER, COLORADO: Mr. Chairman, I wonder if Mr. Bishop's question couldn't be answered by referring to the Colorado River Basin Report of the Bureau which shows for New Mexico an estimated consumption in the Basin of 450,000 acre feet.

MR. WILLIAM R. WALLACE, SALT LAKE CITY, UTAH: Does that include the Indians?

MR. RITER: That includes the Indians.

JUDGE WILSON: Does that include the possible transmountain diversion?

MR. RITER: That is the water that would be consumed in the Basin through the development of the potential projects as listed in the Basin Report.

JUDGE WILSON: But you don't purport to say, Mr. Riter, that there are not other potential possibilities for use of water in New Mexico--

MR. RITER: No.

JUDGE WILSON: --in addition to the ones the Bureau has already reported on?

MR. RITER: Mr. Wilson, I think it would be foolish for me to say there are not other possibilities. The history of development in the Colorado River Basin indicates every time we take a look at it we raise our sights. You will recall back in 1922 we had a report then which indicated the Upper Basin could not use consumptively anywhere near 7,500,000 acre feet. Now the version as of 1946 indicates the Upper Basin could use if it had the water, 9,100,000 acre feet.

JUDGE WILSON: But the point I am making is that under your present tests of feasibility, these are all the projects you have studied. But looking toward the future, there may be a change in the feasibility formula and there might be other land that water could be taken to which we think now would be unfeasible. Perhaps the future might disclose that ten, twenty, fifty years from now, other projects might be feasible.

In other words, there is a vast development here in this area of natural gas. This may be one of the greatest gas producing areas in the world. It is conceivable that with a great deal of cheap gas we might put in pumping projects that would make water available which may be absolutely unfeasible now.

Those are things I want to let the Commission know, that we are not limiting ourselves to the amount of water that has been mentioned in the Bureau of Reclamation Report.

COM. BISHOP: According to the parties that have been studying that, Fred, it takes more water than is available now. It looks like we pretty near have to stay within the ones already studied in the allocation or we aren't going to get any place.

JUDGE WILSON: That is true, but we want all the possibilities considered, and then the state itself will determine where the water is to be used. I imagine a good many of the states have projects mentioned, described, and inventoried where they know they are not going to build them all.

COM. BISHOP: We have a million acres in Wyoming we would like to irrigate. We realize we don't have enough water.

MR. COURY: I don't know what chart Mr. Riter referred to--450,000 acre feet. He is either looking at the wrong chart or all the projects are not listed because on the inventoried projects we have 70,000 at Shiprock; 25,500 on the Monument Rock; 12,000 in the McDermott Glade; outside of the South San Juan, the San Juan-Chama diversion; outside of the 50,000 acres in irrigation now and the supplemental water for the present land and what additional land can be placed under irrigation; and you total that acreage up and multiply by four acre feet to the acre and you will exceed a million acre feet of water. So I think the chart Mr. Riter is looking at--

MR. E. O. LARSON, BUREAU OF RECLAMATION, SALT LAKE CITY, UTAH: I think the question was asked how much water could the State of New Mexico use and Mr. Riter came back and mentioned 450,000 acre feet.

MR. COURY: That isn't diversion depletions.

MR. RITER: It may be I misunderstood the question. If I understood the question properly it was: How much will the depletion be for the projects Mr. Hedderman has described? I referred to page 169 of the Report which refers to in-basin depletions only 450,000 acre feet. That doesn't show what the potential transmountain diversion will be. That is a problem to be studied, Mr. Coury.

And there is another thing to bear in mind also: You take the South San Juan and the San Juan-Chama; you can't use water on both projects, they are competitive. In other words, they both derive the source from the same stream. You either turn it in this way and use it on the South San Juan or you have the alternative of taking it across the Divide and using it in the San Juan-Chama. Those two projects are directly competitive because they both derive the water supply from the same source.

JUDGE WILSON: May the record show that while those two projects are competitive at the present time in that the water comes from the same source and it can't be used on both projects, still there is a possibility that if the water should be taken through the transmountain diversion this other land might be watered in the future from some other source if the water were available.

MR. RITER: If water were available, yes.

THE CHAIRMAN: I don't know whether your question has been answered to your satisfaction or not. There must be a distinction made between the consumption of water and water applied. Your calculations were made, I think, on the basis of how much you would have to apply to that and Mr. Riter attempted to say that what he was talking about was the depletion after the water had been applied. In other words, you might be required to apply five acre feet to an acre of land but the depletion would be maybe as low as a foot and a half or even lower, that is, the consumptive use.

And I hope you will all bear in mind the difference between the amount of water that you are applying and the amount of water you are consuming in certain areas.

COM. BISHOP: Mr. Chairman, my question was to get at what was the ultimate consumptive use by the whole set-up. I don't care about the details. That is what I have in mind.

MR. RITER: For the benefit of Tom McClure I would like to put one statement in the record. I know Mr. McClure has taken issue with our unit rates of depletion. I know if he were here he would say we have underestimated it and want that matter reviewed. If you will permit me I would like to put that in the record for Mr. McClure.

MR. COURY: I believe that we have with us a man who has given one of the potential projects in San Juan Basin quite a bit of thought and spent quite a lot of time on it, Mr. Paul B. Palmer. Will you give us a few words on the Hammond Project in San Juan County?

MR. PAUL B. PALMER, FARMINGTON, NEW MEXICO: Mr. Chairman, Commissioners, and gentlemen: It has been a good many years since I have had this project you might say "under my thumb" and the war has intervened and a lot of water has gone down this river since. The Hammond Project Mr. Hedderman touched on and perhaps has been mentioned too before I came in. I don't know what went on before but briefly, the old Hammond Project was settled prior to 1900 by members of the L. D. S. Church. It was called the colonization program, and from various reasons in which you are not interested, perhaps, the project was ultimately abandoned.

However, before it was abandoned it was one of the most progressive little communities in the county. And there were, so to speak, good engineering reasons why it was a failure. Those engineering problems would not be looked upon nowadays as so important and would not hold us back probably as they did fifty years ago.

The acreage estimates that we did have on the Hammond Project are considerably higher than Mr. Hedderman gave you but I take it he classes it as A-1 land. As a matter of fact, there is probably double that amount of land that we simple country people know is good land because while it may go back through seepage or something of that type, our dairymen find in this country you can grow clover and some of the finest production on this so-called no good land. That has been our experience particularly in the past few years, the land that the Government doesn't think is worth a dollar an acre, we find some of our highest production is made from it by turning it into crops that will be produced on lands that are full of salt and alkalies.

However, the Hammond Project is not entirely dead and there are a few people living over there. Some of them are pumping on it and they are trying to revive the thing and have been for some years. At one time, in fact if the war had not intervened, it is very probable that the Hammond Project would have been fully underway today, but when that came along and Reclamation took it over for analysis, the other project was given up.

Our office did secure land applications on the Hammond and at one time we had applications there that if they had all been approved and accepted would have been enough to settle fifteen or twenty thousand acres of land. We still have all of those applications on file. I don't know how many of them will still be interested.

I don't know exactly what the present acre cost of the new surveys show, but briefly speaking, the Hammond Project covers land that is very similar to what you see here in our valley. It has a nice slope. It is on the south side of the San Juan. It is a little bit higher than Farmington in altitude. The west end of it is approximately three and a half or four miles above

here just across the San Juan River and it extends up from there a distance of approximately twenty miles.

As I recall, the canal would be 25 to 30 miles in length depending on the location of it and how far down they came and where they took out their heading. The land has a gentle slope in most instances. A good deal of it is covered with sagebrush and we know that is an indication of great fertility in our western area. This land at one time had some of the best producing orchards that the county has ever seen. Some of the finest apples were raised up there 35 years ago that the county has ever seen. In other words, the land is good, the water is there, and it is potentially a very fine project and should be put through.

The Indian Department at one time was very desirous of buying this land and settling the Navajo Indians upon it. The white settlers felt that if they did so it would in effect divide the county completely and leave to the white settlers only that land north of the Animas and San Juan Rivers and all south of there would become permanently Indian land. Consequently that design was blocked in 1935 and since that time the Indian Department has not become interested again in buying it for the Indians so far as I know, not that they wouldn't like to but they did give it up.

I don't know that anything more is wanted on that Hammond Project. I think it will suffice to say that the land is fertile, the slope is good, the climate is as good as this is or similar and there can be no question about the feasibility of the projects in my opinion. However, while I am here, with the permission of the Chairman I would like to mention another matter that I am very vitally concerned with and I think all of us are or at least we should be.

Next to my opinion of politics, the Navajo Indian situation in the State of New Mexico and Arizona, and to some extent in Utah and Colorado, is probably the biggest of our national disgraces. We have approximately 60,000 Navajo Indians who used to claim the area where we white people now live and have our homes. They used to live and roam through about 40,000,000 of these acres, and when our fathers came out here they saw fit to push them back as we have been doing for centuries; and we gave them or let them--tolerated perhaps would be better--on land on which it is very difficult for them to make a living. As I say, they once roamed on this area clear over into Colorado, clear over to Albuquerque, clear west to Flagstaff, and north to the southern most and eastern most part of Utah. And the land or the major portion of where this water runoff goes through was all Navajo Indian land.

Today those are the most backward in a way of the peoples of the earth. About 90 percent of them are illiterate. The Government has presumed to educate them for 75 years and yet approximately 90 percent of them can't speak the English language or read and write. It is deplorable to see the condition in which most of them live. We get big headlines in our newspapers about troubles in China and Tibet and faraway lands, but if these farmers would come into the Navajo country they would find conditions that are just as amazing and certainly more appalling.

The point I want to make is that these people at least morally have a very high claim upon the waters of the San Juan, Animas, and La Plata Rivers, and therefore the waters of the Colorado. It is true they haven't been officially used, a great deal of it. It is also true that where they have had ditches built, the Navajo has become a good farmer as he has become a good stockman. Some of the finest wheat, melons, potatoes, and all of the commodities that we raise in this area are raised a little bit west of us by the Navajo Indians on the Navajo Reservation. Many of them become

adept farmers and are, strange enough, making a living on ten acres of land where our white men would starve to death. If they had had larger acreages they would farm it comparatively speaking to that much better advantage.

Now these Navajo Indians have approximately 16,000,000 acres south and west of here in the four states. How much of that could be irrigated I don't know, but the Bureau of Reclamation has some figures on that and so does the Indian Department. For years I have been and still am a critic of the administration of Indian affairs. It has been my observation that the Indian Bureau as a whole--not speaking as individuals but as a whole--have had in mind the protection of their jobs rather than the welfare of the Navajos. That is true in a lot of other bureaus but particularly of the Indian Bureau. And consequently, these white men have been diligent in seeing that they got a job tomorrow rather than that the Navajo had something to live on tomorrow.

Therefore, as a private citizen, however representing a large group if not the largest group of Navajo Indians in a private capacity, I feel perfectly at liberty to speak for them because I do represent the largest Navajo organization that was ever organized and it is in existence and operating in a way very successfully. These Navajo Indians have few spokesmen of their own. They have few collegemen of their own. They have few leaders of their own, and I do presume to speak for them in that capacity because they are not very able to take that burden upon themselves, perhaps I am not either. But I would like to put it into the record that there is claim that the United States Government, the people of these states whether they are white or Indian, should give their moral support to these Indian people and that water should be saved for them.

They have as fine land as we have if it has the water. As I said, they were given the worst of the land because our forefathers considered that water could not be gotten to it and it couldn't have been under the old system; but with modern conveniences, modern machinery, it can be gotten to the Indian land, especially with storage dams. And we can rehabilitate the largest tribe of Indians that is in existence in America today, the Navajo tribe.

They are the largest tribe. They are the most rapidly increasing tribe, and yet they, as I said, are the most backward and most illiterate. However, up to 1930 they were the only self-supporting Indian tribe in the United States, and that has been one result of their great independence and also their ability to change their condition from that of a nomad to a very good stockman and from a stockman to a farmer, which they have been able to do and adapt themselves in a few years.

So I think that we should consider their claims that they have thousands of acres of ground out there and that there are fifty or sixty thousand of those people today, and ten years at the same rate of progress there will be at least 75,000 of them, and as I say there are 16,000,000 acres of those lands and a good many of those acres of land can be irrigated and cultivated successfully. A good deal of that lies in the State of Arizona and about half or a little more of that population is in the State of Arizona. I care not whether that allocation is made in New Mexico or Arizona or both. Some of it I think can be made in Colorado and Utah for their benefit also as they reside in both of those states.

I think we should look at their problem more from the standpoint of our group of states rather than to divide and take away from just one or two. For instance, if New Mexico is entitled to so many acre feet of water, I think the claims of the Navajo Indians should possibly be in excess of that, and the same thing is true of Arizona and the other states where these people reside, because they in a way are still under the Federal Government and they should be looked upon as a joint problem of at least the four states where they live.

Now as surely as that is done and these people are given a means of livelihood they will be amalgamated into our civilization and assimilated and they will take their place shoulder to shoulder with our white people. And you will find they are just as good citizens as any of us when they have the opportunity presented to them. We have declared them to be citizens of the United States by the Act of Congress of 1924. On the one hand we give them liberty and all the rights and privileges of citizenship and on the other hand we snatch the rights all away and leave them the obligations of citizenship. Approximately 3500 of their men were in the services of their country and they don't vote.

There are a lot of things. There are a lot of things I could tell you about why the Navajo Indian situation is a national disgrace. It is also a disgrace to the State of New Mexico and to the State of Arizona in particular. But something should be done by this body to recognize the rights of these people and to do something about it. I am not telling you what to do but I think something should be done and we should recognize that these people have some rights because they were here a long time before we were here. Thank you. (Applause.)

JUDGE WILSON: I would like to call on Mr. Orval Ricketts to make a statement. I am not trying to confine you. You may make a general statement about the situation as you see it, Mr. Ricketts.

MR. ORVAL RICKETTS, FARMINGTON, NEW MEXICO: Mr. Chairman, I got here late. I don't know where you have gone up to here. You might confine me to something definite.

JUDGE WILSON: Just talk about San Juan County and New Mexico and your water aspirations and your need for water.

MR. RICKETTS: As a newspaper man, I am not accustomed to speaking extemporaneously on a subject as vast as this; but I could perhaps give you some idea that would probably be coherent or backed up on statistics just on a moment's notice.

I have lived in the county going on forty years now. Most of that time I have been engaged in the newspaper business. As I related at the meeting last evening, my first impression of the value of irrigation and the possibilities of irrigation development came as a boy who was raised in the Mississippi River Valley where irrigation, of course, was unknown. We came out here and I first worked on a ranch here, and of course the talk was of the productive value of our soil in this country where water could be beneficially applied. And as I learned later, the first ditches in this country were taken out by squatters.

At one time this was Indian Reservation, and back I believe on July 4, 1876, by Congressional Act, the land was opened for homesteading. However, at that time there had been no surveys made and so the original settlers merely came in and took up what they called squatters' rights. They knew they would eventually be entitled to 160 acres and they surveyed in their crude way their small farmsteads along the lower valleys and the beginning of your irrigation came from individual ditches.

A man would take up a lower bench along the valley and go a mile or two above and attempt to build his own ditch, and put a few acres under cultivation. Then as time went on neighbors below would extend the ditch as more squatters would come along. I believe it was not until 1880, four years after it was opened, that the first reconnaissance survey was made by the United States official land department. So these ditches have sprung up that way, first irrigating the lower levels and then they would take out

ditches that were longer in length to irrigate the higher level as I think in our Animas Valley here we have three, possibly four, benches; and as time would go on, these ditches have been built to cover the higher levels.

As you heard Mr. Palmer state, the value of our land and productive ability are excellent. But back in that early day, the general dream was that south of the San Juan River there was a great area of land that was subject to reclamation by water from the San Juan River. As I read to you last evening, this was dramatized and brought to early day attention, about the turn of the century, by a young engineer by the name of Mr. Jay Turley, who had been employed by the Territory of New Mexico to do some engineering work for it. It was a matter of several years' work--he was grub-staked as he went--and then when he presented his bill for his full services, the Territory found it did not have money sufficient to pay their engineer so they made him a proposition that they would offer him the use of the waters of the San Juan River in payment for his services. He finally accepted that proposition.

He didn't question the right of the Territory to so allocate the waters of the stream, took it for granted that that was within their right. So he spent then a number of years, in fact the greater part of his life after that, attempting to organize land companies, private land companies--that was in the days before the Reclamation Bureau--to place this land under cultivation, thereby hoping to recover financially his debt from the Territory for the services rendered.

The early day news stories about that as we find in our old files envisions an empire, such as he claimed, a million acres that he thought could be beneficially irrigated, and I think he had not one but several eastern groups interested in financing his project, but for one reason or another they fell down at the last moment.

I was interested last evening in the discussion of the matter by Fred Wilson of our State, attorney for the Interstate Streams Commission, whose law partner, the late Richard Hanna, was one of the men who had assisted Turley in his project. It was recounted at one time that he was offered I think a certain sum per acre for his rights in this water and in the project that would have netted him a very handsom profit, but he thought if it was worth that much to those fellows it was worth twice that much for future use and so he turned that down.

As I understand it, what I have to say here is more in the nature of the dreams and aspirations of our development rather than the engineering details which the Reclamation Bureau's duty is to take care of so ably. This is kind of a sketchy background.

Mr. Turley's estimate of a million acres was evidently not made by a minute survey but wholesale, I imagine, by looking at the map and taking in the area which he proposed to irrigate and including all that land within that area as being irrigable. Under our present Reclamation Bureau survey which was started this summer, a careful study is being made of these lands. It seems that there are several possible levels to be considered and each higher level entails a greater cost, of course. And so they are making this study as will be a matter of record, and then we will have some accurate information.

At this time I believe we are unable to say that we would ask this new commission for water sufficient to irrigate a stated number of acres because we are not familiar with what is possible or what is practical or what is feasible. That is, as we feel, purely an engineering detail. We don't wish to come to you and say we would like to have 500,000 acres irrigated until such time that we know there are that number of acres that could be beneficially irrigated and would be an economic project. So we have gone a long ways from

Turley's dream of a million acres to the present day.

We wish to be reasonable. We know there is only this 7,500,000 acre feet to be divided among the four Upper States. As yet we are not acquainted with the means or methods by which this will be divided. I don't think that we are going to ask for any lion's share of this water. But when our surveys are completed and we can sit around a table and say we have so many acres here that can be reclaimed beneficially, we should like that of course to be considered.

We should touch probably a little on the Indian situation. Mr. Palmer has gone into the Indian situation as a whole; I should like to touch on the Indian situation as it applies merely to San Juan County.

As you know, roughly speaking there are 18,000 inhabitants of our county. Practically half of those are Navajo Indians. Now we look upon the Navajo Indian not necessarily as a problem, not necessarily as a ward of the Government. But to us the Navajo is a friend and a neighbor.

We have been living among Navajos these many years and Mr. Palmer has told you of their economic condition and he is correct in what he has stated. They are an underprivileged people. In the few projects in the county the Government has prepared for them they have proved to be very excellent farmers, those who care to. Of course they are fundamentally a stock-raising people and even with the small farms they like to raise some livestock, even on these small areas. But we look upon the Navajo as a potential farmer and as a neighbor. We also look upon the Navajo as a fellow citizen.

In discussing this South San Juan Project, we realize that any great project over there would probably be at least half within Navajo Reservations, in Navajo lands. That question has come up in higher circles. You men who have attended water meetings have probably heard that there was some disposition of saying the Navajo was not to be considered in reclamation; but to we people who are his neighbor--as I said both friend and neighbor and a fellow citizen--he should be considered equally in reclamation projects with his white brother.

So in a county where half of our population is Navajo we feel that anything that can benefit his economic status will benefit the entire community. So we have that friendly feeling and that should be a matter of record. And in discussing this south side project, in the future when you come to grips with it from your engineers' reports, I should like to present at least one community sentiment, that the Navajo be considered not as a report, not as a paper proposition, but as a part of the whole scheme. He is a resident here along with the rest of us and whatever will help him will help us and we want no line of demarcation drawn between what benefits the Navajo and what benefits the white man. I wouldn't say that is possibly the prevailing sentiment, it is a strong sentiment, and I think the day will come when it will be the prevailing sentiment.

The Indian Department through the Bureau of Reclamation has certain programs, and I take it, Mr. Wilson, we will hear from the Indian Bureau in this hearing?

JUDGE WILSON: I had hoped some of them would be here.

MR. RICKETTS: --and they will tell you of the 70,000 acres that are now outlined as possible irrigation on the Navajo and an additional 25,000 north of the South San Juan that will benefit your Navajo people. I want you men to feel in the final discussion and the final allocation that

We wish this would be handled with the projects beneficial to the human beings who live in this section regardless of their color or race.

I would like to call your attention to another possibility in speaking of reclamation on either side of the San Juan River. A week ago yesterday the Southern Union Production Company on Parker Dome, which is just this side of the Colorado State Line about fifteen miles northwest of Farmington, brought in the fourth deep testing well. It was not the largest brought in; the largest was 120,000,000 cubic feet daily production. This well proved to be 40,000,000 cubic feet daily production. But the interesting part is it proved a third and as yet unknown producing sand. They have 14 producing wells in the shell sands but they have these four deep test wells and the officials made this statement publicly this week that they have changed their position from that of being worried if there would be gas production enough to supply the State of New Mexico, which has worried them the last fifteen years, to a point now where they are looking for a market for gas, and they feel there is a great unexplored gas field in this region.

That means if we are going to have a surplus of gas, gas is economical for pumping purposes and instead of building long canals it may be the reclamation engineers will find that many areas heretofore considered not feasible for reclamation can be economically furnished with water through pumping systems. That is something for the future. But the point I am trying to bring out is that in any allocation of water at this time I doubt whether we of this county would feel like signing away in perpetuity any water rights at the immediate time because there are so many unknown factors and so many future potential factors involved in our consideration of this water problem.

I feel a little bit at loss here to know how to proceed. I don't want to take in the whole territory here because we have worked with the Bureau of Reclamation at Durango and they have a number of projects which have been completed, that is, the preliminary surveys have been completed, and they of course should go into this record.

But I might close by saying that we of this section, while we possibly have more potential lands than there will be water available, wish in the final analysis to abide by the reports of the Reclamation Bureau engineers, in whom we have every confidence, and when they have made their reports complete and we have access to them, we are willing to sit around a table with our neighbors in Colorado and the other Basin States and to abide by any reasonable decision that these men can arrive at. But that must be done on the basis of intelligent knowledge and not merely based on the dreams we have had in these past many years.

COM. WATSON: May I ask one question? What is the depth of both the shallow and deep production?

MR. RICKETTS: The shallow is in the shell sands with a thousand and fourteen to sixteen to two thousand feet--this varies somewhat; and the deep tests that were brought in were this third sand, that they brought in Friday. They went through, of course, three sands in this deep test well, which was down to 9400 feet but they went back and cut it off to 8600 which was where this third producing sand is now being developed.

MR. A. J. NEFF, FARMINGTON, NEW MEXICO: I would like to have Mr. Mecham's statement read stating the reason he didn't go ahead with his proposition here, if I could get somebody to read it.

MR. COURY: It would be quite lengthy to read.

MR. NEFF: We have been listening to a lot of lengthy discussions

here. I would like to have that read here.

MR. COURY: We would like to have it read for you before the day is through but we have a program set and we will try to get to it this afternoon if we can.

MR. NEFF: I would like to make a statement on this Colorado and New Mexico Compact. If I am not out of order I would like to make a statement here about how this compact was brought out, how it was brought before the legislatures and the governors of the states.

In 1906 I bought a place on the La Plata and settled there. At that time we had the first rights, all the water in the La Plata River. All north of the line there in Colorado was Indian land and hadn't been thrown open for settlement. About the time I came here, I think, just a year before, they threw that land open to settlement, that reservation. Well, the settlers took up that land and went to using the water.

Now the first two years I was here they hadn't taken any of the water, Colorado hadn't. I cut 600, over 600 tons of hay for two years on my place and had the first rights to the water. It was allocated according to priority in New Mexico.

Well, they commenced to taking all the water. We objected and demanded that we had a right to that water, first right to it, but they paid no attention. And they kept taking our water, taking up land and taking our water until 1918 we didn't get a drop of water on my place where in 1906 I cut 600, over 600 tons of hay over the place. In 1918 we didn't get a drop of water out of the River. I cut four tons and a half of hay and that's all I got off my place and the reason I got that there came a rain in July and the water settled in the low places and I got to cut that much hay.

We knew we had to do something or get off the River. So we held a meeting and a committee was appointed and we would go to Durango and see a lawyer there and see what we could do about it. Mr. Hatfield and Toy and myself were appointed to that committee. We went up to Durango and we went in to Mr. Perkins' office. He helped adjudicate the water in New Mexico about 1901. We went in there to see him and told him what we wanted. He took the statute books of Colorado and turned to a place there that said all the water that originated in the State of Colorado belongs to the state. He turned over a few pages and it said water cannot be impounded in the State of Colorado to be used outside of the state. Those laws are still on the statute books of Colorado as far as I know--never heard of them being repealed.

Well, we knew we didn't have money enough to fight the State of Colorado. We came down and appointed a man to go over to Santa Fe and see if we couldn't get help from the State of New Mexico to fight that proposition. We appointed Mr. Retiras. He went over to Santa Fe and stated the case to them and the legislature voted $10,000 and the Governor authorized Stephen P. Davis to take our case to the United States Courts. Well, it took him a little time to collect data, you know, to start a suit on, and about the time that he got ready to start suit, the Chambers of Commerce of Aztec and Farmington began to holler, "Compromise! Compromise!"

They took that out of our hands and they compromised it and we couldn't do a thing up there on the La Plata. We didn't want to compromise it. We had the right to that water. But they compromised it, the two Chambers of Commerce of Aztec and Farmington. They didn't have a bit of interest in that La Plata but they engineered that. They had more influence in Santa Fe and they got that compromise and we got this compact and they

have been trying ever since to break that compact and beat us out of what little water we got under the compact.

Now as I understand it they recognized that Colorado had some right here to that water. They couldn't compromise anything unless they recognized that Colorado had some interest in that water. They have been trying now to build a reservoir up there and whenever they do they will break this compact. When they got the compact, the people up there stopped it when they sent our water down here. We sent a man to Santa Fe to find out what they would do about it, they wouldn't turn it down. The Governor appointed a committee, made an appropriation and appointed a committee and went up to Denver to see what Colorado was going to do about that compact. They went up and they told them they didn't--

JUDGE WILSON: Mr. Neff, pardon me just a moment, please. This is very interesting and we want everybody to have an opportunity to say anything they want to say, but this is just a little bit off the point that the Commission desires to hear information on. It is very interesting and we would be very glad to let you talk later in the day. There are a few men that have to talk this morning.

MR. NEFF: I don't want to take up any of your time. I want to state the position of us people up there on the La Plata on this reclamation business.

JUDGE WILSON: We will be glad to have you state it.

MR. COURY: I would like to have a few words stated by the man who has given a good many years of his life to water problems in San Juan County, one of the main factors who began the proceedings for the adjudication of water in San Juan County. He followed this very closely and I would like to hear a few remarks from Mr. Ed Foster, President of the San Juan Reclamation Association.

MR. ED H. FOSTER, FARMINGTON, NEW MEXICO: Chairman Bashore, Members of the Commission and their assistants: I have been, I think, in five different meetings with you folks and I know it is very tiresome, very boresome, and not a hard thing for you to do. You men put in a lot of hard work and I am not going to bore you with a long talk. But I am going to go in as near as I can to the starting, as you got some of that that has gone on through the different men that have talked already, and just state to you the beginning of the irrigation here, bring it up pretty much to the present time. But I would like to state for the information of those folks within our county who are here to listen and get information--that is what we have been primarily interested in and the reason for myself and others of the county going to your annual meetings and getting informed.

I find that that is the only way that these problems both interstate and national can be solved. We mustn't look at these from a selfish standpoint. And I would like to say to these men of the county that I have sat in the meeting of five different annual reclamation meetings where everyone of those faces within this Commission as well as others that are sitting amongst you here attended. And I find clear from your Government employees on down to members of your Reclamation Association those men are vitally interested in solving these water and land problems on a long drawn out, farsighted plan.

You Government men, Mr. Redderman, Mr. Larson, of our district here, have been very faithful. They are conscientious. These men on your Commission are the same. Everyone of them I find are men who know their business. They have made a study of it throughout their lifetime and in my opinion that is the only way to get the positive facts before you folks, in the form of surveys and records. When we have those I don't think you will find anyone any

better to get along with in those divisions than San Juan County.

And I want to give our county the benefit of knowing these men. I would like to meet them personally. You will find them all mighty fine people and I found this that I would like to state also along this line. This doesn't divide any water nor does it divide any land nor does it put any water on it but it does give you an idea in my opinion what we should have, and I know we will all appreciate that we have got men on here that we have got faith in, men who we have a great leaning toward getting our problems properly settled. They don't do as we do in a great many cases because the ordinary layman cannot do engineering work. He cannot do attorney work. If you folks would hear these folks sometimes, the attorneys and the engineers seem to differ a little; but I notice when they get together there is harmony amongst them. They try to solve those problems.

Another thing I have noticed about them, we all like to get out in politics. Right now it is a little bad, but in all my experience I have never heard one word of a political nature expressed by those men. They do not know state lines. Their surveys and conditions as they find them are just as they are and not according to one state or another. I must say that about our friend, Mr. Hedderman, who is the one probably closest, and Mr. Nielsen, outside of our State Engineer's office, that I have talked to them repeatedly and in no case can anyone as far as I have been in their company say that they have ever mentioned anything regarding politics in the state. They take it as they find it.

And we can rest assured that when these reports and your compact is set up by these men, it will be I am satisfied a very impartial one, not a short-time set-up--it will be a long-time set-up, and as far as trying to tell them what they must do, I don't think we should do that. We have got our projects. We are going to have them surveyed. We are going to have reports on them and I am glad to report--I don't know right now just who said it but it was said officially that instead of it being sometime in the fall perhaps of 1947 the earliest time that these reports could be submitted, I was informed last night that they were in hopes of having these reports finished by the middle of December of 1946, which is just good news to us.

We are assured that with these men taking the evidence as they will of the four states, the five states--excuse me, Mr. Arizona--those reports will be in and we will be able to get all of our projects into the report before there is any final decision made on allocations of water, perhaps divisions of water to the five states. As to our projects, I will quit and let these men go.

But I would like to say back in '77, as has been told you, the first settlers came into this district and along from that time on until the '80's I have been told that these men started irrigation. They found the lower lands of course easily watered by ditch. They were men who came in here and had to succeed by the sweat of their brow. They found the same lands on the bottoms that you will find today on your mesas. Of course all cheaper projects at the present time are irrigated. Those men worked diligently from year to year and up until sometime in the 1900's they were still building ditches, putting more land under cultivation. At that time we never thought anything about a shortage of water, division of water, or anything of the kind, but they have gone ahead and those lands are valuable lands.

We have created a neighborhood here that we feel proud of. We have a county as well as our adjoining state--I am not going to bar them--we have a neighborhood here that I believe is as friendly and as cooperative, and one that wants to live and let live. As you heard them speak, the Indian comes into the picture. They can possibly be taken care of but we still have

Mark land, we have more projects. Most of those projects have been brought out and I will not dwell on them because that is an engineer and attorney feat and those reports will be properly brought to us and I see no reason for taking up your time on that.

But I would like to merely dwell in concluding on the fact of our trying to get those reports, then getting together and making our decisions. There isn't any question somebody has got to drop--in fact all--some projects. When those are made, I would like to see them go right on as they have and allow us to go into those meetings, set up the projects which we believe are the most worthy, and give you our ideas of setting up the program that will finally be followed and no doubt to the satisfaction of this county.

On the diversion, I am satisfied it has got to be in the picture. There are certain things which have brought that into the picture very forcibly and I think when the engineering report is brought in it will be brought out. San Juan County and Colorado are interested. It will be brought out through them just what those conditions are.

As far as our wants are concerned, from all the meetings I have attended I am satisfied the Reclamation people feel that first you must take care of your immediate neighborhood, your immediate settlements. There is no inclination on the part of these engineers nor these commissions to try to upset a neighborhood. I found that out, that it isn't their intention to try to close a settlement that has been set up for years past. It is to help out and give that settlement a right to go ahead and state their cases as they see them. I feel that we have nothing to fear as far as we are concerned when we have projects that are feasible and projects that are in advance of others, or even on similar conditions. I feel that your Commission would study and weigh the situation very closely and probably bend over to give you your present projects in the condition they are now and extend them and build them up.

I think that is the intention of all of their reports, to make the burden so there is no injustice done to anyone. At present that will be all I have to say and I certainly thank you folks. (Applause.)

MR. COURY: At this time I would like to have an expression from Judge Mather Eakes.

MR. MATHER M. EAKES: Mr. Chairman, gentlemen, I shall detain you for just a very few minutes. I have not become closely acquainted or deeply informed about the question of water or water rights and water diversion, conservation or the reclamation projects that are before this group. Consequently it is not possible for me to say things that would be particularly informative.

I was called upon professionally not very long ago to organize and incorporate the La Plata Conservancy District. That was the topic really that I understood was assigned to me this morning and a very simple statement covers that. The La Plata Conservancy District has been incorporated and organized but it incorporates a potentiality of some ten to twelve thousand acres; that is, of course, irrigable land. Most of it is land that has been irrigated in the past. At the present time there are some 4000 acres under irrigation or there were at the time of the formation of this compact with Colorado. That compact from my information, the use, restricts us to 3800 acre feet.

Now that about covers the information with reference to that organization. It was incorporated not to do any particular thing at the present time. As I understand it the directors of that organization do not intend to take any positive action at this time. But it was primarily the placing of a group of people in that splendid farming and production area of the La Plata River Valley

in New Mexico in a position to meet contingencies as they might arise, and that organization is now legally in a position to contract with the United States Government regarding the useage of water if the Government should at any time construct the reservoir that has been contemplated and spoken about on the La Plata River and crossing the Line into Colorado.

I might state that it is not the purpose of this organization to abrogate or attempt to abrogate in the future the compact that exists, as I understand it the purpose of this organization to maintain that compact and the rights that now are obtained for them under that compact. If any effort is made or any development is projected that would in any way interfere with the operation of that compact, this organization is in a position to resist and I believe successfully such efforts that may be made.

Now having spoken of that let me say that generally the purpose of the people of San Juan Basin and New Mexico so far as I understand it is to conserve what they have and to conserve a sufficient quantity of water from these streams to enable them to make such development in the future as may be feasible. Hypothecating what I said in the statement that I made in the beginning that my information is not very extensive, I do think that as a citizen and an observer there is enough reclaimable land in the Valley of the San Juan River at the present time to use most of the water of that stream. It is not necessary for me then to enlarge on the statements that have been made by Mr. Palmer in his discussion here this morning and others and the statement that Mr. Foster has just made that there are projects all throughout and within the reach of irrigation from these streams that would take all the water that can be spared from it.

I am not an engineer and I know very little about engineering. I think I do know that engineering is not an exact science, especially when it comes to dealing with water and water rights any more than medical science is an exact science, any more than law is an exact science. We are dealing with things that are necessarily relevant in their nature and character.

Personally I am convinced that the waters of the San Juan Basin can be used in the San Juan Basin and should be so used. I am not in any sense disposed to fail to cooperate in every constructive move that is made for the development in any of this area by every other area that can use its own resources. I am deeply prejudiced--and I use that word "prejudice" advisedly even if it is a confession--I am deeply prejudiced against any move to take the water of one watershed into the realm of another watershed. I do not believe that there is a watershed area anywhere in the country where the water cannot be used within that watershed if it is properly developed. I mean, of course, a country where there are irrigable lands. There are some sections where that does not exist. But we in this area do not wish and I think we will not sign away our rights to the waters of these rivers unless and until we know that those waters cannot be beneficially used by reclamation projects and by every feasible method of development within that area and within that watershed.

We desire to have a backlog of resource for future development. This is a new country. I use that word "new" advisedly. It is true there have been settlers here for a long time but it has been unfortunately true that their ability and their resources for developing these lands has been limited. It is not sufficient to say, "We want to give you all the water you now use." The waters that are now being used are inadequate for the future. It is not sufficient to say, "After we have given you the water that you are now using we want to take the residue of those waters across the mountains into another area that needs it." We want to know and we would insist on knowing just exactly where we are at before we would consent to those things.

Another thing I wish to mention is this: You dry up the riverbed of these rivers and in my opinion you do an irreparable damage even to that that is now in use. "Oh," you say, "your ditches will be filled; we will give you the water you need for your ditches." Okay. But I still say when you dry up the riverbed you are tending to dry up the valley that is watered by those ditches and ultimately you tend to dry up the ditches themselves. You are dealing with a very delicate and difficult problem when you undertake to say how will divert the water of these streams across mountains into another area.

Now I don't wish to be understood as being in a belligerent frame of mind; I am not. You say engineers will tell us that these things will not dry up a riverbed, that there will still be ample water in that channel. Maybe so. I am open-minded. But I am from Missouri on that question. I have to be shown. And there are engineers and engineers. When you produce a half dozen engineers to testify one way it wouldn't be very difficult to get an equal number as these lawyers know to testify the other way, just as you would medical men, just as you would others. That is why I say these things are not an exact science.

Let's work these problems out harmoniously if possible. We all desire that. But I beg of this association to use every precaution to see that the needs and wants of the people of these valleys are met before anything rash is attempted.

By the way, it may be interesting to the members of the legal profession here present if I call attention to a provision that exists in the laws of the State of Oklahoma. I have never known it in any other state, but there is a statute in that state which provides that the common law is abrogated for the most part--I am not using the exact language--or that all laws shall be interpreted not strictly because they may be in derogation of the common law, but shall be interpreted liberally for the wants and needs of the people. That's been on the statute books of the State of Oklahoma for many, many years. It has never been interpreted or passed upon by the Supreme Court of that state. I think it is a marvelous provision. I think the courts of the state should face up to a proper interpretation of that phrase, that laws should be interpreted to meet the wants and needs of the people.

That is what we ask in this instance, not only in the interpretation of the law but in the administration of the law. And I feel perfectly confident that the members of this association and the Reclamation Association generally, the Reclamation Bureau generally, will find people in this area ready to cooperate to the fullest extent.

Mr. Foster's expressions here have been very interesting and gratifying. He is one of the most cooperative men I have ever known. He's at the head of this organization in this county. He is a broadminded man; the people in this county will probably follow his leadership and I do not mean anything I have said to be in contradiction to the position he has taken, simply that we might decide on the course of action we shall pursue before we relinquish that which we have.

MR. COURY: Seeing that the hour is almost noon, probably we will be breaking for lunch. Prior to recessing, with the permission of the Chairman it may be well at this point to give you some statistics. As I understand it, the Commission is very deeply interested in statistics, particularly in the area that they are visiting. This won't take but a few minutes.

In 1942 the Charles Ilfeld Company was sponsoring a series of broadcasts over Station KOB and Mr. Moulton, president of that corporation, requested that we compile statistical information concerning San Juan County.

Approximately a dozen men spent practically three weeks compiling the factual records.

At the outset I want to make this statement that the statistical records I am giving you on San Juan County for the year 1942 are very conservative. We all know and feel sure that the figures that I am going to quote you on San Juan County are very conservative.

We found that there are 54,091 acres of irrigated farm land in San Juan County. This is in 1942. The number of irrigated farms in San Juan County, Indian and non-Indian--that is both--total 2,683 farms.

The estimates on the livestock and others for 1942 were based on dollar estimates on 1941 prices.

We found that there was 8000 head of cattle shipped from San Juan County with a value of $400,000. There were 55,000 lambs shipped at a value of $375,000. There were a thousand horses and mules at $50,000, and 5,000 hogs at $140,000, which made the livestock industry of San Juan County a total of $965,000.

In the poultry division we found there were shipped or exported 25,000 chickens at a value of $15,750; 2,000 turkeys at a value of $8,000, totalling for the poultry division, $23,750.

Now in the livestock and poultry products, there were 49,200,000 lbs. of milk exported from this county to the outside with a value of $450,000. There were 400,000 dozen eggs at a value of $100,000; and 805,000 lbs. of wool at $300,000 making a total for livestock and poultry products of $850,000.

The farm products are strictly non-Indian. We had no way of determining what the value of the Indian products was and these figures as I stated are the figures on the products that were actually shipped outside the county.

There were 500,000 bushels of corn valued at $450,000. There were 35,000 bags of pinto beans valued at $175,000; 38,500 tons of alfalfa, $577,500; 36,000 bushels of wheat at $36,000; 110,000 bags of potatoes at $165,000; 40,000 bushels of oats and barley at a value of $50,000; 30,000 bags of onions at $45,000. And the truck crop that was shipped, we estimated at $75,000. There were 10,000 lbs. of honey valued at $3,000; which makes a total non-Indian farm products shipped from San Juan County in 1942, based on the 1941 prices, $1,576,500.

The fruit we placed in a different category since this is a great fruit country. There were 300,000 bushels of apples shipped at a value of $225,000. There were 40,000 bushels of peaches at $75,000; 6,000 bushels of apricots at $25,000; 250 tons of grapes at $10,000; and 30 tons of cherries at $4,500; making a total of the fruit, $339,500, and making the total of livestock, poultry, livestock and poultry products, farm products non-Indian, and fruit, $3,754,750.

There were 5,179,434 gallons of gasoline shipped from Farmington at a value of $300,000.

I would like to make one other remark. I was told by a person who had done quite a bit of investigating that the Department of Agriculture in 1901 in Washington printed a pamphlet and made the statement that the apples produced in the San Juan Basin in New Mexico were the highest quality and considered one of the finest apples in the United States.

The New Mexico Agricultural College at Las Cruces in 1944 gave this statistical figure: Of the apple orchard acreage in the State of New Mexico, 38 percent lies in San Juan County. That 38 percent produces 52 percent of the apples of the State of New Mexico and we have always felt and we strongly believe with our soil or the climate and other things pertinent that the San Juan Basin in New Mexico probably has no other equal. We don't mean that as a Chamber of Commerce talk, but you gentlemen should know. I believe you want to hear exactly what we feel and we don't say it in a bragging way. But when some trees produce as many as 75 and 80 boxes of apples to one tree, you certainly have good land, good climate, and good water.

JUDGE WILSON: We will turn the meeting back to the Chairman so he may adjourn if he wishes.

THE CHAIRMAN: It is now five minutes after twelve. We went to give everybody a chance to be heard. I think we might recess for lunch but I would like to get back here as promptly as possible after lunch. What time would be convenient? Can we get back at 1:15 or 1:30?

MR. COURY: Can everyone be back at 1:15?

(Assents.)

THE CHAIRMAN: Let's get back here, then, at 1:15.

(12:05 p.m. Recess for lunch.)

(1:15 p.m. Meeting resumed.)

THE CHAIRMAN: Judge, you and Mr. Coury may proceed. I believe the meeting is in the hands of Mr. Coury. Just go right ahead.

MR. COURY: Mr. Chairman, I would like at this time for Mr. Robert L. Maddox of Aztec to address the Commission. Mr. Maddox.

MR. ROBERT L. MADDOX, AZTEC, NEW MEXICO: Chairman Bashore, Members of the Commission, gentlemen: I will just take a few minutes of your time. I am going to be brief in trying to go over the situation in general. But I have been a resident of San Juan County for forty-six years and I came here when I was a very young child. When I was about 18 or 19 years of age during the summer months I worked on an irrigation project on the survey as chainman. I followed that line of work for a number of years; finally got up where I was a leveller, transfer, and I believe I have been on more section corners in San Juan County or as many as any other man in town. Consequently I am familiar with the County as a whole.

I have always been vitally interested in irrigation possibilities because I know from personal contact what this land will produce here when put under irrigation. And I am satisfied from my personal observation and from the technical data and information that I have obtained from various sources that if we put the land under water that is available here, there won't be any water left going down to the San Juan and Animas Rivers.

Another possibility that has developed here in recent years is this gas development. I am at present engaged in producing natural gas with a gas well. I know that one of the gas wells I have--I believe--would pump as far as fuel is concerned all the water that is in the San Juan River at a very nominal cost.

We had some experience over on the San Juan. One man had a pumping plant that was operating irrigating 200 acres at the cost of approximately

$25.00 per month for fuel.

I know the property south of San Juan. I know there is a million acres out there; I know there is not enough water for the million acres. Take the Las Animas La Plata Project with lands in New Mexico and Colorado there are approximately 125,000 acres taking the big project that covers the Navajo land on the south side of the San Juan. Therefore, as I say, that would utilize all the water that is available to us flowing down those rivers.

I think one gentleman here said that we didn't have a Navajo problem here, but I don't agree with him on that. I feel we do have a Navajo problem that we are eventually going to have to solve if we are going to give the Navajo Indians what they are justly entitled to. We have a good many of them out here. They live more or less, a large percentage of them which is a disgrace to this nation, on a verge of starvation. If we can put some of their land under irrigation they will be able to support themselves and become useful citizens. I think it is the duty of the United States Government to see that those Indian rights are protected because when given the opportunity they are very efficient as farmers as well as stockmen. They are able to support themselves on very small acreages, much smaller than is required by the white man.

We do not irrigate all the land that could be irrigated if the water was available because the carrying capacity is small on account of the state of the dams and headgates. The acreage in this county could be substantially increased and the apple, bean, and hog and sheep production would be substantially increased likewise. I think that is about all I have to say on the subject. (Applause.)

MR. COURY: At this time we have with us a farmer who in the past years has irrigated by pumping with gasoline driven engines and pumped with natural gas driven engines, and he tells me he has irrigated 200 acres at a cost of approximately $25.00 per month for five or six months of the year. At this time I would like to have Mr. Joe Mangum of Bloomfield make a few remarks on his experiences with pumping a 200 acre project farm that he has. Mr. Mangum.

MR. JOE MANGUM, BLOOMFIELD, NEW MEXICO: Mr. Chairman, ladies and gentlemen, Mr. Bashore: I have lived in this county for forty-one years, practically entirely on the same project we have been talking about here today. And in order to keep my water up, I have done some pumping and got quite well, managed to make a living. I find that the natural gas since it came along--I pumped some with gasoline engines before I used the natural gas--I find the natural gas very economical and I watered 200 acres there the first year with it. I think that it's going to prove to be one of the best projects that we have in the way of irrigation in this country.

During these forty-one years this fall that I have been there I have seen the River practically dry and during other times very low in which all the water would be out in the irrigating ditches at times, which means that we have no water to spare to anybody. If all the land in this county was under irrigation, we would just have to have some storage of some sort in some years. In other years we would have an abundance of water. But the river would get very low some years so that it has been in my time that all of the water in the river was in the irrigating ditches up and down the river. I think from the natural gas standpoint, the land is available and if taken care of by water, we have the finest climate and the finest production here that you have anywhere. I don't feel we have any water to spare. Thank you.

COM. BISHOP: Would you mind telling me how high you lift it?

MR. MANGUM: It is just 30 feet. If you men cross the Bloomfield bridge you will notice a little pumping plant right by the side of the bridge to the east is my pumping plant. That is the old bridge site.

COM. BISHOP: Would you mind telling us what kind of a pump and what kind of an engine you have?

MR. MANGUM: It is a Caterpillar 60 engine and a Palmer pump.

COM. BISHOP: What size?

MR. MANGUM: It's a 6 inch intake and 8 out, and pumps water--I will say that pump will throw plenty of water for 400 acres.

COM. WATSON: Do you buy the gas or do you produce it?

MR. MANGUM: I buy it.

COM. WATSON: How much do you pay a thousand for it?

MR. MANGUM: Well, I figured it out about 75 cents a thousand. It has raised considerable since then. I don't know just what it is at the present time.

COM. WATSON: Have you made figures or estimates to compare the cost of pumping with gasoline and natural gas so you are satisfied in your own mind the natural gas is cheaper?

MR. MANGUM: Yes, sir; there is no comparison it is just so much cheaper. I pumped with the gasoline on a 6 inch pump this year and it cost me around $300 for gasoline; and on that big Caterpillar 60 it cost me less than $200 with the natural gas. So it is very economical fuel.

MR. COURY: Mr. Watson, I believe you asked a question what the rate on the gas was?

COM. WATSON: Yes.

MR. COURY: I think Mr. Foster could also answer that; he is connected with the gas company.

MR. FOSTER: To clear the records there I would like to say that the rate we use and that Mr. Mangum used are 75 cents a thousand for the first two thousand or two and a quarter; 60 cents a thousand for the next two thousand; 25 cents a thousand for the next thirty-five thousand; and 15 cents a thousand all over that up to two million feet, with a 12-1/2 cent rate above the million.

THE CHAIRMAN: Will the reporter just see if we have it right? (The record was read.) There is just one question I wanted to ask on that: that pump-ing as I understand it is out of the River?

MR. MANGUM: Yes, sir.

THE CHAIRMAN: All right, thank you.

MR. COURY: I would like to call on Mr. Dave Martin, who is Secretary of the Bloomfield Irrigation District, which is one of the larger irrigation districts in the county. Mr. Dave Martin.

MR. DAVE A. MARTIN, BLOOMFIELD, NEW MEXICO: Mr. Chairman, gentlemen,

our irrigation district serves about 4,000 acres of irrigated land which comes from the San Juan River and we irrigate only from gravity flow, of course. And the statements heretofore made regarding production I think will apply probably as well to the Bloomfield Irrigation District as to any other comparable area in the county.

Our costs for maintenance are usually about $2.00 an acre for actual maintenance. We have had some other charges for deficiency and interest but have retired all of our bonded indebtedness and are now down to a point where our debt is very small and in another year or two we expect to have no charges except for maintenance.

Lying just above our ditch line on the north side of the San Juan River--our ditch, by the way, is taken out of the San Juan River about nine or ten miles above Blanco and is about 35 miles long. Naturally an engineer knows that is a lot of length for the area that we irrigate. However, outside the District there is perhaps a thousand acres of land that is served from the same heading from the same ditch line, but they are old established ditches above our original intake. We have moved up and taken in these other ditches and other lands but they are not included in the District so that we serve altogether about 5,000 acres of land.

Lying just north and above that ditch line there is quite a lot of land that would be susceptible to irrigation by pumping from our ditch. We would hope that in time, if the pumping business develops as we hope it will, a lot of that land could be serviced from our ditch line. In the same time there is a possibility that a higher line from storage on the San Juan would take care of those lands by direct gravity flow--perhaps not all of it. The ditch line might not be high enough to cover it all. But there are many thousands of acres of valuable land lying above the ditch line on the San Juan and Animas, lying between these two rivers that come together at Farmington, that would be susceptible to irrigation by pumping and that perhaps would not be served by gravity flow. I think that has been very well taken care of.

The matter of diversion of the water of the San Juan is very interesting to us of course. And in that connection there has been some talk of what has been termed compensatory storage. Some have thought that eventually since the question of diversion came up, the people of this county if storage were provided for one acre foot of water should be willing to give up one acre foot of water for use on the other side of the Divide by diversion or otherwise, and just personally I want to register an objection to that. This water comes from now, of course, that falls in Colorado--there is very little of this water that originates in New Mexico--but the snow falls in Colorado and we feel like the Lord put it there for the people of this side of the Divide. He put the snow there and the land here and there are people here to use it.

Mr. Wallace very eloquently spoke here last night of the opportunities of the children here. Well, that is the dream of the people here, develop this land for the children that are growing up here. The fathers and mothers that are working here don't want the children to have to leave this country and go somewhere else. They love it themselves and they expect their children to grow up here and find development and opportunity for themselves to develop and to achieve their destiny in San Juan County.

There is one other thing that I wish to speak of. It has been pretty well covered and at the risk of duplicating what some others have said I would like to perhaps add a little to what has been said about the Navajo Indian people. Those of us who live in New Mexico love New Mexico, but I don't believe there is a man here, New Mexican or otherwise, that

It well enough to take the place of the Navajo Indians and stay with it as they have, back about '78 or some such time, many, many years ago at any rate, they can moved those people out of this country, mostly, and took them over to Fort Sumner, and they were in concentration camps, let us say, for a couple of years or three. They were so dissatisfied and unhappy that they told the government that if they could be brought back here they would never make any more trouble and they would get along on this reservation. Well, we feel, or at least I do--perhaps I am not speaking for all--that it was implicit in the contract with those people--if not it should have been--that the water the Lord gave to this land should have been given to them with the land.

Now their country is saturated with people. They have come to the point where they can't progress and exist any longer on that little bit of land. As nomads they raise sheep and goats and maybe a few cattle, and some melons and corn and possibly a little bit of beans when the rain is sufficient and favorable, but they have a desperate way of getting along. If they are not provided for they are going to have to scatter over the country in order to exist and live and they are people that do not intermarry. They do not want to go away. They don't want to scatter. And if their land is irrigated and they are provided for in that way, those people in a number of generations will progress and become civilized and will take their places as good American citizens.

We look on them here as friends and neighbors but we do feel that there is a great moral question there to be taken care of, that it's more than a good neighbor policy. They are people that have been in this country hundreds of years before this country was discovered, before the first one of our forebears came to America. And I would just hope that eventually that great problem of a people who should be provided for will be considered by the Commission.

I know if you understood it and if you understand it at the time that it will commend itself to your hearts for a people that have lived and suffered and struggled and stayed with a country as long as they have, if they had an opportunity, which none but the Government can provide and should have perhaps long ago, no one else can provide it for them and they are really, surely, entitled to a break. Thank you.

MR. COURY: Gentlemen, I am going to ask a gentleman who doesn't belong to this area, he comes over from the Rio Grande side--I wonder if the Assistant Director from Region 5, Mr. Thompson would say a few words as to the needs of water on the other side of the Divide.

MR. A. H. THOMPSON, BUREAU OF RECLAMATION, AMARILLO, TEXAS: Mr. Chairman, Members of the Commission, ladies and gentlemen: For the record I am a representative of Region 5 who is charged with the responsibility of investigating the Rio Grande Basin, I want it understood that I cannot assume any of the responsibilities of these states in dividing the waters of the Colorado River Basin. Nor can I assume any of the responsibilities of the States and local interests in stating which projects might be constructed after the allocations are made.

I do want to point out, if I might, the Rio Grande Basin, extending in about this area (indicating on map), which embraces two of the Colorado River Compact States, the State of Colorado and the State of New Mexico. We have been studying this basin for several years and find that the economy, the livelihood of this basin is directly related to the three great resources, land, water, and people. We find since before the 16th century that the lands have been brought into production to the extent that practically all of the waters of the Rio Grande are now in use. We also find that additional supplies of that needed resource will have to come, if at all, from the Colorado River Basin. We know the population is going to grow. We know that growth and

maintaining an economic standard depends on water.

In addition to the Rio Grande I might add one more statement that should water come over to the Rio Grande through the San Juan-Chama diversion, it will permit backing water up over the Sangre de Cristo Divide, taking it to other parched lands in the area of Colfax and Mora counties in the Canadian River Basin above Conchas Reservoir. I want to present this statement to show what our needs are and if you care for any more details I would be glad to have you call on Mr. Forester, our project engineer at Monte Vista or Mr. Mutz, our area planning engineer at Albuquerque. Thank you.

MR. COURY: Is there anyone else here from San Juan County who would like to make a statement to the Commission before we turn the remainder of the afternoon over to our good friend from Durango? I want you to feel free. If there is anything on your mind, now is the time to state it; and in order to expedite things, instead of calling on you individually I would welcome having any of you take the floor now if you have any questions or if you have anything to say.

MR. A. J. NEFF, FARMINGTON, NEW MEXICO: I would like to have the letter of Mr. Turley before the convention and I would like to have it read.

JUDGE WILSON: Mr. Neff, do you have any more copies of that?

MR. NEFF: I can make one. I don't think I have any. I wouldn't say for sure. That is the original.

JUDGE WILSON: I am sure the Commission would be interested in reading the letter but it is so long that I don't believe we should read it to them but let them read it themselves. If you have another copy you can substitute a copy.

MR. NEFF: Well, I can make a copy.

JUDGE WILSON: Make a copy and mail it in to me or Mr. Coury and we will turn it over to the Secretary of the Commission and he will see to it that every member of the Commission reads it. But I don't believe we have time to have it read. It is eight or ten pages; it is very long. We will be very glad to file it with the Secretary of the Commission.

MR. NEFF: All right.

JUDGE WILSON: I will be glad to have you send me a copy.

MR. NEFF: Will you please give me your name? I didn't catch it.

JUDGE WILSON: Fred Wilson, Albuquerque, New Mexico.

COM. BISHOP: I would like to suggest that if he is going to have it typed he have a copy made for each state. That is five copies.

JUDGE WILSON: I don't know whether you want to go into that expense or not.

MR. NEFF: I don't care anything about that.

JUDGE WILSON: That is fine.

MR. NEFF: I consider it important that this letter be placed before this Commission.

article.

JUDGE WILSON: I am sure the Commission will be interested in your

MR. NEFF: I will have those copies made. Let me send them to you and let you distribute them.

JUDGE WILSON: Be very glad to.

MR. NEFF: All right.

MR. COURY: At this time I believe I will conclude that portion pertaining to the State of New Mexico. Since many of the projects in this part of the State are interlocked with the southwestern part of Colorado and we have a group present with us from that portion of that basin, I at this time will turn the meeting over to Mr. Dwight Sexton of Durango, Colorado, who will present their portion to the Commission. Mr. Sexton.

MR. D. W. SEXTON, DURANGO, COLORADO: Thank you, Mr. Coury. If you gentlemen will excuse me I will not try to stand. For the benefit of the record I am Dwight Sexton of Durango, Secretary-Treasurer of the Southwestern Colorado Water Conservation District, comprising the counties of western Montezuma, San Juan, La Plata, Archuleta, Hinsdale, San Miguel, Montezuma, and Dolores.

Gentlemen of the Commission, we are mighty happy to be here, as we always are, and participate in anything of a water nature in which we are so closely associated with New Mexico. We are just across the Line in Colorado, and as has been stated before, we grow the water up there that you people down here use.

We are vitally interested in a number of projects. I think the largest and most important to our entire San Juan Basin is the Animas-La Plata Project. That project, I believe, consists of some 110,000 acres and is approximately divided equally, 50 percent between Colorado and New Mexico. There may be just a little difference there. That project consists of some nine reservoirs starting at Howardsville above Silverton, Colorado, and extending clear through into New Mexico. We feel that is one project that must be underway. It should be a "must" on the reclamation list and it is a "must" as far as New Mexico and Colorado are concerned.

We next feel that the Pine River Extension is second in line. We have the Vallecito Reservoir already completed. We ask that the present canals and laterals be extended to cover some 50,000 additional acres. That also includes land in Colorado and New Mexico in which we are both vitally interested.

Then we have the project that is not so far along, on the Florida River. That river I believe would have no connection with New Mexico outside of where it empties into the Animas, which is entirely within the State of Colorado. That project would consist of some 20,000 acres over all--7,000 acres of additional land and including supplemental water for some 13,000 acres presently irrigated. In that also the City of Durango should have a vital interest in that future water supplies must come from the Florida River.

The Jackson Gulch or Mancos Project we want to just mention briefly in that it was started some few years ago with conscientious objector labor. At the close of the war this item of labor was discontinued and the project was put up for contract construction. Then the President's economy order came through and this project is at present frozen. It takes in some, I believe, a thousand acres of additional water for lands in that basin plus domestic water for Mesa Verde National Park. I think every effort is being made to blast that project out of the present freeze order. Just what luck we will have we don't

know. Those briefly are the items that we are interested in with our neighbor New Mexico.

We feel that we are against any diversion, either to another basin or transmountain, until such time as the Bureau has had ample time to make sufficient studies and prove that there is water available for the immediate basin. If they prove that, then we will talk to them about diversion intrabasin or otherwise.

We have in the eastern end of our District the counties of Hinsdale and Archuleta. We have a director present from Hinsdale County and I would like to call now upon Archie Toner, who will give you the ideas of Archuleta County in the eastern part of our District. Mr. Toner.

MR. ARCHIE B. TONER, FORT COLLINS, COLORADO: Mr. Chairman, Judge Wilson and Mr. Coury: Water becomes more vital to us every day. I wonder how many of you men ever experienced being in a town where you couldn't even buy a drink, you couldn't get a cup of coffee or you couldn't get water enough to shave by. I experienced that day before yesterday, spent a little over fifteen hours in that town and we couldn't get a drink of water.

Now that brings home very vividly to us just what water can mean to our town and to our farms. I think one of the first things that all of us who are interested in the waters of the Colorado River and the Upper Basin particularly should do would be to acquaint ourselves with the projects in the four Upper Basin States and including that part of Arizona which is considered in the Upper Basin. That is one of the main things. Now our Commissioners are fairly well informed on that and the rest of us should become more so. After this water is allocated we will all begin to discuss it, farmers and all of us, and trips through the upper reaches of the Colorado River would be wonderful vacations to any and all of us. There are many things to see up there, good land up in this part--I mean New Mexico and all of them. There are many wonderful things to see, reservoirs in construction, already constructed, and some of them in the process of engineering surveys being made.

Now we of the Southwestern Water Conservation District feel that we are vitally interested in the lower part of the San Juan Basin, that is, New Mexico and that part of Arizona because their problems are our problems. We are more or less isolated. We are isolated from our capitol city and our industrial area just the same as the people of San Juan County are isolated from theirs. I have a particular interest in San Juan County because I was born here in this town, but when I was quite young they tossed me over the fence, and until '37 we owned a farm here in San Juan County.

If we would take a few moments and project ourselves into the future and try to see the picture that this Commission will--they will be the governing body of the picture in the future hundreds of years from now. We can't consider the period of our lifetime; we have got to consider our relatives in the future, our sons and daughters and granddaughters and on down the line for a period of hundreds of years. We must do that now. The Commission realizes that and we people who are bringing information to them must realize that that is the thing they must look at in the future.

We have been told in the past few years, oh say since 1930, that we had a vast surplus of meat animals in the United States, and I dare say 90 percent or maybe 99 percent of us have believed that we had a surplus. But we started out with 72,000,000 head of cattle--using cattle as an example--that is what we started out with in 1930. You know what happened through the depression. Our standard of living dropped to where a large percent of the people couldn't afford meat. They just didn't have the "wherewith" to buy it. Then we built up our population about 12,000,000

head to close to 85,000,000; the war came on, raised our standard of living, and it is the dream of everyone of us to keep that standard of living where it is today and if we do we have no surplus of cattle. We have no surplus of hogs or sheep.

The sheep population is dropping rather drastically and just mentioning how that can affect us: Take Australia and there. One of my classmates in college is over there. He is administrator of the food we ship to Australia. He wrote back a few months ago and told us what the situation was there. They have lost the major part of their sheep in Australia due to drouth. That's going to help raise the price of wool in this country.

That all leads up to this: The increased need, the increase in population since 1930 has been rather large and it will continue to be large, the increase--it means we are going to need more meat animals and the Forest Service report the forest lands are stocked to capacity today, public domain is stocked to capacity, and we are going to be forced to resort to some other means of raising this livestock. That will mean tame grass and irrigated pasture. That has been one of my hobbies for many years, experimental work along that line.

And we can well utilize all of the water on this side within the Colorado River Basin and that some people think we may have as a surplus. In the future we can utilize every bit of that right here in the Upper Basin to develop tame grass, irrigated pasture, and thereby raise enough beef animals, hogs, cattle and sheep, and poultry, to take care of that amount of water. I mention poultry there because that is a growing industry in the United States, and to raise pullets up to the laying age economically you can utilize a very large amount of pasture, as we call it--range, poultry range. They will do fine up to the laying time and then they must be taken off and put on regular feeds.

I think everyone of us--I hope everyone of us--has confidence in the men who have been appointed to make the decisions on the allocation of the water in this Upper Basin. Then let's give them our support and after they have made their decisions, let's not do a lot of crabbing and go ahead and abide by those decisions and make a concerted effort. Now as Honorable Billy Wallace said the other day, he said, "Regardless of how these decisions are made, the water is to be used by Americans." We are all Americans and we must be patriotic in our attitude on the division of this water. I thank you.

MR. SEXTON: Mr. Coury, I find that I didn't put into my short report the Dolores Dove Creek Project. The reason I didn't was because I understood it came in the Grand Junction meeting, but it might be well to mention it at this time. That is the contemplated reservoir on the Dolores River to take in that vast bean empire around the Dove Creek section over there. That has long been under study but as yet nothing concrete has come from those studies. We are asking that the Bureau expedite those studies just as fast as possible so that the people of that region may have their opportunity to either accept or reject.

Have I covered everything, Judge Stone, from this end of it?

MR. TONER: We might mention a little something on the San Juan-Chama transmountain diversion there and how it is directly connected in the two states. The San Juan-Chama diversion, the big diversion that pertains to the San Juan Basin as a whole, both in Colorado and in New Mexico, would service a sizable amount of land in Colorado in the Kiute Park area which lies partly in Colorado and partly in New Mexico. Then right on south of that, with not too long a canal, we could service a lot of land in the Dulce, New Mexico, country; and then the balance of it could be taken around a long canal--expensive--but

it could be taken around and placed on the South Bloomfield Project.

Then in the report there is a definite figure set to take care of small projects in the country. We have a good many on our side of the State Line there and there are a few in New Mexico on this side of the State Line that are small and not expensive, but they do service a good type, Class 1, land, that we would like considered in there and figured in the division of the water.

The time will come in the not too far distant future when we are going to need to utilize all the land we possibly can do due to the depletion of the soils in the East and Middle East. We are going to have to go to new lands. We have not yet gotten across to a large percent of our farmers the proper methods of irrigation. That is up to we people in the states connected with the college to do that. We can save water; we can save land. You people who came across the Dove Creek area no doubt saw very good examples of the right way and the wrong way to farm on dry land, and the same applies on irrigated land. Thank you.

MR. SEXTON: I think that is all we have, Mr. Chairman. We thank you very kindly for your courtesy.

MR. COURY: Thank you, Mr. Sexton. I ask again before turning this back to Mr. Wilson, is there anyone else present locally who has anything to say or wishes to say anything at this time? (No response.) If not, I will turn this back to Judge Wilson.

Before turning it back I would like to briefly state the viewpoints as we have presented them to the Commission for their deliberations in arriving at a conclusion with respect to the ultimate division of the water. As you have noticed this morning with the huge development of gas fields in San Juan County within the past six or eight months, the matter of pumping water with natural gas has definitely come into the picture. Probably the Bureau of Reclamation and others, being that it is a relatively new idea, haven't given it much serious thought. But I certainly believe that the Commission in their deliberations before arriving at their ultimate conclusion in the division of the water should take into consideration such factors as pumping water with natural gas.

Of course, Judge Wilson I believe at Salt Lake made a statement that it may be wise to divide a certain number of acre feet among the four states equitably and possibly leave the balance of it for a few years hence to be divided. After listening to what the various persons stated here today I have mulled it over in my mind and I believe probably that if that can't be done, in the division of water every state should be at least reserved some certain number of acre feet for possible projects that probably none of us can see at this time. Nevertheless we all feel sure that the Commission in their deliberations and making their final report will probably take all this into consideration; however I felt that I should restate that at this time.

I will turn this meeting back to Judge Wilson.

JUDGE WILSON: Thank you, Mr. Coury. Now on behalf of Mr. McClure, who is the Commissioner for New Mexico, I would like to thank the people from New Mexico as well as the gentlemen who came down from Colorado, for coming here and expressing your views. I think all of you who know Tom McClure know that he will in future negotiations be zealous in guarding and protecting the rights as he sees them of the people of New Mexico. But I think you will also find that he realizes the importance and the necessity of recognizing the interests and rights of the other states in the waters of this basin.

I am very glad to observe the splendid spirit of cooperation that seems to exist between the people in Colorado and the people in New Mexico in this area. It is that sort of a spirit that will settle problems, if they are settled, amicably and reasonably.

In closing I want to say this, that I believe this Commission realizes that it is not its duty, and all of you realize it is not its duty or within its province to say where the water is going to be used in any state. They will attempt to make a fair and just and equitable allocation of water considering the states as a whole, the needs of the states as a whole, the people in them; and then it will be up to the people of each state to determine where the water will be used. I am sure that the people of each state can do that because I feel that the compact method of settling interstate matters is on trial and if these five states can't get together and make a fair and just and equitable allocation of this water, then you need not be surprised if we are confronted with additional bureaucracy with greater powers. The Government will assert greater powers, because progress is going to continue one way or the other and we all want it to continue under the democractic process and the compact process.

I thank you Mr. Commissioner and I will now turn the meeting back to you.

THE CHAIRMAN: The Chairman on behalf of the Commission wishes to express the appreciation of the Commission to you, Judge Wilson, and to you, Mr. Coury, and to Mr. Sexton and Mr. Toner from Colorado, for the efficient and orderly conduct of this meeting; also to you, Mr. Coury, for making our arrangements in advance here in the way of hotel accommodations so efficiently. And thanks to the people of this community for their hospitality. I don't believe there is any doubt in the minds of the Commissioners today in regard to the possibilities of raising apples in the San Juan Basin. I judge that from the evidence before us. It has been a very successful meeting and all of you have made contributions. You have expressed your ideas and you have had the opportunity to say what you have wanted to say. The Commissioners I feel sure all appreciate that.

I wish to make one or two observations and I want to be very brief. References have been made to feasible projects, references have been made to the Colorado River Report, and perhaps some of you conclude that the projects listed in the Colorado River Basin Report are feasible projects. Perhaps they are, but it depends upon the formula or the standard you apply as to their feasibility. This Colorado River Report wherever figures on cost are used, refers to the situation existing on January 1, 1940. Now those costs are out of date as you all know. Take the price of pinto beans in this community; it is considerably different than it was January 1, 1940.

Apparently the Bureau of Reclamation did not attempt to say that these projects were feasible, and with your indulgence, I would like to read from page 1 of the Regional Directors' letter of March 22, 1946:

> "This report, with its substantiating material, provides a basin-wide perspective for planning development on a sound basis. It is intended to serve as a medium through which the Congress may be apprised of the potentialities for the development of the basin's water resources and as a guide in the selection of projects that ultimately will comprise the comprehensive plan for the utilization of the waters of the Colorado River system for irrigation, electrical power, and other purposes."

On page 19 of the report I quote as follows:

"The total estimated construction cost of all the potential within-

basin projects outlined in this report is $2,185,442,000, based on January 1946 prices. Cost allocations to some benefits of a public character cannot appropriately be considered repayable by the water users under Reclamation laws. Of the total cost, it is estimated that an allocation of $25,000,000 may reasonably be made to flood control. It is further estimated that gross revenues collectable from irrigators, power users, and municipalities will amount to $57,500,000 annually in excess of costs for operation and maintenance. The latter sum could be applied toward repayment of those reimbursable costs resulting from the allocations made to the various benefits."

Now whether the projects listed in the Colorado River Basin Report are feasible or not will have to be resolved by the Congress. Certainly I doubt very much, as an individual, whether any of them are feasible under the Reclamation Law as it exists at the present time. However, the Bureau of Reclamation was directed to make a report and that is the report. Now as to what becomes what is an undetermined question at this time. Perhaps if the compact is worked out, the next step will be an attempt to secure a basin-wide authorization for development on some formula not now existing but perhaps similar to that of the Missouri Basin development.

So I make those remarks simply to show you that we have a long ways to go. It is necessary for everybody to work pretty closely together to work this out. The Commission has a big job and you folks have a big job, too. I was impressed with what Mr. Toner said: After the Commission does the best it knows how and comes to some impartial decision, fair to everybody, then in place of doing a lot of crabbing, you get behind it and try to support it because it has a long way to go after this Commission negotiates its compact. It goes to the legislatures of the five states and then to the five governors for approval; then it goes to the Congress of the United States, passed by the Congress of the United States and then signed by the President, if you please, and the President might veto it. There are a lot of hurdles to go over.

I was very much interested in the remarks about the possibilities of pumping with gas. That is something that I think we can all look forward to with hope. But at the same time we must not forget that the difficulties of the old irrigation systems today are largely on account of the low summer flows, and you can have an excellent pumping plant without storage and you are still in difficulty. So storage is going to be necessary on the Colorado River in spite of everything, in spite of all the economies we can introduce into the matter of the operation of irrigation systems.

At the beginning of the session we neglected to introduce the Commissioners from the various states, and at this time the Chairman will call on the Commissioner for Arizona for any comments he wishes to make.

COM. CARSON: Mr. Chairman, gentlemen, I certainly appreciate this meeting and the things that you have told us and want to assure you that we will take them into careful consideration in the progress that we may make.

I don't know that it has yet been explained to you that there is an Engineer Committee appointed by this Commission now functioning, gathering facts, and we are trying to ascertain the facts before we undertake to negotiate this compact. And when those facts are ascertained, we will try to negotiate a compact the best we are able with a full feeling and sense of the responsibility we are undertaking, and with the hope and purpose of doing injury to nobody and benefit for all of the Colorado River Basin States.

This is all one area, one economy. What helps you helps Arizona. What helps Arizona helps you. What helps you helps Colorado and what helps Colorado helps you. It is a matter of adjusting it as fairly and equitably as we can so that ultimately this Upper Basin area will completely utilize and consumptively use 7,500,000 acre feet of water. Thank you.

THE CHAIRMAN: Thank you, Mr. Carson. Going in alphabetical order, the Chair will now call on Com. Stone of Colorado.

COM. STONE: Mr. Chairman, Members of the Commission, gentlemen: Here today as elsewhere we have discussed and there has been much comment concerning the allocation of the water reserved to the Upper Basin under the Colorado River Compact. It seems always to happen in these meetings that we lose sight of a very important element which must be considered by this Commission in negotiating a compact. I refer to the obligations of the four states of the Upper Division to make deliveries of water at Lee Ferry--those four states, Colorado, New Mexico, Utah, and Wyoming.

Someone has referred to the water which arises in the mountains of Colorado and flows into the San Juan Basin. That situation is typical throughout the Upper Basin. These states in signing the Colorado River Compact have already pledged themselves--and it is the purpose of these states I know to observe the Colorado River Compact--to deliver 75,000,000 acre feet of water over continuing ten-year periods at Lee Ferry. That must indicate to you very clearly that whereas in a meeting such as this we are wont to consider the benefits and to talk about the allocation of the water that will benefit us, we must consider a present and a continuing obligation. I want to mention that to you because you must know that this Commission in making allocations of water must likewise consider the respective obligations of these four states to make deliveries of water at Lee Ferry.

Figuratively we are given a pail of water. We have got to empty out half of that pail of water for the Lower Basin, and then we allocate among ourselves, among the five states, what is left.

So that is important when we think of projects and potentialities of development in any area; and when we think of the water that is in that area, there is a present obligation against that water under the Colorado River Compact. We cannot, and keep our obligations under the Colorado River Compact, disregard that very important matter. It is important to call that to your attention I am sure.

Fred Wilson made a very appropriate remark and I should like to briefly emphasize it. He stated that this Commission is obligated and is charged, if you please, with making the allocations among the five states. We haven't got very many things to feel fortunate about in this job we have undertaken, but I think we can feel fortunate that we are not obligated to determine the distribution and use of this water within each state. That is a problem and a matter for each state to decide and work out for itself. The Commission, as would be true if a Supreme Court decision were rendered, is obligated to determine the equitable apportionment among the compacting states. That means a mass allocation of water to each state. What each state does with that water and where each state uses that water, I take it--in fact I know--is not the concern of this Commission. That is the concern of the states and the citizens of each of the states, to work out in cooperation with the Bureau of Reclamation where the Bureau of Reclamation is engaged in working out project plans.

Then another question which came to my mind while some of this evidence was being introduced here today was with reference to what each state is going to give up. It seems quite clear to me on the basis of the Bureau Report that no state is going to be able to get all of the water it would like to have.

The report indicates, I believe, something like 2,000,000 acre feet in excess of what we have if all of the projects that are envisioned in that report were built. And so we get down to the question of an equitable apportionment of a very scarce and limited resource.

Now this question of equitable apportionment is sometimes determined by the courts. In this case we are attempting to determine it amicably through compact negotiations. That is reached by an agreement and we, the Commission, only negotiate a compact. In the end the legislatures must ratify and the Congress must approve of it. I was also much impressed with Judge Wilson's statement that we are on trial, very definitely on trial. We are attempting to demonstrate the states under our constitution and in a democratic way can work out our own water problems. And as he said, this limited resource and its use is going to go forward and if we don't set the pattern some higher power is very apt to set it for us. So we have not only got to be patient but we must be very fair in dealing among ourselves.

That brings to mind another matter which I think we should keep in mind. The immediate occasion for the agreement of the states to initiate compact negotiations is the statement in the Colorado River Report that in a major way--not to the last detail but in a major way--development within the Colorado River Basin by the Bureau of Reclamation had proceeded about as far as it could go until the states had performed in the Upper Basin one important function, namely, the determining of how much water each state could use for its future development. You have mentioned projects here, all of them important. But I think here as elsewhere in the Basin, except for small projects that are clearly within what might be a state's share of the water, we cannot proceed much further until this allocation has been made.

Someone has mentioned this matter of engineering studies. We have used the engineers a lot at the meeting last night and yet we find that they are like a right arm in this work. It seems so utterly foolish in this day with so much information available--not as much as we would like to have--not to carefully sift and understand that information and to properly apply it in determining equitable apportionment. Many of these troublesome questions are resolved through an understanding and agreement upon the facts. Lawyers, some of us lawyers, may quarrel endlessly and find that our arguments are of little avail in the face of the actual facts which must be understood and applied in making an equitable apportionment. For that purpose this Engineer Committee was set up.

Some have assumed that the report of the Bureau of Reclamation furnishes all of the facts. Well, in the first place, the states owe it to their citizens to ascertain whether those facts as found by the Bureau are in accordance with the views of the state. Secondly, there are many important factors of factual information which are needed in making an equitable apportionment which are not covered by the Bureau's Colorado River Basin Report. Some of the matters which are covered do not go far enough for the purposes of making a compact. And so this Commission put the engineers to work and this committee is acting in an advisory capacity to give us the facts before we begin to talk about the apportionment. And as the Chairman told you this morning, we now have a Legal Advisory Committee.

This is a case where we have got to realize that the Upper Basin is an empire in which all of these states have a common interest and we must work together with an understanding of each other's problems while at the same time zealously considering the rights of each individual state. I hope that we can keep that in mind and that as we go along and if and when a compact is negotiated we shall be able to support it not only with the facts but with sound reason and judgment.

Before I close my statement I wish to express our regret that our friend and co-worker, Thomas M. McClure, Member of the Commission for New Mexico, is unable to be here today because of illness. Tom has had wide experience in compact making. He not only has a rich background of experience but--and I have served with him on two other compacts--it has been my experience that Tom McClure will be fair and at the same time will zealously represent the interests of New Mexico. You, indeed, have an able and capable man on the Commission. He has the assistance of a very capable legal adviser in Fred Wilson.

We all want to express our appreciation for your presentation here today. That is our primary function here--to hear from you and to get your statements and I assure you they will be given full consideration.

THE CHAIRMAN: Mr. Watson, Commissioner for Utah.

COM. WATSON: Mr. Chairman, ladies and gentlemen, I wish to express to you my appreciation for the fine spirit of cooperation that you have evidenced here and for the many facts that have been brought out. Such a hearing is the democratic way of arriving at a conclusion. If in all of our difficulties in our lives we could have a common understanding, if we could sit down and talk things over with our opponents and our adversaries, in nearly all cases we would come to a fair conclusion. This is particularly true in a case of this kind.

The hearings that we have had in other states have been of the same order as this hearing. They have brought forth certain facts that we must consider.

You know in this Rocky Mountain cordillera, we have a great desert and the communities where men make their living are more oases in that desert. In that desert there is a great river that now goes in large part to waste--into the ocean. In spite of all that we may do at the present time, much of the water goes to waste. If the energy of that river could be calculated, we would find the loss would be stupendous. So the sooner we can agree upon a formula to apportion equitably these waters the better.

It is true that a long time will have to pass before the final answer and before the final drop of water is utilized. Great reservoirs will have to be built to level out the river so that the water that is now going to waste can be properly utilized. However, at the present time I think we should make an effort to divide the water equitably and on a just basis. Very soon we would have projects developing in each state. It is such a hearing as this that stimulates us and collects the facts so that proper conclusions can be made.

Now when this Engineering Committee reports it will recommend certain facts upon which an equitable apportionment of the water can be made. This Commission is not bound by the recommendation, but it may be such that it can be accepted. It will tell this Commission where the water comes from and how the stream acts. The origin of the water may not be the most important question, it hasn't been in the past. States have gotten water that don't produce any at all, so that may be a minor issue. Then it will tell us how the water can be regulated in the stream, how the river can be made to act subject to our will. That will be a very important question. There are places in the basin where types of beneficial use are of the very highest, municipal use if for pleasure, and also the raising of very productive crops. This is important. The saving of a civilization may come into the picture. These are all things that this Commission must fully consider.

I again wish to thank you for your good work and I am sure everybody

here will do his best to fulfill his obligation.

THE CHAIRMAN: The Commissioner for Wyoming, Mr. Bishop.

COM. BISHOP: Mr. Chairman, ladies and gentlemen, I am indeed pleased to be here today and listen to the problems of the people of New Mexico. From what I have heard in all the other states, your problems are the same as our problems. We all have much more land that we have water.

It is our job on this Commission to divide the 7,500,000 acre feet of water allocated to the states of the Upper Basin by the Colorado River Compact. The Bureau of Reclamation Report shows that we need more than 9,000,000 acre feet of water to take care of the projects that they have proposed. So it's the duty of this Commission to sit around the table and work out a plan for equitable division of that water.

I am not going to try to make a speech about this like all these other fellows because they have taken away all my thunder. All I want to say, ladies and gentlemen, is I thank you for your hospitality and Wyoming is willing to sit around the table with the other fellows and be reasonable in making this division. Thank you.

THE CHAIRMAN: After we adjourn I would like to have Mr. Riter meet with the Commissioners for just a few minutes. Judge Wilson, I didn't call on New Mexico because you I think did your share of the work today, and unless you have further remarks to make and unless the Commissioners have further business to come before this meeting, a motion is now in order for the adjournment.

JUDGE WILSON: I have nothing further.

THE CHAIRMAN: I forgot one thing here that is very important. We have a gentleman here with us today who it doesn't make much difference where you go, if it is a meeting about water, he is present. He doesn't like to have anything to say but he is sure a strong listener; and if he is called on he generally has some very good advice to give us. I don't want to introduce him as a citizen of Utah but rather as a citizen of the West. Mr. Wallace. (Applause.)

MR. WILLIAM R. WALLACE, SALT LAKE CITY, UTAH: Mr. Chairman, I have perfect faith in the willingness and ability of this group to secure all the necessary data and to arrive at the right conclusion. However, I would like to say that I listened with great care to a statement made by the Chairman when these meetings began in which he outlined the information, the quantity and its quality, that was required upon which to base a decision. I have listened carefully and I waited until this time to ask a question.

I have listened very carefully to the reports made by Mr. Riter as Chairman of that Committee. He has confined himself as nearly as I could judge to two problems, the source of the water and the amount of the obligation of each state to deliver water to Lee Ferry. There has not been a settlement made yet in any of these major problems that has not been based as the major item upon the use of water. We have heard no discussion of the use possibilities.

Our settlement with the Republic of Mexico was on the basis of use possibilities. Our settlement with the Lower Basin was on the basis of use possibilities. California produces practically no water and the settlement was on the basis of use possibilities. That is true with the main stem of the Colorado in Arizona and it is certainly true as to the State of Nevada. I don't know why that is the case but I look upon it as far as the State of

Utah is concerned that the paramount item is based upon the possibility of the power possibilities. I like to refer to that matter because I think so far as my state is concerned, it is the major item.

Now I would like to ask a question: Why in the study of the engineer group has that problem not been brought to the fore?

I am not a lawyer or an engineer; I am just an ordinary businessman. But by George it is the one thing that we can look forward to in the West based on our tremendous mineral resources and based on our climate and ability to raise these wonderful fruits. And not only agriculture. The first call upon water supply is water to drink. The next is for municipal supply, all the various uses to which a municipality can put water. The third is agriculture and there can be none of these others unless agriculture is prosperous. And last is the application of the water to the making of power.

I know the Chairman well enough and I know it was in his heart and I know how he emphasized it at the first meeting, said that we should have approximately all the facts before this decision is made; and certainly one of the major factors is that of use of water supply.

Thank you very much, Mr. Chairman. (Applause.)

THE CHAIRMAN: Thank you, Mr. Wallace. Does the Chair hear a motion for adjournment?

COM. STONE: I move we adjourn.

COM. CARSON: Second.

THE CHAIRMAN: It has been moved and seconded that we adjourn.

(Thereupon a vote was taken and the motion of Com. Stone carried unanimously.)

(3:00 o'clock p.m., Saturday, November 2, 1946, Meeting No. 3 of the Upper Colorado River Basin Compact Commission adjourned.)

Upper Colorado River Compact Commission Inflow-Outflow Manual

1949 August

UPPER COLORADO RIVER COMPACT COMMISSION

INFLOW-OUTFLOW MANUAL

PREPARED BY
ENGINEERING ADVISORY COMMITTEE

AUGUST 1949

H. W. BASHORE

Salt Lake City, Utah

August 5, 1949

Upper Colorado River Basin Compact Commission

Gentlemen:

Pursuant to instructions given at your Vernal, Utah, meeting July 21, 1948, the Engineering Advisory Committee has investigated methods which might be adopted by the Commission for the measurement of stream depletions. On October 6, 1948, at Bishops Lodge the Engineering Advisory Committee appointed a sub-committee composed of R. D. Goodrich, Chairman, R. M. Gildersleeve, and John R. Erickson to prepare a manual on the inflow-outflow method of determining stream depletions in the Upper Colorado River Basin. The manual has been completed, and was reviewed and adopted by the Engineering Advisory Committee on July 1, 1949, in Denver, Colorado.

The manual submitted herewith provides examples of the administrative procedures which will be required to carry out the provisions of Article VI of the Upper Colorado River Compact.

Respectfully submitted,

J. R. Riter, Chairman, Federal
J. R. Riter

AUG 19 1949

Mr. H. W. Bashore, Chairman,
Upper Colorado River Basin Compact Commission,
Post Office Box 367,
Mitchell, Nebraska.

Dear Mr. Bashore:

I am enclosing the first copy of the "Inflow-Outflow Manual" accepted by the Upper Colorado River Basin Compact Commission at their final meeting August 5, 1949.

Members of the Engineering Advisory Committee have indicated their approval of the manual by their signatures on the letter of transmittal. As Chairman of the Compact Commission, I believe it desirable that you retain custody of this copy.

Very truly yours,

John R. Riter, Chairman,
Engineering Advisory Committee,
to U.C.R.B.C.C.

Enclosure

UPPER COLORADO RIVER COMPACT COMMISSION

INFLOW - OUTFLOW MANUAL

INTRODUCTION

This manual has been prepared in accordance with the directions of the Upper Colorado River Compact Commission to provide examples of the administrative procedures which will be required to carry out the provisions of Article VI of the Upper Colorado River Compact which reads as follows:

> "The Commission shall determine the quantity of the consumptive use of water, which use is apportioned by Article III hereof, for the Upper Basin and for each State of the Upper Basin by the inflow-outflow method in terms of man-made depletions of the virgin flow at Lee Ferry, unless the Commission, by unanimous action, shall adopt a different method of determination."

During the negotiations leading to the adoption of the Upper Colorado River Basin Compact, there was exhaustive discussion and very careful consideration of the problems arising from the necessity of measuring the amount of man-made depletion of the virgin flow of the Colorado River and its tributaries, especially at Lee Ferry and at State lines. After thorough discussion of available methods of measurement of consumptive use of water and stream depletion due to the activities of man, especially that caused by irrigation of agricultural crops, the Compact Commission, at the Vernal, Utah meeting, adopted the "Inflow-Outflow Method" as the most practical one for the required purpose.

At the Vernal meeting Mr. R. J. Tipton discussed the work of the depletions sub-committee and recommended that the Commission instruct the Engineering Advisory Committee to prepare a report outlining methods which could be adopted by the Commission for making these measurements.

Following that suggestion the Commission adopted the motion, made by Commissioner Stone as follows:

> "Mr. Chairman, to implement and to carry out the suggestions made by Mr. Tipton, I move that there be referred to the Engineering Advisory Committee for its study and report at the next meeting of the Commission, the matters which were suggested by Mr. Tipton and any other engineering matters which in the judgment of that committee should be included in its report at the next meeting of the Commission." (See page 332 of minutes of Meeting No. 7, held at Vernal, Utah, July 7-21, 1948).

As a result of discussions at previous meetings and in accordance with the action by the Commission indicated above, a sub-committee of the Engineering Advisory Committee was appointed at its meeting held on October 6, 1948, at Bishop's Lodge, with instructions to "write the manual on the inflow-outflow method of measuring consumptive use for the guidance of the future administrative body to be created by the proposed compact."

In the Final Report of the Engineering Advisory Committee, dated November 29, 1948, under the subject of Assignments by Compact Commission, it is stated that at the Vernal meeting the Engineering Advisory Committee was instructed, among other things, "to prepare additional studies of the inflow-outflow method of measuring uses in the Upper Colorado River Basin." (p. 10). On the same page of the Report it is also stated, that "Studies of the inflow-outflow method of measuring uses in the Upper Colorado River Basin are being continued. A manual will be presented to the Compact Commission for use by the administrative body when the studies are completed."

From these brief references to the inflow-outflow method in the proceedings of the Commission and its Engineering Advisory Committee, it is evident that its importance in the future administration of the Upper Colorado River is fully appreciated and that the method and its application should be made a matter of record and easy reference for the guidance of the Administrative Commission.

Article VIII, paragraph (d), of the Compact empowered the Commission to establish and maintain gaging stations, collect and analyze data on stream flow, storage and use of water, and to determine the quantity of water used each year in the Upper Colorado River System and the quantity delivered each year at Lee Ferry. All of these powers and duties are necessary and sufficient for the utilization of the inflow-outflow method in the administrative procedures of the Commission.

APPLICATION OF INFLOW-OUTFLOW METHOD

UPPER COLORADO RIVER BASIN

General Discussion

On all rivers utilized for irrigation purposes consumptive use or man-made depletion at the point of use differs in varying degrees from depletion at state lines or at the lower end of a valley or of a basin. This is a fact that depends upon the conditions which modify the quantities of water flowing down stream channels. Of the total amount of precipitation which falls upon any given drainage basin only a small portion ever reaches a stream in the form of actual discharge. After having been gathered from surface run-off and from springs and by seepage from the ground along creek and river banks, losses in stream flow continually occur along these natural banks and from the stream itself. These losses are mostly due to evaporation from the water surface and from the ground adjacent to the stream, especially where the banks are low and the ground water table is relatively high, and to transpiration from the native vegatation, trees, shrubs, or bushes and grasses which now and always have lined most rivers as well as the smaller tributaries. The operations of man do not change the nature of these losses but the quantity is affected in the degree to which the river system is controlled and utilized. Losses due to natural causes vary with the stage of flow in rivers and streams, being greater for high stages than for low stages.

Development of Pertinent Factual Data

After two years of exhaustive research, investigation and study, the Engineering Advisory Committee obtained and agreed upon rates and quantities of man-made depletions at sites of use and the effect of such depletions at key points on the Colorado River and its principal tributaries. The work was carried on by the sub-committee on Depletion, of which Mr. Tipton was chairman. The general studies to determine stream depletions were covered by the following investigations (page 40 of Engineering Advisory Committee Final Report).

1. "Determination of areas using water as a result of man-made irrigation."

2. "Determination of unit rates of consumptive use of irrigation water."

3. "Computation of stream depletions at sites of use by application of unit rates of consumptive use of irrigation to water using areas and summation of transmountain diversions, and other uses of water by man."

4. "Estimation of channel losses between sites of use of water and Lee Ferry, Arizona, for historic and virgin flows during the period 1914-45."

5. "Computation of stream depletions above certain key gages, at state boundaries, and at Lee Ferry."

Unit rates of consumptive use of irrigation water, (item 2 above) were determined by Mr. Harry F. Blaney and Mr. Wayne D. Criddle of the Soil Conservation Service, U. S. Department of Agriculture. These data can be

found in Appendix B of the Engineering Advisory Committee Final Report.

All of this mass of detailed information was utilized in the determination of virgin flows and present stream depletions. As further man-made depletions occur through the development of additional irrigated areas and other uses, the effects of the several factors indicated above upon these depletions will be automatically integrated by the application of the inflow-outflow method.

This method was fully explained by the chairman of the sub-committee on Depletions at the joint meeting of the Legal and Engineering Advisory Committees held in Denver on June 29, and 30, 1948, and thoroughly discussed by them. As a result of the action at this meeting, a similar and more detailed presentation of the subject was made to the entire Commission on July 8, 1948, at Vernal, Utah, illustrated by maps and graphs showing results of earlier studies, and uses that have been made of the method.

The inflow-outflow method of measuring depletion by man's activity is particularly applicable to the Upper Colorado River Basin. A change in the flow of the river at Lee Ferry, because of man's activity in the basin, can be measured by the change in relationship between the sum of the virgin flows of certain key tributaries near the rim of the basin and the outflow at Lee Ferry. The upper rim stations are designated as inflow-index stations because it is not possible or practicable, nor is it necessary, to measure all of the inflow. It is, however, necessary to correct the inflow-index for man-made depletions above the points of measurement.

The depletion by man's activities in the various sub-basins of the Colorado River at or near the state lines can be measured by the change in relationship between the sum of inflow-index amounts and the outflows at points located at or near the state lines.

Practically all of the irrigation development in the Upper Basin will be limited to the irrigation of lands along tributaries and along the upper reaches of the main streams. The lowest major point of diversion of Green River water for irrigation purposes may be a short distance below the Wyoming-Utah state line. Below that point the Green River enters a series of deep canyons. After the Colorado River leaves Colorado and enters Utah it flows in a deep canyon and there is little opportunity to utilize the water in the Upper Basin for irrigation purposes from that point down. The same is true with respect to the San Juan after it leaves the State of New Mexico.

It is in the canyon sections of these rivers where the major reservoir capacity will be provided to generate hydro-electric energy and to enable the States of the Upper Division to comply with their obligation provided for under Article III (d) of the Colorado River Compact, not to deplete the flow of the Colorado River at Lee Ferry below 75,000,000 acre-feet in progressive ten-year series. The Upper Colorado River Basin Compact provides that the evaporation loss from such reservoirs used for the common good of the four States of the Upper Division shall be charged in proportion to the amount of beneficial consumptive use being made by each state at the time the loss occurs. The evaporation loss is to be measured in terms of depletion at Lee Ferry. The best method of determining this loss is by measuring the change in relationship between inflow to the section (which consists of the sum of the flows of the major tributaries and the main streams below the principal irrigated areas and above the main stem reservoirs) and the outflow from the basin at Lee Ferry.

The following discussion and the accompanying maps and curves are presented as a basis for determining future depletions in the Upper Colorado River Basin and within sub-divisions of the Basin. The inflow-outflow correlation curves have been determined from annual values of discharge. Adjustments have been made for transmountain diversions and depletions for irrigation above the inflow-index stations. Examples of such adjustments are given in the Appendix. As further data are accumulated, while development is proceeding, averages of the data in relation to the average for virgin conditions will measure the total depletion. These averages should be computed for periods which are long enough to define accurately the depletions for given stages of development. Prior to and during the construction of the main stem reservoirs the averages should be continuing until the aggregate capacity of such reservoirs have been filled, drawn-down and re-filled, at which time the period prior to the first filling should be dropped from the computation of continuing averages. The period for computing continuing averages shall then extend until the reservoirs have been drawn-down and filled a third time, when the years between the first and second filling shall be dropped, and so forth.

Plate No. 1 is an outline map of the Upper Colorado River Basin on which is shown the major stream system and the location of inflow-index gaging stations which are applicable to develop an inflow-outflow relationship for that basin. Shown also on the plate is the location of Lee Ferry, which is the outflow point for the basin.

Plate No. 2 is a correlation curve showing the relation between the historic flow at the inflow-index stations corrected for man-made depletion above those stations and the outflow at Lee Ferry. The points from which the curve was developed, are the annual values for the years 1932 through 1948.

The Engineering Advisory Committee to the Upper Colorado River Basin Compact Commission, by exhaustive studies, estimated the mean annual virgin flow at Lee Ferry at 15,638,500 acre-feet for the period 1914 to 1945.

It was estimated that the virgin flow at Lee Ferry for a virgin inflow-index of 5,657,000 acre-feet, which was the average for the period 1932 through 1948, amounts to 13,662,000 acre-feet. This is shown on the Plate, and there has been projected through that point a curve indicating estimated relationship between virgin inflow-index and virgin outflow. Actually, the slope of the curve may not be exactly as shown. As time goes on and more development takes place in the Upper Basin, new relationships will result between inflow-index and outflow and the change in slope of those curves will provide a guide for determining the proper slope of the virgin curve. Under ultimate conditions of development, the slope of the virgin curve will have little significance because the flow at Lee Ferry will be largely equated and the depletion at Lee Ferry by man's activity will be the difference between that equated flow and the long-time average virgin flow.

Table No. 1 indicates inflow-index stations that were used to develop the curve on Plate 2, and the annual run-off at each of those stations for the period used. The corrections made for man-made depletions above the stations are also shown.

Plate No. 3 is an outline map of the San Juan Basin above Bluff, Utah. Shown on the map is the main stem of the San Juan and its principal tributaries. There are indicated on the map the locations of inflow-index gaging stations, stations near the Colorado-New Mexico stateline, which measure the outflow from the upper San Juan Basin and inflow to the lower San Juan Basin, and the gaging station near Bluff, Utah, where the outflow from the basin is measured.

Plate No. 4 is a correlation curve, showing the relation between the sum of virgin flows at the inflow-index stations and the outflow at the station near Bluff, Utah, for the period 1932 through 1948.

Plate No. 5 is a correlation curve showing the relation between the virgin inflow at the inflow-index stations of the upper San Juan Basin and the outflow stations near the Colorado-New Mexico stateline.

Plate No. 6 shows the relation between the inflow to the lower San Juan Basin as measured by the flow past the stations near the Colorado-New Mexico stateline and the outflow from the basin near Bluff, Utah.

There are shown on Plates 4, 5, and 6 the virgin relationships, the shapes of which may be changed as more information is gathered in the future. The change in relation between the inflow as shown on Plate No. 5, and the outflow shown on that curve will measure the additional depletion made by man in Colorado above points near the Colorado-New Mexico stateline.

The curve shown on Plate 6 is intended to be the means of measuring additional depletion caused by man's activities in New Mexico and portions of Colorado, Utah and Arizona on the flow of the river near Bluff, Utah. The change in relationship as there is additional development in the states will be a measure of the depletion by man's activities in these states of the flow of the river at Bluff, Utah. The man-made depletion by Colorado and by the other states of the flow of the river at Bluff must be determined by adjustments in the changes in relationships of the inflow-outflow curves shown on Plates 4, 5, and 6 as development in the state proceeds.

The data from which Plates No. 4, 5, and 6 were derived are included in Tables No. 2, 3, and 4.

Plate No. 7 is an outline map of the Colorado River Basin above Cisco, Utah. It shows all the main stem of the Colorado River and its tributaries in Colorado. Included above Cisco is a small low water producing tributary drainage area in Utah. On the map are shown the locations of inflow-index gaging stations and the outflow station at Cisco.

Plate No. 8 is a curve showing the relationship between historic flow past the inflow-index stations corrected for man-made depletions above those stations and the outflow as measured at the gaging station near Cisco, Utah for the period 1932 through 1948. On the plate is shown the estimated virgin inflow-outflow relationship. As time goes on and additional developments are made of the waters of the Colorado River in Colorado, the relationship between the inflow-index and the outflow will change. This change will indicate the increased depletion of the flow of the river at Cisco by man's activities which will have taken place since the period covered by the basic curve, and will also show the depletion of the virgin flow of the river near Cisco.

The values determining the relationships shown in Plate No. 8 are given in Table No. 5.

Plate No. 9 is an outline map of the Green River Basin above Green River, Utah. It shows the Green River and its principal tributaries. Several sub-basins are shown on the map, including the White River above Watson, Utah, the Yampa River above Maybell, Colorado, the Little Snake River above Lily, Colorado, the Green River above Linwood, Utah, and Henry's Fork above Linwood, Utah.

Plate No. 10 shows an inflow-outflow curve for the White River above Watson, Utah. The inflow-index is measured at the gaging station near Meeker. The estimated virgin flow curve is shown on the plate.

On Plate No. 11 is an inflow-outflow curve of the Yampa River above Maybell, Colorado. The inflow stations are the Yampa River at Steamboat Springs and the Elk River at Clark; the outflow station is at Maybell. The period covered by the curve is 1932 through 1948. The estimated virgin relationship is shown on the plate.

The inflow-outflow relationship for the Little Snake River is shown on Plate 12. The inflow-index stations are the Little Snake River near Slater, Slater's Fork near Slater, and Savery Creek near Savery. The outflow station is at Lily, Colorado. The estimated virgin relationship is shown on the plate.

Plate No. 13 shows the inflow-outflow relationship for the Green River in Wyoming. The index-inflow is measured at Green River at Warren Bridge, North Piney Creek near Mason, Pine Creek at Pinedale, Fontenelle Creek near Fontenelle and Black's Fork near Millburne. The outflow is measured at Linwood, Utah. The estimated virgin relationship is shown on the Plate. The change in relationship of the inflow and outflow as shown on this curve will measure the increase in man-made depletion by Wyoming in the Green River basin, except for the Little Snake River and the Henry's Fork.

The curve on Plate 14 shows the inflow-outflow relationship for Henry's Fork above the outflow station on that tributary near Linwood, Utah. The estimated virgin relationship is also shown on this Plate.

The values used to develop the curves shown on Plates 10 to 14 inclusive are given in Tables 6 to 10 inclusive.

Plate 15 shows the relationship between the inflow to the Green River below all major developments in Colorado and Wyoming and above all major developments in Utah and the outflow of the Green River at Green River, Utah. The inflow stations determining this curve are the White River near Watson, Utah, the Yampa River near Maybell, Colorado, the Little Snake River near Lily, Colorado, the Green River near Linwood, Utah, Henry's Fork near Linwood, Utah, Ashley Creek near Vernal, Utah, the Duchesne River near Tabiona, Utah, the Strawberry River at Duchesne, Utah, and the Price River near Heiner, Utah. The outflow station is at Green River, Utah. The records for the inflow-index of Ashley Creek, the Duchesne, Strawberry, and Price Rivers were corrected for the man-made depletions above the stations. This curve will serve as a temporary means of measuring man-made depletions in Utah of the flow of the Green River at Green River, Utah. There should be established or continued outflow stations on the major Utah tributaries, more specifically enumerated as follows: Sheep Creek, Carter Creek, Brush Creek, Ashley Creek, Duchesne River, and Price River. After records have been accumulated for a sufficient period, the Utah inflow-index stations related to the new outflow stations should be used to determine the man-made depletion of the Utah tributaries. The values used for Plate No. 15 are shown in Table No. 11.

Plate No. 16 shows the relationship between all of the inflow-index stations shown on Plate 15, plus the Colorado River at Cisco and the San Juan River at Bluff, and the outflow of the Colorado River at Lee Ferry. A change in the relationship shown on this curve can be used at the beginning of the administration to check the effect of Utah's future development on the virgin flow at Lee Ferry and the effect of main stem reservoirs which may be built. After records of flow have been accumulated near the mouths of the Utah tributaries

named above and near the mouths of the San Rafael. Dirty Devil and Escalante Rivers, the records at those points should be substituted for the upper Utah stations used in computing the relationship shown on Plate 15. From that time on the correlation developed by such a relation can be utilized to determine the effect on the river at Lee Ferry of the operation of main stem reservoirs. The new records of flow near the mouths of the Utah tributaries will permit the substitution of at least two new relationships for the relationship shown on Plate 15. The new relationships will measure directly the Utah depletions and other changes caused by the activities of man.

As development proceeds, gaging stations may of necessity have to be abandoned and others may have to be added because of the pattern of development. For example, the creation of the Flaming Gorge Reservoir will necessitate the moving of the Green River station near Linwood, Utah, and the Henry's Fork station at Linwood, Utah to points upstream. In addition to moving the Henry's Fork station it will then be necessary to retain the existing station on Blacks Fork near Green River, Wyoming, and reestablish the Green River station at Green River, Wyoming. The development of the Yellow Jacket Project along the Yampa River in Colorado and/or the Deadman Bench Project along the White River in Colorado and Utah will necessitate some change in the locations of key stations. There will be other instances throughout the basin where changes in locations of gaging stations will be necessary, some of which will be mentioned later.

Table No. 12 includes the data relative to Plate No. 16.

RECOMMENDATIONS

The Engineering Advisory Committee recommends that:

A. In General:

1. The Commission follow the basic procedure herein outlined as a means of measuring depletions by the inflow-outflow method until refinements or changes are made and agreed to by the Commission.

2. As records of run-off are accumulated the basic procedure be checked and relationships extended for the river sections covered by this report.

3. Studies be made by the Commission in regard to:

   a. Other areas and river sections which may require inflow-outflow relationships.

   b. Segregation of depletions between states in sections where more than one state is involved and where the water leaving the states passes through common carrier channels.

   c. A determination of virgin conditions, throughout the variation of meteorological conditions that can reasonably be expected.

4. Where new gaging stations are constructed to replace old ones, all be maintained concurrently for as long a period as necessary to establish a reliable correlation between the records of these stations.

B. Specifically:

1. The following existing stations were utilized in the determination of the inflow-outflow relationships described herein and should be retained for compact administrative purposes:

   a. LaPlata River at Hesperus, Colorado
   b. LaPlata River at Colorado-New Mexico State Line
   c. Animas River at Durango, Colorado
   d. Florida River near Durango, Colorado
   e. Animas River near Cedar Hill, New Mexico
   f. Los Pinos River near Bayfield, Colorado
   g. Los Pinos River at Ignacio, Colorado
   h. San Juan River at Pagosa Springs, Colorado
   i. Navajo River at Edith, Colorado
   j. San Juan River at Rosa, New Mexico
   k. Dolores River at Dolores, Colorado
   l. Uncompahgre River near Colona, Colorado
   m. Taylor River at Almont, Colorado
   n. East River at Almont, Colorado
   o. Roaring Fork at Aspen, Colorado
   p. Ten Mile Creek at Dillon, Colorado

q. Blue River at Dillon, Colorado
r. Colorado River at Hot Sulphur Springs, Colorado
s. White River near Meeker, Colorado
t. White River near Watson, Utah
u. Yampa River at Steamboat Springs, Colorado
v. Elk River at Clark, Colorado
w. Yampa River near Maybell, Colorado
x. Little Snake River near Slater, Colorado
y. Slater Fork near Slater, Colorado
z. Savery Creek near Savery, Wyoming
aa. Little Snake River near Dixon, Wyoming
bb. Little Snake River near Lily, Colorado
cc. Pine Creek at Pinedale, Wyoming
dd. Green River at Warren Bridge near Daniel, Wyoming
ee. North Piney Creek near Mason, Wyoming
ff. Fontenelle Creek near Fontenelle, Wyoming
gg. Black's Fork near Millburne, Wyoming
hh. Green River near Linwood, Utah
ii. Henry's Fork near Lonetree, Wyoming
jj. Burnt Fork near Burntfork, Wyoming
kk. Henry's Fork at Linwood, Utah
ll. Ashley Creek near Vernal, Utah
mm. Duchesne River near Tabiona, Utah
nn. Strawberry River at Duchesne, Utah
oo. Price River near Heiner, Utah
pp. Green River at Green River, Utah
qq. Colorado River near Cisco, Utah
rr. San Juan River near Bluff, Utah
ss. Colorado River at Lees Ferry, Arizona
tt. Paria River at Lees Ferry, Arizona

2. The following gaging stations which have been discontinued, be re-established:

a. South Fork White River near Buford, Colorado
b. North Fork White River near Buford, Colorado
c. McElmo Creek near Cortez, Colorado
d. Mancos River near Towaoc, Colorado
e. Green River at Green River, Wyoming

3. New gaging stations as follows be established:

a. Colorado River near Colorado-Utah State Line
b. Los Pinos River near Colorado-New Mexico State Line
c. McElmo Creek near Colorado-Utah State Line
d. Pine Creek near Fremont Lake, Wyoming
e. Fontenelle Creek above irrigation
f. Ham's Fork above irrigation
g. Dirty Devil near mouth
h. San Rafael near mouth

APPENDIX

APPENDIX

Statistical Method for Virgin Condition Correlations

Many of the early records of stream discharge in the basin were obtained under less favorable conditions than is the case in more recent years. In many instances, also, it was necessary to complete partial or missing records by estimating. A frequent necessity was that of extending records back for years on numerous tributary streams as well as at some points on the main river when discharge records were only for short periods. This was accomplished by correlations with flow at stations with longer records and usually with satisfactory results. For the present purpose, however, shorter series of years are used since a larger number of index stations can then be selected, including but few estimated values of discharge.

Example of Method as Applied to a Sub-Basin

Perhaps the best procedure for illustrating the methods used in deriving the correlation curves between inflows and outflows shown in the report is by the use of a typical example.

The data relative to which are shown in Table No. 5, Plate No. 8, and which has been previously presented as showing the inflow-outflow relationship for the Colorado River Basin above Cisco, Utah, is an example where both irrigation depletions and transmountain diversions are made above the inflow-index stations. Depletions above these stations due to irrigation have been comparatively constant from year to year during the period of correlation. However, during the same period the annual transmountain diversions made above the inflow-index stations varied between 11,000 acre-feet and 117,000 acre-feet.

The starting point for determining the inflow-outflow relationship was the correlation of historic data for selected inflow and outflow stations. In this case the annual amounts of transmountain diversions above the inflow stations were added to the recorded flows at those stations before the original correlation was made. The average of such adjusted inflow-indices was then plotted against the average of the outflows for the period of correlation as indicated by the point labeled C.G.1. The slope of the curve through the point C.G.1 was calculated from the annual data, and the coefficient of determination for this historic relationship computed to be 0.915. This shows in general 91.5 percent of the variation in outflow is due to corresponding variation in the inflow-index.

The correction for the smaller, more constant depletion due to irrigation was then applied to the average point described above, resulting in a point C.G.2, which is the point from which the average virgin relationship for the period may be determined.

The average of the transmountain diversions made in the entire basin above Cisco for the period of correlation, together with the average of all other man-made depletions in that basin were used in determining the point representing average virgin flow at Cisco for that period.

In the final report of the Engineering Advisory Committee the estimated average depletion at sites of use, due to irrigation, municipal uses, and reservoir evaporation losses, is given as 840,000 acre-feet. The salvage in the basin was also estimated to be 29,900 acre-feet. The average of the transmountain diversions made above Cisco is 79,500 acre-feet for the period of correlation. The sum of the average transmountain diversions and the average depletion at sites of use, minus the estimated salvage, is the average depletion of the virgin flow at Cisco for the period, which in this case amounts to 889,600 acre-feet.

A distance representing this amount was therefore laid off by scale to the right of C.G.2 and marked C.G.3. Lines were then drawn through the points C.G.1, C.G.2, and C.G.3 on the slope previously determined for the historic correlation, to indicate the probable relationship between virgin inflow-index and virgin outflow quantities. As stated in the description of the inflow-outflow curves previously presented, this virgin flow curve may not be exactly parallel to the historic trend lines, but until further data are obtained these curves may be used with reasonable results.

Inflow Stations Required for Index

Throughout the Colorado River Basin there are a few rim gaging stations with long records concurrent with outflow records. Correlations may be established for long periods by using the stations available, including some estimated values to complete missing portions of the record. A considerable number of additional stations have been installed on various tributaries in recent years. A study was made to determine the effect on a basic inflow-outflow relationship of the addition of more rim gaging stations to the original inflow-index, or the substitution of gaging stations for some which were used in the basic correlation.

The Colorado River Basin above Cisco was selected as an example, and the comparative results of the study are shown in the following tabulation:

Number of Inflow-Index Stations	Period of Correlation	Coefficient of Determination	Ratio of Inflow-Index to Outflow
9	1914-1947	0.952	31%
9	1939-1947	0.957	31%
15	1939-1947	0.966	46%
11	1939-1947	0.946	29%

A basic relationship between inflow-index at selected rim stations and outflow of the Colorado River at the gaging station near Cisco, Utah, was determined for the period 1914-1947. No corrections other than for annual transmountain diversions above them were made to the recorded flows at the index stations in determining this relation. The coefficient of determination (r^2), computed by least squares for the relation for individual years, is 0.952. Total corrected run-off at the inflow stations was about 31 percent of the run-off at Cisco for the period.

The inflow stations were selected primarily because of the long period of recorded run-off, rather than that they were ideally located to represent index inflow. The following tabulation lists the inflow stations used in the basic correlation, together with the approximate areas irrigated both above the gage and by water bypassing the gage. These areas were determined by a study of the U.S.B.R. land classification plane table sheets.

Gaging Stations	Acres Irrigated	
	Above Gage	By water Bypassing Gage
Colorado River near Hot Sulphur Springs	12,710	140
Blue River at Dillon	143	0
Roaring Fork at Aspen	120	2,100
Plateau Creek near Collbran plus Buzzard Creek near Collbran	2,180	410
East River at Almont	7,360	0
Taylor River at Almont	360	0
Uncompahgre River at Colona	15,510	1,502
Dolores River at Dolores	2,525	0

By 1939 a number of gaging stations had been established on other tributaries of the Colorado River above Cisco. In order to determine the effect on the inflow-outflow relationship of the addition of inflow stations a correlation was first made between the combined run-off of the stations listed above and the run-off at the outflow station near Cisco for the period 1939-1947. It was assumed that no significant changes had occurred in acreages irrigated above the gages or in the amounts of bypassed water for the long or short periods. Run-off at the inflow stations was corrected for annual transmountain diversions above the stations. For this correlation, $r^2 = 0.957$. The combined corrected run-off of the inflow stations represents about 31 percent of the outflow run-off for the period.

A second annual correlation for the period 1939-1947 was made between inflow-index run-off and outflow run-off at Cisco. The combined run-off of the following gaging stations was added to that of the stations listed above.

Gaging Station	Acres Irrigated	
	Above Gage	By water Bypassing Gage
Williams River near Leal	50	40
Snake River at Dillon	225	18,000 acre-feet (for power)
Ten Mile Creek at Dillon	201	0

Gaging Station	Acres Irrigated Above Gage	Acres Irrigated By water Bypassing Gage
Crystal River near Redstone	115	2,040
North Fork Gunnison River near Somerset	3,207	0
Tomichi Creek near Sargents	1,940	0

This group of inflow stations, together with those listed above, includes gaging stations on the important tributaries of the Colorado River system above Cisco, with the exception of the Eagle River and the Lake Fork of the Gunnison River. Corrections to the recorded run-off at the inflow stations were made for transmountain diversions as for the other correlations. No corrections were made for diversions above or bypassing the stations. The value for r^2, as computed for this correlation was 0.966. Total run-off of the inflow stations was approximately 46 percent of the run-off at the outflow station near Cisco.

Of the inflow stations represented in the latter correlation, there are some with considerable areas irrigated above the gages or comparatively large amounts of water bypassing the gages. In some instances it might be difficult to determine whether changes had occurred in depletions above the gages, or it might be expensive to make measurements of water bypassing the gages. As an example, the Granby and Shadow Mountain Lake Reservoirs, which are regulatory reservoirs for the Colorado-Big Thompson Transmountain Diversion Project, are being constructed above the gage on the Colorado River at Hot Sulphur Springs, Colorado. In the future, the record at Hot Sulphur Springs must necessarily be corrected for the operation of these reservoirs, including the net evaporation losses resulting from their operation.

A third correlation, for the 1939-1947 period was therefore made to ascertain the effect of eliminating some of the stations, or substituting other stations higher on the streams, so that the major portion of the consumptive uses would occur below the inflow stations and thus be automatically integrated into the inflow-outflow relationship. For this analysis, the stations on Colorado River near Grand Lake and Fraser River at Winter Park were substituted for Colorado River at Hot Sulphur Springs and the stations on Snake River at Dillon, Crystal River near Redstone, Uncompahgre River at Colona, and Buzzard and Plateau Creeks near Collbran were eliminated. Such elimination would preclude the necessity for measuring winter flows around Snake River at Dillon or for measuring bypassed water at Colona and Redstone in several ditches. The inflow stations used for the third correlation are listed in the following table:

Gaging Station	Acres Irrigated Above Gage	Acres Irrigated By water Bypassing Gage
Colorado River near Grand Lake	200	2,430
Fraser River at Winter Park	0	0
Blue River at Dillon	143	0
Ten Mile Creek at Dillon	201	0
Williams River near Leal	50	40
Roaring Fork at Aspen	120	2,100
East River at Almont	7,360	0
Taylor River at Almont	360	0
North Fork Gunnison River near Somerset	3,207	0
Tomichi Creek near Sargents	1,940	0
Dolores River at Dolores	2,525	0

The value for r^2 in this correlation was 0.946, with the total run-off at the inflow stations representing 29 percent of the total outflow, as compared with the ratio of 31 percent for the first correlation and 46 percent for the second.

The coefficient of determination for the third correlation is not significantly different from the coefficients for the other correlations for the 1939-1947 period, indicating that the final list of 11 stations would form the basis of a satisfactory inflow-outflow relationship. At the same time the list included only two stations with any considerable amounts of water bypassing them, and in each instance the major portion of this water may be measured in one canal. The irrigated areas above each of the stations is of the native hay meadow type, and these areas have become practically stabilized over a long period of years. Consumptive uses for presently contemplated projects, exclusive of transmountain diversions, will occur in most instances below the inflow stations.

The addition of a station which has been re-established on North Inlet to Grand Lake and stations above principal diversions on Crystal River and Eagle River might strengthen the relationship by increasing the ratio of total measured inflow to recorded outflow.

In any instance of the addition or elimination of inflow stations from those used as an original basis, the stations which are eliminated should be continued in operation for a sufficient length of time to permit correlations to be made so that the relations shown by any selected new group of inflow stations may be used in lieu of the original relation to insure continuity over a long period of time.

and consent of the Senate: *Provided*, That a person who has within ten years been on active duty as a commissioned officer in a Regular component of the armed services shall not be eligible for appointment as Under Secretary of Defense. The Under Secretary shall perform such duties, and shall exercise such powers, as the Secretary of Defense may prescribe. The Under Secretary shall act for, and exercise the powers of, the Secretary of Defense during his absence or disability."

Restriction.

SEC. 2. Subsection (a) of section 301 of such Act (5 U. S. C., sec. 171b), is amended by adding at the end thereof the following:

61 Stat. 507.
5 U. S. C., Supp. II, § 171b.
Post, p. 585.

"The Under Secretary of Defense shall receive the compensation prescribed by law for Under Secretaries of executive departments."

Approved April 2, 1949.

[CHAPTER 48]

AN ACT

April 6, 1949
[S. 790]
[Public Law 37]

To grant the consent of the United States to the Upper Colorado River Basin Compact.

Upper Colorado River Basin Compact.
Consent of Congress.

Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled, That the consent of the Congress is hereby given to the compact, signed (after negotiations in which a representative of the United States, duly appointed by the President, participated and upon which he has reported to the Congress) by the Commissioners for the States of Arizona, Colorado, New Mexico, Utah, and Wyoming, on October 11, 1948, at Santa Fe, New Mexico, and thereafter ratified by the legislatures of each of the States aforesaid, which said compact reads as follows:

"UPPER COLORADO RIVER BASIN COMPACT

"The State of Arizona, the State of Colorado, the State of New Mexico, the State of Utah and the State of Wyoming, acting through their Commissioners,

"Charles A. Carson for the State of Arizona,

"Clifford H. Stone for the State of Colorado,

"Fred E. Wilson for the State of New Mexico,

"Edward H. Watson for the State of Utah and

"L. C. Bishop for the State of Wyoming,

after negotiations participated in by Harry W. Bashore, appointed by the President as the representative of the United States of America, have agreed, subject to the provisions of the Colorado River Compact, to determine the rights and obligations of each signatory State respecting the uses and deliveries of the water of the Upper Basin of the Colorado River, as follows:

"ARTICLE I

"(a) The major purposes of this Compact are to provide for the equitable division and apportionment of the use of the waters of the Colorado River System, the use of which was apportioned in perpetuity to the Upper Basin by the Colorado River Compact; to establish the obligations of each State of the Upper Division with respect to the deliveries of water required to be made at Lee Ferry by the Colorado River Compact; to promote interstate comity; to remove causes of present and future controversies; to secure the expeditious agricultural and industrial development of the Upper Basin, the storage of water and to protect life and property from floods.

"(b) It is recognized that the Colorado River Compact is in full force and effect and all of the provisions hereof are subject thereto.

"ARTICLE II

"As used in this Compact:

"(a) The term 'Colorado River System' means that portion of the Colorado River and its tributaries within the United States of America.

"(b) The term 'Colorado River Basin' means all of the drainage area of the Colorado River System and all other territory within the United States of America to which the waters of the Colorado River System shall be beneficially applied.

"(c) The term 'States of the Upper Division' means the States of Colorado, New Mexico, Utah and Wyoming.

"(d) The term 'States of the Lower Division' means the States of Arizona, California and Nevada.

"(e) The term 'Lee Ferry' means a point in the main stream of the Colorado River one mile below the mouth of the Paria River.

"(f) The term 'Upper Basin' means those parts of the States of Arizona, Colorado, New Mexico, Utah, and Wyoming within and from which waters naturally drain into the Colorado River System above Lee Ferry, and also all parts of said States located without the drainage area of the Colorado River System which are now or shall hereafter be beneficially served by waters diverted from the Colorado River System above Lee Ferry.

"(g) The term 'Lower Basin' means those parts of the States of Arizona, California, Nevada, New Mexico and Utah within and from which waters naturally drain into the Colorado River System below Lee Ferry, and also all parts of said States located without the drainage area of the Colorado River System which are now or shall hereafter be beneficially served by waters diverted from the Colorado River System below Lee Ferry.

"(h) The term 'Colorado River Compact' means the agreement concerning the apportionment of the use of the waters of the Colorado River System dated November 24, 1922, executed by Commissioners for the States of Arizona, California, Colorado, Nevada, New Mexico, Utah and Wyoming, approved by Herbert Hoover, representative of the United States of America, and proclaimed effective by the President of the United States of America, June 25, 1929.

46 Stat. 3000.

"(i) The term 'Upper Colorado River System' means that portion of the Colorado River System above Lee Ferry.

"(j) The term 'Commission' means the administrative agency created by Article VIII of this Compact.

"(k) The term 'water year' means that period of twelve months ending September 30 of each year.

"(l) The term 'acre-foot' means the quantity of water required to cover an acre to the depth of one foot and is equivalent to 43,560 cubic feet.

"(m) The term 'domestic use' shall include the use of water for household, stock, municipal, mining, milling, industrial and other like purposes, but shall exclude the generation of electrical power.

"(n) The term 'virgin flow' means the flow of any stream undepleted by the activities of man.

"ARTICLE III

"(a) Subject to the provisions and limitations contained in the Colorado River Compact and in this Compact, there is hereby apportioned from the Upper Colorado River System in perpetuity to the States of Arizona, Colorado, New Mexico, Utah and Wyoming, respectively, the consumptive use of water as follows:

"(1) To the State of Arizona the consumptive use of 50,000 acre-feet of water per annum.

"(2) To the States of Colorado, New Mexico, Utah and Wyoming, respectively, the consumptive use per annum of the quantities resulting from the application of the following percentages to the total quantity of consumptive use per annum apportioned in perpetuity to and available for use each year by Upper Basin under the Colorado River Compact and remaining after the deduction of the use, not to exceed 50,000 acre-feet per annum, made in the State of Arizona.

"State of Colorado, 51.75 per cent; State of New Mexico, 11.25 per cent; State of Utah, 23.00 per cent; State of Wyoming, 14.00 per cent.

"(b) The apportionment made to the respective States by paragraph (a) of this Article is based upon, and shall be applied in conformity with, the following principles and each of them:

"(1) The apportionment is of any and all man-made depletions;

"(2) Beneficial use is the basis, the measure and the limit of the right to use;

"(3) No State shall exceed its apportioned use in any water year when the effect of such excess use, as determined by the Commission, is to deprive another signatory State of its apportioned use during that water year; provided, that this subparagraph (b) (3) shall not be construed as:

"(i) Altering the apportionment of use, or obligations to make deliveries as provided in Article XI, XII, XIII or XIV of this Compact;

"(ii) Purporting to apportion among the signatory States such uses of water as the Upper Basin may be entitled to under paragraphs (f) and (g) of Article III of the Colorado River Compact; or

"(iii) Countenancing average uses by any signatory State in excess of its apportionment.

"(4) The apportionment to each State includes all water necessary for the supply of any rights which now exist.

"(c) No apportionment is hereby made, or intended to be made, of such uses of water as the Upper Basin may be entitled to under paragraphs (f) and (g) of Article III of the Colorado River Compact.

"(d) The apportionment made by this Article shall not be taken as any basis for the allocation among the signatory States of any benefits resulting from the generation of power.

"ARTICLE IV

"In the event curtailment of use of water by the States of the Upper Division at any time shall become necessary in order that the flow at Lee Ferry shall not be depleted below that required by Article III of the Colorado River Compact, the extent of curtailment by each State of the consumptive use of water apportioned to it by Article III of this Compact shall be in such quantities and at such times as shall be determined by the Commission upon the application of the following principles:

"(a) The extent and times of curtailment shall be such as to assure full compliance with Article III of the Colorado River Compact;

"(b) If any State or States of the Upper Division, in the ten years immediately preceding the water year in which curtailment is necessary, shall have consumptively used more water than it was or they were, as the case may be, entitled to use under the apportionment made by Article III of this Compact, such State or States shall be required to supply at Lee Ferry a quantity of water equal to its, or the aggregate of their, overdraft or the proportionate part of such overdraft, as may be necessary to assure compliance with Article III of the Colorado River Compact, before demand is made on any other State of the Upper Division;

"(c) Except as provided in subparagraph (b) of this Article, the extent of curtailment by each State of the Upper Division of the consumptive use of water apportioned to it by Article III of this Compact shall be such as to result in the delivery at Lee Ferry of a quantity of water which bears the same relation to the total required curtailment of use by the States of the Upper Division as the consumptive use of Upper Colorado River System water which was made by each such State during the water year immediately preceding the year in which the curtailment becomes necessary bears to the total consumptive use of such water in the States of the Upper Division during the same water year; provided, that in determining such relation the uses of water under rights perfected prior to November 24, 1922, shall be excluded.

"ARTICLE V

"(a) All losses of water occurring from or as the result of the storage of water in reservoirs constructed prior to the signing of this Compact shall be charged to the State in which such reservoir or reservoirs are located. Water stored in reservoirs covered by this paragraph (a) shall be for the exclusive use of and shall be charged to the State in which the reservoir or reservoirs are located.

"(b) All losses of water occurring from or as the result of the storage of water in reservoirs constructed after the signing of this Compact shall be charged as follows:

"(1) If the Commission finds that the reservoir is used, in whole or in part, to assist the States of the Upper Division in meeting their obligations to deliver water at Lee Ferry imposed by Article III of the Colorado River Compact, the Commission shall make findings, which in no event shall be contrary to the laws of the United States of America under which any reservoir is constructed, as to the reservoir capacity allocated for that purpose. The whole or that proportion, as the case may be, of reservoir losses as found by the Commission to be reasonably and properly chargeable to the reservoir or reservoir capacity utilized to assure deliveries at Lee Ferry shall be charged to the States of the Upper Division in the proportion which the consumptive use of water in each State of the Upper Division during the water year in which the charge is made bears to the total consumptive use of water in all States of the Upper Division during the same water year. Water stored in reservoirs or in reservoir capacity covered by this subparagraph (b) (1) shall be for the common benefit of all of the States of the Upper Division.

"(2) If the Commission finds that the reservoir is used, in whole or in part, to supply water for use in a State of the Upper Division, the Commission shall make findings, which in no event shall be contrary to the laws of the United States of America under which any reservoir is constructed, as to the reservoir or reservoir capacity utilized to supply water for use and the State in which such water will be used. The whole or that proportion, as the case may be, of reservoir losses as found by the Commission to be reasonably and properly chargeable to the State in which such water will be used shall be borne by that State. As determined by the Commission, water stored in reservoirs covered by this subparagraph (b) (2) shall be earmarked for and charged to the State in which the water will be used.

"(c) In the event the Commission finds that a reservoir site is available both to assure deliveries at Lee Ferry and to store water for consumptive use in a State of the Upper Division, the storage of water for consumptive use shall be given preference. Any reservoir or reservoir capacity hereafter used to assure deliveries at Lee Ferry shall by order of the Commission be used to store water for consumptive

use in a State, provided the Commission finds that such storage is reasonably necessary to permit such State to make the use of the water apportioned to it by this Compact.

"ARTICLE VI

"The Commission shall determine the quantity of the consumptive use of water, which use is apportioned by Article III hereof, for the Upper Basin and for each State of the Upper Basin by the inflow-outflow method in terms of man-made depletions of the virgin flow at Lee Ferry, unless the Commission, by unanimous action, shall adopt a different method of determination.

"ARTICLE VII

"The consumptive use of water by the United States of America or any of its agencies, instrumentalities or wards shall be charged as a use by the State in which the use is made; provided, that such consumptive use incident to the diversion, impounding, or conveyance of water in one State for use in another shall be charged to such latter State.

"ARTICLE VIII

Upper Colorado River Commission.

"(a) There is hereby created an interstate administrative agency to be known as the 'Upper Colorado River Commission'. The Commission shall be composed of one Commissioner, representing each of the States of the Upper Division, namely, the States of Colorado, New Mexico, Utah and Wyoming, designated or appointed in accordance with the laws of each such State and, if designated by the President, one Commissioner representing the United States of America. The President is hereby requested to designate a Commissioner. If so designated the Commissioner representing the United States of America shall be the presiding officer of the Commission and shall be entitled to the same powers and rights as the Commissioner of any State. Any four members of the Commission shall constitute a quorum.

U.S. Commissioner.

"(b) The salaries and personal expenses of each Commissioner shall be paid by the Government which he represents. All other expenses which are incurred by the Commission incident to the administration of this Compact, and which are not paid by the United States of America, shall be borne by the four States according to the percentage of consumptive use apportioned to each. On or before December 1 of each year, the Commission shall adopt and transmit to the Governors of the four States and to the President a budget covering an estimate of its expenses for the following year, and of the amount payable by each State. Each State shall pay the amount due by it to the Commission on or before April 1 of the year following. The payment of the expenses of the Commission and of its employees shall not be subject to the audit and accounting procedures of any of the four States; however, all receipts and disbursement of funds handled by the Commission shall be audited yearly by a qualified independent public accountant and the report of the audit shall be included in and become a part of the annual report of the Commission.

Budget.

"(c) The Commission shall appoint a Secretary, who shall not be a member of the Commission, or an employee of any signatory State or of the United States of America while so acting. He shall serve for such term and receive such salary and perform such duties as the Commission may direct. The Commission may employ such engineering, legal, clerical and other personnel as, in its judgment, may be necessary for the performance of its functions under this Compact.

In the hiring of employees, the Commission shall not be bound by the civil service laws of any State.

"(d) The Commission, so far as consistent with this Compact, shall have the power to:

"(1) Adopt rules and regulations;

"(2) Locate, establish, construct, abandon, operate and maintain water gaging stations;

"(3) Make estimates to forecast water run-off on the Colorado River and any of its tributaries;

"(4) Engage in cooperative studies of water supplies of the Colorado River and its tributaries;

"(5) Collect, analyze, correlate, preserve and report on data as to the stream flows, storage, diversions and use of the waters of the Colorado River, and any of its tributaries;

"(6) Make findings as to the quantity of water of the Upper Colorado River System used each year in the Upper Colorado River Basin and in each State thereof;

"(7) Make findings as to the quantity of water deliveries at Lee Ferry during each water year;

"(8) Make findings as to the necessity for and the extent of the curtailment of use, required, if any, pursuant to Article IV hereof;

"(9) Make findings as to the quantity of reservoir losses and as to the share thereof chargeable under Article V hereof to each of the States;

"(10) Make findings of fact in the event of the occurrence of extraordinary drought or serious accident to the irrigation system in the Upper Basin, whereby deliveries by the Upper Basin of water which it may be required to deliver in order to aid in fulfilling obligations of the United States of America to the United Mexican States arising under the Treaty between the United States of America and the United Mexican States, dated February 3, 1944 (Treaty Series 994) become difficult, and report such findings to the Governors of the Upper Basin States, the President of the United States of America, the United States Section of the International Boundary and Water Commission, and such other Federal officials and agencies as it may deem appropriate to the end that the water allotted to Mexico under Division III of such treaty may be reduced in accordance with the terms of such Treaty;

59 Stat. 1219.
Report.

59 Stat. 1237.

"(11) Acquire and hold such personal and real property as may be necessary for the performance of its duties hereunder and to dispose of the same when no longer required;

"(12) Perform all functions required of it by this Compact and do all things necessary, proper or convenient in the performance of its duties hereunder, either independently or in cooperation with any state or federal agency;

Annual report.

"(13) Make and transmit annually to the Governors of the signatory States and the President of the United States of America, with the estimated budget, a report covering the activities of the Commission for the preceding water year.

"(e) Except as otherwise provided in this Compact the concurrence of four members of the Commission shall be required in any action taken by it.

Availability of information.

"(f) The Commission and its Secretary shall make available to the Governor of each of the signatory States any information within its possession at any time, and shall always provide free access to its records by the Governors of each of the States, or their representatives, or authorized representatives of the United States of America.

"(g) Findings of fact made by the Commission shall not be conclusive in any court, or before any agency or tribunal, but shall constitute prima facie evidence of the facts found.

"(h) The organization meeting of the Commission shall be held within four months from the effective date of this Compact.

"ARTICLE IX

Acquisition of water rights.

"(a) No State shall deny the right of the United States of America and, subject to the conditions hereinafter contained, no State shall deny the right of another signatory State, any person, or entity of any signatory State to acquire rights to the use of water, or to construct or participate in the construction and use of diversion works and storage reservoirs with appurtenant works, canals and conduits in one State for the purpose of diverting, conveying, storing, regulating and releasing water to satisfy the provisions of the Colorado River Compact relating to the obligation of the States of the Upper Division to make deliveries of water at Lee Ferry, or for the purpose of diverting, conveying, storing or regulating water in an upper signatory State for consumptive use in a lower signatory State, when such use is within the apportionment to such lower State made by this Compact. Such rights shall be subject to the rights of water users, in a State in which such reservoir or works are located, to receive and use water, the use of which is within the apportionment to such State by this Compact.

"(b) Any signatory State, any person or any entity of any signatory State shall have the right to acquire such property rights as are necessary to the use of water in conformity with this Compact in any other signatory State by donation, purchase or through the exercise of the power of eminent domain. Any signatory State, upon the written request of the Governor of any other signatory State, for the benefit of whose water users property is to be acquired in the State to which such written request is made, shall proceed expeditiously to acquire the desired property either by purchase at a price satisfactory to the requesting State, or, if such purchase cannot be made, then through the exercise of its power of eminent domain and shall convey such property to the requesting State or such entity as may be designated by the requesting State; provided, that all costs of acquisition and expenses of every kind and nature whatsoever incurred in obtaining the requested property shall be paid by the requesting State at the time and in the manner prescribed by the State requested to acquire the property.

"(c) Should any facility be constructed in a signatory State by and for the benefit of another signatory State or States or the water users thereof, as above provided, the construction, repair, replacement, maintenance and operation of such facility shall be subject to the laws of the State in which the facility is located, except that, in the case of a reservoir constructed in one State for the benefit of another State or States, the water administration officials of the State in which the facility is located shall permit the storage and release of any water which, as determined by findings of the Commission, falls within the apportionment of the State or States for whose benefit the facility is constructed. In the case of a regulating reservoir for the joint benefit of all States in making Lee Ferry deliveries, the water administration officials of the State in which the facility is located, in permitting the storage and release of water, shall comply with the findings and orders of the Commission.

Reimbursement for loss of taxes.

"(d) In the event property is acquired by a signatory State in another signatory State for the use and benefit of the former, the users of water made available by such facilities, as a condition precedent to the use thereof, shall pay to the political subdivisions of the State in which such works are located, each and every year during which such rights are enjoyed for such purposes, a sum of money equivalent to the average annual amount of taxes levied and assessed against the

land and improvements thereon during the ten years preceding the acquisition of such land. Said payments shall be in full reimbursement for the loss of taxes in such political subdivisions of the State, and in lieu of any and all taxes on said property, improvements and rights. The signatory States recommend to the President and the Congress that, in the event the United States of America shall acquire property in one of the signatory States for the benefit of another signatory State, or its water users, provision be made for like payment in reimbursement of loss of taxes.

"ARTICLE X

La Plata River Compact.

"(a) The signatory States recognize La Plata River Compact entered into between the States of Colorado and New Mexico, dated November 27, 1922, approved by the Congress on January 29, 1925 (43 Stat. 796), and this Compact shall not affect the apportionment therein made.

"(b) All consumptive use of water of La Plata River and its tributaries shall be charged under the apportionment of Article III hereof to the State in which the use is made; provided, that consumptive use incident to the diversion, impounding or conveyance of water in one State for use in the other shall be charged to the latter State.

"ARTICLE XI

"Subject to the provisions of this Compact, the consumptive use of the water of the Little Snake River and its tributaries is hereby apportioned between the States of Colorado and Wyoming in such quantities as shall result from the application of the following principles and procedures:

"(a) Water used under rights existing prior to the signing of this Compact.

"(1) Water diverted from any tributary of the Little Snake River or from the main stem of the Little Snake River above a point one hundred feet below the confluence of Savery Creek and the Little Snake River shall be administered without regard to rights covering the diversion of water from any down-stream points.

"(2) Water diverted from the main stem of the Little Snake River below a point one hundred feet below the confluence of Savery Creek and the Little Snake River shall be administered on the basis of an interstate priority schedule prepared by the Commission in conformity with priority dates established by the laws of the respective States.

"(b) Water used under rights initiated subsequent to the signing of this Compact.

"(1) Direct flow diversions shall be so administered that, in time of shortage, the curtailment of use on each acre of land irrigated thereunder shall be as nearly equal as may be possible in both of the States.

"(2) The storage of water by projects located in either State, whether of supplemental supply or of water used to irrigate land not irrigated at the date of the signing of this Compact, shall be so administered that in times of water shortage the curtailment of storage of water available for each acre of land irrigated thereunder shall be as nearly equal as may be possible in both States.

"(c) Water uses under the apportionment made by this Article shall be in accordance with the principle that beneficial use shall be the basis, measure and limit of the right to use.

"(d) The States of Colorado and Wyoming each assent to diversions and storage of water in one State for use in the other State, subject to compliance with Article IX of this Compact.

"(e) In the event of the importation of water to the Little Snake River Basin from any other river basin, the State making the importation shall have the exclusive use of such imported water unless by written agreement, made by the representatives of the States of Colorado and Wyoming on the Commission, it is otherwise provided.

"(f) Water use projects initiated after the signing of this Compact, to the greatest extent possible, shall permit the full use within the Basin in the most feasible manner of the waters of the Little Snake River and its tributaries, without regard to the state line; and, so far as is practicable, shall result in an equal division between the States of the use of water not used under rights existing prior to the signing of this Compact.

"(g) All consumptive use of the waters of the Little Snake River and its tributaries shall be charged under the apportionment of Article III hereof to the State in which the use is made; provided, that consumptive use incident to the diversion, impounding or conveyance of water in one State for use in the other shall be charged to the latter State.

"ARTICLE XII

"Subject to the provisions of this Compact, the consumptive use of the waters of Henry's Fork, a tributary of Green River originating in the State of Utah and flowing into the State of Wyoming and thence into the Green River in the State of Utah; Beaver Creek, originating in the State of Utah and flowing into Henry's Fork in the State of Wyoming; Burnt Fork, a tributary of Henry's Fork, originating in the State of Utah and flowing into Henry's Fork in the State of Wyoming; Birch Creek, a tributary of Henry's Fork, originating in the State of Utah and flowing into Henry's Fork in the State of Wyoming; and Sheep Creek, a tributary of Green River in the State of Utah, and their tributaries, are hereby apportioned between the States of Utah and Wyoming in such quantities as will result from the application of the following principles and procedures:

"(a) Waters used under rights existing prior to the signing of this Compact.

"Waters diverted from Henry's Fork, Beaver Creek, Burnt Fork, Birch Creek and their tributaries, shall be administered without regard to the state line on the basis of an interstate priority schedule to be prepared by the States affected and approved by the Commission in conformity with the actual priority of right of use, the water requirements of the land irrigated and the acreage irrigated in connection therewith.

"(b) Waters used under rights from Henry's Fork, Beaver Creek, Burnt Fork, Birch Creek and their tributaries, initiated after the signing of this Compact shall be divided fifty percent to the State of Wyoming and fifty percent to the State of Utah and each State may use said waters as and where it deems advisable.

"(c) The State of Wyoming assents to the exclusive use by the State of Utah of the water of Sheep Creek, except that the lands, if any, presently irrigated in the State of Wyoming from the water of Sheep Creek shall be supplied with water from Sheep Creek in order of priority and in such quantities as are in conformity with the laws of the State of Utah.

"(d) In the event of the importation of water to Henry's Fork, or any of its tributaries, from any other river basin, the State making the importation shall have the exclusive use of such imported water unless by written agreement made by the representatives of the States of Utah and Wyoming on the Commission, it is otherwise provided.

"(e) All consumptive use of waters of Henry's Fork, Beaver Creek, Burnt Fork, Birch Creek, Sheep Creek, and their tributaries shall be charged under the apportionment of Article III hereof to the State in which the use is made; provided, that consumptive use incident to the diversion, impounding or conveyance of water in one State for use in the other shall be charged to the latter State.

"(f) The States of Utah and Wyoming each assent to the diversion and storage of water in one State for use in the other State, subject to compliance with Article IX of this Compact. It shall be the duty of the water administrative officials of the State where the water is stored to release said stored water to the other State upon demand. If either the State of Utah or the State of Wyoming shall construct a reservoir in the other State for use in its own State, the water users of the State in which said facilities are constructed may purchase at cost a portion of the capacity of said reservoir sufficient for the irrigation of their lands thereunder.

"(g) In order to measure the flow of water diverted, each State shall cause suitable measuring devices to be constructed, maintained and operated at or near the point of diversion into each ditch.

"(h) The State Engineers of the two States jointly shall appoint a Special Water Commissioner who shall have authority to administer the water in both States in accordance with the terms of this Article. The salary and expenses of such Special Water Commissioner shall be paid, thirty percent by the State of Utah and seventy percent by the State of Wyoming.

"ARTICLE XIII

"Subject to the provisions of this Compact, the rights to the consumptive use of the water of the Yampa River, a tributary entering the Green River in the State of Colorado, are hereby apportioned between the States of Colorado and Utah in accordance with the following principles:

"(a) The State of Colorado will not cause the flow of the Yampa River at the Maybell Gaging Station to be depleted below an aggregate of 5,000,000 acre-feet for any period of ten consecutive years reckoned in continuing progressive series beginning with the first day of October next succeeding the ratification and approval of this Compact. In the event any diversion is made from the Yampa River or from tributaries entering the Yampa River above the Maybell Gaging Station for the benefit of any water use project in the State of Utah, then the gross amount of all such diversions for use in the State of Utah, less any returns from such diversions to the River above Maybell, shall be added to the actual flow at the Maybell Gaging Station to determine the total flow at the Maybell Gaging Station.

"(b) All consumptive use of the waters of the Yampa River and its tributaries shall be charged under the apportionment of Article III hereof to the State in which the use is made; provided, that consumptive use incident to the diversion, impounding or conveyance of water in one State for use in the other shall be charged to the latter State.

"ARTICLE XIV

"Subject to the provisions of this Compact, the consumptive use of the waters of the San Juan River and its tributaries is hereby apportioned between the States of Colorado and New Mexico as follows:

"The State of Colorado agrees to deliver to the State of New Mexico from the San Juan River and its tributaries which rise in the State of Colorado a quantity of water which shall be sufficient, together with water originating in the San Juan Basin in the State of New Mexico,

to enable the State of New Mexico to make full use of the water apportioned to the State of New Mexico by Article III of this Compact, subject, however, to the following:

"(a) A first and prior right shall be recognized as to:

"(1) All uses of water made in either State at the time of the signing of this Compact; and

"(2) All uses of water contemplated by projects authorized, at the time of the signing of this Compact, under the laws of the United States of America whether or not such projects are eventually constructed by the United States of America or by some other entity.

"(b) The State of Colorado assents to diversions and storage of water in the State of Colorado for use in the State of New Mexico, subject to compliance with Article IX of this Compact.

"(c) The uses of the waters of the San Juan River and any of its tributaries within either State which are dependent upon a common source of water and which are not covered by (a) hereof, shall in times of water shortages be reduced in such quantity that the resulting consumptive use in each State will bear the same proportionate relation to the consumptive use made in each State during times of average water supply as determined by the Commission; provided, that any preferential uses of water to which Indians are entitled under Article XIX shall be excluded in determining the amount of curtailment to be made under this paragraph.

"(d) The curtailment of water use by either State in order to make deliveries at Lee Ferry as required by Article IV of this Compact shall be independent of any and all conditions imposed by this Article and shall be made by each State, as and when required, without regard to any provision of this Article.

"(e) All consumptive use of the waters of the San Juan River and its tributaries shall be charged under the apportionment of Article III hereof to the State in which the use is made; provided, that consumptive use incident to the diversion, impounding or conveyance of water in one State for use in the other shall be charged to the latter State.

"ARTICLE XV

"(a) Subject to the provisions of the Colorado River Compact and of this Compact, water of the Upper Colorado River System may be impounded and used for the generation of electrical power, but such impounding and use shall be subservient to the use and consumption of such water for agricultural and domestic purposes and shall not interfere with or prevent use for such dominant purposes.

"(b) The provisions of this Compact shall not apply to or interfere with the right or power of any signatory State to regulate within its boundaries the appropriation, use and control of water, the consumptive use of which is apportioned and available to such State by this Compact.

"ARTICLE XVI

"The failure of any State to use the water, or any part thereof, the use of which is apportioned to it under the terms of this Compact, shall not constitute a relinquishment of the right to such use to the Lower Basin or to any other State, nor shall it constitute a forfeiture or abandonment of the right to such use.

"ARTICLE XVII

"The use of any water now or hereafter imported into the natural drainage basin of the Upper Colorado River System shall not be

charged to any State under the apportionment of consumptive use made by this Compact.

"ARTICLE XVIII

"(a) The State of Arizona reserves its rights and interests under the Colorado River Compact as a State of the Lower Division and as a State of the Lower Basin.

"(b) The State of New Mexico and the State of Utah reserve their respective rights and interests under the Colorado River Compact as States of the Lower Basin.

"ARTICLE XIX

"Nothing in this Compact shall be construed as:

"(a) Affecting the obligations of the United States of America to Indian tribes;

"(b) Affecting the obligations of the United States of America under the Treaty with the United Mexican States (Treaty Series 994);

59 Stat. 1219.

"(c) Affecting any rights or powers of the United States of America, its agencies or instrumentalities, in or to the waters of the Upper Colorado River System, or its capacity to acquire rights in and to the use of said waters;

"(d) Subjecting any property of the United States of America, its agencies or instrumentalities, to taxation by any State or subdivision thereof, or creating any obligation on the part of the United States of America, its agencies or instrumentalities, by reason of the acquisition, construction or operation of any property or works of whatever kind, to make any payment to any State or political subdivision thereof, State agency, municipality or entity whatsoever, in reimbursement for the loss of taxes;

"(e) Subjecting any property of the United States of America, its agencies or instrumentalities, to the laws of any State to an extent other than the extent to which such laws would apply without regard to this Compact.

"ARTICLE XX

Termination.

"This Compact may be terminated at any time by the unanimous agreement of the signatory States. In the event of such termination, all rights established under it shall continue unimpaired.

"ARTICLE XXI

Ratification and approval.

"This Compact shall become binding and obligatory when it shall have been ratified by the legislatures of each of the signatory States and approved by the Congress of the United States of America. Notice of ratification by the legislatures of the signatory States shall be given by the Governor of each signatory State to the Governor of each of the other signatory States and to the President of the United States of America, and the President is hereby requested to give notice to the Governor of each of the signatory States of approval by the Congress of the United States of America.

Deposit of original.

"IN WITNESS WHEREOF, the Commissioners have executed six counterparts hereof each of which shall be and constitute an original, one of which shall be deposited in the archives of the Department of State of the United States of America, and one of which shall be forwarded to the Governor of each of the signatory States.

"Done at the City of Santa Fe, State of New Mexico, this 11th day of October, 1948.

[CHAPTER 49]

AN ACT

April 6, 1949
[H. R. 2101]
[Public Law 38]

To abolish the Regional Agricultural Credit Corporation of Washington, District of Columbia, and transfer its functions to the Secretary of Agriculture, to authorize the Secretary of Agriculture to make disaster loans, and for other purposes.

Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled, That (a) there are hereby transferred to the Secretary of Agriculture (hereinafter referred to as the Secretary) all the functions of the Regional Agricultural Credit Corporation of Washington, District of Columbia, including but not limited to functions with respect to—

Regional Agricultural Credit Corporation, Washington, D. C.
Transfer of functions.

(1) loans to bona fide fur farmers as provided for in the last proviso in the paragraph headed "Regional Agricultural Credit Corporation of Washington, District of Columbia", in title II of the Government Corporations Appropriation Act, 1949 (Public Law 860, Eightieth Congress);

62 Stat. 1192.

(2) loans under authorization by the Secretary for the Regional Agricultural Credit Corporation of Washington, District of Columbia, to reenter an area or region where a production disaster has occurred, as provided for in the proviso in section 2 of the Department of Agriculture Appropriation Act, 1949 (Public Law 712, Eightieth Congress); and

62 Stat. 529.

(3) the liquidation of all other loans heretofore made by the Regional Agricultural Credit Corporation of Washington, District of Columbia, and of all assets, contracts, property, claims, rights, and liabilities relating thereto.

(b) There are hereby transferred to the Secretary the functions of the Farm Credit Administration and the Governor thereof with respect to the Regional Agricultural Credit Corporation of Washington, District of Columbia.

Farm Credit Administration.

(c) The Regional Agricultural Credit Corporation of Washington, District of Columbia, is hereby dissolved. The Secretary of the Treasury shall cancel the outstanding certificates of stock of the Corporation.

Dissolution.

UPPER COLORADO RIVER BASIN COMPACT COMMISSION

OFFICIAL RECORD

VOLUME I

Record of Preliminary Governors' Meeting, and
for Commission Meetings No. 1-5, inclusive

FOREWORD

The Upper Colorado River Basin Compact Commission authorized this three volume compilation of its official Record of Proceedings. There is attached the certificate of the Chairman and Secretary of the Commission that the record is complete and correct.

The Upper Colorado River Basin Compact Commission was composed of commissioners representing the States of Arizona, Colorado, New Mexico, Utah, and Wyoming, and one commissioner appointed by the President of the United States to represent the Federal Government. After a preliminary meeting of the Governors of the States, the Commission commenced its negotiations at Salt Lake City, Utah, on July 31, 1946. As a result of its deliberations, the Compact, known as the Upper Colorado River Basin Compact, was signed at the Palace of Governors, Santa Fe, New Mexico, on October 11, 1948. Subsequently the Compact was ratified by the respective legislatures of the signatory States. The consent of the Congress of the United States, required by Article I, Section 10 of the Federal Constitution, was granted by Public Law 37, 81st Congress, First Session (63 Stat. 31), which was approved by the President of the United States on April 6, 1949. The Compact became effective and binding on the signatory States upon the latter date.

The Compact Commission did not adjourn sine die until August 5, 1949. It maintained its organization until that time to further the ratification of the Compact by the States and the approval of the Compact by the Congress and to perform certain other related duties and functions.

All of the States which negotiated and ratified the Upper Colorado River Basin Compact are signatories to the Colorado River Compact which was signed at Santa Fe, New Mexico, on November 24, 1922, and subsequently ratified by the seven States of the Colorado River Basin (Arizona, California, Colorado, Nevada, New Mexico, Utah, and Wyoming). The Congress of the United States gave its consent to the original Compact by the Boulder Canyon Project Act (45 Stat. 1057) in 1928. The provisions of the 1948 Upper Colorado River Basin Compact are subject to the provisions of the 1922 Compact.

The Colorado River Compact of 1922 did not apportion Colorado River water, or its use, among the signatory States. Instead, it divided the beneficial consumptive use of Colorado River water between the Upper and Lower Basins. The division point between the two basins was fixed as Lee Ferry, Arizona, which is located a short distance south of the Arizona-Utah boundary line. The Compact placed an obligation on the Upper Division States (Colorado, New Mexico, Utah, and Wyoming) to deliver specified quantities of water at Lee Ferry for the use of the Lower Basin. Provision was made for the satisfaction of any subsequently created treaty obligations to Mexico. The use of surplus water, over and above that apportioned to the two basins, was reserved for future apportionment.

The Upper Colorado River Basin Compact apportioned among the States of Arizona, Colorado, New Mexico, Utah, and Wyoming the beneficial consumptive use of the water apportioned to the Upper Basin by Article III (a) of the 1922 Compact (7,500,000 acre-feet annually). Provision was made as to the responsibility of the States of Colorado, New Mexico, Utah, and Wyoming in regard to their joint obligation to deliver water at Lee Ferry for use in the Lower Basin.

The 1948 Compact created an administrative agency known as the "Upper Colorado River Commission." This body, in addition to administering the Compact, is charged with the duty of expediting the development of the Upper Colorado River Basin. It is composed of five commissioners, one representing the United States of America, and one representing each of the States of Colorado, New Mexico, Utah, and Wyoming. Arizona is not represented on the Commission because of its relatively small area in the Upper Colorado River Basin. The Federal representative is chairman of the Commission. As an official body, it occupies the unique position of being able to expedite Upper Colorado River Basin development, to aid in shaping such development, and to integrate Federal and State activities and interests.

UPPER COLORADO RIVER BASIN COMPACT COMMISSION

Harry W. Bashore, for the United States of America, Chairman
Charles A. Carson, for Arizona
Clifford H. Stone, for Colorado
Fred E. Wilson, for New Mexico (1)
Edward H. Watson, for Utah (2)
L. C. Bishop, for Wyoming
Grover A. Giles, Secretary

(1) Replaced Thomas M. McClure who died during the time the compact was under negotiation.

(2) Was replaced by Harold A. Linke after the compact was signed but before the Commission adjourned sine die.

ENGINEERING ADVISORY COMMITTEE

J. R. Riter, for the United States of America, Chairman
H. P. Dugan, for the United States of America
R. Gail Baker, for Arizona
R. I. Meeker, for Arizona
Royce J. Tipton, for Colorado
R. M. Gildersleeve, for Colorado
Frank C. Merriell, for Colorado
John H. Bliss, for New Mexico
John R. Erickson, for New Mexico
C. O. Roskelley, for Utah
R. D. Goodrich, for Wyoming
H. T. Person, for Wyoming

Charles L. Patterson for Colorado, F. W. Cottrell for Utah and C. S. Jarvis for Utah served as members of the Committee during the early months of the negotiations.

LEGAL COMMITTEE

Charles A. Carson, for Arizona, Chairman
Jean S. Breitenstein, for Colorado
Fred E. Wilson, for New Mexico
W. J. Wehrli, for Wyoming
J. A. Howell, for Utah
J. G. Will, for the United States of America

EXPLANATORY NOTE

This compilation of the Record of the proceedings of the Upper Colorado River Basin Compact Commission is contained in three volumes, as follows:

Volume 1 - Containing the Record of the preliminary Governors' Meeting, and the Record of Meetings Nos. 1 to 5, inclusive, of the Commission.

Volume 2 - Containing the Record of Meetings Nos. 6 to 11, inclusive, of the Commission.

Volume 3 - Containing the Final Report of the Engineering Advisory Committee, and the Inflow-Outflow Manual.

These various meetings, in Volumes Nos. 1 and 2, are separated by blue insert-sheets, to indicate the division between meetings.

A Subject Index for meetings of the Commission appears at the beginning of Volumes Nos. 1 and 2. (See explanation for use, which prefaces the Subject Index). A separate Index for the Engineering Advisory Committee Report appears in Volume No. 3, as a part of that Report.

There appears in this compilation, at the beginning of each separate meeting of the Commission, a chronological Table of Contents, covering developments in each such meeting.

There were 11 official meetings of the Upper Colorado River Basin Compact Commission before it adjourned sine die at Salt Lake City, Utah, on August 5, 1949.

The schedule of all meetings pertaining to the Compact was as follows:

	GOVERNORS' MEETING		
Preliminary	Cheyenne, Wyoming	July 22, 1946	Volume 1
	COMPACT NEGOTIATIONS		
Meeting No. 1	Salt Lake City, Utah	July 31, 1946	Volume 1
Meeting No. 2	Santa Fe, New Mexico	Sept. 17-18, 1946	Volume 1
Meeting No. 3	Public Hearings	Oct. 28-30-31 and Nov. 2, 1946	Volume 1
Meeting No. 4	Cheyenne, Wyoming	Sept. 8, 1947	Volume 1
Meeting No. 5	Denver, Colorado	Dec. 1-2-3-4, 1947	Volume 1
Meeting No. 6	Denver, Colorado	Feb. 17-18-19-20-21, 1948	Volume 2
Meeting No. 7	Vernal, Utah	July 7-21, 1948	Volume 2
Meeting No. 8	Santa Fe, New Mexico	Oct. 4-11, 1948	Volume 2
	POST-COMPACT MEETINGS		
Meeting No. 9	Denver, Colorado	Dec. 29-30, 1948	Volume 2
Meeting No. 10	Salt Lake City, Utah	Feb. 17-18, 1949	Volume 2
Meeting No. 11	Salt Lake City, Utah	August 5, 1949	Volume 2

C E R T I F I C A T E

Harry W. Bashore, Chairman, and Grover A. Giles, Secretary, of the Upper Colorado River Basin Compact Commission, do hereby certify that the record and proceedings of such Commission, from the 31st day of July, 1946 to the 5th day of August 1949, when the Commission adjourned sine die, contained in the three volume compilation to which this certificate is attached, are a complete and correct reproduction of such record and proceedings, including the Final Report of the Engineering Advisory Committee and the "Inflow-Outflow Manual" approved and adopted by the Commission.

Utah 1:5:129-133

Wyoming 1:5:26-27,86-88

percentage basis or acre-foot 1:4:3,14-16,18; 1:5:72-85

provisions in Colorado River Compact 1:1:17; 2:7:46-47

Apportionment percentages
percentages offered by states:

Arizona 2:7:98-99

Colorado 2:7:63-64,95-97

New Mexico 2:7:69-70,99-100

Apportionment percentages (Con't.)

Utah 2:7:68,97-98

Wyoming 2:7:67-68,100-101

percentages Presented by engineering advisers 2:7:112-113

percentages presented by Federal Representative 2:7:123-124

states' Vote on percentages 2:7:128-129

total of States' proposals exceeds potentialities of river 2:7:105-110

Arizona
apportionment, art. iii 2:7:35,148; 2:8:24,44,63

Limited participation 1:prelim:8-9,25-26; 1:2:4-5

proposed depletion 2:7:98-99

reserves rights as Lower Division and Lower Basin state, art. xviii 2:7:139-140,153; 2:8:58,73

Atomic Energy Commission 2:7:14-15; 2:8:27

Beaver Creek, art. xii 2:8:38-39,54-55,70-71

Beneficial consumptive use
definition and measurement 1:5:70; 2:6:35,46-66,128-129; 2:7:31, 32-33,36-37,57-60

term used in Colorado River Compact 2:7:57-58

Beneficial use (See also Preferential uses)
basis of right to use, art. iii 1:4:12,13-14; 1:5:129,132,161; 2:7:32-33,36; 2:8:10,13,17,25,37,44,63

Birch Creek, art. xii 2:8:38-39,54-55,70-71

Blaney, H. F.
consulting services 1:5:14-15; 2:6:42,43,44-45,55,70; 2:7:20; 2:8:35-36

expenses paid by four participating states 1:5:127-129; 2:6:87-88

Boulder Canyon Project Act, Sect. 19
discussion 1:1:15-25

Bureau of Land Management
statement of interests in compact 1:5:46-47

Bureau of Mines
statement of interests in compact 1:5:47-48

Bureau of Reclamation
Letter re development of river 2:8:28-29

statement of claims for projects 1:5:43; 2:7:9

Bureau of the Budget
correspondence 1:5:59; 2:6:25

Burnt Fork, art. xii 2:8:38-39,54-55;70;

Central Utah Project
letter from Bureau of Reclamation on adequacy of water supply 2:8:39-40

(Chairman see Upper Colorado River Basin Compact Commission - chairman)

Channel Losses 1:4:10; 1:5:16

charges for 1:5:70; 2:6:59; 2:7:48

measurement 1:5:20,24-25,70

report, Engineering Advisory Committee, Aug. 31, 1946 1:2:8 and discussion 1:2:9

report, Engineering Advisory Committee, Dec. 1, 1947 1:5:5

report, Engineering Advisory Committee, July 7, 1948 2:7:18-19

Channel Losses, salvaged 1:5:6,15-19,22-25; 2:7:31,33,43-48,52-53

by state, 1914-1945 (table) 2:7:21

Cheyenne, Wyo.
Commissioners' preliminary meeting, July 22, 1946 1:prelim13-18

Governors' conference, July 22, 1946 1:prelim:1-12

meeting no. 4, Sept. 8, 1947 1:4:1-28

Civil Service
administrative commission personnel, art. viii 2:6:28,73-74; 2:7:135, 149; 2:8:25,48,66

Colorado
apportionment, art. iii 2:7:35,148; 2:8:24,44,63

Colorado (Cont'd.)

Conservancy District Act 1:3:46; 1:5:29-30

proposed depletion 2:7:63-64,95-97

state engineer alone empowered to administer public water 1:5:107

Colorado-New Mexico apportionment
La Plata River, art. x 2:6:110-112; 2:7:31,32,35-36,84-85,134,152; 2:8:25-26,51-52,69

San Juan River, art. xiv 1:5:69,74-76; 2:6:112-116; 2:7:141,143, 145,152-153; 2:8:7,14-15,34,56-57,72

Colorado River Basin
definition, art. ii 2:7:131,146; 2:8:42,62

Colorado River Compact
apportionment provisions 1:1:17; 2:7:31,32,35,46-47,55

definition, art. ii 2:7:131,147; 2:8:43,62

(definitions in see Definitions (Colorado River Compact))

interstate controversies 2:6:107-109

validity recognized, art. i 1:5:129; 2:6:101-104; 2:7:31,32,35, 83-84,131,146; 2:8:42,61-62

Colorado River System
definition, art. ii 2:7:131,146; 2:8:42,62

Colorado-Utah apportionment
Yampa River, art. xiii 2:6:118-120; 2:7:141,143,146,152; 2:8:6, 15,55-56,71

Colorado vs. Kansas 2:7:44

Colorado-Wyoming apportionment
Little Snake River and tributaries, art. xi 1:5:70; 2:6:115-117; 2:8:12-13,52-53,69-70

Commissioner of Reclamation
address 2:8:29-34

Committee coordination
engineering and legal committees 2:6:130-131

tributary basin committees 2:6:133-134; 2:7:103-104,118-121
