Under the terms of the interbureau agreement approved July 28, 1950, it is the responsibility of the National Park Service to prepare for the Bureau monetary evaluations of potential recreational benefits. These monetary benefits may be used by the Bureau in computing the share of the joint costs of reservoir projects allocable to recreation and in justifying Bureau of Reclamation requests for funds for both specific and joint costs allocable to recreation, when such procedure shall be authorized.

The evaluations are based on analysis of all factors involved in the suitability of an area for recreational uses, type and probable

extent of use, and developments and facilities which will be appropriate and adequate to accommodate such use. Basically, and provided no loss or destruction of existing recreational values is involved, it is held that benefits arising specifically from development of recreational facilities will be equivalent to total annual costs, capitalized over the anticipated useful life of the project. Similarly it is estimated that additional benefits accruing from joint use of a reservoir, for recreational purposes, will be equal to those arising from the development of facilities. The sum of these figures represents the total estimated monetary recreational benefits.

This amount, then, represents the judgment of the National Park Service as to a reasonable and conservative valuation of the recreational benefits accruing to the public as a result of a reservoir. It is necessarily conjectural, as the appraisal deals with many intangibles that are difficult to evaluate and involves an attempt to foresee conditions that may or may not materialize.

Upper Colorado River Basin water utilization program and its effect on recreation

The report, A Survey of the Recreational Resources of the Colorado River Basin, emphasizes the magnitude of outstanding scenic, scientific and other geographic and historical features of the basin.

From Gannet Peak in the Wind River Mountains, highest point in Wyoming, elevation 13,785 feet above sea level, Milner Pass in Rocky Mountain National Park, and the 14,000-foot mountain peaks in southwest Colorado to the 3,100-foot elevation of the river at Lee Ferry, marking the lower end of the upper basin, lies a great region of forests, deserts, plains, mountains, canyons, and plateaus. In common with the whole basin, the upper Colorado Basin is one of the most outstanding recreational sections of the United States, because of great variety of natural scenery, climatic conditions, and areas and objects of scientific interest, its early romantic history, archeological background, and present Indian and Anglo cultures.

In this nationally significant recreational region the entire gamut of outdoor recreational activities may be enjoyed, including hunting, fishing, photography, nature study, snow sports, boating, swimming, horseback riding, camping, mountain climbing, and exploration. Two national parks, in whole or in part, and nine national monuments have been established within the basin to preserve some of the most outstanding natural, scientific, and cultural features. Large sections have been included in national forests, wildlife refuges, wilderness areas, grazing districts, and to some extent, Indian reservations. Much of the basin is in public ownership, a natural corollary of a small and thinly scattered population.

It is only natural in a region so endowed that recreation should become one of the major industries. Agriculture is restricted largely to irrigated sections. Mining, lumbering, and the raising of cattle and sheep first attracted settlers to the basin, but the recreational features are now attracting many more; and as the various sections of the basin become better known and more accessible to the densely populated regions of the United States through improved highways and air transportation, catering to the recreational business should become a major industry. To foster this industry, it must be recognized that recreational use of land may in certain places be the highest

or best use for the general welfare of the people in the basin, and in great sections of the basin should be on an equal basis with other uses, such as grazing or production of timber. One of the most important recreational aspects of the basin is the great stretches of open range, unobstructed by buildings, fences, transmission lines, and other signs of modern civilization. As other sections of the United States become more and more highly developed, this one feature of the Colorado River country, if preserved, will have unusual appeal. Such preservation, at least in large measure, should not be difficult in the vast and wild region traversed by the Colorado River in the lower reaches of the upper basin. Here in dramatic contrast to the great forested mountain ranges along the Continental Divide where headwaters of the Colorado and the Green rise is desert and semiarid country slashed by deep and colorful gorges and canyons.

In the development of water resources which are so vital to the basin, recreational use should be considered along with other uses, such as irrigation, power, municipal and industrial water supply. In the mountains and high plateau sections of the basin the clear, cold streams and lakes offer excellent fishing amid delightful surroundings. In some instances the recreational value of these streams and lakes may be such as to make this their most important use. The Green River Lakes, New Fork, Willow, Fremont, Half Moon and Burnt Lakes, within Bridger National Forest, along the slopes of the Wind River Range are natural lakes which are held to be unmistakably in this category. On the other hand, the original scenic values of Boulder Lake in the same area have been impaired by developments and would not be seriously affected by further utilization. The western slopes of the range in which these lakes are located include a mountain area of such exceptional scenic quality and recreational value as to be clearly of national importance.

In other sections, the creation of reservoirs for irrigation, important holdover functions for compact obligations, or power will frequently create new water areas of recreational importance. There are instances where the raising of water in impoundments would submerge natural areas of recreational, scenic, and scientific value or archeological importance. In such cases, it must be decided whether a reservoir in the location justifies the sacrifice of these existing values.

In cases where important archeological features would be inundated by the reservoirs, there should be a thorough survey and excavation for recovery of artifacts and data, so that knowledge of the archeological material will not be lost forever. In the larger reservoir areas, surveys should also be made of flora and fauna and records kept of the original biota.

In varying degrees the recreational potentialities of many of the proposed Upper Colorado River Basin reservoirs have been studied by the National Park Service. These include, notably, the units included in the Colorado River storage project and reservoir units of the proposed participating projects. Some reservoirs outside this group have also been surveyed and initial reports prepared on the findings for the Bureau. As project plans are further developed and construction is authorized, more comprehensive and detailed studies will be required in order to assure properly coordinated recreational developments that are commensurate with established needs, and in the general public interest.

As other projects in the basin are brought into the picture, additional investigations will be necessary. In this category are many possible units under various degrees of consideration in the Yampa, Upper Colorado, Gunnison, Dolores, San Juan, and other tributary drainages. Some of these will involve diversion of water from the Colorado Basin.

The adverse effects certain reservoir units of the Colorado River storage project would have on areas of the National Park System has been a matter of the gravest concern to the Service. The Glen Canyon Reservoir could impair the scenic value and even the stability of the Rainbow Bridge, the largest and most beautiful of all known natural bridges. However, it appears that measures to protect this national monument could and would be included as appropriate features of project development.

The Curecanti and Crystal Reservoir units of the project would regulate river flows through the Black Canyon of the Gunnison National Monument. While such river regulation involves changes in natural conditions that are held to be very undesirable, nevertheless it is recognized that the effects of flow regulation would not be sufficiently adverse to override the economic advantage to be gained thereby in the public interest.

Of the greatest concern to the National Park Service has been the inclusion in project plans of two reservoirs on the Green and Yampa Rivers within Dinosaur National Monument, where nationally significant scenic, scientific and other recreational values would be irreparably damaged or lost altogether by dam construction, related works and by inundation. However, after carefully weighing all factors and values involved, it has been determined by the Secretary of the Interior that the conservation and multiple use of these waters is more in the interest of the people of the West and of the whole Nation than the preservation of existing values.

The foregoing problems are more fully covered in the National Park Service reconnaissance report dated November 1950 on the recreational values of the Colorado River storage project. The purpose of that report was to consider, in only a very broad and preliminary manner, possible recreational aspects of the project reservoirs, with due regard to existing conservation and recreational values. The scope of the report, based on the limited reservoir data and operational information currently available, in most cases, does not permit of analysis of economic factors involved, including consideration of possible recreational benefits or values on a monetary basis. It is contemplated that more detailed studies on certain of the project reservoirs and others similarly involved in the Upper Colorado River Basin water utilization and control plan will follow, in line with schedules of studies and developments.

In the event that any of the project reservoirs are to be created, the report recommends that arrangements be made for adequate archeological surveys, and, so far as judged necessary, for excavations and salvage of scientific artifacts and information.

It further recommends:

That the recreational resources inherent in the reservoirs receive consideration commensurate with their importance during all stages of project planning and development.

Land-acquisition programs receive careful consideration where areas suitable and necessary for recreational uses and development are involved, whether by purchase or by arrangements with Federal agencies where applicable.

Arrangements be made to assure, in each case, adequate administration, operation, and maintenance of recreational developments by some qualified agency prior to final planning and provision of developments with Federal funds.

Excerpts from the report concerning the 10 reservoir units of the Colorado River storage project are given in the following sections.

GLEN CANYON RESERVOIR

The site now under consideration for the Glen Canyon Dam is located near river mile 15 (i. e., above Lees Ferry, Ariz.) in the Glen Canyon section of the main Colorado River. According to information furnished by the sponsor, it would be possible to construct a dam at this site to impound 34 million acre-feet of water which would correspond to a maximum surface elevation of 3,750 feet mean sea level. While the desired capacity has not been determined, physical data for a tentative capacity of 26 million acre-feet have been furnished by the sponsor for use pending the completion of the present studies. These are given below:

Planned capacity	26,000,000 acre-feet.
Corresponding dead-storage capacity	6,000,000 acre-feet.
Maximum water surface elevation	3,710.
Minimum water surface elevation	3,510.
Maximum reservoir area	153,000 acres.
Minimum reservoir area	56,000 acres.
Maximum reservoir length	186 miles to river mile 201.
Minimum reservoir length (approximately)	168 miles to river mile 183.
Present river elevation	3,135 feet.
Dam height	580 feet above present river.

The Glen Canyon Reservoir would offer the last opportunity for control of upper basin residual water flows for meeting compact deliveries to the lower basin at Lee Ferry. Provision for power production would be made. Regarding operation of the reservoir, the following information has been furnished:

> Probable operation would pattern other main-stem reservoirs. During normal or above normal years of runoff, the reservoir drawdown would be less than 30 feet with storage used only for seasonal regulation of power releases. Extensive drawdown would result only during a protracted dry cycle with maximum drawdown the result of a cycle as severe as the 1931–40 period. The reservoir would be refilled by storing the surplus flows of subsequent high years.

Description of the site

The narrow, vertical-walled, red sandstone gorge of the Colorado River at the 15-mile dam site is approximately 700 feet deep. Through a great deal of its length the reservoir will be similarly restricted with occasional extensive basins such as will occur at the State line where Wahweep and Warm Creek Canyons empty into the Colorado—the former a mile and a half above the dam site and the latter at the State line. Similar basin enlargements would occur shortly above the State line at the confluences of Cottonwood Canyon on the north and West Canyon Creek on the south. Between these creeks lies the historic Crossing of the Fathers area, which would be entirely inun-

dated. A little more than 40 miles above the confluence with the San Juan River, where Bullfrog and Hall Creeks flow into the canyon from the north, another important reservoir enlargement would occur. More often, however, canyons and side draws drain into the river on comparatively steep gradients, and reservoir extensions into the draws would, for the most part, be limited. At elevation 3,710 the reservoir would apparently extend up the San Juan River 70 miles or more. The upper reaches of the reservoir would lie in the restricted confines of Cataract Canyon of the Colorado, nearly 20 miles above the mouth of Dark Canyon.

Glen Canyon Reservoir area lies in the heart of the so-called Escalanta country, or canyon lands, of southeast Utah, one of the most rugged, roadless, and inaccessible regions of the United States. In the National Park Service survey of the recreational resources of the Colorado River Basin, this part of the basin is described as a—

> wild and fantastically eroded land of winding gorges and sandstone mesas whose vast expanses are punctuated at irregular intervals by the isolated, steeply upthrust masses of the Henry, Abajo, and Navaho Mountains. With the exception of the mountain summits, which are cool and moist, the greater portion of the area receives but little snowfall in winter and is characterized by a long, warm summer season. Average temperatures are higher than those of valleys to the north, in conformity with the decrease in latitude, but lower than those of deserts to the south. The annual precipitation ranges from about 6 to 14 inches with the greatest amount coming from thunderstorms during July and August. Into this desolate but spectacularly scenic sandstone area, through a deep, meandering gorge, flows the turbid San Juan River from the east, draining a far-reaching area, including La Plata Mountains, the San Juan Mountains, and other lesser ranges on the Continental Divide, the Chuska Mountains, and enormous areas of mesaland in the interior of the basin. From the Wasatch and Aquarius Plateaus on the west come other but lesser, silt-laden streams, all carving the deep, winding canyons which have given this country its name.

Owing to very difficult access, and the extremely limited local population, probably numbering a hundred or less all told in the area, present recreational use must be negligible, although the Fish and Wildlife Service reports that there are some catfish and Colorado whitefish. The most notable recreational use of the area probably consists of the occasional floats or boat trips which are made down the river, notably down the San Juan and Colorado to Lees Ferry and sometimes beyond, even through the Grand Canyon to Lake Mead.

There is ample evidence that the reservoir area is rich in archeological material, as yet very incompletely surveyed. A reconnaissance of archeological sites in the Colorado River canyons between the Fremont River and Lees Ferry was made by boat in 1932. This covered in large part the main reaches of the river that would be flooded by the Glen Canyon Reservoir. The survey was made by Dr. Julian Steward, then of the University of Utah (later staff member, Bureau of American Ethnology, Smithsonian Institution, and presently on the faculty of Columbia University). Some 27 sites were located on the sides of the main canyon. It is probable that many other sites occur in side canyons often, however, above reaches that will be inundated by the reservoir. No known archeological remains presently within a National Park Service area are involved.

No study of historical values associated with this reservoir area has been made in connection with the report but what is probably the most interesting feature in this respect, namely, the Crossing of the Fathers, has been mentioned.

Effect of Glen Canyon Reservoir on National Park Service areas

1. *Rainbow Bridge National Monument.*—This choice, unique and highly significant national monument is located in Rainbow Bridge Canyon shortly above its confluence with Aztec Creek which in turn drains into the Colorado River a little above river mile 68, or approximately 53 river miles above the dam. It comprises 1 quarter section or 160 acres. From United States Geodetic Survey topographic maps, it is estimated that the Rainbow Bridge National Monument is approximately 4 canyon miles from the main river. Grade surveys made by the Bureau of Reclamation indicate a canyon elevation of approximately 3,570 at the west monument boundary and that the bottom of the canyon under the bridge is at elevation 3,654.10.

The maximum water elevation now proposed would, at the site of the bridge, rise approximately 56 feet within the restricted channel, would not overflow the channel and would be more than 11 feet below the lower of the two abutments.

Frequency data have not been provided. There is, therefore, no indication as to how often the contemplated maximum elevation would be reached or how long retained. Both factors have a direct bearing on the effects of the proposed reservoir on the bridge.

Water backing up Rainbow Bridge Creek under the Rainbow Bridge would leave unsightly deposits of flotsam, as well as staining the walls of the gorge. However, by far the most serious effect of floodwaters reaching the bottom of the watercourse beneath the span would be the danger of undermining the buttresses of the bridge itself. Standing water would dissolve cementing materials in the rock causing the sides of the water to slough off, thus rapidly narrowing the supports beneath the ends of the bridge. It is conceivable that with water backing up no farther than to cause standing water in the watercourse beneath the bridge, softening and sloughing of the banks of the watercourse could be, in a relatively few years, sufficient to cause the weakening of the ledges beneath the ends of the bridge and the collapse of the bridge itself.

The Rainbow Bridge is considered by some to be the world's greatest known natural bridge. Certainly it is an outstanding and world famous natural feature, with the protection and preservation of which the National Park Service is entrusted. It is held that no potential recreational values which could otherwise be determined to be inherent in the reservoir could compensate for the loss of this irreplaceable natural feature to the public for all time to come. The National Park Service would be opposed to the Glen Canyon Reservoir on any basis or plan of operation which threatened the stability or natural scenic value of this national monument.

Analysis of the conditions attending the relation of Rainbow Bridge National Monument to the proposed Glen Canyon Reservoir, so far as they can at this time be determined, indicates that some modification of the reservoir and its operational plan might be possible, to an extent which would eliminate dangers of any adverse effect on the monument without jeopardizing unduly the value of the reservoir for primary purposes. A reduction in maximum water level from the proposed 3,710 feet to 3,650 would accomplish this end.

The National Park Service is not, of course, in a position to express a valid opinion as to how seriously such a change in plan would curtail

the value of the reservoir for primary purposes. It is, nevertheless, recalled that at one time a tentative spillway level at 3,528 feet was considered in connection with the alternate 4-mile site shortly above Lees Ferry. It is broadly estimated from area capacity curves furnished by the sponsor that lowering the maximum surface 60 feet would mean a sacrifice of storage capacity of between 8 and 9 million acre-feet. To what extent compensating increases in storage in other reservoirs above Glen Canyon could be accommodated has not as yet, apparently, been determined. These are possibilities which should be fully explored in advancing studies for the Colorado River storage project.

Another method of protecting monument values is under active consideration. This would involve a cutoff dam in the canyon below the monument, which, with appurtenant works, including a bypass pumping plant, would protect the monument with completely negligible loss of Glen Canyon Reservoir storage capacity.

The sponsor has given assurance that adequate protective measures will be included in plans for project development.

2. *Grand Canyon National Park and National Monument.*—This outstanding national park (with the monument) has been mentioned as an area which could be affected by a reservoir above a Glen Canyon Dam. To the extent this would be true would involve almost any plan of reservoir operation. The tributary San Juan River is a heavy silt bearer, and the creation of a river barrier below the mouth of that river would materially reduce the silt content of the Colorado River through the Grand Canyon. Scientifically, this is an important element in the overall Grand Canyon National Park picture. However, since there are considerable contributions to Colorado River silt below the San Juan, changes in the appearance of the river could, possibly, be comparatively slight.

Conceivably of greater significance would be regulation of stream flows through the park, which now vary from minimum flows to the great rushing torrents which result from the melting snows in the high Rocky Mountain sources of the river.

It is not possible to determine exactly, at this time, how extensive effects on Grand Canyon National Park would be. However, on the basis of maintaining the natural conditions of National Park Service areas, any alteration of silt content or stream flow could be considered as an adverse effect.

Nevertheless, certain other elements in the possible effects of the Glen Canyon Reservoir on Grand Canyon National Park (and its related monument) are noted. These involve the probable reduced fluctuations in the proposed Bridge Canyon Reservoir, presently under serious consideration on the Colorado River below Grand Canyon National Park. Reduction in fluctuations in the Bridge Canyon Reservoir would be most apparent in the upper reaches, where both Grand Canyon National Park and Grand Canyon National Monument would be directly involved. In the latter connection, too, reduction in silt and river debris which would occur as a result of the Glen Canyon Dam would likewise reduce the unsightly effects of fluctuation in the lower reservoir.

Potential recreational use

In the event that it is possible to realize a Glen Canyon Reservoir which would not jeopardize irreplaceable natural values in Rainbow

Bridge National Monument, rather striking advantages could result from the creation of an extensive reservoir in this scenic area.

In the National Park Service section of the interim report on the Colorado River (July 1947) it was noted that—

> much of the country bordering the Colorado and Green Rivers through this section of Utah is of high recreational value. It is a region of great colorful spaces, mountains, plateaus, canyons, desert, forest and weird formations, probably the greatest display of erosional effects in the United States, other than the Grand Canyon, and equally grand, though different in character.

Such a reservoir could warrant developments commensurate with estimated recreational use. High among potential values would be the advantages of waterborne access to remote corners of this wild canyon country, including the vicinity of the Rainbow Bridge National Monument. At present, difficulty of access to this natural wonder has limited public enjoyment to the hardy and privileged few who can afford the time, cost and effort of reaching it over a pack trail.

The character of Glen Canyon at the dam site would make access to the reservoir difficult, although the general area would be reached over project construction roads. The situation would be somewhat similar to that at Hoover Dam and Lake Mead, where actual access to the reservoir for general recreational purposes is not in the gorge at the dam, but at various points above the dam where short areas are suitable for access and related developments. At this reservoir the great bay formed where Wahweep and War Creek Valleys enter the Colorado could function in this way. Construction of roads into this area from the dam site would be rather difficult and costly, but, it is believed, not prohibitive. There are indications that it would also be possible to reach this area by road from Kanab, Utah.

It may be feasible to approach the reservoir at some point on the west side near the base of the Kaiparowitz Plateau, and again in the vicinity of Hite, where possibilities of constructing a main highway bridge across the river shortly below the mouth of Fremont (Dirty Devil) River are under consideration. Such a bridge would service an important thoroughfare across the wild country of southeast Utah. The nature of this area indicates that this through road approximately midway between present highway crossings at Moab, Utah, and near Lee Ferry, Ariz., would very probably be the only trans-Escalante County highway for many years to come. It could afford interesting access to the upper reaches of a Glen Canyon Reservoir.

A more comprehensive study of recreational possibilities which may be inherent in the Glen Canyon Reservoir may be undertaken shortly. Consideration of potential recreational use can be more appropriately discussed in such a report than in this preliminary review of the Colorado River storage project as a whole. In general, however, it has been noted in earlier comments on the proposed Glen Canyon Reservoir that the Wahweep and Warm Creeks area appears to be a logical and desirable place for recreational boating and housing facilities, and for headquarters for boating operations and parties wishing to explore this section of Glen Canyon by land or water.

It is emphasized that earlier studies of this project were based on plans of reservoir operation which could not involve such irreplaceable natural values as those which current plans could critically jeopardize at Rainbow Bridge National Monument.

Recommendations

The primary recommendation concerns adequate protection of the nationally significant values in Rainbow Bridge National Monument.

It is especially important that arrangements should be made to fully explore archeological sites in the Glen Canyon Reservoir area and to effect salvage operations so far as justified to prevent loss of artifacts and scientific information.

WHITEWATER RESERVOIR

The Whitewater Dam site of the Whitewater unit is on the Gunnison River shortly above the confluence with the main Colorado River, in west central Colorado. It is about 2 miles south of the small town of Whitewater (on United States Highway 50), and 9½ miles southeast of Grand Junction, most important center of population in this part of Colorado.

The following information has been provided regarding the operation of the reservoir:

> The Whitewater unit of the Colorado River storage project has several potential purposes, some of which are dependent upon decisions which have not been made at this time. For the purpose of present studies, the best estimate is that the reservoir will furnish replacement water (51,400 acre-feet) to Orchard Mesa lands, presently served from the Colorado River. The remaining capacity will be used for regulation for the generation of firm energy. Actually by operating the reservoir as described above, the reservoir can be credited with providing considerable holdover storage for delivery to the lower Colorado River Basin during periods of low runoff.
>
> The above method of operation will be altered when additional storage is provided upstream on the Gunnison River or if future depletions on the upper Colorado River and its tributaries make replacements to the Grand Valley canals necessary.

Analysis of the chart showing monthly reservoir stages through period of operation (1921 to 40, inclusive) and the related table giving pool surface elevations at the end of each month for the same period (both furnished by the sponsor) reveals that operation of the reservoir would be singularly favorable for recreational uses. In common with other impoundments in the main Colorado system, minimum pools would occur late in the winter or early spring—quite consistently about the end of March. With equal consistency, heavy flows from melting high mountain snows would fill the pool to normal capacity by the end of May. Fluctuations during the most important recreation-use seasons would tend to be very nominal, reservoir spills from overflows occurring generally during the summer months, and only by late summer and fall would the long gradual drawdown to late winter lows begin to be noticeable.

The Bureau of Reclamation has furnished the following pertinent information in connection with this reservoir, which is under consideration for irrigation, power, holdover, and replacement for transmountain diversion:

Planned capacity	acre-feet	880, 000
Maximum water surface elevation	feet	4, 880
Minimum water surface elevation	do	4, 756
Maximum water surface area	acres	10, 250
Minimum water surface area	do	2, 700
Present stream bed elevation at dam site	feet	4, 630
Length of reservoir at maximum	river-miles	35
Length of reservoir at minimum (approximate)	do	18
Dam height	feet	255

At extreme high water, the reservoir would extend to a point 4 miles west of Delta.

Description of the site

Located entirely within the lower reaches of the Gunnison River, the reservoir basin lies in rather gently rolling, unspectacular valley lands which intervene between the massive, 10,000 feet high Grand Mesa on the northeast and the similarly forested height of the Uncompahgre Plateau on the southwest. Vegetation is generally sparse, involving some cottonwoods, sycamores, etc., along the river bottom and some juniper along semiarid bordering ridges and hills. For the greater part of its length, the Bridgeport Reservoir would be confined to the rather restricted inner valley which has been eroded through the broader valley. The most notable escape from this narrow course would occur at the confluence with Kannah Creek shortly above the dam site. The lower Kannah Creek tributary drainage empties into the Gunnison through a narrow opening in the bordering ridge. Immediately above this narrow passage, which would assume the character of a gut with the formation of the reservoir, would be a considerable bay surrounded by comparatively gentle slopes and rolling land which would, in 2 or 3 places, require dikes to prevent high water overflows into a secondary valley drainage which roughly parallels the main river and empties into it below the dam site.

The reservoir will be more or less directly accessible practically throughout its entire length from important United States 50 which parallels the river course within a few miles along the northeast side. This highway crosses Kannah Creek where some relocation is indicated. Minor roads, including some county roads, extend into and in some cases across the valley from the main highway, affording access to the farms and cultivated areas that occur in the fertile river bottom. One such road extends into the basin approximately midway in the overall reservoir, to farms at and near the old Denver and Rio Grande Western Railroad station of Broughton (an old line of the railroad traversing the river bottom throughout the length of the reservoir). A county road also crosses the valley at Escalante Creek well up the reservoir basin, above the minimum reservoir pool indicated at elevation 4,756. Although U. S. 50 rather closely parallels the river, the topography is such with generally low, intervening ridges that views of the reservoir from the highway will be comparatively rare and restricted, other than at the Kannah Creek Bay. The prevailing impression on the reservoir would be one of greater remoteness than will actually be the case.

Although the scenery in the vicinity of the reservoir has little to recommend it in a state like Colorado, nevertheless distant views are impressive, in some cases spectacular. The former involve the dominating massives of the Grand and Uncompahgre Plateaus, while the latter include somewhat more distant views of the great Alpine uplifts of the main San Juan ranges to the south which will probably be seen even from the reservoir in the upper reaches of high pools, where bordering hills are reduced and more open valleys extend southward to Montrose and afford views of the towering mountains beyond. To the east lie the impressive West Elk and related outlying mountain ranges of the main Continental Divide Rockies.

The upper reaches of the Gunnison River, including the Black Canyon of the Gunnison National Monument, are spectacular and

offer some of the best trout fishing in this part of the country. However, the Fish and Wildlife Service, in a preliminary report, has indicated that fish in the lower Gunnison River where the Bridgeport Reservoir would be located "consist primarily of catfish and Colorado white fish, with a few largemouth black bass and many species of rough or forage fishes. Existing use is of minor importance." That agency also mentions Gambel quail habitat along the Colorado and Gunnison Rivers in the vicinity of Grand Junction and Delta, Colo. It is believed that present recreational use of the reservoir site is largely, if not wholly, restricted to minor fishing and some small game hunting. It does not appear that recreational values of any importance would be destroyed by the creation of the reservoir.

Very little is presently of record with the National Park Service regarding possible archeological or historic investigations in the Bridgeport Reservoir area. These matters should be sufficiently checked prior to project development to avoid losses of scientific artifacts and information.

No National Park Service area or interest, or any State park area will be affected by the Bridgeport Reservoir or its operation.

Potential recreational use

Even in the absence of immediate scenic values of note, this reservoir should assume appreciable significance for recreation. Plans of operation currently being considered are very favorable to such use. It seems probable that minimum pools would very rarely occur, that normal low pools would be in late winter and that fluctuations in relation to power pool operation (for firm power so far as possible) would tend to be nominal.

The reservoir would be long and winding, with somewhat varied shore lines. It should lend itself to a considerable variety of boating, being somewhat safer in this respect than larger, more open and exposed bodies of water.

In summing up their report, the Fish and Wildlife Service indicated that the Bridgeport Reservoir would be particularly desirable (but admittedly "not so much for any values created by it, but as an alternate site for the Ruedi Reservoir on Frying Pan River, which would cause major losses in irreplaceable fish and wildlife resources").

It is possible that during the warmest summer months there could be considerable appeal for swimming—a form of recreation unlikely to be in much demand, for instance, on the Grand Mesa and similar areas nine and ten thousand feet above sea level.

In appraising the potential recreational values and opportunities believed to be inherent in this considerable reservoir, due consideration should be given to the outstanding recreational appeals generally exercised in southwestern Colorado, many of which assume regional and even national importance. The high, cool, heavily forested areas on nearby Grand Mesa, with its many glaciated lakes is a typical example of such appeal. Nevertheless, there is reason to believe that such outstanding recreational areas can be complemented to an appreciable extent by the Bridgeport Reservoir, very largely because of its much lower altitude, being under 5,000 feet. The recreational season will be much longer at the lower altitude, high mountain areas often remaining closed until late in the spring, and being similarly closed by early snows and cold in the autumn.

The relation of important U. S. 50 to the reservoir has been noted, this highway being one of the main, east-west routes through central Colorado between Colorado Springs and Pueblo to Grand Junction and on to Salt Lake City.

While some recreational use of the reservoir could be derived from travelers along this route, a great deal in this respect would depend on the scope and character of facilities provided for the public, notably in the way of accommodations. Also, the bulk of summer tourist travel over this, as well as other routes through Colorado, will continue to have the pick of higher, cooler, and far more scenic areas (often including lakes or reservoirs) in this spectacular State than could ever be associated with this reservoir, regardless of developments. It is, therefore, believed that the bulk of recreational use made of the reservoir will be derived from visitors from local communities such as Montrose, Delta, and notably Grand Junction, with related communities in that important section of the Colorado River Valley.

It is concluded that the recreational significance of the reservoir, while considerable, would nevertheless be primarily local.

Possible recreational development sites occur on the reservoir, notably in relation to the Kannah Creek Bay area, directly accessible from U. S. 50. Here, too, shore areas will be fairly gentle and topography well suited for a general recreational development area, with provision for boating, swimming, picnicking, campgrounds, possibly a lodge and appurtenances. As elsewhere on this reservoir, considerable tree planting will be required to assure the full appeal inherent in the site.

Other areas which can be considered as suitable for potential developments would occur near Broughton and near the present Escalante road crossing—but the latter depending on frequency of drawdowns that might leave the area above accessible water. Apparently only once would this condition have occurred during the period of study, and then only for late spring months.

The preliminary right-of-way map furnished by the sponsor indicates that most of the privately owned land in the main river bottom will be acquired by purchase. In large measure, these private holdings appear to be flanked by public domain which should reduce land-acquisition problems, for well considered recreational developments, to one of suitable agreement with the public agency involved. It is quite possible, however, that in large measure lands around the Kannah Creek area are in private ownership and considerable care will be necessary to assure acquisition suitable and adequate for all phases of reservoir operation and utilization, including recreation.

Recreational facilities planned for the reservoir should be considered primarily for the largely local day use that can be anticipated, with allowance for concessioner enterprises, including possible accommodations for the traveling public on U. S. 50.

GRAY CANYON RESERVOIR

The Gray Canyon Reservoir dam site is on the Green River, Utah, 22 river miles above Green River and some 4 miles above the confluence with the Price River. It is between Grand and Emery Counties. The site is in the steep-sided, sometimes precipitous canyon which traverses the plateaus out of which the main Tavaputs Plateau rises shortly to the north and which drop abruptly into the valley below

the dam area to form the Book Cliffs. The head of the reservoir, 53 river miles above the dam, will be shortly below Minnie Maude Creek which drains the northerly slopes of West Tavaputs Plateau and 53 river miles below Ouray near confluences with the Duchesne River which drains east slopes of the Wasatch Mountains to the west and the south slopes of the Uintas on the north, and the White River on the east which heads in Colorado.

It has been indicated that the primary purpose of the reservoir would be for power, with winter drawdowns to maintain firm energy generation with rapid refilling in the following spring. It is possible the reservoir could have some value for sediment control, and an allocation of 641,000 acre-feet is indicated for holdover storage in connection with this important phase of the Colorado River storage project. Recent studies, however, appear to emphasize the importance of power output, with as constant a maximum head as possible maintained for this purpose. On this basis, current information furnished by the sponsor is as follows:

> Studies of the Gray Canyon Reservoir indicate that maximum energy generation can be expected if the reservoir is maintained at or near its maximum capacity of 2 million acre-feet. Prior to the need for extensive holdover demands (in 150 to 200 years based on present estimates of sediment encroachment into the system of reservoirs) on Gray Canyon storage, the water-surface fluctuations would be limited to a maximum drawndown of about 40 feet during the winter months with refilling expected each year by May or early June.

The following data have been furnished by the Bureau of Reclamation or estimated from related information similarly provided:

Planned capacity	acre-feet	2, 000, 000
Maximum water surface elevation, mean sea level	feet	4, 590
Minimum water surface elevation (approximate) (based on inactive storage of 500,000 acre-feet)	feet	4, 400
Maximum water surface area	acres	10. 750
Minimum water surface area (approximate)	do	5, 200
Length of reservoir at maximum	miles	53
Length of reservoir at minimum (approximate)	do	28
Present stream bed elevation at dam site	feet	4, 150
Height of dam	do	445

Description of the site

The lower end of the reservoir, for approximately 10 miles above the dam, traverses the steep barren gorge through the southerly outlying mesas of the Tavaputs Plateau. These "steps" range in elevation between 5,000 and 6,000 feet but are in turn dominated by the massives of the east and west Tavaputs uplifts ranging up to 9,000 feet and more and between which the Green River has cut its way through the Gray Canyon from which the reservoir takes its name. The rise to these higher plateaus is abrupt on the south, forming the Roan or Brown Cliffs which extend easterly into Colorado. Beyond Gray Canyon which appears, from the air at least, to be in effect more truly canyon-like in character than a gorge, the reservoir will continue through the narrow passages of the northerly outlying table lands and mesas of the central Tavaputs plateaus. These reaches of the river traverse so-called Desolation Canyon which appears to be appropriately descriptive of this barren, isolated section of the country.

From the limited map data available, it is estimated that throughout its length the reservoir will be almost entirely restricted to a

narrow body of water. The 10,750 surface acres noted for the full pool of a 53-mile-long reservoir strengthens this impression.

Vegetation ranges from scattered juniper and minor range vegetation on the lower steppes to pinion country on the higher plateau areas.

While definitely rugged in a desolate sense, in this generally highly scenic part of the country the Gray Canyon Reservoir site can by no means be characterized as noteworthy in this respect. Gray Canyon appears to be especially appropriately named. The rich colorings which occur in such variety and abundance in lower reaches of the Green and Colorado Rivers through the Escalante country to the south and on through the Grand Canyon of the Colorado, are notably lacking here. Nor, from the reservoir itself, lost in narrow gorges and canyons, would there be the inspiring views of the Wasatch Mountains to the west, the Henry and distant Blue Mountains to the south, or the alpine peaks of La Sal Mountains to the southeast.

Access will have to be provided for dam-construction purposes, but otherwise the reservoir area will be singularly inaccessible, except for the occasional ranch trails which may penetrate the barren lands of this part of Utah. Nor, in the foreseeable future, does it appear at all likely that this general inaccessibility is likely to be altered. Access to the dam area will be from U. S. 6 and 50, either at Green River or down the Price River from Woodside on the west.

Perhaps largely due to inaccessibility, coupled with the rugged and barren aspect of the country, it seems highly improbable that the proposed reservoir area can offer much, if anything, in the way of present recreational values. There may be some hunting in the area and, in the comparatively more accessible reaches of the river between the dam site and Green River, Utah, some fishing. These are values which, to the extent they occur, will undoubtedly be adequately considered by the United States Fish and Wildlife Service. It seems reasonable to assume that no recreational values of importance will be destroyed by the development of the Gray Canyon Reservoir.

National Park Service archeologists have no record of archeological investigations having been made in the barren reaches of the Green River which would be inundated. It is believed very unlikely that archeological sites which may occur would assume much if any importance.

Potential recreational use

The reservoir operation plans, involving only nominal drawdowns during the winter, nonrecreational-use season, and quite constant summer water levels could be indicative of conditions rather unusually favorable to recreational uses. However, the local population which could most readily be drawn to the reservoir is extremely small and scattered. The population of the town of Green River in 1940 was only 470, and there is little indication that it has changed much since the last census. The barren and uncolorful aspect of the reservoir area seems unlikely to attract tourists from U. S. 6–50, except to the extent of the minor detour necessary to see the dam itself, which, rising 445 feet above the river in the narrow gorge, could have some sightseeing appeal.

The reservoir would offer fine opportunities for boating on its own merits, and this form of recreation could be stimulated if fishing proves to be good. A fairly constant water level encourages the belief that

this could be the case, but this phase of reservoir utilization can best be appraised by the Fish and Wildlife Service. Recalling the rather remarkable trout fishing which has developed in the Colorado River from the cold water released through Hoover Dam, at a much lower altitude, it seems highly probable that a similar situation would be created below the Gray Canyon Dam where the Green River would be comparatively easy of access, at least in reaches below the canyon which opens through the Book Cliffs above the main highway.

No detailed recreational survey of the reservoir area has yet been made, but air reconnaissance leads to the belief that in short stretches along the extended shoreline (well above a hundred miles) places would occur in side draws and bays, even in this rugged country, where boats could be beached for camping. Such recreational use of the reservoir as noted above will probably be very limited due to the very small local population which could be most directly served by the reservoir and general lack of scenic and other appeal for tourists traveling United States Highway 6–50. Probably only a widespread and justified reputation for exceptionally good fishing would be likely to materially alter this situation.

Consideration of possible recreational developments for the reservoir should be weighed in the light of the probably very limited use which can be anticipated. Some facilities can possibly be arranged by means of which boating could be handled, although undoubtedly considerable ingenuity would be necessary in this regard, especially if provision for this activity were to be made at or near the dam. This location would normally be the most accessible over construction roads and closest to centers of population and the main highway. But it will be seriously complicated by topography.

It is very unlikely that provision for overnight visitors would be warranted. Development of accommodations on a sound business basis will probably be stimulated at Green River both during dam construction and subsequently for tourists—especially if river fishing below the dam assumes importance. If construction access should be from Woodside via the Price River route, a similar impetus for accommodations would undoutedly occur in that small community.

Recommendations

While the potential value of the Gray Canyon Reservoir for boating and related recreational activities appears to be substantial, the limited use that can reasonably be anticipated because of location, small local population, difficult access and lack of scenic appeal should be recognized. However, it is recommended that ways and means of accommodating boating activities receive careful and early consideration. This should be done at the time dam construction plans are in progress in an effort to provide suitable reservoir access so far as possible to reduce subsequent difficulties and greater costs which might otherwise be involved.

NAVAHO RESERVOIR

Present plans call for locating the Navaho Dam on the San Juan River shortly below the confluence with Pine River (Los Pinos). More generally the dam would be in northeastern San Juan County and northwestern Rio Arriba County where the San Juan River forms the boundary between these two counties in northwestern New Mexico.

The Pine River arm of the reservoir will extend almost to the Colorado State line and the main San Juan will extend about 3 miles or so into Colorado at high water elevation.

The dam site is approximately 45 miles east of Farmington, N. Mex., and about 35 miles southeast from Aztec. Durango, Colo., is 45 miles northwest of the San Juan arm of the reservoir and about 40 miles from the Pine River arm. The latter is not immediately accessible by road, but Bureau of Reclamation plans contemplate location of the construction road south from Ignacio, Colo., which would provide direct access to the dam area and to points along the Pine River.

According to the preliminary plans advanced by the Bureau of Reclamation, the storage in the Navaho Reservoir would be used both for energy generation and holdover storage with the maximum elevation at 6,050 mean sea level and maximum drawdown to 6,010 except during years of extremely low runoff when it could become necessary, under the plan of ultimate development, to reduce water levels to dead storage elevation. It appears that operation could be compatible with general recreational use of the reservoir.

Total reservoir capacity	acre-feet	1,200,000
Maximum water surface elevation	feet	6,050
Minimum water surface elevation	do	6,010
Maximum water surface area	acres	10,800
Minimum water surface area (approximately)	do	6,800
Length of reservoir at maximum (approximately)	miles	33
Present stream-bed elevation at damsite	feet	5,725
Dam height	do	335

According to the 8-year period of study provided by the sponsor, fluctuations will be nominal, with the reservoir at full pool by the end of May something like 5 years out of 8. The lowest elevation which would have been reached during the study period was 6,010, only 40 feet below full pool, and that would have occurred in late November. The recreational use season low would have been at elevation 6,030, late in October. At no time during the 8-year fluctuation study would operation have seriously interfered with recreational use of the reservoir.

At maximum elevation of 6,050, the reservoir would extend approximately 30 miles up the San Juan River reaching widths of a quarter to one and a half miles. The Pine River arm would reach some 10 miles varying in width from one quarter to three quarters of a mile. The La Jara canyon would be inundated for some 5 or 6 miles. There would also be other inlets and bays of smaller note but of considerable recreational interest for boating and fishing.

Description of the site

Rising in Colorado, the San Juan River is the largest stream flowing into or through New Mexico. It flows through the northwest section of New Mexico for a distance of 100 miles. The surrounding topography in the vicinity of the reservoir is the characteristic mesa land with the San Juan River flowing often several hundred feet below the top mesas. Occasional lower benches intervene between the larger tablelands and the river channel bringing available recreational use space within accessible reach of the proposed lake levels.

The flat mesas above the reservoir area are sparsely vegetated with scattered pinion and juniper. There is a notable lack of larger trees for shade. This lack could be altered, however, in the vicinity of recreational development sites by spotting cottonwoods or other shade trees when water becomes available.

The open character of the land permits wide panoramic views that hold considerable interest. However, in conforming to the usual open aspect of the New Mexico landscape, the scenic value surrounding the Navaho site fails to impress one with any individuality worthy of special consideration.

Archeologically, there is known to be much of significance in the San Juan River Basin. Although little or no search has been made in the area of the Navaho Reservoir site, the Smithsonian Institution should be kept informed of the status of the project in order to allow ample time for proper investigation and clearance.

Potential recreational use

Existing recreational values along the San Juan River are very minor in the vicinity of the Navaho Reservoir area. Such use appears to be limited almost exclusively to fishing on which there is no great value at present. In fact the United States Fish and Wildlife Service believes that actual fishery values could be increased by impoundment of the reservoir.

The opportunity for general recreational use will also be enhanced by the reservoir and could include boating, fishing, picnicking, and perhaps some camping. Swimming could become a minor function, but suitable space for a beach appears, at present, only at the upper end of the reservoir and would not be sufficiently well related to population to draw day-use visitors for that purpose. The limiting factor to general development seems to be population. Not only is the immediate area rather sparsely populated, but there will be complications concerning fishing licenses for residents of Colorado who wish to fish in the New Mexico portion of the reservoir. To a lesser extent the reverse may also be true although the Colorado section of the reservoir will be quite small compared to the New Mexico portion. If a reciprocal license could be arranged to accommodate both New Mexico and Colorado fishermen, the recreational use potential of the reservoir would be considerably enhanced.

Comparing the relative areas of population influence in Colorado and New Mexico on a county basis discloses that San Juan (17,115) and Rio Arriba (25,352) counties in New Mexico had a combined population in 1940 of 42,467, whereas La Plata (15,494) and Archuleta (3,806) counties in Colorado had combined population of only 29,300. Since many of the Colorado residents will be attracted to the Vallecito Reservoir on the Pine River well above the tail waters of the Pine River arm of the Navaho Reservoir, the potential drawing power from Colorado would be further reduced.

Appraising the expected recreational use at the Navaho Reservoir on a strictly local basis, it is expected that most of the patronage will come from residents of New Mexico and more particularly from the area around Farmington (1940 population 2,161) and Aztec (1940

population 756) both of which have increased in population since that time. Because of recent oil and gas developments in the area, it is also probable that future population increases will considerably surpass those of the past decade. There is a local need for water-type recreation in this area, and it is anticipated that these local values appraised will be the probable extent of the recreational benefits resulting from the impoundment.

Recommendations

It is recommended that the Navaho Reservoir, as presently proposed by the Bureau of Reclamation, be considered for recreational development fundamentally for local use. Such development could include limited general development in the vicinity of the dam where it would be conveniently accessible via the construction road. Access from the Farmington and Aztec areas should be provided as directly as possible and might include justification for a road from the floor of the canyon to the top of the mesa area on the north side of the reservoir.

Depending upon the degree of success in arranging for a reciprocal fishing license for residents of Colorado to fish in the New Mexico part of the reservoir, it may become feasible to develop a recreational area at the upper end of the reservoir near the Colorado stateline. Suitable and well-related space is located on a low bench on the north side of the reservoir near the maximum water level just south of the stateline. This bench extends northward across the line into Colorado so that if licensing arrangements do not result in a mutually satisfactory solution for residents of both States, it would be possible to develop a small area in Colorado from which direct access could attract quite a few visitors. While early consideration should be given to the development of the sites recommended, it does not seem feasible to recommend actual land acquisitions or specific development until later studies introduce more definite information on actual operation, definite location of the construction road, and the feasibility of arriving at an agreement for providing reciprocal fishing licenses.

Archeological investigation is an important factor in clearing the way for any impoundment in the San Juan Basin. Early clearance should be sought to allow ample time for excavation and removal of valuable material believed to exist in the area.

CURECANTI RESERVOIR

The Curecanti Reservoir will be impounded behind a high (475 feet) dam at the Blue Mesa Dam site on the Gunnison River in the upper reaches of the Black Canyon, shortly below the mouth of Lake Fork and 3½ miles below Sapinero. The whole reservoir area is in Gunnison County, Colo. The dam site is some 13 miles or more above the Black Canyon of the Gunnison National Monument.

Earlier studies made by the Bureau of Reclamation for impoundments at the Blue Mesa site involved a very much smaller reservoir. The present plan calls for an impoundment that will extend up the river nearly to the town of Gunnison an estimated overall distance of something like 30 miles. It is estimated from limited, small scale,

USGS topographic sheets available for this area that the large basin shortly above the gorge in which the dam would be located would be as much as a mile and a half to 2 miles in width.

Information furnished by the sponsor indicates that the primary purposes of the reservoir are for holdover storage in connection with the Colorado River storage project, of which it is one of the units, and for power production. Utilized for these functions, it appears that a high degree of river regulation would be achieved, 2 million acre-feet out of a total of 2,500,000 acre-feet being indicated for holdover storage.

The following data have been furnished by the sponsor, or estimated from related available information:

Planned capacity	acre-feet	2, 500, 000
Maximum water surface elevation	feet	7, 635
Minimum water surface elevation	do	7, 455
(500,000 acre-feet inactive storage from water surface fluctuation chart.)		
Maximum water surface area	acres	18, 200
Minimum water surface area	do	5, 200
(Estimated from area capacity curves at 500,000 acre-feet inactive storage.)		
Length of reservoir at maximum	miles	30
Length of reservoir at inactive storage, estimate	do	17
Dam height	feet	475

The following statement regarding reservoir operation has been provided by the sponsor as follows:

> Reservoir fluctuation will normally follow the drawdown pattern shown for the period 1927–30. Somewhat greater drawdown will result in years of extremely low runoff such as 1931–34. Under conditions of ultimate development, which is expected in about 75 years, it is anticipated that irrigation requirements during years of extreme drought might necessitate the evacuation of the reservoir to the dead storage level for short periods.

Subsequently more extended period of study data for the reservoir have been made available, involving a 34 year period, 1914–47. From this extended table it is possible to make somewhat more sound deductions regarding future probabilities, especially since the period included the years of historically low flows beginning in the early thirties. According to about the first 20 years of the study period, which it is believed represents within close limits a normal cycle of runoff, the reservoir would be filled to capacity about 5 years out of 34 and would approach full pool within 5 feet on 3 other times.

Under ultimate flow conditions, only once during the 32-year period of study provided would the reservoir have filled to within 2 feet of maximum elevation, and frequently would fall far short of full pool. This indicates virtually complete river regulation.

Analysis of capacity tables in relation to area, capacity, elevation curves which have been provided by the sponsor, is summarized in the following table:

45515 --54- —--14

Curecanti Reservoir water elevations, normal and abnormal

FLUCTUATIONS WITH PRESENT MODIFIED FLOWS

(*a*) Under normal cycle conditions:	
Maximum pool (full pool) elevation	7, 635
Minimum, end of August approximate elevation	7, 545
Average, end of June (20 years) elevation	7, 608
Average, end of August (20 years) elevation	7, 608
(*b*) Under dry cycle conditions:	
Maximum pool, approximate elevation	7, 568
Minimum, end of August approximate elevation	7, 495
Average, end of June (14 years) elevation	7, 527
Average, end of August (14 years) elevation	7, 517

FLUCTUATIONS WITH ULTIMATE FLOWS

(*a*) Under normal cycle conditions:	
Maximum pool, approximate elevation	7, 633
Minimum pool, end of August approximate elevation	7, 558
Average pool, end of June (21 years)	7, 617
Average pool, end of August (21 years)	7, 612
(*b*) Under dry cycle conditions:	
Maximum pool, approximate elevation	7, 585
Minimum pool, end of August approximate elevation [1]	7, 505
Average pool, end of June (11 years) elevation	7, 568
Average pool, end of August (11 years) elevation	7, 566

[1] Evacuation to the dead-storage level referred to in the sponsor's statement would rarely, if ever, occur during the summer recreational use season. Capacity table data indicate that such exhaustion of active storage would have been closely approached once during the period of study, late in April.

In the above table, present modified flows are adjusted to account for the depleting effect of all existing and authorized developments in operation. Ultimate flows are adjusted to account for the depleting effect of the system operating under ultimate development.

The above tabulation reveals that while the reservoir would seldom completely fill under ultimate flow conditions, nevertheless average summer pools could actually be somewhat higher than initially and that average recreational use-season fluctuations would be quite comparable. In the light of present studies, therefore, it is believed that changing conditions resulting from ultimate Upper Colorado River Basin developments would not materially affect potential recreational values inherent in the reservoir. Nevertheless, it must be recognized that the effects of fluctuations on fishery will have, in either case, a direct bearing on general recreational importance.

Description of the site

The upper portions of the Black Canyon in which the dam would be located are less deep and, aside from a much reduced inner gorge, less precipitous and spectacular than the reaches embraced by the Black Canyon of the Gunnison National Monument a few miles below. The dam area, and gorge sections of the adjacent reservoir are not lacking, however, in notable scenic appeal, dominated as they are by rugged canyon country with quite spectacular buttes, darkly crowned with coniferous evergreens along the rim. Sapinero, Blue, and Pine Creek Mesas flank the portals of the canyon where it opens into the broader valley bordered by more gentle, rolling, open mesa terrain. This basin extends for some 15 miles and will provide the most significant mass storage section of the reservoir.

Immediately above the small hamlet of Elkhorn, the valley again becomes restricted into a minor gorge a few miles in length, opening

finally into the broader, comparatively flat-bottomed valley in which the town of Gunnison is located. On the basis of limited observation and in the absence of map material, it is very broadly estimated that the upper reservoir pool which would occupy the lower portions of this valley at high water would be some two or three thousand acres in extent. It would reach to within a few miles of Gunnison, and would be surrounded by low, gently rolling hills and mesa rangelands.

The general setting of the reservoir, in addition to immediate scenic values of considerable note at and above the dam, is superb. To the north lies the impressive West Elk Range, to the south the great San Juan uplift, and shortly to the east occurs the great Continental Divide, spectacular with alpine peaks often ranging over 14,000 feet in height. Many of these varying views, except in restricted gorge sections, would be visible from the reservoir itself.

Recreational values

The Gunnison River has long enjoyed a national reputation as an outstanding fishing stream. Anglers in great numbers are attracted to it annually, often from distant parts of the country. This recreational use must contribute appreciably to the economic stability of the valley above the Black Canyon of the Gunnison National Monument, and noteworthy investments have been made for guest and tourist accommodations. Many such camps have been developed along the banks of the river which would be flooded by the Curecanti Reservoir. One disadvantage resulting from these developments, so far as the general public is concerned, has been the posting of many stretches of privately controlled stream banks.

Potential recreational use

Fluctuations in the reservoir during recreation use seasons except during drought periods will not, it is believed, be unfavorable for recreation. The area is located adjacent to United States 50, is near the spectacular Black Canyon of the Gunnison National Monument, and is surrounded by great Rocky Mountain areas which themselves offer recreational opportunities of a very high order. It appears reasonable to assume that the importance of the reservoir, as a complement to other advantages offered by the region, would assume a considerable degree of State significance, meeting a much wider range of recreational needs than presently exist in this comparatively thinly populated part of the State.

The extent to which lake fishing can be developed in lieu of the notable stream fishing which is now enjoyed will have considerable bearing on the popularity of the reservoir. Fluctuations which, because of seasonal occurrence, would not seriously impair general recreational values may complicate the maintenance of quality fishing, a phase of use which can best be analyzed by the Fish and Wildlife Service. In this connection, perhaps mention could be made of a suggestion which has been advanced regarding the possible construction of a large weir shortly below the upper basin by means of which a constant water level could be maintained in the large reservoir section near Gunnison. Should such an arrangement prove feasible, it would maintain an impressive pool under conditions which would be ideal for recreational use and presumably equally so for fish reproduction. This would greatly improve the basic values of

the Curecanti Reservoir, even though at periods of low water, there would be two rather than one body of water. Because of seasonal occurrence this would not be a particularly unfavorable situation.

Even with moderately good lake fishing, the reservoir should encourage day, overnight, and weekend use, and because of the location in relation to various mountain recreational areas, even vacation use should assume importance. As a natural concomitant to these types of visitor use, would be demands for summer home sites, probably group camp areas and notably for boating facilities. Early consideration should be given to planning the reservoir area, especially in connection with land acquisition, to meet various visitor needs in an orderly and well organized manner. It seems highly probable, as a result of the preliminary reconnaissance, that many areas suitable for the various types of development will occur in satisfactory relation to reservoir shores around both the central and upper basins.

Effect on Black Canyon of the Gunnison National Monument

No State park area will be affected by the reservoir. The interests of the National Park Service, however, will be adversely affected in the monument by regulation of river flows. How completely river regulation can be achieved by the Curecanti Reservoir is not, as yet, known but it seems quite probable that it will reach a high degree and that only in comparatively rare years of excessive runoff would there be spills which would course through the canyon in addition to normal regulated flows.

This regulation will drastically alter the historic flows through the monument. These have already been somewhat changed by diversion to the Uncompahgre River Basin by means of a tunnel taking off from the Gunnison River very shortly above the east monument boundary. The degree of regulation resulting from this diversion does not appear to have drastically changed the character of flows through the monument, with great rushing spring torrents, followed by minimum summer flows that are comparatively unimpressive. There are years of record, although very rare, when flow has practically ceased, leaving only scattered pools along the canyon bottom.

It is the historic flows which, over hundreds of millions of years, have carved the spectacular gorge down through the basic, precambrian geological formation to depths ranging from 1,730 feet to as much as 2,425 feet, creating a great earth gash which is, in places, deeper than the width from rim to rim. Other natural weathering forces have combined with the river to create this natural wonder. Spalls, chips, and gravels falling unhindered to the canyon bottom are annually swept away by the great spring tidal flushes of the river.

Evidently with the flow of the river regulated and equalized by the Curecanti Dam this annual spring flushing would no longer take place unless the dam could be operated in such a way as to release large volumes of water during flood periods. The National Park Service would, of course, be concerned with any development which would alter natural conditions in the monument.

National Park Service archeologists are of the opinion that only minor hunting and camp sites of archeological interest are likely to have been found in the basin, and not necessarily prehistoric.

Recommendations

The potential recreational value of the Curecanti Reservoir indicates that appropriate attention should be given to land acquisitions where public domain is not involved, in order to make adequate provision for the various recreational uses which can be anticipated.

Closely related to land acquisition problems will be routes selected for the relocation of U. S. 50 which will be necessitated by reservoir development. There is some indication that the south side will be followed by the new route. On either side, however, it is recommended that consideration be given to areas of potential recreational-use value, both to assure, so far as feasible, suitable access thereto from the highway and, of equal importance, to avoid undesirable relationship to such areas in a way to reduce their subsequent value. This will require early reservoir planning and close cooperation with the State highway authorities.

It is especially recommended that consideration be given to possibilities of providing the weir in the narrow gorge between the lower and upper reservoir basins, by means of which a constant, or nearly constant water level could be maintained in the latter.

CRYSTAL RESERVOIR

The dam site for the Crystal Reservoir is located on the main Gunnison River, about 1 mile below the narrow Crystal Creek side draw which empties into the gorge from the north. The site is only a short distance above the east boundary of the Black Canyon of the Gunnison National Monument, Montrose County, Colo.

The small Crystal Reservoir would function as an after-bay, reregulatory impoundment for the very much larger Curecanti Reservoir, a few miles upstream. It would provide the means of developing important electrical energy, for which it is being considered. It would have no holdover storage function.

The following data is provided for this reservoir:

Planned capacity	acre-feet	40,000
Maximum water surface elevation	feet	6,870
Minimum water surface elevation	do	6,860
Normal water surface area	acres	550
Length of reservoir (estimated)	miles	8
Present stream bed elevation at dam site	feet	6,570
Dam height	do	305

The sponsor has given assurance that operational plans for the reservoir contemplate a practically constant water level at full pool, power spills from the Curecanti unit being reused here for additional energy production. The capacity would be used only to provide power head and for daily regulation with drawdown limited to a maximum of less than 10 feet.

Description of the site

The reservoir area is entirely within the Black Canyon. Viewed from the air it lacks the sheer, precipitous character of the national monument section which begins very shortly below the dam. The reservoir section, while yet extremely rugged, gives the impression of being a deep, very steep-sided V-shaped canyon. It is still 1,500 to 2,000 feet deep.

In addition to dam area access over construction and maintenance roads there will be one other point where limited access to the reservoir

will occur. At elevation 6,870, the impoundment will extend a short distance up the Cimarron Creek side canyon, to within a few hundred yards or possibly a half a mile of U. S. 50. It was through this draw that the old Denver and Rio Grande Western Railroad from the west entered the Black Canyon. A bench mark elevation at the upper end of this draw is given as 6,893, only 23 feet above normal reservoir, clearly indicating the feasibility of water access at this point.

Potential recreational use

At present the some 8 miles of the Gunnison River which would be inundated by the reservoir must have a high value for stream fishing, especially in view of the ready access to this part of the river noted above.

Lake fishing in the reservoir may reasonably compensate for the loss of stream fishing. The constant water level below several miles of the open stream between the Blue Mesa Dam which would impound the Curecanti Reservoir and the headwaters of the Crystal may be factors which are favorable in this regard.

The reservoir should be interesting for boating—an interest which will be enhanced by fishing if it can be established and maintained. Even on its own merit, boating should have considerable appeal affording as it will views of the upper reaches of the scenic Black Canyon. Also, from near the dam, there may be glimpses into the more startling, precipitous sections of the gorge in the national monument below the reservoir. It is anticipated that facilities for boating, including sightseeing excursions, can be developed in the draw at Cimarron where the reservoir will closely approach United States Highway 50.

The extremely steep, rugged nature of the canyon would probably preclude other forms of recreational use and development on the shores of the reservoir, forms of recreational outlets that can be more appropriately and conveniently developed on the great Curecanti Reservoir shortly upstream.

Effect on Black Canyon of the Gunnison National Monument

The monument and its primary values have been described by the National Park Service as follows:

> Black Canyon is notable for its narrowness, depth, ruggedness, great expanses of sheer walls, and interesting gorge formation. The rims of the gorge are only 1,300 feet apart at their nearest approach, yet the gorge ranges from 1,630 to 2,125 feet in depth within the monument. At one location the channel of the Gunnison River narrows to only 40 feet in width. For many millions of years this river has been furiously carving its channel deeper and deeper through this probable Archean complex at a greater speed than all combined natural processes can widen it. The tools which the river uses are the sand and gravel that it carries, mainly in periods of flood. The hardness of its rock formation and the joint, or fracture, system account for the sharp, ragged sheerness of the canyon walls. The rolling hills, which rise above the canyon rim and which formerly entrenched the flow of the Gunnison River, are carved from sedimentary rocks. These rocks are so much younger than those of the gorge itself, which immediately underlies them, that during this gap of time life developed from the single plant cell to the monstrous dinosaur. This tremendous break in the record of geological time is as significant to the imagination as the chasm of Black Canyon is to the sight.

It is true that regulated flows of the Gunnison River through the monument below the existing irrigation diversion tunnel have, for comparatively brief periods, been reduced to hardly more than

scattered pools. But, without exception, these periods have been followed within the space of a few months with the great, furious spring torrents with their scouring effects that have, in the main, been responsible both for creating the spectacular gorge and deepening it. Regulation will have an adverse effect on this natural process.

With the Crystal Reservoir operated as a re-regulatory afterbay for the Curecanti Reservoir, additional effects on river flows through the monument should be negligible. On this basis it can be assumed that it will be the Curecanti which will affect the monument in this respect rather than the Crystal unit. Such changes in natural conditions, while very undesirable, are nevertheless not sufficiently adverse to offset the economic advantages to be gained by river regulation in the public interest.

Recommendations

In the event the Crystal Reservoir is developed, it is recommended that consideration be given to making suitable provision for boating facilities for the reservoir. This should include adequate land acquisition in the restricted area near Cimarron where the reservoir will be primarily accessible for such recreational activities.

FLAMING GORGE RESERVOIR

The proposed Ashley Dam of the Flaming Gorge unit would be located in Red Canyon at a point on the Green River about 32 river miles downstream from the Utah-Wyoming State line. It would rise 440 feet above the river and impound a reservoir having, when filled to capacity, a surface area of 40,800 acres and extending 91 miles upstream through Hideout Canyon, Kingfisher Canyon, Horseshoe Canyon, Flaming Gorge, and the rolling plains of southern Wyoming to a point within 3 or 4 miles of the city of Green River, Wyo. The lower portion of the site lies in the Ashley National Forest on the northeastern flank of the Uinta Mountain Range. No primitive, wild, or wilderness area is involved.

Except for its area of origin in the Green River Lakes, the section of the Green River from Flaming Gorge to Red Canyon, inclusive, is the first highly scenic portion of the river in its course to its junction with the Colorado River. Farther downstream it plunges into the much more spectacular canyons of Dinosaur National Monument.

From Red Canyon upstream to Flaming Gorge is a nearly continuous series of canyons, of which the two named are the more scenic. Many portions of Red Canyon are narrow, precipitous, and colorful, its colors being reminiscent of the reds, grays, and purples found in the Canyon of Lodore in Dinosaur National Monument. It attains a depth of 1,500 feet or possibly more. The slopes are partly forested while the rims are more heavily wooded.

Flaming Gorge is notable for the intense reddish and orange shades of its cliffs which rise abruptly several hundred feet above the river. The colorful cliff on the right bank continues in a southwesterly direction and merges with the northerly slopes of the Canyon of Sheep Creek, a tributary. The cliff forms a finely colored setting for the Green River where, after leaving Horseshoe Canyon, it makes a sharp bend in Nielson Flat before entering Kingfisher Canyon.

The canyons are locally well known for their scenic values, and as features of interest to visitors to the Uinta Mountains. Utah State Highway No. 44 runs from Vernal to a point a few miles from the dam site. Unimproved roads lead southward from Green River, Wyo., to join this road. A side road leads to the rim of the canyon where a small resort has operated for a number of years, and where the Forest Service has provided overlooks. Flaming Gorge and Horseshoe Canyon also are accessible by a side road. The Forest Service has provided a road and campground in Hideout Canyon.

It is doubtful that the reservoir site receives recreational use other than for some hunting and fishing.

It is not known whether an archeological survey of the site has been made. It seems reasonable to assume, however, that evidences of prehistoric occupation exist.

Construction of the Flaming Gorge unit would cause material changes in the scenic characteristics of the site. The visible height of canyon walls from Red Canyon to Flaming Gorge, inclusive, would be reduced and a long still lake substituted for the much narrower river that flows through hilly plains in southern Wyoming and the canyons in northeastern Utah. Vegetation in the river bottoms and up the river slopes would be inundated and habitat for several species of mammals and birds would be lost, including some winter range for deer. The Forest Service campground and road in Hideout Canyon would be covered by the reservoir.

It is surmised that impoundment of the reservoir and possibly construction activities would destroy or damage a number of archeological remains.

Construction operations would also result in impairment to scenic values. Construction roads would involve some scarring of the landscape. Power lines, tunnel adits, construction buildings, and other features would also have adverse effects.

However, some scenic values would remain and a new recreational element would be introduced in the form of a lake. Drawdowns, if amounting to more than a few feet during the recreation season, would, of course, have adverse effects upon both scenic and recreational values. In general, the adverse effects of drawdowns would be more pronounced in portions of the reservoir site where shores are flattest.

It would be advantageous to recreational use if the water level could be kept relatively constant during the recreation season. In this event it is believed that the reservoir area, if suitably planned and developed for recreational purposes, would have local recreational value extending into southern Wyoming and northeast Utah.

Pending more detailed studies, it appears that this reservoir area should be suitable for picknicking, boating, fishing, camping, riding, and hiking. Development of recreational facilities might be limited in many cases by the rugged and steep topography of canyon sections of the area. Recreational planning for Flaming Gorge Reservoir should, however, take into consideration the competitive effects of the Echo Park and Split Mountain Reservoirs, as well as the many existing and potential attractions in the adjacent Uinta Mountains, the more distant Wind River Mountains in Wyoming, and the Wasatch Front near Salt Lake City.

CROSS MOUNTAIN UNIT

The proposed dam, which would be located at the head of Cross Mountain Canyon on the Yampa River 58.5 river miles upstream from its confluence with the Green River, would rise 295 feet above the river, and impound a reservoir having, when filled to capacity, a surface area of 52,200 acres and extending 76 miles nearly to the city of Craig, Colo. The reservoir would inundate the broad and indented valley of the Yampa River to the vicinity of the village of Maybell. Here it would be constricted somewhat; from this point it would extend easterly through Juniper Mountain Canyon, then widen again.

The reservoir site offers little, if anything, in the way of special scenic value. It consists of the river course with bordering deciduous vegetation, adjoining meadows and some irrigated lands, and flanking, semiarid rough grasslands sparsely dotted with cedar and pine. The river itself is fairly clear.

It has been reported that some of the last known resting places of Canada geese in Colorado may be along some of the bars and banks of the Yampa. The reservoir would apparently inundate some of these. An undetermined amount of winter range for deer would also be flooded.

The river is used to some extent for sport fishing, and there may be hunting values in adjacent lands. Although, pending further study, no conclusive statements as to fishing and hunting can be made at this time, it does not appear that there are any recreational values of great importance that the reservoir would destroy or seriously impair.

A brief preliminary archeological survey of the Juniper Mountain portion of the reservoir site in 1942 revealed at least five rather extensive prehistoric Indian campsites, and several others were noted along the river in the vicinity of Maybell. There are, no doubt, other archeological values in the remainder of the reservoir area. However, an intensive survey, together with limited testing, will be necessary to determine the probable extent and scientific importance of the prehistoric occupation of the reservoir area as a whole.

Because of the monotonous character of the terrain through which the reservoir would extend, this artificial lake would have minor scenic value. A long, somewhat broad lake of irregular shoreline in a semiarid setting would add a note of variety and interest to the landscape in normal or above-normal runoff cycles. If, during low runoff cycles, use of the active storage were to result in considerable drawdowns, these would adversely affect scenic values and this effect would progress with the reduction in storage. Large expanses of barren shores would probably be exposed, leaving mud flats and rough cobble beaches. Drawdowns would impair recreational values of the reservoir, the degree of impairment dependent on the extent of drawdown.

In years of normal or above-normal runoff, the reservoir can be expected to offer possibilities for recreation, such as picnicking, boating, camping, and perhaps hunting and fishing. It may provide opportunities for local day use by residents of Craig, Colo., and vicinity. More thorough study would be required to conclude as to probable use from more distant population areas, such as Denver and

Grand Junction, Colo.; Salt Lake City and Vernal, Utah, Rock Springs, Rawlins, and Laramie, Wyo. Recreational planning for this reservoir should take into consideration the competitive effects of other reservoir areas such as Echo Park, Split Mountain, Flaming Gorge, and Pathfinder-Seminoe in Wyoming, as well as mountain areas in this general part of Colorado-Wyoming-Utah region.

ECHO PARK AND SPLIT MOUNTAIN UNITS

Dinosaur National Monument was established by proclamation of President Wilson on October 4, 1915, under authority of the Antiquities Act for the primary purpose of preserving a rich deposit of fossilized dinosaur bones which had been found here in an excellent state of preservation. By President Roosevelt's proclamation of July 14, 1938, the monument was enlarged to include other resources of geological, archeological, and wilderness values. The extension included the Canyon of the Yampa River and the Canyon of Lodore, Whirlpool Canyon, and Split Mountain Canyon on the Green River. Of the total gross area of 209,744 acres, about 70 percent is in Colorado and about 30 percent in Utah.

The enlarged monument is essentially a canyon-plateau area along the most spectacular and scientifically interesting parts of the drainage of the Green River and its major tributary, the Yampa. The dynamic processes of river erosion have produced a colorful, rugged wilderness of deep canyons, dissected erosional benches, and bold promontories. The geological features have been given the place of outstanding importance. Second to these are the scenic features which form an inseparable combination with those of geology.

Functionally, Dinosaur National Monument consists of two sections referred to as the quarry section and the canyon section.

The quarry section comprises a comparatively small area in the vicinity of the dinosaur beds and includes the original monument. The canyon section, consisting of the remainder of the present monument, is over 200,000 acres in extent.

The geologic formations of the quarry section are of scientific importance and of distinct scenic value, but the major significance of this section is considered to be in the dinosaur beds. The principal deposits of fossilized dinosaur bones are found in the coarse sandstones of the Morrison (Jurassic) formation which underlies the shales and sandstones of the Cretaceous and is underlain by other strata of the Jurassic.

The canyon section is characterized by a notable combination of geological, scenic, archeological, and biological values and by its wilderness quality. Its most spectacular features are the canyons of the Green and Yampa Rivers, where interesting geological formations and impressive landscapes are displayed in great variety. One of the exceptional attributes of this section consists of contrasts of these two canyons in their geological formation and scenic character. Echo Park, at the confluence of the Green and Yampa Rivers, is especially notable because of the high, knife-ridge of sandstone known as Steamboat Rock, which rises vertically about 750 feet above the junction of the Green and Yampa Rivers.

In addition to the predominant geologic and wilderness values of the canyon section, there are noteworthy archeological features.

Evidences of prehistoric Indian life have been found in many areas and include campsites, rock shelters, petroglyphs, burials, and caves that were inhabited or used for storage. The archeology of the region is not yet fully known nor have all sites been adequately investigated and recorded.

Likewise, the many interesting historical aspects of the area have not been adequately chronicled.

In addition, there are distinct biological interests. Deer are abundant in some sections, and there have been reports of mountain sheep. There are also many plant associations which are correlated with geological structure and interesting biotic units whose origins are related to the development of the canyons and the local mountain structures on the flank of the Uinta Mountains. Forms of animal and plant life reveal influences of the hardy climate and are evidences that much of interest might be revealed by a careful biologic survey.

The proclamation of July 14, 1938, enlarging the monument, stated that—

> The Director of the National Park Service, under the direction of the Secretary of the Interior, shall have the supervision, management, and control of this monument as provided in the act of Congress entitled "An act to establish a National Park Service, and for other purposes," approved August 25, 1916, Thirty-ninth United States Statutes at Large, page 535 (U. S. C., title 16, secs. 1 and 2) and acts supplementary thereto or amendatory thereof, except that this reservation shall not affect the operation of the Federal Water Power Act of June 10, 1920 (41 Stat. 1063), as amended, and the administration of the monument shall be subject to the reclamation withdrawal of October 17, 1904, for the Brown's Park Reservoir site in connection with the Green River project.

In accordance with the act of 1916, it has been and is the responsibility of the National Park Service to conserve the scenery and the natural and historic objects and wildlife within the areas in the national park system, and to provide for the enjoyment of them in such manner and by such means as will leave them unimpaired for future generations. Accordingly the major aims of the National Park Service in its administration of the Dinosaur National Monument have been:

1. Protection of unimpaired resources and, through elimination of factors that have modified other natural conditions, the restoration of those other conditions to their original state. The modifying factors principally involved are agricultural pursuits which consist largely of grazing, and the presence of non-Federal lands within the exterior boundaries of the area.
2. Protection and preservation of archeological features.
3. Provision of facilities necessary to enable visitors to study and enjoy the features of paleontological, geological, archeological, wilderness, and related interests, and required for proper recreational use and administration of the area.

In accordance with those objectives, the National Park Service prepared a master plan for Dinosaur National Monument. The developments shown thereon were for the purposes of making the noteworthy features of the area accessible and providing facilities and accommodations for visitors, as well as administering the area and protecting its superb natural and archeological values. The general theme of development was centered around the paleontology of the quarry section and the wilderness character of the canyon section. Proposed facilities included a modern road system, an expanded trail system, several tourist centers, and a headquarters area.

In connection with investigations of the Colorado River Basin under authority of the Federal reclamation laws and acts amendatory thereof or supplementary thereto, particularly the Boulder Canyon Project Adjustment Act of July 19, 1940 (54 Stat. 744), the Bureau of Reclamation has studied for several years the water storage and hydroelectric power possibilities of the upper Colorado River Basin including the area included within Dinosaur National Monument. The Bureau arrived at the conclusion that utilization of two storage-power sites within the national monument, referred to as the Echo Park and Split Mountain sites, was necessary for the best development of the water resources of the Colorado River Basin and that suitable alternate sites outside the boundaries of the monument could not be found.

In its role, under congressional mandate, as custodian of the areas of the national park system, of which Dinosaur National Monument is one, the National Park Service believes and, therefore, maintained that the proposed Echo Park and Split Mountain units of the upper Colorado River storage project would seriously and adversely affect numerous splendid natural and archeological values of the extensive canyon portions of the national monument, although they would not physically affect the small area in which the famous dinosaur beds are found. On pages 244 and 245 of the departmental report of July 1947, entitled "The Colorado River," and in the National Park Service report entitled "A Survey of the Recreational Resources of the Colorado River Basin," compiled in 1946 and published in 1950, it is asserted that the effects of the proposed Echo Park and Split Mountain units upon irreplaceable geological, wilderness, and related values of national significance would be deplorable.

The former report also stated that some geological and scenic values would remain, that new scenic and recreational values would result from the impoundment of reservoirs, and that, even though they would not compensate in kind for the losses described in the report, they would be of real importance.

Both reports pointed out that the policy of the National Park Service as the administrative agency responsible for the national monument has been to make the protection of the natural and archeological values of the area the controlling factor in administering it. They also expressed the view that the question of whether this policy is to be changed to permit development for water-control would require for its solution a review of all probable advantages and disadvantages by authorities superior to either the National Park Service or the Bureau of Reclamation, and that, before changes in the status of the canyon section are authorized in order to recognize water control as the principal consideration in administering the unit, it should have been clearly and certainly shown that it would be in the greater national interest to develop the area for such use than to retain it in its natural state for its geologic, scenic and associated values and for the enjoyment of them by the Nation.

The proposal to construct the Echo Park and Split Mountain Dams within Dinosaur National Monument resulted in a controversy of nationwide scope. There were numerous conservation groups and individuals on the one hand who believed that the effects of these projects upon the canyon areas of the national monument would be so disastrous as greatly to impair and even destroy natural values of

the highest order and that suitable alternate sites could be found outside the monument to save the area from despoilation. There were also many groups and individuals on the other hand who believed that utilization of the two sites in question was necessary for the fullest development of the power resources of the Colorado River and that satisfactory alternate sites outside the monument did not exist. The controversy became so intense that the Secretary of the Interior decided to hold a public hearing in Washington, D. C., on April 3, 1950, to afford both sides an opportunity to state their views. After thorough study of the arguments of opponents and proponents of the projects, the Secretary on June 27, 1950, issued a memorandum to the Commissioner, Bureau of Reclamation, and the Director, National Park Service, as follows:

THE SECRETARY OF THE INTERIOR,
Washington, D. C., June 27, 1950.

Memorandum.
To: Commissioner, Bureau of Reclamation, Director, National Park Service
From: The Secretary
Subject: Construction of Dams in the Dinosaur National Monument

The preparation of a comprehensive report for the development of the upper Colorado River Basin has posed the question of whether Echo Park (immediately) and Split Mountain (eventually) Dams should be built in the canyon sections of Dinosaur National Monument. I will not have the final say, but I must determine whether, as Secretary of the Interior, I shall approve and recommend to the Congress a plan that includes these dams.

The history of the issue is well known to you and is well documented in the transcript of proceedings of the hearing I held on April 3, 1950. I shall not review it here.

I am impressed with the fact that the waters of the Colorado River constitute a resource of paramount importance to the region and that in view of the arid nature of the area, my approved plan for the development of the upper basin must make every practicable provision for the conservation and multiple use of these waters in the interest of the people of the West and of the whole Nation.

I am not unmindful of the public interest in the inviolability of our national parks, and in the status, only a little less austere, of the national monuments. By no precedent of mine would I wish to endanger these places.

Weighing all the evidence in thoughtful consideration, I am impelled in the interest of the greatest public good to approve the completion of the Upper Colorado River Basin report, including the construction of the dams in question, because:

(*a*) I am convinced that the plan is the most economical of water in a desert river basin and, therefore, is in the highest public interest; and

(*b*) The order establishing the extension of the monument in the canyons in which the dams would be placed contemplated use of the monument for a water project, and my action, therefore, will not provide a precedent dangerous to other reserved areas.

I note that the fossils are not in the areas of the monument proposed to be flooded and that the creation of the lakes will aid the public in gaining access to scenic sections of the Green and Yampa River Canyons. Much superb wilderness within the monument will not be affected, excepting through increased accessibility.

The importance to the growth and development of the West of a sound upper Colorado River Basin program can scarcely be overemphasized. I hope that this decision on my part will promote quick solution of all other problems connected with this matter so that we may proceed with such a program.

I ask the National Park Service and the Bureau of Reclamation to cooperate fully in making plans that will insure the most appropriate recreational use of the Dinosaur National Monument, under the circumstances.

OSCAR L. CHAPMAN,
Secretary of the Interior.

Accordingly, the National Park Service is making a restudy of the values of the area in line with the Secretary's decision to recommend

to Congress the construction of the Echo Park and Split Mountain units. The objective of the restudy will be the replanning of proposed development, especially of the canyon section, to make the best possible recreational use of the Echo Park and Split Mountain Reservoir areas, in the event the dams are authorized, as well as to protect and make accessible remaining features of natural and archeological interest.

Recreational planning for the Echo Park and Split Mountain Reservoir areas will be based on the assumption that the Congress will approve and provide funds for them and will be focused on the potential values of these two artificial lakes and adjoining lands for such activities as boating, fishing, swimming, hiking, and riding. These will require roads and trails to points of access on the reservoirs and to overlook or view points. Consideration will also be given to needs for overnight facilities including campgrounds. Moreover, planning for the administration of the area will receive careful study. This will include studies for the safety of visitors and the protection of the area itself against soil erosion and fire, as well as plans for an administrative, protective, and interpretive staff and headquarters.

Prior to filling the reservoirs, it is contemplated that more thorough studies of the archeology, paleontology, geology, and wildlife of the area will be made, particularly for the purpose of recording and/or salvaging important scientific data which would be submerged by the reservoirs. The information gained by these studies will be of great value in future interpretive programs for the recreational areas.

The National Park Service will cooperate with the Bureau of Reclamation with regard to the location and layout of the Bureau's permenent and temporary facilities, such as construction camps, roads, tunnels, powerlines, and administrative developments, so that the objectives of the two agencies may be most harmoniously realized. Such cooperative planning should also result in the ultimate combined use of some facilities, such as roads, for both administrative and recreational purposes.

Estimates of cost

Recreational development of the canyon section of Dinosaur National Monument has been impossible because of inadequate funds or other obstacles. Necessarily such developments were deferred during the war period and there has been no opportunity thus far during the postwar period to proceed with logical and needed development. The canyon section is, therefore, inaccessible to the great majority of visitors. Trips into this section have been made almost solely by local residents and a few others who are sufficiently familiar with this type of rough canyon-plateau country to venture into it over very rough roads and trails.

It is believed, however, that there will be considerable demand to develop the canyon section for recreational purposes. Its location between two heavily used transcontinental highways, U. S. 30 and U. S. 40, and possibilities for making it accessible by good roads from both lead to the conclusion that this area, if suitably developed, will receive a good deal of use, not only by residents of nearby portions of Colorado, Utah, and Wyoming, but also from more distant and more

heavily populated districts. While the small number of potential visitors living within the immediate vicinity do not require extensive developments, the number of visitors from more distant sections may be expected to be large and a considerable recreational development will therefore be necessary.

In order to reach final conclusions as to the probable annual number of visitors to the area under adequate recreational development, it is essential to undertake a study involving not only these two reservoirs but also the recreational, scenic, and related resources, existing and potential, of the general region in which these reservoir areas lie. This region includes at least southwestern Wyoming, northwestern Colorado, and northeastern Utah. A regional study is imperative before it can be fully determined how much and what kinds of recreational use will be made of the two reservoir areas, and therefore, the amount and types of recreational facilities that should be provided.

Among the important resources of the region to be fully studied are the existing attractions of the nearby Uinta Mountains including forest recreation in the scenic Ashley and Wasatch National Forests with their natural lakes and streams and good fishing, as well as the cooler summer climate of the Uintas. Also, to be seriously considered is the potential recreational value of the Flaming Gorge reservoir area, particularly in view of its close relationship with the Uinta Mountains and their forests and natural waters. If, as seems contemplated by the Bureau of Reclamation, a good road may be constructed between United States Highway 40 at a point near Vernal, Utah, to United States Highway 30 in the vicinity of Green River or Rock Springs, Wyo., by way of the Ashley Dam of the Flaming Gorge Reservoir, a large and important mountain recreational district including this reservoir will apparently be made readily accessible.

Also to be considered is the Cross Mountain reservoir area, particularly if the fishing proves good.

This regional study has been initiated by the National Park Service, and it is expected that its findings will be made and its conclusions reached within a few months. These will have a direct bearing upon final recreational planning of the Echo Park and Split Mountain Reservoir areas. Pending the completion of this study, the National Park Service has prepared preliminary estimates of cost for Echo Park and Split Mountain, recognizing the possibility, however, that material alterations may have to be made in them when the regional study has been finished. The current estimates follow:

1. PRELIMINARY PLANNING

For study of boundary problems, selection of sites and preliminary sketches for development, soil conservation studies for watershed protection, collaborating with Bureau of Reclamation personnel on location of construction roads, camps, stockpiles, borrow pits, powerlines, and architectural design of structures, etc., preparation of the master plan which includes the development outline and all pertinent drawings as called for in vol. 12 of the National Park Service Administrative Manual, travel, per diem, and incidental expense	$100,000

2. RECREATIONAL PLANNING AND CONSTRUCTION COSTS

Roads: Approximately 85 miles of road construction which will include the approach road from U. S. Highway 40 to proposed developed areas such as Harpers Corner, Buena Vista Peak or Round Top, and Pats Hole	$6, 000, 000
Trails: Approximately 200 miles of trails which include walks within developed areas and nature trails and bridle trails to overlook points and to features and points of scenic, recreational, and related interest throughout the area	800, 000
Campgrounds: It is contemplated to provide 6 areas of varying capacity to accommodate approximately 4,000 camping groups, including such points as Island Park, Pats Hole, and the vicinity of Zenobia Peak	3, 600, 000
Picnic areas: 3 picnic areas are contemplated to accommodate approximately 2,000 picnic groups	1, 600, 000
Beaches: 7 beach developments are contemplated to accommodate the camping, picnicking, and lodge visitors. Among areas tentatively considered for beach development are Island Park and Pats Hole	230, 000
Lodge: Lodging for 400 guests, restaurants, shops, and employee quarters, and motor service. This development is being considered at a location on the Yampa Bench near the lagoon in the Pats Hole area	1, 250, 000
Marinas: 1 large marina in the vicinity of the lodge and 6 smaller ones adjacent to the camping areas	180, 000
Interpretative facilities: It is proposed to have 1 main museum and 8 secondary or wayside museums at other important public use areas to exhibit excavated materials and tell the archeological and geological story of the area	340, 000
Headquarters: This development will include administrative offices, repair shops, equipment storage buildings, and 7 employees' residences. Current studies indicate that the logical place for such development may be on U. S. Highway 40 at a point where the proposed main approach road will lead from the highway to the interior of the canyon section. Related to administrative headquarters will be several ranger stations throughout the area for services to visitors and protection of the area itself against fire	1, 800, 000
Construction cost	15, 800, 000
Construction plans, specifications, and estimates: Planning and supervision of construction average approximately 12 percent of construction cost	1, 896, 000
Grand total, planning and construction	17, 796, 000

3. WILDLIFE PROGRAM

(*a*) To survey the existing terrestrial animal life of the area to be flooded and the adjoining habitats which will be affected and to plan for subsequent management and interpretation_p. a	17, 000
(*b*) To survey the existing fishery resources and to plan for management and public use of the fishery in the future impoundments_p. a	10, 000
(*c*) To survey the existing plant life of the areas to be flooded and affected by flooding, and to plan for subsequent management, use by wildlife and interpretation to the public_p. a	10, 000
A minimum of 3 years will be required for the necessary field investigations and writing reports. Total amount required	111, 000

4. GEOLOGICAL PROGRAM

(*a*) To excavate two important fossil sites in Echo Park and Split Mountain respectively; recovery, preservation, and storage of the fossils and plan for subsequent public exhibit---p. a--	$25,000
(*b*) To survey geologic values of area, prepare geologic maps, and develop future interpretive programs----------p. a--	10,000
A minimum of 2 years will be required for the necessary field investigations, writing and printing reports. Total amount required---	70,000

5. ARCHEOLOGICAL PROGRAM

(*a*) Intensive survey of Yampa and Green River Canyons and testing of new sites as located----------	50,000
(*b*) Complete excavation of Hells Midden----------	20,000
(*c*) Complete excavation of Mantle's Cave----------	8,000
(*d*) Intensive testing of 33 other sites of the total 58 at approximately $3,000 per site----------	99,000
(*e*) Archeological excavation under (*a*) and (*d*) after survey and testing are completed----------	200,000
Total----------	377,000
A minimum of three years should be allowed for adequate completion of this project.	
Grand total----------	18,354,000

Program of estimated planning, construction, and related costs, by fiscal years, Echo Park and Split Mountain units, Colorado River storage project, involving Dinosaur National Monument [1]

[1] Prepared by River Basin Recreation Survey, Region 2, Nov. 14, 1950.

Bureau of Land Management

The Bureau of Land Management is charged with responsibility for managing, developing, protecting, and disposing of the surface and subsurface resources of the vacant, unappropriated public-domain lands of the United States, as well as the mineral resources of public lands withdrawn for other agencies. It has the exclusive responsibility for cadastral surveys on the public lands. It acts as custodian and handles applications for all mineral resources, not only on all public lands, but also upon privately owned lands where mineral rights are retained by the United States. The Bureau is the office of record of all transactions involving the public lands of the United States. It processes withdrawals of the public-domain lands for administration by other Federal agencies, and it classifies the remaining lands for their highest use, and administers them according to such classification. The Bureau rules on all applications to enter the public land under the agricultural land laws and, when proper, issues patents to the land. The Bureau handles the grazing responsibilities of the former Grazing Service under the Taylor Grazing Act of 1934, regulating grazing on the Federal range within the grazing districts and on lands leased for grazing outside of the grazing districts.

From the above general statement of the responsibilities and activities of the Bureau of Land Management in the Upper Colorado River Basin it is apparent that any changes in the general economy and land pattern of the area will have a strong influence on the program of the Bureau of Land Management. The Colorado River storage project and subsequent irrigation projects will have far-reaching beneficial effects on the local economy, making it necessary to make substantial adjustments in public-land programs for the basin.

There remains in the upper Colorado River Basin approximately 29 million acres of public domain, most of which is included in established grazing districts. Approximately 41 percent of the gross area of the basin is administered by the Bureau of Land Management. The acreages of public domain are distributed by State about as follows:

	Acres
Arizona	156, 000
Colorado	6, 610, 000
New Mexico	1, 749, 000
Utah	13, 904, 000
Wyoming	6, 582, 000
Total	29, 001, 000

The public domain consists of remnants of a land-disposal program which has continued for almost a century. These lands are, therefore, the least productive and those which are located in arid regions where crops cannot be produced without extensive investment in irrigation. While these lands have been considered mainly valuable for grazing, industrial development and irrigation have created a demand for lands which were formerly considered as having no value. Their

disposal to individuals and to public programs continues to take place. In addition to those being withdrawn for reclamation purposes, numerous applications are filed each year for homesteads, isolated tract sales, home, cabin and business sites, and various other special uses. Public lands are exchanged for State and privately owned lands where such exchanges are in the public interest. Those lands which have natural recreational or scenic value, or acquire these values through construction of artificial dams, may be reserved for use by State, municipal, or Federal agencies dedicated to the management and development of land for these uses.

The principal use of the public domain at the present time is grazing. These same grazing areas are subjected to multiple uses, including production of forest and woodland products and big game. Another important value attaching to the public domain is its watershed value. The public domain lands are not the principal water-producing lands, but they do contribute the major portion of the sediment deposited in the Colorado River. An analysis of the sediment records available on the Colorado River shows that approximately 60 percent of the sediment entering the stream originates in the area located below the confluence of the Green and Colorado Rivers and above the Grand Canyon. Another 22 percent originates in the San Juan River drainage above the Bluff gaging station. The total water contribution from these two areas is about 25 percent of that passing the Grand Canyon. In these two areas we have a situation where 80 percent of the sediment is contributed by 25 percent of the water; 75 to 80 percent of the land in these 2 areas is federally owned.

With the development of the upper Colorado River it is imperative that broad studies be made which will provide information to determine the proper use of land and water resources as a basis for determining disposal programs and adjustments in land control between Federal agencies. Such studies would form the basis for developing an integrated land-use program which would have as its objective a balance between the various phases of agricultural pursuits as well as mineral development and other industries. These studies should be on an area basis to insure proper consideration of the present and potential uses of land and water in advance of action programs. For example, livestock raising is one of the most important industries in the upper Colorado River Basin and is successful only where there is a proper balance between feed produced on irrigated land and on the open range. Advance area studies are needed to avoid a situation where this balance is not maintained thereby causing overgrazing and accelerated erosion.

The effect of the upper Colorado River storage and participating projects on the program of the Bureau of Land Management is specifically outlined below under the various functions of the Bureau.

Minerals and resource disposal

There are in the public domain lands extensive deposits of coal, oil and gas, and numerous other minerals. Notable examples are the coalfields throughout the basin and oil and gas deposits in the San Juan and Uinta basins and in northwestern Colorado near Rangely.

The Bureau of Land Management is charged with the responsibility of processing applications for leases of oil, gas, coal, phosphate,

potash, and so forth, under the Mineral Leasing Act of February 25, 1920, as amended, and applications for mineral entries; of determining whether the public land is mineral or nonmineral in character, as well as making investigations of mining claims to determine the validity of such claims. The hydroelectric power made available as the result of the Colorado River storage project will greatly stimulate the development of mineral resources, making it necessary for the Bureau of Land Management to adjust its operation to meet changing programs. The number of mineral applications is expected to increase manyfold. The added work connected with investigating and determining the validity of existing mining claims in connection with the construction program will be one of the immediate jobs of the Bureau of Land Management. There will also be a large amount of appraisal work of valid mining claims on lands which will be inundated as a basis for determining damage to claimants. The costs of this accelerated program resulting from the upper Colorado storage project are reflected in the attached budget estimates under "Mineral examination."

Land classification and resource inventory

Prior to designating public land for certain uses or acting upon applications seeking to acquire part of the public land, the law requires that the land be classified according to its suitability for the purpose intended. This includes determining that the lands are proper for withdrawals for national forests, parks, wildlife refuges, and reclamation. Coincident with and a part of the land classification responsibilities of the Bureau of Land Management is the determination of which lands the public interest requires be retained in public ownership, and the planning of a unified management program which encourages the most productive use of these lands from a public viewpoint. Proper management encompasses policies dealing with multiple-land uses such as forestry, grazing, mining, watershed protection, and recreation. Land classification also encompasses economic studies as a basis for determining the relationship between land pattern, public improvements, private improvements, the different phases of agricultural pursuits, and potential and existing industrial development.

The classification of the public lands in the Colorado River Basin has been carried out on a basis of relatively small areas, chiefly those on which land-disposal cases are pending. The initiation of the Colorado River storage project, with the subsequent development of the participating projects, will make it imperative that the program of the Bureau of Land Management on land classification and resource inventories be stepped up manyfold if errors are to be avoided in the overall land-use program of the upper Colorado River Basin.

The character of the public domain is known in a general way, but sufficient information is not available on which to base sound land-management plans or to determine the overall land-use adjustments needed. Detailed physical and economic information is needed to determine the suitability of public lands for such uses as watershed, forestry, grazing, crop production, industrial, recreational, and other special uses. A general resource inventory is needed, which would include the segregation of the lands according to their physical-use capabilities as limited primarily by soil, topography, and climate.

Such a study would appraise the erosion situation as to extent and degree and would include an inventory of the forage and timber resources as to quantity and quality to serve as a basis for stocking the range and determining allowable cut of timber and woodland stands. The data collected in such an area study would serve not only as a basis for planning conservation and watershed protection, but would permit an analysis as to which lands, in the public interest, should be retained and which lands should more properly be managed by other Federal agencies or under private ownership. It will permit a complete analysis of interrelated land values. When analyzed in connection with expected agricultural and industrial development as a result of the development of the upper Colorado River Basin, such a survey will indicate what adjustments will be needed for a balanced economy in the basin.

Such a broad area classification and resource inventory should be initiated at an early date, as the data developed should be available in advance of completion of construction phases. The estimated cost of an area classification and resource inventory is reflected in the attached schedule.

Basic land records

The Bureau of Land Management is charged with the responsibility of keeping the basic land records for the public lands of the United States. This activity is carried on through the Bureau's various land offices. In these offices are recorded all applications for entry upon public lands for any purpose except grazing permits within established grazing districts. Among other kinds of entries, these include homestead entries, desert-land entries, small tracts, isolated tracts, exchanges, special-use, State selections, grazing leases, mineral and gas and oil leases. Records must be maintained on the final disposition of all of the above enumerated applications, including patents issued and patented lands on which the minerals are reserved to the United States. The combined record of all of these entries is the only means of determining current status of the land. Records are also kept of all lands withdrawn for use by other Federal agencies, as well as rights-of-way over public lands. Records of revocation of various orders withdrawing lands are also maintained as a basis for determining the availability of land for other uses.

The development of the water resources of the upper Colorado River and the resulting rapid industrial development through the upper Colorado River storage project and participating projects, will greatly increase the demand for public lands in the basin. The increased number of land transactions will increase the volume of work in the land offices beyond the capacity of the present facilities and personnel, and the present record-keeping system. Lands involved in both the storage project, and the lands which will be irrigated under participating projects, will have to be cleared of all other obligations against the land. This will require a review of all existing withdrawals, including those which overlap, and the mineral claims on the lands affected. Since mineral claims are not filed in the land office until patent is applied for, this will require extensive checks in the various county offices as well as the Federal land offices. The estimated cost of this project is shown in the attached tabulation giving the estimate of funds needed.

Cadastral surveys

The Bureau of Land Management is the only agency authorized to conduct surveys fixing township and section corners in accordance with the rectangular system of surveys. These surveys form the basis of all legal descriptions of land and are necessary in establishing the location for rights-of-way, and in fact establishing ownership or control of land. Accurate locations are necessary in all planning and land classification programs. They form the basis for the mapping of basic resources and the condition and character of the land. Accurate locations in the construction phases of the upper Colorado River storage project will be necessary in the acquisition of rights-of-way and the determination of adverse claims on the lands affected. They will be needed in the laying out of farm units and settlements as the participating projects enter into the overall program.

In the upper Colorado River Basin there is a gross area of some 73,577,000 acres of land divided cadastrally as follows:

Unsurveyed	16,377,000 acres.
Old surveys	32,752,000 acres.
Iron post surveys	24,448,000 acres considered as sufficiently surveyed for most purposes.

With some exceptions the unsurveyed areas should all eventually be resurveyed cadastrally so that the land can all carry a legal description and known area. The exceptions are the very rough canyon areas and such permanent reservations as national parks and monuments where no land transactions normally take place.

The old surveys, those executed before 1910, should all be resurveyed with perhaps the following exceptions:

1. Highly developed suburban areas that have been adequately shown on local plats of record.
2. Incorporated areas, such as cities and towns.
3. Areas within permanent reservations such as national parks and monuments, where cadastral resurveys may be limited to boundary surveys and to surveys within the reservations sufficient to define private property limits.
4. Areas of sold private ownership in counties that have kept good local records of survey monuments and of cadastral activities of local county surveyors and other local engineers.

The cost estimates as shown in the accompanying program are based on a survey of 75 percent of the unsurveyed acreage, and a resurvey of 60 percent of the area of old surveys.

Resource management, protection, and rehabilitation

(*a*) *Grazing.*—The Taylor Grazing Act of June 28, 1934, authorizes the Secretary of the Interior to establish grazing districts upon the public domain. The primary objectives of this act are:

1. To stop injury to the public grazing lands by preventing overgrazing and soil deterioration.
2. To provide for their orderly use, improvement, and development.
3. To stabilize the livestock industry dependent upon the public range.

Almost all the public domain in the upper Colorado River Basin is located within 18 established grazing districts. These districts and the acreage in each are listed below.

Grazing district:	Acres
Colorado No. 1	1,727,000
Colorado No. 2	336,000
Colorado No. 3	1,143,000
Colorado No. 4	1,045,000
Colorado No. 6	858,000
Colorado No. 7	1,336,000
Total	6,445,000
Wyoming No. 3	909,000
Wyoming No. 4	4,400,000
Wyoming No. 5	1,212,000
Total	6,521,000

Grazing district—Con.	Acres
Utah No. 5	2,170,000
Utah No. 6	2,466,000
Utah No. 7	3,127,000
Utah No. 8	1,782,000
Utah No. 9	1,708,000
Utah No. 11	2,528,000
Total	13,781,000
Arizona No. 1	156,000
New Mexico No. 1	872,000
New Mexico No. 7	867,000
Total	1,739,000

The total of lands within grazing districts: 28,642,000 acres.

Livestock raising is the principal agricultural pursuit in the Colorado River Basin. Because of the vastness of the public domain it constitutes an important part of the livestock operations. This industry, being one of the important pursuits, exercises a strong influence on the prosperity of the basin as a whole. The Bureau of Land Management is charged with the responsibility for the stabilization of this industry insofar as use of the public domain is concerned, and at the same time conserving and developing the resources on the public land.

The Taylor Grazing Act authorizes the Secretary of the Interior to issue, or cause to be issued, permits to graze livestock on the grazing district lands, to bona fide residents, settlers, and other livestock owners. Permits have been issued to approximately 4,700 operators to graze a total of approximately 2,237,000 head of livestock. The number of permittees and numbers of livestock permitted to use the grazing district land is shown in the following table.

State and district	Number of permittees	Number of permitted livestock				
		Cattle	Horses	Sheep	Goats	Total
Colorado No. 1	163	22,000	560	127,000	----	149,560
Colorado No. 2	252	48,000	940	41,000	----	69,940
Colorado No. 3	396	36,000	930	117,000	----	153,930
Colorado No. 4	269	17,000	90	90,000	50	107,140
Colorado No. 6	88	4,000	190	92,000	----	96,190
Colorado No. 7	555	38,000	620	80,000	----	118,620
Total	1,723	145,000	3,330	547,000	50	695,380
Utah No. 5	308	20,000	310	49,000	----	69,310
Utah No. 6	103	14,000	190	77,000	----	91,190
Utah No. 7	438	23,000	920	88,000	----	111,920
Utah No. 8	220	12,000	350	177,000	----	189,350
Utah No. 9	92	7,000	80	109,000	----	116,080
Utah No. 11	364	19,000	560	28,000	----	47,560
Total	1,525	95,000	2,410	528,000	----	625,410
Wyoming No. 3	79	6,000	300	115,000	----	121,300
Wyoming No. 4	307	27,800	1,200	430,000	----	459,000
Wyoming No. 5	174	44,200	2,500	105,000	----	151,700
Total	560	78,000	4,000	650,000	----	732,000
Arizona No. 1	13	2,000	----	----	----	2,000
New Mexico No. 1	392	8,000	900	90,000	3,000	101,900
New Mexico No. 7	564	3,600	3,200	66,000	8,000	80,800
Total	956	11,600	4,100	156,000	11,000	182,700
Grand total	4,777	331,600	13,840	1,881,000	11,050	2,237,490

Prior to the passage of the Taylor Grazing Act, there was no control of the use made of these lands and each individual had to be the first one on the lands with his livestock in order to protect his interests. Range livestock operations were conducted with a minimum of overhead. Before the days of reclamation a minimum of cultivated forage crops were produced. The livestock were permitted to graze upon the public range during all seasons of the year, including those seasons when grazing on the range is most destructive. As a result of this condition, when grazing districts were first established a large part of the public domain was in a seriously depleted condition.

Under the Taylor Grazing Act and the rules and regulations promulgated thereunder, the public-domain lands are administered in accordance with accepted range management practices giving appropriate consideration to the effect of such administration on the local economy. Because of the character of the land, proper management requires the application of many scientific principles. The grazing district lands, for the most part, are located in the most arid portions of the basin and there exists a delicate balance between soil conditions, natural vegetative cover, and climate. Under these circumstances natural balances are easily distrubed.

In management of the public ranges four cardinal principles of range management are recognized and applied. These are (1) proper numbers of livestock, (2) proper seasons of use, (3) proper distribution of use, and (4) proper class of livestock. The number of livestock using the range is controlled by the permits issued. Proper seasonal use is accomplished by the construction of drift fences, stock water holes, and other range improvements designed to control or encourage livestock to use the range according to the season for which it has been classified. This practice is, however, influenced to a large degree by the production of cultivated forage on privately-owned land to supplement range forage during periods when the range cannot be properly grazed. The distribution of livestock on the range is accomplished through construction and use of range improvements and such accepted range practices as herding and salting. Class of livestock grazed is ideally governed by the dominant type of range forage. It is often necessary, however, to modify this practice according to the prevailing type of agriculture on the irrigated lands.

The livestock industry is dependent upon the production of hay and other feed crops for their livestock when range forage is not available or cannot be properly used. Experience has also shown that ample supplies are the best insurance against drought and severe winters. A stable livestock economy is dependent upon a proper balance between cultivated feed crops produced and the available seasonal forage production on the range. The increased hay production resulting from the development of the upper Colorado River Basin will complement the range forage and ultimately result in increased total livestock production. However, careful planning will be required to avoid an adverse effect. Most of the ranges are already fully stocked and if the additional production resulting from new irrigation merely permits the introduction of more livestock into the basin without adjustments in seasons of use and feeding periods, there will be increased pressure for more stock on the range for the same periods of time. By advance planning for readjustments in management plans, the increased production on irrigated lands can

relieve the pressure on overgrazed ranges while they are being rehabilitated to produce more forage than they now produce.

The interrelationship between production on privately owned or controlled land is further emphasized by the methods of adjudicating grazing privileges under the Taylor Grazing Act and the Federal Range Code. These rules and regulations under the act provide that preference will be given to livestock owners who own or control land or water used in connection with the public range. With the exception of the grazing districts in Arizona and New Mexico, grazing privileges in the upper Colorado River Basin have been apportioned to livestock operators on the basis of ownership or control of land. It is required that the operator possess sufficient land to feed his livestock for a given period of time. The development of additional feed on irrigated land will make it necessary to make substantial adjustments in range apportionments and livestock operations in the basin.

The upper Colorado River storage project will result in some ranch properties with grazing privileges attached to them being inundated by water. The public land on which some operators have grazing privileges will be cultivated or otherwise needed in connection with the project. In those cases where the operators lose their base properties they should have an opportunity to transfer their grazing privileges to other properties which can be used in connection with the public range. A study of the operations of those whose range allotments are needed in connection with the project should be made with a view to rounding out their operations on other lands or by use of new feed supplies resulting from increased irrigation. This will involve a revision in management plans for the units involved as well as the processing of appropriate transfers of grazing privileges.

The estimated funds required to make the necessary studies, reapportionment and transfer of grazing privileges as a result of the expected expansion of the livestock industry, are reflected in the attached program schedule under "Adjustment in range management plans and apportionment of grazing privileges."

(*b*) *Soil and moisture conservation.*—The President's Reorganization Plan No. 4 of April 11, 1940, transferred the responsibility for soil and moisture conservation operations on lands administered by the Department of the Interior from the Secretary of Agriculture to the Secretary of the Interior. Special funds are made available to the Department of the Interior and to the Bureau of Land Management to carry out this responsibility.

Bureau of Land Management conservation operations are organized by project areas. The project area is a unit of land on which rehabilitation and conservation practices are essential for the prevention of critical soil erosion and the wastage of water resources. These are areas that have been seriously impaired by wind or water erosion, or both, as a result of improper use by man or his animals, drought, or damage by fire or floods to such an extent that they require remedial action. Bureau of Land Management activities are carried out on the public lands within approved soil and moisture project areas. Lands in other ownership, the rehabilitation of which would vitally affect adjacent or nearby public domain lands, also may be included in the soil and moisture conservation program through cooperative agreement and contributed funds.

First priority for soil and moisture conservation operations is given to those lands described as being in the severe-to-critical stage of man-induced erosion, where such erosion is endangering other lands or public facilities such as irrigation projects. Soil and moisture operations may be carried out on lands in less serious condition when their treatment is necessary for success on lands in the first category. Funds made available for soil and moisture conservation are used to carry out proven erosion control practices designed to protect the soil and hold it in place. These practices include reseeding, construction of small detention and check dams, contour furrowing, water-spreading devices, and construction of livestock control fences and stock-water development to insure uniform utilization of native forage.

It is estimated that between 50 and 60 percent of the lands under the administration of the Bureau of Land Management in the upper Colorado River Basin is in severe to critical erosion condition, and it is known that the public domain lands are the principal contributors of sediment to the Colorado River system. This erosion is attributed to a combination of features, including topography, geology, soil, climate, and land use. The situation in the Colorado River Basin with respect to the first four features mentioned naturally results in an unusually high rate of erosion. The public lands in the upper Colorado River Basin are, however, characterized by broad alluvial filled tributary valleys. These are the most productive of the public lands. Because they were originally the best grazing lands, they were the most seriously misused. This misuse is responsible in a great measure for the present extensive gully system which is characteristic of the most critical erosion in the basin. These gullied valleys are the greatest potential source of sediment for transportation into the main system of the Colorado River. Because of the more favorable soil conditions, they are also the areas on which effective treatment has been demonstrated. To obtain optimum benefit of the flow of the Colorado River and to provide maximum benefit for existing and contemplated structures on the river, as well as to prevent excessive destruction of the watershed itself, a conservation program for erosion abatement is essential.

While a number of conservation measures and erosion-control measures have proved effective on a small scale and under given conditions, there is urgent need for extensive studies in erosion control and sediment abatement on a larger scale and over a greater sample of geologic formations, soils, and climatic conditions. For the protection of the upper Colorado River storage project and participating projects, these studies should be undertaken at an early date.

(c) *Timber and woodland management.*—The public domain lands have not been considered important for their production of forest and woodland resources. However, these areas do support unknown quantities of sawtimber and extensive stands of pinon and juniper. Prior to the passage of the act of July 31, 1947 (6 Stat. 681, 43 U. S. C., sec. 1185), commonly called Public Law 291, there was no authority for the orderly management and sale of timber and woodland products from the public lands, except under wartime emergency provisions.

Disposal of these products was by free-use permits for woodland materials such as posts, poles, and cordwood for use by local residents. The Secretary of the Interior is now authorized to sell woodland products and a small amount of money has been appropriated for the administration of this law. The amount appropriated does not allow the inventorying of the woodland areas and providing for supervision to abate trespass and to develop orderly management plans. The total volume of forest and woodland products on the public lands is not known. In addition to the value of the resource for the product itself in the economy of the basin, the protection from erosion afforded by the forest and woodland cover is an important factor. This is especially true because many of the forest and woodland types are found on steep slopes.

The anticipated increase in rural population resulting from the Colorado River storage project and participating projects will create an additional demand for forest and woodland materials. These will consist largely of posts and poles for fencing and other farm improvements. The attached budget schedule for the upper Colorado River Basin reflects the cost of forest and woodland inventories. .. These will consist of detailed inventories to determine total volume and allowable cut in areas where it is anticipated that the demand will be greatest.

(*d*) *Fire control.*—In connection with its public-land management and protection program, the Bureau of Land Management is charged with the responsibility of fire protection. Investments in conservation must be protected from forest and range fires which can cause damages requiring years to correct.

Fire is historically one of the destructive agents of western watersheds and has been the cause of serious erosion problems in some areas. With expected improvement of the Colorado River watersheds through more intensive management, it is reasonable to assume that the fire hazard will become more acute, requiring a greater investment in fire presuppression and suppression.

(*e*) *Wildlife (game management).*—The public domain lands provide part of the yearlong habitat of the big-game population of the basin. Because the lands administered by the Bureau of Land Management are located in medium and lower elevations, they provide a substantial part of the winter grazing for game animals. While the Fish and Wildlife Service and the State game commissions are the agencies responsible for the technical game-management programs, the land-management agencies must consider the use of the land made by game and provide for their use in their management plans, as well as resolve conflicts resulting from competition between wildlife and domestic livestock for range forage. Experience has shown that failure to recognize this dual use has resulted in serious erosion problems. Increases in population in the basin will create a need for recreational opportunities, including hunting and fishing.

Proposed program, Bureau of Land Management, Upper Colorado River Basin

Program element or function	Funds required by fiscal year—						Total estimated cost, 6 years 1952–57	Funds required after fiscal year 1957
	1952	1953	1954	1955	1956	1957		
Adjustments in range-management plans and apportionment of grazing privileges	$10,000	$65,000	$65,000	$65,000	$65,000	$65,000	$335,000	[1] $65,000
Cadastral surveys	169,000	217,000	207,000	363,000	324,000	324,000	1,604,000	[2] 8,000,000
Land classification and resources inventories	130,000	195,000	243,000	244,000	241,000	241,000	1,300,000	1,500,000

Total	337,000	564,000	662,000	752,000	713,000	657,000	3,685,000	9,581,000

[1] Continuing.
[2] Based on resurvey of 60 percent of old surveys (not iron posts) and 75 percent of unsurveyed area. By end of first 6-year period it may be determined that the degree of coverage will need to be revised.

Bureau of Mines

INTRODUCTION

The upper Colorado River Basin is entirely within region IV of the Bureau of Mines, administered from Denver, Colo. The only establishments of the Bureau of Mines within the basin are the Oil-Shale Demonstration Mine and Plant at Rifle, Colo., and a standby helium recovery plant at Shiprock, N. Mex. However, all of the personnel and facilities within the region and some outside are concerned with the many diverse mineral problems in the basin.

The development and conservation of the mineral resources of the upper Colorado River Basin area within the States of Arizona, New Mexico, Colorado, Utah, and Wyoming are directly and indirectly affected by the development of the water resources and power. Without either, the other is impaired.

The national requirements for minerals are increasing, while, on the other hand, the rate of discovery of many high-grade critical and essential minerals, including oil and gas, is on the decline. In order to keep abreast of the increasing national demand, it is necessary to provide measures to step up the rate of discovery of new reserves, reduce the cost of mining and handling ores by improvements in techniques, improve methods of recovery and separation, and develop better usage of the minerals and metals.

This Nation produces and consumes roughly one-half of the aggregate of all the mineral wealth in the world today. It is self-sufficient in many minerals, particularly bituminous coal and lignite, anthracite, natural gas, phosphate rock, and potash; and it is virtually self-sufficient for the immediate future in a number of other metals such as copper, iron, molybdenum, and vanadium. Although many of these minerals in the eastern and central part of the United States are being rapidly depleted, large undeveloped or underdeveloped reserves exist in the upper Colorado River Basin area.

The Nation is dependent on the West for most of its copper, lead, zinc, gold, silver, vanadium, and petroleum. This area contributes a substantial part of these minerals and to a very great extent, the continued welfare of the Nation depends upon maintaining a healthy mineral industry within the upper Colorado River Basin area.

MINERAL PRODUCTION AND EXTENT

The total production of minerals from the upper Colorado River Basin, as shown in table 1, amounts to over $2½ billion based on the value of the raw material at the mine or well. Commercially the most important have been coal and petroleum. Coal represents over half the aggregate value of all minerals produced. Although the statistics of production are not available, the area is the principal source of uranium and vanadium in the Nation. The principal reserves of molybdenum in the Nation occur in the upper basin. Silver,

TABLE 1.—*Production of gold, silver, copper, lead, zinc, coal, petroleum, natural gas, and other minerals in the upper Colorado River Basin area to 1948 (except uranium and vanadium)* [1]

	Colorado	New Mexico	Utah	Wyoming	Total
Gold:					
Ounces	8,905,764				8,905,764
Value	3,397,513			(2)	$108,397,513
Silver:					
Ounces	335,801,274				335,801,274
Value	$248,140,450			(2)	$248,140,450
Copper:					
Pounds	331,212,771				331,212,771
Value	$41,418,335			(2)	$41,418,335
Lead:					
Pounds	2,178,021,871				2,178,021,871
Value	$118,530,742			(2)	$118,530,742
Zinc:					
Pounds	1,250,022,668				1,250,022,668
Value	$110,360,048				$110,360,048
Other metallic: Value	[3] $200,000,000	(2)		(2)	[3] $200,000,000
Coal:					
Tons	141,600,000	28,887,000	190,772,000	265,657,000	616,916,000
Value	$320,000,000	$70,953,000	$473,944,000	$474,316,000	$1,315,212,000
Petroleum:					
Barrels	74,000,000	6,318,000		229,843,000	310,161,000
Value	$146,000,000	$7,992,000	(2)	$245,019,958	$399,002,000

[2] None or minor.
[3] Includes 355 million pounds of molybdenum valued at $150 million.

gold, lead, and zinc are commercially important, and metals of minor interest include copper, manganese, bismuth, and antimony. Potash and magnesium, although undeveloped, occur in large partly proven reserves, and phosphate rock is found in thick, medium-grade beds in Utah and Wyoming. The largest reserves of oil shale in the United States occur in northern Colorado and Utah and southern Wyoming within the basin. The search for petroleum and natural gas is being expanded rapidly and production continues to increase.

Mineral fuels and other hydrocarbons

Coal.—The upper basin contains enormous reserves of coal, mostly of bituminous and subbituminous grade. Reserves here are much larger than those in any other section of comparable size in the world and amount to approximately one-third of all of the coal deposits in the United States and one-sixth of those in the entire world. Some of this coal is below present mineable depths, but mineable reserves alone are nearly one-fourth of the Nation's total deposits. Coal reserves within the upper basin are roughly estimated at 400 billion tons.

The importance of these vast reserves is enhanced by the almost complete absence of any coal deposits in the States west of this region. The only exception of any consequence is the coal deposits of the State of Washington, but this coal is inferior in quality and more difficult to mine than the coals of the upper basin. Large quantities of coal from the upper basin are now shipped west, north, and sometimes east. These coals can be mined more cheaply than those in most other regions and may provide the basis for much of the future industrial development of the western part of the United States.

Mine entries above ground level are possible for a large portion of the deposits. Thick beds, ranging from 8 feet to a maximum of 90 feet and virtually horizontal, can be mined with comparative ease.

Bituminous coals from the upper basin are considered the highest quality bituminous coals on the western market. They are low in ash and moisture, extremely low in sulphur and highly volatile with a high heat value. Largest coal mines in the upper basin are in the Rock Springs and Kemmerer districts in Wyoming, served by the Union Pacific Railroad, and near Price, Utah, on the Denver & Rio Grande Western Railroad. Most of the coal mined in the Colorado area is bituminous but some good grade anthracite is mined in Gunnison County.

Coal production in the upper basin increased more than 50 percent in the period 1940–43. Part of the increase was in coking coals mined near Sunnyside, Utah, for new steel plants at Geneva, Utah, and Fontana, Calif. The new completely mechanized mine located near Sunnyside has a capacity to produce 8,000 tons of coking coal per day. Other important deposits of coking coal are located near Crested Butte, Durango, and Norwood, Colo. Coal in the Willow Creek area, Wyoming, was found recently to be suitable for blending with other coal in the manufacture of metallurgical coke.

Coal production from the upper Colorado River Basin has declined since World War II, due to extreme competition from petroleum and natural gas. However, it is indicated from fuel and population trends on the west coast that large quantities of coal will be needed in the near future. The increasing use of coal in this market will be accelerated due to probable decline in petroleum and gas production. Already large gas lines are being extended from the upper basin to west coast points.

Petroleum and natural gas.—Oil and gas have been discovered in over 40 widely separated fields in the upper basin. Most of the fields are located in northwest Colorado, southwest Colorado, and northwest New Mexico. It is reported that between 15 and 20 wells are in production in the newly discovered Ashley Valley field near Vernal, Utah.

The 1948 estimate of proven petroleum reserve in New Mexico, Colorado, and Wyoming was over 1½ million barrels. The reserve strictly within the upper basin is not segregated. The estimated reserves of natural gas in New Mexico, Colorado, and Wyoming, mostly within the basin in millions of cubic feet, was about 9 million at the end of 1948.

Oil shale.—The upper basin contains the largest deposits of oil shale in the United States. These beds of oil shale occur in Colorado, Utah, and southern Wyoming. Next to coal, they are potentially the most important mineral resource of the upper basin. The estimated oil-shale resources in northwestern Colorado, calculated from all the information obtained through 1950, indicate a total of nearly 500 billion barrels of oil in an average thickness of 500 feet of shale. The reserves in Utah and Wyoming probably are not as large as those in Colorado nor as readily mined.

Bituminous sandstone and rare hydrocarbons.—Another oil-bearing material of great potential importance is bituminous sandstone. At the present time it is being used as a road-surfacing material. Large

deposits are worked near Vernal and Sunnyside, Utah. The Vernal deposit contains about 2 billion tons averaging between 8 and 15 percent bitumen by weight, but most of it can be recovered only by underground mining. The deposit near Sunnyside is also very large; a sample of it averaged 11 percent bitumen by weight.

The only known deposits of gilsonite, elaterite, wurtzilite, and ozocerite are in the upper basin. In normal times these materials are mined from veins and shipped to all parts of the world for use in the manufacture of roofing, insulating materials, and such articles as ink and switch handles.

The gilsonite deposits occur mainly in the Uinta Basin in Utah.

Production of gilsonite in northeastern Utah amounted to 67,165 short tons valued at $1,746,228 in 1947 and 52,122 short tons valued at $1,390,000 in 1948.

Reserves have been estimated at 25 million tons. The annual output of ozocerite and wurtzilite in Utah amounts to only a few hundred tons.

This array of mineral fuels and carbonaceous materials is not approached by any region in any other part of the world. The extent to which these materials may provide the basis for future mining and mineral processing within the basin and in contiguous areas cannot be foretold definitely, but it is certain that their effect on future industrial development will be important.

Nonferrous metals

The upper basin has contributed 8,900,000 ounces of gold, 336 million ounces of silver, 1 million tons of lead, 625,000 tons of zinc, and 165,000 tons of copper to the total mineral production of the Nation. Virtually all of this production came from Colorado, primarily from the San Juan region in San Juan and San Miguel Counties and from Eagle, Pitkin, and Summit Counties. Geologic conditions are favorable for increased production from these areas and other minor areas, providing sufficient incentive is offered.

Ferro-alloy metals

The Climax molybdenum district is the largest molybdenum district in the world and contains the largest single metal mine in Colorado. The district is situated on the Continental Divide in Lake County. The district has produced nearly 350 million pounds of molybdenum, and the reserves are estimated to be 500 million tons containing 2 billion pounds of recoverable molybdenum. Byproducts produced from molybdenum treatment comprise tungsten, pyrite, tin, monazite, and topaz.

The Plateau area of Colorado, Utah, Arizona, and New Mexico is the principal source of uranium and vanadium in the United States. Deposits of manganese in the San Juan Mountains and in Eagle County within the upper basin and at Leadville, just outside the basin, may prove to be extremely important to the Nation during an emergency. These ores are mixed with lead, zinc, and silver and are generally refractory and difficult to treat in order to separate the constituents. They represent one of the major metallurgical problems in the upper basin.

Nonmetallic minerals

Although there has been no production, potentially phosphate rock and magnesium and potash salts constitute some of the most important

mineral resources of the upper basin. Phosphate rock occurs in medium-grade thick beds in the Phosphoria formation along the southern flank of the Uintah Mountains in Utah. Reports indicate the reserves are enormous. Recent exploration by the Bureau of Mines and Geological Survey near Thompson, Utah, has proven the presence of extensive deposits of carnallite, a chemical combination of potassium chloride and magnesium chloride, and of other potash-bearing minerals. Associated beds of salt were found to be up to 2,000 feet thick.

When other more economically situated deposits approach exhaustion, these deposits of phosphate rock and potash will doubtless become important sources of mineral fertilizer.

DEVELOPMENT AND CONSERVATION PROGRAMS

The program of the Bureau of Mines in the Upper Colorado River Basin has as an objective the development and conservation of the mineral resources of the area and the promotion of accident prevention and health of the people working in the mineral industries. Development and conservation is being accomplished by providing means of (1) increasing the rate of discovery of new reserves; (2) reducing the cost of mining and handling ores by improvements in techniques; (3) improving methods of recovery and separation of minerals and metals; and (4) developing better usage of the minerals and metals.

Mineral mining (except oil and gas)

Mineral mining as used here includes the extension or discovery of mineral reserves, extraction of ores from the ground, and related problems. The functions of the Mining Division covering all problems involved in mining broadly comprise: (1) Actual physical development to extend known reserves and discover new ones, (2) collecting information on mining practices at specific operations and actual research on specific mineral deposits, (3) studies of mining and related problems within natural mineral areas or other geographic subdivisions, (4) studies of mineral resources as they relate to other resources within basin areas, and (5) dissemination of the information through publication. All of these functions have as their primary purpose the conservation of mineral resources.

Mining development and research.—Mining development and research include the field of activity wherein (1) work is done to extend reserves of minerals in specific deposits or to discover new ones, and (2) research conducted on specific deposits, usually submarginal in grade, to develop methods of mining and better equipment. This field of endeavor has covered the entire upper Colorado River Basin area and includes many of the metals and nonmetallics found in the area. A current list of pending development and research projects is maintained from which are selected those that best meet the national need as funds become available. Examinations and studies are being made constantly and the list revised to fit changing economic and technical conditions in the Nation and the world at large. Examples of this field of activity are illustrated by the following description of several active and proposed projects.

Coal mining methods and reduction of losses.—The purpose of this project is to conduct research in mining thick beds of coal to increase the extraction as a conservation measure. The overall extraction of

coal in thick beds ranges from 30 to 70 percent. The loss represents a national extravagance that may prove very costly for future generations.

Ferrous metals and alloys.—Large reserves of mixed manganese-lead-zinc ores and refractory manganese silicate are known to exist at Leadville, Gilman, and Silverton, Colo. Nationally, manganese, as well as lead and zinc, are in critically short supply. The higher grade manganese, low in lead and zinc content, has been virtually exhausted, and many of the mines are largely caved and inaccessible. Most of the remaining manganese is marginal or submarginal in grade according to present standards, intimately mixed with lead and zinc, or otherwise refractory, and the metals cannot be separated economically by known methods. The solution of the problems relating to mining and metallurgical recovery would make available an important source of these scarce metals.

Nonferrous metals.—The upper Colorado River Basin area has been the source of a considerable quantity of many of the most important nonferrous metals, particularly copper, lead, zinc, and many minor metals recovered as byproducts from smelter and refining plants. These metals are on the critical list, and most of the mining development and research in the area is devoted to problems relating to increasing reserves by extension of known deposits and discovery of new ones.

It is proposed to conduct experimental mining on narrow lead-zinc-bearing veins that are found in many places throughout the area. The veins contain large quantities of metal that are uneconomic to mine under present standards. The object of this project is to investigate and develop less costly and more efficient methods of mining, to test equipment to determine that which is more adaptable, and establish better practices that will reduce the cost of mining. Successful solution of the problems involved in mining narrow veins will increase the known reserves materially.

Projects designed purely to develop or extend reserves of minerals by examination, comprising mapping and sampling, diamond drilling, trenching, and underground excavation, are selected each year from a list of requests for work from owners of prospects, examinations by Bureau of Mines engineers, and recommendations from the Geological Survey. These projects cover the entire area of the upper basin.

The gravels in many of the streams that have their source in the mountains on the western slope of the Rocky Mountains in Colorado contain gold. Considerable placer mining has been done along these streams. The extent of these gold-bearing gravels and the gold content has never been determined. Before any large reservoirs are established that might cover these potentially valuable gravels, a thorough job of sampling and testing should be done to determine the metal content. Other valuable minerals may also be found.

Consideration should be given to providing sluice boxes to trap gold and other heavy valuable minerals on all Government projects or contracts where aggregates from stream beds are to be mined for construction purposes.

Nonmetallic minerals.—Development and research on nonmetallic mineral deposits are becoming increasingly important as new uses for the minerals are discovered. Steadily increasing demand for these minerals has prompted the Bureau of Mines to expand investigations.

Pegmatite dikes are scattered through the large granitic mountain masses in Colorado and New Mexico within the upper basin. These are the source of many uncommon nonmetallics, such as beryl, mica, lithium minerals, columbite-tantalite, feldspar, and numerous undifferentiated rare earth minerals.

Usually the dikes are mined in a haphazard and expensive manner by individuals or small groups to recover 1 or 2 of the constituent minerals and the remainder is wasted. This results in operations that are uneconomic and the minerals are not available when emergency needs arise. The prices therefore are too high for general use in special processes and industries where they would improve the process or product.

Several projects are being considered to determine the extent and mineral content of selected individual dikes, conduct research to determine the most economical methods of mining the commercial minerals, conduct tests at the mine and in laboratories to effect separation and recovery of the various constituents, and make economic studies to determine the best combined methods of obtaining production from the dikes in case of economic need and emergencies.

Mineral research unclassified.—Mineral surveys are conducted on a district or county basis. These surveys comprise studies of past and present activities in the production of minerals, methods, and practices employed in mining, treatment, and related mineral industry activities. The information is compiled, analyzed, and published.

Mineral-mining methods and cost surveys are made on individual privately operated mines throughout the upper basin. These studies are published and made available to the mining industry. They have proven helpful to the industry in solving many operational problems.

The proposed park tunnel, to drain the mines in the Park City district, Utah, is outside the upper Colorado River Basin; however, it is presented here because any water drained from the mining areas probably will have to be renewed through water exchange which ultimately will have to be supplied from the upper basin.

The great need for additional water in the Salt Lake Valley has prompted studies of the justification and feasibility of a tunnel through the Wasatch Range, serving the purposes of water diversion from the Provo River and drainage of the Park City and Alta mines. The water-diversion aspects of the tunnel now appear to be more economically accomplished by other methods; however, the need for draining the mines is still a virtual necessity to enable the mines to operate over any long period of time.

The important mines are within a 3-mile radius of Park City. Production has been continuous since the first mineral discovery in 1868, and for the years 1870 to 1948, inclusive, the recorded value of recovered gold, silver, copper, lead, and zinc has been $385 million. A group of smaller mines surrounding Alta have produced over $34 million in gold, silver, copper, lead, and zinc.

Water has been the greatest difficulty in developing the Park City mines. As mining has continued to greater depth, tunnels have been driven at progressively lower levels to drain mine areas. At present, the Ontario No. 2 is the lowest drainage tunnel in the Park City area and it drains about 6,000 gallons per minute from 1 section of the area. Mines in this section have been developed 450 feet below the tunnel, but mining below the tunnel has been impossible for some

years because of the excessive cost of pumping that would be involved. The Spiro tunnel drains another section of the area and normally collects about 6,000 gallons a minute, of which 4,500 gallons per minute are pumped from 700 feet below tunnel level. Mines in this latter section have recently been closed and expect to request some Government subsidy to permit them to cover the extra cost of pumping.

It has been estimated that the proposed park tunnel, 1,000 feet lower than present water level, would make accessible for mining 6,500,000 tons of ore above the tunnel and 3,250,000 tons below the proposed tunnel, having an aggregate value of half a billion dollars.

Without the water-diversion features originally considered, it is tentatively estimated, that the tunnel can be driven for twenty to twenty-five million dollars and completed in 7 to 10 years.

Metallurgical research

Today, virtually no mineral resources other than some fuels go directly from the mine to the ultimate consumer. Our mineral economy is based largely upon the economic effort required to convert naturally occurring deposits of raw materials into beneficiated and purified products which will fit into established use patterns. Although billions of tons of important metals such as manganese, aluminum, and iron exist in the United States, we are greatly concerned about shortages, because it is not now feasible, economically and technologically, to convert many of these very low-grade and often refractory resources to materials which are suitable for the production of ferromanganese alloys, aluminum ingots, or pig iron. It is this field of translating mineral resources into terms of useful products that is the concern of the Metallurgical Division.

The metallurgists by employing advances in the sciences and improvements in technology are finding it feasible to beneficiate, smelt, and refine consecutively lower grade and more refractory ores, thereby increasing our mineral wealth in terms of utility. The metallurgist also devises means of recovering and producing new materials demanded by advances in related fields for rare elements such as thallium, zirconium, beryllium, and uranium. Conversely, metallurgical research is concerned with providing new materials from minerals which occur in abundance but have been neglected. For example, research by the Bureau of Mines recently demonstrated that titanium, one of the most plentiful elements in the earth's crust, can be fabricated as a metal in ductile form having the strength of steel and only one-half the weight, and military demands already far exceed production even at prices higher than $10 per pound.

Ferrous metals and alloys.—The proposed metallurgical program in ferrous metals and alloys as it may apply to the upper Colorado River Basin includes investigation of the recovery of titanium, vanadium, and iron from titaniferous magnetite; ferrograde manganese from low-grade ores; silicomanganese from rhodonite ore; and manganese, zinc, and lead by amalgam metallurgy from low-grade complex ores. A few typical proposed investigations are more fully described in the succeeding paragraphs.

Domestic manganese ores in most instances are too low in grade to be used directly by the steel industry and require beneficiation for the production of ferrograde manganese. At present, the steel industry is dependent upon foreign sources of manganese; and in the case of a

global crisis, it is improbable that shipping lanes can be maintained to meet the needs of a wartime economy. It is proposed to develop processes to treat the low-grade ores in the region and to obtain engineering data from pilot-plant operations. The mineral beneficiation and processing by hydrometallurgical and electrometallurgical means would be investigated to demonstrate efficient methods of converting low-grade ore to products acceptable to the ferroalloy industries.

Deposits of rhodonite, a silicate of manganese, and rhodonitic-type ores are a potential source of manganese for the steel industry. The deposits in Colorado represent a considerable tonnage and have been ignored previously because the ores contain excess silica and are unadaptable to the production of ferromanganese. It is reported that in 1949 the steel industry was ready to use as much as 230,000 tons per year of silicomanganese in lieu of ferromanganese and ferrosilicon. It is proposed to investigate the production of silicomanganese from rhodonite.

The I. G. Farbenindustrie of Germany has developed a new metallurgical process called "amalgam metallurgy" based on the cyclic use of mercury as a reagent. Among the accomplishments claimed for this process are (1) production of high-purity zinc, manganese, and other metals from impure electrolytes; (2) direct electrolytic production of alloys of virtually any desired composition; (3) electrolytic production of powdered metals and alloys; and (4) ability to produce 99.999 percent zinc, lead, and other metals from low-grade and complex ores. The process may be applicable to many deposits of low-grade ores in the region such as the manganese-zinc-lead-silver ores of the Leadville and Gilman districts, Colorado. It is proposed to study all available information concerning the process, to conduct investigations on laboratory scale, and if the results are sufficiently encouraging, to try it in a pilot plant treating typical ores.

Pyrometallurgical research proposes to study the development of processes for treating strategic domestic ores such as those of chromium and manganese by pyrometallurgy and by electrometallurgy. This study will develop more economical methods for producing ferroalloys acceptable for use in industry. It will also develop methods for the simultaneous recovery of silver, lead and zinc from low-grade manganese ores. Technologic studies, already complete, indicate the feasibility of developing and improving such processes and the final step in producing metal always involves a process in pyrometallurgy, electrometallurgy or by electrolysis.

The production of manganese by electrodeposition from chloride electrolytes prepared from low-grade domestic ores appears to be economically feasible. Laboratory work has indicated that leaching low-grade manganese ores with hydrochloric acid and ammonium chloride followed by electrolytic deposition of manganese can be adapted to commercial production. This project proposes to study the factors involved in converting the present laboratory process into a commercial process by erecting and operating a production pilot plant that will produce 1,000 pounds of pure manganese metal per day.

Nonferrous metals.—Copper, lead, zinc, antimony, gold, and silver deposits represent the chief nonferrous mineral resources and the suggested metallurgical program includes investigations directed toward the solution of major problems confronting industry for the

more efficient utilization of these resources. In addition to the more common nonferrous metals, the area is the only important source of uranium and vanadium. Programs for these particular metals are given as are descriptions of investigations dealing with the production of such rare metals and elements as hafnium, gallium, germanium, selenium, tellurium, beryllium, titanium, and zirconium by special processes. The following paragraphs discuss the significance and scope of a few typical suggested metallurgical investigations.

Uranium.—The area encompasses virtually all the known producers of uranium ore in the United States. The uranium occurs in many types of minerals which are in general low grade. As the mining and processing of uranium ores become more declassified and are taken over more by industry, the need for technologic data will be critical. It is proposed to investigate processes for beneficiating low-grade ores and for the treatment of many off-grade types to permit the widest production of this important element. The information sought would be that which could be generally disseminated without jeopardizing national security.

Many major problems face the western mineral industry in meeting the demands for ever-increasing amounts of lead and zinc. These problems can be attributed to the exhaustion of high-grade ores, with the consequence that lower grade and more complex ores must be worked, and to the increased cost of obtaining the metals from more remote and smaller deposits. In seeking a technologic solution of these problems, it is proposed to make a comprehensive study in two directions as follows:

Unitized small smelting plants.—The success of large integrated smelters in acting as custom buyers for ore has to a large extent discouraged investigation into the feasibility of building and operating small-scale smelters suitable for treating complex lead ores. However, existing smelters were originally located close to large mining districts, which have now been exhausted; and with the increased cost of hauling ore to these smelters many remotely located complex ore deposits cannot now be profitably exploited. One possible solution is to devise a simplified smelting process using a minimum of equipment to make the capital cost low and so unitized as to be readily moved to a new location.

Volatilization processes.—Another attack on the same problem of treating complex ores, particularly partially oxidized ores of lead and zinc, is the possibility of developing a volatilization process for treatment of this type of ore. The Waelz process, as employed on very low-grade and complex ores in European countries, has not been adequately tried in the United States; and it is proposed to determine what modifications of the basic process are needed to make it applicable to treating domestic ores.

Nonmetallic minerals.—The nonmetallic mineral program of the area is headed by the vital problem of investigation, the utilization of the low-grade western phosphate ores by mineral beneficiation, furnace treatment, and chemical processing. The program also includes the beneficiation and preparation of clays for irrigation ditch linings, catalysts, and various other uses; the recovery of economic and rare, strategic minerals from pegmatite dikes; and the evaluation of the rare earth content of placers, dikes, and disseminated deposits in the area.

The reserves of western phosphate rock are tremendous, but most of the phosphate beds are not high in grade. Utilization of these low-grade deposits will be essential in the future economy of the area. Before any large-scale use can be made of the phosphate ore and shales, a technology must be developed for the low-cost beneficiation, and furnace or chemical treatment, of the low-grade ores and shales that are minable by large-scale and inexpensive methods. Laboratory and small pilot-scale studies would comprise the major part of the initial proposed mineral beneficiation work, and the emphasis would be on the use of low-cost gravity, flotation, and dry methods to produce acceptable feed material for the more expensive chemical or furnace treatment. The pioneering studies would be supplemented by larger scale demonstration units to further prove the processes and provide data using commercial-size equipment. It is further proposed to study the feasibility of treating the beneficiated phosphate material by various alternative chemical and furnace methods to recover superphosphates, elemental phosphorus, byproduct vanadium, and defluorinated products.

In the conservation of water resources, the prevention of seepage losses from water ponds and irrigation ditches is becoming increasingly important. As much as 25 percent of the irrigation water in secondary and tertiary canals and ditches may be lost by seepage. A small amount of a swelling-type bentonite mulched into the porous and sandy soil forms an impervious coating that reduces water seepage and thereby conserves the limited supply for useful irrigation purposes. A number of bentonitic clay deposits are known to occur in the river system areas. Although some of the Wyoming and South Dakota bentonites are high-grade swelling types, the Colorado and Utah deposits are generally of the nonswelling type that would require physical beneficiation and chemical processing to increase their gelling and swelling properties to make them useful as a lining material. It is proposed that a laboratory investigation be initiated to study the beneficiation and base exchange methods for converting the readily available nonswelling type bentonites to useful and low-cost swelling type bentonite. A further objective of the work would be the preparation of satisfactory swelling-type bentonite and activated bentonite for well-drilling muds and oil clarification to be used in oilfields and refineries.

Important areas of pegmatite dikes in the area contain economic minerals such as feldspar, mica, zircon, quartz, and lithium minerals. They also contain rare and strategic minerals such as beryl, columbium, hafnium, and thallium. Quartz, feldspar, and zircon are used in large quantities for the production of ceramics, glass, and refractories, while mica, lithium minerals, beryl, columbium and tantalum, hafnium, and thallium are all important strategically and occur rarely in the United States. It is proposed to make laboratory and pilot-plant studies of methods for the production of economic minerals from the vast dike systems.

The major portion of the metallurgical work would consist of labotory and small pilot-plant studies in mineral beneficiation aimed at the production of the principal minerals such as feldspar, mica, beryl, and lithium minerals. The project would also entail microscopic, chemical, and spectrographic studies of the rare elements and chem-

ical extraction methods if this type of research were a logical sequence of the investigation.

Coal-utilization investigations

Although coal production in the upper Colorado River Basin is relatively low, due to extreme competition of oil and natural gas, it is indicated from fuel and population trends in California that large quantities of coal will be needed in the relatively near future. At present, California uses relatively no coal but by 1955 it is indicated that about 10 million tons will be required per year to supplement oil for generation of electric power. Each year thereafter more coal will be required because the demand for electric power in California more than doubles every 10 years.

Raw coal from Utah costing $4.50 per ton at the mine can be shipped to California to compete with fuel oil at about $2.60 per barrel. Approximately the same will hold for coal from western Colorado with slight adjustments in freight rates. In 1949, the price of fuel oil rose to $2.45 per barrel, and it is indicated that by 1954 the average price of oil will be close to $2.60.

If favorable coals in the upper Colorado River Basin are distilled at low temperatures to make tar-oils and chars, it is feasible to recover up to 45 gallons of tar-oil per ton. The chars produced represent about 73 percent of the available heat in the raw coal but only about 63 percent of the weight. It is indicated that the cost of processing coal will be considerably less than the value of the tar-oils produced; therefore, the probable cost of char on a heating-value basis should be considerably less than the cost of raw coal delivered in California. If this can be proved by adequate research and development, a vast new industry and new markets for coal in the upper Colorado River Basin will be created.

Although hydropower development in the West will relieve the demand for electric power, it is pretty well proven that thermal power is necessary in some areas to sustain firm markets for hydropower. In a relatively few years, it will be necessary to install thermal power plants to supplement hydropower. Such plants should be designed to burn char for steam generation or for the gas turbine. The by-product tars produced would be the basis for new industries or raw materials for synthetic liquid-fuel plants.

Much research is needed to establish the technical and economic facts related to utilization of processed coal for power generation. The coal branch of region IV has studied this problem in connection with utilization of Texas lignites. Similar studies on testing and appraisal of upper Colorado River Basin coals should be conducted as a long-range problem to improve the western fuel picture. National fuel economy requires maximum efficiency in the use of fuel. This is especially true when considering shipments of large quantities of solid fuel to California where the freight cost exceeds the mining cost. By processing coal at the mine to remove moisture and inert constituents, the higher heating-value char can be shipped at less cost per heat unit and the savings in freight will pay a large part of the processing expense. The byproduct tar-oils have value for chemical raw materials or for the manufacture of synthetic liquid fuel.

In planning the fuel economy of the upper Colorado River Basin, multi-purpose use of coal should be considered as a conservation

measure. Solid fuel should replace liquid fuel for generation of electric power because it is not desirable to burn oil for generation of power if coal can be supplied at equal cost. The same applies to natural gas.

The following discussion gives a striking example of the great potential possibilities in the use of processed coal for generation of electric power on the west coast: The Pacific Gas & Electric Co. is just about to complete the construction of two new large power plants at Moss Landing and at Contra Costa. These plants will cost over $100 million and they are designed for use of oil, gas, or coal. Each plant will have a capacity of 300,000 kilowatts. The Pacific Gas & Electric Co. expects to construct additional plants to keep up with the constantly increasing power demand.

Such a plant will require 718,000 tons per year of high-grade Utah coal of 12,500 British thermal units per pound. It will require 2.54 million barrels of fuel oil or 16.86 billion cubic feet of natural gas per year if these higher value fuels are used. Raw coal can be shipped from Utah to compete with oil when the price of oil is about $2.60 per barrel and this may occur in the relatively near future.

If coal is upgraded at the mine to make char and tar-oils, 1 million tons of coal would be processed at the mine to produce 628,000 tons of char of 13,610 British thermal units per pound. The char thus formed will run the plant but the weight represents only 87.5 percent of the weight of raw coal needed. The freight saving will therefore be 12.5 percent or equal to 45 cents per ton of coal processed. The tar produced amounts to 45 million gallons or 1.07 million barrels per year. It is indicated that tar is worth about 11 cents per gallon and the tar value per ton of coal processed is $4.96. With the saving in freight of 45 cents per ton of coal, the potential values created to defray cost of processing amount to $5.41 per ton of raw coal. Since it is indicated that the cost of processing will be about $2 per ton, there is a substantial margin to reduce the cost of char delivered at the power plant to a point where it will compete with fuel oil.

The Coal Branch of region IV, Bureau of Mines, has developed new processes for high-speed drying and carbonization of noncoking coals at low temperatures. Due to the high capacity of plants employing the new process, the investment cost is estimated to be about $1,000 per ton of daily capacity. The process is continuous and subject to automatic control. Coal is handled pneumatically in the fluidized state, there are no moving parts except a gas compressor, and the cost of operation should be less than $2 per ton of coal handled. The development of this process on a pilot-plant scale has been done in cooperation with the Texas Power & Light Co. and it is indicated that processed lignite in Texas may soon compete with natural gas for power generation.

Research and development work on processing coals of the upper Colorado River Basin is necessary to determine the technical and economic data for a more accurate appraisal of the possibilities of treating coal for shipment to California and for use in the basin in powerplants supplementing hydropower.

Oil-shale development

Resources.—It is an accepted conclusion that liquid fuels play a major role in the economy of the United States and it is absolutely

imperative that an adequate supply of such fuels be available at all times if we are to maintain our present standard of living. In the past, these liquid fuels have been produced solely from petroleum, and since petroleum is an exhaustible resource, it is mandatory that other sources of liquid fuels be developed. Liquid fuels can be produced from such natural resources as coal and oil shale. In order that the United States will have an adequate supply of liquid fuels for an indefinite period of time, the 2d session of the 78th Congress passed the Synthetic-Liquid-Fuels Act charging the Bureau of Mines with the responsibility of developing the necessary technology to insure that the Nation would have a continuing supply at a low cost. In accordance with the provisions of this act, the Bureau of Mines established and has in operation an oil-shale demonstration plant and mine near Rifle, Colo., where work conducted to date indicates that liquid fuels can be produced from oil shale at costs not greatly exceeding the production of the same fuels from petroleum. However, in order to produce adequate supplies to augment our dwindling petroleum production at costs satisfactory to our economy, further research and development work are necessary and such research must continue as long as the natural resource is available so as to increase the quantities of liquid fuels, thus conserving the natural resource and reducing its cost so that it can be used more widely.

To date less than one-third of the vast oil-shale deposits in Colorado have been proven or blocked out. An expenditure of nearly $1 million over a period of 6 years would be necessary to block out completely a thousand square miles of probable commercial grade oil shale in northwestern Colorado. This work would include approximately 51 holes for a total length of about 91,000 feet.

Large deposits of Green River formation are known to exist in both Utah and Wyoming. However, little is known about the oil yield from the formation in these States. It is roughly estimated that with the drilling of 45 holes for a total of about 125,000 feet and the expenditure of about $1,440,000 the most important areas of these States could be located. It would take approximately 6 years to complete this preliminary program. Considerably more drilling would be necessary to determine accurately the extent of the areas located.

The term "oil shale" is a misnomer, as it is not a true shale but a marlstone and contains no free oil but an organic material which can be converted to liquid products.

The oil-shale project is composed of three distinct industrial phases; first, the rock must be mined and crushed; second, the solid organic products are converted to liquids; and third, the liquid product is converted to usable fuels. Since there was no technology available pertaining to these three phases of operation, it had to be developed by the Bureau of Mines. Although to date, as a result of experimentation and demonstration, the Bureau has been able to make marked progress in the development of this technology, a large amount of research work is yet to be done before economically feasible commercial projects can be established.

Mining.—During the period 1945–50 the Oil-Shale Mining Branch has developed the equipment, method, and procedure for one means of exploiting the 70- to 90-foot thick Mahogany Ledge of the Green River formation in western Colorado. Production rates of 148 tons

per man-shift underground labor have been demonstrated at a direct cost of 29.2 cents per ton.

It is estimated that a period of 6 years and an expenditure of about $3,200,000 are necessary to complete the present mining research program, design, and fabrication of new and more efficient mechanized equipment, and to demonstrate their use in a unit of a large-scale operation. In addition, alternate methods of mining should be investigated and the mining of thinner sections containing greater values should be demonstrated and evaluated.

Mining research that must be completed includes improvements in operating procedure and lowering of operating supply costs for percussion drilling; rotary drilling research to determine optimum drilling characteristics of the oil-shale formation and the selection of suitable rotary bits; the completion of instrumented blasting research designed to lower the cost of explosives in both heading and bench rounds; investigation of alternate loading and transportation equipment should be done to lower the cost of these phases of the operation; exhaustive studies of accurate methods for determining the stresses in the mine structure must be continued and expanded; methods for ventilating large-scale commercial mine structures must be determined and demonstrated; and the possibility of mining by means of sonic disintegration should be fully investigated.

The present mine structure must be developed to demonstrate mining the 70-foot Mahogany Ledge on two levels employing both percussion and rotary-type drilling upon the completion of suitably designed mechanized equipment. A method for mining a 25-foot-thick bed yielding about 35 to 40 gallons per ton should be determined and studies of the mine structure stresses in such a mine should be made. Suitable equipment should be designed, fabricated, and demonstrated. Efficient mining cycles should be established.

Plant.—During the period 1949–50, the Oil-Shale Demonstration Branch has conducted research on and developed several retorting and refining techniques for the extraction of oil from shale and its subsequent conversion into usable liquid fuels. Numerous processes and specially developed equipment for using these processes have been developed, and from these additional information is steadily forthcoming from which better processes and types of equipment can be developed.

Retorting.—The only way known to date of converting solid organic material to liquid products is through the application of heat, and major problems involved in the development of techniques and equipment are in reality a problem of heat transfer and material handling, and because of the complex organic material occurring in the oil shale the mechanisms of the chemical reactions for its conversion to oil must be understood in order that an adequate solution of the problem may be forthcoming. In order to solve these problems it requires the construction and operation of several stages of pilot-plant equipment to obtain the necessary thermodynamic and engineering information on which to base the design of a commercial plant.

Refining.—Since shale oil is a different chemical substance than petroleum, it cannot be converted to usable products using standard refining practices. The chemical complexity of shale oil is increased because of the presence of sulfur and nitrogen in combination with carbon and hydrogen. To solve the technical problems involved

requires the construction and operation of numerous and various sizes of pieces of pilot-plant equipment. The devising of various processes and design, construction, and operation of equipment to reduce this process to practice and analyses of the data obtained therefrom are the bases of necessary chemical, thermodynamic, and engineering information necessary to produce commercial units capable of producing high-quality, low-cost products.

Plant location survey.—In addition to the development of necessary mining, retorting, and refining technology and drilling of core holes to prove the extent of the oil-shale deposits, it is also necessary to conduct location surveys for adequate sites upon which to establish an oil-shale industry. As previously stated, the Green River oil-shale reserves occur in abundance in northwestern Colorado, northeastern Utah, and southwestern Wyoming. In this particular area the terrain is extremely mountainous and cut with numerous river valleys. Because of the terrain and the extremely isolated areas, and in order to establish industries to utilize the resources, it is imperative that the area be thoroughly surveyed and adequate, detailed plot plants and topography maps be made so that the mines, plants, and refineries could be advantageously located with respect not only to each other, but with respect to availability of water, power, transportation facilities, and existing communities.

Petroleum and natural gas research

In any planning or development program that might be undertaken relative to a river basin, the amount of the reserves of oil and gas should be known as well as the rate at which these reserves can be made available. It is necessary to know that in making these resources available, the oil and gas fields are operated so that the greatest recovery of these resources will be accomplished.

An inventory of the physical plant in its branches of production, pipeline and refinery, as well as the requirements of energy and water and the utilization of manpower, all as of the present and projected into the future are requisites.

In the upper Colorado River Basin there are undeveloped resources of materials that should be studied with the view toward the utilization of these natural resources in the economy of the area, materials such as tar, waxes, gilsonite, and the unusual natural gases.

Mineral statistics and economics

The Bureau of Mines collects production statistics of all the minerals produced in the United States. Each year these statistics and economic studies are published in the publication known as the Minerals Yearbook. This publication has a worldwide circulation and is regarded as the most authentic information available.

Within the area of the upper Colorado River Basin, petroleum and gas statistics are collected in Los Angeles and gold, silver, lead, zinc, and copper statistics are collected in Denver and Salt Lake City. The present plan is to expand this collection of statistics at these offices to include all minerals. The importance of statistics of production cannot be overestimated since it gives an index to the supply of critical minerals and metals available. A mining library is maintained in Denver and in Salt Lake City where the mining public, consulting

engineers, and others interested in mining may obtain information readily.

Accident prevention and health in the mining industry

The Bureau of Mines was organized in 1910 following a series of disastrous coal-mine explosions which resulted in the death of hundreds of miners. The basic act outlined, as one of the principal activities for the Bureau, studies to increase mine safety and the reduction of the accident rate in mines. Subsequent acts of Congress greatly expanded the activities of the Bureau of Mines, and today the Bureau of Mines has an interest in all phases of mining.

The fatality accident rate in coal mines has been reduced from 5.63 killed per million tons of coal production in 1910 to 1.24 in 1949; there has been in the same period over 50 percent reduction in fatalities in noncoal mines on an exposure basis.

All coal mines in the United States are inspected from 1 to 4 times per year by the Federal coal-mine inspectors. Some very small mines have not been inspected because of an insufficient number of inspectors. In the upper Colorado River Basin area virtually every coal mine of whatever size has been inspected at least once every year. In addition to the inspection of coal mines, the inspectors are trained in the use of oxygen-breathing apparatus and are available in case of a disaster such as a coal-mine explosion or a mine fire. There is seldom a year that the Bureau Mines is not called upon to furnish trained personnel to assist in recovery work following a fire or a mine explosion.

The Accident Prevention Branch provides technological assistance in promoting mine safety in the metal and nonmetallic branches of the mineral industry. The work includes demonstrations of the hazards in handling and use of inflammable liquids such as gasoline, the use of diesel engines underground and inspections of operating mines so that the known hazards may be pointed out to the operators. Employees in the mineral industry are given training in first aid to the injured and in the use and care of oxygen-breathing apparatus.

The work of both the Coal-Mine Inspection Branch and the Accident Prevention Branch includes much instruction of mine officials and employees through accident-prevention classes.

The Roof Control Branch studies the roof control methods practiced within the region, the use of timber and metal supports including various types of roof bolts, and the study of roof fall accidents which comprise at least 50 percent of the fatal accidents in the mineral industry. This branch is new to the Bureau of Mines, and considerable expansion is contemplated.

Mine ventilation, particularly in metal and nonmetallic mines, is generally inadequate. Most coal mines are ventilated in accordance with State laws. The Bureau of Mines furnishes technological advice to mine operators whereby the ventilation can be improved and brought to the standards set by the United States Public Health Service.

Studies are made of explosives practices in all types of mining. Explosives are one of the primary sources of serious and fatal accidents in mines. The work in testing explosives, and the study of

fast-delay detonators, double priming, and fumes from explosives should be greatly expanded.

The mechanization in coal mines, particularly, and to a lesser degree in metal mines, has introduced new hazards in mines because of electricity used for power. The hazards of the use of electricity underground are not well known in many instances. This field of study should be augmented, and more information made available to the operator.

Many millions of tons of coal are burned each year by fires which occur in the coal deposits in the Western States. The Bureau of Mines is currently controlling fires in coal beds on the public domain and this should be continued until all known fires have been controlled. The cost of controlling these fires ranges from $200,000 to $350,000 per annum.

Bureau of Indian Affairs

The whole Colorado River Great Basin is of special importance and significance to the Bureau of Indian Affairs. Within its broad boundaries live over one-fourth of the Indians of the United States totaling in numbers to approximately 101,600. Residing in that part of the Great Basin to be directly benefited by the Colorado River storage project of the upper basin are approximately 38,000 Indians. Eighty-four percent of these Indians are Navahos, while members of the Ute and Apache Tribes make up the balance. They are almost entirely dependent on the natural resources of their lands which are inadequate for their minimum needs. To them, as to their non-Indian neighbors, water is of vital importance. Historically, Indians within this arid region settled along the water courses, particularly those of the Colorado River and its tributaries. It was inevitable that conflicts over the use of water with non-Indians should develop, and many such conflicts are still unresolved. With the settlement of the West, and the encroachment of non-Indians on lands which the Indians formerly used at will, reservations were established through treaty, executive order, and congressional action. Restricted to limited areas, and increasing in population, the Indians overgrazed their land and now face with non-Indians the problems of accelerated erosion, soil depletion, and diminished resources.

Tribes within the Colorado River Great Basin have retained their aboriginal culture to a greater degree than tribes elsewhere in the United States. In many parts of the region the Indians have had only slight contact with modern technologies. Many Indians speak only their native tongue, and only a minority can read and write. There is a strong adherence to their traditional patterns of thought and behavior. The reluctance to accept modern technologies and concepts, the inability to read and speak English, and a resistance to leaving their reservations create serious problems in the economic development of the Indians of the region.

The basic responsibilities of the Bureau of Indian Affairs are twofold: To protect and develop Indian resources; and to help and encourage Indians in the slow and sometimes painful process of acculturation. The final goal is the integration of the Indians in the social, economic, and political pattern of American life. It is obvious that the work of the Bureau deviates widely from that of other Bureaus in the Department of the Interior.

INDIANS AND THEIR LAND

The Colorado River Basin is the pre-Columbian home of most Indians now living within its boundaries. They were not transplanted there from other parts of the country under the pressure of the westward movement of the white population. This has an important influence on their attitudes. They have strong emotional

45515—54——17

and cultural ties to their land, even though it is in many cases unproductive.

Within the upper Colorado River Basin region Indian landholdings total approximately 11 million acres located on reservations varying in size from the vast Navaho Reservation of over 8 million acres within the upper basin, while an almost equal acreage of this reservation is located within the adjacent lower basin. The greatest part of this whole area is classified as open grazing land—most of which has a very low carrying capacity. There are 360,000 acres of Indian land susceptible of irrigation in the upper basin taking into account the full development of the projects now partially irrigated.

With some notable exceptions, the land base of the Indians is grossly inadequate, and even with proper development and use cannot support them at a minimum acceptable standard of living. They are, however, peculiarly dependent on the resources of their land. Most Indians are not equipped by education, experience, or ambition to compete with non-Indians away from their reservations. Nor do they have the desire to leave the emotional security of their own environment and face insecurity and discrimination in the outside world, yet it is inevitable that many Indians must progressively seek their living away from their lands.

INDIAN RESOURCE PROBLEMS

The Bureau of Indian Affairs is responsible for the protection, development, and conservation of all lands held in trust for the Indians. In the upper Colorado River-Great Basin region these total over 11 million acres as already stated.

Certain problems faced by Indians in the development and use of their lands are common to all groups making a living from the soil of this arid region. In addition there are other problems peculiar to the Indian which intensify the difficulties of the Bureau in its administrative responsibilities.

Fundamental in consideration of Indian resource problems is the gross inadequacy of the land base, and the peculiar dependence of the Indians on their land for a livelihood. An increasing population has placed a progressively heavier burden on the land, and resulted in serious overuse of the grazing land especially. Its productivity has been drastically reduced, and in many areas accelerated erosion has taken place. The prevention of further deterioration of the soil, and the restoration of damaged areas are of major concern to the Bureau and to the entire region. The effect on Hoover Dam of the soil erosion on the Navaho Reservation has been widely publicized. There are other examples, less dramatic, throughout the region.

There are approximately 10.2 million acres of tribal land and 800,000 acres of trust allotted land in the upper Colorado River Basin region. Both types of ownership present serious problems in the efficient use of the land. On many unallotted reservations the pattern of land-use is according to tribal custom without a formalized system of land assignment. Individuals and groups have certain historical land-use rights in areas which are informally recognized by other members of the tribe, but there is rarely any clear delimitation of the area. The Bureau and the Indians face the task of creating effective land-use codes, through which individuals and groups will have clearly estab-

lished land-use rights to specific areas of land. In addition, governmental and tribal controls are needed to implement these codes and assure sound land-use practices.

Even more serious are the problems of proper land use on trust allotments. The General Allotment Act provided for the allotment of small pieces of land to individual Indians, varying in size from 10 acres of irrigated land to 160 acres of grazing land. Under the law, trust allotments cannot be alienated, but on the death of an allottee are subject to the State inheritance laws. The result over the years has been a progressive subdivision of allotments which were often uneconomic units originally. Unless the numerous heirs to an allotment could agree among themselves, the individual holdings were too small to farm, and often fell into disuse. This process is continuing and threatens paralysis of some of the most valuable Indian land in the region.

Inadequate credit has been another obstacle to the full use of Indian lands for farming and stockraising. Indians are denied the usual sources of credit because of the trust status of their land, and their lack of property to use for security. Congress has never fully recognized the importance of this, and loan funds established through congressional action have not been large enough to meet all Indian needs. This in spite of an extraordinarily fine repayment record by Indians of the funds that have been made available.

The existing and potential projects of irrigable Indian land in the upper basin have all the problems of water rights, maintenance costs, drainage, water supply, and operation which are common to all irrigation projects. In addition the Indians have special problems inherent in the transition from subsistence farming to commercial farming and use of modern farming methods. The Bureau has the task of developing potential irrigation projects to meet the pressing needs of the Indians, safeguarding Indian water rights, and assisting Indians in learning new techniques of agriculture.

IRRIGATION

General

The complete utilization of all Indian basic resources must be brought about with the utmost speed in order to prevent a continuing drain upon the Federal Treasury for Indian support and to forestall the pauperization of a large part of the Indian population. And it is here that the importance of irrigation as a part of the economy of Indian administration becomes apparent.

Agricultural development by irrigation on most of the reservations in the arid and semiarid regions constitutes the principal if not the sole means and opportunity by which the Indian may become self-supporting and make proper use of his lands. Also the continued and further development of Indian irrigation projects is essential to preserve the water rights pertinent to the reservations which have been established by treaties or other Federal enactment. This right becomes increasingly difficult to protect in the face of approaching full development of the general water resources of the country by other water users. At present the Indians are not prepared or equipped to develop their own water rights and it is the Government's duty to do so. Congress, facing the difficulties of Indian self-use of

irrigated land and realizing the subsistence character of farming operations especially in its initial stages, in 1932 passed what is commonly known as the Leavitt Act (47 Stat. 564). This legislation provides in effect that no irrigation construction assessments shall be made against Indian lands so long as the title remains in Indian ownership. It further provides that the Secretary of the Interior may adjust or cancel any unpaid operation and maintenance assessments. Both unpaid construction and operation charges constitute first liens against the land, which will be recited in any patent or instrument issued for such lands.

It accordingly will be seen that the need for and the feasibility of irrigation projects for Indians should be determined by a somewhat different formula than is commonly used in determining the feasibility of irrigation projects for the more mobile white farmers. Economically, the Indian is confined to his reservation until the time comes when he has adjusted himself to the whites' "civilized competitive environment."

A large factor in the question of economic feasibility of Indian irrigation projects is whether it will tend to increase the chances of the Indians becoming self-supporting. Consequently the justification for Indian irrigation projects should to a large extent be measured by what it would cost Federal gratuities if the irrigation projects were not constructed. Included in these gratuities are the many social and administrative costs created by the existence of a large substandard population.

Continuation of irrigation development for Indians together with the construction of works to serve such privately owned land as may be included in Indian irrigation projects should be continued by an organization directly under the control of the Indian Bureau. The success of an Indian irrigation project depends not only upon it being properly and economically constructed and operated but also upon the development of the Indian to the point where he will make use of the facilities provided. This is a human and social problem which necessarily must be worked out in company with the other elements essential to Indian advancement. The irrigation activities must dovetail into an integrated reservation program.

INDIAN IRRIGATION PROJECTS IN THE UPPER BASIN NAVAHO RESERVATION—POTENTIAL AND EXISTING

Shiprock project

The resource development which would provide for the largest number of Navaho families is the proposed Shiprock-San Juan irrigation project. It is located south of Shiprock on the San Juan River in the northwest corner of New Mexico and comprises a large area of Navaho tribal land susceptible of irrigation from the San Juan River. The possibility of developing an irrigation project in this area has been under intermittent consideration for more than 50 years. Surveys have been made by one or more State engineers of New Mexico, the Bureau of Indian Affairs, and the Bureau of Reclamation as well as by private persons. More recent studies of the Bureau of Indian Affairs in which the Bureau of Reclamation has substantially assisted have now reached the preliminary report stage. The final phases of

this report together with any further extensive investigations must necessarily await the outcome of current negotiations endeavoring to reach an agreement covering allocation of the waters of the San Juan River and its tributaries taking into account the apportionments made to the upper basin States by the upper Colorado River compact.

The net area of the Shiprock project pending the water supply determination and as assumed for preliminary report purposes is 114,000 acres, all of which could be irrigated by gravity facilities. A considerably larger gross acreage of 45,000 acres could be served by pumping with a maximum pump lift of 150 feet. In the event the Bureau of Reclamation's proposed south San Juan project is constructed as has been proposed, as much as 23,000 acres additional Indian land area could be included in that project.

Present project major structure plans are based upon participation in the power benefits and the use of the Navaho Dam and Reservoir which comprises one of the main units of the Colorado River storage project, and has long been used as the storage site for the Shiprock project. This unit of the storage project as tentatively designed will have a capacity of over 1 million acre-feet.

At least a portion of the area of the Shiprock project would be competitive for the utilization of the San Juan River water supply with the potential south San Juan project as well as with the San Juan-Chama transmountain diversion project. These two latter proposed developments have been under investigation and study by the Bureau of Reclamation for several years. Obviously the size and cost of the several proposed projects in this region will depend upon final allocations of the available water supply. No determinations have as yet been made as to allocation of construction costs to power or to flood and silt control. The assumed 114,000-acre Shiprock project would provide economically sized farm units averaging 63 acres to 1,800 families. Several times this number of nonfarming families would eventually be supported as incidental to the extensive agricultural production which would surely result from a project of this magnitude.

Navaho Animas-La Plata (potential project)

Within the proposed extension of the Animas-La Plata project of the Bureau of Reclamation there is an area of 25,000 acres of Indian land on the Navaho Reservation which is susceptible of irrigation. This land lies in the Monument Rocks area north of Shiprock and would be served by extending the Animas-La Plata canal system. The Bureau of Reclamation is currently designing this project for a total area of 110,000 acres of which about 24,000 acres of non-Indian land is now under constructed works. The enlarged project involves the construction of nine reservoirs, a hydroelectric powerplant, together with a canal and distribution system.

Navaho miscellaneous irrigation projects (present and potential)

The present irrigation development on the Navaho Reservation within the upper basin region consists of more than 40 small tracts varying in area from 20 to 4,200 acres each. The aggregate area in these units now provided with irrigation facilities is approximately 15,000 acres of which about one-half is class 1 and one-half class 2 land of 5 classes of land surveys.

These small irrigated tracts are scattered over the entire reservation and because of such dispersal fit in well with the livestock economy of the Indians. Expansion of a considerable number of these units to their ultimate irrigable area estimated at some 25,000 acres in the aggregate should be given favorable consideration. The potential work involved in completing these small projects consists of extending and improving the canal and lateral systems, the development of some additional and supplemental storage capacity and the preparation of raw land for Indian use. Construction work is now underway on the more promising of these units and the preparation of detailed plans are sufficiently advanced so that the work can be continued. Further surveys will be made as required for the development of the remaining units which will be carefully selected. Based upon the estimated productive capacity of the present irrigated area it is believed to be sufficient for the support of 300 families. With the eventual completion of the more feasible units, it is estimated that an additional 200 families will be able to obtain self-support by farming.

Uintah and Ouray (existing and potential extensions)—Utah

There are 77,000 acres under irrigated works on the Uintah Reservation in Utah, supplied by water from the Uintah, Duchesne, Lake Fork, and Whitewater Rivers; and 1,250 acres with irrigation facilities on the Uncompahgre Reservation. It is planned to increase this to 22,000 acres.

A preliminary statement of the Bureau of Reclamation on the proposed central Utah project, which is currently under investigation, the initial phase development of which has been named as one of the principal participants in the upper Colorado River account, states that this project—

> proposes to intercept water of the streams flowing down the southern slopes of the Uintah Mountains at sufficient elevation to flow by gravity into the Bonneville Basin * * *. Replacement of water thus diverted from the Uintah Basin would be accomplished under ultimate phase development by diverting water from the Flaming Gorge Reservoir on the Green River.

The Indian as well as the non-Indian landowners throughout the Uintah Basin are vitally interested in this project. The extent to which the proposed irrigation works will affect the water rights and present water supply of the Uintah Indian irrigation project is of utmost importance to the Indians and to the Bureau.

Jicarilla Reservation, N. Mex. (existing and potential)

On the Jicarilla Reservation 800 acres are now being irrigated and plans contemplate increasing this area to 5,000 acres. The water supply is secured from La Jara and Dulce Creeks. The present average annual diversion is 4,000 acre-feet and the average annual diversion requirement for the ultimate area is 25,000 acre-feet. The estimated cost of providing irrigation facilities for the additional area is $250,000.

Southern Ute and Ute Mountain Reservations, Colo. (existing and potential)

Within the upper Colorado River Basin in Colorado are two Indian projects, the Pine River and the Mancos River. The combined present irrigable area amounts to 8,600 acres and plans contemplate expanding this area to 20,350 acres. The present average annual

diversion is 43,000 acre-feet and the average annual diversion requirement for the ultimate area is estimated at 72,750 acre-feet. The two projects are described as follows:

Southern Ute-Pine River.—On the Southern Ute Reservation 8,400 acres are now supplied with irrigation facilities of which 2,400 acres are in non-Indian ownership, and plans contemplate expanding the area to 19,850 acres of which 3,700 will be non-Indian. The water supply is secured from Pine River and tributary creeks. The present average annual diversion is 42,000 acre-feet and the average annual diversion requirement for the ultimate irrigable area is estimated at 70,250 acre-feet. The tentative estimated cost to provide irrigation facilities for the additional area is $860,000.

Ute Mountain-Mancos River.—On the Ute Mountain Reservation there are 200 acres being irrigated and plans contemplate expanding the area to 500 acres. The water supply is secured from Mancos Creek. The present average annual diversion is 1,000 acre-feet and the average annual diversion requirement for the ultimate irrigable area is estimated at 2,500 acre-feet.

SOIL AND MOISTURE CONSERVATION

The approximately 10,700,000 acres of Indian land in the upper basin of the Colorado contribute the highest amount of sediment of any other equal area in the basin. They constitute about one-seventh of the area but contribute between one-fifth and one-fourth of the sediment. Two-thirds of the Indian lands are severely or critically eroded. Erosion and sediment removal are due to a combination of climate, geology, soil, topography, vegetative cover, and land use. Indian lands have been seriously depleted by wind and water erosion caused by improper use by men and livestock together with drought, fires, and torrential rains.

The Indian Bureau has successfully demonstrated that this damage can be economically checked and lands restored by water diversion, water-spreading, revegetation, streambank protection, and other related soil and moisture conservation practices. Control of erosion and restoration of Indian land resources are an integral part of the Bureau programs and policies of resource management. Indian resources in the basin are seriously inadequate for the present population. Land losses from erosion must be checked more rapidly than means to date have made possible or the Indians' extremely low standard of living will be further reduced and accelerated erosion will add progressively increasing amounts of sediment to the already excessive loads into the streams, reservoirs, and other downstream developments.

There are about 3,500,000 acres of forest and woodland on Indian reservations in the upper basin of the Colorado with an estimated stand in excess of 6 billion feet of timber. It has been estimated that within this area on about 500,000 acres of this land there are 2 billion board feet of commercial saw timber. The area and volume of timber are based on ocular estimates and not on actual forest surveys. These forest resources are important to the Indians for fuel, posts, poles, and other forest products and as a source of income from sales of timber. It is the established policy of the Bureau of Indian Affairs to manage the forest resources in accordance with the principles of sustained

yield. In the circumstances, a comprehensive survey of these resources should be made to obtain essential data for dependable management plans. Such a survey is now being made of the forest resources on the Navaho Reservation where a tribal sawmill enterprise is being conducted. Conservative development of the timber on the Jicarilla and Consolidated Ute Reservations has been primarily through sales of timber to non-Indians.

The Indian forest and woodlands in this region have been protected from fire to the extent that limited funds have been available for that purpose. The fire hazard in some parts of this area will probably increase because of the accumulation of forest litter and the dense growth of forest reproduction and other vegetation. This increase in fire hazard presents a serious problem which can be met only with increased funds for adequate organizations for fire prevention and control.

Considerable quantities of oil, gas, copper, uranium, and other minerals are believed to exist on a number of Indian reservations in the region, particularly in the Navaho-Hopi area where there have been productive oil and gas leases for many years. An obstacle to further exploitation of these resources is the lack of adequate surveys and studies. On the Hopi Reservation explorations by the major oil companies indicate the possibilities of highly productive oil deposits, and efforts have been made by them to obtain leases from the tribe. So far, however, these efforts have been unsuccessful because there is no central body among the Hopis authorized to act for the entire tribe. It should be stated with respect to the Hopi Reservation that most if not all of its area as usually designated is located just south of the dividing line between the upper and lower Colorado River Basins and accordingly cannot be considered an upper basin reservation.

BUREAU PROGRAMS

The future programs of the Bureau of Indian Affairs in the upper Colorado River Basin as elsewhere are designed to achieve the economic and social rehabilitation of the Indians through the provision of adequate education, health, and other public service facilities, the development of physical and other subsistence resources on the reservation, and assistance in obtaining stable employment or occupation off the reservation.

Long-range programs are contemplated for all reservations, and are now being prepared by Indian Bureau officials and Indian groups. The basic objectives of these programs as stated by the Commissioner of Indian Affairs are:

> The establishment of various tribes or groups of Indians on an economic level comparable to other citizens of the area; their integration into the social, economic, and political life of the Nation; and the termination at the appropriate future time, of Federal supervision and control special to Indians.

The Navaho program deals with the rehabilitation of a large and comparatively primitive Indian group, living on an unallotted reservation to which they have strong cultural ties, but which is totally inadequate to meet their minimum needs. The program includes vigorous measures to develop and protect the land through soil and water conservation, irrigation projects, and range improvement.

Additional emphasis is placed on the exploitation of minerals, and expansion of the present timber operations.

The funds available to the Bureau of Indian Affairs through annual appropriations have been insufficient to implement long-range plans such as the Navaho. Special authorization was requested for this purpose in a bill to promote the rehabilitation of the Navaho and Hopi Tribes of Indians and the better utilization of the resources of the Navaho and Hopi Indian Reservations, and for other purposes. This bill was passed by both the Senate and the House in the 81st Congress but was vetoed by the President. An amended version was passed in the second session of the 81st Congress in April 1950.

The future work of the Bureau is of course dependent on the availability of funds, and the acceptance by the Congress of the principle that it is sound economy to spend the money necessary to rehabilitate Indian groups to the point that they can become independent of special Federal services. Within the upper Colorado River Basin region, the development of Indian resources is closely related to the overall planning of the area. It must be coordinated with the work of other Bureaus of the Department of the Interior, and all other branches of the Government in this field.

UNITED STATES DEPARTMENT OF THE INTERIOR
FISH AND WILDLIFE SERVICE
WASHINGTON, D. C.

A PRELIMINARY REPORT ON FISH AND WILDLIFE RESOURCES IN RELATION TO THE COLORADO RIVER STORAGE PROJECT AND PARTICIPATING PROJECTS

FIELD WORK AND REPORT BY
OFFICE OF RIVER BASIN STUDIES
ALBUQUERQUE, N. MEX.

A PRELIMINARY REPORT ON THE COLORADO RIVER STORAGE PROJECT AND PARTICIPATING PROJECTS, UTAH, WYOMING, COLORADO, NEW MEXICO, AND ARIZONA,

1. Pursuant to Public Law 732, 79th Congress, 2d session, and a memorandum of agreement between the Fish and Wildlife Service, region 2, and the Bureau of Reclamation, region 4, dated December 5, 1949, there is furnished below a preliminary report which outlines the effect that the Colorado River storage project and its participating projects would have on fish and wildlife resources. It reflects the opinions of the Fish and Wildlife Service and the fish and game conservation agencies of the States of Utah, Colorado, Wyoming, Arizona, and New Mexico. It is planned that detailed fish and wildlife investigations and reports on individual features of the project will be prepared as promptly as possible. The objective of such investigations is to prevent damage to fish and wildlife resources which would otherwise occur as a result of the project.

2. Biological investigations, prerequisite to preparation of a preliminary evaluation report on the effect of the proposed developments on fish and wildlife resources, were begun in 1949, but due to the immensity of the individual projects, the complexity of the habitat, the shortage of time and personnel available, complicated by the inaccessibility of the areas, the information obtained was necessarily meager.

3. This preliminary report reviews available data covering the proposed Colorado River storage project and the participating projects, and describes some of the ways that fish and wildlife resources would be affected by the projects. It points to the developments that would be most detrimental, and suggests some modifications that would mitigate damages to the fish and wildlife resources.

4. The Colorado River storage project would be a multipurpose project. Some of the principal objectives are briefly described below, but not necessarily in their order of importance. One objective would be the storage and regulation of Colorado River flows sufficient to meet aggregate downstream requirements and permit upstream utilization with a reasonable assurance of adequacy during years of low streamflow.

5. Another objective would be to generate electrical power by utilizing the flows released to meet downstream commitments. Sale of this power should according to present plans, provide sufficient funds to repay construction costs and provide an interest component which could be used for a third objective, that of assisting irrigation developments in the basin which could not otherwise meet their repayment costs in the allotted period. These would be participating projects.

6. The fourth objective would be to provide water for irrigation. Some water would be delivered to presently irrigated lands in trade for established water rights so that diversions could be made at higher elevations for use in other basins, especially in connection

with the central Utah project development where transmountain diversion would be made to the Bonneville Basin and possibly in the Gunnison-Arkansas project area where diversion would be made to the Arkansas Basin.

7. The fifth and sixth objectives would be to retain silt and to level out flash-flood peaks.

8. These objectives would be accomplished by the eventual construction of the 10 Colorado River storage project reservoirs and by other coordinated developments throughout the basin which would include construction of 15 or more participating projects. The proposed Colorado River storage project reservoirs, and their purposes are shown in table 1.

TABLE 1.—*Units of Colorado River storage project*

Unit and reservoir	Name of river	Name of dam	Principal purposes to be served
Initial:			
Echo Park	Green	Echo Park	H, P, S.
Flaming Gorge	do	Ashley	I, H, P, S.
Glen Canyon	Colorado	Glen Canyon	H, P, S.
Navaho	San Juan	Navaho	I, H, P, S.
Whitewater	Gunnison	Whitewater	I, H, P, S.
Ultimate:			
Cross Mountain	Yampa	Cross Mountain	H, P.
Crystal	Gunnison	Crystal	P.
Curecanti	do	Blue Mesa	I, H, P.
Gray Canyon	Green	Gray Canyon	H, P, S.
Split Mountain	do	Split Mountain	P.

Symbols used: I—Irrigation. H—Holdover storage for new irrigation. P—Power. S—Sediment retention.

9. Initially, the participating projects would include: The central Utah project (initial phase) extending from Uinta Basin to the Bonneville Basin, Emery County project in the San Rafael Basin, Seedskadee project on Green River, La Barge project on Green River, Eden project on Big Sandy Creek, Lyman project on Blacks Fork, all affecting the Green River drainage; Florida project on Florida River, Pine River project extension on Pine River, the Hammond and Shiprock Indian projects on the San Juan River, all within the San Juan River drainage; Smith Fork project on Smith Fork and Iron Creek, Paonia project on Muddy Creek, all in the Gunnison River drainage; and the silt project in the upper Colorado River drainage. Ultimately other projects will be undertaken as participating projects, all utilizing upper Colorado River waters.

10. The Colorado River storage project and participating projects would be concerned with the possible utilization of available streamflows throughout the entire 110,000 square miles upper Colorado River Basin. Streamflows available for upstream utilization would consist of the apportioned 7.5 million acre-feet annually of Colorado River water above Lee Ferry, Ariz., a point on the Colorado River just below the Utah line. By mutual compact the States of Wyoming, Utah, Colorado, New Mexico, and Arizona have established apportioned shares of this allotment for development and utilization in their respective States.

11. Pertinent engineering data relating to the Colorado River storage project are listed in table 2.

1/ Maximum average annual water elevations less minimum average annual water elevations.
2/ Modified average annual 1914-45 historical flow in 1,000 acre-foot units at damsites.
3/ Only daily or hourly fluctuations. Entire capacity is considered inactive by the Bureau of Reclamation.
4/ Computed as for a point below Split Mountain damsite.

45515 O - 54 (Face p. 247)

12. The construction of dams and reservoirs as proposed in the Colorado River storage project and participating projects would, in general, destroy all present big game, upland game, fur animal, and waterfowl habitat in the reservoir areas. The 10 Colorado River storage project reservoirs would, when filled to maximum capacity, inundate 700 miles of stream fisheries located within the 343,610 acres of reservoir area.

13. The fluctuating reservoirs would provide only poor type resting areas for ducks, unattractive shorelines for fur animals, and would expand the production of already abundant rough fish at the expense of all the above-mentioned more desirable forms of wildlife.

14. Where flows of streams are periodically reduced by reservoir storage or are otherwise diverted from the channel for irrigation or power-production purposes, there would be an additional loss to the fishery and fur animals, and to a lesser extent waterfowl and upland game, unless sufficient and properly regulated flows are maintained.

15. Where sediment loads are reduced by deposition in the reservoirs and continuous favorable releases of cool water are achieved below the dams, highly desirable sport fishing may be increased. Newly irrigated areas may favor production of pheasants, which would supplant the native upland-game populations, sometimes to the detriment of other species such as wild turkeys, sage hens, and deer.

16. The damage that would result to fish and wildlife by construction of the different projects throughout the upper Colorado River Basin would vary markedly between those reservoirs in the mountains and those such as Glen Canyon Reservoir in the arid gorge of the Colorado. In the mountains, where much of the annual precipitation occurs as snow and there are frequent summer rains, vegetation is plentiful, soil fertile, streams generally clear and cold, and fish and wildlife abundant. Along the Green River in central Utah, and along the San Juan and Colorado Rivers in southern Utah, rainfall during the growing season is insufficient to support cultivated crops, soils are dry or saline, palatable vegetative cover is sparse, and the rivers are heavily silt laden. Between these extremes are myriad combinations of slope, climate, and soil. Some combinations favor one type of game, some another, until in the relatively inaccessible canyon of the Colorado River only those animals which live in its muddy waters, or are able to subsist on the sparse vegetation among the cliffs, can maintain themselves.

17. Utilization of fish and wildlife resources produced within the upper basin varies principally with the accessibility of the area, attractiveness of the game, and distance from major centers of population. Split Mountain and Echo Park Reservoirs would lie partially within a national monument where hunting is prohibited. All of the other project areas, except possibly Gray Canyon, are accessible to hunters, but access is not adequate to permit full utilization of the fish and wildlife populations. It is expected that as roads are improved hunting and fishing pressure would increase with, however, much of the use continuing to come from persons living outside of the upper basin. In many instances the abundance of game animals has been the motivating factor in the opening of new roads. Some of the proposed reservoir sites are remote from centers of population, or may be so situated that they would compete with each other for use.

18. There are within the upper basin fewer than 25 communities

having over 1,000 population. Only 5 communities have more than 5,000 of which Grand Junction, Colo., (12,479), and Rock Springs, Wyo. (9,827), are the largest. Total population within the 110,000 square-mile basin is 286,450 with an average of 2.6 persons per square mile.

19. Highway distances from major cities outside the basin to the initial project reservoirs are shown in table 3.

TABLE 3

State and city	Population (1910 census)	Distances to reservoir areas				
		Echo Park [1]	Flaming Gorge	Curecanti	Glen Canyon	Navaho
Colorado:						
Denver	322,412	349	423	206	549	445
Pueblo	52,162	403	537	161	496	331
Colorado Springs	36,789	410	493	173	510	375
Utah:

California: Los Angeles	1,501,277	881	936	1,024	602	913

[1] Also Split Mountain and Cross Mountain Reservoirs.

20. The proposed developments are so interrelated that monetary evaluation of the damages or benefits to fish and wildlife resources caused by any one of the project units would require careful analysis to determine its relationship to all the other projects.

21. In view of the magnitude of the changes that would occur to fish and wildlife habitat due to project construction, it is believed that separate evaluation reports should be prepared on each project as sufficient engineering data becomes available to make proper biological surveys and analyses. The Fish and Wildlife Service and the State fish and game departments would thus have an opportunity to make biological investigations and recommendations based on preliminary plans of the constructing agency. They would then be in a better position to fulfill the requirements of Public Law 732 for participation in the planning of the project in order to prevent loss of and damage to wildlife resources.

Individual Units and Their Anticipated Effect on Fish and Wildlife Resources

INITIAL PHASE

22. The five reservoirs of the Colorado River storage project which are being considered for initial construction are Glen Canyon, Echo Park, Flaming Gorge, Navaho, and Whitewater.

Glen Canyon unit

23. The Glen Canyon Reservoir would be impounded by a dam, 580 feet in height, located in the narrow precipitous canyon of the Colorado River, 15 miles above the Paria River and Lees Ferry in Arizona.

24. The reservoir would inundate 153,000 acres of poor-quality wildlife habitat along the narrow gorge of the Colorado and San Juan Rivers where only meager vegetation persists. The reservoir would extend 186 miles up the Colorado River and 71 miles up the San Juan River and form a lake with but few points of access. The presence of the reservoir in Glen Canyon would make the entire area accessible by boats launched from immediately above the damsite or from either side of the reservoir where the present Blanding to Hanksville road enters the reservoir area. At present the Colorado River in the reservoir area is accessible by automobile at but one place, Hite, Utah, and then only over a partially improved road not passable during rainy weather. Other access is by one-way boat trip down the Colorado River from Moab to Lee Ferry, down the San Juan River from Mexican Hat to Lee Ferry, or by pack trails through extremely rough terrain.

25. Fishery values in the Colorado and San Juan Rivers without the project based on present harvests would be insignificant. The reservoir would provide recreational potentialities, but because of its inaccessibility and the fact that there are other fishing areas nearer the important centers of population, it is expected that the reservoir fishing would not be fully utilized. Fishery value of the reservoir and the river below the dam would depend somewhat on the public recreation facilities provided and improved access.

26. The Colorado River below Glen Canyon Dam would become an improved fishery due to the proposed minimum release of at least 10,000 cubic feet per second of clear, cool water. Access to the river, however, would be limited to about a 25-mile section of the river near Lee Ferry.

27. Wildlife habitat in the reservoir area would be destroyed, but the reservoir would open the canyon area to travel so that some of the now isolated game populations above the reservoir could be better managed.

Echo Park and Flaming Gorge units; considering Split Mountain and Cross Mountain units

28. Echo Park, Ashley (Flaming Gorge Reservoir), Cross Mountain, and Split Mountain Dams would impound a series of closely integrated

45515—54——18

reservoirs on the Green and Yampa Rivers near the point where Utah and Colorado meet along the Wyoming boundary. Only Echo Park and Flaming Gorge Reservoirs are being proposed for initial construction, but because the four reservoirs are so closely interrelated they are described together.

29. United States Highway 40 passes to the south of the Uinta Mountains about 25 miles from the 3 most southern reservoirs. United States Highway 30 crosses southern Wyoming north of the Uinta Mountains about 3 miles from the nearest point on the Flaming Gorge Reservoir. Access roads to the reservoir areas follow the rivers for only very short distances. These roads are open seasonally, generally graded but only occasionally graveled. The canyon areas are accessible only by boat down the rivers and from pack trails.

30. The four dams would form almost contiguous reservoirs on the Green and Yampa Rivers from Split Mountain above Jensen, Utah, to below Green River, Wyo., on the Green River and below Craig, Colo., on the Yampa River. The reservoirs would lie in the canyons and parks along the Green and Yampa Rivers where the rivers have cut through the Uinta Mountains of northeastern Utah, northwestern Colorado, and southern Wyoming.

31. Flaming Gorge Reservoir, the farthest upstream of the reservoirs in this group, would be impounded by the Ashley Dam in the Red Canyon of Utah, but most of the 40,800-acre reservoir area would lie in Wyoming, where it would receive the turbid waters of the Green River.

32. The area to be irrigated from the Flaming Gorge or Echo Park Reservoirs would be on the south side of the Uinta Mountains, where flows would be delivered from Flaming Gorge Reservoir through a tunnel or by pumping from Echo Park Reservoir. There would be some new irrigation areas developed in the Uinta Basin in connection with this reservoir development, but its principal purpose would be to trade assured flows to Uinta Basin areas for water originating in the mountains. The mountain flows could then be diverted by aqueduct to the Bonneville Basin for production of power and irrigation as part of the central Utah project.

33. Cross Mountain Dam, 295 feet in height, would be located in Cross Mountain Canyon; but the resultant 52,200-acre reservoir would inundate an open valley east of the mountains and 76 miles of the Yampa River.

34. Echo Park Dam, 525 feet in height, on the Green River would form a 42,800-acre reservoir 63 miles up the Green River through Lodore Canyon and Brown's Park to just below the Flaming Gorge damsite and for 44 miles up the Yampa to just below the Cross Mountain damsite.

35. Split Mountain Dam, 245 feet in height, would impound releases from Echo Park Reservoir in a 21-mile section of the Green River immediately below the Echo Park damsite. It would have only 4,230 surface acres at maximum water level with little seasonal fluctuation but considerable daily fluctuation.

36. Releases below Flaming Gorge and Cross Mountain Reservoirs would enter Echo Park Reservoir and flows released below Echo Park Dam would flow directly into the proposed Split Mountain Reservoir. Below Split Mountain Reservoir the Green River emerges from the mountains and flows in a southwesterly direction across the Uinta

Basin to Ouray where it is joined by the White and Duchesne Rivers. This section of the Green River, from Split Mountain to Ouray, may have a decidedly improved fishery if constant releases from the reservoirs are provided.

37. There is some sport fishing on the Green and Yampa Rivers but the area is generally rough and inaccessible, the stream habitat is poor and, at present, the type of fish taken is not highly regarded for sport fishing. The reservoirs would probably produce more rough fish than could be taken for sport, so that the principal harvest would be by commercial fishing.

38. The proposed reservoirs would inundate small farming areas which have been established in the parks along the Green and Yampa Rivers. On the steeper slopes above the farms, but within the reservoir areas, are ranges utilized by big game as well as livestock. Impounding of the reservoirs would seriously reduce the deer wintering areas, especially in Brown's Park, and it is doubtful if the remaining range could maintain the present deer herds.

39. Upland game, fur animals, and waterfowl would also be adversely affected by the project. The nesting sites of from 300 to 500 pairs of geese and of numerous ducks would be eliminated by the inundation of the "bottoms."

40. The possibility of establishing a migratory bird refuge on, or adjacent to, the Echo Park Reservoir, provisions for the protection of big game by acquisition of lands about the reservoir, the enhancement of the fishing by maintaining suitable releases to the streams, and providing access to the fisheries so improved are being considered.

Whitewater unit

41. Whitewater Dam would be located on the Gunnison River approximately 9½ miles southeast of Grand Junction, Colo. It would rise 255 feet above the stream bed to create the 10,250-acre Whitewater Reservoir that would extend 35 miles upstream to a point about 4 miles west of Delta.

42. This reservoir would not provide an outstanding sport fishery. A short stream section below the reservoir should be greatly improved by the proposed water releases. The reservoir would inundate about 10,000 acres of big-game, upland-game, and fur-animal habitat. Waterfowl would be benefited by the presence of the reservoir which would serve as a resting area during spring and fall migrations.

Navaho unit

43. The 10,800-acre Navaho Reservoir would be impounded by a dam 335 feet in height on the San Juan River above Blanco, N. Mex., and would inundate 33 miles of the San Juan River Canyon and portions of the Pine and Piedra Rivers.

44. The Bureau of Reclamation is also considering utilizing water from this reservoir for the irrigation of lands under the Shiprock, south San Juan, and possibly the Hammond projects. Water would be carried by a common canal from the Navaho Reservoir to the project lands where smaller canals would divert the water to each of the units.

45. Construction of a dam and reservoir at the Navaho site should be considered in connection with the potential San Juan-Chama diversion to the Rio Grande Basin, which could be very damaging to the upper San Juan River fishery.

46. There is some fishing along the stream segments that would be affected by the reservoir. The meager fishery below the dam would not be maintained as the stream would be shut off periodically for storage; however, the reservoir might provide a better fishery than that destroyed by inundation. The effect on the fishery caused by diverted flows through the San Juan-Chama diversion would depend on the quantity and quality of residual flows in the San Juan Basin and by the type of habitat provided or destroyed in the Rio Grande Basin.

47. Plans are being made to carry out the necessary biological investigations to determine the most desirable operations for maintenance of this fishery. Minimum flows below dams and diversions are recommended especially below the Navaho Reservoir to protect the fishery in the San Juan River.

48. The reservoir area provides winter cover for deer and wild turkey and year-round habitat for small-game animals. This wildlife habitat would be destroyed. However, there would be an increase of upland game in the areas which would be irrigated.

ULTIMATE PHASE

49. The ultimate development of the Colorado River storage project would consist of 10 major reservoirs. Five of these reservoirs would be constructed in the initial phase as already described, and five others, namely, Cross Mountain, Crystal, Gray Canyon, Curecanti, and Split Mountain, would be constructed in the ultimate phase of the project. There may be two other reservoirs, not presently considered, which would have as their principal purposes the production of power and the retention of silt. These would be Dewey Reservoir on the Colorado River and Bluff Reservoir on the San Juan River.

Cross Mountain and Split Mountain

50. Cross Mountain and Split Mountain Reservoirs were previously described with the Echo Park and Flaming Gorge Reservoirs because of their close relationship.

Crystal Reservoir

51. Crystal Reservoir (560 surface acres) on the Gunnison River would serve mainly for power production, utilizing the flows released from Curecanti Reservoir. The reservoir would inundate 10 miles of stream in the walled Black Canyon of the Gunnison River. Fishery values of the Gunnison River without the project are high, but values anticipated for the reservoir are low. The stream fishery below the reservoir as far as the Whitewater Reservoir should be good if the power releases are sufficiently constant.

Gray Canyon

52. The 10,750-acre Gray Canyon Reservoir would be located in the extremely rough and inaccessible canyon of the Green River in central Utah. It would be 440 feet deep at maximum water level and would extend 53 miles back into the canyon. The dam site would be located approximately 22 miles upstream from the town of Green River, Utah, and would flood canyon areas, none of which are of agricultural value with the exception of the McPherson ranch, comprising a small area near the mouth of Florence Creek.

53. Wildlife values in the area are low and the fishery within the reservoir area is almost nonexistent. The reservoir should produce a meager fishery, but its utilization for sport fishing would be low. Constant minimum flows below the dam should, however, improve the stream and provide several miles of fair trout stream.

Curecanti unit

54. The 18,200-acre Curecanti Reservoir would be impounded by the Blue Mesa Dam, 475 feet in height, located on the Gunnison River near Sapinero, Colo.

55. The reservoir, inundating 30 miles of the Gunnison River, would be extremely damaging to both the fish and wildlife in the area. The reservoir would inundate sections of a stream and its tributaries which have been utilized extensively for recreational purposes. The present fishing use of the Gunnison River is high and is expected to become even higher in the future. Because of its scenic location, accessibility, abundance of recreational facilities, and consistent productiveness, this stream section is of exceptional value as a fishing stream.

56. Construction of the dam at Blue Mesa would destroy the valuable established fishery and in exchange would leave a fluctuating reservoir, much less attractive and unlikely to maintain a good trout fishery.

57. Flows of the Gunnison River below the proposed reservoir may have a more dependable late season flow than at present. The reservoir on the Gunnison may make possible water diversions from its headwaters to the Arkansas Basin on the eastern slope of Colorado.

58. The Gunnison River Valley within the Curecanti Reservoir site is important as big-game and upland-game habitat. The reservoir would inundate critically needed winter range for deer. This range is already overutilized and further reduction in the amount of range available due to inundation would have an extremely harmful effect on the deerherd which is of great recreational value to the State. In view of the extremely harmful effects that construction will have on wildlife resources and lack of feasible means for mitigating these anticipated losses, this Service recommends that the investigation of alternate sites be continued, in cooperation with the State game and fish commission and the Fish and Wildlife Service in order that wildlife losses may be kept to a minimum.

59. There would be some beneficial utilization of the reservoir by waterfowl and fur animals but the overall annual loss to wildlife would be great.

PARTICIPATING PROJECTS

60. The separate projects which are presently proposed for initial participation in the Colorado River storage project plan are described briefly in the following paragraphs. The Fish and Wildlife Service, together with the appropriate State game and fish agencies, will prepare separate reports on each of these projects. One of the detailed reports (Paonia) has been completed, preliminary reports have been prepared on nine, and field work has been initiated on several others.

Eden project, Wyoming

61. The Eden project, consisting of a 40,000 acre-foot reservoir on Big Sandy Creek and an irrigation system, 35 miles north of Rock

Springs, Wyo., will provide water for 11,000 acres of new land to be irrigated and a supplemental supply for 9,000 acres of land now under irrigation.

62. The project was approved for construction by President Roosevelt in September 1940, but construction was stopped by order of the War Production Board in December 1942. Completion was reauthorized by the act of June 28, 1949.

63. Fishery values are low in the project area as the stream sections affected are often dewatered. Big Sandy Reservoir is not expected to provide an important fishery. The Eden project will eliminate valuable antelope and sage hen habitat; however, the new land to be brought under irrigation may provide habitat for pheasants.

Paonia project, Colorado

64. The Paonia project, consisting of the 18,000 acre-foot Spring Creek Reservoir and appurtenant irrigation system, is designed to provide water for the irrigation of 2,210 acres of new lands, and supplemental water for 14,830 acres of land already under irrigation adjacent to the North Fork on the Gunnison River in Delta and Gunnison Counties, Colo.

65. The proposed reservoir would not provide a valuable fishery; however, the stream fishery would be benefited under project conditions due to improved streamflows below the dam. Gains to upland game would occur principally as the result of the irrigation of new lands. There would also be small gains to both waterfowl and fur animals. The Paonia project as proposed would result in minor benefits for both fish and wildlife resources.

66. In order to further improve habitat and utilization, it is recommended that waste areas and gullies in the irrigation area be planted and maintained for the propagation of wildlife, and that turnouts or parking areas be provided about the reservoir.

Central Utah project

67. The initial phase of the proposed Central Utah project involves drainage areas of over 7,000 square miles. It would provide water for the irrigation of approximately 28,540 acres of new land and supplemental water for 131,840 acres of irrigated land in the Colorado and Bonneville Basins. In addition, 48,800 acre-feet of water would be available for municipal, industrial, and related uses. Construction of 4 powerplants would generate approximately 373 million kilowatt-hours of energy annually. Part of the power would be required for irrigation and drainage pumping.

68. The 37-mile Strawberry aqueduct would intercept the flows of Rock Creek, Hades Creek, Wolf Creek, West Fork of the Duchesne River, Currant Creek, Layout Creek, and Water Hollow and convey them to the Stawberry Reservoir. Reservoirs to regulate inflow into the aqueduct would be constructed on Rock Creek, West Fork of the Duchesne River, and Currant Creek. Strawberry Reservoir would be enlarged by the construction of Soldier Creek Dam. An enlarged outlet tunnel would permit releases of Strawberry Reservoir water for four powerplants on the western slope of the Wasatch Mountains. Monks Hollow Reservoir, Utah Lake, and an enlarged Mona Reservoir in combination with the Wasatch aqueduct, the Mona-Nephi, and the enlarged Elberta Canals would then distribute the water to the irrigation areas of the Bonneville Basin. Exchange use of Provo River

water as planned would require construction of three additional dams and related works, and include the diking and drainage of Provo Bay in Utah Lake.

69. Project works to provide water for replacement, expanded irrigation, and municipal use in the Uinta Basin would include dams on the North Fork of the Duchesne River, Strawberry River, and Brush Creek, with feeder canals into offstream reservoirs at the Upalco and Stanaker sites from Lake Fork River and Ashley Creek.

70. As a result of project construction, excellent trout streams in the Uinta and Wasatch Mountains would be destroyed or severely damaged with only partial compensation to the sport fishery expected from the proposed reservoirs. Commercial fishing in Provo Bay would be cut off. A Federal refuge would be completely inundated, and excellent waterfowl, upland-game, and fur-animal habitat destroyed. Critically needed big-game range would be further reduced

71. The project would increase the abundance of rough fish and consequently improve the commercial fisheries. It would extend the habitat suitable for pheasants and some other upland-game species.

72. The Fish and Wildlife Service in cooperation with the Utah Fish and Game Commission have been making investigations to determine satisfactory means to replace the lost fish and game habitat in kind and to mitigate unavoidable losses. The difficulty of obtaining water to assure a stream fishery is emphasized, however, by the keen competition between municipal, industrial, and agricultural interests for the water to maintain themselves in this arid region. If the fisheries are to be maintained for posterity, expensive developments will be necessary to effectively manipulate the flows to maintain suitable fish habitat.

Emery County project, Utah

73. The Emery County project, in the Colorado River Basin, would impound the flows of Cottonwood Creek, in lower Joes Valley Reservoir, for release to 3,630 acres of new land. The reservoir would provide a supplemental late season water supply to 20,450 acres of land now irrigated in the Huntingdon, Castle Dale, and Orangeville areas. The reservoir would provide sufficient storage to permit 1,000 acre-feet of water to be diverted to the Sanpete project in the Bonneville Basin.

74. The fishery would be benefited by the project as the reservoir would provide better habitat than exists in Cottonwood Creek or the streams inundated. The elk and deer herds would be adversely affected because a sizable portion of their critically needed winter range would be destroyed. The creation of habitat in the irrigation area would benefit upland game, especially pheasants, and to a lesser extent fur animals and waterfowl.

Florida project, Colorado

75. The Florida project consisting of the 472-acre Lemon Reservoir on the Florida River and an enlarged and rehabilitated distribution system, would provide supplemental irrigation water for 12,650 acres and a full supply for 6,300 acres of new lands in the Florida River Valley and on the Florida Mesa of southwestern Colorado.

76. Construction and operation of the project as proposed by the sponsor would enhance fish and wildlife resources. Deer habitat

would be decreased but upland-game habitat would be improved. The estimated fur-animal values would increase slightly, and no significant changes would occur to waterfowl. Constant releases, fish screens, and stream channel improvements are proposed to improve fishing conditions below the reservoir site.

Hammond project, New Mexico

77. The Hammond project, on the San Juan River, would consist of a low diversion dam, an irrigation system, and a pumping unit with a water lift of approximately 50 feet. The project is designed to provide irrigation water for 3,670 acres of irrigable land near Bloomfield, N. Mex.

78. The waters of the San Juan River in the Hammond project area provide only a poor fishery. They are heavily laden with silt and are warm and generally sluggish; however, Colorado squawfish, catfish, and a few brown trout are taken. Wildlife values in the project area are low. Sparse populations of scaled quail and Gambel's quail and good pheasant habitat are found near Farmington. Probably the only benefits which would accrue through project construction would be derived from increased upland-game habitat.

79. The Hammond project may be included with the Shiprock and South San Juan projects under one plan of development. Water would then be stored in the proposed Navaho Reservoir, and a large canal would carry the water to the project area where it would be used for the irrigation of between 100,000 and 125,000 acres.

Lyman project, Wyoming

80. The Lyman project would consist of a 460-acre off-stream reservoir at the Bridger site on Willow Creek and an irrigation system. The reservoir is designed to store the flows of Black's Fork and the West Fork of the Smith Fork River for supplemental irrigation of 40,600 acres of land near the town of Lyman, Wyo.

81. The proposed project would be detrimental to the fish and wildlife resources of the area. The fishery resulting from construction of Bridger Reservoir would not compensate for the reduced fishery in stream segments affected by the project. Big-game and fur-animal habitat would be damaged; however, the reservoir would create some waterfowl resting habitat. Upland game would not be significantly affected.

Pine River project extension, Colorado and New Mexico

82. The Pine River project extension is a feature of an ultimate project which would provide irrigation water for 69,000 acres of land in southwestern Colorado and northwestern New Mexico. At present, 33,200 acres are being irrigated with water assured by the Vallecito Reservoir. The proposed extension would consist of the enlargement and extension of 8 major canals and ditches and 6 minor laterals to irrigate an additional 15,150 acres of land.

83. The fishery of 42 miles of Pine River below Vallecito Reservoir would be affected by the project extension. The Fish and Wildlife Service has recommended water releases which would prevent damage to the fishery. Without these recommended releases, considerable damage would result. Rotary fish screens are being recommended for the headings of the four largest canals.

84. The project extension would cause a loss to big game through removal of the irrigation area from the present deer winter range. Upland game, in general, would be benefited by the increase in irrigated land; however, sage-hen habitat would be destroyed. The increase in the length and number of canals and ditches and the recommended stabilized and increased flows of the river would result in an increase in the population of fur animals. Waterfowl nesting and feeding habitat would be increased somewhat.

Seedskadee project, Wyoming

85. The purpose of the proposed Seedskadee project would be to irrigate 60,720 acres of sagebrush land on both sides of the Green River in Lincoln and Sweetwater Counties, Wyo. A diversion dam would turn water from the Green River into a canal where a system of pumps and siphons would deliver it to the irrigation areas.

86. The mediocre fishery of the river extending 39 miles below the diversion would be adversely affected by depleted streamflows and occasional periods of no flow during the irrigation seasons. Fish screens are planned for the main canal near the headworks.

87. The project would cause a loss to big game through a reduction in range. There would be a loss in the sage-hen population, but other species of upland game would probably increase. Fur-animal values would be slightly reduced. Some nesting and resting areas for waterfowl would be created.

La Barge project, Wyoming

88. The proposed La Barge project would consist of a wing-type diversion dam and headworks on the Green River near Big Piney, Wyo., and a 38-mile-long canal to provide water for irrigation of 7,970 acres of land along the west side of the river.

89. The La Barge project alone would not adversely affect the fishery of the Green River, but would increase the damage that would be caused by the proposed Seedskadee project. Irrigation of the sagebrush lands would decrease the range of deer and antelope, causing some loss to these species, while the presence of the canal and farm fences would partially restrict the migration of elk through the area. Establishment of open lanes through the irrigation area with means of access for the migrating animals would reduce this restriction. Habitat for upland game with the exception of sage hens, would be increased and improved by the project. Fur animals would not be unfavorably affected by the La Barge project alone; however, the adverse effects of the proposed Seedskadee project would be increased by operation of the La Barge project. Resting and nesting habitat for waterfowl would be slightly increased by the project.

Silt project, Rifle Creek, Colo.

90. The Silt project, consisting of a 300-acre reservoir and a distribution system, is designed to irrigate 1,900 acres of new land and provide supplemental water to 5,400 acres already irrigated.

91. Fish and wildlife would be benefited as a result of the project. Big game would not be affected; however, habitat of upland game, fur animals, and waterfowl would be increased. The present low quality fishery of the 7 miles of Rifle Creek below the dam would be improved if reservoir releases recommended by the Fish and Wildlife Service are made.

Smith Fork project, Colorado

92. The Smith Fork project, consisting of a 420-acre reservoir, diversion canal, and irrigation system, would furnish supplemental water to 8,160 acres and a full supply to 2,270 acres of new land in the Cottonwood Creek and Smith Fork River areas of western Colorado.

93. Little change would occur in the fish and wildlife resources of the area as a result of the project. The fishery of Smith Fork would not be materially altered by the project because of present water priorities that must be maintained. The proposed impoundment would not provide a valuable fishery because of the severe fluctuations and poor quality of the water. A small amount of mule deer winter habitat would be lost; however, upland game, especially pheasants, would be benefited by the food provided on the new land to be irrigated. Value of the project area would be slightly decreased for fur animals but increased somewhat for waterfowl.

Suggestions and Recommendations

94. The foregoing statements were based upon information developed prior to November 1, 1950. Therefore, the Fish and Wildlife Service and the appropriate State fish and game departments should be advised of changes in project plans or methods of operation, as soon as they are anticipated rather than when they become final, so that the reports being prepared may include provisions to prevent damages to fish and wildlife.

95. The Fish and Wildlife Service, the fish and game departments of the States concerned, and the construction agency should confer in the early stages of project planning to formulate a general memorandum of understanding in order to establish a plan of procedure wherein fish and wildlife problems can be effectively presented.

96. The Fish and Wildlife Service, the State fish and game departments concerned, the Bureau of Reclamation, and the irrigation districts should enter into agreements, which would cover such assistance as the Bureau and the districts can reasonably and lawfully provide, making land within each of the districts accessible for public hunting and fishing and otherwise assuring that the maximum possible benefits are realized from the fish and wildlife resources.

97. Leases of Federal land in the project areas should stipulate the right of public access for the purpose of hunting, fishing, and other uncommercialized recreational purposes.

98. Management of the fish and wildlife resources in the project areas should be vested in the States concerned.

99. The Fish and Wildlife Service, the State fish and game departments, and other appropriate State agencies concerned should be given the opportunity to participate in the early planning of auxiliary features of the projects so that adequate road and trail systems and other management developments may be constructed to facilitate public access.

100. Title to all lands within the reservoirs and for an agreed-upon distance from the perimeters at maximum pool elevations should be acquired in fee simple, or through the transfer of property, and be vested in the United States Government for the purpose of providing free public access.

101. No part of the reservoir areas or the acquired strips surrounding the reservoir areas should be leased for the exclusive benefit of any corporation, individual, or groups of individuals for any purpose which would prevent or interfere with the use of project areas for recreation, hunting, or sport fishing by the general public.

102. The Soil Conservation Service or other proper land-management agency should be consulted concerning the employment of proper soil-conservation practices on the project lands and their recommendations should be incorporated in the overall plan for enhancing fish and wildlife habitat.

103. Releases from the reservoirs and diversions below dams should be accomplished by gradual operations of the gates to avoid sudden changes in the flows below the dams and rapid changes in reservoir pool levels.

104. Minimum flows to protect the fisheries in streams affected should be guaranteed as part of the operation of the proposed project.

105. Precautions should be taken during the period of construction to prevent excessive damages to fish and wildlife.

106. In making investigations and preparing detailed reports on the fish and wildlife aspects of individual units and participating projects, recommendations will be made to protect or enhance fish and wildlife values. Following are listed recommendations expected to apply to at least some of the projects.

(*a*) All timber and heavy vegetation be cleared from specified areas of the reservoirs to permit efficient seining operations.

(*b*) Adequate facilities be developed for the protection and management of migratory fishes affected by the project and for the prevention of loss of fishes through power tunnels, pumping plants, or diversion canals.

(*c*) The State fish and game departments concerned be notified of water shutoffs in sufficient time to allow fish to be salvaged from affected stream sections.

(*d*) Provision be made for the possible development of unaffected as well as affected streams so that anticipated losses to fish and wildlife may be mitigated.

(*e*) Grazing by livestock be prohibited or controlled along the reservoir margins and about project works to permit vegetative cover to become established.

(*f*) Waste areas, such as gullies and seeps, be planted and maintained for the benefit of wildlife to offset losses in wildlife habitat occasioned by project construction.

(*g*) Project plans include provisions for the control of domestic and industrial pollution in both the reservoirs and streams of the project areas in accordance with good management practices as well as established State and Federal laws.

(*h*) Suitable lands within the flood pools be devoted to waterfowl food plantings and administered by an appropriate conservation agency.

(*i*) Migratory bird refuges, fish hatcheries, or other management areas and facilities be established, where conditions warrant, to enhance wildlife propagation based upon detailed operation and maintenance plans developed by the Fish and Wildlife Service and the State or States concerned.

JOHN C. GATLIN,
Regional Director.

PROGRAM

The Fish and Wildlife Service program for the protection, development, and utilization of fish and wildlife resources in the upper Colorado River Basin involves a wide variety of activities. The more important of these are the development of habitat and the production of game and fish. The success of these endeavors is made possible through use of techniques and information gained from biological research as to populations, requirements, and diseases of the different fish and wildlife species, and by construction and maintenance of refuges and fish hatcheries. Enforcement of wildlife conservation measures helps to protect the resource as does the cooperative control of injurious species of predators and rodents. The supervision of the Federal-aid acts to restore fish and wildlife and the coordination of fish and wildlife conservation measures on water development projects are becoming important functions of the Service.

A sizable portion of the economy of the upper Colorado River Basin is based on the sales and services involved in the harvesting of fish and game. Most of the lands in the upper basin lie in semiarid regions which have been utilized for production of domestic stock and wildlife. Increased populations, farming, irrigation, and industrial development have reduced the wildlife habitat, while the demand for game has increased tremendously. Past records give strong indication that continued increases can be expected in the pursuit of fish and wildlife for recreation. Fifteen years ago approximately 10,400,000 licenses were issued to hunt and fish in the United States. The latest figures indicate more than 26 million licenses are sold each year. This represents an increase of 150 percent, or about 10 percent annually. In less than 10 years receipts from license sales nearly tripled in both Utah and Wyoming, where each State reported annual harvests of fish and game meat in excess of 9 million pounds. The Colorado Department of Game and Fish reports the money turnover accruing directly from fish and wildlife resources in Colorado amounts to more than $50 million annually. These figures reflect the enormous value of fish and wildlife resources in the upper Colorado River Basin.

Some varieties of animal life are found on almost every acre of land or water throughout the basin. Changes in land use or water manipulation will affect these animals and consequently the fish and wildlife populations of the area. To determine the effect that project development would have on fish and wildlife and to suggest means of mitigating losses or preventing damage is the responsibility of the Office of River Basin Studies. This Office proposes to make surveys and investigations over a period of time sufficient to determine the status and trends of the resource and to determine the effect of the individual projects on the wildlife resources of the Nation.

Conservation aims and the methods of attaining them must be ever sensitive to change and must be constantly improved to meet the new demands. Since wildlife is probably the least static of all our natural resources the Service's program in the upper basin, as elsewhere, must be sufficiently flexible to permit modification to meet the inevitable but often unforeseeable changes in conditions that affect the resource.

Within the organization of the Fish and Wildlife Service are several branches which would need to adjust their programs according to the effect exerted by the upper Colorado River Basin development. The branches involved are described in the following paragraphs with specific reference to their more important functions. These functions all possess an underlying unity directed toward conserving the present populations and if possible increasing the fish and wildlife resources.

THE BRANCH OF WILDLIFE RESEARCH

The Branch of Wildlife Research plans, directs, and supervises the wildlife-research activities of the Service and is charged with the problems of conservation, restoration, and management of the wildlife resources of the Nation. The program, in part, consists of investigations on birds, mammals, and other wildlife, and includes studies of life histories, habits, and distribution. The Branch investigates damage caused by wildlife on agricultural and forest lands, and recommends methods for the reduction or elimination of such damage. It also studies the effect of insecticides and control chemicals on wildlife population.

The relative inaccessibility of many areas in the upper Colorado River Basin has not only obstructed an adequate management program for the wildlife of the area, but has retarded the research necessary for proper management. A research program to be carried out during the preconstruction and construction period seems advisable in order that probable changes might be anticipated.

The proposed Colorado River storage project reservoirs would inundate approximately one-half million acres of poor to excellent wildlife habitat displacing present populations and causing loss where ranges become overstocked, unless adequate habitat is developed.

BRANCH OF FISHERY BIOLOGY

The responsibility for fishery-research activities of the Service rests with the Branch of Fishery Biology. In addition to numerous phases of marine research, it studies the habits, ecology, and distribution of anadromous and fresh-water fishes. The effects of both commercial and sport fishing upon populations are also studied. Recommendations for conservation of fishery resources, improvement of fish-cultural methods, and prevention and control of hatchery fish diseases are made by this branch. It also approves designs, and operates fishways and fish screens to minimize losses from project works.

The Branch would be responsible for investigating the fishery potential of the various reservoirs of the upper Colorado River Basin and for determining the need and feasibility of introducing more suitable species. An integrated research program that would include study of the entire basin should be instituted so that such aspects as the correct species to be introduced into the different waters, their effect on the species already present, and the proper management techniques could be applied.

BRANCH OF WILDLIFE REFUGES

The Branch of Wildlife Refuges plans and executes an integrated wildlife program for the establishment of refuges for migratory waterfowl, big game, and other forms of wildlife. Units of the

program may vary from mere protection during breeding seasons to complex restoration or development of habitat for the preservation and propagation of many species. To expedite the program a wide range of information from extensive investigations is necessary.

Migratory waterfowl and big game refuges are the predominant types of refuges existing in the States that would be influenced by the project.

Waterfowl refuge management is dependent upon proper utilization of available water, thus any proposed water manipulations that may affect the waterfowl program is of utmost importance to the Branch of Wildlife Refuges.

Possible refuge sites within the project area would be examined by this Branch and if finally approved the resulting refuge would be administered by it or by the State game conservation department under proper agreement.

BRANCH OF GAME MANAGEMENT

The Branch of Game Management administers and enforces the Federal statutes for the protection and conservation of migratory birds, mammals, and game and food fishes involved in interstate movement. Its principal responsibility is the apprehension and prosecution of offenders of these statutes. In the enforcement of these laws, close cooperation is maintained with State conservation agencies and organized sportsmen's groups.

The Branch conducts the annual midwinter waterfowl inventory to obtain data on the continental population of these birds by species. It studies nesting conditions, conducts bag checks, collects other hunting and game kill data, and recommends administrative regulations under the Migratory Bird Treaty Act based on bird populations, hunting pressure, and other available factual information.

The Branch has the responsibility for issuance of permits to take, possess, sell, and otherwise traffic in migratory birds for scientific and propagating purposes. It works closely with the United States Customs Service in preventing the unlawful importation of wild birds and mammals. Similar cooperation is carried on with postal inspectors and Railway Express officials to obtain records of unlawful interstate shipment of wild birds, fishes, mammals, and parts thereof. The Game Management Branch with assistance from county agricultural agents investigates depredation to crops by migratory birds, develops and demonstrates methods and devices for abating such damages, and works toward the elimination of such losses. It also disseminates information to the public about game laws and practical conservation through newspapers, schools, and farmers' and sportsmen's organizations.

The Colorado River storage project would tend to increase the human population, intensify the agricultural activities in the basin and would provide new means of public access to this relatively inaccessible country. These changes would necessitate increased supervision and administration by the Branch of Game Management in conserving, protecting, and managing the wildlife resources of the basin.

THE BRANCH OF PREDATOR AND RODENT CONTROL

The Branch of Predator and Rodent Control plans and directs cooperative predator and rodent control operations throughout the United States. This work includes use of various control measures for the protection of livestock, poultry, stored foodstuffs, and agricultural crops as well as beneficial species of wildlife and native vegetation. The Branch operates with the public-health services in initiating rodent-control measures in areas where disease-carrying animals may create a health hazard. Field investigations and demonstrations facilitate control measures in these programs.

Within the upper Colorado River Basin, funds are not available to put into operation such overall control plans as are deemed necessary. Predator and rodent-control work, therefore, is confined to critical areas depending upon the season of the year and the species requiring control. Expanded agricultural activities resulting from the Colorado River storage project would necessitate further control of injurious animals, some of which now present only minor or local problems. Irrigation produces improved habitat for some rodent species.

BRANCH OF FEDERAL AID

The Branch of Federal Aid is concerned with the administration and use of federally collected funds made available to the State game departments through the Pittman-Robertson Act and the newly enacted Dingell-Johnson bill. The activities of this Branch include supervision of matters pertaining to the management of areas acquired, developed, or maintained by cooperating States under the provisions of the acts, and advising the States with regard to biological research and land-development activities for effective fish and wildlife restoration. It assists the State fish and game departments in the formulation of sound management plans and programs relating to upland game, big game, waterfowl, fur-bearing animals, and fishes.

The Colorado River storage project with its numerous water developments and resulting irrigation areas would afford numerous opportunities for the Branch of Federal Aid to cooperate with the States in planning and developing efficient fish and wildlife-management programs.

THE BRANCH OF GAME FISH AND HATCHERIES

The Branch of Game Fish and Hatcheries is concerned with two separate but closely integrated phases of fisheries conservation. First, management plans are formulated and recommended for waters under Federal jurisdiction; cooperation is given other conservation agencies and individuals in the development of management programs for public and private waters.

Second, hatcheries and rearing ponds are operated to produce and distribute, to the extent funds will allow, the fish species, sizes, and numbers which are required to fill the stocking needs as well as to furnish considerable numbers for further rearing and distribution by State conservation agencies.

Development of proposed water storage facilities in the upper Colorado River Basin will create further demands on both phases of the work carried on by the Branch of Game Fish and Hatcheries. Of particular importance will be the increased need for advanced fingerling and larger sizes of trout to maintain the fishery of high elevation impoundments, and for warm water species to stock impoundments at lower elevations. The Service at the present time furnishes virtually all of the warm-water species stocked in the area concerned.

OFFICE OF RIVER BASIN STUDIES

The Office of River Basin Studies, acting in cooperation with the State fish and game departments and the other branches of the Fish and Wildlife Service, is responsible for investigating water-resource development projects to insure proper consideration of fish and wildlife needs. The objectives of such investigations are to determine the project's effect on fish and wildlife and to prevent damage which might result from project construction, point out means of developing or rehabilitating habitat, alleviate pollution and assist in planning for propagation and refuge facilities. The work is carried on in cooperation with the project sponsor and other Government agencies, as well as the State fish and game conservation departments of the States concerned.

The development of the Colorado River storage project with its many dams, reservoirs, irrigation areas, and related works would cause changes in the present land use in the basin which would have a pronounced effect on the fish and wildlife of the area. This effect must be considered in developing sound policies for reducing losses and in making recommendations to insure maximum fish and wildlife production on project areas.

The cost of surveys made by the Office of River Basin Studies is paid by the sponsor of the project as provided in Public Law 732, 79th Congress (60 Stat. 1080) an act to promote the conservation of wildlife, fish, and game and for other purposes.

If provision is made in the final project plans to maintain fish and wildlife populations displaced from all the habitat that will be inundated, in the half million acres of proposed reservoirs, the acquisition and construction costs may well exceed $10 million with operation and maintenance costs of $250,000 per year. The costs of maintaining fish and wildlife adversely affected by the project would be in addition to the expanded program the Fish and Wildlife Service contemplates in the upper Colorado River Basin region as proposed in the following program.

Estimate of funds required by the Fish and Wildlife Service for comprehensive developments in the area influenced by the Colorado River storage project

Branch activity	Current year	Fiscal years, beginning with year of project authorization						Total for initial 6-year period
		First	Second	Third	Fourth	Fifth	Sixth	
Management of fish and wildlife resources:								
Administration of fish and game laws	$14,762	$19,600	$20,050	$20,600	$21,050	$21,600	$22,000	$124,900
Propagation and distribution of food fishes [1]	11,934	30,350	57,150	57,900	57,050	59,400	58,350	320,200
Mammal and bird reservations	20,184	41,600	44,000	45,000	42,000	42,600	42,600	257,800

Public Health Aspects of the Colorado River Storage Project and Participating Projects

The Colorado River storage project and participating projects would consist of a combination of dams, reservoirs, powerplants, and other appurtenant structures on the upper Colorado River and its principal tributaries. The project would provide a means for the full development of the water resources and long time regulatory storage needed to permit States of the upper basin to meet their flow obligations at Lee Ferry, as defined by the Colorado River compact, and still utilize their apportioned share of water. Lee Ferry, in northern Arizona, is the dividing point on the river between the upper and lower Colorado River Basins. During periods of low streamflow, the States would release storage water to meet the Lee Ferry flow obligation and in exchange they would divert upstream-flow for use in the upper basin. The project would provide some water for direct use in the upper basin. In addition, the project would control sediment, abate floods, facilitate recreational development, and aid in fish and wildlife conservation. It also would permit production of a substantial amount of the electric energy needed in the upper basin and adjacent areas.

All projects authorized subsequent to approval of the upper Colorado River Basin compact that would consume water of the upper Colorado River system are considered to be dependent on the storage project for an assured water supply. Such projects have been designated as dependent projects. Benefits from irrigation, municipal, industrial, and related uses in the upper basin would be realized only with the construction of dependent projects. In this respect, the importance of the dependent projects is illustrated by the fact that the central Utah project, one of the major projects in this category, provides for 47,100 acre-feet of water annually for municipal, industrial, and related uses.

Construction Phase of Project

Public-health services in the upper Colorado River Basin are limited and the State and local health units are not adequately staffed in most cases to cope with local public-health problems. The large construction program that will be required during the development stage will be located in rural and isolated areas. The influx of construction workers into areas without proper facilities to care for their needs or to provide for their families may create acute public-health problems involving proper medical care and the provision of adequate sanitary facilities. In some cases, the construction work will be carried on in relatively remote areas and accommodations will have to be provided for the influx of workers and their families. In most cases, temporary camps will be provided for construction workers and facilities of a more permanent nature will be provided for Bureau of Reclamation employees. Problems which may be encountered will include adequate housing, development of safe and ample water

supplies, proper sewage disposal, adequate garbage and refuse disposal, insect and rodent control, proper food-handling facilities and their control, safe sources of milk and meat supplies, and adequate medical care. Sanitary surveys of proposed construction camps by representatives of the State health departments or Public Health Service would be of considerable value in revealing public-health problems that may be encountered during the construction phase of the projects. Plans of proposed sanitary installations should be forwarded to the respective State health departments for approval prior to construction so that the sanitary facilities to be provided will meet the requirements of the State health departments.

Some of the proposed impoundments will flood areas occupied by rural communities. In the relocation of these communities, precautions should be taken to remove or dispose of all wastes prior to the flooding in order to eliminate all sources of pollution. The wastes should be disposed of in accordance with the requirements of the local health authorities. Proper sanitary facilities should be provided for each community. These should include a water supply system with a safe and adequate source of supply, proper sewage disposal and treatment, and adequate garbage and refuse disposal.

In connection with industrial health hazards that may be encountered on construction projects, arrangements should be made for the prevention of health hazards and accidents and for the emergency treatment of injuries.

PROPOSED RECREATIONAL DEVELOPMENT

The impoundments that will be developed will provide opportunities for the development of recreational areas on the adjoining watersheds. Most of these areas will be accessible to the public over highways that will be provided during the construction stage of development. Under these conditions, the areas that provide opportunities for fishing, boating, bathing, hunting, and hiking may be developed for recreational purposes. The areas that are of unusual scenic interest may also be considered for development.

The development of recreational areas in the vicinity of proposed impoundments may create public health problems if local sanitary requirements are not enforced. In addition to the possible effects of these installations on the use of the impounded waters for domestic water supplies at recreational areas or for irrigation purposes, the problem of providing adequate and safe sanitary facilities for the public at recreational areas is important from a public health standpoint. These problems include a safe and ample water supply, proper sewage disposal, adequate garbage and refuse disposal, insect and rodent control, proper food handling facilities, and safe sources of milk supply. Proper design, construction, operation, and maintenance of resorts, tourist courts, private cabins, fishing camps, and boating and bathing facilities at proposed recreational areas are essential both for the protection of visitors and for the maximum benefit of subsequent water users. Sanitary requirements recommended by the State health departments or the Public Health Service should be adopted and enforced to solve the public health problems which will be encountered.

STREAM POLLUTION PROBLEMS

The upper Colorado River drainage basin is sparsely populated and according to the census, 286,450 people were residing there in 1940. The average density was 2.6 persons per square mile, compared with the national average of 44.2 persons per square mile. Grand Junction, Colo.; Rock Springs, Wyo.; Durango, Colo.; Price, Utah; Montrose, Colo.; and Delta, Colo., are the 6 largest towns in the upper drainage basin, but their combined 1950 population is only 47,600. The population in these communities ranges from 14,454 for Grand Junction to 4,077 for Delta, the largest and smallest towns respectively, in this group.

Agriculture, particularly livestock raising, and mining are the principal industries of the upper drainage basin. The processing of agricultural products on a small scale is practically the only manufacturing undertaken in this area. Three factories are available for the processing of fruits and vegetables, and two for the processing of sugar beets and the refining of sugar.

The upper drainage basin is the leading domestic source of vanadium, uranium, molybdenum, and radium ore. Zinc, lead, silver, and gold deposits there also are commercially important. Large coal fields in the upper drainage basin are being extensively worked. About 15 million tons of coal were mined in 1943. Oil and gas are produced in the San Juan River Basin, the Uinta Basin, and in northwestern Colorado. Several producing fields have been developed recently and widespread exploration is continuing. Pilot plants are being operated to determine the best methods of extracting oil from shale.

Under conditions that prevail in the Colorado River Basin at this time, stream pollution problems are considered of minor importance with the exception of a few problems of a local nature. This picture may change materially under expanded industrial development. Although untreated domestic and industrial wastes are discharged into the streams in the Colorado River Basin, the pollution problems that are encountered are confined to local areas due to the limited volume of wastes in proportion to the water available for dilution purposes. Adequate treatment of these wastes prior to disposal is considered essential when the untreated wastes are detrimental to the subsequent use of water below points of pollution.

Large-scale industrial development in the Colorado River Basin may alter the problem of stream pollution to a considerable extent. The industries that may be involved in future development and expansion include: (1) Processing of oil and oil products from vast reserves of oil shale, (2) manufacture of wood pulp and paper, (3) development of major oil fields, (4) further expansion of mining, and (5) processing of food and meat products. Untreated wastes from some of these developments some day may be responsible for pollution which could debase the quality of water to be used for irrigation and domestic purposes, development of recreational areas, and the propagation of fish and wildlife. Most of these problems can be solved by the State health authorities in requiring adequate waste treatment and by the cooperation of industry in voluntarily providing treatment facilities. However, where these wastes will not respond to conventional or known methods of treatment, studies and investigations should be made by industry and the State health authorities in order

to solve these problems. The cooperation of all interested parties is considered essential to the elimination of existing and new sources of water pollution.

Studies to determine the present and future requirements for controlling water pollution in the upper Colorado River Basin are now being made by the States of that area in cooperation with the Public Health Service.

Natural purification that will take place in the proposed impoundments by means of prolonged storage, sedimentation, aeration, and biological changes should improve the physical and bacteriological quality of the water to a marked degree. The greater part of the sediment and soil pollution that will enter all impoundments will be removed or transformed into inert material by the processes referred to. This will produce water of a quality desirable not only from a physical and bacteriological standpoint, but also for various purposes including irrigation, domestic purposes, fish and wildlife development, and recreation. These conditions will prevail if adequate treatment is provided for all domestic and industrial wastes responsible for stream pollution.

MOSQUITO CONTROL

The development of the Colorado River storage project and participating projects may increase the population of mosquito vectors of certain diseases endemic within the boundaries of the project. These increases will probably not be significant over the entire project area. However, unless proper considerations are included in the project, it is believed that in certain locations these increases will be of considerable importance. Determinations of existing conditions relative to mosquito species and densities are necessary for proper evaluation of future developments that may grow out of the project. Investigations for such purposes should be made by public health authorities and completed in sufficient time to permit action which will tend to minimize mosquito production where it is important to the public health to do so.

COMMENTS

COMMENTS, GOVERNOR OF ARIZONA

OFFICE OF THE GOVERNOR,
Phoenix, Ariz., June 19, 1951.

Mr. WESLEY R. NELSON,
Assistant Commissioner, Department of the Interior,
Bureau of Reclamation, Washington, D. C.

MY DEAR MR. NELSON: At last we have completed our study of the report on the Colorado River storage project and participating projects. We apologize for the delay in supplying the enclosed material, but there have been complications over which we had no control.

Incidentally, we appreciate this opportunity to give you the views and recommendations of the State of Arizona.

Beginning with those portions of the report dealing with the generation, transmission, and sale of electric power and energy, we submit the following:

Although the Glen Canyon unit is located above Lees Ferry and therefore wholly within the upper Colorado River Basin, the Glen Canyon Dam site and the proposed Glen Canyon powerplant are both located within northern Arizona, about 13 river miles downstream from the Utah-Arizona State line and 15 miles upstream from Lees Ferry. Despite this fact, the report makes no provision for sale and delivery of electric power and energy in Arizona, as a part of the considered power market.

The market area considered by the report for most of the power to be generated by the Colorado River storage project lies outside of the area contained within the upper Colorado River Basin. A large potential market for such power is shown in the Bonneville Basin around Salt Lake City. This area lies largely within the boundaries of region 4 of the Bureau of Reclamation, but outside and just west of the upper Colorado River Basin. An even larger potential market is shown in the report as contained in three fringe areas in the States of Wyoming, Colorado, and New Mexico. Each of these fringe areas lies largely outside of both the upper Colorado River Basin and region 4. The potential market in Arizona is not included among the so-called fringe areas, although a small part of the State lies within the upper Colorado River Basin and the State contributes within that area one of Arizona's natural resources, the Glen Canyon Dam site and powerplant. This powerplant is proposed for an installed capacity of 800,000 kilowatts, or almost one-half of the total installed capacity of 1,622,000 kilowatts proposed for the Colorado River storage project.

The tentative project power system shows proposed transmission lines throughout that portion of the market area contained within

region 4. No transmission lines are shown as proposed within the three fringe market areas of Wyoming, Colorado, and New Mexico. Transmission interconnections are shown, however, not only between the region 4 market area and the three fringe areas, but between region 4 and Arizona at Glen Canyon and between region 4 and southeastern Idaho. The statement is made that other lines are planned to permit energy from region 4 to be interchanged with energy produced by Bureau projects in other regions in Arizona, California, Colorado, Idaho, Nevada, New Mexico, Utah, and Wyoming.

The report proposes that firm energy will be sold at an average rate of 5.5 mills per kilowatt-hour, and that firm energy produced in advance of market needs would be sold at an average rate of 3 mills per kilowatt-hour. Although the point, or points, of delivery at which such average rates would apply are not set forth in the report, it could be assumed that such applicable points of delivery will be on the transmission system within the boundaries of region 4. This would mean that any energy delivered in the fringe market areas of Wyoming, Colorado, and New Mexico would have to stand a transmission charge in addition to the 5.5 or 3 mills per kilowatt-hour. This is not borne out, however, by the fact that the 5.5 mills per kilowatt hour average rate for firm energy in the market area is considered reasonable when compared with the estimated cost of generation at future steam electric installations at Salt Lake City, Denver, and Albuquerque. Such installations were assumed to include units as large as 100,000 kilowatts, and it was estimated that energy could be produced, with annual generation at 60 percent plant factor, at an average rate of approximately 6 mills per kilowatt-hour at the high voltage side of the plant. This would indicate that the average rate of 5.5 mills per kilowatt-hour was assumed to be applicable to deliveries of energy in the three fringe market areas as well as within region 4. Such a conclusion is also borne out by the fact that the report includes the potential market within the three fringe areas in determining market needs. The balance of available firm energy, considered in excess of such market needs, is to be sold at 3 mills per kilowatt-hour.

Future steam electric installations in southern Arizona, operating at 60 percent annual plant factor, are estimated to produce energy at 6 mills per kilowatt-hour or less. This means that energy will have to be delivered in southern Arizona, as well as in the three fringe areas, at the average rate of 5.5 mills per kilowatt-hour without additional transmission costs, in order to be competitive with local generation.

The Glen Canyon unit is estimated in the report to cost as follows:

Dam and reservoir	$175, 877, 000
Powerplant	75, 801, 000
Transmission system	108, 000, 000
General property	4, 250, 000
Construction facilities	1, 400, 000
Total all classes	363, 928, 000

The installed capacity is proposed for 800,000 kilowatts and the generation is estimated at 1,710 million kilowatt-hours in 1959 increasing to 4,337 million kilowatt-hours in 1976.

The annual costs of the Glen Canyon unit, including operation, maintenance, and replacement, are estimated in the report at:

Dam and reservoir	$93, 500
Powerplant	1, 602, 700
Transmission system	2, 732, 400
Total	4, 428, 600

Based on the above estimates and for the assumed conditions, energy produced at Glen Canyon would cost:

(*a*) Delivered on the transmission system charged to Glen Canyon, allowing 10 percent for losses and with the generation estimated for 1959—2.88 mills per kilowatt-hour.

(*b*) Delivered on the transmission system charged to Glen Canyon, allowing 10 percent for losses and with the generation estimated for 1976—1.13 mills per kilowatt-hour.

(*c*) Delivered at Glen Canyon without charges for transmission and with the generation estimated for 1959—0.99 mills per kilowatt-hour.

(*d*) Delivered at Glen Canyon without charges for transmission and with the generation estimated for 1976—0.39 mills per kilowatt-hour.

The early completion of construction of the Bridge Canyon project, so that operation could begin in 1956, should provide sufficient generation to meet the estimated increased power-market needs for Arizona by that time. In anticipation of such power needs, the Arizona Power Authority has filed an application with the Secretary of the Interior for the entire commercial output of the Bridge Canyon powerplant when available. Arizona must look to a portion of the output of Glen Canyon powerplant to meet its probable needs after 1957, and this need for power from Glen Canyon would be increased should Arizona not be allocated the entire commercial output of Bridge Canyon.

In view of the fact that Arizona is one of the Upper Colorado River Basin States and that the Glen Canyon Dam site and powerplant are located within and constitute a natural resource of the State of Arizona together with consideration of the estimated cost of power generation at Glen Canyon and the possible power-market needs of Arizona, it is recommended that the Secretary of the Interior be requested to include the State of Arizona in the project power market area as fringe area D (Arizona) and that energy be made available to that fringe area on the same basis as proposed for the other three fringe areas. In this connection, it would likewise seem equitable that fringe area C (New Mexico) be increased to include the western edge of that State and that the southwestern portion of Utah also be included in the project power market area.

Turning now to another aspect of the Colorado River storage and participating projects report, we would like to say that we concur in the conclusions listed on pages 20 and 21 of the report, which are as follows:

40. The Colorado River storage project would provide necessary regulatory storage by a combination of reservoirs on the Colorado River and its tributaries above Lee Ferry. All projects that would consume water of the Upper Colorado River system, authorized subsequent to approval of the Upper Colorado River Basin compact, are considered to be dependent on river regulation for an assured water supply.

41. Reservoirs of the Colorado River storage project would provide a total storage capacity of about 48,555,000 acre-feet. In 200 years at the present rate of erosion about 20 million acre-feet of the capacity would be occupied by sediment, leaving 25,941,000 acre-feet of active capacity for river regulation and direct use of water in the upper basin and 2,614,000 acre-feet of inactive capacity for creation of power heads, fish and wildlife propagation, recreation, and other purposes.

42. Releases from regulatory reservoirs would produce substantial amounts of electric energy. Power load growth trends indicate that the project power output would readily be absorbed in the power-market area.

43. The Colorado River storage project has engineering feasibility and is economically justified.

44. The initial construction program would include the Echo Park, Flaming Gorge, Glen Canyon, Navajo, and Whitewater units. These would be constructed in an orderly schedule. Construction of the Whitewater, Echo Park, and Glen Canyon units should be started immediately.

45. Revenues from the sale of electric energy generated by units of the Colorado River storage project would be more than sufficient to pay all reimbursable costs of the project within a period of 50 years after installation of the last generating unit. Project power revenues also would be available to assist irrigators in the payment of construction costs of economically justified and urgently needed participating projects. Financial assistance could best be rendered irrigators through establishment of an upper Colorado River account.

46. Development of the Colorado River storage project and participating projects is essential to the comprehensive development of the upper basin's natural resources. It would provide flexibility in the basin development and coordination of the interests of the Nation and States of the upper Colorado River Basin.

We further concur in the statement on the bottom of page 18 of the report, to the effect that the construction of the holdover reservoirs will assist the States of the upper division in meeting their obligations to make deliveries to the lower basin at Lee Ferry.

We, therefore, recommend that all assistance possible be given to the States of Colorado, New Mexico, Utah, and Wyoming, and the Bureau of Reclamation in securing the expeditious construction of the features proposed in the report, reserving the right to examine the provisions of any bill which may be offered to authorize the construction of the project, particularly Glen Canyon Dam, which is wholly within the State of Arizona.

If there are any questions concerning Arizona's reactions to your Colorado River storage and participating projects report, we would be more than happy to provide the earliest possible answers.

Sincerely,

HOWARD PYLE, *Governor.*

COMMENTS BY DIRECTOR, ARIZONA GAME AND FISH COMMISSION

ARIZONA GAME AND FISH COMMISSION,
Phoenix, Ariz., February 23, 1951.

ALBERT M. DAY,
Director, United States Fish and Wildlife Service,
Washington 25, D. C.

DEAR MR. DAY: Reference is made to your request that the State of Arizona review the report of the activities and proposed programs of the Fish and Wildlife Service as it applies to the Bureau of Reclamation's departmental report on the Colorado River storage project.

Please be advised that the State of Arizona agrees wholeheartedly with the program as submitted by the Fish and Wildlife Service. There is one item, however, which in our opinion needs clarification. It has been stated that acquisition and construction costs to maintain

fish and wildlife populations may well exceed $10 million, but no definite recommendations have been made as to which agency shall be responsible for requesting the funds and for carrying out the development program. I find no recommendation made in this regard by the Fish and Wildlife Service and likewise none has been made by the Bureau of Reclamation. Public Law 732, 79th Congress (60 Statute 1080) provides that when wildlife values are destroyed by river basin development they shall be replaced in kind. We wholeheartedly agree with the provisions of this public law, but we feel that some definite course should be recommended and outlined for carrying out the provisions of the act. In this respect we feel that no appropriation should be made for river basin development work unless at the same time appropriation is made to restore wildlife values which would be destroyed by the completion of the project. We strongly urge that this policy be adopted by the Bureau of Reclamation in conformance with the provisions of Public Law 732.

It is also noted that in the estimate of funds required by the Fish and Wildlife Service there is included an item for the administration of fish and game laws. We are wondering whether or not this is the proper title for this proposed expenditure. We have always been of the opinion that the States held the authority to administer fish and game laws, and I assume that this means the branch of game management which administers and enforces the Federal statutes for the protection and conservation of migratory birds, mammals and game and food fishes involved in interstate movement. In order to eliminate any confusion in this respect I would suggest that this item be made to conform with the Federal authority as above stated.

Yours very truly,

THOMAS L. KIMBALL,
Director, Arizona Game and Fish Commission.

Approved:

HOWARD PYLE, *Governor.*

COMMENTS, CALIFORNIA DIVISION OF PUBLIC WORKS

DEPARTMENT OF PUBLIC WORKS,
Sacramento, Calif., June 14, 1951.

Hon. OSCAR L. CHAPMAN,
Secretary of the Interior,
Washington, D. C.

MY DEAR MR. SECRETARY: Your proposed report entitled "Colorado River Storage Project and Participating Projects, Upper Colorado River Basin," dated January 26, 1951, was received on February 15, 1951, for review in accordance with the provisions of Public Law 534, 78th Congress, 2d session. On the latter date, the report was transmitted to the State engineer for review and comment thereon. The State engineer has submitted his comments, in which I concur and request that they be considered as expressing the views of the State of California on your proposed report.

Very truly yours,

C. H. PURCELL,
Director of Public Works.

STATEMENT OF THE STATE OF CALIFORNIA ON PROPOSED REPORT OF THE SECRETARY OF THE INTERIOR ENTITLED COLORADO RIVER STORAGE PROJECT AND PARTICIPATING PROJECTS

INTRODUCTION

In accordance with section 1 of the Flood Control Act, approved December 22, 1944 (Public Law 534, 78th Cong., 2d sess.), on January 30, 1951, the Assistant Commissioner of Reclamation transmitted two copies of the proposed report of the Secretary of the Interior entitled, "Colorado River Storage Project and Participating Projects, Upper Colorado River Basin," to the director of public works, the official designated by Gov. Earl Warren as his representative in such matters, for his views and recommendations thereon. The report was received in the office of the director of public works on February 15, 1951, and referred on the same date to the State engineer, who is chief of the division of water resources, for review. One copy of the report was referred by the State engineer to the Colorado River Board of California on February 23, 1951, for comment of that board. Additional copies of the report and substantiating material were required for use in connection with the review of the report, and upon request, copies of the report and of reports on seven of the participating projects were transmitted on March 2, 1951, by the regional director, region 4, United States Bureau of Reclamation, to the State engineer and to the chief engineer, Colorado River Board. On April 17, 1951, copies of reports on two additional participating projects were furnished by the regional director, region 4, to the director of public works and to the chief engineer of the Colorado River Board, and on May 11, 1951, copies of two reports, which were all of the reports on participating projects prepared to date, were transmitted to the director of public works and chief engineer of the Colorado River Board.

On April 10, 1951, the State engineer addressed a letter to the Commissioner of Reclamation, as follows:

> Reference is made to letter from Mr. Wesley R. Nelson, Assistant Commissioner, United States Bureau of Reclamation, dated January 30, 1951, transmitting two copies of the Department of the Interior's proposed report on the Colorado River storage project and participating projects, to Mr. C. H. Purcell, director of public works. These reports were received in the director's office on February 15, 1951.
>
> On February 23, 1951, Mr. Purcell acknowledged receipt of the two copies of the report and stated that additional copies of the report and the substantiating material would be needed for this office and for the Colorado River Board of California. In accordance with the suggestion in Mr. Nelson's letter, a request was made to Mr. E. O. Larson, regional director at Salt Lake City, for the additional material.
>
> On March 2, 1951, Mr. Larson forwarded the additional copies of the report and supplemental reports on Florida project, silt project, Smith Fork project, and Paonia project in Colorado; Pine River project extension, Colorado-New Mexico; Hammond project, New Mexico; and Lyman project, Wyoming. This material was received on March 5, 1951. Reports on six of the recommended projects have not yet been received.
>
> In view of the delay in receiving sufficient copies of the main report on the Colorado River storage project, and the additional delay in receiving substantiating material it is anticipated that it will be necessary to ask the Secretary of the Interior to withhold transmittal of his report to the Congress until the comments of the State of California can be submitted.

By letter dated May 11, 1951, the Secretary of the Interior advised the director of public works as follows:

On January 30, 1951, copies of this Department's proposed report on the Colorado River storage project were sent to you by the Commissioner of Reclamation acting in my behalf, for the views and recommendations of the State of California in accordance with the provisions of section 1 (c) of the Flood Control Act of December 22, 1944. This act provides for a waiting period of 90 days during which the affected States may submit comments on the proposed report.

In consideration of the unanimous action taken by the Upper Colorado River Commission at its April 22, 1951, meeting, in passing a resolution urging an extension of the time for the submittal of comments and recognizing the complexities and magnitude of the project, the Department of the Interior will withhold transmittal of the report to the Congress until after June 15, 1951, in order to permit additional time for the States to comment on the report.

The Commissioner of Reclamation by letter dated May 17, 1951, advised the State engineer as follows:

Response to your letter of April 10, relative to the review of the proposed report of the Department of the Interior on the Colorado River storage project and participating projects, has been held up pending decision by the Secretary as to whether transmittal of his report to the Congress would be held up beyond the expiration of the 90-day period established by the Flood Control Act of 1944 for submittal of comments by the States on the Secretary's proposed reports

In consideration of the unanimous action of the representatives of the upper Colorado River Basin States in requesting an extension of time for submittal of comments on this report, the Secretary has decided to withhold transmittal of the report to the Congress until after June 15, 1951, so as to permit those States which require it additional time in which to submit comments. A letter to that effect has already gone forward from the Secretary to Mr. Purcell.

It is noted that at the time of writing your letter you had not received copies of the reports on six of the participating projects. By this time, you have undoubtedly received copies of the reports on central Utah and Emery County projects directly from Mr. Larson, and the LaBarge and Seedskadee project reports should be furnished you soon. These small projects in Wyoming would appear to have little, if any, effect on the State of California, and it is not expected that the delay in furnishing you with copies of the reports will affect the submittal date of comments. It is not contemplated that a participating project report will be made on the Eden project, certain features of which are, as you know, already under construction.

At the time the recommendations for the Colorado River storage project were formulated, we had expected that the report on the Shiprock project, New Mexico, would be completed before the present time. It is now clear that the report will not be completed in the immediate future; however, we are hopeful that the various interests concerned will soon reach agreement.

The proposed report of the Secretary of the Interior consists of (1) a letter, dated December 22, 1950, from the Commissioner, Bureau of Reclamation, to the Secretary of the Interior, which letter was approved on January 26, 1951, by the Secretary of the Interior; and (2) the interim report of the regional director, dated December 15, 1950, with substantiating materials. Reports on participating projects which have been received for review consist of the following:

Florida project, Colorado
Silt project, Colorado
Smith Fork project, Colorado
Paonia project, Colorado
Pine River project extension, Colorado-New Mexico
Hammond project, New Mexico
Lyman project, Wyoming
Central Utah project, Utah
Emery County project, Utah
LaBarge project, Wyoming
Seedskadee project, Wyoming

The Commissioner of Reclamation in his letter, dated December 22, 1950, to the Secretary of the Interior makes, among others, the following recommendations:

(*a*) That the plan of development of the water resources of the upper Colorado River Basin described in this report be approved.

(*b*) That authority be sought for the Secretary of the Interior acting pursuant to the Federal reclamation laws (act of June 17, 1902, 32 Stat. 388, and acts amendatory thereof or supplementary thereto) to construct, operate, and maintain (i) the following units of the Colorado River storage project:

Echo Park	Navaho
Flaming Gorge	Whitewater
Glen Canyon	

and (ii) the following initial participating projects subject to the terms of paragraphs (*c*) or (*g*), as appropriate, of these recommendations:

Central Utah (initial phase), Utah	Pine River extension, Colorado-New Mexico
Emery County, Utah	Seedskadee, Wyo.
Florida, Colo.	Silt, Colo.
Hammond, N. Mex.	Smith Fork, Colo.
La Barge, Wyo.	Paonia, Colo.
Lyman, Wyo.	

all as described in the report of the regional director but with such modification of, omissions from, or additions to the works as the Commissioner of Reclamation, with the approval of the Secretary, may find proper; * * *

(NOTE.—Paragraphs (*c*) and (*g*) set forth qualifications to be met by the participating projects.)

In the report of the regional director, the construction cost of the entire Colorado River storage project is estimated at $1,139,100,000, and the average annual operation, maintenance, and replacement costs are estimated at $9,732,100, with full project development.

COMMENTS

The voluminous reports on the Colorado River project and on the participating projects have been reviewed and studied by the State division of water resources and the Colorado River Board of California as fully as practicable within the limited time available under circumstances existing, and as permitted under provisions of the Flood Control Act, approved December 22, 1944.

It is the policy of the State of California to favor full development of the upper basin of the Colorado River system, utilizing the water apportioned to it under the Colorado River Compact.

The primary interest of the State of California in the specific projects set forth in the report of the Commissioner of Reclamation as approved by the Secretary of the Interior on January 26, 1951, is that in the construction and operation of any of these projects, California will receive its due apportionment of the waters of the Colorado River system as provided for in the Colorado River Compact and related laws, instruments, and documents. Therefore, the State of California favors congressional authorization of the specific projects set forth in the proposed report of the Secretary of the Interior or as may be modified, and their construction with Federal funds consistent with national welfare if (a) such projects qualify under criteria, policies, and procedures of the Congress, and (b) the diversion and utilization of the waters of the Colorado River system by and through these projects will not impair the rights of the State of California or any of

its agencies to the waters of that system as defined and set forth in the Colorado River Compact and related laws and documents.

Submitted by:

A. D. EDMONSTON,
State Engineer.

Approved with the understanding that the phrase "criteria, policies, and procedures of the Congress" refers to "uniform criteria, policies, and procedures to be established by the Congress."

COLORADO RIVER BOARD OF CALIFORNIA,
By FRANKLIN THOMAS, *Chairman.*

SACRAMENTO, CALIF., *June 14, 1951.*

OFFICIAL COMMENTS AND RECOMMENDATIONS OF THE STATE OF COLORADO ON THE COLORADO RIVER STORAGE PROJECT AND PARTICIPATING PROJECTS REPORT, UPPER COLORADO RIVER BASIN

(Project planning report No. 4–8a.81–1, December 1950)

JUNE 12, 1951.

The SECRETARY OF THE INTERIOR.

SIR: On behalf of the State of Colorado, and pursuant to section 1 of the act of December 17, 1944 (58 Stat. 887), there are herewith transmitted the comments, views, and recommendations of the State of Colorado concerning project planning report No. 4–8a.81–1, Bureau of Reclamation, Department of the Interior, dated December 1950 and entitled Colorado River Storage Project and Participating Projects, Upper Colorado River Basin. These comments, views and recommendations are submitted by the Colorado Water Conservation Board under the authority granted to that board by chapter 265, session laws of Colorado of 1937, as amended, and in accordance with the designation of such board by the Governor of the State of Colorado as the official State agency to act in such matters.

PRELIMINARY STATEMENT

The report is vitally important to Colorado because it deals with the only remaining unused major source of water in the State. It has been well said that the Colorado River is Colorado's last waterhole.

The need for water in Colorado is ever present. Many of the important cities and towns of the State need substantial additional quantities of water if they are to grow and prosper. Denver, Grand Junction, Pueblo, Colorado Springs, Boulder, and other communities all look to the Colorado River water to sustain their growing populations. In all areas of the State more water is needed for agricultural pursuits. The livestock growers demand more irrigated pasture and meadow land. Industrial needs are rapidly increasing. Vast oil-shale and coal deposits are available for synthetic liquid-fuel production. Enormous timber reserves await development under a sane conservation program. The industrialist, the farmer, and the city dweller demand more and more hydroelectric power. The satisfaction of these demands will enhance both State and national welfare. Colo-

rado sees in the Colorado River storage project a means of expediting the attainment of the desired development.

Colorado greatly appreciates the expeditious manner in which the Secretary of the Interior and the Bureau of Reclamation have prepared and submitted the report now under consideration. It has quickly followed the consummation of the Upper Colorado River Basin compact. The Bureau of Reclamation, in full compliance with the spirit and intent of the Flood Control Act of 1944, has kept the States directly affected fully informed during the course of its investigations. The Department of the Interior and its several agencies, particularly the Bureau of Reclamation, are to be commended for the manner in which this important undertaking has been handled.

GENERAL COMMENTS

The general plan set forth in the report is acceptable to and approved by Colorado. Upper basin holdover storage must be provided to equate the Lee Ferry flows so that the upper basin may utilize the water apportioned to it by the 1922 compact without the upper division States violating their obligation not to deplete the Lee Ferry flow below the quantity required by that compact. The necessity for such storage was recognized by the negotiators of the 1922 compact and from time to time has been recognized by all basin States. Reservoirs which provide such holdover will also fill the important role of retaining silt so that the usefulness of the great lower basin reservoirs may be prolonged. It is indeed fortunate that the cost of these reservoirs may be financed through the generation and sale of hydroelectric power which is needed in ever-increasing quantities.

Colorado wholeheartedly supports the plan to use a portion of the power revenues to support irrigation projects. In this regard Colorado approves the plan of the basin account and of the participating projects. Such plan will permit the construction of many desirable consumptive use projects which, without the aid from power revenues through the basin account, might not be possible of construction. It is gratifying that this aid may be obtained and at the same time a reasonable rate be set for the sale of power.

In connection with the participating projects Colorado gives general approval of the criteria established by the report for the determination of the right of a project to qualify for aid from the revenues made available by the project. In particular instances it may be found desirable to adjust these criteria to meet unusual situations.

Included among the participating projects in the State of Utah is a project, the central Utah, which will utilize water exported from the natural basin of the Colorado River. No such exportation project in the State of Colorado is mentioned in the report. Perhaps this results from the fact that Colorado exportation projects are located in an area outside of the jurisdiction of region 4 which prepared the report. It is suggested that there should be full and complete cooperation between region 4 and region 7 to determine what, if any, Colorado exportation projects should be approved as participating projects.

To conclude these general observations Colorado says that the development in the upper division States must, so far as is possible,

move forward on an even basis. This should be possible because the plan contains a desirable flexibility which will permit the States, the Department of the Interior, and the Congress to consider from time to time the addition of worthy units and participating projects.

THE APPLICABLE LAW

With reference to particular matters Colorado agrees that the project should be constructed by the Bureau of Reclamation. This construction and the subsequent operation of the project, and of its various units and participating projects, should be in accord with the Federal reclamation laws and acts amendatory thereof or supplementary thereto, the Colorado River compact of 1922, the Upper Colorado River Basin compact of 1948, and the applicable laws of the various States. Colorado directs particular attention to the following compact provisions:

(*a*) Article V (c) of the 1948 compact which reads thus:

> In the event the commission finds that a reservoir site is available both to assure deliveries at Lee Ferry and to store water for consumptive use in a State of the upper division, the storage of water for consumptive use shall be given preference. Any reservoir or reservoir capacity hereafter used to assure deliveries at Lee Ferry shall by order of the commission be used to store water for consumptive use in a State, provided the commission finds that such storage is reasonably necessary to permit such State to make the use of the water apportioned to it by this compact.

The right to convert part of the storage capacity of the project reservoirs from holdover use to storage use for consumptive purposes in an upper division State must be recognized and given full effect.

(*b*) Article IX (a) of the 1948 compact provides:

> No State shall deny the right of the United States of America and, subject to the conditions hereinafter contained, no State shall deny the right of another signatory State, any person, or entity of any signatory State to acquire rights to the use of water, or to construct or participate in the construction and use of diversion works and storage reservoirs with appurtenant works, canals, and conduits in one State for the purpose of diverting, conveying, storing, regulating, and releasing water to satisfy the provisions of the Colorado River compact relating to the obligation of the States of the upper division to make deliveries of water at Lee Ferry, or for the purpose of diverting, conveying, storing, or regulating water in an upper signatory State for consumptive use in a lower signatory State, when such use is within the apportionment to such lower State made by this compact. Such rights shall be subject to the rights of water users, in a State in which such reservoir or works are located, to receive and use water, the use of which is within the apportionment to such State by this compact.

It is plain under this provision that the rights of water users in a State in which a holdover reservoir is located to receive and use water within the apportionment of the State must be recognized.

(*c*) Article IV (b) of the 1922 compact states:

> Subject to the provisions of this compact, water of the Colorado River system may be impounded and used for the generation of electrical power, but such impounding and use shall be subservient to the use and consumption of such water for agricultural and domestic purposes and shall not interfere with or prevent use for such dominant purposes.

This provision must be considered in connection with its counterpart in the 1948 compact to which reference is next made.

(*d*) Article XV (a) of the 1948 compact reads as follows:

> Subject to the provisions of the Colorado River compact and of this compact, water of the upper Colorado River system may be impounded and used for the

generation of electrical power, but such impounding and use shall be subservient to the use and consumption of such water for agricultural and domestic purposes and shall not interfere with or prevent use for such dominant purposes.

The last two mentioned compact provisions must be given effect. They require that the use of project water for power generation purposes is subservient to domestic and agricultural uses and that no firm rights can be secured which will preclude the use within any upper basin State of that State's apportioned share even though such use develops after the power generation use has been perfected. It is entirely correct for the report to recognize a diminishing power use as consumptive use projects come into being.

(*e*) Article XV (b) says:

The provisions of this compact shall not apply to or interfere with the right or power or any signatory State to regulate within its boundaries the appropriation, use, and control of water, the consumptive use of which is apportioned and available to such State by this compact.

This provision is tied into the comments under (*c*) and (*d*) above. Most obviously the holdover storage reservoirs will not fulfill their primary function if they are so used as to prevent the authorization and construction of junior upper basin projects which use water within the apportioned share of any State. Due regard for this important matter must be made in all priorities awarded any of the units of the project.

STORAGE PROJECT UNITS

With reference to the storage units proposed for immediate authorization and construction, Colorado has no comment as to the Flaming Gorge and Navaho units. Their positions in the overall plan seem well established.

In regard to the Echo Park unit, Colorado emphasizes the need for immediate authorization and construction. The wise decision of the Secretary of the Interior approving this unit even though it is located within the Dinosaur National Monument is to be commended. The question of access roads to the Echo Park Reservoir, and also to the Split Mountain unit, is a matter of great importance to Colorado. These roads should be of such a nature that they are useful not only during construction but also thereafter for recreational development in this remote region of unusual attractions which will be made available to the public for the first time by the construction of the proposed reservoirs. Colorado firmly believes that access roads from Colorado points will satisfy all requirements, and requests that before any final decisions are made as to road locations full opportunity be afforded Colorado to be heard on this subject.

The proposed Glen Canyon unit is recognized as an important and essential feature of the project. Colorado does not object to its inclusion as a unit for initial authorization and construction. Its capabilities for holdover storage, power generation, and silt retention are outstanding. Its location at the extreme lower end of the upper basin may possibly raise questions of interbasin relations upon which Colorado may desire to be heard in connection with the authorizing legislation.

Colorado is most vitally interested in securing the development of the Gunnison River. The report contemplates three units as a part of the storage plan on this stream. The Bridgeport is recommended

for initial authorization and construction. The Curecanti and Crystal are recommended for later action.

Colorado believes that full study has not been given to these Gunnison River potentials. Many local problems are presented. Colorado most respectfully requests that it be given opportunity at a later date to state its position with regard to the Gunnison River storage. To this end, it requests that the Bridgeport unit should not be included within the initial list and that further study and consideration should be given to the location of storage units on the Gunnison River which develop, as far as possible under all of the conditions, the full power potential of that stream, permit the early construction of participating irrigation projects, and provide holdover storage, all with the least possible disruption of the local economy. Colorado desires that a unit of the storage plan located on the Gunnison River be included in the initial authorizing legislation. It is anticipated that the restudy herein urged and further comments of the State will be made in due time so as to accomplish this purpose. Colorado pledges its full cooperation with the Bureau of Reclamation in the formulation of an acceptable Gunnison River plan.

PARTICIPATING PROJECTS

The participating projects listed in paragraph (b) of the Commissioner's letter of December 22, 1950, are all approved by Colorado. The early construction of these projects is urged.

Colorado specifically requests that the La Plata project, heretofore recommended by the State and not appearing in the list, should be included among the participating projects for initial authorization. This project is desperately needed to provide a dependable water supply for lands lying in the La Plata Valley and located in both Colorado and New Mexico. The limited and erratic water supply of the La Plata is apportioned between Colorado and New Mexico by the La Plata River compact. This compact was recognized and approved by the Upper Colorado River Basin compact. The La Plata project is of relatively small cost and does not materially or adversely affect other proposed developments, or materially disturb the economic feasibility of the entire basin development. At the request of the States of Colorado and New Mexico, the Bureau of Reclamation commenced investigation of the La Plata project many years ago. At least two reports have been issued by the Bureau. The Colorado landowners have organized a district under the Colorado Conservancy District Act. The La Plata water users have expended considerable money and put forth every effort to obtain a project only to be faced with years of delay and disappointment. Fair treatment of the La Plata farmers requires the inclusion of the La Plata project for initial authorization as a participating project under the Colorado River storage project plan.

Attention is directed to the fact that the Paonia project, which is included in the list of participating projects recommended for initial authorization, has twice been authorized by Congress. The increase in construction costs, the addition of certain acreage, and the relocation of the proposed storage reservoir have resulted in substantially increasing the project cost. This necessitates either reauthorization or amended authorization. The report on the revised project plan

has been pending before the Bureau of the Budget for some time. A bill has been introduced in the Congress for amended authorization. This legislation provides that the Paonia project shall become a participating project under the Colorado River storage plan. Colorado expresses its intent to proceed with the legislation for amended authorization of the Paonia project in advance of the approval of the Colorado River storage project in order that there may be no cessation of construction activities.

Paragraph (d) of the Commissioner's letter of December 22, 1950, makes reference to the Shiprock Indian project. This is of vital concern to both Colorado and New Mexico in view of the provisions of article XIV of the upper Colorado River Basin compact and particularly paragraph (c) thereof providing for curtailment of uses of San Juan River water in times of water shortages. Colorado has not been provided with a planning report on the proposed Shiprock Indian project. It is not advised as to its cost, size, the water users' ability to return operation and maintenance costs, or any other essential data. The extent of the Indian land proposed to be irrigated under the project, the amount of water required for such irrigation, and the relationship of the use of such water to other proposed New Mexico projects are all matters of conjecture. While the project may be a desirable one and may well constitute an essential part of the plan for the development of the San Juan River, Colorado says that no appropriation for, or construction of, the project should be authorized or made until there has been made available to the affected States, and approved by the Congress, a report on the project comparable to the reports already prepared for the other participating projects.

POWER CONTRACTS

Hydroelectric powerplants comprehended within the plan should be operated in conjunction with other Federal powerplants, present and potential, on the Colorado River and its tributaries so as to produce the greatest practical amount of power and energy that can be sold at firm power and energy rates. The Secretary of the Interior should, so far as practicable, make contracts for furnishing firm power and energy at firm power and energy rates from such plants and other Federal powerplants on the Colorado River operated conjointly. Provision should be made for the termination, upon a reasonable notice, of all contracts relating to the disposition for use, outside the upper division States and outside that portion of the State of Arizona within and from which waters naturally drain into the Colorado River system above Lee Ferry, of power and energy generated at such plants to the extent that the power and energy so contracted for is required to satisfy the need of consumers in the mentioned areas.

INVESTIGATION FUNDS

While Colorado approves the recommendation made in paragraph (j) of the Commissioner's letter of December 22, 1950, relating to the establishment of a fund from which money may be appropriated for studies and investigations relating to the development of the waters of the upper Colorado River Basin, it points out that it will be a number of years before the necessary fund will be accumulated to

finance needed investigations. During the interim period, investigations on a large and expedited scale should be carried forward to provide information concerning prospective participating projects. The situation has particular significance to Colorado because it is desirous of determining at as early a date as possible the potential uses of water in the natural river basin in Colorado. At the present time the only money available for this purpose comes from the Colorado River development fund and the upper Colorado River share of general investigation funds. These funds have proven inadequate to accomplish the desired purpose. If a well-conceived program for the development of the Colorado River is to be realized in accordance with the recommendations of the report, then increased annual appropriations of money must be made to expedite investigations in the upper Colorado River Basin. Colorado urges that the report be revised so as to include a recommendation that the Congress authorize the creation of a special fund as a basis for future appropriations to carry on investigations in the upper Colorado River Basin in that period prior to the time when money will become available under the above-mentioned paragraph (j) and that the funds so appropriated shall be nonreimbursable.

ACREAGE LIMITATIONS

Much of the area of the upper Colorado River Basin is devoted to the raising of livestock at high altitude. Additional irrigated pasture and meadowland is needed by the ranchers if the basic meat supply of our country is to be maintained at adequate levels. In such ranching operations the 160-acre limitation of the Federal reclamation laws is unrealistic. The practical development of the upper Colorado River Basin will require water supplies for these livestock ranches. Consideration should be given to a revision of the present law relative to excess lands so that the principle of family operation may be retained in the mountain area.

CONCLUSION

The Colorado River storage project is of basic importance to the economy of the upper Colorado River Basin. A development plan must of necessity be flexible so as to permit adjustments made desirable by investigations and new conditions. Colorado recommends that the interested States should be given opportunity to comment from time to time on these new developments so that there may be the most complete cooperation between the States and the Federal Government to the end that a great national natural resource may be best developed.

Respectfully submitted.

DAN THORNTON,
Governor, State of Colorado, and Ex-Officio Chairman of the Colorado Water Conservation Board.

CLIFFORD STONE,
Director, Colorado Water Conservation Board.

COMMENTS, COLORADO GAME AND FISH COMMISSION

GAME AND FISH COMMISSION,
Denver, Colo., February 23, 1951.

ALBERT M. DAY,
Director, United States Fish and Wildlife Service,
Washington 25, D. C.

DEAR MR. DAY: Reference is made to a proposed supplement to the report of the Department of the Interior on the potential Colorado River storage project and participating projects, copy of which is enclosed herewith.

Careful scrutiny of the material contained in this supplement discloses that it presents an accurate and comprehensive summation of the responsibilities of the United States Fish and Wildlife Service.

The State of Colorado, through the responsible agency, namely the Colorado Game and Fish Department, strongly urges that this supplement be included as a part of the departmental report mentioned above.

We cannot emphasize too strongly the importance of preserving and protecting the wildlife fisheries values of the upper Colorado River Basin.

Very truly yours,

C. N. FEAST, *Director.*

COMMENTS, NEVADA STATE ENGINEER

OFFICE OF STATE ENGINEER,
Carson City, Nev., February 14, 1951.

WESLEY R. NELSON,
Assistant Commissioner,
United States Bureau of Reclamation,
Washington 25, D. C.

DEAR MR. NELSON: This will acknowledge receipt of your letter dated January 30, 1951 (your reference 737) with which you transmitted two copies of the Department of the Interior's proposed report on the Colorado River storage project and participating projects.

We have examined this report and have no objections to offer to its publication as submitted. It is well prepared and the Bureau of Reclamation is to be complimented upon the vast amount of excellent work it has done in preparing the report for publication.

Very truly yours,

ALFRED MERRITT SMITH,
State Engineer.

NEVADA STATE ENGINEER ON EARLIER DRAFT OF REPORT

OFFICE OF STATE ENGINEER,
Carson City, Nev., October 24, 1950.

Re review of upper Colorado River report.

Mr. E. O. LARSON,
Regional Director, United States Bureau of Reclamation,
Region IV, Salt Lake City 8, Utah.

DEAR MR. LARSON: I have reviewed the Bureau of Reclamation's proposed report entitled "Colorado River Storage Project and Partici-

pating Projects, Upper Colorado River Basin," and herewith submit comments on some of the material.

Mr. Michael W. Straus, commissioner, and yourself, who actively supervised the work, deserve the highest praise for this excellent survey and report. In particular we are pleased with the orderly and progressive manner in which it is proposed to construct the various unit dams beginning first with major units designed to protect and preserve existing downstream developments; to be timed over a period of years to permit a gradual absorption of the electric power; and, further, to not burden too rapidly the already exceedingly heavy national budget.

The recommended upper Colorado River account, which is to be credited with profits from power revenues, appears to be a well-designed part of your plan. It will assist the irrigation feature in projects that cannot repay all of their capital investment in 50 years. Disbursements from the river account will enable the more desirable power projects (those that are considered best from a financial view) to help the financially weak or marginal irrigation developments to repay capital investment.

However, I am not yet sold on irrigation projects that will be unable to repay construction costs within a reasonable period of years—if ever. I believe there is a necessity for the Nation to provide more agricultural opportunities for our increasing population, but these should be sound opportunities. We know, too, that various indirect benefits, impossible to precisely evaluate, will result from this new marginal agriculture but which cannot be counted on to directly repay capital investment. It would appear to be a sound business procedure to fix a minimum ratio of capital costs that must be paid rather than to leave this open as suggested on page 10 (d) of the report, which reads:

> * * * based on the irrigator's ability to pay in a period of 50 years following a suitable development period at least part of the capital costs allocated to irrigation.

It will certainly be argued that if any project is unable to pay all costs in 50 or 60 years it is a poor investment, and that the Bureau is only helping to promote such poor business in order to sustain and increase its personnel and prestige; and because it realizes that good reclamation projects are not numerous.

We do not find in your report estimates of time periods for totally paying-off irrigation features. It may have been too soon to have worked this out, but I am of the opinion that it should be done and that some information should be supplied regarding the liquidation of capital costs of irrigation before Congress is asked to give approval to the comprehensive project. Probably the reclamation feature of some of these units should be reduced or omitted and there also should be a fixed limitation as to what extent the Nation will support marginal reclamation features.

You are not to infer, however, that we do not favor any degree of such support. We do favor it, but believe all projects should be very carefully screened before approval by either the Bureau or Congress. Recommendation of irrigation projects by the Bureau, that cannot repay a reasonable part of capital costs, may cause the Bureau to be criticized as being a promotional agency.

We note that the Glen Canyon project as planned would provide 230,000 kilowatts of capacity in 1959 with ultimately completed installation of 800,000 kilowatts in 1964.

As outlined in your report and maps, it appears that all power to be generated at Glen Canyon will eventually be allocated to the Colorado River storage project, specifically in power market division IV. While no objection might be offered to the allocation of all power revenues from Glen Canyon Dam to the proposed upper Colorado River account, as the project is within the upper basin; the immediate and best market for the power would probably be within the lower basin at the rapidly expanding industrial center of basic magnesium project in Nevada and in densely populated southern California. It is suggested that a large portion of Glen Canyon Dam power should be allocated in perpetuity to this fully developed market, which is now extensively served by higher-cost, steam-generated power using oil as fuel. Conservation of the west coast oil reserves will probably be necessary in the interest of national defense as well as for other purposes.

The last paragraph on page 73 of the report states:

> For a number of years energy production by the Glen Canyon unit would exceed by a substantial amount the energy requirements of the States of the upper division. Until required by these States this energy would be available to other States. From time to time, the amounts of energy supplied from within and without the States of the upper division would be adjusted as necessary to meet needs which develop in the States of the upper division.

In accordance with the precedent established with regard to Hoover Dam in the lower division by the Boulder Canyon Project Adjustment Act, whereby $500,000 per year of net power revenue was diverted into a Colorado River development fund for investigation and construction of projects mainly in States of the upper division until the year 1987; it might appear that some portion of power revenues from Glen Canyon project, as well as from other power projects to be constructed on the Colorado in both the upper and lower division States, should be set aside in a special fund for the same purpose.

Very truly yours,

ALFRED MERRITT SMITH, *State Engineer.*

COMMENTS, NEW MEXICO STATE ENGINEER

OFFICE OF STATE ENGINEER,
Santa Fe, N. Mex., June 12, 1951.

Hon. OSCAR L. CHAPMAN,
Secretary of the Interior, Washington, D. C.

DEAR SECRETARY CHAPMAN: This letter contains the views and recommendations of the State of New Mexico with regard to project planning report No. 4–8a.81–1 entitled "Colorado River Storage Project and Participating Projects, Upper Colorado Basin States, December 1950." The report was transmitted by you in accordance with the provisions of section 1 of the Flood Control Act of 1944 (58 Stat. 887) and was received in this office on February 13, 1951. At the request of the Upper Colorado River Commission and some of the States individually, the 90-day period for review was extended by the Secretary of the Interior to June 15, 1951.

The report is an excellently prepared document evidencing a great deal of investigation and study over a period of years. The Department of the Interior and its various branches and employees are to be highly commended, particularly the Bureau of Reclamation which is largely responsible for the preparation of this fine report. During the investigation, the regional director of region 4 of the Bureau has kept the States of the upper Colorado Basin fully informed of the progress of the work and the problems encountered, in full compliance with the spirit and purposes of the Flood Control Act. The Department of the Interior has been particularly helpful to New Mexico by assisting in special studies of those phases of the upper Colorado River plan peculiar to our own State, which problems will be more fully discussed hereinafter. The State is most appreciative of that cooperation.

Subject to specific recommendations hereinafter made, the State of New Mexico approves the plan of development of the water resources of the Upper Colorado River Basin as described in this report and recommends that projects listed in paragraph (b) of the Commissioner's letter of December 22, 1950, be authorized for construction and thereafter operated in accordance with the Federal reclamation laws (act of June 17, 1902, 32 Stat. 388) and acts amendatory thereof or supplementary thereto.

The proposed storage project and the plan of financially assisting participating projects are vital, necessary factors in the development of the water resources of the upper basin. The plan is in accord with the provisions of the upper Colorado River compact and will be invaluable in assisting the upper division States to fulfill the delivery obligations at Lee Ferry called for by the Colorado River compact of 1922. It will also permit them to accomplish in full measure the development provided for through the apportionment made by the original Colorado River compact.

The State of New Mexico is in accord with and recommends the plan for a basin account as set forth in the Commissioner's letter and explained in detail in the report of the regional director. It is the opinion of the State that such an account is consistent with the policies and procedures previously adopted for other projects constructed by the Bureau of Reclamation and carried out within the existing reclamation law. It is consistent with the principle that mutually dependent projects should participate in the benefits of basin development, including, when necessary and with proper safeguards, financial aid from those projects which produce surplus revenues. It is strongly urged that the provisions for assistance to irrigation projects through the basin account method be incorporated as an essential part of the authorization bill.

New Mexico recommends that the hydroelectric plants comprehended within the plan should be operated in conjunction with other Federal powerplants, present and potential, on the Colorado River and tributaries so as to produce the greatest practicable amount of power and energy that can be sold at firm power and energy rates. New Mexico is frankly concerned that such power and energy may be sold to users outside of the upper basin and the States of the upper division in accordance with current demands which in the future may be necessary to provide essential power development to the State. Accomplishment of this objective involves considerations which, at this time, cannot be foreseen. New Mexico requests the privilege of

seeking, at an appropriate time, adequate provisions of law, or procedures for such power operation, as will insure the greatest future benefits for the upper basin and the States of the upper division from the power produced by the Colorado River storage project.

Chapter V of the substantiating materials accompanying the regional director's report deals with power resources available to the power market area, including the potential needs for additional power and energy in the power market area which may be served by the Colorado River storage project. The table on page 70 indicates that for New Mexico (fringe area C) additional power needed by 1970 will amount to 220,000 kilowatts. Preliminary information from the regional office of the Federal Power Commission at Fort Worth, Tex., indicates that the demand for additional dependable power capacity may be even larger than that shown in the regional director's report. New Mexico recommends that the power and energy needs in this State be given careful review and consideration before power contracts are entered into which might leave the State in the position of having to obtain power from other sources at rates which might be considerably larger than those which could be obtained from the storage project. It is realized that as and when the San Juan-Chama transmountain diversion is authorized and constructed there will be a substantial quantity of power and energy available from that source. It is our opinion, however, that the power market needs of the State will far outstrip any power which may be made available by the San Juan-Chama installation and will coincide more nearly with the power which will become available from the storage project.

New Mexico has concurred in the actions taken by the States of the upper basin from time to time through the Upper Colorado River Commission and the Colorado River Basin States Committee looking toward a plan which will insure orderly development so that all of the States will move forward on an even basis insofar as the solution of each State's problems will permit, and it is found practicable so to do. The storage project plan is a flexible one which permits, from time to time, the addition of other storage units and other participating projects, as plans are completed and as the necessary project reports indicate that such projects qualify for authorization within the provisions of the plan.

In recognition of the peculiarity and individuality of each State's problems New Mexico does not oppose any recommendations for changes in the plans within any State from those recommended by the report which may be made by such State or States of the Upper Basin so long as such changes are consistent with the best interests of the basin and with the ultimate plan of development. It has been brought to our attention that the State of Colorado may request the selection of the Curecanti storage unit on the Gunnison River for initial authorization in lieu of the Whitewater unit proposed in the report. It is recognized that such a change may well be in the best interests of the basin and of the State of Colorado and it is, therefore, recommended, should the State of Colorado make such a request for revision, that it have your careful consideration.

At the time the Upper Colorado River Commission and the Colorado River Basin States Committee were considering the preliminary draft of the subject report, a report on the La Plata unit of the Animas-La Plata project had been completed by the Bureau and the

project was approved as a participating project. By the time the main report was ready for transmittal to the affected States, however, departmental review of the La Plata report indicated that the cost-benefit ratio was unfavorable and the project could not be included. It is our understanding that region 4 is currently reviewing the project in an attempt to formulate a revised plan which will meet necessary requirements for participating projects. The La Plata is one of the most deserving projects within the entire basin from the standpoint of need for rehabilitation and reclamation of a project now deficient in water supply. Water shortages in that area are chronic. For this reason we urge that every effort be made to work out a revised project for the La Plata unit which can be included in the near future as a participating project.

In our letter to you dated April 13, 1951, certain inconsistencies were pointed out in the position of the Department of the Interior concerning projects in New Mexico for the utilization of its share of San Juan River water. The question set forth in that letter arose from the recommendations of the Commissioner of Indian Affairs contained in paragraph (*d*) of Commissioner Straus' letter of transmittal. Briefly, our letter sought to determine whether the Department intended to seek authorization of an open-end Shiprock project as indicated in that paragraph, or if the Department intended to continue the course which is now under way of attempting to negotiate the question of the size of Shiprock and other competing projects. Your reply under date of May 28, 1951, while helpful, did not completely answer our query. It is noted that you did agree "that an open-ended authorization of the Shiprock project would be undesirable." You stated that every effort was being made to seek a satisfactory solution and expressed the hope that such a solution would be reached by the time the report was forwarded to the President and the Congress. However, the complexity of the problems encountered is such that there appears to be no solution to the problem possible in time for inclusion in the current report. It is necessary, therefore, for the State to comment in some detail on the recommendation contained in the Commissioner's letter.

Under the provision of New Mexico's constitution, its statutes, and the decision of its courts, the water allocated in New Mexico for consumptive use by the terms of the upper Colorado River Basin compact (except as to present uses) is unappropriated water of the State of New Mexico held by the State as trustee for the benefit of the public.

Because of the physical situation on the San Juan River, the several large projects which would use a major portion of New Mexico's allocated water supply under the terms of the compact are dependent upon the amount of water in the Upper San Juan River and its tributaries available above the site of the Navaho Reservoir. Several facts concerning the final determination of water supply to these projects are important:

(*a*) A substantial Navaho-Shiprock project is a necessary feature of the program of development of the water supply in New Mexico, not only from the standpoint of taking care of the economy of the Navaho Indian but in making the best and fullest use of New Mexico's compact allocation.

(*b*) A transmountain diversion of water from the San Juan to the Chama River is also necessary in order for New Mexico to fully utilize its allocated water supply.

(*c*) The only substantial source of unappropriated water in the State is the San Juan River. This water is required not only to take care of the legitimate needs within the basin but to supply water to the Rio Grande Basin to assist in relieving shortages in existing irrigated areas, to provide for the growth of municipal, industrial, and military uses, and to replace those amounts of water which may be consumed in connection with programs of the Department of Agriculture for watershed rehabilitation within that basin.

Because of the far-reaching effect which allocations made at this time will have upon the economic, irrigation, and industrial growth within the entire State, the selection of projects and the determination of their respective sizes in the current program must be made with the greatest of care.

The record will show that the State has consistently worked for the Shiprock (Navaho) project. It would be desirable to recommend it without reservation for authorization in the initial list of participating projects if a project report had been made available for the States' prior consideration setting forth its size and other essential features demonstrating its qualifications for inclusion therein. Under the circumstances, however, it is obvious that the States cannot give unqualified approval to the blanket recommendations contained in paragraph (d) of the Commissioner's letter.

For over a year the San Juan Coordinating Committee of the Department of the Interior has been working to develop the engineering data necessary for a proper determination of respective sizes of the Shiprock project, the South San Juan (white lands) project in connection therewith, and a San Juan-Chama transmountain diversion project. The committee is working under a directive in the form of a memorandum from Assistant Secretary William E. Warne, which was approved by you August 30, 1950. The directive set forth certain aims and objectives, stating, among other things:

> Once a feasible project is reached which will combine the San Juan-Shiprock area and the San Juan-Chama diversion, while allowing for irrigation of 20,000 acres of white lands, the entire project should be included in one report.

It also directed:

> That the Department endeavor to complete by January 1, 1951, a mutually acceptable report on the above basis which will set out the magnitude of the recommended east slope and west slope units of the project, along with supporting economic data;

and

> That the Department complete by January 1, 1952, feasibility reports to be used as a basis for seeking project authorization.

It seems evident from the memorandum that the policy of the Department is to develop, with the aid and assistance of engineering data obtained by the Interior Coordinating Committee, a solution as to the respective sizes of the three projects which can be agreed upon at State level; and that such coordinated plan be then submitted to the Congress and authorized as a unit.

The work of the Coordinating Committee has been progressing quite satisfactorily. Due to unforeseen delays, however, it has not been able to proceed as rapidly as originally anticipated. For example, the Navaho Tribal Council has entered the picture and is seeking certain information which it feels is required before the council is willing to make any commitments regarding the potential size of their project. The council is employing a private engineer to conduct an independent review of the engineering data so that the council may be fully apprised as to its adequacy. The State feels that the Navahos are entitled to full information regarding their project.

There seems to have been an unfortunate tendency on the part of the several agencies involved in the early project studies to so plan their projects that they could maintain bargaining positions with respect to other projects or plans. I believe this situation has been largely rectified since the appointment of the Coordinating Committee, although there is still a tendency on the part of the Bureau of Indian Affairs to insist that it cannot recede from a certain predetermined size of the Navaho-Shiprock project. The State feels that it is necessary for all agencies to work wholeheartedly in presenting complete data regarding the proposed projects.

In this connection, it is evident that region V of the Bureau should collect and present at the earliest possible time a report showing the needs of the east slope for domestic, municipal, and supplemental water. Such data would be used, together with potential power possibilities, in preparing a transmountain project report. In the San Juan Basin, it is evident that additional data are required to complete the project report on the Shiprock project. Preliminary examination by engineers of the State indicate the need for more detailed study of such features of the project as (1) the question of inclusion of scattered tracts of good land where the distribution costs may be excessive, (2) the question of drainage of many areas on the project, where topography and soil conditions are such that drainage is expensive and difficult, and (3) other project features which might well be reviewed. A study of these matters could have a material effect on the ultimate area which should be recommended for inclusion within the project. A complete report on the South San Juan project is necessary to determine its feasibility and economic size for inclusion as a unit of the larger Navaho Reservoir project.

The above problems were brought to the attention of the Governor and a number of representatives of the areas of the State involved and were carefully considered by them. It was agreed that, since you have recommended the Shiprock project for current authorization, the State's other legitimate needs can be guaranteed and your directive of August 30, 1950, can be effectuated only by inclusion of the other two competing projects in the report for concurrent authorization. Accordingly, New Mexico recommends and strongly urges the inclusion in your recommendations to the President and the Congress of the following: (1) The South San Juan and San Juan-Chama projects, as well as the Shiprock project, be included in the subject report for authorization as participating projects as a unit; and (2) there be no appropriations for, or construction of, any of the

three projects until there has been made available to all of the affected States and approved by the Congress project reports, comparable to reports already prepared for the other participating projects, which demonstrate their feasibility, their favorable qualifications as participating projects, and their compatibility with each other.

On pages 6 and 7 of the regional director's report is set forth his proposed construction schedule for the storage project reservoirs. He recommends therein that the Whitewater, Echo Park, and Glen Canyon units be constructed immediately, followed by the Navaho and Flaming Gorge units. New Mexico, respectfully calls the Secretary's attention to the fact that the Navaho Reservoir is an essential initial phase of the construction of the Shiprock, the South San Juan, or the San Juan-Chama diversion projects since all three are dependent upon equating the flow of the San Juan River at or near that reservoir site. Further, due consideration should be given to the use of presently unappropriated waters of the San Juan for power purposes while such surplus power sources are available. The State, therefore, recommends and urges that you revise the construction schedule so that the Navaho Reservoir is included as one of the initial units of the storage plan, thereby permitting development in this State to proceed on an even basis with that in other States of the upper basin.

Because there will be sufficient credit in a basin account when and as approved by the Congress, and because of the continuing need for project investigations and reports as development of the upper basin progresses, it is recommended that investigational funds adequate for the purpose be authorized from this account in addition to those provided by the Colorado River development fund, Reclamation funds and subparagraph (j) of the Commissioner's letter of December 22, 1950.

Respectfully submitted.

JOHN H. BLISS,
State Engineer of New Mexico.

COMMENT, NEW MEXICO STATE GAME WARDEN

MARCH 22, 1951.

ALBERT M. DAY,
Director, United States Fish and Wildlife Service,
Washington, D. C.:

Reference Fish and Wildlife Service program for protection, development and utilization of fish and wildlife resources in upper Colorado River Basin, this program affects New Mexico only as far as Navaho Reservoir is concerned and in that case meets with our approval and is in accordance with our policies.

ELLIOTT S. BARKER,
State Game Warden, State of New Mexico.

COMMENTS, UTAH STATE ENGINEER

OFFICE OF STATE ENGINEER,
Salt Lake City, Utah, June 12, 1951.

Re Colorado River storage project and participating projects—views and comments

Mr. OSCAR L. CHAPMAN,
Secretary of the Interior, Washington, D. C.

DEAR MR. SECRETARY: Receipt of your letter of transmittal dated January 30, 1951, together with copies of the Colorado River Storage Project and Participating Projects, Upper Colorado River Basin, dated December 1950, as prepared by the Bureau of Reclamation, is acknowledged. It is understood that said reports were submitted to the State of Utah on behalf of the Secretary of the Interior in compliance with the provisions of section 1 (c) of the Flood Control Act of December 22, 1944 (58 Stat. 887). Included in each report was the Commissioner's letter to the Secretary of the Interior under date of December 22, 1950.

Under authority of Utah's Governor, the Hon. J. Bracken Lee, it becomes my responsibility to submit official views and recommendations on the reports for the State of Utah.

We wish to commend the Department of the Interior, the Bureau of Reclamation, and their staffs on the painstaking investigations that have made the reports possible. The basic principles underlying the reports are sound. The reports are comprehensive, well prepared, and the many details of preparation are well done. Region IV of the Bureau of Reclamation is to be particularly commended. Utah appreciates the complete cooperation and congenial working relationship that has existed continuously between the State and the Bureau of Reclamation during the period of report preparation. Full compliance with the spirit and purpose of section 1 of the Flood Control Act of 1944 has been exemplified.

Conferences have been held with State officials; the Utah Water and Power Board; the Utah Water Users Association; the Colorado River Development Association, representing 21 affected counties within the State; chambers of commerce and their water resources committees; the Utah Fish and Game Commission; the Utah State Agricultural College and Agricultural Experiment Station; the Metropolitan Water District of Salt Lake City; various consulting engineers; and many water users and other citizens of this State. In these conferences, the basic principles and details of the Colorado River storage project and participating projects in the upper Colorado River Basin have been explained and discussed. All of the above-mentioned organizations and individuals have officially endorsed and approved the project plan. Two exceptions, however, have been made relative to the details of distribution and construction as it relates to the central Utah project. These exceptions are discussed under the central Utah project.

The State of Utah is in accord with and fully endorses:

(*a*) The proposed plan of development. We believe that such plan will be of invaluable assistance in permitting the upper division States—first, to fulfill their obligations for deliveries at Lee Ferry; and second, to achieve their full measure of develop-

ment within the limits of apportionment made to the upper basin by the Colorado River compact of 1922. It is further believed that the plan contains that desirable degree of flexibility which will permit the upper basin States, the Department of the Interior, and the Congress, to consider from time to time, the addition of other worthy units and participating projects. It also provides coordination of the interests of the Nation and the upper Colorado River Basin States.

(*b*) The upper Colorado River Basin account as proposed in the report. We strongly endorse the provision for aid to irrigation from surplus revenues.

(*c*) The upper Colorado River development fund, as set out in the report. We recommend a development whereby all States of the basin will move forward on an even basis.

Relative the development of the Whitewater unit, as proposed in the report, Utah wishes to indicate its support of the views and comments of the State of Colorado with respect to the more complete development of power potentials on the Gunnison River. We understand that such development will be basically comparable to that proposed within the report.

With respect to the Shiprock project we wish to point out that inasmuch as the report treats it as a participating project, a project planning report should be prepared and made available to affected States. As of this date, no such report has been made available to the State of Utah. Without a planning report on the proposal and therefore not being advised as to project cost, size, or the water users ability to return operation and maintenance costs, we are not prepared to comment further. It is believed that any approval or construction relating to the project should be deferred until there has been made available to all of the affected States, as provided under the Flood Control Act of 1944, and approved by the Congress, a report on the project comparable to reports already prepared for the other participating projects. Such report should demonstrate project feasibility, its favorable qualifications as a participating project and its compatibility with other major projects on the stream which compete directly for the same water supply.

The hydroelectric plants of the Colorado River storage project should be operated in conjunction with other power plants present and potential on the Colorado River in such a way as to produce the greatest practicable amount of power and energy that can be sold at firm power and energy rates. In this connection, however, Utah calls attention to the possible necessity, in the interests of its future economic welfare, as well as the welfare of that portion of the States which lies in the upper Colorado River Basin, of making available the full power output of the Colorado River storage project for use within the upper basin or within the States of the upper division. The determination of this objective involves consideration of conditions, such as production and market demand, which cannot, at this time, be foreseen. It also involves consideration of the extent of future interconnections and of the effect of Federal laws pertaining to preference in the use of power and the application of such laws to an entire river basin, comprising a number of States. Utah, for a number of reasons, reserves the privilege to seek at the appropriate time, adequate provisions of law or approval of plans or procedures for such power opera-

tions as will insure the use of the power output of the Colorado River storage project in a manner consistent with greatest future benefits for the upper Colorado River Basin or the States of the upper division.

Provision should be made, either in the report or in ensuing legislation, or both, for the specific authorization of appropriations of investigation funds, in addition to those provided by the Colorado River development fund, reclamation funds, and those recommended in subparagraph (j) of the Commissioner's letter of December 22, 1950.

CENTRAL UTAH PROJECT

The initial phase of the central Utah project plan reported in the supplement to the Colorado River storage project report dated February 1951, would bring water into Salt Lake County, now being partially served by the Provo River project, and also contemplates the use of works of the Provo River project including the Provo Reservoir canal and the Salt Lake aqueduct. The Metropolitan Water District of Salt Lake City, in commenting upon the report, has raised questions which are of concern to the district. The district points out:

(1) That water from the central Utah project should not be brought into Salt Lake County in competition with existing supplies from the Provo River project;

(2) That the district should be given the first opportunity to replace with water from the central Utah project its Provo River project water disposed of to Salt Lake County interests;

(3) That the district cannot surrender any of its capacity in the Salt Lake aqueduct and the Provo Reservoir canal; and

(4) Expressed some alarm as to integrating the proposed power development at Deer Creek with the central Utah project.

Any legislation authorizing the central Utah project should be sufficiently broad to permit scheduling the availability of water to Salt Lake County and repayment with respect thereto so as to permit full use of the water now available from the Provo River project. It appears that no central Utah project water for municipal and industrial purposes will be required in Salt Lake County prior to the year 1970.

Project authorization should also permit the Metropolitan Water District of Salt Lake City, or other proper organizations, to obtain water made available by the central Utah project for use in Salt Lake County. The circumstances existing at the time should determine the organizations to which central Utah project water should be made available.

Use of capacity in the Salt Lake aqueduct and the Provo Reservoir canal which is in excess of that required to deliver Provo River water is in the interest of development in Salt Lake County. Appropriate arrangements should be made with the Provo River Water Users Association, Metropolitan Water District of Salt Lake City and other proper interested parties for the use of any works of the Provo River project. Such an arrangement, we believe, can be accomplished without detriment to any participants in the Provo River project, and is for the best interests of developing the State of Utah. Legislation authorizing the central Utah project should be sufficiently flexible to permit these arrangements to be worked out and agreed upon when the central Utah project plan is in the final planning stages.

In regard to integrating the proposed power development at Deer Creek Dam with the central Utah project, appropriate agreements

should be made with the Metropolitan Water District of Salt Lake City and the Provo River Water Users Association and other proper interested parties during the final planning stages of the central Utah project.

Some concern has been expressed by the Utah Water Users Association about building the Strawberry aqueduct from Rock Creek to Strawberry Reservoir in two barrels as proposed in the report, see pages 27 to 34 of the central Utah project. Careful consideration has been given to this matter and it appears that the most economic way is to build the aqueduct to the capacity as required in the initial phase and then to build an additional barrel in the future when required. It is our view that since the second barrel of the aqueduct will not be needed for many years, the report presents the most economic plan for construction of the Strawberry aqueduct and we favor proceeding in accordance with the plan recommended in the report.

We have given careful consideration to all questions raised by the Metropolitan Water District and the Utah Water Users Association. These questions should not be interpreted as objections to the project plan. They are matters that can be dealt with appropriately during the final planning stages of the central Utah project.

In the light of the above comments, the State of Utah approves the plan of development of the water resources of the upper Colorado River Basin described in the report and requests authorization for the construction of the projects listed in paragraph (*b*) of the Commissioner's letter of December 22, 1950. We recommend that such projects be constructed and thereafter operated by the Bureau of Reclamation, in accordance with the Federal reclamation laws (act of June 17, 1902, 32 Stat. 388, and acts amendatory thereof or supplementary thereto).

While recommending the construction of these projects, we believe such construction should be deferred if it in any way will impede the defense effort or injure our economy. It would appear to be desirable, in view of the shortages of materials and manpower, to defer such projects until these shortages no longer exist.

Sincerely yours,

JOSEPH M. TRACY,
State Engineer.

COMMENTS, UTAH FISH AND GAME COMMISSION

FISH AND GAME COMMISSION,
Salt Lake City, Utah, March 5, 1951.

MR. ALBERT M. DAY,
Director, Fish and Wildlife Service,
United States Department of the Interior,
Washington 25, D. C.

DEAR MR. DAY: Reference is made to Mr. John C. Gatlin's communication of February 21, 1951, relative to the proposed Colorado River storage project.

We have carefully examined the report of the Fish and Wildlife Service pertaining to this project and are in agreement with its contents. This Department has conferred with representatives of the river basin group of your Service and the report reflects our opinions.

We regret that shortage of funds and personnel have not permitted greater activity and more concentrated contact on such matters during the past several years, during which construction and development plans were being prepared. The meager information we have gained from actual field observations offers no additional data for your report.

Trusting this answers Mr. Gatlin's request, we remain,

Very truly yours,

UTAH FISH AND GAME COMMISSION,
J. PERRY EGAN, *Director.*

COMMENTS, WYOMING STATE ENGINEER

STATE ENGINEER'S OFFICE,
Cheyenne, Wyo., March 30, 1951.

(This letter to be substituted for our letter of February 17, 1951.)

MR. WESLEY R. NELSON,
Assistant Commissioner,
U. S. Bureau of Reclamation,
Washington, D. C.

DEAR MR. NELSON: Agreeable to your request I have reviewed the final report of the Bureau of Reclamation on the Colorado River storage project and participating projects dated December 1950.

Upon receipt of the preliminary draft, I mailed 8 of the 9 copies furnished me to the Wyoming Upper Colorado River Compact Commissioners and asked them to review same and meet with me at the United States Bureau of Reclamation Office in Rock Springs, Wyo., on October 28 at 10 a. m. for discussion and final review of the report.

On October 24 I received a letter from Mr. Emil C. Gradert, one of the compact commissioners, in which he informed me that he could not be present at the Rock Springs meeting, but that he had reviewed the report and forwarded his copy direct to Mr. Larson. In his letter he stated:

> I wish to state that I have read through said report, as time permitted, and find same a rather definite and comprehensive report, well gotten up, and far be it for one so little informed as I to criticize, in any way, or add to or detract from, such an authentic estimate and record of facts.

On October 28 a meeting was held in Rock Springs as scheduled with eight members of the Green River Basin Development Co. present. Also in attendance were 5 members of the industrial development committee of the Rock Springs Chamber of Commerce, Mr. George M. Stevens, chairman of the Board of Commissioners of Sweetwater County, and 6 employees of the U. S. Bureau of Reclamation.

Messrs. Jacobsen and DeLong of the Bureau staff explained the project and answered questions. Members of both the Green River Basin Development Co. and the Rock Springs Chamber of Commerce voiced approval of the project.

It is noted that there is no recommendation in the proposed report for legislation permitting preferential use in the upper basin of electric energy generated by Colorado River storage project units. It is our belief that such a provision should be included in the bill for authorization of the project. We hope you will see fit to include an appropriate recommendation to this effect in your final report.

I will comment that the report is in accord with statements of plans proposed by Mr. E. O. Larson, director of region No. 4, U. S. Bureau of Reclamation, at meetings held in Rock Springs, Wyo., and Salt Lake City, Utah, during the last 2 years. It seems to provide the flexibility for basin development and coordination of the interests of the States as proposed by Mr. Larson.

The plan has been made to conform with allocations of water contained in the upper Colorado River Compact and provides storage facilities to assure delivery at Lee Ferry of not less than 75 million acre-feet in continuing 10-year periods.

Reservoir storage is planned for multiple purposes. The plan is to hold over water from years of plentiful supply to meet the obligation of the Upper Basin at Lee Ferry under the terms of the Colorado River Compact, and to produce revenues to assist in repaying the costs of the dams and other facilities.

The upper Colorado River account will permit uniform power rates and equate costs of the developments with revenues from all sources and assist in repayment of the costs of participating irrigation projects made possible by the storage reservoirs.

From the report it appears that the storage project and participating projects are feasible, economically justified, and financially sound. The benefit in cost ratio being 1.8 to 1. The total benefits to exceed the costs in every instance.

The setting up of a special fund from receipts of the Colorado River storage project to be known as the upper Colorado River development fund is in my opinion a sound and equitable basis upon which to construct the entire project.

We note that in the initial participating projects that four Wyoming projects are included as recommended by the Green River Basin Development Co. and our Water Conservation and Planning Board, namely: LaBarge, Lyman, Seedskadee, and Eden.

Wyoming will be interested in securing detailed plans on the participating projects listed herein.

In conclusion I will say that the report appears to be comprehensive and very well prepared, and as the official representative of Wyoming, I respectfully urge your approval of the same.

Sincerely yours,

L. C. BISHOP,
State Engineer and Interstate Streams Commissioner for Wyoming.

COMMENTS, DEPARTMENT OF THE ARMY

DEPARTMENT OF THE ARMY,
OFFICE OF THE CHIEF OF ENGINEERS,
Washington, D. C., July 3, 1951.

Hon. MICHAEL W. STRAUS,
Commissioner of Reclamation, Bureau of Reclamation, Department of the Interior, Washington, D. C.

DEAR MR. STRAUS: Reference is made to your letters of January 30, 1951, to the Secretary of the Army and to the Chief of Engineers, inclosing for the information and comments of the Department of the Army, in accordance with section 1 of the Flood Control Act of

1944, copies of your report dated December 1950 on the Colorado River storage project and participating projects in the upper Colorado River Basin. Reference is also made to subsequent letters furnishing copies of individual reports on the participating projects. I have been directed by the Secretary of the Army to furnish you the views of the Department of the Army on your report. You state in your letter to the Secretary of the Army that your report will be sent to the President and to the Congress under the provisions of section 9a of the Reclamation Project Act of 1939.

Your report recommends a combination of dams, reservoirs, power plants, and other appurtenant structures in the upper Colorado River Basin which together make up what you refer to as the upper Colorado River storage project and participating projects. Some of the participating projects are located outside the physical limits of the upper Colorado River Basin. The purpose of the structures recommended in your report would be primarily power and irrigation and incidentally river regulation, fish and wildlife benefits, recreation, sediment control, flood control, and mineral development.

The main storage project consists of 10 dams and reservoirs totaling in cost $1,139,100,000. The report also recommends 12 participating projects, including two already authorized, totaling in cost $293,188,800. The total cost of the plan recommended for approval, therefore, is $1,432,288,800, including the cost of the two participating projects already authorized, $12,177,000. One of the participating projects, the central Utah project, is included only to the extent of its initial phase, estimated at $222,015,000. The remaining cost of the central Utah project, after the initial phase, is shown in your separate report on the central Utah project to be $812,085,000. Adding the cost of the remainder of the central Utah project to the cost of the plan recommended for approval in your report gives a grand total of approximately $2¼ billion. In addition, mention is made in the report of certain dependent projects which may be authorized subsequent to the authorization of the storage and participating projects. The additional cost of these dependent projects is not given. In your recommendation you ask approval of the entire plan ($1,432,288,800) and immediate authorization for construction, operation, and maintenance of five of the dams and reservoirs in the storage project and all the participating projects. The cost of the 5 dams and reservoirs recommended for immediate authorization and the 10 participating projects not yet authorized is $996 million.

In addition to the authorization for the project works, your report requests authority for the Secretary of the Interior to establish an upper Colorado River account which, in general, is to be credited with power revenues and charged with the costs allocated to power and the costs of that portion of the irrigation allocation to local interests which cannot be paid by local interests. The account is also to be charged with certain special funds to be available for expenditure by the Secretary of the Interior. Your report also recommends certain provisions to be applied to several individual projects, including the Shiprock Indian irrigation project and Florida and Pine River extension projects. The report recommends the inclusion of recreational facilities in the plan of improvement.

My major comments on the report concern, first, the economic justification of the individual units of the overall plan, which are

reported upon separately, particularly the participating projects; and, second, the unrestricted subsidization of irrigation projects by power revenues.

With respect to the economic justification of the individual units, there is no information in the report which would enable a check on the evaluation of benefits from the irrigation projects. A study of the individual reports on the participating projects which you have furnished appears to reveal questionable methods of economic analysis of secondary benefits. Although the benefit-cost ratios of these participating projects are shown to be in excess of unity, data to support these ratios are missing both from the main report and from the individual project reports. However, the principles stated to be the basis for computation of benefits are not believed to represent an accurate approach to such analyses. The inclusion of relatively large secondary benefits based on the theory that the handling and processing of agricultural goods and the increase in associated goods and services are a benefit to the irrigation project to the extent reflected in your analysis is not concurred in. It may also be stated that the same theory of secondary benefits applied to power production, which you use, is considered unrealistic. For example, after determining that the direct power benefit from the storage project based on the sale of energy amounts to $35,359,000 a year, the report goes on to estimate that an additional $23,725,000 secondary power benefits (amounting to 67 percent of the direct benefit) would result from the following elements:

(*a*) A saving in production cost realized by utilities purchasing project power for resale.

(*b*) A proportionate share of the retailing benefits arising from resale of project power to the consumer at higher rates.

(*c*) A proportionate share in the increased value of goods and services produced by utilization of project power.

Although substantiating data have not been made available for a definitive analysis of the benefits from the overall plan and from the individual units, it is my opinion that these benefits are unrealistically high. The effect of reanalyzing the project and its component parts on the benefit-cost ratios cannot be determined with the information available.

My second concern is with the extent of subsidization of irrigation projects from power revenues, an integral part of the so-called "basin account." Although there are undoubtedly instances in which it would be to the national advantage to assist in the development of irrigation projects, the general formula embodied in the basin account proposed in your report would permit subsidization of any irrigation projects which come within the qualifications set up in your recommendations for the evaluation of participating projects. An examination of these requirements indicates that the minimum requirement with respect to reimbursement contemplates payment on the part of the irrigators of only the operation, maintenance, and replacement cost allocated to irrigation plus a part of the construction cost allocated to irrigation. Since the part of the construction cost is not defined, it would appear that there would be no restriction toward development of a project in which the undefined part of the repayment of the construction cost by the irrigators could be so small as to be negligible. This range of subsidy appears too wide to provide a proper safeguard for the

interests of the United States. It should also be pointed out in this connection that the qualification with respect to economic justification of participating projects may not have the force intended, since, as pointed out in a previous paragraph, the basic principle upon which the economic analyses in your report are predicated should in my opinion be subjected to further study.

In addition to the two basic issues discussed previously, I have certain general and specific comments to make.

The report is actually a preliminary treatment of a plan to provide regulatory storage capacity and power production facilities for the upper Colorado River Basin without full development of sufficient fundamental data for the comprehensive planning of such a system. There are unresolved questions of water rights, the allocation of water, and the optimum future development of the upper basin which would appear to make it impracticable to develop a plan of this magnitude at this time which would not be subject to future modification of such a large nature that the fundamental purpose of preparing a comprehensive plan would be defeated. For example, the question of providing storage for the treaty allocation to Mexico of 1,500,000 acre-feet per year is not covered by the report in a sufficiently firm manner to indicate the effect on the storage proposed. Although I am fully in sympathy with the objective of long-range planning and I realize the necessity of such planning in the development of our water resources, I believe that authorization of such plans should be sought only after the basic elements have become reasonably firm. When major questions remain unresolved, premature authorization may actually hamper and restrict future planning.

It is estimated in the report that full utilization of the water apportioned to the upper basin will not be realized for an estimated 75 years. At that time, the storage project will be operated primarily to supply the lower basin with its apportioned amount. In other words, it would appear that full utilization of the storage project potentialities, insofar as river regulation is concerned, would not be required for 75 years and, therefore, that the primary purpose of the project during its earlier life would be to provide power revenues to subsidize irrigation. Construction of 10 participating projects would not affect this conclusion, since the stream depletion caused by these projects would only be approximately 400,000 acre-feet a year, which is only a fraction of the surplus now available.

With respect to the estimated value of power used in justification of the project, it appears that in addition to the questions raised previously with regard to the assumed large secondary benefits there may also be a question with regard to the direct benefits based upon the value used of 5.5 mills per kilowatt-hour. According to the report, this value was based on the cost of producing energy at steam electric coal-burning plants at the principal load centers in each division of the project market area. However, as set forth in the report, the project market area will be, for a time at least, in the lower Colorado River Basin and in southern California. The report does not clearly show that the rate of 5.5 mills per kilowatt-hour would yield a sufficient return to the project to warrant construction of the necessary transmission facilities to the lower Colorado River Basin and southern California or that a market would exist for the quantity of power

estimated for sale in that area at the rate of 5.5 mills per kilowatt-hour.

In view of the foregoing discussion, it appears that your report on the upper Colorado River storage project and participating projects is insufficiently advanced to permit satisfactory comments to be made on the engineering and economic justification of the plan at this time. Substantiating data are not available to permit reaching conclusions with respect to the justification of the project units or the project as a whole at this time. In addition, some of the basic premises and assumptions used in the economic analysis appear to be questionable, and the effect of modification of these premises may be of major importance in the computation of the benefit-cost ratio. The questions of policy brought up by your report regarding subsidization of irrigation projects which cannot be paid for by irrigators under existing reclamation law is a matter which should require the most careful consideration because of its far-reaching implications in the field of Federal public works. In conclusion, therefore, I am unable to concur in the recommendations in your report at this time with respect to the approval of the overall plan and the immediate authorization of the initial phase proposed.

The opportunity to review your report and your courtesy in furnishing copies of the individual reports on the participating projects are appreciated.

Sincerely yours,

LEWIS A. PICK,
Major General, Chief of Engineers.

COMMENTS, DEPARTMENT OF AGRICULTURE

DEPARTMENT OF AGRICULTURE,
OFFICE OF THE SECRETARY,
Washington, D. C., May 28, 1951.

The Honorable the SECRETARY OF THE INTERIOR.

DEAR MR. SECRETARY: This Department has reviewed a draft, dated December 1950, of a proposed report of the Department of the Interior entitled, "The Colorado River Storage Project and Participating Projects," transmitted, on your behalf, by Assistant Commissioner of Reclamation Wesley R. Nelson with his letter of January 30, 1951.

It is of vital importance that the Nation make the most of the resources with which nature has so richly endowed the Colorado Basin. Decisions taken now will powerfully influence the contribution these resources will make to the strength and prosperity of many generations of the American people. For this reason the planning we do today must be as complete and as farsighted as it is possible to make it. And to this end all agencies should freely offer any ideas or assistance that might contribute to better plans. It is in this spirit that we offer the following comments:

1. A comprehensive and coordinated long-range plan should be developed for the Colorado Basin at an early date

It is especially important, in our opinion, that the system of storage reservoirs proposed in your report be protected and complemented by a coordinate program for the land. The Department of Agricul-

ture recognizes its responsibilities in this matter and will, at the earliest possible moment, undertake to make its contribution to a comprehensive and unified plan for full and efficient development, utilization and conservation of the basin's resources.

2. Further economic studies should be made

To insure that the combined projects will yield a maximum return and that individual projects will constitute harmonious and effective elements in the ultimate program for the basin, additional economic studies should be undertaken.

3. The desirability of establishing the upper Colorado River account is questionable

An account of the type proposed might prevent full and equitable consideration of all components of a comprehensive program and would thus set an undesirable precedent.

For whatever value it may be to you in preparing your final plan and report we are attaching a supplement in which we have elaborated somewhat upon the foregoing points.

We hope that our comments and suggestions may contribute, in some degree, to the eventual development of the best possible plan for the region. We shall be glad to participate in efforts to arrive at such a plan.

Sincerely,

CHARLES F. BRANNAN, *Secretary.*

SUPPLEMENT TO COMMENTS UPON REPORT[1] OF THE DEPARTMENT OF THE INTERIOR ON THE COLORADO RIVER STORAGE PROJECT AND PARTICIPATING PROJECTS

1. A comprehensive and coordinated long-range plan should be developed for the Colorado Basin at an early date

In commenting, in a letter dated September 27, 1946, upon the report The Colorado River (H. Doc. 419, 80th Cong., 1st sess.) the Department of Agriculture pointed out that a truly comprehensive plan for the basin would have to encompass the land. We note that the present report would authorize agencies of the Department of the Interior to prepare such a plan. Feeling sure that you do not intend to duplicate authorities and programs of the Department of Agriculture, we are suggesting that the authorizing language be revised to make it clear that agencies of the Department of the Interior would confine their planning activities to lands under their jurisdiction. We realize, of course, that a unified plan for all lands of the basin must be developed. This Department will make every effort to assume its obligations in this effort. As a matter of fact, we had hoped to initiate work on such a plan soon after pointing o , the need for it in our letter of September 27, 1946. However, limitations upon funds and personnel have so far made it impossible for us to undertake this important task. Our present plans call for a start on this undertaking during the fiscal year 1953. Your estimate (which we consider a conservative one) that the costly reservoirs you propose to build will fill with sediment at a rate of some 100,000 acre-feet annually, emphasizes the need for the earliest possible development

[1] Dated December 1950.

of a program for the land. We are, moreover, anxious to undertake this planning effort at the time that your agencies are planning a program for the lands under their jurisdiction in order that full coordination may be achieved.

As mentioned above, your report is designed to provide a legislative base for further investigations by agencies of the Department of the Interior. Among other things the report proposes that the United States Geological Survey investigate measures to control erosion at its source, and that the Bureau of Land Management undertake large-scale studies in erosion control and sediment abatement. The Department of Agriculture has for many years conducted research in the field of erosion and erosion control. We question the wisdom and necessity of starting a similar program in the Department of the Interior. We would suggest, as an alternative, that your agencies bring to our attention needs for additional investigations in this field. While we have considerable research underway in the Colorado Basin, we have realized for a number of years that additional investigations are needed. Recently, moreover, the Pacific Southwest Interagency Technical Committee recommended intensification of our research in this region. Every effort to expand our going program has been pledged. As a matter of fact, our preliminary plans for the fiscal year 1953 call for a substantial increase in our research work in the Colorado Basin.

Apparently it is planned to provide enough extra storage capacity to store the sediment inflow to the reservoirs for a period of 200 years. A large part of the investment in this extra capacity will provide no return for a long period of time. It seems to us that a study should be undertaken to determine if it would not be better to invest a part of this extra expenditure in a program for the land that would begin to reduce sediment damages, as well as to produce on-site benefits in a relatively short period of time.

We note that the proposal to expand the irrigated acreage in the basin is based upon the assumption that with vast areas of fine range land available for summer range, livestock production is limited by the production of hay for winter feeding. In our opinion the grazing capacity of the range is a more important limiting factor than is the availability of hay for winter feeding. Hence, unless and until steps are taken to improve large areas of depleted and deteriorating summer and spring-fall range, and, in some localities, to develop irrigated pastures, expanded production of winter feed might increase the pressure upon the range and lead to its further deterioration. This again emphasizes the necessity for reinforcing the engineering program with a complementary program for the land at the earliest possible moment.

The present report sets forth but an initial step in the development of the water resources of the basin. It seems to us that a long-range plan should be developed as soon as possible. In the course of formulating such a plan it will be highly important to consider all possible future needs for water. In particular, studies should be made to estimate how much water should be reserved for (*a*) the irrigation of range at higher elevations, and (*b*) industrial purposes—especially for the processing of oil shales and wood pulp. In some instances it can be shown that a given amount of water used to create scattered tracts of high-capacity range in mountain valleys will produce a net benefit

exceeding the net downstream. In some areas the use of water for industrial purposes may also be found to produce greater benefits than other uses. With the Nation's security becoming increasingly dependent upon oil, it is especially important that all necessary provisions be made for future development of the vast oil shale deposits of the basin. At any rate, these and other alternative uses of water should certainly be given full and equitable consideration in arriving at a long-range plan. This plan should be aimed at that combination of projects and uses that will yield a maximum benefit to the Nation. In volume I of its recent report the President's Water Resources Policy Commission advanced, as an essential principle of sound planning, the following:

> Planning should be approached with a multiple-purpose concept and with the aim of maximum net benefits based on full consideration of alternative plans for meeting existing and anticipated needs.

We thoroughly agree with this principle and feel that it should control the formulation of the suggested long-range plan for the Colorado Basin.

2. Further economic studies should be made

The annual benefits attributed to the storage project include the expected revenues from the sale of power ($34,903,000) plus an estimate of indirect benefits ($23,725,000). This latter figure is arrived at by methods that have been questioned, upon various occasions in the past, by the economists of this Department, and that have not been accepted as sound by economists generally.

It is also necessary to point out that almost one-fourth of the average annual cost of the storage project ($9,671,000 out of a total of $41,994,700) has been deducted on account of dependent (irrigation) projects. Since the irrigation benefits that justify this part of the proposed expenditure are not presented, the economic evaluation of the storage project is incomplete.

The report recommends the authorization of (*a*) the initial stage of the Colorado River storage project and (*b*) 11 participating irrigation projects. However, economic evaluations of these participating projects are not presented. Presumably the economic justification for the participating projects appear in the separate reports mentioned in the report submitted for review. This leads us to suggest that authorization of the irrigation projects be provided for in these individual reports rather than in the report on the storage project.

Completion of the storage project will require the construction of 10 major dams. These 10 units are combined for purpose of economic evaluation. It is a generally accepted principle that such a system should be formulated and evaluated increment by increment with a view to maximizing net benefits.

3. The desirability of establishing the upper Colorado River account is questionable

The report proposes the establishment of an upper Colorado River account. An account of the type proposed would establish a precedent in basin planning under which the decision to undertake an irrigation project would hinge upon the power potentials of the basin; a factor which should have no bearing upon that decision. As we have stated in commenting upon earlier proposals, we feel that it should be

possible to proceed with economically sound irrigation projects whether or not Federal power projects can be, or are, constructed in the particular basin within which the irrigation projects would be located.

Conversely, we believe that the presence, or absence, of irrigation projects should have no bearing upon the rates at which public power is sold. It is essential that full and equitable consideration be given to all means of deriving benefit from the resources of our river basins. The establishment of accounts of the type proposed would make it impossible to adhere fully to this principle. And this would prevent attainment of the desired goal of maximum net benefits.

As we have pointed out before, such an account has no real bearing upon the justification for, or the desirability of, the projects covered by it; nor upon the amount that must be withdrawn from the Treasury to construct these projects. If a basin account is considered desirable simply as a matter of information, we would suggest that it be designed to provide a record of all costs and all benefits. An account which merely compares one kind of benefit—power revenues—with the required public contribution toward irrigation projects is, to say the least, incomplete.

At any rate, the account proposed in the present report appears to be incorrectly set up. In the economic evaluation of the storage project, the interest upon the unpaid balance of the investment is correctly counted as a cost. In the repayment schedule on page 94, however, it is noted that only the construction cost of $1,139,100,000 is subtracted from the net project revenues in determining the amount to be credited to the upper Colorado River account. Yet in column 14 of this table (headed "Income deductions—Repayment of investment") the cost of this interest is shown to total $693,281,094. This exceeds the accumulated net credits of $674,906,800 appearing in column 26. In other words, during the first 70 years no net credits would accumulate. This, it seems to us, casts further doubt upon the meaning and utility of an account such as the one proposed.

COMMENTS, DEPARTMENT OF COMMERCE

DEPARTMENT OF COMMERCE,
BUREAU OF FOREIGN AND DOMESTIC COMMERCE,
OFFICE OF INDUSTRY AND COMMERCE,
Washington 25, D. C., April 10, 1951.

Memorandum.

To: Mr. Wesley R. Nelson, Assistant Commissioner, Bureau of Reclamation, United States Department of Interior.

From: H. B. McCoy, Department of Commerce member, Federal Interagency River Basin Committee.

Subject: Colorado River storage project and participating projects.

After reviewing the subject report two agencies of the Department of Commerce commented as follows:

Bureau of Public Roads: * * * our review of the Bureau of Reclamation report indicates that the Bureau of Reclamation estimates are generally sufficient to take care of necessary replacement of roads to be inundated by the dams (including those for which authorizations are not now sought). However, no data are presented regarding supplemental projects or participating irrigation

projects which may not only require relocation of existing roads but may require many additional roads to serve the newly developed agricultural areas.

In regard to the Glen Canyon Reservoir, there is some doubt whether provision has been made for the increment in cost of the Blanding-Hanksville Federal-aid secondary route which will be constructed at some time in the future.

Coast and Geodetic Survey: There is one adverse technical feature of the report itself that we would like to point out. The various maps shown throughout the report do not have any projection lines * * *. Without projections, it is difficult to transfer information shown on one map to another map with a high degree of accuracy; and without connections of surveys to a basic network of geodetic control, it is not practicable to show the correct projection lines on a map, nor will the various surveys for a basin development fit together properly.

H. B. McCoy.

COMMENTS, FEDERAL POWER COMMISSION

FEDERAL POWER COMMISSION,
Washington 25, D. C., May 21, 1951.

Subject: Colorado River storage project and participating projects.

Mr. MICHAEL W. STRAUS,
Commissioner, Bureau of Reclamation,
Department of the Interior, Washington 25, D. C.

DEAR MR. STRAUS: The comments herein with respect to the proposed report of the Department of the Interior on the Colorado River storage project and participating projects are transmitted in response to a letter dated January 30, 1951, from Mr. Nelson, Assistant Commissioner. Transmitted with Mr. Nelson's letter were copies of your report dated December 22, 1950, approved by the Secretary of the Interior on January 26, 1951, and the regional director's report of December 15, 1950. The transmittal of these comments by the Commission is in accordance with the established procedures of the Federal Interagency River Basin Committee.

The subject report proposes a plan for the development of the water resources of the upper Colorado River Basin, consisting of the Colorado River storage project and participating irrigation projects which are considered to be made possible by the storage development. The storage project, with which the report is primarily concerned, would include 10 dam and reservoir units, namely Echo Park, Flaming Gorge, Glen Canyon, Navaho, Whitewater, Cross Mountain, Crystal, Curecanti, Gray Canyon, and Split Mountain, with power-generating facilities at each unit and with associated transmission facilities. The first five named of these units, with appurtenant power and transmission facilities, are recommended for early authorization. An initial group of 12 participating irrigation projects is also recommended for authorization. The primary purpose of the Colorado River storage project is to provide the storage and regulation necessary for the utilization of waters allocated to the upper basin States under the Colorado River compact, and to meet the requirements for flows downstream at Lees Ferry and of the treaty with Mexico.

The aggregate active storage capacity in the 10 proposed reservoirs would amount initially to 37,530,000 acre-feet which, with encroachment by sedimentation, would be expected to be reduced to about 25,900,000 acre-feet in 200 years. The reduced active storage capacity is considered in the report to be adequate to meet the above-mentioned requirements up to that time. The aggregate ultimate

power installation at the 10 developments is 1,622,000 kilowatts. Under initial conditions, with full installation, the annual generation of firm energy would amount to about 9 billion kilowatt-hours. Under ultimate conditions of flow depletion and losses by evaporation, the generation of firm energy would be reduced to about 6 billion kilowatt-hours annually.

The estimated cost of the Colorado River storage project on the basis of December 1949 prices is $1,139,100,000. Of this amount, $806,150,000 is proposed to be allocated to power and the balance of $332,950,000 to irrigation. No part of the cost of the participating irrigation projects is included in these estimates. However, the proposed initial group of participating irrigation projects is estimated to cost an additional $293,188,800.

For purposes of benefit-cost analysis, the report estimates the equivalent annual cost of the storage project at $41,994,700, using a 2.5-percent interest rate and a 100-year amortization period. Estimated benefits to irrigation resulting from operation of the storage project are not given in the report. However, an annual cost of $9,671,000, derived from a study of the alternative justifiable cost of providing compact storage and considered chargeable to dependent irrigation projects, was deducted from the total estimated annual cost. This leaves an annual power cost of $32,323,700. The annual primary and secondary power benefits are estimated at $59,084,000, giving a benefit-cost ratio of 1.8 to 1.

The report also gives the results of a detailed financial analysis for the storage project covering 70 years, including a 20-year development period and a 50-year operating period following the installation of the last generating unit. Operating revenues would be derived from the sale of firm energy, averaging 6,346 million kilowatt-hours annually after allowance of 7 percent for transmission losses, at 5.5 mills per kilowatt-hour, and secondary energy in the amount of 152 million kilowatt-hours annually at 3 mills per kilowatt-hour. The table on page 94 of the substantiating materials shows that over the period of analysis such power revenues should be sufficient to cover all operating costs of the storage project and return its entire investment cost of $1,139,100,000 with interest at 3 percent on the investment of $806,150,000 allocated to power.

As stated above, the total annual power benefits of the storage project are estimated in the report at $59,084,000. This includes $35,359,000 of expected revenue from the sale of energy, $3,554,000 in savings on production cost realized by utilities purchasing project power for resale, $17,844,000 as a proportionate share of the retailing benefits arising from resale of the power to consumers at higher rates, and $2,327,000 as a proportionate share in the increased value of goods and services produced by utilization of project power. The latter three classes of benefits are defined in the report as indirect benefits. The direct benefit, or expected revenue, is computed on the basis of the sale of firm energy at 5.5 mills per kilowatt-hour and the sale of secondary energy at 3 mills per kilowatt-hour. The savings to utilities (assumed to be passed on to the consumers) or the first named of the indirect benefits, amounts to 0.56 mills per kilowatt-hour of firm energy. Together these amount to 6.06 mills per kilowatt-hour, which the report estimates as the cost of alternative steam-electric

power delivered to load centers. This cost of 6.06 mills is the same as the Commission staff estimate of the cost of alternative steam-electric power and is considered by the staff to represent the value of the power and the direct power benefit. The Commission does not include in power benefits the latter two classes of indirect benefits named above and believes that the inclusion of such benefits is, at the least, open to question.

On the basis of the firm energy value of 6.06 mills per kilowatt-hour, the Commission staff estimates the total annual power value at $38,913,000. Assuming that irrigation benefits are equal to the annual cost of $9,671,000 assigned by the report to the participating projects, the total benefits accruing to the Colorado River storage project as computed by the staff would be $48,584,000. Assuming that the total project cost is amortized in 50 years with interest at 2.5 percent and that the proposed power allocation pays interest at 2.5 percent, and using the operation, maintenance, and replacement charges given in the report, the total annual cost of the storage project would be $41,573,000. The resulting benefit-cost ratio for the project would be 1.17 to 1. If power benefits are computed on the basis of the expected selling price of 5.5 mills per kilowatt-hour for firm energy, the benefit-cost ratio would be 1.08 to 1. These ratios may be compared with the value of 1.8 to 1 shown in the report.

The commission staff has given considerable study to problems of the development of the Colorado River Basin over the past several years and reports, in connection with its studies, that it has received the full cooperation of your own field offices. The results of these studies with respect to the availability of water and regulation of stream flows and with respect to generation of power at the proposed projects are in substantial agreement with the estimates of your office. The staff advises that in its opinion the units of the Colorado River storage project are generally well planned and well suited for the purposes intended. It points out certain relatively minor modifications in the plans, however, which it believes may be found desirable. Included among such modifications are possible alternative methods of developing the fall of the Gunnison River immediately downstream from the proposed Curecanti Reservoir, and possible increases in the ultimate power installation at certain of the dams.

The staff observes that although the overall storage project appears to be justified, there is a wide variation in the economics of individual units, particularly with regard to the costs of power computed on the basis of the proposed cost allocations. For example, as planned the Crystal project, which is for power only and does not provide any regulatory storage, appears to be of doubtful economic feasibility. Among the more favorable units from the standpoint of economic justification are the Glen Canyon, Echo Park, and Whitewater projects which are proposed for early construction in the report. The staff is of the opinion that the Glen Canyon and Echo Park projects, particularly, are of such importance as to warrant their consideration for inclusion in any early program for the further development of the Colorado River Basin. Echo Park, possibly with an installation somewhat higher than the 200,000 kilowatts shown in the report, is considered by the staff to be strategically located to assist in serving

power loads of the northerly part of the upper Colorado River Basin. At the southerly end of the upper basin, the Glen Canyon project would also have strategic value from the standpoint of assisting in serving loads to the south and, in addition, in providing desirable regulation of stream flow and in protecting projects downstream from loss of value due to siltation.

The Commission staff has made independent studies of the present and future needs for power in the areas that could be served with the power produced at the Colorado River storage project powerplants. With respect particularly to 1970 loads, for which presumably the so-called initial installations would be made, the staff reports estimated loads as of that year substantially less than the estimates of your Bureau. The aggregate installation considered in your report for the year 1970 amounts to 1,364,000 kilowatts. As a result of its own estimates and studies the Commission staff finds that an aggregate installation of approximately 1 million kilowatts would be adequate for that year. The difference in the estimates results from differing determinations as to the needs for power in the fringe areas of the upper basin and differing assumptions as to the export of power to adjacent areas. It is pointed out that changes in the assumptions regarding the export of power, particularly to the southern California area, could materially alter either of the estimates of 1970 power needs.

Your report does not state specifically that it is proposed to use the interest component of revenue received from the sale of storage project power in assistance to irrigation development. Analysis of the report, however, including the table on page 94 of the substantiating materials, shows that it is proposed to use the interest component for this purpose. The report shows that over a 70-year development and operating period, a total of about $675 million would be accumulated through use of the interest component. It is proposed that the funds so accumulated would be available through the recommended upper Colorado River account to assist participating and dependent irrigation projects by paying irrigation costs which are in excess of the ability of water users to repay. The Commission has consistently taken the position that the public interest would best be served if the interest component were returned to the Treasury of the United States rather than diverted for such other purposes. In this case there is an additional subsidy, amounting to $332,950,000 of the cost of the storage project allocated to irrigation, to be repaid from power revenues.

The Commission understands that the program proposed in your report will necessarily be long range in character, and that modifications may be found desirable from time to time as studies continue. In this connection the Commission staff's suggestions for modifications, which would not constitute major changes in the plans, can be discussed with representatives of the Bureau as studies and detailed consideration of the Colorado River storage project continue.

The Commission appreciates the opportunity of commenting upon the report of your Department.

Sincerely yours,

MON C. WALLGREN, *Chairman.*

he Secretary

of the Interior

ir:

This is my report on the Colorado River Storage Project
nd Participating Projects, Upper Colorado River Basin. It is based
n the accompanying report of the Regional Director, Bureau of
eclamation, Salt Lake City, Utah, dated December 15, 1950, and is a
Department-wide report recommending authorization of the program
f all agencies of the Department.

The Departmental report on the inventory of potential
evelopments in the Colorado River Basin, House Document 419, Eightieth
Congress, pointed out that, in view of the fact that there is not
nough water available in the Colorado River system to permit con-
truction of all of the potential projects and have full expansion
f existing and authorized projects, the States of the Colorado River
Basin should determine their respective rights to deplete the flow
f the Colorado River consistent with the Colorado River Compact.
Following issuance of that document, the States of the Upper Colorado
River Basin negotiated and formalized a compact called the Upper
Colorado River Compact, which has subsequently received the consent
f the Congress. Completion of that compact has permitted formula-
tion of at least an initial stage of further development of the Upper
Colorado River Basin. The plan proposed and presented in this report has
been worked out in close cooperation with representatives of the States
of the Upper Colorado River Basin. It would provide flexibility in the
basin development and coordination of the interests of the Nation and
States of the Upper Colorado River Basin.

It is possible at this time to foresee rather clearly the needs
of the Upper Basin in terms of storage requirements for purposes of
river regulation, although facilities for utilization of the last drops
of water cannot be seen with any clarity. Consequently, the plan is
presented for ultimate development in terms of storage, but only for
partial development in terms of water utilization. Selection of the plan
for ultimate storage is based in general upon securing the needed reservoir
capacity for all purposes, while attaining the minimum in evaporation
losses, water being prerequisite to the livelihood of the area. As indi-
cated in the recommendations hereafter made, the proposal is such as to

permit additions to the plan as other participating projects are investigated and weighed in light of the overall water supply. The ultimate storage plan as proposed will permit, in so far as that is practicable, full utilization by the Upper Basin of the 7,500,000 acre-feet of water apportioned to the Upper Basin under the Colorado River Compact. The storage capacity contemplated is designed to assure that the flow of the river at Lee Ferry will not be depleted below 75,000,000 acre-feet in any ten consecutive years. Thus, the Upper Basin may now go forward safely with utilization of its waters and the Lower Basin may be assured that its rights under the compact are protected.

It is not contemplated that all of the ultimate storage plan should be constructed or even authorized at this time. The units will be constructed as required to meet the needs for consumptive use of water and for generation of electrical energy. Authorization is requested for only five of the storage reservoirs.

In addition to permitting the Upper Basin to move forward with utilization of its waters, the Colorado River Storage Project and Participating Projects will provide electrical energy to a large area where it is urgently needed. Flood protection, sediment retention, fish and wildlife conservation, and recreational opportunities will also be provided.

Basically, therefore, there are three fundamental elements in the plan:

(1) Reservoir storage, to conserve and regulate stream flows, and to generate power, which, in turn, produces revenues which assist in repaying the costs of the entire plan;

(2) The Upper Colorado River Account, which will permit uniform power rates and will equate costs of the developments with revenues from all sources; and

(3) Participating irrigation projects, which are made possible by the storage reservoirs, and which, through the Account, will be aided in the return of their reimbursable costs.

Of the ten major dams and reservoirs which will ultimately be required in the main storage plan, five are essential at the outset and are recommended herein. Of the several score of possible irrigation projects, twelve are recommended for authorization or reauthorization at this time, and provision is made for one additional project which is already authorized and under construction to be included under the Account. The Account, which is essential to the plan, is also recommended, and will make the entire system financially feasible.

The Director of the National Park Service has advised that the creational planning and construction program and the archeological, dlife, and geological programs, incident to the construction of dams d reservoirs in Dinosaur National Monument, are estimated to cost ,354,000. These specific programs should be added to those proposed the Regional Director and the project cost estimate increased by e above amount.

The Colorado River Storage Project and initial participating jects are engineeringly feasible, economically justified, and ancially feasible. Benefits from irrigation and other beneficial ter-consuming uses would be realized through construction of dependent jects. The evaluated annual benefits from the storage project 9,080,000) compare favorably with annual costs assigned to the ject ($32,848,000) to produce a benefit-cost ratio of 1.8 to 1.0. e benefits for each of the initial participating projects exceed the sts. Net revenues from the storage project will repay the total nstruction cost of the storage project within 50 years after the stallation of the last generating unit, aid in the return of rigation costs, make payments to the Upper Colorado River Development nd hereinafter proposed, and contribute substantial funds to the easury. Irrigation revenues from each participating project will y all of the operation, maintenance, and replacement costs of that oject allocated to irrigation, and, in addition, will repay a part of e capital cost of the participating project.

Power payments will be accomplished under contracts which will turn the power allocation together with interest at the rate of 3 rcent on the unamortized balance. Under such contracts, electrical ergy will be furnished at the lowest prices consistent with sound siness principles in order to encourage wide-spread use of power throughout the area of service. Irrigation and municipal water payments will be complished under contracts with appropriate political subdivisions, eferably districts of the water conservancy-type.

In view of the existing national emergency, consideration should given by those familiar with that situation, to the suitability of the wer features of the storage project as they relate to the national fense. The Echo Park and Glen Canyon Dams are so situated in the basin d the status of progress on plans for them is such that either or both uld assist in meeting power demands for defense purposes.

My recommendations follow. For all practical purposes they are dentical with the recommendations of the Regional Director but I am so recommending, pursuant to expressions subsequently received from he States, establishment of an investigation fund to assure a continuing d adequate program of investigations in the Upper Basin. This has ecessitated minor changes in the Regional Director's recommendations) and (h). For clarity and convenience, the entire set of recommendations, thus revised, is repeated.

It is recommended:

(a) That the plan of development of the water resources of the Upper Colorado River Basin described in this report be approved;

(b) That authority be sought for the Secretary of the Interior, acting pursuant to the Federal reclamation laws (Act of June 17, 1902, 32 Stat. 388, and acts amendatory thereof or supplementary thereto) to construct, operate, and maintain (i) the following units of the Colorado River Storage Project:

Echo Park
Flaming Gorge
Glen Canyon
Navajo
Whitewater

and (ii) the following initial participating projects subject to the terms of paragraphs (c) or (g), as appropriate, of these recommendations:

Central Utah (initial phase), Utah
Emery County, Utah
Florida, Colorado
Hammond, N. Mexico
LaBarge, Wyoming
Lyman, Wyoming
Pine River extension, Colorado-New Mexico
Seedskadee, Wyoming
Silt, Colorado
Smith Fork, Colorado
Paonia, Colorado

all as described in the report of the Regional Director but with such modification of, omissions from, or additions to the works as the Commissioner of Reclamation, with the approval of the Secretary, may find proper;

(c) That, as contemplated in its authorizing legislation, the Eden Project, Wyoming, which has previously been authorized and is partially constructed, be included in the plan of development and that the Account hereinafter recommended be charged with that portion of the reimbursable construction cost of the Eden Project which is in excess of the amount specified in the Act of June 28, 1949 (63 Stat. 277); and that the Paonia Project, Colorado, as described in the Regional Director's report, which is also partially constructed, be included in the plan of development and that the Account hereinafter recommended be charged with that portion of the reimbursable costs of the Paonia Project which is in excess of the amount which will be repaid within the period specified in the Act of June 25, 1947 (61 Stat. 181).

(d) That, pursuant to the recommendation of the Commissioner of Indian Affairs, and in order to consolidate the recommendations of

he Secretary for dependent projects in the Upper Colorado River Basin, he Shiprock Indian Project be authorized for construction, operation, nd maintenance in accordance with laws applicable to the development f irrigation projects on Indian reservations including the provisions f the Act of July 1, 1932 (47 Stat. 564, 25 U.S.C. 386 A), the benefits which Act should be extended also to the Indian lands to be served the Florida and the Pine River Extension projects, provided, however, at the Shiprock project shall receive assistance from the Upper Colorado ver Account in the same manner and to the same degree as other parti- pating projects;

(e) That authority be sought for the Secretary, acting pursuant the laws applicable to the development of National parks, monuments, recreational areas to the extent to which those laws are not incon- stent with operation of the Colorado River Storage Project units for eir primary purposes, to construct, operate, and maintain the recrea- onal facilities proposed in this report;

(f) That, because of interrelationship of the projects in he Upper Colorado River Basin, authority be sought for the Secretary of he Interior to establish an Upper Colorado River Account. The Account hould be credited with all power revenues derived from (i) units of he Colorado River Storage Project, and (ii) participating projects ocated within the natural confines of the Colorado River Basin above ee Ferry, and with all net power revenues derived from the Central Utah roject (initial phase) subsequent to complete reimbursement of the eimbursable costs of that project. The Account should be charged with l reimbursable construction, operation, maintenance, and replacement osts of the Colorado River Storage Project and participating projects ocated within the natural confines of the Colorado River Basin above ee Ferry that are allocated to power purposes or assigned to be returned rom power revenues. The Account should be charged with that portion of he irrigation allocation of each participating project's construction ost which is required to be so charged in order to show full reimburse- ent thereof within 50 years following a suitable development period for hat project. The Account should also be charged with payments to the pper Colorado River Development Fund which is recommended and described n (j) below. Revenues and costs in connection with other undertakings ereafter authorized to be constructed should be included in the Upper olorado River Account only upon specific authorization by act of Congress;

(g) That the Secretary from time to time recommend to Congress or authorization additional units of the Colorado River Storage Project nd additional participating projects and that all participating projects e required to meet the following qualifications:

(1) A project, unit, or phase thereof may be eligible to participate only when and to the extent that all sources of estimated revenue directly available to said project, unit, or phase are insufficient to return its reimbursable costs during its payout period as hereafter specified in (4).

(2) It shall be a project for the use in one or more of the States designated in Article III of the Upper Colorado River Basin Compact of of the Upper Colorado River system, as water of the Upper Colorado River system, as that system is defined in such compact, the consumptive use of which is apportioned to those States by that article.

(3) Its total benefits shall exceed its total costs, including, but without limitation, any costs attributable to its direct use of the facilities of the Colorado River Storage Project or any other project, and an appropriate share of the costs of the Colorado River Storage Project.

(4) With anticipated revenues from irrigation, based on the irrigators' ability to pay, it shall be able to pay the operation, maintenance, and replacement costs allocated to irrigation and to pay in a period of 50 years following a suitable development period at least part of the construction cost allocated to irrigation.

(5) There shall be available to aid such participating project, or group of participating projects, an appropriate district, preferably of the water conservancy type, which shall be satisfactory to the Secretary of the Interior, one purpose of which shall be to provide revenues for the project over and above those paid by irrigators, to assist in repayment of construction costs allocated to irrigation.

(6) It shall not require assistance from the Upper Colorado River Account in an amount, which, taking into consideration the prior obligations of the Account and the anticipated revenues from its existing and authorized units, will leave the Account in a deficit position at the end of the pay-out period for the participating project as specified in (4) above or will require an increase in the general level of Colorado River Storage Project power rates

(7) Charges to the Upper Colorado River Account for the benefit of a project commingling water specified in (2) with other water shall not exceed an appropriat share of the construction cost of the works require by that project to use water specified in (2).

(6) Pertinent data sufficient to determine its probable engineering and economic justification and feasibility shall be available.

(h) That the investigations and programs proposed to be undertaken by certain agencies of the Department of the Interior, as summarized in paragraphs 33 through 39 of the Regional Director's report and presented in detail in the appended substantiating materials, be authorized; and that appropriations therefor be nonreimbursable, and that in the case of investigations conducted by the Bureau of Reclamation, except those financed under (j) below, the provisions of the Act of April 19, 1945, should govern;

(i) That there be set up and maintained in the Treasury from the receipts of the Colorado River Storage Project a continuing fund of $1,000,000 to the credit of and subject to expenditure by the Secretary to defray emergency expenses and to insure continuous operation of the project;

(j) That there be set up and maintained in the Treasury from the receipts of the Colorado River Storage Project a special fund, to be known as the Upper Colorado River Development Fund, to which shall be transferred at the end of each fiscal year, beginning with the initial year of commercial power production by the Colorado River Storage Project and the participating projects, 7½ percent of the net power revenues for that year after such net revenues exceed 5 million dollars annually, but not to exceed one million dollars in any one fiscal year, which should be available, upon appropriation (such appropriation to remain available until expended), for expenditure by the Secretary, without prejudice to the use by him for the same purposes of other appropriated moneys, for studies and investigations relating to the development, conservation and utilization of the waters of the Upper Colorado River Basin, all expenditures from said fund to be non-reimbursable and non-returnable under the Federal reclamation laws;

(k) That, as of the close of each fiscal year, beginning with Fiscal Year 1955, the Secretary of the Interior report to the Congress on the status of the Upper Colorado River Basin Account and on the revenues from and costs of constructing, operating, and maintaining the Colorado River Storage Project and participating projects. The Secretary's report should be prepared in such manner as accurately to reflect the Federal investment allocated to power, to irrigation, and to other water supply purposes and the progress of return and repayment thereon, and the estimated rate of progress, year by year, in accomplishing full repayment.

I recommend that you approve and adopt this report as your proposed report on the Colorado River Storage Project and Participating Projects, Upper Colorado River Basin, and that you authorize me in your

behalf to transmit copies to the Secretary of the Army and to the St
signatory to the Colorado River Compact for their views and recommend
in accordance with the provisions of Section 1 of the Flood Control A
1944 (58 Stat. 887), to the heads of the agencies of the States of Ar
Wyoming, Utah, Colorado, and New Mexico exercising administration ove
the wildlife resources of those states for their report and recommend
in accordance with the provisions of the Act of August 14, 1946 (60 St
1080), and to other interested Federal agencies for their views and
comments.

Respectfully,

(Sgd) Michael W. Straus

Commissioner

Storage below the State of Colorado is not the answer—by Hon. E. C. Johnson, former United States Senator, Colorado 251
Upper Colorado River Basin Compact of 1948 136

Senator ANDERSON. May I say to you that he is scheduled to be a witness tomorrow morning, and we hope that he, along with Governor Johnson and Mr. Crawford and others, will put those proposed projects clearly before the committee at that time. He will be a witness.

Mr. WILL. That, then, Mr. Chairman, concludes what I had proposed to say to the subcommittee. As you see, we are trying to accommodate ourselves very fully to the wishes you expressed on February 5.

Senator ANDERSON. You are very kind, Mr. Will, and I appreciate it.

Mr. WILL. Thank you.

Senator ANDERSON. Mr. Larson, I believe, is the next witness. Mr. Larson, would you rather start fresh at 2 o'clock? How long will your testimony be?

Mr. LARSON. I might explain it, and then you can decide what you wish me to do.

Senator ANDERSON. I think in view of all the circumstances, we will recess until 2 o'clock.

(Thereupon at 12:30 p. m., a recess was taken until 2 p. m., the same day.)

AFTER RECESS

Senator O'MAHONEY (presiding). The committee will come to order, please.

The next witness is Mr. E. O. Larson from Salt Lake City. You are the head of the Bureau in that area, are you not?

STATEMENT OF E. O. LARSON, REGIONAL DIRECTOR, BUREAU OF RECLAMATION, REGION 4, SALT LAKE CITY, UTAH

Mr. LARSON. I am regional director of the Bureau of Reclamation, region 4, with headquarters at Salt Lake City.

Senator O'MAHONEY. And you are very familiar with this controversial project?

Mr. LARSON. I am, yes.

Senator O'MAHONEY. Very well. The committee will be glad to hear you.

Mr. LARSON. Mr. Chairman, I would first like to express my appreciation for the opportunity of appearing before you. I have a statement requiring about 30 to 35 minutes to read, and I assume you do not wish me to read it, but I can explain what is in my entire statement, the papers attached, and then by ready for questioning.

Senator O'MAHONEY. Unless there is some objection by some member of the committee, we will allow you to proceed in the manner you have indicated. You may summarize your statement. It will be printed in its entirety in the record. Questions, when the time comes for questioning, may be directed to any part of it.

Senator WATKINS. May I ask, Mr. Chairman, if it is not going to be read, that we permit it to be printed with the large type?

Senator O'MAHONEY. Without objection, it is so ordered.

Mr. LARSON. In addition to the 2 storage units and 11 participating projects recommended for initial authorization by the Secretary of the Interior, the legislation, S. 500, before you contains 2 other storage units and 3 other participating projects. I will first discuss the items recommended by the Secretary and then present material now available

on the additional units and projects in the bill. The investigation of two of the additional participating projects has not been under my administrative jurisdiction. I suggest, therefore, that questions concerning the Indian features of the Navaho project be referred to the Bureau of Indian Affairs, and likewise a representative of region 5 of the Bureau of Reclamation will answer questions concerning the San Juan-Chama project.

The Secretary's proposals would authorize construction of 2 storage reservoirs, Echo Park and Glen Canyon, with a total capacity of 32½ million acre-feet. Besides regulating the flow of the river, these units would generate power needed by the upper basin States and provide sediment control for the lower basin.

Construction of the 11 recommended participating projects would constitute a material advance in the development of the upper basin water resources. They would bring 132,360 acres of land into agricultural production and provide supplemental water to 233,930 acres of land now irrigated with an inadequate water supply. They would also supply industrial and municipal water and hydroelectric energy.

The Echo Park and Glen Canyon units of the storage project are part of the plan for regulation of the upper Colorado River through which the provisions of the Colorado River compact can be met and additional use of apportioned waters can be made in the upper basin.

The basin plan would eventually comprise a system of seven large regulatory reservoirs located at strategic points of control on the main stem and major tributaries of the upper Colorado River. At each of the seven storage sites a powerplant would be constructed for the generation of hydroelectric energy. Two additional power plants with small re-regulating reservoirs that would utilize upstream regulation, would complete the integrated storage and power system of the plan. The Secretary, however, recommends initial construction of only two of these power and storage units and has selected the Echo Park and Glen Canyon units because of their economy and efficiency.

Although the regulatory reservoirs proposed in the basin plan are generally below the points of diversion for the participating projects, they would serve essentially the same purposes as reservoirs above points of diversion. This would be achieved through a replacement practice quite common on western streams where water is diverted upstream in exchange for storage water releases from downstream reservoirs. In this manner the downstream obligations would be met. It would be impossible and there is no necessity to provide this replacement through reservoirs at the sites of the participating projects. Selection of a few large reservoirs would also facilitate the integrated operation of the system, which would be necessary in order to provide river regulation, water for consumptive use and generate the optimum amount of hydroelectric power from the system's water as it is released to meet downstream obligations.

Optimum production of power at the Glen Canyon and Echo Park units would be assured by the construction of interconnecting transmission lines. These interconnecting facilities would permit maximum flexibility in power operation and facilitate the delivery of Glen Canyon power to load centers in the upper basin States. The initial lines would be the backbone of the transmission grid to which subsequently constructed powerplants would be added. Supply lines from the transmission grid would be constructed to serve local market areas.

Ten major private power companies support this project and propose to absorb the project power output from a main transmission system and deliver it to existing and prospective customers. This would relieve the Federal Government of a portion of its contemplated construction cost.

Glen Canyon Dam would be on the Colorado River in northern Arizona approximately 13 miles downstream from the Utah-Arizona border and 16 miles upstream from Lee Ferry. The dam would be a concrete structure rising 700 feet from bedrock and 580 feet above the river. The reservoir would offer final regulation for deliveries of water at Lee Ferry in compliance with the Colorado River compact. Out of a total capacity of 26 million acre-feet, 20 million acre-feet would initially be active capacity. The reservoir when filled would have a normal water surface area of 153,000 acres and would extend about 186 miles up the Colorado River, nearly to the mouth of the Green River, and 71 miles up the San Juan River. It would be the principal point of sediment control in the upper basin. Even after 200 years, at the present rate of sediment flow and with upstream storage developed, almost half the initial storage space would be available for river regulation.

A powerplant would be located near the toe of Glen Canyon Dam. It would consist of 7 generating units with a total installed capacity of about 800,000 kilowatts or approximately one-half the total capacity contemplated for the entire Colorado River storage project.

The total construction cost of the Glen Canyon unit, with an appropriate share of transmission costs, is estimated at $421 million. Also provided in the proposed bill of authorization would be the construction facilities for adequate protection of the Rainbow Natural Bridge.

Echo Park Dam would be located in Colorado on the Green River about 3 miles east of the Utah-Colorado State line and 3 miles below the junction of the Green and the Yampa Rivers in the tri-corner area of Colorado, Wyoming, and Utah. The dam would be a concrete structure rising 690 feet from bedrock and 525 feet above the river. The reservoir would have a storage capacity of 6,460,000 acre-feet, including 5,460,000 acre-feet of active capacity. When filled to capacity, the reservoir would have a surface area of 43,400 acres and would extend 63 miles up the Green River and 44 miles up the Yampa River.

The powerplant at the dam would consist of 4 generating units with a total capacity of about 200,000 kilowatts.

The construction cost of the Echo Park unit is estimated at $176 million including an appropriate part of the basic transmission system but not including recreational development of the Dinosaur National Monument estimated to cost $21 million.

A participating project is defined as any water-consuming project which would utilize water of the upper Colorado River system for irrigation and require repayment assistance on irrigation costs from power revenues of the storage project.

The following 11 such participating projects are recommended for initial authorization in the Secretary's supplemental report.

LaBarge, Wyo.
Seedskadee, Wyo.
Lyman, Wyo.
Silt, Colo.

Smith Fork, Colo.
Paonia, Colo. (including Minnesota unit).
Florida, Colo.
Pine River extension, Colorado-New Mexico.
Emery County, Utah.
Central Utah (initial phase), Utah.
Hammond, N. Mex.

Brief statements on each of the initial participating projects are attached for filing with your committee, and further details can be found in the supplements to the Colorado River storage project report (H. Doc. 364, 83d Cong., 2d sess.).

A 12th project, the Eden project in Wyoming, was authorized in 1949 and is now under construction. That authorization provided that the project be assisted in repayment by power revenues from the Colorado River storage project. The Eden project is therefore included in the plan as a participating project.

The Secretary's supplemental report also included the Shiprock division of the Navaho project. Subsequent studies show that major features of the Navaho project, including the Navaho Reservoir, would be used jointly by the two divisions of the project. The Navaho Reservoir would also be used by the potential San Juan-Chama project. Thus, the Navaho project would be uneconomical of construction by divisions, and authorization of only the Shiprock division of the project would therefore be unsound. For the information of your committee, however, a brief summary on the overall Navaho project prepared by the Bureau of Indian Affairs is attached. Further details on this project can be found in the feasibility report, Navaho Project, New Mexico, January 1955, compiled by the Bureau of Indian Affairs.

The Colorado River compact in article III (a) apportioned from the Colorado River system in perpetuity to the upper basin and lower basin, respectively, exclusive consumptive use of 7½ million acre-feet per annum. There is a provision in article IIId of the same compact that the States of the upper division (Colorado, New Mexico, Utah, and Wyoming) will not cause the flow of the river at Lee Ferry, the point of division between the upper and lower basins, to be depleted below an aggregate of 75 million acre-feet for any period of 10 consecutive years. These are the controlling and most important limitations with respect to water uses in the upper basin although there are other provisions in the compact relating to uses and deliveries of water.

Substantial water development in the upper basin is impossible without regulation of the uneven flow of the Colorado River. Our studies show that without such control only about 58 percent of the water apportioned to the upper basin could be used.

During the past 59 years, the historic annual flow of the Colorado River from the upper basin has varied from a high of 22 million acre-feet in 1907 to less than 5 million acre-feet in 1934. That span of years also presented extended periods of abnormal and subnormal flows, the most impressive being the extremely high flows of the period 1914 to 1929 with historic annual flows averaging over 16 million acre-feet and the prolonged 25-year drought following thereafter with historic annual flows averaging only 11.5 million acre-feet. The long-time average flow, however, including periods of high runoff and

drought, is sufficient to supply the allocated consumptive uses in the upper basin in addition to the downstream obligations. The primary function of the storage units in the plan is to store water during years of high runoff for release during years of low runoff. Therefore, these cyclic conditions must be recognized in planning future uses of water in the upper basin.

A history of 59 years of river operation may or may not have revealed the full characteristics of the Colorado River. Yet an initial development of the magnitude now proposed has the assurance of the availability of sufficient water supply. Later stages of development would derive additional assurances as time goes on, or, if changes are required, time will permit appropriate adjustments in the later stages of development.

Under sound engineering and economic practices it would be impractical to completely regulate past historic flows of the river and its tributaries and in years of extreme drought conditions the users of upper basin water would experience shortages in their supply. In analyzing the upper basin's long-time program for developing its apportioned use of 7½ million acre-feet per annum, we found that such occasional shortages should be within the limits of normal irrigation, industrial, and municipal operations.

The initial storage-project units would provide for a greater amount of replacement storage than would be needed to permit the increase in consumptive use which would result from the initial development. However, these large storage facilities would develop the optimum power potential of these sites necessary to meet the demands of the region. These large power and storage units would also fit into any subsequent phase of the upper basin development which may be authorized.

A start on the required storage facilities in advance of their actual need is imperative because of the time element involved in the construction and initial filling of the storage reservoirs. Apportioned water not presently consumed in the upper basin would greatly facilitate the initial filling of the reservoirs.

Through electrical interconnection between Glen Canyon, Echo Park and existing powerplants in the lower basin a first filling of the storage reservoirs could be attained with no interruption in delivery of firm electric energy to existing and potential customers on the river's system.

The time required to initially fill the Glen Canyon and Echo Park reservoirs will largely depend upon the amount of runoff in the river. Under very favorable runoff conditions the filling period could be less than 5 years whereas a much longer period would be necessary under extreme drought conditions. In either event, however, dead storage levels at Glen Canyon and at Echo Park could be attained during the period of construction of the dams, thereby providing the heads necessary for initial power generation.

Since the initial participating projects do not require the full capacity of Glen Canyon and Echo Park Reservoirs for regulatory purposes, there would be no immediate need to completely fill these reservoirs. Thus the initial filling process can be readily adapted to the amount of runoff and downstream demands for water and firm electric energy. This initial filling process would not violate the terms of the Colorado River compact.

The total consumptive use of water in the upper basin by all constructed projects, those authorized and projects under construction will be approximately 2½ million acre-feet, or one-third of the annual allotment of 7½ million acre-feet to the upper basin.

The 11 participating projects recommended in the Secretary's supplemental report would increase present stream depletion by an additional 400,900 acre-feet annually. Average evaporation from the recommended Echo Park and Glen Canyon storage units would amount to about 613,000 acre-feet annually. The units and projects recommended for authorization would thus involve an increased use of approximately 1 million acre-feet per annum. With accelerated development in the future the remainder (4 million acre-feet per annum) of the upper basin's share of the Colorado River water may be put to beneficial use within the next 75 years.

Our studies show that the recommended units and projects would have no material effect on the quality of water downstream.

With respect to later phases of development, the plan provides for additional gaging and sampling stations to supply data for continued analysis and scrutiny as each phase approaches authorization. Our analysis of the quality of water at Lee Ferry reveals for the critical period of low flow (1931 to 1947) concentrations of dissolved salts averaging 0.78 ton per acre-foot (575 parts per minute), corresponding to uses totaling 2½ million acre-feet per annum in the upper basin.

An average concentration of 0.85 ton per acre-foot (625 parts per minute) or an increase of about 9 percent is anticipated at Lee Ferry following completion of the recommended Glen Canyon and Echo Park storage units and the 11 initial participating projects, with a corresponding use then totaling about 3½ million acre-feet. With full use of the 7½ million acre-feet per annum allotment in the upper basin, the average concentration of dissolved salts at Lee Ferry is estimated at about 1.20 tons per acre-foot (880 parts per minute).

Under any of the above conditions, concentrations and type of salts are well within the standard range for irrigation water designated by the United States Salinity Laboratory at Riverside, Calif., as good to permissible, and within the range of practical treatment for municipal and industrial purposes.

The total construction cost of the initial units and participating projects is estimated at $930 million as summarized in table I.

This cost includes $7,287,000 for the authorized Eden project now nearing completion, $2,035,000 expended on the Paonia project under a previous authorization, and $21 million proposed for recreational development of the Dinosaur National Monument. This cost is based on January 1953 price levels, and if adjusted to October 1954 price levels would be reduced by about 1 percent.

Also included is the cost of a transmission system necessary to deliver electrical energy to power market centers in the upper basin States and to tie in with the lower basin system.

If the Federal Government constructs only the interconnecting trunkline, with the remainder of the system to be constructed by non-Federal interests, the estimated Federal construction cost would be reduced and the purchase price for project power to those non-Federal interests decreased.

Costs of the two initial units of the storage project have been allocated to power, irrigation, and recreation. The costs of the participating projects have been allocated primarily to irrigation.

Costs allocated to recreation represent only the added cost resulting from the inclusion of recreational facilities. The allocation of costs will be subject to further study in connection with preparation of definite plans. The costs as presently allocated on a preliminary basis are presented in table I.

The reimbursable construction costs of each unit and participating project would be repaid within 50 years of the time that unit or project is completed, exclusive of authorized development periods. Commercial power and municipal and industrial water supply investments would be repaid with interest at the going rate for long-term marketable securities. Interest-bearing and non-interest-bearing investments would be paid concurrently to the extent practicable. Repayment of the irrigation investment would be accomplished during a 50-year period with the irrigators paying up to their ability and the balance paid by the application of excess power revenues from the storage project during the same 50-year period.

Exceptions to this are the Paonia and Eden participating projects for which special legislative provision has already been made, and those cases involving Indian lands to which the provisions of appropriate acts—the Leavitt Act—would be made applicable by the terms of the bill.

The cost of the recreational planning and construction program of the National Park Service in the Dinosaur National Monument would be nonreimbursable.

At a 6-mill per kilowatt-hour average firm power rate, power revenues would be sufficient during 50 years of operation to repay the costs allocated to power at the Echo Park and Glen Canyon units and central Utah project, with 2½ percent interest on the unpaid balance, and also to make substantial payments on irrigation costs. Thereafter power revenues would be sufficient to complete repayment of the non-interest-bearing construction costs allocated to irrigation and assigned for repayment from power revenues. The actual selling price of power would be established at rates consistent with sound business principles and would take into account the irrigation costs to be repaid from power revenues.

A payout schedule was included in the supplemental report of the Secretary illustrating how repayment could be accomplished within a 50-year period, assuming power revenues were applied first to the repayment of power costs. The Department now proposes that in those instances where repayment of bearing costs, such as power and non-interest-bearing costs, such as irrigation, are due concurrently, they will be repaid concurrently to the extent practicable.

A benefit-cost analysis has been made of each initial storage unit and each initial participating project to determine whether or not they are justified to the Nation as Federal developments. This analysis compares Federal project costs with tangible project benefits. It is used by the Bureau of Reclamation in addition to and apart from the repayment analysis.

The benefit-cost analysis covers the widespread local, regional and national benefits which are not included in the repayment analysis.

Such benefits susceptible to monetary evaluation are known as tangible benefits, and are used in the benefit-cost comparison. Other benefits for which no monetary value can be estimated are known as intangible and do not appear in this analysis.

There are three main types of tangible irrigation benefits used in the benefit-cost ratio—direct, indirect, and public.

Direct benefits are the increase in net farm income; indirect benefits, the increase in profits of businesses handling, processing, and marketing farm products, and the increase in the supply of goods and services. Public irrigation benefits comprise the increase or improvement in settlement investment opportunities and in community facilities and services.

In general, benefits from power and municipal and industrial water are limited to the costs of providing such power and water from the most economical alternative sources.

Flood control, recreational, and fish and wildlife benefits are computed by the Corps of Engineers, the National Park Service, and the Fish and Wildlife Service, respectively.

The cost side of the benefit-cost comparison includes all Federal or project costs. These are construction costs, interest costs, and operation, maintenance and replacement costs.

The recommended units of the storage project and the participating projects collectively and individually would have tangible benefits greater than costs.

In a plan of this magnitude the authorities and laws under which the various features would be constructed, administered, and operated would normally present serious problems, and certainly would raise grave questions of jurisdiction.

The plan before you is happily free of such complications. The storage project, with its regulatory reservoirs, is of interstate significance, and each of its units would be so treated. These would be constructed, operated, and maintained by the Bureau of Reclamation, and, as far as water is concerned, would be operated in conformance with the Mexican Water Treaty, the Colorado River and upper Colorado River basin compacts. The last document includes provisions to cover all the necessary aspects of such operation.

The participating projects are consumptive-use projects intrastate in character. In the proposed plan these projects would be constructed, operated, and maintained under reclamation law. Water rights would therefore be obtained and administered under the water code of the State in which the project would be built. The participating projects would in general be operated and maintained by water users' organizations after construction.

The plan includes the formation of appropriate districts, preferably of the water conservancy type and subject to Secretary approval, as contracting entities to represent project water users in project operation, repayment, and other matters.

In addition to the two units of the storage project and 11 participating projects I have discussed, the bill before you includes the Cross Mountain, Curecanti, Flaming Gorge and Navaho units of the storage project and the Gooseberry, San Juan-Chama and Navaho participating projects.

The bill provides that the Curecanti Dam shall be constructed to a height which will impound not less than 940,000 acre-feet of water or will create a reservoir of such greater capacity as can be obtained by a high water line located at 7,520 feet above mean sea level. The additional units of the storage project were covered in the 1950 report on the Colorado River storage project and participating projects and in the 1953 supplemental report of the Secretary.

Analyses of the Curecanti unit for any size reservoir, when a dam and powerplant at the Curecanti site are considered alone, indicate that power from the site would be more expensive than power from alternative sources. Preliminary studies are now in progress of a modified plan of development for this unit, including additional downstream power drops dependent on storage regulation at the Curecanti Reservoir. A summary statement of reconnaissance data on this modified plan is attached.

As I have previously stated, the Navaho Reservoir is treated as a feature of the potential Navaho participating project mentioned below rather than as a unit of the storage project.

Project reports have been prepared on the Gooseberry, San Juan-Chama and Navaho projects. Reports on the Gooseberry, San Juan-Chama and Navaho projects recently prepared by regions 4 and 5 of the Bureau of Reclamation and Bureau of Indian Affairs, respectively, are yet to be circulated to other agencies, States, and local interests for review in accordance with the 1944 Flood Control Act.

The present plan of development, as covered in the report on the San Juan-Chama participating project, is a modification of the plan presented for this project at the congressional hearings in 1954.

Brief summary statements on the Gooseberry, the modified San Juan-Chama and the Navaho participating projects are attached. A summary (table II), including the units and participating projects covered in the Secretary's supplemental report as well as the additional units and participating projects in the bill, is also attached.

The additional 3 units of the storage project in the bill would have a total storage capacity of about 10,080,000 acre-feet and an installed hydroelectric generating capacity of 172,000 kilowatts.

The 3 additional participating projects would bring into agricultural production 137.250 acres of new land and provide supplemental water of 245,400 acres of land now irrigated but with an inadequate water supply, as well as develop 55,800 acre-feet annually for municipal and industrial uses.

They would further deplete the flows of the upper basin by about 589,000 acre-feet annually.

Grand total	143,020	243,470	1,061,000	48,800	1,046,300	[7] 930,339,300	27,907,900	546,056,000	45,500,000	305,375,400	82,046,500	814,884,900	896,931,400

[1] Exclusive of nonreimbursable CRDF expenditures.

[2] Costs allocated to power and municipal water are repaid with interest, including interest during construction.

[3] Repayment by water users toward construction costs over 50-year repayment period beyond a reasonable irrigation development period except 60-year period for Eden project and 68-year period for Paonia project

[4] Includes $15,191,000 in irrigation revenues and $45,500,000 from municipal and industrial water users

[5] Includes $27,838,000 of excess power revenues from the central Utah project powerplants accruing during the irrigation repayment periods of this project.

[6] Exclusive of $5,500,000 allocable to purposes of the ultimate phase of central Utah project.

[7] Includes cost ($7,287,000) of authorized Eden project now nearing completion and $2,035,000 expended on Paonia project under previous authorization.

Subtotal	137,250	241,400	---------	55,800	588,900	352,163,800	1,801,000	----------	26,775,000	323,590,800	87,770,000	262,595,800	----------
Total participating projects	280,250	484,870	61,000	104,600	1,022,200	663,810,100	8,708,900	46,669,000	72,275,000	530,627,200	169,816,500	[7] 479,784,700	----------
Grand total	280,250	484,870	1,233,000	104,600	1,779,200	1,464,978,100	29,708,900	675,632,000	72,275,000	681,862,200	169,816,500	1,259,952,700	----------

[1] Costs allocated to power and municipal water are repaid with interest, including interest during construction.

[2] Exclusive of nonreimbursable Colorado River development fund expenditures.

[3] Repayment by irrigation water users toward construction costs over a 50-year repayment period following a reasonable development period.

[4] A power rate of more than 6 mills would be required for these units to repay their construction cost in 50 years at 2.5 percent interest

[5] $800,000 of the $36,400,000 estimated cost for Navaho Dam and Reservoir allocated to the San Juan-Chama project for added capacity necessary to serve the San Juan-Chama project.

[6] Would require an extension of the payout period used in table 1 or an increase in the average power rate.

[7] Exclusive of $5,500,000 allocable to purposes of the ultimate phase of central Utah project.

Statement on La Barge Project, Wyoming

The potential La Barge project would make a direct flow diversion from Green River, a principal tributary of the Colorado River, to provide for the irrigation of 7,970 acres of desert lands in Sublette and Lincoln Counties in southwestern Wyoming. Only about 300 acres of these lands receive any irrigation water at the present time. Their meager supply would likely be used on other lands outside the project area if the project was constructed. Water for domestic and stock-watering use on farms in the project area would be taken from project canals and from shallow wells that would be developed by the water users.

Project lands would generally be utilized for the support of livestock enterprises. Climatically adaptable crops, such as hay, small grain, pasture, and some garden crops would be produced. The principal livestock would be dairy cows and sheep. Analyses made indicate that an average farm of about 210 irrigated acres in the project area would provide the farm family with a reasonable standard of living, provide employment for the available family labor, and permit payment of operation, maintenance, and replacement costs and some payment toward construction costs of project facilities.

Detailed land classification surveys show the project lands to be suitable for sustained production of crops under irrigation farming. Water supply studies, based on records of streamflows as they have occurred in the past, indicate that an adequate irrigation supply of 24,300 acre-feet annually would be available for the project from direct flows with permissible shortages in occasional drought years. A water right for the project can be obtained under Wyoming State law.

Construction features of the project would include a main diversion and distribution canal with an initial capacity of 175 second-feet and extending approximately 40 miles along the west side of Green River, a few short laterals, and a few short drains as required. Construction of the main canal and the laterals would require about 2 years. Drains would not be completed until a few years after application of water to the land so that the extent of works required could be determined. A period of 2 to 3 years would be required to construct the project.

This statement is based on the physical plan of project development presented in the Bureau of Reclamation report on the La Barge project, Wyoming, dated January 1951, a supplement to the Colorado River Storage project report dated December 1950. Results of current January 1953 estimates for this project plan are summarized in the attached project summary tabulation.

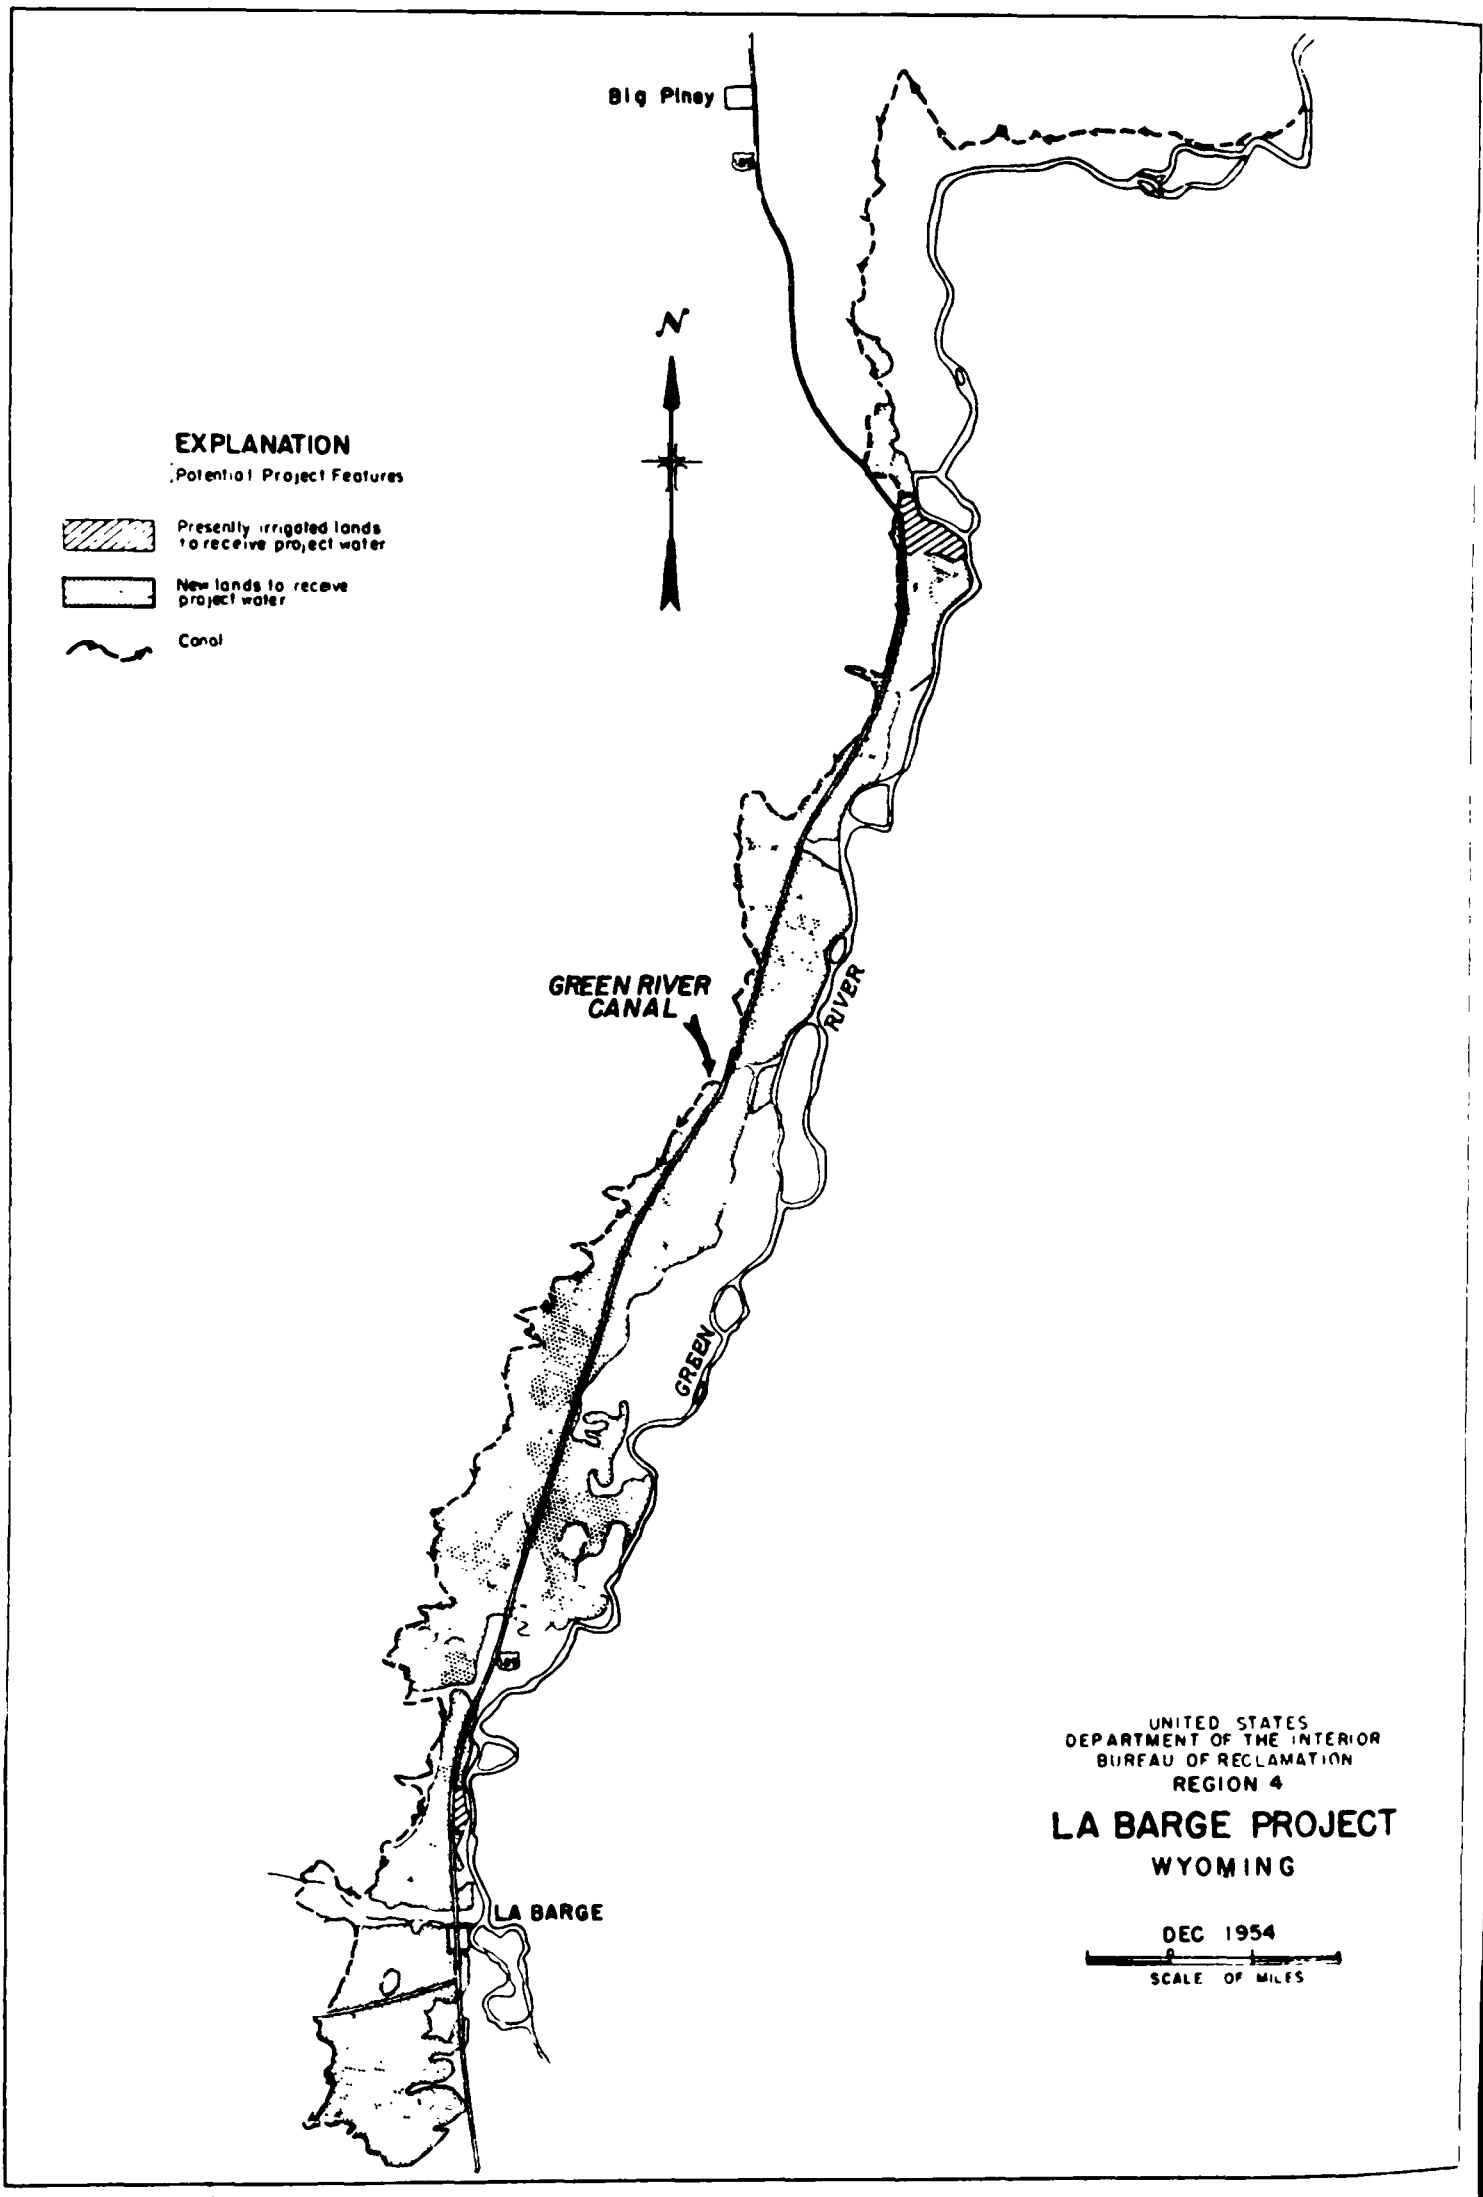
Summary data, La Barge project, Wyoming

Irrigated acreage: New lands, 7,970 acres.
Principal agricultural production:
Hay, pasture and small grain, dairy cows and sheep.

Water supply:	*Acre-feet*
Average annual increase in direct flow diversions	24,300
Average annual increase in storage yield	None
Stream depletion (average annual)	14,200

Project works:
Construction features would include main diversion and distribution canal with initial capacity of 175 second-feet and extending approximately 40 miles along west side of Green River, a few short laterals and a few short drains.

Construction cost and repayment:	
Estimated cost	$1,673,300
Reimbursable cost allocated to irrigation	1,673,300
Nonreimbursable allocation	None
Repayment by:	
Irrigation water users	495,000
Power revenues from Colorado River storage project	1,178,300
Total	1,673,300
Annual operation, maintenance, and replacement costs	14,700
Benefit-cost ratio	2.12 to 1



INTERIOR RECLAMATION SLC UTAH

151-400-24

STATEMENT ON SEEDSKADEE PROJECT, WYOMING

The potential Seedskadee project would divert water from Green River, a principal tributary of the Colorado River, to provide for the irrigation of 60,720 acres of arable dry lands lying along both sides of the river in Lincoln and Sweetwater Counties in southwestern Wyoming. Of the total area 51,960 acres would be included in family-sized farm units and 9,030 acres would be used for community pasture. Water for domestic and stock watering use in the project area would be obtained from project canals and from shallow wells that would be developed by the water users. Fish and wildlife values in the area would probably suffer minor damage as a result of project development. Recreation values would not be materially affected.

With project development, the irrigated lands would be utilized primarily for the support of livestock enterprises, particularly dairy cows and sheep. Climatically adaptable crops, such as grasses for hay and pasture, small grain, alfalfa, and some garden crops would be produced. Analyses made indicate that an average farm of about 200 irrigated acres in the Seedskadee area would be required to provide the farm family with a reasonable standard of living, provide employment for the available family labor, and permit payment of operation, maintenance, and replacement costs of project facilities and some payment toward construction costs of project facilities.

Detailed land classification surveys show the project lands to be suitable for sustained production of crops under irrigation farming. Water supply studies based on records of stream flows as they have occurred in the past indicate that an adequate irrigation supply of 225,800 acre-feet annually would be available from direct flows for the project with permissible shortages in occasional drought years. A water right for the project can be obtained under Wyoming State law.

Principal construction features of the project would include a diversion dam on Green River, a system of main canals and laterals to convey water from the diversion dam and distribute it to project lands, two hydraulic driven pumps at drops in the distribution canals to lift water to some of the lands, and a few miles of artificial drains.

The Seedskadee diversion dam would consist of a low ogee overflow section 400 feet long, canal headworks, a sluiceway, and a dike 1,000 feet long. The Seedskadee diversion canal would extend along the west side of Green River and would convey water from the river to the project lands. It would be 19 miles in length and would have an initial capacity of 1,350 second-feet. The diversion canal would terminate at a bifurcation structure at the headings of the two main canal distribution systems, one serving lands west of the river and the other serving lands east of the river. Main canals in the distribution system would total about 160 miles in length. A lateral system would be constructed to deliver water from the main canals to individual farm tracts.

A construction period of about 8 years, including the completion of definite plan investigations, would be required to complete all project facilities except the drains. Drains would not be completed until several years after application of water to the lands so that the actual extent of drainage works required could be determined.

This statement is based on the physical plan of project development presented in the Bureau of Reclamation report on the Seedskadee project, Wyoming, dated November 1950, a supplement to the Colorado River storage project dated December 1950. Results of current (January 1953) Bureau of Reclamation estimates for this project plan are summarized in the attached project summary tabulation. Studies of the upper Green River Basin made subsequent to 1950 indicate that significant modifications in the project plan may be found desirable during the definite planning stage of the investigation.

Summary data, Seedskadee project, Wyoming[1]

Irrigated acreage:	*Acres*
New lands (largely public domain)	60,720
Supplemental	None
Total	60,720

[1] Studies in the upper Green River Basin subsequent to 1950 indicate that enlargement of the project area and addition of some storage may be found desirable during the definite plan investigations of the potential project.

Principal agricultural production: Hay, pasture, and small grain; dairy cows and sheep.

Water supply:	*Acre-feet*
Increase in average annual direct flow diversions	225,800
Increase in average annual storage yield	None
Stream depletion (average annual)	110,400

Project works:

Construction features would include a diversion dam on the Green River, a system of main canals and laterals, 2 hydraulic driven pumps and a few miles of drains. The diversion canal, 19 miles in length, would have an initial capacity of 1,350 second-feet. Main canals and laterals in the distribution system would total about 160 miles in length.

Cost and repayment:	
Estimated cost	$23,272,000
Reimbursable cost allocated to irrigation	23,272,000
Nonreimbursable allocation	None
Repayment by:	
Irrigation water users	4,785,000
Power revenues from Colorado River storage projects	18,487,000
Total	23,272,000
Annual operation maintenance, and replacement costs	136,600
Benefit-cost-ratio	1.46 to 1

Statement on Lyman Project, Wyoming

The potential Lyman project is contemplated as a means of improving the late-season irrigation water supply and thus of bettering agricultural production on 40,600 acres of land near the town of Lyman in Bridge Valley, a part of the upper Colorado River Basin in southwestern Wyoming. The lands are now irrigated with only a partial supply.

Because of the semiarid climate in the area, irrigation is necessary for successful crop production. Only grasses for hay and pasture, alfalfa, and some small grains can be produced to any extent as the growth of most other crops is precluded by a short growing season and untimely summer frosts that characterize the high 6,500- to 7,000-foot elevations of the project lands. Additional late-season irrigation water is needed to increase yields of the forage and grain crops to bolster the all-important local livestock industry. Principal livestock would be dairy cows and beef cattle.

The Lyman project would provide late-season irrigation water through construction of a dam and reservoir with 43,000 acre-feet total capacity at the Bridger site on Willow Creek to store the spring flood flows of Blacks Fork and its tributary, West Fork of Smiths Fork. Surplus flows of these streams, now largely used for excessive irrigation in the spring runoff season, would be conveyed to the reservoir by 2 feeder canals, 1 diverting from each of the streams. The water would be retained in the reservoir until needed and then released to the Willow Creek Channel. Enlargement of a few miles of this channel and construction of three canals to divert from this enlarged channel would provide the necessary facilities along with the existing irrigation systems in the area to effect the distribution of the water to project lands. The existing canal systems would be improved and extended as necessary. Drains would be provided where necessary to improve the removal of unavoidable waste and excess surface waters on the irrigated lands and to protect the lands from accumulations of harmful salts.

Preliminary land classification surveys indicate that project lands would be suitable for sustained irrigation farming although detailed surveys will be necessary to firmly establish their suitability. Some presently irrigated lands that may be found to be nonarable could be abandoned and their water supply transferred to readily accessible arable lands now idle.

Water supply studies, based on records and estimates of streamflows as they have occurred in the past, indicate the project would increase the irrigation supply from storage by an average of 32,500 acre-feet annually and reduce the present average irrigation shortage of 37 percent to an average of 12 percent. A water right for the project can be obtained for the project as planned under

Wyoming State law provided the necessary agreements and adjustments in water rights can be negotiated with holders of prior natural flow rights in the project area.

A period of 5 or 6 years would be required to complete definite plan investigations and construction of the project facilities excepting the drains. The drains would not be completed until a few years after operation of the project and the actual extent of drainage required could be determined.

This statement is based on the physical plan of project development presented in the Bureau of Reclamation report on the Lyman project, Wyoming, dated October 1950, a supplement to the Colorado River storage project report dated December 1950. Results of current (January 1953) Bureau of Reclamation estimates for this project plan are summarized in the attached project summary tabulation.

Summary data, Lyman project, Wyoming

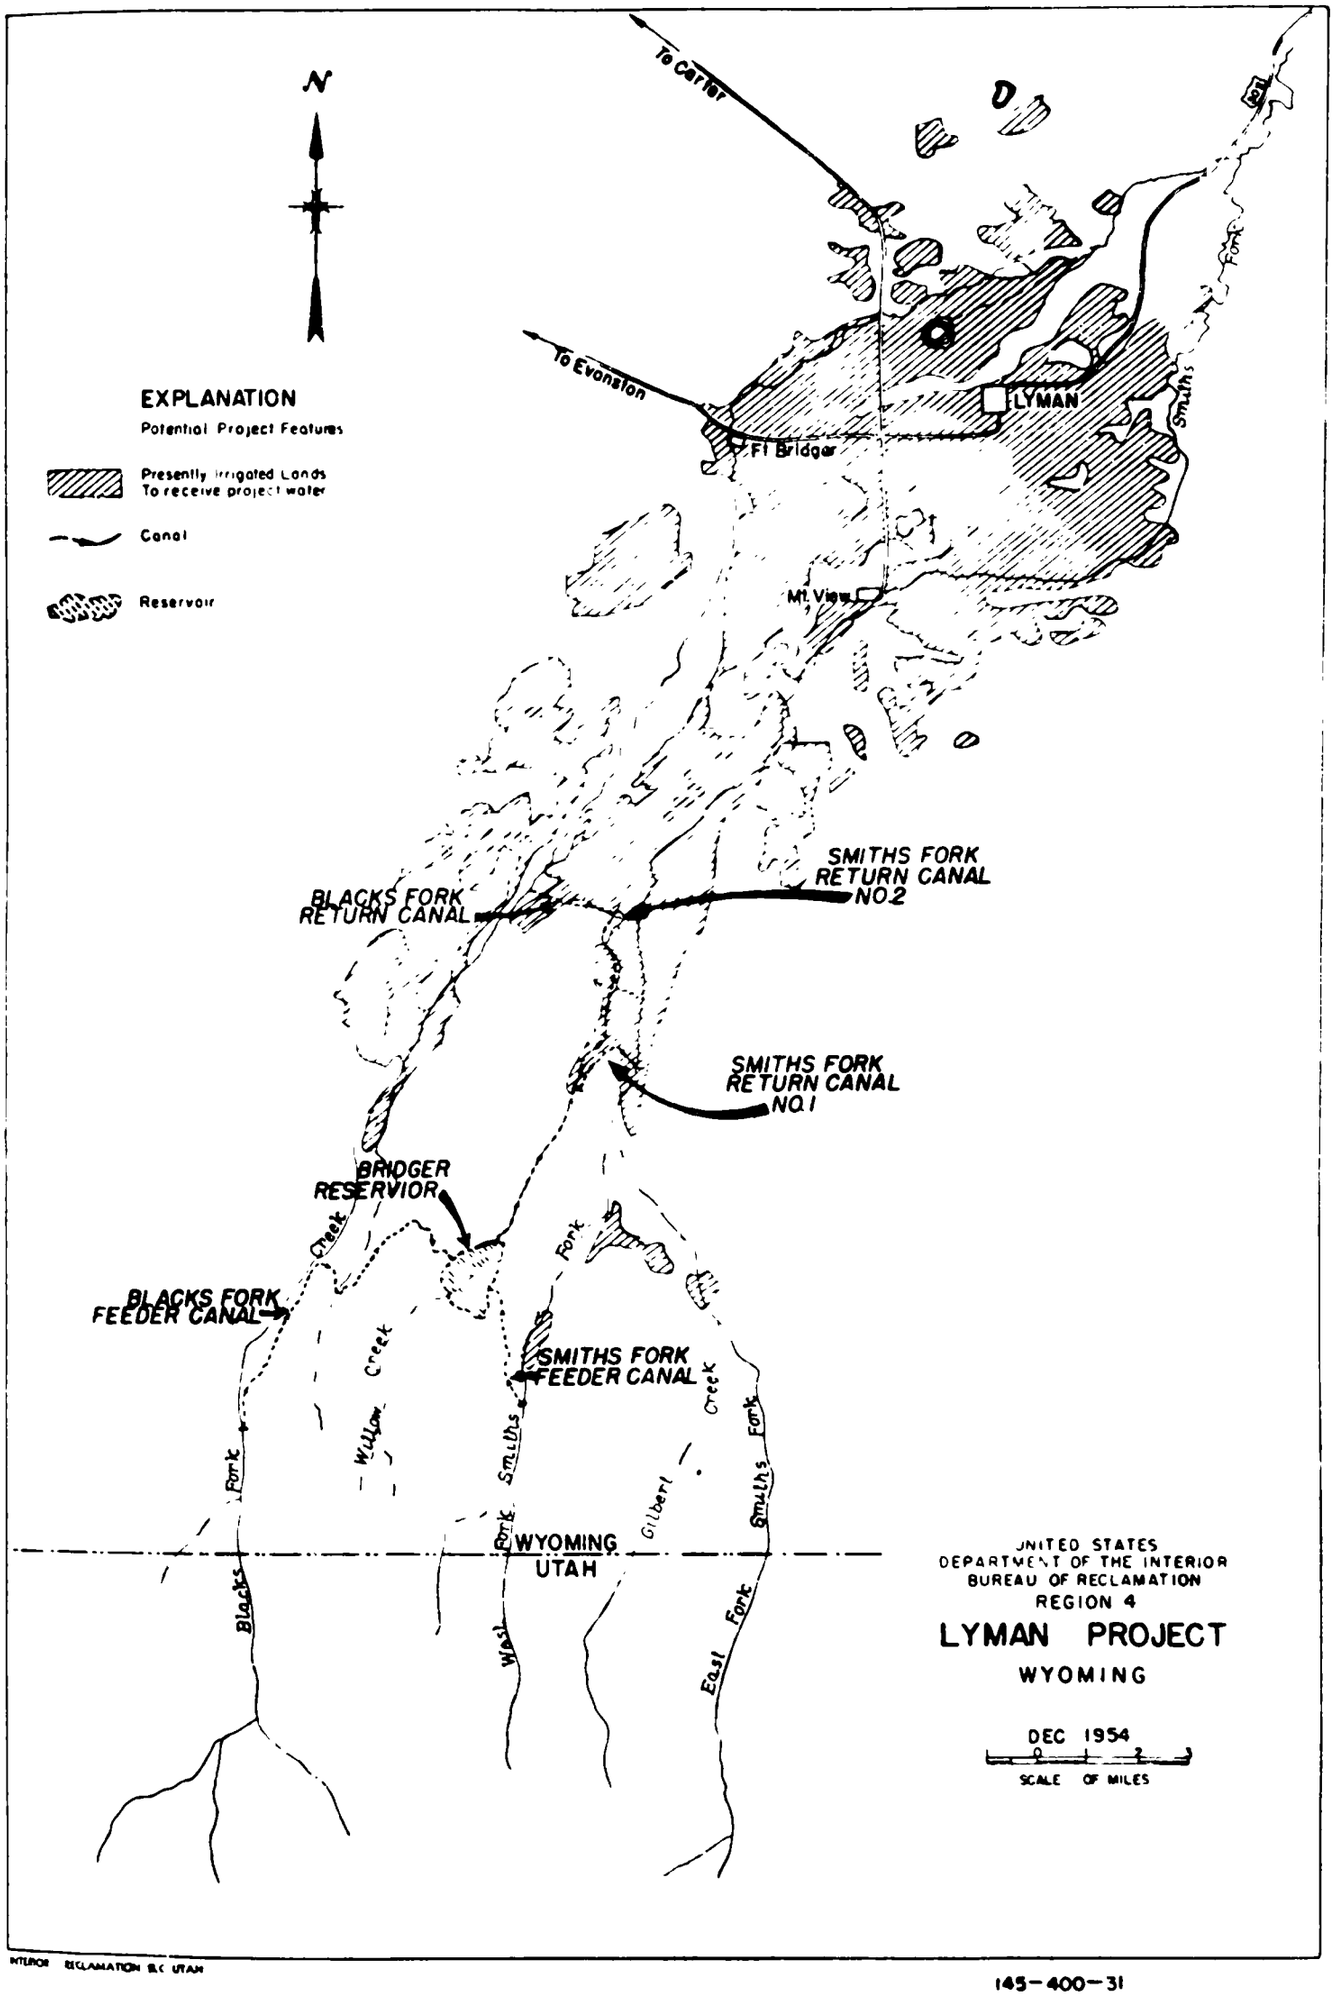
Irrigated acreage:	*Acres*
New lands	None
Supplemental	40,600
Total	40,600
Principal agricultural production: Hay, pasture, and small grain; dairy cows and beef cattle.	
Water supply:	*Acre-feet*
Average annual increase in direct flow diversion	0
Average annual increase in storage yield	32,500
Stream depletion	None
Project works: Construction features would include the Bridger Dam and Reservoir with total of 43,000 acre-feet capacity ,enlargement of the Willow Creek Channel, construction of 3 canals and some drainage facilities.	
Construction cost and repayment:	
Estimated cost	$10,564,000
Reimbursable cost allocated to irrigation	10,564,000
Nonreimbursable allocation	None
Repayment by:	
Irrigation water users	2,255,000
Power revenues from Colorado River storage project	8,309,000
Total	10,564,000
Annual operation, maintenance, and replacement	45,900
Benefit-cost ratio	1.01 to 1

STATEMENT ON SILT PROJECT, COLORADO

The potential Silt project would provide for the full irrigation of 1,900 acres of new land and provide supplemental water to 5,400 acres of partially irrigated land, all in the vicinity of Rifle and Silt, communities in Garfield County of west-central Colorado. The lands are situated in three compact blocks north of the Colorado River between Rifle and Elk Creeks, tributaries of the Colorado River. The project would also provide some enhancement in fish and wildlife values in the area.

The basic type of agriculture in the area would remain unchanged with project development because of climatic and soil conditions. With late-season water provided by the project, however, the plantings of row crops would be increased somewhat as would the yield of livestock feeds. Alfalfa, small grains, sugar beets, and potatoes would continue to be the principal crops grown. Principal livestock would be dairy cows, beef cattle and sheep.

Principal construction features include the Rifle Gap Dam and Reservoir of 10,000 acre-feet total capacity on Rifle Creek, a small hydraulic turbine and direct-connected pump at the dam, reconstruction of 1 presently abandoned ditch, rehabilitation of the existing Grass Valley Canal and construction of some laterals and drains. Except for minor drainage work, about 3 years would be required for construction of project features, including the completion of definite plan investigations.



INTERIOR RECLAMATION SLC UTAH

145-400-31

Preliminary land classification surveys indicate that the lands would be suitable for sustained crop production under irrigation farming. A detailed classification of the presently unirrigated lands would be required to confirm the degree of their suitability.

Water supply studies based on records of streamflows as they have occurred in the past indicate that an adequate irrigation supply would be available for the project from direct flows and storage yield with permissible shortages in occasional drought years. A water right for the project can be obtained under Colorado State law.

This statement is based on the physical plan of project development presented in the Bureau of Reclamation report on the Silt project, Colorado, dated January 1951—a supplement to the Colorado River storage project report dated December 1950. Results of current (January 1953) Bureau of Reclamation estimates for this project plan are summarized in the attached project summary tabulation.

Summary data, Silt project, Colorado

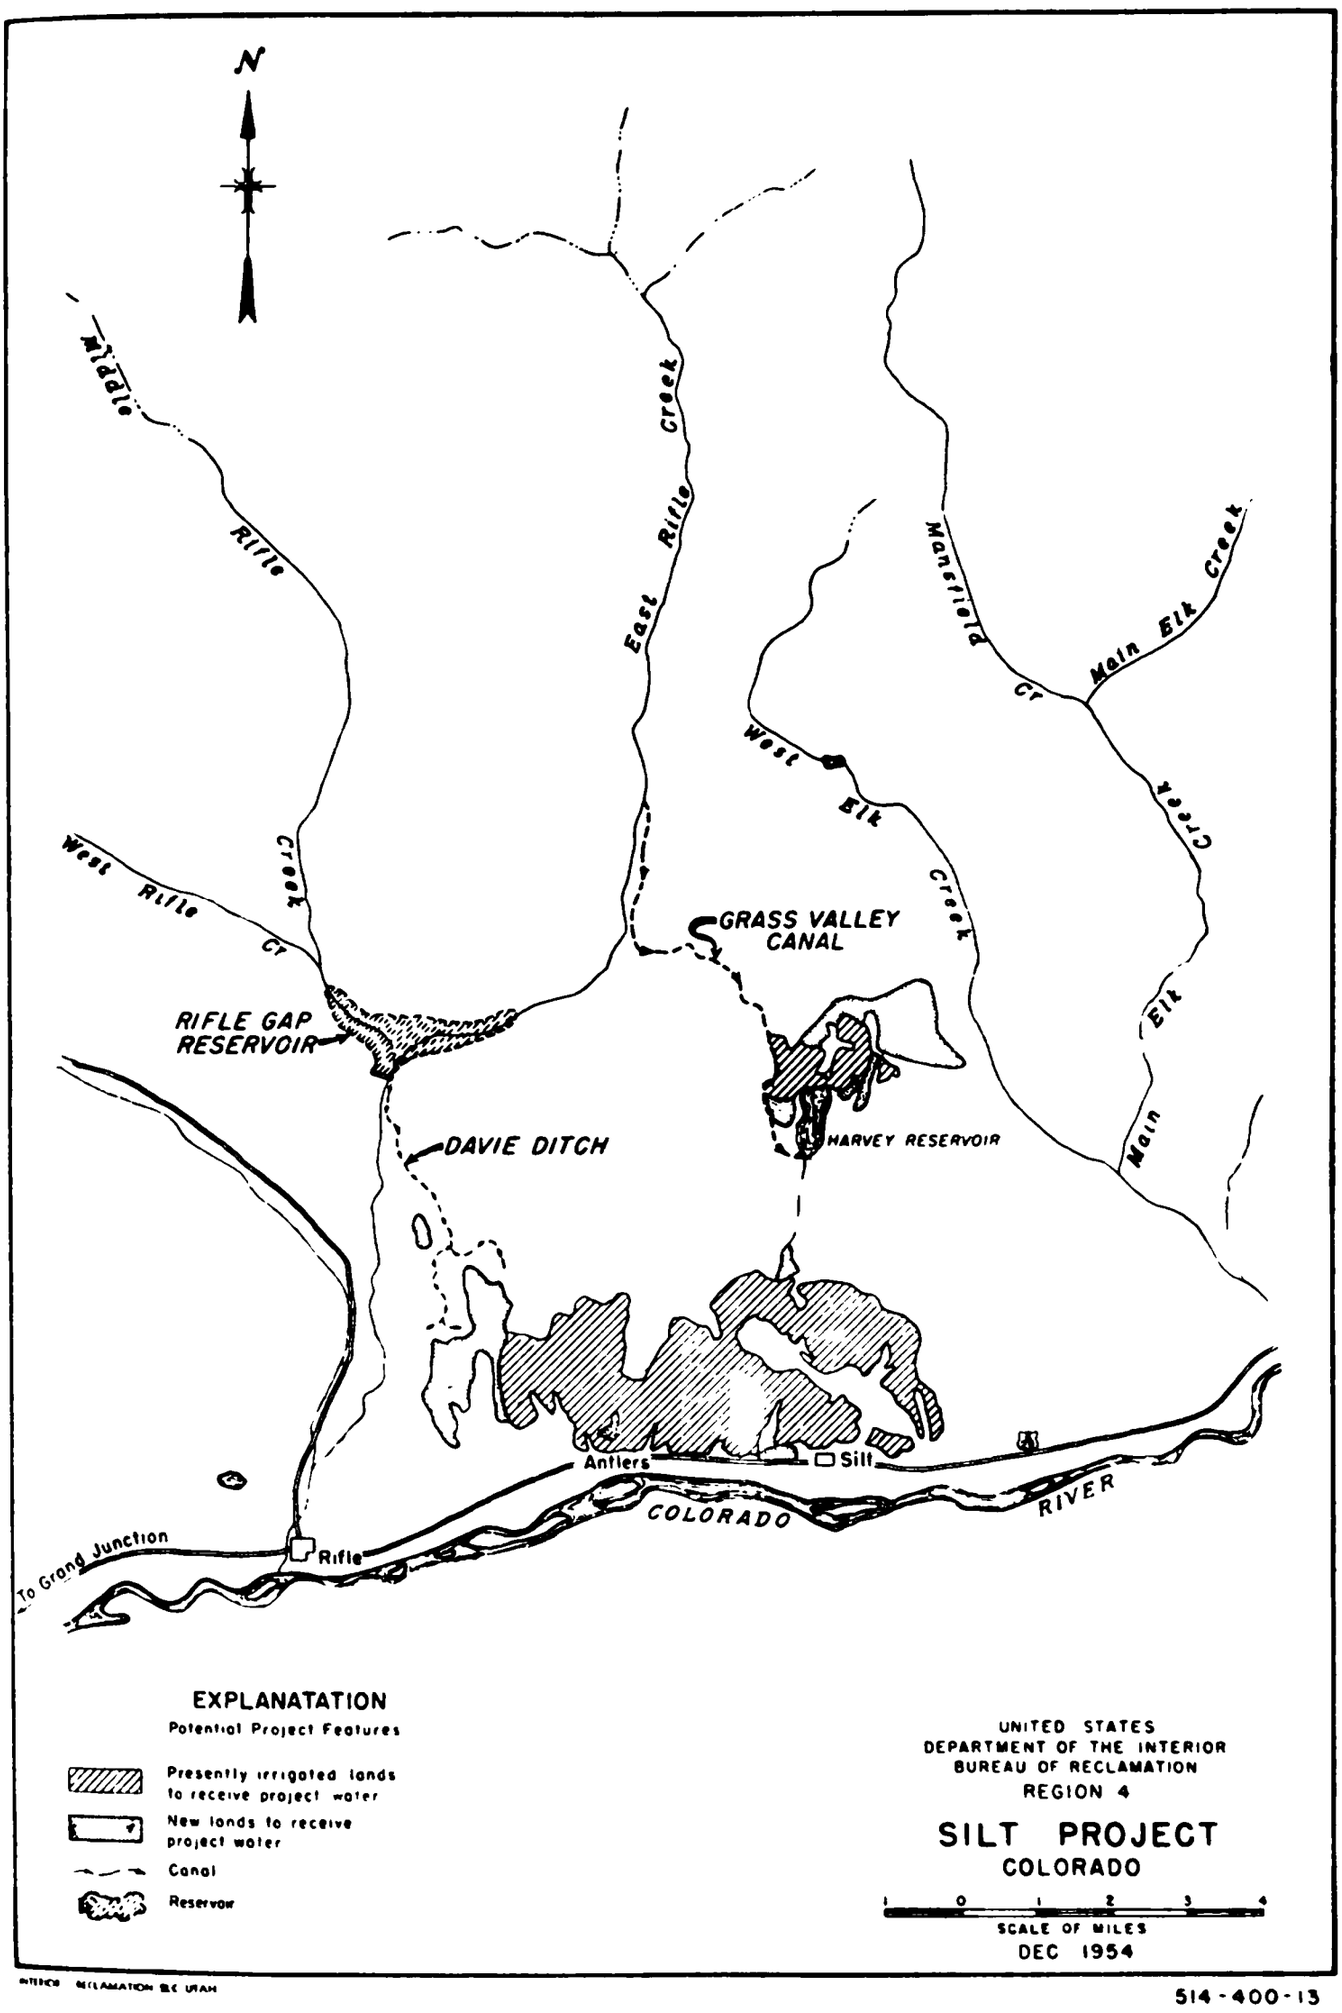
Irrigated acreage:	*Acres*
New lands	1,900
Supplemental	5,400
Total	7,300
Principal agricultural production: Alfalfa, grain, sugar beets, potatoes; dairy cows, beef cattle and sheep.	
Water supply:	*Acre-feet*
Average annual increase in direct flow diversion	4,200
Average annual increase in storage yield	5,900
Total	10,100
Stream depletion (average annual)	5,800
Project works:	
Principal construction features include the Rifle Gap Dam and Reservoir with 10,000 acre-feet total capacity, a small hydraulic turbine and direct-connected pump, reconstruction of abandoned ditch, rehabilitation of an existing canal and construction of some laterals and drains.	
Construction cost and repayment:	
Estimated cost	$3,356,000
Reimbursable cost allocated to irrigation	3,282,400
Nonreimbursable cost allocated to fish and wildlife	73,600
Repayment by:	
Irrigation water users	1,020,000
Power revenues from Colorado River storage project	2,262,400
Total	3,282,400
Annual operation, maintenance, and replacement costs	8,400
Benefit-cost ratio	1.71 to 1

STATEMENT ON SMITH FORK PROJECT, COLORADO

The potential Smith Fork project in west central Colorado would regulate surplus flows of Iron Creek and the Smith Fork of the Gunnison River, a tributary of the upper Colorado River, to increase the irrigation supply for 8,160 acres of land now partially irrigated and provide a new supply for 2,270 acres now unirrigated.

Although an improved irrigation supply would permit new lands to be cultivated and result in better crop yields on presently irrigated lands, the cropping program is largely controlled by climatic soil and topographic conditions. Most of the acreage would continue to be utilized for the production of livestock feeds with hay, small grains, and pasture predominating. Increased feed production in the area would result mostly in increased dairy cows with some increase also in beef cattle, hogs, and poultry.

Detailed land classification surveys show the project lands to be suitable for sustained production of crops under irrigation farming.



INTERIOR RECLAMATION SLC UTAH

514-400-13

Water supply studies, based on records of streamflows as they have occurred in the past, indicate that an adequate irrigation supply would be available for the project from direct flows and storage water with permissible shortages in occasional drought years. A water right for the project can be obtained under Colorado State law.

Construction features of the project include a storage dam and reservoir with 14,000 acre-feet total capacity at the Crawford site on Iron Creek, the Smith Fork diversion dam, the 2.7-mile long Smith Fork feeder canal of 100 second-feet, to divert from Smith Fork to Crawford Reservoir, the 6.6-mile Aspen canal of 145 second-feet initial capacity to convey water from Crawford Reservoir to part of the project lands and feed existing ditches and 4 small lateral canals. Existing irrigation facilities in the area would be utilized as fully as practicable. A period of 3 to 4 years would be required to complete definite plan investigations and construct the project works.

This statement is based on the physical plan of project development presented in the Bureau of Reclamation report on the Smith Fork project, Colorado, a supplement to the Colorado River storage project report dated December 1950. Results of current (January 1953) Bureau of Reclamation estimates for this project plan are summarized in the attached project summary tabulation.

Summary data, Smith Fork project, Colorado

Irrigation acreage:	*Acres*
New lands	2,270
Supplemental	8,160
Total	10,430
Principal agricultural production: Alfalfa, pasture and grain; dairy cows and beef.	
Water supply:	*Acre-feet*
Average annual increase from direct flow diversions and storage	13,650
Stream depletion (average annual)	7,500
Project works:	
The construction features include the Crawford Dam and Reservoir, with 14,000 acre-feet of total capacity, Smith Fork diversion dam, the 2.7-mile-long Smith Fork feeder canal of 100 second-feet, 6.6-feet-long Aspen canal of 145 second-feet and 4 small lateral canals.	
Construction cost and repayment:	
Estimated cost	$3,367,000
Reimbursable cost allocated to Irrigation	3,343,000
Nonreimbursable cost allocated to Recreation	24,000
Repayment by:	
Irrigation water users	1,045,000
Power revenues from Colorado River storage project	2,298,000
Total	3,343,000
Annual operation, maintenance and replacement	8,400
Benefit-cost ratio	1.27 to 1

Statement on Paonia Project, Colorado

The potential Paonia project would divert water from the North Fork of the Gunnison River in the upper Colorado River basin to improve the irrigation water supply, and thus the agricultural production, of 17,040 acres of land in west-central Colorado. Of these lands 14,830 acres are presently irrigated and 2,210 acres are arable but not now irrigated. Fish and wildlife values in the area would be enhanced and flood damages would be decreased.

The general type of farming now practiced in the area would be continued with project development but the additional irrigation supplies would make possible a more intensive crop production. Production of livestock foods and fruit, such as apples, peaches, and cherries, would continue to be the major crops grown. Principal livestock would be dairy cows and beef cattle.

Under the project plan, the Spring Creek Dam and Reservoir would be constructed at a site on Muddy Creek 1 mile about its junction with the North Fork River. The reservoir would have a capacity of 18,000 acre-feet, of which

11,000 acre-feet would be active and 7,000 acre-feet would be reserved for sediment retention and dead storage. The existing Fire Mountain Canal diverting from the North Fork River 5 miles below the Spring Creek Dam would be enlarged and extended. The enlarged canal would be capable of diverting an increased amount of natural streamflow during the early irrigation season and in the late season its supply would be supplemented by water released from the reservoir. In this manner the irrigation water supply for lands under the Fire Mountain Canal would be improved and through its extension the canal would also serve lands on Rogers Mesa that heretofore have been irrigated from Leroux Creek, a tributary of the North Fork River. The Leroux Creek water thus released from Rogers Mesa would be diverted into the higher Overland Canal, which would be improved and enlarged for this purpose, and used to augment the present irrigation supply for lands on Redlands Mesa. Beginning at a point on the Fire Mountain Canal 9 miles below its head, the Minnesota siphon would be constructed to convey part of the water southward 12,000 feet across the North Fork River to the existing Minnesota Canal.

Water supply studies based on records of streamflows as they have occurred in the past indicate that with project development the irrigation supply for project lands would be increased by 18,500 acre-feet annually from direct flows and storage yield. The increase in stream depletion attributable to the development is estimated at an average of 9,000 acre-feet annually.

Land classification surveys indicate that the lands would be suitable for sustained crop production under irrigation farming. Some further detailed classification would be required to confirm the suitability of all the lands, particularly in the Leroux Creek and Minnesota areas.

The project, exclusive of the Minnesota unit, was authorized, under a modification of the above-described plan, by act of Congress on June 25, 1947. Enlargement and extension of the Fire Mountain Canal has been essentially completed under this authorization. Reauthorization of the project, under the revised plan described above, was recommended in the Bureau of Reclamation report on the "Paonia project, Colorado" dated February 1951, a supplement to the Colorado River storage project report dated December 1950.

Results of current (January 1953) Bureau of Reclamation estimates for the physical plan of the project as covered in the Paonia project report of February 1951 are summarized in the attached project summary tabulation.

STATEMENT ON FLORIDA PROJECT, COLORADO

The potential Florida project is planned primarily to supply irrigation water to, and thus increase the agricultural production on, 18,950 acres of Florida Mesa and Florida River Valley lands in the upper Colorado River basin in southwestern Colorado. The lands include 12,650 acres presently irrigated with only a partial supply and 6,300 acres presently not irrigated. Approximately 1,000 acres of the land, including 100 acres partially irrigated and 900 acres now unirrigated, are owned by Indians. In addition to irrigation values, the project would provide some enhancement in fish and wildlife values in the area and affect some decrease in flood damages along Florida River.

With project development, the irrigated lands would be utilized largely for the support of livestock enterprises as now practiced in the area. Climatically adaptable crops, such as small grains, alfalfa, hay, pasture, and some pinto beans, potatoes, apples, vegetables, and berries, would be produced. Analyses made indicate that a family-size farm would provide the farm family with a reasonable standard of living, provide employment for the available labor, and permit payment of operation, maintenance, and replacement costs of project facilities and some payment toward the construction costs of project facilities.

Preliminary land classification surveys indicate that project lands would be suitable for sustained production of crops under irrigation farming. Detailed land classification would be required to confirm the suitability of all the lands.

Water supply studies based on records of streamflows as they have occurred in the past indicate that an adequate irrigation supply would be available for the project with permissible shortages in occasional drought years. The increase in irrigation supply would average 23,200 acre-feet annually including 6,900 acre-feet of direct flows and 16,300 acre-feet of storage water. Water rights for the project could be obtained under Colorado State law.

Construction features of the project would include the Lemon Dam and Reservoir with a total capacity of 23,300 acre-feet to store water on Florida River, construction of a new diversion dam on Florida River at the head of the existing Florida Farmers ditch, enlargement and extension of the existing Florida Farmers ditch diverting from Florida River, and some distribution and drainage facilities. Water would be released from the reservoir as needed and conveyed in the natural river channel to heads of various downstream canals and ditches that would divert the flow for distribution to project lands. A 3- to 4-year period would be required to complete construction of the project.

This statement is based on the physical plan of project development presented in the Bureau of Reclamation report on the Florida project, Colorado, dated January 1951, a supplement to the Colorado River storage project report dated December 1950. Results of current (January 1953) Bureau of Reclamation estimates for this project plan are sumarized in the attached project summary tabulation.

Summary data, Florida project, Colorado

Irrigated acreage:

	Indian	Non-Indian	Total
New	900	5,400	6,300
Supplemental	100	12,550	12,650
Total	1,000	17,950	18,950

Principal agricultural production: Alfalfa, grains, dairy cows, and beef.

Water supply:	*Acre-feet*
Average annual increase in direct flow diversions	6,900
Average annual increase in storage yield	16,300
Total	23,200
Stream depletion (annual average)	12,900

Project works:

Construction features include Lemon Dam and Reservoir with a total capacity of 23,300 acre-feet, a diversion dam on Florida River, enlargement and extension of existing Florida Farmers ditch, and some distribution laterals and drains.

Construction costs and repayment:	
Estimated cost	$6,941,500
Reimbursable allocation to irrigation	6,503,600
Nonreimbursable allocation to:	
Fish and wildlife	208,700
Flood control	229,200
Total	437,900
Repayment by:	
Irrigation:	
Non-Indian lands	1,585,500
Indian lands	126,000
Total	1,711,500
Power revenues from Colorado River storage project	4,792,100
Total	6,503,600
Annual operation, maintenance, and replacement costs	12,600
Benefit-cost ratio	1.4 to 1

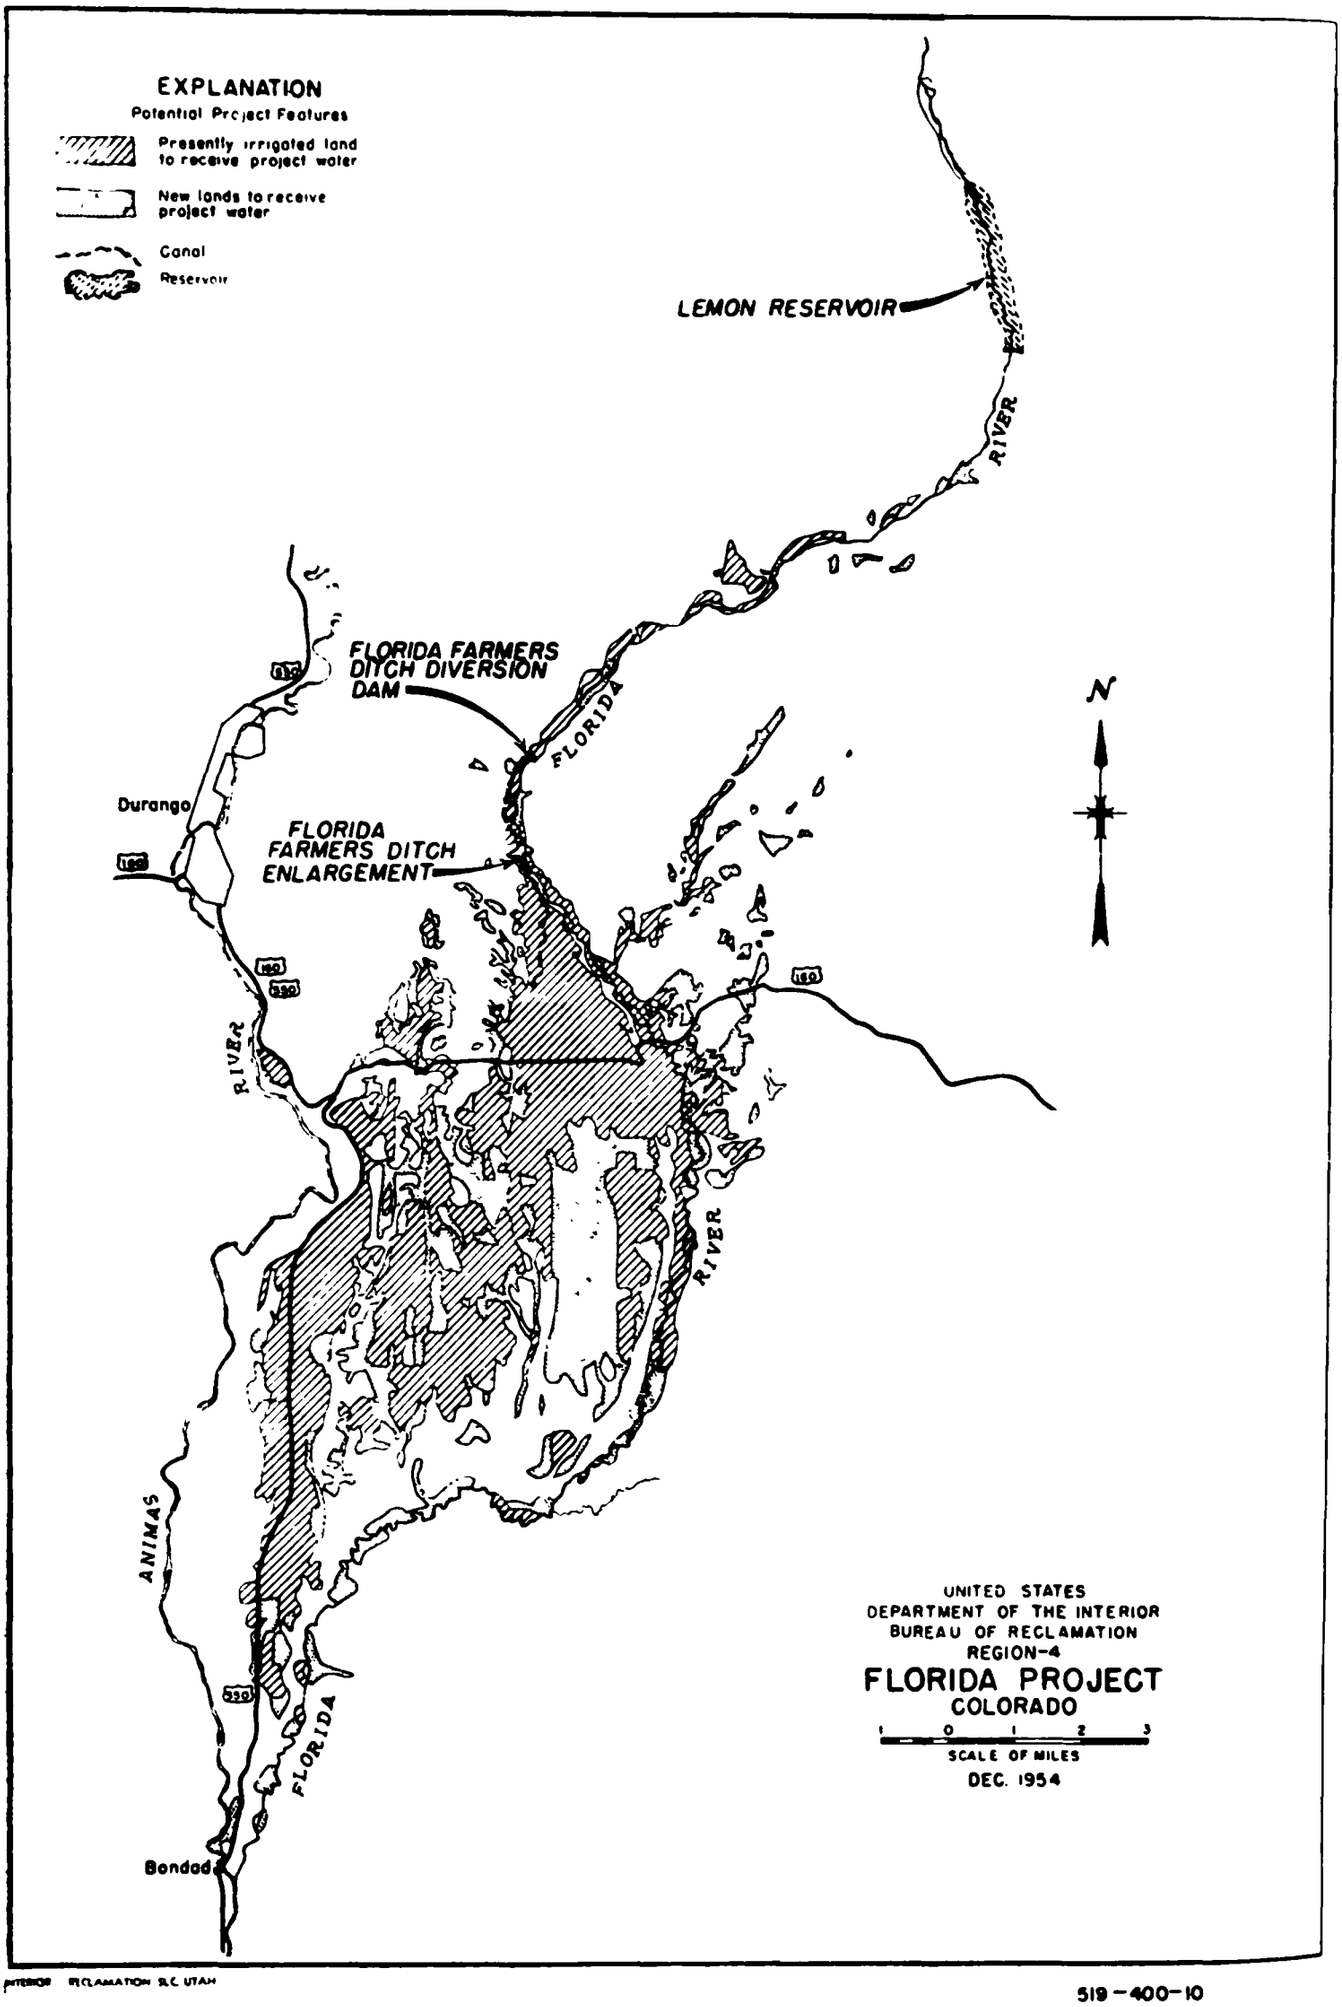
STATEMENT ON PINE RIVER PROJECT EXTENSION, COLORADO AND NEW MEXICO

The potential Pine River project extension would provide distribution canals to deliver water made available by the existing Pine River project to irrigate 15,150 acres of land now unirrigated in southwestern Colorado and northwestern New Mexico. Of this acreage 1,940 acres are within the boundaries of the existing Pine River Indian irrigation project.

The Pine River project, consisting of Vallecito Dam and Reservoir of 126,280 acre-feet active capacity on Pine River, was authorized for construction in 1937 to provide storage water for 69,000 acres and was substantially completed and placed in operation by the Bureau of Reclamation in 1941. About half of the lands to be served were under canals and partially irrigated at the time of construction and now receive supplemental water from Vallecito Reservoir. The remaining lands had no distribution facilities at the time of construction. Facilities for these lands were not included as part of the original project as it was thought that the works required were relatively minor and could be undertaken by the water users with private capital. The required works proved so costly, however, that they have not been privately constructed. As a result, canal systems for the lands that can be economically developed at the present time are planned for Federal construction as the Pine River project extension.

With development of the extension the irrigated lands would be utilized largely for the support of livestock enterprises as now practiced in the general locality. Major crops that would be produced on the extension lands are hay and small grains with some potatoes, pinto beans, and early maturing vegetables, and berries also grown. Principal livestock would be dairy cows and beef cattle.

The project extension would consist of the enlargement and extension of eight major canals and ditches diverting from Pine River, the construction of one new diversion dam on Pine River, and the construction of a number of small distribution laterals. Over half the extension lands would be served by enlargement and extension of the existing King consolidated canal and construction of a new diversion dam at the head of this canal. The other canals and ditches to be enlarged and extended include the Pine River canal and the Myers-Asher, Bennet and Myers, Bear Creek, and Pine River, Sullivan, Shroder



INTERIOR RECLAMATION SLC UTAH

519-400-10

extension, and Thompson Epperson ditches. A period of 3 to 4 years would be required to complete definite plan investigations and construction of the extension works.

Preliminary land classification surveys indicate the extension lands to be suitable for sustained crop production under irrigation farming. A detailed classification is necessary to confirm the suitability of all the lands.

Water-supply studies, based on records of streamflows as they have occurred in the past, indicate that an adequate water supply would be available for the development from direct flows and storage water from the existing Vallecito Reservoir. A water right for the project can be obtained under Colorado and New Mexico State laws.

This statement is based on the physical plan of development presented in the report on Pine River project extension, Colorado and New Mexico, dated January 1951—a supplement to the Colorado River storage project report dated December 1950. Results of current (January 1953) Bureau of Reclamation estimates for this development plan are summarized in the attached project summary tabulation.

Summary data, Pine River project extension, Colorado-New Mexico

Irrigated acreage:

	Colorado	New Mexico	Total
New lands:			
Indian	1,940		1,940
Non-Indian	12,580	630	13,210
Total	14,520	630	15,150

Principal agricultural production: Alfalfa, grains, dairy cows and beef.

Water supply:	*Acre-feet*
Average annual increase in direct-flow diversions	31,550
Average annual increase in storage yield	13,900
Total	[1] 45,450

Storage at existing Vallecito Reservoir of 126,280 acre-feet active capacity of which some 20 to 25 percent of such capacity would be available to the Pine River project extension lands.

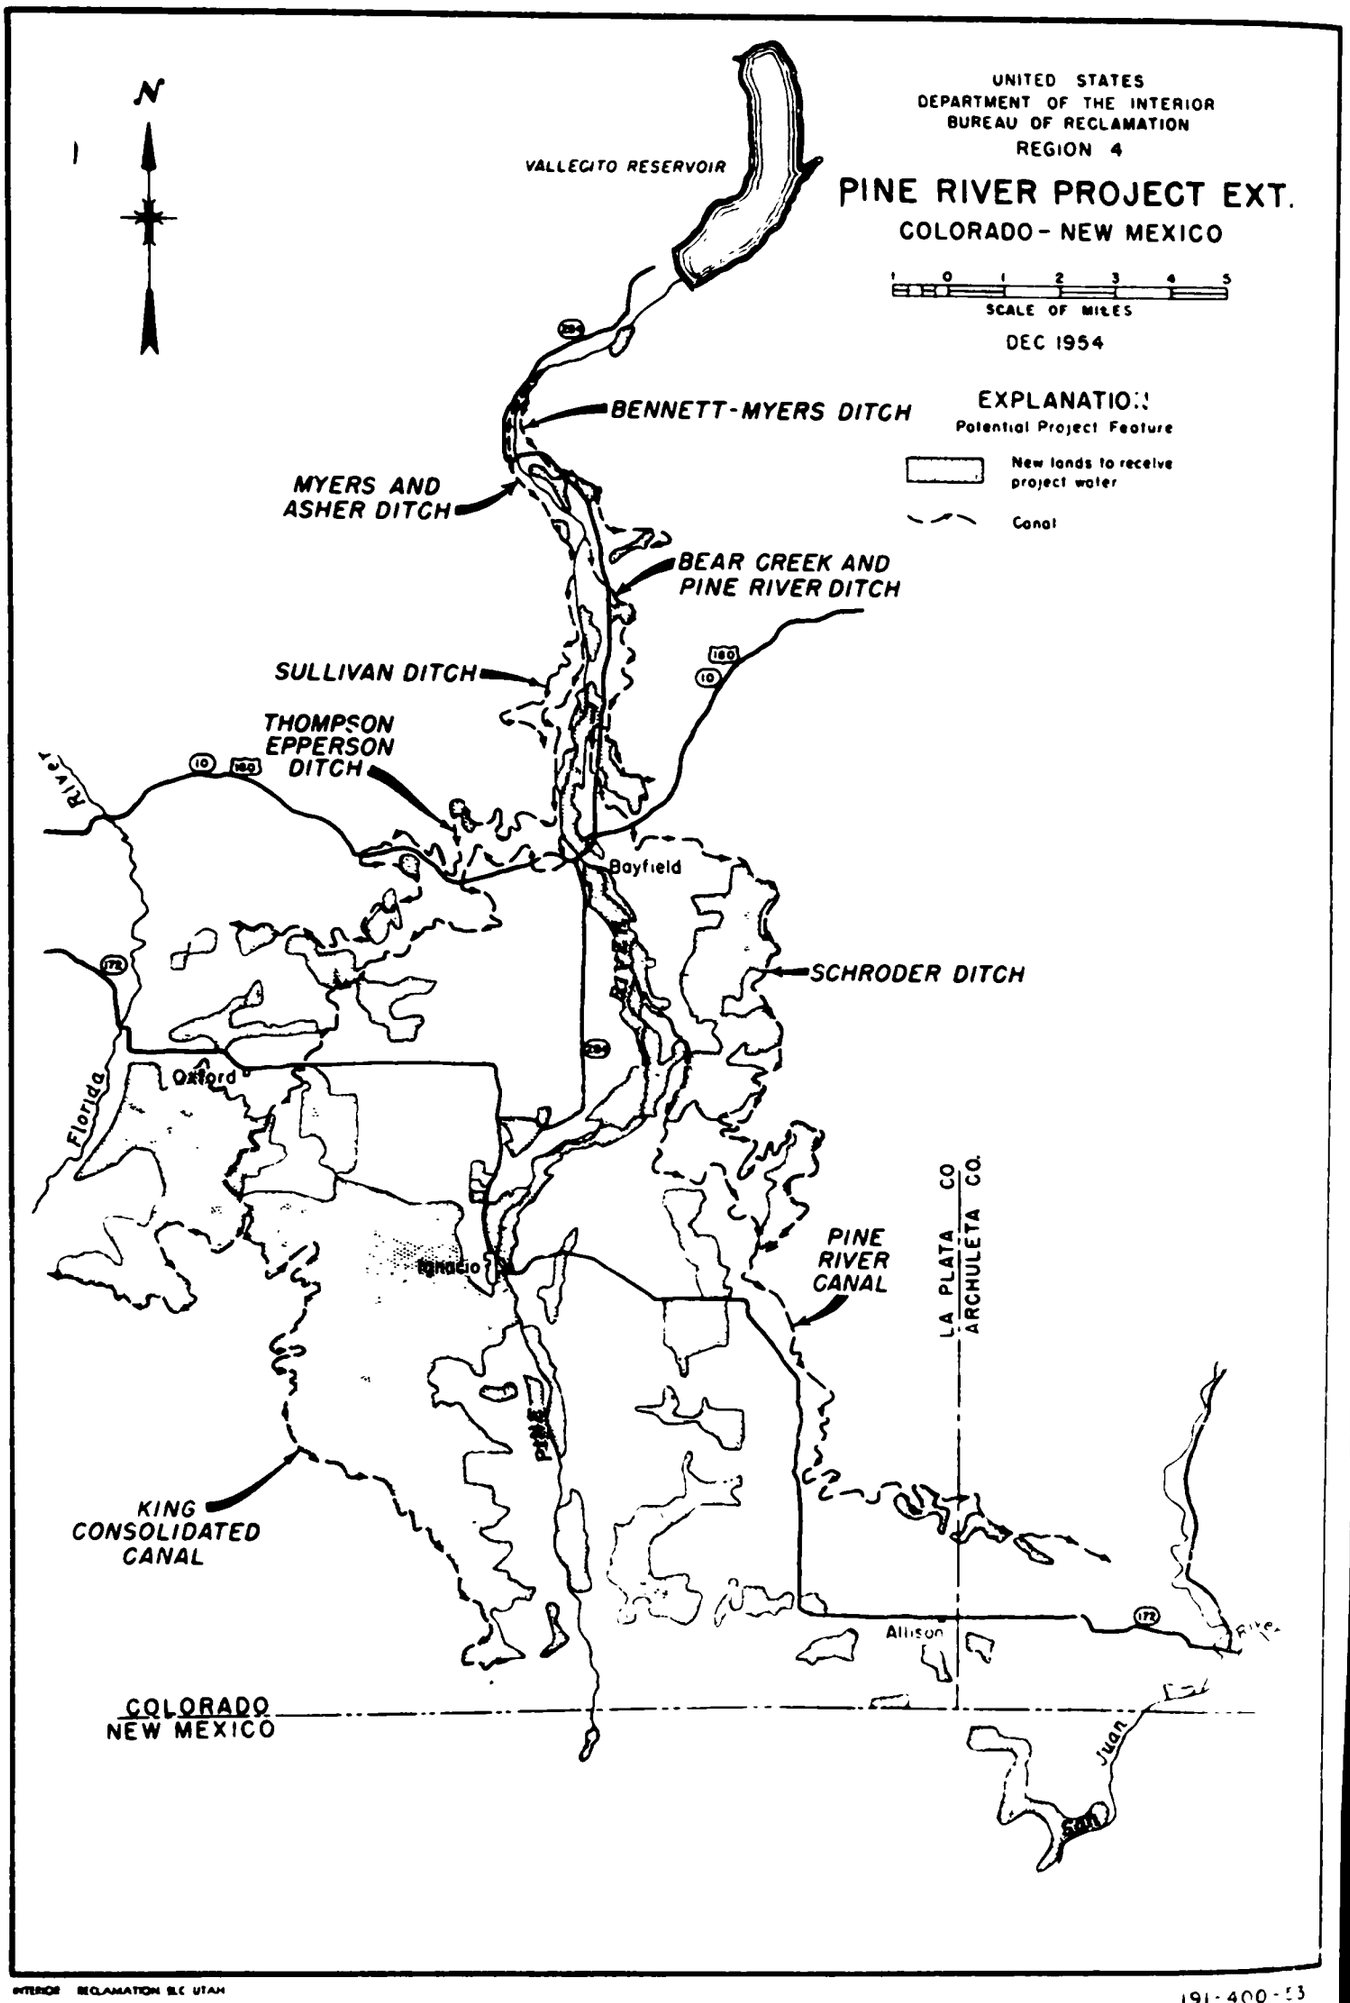
Stream depletion (average annual):	*Acre-feet*
Colorado	27,200
New Mexico	1,100
Total	28,300

Project works:

New construction features include enlargement and extension of eight canals and ditches, a diversion dam, and a number of distribution laterals

Construction cost and repayment:	
Estimated cost	$5,027,000
Reimbursable allocation to irrigation	5,027,000
Nonreimbursable cost allocation	None
Repayment by:	
Irrigation:	
Indian lands	262,000
Non-Indian lands	1,783,000
Subtotal	2,045,000
Power revenues from Colorado River storage project	2,982,000
Total	5,027,000
Annual operation, maintenance, and replacement costs	18,950
Benefit-cost ratio	2.2 to 1

[1] Return flow of 4,250 acre-feet would also be diverted, making a total diversion of water by extension lands of 49,700 acre-feet.



INTERIOR RECLAMATION SLC UTAH

191-400-53

STATEMENT ON EMERY COUNTY PROJECT, UTAH

The potential Emery County project is planned primarily to improve the irrigation water supply and thus better the agricultural production of 24,080 acres of land in Emery County in east-central Utah near the towns of Huntington, Castle Dale, and Orangeville. The project is in the Green River Basin, a part of the upper Colorado River Basin.

The general type of farming now practiced in the area would be continued with project development. Agriculture would continue to center around the livestock industry with more than 90 percent of the irrigated area producing hay and grains. The increased production in livestock feed would permit increased production on the farm of beef, sheep, pork, and dairy products.

Principal construction features of the project would be Joes Valley Dam and Reservoir, with a total capacity of 57,000 acre-feet, to store water on Cottonwood Creek, the Swasey diversion dam on Cottonwood Creek, 10 miles downstream from Joes Valley, and the 17-mile Cottonwood Creek-Huntington Canal, with an initial capacity of 250 second-feet, heading at the Swasey diversion dam. Some canal laterals and drains would be constructed. Existing irrigation facilities in the area would be utilized as fully as practicable. Recreational facilities would be provided at the Joes Valley Reservoir. A construction period of 3 to 5 years, including completion of definite plan investigations, would be required to complete construction of the project.

The project would make available an average of 31,400 acre-feet of water annually for 24,080 acres of land in Emery County, including 20,450 acres now irrigated with only a partial supply and 3,630 acres not now irrigated. In addition, about 1,000 acre-feet of late-season water annually would be made available by exchange for transmountain diversion to lands in the Bonneville Basin now partially irrigated by the Ephraim and Spring City divisions of the existing Sanpete project. Recreational and scenic attractions at Joes Valley Reservoir site would be developed as planned by the National Park Service.

A preliminary land classification survey indicates that the project lands would be suitable for sustained production of crops under irrigation farming. A detailed classification would be necessary to confirm the suitability of the lands.

Water-supply studies, based on records of streamflows as they have occurred in the past, indicate that an adequate irrigation supply would be available for the project with permissible shortages in occasional drought years. Water rights for the project can be obtained under Utah State law.

This statement is based on the physical plan of project development presented in the Bureau of Reclamation report on the Emery County project, Utah, dated February 1951, a supplement to the Colorado River storage project report dated December 1950. Results of current (January 1953) Bureau of Reclamation estimates for this project plan are summarized in the attached project summary tabulation.

Summary data, Emery County project, Utah

Irrigated acreage:	
New land	3,630
Supplemental	20,450
Total	24,080
Principal agricultural production: Alfalfa, grain, peaches, vegetables, dairy cows, beef cattle, and sheep.	
Water supply:	*Acre-feet*
Average annual increase in direct flow diversions	3,900
Average annual increase in storage yield	28,500
Total	32,400
Stream depletion (average annual)	15,500
Project works:	
Joes Valley Dam and Reservoir, with a total capacity of 57,000 acre-feet, a diversion dam, the 17-mile Cottonwood Creek-Huntington Canal with 250 second-feet initial capacity, and some canal laterals and drains are the principal construction features.	

Summary data, Emery County project, Utah—Continued

Construction cost and repayment:	
Estimated cost	$9,865,500
Reimbursable cost allocated to irrigation	9,636,500
Nonreimbursable cost allocated to recreation	229,000
Repayment by:

Power revenues from Colorado River storage project	5,921,500
Total	9,636,500
Annual operation, maintenance, and replacement costs:	
Irrigation	21,870
Recreation	15,110
Total	36,980
Benefit-cost ratio	1.38 to 1

Statement on Central Utah Project, Utah

The potential central Utah project would provide for the multiple-purpose use in Utah of water tributary to the Colorado River. Under the general plan of development, streams draining the southern slope of the Uinta Mountains in the Uinta Basin in northeastern Utah would be intercepted and conveyed westerly by gravity flow through the Wasatch Mountains to the Bonneville Basin. The water would be collected by an aqueduct leading to a storage reservoir high in the Wasatch Mountains. From the reservoir the water would drop through a series of hydroelectric powerplants before being used for irrigation, municipal, and industrial purposes. Replacement water and water for additional development in the Uinta Basin would be provided by a major diversion from the Green River and by smaller developments on local streams.

The project would serve an area along the eastern border of the Bonneville Basin. This area, the most highly developed region in Utah, includes the communities of Salt Lake City, Provo, Heber, Spanish Fork, Payson, Nephi, Richfield, Delta, and Fillmore. The flow of small local streams, practically the only source of water, falls far short of irrigation requirements.

In contrast to the Bonneville Basin, the Uinta Basin has abundant water resources as compared with the land resources. Streams flowing south from the Uinta Mountains—the Duchesne River and its major tributaries, together with Ashley Creek and Brush Creek—produce more than ample water for irrigation.

The project is of such magnitude it has been planned in two parts—the initial phase, a unified portion that could be developed and operate independently, and the ultimate phase. The two phases combined made up the comprehensive plan. Detailed investigations have been made only on the initial phase.

INITIAL PHASE OF PROJECT

In the initial phase of the project only Rock Creek and Uinta Mountain streams west of Rock Creek would be diverted into the Bonneville Basin where development would be limited to areas between Salt Lake City and Nephi. Initial phase development in the Uinta Basin would include the Jensen, Vernal, Upalco, and Duchesne River areas.

The initial phase of the project would provide for the irrigation of 28,540 acres of new land and 131,800 acres now irrigated but in need of more water. Full seasonal regulation would be provided for 42,600 acres of land in the Duchesne River area, more than half of which is owned by Indians or has been acquired from them. Forty-eight thousand, eight hundred acre-feet of water would be provided annually for municipal, industrial, and other miscellaneous uses. Powerplants with an installed capacity of 61,000 kilowatts would generate aproximately 373 million kolowatt-hours of electric energy annually. Aproximately 2.2 million kilowatt-hours of energy would be required by the project for irrigation and drainage pumping. Central Utah project powerplants would be interconnected with plants of the Colorado River storage project.

Preliminary land-classification surveys of the project lands indicate that they would be suitable for sustained crop production under irrigation farming.

The potential Strawberry aqueduct would intercept flows of Rock Creek, Hades Creek, Wolf Creek, West Fork of the Duchesne River, Currant Creek, Layout Creek, and Water Hollow. Reservoirs to regulate inflow to the aqueduct would be provided on Rock Creek (upper Stillwater), West Fork of the Duchesne River (Vat), and Currant Creek (Currant Creek).

The existing Strawberry Reservoir, terminus of the Strawberry aqueduct, would be enlarged through construction of the Soldier Creek Dam.

The existing outlet tunnel from the Strawberry Reservoir would be enlarged Below the tunnel outlet would be constructed the Old West powerplant, Sixth Water aqueduct, Hammock powerplant, Tanner powerplant, Monks Hollow Dam, the Wasatch aqueduct as far as York Ridge near Santaquin, and the Castilla powerplant. The Mona-Nephi Canal would be constructed from York Ridge to Salt Creek near Nephi. The Mona Reservoir would be enlarged, the Elberta Service Pipeline and the existing Elberta Canal would be enlarged to distribute water from Mona Reservoir.

Use of Provo River water through exchange would require Bates Dam on Provo River, Hobble Creek Dam on Little Hobble Creek, the West Valley Canal, and the Front Dam. Provo Bay would be diked and drained and the upper 7 miles of the Jordan River channel would be enlarged.

An exchange of water between the Bates Reservoir and numerous small storage reservoirs on the upper Provo River would be made to provide supplemental water to areas in the vicinity of Francis and Heber City. The Wallsburg area would be served by a similar exchange in Hobble Creek Reservoir. A dam would be constructed creating Round Knoll Lake for recreational and fish and wildlife purposes.

New project works to provide water for replacement and expanded irrigation and munipical use in the Uinta Basin would include Hanna Reservoir on the North Fork of Duchesne River, Starvation Reservoir on Strawberry River with a feeder canal from the Duchesne River, the Upalco Reservoir offstream from Lake Fork River, the Stanaker Reservoir with a feeder canal from Ashley Creek, and the Tyzack Reservoir on Brush Creek.

Construction of some new distribution laterals and drains would be required where existing facilities are not adequate to serve the area and where new lands are developed.

Necessary distribution and treatment facilities for municipal and industrial water within the communities would be constructed and financed by local interests.

Transmission lines for delivery of project power would be constructed to Salt Lake City on the north and to Manti on the south.

Facilities would be constructed for development of fish and wildlife, recreation, and forest resources in general as recommended.

Features would be constructed in an orderly sequence and as water became available irrigation development would be undertaken at different times in 13 areas or blocks, extending over a 13-year period, municipal and industrial water would be supplied in 3 different areas with construction extending over a 7-year period and construction of the 4 hydroelectric plants would require 8 years before reaching full production.

The operation of various existing facilities would require modification for correlation with the construction and operation of works planned for the central Utah project. Among the principal features in the Bonneville Basin affected would be the Strawberry Reservoir outlet tunnel, canals, and powerplants of the Strawberry Valley project; Deer Creek Reservoir, Provo Reservoir Canal, and Salt Lake aqueduct of the Provo River project; Utah Lake; and Mono Reservoir. Principal facilities in the Uinta Basin similarly affected would include Strawberry Reservoir of the Strawberry Valley project, Moon Lake and Midview Reservoirs and canals of the Moon Lake project, works of the Uinta Indian irrigation project, and various other structures on the Duchesne River, Ashley Creek, and Brush Creek systems. There would be a minor effect on some public and private power facilities in both basins.

This statement on the central Utah project, except as otherwise noted in the following paragraphs, is based on the physical plan of development presented in the Bureau of Reclamation report on Central Utah Project, Utah, dated February 1951, a supplement to the Colorado River Storage project report dated December 1950. Significant modifications may be found in the project plan during the definite planning stage of the investigation.

Since preparation of the 1951 report, the communities in eastern Duchesne County have constructed a municipal water pipeline and this feature would therefore be excluded from the project. As a result of eliminating the pipeline, about 2,300 acre-feet of Upalco Reservoir water is considered as a supplemental supply to 2,300 additional acres of land in the Upalco area. A refinement of the water supply studies for lands in the Duchesne River area—Indian and white owned—shows that 4,070 acres of "white lands" formerly considered as receiving replacement water would receive supplemental water instead. Allowances for these revisions in plan are incorporated in the results of current estimates as shown on page 6.

Results of current (January 1953) estimates are shown on the following two summary data sheets.

Summary data, Central Utah project initial phase, Utah

Irrigated acreage:

New land	28,540
Supplemental	131,840
Total	160,380

Principal agricultural production:

Alfalfa, grain, fruit, vegetables, sugar beets, tomatoes, dairy cows, beef cattle, and sheep.

Water supply: Average annual increase in supply (acre-feet):

Purpose	Uinta Basin	Bonneville Basin	Total
Irrigation:			
Direct flow		None	
Return flow and salvage		31,500	
Storage yield		97,500	
Subtotal	[1] 46,200	129,000	175,000
Municipal and industrial:			
Direct flow		None	
Storage		44,300	
Subtotal	[1] 4,500	44,300	48,800
Project summary:			
Direct flow		None	
Return flow and salvage		31,500	
Storage yield		141,800	
Total	[1] 50,700	173,300	224,000
Stream depletion (Colorado River)	47,600	141,800	189,400

[1] Water supplied by direct flow and storage.

Project works:

The principal project features would include construction of the 36.8-mile long Strawberry aqueduct along the south slope of the Uinta Mountains intercepting Uinta Basin streams as far east as Rock Creek, enlargement of the Strawberry Reservoir through construction of the Soldier Creek Dam, an enlargement of the Strawberry Reservoir tunnel, 4 powerplants with a combined generating capacity of 61,000 kilowatts, numerous reservoirs including 5 with capacities over 30,000 acre-feet:

Total Capacity

	Acre-feet
Starvation Reservoir	160,000
Upper Stillwater Reservoir	31,500
Strawberry Reservoir	1,370,000
Stanaker Reservoir	37,000
Bates Reservoir	65,000

Summary data, Central Utah project initial phase, Utah—Continued

Project works—Continued

Aqueducts (including the 28.4-mile long Wasatch), and canals and distribution systems as necessary to deliver and utilize the increased water supply. Drainage would be provided when necessary.

Construction cost and repayment-initial phase:

Estimated cost:	$231,044,000
Reimbursable cost allocated to:	
Irrigation	127,354,000
Power	46,699,000
Municipal and industrial water	45,500,000
Ultimate development	5,500,000
Total	225,053,000
Nonreimbursable cost allocated to:	
Flood control	3,113,000
Recreation	2,830,000
Forest resource development	48,000
Total	5,991,000
Repayment of reimbursable costs by:	
Irrigation costs:	
From water users	15,191,000
From central Utah project power revenue	[1] 27,838,000
From Colorado River storage project power revenues	[2] 84,325,000
Total	127,354,000
Power costs from project power revenues	46,699,000
Municipal and industrial water costs by users	45,500,000
Total repayment	219,553,000
Annual operation, maintenance, and replacement costs:	
Irrigation	253,930
Power	445,900
Municipal and industrial water	69,160
Total	768,990
Benefit-cost ratio	1.23 to 1

[1] Available from net power revenues from central Utah project powerplants over a 17-year period following payment of CUP power costs but prior to the end of the 50-year repayment period on the last irrigation block.

[2] A 1-mill tax under the Utah Water Conservancy Act could appreciably reduce this amount.

THE COMPREHENSIVE PLAN

When fully developed the Central Utah project would provide a full irrigation water supply for 200,000 acres of new land, a supplemental supply for 239,900 acres now inadequately irrigated, and 48,800 acre-feet of water to meet foreseeable demands for municipal, industrial, and other miscellaneuos purposes. Project powerplants would have an installed capacity of 249,000 kilowatts and generate almost 1.2 billion kilowatt-hours of electric energy annually. Additional power potentialities exist and will be evaluated as the investigations progress.

The flow of all important streams on the south slope of the Uinta Mountains would be intercepted by the potential 110-mile aqueduct and conveyed to the Strawberry Reservoir. The flow of Carter Creek on the Uintas' northern slope would be brought to the southern slope. The western 36.8 miles of the

aqueduct, extending from Rock Creek to the Strawberry Reservoir, would consist of two parallel bores.

Water would be released from the Strawberry Reservoir to the Bonneville Basin through two tunnels. In its 12-mile descent to the Bonneville Basin floor, a drop of about 2,600 feet, the water, including the water of the existing Strawberry Valley project, would pass through a series of hydroelectric powerplants, and then would be divided, part continuing to the south and part being diverted to the north.

During the irrigation season the water continuing south would be distributed for irrigation and other purposes in areas as far south as Fillmore. During the nonirrigation season water used through the powerplants and continuing south would be stored in the Dyer Reservoir for irrigation of the lands in the vicinity of Fillmore. Water of the Sevier River could be stored in existing reservoirs by exchange and used for irrigation of lands along the upper reaches of the river, principally near Richfield and on the lower reaches near Delta.

Water diverted during the irrigation season to the north would be used for irrigation and other purposes in the area from Santaquin to Springville now partially served by the Strawberry Valley project. During the nonirrigation season releases would flow down Spanish Fork River to Utah Lake, replacing Provo River water stored in the potential Bates Reservoir on the Provo River and the potential Hobble Creek Reservoir, a tributary. Project water stored in Bates and Wallsburg Reservoir would be used for irrigation, municipal, and industrial purposes in the Heber-Francis-Wallsburg areas and in the Provo-Salt Lake City region as well as the western part of the Jordan River Valley.

Where practicable the project reservoirs would impound water for recreational and fish and wildlife purposes, thus providing partial compensation for damages to these purposes.

A dike would be constructed across the mouth of Provo Bay, an arm of Utah Lake, and the bay drained, reducing evaporation losses and reclaiming 9,340 acres of land. The diking of Goshen Bay of Utah Lake, authorized as a part of the Provo River project but not yet undertaken, would permit the south 26,000 acres of Utah Lake to be drained, reducing the average annual evaporation by 60,000 acre-feet.

A 7-mile section of the Jordan River channel between Utah Lake and Jordan Narrows would be enlarged. The channel improvement was authorized as a part of the Provo River project. Improvement of the river channel from Jordan Narrows to Great Salt Lake is being investigated by the Corps of Engineers.

In order to replace water now used in the Uinta Basin that would be exported and to provide additional water for further development within this basin, water would be diverted from the Flaming Gorge Reservoir that would be constructed on the Green River as a feature of the Colorado River storage project. Under an alternative plan of development Green River water could be supplied to the Uinta Basin from Echo Park Reservoir, another potential feature of the Colorado River storage project and would be pumped an average lift of 170 feet.

Project powerplants and transmission systems would be interconnected with the system proposed for transmission of electric energy produced by plants of the Colorado River storage project.

Rights to flows of Uinta Basin streams have been acquired by both white settlers and Indians. The Central Utah project would largely control the Uinta Basin's surplus waters. Much of the water would be exported, but that needed for further development in the Uinta Basin would be provided directly from the Green River.

Annual depletions to the Colorado River at the sites of use are expected to average 800,600 acre-feet, or one-half of the water available to Utah under the terms of the upper Colorado River Basin compact.

STATEMENT ON HAMMOND PROJECT, NEW MEXICO

The potential Hammond project would divert waters of San Juan River to provide an irrigation supply for 3,670 acres of arable land now unirrigated. The lands lie along the south side of the river in a narrow 20-mile strip opposite the towns of Blanco, Bloomfield, and Farmington, in northwestern New Mexico.

The principal crops that would be grown on the lands with project development would be alfalfa, apples, corn, beans, and barley. Most of the farms are of the fruit-crop and dairy-field crop types.

Preliminary land classification surveys indicate that the lands would be suitable for sustained crop production under irrigation farming. A detailed classification would be necessary to confirm the suitability of all the lands.

Water supply studies, based on records of streamflows as they have occurred in the past, indicate that an adequate irrigation supply of 18,400 acre-feet annually would be available for the project from direct flows with permissible shortages occurring in occasional drought years. A water right for the project can be obtained under New Mexico State law.

Project works would include the Hammond diversion dam on San Juan River, a 28-mile mail gravity canal, a hydraulic turbine-driven pumping plant, the East Highline lateral, the West Highline lateral, minor distribution ditches, and a drainage system. A period of about 2 or 3 years would be required to complete definite plan investigations and construction of project works except the drains. A few years' operation of the project would be necessary to determine the extent of drainage actually required.

This statement is based on the physical plan of project development presented in the Bureau of Reclamation report on the Hammond project, New Mexico, dated November 1950, a supplement to the Colorado River storage project report dated December 1950. Results of current (January 1953) estimates for this project plan are summarized in the attached project summary tabulation.

Studies of the potenial nearby Navajo project subsequent to 1950 indicate that it might be found desirable to materially modify the plan for serving the Hammond project lands during the definite plan investigations.

Summary data, Hammond project, New Mexico

Irrigated acreage: New land, 3,670 acres.

Principal agricultural production: Alfalfa, grains, beans, some fruit; dairy cows and sheep.

Water supply:	*Acre-feet*
Average annual increase in direct flow diversion	18,400
Average annual increase in storage yield	None
Stream depletion (average annual)	7,900
Project works:	
Construction features include Hammond diversion dam on San Juan River, a 28-mile 86-second-foot main gravity canal, a small hydraulic turbine-driven pump, distribution laterals, and drains.	
Construction cost and repayment:	
Estimated cost	$2,302,000
Reimmburable allocation to irrigation	2,302,000
Nonreimbursable allocation	None
Repayment by—	
Irrigation water users	370,000
Power revenues from Colorado River storage project	1,932,000
Total	2,302,000
Annual operation, maintenance, and replacement costs	16,100
Benefit-cost ratio	2.8 to 1

STATEMENT ON EDEN PROJECT, WYOMING

When completed the Eden project in southwestern Wyoming will divert water from the Big and Little Sandy Creeks in the upper Colorado River Basin to irrigate 10,660 acres of arable lands not now irrigated and will replace or otherwise rehabilitate the major features of the irrigation system that heretofore was utilized to irrigate 9,540 acres.

Climatically adapted crops in the area, such as alfalfa, pasture grasses, and small grains, will be produced on the project lands largely in conjunction with livestock operations centered around dairy cows, beef, and farm flocks of sheep and of chickens.

Construction of the Eden project was originally approved by the President on September 18, 1940, as a water conservation and utilization project under the act of August 11, 1939 (53 Stat. 1418). Work on the project was about 16 percent completed when stopped by order of the War Production Board in December 1942. Completion of the project was subsequently authorized by act of June 28, 1949 (Public Law 132, 81st Cong., 1st sess.). Construction of the project under the latter authorization is now well advanced with two major features of the project already completed and work currently under way on some of the other project features. The latter act provided for "such modification in the physical features as the Secretary of the Interior may find will result in greater engineering and economic feasibility: *Provided*, That of the construction costs of the irrigation features of the project not less than $1,500,000 for the project of twenty thousand irrigable acres, or a proportionate part thereof based on the actual irrigable area as determined and announced by the Secretary of the Interior upon completion of the project, shall be reimbursed by the water users in not to exceed sixty years. * * * *Provided further*, That construction costs of the irrigation features of the project which are not hereby made reimbursable by the water users shall be set aside in a special account against which net revenues derived from the sale of power generated at the hydroelectric plants of the Colorado River Storage project in the Upper Basin shall be charged when such plants are constructed."

The current plan of the project is covered in a definite plan report prepared by the Bureau of Reclamation and dated May 1953. Construction features of the project include:

Big Sandy Dam and dikes (now completed) on Big Sandy Creek to form Big Sandy Reservoir of 39,700 acre-feet total storage capacity.

Means Canal (now completed) to convey water from Big Sandy Reservoir to the West Side lateral and to the existing Eden Canal.

West Side lateral to serve lands on the west side of Big Sandy Creek.

Eden Creek enlargement and relocation below the terminus of the Means Canal to serve lands east of Big Sandy Creek.

Little Sandy Canal rehabilitation and extension to connect with the upper section of the Eden Canal.

Enlargement of existing lateral system served by Eden Canal to serve both presently irrigated and new lands under that canal.

Project drainage system.

A detailed classification survey shows the lands of the project to be suitable for sustained crop production under irrigation farming.

Water supply studies, based on records of streamflows as they have occurred in the past, indicate that an adequate irrigation supply would be available for the project area from direct flows and storage with permissible shortages in occasional drought years.

Project construction costs based on January 1953 prices are estimated at $7,287,000. The project repayment was established by the project authorizing act of June 28, 1949, as $1,500,000 to be repaid over 60 years. This amount deducted from total project costs leaves $5,787,000 to be repaid from Colorado River storage project net power revenues under the general repayment plan of the latter project and in accordance with the Eden project authorizing act of 1949.

Data on the project are summarized in the attached tabulation.

Summary data, Eden project, Wyoming

Irrigated acreage:	*Acres*
New land	10,660
Supplemental	9,540
Total	20,200
Principal agricultural production: Hay, pasture, dairy cows, sheep, beef.	
Water supply:	*Acre-feet*
Increase in average annual direct flow diversions	39,600
Increase in average annual storage yield	20,400
Total	60,000
Stream depletion (average annual)	32,400
Project works:	
Construction features include the Big Sandy Dam, Dikes, and Reservoir with 39,700 acre-feet total storage capacity (now completed), Means Canal (now completed) laterals and improvements in existing distribution system, along with drainage to serve the project area.	
Construction costs and repayment:	
Estimated cost	$7,287,000
Reimbursable cost allocated to irrigation	7,287,000
Nonreimbursable cost	None
Repayment by:	
Irrigation [1]	1,500,000
Power revenues from colorado River storage project	5,787,000
Total	7,287,000
Annual operation, maintenance, and replacement costs	40,400
Benefit-cost ratio	1.3 to 1

[1] Based on 60-year repayment period as provided under project authorizing act of 1949

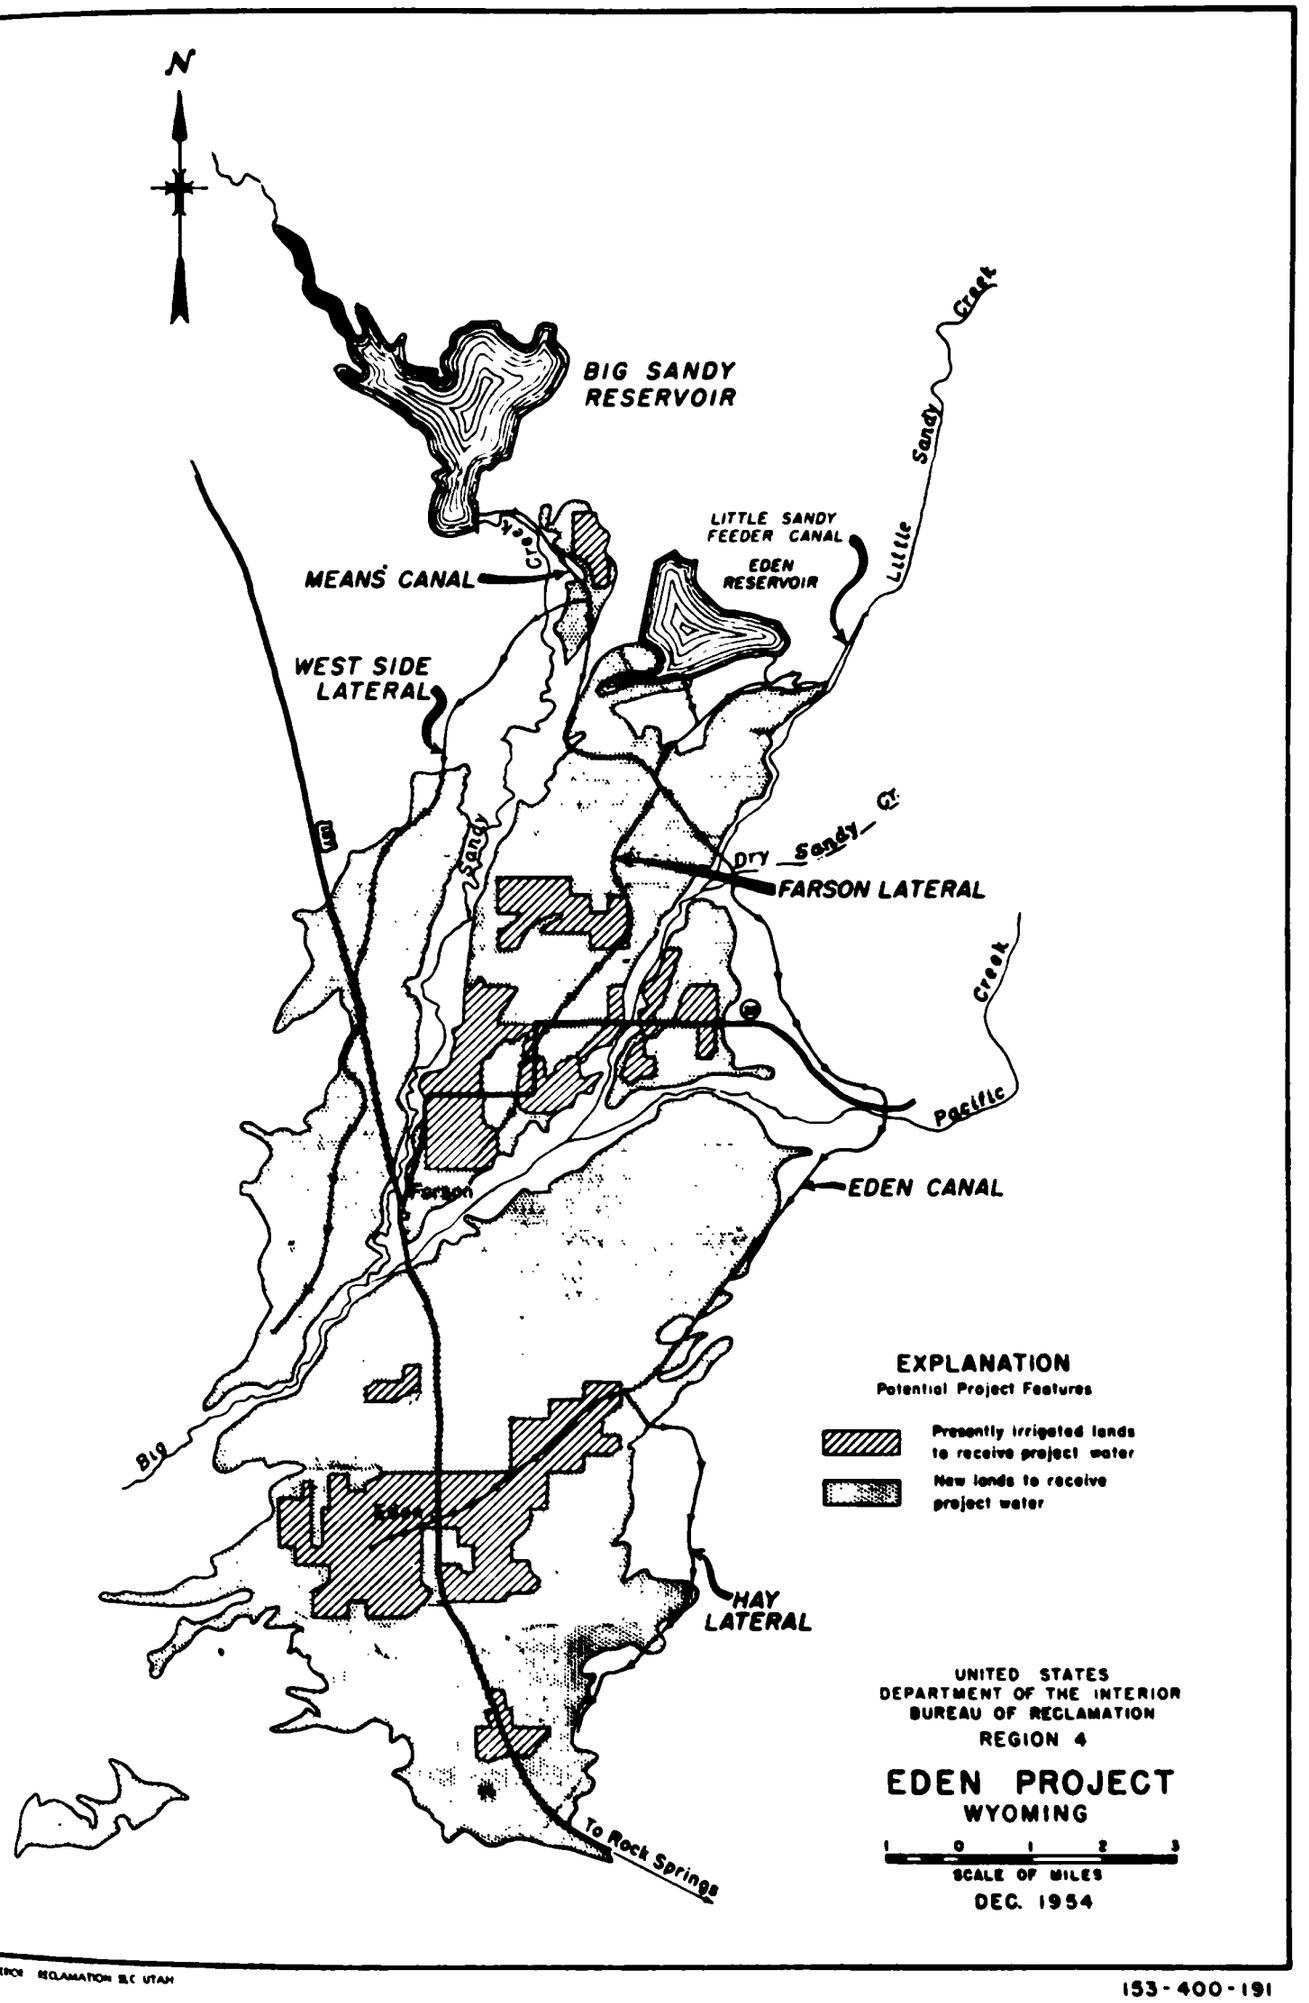
STATEMENT ON CURECANTI UNIT, COLORADO, OF COLORADO RIVER STORAGE PROJECT

(Modified plan)

The Curecanti unit of the Colorado River storage project is located on Gunnison River, a tributary of the Colorado River, in west-central Colorado. The report of the Colorado River storage project and participating projects of December 1950 included plans for development of the Curecanti and Crystal Reservoirs and powerplants. The Curecanti unit recommended in that report was for a reservoir capacity of 2,500,000 acre-feet. The State of Colorado requested that the reservoir water surface is limited to elevation 7,520 or a capacity of 940,000 acre-feet. As a result the committee reports on the bills before the last session of the Congress contained the recommendation of the State of Colorado that the Curecanti unit be limited accordingly. Since the cost of power produced by the smaller dam was somewhat higher than the cost of power produced by alternate means, we have endeavored to work out a plan for improving the economic feasibility of this unit.

Reconnaissance studies of a modified plan are now well advanced and indicate that a greater and more economical utilization of the power resources on the Gunnison River could be made by adding two dams and powerplants between the Curecanti and Crystal Reservoir sites. The resulting unit would consist of an integrated system of four dams and powerplants. It is planned primarily for hydroelectric development and would also provide benefits from flood control, recreation, and ultimately from irrigation and other uses dependent upon river regulation or replacement storage. The reservoirs would extend some 40 miles along a section of the Gunnison River between the town of Gunnison and the Black Canyon National Monument but would lie above and outside the boundary of the monument. Each of the features included in the unit under the modified plan would be dependent for maximum economy upon other features of the unit, and each feature would be justified economically for inclusion in the unit.

The Curecanti Reservoir would be formed by the Blue Mesa Dam. It would be the largest and uppermost of the four reservoirs in the system and would provide the major portion of the system's stream regulation. The three downstream reservoirs referred to as the Narrow Gauge, Morrow Point, and Crystal Reservoirs, in that order, would be primarily for development of power head with only nomi-



153-400-191

59762—55——7

nal active storage capacities. Sufficient active capacity, however, would be provided at the Morrow Point site for some seasonal regulation of stream inflows below Blue Mesa Dam. Small amounts of active capacity would also be necessary at the three downstream sites for successive reregulation of releases from upstream reservoirs to permit flexibility of power production in conformance with power load patterns. Releases from the Crystal Reservoir, the lowest site in the system, would be maintained to provide optimum use of water downstream for irrigation and other uses in addition to generation of power at the Crystal site.

Physical data and estimated reconnaissance construction costs of the principal features in the unit are shown below:

Dam and powerplant or other feature	Height of dam above stream bed (feet)	Reservoir capacity (acre-feet)		Installed generating capacity (kilowatts)	Estimated construction cost of dam and powerplants (July 1951 prices)
		Total	Active		
Blue Mesa	350	940,000	740,000	51,000	$36,500,000
Narrow Gauge	135	8,000	1,000	18,000	9,100,000
Morrow Point	260	82,000	42,000	60,000	20,700,000
Crystal	155	9,000	1,000	23,000	10,700,000
Transmission system					11,500,000
Total	900	1,039,000	784,000	152,000	88,500,000

Operation, maintenance, and replacement costs for the unit are estimated at a total of $863,000 annually.

Stream depletion (reservoir evaporation) attributable to development of the unit would total approximately 17,000 acre-feet annually.

An average of approximately 615 million kilowatt-hours of energy deliverable to power load centers after allowing for transmission losses would be produced annually. Of the total, about 213 million kilowatt hours would be produced at the Blue Mesa powerplant. Market studies show that the potential power could be marketed within a reasonable period after completion of construction. The plan is adaptable to scheduling construction of the dams and powerplants to conform in general with growing market conditions. The most practical initial construction of the unit would probably include the Blue Mesa Dam (Curecanti Reservoir) and powerplant with the other dams and powerplants added later consistent with power load growth.

All of the flows of the Gunnison River would not be controlled by the reservoirs of the unit. Flows of flood magnitude, however, could be reduced and much of the flood damage along the river under present conditions would be reduced. The Corps of Engineers has tentatively estimated that flood-control benefits would amount to $10,000 annually. The National Park Service has tentatively estimated that the recreational value of Curecanti Reservoir would amount to about $20,000 annually if adequate recreational facilities were provided. No evaluation of the recreational potentialities of the other three reservoirs has been made. The Fish and Wildlife Service is presently studying effects of the potential development on fish and wildlife values. No monetary appraisal has yet been made, but the studies made by the Service to date indicate that the development would have an adverse effect on present fish and wildlife values. The Service is therefore opposed to the development.

The following criteria and assumptions were used in the preliminary reconnaissance appraisal of the unit:

(*a*) Only direct power benefits are considered.

(*b*) No allocation of costs is made at this time to river regulation for future irrigation and other consumptive uses.

(*c*) Costs of the unit and of alternative steam power for comparative purposes are based on amortizing costs with an interest rate of 2.5 percent over a 50-year period of analysis. Taxes are not included in the analysis.

(*d*) Average firm-energy production deliverable to load centers is based on estimated 20-year depleted streamflows for the 1931–44 streamflow conditions and estimated power-transmission losses.

(*e*) Present worth of the estimated salvage value at the end of 50 years was deducted from construction costs in computing the benefit-cost ratio.

(*f*) Delta, Montrose, Grand Junction, Nucla, and Gunnison, Colo., were assumed as power market-load centers for the study.

General results of the reconnaissance appraisal on the above basis for the Curecanti Reservoir and Blue Mesa Dam and powerplant alone and for the overall Curecanti unit are summarized below.

	Scale of development	
	Curecanti Reservoir, Blue Mesa Dam, and powerplant alone	Curecanti unit (4 dams and powerplants)
Average cost per kilowatt-hour	9.4 mills	6.5 mills.
Cost per kilowatt-hour of alternative steam power	9.0 mills	8.3 mills.
Benefit-cost ratio	1.1 to 1	1.4 to 1.

Although the reconnaissance studies indicate that the Blue Mesa powerplant when considered alone would have a benefit-cost ratio slightly greater than unity if allowance is made for salvage value, the average cost of energy would slightly exceed the cost of alternative steam power. On the other hand, the benefit-cost ratio for the overall Curecanti unit would be well over unity and the average cost of energy would be 22 percent less than the cost of alternative steam power.

Detailed studies are necessary to refine the economic scale of development and to confirm the present reconnaissance apprasial.

Statement on Gooseberry Project, Utah

The potential Gooseberry project would divert water from a headwater tributary in the Colorado River Basin to improve the irrigation water supply and thus the agricultural production, of 16,400 acres of arable lands in the Bonneville Basin in Sanpete County, central Utah. The project would also enchance recreational values for the population in the general vicinity of the project. A small net loss would probably result in fish and wildlife values. A net benefit to forest resource development would result from relocation of roads in connection with construction of project storage facilities.

The general type of farming now practiced in the area would be continued with project development. Agriculture would continue to center around the livestock industry with more than 95 percent of the irrigated area producing alfalfa, pasture, and small grains for livestock feed. Principal livestock would include dairy cows, beef cattle, and sheep.

Under the project plan surplus flows of Gooseberry Creek would be regulated at the 17,200 acre-foot capacity reservoir that would be constructed at the Mammoth site on the creek and would then be conveyed in the potential 2.4-mile Mammoth tunnel through the Colorado-Bonneville Basin Divide to Cottonwood Creek. The water would be diverted from Cottonwood Creek into existing canals and the potential Gooseberry Highline Canal for conveyance to project lands. The water would be distributed to individual farm tracts by existing laterals that would be rehabilitated as necessary as a part of the project development. Usable return flow would be collected in natural channels that would be cleaned and improved as part of the project. Drains would be provided for land with a high water table and the San Pitch River channel would be improved as necessary to provide an outlet for the drainage system. Boating, camping, and picnicking facilities would be provided at Mammoth Reservoir as recreational features of the project. As part of the reservoir construction, 3 miles of forest roads and sheep corral would be relocated and 2 miles of connecting roads would be constructed. A 3- to 5-year period would be required to complete construction of the project.

Water-supply studies based on records of streamflows as they have occurred in the past indicate that with project development the irrigation supply for project lands would be increased by an average of 14,000 acre-feet annually including 11,700 acre-feet of direct diversion of storage water and an increase of 2,300 acre-feet of usable return flows. Water rights for the project can be obtained under Utah State law.

A preliminary land-classification survey indicates that the project lands would be suitable for sustained production of crops under irrigation farming. Detailed land classification would be required to confirm the suitability of all the lands.

Results of current (January 1953) Bureau of Reclamation estimates for the physical plan of the project, as covered in the Gooseberry project report dated January 1953, are summarized in the attached project summary tabulation.

Summary data, Gooseberry project, Utah

Irrigated acreage:		
New land		None
Supplemental		16,400
Total		16,400
Principal agricultural production: Alfalfa, pasture, grain, dairy cows, beef cattle, and sheep.		
Water supply:		*Acre-feet*
Average annual increase in return flow		2,300
Average annual increase in storage yield		11,700
Total		14,000
Stream depletion: 12,500 acre-feet.		
Project works:		
The construction features would include the Mammoth Dam and Reservoir with a total capacity of 17,200 acre-feet, the 2.4-mile Mammoth tunnel, the Gooseberry Highline Canal, and some rehabilitation of existing canals and laterals.		
Construction cost and repayment:		
Estimated cost		$5,760,500
Reimbursable cost allocated to irrigation		5,727,500
Nonreimbursable cost allocated to recreation		33,000
Repayment by:		
Irrigation water users	$2,375,000	
Power revenues from Colorado River storage project	3,352,500	
Total		5,727,500
Annual operation and maintenance and replacement costs:		
Irrigation	11,020	
Recreation	2,540	
Total		13,560
Benefit-cost ratio		1.2 to 1

STATEMENT ON NAVAHO PROJECT, NEW MEXICO

The potential Navaho project (formerly called the Shiprock and South San Juan projects) would provide for the irrigation of about 137,250 acres of arable dry lands lying along the south side of San Juan River, a principal tributary of Colorado River, near the towns of Bloomfield, Farmington, and Shiprock in northwestern New Mexico. Of the lands that would be irrigated 109,000 acres are located in the Navaho Indian Reservation and 28,250 acres are outside the reservation. All the lands within the reservation and 1,660 acres outside the reservation are Indian-owned. Remaining lands outside the reservation are publicly owned or privately owned by non-Indians.

The general plan of the project includes the Navaho Dam and Reservoir on San Juan River of 1,450,000 acre-feet total capacity (778,000 acre-feet active), and a main highline canal to divert from the reservoir at a point near the dam and at an elevation about 270 feet above the stream bed. This main high line canal of 2,630 second-feet capacity would divert the water to a point about 29 miles downstream from Navaho Dam where the water would be dropped through a direct connected turbine pumping plant to a lower main canal that would extend westerly about 120 miles to serve the major portion of the project lands by gravity. The dropping water would energize the pump to lift a part of the water to serve the portion of the project lands inside and outside of the reservation that are too high to be served by the gravity diversion. A distribution system would extend beyond the pump lift to deliver the pumped water to the high lands. A system of drains would be provided as required to prevent seepage of project lands. The Navaho Reservoir would be used jointly by the Navaho and San Juan-Chama project. The latter project is a potential transmountain diversion to the Rio Grande Basin from the headwaters of the San Juan River.

Planning investigations of the Navaho project have been made jointly by the Bureau of Indian Affairs and region 4 of the Bureau of Reclamation. The project is an integral part of the Indian Affairs' program to bring relief to the Navaho Indians from their very low family incomes and to make them self-sustaining.

Navaho project lands range from about 5,000 to 6,100 feet in elevation and have a semiarid to arid climate with an average frost-free season of about 160 to 170 days. Annual precipitation averages less than 9 inches with about half occurring during the growing season, making irrigation necessary for successful crop production. With irrigation, climatic conditions are favorable for growing most field crops, a variety of garden crops, and such fruits as apples, pears, peaches, cherries, and apricots. Most of the project acreage would be utilized for production of livestock feeds with smaller acreages being utilized for fruit and garden crops. Principal livestock would be dairy cows and sheep.

Detailed land classification of virtually all the project area show the lands to be suitable for sustained production of crops under irrigation farming. Water supply studies show that the 137,250-acre project would require an average annual irrigation diversion of about 630,000 acre-feet. Simulated operation studies, based on streamflows as they have occurred in the past, indicate that an adequate water supply would be available with permissible shortages occurring in occasional drought years. The average annual stream depletion that would result from the development would be about 341,000 acre-feet.

This statement is based on the physical plan of development presented in the January 1955 feasibility report on the Navaho project compiled by the Bureau of Indian Affairs. Results of estimates for the project reflecting October 1954 construction prices are shown in the attached summary tabulation.

Navaho project, New Mexico, summary data

Irrigated acreage:

	Navaho Indian Reservation	Nonreservation	Total
New land, total	109,000	28,250	137,250
Gravity	90,240	2,800	93,040
Pump (hydraulic)	18,760	25,450	44,210

Principal agricultural production:
Alfalfa, grains, pastures, beans, some fruit and vegetables, dairy cows, sheep.

Water supply:	*Acre-feet*
Average annual increase in storage and direct flow diversions	630,000
Stream depletion (average annual)	341,000

Project works:
Construction features would include Navaho Dam and Reservoir on San Juan River, with approximately 1,450,000 acre-feet total capacity (778,000 acre-feet active), a 29-mile main highline canal to divert from reservoir about 270 feet above stream bed at dam, a drop from highline canal to a lower main gravity canal extending about 120 miles from the drop, a turbine-driven pump at the drop to lift water to about 32 percent of project lands, 2 main canals extending beyond the pump lift, distribution laterals, and drains. Reasonably efficient construction of the project would require about 15 years, except for drains.

Construction cost and repayment:		
Estimated construction cost[1]		$212,037,300
Reimbursable allocation to:		
Navaho project irrigation	$209,939,300	
San Juan-Chama project	800,000	
		210,739,300
Nonreimbursable allocation to:		
Flood control	1,106,000	
Recreation	192,000	
		1,298,000
Repayment by:		
Navaho project irrigation water users[2]	30,730,000	
San Juan-Chama project	800,000	
Power revenues from Colorado River storage project	179,209,300	
		210,739,300

Annual operation, maintenance, and replacement costs:	
Irrigation	370,600
Flood control	200
Recreation	65,000
Total	435,800

[1] Includes $192,000 for cost of recreation facilities.
[2] Based on assumption that all Indian-owned lands would repay at same rate as non-Indian-owned lands, and that repayment on Indian-owned lands would be deferred under provisions of act of July 1, 1932 (47 Stat. 564).

Statement on San Juan-Chama Project, Colorado and New Mexico

The San Juan-Chama project would divert water from the headwaters of the San Juan River, a principal tributary of the Colorado River, into the Rio Grande Basin for the purposes of providing supplemental water for existing irrigation projects and for municipal and industrial uses. Although water for diversion would be collected from the tributaries of the San Juan located in both Colorado and New Mexico, all of the water would be used in New Mexico in the Rio Grande Basin. By exchange the project would also increase the use of water in New Mexico in the Canadian River Basin. The present plan provides for the diversion of 235,000 acre-feet of Colorado River Basin water annually out of the total amount allocated to New Mexico under the provisions of the upper Colorado River Basin compact.

With project development, an adequate supply of excellent quality water would be available to satisfy the rapidly growing municipal and industrial requirements of the Albuquerque metropolitan area, the population center of the Rio Grande Basin. Water would also be available to supplement the now deficient supply for some 225,000 acres of irrigated land in the area and to replace water depletions occurring throughout the basin from watershed improvement programs and groundwater pumping. In addition, the project would improve the conditions

for recreation, fish, and wildlife activities in the Rio Grande Basin, which is the center of one of the more important tourist and recreational areas in the country.

1. *Collection and diversion features.*—This system would comprise three reservoirs having a total capacity of 190,000 acre-feet located on the West Fork, East Fork, and Rio Blanco tributaries of the San Juan River and a feeder canal and conduit system to collect and transport the water to the head of Willow Creek in the Rio Grande Basin. The conduit system would be about 49 miles in length and would have a terminal capacity at the outlet of the tunnel through the Continental Divide of 1,000 cubic feet per second.

2. *Regulatory features.*—Heron No. 4 reservoir, having a 400,000 acre-foot capacity, located on Willow Creek, a tributary of the Rio Chama, would provide the storage required to regulate water releases for irrigation, municipal and industrial uses, and replacement of basin depletions. The outlet works of the existing El Vado Reservoir, downstream, woudl be enlarged to permit full transmissions of anticipated releases from Heron No. 4 reservoir.

3. *Water-use features.*—Construction features for irrigation purposes would comprise regulatory reservoirs, rehabilitation of distribution systems, and some relocation and extension of canals and laterals on existing irrigation projects on Rio Grande tributaries. Water for these projects would be made available by operation under exchange agreements. Supplemental irrigation water would also be furnished the Middle Rio Grande project and the Elephant Butte district of the Rio Grande project, utilizing existing distribution facilities. The present plan does not include construction features for delivery of municipal and industrial water beyond the regulating reservoir. Such features could be added later as part of the project if the local interests desire Federal construction and financing. No facilities are required to be constructed for delivery of the water to replace basin depletions. Construction of project features would be accomplished over a period of about 6 years.

This statement is based on the physical plan contained in a Bureau of Reclamation project report now in the process of completion. The financial data and analysis of the project were made in January 1955 and conform to current policy and procedure. The project investigations are of adequate degree of detail to use in project authorization, with the construction costs based on October 1954 prices. Preliminary studies of the potentialities of fish and wildlife development indicate it may ultimately be desirable to make an allocation of water to this purpose. Results of current estimates for the project are included in the attached summary tabulation.

Summary data, San Juan-Chama project, Colorado and New Mexico

Irrigated acreage:	*Acres*
New land	None
Supplemental land	225,000
Water supply: Allocation of diverted San Juan River water:	*Acre-feet*
Irrigation	179,200
Irrigated lands	136,700
Replacement of Rio Grande Basin depletions	42,500
Municipal and industrial water	55,800
Stream depletion (average annual diversion from San Juan River Basin)	235,000

Project works:

Principal construction features would include 3 reservoirs of 190,000-acre-foot total capacity in the headwaters of San Juan River, a 49-mile conduit system to collect and divert water from San Juan River Basin to Rio Grande Basin, a 400,000-acre-foot reservoir in Rio Grande Basin to regulate San Juan River diversions, some additional reservoirs, rehabilitation of distribution systems, and some relocation and extension of canals and laterals in existing systems on Rio Grande tributaries.

Summary data, San Juan-Chama project, Colorado and New Mexico—Continued

Construction cost and repayment:	
Estimated construction cost	[1] $135,169,000
Reimbursable allocation to:	
Irrigation:	
Irrigated lands	87,531,000
Replacement of Rio Grande Basin stream depletions	20,393,000
Municipal and industrial water	26,775,000
Total reimbursable allocations	134,699,000
Nonreimbursable allocation	470,000
Total allocation	135,169,000
Repayment by:	
Irrigation water users	21,290,000
Basin depletions (Rio Grande Basin)	6,600,000
Municipal and industrial water users	[2] 26,775,000
Power sources from Colorado River Storage project	80,034,000
Total	134,699,000
Annual operation, maintenance and replacement costs:	
Irrigation:	
Irrigated lands	234,100
Basin depletions (Rio Grande Basin)	41,400
Municipal and industrial water	54,300
Total	[3] 329,800
Benefit-cost ratio	1.84 to 1

[1] Includes $800,000 of cost of potential Navaho Dam and Reservoir on San Juan River $110,000 for stream gaging and river operating facilities, and $360,000 for recreational facilities.

[2] Interest during construction amounting to $728,000 and interest on investment amounting to $27,539,000 would also be paid.

[3] Excludes $33,500 operation and maintenance of stream-gaging program.

Senator O'MAHONEY. Do not skip anything which we ought to know.

Mr. LARSON. I assume you know pretty well what is in it.

Senator O'MAHONEY. Some people do not seem to think so. I want the Senator from California to know what is in your statement.

Senator KUCHEL. Mr. Chairman, I assume that the recommendation of the Senator from Utah that the matter be printed in large type would, he felt, facilitate my understanding of it. Actually I am ready to make a motion that we do away with this small type all the way through the hearing because I have a difficult time reading it anyway.

Senator O'MAHONEY. He was directing his remark to me because he sees I carry reading glasses.

You may proceed, Mr. Larson.

Mr. LARSON. In my statement I briefly covered the 11 participating projects and the 2 storage units recommended for initial authorization by the Secretary of the Interior.

Then I covered the additional projects and storage units contained in S. 500.

At the end of the statement I have a map of the Colorado Basin, showing the location of the storage units and the participating projects, and following the map is table 1, a summary of initial units of the Colorado River storage project and the 12 participating projects, the Eden project in Wyoming being the 12th project already authorized by previous legislation.

That gives a summary of information pertaining to the recommended projects.

Table 2 is a summary of information with the additional units added, namely, Cross Mountain, Curecanti, and Flaming Gorge, and the additional participating projects, Gooseberry, Navaho, and San Juan-Chama.

Following the tables there is a short 1- or 2-page statement of each of the participating projects and a small map showing the location of the land and the works.

For one of the projects, the Navaho, the statement was prepared by the Bureau of Indian Affairs, and another project, the San Juan-Chama, the statement was prepared by region 5 of the Bureau of Reclamation.

That is in general the information contained in my statement.

Senator O'MAHONEY. These charts are in such form that they can be reproduced in our hearings.

Mr. LARSON. Yes. The maps were all prepared on the basis that they readily can be reproduced for the hearings.

Senator O'MAHONEY. Very good.

Senator WATKINS. May I ask, Mr. Larson, have you any new matter in this statement that you did not give us a year ago when we held the hearings?

Mr. LARSON. I do not believe so, except that I have probably covered in a little more detail the water supply explanation.

Senator WATKINS. Is this largely a reproduction of what you gave us last year?

Mr. LARSON. Yes, it is essentially the same as last year, but changed to meet the present bill, S. 500, and as I stated, I have a more complete explanation of the water supply and have extended the explanations on costs, allocations and repayment, just to be more explicit as to what we meant before.

Senator WATKINS. Have you anything additional on the operation of the project and how it will work when completed?

Mr. LARSON. No. The operation of the plan has not been changed.

Senator O'MAHONEY. Have you made yourself familiar with the discussions which have been going on by members of the Upper Colorado River Basin Commission?

Mr. LARSON. Yes.

Senator O'MAHONEY. Are they covered in this statement?

Mr. LARSON. Do you have reference to the additional projects that were suggested by Governor Johnson of Colorado?

Senator O'MAHONEY. Yes; or any other project.

Mr. LARSON. Since those projects are not contained in S. 500, I did not include them in my statement. However, we do have information on those 20 projects.

Senator O'MAHONEY. When the Governor gives his testimony, you will be prepared to make any comment that the Bureau of Reclamation has reached with respect to such suggestions, will you?

Mr. LARSON. Yes, sir. We will be prepared to explain to you the reconnaissance work done on each of those projects and what the reconnaissance results show.

Senator O'MAHONEY. I think the question asked by Senator Watkins is one of great importance and ought to be made clear in everyday language so that those who do not understand how a flowing river

is administered by the Bureau and who fear that somehow or other the storage of water now being wasted would be disastrous or at least disadvantageous to those who through the magnificent action of Congress and its appropriations in the past have stored waters for the projects which they now enjoy.

Will you tell us how the Bureau balances the flow of the stream while it is building a reservoir so as not to destroy existing rights?

Mr. LARSON. Our studies show that the flow of the Colorado River varies greatly over the long period of years for which we have records. That means that we must build large holdover reservoirs that will carry water over from cycles of high runoff to dry cycles of drought years and smooth out, you might say, the river. With sufficient reservoir capacity the upper basin can be operated consistent with the 1922 Colorado River compact, and of course the 1948 upper Colorado River Basin compact.

Senator O'MAHONEY. Would I be stating it correctly by saying that the plan of administration of such a project as this would be to store floodwaters which in effect are not being used below and which would otherwise go to waste if they were not stored, and that this storage can be carried on without damage to those below?

Mr. LARSON. Yes, it can be accomplished within the terms of the compact without injuring rights below.

Senator O'MAHONEY. That is right. Of course, the compact binds us all. What was the purpose of those who drew the original compact in 1922, to provide that delivery of 7½ million acre-feet at Lee Ferry annually or 75 million in a 10-year period?

Mr. LARSON. Did you ask me a question?

Senator O'MAHONEY. Yes, sir.

Mr. LARSON. I do not think I have the question in mind. Will you please repeat it?

Senator O'MAHONEY. Yes. Do you know what the reason was of those who drafted the original compact to provide for the division at Lee Ferry of 7½ million acre-feet to the upper and lower basins—I am skipping the Mexican Treaty and the other provisions—and provide that the lower basin should deliver 7½ million acre-feet per year at Lee Ferry or 75 million acre-feet over a 10-year period? Was it not because of the great change in the flow of the stream?

Mr. LARSON. Yes, I assume the main purpose is to permit the development of the water resources of the Colorado River with an equitable share apportioned to each basin, so that the development could go forward. Both basins were anxious at that time to have things settled so development could go forward.

Senator O'MAHONEY. Was that not the only way by which there could be an adjustment of the great changes in the annual flow of the stream?

Mr. LARSON. By long-time regulation, yes.

Senator O'MAHONEY. Is there anything else you wish to tell the committee with respect to the Bureau of Reclamation's point of view? Some questions were asked of the Commissioner this morning, who referred the committee to you for answers. I assume you took note of them at the time; that is, having to do with some of the details.

Mr. LARSON. There is one point that we have tried to stress—the importance of the Glen Canyon Reservoir in the system. It provides

half of the storage of the main units in the upper basin. Inasmuch as it does, we tried to stress at least year's hearings, and we stress this time, that the holdover storage actually has to be long-time holdover storage and must be started in advance of when it is needed so that the reservoirs can be filled.

Senator BARRETT. May I ask a question, Mr. Chairman?

Senator O'MAHONEY. Surely.

Senator BARRETT. Mr. Larson, I note in your statement on page 9, you make the statement that the total consumptive use of water in the upper basin by all constructed projects, those authorized, and projects under construction, will be about 2½ million acre-feet.

Could you break those down and tell me offhand how much consumptive use is made by the constructed projects?

Mr. LARSON. It depends on which year you are talking about. Two or 3 years ago, or last year, we assumed that present uses were around 2 million acre-feet, and when all authorized projects are fully developed, it will be about 2½ million acre-feet. I do not know the latest figures on the transmountain diversion for Colorado-Big Thompson and other projects. We will have to bring that up to date for more accurate figures as to present cases.

Senator BARRETT. The total of the constructed projects and those under construction and the ones that are authorized now is 2½ million acre-feet?

Mr. LARSON. That is correct.

Senator BARRETT. How much do you estimate is the upper Colorado River depletion with the projects that are authorized in this bill?

Mr. LARSON. The stream depletion of the 11 participating projects and the Glen Canyon and Echo Park evaporation would bring the annual depletions up to 3½ million acre-feet, or an additional million acre-feet. The additional projects in the bill, the ones I read to you, would increase the total another 800,000 acre-feet. That is, the San Juan-Chama, Navaho, Gooseberry, Flaming Gorge, Curecanti, and Cross Mountain would bring the total up to 4,300,000 acre-feet.

Senator BARRETT. I would like to ask you, in 10 years time how much will the consumptive use be increased over and above the 2½ million we have at the present time, assuming that we have fairly orderly construction work going on?

Mr. LARSON. It would be a comparatively small amount because it would take at least 5 years to construct Echo Park and before the evaporation got too great. With the construction of Glen Canyon the period would be even longer than that. Then there is a long period of years for filling. The construction of anticipated initial projects is estimated at about 21 years, maybe more or less. These are the initial projects of our plan.

Senator BARRETT. In a period of 10 years, would you care to estimate how much of this additional consumptive use will be taken out of the stream there?

Mr. LARSON. What percent of the million acre-feet?

Senator BARRETT. Yes.

Mr. LARSON. Without making studies, I would not know. I would have to see which projects you are going to build first.

Senator BARRETT. Would it be less than half of it, would you say, in making a wild guess?

Mr. LARSON. For the first 10 years?

Senator BARRETT. Yes.

Mr. LARSON. There again it depends on whether you fill Glen Canyon within the 10-year period, stretch it out, and so on, and I don't believe I should pin that down. But it would certainly be much less than a million acre-feet.

Senator BARRETT. None of the 800,000 would be consumed in the 10-year period. That is, the other additional projects here. None of them will be under construction at all in 10 years.

Mr. LARSON. That again depends on the Congress appropriating money and their schedule of construction.

Senator BARRETT. First things are going to come first. We are going to work on the projects that are authorized under this bill, I assume, so it will be some time before you get on to other projects; is that right?

Mr. LARSON. Yes, I would assume that if all the other projects are added, the construction period will extend beyond 21 years.

Senator BARRETT. Would you be willing to say that in 10 years' time the consumptive use on the upper Colorado River project would not exceed 3,250,000 acre-feet, assuming that the project is authorized this year? That is adding 750,000 acre-feet annually to your 2½ million.

Mr. LARSON. Yes, that appears to be as good a guess as any.

Senator BARRETT. Assuming that is the case, would you think that my colleague from California, who is sitting on my right, has any reason to be concerned about the water that may be taken out of the river in the upper Colorado River States in that period of time?

Mr. LARSON. No; myself, I am not concerned. There is a feasible way of filling those reservoirs without interfering with the lower-basin rights under the compact.

Senator BARRETT. When we construct a reservoir that makes it doubly sure that his State, as well as the upper States are going to be that much better off; is that right?

Mr. LARSON. Yes; the lower basin States certainly will be better off with the construction of Glen Canyon.

Senator BARRETT. Thank you very much, Mr. Chairman.

Senator WATKINS. I would like to know, since you mentioned there is a way that could be done, how it can be done. How do you fill those reservoirs without interfering with anybody's rights?

Mr. LARSON. To begin with, we as engineers have assumed that the upper basin would have the right to store water, and would have the right to generate power. We realize that the Glen Canyon Reservoir has about half the capacity of the system of reservoirs that we have selected. So it sets the pace. If we can fill Glen Canyon, naturally we can fill the rest. It will take a long time.

Senator WATKINS. It will have a capacity of 26 million acre-feet.

Mr. LARSON. Yes, sir. We have proceeded on the basis that the upper basin would be completely fair in the delivery of water to which the lower basin is entitled under the compact, for the delivery of any water to Mexico which may have to come down from the upper basin and in the production of firm energy at Hoover Dam. Keeping those things in mind, Glen Canyon can be filled.

We have made a study and in years of high runoff when water runs on through the channel into the Gulf of California, there, of course, is

no question about filling Glen Canyon Reservoir. In average years it also could be done quite easily.

Senator WATKINS. What would you call an average year? What would be the flow of the river in an average year?

Mr. LARSON. I might say a series of average years when the historic flow was above 12 million acre-feet or some such figure. But the real test comes in the dry years. We have satisfied ourselves that under the most adverse streamflow conditions of record, upstream reservoirs can be filled and firm energy delivery maintained from Hoover through a combination of generation at Hoover and delivery of Glen Canyon energy to Hoover in lieu of releasing water through Hoover solely for power generation. In other words, in a year like we have right now, where water is short for firm energy at Hoover, we could not start storing at Glen Canyon. We must pick a year when Lake Mead has greater storage reserve, maybe over the 15 million acre-feet level. I am giving you one practical way in a dry cycle that will work. In that manner some water could be released from Lake Mead to keep up firm energy. With the interconnecting transmission line from Glen Canyon to Hoover, as soon as we get the dead-water space filled in Glen Canyon, and have at least half of the wheels installed before the gates are closed down, then Glen Canyon energy can be transmitted down to Hoover, thereby keeping the firm energy whole until Lake Mead reserve storage is built back. That is one practical way.

Senator WATKINS. What you would do in effect then is deliver power instead of water in the event of a shortage at Hoover of enough water for the energy needed.

Mr. LARSON. That is right. In some years you might take the whole 6 million acre-feet, which is about the dead-water capacity in Glen Canyon, or you could take it over 3 years, depending on the runoff years you have.

The other way is to wait for the years of high runoff when filling could be done fairly easily. So our study shows that there should be no insurmountable difficulties for the initial filling of the reservoir within a reasonable period of time. That is the conclusion we have reached as a result of our studies.

Senator WATKINS. That includes, of course, not only Glen Canyon, but Echo Park, and the rest.

Mr. LARSON. Yes. As soon as we get storage in Glen Canyon Reservoir, if the river should go down and we have to make deliveries to the lower basin, we can still do so from Glen Canyon and still store water in other reservoirs in the upper basin.

Senator WATKINS. Of course, Glen will make it possible through the catching of the silt to make Hoover itself much more valuable and have a bigger storage.

Mr. LARSON. That is correct. We have allowed for sediment detention in Glen Canyon for 200 years at the rate of somewhere near 100,000 acre-feet a year.

There is one other point I should have stressed in filling Glen. After we get up to the dead-water elevation of approximately 6 or 7 million acre-feet——

Senator WATKINS. What do you mean by "dead water"?

Mr. LARSON. It is the capacity which, after once filled is not drained, but used solely for power head and silt detention. The live storage is above that capacity.

Senator WATKINS. I was wondering when you said that you would take energy to make up at Hoover, whether you meant you would release water at Glen to make more power to send to Hoover, or whether you would take the normal flow of the stream which would go through Glen and develop the power sufficient there to make up for Hoover?

Mr. LARSON. In the drought years you could not afford to run any water from Glen solely for power into the Gulf of California. Naturally you would release what the lower basin was entitled to have, and simply transmit energy down there and some water, and let them store and build the reserve back in Lake Mead that was taken out during the filling of the 26 million acre-feet at Glen. That is just one way. There are different ways of filling Glen.

Senator WATKINS. I am certain that the committee would like to know some of the other ways.

Mr. LARSON. The other way is to wait for your high years. In other words, years of extremely high runoff.

Senator WATKINS. By doing that you would not interfere with the operation at Hoover Dam?

Mr. LARSON. No.

Senator WATKINS. You would simply be taking the water that otherwise would go into the gulf?

Mr. LARSON. Yes; we do not have many such years when water runs through Hoover without being used for power purposes, that is for firm and secondary energy purposes.

Senator WATKINS. For consumptive use there would be some that would be over and above what the lower basin could use consumptively.

Mr. LARSON. Yes. In working these studies we have based it on a delivery of 7½ million acre-feet to the lower basin through this drought period in case their uses were up to that.

Senator WATKINS. That would be each year delivery.

Mr. LARSON. That is right.

Senator WATKINS. In other words, you are not going to take advantage of the situation whereby you might short them for a time, but over a 10-year period deliver the full 75 million?

Mr. LARSON. Yes. Regardless of that provision, in our studies we have not shorted anybody in requirements up to that amount for irrigation and other uses.

Senator WATKINS. What I am getting at is that there would not be any time when you would short them under your program. They get full delivery every year.

Mr. LARSON. That is right.

Senator WATKINS. That is the program you are working out in connection with the filling of the reservoirs as they are built, and the delivery of water to lower interests.

Mr. LARSON. That is correct.

Senator WATKINS. So in effect they would not have any years in the future after this program got under way where they would only get 4 million, which was the amount of water delivered downstream a few years. I am talking about the shortage under the full amount for both divisions.

Mr. LARSON. The amount of releases from Glen Canyon would change from what the natural flow has been through the operation of a powerplant at the Glen Canyon Dam. The releases would be more uniform annually to generate power and meet the water requirements of the compact below.

Senator WATKINS. The point I want to be sure about is whether or not there would be under this arrangement sufficient water to meet the requirements on an annual basis for the lower users.

Mr. LARSON. Yes.

Senator KUCHEL. Mr. Chairman, first of all, does the Department's recommendations of projects coincide with the projects that are included in S. 500?

Mr. LARSON. The Secretary has recommended construction of 11 participating projects and 2 storage units, Glen Canyon and Echo Park, in his report of October of 1953. In addition to that you have other units and participating projects in the bill on which we are submitting information.

Senator KUCHEL. And those are Navaho.

Mr. LARSON. The Secretary has statements on Navaho, in his report of October, and some of the rest of them.

Senator KUCHEL. What are the others, Mr. Larson, which the bill includes, but which the Department does not recommend?

Mr. LARSON. Table 2 contains the additional projects in the bill not covered in the Secretary's initial recommendation.

Senator KUCHEL. This is in your large statement?

Mr. LARSON. Yes.

Senator KUCHEL. Subject to the approval of the chairman and the committee, I wonder if I might ask if you could be available in a week so that study could be made of your long report, and perhaps questions asked a little bit more intelligently.

Mr. LARSON. I am sure I will be here.

Senator KUCHEL. Mr. Larson, I want to thank you very much for sending me on Saturday a copy of your memorandum of February 24, 1955, addressed to you from the Assistant Commissioner and Chief Engineer. I would like to read a portion of it to the committee:

> In connection with the statement of the adequacy of the foundation rock at Glen Canyon Dam site, you are referred

says the memorandum—

> to my letter of July 1, 1954, to the Commissioner, subject: Colorado River storage project and possible alternative sites for Echo Park Reservoir, copy of which was sent to you at Salt Lake City. The third paragraph of this letter is quoted as follows:
>
> "The engineering and geologic problems incident to the construction of a dam at the Glen Canyon site have been discussed with Regional Director E. O. Larson, and he is familiar with the conditions at this site. The views of this office, which I am sure are shared by the regional office, are that the 26 million acre-feet capacity shown in the reports on the Colorado River storage project represents the maximum justifiable size of this reservoir on the basis of preliminary studies and testing. Following authorization of the project during the preconstruction phase, additional study and testing will be carried forward for the Glen Canyon site. It is anticipated that these tests will confirm our present opinion."

Then I would like to read a portion, Mr. Chairman, of a letter from the Secretary of the Interior under date of November 30, 1954, into the record, and I would like the permission of the Chair to put the entire letter in, which is only 2 pages.

Senator O'MAHONEY. Without objection it is so ordered.

Senator KUCHEL. Now, I quote a letter which Secretary McKay wrote to Mr. Brower, of California.

MY DEAR MR. BROWER: On October 21, 1954, you were informed that further reply would be made to your inquiries of September 28, 1954, addressed to the Secretary of the Interior and the Commissioner of Reclamation, concerning the effect of the proposed Glen Canyon Reservoir upon the Rainbow Ridge National Monument. We now have the necessary information from the field to complete that reply.

It is our intention to take whatever steps are necessary to protect the Rainbow Bridge National Monument from waters of the proposed Glen Canyon Reservoir and to ask Congress to provide for such protection in the authorizing legislation. Cooperative studies are underway by the field offices of the Bureau of Reclamation and the National Park Service to determine the best means of providing this protection, and to date these studies have revealed no unsurmountable problems. The topography of the area surrounding the monument indicates that a barrier dam 1 mile below the natural arch and outside the monument would provide adequate protection. Details of such a plan will require extensive study and are not available at this time.

On the basis of data available at the time of writing the 1950 report on Colorado River storage project and participating projects, a 700-foot dam (580 feet above stream level) at Glen Canyon was the maximum height which met the criteria of economy, safety of the structure, and adequate protection of the Rainbow Natural Bridge. Subsequent to writing the 1950 report on the Colorado River storage project, the Bureau conducted grouting tests in the drift tunnels driven 50 or 60 feet into each canyon wall of the Glen Canyon Dam site. Also, special bearing tests of 6-inch cores and large fragments of the foundation materials were made in the Bureau's Denver laboratory. The poorly cemented and relatively weak condition of the materials in comparison with the foundations common to most high dams has given the engineers who prepared the preliminary designs of the dam some concern as to the competency of the foundation to support any structure higher than 700 feet. Experiments to improve the strength of the foundation through a chemical grouting process were unsuccessful. These are the geological reasons why Commissioner W. A. Dexheimer made his statement in Denver about the limitation on the height of the proposed Glen Canyon Dam.

Following congressional authorization, more intensive studies will be made of the foundation conditions and of the Bureau's preliminary design to secure information for the preparation of plans and specifications for construction of the Glen Canyon Dam. If such intensive studies indicate the advisability of modifying the present selected height of dam, appropriate changes will be made in the designs prior to construction.

That to me is a very strange statement. It to me also however is a little bit troublesome. Would it be fair to say, Mr. Larson, that the technical engineering studies on the Glen Canyon Dam site so far indicates the possibility that Glen Canyon Dam might not be built there on the basis of engineering feasibility?

Mr. LARSON. No, sir; I do not think they infer that at all.

Senator KUCHEL. Tell me in your own words what the status is. Have you made some inquiry?

Mr. LARSON. The status is simply this. There have been more tests on Glen Canyon Dam site today than most dams that have been authorized in the past. Here the foundation is Navaho sandstone.

It is poor rock compared with granite and other dense rock, such as found at Hoover, so that our studies called for certain other elaborate tests. Six-inch cores were shipped to Denver and tested over a long period of time, to see what height of dam the rock would support. As a foundation gets less attractive, safety measures have to be taken to thicken the dam. You then get into economic design and ultimately, of course, you come to the safety of the structure as to how high you can go knowing certain conditions of the foundation and nature of the rock.

At the same time we have the large Rainbow Bridge to be concerned with upstream. A higher dam raises the water elevation on to the foot or pedestal of the natural bridge, so that taking into consideration the safety of the structure, the economics, and the protection of the Rainbow Natural Bridge, we arrived at 700 feet as the height that we would stop.

From all the studies we have up to now we feel that we can build a dam that high, but there is certainly a limit as to what you do, taking these three things into consideration. That was the height adopted, and we have nothing to cause us to change that height now, and I doubt it will be changed much later on.

Senator KUCHEL. Has the Bureau of Reclamation determined now that the present Glen Canyon Dam site is completely feasible from an engineering standpoint for construction?

Mr. LARSON. Yes, even though it does involve a large cost, it has a very great power potential and is a great storage reservoir. Taking those facts into consideration, to me it is a very feasible unit.

Senator KUCHEL. Would you say that the Secretary, when he said "following congressional authorization more intensive studies will be made of the foundation conditions and the Bureau's preliminary design" is now outdated since the time of this letter, and now you have completed your engineering studies?

Mr. LARSON. No. We would want to follow our usual practice. When a dam is authorized, we go in with much greater detailed tests to confirm what we have already found. That was true of Hoover, Hungry Horse, Shasta, and many other dams built in the past. Before we start construction we certainly want to verify our conclusions.

Senator KUCHEL. And if you were not sure and your subsequent inquiries demonstrated that you could not be sure, then you would not build Glen Canyon Dam at the present dam site?

Mr. LARSON. Yes. If they found something unexpected. But this rock is uniform both upstream and downstream from the site according to drill logs 400 feet below the bedrock under the river and 400 feet into the abutments, and examinations for miles upstream and each side, I cannot see that it can be upset very much, if any.

Senator KUCHEL. The only reason, again I speak as a layman, when I read a letter from the Secretary in which he speaks about experiments of the Bureau being unsuccessful, it raises in my mind some doubt as to just what the engineering feasibility of the project may be right now.

Mr. LARSON. You have to understand that in this way. Since the Navaho sandstone is what we call a somewhat porous rock, it would be advantageous if chemical grout could be used to close the pores. That might cheapen the construction cost of the dam. Certain factors of safety might be less, and we might save money by it.

Senator KUCHEL. So the fact that the experiments were unsuccessful really may be a boon?

Mr. LARSON. Then we do something else.

Senator WATKINS. The impression seems to have gone out from the Secretary's statement that there is grave doubt as to the safety of the height of the dam as proposed.

Mr. LARSON. I do not think there is any doubt as stated by the Chief Engineer in his letter just read by Senator Kuchel, which referred to stopping at a dam up to 700 feet high. That was the height he was willing to go on. I have been in conferences on this subject on several occasions.

Senator WATKINS. Then 700 feet is considered from the standpoint of the engineers to be safe?

Mr. LARSON. Yes. We can build a dam that high.

Senator WATKINS. In that particular formation.

Mr. LARSON. That is right.

Senator WATKINS. There is not any particular doubt or any specific doubt about the safety of a dam that high in that place?

Mr DEXHEIMER. May I amplify that a little bit?

Senator WATKINS. I wish you would because there has been some misunderstanding created. If it is not a safe place to build a dam, certainly we do not want to build it there.

Mr. DEXHEIMER. I have personally been in on the original exploration and the construction of Hoover Dam, Shasta Dam, and many others from days before they were conceived. I have investigated this site and gone through the geology. We have done a great deal more investigation on Glen Canyon than we have on Hoover or the others. We have no doubt at all but what a dam of 700 feet height at the Glen Canyon site is entirely practical, feasible, and economical, and would be safe from an engineering standpoint.

Senator WATKINS. Then how does this question arise about an additional height being unsafe?

Mr. DEXHEIMER. The question there related to a possibility that we might raise the height of Glen Canyon Dam as a substitute for some other project.

Senator WATKINS. To be specific, it has been suggested by some of the opponents of this project that Glen Canyon raised would be a substitute for Echo Park.

Mr. DEXHEIMER. The opposition has raised that question; yes.

Senator WATKINS. What you are saying now is that if you raise it beyond 700 feet in height you are taking a chance and it would be unsafe to build it to the extra height as a substitute for Echo Park.

Mr. DEXHEIMER. That is right. Under no circumstances should a higher Glen Canyon be considered as a substitute for Echo Park.

Senator WATKINS. If you are justified in your opinion, that would eliminate a high Glen Canyon as a substitute for Echo Park?

Mr. DEXHEIMER. That is correct, even though from an engineering standpoint it might be feasible to raise it a little higher, it still would not be a substitute for Echo Park, because of many other factors.

Senator WATKINS. Would you care to name those factors, because later on you are certainly going to be asked to name them.

Mr. DEXHEIMER. The question of the protection of the Rainbow Natural Bridge. Of course, the safety of the structure. If we went

higher, it might add to the cost of enlarging the foundation and so on, and the question of evaporation, because the water at a higher elevation than we plan for Glen Canyon would spread out over a wider territory, and evaporation would be much greater percentagewise over the water stored than the 26 million acre-foot limitation.

Senator WATKINS. Let us get back to the physical safety of a higher dam. It that an important element in what you have just said?

Mr. DEXHEIMER. It is very important.

Senator WATKINS. Then you would not recommend a higher dam than 700 feet even from the safety factor.

Mr. DEXHEIMER. The only reason we would go a little bit higher would be if our detailed investigations at a later time indicated that it was perfectly safe, was practical and economical to do so. But at the present time our studies indicate that 700 feet is the practical maximum at this time, because of all these other considerations.

Senator BARRETT. Mr. Dexheimer, I would like to ask you this question. Is the formation at Glen substantially the same as at Hoover and at Shasta?

Mr. DEXHEIMER. No, sir; they are entirely different rock formations.

Senator BARRETT. It is not sandstone at Hoover Dam?

Mr. DEXHEIMER. No, sir. Hoover Dam is what we call an andesite.

Senator BARRETT. Is Shasta sandstone?

Mr. DEXHEIMER. No, sir; it is granite.

Senator BARRETT. Do you have another dam site where you have used sandstone similar to this Navaho sandstone that is proposed to be used at Glen Canyon?

Mr. DEXHEIMER. There are a number of them around the world at different places, none quite the same as this particular formation, however.

Senator BARRETT. You never have heard of any difficulty arising because of the porosity of the sandstone being used as a base for the dam?

Mr. DEXHEIMER. No, sir. In fact, there are dams in other parts of the world where we have similar sandstone interlined with shale, which makes a much worse condition. We plan and think they can be feasibly built even to higher elevations than the 700 feet in this one.

Senator BARRETT. Now, Mr. Larson suggested that perhaps the porosity of the Navaho sandstone might be overcome by some filling of those little streaks through there. Has that ever been tried anywhere?

Mr. DEXHEIMER. We have experimented with cement grouting but it is just the porosity of the rock itself. When you get a certain amount of pressure on it, it might tend to give. There is a certain point where you might have a little difficulty. Chemical grouting has been tried in various formations and to some extent effective. It is particularly used in oil-well drilling. We would hope that when money is available for going ahead and this is authorized, to carry out further experiments to see if we could not solidify that foundation a little more by chemical grouting.

Senator BARRETT. Let me ask you this question. Assuming that you would take a slab of that standstone and exhibit it here on this table, would anybody be able to ascertain by looking at it that it was porous? I am talking about with the naked eye, and not a magnifying glass.

Mr. DEXHEIMER. Not that it would be porous as you might think of something with holes in it, but it is a question of relative porosity as compared with a much harder, denser rock. You could compare it in this way, that sandstone would appear to be something like a well-compressed brick as compared with a very dense hard rock.

Senator BARRETT. The reason I asked you that question is that I have seen cores come out of oil wells that looked just as solid as these colonnades here, and how in the world you could get oil to be produced from rocks of that type has always been intriguing to me, to say the least. I assume that is the same situation as far as this sandstone is concerned.

Mr. DEXHEIMER. Of course, the rocks they get oil from are generally a much more porous rock, and they have seams and cracks in them that let the oil through.

Senator BARRETT. If you look at one you will think it is just as solid as that marble over there. I will swear to that right now. You cannot ascertain it with the naked eye.

Mr. DEXHEIMER. I think that is true of many of our oil shales, too.

Senator KUCHEL. Mr. Dexheimer, I respect you as an engineer. I know nothing about it. When I receive a copy of a letter which the Secretary of the Interior has written, and he speaks of poorly cemented and relatively weak condition of the materials in Glen Canyon in comparison with the foundation common to most high dams has given the engineers who prepared the preliminary designs of the dam some concern as to the competency of the foundation to support any structure higher than 700 feet—so that I read his entire sentence—I do think we have a responsibility at least to inquire if it is not a fact that here at this time the conclusions which the Department has come to as to the site for Glen Canyon Dam, its feasibility, its safety, and all other factors, must at most be tentaive. Those are tentative conclusions?

Mr. DEXHEIMER. No, sir. They are firm conclusions for a structure up to 700 feet. There is no question in our minds.

Senator KUCHEL. Let me point out what else the Secretary of the Interior says:

> If such intensive studies—

and he is talking about the studies that would be made after congressional authorization—

> indicate the advisability of modifying the present selected height of the dam, appropriate changes will be made in the design prior to construction.

I shall not belabor this point, and certainly the engineering professionals in the Department are qualified to make that answer, I understand, but it did seem to me that the comments of the Secretary had some relevance to this hearing as they might indicate that the conclusions on a major project here, Glen Canyon, are tentative.

Mr. DEXHEIMER. No, sir; they are not. Up to 700 feet they are as firm as it is possible for us to get them with the much greater investigation than we have conducted on similar type structures. We are convinced that is entirely feasible and practical up to that height. As I mentioned before, however, we might change it a little bit depending on the future studies. It might even be a little bit higher provided all the other criteria of economy, protection of the bridge, and other factors would balance out in that important detailed design study.

Senator KUCHEL. The Secretary is correct, is he not, Mr. Dexheimer, that if authorization were provided by Congress, more intensive studies, to use the Secretary's words, would then be made of the foundation conditions and of your preliminary design?

Mr. DEXHEIMER. That is our standard practice. We always do that. However, we are much further ahead with those studies in the case of Glen Canyon than we have ever been on any dam before.

Senator KUCHEL. Now I would like to ask Mr. Larson just a few questions in addition. I think it might be of interest to the members of the committee. I have here an order of the United States Supreme Court entered this morning:

The motion of California defendants for leave to file an amended answer is granted. The motion to join as parties the States of Colorado, New Mexico, Utah, and Wyoming is hereby referred to George I. Haight, special master, to hear the parties and report with all convenient speed his opinion and recommendation as to whether the motion should be granted. The Chief Justice took no part in the consideration or decision of these motions.

That was the order of the Supreme Court this morning. I read it because I do feel that the whole question involved in quantity of water under the Colorado River compact is relevant here. I think this committee ought to be able to obtain from competent witnesses connected with the Department of the Interior their understanding of what the compact would require the Department of the Interior to do under the provisions of S. 500. I do not want to take the time of the committee, or yours, Mr. Larson, to go over the questions which I endeavored to ask Mr. Dexheimer this morning, except to ask you if S. 500 became the law, and if Glen Canyon Dam were erected, there would be a responsibility, would there not, on the Department of the Interior to release such waters from Glen Canyon as would meet the compact requirements at Lee Ferry?

Mr. LARSON. That is correct. There is so much leeway between the water that is used now, the 2½ million acre-feet for authorized projects, and since several years would elapse before it gets very much more than that there is so much leeway between the 2½ and the 7½ million acre-feet apportioned to the upper basin States that surely engineeringwise there is a way of filling Glen Canyon reservoir without violating or being inconsistent with the terms of the Colorado River compact.

Senator KUCHEL. What would be your understanding of the amount of water that would have to be released from Glen Canyon Dam to Lee Ferry in order to meet the obligations imposed by the Colorado River compact.

Mr. LARSON. That depends on several things. It depends on the requirements within the rights below, the streamflow, and whether there is surplus water or not. Several factors enter into that so I could not give you any exact amount.

Senator KUCHEL. What would be your understanding of your responsibility as the representative of the Department of the Interior under the very terms of the Colorado River compact?

Mr. LARSON. Our responsibility, I think, would be this: We start out on the assumption that the upper basin has the right to store water and has the right to use the water for the generation of power. Next would be to operate the river consistent with the Colorado compact of 1922 and the upper basin compact of 1948, and also make any

deliveries of water to Mexico that may be required of the upper basin under the Mexican Treaty or the compact.

Senator KUCHEL. And again with respect to the Colorado River compact, what would your understanding be of the amount of water required to be delivered by the Department of the Interior to the lower basin States at Lee Ferry?

Mr. LARSON. That again would vary from year to year but in our studies we have satisfied ourselves that if they were using the entire 7½ million apportioned to them together with any surplus to which they are entitled, we could still fill Glen Canyon Reservoir inasmuch as the upper basin is using only a small portion of its total 7½ million acre-feet.

Senator KUCHEL. Did you agree with Governor Johnson's statement which I read this morning on the Colorado River compact?

Mr. LARSON. I would not attempt to pass any opinion on the interpretations of the Colorado River compact.

Senator KUCHEL. Do you feel that the Colorado River compact must inevitably be interpreted by whoever determines how much the Department of the Interior is going to be required to release from Glen Canyon Dam?

Mr. LARSON. I do not think you have to have it interpreted to go ahead with the development in the upper basin on account of all the leeway I have described to you. There is so much leeway in unused water in the upper basin under its apportionment that we should not have any trouble filling Glen over the years and——

Senator KUCHEL. Suppose you did?

Mr. LARSON. And particularly where water is going to waste into the Gulf of California as far as irrigation use is concerned.

Senator KUCHEL. In other words, what I am trying to get to is this: In your statement you suggest on page 6 of the Colorado River compact in article IIIa apportioned from the Colorado River system in perpetuity to the upper basin and the lower basin, respectively, exclusive of the consumptive use of 7½ million acre-feet per annum. There is a provision in article IIId of the same compact, the States of the upper basin, Colorado, New Mexico, Utah, and Wyoming, will not cause the flow of the river at Lee Ferry, the point of division between the upper and lower basins, to be depleted below an aggregate of 75 million acre-feet for any period of 10 consecutive years. These are controlling and most important limitations with respect to the water uses in the upper basin, although there are other provisions in the compact relating to uses and deliveries of water.

That was a part of your prepared statement.

Mr. LARSON. That is correct.

Senator KUCHEL. So it seems to me that it should be a clear responsibility of the Department of Interior to regulate the flow of water from Glen Canyon in accordance with the Colorado River compact. There would be no question about that.

Mr. LARSON. No, regulation has to be consistent with it, that is correct.

Senator KUCHEL. And the needs of the people in the lower basin States and in particular parts of the State from which I come are going to grow. Their only guideline as to how much water they have from the waters of the Colorado River are involved in the Colorado

River compact: is that not right? Certainly I want them to get not a drop more than they are entitled to under the Colorado River compact, and I do not want them to get a drop less than what is entitled to them under the Colorado River compact. I do think that some of the reasonable people from my State have raised these questions of just exactly the jurisdiction the Interior Department would have over the project, and that got me this morning into the questions with Mr. Dexheimer.

Somewhere along the line someone is going to have to advise the Department of the Interior how much, and when, water shall be released from Glen Canyon Dam to be delivered at Lee Ferry. That is certainly correct; is it not?

Mr. LARSON. Yes, I assume so. The Upper Basin Commission will make a finding of fact which we would operate within.

Senator KUCHEL. Sir?

Mr. LARSON. The upper basin compact provides for the findings of fact by the Upper Basin Commission, and I assume we would operate within those, and also operate consistent with the 1922 compact.

Senator KUCHEL. The upper basin compact?

Senator WATKINS. If I may be permitted a question there, the use of the upper basin compact findings of fact would be for the distribution of water to the upper basin States.

Mr. LARSON. That is right.

Senator WATKINS. They would not attempt to write any findings of fact or regulations for the lower basin, I understand.

Mr. LARSON. No sir; as I understand it.

Senator KUCHEL. I do want that whole question of quantity of water explored, and again, Mr. Larson, I would like to be able to defer until later on in this hearing for a couple of days questions on your complete report. I want also very briefly, however, at this time, to raise the question which likewise is of concern to the lower basin, or anyway part of the lower basin, and that is this question of quality of water.

Have studies been made now by the Department of the Interior relative to the problem of quality of water?

Mr. LARSON. Yes. Our technicians have gone over the quality of water samples taken by the Geological Survey at various points in the upper basin States. If you care to have me read from my statement the comments I have on the quality of the water——

Senator KUCHEL. Where is that?

Senator O'MAHONEY. Pages 9 and 10 of the introduction.

Senator WATKINS. Mr. Chairman, I suggest that be read, because that is one of the controverted points.

Senator O'MAHONEY. Will you proceed, please?

Mr. LARSON. Our studies show that the recommended units and projects would have no material effect on the quality of water downstream. With respect to later phases of development, the plan provides for additional gaging and sampling stations to supply data for continued analysis and scrutiny as each phase approaches authorization. Our analysis of the quality of water at Lee Ferry reveals for the critical period of low flow, 1931 to 1947, concentrations of dissolved salts averaging 0.78 ton per acre-foot (575 parts per million), corresponding to uses totaling 2½ million acre-feet per annum in the upper basin. An average concentration of 0.85 ton per acre-

foot (625 parts per million) or an increase of about 9 percent is anticipated at Lee Ferry following completion of the recommended Glen Canyon and Echo Park storage units and the 11 initial participating projects, with a corresponding use then totaling about 3⅓ million acre feet. With full use of the 7½ million acre-feet per annum allotment in the upper basin, the average concentration of dissolved salts at Lee Ferry is estimated at about 1.20 tons per acre-foot (880 parts per million).

Under any of the above conditions, concentrations and type of salts are well within the standard range for irrigation water designated by the United States Salinity Laboratory at Riverside, Calif., as "good to permissible," and within the range of practical treatment for municipal and industrial purposes.

Senator KUCHEL. What does that phrase "good to permissible" mean, Mr. Larson? How do you define it?

Mr. LARSON. I would like to refer that question, if I may, to Mr. Jacobson, our engineer for the Colorado River storage project, who is more familiar with it and can answer the question better. May I do that, Mr. Chairman?

Senator O'MAHONEY. Certainly.

Mr. JACOBSON. The United States Salinity Laboratory in California is recognized as probably the most expert and well-grounded source of information in this field.

Senator O'MAHONEY. In what State is that?

Mr. JACOBSON. It is operated by the United States Department of Agriculture in Riverside, Calif. They have calibrated irrigation water into four different categories, the first being "excellent to good."

Senator KUCHEL. You were not attempting to attack the credibility, were you, Senator?

Senator O'MAHONEY. Not at all. I was trying to strengthen it.

Mr. JACOBSON. The second category is "good to permissible." The third is "doubtful to unsuitable." The fourth is "unsuitable." These categories are merely a means of calibrating irrigation water based on a salinity expressed in parts per million and the percentage of sodium in the dissolved solids.

Senator KUCHEL. In that category, then, I suppose the different types of water are all fit for human consumption except No. 4. If it is not to be defined as unsuitable, the other waters are good waters.

Mr. JACOBSON. These categories, of course, are calibrations for irrigation purposes, and not necessarily for domestic uses. Colorado River water is well within the range of treatment for domestic purposes.

Senator KUCHEL. It is well within for domestic purposes?

Mr. JACOBSON. That is right.

Senator KUCHEL. And also for purposes of irrigation?

Mr. JACOBSON. That is correct.

Senator KUCHEL. Have those studies gone along and are going along today by the Department of Agriculture?

Mr. JACOBSON. Yes, the most recent report of their salinity laboratory was released last year, going even one step further, whereby they apply water of various types and salt concentrations to soils of various absorptive abilities.

Senator KUCHEL. Has any other agency of Government made such study on the question of quality of water? Has your own agency made any studies along those lines?

Mr. JACOBSON. We do in relation to application of the water to soils, yes. But the experimental work is largely done under the Department of Agriculture, and I think this is the focus or the center where such experiments are conducted.

Senator KUCHEL. Was there not established in the Boulder Canyon Adjustment Act a fund of approximately half a million dollars a year to be used in part for determining studies of both quantity and quality of water?

Mr. LARSON. Yes. There was established the fund of $500,000 annually, retroactive to 1938, and it has been used by the Bureau of Reclamation ever since, and is being used today. There is some money being spent for quality of water analysis but most is used for investigation throughout the upper Colorado River Basin for the irrigation projects. The quality of water programs on the main river and tributaries are being carried on at sampling stations maintained by the Geological Survey.

Senator KUCHEL. So that the studies that have been made so far on the question of quality of water have not been made by the Department of Interior. They have been made by the Department of Agriculture, as Mr. Jacobson suggests, and by the Geological Survey.

Mr. LARSON. The measurements of the salt content of the water are by the Geological Survey which maintains these stations for measuring the silt and the salt.

Senator KUCHEL. Are the results of the investigation of the Geological Survey available for this committee?

Mr. JACOBSON. Yes. I possibly should make an explanation. The Geological Survey is a unit of the Department of the Interior. It is largely a basic data-gathering agency. The studies conducted by the Bureau of Reclamation are an assembly of the basic data, and an analysis by which the basic data are put into proposed river operations studies for the forecast of future salinity. The Geological Survey data are available in their annual publications.

Senator KUCHEL. Could they be made available? Do they have a bearing on this question of quality of water? Is there anything in the Geological Survey's investigations that would aid people in endeavoring to determine the quality of water? If they would, we ought to have them.

Mr. LARSON. The statement that I read is based on the salt measurements or the salinity measurements made by the Geological Survey, and then rated under the Standards of the Riverside Laboratory of the Department of Agriculture.

Senator O'MAHONEY. Mr. Larson, and Mr. Jacobson, is it not a fact that the human body can use more salt water than a farm can for growing good crops?

Mr. LARSON. I think that is correct, Senator.

Senator O'MAHONEY. And if the human body cannot consume a lot of salt water, what would the people on the California beaches do?

Mr. LARSON. Dehydrate, I suppose, if they did not have any salt.

Senator KUCHEL. I have nothing further.

I have no further questions on this quality of water except to say it has not been developed here as I think it ought to be developed.

I would like again to have an opportunity to ask further questions of you on that point, Mr. Larson.

Just so I understood the comments on so-called dead water, does that constitute water that remains in the Glen Canyon Dam more or less permanently as a part of the capacity of the reservoir that stays there?

Mr. LARSON. Yes, sir.

Senator KUCHEL. Under your contemplation that would have no bearing on the amount of water that was released from Glen Canyon?

Mr. LARSON. Yes, it would have a bearing. It would have to be acquired without interfering with the deliveries of water in the compact. It would be out of the upper basin's share.

Senator KUCHEL. To that extent its presence in that dam would not affect the flow of water out of the dam to the lower basin?

Mr. LARSON. That is correct. I should correct the figure of 7 million acre-feet; Mr. Jacobson tells me it is closer to 6 million than 7 million, but, anyway, it is within that range.

Senator KUCHEL. That is all.

Senator O'MAHONEY. Mr. Larson, just a few questions.

On page 10 of your statement you fix the amount of water to be used in the 11 participating projects in S. 500 as 3½ million acre-feet. That is the maximum, is it?

Mr. LARSON. That would be the amount of water depletion above Lee Ferry for all existing projects including those authorized and the projects in the bill recommended by the Secretary.

Senator O'MAHONEY. Yes.

Mr. LARSON. There are some additional ones in the bill other than the Secretary's recommendation that would bring it up to 4,300,000.

Senator O'MAHONEY. But the projects, the participating projects which the Secretary and the Bureau have had an opportunity to investigate——

Mr. LARSON. Echo Park.

Senator O'MAHONEY. Echo Park, Glen Canyon, and 11 participating projects altogether would not use more than 3½ million feet.

Mr. LARSON. That is correct.

Senator O'MAHONEY. And if some other projects which were put in the bill last year, which I take it are in this year, in the upper Colorado River, were to be authorized, that would raise the use of water about 11 million acre-feet additionally.

Mr. LARSON. About 800,000 more. That is the San Juan-Chama diversion, the Navaho and Gooseberry projects, and the additional units, Curecanti, Cross Mountain, and Flaming Gorge reservoirs, that is, the evaporation from these three reservoirs.

Senator O'MAHONEY. That would be just a little over 4 million acre-feet.

Mr. LARSON. That is right.

Senator O'MAHONEY. Would that use in the upper basin be any danger to the use in California?

Mr. LARSON. No. taking into consideration the average goal, the long-time goal.

Senator O'MAHONEY. Would it be any danger to the use in California and the lower basin of the 7½ million acre-feet annually totaling 75 million acre-feet over any given 10-year period, which the upper basin is obliged to deliver to the lower basin?

Mr. LARSON. No. It would not interfere in a 10-year period. If you had Glen Canyon, Echo Park storage reservoirs, you are O. K.

Senator O'MAHONEY. That is why you have Glen Canyon, that is why you have Echo Park, in order to provide storage for waste water so as to protect California while the upper basin gets the use to which California agreed when it signed the compact; is not that the fact?

Mr. LARSON. That is correct.

Senator O'MAHONEY. How long have you been with the Bureau?

Mr. LARSON. I have been with the Bureau since June 15, 1923, about 32 years.

Senator O'MAHONEY. Were you an engineer when you began?

Mr. LARSON. Yes; I have been an engineer for 37 years.

Senator O'MAHONEY. Have you ever built a dam that collapsed yet?

Mr. LARSON. No, sir; and I hope I never do.

Senator O'MAHONEY. You would not want to, would you?

Mr. LARSON. No, sir.

Senator O'MAHONEY. Mr. Dexheimer, how long have you been an engineer?

Mr. DEXHEIMER. Twenty-six years with the Bureau of Reclamation and about 30 years altogether.

Senator O'MAHONEY. You mean that 30 added to 26?

Mr. DEXHEIMER. No, sir; not altogether.

Senator O'MAHONEY. Well, I saw that baldness. So that 30 years you have been an engineer and you have worked on a number of dams?

Mr. DEXHEIMER. Yes, sir.

Senator O'MAHONEY. Have you ever built a dam that collapsed, or worked on one for the Bureau that collapsed?

Mr. DEXHEIMER. No, sir.

Senator O'MAHONEY. You personally gave your study to this project?

Mr. DEXHEIMER. Yes, sir.

Senator O'MAHONEY. Mr. Larson, did you?

Mr. LARSON. Yes, sir. I have been on the Colorado River with a force of engineers for 10 years.

Senator O'MAHONEY. Would you consciously recommend to the Congress the building of a system that would be dangerous to the lower basin?

Mr. LARSON. No, sir.

Senator O'MAHONEY. Have both of you gentlemen given time to examination of these plans?

Mr. DEXHEIMER. Yes, sir.

Senator O'MAHONEY. How much time have you given, Mr. Dexheimer?

Mr. DEXHEIMER. Off and on for a period of 5 or 6 years.

Senator O'MAHONEY. Mr. Larson, what about you?

Mr. LARSON. Almost every day for 10 years.

Senator O'MAHONEY. Have you any doubts, either of you, in your minds, about the recommendation which has been made by the Secretary and by the President of the United States to the Congress with respect to this upper Colorado storage project?

Mr. DEXHEIMER. None whatever.

Mr. LARSON. No, sir.

Senator O'MAHONEY. Are there any other questions?

Senator WATKINS. Mr. Larson, I think you mentioned several times there were 11 participating projects. Do you not mean 12?

Mr. LARSON. Twelve, with Eden. Eden is already authorized. It need not be recommended for authorization again. Eden is included because it participates in the storage project revenues.

Senator WATKINS. I do not think Eden is in the list. I am talking about the projects in the bill S. 500. Central Utah, initial phase; Emery County, Florida, Gooseberry, Hammond, LaBarge, Lyman, Paonia, Pine River extension, Seedskadee, Silt, Smith Fork.

As we add them up here they come to 12, the engineer coaching me here has miscounted.

Senator O'MAHONEY. As the witness has said, Eden was authorized by bill reported out of the Interior Committee several years ago. It does not have to be included in this bill.

But the question is suggested, the use of water in the Eden project, is that computed in your figure of approximately 4 billion acre-feet?

Mr. LARSON. Yes.

But, Mr. Chairman, may I make this explanation: the 11 projects I refer to are the 11 recommended by the Secretary that are in the bill. In addition, there is Eden.

Senator WATKINS. We do not find it in the list I just read. As we count them here, as I say if my engineer assistant here has not miscounted——

Mr. LARSON. I think I can clear it up now. In the Secretary's supplemental report he recommended Echo Park and Glen Canyon units, the 11 participating projects, and then mentioned the Eden project as participating in revenues. We have to put it in our table. It is already authorized to participate.

Then in table 2 of my statement I have included the additional projects in the bill.

Senator WATKINS. The ones we have in the bill itself come to 12. The ones I just read.

Mr. LARSON. Well, I have them in the tables, but there were not 12 in the Secretary's recommendation.

Senator WATKINS. Well, I am talking about the bill.

Mr. LARSON. It is in here.

Senator O'MAHONEY. Eden is not left out. Nobody need worry about that.

Senator WATKINS. Apparently you left out Gooseberry, because that had not been sent to the States yet.

Mr. LARSON. Yes; it had not cleared the Bureau of the Budget and the affected States, and therefore was not included in the Secretary's recommendation.

Senator WATKINS. He could not do that. That is why his package is 11 projects. The package we have here is 12.

Mr. LARSON. That is correct.

Senator O'MAHONEY. Are these all feasible projects, these 11?

Mr. LARSON. Yes; they all have a favorable benefit-cost ratio. One or two of them are very close.

We hope that the benefit-cost ratio will improve with detailed investigation.

Senator O'MAHONEY. Well, we are very grateful to you, Mr. Larson, for your presentation and for your responses to our questions.

Senator KUCHEL. May I ask 1 or 2 more questions, Mr. Chairman?

Senator O'MAHONEY. Yes, indeed.

Senator KUCHEL. I think this is self-evident, but I would like the record to show it.

None of the water which would be stored in the Glen Canyon Dam would ever be used for either agriculture, domestic, or other purposes in the upper basin; is that correct, Mr. Larson?

Mr. LARSON. No; it would be used for all the purposes by exchange.

Senator KUCHEL. What I mean is none of the water that would be stored in Glen Canyon Dam would ever be used for any domestic or irrigation purposes in the upper basin: is that correct?

Mr. LARSON. Yes, generally; but I can't answer you that direct. There may be a town right on the bank by the Glen Canyon Reservoir that would pump the water out of the reservoir the same as Boulder City does out of Lake Mead.

Senator KUCHEL. It is hardly necessary to make the 26 million acre-feet.

Mr. LARSON. It would be very minor.

Senator KUCHEL. So that aside from any such minor contingency you would agree with me that the water stored in Glen Canyon would not be used for purposes in the upper basin?

Mr. LARSON. Physically, that is correct.

Senator WATKINS. You are referring to the actual physical water stored in that dam, I believe, Senator?

Senator KUCHEL. Yes, sir.

Thank you, sir.

Senator O'MAHONEY. You are excused, Mr. Larson.

Senator WATKINS. May I make this remark, Mr. Chairman?

Senator O'MAHONEY. Yes.

Senator WATKINS. I think Mr. Larson is disappointed that I have not asked him the series of questions that I did before, but I am relying on the record that went on before so I am going easy on you today.

Mr. LARSON. Thank you.

Senator O'MAHONEY. Mr. Keesee, of Gallup, N. Mex.

I should say to you, Mr. Keesee, that Senator Anderson is obliged to attend the meeting of the Atomic Energy Committee of which he is chairman, a Joint Committee. So he is unable to be present today.

Will you state your name for the record and identify yourself and then proceed with your statement.

Mr. KEESEE. I am J. B. Keesee, irrigation engineer on the Navaho Reservation for the Bureau of Indian Affairs.

The statement which I will read is contained in Mr. Larson's report, the large report which he just referred to.

This was prepared by our office and included in his report as among the participating projects.

STATEMENT OF J. B. KEESEE, INVESTIGATION ENGINEER ON THE NAVAHO RESERVATION FOR THE BUREAU OF INDIAN AFFAIRS

The potential Navaho project, formerly called the Shiprock and South San Juan projects, would provide for the irrigation of about 137,250 acres of arable dry lands lying along the south side of San Juan River, a principal tributary of Colorado River, near the towns of Bloomfield, Farmington, and Shiprock in northwestern New Mex-

COLORADO RIVER STORAGE PROJECT

MONDAY, JUNE 28, 1954

UNITED STATES SENATE,
SUBCOMMITTEE OF THE COMMITTEE
ON INTERIOR AND INSULAR AFFAIRS,
Washington, D. C.

The subcommittee met at 10:45 a. m., pursuant to call, in room 457, Senate Office Building, Senator Eugene D. Millikin presiding.

Present: Senators Eugene D. Millikin, Colorado (chairman of the subcommittee); Arthur V. Watkins, Utah; and Clinton P. Anderson, New Mexico.

Present also: Senators Edwin C. Johnson, Colorado, Thomas H. Kuchel, California; and Wallace F. Bennett, Utah.

Present also: Elmer K. Nelson, staff consulting engineer, and N. D. McSherry, assistant chief clerk.

Senator MILLIKIN. The subcommittee will come to order.

This will be the opening of hearings on the upper Colorado River Basin storage program. There will be inserted in the record S. 1555, a bill to authorize the Secretary of the Interior to construct, operate, and maintain the Colorado River storage project, and participating projects, and for other purposes.

(The bill S. 1555 is as follows:)

[S. 1555, 83d Cong., 1st sess.]

A BILL To authorize the Secretary of the Interior to construct, operate, and maintain the Colorado River storage project and participating projects, and for other purposes

Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled, That, in order to initiate the comprehensive development of the water resources of the Upper Colorado River Basin, the Congress, in the exercise of its constitutional authority to provide for the general welfare, to regulate commerce among the States, and to make all needful rules and regulations respecting property belonging to the United States, and for the purposes, among others, of regulating the flow of the Colorado River, storing water for beneficial consumptive use, making it possible for the States of the Upper Basin to utilize, consistently with the obligation undertaken by the States of the upper division in article III of the Colorado River Compact, the apportionments made to and among them in the Colorado River Compact and Upper Colorado River Basin Compact, respectively, providing for the control of floods and for the improvement of navigation, and generating hydroelectric power, hereby authorizes the Secretary of the Interior (1) to construct, operate, and maintain the following initial units of the Colorado River storage project, consisting of dams, reservoirs, power plants, transmission facilities, and appurtenant works: Echo Park, Flaming Gorge, Glen Canyon, Navaho, and Curecanti: *Provided, however,* That the Curecanti Dam shall be constructed to a height which will impound not less than nine hundred and forty thousand acre-feet of water or will create a reservoir of such greater capacity as can be obtained by a high water line located at seven thousand five hundred and twenty feet above mean sea level; and (2) to construct, operate, and maintain the following additional reclamation projects (including power generating and transmission facilities related thereto), hereinafter referred to as participating projects: Central

I thank you and commend you for using the language you did. But when you use the term "evolve," by whom would those plans be evolved? Do you recognize the responsibility of the State to decide where its water should be used?

Mr. WILL. We think that it is a responsibility of the State, working in close cooperation with our commission and with the Federal Government.

Senator ANDERSON. But the quotation you have on the front page of your statement speaks of this fundamental policy that includes the interests and rights of the States in the development of the watersheds within their borders.

Mr. WILL. Yes, sir. We believe that the States now have, by law, in the language of section 1 of the 1944 Flood Control Act, certain duties and responsibilities and privileges in connection with the utilization and control of the waters within their borders.

Senator ANDERSON. You recognize, then, the responsibility of the State?

Mr. WILL. Yes, sir.

Senator ANDERSON. That is all, Mr. Chairman.

Senator MILLIKIN. Thank you very much, Mr. Will.

The next witness is Hon. Ralph Tudor, Under Secretary of the Interior.

Senator ANDERSON. Mr. Chairman, again I have had no opportunity to go over Mr. Tudor's statement in advance. I wonder if we might have an agreement that if necessary he will come back at some other time in case questions arise.

Senator MILLIKIN. Yes. I hope he will be available at any time.

I would like to say, Mr. Tudor, that I have to appear on the floor of the Senate in just a little while, so I will not be able to be here all the time. Senator Watkins will take over pretty soon.

Senator ANDERSON. Could we depart a moment to ask whether you plan to continue this afternoon?

Senator MILLIKIN. Yes.

Senator ANDERSON. Senator Kuchel and I are involved in the Santa Margarita water bill which, as the chairman knows, is a somewhat warm issue in the State of California. I think that would be considered a moderate statement. We would like to try to finish the conference and at the same time I would like to be here.

Senator MILLIKIN. We should go ahead with this, Senator, and if anything develops in your absence, it would be an easy matter to restore the witness so you can have your questions and get what information you wish. I don't think we should stop the hearing once we have started it.

Proceed, Mr. Tudor.

STATEMENT OF HON. RALPH A. TUDOR, UNDER SECRETARY OF THE INTERIOR, WASHINGTON, D. C.

Mr. TUDOR. Senator Millikin and gentlemen, I must confess I was not aware of a rule that the statement should be up here 24 hours in advance and perhaps that was my fault. I do not think, however, that there is anything in my statement that is new. It is more of an emphasis to things that have been here before, and I will be glad to return at any time the committee desires.

Senator ANDERSON. I think, Mr. Secretary, that the rule was adopted so that when it comes to a technical question, the people who are going to examine will have a chance to prepare that examination, just as you prepare the statement.

Senator MILLIKIN. I would suggest that all witnesses get their written material into the committee as rapidly as possible in advance of their appearing before the committee.

Senator WATKINS (presiding). Proceed, Mr. Tudor.

Mr. TUDOR. I have a prepared statement which I would like to read, and if there are any questions as I progress, please interrupt me.

I am appearing before your committee this morning to discuss the proposal and the legislation for the Colorado River storage project.

The project has a considerable history and a background of negotiating and planning that has covered many years. The development of irrigation enterprises using water from the Colorado River and its tributaries accelerated very rapidly between 1900 and 1920. This is particularly true in the lower portion of the basin in Arizona and California. The river has always been very erratic in flow and even in those early years it was evident that the time would come when all of the available water would have to be used with care and economy if even the ultimate essential needs were to be met.

In particular, it was evident that large storage facilities would have to be provided to equalize the erratic flows, conserve supplies, and make it possible to have an equitable division of the available water among the various States of the basin.

To this end the Colorado River compact was signed on November 24, 1922, and all 7 States were participants. This compact apportioned to the 5 upper basin States (Wyoming, Utah, Colorado, New Mexico, and Arizona) the right to exclusive beneficial consumptive use of 7,500,000 acre-feet of water annually. At this time the upper basin was obligated not to deplete the flow of the Colorado River at Lee Ferry below an aggregate of 75 million acre-feet in any consecutive 10-year period.

Senator ANDERSON. Right there, Mr. Secretary, those two statements don't completely tie together, do they?

Actually, what the upper basin States were guaranteed was that they could have whatever was left over after they delivered the seven-million-odd acre-feet?

Mr. TUDOR. I believe that is right.

Senator KUCHEL. Wasn't that the same theory on which the Mexican water treaty was adopted and ratified by the Senate, that we would deliver to Mexico a certain annual quantity of water each year, so that to that extent all the States of the Colorado Basin would have what was left?

Mr. TUDOR. I believe that is the case. I am not familiar with the details, but I believe it was agreed that you would deliver a million and a half acre-feet which had to be divided equally between the upper States and lower States, with one State, I believe, having a specific amount.

Senator ANDERSON. I would only say there that Senators McFarland of Arizona and Downey of California tried to stop or modify the compact with the Republic of Mexico, and I think if we had known what direction we were headed, we might not have approved it, because we are certainly in a position now where we would like to buy back that

million and a half acre-feet. I don't imagine Mexico would sell at any low price, but unfortunately we made the treaty.

Senator WATKINS. Which State tried to stop it?

Senator ANDERSON. Arizona delayed Senate committee action and some of our other Western States should have realized the possibilities at that time, Arizona sensing apparently what was to happen. It has been a frightening thing ever since, because here we are with this guaranty and no water to fulfill it.

Senator WATKINS. I happen to have been present at those hearings. The State of Utah officially supported it as did the upper basin States, with the possible exception of Wyoming. I represented a faction in Utah at the time which was opposed to it, and I think time has vindicated our opposition. I wanted to call that to your attention.

Senator ANDERSON. I congratulate my colleague for that stand. I am not worrying about the official position of the States. I just happen to know that Senator McFarland went as long as he could with his committee filibuster and it is too bad he didn't get more help.

Senator KUCHEL. May I inquire, also, where you say as you just read, this compact apportioned to the five upper Basin States the right to exclusive beneficial consumptive use of 7½ million acre-feet of water annually, do I understand by that that you mean that your interpretation there is that the compact provided that in each 12-month period that amount of water would be the maximum of beneficial consumptive use of the waters of the river to the five upper basin States?

Mr. TUDOR. Did you say the maximum?

Senator KUCHEL. There are two sentences. The first one is this compact apportioned to the five upper basin States the right to exclusive beneficial consumptive use of 7½ million acre-feet of water annually. That is to say that each year they would be entitled to that much?

Mr. TUDOR. Without benefit of having that before me, I think that is the minimum and not the maximum.

Senator ANDERSON. I believe that is correct. There is a provision for subsequent adjudication of the waters, which we now think do not exist. But certainly if there had been surplus, there would be an opportunity to adjudicate it. I did not mean to get into an interpretation of the compact, but nevertheless the fact remains that the upper basin States may end up with 40 or maybe 37½ percent of the water in a short time.

Senator KUCHEL. By way of comments to the suggestion of my friend from New Mexico, it is a fact, is it not, Mr. Secretary, that the Colorado compact must control the manner in which this legislation would be considered by the Congress?

Mr. TUDOR. That is correct, sir. That is our anticipation.

Senator KUCHEL. To that extent, where interpretations are required with respect to the provisions of the Colorado River compact, those interpretations, obviously, would have an effect upon the legislation which we are considering?

Mr. TUDOR. That is our intention. Our recommendations are that this legislation be within the confines of those two compacts.

Senator WATKINS. You may proceed.

I may make a suggestion to the members of the committee present that, if possible, let's mark the text where we want to ask questions and ask them at the conclusion of the witness' statement. Probably we will get a more consecutive understanding of what he is trying to say. Sometimes we fill the record up so full between the parts of the statement that it is almost impossible to get the clearcut interpretation.

Senator ANDERSON. I am afraid the Senator from California and I cannot wait to get into an argument. But go ahead, that is all right.

Senator WATKINS. Proceed, please.

Mr. TUDOR. By this compact the quantity of water available for consumptive use in the upper basin was specifically limited. In addition, any deficit in the water supply available for delivery to Mexico under the Mexican Treaty of 1944 must be furnished one-half by the upper basin and one-half by the lower basin.

As a result of this 1922 compact, it was possible to proceed with the development of the lower Colorado for the benefit of the lower basin States. In particular, the Boulder Canyon project proceeded immediately and other projects have followed.

In the meantime, the upper basin States had a problem of their own to divide among themselves the water that had been allocated for their joint use. To this end the upper Colorado River compact, specifying the percentages of the available water which each upper basin State might use, was negotiated and formalized. The Congress granted its consent to this compact and it became effective on April 6, 1949.

Thus the presently proposed upper Colorado River project is now presented to enable the upper Colorado River States to carry out their responsibilities to the lower basin States under the Colorado River compact of 1922 and distribute the remaining benefits among themselves in accordance with the upper Colorado River compact of 1949.

The Department of the Interior through the Bureau of Reclamation has been working in close cooperation with the upper basin States and various Federal agencies in the preparation of a coordinated plan of development of these water resources.

Adequate reservoir storage is the key to this plan and it is necessary to store water not only to take care of fluctuations in flow during any year, but also to take care of the very erratic flow of the Colorado River from year to year. This may vary from 4 million to 23 million acre-feet annually. The variation is unusually broad.

For this reason, the ultimate plan of development anticipates a series of 9 storage reservoirs having an initial total storage capacity of about 47,000,000 acre-feet. This amount of storage regulation is necessary to assure meeting the obligation of the upper basin to deliver 75 million acre-feet to the lower basin over a 10-year period and, at the same time, permit development of irrigation, municipal, and industrial use of water in the upper basin.

It is not my purpose to describe in detail features of the plan of development. Other witnesses who have participated in the detailed work and are more familiar with it than I am are available and will appear before your committee to cover these items. It is my pur-

pose, however, to bring out the general features and the basic policies which this plan as now presented and recommended by the Department of the Interior includes.

In the first place, I want to emphasize that this is a basinwide plan, and the various individual projects are designed to support each other and to provide the maximum economy of use of this water resource which is so vital to the area.

It is our recommendation that authorization be approved to provide for the initial construction of 2 reservoirs, Glen Canyon and Echo Park, and subsequent construction of 11 new participating projects. Echo Park and Glen Canyon Dams are the most effective and necessary units to river regulation. Furthermore, they generate power and will contribute substantially to the financial success of the entire development.

It is to be noted that these two projects will pay for themselves together with interest within 50 years even if no other features are built in the meantime.

It is our further recommendation that these 11 new participating projects, including both storage and reclamation developments, be authorized at this time subject to reexamination of the economic justification of each project and further report by the Secretary to the President and the Congres when it is later proposed to proceed with each such project. These further reports shall include certifications that the benefits of each project exceed its cost.

It is also recommended that these further reports include a joint study with the Department of Agriculture of the direct agriculture benefits of each of these projects. It is our intention that this reappraisal of the economic justification of each project will be based upon national water, economic, and other appropriate policies in effect at the time the first appropriations for such project are sought.

The economics of the upper Colorado River project anticipate that all investments for the production and transmission of power and for providing municipal and industrial water will pay for themselves in full, including interest, within a period of not to exceed 50 years, and that both the interest and the principal will be returned to the Treasury. Additional net earnings from these activities are expected to be used to assist the irrigators in paying for the capital investment in irrigation developments.

In the case of irrigation, the plan contemplates that full repayment of the principal will be returned to the Treasury within a combined period of 10 years, allowed for initial development, and an additional pay-out period of 50 years. It is not anticipated that interest on the investment in irrigation will be repaid, since this has been the continuous national policy from the enactment of the original Reclamation Act of 1902. This policy relative to the interest has been applied to all other reclamation projects heretofore built by the Federal Government.

It is our proposal that in those instances where repayment of interest-bearing costs, such as power, and noninterest-bearing costs, such as reclamation, are due concurrently, they will be repaid concurrently to the extent practicable. In other words, it is not the intention to defer payments on noninterest-bearing items until the interest-bearing items have been paid out.

This total project is made up of a number of individual units. The initiation of construction of these individual units is to be scheduled over the years so that each one may be paid for within the time limits described above.

We propose that in order to assure better repayment of irrigation costs of these projects conservancy type districts be established in each instance. This will give a broader base for repayment.

We also recommend that provision be made for financing the entire undertaking through a separate revolving fund to be established in the Treasury of the United States. This fund would—

(*a*) Receive all appropriations for construction, operation and maintenance as advances from the general fund of the Treasury;

(*b*) Receive all revenues collected in connection with the operation of the project;

(*c*) Be available for the operation and maintenance of the project subject to such limitations as may be imposed by the Congress in annual appropriations acts;

(*d*) Be available for construction in accordance with the appropriations made therefor;

(*e*) Pay to the general fund of the Treasury, annually, after completion of any feature or unit, a sum sufficient to return within 50 years, exclusive of authorized development periods, the full reimbursable costs of that unit or feature, including interest on power and municipal water supply investment; and

(*f*) Provide Congress with a business-type budget for the project annually.

It is anticipated that the above recommendation will provide a sound and understandable continuous accounting of the funds invested in and received from this upper Colorado River project.

In making this presentation to the committee, it is my desire to give special consideraiton to one feature of the project because of certain unusual circumstances surrounding it and certain personal investigations and recommendations that I have made in this instance. I refer to the Echo Park Dam and reservoir. Inasmuch as this dam and reservoir fall within the confines of the Dinosaur National Monument, there has been opposition to its inclusion. In view of this opposition, the former Secretary of the Interior agreed to study and consider proposals for alternate reservoirs that would be outside the limits of the monument. In keeping with this commitment, Secretary McKay directed that such a study be made and in particular directed me to give it my personal attention.

In accordance with these instructions, I reviewed the reports which have been made by the Bureau of Reclamation and the studies, comments and other information which was made available to me by the National Park Service. I also met with a number of people and organizations who were interested and had expressed opinions both for and against this development. I was furnished with considerable literature and read most of it.

Finally, I made a personal reconnaissance of much of the upper Colorado River Basin area. In particular, and in company with the Commissioner of Reclamation, I went by auto and boat to the vicinity of the Glen Canyon Dam site. I flew over much of the Colorado River and its tributaries from the southern boundaries of Colorado to Vernal via Grand Junction and Salt Lake City.

These rivers are in a region noted for its scenery. I viewed a number of the proposed alternate dam sites, including New Moab, Desolation, and Dewey. Finally, in company with the Director of the National Park Service and the Commissioner of Reclamation together with members of their staffs, I spent 3 days in the Dinosaur National Monument. This included a boat trip through Whirlpool Canyon of Green River from the mouth of Yampa River to Island Park.

I also visited most other major points of interest by jeep and viewed by air the entire length of Lodore Canyon.

As a result of these studies and this field trip, I recommended to the Secretary that the Echo Park Dam and Reservoir be included in the upper Colorado River Basin project. My recommendation to him was in a brief memorandum, dated November 27, 1953, and approved by Secretary Douglas McKay November 30, 1953, which reads as follows:

In accordance with your verbal instructions I have made a study concerning the proposal to build the Echo Park Dam and the Split Mountain Dam as a part of the upper Colorado River Basin development. These two dams, if built, will be located within the Dinosaur National Monument. They were originally proposed to be included in the plan of development of the basin which was prepared by the Bureau of Reclamation and recommended for approval by the Secretary of the Interior in January 1951. Opposition developed to the construction of these two dams in the Dinosaur National Monument, and on December 4, 1952, the then Secretary of the Interior revised his recommendation and proposed that further consideration be given to studies of alternate sites. It was under these circumstances that you directed me to investigate the matter with particular reference to the suggested alternate sites.

In connection with this investigation I have reviewed the reports, sought and been furnished data, and information from both the National Park Service and the Bureau of Reclamation, conferred with various interested parties and organizations, and have, in company with the Director of the National Park Service and the Commissioner of the Bureau of Reclamation, personally visited the two dam sites in question and inspected a considerable portion of the Dinosaul National Monument. I also inspected on the ground and from the air other portions of the upper Colorado River area.

The oppostion to the two dams in question arises from persons and organizations interested in the national parks and their desire to preserve the Dinosaur National Monument in its present natural state. The Echo Park Dam, in particular, will create a large reservoir within this monument and will alter its appearance and the existing conditions. It is a matter of personal opinion as to the extent of the harm that may be created by this reservoir. My own feeling is that the alteration will be substantial and if conflicting interests did not exis, I would prefer to see the monument remain in its natural state. However, I do feel that if the dam is built, the beauty of the park will by no means be destroyed, and it will remain an area of great attraction to many people.

It should be noted that neither of these proposed reservoirs will inundate any portion of the quarry where the dinosaur skeletons have been found.

I have examined the proposals for various alternate reservoirs. To be effective these alternates must provide approximately the same storage of water and must waste as little water as possible. The latter is extremely important for the available water for consumptive uses in the upper Colorado River Basin is for less than will be needed for the full economy of this region.

I have been furnished with information on the New Moab, Dewey, Desolation Dam sites, and have considered the possibility of increasing the height of the proposed Glen Canyon Dam. I am particularly impressed with the showing that any of these alternate dam and reservoir sites would result in a net loss of water from evaporation from approximately 100,000 to 200,000 acre-feet per year. Even the lower figure is enough to provide all of the domestic, commercial, and industrial water for a city the size of Denver. In an area where water is so precious this is a matter of very serious consequence. Such lost water cannot be replaced at any cost and the ultimate regional economy would have to be reduced accordingly.

There has been some question as to the accuracy of the estimates of evaporation and the application of the formulas used to compute losses. I have reviewed this matter and, while there may be some error due to a shortage of experimental data, I am convinced that the calculations are reasonable and any error that exists is equally applicable to the calculations for all reservoirs. Therefore, the error in net differences in calculated losses between any two reservoirs must be small.

There would be substantial loss in electric generating capacity if any one of the alternate sites were selected. While this is a matter of economic importance, I do not attach as much weight to it as the loss of water. The power loss could be replaced by steam power at some increased cost.

I share the concern of those who would preserve the beauties of the Dinosaur National Monument in their present natural state, but as between a choice of altering this scenery without destroying it in a basin which is and will remain rich in scenery, or the irreplaceable loss of enough water to supply all the needs of a city the size of Denver, I believe the conservation of the water in the interest of the Nation is of greatest importance.

In view of the foregoing, I recommend that the plan for the development of the upper Colorado River Basin include the Echo Park and Split Mountain Dams and Reservoirs within the Dinosaur National Monument. This is in keeping with the original recommendation made by the former Secretary of the Interior.

Except to the extent that an error was made by the Bureau of Reclamation in a calculation of evaporation losses of the high Glen Canyon Dam and Reservoir, this statement stands. In the case of a high Glen Canyon Reservoir, the increased evaporation compared to that of Echo Park and Split Mountain Reservoirs would be approximately 25,000 acre-feet annually.

However, as pointed out in testimony before the House committee, a high Glen Canyon Dam is not an acceptable alternate. The storage it provides is at the extreme lower end of the upper basin and would, therefore, be very substantially less effective than upstream storage. This would impair needed regulation of the upper section of the river system and have important adverse effects on the operation and economic value of the total development.

In making this recommendation on behalf of the Echo Park Dam and Reservoir, the Department is, of course, on the horns of a dilemma. On the one hand, there is a fundamental desire to preserve the natural beauty of the Dinosaur National Monument. The Department does not subscribe to any policy which contemplates indiscriminate or haphazard construction of reservoirs or other artificial developments in this or any other national park or monument area.

It opposes any development in such areas if this can possibly be avoided without undue and irredeemable losses of some other natural resources. On the other hand, the Department does recognize that in this instance any otherwise acceptable alternate would result in a serious loss of water in a region which will always be short of this commodity and in which water is the limiting factor on the development of the economy and resources of the basin.

Again I point out that the choice is simply one of altering the scenery of the Dinosaur National Monument without destroying it in a basin which is and will remain rich in scenery, or of irreplaceably losing enough water to supply all the needs of a city of more than 600,000 people. In the opinion of the Department of the Interior, in this particular instance, and not as a matter of precedent, we believe that the choice should be in favor of building the dam and reservoir, and that this is to the greatest interest of the Nation. We so recommend to the Congress.

Senator WATKINS. At this point the committee will take a recess. I think the members of the committee would like to be on the floor when the new Senator is sworn in, and the Secretary has immediate appointments downtown.

I would like to inquire of the Senators present if they would like to question Secretary Tudor.

Senator ANDERSON. Yes.

Senator WATKINS. Then we will ask the Secretary to come back at 2 o'clock.

Senator ANDERSON. Senator Kuchel and I would be very appreciative if you would give us an hour to be on the floor and reconvene at 3 o'clock. I am doing this not at the convenience of myself, I assure you, but the Senator from California has too been interested in this, and I would like to stay through the conference if at all possible.

Senator KUCHEL. I urge you, Mr. Chairman, to consider that request.

Senator WATKINS. May I say this: I am not entirely a free agent in this matter. I am acting at the instance of the Chairman of the Subcommittee, and he asked that I recess until 2 o'clock.

Senator KUCHEL. Would you consider recessing until 3 o'clock, Mr. Chairman, so that that extra hour would be available to us? That would be all the time we would spend in our conference committee.

It does represent a 2 weeks' continuance, to 2 o'clock this afternoon, and it would be of great benefit to the junior Senator from California, and certainly the junior Senator from New Mexico is interested in the problem.

If we just had that hour's time, I am sure we could make substantial progress and come back here.

Senator ANDERSON. I will put it this way, Mr. Chairman. If we do come back at 2 o'clock, others can go ahead and question Mr. Tudor as much as desired, but I am going to be back at 3 o'clock and question him all over again. I just hope we can delay it.

Senator WATKINS. You heard the explanation the presently acting chairman made. I don't want to be unreasonable about it. I will go as far as I can. Can you make it at 2:30?

Senator ANDERSON. As far as I personally am concerned, the Senator from California knows I have been opposed to earlier versions of his bill for a long time. It might suit me individually to let the bill die. Unfortunately I am in this group now trying to help individuals get a solution to a problem that has been bothering the people in California a long time. And I would like to see it through.

Senator WATKINS. I will assume the responsibility for recessing until 3 o'clock.

Senator ANDERSON. Thank you.

Senator WATKINS. That means we will probably continue later tonight.

Senator ANDERSON. That is all right.

(Whereupon, at 12:15 p. m. the committee was recessed, to reconvene at 3 p. m. the same day.)

AFTERNOON SESSION

Senator WATKINS. The committee will be in session.

The chairman is advised that the two Senators who wish to examine Mr. Tudor will not be here for a few minutes. They are still in conference on the Santa Margarita bill.

We will call a witness out of order. Hon. L. C. Bishop, Colorado River Commissioner for Wyoming, will be our next witness.

STATEMENT OF L. C. BISHOP, WYOMING STATE ENGINEER

Senator WATKINS. Mr. Bishop, we are very glad to have you with us. You may proceed.

Mr. BISHOP. Mr. Chairman, members of the committee, my name is L. C. Bishop. I am State engineer of the State of Wyoming, and I offer the following statement with reference to the bill that is now before the Senate, for authorization of the upper Colorado River storage project and participating projects. The bill under consideration by this committee proposes the authorization for construction of 5 initial units of the so-called Colorado River storage project, and 16 participating projects. Three of the participating projects are located in Wyoming. None of the proposed storage units are in Wyoming.

The proposed storage units are important, not only to the upper Colorado River Basin but to the State of Wyoming. These storage units are essential to making possible the use of the water by the upper Colorado River Basin States which was allocated to them under the 1922 Colorado River compact. They are essential to meeting the minimum flow obligations at Lee Ferry imposed by the 1922 compact.

The most important of the five proposed storage units to the upper Colorado River Basin and to Wyoming are the Glen Canyon and Echo Park Reservoirs. These two units are essential elements of the team of reservoirs required to permit the use and to meet the obligations resulting from the 1922 Colorado River compact. The power revenue from these two units are necessary in connection with the irrigation development in the upper basin States, since irrigation development cannot be accomplished without a subsidy from power revenues. These two units are essential from the standpoints of (1) maximum water utilization, (2) minimum evaporation loss and (3) most economical power production.

I discussed the Echo Park Reservoir situation at some length at the House hearings on the Colorado River storage and participating projects and I refer you to pages 273–280 of the House committee hearings on this matter.

The three participating projects in Wyoming proposed for construction under this bill are the LaBarge, Lyman and Seedskadee projects. These projects will irrigate 68,000 acres of new land and provide supplemental supply to about 40,000 acres which are already under irrigation. The total water depletion resulting from these 3 projects will be using only about 35 percent of the water allocated to it under the 1948 upper Colorado River Basin compact.

The completion of the units of the Colorado River storage project and the participating projects proposed under this bill will result in a

COLORADO RIVER STORAGE PROJECT AND PARTICIPATING PROJECTS

LETTER

FROM THE

SECRETARY OF THE INTERIOR

TRANSMITTING

THE FIRST ANNUAL REPORT ON THE STATUS OF THE COLORADO RIVER STORAGE PROJECT AND PARTICIPATING PROJECTS TOGETHER WITH A STATEMENT ON HYDROLOGIC BASES FOR FINANCIAL STUDIES, COLORADO RIVER STORAGE PROJECT, PURSUANT TO PUBLIC LAW 485 OF THE EIGHTY-FOURTH CONGRESS

PRESENTED BY SENATOR ANDERSON

JANUARY 16, 1958.—Ordered to be printed with an illustration

UNITED STATES
GOVERNMENT PRINTING OFFICE
20223 WASHINGTON : 1958

LETTER OF TRANSMITTAL

DEPARTMENT OF THE INTERIOR,
OFFICE OF THE SECRETARY,
Washington, D. C., December 30, 1957.

Hon. RICHARD M. NIXON,
President of the Senate,
Washington, D. C.

DEAR MR. NIXON: Transmitted herewith is the first annual report on the status of the Colorado River storage project and participating projects as required by section 6 of the authorizing act of April 11, 1956 (70 Stat. 105).

The Department also has in progress preliminary repayment studies. They are associated, among other things, with hydrologic conditions, time needed for reservoir filling, and the schedule of construction of the project. The Department contemplates keeping the legislative and appropriation committees informed of the results of these studies.

Attached also is a copy of the statement "Hydrologic Bases for Financial Studies Colorado River Storage Project, Revised December 1957." In considering the processes of initial storage, many factors must be taken into consideration. These factors are now being studied by the Department and by the States concerned. The statement recognizes that changing conditions must be appraised in relation to formulation and application of operational rules. A final operating rule has not been adopted.

Sincerely yours,

FRED A. SEATON,
Secretary of the Interior.

FIRST ANNUAL REPORT, COLORADO RIVER STORAGE PROJECT AND PARTICIPATING PROJECTS

Introduction

On April 11, 1956, legislation authorizing construction of the Colorado River storage project and participating projects was signed into law (70 Stat. 105) by the President. The act initiated an extensive program for the development of water resources in the upper Colorado River Basin. Authorized for construction were 4 initial units of the Colorado River storage project on the Colorado River or its larger tributaries, primarily for river regulation and power production, and 11 participating projects for irrigation and other related purposes. Construction of the Curecanti unit, 1 of the 4 authorized units, is not to be undertaken until the Secretary of the Interior has certified to the Congress and to the President that, in his judgment, the benefits of such unit will exceed its costs.

Section 6 of the act stipulates that on January 1 of each year the Secretary shall report to Congress for the previous fiscal year—

1. Status of revenues from, and
2. Cost of, constructing, operating, and maintaining the Colorado River storage project and participating projects (hereinafter referred to as the project).

The report is to be prepared so as to reflect accurately the

3. Federal investment allocated at that time to power, to irrigation, and to other purposes;
4. Progress of return and repayment thereon; and
5. Estimated rate of progress, year by year, in accomplishing full repayment.

During the first fiscal year of the project, which ended June 30, 1957, activities were confined to initiation of construction on 3 of the 4 storage units and continuation of investigations on the Curecanti storage unit and the 11 participating projects authorized for construction by the act.

This report deals primarily with the status to June 30, 1957, of the cost of construction and of investigations related thereto or financed from project funds, as required to be reported under item 2 above. The statements under each of the other matters required to be reported upon will be expanded in future annual reports as the activities pertaining to them progress.

1. Status of Revenues

Nonoperating revenues amounting to $1,443 arising from grazing leases accrued to the project during fiscal year 1957. However, there were no revenues from water rental, water sales, or from sales of electric energy during the period. For this reason no statement of revenues accompanies this first annual report.

2. Cost of Constructing, Operating and Maintaining the Project

The attached "Balance sheet, June 30, 1957, exhibit A" presents the financial position of the project at that date.

Costs to June 30, 1957, of constructing the project are identified as follows:

Particulars	*Amount*
Direct costs: Construction work in progress	$8,394,711
Unapplied costs:	
Investigation costs	1,282,719
Construction service facilities	1,205,420
Materials and supplies	24,400
Prepayments and advances	72,091
Other charges and work in progress	18,575
Total	10,997,916

Through June 30, 1957, no costs had been incurred with respect to operating and maintaining the project.

3. Allocation of Federal Investment

No formal allocations to the several purposes served by the project have been made of the cost to June 30, 1957, as reflected in construction work in progress accounts. This is in accordance with the provisions of section 6 of Public Law 485 which states that upon completion of each unit, participating project or separable feature thereof, the Secretary shall allocate the total costs of constructing said unit, project or feature to the various purposes authorized in the act or authorized under reclamation law.

4. Progress of Return and Repayment of Federal Investment

As indicated in the forepart of this report the fiscal year 1957 marked the inception of construction on the project and no income producing facilities were in an operational status. Hence, there is no progress to report on the return and repayment of the Federal investment.

5. Estimated Rate of Project Repayment Year by Year

During the first fiscal year of the project, no storage unit, participating project, or separable feature thereof had been completed. Therefore, at June 30, 1957, cost allocations of the Federal investment to the several purposes served by the project, as prescribed by section 6 of the act, had not been made. Accordingly, no estimated rate of progress of return and repayment, year by year, of the investment to be so allocated, is included in this annual report.

EXHIBIT A.—*Balance sheet, June 30, 1957*

ASSETS

Plant: Construction work in progress		$8,394,711
Construction service facilities		1,205,420
Investigation costs		1,282,719
Current assets:		
Cash and fund balances with U. S. Treasury:		
Operating funds (note 1)	$5,320,870	
Special deposit funds	289,747	
	5,610,617	
Accounts receivable:		
Government agencies	20,300	
Other	293,181	
Materials and supplies	24,400	
Prepayments and advances (note 2)	72,091	
		6,020,589
Other assets:		
Undistributed and deferred charges	18,425	
Other work in progress	150	
		18,575
Total		16,922,014

LIABILITIES

Net investment:		
United States:		
Congressional appropriations	$13,600,000	
Transfers of property and services	1,508,090	
Interest accrued on plant under construction	75,273	
	15,183,363	
Non-Federal: Contributions in aid of project development and construction	843,772	
		16,027,135
Current liabilities:		
Accrued liabilities	289,706	
Accounts payable:		
Government agencies	67,392	
Other	536,336	
		893,434
Other deferred credits		1,445
Total		16,922,014

The accompanying notes are an integral part of this exhibit.

Note 1. Operating funds:

Cash and fund balances available for payment of outstanding obligations and accounts payable	3,765,393
Unobligated balances	1,555,477
Total	5,320,870

Note 2. Prepayments and advances, includes advances to other Bureau of Reclamation activities aggregating $66,720. The components of such advances, as reflected on the records of such other Bureau entities, namely:

Fund balance with U. S. Treasury		$219,742
Accounts receivable:		
Other	$56,292	
Project	13,903	
		70,195
		289,937
Less accounts payable:		
Other	219,153	
Project	4,064	
		223,217
Total		66,720

have not been consolidated with or eliminated from the related components of the project for purposes of this balance sheet.

HYDROLOGIC BASES FOR FINANCIAL STUDIES, COLORADO RIVER STORAGE PROJECT

Public Law 485, section 6, requires that certain financial data relative to the Colorado River storage project be reported to Congress on January 1 of each year commencing in 1958. Basic to such a report is the relationship of anticipated power revenues to the financial requirements of the act. In turn, the anticipation of power revenues involves assumptions and premises as to future hydrologic conditions and as to water passing the storage dams to downstream uses. This statement deals with the development of a working hypothesis employing those assumptions and premises for short term application.

Four main storage reservoirs are authorized by Public Law 485: Glen Canyon, Flaming Gorge, Curecanti, and Navajo. For simplification, storage at the latter three may be recognized by reflecting the effect of their operations upon streamflows at Glen Canyon, the last point of storage control in the upper Colorado River Basin.

Under the assumption of average streamflow conditions, the premises of river regulation set forth herein would, if ultimately employed, result in obtaining by 1970 initial storage and power head in the storage reservoirs, to be followed by long-time cyclical operation.

The basic premises to be used in connection with development of the January 1, 1958, report to Congress follow:

(1) Water to be passed by the Glen Canyon Dam sufficient to meet downstream uses, exclusive of power, with Lake Mead used only for the purpose of providing seasonal regulation for water so passed at Glen Canyon.

(2) Net flow differences between Glen Canyon Dam site and Hoover Dam should account for channel losses and inflows based on the period 1938–56, inclusive, for present and future uses on tributaries, Lake Mead evaporation, and present and future uses by pumping out of Lake Mead.

(3) Water uses below Hoover Dam, exclusive of power, should be those estimated to occur in the interim between 1958 and 1970. By 1970 they are assumed to consist of and be the sum of the following:

	Acre-feet [1]
(*a*) Arizona	1, 225, 000
(*b*) California	5, 362, 000
(*c*) Nevada	46, 000
(*d*) Mexico	1, 762, 000
(*e*) Unaccounted-for wat[illegible]	508, 000

[1] Of the total face amount of the Arizona water contract of 2,800,000 acre-feet, this figure represents the estimate of use by 1970.

(4) Power is to be generated at Hoover to the extent that water required to meet downstream uses, as defined in (3) above, will permit such generation. If such releases do not permit generation of firm power as defined by contract, then Lake Mead storage would be drawn upon for firm power, except that when Lake Mead storage is thereby drawn down to 17 million acre-feet (active), the accumulation of additional storage in Glen Canyon Reservoir shall be restricted to the extent necessary to permit continuance of firm power production at Hoover without further demand upon Lake Mead storage. Water already stored in Glen Canyon Reservoir shall not be released, however, for continuance of firm generation at Hoover.

Reservoir operations will necessarily depend upon the conditions of use, of flow, and of storage as they develop. If, in the course of actual operations during the period 1958–70, there are appreciable deviations from average flows the foregoing premises, including the criteria for operation of Glen Canyon and Hoover, should be reconsidered.

Application and further discussion of, and the resulting computations under the foregoing basic premises are contained hereinafter.

ASSUMED STREAMFLOW CONDITIONS

An assumption as to expected streamflows is necessary in any reservoir-filling demonstration. The assumption of average streamflow conditions is a reasonable one for this study. Reservoir operation studies presented herein assume average streamflow at Glen Canyon equal to that obtained from the period 1914–45, inclusive, modified to reflect present conditions of development and progressively reduced each year through the operation period consistent with a projected schedule of increasing annual depletions. Of course, streamflow realized at Glen Canyon will depart from the average in any given year, but speculation involving variants in the developing physical situation is premature and would not be useful.

Lake Mead storage reached a low point immediately prior to the 1957 flood season due to a recent drought (1953–56 being the lowest 4 years in sequence in the history of the Colorado River). The flood runoff in 1957 was considerably greater than average and Lake Mead active storage content is expected to be 20.0 million acre-feet on April 1, 1958. Therefore the operation studies begin April 1, 1958, with Lake Mead active storage content of 20.0 million acre-feet.

Historically, the annual flow at the Glen Canyon Dam site averaged 13.8 million acre-feet during the 32-year period 1914 to 1945, inclusive. When modified to reflect present conditions of development in the upper basin, the average annual flow is about 13.1 million acre-feet. Further developments in the upper basin, such as construction of water-consuming projects and storage reservoirs, will require further adjustment in the expected flow. Table I is a tabulation of the flows to be expected in the near future at Glen Canyon Dam assuming average streamflow conditions.

TABLE I

[Million acre-feet]

Year beginning Apr. 1—	Average flow at Glen Canyon Dam with present development	Adjustment for new upstream uses		Assumed inflow to Glen Canyon Reservoir
		Consumptive use including evaporation	Upstream storage gains	
1958	13.1	0	0	13.1
1959	13.1	0	0	13.1
1960	13.1	0	0	13.1
1961	13.1	0	.2	12.9
1962	13.1	.1	.5	12.5
1963	13.1	.1	.4	12.6
1964	13.1	.3	.4	12.4
1965	13.1	.3	.4	12.4
1966	13.1	.4	.3	12.4
1967	13.1	.5	.6	12.0
1968	13.1	.5	.4	12.2
1969	13.1	.6	.4	12.1
1970	13.1	.7	.4	12.0

NET FLOW DIFFERENCES BETWEEN GLEN CANYON AND HOOVER

Table II compares, for the past 19 years of record, the flows at the Glen Canyon Dam site (Colorado River at Lees Ferry), the changes in Lake Mead storage, and the flows of the Colorado River below Hoover Dam. In this 19-year period, the indicated annual differences vary from a loss of 1,003,000 acre-feet to a gain of 524,000 acre-feet with an average annual loss of about 113,000 acre-feet. Studies presented by the Bureau of Reclamation in the report on the Colorado River Basin (H. Doc. 419, 80th Cong., 1st sess.) show annual streamflow depletions from present irrigation and industrial developments in this portion of the Colorado River Basin to the extent of 166,000 acre-feet. These present uses are reflected in the determination of past annual net losses.

TABLE II

[In thousands of acre-feet]

Year beginning Apr. 1—	Colorado River at Glen Canyon Dam site [1]	Storage change in Lake Mead	Colorado River below Hoover Dam	Net gains (+) or losses (−) Glen Canyon Dam site to Hoover Dam
1938	15,620	+6,393	8,224	−1,003
1939	8,387	+808	7,749	+170
1940	8,047	+738	7,833	+524
1941	17,849	+110	18,234	+495
1942	14,539	+760	13,679	−100
1943	11,366	−2,390	13,691	−65
1944	13,001	−1,070	14,137	+66
1945	11,336	−260	12,090	−6
1946	8,858	−1,387	10,242	−3
1947	14,268	+2,237	11,590	−441

1955	7,063	−838	8,125	+224
1956	8,597	+782	7,692	−123
Average	11,578	−25	11,490	−113

[1] Historic flow at Lees Ferry gaging station.
[2] New capacity curve placed into use beginning Oct. 1, 1949.

Potential future irrigation developments in this portion of the Colorado River Basin are estimated in House Document 419 to deplete the stream flow by an additional 285,000 acre-feet annually, if and when the potential projects are constructed. In the operation studies reported herein, the average annual net loss is assumed to vary from 100,000 acre-feet in the year 1958 to 400,000 acre-feet in the year 1970 as shown in table III.

TABLE III.—*Net losses and uses, Glen Canyon to Hoover Dam,*[1] *by year beginning Apr. 1*

[In million acre-feet]

1960	.1	1965	.2	1970	.4
1961	.2	1966	.2		
1962	.2	1967	.3		

[1] Net losses (including Lake Mead evaporation) and uses in excess of net inflow. Estimated to vary from 100,000 acre-feet in 1958 to 400,000 acre-feet in 1970.

USES AND LOSSES BETWEEN HOOVER DAM AND MEXICO

The uses below Hoover Dam which are expected to increase in the immediate future are discussed hereinafter.

The estimate of potential Arizona uses is based upon serving the following acreages or legal limitations: Colorado River Indian Reservation, 100,000 acres; Yuma Valley, 48,000 acres; unit B, 3,300 acres; Gila project, 600,000 acre-feet. Circumstances seem to indicate that there will not be further new major developments completed in Arizona prior to 1970 to utilize its contract amount of 2,800,000 acre-feet.

The estimate of potential California uses of 5,362,000 acre-feet is equal to the total of the first 6 priorities referred to in the California contracts.

Nevada uses are based upon furnishing water equal to the contract amount of 300,000 acre-feet. Of this total, it is estimated that 46,000 acre-feet will be used below Hoover Dam while 254,000 acre-feet will be used above the dam. The 254,000 acre-feet is accounted for in the estimate of flow differences between Glen Canyon and Hoover.

During operating year beginning April 1, 1956, measured water reaching Mexico totaled 1,762,000 acre-feet. A part of this total consisted of water released to satisfy orders made by United States users, and not taken by them. As additional skill is gained in the operation of the river with a close water supply, it is expected that the amount could be reduced somewhat. Nevertheless, for purposes of this study, 1,762,000 acre-feet should be a part of the assumed releases.

TABLE IV

[Units in thousands of acre-feet]

Item	Year beginning Apr. 1—					
	1951	1952	1953	1954	1955	1956
(*a*) Colorado River below Hoover Dam [1]	10,979	15,479	10,452	10,382	8,125	7,692
(*b*) Wasteway and drainage returns [2]	1,534	1,690	1,776	1,802	1,554	1,534
(*c*) Net storage release from Lake Mohave and Havasu Lake [3]	[4] −40	[4] −67	[4] −161	34	54	5
Sum of (*a*), (*b*), and (*c*)	12,473	17,102	12,067	12,218	9,733	9,231
(*d*) Diversions [5]	6,282	6,808	7,159	7,210	6,952	6,935
(*e*) Colorado River at Mexican Boundary [6]	5,698	9,854	4,383	4,413	2,323	1,762
Sum of (*d*) and (*e*)	11,980	16,662	11,542	11,623	9,275	8,697
(*f*) Unaccounted for water [7]	493	440	525	595	458	534

[1] The flows of the Colorado River below Hoover Dam.

[2] Measured wasteway and drainage returns to the Colorado River between Hoover Dam and the Mexican boundary (Colorado River Indian Reservation, Palo Verde Irrigation District, Pilot Knob wasteway, California wasteway, drainage from reservation division of Yuma project, waste from valley division of Yuma project, east main canal wasteway, and boundary pumping plant).

[3] Net storage releases from Lake Mohave and Havasu Lake.

[4] Storage impounded in reservoirs.

[5] Measured diversions from the Colorado River between Hoover Dam and the Mexican boundary (Metropolitan Water District, Colorado River Indian Reservation, Palo Verde Irrigation District, Yuma project, All-American Canal above Pilot Knob, Gila gravity main canal and (prior to 1955) North Gila Irrigation District from Laguna Dam).

[6] Measured water reaching Mexico (sum of Colorado River at northern boundary, waste from valley division, Yuma project, east main canal wasteway and boundary pumping plant).

[7] Unaccounted for water.

The item of "unaccounted-for water" consists of the average amount necessary to be placed algebraically in the hydrologic equation in order to balance that equation under the conditions encountered during the operating years 1951–56. It includes reservoir losses, channel losses, impoundment and recovery of bank storage, inflow from tributary streams, unmeasured diversions, unmeasured returns, and errors in stream-flow measurements. The amount is 508,000 acre-feet, which is the average of the annual amounts shown in table IV.

It is estimated that by the year 1970 demands will be made upon Lake Mead to meet downstream uses in the United States and Mexico to the extent of about 8,900,000 acre-feet; the derivation of this estimate is shown on table V. By use of this figure, it is not intended to imply that this figure represents the legal bounds of permissible use under the law of the river.

TABLE V

[In thousands of acre-feet]

Arizona uses:	
Colorado River Indian Reservation, 100,000 acres at 4 acre-feet per acre	400
Yuma Valley, 48,000 acres at 4 acre-feet per acre	192
Unit B, 3,300 acres at 10 acre-feet per acre	33
Gila project	600
Subtotal, Arizona	1, 225
California uses	5, 362
Nevada uses	46
Subtotal	6, 633
Unaccounted for water, Hoover Dam to boundary	508
Water at the Mexican boundary	1, 762
Total	8, 903

OPERATION OF LAKE MEAD FOR POWER

Firm power from the Boulder Canyon project is defined under the Hoover Dam power contracts as 4,330 million kilowatt-hours annually with a diminution of 8.76 million kilowatt-hours annually after operating year ending May 31, 1938. In years of high runoff, when excess flow would be available and the reservoir nearly full, such excess flow may be used for the generation of secondary energy. During the immediate past few years, due to severe drought and low reservoir content, some shortages have occurred in the firm-energy generation. It is estimated that by April 1, 1958, the active content of Lake Mead will be about 20 million acre-feet.

Table VI summarizes the operations of Lake Mead and Glen Canyon Reservoirs, under the premises adopted for these studies, during the years 1958–70, inclusive.

TABLE VI.—*Expected operation Glen Canyon Reservoir and Lake Mead with years of average streamflow*

[Units in millions of acre-feet]

[1] Estimated by deducting from Glen Canyon releases, the net losses and uses shown in table III.
[2] Available for generation of secondary energy.

SUMMARY OF ASSUMED OPERATION

In the years 1958 to 1961, inclusive, the entire flow of the Colorado River would have been bypassed at Glen Canyon Dam site. In these years Lake Mead storage would have been drawn down to an active content of 20 million acre-feet at the end of each operating year. In these years a total of about 13,300,000 acre-feet would be available for generation of secondary energy at Hoover.

In the year 1962, storage would have been initiated at Glen Canyon with about 1 million acre-feet being impounded. In that year, due to the availability of vacant storage space in the Glen Canyon Reservoir, in lieu of producing secondary energy at Hoover powerplant about 1,800,000 acre-feet of inflow would have been withheld in the zone of Lake Mead previously reserved for flood control purposes. This 1,800,000 acre-feet is in excess of releases for generation of firm energy.

In the 4 years 1963 to 1966, inclusive, while sufficient storage was being impounded in Glen Canyon Reservoir, first to permit initial generation at minimum head (beginning in June 1964), and later to permit firm generation (beginning April 1967), releases would havebeen made from Glen Canyon to meet downstream uses and losses in the United States and deliveries to Mexico. In this 4-year period, Lake Mead storage would have been released to the extent of about 4,700,000 acre-feet (including that stored in the flood-control reservation in 1962) to sustain firm power generation. In the year 1967 Lake Mead storage would have been drawn down to an active content of 17 million acre-feet.

In the years 1968 to 1970, inclusive, releases would have been made from Glen Canyon for the generation of firm and secondary energy at that site. Such releases would have been sufficient for the generation of firm energy at Hoover Dam in these years without drawing Lake Mead storage below an active content of 17 million acre-feet while accumulating additional storage in Glen Canyon Reservoir.

○

for residence purposes lots not exceeding three acres in area; but any lot not sold after public auction, or sold and forfeited, or any lot or part thereof surrendered with the consent of the commissioner, which consent is authorized, may upon application be sold without further public notice or auction within the period of two years immediately subsequent to the day of the public auction, at the advertised price if the sale is within the period of six months immediately subsequent to the day of the public auction, and at the advertised price or the price fixed by a reappraisal of the land, whichever is greater, if the sale is within the period subsequent to the said six months but prior to the expiration of the said two years:".

Public Law 485 — CHAPTER 203

AN ACT

April 11, 1956
[S. 500]

To authorize the Secretary of the Interior to construct, operate, and maintain the Colorado River storage project and participating projects, and for other purposes.

Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled, That, in order to Colorado River storage project.

initiate the comprehensive development of the water resources of the Upper Colorado River Basin, for the purposes, among others, of regulating the flow of the Colorado River, storing water for beneficial consumptive use, making it possible for the States of the Upper Basin to utilize, consistently with the provisions of the Colorado River Compact, the apportionments made to and among them in the Colorado River Compact and the Upper Colorado River Basin Compact, respectively, providing for the reclamation of arid and semiarid land, for the control of floods, and for the generation of hydroelectric power, as an incident of the foregoing purposes, the Secretary of the Interior is hereby authorized (1) to construct, operate, and maintain the following initial units of the Colorado River storage project, consisting of dams, reservoirs, powerplants, transmission facilities and appurtenant works: Curecanti, Flaming Gorge, Navajo (dam and reservoir only), and Glen Canyon: *Provided*, That the Curecanti Dam shall be constructed to a height which will impound not less than nine hundred and forty thousand acre-feet of water or will create a reservoir of such greater capacity as can be obtained by a high waterline located at seven thousand five hundred and twenty feet above mean sea level, and that construction thereof shall not be undertaken until the Secretary has, on the basis of further engineering and economic investigations, reexamined the economic justification of such unit and, accompanied by appropriate documentation in the form of a supplemental report, has certified to the Congress and to the President that, in his judgment, the benefits of such unit will exceed its costs; and (2) to construct, operate, and maintain the following additional reclamation projects (including power-generating and transmission facilities related thereto), hereinafter referred to as participating projects: Central Utah (initial phase); Emery County, Florida, Hammond, La Barge, Lyman, Paonia (including the Minnesota unit, a dam and reservoir on Muddy Creek just above its confluence with the North Fork of the Gunnison River, and other necessary works), Pine River Extension, Seedskadee, Silt and Smith Fork: *Provided further*, That as part of the Glen Canyon Unit the Secretary of the Interior shall take adequate protective measures to preclude impairment of the Rainbow Bridge National Monument.

63 Stat. 31.

Planning reports. Priority.

SEC. 2. In carrying out further investigations of projects under the Federal reclamation laws in the Upper Colorado River Basin, the Secretary shall give priority to completion of planning reports on the Gooseberry, San Juan-Chama, Navajo, Parshall, Troublesome, Rabbit Ear, Eagle Divide, San Miguel, West Divide, Bluestone, Battlement Mesa, Tomichi Creek, East River, Ohio Creek, Fruitland Mesa, Bostwick Park, Grand Mesa, Dallas Creek, Savery-Pot Hook, Dolores, Fruit Growers Extension, Animas-La Plata, Yellow Jacket, and Sublette participating projects. Said reports shall be completed as expeditiously as funds are made available therefor and shall be submitted promptly to the affected States, which in the case of the San Juan-Chama project shall include the State of Texas, and thereafter to the President and the Congress: *Provided*, That with reference to the plans and specifications for the San Juan-Chama project, the storage for control and regulation of water imported from the San Juan River shall (1) be limited to a single offstream dam and reservoir on a tributary of the Chama River, (2) be used solely for control and regulation and no power facilities shall be established, installed or operated thereat, and (3) be operated at all times by the Bureau of Reclamation of the Department of the Interior in strict compliance with the Rio Grande Compact as administered by the Rio Grande Compact Commission. The preparation of detailed designs and specifications for the works proposed to be constructed in connection

Reports to States, President and Congress.

with projects shall be carried as far forward as the investigations thereof indicate is reasonable in the circumstances.

Juniper project.

The Secretary, concurrently with the investigations directed by the preceding paragraph, shall also give priority to completion of a planning report on the Juniper project.

Congressional intent.

SEC. 3. It is not the intention of Congress, in authorizing only those projects designated in section 1 of this Act, and in authorizing priority in planning only those additional projects designated in section 2 of this Act, to limit, restrict, or otherwise interfere with such comprehensive development as will provide for the consumptive use by States of the Upper Colorado River Basin of waters, the use of which is apportioned to the Upper Colorado River Basin by the Colorado River Compact and to each State thereof by the Upper Colorado River Basin Compact, nor to preclude consideration and authorization by the Congress of additional projects under the allocations in the compacts as additional needs are indicated. It is the intention of Congress that no dam or reservoir constructed under the authorization of this Act shall be within any national park or monument.

63 Stat. 31.

Laws governing.

SEC. 4. Except as otherwise provided in this Act, in constructing, operating, and maintaining the units of the Colorado River storage project and the participating projects listed in section 1 of this Act, the Secretary shall be governed by the Federal reclamation laws (Act of June 17, 1902, 32 Stat. 388, and Acts amendatory thereof or supplementary thereto): *Provided*, That (a) irrigation repayment contracts shall be entered into which, except as otherwise provided for the Paonia and Eden projects, provide for repayment of the obligation assumed thereunder with respect to any project contract unit over a period of not more than fifty years exclusive of any development period authorized by law; (b) prior to construction of irrigation distribution facilities, repayment contracts shall be made with an "organization" as defined in paragraph 2 (g) of the Reclamation Project Act of 1939 (53 Stat. 1187) which has the capacity to levy assessments upon all taxable real property located within its boundaries to assist in making repayments, except where a substantial proportion of the lands to be served are owned by the United States; (c) contracts relating to municipal water supply may be made without regard to the limitations of the last sentence of section 9 (c) of the Reclamation Project Act of 1939; and (d), as to Indian lands within, under or served by any participating project, payment of construction costs within the capability of the land to repay shall be subject to the Act of July 1, 1932 (47 Stat. 564): *Provided further*, That for a period of ten years from the date of enactment of this Act, no water from any participating project authorized by this Act shall be delivered to any water user for the production on newly irrigated lands of any basic agricultural commodity, as defined in the Agricultural Act of 1949, or any amendment thereof, if the total supply of such commodity for the marketing year in which the bulk of the crop would normally be marketed is in excess of the normal supply as defined in section 301 (b) (10) of the Agricultural Adjustment Act of 1938, as amended, unless the Secretary of Agriculture calls for an increase in production of such commodity in the interest of national security. All units and participating projects shall be subject to the apportionments of the use of water between the Upper and Lower Basins of the Colorado River and among the States of the Upper Basin fixed in the Colorado River Compact and the Upper Colorado River Basin Compact, respectively, and to the terms of the treaty with the United Mexican States (Treaty Series 994).

Basin Fund.

SEC. 5. (a) There is hereby authorized a separate fund in the Treasury of the United States to be known as the Upper Colorado River Basin Fund (hereinafter referred to as the Basin Fund), which

shall remain available until expended, as hereafter provided, for carrying out provisions of this Act other than section 8.

(b) All appropriations made for the purpose of carrying out the provisions of this Act, other than section 8, shall be credited to the Basin Fund as advances from the general fund of the Treasury.

Availability of revenues.

(c) All revenues collected in connection with the operation of the Colorado River storage project and participating projects shall be credited to the Basin Fund, and shall be available, without further appropriation, for (1) defraying the costs of operation, maintenance, and replacements of, and emergency expenditures for, all facilities of the Colorado River storage project and participating projects, within such separate limitations as may be included in annual appropriation acts: *Provided*, That with respect to each participating project, such costs shall be paid from revenues received from each such project; (2) payment as required by subsection (d) of this section; and (3) payment as required by subsection (e) of this section. Revenues credited to the Basin Fund shall not be available for appropriation for construction of the units and participating projects authorized by or pursuant to this Act.

(d) Revenues in the Basin Fund in excess of operating needs shall be paid annually to the general fund of the Treasury to return—

(1) the costs of each unit, participating project, or any separable feature thereof which are allocated to power pursuant to section 6 of this Act, within a period not exceeding fifty years from the date of completion of such unit, participating project, or separable feature thereof;

(2) the costs of each unit, participating project, or any separable feature thereof which are allocated to municipal water supply pursuant to section 6 of this Act, within a period not exceeding fifty years from the date of completion of such unit, participating project, or separable feature thereof;

(3) interest on the unamortized balance of the investment (including interest during construction) in the power and municipal water supply features of each unit, participating project, or any separable feature thereof, at a rate determined by the Secretary of the Treasury as provided in subsection (f), and interest due shall be a first charge; and

(4) the costs of each storage unit which are allocated to irrigation pursuant to section 6 of this Act within a period not exceeding fifty years.

Apportionment of revenues.

(e) Revenues in the Basin Fund in excess of the amounts needed to meet the requirements of clause (1) of subsection (c) of this section, and to return to the general fund of the Treasury the costs set out in subsection (d) of this section, shall be apportioned among the States of the Upper Division in the following percentages: Colorado, 46 per centum; Utah, 21.5 per centum; Wyoming, 15.5 per centum; and New Mexico, 17 per centum: *Provided*, That prior to the application of such percentages, all revenues remaining in the Basin Fund from each participating project (or part thereof), herein or hereinafter authorized, after payments, where applicable, with respect to such projects, to the general fund of the Treasury under subparagraphs (1), (2), and (3) of subsection (d) of this section shall be apportioned to the State in which such participating project, or part thereof, is located.

Revenues so apportioned to each State shall be used only for the repayment of construction costs of participating projects or parts of such projects in the State to which such revenues are apportioned and shall not be used for such purpose in any other State without the con-

sent, as expressed through its legally constituted authority, of the State to which such revenues are apportioned. Subject to such requirement, there shall be paid annually into the general fund of the Treasury from the revenues apportioned to each State (1) the costs of each participating project herein authorized (except Paonia) or any separable feature thereof, which are allocated to irrigation pursuant to section 6 of this Act, within a period not exceeding fifty years, in addition to any development period authorized by law, from the date of completion of such participating project or separable feature thereof, or, in the case of Indian lands, payment in accordance with section 4 of this Act; (2) costs of the Paonia project, which are beyond the ability of the water users to repay, within a period prescribed in the Act of June 25, 1947 (61 Stat. 181); and (3) costs in connection with the irrigation features of the Eden project as specified in the Act of June 28, 1949 (63 Stat. 277).

Interest rate.

(f) The interest rate applicable to each unit of the storage project and each participating project shall be determined by the Secretary of the Treasury as of the time the first advance is made for initiating construction of said unit or project. Such interest rate shall be determined by calculating the average yield to maturity on the basis of daily closing market bid quotations during the month of June next preceding the fiscal year in which said advance is made, on all interest-bearing marketable public debt obligations of the United States having a maturity date of fifteen or more years from the first day of said month, and by adjusting such average annual yield to the nearest one-eighth of 1 per centum.

Budget to Congress.

(g) Business-type budgets shall be submitted to the Congress annually for all operations financed by the Basin Fund.

Cost allocations.

SEC. 6. Upon completion of each unit, participating project or separable feature thereof, the Secretary shall allocate the total costs (excluding any expenditures authorized by section 8 of this Act) of constructing said unit, project or feature to power, irrigation, municipal water supply, flood control, navigation, or any other purposes authorized under reclamation law. Allocations of construction, operation and maintenance costs to authorized nonreimbursable purposes shall be nonreturnable under the provisions of this Act.

Navajos.

In the event that the Navajo participating project is authorized, the costs allocated to irrigation of Indian-owned tribal or restricted lands within, under, or served by such project, and beyond the capability of such lands to repay, shall be determined, and, in recognition of the fact that assistance to the Navajo Indians is the responsibility of the entire nation, such costs shall be nonreimbursable.

Report to Congress.

On January 1 of each year the Secretary shall report to the Congress for the previous fiscal year, beginning with the fiscal year 1957, upon the status of the revenues from, and the cost of, constructing, operating, and maintaining the Colorado River storage project and the participating projects. The Secretary's report shall be prepared to reflect accurately the Federal investment allocated at that time to power, to irrigation, and to other purposes, the progress of return and repayment thereon, and the estimated rate of progress, year by year, in accomplishing full repayment.

Power plant operations.

SEC. 7. The hydroelectric powerplants and transmission lines authorized by this Act to be constructed, operated, and maintained by the Secretary shall be operated in conjunction with other Federal powerplants, present and potential, so as to produce the greatest practicable amount of power and energy that can be sold at firm power and energy rates, but in the exercise of the authority hereby granted he shall not affect or interfere with the operation of the provisions of the Colorado River Compact, the Upper Colorado River Basin Compact, the

43 USC 617 note.
54 Stat. 774.
43 USC 618o.

Boulder Canyon Project Act, the Boulder Canyon Project Adjustment Act and any contract lawfully entered unto under said Compacts and Acts. Subject to the provisions of the Colorado River Compact, neither the impounding nor the use of water for the generation of power and energy at the plants of the Colorado River storage project shall preclude or impair the appropriation of water for domestic or agricultural purposes pursuant to applicable State law.

Recreational and fish and wildlife facilities.

SEC. 8. In connection with the development of the Colorado River storage project and of the participating projects, the Secretary is authorized and directed to investigate, plan, construct, operate, and maintain (1) public recreational facilities on lands withdrawn or acquired for the development of said project or of said participating projects, to conserve the scenery, the natural, historic, and archeologic objects, and the wildlife on said lands, and to provide for public use and enjoyment of the same and of the water areas created by these projects by such means as are consistent with the primary purposes of said projects; and (2) facilities to mitigate losses of, and improve conditions for, the propagation of fish and wildlife. The Secretary is authorized to acquire lands and to withdraw public lands from entry or other disposition under the public land laws necessary for the construction, operation, and maintenance of the facilities herein provided, and to dispose of them to Federal, State, and local governmental agencies by lease, transfer, exchange, or conveyance upon such terms and conditions as will best promote their development and operation in the public interest. All costs incurred pursuant to this section shall be nonreimbursable and nonreturnable.

Saving provision.

43 USC 617 note.
43 USC 618o.

SEC. 9. Nothing contained in this Act shall be construed to alter, amend, repeal, construe, interpret, modify, or be in conflict with the provisions of the Boulder Canyon Project Act (45 Stat. 1057), the Boulder Canyon Project Adjustment Act (54 Stat. 774), the Colorado River Compact, the Upper Colorado River Basin Compact, the Rio Grande Compact of 1938, or the Treaty with the United Mexican States (Treaty Series 994).

53 Stat. 785.
59 Stat. 1219.

Expenditures.

SEC. 10. Expenditures for the Flaming Gorge, Glen Canyon, Curecanti, and Navajo initial units of the Colorado River storage project may be made without regard to the soil survey and land classification requirements of the Interior Department Appropriation Act, 1954.

67 Stat. 266.

Effectivity and approval of court decree, etc.

SEC. 11. The Final Judgment, Final Decree and stipulations incorporated therein in the consolidated cases of United States of America v. Northern Colorado Water Conservancy District, et al., Civil Nos. 2782, 5016 and 5017, in the United States District Court for the District of Colorado, are approved, shall become effective immediately, and the proper agencies of the United States shall act in accordance therewith.

Appropriation.

SEC. 12. There are hereby authorized to be appropriated, out of any moneys in the Treasury not otherwise appropriated, such sums as may be required to carry out the purposes of this Act, but not to exceed $760,000,000.

Net power revenues.

SEC. 13. In planning the use of, and in using credits from, net power revenues available for the purpose of assisting in the pay-out of costs of participating projects herein and hereafter authorized in the States of Colorado, New Mexico, Utah, and Wyoming, the Secretary shall have regard for the achievement within each of said States of the fullest practicable use of the waters of the Upper Colorado River system, consistent with the apportionment thereof among such States.

Operation and maintenance, compliance.

SEC. 14. In the operation and maintenance of all facilities, authorized by Federal law and under the jurisdiction and supervision of the Secretary of the Interior, in the basin of the Colorado River, the Secretary of the Interior is directed to comply with the applicable

provisions of the Colorado River Compact, the Upper Colorado River Basin Compact, the Boulder Canyon Project Act, the Boulder Canyon Project Adjustment Act, and the Treaty with the United Mexican States, in the storage and release of water from reservoirs in the Colorado River Basin. In the event of the failure of the Secretary of the Interior to so comply, any State of the Colorado River Basin may maintain an action in the Supreme Court of the United States to enforce the provisions of this section, and consent is given to the joinder of the United States as a party in such suit or suits, as a defendant or otherwise.

63 Stat. 31.
45 Stat. 1057; 54 Stat. 774.

SEC. 15. The Secretary of the Interior is directed to continue studies and to make a report to the Congress and to the States of the Colorado River Basin on the quality of water of the Colorado River.

Report to Congress.

SEC. 16. As used in this Act—

Definitions.

The terms "Colorado River Basin", "Colorado River Compact", "Colorado River System", "Lee Ferry", "States of the Upper Division", "Upper Basin", and "domestic use" shall have the meaning ascribed to them in article II of the Upper Colorado River Basin Compact;

The term "States of the Upper Colorado River Basin" shall mean the States of Arizona, Colorado, New Mexico, Utah, and Wyoming;

The term "Upper Colorado River Basin" shall have the same meaning as the term "Upper Basin";

The term "Upper Colorado River Basin Compact" shall mean that certain compact executed on October 11, 1948 by commissioners representing the States of Arizona, Colorado, New Mexico, Utah, and Wyoming, and consented to by the Congress of the United States of America by Act of April 6, 1949 (63 Stat. 31);

The term "Rio Grande Compact" shall mean that certain compact executed on March 18, 1938, by commissioners representing the States of Colorado, New Mexico, and Texas and consented to by the Congress of the United States of America by Act of May 31, 1939 (53 Stat. 785);

The term "Treaty with the United Mexican States" shall mean that certain treaty between the United States of America and the United Mexican States, signed at Washington, District of Columbia, February 3, 1944, relating to the utilization of the waters of the Colorado River and other rivers, as amended and supplemented by the protocol dated November 14, 1944, and the understandings recited in the Senate resolution of April 18, 1945, advising and consenting to ratification thereof.

59 Stat. 1219.

Approved April 11, 1956.

Upper Colorado Storage Projects

NE
3/18/54

EXPLANATION OF PROPOSED AMENDMENTS
TO H. R. 4449 AND COMPANION BILLS,
TO AUTHORIZE CONSTRUCTION OF THE
COLORADO RIVER STORAGE PROJECT

Amendment No. 1:

Page 8, line 1. This amendment strikes all of Section 5 and substitutes language reserving to the Congress the right to add participating projects to those listed in Section 1 and delete any now listed in Section 1. Section 1 specifically lists fifteen participating projects, whereas Section 5 contains general language authorizing the addition of un-named, undescribed future participating projects at some later time, with no standards of feasibility prescribed, leaving it uncertain whether the Secretary of the Interior is authorized by Section 5 to add these later participating projects by his own action without further action by Congress, or whether Congress is to pass upon them after he identifies them. The proposed amendment simply provides that these un-named, undescribed future participating projects shall be brought to Congress and individually authorized by Congress on their merits, under existing statutory procedure. For example, the Flood Control Act of 1944 requires the submission of reports on the proposed projects to the affected states for their comments.

Amendment No. 2: assurance against interpretations.

Page 12, line 24. This amendment simply provides that nothing in the Act shall be deemed to construe or interpret any provision of the documents which comprise the law of the river, i.e., the Colorado River Compact, the Boulder Canyon Project Act, the Boulder Canyon Project Adjustment Act, or the treaty with Mexico.

The meaning of these documents is now at issue in Arizona vs. California et al., No. 10 Original, October Term, 1953, in the United States Supreme Court. The Bureau's Upper Basin plan, and some of the testimony in support of it, does interpret these documents. For example, the Bureau assumes that the apportionment to the Upper Basin States in Article III(a) of the beneficial consumptive use of 7,500,000 acre-feet per annum means that there is available that average amount, instead of that maximum amount each year, so that the Upper Basin may use nine million acre-feet or more of water in one year and consider it as apportioned under Article III(a), if it uses six million acre-feet or less in some other year so long as it averages 7,500,000 acre-feet. This is diametrically opposed to the Reclamation Bureau's interpretation of the Compact in negotiating its water delivery contracts with the three States in the Lower Basin, which were all upon the assumption that the apportionment to the Lower Basin is of a maximum, not an average, and the quantities each contractor may use each year are stated in maximum, not average quantities. This one issue involves about 1,250,000 acre-feet

per year. There are other assumptive interpretations in the pending report. Congress should disclaim any intention to interpret the law of the river in enacting this bill.

Amendment No. 3: transmountain diversions.

Page 13, line 2. This amendment provides that waters of the Colorado River which are taken into other river basins by transmountain diversion shall be made available only for use in the states parties to the Colorado River Compact, and shall not be made available by exchange, substitution or use of return flow, or otherwise, for consumptive use in any other state, and that nothing in the Act by implication or otherwise, shall commit the United States to the further exportation of water from the Colorado River System.

The water supply of the Colorado River Basin is too short as it is to permit it to come to the rescue of other basins such as the Missouri, by exchange with Nebraska or any other state. There is reason to believe that the State of Colorado does plan to effect such exchanges and improve its position in its controversy with some of its neighbor states. If Colorado has no such intention it should not object to this language.

Amendment No. 4: studies of salinity.

Page 3, line 9. This amendment proposes to insert a new section to require a report by the Secretary of the Interior on the effect of transmountain diversions on the quality of water available at Lee Ferry.

The amendment is obviously sensible. California maintains that Article VIII of the Colorado River Compact, which provides that present perfected rights are unimpaired by the Compact means, that they shall be unimpaired both as to quality and quantity. The Upper Basin States, or some of them, dispute this. Whichever group is right, the facts ought nevertheless to be ascertained.

Amendment No. 5: state representation in the operation of reservoirs.

Page 13, line 9. This amendment proposes a new section authorizing each state of the Colorado River Basin to appoint one representative to an intergrading committee to advise with the Secretary of the Interior in the programming of the storage and release of water from the main stream reservoirs in the Upper Basin, for use in the Lower Basin; directs the Secretary of the Interior to comply with the applicable provisions of the Colorado River Compact, the Boulder Canyon Project Act, the Boulder Canyon Project Adjustment Act, and the Mexican Water Treaty, and in the event of its failure to do so, authorizes any state in the Colorado River Basin to maintain an action in the Supreme Court against him to enforce the provisions of this section of the Act, and grants the consent of Congress to the joinder of the United States as a party in such suit or suits.

A provision of this sort is absolutely essential to all seven states of the Basin. Under the Upper Basin Storage Project plan the Secretary of the Interior would build a gigantic reservoir at Glen Canyon and perhaps also at Echo Park, capable of impounding the whole flow of the river for several years. If there is no control over him as to the rates at which he accumulates water in these reservoirs, and releases it, he has the whole interpretation

of the Colorado River Compact in his own hands. These reservoirs are too far down stream to impound water for actual diversion by the Upper Basin, yet are outside of the Lower Basin. As no state can sue the United States without its consent, if the Secretary builds up storage in these reservoirs more rapidly than the Lower Basin States think he is entitled to do under the Compact, they have no way of controlling him. Conversely, if he releases water in larger quantities than the Upper Basin States think he should, they have no control over him. Both groups of states are entitled to this protection against the United States.

Amendment No. 6: covenants.

Page 13, line 9: This amendment proposes a new section subjecting all projects and uses of water in the Upper Basin to the Colorado River Compact and directs that this obligation shall "run with the land" as a covenant.

It is modeled on language in the Boulder Canyon Project Act, and in the provisions which the Upper Basin insisted be inserted in the legislation which authorized the San Diego Aqueduct.

Amendment No. 7: subjection to law of the river.

Page 13, line 9. This amendment also is modeled on those inserted by the Upper Basin states in the legislation authorizing the San Diego Aqueduct, and is founded on language in the Boulder Canyon Project Act.

H. R. 4449

COLORADO RIVER STORAGE PROJECT

AND PARTTICIPATING PROJECTS

- - -

WEDNESDAY, APRIL 14, 1954

House of Representatives,

Subcommittee on Irrigation and Reclamation of the Committee on Interior and Insular Affairs

Washington, D. C.

The subcommittee met, pursuant to recess, in the committee room, New House Office Building, at 10:32 a.m., Honorable William H. Harrison (chairman) presiding.

Mr. Harrison. The Subcommittee on Irrigation and Reclamation will come to order. We will continue the discussion on amendments to H. R. 4449.

Mr. Engle. Mr. Chairman?

Mr. Harrison. Before I recognize the gentleman from California, the Chair would like to say he will try so far as possible today to see the time is evenly divided among those who amendments, so that all possible amendments may be discussed in the time allotted.

Mr. Engle has, as I understand, a couple of amendments which have been more or less agreed to, and at this time the Chair recognizes Mr. Engle.

Mr. Engle. I have five amendments. I am going to ask to

have them all distributed. There are two that are not controversial and I understand there are no objections to them. I will submit them. Each one is a new section to be added on to the end of the bill. This one reads as follows:

"The Secretary of the Interior is directed to institute studies and to make a report to the Congress and to the States of the Colorado River Basin of the effect upon the quality of water available at Lee Ferry, of all transmountain diversions of water of the Colorado River System and of all other storage anc reclamation projects, existing and proposed to be made in the Upper Colorado River Basin under full practicable development and use of water apportioned by the Colorado River Compact, including those proposed to be made under the authority of this Act."

Now the purpose of that amendment is simply to authorize and direct the Secretary to make a study, to keep us informed, as he certainly should, on one of the questions which is most vital, of course, to the people in the Lower Basin; namely, that we do not get the quality of the water in such condition that we not only would be in difficulty down in the Lower Basin but that we would have trouble with the Mexican Treaty, which has an overriding claim on the Colorado River water to the tune of about a million acre feet.

Mr. Saylor. Will you yield?

Mr. Engle. Just let me add one more sentence and I will

be glad to yield.

I say that this amendment does not does not do anything except to get what we regard as continuing and necessary information to protect the quality of water.

There are only three things that California, as far as I am concerned, is interested in in this bill. Number one is that we be given absolute assurance that the quantity of water is not affected by anything you do in the Upper Basin, which we regard as safeguarded under the Colorado River Basin Compact. Number 2 is that the quality of water be maintained at least so that the water is fit for the use for which it is intended in the Lower Basin. And Number 3 is with reference to the administration of the project itself, that it be administred fairly and that the States themselves have some participation in that. I have another amendment dealing with that.

That is about all we think that ought to be done here to perfect this legislation as far as California's direct interests are concerned. This first amendment is one along that line; it does nothing more than provide for study.

Mr. Regan. Will you yield?

Mr. Engle. I will yield now.

Mr. Regan. I would like to ask you what your obligation is to the Republic of Mexico in this million acre feet of water. Do we supply them with a certain quality of water or

just the quantity of a million acre feet?

Mr. Saylor. Following that, where in the Mexican Treaty or the Colorado River Compact is the quality of water mentioned?

Mr. Engle. It is not mentioned specifically, but it is implicity in the treaty and in the Compact. In short --

Mr. Dawson. Will you yield to me?

Mr. Engle. I will, but let me finish the sentence. In short, we did not make a treaty with Mexico which presupposed that we would deliver to Mexico water unfit for the uses specified in the treaty, which are domestic uses, agricultural uses, as well as municipal uses. And any intimation that this country could get away with burdening this water with as much salt that it would be unusable for the purposes for which the treaty was entered into is repugnant to the basic terms and intent of the treaty itself.

I am not implying that it is in that shape yet, but I say we ought to watch it; and all this amendment provides for is continuing studies so it can be watched.

Mr. Bentsen. Will you yield?

Mr. Engle. Yes.

Mr. Bentsen. Is it not also for the protection of California?

Mr. Engle. Yes, by all means. But I say we are not the only fellows who might be gored in this. Arizona might get

gored too.

Mr. Rhodes. Will the gentleman yield?

Mr. Engle. Yes.

Mr. Rhodes. Is it the gentleman's thought that an increase in the salinity content of the water is quite similar in legal connotations to pollution of water? In other words, I think it is a pretty well known fact that an upstream user cannot pollute the water in such manner that downstream users are denied riparian or appropriative rights to use the water. You mentioned you felt this question was inherent in the Compact. Is that the theory upon which you go?

Mr. Engle. Yes. I think the question of water quality is inherent in the Compact and is inherent in the treaty. This does not imply we are in shape yet where we are going to get pinched in either one. This does nothing more than to say that the Secretary will study it on the proposition we may get in trouble.

Mr. Harrison. The time of the gentleman from California has expired. Do you desire time, Mr. Rhodes?

Mr. Rhodes. Yes, I wish time to continue my colloquy with the gentleman from California.

Mr. Harrison. The gentleman from Arizona is recognized for five minutes.

Mr. Rhodes. As I understand your amendment, it does not stop any project which is now existing or may be existing in

the future. It merely asks the Secretary of the Interior to inform the Congress and member States of the Colorado River Basin as to the true situation as it exists. Therefore, it seems to me that certainly it is information which might be very helpful to the Congress and particularly to those States.

Mr. Dawson. Will you yield to me?

Mr. Rhodes. I yield.

Mr. Dawson. I call the attention of the gentleman from California to the fact that the argument he is making is exactly the same argument that the people from Mexico made when they were asking that California guarantee the purity of water, and I would like to read the comment from the representatives of California in the 1947 report. Here is what your own people from California said when Mexico was making these same demands:

"The Treaty makes no direct reference to quality of water. The ambiguity of the Treaty with respect to the subject shown by the diametrically opposed interpretations of the negotiators creates a serious problem. The final division will greatly affect the burden of the Mexican Treaty and water users of the Unites States." Listen to this: "If the Mexican interpretation were upheld, annual quantity of water that would be required in fulfillment of the Treaty might be several times the annual quantity that would be required if the interpretation of the negotiators of the United States

were upheld."

Our argument is the same argument that you people from California were making. There is no reference in the treaty guaranteeing the purity of the water, and for us to step in here now and try to write something into that treaty that was not in is just opening it up to endless complications.

Mr. Engle. Will the gentleman yield?

Mr. Dawson. Yes.

Mr. Engle. All this says is that the Secretary shall study and keep abreast of this question of water quality.

Mr. Dawson. Of course the gentleman knows the Secretary is making continual study, and the effect of this amendment would be to confine it to the Upper Basin States. The studies are being made continually on it.

Mr. Hosmer. Will the gentleman yield?

Mr. Engle. It would not confine it, it is the whole river. If they are going on now, I do not see why you object to putting it in the bill. It is not hurting anybody. It is a subject we should know about. I do not see how asking somebody to study something can hurt.

Mr. Rhodes. Mr. Chairman, I will yield back the balance of my time if nobody wants me to yield.

Mr. Aspinall. Mr.Chairman?

Mr. Harrison. The gentleman from Colorado is recognized for five minutes.

Mr. Aspinall. I oppose the amendment as now written because it presupposes there is an obligation on the Upper Basin to furnish certain quality of water at Lee Ferry. I am not opposed to study the Secretary whatsoever, but I think that general legislation would be more appropriate in this instance than to place it in the bill before us.

However, with the thought that perhaps the committee would feel favorable toward the proposed amendment, I offer the following amendment as an amendment to the amendment:

Line 4, strike the words "available at Lee Ferry" and insert in lieu thereof the phrase "of the Colorado River."

Mr. Westland. What is the first word?

Mr. Aspinall. Strike the words "available at Lee Ferry" and insert in lieu thereof the phrase "of the Colorado River."

Mr. Saylor. Mr. Aspinall --

Mr. Aspinall. Just a minute; that is only part of the amendment, and then I will be open for questions.

Mr. Saylor. All right.

Mr. Aspinall. Then in line 6, strike the comma and the balance of that line and the following three lines and insert in lieu thereof the words "in the Colorado River Basin" period.

The reason that I do this is in order to make it necessary that we consider the whole Basin in this question, and that we do not write anything into this legislation which would try to determine as of this time the obligation of the Upper Basin

as to duty of delivering certain water at Lee Ferry.

Mr. Engle. I have no objection to the amendment and I will accept the amendment to the amendment. We are perfectly willing to have the whole river studied.

Mr. Saylor. Would you yield at that point?

Mr. Aspinall. Yes, I yield.

Mr. Saylor. I think that your amendments to the amendment are good, but would it not further the purpose for which these studies are being made to have a place of study both in the Upper Basin and the Lower Basin? I think that the study should be made in the entire river. With that I agree. But I think that we should make the study both for the Upper Basin and the Lower Basin.

Mr. Aspinall. I think that is in the province of the Secretary to report back to Congress; and if we cannot come to some agreement, which sooner or later I feel we must come to about this question of the quality of water, then Congress will perhaps have to take up this question. Let the Secretary make his surveys and attendant determinations.

Mr. Engle. I am not asking the Secretary to make a determination, but to make findings of facts and studies. That is all.

Mr. Aspinall. That is what I mean by "determination."

Mr. Engle. If there is no further discussion, Mr. Chairman, because we are on short time, I will ask the previous

question. The author of the amendment will accept the amendment to the amendment. Is there any objection to the amendment.

Mr. Dawson. I have a further objection. The amendment presupposes that somehow or other by transmoutain diversion of water there is a promise of a guarantee of the purity of that water. I think you are writing something into the Compact that was never there. I think you are attempting to make the interpretation of the Colorado River Compact.

Mr. Engle. No, we are not. We say this: When we take pure water out of the watershed that it has a tendency to take away water which would otherwise dillute water which might not be so pure. But this does not make an interpretation; it asks the Secretary to make studies on it.

SEVERAL MEMBERS: Question.

Mr. Harrison. The Chair rules that the gentleman from California has accepted the amendment to the amendment as proposed by the gentleman from Colorado, Mr. Aspinall. Unless there is objection, the vote will be upon the amendment offered by the gentleman from California, as amended by the gentleman from Colorado.

All those in favor of that motion will say aye.

Opposed, no?

The Chair is in doubt. Those in favor of that motion will raise their hands. (Showing of hands.)

Those opposed will raise their hands. (showing of hands.)

The vote is 6 to 5. The amendment is agreed to.

Mr. Engle. Mr. Chairman?

Mr. Harrison. Mr. Engle is recognized.

Mr. Engle. Mr. Chairman, I have one further amendment, which is the most important amendment I have to offer, and I will have the clerk pass it out. I will read it. This is additional new section to be added to the bill following the addition of the new section just adopted, as amended:

"Each State of the Colorado River Basin is authorized to appoint one representative to an Integrating Committee, to advise with the Secretary of the Interior in programming the storage and release of water from main stream reservoirs located in the Upper Basin, for use in the Lower Basin.

"(b) The Secretary of the Interior is directed to comply with the applicable provisions of the Colorado River Compact, the Boulder Canyon Project Act, the Boulder Canyon Project Adjustment Act, and the Treaty with the United Mexican States, in the storage and release of water from reservoirs in the Upper Basin for use in the Lower Basin, and, in the event of his failure to so comply, any State of the Colorado River Basin may maintain an action in the Supreme Court of the United States against him to enforce the provisions of this section, and consent is given to the joinder of the United States as a party in such suit or suits."

I will be very brief about this. Here is what we are

getting into: We have a river hundreds of miles long under the supervision of one individual, to wit, the Secretary of the Interior. Now we want to be sure that he complies with the basic law of the river which is set forth in these various documents which are mentioned in this amendment and which are also mentioned in the bill, by the way, in section 9. The sponsors of this legislation have said in their bill that this project shall be subject to precisely these provisions.

But we get into this situation: Let us assume that the Secretary of the Interior makes an interpretation of the basic compact in his operation of the river which is contrary to what the people in the Upper Basin think that it should be. They have no appeal from his decision unless someway is provided for them to challenge his operation of the river under what he believes to be the provisions of the compact. So this simply says this: that we set up an advisory committee. Each State, little ones and big ones, have one representative on the advisory committee to advise the Secretary. Then if the States get into a hassle about whether or not the Secretary is correctly interpreting and managing the river under basic law, they can go to court and test his decision in that regard.

I want to make this very clear: that this not an amendment necessary to protect California. It protects every State in the Basin, because the time might come when the people in

the Upper Basin are looking at a Secretary of Interior from the State of California, and they might think that his ruling as to the operation of the river is totally unfair and unwarranted by the basic law. This would give them some recourse to challenge his decision which they thought was adverse to their interests in the courts -- Arizona or anybody in the Lower Basin or Upper Basin. It provides for a method for getting a legal administration of the river.

This is not a reflection on the present Secretary of the Interior, who I regard as a fair man, or anybody who is Secretary; but this thing is going on for 50 or 100 years, and there ought to be some way, if one of the States disagrees or thinks they are being prejudiced, or the Lower Basin thinks they are being prejudiced by his interpretation, to get it straightened out.

That is all this does and I submit it on that statement.

Mr. Pillion. Will you yield to me for a question?

Mr. Engle. Yes.

Mr. Pillion. Is there a possibility that this section may be creating a right of action against the United States for more than an injunctive relief, in that it may provide a basis for suits for damages against the United States? If it does that, it simply is a borad section. I hate to see the United States Government spend a billion dollars and then be subjected to a series of suits for damages by the

various States by reason of this section,

Mr. Hosmer. Will you yield?

Mr. Pillion. Yes.

Mr. Hosmer. I think it is clear in stating that the suit may be maintained in the Supreme Court to enforce the provisions of this section, and that is certainly a limitation on it.

Mr. Pillion. I am not so sure it is a limitation.

Mr. Engle. I have never heard of a damage suit in the Supreme Court. This would be an action for declaratory relief to the interpretation of the compact. That is what we are trying to get to.

Mr. Pillion. Suppose it were determined that the Secretary of the Interior did make an honest error or was guilty of a negligent act and so determined. In the meanwhile some of the States had suffered losses while the suit was pending. Would there be any recourse against the United States by reason of that finding?

Mr. Engle. This does not create a right of action.

Mr. Pillion. I know it does not specifically so state. I am just wondering if there is not an inferential grant of a right of action here created.

Mr. Engle. I suggest the gentleman read the language of the amendment. All the amendment does is give the right to get an interpretation of the Compact. It creates no right of

action which would not exist in the absence of this provision. If there is any doubt about it, I suggest to the gentleman that he just prepare a line to go on the bottom of this amendment which says that this would not create any right of action against the Federal Government or any of its agencies that did not exist in the absence of the amendment.

Mr. Saylor. If you will yield, that may be true. It might not create any additional right which did not exist, but the gentleman has had enough prior experience to know that if you went back to try a case in the lower court with a decision of the United States Supreme Court saying that you had a right to be here, and there had been an injunction performed, you have an awful leg up on your opponent.

I think it creates that right, whether it be a suit against the United States or a suit between States, and I think that is a very dangerous precedent.

Mr. Harrison. The time of the gentleman from California has expired. Do any other members of the committee desire time?

Mr. Regan. I would like to ask the gentleman a question.

Mr. Harrison. Mr. Regan.

Mr. Regan. You have representatives from each of the 7 States. What are you going to do about Mexico? Should not they have a man to represent Mexico on this board you are setting up?

Mr. Engle. No, because they are a foreign country.

Mr. Harrison. Any further discussion?

Mr. Engle. Did you take the time, Mr. Saylor?

Mr. Saylor. I will take five minutes.

Mr. Engle. I wanted to get somebody to yield.

Mr. Hosmer. I will ask for time so I can yield.

Mr. Harrison. I am not going to shut anybody off as long as you want to talk. All I want to do is to follow procedure and have somebody recognized.

Mr. Hosmer. Mr. Chairman?

Mr. Harrison. Mr. Hosmer.

Mr. Hosmer. I yield to the gentleman from California.

Mr. Engle. I thank the gentleman.

I want a minute to make further comment on this matter that Mr. Pillion has brought up. The question he brings up is whether or not we are creating a liability on the Federal Government which would not exist in the absence of this amendment. What I am saying to him is that all this amounts to is an intent to go to the Supreme Court, just like we passed here last year or two years ago, when we permitted the States of the Colorado Basin Compact to go to the Supreme Court. It is over there now.

What we are saying is that 25 or 50 years from now when we get this big integrated project in operation we want consent ahead of time and want an advisory committee to work with

the Secretary of the Interior. I say --

Mr. Saylor. Will you yield?

Mr. Hosmer. I have the time.

Mr. Harrison. Mr. Hosmer has the time.

Mr. Hosmer. I would like to state that this reads that action may be maintained in the Supreme Court to enforce the provisions of this section. So it is highly restricted and highly limited and applies only to this section, which in no way provides any rights to damages or anything other than the Secretary's programming the storage and release of water.

Now I will yield to the gentleman from New York.

Mr. Pillion. I will yield to Mr. Saylor.

Mr. Saylor. The thing I am worried about is this: If there is this much concern over this matter among the members of the committee who are representatives of the States on the Colorado River, then I would suggest that in 1963 when the Colorado River Compact is up for review this matter be then considered. It is only 9 years away, and who is to say when all of these projects will be built. If it is a matter of such importance, I feel certain we will be in a position to have this considered at that time.

Mr. Rhodes. Will you yield?

Mr. Saylor. Yes.

Mr. Harrison. The gentleman from California, Mr. Hosmer,

has the time.

Mr. Hosmer. I yield to the gentleman from Arizona.

Mr. Rhodes. If the gentleman from Pennsylvania will read the first section, I think it would be fairly obvious that in order for this Integrating Committee to come into being at all it would be necessary for the States to take some action. It does not say the Integrating Committee is hereby created; it says "Each State is authorized to appoint a member." And if two States appoint members of the committee, I would doubt that the committee would be in existence. I would think that the legislature of each State involved would have to state that they would desire an Integrating Committee and they would appoint a member of the Integrating Committee. We are not creating the committee in this amendment in my opinion.

Mr. Engle. Will the gentleman yield?

Mr. Rhodes. Yes.

Mr. Harrison. Mr. Hosmer has the time. Do you yield?

Mr. Hosmer. I yield to Mr. Engle.

Mr. Engle. All we are doing is setting up, authorizing an advisory committee. But the essential of this amendment is in the portion of it that gives consent to take an interpretation of the basic law to the Supreme Court. It avoids an absolute impasse on the river.

After you get all of these great reservoirs set up, the rate at which the water is accumulated in those reservoirs

and released from those reservoirs for any purpose can in effect rest in this one man and his interpretation solely is the complete law of the river. All we are saying is, "That is all right with us provided that it is done under the law of the river, the basic Compact." But if we get in an argument about the interpretation -- Arizona may get into an argument about the interpretation -- and say, "That is wrong" -- or the Upper Basin may say that the Secretary being a Californian, 25 years from now, is handling the reservoirs in such a way as to favor California's position on the river, and challenge it on the grounds that it is contrary to basic compact. In the situation as it now exists they could not go anywhere if the Secretary of the Interior in that instance wanted to thumb his nose at them.

Mr. Regan. Will you yield?

Mr. Engle. Yes.

Mr. Hosmer. It is still my time. I want to say the amendment is crystal clear, and I think the interpretations are quite unwarranted here. If the gentlemen will just read the thing again, it is very simply worded and provides only these States can have a checkrein, both the Lower Basin and Upper Basin, in case of indiscretion on the part of the Secretary.

Now I will yield to the gentleman from Texas.

Mr. Regan. Does not your Compact Commission carry out

those functions? You have a compact commission set up now.

Mr. Hosmer. Yes; but in the event of a disregard by the Secretary of the Interior, this would provide the means by which the Commission could unite in joint action to require the Secretary to observe the provisions of the agreements between the States. So that is all we are trying to do -- we are trying to avoid an impossible situation where you would have a Secretary of the Interior who might by reason of his programming of the release and storage of this water act in a fashion detrimental to the States along this river.

Mr. Regan. Is not that the function of the Compact Commission to direct the Secretary to see there is an equitable divis'on of the waters under the Compact?

Mr. Hosmer. That is his function, yes, sir; but if he refuses to do so, then they have the right to ask the Supreme Court to require him to do so. This merely puts them into the Supreme Court.

Mr. Harrison. The time of the gentleman from California has expired.

Mr. Pillion. Mr. Chairman, I would like to offer an amendment to the amendment.

Mr. Harrison. The Chair recognizes Mr. Pillion of New York.

Mr. Pillion. Following the section itself, insert a

comma instead of a period at the end of the last sentence and insert "Provided, That no right of action for damages against the United States shall be created by this section."

Mr. Harrison. You have heard the amendment to the amendment submitted by the gentleman from New York, Mr. Pillion. Is there any discussion on that? Are you ready for the question?

Mr. Engle. May I suggest to the gentleman that I would accept his amendment if he would change it to read -- "Provided, That this section creates no liability on the United States which would not exist in the absence of this section."

Mr. Pillion. I will accept that.

Mr. Engle. I will accept then the gentleman's amendment to my amendment.

Mr. Dawson. What you are doing here is opening up a Pandora box. You are providing something here that should not be in my opinion. If you want to say you are going to put it in the court of appropriate jurisdiction which is already open to them rather than let them come right into the Supreme Court, there might be more sense to it.

Mr. Engle. The gentleman does not seem to realize the Supreme Court is the only court with jurisdiction.

Mr. Dawson. I do not know about that.

Mr. Engle. Yes, sir, by the Constitution itself.

Mr. Harrison. The gentleman from New York, Mr. Pillion,

has the time.

Mr. Pillion. I will yield back the balance of my time.

Mr. Harrison. Is there further discussion on the amendment? The amendment before the house now is the amendment of the gentleman from California, Mr. Engle, as amended by the gentleman from New York, Mr. Pillion.

Mr. Aspinall. Mr. Chairman, I wish to be heard in opposition.

Mr. Harrison. The gentleman is recognized for five minutes.

Mr. Aspinall. This again is a change in the interpretation or in the provisions of the Compact which governs. I think I know what the gentleman has in mind. I am not so sure but what later on after we get some installations in the Upper Basin I may look with favor on some arrangement such as he proposes, but at the present time the only obligation on the Upper Basin is to deliver certain waters in certain amounts at Lee Ferry; and the Lower Basin has nothing to say whatsoever providing those waters are delivered in accordance with the Compact.

Now we are setting up another body which is to have jurisdiction over this particular obligation of the Upper Basin. Personally, I just do not see that it is material to the bill before us.

Mr. Engle. Will the gentleman yield?

Mr. Aspinall. Certainly.

Mr. Engle. This body is merely advisory and they cannot tell the Secretary what to do. What this section says is that if your State thinks that the Secretary of the Interior is operating the river in violation of the very Compact you want to abide by, that you have a right to take him to the Supreme Court and get that settled. That is all it does.

There is no hidden motive or secret intent on our part. We just think that eventually you are bound to run into an impasse if you do not have some mechanics set up where you get a final decision that is beyond the province of one man. Nobody likes to go to court; it takes time and costs a lot of money. We do not want to go to court and we are sure no other State wants to.

Mr. Aspinall. In fact what you are saying is there shall be appointed a commission, members of which shall be from the Lower Basin, and they shall have the right to go into the Upper Basin and make examinations to determine what they consider to be the equities involved, and then advise the Secretary; and then it is up to the Secretary to determine whether or not he shall listen to the advice which he has. But if any State considers he is not right, then it has a right to go into the Supreme Court of the United States to ask for relief.

Mr. Engle. Only if it violates the basic law of the river.

Mr. Aspinall. To determine whether it is in violation of the basic law of the river.

Mr. Engle. The Supreme Court will determine eventually, as it is going to do over there with reference to the suit now pending. We admit the Secretary has certain discretionary powers which cannot be challenged in any court because they fall within the province of his discretion within the operation of the river. This is a protection for little states on the river. California's political power in the years to come, when we expect to be a greater State in population than New York, which we will achieve in the next 10 years, will be such that we will take care of ourselves in any political hassle.

This amendment is a good amendment for small states, and I just cannot understand anybody in the Upper Basin sitting up there opposed to this kind of thing, because it gives them absolute access to the final authority in case they think in someway or other the law of the river is being violated in the operation of the project. Most people do not complain about giving a man a right to go into court.

Mr. Bentsen. Will you yield?

Mr. Harrison. The gentleman from Colorado has one minute left. Will he yield for a question from the gentleman from Texas?

Mr. Aspinall. I yield.

Mr. Bentsen. Is it correct then they do not have the authority to go to the Supreme Court now if they believe the Secretary of the Interior is operating the project in violation of the Compact?

Mr. Aspinall. I would not place that interpretation upon present law because California and Arizona are in the Court at the present time. If any of these problems should arise, I think the State would be able to get in without this Integrating Committee.

Mr. Engle. You know the trouble we had getting in on this last one.

Mr. Harrison. The time of the gentleman from Colorado has expired.

Mr. Dawson. Mr. Chairman?

Mr. Harrison. The Chair recognizes Mr. Dawson.

Mr. Dawson. I want to call attention to the fact the gentleman from Pennsylvania has a point which would solve this. If we do have problems in the river they will develop within the next 10 years and then would be the time to come in and decide whether we need to open up the door to going into court. I think we are making a mistake by writing it into this legislation.

Mr. Saylor. If the gentleman will yield, is it not correct the Compact itself, the so-called law of the river, requires it be subject to review in 1963?

Mr. Dawson. That is correct. Not only that, but tied into this bill is the Colorado Compact in a good number of places so as to be sure it would not be done in violation of the Compact.

Mr. Engle. Will you yield?

Mr. Dawson. Yes.

Mr. Engle. How does the gentleman say, just because it says in this bill or elsewhere that the Compact will be complied with, that it will in fact be complied with?

Mr. Dawson. If it is not complied with --

Mr. Engle. What would you do?

Mr. Dawson. It is time to come to Congress and say, "We have to have permission that a review be made", and it will be given.

Mr. Engle. Why go to all that trouble? Why not just put it in here?

Mr. Dawson. Why go looking for trouble.

Mr. Engle. You fellows may find yourselves the ones out on a limb, not California, when it comes down to getting into the courts.

Mr. Harrison. Any further discussion on the amendment?

Mr. Saylor. Question.

Mr. Harrison. The amendment you will vote on now is the amendment of the gentleman from California, Mr. Engle, as amended by the gentleman from New York, Mr. Pillion.

All those in favor --

Mr. Saylor. A parliamentary inquiry. Is it correct that the gentleman from California has accepted the amendment to his amendment?

Mr. Harrison. That is correct. All those in favor of the amendment so amended will say aye.

Opposed, no?

The Chair is in doubt. All those in favor of the amendment will raise their hands. (Showing of hands.)

All those opposed will raise their hands. (Showing of hands.) The vote is 6 to 6. Is that right?

The Clerk: Yes, sir.

Mr. Harrison. The Chair will have to cast the deciding vote against the amendment. The amendment is not agreed to.

Mr. Engle. Mr. Chairman, I ask the roll be called.

Mr. Harrison. A roll call has been requested and the clerk will call the roll.

The Clerk: Mr. Aspinall?

Mr. Aspinall. No.

The Clerk: Mr. Bender?

Mr. Dawson. No, by proxy.

The Clerk: Mr. Bentsen?

Mr. Bentsen. Aye.

The Clerk. Mr. Barry?

(No response.)

The Clerk. Mr. Budge?

(No response.)

The Clerk. Mr. Dawson?

Mr. Dawson. No.

The Clerk. Mr. D'Ewart?

(No response.)

The Clerk. Mr. Donovan?

(No response.)

The Clerk. Mr. Engle?

Mr. Engle. Aye.

The Clerk. Mr. Hosmer?

Mr. Hosmer. Aye.

The Clerk. Mr. O'Brien?

(No response.)

The Clerk. Mrs. Pfost?

Mrs. Pfost. Aye.

The Clerk. Mr. Pillion?

Mr. Pillion. Aye.

The Clerk. Mr. Regan?

Mr. Regan. No.

The Clerk. Mr. Rhodes?

Mr. Rhodes. Aye.

The Clerk. Mr. Rogers?

(No response.)

The Clerk. Mr. Saylor?

Mr. Saylor. No.

The Clerk. Mr. Westland?

Mr. Westland. No.

The Clerk. Mr. Wharton?

Mr. Wharton. No.

The Clerk. Mr. Yorty?

Mr. Engle. Aye, by proxy.

The Clerk. Mr. Young?

(No response.)

The Clerk. Mr. Miller?

Mr. Dawson. No, by proxy.

Mr. Harrison. The vote on the amendment shows 7 votes in the affirmative and 8 votes in the negative, and the motion is defeated, the amendment is not agreed to.

The gentleman from California, Mr. Hosmer, will be recognized for amendments and then Mr. Saylor, or do you want to go ahead?

Mr. Saylor. I thought Mr. Engle had five amendments.

Mr. Harrison. He is withholding the balance at this time.

Mr. Saylor. I might ask, were the two he offered the controversial ones or the noncontroversial ones?

(Discussion off the record.)

Mr. Harrison. Mr. Hosmer.

Mr. Hosmer. Mr. Chairman, I have four amendments to section 4. I do not know we have the time for all of them.

Mr. Harrison. I believe the gentleman from Pennsylvania, Mr. Saylor, has an amendment and I would like to recognize hime. Take one amendment and see how the time is. I do not want to cut your short, but I do also want to recognize the gentleman from Pennsylvania.

Mr. Hosmer. Do you recognize the gentleman from Pennsylvania or myself?

Mr. Harrison. You. All I say is I would like to give him some time before we adjourn this morning.

Mr. Hosmer. I hardly know how to proceed under that basis. I will offer the amendments to section 4.

Mr. Bentsen. Did you say section 4?

Mr. Homser. Yes.

Mr. Dawson. Do we have a copy of these?

Mr. Hosmer. I am trying to figure out which one to offer in line with the time, and I have them all on one paper, so I have a little difficulty here.

Mr. Harrison. Do you want to offer them all at one time and vote en bloc?

Mr. Hosmer. I will offer one at a time and vote on them separately. I think some of them you might like and some of them you might not. I can do that, Mr. Chairman?

Mr. Harrison. Yes.

Mr. Hosmer. Those on the mineographed page. At page 6, line 18, add after the word "maintenance" the words

"and replacements".

The purpose of that is that in numerous projects authorized over recent years they have provided for inclusion of a maintenance fund provision as well as making allowances for replacements. This would merely add to that section and allow for replacements, which is more or less considered as a depreciation reserve. This thing was provided in Mr. Dawson's original bill and was probably overlooked in the preparation of the current committee print.

Mr. Dawson. I have no objection to the amendment.

Mr. Saylor. Will the gentleman yield?

Mr. Hosmer. Yes.

Mr. Saylor. I have a substitute to that section which I would like to offer at this time.

Mr. Harrison. Does the gentleman yield?

Mr. Hosmer. A substitute for the whole section or the amendment?

Mr. Saylor. The whole section.

Mr. Harrison. Does the gentleman from California yield for that purpose?

Mr. Hosmer. I yield.

Mr. Saylor. My amendment is on page 6, line 14, strike out line 14 and the rest of page 6 down through and including line 9 on page 7, and substitute therefor the following:

"All revenues collected in connection with the operation

of the Colorado River storage project and participating projects shall be paid annually into the general fund of the Treasury, except such amounts as are necessary to defray the costs of operation, maintenance, and replacement of, and emergency expenditures for, all facilities of the Colorado river storage project and participating projects, within such separate limitations as may be included in any annual appropriation act."

Now, Mr. Chairman, the purpose of this amendment. If you will look at section (d) of this section, it states that all revenues shall be paid annually into the general fund of the Treasury such as are necessary for certain specific items; and in order to clarify this and to indicate that the revenues are to be paid into the Treasury I have made section (c) and section (d) consistent.

I think that if Committee Print No. 17, which has been presented to all of the members, represents the thinking of the proponents of this bill, they should have no objection to this amendment, because it specifically states what section (d) authorizes and is merely for the purpose of making sure that section (d) will be carried out with the exception of the funds which are specifically specified in section (c), namely, the cost of operation, maintenance and repair and emergency expenditures.

Mr. Dawson. Do you have a copy of that?

Mr. Saylor. Here (handing document).

Mr. Aspinall. Will you yield for a question?

Mr. Saylor. Yes.

Mr. Aspinall. Does not your amendment in fact destroy the basic account system?

Mr. Saylor. It does not destroy the basic account system because, if you will look at section (d), I was very careful to make sure it did not. If you will notice section (d) and read it, section (d) says, "Revenues in excess of operating needs shall be paid annually to the general fund of the Treasury" and then specifies what credits shall be given when they are in the general fund of the Treasury. I am not touching that section of the bill.

Mr. Harrison. The time of the gentleman from California has expired.

Mr. Hosmer. I ask unanimous consent all debate on this amendment end in five minutes.

Mr. Harrison. Do I hear any objection?

Hearing none, it is so ordered.

Mr. Saylor. If I can be recognized, I would like to say to the gentleman from Colorado, I have been very particular to see to it that the basic account system has not been destroyed.

Mr. Harrison. The Chair has not recognized anyone. We have five minutes. Does anyone ask to be recognized at this time?

Mr. Dawson. Mr. Chairman?

Mr. Harrison. Mr. Dawson is recognized for five minutes.

Mr. Dawson. I think it definitely has destroyed the basin account. He is requiring that any revenues in excess of the amount needed for maintenance expense for the current year be paid into the Treasury. That would mean we would have to come back here.

Mr. Saylor. If the gentleman has read his own bill, that is just what you provide if you will look at section (d) -- "Revenues in excess of operating needs shall be paid annually to the general fund of the Treasury."

Mr. Dawson. Then that is true, but what are you doing here with this amendment?

Mr. Saylor. All my amendment is doing is making section (c) and section (d) consistent, in stating that we are specifying what shall be paid in and we are authorizing them -- I have almost taken verbatim the wording of your section in the bill in many instances.

Mr. Dawson. I see no inconsistency in those two sections. I cannot see what the gentleman is attempting to do by his amendment other than destroy the basin account.

Mr. Saylor. I am not attempting to destroy the basin account. The Director of the Budget stated that when they they prepared this bill -- all revenues in excess of those certain items should be paid into the Treasury.

Mr. Bentsen. Will you yield to me?

Mr. Saylor. Yes.

Mr. Bentsen. Are you contending there is now an inconsistency between section (c) and section (d)?

Mr. Saylor. Yes.

Mr. Bentsen. There is an inconsistency?

Mr. Saylor. Yes.

Mr. Bentsen. And you are doing away with it?

Mr. Saylor. All I am trying to do is to make sure section (c) and section (d) are consistent.

Mr. Bentsen. What is the inconsistency now?

Mr. Saylor. In other words, if you will read section (c), if says, "All revenues collected in connection with the operation of the Colorado River storage project and participating projects shall be credited to the Basin Fund, and shall be available, without further appropriation" for certain specified things. Now section (d) states that revenues in excess of the operating needs which are specified in 1, 2, and 3 of section (c) shall be paid annually into the general fund of the Treasury.

Now all I am specifying is that section (c) and section (d) be consistent and that all revenues shall be paid into the Treasury in excess of the operating funds which are specified in items 1, 2, and 3. I am not destroying the Basin account

in any manner.

Mr. Rhodes. Will you yield?

Mr. Saylor. Yes.

Mr. Harrison. The gentleman from Utah has the time.

Mr. Dawson. I will yield to the gentleman from Arizona.

Mr. Rhodes. The way it is written it appears to me all the money is paid into the Treasury and they actually have to get appropriations from Congress to spend any money for replacement, operation and maintenance. Is that the intent of the gentleman?

Mr. Saylor. No, sir.

Mr. Rhodes. I will read the language back: "All revenues to be collected in connection with the operation of the Colorado Storage project and participating projects shall be paid annually into the general fund of the Treasury" --

Mr. Saylor. Except.

Mr. Rhodes. --"except such amounts as are necessary to defray the cost of operation, maintenance and replacement of, and emergency expenditures, for all facilities of the Colorado River storage project and participating projects, within such separate limitations as may be included in any annual appropriation act."

Mr. Saylor. And I have taken that language, since you object to it -- I have taken that language verbatim right from section (c), lines 20 and 21 -- "within such separate

limitations as may be included in annual appropriation acts."

Mr. Rhodes. I see.

Mr. Saylor. In other words, I have taken it verbatim -- taken the very bill out of it.

Mr. Dawson. I think you have taken more than out.

Mr. Rhodes. I think Committee Print No. 17 needs some revamping in section (c) then.

Mr. Saylor. In other words, the sections vary.

Mr. Rhodes. Because the way it reads now, these items of operation, maintenance and replacement are apparently subject to limitations in the annual appropriations bill.

Mr. Saylor. If they are in section (c) of the committee print, they under my amendment.

Mr. Rhodes. Then it would appear to me they are.

Mr. Saylor. I have taken the language right out of the bill of the gentleman from Utah.

Mr. Rhodes. Also you have left out the provision for repayment of reimbursable construction costs for the Paonia and Eden projects.

Mr. Saylor. That is correct.

Mr. Harrison. The time of the gentleman from Utah has expired. All time has expired and thevote is on the amendment to the amendment proposed by the gentleman from Pennyslvania, Mr. Saylor. All those in favor of the amendment --

Mr. Saylor. I ask the ayes and nayes.

Mr. Harrison. The ayes and nayes have been asked for. The clerk will call the roll.

Mr. Bentsen. A parliamentary inquiry. Has the gentleman accepted the amendment to the amendment?

Mr. Hosmer. No, it has not been accepted.

Mr. Bentsen. I did not think so.

Mr. Harrison. He merely yielded to him for the purpose of making an amendment.

Mr. Bentsen. That is what I thought. You stated an amendment to the amendment. This is just an amendment of the gentleman from Pennsylvania. He has not amended the amendment of the gentleman from California.

Mr. Dawson. He is attempting to do it now.

Mr. Saylor. A substitute.

Mr. Hosmer. He is substituting a new subsection (c).

The Clerk. Mr. Aspinall?

Mr. Aspinall. No.

The Clerk. Mr. Bender?

Mr. Dawson. No, by proxy.

The Clerk. Mr. Bentsen?

Mr. Bentsen. No.

The Clerk. Mr. Berry?

Mr. Harrison. No, by proxy.

The Clerk. Mr.Budge?

Mr. Harrison. No, by proxy.

The Clerk. Mr. Dawson?

Mr. Dawson. No.

The Clerk. Mr. D'Ewart.

(No response.)

The Clerk. Mr. Conovan?

(No response.)

The Clerk. Mr. Engle?

Mr. Engle. No.

The Clerk. Mr. Hosmer?

Mr. Hosmer. Aye.

The Clerk. Mr. O'Brien?

(No response.)

The Clerk. Mrs. Pfost?

(No response.)

The Clerk. Mr. Pillion?

Mr. Pillion. Aye.

The Clerk. Mr. Regan?

Mr. Regan. No.

The Clerk. Mr. Rhodes?

Mr. Rhodes. Pass.

The Clerk. Mr. Rogers?

(No response.)

The Clerk. Mr. Saylor?

Mr. Saylor. Aye.

The Clerk. Mr. Westland?

Mr. Westland. No.

The Clerk. Mr. Wharton?

Mr. Wharton. Aye.

The Clerk. Mr. Yorty?

(No response.)

The Clerk. Mr. Young?

Mr. Young. No.

The Clerk. Mr. Miller?

Mr. Dawson. No, by proxy.

The Clerk. Mr. Rhodes?

Mr. Rhodes. No.

Mr. Harrison. The vote on the amendment to the amendment shows four votes in the affirmative and 12 votes in the negative, and the amendment is not agreed to.

The question now before the committee is --

Mr. Regan. Mr. Chairman, before putting that, I notice there are two and's -- and maintenance and replacements. Do you not want to strike out the one "and" before maintenance?

Mr. Hosmer. I will accept the gentleman's suggestion -- strike out the "and" after "operation", insert a comma, add "and replacements".

Mr. Harrison. The question before the committee now is the amendment offered by the gentleman from California, Mr. Hosmer, to page 6, line 18. Is there further discussion or

are you ready for the question?

Mr. Westland. I would like to ask the gentleman from California a question.

Mr. Harrison. Mr. Westland.

Mr. Westland. As I understand it, you put the funds for replacement of these projects into the Basin Fund?

Mr. Hosmer. You would allow the Basin Fund to expend for replacement as well as defraying the cost of operation and maintenance.

Mr. Westland. Ordinarily replacement is an amortization fund, is it not?

Mr. Hosmer. It is more in the nature of a depreciation reserve in this case, and it has been used in previous legislation, and I think it was in Mr. Dawson's original bill.

Mr. Westland. This could be actual cash then, could it not? What would the gentleman from California figure they would do with this money?

Mr. Hosmer. It would be in the discretion -- say they had 35 feet of pipe that went sour and they wanted to replace, they could do it.

Mr. Westland. I think a thing like that would come under operation and maintenance.

Mr. Saylor. No.

Mr. Hosmer. It is a difficult question, but this certainly has no effect except the one to make the expenditure of

of the fund a little bit more liberal and more in line with ordinary business-type procedures which would probably be used and would want to be used by the Secretary in maintaining, operating and replacing segments of the project.

Mr. Harrison. Is there further discussion? Are you ready for the question?

SEVERAL MEMBERS. Question.

Mr. Harrison. The question before the committee now is the amendment by Mr. Hosmer of California, page 6, line 16. All those in favor of the amendment will say aye.

Opposed, no?

In the opinion of the Chair the noes have it. The noes have it.

Mr. Hosmer. May we have a show of hands?

Mr. Harrison. A division has been asked for. Those in --

Mr. Dawson. Mr. Chairman, I demand a roll call.

Mr. Harrison. A roll call has been asked for. The clerk will call the roll.

The Clerk. Mr. Aspinall?

Mr. Aspinall. No.

The Clerk. Mr.Bender?

Mr. Dawson. No, by proxy.

The Clerk. Mr. Bentsen?

Mr. Bentsen. Aye.

The Clerk. Mr. Berry?

Mr. Harrison. No, by proxy.

The Clerk. Mr. Budge?

Mr. Harrison. No, by proxy.

The Clerk. Mr. Dawson?

Mr. Dawson. No.

The Clerk. Mr. D'Ewart?

(No response.)

The Clerk. Mr. Donovan?

(No response.)

The Clerk. Mr. Engle?

Mr. Engle. No.

The Clerk. Mr. Hosmer?

Mr. Hosmer. Aye.

The Clerk. Mr. O'Brien?

(No response.)

The Clerk. Mrs. Pfost?

(No response.)

The Clerk. Mr. Pillion?

Mr. Pillion. Aye.

The Clerk. Mr. Regan?

Mr. Regan. Aye.

The Clerk. Mr. Rhodes?

Mr. Rhodes. Aye.

The Clerk. Mr. Rogers?

(No response.)

The Clerk. Mr. Saylor?

Mr. Saylor. Aye.

The Clerk. Mr. Westland?

Mr. Westland. No.

The Clerk. Mr. Wharton?

Mr. Wharton. Aye.

The Clerk. Mr. Yorty?

(No response.)

The Clerk. Mr. Young?

Mr. Young. Aye.

The Clerk. Mr. Miller?

Mr. Dawson. No, by proxy.

Mr. Engle. Mr. Chairman, I want to change my vote.

Mr. Harrison. Mr. Engle changes his vote from no to aye.

The vote on this amendment shows 9 votes in the affirmative and 7 votes in the negative, and the amendment is agreed to.

Mr. Dawson. There is a typographical error on the next to the last line. I think "businesslike budget" should be "business-type budget."

Mr. Hosmer. Yes, but that is another amendment.

Mr. Harrison. Proceed, Mr. Hosmer.

Mr. Hosmer. Page 8, line 9, in discussing the pay-back to the Treasury after 50 years, following the word "years" insert: "(in annual payments over that period approximately equal in amount)".

All that does is prevent the pay-back first of interest-bearing features and then leave to last the non-interest-

bearing features.

Mr. Dodge's letter of March 18 says, "It is expected interest-bearing andnon-interest-bearing investments will be paid concurrently to the extent practicable." This amendment would merely accomplish this expectation and insure there is an orderly pay-back in proportionate amounts to both interest- and non-interest-bearing features of the project.

That is all I have to say on it, Mr. Chairman.

Mr. Harrison. Any further discussion on this amendment?

Mr. Engle. Will you read the amendment again, please?

Mr. Hosmer. I would be glad to. On page 8, line 9, add after the words "for a period not exceeding 50 years", the following: "in annual payments over that period approximately equal in amount."

Mr. Dawson. Does the gentleman have a copy of that?

Mr. Hosmer. Yes, you have it in front of you on the purple sheet.

Mr. Dawson. Will you yield to me?

Mr. Hosmer. Yes.

Mr. Dawson. Do you have in mind that the total payments including those to be paid by power will be included in those payments?

Mr. Hosmer. No; we are talking about the cost of these units -- each unit, participating project, or any separable feature thereof which are allocated to irrigation.

Mr. Dawson. I would like to have Mr. McFarland explain what this does to us, what it would mean. I think we are getting into some amendments that are pretty technical and which may throw us all out of kilter.

Mr. McFarland. As I understand it, the cost of the participating project, if it includes the part to be repaid by power, that part is paid over the last few years in heavy amounts.

Mr. Hosmer. I think there is a misunderstanding there. We are talking about repayment of the part allocable to irrigation, and we are trying to get it so that they will pay it in almost equal amounts and not use the money to pay off the part allocable to interest-bearing, power, in the first few years, and leave this non-interest-bearing obligation unrepaid until the very last when it could be repaid in part over this period of 50 years.

Mr. Dawson. Of course, it is anticipated that there will be more than uniform payments at the end of the power payout.

Mr. Hosmer. That does not interfer with that anticipation at all. You still got your Collbran formula in there. It just means until the Collbran formula takes effect in the last six years your irrigators are going to pay as nearly as possible equal amounts during the 44 years. Say in the first 44 years they would allocate five cents of it to irrigation

and all of the rest of it to power. You would still have this big non-interest-bearing debt hanging out on it, and this requires them as anticipated by Mr. Dodge's letter -- he said he expects that the interest and non-interest-bearing investments would be paid concurrently to the extent practicable.

Mr. Dawson. Of course, this bill is drafted by Mr. Dodge's office; so I assume they had this in mind when they drafted it.

Mr. Hosmer. We ran across one other case where they left out something that was supposed to be in, and I do not think we can assume they are perfect down there.

Mr. Rhodes. Will you yield to me?

Mr. Hosmer. Yes.

Mr. Rhodes. Does the gentleman feel if this provision is put in the Act that it would do away with the authority of the Secretary of the Interior to provide irrigators pay only that amount which they can afford to pay?

Mr. Hosmer. No. That amount which they can afford to pay, it just requires them to pay it in approximately equal annual installments.

Mr. Westland. Will the gentleman yield?

Mr. Hosmer. Yes.

Mr. Westland. What does that mean on Echo Park and Glen Canyon -- that this $98 million that is debited to irrigation, instead of being paid off principally in the last

6 years of this project, would be paid off equally during the 50-year period?

Mr. Hosmer. That is not it at all. It means that amount which irrigation is going to pay without the additional power help, as you have written into this bill, will be paid in approximately equal annual installments.

Mr. Bentsen. Will the gentleman yeild?

Mr. Hosmer. Yes.

Mr. Bentsen. Is it not possible there will be cycles in there where they might be more able to pay and others where they might be less able to pay, and it might influence?

Mr. Hosmer. We have written the word "approximately" into the amendment.

Mr. Dawson. Will you yield to me?

Mr. Hosmer. Yes.

Mr. Dawson. The bill already provides there is some discretion given, as I read it. You are putting them into a strait jacket here where they could not move.

Mr. Hosmer. No, this amendment does not do that at all. I ask unanimous consent all debate on the amendment end in 3 minutes.

Mr. Harrison. A unanimous consent request has been made. Is there any objection?

Mr. Dawson. No objection, but I would like counsel to make a statement.

Mr. Harrison. Proceed, Mr. McFarland.

Mr. McFarland. I do not believe that the amendment does what Mr. Hosmer has stated that it will do. The cost of these participating projects allocated to irrigation include about 85 percent to be repaid by power revenue. I believe the wording of the amendment would require that the total cost including the 85 percent to be repaid by power revenues would have to be repaid in approximately equal payments over the 50 years.

Mr. Harrison. Any further discussion of it? We have two minutes. Further discussion not being asked, the question is on the amendment of the gentleman from California, Mr. Hosmer, to page 8 line 9. All those in favor will say aye.

Opposed, no?

In the opinion of the Chair the noes have it. The noes have it and the amendment is not agreed to.

Mr. Hosmer. On the same page, line 15, reletter the existing subsections (e) and (f) of section 4 to make them subsections (f) and (g) respectively and insert a new section 4(e) as follows:

"(e) Contracts for water and power shall in the aggregate provide revenues at least sufficient to meet the requirements of subsection (c) of this section 4."

This amendment would merely provide that the sources of revenues shall when taken together provide enough money to

handle the repayments requirements enumerated in section 4 (c). It is very simply a businesslike requirement in there and points up to the Secretary the need for doing what he is required to do under the Act in order to make the Basin Account pay off.

I have no further discussion on the amendment.

Mr. Dawson. Do you have a copy of that?

Mr. Hosmer. It is also on the same sheet.

Mr. Harrison. It is on the sheet "Proposed Amendments to Section 4".

Is there further discussion?

Mr. Aspinall. Will the gentleman yield for a question?

Mr. Harrison. Mr. Hosmer has yielded back his time. I will recognize the gentleman from Colorado.

Mr. Aspinall. As I understand it, Mr. Hosmer, you state this is just to see that the Secretary does what by law at the present time he is supposed to do. Now let me ask you what advantage there would be by placing this in the law if that is right.

Mr. Hosmer. It is not in the law as a requirement in section 4(c) that he make these various payments, and without such amendment as mine thereis nothing in the bill to require that the contracts provide enough revenues to meet these requirements.

Mr. Aspinall. What if the contract does not? What if the Secretary should proceed and then sometime later the

contracts should not provide those revenues? Then what are you going to do?

Mr. Hosmer. The contracts when made are the best basis that he can go on. You cannot blame him for what happens if he makes a contract and something happens 10 years later. But when he makes these contracts he is required to make them in such fashion they will be able to provide the revenues to make the payout he is required to pay out.

Mr. Aspinall. You suggest that is not the procedure at the present time?

Mr. Hosmer. There is nothing at all with respect to it. He could sell the stuff for a penny if he wanted to, and I do not think we are entitled to give any Secretary that amount of discretion.

Mr. Aspinall. Do you mean to say our Secretaries for the last 50 years have proceeded that way and that any of them have violated their trust to see that the Government was repaid?

Mr. Hosmer. I think there is some argument about the activities of some of them. I just have a businesslike provision up before you, and I offer it to you in that spirit and in that light. If there is no further discussion, I ask the question.

Mr. Young. Mr. Chairman?

Mr. Harrison. Mr. Young is recognized.

Mr. Young. I would like to ask the gentleman from California a couple of questions.

Does it apply to irrigation repayments or distribution repayments?

Mr. Hosmer. This applies to contracts for both water and power he makes under the authority of this bill, to the aggregate of them. It does not say, like we had the other day when we had this difficulty about one project and one power plant that you might have to sell below cost. We are talking about the aggregate of all the power and water contracts he sells. We are just telling him he ought to do what he ought to have sense enough to do anyway, that is, make those contracts for such amounts of money so the revenues will come in and pay out the money this bill requires him to pay out.

Mr. Young. It requires him to pay out for operation, maintenance and replacements.

Mr. Hosmer. Yes.

Mr. Young. And the minimum from a water contract would have to bring in enough for operation, maintenance and replacement; is that it?

Mr. Hosmer. Yes. You take what happend out in Sacramento Valley, Central California project, where the Secretary went in and deliberately made a contract with the Sacramento Public Utilities District to sell power over a long period of years below cost, so that he put the project there in a non-paying status so it would not be attractive to the people of California to take it off the Federal Government's hands.

Mr. Aspinall. If you will yield, that is your opinion of what took place? You are not stating that as fact?

Mr. Hosmer. That is the facts as I know them. It comes to me as hearsay, just as most of the rest comes as hearsay. That is the official position of most people in my State.

Mr. Harrison. Any further discussion?

Mr. Young. I have one more question. I am not sure whether this applies only to operation, maintenance and replacement or to the capital investment which is to be repaid too.

Mr. Hosmer. This meets the requirements of subsection (c) of section 4. If you read that you will see where it applies to the whole thing.

Mr. Young. In other words, they cannot charge below cost then?

Mr. Hosmer. On the over-all project, that is right.

Mr. Harrison. Does the gentleman from Nevada have further questions?

Mr. Young. I will yield back the balance of my time.

Mr. Harrison. The question now is on the amendment submitted by the gentleman from California, Mr. Hosmer, on page 6, line 15. Those in favor of that amendment will say aye.

Opposed, no?

The Chair is in doubt. Those in favor of the amendment will raise their hands.

Those opposed, the same?

Mr. Dawson. Mr. Chairman, I demand a roll call.

Mr. Harrison. A record vote has been demanded. The clerk will call the roll.

The Clerk. Mr. Aspinall?

Mr. Aspinall. No.

The Clerk. Mr. Bender?

Mr. Dawson. No, by proxy.

The Clerk. Mr. Bentsen?

Mr. Bentsen. Aye.

The Clerk. Mr. Berry?

Mr. Harrison. No, by proxy.

The Clerk. Mr. Budge?

(No response.)

The Clerk. Mr. Dawson?

Mr. Dawson. No.

The Clerk. Mr. D'Ewart?

(No response.)

The Clerk. Mr. Donovan?

Mr. Donovan. Aye.

The Clerk. Mr. Engle?

Mr. Engle. Aye.

The Clerk. Mr. Hosmer?

Mr. Hosmer. Aye.

The Clerk. Mr. O'Brien?

(No response.)

The Clerk. Mrs. Pfost?

(No response.)

The Clerk. Mr. Pillion?

Mr. Pillion. Aye.

The Clerk. Mr. Regan?

Mr. Regan. No.

The Clerk. Mr. Rhodes?

Mr. Rhodes. No.

The Clerk. Mr. Rogers?

(No response.)

The Clerk. Mr. Saylor?

Mr. Saylor. Aye.

The Clerk. Mr. Westland?

Mr. Westland. No.

The Clerk. Mr. Wharton?

Mr. Wharton. Aye.

The Clerk. Mr. Yorty?

(No response.)

The Clerk. Mr. Young?

Mr. Young. Aye.

The Clerk. Mr. Miller?

Mr. Dawson. No, by proxy.

Mrs. Pfost. Mr. Chairman, I was to far away. I vote no.

Mr. Harrison. The vote on this amendment shows 8 voting in the affirmative and 9 voting in the negative, and the amendment is not agreed to.

Mr. Hosmer. Mr. Chairman?

Mr. Harrison. Mr. Hosmer.

Mr. Hosmer. At page 9, after line 4, at the end of section 4, add a new subsection (g), providing:

"Notwithstanding other provisions of this Act, the Secretary shall delay, during any fiscal year or years, commencement or continuation of construction of such participating projects, or any separable features thereof, authorized by this Act or subsequently, as reasonably may be necessary to insure that estimated revenues for any succeeding fiscal year or years, in excess of estimated costs of operation and maintenance, and emergency expenditures for, all facilities of the Colorado River storage project and participating projects, will be sufficient to permit payment from the Basin Account to the general fund of the Treasury amounts required to make the returns specified in subsection (d) of this section; and the Secretary shall make such estimates annually, before the commencement of each fiscal year, and include a statement with respect to same with the business-type budget required by subsection (f) of this section."

In other words, this amendment merely goes to the financial soundness of the over-all project; and if and when

it appears to the Secretary that the project is going to be bankrupt, he can delay construction or the additional construction until such time as revenues will be enough to pay out.

Mr. Harrison. The gentleman from California is recognized for five minutes.

Mr. Rhodes. Will you yield for a question?

Mr. Hosmer. I yield for a question.

Mr. Rhodes. Does this amendment presuppose that participating projects will be constructed from the Basin Fund? It is my understanding from the language of section (c) of section 4 that will not be done.

Mr. HOsmer. We do not know what may be done in the future with respect to this thing. The whole affair is bank-account business, and that is why the amendment includes the projects authorized by this Act or which might subsequently be authorized to be constructed out of the Basin Fund.

Mr. Rhodes. I call the gentleman's attention to the language on page 7, line 6: "Provided, That revenues credited to the Basin Fund shall not be available for appropriation for construction of the units and participating projects authorized by or pursuant to this Act."

Mr. Hosmer. And, as I say, this encompasses the additional development that is going on, anticipated to go on by the statements of the witnesses before this committee.

Mr. Westland. Will you yield there?

Mr. Hosmer. Yes.

Mr. Westland. About eight lines down you say "estimated revenues for any succeeding fiscal year or years." Would that mean he might estimate the revenues 40 years from now? That might be any year. He can pick at random. And if the revenues then were derived in sufficient amount to meet these requirements of this amendment, that would be satisfactory? Or are you going to confine it --

Mr. Hosmer. Will you yield?

Mr. Westland. Just a second. Are you going to confine it to the next year?

Mr. Hosmer. You cannot do that because he has got a 10-year development period on some of these projects. Maybe 31 years from now he sees with all the revenues coming in that year he is going to be in trouble. All right. So he would delay this construction for an additional year to get him over that hump. So that he would not have to make quite as many expenditures in that 31st year forward; he can delay it to the 32nd year forward, and at all times guarantee the financial feasability of this project.

Mr. Bentsen. Will you yield to me?

Mr. Hosmer. Yes.

Mr. Bentsen. Is it not possible at the end of 31 years he is losing money and he sees if he builds this particular project he will get in the black, and --

Mr. Hosmer. That is right, and this does not prevent him.

Mr. Bentsen. It seems to me this does prevent him.

Mr. Hosmer. No, because if he can see the 31st year it is going to be in the black, he can go ahead and build; and if it is going to be in the red --

Mr. Bentsen. It might be a project of three or four years construction, and one year it may be in the red, maybe two or three years which would be required for completion of this project.

Mr. Hosmer. Then he is required to so initiate his construction that he can keep this project in the black, which is the only businesslike thing to do. I do not want the Basin Account to go bankrupt, do you?

Mr. Bentsen. I can see a position where it might be in the red for a while, but in a period of years come back in the black.

Mr. Hosmer. But your Basin Account theory is not predicated upon an insolvent Basin Account, but it is predicated, built and argued and presented to the Congress on the basis of a solvent account at all times.

Mr. Dawson. Will you yield to me?

Mr. Hosmer. This requires him, it says, "Mr. Secretary, you will do that. You will carry out the intent of Congress. You will so operate, manage and commence your construction and

regulate your expenditures on this project you will do what Congress wants you to do -- keep a solvent basin account, a solvent series of projects."

Mr. Dawson. Will you yield?

Mr. Hosmer. Yes.

Mr. Harrison. The time of the gentleman from California has expired. Does the gentleman from Utah wish time?

Mr. Dawson. Just this one word: I think we still have in the bill plenty of safeguards to do the very thing the gentleman from California wants. This is simply putting us in a strait jacket here that may defeat the very purpose which he is seeking to achieve here. It may even thrust us into bankruptcy by tying us up here so we cannot spread these operations over a number of years.

Mr. Hosmer. Will you yield?

Mr. Dawson. Yes.

Mr. Hosmer. In his estimates which are required to be submitted with the business-type budget he estimates that very thing. If he starts this particular project and it is going to start paying in revenues in the 31st year, then he is free to start it.

Mr. Dawson. Does not the bill already provide for that?

Mr. Hosmer. No, it certainly does not.

Mr. Rhodes. Will the gentleman yield?

Mr. Dawson. Yes.

Mr. Rhodes. Actually, is not the amendment telling the Secretary in one place he may build participating projects from the Basin Fund, and on page 7 we are telling him he cannot build participating projects from the Basin Fund? It seems to me inconsistent with the other provisions of the Act.

Mr. Hosmer. I tried to explain that to the gentleman from Arizona a few moments ago, and I must call his attention to the fact that this particular amendment contemplates the addition of projects to the Upper Basin by subsequent legislation.

Mr. Dawson. Mr. Chairman, I yield back the rest of my time.

Mr. Regan. Will you yield?

Mr. Dawson. I yield.

Mr. Saylor. I ask unanimous consent --

Mr. Regan. Would you not feel you are putting the State of California and the Lower Basin in a rather hazardous position if you bankrupt the Upper Basin? The people who expect to supply the water, if they are bankrupt, might not be able to supply this water.

Mr. Hosmer. No, sir; I can guarantee --

Mr. Regan. I think you defeat your own objective there.

Mr. Hosmer. We are trying to avoid bankruptcy.

Mr. Harrison. The gentleman from Utah yielded back the rest of his time, so there is no one recognized now, and the gentleman from Pennsylvania has an unanimous consent request.

Mr. Saylor. I ask unanimous consent that all debate on this amendment and amendments thereto end in two minutes.

Mr. Harrison. Is there any objection?

The Chair hears no objection and it so ordered.

Does anyone wish to be recognized for the two minutes?

SEVERAL MEMBERS. Question.

Mr. Harrison. The question has been called for. All those in favor of the amendment submitted by the gentleman from California, Mr. Hosmer, say aye.

Opposed, no?

In the opinion of the Chair the noes have it. The noes have it and the amendment is not agreed to.

At this time the Chair will recognize the gentleman from Pennsylvania for an amendment.

Mr. Hosmer. Will the gentleman yield for just one observation?

Mr. Harrison. Does the gentleman from Pennsylvania yield to the gentleman from California?

Mr. Saylor. For an observation. I want to make sure I get this amendment in.

Mr. Hosmer. This time, I think, has been very well spent, and I think we have accomplished some matters of benefit to the bill. With the time limitation now imposed on the committee, it is going to be impossible to offer these amendments, and further discussion would be of help to the project.

I would like to state, Mr. Chairman, in my opinion, that perhaps it might be well if the committee could see fit and have a quorum present and sit this afternoon and finish off this business.

Mr. Saylor. I yielded for an observation. Now I have an amendment.

Page 12, section 11, line 9, after the word "appropriated" strike the comma and insert the following: "such sums as may be required to carry out the purpose of this Act but not to exceed $1,000,000,000."

Now the purpose of this amendment that I have is to take care of the action which the committee took yesterday. Yesterday we very graciously went along with our colleague from Colorado, and very properly so, for a project in the Colorado storage known as the Curecanti project, and it was adopted in this committee.

Now certainly if the committee adopted the resolution, they certainly intended to pay for it; and if they intend to pay for it, we have got to provide the money.

Now there seems to be some confusion as to just what this is going to cost the --

Mr. Dawson. Will the gentleman yield?

Mr. Saylor. I will not yield. I only have a couple of minutes here.

Mr. Dawson. I just wanted to say to the gentleman we will

accept his amendment.

Mr. Aspinall. Now --

Mr. Harrison. Does the gentleman yield or does he not?

Mr. Saylor. I do not.

Mr. Harrison. The gentleman refuses to yield.

Mr. Saylor. I want to say there are figures which have been submitted by the Bureau indicating that the cost of the high Curecanti is $80 million. Now it was very evident at the time the gentleman from Colorado made his amendment, which was adopted by this committee, that he did not want high Curecanti, in fact, he was very careful to fix the maximum elevation at which the water could be stored; and the purpose of it was to prevent a town in his district from being flooded out.

But the best estimate that anybody has seen -- and I just called this morning -- is that even the low Curecanti which he suggested would be $49,300,000.

Now I think the members of this committee have had enough experience with the Bureau of Reclamation to know that they cannot even come that close, and I do not want this bill to be considered as a bargain bill. This is not a sale item. This is not a one-cent sale which has become so popular. We want to give this great Bureau of Reclamation and all of its engineers, who have been able in 50 years to build one project at cost, a lot of money they can play with. So I am willing to up this $700,000, according to the best estimates which

they have, because I want this to be rounded out in a nice figure of a billion dollars.

Mr. Dawson. A parliamentary inquiry?

Mr. Aspinall. Will you yield to me?

Mr. Saylor. I will yield to my good colleague from Colorado.

Mr. Aspinall. I appreciate the position of my colleague, I think all of us do. We know he would like to refer to this as a "billion-dollar bill." But do not put the onus on your colleague from western Colorado.

Mr. Saylor. Oh, no.

Mr. Aspinall. We did yesterday, with the help of my colleagues, not quite bring this to a billion-dollar bill. Would my colleague be willing to make it $199,300,000?

Mr. Saylor. I do not want to put the onus on my colleague and that is why I fixed it at a billion dollars. The reason I fixed it at a billion dollars is that I do not want you to go back to Colorado and have it said that you were responsible for having this really tremendous sum. I want this big committee to step right up to it and assume the responsibility for a billion dollars when they go on to the floor of the House.

Mr. Aspinall. Of course, my colleague --

Mr. Saylor. As much as I love my colleague from Colorado and as much as I admire him, I would not want the people back

there to say he was responsible for the expenditure of this $49,300,000. So since the Bureau has always been under before-- I would like to call the attention of the committee to that business which we had before, namely, one up in Alaska known as Eklutna -- knowning the experiences which we have had -- and there has not been much change downtown with the engineers and their estimates -- then I think we are being very conservative when we only give them an additional $300,000, and I think that we ought to give them at least a billion dollars.

Mr. Harrison. The time of the gentleman from Pennsylvania has expired.

Mr. Bentsen. Mr. Chairman, a comment off the record.

(Discussion off the record.)

Mr. Harrison. The question has been called for. All those in favor of the amendment of the gentleman from Pennsylvania will say aye.

Those opposed, no?

In the opinion of the Chair the ayes have it.

Mr. Dawson. Mr. Chairman?

Mr. Harrison. Mr. Dawson.

Mr. Dawson. I have just two minor amendments which are noncontroversial.

Mr. Saylor. I am delighted to know they are not controversial.

Mr. Dawson. On page 11, line 10, insert the word in

italics "necessary."

Mr. Hosmer. Where is that?

Mr. Dawson. Page 11, line 10, the word in italics -- "necessary." That is conforming to the previous practices. In other words, it is our feeling that we would not want the Government to withdraw lands if they were not necessary. I do not think there would be any question on that.

Mr. Saylor. Where?

Mr. Dawson. Page 11, line 10. In other words, the Secretary may withdraw land, and we felt that he should not be withdrawing it unless it was necessary.

Mr. Harrison. Any objection to that amendment?

Mr. Hosmer. Will you yield to me?

Mr. Dawson. Yes.

Mr. Hosmer. I am going to ask you a question that you have asked me several times. Why is this necessary, because of the fact you have expressed such reliance upon the great judgment and obedience to law of the Secretary of the Interior?

Mr. Dawson. I have no objection if you want to take it out. It does not make any difference.

Mr. Hosmer. I just asked the question. Do you have an answer for it?

Mr. Dawson. I think we have put plenty of curbs on him as we have gone along.

SEVERAL MEMBERS. Question.

Mr. Harrison. Any further discussion? The question has been called for. All those in favor of the amendment by Mr. Dawson, page 11, line 10, will say aye.

Opposed, no?

In the opinion of the Chair the ayes have it.

Mr. Saylor. A point of order. The House is in session.

Mr. Harrison. The point of order has been raised that the House is in session. The point of order will be sustained.

The committe started working at 10:30 this morning and we have consumed an hour and one-half of the two hours which were allotted yesterday by the action of the committee.

The committee will stand adjourned until April 29 at ten o'clock a.m., for one-half hour's work on amendments. Following that one-half hour there will be a vote on the bill.

Mr. Hosmer. I ask unanimous consent that the time on April 29 be extended for an additional hour and a half.

Mr. Regan. I object.

Mr. Harrison. Objection has been heard.

Mr. Hosmer. I will so move.

Mr. Harrison. A point of order has been raised, Mr. Hosmer. The committee cannot transact any business, I regret to say. The committee stands adjourned.

(Whereupon, at 12:02 p.m., the subcommittee adjourned, to reconvene at 10:00 a.m., Thursday, April 29, 1954.)

H. R. 4449

- - -

TO AUTHORIZE THE SECRETARY OF THE INTERIOR TO CONSTRUCT, OPERATE, AND MAINTAIN THE COLORADO RIVER STORAGE PROJECT AND PARTICIPATING PROJECTS, AND FOR OTHER PURPOSES.

- - -

TUESDAY, MAY 18, 1954

House of Representatives,

Committee on Interior and Insular Affairs,

Washington, D. C.

The Committee met at 9:30 a.m. in the Committee Room of the House Committee on Interior and Insular Affairs, the Honorable A. L. Miller (The Chairman) presiding.

The Chairman. We have for further consideration at this time H. R. 4449.

Let the Chair inquire of the Clerk: When we recessed, when the House was in session last Thursday, I believe there was an amendment pending before the Committee.

Mr. Young. Mr. Chairman, I have several amendments.

The Chairman. I would like to ask: Was there an amendment pending at that time? I thought there was an amendment pending at that time. That will be the next order of business.

Let the Chair say that when we closed before we had

hoped we might finish the bill in thirty minutes. Is there any objection to limiting debate to all amendments and to all amendments thereto to thirty minutes?

Mr. Young. I have three or four amendments, Mr. Chairman. I am not sure how long they will take.

Mr. Saylor. Mr. Chairman, I move the time be limited to 11:45.

Mr. Engle. May I be heard on the motion?

The Chairman. The gentleman from California may be heard.

Mr. Engle. May we find out how many amendments will be offered? I have one I would like to have five minutes on.

Mr. Regan. I have an amendment.

The Chairman. The motion was: Not later than 11:45?

Mr. Saylor. Not later than 11:45.

Mr. Engle. Let us get an idea of who has amendments and divide the time.

The Chairman. How many amendments are there?

Mr. Engle. I have one.

The Chairman. Mr. Young.

Mr. Young. I have four.

The Chairman. Mr. Regan has one. That is six.

Mr. Engle. Six times five is thirty minutes.

The Chairman. Thirty minutes would give five minutes

on an amendment.

Mr. Saylor. Five minutes for and five minutes against; to make it not later than 11:45.

The Chairman. Not later than 11:45. We will proceed on that basis, without objection.

The amendment pending when we recessed or adjourned on last Thursday can be reported.

Let us try to limit debate on the amendments to not more than ten minutes. We will ask the Clerk to keep the time on the amendments.

The gentleman from Pennsylvania, Mr. Saylor, had an amendment pending, I believe.

Mr. Saylor. On page 18, line 3, strike out the provision,

"contracts relating to municipal water supply may be made without regard to the limitations of the last sentence of section 9(c) of the Reclamation Project Act of 1939;"

The Chairman. The gentleman is recognized on his amendment.

Mr. Saylor. I have spoken, Mr. Chairman, on that. I say that the municipal water supply in this project should be subject to the same rules and regulations of municipal water supply for other projects. That is all.

The Chairman. Are there any other comments?

Mr. Saylor. Question.

My motion is to strike out, and make the municipal water supply in this project subject to the same rules and regulations that there are on other projects.

The Chairman. The motion is on the amendment, page 18, line 3.

Mr. Engle. What are the limitations? May I ask a question?

The Chairman. The gentleman may.

Mr. Engle. What limitations are provided in Section 9(c) of the Reclamation Project Act of 1939, which are taken off?

Mr. Saylor. The present law is this: That no contract relating to municipal water supply or miscellaneous purposes or for electrical power purposes shall be made unless in the judgment of the Secretary it will not impair the efficiency of the project for irrigation purposes. That is the present law.

Mr. Aspinall. Mr. Chairman, I would like to be heard.

The Chairman. Mr. Aspinall is recognized.

Mr. Aspinall. This goes to the heart of the control of the use of water in the western states. It is not only the use of water, but the state's power to declare priorities of use.

In the State of Colorado we have a system whereby

domestic water users have first priority. All rights can be condemned for that use where it is found to be necessary. Then come the other uses. Irrigation is placed down around the third place.

If we do not have this provision in this bill it takes away from the state the right to determine just what uses shall have priority. This is placed here so that if there is any necessity for using the water which will be taken into consideration by this legislation the state can go ahead and declare the right of the municipality to be first.

The present Reclamation Law, as our colleague from Pennsylvania states, is to the effect that irrigation users have priority. We folks in the West contend that the states should have jurisdiction over this question. It is not a matter for federal determination.

Mr. Saylor. In other words, Mr. Aspinall, what you are trying to tell this Committee is that you are in favor of having one law apply to this section, which will be affected by the Upper Colorado River Basin, and another law apply to the other, so far as municipal water is concerned.

Mr. Aspinall. If the gentleman has asked me to yield, he has not stated my position correctly. I still maintain that the states should have the right to make the priority
7-13 on the use of water.

The Chairman. Are there any other comments? If not,

the question is on the amendment. Those in favor signify by saying "Aye".

(General response of "Aye".)

The Chairman. Contrary, "No".

(General response of "No.".)

The Chairman. The Chair is in doubt. Those in favor of the amendment signify by holding up their right hands. The Clerk will count. Seven.

Those opposed? Seven.

The vote is seven to seven. The Chair votes "No". The amendment is defeated.

For the next amendment the Chair recognizes Mr. Young. Then he will recognize Mr. Regan for his amendment.

Mr. Young. Mr. Chairman, I would like to first move to amend the present Section 6 by striking out the existing language and inserting the language contained on the typewritten memorandum which has been distributed.

(The information is as follows:)

A H. R. 4449 - Committee Print No. 21; p.22, sec.6.

The hydroelectric power plants authorized by this Act to be constructed, operated, and maintained by the Secretary shall be operated in conjunction with other Federal power plants, present and potential, so as to produce the greatest practicable amount of power and energy that can be sold at firm power and energy rates, but no exercise of the authority hereby granted shall affect or interfere with the operation of any provision of the Colorado River Compact, the Upper Colorado River Basin Compact, the Boulder Canyon Project Act, the Boulder Canyon Project Reimbursement Act, or any contract lawfully entered into under said Acts without the consent of the other contracting parties. Neither the impounding nor the use of water for the generation of power and energy at the plants of the Colorado River Storage Project shall preclude or impair the appropriation for domestic or agricultural purposes, pursuant to applicable State law, of waters apportioned to the States of the Upper Colorado River Basin.

- - - - - - -

Mr. Young. In effect the present Section 6 provides for disposition of power created or produced on the Upper Colorado Project. It gives a priority to the Upper Basin and prohibits the sale of firm power to the Lower Basin for periods of more than twenty years.

In essence my proposed substitute would grant the same right to purchase this power produced at Glen Canyon and Echo Park, on the same basis, upon the same conditions as the states of the Upper Basin.

I oppose the present provisions of Section 6 for a number of reasons. In the first place, I think the priority provisions of the present Section 6 are novel, arbitrary, and unprecedented.

The Bureau of Reclamation at the present time disposes of some 20 billion kilowatts of power each year. I have been unable to find any place where a geographic limitation is put upon the distribution of power. In most instances the only limitation is one of economic transmission.

I recall having read one provision of the Bonneville Power Administration Act, which provides with respect to preference customers that the economic transmission shall be the determinant factor in determining who shall be the consumer.

When Hoover Dam was constructed it is my understanding there was no limitation upon who would be allowed to purchase

the power.

It so happens that none of the states of the Upper Basin desired to participate, so the power was distributed to allottees all of whom were located in the Lower Basin.

Secondly, I oppose the present provisions because I do not believe they make a maximum use of facilities so as to obtain an optimum amount of firm power. The thing that will best develop our economy and create growth of the western states is a maximum amount of firm power.

I can visualize some day when the Colorado River is developed and such plants as Bridge, Marble, and seven or eight additional multiple-purpose dams are constructed, that the Upper Basin will be able to have an integrated grid system which will permit the production of maximum firm power, which is the type of power upon which industry can depend to come in and invest and contribute to the economic growth of that area.

As a corollary of that, by failing to produce the maximum firm power I think we are reducing the maximum income or revenues that can be obtained from the production of this power. Our reclamation is expensive. I know many of our colleagues from the East look askance at the millions they are asked to invest in Western reclamation.

I think in considering these bills we should try to formulate plans and enact legislation which will permit the

obtaining in revenues of the maximum amount of money so as to lighten the burden upon our taxpayers.

I think that by providing for integration of power produced on the Colorado River and by allowing all of the states to participate on an equal basis we can obtain the maximum amount of firm power and as a result thereof get the greatest amount of income to help pay for the investment on the part of the American taxpayers.

Lastly, I think the plan which provides for a basin use or a basin priority with respect to distribution of power violates the basic philosophy of our federal power legislation, which is to obtain the most widespread use of our power to make the maximum use of our resources.

I particularly am interested in the position of the State of Nevada with respect to this power. We have limited power resources. We do not have the vast coal and oil of the Upper Basin. We have a growing industrial area in Southern Nevada, particularly in the city of Henderson. We are producing, I believe, the largest part of the titanium produced in this country at the present time. It is highly sought after by the Air Force.

There is a serious power shortage. If this project is constructed of course we in the Lower Basin are anxious to see the Upper Basin continue with its development. There is no doubt but what there will be a reduction of power at

Hoover Dam. Hoover Dam now produces some 4.3 billion kilowatts of power each year, which are distributed to consumers in the Lower Basin. There is already a power shortage in that area.

If Glen Canyon is filled it will result in an increased power shortage which will only further the difficulties of industrial growth in that area.

Mr. Bentsen. Will the gentleman yield?

Mr. Young. Very well.

Mr. Bentsen. Has his time expired?

The Chairman. The gentleman's time has expired. Does anyone wish to be heard in opposition?

Mr. Bentsen. I would like to be heard.

The Chairman. The Chair recognizes Mr. Bentsen.

Mr. Bentsen. I had a little difficulty hearing you at first.

Can you show me specifically what the difference is in objective?

Mr. Young. Yes, I can.

Mr. Bentsen. Between the wording as it is in the bill and your amendment?

Mr. Young. The present provisions of Section 6 provide that the Lower Basin states shall not be able to purchase power for more than twenty years. My substituted Section 6 would provide for disposition of power under the provisions

of Reclamation Law, allowing the Secretary of Interior to dispose of the power in a manner which he feels will give the most widespread value to its disposition for forty-year periods.

Mr. Bentsen. I yield to the gentleman from Colorado.

Mr. Aspinall. In other words, as I understand your amendment, it permits the following procedure: If the firm power can be made more effective in the Lower Basin at any time in the future than the use of such power could be made effective in the Upper Basin, it permits the Lower Basin to use the power at the expense of the development of the Upper Basin.

Mr. Young. Not at the expense of the development of the Upper Basin, because the Upper Basin is getting the revenue from the sale of the power at the present time. It enables the irrigation and reclamation development of the Upper Basin.

This will allow all states in the Upper and Lower Basins and elsewhere, if within economic distance of the production of that power, to put in their offers or applications for distribution of power.

Mr. Aspinall. Then your answer is that this supervision and administration is not to be made at the expense of the Upper Basin; is that right?

Mr. Young. Not at the expense of the Upper Basin,

unless the gentleman assumes that the Upper Basin has a priority with respect to this power, which, of course, I do not assume. It is admitted that they do with respect to the water, but there are other benefits, too.

Mr. Aspinall. If the Lower Basin and the Upper Basin should both need the power in the future, at any time in the future, if the use had already been established in the Lower Basin, the Upper Basin would have to look elsewhere for its power?

Mr. Young. The Upper Basin has seven additional multiple-purpose dams which will be constructed. It has vast resources of oil and coal.

Mr. Aspinall. Let me ask my colleague this: It is my understanding that those who represent Nevada in Congress from now on will be friendly toward the authorization of additional projects in the Upper Basin when necessary?

Mr. Young. We certainly want to see the Upper Basin developed. If Bridge Canyon is ever built it is my hope that the Upper Basin will be able to seek power on the same basis as the Lower Basin.

Mr. Bentsen. Is it not correct that what you are saying is that the Lower Basin will be put on an equal competitive basis for the purchase of that power? Your contention is that they have the right to the water but that the power is more of a free agent. The revenues of it go to pay

for the project. The Lower Basin has just as much right to competitively bid for that power; is that right?

Mr. Young. That is it, in essence.

Mr. Bentsen. I yield back the balance of my time.

Mr. Dawson. Mr. Chairman?

The Chairman. Would you yield to the gentleman from Utah? You have two or three minutes left.

Mr. Bentsen. I yield to the gentleman.

Mr. Dawson. I want to say I have no objection to this amendment. I think the objective the gentleman seeks to attain is worth while. I can see some benefit to us in the Upper Basin states in firming up this power.

Mr. Bentsen. It might mean a picking up of the project sooner.

Mr. Dawson. That is right.

The Chairman. The question occurs on the amendment suggested by Mr. Young. The amendment is before you. Those in favor of the amendment signify by saying "Aye".

(General response of "Aye".)

The Chairman. Contrary, "No".

8-23 (Responses of "No".)

The Chairman. In the opinion of the Chair the "Ayes" have it. The "Ayes" have it. The motion is carried.

Mr. Young, have you another amendment?

Mr. Young. Mr. Chairman, with respect to the production

of power at Hoover Dam, at the present time there are a number of power allottees and they have firm contracts which extend up to 1987. The construction of Glen Canyon and the filling of the reservoir behind that, which will contain some 26 million acre-feet, which would hold the entire flow of the Colorado River for several years, means that there will inevitably be some drop in power production in the generators at Hoover Dam. Of course, that was recognized when Hoover Dam was constructed.

It was provided that there would be a diminution of at least 1,000 kilowatts a year, and I believe that is around 8,760,000 kilowatt-hours a year.

If the power is reduced at Hoover Dam, it is going to have a bad effect upon industry in Southern Nevada, Arizona and California.

Mr. Bentsen. Will the gentleman yield to me?

Mr. Young. Yes, I will.

Mr. Bentsen. Have we not just passed an amendment that takes care of you on that, and puts you on a competitive basis for that power which is generated?

Mr. Young. That is for the power to be produced at Glen Canyon. There perhaps will be a reduction in the water which flows into Lake Meade.

Mr. Bentsen. But you have a supplemental source you can bid for now.

Mr. Young. Perhaps it will not be available for a number of years. It takes at least five or six years to complete the construction of Glen Canyon and the filling up of the reservoir behind it. Therefore I would like to amend the new Section 6 by adding:

> "Provided further, that to the extent that the operation of Glen Canyon and Echo Park Dams diminish the production of firm energy at Hoover Dam below the quantities specified in contracts of the United States heretofore made, replacement firm energy from Glen Canyon Dam shall be made available at Hoover Dam upon the same prices, terms and conditions as the Hoover Dam firm energy so replaced."

I feel that it would be only fair that if the existing contracts are harmed by filling up the reservoir behind the Glen Canyon Dam that the Secretary should take that into consideration, and allow newly produced power to go to the allottees whose power has been diminished by the filling of Glen Canyon Dam.

On the amendments, that would be on the second page, paragraph 6:

> "Provided further, that to the extent that the operation of Glen Canyon and Echo Park Dams diminish the production of firm energy at Hoover Dam below the quantities specified in contracts

of the United States heretofore made, replacement firm energy from Glen Canyon Dam shall be made available at Hoover Dam upon the same prices, terms and conditions as the Hoover Dam firm energy so replaced."

We in the Lower Basin are anxious to see the Upper Basin developed, but we hate to see it develop at the expense of firm power contracts now in existence in the Lower Basin.

Mr. Pillion. Will the gentleman yield?

Mr. Young. Yes.

Mr. Pillion. Is there an engineering or a mathematical method by which this reduction in power can be measured definitely?

Mr. Young. Yes, there is. You can take the power head and use a slide rule and come out with the exact amount of reduction. There will be a substantial reduction in the power produced at Hoover Dam with the filling up of Glen Canyon.

Of course, that was anticipated when the original contracts were made. It was visualized that the Upper Basin would develop and as a consequence there would be a reduction in the power. But the reduction will probably be greater than was anticipated in the contracts providing this distribution of power to the present allottees.

Mr. Dawson. Will the gentleman yield to me?

Mr. Young. Yes.

Mr. Dawson. Was it not anticipated that when the Upper Basin put the water to use there would be some diminution of the flow to the Lower Basin?

Mr. Young. Yes, it was. It was estimated, I think, to be 1,000 kilowatts a year, or 8,760,000 kilowatt-hours.

Mr. Dawson. Is it not also a fact that in these contracts which the government has with these power users they took it into consideration, and that there is a clause in there providing that the government is not bound to deliver any particular amount of power?

The Chairman. The time of the gentleman has expired. Does anyone else desire to be heard in opposition to the amendment?

Mr. Dawson. Mr. Chairman, I oppose the amendment. I think if we accept this amendment we will simply be modifying in effect the Colorado River Compact. We are asked to guarantee the Lower Basin the same amount of power which they have had. They have been using the water allocated to the Upper Basin states. If they want to be guaranteed the same amount of power which that additional water gave them they are going completely beyond the agreement contained in the compact.

Mr. Young. Will the gentleman yield for a question?

Mr. Dawson. Yes.

Mr. Young. Of course, the compact says nothing with respect to the present contracts with the allottees. Those were made under the provisions of the Boulder Canyon Project Act.

Of course, it was understood there would be a diminution. However, the amendment I have suggested is only with respect to the firm power. I believe that the other power to a large extent is what they call secondary power and is based upon the additional water which has been coming down, admittedly, from the Upper Basin; more than perhaps would come once the contract is in operation.

Mr. Dawson. I would say your amendment goes further than that. It concerns firm power as well as secondary power. It concerns all power.

Mr. Aspinall. Will my colleague from Utah yield to me?

Mr. Dawson. I will yield to my colleague from Colorado.

Mr. Aspinall. I wish to state my opposition to the proposed amendment. I think that the amendment which our colleague from Nevada suggested before takes care of the equities concerned.

It is my understanding that the feeling of all parties concerned to the Colorado River Compact was that the various basins -- the Upper Basin and the Lower Basin -- should be permitted to develop, and that each should be entitled to the equities of that development.

Now it seems to me that my colleague from Nevada by this proposal, at least, -- and I am not so sure but what by the other, also -- is placing certain road blocks in the way of the equities which the Upper Basin has a right to expect will be received, and those are endangered by his proposal to write into this bill everything which will benefit the Lower Basin and the danger and the cost to the Upper Basin is not clear.

Mr. Bentsen. A parliamentary inquiry. Is the gentleman proposing all these amendments as one?

Mr. Young. Just the one on the second page, at the top of the second page.

Mr. Bentsen. Is that all?

Mr. Young. That is all on this particular section. I have another amendment after this.

Mr. Dawson. Mr. Chairman, I yield back the balance of my time.

The Chairman. The gentleman yields back his time. There are two minutes remaining.

Mr. Harrison. Mr. Chairman?

The Chairman. Mr. Harrison.

Mr. Harrison. I just wanted to add my statement to those made by the gentleman from Utah and the gentleman from Colorado.

All during the hearings on this particular project bill

we of the Upper Basin have tried to assure those of the Lower Basin that we did not want any change made in the Colorado River Compact and that we were perfectly willing at all times to see that the proper language was placed in the bill to see that no change would be made in the compact.

It is my position that we in the Upper Basin want nothing more than the Compact guarantees us. We want to live up to the terms of the Compact, and in return we want the Lower Basin to live up to the terms of the Compact. I think if we follow that Compact explicitly both basins will not suffer.

That was a compact entered into in good faith in 1922. I think that good faith should extend not only to now but into the future.

Mr. Saylor. Will the gentleman yield for an observation?

Mr. Harrison. Yes.

Mr. Saylor. If that is the position which the State of Wyoming takes, and Utah and Colorado take, then I am surprised that they voted to accept the First Amendment which Mr. Young offered, because that goes to the very heart of it and does not do what the gentleman just specified that the upper states desire. It changes entirely the concept of the Colorado River Compact and puts an entirely new light on it, and gives now to the Lower Basin states a right which

they never had and will only have if this bill goes through.

Mr. Dawson. Will the gentleman from Wyoming yield to me?

Mr. Harrison. Yes.

Mr. Dawson. I call the attention of the gentleman from Pennsylvania to the fact that the same wording is already in the bill, practically, which went in with that last amendment.

Mr. Saylor. Oh, no. It is very important to notice that the very important wording which changes the whole context is on page 23, and that has been carefully deleted from the bill.

The Chairman. All time has expired on the amendment offered by the gentleman from Nevada, Mr. Young. Are you ready for the question?

Mr. Bentsen. Question.

The Chairman. Those in favor of the amendment as suggested signify by saying "Aye".

(General response of "Aye".)

The Chairman. Contrary, "No".

(General response of "No".)

The Chairman. In the opinion of the Chair the "Noes" have it. The "Noes" have it.

The Chair observes that the next amendment the gentleman wishes to offer is a new section. I think we will pass over

9-32 that and recognize the gentleman from California, Mr. Engle. Mr. Regan has kindly yielded to the senior member on his side, Mr. Engle.

Mr. Engle. I appreciate that very much, Mr. Chairman.

I offer now the same amendment that was offered in the Subcommittee, with some changes; that amendment having been defeated by one vote.

The purpose of the amendment deals with disagreements about the interpretation of the Compact. It has been agreed throughout these discussions that all of the projects of the Colorado River shall be administered and managed in accordance with the terms of the basic law of the river; the Colorado River Compact and all the other laws of the river.

The only thing which has concerned us is the fact that there have been reoccurring disagreements as to what the Compact means and what the law of the river is. Therefore, we have sought for some assurance for everybody -- not just California, Arizona, or Nevada, but for everybody in the Upper Basin -- that in the management of the river there can be some final determination of the meaning of the Compact where there is disagreement about the Compact.

So this amendment which I shall submit to you has been submitted also to Mr. Aspinall, and he has made some changes. As I read the amendment I will indicate what he has added.

The amendment before you starts:

"The Secretary of the Interior is directed to comply with the applicable provisions of the Colorado River Compact, -- "

and so forth.

Mr. Aspinall has added this language in front of that:

"In the operation and maintenance of all facilities authorized by federal law and under the jurisdiction and supervision of the Secretary of the Interior, in the basin of the Colorado River, the Secretary of the Interior is directed -- "

and so forth. Then follows the language of the amendment as submitted to you.

The purpose of Mr. Aspinall's addition is to make this amendment applicable to the whole basin, and not just the Upper Basin. So down in the middle of the section, where "Upper Basin" appears, he has stricken "Upper Basin" and substituted "Colorado River Basin".

With those two changes that is the amendment which I am offering. It goes on to say that the Secretary is required to comply with all the law of the river, naming the documents, and that in the event of the failure of the Secretary to so comply any state of the Colorado River Basin may maintain an action in the Supreme Court of the United

States to enforce the provisions of this section, and consent is given to the joinder of the United States as a party to such suit or suits.

(The language of the amendment is as follows:)

Page 25, line 2, insert the following:

In the operation and maintenance of all facilities authorized by Federal law and under the jurisdiction and supervision of the Secretary of the Interior, in the basin of the Colorado River, the Secretary of the Interior is directed to comply with the applicable provisions of the Colorado River Compact, the Boulder Canyon Project Act, the Boulder Canyon Project Adjustment Act, and the treaty with the United Mexican States, in the storage and release of water from reservoirs in the Colorado River basin. In the event of the failure of the Secretary of the Interior to so comply, any State of the Colorado River basin may maintain an action in the Supreme Court of the United States to enforce the provisions of this Section, and consent is given to the joinder of the United States as a party in such suit or suits.

- - - - - - -

Mr. Engle. I have briefly stated the purpose of this amendment; that is, to settle quickly and effectively disagreements about the interpretation of the basic compact.

It is altogether conceivable that both sides would swear up and down they were complying with the compact; the Secretary would say he was; but there would be disagreement either in the Upper Basin or in the Lower Basin or by some state that he had correctly interpreted the compact.

This amendment would allow any state so affected -- that means Wyoming, Colorado, Utah and all the others in the Upper Basin, or any state in the Lower Basin -- Nevada or Arizona or California -- to step in and ask for an immediate interpretation, because this amendment deals solely with management of the river and it does not -- and I emphasize this -- does not interfere with construction of the project.

I want to make it perfectly clear that there is no intention in offering this amendment to interfere with construction of the project. It relates solely to management of the river. Because it relates solely to management of the river it facilitates a problem for everybody. I hope the amendment will be adopted.

I now yield to Mr. D'Ewart.

Mr. D'Ewart. I remember all of the arguments that we had in the Arizona-California case about justiciable issues. As I remember it, only the Supreme Court can determine what

is a justiciable issue before that court. Here we are trying to write into the law that in the event of failure to comply then there is a justiciable issue. I believe that is something which the Supreme Court has to determine, and not the Congress.

Mr. Engle. The gentleman is correct, except as to what this amendment does. The Congress cannot create a justiciable issue. Each case is taken into the Supreme Court and the Supreme Court says that if it is not a justiciable issue then the petitioner is immediately tossed out. That is what will happen if this amendment goes into effect, as under all circumstances. It does not create a justicable issue.

It would be impossible for Congress in the very nature of the case to legislate a justiciable issue. If it is not there it is not there, and the Supreme Court would so declare.

Mr. Rhodes. Is it not true that about all this amendment does, Mr. Engle, is to give consent to the joinder of the United States as a party to any such action? You will remember that in the action between the two states the court has held that the United States is a necessary party, and we have had trouble at times getting the United States in.

Mr. Engle. That is correct, with one limitation, and that is the one I want to put my finger on: It limits the

consent to those actions relating to the management of the river. You will note the specific language:

" -- in the storage and release of water from reservoirs in the Colorado River Basin."

It is those downstream from the Upper Basin as well as those upstream.

Mr. Donovan. I ask unanimous consent that the gentleman from California have one more minute.

Mr. Engle. Take the time yourself.

The Chairman. The debate is limited. Take the time yourself.

The Chair will recognize the gentleman from New York, Mr. Donovan.

Mr. Donovan. For one specific question.

Will the gentleman from California agree that this amendment, if adopted, will to some extent broaden the area of litigation which now exists?

Mr. Engle. No, it will not. It will merely facilitate the procedure for getting the litigation settled. Otherwise it would be necessary in each instance for a state disagreeing --

Mr. Donovan. Will it broaden it to any extent, however slight?

Mr. Engle. It would not. It would not broaden the field of litigation. It would merely facilitate litigation.

Mr. Donovan. Then what is the need for it?

Mr. Engle. Because you have to have the consent of Congress to go into court. There would be a constant barage of bills in here to get consent.

Mr. Donovan. Does the state have to have the consent of Congress to sue another state?

Mr. Engle. No, but you have to have the consent of Congress to join the Federal Government, and the Supreme Court has held that the Federal Government is a necessary party on the Colorado River.

Mr. Donovan. Then it does broaden the area of litigation.

Mr. Engle. It does not broaden the area of litigation; it only facilitates the method for getting it into court.

Mr. Donovan. It brings another party into it who would not be in it before, does it not?

Mr. Engle. That depends. We could get a bill through Congress. This simply takes care of it ahead of time.

Mr. Rogers. Mr. Engle, would this amendment not open a field where the parties could control the situation, if they could have the Supreme Court rendering declaratory judgments?

Mr. Engle. That is right. Any time you have a disagreement about the river you can step in and get it settled.

Mr. Rogers. The thing about it is that this amendment,

as Mr. D'Ewart pointed out, actually in effect permits the states to determine what is a justiciable issue.

Mr. Engle. No, it does not. The Supreme Court will determine that in any case. All this does is give the parties a chance to get a final decision, because there is not going to be any final decision, if there is disagreement on the interpretation of the compact, except in the Supreme Court.

The Chairman. Mr. Donovan, will you yield to Mr. Rhodes of Arizona?

Mr. Donovan. I will yield to anybody who wants the time.

The Chairman. Mr. Rhodes.

Mr. Rhodes. It is my understanding this would not create a justiciable issue and could not create a justiciable issue where none exists.

Mr. Engle. That is correct.

Mr. Rhodes. This is purely a matter of allowing these states to get into court to decide the one question of the storage of water and its release from the Upper Basin to the Lower Basin.

The Chairman. Will the gentleman yield to Mr. Pillion of New York?

Mr. Donovan. Do I still have the time?

The Chairman. Yes.

Mr. Donovan. I yield.

Mr. Pillion. This amendment appears to grant injunctive relief against the United States, but supposing that the injunctive relief were given to a state against the United States and then the United States were to violate it. Would this amendment give rise to a possible action for money damages and thereby create new liabilities and broadened liabilities against the United States Government? After the United States Government has financed these various projects are we going to be placed in a position where we are then sued by reason of differences that may arise?

Mr. Donovan. I will answer that. It certainly would.

Mr. Engle. May I answer that question? The answer to
10-42 the question is that it would create no liability that would not exist in the absence of the section. All this does is to permit somebody to get into court and take care of the multiplicity of bills which might come along to adjudicate specific issues as they arose. It gives everybody a chance to get a final determination.

Mr. Donovan. May I have the last few minutes of my five minutes?

The Chairman. The time of the gentleman has expired. All time has expired on this amendment.

The vote occurs on the amendment suggested by Mr. Engle of California, page 25, line 2.

Are you ready for the question? All those in favor of the amendment signify by saying "Aye".

(General response of "Aye".)

The Chairman. Contrary, "No".

(General response of "No".)

The Chairman. The Chair is in doubt. Those in favor of the amendment signify by raising their right hands. The Clerk will count. Nine.

Those in opposition?

The vote is nine "Ayes" and ten "Nays". The motion is lost.

The next amendment to be offered is by Mr. Regan of Texas, who is recognized for his amendment for five minutes.

Mr. Regan. On page 19, line 21, I want to add this proviso following the period:

> "Provided further, that the subsidy from power revenues to assist the participating irrigation projects in each state shall be proportional to the revenues derived from sale of power of the Colorado River Storage Project in that state."

That is to limit the moving of this money from one state to another; and I have in mind particularly the State of New Mexico, where they propose putting in participating projects in the number of four power dams, which we are convinced would not be profitable.

I do not want to see them moving money from the Upper States to subsidize those projects on the Rio Grande River or its tributaries.

Mr. Dawson. Would the gentleman yield to me?

Mr. Regan. Yes.

Mr. Dawson. Does that mean that Arizona, getting Glen Canyon Dam, the big power producer, would be entitled to the revenues from Glen Canyon? That is about six miles across the line from Utah. Then Echo Park is about thirteen miles across the line, in Colorado.

Mr. Regan. It might have that effect.

Mr. Dawson. I am opposed to the amendment.

Mr. Regan. I move the adoption of the amendment. It is a very good and wholesome amendment.

Mr. Saylor. Mr. Chairman, I would like to concur in the statement of the gentleman from Texas. It is a wholesome amendment.

The Chairman. Are there any other comments? If not, the vote occurs on the amendment offered by Mr. Regan of Texas. Those in favor of the amendment signify by saying "Aye".

(General response of "Aye".)

The Chairman. Contrary, "No".

(General response of "No".)

The Chairman. The Chair is in doubt.

Mr. Aspinall. Mr. Chairman, I ask for a roll call.

The Chairman. A roll call is called for. The Clerk will call the roll.

Mr. Huyck (The Clerk). Mr. Aspinall?

Mr. Aspinall. No.

Mr. Huyck. Mr. Bender? Mr. Bentsen?

Mr. Bentsen. Present.

Mr. Huyck. Mr. Berry?

Mr. Berry. No.

Mr. Huyck. Mr. Budge? Mr. Dawson?

Mr. Dawson. No.

Mr. Huyck. Mr. D'Ewart?

Mr. D'Ewart. No.

Mr. Huyck. Mr. Donovan?

Mr. Donovan. Aye.

Mr. Huyck. Mr. Engle?

Mr. Engle. No.

Mr. Huyck. Mr. Gross?

Mr. Gross. Aye.

Mr. Huyck. Mr. Haley?

Mr. Haley. Present.

Mr. Huyck. Mr. Harrison?

Mr. Harrison. No.

Mr. Huyck. Mr. Hosmer?

Mr. Pillion. "Aye" by proxy.

Mr. Huyck. Mr. O'Brien?

Mr. Regan. "Aye" by proxy.

Mr. Huyck. Mrs. Pfost?

Mrs. Pfost. No.

Mr. Huyck. Mr. Pillion?

Mr. Pillion. Aye.

Mr. Huyck. Mr. Regan?

Mr. Regan. Aye.

Mr. Huyck. Mr. Rhodes?

Mr. Rhodes. Aye.

Mr. Huyck. Mr. Rogers?

Mr. Rogers. Aye.

Mr. Huyck. Mr. Saylor?

Mr. Saylor. Aye.

Mr. Huyck. Mr. Shuford?

Mr. Shuford. Aye.

Mr. Huyck. Mr. Westland?

Mr. Westland. No.

Mr. Huyck. Mr. Wharton?

Mr. Wharton. Aye.

Mr. Huyck. Mr. Yorty?

Mr. Regan. "Aye" by proxy.

Mr. Huyck. Mr. Young?

Mr. Young. No.

Mr. Rhodes. Mr. Chairman, before the vote is announced

I would like to change my vote from "Aye" to "No".

Mr. Haley. Mr. Chairman, I would like to vote "Aye".

The Chairman. The Chair would like to examine the proxies that are offered. There were two or three proxies voted. Mr. Regan and Mr. Pillion voted proxies.

Mr. Budge. Mr. Chairman?

The Chairman. Mr. Budge.

Mr. Budge. A point of order. Am I entitled to vote on this motion?

The Chairman. The vote has not been closed. The gentleman is entitled to vote.

Mr. Budge. I wish to be recorded as voting "No".

The Chairman. The vote will be recorded. The Chair feels that the proxies are in order.

Mr. Westland. Mr. Chairman, I would like a typewritten copy of that amendment.

Mr. Saylor. Point of order, Mr. Chairman.

The Chairman. It is too late. The amendment is before the Committee.

The vote is 12 "Aye" and 11 "Nay".

The Chair votes "No". The amendment is lost for lack of a majority.

Is there any other amendment to be offered at this time?

Mr. Young. I have one more amendment, Mr. Chairman.

The Chairman. Mr. Young.

Mr. Young. Mr. Chairman, I would like to add a new section, to be known as Section 11, which will read as follows:

"Section 11. Section 2(d) of the Boulder Canyon Project Adjustment Act (Act of July 19, 1940, 54 Stat. 774), is amended by adding thereto the following:

"'Upon the commencement of operation of the Glen Canyon Power Plant, the payment from Hoover Dam power revenues of $500,000 per year into the Colorado River Development Fund shall cease, and thereafter the amounts payable annually to each of the states of Nevada and Arizona out of Hoover Dam power revenues in lieu of taxes shall be increased from $300,000 to $550,000.'"

The Chairman. The gentleman is recognized for five minutes.

Mr. Young. In 1940 with the enactment of the Boulder Canyon Project Adjustment Act the sum of $500,000 was given annually to the Upper Basin states for the purpose of investigation and development.

Mr. Rhodes. Mr. Chairman, a point of order. The Committee is not in order.

The Chairman. The point is well taken. We will ask that the Committee be in order.

You may proceed.

Mr. Young. With the enactment of the Boulder Canyon Project Adjustment Act of 1940 the sum of $500,000 annually was given to the Upper Colorado Basin for the purpose of investigation and development of reclamation on the Colorado River. I believe that terminates in 1955, and thereafter the $500,000 is distributed between the Upper and Lower Basin.

At the time of the enactment of the Boulder Canyon Project Adjustment Act it was my understanding that $300,000 was to be paid to Arizona and Nevada in lieu of taxes. In Nevada and Arizona you have Lake Meade, which contains some 30 million acre-feet and has a shore line of 550 miles.

In the State of Nevada you have Boulder City, which is federal property and not subject to taxation, which furnishes an additional burden upon the state.

The $300,000 was given to the State of Nevada in lieu of taxes, which could not be assessed or collected against federal property. The same is true, I understand, with respect to the State of Arizona.

In view of the inflation which has occurred during the past decade I feel it only fair that the in-lieu amount of $300,000 be raised to $550,000 and that now since the Upper Basin States will soon have the operation, I hope, of Glen Canyon, Echo Park, and other power producers in the future, it will no longer be necessary to pay to them the $500,000 each year for the purpose of development of the Upper Basin

region.

Therefore, I urge the adoption of this new section which would raise the in-lieu taxes or payments from $300,000 per year to $550,000; the sum, of course, to come from the $500,000, which now comes from revenues of Hoover Dam for development of the Upper Basin region.

Mr. Saylor. Mr. Chairman, I have a substitute amendment.

The Chairman. The gentleman may offer it.

Mr. Saylor. At the end of line 4 of the amendment offered by the gentleman, after the word "cease", place a period and strike the remainder of the paragraph. The effect of this would be that after the commencement of operation of Glen Canyon power unit the $500,000 shall be paid into the United States Treasury.

The Chairman. Any other comments?

Mr. Pillion. I would like to offer another amendment.

The Chairman. An amendment to the amendment?

Mr. Pillion. Yes, an amendment to the substitute amendment.

The Chairman. I think it would be in order.

Mr. Pillion. On the last line of the original amendment, instead of $550,000, substitute the sum of $400,000, which would give each of the states $100,000 and save the United States Government $300,000.

The Chairman. The vote occurs on the amendment offered

by the gentleman from New York, Mr. Pillion.

Mr. Bentsen. Does the gentleman want to withdraw his amendment?

The Chairman. Those in favor of the amendment signify by saying "Aye".

(General response of "Aye".)

The Chairman. Contrary "No".

(General response of "No".)

The Chairman. The motion is defeated.

The vote now occurs on the amendment offered by the
11-51 gentleman from Pennsylvania, Mr.Saylor. Those in favor of the amendment signify by saying "Aye".

(General response of "Aye".)

The Chairman. Contrary, "No".

(General response of "No".)

The Chairman. In the opinion of the Chair the "Noes" have it. The "Noes" have it.

The vote now occurs on the amendment offered by the gentleman from Nevada.

Mr. Aspinall. Mr. Chairman, I wish to speak in opposition.

The Chairman. The gentleman can be heard. According to the Chair's record there are four minutes left.

Mr. Aspinall. I just wish to say this to my colleagues: This amendment would come in good grace, it seems to me, after

Glen Canyon gets into operation and the revenues begin, but at the present time, without any definition here at all as to what is to be considered a commencement, or any study at all of how much revenue will come from the Glen Canyon Project when the wheels begin to turn, it seems to me that the gentleman from Nevada has lost sight of the fact that the Upper Basin has cooperated with the Lower Basin on the Boulder Canyon Project Adjustment Act. That was part of the philosophy behind the legislation.

Mr. Rhodes. Will the gentleman yield?

Mr. Aspinall. Yes.

Mr. Rhodes. Is it not true that the $500,000 was originally paid to more or less compensate the Upper Basin for the fact that the water was coming down the river and was being used to manufacture power in the Lower Basin? At such time as the Glen Canyon Dam begins to fill up the water which was coming down as surplus will no longer be coming.

Mr. Aspinall. I do not think that was the reason for it. I think the reason for it was the study of the Upper Basin, so that the Upper Basin interests could be harmonized with the Lower Basin interests in the development of each one of the areas.

Mr. Dawson. Would the gentleman yield to me?

Mr. Aspinall. I yield.

Mr. Dawson. Would it not be a more appropriate procedure to come in after these projects are in and then amend the Boulder Canyon Project Adjustment Act, which was a separate act entirely, rather than to come in with this new legislation and attempt to amend that act?

Mr. Aspinall. Of course.

Mr. Dawson. At that time you could see just what the needs were and what the equities were.

The Chairman. The vote now occurs upon the amendment offered by Mr. Young. Those in favor of the amendment signify by saying "Aye".

(General response of "Aye".)

The Chairman. Contrary, "No".

(General response of "No".)

The Chairman. In the opinion of the Chair the "Noes" have it. The "Noes" have it. The amendment is defeated.

Are there other amendments to the bill?

Mr. Saylor. Mr. Chairman, I move to strike out the last word.

The Chairman. The gentleman is recognized. Have you an amendment to offer?

Mr. Saylor. I have no amendment to offer at this time, Mr. Chairman, but I move to strike out the last word because on Friday of last week --

Mr. Dawson. Mr. Chairman, a parliamentary inquiry.

Mr. Saylor. I have the floor. I refuse to yield.

Mr. Dawson. I think a parliamentary inquiry is in order.

The Chairman. Will the gentleman yield the floor?

Mr. Saylor. No, I refuse to yield. I have only a few minutes and I will not take the time.

Mr. Dawson. A point of order, Mr. Chairman.

The Chairman. The gentleman has a point of order.

Mr. Dawson. The point of order is this: According to the ruling of the Chair and the concurrence of the Committee we were to vote on this measure at a quarter to 12:00. Is the gentleman from Pennsylvania going to be given all the time from now on until a quarter of 12:00, or will some of the rest of us be given an opportunity?

The Chairman. The time, the Chair must rule, was allocated for the presentation of amendments. Unless the gentleman from Pennsylvania has an amendment to offer he could hardly be recognized for five minutes.

Mr. Saylor. Very well, Mr. Chairman. I will offer this in the form of an amendment.

Mr. Engle. Mr. Chairman, I have a motion on an amendment.

The Chairman. The Chair asks if there are other amendments.

Mr. Engle. I have one.

Mr. Saylor. I have an amendment, Mr. Chairman, which I

asked to be recognized for.

The Chairman. There are approximately four minutes left. The gentleman from Pennsylvania is recognized for two minutes, and the gentleman from California, Mr. Engle, is recognized for two minutes, to present their amendments.

Mr. Saylor. Mr. Chairman, my amendment will have to do with the placing as a part of this bill of the letter or the paragraphs from the letter directed by Mr. Ralph A. Tudor, the Under Secretary of the Interior, to William A. Harrison, the Chairman of the Subcommittee on Irrigation and Reclamation.

Mr. Harrison. A point of order, Mr. Chairman.

Mr. Saylor. It has been pointed out --

Mr. Harrison. No amendment has been proposed at the present time, or designated by the gentleman from Pennsylvania, as to where the amendment would take place.

Mr. Saylor. After the last section, sir. I would be glad to put it in the last section. Add a new section, whatever the number is, and make it a new section.

It will take the form of a letter from the Secretary of the Interior. I would like to read it.

"On January 18, 1954, I appeared before your Subcommittee and testified on behalf of the Upper Colorado River Project. A part of that testimony was a recommendation that the Echo Park and Split

Mountain Dams be included in the project. These two dams have been opposed by persons and organizations interested in conservation. This Department recommended construction of the dams rather than other possible alternates for various reasons including lesser evaporation losses.

"On March 9 I advised you by letter of certain errors that had been made by me in my testimony, and I particularly advised you that if a high dam should be built at Glen Canyon in lieu of dams at Echo Park and Split Mountain the increased losses for evaporation will amount to 70,000 acre-feet per year."

The Chairman. The time of the gentleman from Pennsylvania has expired.

Mr. Saylor. I ask for a vote on it.

The Chairman. It is hardly an amendment to the bill. It was not designated as a new section.

Mr. Saylor. It has been designated as a new section at the end of the bill; add a new section.

Mr. Harrison. I raise a point of order, Mr. Chairman, that that is not an amendment.

The Chairman. The Chair will sustain it. It is not an amendment to the bill.

The gentleman from California is recognized for two

minutes.

Mr. Engle. Mr. Chairman, I move reconsideration of the vote whereby the Committee failed to adopt the amendment which I offered a few minutes ago. I will submit the motion and ask for yeas and nays.

Mr. Donovan. A point of order, Mr. Chairman. A point of order. I understand the parliamentary rule is that only a Member of the Committee who votes against the amendment can move for reconsideration.

The Chairman. The point of order will be sustained.

Let the Chair make one short statement before the final vote is taken on the bill. As Chairman of the full Committee I want to say publicly at this time I appreciate the fine attendance and interest this Committee has taken in not only this legislation but other legislation before the Committee, and the long time which Mr. Harrison's subcommittee has put in on the bill. We have tried to hammer out on the anvil of debate the big, tough problems confronting the country. The Chairman of the Committee appreciates the attention and zeal and earnestness in which amendments have been presented.

Mr. Saylor. Mr. Chairman?

The Chairman. Just before the preferential motion is made, or other motions are made, the Chair reminds the Committee that tomorrow at 10:30 there is a hearing before

the Rules Committee relative to Statehood for Hawaii and Alaska. I do not know how many people will be heard by the Rules Committee, but they have designated two or three people to be heard. I believe an hour's time is given the proponents and the opponents of Statehood for Alaska.

Let me make this statement: The Chair would also observe that we will not be able to finish the agenda placed on your desks. At some suitable time within the next week or two we will try to approach the problem of those bills with a full Committee hearing. Due notice will be given.

The Chair will recognize the gentleman from Pennsylvania, Mr. Saylor.

Mr. Saylor. I move that H. R. 4449 be recommitted to the Subcommittee on Irrigation and Reclamation. The basis for my motion, Mr. Chairman --

Mr. Aspinall. Mr. Chairman, a point of order.

The Chairman. The motion before the Committee is a preferential motion and is not open to debate. The motion occurs on a recommittal of H. R. 4449. Those in favor of a recommittal will signify --

Mr. Pillion. I ask for a roll call, Mr. Chairman.

The Chairman. The Chair will assume that a sufficient number have asked for a roll call. The Clerk will call the roll.

Mr. Huyck. Mr. Aspinall?

Mr. Aspinall. No.

Mr. Huyck. Mr. Bender?

Mr. Saylor. "Aye" by proxy.

Mr. Huyck. Mr. Bentsen?

Mr. Bentsen. No.

Mr. Huyck. Mr. Berry?

Mr. Berry. No.

Mr. Huyck. Mr. Budge?

Mr. Budge. No.

Mr. Huyck Mr. Dawson?

Mr. Dawson. No.

Mr. Huyck. Mr. D'Ewart?

Mr. D'Ewart. No.

Mr. Huyck. Mr. Donovan?

Mr. Donovan. Aye.

Mr. Huyck. Mr. Engle?

Mr. Engle. No.

Mr. Huyck. Mr. Gross?

Mr. Gross. Aye.

Mr. Huyck. Mr. Haley?

Mr. Haley. Aye.

Mr. Huyck. Mr. Harrison?

12-60 Mr. Harrison. No.

Mr. Huyck. Mr. Hosmer?

Mr. Pillion. "Aye".

Mr. Huyck. Mr. O'Brien?

Mr. Regan. "Aye".

Mr. Huyck. Mrs. Pfost?

Mrs. Pfost. No.

Mr. Huyck. Mr. Pillion?

Mr. Pillion. Aye.

Mr. Huyck. Mr. Regan?

Mr. Regan. Aye.

Mr. Huyck. Mr. Rhodes?

Mr. Rhodes. No.

Mr. Huyck. Mr. Rogers?

Mr. Rogers. Aye.

Mr. Huyck. Mr. Saylor?

Mr. Saylor. Aye.

Mr. Huyck. Mr. Shuford?

Mr. Shuford. Aye.

Mr. Huyck. Mr. Westland?

Mr. Westland. No.

Mr. Huyck. Mr. Wharton?

Mr. Wharton. No.

Mr. Huyck. Mr. Yorty?

Mr. Regan. "Aye".

Mr. Huyck. Mr. Young?

Mr. Young. No.

The Chairman. The "Yeas" are 12 and the "Nays" 13.

The "Nay" votes prevail and the motion is lost.

The Chair finds that he was in error in making the ruling on Mr. Engle's authority or right to resubmit the amendment that he lost, when he voted in the affirmative, and cites the rule in Section 813, on "Maker of the Motion to Reconsider":

> "Where the Yeas and Nays have not been ordered recorded in the Journal, any Member, irrespective of whether he voted with the majority or not, may make the motion to reconsider."

The vote was not recorded. The Chair will now place the motion of the gentleman from California, Mr. Engle. The Chair had felt that the vote had been recorded. Attention was called to the fact that it was not recorded. Since it was not recorded it can be reconsidered and presented by Mr. Engle.

The amendment was on page 25, line 2. I think the Members are all familiar with it.

Mr. Engle. A parliamentary inquiry, Mr. Chairman.

The Chairman. You may state it.

Mr. Engle. I wish to ask whether or not it is true that the vote occurs on the motion to reconsider the action of the Committee whereby the previous motion was lost. Then the vote will reoccur upon the amendment itself.

In other words, those who want to revote on this and who want the amendment to prevail should vote "Aye" for the motion

to reconsider and vote "Aye" for the amendment. Is that correct?

The Chairman. The gentleman is correct on his statement of the parliamentary situation.

Mr. Engle. Now, Mr. Chairman, I call for Yeas and Nays.

Mr. Gross. A parliamentary inquiry.

The Chairman. The gentleman may state it.

Mr. Gross. Is this a majority vote?

The Chairman. This is a majority vote.

Mr. Gross. Is this the lawyers' "justiciable issue" amendment?

The Chairman. I doubt whether that should be explained by the Chairman.

The roll call vote has been called for on reconsidering the vote taken on the Engle amendment. The Clerk will call the roll.

Mr. Huyck. Mr. Aspinall?

Mr. Aspinall. Aye.

Mr. Huyck. Mr. Bender?

Mr. Saylor. "No".

Mr. Huyck. Mr. Bentsen?

Mr. Bentsen. Aye.

Mr. Huyck. Mr. Berry?

Mr. Berry. No.

Mr. Huyck. Mr. Dawson?

Mr. Dawson. No.

Mr. Huyck. Mr. D'Ewart?

Mr. D'Ewart. No.

Mr. Huyck. Mr. Budge?

Mr. Budge. Aye.

Mr. Huyck. Mr. Donovan?

Mr. Donovan. Aye.

Mr. Huyck. Mr. Engle?

Mr. Engle. Aye.

Mr. Huyck. Mr. Gross?

Mr. Gross. Aye.

Mr. Huyck. Mr. Haley?

Mr. Haley. Aye.

Mr. Huyck. Mr. Harrison?

Mr. Harrison. Aye.

Mr. Huyck. Mr. Hosmer?

Mr. Pillion. "Aye".

Mr. Huyck. Mr. O'Brien? Mrs. Pfost?

Mrs. Pfost. Aye.

Mr. Huyck. Mr. Pillion?

Mr. Pillion. No.

Mr. Huyck. Mr. Regan?

Mr. Regan. Aye.

Mr. Huyck. Mr. Rhodes?

Mr. Rhodes. Aye.

Mr. Huyck. Mr. Rogers?

Mr. Rogers. No.

Mr. Huyck. Mr. Saylor?

Mr. Saylor. No.

Mr. Huyck. Mr. Shuford?

Mr. Shuford. Aye.

Mr. Huyck. Mr. Westland?

Mr. Westland. No.

Mr. Huyck. Mr. Wharton?

Mr. Wharton. No.

Mr. Huyck. Mr. Yorty?

Mr. Regan. "Aye".

Mr. Huyck. Mr. Young?

Mr. Young. Aye.

The Chairman. The Clerk will present the vote to the Chair.

Mr. Huyck. Mr. Chairman, there are 15 "Ayes" and 9 "Noes".

The Chairman. The motion to reconsider is carried. Now the vote occurs upon the amendment offered by the gentleman from California, Mr. Engle, on page 25, line 2.

Mr. Engle. I ask that the Chair call for Yeas and Nays.

The Chairman. The Chair will consider that a sufficient number have asked for Yeas and Nays, and Yeas and Nays are

ordered. The Clerk will call the roll.

Mr. Huyck. Mr. Aspinall?

Mr. Aspinall. Aye.

Mr. Huyck. Mr. Bender?

Mr. Saylor. "Aye" by proxy.

Mr. Huyck. Mr. Bentsen?

Mr. Bentsen. Aye.

Mr. Huyck. Mr. Berry?

Mr. Berry. No.

Mr. Huyck. Mr. Budge?

Mr. Budge. Aye.

Mr. Huyck. Mr. Dawson?

Mr. Dawson. No.

Mr. Huyck. Mr. D'Ewart?

Mr. D'Ewart. No.

Mr. Huyck. Mr. Donovan?

Mr. Donovan. Aye.

Mr. Huyck. Mr. Engle?

Mr. Engle. Aye.

Mr. Huyck. Mr. Gross?

Mr. Gross. Aye.

Mr. Huyck. Mr. Haley?

Mr. Haley. Present.

Mr. Huyck. Mr. Harrison?

Mr. Harrison. Aye.

Mr. Huyck. Mr. Hosmer?

Mr. Pillion. "Aye" by proxy.

Mr. Huyck. Mr. O'Brien? Mrs. Pfost?

Mrs. Pfost. Aye.

Mr. Huyck. Mr. Pillion?

Mr. Pillion. No.

Mr. Huyck. Mr. Regan?

Mr. Regan. Aye.

Mr. Huyck. Mr. Rhodes?

Mr. Rhodes. Aye.

Mr. Huyck. Mr. Rogers?

Mr. Rogers. No.

Mr. Huyck. Mr. Saylor?

Mr. Saylor. Aye.

Mr. Huyck. Mr. Shuford?

Mr. Shuford. Aye.

Mr. Huyck. Mr. Westland?

Mr. Westland. No.

Mr. Huyck. Mr. Wharton?

Mr. Wharton. No.

Mr. Huyck. Mr. Yorty?

Mr. Regan. "Aye".

Mr. Huyck. Mr. Young?

Mr. Young. Aye.

The Chairman. The Clerk will announce the vote.

Mr. Huyck. The "Ayes" 16; the "Noes", 7.

The Chairman. The amendment offered by Mr. Engle of California has been adopted.

Now the vote occurs upon the favorable report to the House of Representatives of H. R. 4449 as amended.

Mr. Harrison. I would like to make that motion, that H. R. 4449 be reported favorably by this Committee to the House as amended.

The Chairman. Is there a second?

Mr. Dawson. I second the motion.

The Chairman. The Chair presumes a roll call is demanded and a roll call is ordered.

Mr. Bentsen. This is on final passage?

The Chairman. This is on final passage by this Committee.

Mr. Huyck. Mr. Aspinall?

Mr. Aspinall. Aye.

Mr. Huyck. Mr. Bender?

Mr. Saylor. "No"by proxy.

Mr. Huyck. Mr. Bentsen?

Mr. Bentsen. Aye.

Mr. Huyck. Mr. Berry?

Mr. Berry. Aye.

Mr. Huyck. Mr. Budge?

Mr. Budge. Aye.

Mr. Huyck. Mr. Dawson?

Mr. Dawson. Aye.

Mr. Huyck. Mr. D'Ewart?

Mr. D'Ewart. Aye.

Mr. Huyck. Mr. Donovan?

Mr. Donovan. No.

Mr. Huyck. Mr. Engle?

Mr. Engle. Aye.

Mr. Huyck. Mr. Gross?

Mr. Gross. No.

Mr. Huyck. Mr. Haley?

Mr. Haley. No.

Mr. Huyck. Mr. Harrison?

Mr. Harrison. Aye.

Mr. Huyck. Mr. Hosmer?

Mr. Pillion. "No" by proxy.

Mr. Huyck. Mr. O'Brien?

Mr. Regan. "No" by proxy.

Mr. Huyck. Mrs. Pfost?

Mrs. Pfost. Aye.

Mr. Huyck. Mr. Pillion?

Mr. Pillion. No.

Mr. Huyck. Mr. Regan?

Mr. Regan. No.

Mr. Huyck. Mr. Rhodes?

Mr. Rhodes. Aye.

Mr. Huyck. Mr. Rogers?

Mr. Rogers. No.

Mr. Huyck. Mr. Saylor?

Mr. Saylor. No.

Mr. Huyck. Mr. Shuford?

Mr. Shuford. No.

Mr. Huyck. Mr. Westland?

Mr. Westland. Aye.

Mr. Huyck. Mr. Wharton?

Mr. Wharton. Aye.

Mr. Huyck. Mr. Yorty?

Mr. Regan. "No" by proxy.

Mr. Huyck. Mr. Young?

Mr. Young. Aye.

The Chairman. The Clerk will announce the vote.

Mr. Huyck. Mr. Chairman, the "Ayes", 13; the "Noes", 12.

The Chairman. The motion to report the bill favorably has been adopted. The Committee will stand adjourned to the call of the Chair for a full Committee meeting later on.

(Thereupon, at 11:58 a.m., Tuesday, May 18, 1954, an adjournment was taken to meet at the call of the Chairman.)

EXECUTIVE SESSION - CONFIDENTIAL

S. 1555

- - -

SATURDAY, JULY 24, 1954

United States Senate,

Committee on Interior and
Insular Affairs,

Washington, D. C

The committee met pursuant to call, at 11:30 a.m., in Room P-38, The Capitol. Hon. Eugene D Millikin, presiding.

Present: Senators Millikin (presiding), Malone, Watkins, Kuchel, Crippa, Barrett, Murray, Anderson, and Daniel.

Also Present: Kirkley S. Coulter, Chief Clerk and Staff Director; Elmer K. Nelson, Staff Engineer; N. D. McSherry, Assistant Chief Clerk; and E. F. Bennett, Legislative Representative, Department of the Interior.

Senator Millikin The committee will come to order.

This hearing concerns S 1555, a bill to authorize the Secretary of the Interior to construct, operate, and maintain the Colorado River storage project and participating projects, and for other purposes

Go ahead with your explanation and let's give Senator Kuchel an answer to this

Mr Nelson May I suggest, Senator, that we are on the record and that the project as presented here in this bill has

been studied and is chiefly sponsored by the Upper Colorado River Commission.

Senator Kuchel. Are you answering the specific question I asked before we went on the record?

Mr. Nelson. I am coming to that in a moment. I would like to take another start.

Senator Millikin. Go ahead. When you come to that point, let us have a clear answer.

Mr. Nelson. This Commission is represented here by its chief counsel and secretary, and the Commission has been on this project for a number of years. It has presented testimony before this committee as well as before the House Committee, and I would like to ask you, Mr. Chairman, if it would not be well to have Mr. Will state in general terms concerning the bill Then we will come to these particular exceptions.

Senator Millikin. Speak right up loud so we can hear.

STATEMENT OF JOHN G. WILL, CHIEF COUNSEL AND SECRETARY, UPPER COLORADO RIVER COMMISSION

Mr. Will. This bill would authorize a series of so-called hold-over reservoirs named in the bill. They are the Cross Mountain, Curecanti, Echo Park, Flaming Gorge, Glen Canyon, and Navajo hold-over storage reservoirs It would authorize a series of so-called participating projects.

Senator Kuchel. Senator, I will abide by your wishes. There will be questions which will occur to me as this statement is being made. Do I have your permission to interrupt.

Senator Millikin. If it looks like a long controversy, we will withhold and come back to it because we ought to have the story.

Mr. Will. These participating projects are called participating because they participate in financial assistance from power revenues to pay out their irrigation costs. Those participating are spread among the four upper division states. There are certain projects in the State of New Mexico -- one the San Juan Chama and the other one the Navajo participating project -- which are mentioned in this bill but which will require further act of Congress before they are authorized. Initiation of construction on the participating projects may not be commenced until the Secretary of the Interior has re-evaluated their economics.

Senator Millikin. Which ones are subject to immediate action?

Mr. Will. All participating projects are subject to the condition that the Secretary shall re-evaluate their benefit-cost ratio after consultation with the Secretary of Agriculture and shall certify to the Congress that their benefits exceed their costs.

Senator Millikin. So no participating project can get started until it receives that treatment, is that correct?

Mr. Will. That is right.

Senator Millikin. Without exception.

Mr. Will. That condition also applies to one of the hold-over storage reservoirs; to wit, Curecanti, Colorado.

Then, as I said, the two New Mexico projects mentioned require further act of Congress.

Senator Millikin. Which New Mexico projects?

Mr. Will. The San Juan Chama and the Navajo participating project.

Senator Millikin. They have to come before the Congress?

Senator Malone. Name those again.

Mr. Will. San Juan Chama and Navajo participating.

Senator Malone. How many participating projects are there, and how many are you authorizing?

Mr. Will. I think there are eleven. Let me count them.

There are fourteen participating projects. That is on page 16, line eight, of the bill.

Senator Malone. How many of the others?

Senator Millikin. Main reservoirs?

Mr. Will. The hold-over storage reservoirs -- there are six.

Senator Malone. They are authorized by this bill?

Mr. Will. Yes, sir.

Senator Malone. All they need is an appropriation to get started?

Mr. Will Yes, sir. There are six of them, but one of those requires further act by the Secretary of the Interior but

in further action by the Congress.

Senator Millikin. That is Curecanti?

Mr. Will. Yes.

Senator Malone. What does he have to do?

Mr. Will. He has to certify it is feasible.

Senator Malone. You mean that is left to him?

Mr. Will. Yes, sir.

Senator Malone. But there are five that are authorized without any further action except by the Appropriations Committee?

Mr. Will. That is right.

Senator Millikin. Go ahead.

Senator Kuchel. I do not think that tells the whole story. The other fourteen are authorized so far as Congress is concerned. All that is necessary subsequently, as I understand the provisions of the bill, is for the Secretary to make certain findings administratively.

Mr. Will. That is right.

Senator Malone. Did you not say further action of Congress on these fourteen was necessary?

Mr. Will. Those on these two, the San Juan Chama and the Navajo participating project, they take further action by Congress.

Senator Millikin. What is the reason for that as distinguished from the other?

Mr. Will. The reason for that is there are negotiations now proceeding between New Mexico and the State of Texas. There are problems involving the right of land compact that are involved.

Senator Barrett. That would comply with the Flood Control Act of 1944; they are required to do so?

Mr. Will. Yes.

Senator Barrett. All that is necessary on all of these projects, seventeen of them -- or rather, eighteen, is for the Secretary of Agriculture to say they should be built, is that right? Then you go to the Appropriations Committee?

Mr. Will. That, no, sir. That would pertain only to the twelve participating projects. That is to say, those other than the San Juan Chama.

Senator Barrett. I have a wrong idea. Start over, please.

Mr. Will. There are twelve participating projects in this bill that will require no further act of Congress for their authorization, the only conditions for the initiation of their construction being that the Secretary of the Interior shall certify after consultation with the Secretary of Agriculture --

Senator Malone. Who certifies?

Mr. Will. The Secretary of the Interior after consultation with the Secretary of Agriculture that their benefits exceed their cost.

Senator Malone. We have not had very satisfying experiences

with either in the last fifteen or twenty years, the Secretary of the Interior or the Secretary of Agriculture.

Senator Millikin. Please speak louder.

Senator Malone. Our experience with the Secretary of the Interior and the Secretary of Agriculture for twenty years has not been very satisfactory. I have never heard of putting in their hands just the order to build something.

Mr. Will. Sir, they have that authorization under general reclamation law right now. Section 9 of the Reclamation Project Act authorizes the Secretary of the Interior --

Senator Malone. Without the action of Congress?

Mr. Will. Yes, sir.

Senator Millikin. As far as these participating projects are concerned that are in the bill, the Secretary has already looked after them, has found them to be feasible. We are asking him to take another look, is that right?

Mr Will. That is exactly right.

Senator Malone. Start over. I am reading Section 9(a). Maybe we have been spending too much time on projects.

Mr. Will. Shall I read Section 9(a)? That is the section which authorizes the Secretary to authorize projects finding them feasible.

"No expenditures for the construction of any division, new divisionary project, or new supplemental works on the project shall be made, nor shall estimates be submitted therefor by the

Secretary until after he has made an investigation thereof and has submitted to the President and to the Congress his report and findings on (1) the engineering feasibility of the proposed construction; (2) the estimated cost of the proposed construction; (3) the part of the estimated cost which can properly be allocated to irrigation and probably be repaid by the water users; (4) part of the estimated cost which can properly be allocated to power and probably be returned to the United States in net power revenues; (5) the part of the estimated cost which can properly be allocated to water supply or other miscellaneous purposes and probably be returned to the United States.

"If the proposed construction is found by the Secretary to have engineering feasibility and if the repayable and returnable allocations to irrigation, power, and principal water supply or other miscellaneous purposes found by the Secretary to be proper, together with any allocations of flood control or navigation made under Subsection (b) of this section, equal to total estimated cost of construction as determined by the Secretary, then the new project, new diversionary project or supplemental works on a project covered by his findings shall be deemed authorized and may be undertaken by the Secretary.

"If all such allocations do not equal said total estimated cost, then said new project, new division or new supplemental works may be undertaken by the Secretary only after provision

therefor has been made by act of Congress enacted after the Secretary has submitted to the President and the Congress a report and findings involved."

Senator Malone. He can build a project if these costs are to be written off and not collected from the people and they equal the cost of the project, is that right?

Mr. Will. Yes, sir.

Senator Malone. What becomes of it if the cost is more than that?

Mr. Will. Then he could not find it feasible. Therefore, he could not authorize it.

Senator Malone. It might be feasible, but he could not authorize it. It might be feasible if they repay certain money. I do not understand what you are talking about; that it could not be feasible if it could not be allocated to a Secretary that is not to be repaid.

Mr. Will. I misunderstood your question. I am sorry.

If the Secretary finds that these costs that are allocable under the reclamation laws can be repaid and the project has engineering feasibility or that the costs that are reimburseable can be repaid and the sum of those costs added to the costs for non-reimburseable purposes -- navigation and flood control -- equal the total cost of the project, then he can authorize the project by so-called finding feasibility.

Senator Malone. Without referring to Congress?

Mr. Will. Yes, sir.

Senator Malone. Who checks his allocation?

Mr. Will. There are various checks. In the first place, his report on a project would have to go to the Bureau of the Budget. It has been the practice for it to go to the Bureau of the Budget.

Senator Millikin. Aren't these things before Congress now?

Mr. Will. Yes.

Senator Millikin. The Secretary has the power, if he wanted to use the power, to authorize this whole project?

Mr. Will. Yes, with this qualification: If there has been objection by any affected state within the meaning of that term as used in Section 1 of the Flood Control Act, then he would not have that authorization. I believe there has been formal objection by one state, and therefore the Secretary would lack authority to authorize this by a finding of feasibility.

Senator Malone. You have just read a provision that a Secretary of Agriculture can estimate the cost of the project and then make his own allocation to flood control, to municipal costs, to perhaps navigation or any other costs that he sees fit.

Mr. Will. Except for this --

Senator Malone. Wait a minute. I want to get myself

straightened out. He can make this allocation without being checked by Congress. If in his judgment these allocations are correct and if they cover the cost, then he can declare the project to be feasible and authorize it. Then he has only to go to the Budget Director and to the Appropriations Committee and not Congress at all, is that right?

Mr. Will. He would have only to come to Congress for authorization for appropriations.

Senator Malone He has only to go to the Budget Bureau and then to the Appropriations Committee to bring it in among other projects on the Senate floor without any further authorization or checking of his allocation.

Mr. Will. That is true, with this one exception: On his allocations to flood control or navigation those are required to be made after consultation with the Secretary of the Army.

Senator Malone. But it is all in the administrative department He does not have to come to this committee or any committee of Congress to study his allocations and to discuss them on the Senate floor.

Mr. Will. That is right

Senator Malone. Go ahead.

Mr. Will. Section 2 of this bill looks to future development and lays down the criteria for additional projects.

Senator Malone. There are twelve of these projects that come under this provision you just read?

Mr. Will. Yes.

Senator Millikin. The answer is yes. There are twelve participating projects in the bill.

Senator Malone. What is the total cost?

Mr. Will. The total cost, including the San Juan Chama and the Navajo participating projects, is approximately a billion and a half. It is just a little less than a billion and a half. It is a billion four hundred some million.

Senator Malone. They are the projects that the Secretary of Agriculture can declare feasible without coming back to Congress for authorization?

Mr. Will. Yes, sir.

Senator Barrett That is not quite true. The entire project is included in one billion four hundred million dollars. We are finding five of them feasible in this bill. It is just the participating projects the Secretary determines to be feasible?

Mr. Will. That is right, the hold-over storage.

Senator Malone. What do they cost?

Mr. Will. The twelve participating projects?

Senator Malone. Just the projects we are not authorizing but we are allowing the Secretary of Agriculture to authorize at his discretion after he has allocated certain flood control projects.

Mr. Will. This will require me to have a little addition

done.

Senator Malone. You go right ahead, and you can insert it in the record.

(The information referred to follows):

Mr. Will. Section 33 provides that the Secretary shall be governed by the Federal reclamation laws. Certain specific exceptions are included in there for the Paonia and the Eden projects which are existing projects for which some excess financial assistance for irrigation cost will be derived from our revenues.

It is provided in Subsection (b) in the second part of the proviso to Section 3 that contracts for the repayment of irrigation costs shall be made with an organization as defined in Paragraph 2(g); that is, an organization satisfactory to the Secretary of the Interior, and it goes on to say "which has the capacity" --

Senator Malone. You are reading from the bill?

Mr. Will. Yes, sir; page 19, line twelve.

Senator Malone. What is this organization you are putting this in to determine feasibility?

Mr. Will. It is not connected with determining feasibility, Senator. This is just describing the type of organization which shall contract with the United States to repay the irrigation costs. It refers to organizations as defined in Paragraph 2(g) of the Reclamation Project Act of 1939. Paragraph 2(g) defines an organization as follows: The term "organization" shall mean any conservancy district, irrigation district, water users association, or any other organization which is organized under state law and which has capacity to enter into contracts with the United

States pursuant to the Federal Reclamation Law.

The third part of the proviso provides that contracts relating to municipal water supply may be made without regard to the limitations of the last sentence of Section 9(c) of the Reclamation Project Act of 1939. Section 9(c), that last sentence, reads as follows: "No contract relating to municipal water supply for miscellaneous purposes or to electric power or power privileges shall be made unless in the judgment of the Secretary it will not impair the efficiency of the project for irrigation purposes."

Under the terms of this bill the Secretary would not be required to make a finding that a contract for municipal water supply would not interfere with the use of water for irrigation purposes.

There are certain exceptions as to Indian lands covered by the act.

Senator Barrett. Does the municipal include the industrial, too?

Mr. Will. Yes, sir.

Senator Barrett. I thought so, but I was not sure

Senator Kuchel. What you are doing here is, in effect, repealing the reclamation law's general applications; and with respect to the Upper Colorado River Basin States you are providing for a new kind of priority with respect to reclamation water, is that right?

Mr. Will. I would not put it quite that way. I think that is a little bit broad.

Senator Kuchel. Where is it broad?

Mr. Will. I think all we are doing here by that provision is saying that we are looking at this picture. There are going to be lots of uses of water for municipal and industrial purposes in the Upper Basin. There will be development of phosphates and so forth, shale. The Secretary ought to be able to enter into contracts for disposing of water for those purposes without first determining that such disposition will not unduly limit the use of water for irrigation.

Senator Kuchel It says "contracts relating to municipal water supply," and there I call attention to the Senator from Wyoming whether municipal does actually include industrial. That section of the bill, contracts relating to municipal water supply, may be made without regard to the limitations of the last section of Section 9(c) of the Reclamation Act of 1949. If I am wrong, I would like to be shown where I am wrong. I do not raise a question of policy. I want to raise a question of what the language means.

Is it not true that does mean that to the extent that this bill would apply to the states of the Upper Colorado River Basin a different form of allocation of reclamation water may be used by the Secretary of the Interior?

Mr. Will. I think that is proper.

Senator Anderson. Are all these states governed by the provisions of their state constitutions which say the first use shall be domestic, the second industrial?

Senator Bennett. The 1939 Act, so far as reclamation projects are concerned, has this provision we are dealing with in it. It does run contrary to state law in every one of the western states I can think of at the present time. In those states your water right is generally judged strictly by priority of time subject to a superiority of domestic water uses under which a junior domestic water need can be exercised in such a fashion as to condemn through eminent domain a senior right for irrigation purposes. So in effect this provision takes out, so far as this project is concerned, an inconsistency between Federal reclamation law and state law in the states that are interested in this project

Senator Kuchel. To turn it around, the inconsistency would still remain in the Lower Basin?

Senator Bennett. That is correct.

Senator Kuchel. Under that inconsistency, to the extent the Federal law as it reads today is applied, which takes priority, the reclamation law or the laws of the states?

Senator Barrett. The laws of the state

Senator Kuchel. Is that your answer, too?

Senator Bennett. You have this consideration. The 1902 Act gives state law a controlling effect on reclamation projects

and the uses of water under reclamation projects. But the 1939 Act, which has this section in it, was a later enactment of Congress. As far as projects constructed after 1939, the 1939 Act has not modified the original reclamation law rule of superiority of state law. That is an open question because it was a subsequent act of Congress.

Senator Barrett. I do not quite agree. I think the courts have upheld the rights of the several states to appropriate the water within their own confines. I do not believe we have surrendered that right to the Federal Government.

Senator Malone. The states would elect not to enforce their state law and just allow it to go along and be done on this basis regardless, even though the state law provides against it. What would then happen? Could any citizen bring it up? How does it operate?

Senator Bennett. That gets into a lot of questions I am not prepared to testify to off-the-cuff. This thing is complicated by a series of Federal statutes and different views as to what the effect of them is. I personally agree with Senator Barrett, but it so happens that there are attorneys in the Justice Department which right in the Arizona suit have intervened on an entirely different basis and said when the Federal Government uses water, appropriates water and uses it for reclamation projects, it is not limited by the state laws of the state constitutions

Senator Malone. What side are these government attorneys on in this suit?

Mr. Will. They are intervened. They are not on the side of either of the two states involved. In fact, their contentions will seriously affect the uses of water by either Arizona or California.

Senator Daniel. I want to say I am glad that has come out. I think it is one of the most serious things facing us in the West. I think this committee in the future somewhere is going to have to go into this completely because the Department of Justice has taken the same old position as taken by the past administration as to the ownership of the waters and the rivers in the West. I want to tell you it is a serious matter. I have been checking into it a little, and we are going to do something about it to straighten out this administration insofar as the Justice Department speaking for it.

Senator Watkins. I think we have got to take a broad view of this situation. The state constitutions were ratified, of course, and accepted by the Congress. The Federal Government in carrying out the reclamation program -- know this is a fact because I have gone through it time and time again through fourteen years of work in the reclamation field -- recognizes state law It files applications for the benefit of those who are to benefit from the project with the state engineer. It goes right right on through and complies with state law.

Now the waters that are to be diverted on these participating projects, that is the only way you can get water out for irrigation -- through the participating projects. Each of those projects take water out of the stream within the state where it is to be used. The filings will be made with the state engineers or state water boards just as we would in any case in the state recognizing the fact that the State of Utah owns the water, where it is in Utah.

The people can acquire the use of it through compiling with the state law. The Federal Government acts just as an individual acts; it goes right through with all of these applications, time for extension, proof of constructing the works, and all that sort of thing. That is all recognized. As a practical matter, the Government has not backed away from it yet. They are doing that continually.

Senator Barrett. The Flood Control Act of 1944 reiterated that position. We required them to go to the governments of the several states that are involved.

Senator Watkins. I think it is not as serious as it sounds, but I think Senator Daniel is right. A little later I think we ought to go into that and clear up ambiguity.

The 1922 compact which was approved by the Congress allocated the waters to the seven states. The 1938 or the Upper Colorado River Compact was ratified by the Congress, approving again the same principle. The water allocated to those states

-- 52 per cent to Colorado, 24 per cent to Utah, 14 per cent to Wyoming, and 11 per cent to New Mexico -- that belongs to those people in the states. The state government acts for them. The United States in building this project will comply with each one of those regulations they require for the filing of their water.

Senator Daniel. For over a hundred years the Federal Government did just that respecting the ownership of the submerged lands by the states, but then an Attorney General comes along in the court and in the name of the United States Government asserts a contrary position. This thing is serious when the Attorney General's office can go into the courtroom and assert in the name of this nation a position contrary to that recognized and asserted by the Congress. If he happens to get in a court that will follow him, then you have got the same kind of proposition we have had in other matters. That is why I say it is serious. That assertion is now being made in more than one case by the Justice Department. It is something we ought to watch out for

Senator Watkins. I have it up with the Department of Justice now in the cases out in Utah. It has been before the Supreme Court. Before we get through, the Department of Justice will change its view.

Senator Malone. Mr. Chairman, I go back about fifteen years further than the senior Senator from Utah in dealing with this Bureau. In 1927 and then subsequent to those years the Government has always asserted ownership to unappropriated waters, and the

question has never been decided by the Supreme Court.

When we had Dr. Meade as a Reclamation Commissioner, Dr. Meade wanted to build projects. He wanted to get along. I recall that I organized the western seventeen state engineers for the specific purpose of knocking the ears off of the Indian Bureau that was at that moment asserting ownership of water for the Indian tribes in South Dakota and a little notice that it would take precedent over the arid states when they said in that court that when they withdrew the Indian land in 1850 or 1860 that they automatically withdrew enough water to irrigate this land.

Therefore, no one subsequently could acquire rights superior to rights on this land. Every irrigation project in the West bonded themselves, and the bonds had been sold on the theory this water belonged to this land under the appropriation theory and could not be taken away. That constituted the only value the bonds had. So it was in Denver, I would say to the distinguished chairman of this committee and the junior Senator from Colorado, that they met for about a month.

About the third week the state engineer in Nevada -- now the junior Senator -- called this meeting and organized the seventeen western states. They did not know why we were doing it, and I did not say. We did it for interchange of information between state engineers. The state engineer of Wyoming was very cooperative. I was the first president of it, and after we

organized it, suddenly every Attorney General in those states appeared as friends of the court in South Dakota. They scared them out of South Dakota, So they dropped the thing temporarily.

I cannot tell you the ultimate result but they quit. It has been periodically claimed for a long time, and it has never been decided. I agree with the junior Senator from Texas it is a very serious thing and you cannot overlook it. In this bill apparently we are giving the Secretary of Agriculture and the Secretary of the Interior the power to do things there that would have scared a Senator to death twenty-six years ago.

Senator Millikin. It was the Senators twenty-six years ago that wrote it into law that the Secretary could do those things. The Secretary right now can, on his own authorization, go ahead with these projects.

Senator Malone. What I am trying to say is this: We are playing into the hands of the Justice Department by ignoring these things and then giving cabinet officers additional power.

Senator Barrett. Will the Senator yield?

Senator Malone. Yes.

Senator Barrett. It is the opposite of that.

Senator Malone. I do not see it.

Senator Barrett. Under the present law, Section 9(c), that was read a moment ago, the Secretary of the Interior can make an order allowing the district or the city or the community to use water for municipal purposes and industrial purposes only when

he finds that it will not interfer with the irrigation. This provision says the Secretary of the Interior may disregard that original law; and consequently, the effect of this law is to say that the constitutions in the western states, the statutes there, shall be respected and you can give preference to uses for municipal purposes or induatrial purposes over and above reclamation.

Will the Senator agree with me?

Senator Malone. We are getting entirely mixed up on it and taking no position at all, which means that the Attorney General is strengthening his position in any position he might take along the line of claiming the unappropriated water. What is the limit? I did not ask that a while ago. What is the limit to the size of the project that the Department of Agriculture can authorize on their own?

Mr. Will. They are all very small.

Senator Malone. There is a limit in the provision.

Mr. Will. The bill itself --

Senator Malone. Not the bill, the original act.

Mr. Will. There is no limit in the original act.

Senator Malone. In other words, you can authorize a billed project. All he has to do is allocate the money to something else.

Senator Barrett. Isn't there a regulation there? There is some restriction in there.

Senator Anderson. Not the Secretary of Agriculture. He has not any authority at all.

Senator Malone. Tell us the limit of this thing. Is there any limit to these cabinet officers' power?

Mr. Will. According to my best recollection, there is no limit in the statute that I read as to the size of the project the Secretary of the Interior could authorize by finding feasibility.

Senator Malone. All he has to do is get his own admission and the Bureau of the Budget to approve it?

Mr. Will. That is right. There is, in effect, a very strict limit in this bill on the participating projects that the Secretary can certify. The participating projects as to which he can certify and then initiate their construction are the participating projects named in this bill and no others.

Senator Malone. I understand that, but we do not know what the cost is, do we?

Mr. Will. Yes, we do. Extensive hearings are involved.

Senator Malone. What is the cost?

Mr. Will. I can now give you the figure you asked me for a moment ago. The cost of the twelve participating projects -- that is to say, exclusive of Navajo and San Juan Chama -- is $317,000,000 in round figures.

Senator Watkins. That is for within the four states?

Mr. Will. Yes, sir.

Senator Malone. Where does this money come from? Is there any allocation for irrigation and power?

Mr. Will. The costs would be allocated among irrigation, power, municipal water supply, and flood control. I can give you the totals.

Senator Barrett. Please give them to us.

Mr. Will. The total allocation to power is $603,921,000.

Senator Malone. Out of what amount?

Mr. Will. One billion four hundred some million dollars.

Senator Malone. About sixty per cent of it is to power, is that right?

Mr. Will. Yes. The total allocation to irrigation -- I am giving you the allocations of the storage units -- will be $217,347,000.

The irrigation allocation of the participating projects which would be made out of power revenues is $217,347,000.

Senator Malone. On what project?

Mr. Will. On the initial storage units. In other words, it would be Echo Park, Glen Canyon, Curecanti, Cross Mountain, Flaming Gorge, and Navajo.

Senator Kuchel. Whose figures are those?

Mr. Will. The Bureau of Reclamation.

Senator Millikin. Proceed.

Mr. Will. The balance of Section 3 of the bill provides that the operation of these participating projects and storage

units shall be subject to the apportionments of the use of water between the Upper and Lower Basins in accordance with the 1922 compact.

Section 4 of the bill is a section which deals with the financial setup. It sets up a basin fund in the Treasury. Into that basin fund there will be credited sums appropriated for the construction of the project, except as to appropriations made to carry out the reclamational developments at these several storage units.

Senator Millikin. Why is that omitted?

Mr. Will. Because it is a separate, distinct problem; separate and aside from the purposes of this bill. The principal purposes of the bill are to provide river regulation, irrigation, municipal water supply, and power.

Senator Millikin. Those are not reimburseable funds, are they?

Mr. Will. That is right.

Senator Millikin. So they should not be in here.

Mr. Will. That is right.

Revenues collected in connection with the operation of the project will be available, will be credited to this fund, and will be available for operation and maintenance of the project without necessity for appropriation but subject to such general limitations as are contained in the appropriation acts.

Senator Millikin. Just what does that mean?

Mr. Will. That means, sir, that while they do not have to come to the Appropriations Committees and to the Congress for appropriation, for operatin and maintenance of the project, nevertheless the Appropriations Committees will have an opportunity to write such limitations as they deem proper in connection with the use of those funds for operation and maintenance of this project.

Senator Millikin. Does that curtail the normal powers of Appropriations Committees?

Mr. Will. I do not think so. It gives them full jurisdiction to control the manner in which these funds shall be used.

Senator Millikin. What will be the role of the Appropriations Committees under this bill? Every year they will be asked for certain money, will they not?

Mr. Will. They will be asked for moneys for construction. They will not be asked for moneys for operation purposes.

Senator Millikin. Because that comes out of this basin fund which in turn is provided by revenues from the basin fund?

Mr. Will. That is right.

Senator Millikin. How do you connect up whatever the Appropriation Committees may want to do over this particular fund?

Mr. Will. The Appropriations Committee will have the benefit of annual reports from the Secretary of the Interior

as to the manner in which these operation funds are utilized.

Senator Millikin. So if the Appropriations Committee is not satisfied with the report, it can do its own business to make a better operation?

Mr. Will. That is correct.

Senator Watkins. Section (f) on page 23, line five,

"Business-type budgets shall be submitted to the Congress annually for all operations financed by the Basin Fund."

Mr. Will. That is right.

The interest return on the power and municipal water supply, including interest during construction --

Senator Millikin. You are not talking about irrigation; you are talking about power and municipal supply?

Mr. Will. That is right. The amount of that interest will be determined by the Secretary of the Treasury according to a formula set forth in this bill.

Senator Millikin. That formula takes into account the average rates applying to Government securities, whether it is eleven years or longer?

Mr. Will. It is the cost to the Treasury of long-term money. As Senator Watkins said, there is a requirement for the submission of business-type budgets.

Senator Barrett. The long-term money, that is substantially what they do with other types of money? Is that the general rule?

Mr. Will. I would think that would be the general rule. You want to find out what it costs the Treasury to borrow money, so you would take the average long-term.

Section 5 provides for the allocation of costs of the project among the several purposes which I have already mentioned. It provides for an annual report by the Secretary to reflect accurately the Federal investment allocated to these several purposes and the project of return and repayment thereof.

Section 6 provides that hydro power plants authorized by the Act shall be operated in conjunction with other Federal power plants in order to provide the greatest amount of firm power. That is quite an important provision because it assures that the policy will be to cover as much revenue as practicable through the sale of firm power rather than the disposition of large quantities of secondary power.

Section 7 authorizes the Secretary to investigate and plan public recreational facilities in connection with these water areas that will be provided particularly at the hold-over storage reservoirs, and he is authorized ti enter into arrangements with states or subdivisions or agencies thereof in connection with the operation of those facilities.

Senator Millikin. That is more or less customary procedure, is it not?

Mr. Will. Yes, sir.

Section 8 provides that nothing in this Act shall be construed to alter, amend, repeal, construe, interpret, modify, or be in conflict with any provision of the law of the river, naming the several statutes and the compacts.

Section 9 provides that expenditures for these hold-over storage reservoirs may be made without regard to the soil survey and land classification requirement of the Appropriation Act of 1954.

Section 10 authorizes appropriations.

Senator Millikin. What is Section 9 again?

Mr. Will. Section 9 makes it possible for the Secretary to proceed with construction of the hold-over storage reservoirs without making first the land classification and soil survey that is required in the Interior Department.

Senator Millikin. Why is that advisable for this bill?

Mr. Will. Because out of these hold-over storage reservoirs, except the Navajo, there will be no direct uses for irrigation purposes. Hence, there is no need for land classifications and soil surveys before they begin construction. They are river regulators and power producers.

Senator Watkins. Is it not true that when it comes to the irrigation features and the participating projects that those surveys have, for the most part, already been made?

Mr. Will. In many cases they have been made.

Senator Watkins. Or will be made before they go forward

with the projects.

Mr. Will. They will all be required to be made before the Secretary can initiate construction of any participating project.

Section 11 authorizes the conveyance to the city and county of Denver for a use as a part of its municipal water supply system of water rights acquired solely for the generation of power.

Senator Millikin. Has that been checked again since we talked yesterday? Have we the language so it is restricted to reservoirs?

Mr. Will. That is satisfactory here.

Senator Millikin. Let us see what you have for that.

Mr. Will. "The appropriate agencies of the United States are authorized to convey to the city and county of Denver, Colorado, for use as a part of its municipally owned water system, such interests in lands or water rights used or acquired by the United States solely for the generation of power and other property of the United States as shall be required in connection with the development or use of its project "

Senator Millikin. "And other property of the United States," does that mean water rights?

Mr. Will. That other property of the United States would not include water rights; water rights being named specifically prior to that.

Senator Millikin. Go ahead.

Mr. Will. Shall I read the balance of it?

Senator Millikin. Yes.

Mr. Will. " * * * and other property of the United States as shall be required in connection with the development or use of its Blue River project, upon payment by Denver for any such interest of the value thereof at the time of its acquisition by Denver, and provided that any such transfer shall be so limited as not to preclude the use of the property other than water rights for the necessary functions of the United States Government."

Senator Millikin. At this point tell us what are the rights of the United States as to the Blue River at the present time, what are the rights of Denver, so we can see what it is all about.

Mr. Will. The United States has certain direct flow rights in the Blue River at the Green Mountain site.

Senator Millikin. For power purposes?

Mr. Will. Yes.

Senator Millikin. Any other purposes?

Mr. Will. No. We are not trying to acquire any rights the United States may have for purposes other than power.

Senator Millikin. I have been told that the United States claimed the water rights for several purposes, including power; but since we are limiting it to power, it would exclude the

others.

Mr. Will. Section 7 --

Senator Millikin. Have you finished your discussion of the Denver situation?

Mr. Will. All I intended to say was that the only thing that Denver is trying to acquire here is direct flow rights. It does not propose to interfer with any other rights there may be at Green Mountain Reservoir. Nothing in this section can, in my judgment, be held to affect in any sense any questions that are the subject of pending litigation, both in the Colorado Supreme Court and the United States Supreme Court of Colorado.

Senator Millikin. Wouldn't what we are doing here be affected by the outcome of the litigation?

Mr. Will. Yes. There may be some effect. The question may well be how much, if anything, does Denver have to pay for these direct flow rights.

Senator Millikin. But Denver has to pay for them?

Mr. Will. Yes, if the United States has them.

Senator Millikin. That is subject t agreement between the Department and Denver, is that right?

Mr. Will. That would be subject to negotiation.

Senator Millikin. Tell me what the effect of Denver's rights would have on the claimed water rights of the western part of the state.

Mr. Will. Naturally, the western slope of Colorado is opposed to any further diversion by the City of Denver --

Senator Millikin. What would this diversion amount to?

Mr. Will. An average of 177,000 acre feet.

Senator Millikin. For power purposes?

Mr. Will. Yes, sir.

Senator Millikin. Does the western slope have a claim to those power purposes at the present time?

Mr. Will. The pending litigation may to some extent determine whether the western slope has any claim on those particular waters?

Senator Millikin. Does it involve the rights of the United States as well as Denver?

Mr. Will. It involves rights of the United States, rights of Denver, and rights of appropriators downstream.

Senator Millikin. Let us take the various alternatives then. Supposing that the decision should be in favor of the United States. What happens to Denver?

Mr. Will. Then Denver would have to pay the United States the value of those direct flow rights for power purposes. That compensation might be in money or in terms of power.

Senator Millikin. Give us an illustration of how it might be in terms of power.

Mr. Will. Making this diversion will probably afford the City of Denver an opportunity to develop power at one or two

sites on the eastern slope. It would be possible that the power thus developed might be used in part to compensate the United States for the value of the rights acquired.

Senator Millikin. If the reverse were true, if the entirely opposite effect of litigation happened, what would be the effect on the western slope? What would be the effect on Denver?

Mr. Will. The effect on the western slope would be to reduce flows by an average of 177,000 acre feet per annum. The effect on Denver would be that she would not have to compensate the United States for those power rights.

Senator Millikin. What are you really doing for Denver here?

Mr. Will. What we are doing for Denver here is merely authorizing the appropriate executive agencies to negotiate with Denver and sell, if they chose to do so, the rights that they have, rights of way and interests in lands. For instance, in connection with her proposed diversion, Denver will need certain lands that are under the jurisdiction of the Forest Service of the Department of Agriculture. The Secretary of Agriculture then, under the terms of this provision, would have authority to negotiate with Denver.

Senator Millikin. Denver would have to pay?

Mr. Will. Denver would have to pay. She might pay in comparison or by exchange, but --

Senator Millikin. But she would have to pay one way or the

other in terms satisfactory to the Secretary of the Interior, is that right?

Mr. Will. Or the Secretary of Agriculture, since those lands are under his jurisdiction.

Senator Millikin. How would the western slope be injured under what we are doing here?

Mr. Will. The western slope naturally would not like to see a provision in this or in any other measure which would afford Denver the possibility of making that diversion of 177,000 acre feet on the average, if that reduces the flows to the western slope.

Senator Watkins. However, Mr. Will, that water that is allocated to the State of Colorado under the Upper Basin Compact and the State of Colorado with its laws, subject to whatever rights we give Denver to acquire the facilities for doing the job, will make the decision?

Mr. Will. That is right.

Senator Watkins. In other words, it is not up to the Congress or anyone else to decide how Colorado will divide up its waters?

Mr. Will. No, sir.

Senator Millikin. The position of the western slope is largely influenced by her views of her future industrial and agricultural and other developments, is that correct?

Mr. Will. That is correct.

Senator Millikin. What percentage of the water that might be affected by this section and the pending litigation -- what is the percentage of that water toward the whole production of the stream?

Mr. Will. It is very small. Call it 200,000 acre feet just in round figures. The total use that Colorado is now making is about two million acre feet.

Senator Millikin. What is assigned for it under the Upper Colorado River Basin? How much water is Colorado entitled to under its allocation under the Upper Colorado River Basin?

Mr. Will. It is fifteen and three-quarters per cent of seven and a half million, about three and three-eights million.

Senator Millikin. How much of that Colorado water is being diverted to the eastern slope?

Mr. Will. I would have to supply that, Senator.

Senator Millikin. How much is now being diverted for the purposes of the Big Thompson Project?

Mr. Will. I will have to supply that.

Senator Millikin. Let us put that in the record, what we are taking out now and what will be taken out by the Frying Pan Arkansas; what is being taken out by private companies that are going over to the western slope for their water.

Mr. Will. I will supply that.

(The information referred to follows):

Senator Watkins. It is a small percentage.

Senator Millikin. Yes, but it is a large percentage under the viewpoints of the western slope which has great shale deposits, great coal deposits, and great mineral deposits. It naturally wants as much water available for its future development as it can get.

Senator Watkins. It all points up, no matter how much we get up the stream, we are still away short of water needed.

Senator Millikin. I was going to explain the diversion situation a little more, but everyone here understands diversion.

Senator Barrett. I am not sure I understand it all. I would like to ask this question: On the top of page 26, in the first line, it says that the interests or the water rights -- "interests in lands or water rights used or acquired by the United States * * *." Is it the contention by that phrase that the water in the Green Mountain Reservoir belongs to the United States?

Mr. Will. No, sir. This deals solely with direct flow rights.

Senator Barrett. Why would the United States own the direct flow rights?

Mr. Will. For power purposes. It claims certain rights for power purposes.

Senator Watkins. But not for a consumptive use?

Mr. Will. That is right.

Senator Barrett. I do not see what right the United States has to sell that water.

Mr. Will. It would not be selling the water, it would be disposing of any rights they may have by reason of filings for power purposes.

Senator Barrett. Denver is buying the water?

Mr. Will. Denver is buying the water rights. That is the difference. This is not buying the water; this is buying water rights.

Senator Barrett. If they are buying the water rights, who owns the water rights?

Mr. Will. The United States has made certain filings. Under its present claims it claims to have certain rights to use direct flow for development power. Just what the extent of those rights is will be determined by litigation now pending.

Senator Barrett. Their rights for developing power are such that they cannot interfer with the normal flow of that water after they use it for that purpose, is that not right?

Mr. Will. As they use the water for power, it goes downstream to the western slope.

Senator Barrett. What they are saying is that we are going to use that water for power and we are not going to let it run downstream, is that right?

Mr. Will. What this provision would do would be to authorize the Secretary of the Interior to convey those power rights of the United States to the City of Denver.

Senator Barrett. The Federal Government would not develop power there?

Mr. Will. They are at Green Mountain now.

Senator Barrett. After this legislation, are they surrendering their rights?

Mr. Will. Their right to develop power will be reduced to the extent necessary to enable Denver to make that average annual diversion of 177,000 acre feet.

Senator Barrett. The water really goes through the power plant, is that right?

Mr. Will. That is right.

Senator Barrett. Who gets the benefit of any compensation Denver might pay for the water rights?

Mr. Will. The Federal Treasury, I would suppose.

Senator Barrett. Who pays for the Green Mountain project?

Mr. Will. The Green Mountain Reservoir is part of the Colorado --

Senator Millikin. Tell Senator Barrett what is the function of the Green Mountain project so we can get this related.

Mr. Will. The Green Mountain Reservoir is a part of the Colorado Big Thompson project. The Colorado Big Thompson project involved a diversion from the west slope to the east slope.

Part of the purpose of Green Mountain Reservoir is to store water for replacement purposes.

Senator Millikin. Explain that and give us an illustration.

Mr. Will. What that means is that there is storage in Green Mountain Reservoir which is released to satisfy the requirements downstream for flow of the river. There are certain interests, including the Grand Valley Irrigation District, just east of Palisades and the Shoshone power plant of the Public Service Company of Colorado.

Senator Millikin. The point is that the former users and I suppose the present users from the supply that furnishes the water in Green Mountain wanted to be assured their supply would not be interferred with. So a part of the reservoir capacity is designated, or whatever the technical term is -- but a part of the reservoir capacity is to assure that the water they give up for this purpose will be replaced.

Mr. Will. That is right.

Senator Millikin. Do you have that figure?

Mr. Will. That storage for replacement purposes is around 50,000 acre feet.

Senator Millikin. So those people over on the western slope who are depending upon the Green Mountain, the protection they get will not be interferred with?

Mr. Will. It will not be affected by this at all.

Senator Millikin. It is limited that way in the bill?

Mr. Will. Yes, sir.

Section 12 of the bill requires the Secretary of the Interior to comply with the law of the river in the operation of these several works, and it waives the United States immunity from suit so that if any state claims that the operation of any of these works is contrary to the law of the river, that state may bring suit in the United States Supreme Court of the United States and the United States may be made a party.

Senator Millikin. In connection with this general Green Mountain project which serves the eastern slope in part, I wanted to call attention that under the Constitution as interpreted in Colorado and under our leading cases there it does not matter where the water originates if you do those things necessary to perfect a right to that water.

Mr. Will. That is right. The Supreme Court of Colorado held that back in the Coffin versus the Left Hand Inch case.

Senator Millikin. In the same way, I think there is a protection for diversion of that kind in the compact itself. For example, you could not use any Colorado River water in many cases where it is used in California if you paid strict attention to the Basin which serves the stream.

Mr. Will. The compact contemplates uses out of the Basin provided they are within the states of the Colorado River Basin.

Section 13 contains the definitions of several terms used in the bill.

That concludes the bill, Senator.

Senator Millikin. Any questions about the bill?

Senator Kuchel. Mr. Chairman.

Senator Millikin. Senator Kuchel.

Senator Kuchel. First of all, Mr. Will, did you participate in the drafting of this legislation? You are acquainted with the reasons why some changes were made in the committee print?

Mr. Will. Yes, I think I have some understanding of it.

Senator Kuchel. You say you participated in the drafting of this committee print?

Mr. Will. Yes, sir; I assisted.

Senator Kuchel. With respect to the eleven projects that are called participating projects, I think it is clear that so far as the Congress is concerned the Congress, under this legislation, would give approval to each of those projects and thereafter only an administrative act in the discretion of the Secretary of the Interior would be required to add any or all of the participating projects to those projects to be undertaken, is that right?

Mr. Will. Yes. All that is required under the terms of this bill as to those twelve participating projects is that the Secretary shall make the finding provided for. In other words, that finding is that, first, construction of the participating projects shall not be undertaken until the Secretary has

re-examined the economic justification of the project and accompanied by appropriate documentation in the form of a supplemental report as certified to the Congress through the President that in his judgment the benefits of such project will exceed its cost.

Senator Kuchel. Can you state why as a matter of policy the Congress should adopt that type of legislation where a blanket approval in advance of feasibility findings is made?

Mr. Will. I think there are reasons why that is thoroughly justified in this case, Senator. In the first place, each one of these participating projects has already been very thoroughly investigated. However, there has been contention between the Department of the Interior on the one hand and the specialists in the Department of Agriculture on the other regarding the means of determining certain benefits, direct agriculture benefits. The purpose was to afford the Secretary of Agriculture an opportunity to consult with the Secretary of the Interior so there might be an other determination on the subject.

Senator Millikin. Is it not a fact that every one of these participating projects, with the possible exception of Gooseberry, has already been reported on by the Department of the Interior?

Mr. Will. That is even true of Gooseberry.

Senator Millikin. I want to add, also reported on and found feasible and reported so to the Congress?

Mr. Will. Yes, that is correct.

Senator Millikin. With the exception of Gooseberry, which has been reported upon, but I do not know whether it has gone any further than that.

Senator Bennett. It is in the Bureau of the Budget.

Senator Millikin. Is that correct?

Mr. Will. Yes, sir.

Senator Daniel. May I ask if what you have said applies only to the first twelve of these participating projects and does not apply to San Juan Chama and Navajo?

Mr. Will. That is correct. It does apply to them.

Senator Daniel. What you have just said in reply to Senator Kuchel does not apply to San Juan Chama and Navajo?

Mr. Will. That is right.

Senator Watkins. That is, the participating projects known as Navajo?

Mr. Will. Yes.

Senator Kuchel. Is it not possible that the benefit to cost ratio that might be found by the Department of the Interior would be on a different basis for some indeterminate time in the future and might require the Congress to take a second look at it before it gives this blanket approval in this bill?

Mr. Will. That is a possibility. Let me suggest this: It is extremely remote because of the provision here for consultation with the Secretary of Agriculture. You have there an additional safeguard not contained in general law.

Senator Millikin. You have the safeguard of the Appropriations Committees, too.

Mr. Will. Yes.

Senator Watkins. Also the fact that the Secretary of the Interior has already certified the benefit-cost ratio of practically all of these participating projects.

Mr. Will. That is correct.

Senator Watkins. That has been done after some consultation with Agriculture. I happen to know that is the situation. Agriculture has been consulted along the line.

Senator Millikin. Proceed, Senator Kuchel.

Senator Kuchel. The draft of the bill retains that section that was previously in either the House or the Senate bill which set as a declaration of policy the Congress might add additional participating projects?

Mr. Will. That is in Section 2 on page 17, beginning line nineteen. It says that in order to achieve such comprehensive development as will assure the consumptive use in the states of the Upper Colorado River Basin of waters of the Colorado River system, the use of which is apportioned to the Upper Colorado River Basin by the Colorado River Compact, and to each state thereof by the Upper Colorado River Basin Compact, it is the intent of the Congress in the future to authorize the construction, operation, and maintenance of units of the Colorado River Storage Project of additional phases of participating projects authorized

in this act and of new participating projects as additional information becomes available and additional needs are indicated.

It is hereby declared to be the purpose of the Congress to authorize as participating projects only projects including units or phases thereof (1) for the use in one or more of the states designated in Article 3 of the Upper Colorado River Basin Compact of waters of the Upper Colorado River system, the consumptive use of which is apportioned to those states by that article, and (2) for which pertinent data sufficient to determine a probable engineering and economic justification and feasibility shall be available.

It likewise delcares that to be the policy of the Congress -- that the costs of any participating project authorized in the future shall be amortized from its own revenues to the fullest extent consistent with the provisions of this act and the Federal Reclamation Law.

Senator Kuchel. What is the legal effect of that?

Mr. Will. It does not authorize any project. It just sets forth a statement of policy which is not binding on any future Congress.

Senator Kuchel. So to that extent i constitutes surplusage?

Mr. Will. It does this, and I think it is quite important: When you look at these participating projects you see there is

provision for very small use -- in fact, I think Senator Millikin noted in the meeting of the subcommittee the other day that there were very few water use projects proposed for the State of Colorado in this bill.

Senator Millikin. It grieves me that is true.

Mr. Will. This gives those people who yearn for some development and who have waited many years for it hope that they will get some.

Senator Kuchel. Your statement is it would have no binding effect on any future Congress?

Mr. Will. None at all.

Senator Kuchel. It merely is a gratuitous expression of intent of this Congress and perhaps a hope by this Congress that future Congresses would find additional projects feasible and thus bring them into this over-all plan of development.

Mr. Will. That is correct.

Senator Watkins. One of the objectives would be to indicate that this program, the part which is authorized or will be authorized by this bill, is a part of the over-all possible development of the Upper Basin and a program by which if the Congress should authorize these additional projects in the future they might put to a beneficial use more of the water allotted to those states?

Mr. Will. Yes, sir.

Senator Kuchel. As you know, there are representatives

here of the state government in California and other public agencies that have viewed this proposed legislation with some apprehension as far as the interpretation of the Colorado River Compact is concerned, and I want to be assured that the bill would not have anything offensive to the Colorado River Compact. You agree with that general philosophy, I am sure.

Mr. Will. I think we have protected them fully, however, in that respect, don't you?

Senator Kuchel. That is the reason for a number of these questions I want to ask.

With respect to Section 3, going down to page 10, line nineteen, with respect to Indian lands within, under, or served by any participating projects, et cetera, as one of the bases for action by the Federal Government, during the hearings in the Senate Committee there was testimony to the effect that the Department of the Interior, through its agencies, was ruling both ways on the question of priority of rights of Indians to water. Do you recall that?

Mr. Will. Yes.

Senator Kuchel. So we have here a specific delegation that the Indian lands are going to be protected as far as their water rights are concerned, but we have testimony in the record that the administrative agency which would have the responsibility of

carrying this bill into effect if it became law has not made up its mind what legal rights the Indians have in this Colorado River Basin and has not taken a position, or rather has taken two positions on the matter. Do you recall that testimony?

Mr. Will. I recall that testimony.

Senator Watkins. Under the Levitt Act the project may be built and the charges for the project will be allotted to the Indians, but they are not required to pay it so long as it is in Indian lands.

Mr. Will. That is right. If it passes into White ownership, then payment of those accummulated charges is required.

Senator Watkins. That part of the cost will come out of the United States Treasury because that is for the wards of the Government.

Mr. Will. Yes, sir.

Senator Kuchel. To the extent Indian lands and rights are mentioned, your point is this subdivision of the bill has to do merely with --

Senator Anderson. With exactly the same thing that is going along on the Colorado River in California where the Colorado Indians and the Navajos are occupying lands there. The assessment is being made against the land. The charge goes against the land. So long as it remains in Indian ownership, no payment is made by the Indians.

Senator Watkins. That is the universal law that applies to

all the reclamation projects. We had one case in Utah where we passed the liberation bill for those Indians, and we had something like $60,000 of accummulated charges against those Indian lands. We just wiped it out in the bill. They said, "We won't hold you for it." Those Indians do not have to pay because some day they may transfer them over to White people.

Senator Kuchel. On the cost of the projects, can you supply the cost of the San Juan Chama project which is included in the bill?

Mr. Will. Yes, I can supply that.

Senator Anderson. I think you ought to supply the figure which was finally put in after taking out the power dams and generating facilities. It comes down to about $150 million or $160 million.

Mr. Will. Referring to the question asked of me by Senator Malone, the cost of the participating projects other than Navajo participating and San Juan Chama is $317,000,000 in round figures.

The cost of the Navajo participating project is estimated at $174,000,000. The cost of the San Juan Chama project is estimated at $144,000,000.

Senator Kuchel. Whose figures are those?

Mr. Will. These are Bureau of Reclamation figures.

Senator Kuchel. On the question of leave to sue the Secretary of the Interior, page 26, Section 12, particularly beginning at line nineteen, why was that provision put in?

Mr. Will. Here is the reason why that was put in, Senator. Of course, the United States as a sovereign is immune from suit. That being the case, you can have complete frustration of a state seeking in the Supreme Court redress against operation of one of these reservoirs contrary to the law of the river unless you can sue the United States. You haven't got the primary party in interest before the court.

Senator Kuchel. I think it is a good thing to have it in there. The reason I raise it is because Judge Brietenstein disagreed with your statement just now.

Mr. Will. I did not so understand him.

Senator Kuchel. On page 295 of the record, Mr. Brietenstein said, "That is right. There is another point I would like to make there. I am not trying to express my judicial opinions here, but in my opinion if the Secretary of the Interior or any of those under him in constructing or operating this project violated the law of the river, I think they could be stopped and the question of waver of immunity by the United States would be immaterial to that suit."

Mr. Will. Now I understand what you are referring to. Judge Brietenstein was talking in that case of the possibility that exists of bringing suit against the Secretary of the Interior personally. That can be done. That is not suing the United States; that is suing the Secretary of the Interior personally seeking to enjoin him from an improper operation of a reservoir.

That can be done. However, this provision seems highly desirable to expedite matters. You sue the Secretary of the Interior personally. District Court, up through various appeals, and perhaps eventually you get to the Supreme Court of the United States hence. By this provision you get to the Supreme Court of the United States immediately.

Senator Kuchel. So the purpose of this provision is to give any state in the Colorado River Basin, Upper Basin or Lower Basin, the right to file a lawsuit against the Secretary of the Interior in the United States Supreme Court if it alleges that it is aggrieved by his actions and he is violating either the bill before us or the Colorado River Compact, the Boulder Canyon Project Act, the Boulder Canyon Project Adjustment Act. or the treaty with Mexico?

Mr. Will. That is substantially correct. The only respect in which I could not quite agree with you is that here this authorizes suit by a state against the United States as a sovereign, not just the Secretary of the Interior.

Senator Kuchel. And to that extent, in your judgment, it would be broader jurisdiction?

Mr. Will. This is much more positive protection.

Senator Kuchel. I must say, Mr. Chairman, I am glad the subcommittee recommended that provision which I have strongly urged in the bill.

Senator Millikin. Are there any other questions?

Senator Kuchel. There are some questions that I should

ask, and I do not know whether Mr. Will is the witness I should ask it of. I want to ask those questions based upon the testimony in the subcommittee by representatives of the State of California. Perhaps some other witness, however, would be better qualified to answer them.

Senator Millikin. We are about to vote on this bill.

Senator Kuchel. Do you have any more witnesses?

Senator Anderson. We have some up here that we are doing to deal with. The San Juan Chama Project has been the cause of some argument between the States of Texas and New Mexico. The Senator and I tried to work out a little language. This would be the language: that on page 17 after the other items are handled -- and I would like to make one other suggestion before that, but it does not matter. But when we get down to the end of line eighteen we would strike the period, add a comma and say, "provided further that with reference to the San Juan Chama project, it shall be limited to a single off-stream dam and reservoir to be used solely for the control and regulation of water imported from the San Juan River, that no power facilities shall be established, installed, or operated along the diversion or on the reservoir or dam, and such dam and reservoir shall at all times be operated in strict compliance with the Rio Grande Compact as administered by the Rio Grande Compact Commission by the Bureau of Reclamation of the Department of the Interior."

I have not had a chance to check that with the Water

Commissioner, the water engineer, or the legal authority in the State of New Nexico, and I would like to agree to the language and then have an opportunity before we ever get to printing anything to consult with the Senator from Texas again, and if there is any small change, to submit it to the chairman with his approval and alter it before the language is printed.

Senator Millikin. We will be getting to the printing real quick, so settle your minds on that, gentlemen.

Senator Daniel. I would like to have the same privilege. I offer this with Senator Anderson with the same provision. I have not checked this draft with representatives of the State of Texas, either. So we understand that it will go in under those conditions. Is that the will of the committee?

Senator Millikin. Is the committee agreeable?

Without objection we will do it that way.

If the time for printing is not sufficient, we can cure it on the floor. I would rather not do it that way, but assuming you agree and the rest agree, we will do it that way.

Senator Daniel. We will go ahead with the printing as suggested.

Senator Anderson. And the words "and authorized" are to come up in the line, also.

Senator Millikin. We can fix it on the floor.

Senator Daniel. On page 17, line eighteen, after the word "approved" the words "and authorized" are to be inserted.

Senator Millikin. What is the significance of that?

Senator Daniel. It simply makes it clear that this particular project must not only be approved but it must have actual authority from the Congress.

Senator Bennett. I think it might be better if it read, "and approved by an act of Congress" or "authorized by an act of Congress." What you are thinking about is the possibility of two concurrent resolutions.

Senator Daniel. The main thing is we do not want this action to be interpreted as an authorization of the San Juan Chama project.

Mr. Will. That is a little too flat for Senator Anderson.

Senator Anderson. No; the people from the Lower Basin were worried that "approved" might have given them partial authorization. We said we wanted true authorization, and we do.

Senator Millikin. Let us leave that to the draftsmen. I think it will be cleaned up before we print it.

Senator Daniel. You have the words Senator Anderson and I agreed upon in line eighteen. We would like to have a definition of the Rio Grand Compact inserted after the definitions of the compacts since we are now referring to it. That would come at page 27 after line twenty-four. Add a paragraph which would define the Rio Grande Compact. We will give the words to the Clerk of the committee.

Senator Millikin. Is there any objection on that?

Senator Watkins. No, sir.

Mr. Will. No.

Senator Anderson. You define the Upper Colorado River Basin Compact. We just want the Rio Grande Compact.

Senator Millikin. You may fix that up.

Senator Kuchel. Mr. Chairman, I offer this amendment: "The Secretary of the Interior is directed to institute studies and to make a report to the Congress and to the states of the Colorado River Basin of the effect upon the quality of water available at Lee Ferry of all transmountain diversions of water of the Colorado River system and of all other storage and reclamation projects existing and proposed to be made in the Upper Colorado River Basin under full practicable development and use of water apportioned by the Colorado River Compact, including those proposed to be made under the authority of this Act."

Senator Millikin. Senator, if you will permit me to say so, personally I would have to oppose that very strongly because I think it is a recognition or an implication that you lend weight to, let's call it, the California theory that we have some responsibility to supply you water free of salinity or a certain degree of salinity. I would not want to see anything of that kind in the bill because I am afraid we would be building up implications that some of us in the Upper States are very strong against.

Senator Kuchel. I would respectfully state to the chairman that all this is is a directive to the Secretary of the Interior to make findings on the effect of the quality of water.

Senator Millikin. Senator, I think if you would walk over there and ask them to do it on your own, I think they would do something of that kind. I think you put it in the bill and it lends fire to the thought that there is some responsibility here for certain salinity delivered to the lower states by upper states, and I could not possibly agree to that. I am talking personally, of course. If you want to know, that is one thing. But to put it in the law as an implication of a principle, that is something entirely different.

I think, Senator, that you probably could get that information just by asking for it on your own.

Senator Watkins. I am advised that these studies are already underway by the Department of Agriculture and the Department of the Interior under existing law.

Senator Kuchel. If that is true, what possible implications could there be from adopting a simple amendment that on its face merely directs the Secretary to do that? I do not see you run into a question of implications.

Senator Millikin. Supposing we did this and these departments give a report. Let us take a leap into the imagination and say California came along and made certain claims. We do not need to argue them now, but claims as to salinity. Suppose

somebody said salinity does not enter into this. Then some Senator from California might say, "Well, if that be true, why put this provision in this important bill?" That argument would not be without strength.

Senator Watkins. By leaving it out we are not prejudicing either side.

Senator Kuchel. I attended the hearings of the Senate subcommittee, and the printed report of those hearings is in direct contradiction to any claim that studies are going on. We were unable to find from the Department of the Interior or from anyone else any information on the effect by diversions and otherwise on the quality of water.

I urged the Senator from Utah to listen to this once more. "The Secretary of the Interior is directed to institute studies and to make a report to the Congress and to the states of the Colorado River Basin of the effect upon the quality of water available at Lee Ferry of all trans-mountain diversions of water of the Colorado River system and of all other storage and reclamation projects existing and proposed to be made in the Upper Colorado River Basin under full, practicable development and use of water apportioned by the Colorado River Compact, including those proposed to be made under the authority of this Act."

If it is true that the Department is undertaking some of those inquiries, and certainly the record does not indicate any accumulation of knowledge by the Department on that subject,

then I most respectfully urge this is something that should be of a non-controversial nature. At any rate, that would be the position of the junior Senator from California.

Senator Millikin. I see no merit in that question at all, but I do see if there were merit in it, it would destroy our whole present system of the distribution of water, the obligations of upstream fellows to lower stream fellows not recognized in law now and never have been. I see a complete revolution in the management of our water systems throughout the West.

Therefore, and I may be a crank, but I do not want to give any recognition of any kind directly in a bill of this nature that we think there may be some obligation so far as salinity is concerned to lower states, I could never vote for anything of that kind. I think it would be destructive of our whole system.

Senator Kuchel. I want to deny the Chairman as a crank.

Senator Millikin. I am glad to hear you say that. After several nights without sleep, I should be.

Senator Kuchel. Number two, the question of quality of water is going to be put in issue in any decision that the United States Supreme Court renders in Arizona versus California. The State of Nevada has seen fit to intervene in that lawsuit Now suppose that the decision of the Supreme Court did find that questions of quality of water were important and were implicit in the Colorado River Compact. Then there would be a need for an accumulation of data on it.

Senator Millikin. The Supreme Court would either have its referees make a special study or the referees would ask the Departments to make a special study of it. If that ever is decided that it is important as a legal proposition, there would be no dearth of experts to appear on the subject, including the Department.

Again I am speaking personally and thinking of the Upper Basin states, but we certainly should not do anything in the way of any reclamation law that it might be important. I think it would be devastating if we were to admit this question of salinity could be a controlling question. How can you use water in the upper states without increasing salinity? It is unfortunate if someone does not get the purity of the water he would like to have if he were further upstream.

Senator Kuchel. My only point is there should be a technical, professional accumulation of knowledge on the effect of water because I think it is implicit in the compact that the water which will be delivered at Lee Ferry will be of a usable type. However, I believe I know the Chairman's position. I am firm on this. I do ask the Chairman if he would entertain a motion that this be adopted.

Senator Millikin. You have heard the motion. All in favor say aye.

Senator Kuchel. Aye.

Senator Millikin. Contrary?

The motion is lost.

Senator Anderson. I think what the Senator said about no information being available was absolutely correct, but I do not think we --

Senator Watkins. On page 157 of the hearing record before the Senate subcommittee there were some statements by Mr. Clyde who was testifying that the Geological Survey has been making those studies. Based on that information available to date, he gave it as his opinion there would be no effect of increasing salinity in the Lower Basin by reason of the upstream diversion to trans-mountain areas.

Senator Kuchel. If that were true, what possible harm could there be from directing the Secretary to supply that information?

Senator Millikin. Whether it is true or not, it remains to be determined, and I think we have already voted.

Senator Malone. The junior Senator from Nevada was listening to a 40,000 word speech by the senior Senator from Utah in 1928 that said the water out of Boulder Dam would not be fit for human consumption.

Senator Watkins. You must identify that Senator. It is Senator Smoot, I imagine.

Senator Malone. He was the only senior Senator we had.

Senator Watkins. Just so the record is clear.

Senator Kuchel. Mr. Will, I did not previously ask you this: Can you tell how many projects in the committee draft

here are included within the Bureau of the Budget draft?

Mr. Will. All except Gooseberry. You are talking about the participating projects?

Senator Kuchel. Yes.

Mr. Will. I think all except the Gooseberry have been cleared by the Bureau of the Budget, and Gooseberry is pending before the Bureau at the present time.

Senator Kuchel. The Bureau approved both Echo Park Dam and Glen Canyon?

Mr. Will. Yes.

Senator Watkins. In addition, the President of the United States.

Senator Kuchel. I would like to file a minority report. How much time might I have?

Senator Millikin. I want to suggest to you there would be no objection to doing that, but do it fast because we have got to move fast on this. Have it early Monday.

Senator Kuchel. It will be difficult with the night session here.

Senator Millikin. Monday at four o'clock.

Senator Kuchel. I will have it Monday.

Senator Malone. Mr. Chairman, may I ask if this bill we are considering is exactly like the bill that has been reported by the subcommittee to the full committee of the House?

Senator Millikin. To the House?

Senator Malone. The House Committee.

Mr. Nelson. No, it is not.

Senator Malone. Let me ask if there is a limitation, as there was in the original House bill, on the time that Nevada, Arizona, or any of the other states could purchase power from Glen Canyon or any other place. Is there a limitation to the number of years they can purchase power there in this bill?

Mr. Will. There is no such limitation in this bill.

Senator Malone. You understand what I am talking about. There was in the House bill.

Mr. Will. Yes, but there is none in this bill.

Senator Malone. What does it provide?

Mr. Will. It contains no provisions governing the disposition of power to customers in any state. In other words, the Secretary of the Interior is free under the terms of this bill to negotiate power contracts with anybody he wants to.

Senator Malone. For any time that he sees fit?

Mr. Will. Yes, sir. I think it says up to forty years.

Senator Malone. In accordance with the reclamation law?

Mr. Will. Yes.

Senator Malone. And the renewal is in accordance with the reclamation law?

Mr. Will. That is true.

Senator Malone. Will you read me the provision out of this bill?

Mr. Will. Here is the provision of this bill that is pertinent: "The hydroelectric power plants authorized by this Act to be constructed, operated, and maintained by the Secretary shall be operated in conjunction with other Federal power plants, present and potential, so as to produce the greatest practicable amount of power and energy that can be sold at firm power and energy rates, but no exercise of the authority hereby granted shall affect or interfere with the operation of any provision of the Colorado River Compact, the Upper Colorado River Basin Compact, or the Boulder Canyon Project Act."

Senator Malone. Is that the only reference to the power contracts?

Mr Will. The other is the provisions the Federal reclamation laws apply except where they are specific exceptions.

Senator Malone. Will you read the provision and then the specific exceptions?

Mr. Will. It is in Section 3, page 18, beginning line twenty-one. "Except as otherwise provided in this Act, in constructing, operating, and maintaining the units of the Colorado River storage project and the participating projects listed in Section 1 of this Act, the Secretary shall be governed by the Federal reclamation laws (Act of June 17, 1902, 32 Stat. 388, and Acts amendatory thereof or supplementary thereto): Provided, That (a) irrigation repayment contracts shall be entered into which, except as otherwise provided for the Paonia

and Eden projects, provide for repayment of the obligation assumed thereunder with respect to any project contract unit over a period of not more than fifty years exclusive of any development period authorized by law * * *."

Senator Malone. What does it say about those projects?

Mr. Will. "Provided, That (a) irrigation repayment contracts shall be entered into which, except as otherwise provided for the Paonia and Eden projects, provide for repayment of the obligation assumed thereunder with respect to any project contract unit over a period of not more than fifty years exclusive of any development period authorized by law."

Senator Millikin. By law we approved both of those projects have a longer life than fifty years.

Mr. Will. "(b) prior to construction of irrigation distribution facilities repayment contracts shall be made with an 'organization' as defined in Paragraph (j) of the Reclamation Project Act of 1939 (53 Stat. 1187, 43 U. S. C. 485) which has the capacity to levy assessments upon all taxable real property located within its boundaries to assist in making repayments, except where a substantial proportion of the lands to be served are owned by the United States."

Senator Malone. This is in relation to power?

Mr. Will. No. There are no exceptions relating to power, Senator.

Senator Malone. This is a transmission line you are talking

about?

Mr. Will. No, sir. This does not even relate to transmission lines.

Senator Malone. It says, "provided for the Paonia and Eden projects, provide for repayment of the obligation assumed thereunder with respect to any project contract unit over a period of not more than fifty years exclusive of any development period authorized by law."

These are the only two exceptions in the whole project to the regular reclamation law governing the sale of power. Does this in any way limit the sale of power?

Mr. Will. No, sir. This has no connection with the sale.

Senator Malone. In the limitations and exceptions you noted these two projects when it says "except as otherwise provided in this Act, it has no reference to power at all."

Mr. Will. That is right.

Senator Malone. I will tell you why I am asking this. There was a limitation, I believe it was ten years, in the House bill that would limit Nevada or any other state outside of this Basin in contracting for power.

Mr. Will. Yes, sir.

Senator Malone. There is nothing with relation to that act, provision of the House act, in this bill at all?

Mr. Will. None at all.

Senator Malone. This does conform to the change that was

made in the House act?

Mr. Will. Yes, sir. As this has been reported by the Irrigation Subcommittee of this committee, it meets the objections that Congressman Young had on the House side to a number of provisions that were in the bill that the House was considering that would provide for recapture from the lower basin states of power disposed of.

Senator Malone. No money, unless it be Government -- of course, you can do anything with Government money and give that to foreign nations in large chunks. But no private money like the industrial center in Anderson, Nevada, and it is spreading through the county, could be secured to invest in machinery and plants to use a ten-year contract on power. So I am asking you the direct question now, if Nevada bidding for the power at Glen Canyon or any other project would be limited in securing that power in any other way by this act than it is limited by the Reclamation Act.

Mr. Will. No, sir; it would not.

Senator Anderson. I ask permission to leave with the reporter the exact words of this amendment as we have now worked it out. I would like to move it out.

Senator Millikin. The reporter will take that copy.

Senator Kuchel. Mr. Chairman, when the Bureau of the Budget originally approved the draft of the legislation, the bill provided for two immediate projects; Echo Park and Glen

Canyon. The bill before us now adds several more; to wit, Cross Mountain, Curecanti, Flaming Gorge, and Navajo.

Can you tell me why those were added?

Mr. Will. Yes, I think so. There was testimony before the committee that the most desirable and most efficient project would consist of this combination of hold-over storage reservoirs, including Cross Mountain, Flaming Gorge, Echo Park, Glen Canyon, and small Curecanti. I assume that is why the subcommittee added it.

Senator Kuchel. The bill recommended by the presidential departments is not the same, Senator Watkins, as we have before us now.

Senator Watkins. That is correct. It happened to be the judgment of the subcommittee --

Senator Millikin. The Department has approved the addition of these others.

Senator Watkins. They have not objected in any way. I would like to make a motion.

Senator Kuchel. There is testimony in the record from the Department of the Interior, at least, objecting to one of the projects. Your statement now is that there has been no objection. Do we have anything to indicate that the Department is in favor of this new draft, the Department of the Interior?

Mr. Nelson. Yes, we have.

Senator Kuchel. I wonder if that could be made a part of

the record.

Mr. Nelson. In other words, they are cooperating with us in the preparation of this bill.

Senator Malone. Get a letter.

Senator Watkins. There are many times we prepare bills up here that do not meet a hundred per cent the recommendations made by the Departments. That is the function of Congress, to go ahead and direct the kind of legislation it finally wants to write. There is no objection so far as I know to the inclusion of these features.

Senator Kuchel. I agree with your statement, but I did want the record to show when you suggested the President of the United States was for this legislation that the legislation which came to the committee from his Departments is considerably different than the judgment of the subcommittee on the legislation.

Senator Watkins. It includes more for initial authorization, that is true.

Senator Malone. May I ask one more question, Mr. Chairman?

Senator Millikin. Yes.

Senator Malone. I want to ask Mr. Bennett of the Department of the Interior if there is anything in this bill that limits the Secretary of the Interior in the coordination and the integration of the power units from Lee Ferry to Parker Dam in firming, in bringing about the maximum firm power in that area.

Mr. Bennett. No, nothing at all. As originally introduced

this bill did have a series of limitations on the marketing and the development of the power in this project. Those have all been deleted from this bill as it now stands before the committee.

Senator Malone. You are a lawyer?

Mr. Bennett. That is correct.

Senator Malone. Have you studied or do you understand the necessity of firming power to the greatest extent?

Mr. Bennett. Yes. As a matter of fact, it is very vital to the financial as well as the engineering feasibility of this project.

Senator Malone. You understand, then, the relationship between Glen Canyon and Bridge Canyon in the matter of the generation of power?

Mr. Bennett. That is correct, sir.

Senator Malone. What is it?

Mr. Bennett. Glen Canyon would be first in the series. Then you would have, presumably, in the ultimate plan Bridge Canyon and then you would have Hoover Dam below that. As your releases from Glen Canyon took place, if they were proper coordinated, those releases would be most economically beneficial if they could be worked into the generation of power at Bridge Canyon and then following that the development of power at Hoover Dam.

Senator Malone. And Davis and Parker?

Mr. Bennett. Yes, beyond that. Of course, they are coordinated with Hoover now, Parker and Davis.

Senator Malone. Do you understand if the power generated at Bridge Canyon, which is controlled by the storage of water in Glen Canyon, that Glen Canyon has a capacity of about twenty-five or twenty-six million acre feet?

Mr. Bennett. It is not named in the bill, but it is about that.

Senator Malone. You understand that the twenty-six million acre feet of storage coordinated with the ultimate construction of Bridge Canyon, which has only a storage of about theee million -- that the coordination or integration of the release of water from Glen Canyon through Bridge Canyon is absolutely important and necessary to make Bridge Canyon feasible. Then to bring about a maximum of firm power from Glen Canyon to Parker, it is necessary to integrate the storage and the power generation facilities through that whole area.

Mr. Bennett. I am very well aware of that.

Senator Malone. Does this bill provide for that?

Mr. Bennett. There is a provision here, Section 6 of the bill, on page 24 which deals with that subject. It begins on line one of page 24.

Senator Malone. Will you read it and explain it?

Mr. Bennett. "The hydroelectric power plants authorized by this Act to be constructed, operated, and maintained by the

Secretary shall be operated in conjunction with other Federal power plants, present and potential, so as to produce the greatest practicable amount of power and energy that can be sold at firm power and energy rates, but no exercise of the authority hereby granted shall affect or interfere with the operation of any provision of the Colorado River Compact, the Upper Colorado River Basin Compact, or the Boulder Canyon Project Act."

Senator Malone. Is that possible?

Mr. Bennett. Yes.

Senator Malone. Is there any provision in the Upper Colorado River Basin Compact that would interfer with the Colorado River Compact or the Boulder Canyon Project Act?

Mr. Bennett. As I understand it, there are many questions of interpretation involved, but certainly the Colorado River Compact is the paramount authority. Any conflict between the Colorado River Compact and the Upper Colorado River Bas Compac must be resolved in favor of the Colorado River Compact so far the rights of parties to the Colorado River Compact are concerned where those parties are not also members of the Upper Colorado River Compact.

In other words, Nevada and California are not parties in any way to the Upper Colorado River Compact. Yet all the state that signed the Upper Colorado River Compact are parties to the Colorado River Compact. For that reason, ther, so far as Neva

and California are concerned their rights under the Colorado River Compact are superior to any competing claims of upper basin states which rest solely on the Upper Basin Compact.

Senator Watkins. Is it not a fact, then, that the Upper Colorado River Compact says it is in conformity with the 1922 Colorado River Compact?

Mr. Bennett. Yes.

Senator Malone. In case of a disagreement or a question between the provisions of the Upper Colorado River Basin Compact and the Boulder Canyon Act, how would that question be resolved?

Mr. Bennett. The Upper Colorado River Compact certainly would not be in a position to change the rights of any beneficiaries of the Boulder Canyon Project Act in my estimation.

Senator Malone. Would you object to a provision of that kind here?

Mr. Bennett. I do not think it is necessary, but at the moment without having an opportunity to think through all the ramifications, I do not see any particular objection.

Senator Malone. Since we are now passing a new act, nothing in the act shall interfer with carrying out the provisions of the Boulder Canyon Project Act.

Mr. Will. It is in Section 8.

Senator Watkins. "Nothing contained in this Act shall be construed to alter, amend, repeal, construe. interpret, modify, or be in conflict with any provision of the Boulder Canyon Proje

Act (45 Stat. 1057), the Boulder Canyon Project Adjustment Act (54 Stat. 774), the Colorado River Compact, the Upper Colorado River Basin Compact, or the Treaty with the United Mexican States."

Senator Malone. There is likely to be a difference, and that is you are now passing an act that is in conformance with the Upper Colorado River Basin Compact. So now is the time to discuss any conflict between the Boulder Canyon Project Act, the Boulder Canyon Project Adjustment Act, and the Upper Colorado River Basin Compact. In other words, if there is a difference, how will the difference be resolved? We know the Upper and Lower Basin must conform to the Colorado River Compact. It is here, and I think properly so.

Senator Anderson. If there is a difference, there is a provision in the bill for a suit to be entered and you do not even ask the consent of the United States on it. That is granted by the bill. If there is the slightest conflict, it can be resolved in the courts immediately. This is the first time that legislation has been drawn that way that I know.

Senator Malone. We already have legislation now in the Lower Canyon Project Act. Now we are about to pass another act that could very easily have a conflict arise. Couldn't we have a provision here that in case of a conflict that it would be resolved in favor of the existing legislation?

Senator Anderson. There is provision for its resolution in

case there is conflict. There is a section that says that.

Mr. Will. Section 12, page 26.

Senator Malone. Read that and tell me where it covers that.

Mr. Bennett. "In the operation and maintenance of all facilities, authorized by Federal law and under the jurisdiction and supervision of the Secretary of the Interior, in the basin of the Colorado River, the Secretary of the Interior is directed to comply with the applicable provisions of the Colorado River Compact, the Boulder Canyon Project Act, the Boulder Canyon Project Adjustment Act, and the Treaty with the United Mexican States, in the storage and release of water from reservoirs in the Colorado River Basin.

"In the event of the failure of the Secretary of the Interior to so comply, any State of the Colorado River Basin may maintain an action in the Supreme Court of the United States to enforce the provisions of this section, and consent is given to the joinder of the United States as a party in such suit or suits."

Senator Watkins. It makes it very clear.

Mr. Bennett. The rest of it deals with another subject, but I will be happy to read it if you would like to have it.

"No right to impound or use water for the generation of power or energy, created or established by the building, operation or use of any of the power plants authorized by this Act,

shall be deemed to have priority over or otherwise operate to preclude or impair any use, regardless of the date of origin of such use, of the waters of the Colorado River and its tributaries for domestic or agricultural purposes within any of the States of the Upper Colorado River Basin."

Senator Watkins. Mr. Chairman, I move that the bill as reported by the subcommittee and as amended be reported favorably to the Senate.

Senator Anderson. I second the motion.

Senator Malone. That is all right, Mr. Chairman, but I have a question or two to ask.

Senator Millikin. All right.

Senator Malone. This is the first time that any of us have heard anything about this proposition.

Is this the first meeting of the main committee?

Senator Millikin. This is the first meeting of the main committee on this business. The subcommittee has already met.

Senator Malone. I thought with the rush of business and being on three or four committees, maybe I had overlooked something here.

Senator Malone. Would there be an objection to adding language to the section where it is evident that there will be a conflict or there could be a conflict? I am not cognizant of all of the provisions -- and there is no necessity for me being cognizant of these provisions on your division of water in the

Upper Basin states -- but I can see there can very easily be a conflict between the provisions of the Upper Colorado River Basin Compact and the provisions of the Boulder Canyon Project Act.

Section 6, then, could easily be in that event in conflict with Section 8 and might be ruled to be controlling.

If it would be accepted that in the event of a conflict between these two acts it would be resolved in favor of the existing act, I see no reason in view of the provisions of these other two sections why there would be any objection to it.

Senator Millikin. It is already covered. The whole question is covered.

Senator Malone. Here it is obvious that the Secretary of the Interior is to administer the act in conformance with all three of these acts and provisions. Then there is a provision some place there can be a suit brought if some state is not satisfied with his interpretation. If there is a conflict between these two acts or between these two compacts, or the compact and the act, if there would be some indication as to how that would be resolved, it would be very helpful.

Mr. Bennett. I have the answer to that, I think. The Boulder Canyon Project Act itself says that the rights of the United States in or to waters of the Colorado River and its tributaries, howsoever claimed or acquired, as well as the rights of those claiming under the United States, shall be

subject to and controlled by said Colorado River Compact.

In other words, the Colorado River Compact limits the Boulder Canyon Project Act. Then we start then from that point with the proposition that in this bill this bill is subject to the Colorado River Compact. As we previously said, the Upper Colorado River Compact is subject to the Colorado River Compact. So in the end, all of these things lead you right back to the Colorado River Compact in the event of any conflict.

Senator Malone. There is an obvious basis for interpretation here in this bill that is not in any other compact. Suppose the Lower Basin should arrive at a compact. I personally do not expect it, and I have been in it for twenty-two years and have always said that there probably would not be any. Let us suppose there were and there was a conflict with the Colorado River Compact and a conflict with the Upper Colorado River Basin Compact.

What you are throwing in here is a compact that was approved by the Senate, but the Senate had no part in it. They simply passed an act allowing the Upper Basin to get together on the division of water and then approved that compact. They would do the same with the Lower Basin Compact. They have already said we can get together. If we bring it back here, it will no doubt be approved. But there may be a conflict, so you are throwing in this bill for legislation by Congress something that

was never passed on; that is, a compact between the Upper Basin states.

Senator Watkins. Congress has already authorized the Upper Basin states.

Senator Malone. But it did not participate in the negotiations.

Senator Watkins. Any more than it did in the Colorado River Compact.

Senator Malone. But all of the states were in the Colorado River Compact and Congress passed on the Boulder Dam Project Act.

Senator Watkins. If there are any conflicts between any of the compacts that may be entered into, with the apparent law, the law of the river, which is the 1922 Colorado River Compact, they may arise; but we have provided the machinery. There is only one place that could be resolved. That is, in the court.

What I am trying to say is the only place it can be resolved will be in the Supreme Court. We have provided machinery so they do not have to get a resolution. The state can file its petition and ask for a ruling on the interpretation.

Senator Malone. You are an attorney, and I am merely pointing out to you if we had had a compact or if we subsequently get one -- suppose you added "any subsequent compact with the Lower Basin States." It would be just as reasonable to put that in.

Senator Watkins. We have not any right to predict.

Senator Malone. Then why not remove the Upper Colorado River Basin Compact from this paragraph? "Neither the Lower Basin states or" --

Senator Watkins. Do you see what that would do? It would make it so you could not sue us on that if you take that out.

Senator Malone. I move, Mr. Chairman, that it be taken out. There is no reason for it.

Senator Anderson. Let us go ahead on that. That is the only way you will straighten it out.

Senator Millikin. What is your motion?

Senator Malone. I do not see we should be pushed into this at this hour and minute. There are things here to be discussed that have a very grave bearing on the legislation already passed by the Congress. The reason that I made that motion was so we could discuss it here. You are putting in the Upper Colorado River Basin Compact and saying that nothing shall interfer with the Upper Colorado River Basin Compact, but the Congress has never discussed or authorized or passed or entered into this division of water. That is merely a division between the Upper Basin states that are entitled to a certain amount of water.

Senator Millikin. That again is subject to the Basin Compact.

Senator Malone. Then it seems to me if you are going to bring in the Upper Basin Compact we should include any compact

that the Lower Basin states might agree upon.

Senator Millikin. If the Lower Basin states come in with a compact, it has to be approved by the United States.

Senator Malone. I am not sure I am making my point clear. My point is we are including something here. By the Colorado River Compact all seven states were in. So when all seven states signed that, there is no question about the compact. Then there is only a question of what the compact means.

There would be five in the Lower Basin. If they agreed on a compact that had in that compact something that was inimical to the Upper Colorado River Basin Compact, the two things refer only to certain states in the Basin. The acts we pass here, after due consideration, I hope, to authorize certain legislation and investments being made on the basis of that authorization and legislation -- like the Boulder Dam Project Act -- very great investments have been made there.

If the Lower Basin states were in on the Upper Colorado River Basin Compact or if the Upper Basin states were in on the Lower Basin Compact, then that would be an entirely different complex. But you are inserting something in that legislation and making it on a basis, an equal basis, with the Colorado River Compact and the Boulder Canyon Project Act that I at the moment cannot see belongs there.

Mr. Bennett. I think I can give you part of the answer. Take Glen Canyon as an example. Presumably Glen Canyon would

the first unit constructed. If that is the case, you will have a dam and some very large power plants developed. In that process the United States, if it complies with Section 8 of the Reclamation Act, will apply for water rights to generate power. It will acquire water rights to generate power. In the absence of statutory or other provisions limiting the rights of the United States in that respect, it could demand at all times into perpetuity that prospective users of water upstream from Glen Canyon must allow all water to come down to satisfy those water rights.

The Upper Colorado River Compact as between the Upper Basin states says that the generation of power shall be a subservient use. This is a direction to the Secretary with respect to the apportionments of water to the Upper Basin states that he must comply with the provisions of the Upper Colorado River Compact insofar as any of the Upper Basin states have any rights or have set down any rules as between themselves for the use of water apportioned to them. So insofar as they are concerned, it becomes very important that the Upper Colorado River Basin Compact be included as one of the guide lines for the Secretary in the operation of these dams.

Senator Malone. Let me repeat one thing you have said, and I do not think it has anything to do with it. That is, the United States when they build Glen Canyon will acquire a right to do something with water that is not intended in the Colorado

River Compact.

Mr. Bennett. Oh, no; I did not say that.

Senator Malone. I said that, but you said it would acquire rights to take the water away from these Basin states.

Mr. Bennett. By compliance with state law, though. It will have to comply with state law under the Reclamation Act of 1902.

Senator Malone. That is one reason you have to pay the price. That is my present reaction; that if you build this Glen Canyon that you will acquire a right to operate a power plant in contravention of the rights of the Upper Basin states. They are required only to turn down a certain amount of water at Lee Ferry. They are not required to turn anything down through here, and the United States cannot acquire any rights to make them do it beyond the amount that is required in the Colorado River Compact. If they can, then I would like to have your idea about it.

Mr. Bennett. What I said was that the compacts themselves by direct inclusion in this bill make it certain that the United States cannot at some future date claim the acquired rights for power.

Senator Malone. You cannot possibly acquire any rights unless the Department of Justice is right.

Mr. Bennett. Interior is not going to help them.

Senator Malone. You do not know how long you are going to

be in there.

Mr. Bennett. That is right. They will be back at it again in the future.

Senator Malone. You are a temporary adjunct to that Department. Nobody knows, even the junior Senator from Nevada, how long you are going to be there. We hope for some time, but it does not look very good at the moment. So I am not questioning you as a person; I am questioning you as the Interior Department representative. I hardly know you, and I probably would not know you when you left there; but I will have to deal with somebody if I am still in the Senate. I am a temporary adjunct to the Senate. Only I realize it.

What I am asking you, then, is how you can possibly sit here and say that the Government of the United States, by building Glen Canyon, can acquire a right to make those Upper Basin states do something that the seven-state compact does not require them to do.

Mr. Bennett. I did not say that. I said in the absence

Senator Millikin. State what you said.

Mr. Bennett. I said by including the specific reference to compacts in this bill you set up certain guide lines and limitations on what the Secretary of the Interior can do in operating any of these stands, whether we are talking about Glen Canyon or Echo Park or the Central Utah or any of the others. By including those sections you make it indelibly

clear that he must comply with those provisions. It tends to avoid the very thing that you are fearing and I am fearing.

Senator Malone. You have proved what I have brought up is dangerous. In other words, by including this compact -- this was my point: that you inject something in here for the first time, taking cognizance of what you have done in the Upper Basin states and making it a part of the law of the land You have then injected something that should not be injected in this bill because I for one do not know what you have agreed on in the Upper Basin states and do not think it is of interest to me unless you make it paramount and the guiding principle in the interpretation of what the Secretary is going to do with these lower projects. That is the reason I do not like to see this.

Senator Millikin. Doesn't the Upper Basin Compact specifically make itself subservient to the other compact?

Mr. Bennett. That is right. Furthermore, even if it did not, it would be subservient so far as any rights in California or Nevada.

Senator Millikin. But it does?

Mr. Bennett. That is right.

Senator Malone. Why put it in here?

Senator Millikin. Just the same as why put in something else you want.

Senator Malone. It is not a question of me wanting it; it

is a question that this new legislation does not intend to interfer. I think you are entirely right; that you do not need to put the Colorado River Compact in here.

Senator Millikin. Because California insists that be in everything that touches the river. I think it should be.

Senator Malone. I agree. The Boulder Canyon Project Act should be in there because it is already passed. Investments are already made on the basis of it. But when you inject an agreement where the amendment itself may interfer with the proper carrying out of the Boulder Dam Project Act, then you inject the Upper Basin agreement but you inject nothing that might happen down below that could contravene some provision of the Boulder Canyon Project Act. It is a fifth wheel in ther

Senator Millikin. There are lots of things we might want to do with the Lower Basin, but we cannot do that because we want to.

Senator Malone. You are not saying in here you are going to make this conform to any agreement we make in the Lower Basin.

Senator Millikin. You do not ask us now. To anticipate what kind of an agreement in the future and conform this act to what you are going to do in the future --

Senator Malone. But you have something in here that may have provisions of conflict with the laws already passed.

Senator Millikin. This law says they should be consistent with the law of the river.

Senator Malone. It may be consistent with the Colorado River Compact and not be consistent with the Boulder Dam Project Act.

Senator Millikin. What other things does it have to be consistent?

Senator Malone. The very statement that Mr. Bennett just made that the Secretary of the Interior had to conform with this agreement you have made up there is a fifth wheel because you do have to conform to the Colorado River Compact. I think it is a good idea to have it with the Boulder Dam Project Act, but you might find something you could not conform to both of them.

Senator Millikin. We will just have to meet that when we come to it.

Senator Malone. Why do we buy a lawsuit? We have plenty.

Senator Millikin. I do not see there is an invitation for a lawsuit, but this makes it very clear. Those provisions are in there.

Senator Malone. I think Section 8 is all right. If this conforms to Section 8 --

Senator Watkins. It does.

Senator Malone. Your Colorado River Basin Compact is not in Section 8

Senator Watkins. Section 8 simply says in this law we are now going to pass that we cannot change any of those acts which

have been adopted.

Senator Malone. It says you cannot change the Upper Colorado River Basin Compact, too; where, as a matter of fact, if you have done something in that act that does not coincide with the Colorado River Compact or the Boulder Dam Project Act, you cannot interfer with it.

Senator Watkins. This says, "Nothing contained in this Act shall be construed to alter, amend, repeal, construe, interpret, modify, or be in conflict with any provision of the Boulder Canyon Project Act (45 Stat. 1057), the Boulder Canyon Project Adjustment Act (54 Stat. 774), the Colorado River Compact, the Upper Colorado River Basin Compact, or the Treaty with the United Mexican States."

Senator Malone. It is still injected in the thing.

Senator Watkins. We are not trying to undo any of these things that have been done in any of these acts. This law is not intended in any way to do those things.

Senator Malone. I am not belaboring the point, but I want the record to show what we are bringing into this thing for the first time is a compact formed by a portion of the states and saying that shall not be violative.

Senator Watkins. We cannot change the Colorado River Compact, the Adjustment Act. In this law we should not attempt to change the Upper Colorado agreement approved by the Congress. If there are any conflicts along the line, any interpretation,

we have provided the remedy so it makes it easy.

Senator Malone. I am arguing with two very good attorneys The Constitution of the United States provides that any compact between two or more states shall be approved by the Senate. I am not trying to quote it, but if it is, it brings it in the perview of the Constitution of the United States. It does not attempt to say whether the agreement made between these states is right or wrong. But it does say it gives its permission to make this compact and then approves the fact you have made a compact. It does not approve the equity of it.

When you come to the Columbia River Basin, the Senate does not care because all the states are in it. When you inject something that two or more states within the Basin make and you approve that by law and throw it in with the compact that has been made by the seven states, and then into a legislation passed by Congress and upon which investments have been made, you are inserting something there that merely is something new upon which you have to base a suit to get out of.

Senator Watkins. When any of these compacts come before the Congress, and if the Upper Basin Compact brought before the Senate for ratification had contained in it a provision that it made it absolutely conditioned upon the Colorado River Compact of 1922, you and the other states downstream would have been here in a minute and fought it.

Senator Malone. Did it have any provision in it that did

not interfer with the previous legislation passed by the Congre

Senator Watkins. I do not know it has with reference to the legislation, but the law of the river is the Colorado River Compact of 1922. Even the Adjustment Act and the Boulder Canyo Act are conditioned on them being in harmony with -- and cannot be in conflict with -- the 1922 compact.

Senator Millikin. All in favor of the amendment say aye.

Contrary, no.

The amendment is defeated.

Senator Watkins. I made the original motion that we report it.

Senator Malone. So this will be clear, the amendment was to take out the Upper Colorado Basin Compact out of Section 6.

Senator Millikin. Call the roll now, Miss McSherry.

Miss McSherry. Mr. Chairman?

Senator Millikin. Aye.

Miss McSherry. Mr. Malone?

Senator Malone. Aye.

Miss McSherry. Mr. Watkins?

Senator Watkins. Aye.

Miss McSherry. Mr. Dworshak?

Mr. Kuchel?

Senator Kuchel. No.

Miss McSherry. Mr. Barrett?

Senator Barrett. Aye.

Miss McSherry. Mr. Crippa?

Senator Crippa. Aye.

Miss McSherry. Mr. Murray?

Senator Anderson. Aye.

Miss McSherry. Mr. Anderson?

Senator Anderson. Aye.

Miss McSherry. Mr. Jackson?

Senator Anderson. Aye.

Miss McSherry. Mr. Daniel?

Mr. Lennon?

Senator Anderson. Aye.

Miss McSherry. Mr. Burke?

Senator Malone. Mr. Chairman, to make this a matter of record, I reserve the right -- and I do not want to interfer with any consistent legislation -- to bring this discussion to the Senate floor that I have already brought up here.

Senator Anderson. Mr. Long made the same reservation whe he asked me to vote for him. He said, "I think everything yo vote is all right."

Senator Millikin. Is there any further business before t committee?

Senator Watkins. May the other Senators who have not voted do so?

Senator Millikin. Yes.

Senator Kuchel. If I am unable to complete a report by

Monday afternoon, may I have the Chairman's permission to file it subsequently and have it printed separately?

Senator Millikin. Certainly.

(Whereupon, at 2:05 p.m., the committee recessed, subject to call.)

- - -

EXECUTIVE SESSION

- -

H. R. 3383 AND RELATED BILLS

COLORADO RIVER STORAGE PROJECT

- -

MONDAY, JUNE 13, 1955

House of Representatives,
Subcommittee on Irrigation and
Reclamation of the Committee
on Interior and Insular Affairs,
Washington, D. C.

The subcommittee met, pursuant to call, at 10:05 a.m., in the committee room, New House Office Building, Honorable Wayne N. Aspinall (chairman of the subcommittee) presiding.

Mr. Aspinall. The Subcommittee on Irrigation and Reclamation will now be in session for the further consideration of marking up H. R. 3383.

At the time we closed our session on Friday the gentleman from California, Mr. Hosmer, had the time and was presenting certain amendments in which he is interested. The gentleman is recognized further for amendments at this time.

Mr. Hosmer. Will Mr. Abbott read the next amendment.

Mr. Abbott. Amendment proposed by Mr. Hosmer, which occurs on page 13, line 21 of H. R. 3383 in section 13 of the printed bill, to strike all of the balance of that section after the word "basin" down to and including all of line 2 on page 14

and substitute the following language:

"In the event that any State of the Colorado River Basin either on its own behalf or as parens patriae seeks to maintain an action in the Supreme Court of the United States to enforce any of the provisions of the Colorado River Compact, the Upper Colorado River Basin Compact, the Boulder Canyon Project Act, the Boulder Canyon Project Adjustment Act, the Mexican Water Treaty or of this Act, consent is given to the joinder of the United States in such suit or suits.

"Consent is hereby given to joinder of the United States to any suit, action or proceeding brought in any court of competent jurisdiction upon any cause of action arising under any contract lawfully entered into by the United States pursuant to either of the Compacts or the Acts named in this section."

Mr. Hosmer. I move the adoption of the amendment.

Mr. Utt. Second.

Mr. Aspinall. You have heard the motion and the second. The gentleman of California is recognized for five minutes.

Mr. Hosmer. This provision, in my belief, cleans up and particularizes the provision relative to suits.

Those of you who were here remember during the questioning of Mr. Bennett as to the interpretations of the Department his discussion with me on the matter of suits in general and the particular question of parens patriae, where we have in this situation in the Lower Basin a number of public agencies and

subdivisions and parts of the State government of California -- and I presume the same would possibly be true in Nevada and Arizona. There is a general law that the States will have parens patriae responsibility in connection with water, but this specifies it and lays it out and, I think, resolves some of the questions that would be subject to procedural motions if there ever was a suit. You know as long as Arizona versus California has been going on they still have not gotten through with their procedural motions and down to the merits. I hope by this kind of an amendment to bring to quicker decision any suit that might be brought.

Of course, I do not want to intimate that I am threatening any suits on this, but we all recognize the possibility of lawsuits, particularly when it comes to water rights in the arid West, and the same would be true as to any action which might be entered into by Hoover contractors. But it does not authorize any actions to be taken by Hoover contractors that are not at the present time authorized and available to them should they feel that their contracts are not being carried out.

I realize there may be some opposition to this amendment and therefore I reserve the balance of my time.

Mr. Rhodes. Mr. Chairman?

Mr. Aspinall. The Chair recognizes the gentleman from Arizona, Mr. Rhodes.

Mr. Rhodes. Mr. Chairman. The background of the California

versus Arizona lawsuit is that from time to time the State of Arizona has tried to get into court on the suit and has been unable to do so because the United States would not become a party and also because at one time there was not a justiciable issue.

I think this amendment is far too broad, in that it gives a blank check to any State in the Basin to bring any kind of a lawsuit, and whether or not the United States is a necessary party the United States may be joined. In other words, we are in a position of saying, no matter what the facts of the suit are, no matter what the law involved might be, the United States may be joined as a party. I think that is a very bad approach. If the lawsuit is indeed filed and the United States may be a necessary party, then at that time the Congress should consider whether the United States should give consent to being joined.

Mr. Aspinall. If the gentleman will yield. It even goes further than that. It permits persons and individuals such as a power company who might wish to file a suit to come into the court and make such a request.

Mr. Rhodes. I believe that the wording of the amendment might preclude that. It says "in the event that any State of the Colorado River Basin" -- section 2 may well have that effect. I will say that to the chairman.

It seems to me it is far too broad, that we may be getting

the United States into a hornet's nest which she might not want to get into. It makes it possible for a multiplicity of suits to be filed because, of course, any state may file an action against the other states and possibly would do so if the United States could be joined immediately, and this would certainly enhance the possibilities and, in fact, the probabilities of being able to file a lawsuit on any particular ground to get into court.

Mr. Hosmer. Will the gentleman yield?

Mr. Rhodes. I yield.

Mr. Hosmer. I think it does do the contrary, in that it would bring in one lawsuit at one time all the parties and get it disposed of, rather than we have the current situation of a couple of states suing each other on a few issues and then some other states coming along and suing on some more. This will settle the thing once and for all, and there is nothing more important to the West and the States that are concerned with this river than for once and for all in one lawsuit to have the rights litigated and settled so they know where they stand instead of carrying on litigation for years and years and years, getting one suit out of the way, and then starting another case and having it go on forever.

Mr. Rhodes. The gentleman knows full well that in the case of Arizona versus California the State of California is even now trying to bring in the States of the Upper Basin, and

if this amendment were passed, then California could file another lawsuit agsinst the States of the Upper Basin on very similar grounds to those which are in the case of Arizona versus California, and the United States is a necessary party and would be joined under the provisions of this Act. Instead of providing for one quick lawsuit, you would probably have two lawsuits.

I will say, further, that the question of whether the Upper Basin States should be in this lawsuit or not is now before the Master and the Master is now considering the question, and if we were to pass this amendment it would be to preempt the field from the Master which has been appointed by the Supreme Court to determine that.

Mr. Engle. Will the gentleman yield?

Mr. Rhodes. Yes.

Mr. Engle. Does not the present bill provide for the joinder of the States in the Basin whenever they get in an argument?

Mr. Dawson. Will the gentleman yield?

Mr. Rhodes. I yield.

Mr. Dawson. I call my chairman's attention to page 13 of the bill where it says: "In the event of the failure of the Secretary of the Interior to so comply" -- that is, with the Compact, the Boulder Canyon Project Act and all of the Acts -- "In the event the failure of of/the Secretary of the Interior to so comply, any State of the Colorado River Basin may maintain an action in the Supreme Court

of the United States to enforce the provisions of this section, and consent is given to the joinder of the United States as a party in such suit or suits."

Mr. Engle. Is that not the language presented by the California witnesses last year?

Mr. Dawson. That was their language and it was inserted at their request.

Mr. Rhodes. I think it is fairly obvious, Mr. Chairman, that the only motive back of this amendment is to broaden the suit and make it possible for the States of the Upper Basin to be sued on grounds other than those which might appear in this Act.

Mr. Aspinall. The time of the gentleman from Arizona has expired.

The Chair recognizes the gentleman from California, Mr. Engle.

Mr. Engle. I ask to be recognized to try to find out what is in this amendment and why it is preferable from California's standpoint to the language in the bill.

Last year when we had this project up I offered the amendment which had been written by the California people and it was adopted. If my recollection serves me, the purpose of the amendment was to prevent the Secretary of the Interior from entering in and upon a capricious management of the water of the river. With a whole string of reservoirs up and down the river, it was considered possible for an arbitrary Secretary of

the Interior to fluctuate the reservoirs in a way detrimental to the one Basin or the other. The case operated as well on one foot as it did on the other, because the Secretary of the Interior might turn all of the water down into the Lower Basin and not catch enough in the Upper Basin, or he might catch too much in the Upper Basin. But the standard of what he should do is set up in the basic Colorado River Compact, and our idea was to put any state in a position to challenge him in the event that they thought his administration of the river was capricious and in violation of the Colorado River Compact.

As I read this amendment, it goes further than that. The amendment to section 13 would automatically permit the Federal Government in any litigation between two of the states irrespective of what the Secretary of the Interior had done.

Mr. Dawson. Will the gentleman yield?

Mr. Engle. And the second provision would permit any power company that had a contract with the Federal Government to walk in the court and bring a suit. Is that right? Is that what it does?

Mr. Hosmer. Will the gentleman yield?

Mr. Engle. Yes.

Mr. Hosmer. The first section is largely designed to clear up -- I do not think the gentleman was here when we discussed the matter at length with Mr. Bennett -- clear up the

parens patriae business and --

Mr. Engle. Clear up the what?

Mr. Hosmer. And that is the reason concern is given for the joinder of the United States as a party to such suit. And here it is on page 14, the same language: "consent is given to the joinder of the United States as a party in such suit or suits".

So there is nothing mysterious about this first paragraph of the amendment. It takes care of the parens patriae business.

Mr. Engle. What is that?

Mr. Hosmer. When you have like the Metropolitan Water District. In our State, according to the law, the Metropolitan Water District can not come in and sue. The general law of the river is that the states can sue in behalf of their local subdivisions, but this specifies it so there is no question about it.

Mr. Engle. Let me get this straight. Where does it specify it?

Mr. Hosmer. (Reading.) "In the event any State of the Colorado River Basin either on its own bahalf or parens patriae".

Mr. Engle. I do not see that in the language before me.

Mr. Hosmer. It is the language read, and I am sorry if the copies were not corrected.

Mr. Engle. Do I have the right amendment -- the one that is pending?

Mr. Aspinall. Yes.

Mr. Engle. I do not see anything about "parens" or anything else.

Now I have a corrected copy.

Mr. Hosmer. It should be at the end of the first line.

Mr. Engle. There is a very clear distinction between this language and the language that is presently in the bill. The language that is presently in the bill permits the joinder when the Secretary of the Interior is not complying --

Mr. Hosmer. Can you conceive of any possibility that a lawsuit would be brought when it is not being done in compliance, when it is not a question of the Secretary of the Interior, because he is the one that is going to manage and operate this thing?

Mr. Engle. If that is the case, then the gentleman should have no objection to the language in the bill.

Mr. Hosmer. I do for the reasons explained, and the reasons brought out in the testimony of Mr. Bennett.

That is just an example of the illogic of proceeding in these hearings without a quorum. We had about three people here and --

Mr. Engle. You do not have to kick me. I can read English. But when the gentleman submitted his amendment it did not have that extra language in it. It has been penciled in.

Mr. Aspinall. The time of the gentleman has expired.

Mr. Metcalf. Mr. Chairman?

Mr. Aspinall. The Chair recognizes the gentleman from Montana, Mr. Metcalf.

Mr. Metcalf. I will yield to the gentleman from California and then I want to ask a couple of questions.

Mr. Engle. What I was going to say to the gentleman is, if this additional language that is penciled in the typewritten copy of the amendment were added to the language which is now in the bill, it would take care of his problems, would it not?

Mr. Hosmer. Not specifically, I think, because we reiterate there what compacts and treaties we are talking about and tie it down to those and do not leave it for a general speculation in any dispute that might arise on the river.

Mr. Engle. Those are all specified in the preceding sentence in section 13. As far as I can determine from a cursory reading of them, they are the same.

What I am trying to find out is what is the difference between what the gentleman has proposed and what is currently in section 13.

Mr. Hosmer. I just told you it adds the parens patriae portion, and it brings out the question that we discussed when we were asking about the law -- that the contractors at Hoover are not an unlimited group of people. They are a small group and they are limited to the signatories of that contract. We can foresee now that there may be litigation. It was admitted

that those people did not have adequate remedies under the present law, they had to resort to the Court of Claims and go through a tedious and long procedure. Inasmuch as we do have a specific small group of people who would be in a position to litigate, this is a situation in which we would anticipate the trouble and provide an adequate relief instead of leaving them to what was admitted by the Interior Department counsel to be inadequate relief.

Mr. Metcalf. I am not familiar with the doctrine of parens patriae. As I understand it, this is put in here so that some of these quasi municipal corporations can sue in the name of the state. Is that correct?

Mr. Hosmer. The state would sue in their behalf, except only as to people under the Hoover contracts who would be allowed to go ahead and sue on their own behalf.

Mr. Metcalf. The Attorney General of California would probably bring such suit in any event, could he not?

Mr. Hosmer. It is not certain he would, though, because he is bringing to the taxpayers of the State a terrific burden when he does that.

Mr. Metcalf. Under this language here in the bill at present, if the Secretary of the Interior arbitrarily and capriciously interferes in the storage and release of water to the detriment of one of the parties to the contract -- what is the name of the organization in Los Angeles?

Mr. Hosmer. The Metropolitan Water District.

Mr. Metcalf. And the Metropolitan Water District was damaged, could they not bring an action?

Mr. Hosmer. Under that language -- "arbitrary and capricious" -- think of the burden of proof you are going to have and the allegations of fact you are going to have to have to support arbitrariness and capriciousness. That is a lot more than "unreasonable", and it would probably preclude the people from coming into court if they had to make a pleading alleging that.

Mr. Metcalf. I inserted the "arbitrary and capricious." The Secretary is directed to comply, and if there is a breach of contract with relation to storage or release of water, then there is in the present bill a consent to sue.

Mr. Dawson. Will the gentleman yield to me?

Mr. Metcalf. Yes.

Mr. Dawson. On page 13 of the bill it says very plainly there is no limitation as to whether it need to be capricious or arbitrary.

Mr. Metcalf. No, any breach.

Mr. Dawson. (Reading.) "In the event of the failure of the Secretary of the Interior to so comply, any State of the Colorado River Basin may maintain an action in the Supreme Court of the United States to enforce the provisions of this section, and consent is given to the joinder of the United States as a party in such suit or suits."

Mr. Hosmer. Let us take just one further circumstance in connection with this.

Mr. Aspinall. The time of the gentleman from Montana has expired.

Mr. Engle. Will the gentleman from Oklahoma take some time?

Mr. Edmondson. Mr. Chairman?

Mr. Aspinall. The Chair recognizes the gentleman from Oklahoma, Mr. Edmondson.

Mr. Edmondson. I yield to the gentleman from California, Mr. Engle.

Mr. Engle. Getting back to what we are talking about here, it seems to me that the amendment submitted goes even further than the gentleman says. Anytime there is a hassle on the river, literally, the Federal Government can be hauled in and made a party to it. That is what it boils down to.

The language in the bill says that whenever the Federal Government is interfering with the rights of the parties that a suit can be brought and the Federal Government can be brought in. There is not anything to keep one state from suing another anyway, as far as that is concerned, and California can sue Arizona tomorrow in the Supreme Court if she wants to. She may get tossed out, too, but there is nothing to keep her from going in there.

The second part of this amendment, though, would permit

any private outfit that thought they had a claim to sue the Federal Government immediately, and it seems to me that is too broad.

In reference to the language in regard to parens patriae, in my opinion the states can bring that kind of a suit anyway. In other words, the language is surplus. So I do not know about this.

Mr. Rhodes. Will the gentleman yield to me?

Mr. Edmondson. Yes.

Mr. Rhodes. I think it is rather plain that this is nothing but an attempt to circumvent the ruling of the Master in the case of Arizona versus California. It is so broad that any suit could be brought against any state and the United States would have to be a party, which sets the stage exactly for the bringing of another suit by California against the States of the Upper Basin to do just what they are now trying to do in the case of Arizona versus California but without the necessity of getting a Master to rule that the other States are necessary.

Mr. Hosmer. Will the gentleman yield to me?

Mr. Edmondson. Yes.

Mr. Hosmer. It is impossible for the State of California to bring another action on this litigation because this pending litigation was negotiated by the State of Arizona. The gentleman has not analyzed the amendment in connection with the present lawsuit correctly.

Mr. Rhodes. Will the gentleman yield to me?

Mr. Edmondson. Yes.

Mr. Rhodes. The gentleman has failed to analyze what the gentleman from Arizona said. I did not say they would be brought into the suit of Arizona versus California but another lawsuit would be filed in much the same manner as the State of California is now attempting to litigate in that suit, and this would set the stage completely. All we have to do is pass this bill with this in it and we have got another lawsuit on our hands.

Mr. Hosmer. That is impossible because Arizona, as I pointed out, is the party plaintiff.

Mr. Rhodes. But not in the other lawsuit. You can bring any number of lawsuits.

Mr. Engle. Will the gentleman yield?

Mr. Edmondson. Yes.

Mr. Engle. I would like to say this: It is not unusual if this language, as I think it does, changes the entire position now from what it was last year. It was a year ago that the Colorado River Board people came in and testified in favor of the Fryingpan-Arkansas. Every state water agency of any importance from California testified in favor of Glen Canyon dam. Then they were right back here last year to the embarrassment of Californians who were trying to do a fair-minded job, with their colleague in this Congress, contradicting themselves

Now the language presently in the bill is the language which I offered at their request last year. Now I am trying to find out why they are coming back here and monkeying around with the language again. If it was good last year, why is it not good now?

Mr. Hosmer. Will the gentleman yield?

Mr. Edmondson. Yes.

Mr. Hosmer. The "they" in this particular instance who has come in here with this amendment happens to be myself. It is my amendment and I am offering it. It has nothing to do with the people to whom you refer as "they". It is an amendment I suggested and had drafted at my request and which covers a point I wanted to cover.

Mr. Aspinall. The time of the gentleman from Oklahoma has expired.

A vote has been called for. All those in favor of the amendment proposed by the gentleman from California say "Aye."

Those opposed will say "No."

The "Noes" appear to have it. The "Noes" do have it. The motion is declared lost and the amendment is not agreed to.

Mr. Hosmer. I have another amendment, Mr. Chairman.

Mr. Aspinall. The gentleman will propose his next amendment.

Mr. Hosmer. I will read it. It is a proposed new section 7.

"From the revenues of the project, reimbursement shall be made to those having rights under presently existing contracts with the United States for the delivery of falling water or electric energy at points on the Colorado River downstream from the project, for all damages suffered by them through loss of falling water or electric energy available at such downstream points occasioned by storage at the Storage Project hereby authorized of water not then reasonably required in order to fulfill the requirements of the consumptive uses for irrigation or domestic water supply purposes then being made in the Upper Basin, together with fulfillment of the obligation of the States of the Upper Division pursuant to Article III(d) of the Colorado River Compact."

I movethe adoption of the amendment.

Mr. Aspinall. You have heard the motion.

Mr. Utt. Second.

Mr. Aspinall. And the second. The gentleman is recognized.

Mr. Hosmer. This amendment attempts to take care of the situation where the Secretary of the Interior is anxious to fill these dams here and prevent water from coming down the river which should come down the river either under 3(d) of the contract or under the general law of the river which applies to use of water for power generation purposes, which is not included in the compact and subject to the law of prior appropriation.

This seeks to compensate those who may be suffering damages on account of the withholding of the water which should not be withheld in the upstream area. I reserve the balance of my time.

Mr. Pillion. Will the gentleman yield?

Mr. Hosmer. Yes.

Mr. Pillion. The reimbursement mentioned here, would that also include reimbursement, say, for loss by evaporation?

Mr. Hosmer. Only insofar as the evaporation in the upstream areas might go beyond what would be determined beneficial consumptive use, and I believe that any evaporation out of the upstream reservoirs which occurs prior to the time that the storage is needed in order to make the beneficial consumptive uses that the Upper Basin is entitled to under 3(a) would be in that category.

Mr. Edmondson. Will the gentleman yield for a question?

Mr. Hosmer. Yes.

Mr. Edmondson. Do I understand that it is contended there are some presently existing contracts with the United States for falling water or electrical energy in excess of the allotments of any particular state under the Colorado Compact? Is it contended by any of the states that there are contracts for supplies of the water the Compact allows or provides for?

Mr. Hosmer. In connection with the contracts at Hoover

Dam, they contemplate generating electricity with any of the water that is available, naturally. Now should a certain amount of that water be put to beneficial consumptive use and in accordance with the Compact in the Upper Basin, then of course it would not be available for power generation purposes in the Lower Basin. However, if it were withheld for another purpose, not for beneficial consumptive use, and withheld not under authority of the Compact, then it would be water to which the Lower Basin would be entitled for power generation purposes because of prior appropriation. It is water in that category, water that would not be withheld under the provisions of the Compact, but water withheld contrary or notwithstanding the provisions of the Compact that this particular clause seeks to compensate.

Mr. Edmondson. This section is to establish, then, a fund to reassure reimbursement of the States in the Lower Basin which might have its receipt of either power or of water reduced as a result of some other use upstream?

Mr. Hosmer. It does not seek to establish a fund to do that, but it seeks to provide where the money is coming from, and that is specifically under revenues of the project.

Mr. Dawson. Will the gentleman yield?

Mr. Hosmer. Yes.

Mr. Dawson. Would it be possible under this amendment to store any water in Glen Canyon dam?

Mr. Hosmer. I do not see why not. Any that is reasonable. As Mr. Bennett says, any water reasonably needed, if his theory is correct, to be stored today for beneficial consumptive uses in the Upper Basin for a reasonable time until used in the future under the exchange principle, can be stored.

Mr. Dawson. If the gentleman will yield further.

Mr. Hosmer. Yes.

Mr. Dawson. I understood you to say you do not recognize the exchange principle. You say that the water stored there and which is not being taken out of the reservoir for beneficial consumptive use must be released and sent on down the river.

Mr. Hosmer. Of course, that is one interpretation, and there is another interpretation, and the court may come up with a third. We do not know.

Mr. Aspinall. The time of the gentleman has expired.

Mr. Dawson. Mr. Chairman?

Mr. Aspinall. The Chair recognizes the gentleman from Utah, Mr. Dawson.

Mr. Dawson. I think the committee should understand exactly what is being attempted here. It is true there has been over 4 million acre-feet of water going over the dam at Hoover to generate secondary power, power which is being sold for approximately 1-1/2 mills, which is cheap power. That is Upper Basin water. And of course it has been going over the

dam, and under this amendment I think that the Federal Government would be liable for damages if they did not continue to let all of that water go over the dam and go to waste in the Pacific Ocean, for this simple reason: Under the interpretation of the gentleman from California of the Colorado River Compact we cannot store any waters in these compensating reservoirs for replacement purposes and have it considered as water being beneficially and consumptively used because that would be, as he says, water for power generation, which would mean that we would have to let the water go on down. So the effect of the amendment would be that the whole project would just go out of the window if this were adopted, and certainly his interpretation is not in line with the Colorado River Compact, and we would just simply be deprived of all of our water if we were required to, as he says, firm up these contracts.

I think the committee should also understand this fact: that the Federal Government is not under any firm commitment on these contracts to continue to let this water go down. It is written into every one of the contracts on secondary power that the water only go there as long as it is available, and anytime it is required by the Upper Basin States then the water and power shall not be delivered. That is in each one of the contracts.

Now by the terms of this amendment, if you did not let the

water go down there, then you would be bound to pay damages even though the contract says the water is not to come down if it is used in the Upper Basin States.

That is in simple terms the effect of the amendment. It would simply kill the bill if it were adopted.

Mr. Rhodes. Will the gentleman yield?

Mr. Dawson. I will be happy to yield.

Mr. Rhodes. Would you be willing to admit that the Upper Basin gets $500,000 a year for the use of this water which comes down from the Upper Basin that it is not now using?

Mr. Dawson. You are talking of the investigation fund?

Mr. Rhodes. The investigation fund which is paid from the proceeds from Hoover Dam.

Mr. Dawson. That is right, and that was written into the bill at the time the Hoover project was approved.

Mr. Rhodes. If this surplus water no longer comes down, then do you think that it would be fair that the $500,000 payment to the investigation fund should be discontinued?

Mr. Dawson. It is my understanding it will be discontinued --

Mr. Aspinall. This is the last year.

Mr. Dawson. Next year. This is the last year and it is through.

Mr. Rhodes. I thank the gentleman.

Mr. Hosmer. Will the gentleman yield?

Mr. Dawson. Yes.

Mr. Hosmer. I respectfully wish to differ from you in your statement that this will kill the project or anything like that. All this amounts to is to see that the project will be managed and operated in conformity with the contracts.

Mr. Dawson. I will be happy to give the gentleman the rest of my time if he will explain to this committee whether my interpretation of what his contention is on this storage basin is wrong. If I am wrong, I wish he would tell the committee, because I sat through it and that is exactly what you contended -- that any water held in these compensating reservoirs which is not taken out for the irrigators and used is not a consumptive use, and therefore it must be let on down the river, which would mean that there would be absolutely no need for the compensating reservoirs.

Mr. Hosmer. As the gentleman well knows, the only rights the Upper Basin has are those by 3(a) to beneficial use. What other rights they may have are over and above the Compact.

Mr. Dawson. What the gentleman is saying is that I am correct in my interpretation of how he views this Compact.

Mr. Aspinall. The time of the gentleman has expired. All those in favor of the amendment by the gentleman from California, Mr. Hosmer, signify by saying "Aye".

Those opposed will say "No."

The "Noes" appear to have it. The "Noes" do have it.

The motion is declared lost and the amendment is not

agreed to.

The gentleman will offer his next amendment.

Mr. Hosmer. The next amendment is to page 15. At line 16, strike the word "and", insert a period and all of lines 17 through 26.

I move the adoption of the amendment.

Mr. Aspinall. You have heard the motion.

Mr. Utt. Second.

Mr. Aspinall. And the second. The Chair recognizes the gentleman from California, Mr. Hosmer.

Mr. Hosmer. This merely takes out the language which violates the present reclamation law and seeks to extend the economic life of the project ad infinitum. That language is objectionable on any reasonable grounds and should be out of the bill to clean it up.

I reserve the balance of my time.

Mr. Dawson. Mr. Chairman?

Mr. Aspinall. The Chair recognizes the gentleman from Utah, Mr. Dawson.

Mr. Dawson. First, under the repayment plan that the gentleman from Colorado has inserted in his bill, which incidentally is different than the plan I have proposed, it is necessary to have a definition of the term "economic life."

If you will turn back to the repayment plan in the bill,

REPRODUCED AT THE NATIONAL ARCHIVES

starting at the bottom of page 7, the last line, "the costs of each unit, participating project, or any separable feature thereof which are allocated to power pursuant to section 5 of this Act, within a period of years not exceeding the expected economic life of such unit or participating project but not to exceed 100 years."

Now that necessitates the inclusion of a definition of the term "economic life." I might explain to the committee the difference in my proposal on a payout of this project and that of the gentleman from Colorado.

Under the Senate bill and under my bill this project would be paid out in 50 years' time by speeding up the power payments to irrigation features within approximately the last three years of the project. In other words, the power features of this project will pay out in approximately 47 years and during the remaining three years all of the revenues from power, less interest, would then go to pay the participating irrigation projects off, which would pay the whole thing off in 50 years.

Under the proposal of the gentleman from Colorado more of these payments would go to pay off power features during the early years of the project, and then when you get up to the 50-year period it would then extend some of those power payments off beyond the 50-year period.

REPRODUCED AT THE NATIONAL ARCHIVES

Mr. Aspinall. If the gentleman will yield right at that point?

Mr. Dawson. Yes.

Mr. Aspinall. That is not just exactly right. More of the revenues would be used to pay out the cost allocated to irrigation because all irrigation costs on each unit would have to be paid within 50 years after the development period. This then would cause to be held back for repayment more costs of the power construction facilities than otherwise would, and that without interest. In other words, what the gentleman from Colorado has tried to do is to firm up the interest-paying obligation to the Federal Government.

Mr. Dawson. That is exactly what I was trying to explain. Perhaps I was mixed up on it. But in any event it would mean less interest to the Government, I think, under the proposal of the gentleman from Colorado than it would under my proposal.

Mr. Aspinall. No. It would be more interest to the Government and less subsidy under my proposal than otherwise.

Mr. Dawson. When I say "more interest" I mean the Government would be out less money.

Mr. Aspinall. That is right.

Mr. Pillion. Will the gentleman yield?

Mr. Dawson. Yes.

Mr. Pillion. Under the definition of economic life on

page 15, what is the gentleman's estimate as to the number of years that will be translated into?

Mr. Aspinall. If the gentleman will yield?

Mr. Dawson. I yield.

Mr. Aspinall. The estimate is that it would go up to 100 years but not over a 100 years. The reason for going up that far is that private industry in its control of such projects, as you know, always continues on, they pay no attention to that but they issue their bonds just the same and keep issuing them without any consideration at all to the economic life. The project continues to produce as long as it can, and then they have to come in and rebuild. In other words, whether the Federal Government or private industry is managing this project, there should be certain sums laid aside to take care of replacement, repair and so forth.

Does that answer the gentleman's question?

Mr. Pillion. Yes, it does. It does not quite satisfy me, but it does answer me.

Mr. Aspinall. Let me ask you this: Is not the gentleman more satisfied with the proposal by the gentleman from Colorado than he is with the usual proposal in relation to payout as far as the use of Federal moneys?

Mr. Pillion. I understood that the normal repayment of these projects was over a 50-year maximum period.

Mr. Aspinall. That is right. But if you place all the

amount allocated to irrigation to be repaid in the last 5, 6 or 10 years, is not that more of a subsidy that the Federal Government is granting to users than if you make it necessary to follow the usual procedure usually entered into, paying out in annual equal payments within the 50 years and thereby retiring it right from the very beginning rather than wait to the end of the payout period to retire the allocation in non-interest bearing funds?

Mr. Pillion. I do not know. I just cannot follow the mathamatics. I am sorry. It is my fault.

Mr. Aspinall. Let me say to the gentleman, after this is over with I will be glad to come to the gentleman and show exactly where this varies from the usual procedure in the Collman or modified Collbran formula.

Mr. Hosmer. I move the previous question.

Mr. Aspinall. The previous question has been called for. All thos in favor of the motion signify by saying "Aye".

Those opposed will say "No."

The "Noes" appear to have it. The "Noes" do have it. The motion is lost and the amendment is not agreed to.

Does the gentleman have another amendment?

Mr. Hosmer. I do. This amendment is in the nature of a substitute, Mr. Chairman. Strike all after the enacting clause and substitute the following:

"Resolved, by the Senate and House of Representatives of

the United States of America in Congress assembled:

"The Secretary of the Interior is hereby authorized and directed to appoint a board of five eminent engineers and geologists, at least one of whom shall be an Engineer Officer of the Army, on the active or retired list, to examined the proposed sites of the dams and projects to be constructed under the provisions of S. 500 and H. R. 3383, 84th Congress, and review the plans and estimates made therefor, and to advise him prior to July 1, 1956, as to matters affecting the safety, the financial and engineering feasibility, and adequacy of the proposed structures and incidental works; and provided further that the work of construction shall not be commenced until plans therefor are approved by said special board of engineers. No authority hereby conferred on the Secretary of the Interior shall be exercised without the President's sanction and approval.

"Section 2. The report of the board shall be submitted to the Congress and to the Secretary of the Interior, and shall be printed as a House or Senate Document.

"Section 3. The appropriation of not to exceed $200,000 is hereby authorized for the purposes of this resolution."

Mr. Chairman, I move the adoption of the amendment.

Mr. Utt. Second.

Mr. Aspinall. You have heard the motion and the second.

The Chair recognizes the gentleman from California.

Mr. Hosmer. I do not expect it to be passed. It is

offered for the purpose of getting it on record. It would just tear up the bill and substitute a board of engineers to go by and take a look at the thing and see if they could come back with some answers to questions we have not been able to get answered by the Interior Department.

Incidentally, it is the same procedure that was adopted in connection with the Boulder Canyon Project. In other words, a board of engineers and geologists went out there, looked into the thing, and determined what should be done, the feasibility, and then the Congress acted. That is all I want to do by this amendment.

I yield back the balance of my time and move the previous question.

Mr. Aspinall. All those in favor signify by saying "Aye".

Those opposed will say "No."

The "Noes"appear to have it. The "Noes" do have it. The motion is declared lost and the amendment is not agreed to.

Mr. Hosmer. I have one final last amendment, Mr. Chairman.

I ask that the reading of the amendment be dispensed with.

It is a substitute bill to strike out all after the enacting clause, substitute the same board of engineers. Then if they found it was feasible to build Glen Canyon and the participating projects in the regular bill, less Central Utah, they would go ahead and that would be done, but it would be

done on the basis of the present reclamation law.

In the bill is included all these safeguards I tried to get for California, like the suit clause and the compensation for damages.

I want to get it on the record.

I move the previous question.

Mr. Aspinall. Just a moment. The gentleman made a request that the substitute will be considered read and open for discussion and amendment.

Is there any objection to the request of the gentleman?

Hearing none, it is so ordered and the substitute is now before the body.

(The substitute referred to follows:)

550606

H. R. 3383, 84th Cong.

Amendment in the
nature of a substitute

P. 1 line 2 Strike all of H. R. 3383 after the enacting clause, and substitute the following:

Board of Engineers

Sec. 1. The Secretary of the Interior is hereby authorized and directed to appoint a board of five eminent engineers and geologists, at least one of whom shall be an Engineer Officer of the Army, on the active or retired list, to examine the proposed sites of the Glen Canyon dam and power features and participating projects named in Section 5 of this Act and review the plans and estimates made therefor, and to advise him prior to January 1, 1956, as to matters affecting the safety, the financial, economic and engineering feasibility, and adequacy of such proposed dam, power features and participating projects; provided, that no work of construction shall be commenced nor money appropriated nor spent, until plans therefor are approved by said board of engineers, and the Congress has thereafter authorized said works. No authority hereby conferred on the Secretary of the Interior shall be exercised without the President's sanction and approval.

AUTHORIZATION FOR CONSTRUCTION OF GLEN CANYON DAM

Sec. 2 (a) The Secretary of the Interior, subject to a favorable report by the Board appointed pursuant to Section 1 of this Act, and subsequent authorization by the Congress and to the other terms and conditions of this Act, is authorized to construct, operate, and maintain a dam in the main stream of the Colorado River in or near Glen Canyon, Arizona, together with a power plant, incidental works and necessary main transmission lines to load centers, hereinafter referred to as the Glen Canyon Dam Project.

Allocations of Cost of Glen Canyon Dam

(b) The Secretary of the Interior, with the concurrence of the Board created under Section 1 of this Act, is directed to allocate the capital cost of the Glen Canyon Dam Project, upon the following basis:

1. Allocations which shall be non-reimbursable:

   (i) Flood control and navigation.

   (ii) Preservation of fish and wildlife.

2. Allocations which shall be recovered and paid into the Treasury with interest at 2 1/2% upon the unpaid balance, within 50 years from the date or dates of completion of the dam and of each unit of the power plant, out of revenues from the sale of electric power and energy generated at said Dam:

   (i) Commercial power.

3. Allocations which shall be recovered and paid into the Treasury without interest in 50 equal annual instalments commencing with the date of completion of the dam, out of revenues from the sale of such electric power and energy:

(i) Irrigation and reclamation

(c) The Secretary, with the concurrence of said Board, shall determine the rates and charges required for:

(1) Payment to the Treasury of the amounts required annually by subsection (b) of this section.

(2) Payment of the annual costs of operation and maintenance and provision for reasonable replacement reserves.

(3) Payment of a subsidy equal to one mill per kilowatt hour sold, to be applied in aid of recovery by the Treasury of its investment in the participating projects referred to in Section 5 of this Act.

(d) Before any money is appropriated for the construction of Glen Canyon Project, or any construction work done or contracted for, the Secretary of the Interior shall make provision for revenues by contract, in accordance with the provisions of this Act, adequate to insure payment of the aggregate of the amounts specified in subsection (c) of this Section 2, and to otherwise meet the revenue requirements of this Act.

CRITERIA IN THE OPERATION OF GLEN CANYON DAM AND RESERVOIR

Sec. 3. The following criterial shall govern the filling and operation of the reservoir to be created by the Glen Canyon Dam.

(a) During the initial filling of Glen Canyon reservoir, and until it shall first spill, only the water in excess of the natural flow at Lee Ferry of twelve million acre-feet in any one year shall be added to storage in said reservoir.

(b) Said reservoir shall be operated to conform with the requirements of the Colorado River Compact, the Boulder Canyon Project Act, the Boulder Canyon Project Adjustment Act, and the Mexican Water Treaty; provided, that unless and until beneficial consumptive use in the Upper Basin equals or exceeds 4,300,000 acre-feet per annum, Glen Canyon reservoir shall not be deemed to be required for the performance of Article III(d) of the Colorado River Compact.

(c) In conformity with Article IV(b) of the Colorado River Compact, the impounding, and use of water impounded, in Glen Canyon reservoir shall be subservient to the use and consumption of such water for agricultural and domestic purposes, and shall not interfere with or prevent use for such dominant purposes.

(d) In conformity with Article III(e) of the Colorado River Compact, neither the United States nor the States of the Upper Division shall withhold water in Glen Canyon reservoir which can reasonably be applied to domestic and agricultural uses in the Lower Basin.

(e) Until such time as the storage of water in Glen Canyon reservoir is required for the performance of Article III(d) of the Colorado River Compact, neither the United States nor the States of the Upper Division shall withhold in Glen Canyon reservoir any water required for the performance of any contract for the generation and sale of electric power and energy into which the United States has entered under the Boulder Canyon Project Act or the Boulder Canyon Project Adjustment Act.

DISPOSITION OF ELECTRIC ENERGY

Sec. 4. The Secretary of the Interior is authorized to dispose of the electric power and energy generated at the Glen Canyon Dam upon the following terms and conditions:

(a) The Secretary shall transmit and deliver to the Hoover Dam Power Plant so much energy as may be required to replace all energy which would have been generated at Hoover Dam Power Plant had the Glen Canyon Dam not been constructed. Such replacement energy shall be delivered under the contracts heretofore made under the authority of the Boulder Canyon Project Act or the Boulder Canyon Project Adjustment Act (Act of July 19, 1940, 54 Stat. 774) upon the same terms and conditions as though generated at the Hoover Dam Power Plant.

(b) All other energy shall be sold upon the criteria as to rates and charges and preferences to public agencies established by Section 5 of the Flood Control Act of 1944 (Act of _____, 1944, ____Stat. ____), to contractors who will pay the rates and charges necessary to meet the revenue requirements stated in this Act.

AUTHORIZATION FOR CONSTRUCTION OF PARTICIPATING PROJECTS

Sec. 5. (a) The Secretary of the Interior, subject to a favorable report thereon by the Board appointed pursuant to Section 1 of this Act, and subsequent authorization by the Congress, and to the other terms and conditions of this Act, is authorized to construct each of the following reclamation projects (hereinafter called "participating projects") in accord with the provisions of the Reclamation Law, except where such laws are inconsistent with this Act: Emery County, Florida, Hammond, La Barge, Lyman, Paonia (including the Minnesota unit, a dam and reservoir on Muddy Creek just above its confluence with the North Fork of the Gunnison River, and other necessary works), Pine River Extension, Seedskadee, Silt, Smith Fork.

(b) The Board established by Section 1 of this Act shall review the Secretary's plans for each participating project and shall report with respect thereto:

1. Its capital cost, in total and per acre

2. The probable annual cost of operation and maintenance and of a reasonable allowance for replacement reserves.

3. The amounts which the water users reasonably can be expected to pay for annual costs of operation and maintenance and replacement reserves and toward repayment of the capital cost, within 50 years in substantially equal annual payments after a ten year development period.

4. The amount of capital allocated to irrigation which will not be recovered from the water users.

5. The amount of such capital which will be recovered out of the subsidy from power revenues provided for in Section 2 of this Act, payable in substantantially equal annual installments concurrently with the payments under subsection (b) 3 of this Section 5.

6. The probable value of the land to be irrigated, before and after construction of the project.

7. The number of farms to be created or benefited, and the types of crops for which the land is suitable.

8. The increase in the national debt which will be occasioned by the construction of the project.

9. The net direct benefits which will accrue from the construction of the project.

(c) No participating project shall be authorized or constructed unless the Board shall find that

(i) The capital investment by the United States will be equalled by the amounts applicable thereto to be repaid by the water users plus the subsidy from powe r revenues under the provisions of subsection (b) 3 and (b) 5 of this Section 5, and

(ii) The net benefits will exceed the increase in the national debt to be occasioned by the project's construction.

LIMITATION ACT

Section 6. Except as to the carrying out of the provisions of Section 1 of this Act relative to the Board provided for therein, this Act shall not take effect and no authority shall be exercised hereunder and no work shall be begun and no moneys expended on or in connection with the works or structures provided for in this Act, and no valid rights shall be claimed or initiated hereunder, and no steps shall be taken by the United States or by others to initiate or perfect any claims to the use of water pertinent to such works or structures unless and until each of the States of Colorado, New Mexico, Utah and Wyoming, by acts of their respective legislatures, have each agreed irrevocably and unconditionally with the United States and for the benefit of the States of Arizona, California and Nevada, as an express covenant and in consideration of the passage of this Act, that (1) said State shall be bound by the decree in the case of Arizona v. California, et al., now pending in the United States Supreme Court; (2) that the aggregate annual consumptive use (diversions less returns to the river) of water of and from the Colorado River System by transmountain diversions out of the Colorado River Basin for use in said State, including all uses under contracts with the United States and all water necessary for the supply of any rights which may now exist, shall not exceed ten (10%) per centum of the waters, the use of which is apportioned to said State by the Upper Colorado River Basin Compact, such uses always to be subject to the terms of the Colorado River Compact; and (3) that no waters diverted out of the Colorado River Basin shall be made available to any

State not a party to the Colorado River Compact, either directly or by exchange, or by return flow, or otherwise.

CONSENT TO SUIT

Section 7. (a) In the event that any State of the Colorado River Basin seeks to maintain an action in the Supreme Court of the United States to enforce any of the provisions of the Colorado River Compact, the Upper Colorado River Basin Compact, the Boulder Canyon Project Act, the Boulder Canyon Project Adjustment Act, the Mexican Water Treaty or of this Act, consent is given to the joinder of the United States as a party in such suit or suits.

(b) Consent is hereby given to joinder of the United States as a party to any suit, action or proceeding brought in any court of competent jurisdiction upon any cause of action arising under any contract lawfully entered into by the United States pursuant to either of the Compacts or the Acts named in this section.

APPROPRIATIONS

Sec. 8. The appropriation of not to exceed $ 671,008,300 for the purposes of this Act is hereby authorized, upon the terms and conditions of this Act.

Mr. Aspinall. The gentleman moves the previous question.

All those in favor of the previous question signify by saying "Aye".

Those opposed will say "No".

The motion is carried and the previous question is in order.

All those in favor of the substitute signify by saying "Aye".

Those opposed will say "No".

The "Noes" appear to have it. The "Noes" do have it. The motion is declared lost and the substitute is not agreed to.

Is that all of the amendments for the gentleman?

Mr. Hosmer. That is all I have at the present time.

Mr. Aspinall. The Chair would offer the following amendment.

(Discussion off the record.)

Mr. Aspinall. The staff member will read the amendment.

Mr. McFarland. (Reading) Page 12, line 25, strike the amount "$1,055,000,000" and substitute therefor the amount "$785,000,000."

Mr. Dawson. I move the adoption of the amendment.

Mr. Westland. Second.

Mr. Aspinall. It has been moved and seconded.

May the Chair state to his colleagues that this amendment proposes to bring the bill in line with the participating projects and units that have been so far agreed to, and it tends to reduce

the amount by almost 12-1/2 percent. The gentleman from Colorado thinks that 15 to 20 percent is too much of a contingent fund and it is not necessary in this instance, and he believes that a more realistic amount is the amount that has been proposed.

Also the gentleman from Colorado would advise his colleagues that there is an amount in here for the conditional project Curecanti and that the gentleman from Colorado has left Curecanti project authorization amount in the amount he has suggested to the committee; but it is his feeling that that amount is not going to be used forsome time, that if the project is authorized and approved by the President that it will be sometime, several years perhaps, before the Secretary is able to make a decision on Curecanti. Then, if it should appear that there are not sufficient funds at that time, they will have to come back in for Curecanti.

As far as I am concerned, I feel that this committee has a right to expect the Bureau of Reclamation or the Department of the Interior to stay within the amount for each individual project. They should not embarrass one project by using funds that are set forth in this study for that particular project in order to complete another project; and if the Bureau gets itself in that position, it should return to this committee and ask for further authorization.

This is nothing new even if the authorization were not

as much as the authorization to complete the whole project because, as I understand it, in the Missouri Valley Project they authorized a certain amount and have had to return to Congress in order to get further appropriation.

That is about all I have to say. It is realistic, I think, and it puts the bill in a better position as far as the public is concerned.

Mr. Sisk. Will the chairman yield for a question?

Mr. Aspinall. Certainly.

Mr. Sisk. I do not havethe figures in front of me, Mr. Chairman. What is the amount set aside for Curecanti?

Mr. Aspinall. The amount set aside for Curecanti is $49,305,000, which under the new proposal would only be a part of the amount that would be necessary in the ultimate, and that is the reason why I do not believe it is a realistic figure, as such; if the Curecanti is finally proposed, it will cost in the neighborhood it will cost in the neighborhood of $75,000,000.

Mr. Sisk. This $49,000,000, then, is actually or would be only a portion of what it would cost. Do you feel it is necessary to even leave that amount in there? What is the point, might I ask the chairman?

Mr. Aspinall. The only point is that I think it goes before the people a little firmer for Curecanti than if you leave it out entirely and they say, "We do not have anything here at all."

But if the Secretary of Interior comes back, Mr. Sisk, with an authorization that goes up to 65 or 75 million, he has got to come before the committee in order to confirm it.

Mr. Dawson. Will the chairman yield?

Mr. Aspinall. Yes.

Mr. Dawson. In view of that fact, would it not be better to leave it out entirely, if they are going to come back anyway. And certainly they are going to make an appraisal of it and get a feasibility report on it before they ever proceed. Would it not be better to leave it off?

Mr. Aspinall. If the gentleman wishes to offer an amendment, he may do so. I think I would have to more or less resist it, but if that is the feeling of the committee --

Mr. Dawson. If the chairman would not resist it very strongly, I would offer it.

Mr. Aspinall. Off the record.

(Discussion off the record.

Mr. Dawson. Mr. Chairman, I would like to offer an amendment to the amendment reducing the figure from $785,000,000 to $760,000,000.

The reason for that is this: In my opinion the $49,000,000 for the Curecanti should not be in this bill until such a time as that project is reported back by the Secretary as to its feasibility, and it would be a truer reflection on the actual

costs of the project not to have it included. By reducing it to $760,000,000 you would be taking the $49,000,000 out of the project and then reducing the overall by 10 percent rather than 12-1/2 percent.

It is true that there is a contingency section in the computations, but you also have a good many contingencies, too, that it is impossible to figure on at the time a project of this size is set up. But I think we could safely go to 10 percent and still be more realistic.

Now we have discussed this some, and I think the general feeling was that 10 percent would be a more realistic figure.

I offer that as an amendment to the amendment, and if my friend cares to, I will yield to him at this time to comment on it.

Mr. Aspinall. No.

Mr. Pillion. Will the gentleman yield?

Mr. Dawson. Yes.

Mr. Pillion. What is your amendment? I am sorry, I did not hear it.

Mr. Dawson. Reduce the amount from $785,000,000 to $760,000,000.

Mr. Pillion. That is not excluding Curecanti?

Mr. Dawson. That is excluding Curecanti.

Mr. Pillion. My opposition, Mr. Chairman, to excluding Curecanti is that it is part of the bill, and while it is

a conditional authorization, the contingency upon which it depends is not within the province of Congress to decide. If the Secretary of the Interior comes up with a favorable report, then we are committed regardless of any further action by Congress. And if we are committed to Curecanti as a project based only upon a report from the Secretary of the Interior, then certainly the money ought to be in here, the authorization for the money ought to be in here.

Dr. Miller. Will the gentleman yield?

Mr. Dawson. Yes.

Dr. Miller. Of course, we are not committed even though the Secretary of Interior finds a favorable report on Curecanti because it will require another authorization by this committee and by the Congress as presently being done in the Missouri Valley project. So in either case I believe if we follow the amendment adopted by the Appropriations Committee in this committee, it would be necessary to come back for the approval of the Secretarial authorization.

Mr. Pillion. But it will not be necessary to come back to this committee. And by law, and not by rule or regulation, by law, this committee has authorized Curecanti.

Dr. Miller. As I understand, there will be no Secretarial authorizations.

Mr. Dawson. I would like to add to that, we have had a

number of projects here on exactly this same basis, which, it is true, we do not have to reauthorize the project, but certainly under the interpretation of the Appropriations Committee we, in effect, have to do it because it has to come back here, and before they will give an appropriation they have to have a reapproval of the whole project, you see, by this committee.

We have done that on a number of them here this session.

Mr. Fillion. I still say it is not law; it is a matter of rule and conditions by the Appropriations Committee.

Mr. Dawson. But it is law as far as we are concerned because the Appropriations does not want to appropriate the money unless the whole thing is brought before this committee and we approve it.

Mr. Aspinall. Is there any further discussion.

If not, all those in favor of the Dawson amendment to the amendment signify by saying "Aye".

Those opposed will say "No."

The"Ayes" appear to have it. The "Ayes" do have it. The motion is declared carried and the amendment to the amendment is declared adopted.

All those in favor of the Aspinall amendment, as amended, by the Dawson amendment, signify by saying "Aye."

Those opposed will say "No."

The "Ayes" have it. The motion is carried. The amendment

is declared adopted.

Dr. Miller. Mr. Chairman?

Mr. Aspinall. The Chair recognizes the gentleman from Nebraska.

Dr. Miller. I would like to raise a question as to procedure. I understand there are no more amendments to be presented to the bill, unless there are some that grow up between now and tomorrow morning.

Mr. Aspinall. That is right.

Dr. Miller. I wondered if it would be possible tomorrow, since we meet at 9:30, and I believe the House meets at 11 o'clock, we might have agreement to vote, say, at 10:15 on the bill. I think we ought to try to give notice ahead of time so it will not be done at 9:31.

Mr. Aspinall. Does the gentleman make a unanimous consent request?

Dr. Miller. I ask unanimous consent that we vote tomorrow at ten-thirty.

Mr. Aspinall. Unanimous consent has been requested that we have a final vote on the bill tomorrow at ten-thirty.

Mr. Rhodes. A parliamentary inquiry. Could that be made on or before ten-thirty?

Mr. Aspinall. That is the reason why the request was made so there would be a time definite.

Without objection, the request is granted and it is so

ordered.

Dr. Miller. Are other amendments in order?

Mr. Aspinall. Other amendments will be in order.

Dr. Miller. Up to ten-thirty?

Mr. Aspinall. That is right.

The Chair would ask unanimous consent of the committee that the committee members do not make a point of order because of a lack of quorum before ten-thirty tomorrow. In other words, we do not want to meet and have nothing to do and have the members drifting away.

With that understanding, the request being granted as such, the committee stands adjourned.

(Whereupon, at 11:15 a.m., the subcommittee recessed, to reconvene at 9:30 a.m., Tuesday, June 14, 1955.)

COLORADO RIVER STORAGE PROJECT

WEDNESDAY, MARCH 9, 1955

HOUSE OF REPRESENTATIVES,
SUBCOMMITTEE ON IRRIGATION AND RECLAMATION
OF THE COMMITTEE ON INTERIOR AND INSULAR AFFAIRS,
Washington, D. C.

The subcommittee met, pursuant to call, at 10:05 a. m., in the committee room, New House Office Building, Hon. Wayne N. Aspinall (chairman) presiding.

Mr. ASPINALL. The Subcommittee on Irrigation and Reclamation of the Committee on Interior and Insular Affairs will now be in session for the consideration of five bills for authorizing the Colorado River storage project and participating projects. These bills are H. R. 3383 and H. R. 3384, by Aspinall; H. R. 270, by Dawson; H. R. 2836, by Fernandez; and H. R. 4488, by Rogers of Colorado.

(H. R. 3383, H. R. 3384, H. R. 270, H. R. 2836, and H. R. 4488 read as follows:)

[H. R. 3383, 84th Cong., 1st sess.]

A BILL To authorize the Secretary of the Interior to construct, operate, and maintain the Colorado River storage project and participating projects, and for other purposes

Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled, That, in order to initiate the comprehensive development of the water resources of the Upper Colorado River Basin. the Congress, in the exercise of its constitutional authority to provide for the general welfare, to regulate commerce among the States and with the Indian tribes, and to make all needful rules and regulations respecting property belonging to the United States, and for the purposes, among others, of regulating the flow of the Colorado River, storing water for beneficial consumptive use, making it possible for the States of the Upper Basin to utilize, consistently with the provisions of the Colorado River Compact, the apportionments made to and among them in the Colorado River Compact and the Upper Colorado River Basin Compact, respectively, providing for the reclamation of arid and semiarid land, for the control of floods and for the improvement of navigation, and the generation of hydroelectric power, as an incident of the foregoing purposes, hereby authorizes the Secretary of the Interior (1) to construct, operate, and maintain the following initial units of the Colorado River storage project, consisting of dams, reservoirs, powerplants, transmission facilities and appurtenant works: Curecanti, Echo Park, Flaming Gorge and Glen Canyon: *Provided,* That the Curecanti Dam shall be constructed to a height which will impound not less than nine hundred and forty thousand acre-feet of water or will create a reservoir of such greater capacity as can be obtained by a high waterline located at seven thousand five hundred and twenty feet above mean sea level and that construction thereof shall not be undertaken until the Secretary has, on the basis of further engineering and economic investigations, reexamined the economic justification of such unit and, accompanied by appropriate documentation in the form of a supplemental report, has certified to the Congress and to the President that, in his judgment, the benefits of such unit will exceed its costs; and (2) to construct, operate, and maintain the following additional reclamation projects (including power-generating and transmission facilities related thereto), hereinafter referred to as participating projects: Central Utah (initial phase); Emery County, Florida, Hammond, La Barge, Lyman, Paonia (including the Minnesota unit, a dam and reservoir on Muddy

Creek just above its confluence with the North Fork of the Gunnison River, and other necessary works); Pine River extension, Seedskadee, Silt, Smith Fork, San Juan-Chama, Navajo: *Provided*, That (a) no appropriation for or construction of the San Juan-Chama project or the Navajo participating project shall be made or begun until coordinated reports thereon shall have been submitted to the affected States, including (but without limiting the generality of the foregoing) the State of Texas, pursuant to the Act of December 22, 1944, and said projects shall have been approved and authorized by the Congress: *Provided further*, That with reference to the San Juan-Chama project, it shall be limited to a single off stream dam and reservoir on a tributary of the Chama River to be used solely for the control and regulation of water imported from the San Juan River, that no power facilities shall be established, installed, or operated along the diversion or on the reservoir or dam, and such dam and reservoir shall at all times be operated by the Bureau of Reclamation of the Department of the Interior in strict compliance with the Rio Grande Compact as administered by the Rio Grande Compact Commission.

SEC. 2. In order to achieve such comprehensive development as will assure the consumptive use in the States of the Upper Colorado River Basin of waters of the Colorado River System the use of which is apportioned to the Upper Colorado River Basin by the Colorado River Compact and to each State thereof by the Upper Colorado River Basin Compact, it is the intent of the Congress in the future to authorize the construction, operation, and maintenance of further units of the Colorado River storage project, of additional phases of participating projects authorized in this Act, and of new participating projects as additional information becomes available and additional needs are indicated. It is hereby declared to be the purpose of the Congress to authorize as participating projects only projects (including units or phase thereof)—

(1) for the use, in one or more of the States designated in article III of the Upper Colorado River Basin Compact, of waters of the Upper Colorado River system the consumptive use of which is apportioned to those States by that article; and

(2) for which pertinent data sufficient to determine their probably engineering and economic justification and feasibility shall be available. It is likewise declared to be the policy of the Congress that the costs of any participating project authorized in the future shall be amortized from its own revenues to the fullest extent consistent with the provisions of this Act and Federal reclamation law.

SEC. 3. Except as otherwise provided in this Act, in constructing, operating, and maintaining the units of the Colorado River storage project and the participating projects listed in section 1 of this Act, the Secretary shall be governed by the Federal reclamation laws (Act of June 17, 1902, 32 Stat. 388, and Acts amendatory thereof or supplementary thereto): *Provided*, That (a) irrigation repayment contracts shall be entered into which, except as otherwise provided for the Paonia and Eden projects, provide for repayment of the obligation assumed thereunder with respect to any project contract unit over a period of not more than fifty years exclusive of any development period authorized by law; (b) prior to construction of irrigation distribution facilities, repayment contracts shall be made with an "organization" as defined in paragraph 2 (g) of the Reclamation Project Act of 1939 (53 Stat. 1187) which has the capacity to levy assessments upon all taxable real property located within its boundaries to assist in making repayments, except where a substantial proportion of the lands to be served are owned by the United States; (c) contracts relating to municipal water supply may be made without regard to the limitations of the last sentence of section 9 (c) of the Reclamation Project Act of 1939; and (d), as to Indian lands within, under or served by any participating project, payment of construction costs within the capability of the land to repay shall be subject to the Act of July 1, 1932 (47 Stat. 564). All units and participating projects shall be subject to the apportionments of the use of water between the Upper and Lower Basins of the Colorado River and among the States of the Upper Basin fixed in the Colorado River Compact and the Upper Colorado River Basin Compact, respectively, and to the terms of the treaty with the United Mexican States (Treaty Series 994).

SEC. 4. (a) There is hereby authorized a separate fund in the Treasury of the United States to be known as the Upper Colorado River Basin Fund (hereinafter referred to as the "Basin Fund"), which shall remain available until expended, as hereafter provided, for carrying out provisions of this Act other than section 7.

(b) All appropriations made for the purpose of carrying out the provisions of this Act, other than section 7, shall be credited to the Basin Fund as advances from the general fund of the Treasury.

(c) All revenues collected in connection with the operation of the Colorado River storage project and participating projects shall be credited to the Basin Fund, and shall be available, without further appropriation, for (1) defraying the costs of operation, maintenance, and replacements of, and emergency expenditures for, all facilities of the Colorado River storage project and participating projects, within such separate limitations as may be included in annual appropriation acts, (2) payment as required by subsection (d) of this section, (3) payment of the reimbursable construction costs of the Paonia project which are beyond the ability of the water users to repay within the period prescribed in the Act of June 25, 1947 (61 Stat. 181), said payment to be made within fifty years after completion of that portion of the project which has not been constructed as of the date of this Act, and (4) payment in connection with the irrigation features of the Eden project as specified in the Act of June 28, 1949 (63 Stat. 277): *Provided*, That revenues credited to the Basin Fund shall not be available for appropriation for construction of the units and participating projects authorized by or pursuant to this Act.

(d) Revenues in the Basin Fund in excess of operating needs shall be paid annually to the general fund of the Treasury to return—

(1) the costs of each unit, participating project, or any separable feature thereof which are allocated to power pursuant to section 5 of this Act, within a period of years not exceeding the expected economic life of such unit or participating project but not to exceed one hundred years;

(2) the costs of each unit, participating project, or any separable feature thereof which are allocated to municipal water supply pursuant to section 5 of this Act, within a period not exceeding fifty years from the date of completion of such unit, participating project, or separable feature thereof;

(3) interest on the unamortized balance of the investment (including interest during construction) in the power and municipal water supply features of each unit, participating project, or any separable feature thereof, at a rate determined by the Secretary of the Treasury as provided in subsection (e), and interest due shall be a first charge; and

(4) the costs of each unit, participating project, or any separable feature thereof which are allocated to irrigation pursuant to section 5 of this Act in equal annual installments within a period not exceeding fifty years, in addition to any development period authorized by law, from the date of completion of such unit, participating project, or separable feature thereof, or, in the cases of the Paonia project and of Indian lands, within a period consistent with other provisions of law applicable thereto.

(e) The interest rate applicable to each unit of the storage project and each participating project shall be determined by the Secretary of the Treasury as of the time the first advance is made for initiating construction of said unit or project. Such interest rate shall be determined by calculating the average yield to maturity on the basis of daily closing market bid quotations during the month of June next preceding the fiscal year in which said advance is made, on all interest-bearing marketable public debt obligations of the United States having a maturity date of fifteen or more years from the first day of said month, and by adjusting such average annual yield to the nearest one-eighth of 1 per centum.

(f) Business-type budgets shall be submitted to the Congress annually for all operations financed by the Basin Fund.

SEC. 5. Upon completion of each unit, participating project or separable feature thereof the Secretary shall allocate the total costs (excluding any expenditures authorized by section 7 of this Act) of constructing said unit, project or feature to power, irrigation, municipal water supply, flood control, navigation, or any other purposes authorized under reclamation law. Allocations of construction, operation, and maintenance costs to authorized nonreimbursable purposes shall be nonreturnable under the provisions of this Act. On January 1 of each year the Secretary shall report to the Congress for the previous fiscal year, beginning with the fiscal year 1956, upon the status of the revenues from and the cost of constructing, operating, and maintaining the Colorado River storage project and the participating projects. The Secretary's report shall be prepared to reflect accurately the Federal investment allocated at that time to power, to irrigation, and to other purposes, the progress of return and repayment thereon, and the estimated rate of progress, year by year, in accomplishing full repayment.

SEC. 6. The hydroelectric powerplants authorized by this Act to be constructed, operated, and maintained by the Secretary shall be operated in conjunction with

other Federal powerplants, present and potential, so as to produce the greatest practicable amount of power and energy that can be sold at firm power and energy rates, but no exercise of the authority hereby granted shall affect or interfere with the operation of any provision of the Colorado River Compact, the Upper Colorado River Basin Compact, the Boulder Canyon Project Act, the Boulder Canyon Project Adjustment Act, or any contract lawfully entered into under said Acts without the consent of the other contracting parties. Neither the impounding nor the use of water for the generation of power and energy at the plants of the Colorado River storage project shall preclude or impair the appropriation for domestic or argicultural purposes, pursuant to applicable State law, of waters apportioned to the States of the Upper Colorado River Basin.

SEC. 7. In connection with the development of the Colorado River storage project and of the participating projects, the Secretary is authorized and directed to investigate, plan, construct, operate, and maintain (1) public recreational facilities on lands withdrawn or acquired for the development of said project or of said participating projects, to conserve the scenery, the natural, historic, and archeologic objects, and the wildlife on said lands, and to provide for public use and enjoyment of the same and of the water areas created by these projects by such means as are consistent with the primary purposes of said projects; and (2) facilities to mitigate losses of and improve conditions for the propagation of fish and wildlife. The Secretary is authorized to acquire lands and to withdraw public lands from entry or other disposition under the public land laws necessary for the construction, operation, and maintenance of the facilities herein provided, and to dispose of them to Federal, State, and local governmental agencies by lease, transfer, exchange, or conveyance upon such terms and conditions as will best promote their development and operation in the public interest. All costs incurred pursuant to this section shall be nonreimbursable and nonreturnable.

SEC. 8. Nothing contained in this Act shal be construed to alter, amend, repeal, construe, interpret, modify, or be in conflict with any provision of the Boulder Canyon Project Act (45 Stat. 1057), the Boulder Canyon Project Adjustment Act (54 Stat. 774), the Colorado River Compact, the Upper Colorado River Basin Compact, the Rio Grande Compact of 1938, or the Treaty with the United Mexican States (Treaty Series 994).

SEC. 9. Expenditures for the Flaming Gorge, Glen Canyon, Curecanti, and Echo Park initial units of the Colorado River storage project may be made without regard to the soil survey and land classification requirements of the Interior Department Appropriation Act, 1954.

SEC. 10. Construction of the projects herein authorized shall proceed as rapidly as is consistent with budgetary requirements and the economic needs of the country.

SEC. 11. There are hereby authorized to be appropriated, out of any moneys in the Treasury not otherwise appropriated, such sums as may be required to carry out the purpose of this Act but not to exceed $1,055,000,000.

SEC. 12. In planning the additional development necessary to the full consumptive use in the Upper Basin of the waters of the Colorado River system allocated to the Upper Basin and in planning the use of and in using credits from net power revenues available for the purpose of assisting in the pay-out of costs of participating projects herein and hereafter authorized in the States of Colorado, New Mexico, Utah, and Wyoming, the Secretary shall have regard for the achievement within each of such States of the fullest practicable consumptive use of the waters of the Upper Colorado River system consistent with the apportionment thereof among such States.

SEC. 13. In the operation and maintenance of all facilities, authorized by Federal law and under the jurisdiction and supervision of the Secretary of the Interior, in the basin of the Colorado River, the Secretary of the Interior is directed to comply with the applicable provisions of the Colorado River Compact, the Boulder Canyon Project Act, the Boulder Canyon Project Adjustment Act, and the Treaty with the United Mexican States, in the storage and release of water from reservoirs in the Colorado River Basin. In the event of the failure of the Secretary of the Interior to so comply, any State of the Colorado River Basin may maintain an action in the Supreme Court of the United States to enforce the provisions of this section, and consent is given to the joinder of the United States as a party in such suit or suits.

SEC. 14. The Secretary of the Interior is directed to institute studies and to make a report to the Congress and to the States of the Colorado River Basin of the effect upon the quality of water of the Colorado River, of all transmountain

diversions of water of the Colorado River system and of all other storage and reclamation projects in the Colorado River Basin.

SEC. 15. As used in this Act—

The terms "Colorado River Basin", "Colorado River Compact", "Colorado River System", "Lee Ferry", "States of the Upper Division", "Upper Basin", and "domestic use" shall have the meaning ascribed to them in article II of the "Upper Colorado River Basin Compact";

The term "States of the Upper Colorado Basin" shall mean the States of Arizona, Colorado, New Mexico, Utah, and Wyoming.

The term "Upper Colorado River Basin" shall have the same meaning as the term "Upper Basin";

The term "Upper Colorado River Basin Compact" shall mean that certain compact executed on October 11, 1948, by commissioners representing the States of Arizona, Colorado, New Mexico, Utah, and Wyoming, and consented to by the Congress of the United States of America by Act of April 6, 1949 (63 Stat. 31);

The term "Rio Grande Compact" shall mean that certain compact executed on March 18, 1938, by commissioners representing the States of Colorado, New Mexico, and Texas and consented to by the Congress of the United States of America by Act of May 31, 1939 (53 Stat. 785);

The term "treaty with the United Mexican States" shall mean that certain treaty between the United States of America and the United Mexican States signed at Washington, District of Columbia, February 3, 1944, relating to the utilization of the waters of the Colorado River and other rivers, as amended and supplemented by the protocol dated November 14, 1944, and the understanding recited in the Senate resolution of April 18, 1945, advising and consenting to ratification thereof; and

The term "economic life," as used herein in relation to repayment of costs allocated to power, shall mean the period during which the unit or project is expected to continue to provide the power and energy contemplated from the design and construction of the power facilities of the unit or project, due regard being given to historical experience with similar types of works, allowances included in "replacement costs" for replacing major items of equipment, and other pertinent factors which may affect the useful life.

[H. R. 3384, 84th Cong., 1st sess.]

A BILL To authorize the Secretary of the Interior to construct, operate, and maintain the Colorado River storage project and participating projects, and for other purposes

Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled, That, in order to initiate the comprehensive development of the water resources of the Upper Colorado River Basin, the Congress, in the exercise of its constitutional authority to provide for the general welfare, to regulate commerce among the States and with the Indian tribes, and to make all needful rules and regulations respecting property belonging to the United States, and for the purposes, among others, of regulating the flow of the Colorado River, storing water for beneficial consumptive use, making it possible for the States of the Upper Basin to utilize consistently with the provisions of the Colorado River Compact, the apportionments made to and among them in the Colorado River Compact and the Upper Colorado River Basin Compact, respectively, providing for the reclamation of arid and semiarid land, for the control of floods and for the improvement of navigation, and the generation of hydroelectric power, as an incident of the foregoing purposes, hereby authorizes the Secretary of the Interior (1) to construct, operate, and maintain the following initial units of the Colorado River storage project, consisting of dams, reservoirs, powerplants, transmission facilities, and appurtenant works: Curecanti, Echo Park, Flaming Gorge, Glen Canyon, Juniper, and Navajo: *Provided*, That the Curecanti Dam shall be constructed to a height which will impound not less than nine hundred and forty thousand acre-feet of water or will create a reservoir of such greater capacity as can be obtained by a high waterline located at seven thousand five hundred and twenty feet above mean sea level, and (2) to construct, operate, and maintain the following additional reclamation projects (including power-generating and transmission facilities related thereto), hereinafter referred to as participating projects: Central Utah (initial phase); Emery County, Florida, Gooseberry, Hammond, LaBarge, Lyman, Paonia (including the Minnesota unit, a dam and reservoir on Muddy Creek just above its confluence with the North Fork of the Gunnison River,

and other necessary works), Pine River Extension, Seedskadee, Silt, Smith Fork, San Juan-Chama, Navajo, Parshall, Troublesome, Rabbit Ear, Eagle Divide, Woody Creek, West Divide, Bluestone, Battlement Mesa, Tomichi Creek, East River, Ohio Creek, Fruitland Mesa, Bostwick Park, Grand Mesa, Dallas Creek, Savery-Pot Hook, Dolores, Fruit Growers Extension, Elkhorn, Kendall: *Provided*, That (a) construction of the participating projects set forth in this clause (2) shall not be undertaken until the Secretary has reexamined the economic justification of such project and, accompanied by appropriate documentation in the form of a supplemental report, has certified to the Congress, through the President, that, in his judgment, the benefits of such project will exceed its costs, and that the financial reimbursability requirements set forth in section 4 of this Act can be met. The Secretary's supplemental report for each such project shall include, among other things, (i) a reappraisal of the prospective direct agricultural benefits of the project made by the Secretary after consultation with the Secretary of Agriculture; (ii) a reevaluation of the nondirect benefits of the project; and (iii) allocations of the total cost of construction of each participating project or separable features thereof, excluding any expenditures authorized by section 7 of this Act, to power, irrigation, municipal water supply, flood control or navigation, or any other purpose authorized under reclamation law. Section 1 (c) of the Flood Control Act of 1944 shall, except as hereinafter provided for the San Juan-Chama, Navajo, Parshall, Troublesome, Rabbit Ear, Eagle Divide, Woody Creek, West Divide, Bluestone, Battlement Mesa, Tomichi Creek, East River, Ohio Creek, Fruitland Mesa, Bostwick Park, Grand Mesa, Dallas Creek, Savery-Pot Hook, Dolores, Fruit Growers Extension, Elkhorn, and Kendall participating projects, not be applicable to such supplemental reports; and, (b) that no appropriation for or construction of the San Juan-Chama project or the Navajo participating project shall be made or begun until coordinated reports thereon shall have been submitted to the affected States, including (but without limiting the generality of the foregoing) the State of Texas, pursuant to the Act of December 22, 1944, and said projects shall have been authorized by the Congress: *Provided further*, That with reference to the San Juan-Chama project, it shall be limited to a single off-stream dam and reservoir on a tributary of the Chama River to be used solely for the control and regulation of water imported from the San Juan River, that no power facilities shall be established, installed, or operated along the diversion or on the reservoir or dam, and such dam and reservoir shall at all times be operated by the Bureau of Reclamation of the Department of the Interior in strict compliance with the Rio Grande Compact as administered by the Rio Grande Compact Commission: *Provided further*, That no appropriation for or construction of the Parshall, Troublesome, Rabbit Ear, Eagle Divide, Woody Creek, West Divide, Bluestone, Battlement Mesa, Tomichi Creek, East River, Ohio Creek, Fruitland Mesa, Bostwick Park, Grand Mesa, Dallas Creek, Savery-Pot Hook, Dolores, Fruit Growers Extension, Elkhorn, and Kendall participating projects shall be made or begun until reports thereon shall have been submitted to the affected States, pursuant to the Act of December 22, 1944, and said projects shall have been authorized by the Congress.

SEC. 2. In order to achieve such comprehensive development as will assure the consumptive use in the States of the Upper Colorado River Basin of waters of the Colorado River system the use of which is apportioned to the Upper Colorado River Basin by the Colorado River Compact and to each State thereof by the Upper Colorado River Basin Compact, it is the intent of the Congress in the future to authorize the construction, operation, and maintenance of further units of the Colorado River storage project, of additional phases of participating projects authorized in this Act, and of new participating projects as additional information becomes available and additional needs are indicated. It is hereby declared to be the purpose of the Congress to authorize as participating projects only projects (including units or phases thereof)—

(1) for the use, in one or more of the States designated in article III of the Upper Colorado River Basin Compact, of waters of the Upper Colorado River system the consumptive use of which is apportioned to those States by that article; and

(2) for which pertinent data sufficient to determine their probable engineering and economic justification and feasibility shall be available. It is likewise declared to be the policy of the Congress that the costs of any participating project authorized in the future shall be amortized from its own revenues to the fullest extent consistent with the provisions of this Act and Federal reclamation law.

SEC. 3. Except as otherwise provided in this Act, in constructing, operating, and maintaining the units of the Colorado River storage project and the participating projects listed in section 1 of this Act, the Secretary shall be governed by the Federal reclamation laws (Act of June 17, 1902, 32 Stat. 388, and Acts amendatory thereof or supplementary thereto): *Provided*, That (a) irrigation repayment contracts shall be entered into which, except as otherwise provided for the Paonia and Eden projects, provide for repayment of the obligation assumed thereunder with respect to any project contract unit over a period of not more than fifty years exclusive of any development period authorized by law; (b) prior to construction of irrigation distribution facilities, repayment contracts shall be made with an "organization" as defined in paragraph 2 (g) of the Reclamation Project Act of 1939 (53 Stat. 1187) which has the capacity to levy assessments upon all taxable real property located within its boundaries to assist in making repayments, except where a substantial proportion of the lands to be served are owned by the United States; (c) contracts relating to municipal water supply may be made without regard to the limitations of the last sentence of section 9 (c) of the Reclamation Project Act of 1939; and (d), as to Indian lands within, under or served by any participating project, payment of construction costs within the capability of the land to repay shall be subject to the Act of July 1, 1932 (47 Stat. 564). All units and participating projects shall be subject to the apportionments of the use of water between the Upper and Lower Basins of the Colorado River and among the States of the Upper Basin fixed in the Colorado River Compact and the Upper Colorado River Basin Compact, respectively, and to the terms of the treaty with the United Mexican States (Treaty Series 994).

SEC. 4. (a) There is hereby authorized a separate fund in the Treasury of the United States to be known as the Upper Colorado River Basin Fund (hereinafter referred to as the "Basin Fund"), which shall remain available until expended, as hereinafter provided, for carrying out provisions of this Act other than section 7.

(b) All appropriations made for the purpose of carrying out the provisions of this Act, other than section 7, shall be credited to the Basin Fund as advances from the general fund of the Treasury.

(c) All revenues collected in connection with the operation of the Colorado River storage project and participating projects shall be credited to the Basin Fund, and shall be available, without further appropriation, for (1) defraying the costs of operation, maintenance, and replacements of, and emergency expenditures for, all facilities of the Colorado River storage project and participating projects, within such separate limitations as may be included in annual appropriation Acts, (2) payment as required by subsection (d) of this section, (3) payment of the reimbursable construction costs of the Paonia project which are beyond the ability of the water users to repay within the period prescribed in the Act of June 25, 1947 (61 Stat. 181), said payment to be made within fifty years after completion of that portion of the project which has not been constructed as of the date of this Act, and (4) payment in connection with the irrigation features of the Eden project as specified in the Act of June 28, 1949 (63 Stat. 277): *Provided*, That revenues credited to the Basin Fund shall not be available for appropriation for construction of the units and participating projects authorized by or pursuant to this Act.

(d) Revenues in the Basin Fund in excess of operating needs shall be paid annually to the general fund of the Treasury to return—

(1) the costs of each unit, participating project, or any separable feature thereof which are allocated to power pursuant to section 5 of this Act, within a period not exceeding fifty years from the date of completion of such unit, participating project, or separable feature thereof;

(2) the costs of each unit, participating project, or any separable feature thereof which are allocated to municipal water supply pursuant to section 5 of this Act, within a period not exceeding fifty years from the date of completion of such unit, participating project, or separable feature thereof;

(3) interest on the unamortized balance of the investment (including interest during construction) in the power and municipal water supply features of each unit, participating project, or any separable feature thereof, at a rate determined by the Secretary of the Treasury as provided in subsection (e), and interest due shall be a first charge; and

(4) the costs of each unit, participating project, or any separable feature thereof which are allocated to irrigation pursuant to section 5 of this Act within a period not exceeding fifty years, in addition to any development period authorized by law, from the date of completion of such unit,

participating project, or separable feature thereof, or in the cases of the Paonia project and of Indian lands, within a period consistent with other provisions of law applicable thereto.

(e) The interest rate applicable to each unit of the storage project and each participating project shall be determined by the Secretary of the Treasury as of the time the first advance is made for initiating construction of said unit or project. Such interest rate shall be determined by calculating the average yield to maturity on the basis of daily closing market bid quotations during the month of June next preceding the fiscal year in which said advance is made, on all interest-bearing marketable public debt obligations of the United States having a maturity date of fifteen or more years from the first day of said month, and by adjusting such average annual yield to the nearest one-eighth of 1 per centum.

(f) Business-type budgets shall be submitted to the Congress annually for all operations financed by the Basin Fund.

SEC. 5. Upon completion of each unit, participating project or separable feature thereof the Secretary shall allocate the total costs (excluding any expenditures authorized by section 7 of this Act) of constructing said unit, project or feature to power, irrigation, municipal water supply, flood control, navigation, or any other purposes authorized under reclamation law. Allocations of construction, operation and maintenance costs to authorized nonreimbursable purposes shall be nonreturnable under the provisions of this Act. On January 1 of each year the Secretary shall report to the Congress for the previous fiscal year, beginning with the fiscal year 1956, upon the status of the revenues from and the cost of constructing, operating and maintaining the Colorado River storage project and the participating projects. The Secretary's report shall be prepared to reflect accurately the Federal investment allocated at that time to power, to irrigation, and to other purposes, the progress of return and repayment thereon, and the estimated rate of progress, year by year, in accomplishing full repayment.

SEC. 6. The hydroelectric powerplants authorized by this Act to be constructed, operated, and maintained by the Secretary shall be operated in conjunction with other Federal powerplants, present and potential, so as to produce the greatest practicable amount of power and energy that can be sold at firm power and energy rates, but no exercise of the authority hereby granted shall affect or interfere with the operation of any provision of the Colorado River Compact, the Upper Colorado River Basin Compact, or the Boulder Canyon Project Act.

SEC. 7. In connection with the development of the Colorado River storage project and of the participating projects, the Secretary is authorized and directed to investigate, plan, construct, operate, and maintain (1) public recreational facilities on lands withdrawn or acquired for the development of said project or of said participating projects, to conserve the scenery, the natural, historic, and archeologic objects, and the wildlife on said lands, and to provide for public use and enjoyment of the same and of the water areas created by these projects by such means as are consistent with the primary purposes of said projects; and (2) facilities to mitigate losses of and improve conditions for the propagation of fish and wildlife. The Secretary is authorized to acquire lands and to withdraw public lands from entry or other disposition under the public land laws necessary for the construction, operation, and maintenance of the facilities herein provided, and to dispose of them to Federal, State, and local governmental agencies by lease, transfer, exchange, or conveyance upon such terms and conditions as will best promote their development and operation in the public interest. All costs incurred pursuant to this section shall be nonreimbursable and nonreturnable.

SEC. 8. Nothing contained in this Act shall be construed to alter, amend, repeal, construe, interpret, modify, or be in conflict with any provision of the Boulder Canyon Project Act (45 Stat. 1057), the Boulder Canyon Project Adjustment Act (54 Stat. 774), the Colorado River Compact, the Upper Colorado River Basin Compact, the Rio Grande Compact of 1938, or the Treaty with the United Mexican States (Treaty Series 994).

SEC. 9. Expenditures for the Flaming Gorge, Glen Canyon, Navajo, and Echo Park initial units of the Colorado River storage project may be made without regard to the soil survey and land classification requirements of the Interior Department Appropriation Act, 1954.

SEC. 10. There are hereby authorized to be appropriated such sums as may be required to carry out the purposes of this Act.

SEC. 11. (a) In the operation and maintenance of all facilities, authorized by Federal law and under the jurisdiction and supervision of the Secretary of the Interior, in the basin of the Colorado River, the Secretary of the Interior is directed to comply with the applicable provisions of the Colorado River Compact, the Boulder Canyon Project Act, the Boulder Canyon Project Adjustment Act, and the Treaty with the United Mexican States, in the storage and release of water from reservoirs in the Colorado River Basin. In the event of the failure of the Secretary of the Interior to so comply, any State of the Colorado River Basin may maintain an action in the Supreme Court of the United States to enforce the provisions of this section, and consent is given to the joinder of the United States as a party in such suit or suits. No right to impound or use water for the generation of power or energy, created or established by the building, operation or use of any of the powerplants authorized by this Act, shall be deemed to have priority over or otherwise operate to preclude or impair any use, regardless of the date of origin of such use, of the waters of the Colorado River and its tributaries for domestic or agricultural purposes within any of the States of the Upper Colorado River Basin.

(b) In the operation of works under his jurisdiction for the storage and release of waters of the Colorado River System and in programing the storage and release of such waters, the Secretary of the Interior shall consult from time to time with an Integrating Committee consisting of one representative from each of the Colorado River Basin States, one representative of the Colorado River Board of California, one representative of the Upper Colorado River Commission, and one representative of the United States Section of the International Boundary Commission, United States and Mexico.

SEC. 12. As used in this Act—

The terms "Colorado River Basin," "Colorado River Compact," "Colorado River System," "Lee Ferry," "States of the Upper Division," "Upper Basin," and "domestic use" shall have the meaning ascribed to them in article II of the Upper Colorado River Basin Compact;

The term "States of the Upper Colorado River Basin" shall mean the States of Arizona, Colorado, New Mexico, Utah, and Wyoming;

The term "Upper Colorado River Basin" shall have the same meaning as the term "Upper Basin";

The term "Upper Colorado River Basin Compact" shall mean that certain compact executed on October 11, 1948, by commissioners representing the States of Arizona, Colorado, New Mexico, Utah, and Wyoming, and consented to by the Congress of the United States of America by Act of April 6, 1949 (63 Stat. 31);

The term "Rio Grande Compact" shall mean that certain compact executed on March 18, 1938, by Commissioners representing the States of Colorado, New Mexico, and Texas and consented to by the Congress of the United States of America by Act of May 31, 1939 (53 Stat. 785); and

The term "treaty with the United Mexican States" shall mean that certain treaty between the United States of America and the United Mexican States signed at Washington, District of Columbia, February 3, 1944, relating to the utilization of the waters of the Colorado River and other rivers, as amended and supplemented by the protocol dated November 14, 1944, and the understandings recited in the Senate resolution of April 18, 1945, advising and consenting to ratification thereof.

[H. R. 270, 84th Cong., 1st sess.]

A BILL To authorize the Secretary of the Interior to construct, operate, and maintain the Colorado River storage project and participating projects, and for other purposes

Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled, That, in order to initiate the comprehensive development of the water resources of the Upper Colorado River Basin, the Congress, in the exercise of its constitutional authority to provide for the general welfare, to regulate commerce among the States and with the Indian tribes, and to make all needful rules and regulations respecting property belonging to the United States, and for the purposes, among others, of regulating the flow of the Colorado River, storing water for beneficial consumptive use, making it possible for the States of the Upper Basin to utilize, consistently with the provisions of the Colorado River Compact, the apportionments made to and among them in the Colorado River Compact and the Upper Colorado River Basin Compact, respectively, providing for the reclamation of arid and semiarid land, for the control of floods and for the improvement of navigation, and the generation

of hydroelectric power, as an incident of the foregoing purposes, hereby authorizes the Secretary of the Interior (1) to construct, operate, and maintain the following initial units of the Colorado River storage project, consisting of dams, reservoirs, powerplants, transmission facilities, and appurtenant works: Cross Mountain, Curecanti, Echo Park, Flaming Gorge, Glen Canyon, and Navaho: *Provided*, That the Curecanti Dam shall be constructed to a height which will impound not less than nine hundred and forty thousand acre-feet of water or will create a reservoir of such greater capacity as can be obtained by a high waterline located at seven thousand five hundred and twenty feet above mean sea level and that construction thereof shall not be undertaken until the Secretary has, on the basis of further engineering and economic investigations, reexamined the economic justification of such unit and, accompanied by appropriate documentation in the form of a supplemental report, has certified to the Congress and to the President that, in his judgment, the benefits of such unit will exceed its costs; and (2) to construct, operate, and maintain the following additional reclamation projects (including power-generating and transmission facilities related thereto), hereinafter referred to as participating projects: Central Utah (initial phase), Emery County, Florida, Gooseberry, Hammond, LaBarge, Lyman, Paonia (including the Minnesota unit, a dam and reservoir on Muddy Creek just above its confluence with the North Fork of the Gunnison River, and other necessary works), Pine River Extension, Seedskadee, Silt, Smith Fork, San Juan-Chama, Navajo: *Provided*, That (a) construction of the participating projects set forth in this clause (2) shall not be undertaken until the Secretary has reexamined the economic justification of such project and, accompanied by appropriate documentation in the form of a supplemental report, has certified to the Congress, through the President, that, in his judgment, the benefits of such project will exceed its costs, and that the financial reimbursability requirements set forth in section 4 of this Act can be met. The Secretary's supplemental report for each such project shall include, among other things, (i) a reappraisal of the prospective direct agricultural benefits of the project made by the Secretary after consultation with the Secretary of Agriculture; (ii) a reevaluation of the nondirect benefits of the project; and (iii) allocations of the total cost of construction of each participating project or separable features thereof, excluding any expenditures authorized by section 7 of this Act, to power, irrigation, municipal water supply, flood control or navigation, or any other purpose authorized under reclamation law. Section 1 (c) of the Flood Control Act of 1944 shall, except as hereinafter provided for the San Juan-Chama and the Navajo participating projects, not be applicable to such supplemental reports; and, (b) that no appropriation for or construction of the San Juan-Chama project or the Navajo participating project shall be made or begun until coordinated reports thereon shall have been submitted to the affected States, including (but without limiting the generality of the foregoing) the State of Texas, pursuant to the Act of December 22, 1944, and said projects shall have been authorized by the Congress: *Provided further*, That with reference to the San Juan-Chama project, it shall be limited to a single off stream dam and reservoir on a tributary of the Chama River to be used solely for the control and regulation of water imported from the San Juan River, that no power facilities shall be established, installed, or operated along the diversion or on the reservoir or dam, and such dam and reservoir shall at all times be operated by the Bureau of Reclamation of the Department of the Interior in strict compliance with the Rio Grande Compact as administered by the Rio Grande Compact Commission.

SEC. 2. In order to achieve such comprehensive development as will assure the consumptive use in the States of the Upper Colorado River Basin of waters of the Colorado River system the use of which is apportioned to the Upper Colorado River Basin by the Colorado River Compact and to each State thereof by the Upper Colorado River Basin Compact, it is the intent of the Congress in the future to authorize the construction, operation, and maintenance of further units of the Colorado River storage project, or additional phases of participating projects authorized in this Act, and of new participating projects as additional information becomes available and additional needs are indicated. It is hereby declared to be the purpose of the Congress to authorize as participating projects only projects (including units or phases thereof)—

(1) for the use, in one or more of the States designated in article III of the Upper Colorado River Basin Compact, of waters of the Upper Colorado River system the consumptive use of which is apportioned to those States by that article; and

(2) for which pertinent data sufficient to determine their probable engineering and economic justification and feasibility shall be available. It is likewise declared to be the policy of the Congress that the costs of any participating project authorized in the future shall be amortized from its own revenues to the fullest extent consistent with the provisions of this Act and Federal reclamation law.

SEC. 3. Except as otherwise provided in this Act, in constructing, operating, and maintaining the units of the Colorado River storage project and the participating projects listed in section 1 of this Act, the Secretary shall be governed by the Federal reclamation laws (Act of June 17, 1902, 32 Stat. 388, and Acts amendatory thereof or supplementary thereto): *Provided*, That (a) irrigation repayment contracts shall be entered into which, except as otherwise provided for the Paonia and Eden projects, provide for repayment of the obligation assumed thereunder with respect to any project contract unit over a period of not more than fifty years exclusive of any development period authorized by law; (b) prior to construction of irrigation distribution facilities, repayment contracts shall be made with an "organization" as defined in paragraph 2 (g) of the Reclamation Project Act of 1939 (53 Stat. 1187) which has the capacity to levy assessments upon all taxable real property located within its boundaries to asist in making repayments, except where a substantial proportion of the lands to be served are owned by the United States; (c) contracts relating to municipal water supply may be made without regard to the limitations of the last sentence of section 9 (c) of the Reclamation Project Act of 1939; and (d) as to Indian lands within, under, or served by any participating project, payment of construction costs within the capability of the land to repay shall be subject to the Act of July 1, 1932 (47 Stat. 564). All units and participating projects shall be subject to the apportionments of the use of water between the Upper and Lower Basins of the Colorado River and among the States of the Upper Basin fixed in the Colorado River Compact and the Upper Colorado River Basin Compact, respectively, and to the terms of the treaty with the United Mexican States (treaty series 994).

SEC. 4. (a) There is hereby authorized a separate fund in the Treasury of the United States to be known as the Upper Colorado River Basin Fund (hereinafter referred to as the Basin Fund), which shall remain available until expended, as hereafter provided, for carrying out provisions of this Act other than section 7.

(b) All appropriations made for the purpose of carrying out the provisions of this Act, other than section 7, shall be credited to the Basin Fund as advances from the general fund of the Treasury.

(c) All revenues collected in connection with the operation of the Colorado River storage project and participating projects shall be credited to the Basin Fund, and shall be available, without further appropriation, for (1) defraying the costs of operation, maintenance, and replacements of, and emergency expenditures for, all facilities of the Colorado River storage project and participating projects, within such separate limitations as may be included in annual appropriations acts; (2) payment as required by subsection (d) of this section; (3) payment of the reimbursable construction costs of the Paonia project which are beyond the ability of the water users to repay within the period prescribed in the Act of June 25, 1947 (61 Stat. 181), said payment to be made within fifty years after completion of that portion of the project which has not been constructed as of the date of this Act; and (4) payment in connection with the irrigation features of the Eden project as specified in the Act of June 28, 1949 (63 Stat. 277): *Provided*, That revenues credited to the Basin Fund shall not be available for appropriation for construction of the units and participating projects authorized by or pursuant to this Act.

(d) Revenues in the Basin Fund in excess of operating needs shall be paid annually to the general fund of the Treasury to return—

(1) the costs of each unit, participating project, or any separable feature thereof which are allocated to power pursuant to section 5 of this Act, within a period not exceeding fifty years from the date of completion of such unit, participating project, or separable feature thereof;

(2) the costs of each unit, participating project, or any separable feature thereof which are allocated to municipal water supply pursuant to section 5 of this Act, within a period not exceeding fifty years from the date of completion of such unit, participating project, or separable feature thereof;

(3) interest on the unamortized balance of the investment (including interest during construction) in the power and municipal water supply features of each unit, participating project, or any separable feature thereof, at a rate determined by the Secretary of the Treasury as provided in subsection (e), and interest due shall be a first charge; and

(4) the costs of each unit, participating project, or any separable feature thereof which are allocated to irrigation pursuant to section 5 of this Act within a period not exceeding fifty years, in addition to any development period authorized by law, from the date of completion of such unit, participating project, or separable feature thereof, or, in the cases of the Paonia project and of Indian lands, within a period consistent with other provisions of law applicable thereto.

(e) The interest rate applicable to each unit of the storage project and each participating project shall be determined by the Secretary of the Treasury as of the time the first advance is made for initiating construction of said unit or project. Such interest rate shall be determined by calculating the average yield to maturity on the basis of daily closing market bid quotations during the month of June next preceding the fiscal year in which said advance is made, on all interest-bearing marketable public debt obligations of the United States having a maturity date of fifteen or more years from the first day of said month, and by adjusting such average annual yield to the nearest one-eighth of 1 per centum.

(f) Business-type budgets shall be submitted to the Congress annually for all operations financed by the Basin Fund.

SEC. 5. Upon completion of each unit, participating project, or separable feature thereof the Secretary shall allocate the total costs (excluding any expenditures authorized by section 7 of this Act) of constructing said unit, project, or feature to power, irrigation, municipal water supply, flood control, navigation, or any other purposes authorized under reclamation law. Allocations of construction, operation, and maintenance costs to authorized nonreimbursable purposes shall be nonreturnable under the provisions of this Act. On January 1 of each year the Secretary shall report to the Congress for the previous fiscal year, beginning with the fiscal year 1956, upon the status of the revenues from and the cost of constructing, operating, and maintaining the Colorado River storage project and the participating projects. The Secretary's report shall be prepared to reflect accurately the Federal investment allocated at that time to power, to irrigation, and to other purposes, the progress of return and repayment thereon, and the estimated rate of progress, year by year, in accomplishing full repayment.

SEC. 6. The hydroelectric powerplants authorized by this Act to be constructed, operated, and maintained by the Secretary shall be operated in conjunction with other Federal powerplants, present and potential, so as to produce the greatest practicable amount of power and energy that can be sold at firm power and energy rates, but no exercise of the authority hereby granted shall affect or interfere with the operation of any provision of the Colorado River Compact, the Upper Colorado River Basin Compact, or the Boulder Canyon Project Act.

SEC. 7. In connection with the development of the Colorado River storage project and of the participating projects, the Secretary is authorized and directed to investigate, plan, construct, operate, and maintain (1) public recreational facilities on lands withdrawn or acquired for the development of said project or of said participating projects, to conserve the scenery, the natural, historic, and archeologic objects, and the wildlife on said lands, and to provide for public use and enjoyment of the same and of the water areas created by these projects by such means as are consistent with the primary purposes of said projects; and (2) facilities to mitigate losses of and improve conditions for the propagation of fish and wildlife. The Secretary is authorized to acquire lands and to withdraw public lands from entry or other disposition under the public land laws necessary for the construction, operation, and maintenance of the facilities herein provided, and to dispose of them to Federal, State, and local governmental agencies by lease, transfer, exchange, or conveyance upon such terms and conditions as will best promote their development and operation in the public interest. All costs incurred pursuant to this section shall be nonreimbursable and nonreturnable.

SEC. 8. Nothing contained in this Act shall be construed to alter, amend, repeal, construe, interpret, modify, or be in conflict with any provision of the Boulder Canyon Project Act (45 Stat. 1057), the Boulder Canyon Project Adjustment Act (54 Stat. 774), the Colorado River Compact, the Upper Colorado River Basin Compact, the Rio Grande Compact of 1938, or the Treaty with the United Mexican States (Treaty Series 994).

SEC. 9. Expenditures for the Cross Mountain, Flaming Gorge, Glen Canyon, Navaho, and Echo Park initial units of the Colorado River storage project may be made without regard to the soil-survey and land-classification requirements of the Interior Department Appropriation Act, 1954.

SEC. 10. There are hereby authorized to be appropriated such sums as may be required to carry out the purposes of this Act.

SEC. 11. The appropriate agencies of the United States are authorized to convey to the city and county of Denver, Colorado, for use as a part of its municipally owned water system, such interests in lands and water rights used or acquired by the United States solely for the generation of power and other property of the United States as shall be required in connection with the development or use of its Blue River project, upon payment by Denver for any such interest of the value thereof at the time of its acquisition by Denver: *Provided*, That any such transfer shall be so limited as not to preclude the use of the property other than water rights for the necessary functions of the United States Government.

SEC. 12. (a) In the operation and maintenance of all facilities, authorized by Federal law and under the jurisdiction and supervision of the Secretary of the Interior, in the basin of the Colorado River, the Secretary of the Interior is directed to comply with the applicable provisions of the Colorado River Compact, the Boulder Canyon Project Act, the Boulder Canyon Project Adjustment Act, and the Treaty with the United Mexican States, in the storage and release of water from reservoirs in the Colorado River Basin.

(b) In the operation of works under his jurisdiction for the storage and release of waters of the Colorado River System and in programing the storage and release of such waters, the Secretary of the Interior shall consult from time to time with an integrating committee consisting of one representative from each of the Colorado River Basin States, one representative of the Colorado River Board of California, one representative of the Upper Colorado River Commission, and one representative of the United States Section of the International Boundary Commission, United States and Mexico.

SEC. 13. As used in this Act—

The terms "Colorado River Basin," "Colorado River Compact," "Colorado River System," "Lee Ferry," "States of the Upper Division," "Upper Basin," and "domestic use" shall have the meaning ascribed to them in article II of the Upper Colorado River Basin Compact;

The term "States of the Upper Colorado River Basin" shall mean the States of Arizona, Colorado, New Mexico, Utah, and Wyoming;

The term "Upper Colorado River Basin" shall have the same meaning as the term "Upper Basin";

The term "Upper Colorado River Basin Compact" shall mean that certain compact executed on October 11, 1948, by commissioners representing the States of Arizona, Colorado, New Mexico, Utah, and Wyoming, and consented to by the Congress of the United States of America by Act of April 6, 1949 (63 Stat. 31);

The term "Rio Grande Compact" shall mean that certain compact executed on March 18, 1938, by Commissioners representing the States of Colorado, New Mexico, and Texas and consented to by the Congress of the United States of America by Act of May 31, 1939 (53 Stat. 785); and

The term "treaty with the United Mexican States" shall mean that certain treaty between the United States of America and the United Mexican States signed at Washington, District of Columbia, February 3, 1944, relating to the utilization of the waters of the Colorado River and other rivers, as amended and supplemented by the protocol dated November 14, 1944, and the understandings recited in the Senate resolution of April 18, 1945, advising and consenting to ratification thereof.

[H. R. 2836, 84th Cong., 1st sess.]

A BILL To authorize the Secretary of the Interior to construct, operate, and maintain the Colorado River storage project and participating projects, and for other purposes

Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled, That, in order to initiate the comprehensive development of the water resources of the Upper Colorado River Basin, the Congress, in the exercise of its constitutional authority to provide for the general welfare, to regulate commerce among the States and with the Indian tribes, and

to make all needful rules and regulations respecting property belonging to the United States, and for the purposes, among others, of regulating the flow of the Colorado River, storing water for beneficial consumptive use, making it possible for the States of the upper basin to utilize, consistently with the provisions of the Colorado River compact, the apportionments made to and among them in the Colorado River compact and the Upper Colorado River Basin Compact, respectively, providing for the reclamation of arid and semiarid land, for the control of floods and for the improvement of navigation, and the generation of hydroelectric power, as an incident of the foregoing purposes, hereby authorizes the Secretary of the Interior (1) to construct, operate, and maintain the following initial units of the Colorado River storage project, consisting of dams, reservoirs, powerplants, transmission facilities and appurtenant works: Cross Mountain, Curecanti, Echo Park, Flaming Gorge, Glen Canyon, and Navajo: *Provided*, That the Curecanti Dam shall be constructed to a height which will impound not less than nine hundred and forty thousand acre-feet of water or will create a reservoir of such greater capacity as can be obtained by a high waterline located at seven thousand five hundred and twenty feet above mean sea level and that construction thereof shall not be undertaken until the Secretary has, on the basis of further engineering and economic investigations, reexamined the economic justification of such unit and, accompanied by appropriate documentation in the form of a supplemental report, has certified to the Congress and to the President that, in his judgment, the benefits of such unit will exceeds its costs; and (2) to construct, operate, and maintain the following additional reclamation projects (including power-generating and transmission facilities related thereto), hereinafter referred to as participating projects: Central Utah (initial phase); Emery County, Florida, Gooseberry, Hammond, La Barge, Lyman, Paonia (including the Minnesota unit, a dam and reservoir on Muddy Creek just above its confluence with the North Fork of the Gunnison River, and other necessary works), Pine River Extension, Seedskadee, Silt, Smith Fork, San Juan-Chama, Navajo: *Provided*, That (a) construction of the participating projects set forth in this clause (2) shall not be undertaken until the Secretary has reexamined the economic justification of such project and, accompanied by appropriate documentation in the form of a supplemental report, has certified to the Congress, through the President, that, in his judgment, the benefits of such project will exceed its costs, and that the financial reimbursability requirements set forth in section 4 of this Act can be met. The Secretary's supplemental report for each such project shall include, among other things, (i) a reappraisal of the prospective direct agricultural benefits of the project made by the Secretary after consultation with the Secretary of Agriculture; (ii) a reevaluation of the non-direct benefits of the project; and (iii) allocations of the total cost of construction of each participating project or separable features thereof, excluding any expenditures authorized by section 7 of this Act, to power, irrigation, municipal water supply, flood control or navigation, or any other purpose authorized under reclamation law. Section 1 (c) of the Flood Control Act of 1944 shall, except as hereinafter provided for the San Juan-Chama and the Navajo participating projects, not be applicable to such supplemental reports; and (b) that no appropriation for or construction of the San Juan-Chama project or the Navajo participating project shall be made or begun until coordinated reports thereon shall have been submitted to the affected States, including (but without limiting the generality of the foregoing) the State of Texas, pursuant to the Act of December 22, 1944, and said projects shall have been approved and authorized by the Congress: *Provided further*, That with reference to the San Juan-Chama project, it shall be limited to a single off-stream dam and reservoir on a tributary of the Chama River to be used solely for the control and regulation of water imported from the San Juan River, that no power facilities shall be established, installed, or operated along the diversion or on the reservoir or dam, and such dam and reservoir shall at all times be operated by the Bureau of Reclamation of the Department of the Interior in strict compliance with the Rio Grande Compact as administered by the Rio Grande Compact Commission.

SEC. 2. In order to achieve such comprehensive development as will assure the consumptive use in the States of the Upper Colorado River Basin of waters of the Colorado River system the use of which is apportioned to the Upper Colorado River Basin by the Colorado River Compact and to each State thereof by the Upper Colorado River Basin Compact, it is the intent of the Congress in the future to authorize the construction, operation, and maintenance of further units of the Colorado Rivert storage project, of additional phases of participating proj-

ects authorized in this Act, and of new participating projects as additional information becomes available and additional needs are indicated. It is hereby declared to be the purpose of the Congress to authorize as participating projects only projects (including units or phases thereof)—

(1) for the use, in one or more of the States designated in article III of the Upper Colorado River Basin Compact, of waters of the Upper Colorado River system the consumptive use of which is apportioned to those States by that article; and

(2) for which pertinent data sufficient to determine their probable engineering and economic justification and feasibility shall be available. It is likewise declared to be the policy of the Congress that the costs of any participating project authorized in the future shall be amortized from its own revenues to the fullest extent consistent with the provisions of this Act and Federal reclamation law.

SEC. 3. Except as otherwise provided in this Act, in constructing, operating, and maintaining the units of the Colorado River storage project and the participating projects listed in section 1 of this Act, the Secretary shall be governed by the Federal reclamation laws (Act of June 17, 1902, 32 Stat. 388, and Acts amendatory thereof or supplementary thereto): *Provided*, That (a) irrigation repayment contracts shall be entered into which, except as otherwise provided for the Paonia and Eden projects, provide for repayment of the obligation assumed thereunder with respect to any project contract unit over a period of not more than fifty years exclusive of any development period authorized by law; (b) prior to construction of irrigation distribution facilities, repayment contracts shall be made with an "organization" as defined in paragraph 2 (g) of the Reclamation Project Act of 1939 (53 Stat. 1187) which has the capacity to levy assessments upon all taxable real property located within its boundaries to assist in making repayments, except where a substantial proportion of the lands to be served are owned by the United States; (c) contracts relating to municipal water supply may be made without regard to the limitations of the last sentence of section 9 (c) of the Reclamation Project Act of 1939; and (d), as to Indian lands within, under or served by any participating project, payment of construction costs within the capability of the land to repay shall be subject to the Act of July 1, 1932 (47 Stat. 564). All units and participating projects shall be subject to the apportionments of the use of water between the Upper and Lower Basins of the Colorado River and among the States of the Upper Basin fixed in the Colorado River Compact and the Upper Colorado River Basin Compact, respectively, and to the terms of the treaty with the United Mexican States (Treaty Series 994).

SEC. 4. (a) There is hereby authorized a separate fund in the Treasury of the United States to be known as the Upper Colorado River Basin Fund (hereinafter referred to as the Basin Fund), which shall remain available until expended, as hereafter provided, for carrying out provisions of this Act other than section 7.

(b) All appropriations made for the purpose of carrying out the provisions of this Act, other than section 7, shall be credited to the Basin Fund as advances from the general fund of the Treasury.

(c) All revenues collected in connection with the operation of the Colorado River storage project and participating projects shall be credited to the Basin Fund, and shall be available, without further appropriation, for (1) defraying the costs of operation, maintenance, and replacements of, and emergency expenditures for, all facilities of the Colorado River storage project and participating projects, within such separate limitations as may be included in annual appropriation acts, (2) payment as required by subsection (d) of this section, (3) payment of the reimbursable construction costs of the Paonia project which are beyond the ability of the water users to repay within the period prescribed in the Act of June 25, 1947 (61 Stat. 181), said payment to be made within fifty years after completion of that portion of the project which has not been constructed as of the date of this Act, and (4) payment in connection with the irrigation features of the Eden project as specified in the Act of June 28, 1949 (63 Stat. 277): *Provided*, That revenues credited to the Basin Fund shall not be available for appropriation for construction of the units and participating projects authorized by or pursuant to this Act.

(d) Revenues in the Basin Fund in excess of operating needs shall be paid annually to the general fund of the Treasury to return—

(1) the costs of each unit, participating project, or any separable feature thereof which are allocated to power pursuant to section 5 of this Act,

within a period not exceeding fifty years from the date of completion of such unit, participating project, or separable feature thereof;

(2) the costs of each unit, participating project, or any separable feature thereof which are allocated to municipal water supply pursuant to section 5 of this Act, within a period not exceeding fifty years from the date of completion of such unit, participating project, or separable feature thereof;

(3) interest on the unamortized balance of the investment (including interest during construction) in the power and municipal water supply features of each unit, participating project, or any separable feature thereof, at a rate determined by the Secretary of the Treasury as provided in subsection (e), and interest due shall be a first charge; and

(4) the costs of each unit, participating project, or any separable feature thereof which are allocated to irrigation pursuant to section 5 of this Act within a period not exceeding fifty years, in addition to any development period authorized by law, from the date of completion of such unit, participating project, or separable feature thereof, or, in the cases of the Paonia project and of Indian lands, within a period consistent with other provisions of law applicable thereto.

(e) The interest rate applicable to each unit of the storage project and each participating project shall be determined by the Secretary of the Treasury as of the time the first advance is made for initiating construction of said unit or project. Such interest rate shall be determined by calculating the average yield to maturity on the basis of daily closing market bid quotations during the month on June next preceding the fiscal year in which said advance is made, on all interest-bearing marketable public debt obligations of the United States having a maturity date of fifteen or more years from the first day of said month, and by adjusting such average annual yield to the nearest one-eighth of 1 per centum.

(f) Business-type budgets shall be submitted to the Congress annually for all operations financed by the Basin Fund.

SEC. 5. Upon completion of each unit, participating project, or separable feature thereof, the Secretary shall allocate the total costs (excluding any expenditures authorized by section 7 of this Act) of constructing said unit, project, or feature to power, irrigation, municipal water supply, flood control, navigation, or any other purposes authorized under reclamation law. Allocations of construction, operation, and maintenance costs to authorize nonreimbursable purposes shall be nonreturnable under the provisions of this Act. On January 1 of each year the Secretary shall report to the Congress for the previous fiscal year, beginning with the fiscal year 1955, upon the status of the revenues from and the cost of constructing, operating, and maintaining the Colorado River storage project and the participating projects. The Secretary's report shall be prepared to reflect accurately the Federal investment allocated at that time to power, to irrigation, and to other purposes, the progress of return and repayment thereon, and the estimated rate of progress, year by year, in accomplishing full repayment.

SEC. 6. The hydroelectric powerplants authorized by this Act to be constructed, operated, and maintained by the Secretary shall be operated in conjunction with other Federal powerplants, present and potential, so as to produce the greatest practicable amount of power and energy that can be sold at firm power and energy rates, but no exercise of the authority hereby granted shall affect or interfere with the operation of any provision of the Colorado River Compact, the Upper Colorado River Basin Compact, or the Boulder Canyon Project Act.

SEC. 7. In connection with the development of the Colorado River storage project and of the participating projects, the Secretary is authorized and directed to investigate, plan, construct, operate, and maintain (1) public recreational facilities on lands withdrawn or acquired for the development of said project or of said participating projects, to conserve the scenery, the natural, historic, and archeologic objects, and the wildlife on said lands, and to provide for public use and enjoyment of the same and of the water areas created by these projects by such means as are consistent with the primary purposes of said projects; and (2) facilities to mitigate losses of and improve conditions for the propagation of fish and wildlife. The Secretary is authorized to acquire lands and to withdraw public lands from entry or other disposition under the public land laws necessary for the construction, operation, and maintenance of the facilities herein provided, and to dispose of them to Federal, State, and local governmental agencies by lease, transfer, exchange, or conveyance upon such terms and conditions as will best promote their development and operation in the public in-

terest. All costs incurred pursuant to this section shall be nonreimbursable and nonreturnable.

SEC. 8. Nothing contained in this Act shall be construed to alter, amend, repeal, construe, interpret, modify, or be in conflict with any provision of the Boulder Canyon Project Act (45 Stat. 1057), the Boulder Canyon Project Adjustment Act (54 Stat. 774), the Colorado River Compact, the Upper Colorado River Basin Compact, the Rio Grande Compact of 1938, or the Treaty With the United Mexican States (Treaty Series 994).

SEC. 9. Expenditures for the Cross Mountain, Flaming Gorge, Glen Canyon, Navajo and Echo Park initial units of the Colorado River storage project may be made without regard to the soil survey and land classification requirements of the Interior Department Appropriation Act, 1954.

SEC. 10. There are hereby authorized to be appropriated such sums as may be required to carry out the purposes of this Act.

SEC. 11. The appropriate agencies of the United States are authorized to convey to the city and county of Denver, Colorado, for use as a part of its municipally owned water system, such interests in lands and water rights used or acquired by the United States solely for the generation of power and other property of the United States as shall be required in connection with the development or use of its Blue River project, upon payment by Denver for any such interest of the value thereof at the time of its acquisition by Denver, and provided that any such transfer shall be so limited as not to preclude the use of the property other than water rights for the necessary functions of the United States Government.

SEC. 12. In the operation and maintenance of all facilities, authorized by Federal law and under the jurisdiction and supervision of the Secretary of the Interior, in the basin of the Colorado River, the Secretary of the Interior is directed to comply with the applicable provisions of the Colorado River Compact, the Boulder Canyon Project Act, the Boulder Canyon Project Adjustment Act, and the Treaty with the United Mexican States, in the storage and release of water from reservoirs in the Colorado River Basin. In the event of the failure of the Secretary of the Interior to so comply, any State of the Colorado River Basin may maintain an action in the Supreme Court of the United States to enforce the provisions of this section, and consent is given to the joinder of the United States as a party in such suit or suits. No right to impound or use water for the generation of power or energy, created or established by the building, operation or use of any of the powerplants authorized by this Act, shall be deemed to have priority over or otherwise operate to preclude or impair any use, regardless of the date of origin of such use, of the waters of the Colorado River and its tributaries for domestic or agricultural purposes within any of the States of the Upper Colorado River Basin.

SEC. 13. As used in this Act—

The terms "Colorado River Basin", "Colorado River Compact", "Colorado River System", "Lee Ferry", "States of the Upper Division", "Upper Basin", and "domestic use" shall have the meaning ascribed to them in article II of the Upper Colorado River Basin Compact;

The term "States of the Upper Colorado River Basin" shall mean the States of Arizona, Colorado, New Mexico, Utah, and Wyoming;

The term "Upper Colorado River Basin" shall have the same meaning as the term "Upper Basin";

The term "Upper Colorado River Basin Compact" shall mean that certain compact executed on October 11, 1948, by commissioners representing the States of Arizona, Colorado, New Mexico, Utah, and Wyoming, and consented to by the Congress of the United States of America by Act of April 6, 1949 (63 Stat. 31);

The term "Rio Grande Compact" shall mean that certain compact executed on March 18, 1938, by commissioners representing the States of Colorado, New Mexico, and Texas and consented to by the Congress of the United States of America by Act of May 31, 1939 (53 Stat. 785); and

The term "treaty with the United Mexican States" shall mean that certain treaty between the United States of America and the United Mexican States signed at Washington, District of Columbia, February 3, 1944, relating to the utilization of the waters of the Colorado River and other rivers, as amended and supplemented by the protocol dated November 14, 1944, and the understandings recited in the Senate resolution of April 18, 1945, advising and consenting to ratification thereof.

[H. R. 4488, 84th Cong., 1st sess.]

A BILL To authorize the Secretary of the Interior to construct, operate, and maintain the Colorado River storage project and participating projects, and for other purposes

Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled, That, in order to initiate the comprehensive development of the water resources of the Upper Colorado River Basin, the Congress, in the exercise of its constitutional authority to provide for the general welfare, to regulate commerce among the States and with the Indian tribes, and to make all needful rules and regulations respecting property belonging to the United States, and for the purposes, among others, of regulating the flow of the Colorado River, storing water for beneficial consumptive use, making it possible for the States of the upper basin to utilize, consistently with the provisions of the Colorado River Compact, the apportionments made to and among them in the Colorado River Compact and the Upper Colorado River Basin Compact, respectively, providing for the reclamation of arid and semiarid land, for the control of floods and for the improvement of navigation, and the generation of hydroelectric power, as an incident of the foregoing purposes, hereby authorizes the Secretary of the Interior (1) to construct, operate, and maintain the following initial units of the Colorado River storage project consisting of dams, reservoirs, powerplants, transmission facilities and appurtenant works: Curecanti, Echo Park, Flaming Gorge, Glen Cayon, Juniper, and Navajo: *Provided,* That the Curecanti Dam shall be constructed to a height which will impound not less than nine hundred and forty thousand acre-feet of water or a reservoir of such greater capacity as may be acceptable to local interests in the vicinity of the city of Gunnison, Colorado, and that construction thereof shall not be undertaken until the Secretary has, on the basis of further engineering and economic investigations, reexamined the economic justification of such unit and, accompanied by appropriate documentation in the form of a supplemental report, has certified to the Congress and to the President that, in his judgment, the benefits of such unit will exceed its costs; and (2) to construct, operate, and maintain the following additional reclamation projects (including power-generating and transmission facilities related thereto), hereinafter referred to as participating projects: Central Utah (initial phase); Cliff-Divide (consisting of eight project units), Dolores, Emery County, Elkhorn, Florida, Gooseberry, Gunnison River (consisting of eight project units), Hammond, Kendall, La Barge, Lyman, Paonia (including the Minnesota unit, a dam and reservoir on Muddy Creek just above its confluence with the North Fork of the Gunnison River, and other necessary works), Pine River Extension, Savery-Pot Hook, Seedskadee, Silt, Smith Fork, San Juan-Chama, Navajo: *Provided,* That (a) construction of a participating project set forth in this clause (2) shall not be undertaken until the Secretary has reexamined the economic justification of such project and, accompanied by appropriate documentation in the form of a supplemental report, has certified to the Congress, through the President, that, in his judgment, the benefits of such project will exceed its costs, and that the financial reimbursability requirements set forth in section 4 of this Act can be met. The Secretary's supplemental report for each such project shall include, among other things, (i) a reappraisal of the prospective direct agricultural benefits of the project made by the Secretary after consultation with the Secretary of Agriculture: (ii) a reevaluation of the nondirect benefits of the project; and (iii) allocations of the total cost of construction of each participating project or separable features thereof, excluding any expenditures authorized by section 7 of this Act, to power, irrigation, municipal water supply, flood control or navigation, or any other purpose authorized under reclamation law. Section 1 (c) of the Flood Control Act of 1944 shall, except as hereinafter provided for the San Juan-Chama and the Navajo participating projects, not be applicable to such supplemental reports; and, (b) that no appropriation for or construction of the San Juan-Chama project or the Navajo participating project shall be made or begun until coordinated reports thereon shall have been submitted to the affected States, including (but without limiting the generality of the foregoing) the State of Texas, pursuant to the Act of December 22, 1944, and said projects shall have been approved and authorized by the Congress: *Provided further,* That with reference to the San Juan-Chama project, it shall be limited to a single off-stream dam and reservoir on a tributary of the Chama River to be used solely for the control and regulation of water imported from the San Juan River, that no power facilities shall be established, installed, or operated along the diversion or on the reservoir or dam, and such dam and reservoir shall at all times be operated by the Bureau of Reclamation

of the Department of the Interior in strict compliance with the Rio Grande Compact as administered by the Rio Grande Compact Commission.

SEC. 2. In order to achieve such comprehensive development as will assure the consumptive use in the States of the Upper Colorado River Basin of waters of the Colorado River system the use of which is apportioned to the Upper Colorado River Basin by the Colorado River Compact and to each State thereof by the Upper Colorado River Basin Compact, it is the intent of the Congress in the future to authorize the construction, operation, and maintenance of further units of the Colorado River storage project, of additional phases of participating projects authorized in this Act, and of new participating projects as additional information becomes available and additional needs are indicated. It is hereby declared to be the purpose of the Congress to authorize as participating projects only projects (including units or phases thereof)—

(1) for the use, in one or more of the States designated in article III of the Upper Colorado River Basin Compact, of waters of the Upper Colorado River system the consumptive use of which is apportioned to those States by that article; and

(2) for which pertinent data sufficient to determine their probable engineering and economic justification and feasibility shall be available. It is likewise declared to be the policy of the Congress that the costs of any participating project authorized herein or in the future shall be amortized from its own revenues to the fullest extent consistent with the provisions of this Act and Federal reclamation law. Furthermore, participating projects authorized in the future shall be on a full equality with participating projects authorized herein with respect to all considerations including economic justification, appraisal of agricultural and other benefits, irrigation repayment contracts and obligations, interest charges, financial reimbursability requirements and payment, allocation of costs of construction to power, irrigation, municipal water supply, flood control and any other purpose or benefit authorized under reclamation law.

SEC. 3. Except as otherwise provided in this Act, in constructing, operating, and maintaining the units of the Colorado River storage project and the participating projects listed in section 1 of this Act, the Secretary shall be governed by the Federal reclamation laws (Act of June 17, 1902, 32 Stat. 388, and Acts amendatory thereof or supplementary thereto): *Provided*, That (a) contracts shall be entered into which (except as otherwise provided for the Paonia and Eden projects) provide for repayment of the irrigation obligation assumed thereunder with respect to any project contract unit over a period of not more than fifty years exclusive of any development period authorized by law; (b) prior to construction of irrigation distribution facilities, repayment contracts shall be made with an "organization" as defined in paragraph 2 (g) of the Reclamation Project Act of 1939 (53 Stat. 1187) which has the capacity to levy assessments upon all taxable real property located within its boundaries to assist in making repayments, except where a substantial proportion of the lands to be served are owned by the United States; (c) contracts relating to municipal water supply may be made without regard to the limitations of the last sentence of section 9 (c) of the Reclamation Project Act of 1939; and (d), as to Indian lands within, under or served by any participating project, payment of construction costs within the capability of the land to repay shall be subject to the Act of July 1, 1932 (47 Stat. 564). All units and participating projects shall be subject to the apportionments of the use of water between the upper and lower basins of the Colorado River and among the States of the upper basin fixed in the Colorado River Compact and the Upper Colorado River Basin Compact, respectively, and to the terms of the treaty with the United Mexican States (Treaty Series 994).

SEC. 4 (a) There is hereby authorized a separate fund in the Treasury of the United States to be known as the Upper Colorado River Basin Fund (hereinafter referred to as the Basin Fund), which shall remain available until expended, as hereafter provided, for carrying out provisions of this Act other than section 7.

(b) All appropriations made for the purpose of carrying out the provisions of this Act, other than section 7, shall be credited to the Basin Fund as advances from the general fund of the Treasury, and such funds shall be available for expenditures within the limitations of the provisions of this Act and of the provisions of the appropriations.

(c) All revenues collected in connection with the operation of the Colorado River storage project and participating projects shall be credited to the Basin

Fund, and shall be available, without further appropriation, for (1) defraying the costs of operation, maintenance, and replacements of, and emergency expenditures for, all facilities of the Colorado River storage project and participating projects, within such separate limitations as may be included in annual appropriation acts, (2) payment as required by subsection (d) of this section, (3) payment of the reimbursable construction costs of the Paonia project which are beyond the ability of the water users to repay within the period prescribed in the Act of June 25, 1947 (61 Stat. 181), said payment to be made within fifty years after completion of that portion of the project which has not been constructed as of the date of this Act, (4) payment in connection with the irrigation features of the Eden project as specified in the Act of June 28, 1949 (63 Stat. 277), and (5) any remaining surplus to be available only for appropriation for construction of the units and participating projects authorized by or pursuant to this Act.

(d) Revenues in the Basin Fund in excess of operating needs shall be paid annually to the general fund of the Treasury to the extent required to return for that year—

(1) the costs of each unit, participating project, or any separable feature thereof which are allocated to power pursuant to section 5 of this Act, within a period not exceeding fifty years from the date of completion of such unit, participating project, or separable feature thereof;

(2) the costs of each unit, participating project, or any separable feature thereof which are allocated to municipal water supply pursuant to section 5 of this Act, within a period not exceeding fifty years from the date of completion of such unit, participating project, or separable feature thereof;

(3) interest on the unamortized balance of the investment (including interest during construction) in the power and municipal water supply features of each unit, participating project, or any separable feature thereof, at a rate determined by the Secretary of the Treasury as provided in subsection (e), and interest due shall be a first charge; and

(4) the costs of each unit, participating project, or any separable feature thereof which are allocated to irrigation pursuant to section 5 of this Act within a period not exceeding fifty years, in addition to any development period authorized by law, from the date of completion of such unit, participating project, or separable feature thereof, or, in the cases of the Paonia project and of the Indian lands, within a period consistent with other provisions of law applicable thereto.

(e) The interest rate applicable to each unit of the storage project and each participating project shall be determined by the Secretary of the Treasury as of the time the first advance is made for initiating construction of said unit or project. Such interest rate shall be determined by calculating the average yield to maturity on the basis of daily closing market bid quotations during the month of June next preceding the fiscal year in which said advance is made, on all interest-bearing marketable public debt obligations of the United States having a maturity date of fifteen or more years from the first day of said month, and by adjusting such average annual yield to the nearest one-eighth of 1 per centum.

(f) Business-type budgets shall be submitted to the Congress annually for all operations financed by the Basin Fund.

SEC. 5. Upon completion of each unit, participating project, or separable feature thereof the Secretary shall allocate the total costs (excluding any expenditures authorized by section 7 of this Act) of constructing said unit, project or feature to power, irrigation, municipal water supply, flood control, navigation, or any other purposes authorized under reclamation law. Allocations of construction, operation, and maintenance costs to authorized nonreimbursable purposes shall be nonreturnable under the provisions of this Act. On January 1 of each year the Secretary shall report to the Congress for the previous fiscal year, beginning with the fiscal year 1955, upon the status of the revenues from and the cost of constructing, operating, and maintaining the Colorado River storage project and the participating projects. The Secretary's report shall be prepared to reflect accurately the Federal investment allocated at that time to power, to irrigation, and to other purposes, the progress of return and repayment thereon, and the estimated rate of progress, year by year, in accomplishing full repayment.

SEC. 6. The hydroelectric powerplants and transmission facilities authorized by this Act to be constructed, operated, and maintained by the Secretary shall be operated in conjunction with other Federal powerplants, present and potential,

so as to produce the greatest practicable amount of power and energy that can be sold at firm power and energy rates, but no exercise of the authority hereby granted shall affect or interfere with the operation of any provision of the Colorado River Compact, the Upper Colorado River Basin Compact, or the Boulder Canyon Project Act: *Provided*, That power produced pursuant to this Act shall be sold at the highest practicable price to enhance the development of the Upper Colorado River Basin and operation in conjunction with other powerplants shall not deprive the Basin Fund of revenues which it would receive in the absence of such joined operation.

SEC. 7. In connection with the development of the Colorado River storage project and of the participating projects, the Secretary is authorized and directed to investigate, plan, construct, operate, and maintain (1) public recreational facilities on lands withdrawn or acquired for the development of said project or of said participating projects, to conserve the scenery, the natural, historic, and archeologic objects, and the wildlife on said lands, and to provide for public use and enjoyment of the same and of the water areas created by these projects by such means as are consistent with the primary purposes of said projects; and (2) facilities to mitigate losses of and improve conditions for the propagation of fish and wildlife. The Secretary is authorized to acquire lands and to withdraw public lands from entry or other disposition under the public land laws necessary for the construction, operation, and maintenance of the facilities herein provided, and to dispose of them to Federal, State, and local governmental agencies by lease, transfer, exchange, or conveyance upon such terms and conditions as will best promote their development and operation in the public interest, and with due regard for any change in use that may occur at some future time. All costs incurred pursuant to this section shall be nonreimbursable and nonreturnable.

SEC. 8. Nothing contained in this Act shall be construed to alter, amend, repeal, construe, interpret, modify, or be in conflict with any provision of the Boulder Canyon Project Act (45 Stat. 1057), the Boulder Canyon Project Adjustment Act (54 Stat. 774), the Colorado River Compact, the Upper Colorado River Basin Compact, the Rio Grande Compact of 1938, or the Treaty With the United Mexican States (Treaty Series 994).

SEC. 9. Expenditures for the Curecanti, Echo Park, Flaming Gorge, Glen Canyon, Juniper, and Navajo initial units of the Colorado River storage project may be made without regard to the soil survey and land classification requirements of the Interior Department Appropriation Act, 1954.

SEC. 10. There are hereby authorized to be appropriated such sums as may be required to carry out the purposes of this Act.

SEC. 11. The appropriate agencies of the United States are authorized to convey to the city and county of Denver, Colorado, for use as a part of its municipally owned water system, such interests in lands and water rights used or acquired by the United States solely for the generation of power and other property of the United States as shall be required in connection with the development or use of its Blue River project, upon payment by Denver for any such interest of the value thereof at the time of its acquisition by Denver, and provided that any such transfer shall be so limited as not to preclude the use of the property other than water rights for the necessary functions of the United States Government.

SEC. 12. In the operation and maintenance of all facilities, authorized by Federal law and under the jurisdiction and supervision of the Secretary of the Interior, in the basin of the Colorado River, the Secretary of the Interior is directed to comply with the applicable provisions of the Colorado River Compact, the Upper Colorado River Basin Compact, the Boulder Canyon Project Act, the Boulder Canyon Project Adjustment Act, and the Treaty with the United Mexican States, in the storage and release of water from reservoirs in the Colorado River Basin. In the event of the failure of the Secretary of the Interior to so comply, any State of the Colorado River Basin may maintain an action in the Supreme Court of the United States to enforce the provisions of this section, and consent is given to the joinder of the United States as a party in such suit or suits. No agency or official of the United States shall seek or accept a right to impound or use water for the generation of power or energy, created or established by the building, operation or use of any of the powerplants authorized by this Act.

SEC. 13. As used in this Act—

The terms "Colorado River Basin", "Colorado River Compact", "Colorado River System", "Lee Ferry", "States of the Upper Division", "upper basin",

and "domestic use" shall have the meaning ascribed to them in article II of the Upper Colorado River Basin Compact;

The term "States of the Upper Colorado River Basin" shall mean the States of Arizona, Colorado, New Mexico, Utah, and Wyoming;

The term "Upper Colorado River Basin" shall have the same meaning as the term "upper basin";

The term "Upper Colorado River Basin Compact" shall mean that certain compact executed on October 11, 1948, by commissioners representing the States of Arizona, Colorado, New Mexico, Utah, and Wyoming, and consented to by the Congress of the United States of America by Act of April 6, 1949 (63 Stat. 31);

The term "Rio Grande Compact" shall mean that certain compact executed on March 18, 1938, by commissioners representing the States of Colorado, New Mexico, and Texas and consented to by the Congress of the United States of America by Act of May 31, 1939 (53 Stat. 785); and

The term "treaty with the United Mexican States" shall mean that certain treaty between the United States of America and the United Mexican States signed at Washington, District of Columbia, February 3, 1944, relating to the utilization of the waters of the Colorado River and other rivers, as amended and supplemented by the protocol dated November 14, 1944, and the understandings recited in the Senate resolution of April 18, 1945, advising and consenting to ratification thereof.

Mr. ASPINALL. The Committee on Interior and Insular Affairs, during the 83d Congress, spent a total of 24 days considering this legislation. The Irrigation and Reclamation Subcommittee spent a total of 41 hours over a 10-day period in public hearings. The subcommittee spent an additional 16 hours over a 12-day period in executive session in amending and reporting a bill. The full committee spent 5 hours in 2 days on the legislation. Most of the members of this committee are familiar with it. The committee does not feel justified in going back into all the details of this development. Only new evidence, for the most part, should be submitted. It is the hope of the Chair to limit the hearings to 8 days, tentatively divided to give the Department 2 days to make a technical presentation, the proponents of the legislation 3 days, and those in opposition 3 days.

The five bills before the committee are all different with respect to plan. From 4 to 6 storage units are included for authorization and from 13 to 33 participating projects are included. The administration recommends 2 storage units and 11 participating projects for immediate authorization. For those participating projects where the planning has not advanced to the point where feasibility-type reports have been transmitted to the Congress, there is expected to be language in the bill providing for later congressional approval. Therefore, this committee will sometime in the future in another Congress consider these projects for authorization of construction. This being so, it is the Chair's position, approved by the chairman of the full committee, that this committee should not go into the engineering and economic details of these units but be advised only on the status of the planning with a few pertinent facts on the units themselves.

Now, with respect to the procedure to be followed by the committee, I would like to quote from the Legislative Reorganization Act of 1946, section 133, subsection (e), which reads as follows:

Each such standing committee shall, so far as practicable, require all witnesses appearing before it to file in advance written statements of their proposed testimony, and to limit their oral presentations to brief summaries of their argument.

With the approval of the chairman, this is the procedure which the committee desires to follow. I will ask that statements of the wit-

nesses, in 35 copies, be delivered to the staff prior to the beginning of the hearing on the date that the witness is scheduled to appear. It is expected that those witnesses who have detailed statements supporting their argument, which will require more than a few minutes to present, will limit their oral presentation to a brief summary of their argument. Each member of the committee will have a copy of the detailed statement.

We have scheduled today the Department witnesses and I believe Assistant Secretary Aandahl, Commissioner Dexheimer and Mr. Larson, Regional Director of the Bureau, are present. I understand Assistant Secretary Aandahl has a brief statement. I would hope that the members will not question Mr. Aandahl with respect to the engineering and economic details of the development but only with respect to broad, departmental policy. After Mr. Aandahl has made his brief statement, I would like for Commissioner Dexheimer and Regional Director Larson to come up together and such others of the staff as he wishes to have with him. I understand Commissioner Dexheimer has a brief statement and that Regional Director Larson will go into the details of the project. After Mr. Dexheimer makes his statement, I would appreciate it if the members will withhold questions so that he and Mr. Larson may be questioned together. I hope that Mr. Larson can summarize his statement. In order that we may keep straight on the development which is recommended for immediate authorization and construction by the administration, I am going to ask Mr. Larson in his statement to speak first only on the plan and on the units which the administration has recommended and at that time submit himself to questioning on that plan. After this procedure is completed, Mr. Larson could then describe the other units and projects in the plan, give us the status of the planning on these units and a few of the pertinent facts.

Mr. ENGLE. Mr. Chairman?

Mr. ASPINALL. Mr. Engle of California is recognized.

Mr. ENGLE. I would like to ask unanimous consent that the procedural arrangement stated by the Chair be approved and accepted and made the order of the committee.

Mr. SAYLOR. I object.

Mr. HOSMER. I object.

Mr. ENGLE. I so move, and desire to be heard briefly in support of the motion.

Mr. SAYLOR. Point of order.

Mr. ASPINALL. The gentleman from Pennsylvania makes a point of order. What is your point of order?

Mr. SAYLOR. I make the point of order there is no quorum present.

Mr. ASPINALL. The gentleman is sustained in his point of order. The Chair will ask that the staff members phone to the other members of the committee and ask them if they are going to present themselves.

(There was a short recess.)

Mr. ASPINALL. The committee will be in order. The Chair recognizes the gentleman from Pennsylvania.

Mr. SAYLOR. My understanding is that the gentleman from California will withdraw his motion and I will withdraw my point of order.

Mr. ASPINALL. The Chair wants to know if the gentleman from Pennsylvania will withdraw his point of order for the time being.

Mr. SAYLOR. For the time being, Mr. Chairman.

Mr. ENGLE. I ask unanimous consent to withdraw my motion.

Mr. ASPINALL. Are there any objections to the withdrawal of the motion by the gentleman from California?

Hearing none, it is so ordered.

The Chair would ask the committee at this time for unanimous consent for those sponsoring the different bills to be permitted to file a statement for the record at this place in the hearings. Are there any objections?

Mr. SAYLOR. By that, do you mean the sponsors or the proponents of this legislation, namely——

Mr. ASPINALL. I mean the sponsors.

Mr. SAYLOR. That is Mr. Dawson, Mr. Fernandez, yourself and Mr. Rogers of Colorado?

Mr. ASPINALL. That is right.

Mr. SAYLOR. No objection.

Mr. ASPINALL. Hearing no objection, it is so ordered.

At this time, the Chair would ask unanimous consent that any Member of Congress who wishes to file a statement to be placed in the record be permitted to do so on this legislation. Is there any objection?

Hearing none, it is so ordered.

Is there any objection to having the memorandum prepared by the committee staff filed at this point in the record, explaining the legislation before the committee?

Mr. HOSMER. I object, Mr. Chairman.

Mr. ASPINALL. Hearing the objection, it is sustained.

We have a report from the Department under date of March 8, 1955, explaining the Department's position on the legislation and with an explanation of the differences in the various bills before the committee. Is there any objection to having the departmental report made a part of the record at this place in the hearings?

Hearing none, it is so ordered.

(The report referred to reads as follows:)

DEPARTMENT OF THE INTERIOR,
OFFICE OF THE SECRETARY,
Washington 25, D. C., March 8, 1955.

Hon. CLAIR ENGLE,
Chairman, Committee on Interior and Insular Affairs,
House of Representatives, Washington 25, D. C.

MY DEAR MR. ENGLE: A report has been requested from this Department on H. R. 3383, a bill to authorize the Secretary of the Interior to construct, operate, and maintain the Colorado River storage project and participating projects, and for other purposes. You have also requested that we comment on H. R. 270, H. R. 2836, and H. R. 3384 to the extent to which they differ from H. R. 3383.

In his address to the Congress on the state of the Union, President Eisenhower said (H. Doc. No. 1, 84th Cong., p. 8):

"* * * the Federal Government must shoulder its * * * partnership obligations by undertaking projects of such complexity and size that their success requires Federal development. In keeping with this principle I again urge the Congress to approve the development of the upper Colorado River Basin to conserve and assure better use of precious water essential to the future of the West."

Likewise in his budget message (H. Doc. No. 16, 84th Cong., p. M65) the President said:

"I also recommend enactment of legislation authorizing the Bureau of Reclamation to undertake construction of two comprehensive river-basin improvements which are beyond the capacity of local initiative, public or private, but which are needed for irrigation, power, flood control, and municipal and industrial

water supply. These are the upper Colorado River Basin development in the States of Colorado, Utah, Wyoming, Arizona, and New Mexico, and the Fryingpan-Arkansas development in Colorado. The Colorado River development will enable the upper basin states to conserve floodwaters and to assure the availability of water and power necessary for the economic growth of the region. * * * Sale of power generated at these developments will repay the power investment within 50 years and will make a contribution toward repayment of other investments."

In the budget itself it was pointed out (p. 830) that the administration proposes to initiate construction of the Colorado River storage project during the next fiscal year if it is authorized and that the budget includes an item for funds to be requested for this purpose.

The substance of our views on the proper contents of a bill to implement the President's recommendation and particularly on those projects and units which should be covered in the initial legislation is contained in the draft of bill which was developed by the Bureau of the Budget in collaboration with this Department and submitted to your committee on April 1, 1954, in connection with H. R. 4449, 83d Congress, a predecessor of the present H. R. 3383.

We recommend that H. R. 3383 be examined in the light of the proposal there made in the light of the two letters dated March 18, 1954, from the Director of the Bureau of the Budget to the Senate Committee on Interior and Insular Affairs and to this Department which are reprinted in Senate Report No. 1983, 83d Congress, and that, with suitable amendments, H. R. 3383 be enacted.

The Bureau of the Budget has advised that there would be no objection to the submission of the above report to your committee. That office, however, has not yet had an opportunity to consider the attached comparative analysis of H. R. 3383, H. R. 270, H. R. 2836, and H. R. 3384. The comments made therein must not, for this reason, be regarded as representing any commitment with respect to their conformity to the program of the President.

Sincerely yours,

FRED G. AANDAHL,
Assistant Secretary of the Interior.

COMPARATIVE ANALYSIS OF H. R. 3383, H. R. 270, H. R. 2836, AND H. R. 3384, 84TH CONGRESS

Storage project units named

H. R. 3383: Curecanti, Echo Park, Flaming Gorge, Glen Canyon.

H. R. 270: Adds Cross Mountain and Navaho to above.

H. R. 2836: Same as H. R. 270.

H. R. 3384: Adds Juniper and Navaho to those covered in H. R. 3383.

Comment.—The Department of the Interior recommends that only Glen Canyon and Echo Park be authorized as storage units at this time.

Participating projects named

H. R. 3383: Central Utah (initial phase), Emery County, Florida, Hammond, La Barge, Lyman, Paonia (new works), Pine River extension, Seedskadee, Silt, Smith Fork, San Juan-Chama, Navaho.

H. R. 270: Adds Gooseberry to above.

H. R. 2836: Same as H. R. 270.

H. R. 3384: Adds Gooseberry, Parshall, Troublesome, Rabbit Ear, Eagle Divide, Woody Creek, West Divide, Bluestone, Battlement Mesa, Tomichi Creek, East River, Ohio Creek, Fruitland Mesa, Bostwick Park, Grand Mesa, Dallas Creek, Savery Pot Hook, Dolores, Fruitgrowers extension, Elkhorn, Kendall to those named in H. R. 3383.

Comment.—Department of the Interior recommends that the projects covered be limited to the 11 listed in the administration bill submited to the committee on April 1, 1954, viz, central Utah (initial phase), Emery County, Florida, Hammond, La Barge, Lyman, Paonia (new works), Pine River extension, Seedskadee, Silt, and Smith Fork.

Extent of authorization

H. R. 3383: Echo Park, Glen Canyon, and Flaming Gorge fully authorized; Curecanti subject to certification, on basis of further engineering and economic investigations, that its benefits will exceed its costs. All participating projects except San Juan-Chama and Navaho fully authorized; San Juan-Chama and Navaho subject to submission of coordinated reports to States under Flood Control Act of 1944 and to approval of and authorization by the Congress.

H. R. 270: Same as H. R. 3383 for storage units. All participating projects subject to reexamination by Secretary of the Interior with respect to their economic justification and to certification by him that their benefits will exceed their costs and that they meet reimbursement requirements of bill. Estimates of direct agricultural benefits to be made after consultation with Secretary of Agriculture. Provisions with respect to San Juan-Chama and Navaho substantially same as in H. R. 3383.

H. R. 2836: Virtually identical with H. R. 270.

H. R. 3384: Same as H. R. 3383 for storage units. Virtually the same as H. R. 270 for participating projects named in that bill but with respect to the other participating projects not named therein requires submission of planning reports to States under Flood Control Act of 1944 and authorization by Congress.

Comment.—The administration bill submitted to the committee on April 1, 1954, provided that authority to construct the participating projects named in it should not become effective until the Secretary of the Interior had reexamined their economic justification (his appraisal of the direct agricultural benefits to be made in cooperation with the Secretary of Agriculture) and had certified to the Congress that their benefits exceeded their costs. We adhere to the principles of the bill and, as has been said before, to the list of projects named therein. As among the four bills now before the committee, we prefer the provisions of H. R. 270, H. R. 2836, and H. R. 3384 with respect to actions to be taken prior to construction of participating projects to those of H. R. 3383 on this point.

Repayment

H. R. 3383: Irrigation allocations to be returned to Treasury in equal annual installments over a period of not more than 50 years (exclusive of development period) from completion of each unit, participating project, or separable feature thereof. Municipal water allocation to be returned to Treasury with interest over a period of not more than 50 years from completion of each unit, participating project, or separable feature thereof. Commercial power allocation to be returned to Treasury with interest over expected economic life of unit, participating project, or separable feature or within 100 years, whichever is shorter.

H. R. 270: Irrigation, municipal water, and commercial power allocations—the latter 2 with interest—to be returned to the Treasury within not more than 50 years plus, in the case of irrigation, a development period.

H. R. 2836: Same as H. R. 270.

H. R. 3384: Same as H. R. 270.

Comment.—The provisions of H. R. 270, H. R. 2836, and H. R. 3384 are, in this respect, like those of the administration bill of April 1, 1954. We adhere to these provisions and recommend that they be substituted for those of H. R. 3383.

Operation of powerplants

H. R. 3383: After providing for operation of the powerplants covered by the bill in conjunction with other Federal power facilities, the bill provides that no exercise of that authority "shall affect or interfere with the operation of any provision of the Colorado River compact, the upper Colorado River Basin compact, the Boulder Canyon Project Act, the Boulder Canyon Project Adjustment Act, or any contract lawfully entered into under said Acts without the consent of the other contracting parties."

H. R. 270: Same as H. R. 3383 but omits express reference to contracts.

H. R. 2836: Same as H. R. 270.

H. R. 3384: Same as H. R. 270.

Comment.—The language of H. R. 3383 with respect to contracts appears to be superfluous but is otherwise unobjectionable.

Appropriability of water used for power purposes

H. R. 3383: Provides that "neither the impounding nor the use of water for the generation of power and energy at the plants of the Colorado River storage project shall preclude or impair the appropriation for domestic or agricultural purposes, pursuant to applicable State law, of waters apportioned to the States of the upper Colorado River Basin."

H. R. 270: Omits the above.

H. R. 2836: Has provision similar to that of H. R. 270, but extends to all powerplants authorized by bill.

H. R. 3384: Same as H. R. 2836.

Comment.—The provisions of H. R. 3383 are in this respect identical with those of the administration bill and are recommended for inclusion in the legis-

lation. Unless a great deal of excess storage capacity beyond that provided by Glen Canyon and Echo Park is authorized and constructed, the waters impounded in these reservoirs will, within a comparatively few years, be devoted almost entirely to fulfilling the obligations of the upper division States with respect to deliveries at Lee Ferry for lower basin and Mexican Treaty purposes. The generation of power will be a byproduct of release for these purposes. Payout studies have been based upon the assumption that the upper basin depletion of the stream contemplated by this provision will occur in any event.

Soil survey and land classification exemption

H. R. 3383: Exemption applicable to four storage project units covered in bill.

H. R. 270: Exemption applicable to five storage project units covered in bill; not applicable to Curecanti.

H. R. 2836: Same as H. R. 270.

H. R. 3384: Exemption applicable to four storage project units covered in bill; not applicable to Curecanti, Juniper, and Navaho.

Comment.—It is believed that the exemption should be commensurate with whatever storage project units are ultimately covered by the bill.

Authorized appropriations

H. R. 3383: Limits authorized appropriations to $1,055 million.

H. R. 270: Omits limitation.

H. R. 2836: Omits limitation.

H. R. 3384: Omits limitation.

Comment.—The Department of the Interior would have no objection in this case to specifying the amount authorized to be appropriated. If such a limitation is spelled out in the bill, as it is in H. R. 3383, the text should make clear, as that of H. R. 3383 does not, that the sum specified is for construction costs only and is not inclusive of initial operation and maintenance costs.

Future planning

H. R. 3383: Section 12 of this bill provides that "in planning the additional development necessary to the full consumptive use in the upper basin of the waters of the Colorado River system allocated to the upper basin and in planning the use of and in using credits from net power revenues available for the purpose of assisting in the payout of costs of participating projects herein and hereafter authorized in the States of Colorado, New Mexico, Utah, and Wyoming, the Secretary shall have regard for the achievement within each of such States of the fullest practicable consumptive use of the waters of the upper Colorado River system consistent with the apportionment thereof among such States."

H. R. 270: Omits above.

H. R. 2836: Omits above.

H. R. 3384: Omits above.

Comment.—The Interior Department has no objection to the inclusion of the provision of H. R. 3383 quoted above. It would, in any event, seek to achieve the end specified. If this provision is included, however, it suggests that Arizona be added to the other States named in the bill since it is an upper basin State and is apportioned a small quantity of upper basin water by the upper Colorado River Basin compact.

Litigation and consultation

H. R. 3383: Provides that the Secretary of the Interior shall, in the storage and release of water from reservoirs under his jurisdiction anywhere in the Colorado River Basin, "comply with the applicable provisions of the Colorado River compact, the Boulder Canyon Project Act, the Boulder Canyon Project Adjustment Act, and the treaty with the United Mexican States." Provides further that, in the event of his failure so to comply "any State of the Colorado River Basin may maintain an action in the Supreme Court of the United States to enforce the provisions of this section" and gives the consent of the United States to its joinder as a party in any such suit.

H. R. 270: Directs compliance with the applicable provisions of the documents referred to above in the operation and maintenance of all Federal facilities in the Colorado River Basin under his jurisdiction. Provides further for consultation with an "integrating committee consisting of 1 representative from each of the Colorado River Basin States, 1 representative of the Colorado River Board of California, 1 representative of the Upper Colorado River Commission, and 1 representative of the United States section of the International Boundary Com-

mission, United States and Mexico" on the storage and release of waters from works under his jurisdiction.

H. R. 2836: Similar to H. R. 270.

H. R. 3384: Includes provisions similar both to those in H. R. 3383 and to those in H. R. 270.

Comment.—(*a*) Unless extraordinary circumstances so require, it would seem unwise to single out the Colorado River for special treatment with respect to litigation. Moreover, assuming that the Secretary will be directed (as all of the bills provide in various places) to comply with the Colorado River compact and related documents, there is no apparent reason for the waiver of the immunity of the United States from suit in the Supreme Court. There is ample in the other parts of the bills, we believe, on which to found an action against the Secretary alone in case he exceeds the authority given him under their terms. But if it is the desire of the committee to include such a provision as that contained in H. R. 3383 and H. R. 3384 on this subject and if it is restricted (as those bills now provide) to litigation with respect to the storage and release of water, we will not object. We suggest, however, that it be made clear that the waiver runs only in favor of a State adversely affected by the storage and release spoken of in order to forestall the provisions being looked upon as an open invitation to anyone to institute harassing, even though fruitless, litigation at any time it chooses to do so. We suggest also that the committee bear in mind that this provision, if enacted, will necessarily be read in conjunction with section 208 (c) of the Justice Department Appropriation Act, 1953 (66 Stat. 549, 560, 43 U. S. C., sec. 666) and that it is unlikely, therefore, that it will be usable except in quite extraordinary circumstances.

(*b*) We would have no objection, if the committee wishes to include such in the bill that it reports out, to a provision for an "integrating committee" along the lines of that set out in H. R. 270 and H. R. 3384. Its creation would not be in derogation of the ultimate responsibility of the Secretary of the Interior in the management of the works covered by it, but it could assist him in securing the advice of representatives of the States concerned and would furnish them with a forum in which to discuss and, it is to be hoped, iron out certain, and perhaps many, of their problems. The creation of such a committee might well assist its members in taking an overall view of the Colorado River and in treating its problems as of basinwide importance. It would also be a useful supplement to, and would perhaps supplant, the advisory provisions of section 16 of the Boulder Canyon Project Act. One of the objects of these provisions was to further "any comprehensive plan formulated hereafter for the control, improvement, and utilization of the resources of the Colorado River system" and to assure treatment of the works authorized by that Act "as a unit in such control, improvement, and utilization * * *." We have no suggestions to make on the composition of the "integrating" committee.

Quality of water studies

H. R. 3383: Direct the Secretary "to institute studies and to make a report to the Congress and to the States of the Colorado River Basin of the effect upon the quality of water of the Colorado River, of all transmountain diversion, of water of the Colorado River system and of all other storage and reclamation projects in the Colorado River Basin."

H. R. 270: Omits the above.

H. R. 2836: Omits the above.

H. R. 3384: Omits the above.

Comment.—No objection if the committee sees fit to include a provision along the lines of that included in H. R. 3383.

Denver diversions

H. R. 3383: Omits.

H. R. 270: Authorizes conveyance to the city of Denver of such lands and water rights used or acquired by the United States solely for the generation of power as may be required by Denver in connection with the development and use of its Blue River project, payment for the value of the rights acquired to be made by Denver to the United States.

H. R. 2836: Same as H. R. 270.

H. R. 3384: Omits.

Comment.—The terms of the provision in H. R. 270 are such as not to require objection from this Department. It should be understood, however, that maintenance of the integrity of the Colorado-Big Thompson project, including fulfill-

ment of its obligations to western slope water users in Colorado under Senate Document No. 80, 75th Congress, whatever those obligations may be, will be ultimately involved in the administration of this provision and that, for this reason, among others, no commitment can be made at this time concerning the exercise of the authority which its enactment would confer upon this Department.

Mr. ASPINALL. At this time, the Chair calls to the witness stand a former member of this commitee, Hon. Fred G. Aandahl, Assistant Secretary of the Interior, who will make a statement for the administration. Mr. Aandahl, we are glad to have you before the committee.

STATEMENT OF FRED G. AANDAHL, ASSISTANT SECRETARY OF THE INTERIOR

Mr. AANDAHL. Mr. Chairman, we appreciate the privilege of appearing before your committee.

I have a very brief statement I would like to read, indicating the support of the executive branch of the Government for the legislation that is now before the committee.

On January 18, 1954, representatives from the Department of the Interior were before a previous session of this committee to explain in detail the Department's recommendations concerning the proposal and the legislation for the Colorado River storage project and participating projects. Our purpose here today is to reiterate those recommendations which remain essentially unchanged.

I will not attempt to restate our recommendations and will leave the details to those who will follow me. However, I wish to bring to your attention some recent items which I believe are important in your consideration of the legislative bills before you.

The proposed development of the upper Colorado River Basin received the personal attention of President Eisenhower during his visit last fall in the West. The need for and the great benefits to be derived from this development so impressed the President that he included in his address to the Congress on the state of the Union the following:

> * * * the Federal Government must shoulder its * * * partnership obligation by undertaking projects of such complexity and size that their success requires Federal development. In keeping with this principle, I again urge the Congress to approve the development of the upper Colorado River Basin to conserve and assure better use of precious water essential to the future of the West.

Likewise in his budget message the President said:

> I also recommend enactment of legislation authorizing the Bureau of Reclamation to undertake construction of two comprehensive river-basin improvements which are beyond the capacity of local initiative, public or private, but which are needed for irrigation, power, flood control, and municipal and industrial water supply. These are the upper Colorado River Basin development in the States of Colorado, Utah, Wyoming, Arizona, and New Mexico, and the Fryingpan-Arkansas development in Colorado. The Colorado River development will enable the upper basin States to conserve floodwaters and to assure the availability of water and power necessary for the economic growth of the region. * * * Sale of power generated at these developments will repay the power investment within 50 years and will make a contribution toward repayment of other investments.

The Administration proposes to initiate construction of the Colorado River storage project during the next fiscal year if it is author-

COLORADO RIVER STORAGE PROJECT

WEDNESDAY, MARCH 16, 1955

HOUSE OF REPRESENTATIVES,
SUBCOMMITTEE ON IRRIGATION AND RECLAMATION OF THE
COMMITTEE ON INTERIOR AND INSULAR AFFAIRS,
Washington, D. C.

The subcommittee met, pursuant to recess, at 9:30 a. m., in the committee room, New House Office Building, Hon. Wayne N. Aspinall (chairman) presiding.

Mr. ASPINALL. The Subcommittee on Irrigation and Reclamation of the Committee on Interior and Insular Affairs will now be in session for the further consideration of legislation having to do with the upper Colorado River program.

When we adjourned our hearings last Monday afternoon, we had before the committee at that time for questioning Charles J. Fain, representing the REA. Is he present this morning? Is anybody here for the REA?

(No response.)

Mr. ASPINALL. Mr. David Moffat of the Utah Power & Light Co.; Mr. L. R. Patterson, of Public Service Co. of Colorado. Will you two gentlemen be seated before the witness table and we will hope that Mr. Fain makes his appearance in the next few minutes, in accordance with our request. Here he comes.

The time from now until 10 o'clock has been set aside for questioning the witnesses now before the committee. The Chair recognizes the gentleman from Pennsylvania, Mr. Saylor.

QUESTION PERIOD OF CHARLES J. FAIN, DAVID MOFFAT, AND L. R. PATTERSON

Mr. SAYLOR. Thank you, Mr. Chairman. The first series of questions I have I will direct to Mr. Fain since he was the first witness.

Mr. Fain, do I gather from your statement that your organization is in favor of construction of parallel transmission lines throughout this entire area?

Mr. FAIN. I would not say that we would be in favor of parallel transmission lines, especially if those transmission lines were of the same size. When we talk about parallel transmission lines there are different size transmission lines to carry different loads that must be taken into consideration. And if the lines were of a comparable size, Congressman Saylor, and if proper agreement could be arranged so that the energy could be carried over the lines that are already existing, then I would say that certainly in that case we would not be in favor of duplicating those lines if such duplication meant a greater

Considerable doubt has been expressed by people of other areas as to the feasibility of applying water to the lands of such high altitudes where the growing season is so short.

To begin with, I wish to point out that we have many very productive meadows at altitudes up to 8,500 feet in both Wyoming and Colorado. Our proposed projects are all at altitudes below 6,500 feet.

In Wyoming we are in an extremely favorable position to prove our productivity. We did not just jump into this reclamation scheme without first checking up on our capabilities. 'Way back in the 1920's the first phase of the Eden project was created encompassing 9,000 acres right out in the middle of the Little Red Desert at an altitude of from 6,600 to 6,700 feet.

This tract of worthless desert land has developed into a very prosperous community. Most of the land is owned by the original settlers or their families. They are prosperous and happy. Their children and their children's children are attending our State university where they will become even better equipped to reap benefits from the soil.

The main crops are alfalfa, barley, and oats; crops that have been sorely needed during our disastrous drought. We produce from 3 to 4 tons of alfalfa per acre in this area and produce oats and barley that will compare well with those from any of our Western States. We have produced some oats and barley on our ranch ever since it was first started and we have never had a crop failure caused by frost.

While our production per acre is favorable another measure even more important in the arid West that we should keep in mind is the production per acre-foot of water. At our high altitude where the growing season is short, our irrigation season is also short, evaporation is at a minimum and all of the water not actually consumed by the plants finds its way back to the streams of the basin where it can be used over and over again on its way to the ocean.

The authorization of the upper Colorado River storage project is essential to the development of this area, because without the storage that it will provide, we cannot even hope for an uninterrupted or dependable water supply. You cannot ask a man to settle on a project that does not have such a supply.

We hope that this committee and the Members of Congress will give favorable consideration to this project. Do not fear that the authorization of this project will add to our surplus problems. It will be many years before the participating projects are actually producing food for our rapidly growing Nation. By that time, in all probability we shall be dealing with shortages.

Mr. ASPINALL. The next witness appearing for Wyoming is Paul Rechard, chief of water development, Wyoming Natural Resource Board.

We are very glad to have you with us this morning.

STATEMENT OF PAUL RECHARD, CHIEF OF WATER DEVELOPMENT, WYOMING NATURAL RESOURCE BOARD

Mr. RECHARD. Thank you, Mr. Chairman.

Mr. Chairman and members of the committee, my name is Paul Rechard and I am chief of water development for the Wyoming Natural Resource Board. I am here to speak for the board in favor of the Colorado River storage project and participating projects.

Four participating projects mentioned in the various bills before this committee are in Wyoming. Besides these units, we also have some other projects which we hope will some day be constructed. One of these is the Elkhorn project in Sublette County of Wyoming. I understand that the Bureau of Reclamation has chosen to call it the Buckskin division of the Sublette project. This development would irrigate lands along the east side of the Green River from the town of Pinedale to the Big Sandy.

Wyoming would also like to have Kendall Reservoir included as part of the Seedskadee project or as an initial storage unit since it would be on the headwaters of the Green River.

If Wyoming and the other upper basin States are to be able to develop their potential lands, holdover storage is a necessity. None of the storage dams included in the proposed legislation are in Wyoming; even so, we are wholeheartedly in favor of constructing these large units, such as Glen Canyon and Echo Park, and in starting them now. It will take a number of years before these units are completed and even longer before water can be put on the lands for irrigation. The storage projects are a vital and necessary part of this proposed development at the present time. The statement has been made that 58 percent of the water allocated to the upper basin could be utilized without providing holdover storage. Gentlemen, this is purely a theoretical assumption and must be recognized as such.

With good conscience, no person could ask a rancher or farmer to settle on a project, work his heart out preparing the land, planting the seed, and constructing his home when water cannot be guaranteed for his lands. In fact, any person with the knowledge of this business would not attempt to settle on the land even if someone would have the nerve to ask him to.

We are going to live within the terms of the laws of the river which include the 1922 and 1948 compacts. By these instruments we were given the opportunity to develop our water resources to the fullest practicable extent, providing the flow of the Colorado River at Lee Ferry were not depleted below 75 million acre-feet in any continuing 10-year period. The only way we can do this is to have large holdover storage reservoirs in the upper basin which will be filled in years of plentiful supply. The water would then be released in drought periods to the lower basin to satisfy our commitment as mentioned above.

If we proceed on the theory, and let me emphasize that it must only be theory, that the upper basin could develop 58 percent of the water allocated to us without the storage reservoirs, we find that the development of the remaining 42 percent could only be done with greatest difficulty. At the present time we are only utilizing about 33 percent of our water. Right now California is objecting to our stopping some of the water in Echo and Glen Canyon Reservoirs. I cannot believe that they would feel any more kindly 25 years from now when the additional 25 percent has been developed. During the interim more sediment would have been deposited behind Hoover Dam and then during a filling period power generation would be curtailed. But most important a delay would almost preclude the States of Colorado, New Mexico, Utah, and Wyoming from ever being able to use the water to which we are entitled. I believe that this committee of rea-

sonable persons would not want us to violate the law of the river, but neither would they want California to violate not only the law of the river but their solemn word as given to the upper division States during the negotiations of the 1922 compact.

I cannot believe that the people of California are no longer interested in western reclamation which has been such a great factor in the building of our country, nor can I believe that they are selfish to the extent that they are only interested in reclamation for themselves. Rather, I feel the true sentiment was expressed earlier in these hearings by the Congressman from California when to protect this great reclamation program he voiced vigorous disapproval of those who sponsor vicious and untruthful propaganda that tends not only to discourage this project but all western reclamation.

Not only are the storage projects needed now, but they will be needed from now on. Actually the storage in these reservoirs is as valuable below irrigation as above. The water will be used for irrigation upstream just as surely as we know money that is deposited in a bank account and withdrawn by check is used; the actual paper or water is different but the effect is the same.

We in the upper basin are ready and most anxious to proceed with this development—all we need is the opportunity as afforded by the legislation now before you.

Mr. ASPINALL. Thank you very much, Mr. Rechard.

Mr. RECHARD. Mr. Chairman, I would also like to introduce into the record two letters which have been sent to me by residents of the area explaining the need for water in their particular area.

Mr. ASPINALL. Will you show the Chair the letters, please?

(The documents were handed to the chairman.)

Mr. ASPINALL. Members of the committee, the request of Mr. Rechard is for introduction of a letter by Mr. Micheli, of Fort Bridger, Wyo., and Mr. Gradert, of Fort Bridger, Wyo.

As I understand, Mr. Rechard, these are in support of the upper Colorado River project?

Mr. RECHARD. Yes, sir.

Mr. ASPINALL. Is there any objection?

Hearing none, it is so ordered.

(The letters referred to follow:)

MICHELI HEREFORD RANCH,
Fort Bridger, Wyo., February 14, 1955.

Mr. PAUL A. RECHARD,
Natural Resource Board,
Cheyenne, Wyo.

DEAR SIR: This letter is in regard to some information on the effects of the 1954 drought in this area, which will long be remembered by the ranchers and farmers of this section as a disaster year.

I will confine my remarks only to the Black and Smith Fork area, but I am sure that similar conditions prevailed in other parts of the Green River Basin.

This valley comprises approximately 50,000 acres of land that has some degree of irrigation water at the present time. However, few indeed are the years that this acreage can properly be irrigated. Of the 50,000 acres, about half is in hay meadows, a little acreage in small grains, and the rest in pasture. In an average year, the meadows will yield approximately 1 ton to the acre or about 25,000 tons. I am sure that in the drought year of 1954 the yield was less than 8,000 tons, the grain reduced in the same proportion; plus the fact that the carrying capacity of the pasture was less than one-third of normal.

In the event of water development in this valley, it could be very feasible to increase the total irrigated acreage to 100,000 acres with the additional land as good or better than what is now irrigated.

I hope this gives you some idea of the great need for water development in this area and that the information given will be of some help.

Yours truly,

JOSEPH MICHELI.

FORT BRIDGER, WYO., *February 12, 1955.*

NATURAL RESOURCE BOARD,
Cheyenne, Wyo.

(Attention of Mr. Paul A. Rechard, chief of water development)

GENTLEMEN: In support of water storage development in the Green River system basin in Wyoming, I wish to state that by virtue of being superintendent of Water Division No. 4 of the State of Wyoming, and it being the foremost of my duties to supervise the distribution of waters for irrigation and other uses, I naturally come into closer contact than perhaps any other person with the water user or irrigator himself and do, therefore, know of the difficulties experienced by the water users in the Green River system.

The season of 1953 was what must be considered a season of inadequate water supply owing to the below normal snowfall during the winter of 1952–53 and insufficient rainfall during the irrigation season of 1953, and while considerable shortage of crops in some localities was brought to my attention, the damage was not extensive, but shortage of water supply had a tendency to lay the foundation through drying out the lands and the consequent lowering of the natural water table for the disastrous insufficiency of water supply during the drought of the 1954 season.

Again, the snowfall during the winter of 1953–54 was far below normal and with the exception of a little of the upper portion of the Green River Basin, in Wyoming, little, if any, rainfall occurred, and in consequence many of our water users along the tributaries of said Green River raised much below average crops of forage, many ranchers in Uinta County, Wyo., having harvested no crops of hay and but scant pasturage and, therefore, have been forced to dispose of half-fat livestock at competitive prices in order to save their stock from starvation during this winter of 1954–55.

My heart indeed goes out to those unfortunate ones who, after years of toil and privations having built up what they considered a livelihood for their later years, and through no fault of theirs, were forced to thus sacrifice.

When one has experienced such a disaster, it certainly brings to attention the fact that water storage should be brought about in accordance with the plan set up under the Colorado River compacts, wherein it was intended to construct storage reservoirs in the Colorado River Basin, including Green River Basin, had we people in the counties of Uinta, Sweetwater, and the southern portion of Sublette County had access to stored water that could have been stored in standby reservoirs during past flood stages, such catastrophies could have been avoided on farms and ranches now in existence and many thousands of new acres yet undeveloped could have been brought under cultivation and thus affording homes and livelihoods for many now looking for help through welfare or kindred setups and bringing about more payments in taxes from well-tilled lands now only capable of supporting 1 sheep on 7 or 8 acres and 1 cow on 25 to 30 acres.

We cannot but know that water in these semiarid regions of the United States is the lifeblood of the land and its people and such lifeblood should not be allowed to flow uselessly into the Gulf of Mexico, and I, therefore, urge that all interested in building and developing our western lands get behind the movement to get approved the Colorado River project as first intended.

Yours most respectfully,

EMIL C. GRADERT,
Superintendent of Water Division No. 4.

Mr. ASPINALL. The Chair would advise the committee, at the time Mr. Person appeared before the committee there was also given to each member of the committee a six-page statement, with attached map, on the subject of utilizing Colorado River water which originates above Lee Ferry. It is the wish of the Wyoming group that the questioning of the witnesses whose statements have already been made be undertaken at this time and Mr. Person be allowed to make

his other presentation upon the conclusion of the questioning of the witnesses now before us.

Is there any objection?

Hearing none, it is so ordered.

I have one question, Dean Person. In your statement you spoke of three participating projects—LaBarge, Lyman, and Seedskadee. You do not mean to overlook the Eden, which is already authorized and being constructed and will receive a part of its construction costs from the proposed project now beforethe committee?

Mr. PERSON. That is right. The Eden project is a participating project from the standpoint of its participating in power revenues.

Mr. ASPINALL. The Chair recognizes the gentleman from North Carolina, Mr. Shuford.

Mr. SHUFORD. No questions.

Mr. ASPINALL. The gentleman from Utah, Mr. Dawson.

Mr. DAWSON. I will be glad to yield my time to the gentleman from Wyoming, Mr. Thomson.

Mr. THOMSON. It it would please the Chair, I would like to ask just a couple of questions.

Mr. ASPINALL. Certainly.

Mr. THOMSON. In the first place, I would like to ask of Mr. Budd, you mentioned in your statement that the principal crops to be raised are alfalfa, oats, and some barley. That is the essence of it, is it not?

Mr. BUDD. That is correct.

Mr. THOMSON. And these will not go into surplus. Are these products needed in this area at the present time for use within the area as seed there?

Mr. BUDD. They are definitely needed. As I imagine most of the members of the committee are informed, we are having quite a disastrous drought in the State of Wyoming, and we need these crops sorely at the present time and would have use for them continually.

Mr. THOMSON. In other words, we are not only trying to create something new here, but more than that, we are taking care of the needs to stabilize the economy of this area as it presently exists. Is that correct?

Mr. BUDD. That is correct.

Mr. THOMSON. Has that economy varied with the flow of the upper Colorado River, from your ranching activity and the ranching activity of your family here for many, many years?

Mr. BUDD. I think if you would check the record of the flow of the Colorado River, you would have a pretty good record as to how the bank accounts have fluctuated in our particular area.

Mr. THOMSON. Does that also refer to the purchasing power of your particular area and the income-tax returns from your particular area?

Mr. BUDD. That is definitely true. In years that we are short of water, we just do not raise feed for our livestock and naturally do not have money to spend for machinery and automobiles and other necessary equipment.

Mr. THOMSON. When this river hit its low spot in 1934, what were you doing?

Mr. BUDD. I was engaged in the ranching business, but in the fall of 1934 I acted as assistant appraiser on the drought relief buying program.

Mr. THOMSON. Do you know how many cattle, or approximately how many cattle, were purchased and shipped out of that area and slaughtered there because of the competitive conditions that existed?

Mr. BUDD. In our particular county, the Federal Government bought 14,000 head of cattle. We killed 1,400 head of them right out on the ranches.

In the State of Wyoming the Federal Government bought two-hundred-eighty-four-thousand-some-odd cattle, of which, as I recall, at least 10 percent were slaughtered. It amounted to over 25 percent of all the cattle in Wyoming that were purchased by the Federal Government to help us through that.

Mr. THOMSON. And about 10 percent of them were just slaughtered on the range there?

Mr. BUDD. That is right. They were in such condition that they could not even be shipped to market where the other cattle were put in pens.

Mr. THOMSON. How long did it take the area to recover from that shock and become a worthwhile cog in our economic setup in this country?

Mr. BUDD. A large majority of the ranchers just did not recover. They were forced to sell out. Everyone was fighting to retain their ranches for the rest of the thirties. In fact, the economy was definitely strained. I guess we might say that we were in all probability just saved by the war.

Mr. THOMSON. It was not until after World War II came along that the numbers of your cattle recovered from that 1934 drought?

Mr. BUDD. That is right; they held at practically the numbers we were left with.

Mr. THOMSON. And a lot of the ranchers were forced into bankruptcy?

Mr. BUDD. Yes; a great number.

Mr. THOMSON. Then the point is that we need this project to stabilize present existing economy just as a flood-control project stabilizes existing economy; is that correct?

Mr. BUDD. That is definitely true.

Mr. THOMSON. In the last year we spent five or six hundred thousand dollars of Federal money trying to overcome the hay situation out there. This area stands to be, and in good years is, a source of supply for hay for the entire area, the entire State?

Mr. BUDD. Yes; it has been and will be.

Mr. THOMSON. And will stabilize the activities of the entire grazing industry and ranching industry in the entire State?

Mr. BUDD. It will stabilize the entire economy.

Mr. THOMSON. You mentioned frost there. What is the effect of frost in this higher altitude? I think your ranch sits right along the top in about the coldest spot there.

Mr. BUDD. It is very peculiar. I know that people read of our extremely low temperatures and the frequent occurrence of frost in that particular area, and they just feel we should be unable to grow anything. Apparently in that high, dry area it takes a much lower temperature, as recorded by the thermometer, to create crop damage than it does in a lower altitude because, as I said in my statement, in all the years we have produced oats and barley on our ranch,

we have never lost a crop due to frost. We have lost some because of lack of water.

Mr. THOMSON. Dean Person, you have been a civil engineer for several years, have you not?

Mr. PERSON. Yes, sir.

Mr. THOMSON. And you have worked with the Bureau of Reclamation and cooperated in working with them on various projects?

Mr. PERSON. I have worked in cooperative work, working with the State of Wyoming.

Mr. THOMSON. Yes. You have cooperated with the Bureau. You are familiar with this Glen Canyon site, are you?

Mr. PERSON. Yes, sir.

Mr. THOMSON. Are you concerned at all, or do you have any concern with the safety of a 700-foot structure proposed by the Bureau of Reclamation to be built at Glen Canyon?

Mr. PERSON. I have enough confidence in the Bureau of Reclamation and their records in building dams that, if they say you can build a 700-foot dam, you can build it.

Mr. THOMSON. You are also familiar with the fact that this area is developing as far as atomic energy is concerned, very rapidly?

Mr. PERSON. Yes.

Mr. THOMSON. And I believe in and around Lander they are looking forward to a uranium mill—and in the DuBois area uranium has been discovered—and the Colorado Plateau. Are you familiar with the electrical requirement in order to develop that atomic energy to make it available

Mr. PERSON. I know they are very short of power at the present time. The whole area.

Mr. THOMSON. In the development of atomic energy or uranium, it does require a great deal of electricity, does it not?

Mr. PERSON. It does that.

Mr. THOMSON. And that has been one of the principal reasons for the growth of the country as a whole?

Mr. PERSON. That is right.

Mr. THOMSON. Senator Crippa, you were a United States Senator last year?

Mr. CRIPPA. Yes, sir.

Mr. THOMSON. Did you vote for the flood-control project that passed, almost a billion dollars?

Mr. CRIPPA. Yes, sir.

Mr. THOMSON. Did you try to compute the interest that would accumulate on that compounded for the next 100 or 200 or 500 years?

Mr. CRIPPA. I am afraid I could never do that.

Mr. THOMSON. Why was it you voted for something like that which meant absolutely nothing directly to the benefit of Wyoming?

Mr. CRIPPA. Mr. Congressman, I feel this way: When I was in the United States Senate I felt it was the duty of the Congress of the United States to take care of and do the things that the people themselves cannot do. If private industry can do them, I am willing to go along with private industry. But I find in flood control that is almost out of the hands of private enterprise. You are spending a great deal of money, that is true, but you are also saving lives, saving farms, everything else, where you have an abundance of water with no control over it. It is a much different issue than we have out in

Wyoming where we are now fighting to try to conserve what we have by building reclamation dams. That is one of the reasons I am fully convinced, if I had the opportunity to be in the United States Senate again today, I would vote for flood control and also insist upon reclamation for the West.

Mr. THOMSON. I think Senator Duff, of Pennsylvania, sat beside you as your colleague at that time.

Mr. CRIPPA. Yes.

Mr. THOMSON. And you told him that if it was good for another area of the country, it will be good for the country as a whole, and you would support it.

Mr. CRIPPA. I did; I told that to Senator Duff. As a matter of fact, I happened to be one of the few Senators in the United States Senate who had never been in Pennsylvania. I listened to Senator Duff. He told me it was a very good idea and thought it was needed. From what I have been able to read, where we have disasters I think it is the duty of the Congress to take care of those things, and I also felt he should go out and visit with us and see our problems where we have a shortage of what they have an overabundance and no control over.

Mr. THOMSON. Thank you. Thank you, Mr. Chairman.

Mr. SHUFORD (presiding). Mr. Dawson, do you have any further questions?

Mr. DAWSON. That is all I had, except, Mr. Chairman, to commend the witnesses for a fine presentation. I think it is a good picture of the situation in Wyoming.

I particularly want to commend Mr. Rechard for the fine statement he has made, particularly in reference to the 58 or 56 percent doctrine that has been enunciated here by some of the opponents of this project. I think that is a very clear statement of what the facts are.

Mr. ASPINALL (presiding). The Chair recognizes the gentleman from Arizona, Mr. Udall.

Mr. UDALL. I have no questions, Mr. Chairman.

Mr. ASPINALL. The gentleman from California, Mr. Hosmer.

Mr. HOSMER. No questions.

Mr. ASPINALL. The gentleman from California, Mr. Sisk.

Mr. SISK. Yes; I have one comment to make, Mr. Chairman.

With reference to Mr. Rechard's statement on page 3, as a Representative from California, I wish to commend him for the fact that he does not believe that certain statements that have been rather promiscuously tossed around do represent the views of the people of California. I want to assure him, as one Representative to the State of California, they do not.

I would like to say, we very strongly believe in reclamation. I happen to come from the central part of the great State of California, and we are certainly in need of further reclamation projects, and particularly in northern and central California we are desirous that they continue.

I would like to commend the gentlemen from Wyoming, from that great State, for the excellent presentation that they have made here this morning.

I, for one, am anxious to see that they, along with other States of the West, have an opportunity to develop and to use reclamation and irrigation for the development of that great area. I heartily disagree with some of the propaganda that has been presented by, what I feel

to be, a small group of rather perverse thinkers in our area. But I can assure you that the State of California is interested in being completely fair to the West and to the Nation as a whole.

So far as I am concerned, in my particular area we stand shoulder to shoulder with the development of the West.

Thank you, Mr. Chairman.

Mr. DAWSON. Will the gentleman yield?

Mr. HOSMER. Will the gentleman yield on that point?

Mr. ASPINALL. Does the gentleman yield?

Mr. SISK. I will yield to my colleague from California.

Mr. HOSMER. I think my colleague from California has made a very fair statement in expressing to this committee that the State of California does believe in reclamation and does believe in the upper Colorado River development.

Our only concern is that it be carried on in such manner as not to trample upon the water rights of the State of California, and so as not to withhold in the upper basin water which is reasonably necessary for us to carry on our existing uses in the lower basins.

The kernel of the nut in this whole controversy is whether or not this project will permit sufficient water to pass Lee Ferry to carry on these uses, and whether or not the project is so conceived and designed and is proposed to be constructed and operated in such a manner as to observe these rights of the lower basin acquired by appropriation, contract, and compact.

Mr. DAWSON. Will you yield to me there?

Mr. HOSMER. There is in the rivers of the Colorado system sufficient water to permit reasonable development in the upper basin and to permit reasonable uses in the lower basin. That amount of water is undoubtedly, to my mind, fixed and determinable. So at any time the proponents of the projects in the upper basin will admit that fact and come to the figure and agree to it, and keep it, we have no objection to the upper basin development. But we see before this committee a constant series of people coming in proposing some developments, and then some of the other witnesses in the upper basin come in and disagree with them, and they want other developments, and then we have other bills for additional developments in the upper basin, and as reasonable men we do not know where it will stop. But, as reasonable men, we know you can build those projects within the live-and-let-live doctrine, which for the first time I heard announced by an upper-basin proponent this morning, Senator Barrett, of Wyoming.

All we are trying to do is live and let live on that river, and any time the upper basin will decide and agree upon that doctrine, I doubt if they will have any opposition whatsoever from the lower basin.

I yield back.

Mr. SISK. I yield to the gentleman from Utah.

Mr. DAWSON. I want to commend the gentleman from California, Mr. Sisk, for a very fair statement, and I can assure him it is reassuring to those of us in the upper basin States who are only asking for our fair share of this water, to find such a fair attitude on the part of the Representative from California.

And to my friend on this side of the aisle, I simply want to remind him once again there is written in this bill in a number of places the provision that nothing shall be done in the development of these waters which will in any way violate the terms of the Colorado River com-

pact, which in itself is a guaranty that your rights are going to be protected.

Mr. HOSMER. Will you yield on that point?

Mr. DAWSON. Yes; I will be happy to yield.

Mr. ASPINALL. Gentlemen, the Chair wants to be fair. We would like to have a statement from Mr. Person, if possible. Of course, these arguments will come before the committee later on.

Will the gentleman yield to the gentleman from California?

Mr. SISK. Yes.

Mr. HOSMER. That is all right. I will yield back. I do not want to interrupt the progress of the hearings.

Mr. SISK. That is all.

Mr. ASPINALL. The Chair recognizes the gentleman from California, Mr. Utt.

Mr. UTT. I have nothing to say but to associate my feelings with those of my colleague, Mr. Sisk, in an effort to cooperate and still defend our own position.

Mr. ASPINALL. The gentleman from Oklahoma, Mr. Edmondson.

Mr. EDMONDSON. I also would like to commend my colleague from California, Mr. Sisk, for his very fine statement of the purposes and principles in the use of the Nation's water resources, and his emphasis on the need for teamwork among the States in developing the water resources of the entire West. I am sure the people of Oklahoma feel exactly as Mr. Sisk has expressed the sentiments of California to be—that reclamation is something that affects the welfare of the entire area, the entire West. I am sure that if that is the spirit in which we proceed we can accomplish a wonderful future for this Nation.

That is all.

Mr. ASPINALL. The Chair recognizes the gentleman from Texas, Mr. Rutherford.

Mr. RUTHERFORD. No questions.

Mr. ASPINALL. Thank you very much for your statements and your appearance, gentleman, and at this time we shall listen to the statement by Dean Person, a statement which has already been handed to us, on utilizing Colorado River water that originates above Lee Ferry.

You may proceed, Mr. Person.

STATEMENT OF H. T. PERSON, DEAN OF ENGINEERING, UNIVERSITY OF WYOMING, LARAMIE, WYO.—Resumed

Mr. PERSON. Virgin flow: Analysis of the streamflow records and the available data on uses of water in the upper Colorado River Basin indicates that the average annual flow of the Colorado River at Lee Ferry (the dividing point between the upper and lower basin) under virgin conditions would have been about 15½ million acre-feet during the 40-year 1914–53 period. Of this total average annual flow, 7½ million acre-feet are apportioned to the lower basin and 7½ million acre-feet to the upper basin by the 1922 Colorado River compact. Constructed and authorized projects in the upper Colorado River Basin will use consumptively about 2½ million acre-feet per year. This leaves 5 million acre-feet of consumptive use per year still to be realized in the upper basin States, before full development of the water resources is attained under the 1922 compact apportionment.

84TH CONGRESS, 1st Session | SENATE | REPORT No. 128

COLORADO RIVER STORAGE PROJECT AND PARTICIPATING PROJECTS

MARCH 30 (legislative day, MARCH 10), 1955.—Ordered to be printed

Mr. ANDERSON, from the Committee on Interior and Insular Affairs, submitted the following

REPORT

[To accompany S. 500]

The Senate Committee on Interior and Insular Affairs, to whom was referred the bill (S. 500) to authorize the Secretary of the Interior to construct, operate, and maintain the Colorado River storage project and participating projects in the States of Arizona, Colorado, New Mexico, Utah, and Wyoming, having considered the same, report favorably thereon with amendments, and with the recommendation that the bill, as amended, do pass. Senate 500 was introduced by Mr. Anderson and sponsored by the following nine other Senators: Mr. Allott, Mr. Barrett, Mr. Bennett, Mr. Chavez, Mr. Goldwater, Mr. Hayden, Mr. Millikin, Mr. O'Mahoney, and Mr. Watkins.

Public hearings on S. 500 were held by the Committee on February 28, March 1, 2, 3, 4, and 5, 1955. Some 57 witnesses appeared, including Members of the Senate and House of Representatives, the Secretary of the Interior, the Governor of Colorado, and many officials from other interested States. Testimony and exhibits submitted to the committee during the hearings comprise 734 printed pages.

1. PURPOSE OF THE BILL

S. 500, as amended, has four principal purposes. First, it would authorize a series of holdover storage reservoirs, with hydropower plants and incidental works. Second, it would authorize a number of consumptive use irrigation projects. Third, it would recognize, with a view to laying a foundation for eventual further action by the Congress, certain units and projects in several stages of planning, but plans for which are not sufficiently advanced to warrant final and unconditional authorization. Finally, the bill recognizes that the works authorized constitute only an initial phase of a comprehensive develop-

ment of the water resources apportioned to the Upper Basin and that the specific authorizations in this bill are not intended to limit or preclude the consideration and authorization by Congress of other projects for the use of waters apportioned under the compacts as additional needs are indicated.

2. BACKGROUND

The Colorado River Compact of 1922 divides the Colorado River Basin into two parts, the Upper Basin, comprising those parts of the States of Arizona, Colorado, New Mexico, Utah, and Wyoming—

within which and from which waters naturally drain into the Colorado River system above Lee Ferry, and also all parts of said States located without the drainage area of the Colorado River system which are now or shall hereafter be beneficially served by waters diverted from the system above Lee Ferry (Colorado River Compact, art. II f)—

and the Lower Basin, comprising—

those parts of the States of Arizona, California, Nevada, New Mexico, and Utah within and from which waters naturally drain into the Colorado River system below Lee Ferry, and also all parts of said States located without the drainage area of the Colorado River system which are now or shall hereafter be beneficially served by waters diverted from the system below Lee Ferry (Colorado River Compact, art. II g).

Article III (a) of the compact apportions to each basin in perpetuity—

the exclusive beneficial consumptive use of 7,500,000 acre-feet of water per annum * * *.

Article III (d) of the compact provides that the—

States of the upper division will not cause the flow of the river at Lee Ferry to be depleted below an aggregate of 75 million acre-feet for any period of 10 consecutive years * * *.

The Colorado River Compact and the Boulder Canyon Project Act (45 Stat. 1057) became effective in 1929 upon ratification of the compact by all States other than Arizona, the enactment of the California Limitation Act, and proclamation by the President.

The Upper Colorado River Basin Compact of 1948 apportions among the States of Arizona, Colorado, New Mexico, Utah, and Wyoming the consumptive use of waters apportioned to the Upper Basin by the Colorado River Compact of 1922.

Lower Basin development has proceeded at a rapid pace with the construction of Hoover Dam and the Boulder Canyon project, Parker Dam, Davis Dam, and other works. Large populations in cities such as Los Angeles and San Diego, and extensive agricultural areas served by the Imperial Irrigation District, the Palo Verde District, and others create expanding uses of the waters of the Colorado River for domestic, industrial, and agricultural purposes.

Development in the Upper Basin States of the consumptive use of water awarded to that area by the original compact has been retarded while a comprehensive plan for the most efficient use of their waters has been in preparation, while the investigation and selection of the best dam sites has been under way, and while engineering and economic problems have been considered. The Upper Basin comprises an area of some 110,000 square miles. On its fringes lie such large centers of population as Albuquerque, Denver, and Salt Lake City and their environs, each of which has experienced rapid growth in

recent years; each of which anticipates additional significant growth, with ever more urgent need for water and power. In Wyoming, there are several counties in the southwestern part of the State also on the fringes of the basin, which are rich in natural resources. The Upper Basin proper has been primarily an agricultural area. Beginning with the Green River and its tributaries in Wyoming, it contains, however, important resources of uranium, vanadium, iron, and other metals, coal, oil, oil shale, and phosphates. It stands, the committee believes, on the verge of great industrial growth, with consequent increase in need for water for domestic, industrial, and agricultural purposes, as well as for power.

The Colorado River is an erratic stream. The periods of high flow do not coincide with the periods of greatest demand on its waters. If, therefore, any substantial uninterrupted uses of available water are to be made by the upper division States (Colorado, New Mexico, Utah, Wyoming), in addition to those small projects constructed prior to adoption of the compact, there must be provided a series of holdover storage reservoirs, which will assure compliance with article III (d) of the 1922 Compact and, at the same time, permit the Upper Basin States to achieve ultimate development of waters apportioned to them. As these waters are released, they will generate hydroelectric power, which can be used to advantage and for which there is a ready market throughout all the Colorado River Basin States. These reservoirs can at the same time provide recreational areas comparable to Lake Mead behind Hoover Dam.

3. DESCRIPTION OF THE BILL

The repayment provisions of the bill, following very closely recommendations made by the President, the Bureau of the Budget, and the Secretary of the Interior, are designed to achieve, so far as practicable, the concurrent return of expenditures for power and irrigation and municipal and industrial water supply purposes, insofar as expenditures therefor are made concurrently. The power and municipal and industrial water supply expenditures are returned with interest. All reimbursable costs are returnable within 50-year periods, and this is specifically required by section 4 of the bill as amended.

The committee considered whether litigation now pending in the Supreme Court of the United States between Arizona and California et al. raises any question affecting the advisability or propriety of the authorization at this time of the works herein recommended. The committee is convinced that nothing in such pending litigation warrants delay in authorization of the works proposed in the bill, and that such is the case even if Colorado, New Mexico, Utah, and Wyoming should be impleaded.

The works recommended by the Upper Colorado River Commission for the States of Colorado, New Mexico, Utah, and Wyoming are fully justified because they are designed only to make effective part of the perpetual apportionment of 7,500,000 acre-feet annually made to the Upper Basin in the Colorado River Compact, and partake of the character of works heretofore authorized under the Federal reclamation program. The committee concludes that the authorization of this plan of development, being plainly within the Upper Basin apportionment, cannot and should not be construed as detri-

mental in any respect to the rightful interests of Arizona, California, or Nevada, as lower basin States, whether as litigants or otherwise. However, the committee calls attention to section 12 of the bill which makes it possible for any Colorado River Basin State to institute litigation promptly in the Supreme Court of the United States, in the event questions arise regarding the legality of the operation of any works herein authorized or of any other works on the river. Possible frustration of efforts effectively to litigate such questions is avoided by waiver of the immunity of the United States from such a suit. Thus, all States of the Colorado River Basin are fully protected against the operation of any works on the Colorado River system in contravention of the Colorado River Compact of 1922, the Boulder Canyon Project Act, and the Mexican treaty. Furthermore, the provision contained in the bill (sec. 12 (b)) for consultation with an Advisory Committee in connection with the operation of works on the river will tend, as a practical matter, to obviate misunderstanding and to reduce occasions for litigation.

The Committee concluded that it was satisfactorily established by the evidence that the aggregate of the consumptive use of water that will be made, if all of the works hereby proposed to be authorized are eventually constructed after meeting the various conditions imposed, when added to consumptive use already being made in the upper division States, will amount to less than two-thirds of the apportionment made to the upper basin under the compact. When all storage units and participating projects named in this bill are constructed, the aggregate of all consumptive uses in the Upper Basin would not exceed 4.8 million acre-feet of water per annum. This would leave an unused apportionment of 2.7 million acre-feet of the 7.5 million acre-feet apportioned to the Upper Basin to meet any contingencies arising out of litigation over varying interpretations of the compact. In the circumstances, the continuity of the water supply for the Lower Basin would be assured.

The evidence showed that the difference in Upper Basin uses, derived, on the one hand, from the application of the diversions-less-returns method and, on the other, from the application of the inflow-outflow method of measuring consumptive use, accepting the most extreme estimates, cannot exceed half a million acre-feet. Therefore, the committee concluded that existing differences of opinion as to which theory or method of measuring uses should prevail have no bearing on the consideration of S. 500. The same conclusion was reached in connection with other questions, the answers to which depend on interpretation of the Colorado River Compact, the construction of treaties with Indian tribes, construction of the Boulder Canyon Project Act, or construction of the treaty with the United Mexican States. The evidence showed that even if all of the questions so raised by opponents of this measure were to be resolved against the upper division States, the requirements of the consumptive use projects authorized or proposed to be authorized would be well within the Upper Basin's apportionment.

Legislative proposals made in connection with the Colorado River storage project and participating projects are in general accord with the established policy followed by the Congress in connection with Federal reclamation projects for the last 50 years. In some respects such proposals are more conservative than established policy. Nor are they, in some respects, as generous as the Federal reclamation

legislation under which the Central Valley of California has prospered and hopes for further development. They are similar to the policies under which the Boulder Canyon project was developed. The understandable desire of certain Lower Basin entities for continuation of the status quo on the Colorado River cannot justify the Congress in longer delaying legitimate Upper Basin development.

The Committee concludes that the use of holdover storage reservoirs for river regulation is contemplated by the Colorado River compact. To accept the argument against holdover storage would be a negation of the compact itself. The committee's conclusions in this connection are amply supported by repeated statements by Hon. Herbert Hoover and other negotiators of the compact showing beyond doubt that river regulation through storage is implicit in the compact and that article III (e) of the Colorado River Compact relates only to arbitrary withholding of water.

The Committee likewise concludes that the suggestion that the compact requires the upper division States to deliver water of a particular quality is without merit. In any event the additional use of water involved in S. 500 will have no marked effect on the quality of water delivered to the Lower Basin. There may, in fact, be some improvement therein as a result of such development. So far as mineral content is concerned, exhaustive studies show that, as Mr. Julian Hinds, general manager and chief engineer of the Metropolitan Water District of Southern California said in 1950:

> Under the most unfavorable future conditions, (mineral content) will be lower than the average of waters diverted and successfully used in the Yuma and Imperial Valleys prior to the construction of Hoover Dam (p. 13, report of Metropolitan Water District of Southern California, October 1950).

4. PROJECT WORKS

Features in the plan for developing the Upper Colorado River Basin are divided into two categories: storage units and participating projects. This bill would authorize the initial phase of the plan. In this initial phase are the following storage units: Curecanti, Echo Park, Flaming Gorge, Glen Canyon, Juniper, and Navajo; and the following participating projects: Central Utah (initial phase), Emery County, Florida, Gooseberry, Hammond, LaBarge, Lyman, Paonia (including the Minnesota unit), Pine River extension, Seedskadee, Silt, Smith Fork, and, subject to further approval and authorization by Act of Congress, of feasibility reports before construction of the following additional participating projects: Battlement Mesa, Bluestone, Bostwick Park, Dallas Creek, Dolores, Eagle Divide, East River, Fruit Growers' Extension, Fruitland Mesa, Grand Mesa, Navajo, Ohio Creek, Parshall, Rabbit-Ear, San Juan-Chama, Savery-Pot Hook, Sublette, Tomichi Creek, Troublesome, West Divide, and Woody Creek.

Brief descriptions of the physical features of these storage units and participating projects follow:

5. STORAGE UNITS

Curecanti (modified plan)

The Curecanti unit would consist of a reservoir on the Gunnison River formed by the Blue Mesa Dam below the town of Gunnison,

Colo., and of three downstream reservoirs respectively referred to as the Narrow Gauge, Morrow Point, and Crystal Reservoirs. The bill limits the water-surface elevation of the reservoir formed by Blue Mesa Dam to 7,520 feet. At this water-surface elevation, the capacity of the reservoir is estimated at 940,000 acre-feet. The three downstream reservoirs would be primarily for the development of power head with only nominal active storage capacities. Sufficient active capacity would be provided at the Morrow Point site for some seasonal regulation of stream inflows below Blue Mesa Dam.

Echo Park

The Echo Park Dam would be located in Colorado, on the Green River, about 3 miles east of the Utah-Colorado State line and 3 miles below the junction of the Green and Yampa Rivers. The Echo Park Dam is in the power market area of the Upper Basin States. Because of its strategic location below the junction of the Yampa and Green Rivers, and the large and efficient reservoir created by it, the construction and operation of the Echo Park unit would increase the effectiveness of supplementary storage and power developments at the Flaming Gorge and Juniper units and of the future Split Mountain and Gray Canyon units. The Echo Park Dam would be a curved, gravity type, concrete structure rising 690 feet above bedrock. The reservoir would have a storage capacity of 6,460,000 acre-feet, and the powerplant a generating capacity of 200,000 kilowatts.

The Committee recognizes that the opposition to Echo Park Dam stems from individuals who sincerely believe that the authorization of this dam would be an "invasion" of Dinosaur National Monument and constitute a precedent detrimental to other units of the national parks system. However, the committee and the Congress have been provided with documentary evidence which shows conclusively that a tremendous acreage—virtually the complete course of the Green and Yampa Rivers and bordering lands—within the present monument boundaries was reserved for water and power development from 13 to 34 years before the 2,500-fold extension of Dinosaur Monument in 1938. Furthermore, these reservations for water resource development are still valid and in effect today—clearly exempted by the language of the 1938 Dinosaur Monument proclamation; this language is unique in proclamations and laws pertaining to parks and monuments. These documents, some of which were introduced in the House hearings in 1954, have not been refuted.

The Echo Park Dam site has many advantages as a component of the initial phase of the project. To deny now the use of the Echo Park site for that purpose would amount to a breach of faith on the part of the Government. Such denial would tend to weaken reclamation and power reservations now applying to public lands on many other streams in the western United States.

After hearing much testimony on both sides of the question, the committee concludes that there is no invasion of national park or monument areas. In view of these legal and historical precedents for priority use of the Green and Yampa Rivers for water resource development, and in view of the obvious fact that water is so precious in the semiarid Colorado River Basin, the decision must be in favor of the selection of that site (Echo Park) where evaporation losses are reduced by a significant amount. Furthermore, there is urgent need

for the orderly development of the land and water resources of the Colorado River Basin.

Flaming Gorge

The principal feature of the Flaming Gorge unit is the dam, which will be located on the Green River in Utah, about 32 miles north of Vernal, and which would be a concrete, gravity-type structure rising 440 feet above the river. Flaming Gorge Reservoir formed by the dam would have a total capacity of 3,940,000 acre-feet. The powerplant at the dam would have a capacity of 72,000 kilowatts.

Glen Canyon

The Glen Canyon Dam would be located on the Colorado River in northern Arizona, about 13 miles downstream from the Utah-Arizona State line and 15 miles upstream from Lee Ferry—the division point between the lower and upper basins. It would be a concrete, curved, gravity-type structure rising 700 feet above bedrock. The reservoir, with a total capacity of 26 million acre-feet, would provide final regulation for deliveries to the lower basin under the Colorado River compact. The powerplant would be located near the toe of the dam. It would have a total installed capacity of 800,000 kilowatts.

Juniper

This storage and diversion unit is substituted for Cross Mountain Dam in the development plan. The dam would be located on the Yampa River 24 miles downstream from Craig, Colo., and 10 miles upstream from Maybell, Colo. The reservoir would have a capacity of 1,500,000 acre-feet, and a powerplant of 25,000 kilowatt capacity would be installed. Diversions through a canal would irrigate approximately 29,000 acres of new land in Colorado and 61,000 acres of new land in Utah between the Yampa and White Rivers.

Navajo

The Navajo Dam would be located on the San Juan River in northwestern New Mexico about 34 miles east of the town of Farmington. The dam would be a rolled, earth-filled embankment rising 335 feet above stream bed. Navajo Reservoir would have a total capacity of 1,450,000 acre-feet. The dam and reservoir will provide for gravity diversion for white and Indian lands to be irrigated under the Navajo project. Also, in connection with the San Juan-Chama project, the reservoir would constitute a source of supply for downstream irrigation users in exchange for natural flow diverted upstream.

6. PARTICIPATING PROJECTS

Central Utah

The Central Utah project (initial phase) is located in the eastern Bonneville Basin in central Utah and in the Uinta Basin, part of the Colorado River Basin in northeastern Utah. The plan would include construction of the Strawberry aqueduct along the south slope of the Uinta Mountains for intercepting Uinta Basin streams as far east as Rock Creek, enlargement of the Strawberry Reservoir by construction of the Soldier Creek Dam, enlargement of the Strawberry Reservoir outlet tunnel, construction of five powerplants with a combined generating capacity of 61,000 kilowatts, and construction of a number of other reservoirs for regulation, storage, and water exchanges.

The Wasatch aqueduct, canals, and distribution system would be constructed as necessary to deliver and utilize the increased water supply. Drainage would be provided where necessary. The project would irrigate about 28,540 acres of new land. It would also supply supplemental water for about 131,840 acres and furnish 48,800 acre-feet of municipal water.

Emery County

The Emery County project is located in east-central Utah along the San Rafael River. The project works would include a dam and reservoir, a diversion dam, a canal, and laterals and drains. The project would irrigate about 3,630 acres of new land and furnish supplemental water for about 20,450 acres.

Florida

The Florida project is in southwestern Colorado, in the Florida River Valley. Project works would include a dam and reservoir, a diversion dam, enlargement and extension of existing canal, and distribution laterals and drains. The project would irrigate about 6,300 acres of new land and furnish supplemental water to about 12,650 acres.

Gooseberry

The Gooseberry project would be located in central Utah. It would consist of a storage reservoir on Gooseberry Creek, a tributary to the Colorado River, having a capacity of 17,200 acre-feet, a 2½-mile tunnel to San Pete Valley in the Bonneville Basin, a diversion dam and high-line canal to deliver the water to existing distribution systems. It would furnish supplemental water for 16,400 acres of irrigated lands now having an inadequate water supply.

Hammond

The Hammond project is in northwestern New Mexico along the San Juan River. The project works would include a diversion dam, a canal, and distribution laterals and drains. The project would irrigate about 3,670 acres of new land.

LaBarge

The LaBarge project is in southwestern Wyoming in the upper end of the Colorado River Basin. It extends approximately 40 miles along the west side of Green River. Project works would include a diversion, a conveyance canal, and distribution laterals. About 7,970 acres of new land would be irrigated by this project.

Lyman

The Lyman project is in southwestern Wyoming, just above the Utah-Wyoming State line. It lies along Blacks Fork, a tributary of the Green River. Project works include a reservoir, conveyance canals, and drainage facilities. Supplemental water would be furnished to about 40,600 acres.

Paonia

The Paonia project is located in west-central Colorado on the North Fork of the Gunnison River. This project was previously authorized and is partially constructed. It would, however, be extended by this reauthorization. The project works include a dam and reservoir, canals, and siphon. As reauthorized, the area to be served would

include 17,040 acres, of which 2,210 would be new land and 14,830 acres would be furnished supplemental water.

Pine River extension

The Pine River extension is in southwestern Colorado and northwestern New Mexico, on Pine River, 20 miles east of Durango, Colo. The project works include a diversion dam, the enlargement and extension of canals, and a number of distribution laterals. The project would irrigate about 15,150 acres of new land. Storage water is to be obtained from existing Vallecito Dam and Reservoir on Pine River.

Seedskadee

The Seedskadee project is in southwestern Wyoming along the Green River below the LaBarge project. Project works would include a diversion dam, conveyance canals, and distribution laterals. About 60,720 acres of new land would be irrigated by the project.

Silt

The Silt project is located in west-central Colorado between Rifle and Elk Creeks. The project works include a dam, and reservoir pumping system, rehabilitation of existing canal, and construction of some new laterals and drains. The project would irrigate about 1,900 acres of new land and would furnish supplemental water for about 5,400 acres.

Smith Fork

The Smith Fork project is located in west-central Colorado along Smith Fork, a tributary of the Gunnison River. The project works would include a dam and reservoir, diversion dam, canals, and laterals. The project would irrigate about 2,270 acres of new land and furnish supplemental water for about 8,160 acres.

PARTICIPATING PROJECTS CONDITIONALLY AUTHORIZED

The following participating projects would be authorized now, conditioned on approval of feasibility reports by Act of Congress before construction could begin:

A brief description of these projects is as follows:

Battlement Mesa, Colorado
Bluestone, Colorado
Bostwick Park, Colorado
Dallas Creek, Colorado
Dolores, Colorado
Eagle Divide, Colorado
East River, Colorado
Fruit Growers' Extension, Colorado
Fruitland Mesa, Colorado
Grand Mesa, Colorado
Navajo, New Mexico
Ohio Creek, Colorado
Parshall, Colorado
Rabbit Ear, Colorado
San-Juan Chama, New Mexico
Savery-Pot Hook, Colorado and Wyoming
Sublette, Wyoming
Tomichi Creek, Colorado
Troublesome, Colorado
West Divide, Colorado
Woody Creek, Colorado

Battlement Mesa

The Battlement Mesa project in Mesa County, west-central Colorado, would regulate the surplus runoff in Buzzard Creek of the Upper Colorado River drainage and two branches of Muddy Creek

of the Gunnison River drainage to provide for the irrigation of 6,780 acres of full service land and 50 acres of supplemental service land located on the south slope of Battlement Mesa near the town of Collbran, Colo. The project would also aid in fishery and wildlife conservation.

Bluestone

The Bluestone project in Garfield and Mesa Counties, west-central Colorado, would divert water from Colorado River to provide for the irrigation of 8,660 acres of new land and 2,215 acres of supplemental service land located in the Colorado River Valley between the town of Rifle and the head of De Beque Canyon near De Beque, Colo.

Bostwick Park

The Bostwick Park project would provide a water supply for 1,040 acres of arable nonirrigated lands and supplemental water for 5,830 acres of presently irrigated lands. The lands are located along the west side of Cimarron Creek below the existing Cimarron Canal and in Bostwick and Shin Parks which lie about 10 miles east of the city of Montrose and also obtain their water supply through the Cimarron Canal. The source of the water supply for the project would be Cimarron Creek, a tributary of Gunnison River in the Upper Colorado River Basin.

Dallas Creek

The Dallas Creek project would provide an irrigation supply for 15,750 acres of arable nonirrigated lands and supplemental water for 6,190 acres of irrigated lands. The lands are located in the drainage basin of the Uncompahgre River, a tributary of Gunnison River in the Upper Colorado River Basin. The water supply for the project would be made available through utilization of surplus flows of Uncompahgre River and two of its tributaries, Dallas Creek and Cow Creek.

Dolores

The Dolores project is planned primarily to store and divert waters of Dolores River to supply irrigation water for 66,000 acres of land in the San Juan River Basin in southwestern Colorado. The lands include 30,550 acres presently irrigated with only a partial water supply and 35,450 acres not now irrigated. The project lands lie near the towns of Cortez and Dove Creek, Colo.

Eagle Divide

The Eagle Divide project in Eagle County, northwestern Colorado, would regulate surplus runoff in Piney River, tributary to the Colorado River, and would divert surplus flows from several small streams, tributaries to the Piney and Colorado Rivers below the planned reservoir, to provide for the irrigation of 8,990 acres of new land and 1,885 acres of supplemental service land. The project lands are located on the divide between the Eagle and Colorado Rivers in the vicinity of the following towns: Eagle, Wolcott, McCoy, and Burns. The project would increase fishery, wildlife, and recreational values of the area.

East River

Development of the potential East River project would provide for irrigation of 1,780 acres of nonirrigated lands and would provide

supplemental water for 970 acres of presently irrigated lands north of the town of Gunnison in the Upper Colorado River Basin. The water would be made available through construction of the 5-mile East River Canal which would divert from East River, one of the upper tributaries of Gunnison River. No storage facilities would be required to provide an adequate water supply for lands of the project.

Fruit Growers' Extension

The Fruit Growers' Dam project extension would utilize surplus flows of Grand Mesa tributaries of the Gunnison River in the Upper Colorado River Basin to provide supplemental irrigation water for 2,000 acres of presently irrigated lands and a new water supply for 1,850 acres of nonirrigated lands.

Fruitland Mesa

The Fruitland Mesa project would provide a water supply for 11,700 acres of arable nonirrigated land and supplemental water for 7,700 acres of presently irrigated land between the town of Crawford and the Black Canyon of the Gunnison National Monument. The water supply would be made available from Sapinero, Curecanti, Crystal, and Iron Creeks, tributaries of Gunnison River in the Upper Colorado River Basin.

Grand Mesa

The Grand Mesa project would provide a water supply for 11,070 acres of arable nonirrigated land and supplemental water for 14,230 acres of irrigated land in the Gunnison River drainage of the Upper Colorado River Basin. These acreages include nearly all of the lands along the south slope of Grand Mesa except lands included in the service areas of the potential Paonia project and the Fruit Growers Dam project extension. The water supply for the project would be made available from Muddy Creek and other Grand Mesa tributaries of Gunnison River.

Navajo

The Navajo project (formerly called the Shiprock and south San Juan projects) is in northwestern New Mexico along the San Juan River. The project would provide for the irrigation of 151,000 acres of new lands in the vicinity of the towns of Bloomfield, Farmington, and Shiprock. Of that total, 122,000 acres are located in the Navajo Indian Reservation and 29,000 acres are outside the reservation. A main high-line canal from the Navajo Reservoir would extend 28 miles to a drop and direct-connected turbine pump for service of highlands and then 60 miles to serve the major portion of the lands by gravity. A distribution system and drains also are planned. With respect to the authorization of this project, see section 2 of the bill.

Ohio Creek

The Ohio Creek project would provide for the irrigation of 6,200 acres of arable nonirrigated land and 10,710 acres of irrigated land in need of additional water. The source of the water would be Ohio Creek, a Gunnison River tributary in the Upper Colorado River Basin.

Parshall

The Parshall project would provide for the full irrigation of 24,410 acres of new land and would supply supplemental water to 3,100 acres of partially irrigated land along Williams River, Little Muddy Creek, and the lower east side of the Blue River Valley in the vicinity of the communities of Parshall and Kremmling, Grand and Summit Counties in north-central Colorado. The project would also aid in fishery and wildlife conservation.

Rabbit Ear

The Rabbit Ear project in Grand County, north-central Colorado, would regulate surplus runoff of Muddy Creek, tributary to the Colorado River near Kremmling, Colo., to provide for the irrigation of 13,955 acres of new service land and 5,235 acres of supplemental service land. The project lands are located in the Muddy Creek drainage, south and west of Kremmling. The project would also provide some flood-control benefits and also increase fishery and wildlife values.

San Juan-Chama

The San Juan-Chama project would be located in northern New Mexico partly in the San Juan Basin of southern Colorado and partly in the Rio Grande and Canadian River Basins in northern New Mexico. This project would provide for a maximum diversion of 235,000 acre-feet of water annually from the headwaters of the San Juan River through a collection system and a tunnel to the headwaters of the Chama, a tributary of the Rio Grande. An off-channel holding and regulatory reservoir would be provided on the Chama watershed. The water would be delivered to the agricultural users through the distribution systems of existing projects. With respect to the authorization of this project, see section 2 of the bill.

Savery-Pot Hook

The Savery-Pot Hook project would provide supplemental irrigation water for 13,230 acres of presently irrigated lands and a new supply for 18,380 acres of nonirrigated lands located in northwestern Colorado and south-central Wyoming. The additional water would be made available through utilization of surplus flows of streams of the Little Snake River Valley, a part of the Upper Colorado River Basin.

Sublette

The Sublette project is planned to store and divert waters of the upper Green River and its tributaries to supply irrigation water for about 72,000 acres of undeveloped lands and 12,000 acres of lands presently irrigated with an inadequate supply. The plan also includes a small hydroelectric powerplant. The project would be located in the Green River Basin in Sublette County, western Wyoming. Although reconnaissance studies to date indicate that the project would consist of two independent divisions (Buckskin and West Side divisions), the data presented herein are for the overall project.

Tomichi Creek

The Tomichi Creek project would provide supplemental irrigation water for 15,400 acres of presently irrigated land and a new supply

for 12,180 acres of arable nonirrigated land located east of the town of Gunnison near the Continental Divide. Water would be made available from Tomichi and Quartz Creeks, tributaries of Gunnison River in the Upper Colorado River Basin.

Troublesome

The Troublesome project in Grand County, north-central Colorado, would regulate surplus runoff in East Troublesome Creek, tributary to the Colorado River, and would divert surplus flows of the Williams River at the existing Williams Reservoir to provide for the irrigation of 8,990 acres of new land and 4,650 acres of supplemental service land. The project lands are located in the Troublesome Creek Valley and on river benches north of the Colorado River between the towns of Parshall and Kremmling, Colo. The project would also increase fishery, wildlife, and recreational values of the area.

West Divide

The West Divide project would regulate and divert surplus runoff of Crystal River, Thompson Creek, West Divide Creek, and Mamm Creek and would divert surplus runoff of several tributaries of the Roaring Fork and Colorado Rivers in order to provide for the irrigation of 40,500 acres of new land and 25,110 acres of supplemental service land. The lands are located along the west side of the Roaring Fork drainage in the vicinity of Carbondale and Glenwood Springs, Colo., and along the south side of the Colorado River Valley in the vicinity of the towns of New Castle, Silt, Rifle, Grand Valley, and DeBeque, Colo. The project area is contained in Pitkin, Garfield, and Mesa Counties, west-central Colorado.

Woody Creek

The Woody Creek project would provide an average of 3,900 acre-feet of water annually for the irrigation of 645 acres of new service land and 2,320 acres of supplemental service land located along the east side of the Roaring Fork River Valley and north of the town of Aspen, Pitkin County, west-central Colorado.

7. OTHER FEATURES OF THE BILL

The Committee recognizes that it may be found desirable to authorize additional storage in the upper reaches of the Colorado River and its tributaries above Grand Junction, Colo., and of additional participating projects in the several upper division States (see sec. 2 of the bill); but it recommends deferment of any commitment by the Congress thereto, due to the fact that engineering reports are not complete.

The bill contains a provision authorizing the appropriate agencies of the United States to convey for value to the city and county of Denver, Colo., water rights and interests in lands required for the enlargement of that city's municipal water supply.

The Committee believes that the Colorado River storage project and participating projects plan is financially sound. It has been subjected to the most rigid economic and financial analyses. Less than 3 percent of the total cost is nonreimbursable for flood control, fish and wildlife, and recreation.

The entire cost of the power and municipal water features will be returned to the United States Treasury with interest not only on the capital investment but also with interest accruing during their construction. Interest would be computed at the going rate for long-term Treasury obligations. The irrigation costs do not bear interest, pursuant to the 50-year-old policy of the reclamation law. The Federal Government has recognized that the development of irrigated lands stabilizes the agricultural economy and is a good public investment.

Section 3 of the bill, relating to water conservancy districts, takes into account the indirect benefits that will accrue to the general areas served by these projects. Indirect beneficiaries in the service areas of these projects would thereby aid in the repayment of irrigation costs. The irrigation farmers would be assesssed, according to their ability to pay over a 50-year period, and the balance of the costs allocated to irrigation would be repaid by power revenues. Safeguards are contained in the bill to obviate initiation of construction of participating projects prior to a thorough review of their economic justification.

The committee concurs in the view expressed by the Civil Defense Administrator, that the Colorado River storage project will be an important factor in an industrial and human dispersal program in the event of a national emergency. This vital factor gives added nationwide importance to this development, in addition to broadening the Federal tax base, increasing purchasing power, and thereby providing an expanding home market for the products of American manufacturing and other enterprises.

The committee's position on power marketing of the project is that the area to be served shall be governed only by economical transmission distance direct or through interconnections with other plants either in the Upper or Lower Basin. This policy is necessary to the economic and financial health of the project. This policy in the committee's opinion accords with established practice and policies of reclamation power operations. The committee intends that full equality of treatment be accorded to both Upper and Lower Basin power customers. Established preferences and sound business principles in accordance with existing reclamation law are intended to be applied in the marketing of power from the project, and it is not intended that Lower Basin customers should be discriminated against in any respect.

The principal amendments recommended are for the purpose of clarification only and relate, first, to the inclusion of 19 additional participating projects in Colorado and Wyoming which can be constructed only after submittal of feasibility reports, and approval and authorization by the Congress. Section 2 is revised to declare that it is not the intention of Congress by authorizing only certain designated projects at this time to preclude future comprehensive water resource developments in the Upper Basin. A provision is included for consultation by the Secretary of the Interior with an Advisory Committee in connection with the operation of works in the Colorado River.

Section 12 of the bill would grant consent to suits against the United States in the Supreme Court by States in the Colorado River Basin to enforce the provisions of specifically named compacts,

projects, Federal statutes, and treaties relating to the release of water from reservoirs in the basin. In order to make certain that the immunity waiver would permit such suits both in a State's own quasi-sovereign capacity and on behalf of those of its political subdivisions that might have water rights under the compacts, projects, or statutes enumerated, the committee amended the section to give legislative recognition to the established judicial doctrine of *parens patriae*.

The waiver of the sovereign immunity of the United States goes only to suits brought by the basin States and not to suits by any other political entity; action would have to be brought by the State itself, and determination as to whether to bring action as *parens patriae* would rest with the State.

For an exposition of the *parens patriae* doctrine, as it relates to the original jurisdiction of the Supreme Court, reference is made to such cases as *Georgia* v. *Pennsylvania Railroad Co. et al.* (324 U. S. 401; 1945); *Kansas* v. *Colorado* (206 U. S. 46; 1906); or *Missouri* v. *Illinois* (180 U. S. 208; 1900).

8. ESTIMATED OVERALL CONSTRUCTION COSTS

The estimated overall construction costs of the projects under each of the several categories set forth in S. 500, as amended, are as follows:

Storage units:	
Authorized for construction (5)	$733, 578, 000
Authorized subject to report to Congress (1)	49, 305, 000
Total storage units (6)	782, 883, 000
Participating projects: Authorized subject to supplemental reports (12)	310, 116, 800
Total projects authorized in S. 500, as amended	1, 092, 999, 800
Participating projects:	
Subject to further approval and authorization by Congress (21)	558, 173, 300
Total all participating projects in S. 500, as amended	868, 290, 100
Project, previously authorized, participating in revenue (1)	7, 287, 000
Total all participating projects (34)	875, 577, 100
Grand total, all projects in S. 500, as amended	1, 658, 460, 100

9. SUMMARY, CONSTRUCTION COSTS AND ALLOCATIONS, COLORADO RIVER STORAGE PROJECT AND PARTICIPATING PROJECTS

Project	State	Construction costs					Repayment of reimbursable costs [2]	
		Total [1]	Nonreimbursable	Reimbursable allocations			By water users [2]	By power
				Power	Municipal water	Irrigation		
Storage units:								
Authorized for construction under S. 500:								
Echo Park	Colorado-Utah	$176,426,000		$128,383,000		$48,043,000		$176,426,000
Glen Canyon	Arizona-Utah	421,270,000		370,974,000		50,296,000		421,270,000
Juniper	Colorado	16,348,000		16,348,000				16,348,000
Flaming Gorge	Utah-Wyoming	82,942,000		52,042,000		30,900,000		82,942,000
Navajo Dam	New Mexico	36,592,000	$1,298,000			35,294,000		35,294,000
Subtotal		733,578,000	1,298,000	567,747,000		164,533,000		732,280,000
Authorized subject to report to the Congress:								
Curecanti (940,000 acre-feet)	Colorado	49,305,000		41,205,000		8,100,000		49,305,000
Total storage units		782,883,000	1,298,000	608,952,000		172,633,000		781,585,000
Participating projects:								
Authorized subject to supplemental reports:								
LaBarge	Wyoming	1,673,300				1,673,300	$495,000	1,178,300
Seedskadee	do	23,272,000				23,272,000	4,785,000	18,487,000
Lyman	do	10,564,000				10,564,000	2,255,000	8,309,000
Silt	Colorado	3,356,000	73,600			3,282,400	1,020,000	2,262,400
Smith Fork	do	3,367,000	24,000			3,343,000	1,045,000	2,298,000
Paonia	do	[4] 6,944,000	152,400			6,791,600	2,414,000	4,377,600
Florida	do	6,941,500	437,900			6,503,600	1,711,500	4,792,100
Pine River project extension	Colorado-New Mexico	5,027,000				5,027,000	2,045,000	2,982,000
Emery County	Utah	9,865,500	229,000			9,636,500	3,715,000	5,921,500
Central Utah (initial phase)	do	231,044,000	5,991,000	46,699,000	45,500,000	127,354,000	[5] 60,691,000	[6 7] 158,862,000
Hammond	New Mexico	2,302,000				2,302,000	370,000	1,932,000
Gooseberry	Utah	5,760,500	33,000			5,727,500	2,375,000	3,352,500
Subtotal		310,116,800	6,940,900	46,699,000	45,500,000	205,476,900	82,921,500	[7] 214,754,400
Total projects authorized in S. 500, as amended		1,092,999,800	8,238,900	655,651,000	45,500,000	378,109,900	82,921,500	996,339,400

Participating projects subject to further approval and authorization by the Congress:								
Navajo irrigation project	New Mexico	175,445,300				175,445,300	30,730,000	144,715,300
San Juan-Chama	do	134,369,000	470,000		26,775,000	107,124,000	54,665,000	79,234,000
Savery-Pot Hook	Colorado-Wyoming	10,814,000				10,814,000	1,390,000	9,424,000
Dolores	Colorado	24,633,000				24,633,000	1,533,000	23,100,000
Sublette, Gunnison River projects	Wyoming	37,099,000		953,000		36,146,000	1,350,000	35,749,000
Fruit Growers Dam extension	Colorado	1,690,000				1,690,000	470,000	1,220,000
Bostwick Park	do	2,634,000				2,634,000	695,000	1,939,000
Dallas Creek	do	10,330,000				10,330,000	950,000	9,380,000
East River	do	212,000				212,000	95,000	117,000
Fruitland Mesa	do	11,551,000				11,551,000	1,060,000	10,491,000
Grand Mesa	do	20,164,000				20,164,000	30,000	20,134,000
Ohio Creek	do	3,402,000				3,402,000	35,000	3,367,000
Tomichi Creek, Cliffs-Divide projects	do	11,523,000				11,523,000	0	11,523,000
Battlement Mesa	do	5,853,700				5,853,700	645,000	5,208,700
Bluestone	do	3,329,900				3,329,900	370,000	2,959,900
Eagle Divide	do	3,411,700				3,411,700	305,000	3,106,700

[1] Exclusive of nonreimbursable Colorado River development fund expenditures for investigations.

[2] Costs allocated to power and municipal water are repaid with interest, including interest during construction.

[3] Repayment by water users toward construction costs over 50-year repayment period beyond a reasonable irrigation development period except 60-year period for Eden project and 68-year period for Paonia project.

[4] Includes $2,035,000 expended on construction of the previously authorized Paonia project.

[5] Includes $15,191,000 in irrigation revenues and $45,500,000 from municipal and industrial water users.

[6] Includes $27,838,000 of excess power revenues from the Central Utah project powerplants accruing during the irrigation repayment periods of this project.

[7] Exclusive of $5,500,000 allocable to purposes of the ultimate phase of Central Utah project.

10. EXECUTIVE REPORTS

The comments of the Departments of the Army, Interior, and Agriculture, including endorsements by the President, the Bureau of the Budget, and the Federal Power Commission are made a part of this report, as follows:

DEPARTMENT OF THE INTERIOR,
OFFICE OF THE SECRETARY,
Washington 25, D. C., February 25, 1955.

Hon. JAMES E. MURRAY,
Chairman, Committee on Interior and Insular Affairs,
United States Senate, Washington 25, D. C.

MY DEAR SENATOR MURRAY: A report has been requested from this Department on S. 500, a bill to authorize the Secretary of the Interior to construct, operate, and maintain the Colorado River storage project and participating projects, and for other purposes.

In his address to the Congress on the state of the Union, President Eisenhower said (H. Doc. No. 1, 84th Cong., p. 8):

"* * * the Federal Government must shoulder its * * * partnership obligations by undertaking projects of such complexity and size that their success requires Federal development. In keeping with this principle I again urge the Congress to approve the development of the upper Colorado River Basin to conserve and assure better use of precious water essential to the future of the West."

Likewise in his budget message (H. Doc. No. 16, 84th Cong., p. M65) the President said:

"I also recommend enactment of legislation authorizing the Bureau of Reclamation to undertake construction of two comprehensive river-basin improvements which are beyond the capacity of local initiative, public or private, but which are needed for irrigation, power, flood control, and municipal and industrial water supply. These are the Upper Colorado River Basin development in the States of Colorado, Utah, Wyoming, Arizona, and New Mexico, and the Fryingpan-Arkansas development in Colorado. The Colorado River development will enable the upper basin States to conserve floodwaters and to assure the availability of water and power necessary for the economic growth of the region. * * * Sale of power generated at these developments will repay the power investment within 50 years and will make a contribution toward repayment of other investments."

In the budget itself it was pointed out (p. 830) that the administration proposes to initiate construction of the Colorado River storage project during the next fiscal year if it is authorized and that the budget includes an item for funds to be requested for this purpose.

The substance of our views on the proper contents of a bill to implement the President's recommendation and particularly on those projects and units which should be covered in the initial legislation is contained in the draft of a bill which was developed by the Bureau of the Budget in collaboration with this Department and submitted to your committee on April 1, 1954, in connection with S. 1555, 83d Congress, a predecessor of the present S. 500.

We recommend that S. 500 be examined in the light of the proposal there made and in the light of the two letters dated March 18, 1954, from the Director of the Bureau of the Budget to your committee and to this Department which are reprinted in Senate Report No. 1983, 83d Congress, and that, with suitable amendments, S. 500 be enacted.

The Bureau of the Budget has advised that there would be no objection to the submission of this report to your committee.

Sincerely yours,

FRED G. AANDAHL,
Assistant Secretary of the Interior.

EXECUTIVE OFFICE OF THE PRESIDENT,
BUREAU OF THE BUDGET,
Washington 25, D. C., March 17, 1955.

Hon. JAMES E. MURRAY,
Chairman, Committee on Interior and Insular Affairs,
United States Senate, Washington 25, D. C.

MY DEAR MR. CHAIRMAN: This will acknowledge Mr. Stewart French's letter of January 20, 1955, requesting the views of the Bureau of the Budget on S. 500,

a bill to authorize the Secretary of the Interior to construct, operate, and maintain the Colorado River storage project and participating projects, and for other purposes.

Enactment of legislation authorizing the Colorado River storage project was recommended by the President both in his state of the Union message and his budget message this year. The views of this Bureau concerning the details of such legislation were expressed in letters of March 18, 1954, to your committee and to the Secretary of the Interior, which are printed in Senate Report No. 1983, 83d Congress, 2d session. On April 1, 1954, a draft bill, which was developed in collaboration with the Department of the Interior, was submitted to your committee.

With respect to the detailed provisions of S. 500, this Bureau has the following comments:

1. In the absence of new information justifying their inclusion at this time we have no basis for reappraising the merits of those projects heretofore considered and not recommended for authorization either by the Secretary of the Interior or the Bureau of the Budget. Similarly, in the absence of detailed planning reports for those projects not heretofore considered by the Bureau of the Budget, including data on engineering, financial, and economic feasibility, detailed estimates of costs and benefits, and sufficient other pertinent information necessary for a complete understanding of the justification and necessity for the work, there is no adequate basis for appraising the merits of such projects. For these reasons we believe that the authorizations for the Cross Mountain, Flaming Gorge, Curecanti, and Navajo units, and the Gooseberry, San Juan-Chama, and Navajo participating projects should be deferred until the necessary information justifying such action has been submitted to the Congress in accordance with established procedures.

2. There would appear to be ample justification for the closest cooperation between the Departments of Agriculture and Interior concerning the agricultural aspects of the participating projects. The use of the word "consultation" on page 3, line 25, would therefore be understood to mean consultation in its broadest sense.

3. Section 7 and reference to it in section 1 (2) (a) (iii) is interpreted to mean that all costs for improvements in fish and wildlife, as well as mitigation of losses not attributable to the construction of the project, shall be nonreimbursable and nonreturnable and shall be financed by the agencies responsible for these programs. However, the cost of preventing damages attributable to the construction of the project should be treated as a part of the cost and allocated to the various purposes in the same manner as other damages. The addition of clarifying language would avoid misinterpretations.

4. The inclusion of section 10 in our draft bill referred to above, namely, "Construction of the projects herein authorized shall proceed as rapidly as is consistent with budgetary requirements and the economic needs of the country," would appear to be a desirable addition to S. 500, since this would be the principal consideration in determining rate of construction and development.

5. It is considered that the authorization should be limited to $950 million, as proposed in the draft bill, in order to give the Congress a greater measure of control over the extent of the development and an opportunity to review the program from time to time.

6. Since we do not have detailed information concerning the city of Denver's proposed Blue River project or the effects of the provisions of section 11 of S. 500 on the interests of the Federal Government or on pending litigation, we are not in a position to comment on this section at this time, and have requested the Department of Justice to review this section.

7. The Bureau of the Budget also is not in a position to comment on section 12, until we have received the views of the Department of Justice on this section.

8. It is recommended that the title be amended to read, "To authorize the Secretary of the Interior to construct, operate, and maintain initial units of the Colorado River storage project and participating projects, and for other purposes."

Accordingly, it is recommended that S. 500 be amended as outlined above.

Sincerely yours,

DONALD R. BELCHER,
Assistant Director.

FEDERAL POWER COMMISSION,
Washington 25, March 25, 1955.

Re S. 500, 84th Congress, 1st session.

Hon. JAMES E. MURRAY,
Chairman, Committee on Interior and Insular Affairs,
United States Senate, Washington 25, D. C.

DEAR MR. CHAIRMAN: In response to your request there are enclosed three copies of the report of the Federal Power Commission on the bill S. 500, 84th Congress, to authorize the Secretary of the Interior to construct, operate, and maintain the Colorado River storage project and participating projects, and for other purposes.

We have just been advised that there is no objection by the Bureau of the Budget to the presentation of this report to your committee.

Sincerely yours,

JEROME K. KUYKENDALL, *Chairman.*

FEDERAL POWER COMMISSION REPORT ON S. 500, 84TH CONGRESS

A BILL TO AUTHORIZE THE SECRETARY OF THE INTERIOR TO CONSTRUCT, OPERATE, AND MAINTAIN THE COLORADO RIVER STORAGE PROJECT AND PARTICIPATING PROJECTS, AND FOR OTHER PURPOSES

Section 1 of the bill would authorize the Secretary of the Interior to construct, operate, and maintain the Cross Mountain, Curecanti, Echo Park, Flaming Gorge, Glen Canyon, and Navajo initial units of the Colorado River storage project, consisting of dams, reservoirs, powerplants, transmission facilities, and appurtenant works, provided that the authority to construct the Curecanti Dam shall not be undertaken until the Secretary has, on the basis of further engineering and economic investigations, reexamined the economic justification of such unit and, accompanied by appropriate documentation in the form of a supplemental report, has certified to the Congress and to the President that, in his judgment, the benefits of such unit will exceed its costs. The Commission believes that such conditional authorization of the Curecanti project is highly desirable, and that it would be desirable to amend the bill to likewise require conditional authorization with respect to undertaking construction of the Cross Mountain, Flaming Gorge, and Navajo projects.

Based upon a consideration of the power features involved, it is believed that authorization of the Echo Park and Glen Canyon Dam and Reservoir projects, as provided for in the bill, is desirable for inclusion in the initial program for future development of the Colorado River Basin. The Echo Park project is favorably located to assist in serving power loads of the northerly part of the Upper Colorado River Basin, and the Glen Canyon project is favorably located for assisting in serving power loads to the south.

Section 1 of the bill would also authorize 14 enumerated participating reclamation and power projects provided that the construction of the participating projects shall not be undertaken until the Secretary has reexamined the economic justification of each project and, accompanied by appropriate documentation in the form of a supplemental report, has certified to the Congress, through the President, that, in his judgment, the benefits of such project will exceed its costs, and that the financial reimbursability requirements set forth in section 4 of the bill can be met. Such supplemental reports, except for San Juan-Chama and the Navaoj projects, would not, however, be subject to section 1 (c) of the Flood Control Act of 1944 (58 Stat. 887) which provides that the Secretary of the Interior, in making investigations and reports for irrigation and purposes incidental thereto, shall give the affected State or States opportunity to cooperate in the investigations. The Commission agrees that authorization of these participating reclamation and power projects should be made conditional on the findings and recommendations of supplemental detailed reports dealing with their economic and engineering feasibility, as provided for in the bill, but it does not feel that the public interest requires or justifies the exemption of such supplemental reports from the opportunity for State cooperation afforded by section 1 (c) of the Flood Control Act of 1944.

Section 2 of the bill declares it to be the intent of Congress to authorize further units of the storage project and new participating projects upon the basis of the data which may be made available to it in the future in accordance with this bill and also in conformity with beneficial consumptive use provisions of article III

of the Upper Colorado River Basin compact. The costs of any participating projects thus authorized shall be amortized in accordance with the Federal reclamation law and this bill.

Section 4 provides that revenues in excess of operating needs shall be paid annually to the general fund of the Treasury to return the costs of each unit, participating project, or any separable feature thereof which are allocated to commercial power within a period not exceeding 50 years from the date of completion of such unit, participating project, or separable feature thereof. It also provides that revenues in excess of operating needs shall be paid annually to the general fund of the Treasury to return interest on the unamortized balance of the investment (including interest during construction) in the commercial power features of each unit, participating project, or any separable feature thereof, at a rate determined by the Secretary of the Treasury as of the time the first advance is made for initiating construction of said unit or project. These repayment provisions correspond generally with the Commission's established practice in analyzing and evaluating Federal multiple-purpose power projects of assuming amortization of power investments in not to exceed 50 years from the in-service date, with interest, usually at the rate of 2½ percent.

Section 5 provides that upon completion of each unit, participating project, or separable feature thereof, the Secretary of the Interior shall allocate the total costs (excluding certain nonreimbursable costs for recreation and fish and wildlife) of constructing said unit, project, or feature to power, irrigation, municipal water supply, flood control, navigation, or any other purposes authorized under reclamation law. The Commission believes that the bill should provide for such cost allocations to be made in conformity with those standards and procedures which may have been established for interagency use at that time.

Section 5 also provides that the Secretary would be required to report to the Congress, on January 1 of each year beginning with the fiscal year 1956, upon the status of the revenues from and the cost of constructing, operating, and maintaining the Colorado River storage project and the participating projects. The Secretary's report would be prepared to reflect accurately the Federal investment allocated at that time to power, to irrigation, and to other purposes, the progress of return and repayment thereon, and the estimated rate of progress, year by year, in accomplishing full repayment. This requirement of periodic detailed reports on the financial aspects of the proposed improvements appears to be highly desirable.

In several statutes (e. g., sec. 5, act of December 22, 1944, 58 Stat. 887, 890; act of July 31, 1950, 64 Stat. 382) Congress has provided that the rate schedules for power sales from certain Federal power projects shall be subject to approval by the Federal Power Commission. The Commission is of the opinion that similar rate control should be provided in this instance and that it should be authorized not only to approve the initial rate schedules, but should have authority to review the rates at appropriate intervals and prescribe those rates which will return to the United States the costs which are properly chargeable to power under the criteria laid down by Congress. It should be noted that the Commission is not an operating agency, but was created by Congress to act as its agent to perform functions directly related to the rate supervision here recommended.

The Commission believes that the authority to determine the portion of the investment in multiple-purpose projects allocable to electric power should rest with the agency responsible for the approval of electric power rates. In this connection, the Commission points out that it has been given authority to make cost allocations for the Bonneville and McNary projects on the Columbia River, the Fort Peck project on the Missouri river, and four proposed projects on the lower Snake River.

If the Congress should see fit to enact this legislation, it is recommended that the Commission be given jurisdiction over rates for the sale of power from the projects in the Colorado River Basin and authority to allocate the costs of such projects among the several project purposes. The Commission also recommends that authorization to undertake construction of the Cross Mountain, Flaming Gorge, and Navajo projects be made conditional upon supplemental investigation reports by the Secretary of the Interior, and that section 1 (c) of the Flood Control Act of 1944, relating to opportunity for State participation, be made applicable to supplemental reports of the Secretary on participating projects.

FEDERAL POWER COMMISSION,
By JEROME K. KUYKENDALL,
Chairman.

DEPARTMENT OF AGRICULTURE,
Washington 25, D. C., March 28, 1955.

Hon. JAMES E. MURRAY,
Chairman, Committee on Interior and Insular Affairs,
United States Senate.

DEAR SENATOR MURRAY: This is in reply to Mr. Stewart French's letter of January 21, 1955, requesting a report by this Department on S. 500, a bill to authorize the Secretary of the Interior to construct, operate, and maintain the Colorado River storage project and participating projects, and for other purposes.

Since S. 500 relates primarily to Department of the Interior authority, this Department takes no position regarding enactment of the bill. However, in the event favorable consideration is given to such legislation, we recommend (1) that it provide for cooperation by the Secretary of Agriculture with the Secretary of the Interior in the appraisal, before authority to construct projects becomes effective, of the prospective direct agricultural benefits of each proposed project that is expected to produce such benefits; and (2) that it provide that the Secretary of Agriculture shall be granted the same authorities as the Secretary of the Interior under the provisions of section 7 when any unit or project is within or partly within the boundary of a national forest.

The bill would authorize the Secretary of the Interior to construct, operate, and maintain 6 specified initial units of the Colorado River storage project, consisting of dams, reservoirs, powerplants, transmission facilities, and appurtenant works and, after reexamination of the economic justification of each such project including a reappraisal of the prospective direct agricultural benefits after consultation with the Secretary of Agriculture, 14 other specified participating projects. It would declare the intent of the Congress to authorize additional units of the Colorado River storage project and additional participating projects. It also would authorize the Secretary of the Interior to plan, construct, operate, and maintain public recreational facilities on lands withdrawn or acquired for Colorado River storage project units and participating projects.

In reporting to the Committee on Interior and Insular Affairs on June 30, 1954, on S. 1555 we referred to a substitute draft bill submitted to the Congress by the Secretary of the Interior on April 1, 1954. It provided for a reappraisal of the prospective direct agricultural benefits of the project, made by the Secretary of the Interior in cooperation with the Secretary of Agriculture. We consider that provision to more clearly express the relationship that should prevail in such a reappraisal than the provision for consultation included in S. 500.

The Department of Agriculture has a responsibility, commensurate with its national responsibilities, in the agricultural phases of the development, conservation, and utilization of land and water in the Upper Colorado River Basin which would be authorized by such bills. This includes the furnishing of reports to the President and the Congress on the agricultural aspects concurrently with reports by other agencies on other aspects of the proposed developments and the planning, operation, and maintenance of public recreational facilities on those portions of storage project units or participating projects that are within national forest boundaries.

The Bureau of the Budget advises there is no objection to the submission of this report.

Sincerely yours,

TRUE D. MORSE, *Under Secretary.*

DEPARTMENT OF THE ARMY,
Washington 25, D. C., April 6, 1955.

Hon. JAMES E. MURRAY,
Chairman, Committee on Interior and Insular Affairs,
United States Senate.

DEAR MR. CHAIRMAN: Reference is made to your request for the views of the Department of the Army with respect to S. 500, 84th Congress, a bill to authorize the Secretary of the Interior to construct, operate, and maintain the Colorado River storage project and participating projects, and for other purposes.

The Department of the Army has considered the above-mentioned bill. The purpose of the bill is to authorize the principal features of the Colorado River storage project and participating projects of the Bureau of Reclamation.

Comments on four of the major units (Cross Mountain, Flaming Gorge, Navajo, and Curecanti) in the comprehensive plan covered by S. 500 and on the participating projects are not practicable from an engineering and economic standpoint

without an up-to-date engineering and economic report. However, with respect to the two remaining major units (Echo Park and Glen Canyon), the Department of the Army has reviewed a report of the Department of the Interior and has advised that Department that these two storage projects appear to be justified.

Although the Department of the Army is authorized to undertake certain examinations and surveys in the Upper Colorado River Basin and has an interest in the Rio Grande Basin which is involved in the bill to the extent of the diversion contemplated in one of the participating projects, there appears to be no basic conflict between the project units proposed in the bill and any which the Department now has or might have an interest in as a result of future investigation or construction. However, because of the departmental interest in flood control and navigation, it is recommended that the bill be amended in the following manner:

(1) In section 1, page 4, lines 8–10, strike the portion beginning with the comma in line 8 and extending through the word "not" in line 10 in order that section 1 (c) of the Flood Control Act of 1944, having to do with consultation with affected States and the Secretary of the Army and providing for comment by those parties, will be made applicable to supplemental reports on participating projects;

(2) In section 1, page 4, line 15 after "affected States", insert "and the Secretary of the Army";

(3) In section 3, page 6, line 12, after "*Provided,*" insert "That allocation of costs to flood control or navigation as nonreimbursable costs shall be determined by the Secretary after consultation with the Chief of Engineers and the Secretary of the Army and any necessary investigations or studies therefor may be performed under a cooperative agreement with the Secretary of the Army: *Provided further,*".

In connection with S. 500, the attention of your committee is invited to draft legislation which was submitted by the Secretary of the Interior to the 83d Congress on April 1, 1954, and which is set forth at pages 13–16 of Senate Report 1983 on S. 1555 of the 83d Congress. The draft bill was intended to bring proposed authorizing legislation into correlation with the project report referred to above in that it would authorize only the Echo Park and Glen Canyon storage units, and, as S. 500 does, would grant provisional authorization only for certain of the participating projects. To the extent that the bill authorizes only these two major storage units, the Department of the Army considers the draft bill as being preferable to S. 500 and offers no objection to the authorization of the improvements proposed in the draft legislation. However, the suggestions in (1) and (3) above would apply as well to the draft bill, with the exception that the language in (3) would be inserted in the fifth line of section 3 at page 14 of the above-mentioned Senate report, and an appropriate deletion similar to (1) above would be made in the last line of section 1 at page 13 of the Senate report.

The Bureau of the Budget advises that there is no objection to the submission of this report.

Sincerely yours,

CHARLES C. FINUCANE,
Acting Secretary of the Army.

11. THE COMMITTEE AMENDMENTS

For the information of the sponsors of S. 500 and for the other Members of the Senate, the text of the measure as introduced with each change shown in *italic* is set forth below. The specific amendments are numbered and each is explained individually immediately following the text of the amended bill.

(S. 500 as introduced is shown in Roman type. Amendments by the Committee on Interior and Insular Affairs to S. 500 as introduced, are numbered and shown in *italic.*)

[S. 500, 84th Cong., 1st sess.]

[Omit the part struck through and insert the part printed in *italic*]

A BILL To authorize the Secretary of the Interior to construct, operate, and maintain the Colorado River storage project and participating projects, and for other purposes

Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled, That, in order to initiate the comprehensive development of the water resources of the Upper Colorado River Basin, the

Congress, in the exercise of its constitutional authority to provide for the general welfare, to regulate commerce among the States and with the Indian tribes, and to make all needful rules and regulations respecting property belonging to the United States, and for the purposes, among others, of regulating the flow of the Colorado River, storing water for beneficial consumptive use, [1] ~~making it possible for the States of the Upper Basin to utilize~~ *commencing a program for utilization in the States of the Upper Basin*, consistently with the provisions of the Colorado River Compact, the apportionments made to and among them in the Colorado River Compact and the Upper Colorado River Basin Compact, respectively, providing for the reclamation of arid and semiarid land, for the control of floods and for the improvement of navigation, and the generation of hydroelectric power, as an incident of the foregoing purposes, hereby authorizes the Secretary of the Interior (1) to construct, operate, and maintain the following initial units of the Colorado River storage project, consisting of dams, reservoirs, powerplants, transmission facilities and appurtenant works: [2] ~~Gross Mountain,~~ Curecanti, Echo Park, Flaming Gorge, Glen Canyon, [3] *Juniper*, and Navajo: *Provided*, That the Curecanti Dam shall be constructed to a height which will impound not less than nine hundred and forty thousand acre-feet of water or will create a reservoir of such greater capacity as can be obtained by a high waterline located at seven thousand five hundred and twenty feet above mean sea level [4] *and approved by the Colorado Water Conservation Board*, and that construction thereof, [5] *and of the Juniper unit*, shall not be undertaken until the Secretary has, on the basis of further engineering and economic investigations, reexamined the economic justification of [6] ~~such~~ each unit and, accompanied by appropriate documentation in the form of a supplemental report, has certified to the Congress and to the President that, in his judgment, the benefits of [7] ~~such~~ *each* unit will exceed its costs; and (2) to construct, operate, and maintain the following additional reclamation projects (including power-generating and transmission facilities related thereto), hereinafter referred to as participating projects: Central Utah (initial phase); Emery County, Florida, Gooseberry, Hammond, La Barge, Lyman, Paonia (including the Minnesota unit, a dam and reservoir on Muddy Creek just above its confluence with the North Fork of the Gunnison River, and other necessary works), Pine River Extension, Seedskadee, Silt, Smith Fork, San Juan-Chama, Navajo, [8] *Parshall, Troublesome, Rabbit Ear, Eagle Divide, Woody Creek, West Divide, Bluestone, Battlement Mesa, Tomichi Creek, East River, Ohio Creek, Fruitland Mesa, Bostwick Park, Grand Mesa, Dallas Creek, Savery-Pot Hook, Dolores, Fruit Growers Extension, and Sublette*: *Provided*, That [9] ~~(a)~~ construction of the participating projects set forth in this clause (2) shall not be undertaken until the Secretary has reexamined the economic justification of such project and, accompanied by appropriate documentation in the form of a supplemental report, has certified to the Congress, through the President, that, in his judgment, the benefits of such project will exceed its costs, and that the financial reimbursability requirements set forth in section 4 of this Act can be met. The Secretary's supplemental report for each such project shall include, among other things, (i) a reappraisal of the prospective direct agricultural benefits of the project made by the Secretary after consultation with the Secretary of Agriculture; (ii) a reevaluation of the nondirect benefits of the project; and (iii) allocations of the total cost of construction of each participating project or separable features thereof, excluding any expenditures authorized by section 7 of this Act, to power, irrigation, municipal water supply, flood control or navigation, or any other purpose authorized under reclamation law. [10] ~~Section 1 (c) of the Flood Control Act of 1944 shall, except as hereinafter provided for the San Juan-Chama and the Navajo participating projects, not be applicable to such supplemental reports; and, (b) that no appropriation for or construction of the San Juan-Chama project or the Navajo participating project shall be made or begun until coordinated reports thereon shall have been submitted to the affected States, including (but without limiting the generality of the foregoing) the State of Texas, pursuant to the Act of December 22, 1944, and said projects shall have been approved and authorized by the Congress~~ *Except as hereinafter provided, section 1 (c) of the Flood Control Act of 1944 shall not be applicable to such supplemental reports: Provided further, That with respect to the San Juan-Chama, Navajo, Parshall, Troublesome, Rabbit Ear, Eagle Divide, Woody Creek, West Divide, Bluestone, Battlement Mesa, Tomichi Creek, East River, Ohio Creek, Fruitland Mesa, Bostwick Park, Grand Mesa, Dallas Creek, Savery-Pot Hook, Dolores, Fruit Growers Extension, and Sublette participating projects no appropriation for or construction of such participating projects shall be made or begun until coordinated reports thereon shall have been submitted to the affected States (which in the case of*

the San Juan-Chama and Navajo participating projects shall include the State of Texas), pursuant to the Act of December 22, 1944, and such participating projects shall have been approved and authorized by Act of Congress: Provided further, That with reference to the San Juan-Chama project, it shall be limited to a single off stream dam and reservoir on a tributary of the Chama River to be used solely for the control and regulation of water imported from the San Juan River, that no power facilities shall be established, installed, or operated along the diversion or on the reservoir or dam, and such dam and reservoir shall at all times be operated by the Bureau of Reclamation of the Department of the Interior in strict compliance with the Rio Grande Compact as administered by the Rio Grande Compact Commission.

[11] ~~SEC. 2. In order to achieve such comprehensive development as will assure the consumptive use in the States of the Upper Colorado River Basin of waters of the Colorado River system the use of which is apportioned to the Upper Colorado River Basin by the Colorado River Compact and to each State thereof by the Upper Colorado River Basin Compact, it is the intent of the Congress in the future to authorize the construction, operation, and maintenance of further units of the Colorado River storage project, of additional phases of participating projects authorized in this Act, and of new participating projects as additional information becomes available and additional needs are indicated. It is hereby declared to be the purpose of the Congress to authorize as participating projects only projects (including units or phases thereof)—~~

~~(1) for the use, in one or more of the States designated in article III of the Upper Colorado River Basin Compact, of waters of the Upper Colorado River system the consumptive use of which is apportioned to those States by that article; and~~

~~(2) for which pertinent data sufficient to determine their probable engineering and economic justification and feasibility shall be available. It is likewise declared to be the policy of the Congress that the costs of any participating project authorized in the future shall be amortized from its own revenues to the fullest extent consistent with the provisions of this Act and Federal reclamation law.~~

[12] *SEC. 2. It is not the intention of Congress, in authorizing only those projects designated in section 1 of this Act, to limit, restrict, or otherwise interfere with such comprehensive developments as will provide for the consumptive use by States of the Upper Colorado River Basin of waters, the use of which is apportioned to the Upper Colorado River Basin by the Colorado River Compact and to each State thereof by the Upper Colorado River Basin Compact, nor to preclude consideration and authorization by the Congress of additional projects under the allocations in the compacts as additional needs are indicated.*

SEC. 3. Except as otherwise provided in this Act, in constructing, operating, and maintaining the units of the Colorado River storage project and the participating projects listed in section 1 of this Act, the Secretary shall be governed by the Federal reclamation laws (Act of June 17, 1902, 32 Stat. 388, and Acts amendatory thereof or supplementary thereto): *Provided*, That (a) **[13]** ~~irrigation repayment~~ contracts shall be entered into which, except as otherwise provided for the Paonia and Eden projects, provide for repayment of the **[14]** *irrigation* obligation assumed thereunder with respect to any project contract unit over a period of not more than fifty years exclusive of any development period authorized by law; (b) prior to construction of irrigation distribution facilities, repayment contracts shall be made with an "organization" as defined in paragraph 2 (g) of the Reclamation Project Act of 1939 (53 Stat. 1187) which has the capacity to levy assessments upon all taxable real property located within its boundaries to assist in making repayments, except where a substantial proportion of the lands to be served are owned by the United States; (c) contracts relating to municipal water supply may be made without regard to the limitations of the last sentence of section 9 (c) of the Reclamation Project Act of 1939; and (d), as to Indian lands within, under or served by any participating project, payment of construction costs within the capability of the land to repay shall be subject to the Act of July 1, 1932 (47 Stat. 564). All units and participating projects shall be subject to the apportionments of the use of water between the Upper and Lower Basins of the Colorado River and among the States of the Upper Basin fixed in the Colorado River Compact and the Upper Colorado River Basin Compact, respectively, and to the terms of the treaty with the United Mexican States (Treaty Series 994).

SEC. 4. (a) There is hereby authorized a separate fund in the Treasury of the United States to be known as the Upper Colorado River Basin Fund (hereinafter

referred to as the Basin Fund), which shall remain available until expended, as hereafter provided, for carrying out provisions of this Act other than section 7.

(b) All appropriations made for the purpose of carrying out the provisions of this Act, other than section 7, shall be credited to the Basin Fund as advances from the general fund of the Treasury, **[15]** *and such funds shall be available for expenditures within the limitations of the provisions of this Act.*

(c) All revenues collected in connection with the operation of the Colorado River storage project and participating projects shall be credited to the Basin Fund, and shall be available, without further appropriation, for (1) defraying the costs of operation, maintenance, and replacements of, and emergency expenditures for, all facilities of the Colorado River storage project and participating projects, within such separate limitations as may be included in annual appropriation acts, (2) payment as required by subsection (d) of this section, (3) payment of the reimbursable construction costs of the Paonia project which are beyond the ability of the water users to repay within the period prescribed in the Act of June 25, 1947 (61 Stat. 181), said payment to be made within fifty years after completion of that portion of the project which has not been constructed as of the date of this Act, and (4) payment in connection with the irrigation features of the Eden project as specified in the Act of June 28, 1949 (63 Stat. 277): *Provided*, That revenues credited to the Basin Fund shall not be available for appropriation for construction of the units and participating projects authorized by or pursuant to this Act. **[16]** *After repayments to the United States of all money required to be repaid under this Act, such revenue shall be available for expenditures within the Upper Colorado River Basin as may hereafter be authorized by Congress.*

(d) Revenues in the Basin Fund in excess of operating needs shall be paid annually to the general fund of the Treasury to return—

(1) the costs of each unit, participating project, or any separable feature thereof which are allocated to power pursuant to section 5 of this Act, within a period not exceeding fifty years from the date of completion of such unit, participating project, or separable feature thereof;

(2) the costs of each unit, participating project, or any separable feature thereof which are allocated to municipal water supply pursuant to section 5 of this Act, within a period not exceeding fifty years from the date of completion of such unit, participating project, or separable feature thereof;

(3) interest on the unamortized balance of the investment (including interest during construction) in the power and municipal water supply features of each unit, participating project, or any separable feature thereof, at a rate determined by the Secretary of the Treasury as provided in subsection (e), and interest due shall be a first charge; and

(4) the costs of each unit, participating project, or any separable feature thereof which are allocated to irrigation pursuant to section 5 of this Act within a period not exceeding fifty years, in addition to any development period authorized by law, from the date of completion of such unit, participating project, or separable features thereof, or, in the cases of the Paonia project and of Indian lands, within a period consistent with other provisions of law applicable thereto.

(e) The interest rate applicable to each unit of the storage project and each participating project shall be determined by the Secretary of the Treasury as of the time the first advance is made for initiating construction of said unit or project. Such interest rate shall be determined by calculating the average yield to maturity on the basis of daily closing market bid quotations during the month of June next preceding the fiscal year in which said advance is made, on all interest-bearing marketable public debt obligations of the United States having a maturity date of fifteen or more years from the first day of said month, and by adjusting such average annual yield to the nearest one-eighth of 1 per centum.

(f) Business-type budgets shall be submitted to the Congress annually for all operations financed by the Basin Fund.

SEC. 5. Upon completion of each unit, participating project of separable feature thereof the Secretary shall allocate the total costs (excluding any expenditures authorized by section 7 of this Act) of constructing said unit, project or feature to power, irrigation, municipal water supply, flood control, navigation, or any other purposes authorized under reclamation law. Allocations of construction, operation and maintenance costs to authorized nonreimbursable purposes shall be nonreturnable under the provisions of this Act. On January 1 of each year the Secretary shall report to the Congress for the previous fiscal year, beginning with the fiscal year **[17]** ~~1955~~ *1956*, upon the status of the revenues from and the cost of constructing, operating, and maintaining the Colorado River storage project

and the participating projects. The Secretary's report shall be prepared to reflect accurately the Federal investment allocated at that time to power, to irrigation, and to other purposes, the progress of return and repayment thereon, and the estimated rate of progress, year by year, in accomplishing full repayment.

SEC. 6. The hydroelectric powerplants [18] *and transmission lines* authorized by this Act to be constructed, operated, and maintained by the Secretary shall be operated in conjunction with other Federal powerplants, present and potential, so as to produce the greatest practicable amount of power and energy that can be sold at firm power and energy rates, but no exercise of the authority hereby granted shall affect or interfere with the operation of any provision of the Colorado River Compact, the Upper Colorado River Basin Compact, or the Boulder Canyon Project Act.

SEC. 7. In connection with the development of the Colorado River storage project and of the participating projects, the Secretary is authorized and directed to investigate, plan, construct, operate, and maintain (1) public recreational facilities on lands withdrawn or acquired for the development of said project or of said participating projects, to conserve the scenery, the natural, historic, and archeologic objects, and the wildlife on said lands, and to provide for public use and enjoyment of the same and of the water areas created by these projects by such means as are consistent with the primary purposes of said projects; and (2) facilities to mitigate losses of and improve conditions for the propagation of fish and wildlife. The Secretary is authorized to acquire lands and to withdraw public lands from entry or other disposition under the public land laws necessary for the construction, operation, and maintenance of the facilities herein provided [19] *for*, and to dispose of them to Federal, State, and local governmental agencies by lease, transfer, exchange, or conveyance upon such terms and conditions as will best promote their development and operation in the public interest. All costs incurred pursuant to this section shall be nonreimbursable and nonreturnable.

SEC. 8. Nothing contained in this Act shall be construed to alter, amend, repeal, construe, interpret, modify, or be in conflict with any provision of the Boulder Canyon Project Act (45 Stat. 1057), the Boulder Canyon Project Adjustment Act (54 Stat. 774), the Colorado River Compact, the Upper Colorado River Basin Compact, the Rio Grande Compact of 1938, or the Treaty With the United Mexican States (Treaty Series 994).

SEC. 9. Expenditures for the [20] ~~Cross Mountain,~~ Flaming Gorge, Glen Canyon, [21] *Juniper*, Navajo and Echo Park initial units of the Colorado River storage project may be made without regard to the soil survey and land classification requirements of the Interior Department Appropriation Act, 1954.

SEC. 10. There are hereby authorized to be appropriated such sums as may be required to carry out the purposes of this Act.

SEC. 11. The appropriate agencies of the United States are authorized to convey to the city and county of Denver, Colorado, for use as a part of its municipally owned water system, such interests in lands and water rights used or acquired by the United States solely for the generation of power and other property of the United States as shall be required in connection with the development or use of its Blue River project, upon payment by Denver for any such interest of the value thereof at the time of its acquisition by Denver, and provided that any such transfer shall be so limited as not to preclude the use of the property other than water rights for the necessary functions of the United States Government.

SEC. 12. [22] (*a*) In the operation and maintenance of all facilities, authorized by Federal law and under the jurisdiction and supervision of the Secretary of the Interior, in the basin of the Colorado River, the Secretary of the Interior is directed to comply with the applicable provisions of the Colorado River Compact, [23] *the Upper Colorado River Basin Compact*, the Boulder Canyon Project Act, the Boulder Canyon Project Adjustment Act, and the Treaty with the United Mexican States, in the storage and release of water from reservoirs in the Colorado River Basin. In the event of the failure of the Secretary of the Interior to so comply, any State of the Colorado River Basin may maintain an action in the Supreme Court of the United States, [24] *either on its own behalf or as parens patriae*, to enforce the provisions of this section, and consent is given to the joinder of the United States as a party in such suit or suits. No right to impound or use water for the generation of power or energy, created or established by the building, operation or use of any of the powerplants authorized by this Act, shall be deemed to have priority over or otherwise operate to preclude or impair any use, regardless of the date of origin of such use, of the waters of the Colorado River [25] ~~and its tributaries~~ *System* for domestic or agricultural purposes [26] ~~within any of the States of the Upper Colorado River Basin.~~

[27] (b) *In the operation of works under his jurisdiction for the storage and release of waters of the Colorado River system and in programing the storage and release of such waters, the Secretary of the Interior shall consult from time to time with an advisory committee consisting of one representative appointed by each of the Colorado River Basin States, one representative of the Colorado River Board of California, one representative of the Upper Colorado River Commission, and one representative of the United States Section of the International Boundary Commission, United States and Mexico.*

SEC. 13 As used in this Act—

The terms "Colorado River Basin", "Colorado River Compact", "Colorado River System", "Lee Ferry", "States of the Upper Division", "Upper Basin", and "domestic use" shall have the meaning ascribed to them in article II of the Upper Colorado River Basin Compact;

The term "States of the Upper Colorado River Basin" shall mean the States of Arizona, Colorado, New Mexico, Utah, and Wyoming;

The term "Upper Colorado River Basin" shall have the same meaning as the term "Upper Basin";

The term "Upper Colorado River Basin Compact" shall mean that certain compact executed on October 11, 1948, by commissioners representing the States of Arizona, Colorado, New Mexico, Utah, and Wyoming, and consented to by the Congress of the United States of America by Act of April 6, 1949 (63 Stat. 31);

The term "Rio Grande Compact" shall mean that certain compact executed on March 18, 1938, by commissioners representing the States of Colorado, New Mexico, and Texas and consented to by the Congress of the United States of America by Act of May 31, 1939 (53 Stat. 785); and

The term "treaty with the United Mexican States" shall mean that certain treaty between the United States of America and the United Mexican States signed at Washington, District of Columbia, February 3, 1944, relating to the utilization of the waters of the Colorado River and other rivers, as amended and supplemented by the protocol dated November 14, 1944, and the understandings recited in the Senate resolution of April 18, 1945, advising and consenting to ratification thereof.

12. EXPLANATION OF AMENDMENTS

[1] Strike out "making it possible for the States of the Upper Basin to utilize", and insert in lieu thereof *commencing a program for utilization in the States of the Upper Basin,* .

[1] Clarifying amendment. This substitution of language is to make it clear that this is the commencement of a program for utilization of Colorado River waters in the States of the Upper Basin, and does not in any way bar the States of the Upper Basin from subsequent utilization of additional waters through other projects.

[2] and [3] Strike out "Cross Mountain", and insert in alphabetical order *Juniper.*

[2] and [3] Gov. Edwin C. Johnson, of Colorado, in his testimony before the Committee, advised there would be serious flooding of irrigated areas if the Cross Mountain Dam were to be built. It was his opinion that the Juniper Dam, although a smaller project, would be more desirable and could be supplemented by other dams on the Yampa River.

[4] After the words "sea level" insert *and approved by the Colorado Water Conservation Board,* .

[4] Inasmuch as the Colorado Water Conservation Board is the official water agency of the State, this amendment was recommended.

[5] After the word "thereof," insert *and of the Juniper unit,* .

[5] A detailed feasibility report has not yet been completed by the Interior Department on this unit. The above amendment requires the Secretary to certify to the Congress that the project meets

feasibility requirements from engineering and economic standpoints before its construction can be started.

[6] and [7] Strike out "such" and insert *each.*

[6] and [7] Perfecting amendment necessary by the addition of the Juniper unit.

[8] After the word "Navajo" insert *Parshall, Troublesome, Rabbit Ear, Eagle Divide, Woody Creek, West Divide, Bluestone, Battlement Mesa, Tomichi Creek, East River, Ohio Creek, Fruitland Mesa, Bostwick Park, Grand Mesa, Dallas Creek, Savery-Pot Hook, Dolores, Fruit Growers Extension, and Sublette.*

[8] These participating projects as listed are in the form recommended by the Upper Colorado River Commission and agreed to by all the States participating as members of the commission.

[9] Strike out "(a)".

[9] Perfecting amendment.

[10] Beginning with the word "Section" in line 14, page 4, strike out all of lines 15 to 24, inclusive, and the words "approved and authorized by the Congress" in line 1, page 5, and insert in lieu thereof the following:

Except as hereinafter provided, section 1 (c) of the Flood Control Act of 1944 shall not be applicable to such supplemental reports: Provided further, That with respect to the San Juan-Chama, Navajo, Parshall, Troublesome, Rabbit Ear, Eagle Divide, Woody Creek, West Divide, Bluestone, Battlement Mesa, Tomichi Creek, East River, Ohio Creek, Fruitland Mesa, Bostwick Park, Grand Mesa, Dallas Creek, Savery-Pot Hook, Dolores, Fruit Growers Extension, and Sublette participating projects no appropriation for or construction of such participating projects shall be made or begun until coordinated reports thereon shall have been submitted to the affected States (which in the case of the San Juan-Chama and Navajo participating projects shall include the State of Texas), pursuant to the Act of December 22, 1944, and such participating projects shall have been approved and authorized by Act of Congress:

[10] The language was stricken because of the inclusion of the additional projects listed in amendment No. 8. At the top of page 5 the new language inserted beginning on line 1 reads as follows:

Except as hereinafter provided, section 1 (c) of the Flood Control Act of 1944 shall not be applicable to such supplemental reports:

That part of the new language refers to the requirements of the O'Mahoney-Millikin amendment of the Flood Control Act of 1944, which requires that project plans be submitted to the States affected before submittal by the Interior Department to the Congress.

The preceding language to which this exception refers provides for supplemental reports by the Secretary evaluating the direct and indirect benefits of the participating projects named in the bill. Each of the participating projects which are named on page 3, with the exception of the additional ones listed beginning on line 4 of page 5, have already been submitted to the States in the form of project reports presenting an evaluation of benefits.

The language dealing with the requirement for supplemental reports was inserted to make doubly sure, under the circumstances involved in the upper basin, that the first evaluation of direct benefits was

accurate before Federal funds are actually expended in the construction of the projects.

The language beginning on line 4, page 5, requires that reports on those participating projects listed beginning at that point must be submitted to the States in accordance with the Flood Control Act of 1944 since no feasibility reports on the projects in this category have been reviewed by the States of the Colorado River Basin.

Beginning on line 13, page 5, there is a specific provision requiring that the reports on San Juan-Chama and Navajo participating projects be submitted to the State of Texas. This requirement recognizes the interest of the State of Texas in the waters of the Rio Grande Basin, including those exported from the Colorado River Basin into the Rio Grande Basin. Because of the interest of Texas over the years in this question, the amendment affords Texas an opportunity to review the project plans of the San Juan-Chama and Navajo which have not been submitted to any of the affected States either in the Rio Grande Basin or in the Colorado River Basin.

[11] and **[12]** Strike out all of section 2 and insert in lieu thereof the following:

SEC. 2. It is not the intention of Congress, in authorizing only those projects designated in section 1 of this Act, to limit, restrict, or otherwise interfere with such comprehensive developments as will provide for the consumptive use by States of the Upper Colorado River Basin of waters, the use of which is apportioned to the Upper Colorado River Basin by the Colorado River Compact and to each State thereof by the Upper Colorado River Basin Compact, nor to preclude consideration and authorization by the Congress of additional projects under the allocations in the compacts as additional needs are indicated.

[11] and **[12]** The new language in section 2 deals with future developments in the Upper Colorado River Basin. It sets forth that it is not the intention of the Congress, in authorizing only those projects designated in section 1 of this act, to limit, restrict, or otherwise interfere with such comprehensive developments as will provide for the consumptive use by the States of the Upper Colorado River Basin of waters, apportioned to the Upper Colorado River Basin by the Colorado River Compact of 1922, and to each State thereof by the Upper Colorado River Basin Compact of 1948, nor to preclude consideration and authorization by the Congress of additional projects within the allocation made in the Colorado River Compact of 1922 as additional needs are indicated.

[13] On page 7, line 24, after "(a)" strike out "irrigation repayment".

[14] On page 8, line 2, after the words "repayment of the", insert *irrigation*.

[13] and **[14]** Perfecting amendments.

[15] After "Treasury," insert *and such funds shall be available for expenditures within the limitations of the provisions of this Act.*

[15] Perfecting amendment to make clear intent that construction funds appropriated by Congress may be expended after crediting to the basin fund.

[16] After "Act" insert:

After repayments to the United States of all money required to be repaid under this Act, such revenue shall be available for expenditures within the Upper Colorado River Basin as may hereafter be authorized by Congress.

[16] This amendment is to clarify the intent of Congress that net project revenues will be available for additional projects consistent with comprehensive upper basin development and within compact apportionments, after repayment of all obligations pursuant to this act, subject to future authorization by Congress. This is not an exclusive earmarking of these funds, however, and is designed only to establish conclusively that this bill is not intended to preclude future development in the upper basin from project revenues as may be authorized by Congress.

[17] Strike out "1955" and insert in lieu thereof *1956,*.

[17] Perfecting amendment.

[18] After "powerplants" insert *and transmission lines.*

[18] Perfecting amendment. Inadvertently omitted.

[19] After the word "provided" insert the word *for.*

[19] Perfecting amendment.

[20] and [21] Strike out "Cross Mountain" and insert after "Glen Canyon" the word *Juniper,*.

[20] and [21] This change was made to conform to amendments (2) and (3).

[22] After "SEC. 12." insert (*a*).

[22] Perfecting amendment.

[23] After "Colorado River Compact," insert *the Upper Colorado River Basin Compact,*.

[23] Perfecting amendment.

[24] After "United States," insert *either on its own behalf or as parens patriae,*.

[24] The words, *either on its own behalf or as parens patriae* are added to waive the sovereign immunity of the United States to actions brought by basin States in the Supreme Court of the United States under the judicial doctrine of *parens patriae* on behalf of one of their cities or other political subdivisions to enforce the requirements of section 12. The Committee recognizes that the Congress cannot restrict or enlarge the original jurisdiction of the Supreme Court under Article III of the Constitution.

[25] After "Colorado River" strike out "and its tributaries" and insert *System.*

[25] Perfecting amendment in order to conform to other necessary legislation.

[26] After the word "purposes" insert a period and strike out "within any of the States of the Upper Colorado River Basin."

[26] This was stricken to protect power generation against other uses.

[27] Insert a new subsection under Section 12 as follows:

(*b*) *In the operation of works under his jurisdiction for the storage and release of waters of the Colorado River system and in programing the storage and release of such waters, the Secretary of the Interior shall consult from time to time with an advisory committee consisting of one representa-*

tive appointed by each of the Colorado River Basin States, one representative of the Colorado River Board of California, one representative of the Upper Colorado River Commission, and one representative of the United States Section of the International Boundary Commission, United States and Mexico.

[27] Provides for appointment of an Advisory Committee representing the States concerned and for consultation with the Secretary of the Interior.

II

SEPARATE VIEWS

OF

SENATOR RICHARD L. NEUBERGER, OF OREGON, ON S. 500, THE UPPER COLORADO RIVER STORAGE PROJECT

I concur with the majority of the committee in the recommendation that the Upper Colorado project be authorized for construction by the Federal Government, but I oppose the construction of Echo Park Dam on the Green River. I hope that the Senate will delay authorization of this phase of the project until adequate consideration has been given to alternative undertakings which will produce equivalent multipurpose benefits without encroaching on the scenic grandeur of a national park or monument.

ECHO PARK DAM A THREAT TO NATIONAL PARK SYSTEM

The Echo Park Dam site is within the boundaries of Dinosaur National Monument. In my opinion, construction of this dam would constitute a serious threat to the future integrity of our great national park system. It would set a fatal precedent for other inroads on our natural recreational reserves for economic purposes. If the pressure for such encroachments is to be resisted, the task, under the present administration, falls upon the Congress to resist it.

Our national park system represents one of the most valuable natural properties which we possess. It contributes today to the physical, inspirational, and educational well-being of our people, nearly 50 million of whom visited the system last year. As our population expands, and the tensions of urban culture and industrialized civilization increase, we shall need more sanctuaries where our people can relax the tightened nerves that come with modern living. Only in our national park system and a few other areas have we preserved a remnant of the natural treasury that once covered this continent, and only here will our children be able to know America as our forefathers knew it.

The lands reserved in our national parks and monuments are dedicated to their wisest use, and their essential contributions are directly dependent on strict preservation of their natural conditions without distortion by human activity. Their benefits cannot be measured solely in dollar return, but they are the keystone of the vast tourist industry.

PROTECTION OF PARKS AND MONUMENTS IS TRADITIONAL

Ever since the National Park Service was established in 1916, Congress has consistently refused to enact legislation which would violate the protection given our national parks and monuments, in spite of constant pressures to do so. Construction of Echo Park Dam not only would set a ruinous precedent, but it would specifically

destroy the features and qualities that led to reservation from commercial use of the great canyons of the Green and Yampa Rivers.

The beauty of the Dinosaur National Monument has been left in its undisturbed natural condition. The majesty of the canyon walls, the intricate pattern of eroded cliffs, their colors and shadows, present an unparalleled example of our Nation's original tranquil wilderness. This section of the Green and Yampa Rivers has some of the most beautiful scenery in the world.

We are promised the expenditure of millions of dollars to make a more accessible recreational area of the reservoir which will fill the precipitous gorges of the Green and Yampa Rivers. Yet to those who love the silent, pristine isolation of our primitive wilderness, this is little comfort. The wisest use of Dinosaur National Monument is to preserve inviolate for the future its wild beauty, a value worthy of as much consideration as the purely utilitarian objectives of S. 500.

In spite of the mass of testimony about Echo Park Dam, no concrete evidence has been presented that Echo Park Dam is necessary. Asserted justifications for it have changed repeatedly, as one or another contention has been found to be invalid. It is difficult to understand why the sponsors of the Colorado storage project are so insistent that Echo Park Dam be built here and now, rather than defer recommendation for authorization while thorough studies are made of the possibility of revising the project to secure the desired benefits without the damage this dam would do. The House Subcommittee on Irrigation and Reclamation has requested further information from the Bureau of Reclamation about feasible alternative methods of constructing the project, and this information should be made available to the Senate before final consideration is given this legislation.

In the absence of undeniable proof that Echo Park Dam is necessary to the welfare of the Nation as a whole, this feature of the project should be deleted from the present authorization.

The question is not a choice between preserving a national monument or securing water benefits. Rather, it is how to adjust the present plans to utilize the water and secure the desired power in such a way as to reaffirm the primary values embodied by our national park system.

ECHO PARK COULD SET A PERILOUS PRECEDENT

Once the inviolability of that system is ignored in the Dinosaur Monument, it will be imperiled everywhere. Certain lumber operators hope to harvest the fir and spruce rain forests of the Olympic National Park. Irrigationists have hungrily eyed the waters of the Yellowstone. Some groups would like to construct a dam across a river within Glacier National Park.

To the values of conservation, it makes little difference whether the encroachment is by public or private enterprise. Once the traditional policies of the National Park Service are sacrificed at Echo Park, a coordinated onslaught by private interests against the boundaries of national parks and national monuments will begin all over the land.

If the reclamation service can cross the frontier of Dinosaur National Monument, why should not timber operators in the Olympics insist that a similar privilege be accorded them? What about sheep and stock ranchers eyeing the lush meadows of the Yellowstone or

the rangelands of Grand Canyon National Park? Will there be pressure to cut the pine forests of Crater Lake National Park in Oregon? Echo Park is the test. If the beauties of Dinosaur National Monument can be sacrificed for Echo Park Dam, then other national monuments and national parks are in danger of commercial exploitation justified by reasons which will be made to sound equally compelling.

An attempt has been made by supporters of Echo Park Dam to belittle the opposition to the project by people who place the contemplation and enjoyment of unspoiled natural grandeur above values which can be measured in dollars and cents. Yet, many illustrious Americans have shared their preference, and it is wrong to minimize the extent of the popular rallying in defense of Dinosaur National Monument, which extends across the length and breadth of our country.

AMERICAN CONSERVATION GROUPS QUESTION WISDOM OF ECHO PARK

Let me refer only to the statement of policy, appearing on page 689 of the committee's hearings on S. 500, which was adopted by representatives of more than 20 conservation organizations, called into emergency meeting in November of 1954 by the National Parks Association:

1. The national park system, established by law, is urgently needed and is increasingly being enjoyed and supported by millions of people. The conservationists represent the public interest in the preservation of these areas. That is what brings us together in this crisis.

2. We are opposed to any legislation that would authorize building the proposed Echo Park Dam in the Dinosaur National Monument in northwestern Colorado and northeastern Utah—or any other dam that would flood any portion of any national park or monument.

3. We are mindful of the extreme importance of water in the West. And we are sincerely interested in any sound Upper Colorado water development that can effectively utilize the water without threatening the national park system. We point out that the necessity for Echo Park Dam has never been demonstrated. It has only been asserted. We also point out that the alternatives to Echo Park Dam have never been adequately studied by the Bureau of Reclamation, and have never been proved inferior.

4. We invite all citizens to join with us to make sure that areas set aside for preservation in the national park system are not needlessly invaded or destroyed.

The inundation of part of the Dinosaur National Monument by the proposed Echo Park Dam is opposed, in summary, by virtually all the organizations which traditionally have fought to protect what remains of our original scenery and outdoor grandeur. Yet I call to the attention of the Senate the constructive and openminded nature of this statement. It does not attempt to discredit the entire Upper Colorado project, opposed though these conservation groups may be to one phase of the project. It simply suggests that the project be undertaken without that single feature which would imperil national park standards.

ONLY ECHO PARK PHASE OF PROJECT IS OPPOSED

Because I share this view, I have joined the majority of the committee in voting to report S. 500 out for consideration by the Senate. Although I oppose the Echo Park phase of the project, I do not agree with those few conservation groups, such as the California Academy of Sciences, which launched an all-out attack against the entire project. I regard this as shortsighted and not within the general purview of our conservation organizations. The inclusion of Echo Park Dam does not condemn the entire Upper Colorado project. It merely means that Echo Park Dam should be eliminated because of its location within a national monument.

The present national administration has endorsed the Upper Colorado project. Many of the administration's political backers in the Congress have sought to carry out this endorsement through the enactment of the present bill.

Yet this same administration opposes the Hells Canyon project in the Pacific Northwest on the grounds that Hells Canyon would be a drain on the Federal Treasury.

In the Upper Colorado River Basin the administration proposed full Federal financing of the multipurpose projects, but in the Columbia River Basin its spokesmen advocate "partnership" with the profit-making power facilities going to the electric utility partner. The incongruities and inconsistencies in this approach to development of water resources are obvious.

UPPER COLORADO A HIGH-COST PROJECT

The energy to be developed at the sites in the Columbia River Basin such as Hells Canyon will be marketed for approximately 2.5 mills per kilowatt-hour. For this low-cost energy there is certain to be vast demand—for manufacturing, for business payrolls, for farms, for homes.

The cost of Upper Colorado power, delivered at load centers, will be approximately 6 mills per kilowatt-hour, substantially more than twice the cost of current from the Federal sites in the Columbia Basin. Demand for Upper Colorado energy, particularly for industry, will be far less than in the Pacific Northwest. Few industries would seek Upper Colorado energy at 6 mills when Columbia Basin kilowatts can be purchased for 2.5 mills. Other factors being equal, the competitive factor alone rules out the use of Upper Colorado energy for any manufactured product which could be made more cheaply elsewhere in the country.

I am not opposing the Upper Colorado project as a government undertaking. I merely am posing what to me seems an obvious question: Is it not curious that this national administration, supposedly dedicated to financial integrity, favors the Upper Colorado project and yet, in the same breath, opposes Federal development of the power sites in the Columbia Basin which are economically far more feasible?

This administration would reserve the 6-mill waterpower locations as government projects, but it willingly abandons the 2.5-mill choice power sites to the electric utilities.

WHY "YES" ON UPPER COLORADO BUT "NO" ON THE COLUMBIA?

Is an administration responsive to the public welfare when it saves for government the marginal aspect of any resource and abandons the choice features to private corporations?

It is not my purpose to indict or embarrass the Upper Colorado project. Its $1,659 million total cost probably can be justified on the grounds that underdeveloped areas of our vast country long have needed capital improvements. The economy of the intermountain region will gain by having its agricultural economy strengthened and its energy resources increased. Echo Park is not justified, because it threatens our national park system, but I refuse to join with those who use that argument to condemn the remainder of the Upper Colorado River project.

The balance between commercial development and resource conservation must be carefully maintained in this country. Too great an emphasis in either direction can lead to serious consequences.

EX-SECRETARY OSCAR CHAPMAN WITHDREW ECHO PARK ENDORSEMENT

During preliminary discussion of the Upper Colorado project on the floor of Congress, an effort has been made to convince the public that former Secretary of the Interior Oscar L. Chapman, a prominent and leading conservationist, favored construction of a dam within the boundaries of the Dinosaur National Monument, at Echo Park.

In this connection, I call attention to a letter from ex-Secretary Chapman to the President of the United States, written on December 4, 1952, shortly before both Mr. Chapman and President Truman were succeeded in office, respectively, by Douglas McKay and Dwight D. Eisenhower.

Mr. Chapman modified previous recommendations regarding the Upper Colorado project, to bring about—

> deletion of the recommendation for immediate authorization of the Echo Park unit and the deletion of the recommendation for inclusion of the Split Mountain unit in the plan of development for later authorization.

Both Echo Park and Split Mountain would create reservoirs within the Dinosaur borders.

In this letter, Secretary Chapman made it explicit that alternative sites should be studied and decided upon. Portions of Mr. Chapman's letter of December 4, 1952, make clear his belief further study was needed. The letter said, in part:

> Attached for your consideration is my report on a proposed plan for the development and utilization of a portion of the water resources of the Upper Colorado

River Basin by construction of the Colorado River storage project and participating projects.

* * * * * * *

Proposals are made in the report for authorization of a series of dams and reservoirs in the Upper Colorado River Basin for river regulation and the generation of hydroelectric power and for authorization or reauthorization of a number of related irrigation projects. Construction of the storage project would aid the States of the Upper Colorado River Basin to achieve the benefits contemplated under the Upper Colorado River Basin Compact, to which the consent of the Congress was given by the act of April 6, 1949 (63 Stat. 31). The report also proposes the establishment of an Upper Colorado River Account. This would furnish a basis for uniform power rates and would aid in accounting for the return of the reimbursable costs of the participating irrigation projects.

This report as approved by me on January 25, 1951, as my proposed report for transmittal to the interested States and Federal agencies for comment, included a recommendation for authorization of the Echo Park unit and a proposal for the inclusion of the Split Mountain unit in the recommended plan of development for later authorization. Both of these units would encroach on the Dinosaur National Monument.

I am acutely aware of the controversy surrounding the issue between those who favor full development of the water and power resources of the Colorado River and those who oppose reservoir encroachments on the canyons of the Green and Yampa Rivers within the Dinosaur National Monument. It must be recognized that there exists no adequate measure by which the merits of the opposing views in this controversy may be gaged. Among other things, exceptionally important intangible values must be weighed against very real economic needs and potentials. The formulation of my recommendation required very careful consideration of the following points:

1. Need for a reservoir development at Echo Park versus the national value of the monument.
2. Effect of Echo Park Reservoir upon the monument.
3. Presidential order of 1938 enlarging the Dinosaur National Monument and its legal and implied interpretations.
4. Possible alternative reservoirs and their relationship to river basin development.

I have now concluded that the terms of the recommendations of the report should be modified in respect to these two units. Accordingly, the report as modified by the letter of June 29, 1951, of the Commissioner of Reclamation is further modified by the deletion of the recommendation for immediate authorization of the Echo Park unit and the deletion of the recommendation for inclusion of the Split Mountain unit in the plan of development for later authorization. In lieu of the recommendation of the Echo Park unit, I recommend that the Secretary of the Interior be authorized to construct and operate facilities, at Echo Park or at an alternate site, to serve the purposes intended to be served by the Echo Park unit. This authorization should be made subject to the requirement that the Secretary give further consideration to studies of alternate sites and subject also to a finding by the Secretary, prior to the submission of requests for appropriations to initiate construction, as to the site best adapted for development in the light of all factors involved.

* * * * * * *

As so further modified, the report as modified by the Commissioner's letter of June 29, 1951, is adopted and approved as my report.

ECHO PARK ONLY ONE OUT OF 39 SEPARATE UNITS

The Upper Colorado project consists of many individual units. The total number, in fact, is 6 storage projects, 12 participating projects, and 21 which are subject to further authorization.

Echo Park is merely one of these separate undertakings. In my opinion, it should be eliminated—certainly for the time being. If the population of the intermountain region ever is so large that needed hydroelectric power can be obtained only at Echo Park, then the time may be at hand when the scenic values of a national monument must be sacrificed to make way for an expanding civilization. Of

course, we must always weigh the quantity of added power against the conservation values destroyed or lost.

This rule should govern all regional development, everywhere in the West. Nor should it apply exclusively to dams. Certain lumber interests, for example, would like to bring about the breaching of the national park system on the Olympic Peninsula so these mills can cut trees within the borders of the Olympic National Park in the State of Washington.

America someday may be at the stage when these trees, magnificent though they are, are imperative to national survival or to the basic comforts of America's people. If that hour is reached, then the rain forests of the Olympics may have to succumb to ax and saw. But, so long as other sources of commercial timber remain, I believe it would be little short of criminal to log and harvest one of the last remaining museums of the original coastal evergreens which once flourished in such abundance along the Pacific slope.

In essence, such a philosophy was substantiated as recently as the 83d Congress, when the Atomic Energy Act was amended to prohibit prospecting or mining of fissionable material in national parks or monuments, except when the President, by Executive order, declares that the requirements of national defense make such action necessary. Certainly if the Congress believes the boundaries of national parks must be defended from invasion even during the present search for such a vital defense product as fissionable material for atomic energy, then it cannot in good conscience endorse partial flooding of the Dinosaur National Monument for electric energy, especially when such action is not required for the defense and security of the country.

WILL THERE BE A STEADY MARKET FOR 6-MILL POWER?

Indeed, there probably is available in the Upper Colorado region a great deal more potential energy than can be used in the foreseeable future, particularly at the delivered rate of 6 mills a kilowatt-hour—a rate which precludes extensive use for competitive manufacturing. Why, then, sacrifice the most scenic parts of a national monument to build Echo Park, thus jeopardizing conservation principles which have grown up with our national park system? This is not necessary today. It may not be necessary tomorrow, or for many tomorrows.

The last projects to be undertaken for commercial development—whether by the Government or by private enterprise—should be those which imperil conservation values.

The power and storage at Echo Park are not essential to the prosperity of the intermountain West, today. Why not preserve a national monument as long as no compelling or immediate reasons dictate a different course? Urgency is not presently a prevailing factor.

I believe Echo Park Dam, inside the Dinosaur National Monument, should be eliminated from the general authorization for the Upper Colorado project until adequate consideration has been given to alternative dam sites which will produce equivalent multipurpose benefits without invading a national park or monument.

RICHARD L. NEUBERGER,
United States Senator from Oregon.

III

MINORITY VIEWS

OF

SENATOR THOMAS H. KUCHEL, OF CALIFORNIA, ON S. 500, THE UPPER COLORADO RIVER STORAGE PROJECT

After painstaking study of the bill and close analysis of the testimony, I believe that S. 500 is an unsound measure and I am forced to recommend its rejection.

The bill, which is put forward in an earnest attempt to promote the development of natural resources of the Upper Colorado River Basin, is based on interpretations of the Colorado River Compact and related documents making up the law of the river which are, at the very least, strained. Certainly, they are challenged and contested. Furthermore, enactment at this time would be premature in view of the absence of much essential data about the cost, operation, and effect of the numerous projects embodied in an open-ended program that undeniably will require an outlay of billions of dollars from the Federal Treasury.

I cannot believe that the Senate will consider it wise action to approve legislation of such proportions which raises so many complex questions of policy, establishes precedents which radically depart from tested principles of natural resources development, and is characterized by grave uncertainty about eventual results.

The impact of this legislation on the future growth and progress of the western part of our Nation might well amount to revolutionary changes in interstate relations, nullification of solemn pacts between various units of government, destruction of the foundations of agricultural and industrial economy over a wide area, and jeopardizing of the welfare of tremendous numbers of people.

Sound and orderly utilization of all resources of the Colorado River system and basin is essential to the expanding prosperity of a vast section of our Nation. Assuredly, it would benefit the entire country. However, S. 500 is an ill-advised and hazardous way to try to reach this commendable goal.

Extended hearings before the Committee on Interior and Insular Affairs in both the 83d Congress and the 84th Congress unmistakably demonstrated that there are widely differing schools of thought about the most efficient and productive courses to bring about maximum development of natural resources of the Upper Colorado River Basin. It would be foolhardy to sidestep these differences of opinion by enacting a statute which employs a flexible yardstick for measuring economic and financial feasibility, which virtually writes a blank check on the United States Treasury, which delegates to administrative agencies authority and responsibility clearly imposed upon the Con-

gress, and which brushes aside grave issues involved in complex litigation currently pending in the highest court of this Nation.

The proposed program of development in S. 500 goes far beyond the recommendations of the President of the United States. Nevertheless, this costly and difficult undertaking is advanced with only a fragment of the extensive engineering, financial, economic, agricultural, and other data which should receive the most thorough analysis and examination before the Congress approves investment of immense sums of taxpayers' money on projects of the character envisioned.

As presented to the Senate, S. 500 contemplates an intricate network of dams, powerplants, and irrigation-reclamation works the ultimate cost of which cannot be conjectured. Specifically, the measure would authorize 6 major storage projects and 33 participating projects for the impounding, diversion, and delivery of water, and for the generation of hydroelectric power. Only the scantiest preliminary estimates are available about the cost of many of these works. The bill contains no definite limit on the amounts of public funds which may be expended for this ambitious plan. The minimum outlay admittedly would exceed $1.5 billion, while the aggregate charges for interest on the capital expenditure would be more than double this prodigious figure.

Virtually all of the objections raised in the 83d Congress against the predecessor to S. 500 apply with undiminished force. Many additional challenges have been presented in the present Congress which merit the most serious deliberation by the Senate before a decision is reached upon this proposal.

The principal arguments which I feel compelled to present to the Senate may be summarized generally in three categories. These are: legal, economic, and policy questions.

GRAVE LEGAL QUESTIONS

The proposed projects and the contemplated basis of operating them bring squarely before the Congress sharp conflicts about interpretations of the Colorado River Compact and the law of the river. Assumptions underlying the legislation would constitute encroachment upon and veritably rewrite the basic seven-State agreement negotiated in 1922 to make possible development of this great stream, its tributaries, and the vast, varied territory embraced in its watershed.

Pending before the Supreme Court of the United States is the case of *Arizona* v. *California* (No. 10 Original, October Term 1953) which presents no less than eight fundamental and sharply contested issues which cannot be ignored in the consideration of any legislation dealing with further development of the Colorado River system.

In the 83d Congress, attention was drawn to the direct implications of this lawsuit. Recently, the Supreme Court has referred to its special master the question of whether to include the States of the Upper Basin as essential and affected parties. It is impossible to forecast the effect this litigation may have on the rights of those States. The final decisions which will be forthcoming in the case may well exercise a profound influence on plans for additional works and compel fundamental changes in suggested undertakings designed to benefit New Mexico, Colorado, Utah, and Wyoming.

All parties concerned about Upper Basin development concur that the practicality and feasibility of the Colorado River storage project turn directly upon the availability of water in the system to generate the hydroelectric power contemplated and to supply the agricultural and domestic needs which would be served by the projects to be authorized.

A vital question presented in *Arizona* v. *California* is the method of measurement of consumptive use. Availability and use of water are interwoven questions which cannot be separated.

The controversy over this point has gained steadily in importance with mounting indications the Colorado River system in actuality contains only about three-quarters of the volume of water that framers of the seven-State compact believed it contained and could be employed and enjoyed. The intention and meaning of several related portions of the compact dealing with diversion, distribution, and utilization of water are the heart of the litigation now before the Supreme Court.

In view of decided differences of thought about measurement of "beneficial consumptive use," grave and far-reaching uncertainty now exists about the effect of almost all of article III of the compact. This article is the very foundation upon which rest all present and proposed works to realize the potential benefits of the entire Colorado River system.

These doubts embrace language of the compact which (1) apportioned in perpetuity the right to utilize 7.5 million acre-feet per annum in each basin; (2) which permitted use of 1 million acre-feet annually of so-called surplus water in the lower basin; (3) which specified the manner of providing water for Mexico now required by the Mexican Water Treaty ratified over the stern protests of California 10 years ago; (4) which is a promise by Upper Basin States they will not diminish the flow at Lee Ferry below an aggregate of 75 million acre-feet in any 10-year period; and (5) which stipulates the Upper Division will not withhold and the Lower Division will not compel delivery of water which could not reasonably be put to domestic and agricultural use.

The significance of the dispute about interpretations of various features of article III has been demonstrated by doubts expressed about the meaning and obligations of the compact by a respected former colleague, Gov. Edwin C. Johnson, of Colorado. While eager to obtain congressional approval for ambitious plans for development of the Upper Basin, Governor Johnson candidly testified before the committee that he is gravely apprehensive concerning provisions of article III (d) and III (e) relating to the guaranteed flow to the Lower Basin and possible withholding by the Upper Basin.

Former Senator Johnson last December publicly asked a series of questions stemming from his uncertainty about the intent and effect of specific provisions of the compact. During his appearance before the committee more than 2 months later, he still was not satisfied the Upper Colorado Basin States could withhold the water which is proposed in this bill.

I call attention to page 237 of the transcript of committee hearings, where the following discussion is reported:

Senator KUCHEL. Yes; I was quoting the Governor's words there in that last paragraph.

Then on page 12, Governor, again your own language:

"I am compelled to keep emphasizing that whatever water is stored in the Glen Canyon and Echo Park Reservoirs will be surplus to the agricultural and domestic needs of the Upper Basin and must be delivered to the Lower Basin to satisfy the award of 1.5 million acre-feet to Mexico and 1 million acre-feet to the Lower Basin.

"Furthermore, should the Lower Basin require an additional supply of water for agricultural and domestic purposes the water stored in these reservoirs must be released."

On the basis of that comment, Governor, I first ask if those views of yours are the same today as when you gave them to the press in December of last year.

Governor JOHNSON. Those views are all in the nature of a question and I have had not the answer to that question. So the question is still bothering me.

This whole document is in the nature of a question and I am anxious to know the answer. I understand that the members of this committee do not feel that the questions have the merit which I gave them, but, nevertheless, I am still seeking answers to this whole document.

In the event the final decision of the Supreme Court in *Arizona* v. *California* sustains interpretations of the compact as are contended by California, the fears voiced by Governor Johnson will have been justified. A ruling in consonance with California's position will mean that availability of water for two key features of the project—Glen Canyon and Echo Park Dams—will be reduced to the point where the entire basis for the Upper Basin storage project will have been eliminated.

Another feature of the compact is involved in the pending lawsuit in a fashion which throws further doubt on the availability of water to generate the power to provide revenues to make the entire project feasible and to supply the more than 1.1 million acres intended to be furnished with new or supplemental quantities. The Supreme Court has been asked to rule on the meaning and effect of article VII which relates to rights of Indian tribes in the basin.

In the pending controversy, the Department of Justice has made claims which seem to involve over 1.7 million acre-feet of water of the system and seriously reduce the allocations of 7.5 million acre-feet to each basin. During the 1954 hearings, Judge Jean S. Breitenstein, who for years was attorney for the Colorado Water Conservation Board, acknowledged the ultimate scope of the question about Indian rights is itself disputed. Judge Breitenstein conceded that if the Supreme Court upholds a theory that Indian claims constitute a first demand upon the water—

then every right to the use of water of the Colorado River and its tributaries is of doubtful validity.

The committee was unable to obtain a clear statement of the attitude which the United States takes in regard to quantities of water to which the Indian tribes may eventually be entitled. Officials of the Department of the Interior, while maintaining the Indian rights issue is immaterial to S. 500, could not state what priorities are claimed on behalf of the tribes resident in the basin. The question is, at the very least, confused and clouded since the compact declares nothing in the way of allocations to individual States shall impair obligations of the United States to Indian tribes.

In the present situation, the Department of Justice asserts superior rights for Indian tribes, yet the Department of the Interior cannot testify concerning the amounts of water which are involved. Apparently the issue is so debatable there is difference of opinion within

the Interior Department and reluctance on the part of that agency to agree with the Justice Department contention.

The broad question of measurement of water has an undeniable impact on the distant future welfare of the entire Lower Basin, just as it does on possible development of the Upper Basin. The aggregate capacity of the storage reservoirs proposed in S. 500 is more than 40 million acre-feet. The average flow of the stream at Lee Ferry, according to studies over 40 years, is 15.4 million acre-feet annually. On this basis, in the opinion of experts, an estimated 20 years would be required to fill the reservoirs and make possible the generation of the hydroelectric power which is essential to provide revenues by which the entire project would be feasible. If the Supreme Court finds the water may not be withheld, the financial foundation of the whole project crumbles.

My colleagues of the majority of the committee are disposed to minimize the relationship between *Arizona* v. *California* and this legislation. They contend that the issues involved in the litigation are inconsequential except as they will determine disposition of Lower Basin problems. I cannot agree.

The whole concept of the Upper Colorado River storage project is based on interpretations of the law of the river by proponents of the legislation and by the Department of the Interior which would administer it. I submit that operation of the Upper Basin development plan would be directly influenced by findings of the Supreme Court on such points as the meaning of "per annum" in article III (a) relative to apportionment of water between the two basins, the extent of "rights which may now exist," the availability of III (b) water in the Lower Basin, the means of carrying the Mexican treaty burden, the status of Indian claims, and the respective rights of Upper and Lower Basins to withhold or require delivery of water.

Prudence and conscientiousness seemingly would dictate the obtaining of final answers to the many far-reaching questions before the United States proceeds to expend upwards of $1.5 billion and assume a burden that eventually could reach $4 billion for a network of projects whose feasibility is so largely contingent upon revenues from key powerplants. Only after the questions in the suit are settled, and not while they remain unanswered, would enactment of a measure authorizing future expensive works on the Colorado River be warranted and sensible procedure.

SERIOUS FISCAL PROBLEMS

The financial and economic problems involved in this legislation are equally important and complex.

This program is described as in accord with recommendations of the President. However, in its present form, S. 500 goes far beyond the program submitted to the Congress by the Department of the Interior which President Eisenhower termed "well-conceived."

The development plan as outlined by the administration consisted of 2 major storage dams—Echo Park and Glen Canyon—and 11 new participating irrigation and reclamation projects. The Interior Department did not recommend the bill before us, has reservations about the benefits and feasibility of certain of the works sought to be undertaken, and can supply only rough estimates of cost and repayment in

reports on reconnaissance investigations into 15 of the participating projects enumerated in S. 500 as it emerged from our committee.

The Department proposed the construction of works which would create reservoirs with storage capacity of 32,460,000 acre-feet, costing $597,696,000, together with 11 new participating projects, costing $304,356,000, to provide new and supplemental water supplies for 366,290 acres.

The works proposed by S. 500 comprise 6 storage dams, capable of storing 40,390,000 acre-feet of water and costing $821,886,000 plus 33 participating projects, calling for an investment of $874,281,800 to supply 1,208,645 acres with new and supplemental water.

Thus, the development envisioned by S. 500 would require expenditures nearly twice the total deemed feasible by the Interior Department, impounding more than 21 percent more water, and supplying over three times as many acres of land.

The ultimate aggregate cost of this legislation cannot be even guessed, inasmuch as only preliminary and partial studies have been made of 17 of the 33 participating projects. The interest charge which eventually will be paid by the Nation's taxpayers obviously will amount to several billions of dollars, since the Interior Department has advised the comparable burden imposed by those works it originally recommended will amount to a total of $1,153 million in the year 2032.

The fundamental economics of the entire program are subject to challenge and depart from precedent. Although this venture would be built under the reclamation laws, its success from a financial viewpoint will be determined by the sale of power proposed to be produced at the six main reservoirs.

Of the aggregate $1,696,147,800 construction cost of the 33 participating projects and 6 storage dams, the agricultural water users would repay only $108,212,200, according to Reclamation Bureau estimates. The taxpayers' prospects of getting back investment costs rest on the soundness of predictions about the market for power and the willingness of consumers to pay prices for hydroelectricity which are substantially above the level established at comparable other developments constructed by the Interior Department.

The statistics furnished the committee by the Bureau of Reclamation show the estimated income over the payout period from sales of power from the six major storage works would be $909,152,300. The revenue is based on an assumption of a ready market for energy at the high price of 6 mills per kilowatt-hour. As indicated in the portion of this report dealing with legal issues, the availability of water to generate this electricity is by no means certain.

The idea of justifying such an ambitious undertaking by forecasting prospective power revenues is in itself extraordinary in view of the conditions surrounding this program. In the case of the first venture on the Colorado River, Hoover Dam, firm contracts for power sales were consummated in advance of construction. In the instant case, the extent of the market in many areas has been merely estimated in reconnaissance studies while the population is widely distributed with an average density of only 3 persons per square mile compared to the national average of approximately 51. The committee received only general assurances that, subject to conditions which have not been

worked out, private utilities stand ready to purchase "large blocks" of energy.

To illustrate the premature nature of this bill, the committee was unable to get any estimate of revenues from the proposed Juniper Dam and powerplant, although engineering plans call for generating and transmission features costing $5,834,000. Initial energy output was estimated at 125 million kilowatt-hours.

The basis on which the Congress and the Federal Government have undertaken a variety of public works in the past has included consideration of what is known as a cost-benefit ratio. In one form or another, such a figure is applied against proposed river and harbor improvements, flood prevention works, and all irrigation-reclamation developments. This program embraces a number of projects with widely varying cost-benefit ratios.

Disregarding the actual value of lands to be served and such questions as the type of crops to be raised, the evidence before the committee about the project costs is such that Congress should weigh carefully the lengths to which the United States goes in underwriting such developments.

Let me make this clear. I do not condemn so-called high-cost projects per se and I acknowledge that this Nation has virtually constructed all of the low-cost developments which appear feasible.

Nevertheless, I am disturbed at the variations from $210 to $749 per acre for construction costs of the initial projects and from $77 to $1,530 per acre for the participating projects added by the committee. As I have noted in other connections, the estimates for many of these latter projects are extremely preliminary, coming from what are termed by the Reclamation Bureau "reconnaissance reports."

Besides relying on power revenues to substantiate arguments that the entire development is "feasible," proponents of S. 500 have endorsed a remarkable and novel repayment plan. The reimbursements would be greatly delayed, with much of the repayment not scheduled to begin until 50 years after completion of construction. A substantial amount of the outlay is assigned arbitrarily to irrigation features, thus reducing the interest charge against the program and transferring an additional load to all of the Nation's taxpayers.

The allocation of construction costs to irrigation is exceedingly difficult to accept in the case of the main storage dams. Little water for agricultural use would be withdrawn from the reservoirs behind these structures, yet a high percentage of the investment would be charged against irrigation and reclamation. This is especially true in the case of the two biggest units, Echo Park and Glen Canyon. The Reclamation Bureau assigns $48,043,000 of $176,426,000 and $50,296,000 of $421,270,000, respectively, to irrigation and reclamation, but not a dollar of repayment of the costs would be received from water users.

Another reason for the utmost caution is the possible effect of Upper Basin development on the financial structure of Lower Basin developments. Revenues from Hoover Dam would be jeopardized if, because of dry cycles or other factors, water should not be available for the downstream powerplant. The committee, in other hearings on a related matter concerning the Colorado River, recently was advised that the hydroelectric output in the Lower Basin had been curtailed because of inadequate water.

The optimism of proponents of the Upper Basin program was questioned by an expert consultant for one of the States which expects to benefit. Raymond A. Hill, consulting engineer retained by Colorado, declared that even if the Upper Colorado River storage project, on the modest scale proposed by the Interior Department, had been built a quarter-century ago and put in operation as soon as the seven-State compact was consummated—

there would not have been enough water since then for the beneficial consumptive uses in the Upper Basin permitted by that compact.

CONSIDERATIONS OF POLICY

The foregoing discussion implies some of the broad policy matters that are inherent in legislation of the sort of S. 500. I believe that it is unwise to make decisions on fundamental principles in piecemeal fashion. Some aspects of those questions are being studied and weighed by the Commission on Organization of the Executive Branch of the Government which Congress specifically created to ponder issues of the type here presented.

The bill seeks to bypass certain obligations presently recognized by both Congress and the executive branch of the Government. By implication, Congress would commit itself as far as is legally possible to a long-range plan of comprehensive developments in the Upper Colorado River Basin.

The thoroughness of essential engineering investigations is open to question. Apprehension exists about the geological characteristics of the site chosen for Glen Canyon Dam while a possibility exists that Rainbow Natural Bridge would be impaired. The rock in the Glen Canyon area, the Reclamation Bureau admits, is "poor" compared with the strata underlying other big structures.

Extra steps to insure safety and efficiency of the Glen Canyon unit will increase the cost but there is no assurance that seepage will not result in water losses that will upset all operating plans. The Bureau intends, even while recommending this structure, "to carry out further experiments, to see if we could not solidify that foundation a little more by chemical grouting." Protection of Rainbow Natural Bridge by a dike is contemplated, yet backing up water behind Glen Canyon concededly will make access to this scenic rarity "more difficult." Indeed, there is question whether Glen Canyon should be erected at all on the site selected.

Evaporation losses behind the major dams will be substantial and an undeniable drain on a river system already threatened with excessive burdens. In order to generate the power required to finance the project, reservoirs will be created from which 1,065,000 acre-feet annually will be lost forever through evaporation. Certainly Congress should face squarely the question whether it is desirable to accept each year an irrecoverable loss equivalent to two-thirds of the quantity of water the United States has guaranteed to deliver to Mexico. Incidentally, the manner in which the Interior Department, even during the course of hearings in 1954, modified estimates of evaporation losses and revised computations is reason for honest question as to whether they may be the sound and final answers.

A major policy problem inherent in this legislation has been foreshadowed in the section of this report dealing with some economic

aspects. In passing on this proposal, Congress should consider whether it wishes to adopt a rubber yardstick for evaluating such developments. This point becomes important since one of the participating units will not result in a single dollar of repayment by water users and the investment ranges so greatly, from $77 to $1,530, on the basis of areas benefited.

An unusual delegation of authority would result from enactment of this bill. In the case of at least 12 of the participating projects, Congress is asked to accept without further review results of reexaminations and reappraisals by the Interior Department. A return of this kind to the blank-check procedure which encumbered the Federal Government and short-circuited Congress in past years is deplorable.

Inadequate study has been given, as was noted last year, to the possible effect of water diversions out of the Upper Basin on the quality of water remaining for downstream users. Undeniably exportation of water at higher elevations, where purity is greatest, will impair the quality in lower reaches. There is about 1 ton of salts in each acre-foot of water now coming to the Lower Basin. The effect of the impounding and diversion through works proposed in S. 500 certainly merits more investigation than has been carried out to date.

Conflicting interests in national resources have been cited in connection with this contemplated development. Sincere protests have been registered about the effect of Echo Park Dam on the Dinosaur National Monument and uneasiness shown about the consequences of Glen Canyon Dam to Rainbow Natural Bridge. Surely the historic policy of preserving scenic and historical wonders should not be altered without earnest deliberation.

CONCLUSION

The measure as reported in some regards is a definite improvement over the original proposals for development of the Upper Basin but the willingness of the committee to add projects which have not been thoroughly examined and investigated is cause for alarm.

I cannot concur, however, in the judgment of the majority that the time has come to authorize expenditures of such proportions and establish precedents of such far-reaching consequences, especially when the intended safeguards leave much to chance and the ostensible disclaimer of intent to construe the law of the river is in effect contradicted by testimony concerning the plan of operation of this project.

For the reasons recited in this report, I believe that S. 500 should not be passed.

THOMAS H. KUCHEL,
United States Senator from California.

○

84TH CONGRESS } HOUSE OF REPRESENTATIVES { REPORT
2d Session } { No. 1950

AUTHORIZING THE SECRETARY OF THE INTERIOR TO CONSTRUCT, OPERATE, AND MAINTAIN THE COLORADO RIVER STORAGE PROJECT AND PARTICIPATING PROJECTS

MARCH 27, 1956.—Ordered to be printed

Mr. ENGLE, from the committee of conference, submitted the following

CONFERENCE REPORT

[To accompany S. 500]

The committee of conference on the disagreeing votes of the two Houses on the amendments of the House to the bill (S. 500) entitled "An Act to authorize the Secretary of the Interior to construct, operate, and maintain the Colorado River storage project and participating projects, and for other purposes," having met, after full and free conference, have agreed to recommend and do recommend to their respective Houses as follows:

That the Senate recede from its disagreement to the amendment of the House, and agree to the same with an amendment, as follows:

In lieu of the matter inserted by the House amendment insert the following: *That, in order to initiate the comprehensive development of the water resources of the Upper Colorado River Basin, for the purposes, among others, of regulating the flow of the Colorado River, storing water for beneficial consumptive use, making it possible for the States of the Upper Basin to utilize, consistently with the provisions of the Colorado River Compact, the apportionments made to and among them in the Colorado River Compact and the Upper Colorado River Basin Compact, respectively, providing for the reclamation of arid and semiarid land, for the control of floods, and for the generation of hydroelectric power, as an incident of the foregoing purposes, the Secretary of the Interior is hereby authorized (1) to construct, operate, and maintain the following initial units of the Colorado River storage project, consisting of dams, reservoirs, powerplants, transmission facilities and appurtenant works: Curecanti, Flaming Gorge, Navajo (dam and reservoir only), and Glen Canyon: Provided, That the Curecanti Dam shall be constructed to a height which will impound not less than nine hundred and forty thousand acre-feet of water or will create a reservoir of such greater capacity as can be obtained by a high waterline located at seven thousand five hundred and twenty feet above mean sea level, and that construction thereof shall not*

be undertaken until the Secretary has, on the basis of further engineering and economic investigations, reexamined the economic justification of such unit and, accompanied by appropriate documentation in the form of a supplemental report, has certified to the Congress and to the President that, in his judgment, the benefits of such unit will exceed its costs; and (2) to construct, operate, and maintain the following additional reclamation projects (including power-generating and transmission facilities related thereto), hereinafter referred to as participating projects: Central Utah (initial phase); Emery County, Florida, Hammond, La Barge, Lyman, Paonia (including the Minnesota unit, a dam and reservoir on Muddy Creek just above its confluence with the North Fork of the Gunnison River, and other necessary works), Pine River Extension, Seedskadee, Silt and Smith Fork: Provided further, That as part of the Glen Canyon Unit the Secretary of the Interior shall take adequate protective measures to preclude impairment of the Rainbow Bridge National Monument.

SEC. 2. In carrying out further investigations of projects under the Federal reclamation laws in the Upper Colorado River Basin, the Secretary shall give priority to completion of planning reports on the Gooseberry, San Juan-Chama, Navajo, Parshall, Troublesome, Rabbit Ear, Eagle Divide, San Miguel, West Divide, Bluestone, Battlement Mesa, Tomichi Creek, East River, Ohio Creek, Fruitland Mesa, Bostwick Park, Grand Mesa, Dallas Creek, Savery-Pot Hook, Dolores, Fruit Growers Extension, Animas-La Plata, Yellow Jacket, and Sublette participating projects. Said reports shall be completed as expeditiously as funds are made available therefor and shall be submitted promptly to the affected States, which in the case of the San Juan-Chama project shall include the State of Texas, and thereafter to the President and the Congress: Provided, That with reference to the plans and specifications for the San Juan-Chama project, the storage for control and regulation of water imported from the San Juan River shall (1) be limited to a single offstream dam and reservoir on a tributary of the Chama River, (2) be used solely for control and regulation and no power facilities shall be established, installed or operated thereat, and (3) be operated at all times by the Bureau of Reclamation of the Department of the Interior in strict compliance with the Rio Grande Compact as administered by the Rio Grande Compact Commission. The preparation of detailed designs and specifications for the works proposed to be constructed in connection with projects shall be carried as far forward as the investigations thereof indicate is reasonable in the circumstances.

The Secretary, concurrently with the investigations directed by the preceding paragraph, shall also give priority to completion of a planning report on the Juniper project.

SEC. 3. It is not the intention of Congress, in authorizing only those projects designated in section 1 of this Act, and in authorizing priority in planning only those additional projects designated in section 2 of this Act, to limit, restrict, or otherwise interfere with such comprehensive development as will provide for the consumptive use by States of the Upper Colorado River Basin of waters, the use of which is apportioned to the Upper Colorado River Basin by the Colorado River Compact and to each State thereof by the Upper Colorado River Basin Compact, nor to preclude consideration and authorization by the Congress of additional projects under the allocations in the compacts as additional needs are indicated. It is the intention of Congress that no dam or reservoir constructed under the authorization of this Act shall be within any national park or monument.

SEC. 4. Except as otherwise provided in this Act, in constructing, operating, and maintaining the units of the Colorado River storage project and the participating projects listed in section 1 of this Act, the Secretary shall be governed by the Federal reclamation laws (Act of June 17, 1902, 32 Stat. 388, and Acts amendatory thereof or supplementary thereto): Provided, That (a) irrigation repayment contracts shall be entered into which, except as otherwise provided for the Paonia and Eden projects, provide for repayment of the obligation assumed thereunder with respect to any project contract unit over a period of not more than fifty years exclusive of any development period authorized by law; (b) prior to construction of irrigation distribution facilities, repayment contracts shall be made with an "organization" as defined in paragraph 2 (g) of the Reclamation Project Act of 1939 (53 Stat. 1187) which has the capacity to levy assessments upon all taxable real property located within its boundaries to assist in making repayments, except where a substantial proportion of the lands to be served are owned by the United States; (c) contracts relating to municipal water supply may be made without regard to the limitations of the last sentence of section 9 (c) of the Reclamation Project Act of 1939; and (d), as to Indian lands within, under or served by any participating project, payment of construction costs within the capability of the land to repay shall be subject to the Act of July 1, 1932 (47 Stat. 564): Provided further, That for a period of ten years from the date of enactment of this Act, no water from any participating project authorized by this Act shall be delivered to any water user for the production on newly irrigated lands of any basic agricultural commodity, as defined in the Agricultural Act of 1949, or any amendment thereof, if the total supply of such commodity for the marketing year in which the bulk of the crop would normally be marketed is in excess of the normal supply as defined in section 301 (b) (10) of the Agricultural Adjustment Act of 1938, as amended, unless the Secretary of Agriculture calls for an increase in production of such commodity in the interest of national security. All units and participating projects shall be subject to the apportionments of the use of water between the Upper and Lower Basins of the Colorado River and among the States of the Upper Basin fixed in the Colorado River Compact and the Upper Colorado River Basin Compact, respectively, and to the terms of the treaty with the United Mexican States (Treaty Series 994).

SEC. 5. (a) There is hereby authorized a separate fund in the Treasury of the United States to be known as the Upper Colorado River Basin Fund (hereinafter referred to as the Basin Fund), which shall remain available until expended, as hereafter provided, for carrying out provisions of this Act other than section 8.

(b) All appropriations made for the purpose of carrying out the provisions of this Act, other than section 8, shall be credited to the Basin Fund as advances from the general fund of the Treasury.

(c) All revenues collected in connection with the operation of the Colorado River storage project and participating projects shall be credited to the Basin Fund, and shall be available, without further appropriation, for (1) defraying the costs of operation, maintenance, and replacements of, and emergency expenditures for, all facilities of the Colorado River storage project and participating projects, within such separate limitations as may be included in annual appropriation acts: Provided, That with respect to each participating project, such costs shall be paid from revenues received from each such project; (2) payment as required by

subsection (d) of this section; and (3) payment as required by subsection (e) of this section. Revenues credited to the Basin Fund shall not be available for appropriation for construction of the units and participating projects authorized by or pursuant to this Act.

(d) Revenues in the Basin Fund in excess of operating needs shall be paid annually to the general fund of the Treasury to return—

(1) the costs of each unit, participating project, or any separable feature thereof which are allocated to power pursuant to section 6 of this Act, within a period not exceeding fifty years from the date of completion of such unit, participating project, or separable feature thereof;

(2) the costs of each unit, participating project, or any separable feature thereof which are allocated to municipal water supply pursuant to section 6 of this Act, within a period not exceeding fifty years from the date of completion of such unit, participating project, or separable feature thereof;

(3) interest on the unamortized balance of the investment (including interest during construction) in the power and municipal water supply features of each unit, participating project, or any separable feature thereof, at a rate determined by the Secretary of the Treasury as provided in subsection (f), and interest due shall be a first charge; and

(4) the costs of each storage unit which are allocated to irrigation pursuant to section 6 of this Act within a period not exceeding fifty years.

(e) Revenues in the Basin Fund in excess of the amounts needed to meet the requirements of clause (1) of subsection (c) of this section, and to return to the general fund of the Treasury the costs set out in subsection (d) of this section, shall be apportioned among the States of the Upper Division in the following percentages: Colorado, 46 per centum; Utah, 21.5 per centum; Wyoming, 15.5 per centum; and New Mexico, 17 per centum: Provided, That prior to the application of such percentages, all revenues remaining in the Basin Fund from each participating project (or part thereof), herein or hereinafter authorized, after payments, where applicable, with respect to such projects, to the general fund of the Treasury under subparagraphs (1), (2), and (3) of subsection (d) of this section shall be apportioned to the State in which such participating project, or part thereof, is located.

Revenues so apportioned to each State shall be used only for the repayment of construction costs of participating projects or parts of such projects in the State to which such revenues are apportioned and shall not be used for such purpose in any other State without the consent, as expressed through its legally constituted authority, of the State to which such revenues are apportioned. Subject to such requirement, there shall be paid annually into the general fund of the Treasury from the revenues apportioned to each State (1) the costs of each participating project herein authorized (except Paonia) or any separable feature thereof, which are allocated to irrigation pursuant to section 6 of this Act, within a period not exceeding fifty years, in addition to any development period authorized by law, from the date of completion of such participating project or separable feature thereof, or, in the case of Indian lands, payment in accordance with section 4 of this Act; (2) costs of the Paonia project, which are beyond the ability of the water users to repay, within a period

prescribed in the Act of June 25, 1947 (61 Stat. 181); and (3) costs in connection with the irrigation features of the Eden project as specified in the Act of June 28, 1949 (63 Stat. 277).

(f) The interest rate applicable to each unit of the storage project and each participating project shall be determined by the Secretary of the Treasury as of the time the first advance is made for initiating construction of said unit or project. Such interest rate shall be determined by calculating the average yield to maturity on the basis of daily closing market bid quotations during the month of June next preceding the fiscal year in which said advance is made, on all interest-bearing marketable public debt obligations of the United States having a maturity date of fifteen or more years from the first day of said month, and by adjusting such average annual yield to the nearest one-eighth of 1 per centum.

(g) Business-type budgets shall be submitted to the Congress annually for all operations financed by the Basin Fund.

SEC. 6. Upon completion of each unit, participating project or separable feature thereof, the Secretary shall allocate the total costs (excluding any expenditures authorized by section 8 of this Act) of constructing said unit, project or feature to power, irrigation, municipal water supply, flood control, navigation, or any other purposes authorized under reclamation law. Allocations of construction, operation and maintenance costs to authorized nonreimbursable purposes shall be nonreturnable under the provisions of this Act. In the event that the Navajo participating project is authorized, the costs allocated to irrigation of Indian-owned tribal or restricted lands within, under, or served by such project, and beyond the capability of such lands to repay, shall be determined, and, in recognition of the fact that assistance to the Navajo Indians is the responsibility of the entire nation, such costs shall be nonreimbursable. On January 1 of each year the Secretary shall report to the Congress for the previous fiscal year, beginning with the fiscal year 1957, upon the status of the revenues from, and the cost of, constructing, operating, and maintaining the Colorado River storage project and the participating projects. The Secretary's report shall be prepared to reflect accurately the Federal investment allocated at that time to power, to irrigation, and to other purposes, the progress of return and repayment thereon, and the estimated rate of progress, year by year, in accomplishing full repayment.

SEC. 7. The hydroelectric powerplants and transmission lines authorized by this Act to be constructed, operated, and maintained by the Secretary shall be operated in conjunction with other Federal powerplants, present and potential, so as to produce the greatest practicable amount of power and energy that can be sold at firm power and energy rates, but in the exercise of the authority hereby granted he shall not affect or interfere with the operation of the provisions of the Colorado River Compact, the Upper Colorado River Basin Compact, the Boulder Canyon Project Act, the Boulder Canyon Project Adjustment Act and any contract lawfully entered unto under said Compacts and Acts. Subject to the provisions of the Colorado River Compact, neither the impounding nor the use of water for the generation of power and energy at the plants of the Colorado River storage project shall preclude or impair the appropriation of water for domestic or agricultural purposes pursuant to applicable State law.

SEC. 8. In connection with the development of the Colorado River storage project and of the participating projects, the Secretary is author-

ized and directed to investigate, plan, construct, operate, and maintain (1) public recreational facilities on lands withdrawn or acquired for the development of said project or of said participating projects, to conserve the scenery, the natural, historic, and archeologic objects, and the wildlife on said lands, and to provide for public use and enjoyment of the same and of the water areas created by these projects by such means as are consistent with the primary purposes of said projects; and (2) facilities to mitigate losses of, and improve conditions for, the propagation of fish and wildlife. The Secretary is authorized to acquire lands and to withdraw public lands from entry or other disposition under the public land laws necessary for the construction, operation, and maintenance of the facilities herein provided, and to dispose of them to Federal, State, and local governmental agencies by lease, transfer, exchange, or conveyance upon such terms and conditions as will best promote their development and operation in the public interest. All costs incurred pursuant to this section shall be nonreimbursable and nonreturnable.

SEC. 9. Nothing contained in this Act shall be construed to alter, amend, repeal, construe, interpret, modify, or be in conflict with the provisions of the Boulder Canyon Project Act (45 Stat. 1057), the Boulder Canyon Project Adjustment Act (54 Stat. 774), the Colorado River Compact, the Upper Colorado River Basin Compact, the Rio Grande Compact of 1938, or the Treaty with the United Mexican States (Treaty Series 994).

SEC. 10. Expenditures for the Flaming Gorge, Glen Canyon, Curecanti, and Navajo initial units of the Colorado River storage project may be made without regard to the soil survey and land classification requirements of the Interior Department Appropriation Act, 1954.

SEC. 11. The Final Judgment, Final Decree and stipulations incorporated therein in the consolidated cases of United States of America v. Northern Colorado Water Conservancy District, et al., Civil Nos. 2782, 5016 and 5017, in the United States District Court for the District of Colorado, are approved, shall become effective immediately, and the proper agencies of the United States shall act in accordance therewith.

SEC. 12. There are hereby authorized to be appropriated, out of any moneys in the Treasury not otherwise appropriated, such sums as may be required to carry out the purposes of this Act, but not to exceed $760,000,000.

SEC. 13. In planning the use of, and in using credits from, net power revenues available for the purpose of assisting in the pay-out of costs of participating projects herein and hereafter authorized in the States of Colorado, New Mexico, Utah, and Wyoming, the Secretary shall have regard for the achievement within each of said States of the fullest practicable use of the waters of the Upper Colorado River system, consistent with the apportionment thereof among such States.

SEC. 14. In the operation and maintenance of all facilities, authorized by Federal law and under the jurisdiction and supervision of the Secretary of the Interior, in the basin of the Colorado River, the Secretary of the Interior is directed to comply with the applicable provisions of the Colorado River Compact, the Upper Colorado River Basin Compact, the Boulder Canyon Project Act, the Boulder Canyon Project Adjustment Act, and the Treaty with the United Mexican States, in the storage and release of water from reservoirs in the Colorado River Basin. In the event of the failure of the Secretary of the Interior to so comply, any State of the Colorado River Basin may maintain an action in the Supreme Court of

the United States to enforce the provisions of this section, and consent is given to the joinder of the United States as a party in such suit or suits, as a defendant or otherwise.

SEC. 15. The Secretary of the Interior is directed to continue studies and to make a report to the Congress and to the States of the Colorado River Basin on the quality of water of the Colorado River.

SEC. 16. As used in this Act—

The terms "Colorado River Basin", "Colorado River Compact", "Colorado River System", "Lee Ferry", "States of the Upper Division", "Upper Basin", and "domestic use" shall have the meaning ascribed to them in article II of the Upper Colorado River Basin Compact;

The term "States of the Upper Colorado River Basin" shall mean the States of Arizona, Colorado, New Mexico, Utah, and Wyoming;

The term "Upper Colorado River Basin" shall have the same meaning as the term "Upper Basin";

The term "Upper Colorado River Basin Compact" shall mean that certain compact executed on October 11, 1948 by commissioners representing the States of Arizona, Colorado, New Mexico, Utah, and Wyoming, and consented to by the Congress of the United States of America by Act of April 6, 1949 (63 Stat. 31);

The term "Rio Grande Compact" shall mean that certain compact executed on March 18, 1938, by commissioners representing the States of Colorado, New Mexico, and Texas and consented to by the Congress of the United States of America by Act of May 31, 1939 (53 Stat. 785);

The term "Treaty with the United Mexican States" shall mean that certain treaty between the United States of America and the United Mexican States, signed at Washington, District of Columbia, February 3, 1944, relating to the utilization of the waters of the Colorado River and other rivers, as amended and supplemented by the protocol dated November 14, 1944, and the understandings recited in the Senate resolution of April 18, 1945, advising and consenting to ratification thereof.

And the House agree to the same.

Managers on the Part of the Senate.

STATEMENT OF THE MANAGERS ON THE PART OF THE HOUSE

The managers on the part of the House at the conference on the disagreeing votes of the two Houses on the amendment of the House to the bill (S. 500) to authorize the Secretary of the Interior to construct, operate, and maintain the Colorado River storage project and participating projects, and for other purposes, submit the following statement in explanation of the effect of the language agreed upon and recommended in the accompanying conference report. The language incorporates the recommendations of the conference committee with respect to each of the differences between the Senate and House bills.

SCOPE OF THE PROJECT

With respect to the scope of the project, the conference committee agreed to retain in the bill for authorization only the four storage units and eleven participating projects in the House-approved bill.

The matter of retaining intact our national park system was an important issue in the consideration by Congress of this legislation. The House-approved bill—

(1) deleting the Echo Park storage unit;

(2) requiring "protective measures to preclude impairment of the Rainbow Bridge National Monument"; and

(3) expressing the "intention of Congress that no dam or reservoir constructed under the authorization of this Act shall be within any national park or monument"—

makes clear the intention of the House that there be no invasion or impairment of the national park system by the works authorized to be constructed under this legislation. The conference committee upheld the House position and adopted the House-approved language.

The Juniper project would have been authorized as a storage unit by the language in the Senate bill. The House language would have required the Secretary to give priority to completion of a planning report on the Juniper unit in the event he found the Curecanti unit infeasible. The conference committee adopted substitute language, which requires that priority be given to completion of a planning report on the Juniper project but removes the contingency in the House language and does not specify whether the Juniper project is to be a storage unit or a participating project.

The conference committee adopted House language requiring the Secretary to give priority to completion of planning reports on certain participating projects including those, except Woody Creek, which would have been conditionally authorized by the language in the Senate bill.

The sum of $760 million remains in the bill as the amount authorized to be appropriated. However, the conference committee, in retaining this amount in the bill, agreed that it should not be earmarked project-wise and that there is no prohibition against the use of such funds for the construction of the Curecanti unit, subject to the certification by the Secretary required in section 1 of the act.

REPAYMENT PLAN AND BASIN FUND

With respect to the repayment plan incorporated in the legislation, the conference committee agreed to and adopted language in the Senate bill, which requires the repayment with interest of costs allocated to power in not to exceed 50 years—a requirement that is in accordance with presently established policy.

The House-approved bill contained language setting out certain accounting and funding requirements to be made applicable to the basin fund. The conference committee adopted the language of the House bill, which provides for the establishment, from surplus power revenues of the storage project, of credits, within the basin fund, to each State of the upper basin for financial assistance to irrigation development in such State. It should be understood that the revenues thus credited to the States are only for use, within the individual States, in assisting the construction of Federal reclamation projects and shall not be used for any other purpose.

INDIAN LANDS

The House-approved bill contained language making nonreimbursable the costs allocated to irrigation of Indian lands which are beyond the capability of such lands to repay. The conference committee agreed to and adopted substitute language limiting this provision to the Navajo participating project. This language was adopted in recognition of the fact that assistance to the Navajo Indians is the responsibility of the entire Nation and not just the upper basin States.

OPERATION OF POWER FACILITIES

Section 7 of the House-approved bill, containing a grant of authority to the Secretary of the Interior relating to operation of the power facilities authorized to be constructed by S. 500, has been amended by the conference committee in two respects.

The first sentence of section 7, directing the Secretary to operate such facilities so as to produce the greatest amount of power and energy that can be sold at firm rates, has been amended through adoption of substitute language which relates to the grant of authority to the Secretary, and provides that such operation—

> * * * shall not affect or interfere with the operations of the provisions of the Colorado River Compact, the Upper Colorado River Basin Compact, the Boulder Canyon Project Act, the Boulder Canyon Project Adjustment Act and any contract lawfully entered into under said Compacts and Acts.

This language has been adopted to make clear the intent that all of the instruments constituting the law of the Colorado River shall be read together by the Secretary of the Interior in the operation of the power facilities authorized to be constructed, operated, and maintained by this legislation.

In a similar vein, the conference committee has adopted an amendment in the nature of a substitute for the House-approved language contained in the second sentence in section 7. The language of this sentence, which deals with the impounding and use of water for the generation of power and energy at the plants of the Colorado River storage project, has been rewritten to make clear the intent of Congress that, subject to the provisions of the Colorado River compact,

such impounding and use shall be subservient to the appropriation of water for domestic or agricultural purposes.

APPROVAL OF FINAL COURT DECREE RELATING TO BLUE RIVER WATER

The Senate bill contained language authorizing conveyance to the city of Denver of certain water rights used for the production of power at Green Mountain Dam on the Blue River in Colorado. The conference committee adopted substitute language. These water rights have been the subject of prolonged litigation between the United States, Denver, and water users on both the eastern and western slopes of Colorado in the consolidated cases of the *United States of America* v. *Northern Colorado Water Conservancy District, et al.*, in the United States District Court for the District of Colorado. Since the Senate action on S. 500, agreement has been reached between representatives of the eastern slope and western slope of Colorado, and a final decree has been filed by the United States district court in this matter. Copies of the final decree and stipulations have been submitted to the Congress. The substitute language adopted by the conference committee gives immediate congressional approval to the final judgment, final decree and stipulations and instructs the proper agencies of the United States to act in accordance therewith.

PLANNING OF FUTURE PROJECTS

With respect to House language in section 13 of the bill, relating to the planning of future projects by the Secretary, the conference committee adopted substitute language which does not change the intended purpose of this section. The intention of the language is to require the Secretary, in planning additional developments in the upper basin, to give consideration to achievement, within each of the States, of the fullest practicable use of the water apportioned to each State. Since, under section 5, revenues to assist irrigation development are apportioned to the States on the basis of the estimated percentages of upper-basin water remaining to be developed in each such State, the intention of this section could also be stated as requiring the Secretary, in planning future projects, to give consideration to the revenues which it is anticipated will be available for repayment of such projects.

CONSENT TO SUIT OF UNITED STATES

Section 14 of the bill, which gives consent to joinder of the United States as a party to an action or actions by any State of the Colorado River Basin asserting noncompliance with the provisions of law made applicable by this section, has been amended to make clear the intent of Congress that the United States may be joined as a party thereto as a defendant or otherwise.

QUALITY-OF-WATER STUDIES

The House-approved bill included language in section 15 requiring the Secretary of the Interior to make certain quality-of-water studies. The conference committee adopted substitute language which, al-

though not as specific, accomplishes the same purpose and recognizes that such studies are already required by law and are underway.

OTHER DIFFERENCES BETWEEN HOUSE AND SENATE LANGUAGE

With respect to all other major differences between the House and the Senate bills not discussed hereinbefore, the conference committee concurred in and adopted the House language.

In conclusion, one additional observation appears in order: Throughout the hearings and deliberations of the House Committee on Interior and Insular Affairs on this legislation, in floor presentation and debate, and in the several sessions of the conference committee, there has existed unity of understanding and agreement on the purpose of this legislation. That purpose is to authorize the construction of the Colorado River storage project and participating projects and to provide for the operation of the facilities thereof in accordance with the law of the Colorado River.

CLAIR ENGLE,
WAYNE N. ASPINALL,
LEO W. O'BRIEN,

DOCUMENT
No. 101

FINANCIAL AND ECONOMIC ANALYSIS

COLORADO RIVER STORAGE PROJECT AND PARTICIPATING PROJECTS

A STUDY

PREPARED BY THE

UNITED STATES
DEPARTMENT OF THE INTERIOR
BUREAU OF RECLAMATION

FEBRUARY 1958

MAY 21, 1958.—Ordered to be printed

UNITED STATES
GOVERNMENT PRINTING OFFICE
25927 WASHINGTON : 1958

S. Res. 302

IN THE SENATE OF THE UNITED STATES,
May 21, 1958.

Resolved, That a study entitled "Financial and Economic Analysis, Colorado River Storage Project and Participating Projects, February 1958", prepared by the Department of the Interior, be printed with illustrations as a Senate document, and that two thousand additional copies be printed for the use of the Committee on Interior and Insular Affairs.

Attest:

FELTON M. JOHNSTON,
Secretary.

By EMERY L. FRAZIER,
Chief Clerk.

LETTER OF TRANSMITTAL

DEPARTMENT OF THE INTERIOR,
OFFICE OF THE SECRETARY,
Washington, D. C., April 15, 1958.

Hon. RICHARD M. NIXON,
President of the Senate,
Washington, D. C.

DEAR MR. PRESIDENT: With my letter of December 30, 1957, I transmitted to you the first annual report on the status of the Colorado River storage project and participating projects as required by section 6 of the authorizing act of April 11, 1956 (70 Stat. 105).

The preliminary repayment studies, referred to in that letter, have been completed and a copy of the study entitled "Financial and Economic Analysis, Colorado River Storage Project and Participating Projects, February 1958," is transmitted herewith for the information of the Congress.

This analysis is intended to be used as a reference and guide by those having responsibility for carrying out the water resource development program in the Upper Colorado River Basin.

With construction just starting on initially scheduled units, this first analysis is based largely on planning estimates with such refinements as are possible in a few instances from detailed preconstruction estimates and from bids on construction work. The analysis will be reviewed and revised periodically as detailed investigations and construction of the development progress, and as new data becomes available.

Sincerely yours,

FRED A. SEATON,
Secretary of the Interior.

FINANCIAL AND ECONOMIC ANALYSIS

Colorado River Storage Project and Participating Projects

Introduction

An extensive program for the development of water resources in the Upper Colorado River Basin was initiated by the act of April 11, 1956 (70 Stat. 105). Authorized for construction were four initial units of the Colorado River storage project on the main river or its larger tributaries, primarily for river regulation and power production. Also authorized were 11 participating projects for irrigation and other related purposes, including the partially constructed Paonia project in Colorado. The entire development is linked financially through the Upper Colorado River Basin fund which was established by the act. The largely constructed Eden project in Wyoming was also made a participant in the basin fund.

The economic and financial analysis reported in this volume is intended to be used as a reference and guide by the Bureau of Reclamation and others having responsibility in carrying out the authorized development program in the Upper Colorado River Basin. With construction just starting on initially scheduled units, this first report is based largely on planning estimates with such refinements as are possible in a few instances from detailed preconstruction estimates and from bids on construction work. The report will be revised periodically as progress is made in detailed investigations and construction and as new data become available.

The estimates of power production at the authorized storage units involve assumptions on the future depletion upstream from these units and resultant regulated annual releases. Utilization of any of the assumptions underlying the basic water supply studies does not carry with it any actual or implied finding of legal restrictions or limitations.

Water Compact and Treaty Obligations

DIVISION OF WATER

Water of the Colorado River was divided between the Upper and Lower Colorado River Basins by the Colorado River compact, which was signed in 1922 by a commissioner of each of the seven States of the river basin and by a representative of the United States and which was subsequently approved by the Congress and the President of the United States. The dividing point on the river between the upper and lower basins is at Lee Ferry near the northern border of Arizona below the mouth of the Paria River. Among other things, the compact apportions to the upper basin the beneficial consumptive

use of 7,500,000 acre-feet of water per annum. The compact provides also that

> The States of the upper division will not cause the flow of the river at Lee Ferry to be depleted below an aggregate of 75 million acre-feet for any period of 10 consecutive years * * *

The compact prescribes the manner in which waters of the Colorado River system may be made available to Mexico under any water rights recognized by the United States. The Mexican Treaty of 1945 provides basically for an annual delivery by the United States to Mexico of 1,500,000 acre-feet of Colorado River water. Of the many provisions in the Colorado River compact and the Mexican Treaty concerning the use of the water of the Colorado River system, those briefed above are of particular importance to the program now being initiated in the upper basin.

Water allocated to the upper basin by the Colorado River compact was further apportioned to the individual States of the upper basin by the Upper Colorado River Basin compact which was signed in 1948. Under the terms of this compact Arizona is permitted to consume 50,000 acre-feet of water annually from the upper Colorado River system and the remaining water allocated to the upper basin is apportioned to other States in the following percentages.

	Percent		*Percent*
Colorado	51.75	Utah	23.00
New Mexico	11.25	Wyoming	14.00

The upper-basin compact created the Upper Colorado River Commission, an interstate administrative agency. The commission consists of a representative of each of the States of Colorado, New Mexico, Utah, and Wyoming, and the Federal Government.

STORAGE REQUIREMENT

The flow of the Colorado River is extremely erratic, historical flow varying from 4,400,000 to 22,000,000 acre-feet annually at Lee Ferry. The extreme drought of recent years has accentuated the problems of river regulation and use. In prolonged dry periods there is not enough flow to permit the upper basin to consume its apportioned water and at the same time to meet its obligations to the lower basin and to Mexico. In wetter periods, however, flows are more than sufficient for these purposes. Large holdover storage reservoirs are thus needed to provide additional water when needed for compact fulfillment during prolonged periods of drought. Favorable opportunities for such reservoirs are provided by the deep canyons of the Colorado River and its principal tributaries in the upper basin.

Further information on the water-supply situation is presented later in this report.

PROJECT PLAN

A plan for the Colorado River storage project and an initial group of participating projects has been formulated by the Bureau of Reclamation in cooperation with other Federal agencies and with the States of the Upper Colorado River Basin. The project report prepared in 1950 and a supplemental report prepared in 1953 were printed as House Document No. 364, 83d Congress, 2d session. Reports on the participating projects in the initial group, supplemental

to the 1950 report, were also completed in 1950 and 1951. Since its introduction in the 1950 report, the project plan has been subject to modifications as shown in the 1953 supplement, in the authorizing act, and in definite plan studies.

COLORADO RIVER STORAGE PROJECT

The various dams and reservoirs of the Colorado River storage project will regulate the flow of the river, thus permitting an expansion of irrigation and other water use in the upper basin within the limits of the Colorado River compact. In most instances powerplants and switchyards will be installed at the dams and transmission lines will be provided to transmit the power to load centers. Facilities will be provided as appropriate for recreation and to mitigate losses of, and improve conditions for, the propagation of fish and wildlife. Minor flood control and other benefits, largely unevaluated at present, are anticipated from the storage project.

The Colorado River storage project as outlined in the 1950 report included 10 storage units. Four of these were authorized for construction by the act of April 11, 1956. It is anticipated that additional units will be authorized as they become needed. The four authorized units are the Glen Canyon, Flaming Gorge, Navajo, and Curecanti. Together they will provide about 34,670,000 acre-feet of reservoir capacity and about 1,167,000 kilowatts of installed generating capacity. More than three-fourths of both capacities will be provided by the Glen Canyon unit alone.

Brief descriptions of the four authorized units and their common transmission system appear below. Data on reservoir and powerplant capacities and stream depletions are summarized in the table on page 8.

Glen Canyon unit

Glen Canyon Dam will be on the Colorado River in northern Arizona, about 13 miles downstream from the Utah-Arizona State line and 16 miles upstream from Lee Ferry. It is the only one of the authorized dams that will be on the Colorado River proper.

Glen Canyon Dam will be a gravity arch concrete structure that will rise 700 feet above its foundation and 573 feet above the river. It will have a crest length of 1,500 feet. The dam will be the fourth highest in the world and second in height only to Hoover Dam in the United States. The reservoir will have a capacity of 28,040,000 acre-feet. When full, it will cover about 163,000 acres and will extend 186 miles up the Colorado River, nearly to the mouth of Green River, and 71 miles upstream on the tributary San Juan River. About 6,535,000 acre-feet of the reservoir capacity will be inactive and will be useful for sediment accumulation, to protect fish, and to provide the power head at the dam. A powerplant and switchyard will be constructed at the dam. The powerplant will include 8 generating units with a total installed capacity of 900,000 kilowatts. An access road and a bridge across the canyon about 900 feet downstream from the dam site will be constructed to Federal highway standards.

Measures will be taken to protect the Rainbow Bridge National Monument at one of the side bays of the Glen Canyon Reservoir.

Flaming Gorge unit

Flaming Gorge Dam will be on the Green River, a major tributary of the Colorado, in northeastern Utah about 6 miles south and 20 miles west of the corner common to Utah, Wyoming, and Colorado. The dam will be a concrete thin-arch structure rising about 495 feet above its foundation and about 445 feet above the river. It will have a crest length of 1,270 feet. The reservoir will have a total capacity of about 3,930,000 acre-feet and an area of about 42,000 acres. It will extend upstream 93 miles, nearly to the town of Green River, Wyo. About 330,000 acre-feet of the reservoir capacity will be inactive. The powerplant at the dam will consist of 3 generating units with a total installed capacity of 108,000 kilowatts. A switchyard will be constructed nearby.

Navaho unit

Navaho Dam will be constructed on the San Juan River in New Mexico about 34 miles east of Farmington. The dam will be an earth-fill structure about 385 feet high above the river and nearly 3,800 feet long at the crest. Navaho Reservoir will provide water for the Navaho Indian irrigation project, when that project is authorized and constructed, and also will provide water directly or indirectly for other potential projects in New Mexico. The reservoir will have a total capacity of 1,700,000 acre-feet and an inactive capacity of 672,000 acre-feet, of which about 70,000 acre-feet will be dead storage. The reservoir when full will inundate 15,300 acres and will extend approximately 34 miles up the San Juan River. Although the outlet works are such that a powerplant could be installed at a later date, no powerplant is included in the present plan. Recreational facilities will be provided at the reservoir.

Curecanti unit

The Curecanti unit will develop storage and power possibilities along part or all of a 40-mile stretch of a deep canyon section of the Gunnison River above the Black Canyon of the Gunnison National Monument and below the town of Gunnison, Colo. In order to prevent the inundation of land near the town, the authorizing legislation provides that—

> * * * the Curecanti Dam (now called Blue Mesa Dam) shall be constructed to a height which will impound not less than 940,000 acre-feet of water or will create a reservoir of such greater capacity as can be obtained by a high waterline located at 7,520 feet above mean sea level. * * *

The act also requires that construction shall not be undertaken until further engineering and economic investigations have been made and until the Secretary of the Interior has certified to the Congress and the President that in his judgment the benefits of the unit will exceed its costs.

Bureau of Reclamation reconnaissance studies indicate that a favorable plan, consistent with the authorizing act, would include a series of four dams, reservoirs, powerplants, and switchyards. The developments in order moving downstream would be known as the Blue Mesa, Narrow Gauge, Morrow Point, and Crystal. Collectively, the reservoirs would have a capacity of about 1 million acre-feet. The powerplant, with an installed generating capacity of about 159,000 kilowatts, would develop a maximum of about 940 feet of static power head.

The Blue Mesa Dam, located 30 miles downstream from Gunnison, would be the largest of the series in the Curecanti unit. It would be an earth-fill structure about 350 feet high above its foundation and about 820 feet long at its crest. The reservoir would have a capacity of about 940,000 acre-feet at a high-water elevation of 7,520 feet. About 200,000 acre-feet of the reservoir capacity would be inactive. The active capacity would provide the principal seasonal river regulation for the unit powerplants. Recreational facilities would be provided at the reservoir.

Investigation and planning of the Curecanti unit are continuing in more detailed scope as required by the authorizing act.

Transmission division

The authorizing act of April 11, 1956, provides that project powerplants and transmission facilities shall be operated in conjunction with other Federal powerplants, present and potential, so as to produce the greatest practicable amount of power and energy that can be sold at firm power and energy rates. To carry out the provisions of the law, a high-voltage transmission and grid will be constructed to interconnect the plants of the authorized units of the storage project and to effect interconnection with other existing Federal powerplants and utility systems in the area.

The transmission division includes the high-voltage lines from storage unit switchyards to substations at major load centers and points of interconnection and the substations at those points. Facilities of the transmission division will be extended as necessray to provide interconnections with future units of the storage project and with Other Federal plants and to provide for interconnection of future participating project transmission lines with the high-voltage grid. The extent and location of the high-voltage transmission grid will depend on the market area requirements for project power, the desires of power users to purchase project power, points of interconnection with other systems, and the final allotments of power to various users.

PARTICIPATING PROJECTS

Participating projects are those which will consume water of the upper Colorado River system for irrigation and other purposes and which will require assistance from power revenues of the storage project in the repayment of irrigation costs. An initial group of 11 participating projects was authorized by the act of April 11, 1956. These include the Paonia, Smith Fork, Florida, and Silt projects in Colorado; the Pine River extension in Colorado and New Mexico; the Hammond project in New Mexico; the central Utah project (initial phase) and Emery County project in Utah; and the Seedskadee, La Barge, and Lyman projects in Wyoming. The projects combined will provide water for a total of about 365,100 acres, including about 132,800 acres of full service land and about 232,300 acres of supplemental service land.

Brief descriptions of the 11 initial participating projects appear below. Data on irrigable area, reservoir storage capacity, and water supply are summarized in the table on page 8.

Paonia project

The Paonia project on the North Fork of the Gunnison River in west-central Colorado was partially constructed under the authorizing act of June 25, 1947. It was reauthorized by the act of April 11, 1956, and the entire development was linked with the basin fund as a participating project. The project will provide water to 2,200 acres of full-service land and 13,100 acres of supplemental-service land. It will provide incidental benefits to fish and wildlife, recreation, and flood control.

The Fire Mountain Canal was enlarged and partially extended under the intial authorization. Work yet to be accomplished under the 1956 reauthorization includes construction of the Paonia Reservoir on Muddy Creek to a capacity of 21,000 acre-feet, further extension of the Fire Mountain Canal, and rehabilitation of critical sections of the previously enlarged canal.

Pine River project extension

An extension will be constructed to the existing Pine River project, located in southwestern Colorado and northwestern New Mexico about 20 miles east of Durango, Colo. The extension will provide irrigation water for about 15,200 acres of full-service land, of which about 1,940 acres are within the Pine River Indian irrigation project. The extension will involve enlargement and extension of eight canals and ditches diverting from Pine River, a new diversion dam, and several small distribution laterals.

Smith Fork project

The Smith Fork project will be constructed in west-central Colorado along the Smith Fork of Gunnison River near Crawford. It will provide water for about 2,300 acres of full-service land and 8,200 acres of supplemental-service land. Recreational opportunities also will be provided. Construction features will include the Crawford Reservoir with 14,000 acre-feet of capacity, a diversion dam, feeder canals, and laterals.

Florida project

The Florida project will be constructed in southwestern Colorado on the Florida River. It will provide a full supply of water for about 6,300 acres of land and a supplemental supply for about 12,700 acres. Construction features will include the Lemon Reservoir with a capacity of about 23,000 acre-feet, a diversion dam, and distribution and drainage systems. An existing canal also will be enlarged. Operation of the project also will provide flood control and some enhancement of fish and wildlife values in the area.

Silt project

The silt project will provide water for about 1,900 acres of full-service land and 5,400 acres of supplemental-service land between Rifle and Elk Creeks in west-central Colorado. The project also will enhance fish and wildlife values in the area. Construction features will include the Rifle Gap Reservoir of 10,000-acre-foot capacity, a pumping plant, diversion dam and feeder canal, and laterals and drains. Some existing works will be rehabilitated.

Hammond project

The Hammond project in northwestern New Mexico will divert San Juan River water for irrigation of about 4,000 acres of full-service land along the river in the vicinity of Farmington and Bloomfield. Principal features of the development will be a diversion dam, distribution canal, pumping plant, and lateral and drainage systems.

Central Utah project (initial phase)

The central Utah project (initial phase) will be an extensive undertaking to develop water resources of the Uinta Basin, a segment of the Colorado River Basin in northeastern Utah. Part of the developed water will be conveyed westward for use in the Bonneville Basin in central Utah and the remainder will be used in the Uinta Basin. Reservoirs with a total capacity of about 1,663,000 acre-feet will make water available for about 28,600 acres of full-service land and about 131,800 acres of supplemental-service land. Four project powerplants will have a combined installed capacity of 61,000 kilowatts. Approximately 48,800 acre-feet of water will be provided annually for municipal, industrial and miscellaneous uses. The project will provide recreational benefits and will have value in flood and sediment control.

The potential Strawberry aqueduct will intercept flows of Rock Creek and streams west of Rock Creek. It will convey the water to the existing Strawberry Reservoir on Strawberry River which will be enlarged through donstruction of Soldier Creek Dam downstream from the present dam. The existing outlet tunnel from the reservoir will be enlarged. This tunnel conveys water westward through the Wasatch Mountain divide to the Bonneville Basin. In descending the west slope of the Wasatch Mountains, the water will pass through a series of four powerplants. In the Bonneville Basin the water will be used in an area extending from Salt Lake City south 80 miles to Nephi. Part of the use will be effected by exchanges involving the waters of Utah Lake, Provo River, and other streams. These exchanges will require construction of Bates Dam on Provo River, Hobble Creek Dam on Little Hobble Creek, and the Front Dam near Salt Lake City. Transmission lines will be constructed to serve local market areas and to interconnect with the main grid transmission system.

New project works to provide water for replacement and expanded irrigation and municipal use in the Uinta Basin will include Hanna Reservoir on the north fork of the Duchesne River, Starvation Reservoir on Strawberry River with a feeder canal from the Duchesne River, the Upalco Reservoir off-stream from Lake Fork River, the Stanaker Reservoir with feeder canal from Ashley Creek, and a service canal (Vernal unit), and Tyzack Reservoir on Brush Creek.

Emery County project

The Emery County project will be in the headwaters of the San Rafael River in east-central Utah. It will provide irrigation water for about 3,600 acres of full-service land and 20,500 acres of supplemental-service land and will provide for recreational opportunities. Joes Valley Reservoir with a total capacity of 57,000 acre-feet, a diversion dam, canal, laterals, and drains will be the principal features of the project.

Seedskadee project

The Seedskadee project will be constructed in southwestern Wyoming along the Green River below the authorized La Barge project. Principal works under the present tentative plan include a diversion dam on the river, conveyance canals, pumps, and distribution laterals. Such works will provide an irrigation water supply for about 60,700 acres of full-service land.

Modifications of the plan to provide storage and fish and wildlife facilities are being investigated. As the studies are still incomplete, however, the modifications are not included in the project data used in this report.

Lyman project

The Lyman project will be constructed in southwestern Wyoming along Blacks Fork of the Green River near the Wyoming-Utah boundary. It will supplement the irrigation water supply for about 40,600 acres of land. Bridger Reservoir will be constructed on Willow Creek to a capacity of 43,000 acre-feet. Other features will include feeder canals to the reservoir, return canals to distribute the reservoir releases, improvement of the Willow Creek channel, drainage, and improvement of the existing irrigation system.

La Barge project

The La Barge project will divert water directly from the Green River in southwestern Wyoming to provide irrigation water for about 8,000 acres of full-service land. Project works will include a diversion dam, conveyance canal, distribution laterals, and drains.

Summary of irrigation and power data: Colorado River storage project and participating projects

Units and projects	Irrigable area			Total reservoir storage capacity	Installed power-plant capacity	Average annual water supply	
	Full-service land	Supplemental service land	Total			Increase in usable irrigation supply	Increase in stream depletion
STORAGE UNITS	*Acres*	*Acres*	*Acres*	*Acre-feet*	*Kilowatts*	*Acre-feet*	*Acre-feet*
Glen Canyon				28,040,000	900,000		576,000
Flaming Gorge				3,930,000	108,000		62,000

La Barge, Wyo	8,000		8,000			24,300	14,200
Subtotal	132,800	232,300	365,100	1,831,000	61,000	621,100	403,100
Total	132,800	232,300	365,100	36,501,000	1,228,000	621,100	1,094,100

[1] In addition, an average of 48,800 acre-feet annually will be made available for municipal, industrial, and miscellaneous uses under the initial phase of the central Utah project.

Project Costs and Construction Schedule

COST ESTIMATES

Construction costs

The total construction cost of the 4 initial units and transmission division of the Colorado River storage project and the 11 initial participating projects, including costs of past and future investigations, is estimated at $992,174,000. Of the total, $677,382,000 represents the cost of the storage units and transmission division and $314,792,000 the cost of the participating projects. The cost estimate is the latest official estimate of the Bureau of Reclamation and cooperating agencies. It is based generally on the price level of January 1957 except that bid prices were used where available and actual costs of past investigations and construction were used. Since the location of facilities in the transmission division has not been definitely determined, the construction cost of such facilities was estimated on the basis of an average of about $135 per kilowatt of installed powerplant generating capacity. The cost estimates will be revised periodically to include costs of completed work, changes in estimates resulting from future modifications in plans, and latest available data including bid prices.

Operation, maintenance, and replacement costs

Operation, maintenance, and replacement costs are estimated at $7,729,000 annually, including $6,282,000 for the storage units and transmission division and $1,447,000 for the participating projects. The operation and maintenance costs were estimated at price levels of the 3-year period 1954–56 and the replacement costs were based on current construction cost estimates. The estimates shown above, which were used in the repayment analysis, include replacement costs computed at 2⅞ percent interest over a 100-year period.

Summary

The table on the following page summarizes construction costs and annual operation, maintenance, and replacement costs for each storage unit, the transmission division, and each participating project. For convenience in the economic and financial analysis in later sections of the report, the table also itemizes expenditures through June 30, 1957, the costs used as a basis for the benefit-cost analysis, and the costs to be allocated.

Summary of project costs: Colorado River storage projects and participating projects

[In thousands of dollars]

[1] Based on January 1957 price level except that bid prices were used where available and actual costs of past investigation and construction were used.

[2] Contributed funds, some of which have been expended to date, include $60,000 from city of Los Angeles for investigation of Glen Canyon Dam site; $1,635,000 from State of Arizona and $600,000 from Bureau of Public Roads for improvement of Glen Canyon bridge and access road to meet Federal highway standards; and $63,000 from the State of Utah and private groups for investigation of the central Utah and Emery County projects.

[3] Operation and maintenance costs are based on 1954–56 price levels and replacement costs on current prices. Figures shown include replacement costs at 2+ percent interest for use in the repayment analysis.

[4] Includes $207,000 for recreational facilities at Navajo unit.

[5] Includes $452,000 for recreational facilities at Curecanti unit.

[6] Excludes $5,750,000 for construction of certain central Utah project features to ultimate phase capacity.

25927—58—2

CONSTRUCTION SCHEDULE

Expenditures by the Bureau of Reclamation for advance planning and construction of the authorized storage units and participating projects are tentatively programed as shown in the schedule on the following page. Construction already has been started on the principal features of the Colorado River storage project, except those of the Curecanti unit. The first participating projects programed are the Paonia, Hammond, and Seedskadee projects and the Vernal unit of the central Utah project, all of which are scheduled for the start of construction in fiscal year 1961.

The advance planning and construction schedule has been followed in the economic and financial analysis discussed later in this report. The program as now outlined could be substantially modified, however, as actual progress will be determined by congressional appropriations. It will be desirable for work on the storage project to follow the general rate established by contracts now in force and to be awarded in fiscal year 1958. Any slowdown in the rate established would increase costs of interest during construction and in the case of the Glen Canyon and Flaming Gorge units would delay availability of power revenues to assist in repayment of irrigation costs.

WATER SUPPLY

Water supplies available for development by authorized units of the Colorado River storage project and participating projects have been estimated on the basis of recorded flows, with consideration given to downstream uses and past and anticipated upstream depletions. It is not within the scope of this report to summarize the water-supply studies made for each participating project. A brief summary of the water supply available to the Upper Colorado River Basin and units of the storage project is presented in the following paragraphs, however, in view of the importance of water supply as related to project power production and revenues.

STREAMFLOWS

Three terms are commonly used to define flows of the Colorado River. Historical flows are those which have actually occurred. Virgin flows are the estimated flows which would have occurred without man-made depletions. Present modified flows are those which would have occurred in the past had the present level of development and depletions been in full effect.

Average annual historical and present modified flows at units of the storage project have been estimated as shown in the following table.

Average annual flows for 1914–1945 period [1]

[In acre-feet]

Unit	Historical flow	Present modified flow
Glen Canyon	13,763,000	13,064,000
Flaming Gorge	1,636,000	1,615,000
Navaho	1,260,000	1,244,000
Curecanti (Morrow Point Dam site)	1,270,000	1,270,000

[1] Period adopted in negotiations for the Upper Colorado River Basin compact as representative of longtime flow conditions.

2/ Does not include $207,000 for recreational facilities.
3/ Does not include $452,000 for recreational facilities.

25927 O - 58 (Face p. 12)

INTERIOR - RECLAMATION, W.C. UTAH

At a point 15 miles below Glen Canyon Dam site, the Paria River contributes an average of about 25,000 acre-feet annually to the Colorado River, but the flow is erratic from year to year. For all practical purposes the flow at Glen Canyon approximates the flow at Lee Ferry, 16 miles downstream, the dividing point on the river between the upper and lower basins. The average annual virgin flow at Lee Ferry over the 1914–45 period is estimated at about 15,640,000 acre-feet.

STREAM DEPLETIONS

Annual man-made depletions in the Upper Colorado River Basin from existing developments and developments authorized prior to 1949, the year the Upper Colorado River Basin compact became effective, are estimated to average about 2,550,000 acre-feet. A number of years will be required for full development of projects authorized prior to 1949. The 2,550,000-acre-foot depletion is therefore used in this report as also applying to fiscal year 1963, when initial operation of the storage project is scheduled and is also referred to as the present depletion. On the basis of the annual depletion of 2,550,000 acre-feet, the upper basin is utilizing only about one-third of the consumptive use apportioned to it by the Colorado River compact.

As a basis for evaluating the Colorado River storage project and participating projects, a projection was made of future stream depletions estimated to occur in the upper basin during the 100-year period from fiscal year 1963 through fiscal year 2062. It was estimated that the depletions by 2062 would total about 6,191,000 acre-feet annually, consisting of 2,550,000 acre-feet from existing developments, 691,000 acre-feet from evaporation from the authorized storage units, and 2,950,000 acre-feet from new projects including the authorized participating projects and other future Federal and non-Federal developments. The 2,950,000-acre-foot depletion from new projects expressed as a weighted average amount over the 100-year period approximates 1,800,000 acre-feet, a figure used hereinafter in the project economic analysis. Assumed average depletions are summarized in the table below.

Projected depletions [1]

[In thousand acre-feet]

Fiscal year	Depletion from existing and new projects in upper basin	Average evaporation losses from storage units [2]	Total
1963	2,550	Negligible	2,550
1970	3,150	691	3,841
2020	4,750	691	5,441
2062	5,500	691	6,191

[1] Based on averages for runoff period 1914 to 1945, inclusive.
[2] Estimated average stream depletions due to evaporation from Glen Canyon, Flaming Gorge, Navaho, and Curecanti storage units.

REPLACEMENT STORAGE

The holdover reservoirs in the Upper Colorado River Basin are designed to impound water in years of high runoff and release such water during prolonged dry periods to permit the upper basin to

increase its uses and still meet its compact obligations for flows at Lee Ferry for the benefit of the lower basin and Mexico.

The estimated total active storage capacity available in fiscal year 2062 in the four authorized units after sediment encroachment is shown in the following table. This available capacity may be appropriately referred to as replacement storage capacity since it will be used, among other things, to replace to the lower basin an appropriate part of the natural streamflow consumed upstream in the upper basin during prolonged drouth periods.

Estimated active storage capacities in fiscal year 2062

[In thousand acre-feet]

Unit	Fiscal year of initial storage	Initial active active storage capacity	Sediment deposition to end of fiscal year 2062		Remaining active storage capacity in fiscal year 2062
			In dead storage capacity	In active storage capacity	
Glen Canyon	1963	21,505	5,260	4,180	17,325
Flaming Gorge	1964	3,600	70	130	3,470
Navaho [1]	1964	1,028	250	80	948
Curecanti	1969	720	10	20	700
Total		26,853	5,590	4,410	22,443

[1] The storage capacity at the Navaho unit may be needed ultimately by the potential Navaho irrigation project and other local developments and hence may not be available to meet compact obligations. This situation will be reviewed when the Navaho irrigation project is authorized.

RESERVOIR OPERATIONS

Two studies were made of the coordinated operation of the four authorized units of the storage project. The first was an initial reservoir filling study to bring the reservoirs to power operating levels and to roughly determine power production potentialities to March 31, 1971. The second was a more detailed study covering coordinated reservoir operations to estimate annual power production after March 31, 1971.

The initial filling study was based on average streamflow conditions for the 32-year period 1914–45. The average flow was progressively modified throughout the filling period in accordance with the projected schedule of upstream depletions. Allowances were made for reservoir evaporation and for increases in storage at upstream reservoirs. Each reservoir was first filled to the minimum power operating level in order that power generation might be obtained as early as practicable. Thereafter additional storage was progressively accumulated at all reservoirs from available storable supplies. The filling study indiactes that Glen Canyon, the first reservoir scheduled for completion, would start filling at the beginning of fiscal year 1963. All the reservoirs would fill to reasonable operating levels by March 31, 1971, and the major part of the system power output at the three storage units would then be attained. An annual summary of the initial filling operation for the Glen Canyon Reservoir with allowance for filling of the storage project upstream reservoirs is shown on the following page.

The post-filling reservoir operation study was based on several repetitions of a runoff cycle similar to the 32-year runoff period 1914 to 1945. Data corresponding to the 32 years in sequence were inserted in the study for fiscal year 1971 through fiscal year 2002 and the process was repeated for each 32 years thereafter with proper adjustments for increased depletions. Annual releases for system

energy generation were made in varying amounts in accordance with normal operating and forecast procedures. The monthly pattern of releases for energy generation followed the pattern of energy requirements estimated for 1980 in the project power market area.[1] Additional releases made in anticipation of later spills were also utilized in the generation of energy.

Expected operation of Glen Canyon Reservoir during initial filling period

[In million acre-feet]

Year beginning Apr. 1 [1]	1914-45 average annual present modified flow at Glen Canyon Dam	Adjustments for new upstream uses		Assumed inflow to Glen Canyon Reservoir	Losses	Release from Glen Canyon Reservoir	Total storage in Glen Canyon Reservoir at end of year
		Increase in consumptive use including reservoir evaporation	Increase in storage at upstream reservoirs				
1961	13.1	----------	----------	13.1	----------	13.1	0
1962	13.1	0.1	----------	13.0	----------	11.5	1.5
1963	13.1	.1	0.2	12.8	0.1	8.7	5.5
1964	13.1	.1	.6	12.4	.2	8.8	8.9

1968	13.1	.5	.6	12.0	.5	10.4	17.0
1969	13.1	.6	.5	12.0	.5	10.4	18.1
1970	13.1	.7	.4	12.0	.5	10.5	19.1

[1] Annual summary is based on years beginning Apr. 1 when Lake Mead and Glen Canyon Reservoir will normally be at lowest stage.

Power Production and Marketing

POWER MARKET AREA AND REQUIREMENTS

The Federal Power Commission is currently making a power market survey for the Colorado River storage project. The market area covered by the survey is shown on the map on the following page.

It is estimated that in addition to capacity and generation from existing and scheduled plans in the market area, not including scheduled plants of the Colorado River storage project, about 3,659,000 kilowatts of generating capacity and 14,313 million kilowatt-hours of generation will be needed by 1970 to meet new power requirements throughout the market area. The estimated additional requirements for 1970 and 1980 are summarized below.

Additional power and energy requirements

Division number	Principal State	1970		1980	
		Thousand kilowatts	Million kilowatt-hours	Thousand kilowatts	Million kilowatt-hours
I	Nevada	228	1,247	500	2,783
II	Arizona	954	2,871	2,806	11,770
III	Utah	936	4,612	1,881	9,942
IV	Colorado	1,146	4,708	2,538	12,134
V	Wyoming	194	674	478	2,170
VI	New Mexico	201	201	496	1,802
	Total	3,659	14,313	8,699	40,601

[1] Pattern of energy requirements was taken from preliminary data for a power market survey that is being made by the Federal Power Commission for the Colorado River storage project.

POWER PRODUCTION

Powerplants are presently planned at 3 of the 4 authorized units of the Colorado River storage project and at the central Utah participating project. The total installed generating capacity will be 1,228,000 kilowatts, with the installed capacity at each powerplant as tabulated on page 8. With allowances made for peak-load transmission losses, an estimated 1,109,000 kilowatts of power can be delivered to load centers.

Future power production has been estimated on the basis of coordinated reservoir operation studies as previously discussed. In accordance with the operation studies, power production will commence at the beginning of fiscal year 1965 at the Glen Canyon and Flaming Gorge units, in fiscal year 1970 at the Curecanti unit, and in fiscal year 1974 at the central Utah project. All powerplants will be completed and in full production by about the end of fiscal year 1985. The schedule of estimated energy deliverable to load centers is shown in the table below.

Estimated energy deliverable to load centers from power plants—Colorado River storage project and Central Utah project

[In million kilowatt-hours]

Fiscal year	Colorado River storage project			Central Utah project	Total		
	Glen Canyon	Flaming Gorge	Curecanti		Firm	Nonfirm	Total
1965	2,835	315	----------	----------	1,500	1,650	3,150
1966	3,082	268	----------	----------	2,950	400	3,350
1967	3,450	300	----------	----------	3,200	550	3,750
1968	3,952	298	----------	----------	3,750	500	4,250
1969	4,049	401	----------	----------	3,950	500	4,450
1970	4,079	480	241	----------	4,250	550	4,800
1971	4,066	540	294	----------	4,250	650	4,900
Average 1972-81	5,303	529	782	236	5,700	1,150	6,850
Average 1982-91	4,534	402	804	360	5,550	550	6,100
Average 1992-2001	3,412	360	718	360	4,850	0	4,850
Average 2002-11	4,825	497	866	[1] 362	5,400	1,150	6,550
Average 2012-21	4,397	449	792	362	5,200	800	6,000
After 2021 [2]	3,674	388	776	362	4,850	350	5,200

[1] Annual amounts of energy from the central Utah project are assumed to remain constant after 2001.
[2] For the Colorado River storage project, the annual amounts of energy after 2021 are assumed to be constant and equal to the 20-year average obtained by continuing the study from the year 2022 through 2041.

The average annual energy deliverable to load centers, adjusted to account for time-value considerations in determining the average equivalent energy over a 100-year period after each plant is in full production, is 5,920 million kilowatt-hours. This includes 5,558 million kilowatt-hours for the units of the Colorado River storage project and 362 million kilowatt-hours for the central Utah project. The average annual equivalent capacity for a 100-year period when adjusted in the same manner as the energy is 1,095,000 kilowatts, including 1,036,000 kilowatts for the storage project and 59,000 kilowatts for the central Utah project.

During the filling period, firm energy for each year is considered to be all the energy that can be utilized within the monthly load pattern to meet the annual load growth estimated for the power market area by the Federal Power Commission. Beginning with the post-filling operation of the reservoirs, annual firm energy has been

determined for each subsequent 10-year period to be the average annual generation for each period within the monthly load pattern estimated by the Federal Power Commission. Data from the study indicate that the installed capacity of 1,228,000 kilowatts is required in the initial decades to market power and energy at the estimated load factor for the market area of the study. When stream depletions increase in later years, project power could be marketed at lowerload factors than the area load factor. Marketing the power initially at the load factor for the area and later at lowerload factors will result in utilizing the project plants most effectively to supply the requirements of the area when operated in conjunction with other power systems.

Preliminary data from the power market survey indicate that project-produced power and energy can be readily absorbed in the market area as it becomes available from the project powerplants. The estimated requirement by 1970 for 3,659,000 kilowatts of new generating capacity and 14,313 million kilowatt-hours of generation can only be partially satisfied by the 1,109,000 kilowatts of capacity and 6,850 million kilowatt-hours of energy deliverable to load centers from the authorized units of the Colorado River storage project and the central Utah participating project.

POWER RATES

As shown in the preliminary repayment study on page 48, an average rate of 6 mills per kilowatt-hour for firm energy and 2.5 mills per kilowatt-hour for nonfirm energy will provide sufficient revenues to repay all reimbursable power costs and additional revenues to assist in repayment of irrigation costs as required by the authorizing legislation. Definite rate schedules for firm and nonfirm power and energy will be developed in accordance with departmental policy and marketing criteria when costs are more firmly established and a need for such schedules exists.

Summary of Procedures for Economic and Financial Analysis

Procedures adopted for the economic and financial analysis of the Colorado River storage project and participating projects are consistent with present policies of the Bureau of Reclamation and with the provisions of the project authorizing act of April 11, 1956. Salient information concerning the procedures is listed below.

(1) Analyses were made of the storage project units and participating projects in the following combinations:

(*a*) The four storage units were analyzed separately and jointly for benefit-cost comparisons and jointly for cost allocations and repayment.

(*b*) The 11 participating projects were each analyzed separately.

(*c*) The 4 storage units and 11 participating projects were analyzed jointly to show the overall expenditure and repayment requirements.

(2) Construction cost estimates are the latest official estimates of the Bureau of Reclamation and cooperating agencies and are based on the January 1957 price level except that bid prices are used where

available and actual costs of past investigations and construction are included.

(3) Operation and maintenance cost estimates are based on 1954–56 price levels. Replacement costs are based on current construction cost estimates.

(4) A 100-year period is used in the benefit-cost and cost-allocation analyses.

(5) Water supply, power production, and related studies are based on the assumption that average annual stream depletions from projects in the upper basin will increase from an average of 2,550,000 acre-feet at present to an average of 5,500,000 acre-feet by the end of the 100-year period from fiscal year 1963 through fiscal year 2062. In addition depletions due to evaporation losses from the 4 authorized storage units are estimated to average 691,000 acre-feet at the end of the 100-year period.

(6) Benefits for use in the benefit-cost and cost-allocation analyses are determined for all project purposes in accordance with existing procedures of the Bureau of Reclamation. Irrigation benefits are evaluated as direct, indirect, and public and are based on anticipated agricultural conditions without and with the development. Benefits from power and municipal and industrial water are based on the cost of the most economical single-purpose alternative that is likely to be developed in the absence of the project and that would provide benefits comparable to those of the project. Flood control, recreation, and fish and wildlife benefits are evaluated by the Corps of Engineers, National Park Service, and Fish and Wildlife Service, respectively.

(7) A 2½-percent interest rate is used in the benefit-cost and cost-allocation analyses, except that an interest rate of 6¼ percent for private financing is used in estimating alternative power costs and annual power benefits.

(8) Taxes are included in the estimated cost of the most economical alternative for project power in evaluating power benefits. Accordingly an amount equal to the taxes is included in the cost of project power in benefit-cost comparisons. No provision for payment of a tax equivalent is made in power repayment studies.

(9) All costs of past investigations and construction costs paid from contributed funds are excluded from the benefit-cost analysis. Contributed funds and expenditures from the Colorado River development fund are excluded from the cost allocation and repayment analyses.

(10) In the benefit-cost analysis a share of the cost of the storage project is apportioned to irrigation and other water-consuming uses initiated subsequent to 1949, the year the Upper Colorado River Basin compact became effective.

(11) Costs are allocated by the separable cost-remaining benefits method except that only separable costs are allocated to recreation and fish and wildlife.

(12) Repayment of all reimbursable costs of units and participating projects is based on a 50-year period following completion of each unit, project, or separable feature thereof, with appropriate development periods in the case of irrigation. The exceptions to this are in the repayment of the Paonia and Eden projects for which repayment

periods of 68 and 60 years, respectively, have been authorized. The costs allocated to flood control, recreation, and fish and wildlife are nonreimbursable. Irrigation costs are repayable without interest. Costs allocated to power and municipal and industrial use, including interest during construction, are repayable with interest. In this study an interest rate of 2⅞ percent is used in the repayment calculations in all instances where costs are repayable with interest. This rate has been officially determined in the manner prescribed by law as applicable to the Glen Canyon, Flaming Gorge, and Navaho units. An official determination of rates applicable to the Curecanti unit and to participating projects has not yet been made.

(13) Average rates of 6 mills per kilowatt-hour for firm energy and 2.5 mills per kilowatt-hour for nonfirm energy are used in this analysis. These rates are estimated to be required to return enough revenue to pay, under the provisions of the authorizing act, the following construction costs in addition to the annual operating costs:

(*a*) Costs allocated to power with interest.

(*b*) Storage unit costs allocated to irrigation without interest.

(*c*) Costs of participating projects that are allocated to irrigation and that are beyond the repayment ability of the irrigators, without interest.

(14) Anticipated revenue collections from conservancy-type districts are included as participating project revenues.

Benefit-Cost Analysis

The economic desirability of developing the Colorado River storage project and participating projects was measured by a comparison of anticipated benefits from a national standpoint and the Federal costs of development. Both benefits and costs were converted to average annual equivalent values at 2½ percent interest over a 100-year period beginning with the initial operation of each individual storage unit and participating project.

BENEFITS

The benefit-cost comparisons were based on consideration of all benefits from the authorized developments that could be evaluated in monetary terms, including substantial benefits from irrigation and power and smaller amounts of benefits from municipal and industrial water, flood control, fish and wildlife conservation, recreation, and other project services.

Irrigation benefits

Irrigation benefits are estimated to average $15,464,000 annually over the 100-year period of analysis. About $6,712,000 represents storage benefits assignable to future participating projects, and about $8,752,000 represents benefits estimated for the 11 initial participating projects.

The irrigation benefit used in the cost allocation of the storage project is $9 million annually. This estimate is the sum of the $6,712,000 for future participating projects and $2,288,000 representing the value of regulatory storage to the 11 participating projects.

INTERIOR - - RECLAMATION, SLC, UTAH

25927 O - 58 (Face p. 21) No. 2

The irrigation benefit from participating projects includes direct, indirect, and public benefits. About $4,309,000 of the total represents direct benefits, measured by the increase in net farm income that will be realized with project development. Approximately $2,951,000 represents indirect benefits, measured by the increased profits of businesses handling, processing, and marketing products from the developments and of enterprises supplying goods and services to project farms. The remaining $1,492,000 will be of a public nature realized from the increase or improvement in community facilities and services and stabilization of the local and regional economy.

Benefits from irrigation were evaluated on the basis of average long-term projected price levels.

Power benefits

Total power benefits for the storage project and participating projects are estimated at an average of $42,812,000 annually. These benefits are taken as the average annual value of the total estimated cost of obtaining equivalent power from the most economical alternative source likely to be developed in the absence of the storage project and participating projects. Steam-electric plans constructed and operated by private utilities are considered to be the most likely alternative source. The private plants and necessary transmission lines would be located throughout the market area so as to provide the most economical means of serving the load centers with the necessary power. The plants generally would be large, modern, three-unit installations having a high efficiency and being strategically located with respect to fuel supply. The average cost of alternative steam-electric power and energy delivered to representative load centers throughout the market area is estimated to be $24.50 a year per kilowatt of dependable capacity (including $8.50 per year for taxes) and 2.7 mills per kilowatt-hour for energy. The average annual benefits as shown above result from applying these unit costs to the average annual equivalent amounts of capacity and energy estimated at 1,095,000 kilowatts and 5,920 million kilowatt-hours for the storage project and central Utah project.

The total cost of the most economical alternative source of equivalent power or power benefits for the Colorado River storage project is estimated at $40,389,000 annually as shown under "Cost allocations." The total cost of the most economical alternative source of equivalent power or power benefits for the central Utah project is estimated at $2,423,000 annually.

Municipal and industrial water benefits

Benefits from municipal and industrial water in present evaluations are confined to those that will result from the central Utah project and are estimated to average $1,437,000 annually. This estimate is based on the average annual equivalent cost of obtaining a comparable water supply from the most economical alternative single-purpose means of development.

Flood-control benefits

Preliminary appraisals by the Corps of Engineers indicate that the reduction in flood damage that will result from operation of the authorized project developments will average $124,000 annually. The benefits are equal to the different between the flood damage that is expected to occur with and without the project. The corps will further evaluate flood-control benefits in connection with definite plan studies.

Fish and wildlife benefits

Effects of participating projects on fish and wildlife resources, both beneficial and adverse, have been partially evaluated by the Fish and Wildlife Service. The total adverse effects for the projects studied were found to exceed the total benefits by an average of $5,000 annually. No evaluation, however, has been made of the effects of the storage units on fish and wildlife. The example of Lake Mead suggests that the net benefits of the large storage reservoirs may be substantial. Further evaluation of fish and wildlife benefits will be made as a part of pre-construction surveys.

Recreational benefits

The National Park Service estimates the recreational benefits of the authorized projects and units studied to date at $698,000 annually. The estimate is generally based on the service's judgment that annual benefits of the specific (Federal and non-Federal) recreational facilities included in preliminary plans are at least equal to the annual equivalent cost of constructing, operating, and maintaining the facilities and that a like benefit value will accrue from the recreational use of dams and reservoirs. The evaluation of recreational benefits will be continued in preconstruction surveys.

Other benefits

A number of minor benefits in addition to those mentioned may be expected from project development. The only one so far evaluated is a sediment control benefit in connection with a potential reservoir of the central Utah project which, according to an estimate by the Bureau of Indian Affairs, will have a value of $2,000 annually in preventing sedimentation of Indian irrigation canals.

AVERAGE ANNUAL EQUIVALENT COSTS

Determination of costs

For comparison with the average annual benefits, an estimate was made of the average annual equivalent Federal cost of development. This cost includes the Federal investment amortized over the 100-year period of analysis at 2½ percent interest and annual operation, maintenance, and replacement costs. Construction costs used in the benefit-cost analysis do not include past investigation costs since these do not bear on the advisability of future expenditures. Also they do not include contributed funds for the Glen Canyon bridge and highway nor costs of constructing certain central Utah project features to ultimate phase capacity since no evaluations have been made of benefits from such expenditures. Interest on expenditures during the construction period is added to construction costs. An amount

equivalent to taxes on an alternative private power development is also included as an economic cost of developments involving power production. Also included for participating projects is each project's pro rata share of the cost of regulatory facilities of the Colorado River storage project for reasons explained below.

Storage project costs assigned to participating projects

Reservoirs of the Colorado River storage project, as explained under "Water Supply," will provide replacement water for the lower basin and Mexico in prolonged drought periods in order to permit continued expansion of water-consuming uses in the upper basin. A portion of the cost of the storage reservoirs may therefore appropriately be assigned to the water-consuming uses of participating projects in the benefit-cost analysis. Under the authorized repayment plan, however, all of the reimbursable storage costs will be rapaid from power revenues.

Since the amount of replacement storage required is a direct function of increases in stream depletion, it is equitable to assign the allocated costs of replacement storage to each participating project in proportion to the amount of stream depletion that it will cause. In a later section of this report, a total cost of $122,086,000 on a present worth basis for units of the storage project is allocated to irrigation. This allocation, prorated to an average increase in consumptive use of 1,800,000 acre-feet annually over the 100-year period of analysis, amounts to about $70 per acre-foot. On an annual equivalent basis it is about $2 per acre-foot of depletion.

BENEFIT-COST SUMMARY

Benefit-cost comparisons have been made for each unit of the Colorado River storage project, the combined storage units, each participating project, and for the storage project and participating projects combined. Comparisons have been made for a 100-year period of analysis in accordance with Bureau of Reclamation policy and for a 50-year period in response to requests from the Bureau of the Budget. For both periods of analysis comparisons have been made for total benefits (direct, indirect, and public) and where possible for direct benefits only. Results of the comparisons are shown in the tables facing page 21.

The benefit-cost analysis for the 100-year period, with consideration given to all the benefits, is believed to be the most equitable measure of economic justification. Use of the 100-year period of study is more realistic than a 50-year period since the major features have been designed and are being constructed to last well beyond 100 years. Recognition of all benefits is desirable because direct benefits do not fully measure the significance of the project. Operation of the storage units and participating projects will be interrelated in stream regulation, power production, and power transmission. Consequently, the benefits of storage are recognized in the analysis of the participating projects, and a corresponding assignment of costs for stream depletion is made as discussed above. Because of the interdependence of storage works and local facilities for use of water, a

benefit-cost ratio for an individual storage unit or participating project is necessarily arbitrary and is less significant than a ratio of total benefits to total costs for the authorized features.

In the analysis for the 100-year period and with consideration given to all the anticipated benefits, the Colorado River storage project and participating projects combined have benefits in excess of costs and each individual storage unit and participating project has benefits equal to or greater than the costs. The overall project benefit-cost ratio is 1.3 to 1.

Cost Allocations

Preliminary allocations have been made of the estimated costs of the Colorado River storage project and participating projects as a basis for determining reimbursable costs by purposes and for making repayment studies. Costs of the four units of the storage project have been allocated as a single project cost and have been apportioned to irrigation and other water-consuming uses, power, flood control, and recreation. Costs of each participating project have been separately allocated to the same purposes as the storage project costs and also on some instances to municipal and industrial water and to fish and wildlife. The allocations are of necessity preliminary in nature since they are based on estimated costs and project plans that may be modified in definite plan studies.

Procedures used in allocations of the storage project costs are discussed in the following sections and the resulting allocations are summarized in the table on page 29. Allocations of cost of participating projects also are summarized in the table on pages 30 and 31. Procedures used in making the participating project allocations are similar to those for the storage project.

DERIVATION OF STORAGE PROJECT COST ALLOCATIONS

Storage project costs used as a basis for the allocations include construction costs, interest during construction, and operation, maintenance, and replacement costs. Costs of past investigations financed from the reimbursable Reclamation and Upper Colorado River Basin funds were included in the construction costs, but those financed from the nonreimbursable Colorado River development fund and contributed funds were excluded. Also excluded were costs of construction financed from contributed funds.

Method of allocation

Only separable costs of recreational facilities were allocated to recreation. Remaining costs were then allocated to irrigation, power, and flood control by the separable cost-remaining benefits method. Under this method the separable costs of each purpose were allocated to that purpose and the sum of the separable costs for all purposes was subtracted from the total project costs to obtain remaining joint costs. The remaining joint costs were then allocated to the various project purposes in proportion to the remaining benefits of the purposes in excess of their separable costs. Thus the total allocation to each purpose is equal to or greater than the separable cost of including that purpose in the project and is not more than either the benefits or the cost of the most economical single-purpose alternative. Under this method

the costs of facilities serving more than one purpose are allocated to the various purposes in a manner that permits each purpose to share in the economy of the multiple-purpose development.

In the allocation procedure all benefits and costs including interest during construction were converted to present values at the beginning of the 100-year period of analysis at an interest rate of 2½ percent. The total allocations made on this basis were then converted to appropriate capital and annual amounts. The amount of interest during construction was then converted to reflect a 2⅞-percent rate to determine the amount of interest during construction to be reimbursed.

Separable and joint costs

The separable costs for each purpose of the multiple-purpose project are defined as the difference between the cost of the multiple-purpose project and the cost of the project with the purpose omitted. Thus the separable costs for each purpose include the costs of those project facilities used solely by that purpose plus the difference in costs of the joint use facilities that would change in size or design with the purpose omitted. Separable costs were determined by assuming each purpose in turn as the last purpose added to the multiple-purpose project. The remaining joint costs are the total project costs less the sum of the separable costs for the various purposes. The estimated separable costs of power, irrigation, flood control, and recreation for the four units of the storage project and the remaining joint costs for the project are shown in the following table.

Determination of separable and remaining joint costs—Colorado River storage project

[In thousands of dollars]

Unit and item	Construction costs [1]	Interest during construction at 2½ percent	Annual costs		
			Operation and maintenance costs	Replacement costs	Total
	Multiple-purpose project cost

Total	673,491	44,759	3,166	3,369	6,535
Separable recreational costs	659				
	Recapitulation				
All units:					
Total costs	$674,150	$44,759	$3,166	$3,369	$6,535
Less total separable costs	416,150	24,560	2,614	3,308	5,922
Remaining joint costs	258,000	20,199	552	61	613

[1] Excludes nonreimbursable costs of past investigation paid from Colorado River development fund and contributed funds. Also excludes money contributed for construction.

[2] Includes flood-control costs on San Juan River and therefore considered as a dual cost in cost-allocation table.

Justifiable irrigation expenditure

The justifiable irrigation expenditure for the Colorado River storage project is limited to the maximum benefits that could be attributed to the storage water replacement function or the costs of the most economical alternative single-purpose replacement storage, whichever is the lesser. The alternative single-purpose costs were found to be substantially less than the benefits and thus were taken as the justifiable expenditure. Both the benefits and the alternative costs are discussed in the following sections.

Benefits.—The maximum benefits that could be attributed to the water replacement function of the storage project are taken as the benefits in excess of local construction and operating costs of future water-consuming projects in the upper basin over the 100-year period of analysis. Consideration was given only to the benefits and costs associated with irrigation, municipal, and industrial use. The excess of the benefits over costs for the 100-year period was estimated by projection of the excess benefits anticipated for the 11 initial participating projects. The projections were made on the basis of the average value of excess benefits per acre-foot of stream depletion. In order to arrive at a conservative estimate, however, the excess benefit value determined for the initial participating projects was slightly lowered when related to other future projects. Also the computations were based on the weighted average increase in stream depletions of 1,800,000 acre-feet over the 100-year period rather than the projected total increase of 2,950,000 acre-feet by the end of the period. Derivation of the excess benefits is summarized in the following table.

Excess annual benefits of initial participating projects and projection for future water-consuming projects [1]

[In thousands]

Participating projects	Annual benefits	Annual costs	Annual benefits in excess of costs	Increased annual stream depletion (acre-feet)	Average excess benefits per acre-foot of stream depletion
Paonia	$640	$236	$404	10	$40
Pine River extension	509	178	331	28	12
Smith Fork	150	110	40	8	5
Florida	341	221	120	13	9
Silt	198	111	87	6	15
Hammond	202	84	118	9	13
Central Utah	5,562	5,317	245	189	1
Emery County	426	298	128	16	8
Seedskadee	1,567	893	674	110	6
Lyman	388	384	4	0	0
La Barge	206	69	137	14	10
Subtotal	10,189	7,901	2,288	403	6
Total projected average including future projects for 100-year period			9,000	1,800	5

[1] Includes only those benefits associated with irrigation, municipal, and industrial water.

As shown in the table, the estimate of total excess benefits for the 100-year period of analysis amounts to an average of $9 million annually. The present worth of this annual amount over a 100-year period at 2½ percent interest is about $330 million.

Alternative single-purpose costs.—The alternative single-purpose irrigation costs of the Colorado River Storage project were estimated

as the costs of providing replacement storage for irrigation and other upstream water-consuming uses equivalent to that at the Glen Canyon, Flaming Gorge, Curecanti, and Navajo units.

After allowances are made for sediment deposition to year 2062 and minimum operating levels for power production, the multiple-purpose reservoirs at Glen Canyon, Flaming Gorge, Curecanti, and Navajo units will have about 22,443,000 acre-feet of active storage capacity. The single-purpose alternative must have an equivalent amount of active storage capacity, without any specific reservation of dead storage to maintain a minimum power pool, after making allowances for evaporation losses and sediment deposition to year 2062. The lowest cost single-purpose alternative was found to consist of the Cross Mountain, Flaming Gorge, Dewey, and Navajo Reservoirs. To assure the initial filling of such alternative reservoirs during the present period of incomplete water use in the Colorado River Basin, they would need to be constructed under the same schedule as the authorized multiple-purpose reservoirs.

The lowest cost single-purpose replacement storage alternative was selected by reconnaissance analyses using available data on the various large reservoir sites in the upper basin. The estimated capacities and construction costs of the selected alternative system of reservoirs are shown in the table on the following page.

Justifiable power expenditure

The justifiable expenditure for power is taken as the cost of the most economical single-purpose alternative power development described on page 29. As previously explained, this same cost is taken as a measure of the project power benefit. The total annual costs of the alternative development were estimated on the basis of private financing including taxes and interest at the rate of 6¼ percent. The estimated costs are summarized below.

Item	Average annual equivalant of total cost	Present worth [1]
Cost excluding taxes	$31,583,000	$1,156,380,000
Taxes	8,806,000	322,423,000
Total	40,389,000	1,478,803,000

[1] Computed over a 100-year period with interest at rate of 2½ percent.

Estimated cost of single-purpose storage alternative—Colorado River storage project

	Cross Mountain Dam and Reservoir	Flaming Gorge Dam and Reservoir	Dewey Dam and Reservoir	Navajo Dam and Reservoir	Total
Initial active storage capacity	5,200,000	3,930,000	9,500,000	1,028,000	19,658,000
Active capacity remaining in year 2062	5,160,000	3,730,000	8,000,000	948,000	17,838,000
Construction cost	$20,265,000	$48,446,000	$92,350,000	$42,333,000	$203,394,000
Interest during construction [1]	1,139,000	3,246,000	7,389,000	2,403,000	14,177,000
Net investment by year completed	21,404,000	51,692,000	99,739,000	44,736,000	217,571,000
Annual operation, maintenance, and replacement costs	104,000	77,000	193,000	25,000	399,000
Present worth of operation, maintenance, and replacement costs	3,808,000	2,819,000	7,066,000	915,000	14,608,000
Present worth of total cost	25,212,000	54,511,000	106,805,000	45,651,000	232,179,000

[1] Computed at an interest rate of 2½ percent.

Justifiable flood-control expenditure

Flood control benefits, as estimated by the Corps of Engineers, were used as the justifiable flood-control expenditure. These have been evaluated only for the Navaho unit and are estimated at $1,135,000 as the present worth of $31,000 annually over 100 years at 2½ percent interest. No estimate was made of the cost of the cheapest alternative means of providing flood control for consideration as the justifiable flood-control expenditure as the cost of such an alternative would far exceed the anticipated flood-control benefits.

RESULTS OF ALLOCATIONS—STORAGE PROJECT AND PARTICIPATING PROJECTS

A summary of the derivation of the allocations made for the storage project is shown in the following table. Results of the allocations made for the storage project and for the participating projects are summarized on pages 30 and 31.

Derivation of cost allocations—Colorado River storage project [1] *(separable costs-remaining benefits method)*

[In thousands of dollars]

	Irrigation	Power	Flood control	Subtotal	Recreation	Total
1. Benefits [2]	330,000	1,478,803	1,135	1,809,938	-------	----------

Subtotal, participating projects:									
Construction costs	208,938	49,048	44,419	2,429	304,834	1,774	529	5,750	312,887
Reimbursable interest during construction		3,062	2,456		5,518				5,518
Operation, maintenance, and replacement costs	631	490	53		1,174	203	70		1,447
Total, storage project and participating projects:									
Construction costs	316,849	614,416	44,419	2,641	978,325	2,433	529	5,750	987,037
Reimbursable interest during construction		46,971	2,456		49,427				49,427
Operation, maintenance, and replacement costs	805	6,598	53		7,456	203	70		7,729

[1] Allocated construction costs exclude expenditures from contributed funds and Colorado River Development Fund. Interest during construction and replacement costs are based on interest at rate of 2⅞ percent.

[2] The fish and wildlife allocation is incomplete because no appraisal of fish and wildlife benefits from the storage project has been made and benefits from the participating projects have been only partially evaluated.

[3] Estimated cost of constructing certain features to ultimate phase capacity.

Project Repayment

A repayment analysis of the Colorado River storage project and participating projects has been made to demonstrate how repayment of reimbursable construction costs of the project, including interest during construction, can be accomplished in accordance with the provisions of the authorizing legislation. Costs allocated to recreation and to fish and wildlife are made nonreimbursable by the authorizing act. Costs allocated to flood control are also nonreimbursable. Costs allocated to irrigation, power, and municipal and industrial water use, which represent more than 99 percent of the project cost after deductions are made for contributed funds and nonreimbursable investigation expenditures, are reimbursable.

Reimbursable costs except as noted below will be repaid in a period of not more than 50 years from the date of completion of the respective storage units, participating projects, or separable features thereof, following in the case of irrigation a suitable development period of not more than 10 years. Irrigation-water users will repay in accordance with their estimated ability for a period of 50 years except as otherwise provided by separate authorization acts for the Eden and Paonia projects. Project repayment contracts will be executed with conservancy-type districts which have the capacity to levy assessments upon all taxable real property located within their boundaries to assist in paying project costs. Municipal and industrial water users will repay with interest at 2⅞ percent the full cost allocated to municipal and industrial water. Power will be sold at rates at which all costs allocated to power will be repaid with interest at 2⅞ percent and revenues will be provided to assist in the repayment of irrigation costs.

Upper Colorado River Basin Fund

All revenues collected in the operation of the Colorado River storage project and participating projects will be credited to and disbursed from the Upper Colorado River Basin fund as provided by the project authorizing act. Accounting records for the basin fund will be maintained to show (1) source of revenue and (2) the application of total revenues received into the fund. Surplus revenues in the basin fund, as defined in section 5 (e) of the act of April 11, 1956, will be used to repay irrigation costs of participating projects that are beyond the repayment ability of the project irrigators. Surplus revenues remaining in the basin fund from participating projects will be apportioned to the State in which such participating project is located and surplus revenues from the storage units will be apportioned by States as shown below.

	Percent		*Percent*
Colorado	46.0	Wyoming	15.5
Utah	21.5	New Mexico	17.0

In accordance with the foregoing procedures, disbursements from the basin fund for the storage project or for participating projects will be made generally in the following order:

(1) Payment of operation, maintenance, replacement, and emergency costs for project facilities.

(2) Payment of interest on the unpaid balance of construction costs allocated to power and municipal and industrial water.
(3) Repayment of reimbursable construction costs.

SUMMARY OF COSTS AND REPAYMENT

Tentative construction cost allocations and estimated repayment under the procedures previously discussed are summarized in the table facing page 34. Following that summary six different repayment schedules are presented. The first (p. 35) is a repayment schedule for all power costs, including those of the storage project and central Utah project, and for irrigation costs of the storage project. It shows how power revenues will repay all reimbursable costs of the storage project and power costs of the central Utah project and establishes revenues available to assist in the repayment of irrigation costs of participating projects. The next four schedules (pp. 36 to 39) demonstrate repayment of irrigation costs of participating projects segregated by the States of Colorado, New Mexico, Utah, and Wyoming, respectively. The last schedule is a summary of power, municipal and industrial water, and irrigation repayment for all authorized units of the storage project and all participating projects, as well as the Eden project in Wyoming.

The repayment tables and schedules indicate that all costs allocated to power for both the storage project and participating projects, amounting to $661,387,000 including interest during construction, can be repaid with interest within a period of 50 years following completion of each of the separable power features. Power costs according to present schedules would be fully repaid in year 2008. Costs of the storage units allocated to irrigation, amounting to $107,911,000, would be repaid from power revenues in 5 years or in the 43d year (2012) following completion of the irrigation investment at the different units. Costs allocated to municipal and industrial water, amounting to $46,875,000 including interest during construction, would be repaid with interest in 50 years following completion of appurtenant facilities. The municipal and industrial water development is presently scheduled in three blocks with repayment being completed in years 2014, 2023, and 2031. Costs of the 11 participating projects and the Eden project allocated to irrigation, totaling $217,129,000 plus $5,750,000 allocated to the ultimate phase of the central Utah project, would be repaid within a 50-year period following the development periods, except that authorized periods of 68 years and 60 years would be used for the Paonia and Eden projects, respectively. The last payment would be made in year 2049, the 90th year of the combined operation of all storage units, the participating projects, and Eden project. The irrigation repayment would be made by the irrigators and from power revenues and conservancy district taxes as illustrated in the summary table. In repayment studies for participating projects, drafts on power revenues in the basin fund at no time exceeded scheduled revenues apportioned to the State in which the respective projects are located. Repayment of reimbursable project costs was accomplished prior to the dates on which final payments are due and interest-bearing and non-interest-bearing costs, to the extent practicable, were paid concurrently.

Summary of cost allocations and repayment—Colorado River storage project and participating projects

[In thousands of dollars]

Item	Allocated construction costs of storage units and participating projects	Reimbursable interest during construction for storage units and participating projects	Eden project construction costs	Total repayment for storage units, participating projects, and Eden project
Reimbursable costs:				
Irrigation	316,849		8,191	325,040
From water users				(31,612)
From power revenues				(284,985)
From conservancy districts				(8,443)
Power	614,416	46,971		661,387
Municipal and industrial use	44,419	2,456		46,875

UPPER COLORADO
RIVER COMMISSION

1964

OFFICIAL RECORD

VOLUME 16

UPPER COLORADO RIVER COMMISSION

1964

FOREWORD

The Upper Colorado River Commission is an interstate administrative agency created under the terms of the Upper Colorado River Basin Compact executed at Santa Fe, New Mexico, on October 11, 1948, and subsequently ratified by each of the legislatures of the states and by the Congress of the United States. The Commission represents the states of Colorado, New Mexico, Utah and Wyoming and the Federal Government.

The major purposes of the Upper Colorado River Basin Compact are: (1) to provide for the equitable division of the use of waters of the Colorado River System among the Upper Basin States, namely, Arizona, Colorado, New Mexico, Utah and Wyoming; (2) to establish obligations of each state with respect to the delivery of water to the Lower Basin; (3) to promote interstate harmony; (4) to remove causes of controversies; (5) to secure the expeditious agricultural and industrial development of the Upper Basin states, the storage of water, and the protection of life and property from floods.

The Commission, in order to fulfill the major purposes of the Compact, has been granted broad and comprehensive powers and charged with well-defined duties and responsibilities. Among its powers and duties are: adopting rules and regulations; locating and establishing water-gaging stations; making forecasts of water run-off; engaging in cooperative studies of water supplies; collecting, analyzing, correlating and preserving all types of water supply data; determining the quantity of water used each year in the Upper Colorado River Basin and in each state, and delivered to the Lower Basin; determining extent of curtailment of use, if necessary; determining reservoir losses and their apportionment; making findings of fact concerning obligations under the Mexican Treaty; acquiring and holding property; performing all functions required of it under the Upper Colorado River Basin Compact; reporting annually on its activities to the Governors of the signatory states and to the President of the United States.

This volume contains the transcripts of all meetings of the Commission during the 1964 calendar year.

EXPLANATORY NOTE

This document consists of a series of verbatim transcripts of meetings of the Upper Colorado River Commission. The records for each calendar year are in a separate volume.

The meetings of each Volume are separated by blue insert sheets.

A subject index is to be found at the beginning of each Volume with an explanation of its use.

At the beginning of the transcript of each meeting, there is a Table of Contents that refers to the major actions or decisions of the Commission.

Volume 16 includes transcripts of the following meetings of the UPPER COLORADO RIVER COMMISSION:

Meeting No.	City and State	Month, Day, Year
87	Boise, Idaho	March 16, 1964

PROCEEDINGS

The Adjourned Regular Meeting was called to order by Mr. Robert J. Newell, the Chairman, on Tuesday, April 14, 1964, at 10:00 o'clock a.m. in Room 330, State Office Building, Denver, Colorado.

THE CHAIRMAN: The Commission will be in order. The Secretary will call the roll of appearances.

MR. GOSLIN: Mr. Newell?

THE CHAIRMAN: Here.

MR. GOSLIN: Mr. Bliss?

COM. BLISS: Here.

MR. GOSLIN: Mr. Van Camp?

COM. VAN CAMP: Here.

MR. GOSLIN: Mr. Clyde?

COM. CLYDE: Here.

MR. GOSLIN: Mr. Johnson?

COM. JOHNSON: Present.

MR. GOSLIN: Mr. Chairman, all Commissioners are present and accounted for.

THE CHAIRMAN: The next item is to get this meeting legal. Because we change our mind about the place and the date rather informally, we have to get legal at the beginning of the following meeting. Mr. Secretary, will you proceed to read the necessary documents into the record.

MR. GOSLIN: Mr. Chairman, if it is permissible I will merely submit these documents in written form for the record.

The first thing that was necessary was an agreement to change the place of the Regular Meeting of the Upper Colorado River Commission. This was done by unanimous written agreement of the Commissioners under the By-Laws, the meeting being changed from its regular place in Salt Lake City to Boise, Idaho

(Documents submitted for the record read as follows:)

"AGREEMENT TO CHANGE PLACE OF REGULAR MEETING
OF UPPER COLORADO RIVER COMMISSION

Pursuant to Article IV, Paragraph 5, of the By-Laws of the Upper Colorado River Commission, I hereby agree that the Regular Meeting of the Upper Colorado River Commission scheduled for March 16, 1964 (third Monday in March) shall be held at 3 Hulbe Road, Boise, Idaho."

(Documents reading as above, dated March 6, 1964, signed by the following: Robert J. Newell, Commissioner for the United States; Edwin C. Johnson, Commissioner for the State of Colorado; John H. Bliss, Commissioner for the State of New Mexico; George D. Clyde, Commissioner for the State of Utah; and E. J. Van Camp, Commissioner for the State of Wyoming.)

MR. GOSLIN: Then the notice together with a letter of explanation. The notice of this Regular Meeting was prepared and sent to those interested with the explanation that the meeting would be adjourned for a lack of a quorum.

(Documents submitted for the record read as follows:)

"UPPER COLORADO RIVER COMMISSION
355 South Fourth East Street
Salt Lake City 11, Utah

March 6, 1964

NOTICE OF REGULAR MEETING

In accordance with Article IV, Paragraph 4, of the By-Laws, notice is hereby given that the Regular Meeting of the Upper Colorado River Commission will be held, beginning at 8:00 a.m., on Monday, March 16, 1964, at 3 Hulbe Road, Boise, Idaho.

(Signed) Ival V. Goslin
Secretary."

"March 6, 1964

Commissioners and Advisers
Upper Colorado River Commission

Gentlemen:

Attached is a Notice of the Regular Meeting of the Upper Colorado River Commission. According to the By-Laws this meeting is to be convened in Salt Lake City, on the third Monday in March, March 16, 1964.

Other business makes impossible the holding of this meeting on the regular date. Our Commissioners have agreed to schedule the Regular Meeting in Boise, Idaho on March 16, 1964 pursuant to the attached notice; and Chairman Newell shall adjourn it for lack of a quorum.

After consultation with the Commissioners, arrangements will be made for holding an Adjourned Regular Meeting.

Sincerely yours,

(Signed) Ival V. Goslin
Secretary."

MR. GOSLIN: Next, we established the time and place of the Adjourned Regular Meeting by unanimous written agreement of the Commissioners, the agreement being that the meeting should be held on April 6, 1964, here in Denver, Colorado.

(Documents submitted for the record read as follows:)

"AGREEMENT TO ESTABLISH TIME AND PLACE
OF ADJOURNED REGULAR MEETING

In accordance with Article IV (12) of the By-Laws, I, the undersigned, Commissioner for _____, concur that the Regular Meeting of the Upper Colorado River Commission, which I previously agreed should be held in Boise, Idaho on March 16, 1964, and which was adjourned for lack of a quorum, shall be held in Denver, Colorado in Room 330, State Office Building, commencing at 10:00 o'clock a.m. on Monday, April 6, 1964."

(Documents reading as above, dated March 24, 1964, signed by the following: Robert J. Newell, Commissioner for the United States; Edwin C. Johnson, Commissioner for the State of Colorado; John H. Bliss, Commissioner for the State of New Mexico; George D. Clyde, Commissioner for the State of Utah; and E. J. Van Camp, Commissioner for the State of Wyoming.)

MR. GOSLIN: Notice of this Adjourned Regular Meeting in accordance with the By-Laws was also sent to the Commissioners and interested parties.

(Document submitted for the record reads as follows:)

"UPPER COLORADO RIVER COMMISSION
355 South Fourth East Street
Salt Lake City 11, Utah

March 25, 1964

NOTICE OF ADJOURNED REGULAR MEETING

In accordance with Article IV (4) of the By-Laws, notice is hereby given that the Adjourned Regular Meeting of the Upper Colorado River Commission will be held beginning at 10:00 o'clock a.m. on Monday, April 6, 1964 in Room 330, State Office Building in Denver, Colorado.

The Regular Meeting of the Upper Colorado River Commission, which by unanimous written consent was scheduled to be convened in Boise, Idaho, on March 16, 1964, was adjourned for lack of a quorum.

(Signed) Ival V. Goslin
Secretary."

MR. GOSLIN: Next, because we ran into the situation in which we needed additional technical data and water supply forecast data, by unanimous agreement the Commissioners agreed to change the meeting to April 14, 1964, this agreement being a supplemental agreement to re-establish the time and place of the Adjourned Regular Meeting.

(Documents submitted for the record read as follows:)

"SUPPLEMENTAL AGREEMENT TO RE-ESTABLISH TIME
AND PLACE OF ADJOURNED REGULAR MEETING

In accordance with Article IV (12) of the By-Laws, I, the undersigned, Commissioner for _____, concur that the Regular Meeting

of the Upper Colorado River Commission, which I previously agreed should be held in Boise, Idaho on March 16, 1964, and which was adjourned for lack of a quorum, and which I subsequently agreed should be held in Denver, Colorado on April 6, 1964, shall be held in Room 330 of the State Office Building, commencing at 10:00 o'clock a.m. on April 14, 1964."

(Documents reading as above, dated April 2, 1964, signed by the following: Robert J. Newell, Commissioner for the United States; Edwin C. Johnson, Commissioner for the State of Colorado; John H. Bliss, Commissioner for the State of New Mexico; George D. Clyde, Commissioner for the State of Utah; and E. J. Van Camp, Commissioner for the State of Wyoming.)

MR. GOSLIN: Then again in accordance with the By-Laws, supplemental notice of the Adjourned Regular Meeting was sent to the Commissioners and other interested parties.

(Document submitted for the record reads as follows:)

"UPPER COLORADO RIVER COMMISSION
355 South Fourth East Street
Salt Lake City 11, Utah

April 2, 1964

SUPPLEMENTAL NOTICE OF ADJOURNED REGULAR MEETING

In accordance with Article IV (4) of the By-Laws, notice is hereby given that the Adjourned Regular Meeting of the Upper Colorado River Commission will be held beginning at 10:00 o'clock a.m. on Tuesday, April 14, 1964 in Room 330, State Office Building, in Denver, Colorado.

The Regular Meeting of the Upper Colorado River Commission, which by unanimous written consent was scheduled to be convened in Boise, Idaho, on March 16, 1964, was adjourned for lack of a quorum.

The Adjourned Regular Meeting previously scheduled for April 6, 1964 has been cancelled by unanimous agreement of our five Commissioners in order that the necessary April 1st stream forecast and other technical data may be available for a constructive discussion of the Glen Canyon reservoir filling problem at the Adjourned Regular Meeting scheduled above.

(Signed) Ival V. Goslin
Secretary."

MR. GOSLIN: Mr. Chairman, I believe that constitutes the necessary legal work to get this meeting to its proper status.

THE CHAIRMAN: Then if we are now legal, we will proceed with the agenda as has been distributed?

MR. GOSLIN: Yes, sir.

THE CHAIRMAN: The next item, "Reading and approval of minutes of Adjourned Annual Meeting of September 27, 1963."

MR. GOSLIN: Mr. Chairman, these minutes have been distributed to the Commissioners in accordance with the By-Laws. If the Commission wishes them read into the record, I will be happy to do so.

THE CHAIRMAN: Does the Commission want these minutes read now?

COM. BLISS: Mr. Chairman, I move they be approved as distributed.

COM. VAN CAMP: I second it.

THE CHAIRMAN: It has been moved and seconded that these minutes be approved as distributed. (Thereupon a vote was taken.) Motion is carried; these minutes are approved.

The next item, "Reading and approval of minutes of Regular Meeting of March 16, 1964."

MR. GOSLIN: Mr. Chairman, this was meeting No. 87 of the Commission. It was the meeting that was adjourned for lack of a quorum. In order that we have a complete record it will be necessary that I read these short minutes into the record:

"MINUTES OF REGULAR MEETING
UPPER COLORADO RIVER COMMISSION
March 16, 1964

Pursuant to notification, Article IV (4) of the By-Laws and to written consent executed by each Commissioner, Article IV (5) of the By-Laws, the Commission met at 3 Hulbe Road, Boise, Idaho.

The meeting was called to order at 8:00 o'clock a.m. by Chairman Robert J. Newell. Noting the absence of a quorum, and there being no objection, the Chairman announced that the meeting would be adjourned to a day and place to be announced later."

These minutes are signed by Mr. Robert J. Newell, Chairman.

THE CHAIRMAN: Are there any corrections for these minutes? (No response.) Without a correction, then these will stand approved.

The next item is a report of the Chairman and it has not been the practice in this Commission to take up valuable time unless there is something important for the party to say. The Chairman has no important report to make this morning and we will proceed with the report of the Executive Director, Ival Goslin.

MR. GOSLIN: Mr. Chairman, I think that was about the shortest report on record.

Before I read my report and while the gentlemen are passing out copies of it to the members of the audience, Mr. Dick Eckles has an announcement he would like to make to the Commission. Is Mr. Eckles in the room?

MR. ECKLES: I would like to invite the Commission, their Legal Committee and the Engineering Committee for lunch this noon. The reservation has not been confirmed yet, so when the meeting adjourns at noon I will make the announcement where we are going to have lunch.

MR. GOSLIN: Thank you very much, Dick.

(Documents distributed.)

MR. GOSLIN: Mr. Chairman, I am going to stand while I am doing this because I am hidden behind your shoulders here. This is the report of the Executive Director of the Commission dated as of today, April 14, 1964.

Due to the long interval since our last Commission meeting this report will touch only briefly on several items, especially those about which we have sent detailed memoranda or other correspondence to our Commission members and advisers. In order to keep this report to a reasonable length some items that ordinarily would be discussed may be omitted. These conditions, however, should not preclude a full discussion of any item at this meeting.

PACIFIC SOUTHWEST WATER PLAN

Pursuant to instructions of the Commission, our staff prepared a detailed analysis of the August 1963 Pacific Southwest Water Plan and presented it in a documented and illustrated manner to our four Governors,

Commissioners, and others, at a meeting in Salt Lake City on November 8, 1963. Following this meeting each of the Governors submitted official comments on the Pacific Southwest Water Plan to the Secretary of the Interior. Although I have not had an opportunity to make a detailed study of each of these comments, it appears that each Governor, in general, approved the principle of broad-scale, basin-wide, water resource development for the Lower Colorado River Basin with recommendations that the interests of the Upper Basin must be adequately protected in the authorizing legislation.

The Secretary of the Interior has prepared a revised report of the plan dated January 1964. This report was filed February 14 with the Federal Power Commission pursuant to orders issued in license proceedings in which the Arizona Power Authority seeks permission to construct a hydroelectric development at Marble Canyon. The Department of the Interior has opposed the granting of a license to the Arizona Power Authority. The major points of the revised Pacific Southwest Water Plan include:

1. Immediate authorization for Federal construction of Bridge and Marble Canyon dams and powerplants as "cash register" contributors to the Pacific Southwest Development Fund.

2. A guarantee of the equivalent of 7,500,000 acre-feet of water per year for consumptive use: 4,400,000 acre-feet in California; 2,800,000 acre-feet in Arizona; 300,000 acre-feet in Nevada.

3. The Development Fund would underwrite the guarantee of 7,500,000 acre-feet of water, regardless of any future deficiencies in Colorado River supplies, at no greater cost to the users than they would incur if there were sufficient natural flows in the river to meet this guarantee.

4. Immediate provision for enlargement of the California Aqueduct now under construction, and completion of investigations for construction at a later date of a new system of reservoirs and conveyance structures to transport excess water from Northern to Southern California.

5. Water salvage and recovery programs to assure maximum beneficial use of existing supplies.

6. Immediate authorization of:

   (a) Central Arizona Project--including Hooker Dam and reservoir in New Mexico

(b) Southern Nevada Water Supply Project

(c) Moapa Valley Pumping Project in Nevada

(d) Dixie Project in Utah

(e) Indian irrigation systems--both new irrigation and drainage projects and rehabilitation and betterment of old systems in the Lower Basin

(f) Outdoor recreation and fish and wildlife facilities.

In the section of Interior's revised report on the Pacific Southwest Water Plan dealing with a "Discussion of the Comments of the Upper Colorado River Basin States", it is made clear that the suggestions from the Upper Basin were either rejected, ignored, or brushed off as inconsequential. In view of this situation coupled with events related to the filling of Glen Canyon Reservoir and the Supreme Court's decision in Arizona versus California, it is apparent that when legislation to authorize the Central Arizona Project and/or the Pacific Southwest Water Plan reaches the House of Representatives the Upper Basin must be prepared to offer a number of protective amendments. If agreement concerning the amendments to protect the rights of the Upper Basin cannot be reached with the proponents of the legislation, we should be prepared to fight for this protection to the extent of letting the Congress know that we are opposed to authorization legislation for Lower Basin Colorado River projects that does not encompass Upper Basin protection. We surely should have learned by this time that a couple of statements in a project report saying that the Pacific Southwest Water Plan will not encroach upon the water supply of the Upper Basin as defined by the Colorado River Compact, or that the Compact provisions are not at issue and are not discussed or interpreted by implication, are not sufficient protection for the future development of the water resources of the Upper Basin.

WATER RESOURCES PLANNING ACT

The House Committee on Interior and Insular Affairs held hearings on S. 1111, the proposed Water Resources Planning Act, as amended by the Senate, and H. R. 3620 by Congressman O'Brien of New York during the week of March 23. There will be another day of hearings on these bills on April 20. It is doubtful that the House Committee will take any further action on S. 1111 very soon after April 20.

SAVERY-POT HOOK, BOSTWICK PARK, FRUITLAND MESA PROJECTS

On March 9 and 10 the House Subcommittee on Irrigation and Reclamation held hearings on H. R. 3672, a bill to authorize the Savery-Pot Hook Project in Wyoming and Colorado and the Bostwick Park and Fruitland Mesa Projects in Colorado. The two most important developments during these hearings were the arguments about the size of a farm unit necessary to provide an adequate family living, and the advisability of authorizing any future projects at a time when Glen Canyon Reservoir cannot be filled to the point of generating power and revenues for repayment of project costs beyond the ability of the water users to repay. Members of Congress are extremely sensitive to both of these problems. H. R. 3672 is now pending before the House Committee. The earliest date that the Subcommittee can give further consideration to this bill will be during or following the first week in May.

APPROPRIATIONS OF FUNDS FOR THE COLORADO RIVER STORAGE PROJECT

The total Colorado River Storage Project construction program for fiscal 1965 will require about $67,000,000 in new funds. In addition, $4,767,180 are being requested for the operation and maintenance of the three storage units, the transmission division, and three participating projects. A memorandum summarizing the items in the President's budget request was transmitted to our Commissioners and their advisers on January 23.

We have written to Chairman Cannon of the House Appropriations Committee requesting time for the presentation of testimony in support of appropriations. We have not been notified of the time for our witnesses to appear, but expect to receive a definite answer soon. The Commission should decide at this meeting how it wishes to have its testimony presented this year.

FILLING GLEN CANYON RESERVOIR

One of the major problems confronting us at this time is the filling of the minimum power pool--6,100,000 acre-feet at elevation 3490--in Glen Canyon Reservoir in order that hydroelectric generation and the accumulation of revenues in the Upper Basin fund can be commenced as soon as possible. Anything that affects the initiation of generation or the amount of generation at Glen Canyon also affects the amount of revenues going to the Basin Fund, and consequently, the rate of repayment of presently authorized projects and the starting of new water development projects in the Upper Basin.

On March 25, 1964, there were about 3,100,000 acre-feet of water in Lake Powell behind Glen Canyon Dam. On March 26 under orders from the Secretary of the Interior, water began flowing from the reservoir in quantities greatly in excess of the inflow.

In order to place this problem of reservoir filling in its proper perspective we should briefly review a little past history. On blue paper attached to this report are several appendices to which references are made in this history. Although I do not intend to read these documents they are an integral part of the official proceedings of this meeting and are attached for your information. (Blue paper appendices referred to--A-1 through A-22--attached hereto at end of the report of Executive Director.)

As far as this immediate problem is concerned, the one marked A-7, the letter from the Secretary of the Interior to Governor Clyde attached to the News Release of March 26, 1964, is of extreme importance.

The next one, A-9, is a letter of March 27, 1964, from the Upper Colorado River Commission to Mr. Robert T. Person, President of the Public Service Company of Colorado. Identical letters were also sent to the presidents of the other private utilities in the Upper Basin area.

1. During 1957 the Bureau of Reclamation made an economic and financial analysis of the Colorado River Storage Project. As an assumed basis for filling the Upper Basin reservoirs the Bureau used the "Hydrologic Bases" which it announced on October 24, 1957, at a meeting of Colorado River Basin Governors or their representatives in Washington, D. C.

During the next three years a series of meetings were held by the Bureau's engineers with the engineers of the Lower Division States and with the engineers of the Upper Division States. All three of these groups of engineers made literally hundreds of studies of various proposed methods of filling the Storage Project reservoirs without reaching agreement. Secretary Seaton tentatively approved a draft of criteria on February 9, 1960, after which negotiations again proceeded.

On April 2, 1962, Secretary Udall officially approved and released the filling criteria, known as the "General Principles to Govern, and Operating Criteria for, Glen Canyon Reservoir (Lake Powell) and Lake Mead During the Lake Powell Filling Period", under which he is now operating the reservoirs. The "general principles" were published in the Federal Register on July 19, 1962.

The filling criteria were not approved by the Upper Basin States or the Upper Colorado River Commission. I suppose it would be fair to say that these entities did not formally reject the criteria either.

Paragraph 5 of the criteria requires that diminutions in generation of firm energy--the so-called deficiencies--at Hoover Dam caused by the operation of Upper Basin reservoirs during the Lake Powell filling period shall be made up at the expense of the Upper Basin Fund, with partial restitution to that fund after 1987, if Congress so directs.

The portions of Paragraph 7 of the Secretary's filling criteria that are pertinent to the present problem provide that:

(a) the filling of the minimum power pool--6,100,000 acre-feet at elevation 3490--shall be accomplished at the earliest practicable time;

(b) until elevation 3490 is reached any water stored in Lake Powell can be released to maintain rated head--14,500,000 acre-feet at elevation 1123--on the Hoover powerplants;

(c) when the elevation of Lake Powell reaches 3490 the stored water cannot be released below that point;

(d) the filling of the minimum power pool in Lake Powell will be in such manner as not to cause Lake Mead to drop below elevation 1123; and

(e) in the process of filling the minimum power pool at Lake Powell, the release of water at Glen Canyon Dam shall not be less than 1,000,000 acre-feet per year and 1,000 second-feet.

During conferences with Bureau engineers preceding the promulgation of the criteria several engineer representatives of the Upper Basin objected strenuously to the provisions of both Paragraph 5 and Paragraph 7 of the criteria. In general, the objections to Paragraph 5 were that it gave a guarantee of firm energy to the Lower Basin Hoover power allottees that was not contemplated at the time they signed contracts for energy with the Secretary--this guarantee was at the expense of the development of the water resources of the Upper Basin which is not a party to the contracts--and the Upper Basin has as much right to unimpaired development of its water resources as the Lower Basin.

The objections to Paragraph 7 were that it made the operation of Lake Powell subservient to Lake Mead--that it guaranteed a fixed generating capacity at Lake Mead which was even more unreasonable than guaranteeing the firm energy--that it placed the burden of supplying water for evaporation from Lake Mead upon the Upper Basin--that during a poor water year

or series of poor water years during the filling period the requirement to hold Lake Mead at 14,500,000 acre-feet would make the filling of Lake Powell impossible for long periods. This is the situation in which we now find ourselves in 1964.

2. On March 13, 1963, the gates were partially closed at Glen Canyon Dam and storage of water began. Lake Mead held 22,300,000 acre-feet of water at elevation 1188.2 feet. The flow below Glen Canyon Dam was reduced to about 1,000 second-feet and water accumulated until there were about 3,100,000 acre-feet at elevation 3414.9 feet.

3. On January 30, 1964, the flows from Lake Powell were increased to about 2,440 second-feet; on January 31st to 3,770 second-feet; and from February until March 26 continued at about 4,000 second-feet. These increases in flow were made to meet the requirements of 1,000,000 acre-feet per year following March 13, 1963, in Paragraph 7 of the criteria. About 2,500,000 acre-feet were delivered to Lake Mead during the 1963 water year ending September 30, 1963, and about 1,400,000 acre-feet during the calendar year 1963.

4. At the end of January 1963 there were 22,700,000 acre-feet of water in Lake Mead. By the end of January 1964 Lake Mead had dropped to 15,400,000 acre-feet. There were 3,100,000 acre-feet in Lake Powell. The runoff at Lee Ferry for 1963, adjusted for the storage in Flaming Gorge, Navajo and Lake Powell, amounted to only 6,300,000 acre-feet. The runoff for 1963 was the third lowest in history.

5. After the February 1, 1964 streamflow forecasts became available our office became acutely aware that there was a strong possibility that 1964 was going to be another "bad" water year, and that under a strict adherence to the filling criteria it might be impossible to have the minimum power pool at Glen Canyon filled during 1964 or by the time the generators would be ready to operate which at that time was estimated to be July 1st. We now understand that all facilities necessary for initiating generation may not be available until August 1 or September 1, or later. Another way of stating the situation as it appeared on the basis of the runoff anticipated on February 1, is to say that it seemed extremely unlikely that the minimum power pool could be filled at Lake Powell in 1964 and at the same time hold Lake Mead at rated head with 14,500,000 acre-feet.

While in Washington, D. C., during the week of February 17, I called this problem to the attention of the Secretary of the Interior, the Assistant Secretary, the Commissioner and Assistant Commissioner of Reclamation. I requested that, in the interest of getting the generators at Glen Canyon on the line as soon as possible and preserving harmony among the

interested people in the Upper Basin, the Bureau should study the problem thoroughly and seek a means of filling the minimum power pool at Glen Canyon. It was further suggested, should conditions warrant, purchase of energy and generating capacity from outside sources should be considered and negotiated in order to compensate for the additional diminution in generation at Hoover Dam that would be caused by drawing Lake Mead below the rated head of the Hoover powerplants while accumulating water at Glen Canyon. I also offered the services of our Commission and other interested parties in the Upper Basin to aid in finding a solution to the problem, and requested that we be kept informed regarding progress towards a solution. I was given positive assurances of cooperation and information.

6. Although there was no evidence that the anticipated runoff had improved by the end of February, there was no indication that negotiations were being held by the Bureau with utilities in the area or the Hoover Power contractors that might lead to a solution of the problem if the streamflow should prove to be too low to fill Glen Canyon's minimum power pool and hold Lake Mead at rated head--yet high enough to justify purchasing energy and capacity for replacement to the Hoover power users. Knowing how erratic the Colorado River streamflows have been in the past, it is reasonable to believe that the Bureau was waiting for more reliable information from later forecasts before moving in the direction of negotiating an alternative solution.

7. Realizing the difficulties inherent in rapid negotiations, the limitations that exist with respect to delivery of energy from the Upper Basin to the Los Angeles area, and the need for a solution at a definite time in order to have storage water in Glen Canyon, we began making inquiries of our own during the first week of March about the availability of energy and capacity for Hoover replacement purposes. Among other things, Mr. Kuiper and I learned in Los Angeles that (a) some of the Hoover power contractors were interested in having Glen Canyon generators on the line as soon as possible; (b) that energy and capacity for replacement purposes were available in California but the cost would be higher than average because it would have to be derived from the less efficient generating plants not presently being used to full capacity; and (c) that the Hoover power contractors believe that it was not their responsibility to work out a solution to the problem and take it to the Secretary, but that the Secretary should devise alternatives for their consideration and negotiation. We also learned in Arizona that energy and capacity might be available in Arizona through an exchange process from the Arizona Power Authority generators at Hoover Dam, and that capacity in excess of normal reserve requirements is available from Arizona Public Service Company.

Due to the lack of connections at the Hoover switchyard between the powerplant on the Arizona side of the river and the plants on the California side a real problem exists relative to the transmission of large quantities of power from Arizona to Southern California.

8. On March 2 Governor Clyde wrote to the private utilities of the area asking them to consider the "problem of filling Glen Canyon Reservoir with the view that there may be a way in which your companies will be able to aid in its resolution, perhaps by furnishing generating capacity and energy together with transmission service to supply Hoover power contractors with power and energy during the period Lake Mead may be drawn below rated head as the result of accumulating storage at Glen Canyon."

9. On March 10 the utilities answered Governor Clyde's letter by saying that engineering and power supply studies were underway by five utilities, and that preliminary results of these studies indicated that these five utilities, together with neighboring utilities, were able and willing to be of substantial aid, beginning this summer, in solving the problem.

10. The streamflow forecasts for March 1, 1964, showed even lower anticipated runoff than the forecasts of February 1, thus making the resolution of the problem by the purchase of replacement power and energy for Hoover power contractors to appear to be less practicable than before--but not impossible, if the future forecasts were as good as, or better than, those of March 1.

Therefore, we appeared to be faced with two "dry" years in succession on the Colorado River--a condition that existed at least once before in 1954 and 1955 without Glen Canyon Dam on the river when a total of less than 13,500,000 acre-feet passed Lee Ferry in two years, to be followed by only 8,750,000 acre-feet at Lee Ferry in 1956.

11. On March 17 our four Governors addressed a letter to the Secretary of the Interior urging the Department to adopt a policy under which the minimum power pool at Glen Canyon can be filled in 1964 without detriment to other power and water uses in the Colorado River Basin and offering their cooperation in attaining this objective.

12. On March 26 the Secretary of the Interior announced his decision to release stored water from Lake Powell on an interim basis in amounts sufficient to maintain the level of Lake Mead at rated head--14,500,000 acre-feet at elevation 1123. The Secretary attached a copy of his reply to the letter from our four Governors to his announcement. In this reply he stated, ". . . that early spring storms could increase the

anticipated runoff to the point where Lake Mead storage could be permitted to drop somewhat below the 14,500,000 acre-foot mark temporarily. The resultant reduction in Hoover generation would then be made up by purchase of power from outside sources." The Secretary thus left the door open for a later, more final decision to purchase replacement power, if the actual runoff is near or exceeds the median March 1 forecast of 4,700,000 acre-feet for April-July runoff, and if the energy and capacity are available and can be delivered to the Hoover power users.

13. In his letter to the Governors the Secretary mentioned that any major interim purchase of power would require special fiscal arrangements because funds are not now programmed for that purpose; that is, an item for funds for this purchase is not in the President's budget request for fiscal 1965. He also stated:

> "I may add that up to the present time, although we have read newspaper stories concerning an offer by Upper Basin private utilities to supply replacement power, we have had no proposal with necessary data such as rates and the means the utilities would use to get the power to the Lower Basin, particularly California. While under present circumstances we could not avail ourselves of the utilities' offer because of the critical outlook, we hope these data will be forthcoming immediately. It will be necessary to have these data without delay if the proposal is to be considered when the water situation is reviewed and a final decision reached concerning a course of action on operation of the river in this critical water year."

14. On March 27 after a careful study of the Secretary's news release of March 26 and his reply to our four Governors' letter, we directed a letter to the president of each of the private utilities in the area in which we (1) outlined and proposed for exploration a manner by which the utilities might be able to provide replacement generation capacity and energy under an "exchange and banking" procedure that would not require large sums of Federal cash; (2) asked the utilities if they had studied the feasibility of transmitting power to the Hoover power contractors and if they knew of any physical limitations to accomplishing this delivery; and (3) asked the utilities to inform us as soon as possible of their willingness to negotiate with the Secretary of the Interior on the basis outlined, if the capacity and energy "exchange" conditions would be satisfactory and there were no physical limitations to the delivery of power to the Lower Basin users.

15. The next day we wrote to the Secretary of the Interior telling him that we had written to the utilities. We also informed the Secretary that if favorable replies were received from the utilities we would let him

know, and would urge that he hold a joint meeting with the Governors, the Bureau of Reclamation, the utilities, and representatives of the Upper and Lower Basin States for the purpose of further exploring a solution to the reservoir filling problem. Of course, the proposed courses of action must be subject to the availability of sufficient runoff and reasonable cost.

16. The utilities replied promptly to our letter of March 27. Their replies were not identical but they did express about the same views. Since today we are in the State of Colorado I will use the following quotation from the letter of Mr. Robert T. Person, President, Public Service Company of Colorado, to illustrate the type of answer received. He said in his letter:

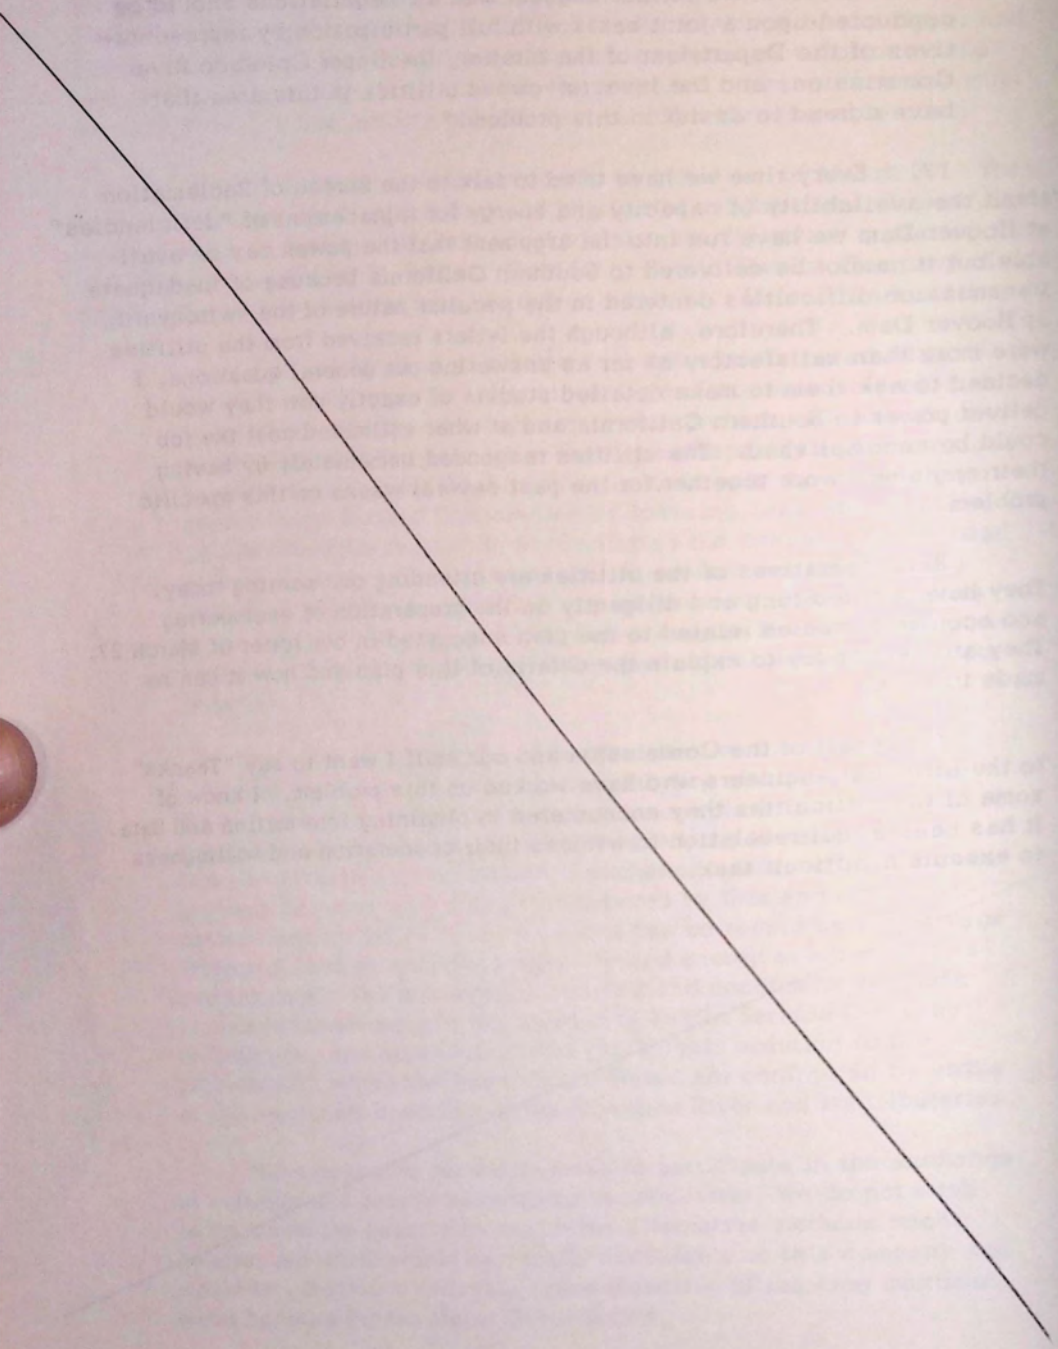
> "As indicated in your letter, we have participated with various other companies in engineering and power supply studies in an effort to arrive at a solution to this problem. These studies established that the necessary generating capacity and energy can be made available by these companies to supply the deficiency in generation at Hoover Dam created by lowering Lake Mead below 14,500,000 acre-feet while accumulating the minimum power head at Glen Canyon. We might add that at present our engineering investigation has not disclosed any serious physical limitations in the means of delivering power and energy to Hoover power contractors of a sufficient magnitude to prevent carrying forward your proposal.
>
> "In view of the fact that the Secretary of the Interior has indicated some concern over the availability of funds to pay for the necessary capacity and energy to accomplish this purpose, Public Service Company of Colorado is willing to participate in this undertaking on your proposed exchange basis. In this manner payment for power and energy contributed by this and other companies need not be made in cash but can be repaid by the Storage Project in kind by supplying capacity and energy at agreed times and amounts. The remaining principles and conditions set forth in your letter are equally acceptable to Public Service Company of Colorado, and appear to offer a practicable solution to the problem with which the Upper Basin States are confronted by virtue of the low runoff condition of the Colorado River and its tributaries.
>
> "By expressing our willingness to participate in the exchange of capacity and energy as outlined in your letter, we do not wish to foreclose the possibility that other alternative methods might be arranged which would be equally acceptable to this company and would be consistent with your prime objective of insuring maximum water benefits for the Upper Basin States.

". . . . We further suggest that all negotiations should be conducted upon a joint basis with full participation by representatives of the Department of the Interior, the Upper Colorado River Commission, and the investor-owned utilities in this area that have agreed to assist in this problem."

17. Every time we have tried to talk to the Bureau of Reclamation about the availability of capacity and energy for replacement of "deficiencies" at Hoover Dam we have run into the argument that the power may be available but it cannot be delivered to Southern California because of inadequate transmission difficulties centered in the peculiar nature of the switchyard at Hoover Dam. Therefore, although the letters received from the utilities were more than satisfactory as far as answering our general questions, I decided to ask them to make detailed studies of exactly how they would deliver power to Southern California and at what estimated cost the job could be accomplished. The utilities responded immediately by having their engineers work together for the past several weeks on this specific problem.

Representatives of the utilities are attending our meeting today. They have worked long and diligently on the preparation of engineering and economic studies related to the plan suggested in our letter of March 27. They are here today to explain the details of this plan and how it can be made to work.

On behalf of the Commission and our staff I want to say "Thanks" to the utilities' engineers who have worked on this problem. I know of some of the difficulties they encountered in obtaining information and data. It has been a real revelation to witness their cooperation and willingness to execute a difficult task.



STATE OF UTAH
OFFICE OF THE GOVERNOR
Salt Lake City

George D. Clyde
Governor

March 2, 1964

Mr. Ed Naughton, President
Utah Power and Light Company
Salt Lake City, Utah

Dear Mr. Naughton:

As you probably know from recent newspaper articles it appears that the runoff on the Colorado River for 1964 will be much below average. There appears to be little chance this year of filling the reservoir at Glen Canyon to minimum power head and starting generation under the reservoir filling criteria promulgated by the Secretary of the Interior. In the interests of paying for the reimbursable costs of the Colorado River Storage Project and aiding the development of the water resources of the State of Utah and her sister States, as contemplated in the Congressional authorizing Act, it is vitally important that generation of electric energy be initiated at Glen Canyon as soon as possible.

I am advised that the minimum power head at Glen Canyon can be reached in 1964, under adverse streamflow conditions, if the criteria for filling the reservoir were to be modified by the Secretary of the Interior to allow the withholding this spring of from one-half million to one and one-half million acre-feet of water from Lake Mead below the rated head figure of 14.5 million acre-feet. Under other requirements of the criteria the Upper Basin Fund is charged with the costs of curtailment in generation at Hoover Dam due to the filling of Glen Canyon. For this reason a question is raised concerning the availability of electrical energy, generating capacity and transmission facilities that would be necessary to replace the power that would be curtailed at Hoover Dam by withholding the water in Lake Powell.

I recall that during the trying days preceding the enactment of the Colorado River Storage Project Act the electric utility companies in the Colorado Basin testified on numerous occasions as to their willingness to aid in the resolution of problems associated with the financial feasibility and electrical stability of the Storage Project. Therefore, I am asking you in

conjunction with your associated investor-owned utilities in the Colorado River Basin to consider this important problem of filling Glen Canyon Reservoir with the view that there may be a way in which your companies will be able to aid in its resolution, perhaps by furnishing generating capacity and energy together with transmission service to supply Hoover power contractors with power and energy during the period Lake Mead may be drawn below rated head as the result of accumulating storage at Glen Canyon.

I fully realize that there are many complex engineering problems involved that I have not contemplated, but any suggestions you may have to offer will be much appreciated.

Yours sincerely,

/s/ George D. Clyde

Governor

GDC/mw

UTAH POWER & LIGHT COMPANY
P. O. Box 899
Salt Lake City 10, Utah

March 10, 1964

E. M. Naughton
President & General Manager

The Honorable George D. Clyde
Governor of the State of Utah
State Capitol Building
Salt Lake City 14, Utah

Dear Governor Clyde:

This is in response to your letter of March 2, 1964 concerning the finding of a solution to the problem of filling Lake Powell and at the same time satisfying U. S. Bureau of Reclamation contractual obligations to supply Hoover Dam power during the period Lake Mead may be drawn below rated head as a result of accumulating storage for power head at Glen Canyon.

Pursuant to your request, the executive officers of five inter-mountain investor-owned electric utilities met in Salt Lake City today, March 10, and I am authorized in their behalf to assure you that these companies stand ready and willing now, as we have in the past, to make every effort to help place this highly important Colorado River Storage Project in operation.

All of these companies are very much concerned not only with the current problem brought about by low runoff of the Colorado River, but with the long-range problem of making certain that a maximum of power revenues are produced to allow construction of the participating water use projects at the earliest possible date. I am sure we all agree the development of these participating projects and maximum utilization of the water of the Colorado are of prime importance and will benefit every citizen of the Basin area, and must be the foremost consideration.

Engineering and power supply studies were started the day I received your letter, by Public Service Company of New Mexico, Public Service Company of Colorado, Idaho Power Company, Utah Power & Light Company, and Pacific Power & Light Company.

I am pleased to assure you that preliminary results of these studies indicate that these five investor-owned companies, together with neighboring utilities, can be of substantial aid, beginning this summer, in solving this serious problem.

These studies indicate that the investor-owned utilities can provide displacement power which we believe will be equivalent to 2 or 2-1/2 million acre-feet of water per year, that would otherwise have to be generated at Hoover Dam to satisfy power commitments of the Bureau for power generated at Hoover Dam. The objective here, of course, is early water storage in Lake Powell. As you know, our utilities have reserve steam-electric generating capacity and their operations can be pooled and coordinated by utilizing their high-voltage interconnections which will permit us to provide substantial assistance to the project.

The fact that the Bureau of Reclamation will be unable to meet its commitments to supply Upper Basin preference customers with power from Glen Canyon generators beginning May 1 of this year, presents no problem. Rocky Mountain Investor-owned electric utilities have been supplying most of the power requirements of these customers for many years and we will continue to do so.

While you may rest assured that these utilities can and will help, the ultimate solution will involve many and varied engineering problems. All of us have one common interest--the earliest possible development of the participating water use projects and maximum utilization of our water.

I will report our findings to you at the earliest possible date.

Cordially,

/s/ E. M. Naughton

EMN/ws

COLORADO NEW MEXICO UTAH WYOMING

March 17, 1964

Honorable Stewart L. Udall
Secretary
Department of the Interior
Washington 25, D. C.

Dear Secretary Udall:

It has been called to our attention that under a strict adherence to the "General Principles to Govern, and Operating Criteria for, Glen Canyon Reservoir and Lake Mead During the Lake Powell Filling Period," as promulgated, there will be very little if any chance of storing sufficient water behind Glen Canyon Dam to generate electric energy in 1964. The purpose of the criteria was to provide guide lines as the basis of securing a practical approach to the problems of reservoir filling within a reasonable exercise of Secretarial discretion, while, at the same time, protecting the interests of water and power users.

Now, at a time when water should be accumulating at Glen Canyon, we find that an exceptional circumstance in the form of a "bad" water year has intervened--a circumstance that could preclude the filling of the minimum power pool at Glen Canyon unless wise and judicial use is made of the available water.

On the basis of water and power analyses that have been made we are convinced that it would be practicable to store sufficient water at Glen Canyon to cause the generators to produce energy by August 1, 1964, and that this objective can be attained without injury to downstream water or power users. We understand that a solution to this problem will entail considerable leadership and cooperation among the many diverse Colorado River Basin interests, including your Bureau of Reclamation.

From the information presently available it appears that a policy decision regarding the operation of the various facilities on the Colorado River under the jurisdiction of the Secretary of the Interior should be made prior to April 1st in order to insure power production at Glen Canyon in 1964.

Both private and public entities in the Upper and Lower Basins are willing to cooperate fully to make possible the generation of power at Glen Canyon in 1964. We are also confident that it is in the best interests of everyone concerned to arrive at a method of filling the minimum power pool at Glen Canyon at the earliest possible date.

We know that you are informed regarding the many ramifications of this complex problem. We, therefore, urge that the Department of the Interior adopt a policy under which the minimum power pool at Glen Canyon will be filled in 1964 without detriment to other water and power uses in the Colorado River Basin.

In order to reach these objectives we offer our full cooperation, and respectfully request that you consult with us in the development of your plans with reference to the problems herein outlined.

Sincerely yours,

/s/ John A. Love
Governor of Colorado

/s/ Jack M. Campbell
Governor of New Mexico

/s/ George D. Clyde
Governor of Utah

/s/ Clifford P. Hansen
Governor of Wyoming

Attached to March 26, 1964
News Release of Department of the Interior

UNITED STATES
DEPARTMENT OF THE INTERIOR
Office of the Secretary
Washington 25, D. C.

Dear Governor Clyde:

We appreciate very much the letter of March 17 from you and the other Governors of the Upper Colorado River Basin States concerning the operating criteria for Glen Canyon reservoir, which is now known as Lake Powell, and Lake Mead during the Lake Powell filling period. We join with you in your expressions of concern over release of water from Glen Canyon reservoir before the lake has reached the operating level.

Regrettably, and for the time being, we can see no satisfactory alternative to undertaking immediate discharge of sufficient water from Glen Canyon reservoir to maintain the level of Lake Mead at the minimum operating level of 1,123 feet above mean sea level, or 14.5 million acre-feet of storage. A press release announcing this interim decision is attached.

As the press release explains, there is still a possibility, albeit an unlikely one, that early spring storms could increase the anticipated runoff to the point where Lake Mead storage could be permitted to drop somewhat below the 14.5 million acre-foot mark temporarily. The resultant reduction in Hoover generation would then be made up by purchase of power from outside sources. Any major interim purchase of power, of course, would require special fiscal arrangements inasmuch as funds are not now programmed for that purpose.

However, the existing situation is such that at least until we have a better knowledge of the 1964 water supply, we have no alternative but to live with the filling criteria which were first promulgated in 1960 by my predecessor Secretary of the Interior, Fred Seaton. After careful review of the criteria in light of the administration's fiscal policy, I approved the criteria in 1962 as the best procedure to protect the Federal investment already made in Hoover, Davis, and Parker Dams, as well as the investment in the Upper Basin and the objectives of the total development program.

I may add that up to the present time, although we have read newspaper stories concerning an offer by Upper Basin private utilities to supply replacement power, we have had no proposal with necessary data such as rates and the means the utilities would use to get the power to the lower basin, particularly California. While under present circumstances, we could not avail ourselves of the utilities' offer because of the critical outlook, we hope these data will be forthcoming immediately. It will be necessary to have these data without delay if the proposal

is to be considered when the water situation is reviewed and a final decision reached concerning a course of action on operation of the river in this critical water year. I have directed the Commissioner of Reclamation, through his Regional offices, to maintain close and continuing contact with the utilities and to keep me advised on a day to day basis of any changes in the water situation, in order that necessary decisions can be made on a timely basis.

I should also explain that if the presently forecast mean runoff occurs in 1964, Lake Powell is expected to remain at approximately its present level or even to increase somewhat during the runoff period which coincides with the principal recreation demands on the lake. After the runoff, of course, if there is no material improvement in the water outlook, the lake may be drawn down considerably to meet necessary downstream commitments.

Sincerely yours,

/s/ Stewart L. Udall

Secretary of the Interior

Hon. George D. Clyde
Governor of Utah
Salt Lake City, Utah

Identical letters to:

Governor John A. Love, Colorado
Jack M. Campbell, New Mexico
Clifford P. Hansen, Wyoming

UPPER COLORADO RIVER COMMISSION
355 South Fourth East Street
Salt Lake City, Utah 84111

March 27, 1964

Mr. Robert T. Person
President
Public Service Company of Colorado
P. O. Box 840
Denver, Colorado

Dear Mr. Person:

The recent action of the Secretary of the Interior ordering the release of water stored in Lake Powell at a rate that will maintain storage in Lake Mead at a minimum of 14.5 million acre-feet pending a final decision dependent upon stream runoff during the next two months makes it imperative that the Upper Basin States find a way to save this water.

Governor Clyde in his letter of March 2, 1964 to the electric utilities in the area stated that the problem appears to be one "concerning the availability of electrical energy, generation capacity and transmission facilities that would be necessary to replace the power that would be curtailed at Hoover Dam by withholding the water in Lake Powell." In answer to Governor Clyde's letter, your Company and others indicated that they were willing and able to be of substantial aid in solving this problem.

The Secretary of the Interior in his answer to a letter of March 17th from the Governors of the four Upper Basin States said that although there had been newspaper stories concerning an offer by Upper Basin utilities to supply replacement power, his Department had received no proposals with the necessary data, such as, rates and the means the utilities would use to deliver the power to the Lower Basin, particularly California. He also said that it will be necessary to have these data immediately, if a proposal is to be considered when the water situation is reviewed and a final decision reached concerning a course of action on operation of the river in this critical water year.

We believe that because water is now being released at a rapid rate from Lake Powell, the situation has become even more urgent, and there must be an immediate solution, if the minimum power pool in Lake Powell is to be filled in 1964. The utilities' letter of March 10th to Governor Clyde indicated that the various companies started immediately to make engineering and power supply studies pertaining to this problem.

We have also noted in the Secretary's reply to our four Governors that he seems to be concerned about the availability of federal funds for any major interim purchase of power because funds are not now included in the President's budget for that purpose.

After reviewing the overall problem we would like to know if your Company, in cooperation with other electrical utilities in the area, can and will make available the necessary capacity and energy to supply the deficiency in generation at Hoover Dam created by lowering Lake Mead below 14.5 million acre-feet while accumulating the minimum power head at Glen Canyon Dam under an arrangement similar to the following:

(a) The Companies' obligation to extend to the supplying of generation deficiency at Hoover created by filling Lake Powell to its minimum power head and to terminate when Lake Mead reaches 14.5 million acre-feet, or at such time as power generation at Glen Canyon Dam is equal to the deficiency so created at Hoover; and

(b) any energy generated at Glen Canyon Dam following creation of minimum power head to be used first to supply the deficiency at Hoover, described above, with the utilities providing the balance; and

(c) the capacity and energy supplied by the companies to be returned in kind by the Colorado River Storage Project at a time agreeable to the companies upon appropriate notice and under conditions to be agreed upon with the Secretary of the Interior; and

(d) the amount of energy to be returned under (c) to be increased over the amount delivered by a fixed percent per year as compensation to the companies for the cost of money associated with the "banked" energy.

In addition to meeting the concern of the Secretary with regard to the availability of federal cash, we have suggested the above method of repayment because we feel that it results in both a practicable and acceptable means of repaying the companies for their services while at the same time maintaining an optimum financial position for the CRSP. This suggestion, however, certainly does not preclude other methods of repayment, if such methods can be satisfactorily negotiated by the parties concerned.

Mr. Robert T. Person
March 27, 1964
Page Three

We have heard considerable argument to the effect that although the utilities may have the necessary capacity and energy available, the means may be lacking for the transmission of energy to the power users in the Lower Colorado River Basin. Have your engineers or those of your associated utilities studied the feasibility of delivery of power to the Hoover power contractors? Do you know of any physical limitations to accomplishing this phase of the job?

If the capacity and energy "exchange" conditions generally outlined in (a) to (d) above would be satisfactory to your Company, and if you know of no physical limitations to the delivery of power to the Lower Basin users, will you please inform us at the earliest possible date of your willingness to negotiate with the Secretary of the Interior on the basis outlined herein.

Sincerely yours,

/s/ Ival V. Goslin

Ival V. Goslin
Executive Director

Public Service Company of New Mexico
Utah Power & Light Company
Pacific Power & Light Company

UPPER COLORADO RIVER COMMISSION
355 South Fourth East Street
Salt Lake City, Utah 84111

March 28, 1964

Hon. Stewart L. Udall
Secretary
U. S. Department of the Interior
Washington 25, D. C.

Dear Mr. Secretary:

Your reply to the letter of March 17, 1964 from the four Upper Colorado River Governors and the March 26th news release to which both letters were attached indicates that if actual stream run-off conditions warrant there is a possibility of filling the minimum power pool at Glen Canyon in 1964. To resume storage in Lake Powell might require dropping the level of Lake Mead below elevation 1123 temporarily and making up for the resultant reduction in generation at Hoover Dam by purchases of power from outside sources.

You commented that although there have been newspaper stories concerning an offer by Upper Basin electric utilities to supply replacement power, you have had no proposal with necessary data such as rates and the means to be used to get the power to the Lower Basin, particularly California. You expressed an urgent need for these data, if the proposal is to be considered when the water situation is reviewed and a final decision reached concerning a course of action on operation of the river in this critical water year.

I have been informed that since the seriousness of this problem of reservoir filling first became apparent back in February when I talked to you and Commissioner Dominy about it, there has been very little, if any, liaison between the Bureau of Reclamation and the electric utilities who offered to aid; nor have there been any serious proposals to negotiate an alternative solution with the Lower Basin's interested parties.

Your letter to the Governors also mentioned that any major interim purchase of power for replacement purposes would require special fiscal arrangements inasmuch as funds are not now programmed for that purpose.

Hon. Stewart L. Udall
March 28, 1964
Page Two

In view of the above situation, yesterday I directed a letter to the president of each of the six electric utilities in this area. I outlined and proposed for exploration a manner of having the utilities provide replacement generation capacity and energy on an "exchange and banking" basis that should not require large outlays of Federal cash. Second, I asked the utilities if they had studied the feasibility of delivery of power to the Hoover power contractors, and if they knew of any physical limitations to accomplishing this part of the job. Third, I asked the utilities that if they believed the capacity and energy "exchange" idea might work, and if they knew of no reasons why power could not be delivered to the Lower Basin users, to inform us immediately of their willingness to negotiate with the Secretary of the Interior on the basis outlined.

If favorable replies are received from the utilities, we will immediately let you know and urge you to hold a joint meeting with the Governors, the Department's engineers and those of the utilities, and the Upper and Lower Colorado River Basin States for the purpose of further exploring a solution to this complex problem.

In the meantime we will all be hoping for heavy snow storms on the Colorado watershed.

Sincerely yours,

/s/ Ival V. Goslin

Salt Lake City 11, Utah

Dear Mr. Goslin:

We have given consideration to your letter of March 27, 1964 concerning the availability of electric energy to replace the power that would be curtailed at Hoover Dam by withholding water in Lake Powell.

Only for the purpose of accuracy, I would like to point out that our company did not receive a letter from Governor Clyde, so therefore, we have not been in communication with your good Governor. However, in response to a request by Utah Power and Light Company, we did express our willingness to assist the Upper Basin companies in supplying power and energy to meet Colorado River deficiencies.

I am enclosing copy of a letter which Mr. Forman of our company addressed to Mr. N. B. Bennett on March 12, which expresses our ability, in connection with some of our neighboring systems, to supply approximately 400,000 kilowatts to the Bureau, and our willingness to discuss making it available by sale or on an equitable exchange basis.

We wish to assure you, as we have advised the Bureau and the Upper Basin companies, of our willingness to cooperate with all agencies and Upper Basin companies to assist in solving this very great problem. We believe that our willingness to arrange an equitable exchange of electricity with the USBR meets the conditions outlined in your letter.

Yours very truly,

/s/ Walter T. Lucking

A. H. Forman, Jr.
Executive Vice President

March 12, 1964

Mr. N. B. Bennett
Assistant Commissioner
U. S. Bureau of Reclamation
Department of the Interior
Washington, D. C.

Dear Mr. Bennett:

In our meeting in Washington on February 11 you asked about our margin of generation in excess of load and about our ability to sell you energy from our Four Corners Plant. I told you that we expect to use the output of that plant but do have substantial margins in other plants.

In the years 1964, 1965 and 1966 we expect to have capacity in excess of normal reserve requirements which, in connection with some neighboring systems, would permit the supply of approximately 400 mw. As you know, we now have contracts to furnish excess energy to the Bureau. However, if the current water conditions in the Colorado River made it desirable for you to purchase firm capacity, we would be pleased to discuss making it available by sale or on an equitable exchange basis.

We have been asked by Utah Power & Light Company whether we would agree to assist Upper Basin companies in supplying capacity to meet Colorado River deficiencies and have expressed our willingness to do so if needed.

We would appreciate hearing from you.

Very truly yours,

President

Mr. Ival V. Goslin, Executive Director
Upper Colorado River Commission
355 South Fourth East Street
Salt Lake City 11, Utah

Dear Mr. Goslin:

This will acknowledge your letter of March 27, 1964 regarding the offer of the intermountain utilities to join in making available energy which would avoid the necessity of drawing Lake Powell storage in order to satisfy power delivery obligations below Hoover Dam.

Our offer to participate in this joint effort was made in conjunction with Utah Power & Light Company, inasmuch as the systems of our two companies have been closely coordinated over a great many years in order to make the most effective and economical use of our respective facilities. In keeping with those joint efforts, we are prepared to supply such energy and transmission capacity as we may have available to assist your Commission in resolving this problem and to accept reimbursement under the conditions and in the manner agreed upon by Utah Power & Light Company and the other participating utilities.

Cordially,

/s/ T. E. Roach

TER C

PUBLIC SERVICE COMPANY OF COLORADO
P. O. Box 840
Denver, Colorado 80201

R. T. Person
President

April 1, 1964

Mr. Ival V. Goslin
Executive Director
Upper Colorado River Commission
355 South 4th East Street
Salt Lake City 11, Utah

Dear Mr. Goslin:

We are pleased to reply to your letter of March 27, 1964 in which you set forth the proposal that Public Service Company of Colorado, in conjunction with other utilities in the Rocky Mountain Area, provide the necessary electrical generating capacity and energy to allow the continued filling of Glen Canyon Reservoir as originally contemplated. Our company is happy to cooperate in this important endeavor.

As indicated in your letter, we have participated with various other companies in engineering and power supply studies in an effort to arrive at a solution to this problem. These studies established that the necessary generating capacity and energy can be made available by these companies to supply the deficiency in generation at Hoover Dam created by lowering Lake Mead below 14.5 million acre feet while accumulating the minimum power head at Glen Canyon. We might add that at present our engineering investigation has not disclosed any serious physical limitations in the means of delivering power and energy to Hoover power contractors of a sufficient magnitude to prevent carrying forward your proposal.

In view of the fact that the Secretary of the Interior has indicated some concern over the availability of funds to pay for the necessary capacity and energy to accomplish this purpose, Public Service Company of Colorado is willing to participate in this undertaking on your proposed exchange basis. In this manner payment for power and energy contributed by this and other companies need not be made in cash, but can be repaid by the Storage Project in kind by supplying capacity and energy at agreed times and amounts. The remaining principles and conditions set forth in your letter are equally acceptable to Public Service Company of Colorado, and appear to offer a practicable solution to the problem with which the Upper Basin states are confronted by virtue of the low runoff condition of the Colorado River and its tributaries.

By expressing our willingness to participate in the exchange of capacity and energy as outlined in your letter, we do not wish to foreclose the possibility that other alternative methods might be arranged which would be equally acceptable to this company and would be consistent with your prime objective of insuring maximum water benefits for the Upper Basin states.

We wholeheartedly agree with your statement that the recent action of the Secretary of the Interior, in ordering the release of water stored in Lake Powell for the benefit of power production at Lake Mead makes it imperative that the Upper Basin states find a way to save this water. In order that your proposal may be implemented and placed in actual operation at the earliest possible date, we not only agree to negotiate with the Secretary of the Interior on the basis outlined in your letter, but suggest that you immediately call a meeting for that purpose. We further suggest that all negotiations should be conducted upon a joint basis with full participation by representatives of the Department of the Interior, the Upper Colorado River Commission, and the investor-owned utilities in this area that have agreed to assist in this problem.

We again wish to commend you and the Commission for your dedication to the water interests of the states comprising the Upper Basin of Colorado River and for your collective efforts to bring about an equitable water conservation and storage program. You may rest assured that Public Service Company of Colorado will continue to cooperate with the Upper Colorado River Commission in every way possible.

With best personal regards.

Very truly yours,

/s/ R. T. Person

President

R. T. Person/m

UTAH POWER & LIGHT COMPANY
P. O. Box 899
Salt Lake City 10, Utah

E. M. Naughton
President & General Manager

April 1, 1964

Mr. Ival V. Goslin
Executive Director
Upper Colorado River Commission

Dear Mr. Goslin:

This is in reply to your letter of March 27 regarding the problem of not only retaining the water now in Lake Powell but also increasing its level to minimum power head requirements.

As I indicated in my letter of March 10 to Governor Clyde, our company is willing and anxious, as it always has been, to aid Utah and surrounding states in promoting development of water resources. Since being asked to pursue this matter, our company, in conjunction with other area electric utilities, has made studies and arrived at the conclusion that we are in a position to be of material assistance.

It has been determined that collectively the area's investor-owned utilities can meet the electric power deficiencies caused by lowering the level of Lake Mead while accumulating the minimum level for power head at Lake Powell. This company, in cooperation with such utilities, welcomes the opportunity to negotiate toward this end generally in accordance with the method outlined in your letter. We see no serious problems in following a plan of repayment through a capacity and energy exchange as you have suggested but we are willing to explore other methods of payment the Commission or others may suggest.

In answer to your other question concerning the ability of the transmission system to handle the delivery of replacement power to Hoover power customers, studies have been made of the utility systems and that portion of the Federal system which would be affected by the exchange of power. These studies show that the required amounts of power from the utility systems can be delivered to Hoover and that electrical bus modifications at Hoover would require minimal time and expense. In other words, we know of no serious physical limitations that would either unduly delay or prevent rapid solution of this problem. We also know of no reason why releases of water could not be curtailed so that all possible water could be retained in Lake Powell.

We look forward to an early meeting with your Commission and representatives of the Department of the Interior to resolve this serious problem as quickly as possible.

Very truly yours,

/s/ E. M. Naughton

EMN/ws

PACIFIC POWER & LIGHT COMPANY
Public Service Building
Portland 4, Oregon

D. R. McClung
President

April 2, 1964

Mr. Ival V. Goslin, Executive Director
Upper Colorado River Commission
355 South Fourth East Street
Salt Lake City 11, Utah

Dear Mr. Goslin:

In response to your letter dated March 27, 1964, Pacific will be very happy to join other utilities in the region in assisting in the filling of Lake Powell by furnishing electric power. We are advised that by August 1964 there should be sufficient transmission capacity available to deliver this power to the Lower Colorado Basin from whence we further understand arrangements can be made to deliver the power into California.

The general proposed arrangements indicated in your letter for the delivery and later return of the power would be satisfactory to Pacific.

We are glad to be able to assist in the matter and appreciate this opportunity to be of service.

Sincerely yours,

/s/ D. R. McClung

DRM:rbk

THE CHAIRMAN: Thank you, Mr. Goslin. What does the Commission want to do, if anything, at this point with this report?

COM. BLISS: Mr. Chairman, I assume that the items mentioned in the report will come up for further discussion during the meeting and I now move that the report be accepted and filed.

THE CHAIRMAN: Is there a second?

COM. VAN CAMP: I second it.

THE CHAIRMAN: Any questions? (No response. Thereupon a vote was taken.) Motion is carried; the report is received for filing.

MR. GOSLIN: Mr. Chairman, is it then the desire of the Commission to go on with the presentation of more background data? If so, Mr. Paul Rechard, our Principal Hydraulic Engineer on the staff in Salt Lake City, has a report ready on water supply and reservoir operation which I think you should hear.

COM. CLYDE: Mr. Chairman, it is my understanding that there will be an opportunity later in this meeting to consider further this report?

THE CHAIRMAN: Yes, sir. Mr. Rechard.

MR. RECHARD: Mr. Chairman, I don't have a written report. The water supply situation we are facing as far as filling Glen Canyon Reservoir should start, I believe, with the situation as it now exists or as it existed as of April 1.

At that time Navajo Reservoir had 330,000 acre-feet in storage, Flaming Gorge had 872,000, Lake Powell had 3,000,000, and Lake Mead had 14,600,000 acre-feet. The Bureau estimates that the units of the Storage Project have approximately an additional 10 percent in bank storage.

The various agencies made forecasts of inflow to the reservoirs as of April 1. They are shown on your table, and probably the most important one or at least the one that will have the most effect with the Secretary of the Interior is the Bureau's forecast which is 4,700,000 acre-feet during the April-July runoff period into Lake Powell. The S.C.S. for that same period had a little greater, 5,100,000. The Weather Bureau had a little less, 4,400,000. For the purposes of my studies I used the Bureau's forecast.

The water that is in storage now can be moved around somewhat. However, there are minimum storages that we must recognize. These are not final

figures; however, they were used by me in my studies. I used Navajo could be drawn down to its dead storage level of 175,000 acre-feet; Flaming Gorge to its minimum power head of 275,000 acre-feet; Lake Mead down to 10,700,000 acre-feet, which is the level at which the generators at Hoover Dam run into difficulties we are informed.

Lake Powell, of course, we are attempting to get to 6,124,000 acre-feet. Therefore, the point at which I was aiming was to get Glen Canyon up to elevation 3490 by August 1, which was the date I was informed the first generator would be capable of being operated.

The water that I had to work with then was 171,000 acre-feet that could be drawn from Navajo, 658,000 acre-feet from Flaming Gorge, 3,900,000 acre-feet from Lake Mead, or a total draw from storage of 4,737,000 acre-feet, when added to the forecast for the April-July period of 4,700,000, gave me 9,437,000 acre-feet that I had to work with.

The downstream requirements were about 3,500,000 acre-feet during April-July, giving me a total then possible to use of about 6,000,000 acre-feet, of which I needed at Lake Powell 3,434,000 acre-feet. Therefore, on this basis there is enough water in the system if the forecasts are accurate to fill Lake Powell and not go below the minimum storage in the other reservoirs that I stated earlier, and have a little bit to spare.

COM. BLISS: What is the figure at Hoover?

MR. RECHARD: 10,700,000 acre-feet. That is elevation 1083 approximately.

This is up to August 1; however, the point of danger is after the snow melt runoff has occurred and the stream does not continue to flow enough water to meet downstream requirements. Therefore, the low point of storage occurs in March of 1965.

Looking at the total water supply picture again, we can move from storage 4,700,000 acre-feet, we needed in Glen Canyon 3,400,000, leaving us an excess in storage of 1,300,000 acre-feet. With an estimated inflow between April 1964 and March 1965 of about 8,000,000 acre-feet, subtracting the estimated downstream requirements of about 8,500,000 acre-feet, there was still a little bit of a cushion for consideration.

Using this then, I decided it should be worked through on an operation study. These operation studies are in front of the Commission. I chose to make my operation study only as an example of what could be done, not as a final decision that this is the way that the water should be passed from reservoir to reservoir, but just to see if it were possible.

To give you the criteria I used: Navajo Reservoir, I passed the inflow until the high water was gone, which was through June. Then I drew the reservoir to dead storage by continuing to release from Navajo about the same quantity that I had been during the high water. This resulted in reaching dead storage by the end of August. From then on I held Navajo at dead storage and passed all the inflow.

For Flaming Gorge, the turbines at Flaming Gorge will carry about 5,000 second-feet. This is not exactly correct; that is the elevation in the reservoir now, but it is close so I chose to pass 5,000 second-feet until the reservoir was drawn almost to minimum power pool and a little cushion--I used 50,000 acre-feet as a cushion--then I passed the inflow.

For Glen Canyon, since the generators won't be ready to operate until August 1st there was no need to cover a minimum power pool until then. So on the basis of forecasts and the operation of Navajo and Flaming Gorge which I just stated, I operated to fill Glen Canyon as of August 1. This resulted in being able to release approximately 400,000 acre-feet per month, and then after Glen Canyon reached the minimum power pool I passed the inflow.

Lake Mead, of course, the operation was more or less straightforward. I had the inflow from Glen Canyon, and I used the releases for downstream requirements, and then there was some gain between Glen Canyon and Hoover Dam.

To give you the data that I used in a little more detail, the inflow to the reservoirs was obtained from the forecasts. Rather than just using the figures in the forecast, I went through the records and chose the year which came closest to the forecast. For Navajo that happened to be the year 1956; for Flaming Gorge the year was 1959; and for Lake Powell I had to average the years 1959, '60 and '61. These similar periods were assumed to continue not only for the forecast period but beyond to the end of the calendar year. A thorough check was not made as to the hydrologic characteristics of each of the years after the April-July runoff; however, the records did not indicate there were any unusual occurrences during those years which would invalidate their use.

Starting in January of 1965 I assumed a longtime average, 1906 to 1962, of the present modified inflow to the reservoirs. To obtain the gain from Glen Canyon to Hoover Dam, I estimated it to be the same as the year 1961, which was a year of low runoff. During that year the gain was 836,000 acre-feet, but there was a drawdown in Lake Mead of about 2,000,000 acre-feet during that year. And I estimated that of that 836,000 acre-feet of gain, there was 120,000 acre-feet of bank storage, and therefore the gain should be 716,000 acre-feet for the year. This is within 100,000 acre-feet of the evaporation that I assumed at Lake Mead, incidentally.

For power generation, the schedule of the generator installation that I was informed was in the planning at Glen Canyon, the first unit would be available by August 1, the second unit by September 1, the third unit by October 1, and additional units on four-month intervals. This would make it the fourth unit on February 1 of 1965, and the fifth unit by June 1 of 1965.

The capability of these units at minimum power head has been estimated to be 71,300 kilowatts. Operating this on the basis of kilowatt-hours it grew to about 50,000,000 kilowatt-hours per month, which was the figure I used. And also to figure my energy output factor, I used 78 percent efficiency and a tailwater elevation of 3143.

Hoover generation was computed on the basis that the capability of the powerplant would reduce to about 86 percent of the name plate capacity when Lake Mead was drawn down to elevation 1083. The energy output factors were based on reducing the efficiency starting with 83 percent when Lake Mead was about 14,000,000 acre-feet of storage; 78 percent when it was between 13 and 14; 74 percent when it was between 12 and 13; and 70 percent when it was below 13,000,000 acre-feet. I used a constant tailwater elevation of 646 feet.

In the operation that I chose there would be a reduction of 708,000,000 kilowatt-hours of generation at Hoover Dam through June of 1965. And on the basis of the curve that I used, which I said resulted in 86 percent reduction in the name plate capacity at elevation 1083, the maximum decrease in capability of Hoover powerplant was 142 megawatts. During this time Glen Canyon would generate 1.5 billion kilowatt-hours. Also by June of 1965 the capability at Glen Canyon would be better than 300 megawatts.

Now there are methods of juggling the water among the reservoirs. The one that I used was only an example of how it could be done. I am sure that the Bureau didn't exactly duplicate my figures, probably the utilitities didn't. Anyone else who has made an operation study undoubtedly did not duplicate them. However, they should be within the ball park.

Hydrologically I feel that I can state that there is an advantage to the Colorado River system as a whole in bringing Lake Powell to elevation 3490 by August 1.

To bring us up a little bit more to date, these studies were based on April 1 forecasts. The Weather Bureau, that is Gene Peck in the Weather Bureau in Salt Lake, has at our request made a special mid-April forecast of runoff. They went to a great deal of work to get the information for us, calling most of their stations to find out what has happened in the Basin to the middle of April. Also just this morning they informed me of their 30-day outlook, that is up until May 15th.

The results of their mid-April forecast if you have got it in front of you--I won't read it completely--however, over a large part of the Basin the precipitation was very good, up from 150 to 200 percent of normal for the southwest drainage in Utah, the Grand Mesa area in Colorado and the lower valley areas of the Gunnison River and over the San Juan River Basin. However, the upper headwaters of the Green River and the Upper Colorado River were not very good.

The result of their forecast then is that they reduced the inflow to Lake Powell in forecast by about one percent, which in visiting with Gene, I don't believe that he would say that they can be exactly this accurate. So in effect it is about the same as the April 1 forecast. I have a few copies of Gene's statement which I can pass out later.

Also this morning he informed me of their 30-day outlook, which is for the temperature over the Colorado River Basin to be slightly below normal --this is just slightly below normal--with a tendency for the west side of the Basin, that is Utah, to be near normal. Precipitation is to be more or less moderate, that is about normal, with a very slight tendency to be a little bit below normal in the San Juan Basin. The five-day outlook is for fair skies, as we see now, with some weather to move in after that short period. So in essence, as far as he was concerned, the April 1 forecast will probably be pretty good for the next 30 days.

Are there any questions?

THE CHAIRMAN: Thank you, Mr. Rechard. Does the Commission want to ask him any questions at this point?

COM. BLISS: Mr. Chairman, I don't know whether it is a fair question: He said, as I understand it, that hydrologically there was an advantage to filling Glen Canyon. I wonder if he has translated this into economics.

MR. RECHARD: Pardon me?

COM. BLISS: You said hydrologically there was an advantage. Economically is there an advantage to filling Lake Powell?

MR. RECHARD: This depends, of course, on the rates that are used. I made a study of it. I used a rate for the sale of Glen Canyon energy and I assumed a rate for the purchase of energy to make up the Hoover deficiency, and my study showed that it was economically feasible also.

COM. BLISS: Perhaps this is a question that should come later.

MR. RECHARD: Yes.

THE CHAIRMAN: It has been stated at some length, the utilities have rallied around and made studies of their own to try to discover a solution for this problem. May I present Mr. Leever of the Pacific Power and Light--I got that right, did I not?

MR. LEEVER: You did.

THE CHAIRMAN: I am asking Mr. Leever to present the people from the other utilities that have been working on this program and to direct the presentation.

MR. LEEVER: Mr. Chairman, the utilities in the area were asked to make engineering studies and prepare a report, and so we have done that. We have a report prepared and which is here today to present to the Commission. It is entitled, "Attainment of Minimum Power Head at Glen Canyon Powerplant in 1964". (This report appears on pages 99 through 124.)

The engineers that worked on this report are here: Mr. R. L. Baugh of Public Service Company of New Mexico; Mr. R. F. Walker, Public Service Company of Colorado; Mr. R. W. Moody, Utah Power and Light Company, Salt Lake City. I am C. R. Leever of the Pacific Power and Light Company from Casper. Mr. Walker and Mr. Moody will present this report.

MR. GOSLIN: Mr. Chairman, I noticed Mr. Person, President of the Colorado Public Service Company, in the audience. I quoted rather extensively from his letter to us. I wonder if it wouldn't be appropriate to ask Mr. Person if he has a few words to say.

THE CHAIRMAN: I think he should have a chance to speak back.

MR. R. T. PERSON: Mr. Chairman, members of the Commission, Ival Goslin: I gather from this, such speaking as I do should be of minimum duration. But I do appreciate your making it possible for me to say one or two things that I think are perhaps self-evident.

It goes without saying that we as a company, and our group of companies who are associated in studying this problem, share with you the concern for filling Lake Powell and in turn meeting the deficiency at Lake Mead. Mr. Goslin has very well and capably and concisely presented the background to the problem. He has pointed out the letter which we received from Governor Clyde, the reply by Mr. Naughton on March the 10th, and in turn his letter to the companies, to the individual companies, on March the 27th.

I think it is apparent from the dates on these replies which are contained in your information, that we do share this problem and are concerned with it to the end that maximum benefits might be provided for the Upper Basin Fund, which in turn would provide those participating projects which are important to all of us in this general area.

We recognize also, in making these studies, we proceeded promptly to analyze these questions in the light of the best information that was available to us; and we recognize also that there are many other questions which this Commission and others involved must resolve in order to arrive at the best possible solution.

We recognize that there are questions of a legal nature; we recognize that there are questions concerning the actual hydrological problems of the project, and we have tried to work broadly on a very conservative basis within the realm of this broad concept to come up with a plan that we felt would assist the Commission in its deliberations and the Bureau of Reclamation and the Department of Interior in solving this very critical problem. We feel that we have arrived at a satisfactory solution, and as was indicated in Mr. Goslin's remarks and in his letter, a third problem which enters into this general consideration is the budgetary problem. So we have also tried to work within the broad scope of that particular problem as well as the water and power facets.

I will not belabor this subject any more but before I present Mr. Walker, who I think is going to act as the spokesman for the committee, I want to do this, and I know that my friends and fellow executives of the other participating companies, would like to commend this Commission for the diligence, the sincerity, and the aggressive manner in which they have and are, and we hope will continue, to work with this problem. I assure you that it will always be our desire and our hope to work constructively with you in the broad framework of the questions you are confronted with.

With that I would like to present Mr. Dick Walker of the Public Service Company of Colorado, who participated in these studies and who will make the presentation to the Commission and other interested parties here today.

THE CHAIRMAN: Thank you.

MR. WALKER: I have one chart that I would like to show, that I think would be advantageous to put up here (places chart on blackboard).

Thank you, Mr. Newell, and your fellow Commissioners, and Mr. Goslin. It is certainly a pleasure to be here to present our report.

Mr. Goslin has very appropriately read much of the background to this study, and I would like to take off where he ended, and I will do it in this manner: After talking with Mr. Goslin and looking at the time, I will give you a brief introduction and summary of the results which we have come up with, and then will give you my guesses on the water supply situation; and at that time, if it is close to noon, then we will break and have the discussion of the electrical features and the transmission after lunch. We want to go into this in quite a little detail, and we don't want to have to rush it.

Basically our report covers two phases: The first one is the determination of the amount of Hoover impairment and how long would this impairment last; the second phase of our study covers the transmission and physical arrangements necessary to deliver this power to the Hoover power contractors.

I think you are all aware of the time element involved here and the number of factors involved. Any time you work with water data, every water man comes up with slightly different water figures, and I am no exception. My figures are slightly different than the previous speaker, but we feel they are reasonable and in line with the most reasonable forecast.

Our report shows that if Lake Mead is temporarily reduced below 14,500,000 acre-feet, which is the storage set in the criteria, that Glen Canyon can commence generation in August of 1964, assuming that the units will be available at that time, and this is our understanding, that one of them will be.

Also our studies showed by March of 1965 there would be more than ample Glen Canyon generation to make up for the Hoover deficiencies; in other words, the additional generation at Glen Canyon would be greater than the impairment at Hoover at that time.

For purposes of illustration, our studies showed that for the period April 1 through March of 1965, Glen Canyon would generate a little over 500 million kilowatt-hours and that the Hoover impairment during this time would be approximately 250 million kilowatt-hours. So you can see the difference of 250 million kilowatt-hours would be excess over the impairment.

It is our feeling that if the present filling criteria is followed, this difference in generation would not be available and part of it would be lost entirely; and possibly Glen Canyon could not start generation until June of 1966.

We have been a little more conservative on our study figures than some other people. Our studies show that the Hoover capacity impairment would start immediately with 10 megawatts or 10,000 kilowatts in April of this year, and would build up to 192,000 kilowatts in March of 1965. These figures are of the same magnitude as the previous speaker talked about. Ours are slightly higher.

The Glen Canyon generation would start in August with the availability of the units. For the purpose of our study we used 70,000 kilowatts as the generation of the Glen Canyon units at their minimum power head. For the purposes of our study we used 6,200,000 acre-feet of storage as the minimum power head, and this would increase of course as additional units would be added. We had three units installed by March of next year, which is slightly different than the figure that the previous speaker used, but here again our estimate is somewhat more conservative.

In order to put this in proper sequence, the first thing you have to have if you are going to supply generating capacity or banking or exchange arrangement is the generating capacity. We have analyzed our generating resources, and the six companies--which in addition to the four companies that prepared the report are the Idaho Power Company and the Arizona Public Service Company--by this summer will have a total generating capability of 5,170,000 kilowatts. This is over 20 times larger than the maximum Hoover impairment that could occur, and they would have adequate capacity from a generating standpoint to cover this problem.

We have also made I.B M. digital computer flow studies of the transmission system to determine whether sufficient transmission line capability existed to do this job and have concluded that we can also handle any amount of this power transmissionwise from Arizona over to the Hoover system.

However, as you all well know, it is not possible to supply the Southern California Edison Company and the City of Los Angeles impairment at Hoover without making certain electrical changes. From the standpoint of technical feasibility, we feel the best method of supplying this deficiency and getting it to California would be to switch a Metropolitan Water District unit over to the City of Los Angeles generating bus and then to move a Colorado River Commission unit over to the Metropolitan Water District bus. You would also have to change one transformer connection to take an allotment that goes to the Nevada system off of the City of Los Angeles bus. We will have diagrams and we will go into this discussion of these arrangements in great detail a little later on.

The thing that makes this the best solution as we look at it is that this could be done by just switching--no undue delay involved in ordering

equipment--and in this of course, time is of the essence. The one thing that this plan would require is that the Southern California Edison Company supply their own impairment by an arrangement with them. We have talked to them on a technical level, but, obviously, I cannot speak for the management of the Southern California Edison Company.

As I said, we think this method is probably the best because it can be done with just switching, without entailing any large investment.

If it is determined, however, that we have to supply the total impairment from the Arizona system, this can also be done. This would require paralleling the Southern California Edison 230 kv bus with the Arizona-Nevada --commonly called the States--bus. Paralleling these 230 kv busses would increase the transmission into California, and then by displacement would allow all the impairment to come from Arizona over to that area and into California.

It is our understanding that certain metering and load control facilities would be required which would require a minimal amount of investment at some time for the installation of these facilities. Here again we will explain this in more detail a little bit later on.

The one thing I want to point out is, our report is from an engineering technical feasibility standpoint. We certainly realize there are certain operating contractual arrangements that would have to be modified and worked on, and it would require the cooperation of everybody involved--the Hoover power contractors, the Bureau, the utilities, anyone involved in this. And it is like any type of an arrangement, when you are working with somebody else's system and someone else's system is involved, everyone will have to cooperate and just sit down around the table as has been suggested by Mr. Goslin, and work out all these details. We feel though that our solution is technically feasible. This in a nutshell is our proposal, which we will explain to you now in detail.

I would like to cover now some of the water information that I used, which will be somewhat of a repetition of the previous speaker.

For our runoff we used 8,000,000 acre-feet for the 12-month period beginning April 1 of this year to March 31 of 1965. For our spring runoff we used 4,880,000 acre-feet, which is slightly higher than the Bureau forecast. In order to make our operation study, we prorated these on a monthly basis, based on historical monthly percentages of inflow. And for the following two 12-month periods we used 10,500,000 acre-feet as the probable runoff into Lake Powell.

I might also comment on how we handled the stretch of river between Glen Canyon and Lake Mead. We assumed that the inflow in that portion of the river would be equal to the evaporation loss at Lake Mead. A look at the historical data shows some variation in these two factors, but we believe this to be a reasonable and a conservative assumption. Some people use 100,000 or 200,000 acre-feet increase in that stretch of the river.

For releases from Lake Mead we used an annual figure of 8,500,000 acre-feet, which is fairly close to the average for the water year 1961-62 and the water year 1962-63; and it is also the same figure, as I recall, that the Bureau used in their Colorado River Storage Project payout analysis.

I do wish to point out that the use of this figure for study purposes doesn't necessarily mean that we accept this as the amount of water that should go into the Lower Basin. We are operating engineers and are not attempting to interpret the legal aspects of the Compact, and we based it on those two historical years. And obviously if the releases from Lake Mead are reduced, your problem is reduced, the impairment would be reduced.

Now I would like to show you--rather than read you a lot of figures--I will show you the basis of our operation study.

This is Lake Powell on this side (indicating on chart) and Lake Mead over on the other side. We have shown the years here with the small dashes being the months. On this scale we have shown the elevation of the reservoir, this for Lake Powell, and this is the elevation for Lake Mead.

Under the blue tape, which we have labelled, "Present filling criteria," based on holding Lake Mead at 14,500,000 acre-feet throughout this period, that would be this blue line here.

Using the water assumptions we made--8,000,000 acre-feet this year with 10,500,000 acre-feet in the two following years--this is what the Lake Powell elevation would be following the blue line (indicating). Incidentally this point here is the minimum power head of 6,200,000. It would get down there for one month and then come back down and then June of 1966 would be back up to minimum power head.

Under the proposal we are discussing here today, so modifying the criteria, this is the red line. In this case we brought Lake Powell up to 6,200,000, which is the red line, and held it there until mid 1966, and then let it build up gradually. Of course, when you do this, you have to let Lake Mead drop down, which is shown by the red line here; that goes down and down following the inflow.

At this point here (indicating), we came out 1084 feet, which corresponds to a reservoir storage of 10,800,000 acre-feet, which occurred in March of 1965. This is the point of Hoover impairment of 192,000 kilowatts. The area in here, of course (indicating), this area is about equal to this area; and this area is about equal to this area, which it should be working with the same amount of water. You are just transferring it from here to here, and from here down to here (indicating).

Under the assumptions we have made, however, in addition, with the inflow between the two reservoirs being equal to the evaporation, why any decrease in releases from Lake Mead is just as good as an increase in inflow into Lake Powell. A rough rule of thumb that you can use is 1,000,000 acre-feet difference would make about 50,000 kilowatts difference in impairment. In other words, if we had 1,000,000 acre-feet less release from Lake Mead, the impairment could be reduced some 50,000 kilowatts. Or if you got 1,000,000 more acre-feet inflow into Lake Powell, then we assume you could reduce the impairment also by 50,000 kilowatts.

I think I need to say that also the data involved here in working with a system that is not your own, we gathered together the information that was available to us and made the best estimates we could on this information. We don't hold ourselves as experts in this field. We used as much published data and performance curves as we could find; and our answers will probably vary slightly from other people who have worked out the same answers. I think the picture is the same; the figures might be slightly different but they are all in the same ball park.

I think the important factor is that the impairments are of such magnitude that they can easily be handled by our generation, by the transmission of all the systems and some physical arrangement at the Hoover switchyard.

The next item we would have would be a detailed discussion of the electrical arrangements involved at the Hoover switchyard. I will ask Mr. Goslin, how would you like to proceed? This would probably take what, Bob, 30 minutes?

MR. MOODY: I think it would take about that, or less.

MR. WALKER: It would take close to 25 or 30 minutes to cover these electrical arrangements. We will abide by your decision.

MR. GOSLIN: Do you think you would have plenty of time?

(Commissioners confer.)

MR. GOSLIN: Mr. Chairman, our Recorder I think needs a recess; she has been real busy here. And perhaps if it is all right with you fellows, we will postpone this until after lunch; that might be a good idea.

MR. WALKER: Okay.

MR. GOSLIN: Mr. Chairman, you have had a lot of background information and so on here this morning. I have a little article here that I think you might like to hear. This is a poem that appeared over in one of the papers in Salt Lake City. It was unsigned so I can't give credit to the author.

I also wish to state that it is being read purely for your entertainment. I have no reason whatsoever to read it for any other purpose. In fact, while it uses our good Secretary's name here, I want you to understand that Secretary Udall is a personal friend of mine. I don't mean it as any sign of disrespect to him. But it is an interesting poem and represents another facet of this problem.

It says:

"QUIT TAKING OUR WATER!

It now appears to Utahns
That we pulled one big boner . . .
We robbed our Utah lakes of fish
For Udall's Arizona.

We raised the fish and planted Powell,
They grew to luscious size;
Then Udall opens all the gates
And stole them 'fore our eyes.

When fish go through that dam, my friends,
They're then in Udall's state.
Let's get some legal action goin'
Before the time's too late.

Let's all petition L. B. J.
To crack down on Udall.
Before our "neighbor" wrecks the West
We'd best get on the ball!"

(Laughter.)

MR. ECKLES: The luncheon is going to be here in the Argonaut Hotel, and our reservation is between 12:00 and 12:30 at your pleasure.

MR. GOSLIN: Thank you, Dick.

MR. SPARKS: Members of the Legal Committee, could we meet over in the Water office library at 1:00 o'clock, briefly.

THE CHAIRMAN: We will stand in recess than until 1:30 p.m.

(11:45 a.m., Noon Recess.)

- - - - - - - - - - -

(1:30 p.m., Meeting resumed. All Commissioners present.)

THE CHAIRMAN: Mr. Kuiper?

MR. KUIPER: Yes.

THE CHAIRMAN: You have an announcement to make? We will be happy to hear it.

MR. KUIPER: There are some new developments that have come up in this Mexican salinity problem, and there are several representatives of the Committee of Fourteen, including Nevada, and we would all like to meet at 8:30 in the Water Board library tomorrow morning. If all of us meet, with one from each State, we could get the information out. That is across the street in the State Services Building in Room 215.

THE CHAIRMAN: The utilities have the floor.

MR. WALKER: Mr. Bob Moody of the Utah Power and Light Company will now discuss the electrical arrangements and transmission aspect of our report. Bob.

MR. MOODY: Mr. Chairman, my part of the report will be pertaining to the electrical transmission system and the physical arrangement of Hoover plant.

This map I have here shows the principal transmission lines in the Western United States. Obviously all the lines are not there in New Mexico and California and Nevada. I have shown enough to illustrate how we would interconnect and satisfy by transmission any impairment that may be developed at Hoover.

At the present time the Northwest power pool and the Rocky Mountain power pool, encompassing this region up here (indicating on map), has approximately 16 million kilowatts installed capacity. Electrically separated from there at this time along the Colorado, Utah and Arizona, New Mexico lines are the Pacific Southwest power pool. That system has approximately 18 million kilowatts installed capacity.

This year there will be an electrical tie between these three power pools, and it will run in the vicinity of the Utah-Colorado-New Mexico-Arizona lines. These ties are coming as a result of the Colorado River Storage Project, the lines that are associated with it. The initial tie that could be made would be August, about the same time as the first unit would be available at Glen Canyon. That tie could be made from the 230-kv system coming out of Salt Lake to Glen Canyon and then over Federal lines from Glen Canyon over to Shiprock, whereby it could be tied with the systems of the Public Service of New Mexico and Arizona Public Service. That would then make a connection in this manner through here (indicating on map).

Later this year, I believe it is scheduled about September, the Bureau 345 kv line from Glen Canyon to Phoenix will be available for operation. Then we will have a fairly substantial electrical intertie between the Northwest and Pacific Southwest.

Our problem is supplying over this network the impairment as it develops with Hoover. The impairment, if this plan is adopted, would commence in April, progressively increase through the months; but up until August there is no tie in the Upper Basin area, and, therefore, impairment as it developed would initially have to be satisfied from the systems of Public Service of New Mexico and the Arizona Public Service Company. They have sufficient capacity to meet any impairment as it develops at that time. After the tie is made, then by system operations and transfers it is possible together with the generation at Glen Canyon to schedule impairment power to Hoover contractors; and that would be accomplished with the various networks that would be connected at that time.

We have made studies to determine capability of the system in its various stages, and we find that the transmission network as it will be connected is easily capable of supplying the maximum amount of Hoover impairment. That is a figure somewhere around 360 megawatts. We did not have to go that far in our studies, but the system itself is capable of putting 350 megawatts over to the river.

This comes about largely because during summer operation the transmission lines going southeasterly into Arizona from Hoover have power flow in that direction. The effect of the power generated in New Mexico and Arizona, Utah, Colorado and so forth, would be to transmit that power into

the Arizona system, and Arizona, in turn, would further transmit that to the river; the river plants being Parker, Davis and Hoover. But the effect would be to turn that power around first and then transmit it further in towards California.

So that our studies have shown that we can get easily the transmission to the river, Hoover and the adjacent plants. But with the arrangement at Hoover it is not possible to utilize all of that power unless certain modifications are made. That leads us into Hoover switchyard.

This is a very simplified diagram of Hoover (indicating chart). The open positions here merely indicate that there is no electrical connection across there, and this is just showing the normal method of operation. There is no attempt to show the number of circuit breakers and disconnect switches which are there.

Basically, Hoover as it operates, it has, I believe, five power contractors. They of course have the electrical facilities; they own and operate those facilities as their own. Here is California Electric (indicating), now Southern California Edison, beginning up at this point (indicating).

Then they have Unit A9, which is a Colorado River Commission unit, or commonly referred to as Nevada. Its power goes into the 69 kv system.

Then the City of Los Angeles has six units. Capacity out of two of these units is available for Colorado River Commission.

Metropolitan Water District has three units and its 230 kv bus at this point (indicating). And N8 is again a Colorado River Commission unit, or called Nevada. Arizona Power Authority has the two units frequently referred to as Arizona; and Southern California Edison, the three units.

In our studies we have found that we could easily supply without any changes at all at Hoover, any impairment that developed for Nevada, Arizona and Metropolitan Water District. That maximum amount would be 84 megawatts, at the time the total impairment would be 192 as we previously mentioned. By transmission that could be supplied with no further changes.

Now if it is desired, and the plan we have recommended as being technically the best would be to make an arrangement whereby we could supply the City of Los Angeles, and Southern California Edison Company carrying its own. The only means of getting capacity in the City of Los Angeles is to transfer units or allocations of power to the City, in effect creating a larger impairment over on the Arizona side, and that impairment in turn would be supplied by transmission out of Arizona.

We have a switching proposal here that would show basically how we would change from this arrangement to the one where we are supplying the City of Los Angeles.

(Transparency placed over chart.)

Can you gentlemen see this?

We have the transparency showing the switching changes that would be made. Green indicates the opening changes and red indicates closing.

Under this condition of 192 megawatts impairment at Hoover, we would supply the City of Los Angeles by transferring a Metropolitan Water District unit, N5 to the City of Los Angeles bus--opening here and closing this (indicating), this sequence to get it on the network in this manner. We would transfer the allocation of Bank Y to the City of Los Angeles. That is a 40 megawatt rated transformer. So for our purpose, we have considered 40 megawatts being available from these two units for the City. And, therefore, we would require closing here (indicating) to take care of the load that is normally supplied off these lines from the transmission system, and opening up the network here, leaving the transmission normally through this Bank Y to the City. Their change would be to take Unit N8, which is a Nevada unit, and transfer that to the Metropolitan Water District. That, in effect, replaces the unit losses from Metropolitan Water District. Then the impairment would be supplied, this transmission system supplying the total (indicating).

I have a few figures here which might illustrate briefly what that impairment is in regard to the City. Under this condition the City of Los Angeles would have an impairment of 66 megawatts. To satisfy that 66 megawatts, there would be 40 megawatts from Bank Y and from Unit N5 26 megawatts, providing the 66 megawatts.

In developing the impairment at Hoover totally, N5 has a capacity of 71 megawatts at this particular head. We are using 26 for the City. That leaves 45 megawatts unused from the unit, which does create an additional impairment.

So to illustrate what the total impairment would be, we have 192 megawatts all unused, unused from Unit N5 is 45 megawatts, creating a total of 237 megawatts impairment.

Southern California Edison, if they supplied their own, would supply 42 megawatts, that is including California Electric; and from the transmission system in Arizona there would be supplied 45 megawatts.

This method is the one that we believe is the simplest; the one that can be handled by merely switching and no investment.

We looked further into another method if it is desired that the total impairment be supplied from the transmission system. We have a proposal to that effect which we will show you on this next transparency.

(Transparency placed over chart.)

Of course, it is obvious if transmission of power is going right into Los Angeles for those that are involved, mainly Southern California Edison, there will have to be some additional transmission capacity from Arizona into the Southern California system. The studies have shown that if we take an initial step towards increasing this transmission capacity between Arizona and California, we would propose an electrical tie between what we call the Southern California Edison 230 kv bus and the States 230 kv bus--the states meaning Arizona and Nevada. This, of course, puts in more lines.

This map is not very clear, but it in effect ties more lines together running to Los Angeles, for which more power can be transmitted across.

To accomplish that we do basically the same thing for the City of Los Angeles as discussed previously by transferring Unit N5 to the City, an allocation out of Bank Y to the City. To make this connection at Hoover between the States and Southern California Edison, it is just a matter of closing some switches, to do that.

However, in the process it does involve certain facilities, and, as we understand it, it would be principally metering facilities which are required for energy accounting and system operation, for load control and dispatching purposes; very probably some other minor changes, relay changes and switching, but we do not believe this to be of a large magnitude.

With the network so connected as described here, together with the changes in the City of Los Angeles, we could then supply the total impairment developed at Hoover; and the figure that we have is 237 megawatts, that includes Southern California Edison.

I believe that covers my phase of it, Dick, unless there is anything more you think I should say.

MR. WALKER: Okay, Bob, thank you very much. This essentially completes our report. I might just summarize very briefly.

Our water studies do show that Glen Canyon could start operating this August or September and that this Hoover impairment would be created on around 200 megawatts which could be supplied. We as utilities have generating capacity to do so. There is transmission line capacity available to get the power there. And with the switchyard changes proposed and discussed by Mr. Moddy there are two methods of making arrangements at the Hoover switchyard to carry this out.

I would like to point out that this would require the cooperation of all the parties involved--the operators there, the Bureau of Reclamation, the people that are going to supply the energy with us in this case--but I think if everybody wanted to solve this problem, this could be done.

I would like also to express our willingness again on this banking of energy and capacity. We have capacity that can be banked; and to us this looks like a real good solution of this and gets you out of the appropriations thing. And we are willing to bank and take it back at a time when they would have generation to do so.

The arrangements that would be made between the companies, obviously our five or six companies would have to work out our own arrangements for taking care of this. We have explored this and can do this. As Mr. Moody mentioned, in the early months Arizona and New Mexico are the only ones that can physically supply it when there is no connection. After that, it can be taken from various parties and paid back to various parties.

As stated in Mr. Goslin's letter on the energy, there would be a cost of money thing. Some of you would have to expend money for fuel to produce this energy and would have some working capital tied up.

We have done the best job we could with the data involved here, and we are certainly willing to sit down and work with the parties involved tomorrow, the next day, or any day that you want to. We are willing to cooperate to the fullest extent, and I think I can speak for all the management in that respect. We want to help, we want to get Glen Canyon operating, and this looks like it might be the way to do it. We have a lot of problems to solve however.

THE CHAIRMAN: We greatly thank the utilities.

COM. BLISS: I would like to ask Mr. Walker if the companies have any choice in these two selections. Is there any one or the other you feel is better as far as arrangements or complications?

MR. WALKER: From the time standpoint, the first method that requires none of this metering equipment for load control and accounting purposes, would be the better because it is just a matter of closing switches. The other could require some time to install metering equipment and this type of thing, which would be a matter of months. So just from the time standpoint--and time seems to be critical--we would say this would be preferable. Of course, that means Southern California Edison would have to cooperate.

MR. BLISS: Moneywise there would be little choice in the two?

MR. WALKER: I don't know exactly what this metering and load control equipment would cost, but it would be very minimal as investments go.

MR. GOSLIN: One of the great questions that will come up with regards to this, of course, is going to be the rate, in other words, the cost of this energy. Of course we have noticed in here that you have not used any rate figures or cost of money figures specifically; and you stated, I think, just a moment ago that was due to the fact that the various companies have different rates of money costs, and they would have to have facilities tied up in the process if this is done.

Are you as a group of companies in a position to sit down and talk with the representatives of the Secretary of the Interior and other interested parties about what that cost might be? I am referring specifically to Paragraph (d) of the proposal that was sent in my letter to you, that:

> "the amount of energy to be returned under (c) to be increased over the amount delivered by a fixed percent per year as compensation to the companies for the cost of money associated with the 'banked' energy."

Could you elaborate any further on that question?

MR. WALKER: I think Mr. Person would like to take that one.

MR. R. T. PERSON: Maybe I can answer that very quickly.

No. 1, we are prepared to sit down and discuss it in the light of your letter. We think it is worthy of emphasis that we do not contemplate the payment of cash for the exchange of energy.

There are some variations insofar as cost of money and the obligations of the various companies involved. The plan would contemplate that an increment of energy would be returned to the companies in order to compensate

them for that. This hasn't been precisely determined. I am sure that it is fair to say that I would not visualize there would be any problems in that general connection.

On the extremely low side, I think those who view this from an objective viewpoint visualize that something in terms of six percent energy per year might very well be in line; and recognizing also I think that if that ran to as much as, let us say, ten percent, this would still make the plan a very feasible one.

So within the broad range of that general concept, I feel confident that I can say on behalf of the companies there would be no reason why we could not arrive at a successful arrangement or satisfactory arrangement in order to accomplish these exchanges of capacity and energy.

Does that satisfy you?

MR. GOSLIN: Yes, I think that answers my question. I asked the question, Mr. Person, of course, because that is one question that anybody else is going to ask us or you when you sit down around the conference table.

COM. CLYDE: Mr. Chairman, I would like first to commend the utilities for this very excellent definitive report. It appears to offer a solution to this problem which we face; namely, to provide energy and capacity to make up the impairment in power output at Hoover, to provide transmission facilities and to provide a means of paying for the cost of this operation. It in effect answers the questions which we are facing as to how we can operate the river, bring Lake Powell up to the minimum head and keep the impairment in Hoover at a minimum.

Therefore, Mr. Chairman, I move that a copy of this proposal entitled, "Survey Report, Attainment of Minimum Power Head at Glen Canyon Powerplant in 1964", be transmitted this day to the Secretary of the Interior; and that the Executive Director of the Commission urge the Secretary of the Interior to institute negotiations immediately directed toward accepting the plans outlined in this report.

THE CHAIRMAN: You have heard that motion. Is there a second?

COM. BLISS: I will second the motion.

THE CHAIRMAN: Any discussion? Are you ready to vote?

COM. BLISS: Question.

(Thereupon a vote was taken.)

THE CHAIRMAN: Motion carried. It is so ordered.

MR. GOSLIN: Mr. Chairman, the other day I had a phone call from a friend of mine who represents one of the Hoover power contractors, who wanted to know if he could come to this meeting. I told him certainly that he could. I think it is very well that he is here today because as was so ably expressed by Mr. Walker, any plan of this kind is going to require the cooperation of all parties concerned.

Mr. Pat Head of the Colorado River Commission of Nevada is sitting in the back of the room. I do not wish to put him on the spot but I would like to have, if he feels that he could do so, a statement from him with regards to whether he and his organization would be willing to sit down and talk about this plan in the interest of seeing if it could be made practicable.

MR. HEAD: Yes, Ival, thank you. I can't speak for the Lower Basin of course, but I can speak for Nevada. We certainly not only would be willing to sit down, but I think the solution to this problem is for the Southern Division Hoover contractors to sit down with the Upper Basin people, with the power companies and with the Secretary's representatives to work this out. I am sure we can all work it out and come to a satisfactory conclusion.

But I have noticed a viewpoint in this procedure that has taken place on the filling criteria recently. I have one question to ask Mr. Moody, if he was aware of the installation of Bank Z along with Bank Y.

MR. MOODY: I believe Bank Z is one that is to be paralleled with Bank Y?

MR. HEAD: Right.

MR. MOODY: For the supply to U.S.B R., Boulder City?

MR. HEAD: Yes.

MR. MOODY: As I understand the allocation, there is 60 megawatts from the City of Los Angeles Units A1 and A2.

MR. HEAD: I have nothing else except I appreciate being here. I am enjoying getting the information this way rather than getting it over the telephone or someone telling what went on at the meeting.

MR. GOSLIN: We are glad to have you here and we appreciate your statement very much; and you can tell your other friends in the Lower Basin we want to sit down and talk with them about this matter.

MR. HEAD: Thank you.

MR. WALKER: We do have a five-page summary of this report. It may be some people here would like to have it. We don't have enough with the attachments, but we do have the summary that I will leave on the table.

THE CHAIRMAN: Anything further?

MR. KUIPER: This is apart from the problem at hand but we would like to get some information right away. Mr. Friedkin from the International Boundary Commission is in town and he can meet with us this afternoon. How many of your people, the Committee of Fourteen people, would like to meet this afternoon with Friedkin?

(Informal discussion.)

THE CHAIRMAN: I have always forgotten how to address you, Governor Johnson, whether it is Senator or Commissioner or whatnot, but you have the floor.

COM. JOHNSON: Thank you, Mr. Chairman. I want to discuss the theme that the Secretary discussed this morning. I have some copies of what I am going to say and anybody that wants a copy may have it.

(Document distributed.)

Mr. Chairman, I want to discuss the matter our Secretary discussed this morning from this point of view: That here in this great problem we have two basins--not just one basin, two basins. And so far as the legal procedures are concerned, these two basins are very different, one from the other. I think there must be a great deal of confusion over the fact that we have two basins and that they are so different. I think it makes our problem much more difficult because we get these two basins confused in their operation. I have tried to approach this matter on the basis that we have two basins, and that I want to talk about the Upper Basin.

As I say, about the only thing they have in common is that they are on the same river, the Colorado River; and beyond that, besides a few obligations and burdens that have been placed upon the Upper Basin to serve the Lower Basin, they are not at all similar.

On August 25-27, 1920, the League of the Southwest--and that was the Daddy of the present organization--assembled in Denver, just across the street from where we now sit, to develop a practical plan for negotiating a Seven-State Compact. Governor Campbell of Arizona presided. Delph

Carpenter, Colorado Water Commissioner, proposed that the League utilize the treaty making procedures provided in the Federal Constitution, and which is open to the states. The League agreed, and this course of action was adopted and to a considerable extent it has been followed.

In five of its original articles, treaty making by the states is authorized and circumscribed by the Federal Constitution. I quote them here:

> "Article I, Sec. 10, Par. 3: No state shall, without the consent of Congress . . enter into any agreement or compact with another state. . . .
>
> "Article II, Sec. 2, Par. 2: He (the president) shall have power by and with the advice and consent of the Senate, to make treaties, provided two-thirds of the Senators present concur;
>
> "Article III, Sec. 2, Par. 1: The judicial power shall extend to all cases in Law and equity, arising under. . ., treaties made, or which shall be made . . . .
>
> "Article III, Sec. 2, Par. 2: In all cases affecting Ambassadors, other public ministers and consuls, and those in which a state shall be a party, the Supreme Court shall have original jurisdictions.
>
> "Article VI, Par. 2: All Treaties made, or which shall be made, under the authority of the United States, shall be the Supreme Law of the Land, and the Judges in every State shall be bound thereby, anything in the constitution or laws of any State to the contrary notwithstanding."

The Founding Fathers could not have made it clearer that treaties and state compacts cannot be interpreted, altered, amended or modified by Congress. No court other than the Supreme Court has jurisdiction in a compact case in which a state is a party--no court has jurisdiction except the Supreme Court. However, the Seven-State Compact itself provided that it could be terminated at any time by the unanimous agreement of the signatory states, and, of course, it could be amended by those states also, but only on a unanimous basis. No one state can amend this Compact.

So it is not true--and I have heard it stated, and that is the reason I have stated here--it is not true that Congress amended or interpreted the Seven-State Compact or the temporary Six-State Compact by the enactment of the Boulder Canyon Project Act. Congress had no such authority, and it did not attempt to do so. The Boulder Canyon Project Act did not dot an "i" or cross a "t" in any article, paragraph or provision of either of these compacts.

President Hoover was very careful to not make the Project Act effective by Presidential Proclamation until after six states, including California, had ratified the Colorado River Compact, and the California Legislature had accepted the limitation of 4,400,000 acre-feet of water as being California's maximum share as required by this act; and this act I am talking about is the Boulder Canyon Project Act. By this clever and effective maneuver, President Hoover made certain that the Boulder Canyon Project Act was subservient to the Colorado River Compact. You hear it stated otherwise, but I think this distinctly clarifies that situation and makes the Project Act secondary, which, of course, it is.

As a matter of fact this act of Congress, and I mean the Project Act, has the identical relationship to the Seven-State Compact in the Lower Basin as has Public Law No. 485 authorizing the Colorado River Storage Project in the Upper Basin. Both can be amended, modified, changed or repealed by Congress; that is, the Boulder Canyon Project Act and Public Law No. 485 are subject to the will of Congress. Congress can change them any time that they want to, but Congress cannot change the Compact, and neither can the Secretary of the Interior, but he hasn't found that out yet. That is but one of their differences to the Seven-State Compact. Congress can amend, repeal, restrict or do anything it wishes with and to the Boulder Canyon Project Act.

On July 19, 1940, Congress did amend this act by the enactment of the Boulder Canyon Project Adjustment Act. I was a member of the Senate when that act was passed and supported it at the urgency of Secretary Ickes. But neither Congress nor the Secretary of the Interior can touch a solitary provision of the Seven-State Colorado River Compact. And only the Supreme Court in the Judicial Branch of Government can interpret it. If the Secretary understood that, he would not be violating its provisions, and if the Upper Basin realized this extraordinary status, as they should, it would not permit the Secretary to make the Compact his personal puppet. Sometimes we must conclude that the Upper Basin doesn't really know what a solid foundation legally they stand on.

The Glen Canyon Dam 13 miles downstream from the Utah-Arizona boundary cost more than $425,000,000 to construct. It is a very important unit of the Upper Basin.

It will store more than 26,000,000 acre-feet, backing water 196 miles up the Colorado River and 71 miles up the San Juan River. It will have an average annual generation of 4.1 billion kilowatt-hours. Now this 4.1 is an earlier estimate; we have some more recent estimates here today and they would be much more accurate. Its reservoir, Lake Powell, will be useful for river regulation, power production and sediment control. It will

catch 80,000 acre-feet of sediment annually and extend the life of Lake Mead 200 years. It will be the big revenue producer for the entire Upper Basin. It will insure Upper Basin delivery at Lee Ferry of 7,500,000 acre-feet every year. And that is an important thing, to have that flow going down there constantly year after year, not high water one year and low water the next; and that is the reason that we built these reservoirs, so we will have an even flow, and that is especially important and necessary in the production of power and in the regulation of the river.

The Colorado River Compact imposes a terrifying burden on the Upper Basin. Before the people of Denver or Colorado Springs or the Air Force Academy can take a drink of Colorado River water, before Northern Colorado or the Arkansas Valley can turn a drop of Colorado River water on their parched crops, to say nothing of the Western Slope of Colorado, the State of Utah, Wyoming and New Mexico, 7,500,000 acre-feet of water must be delivered to the Lower States at Lee Ferry. Of course, we know that is on a ten-year basis, 75,000,000 acre-feet in those ten years, but that is a terrible burden.

I was in the Colorado Legislature when this Compact was ratified by the State of Colorado, and I objected strenuously to that provision. Instead of dividing it so each of them would get their water, we gave the Lower Basin the preference.

But Delph Carpenter, a brilliant lawyer and a great patriot, and Ward Bannister, another great water lawyer, called on me and said, "We don't want you to oppose it, we want you to go along because we are getting some advantages too. We are in a bad position with the Lower States because they are in shape to go ahead with the development, and under our doctrine of first-in-time, first-in-right, with this kind of a doctrine we are in grave danger." And then they pointed out a recent decision that shook all of Colorado and that was the Wyoming-Colorado case in which the first-in-time was the first-in-right was extended interstate and made available to the lower states on a river.

It is not a share and share alike proposition; it is a preference arrangement--a preference arrangement, mind you. Can we be blamed if we try to protect ourselves and the Lower Basin? Protecting them too, trying to give them good water service, that is what Glen Canyon will do for them, and give them 200 years' longer life by collecting sediment. Can we be blamed if we utilize Glen Canyon for the wholesome and prudent purpose for which it was built? Are we ready to accept Glen Canyon as a monument to the perfidy of the Secretary of the Interior? Slaves would do so, but not proud states, and we are proud states.

In 1923 when they preached a good neighbor policy--and they preached it to me--did Delph Carpenter, Ward Bannister, S. B. Davis of New Mexico, R. E. Caldwell of Utah and Frank C. Emerson of Wyoming believe for one split second that we were dealing with water thieves? And yet today when

we attempt to fill our own Lake Powell with our own water--not with somebody else's water, with our own water, mind you--to protect ourselves and the Lower Basin, the Secretary of the Interior illegally and arbitrarily and against our wishes opens the gates of Glen Canyon! I want to ask in all seriousness: Is he inviting mob rule by that illegal and arbitrary action?

The Compact requires the Upper Basin States to deliver at Lee Ferry 75,000,000 acre-feet in each ten-year period--I am explaining why that is our water and this is the reason it is our water. The Compact requires the Upper Basin States to deliver at Lee Ferry 75,000,000 acre-feet in each ten-year period; and in this present ten-year cycle, instead of delivering 75,000,000 we have delivered 93,740,000 acre-feet. 18,740,000 acre-feet of it was Upper Basin water. We must have 3,000,000 acre-feet to put the Glen Canyon powerplant into production, and the Secretary unlawfully denies us that lawful right by opening our gates and taking our water!

We have met our commitment. The Compact gives us the consumptive use of 7,500,000 acre-feet of water, and the only string on it is that commitment. Now we have met that commitment, and we are entitled to that much water because we haven't used 7,500,000 acre-feet consumptively in the Upper Basin, and so it is our water. And it is our reservoir, Lake Powell is our reservoir. We built it; and the water that we are putting in it is our water, and we have a clear title to it, and the Secretary has no right to take a drop of that water.

Maybe I am using some strong language, but I grew up in an irrigation country, and when they take water that belongs to somebody else, sometimes a shotgun comes into good play. Many men have been murdered for stealing water. It is a high crime. And people will take a greater offense at a crime of that kind than they will an ordinary crime.

Once the Upper Basin has enough water in Lake Powell to put its powerplant into production, the Upper Basin out of the goodness of its heart, and not because it is required by the Compact to do so, is willing to permit all the additional water at Glen Canyon go on down the river to Lake Mead and carry these folks over their present predicament of water shortage, but we are doing that out of the goodness of our heart and not because somebody has a lash to use upon our naked backs.

The Secretary vetoes that good-will settlement of an emergency caused by his own incompetence. Stupidly he failed to harbor water to carry him over the temporary shortage at Lee Ferry which he knew would occur when Glen Canyon was being put into energy production. The minute that Glen Canyon was authorized by the Congress of the United States they knew, the Secretaries of the Interior, whoever they may have been, knew, and they should have been storing that water because it was precious, mighty precious. The evidence supports a record of reckless water extravagance below Lee Ferry especially in 1962, 1963, and in previous years.

The United States is required by treaty to deliver to Mexico 1,500,000 acre-feet of water annually but during the period when we should have been storing water in Lake Mead, 10,000,000 acre-feet was being poured into the Gulf of California, wasted, lost.

Here is the unbelievable record of incompetence by the Secretaries of the Interior. I could have included other years but I have included the year 1958 and so on:

Year	Excess delivery of Water to Mexico over and above required deliveries of 1,500,000 acre-feet
1958	4,909,000 acre-feet
1959	2,196,000 acre-feet
1960	1,243,000 acre-feet
1961	509,000 acre-feet
1962	267,000 acre-feet
1963	616,000 acre-feet
Total	9,740,000 acre-feet

It is a good guess that there were other excesses of water wastage or unnecessary uses which would bring this total to more than 15,000,000 acre-feet. This excess should have been stored in the reservoirs below Lee Ferry to carry us over the period of drastic reductions at Lee Ferry which everyone knew was coming--the inevitable period when we would put Glen Canyon into energy production.

Mr. Sparks has asked the Interior Department to give us the figures on the amount of water that was in excess to the water rights of the people that used the water in the Lower Basin, but we haven't had a reply yet, or, at least, so far as I know, there has been no reply. I hope that when Mr. Dominy gets here tomorrow he will have accurate figures on that and an explanation of how come.

On July 1, 1962, Lake Mead contained 24,600,000 acre-feet of water. Since that date the Upper Basin delivered at Lee Ferry water that had not yet reached Lake Mead, 10,400,000 acre-feet. And yet on January 1, 1964, Lake Mead was down to 16,000,000 acre-feet; and April 1st Lake Mead was down to 14,500,000 acre-feet. What became of all of this water? What became of it?

It would do no harm if Lake Mead were reduced to 12,500,000 acre-feet instead of 14,500,000, so I am told. Production of energy would be slightly reduced but the private power lines have offered to supply this shortage of falling water production of power. From where I sit it appears to me the Secretary of the Interior is determined to keep Glen Canyon out of production for some reason or other. There will never be a better time to get it going than this spring and summer. The law is on our side and common sense is on our side. Remember, it is Upper Basin water the Secretary is confiscating.

And I want to read you a statement here of some pretty good lawyers. Lawyers often caution me not to be making so much talk about the legality of matters, and I apologize because I do it so often. But in this case I brought in eight mighty good lawyers--not just ordinary run-of-mine lawyers, not just country laywers--I brought in eight Justices of the United States Supreme Court to talk a little about the two Basins. I am going to quote from the Supreme Court decision in Arizona versus California; I am on Page 16 of that now. I am just going to read very little, not very much; don't get nervous.

> "Nothing in that Compact"--they are talking about the Colorado River Compact--"purports to divide water among the Lower Basin States"--that is among the three states--"nor in any way to affect or control any future apportionment among those States or any distribution of water within a state." They kept clear out of that. "That the Commissioners were able to accomplish"--that is the Commissioners who wrote the Compact--"That the Commissioners were able to accomplish even a division of water between the Basins is due to what is generally known as the 'Hoover Compromise'."
>
> And this is the Hoover Compromise: "Participants (in the Compact negotiations) have stated that the negotiations would have broken up but for Mr. Hoover's proposal: that the Commission limit its efforts to a division of water between the Upper Basin and the Lower Basin, leaving to each Basin the future internal allocation of its share."

That is the end of that quote. Here the Supreme Court begins talking:

> "And in fact this is all the Compact did"--that is, divided the water between the two Basins.

They didn't try to divide the water between the States. In the Upper Basin we have the Upper Colorado River Basin Compact of our own. In the

Lower Basin they couldn't get that job done. But we got the job done, and that is why I say that the Upper Basin is dissimilar to the Lower Basin in many regards, and that is one of the most important.

> "To begin with, the Act explicitly approves the Compact"--that's the Boulder Canyon Project Act--"To begin with, the Act explicitly approves the Compact and thereby fixes a division of waters between the Basins which must be respected."

That is what my eight lawyers said that that division must be respected. The Secretary does not respect it.

> "Further, in several places the Act refers to terms contained in the Compact. For example, Section 12 of the Act"--and that is still the Boulder Canyon Project Act--"adopts the Compact definition of 'domestic', and Section 6 requires satisfaction of 'present perfected rights' as used in the Compact. Obviously, therefore, those particular terms, though originally formulated only for the Compact's allocation of water between Basins, are incorporated into the Act and are made applicable to the Project Act's allocation among Lower Basin States. The Act also declares that the Secretary of the Interior and the United States in the construction, operation, and maintenance of the dam and other works and in the making of contracts shall be subject to and controlled by the Colorado River Compact. These later references to the Compact are quite different from the Act's adoption of Compact terms. Such references, unlike the explicit adoption of terms, were used only to show that the Act and its provisions were in no way to upset, alter, or affect the Compact's Congressionally approved division of water between the Basins."

Let me read that again. We are talking about the problem of water between the two Basins. That is what we are talking about. That is what we are in trouble about. That is what we are arguing about. And my eight lawyers say:

> "Such references, unlike the explicit adoption of terms, were used only to show that the Act and its provisions were in no way to upset, alter, or affect the Compact's Congressionally approved division of water between the Basins."

How much plainer can you get a statement than that? But that's what these eight lawyers call attention

> "They were not intended to make the Compact and its provisions control or affect the Act's allocation among and

> distribution of water within the States of the Lower Basin. Therefore, we look to the Compact for terms specifically incorporated in the Act, and we would also look to it to resolve disputes between the Upper and Lower Basins, were any involved in this case."

The Supreme Court don't know about this argument we are having out here all by ourselves--"were any involved in this case".

Now I want to go over here to Page 34 of the Supreme Court's decision in the case between Arizona and California. They are talking over here about something that is very important to us and a very important point in this whole dispute; and that is the power of the Secretary.

Now the Secretary was given tremendous power in the Boulder Canyon Project Act; but the Project Act itself applied only to the Lower Basin. There is no question whatever about the Secretary having tremendous power and tremendous authority in the Lower Basin, but he does not have any power at all of this nature in the Upper Basin. He has no right to be taking our water; he has no authority to do anything of that kind.

> "It specifically set out in order the purposes"--the Boulder Canyon Project Act--"for which the Secretary must use the dam and reservoir:"

Here are the uses for which he must use it.

> "'First, for river regulation, improvement of navigation, and flood control; second, for irrigation and domestic uses and satisfaction of present perfected rights in pursuance of Article VIII of said Colorado River Compact; and third, for power.'
>
> "The Act further requires the Secretary to make revenue provisions in his contracts adequate to insure the recovery of the expenses of construction, operation, and maintenance of the dam and other works within 50 years after their construction."

And that is what we were concerning ourselves with in the United States Senate, I think it was in 1944, when we passed the Boulder Canyon Project Adjustment Act.

> "The Secretary is directed to make water contracts for irrigation and domestic uses only for 'permanent service.'"--but he was to make them all in the Lower Basin, not in the Upper.

> "He and his permittees, licensees, and contractees are subject to the Colorado River Compact, and therefore can do nothing to upset"--listen to this--"and therefore can do nothing to upset or encroach upon the Compact's allocation of Colorado River water between the Upper and Lower Basins."

These eight lawyers of mine say he can't do one thing about that he evidently heretofore hasn't read the decision in this lawsuit.

> "In the construction, operation, and management of the works, the Secretary is subject to the provisions of the Reclamation Law, except as the Act otherwise provides."

This particular part of the Supreme Court decision was made to explain what powers the Secretary has or doesn't have. That has been quite a dispute in the Lower Basin. In the Upper Basin there is no dispute because he has none. But in the Lower Basin there has been considerable dispute about it, and that is what the Supreme Court is talking about.

> "One of the most significant limitations in the Act is that the Secretary is required to satisfy present perfected rights, a matter of intense importance to those who had reduced their water rights to actual beneficial use at the time the Act became effective. And, of course, all of the powers granted by the Act are exercised by the Secretary and his well-established Executive Department, responsible to Congress and the President and subject to judicial review."

That is in the Lower Basin.

> "Notwithstanding the Government's construction, ownership, operation, and maintenance of the vast Colorado River works that conserve and store the river's waters and the broad power given by Congress to the Secretary of the Interior to make contracts for the distribution of the water"--that is all down in the Lower Basin--"it is argued that Congress in Sections 14 and 18 of the (Boulder Canyon Project) Act took away practically all the Secretary's power by permitting the States to determine with whom and on what terms the Secretary would make water contracts. Section 18 states:
>
> > "'Nothing herein shall be construed as interfering with such rights as the States now have either to the waters within their borders or to adopt such policies and enact such laws as they may deem necessary with respect to the appropriation, control, and use of waters within their borders. . . .'"

I could go through this decision and point out to you maybe as many as twenty places where the Supreme Court talks about the 7,500,000 acre-feet of water that the Upper Basin shall let flow down to Lee Ferry--at least that many cases. And I don't see how there could be any reserve in anyone's mind in reading this document and noting all the times that they talk about that 7,500,000. And that is all they talk about, that is all the water they talk about, is that 7,500,000 that we have assumed very reluctantly, but we have assumed it, and we have to let it go down there. And the Supreme Court has taken notice of that and discounts that as one of the parts of this whole problem; the 7,500,000 acre-feet is going down there and the Lower Basin States are going to use that water. It is taken for granted that it will be there, the Supreme Court has said.

We are stuck; we have to let it flow down there. But we don't have to let more than 7,500,000 acre-feet flow down there. We don't have to let the Secretary come up to Glen Canyon and open the gates and take our water that we have such a great use for.

I thank you very much for letting me get this off my chest. (Applause.)

THE CHAIRMAN: The next item is the Report of the Treasurer, I. J. Coury.

(Documents distributed.)

MR. COURY: Mr. Chairman, members of the Commission, the Report of the Treasurer is for the period July 1, 1963, to March 31, 1964, which represents three-quarters of the fiscal year.

	1st Nat. Bank Grand Junction Operating Account	U.S. Bank GrandJunction Motion Picture Account	Total Account
Balance on deposit per bank statements, July 1, 1963	$ 55,953.26	$ 742.31	$ 56,695.57
Less outstanding checks, 7/1/63	3,771.04		3,771.04
	$ 52,182.22	$ 742.31	$ 52,924.53
Cash received during period	79,915.00		79,915.00
	$132,097.22	$ 742.31	$132,839.53
Less Cash disbursements during period:			
For expense of prior year	$ 1,262.40		$ 1,262.40
For operating expenses	51,990.71		51,990.71
	$ 53,253.11		$ 53,253.11
	$ 78,844.11	$ 742.31	$ 79,586.42
Add outstanding Checks March 31, 1964	4,368.97		4,368.97
Balance per bank statements March 31, 1964	$ 83,213.08	$ 742.31	$ 83,955.39

The Cash Statements prepared in the office of the Executive Director of the Upper Colorado River Commission for the period ending March 31, 1964, have been distributed to the Commissioners, Treasurer, Assistant Treasurer and the Finance Committee Chairman.

COM. CLYDE: Mr. Chairman, I move the report be accepted.

THE CHAIRMAN: Is there a second?

COM. BLISS: Second the motion.

THE CHAIRMAN: It has been moved and seconded that this report be accepted. (Thereupon a vote was taken.) Motion carried. The report is accepted.

The next item is the Report of the Legal Committee.

COM. BLISS: Mr. Chairman, before you start with the Legal Committee, I would like to say that since the unfortunate and untimely death of Dudley Cornell, one of our legal advisers to the Commissioner, I would like at this time to appoint Harlan Flint as a legal adviser to the Commissioner from New Mexico in place of Dudley Cornell.

THE CHAIRMAN: Thank you. It is certainly accepted.

COM. BLISS: I think you were introduced before, but I wish you would stand up and take a bow, if you will.

MR. FLINT: Thank you (standing).

THE CHAIRMAN: The Legal Committee, Mr. Sparks.

MR. SPARKS: Mr. Chairman and gentlemen of the Commission: Governor Johnson has upstaged the Legal Committee, and we are in thorough agreement, I will say, with what he had to say. And since he has already thrown the wildcat in the hen house, I suppose we can continue in the same vein.

We have some specific recommendations to make to the Commission. First I would like to preface them with a few remarks telling why we feel the way we do.

It has already been mentioned by Governor Johnson that the Upper Basin was sold a bad bill of goods, or to quote a poor pun, was sold down the river in 1922, and what we all thought was an equal division of the water, turned out to be not that way at all.

When these filling criteria first came up some years ago, I think it was realized by every member of the Commission, and certainly as well by the Legal and Engineering staff, that there were very obvious dangers posed in those filling criteria to the Upper Basin. We pointed out those dangers as forcefully as we knew how and objected strenuously to many provisions of the filling criteria.

I was somewhat appalled to read in the press a few weeks ago a release purported to come from the Bureau of Reclamation that these filling criteria were adopted as a result of agreement among the States. No such thing occurred. This was a one-party agreement--the agreement was arrived at by the Bureau of Reclamation.

At that time the State of Colorado started the preparation of a document on a crash basis using consultant help, the best we could find. We sent our staff and consultants into the Lower Basin and interviewed power users, water users, and went into the operation of Hoover Dam, met with the International Boundary Commission, and surveyed the river from Hoover on down to Mexico. We prepared a publication entitled, "Future Operation of Glen Canyon Reservoir as related to the Colorado River Compact."

The fears that we had and the fears that the other states had have now come to pass. Our only fault was that we fell in with that possibility that perhaps the weather would be kind enough to eliminate any future controversy, but we knew better. The weather has not created any problem; the weather has only exposed this situation. When you build upon a rotten foundation you come back eventually to a rotten condition. But we have been equally guilty with the Bureau of Reclamation in believing that weather would solve our problems.

It goes back to the old saying, in connection with the Colorado River Compact and now with the filling criteria that we let slide by--it is a saying with a moral: "Rape me once, shame on you; rape me twice, shame on me." And this is exactly what we have done. We have allowed this situation to go on merely by protesting in the form of letters without any specific recommendations. The Legal Committee is about to propose some specific recommendations.

The filling criteria, as we all knew and pointed out at its original inception, placed the entire burden of stream deficiencies on the Upper Basin and placed the Upper Basin at the complete mercy of the Hoover Dam operation and particularly the Hoover Dam power contractors.

It has been said that the Government is anxious to protect its investment at Hoover, and, therefore, the reason for Glen Canyon not being allowed

to fill. This is an astonishing philosophy. The Congress has authorized for appropriation to date over one billion dollars for the Upper Basin Projects. The remaining Federal investment in Hoover Dam is less than 100 million dollars. So this is a case where ten dollars are sent to chase one. So we cannot understand a philosophy of protecting the Federal investment in Hoover.

Secondly, we have been told that the Federal Government is under an obligation to deliver power to the contractors at Hoover Dam. Nothing could be further from the truth--nothing could be further from the truth. When the Hoover Dam power contracts were entered into they plainly stated in each contract that the Government did not guarantee the delivery of any water or the delivery of any power. This was a fully recognized fact, was accepted by the power contractors at Hoover Dam when the contracts were first entered into.

Neither has Congress nor the contracts ever indicated that there was any obligation on the part of either the Upper Basin or the Federal Government to deliver power to the Hoover Dam contractors. Yet suddenly we find a philosophy which is to the effect that the Hoover Dam contractors are a sacred cow and take precedence over everything else in the river. They are given favored and preferential treatment by virtue of what authority we have not yet been able to determine.

We have been told constantly that unless this filling criteria were agreed to, the Lower Basin would bring a suit against us to stop the construction of Glen Canyon. Now we have never found the Hoover contractors nor the Lower Basin interests to be unreasonable at any time throughout this long period of the authorization of the Colorado River Storage Project Act or subsequent negotiations with them. We have found them to be most reasonable at all times. I am not stating that they are to blame at all in the situation we find ourselves today.

The gentleman from Nevada hit the nail on the head, the vacuum has existed in the negotiations between the two Basins. And I am fully convinced that if this problem had been left up to the two Basins some years ago, there would be no problem today. Our problem emanates from that City known as Washington, D. C.

You have all heard of scrambling devices, which is a device put on telephone or radio communication to deceive the listener. We have a scrambling device in Washington when it comes to communication between the Upper and Lower Basin. We think there are no real issues in controversy between the two Basins except those artificial impediments which have been created in Washington.

We have had the utmost cooperation from the Bureau of Reclamation in the Colorado River Storage Project. The people who have worked on those projects have been devoted to their jobs, and on the regional level. We can do nothing more than to acknowledge the tremendous contribution of the Bureau of Reclamation. But for some reason or other, there is somebody in Washington determined that at all costs the Federal Government must honor those power contracts at Hoover.

Now we are willing to assist in their being honored within reasonable limitations, and we will point out shortly here a method. But what Governor Johnson has stated is correct, there has been a prodigious waste of water from Hoover Dam. And today the filling criteria is nothing more than a relationship with the releases at Hoover, which again is nothing more than a discretion of the people who are operating and ordering the operation of Hoover Dam. They are simply unable to recognize the facts of life, that another reservoir is on the river.

There is a saying that you can't teach old dogs new tricks. We submit to them, to get some new dogs on the job.

We have said that this foundation was rotten from the beginning, and it is now being blamed on the weather. You will recall that in recent months there was a great scandal in New York in connection with certain brokage firms. A certain gentleman pledged thousands of gallons of nonexistent soy bean oil and accumulated debts running into many millions of dollars. When the price of soy bean oil suddenly dropped, he had to make up his margin and was unable to do so. There was no foundation for the market that he was building up.

And there has been no foundation for the filling criteria which was foisted upon the Upper Basin. We are completely at the mercy of what is considered to be the necessary releases from Hoover Dam. As Governor Johnson has pointed out, there has been little or no attempt to improve that situation.

The Legal Committee for over a year now has been preparing exhaustive information in connection, first, with the treatment of the Lower Basin tributaries. We have compiled, primarily through the Commission's office and their counsel, Mr. Billhymer, voluminous briefs and information on the treatment of tributary problems. We are continuing those briefs on all aspects of the Colorado River problem.

The Legal Committee would be the last one to recommend precipitate legal action. There is an old saying that most lawyers know and remember that goes something like this:

"Here lies the body of Jonathan Gray,
He died defending his right-of-way.
He was legally right as he sped along
But he is just as dead as if he were wrong."

California found this out in the Arizona-California suit. So the chances are that the protracted litigation would do nothing more than further muddy the water in the Arizona-California way, adding to our problems rather than solving them. But there comes a point where you have no other recourse, so the Legal Committee is preparing for that today. We believe however that most of the salient issues can be solved by reasonable agreement among the States, and only on one of these points we have here we believe there is any disagreement and that is on the part of one State only.

We recommend that positive action be taken along the following lines and the resolutions and the necessary legislation be prepared within the next 15 to 20 days, and that a special meeting of the Commission be held immediately thereafter to consider these resolutions that will be prepared along with the legislation.

This very day hearings are being held in Washington on the Central Arizona Project. Yet the States have nothing to offer in a way of constructive amendments to that legislation, nor has the Commission. We think this is a lamentable situation and must be remedied immediately.

First, we recommend that legislation be introduced immediately to accomplish the return in full of all funds and the value of power, whether primary or secondary, diverted from the Upper Basin Fund to make up so-called deficiencies at Hoover Dam.

In the filling criteria it was promised that something would be done along this line after 1987. Now we cannot postpone today's problems we feel until 1987. I for one doubt I will be around here in 1987 unless I am as hardy as Governor Johnson, and I am not.

In this connection we think we can work out a reasonable agreement with the Lower Basin States so that they can receive power that will permit them to get along, and at the same time our Basin Fund could be fully reimbursed. The criteria provides for the return of some funds after 1987, but only a small part. In other words, we were thrown a small bone and said, "Well give us ten dollars today, and we will give you a dollar back in 1987." That is the effect of the filling criteria. If we lose a dollar today, we want a dollar back in 1987 or before because we are not talking about peanuts, as one of the high ranking members of the Bureau of Reclamation staff told

us in Washington one time; we are talking about millions and millions of dollars. Perhaps to him a million dollars is a peanut, but it is a million dollars to me and to all of us in the Upper Basin, and we believe that this can be accomplished, as has already been pointed out.

We suggest that legislation be immediately prepared to amend the Boulder Canyon Project Act to provide that the Colorado River Development Fund of $500,000 a year be immediately applied to the power deficiencies at Hoover, and applied thereafter as long as necessary and until the Upper Basin Fund is reimbursed 100 percent for the diversion of either money or power from that fund.

This to us is an equitable arrangement, and it should attract the economy-minded members of Congress because that $500,000 a year is presently non-reimbursable to the Federal Government. In other words, it is a gift by the Federal Government to the seven states of the Colorado River. We in the Upper Basin feel that this is part our money, and it is part the Lower Basin's money. So we think it is a neighborly division or return of the money to the Federal Government of the $500,000 a year from all of our pockets.

This can be accomplished by a simple amendment to the Boulder Canyon Project Act. It will not increase the cost of the power to the Lower Basin users; it will permit them to receive their full contract amounts and will provide a return of $500,000 a year to the Federal Government that it would not otherwise get.

Secondly, in any legislation which is introduced, or which will be introduced, to authorize either the Central Arizona or the Pacific Southwest Water Plan, that an amendment must be put onto that legislation to the effect that the State of Arizona shall agree or must agree that the Lower Basin tributaries must be accounted for as part of the water allocated to the Lower Basin under Articles III (a) and (b) of the Colorado River Compact; that unless such amendments are agreed upon that the Upper Basin will oppose with all the vigor at its command any authorization of any of the Pacific Southwest Water Plan or any of its component parts.

Now is the time to strike. This opportunity, as Governor Johnson said, will never pass this way again. This is a way to eliminate we think a lawsuit on this critical problem. If the State of Arizona is going to maintain that it is not bound by the Colorado River Compact, it is time the Upper Basin found it out.

Three, that action be taken immediately to reduce or eliminate the regulatory waste below Hoover Dam. Now those figures have run as high as a million acre-feet annually, what is conveniently charged off in the Bureau

reports as regulatory waste. And most of them are not regulatory wastes at all; they are the result of water which could be properly accounted for.

One significant use is the illegal use of water by illegal occupants of Federal lands along the lower Colorado River. This is an incredible situation and exists only because the people who started that practice were former members of the Bureau of Reclamation. It may be that there is something sacred about not kicking those people off of Federal land. But if this practice is continued, we should urge the President to open up lands in the Upper Basin so we can privately hold them without buying them, without paying taxes, and have the Government give us free water, and have them paid retirement funds from the Federal Government!

It is an incredible set of circumstances. It takes one order to get these people off, and they are consuming in excess of 100,000 acre-feet of water annually. In the entire authorization of the Colorado River Storage Project, Colorado had five projects authorized which we fought for for 50 years, and they utilize less water than do these illegal occupants of Federal lands on the lower Colorado River.

We submit that a resolution should be framed by the Commission directed to the President, to the Secretary of the Interior and to the Attorney General of the United States that immediate legal action be instituted to return this land into Federal ownership; or in the alternative that the people be allowed to purchase the land and that it be included as part of the project so that proper accounting for the water can be made. At the present time it is the Upper Basin that is furnishing that 100,000 acre-feet of water to those illegal occupants of Federal lands.

Fourth, that the dilution of the water of the Colorado River be immediately stopped. As Governor Johnson has pointed out, many hundreds of thousands of acre-feet, as a matter of fact, millions of acre-feet in just the past few years over and above the requirements of the Treaty with the Republic of Mexico have been allowed to flow down the Colorado River. In recent years part of that excess delivery has been to dilute the saline waters in the lower reaches, the water originating from the Wellton-Mohawk Project in the State of Arizona.

Again it is Glen Canyon which is bearing the burden of that dilution and the Upper Basin. Everything that is done apparently down there, it should be the Upper Basin that has to take care of it; this is the prevailing philosophy. If legal action is necessary on this point, then we should institute it.

We are willing to work with the State of Arizona, this Committee of Fourteen, to solve that problem, and admittedly it is a problem, and we would like to see it solved. But we do not consider it a solution, in order that we

should receive credit for 40,000 acre-feet of water, bad water, that we should chase it with a hundred thousand acre-feet of good water. That makes no good sense but it is being done today.

We hope the Committee of Fourteen can come up with a reasonable solution, and certainly we will work with Arizona to the end that they are not charged with this water for a reasonable period of years; but the present solution is no solution at all.

Fifth, that interconnection be immediately provided at the switchyard at Hoover Dam. Again this is an impossible situation where, as shown by this diagram, there is a series of disconnected generators. This has resulted in a prodigious waste of water and energy at Hoover, a situation which continues to this date. And the cost of this interconnection is relatively minor; it is less than our Fund is being bled for each year to make up these power deficiencies.

The Colorado River Storage Project Act directs the Secretary to interconnect these systems to make the maximum use of the power produced by the two systems. How can that be done without an interconnection at Hoover Dam? Right today we are faced with a problem of how to replace river power to the Lower Basin because of this lack of interconnection. I don't think you will find another powerplant in the United States, and possibly the world, that is so operated.

We think that a resolution should be adopted by the Commission urging immediate action and we should assist the Lower Basin in securing appropriation for this point.

And one other point: The Lower Basin was charged by the Boulder Canyon Project Act with the repayment of the flood control capacity of Hoover Dam. I forget what the charge was but I think it was in the magnitude of $25,000,000.

We think this is an improper charge against the Lower Basin and insofar as we know, no other project, no other Federal project in the United States is so constituted so that flood control is charged to the project.

We think some remedial legislation should be sought along this line, and again we are willing to assist the Lower Basin to take a tremendous burden off them in the payment of that project and give them equal treatment with all projects in the United States.

Mr. Chairman, that is our report.

THE CHAIRMAN: There is a request for a break. Is there any objection to a recess for 10 minutes? (No response.)

(3:10 p.m., Recess.)

(3:30 p.m., Meeting reconvened.)

THE CHAIRMAN: You have heard the Report of the Legal Committee. What do you want to do with it?

COM. CLYDE: Mr. Chairman, I move we accept the Report of the Committee, and I think there will be a resolution introduced covering it.

THE CHAIRMAN: Is there a second?

COM. VAN CAMP: Second.

(Thereupon a vote was taken.)

THE CHAIRMAN: The Report of the Legal Committee is accepted.

COM. JOHNSON: Mr. Chairman, I offer the following resolution and move that it be adopted, and let the Secretary read it.

MR. GOSLIN: All right, sir.

"I move that the Legal and Engineering Committees be instructed to prepare the necessary resolutions and legislation to accomplish the five recommendations contained in the Report of the Legal Committee.

"I further move that this Commission meet in special session within the next 30 days to discuss the resolutions and legislation so prepared."

COM. JOHNSON: I so move.

COM. CLYDE: Second the motion.

THE CHAIRMAN: You have heard this motion and its second. Is there any discussion?

COM. BLISS: Question.

(Thereupon a vote was taken.)

THE CHAIRMAN: Motion carried; the resolution is adopted. Those Committees are so ordered.

MR. GOSLIN: Mr. Chairman, speaking for Mr. Sparks and myself, we will have the necessary meetings to draw up the necessary documents.

THE CHAIRMAN: The next item on the agenda is Unfinished Business and the Report of the Commissioner of Reclamation. It is understood that the Commissioner of Reclamation will be here tomorrow morning. What is the wish of the Commission?

COM. CLYDE: Mr. Chairman, if it is appropriate I would like to submit a resolution.

THE CHAIRMAN: It is in order.

COM. CLYDE: Since the President's budget was prepared, certain developments and progress has been made with respect to the Central Utah Project in my State. The definite plan report is now complete, the Conservancy District has been organized, the repayment contract can be prepared we hope in about six months, which means that actual construction of that project could start in 1965 were appropriations available.

I would therefore like to submit for the consideration of the Commission the following resolution:

"WHEREAS, the States of the Upper Colorado River Commission have traditionally worked for development of the water resources of the Basin and have given unified support to the early construction of participating projects; and,

WHEREAS, the Central Utah Project is an authorized participating project; and,

WHEREAS, the Definite Plan Report for the Bonneville Unit of the Initial Phase has been completed by the Regional Office of the U. S. Bureau of Reclamation; and,

WHEREAS, the Central Utah Water Conservancy District was officially created by the District Court on March 2, 1964; and,

WHEREAS, the Project is needed; and,

WHEREAS, appropriations are needed to initiate construction, it should be supported by the Upper Colorado River Commission:

NOW, THEREFORE, BE IT RESOLVED that the Upper Colorado River Commission and the individual states it represents, do hereby give support to the inclusion in the Reclamation Appropriation Act an item of $1,500,000 to commence construction during fiscal year 1965."

I move the resolution be adopted.

COM. JOHNSON: Second the motion.

THE CHAIRMAN: You have heard that resolution read, the motion that it be adopted and the second. Is there any discussion or question?

COM. BLISS: Question.

(Thereupon a vote was taken.)

THE CHAIRMAN: The resolution is adopted.

COM. CLYDE: Mr. Chairman, I have another suggestion I would like to make for the consideration of the Commission. It has developed over recent years that the problem of water pollution has become of major importance and that there are many actions being taken at the present time with respect to the matter of water pollution. I am not sure of the organization in the respective states, but in my State we have what we call a Water Pollution and Control Board, the director of which, I think, could make a contribution to the Engineering Committee.

I am wondering if it wouldn't be desirable, if it is in the interest of the respective states to authorize a member or representative of the water pollution agency in the respective states to be made a part of the Engineering Committee of this Commission.

The purpose of that proposal is simply to bring into focus the matters of pollution as they might affect the projects which we have under consideration.

MR. GOSLIN: Mr. Chairman, the reason I hastily grabbed this Tenth Annual Report was to look up the By-Laws of the Commission to see what might be necessary in order to comply with them. May I have just a moment?

(Mr. Goslin examines book.)

COM. CLYDE: I might say, Mr. Chairman, my purpose of bringing this up is not necessarily to get action right now, but I thought the idea was worth considering.

THE CHAIRMAN: We would like to have comment or discussion in any case.

MR. GOSLIN: Mr. Chairman, may I speak to the motion? I realize I don't have a vote, but for a good many years our staff has been watching this problem of pollution more or less strictly on its own because we realized that it was a very important problem as Commissioner Clyde has pointed out.

I feel quite strongly that we should definitely have some close liaison with members of the pollution control boards in the various states. Therefore, I would certainly look with favor upon any manner of getting this problem of pollution before us and in giving our staff or its committees official authority of the Commission to pursue it.

The problem of pollution in the Colorado River Basin is becoming recognized more and more every day. The Department of Health, Education and Welfare of the Federal Government has been asked by the various Health Departments of the states to set up committees. They have regular meetings. I have been asking Mr. Billhymer to attend these meetings to make reports to us with respect to what transpires there. And certainly I believe that this action that is being asked by Governor Clyde is in the best interests of the Upper Basin and of the Commission.

I am not exactly sure of the desirability of having a member appointed from each state as a member of the Engineering Committee because of so many other duties that the Committee has. Although if that is the way that the Commission directs that it be done, certainly we would recommend that suggestion from the Commission.

COM. JOHNSON: Mr. Chairman, I would like to move to have the matter lay over and have a report from the Secretary with respect to it for consideration at the next meeting.

COM. CLYDE: Second the motion.

MR. GOSLIN: Is that satisfactory to you, Governor Clyde?

COM. CLYDE: Yes.

MR. GOSLIN: I am certainly not opposing it. I am for the idea very strongly, but just want to be sure we do it in a proper manner is all.

COM. CLYDE: I think we should study it.

COM. BLISS: Mr. Chairman, I think I would like to take a little time to think this matter over.

Let me say this: It appeals to me that the action of the Health, Education and Welfare and the State Health Departments in many instances seem to be at cross purposes to what we as a Commission are attempting to accomplish. Now perhaps Governor Clyde's suggestion is a way to bring them into camp--I don't know. But I do think there should be closer liaison between this Commission and the Health, Education and Welfare and the State agencies and see if we can't perhaps direct some of their activities more in line with what we are attempting to do.

COM. CLYDE: It might be one way to find out what they are doing.

MR. GOSLIN: Mr. Chairman, I certainly concur with what Mr. Bliss has said. As I indicated a moment ago, I have been asking Mr. Billhymer to follow this matter closely. He has done so and has been attending all the meetings to which he could get. I would like to have him say a few words about the subject, its importance and so on, if he would.

MR. BILLHYMER: Mr. Chairman and Commissioners: Right now there is pending in Congress a bill in the House to amend Public Law 660 for the third time to increase the authority of Health, Education and Welfare in the field of water pollution. It seems as if it is stymied.

Now I talked to Lynn Thatcher from Utah, who is the pollution man representing Utah on this Colorado River pollution; and he tells me that the States may have derailed the thing.

There was a provision in that bill that is kind of interesting--I think we sent a memorandum around to everybody on this--which provided for quality standards in river basins of the United States, determined by the Secretary of Health, Education and Welfare.

Colorado River pollution problems will be considered May the 26th and 27th, I know, in Las Vegas, New Mexico. This will be the fifth conference on this.

A VOICE: Nevada.

MR. BILLHYMER: I am sorry. They wouldn't go to New Mexico; you can't gamble there. I. J. used to have some tables there but they took them out.

As I understand it there is a new program. The program is going to be continued, what they had before. They are going to make an economic study, and I believe it is Dr. Wollman from New Mexico that is in charge of the economic study, evaluation of water uses.

I think this is something that this Commission better take a good look at because they are going to evaluate or attempt to evaluate the value of an acre-foot of water in various water uses, and there are some people in our Basin that are very enthusiastic about it. In other words, an acre-foot of water may be a lot more valuable for trout than it is for the project you are trying to advocate.

They are also going to take another look at pollution by pesticides and residual fertilizers in farming. This has some real interesting aspects and may well mean that some of our farmers are going to find themselves enjoined from the type of farming they have been used to by the Health, Education and Welfare because they are polluting the Colorado River.

And you have read in the papers what happened along the Mississippi, about the fish killed down there. Thatcher again told me that they are appalled at what they found in those fish. The fact of the matter is they found two poisons they don't even know a name for which still killed the fish.

So this H. E. W. stuff on pollution is really a potent thing, and let me warn you, they have the authority to act. Now I am just clueing you, Public Law 660 gives the Secretary of Health, Education and Welfare real authority and there are real teeth in it. Blatnik and some of the other people--what is the name of the man from Maine?

A VOICE: Muskie

MR. BILLHYMER: --Muskie, are real eager to give him more authority. The strange thing is that the Health, Education and Welfare people are reluctant to grab the authority Congress is willing to give them; this is the thing that is kind of amazing. But it looks as if it may get crammed down their throats. This group has money. Frankly, I think they are also looking for people to help them out and are willing to cooperate with people. The ones that I have talked to are very receptive to discussion.

It seems to me it is time we get on the ball and work with them rather than to find them looking down our throats and telling us what to do. And I think they are willing to work with us at this time.

THE CHAIRMAN: Thank you.

COM. VAN CAMP: Mr. Chairman, just a brief remark. Governor Clyde, we certainly concur in your concern on this matter of pollution, particularly in regard to the legislation that Mr. Billhymer has just referred to that was passed by the Senate last November.

I believe the matter has been called to the attention of several groups, and I am happy to report that as far as the State of Wyoming is concerned, we did take action even though it was passed in the Senate.

We understand it is in the House, and we are opposed to these amendments permitting Health, Education and Welfare to have this additional authority. I would concur in the thought that you had expressed here, that we explore this as has been explained here to see if better coordination can be had within the activities of the Upper Colorado River Commission.

That is all I have to say.

COM. CLYDE: Thank you. I believe Mr. Kuiper had his hand up down there.

THE CHAIRMAN: Mr. Kuiper.

MR. KUIPER: Along with what Paul Billhymer said, I might report that the Council of State Governments is actively and almost unanimously opposing the amendments which are proposed for 660, and certainly we are supporting that opposition.

One further thing let me say, any of you who have seen this proposed study of the Colorado River, there is one thing that is extremely frightening to me and that is the evaluation of damages to the quality of water in the river by uses upstream whether they be irrigation or what have you. And as I read this, it is possible to incorporate as a cost of future projects in the Upper Basin the damage that they may cause to the water which is downstream. This is very frightening to us, and we have come up with nothing on what to do about it.

But I would like to commend to any of you that have an opportunity to take a look at this report. It sure scares us.

MR. BILLHYMER: You are talking about the report that came out of this Denver conference just the other day?

MR. KUIPER: One I sent you a copy of.

MR. BILLHYMER: We got a copy.

THE CHAIRMAN: Is there further discussion?

COM. CLYDE: Mr. Chairman, I would like to raise another red flag. All I know is what I read in the newspaper. But this action which was recently taken to bring power from the Pacific Northwest into this area at 2.2 mills would appear at first glance to pose a very definite threat to all future reclamation projects which depend on power revenues for payout. Our rate for the Colorado River Project is 6 mills. If they can bring it in here for 2.2 mills, what is it going to do the power we generate in our plants? Of course you know that 2.2 mills can be brought in only because of Government subsidy.

I merely drop that as a suggestion to you. I think you ought to be thinking about it.

MR. GOSLIN: Mr. Chairman, the only other item I had on the agenda --I referred to it briefly in my report this morning--that is the matter of the appropriations for the Colorado River Storage Project for the fiscal year 1965. If I recall correctly, I suggested that the Commission should decide at this meeting how it wished those hearings handled this year.

Last year we asked our four Governors to appear before the House Committee on Appropriations. We have done that on several occasions. On several occasions we have done it in other ways by having Commissioners appear, or I have appeared on numerous occasions.

I think it is only fair that the Commission express its will with regard to this question.

COM. BLISS: Mr. Chairman, it seems to me that the presentation by the Governors makes a very effective presentation for the Committee. If it is at all possible I would hope that the four Governors could go back again for the presentation in regard to the appropriations for the 1965 fiscal year.

If it is in order, I will move that the Secretary approach the problem in this manner and see if we cannot arrange for the Governors to be back there for the hearings.

THE CHAIRMAN: You have heard the suggestion, which is a motion?

COM. BLISS: It is a motion, that is right.

COM. VAN CAMP: I second it.

THE CHAIRMAN: And the second.

COM. JOHNSON: Did you get the word "invite" in there--inviting the Governors to do it?

COM. BLISS: I will so amend my motion if it isn't there.

COM. JOHNSON: Put it in there.

COM. BLISS: We will invite them to go back.

COM. JOHNSON: I would like to have it in there because you can't be telling these Governors what to do. (Laughter.)

THE CHAIRMAN: Is there any comment or discussion on this matter? The motion is that the Secretary invite the Governors to follow out that program.

COM. JOHNSON: Right.

(Thereupon a vote was taken.)

THE CHAIRMAN: Motion is carried. The Secretary is instructed.

COM. VAN CAMP: Mr. Chairman, I have just a few words to say here in I hope the closing of the meeting here, and I am not going to elaborate on any details at this time, but I think I want to reaffirm our concern as far as Wyoming is involved in the seriousness of this situation in regard to Glen Canyon.

I think it is apparent that the action that has been taken has been taken on rather short notice in order to get the job moving, and I hope we can get it done. In other words, time I think was and is of the essence.

I want to express appreciation as far as Wyoming is concerned to the utilities that have appeared here today in a very outstanding presentation of this problem. And last but not least, I want to express our thanks to the Commission staff, which has required an extraordinary amount of time and work on their part in preparing the meeting that we have had here today--I think this is a good example to show in handling situations of this nature, of what can be done--as well as thanks to the other Commissioners of this Commission, and particularly Governor Clyde. Thank you very much.

MR. GOSLIN: Mr. Chairman, I believe it would be appropriate to announce that this meeting of the Commission will continue tomorrow morning at 10:00 o'clock in this room.

MR. BARLOW: Mr. Chairman, may I ask in the motions that were made by Governor Johnson and Governor Clyde, is it the feeling of the Commission that we have taken appropriate action, if it is the sense of this Commission's thinking at this point that we are in agreement that the gates be closed at Glen Canyon at an appropriate time, maybe day after tomorrow or some similar suggested date; or is it necessary to discuss it any further? A matter of information.

MR. GOSLIN: Mr. Chairman, tomorrow representatives of the Bureau of Reclamation and the Department of the Interior will be here for a presentation. I have no doubt that after they appear the Commission will probably wish to take some additional action. The matter that Mr. Barlow has mentioned could more properly be discussed at the meeting tomorrow than it could today.

THE CHAIRMAN: We asked them to come, didn't we?

MR. GOSLIN: Yes, sir. They told us they were coming.

THE CHAIRMAN: Any comment?

COM. CLYDE: Mr. Chairman, just for the purpose of amplification, you will recall the motion, Norm, that I made has to do with the report submitted by the utilities specifically and the further action by the Commission I am sure will come after we have the meeting tomorrow.

This motion you will recall specified that the report be transmitted this day to the Secretary of the Interior and the Executive Director urge the Secretary of the Interior to institute negotiations immediately towards implementing this plan. So that was specific, as far as that goes.

MR. BARLOW: That was my inquiry, Mr. Chairman, as to what Governor Clyde has just said.

I do think, I am sure that this Commission and those that are in this room feel that now we have data that has been presented today, that we do have an urgency relative to some regulation at Glen Canyon. Official action of this Commission I am sure will be had at the appropriate time.

I would hope the discussions here--it is an open meeting--I would hope that it would get onto all the wires and the Commissioner and the Secretary of the Interior would know we have had a meeting here today in Denver and a good one.

I do think we have an urgency in that particular matter of business. I am sure it is something that we want to settle before we leave Denver.

COM. BLISS: Mr. Chairman, I move we recess until 10:00 o'clock tomorrow morning.

THE CHAIRMAN: Is there objection? (No response.)

Without objection we will recess until 10:00 o'clock tomorrow here.

(4:00 p.m., Tuesday, April 14, 1964, Meeting recessed.)

SURVEY REPORT

ATTAINMENT OF MINIMUM POWER HEAD AT GLEN CANYON POWER PLANT in 1964

Prepared by

Pacific Power & Light Company
Public Service Company of Colorado
Public Service Company of New Mexico
Utah Power & Light Company

At the Request of

The Upper Colorado River Commission

April 14, 1964

ATTAINMENT OF MINIMUM POWER HEAD AT GLEN CANYON POWER PLANT in 1964

By letter to Utah Power & Light Company dated March 2, 1964, Governor George D. Clyde of the State of Utah advised that run-off on the Colorado River for 1964, was expected to be much below average and that under the present Glen Canyon filling criteria there appeared to be little chance this year of filling the reservoir to minimum power head and commencing the generation of electric power and energy. Temporary modification of the filling criteria to permit lowering of Lake Mead below the rated head value corresponding to 14.5 million acre-feet of storage may be necessary to allow sufficient storage at Lake Powell. It also appears that the Upper Basin Fund would be charged with the costs of any power impairment at Hoover due to the filling of Lake Powell and, therefore, would be required to furnish sufficient power and energy to supply the impairment created by reducing Lake Mead below 14.5 million acre-feet or provide suitable compensation to the Hoover Power Contractors.

For the above reasons Governor Clyde requested that the investor-owned utilities in the Colorado River Basin consider the problem of filling Lake Powell to minimum power head to determine if the companies could aid in its resolution, perhaps by furnishing generating capacity and energy together with transmission service to supply the Hoover power impairment during the period that Lake Mead would be drawn below rated head as a result of filling Lake Powell.

In response to Governor Clyde's request, engineering studies were started, and on the basis of preliminary results, Governor Clyde was

advised on March 10, 1964, that the companies, together with neighboring utilities, could supply the Hoover impairment. Following the companies' reply, Mr. Ival V. Goslin, Executive Director of the Upper Colorado River Commission, on March 27, 1964, wrote to Arizona Public Service Company, Idaho Power Company, Pacific Power & Light Company, Public Service Company of Colorado, Public Service Company of New Mexico and Utah Power & Light Company and inquired if the companies would be willing to negotiate with the Secretary of Interior to supply the Hoover impairment under a power and energy exchange arrangement outlined generally by Mr. Goslin. A copy of this letter is included as an attachment to this report.

Each of the aforementioned companies expressed a willingness and desire to cooperate fully with the Upper Colorado River Commission and the Department of Interior in resolving this problem.

PURPOSE

This Survey Report was prepared at the request of the Upper Colorado River Commission by an engineering committee of the investor-owned utilities in the Upper Basin area to investigate technical feasibility of the utility companies and/or Glen Canyon supplying the Hoover impairment until such time as storage at Lake Mead is returned to 14.5 million acre-feet. Basically the study covers two areas of investigation consisting of: (1) Determination of the amount and period of Hoover impairment; and (2) the transmission system and physical method of supplying Hoover impairment. The results of these studies are set forth in detail in the following sections of this report.

In all cases the information contained in this report was prepared from the best and most recent data available to the companies

within the limited time available for preparation of this report. The results are not intended to represent a comprehensive engineering study, but are more than adequate to demonstrate that minimum power head can be attained at Glen Canyon during 1964.

SUMMARY

This report shows that if storage at Lake Mead is temporarily reduced below 14.5 million acre-feet, Glen Canyon can attain minimum operating head and commence power generation by August of 1964. The study further shows that Glen Canyon generation would exceed the associated Hoover impairment by March of 1965, and subsequent operations would show a substantial surplus to assist in CRSP payout. For purposes of illustration Glen Canyon would generate approximately 541,000 mwh during the operating year of April 1, 1964, through March, 1965 as compared to only 254,000 mwh impairment at Hoover. If the present filling criteria is followed this difference in generation would be lost entirely and Glen Canyon could not commence generation before June of 1966.

The Hoover capacity impairment would vary from 10 mw in April, 1964 to a maximum of 192 mw in March of 1965, and would disappear entirely in June of 1966, when Lake Mead regains a storage of 14.5 million acre-feet. Glen Canyon capability would become 70 mw in August of 1964, and would increase to 210 mw by March of 1965, as additional units are added.

On the basis of the assumptions made in this analysis, the minimum elevation at Lake Mead would be 1084 feet representing 10.8 million acre-feet of storage which would occur in March, 1965.

The six investor-owned utilities have made realistic surveys of their loads and generating resources and have concluded that they have

more than ample generating capacity to supply any conceivable impairment in generation at Hoover that results from lowering Lake Mead storage below 14.5 million acre-feet. The six utilities will have 5,170 mw of generating capacity by the summer of 1964, which is over 20 times the maximum Hoover impairment.

Studies made of the transmission system show that there is adequate line capacity to supply any amount of Hoover impairment. However, because of the present electrical arrangement at Hoover, it is not possible to supply the Southern California Edison Company (Edison Company) and the Los Angeles Department of Water and Power (City of L.A.) impairment without making certain changes at Hoover.

From the standpoint of technical feasibility the best method of supplying the total Hoover impairment would involve switching a Metropolitan Water District unit, switching a Colorado River Commission unit and transferring the Colorado River Commission allotment from "Bank Y" at Hoover to provide for the City of L.A. impairment. Under this method, the Edison Company would supply its own impairment and the balance of the total expected impairment could be supplied from the Arizona transmission system. It appears that this method could be accomplished without any investment or undue delay.

If it is determined that the transmission system from Arizona should supply the total impairment at Hoover, it is physically possible to do so by providing an electrical interconnection at Hoover between the Arizona-Nevada (States) and Edison Company 230 kv busses together with the transfer of generating capacity similar to that described above for the City of L. A. Such a connection would materially increase the transmission capacity between the Arizona and California systems and

could be effected primarily by the installation of metering and load control equipment.

While the plans proposed in this report are technically feasible, it is recognized that temporary modification of operating and contractual arrangements may be necessary. However, with the full cooperation of all parties this should present no problem.

CALCULATION OF HOOVER IMPAIRMENT

In order to analyze the problem of attaining minimum power head at Glen Canyon it was necessary to make certain assumptions as to the inflow to Lake Powell and the releases from Lake Mead.

On the basis of the latest information on the water conditions in the Colorado River Basin, a value of 4.88 million acre-feet for the April-July, 1964 spring runoff and a total annual inflow to Lake Powell for the period April 1, 1964 to March 31, 1965 of 8.0 million acre-feet was selected. Monthly inflows were obtained by prorating the annual flows on the basis of historical data. For purposes of this study, annual flows of 10.5 million acre-feet were assumed for the following two twelve-month periods.

Since the inflow between Glen Canyon and Lake Mead is about equal to the evaporation from Lake Mead, the releases from Glen Canyon are assumed to be the inflows to Lake Mead. Historical data shows some variation in these two factors; but for purposes of analysis, the error so created would be insignificant.

The monthly releases from Hoover were based on the historical releases for the water years 1961-62, and 1962-63, which averaged about 8.5 million acre-feet. This figure is in agreement with the releases

used in the CRSP payout studies. The use of this figure for study purposes does not mean that the committee necessarily accepts this as the amount of water to which the Lower Basin is entitled. If releases are reduced below the 8.5 million acre-feet per year, the Hoover impairment created by attaining minimum power head at Glen Canyon would be reduced.

The results of the water studies based on the above assumptions are shown in tabular form on the following two pages.

Basically these tables show that the minimum level of Lake Mead of 1084 feet would occur in March, 1965. The tables also show that the maximum impairment would be 192 mw. The impairment would end in June of 1966. The total energy impairment would amount to 421,000 mwh.

Glen Canyon generation could commence in August, 1964, if the published information on the installation of units at Glen Canyon is followed. Since the studies are based on holding Lake Powell to 6.2 million acre-feet (approximately minimum power head) until Lake Mead reaches 14.5 million acre feet, the generation at Glen Canyon would be limited to 70 mw per machine during this period. During the period of the Hoover impairment resulting from operation below 14.5 million acre-feet, the Glen Canyon power plant would generate 2,396,000 mwh.

After Lake Powell reaches minimum power head and if storage is maintained at this level, the Hoover impairment is a direct function of the annual inflow to Lake Powell minus the releases from Lake Mead. In other words, a reduction in Lake Mead releases is approximately equivalent to an increase in inflow at Lake Powell of the same magnitude. A one million acre-foot change is equivalent to an impairment of approximately 50 mw.

The data used to develop capacity and energy values were based on the best information available to the committee at this time. This information is believed to be accurate enough for the purposes of this study and that any minor modification would not affect the overall answer.

(1) Calculated from performance data of output versus elevation.

(2) Calculated from 265 kwh/acre-foot of release or 550 hours use of capacity per month whichever produced the least energy.

PHYSICAL METHOD OF SUPPLYING HOOVER IMPAIRMENT

Power generated at Hoover Plant is transmitted to loads in Southern California, Southern Nevada and Arizona. The recipients of this power are Arizona Power Authority (APA), The Colorado River Commission (Nevada), Metropolitan Water District (MWD), Los Angeles Department of Water and Power (City of L.A.), and Southern California Edison Company including former California Electric Power Company (Edison Company).

If Lake Mead is lowered below 14.5 million acre-feet storage as a result of storing water in Lake Powell, the generators at Hoover operate at a reduced capacity. This reduced capacity or generation impairment affects all Hoover Power Contractors and it must be made up from other sources.

Transmission interconnections will be made this year between the Upper and Lower Basin systems, which will integrate the Pacific Northwest, Rocky Mountain and Pacific Southwest Power Pools. The map on page 12 of this report shows the principal transmission lines of the utilities and the Federal Government that could be used to assist in supplying the impairment capacity and energy to Hoover contractors.

Studies made show that by displacement any anticipated amount of Hoover impairment can be transmitted to the River Plants (Parker, Davis, Hoover) from Arizona (see power flow diagrams on pages 13-16). However, with the existing electrical arrangement of separate busses at Hoover, it is not possible to receive and utilize more than the generation impairment of APA, Nevada and MWD. For this reason and from the standpoint of technical feasibility, the best method of supplying total impairment would be an arrangement whereby the Edison Company would supply its own impairment, with the remainder of the impairment supplied by the transmission system from Arizona. To accomplish this it would be

necessary to shift generation capacity normally connected to Arizona-Nevada (States) system to the City of L.A. system. Such a connection provides for the capacity impairment at Hoover for the City of L.A. and in effect transfers that impairment to the States' system where it can be supplied by existing transmission lines.

Specifically the suggested changes at Hoover to supply the maximum expected impairment of 192 mw are as follows:

1. Units A1 and A2 of the City of L.A. would normally supply as much as 40 mw to the States' 69 kv system. Opening the connection to the States' 69 kv system (Bank Y) would provide 40 mw of impairment capacity for the City of L.A. (See diagrams on pages 17-18).

2. Electrically connect Unit N5 (MWD unit) to the City of L.A. bus and operate this unit in parallel with Units N3 and N4. The City of L.A. impairment under these conditions is 66 mw. Of this amount 40 mw is obtained from Bank Y as described in 1 above. Therefore, only 26 mw will be required from the Unit N5 which has a capacity of 71 mw at this level of impairment. This creates an additional impairment of 45 mw which must be supplied by transmission from Arizona. This arrangement keeps the total generation of the three units within the rating of the step-up transformer.

3. Electrically connect Unit N8 (Nevada unit on States Bus) to the MWD 230 kv bus. This transfer replaces Unit N5 for MWD.

4. Edison Company would supply its own capacity impairment.

The maximum capacity impairment at Hoover would be met as follows:

	Impairment mw	Source of Impairment Supply mw				
		Transfers				Transmission
		N5	N8	Bank Y	Edison	from Arizona
City of L.A.	66	26		40	0	0
Edison	42				42	0
MWD	36	-71	71		0	36
Arizona	24				0	24
Nevada	24		-71	-40	0	135
Total	192	-45*	0	0	42	195

* Unused capacity due to transferring Unit N5 to City of L.A.

The table on page 19 shows by months how the Hoover capacity impairment is supplied, and that Glen Canyon generation could supply the total Hoover impairment by March, 1965. A sequence for the above changes would have to be developed to fit the monthly variations in Hoover impairment. The above-described method outlines a plan to supply Hoover impairment with minimal changes at Hoover.

If it is desired, the total impairment, including Edison Company, can be supplied by transmission from Arizona. This can be accomplished by supplying the City of L.A.'s impairment at Hoover as described above and making an electrical interconnection at Hoover between the Edison Company and States' 230 kv bus. This connection increases the transmission capacity between Arizona and Southern California making it possible to supply the impairment of Edison Company and MWD from the Arizona system. Under these conditions the entire impairment of MWD plus the loss of Unit N5 capacity could be supplied from the transmission system. (See page 20).

These changes make it necessary to install metering equipment for energy accounting and load control and possibly other minor modifications such as protective relay changes.

CHANGES AT HOOVER TO SUPPLY TOTAL IMPAIRMENT

ATTACHMENTS

Copy of a letter from the
UPPER COLORADO RIVER COMMISSION

March 27, 1964

Mr. Robert T. Person
President
Public Service Company of Colorado
P. O. Box 840
Denver, Colorado

Dear Mr. Person:

The recent action of the Secretary of the Interior ordering the release of water stored in Lake Powell at a rate that will maintain storage in Lake Mead at a minimum of 14.5 million acre-feet pending a final decision dependent upon stream runoff during the next two months makes it imperative that the Upper Basin States find a way to save this water.

Governor Clyde in his letter of March 2, 1964 to the electric utilities in the area stated that the problem appears to be one "concerning the availability of electrical energy, generation capacity and transmission facilities that would be necessary to replace the power that would be curtailed at Hoover Dam by withholding the water in Lake Powell." In answer to Governor Clyde's letter, your Company and others indicated that they were willing and able to be of substantial aid in solving this problem.

The Secretary of the Interior in his answer to a letter of March 17th from the Governors of the four Upper Basin States said that although there had been newspaper stories concerning an offer by Upper Basin utilities to supply replacement power, his Department had received no proposals with the necessary data, such as, rates and the means the utilities would use to deliver the power to the Lower Basin, particularly California. He also said that it will be necessary to have these data immediately, if a proposal is to be considered when the water situation is reviewed and a final decision reached concerning a course of action on operation of the river in this critical water year.

We believe that because water is now being released at a rapid rate from Lake Powell, the situation has become even more urgent, and there must be an immediate solution, if the minimum

power pool in Lake Powell is to be filled in 1964. The utilities' letter of March 10th to Governor Clyde indicated that the various companies started immediately to make engineering and power supply studies pertaining to this problem.

We have also noted in the Secretary's reply to our four Governors that he seems to be concerned about the availability of federal funds for any major interim purchase of power because funds are not now included in the President's budget for that purpose.

After reviewing the overall problem we would like to know if your Company, in cooperation with other electrical utilities in the area, can and will make available the necessary capacity and energy to supply the deficiency in generation at Hoover Dam created by lowering Lake Mead below 14.5 million acre-feet while accumulating the minimum power head at Glen Canyon Dam under an arrangement similar to the following:

(a) The Companies' obligation to extend to the supplying of the generation deficiency at Hoover created by filling Lake Powell to its minimum power head and to terminate when Lake Mead reaches 14.5 million acre-feet, or at such time as power generation at Glen Canyon Dam is equal to the deficiency so created at Hoover; and

(b) any energy generated at Glen Canyon Dam following creation of minimum power head to be used first to supply the deficiency at Hoover, described above, with the utilities providing the balance; and

(c) the capacity and energy supplied by the companies to be returned in kind by the Colorado River Storage Project at a time agreeable to the companies upon appropriate notice and under conditions to be agreed upon with the Secretary of the Interior; and

(d) the amount of energy to be returned under (c) to be increased over the amount delivered by a fixed

percent per year as compensation to the companies for the cost of money associated with the "banked" energy.

In addition to meeting the concern of the Secretary with regard to the availability of federal cash, we have suggested the above method of repayment because we feel that it results in both a practicable and acceptable means of repaying the companies for their services while at the same time maintaining an optimum financial position for the CRSP. This suggestion, however, certainly does not preclude other methods of repayment, if such methods can be satisfactorily negotiated by the parties concerned.

We have heard considerable argument to the effect that although the utilities may have the necessary capacity and energy available, the means may be lacking for the transmission of energy to the power users in the Lower Colorado River Basin. Have your engineers or those of your associated utilities studies the feasibility of delivery of power to the Hoover power contractors? Do you know of any physical limitations to accomplishing this phase of the job?

If the capacity and energy "exchange" conditions generally outlined in (a) and (d) above would be satisfactory to your Company, and if you know of no physical limitations to the delivery of power to the Lower Basin users, will you please inform us at the earliest possible date of your willingness to negotiate with the Secretary of the Interior on the basis outlined herein.

Sincerely yours,

/s/ IVAL V. GOSLIN
Ival V. Goslin
Executive Director

IVG:hiw

Identical letters to presidents of Arizona Public Service Company, Utah Power & Light Company, Pacific Power and Light Company, Public Service Company of New Mexico and Idaho Power Company.

(10:00 o'clock a.m., Wednesday, April 15, 1964, Room 132 State Services Building, Denver, Colorado. All Commissioners present.)

THE CHAIRMAN: This session will resume. It is my pleasure to introduce to you now the Governor of Wyoming. (Applause.)

If you have anything to say, you have a chance to say it.

GOVERNOR HANSEN: I don't have at this time, thank you, sir.

THE CHAIRMAN: There has been some very clumsy introducing from this Chair, and I want you all to know the group that is representing the Bureau of Reclamation and the Interior Department this morning. And so there will be no mistakes made, I am asking my friend, Frank Clinton, to introduce them.

MR. CLINTON: Thank you, Mr. Chairman. I will start with our Assistant Commissioner, Buz Bennett. I think you all know him.

(Applause following each introduction.)

We have with us the Deputy Solicitor from the Department of the Interior from Washington, Eddie Weinberg.

Our Regional Director from Region 3 at Boulder City, Arleigh West. He has with him Paul Oliver, head of his River Control Division. And also By Miller, Power Division.

We have from the Denver office Wade Taylor of the Power Division. Art Mitchell from Randy Riter's Planning Division.

We have a Wyomingite here somewhere, Val Killin.

I think that is all we have here. I am passing up one, Mr. Chairman.

THE CHAIRMAN: I reserve the privilege of introducing the Commissioner, whose position I know positively. Commissioner Dominy. (Applause.)

MR. SPARKS: Mr. Chairman, I have here a letter submitted to the Secretary of the Interior by the Honorable Wayne N. Aspinall, our Congressman and Chairman of the Interior and Insular Affairs Committee of the House of Representatives, dated March 30, 1964.

I would like to read this letter and then commend it to the Commission for possible inclusion in the record of this proceeding. If you would permit me, I would like to read the letter.

"March 30, 1964

Dear Mr. Secretary:

In view of the situation we now find ourselves in with respect to the filling of Lake Powell, I believe it is imperative that we have a complete and detailed accounting with respect to all water releases from Lake Mead and water deliveries below Hoover Dam over the last 24 months. I would like to have this information at the earliest possible date.

The information furnished should show the release schedules from Hoover for the entire 24-month period in as great a detail as is available and the precise purpose or purposes for which the water was released. A recapitulation should show the total amounts released for each purpose including the 280,000 acre-feet released to Mexico (outside the Treaty) in the final months of 1962, the amounts released for meeting the various water contracts on a contract-by-contract basis and the amount and timing of releases for power production only.

With respect to deliveries, the information should include a complete listing of water contracts, the contract requirements with respect to deliveries, and the amounts and timing of deliveries under each of the contracts during the 24-month period, with a brief statement on the method and responsibility for measurement.

I would also like to have an estimate of the amounts of water diverted illegally from the River and a discussion of actions that are being taken to prevent these illegal operations.

In connection with water deliveries under the contracts, I would like to know the extent of the oversight responsibilities of the Bureau of Reclamation with respect to such matters as ultimate use of the water and a determination as to whether water is used excessively or is otherwise wasted. Over the last 24 months, what is the estimated amount of water included in the categories of excess use, waste, and illegal diversions from the River?

I would like to have the Department's position with respect to withholding water, under the Colorado River Compact and the water contracts, which it determines to be unnecessary or which may be wasted, if such water could be effectively used in other parts of the Basin. In view of the present water situation, does the Department have any plans at this time for saving water by reducing overuse and waste and preventing illegal diversions?

Again, I stress the importance of compiling this information and the need for furnishing it at an early date.

With best personal regards.

Sincerely,

Wayne N. Aspinall
Chairman

Honorable Stewart L. Udall
Secretary of the Interior
Department of the Interior
Washington, D. C."

MR. SPARKS: Mr. Chairman, it is my understanding that under date of April 13th, 1964, a reply to this letter was forwarded to Congressman Aspinall signed by Mr. Kenneth Holum, Assistant Secretary of the Interior. This reply was rather voluminous and contains numerous appendices in explanation of the basic reply letter.

This letter has been forwarded, I understand, to the Executive Director of the Commission, Mr. Ival Goslin, and he has it in his possession. I would also commend to the Commission that the reply to Congressman Aspinall be made a part of the record of this proceeding.

I have had only a brief opportunity this morning to examine the contents of the letter submitted in reply to the Congressman's inquiries. From what I saw, it was a forthright discussion of the problems and did present a picture of various attempts to solve the many problems of which we were so highly critical. The letter is full of good intentions; and if those good intentions are carried out, it is very possible that many of the questions would be resolved that were discussed yesterday.

I might add that we in Colorado have been concerned for some years now with the operation of the Committee of Fourteen. One of the points

specifically raised in the recommendations of the Legal Committee yesterday was that we felt that the so-called regulatory waste below Hoover Dam must be decreased. It is, of course, impossible to eliminate all of such waste, and we are hopeful that the Committee of Fourteen would come up with some solution to the salinity problem.

In the first instance there were three obvious solutions it seemed to us here in Colorado. One was to stop the pumping from the Wellton-Mohawk Project in Arizona. Two was to bypass the saline water which is being extracted from the aquifer there, bypassing Morelos Dam.

The other solution which was imposed upon us and was not of our will, was to dilute that water by deliveries from Hoover, and, thusly, from Glen Canyon. The third solution was imposed upon the Upper Basin without its consent.

I think there is a short report forthcoming from the Committee of Fourteen.

At least from Colorado's, and I think from the Commission's viewpoint, two years have been almost wasted in dawdling with this problem, and we are getting a little impatient of solutions which are obviously apparent. We in Colorado, and I am sure the Commission, wish to make every attempt to preserve the integrity of the Wellton-Mohawk Project in Arizona, but not at the expense of the Upper Basin States.

Mr. Chairman, I submit this letter.

UNITED STATES
DEPARTMENT OF THE INTERIOR
OFFICE OF THE SECRETARY
Washington 25, D. C.

April 13, 1964

Dear Mr. Chairman:

This will respond to your letter of March 30, 1964. We share your concern over the continuing water shortage in the Colorado River Basin and the increasing demands on the river water. Accordingly, we are continuing to tighten up administration of water service contracts, to develop practices which will conserve water, and to propose measures which will prevent water losses. The steps we have taken in this regard are summarized later in this letter.

You have asked for a complete and detailed accounting with respect to all releases from Lake Mead and water deliveries below Hoover Dam over the last 24 months. This basic information is contained in the following enclosures:

(1) Water Logs of the Colorado River (Provisional Records), for calendar years 1962 and 1963.

(2) Table 1 - "Colorado River Flows and Diversions, 1962 and 1963."

(3) Table 2 - "Principal Lower Colorado River System Hydrographic Stations."

(4) Table 3 - "Diversion of Colorado River Water at Imperial Dam, Arizona Side, 1962 and 1963."

(5) Table 4 - "Diversion of Colorado River Water at Imperial Dam, California Side, 1962 and 1963."

(6) Table 5 - "Listing of Contractors Receiving Colorado River Water below Hoover Dam, 1963," including Form 7-322 - "Monthly Water Distribution Record on Reclamation Projects," for 1962 and 1963.

(7) Statement - "Illegal Diversion of Water from Colorado River to Federal, Private, and State Lands," including tables I, II, and III

The Water Logs of the Colorado River show diversions to other water users exclusive of permittees and illegal users. They also show cumulative return flows

Table 1 shows the water released from Hoover Dam in 1962 and 1963 and follows it down the river showing losses, diversions, returns, and ultimate delivery to Mexico.

No water has been released from Lower Colorado River powerplants then or now, for power production only. Power is generated only when water is released to meet downstream requirements.

As you are aware, our basic regulatory structure for the Lower Colorado River is Hoover Dam. That Dam is located 300 miles upstream from points of diversion for the Yuma Projects, Imperial and Coachella Districts, and treaty delivery to Mexico. It is extremely difficult, if not impossible, to control releases from Hoover so as to meet precisely requirements so far downstream. Even from Parker Dam, the lowest regulatory structure, it takes 72 hours for water to reach Imperial Dam. The vagaries of weather, bank storage, and winds are largely unpredictable and necessarily affect water deliveries through the river channel.

Illegal diversions present a further complication. Contract water users, ordering water days ahead from a distant point, simply do not order water with the same efficiency that they could achieve if the storage was immediately adjacent to their projects. These difficulties lead to the wasting of water and increase our problem of providing water to meet the delivery schedule to Mexico. Senator Wash Regulating Reservoir, now under construction approximately two miles above Imperial Dam on the California side of the river, will allow much closer regulation of river deliveries, and relieve this problem in part. It could be further relieved by the installation of ground water recovery facilities in the Yuma area. However, the State Department has advised that under the Mexican Water Treaty of 1944, consultation with Mexico is necessary prior to proceeding with such a program and the Mexican Government has expressed its concern regarding it.

Total amounts of water released from Lake Mead for the various purposes may be recapitulated as follows:

Purpose	Amount (acre-feet) 1962	1963
Irrigation and Domestic Purposes (United States)	6,136,878	6,203,915
Mexican Treaty Requirements	1,500,000	1,500,000
River Regulation and Sluicing	181,590	86,050
Reservoir and River Losses	481,642	473,782
Uncontrollable Flows (reject orders, vagaries of weather, etc.)	299,890	422,253
Reservoir Storage Change	+15,000	-153,000
TOTAL	8,615,000	8,533,000

You refer to "280,000 acre-feet released to Mexico (outside the Treaty) in the final months of 1962." The figures in the above tabulation of 181,590 acre-feet in 1962 and 86,050 acre-feet in 1963 represent releases for sluicing purposes during the October 1962 - February 1963 period. As set forth in the hearing before the Subcommittee on Irrigation and Reclamation of the Senate Interior and Insular Affairs Committee on June 7, 1962, releases in the amount of 280,000 acre-feet were planned to reduce a critical sediment aggradation problem on the Lower Colorado River below Imperial and Morelos Dam. The quantity of water actually released was 267,640 acre-feet which had been captured as a result of impingement upon the flood control regulations at Hoover in April 1962 and represented water that otherwise would have been released for flood control. These flows naturally served as an ancillary benefit to Mexico.

You have asked for a listing of water contracts, delivery requirements thereunder, and amounts and timing of deliveries under each contract, with a statement on the method and responsibility of measurement. These are provided as described below:

Table 2 lists the principal hydrographic stations, and describes their location, type of device used, and name of responsible agent.

Table 3 shows the delivery to the several contract water users of water diverted at Imperial Dam to the Gila Gravity Main Canal.

Table 4 provides similar information for water diverted at Imperial Dam into the All-American Canal.

Table 5 lists the principal contract water users. Their contracts do not specify delivery entitlements in acre-foot quantities. Rather they provide for delivery of water in such amounts as may be reasonably required by the water user (see Art. 17 of contract dated 12/1/32 between the United States and Imperial Irrigation District, p. 75 in "Hoover Dam Power and Water Contracts," Boulder Canyon Project Final Reports).

The Monthly Water Distribution Records (Form #7-322) included as a part of Table 5 show water diverted at Imperial Dam for each of the principal water-user organizations on Bureau of Reclamation projects. They show the disposition of water from the main delivery point of each organization through its canals and laterals, to final farm delivery. Return flows from each project or district are not shown.

You have asked for an estimate of the amounts of water diverted illegally from the river and a discussion of actions taken to prevent these illegal operations. The narrative statement entitled "Illegal Diversion of Water from Colorado River to Federal, Private, and State Lands" describes in detail illegal diversions, diversions under the Lower Colorado River Land Use Permit Program, and illegal occupancy of Federal Lands. In several cases, the threat of legal action has halted illegal diversions or trespass. Generally, illegal diversions by those owning private lands can only be stopped by a court-obtained injunction. Illegal diversions by trespassers can also be halted by evicting them from the land. The Langendorf case (a trespass case) is now in the Courts. The Milpitas Cattle Company case (an illegal diversion case) has also been referred to the Department of Justice, but its filing in court was delayed pending the handing down by the Supreme Court of its final decree in Arizona v. California. We are advised that the filing will be made shortly.

Within the last few months we have met in Los Angeles with representatives of the United States Attorneys' offices of both Arizona and Southern California in preparation for the processing of a number of these cases of both types. Eight cases are now in the office of our Regional Solicitor in Los Angeles receiving final preparation for referral to Justice. Thirty more cases are now in various stages of preparation in the Land Use Office in Yuma. Before this referral we propose to meet again with the appropriate Department of Justice personnel. That meeting is scheduled to take place in Washington, D. C. soon. You will appreciate that, apart from problems of land ownership which may be very troublesome, there are difficult evidentiary problems (particularly where the diversion is from wells). Thus it may not be easy to show that a particular well is pumping water from the river.

Permits issued to trespassers upon Federal lands under the Land Use Permit Program allow certain uses of water on the permitted lands. The program closed on October 15, 1963, and no permits have been issued since that date. The permits contain a 30-day water-use cancellation provision. We believe this program to be a valuable solution to a difficult problem on the river (it is the first effective solution reached in 50 years of trespass along the river) and, therefore, believe it should continue along present lines. However, we have the problem under continued study.

Where permittees have substantially violated the terms of their permits, as by failure to make their required payments, they will be treated as trespassers and eviction sought. Such cases are also being prepared for referral to Justice for appropriate litigation action.

You have asked regarding the extent of the responsibility of the Bureau of Reclamation for the ultimate use of the water so as to control excess use and waste.

Under the Supreme Court decision in Arizona v. California the Secretary is ultimately responsible for the management of the Lower Colorado River. We are convinced that there is excess use and waste of Colorado River water. The Bureau of Reclamation is now investigating the extent of such excess use and waste, in order to find ways to reduce the losses. Promising possibilities for water conservation include improvement in on-farm irrigation practices, lining or piping distribution systems, lining or treating major canals, recovering farm runoff water and ground water for use and re-use, etc. Some of these primarily require changes in irrigation practices. Some require the expenditure of sizable sums of money. Many of these approaches are included in the proposed Southwest Water Plan.

We have already formally warned all contract users of the current water shortage and asked that they conserve water. We propose to continue an active program of soliciting voluntary cooperation action in water conservation, together with the other measures described herein.

The water-use contracts limit the users to water which they reasonably require for potable and irrigation purposes (see previous reference - Art. 17 of Imperial Irrigation District contract).

The contracts also allow the Secretary to prescribe regulations for the diversion and delivery of water. We are now engaged in the preparation of such regulations. Preliminary drafts to serve as a basis for consultation with the water users involved should be ready within the next month or so. We hope that they will help us to bring wasteful practices under control.

These regulations will be preliminary to still wider and more all-embracing regulations which we propose to promulgate under the authority of the Boulder Canyon Act as interpreted by the Supreme Court in Arizona v. California. The importance of such regulations requires both their careful preparation and an opportunity for public review. We anticipate that this process will require at least six months.

In summary, this Department will exercise to its utmost all the authority and responsibility it possesses to prevent the waste of water which can be effectively used elsewhere.

Sincerely yours,

(sgd) Kenneth Holum

Assistant Secretary of the Interior

Hon. Wayne N. Aspinall, Chairman
Committee on Interior and Insular Affairs
House of Representatives
Washington, D.C.
Enclosures

1/ Difference between total diversions at Station 60 and deliveries to contractors and to Mexico represent main canal losses.
2/ Includes 7,929 acre-feet delivered to City of Yuma.
3/ Includes 8,055 acre-feet delivered to City of Yuma.

Table 5

Listing of Contractors Receiving Colorado River Water Below Hoover Dam, 1963

California Contractors

Metropolitan Water District of Southern California

San Diego County Water Authority

Palo Verde Irrigation District

Imperial Irrigation District, All-American Canal

Coachella Valley County Water District, All-American Canal

Reservation Division, Yuma Project (Individual water-right applicants and Bureau of Indian Affairs)

In general, water deliveries to these California users are made within the framework of the amounts and with priorities in accordance with the recommendation of the Chief of the Division of Water Resources of the State of California (subject to availability thereof for use in California under the Colorado River Compact and the Boulder Canyon Project Act). Said water is delivered as ordered by the contractor, insofar as reasonable diligence will permit.

Arizona Contractors

Colorado River Indian Reservation (Contract not required)

Yuma County Water Users' Association, Valley Division, Yuma Project

Unit B Irrigation and Drainage District, Yuma Auxiliary Project

Wellton-Mohawk Irrigation and Drainage District, Gila Project

North Gila Valley Irrigation District, Gila Project

Yuma Mesa Irrigation and Drainage District, Gila Project 1/

Yuma Irrigation District, Gila Project 2/

Warren Act Contractors, Gila Project (14 contractors)

These contracts generally provide for water facilities on a capacity basis, with water deliveries to be in such amounts as may be reasonably required and beneficially used.

1/ A number of miscellaneous water contractors obtain small quantities of water for special purposes through the Yuma Mesa Irrigation and Drainage District's system.

2/ No surface water deliveries to this District until 1-1-65. Distribution system now under construction.

GPO 840934

ILLEGAL DIVERSION OF WATER FROM COLORADO RIVER TO FEDERAL, PRIVATE, AND STATE LANDS

April 8, 1964

Summary

There are 15,785 acres of Federal lands being farmed in the flood plain along the Colorado River, of which 5,544 acres, or about 35 percent, is covered by land use permits. Of the total acreage, 5,102 acres receive water from irrigation districts, 7,153 acres are served from pumps taking water directly from the Colorado River, and 3,530 acres are served from wells. In addition, there are 10,900 acres of private and State lands being irrigated without benefit of contracts therefor with the Secretary of the Interior, i.e., 6,740 acres served by pumps in the river, and 4,160 acres irrigated from wells. A conservative average of water diversion is six acre-feet of water pumped from the river or drawn from the underground to irrigate each acre of land. The consumptive use of water by the crops being raised would be less, probably slightly more than four acre-feet per irrigated acre. Based on six acre-feet measured at the pumps or wells, there would be more than 100,000 acre-feet of water used on Federal lands of which only slightly over 21,000 acre-feet is pumped from wells. To irrigate private and State lands over 38,000 acre-feet of water is pumped from the river and nearly 25,000 acre-feet is taken from wells.

Combining these figures, it is apparent that over 160,000 acre-feet of water is diverted to Federal, private, and State lands, of which amount 117,000 acre-feet is pumped directly from the river or served to the land through facilities of an irrigation district. In addition, about 1,000 acre-feet is pumped or lifted from wells for use by over 500 commercial, residential or recreational developments on Federal, private, and State lands along the Colorado River. The small amount of water used by these entities is not considered significant.

General Comments

Illegal occupancy of Federal lands along the Colorado River from Davis Dam to the international boundary and use of water on these and private lands has been a continually growing problem since immediately preceding World War II. The acreage of bottomlands along the river farmed since 1955 is shown in the enclosed Table I.

Irrigation water to serve the farmlands, for most part lands lying outside of organized irrigation districts, has been developed by the trespasser or owner of the private lands either by digging a well or placing a pump directly in the Colorado River or in a slough or backwater area fed from the river. There is little doubt that the ground water is Colorado River water or in any case the

recharge of the underground is directly from the river. The source of water used to irrigate the Federal, private and State lands, and quantity of water diverted to each ownership category is as shown on the enclosed Table II.

In May 1959, a concerted effort was undertaken by the Department of the Interior to evict illegal occupants on Federal lands who were using water without a contract as required by the Boulder Canyon Project Act. Five initial instances of clearly illegal occupancy of Federal lands and use of Colorado River water were filed with the courts.

In April 1961, the Lower Colorado River Land Use Office was established for the purpose of regularizing use of the Federal lands by the 800 or more trespassers. The permit covering agricultural lands states the following with regard to water:

> "12 (a) In the event that the applicant diverts or pumps Colorado River water in connection with the enjoyment of the permit area such diversion or pumping by applicant during the term of this permit or any extension thereof shall be for essential beneficial use only and shall cease upon and as provided by 30 days' written notice to applicant from the Secretary of the Interior or the officer issuing the permit that Colorado River water is no longer available for use within the permit area. In the event that such notice is given, applicant may terminate this permit.
>
> (b) If the applicant diverts or pumps Colorado river water for agricultural use, applicant shall give advance notice of the daily water requirements for each period of seven (7) consecutive days beginning Monday of each week. Such notice shall be given not later than the Wednesday preceding such Monday to the official of the Bureau of Reclamation designated for that purpose by the officer issuing the permit. Quantities specified in such notice may be modified with the approval of the Bureau of Reclamation. Such notice shall be in the form prescribed by the Bureau of Reclamation, and applicant shall keep such records of water use as may be required by the Bureau of Reclamation."

The permit is silent concerning water taken from wells to serve Federal lands.

On December 31, 1963, the Land Use Office had entered into permits covering most of the residential and commercial areas and 73 permits covering 5,544 acres of irrigated Federal land on about 35 percent of the total Federal land being farmed. The breakdown of Federal land being farmed by States and acreage under permit is shown in the enclosed Table III.

A concerted effort was made by this Department during the Fall of 1963 to initiate legal action to stop the installation of a large-sized pump in the Colorado River to serve private lands then being leveled and developed. The recommendation of the Department of Justice was that institution of action on this case be withheld pending issuance of the decree in Arizona v. California, et al., which was then being prepared. The decree was issued March 9, 1964, and shortly thereafter, the Department of the Interior again requested the Department of Justice to file action to prevent further diversion of Colorado River water by the party under consideration in 1963.

It follows that additional actions should be initiated to curb direct pumping of water from the river to private lands and to Federal lands not under Land Use Office permits. Curbing the use of water taken from underground to irrigate private lands poses complex legal and enforcement problems. Stopping the use of water from wells on Federal lands not under permit can be accomplished by eviction of the trespassers.

TABLE I

FEDERAL AND PRIVATE LAND USE - 1955 - 1963

DAVIS DAM TO INTERNATIONAL BOUNDARY

	1955	1957	1958	1963

MR. KUIPER: In regard to the Committee of Fourteen, there are five states here represented at a meeting which was held yesterday evening and this morning. The conclusion we reached was that we should have an early meeting, which we hope to have the latter part of next week or the second full week of May to be brought up to date on developments in the area.

There has been some tile drainage, there have been some additional pumps installed down there. We don't know what the results of the pumps have been. We hope to have this information available to us so that the full Committee of Fourteen, representing all seven of the Colorado River Basin States, can come to arrive at some definitive action which will solve this. And we would hope to be able to report this to the Commission at the special meeting which was directed to be called yesterday. We will bend all our efforts to have a full report for the Commission at that time.

THE CHAIRMAN: Thank you. Through yesterday and early this morning a number of questions have been directed toward the Bureau and the Department. It is time for answers. The Commissioner, Mr. Dominy, is given the floor to present everything that he wants to present.

MR. DOMINY: If it pleases the Commission, I will move up here to the end of the table. (Document distributed).

Mr. Chairman, members of the Upper Colorado River Commission, ladies and gentlemen: It is of course a privilege and a pleasure for the Commissioner of Reclamation to be here and I appreciate your making yourselves available in an extra day at this session to permit me to come with appropriate members of my staff and with the Deputy Solicitor of the Department to be accountable to you for the stewardship of the Colorado River, which is recognized by all to be a legitimate and continuing all-important concern to you and the states that you represent.

So much information, misinformation and gratuitous comment have been circulating in the Upper Colorado River Basin States in recent weeks concerning filling operations at Lake Powell that I certainly welcome this opportunity to meet with the Upper Colorado River Commission.

Between us, we may be able to set the record straight and achieve a greater public understanding of the necessity for our actions. We have sought to explain this in our letter to the Governors of the Upper Basin States announcing the stepup in releases from Lake Powell and in public statements, but for some reason, many important details were ignored or pushed aside as critics of our operation rushed into print.

Let me say that Secretary of the Interior Stewart Udall and the Commissioner of Reclamation have a united objective to provide the fairest and most objective treatment possible to both the Upper and Lower Basin States during the filling of Lake Powell. This filling has been made most critical by the coincidence of two years of extreme drouth conditions.

I may say parenthetically that the Upper Colorado River Storage Project was designed to remedy just such a situation as we are now confronted with. If Lake Powell had been filled to normal operating level prior to these two years of consecutive drouth condition, the problem of river operation would have been simplified in these years of drouth, even beyond that which had existed if Glen Canyon Dam had not been built and were not on the river. Without Lake Powell storage, it is entirely possible that in periods such as this the Upper Basin would not have been able to deplete the river for the uses contemplated by the construction of the Colorado River Storage Project participating projects.

It must be recognized that neither Secretary Udall nor the Commissioner of Reclamation are free agents in the operation of the Colorado River. We are governed by the "law of the river" which includes among other things, a specific direction that the Upper Colorado River Storage Project is subject to the Colorado River Compact and to the Boulder Canyon Project Act.

Finally, by way of preface, let me reiterate my statement which has repeatedly been ignored that there has not yet been a final decision on filling operations for this year. If one could judge from comments, it was foregone conclusion that we are immediately going to drain Lake Powell dry. Now when Secretary Udall made the tentative decision--and I repeat--the tentative decision on March 26 to follow the filling criteria, the filling criteria that had been discussed for years and was announced by the Department long ago, on an interim basis so as to maintain rated head at Hoover powerplant, he simultaneously directed the Bureau of Reclamation to keep the runoff situation above Lake Powell under continuing re-examination. You can be certain that Secretary Udall will begin storing water in Lake Powell and undertake a power purchase program at Hoover Dam whenever runoff forecasts make such a decision economically possible. In regard to this latter possibility, the Bureau started in mid-February to explore with power suppliers in the Lower Basin the availability of replacement power for Hoover.

The normal precipitation registered during March is a big step toward that hoped for runoff. But it will require at least normal precipitation during April and May as well as during June and July, together with normal runoff conditions, to achieve this total. The normal precipitation during March did postpone into May the "point of no return" when we must make an irrevocable decision on this year's operations. Thus a final decision may be expected

when the May forecast of moisture in the Colorado drainage basin is available. In the meantime we will continue to investigate possible avenues for power purchase including the much publicized but until yesterday undocumented offer of the Upper Basin States' utilities.

With this preface, I would like to make the following comments concerning particular points of controversy:

DELIVERIES OF WATER TO MEXICO

During 1961, we limited Mexico's scheduling of Colorado River water deliveries to the guaranteed annual quantity of 1,500,000 acre-feet provided for in Article 10 (c) of the 1944 Treaty. We insisted upon this same limit in 1962, 1963, and again in 1964. However, there is always some variance between scheduled and actual water deliveries because of many factors, most of which are out of our control.

In 1963, an overdelivery of 503,890 acre-feet occurred to Mexico. Of this, 86,050 acre-feet were river regulation water released in January and February of 1963, and 68,000 acre-feet resulted from storm runoff below Imperial Dam between September 17-25, 1962, leaving a net overdelivery of 349,840 acre-feet caused by physical inability to completely control the river flow. This compares to overdeliveries of 258,700 acre-feet in 1961 and 295,440 acre-feet in 1962. Keep in mind, gentlemen, that we have a 72-hour uncontrolled period in releases of water out of Lake Mead and Parker Dam to meet downstream commitments, and that frequently the vagaries of Nature provides excess water at the boundary that we have no control over. We have never been able to hold our deliveries to Mexico precisely in accord with scheduled deliveries for that reason. We expect to bring these deliveries closer to schedule when the Senator Wash Dam and Reservoir, now under construction upstream from Imperial Dam, is completed, as we will explain further in this statement.

ADJUSTMENT OF FLOOD CONTROL CRITERIA TO CONSERVE WATER

To conserve the maximum amount of water in 1962, a year of good runoff, we reached an agreement with the Corps of Engineers to infringe on flood control space in Lake Mead to hold back an additional million acre-feet of water. An additional 370,000 acre-feet of water were subsequently stored and 267,640 acre-feet of that released between October 1962 and March 1963, as river regulation flow below Imperial Dam to scour a channel in that aggraded reach where phreatophytes were beginning to consume large quantities of water and Mexico was able to gain ancillary benefits from this release during that period by the resulting lowered salinity of water delivered under the Treaty. Details of the operation were fully discussed in hearings June 7, 1962, before the Senate Interior and Insular Affairs Committee and were public.

CUTBACK OF POWER GENERATION

Despite the opinions expressed by representatives of the power allottees at Hoover Dam that sufficient water should be available for generation of firm energy during the 1962-1963 year of operation, Regional Director A. B. West of the Bureau, and with my backing, held that only sufficient "water be made available at least sufficient to meet downstream requirements." It is a matter of record that water for downstream irrigation and domestic requirements only were released from Lake Mead in that year in anticipation of the needs to start filling operations at Lake Powell the following year and the same condition has since applied. No water has been released at Hoover Dam solely for power production since 1960. Starting with the runoff year 1961 there have been no releases of water at Lake Mead through the Hoover generators except water that was scheduled for downstream diversion.

WATER SALVAGE ON LOWER COLORADO RIVER

Channelization of the Colorado River from Topock Gorge to Big Bend has resulted in an annual water salvage of over 65,000 acre-feet. The printed copies distributed to you say 130,000 acre-feet; that is in error. It has been 65,000 acre-feet but an additional salvage of 190,000 acre-feet will result from the total channelization program which is being carried on; and when that is completed, we will not have just 65,000 acre-feet a year, we will have 65,000 plus 190,000 of salvage saved as a result of this non-reimbursable channelization program that is being carried on.

Since early 1960 the Bureau has had an approved plan for the rectification of 16 miles of badly braided river channel in the Cibola Valley that would result in an estimated additional annual salvage of 36,000 acre-feet of water. Work has been delayed until early this year by Congressional Committees pending agreement between the States of Arizona and California on their common boundary.

As mentioned above, up to 285,000 acre-feet annually of additional water salvage will be possible by operation of Senator Wash Dam and Reservoir, an offstream facility which we now have under construction at a site only two miles upstream from Imperial Dam. The reservoir, in a strategic offstream site, will be used for the storage of excess water reaching Imperial Reservoir, including minor floods, for later release as required to satisfy irrigation requirements. As pointed out previously, in our best years of operation at Imperial Dam, we have seldom been able to regulate flows reaching Imperial so that less than 300,000 acre-feet of water in excess of Mexico's scheduled annual requirement reached the International Boundary. We anticipate much closer and much more accurate downstream deliveries when Senator Wash Dam is completed. It will take two years to construct it so we have the runoff year of 1964 and the runoff year of 1965 before that facility will be available to us.

All of you people who are interested and have some knowledge of irrigation operations on a river system know that if you have a 72-hour delay from the time you release water under scheduled deliveries before it reaches the final diversion point, that you don't have a very good control, and we haven't had a good control of the Colorado River. We have needed this Senator Wash Dam for years. But until the Arizona-California suit was of record and the law of the river decided, and until we had all of these things working for us, it was impossible to get Congress to appropriate the kind of money needed, some $26,000,000, to build the Senator Wash regulating reservoir, but now it is under construction.

NEED OF CONSERVING WATER IN LOWER BASIN

Since issuance of the decree in Arizona versus California by the Supreme Court less than six weeks ago, we have given high priority to a determination of overall operating criteria to be followed in river operations under the decree.

On August 14, 1962, Regional Director West wrote all contractors of Colorado River water calling attention to the potential critical situation and urging a reduction in water requirements where possible. This has not been too successful, but since issuance of the decree the extent and requirements for uses of water all along the river have been and are presently under scrutiny to develop plans for reduced delivery schedules to irrigation and domestic users conforming with reasonable use provisions of the Lower Basin water contracts.

ILLEGAL DIVERSIONS

Reclamation has not been unaware of the problem of illegal use of water along the Colorado River. The decree in Arizona versus California has also strengthened the Secretary of the Interior's authority to enjoin use of river water without a contract.

There is some popular belief that illegal diversions can be halted simply by moving illegal occupants from the land or by shutting off their water supply through the medium of warrants served by a United States Marshal. Unfortunately it is not that simple, as I have learned to my sorrow.

In some cases the threat of legal action has halted illegal diversion or trespass but generally illegal diversion by those owning private lands can only be stopped by a court obtained injunction. Illegal diversions by trespassers can also be halted by evicting them from the land.

A trespass case is now in the courts and has been there for about five years. A recently instituted illegal diversion case has also been referred to

the Department of Justice, but its filing in court was delayed pending the final decree in Arizona versus California. Within the last few months we have met in Los Angeles with representatives of the United States Attorney's offices of both Arizona and Southern California in anticipation of processing a number of these cases of both types. Approximately eight trespass cases are now in the office of our Regional Solicitor in Los Angeles in final preparation for referral to Justice. Thirty more cases are in various stages of preparation in the Land Use office at Yuma, Arizona.

I might say parenthetically that as near as we can compute the total net depletion from these illegal diversions, it runs in the neighborhood of 100 to 125 thousand acre-feet annually.

FISHERY AND RECREATION RESOURCES AT LAKE POWELL

As with most Reclamation projects Lake Powell has created an outstanding fishery and outstanding recreation resource which outdoor sportsmen, in which I include myself, have taken great pride. I must nevertheless point out that these ancillary benefits are secondary to the primary purposes of the water for consumptive uses.

But I will also hasten to point out that the expressions of alarm over total draining of Lake Powell have been completely unfounded. Only under the most critical drouth conditions could this occur, and I mean another year beyond 1964 of drouth, and the normal precipitation during March has virtually eliminated this possibility for the current year at least. Even under the poor forecast conditions as they exist today, if we are not able to resume storage in Lake Powell, there will be a pool of more than 2,000,000 acre-feet of water during the summer. Within this same forecast we do not foresee any condition requiring a drawdown of Lake Powell below 400,000 acre-feet as a minimum, and even this should provide a lake 100 feet deep at the dam and extending 50 miles upstream. This would occur, if at all, in the late fall and winter when temperatures would be low enough to maintain the trout fishery.

Of course, if we have another minimum water year in 1965, the lake could well be drained. That is one of the exigencies we must face. On the other hand, as I have stated, if our early May runoff forecast shows normal precipitation in April and an April-July runoff of 4,700,000 acre-feet or better, we can carefully consider and, I for one fervently hope, undertake a power purchase program which will solve our immediate filling problems at Lake Powell.

The water meanwhile that we are releasing over and above the inflow into Lake Powell will not interfere if we are able to make a decision by the middle of May that there are reasonable prospects of an April-July runoff of as great as 4,700,000 acre-feet, because those quantities of water would need to be released to Hoover in any event to keep it from going below a level of 1083.

I told Congressman Aspinall the other day that I never wanted to be guilty of misrepresentation to Congress, and I told him that after two wonderful days on Lake Powell that I felt I had misled Congress when I had reported to them that this was a man-made lake, the greatest scenic and recreational potential in America. And I said after visiting there, I thought I had misled Congress because I underestimated, I think it is the most scenic and recreational lake in the world. And I certainly don't want to drain it. I want to help fill it as rapidly as possible, consistent with good business management and the total Federal investment on the entire Colorado River.

And the decision we have made on an interim basis is predicated solely on the fact that Nature has dealt us a low blow by depriving us of a normal snow pack on the Colorado drainage basin, coupled with a bad year the year previous.

Now if these conditions can change, certainly our decision can change and will change in my judgment. We do know that in 1962 we got the kind of months that we need now. We can hope that Nature will repeat the 1962 runoff precipitation pattern of April, May, June and July. If it does, our problem will be solved. If it doesn't, I am afraid we will continue to wrestle with it to the dissatisfaction of many people.

I and the members of my staff are here for such time as the Commission wants to devote to questions to us. We will not duck any; we will answer them as fully and factually as our knowledge and understanding of the problem permits.

THE CHAIRMAN: Thank you, Mr. Commissioner. Do you wish to have any of the staff of the Bureau or Department people offer anything further until questions are asked?

MR. DOMINY: I think not. I think that the best way to handle our time would be to go into any direct questions which the Commission members have, and I will call upon the appropriate member of my staff which I think is best informed on the particular question involved.

THE CHAIRMAN: Yes.

COM. CLYDE: Mr. Chairman.

THE CHAIRMAN: Governor Clyde.

COM. CLYDE: I appreciate very much, Commissioner Dominy, your frank statement of the situation as you see it. I think that we are all striving to reach the same objective, but we feel that the time to act is now, not next

May which is only 30 days hence or 45 days hence. And I would like to pose this question: Why these actions, these positive actions, cannot be taken now rather than to wait for another 45 days to do it.

Now I understand fully the relationship between the forecasted runoff and the operation procedures necessary to maintain the controls at Lake Mead and Lake Powell. I realize fully that we have had a fair but not unusually large precipitation during the fourteen days of April that have just passed, but we haven't lost ground. All of the prognostications that have been made to date appear to be on the conservative side, which is a good side to be on. But the fact remains that water has a habit of running downhill; we can always put it downhill but we can't bring it back uphill if our estimates and our conclusions are proven to be wrong.

Therefore, it would seem to me that now is the time to act, to set in motion a procedure which will involve the closing as required of the gates at Glen Canyon, and with a firm provision for providing a power source to meet the impairment which will result as a result of that action. Now those are things that can be done, and we have nothing to lose by doing them.

I would like to urge your group and the Secretary to take seriously into consideration the proposition that we immediately take the necessary steps to put this program into action now, that we start to close those gates, we do it in harmony with the presently known information and the information which will become known as the days pass; that we set up the procedures and the machinery whereby we can provide this replacement power in order to keep that water as high on the watershed as possible, and that means to put it in Lake Powell.

MR. DOMINY: Governor Clyde, there is no difference between the Department of the Interior, the Bureau of Reclamation and you as to the desirable situation, which would be of course to get the upstream reservoirs in full operation at the earliest practical moment.

Faced with the runoff situation, we see the distinct possibility that were we to attempt to hold the water now and bring Hoover down below rated head at this time, that we still wouldn't get enough water to accomplish minimum operation at Glen, we would then have to release the water later in any event, and meanwhile the Upper Basin would be charged with the making up of power losses at Hoover that would have been unnecessary had we put the water down to maintain it at 1123 from the start.

I point out also that the water we are putting down there now and would put down under this minimum operation decision up until about the middle of May, does not impair the prospects of bringing Lake Powell up to 6,100,000 acre-feet if by the middle of May we can be reasonably assured that we may have an April-July runoff of 4,700,000 acre-feet.

So a decision now is only adverse as we see it to the economic payout of the Upper Basin States because we know full well that last year in March we had a mean forecast of 5.9, we had a May forecast of 4.7, but we got an April-July runoff of only 3.2. We have no assurance on the basis of the studies we have to date on the moisture in the Basin that we can look for anything like 4.7 at this time.

COM. CLYDE: Mr. Chairman, I disagree with the last point there, but that is a matter of opinion. You say we cannot reach this 4.7. It seems to me all the evidence at hand to date indicates that we can. But my point is this, that there is no reason why we shouldn't provide the machinery and put it into motion to meet these contingencies when they arise.

I think it is entirely possible that we could get a depreciated streamflow. It is also entirely possible that we could get an appreciated streamflow. All we are doing by using this procedure is to set up the machinery to do this job. It takes a few days to do it. We don't have many days left.

And I think that the important thing, as I am sure you will all realize, is to get these reservoirs in the Upper Basin filled as quickly as possible because the whole Colorado River program is based on the basic assumption that this storage must be provided in order for this program to work. If we don't fill these reservoirs, the Colorado River Compact cannot be implemented. Therefore, we should hoard water if necessary. And I say that deliberately, we should hoard water until these reservoirs are filled and we can get this machine in operation as it was intended to operate in 1922 when this Compact was signed.

Here is an opportunity for us to begin. No one knows exactly the answer, I appreciate that, but all I am asking is that we put in motion now, that the Secretary acquiesce in a plan which will so operate those gates at Glen Canyon that in connection with Lake Powell and Lake Mead we can preserve the maximum water in Glen Canyon and have the minimum impairment at Lake Mead to meet. I think that is not asking too much. I hope we don't delay for 45 days before we decide whether or not to do this.

COM. JOHNSON: Mr. Chairman, I have some questions I would like to ask.

THE CHAIRMAN: Senator Johnson--is that proper?

COM. JOHNSON: It is improper but I will accept it, sir.

THE CHAIRMAN: All right.

COM. JOHNSON: Mr. Dominy, I have several questions that I would like to discuss with you briefly, sir. The problem that we have before us is the problem of the division of water between the Upper Basin and the Lower Basin. It is easy enough to confuse that simple problem with a lot of other problems on the river where there are so many problems. But I would like to confine my thinking and my approach and my conclusions upon the one problem of the division of the water between the two Basins.

Mr. Dominy, I think it was Confucius who said that "A fool can ask questions that the wisest man cannot answer." I think you can answer these questions of mine, and they are meant to make clear that one single problem of the division of water between the two Basins.

That is the one point that I am greatly concerned with today, not only for the year 1964 but for all of the years ahead. If there is confusion in the relationship and the water supplies between the two Basins, then we are going to be in for a long period of confusion. We just as well settle it now at this time and have it back of us; because if we don't settle it, it is going to plague the people on the Colorado River, the Upper and the Lower Basin, as long as that river is utilized for water supplies.

Now with my questions, Mr. Dominy, are you familiar with a legal document identified as the Seven-State Colorado River Compact?

MR. DOMINY: I am generally familiar with it, and my attorneys and some of my top staff are explicitly familiar with it.

COM. JOHNSON: But you are familiar with it?

MR. DOMINY: Yes, sir, in a general sense.

COM. JOHNSON: Does it have 11 articles, each dealing with some phase of the development of the Colorado River?

MR. DOMINY: I am assuming from the question that it does have.

COM. JOHNSON: Do you respect each of its provision, or do you consider it a scrap of paper? That is not meant to be an insult, sir.

MR. DOMINY: I consider it a very momentous scrap of paper. I also recognize--

COM. JOHNSON: You consider it what?

MR. DOMINY: A very momentous scrap of paper, an important scrap of paper. I think it is--

COM. JOHNSON: But you still think it is a scrap of paper?

MR. DOMINY: Oh, indeed not. I used that strictly in the humorous vein. I think it is a very significant document of great import on the Colorado River.

COM. JOHNSON: Does it divide the Colorado River drainage area into two Basins known as the Upper Colorado River Basin and the Lower Colorado River Basin?

MR. DOMINY: It does indeed and selects Lee Ferry as the arbitrary point of division.

COM. JOHNSON: Does the Colorado River Compact divide the consumptive use of the water of these two Basins?

MR. DOMINY: It presumes to do that, yes, sir.

COM JOHNSON: What do you mean by "presumes"?

MR. DOMINY: Well this is the purpose of it. There still has to be--

COM. JOHNSON: Does it or does it not?

MR. DOMINY: I think it does. There may be differences of opinion as to how it does it, but certainly it presumes to do it. I use that word advisedly.

COM. JOHNSON: I don't like your word "presume". I like to have, it either does or it doesn't. Now I can get a copy of the Compact and point out to you Article III and maybe you want to refresh your memory.

MR. DOMINY: I think I can amend my answer so it will satisfy you better, Mr. Johnson.

COM. JOHNSON: I wish you would.

MR. DOMINY: By saying that it certainly is the purpose and intent of the document to do that.

COM. JOHNSON: Well but does it do it?

MR. DOMINY: I think it does.

COM. JOHNSON: Thank you.

MR. DOMINY: There may be others who have some disagreement as to how it does.

COM. JOHNSON: You mean by "others" your attorneys?

MR. DOMINY: I mean all people involved in looking to the Colorado River for their economic life blood, including you, including Ival Goslin, including all of the Governors of the States affected, and so on.

COM. JOHNSON: How much water is apportioned to each Basin by the Compact?

MR. DOMINY: Well this is one of the questions that I want my legal eagle to give the answer to. Mr. Weinberg.

MR. WEINBERG: Article III (a) apportions 7,500,000 acre-feet to the Upper Basin and to the Lower Basin; and Article III (b) provides that the Lower Basin can increase its use by a million acre-feet a year.

COM. JOHNSON: May I read Article III and see if that is the way you understand it?

MR. WEINBERG: I will have to read it too then.

COM. JOHNSON: I will not read all of Article III; I will read Article III (a):

> "There is hereby apportioned from the Colorado River system in perpetuity to the Upper Basin and to the Lower Basin, respectively, the exclusive beneficial consumptive use of 7,500,000 acre-feet of water per annum, which shall include all water necessary for the supply of any rights which may now exist.
>
> "(b) In addition to the apportionment in Paragraph (a), the Lower Basin is hereby given the right to increase its beneficial consumptive use of such waters by 1,000,000 acre-feet per annum."

Is that the way you understand it?

MR. WEINBERG: I think that is in line with the answer I gave, Senator, speaking from memory.

COM. JOHNSON: Thank you. It is a very important question and I wanted there to be no question about it. One of the great troubles that we are facing today is because of so many different opinions instead of the actual facts. Now where is this water divided between the two Basins?

MR. DOMINY: The measurement is at Lee Ferry, which is a few miles below Glen Canyon Dam.

COM. JOHNSON: Outside of the Gila River drainage, does the Upper Basin produce practically all the water of the Colorado River?

MR. DOMINY: Substantially.

COM. JOHNSON: Substantially?

MR. DOMINY: I would say substantially all of the water outside of the Gila, and, of course, the Little Colorado puts some water in the river as well as other minor tributaries.

COM. JOHNSON: The Little Colorado?

MR. DOMINY: But this is a reasonable statement, that the great volume of water that reaches the lower basin is in the river at Lee Ferry and relatively small portions come in below that point.

COM. JOHNSON: The Little Colorado River is in the drainage basin of the Colorado River?

MR. DOMINY: That is right.

COM. JOHNSON: How many feet of water does the Compact require the Upper Basin to deliver to the Lower Basin at Lee Ferry in each 10-year period?

MR. DOMINY: I again ask Mr. Weinberg to answer for me.

MR. WEINBERG: Article III (d) of the Compact provides that:

> "The States of the Upper Division will not cause the flow of the river at Lee Ferry to be depleted below an aggregate of 75,000,000 acre-feet for any period of ten consecutive years reckoned in continuing progressive series. . ."

COM. JOHNSON: ". . . beginning with the 1st day of October next succeeding the ratification of this Compact." So now we know the definite commitment that the Upper Basin is pledged to sustain and fulfill, is that correct?

MR. WEINBERG: Not by that reference to 75,000,000 acre-feet, Senator.

COM. JOHNSON: I didn't hear you.

MR. WEINBERG: I say the reference to 75,000,000 acre-feet is not the sole statement of the Upper Division's responsibilities under the Compact.

COM. JOHNSON: Would you name the other responsibilities that you have in mind?

MR. WEINBERG: Article III (e) is one.

COM. JOHNSON: III (e).

MR. WEINBERG: And the other one--

COM. JOHNSON: Yes, I think that is a very important one, and I think that it is very pertinent today.

MR. WEINBERG: The other one has reference to--

COM. JOHNSON: May I comment on (e):

> "The States of the Upper Division shall not withhold water, and the States of the Lower Division shall not require the delivery of water, which can not reasonably be applied to domestic and agricultural uses."

My understanding is that in this particular case, the demand on the part of the Lower Division is for water to make power and not for irrigation, domestic or agricultural uses.

MR. WEINBERG: The other provision has to do with the bearing of any Mexican Treaty burden which may develop in the event of a deficiency.

COM. JOHNSON: What is the paragraph?

MR. WEINBERG: That is Article III (c).

COM. JOHNSON: Article III (c):

> "If, as a matter of international comity, the United States of America shall hereafter recognize in the United States of Mexico any right to the use of any waters of the Colorado River system, such waters shall be supplied first from the waters which are surplus over and above the aggregate of the quantities specified in Paragraphs (a) and (b); and if such surplus shall prove insufficient for this

purpose, then the burden of such deficiency shall be equally borne by the Upper Basin and the Lower Basin, and whenever necessary the States of the Upper Division shall deliver at Lee Ferry water to supply one-half of the deficiency so recognized in addition to that provided in Paragraph (d)."

It is your opinion that that is an additional burden?

MR. WEINBERG: Well this is an additional requirement that the Compact provides.

COM. JOHNSON: But you don't like to think of it as a burden?

MR. WEINBERG: Senator--

COM. JOHNSON: There are questions, legal questions with respect to Paragraph (c), whether that is a burden or whether it is not, whether that amount of water for Mexico is not included in the 75,000,000 overall. But that is a legal question and we won't try to argue that here today, unless you desire to be arguing.

MR. DOMINY: As a matter of fact, Mr. Johnson, the very purpose we had in spending several years of very intensive negotiations with the Lower Basin people and with the Upper Basin people in attempting to arrive at a filling criteria was an attempt to work out a practical, reasonable, economically sound method of filling Glen Canyon Dam and the other Upper Basin Reservoirs without getting into litigation and the long delays that could certainly result if we attempted to define in detail each word and punctuation and paragraph in this Compact.

Now we didn't ever ask either the Lower Basin or the Upper Basin to pass a resolution endorsing specifically the criteria that was finally announced. It was, however, agreed to as the best we could come up with to meet all of the possible exigencies with which we could be confronted, with all of us recognizing that were we unfortunate enough to get into a series of dry years, that we had a real problem on our hands. And unfortunately we have that problem on our hands.

COM. JOHNSON: You say it was agreed to; by whom was it agreed to in the Upper Basin?

MR. DOMINY: I said we did not ask for formal agreement on the part of this body which represents the Upper Basin. We did, however, give ample opportunity for everyone concerned to debate the issues with us and give us their judgment as to what kind of a filling criteria in their judgment meant the Upper Basin reservoirs--

COM. JOHNSON: The Governors of the Upper Basin did not agree. The Upper Basin Commission did not agree. I don't recall ever seeing you present at one of our meetings telling us you would like to have us agree to something or other.

MR. DOMINY: Well, sir, I made the statement that we asked for no formal agreement. I did have the very top members of our technical staff available to debate the issues with competent technical staff members of the Upper Basin States and the Lower Basin States.

COM. JOHNSON: I think the Upper Basin--I don't know whether I am representing their views exactly or not by this statement--but I think the Upper Basin relied upon something more substantial than manufactured criteria. I think they were depending upon the Compact, the Colorado River Compact, which was very specific on the point of division of water between the Upper Basin and the Lower Basin. I think they wanted to stay with the Compact.

That is the only assurance that we have, the Upper Basin States have, of being able to consumptively use 7,500,000 acre-feet of water and deliver to the Lower Basin 75,000,000 acre-feet of water in the 10-year period.

MR. DOMINY: And the entire Colorado River Storage Project, which has moved forward with the greatest rapidity of any project of this magnitude in the history of Reclamation, is predicated exactly on that premise.

COM. JOHNSON: And now at the critical time you are abandoning that Storage Project. You have got it built, you have got a lot of it built, you have spent $425,000,000 plus, and now you want to leave it inactive. That is one of our complaints.

MR. DOMINY: This of course comes down to matters of opinion and matters of judgment. I have repeatedly stated that the decision, the tentative decision, that is being followed is one strictly based on economics; and it is our judgment, based on all the facts, that we are protecting the interests of the Upper Basin Account as well as preserving the Secretary of the Interior's and Commissioner of Reclamation's responsibility for the total Federal investment on the river, by the tentative operation that we are following pending a more conclusive knowledge of what the flow will be during April-July of 1964.

COM. JOHNSON: Yes, but you are ignoring the Compact and the provisions of the Compact. Now under the Compact we are required to deliver a certain amount of water at a certain time; and we are also under the Compact awarded a consumptive use of 7,500,000 acre-feet of water annually and we want to live up to that Compact. We take that seriously, not as a scrap of paper, not as just a happy thought; we take it seriously and we want everyone to observe it and we want to observe it ourselves.

Under the Colorado River Compact does delivery--that is delivery of 75,000,000 acre-feet in ten years--take precedence over the 7,500,000 acre-feet of water the Upper Basin is authorized to consume each year?

MR. DOMINY: I defer to my lawyer again.

MR. WEINBERG: Well I think before you call upon me to answer a question like that, you should have the advice of your own counsel.

COM. JOHNSON: I didn't quite catch that answer.

MR. WEINBERG: I said I think you should have the advice of your own counsel before we are called upon to interpret the Compact in relation to these questions in terms of the most severe problem that faces all of us today with respect to the filling of Glen Canyon.

COM. JOHNSON: Mr. Chairman, am I a member of this Commission?

THE CHAIRMAN: You are, sir.

COM. JOHNSON: As a member of this Commission I am asking these questions and I repeat my question: Under the Colorado River Compact, does such delivery--and we are talking about the delivery of 75,000,000 acre-feet--take precedence over the 7,500,000 acre-feet of water the Upper Basin is authorized to consume each year? That is, can we consume the 7,500,000 acre-feet of water until we fulfill that commitment and make that delivery to the Lower Basin?

MR. WEINBERG: Senator, if it comes down to a question of whether there is enough water for 7,500,000 acre-feet of beneficial consumptive use in the Upper Basin and the meeting of the 75,000,000 acre-foot guarantee, I have never heard anyone express any other opinion than that the 75,000,000 acre-foot guarantee is the first responsibility.

COM. JOHNSON: It has a preference right and a preference status?

MR. WEINBERG: That is the only opinion I have ever heard expressed on this subject.

COM. JOHNSON: I am not expressing one today. Might such a commitment constitute, Mr. Dominy, a severe burden on the Upper Basin in a series of dry years?

MR. DOMINY: Yes, I think it is fully recognized that the Upper Basin has that commitment, and it does possibly cause real problems for you if a long dry cycle were to prevail.

COM. JOHNSON: Yes, we consider it a tremendous burden upon us and one to which we must give great concern and great attention. We can't just laugh it off.

MR. DOMINY: This is completely understandable.

COM. JOHNSON: One dry year--several dry years in a row and the Upper Basin would not have one drop of water.

MR. DOMINY: Of course Glen Canyon is the structure that is built to give you the control necessary so that you can meet that commitment without impairment of your rights. And we are satisfied that once we get the kind of years that will let us fill these main stream reservoirs that we will be able to ride through dry cycles without undue burden to anybody.

COM. JOHNSON: I am especially pleased and very glad to have you subscribe to that opinion. Your words are beautiful, your words are reassuring, but your actions to make Glen Canyon impotent are not reassuring, they are devastating and they bother us. That is what we are worried about and that is why we are meeting here.

MR. DOMINY: I would be pleased of course, Commissioner Johnson, if I were so potent in my control and operations that I could decide how much moisture we had in the Colorado River drainage basin; and if I were, I can guarantee we wouldn't have this problem. We have a problem strictly because Nature has deemed to give us the headache to wrestle with.
