COM. JOHNSON: I heard you say a few moments ago that is the very reason that we built these projects, to take care of these problems. If there were no problem on the river, if there was an abundance of water for everybody, Upper and Lower Basin, and everybody that wanted to use the water, of course, there would be no problem, but that is completely not the situation. The situation is the reverse of that; and that is why we have built these projects. That is why we have gotten into this controversy. That is why we are meeting here today, trying to find our way out of a most difficult situation.

And speaking for myself, and I think I am speaking for a great many other people in the Upper Basin, we think the only procedure to follow is the Compact itself that was devised 40 years ago to take care of the situation that we are in today. We don't like to abandon what the patriots who worked on this problem thought was necessary to do 40 years ago.

MR. DOMINY: I must again state with emphasis, Mr. Johnson, that the actions of the Secretary of the Interior, made on my recommendation based on the facts as we obtained them and analyzed them on the basis of historical hydrology, is not capricious; it is not arbitrary; and it is not in our judgment adverse to the best interests of the Colorado River Storage Project.

We have made the decision because of our responsibility to protect the total Federal investment on that river. And were we to operate in such a way that neither Glen or Hoover is up to operating level and neither of the powerplants were functioning, we would be derelict in our responsibility. And based on the runoff forecast that we have, this is entirely possible were we to pull Hoover down now by storing in Lake Powell.

And I repeat that in our judgment our decision was a wise one. It was the only reasonable one that responsible people could make, given the facts that we have to face. And we are still hopeful that the storm clouds will hover over that area and dump a lot of moisture so that a more favorable forecast of runoff might later obtained.

COM. JOHNSON: It is not adverse to certain objectives which are noble objectives, to be sure. But I do continue to point out to you, Mr. Dominy, that it is adverse to the terms, the provisions, of the Colorado River Compact, and the Upper Basin States do not dare to not have that Compact followed to the letter by everybody. That is the only safety we have got. You have admitted that we have a tremendously difficult problem in the Upper Basin. But giving a preference right on the water that is produced there, 75,000,000 we must deliver to the Lower Basin, and we must deliver that and then take what is left for ourselves to fulfill the amount of water that we are authorized to consume. That is a terrible burden.

I was in the Colorado General Assembly in 1923 when the Colorado River Compact was ratified by our General Assembly. And I opposed with all the might that I could bring to bear against giving the Lower Basin a preference to the water that was produced in the Upper Basin. I was willing for them to have a share of that water, an equal share of it, but I objected strenuously to the preference right that they were given.

And that preference right is the very thing that brings us here today and causes us to plead with every word and every idea that we can bring forth to have everybody on the river follow the Colorado River Compact implicitly.

MR. WEINBERG: Commissioner Johnson, with the same earnestness and sincerity with which you state your position, let me say to you, sir, and

to the members of this Commission that the Secretary of the Interior and the Commissioner of Reclamation do not for one minute concede that any action that they have taken violates the responsibilities and duties imposed upon them by the law of the river, including the Colorado River Compact.

They will plead guilty to one act and one act alone, or one motive and one motive alone, and that is to frame criteria and to take actions after the fullest consultation designed to provide a reasonable solution to most difficult and vexing problems, and designed above all, Commissioner Johnson, to avoid in the Colorado River Basin another tragedy such as that that befell the Lower Basin by 14 years of continuous litigation in the Supreme Court which has not added a drop of water to the Colorado River; which has delayed planning for 14 years.

The greatest tragedy that could befall the Upper Basin or the whole Basin--and I speak only for myself in this--would be to plunge this river into litigation to examine issues which are not now present, which may never arise and which in today's context can only be considered on the basis of varying hypotheses. As I say, I think no greater tragedy, no greater error could be made than to plunge this river into litigation to litigate some of these concepts that have bothered all of us. If we are successful, and if the Upper and Lower Basins are successful, reasonable men will achieve reasonable solutions. The mark of our lack of success will come if we have to go back to the courtroom.

COM. JOHNSON: I know the Upper Basin, and I know that I am speaking for more than myself when I say it, would regard litigation and a lawsuit as a tragedy. We are not seeking a lawsuit. We would like to have a reasonable settlement of this problem, but we do not think it a reasonable settlement for the Secretary of the Interior to come up into the Upper Basin and open our storage reservoirs and take our water instead of working out or attempting to work out in a reasonable sort of a way an agreement between the two Basins.

Mr. Dominy said just a few minutes ago that they did not ask this Commission anything about the criteria, anything about a decision as to how to settle these questions. He said they didn't ask us, which they didn't.

MR. DOMINY: Let us keep the record exactly correct. I said we did not ask for formal approval by either Basin on the filling criteria as finally announced.

COM. JOHNSON: I thank you for the correction.

MR. DOMINY: I went on to say it had been discussed over a period of many, many months, actually several years, with the top technical experts of the Bureau of Reclamation and the top technical experts representing the States of the Upper Basin. And that the members of this Commission were not fully informed is something that I cannot accept.

I am satisfied that you were well aware of the nature of those discussions. We just didn't ask either the Lower Basin or the Upper Basin to give us a formal resolution of agreement because we recognized that there are elements of controversy in the operation of this river that we hope can be worked out by reasonable people meeting the problems as they arise and avoiding a final lengthy court test of every item in the Compact.

COM. JOHNSON: We realize you are afraid of a court test, and we don't want to impose one upon you.

MR. DOMINY: I don't fear a court test, Commissioner Johnson.

COM. JOHNSON: Your attorney said he did.

MR. DOMINY: If you are implying we fear a court test because we are operating outside the Compact, I want to make it abundantly clear that such is not the case.

We say we fear a court test because of the adverse effects of delays and the internal expense and the expense to all of us in the economic development that would not be made while the test was being made--which was 14 years in the Lower Basin where they had the fastest growing population in the Nation--with no plans to solve our water problems other than a court test.

We don't want to see any further controversy of that sort to delay the progress in the Colorado River Basin as a whole if it can be avoided.

COM. JOHNSON: I would agree with you completely if you would agree to follow the letter of the Compact. That is all we have to depend on. Everything else is sand under our feet. That Compact is the only solid rock we have got and we have got to adhere to it; we have got to stay with it.

MR. DOMINY: There apparently is a difference of opinion between yourself and the Commissioner of Reclamation. You imply that the means, our interim operation under the filling criteria, is in violation of the Compact. We do not so consider it.

COM. JOHNSON: I contend that when we delivered our commitment of water as required by the Compact, 75,000,000 acre-feet in the present

10-year period, and we have not consumed our 7,500,000 acre-feet which the Compact awards us, that we can store water up to the amount that we haven't used and utilized of that 7,500,000 in Lake Powell, and that it is our water.

MR. DOMINY: Part of our differences, Commissioner Johnson, may arise from the fact that you are using some figures that differ from ours in the statements you presented to the Commission late yesterday afternoon.

You stated on July 1, 1962, Lake Mead contained 24,600,000 acre-feet of water. Our records indicate that on July 1, 1962, Lake Mead contained 23,722,000 acre-feet of water.

You then go on to say that since that date the Upper Basin delivered at Lee Ferry water in the amount of 10,400,000 acre-feet. Our records indicate that during that period the delivery was 6,297,000 acre-feet.

The total of the two figures according to your mathematics was 35,000,000 acre-feet when actually it was 30,019,000 acre-feet.

COM. JOHNSON: I got my figures from the Commission's headquarters in Salt Lake City, and I think that they are accurate.

MR. DOMINY: I am sorry, sir, but they aren't.

COM. JOHNSON: I want to ask you some questions about these figures because I noticed from what you said this morning in your opening statement that there was a conflict between my figures and your figures. I got my figures from our Salt Lake office, and I think that they are accurate. You think your figures are accurate; but it is tremendously important that your figures and our figures are resolved.

MR. DOMINY: Well the Bureau of Reclamation has represented the people of the West for 62 years. We do operate the structures on the river. We do keep accurate records, and we do have the figures that represent the true facts of inflow and outflow, and they are readily obtainable. I don't know how the error came about, but I repeat; there is an error obviously.

THE CHAIRMAN: Commissioner Johnson, Governor Clyde has a question to ask here.

COM. CLYDE: Mr. Chairman, you know you don't grind grain with water that has gone over the dam. It seems to me that we are talking about some things now which are important and have been important in the Basin, but we are not getting at the nubbin of this thing. I think it is rather simple, I am sure, in answer to Mr. Weinberg, no one wants to create a lawsuit. We don't make water by going to court. But there are times when you have to resort to final action when a decision has to be made.

Now as Mr. Dominy has just said, we have enjoyed--I say "we"--the people of the West have enjoyed cooperating with the Bureau of Reclamation for over 60 years. We have had good relations with them. We have had our differences of opinion; they have been legitimate. Errors have been made; nobody is invulnerable. Maybe we are making errors now.

But the fact remains that this Colorado River Storage Project, which was predicated upon a division of water between the two Basins, was also predicated upon long-time storage, long-time holdover storage which makes this thing function. We have got to do everything within our power to build up and establish that storage so that we can get this program functioning as it was intended, and you can't do that overnight.

Now as we sit here and argue, the water is going down the river, that is the thing that I am fearful of. And I think we will lose nothing by getting our affairs in order so that we can take immediate and quick action if it is dictated by the information which we get day by day and hour by hour from here on out. And it seems to me that that is all we are asking as of the present.

MR. WEINBERG: Governor Clyde, I couldn't agree with you more. It wasn't my purpose to suggest that the Upper Basin should do other than seek the earliest filling of the Upper Basin reservoirs. I think you and I are in full agreement.

COM. CLYDE: No question.

MR. WEINBERG: It was my purpose to suggest that we lawyers can argue some of these questions endlessly. But that is not the immediate problem before the House, with all due deference. The Department of the Interior is in full agreement with you that the machinery should be gotten ready so that when a decision is taken it can be put into effect, and this is exactly what the Department of the Interior is proceeding to do.

COM. CLYDE: That is the question that I would like to put specifically to Mr. Dominy, and whether or not you can speak for the Secretary at this moment I don't know. But it seems to me there is only one question before us: Is the Secretary willing to sit down in the light of the information which we have received as late as yesterday and go over this whole situation and bring these minds together--and no man has got a corner on brains in this matter--and bring these minds together to work out a solution to this problem? We are interested in solutions, not more problems.

But the solution immediately at hand is this: We want to so operate, if the good Lord gives us the water, so that on the first of August when those generators at Glen Canyon are ready to turn, we will have the water to turn them with, and that is all we are asking.

Therefore, Mr. Dominy, do you feel that the Secretary would be willing to sit down with representatives of this Commission, with representatives of the utilities who have made an offer which I believe is a solution to this thing, under the principle of providing capacity and energy to meet the impairment of the operation at Hoover, so that we might put this water where it will be most effective, to get to my original proposition?

MR. DOMINY: Yes, I can speak without hesitation that Secretary Udall continues to be available to discuss any of these important matters over which his Department has jurisdiction with any organized group from the states involved in an attempt to work out the best possible solution at any time.

And we have been working with Lower Basin power interests to get some figures from them as to replacement of power. Now we have a proposal from the Upper Basin group.

COM. CLYDE: We feel a little badly about that, if I might inject this in there, because the letter that I sent to the Utah Power and Light Company which precipitated this approach to the thing and was done because I believed--and I believe it more now than I did then because I didn't have the information then--that between these private utilities they can provide the capacity and the energy and the transmission and all of the mechanical facilities necessary to make this function to do the job we have to do. That is the thing we were trying to establish and it was established finally as late as yesterday, and that report which the utilities submitted to the Commission has been forwarded to the Secretary.

My question then is: Would the Secretary be willing now to sit down with the interested parties, all of them, and see if we can't work out an action which will reach this goal which we are all seeking? I don't think there is any difference in us on the goal.

MR. DOMINY: I am sure we would be happy to sit down and debate the issues.

COM. CLYDE: That answers my principal question, Mr. Chairman.

MR. DOMINY: I would like to make one statement here. I would like to have you all familiar with the actual releases from Lake Mead in 1962 and 1963. Now for all practical purposes, Commissioner Johnson and members of the Commission, we started with 1962 because that was the year we did fill Lake Mead and actually under the flood control criteria under which we were operating, we overfilled; and there was actually water that normally would be released which we held up for sluicing purposes.

COM. JOHNSON: What was the point in 1962 when Lake Mead was full?

(Mr. Dominy turns to staff.)

B. R. STAFF MEMBER: 1204.2 on the 24th of July 1962.

MR. DOMINY: How many acre-foot capacity have you got? We infringed on the flood curve in 1962.

B. R. STAFF MEMBER: 24,578,000 acre-feet.

COM. JOHNSON: I said a moment ago 24,600,000 and you challenged that.

MR. DOMINY: That wasn't on July 1.

MR. GOSLIN: Let me clarify that figure for these two gentlemen.

COM. JOHNSON: Give me that figure again please, twenty-four million what?

B. R. STAFF MEMBER: 24,578,000. The figure we are giving you is on the 24th of July and the figure I believe you had was on the 1st of July.

COM. JOHNSON: And the amount of water was 24,578,000?

B. R. STAFF MEMBER: 24,578,000.

COM. JOHNSON: I want to get these figures accurate.

B. R. STAFF MEMBER: That is taken from the area capacity release on Lake Mead.

COM. JOHNSON: But that is the figure and what is the date? I want to get that date.

MR. DOMINY: The 24th of July.

COM. JOHNSON: The 24th of July?

MR. DOMINY: 1962.

COM. JOHNSON: 1962.

MR. DOMINY: The content of Lake Mead was 24,578,000 acre-feet.

COM. JOHNSON: I had the date wrong in that I gave you July 1. That wasn't the fault of our office, Ival; it was my fault.

MR. GOSLIN: We gave you a different date.

COM. JOHNSON: I got a chart and I thought it would be the 1st of July instead of the 24th.

MR. DOMINY: Let us clear up one thing more.

COM. JOHNSON: Okay.

MR. DOMINY: There was no water released from Lake Mead in either 1962 or 1963 specifically for the production of power. The only water released was that necessary in the river to meet downstream diversion requirements. And in 1962 we released at Lake Mead a total of 8,615,000 acre-feet of water.

COM. CLYDE: In connection with that, what was the run of the river that year?

MR. DOMINY: About 14 something, wasn't it (turning to staff)?

COM. CLYDE: 14,000,000?

MR. DOMINY: 14,800,000. That was my recollection.

COM. CLYDE: That is in addition to your discharge from storage?

MR. DOMINY: Well the run of the river. Of course you have to take our evaporation and bank storage, phreatophytes. We released that from Lake Mead.

COM. CLYDE: Out of storage?

MR. DOMINY: Well, yes.

COM. CLYDE: What was the total consumptive demand below the dam in that year?

MR. DOMINY: This in effect was it.

COM. CLYDE: The 8,000,000. Where did the run of the river come in then?

B. R. STAFF MEMBER: At the Compact point, Governor, in 1962 it was 14,800,000 acre-feet. Released from Lake Mead, as Commissioner Dominy stated, was 8,600,000 acre-feet.

MR. DOMINY: At Lee Ferry you had a 14,800,000 acre-feet runoff.

COM. CLYDE: And you took in addition to that 8,000,000 out of the reservoir?

MR. DOMINY: No, we took out 8,600,000 acre-feet.

COM. JOHNSON: And part of that 14,000,000--it wasn't all delivered by July 24th?

MR. DOMINY: No, that is for the entire year.

COM. JOHNSON: But there was part of the 14,000,000 that still wasn't delivered to Lake Mead by July 24th.

COM. CLYDE: What were the consumptive requirements for that year below Hoover?

MR. DOMINY: When you talk about consumptive requirements--

COM. CLYDE: The Compact says you shall not discharge any water past Hoover Dam for purposes of generating power only. That means the waters discharged should be for consumptive purposes.

MR. DOMINY: This is true.

COM. CLYDE: All of them.

MR. DOMINY: And this is what I have said, we delivered 8,000,000 out of Lake Mead, 8,615,000 acre-feet, for diversionary requirements below Lake Mead, none for power specifically.

COM. CLYDE: The answer to my question is then, all of this was for consumptive purposes?

MR. DOMINY: Yes. Now in 1963 we delivered out of Lake Mead 8,533,000 acre-feet.

COM. CLYDE: Well now on the 31st day of July in 1962 you had 24,548,000 acre-feet in the reservoir. Now there is 10,000,000 acre-feet of that that has disappeared between then and now because it is down below 14,500,000 now.

MR. DOMINY: Well yes, it is down to 14,500,000; and we are holding it at that level. But you want to remember in 1963 we put very little water down below Glen Canyon. We released only a thousand second-feet for most of the time and stored it. We stored 3,100,000 acre-feet in Glen Canyon. And, of course, there was some bank storage loss and everything else involved in filling a new reservoir too, and there continues to be evaporation losses and all the other things that go into operating a river.

MR. WEINBERG: Governor Clyde, the Compact does not prohibit the release of Lake Mead solely for power purposes. I think your premise is--

COM. CLYDE: You say it doesn't?

MR. DOMINY: At any rate it is an academic point because 1960 we haven't done it, and we don't intend to do it.

COM. CLYDE: Do you have in your records that would be available to us an accounting of the water distribution?

MR. DOMINY: This is actually available in the reply to Congressman Aspinall; and if you decide to put that in your record here, I think all of these logs are in the detailed reply to Congressman Aspinall.

I wanted you to get this one figure here. You see actually if you take the Compact requirement of the Lower Basin States of 7,500,000 acre-feet and you add to it the million and a half for the Mexican Treaty, you have got 9,000,000 acre-feet. I don't mean to imply that the Upper Basin has to deliver 1,500,000 acre-feet for the Mexican Treaty under the Compact; I merely say the use contemplated in the Compact is 9,000,000 acre-feet to the Lower Basin, the consumptive use.

COM. JOHNSON: The burden.

MR. DOMINY: All right, the burden, the consumptive use as contemplated in the Compact. The last two years we have delivered 8,615,000 acre-feet in 1962 and 8,533,000 acre-feet in 1963.

Now I am not arguing that it shouldn't have been less than that. There were overdeliveries to Mexico; there were illegal diversions. It may well be that a careful husbanding of the actual needs and the beneficial use to both Arizona and the diverters in critical runoff years, we could get by with less diversions than we have been.

Unfortunately our contracts are not too explicit and they talk in terms of reasonable beneficial use and so on, and we don't have any firm acre-foot commitments one way or the other. And when the people who operate it say, "We want so much on such-and-such a date", we have very little basis on which to say, "We are sorry, you don't need that many second-feet. We are only going to give you 90 percent."

COM. CLYDE: Mr. Dominy, one additional question: As of today or yesterday, how much water was running into Lake Powell? What was your inflow?

MR. DOMINY: Do you have that (turning to staff)?

MR. CLINTON: It is running around 5,000 now.

COM. CLYDE: Second-feet?

MR. CLINTON: Yes.

COM. CLYDE: And what is the discharge out of Lake Powell?

MR. CLINTON: 12,000.

COM. CLYDE: So you are pulling down at the rate of 7,000 second-feet?

MR. CLINTON: About that.

MR. DOMINY: Didn't you get up to as high as 12,000 inflow there? Didn't you have one or two days where you got up that high?

MR. CLINTON: It should start up again with these warm days.

COM. BLISS: Mr. Chairman--

COM. JOHNSON: Did you want to make a statement, Mr. Bliss?

COM. BLISS: I would like to ask a question if I could, Governor.

COM. JOHNSON: Fine. I don't want to lose the floor.

COM. BLISS: Why don't you go ahead with your questioning, and I will raise this question later.

COM. JOHNSON: I am glad to have Commissioner Clyde and Governor Clyde interrupt and make the very fine statement that he made here today. I subscribe wholeheartedly to every word that he said. I am in complete agreement with what he said, and I am glad that he interrupted our discussion over at this end of the table to make that statement. I think it was timely, and I think it was very necessary that it be made at that very point.

Some questions have been raised about the accuracy of some of my figures. All of my figures I have gotten from the Commission. We knew that this meeting was coming; in fact, it was coming a week earlier, and it was postponed so that we could get replies to the questions that Congressman Aspinall had asked the Department. We wanted to get the figures from Washington for this meeting, but we didn't get them. They didn't show up. They didn't leave Washington until the day that we met.

Now it is necessary in arguing points of this nature to have accurate figures. I believe that our figures are completely accurate, but there was this difference that Mr. Dominy very properly called attention to between July 1 and July 24. And that was my error; that wasn't the error of the Commission office. They gave it to me in the form of a chart, and the chart showed July 1 and it is pretty hard to show 24 days' difference on a chart.

Now I have some other figures that I want to ask Mr. Dominy about that I have quoted in my statement. I stated in my statement that in the current 10-year period we delivered at Lee Ferry, the Upper Basin delivered at Lee Ferry, 93,700,000 acre-feet of water; that we were required to deliver 75,000,000.

Now whether we are required to deliver in addition to that 75,000,000 the part that goes to Mexico or not is another question. But even if we were required to deliver to Mexico, that would only be 7,500,000 and that would mean that in this current 10-year period we have delivered more than 11,000,000 acre-feet above our obligation.

And I want to ask Mr. Dominy if he cares to discuss that figure, 93,700,000 acre-feet. If I had the figure that has been submitted to Congressman Aspinall, there wouldn't be this question. But we were diligent up here at this end in trying to get accurate figures from Washington so that there would be no dispute about the figures.

And I would like to ask Mr. Dominy if he is satisfied with the 93,700,000 acre-feet delivered at Lee Ferry in the current 10-year period?

MR. DOMINY: That is up through 1963. My staff tells me that that figure is the accurate running average over the most recent 10-year period.

I have this comment to make: That had we been able to get Glen Canyon built a year sooner, of course, then 1962 would be a wonderful year to have filled our dead storage. We just were unfortunate in that we weren't prepared in 1962 to capture a pretty good flowing river.

I for one think it is a little academic to think and to talk about a 10-year average, a moving average that goes back beyond the time that we were capable of storing water at Lake Powell, because in the years that you had no capability, the water was there and it went down.

COM. JOHNSON: We delivered it.

MR. DOMINY: Yes.

COM. JOHNSON: It was our burden to deliver it. The point that you raised there about the dry years, the point we want to make or at least I want to make in the Upper Basin is that the Upper Basin ought not to be saddled with the total responsibility of what happens during a drouth. We ought not to have to carry the whole load.

We built Glen Canyon for the very purpose of giving us protection and in giving protection to the Lower Basin of a constant delivery of water, which is very advantageous to the Lower Basin. And we have undertaken to meet our responsibilities, heavy and terrible as they are--and they are terrible and they are heavy--but we are trying to get in shape so that we can meet our responsibilities on that river; and we think that we should not be condemned for that, that it should be recognized that we were just merely meeting our responsibilities.

Now I want to check another set of figures here. Here is a record of the excess of delivery of water to Mexico over and above the required deliveries of 1,500,000 acre-feet, beginning with 1958. In 1958, 4,909,000 acre-feet we delivered over and above what we needed to deliver, what we were required to deliver. Do you have any figures on that? You have my figures there, Mr. Dominy?

MR. DOMINY: Yes, I have them. Mr. West is looking at his chart.

MR. WEST: That is a year we were able to give Mexico 1,700,000 acre-feet, and that was a year in which power was produced.

COM. JOHNSON: I am glad to have Commissioner Clyde and Governor Clyde interrupt and make the very fine statement that he made here today. I subscribe wholeheartedly to every word that he said. I am in complete agreement with what he said, and I am glad that he interrupted our discussion over at this end of the table to make that statement. I think it was timely, and I think it was very necessary that it be made at that very point.

Some questions have been raised about the accuracy of some of my figures. All of my figures I have gotten from the Commission. We knew that this meeting was coming; in fact, it was coming a week earlier, and it was postponed so that we could get replies to the questions that Congressman Aspinall had asked the Department. We wanted to get the figures from Washington for this meeting, but we didn't get them. They didn't show up. They didn't leave Washington until the day that we met.

Now it is necessary in arguing points of this nature to have accurate figures. I believe that our figures are completely accurate, but there was this difference that Mr. Dominy very properly called attention to between July 1 and July 24. And that was my error; that wasn't the error of the Commission office. They gave it to me in the form of a chart, and the chart showed July 1 and it is pretty hard to show 24 days' difference on a chart.

Now I have some other figures that I want to ask Mr. Dominy about that I have quoted in my statement. I stated in my statement that in the current 10-year period we delivered at Lee Ferry, the Upper Basin delivered at Lee Ferry, 93,700,000 acre-feet of water; that we were required to deliver 75,000,000.

Now whether we are required to deliver in addition to that 75,000,000 the part that goes to Mexico or not is another question. But even if we were required to deliver to Mexico, that would only be 7,500,000 and that would mean that in this current 10-year period we have delivered more than 11,000,000 acre-feet above our obligation.

And I want to ask Mr. Dominy if he cares to discuss that figure, 93,700,000 acre-feet. If I had the figure that has been submitted to Congressman Aspinall, there wouldn't be this question. But we were diligent up here at this end in trying to get accurate figures from Washington so that there would be no dispute about the figures.

And I would like to ask Mr. Dominy if he is satisfied with the 93,700,000 acre-feet delivered at Lee Ferry in the current 10-year period?

MR. DOMINY: That is up through 1963. My staff tells me that that figure is the accurate running average over the most recent 10-year period.

I have this comment to make: That had we been able to get Glen Canyon built a year sooner, of course, then 1962 would be a wonderful year to have filled our dead storage. We just were unfortunate in that we weren't prepared in 1962 to capture a pretty good flowing river.

I for one think it is a little academic to think and to talk about a 10-year average, a moving average that goes back beyond the time that we were capable of storing water at Lake Powell, because in the years that you had no capability, the water was there and it went down.

COM. JOHNSON: We delivered it.

MR. DOMINY: Yes.

COM. JOHNSON: It was our burden to deliver it. The point that you raised there about the dry years, the point we want to make or at least I want to make in the Upper Basin is that the Upper Basin ought not to be saddled with the total responsibility of what happens during a drouth. We ought not to have to carry the whole load.

We built Glen Canyon for the very purpose of giving us protection and in giving protection to the Lower Basin of a constant delivery of water, which is very advantageous to the Lower Basin. And we have undertaken to meet our responsibilities, heavy and terrible as they are--and they are terrible and they are heavy--but we are trying to get in shape so that we can meet our responsibilities on that river; and we think that we should not be condemned for that, that it should be recognized that we were just merely meeting our responsibilities.

Now I want to check another set of figures here. Here is a record of the excess of delivery of water to Mexico over and above the required deliveries of 1,500,000 acre-feet, beginning with 1958. In 1958, 4,909,000 acre-feet we delivered over and above what we needed to deliver, what we were required to deliver. Do you have any figures on that? You have my figures there, Mr. Dominy?

MR. DOMINY: Yes, I have them. Mr. West is looking at his chart.

MR. WEST: That is a year we were able to give Mexico 1,700,000 acre-feet, and that was a year in which power was produced.

COM. JOHNSON: If Mexico requires it, they can ask us for 1,700,000 instead of 1,500,000, if they ask it, but if they don't ask it--they haven't asked it.

MR. WEST: Mexico is entitled to 1,700,000 if it is available. She is not entitled to ask for 1,700,000 if we are not able to give more than 1,500,000.

COM. JOHNSON: That's right, but I didn't take that into consideration here because I knew that there was no dispute on that point.

MR. DOMINY: Commissioner Johnson, we can debate figures as far back as we have records, if that is your view, if that is your purpose. But let us remember that in 1962, regardless of what went on before that, Hoover filled and anything that went before that is academic because we had enough water to fill in 1962. As recently as 1962 we impinged on the flood curve at Hoover Dam, Lake Mead.

So that whatever happened before that is of no concern. We couldn't have done anything about it, as Governor Clyde said a moment ago. We ought to start where we are and look at the problem from here on.

COM. JOHNSON: Were all your reservoirs completely filled in 1962?

MR. DOMINY: Yes.

COM: JOHNSON: What is the capacity of Lake Mead?

MR. DOMINY: Well it has a maximum capacity, including flood storage and surcharge pool, of something like 29,000,000 acre-feet.

COM. JOHNSON: That is what I was figuring, 29,000,000.

MR. DOMINY: But the Corps of Engineers gives us flood curves to follow on all of our principal river structures, and Hoover has a flood control function to perform too. We are not permitted to encroach on the flood curve except for a minimum period of time. That is not conservation storage.

COM. JOHNSON: It looks to me, at a time when you knew Lake Powell was coming up for filling and that there would be an extreme shortage of water anyway and a critical time, that you would have stored all the water that you could in your reservoir.

MR. DOMINY: We did. We did. We infringed on the flood curve, and we got the Corps to change it and move it up by a million acre-feet by reason of Navajo and Flaming Gorge being on the river and by reason of Glen Canyon being imminent on the river.

We have not operated this river negligently in spite of your position, Commissioner Johnson.

COM. JOHNSON: All I was going by was statistics, and I took the capacity of Lake Mead. I didn't know that 24,600,000 acre-feet was all that Lake Mead could hold.

MR. DOMINY: We have a conservation space limit and a flood space as established under the flood criteria. With Glen on the river we will be able to change that. We have already got them to move it up by a million acre-feet, and we think there is a good chance that we can get that released to a further extent but this doesn't help us in the future.

COM. JOHNSON: It would help us at the present time if we had that water that has gone down and been dumped into the Gulf of California, if that water was stored in Lake Mead and the other lakes below Lake Mead.

MR. DOMINY: This is where you and I differ because in 1962 we did not have the control on the river. The water came down uncontrolled in an amount that filled Lake Mead to the then current operating criteria, and we even infringed upon it and held all that we possibly could, Commissioner Johnson. There was no waste of water.

COM. JOHNSON: I was not aware of that fact and I did not understand it that way. But I did think that you could put more water in Lake Mead, and I think you had the water there to put in.

MR. DOMINY: I am sorry, sir, but the facts dispute your contention, and I shall stick with the facts.

COM. JOHNSON: Mr. Chairman, that concludes my questions.

THE CHAIRMAN: Mr. Bliss.

COM. BLISS: Mr. Chairman, I would like to echo what Governor Clyde has said as to the need for action. It seems to me that what our Commission is up against at the present time is this: We feel that analyses have been made, that the reports of the power companies have been made which show that they can take care of any deficiencies which may be created by starting to fill Glen Canyon at this time. We feel that now is the time to do it.

It is a calculated risk--we recognize that, you recognize it--but we feel that in any event it is the Upper Basin which will stand the loss if there is indeed a loss and later we have to effectuate the power capacity in Glen Canyon.

We feel that now is the time to proceed, for the Secretary to close the gates, and we would certainly like an opportunity to convince him that this is the time to do it.

MR. DOMINY: Let us take a look at this picture. Today is the 15th of April. We will have the May 1 snow survey available by May 8th.

I have asked Frank Clinton to get on this negotiating with the power companies immediately. We have the proposal as presented; we don't find rates and various details in there that will be necessary to discuss.

COM. BLISS: I think those have to be negotiated.

MR. DOMINY: And I personally don't see how this could possibly be negotiated into any final document ready for execution on the part of the companies and the Department of the Interior prior to May 8th in any event.

And I am willing to put full pressure behind it with Mr. Bennett, my Assistant Commissioner for power matters, and Regional Director Clinton and Regional Director West, who have the day-to-day on-the-job task of operating this river, to work to get everything we need for a final definitive decision as to the best course of action by May 8. And I think that the Secretary's interim announcement as to the operation should and will continue until that date.

I repeat again that the releases from Powell greater than inflow up until that time is not a critical factor, if we make the decision then that replacement power can be purchased and that we do have reasonable prospect of a runoff that will build up to 6,100,000 acre-feet at Lake Powell.

COM. CLYDE: You are fully aware I am sure, and I think you pointed this out, Mr. Dominy, that it takes some time to negotiate these agreements. There have got to be agreements between companies and there have to be agreements between the Secretary and the utilities as a group. There have to be agreements and understandings with the states. That all takes time.

Today is the 15th. The 1st of May will be here before we know it. I think it is quite important that action be taken immediately to enter into those negotiations to set up the machinery which can be put into effect once this decision is finally made without the necessary delay then of going through these things.

MR. DOMINY: I don't see how physically we could have all the answers required to adjust to the course of action the Commission is arguing for earlier than May 8th.

We have got to work with the Lower Basin power users and make arrangements for the delivery of the exchange power, if that is to be done; and we have got to ascertain with finality the means of delivering this power.

COM. CLYDE: Why can't that be done now by the 1st of May?

MR. DOMINY: I think I said by the 8th of May we can have these things resolved. I don't think we can do it prior to that, nor do I think the Secretary would want to make a final decision until the May 8th snow survey is available.

COM. CLYDE: But is the Secretary going to oppose the working out of the details of this thing? You may never use the details; that is entirely possible.

MR. DOMINY: I have already authorized Frank Clinton, as my agent, to proceed to consider the proposal with the companies right out in the West where the companies are, where our people are that are informed on the details of it. They will be working on it immediately.

COM. CLYDE: I think we ought to have more than a discussion, Floyd. I really think--

MR. DOMINY: My definition of "discussion" was actually negotiating details, getting into line and item contract detail.

COM. CLYDE: Are you authorizing him to enter into agreements if such agreements are found mutually acceptable?

MR. DOMINY: Of course we will give him that authority as soon as we see what the facts are. Meanwhile I have already told you that we haven't been idle; we have been discussing this same problem with the Lower Basin.

COM. CLYDE: We haven't been able to--and I would like to make it clear we do have a few brains--to work out this problem and we don't think we should be completely ignored on it. I think that is part of this cooperative program we have conducted for more than 50 years with good results.

MR. DOMINY: Let me state I have been a little bit distressed by some of the stories that made it sound like you people were completely unaware of this problem until the directive went out on March 26, and this I will not accept as a fact.

As early as last fall Frank Clinton told this Commission that because of the very dry year in 1963, that if we had a repetition of it we were in real trouble.

As early as January and February I had several discussions with Ival Goslin and other people out here who are interested in this problem.

We were all aware that we had a bear by the tail unless the snow started to fall. We haven't kept you uninformed.

COM. CLYDE: No one has ever questioned that, Floyd. But you remember through all these discussions we have mutually--and I say this honestly--we have mutually expressed the opinion that we should work together for the solution of these problems. I have sat in meetings with you and other members of your staff, and these other men have done the same thing. We hope we can continue to do that.

But in this particular case, this thing was dropped in our lap and that is the thing that prompted the first correspondence to see if we had the machinery to do this with. We didn't know whether we had or not.

MR. DOMINY: Once again, Governor, you say it was dropped in your lap. Everyone was aware of the published criteria that the Department had announced they would follow.

COM. CLYDE: That is true but no one knew, not even the Bureau, whether or not there was capacity and energy in such shape that it could be quickly and effectively utilized; that is the thing we had to find out. The report came in yesterday as to whether or not that could be done.

MR. DOMINY: You had a report from some Upper Basin power companies yesterday.

COM. CLYDE: That is right.

MR. DOMINY: We already had assurance from the Lower California companies we could do it. Now we have a choice as to who can do it the cheapest and the best arrangements for the financial return. But we have known that, if we elected, and when the water conditions will permit--

COM. CLYDE: You know this as well as we do, this has to be done with both Upper and Lower Basin utilities.

MR. DOMINY: We have known for many weeks that the California companies as well as Arizona Public Service Company have the capacity to make up the deficiency if we could afford to do it, and if the water supply availability made it practical to do it. And now we have the Upper Basin proposal. We will be in a position to evaluate them.

COM. CLYDE: That is the reason we all ought to sit down immediately and see what we can work out.

MR. DOMINY: This we are prepared to do.

MR. GOSLIN: By "immediately", Mr. Commissioner, what do you mean? You yourself stated that the point of no return is somewhere in May.

MR. DOMINY: It is in May.

MR. GOSLIN: Presumably early in May I think.

MR. DOMINY: Our charts indicated about the middle of May.

MR. GOSLIN: That is close enough we aren't going to quibble over a few days.

MR. DOMINY: We ought to have the most accurate snow survey we can get, which is May 1, available to us.

MR. GOSLIN: In the meantime we should be working out the details of a plan to implement, if those snow surveys bear it out, the manner in which you can store water, or that it can be done.

We have with us today representatives of the utilities who were here yesterday, Floyd. They have expressed a willingness to sit down any time and negotiate with the Secretary's representatives.

MR. DOMINY: They can start with Frank Clinton at once today, as far as I am concerned.

MR. GOSLIN: Fine, I would like to see that done.

MR. CLINTON: Let's wait until after lunch.

MR. GOSLIN: I think now is the time for action. I know full well, and so do you, that it is going to take more than one meeting to do this. It is going to take a series of negotiations. And the only real criticism that I have at all about this is it has been delayed so long. Further I think that you should have made a request of the power companies for this information that we had to go get. We have transmitted it officially to the Secretary as of yesterday, and representatives of your office were in a meeting yesterday and were given copies of the proposal. I am sure that the representatives of the utilities that are here today would be perfectly willing to hand you additional copies and to sit down this afternoon and start getting it done.

The problem now is one of immediacy. I see no further reason for delays. If there is anything that our Commission can do at the staff level, or any level, or the Commissioner level, I think I am authorized to speak up and say that we will be very happy to help you get together.

MR. DOMINY: I don't want the record to indicate here that we have been completely unaware of this problem and that we haven't been doing something about preparing for the day that we might be able to change this tentative decision to one more palatable to the Upper Basin.

I would like to have Commissioner Bennett stand up and give you a little review of the considerations we have been making.

MR. GOSLIN: We appreciate that, I know.

THE CHAIRMAN: Mr. Bennett, could we have a five-minute recess before you start?

COM. BLISS: In the interest of eating, let's eat.

THE CHAIRMAN: If the Commission would rather recess for lunch, when do you want to come back?

COM. BLISS: One-thirty.

THE CHAIRMAN: Without objection then we will recess until one-thirty.

(12:10 p.m., Noon Recess.)

- - - - - - - - -

(1:30 p.m., Meeting resumed. All Commissioners present.)

THE CHAIRMAN: It is our pleasure to have Governor Love with us this afternoon.

(Applause.)

GOVERNOR LOVE: Thank you very much.

THE CHAIRMAN: We had Mr. Bennett partly take the floor.

MR. DOMINY: Mr. Chairman, just before Mr. Bennett does the thing that I asked him to do with your permission just before lunch, I just want to

let you know that my statement that we were prepared now to move with dispatch to meet with the Upper Basin group to explore in detail the propositions which they are prepared to offer, was taken very seriously and Frank Clinton has arranged a conference, he met with each of the company representatives during the noon hour, and they will get together in Phoenix next Tuesday.

And I want to tell the Commission if you want your Executive Secretary or any officials from the Commission to participate in that meeting, that they will be more than welcome.

And I want to tell each of the Governors of the Upper Basin States, if they would like to have a personal representative in that meeting, they will be more than welcome.

We in the Bureau of Reclamation recognize that our sole business is to represent the best interests of the Nation and the public that we serve, and we are willing to operate in a goldfish bowl at all times. You will be welcome to participate in these meetings as they progress, and I have every reason to think that we can get definitive answers by the May 8th deadline.

Now, Mr. Bennett, I would like to have you tell them of some of the things we have already done that are essential in order to be able to weigh this proposal that will be coming from the Upper Basin States.

MR. BENNETT: Gentlemen, immediately following the availability of the February forecast, I personally contacted the Arizona Public Service Company to see what power they might have available for sale to us for Hoover replacement in the event it looked like that was the thing to do. We didn't have any idea at that time as to quantities of power, so we could sound them out only on generalities: How much do you have?

At that time Mr. Foreman told me that he thought they could make available about 400 megawatts. That was as I recall on February 11.

On February 20th I had our Region 3 people contact the City of Los Angeles and the Southern California Edison Company, who are also Hoover allottees, to see what they might do. This was a preliminary contact. We decided at that time to talk first to those people because they were the affected allottees and they were also closest to the market, shall we say, right in the market area, involving the shortest transmission and an ability to put power immediately into the load area affected by any diminution at Hoover.

We are happy to report that even in those early days, both the City of Los Angeles and the Southern California Edison Company reported they thought

they could handle--Edison its own load and Metropolitan Water District the City of Los Angeles--that it could handle its load and the load of the surrounding small communities who are also Hoover allottees.

I subsequently received a letter from Arizona Public Service in which they confirmed our discussion and told us that they had up to 400 megawatts of power which they could make available.

We also began looking at that time into ways and means that the Hoover units might be switched or rewired or otherwise made available for use into the Coastal areas. The Coastal areas we have seen are our problems in terms of ability to transmit.

I am sure you are aware, most of you at least, that the Hoover powerplant is not one powerplant the way it is presently hooked up. It is two powerplants to start with, one on each side of the river; and within each powerplant it is separate powerplants. Now we did explore back in 1960 what it might take and how we might make this one powerplant, but that is quite a job in itself.

We do know that we can make rearrangements on certain Hoover units. N8, for example, can be switched over to put its generation on the City line; and its power that Nevada otherwise would have can be replaced over the Parker-Davis system. That amounts to 70 megawatts. There are many things of that nature that can be done.

I think at that point, prior to yesterday, we were to a point where we could have entered into a contract within a week with any one of these entities or all of them actually to do the job. Now the receipt of the proposal by the Upper Basin utilities is something we want to study, we want to know more about it after Frank and his people have had an opportunity to work out more details. We are very happy to have that proposal in order to compare it with what might be done by these other approaches.

We want to do this job, if it is to be done, in the most economical manner possible. We think that helps the Upper Basin. It helps the Upper Basin Fund, and it, of course, over-all, aids the entire river payout situation.

So be assured we have not been idle in this regard. We will make these comparisons just as quickly as we can and bring contract negotiations, if that is the proper term, up as far as we can in order to make a final decision.

THE CHAIRMAN: Thank you, Mr. Bennett. Is it your intent, Mr. Commissioner, that if the Commissioners have questions to ask, they all come through you for reference or--

MR. DOMINY: Yes, I think that is the orderly process.

THE CHAIRMAN: Are there any questions from the Commissioners in regard to Mr. Bennett's report?

COM. CLYDE: Mr. Chairman.

THE CHAIRMAN: Governor Clyde.

COM. CLYDE: I understand that under this arrangement, Mr. Clinton has already been discussing this matter with the utilities who are here today?

MR. DOMINY: Yes.

COM. CLYDE: I appreciate this very much. I think this is the kind of action we need to get this show on the road.

I would like to make a motion at this time that the Commission authorize Mr. Goslin, its Secretary, to join with this group in these deliberations, I so move, Mr. Chairman.

THE CHAIRMAN: You have heard that motion.

COM. VAN CAMP: Second the motion.

THE CHAIRMAN: And its second.

COM. BLISS: I would agree with the motion if it is understood that this will be Ival and the staff.

COM. CLYDE: Yes, that is my interpretation.

(Thereupon a vote was taken.)

THE CHAIRMAN: Motion is carried.

COM. CLYDE: Mr. Chairman, I should also like as one of the Governors to take advantage of the opportunity to have a personal representative sit in on these meetings.

GOVERNOR LOVE: I join in that too.

GOVERNOR HANSEN: Wyoming also wishes to join in this.

MR. DOMINY: I am delighted that is what you are going to do. We want your participation, we want your guidance, and we want you to be in on all these meetings because we know the importance of the Colorado River to the economy of the Upper Basin.

GOVERNOR LOVE: I would like, Mr. Chairman, if I could make a very brief statement in addition to that.

THE CHAIRMAN: We would be happy to have you, sir.

GOVERNOR LOVE: I unfortunately have not been able to be present in the beginning to participate in the prior deliberations here. Certainly as far as Colorado is concerned we are delighted that active measures are evidently being taken to determine the feasibility of working out a proposition on the exchange of power which will allow Glen Canyon to be filled to its minimum power pool level. I would also like to say we are happy to cooperate in this area and aid in any way we can.

But in so doing I would like to state my understanding of this situation. It may be repetitious in that it may have been said before by representatives of Colorado, able representatives such as Governor Johnson. But first let me state that it is my understanding that the delivery of water to the Lower Basin States is controlled by the Compact, and it is my interpretation of the Compact from the advice I have received that the requirement measured in acre-feet is a running 10-year requirement rather than an annual requirement. If this is true, there is an implication perhaps of placing another requirement for delivery of water to the Lower Basin States than under the Compact, and that is the generation of power at Hoover Dam. It is my understanding that that is the position you have taken, Governor Johnson?

COM. JOHNSON: Yes, I take the position that we ought to follow the provisions of the Compact without any variation whatsoever, and the Compact provides for the burden of water that we must deliver to the Lower States, and it is a preference right, and we have fulfilled that right. And the Compact has stated the amount of water that the Upper Basin is entitled to, and this water that we are putting in Glen Canyon is part of the water that the Compact has awareded to us.

GOVERNOR LOVE: Under the terms of the Compact if we had means to retain it, if I understand it correctly, there would be no annual requirement of any water necessarily going downstream this year, is that right?

COM. JOHNSON: That is correct. We have delivered 18,000,000 acre-feet in the current 10-year period in excess of the 75,000,000 acre-feet that we are required to deliver. We are ahead of the game. But we have not

consumed the 7,500,000 acre-feet which the Compact gives to us for annual consumption, and so we are ahead. We are not putting any water into Glen Canyon. We won't put any water into Glen Canyon that is not our own water. I think we have a title to it, a clear title to it under the Compact.

And I think this other thing ought to be said--I have said it a good many times--that we realize that there is a grave difficulty because of the shortage of rainfall; and that out of the goodness of our hearts and not by any compulsion of the Compact, we are willing to let just as much water go down the stream as we can as soon as we get enough water stored at Glen Canyon that will permit us to produce power.

The moment we get enough in there to produce power, we will let the whole river at Glen Canyon go on down to Lake Mead--out of the goodness of our hearts and not because the Compact compels us to let it go down.

GOVERNOR LOVE: I agree, Mr. Chairman, and that may be repetitious without knowing what has gone before. But I certainly want to make it clear for the record that that is Colorado's position on this; and that any agreement or negotiation or exploration leading to the exchange of power--which we are for--should not be construed as any precedent which goes to the contrary of that position.

THE CHAIRMAN: Thank you, Governor. At the meeting yesterday the Chairman of the Legal Committee made a report in which he had framed certain questions. He is asking for the floor now to explore those questions. Mr. Sparks.

MR. SPARKS: Thank you, Mr. Chairman. Gentlemen, Governors: First, the letters that were mentioned this morning from Congressman Aspinall and the reply thereto by Assistant Secretary Holum, have been reproduced by our staff upstairs and those letters are available here on the corner of the desk. However, the appendices we did not have time to reproduce, and they will be reproduced by the Commission staff during this week, and will be available. Appendix 7, which involves the squatter problem, is being reproduced upstairs and will be available in about another hour.

Mr. Chairman, Gentlemen of the Commission and Governors, Mr. Commissioner Dominy: As has been stated, the Legal Committee Report to the Commission yesterday recommended that certain action be taken in connection with the Colorado River problem now facing us.

The Legal Committee is fully aware of the pitfalls of attempting to institute litigation to resolve the many problems of the Colorado River. As a

long-time practicing attorney and a former Justice of the Supreme Court of this State, along with the able representation we have from the other states--the Attorney Generals of Utah and Wyoming are on our Legal Committee along with representatives from the Interstate Stream Commission of New Mexico--we are all in full accord with the proposition that it is futile to institute legal action unless it is a case of final resort. And we informed the Commission that it was our opinion that there were methods to solve the various problems without resorting to litigation; but if they could not be so solved, eventually some of these issues would have to be presented to the United States Supreme Court.

Specifically we are concerned, Mr. Commissioner, with newspaper accounts originating from Washington to the effect that an agreement was reached on the adoption of the filling criteria. We are fully aware that newspaper accounts sometimes are at least partially erroneous or exaggerated. But nevertheless, I head your explanation this morning that there was no formal agreement entered into on the filling criteria.

What I want to ask you? Is it your impression that an informal agreement was reached on the approval of these filling criteria?

MR. DOMINY: My impression, Mr. Sparks, and members of the Commission, was that my able representatives, meeting with your able technical experts and political scientists, agreed pretty completely that there was not possible a document outlining a precise filling criteria that the Upper Basin States and the Lower Basin States could formally agree to and accept with finality.

My understanding further was that we narrowed the differences of opinion between what the Upper Basin States felt was fully proper from their point of view and what the Lower Basin States felt was fully proper from their point of view to protect their interests, into as narrow a range of differences as was humanly possible, short of a court adjudicated settlement of a number of touchy elements. And our filling criteria was deliberately announced within that range as being the closest we could come to that reconciled two widely differing points of view between two able and intelligent groups of people representing vastly different views as to what was right and proper for their own interests on the Colorado River.

MR. SPARKS: To return to my question: The true statement is then that the Upper Basin never agreed to these filling criteria?

MR. DOMINY: And neither did the Lower Basin. We asked neither of you to formally say, "This is a criteria that we will bind ourselves to irrevocably." We didn't ask for that, nor did we receive it.

MR. SPARKS: All right, then there was no agreement on the filling criteria?

MR. DOMINY: No, sir.

MR. SPARKS: That clears up that point. We were probably misinformed by the newspapers.

The second question, Mr. Dominy: It was stated that no water is being utilized for the generation of power in the Lower Basin since these filling criteria were adopted. May we ask you, Mr. Dominy, what is the purpose of ordering the release from Glen Canyon during the last few weeks?

MR. DOMINY: The purpose of ordering the release of water from Glen Canyon is to maintain a minimum head and--

MR. SPARKS: For what purpose?

MR. DOMINY: It is not for the purpose of putting water through the powerplants that would not go through independent of downstream diversionary requirements.

MR. SPARKS: For what purpose are you maintaining a minimum head at Hoover Dam?

MR. DOMINY: The purpose is to maintain a head so that what water is released at Lake Mead will give us the rated power head at the plant.

MR. SPARKS: Well to put it in simple language, it is to generate power, is it not, at Hoover Dam?

MR. DOMINY: It is not to generate power; it is to keep the level of the late at a rated head on the powerplant so that what water we do release, we create the maximum amount of power possible for the units that are there, and not just put the same water downstream at a lower head and decrease the power.

MR. SPARKS: Let us get at the problem another way then, Mr. Dominy. The filling criteria provide that no water shall be utilized from the Colorado River flow for the Lower Basin with the exception for the purposes of irrigation and municipal uses, isn't that correct?

MR. DOMINY: That is correct, and that is exactly the way we are operating Lake Mead.

MR. SPARKS: Is that the purpose of the withdrawal today from Glen Canyon?

MR. DOMINY: The purpose of the withdrawal, as I have stated, is to preserve the level of Lake Mead so as to maintain a rated head on the powerplants.

MR. SPARKS: For the generation of power?

MR. DOMINY: For the generation of power with the water that would be otherwise released regardless of the level of Lake Mead to meet downstream requirements.

MR. SPARKS: Let us be practical, Mr. Dominy. Then the purpose of the withdrawal of Glen Canyon Reservoir today is for generation of power in the Lower Basin, is that correct?

MR. DOMINY: It is to maximumize the generation of power with the same water releases so required irrespective of the head maintained there.

MR. SPARKS: Isn't it true that the water released from Glen Canyon is for generation of power in the Lower Basin and not for beneficial use as specified in the Compact?

MR. DOMINY: It is to maintain rated head but the same quantities of water would be released for downstream uses whether Lake Mead was 1080, 1100, 1120 or 1123. It just happens that we maintain it at 1123. This gives us the best economic management of the river under the kind of runoff conditions we have and protects the Upper Basin to that extent.

MR. SPARKS: For the generation of power.

MR. DOMINY: For the maintenance of maximum power generation in a powerplant that is already in existence with all units in place.

GOVERNOR LOVE: Just a matter of clarification: If it were not for the process of generating power at Hoover Dam, is there sufficient water in Lake Mead to meet agricultural and municipal needs downstream.

MR. DOMINY: Yes, sir. Yes, sir, we could release that even if we were to pull Lake Mead down to 1050.

MR. SPARKS: I think we all understand the problem, Mr. Dominy. I merely want to correct the impression that was put out this morning, that this problem is not created because of the generation of power at Hoover Dam actually.

MR. DOMINY: Mr. Sparks, I read the newspapers, too, and the newspapers have interpreted you as saying we have been releasing water at Lake Mead specifically for the generation of power, and this is incorrect. We have not done so since 1960, we will not do so in 1964, and as far as I can see we will not do so hereinafter because of the Upper Basin requirements. I doubt if the river will ever--

MR. SPARKS: This is a clever decision: You do not release it from Hoover for power, you release it from Glen Canyon instead, and that is what we are complaining about.

MR. DOMINY: Apparently you were absent when I pointed out the runoff projections of this river are such that if we followed apparently what is your recommendation, we could end up with both reservoirs at an inadequate level to generate power; and this I do not consider would be carrying out my responsibility as Commissioner to protect the investment of the United States in the Colorado River system.

MR. SPARKS: I am glad you touched on the point of investment, Mr. Dominy. How much Federal investment remains in Hoover Dam?

MR. DOMINY: Hoover Dam is well on schedule of its repayments. It has been a very fine economic--

MR. SPARKS: It is less than a hundred million dollars, isn't that right?

MR. DOMINY: I think that is right.

MR. SPARKS: How much has Congress authorized for the Upper Basin Projects at the present time?

MR. DOMINY: Glen Canyon, $345,000,000 roughly and we have had authorized $760,000,000 for participating projects.

MR. SPARKS: Plus about $300,000,000 in addition to that?

MR. DOMINY: With the San-Juan Chama and Navajo Indian Projects, yes.

MR. SPARKS: So Congress to date has authorized in excess of one billion dollars for the Upper Basin Projects?

MR. DOMINY: That is correct.

MR. SPARKS: And the Federal investment is protected and is best being served by protecting the less than one hundred million at Hoover, is that the implication?

MR. DOMINY: No, you are again deliberately apparently overlooking the fact that we have specifically and repeatedly said, that our studies indicate that to protect the Upper Basin account we cannot now reconcile the burden of power replacement when we have no assurance that even were we to do so we could get 6.1 million at Lake Powell in 1964, and there is no way of knowing what 1965 will bring.

MR. SPARKS: That is what is worrying us. Mr. Dominy, let us get back to a basic question. Of course, when the filling criteria were discussed, and they have been discussed for many years, we only had essentially two basic objections to that filling criteria.

One was the fact, the situation we clearly pointed out at the time that we now find ourselves in today, and that was that the entire burden of deficient streamflow was placed on the Upper Basin. When you made the remark, you said, "We are in trouble," you meant the Upper Basin. We are wondering why you remark that "we" in the Upper Basin are in trouble and not the Lower Basin.

That is one of the basic objections we had which was never satisfied in the filling criteria.

The other one, and the important one, is that we were not willing to quibble about how money is exchanged back and forth as long as the Upper Basin Fund was made whole. In other words, the diversions of electric power or money that are being made today to recompense Hoover power contractors, if that were returned in whole to the Upper Basin Fund, we said that we could go along with that criteria.

Unfortunately that was not done. The criteria was modified slightly to provide a return on certain funds, a minor part of the funds after 1987.

The Legal Committee yesterday proposed that the Boulder Canyon Project Act and Adjustment Act be amended to the effect that the Colorado River Development Fund therein provide $500,000 a year be utilized to provide the purchase of substitute energy.

Does your Department have any objection to that procedure?

MR. DOMINY: Not at all. And we have publicly stated that this could be possible only by Congressional action, and that we would not

object in any way if Congress wanted to do it in this fashion. As a matter of fact we would very probably endorse it.

MR. SPARKS: Would you have any objection if we said 100 percent of the return to the Upper Basin, including secondary energy and any other benefits that are diverted from the Upper Basin for the benefit of Hoover power contractors?

MR. DOMINY: Well I can't speak for the Department on that particular element. Certainly if Congress chose to use the Fund for that purpose and passed a law, we would have no objection whatever. I am not at all certain that we would not report favorably on such a proposal.

MR. SPARKS: This is something that has baffled us over the several years we have had numerous negotiations with the Lower Basin States and power users and other people, we have never found them to be unreasonable in any case.

We have been repeatedly told and were told at the time these filling criteria were adopted that the Lower Basin would not stand still for return to the Upper Basin of 100 percent of the revenues which were diverted for the Hoover power contractors. Now can you or anyone on your staff tell me who in the Lower Basin made that statement?

MR. DOMINY: Well Assistant Commissioner Bennett represented me in all the discussions.

MR. SPARKS: Mr. Bennett is the gentleman who made that statement to me, so I would assume he can explain it.

MR. BENNETT: Well I am trying to get back in my mind these events.

We discussed at some length with the Lower Basin people, particularly the power allottees, the idea that I believe Mr. Goslin had initially of this repayment.

And I think it is a fair statement, collectively they were opposed to a hundred percent repayment, by that meaning that if you spent $3,000,000 today, the amount repaid in 1987 or thereafter would be the $3,000,000 with accumulated interest. They told us flatly--and I say "they," as I say I think it was and is a fair statement now that every one of them told us that at the time--that they would not put up any major objection to a return on a dollar-for-dollar basis; but that they would object vigorously as a matter of fact to a return of, what you term, total cost.

MR. SPARKS: I assume that the Department has no objection if arrangements can be worked out with the Lower Basin on some method to reimburse the Upper Basin Fund 100 percent.

I think, Mr. Dominy, this points up one of our major problems that has occurred in this whole controversy. The Upper Basin and Lower Basin have been dealt with at arms' length with an intervening force in Washington, D. C.

We urged repeatedly some years ago that some type of coordinating committee be established between the Upper and Lower Basin States to the end that we could work out our own problems. We are told one thing that happens in negotiations between the Bureau and the Lower Basin, and then when we meet with the Lower Basin we are told something else. This points up a total lack of communication between the Upper and Lower Basins.

I don't think the problems are very great between the two Basins, and I at this time would like to again urge that through the jurisdiction of the Secretary of the Interior, the Upper and Lower Basins be entitled to participate jointly with the Bureau of Reclamation, not separately as has been done in the past. I think this is a large part of our trouble, is a lack of communication among all parties concerned.

MR. DOMINY: Well certainly even if I were disposed to do so--which I am not--I could not prevent the Lower Basin and the Upper Basin from getting together and setting up a joint board of control of some kind to meet and discuss their problems, and we would not object to it at all. In fact, I think it is a good idea.

MR. SPARKS: The problem is created--I think the gentleman from Nevada summed it up very well yesterday--he said that the Lower Basin power allottees had no reason to get into this picture at all. The reason is very obvious: They haven't had to do anything because they haven't had anything to worry about. Their interests have been fully protected by the criteria that has been adopted.

So there is no incentive on their part to try to work out any mutual arrangements and in our recent negotiations with Southern California Edison Company, for instance, we were given pretty much a cold shoulder on the grounds that, well, this was a matter they would have to take up with the Bureau. And it is this type of exasperating run-around which has made it impossible for the Lower and the Upper Basins to try to get together.

MR. DOMINY: I would like to point out, Mr. Sparks, when we decided in 1962 to start operating Lake Mead and Hoover Dam as though Glen Canyon gates had already been closed, that the Lower Basin power allottees objected quite strenuously that we should not interpose the criteria until we actually were physically capable of storing water at Lake Powell--but we did.

I wish it were true that one element on this river were completely satisfied with the manner in which I am operating it. I remain in the middle and this is a very uncomfortable position, because the Commissioner of Reclamation as a Federal employee must never embrace the extreme on either side of a controversy.

MR. SPARKS: Is there any objection then with the Bureau people to the Upper and Lower Basins appointing representatives and meeting together so we can determine what the actual disputes are?

MR. DOMINY: Certainly not.

I would like to call your attention to Senate Document No. 7, 88th Congress 1st Session, which is "The Sixth Annual Report on the Status of the Colorado River Storage Project and Participating Projects, together with a Statement to govern, and operating criteria for, Glen Canyon Reservoir (Lake Powell) and Lake Mead during the Lake Powell filling period and related documents."

On Page 9 of this document you will find in discussing Principles 9 and 10, the following statement:

> "The suggestion was again advanced that the Upper Basin should be formally represented on a river operations committee. It was suggested also that working committees should be formed which would include representation of Lower Basin water users as well as power contractors who would have an effective voice in secretarial decisions in resolving problems which may arise in filling Lake Powell. In both cases it was indicated that Congressional authorization of such committees probably would be necessary or desirable. Responsibility for operation of the Federal projects involved is now vested in the Secretary of the Interior and, we believe, properly should remain so. Creation of new bodies with statutory powers which might tend to complicate and make more difficult the coordinated operation of a widespread river basin system."

Now I don't think you are talking about, as I understand it, a group with statutory powers; you are talking about a group advisory in nature?

MR. SPARKS: That is correct.

MR. DOMINY: Which would meet and try to reconcile your own differences and thereby help us resolve some of the controversies that exist.

MR. SPARKS: That is exactly correct.

MR. DOMINY: I think this would be splendid.

MR. SPARKS: We have urged this for a number of years. We asked for it some five years ago. And as I say, I still think it accounts for a large part of our troubles. The communication we get from the Lower Basin is not the same communication we get from your office in Washington; somebody has lied to us, and one of these days we are going to find out.

One other point is: By what authority does the Secretary think that you can divert funds from the Upper Basin to make good Hoover power contracts?

MR. DOMINY: I will call upon my counsel, Mr. Weinberg.

MR. SPARKS: I am anxious to hear this.

MR. WEINBERG: I will be brief; I will also be unpopular. In our opinion this is properly classified by the Secretary as an operating expense or a construction expense of constructing and operating the Upper Basin projects, and it is on that basis that we obtain the funds.

MR. SPARKS: An operating expense?

MR. WEINBERG: Right.

MR. SPARKS: By what contract, law, authority or Congressional act is the United States obligated to deliver water for power generation at Hoover Dam?

MR. WEINBERG: Well, Mr. Sparks, you are right back to the same question that you have been sparring around with Mr. Dominy.

MR. SPARKS: I am not sparring; I am trying to get an answer.

MR. WEINBERG: Mr. Sparks, you are attempting to put into Mr. Dominy's mouth and now into my mouth an answer that you want. We are not going to give you that answer because we do not agree with your answer.

MR. SPARKS: Because you do not have an answer. That is what I want, is to get an answer.

MR. WEINBERG: No.

MR. SPARKS: You are doing it. Why are you doing it, by what authority?

MR. WEINBERG: Mr. Sparks, we have an answer. The difficulty with our answer is that it doesn't satisfy you.

MR. SPARKS: What is the answer?

MR. WEINBERG: It is a matter of regret but this is something that we can't help.

MR. SPARKS: Well try us with the answer; maybe we can understand.

MR. WEINBERG: We have given you the answer.

MR. SPARKS: Mr. Dominy, I will say yesterday a great deal was said about the regulatory wastes below Hoover Dam, and I will state after reading the letter that was received by Congressman Aspinall, there is a very fine explanation of the actions that are being undertaken to eliminate a major part of that condition. And we fully realize that the illegal diversion of water has existed for many, many years prior to anybody now in the Bureau having any responsibility in connection with it.

We can only assure you that you have our support in attempting to evict people down here or to stop the illegal diversions. I think the Commission when they read the answers that were given on that problem will find they are quite satisfactory. That was another problem that we brought up in the Legal Committee.

MR. WEINBERG: May I comment on that. We certainly are going to need your help. We have had a very difficult time in our trespass actions. One action Mr. Dominy referred to in his speech was commenced over five years ago. I will not use names, but I will give you the facts in that case. The facts are very simple.

An individual went on to withdrawn land, proceeded to subdivide it, sell it on quitclaim deeds. Five years ago we brought an action to enjoin him, to evict him, and for an accounting.

The District Court refused to enter an order that the United States was entitled to damages. The eviction was stayed. We had to go to the Court of Appeals, which reversed the District Court on the question of the entitlement of the United States to damages; directed the District Court to determine damages.

We are back in court, it is five years later, and that man is still not off the property. These are the problems that we are encountering. This is one case.

So it is not an easy job, and we certainly appreciate your support, and we feel that it is going to take an aroused public opinion to overcome the feeling of sympathy with the underdog which has obtained when the United States in all of its majesty goes in there to evict a man who says, "I am a twentieth century pioneer. If this had been in 1865 I would have been a hero." And unfortunately this gives us problems.

MR. SPARKS: We realize that. We also realize that we in the Upper Basin have been laggard in not insisting on action prior to this time. We don't care whether or not the land is actually open to homestead. We would prefer that the land be opened up for sale and put into private ownership. But the situation being what it is, until that is done, why we don't want our water used.

There are only two other points, Mr. Dominy: First is the interconnection that has already been mentioned. Is there a real program to try to interconnect the powerplants at Hoover Dam?

MR. DOMINY: Mr. Bennett mentioned that he is looking at every possible way to get that power across through the plant which is not now interconnected; and they do think that there may be some bypassing in the switchyards that would be possible to satisfy the movement of that power within the requirements.

MR. SPARKS: This is a situation which we have all known about for some 25 years and it still has not been corrected; and of course like many of these other problems we are impatient now to get them corrected.

MR. BENNETT: Let me add to this one--two thoughts actually: That we started studying that situation seriously when we began to study the joint operation of Glen and Hoover. We found at that time that the hydrology didn't produce a greater power operation jointly than it did the sum singularly. This was a surprise to us. We thought the other would be true; it wasn't.

We found at that time it would cost between $8,500,000 and $10,000,000 to place Hoover in a situation such that it could be operated as a single plant. It was not worth it at that time for the purposes we were trying to gain.

However two things are now in the picture: Bridge Canyon and Marble Canyon coming on the line will require that something be done at Hoover, and the intertie line with the Pacific Northwest will require that something be done at Hoover, either one of which would be a cost not against Hoover but whatever the plan might be at that time.

So from those three standpoints, this matter has been explored in some depth.

MR. SPARKS: Only one final point, Mr. Dominy. I want to correct an impression that was left this morning. I think it was brought up that the releases from Hoover have been in the last few years in the magnitude of some 8,500,000 acre-feet for various purposes, Mexico and the contracts downstream.

Isn't it true that in addition to that 8,500,000 acre-feet that was released from Hoover, there is some additional 3,000,000 acre-feet used from the Lower Basin tributaries by the Lower Basin States?

MR. DOMINY: Mr. West.

MR. WEST: No, I think 3,000,000 is too high a figure. A million perhaps from the Gila; the Gila has been frequently referred to as a source of around a million acre-feet.

MR. SPARKS: Arizona at one time claimed 4,000,000.

MR. WEST: That is the year it flooded us out and we tried to put a siphon under it.

MR. SPARKS: Anyway, the beneficial use being made by the Lower Basin, it is not just the releases from Hoover but it is the tributaries as well?

MR. WEST: There is no tributary water that reaches the Colorado except for some very slight flow from the Little Colorado above Hoover Dam.

MR. SPARKS: But the Gila is used in Arizona?

MR. WEST: Yes, it is.

MR. SPARKS: So the releases to the Lower Basin, their beneficial consumptive use, is the total of the Lower Basin tributaries plus the releases from Hoover?

MR. WEST: Well yes. The decree separates the tributaries from the main stream.

MR. SPARKS: The what?

MR. WEST: The Colorado River decree.

MR. SPARKS: Not the Colorado River Compact.

MR. WEST: I think it is moot. Eddie, you are the lawyer here.

MR. WEINBERG: Under the Boulder Canyon Project Act as construed by Arizona-California, tributary uses are not included in determining the apportionment of the 7,500,000 acre-feet.

MR. SPARKS: In the Lower Basin.

GOVERNOR LOVE: That was only as between California and Arizona?

MR. WEINBERG: That is right.

GOVERNOR LOVE: The Supreme Court does not carry that context into the division between the Upper and Lower Basins?

MR. WEINBERG: No. The Supreme Court made it quite clear it was not interpreting the Compact.

MR. SPARKS: Mr. Chairman, that is all I have. Thank you.

THE CHAIRMAN: Mr. Commissioners, the field is open. Our visitors are here waiting to answer questions.

MR. BARLOW: Mr. Chairman, at this point, at his pleasure, we have our Governor from Wyoming here. He has been very attentive and a good listener, and sometimes when he gets out with his cattle he talks out loud. I wonder if he didn't have a word or two to say at this point.

GOVERNOR HANSEN: Mr. Commissioners and Mr. Dominy: I was delighted to be here. I was sorry I too could not have been here yesterday. I am a relative neophyte at this operation. We have been interested for some years past in the Snake River and Columbia River systems of the Pacific Northwest. We have a very real interest in water in Wyoming as do these other Upper Colorado River Basin States.

It seems to me that if I were to try to summarize some of the things I heard here this morning that are of importance, I would point out that it is necessary, if we are to get on with the project, if we are to get on with the work that we recognize must be done--and as was so eloquently pointed out by Senator-Governor Johnson this morning--that we have got to fill these upstream reservoirs. It is obvious that there is not enough water, a dependable source of supply, every year that can fulfill the commitments that we are called upon under the terms of the Compact to meet. So it is important, it is terribly important that we get the Upper Basin reservoirs filled.

It is important too that we get this job done so that the powerplants at these Upper Basin reservoirs can go on stream to help with the repayment of the projects that we recognize must be brought into being before we can bring about the full development of our agricultural and water potential in the Upper Basin system.

There have been several proposals made here this morning that I think are particularly meritorious. I recognize, as was pointed out by the Commissioner here, that it has been a tough job for him and for those in his Department to try to reach a consensus; and I am not criticizing what may have been done in the past.

But I would say to you, sir, that I hope with an open mind you will consider and mull over seriously the proposals that have been made here in the last two days; and if you find merit in these proposals--and I sincerely believe there is merit in these proposals--that you take a second look at the filling criteria you have set up.

It seems to me that fairness and equity would certainly proclaim that over the past ten years there has been a significant contribution made to the power supply of Hoover because of the inability as of that ten-year period of time for us to put the waters that were rightly ours to good use here. I think that it would not be out of the way at all for the Lower Basin States under your tutelage to say, "Now we are going to make whatever rearrangements we can in the impounding of these waters at Glen Canyon so as to assure the early onstream development of the powerplant"--that will be, I understand, capable of turning out juice early this autumn. If this can be done, then it makes awfully good sense to me that we can use this water twice.

I know that we have had two dry years and it seems to me that the two dry years we have had might well have been anticipated by the hydrologists who have been observing the precipitation pattern throughout this great arid southwest for a number of years.

I can't think that the Upper Basin States haven't contributed far more than they have gotten. All these benefits of extra water, all the benefits of our lack of development of our potential here, have accrued to the advantages of the states downstream. And I think we have a good reason now to say, "We are entitled to a little bit of a break."

Wyoming will have someone sit in with the officials of your Department along with the private power people who have come in and have offered to fill this breach. I am appreciative of this great effort, this indication of a willingness to resolve problems on the part of private enterprise along with Government. And we will have someone there from Wyoming to sit in with Ival Goslin.

I repeat again, I think we have contributed far more than we have gotten. I think it is time that justice and equity demand that we receive more consideration than we have up to this time. Thank you, sir.

MR. DOMINY: Mr. Chairman, may I comment for just one word or two.

I can't disagree with anything my good friend, the Governor of Wyoming, has said. The Bureau of Reclamation, the Department of the Interior, is in the unenviable position here of having on the one side a developed area that has its projects and has an economy built upon the use of those projects, and who from the extreme point of view would like to see that all the filling be done with flood waters above and beyond anything that they can store and use in their reservoirs already established.

Now this position we have not accepted in the filling criteria. We have compromised seriously from that position.

Contrasting that with the position so ably represented by Commissioner Johnson in what I have seen of his statements previously and today, that now that the Upper Basin has the structures on the river we ought to close them up and stop all water until the minimum filling is acquired without regard to downstream needs and uses. This also is an extreme position which we cannot accept and have not accepted in the filling criteria.

We have tried to find a realm between those two extremes that represent an equitable point of view accepting the facts of life and the Federal investment in total on the river.

Now to the extent that we haven't satisfied anybody, it sort of convinces me that we are in the realm of possibly being fairly right in what we are doing.

COM. JOHNSON: Mr. Chairman.

THE CHAIRMAN: Commissioner Johnson.

COM. JOHNSON: Mr. Dominy does not agree with me when I contend that the Secretary of the Interior has no authority to open the gates of Glen Canyon. I regret that he does not agree with me, but I am very pleased that eight members of the Supreme Court do agree with me, and I would like to read four or five lines here in the Arizona versus California case. It's the copy that was presented by Mr. Hayden as a Senate document, and on Page 34, in that decision I find these words:

> "He"--and that is the Secretary--"He and his permittees, licensees, and contractees are subject to the Colorado River Compact,

and therefore"--get these words, please--"and therefore can do nothing to upset or encroach upon the Compact's allocation of Colorado River Water between the Upper and Lower Basins."

COM. BLISS: Mr. Chairman, I have no desire to cut off anyone who desires to talk; but it seems to me that we have explored this thing pretty fully.

We have the assurance from Commissioner Dominy, and from the Secretary I think, on what we came here to obtain. We have received an excellent report from the power companies of the Upper Basin. I think we are on the way toward arriving probably at a settlement which I hope will be favorable to the Upper Basin.

I would like to thank the power companies personally for the immense amount of work they have done in preparing this report; and I would like to thank Commissioner Dominy and his group for coming here and talking with us today.

If there is nothing further, I would move, sir, we adjourn.

COM. VAN CAMP: Second the motion.

THE CHAIRMAN: It has been moved and seconded that we adjourn, with all the felicities that Mr. Bliss has stated. (Thereupon a vote was taken.)

Motion carried. We are adjourned.

(2:40 p.m., Wednesday, April 15, 1964, Adjourned Regular Meeting adjourned.)

Public Law 90-535

AN ACT

September 28, 1968
[S. 1440]

To include in the prohibitions contained in section 2314 of title 18, United States Code, the transportation with unlawful intent in interstate or foreign commerce of traveler's checks bearing forged countersignatures.

Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled, That section 2314 of title 18, United States Code, is amended by inserting after the third paragraph thereof a new paragraph as follows:

Crimes.
Forged traveler's checks, transportation.
62 Stat. 806.

"Whoever, with unlawful or fraudulent intent, transports in interstate or foreign commerce any traveler's check bearing a forged countersignature; or".

Approved September 28, 1968.

Public Law 90-536

AN ACT

September 28, 1968
[S. 1637]

To amend the Tennessee Valley Authority Act of 1933 with respect to certain provisions applicable to condemnation proceedings.

Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled, That the last six paragraphs of section 25 of the Tennessee Valley Authority Act of 1933 (48 Stat. 70), as amended (16 U.S.C. 831x), are hereby repealed.

TVA property condemnation proceedings.

SEC. 2. The amendment made by this Act shall be effective only with respect to condemnation proceedings initiated after thirty days following the date of enactment of this Act.

Effective date.

Approved September 28, 1968.

Public Law 90-537

AN ACT

September 30, 1968
[S. 1004]

To authorize the construction, operation, and maintenance of the Colorado River Basin project, and for other purposes.

Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled,

TITLE I—COLORADO RIVER BASIN PROJECT: OBJECTIVES

Colorado River Basin Project Act.

SEC. 101. That this Act may be cited as the "Colorado River Basin Project Act".

AUTHENTICATED
U.S. GOVERNMENT
INFORMATION
GPO

SEC. 102. (a) It is the object of this Act to provide a program for the further comprehensive development of the water resources of the Colorado River Basin and for the provision of additional and adequate water supplies for use in the upper as well as in the lower Colorado River Basin. This program is declared to be for the purposes, among others, of regulating the flow of the Colorado River; controlling floods; improving navigation; providing for the storage and delivery of the waters of the Colorado River for reclamation of lands, including supplemental water supplies, and for municipal, industrial, and other beneficial purposes; improving water quality; providing for basic public outdoor recreation facilities; improving conditions for fish and wildlife, and the generation and sale of electrical power as an incident of the foregoing purposes.

(b) It is the policy of the Congress that the Secretary of the Interior (hereinafter referred to as the "Secretary") shall continue to develop, after consultation with affected States and appropriate Federal agencies, a regional water plan, consistent with the provisions of this Act and with future authorizations, to serve as the framework under which projects in the Colorado River Basin may be coordinated and constructed with proper timing to the end that an adequate supply of water may be made available for such projects, whether heretofore, herein, or hereafter authorized.

TITLE II—INVESTIGATIONS AND PLANNING

SEC. 201. Pursuant to the authority set out in the Reclamation Act of June 17, 1902, 32 Stat. 388, and Acts amendatory thereof or supplementary thereto, and the provisions of the Water Resources Planning Act of July 22, 1965, 79 Stat. 244, as amended, with respect to the coordination of studies, investigations and assessments, the Secretary of the Interior shall conduct full and complete reconnaissance investigations for the purpose of developing a general plan to meet the future water needs of the Western United States. Such investigations shall include the long-range water supply available and the long-range water requirements in each water resource region of the Western United States. Progress reports in connection with these investigations shall be submitted to the President, the National Water Commission (while it is in existence), the Water Resources Council, and to the Congress every two years. The first of such reports shall be submitted on or before June 30, 1971, and a final reconnaissance report shall be submitted not later than June 30, 1977: *Provided*, That for a period of ten years from the date of this Act, the Secretary shall not undertake reconnaissance studies of any plan for the importation of water into the Colorado River Basin from any other natural river drainage basin lying outside the States of Arizona, California, Colorado, New Mexico, and those portions of Nevada, Utah, and Wyoming which are in the natural drainage basin of the Colorado River.

43 USC 371.
42 USC 1962 note.

Reports.

SEC. 202. The Congress declares that the satisfaction of the requirements of the Mexican Water Treaty from the Colorado River constitutes a national obligation which shall be the first obligation of any water augmentation project planned pursuant to section 201 of this Act and authorized by the Congress. Accordingly, the States of the Upper Division (Colorado, New Mexico, Utah, and Wyoming) and the States of the Lower Division (Arizona, California, and Nevada) shall be relieved from all obligations which may have been imposed upon them by article III(c) of the Colorado River Compact so long as the Secretary shall determine and proclaim that means are available and in operation which augment the water supply of the Colorado River system in such quantity as to satisfy the requirements of the Mexican Water Treaty together with any losses of water associated with the performance of that treaty: *Provided*, That the satisfaction of the requirements of the Mexican Water Treaty (Treaty Series 994, 59 Stat. 1219), shall be from the waters of the Colorado River pursuant to the treaties, laws, and compacts presently relating thereto, until such time as a feasibility plan showing the most economical means of augmenting the water supply available in the Colorado River below Lee Ferry by two and one-half million acre-feet shall be authorized by the Congress and is in operation as provided in this Act.

SEC. 203. (a) In the event that the Secretary shall, pursuant to section 201, plan works to import water into the Colorado River system from sources outside the natural drainage areas of the system, he shall make provision for adequate and equitable protection of the interests of the States and areas of origin, including assistance from funds specified in this Act, to the end that water supplies may be available for use in such States and areas of origin adequate to satisfy their ultimate requirements at prices to users not adversely affected by the exportation of water to the Colorado River system.

(b) All requirements, present or future, for water within any State lying wholly or in part within the drainage area of any river basin from which water is exported by works planned pursuant to this Act shall have a priority of right in perpetuity to the use of the waters of that river basin, for all purposes, as against the uses of the water delivered by means of such exportation works, unless otherwise provided by interstate agreement.

SEC. 204. There are hereby authorized to be appropriated such sums as are required to carry out the purposes of this title.

TITLE III—AUTHORIZED UNITS: PROTECTION OF EXISTING USES

SEC. 301. (a) For the purposes of furnishing irrigation water and municipal water supplies to the water-deficient areas of Arizona and western New Mexico through direct diversion or exchange of water, control of floods, conservation and development of fish and wildlife resources, enhancement of recreation opportunities, and for other purposes, the Secretary shall construct, operate, and maintain the Central Arizona Project, consisting of the following principal works: (1) a system of main conduits and canals, including a main canal and pumping plants (Granite Reef aqueduct and pumping plants), for diverting and carrying water from Lake Havasu to Orme Dam or suitable alternative, which system may have a capacity of 3,000 cubic feet per second or whatever lesser capacity is found to be feasible: *Provided*, That any capacity in the Granite Reef aqueduct in excess of 2,500 cubic feet per second shall be utilized for the conveyance of Colorado River water only when Lake Powell is full or releases of water are made from Lake

Powell to prevent the reservoir from exceeding elevation 3,700 feet above mean sea level or when releases are made pursuant to the proviso in section 602(a)(3) of this Act: *Provided further*, That the costs of providing any capacity in excess of 2,500 cubic feet per second shall be repaid by those funds available to Arizona pursuant to the provision of subsection 403(f) of this Act, or by funds from sources other than the development fund; (2) Orme Dam and Reservoir and power-pumping plant or suitable alternative; (3) Buttes Dam and Reservoir, which shall be so operated as not to prejudice the rights of any user in and to the waters of the Gila River as those rights are set forth in the decree entered by the United States District Court for the District of Arizona on June 29, 1935, in United States against Gila Valley Irrigation District and others (Globe Equity Numbered 59); (4) Hooker Dam and Reservoir or suitable alternative, which shall be constructed in such a manner as to give effect to the provisions of subsection (f) of section 304; (5) Charleston Dam and Reservoir; (6) Tucson aqueducts and pumping plants; (7) Salt-Gila aqueducts; (8) related canals, regulating facilities, hydroelectric powerplants, and electrical transmission facilities required for the operation of said principal works; (9) related water distribution and drainage works; and (10) appurtenant works.

(b) Article II(B)(3) of the decree of the Supreme Court of the United States in Arizona against California (376 U.S. 340) shall be so administered that in any year in which, as determined by the Secretary, there is insufficient main stream Colorado River water available for release to satisfy annual consumptive use of seven million five hundred thousand acre-feet in Arizona, California, and Nevada, diversions from the main stream for the Central Arizona Project shall be so limited as to assure the availability of water in quantities sufficient to provide for the aggregate annual consumptive use by holders of present perfected rights, by other users in the State of California served under existing contracts with the United States by diversion works heretofore constructed, and by other existing Federal reservations in that State, of four million four hundred thousand acre-feet of mainstream water, and by users of the same character in Arizona and Nevada. Water users in the State of Nevada shall not be required to bear shortages in any proportion greater than would have been imposed in the absence of this subsection 301(b). This subsection shall not affect the relative priorities, among themselves, of water users in Arizona, Nevada, and California which are senior to diversions for the Central Arizona Project, or amend any provisions of said decree.

(c) The limitation stated in subsection (b) of this section shall not apply so long as the Secretary shall determine and proclaim that means are available and in operation which augment the water supply of the Colorado River system in such quantity as to make sufficient mainstream water available for release to satisfy annual consumptive use of seven million five hundred thousand acre-feet in Arizona, California, and Nevada.

SEC. 302. (a) The Secretary shall designate the lands of the Salt River Pima-Maricopa Indian Community, Arizona, and the Fort McDowell-Apache Indian Community, Arizona, or interests therein, and any allotted lands or interests therein within said communities which he determines are necessary for use and occupancy by the United States for the construction, operation, and maintenance of Orme Dam and Reservoir, or alternative. The Secretary shall offer to pay the fair market value of the lands and interests designated, inclusive of improvements. In addition, the Secretary shall offer to pay toward the cost of relocating or replacing such improvements not to exceed $500,000 in the aggregate, and the amount offered for the actual relocation or replacement of a residence shall not exceed the difference between the fair market value of the residence and $8,000. Each community and

each affected allottee shall have six months in which to accept or reject the Secretary's offer. If the Secretary's offer is rejected, the United States may proceed to acquire the property interests involved through eminent domain proceedings in the United States District Court for the District of Arizona under 40 U.S.C., sections 257 and 258a. Upon acceptance in writing of the Secretary's offer, or upon the filing of a declaration of taking in eminent domain proceedings, title to the lands or interests involved, and the right to possession thereof, shall vest in the United States. Upon a determination by the Secretary that all or any part of such lands or interests are no longer necessary for the purpose for which acquired, title to such lands or interests shall be restored to the appropriate community upon repayment to the Federal Government of the amounts paid by it for such lands.

62 Stat. 986; 46 Stat. 1421.

(b) Title to any land or easement acquired pursuant to this section shall be subject to the right of the former owner to use or lease the land for purposes not inconsistent with the construction, operation, and maintenance of the project, as determined by, and under terms and conditions prescribed by, the Secretary. Such right shall include the right to extract and dispose of minerals. The determination of fair market value under subsection (a) shall reflect the right to extract and dispose of minerals and all other uses permitted by this section.

(c) In view of the fact that a substantial portion of the lands of the Fort McDowell Mohave-Apache Indian Community will be required for Orme Dam and Reservoir, or alternative, the Secretary shall, in addition to the compensation provided for in subsection (a) of this section, designate and add to the Fort McDowell Indian Reservation twenty-five hundred acres of suitable lands in the vicinity of the reservation that are under the jurisdiction of the Department of the Interior in township 4 north, range 7 east; township 5 north, range 7 east; and township 3 north, range 7 east, Gila and Salt River base meridian, Arizona. Title to lands so added to the reservation shall be held by the United States in trust for the Fort McDowell Mohave-Apache Indian Community.

(d) Each community shall have a right, in accordance with plans approved by the Secretary, to develop and operate recreational facilities along the part of the shoreline of the Orme Reservoir located on or adjacent to its reservation, including land added to the Fort McDowell Reservation as provided in subsection (b) of this section, subject to rules and regulations prescribed by the Secretary governing the recreation development of the reservoir. Recreation development of the entire reservoir and federally owned lands under the jurisdiction of the Secretary adjacent thereto shall be in accordance with a master recreation plan approved by the Secretary. The members of each community shall have nonexclusive personal rights to hunt and fish on or in the reservoir without charge to the same extent they are now authorized to hunt and fish, but no community shall have the right to exclude others from the reservoir except by control of access through its reservation or any right to require payment by members of the public except for the use of community lands or facilities.

(e) All funds paid pursuant to this section, and any per capita distribution thereof, shall be exempt from all forms of State and Federal income taxes.

SEC. 303. (a) The Secretary is authorized and directed to continue to a conclusion appropriate engineering and economic studies and to recommend the most feasible plan for the construction and operation of hydroelectric generating and transmission facilities, the purchase of electrical energy, the purchase of entitlement to electrical plant capacity, or any combination thereof, including participation, operation, or construction by non-Federal entities, for the purpose of supplying the power requirements of the Central Arizona Project and

augmenting the Lower Colorado River Basin Development Fund: *Provided*, That nothing in this section or in this Act contained shall be construed to authorize the study or construction of any dams on the main stream of the Colorado River between Hoover Dam and Glen Canyon Dam.

(b) If included as a part of the recommended plan, the Secretary may enter into agreements with non-Federal interests proposing to construct thermal generating powerplants whereby the United States shall acquire the right to such portions of their capacity, including delivery of power and energy over appurtenant transmission facilities to mutually agreed upon delivery points, as he determines is required in connection with the operation of the Central Arizona Project. When not required for the Central Arizona Project, the power and energy acquired by such agreements may be disposed of intermittently by the Secretary for other purposes at such prices as he may determine, including its marketing in conjunction with the sale of power and energy from Federal powerplants in the Colorado River system so as to produce the greatest practicable amount of power and energy that can be sold at firm power and energy rates. The agreements shall provide, among other things, that—

(1) the United States shall pay not more than that portion of the total construction cost, exclusive of interest during construction, of the powerplants, and of any switchyards and transmission facilities serving the United States, as is represented by the ratios of the respective capacities to be provided for the United States therein to the total capacities of such facilities. The Secretary shall make the Federal portion of such costs available to the non-Federal interests during the construction period, including the period of preparation of designs and specifications, in such installments as will facilitate a timely construction schedule, but no funds other than for preconstruction activities shall be made available by the Secretary until he determines that adequate contractual arrangements have been entered into between all the affected parties covering land, water, fuel supplies, power (its availablity and use), rights-of-way, transmission facilities and all other necessary matters for the thermal generating powerplants;

Operation and maintenance costs.

(2) annual operation and maintenance costs shall be apportioned between the United States and the non-Federal interests on an equitable basis taking into account the ratios determined in accordance with the foregoing clause (1): *Provided, however*, That the United States shall share on the foregoing basis in the depreciation component of such costs only to the extent of provision for depreciation on replacements financed by the non-Federal interests;

(3) the United States shall be given appropriate credit for any interests in Federal lands administered by the Department of the Interior that are made available for the powerplants and appurtenances;

(4) costs to be borne by the United States under clauses (1) and (2) shall not include (a) interest and interest during construction, (b) financing charges, (c) franchise fees, and (d) such other costs as shall be specified in the agreement.

Recommendations to Congress.

(c) No later than one year from the effective date of this Act, the Secretary shall submit his recommended plan to the Congress. Except as authorized by subsection (b) of this section, such plan shall not become effective until approved by the Congress.

Arizona, apportionment of diverted water.

(d) If any thermal generating plant referred to in subsection (b) of this section is located in Arizona, and if it is served by water diverted from the drainage area of the Colorado River system above Lee Ferry,

other provisions of existing law to the contrary notwithstanding, such consumptive use of water shall be a part of the fifty thousand acre-feet per annum apportioned to the State of Arizona by article III(a) of the Upper Colorado River Basin Compact (63 Stat. 31).

Irrigation restriction.

SEC. 304. (a) Unless and until otherwise provided by Congress, water from the Central Arizona Project shall not be made available directly or indirectly for the irrigation of lands not having a recent irrigation history as determined by the Secretary, except in the case of Indian lands, national wildlife refuges, and, with the approval of the Secretary, State-administered wildlife management areas.

Water supply, repayment contracts.

(b) (1) Irrigation and municipal and industrial water supply under the Central Arizona Project within the State of Arizona may, in the event the Secretary determines that it is necessary to effect repayment, be pursuant to master contracts with organizations which have power to levy assessments against all taxable real property within their boundaries. The terms and conditions of contracts or other arrangements whereby each such organization makes water from the Central Arizona Project available to users within its boundaries shall be subject to the Secretary's approval, and the United States shall, if the Secretary determines such action is desirable to facilitate carrying out the provisions of this Act, have the right to require that it be a party to such contracts or that contracts subsidiary to the master contracts be entered into between the United States and any user. The provisions of this clause (1) shall not apply to the supplying of water to an Indian tribe for use within the boundaries of an Indian reservation.

(2) Any obligation assumed pursuant to section 9(d) of the Reclamation Project Act of 1939 (43 U.S.C. 485h(d)) with respect to any project contract unit or irrigation block shall be repaid over a basic period of not more than fifty years; any water service provided pursuant to section 9(e) of the Reclamation Project Act of 1939 (43 U.S.C. 485h(e)) may be on the basis of delivery of water for a period of fifty years and for the delivery of such water at an identical price per acre-foot for water of the same class at the several points of delivery from the main canals and conduits and from such other points of delivery as the Secretary may designate; and long-term contracts relating to irrigation water supply shall provide that water made available thereunder may be made available by the Secretary for municipal or industrial purposes if and to the extent that such water is not required by the contractor for irrigation purposes.

53 Stat. 1195.

(3) Contracts relating to municipal and industrial water supply under the Central Arizona Project may be made without regard to the limitations of the last sentence of section 9(c) of the Reclamation Project Act of 1939 (43 U.S.C. 485h(c)); may provide for the delivery of such water at an identical price per acre-foot for water of the same class at the several points of delivery from the main canals and conduits; and may provide for repayment over a period of fifty years if made pursuant to clause (1) of said section and for the delivery of water over a period of fifty years if made pursuant to clause (2) thereof.

Water conservation.

(c) Each contract under which water is provided under the Central Arizona Project shall require that (1) there be in effect measures, adequate in the judgment of the Secretary, to control expansion of irrigation from aquifers affected by irrigation in the contract service area; (2) the canals and distribution systems through which water is conveyed after its delivery by the United States to the contractors shall be provided and maintained with linings adequate in his judgment to prevent excessive conveyance losses; and (3) neither the contractor nor the Secretary shall pump or permit others to pump ground water from within the exterior boundaries of the service area of a contractor receiving water from the Central Arizona Project for any use outside

said contractor's service area unless the Secretary and such contractor shall agree, or shall have previously agreed, that a surplus of ground water exists and that drainage is or was required. Such contracts shall be subordinate at all times to the satisfaction of all existing contracts between the Secretary and users in Arizona heretofore made pursuant to the Boulder Canyon Project Act (45 Stat. 1057).

43 USC 617t.

Water exchanges.

(d) The Secretary may require in any contract under which water is provided from the Central Arizona Project that the contractor agree to accept main stream water in exchange for or in replacement of existing supplies from sources other than the main stream. The Secretary shall so require in the case of users in Arizona who also use water from the Gila River system to the extent necessary to make available to users of water from the Gila River system in New Mexico additional quantities of water as provided in and under the conditions specified in subsection (f) of this section: *Provided*, That such exchanges and replacements shall be accomplished without economic injury or cost to such Arizona contractors.

Water shortage priorities.

(e) In times of shortage or reduction of main stream Colorado River water for the Central Arizona Project, as determined by the Secretary, users which have yielded water from other sources in exchange for main stream water supplied by that project shall have a first priority to receive main stream water, as against other users supplied by that project which have not so yielded water from other sources, but only in quantities adequate to replace the water so yielded.

New Mexico users, water exchange contracts.

(f) (1) In the operation of the Central Arizona Project, the Secretary shall offer to contract with water users in New Mexico for water from the Gila River, its tributaries and underground water sources in amounts that will permit consumptive use of water in New Mexico of not to exceed an annual average in any period of ten consecutive years of eighteen thousand acre-feet, including reservoir evaporation, over and above the consumptive uses provided for by article IV of the decree of the Supreme Court of the United States in Arizona against California (376 U.S. 340). Such increased consumptive uses shall not begin until, and shall continue only so long as, delivery of Colorado River water to downstream Gila River users in Arizona is being accomplished in accordance with this Act, in quantities sufficient to replace any diminution of their supply resulting from such diversion from the Gila River, its tributaries and underground water sources. In determining the amount required for this purpose full consideration shall be given to any differences in the quality of the waters involved.

(2) The Secretary shall further offer to contract with water users in New Mexico for water from the Gila River, its tributaries, and underground water sources in amounts that will permit consumptive uses of water in New Mexico of not to exceed an annual average in any period of ten consecutive years of an additional thirty thousand acre-feet, including reservoir evaporation. Such further increases in consumptive use shall not begin until, and shall continue only so long as, works capable of augmenting the water supply of the Colorado River system have been completed and water sufficiently in excess of two million eight hundred thousand acre-feet per annum is available from the main stream of the Colorado River for consumptive use in Arizona to provide water for the exchanges herein authorized and provided. In determining the amount required for this purpose full consideration shall be given to any differences in the quality of the waters involved.

(3) All additional consumptive uses provided for in clauses (1) and (2) of this subsection shall be subject to all rights in New Mexico and Arizona as established by the decree entered by the United States District Court for the District of Arizona on June 29, 1935, in United States against Gila Valley Irrigation District and others (Globe Equity Numbered 59) and to all other rights existing on the effective

date of this Act in New Mexico and Arizona to water from the Gila River, its tributaries, and underground water sources, and shall be junior thereto and shall be made only to the extent possible without economic injury or cost to the holders of such rights.

Newly irrigated lands, restriction.

(g) For a period of ten years from the date of enactment of this Act, no water from the projects authorized by this Act shall be delivered to any water user for the production on newly irrigated lands of any basic agricultural commodity, as defined in the Agricultural Act of 1949, or any amendment thereof, if the total supply of such commodity for the marketing year in which the bulk of the crop would normally be marketed is in excess of the normal supply as defined in section 301(b)(10) of the Agricultural Adjustment Act of 1938 (52 Stat. 38), as amended (7 U.S.C. 1301), unless the Secretary of Agriculture calls for an increase in production of such commodity in the interest of national security.

63 Stat. 1051.
7 USC 1421 note.

62 Stat. 1251.

Main stream water cost.

SEC. 305. To the extent that the flow of the main stream of the Colorado River is augmented in order to make sufficient water available for release, as determined by the Secretary pursuant to article II(b)(1) of the decree of the Supreme Court of the United States in Arizona against California (376 U.S. 340), to satisfy annual consumptive use of two million eight hundred thousand acre-feet in Arizona, four million four hundred thousand acre-feet in California, and three hundred thousand acre-feet in Nevada, respectively, the Secretary shall make such water available to users of main stream water in those States at the same costs (to the extent that such costs can be made comparable through the nonreimbursable allocation to the replenishment of the deficiencies occasioned by satisfaction of the Mexican Treaty burden as herein provided and financial assistance from the development fund established by section 403 of this Act) and on the same terms as would be applicable if main stream water were available for release in the quantities required to supply such consumptive use.

Water salvage programs.

SEC. 306. The Secretary shall undertake programs for water salvage and ground water recovery along and adjacent to the main stream of the Colorado River. Such programs shall be consistent with maintenance of a reasonable degree of undisturbed habitat for fish and wildlife in the area, as determined by the Secretary.

Dixie project, integration.

SEC. 307. The Dixie Project, heretofore authorized in the State of Utah, is hereby reauthorized for construction at the site determined feasible by the Secretary, and the Secretary shall integrate such project into the repayment arrangement and participation in the Lower Colorado River Basin Development Fund established by title IV of this Act consistent with the provisions of the Act: *Provided*, That section 8 of Public Law 88-565 (78 Stat. 848) is hereby amended by deleting the figure "$42,700,000" and inserting in lieu thereof the figure "$58,000,000".

43 USC 616hh.

Fish and wildlife conservation and development.

SEC. 308. The conservation and development of the fish and wildlife resources and the enhancement of recreation opportunities in connection with the project works authorized pursuant to this title shall be in accordance with the provisions of the Federal Water Project Recreation Act (79 Stat. 213), except as provided in section 302 of this Act.

16 USC 460*l*-12 note.

Central Arizona project, appropriation.

SEC. 309. (a) There is hereby authorized to be appropriated for construction of the Central Arizona Project, including prepayment for power generation and transmission facilities but exclusive of distribution and drainage facilities for non-Indian lands, $832,180,000 plus or minus such amounts, if any, as may be justified by reason of ordinary fluctuations in construction costs as indicated by engineering cost indices applicable to the types of construction involved therein and, in addition thereto, such sums as may be required for operation and maintenance of the project.

Non-Indian lands facilities, appropriation.

(b) There is also authorized to be appropriated $100,000,000 for construction of distribution and drainage facilities for non-Indian lands. Notwithstanding the provisions of section 403 of this Act, neither appropriations made pursuant to the authorization contained in this subsection (b) nor revenues collected in connection with the operation of such facilities shall be credited to the Lower Colorado River Basin Development Fund and payments shall not be made from that fund to the general fund of the Treasury to return any part of the costs of construction, operation, and maintenance of such facilities.

TITLE IV—LOWER COLORADO RIVER BASIN DEVELOPMENT FUND: ALLOCATION AND REPAYMENT OF COSTS: CONTRACTS

SEC. 401. Upon completion of each lower basin unit of the project herein or hereafter authorized, or separate feature thereof, the Secretary shall allocate the total costs of constructing said unit or features to (1) commercial power, (2) irrigation, (3) municipal and industrial water supply, (4) flood control, (5) navigation, (6) water quality control, (7) recreation, (8) fish and wildlife, (9) the replenishment of the depletion of Colorado River flows available for use in the United States occasioned by performance of the Water Treaty of 1944 with the United Mexican States (Treaty Series 994; 59 Stat. 1219), and (10) any other purposes authorized under the Federal reclamation laws. Costs of construction, operation, and maintenance allocated to the replenishment of the depletion of Colorado River flows available for use in the United States occasioned by compliance with the Mexican Water Treaty (including losses in transit, evaporation from regulatory reservoirs, and regulatory losses at the Mexican boundary, incurred in the transportation, storage, and delivery of water in discharge of the obligations of that treaty) shall be nonreimbursable: *Provided*, That the nonreimbursable allocation shall be made on a pro rata basis to be determined by the ratio between the amount of water required to comply with the Mexican Water Treaty and the total amount of water by which the Colorado River is augmented pursuant to the investigations authorized by title II of this Act and any future Congressional authorization. The repayment of costs allocated to recreation and fish and wildlife enhancement shall be in accordance with the provisions of the Federal Water Project Recreation Act (79 Stat. 213): *Provided*, That all of the separable and joint costs allocated to recreation and fish and wildlife enhancement as a part of the Dixie project, Utah, shall be nonreimbursable. Costs allocated to nonreimbursable purposes shall be nonreturnable under the provisions of this Act.

16 USC 460*l*-12 note.

Indian lands, repayment capability.

SEC. 402. The Secretary shall determine the repayment capability of Indian lands within, under, or served by any unit of the project. Construction costs allocated to irrigation of Indian lands (including provision of water for incidental domestic and stock water uses) and within the repayment capability of such lands shall be subject to the Act of July 1, 1932 (47 Stat. 564; 25 U.S.C. 386a), and such costs that are beyond repayment capability of such lands shall be nonreimbursable.

Lower Colorado River Basin Development Fund. Establishment.

SEC. 403. (a) There is hereby established a separate fund in the Treasury of the United States to be known as the Lower Colorado River Basin Development Fund (hereafter called the "development fund"), which shall remain available until expended as hereafter provided.

Ante, p. 887.

(b) All appropriations made for the purpose of carrying out the provisions of title III of this Act shall be credited to the development

fund as advances from the general fund of the Treasury, and shall be available for such purpose.

(c) There shall also be credited to the development fund—

(1) all revenues collected in connection with the operation of facilities authorized in title III in furtherance of the purposes of this Act (except entrance, admission, and other recreation fees or charges and proceeds received from recreation concessionaires), including revenues which, after completion of payout of the Central Arizona Project as required herein are surplus, as determined by the Secretary, to the operation, maintenance, and replacement requirements of said project; *Ante*, p. 887.

(2) any Federal revenues from the Boulder Canyon and Parker-Davis projects which, after completion of repayment requirements of the said Boulder Canyon and Parker-Davis projects, are surplus, as determined by the Secretary, to the operation, maintenance, and replacement requirements of those projects: *Provided, however*, That the Secretary is authorized and directed to continue the in-lieu-of-tax payments to the States of Arizona and Nevada provided for in section 2(c) of the Boulder Canyon Project Adjustment Act so long as revenues accrue from the operation of the Boulder Canyon project; and 54 Stat. 775. 43 USC 618a.

(3) any Federal revenues from that portion of the Pacific Northwest-Pacific Southwest intertie located in the States of Nevada and Arizona which, after completion of repayment requirements of the said part of the Pacific Northwest-Pacific Southwest intertie located in the States of Nevada and Arizona, are surplus, as determined by the Secretary, to the operation, maintenance, and replacement requirements of said portion of the Pacific Northwest-Pacific Southwest intertie and related facilities.

(d) All moneys collected and credited to the development fund pursuant to subsection (b) and clauses (1) and (3) of subsection (c) of this section and the portion of revenues derived from the sale of power and energy for use in Arizona pursuant to clause (2) of subsection (c) of this section shall be available, without further appropriation, for— Development fund revenue use.

(1) defraying the costs of operation, maintenance, and replacements of, and emergency expenditures for, all facilities of the projects, within such separate limitations as may be included in annual appropriation Acts; and

(2) payments to reimburse water users in the State of Arizona for losses sustained as a result of diminution of the production of hydroelectric power at Coolidge Dam, Arizona, resulting from exchanges of water between users in the States of Arizona and New Mexico as set forth in section 304(f) of this Act.

(e) Revenues credited to the development fund shall not be available for construction of the works comprised within any unit of the project herein or hereafter authorized except upon appropriation by the Congress.

(f) Moneys credited to the development fund pursuant to subsection (b) and clauses (1) and (3) of subsection (c) of this section and the portion of revenues derived from the sale of power and energy for use in Arizona pursuant to clause (2) of subsection (c) of this section in excess of the amount necessary to meet the requirements of clauses (1) and (2) of subsection (d) of this section shall be paid annually to the general fund of the Treasury to return—

(1) the costs of each unit of the projects or separable feature thereof authorized pursuant to title III of this Act which are allocated to irrigation, commercial power, or municipal and industrial water supply, pursuant to this Act within a period not

exceeding fifty years from the date of completion of each such unit or separable feature, exclusive of any development period authorized by law: *Provided*, That return of the cost, if any, required by section 307 shall not be made until after the payout period of the Central Arizona Project as authorized herein; and

(2) interest (including interest during construction) on the unamortized balance of the investment in the commercial power and municipal and industrial water supply features of the project at a rate determined by the Secretary of the Treasury in accordance with the provisions of subsection (h) of this section, and interest due shall be a first charge.

(g) All revenues credited to the development fund in accordance with clause (c)(2) of this section (excluding only those revenues derived from the sale of power and energy for use in Arizona during the payout period of the Central Arizona Project as authorized herein) and such other revenues as remain in the development fund after making the payments required by subsections (d) and (f) of this section shall be available (1) to make payments, if any, as required by sections 307 and 502 of this Act, and (2) upon appropriation by the Congress, to assist in the repayment of reimbursable costs incurred in connection with units hereafter constructed to provide for the augmentation of the water supplies of the Colorado River for use below Lee Ferry as may be authorized as a result of the investigations and recommendations made pursuant to section 201 and subsection 203(a) of this Act.

Interest rate.

(h) The interest rate applicable to those portions of the reimbursable costs of each unit of the project which are properly allocated to commercial power development and municipal and industrial water supply shall be determined by the Secretary of the Treasury, as of the beginning of the fiscal year in which the first advance is made for initiating construction of such unit, on the basis of the computed average interest rate payable by the Treasury upon its outstanding marketable public obligations which are neither due nor callable for redemption for fifteen years from the date of issue.

Annual budgets, submittal to Congress.

(i) Business-type budgets shall be submitted to the Congress annually for all operations financed by the development fund.

Report to Congress.

SEC. 404. On January 1 of each year the Secretary shall report to the Congress, beginning with the fiscal year ending June 30, 1969, upon the status of the revenues from and the cost of constructing, operating, and maintaining each lower basin unit of the project for the preceding fiscal year. The report of the Secretary shall be prepared to reflect accurately the Federal investment allocated at that time to power, to irrigation, and to other purposes, the progress of return and repayment thereon, and the estimated rate of progress, year by year, in accomplishing full repayment.

TITLE V—UPPER COLORADO RIVER BASIN: AUTHORIZATIONS AND REIMBURSEMENTS

SEC. 501. (a) In order to provide for the construction, operation, and maintenance of the Animas-La Plata Federal reclamation project, Colorado-New Mexico; the Dolores, Dallas Creek, West Divide, and San Miguel Federal reclamation projects, Colorado; and the Central Utah project (Uintah unit), Utah, as participating projects under the Colorado River Storage Project Act (70 Stat. 105; 43 U.S.C. 620), and to provide for the completion of planning reports on other participating projects, clause (2) of section 1 of said Act is hereby further amended by (i) inserting the words "and the Uintah unit" after the

word "phase" within the parenthesis following "Central Utah", (ii) deleting the words "Pine River Extension" and inserting in lieu thereof the words "Animas-La Plata, Dolores, Dallas Creek, West Divide, San Miguel", (iii) adding after the words "Smith Fork:" the proviso "*Provided*, That construction of the Uintah unit of the Central Utah project shall not be undertaken by the Secretary until he has completed a feasibility report on such unit and submitted such report to the Congress along with his certification that, in his judgment, the benefits of such unit or segment will exceed the costs and that such unit is physically and financially feasible, and the Congress has authorized the appropriation of funds for the construction thereof:". Section 2 of said Act is hereby further amended by (i) deleting the words "Parshall, Troublesome, Rabbit Ear, San Miguel, West Divide, Tomichi Creek, East River, Ohio Creek, Dallas Creek, Dolores, Fruit Growers Extension, Animas-La Plata", and inserting after the words "Yellow Jacket" the words "Basalt Middle Park (including the Troublesome, Rabbit Ear, and Azure units), Upper Gunnison (including the East River, Ohio Creek, and Tomichi Creek units), Lower Yampa (including the Juniper and Great Northern units), Upper Yampa (including the Hayden Mesa, Wessels, and Toponas units)"; (ii) by inserting after the word "Sublette" the words "(including a diversion of water from the Green River to the North Platte River Basin in Wyoming), Ute Indian unit of the Central Utah Project, San Juan County (Utah), Price River, Grand County (Utah), Gray Canyon, and Juniper (Utah)"; and (iii) changing the period after "projects" to a colon and adding the following proviso: "*Provided*, That the planning report for the Ute Indian unit of the Central Utah participating project shall be completed on or before December 31, 1974, to enable the United States of America to meet the commitments heretofore made to the Ute Indian Tribe of the Uintah and Ouray Indian Reservation under the agreement dated September 20, 1965 (Contract Numbered 14–06–W–194).". The amount which section 12 of said Act authorizes to be appropriated is hereby further increased by the sum of $392,000,000, plus or minus such amounts, if any, as may be required, by reason of changes in construction costs as indicated by engineering cost indices applicable to the type of construction involved. This additional sum shall be available solely for the construction of the Animas-La Plata, Dolores, Dallas Creek, West Divide, and San Miguel projects herein authorized.

Report to Congress.

43 USC 620a.

Authorization increase.
43 USC 620k.

(b) The Secretary is directed to proceed as nearly as practicable with the construction of the Animas-La Plata, Dolores, Dallas Creek, West Divide, and San Miguel participating Federal reclamation projects concurrently with the construction of the Central Arizona Project, to the end that such projects shall be completed not later than the date of the first delivery of water from said Central Arizona Project: *Provided*, That an appropriate repayment contract for each of said participating projects shall have been executed as provided in section 4 of the Colorado River Storage Project Act (70 Stat. 107) before construction shall start on that particular project.

43 USC 620c.

(c) The Animas-La Plata Federal reclamation project shall be constructed and operated in substantial accordance with the engineering plans set out in the report of the Secretary transmitted to the Congress on May 4, 1966, and printed as House Document 436, Eighty-ninth Congress: *Provided*, That construction of the Animas-La Plata Federal reclamation project shall not be undertaken until and unless the States of Colorado and New Mexico shall have ratified the following compact to which the consent of Congress is hereby given:

Animas-La Plata Federal reclamation project; consent of Congress.

"ANIMAS-LA PLATA PROJECT COMPACT

"The State of Colorado and the State of New Mexico, in order to implement the operation of the Animas-La Plata Federal Reclamation Project, Colorado-New Mexico, a proposed participating project under the Colorado River Storage Project Act (70 Stat. 105; 43 U.S.C. 620) and being moved by considerations of interstate comity, have resolved to conclude a compact for these purposes and have agreed upon the following articles:

"ARTICLE I

"A. The right to store and divert water in Colorado and New Mexico from the La Plata and Animas River systems, including return flow to the La Plata River from Animas River diversions, for uses in New Mexico under the Animas-La Plata Federal Reclamation Project shall be valid and of equal priority with those rights granted by decree of the Colorado state courts for the uses of water in Colorado for that project, providing such uses in New Mexico are within the allocation of water made to that state by articles III and XIV of the Upper Colorado River Basin Compact (63 Stat. 31).

"B. The restrictions of the last sentence of Section (a) of Article IX of the Upper Colorado River Basin Compact shall not be construed to vitiate paragraph A of this article.

"ARTICLE II

"This Compact shall become binding and obligatory when it shall have been ratified by the legislatures of each of the signatory States."

(d) The Secretary shall, for the Animas-La Plata, Dolores, Dallas Creek, San Miguel, West Divide, and Seedskadee participating projects of the Colorado River storage project, establish the nonexcess irrigable acreage for which any single ownership may receive project water at one hundred and sixty acres of class 1 land or the equivalent thereof, as determined by the Secretary, in other land classes.

(e) In the diversion and storage of water for any project or any parts thereof constructed under the authority of this Act or the Colorado River Storage Project Act within and for the benefit of the State of Colorado only, the Secretary is directed to comply with the constitution and statutes of the State of Colorado relating to priority of appropriation; with State and Federal court decrees entered pursuant thereto; and with operating principles, if any, adopted by the Secretary and approved by the State of Colorado.

(f) The words "any western slope appropriations" contained in paragraph (i) of that section of Senate Document Numbered 80, Seventy-fifth Congress, first session, entitled "Manner of Operation of Project Facilities and Auxiliary Features", shall mean and refer to the appropriation heretofore made for the storage of water in Green Mountain Reservoir, a unit of the Colorado-Big Thompson Federal reclamation project, Colorado; and the Secretary is directed to act in accordance with such meaning and reference. It is the sense of Congress that this directive defines and observes the purpose of said paragraph (i), and does not in any way affect or alter any rights or obligations arising under said Senate Document Numbered 80 or under the laws of the State of Colorado.

SEC. 502. The Upper Colorado River Basin Fund established under section 5 of the Colorado River Storage Project Act (70 Stat. 107; 43 U.S.C. 620d) shall be reimbursed from the Colorado River Development Fund established by section 2 of the Boulder Canyon Project Adjustment Act (54 Stat. 774; 43 U.S.C. 618a) for the money expended heretofore or hereafter from the Upper Colorado River Basin

Fund to meet deficiencies in generation at Hoover Dam during the filling period of storage units of the Colorado River storage project pursuant to the criteria for the filling of Glen Canyon Reservoir (27 Fed. Reg. 6851, July 19, 1962). For this purpose, $500,000 for each year of operation of Hoover Dam and powerplant, commencing with fiscal year 1970, shall be transferred from the Colorado River Development Fund to the Upper Colorado River Basin Fund, in lieu of application of said amounts to the purposes stated in section 2(d) of the Boulder Canyon Project Adjustment Act, until such reimbursement is accomplished. To the extent that any deficiency in such reimbursement remains as of June 1, 1987, the amount of the remaining deficiency shall then be transferred to the Upper Colorado River Basin Fund from the Lower Colorado River Basin Development Fund, as provided in subsection (g) of section 403.

62 Stat. 284.
43 USC 618a.

TITLE VI—GENERAL PROVISIONS: DEFINITIONS: CONDITIONS

SEC. 601. (a) Nothing in this Act shall be construed to alter, amend, repeal, modify, or be in conflict with the provisions of the Colorado River Compact (45 Stat. 1057), the Upper Colorado River Basin Compact (63 Stat. 31), the Water Treaty of 1944 with the United Mexican States (Treaty Series 994; 59 Stat. 1219), the decree entered by the Supreme Court of the United States in Arizona against California and others (376 U.S. 340), or, except as otherwise provided herein, the Boulder Canyon Project Act (45 Stat. 1057), the Boulder Canyon Project Adjustment Act (54 Stat. 774; 43 U.S.C. 618a) or the Colorado River Storage Project Act (70 Stat. 105; 43 U.S.C. 620).

43 USC 617t.

(b) The Secretary is directed to—

Reports to the President, Congress, etc.

(1) make reports as to the annual consumptive uses and losses of water from the Colorado River system after each successive five-year period, beginning with the five-year period starting on October 1, 1970. Such reports shall include a detailed breakdown of the beneficial consumptive use of water on a State-by-State basis. Specific figures on quantities consumptively used from the major tributary streams flowing into the Colorado River shall also be included on a State-by-State basis. Such reports shall be prepared in consultation with the States of the lower basin individually and with the Upper Colorado River Commission, and shall be transmitted to the President, the Congress, and to the Governors of each State signatory to the Colorado River Compact; and

(2) condition all contracts for the delivery of water originating in the drainage basin of the Colorado River system upon the availability of water under the Colorado River Compact.

Federal officers and agencies, compliance.

(c) All Federal officers and agencies are directed to comply with the applicable provisions of this Act, and of the laws, treaty, compacts, and decree referred to in subsection (a) of this section, in the storage and release of water from all reservoirs and in the operation and maintenance of all facilities in the Colorado River system under the jurisdiction and supervision of the Secretary, and in the operation and maintenance of all works which may be authorized hereafter for the augmentation of the water supply of the Colorado River system. In the event of failure of any such officer or agency to so comply, any affected State may maintain an action to enforce the provisions of this section in the Supreme Court of the United States and consent is given to the joinder of the United States as a party in such suit or suits, as a defendant or otherwise.

63 Stat. 31; 59 Stat. 1219.

70 Stat. 105; 45 Stat. 1057; 54 Stat. 779. 43 USC 620, 617t, 618o.

SEC. 602. (a) In order to comply with and carry out the provisions of the Colorado River Compact, the Upper Colorado River Basin Compact, and the Mexican Water Treaty, the Secretary shall propose criteria for the coordinated long-range operation of the reservoirs constructed and operated under the authority of the Colorado River Storage Project Act, the Boulder Canyon Project Act, and the Boulder Canyon Project Adjustment Act. To effect in part the purposes expressed in this paragraph, the criteria shall make provision for the storage of water in storage units of the Colorado River storage project and releases of water from Lake Powell in the following listed order of priority:

(1) releases to supply one-half the deficiency described in article III(c) of the Colorado River Compact, if any such deficiency exists and is chargeable to the States of the Upper Division, but in any event such releases, if any, shall not be required in any year that the Secretary makes the determination and issues the proclamation specified in section 202 of this Act;

(2) releases to comply with article III(d) of the Colorado River Compact, less such quantities of water delivered into the Colorado River below Lee Ferry to the credit of the States of the Upper Division from other sources; and

(3) storage of water not required for the releases specified in clauses (1) and (2) of this subsection to the extent that the Secretary, after consultation with the Upper Colorado River Commission and representatives of the three Lower Division States and taking into consideration all relevant factors (including, but not limited to, historic stream-flows, the most critical period of record, and probabilities of water supply), shall find this to be reasonably necessary to assure deliveries under clauses (1) and (2) without impairment of annual consumptive uses in the upper basin pursuant to the Colorado River Compact: *Provided*, That water not so required to be stored shall be released from Lake Powell: (i) to the extent it can be reasonably applied in the States of the Lower Division to the uses specified in article III(e) of the Colorado River Compact, but no such releases shall be made when the active storage in Lake Powell is less than the active storage in Lake Mead, (ii) to maintain, as nearly as practicable, active storage in Lake Mead equal to the active storage in Lake Powell, and (iii) to avoid anticipated spills from Lake Powell.

Criteria, review and comment.

(b) Not later than January 1, 1970, the criteria proposed in accordance with the foregoing subsection (a) of this section shall be submitted to the Governors of the seven Colorado River Basin States and to such other parties and agencies as the Secretary may deem appropriate for their review and comment. After receipt of comments on the proposed criteria, but not later than July 1, 1970, the Secretary shall adopt appropriate criteria in accordance with this section and publish the same in the Federal Register. Beginning January 1, 1972, and yearly thereafter, the Secretary shall transmit to the Congress and to the Governors of the Colorado River Basin States a report describing the actual operation under the adopted criteria for the preceding compact water year and the projected operation for the current year. As a result of actual operating experience or unforeseen circumstances, the Secretary may thereafter modify the criteria to better achieve the purposes specified in subsection (a) of this section, but only after correspondence with the Governors of the seven Colorado River Basin States and appropriate consultation with such State representatives as each Governor may designate.

Publication in Federal Register.

Report to Congress, etc.

43 USC 620f.

(c) Section 7 of the Colorado River Storage Project Act shall be administered in accordance with the foregoing criteria.

SEC. 603. (a) Rights of the upper basin to the consumptive use of water available to that basin from the Colorado River system under the Colorado River Compact shall not be reduced or prejudiced by any use of such water in the lower basin.

(b) Nothing in this Act shall be construed so as to impair, conflict with, or otherwise change the duties and powers of the Upper Colorado River Commission.

SEC. 604. Except as otherwise provided in this Act, in constructing, operating, and maintaining the units of the projects herein and hereafter authorized, the Secretary shall be governed by the Federal reclamation laws (Act of June 17, 1902; 32 Stat. 388, and Acts amendatory thereof or supplementary thereto) to which laws this Act shall be deemed a supplement. 43 USC 371 note.

SEC. 605. Part I of the Federal Power Act (41 Stat. 1063; 16 U.S.C. 791a–823) shall not be applicable to the reaches of the main stream of the Colorado River between Hoover Dam and Glen Canyon Dam until and unless otherwise provided by Congress.

SEC. 606. As used in this Act, (a) all terms which are defined in the Colorado River Compact shall have the meanings therein defined; Definitions.

(b) "Main stream" means the main stream of the Colorado River downstream from Lee Ferry within the United States, including the reservoirs thereon;

(c) "User" or "water user" in relation to main stream water in the lower basin means the United States or any person or legal entity entitled under the decree of the Supreme Court of the United States in Arizona against California, and others (376 U.S. 340), to use main stream water when available thereunder;

(d) "Active storage" means that amount of water in reservoir storage, exclusive of bank storage, which can be released through the existing reservoir outlet works;

(e) "Colorado River Basin States" means the States of Arizona, California, Colorado, Nevada, New Mexico, Utah, and Wyoming;

(f) "Western United States" means those States lying wholly or in part west of the Continental Divide; and

(g) "Augment" or "augmentation", when used herein with reference to water, means to increase the supply of the Colorado River or its tributaries by the introduction of water into the Colorado River system, which is in addition to the natural supply of the system.

Approved September 30, 1968.

Public Law 90-538

AN ACT

September 30, 1968
[H.R. 18763]

To authorize preschool and early education programs for handicapped children.

Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled, That this Act may be cited as the "Handicapped Children's Early Education Assistance Act". Handicapped Children's Early Education Assistance Act.

PROGRAM AUTHORIZED

SEC. 2. (a) The Commissioner of Education (hereafter in this title referred to as the "Commissioner") is authorized to arrange by contract, grant, or otherwise with appropriate public agencies and private nonprofit organizations, for the development and carrying out by such agencies and organizations of experimental preschool and early education programs for handicapped children which the Commissioner determines show promise of promoting a comprehensive and strength-

EXPLANATORY NOTE

This document consists of a series of verbatim transcripts of meetings of the Upper Colorado River Commission. The records for each calendar year are in a separate volume.

The meetings of each Volume are separated by blue insert sheets.

A subject index is to be found at the beginning of each Volume with an explanation of its use.

At the beginning of the transcript of each meeting, there is a Table of Contents that refers to the major actions or decisions of the Commission.

Volume 21 includes transcripts of the following meetings of the UPPER COLORADO RIVER COMMISSION

Meeting No.	City and State	Month, Day, Year
108	Denver, Colorado	February 13, 1969
109	Salt Lake City, Utah	March 17, 1969
110	Salt Lake City, Utah	September 15, 1969
111	Denver, Colorado	October 1, 1969
112	Denver, Colorado	December 5, 1969

FOREWORD

The Upper Colorado River Commission is an interstate administrative agency created under the terms of the Upper Colorado River Basin Compact executed at Santa Fe, New Mexico, on October 11, 1948, and subsequently ratified by each of the legislatures of the states and by the Congress of the United States. The Commission represents the states of Colorado, New Mexico, Utah and Wyoming and the Federal Government.

The major purposes of the Upper Colorado River Basin Compact are: (1) to provide for the equitable division of the use of water of the Colorado River System among the Upper Basin States, namely, Arizona, Colorado, New Mexico, Utah and Wyoming; (2) to establish obligations of each state with respect to the delivery of water to the Lower Basin; (3) to promote interstate harmony; (4) to remove causes of controversies; (5) to secure the expeditious agricultural and industrial development of the Upper Basin states, the storage of waters, and the protection of life and property from floods.

The Commission, in order to fulfill the major purposes of the Compact, has been granted broad and comprehensive powers and charged with well-defined duties and responsibilities. Among its powers and duties are: adopting rules and regulations; locating and establishing water-gaging stations; making forecasts of water runoff; engaging in cooperative studies of water supplies; collecting, analyzing, correlating and preserving all types of water supply data; determining the quantity of water used each year in the Upper Colorado River Basin and in each state, and delivered to the Lower Basin; determining extent of curtailment of use, if necessary; determining reservoir losses and their apportionment; making findings of fact concerning obligations under the Mexican Treaty; acquiring and holding property; performing all functions required of it under the Upper Colorado River Basin Compact; reporting annually on its activities to the Governors of the signatory states and to the President of the United States.

This volume contains the transcripts of all meetings of the Commission during the 1969 calendar year.

SUBJECT INDEX

This subject Index is prepared according to a code number system in this manner: 21:108:5; 21:109:34-40; 21:110:11, 14, 28. Interpreted, this code means: Volume 21, Meeting 108, Page 5; Volume 21, Meeting 109, pages 34 to 40; Volume 21, Meeting 110, Pages 11, 14, and 28.

PROCEEDINGS

The Special Meeting of the Upper Colorado River Commission was called to order by Mr. H. P. Dugan, Chairman, on Thursday, February 13, 1969 in the Summit Room of the Diplomat Motor Hotel, 1840 Sherman Street, Denver, Colorado, at 10:00 o'clock a.m.

CHAIRMAN DUGAN: Gentlemen, we have called the Special Meeting of the Upper Colorado River Commission to order. I would like to say at the outset that it is with a great deal of pleasure that I become a member of this Commission. I have been interested in the activities of the Upper Colorado River Basin for many, many years, and I was a member of the Engineering Advisory Committee to the Upper Basin Compact Commission when the Compact was being negotiated. And so it is with real pleasure that I again resume my association with this Commission.

I was appointed as U.S. Commissioner by President Lyndon Johnson on November 4, 1968, and I would like to have my appointment made a part of this record. (A copy of President Johnson's letter appointing Mr. Dugan to the Commission appears on page 5.)

I would like to ask at this time that the Commissioners introduce the representatives they have here from their states, and I would like to call on Mr. Sparks.

THE WHITE HOUSE
WASHINGTON

November 4, 1968

Dear Mr. Dugan:

Pursuant to Public Law 81-37, approved April 6, 1949, granting the consent of the Congress to a compact among the States of Arizona, Colorado, New Mexico, Utah, and Wyoming relating to the equitable division and apportionment of the waters of the Colorado River among the States of the Upper Basin according to the Colorado River Compact of November 24, 1922, you are hereby appointed as United States Commissioner on and Chairman of the Upper Colorado River Commission. You shall participate in deliberations of the Commission, pursuant to Article VIII of the Compact as the United States Commissioner and carry out all of the duties and responsibilities of that office.

I have informed the Governors of the Compact States of your appointment, and am asking the Director of the Bureau of the Budget to notify the affected Federal agencies.

You are requested to report to me through the Director of the Bureau of the Budget.

Sincerely,

/s/ Lyndon B. Johnson

Honorable H. P. Dugan
3232 Nelson Street
Wheat Ridge, Colorado

Mr. Sparks, would you like to introduce your Colorado Representatives?

MR. SPARKS: My Chief Engineer, Mr. Larry Morrill; Water Resource Analyst, Don Hamburg; one of our Senior Engineers, Frank Bell; another Water Resource Analyst, Warren Swick; Senior Engineer, George Brown; Supervising Engineer, Fred Boydston. Is that all we have from our state? I guess that's -- no, Lew Williams, a former member of our board, from over in western Colorado; Dan Noble from the San Miguel Water Conservancy District, Bob Fischer, of the Denver Water Board; and Bill Raley, from the San Miguel Water Conservancy District and Bruno -- am I seeing right -- is that Bruno? Bruno Lukens, from an oil company. (Laughter.)

CHAIRMAN DUGAN: Mr. Bliss, do you have some representatives from New Mexico?

COM. BLISS: Yes. I have with me David Hale, who is the Engineer on the Interstate Stream Commission and has been my consultant for a number of years, and Claud Mann, Special Attorney General and my Legal Consultant.

CHAIRMAN DUGAN: Thank you, gentlemen.

COM. WADDINGHAM: I believe we have four here. We have Mr. Hugh Colton, Adviser to the Commissioner, Central Utah Water Conservancy District; Mr. Siddoway, right next to him, who is representing the Central Utah Conservancy District. We have Dallin Jensen, from the State Engineer's Office and the Adviser to our Natural Resources Department. And Dan is just coming in -- Dan Lawrence, who is the head of our Water Resources Department in Utah.

CHAIRMAN DUGAN: Mr. Person.

COM. PERSON: Mr. Chairman, we have Floyd Bishop, State Engineer. I am sure you all know him. Jack Gage, Assistant Attorney General, and Delbert Boyer, Assistant State Engineer.

CHAIRMAN DUGAN: We do have a few federal representatives here: Stuart McMaster, Interior Solicitor, Salt Lake City, and John R. Riter, Technical Adviser to the Chief Engineer; David Crandall, Regional Director, Bureau of Reclamation, Salt Lake City, and Richard Nash, Chief Engineer's Office, U. S. Bureau of Reclamation.

Any other federal representatives here?

MR. GOSLIN: Mr. Chairman, Governor Love has just arrived.

CHAIRMAN DUGAN: Governor, it is indeed a pleasure to have you with us. Would you like to say a few words to the Commission at this time?

GOVERNOR LOVE: Only that, unfortunately, without advance notice, I am not going to be able to stay for the entire meeting, but I did want to come by and participate. But, in any event, it might not even conform to the purpose of this particular meeting, so I won't say any more at this time.

CHAIRMAN DUGAN: Thank you very much, Governor. It is indeed a pleasure to have you with us.

Mr. Goslin, would you read the Notice of the Meeting?

MR. GOSLIN: Mr. Chairman, the Notice of this meeting was sent to the Commissioners and other interested parties in compliance with the By-Laws. It is dated January 30, 1969. It is a Notice of a Special Meeting that says:

> "In accordance with Article VI of the By-Laws, notice is hereby given that Chairman H. P. Dugan has called a Special Meeting of the Upper Colorado River Commission to be held beginning at 10:00 o'clock a.m. on Thursday, February 13, 1969, in Denver, Colorado.
>
> "The meeting will be held in the Summit Room of the Diplomat Motor Hotel, located at 1840 Sherman Street, Denver, Colorado 80203. The phone number is 303+234-4171. Each person should make his own room reservation."

And this is signed, in accordance with the By-Laws, by Ival V. Goslin, Secretary.

CHAIRMAN DUGAN: Thank you, Mr. Goslin.

The meeting of September 23, 1968, was held in Page, Arizona, and the Minutes of that meeting are available. Is it the pleasure of the Commissioners that these minutes be read?

COM. BLISS: Mr. Chairman, I have looked over the Minutes. I find nothing wrong with them. I move that the Minutes of the Page meeting be approved as set out.

COM. PERSON: Second the motion.

CHAIRMAN DUGAN: It's been moved and seconded that the Minutes of the September Meeting, 1968, at Page, Arizona, be approved as written. Is there any discussion?

(No response.)

Question?

COM. WADDINGHAM: Yes.

CHAIRMAN DUGAN: All in favor?

(Ayes.)

The Minutes of the Adjourned Meeting of September 23, 1968, are approved.

CHAIRMAN DUGAN: Gentlemen, as a brief Report of the Chairman, I would like to remark briefly about the plans of the Bureau of Reclamation. In connection with the responsibility that was given to the Secretary of Interior under the Colorado River Basin Act passed during the last session of the Congress, and, particularly, as it pertains to Section or Title Two of that Act, this Act calls for the reconnaissance study of the water supply needs, the water resources, and the means possible for augmenting the water resource needs of the western states, wholly or partially west of the Continental Divide.

Now this, gentlemen, means that there are eleven western states to come under the scope of this study. And the first progress report on this work is to be presented by the Secretary on June 30, 1971. A final reconnaissance report is to be presented by the Secretary June 30, 1977. I know that the Commission and the states of the Upper Basin, as well as all of the states of the west, and the various individual interests, and formal groups have a real and vital interest in this study. The Secretary of the Interior was directed by the Act to conduct full and complete reconnaissance pursuant to reclamation law, and the Water Resources Planning Act of 1965 to develop this general plan to meet the future water needs of these western states, as specified.

The legislative history connected with the Act gives some guidelines that must be followed. The reference to the Water Resources Planning Act is to assure that cooperation and coordination among all the federal

agencies, affected states, river commissions, and study commissions be made to the fullest to eliminate duplication and to assure that all parties have a part in the activities at the outset.

Now, as I am sure many of you know, for a period of ten years from the date of the Act, the Secretary cannot undertake studies of any plan for importation of water into the States of Arizona, California, Colorado and New Mexico, and that portion of Nevada, Utah, and Wyoming, which are in the natural drainage basin of the Colorado River.

The investigations and studies do not end with the submission of the initial report in 1967. This is only the first phase. It is intended that following the completion of the initial phase, the Secretary shall continue pursuant to existing authority to pursue vigorously the stated objective of Section 201, which is to develop a general plan to meet the future water needs of western states.

Now, the restrictions that are imposed in considering trans-basin works lead us to examine into very thoroughly what can be done with weather modifications, potential surpluses of water that might be developed in northern California, salvage of waste waters, and a very important aspect would be taking advantage of desalinization of sea water.

In implementing the studies, it is the plan of the Bureau of Reclamation to use the existing organization that we have, buttressing it as might become necessary to carry out the work, and we are, of course, certain that buttressing of the staff will be required to do a thorough and competent job. We will take fullest advantage of any information that has been made available through planning reports of all federal agency reports of all federal and state agencies, of comprehensive planning work that has been in progress in many parts of the west, of on-going work in the way of project investigations and complement the available information with what is available from any and all sources. I know that the Upper Basin Commission will have a very vital interest, and we would expect the Commission to display a very leading role in working with the Department of the Interior in the conduct of these studies.

Now, all of our planning on procedures has not been done. We are still holding meetings, the Bureau of Reclamation, staff, to finalize plans, and it is anticipated that some formal communication will be forthcoming to the Commission and to the interested states in the very near future.

If any of you have questions or comments about this activity, I would be very happy to have them now.

MR. GOSLIN: Mr. Chairman, what is going to be the relationship between the Type-1 Comprehensive River Basin Studies that are now under way and the studies that the Secretary is directed to make under Public Law 90-537?

CHAIRMAN DUGAN: We intend to make fullest use of the Type-1 Comprehensive Study work that is in progress or has been available at the time the reconnaissance report is being finalized. However, as I am sure all of you are acquainted with problems of this type know, it will be necessary to implement the information that we get from the Type-1 Studies, and so whatever needs to be done in the way of implementation will be pursued and injected into these activities.

MR. GOSLIN: Will the Type-1 Studies have to be completed first before they get into these other studies?

CHAIRMAN DUGAN: No, certainly not. We will proceed with dispatch on the studies under Title Two of the Act, but taking advantage of whatever concurrent information is available from Type-I Studies.

MR. BILLHYMER: May I ask you one question, too? Under this study, you will notice that there is nothing -- the final report is due in 1977.

CHAIRMAN DUGAN: Yes, Bill.

MR. BILLHYMER: Does that mean that until 1977, the Interior is not going to do anything other than reconnaissance studies for augmentation?

CHAIRMAN DUGAN: Well, certainly not. We do have on-going programs in regard to weather modification, desalinization. We plan to buttress our studies on waste water renovation and improvement.

MR. BILLHYMER: I mean, are you going to submit any feasibility plans for this type of thing prior to 1977?

CHAIRMAN DUGAN: Well, of course, we will have to pursue any feasibility study that is authorized and is going work. This would go on concurrently.

MR. BILLHYMER: That isn't what is indicated in the Conference Report, though, is it? If you study that, you can get the idea that there may be some limitation on feasibility presentations under this program of Title Two.

CHAIRMAN DUGAN: Well, I am not aware of any. Are you, David?

MR. CRANDALL: No, I would say that our regular investigation program would proceed on the basis of the merit of the individual development proposal.

CHAIRMAN DUGAN: I am sure this would be correct. Any other comments or questions?

(No response.)

If not, gentlemen, we would like to move to the report of Director Goslin.

MR. GOSLIN: Mr. Chairman, there are copies of the report available. I think they have all been distributed. If they have not, there are certainly others here.

I might remark at the beginning that what I have tried to do in this report is to condense this notebook here (indicating) into my report this morning. The bulk of this has to do with one major problem, and that is the use of the 50,000 acre-feet of water by Arizona in the Upper Basin.

Now, to get at the report, at our last meeting we discussed the study made by the members of the Commission Staff and the Bureau of Reclamation of the consumptive use of water by Arizona in the Upper Basin. The Bureau of Indian Affairs and the Navajo Tribe also cooperated in making the study. The report on the study was referred to the Engineering and Legal Committees where it was reviewed and revised. This study was a fact-finding study. The objective of which was to determine the amount of consumptive use of water remaining within Arizona's compact apportionment of 50,000 acre-feet per year for a coal-fired powerplant, other new uses, and expansion of present uses.

From the study it appeared that if the Indians successfully claimed rights under the Winters doctrine, if a large, three-unit, thermal-electric powerplant were constructed, if new water uses developed, and if existing uses expanded, there would be a real possibility of the total consumptive use of water in the Upper Basin portion of Arizona exceeding her compact-apportionment. The next logical step, therefore, was to provide some effective means of limiting the total uses of water to the ceiling of 50,000 acre-feet per

year through a relinquishment of Winters doctrine rights by the Indians, as was done for the San Juan-Chama and Navajo Indian Irrigation Projects in New Mexico, or by some other means, if those rights were not relinquished.

For one reason, and one reason only, that of protecting the interests of the Upper Division States in their future water development, our staff participated in making the water supply study and participated in the events described in the following paragraphs. It is fortunate that there developed an atmosphere of cooperative efforts on the part of the public and private utility participants in the proposed Page powerplant, led by the Salt River Project as the contractor for water with the Federal Government, and the Department of the Interior directed toward obtaining an effective limitation on total uses of water, by Indians and non-Indians, in the Upper Basin in Arizona within the 50,000 acre-feet compact apportionment to Arizona. This type of limitation would protect the Upper Division States against a combination of future uses of Upper Basin water that could exceed 50,000 acre-feet under Winters doctrine claims by the Indians, the powerplant, and all other present and potential water uses. The utility participants in the construction of the proposed powerplant desire the limitation in order to clarify the water availability question, which, in turn, aids in assuring their ability to obtain financial aid. We were told that the Secretary of the Interior desired such a limitation, also, in order to clarify the water availability-question, and to avoid future controversy over the water contract in the Congress or in the courts. I cannot help but add the thought at this point that had the idea of an effective limitation not been raised, the Secretary may have executed a water-commitment contract that would have been much less desirable than the one he signed on January 17.

At the request of officials of the Bureau of Indian Affairs and the Bureau of Reclamation, on December 5, 1968, I attended a meeting in Phoenix of these officials and representatives of the Salt River Project. The purpose of this meeting was to discuss procedure to assure that the total uses of water by Arizona in the Upper Basin would be limited to 50,000 acre-feet per year -- including the use by the thermal-generating powerplant proposed to be built near Page in conjunction with the Central Arizona Project, and in which the United States may participate by prepaying the costs of part of the generating capacity. The discussions clearly revealed that such a limitation is necessary, not only to protect the future water resource development of the four Upper Division States, but also, to assure financing of the portion of the powerplant that would be constructed at the expense of non-federal utilities and to avoid future controversy.

On December 9, 10, and 11, 1968, representatives of the Bureau of Reclamation, Bureau of Indian Affairs, Salt River Project, an Associate Solicitor of the Department of the Interior, and I attended meetings of the Navajo Tribal Council at Window Rock, Arizona. The reason for attending these meetings was that we had learned that on those dates the Tribal Council was going to consider matters relating to a contract between the Secretary of the Interior and the Salt River Project, operator of the coal-fuel powerplant, committing the consumptive use of 34,100 acre-feet of water per year for the powerplant to be located on the Navajo Indian Reservation near Page, Arizona. It appeared to the above-mentioned representatives that the time had come to formally present to the Tribe the opportunity for the thermal-electric development on the reservation, and at the same time clearly set forth the necessity for a water-use limitation in the Tribe's resolution to assure the utilities building the powerplant, as well as the Upper Basin States, that the Indians will not make demands upon the 50,000 acre-feet of water per year allocated to the State of Arizona, pursuant to the Upper Colorado River Basin Compact, that will cause the total consumptive use of water in that part of Arizona in the Upper Basin to be in excess of 50,000 acre-feet of water per year.

The Bureau of Reclamation representative explained, with modification, the details of the study of the consumptive use of water in the Upper Basin portion of Arizona that had been made jointly by the Bureau and the Commission with the cooperation of the Navajo Tribe and Bureau of Indian Affairs.

An official of the Salt River Project described the coal-fired, thermal generating plant proposed to be constructed near Page and the great monetary and social benefits that would accrue to the Navajo Indians from its construction and operation.

A resolution on the subject had been prepared by the Solicitor's office and BIA in Washington and transmitted to the Navajo Tribe some time prior to our trip to Window Rock. This resolution, so far as the limitation of all uses in Arizona to 50,000 acre-feet of water per year is concerned, was OK. This resolution was distributed to the Tribal Council. During the proceedings all copies were collected from the Council members. The Tribe's attorney was asked to prepare another resolution. The first draft of the resolution by the Tribal Attorney was completely unsatisfactory on the point in question; and, so far as the Associate Solicitor of the Department of the Interior was concerned, on this point and several others it was not satisfactory.

When the objectionable nature of the Tribal attorney's draft resolution was made known to tribal leaders, the Associate Solicitor, a Salt River Attorney, and I were requested to work in the evening with the Tribe's attorney to redraft the resolution. When we left the Tribal attorney's office after an involved evening session we felt the resolution was in good shape.

On the following day when the newly drafted resolution was distributed to the Tribal Council we noticed that it had been changed to say that the Indians would agree to limit their demands upon the water allocated to Arizona to 50,000 acre-feet per year, of which 34,100 acre-feet shall be used by the coal-fired powerplant to be located on the reservation near Page. The language of the resolution excluded non-Indian uses of water, such as, by the City of Page, by the Glen Canyon Powerplant, by recreational establishments, or by other non-Indian users.

After reading the new draft of resolution the Associate Solicitor and I asked the Tribe's attorney why the agreed language of the evening before was not included in the resolution. We were told that the changed form was the form in which he had been instructed to prepare the resolution and that he could not change it; and furthermore, that the Tribe was going to consider the resolution in that form, and that any further changes in the resolution would have to be made by amendments offered from the floor of the Council meeting. We then talked to several Tribal leaders before noon and requested an opportunity to explain to the Council the reasons why the resolution should be amended to include all uses of water within the 50,000 acre-feet allocated to Arizona. We were assured that such an opportunity would be granted after lunch. In the afternoon while listening to the extended debate, we were informed that the decision had been reached to restrict any further talk about the resolution to Council members only, thus foreclosing any further explanations.

During the afternoon one of the Council members asked if the Salt River Project would contribute $35,000 per year for five years instead of $25,000, as stated in the resolution, for establishing a professorial chair at the Navajo Community College as part of the consideration for the privilege of building a powerplant on the reservation. A spokesman for the Salt River Project was called upon to answer the question. His answer was affirmative.

At another point in the proceedings a Council member said that he knew that a representative of the Upper Colorado River Commission was in the room and wanted to know if he could have an explanation of

the source of the 50,000 acre-feet figure that was being discussed. I explained that the 50,000 acre-feet of consumptive use of water was a grant or allocation of water in the Upper Colorado River Basin Compact to the State of Arizona, that the Compact also included all uses of water by the Indians within the 50,000 acre-feet, and that the original intention of the Compact negotiators was that this block of water would be used almost entirely in the Upper Basin in Arizona by the Indians from tributaries of the San Juan River. I also took advantage of the opportunity to explain the economic, practical reasons why it was necessary for the resolution to be amended to express a willingness on the part of the Indians to limit their future uses of water in such a manner that all consumptive uses of water in the Arizona portion of the Upper Basin would not exceed 50,000 acre-feet as their part of the consideration for the opportunity to receive the many benefits from having the powerplant on their reservation.

The Tribal Council adopted the resolution, as written, without amendment with respect to raising the $25,000 per year contribution by the Salt River Project for the college to $35,000, or to limiting their uses so that all consumptive uses of water in the Arizona portion of the Upper Basin would remain within 50,000 acre-feet. A telephone call by the Associate Solicitor and myself to the Solicitor of the Department in Washington confirmed the fact that he could not advise the Secretary of the Interior to execute a contract with the Salt River Project committing 34,100 acre-feet of consumptive use of water in view of the terms of the adopted resolution.

After leaving the Tribal Council meeting, the BIA Area Director requested a number of us to meet in his office for a discussion of what might be done to make the situation more palatable to the interested parties. At this session were representatives of the Bureau of Reclamation, the Bureau of Indian Affairs, the Tribe, the Salt River Project, the Associate Solicitor, and myself. We learned that the Indians would like to have a certain piece of land, known as Antelope Point, that was withdrawn by the Secretary for reservoir purposes, transferred to Indian ownership. Under the law (41 Stat. 34) this transfer cannot be made without action by the Congress. The legislation to authorize such a transfer has been drafted and transmitted to the Interior Department in Washington. It is my understanding that the Bureau of Reclamation and other Interior Department agencies have no objections to the transfer of Antelope Point to the Indians. It was suggested that it might be much less difficult to get this piece of legislation through the Congress if the Indians would revise their resolution concerning the 50,000 acre-feet of Upper Basin water. Presently, there is some evidence that the Indians may agree to modify their resolution in exchange for support for their land-transfer legislation.

Since the meetings at Window Rock, and in anticipation of the Indians not agreeing to the desired amendment of their resolution, the Salt River Project, after informal consultation with the Bureau of Reclamation and other department representatives, has offered another plan to provide a future water supply in excess of the 50,000 acre-feet apportioned to Arizona (with a limit of 3,000 acre-feet per year) for the City of Page, recreational areas and other non-Indian lands lying within the Upper Basin in Arizona. The elements of this plan are described in a letter of December 27, 1968 from Mr. V. I. Corbell, President of the Salt River Project, to Governor Jack Williams of Arizona.

They are as follows:

1. Salt River Project would make available from the water for which it proposes to contract under the Central Arizona Project in the Lower Basin up to 3,000 acre-feet, when and if uses within the Upper Basin part of Arizona exceed 50,000 acre-feet. This 3,000 acre-feet of water would be for the City of Page and other non-Indian purposes in Arizona in the Upper Basin.

2. The 3,000 acre-feet would be Lower Basin water that would be diverted from Lake Powell in the Upper Basin.

3. In order to implement this plan some arrangement involving agreement of all seven basin States is required.

On December 30, 1968 a letter dated December 27, 1968 was received from Governor Williams in which he endorsed the Salt River Project's proposal and stated that he is willing to use the full powers of his office to implement the Salt River project proposal by legislation, changes in existing compact, or agreement among all of the interested States, or whatever may be necessary. The Governor also asked for an indication to him and to the Secretary of the Interior whether our Commission is willing to proceed in any way which is agreed to be appropriate to effectuate the Salt River Project's proposal.

Governor Williams also stressed the urgency of the matter. This urgency was based upon the assumption that the water commitment contract between the federal government and the Salt River Project should be signed by the former Secretary of the Interior before he relinquished the reins of his office on January 20, 1969. Representatives of Arizona said that they were fearful that time required by a new Secretary and his top staff to become acquainted with the complex problems would not result in an executed contract soon enough to provide the necessary lead time for design and construction.

Early in January we tried to schedule a special meeting for January 10th, but failed because unanimous agreement of all members of the Commission to convene such a meeting could not be obtained.

Subsequent conversations with representatives of the Salt River Project and the Interior Department revealed that both of those contracting parties felt strongly that there should be an expression from our Commission in response to the Arizona Governor's letter prior to execution of the contract. Therefore, attempts were made to schedule another special Commission meeting. It was learned that the only day on which a meeting could be scheduled was January 20th, the last day in which the former Secretary would be in office. After ascertaining from representatives of the Department and of Arizona that arrangements could and would be made to receive a telephonic communication from our Commission on the subject as late as January 20th we proceeded with scheduling a special meeting in Denver on that date.

Among the various facets of the over-all problem that should be examined by our Commissioners in their consideration of the Arizona Governor's request are the following:

1. We learned on January 17, 1969 that the Secretary of the Interior that morning had executed the contract with the Salt River Project committing the consumptive use of 34,100 acre-feet of Arizona's Upper Basin water for a thermal-electric generating plant near Page, Arizona. It is presumed that he proceeded with the contract signing, because he did not want to wait until after 12:00 o'clock noon, January 20th to hear from our Commission, which was planning to meet on that date, concerning any action it might desire to take. He may also have believed that a 50,000 acre-feet limitation on the total Arizona water uses in the Upper Basin could be satisfactorily effectuated.

2. The Secretary in a letter of January 17, 1969 told Chairman Aspinall ". . . that the problem of protecting the upper basin States against the possibility that Arizona's upper basin uses might exceed 50,000 acre-feet per annum has, as a practical matter, been resolved." It has not.

3. Prior to January 17th it was understood that an expression from our Commission of its willingness to recommend to the Upper Division States that they proceed by some appropriate means to validate the water transfer would be regarded as clearing the way for the Secretary to execute such a contract. I do not mean to infer that a negative response by the Commission would have caused the Secretary to refrain from signing the

contract. It may have -- or it may not have. As soon as it was learned that the Secretary had signed the contract with the Salt River Project the special Commission meeting of January 20, 1969 was cancelled.

4. The Upper Colorado River Commission cannot commit its four member States individually or collectively to a future course of action because it cannot commit its four legislatures or Governors to a course of action.

5. About all our Commission can do in a matter of this kind would be to recommend a course of action to its member States. Therefore, when viewing the situation in the light of what we can do, the Arizona Governor is asking if our Commission is willing to recommend to our four States the transfer of up to 3,000 acre-feet of Lower Basin water for diversion and use in the Upper Basin portion of Arizona to be made valid in the future "by legislation, changes in existing compacts, or agreement among all of the interested states, or whatever may be necessary in this regard."

6. Agreement by all seven States of the basin is necessary in order to make such a water transfer valid by the process outlined in the Arizona governor's letter. So far as I know, California and Nevada have not expressed willingness that they would proceed.

7. Amendment of the compact, enactment of legislation, or some other procedure which is agreed to be appropriate might take months or years.

8. Should the Indians as part of the price for the transfer of Antelope Point to the Tribe amend their resolution of December 11, 1968 to state that they will not make demands upon the 50,000 acre-feet of water per year allocated to the State of Arizona, pursuant to the Upper Colorado River Basin Compact, that will cause the total consumptive use of water in Arizona in the Upper Basin to be in excess of 50,000 acre-feet of water per year, the need for a seven-State agreement, such as the one suggested by the Arizona Governor would be eliminated.

9. When we transmitted the memorandum-report on consumptive uses of Upper Basin water in Arizona, as revised and approved by the Engineering Committee and our Commissioners, to the Secretary of the Interior on December 2, 1968 it was recommended that:

"(a) if all or a substantial portion of the unused balance of Arizona's compact-apportioned, Upper Basin water is to be

consumed by a powerplant or powerplants, contracts for the use of such water to be predicated upon a relinquishment by the Indian Tribes of any rights to use of Arizona's Upper Basin water that might be claimed under the Winters doctrine, and

"(b) contracts for the use of Arizona's Upper Basin water specify that water will not be delivered under the contract if such delivery would cause the sum of all consumptive uses of water under contract plus consumptive uses for any and all other purposes in the Upper Basin in Arizona to exceed 50,000 acre-feet per annum."

GOVERNOR LOVE: May I interrupt you just a moment?

MR. GOSLIN: Yes, sir.

GOVERNOR LOVE: I am going to have to leave you, but I want to say two things very briefly. As you know, Governor Johnson, who has served on this Commission so long and so well, has submitted his resignation. For the purposes of this meeting, I am going to ask, as I believe your minutes indicate, that Larry Sparks serve as Acting Commissioner. A permanent appointment will be made later.

But I also on the subject that you are discussing wanted to say that it seems to me that I agree with the thrust of the report that we cannot allow this matter to stand in its present situation. I mentioned the matter to Secretary Hickel yesterday. He was not familiar with it but certainly is willing to re-examine. I don't know whether a re-examination at that level can produce anything or some of these other suggested forms are necessary. But it is a matter of concern, and I will be interested in any action the Commission seeks to take on it.

MR. GOSLIN: Thank you, Governor Love.

CHAIRMAN DUGAN: Thank you, very much, Governor.

MR. GOSLIN: By the way, I am sure that every single one of us is going to miss Governor Johnson on this Commission. I know I certainly shall. He has been a regular fellow with me over many, many years.

GOVERNOR LOVE: He has made a tremendous contribution, and I would perhaps be out of line, but I would suggest that perhaps the Commission might so indicate in its proceedings and send a copy to him.

MR. GOSLIN: We will take care of that.

CHAIRMAN DUGAN: Thank you, Governor.

(Off the record discussion.)

MR. GOSLIN: We were informed that placing a limitation in the contract on water deliveries to the powerplant would preclude construction of the plant because water deliveries to such an installation must be dependable and constant-in-quantity. Therefore, the only other reliable limitation is dependent upon the agreement of the Indians to relinquish their Winters doctrine rights as they did in the case of the San Juan-Chama and Navajo Indian Irrigation projects legislation. If such a relinquishment is not forthcoming there will always be a dark cloud on water rights of the Upper Division States because the Indians are serious about their paramount claims under the Winters doctrine -- claiming that they are not subject to the terms of the compacts. If the Indians could successfully claim additional water under the Winters doctrine the total compact grant of 50,000 acre-feet o Arizona might be expanded to 60,000 -- 80,000, or 100,000 acre-feet -- depending upon how many water-consuming industries, irrigation enterprises, recreational facilities, thermal-generating plants, and so forth are constructed in the future on the reservation. If the Indians do not wish to limit their uses of water so that the total water consumption in Arizona in the Upper Basin will stay within the compact grant of 50,000 acre-feet, a powerplant of the size contemplated near Page should not be allowed to be constructed. The problem is that simple if the Upper Division States wish to protect their future compact rights under a document to which Arizona, as well as our member states, is a party.

10. The Secretary in his letter of January 15, 1969 to the Chairman of the Navajo Tribal Council said that:

> "Subject to the usual Executive Branch clearance processes and to the views of my successor, it would seem appropriate that there be accepted as compensation, an assurance from the Tribe that, for so long as the proposed Navajo thermal-electric power plant is operated, the Tribe will not assert claims to water which would result in its present and future water uses in that part of Arizona in the upper basin, together with approximately 34,100 acre-feet of water needed for the Navajo thermal-electric power plant and approximately 3,000 acre-feet of water for community and recreational requirements associated with the Glen Canyon Unit, exceeding the 50,000 acre-feet of Colorado River water apportioned for use in Arizona under the Upper Basin Colorado River Compact."

The 3,000 acre-feet limitation that the Secretary placed upon non-Indian water uses, and that he infers should be included in the Indian's resolution, may not be sufficient to keep the total water consumption in Arizona under 50,000 acre-feet per year, if the thermal generating plant is constructed under the terms of the Secretary's contract.

11. In the event the Indians do not amend their resolution a commitment from Arizona, such as that suggested by the Governor, that Arizona is willing to implement in the future if the other six States are willing, for 3,000 acre-feet of Lower Basin water to be added to the Upper Basin supply would be better than nothing -- but, again, this quantity may not be sufficient to keep the total water consumption under 50,000 acre-feet per year, if the plant is constructed under the terms of the Secretary's contract. In the light of the Indians' December 11, 1968 resolution wherein they agree to limit their uses to 50,000 acre-feet per year, including 34,100 acre-feet for the steam plant, they have only relinquished Winters doctrine rights above 50,000 acre-feet, and the Lower to Upper Basin transfer proposed by Salt River, if it can be effectuated, would become a partial cushion, limited to 3,000 acre-feet, against expansion of water uses in Arizona in the Upper Basin.

12. If the Commission should decide to explore ways of effectuating the proposal of the Salt River Project to transfer the use of 3,000 acre-feet of Lower Basin water to non-Indian purposes in the Upper Basin part of Arizona, such a transfer should be subject to the proviso that such Upper Basin diversions shall be charged as part of the Upper Division States' delivery of water to the Lower Basin at Lee Ferry; and, provided, that the Upper Basin Fund is fully compensated for energy losses and capacity impairment at the Glen Canyon powerplant that are attributable to diversions of Lower Basin water in the Upper Basin.

13. After talking to several of our Commissioners and others, it is believed that amending the compact or compacts should not be attempted at this time, and that this process should be excluded from the list of ways to be explored to effectuate the water transfer. If proper recognition is given to equities, the making of such a transfer, in reality, becomes a mechanical process. It may be possible to write the necessary elements of an operable transfer into the criteria for the coordinated long-range operation of the Colorado River reservoirs required to be formulated under section 602 of the recently enacted Colorado River Basin Project Act -- or there may be other ways suggested.

From paragraphs 10 and 11 above, it appears that there may not be enough water within the 50,000 acre-feet apportioned to Arizona for three 800 MW (nameplate) generating units near Page, the expansion of

present uses of water, and new uses of water by agriculture, industry, municipalities, recreation areas, etc. -- even with 3,000 acre-feet reserved by resolution of the Indians for non-Indian uses or supplied by Arizona on a transfer basis from the Lower Basin. First, let's examine the process by which this 3,000 acre-feet figure was derived. Secretary Udall in paragraph five of his letter of January 17, 1969 to Congressman Aspinall said:

> "Currently those uses total about 750 acre-feet per annum. That amount is included in the quantification of the maximum historical single-year use of water on the western Navajo reservation, which is estimated by the Bureau of Reclamation, the Bureau of Indian Affairs, and representatives of the Upper Colorado River Commission to be just over 13,000 acre-feet."

This quoted paragraph is not true. So far as I know, no member of the Commission, its Engineering Committee, or its staff participated in the mathematical gymnastics behind the 13,000 acre-feet figure. This figure was developed by the Department of the Interior. It is the result of scaling down the data of the study made jointly by the Bureau of Reclamation and the Commission staffs and approved by the Engineering Committee of this Commission. The scaling down may have been done for the purpose of obtaining a paper consumptive-use figure that would show the total uses under 50,000 acre-feet per year when considered together with the amounts of consumptive use in the Secretary's contract. The Indians have not agreed that they would be willing to accept such scaled-down irrigation activities. In fact, there are several proposals for adding new irrigation projects on the reservation.

It might be inferred that the Indians did agree to that when they adopted their resolution, but in view of the fact that there are new irrigation projects being proposed on the reservation and because I have talked to several of the Tribal leaders since, and because they did not specifically mention an agreement to this scaling-down in their resolution, it is my opinion that the Indians have not agreed that they would be willing to accept such scale-down irrigation activities.

Columns (1) and (2) of the table on the next page show a comparison of the scaled-down data with that in the joint memo-report of the Bureau of Reclamation and the Commission.

The principal differences between the joint study and the Bureau's scaled-down study are: (a) in the scaled-down study the acres irrigated

	Joint Memorandum Bureau of Reclamation and Commission	Bureau of Reclamation scaled-down study	Max. Year (1965) Bureau study with no shortage of supply
Acreage with Irrigation History (acres)			
Indian lands	7,459	---	---
Non-Indian lands	40	---	---
Total	7,499		
Maximum Acres irrigated in any one year (1965)			
Indian Lands	---	6,291	6,291
Non-Indian Lands	---	40	40
Total		6,331	6,331
Annual Consumptive Use Rates (af/acre)			
Indian Lands	1.36	0.89	1.36
Non-Indian Lands	1.50	1.00	1.50
Total	(1.36)	(0.89)	(1.36)
Present Annual Consumptive Use (acre-feet)			
Irrigation	10,171	5,636	8,610
Incidental use (10%)	1,017	564	861
Reservoir Evaporation	5,370	5,370	5,370
Indian Communities	814	814	814
Rural Indians	0	0	0
Page	741	741	741
Wahweap	10	10	10
Sub-total	18,123	13,135	16,406
Future Increase in Annual Consumptive Use (acre-feet)			
Irrigation	---	0	0
Reservoir Evaporation	---	0	0
Indian Communities	---	1,400	1,400
Rural Indians	---	0	0
Page	---	2,000	2,000
Wahweap	---	0	0
Tourism	---	250	250
Page Powerplant	---	34,100	34,100
Sub-total		37,750	37,750
Balance Remaining	31,877	---	---
TOTAL ANNUAL Consumptive Use (Acre-feet)	50,000	50,885	54,156

in the maximum year (1965) were used in place of the total acreage with an irrigated history which was an accumulation of maximum annual use figures for a number of individual projects; and (2) the Bureau, on the maximum year (1965) acreage applied a consumptive-use factor which was only 65% of that used in the joint study. In the process the Bureau discarded 1,168 acres or 16% of the 7,499 acres having an irrigation history, and to the 1965 acreage applied a consumptive-use factor of 0.89 instead of 1.36. The Bureau's annual use figure (13,135 acre-feet) then became almost 5,000 acre-feet less than the 18,123 acre-feet of the joint study.

It is interesting to note from col. 2 that the Bureau -- even after the scaling-down process -- shows an overdraft of 885 acre-feet beyond the Arizona apportionment. Since the Secretary has now signed a contract for 34,100 acre-feet consumptive use of water per year for the powerplant, and assuming that the other items in the Bureau's tabulation remain the same, except irrigation, the 1965 irrigated lands (6,331 acres) could actually receive only a 56% water supply without causing an overdraft of Arizona's apportionment.

$$\frac{(5636 + 564 - 885) \times 0.9}{6331 \times 136} = 56\%$$

In that formula, gentlemen, in the typing process we lost a figure. There should be inside the parenthesis a minus 885. That should be 5636, which is the irrigated acreage consumptive use assumed by the Bureau for 1965. The 564 is the incidental uses, ten percent of the first figure, and the 885 is the overdraft. And the 885 got lost somewhere in typing, I presume.

In other words, the Indians would have to abandon 16% of their lands having an irrigated history and receive only a 56% water supply on the remainder every year limited to no more lands than were irrigated in 1965 -- or cut their irrigated acreage substantially below the 1965 figure in order to have a larger percentage water supply per acre. Again, in my opinion, the Navajo Tribe has not agreed to do this.

Column 3 of the tabulation shows the situation if only the lands farmed in 1965 were supplied with a full water supply. (These are the lands for which the Bureau assumed a 65% or 56% supply.) In this instance the consumptive-use would be 16,406 acre-feet, compared with 13,135 acre-feet used by the Bureau, a difference of almost 3300 acre-feet. Under the assumption of a full water supply for the 1965 farmed lands and keeping the other Bureau figures constant the Arizona compact-apportionment would be exceeded by about 4,200 acre-feet. If you go back

to the tables for just a moment and study that at your leisure, the 3,000 acre-feet figure that we have been talking about, that would be transferred either by Arizona from the Lower Basin to the Upper Basin, or it would be put in the Indians' resolution, would be found, if you look in Column (2) in the lower part of the column where it says, "Indian Communities -- 1,400 acre-feet; Page -- 2,000 acre-feet; Tourism -- 250 acre-feet, et cetera."

I assume that what the Bureau did there was assign 2,000 acre-feet to the City of Page, 250 acre-feet for the recreational areas under the heading "Tourism," and the other 750 acre-feet is now being used by the City of Page, which totals 3,000 acre-feet.

Note that the discussion to this point is based upon the assumption that 34,100 acre-feet of water is adequate for "three nominally 800 mega-watt rated generating units."

The question of whether the consumptive use of 34,100 acre-feet of water is sufficient for three 800 MW units requires close scrutiny. On the subject of water availability the contract includes the following three important paragraphs:

> "7. (a) The Contractor's right to water service from Lake Powell during the term of this contract shall be in accordance with the following schedule:
>
> | Year | Acre-Feet |
> |---|---|
> | 1974 | 15,000 |
> | 1975 | 30,000 |
> | 1976 | 40,000 |
>
> and for each successive year thereafter during the term of this contract, provided that the difference between the amounts of water diverted under this contract and the amounts of water returned, both measured in a manner approved by the Contracting Officer, shall not exceed 34,100 acre-feet in any calendar year. If the Secretary determines there is additional water for consumptive use which the United States may make available to Contractor under this contract, the parties agree to amend this contract by increasing the 34,100 acre-feet set forth in this subarticle (a) and Article 9 by the amount of such additional water."

* * *

"9. The Contractor anticipates constructing three units of 750 MW or 800 MW nominal capacity each with cooling towers for each unit. The Contractor may elect to construct one of these units to be cooled by a 'flow through' method whereby the cooling water diverted is returned to Lake Powell after use provided that the total depletions under this contract will not exceed 34,100 acre-feet. In the event of such election, Contractor shall be permitted to divert a maximum of 30,000 acre-feet per annum to serve the two units having cooling towers with payment therefor as provided in Article 8. Contractor may also divert additional quantities of water as may be necessary to operate the 'flow through' unit, provided the cooling water for said 'flow through' unit is returned to Lake Powell. Contractor shall pay $105,000 annually in quarterly payments as provided in Article 8(a), as payment for the water diverted to the 'flow through' unit. Designs and plans for the diversion and return of water utilized in the 'flow through' unit shall be subject to approval of the Secretary as provided in Article 15 (a)."

* * *

"15. (b) The Contractor shall have the right to return water from the Navajo Power Project to Lake Powell at locations and under measurement procedures approved by the Secretary so long as the temperature of such water shall not average more than 90° Fahrenheit, for any 24-hour period."

It has been ascertained from reliable sources that the proposed Page (Navajo) powerplant now under consideration is one that would consist of three nominal 800 MW units with a maximum load capability of 853 MW. I think the exact figure is 852.9. A number of people to whom I have talked have questioned whether 34,100 acre-feet of water per year are sufficient for 2559 MW. This amounts to 14.21 acre-feet per year per MW on basis of nominal rating; or 13.33 acre-feet per year per MW on basis of maximum load. According to the Federal Power Commission and to several power plant authorities a rule-of-thumb allowance of 20 acre-feet per MW is usually made for design purposes. Answers to inquiries have revealed that in actual practice several thermal generating plants consume less than 20 acre-feet per MW. Around 18 acre-feet per MW, or perhaps as low as 16 acre-feet per MW, are considered by some authorities as reasonable figures for modern, efficient powerplants with cooling towers. I have found no authorities who could state that experience has been had with any powerplants that consume in the range of 13-14 acre-feet per MW per year. In fact, all seem to agree that

these figures appear to be too low. Three important factors that determine the amount of water consumed are the design of the cooling tower, the meteorology of the area, and the quality of the water.

Under the terms of the Secretary's contract one of the generating units at Page can be of the flow-through design with the heated water returned to Lake Powell. It is generally conceded that the flow-through cooling system consumes less water than a cooling tower for the same size generating unit. How much less seems to be a point of difference among authorities. One authority claims that the flow-through system will consume the same amount of water as a cooling tower if all uses and losses are counted; especially if full account is taken of the induced evaporation from the lake caused by dumping the heated water into it. Some authorities said that a flow-through system consumes 50% of the water used by a cooling tower; another said 58%; and others said less than a cooling tower, but could not say how much less.

There has been considerable rumor, even in newspaper accounts, that sponsors of the Page powerplant take the position that none of the evaporation from Lake Powell should be charged against the Arizona apportionment. Evaporation from the lake, induced by adding heated water to it, certainly should be chargeable because such loss reduces the overall supply. Also, there may be some merit in insisting that a proportionate part of the natural evaporation should also be charged to the powerplant because the compact negotiators originally intended that the Arizona upper basin water would be used for irrigation near tributaries, in which case the evaporation would be part of the evapotranspiration from cropped lands and small reservoirs, instead of from Lake Powell, a reservoir built primarily for Upper Basin purposes.

Because of the large amount of confusion concerning the consumptive use of water by the proposed Page powerplant and the real danger of Arizona exceeding her compact apportionment it may be prudent to have a completely independent investigation made by a competent organization under the exclusive auspices of the Upper Colorado River Commission. Furthermore, the Commission may also wish to recommend a reevaluation of the contract by the new Secretary of the Interior and the House Committee on Interior and Insular Affairs. The chairman of this Committee left the door open for such a request in his letter of October 28, 1968 to the former Secretary.

In the absence of an agreement by the Indians that they will not make demands upon the 50,000 acre-feet of water per year allocated to the State of Arizona pursuant to the Upper Colorado River Basin Compact,

that will cause the total consumptive use of water in that part of Arizona to be in excess of 50,000 acre-feet of water per year, the Upper Division States cannot allow a situation to be created under which the compact can be violated. Once the situation is created and the water is put to use, the chances of getting it back may be slim.

Newsletter on Legislation

At our last meeting the Commission was informed that Mr. Billhymer, our General Counsel, beginning with the 91st Congress, would periodically send a newsletter on pertinent proposed resource legislation. WATER NEWSLETTER No. 1 was mailed about February 1, 1969. We want this publication to be useful. If you have any criticisms or suggestions, please send them to us. Also, if you encounter any particular legislative Bill, law, regulation, etc. that you would like to have analyzed, please make a request to our office and we will do our best to be of service. We are continuing to develop one of the best water document libraries in the country. It should be constructively used. Copies of the first Newsletter are available here today for those who want them.

Appropriations of Funds for Reclamation Projects

At its last meeting the Commission adopted a resolution urging the support and maintenance of a reclamation project construction program of at least $500 million per year until the backlog of unfunded authorized projects is reduced by construction activities to a more reasonable level. This resolution has been transmitted to the 91st Congress, to Governors and legislatures of the reclamation States and to others as directed. Many letters in response have been received.

President Johnson's budget request for fiscal year 1970 was sent to the Congress on January 15, 1969. We have prepared a summary of the amounts requested by President Johnson for the Colorado River Storage Project and participating projects and other reclamation projects in our four States. Copies of this summary have been distributed to our Commissioners, their advisers, and to other interested parties. Copies are also available today for those who may desire them.

We have written to the Committee on Appropriations and requested opportunity for witnesses to testify concerning the budget items. If the Commission desires we will also attempt to coordinate and correlate the testimony and presentations before the subcommittees in order to show an effective, unified position of the States, as we have done in the past. Representatives of our States probably have examined the budget as it affects each State and are able to determine the nature of the testimony they wish to present.

Annual Report

The 20th Annual Report of the Commission is at the printer's. It will be distributed as soon as it is ready.

Bureau of Reclamation Activities

Regional Director Crandall will report on progress of the Bureau of Reclamation on the construction, advance planning, investigations, and other activities related to the Colorado River Storage Project and participating projects.

Mr. Chairman, before I conclude, I might also say that several of the documents to which I have referred in my report are here in multiple copies; for instance, we have our letter of transmittal to the Secretary, that we transmitted our Water Use Study. We have a copy of Udall -- Secretary Udall's letter to Mr. Nakai, who is Chairman of the Navajo Tribal Council. We have copies of the Secretary's letter to Congressman Aspinall, and we also have copies of Mr. Aspinall's letter of last autumn to the Secretary, in which he laid out the various problems; copies of the Salt River Project Proposal that were transmitted to us by the Governor of Arizona, and also copies of the Secretary's news release at the time he signed the contract with Salt River.

CHAIRMAN DUGAN: Thank you, Mr. Goslin. I am sure that the Commissioners will wish to discuss in some depth the report of the Executive Director. We will call on Colorado. Mr. Sparks?

MR. SPARKS: Mr. Chairman, we have followed this matter quite closely concerning the contract recently executed by the Secretary of the Interior. We were considerably disturbed that the contract was executed without any guidance from this Commission, although we well understood that there was some urgency in getting the contract executed.

I think as far as Colorado is concerned, we are anxious to see the Page plant constructed, if at all possible. We think that continued efforts must be made to persuade the Navajo Tribe to execute the resolution, which was at one time agreed upon, in which they agreed to limit their uses to 50,000 feet, including the uses at Page and at the proposed thermal-plant.

It seems to me that this is the best way to proceed at this time, is to follow efforts to get the Navajo Tribe to execute such a resolution. This was a problem in the State of New Mexico, as the people here from New Mexico well know, in connection with the Navajo Project. New Mexico was successful in getting an agreement with the Indians that permitted development of the Navajo Project along lines that were mutually satisfactory to the people in New Mexico.

As far as amending any compact at this time, we are in agreement that this would be rather futile to attempt to amend the compact, and I personally do not consider that any amendment is necessary if a satisfactory agreement can be worked out with the Navajo Tribe, despite the fact that technically we might be violating some provisions of either the Upper Basin or the Colorado River Compact. I don't think we want to quibble about technicalities at this point. We all worked long and hard in putting that Senate Bill 1004 together and getting it enacted last year. And Colorado is not in a position to try to create any unreasonable roadblocks.

I think it will be perhaps necessary for the Legal Committee of this Commission to formulate some legal policy that we could recommend to the Commission in the near future. We think that the staff of of the Commission has done an outstanding job of preparing the material and the surveys necessary for the Commission to adopt a position in connection with this problem.

I have nothing further.

CHAIRMAN DUGAN: Thank you, Mr. Sparks. Mr. Bliss?

COM. BLISS: Mr. Chairman, I think Larry Sparks has outlined the situation in pretty fair shape. I think, basically, the problem of the Upper Basin states is to see that the compact is not violated and that the total uses in Arizona do not exceed the 50,000 acre-feet permitted by the compact. How this may be done and what action should be taken at the present time, I am not prepared to say. There are several possible courses that could be taken, and I would like to explore them with our people and with the Commission.

CHAIRMAN DUGAN: Utah?

COM. WADDINGHAM: Mr. Chairman, I have nothing constructive to add to what has been said by the two commissioners preceding me except to say that after a full discussion in Utah, that we are, of course, agreed that we should take whatever action is necessary to see that the contract limitations are complied with, and we, of course, would agree that if the Indians can be talked into the proposition of passing the proper resolution, that this would solve all of the problems, but if not, we would want to pursue whatever other options we would have available.

CHAIRMAN DUGAN: Wyoming?

COM. PERSON: Well, I will say that Wyoming is disturbed that the Secretary has entered into a contract which clearly is going to violate the compact, and now that the contract has been entered into, it's going to be a little hard maybe to get a resolution from the Indians. We could have gotten the resolution before the contract was entered into, or possibly, and we think we should be doing something about it, not sitting by agreeing to a violation of the compact.

MR. MANN: Mr. Chairman, may I ask Mr. Sparks a question? My name is Mann.

CHAIRMAN DUGAN: Yes, sir.

MR. MANN: Larry, assuming that such a resolution would be adopted by the Navajos, wouldn't it, as a protective measure, be required that the contract be amended to clarify the resolution and incorporate enough of it to protect everybody?

MR. SPARKS: Yes, very definitely, the contract would have to be predicated upon the agreement reached by the Indians because the whole crux of this problem, as everyone is well aware, is that Winters doctrine.

MR. MANN: That was my conclusion. I just wanted to get your opinion on it.

MR. GOSLIN: That then would require a complete reevaluation of the contract by the new Secretary, as suggested by Governor Love.

MR. SPARKS: That is right.

CHAIRMAN DUGAN: Does the Commission wish to consider some course of action at this time to bear upon the situation we are confronted with in regard to use of the water by Arizona?

MR. GOSLIN: I think the Commission should.

MR. DUGAN: Mr. Sparks has suggested that a review by the Legal Committee should be undertaken, and that efforts should be made to obtain from the Tribal Council a satisfactory resolution regarding the restriction of use. Are there suggestions as to how to proceed?

COM. WADDINGHAM: Mr. Chairman, could I ask Director Goslin a question? Ival, would you explain for my benefit, if no one else's, what would be involved in your statement in your report that the Commission may wish to recommend a reevaluation of the contract by the new Secretary and the House Committee?

MR. GOSLIN: I think a communication with the new Secretary, making such a request, would be about all that is required. Also, a request to the Chairman of the House Committee, I think would be very much in order. I think that he certainly is waiting at this moment to see what the position of the Commission might be with respect to this problem.

COM. WADDINGHAM: I suppose we maybe ought to authorize the writing of such a letter, shouldn't we, Mr. Person?

COM. PERSON: Yes.

COM. WADDINGHAM: Do you want to wait until after lunch?

COM. BLISS: Mr. Chairman, it seems to me that we might make some progress here if we go ahead with whatever additional business we have here on the agenda and give each state a chance to discuss this at the noon recess and come back, and we might be in a better position to state what we want to do.

CHAIRMAN DUGAN: Mr. Bliss' suggestion is that this matter be tabled until after the noon recess and that we resume the remaining business of the Commission. Is this agreeable to the members of the Commission?

(All members of the Commission indicate affirmatively.)

Mr. Sparks?

MR. SPARKS: Yes.

CHAIRMAN DUGAN: Very well, then.

(Off the record discussion.)

CHAIRMAN DUGAN: Well, on the record, we will recess at a quarter to twelve and resume discussion of the Executive Director's Report and the situation as it applies to the use of water in Arizona, at 1:15. Do we have a Report of the Treasurer?

MR. GOSLIN: Mr. Chairman, we do have a report of the Treasurer. If Mr. Bliss would condescend to do so, I would like to ask him to give it so my voice won't give out.

COM. BLISS: If I can find it here, I will read it. This is the Report of the Treasurer for the period July 1, 1968 through January 31, 1969. I don't know how many of you have copies of it, but the balance on deposit at the bank as of July 1, 1968 is $19,048.58; less outstanding checks in the amount of $5,768.08; leaving an actual balance of $13,280.50. Cash received during the period from assessments to the states, $98,337.50. The certificate of time deposits and interest, $66,807.88. The total, $165,145.38; and a grand total of just over $178,000.00. Cash disbursements during the period; expenses of the prior year, $314.77; operating expenses, $60,849.79; and the purchase of certificates of time deposit, $97,000.00; for a total of $158,164.56; leaving a balance of $20,261.32; to which you add the checks outstanding as of January 31, 1969 of $2,225.80, justifying the bank statement of $22,487.12.

"The Operating Cash Statement and Financial Statement prepared in the office of the Executive Director of the Upper Colorado River Commission for the period ending January 31, 1969, have been distributed to the Commissioners, Treasurer, Assistant Treasurer, and the Finance Committee Chairman." Signed, "I. J. Coury, Treasurer."

Mr. Chairman, I move the acceptance of the Report of the Treasurer.

COM. PERSON: Second the motion.

CHAIRMAN DUGAN: Any discussion or questions?

(No response.)

COM. BLISS: Question.

CHAIRMAN DUGAN: All in favor of the motion say "Aye."

(Ayes.)

The Report of the Treasurer is adopted.

UPPER COLORADO RIVER COMMISSION

Salt Lake City, Utah
January 31, 1969

REPORT OF THE TREASURER

The following figures summarize the financial transactions of the Upper Colorado River Commission for the period July 1, 1968 through January 31, 1969.

Balance on Deposit per bank statement July 1, 1968		$ 19,048.58
Less outstanding checks at July 1, 1968		5,768.08
		$ 13,280.50
Cash received during period:		
Assessments	$98,337.50	
Certificate of Time Deposit and Interest	66,807.88	
		$165,145.38
		$178,425.88
Less cash disbursements during period:		
For expenses of prior year	$ 314.77	
For operating expenses	60,849.79	
Purchase of Time Certificates of Deposit	97,000.00	
		$158,164.56
		$ 20,261.32
Add outstanding checks, January 31, 1969		2,225.80
Balance per bank statement, January 31, 1969		$ 22,487.12

The Operating Cash Statement and the Financial Statement prepared in the office of the Executive Director of the Upper Colorado River Commission for the period ending January 31, 1969, have been distributed to the Commissioners, Treasurer, Assistant Treasurer, and the Finance Committee Chairman.

/s/ I. J. COURY
I. J. COURY
Treasurer

CHAIRMAN DUGAN: Is there a Report of the Engineering Committee?

MR. GOSLIN: Mr. Chairman, the Engineering Committee did meet on October 14, 1968 to discuss the Consumptive Use Study to which reference was made in my report. Since that time copies of the Engineering Committee's Report have been transmitted to practically all interested parties, including the Legal Committee, and action has been taken upon the result of the Report and our transmittal to the Secretary of the Interior; therefore, I think the answer would be that there would be no other special report at this time.

CHAIRMAN DUGAN: Is there a report of the Legal Committee?

MR. SPARKS: I have no report.

CHAIRMAN DUGAN: I will move to unfinished business.

COM. BLISS: Mr. Chairman, I suggest at this time that we recess for lunch.

CHAIRMAN DUGAN: If this is agreeable with the other members of the Commission, we will adjourn.

(Whereupon, the Special Meeting was recessed at 11:45 a.m. and reconvened at 1:15 p.m.)

AFTERNOON SESSION

CHAIRMAN DUGAN: Gentlemen, the Commission meeting will reconvene, and we will return to discussion of the Report of the Executive Director. Now, are there additional observations on the part of the Commission?

COM. PERSON: Are we ready to take some action on this, in that case?

CHAIRMAN DUGAN: Would you care to propose some, Mr. Person?

COM. PERSON: I move that the Commission request the new Secretary of the Interior to reevaluate this contract.

COM. WADDINGHAM: Would you include in your motion that the same request be made to the House Committee on Interior and Insular Affairs?

COM. PERSON: Yes, I will add that to the motion.

COM. WADDINGHAM: I will second that motion.

CHAIRMAN DUGAN: It's been moved and seconded that the Commission ask for review of the contract and to express its views to the Chairman of the Interior and Insular Affairs Committee. Is that the sense of your motion?

COM. PERSON: Yes.

CHAIRMAN DUGAN: Is there discussion of the motion?

COM. BLISS: Mr. Chairman, I was wondering just -- and we have discussed -- in what manner this thing should be presented to the powers that be. I might suggest that one of the very interested parties would be the power people, particularly the Salt River people because they are the contractee in this thing, and further, of course, the Governor of Arizona has asked for some sort of a commitment. I think we should make our opinion known to him as some sort of reply to the request he made and which was not -- well, not ignored by our Commission, but which we are unable to reply to because of the events that occurred the latter part of January. I am wondering if it would not be just as effective if we directed the secretary to make this request, both to the Secretary of the Interior and to the Committee, Interior and Insular Affairs Committee in both the Senate and the House, and also request that each of the states contact their own Congressional representatives to the end that they can apply what pressure and what evidence they need to present.

COM. PERSON: I am sure, as far as Wyoming is concerned, our Congressional delegation is going to be contacted.

MR. MANN: Mr. Chairman, may I ask Dean a question? Dean, as I understand your motion, it's to request a review of the contract?

COM. PERSON: Reevaluation.

MR. MANN: Reevaluation. I wonder if it would be well to say, "reevaluate and amend"? They can reevaluate, and if they don't do anything about it, it doesn't make a bit of difference.

COM. PERSON: I like that, "reevaluate and amend."

COM. WADDINGHAM: I will second that in that form.

CHAIRMAN DUGAN: Is there further discussion?

MR. SPARKS: I assume that when the secretary writes this letter, that we will point out in what respect we think an amendment should be made. Is that understood as part of the motion?

CHAIRMAN DUGAN: Yes.

COM. BLISS: I think it would be a very essential part of the motion. In discussing this contract, it seems to me that not only is the Upper Basin not fully protected, or at least potentially not fully protected, it seems to me that the power contractees are not fully protected, certainly not protected by the resolution adopted by the Navajo Tribe.

Now, that is not a direct concern, I suppose, of the Upper Colorado River Commission. Our basic and perhaps only concern is that uses in Arizona of Upper Basin water do not exceed the 50,000 acre-feet, but it seems to me this is an added reason why the Secretary should reevaluate the contract, reexamine it.

CHAIRMAN DUGAN: Any further discussions?

(No response.)

Well, gentlemen, it seems to me that Mr. Sparks' remarks were very pertinent in that the agreement with the Tribal Council is not totally clear and satisfactory, and that efforts should be made to amend this agreement.

Now, it would seem that this is a very desirable goal and that the Secretary's efforts should be solicited in this regard and that any communication that the Commission might choose to have with the Secretary, that this point be brought out. The understanding that is held in the Department, and I think Mr. Crandall might confirm this, is that the contract is limited to an amount of 50,000 acre-feet, including any and all uses, and I believe that this is to be construed as including evaporation losses.

MR. BLISS: Excuse me, Mr. Chairman. You don't mean any and all uses, including the uses of Page, do you?

CHAIRMAN DUGAN: Well, I think this is the purpose of revising the agreement with the Indians, to clarify this one issue.

COM. BLISS: I see what you're saying.

CHAIRMAN DUGAN: And I would like to ask Mr. Crandall to comment on the point I have just made in regard to the 50,000 acre feet.

MR. CRANDALL: Well, the contract itself says that it must be in accordance with the compacts and the other specific rules of the river and without presuming that they would be violated, the consumption of water in Arizona could not exceed 50,000 acre-feet. The concern, as Ival has so well expressed it in his statement, is that the contract, plus other understandings, would set up a situation where uses in combination would go over 50,000 acre-feet, and everyone on the river would have the practical problem then of trying to shrink back to that, and so the whole thrust is to avoid setting up circumstances where this might take place. But the contract itself says that it has to be in accord with the compact, which very clearly limits Arizona's use to 50,000 acre-feet.

MR. GOSLIN: Mr. Chairman, may I ask Mr. Crandall a question on a point I think you brought up, but he didn't answer? That is this: In the event there is a flow-through unit involved at this Page powerplant, is it the position of the Department of the Interior that the induced evaporation be counted as a part of the consumptive use?

MR. CRANDALL: That has been our position all the way along, and I should have made that clear, Ival. The consumption that results from the man made activity associated with this plant, even though it be an induced, greater amount of evaporation at Lake Powell, is a charge and would be counted in any calculation to see whether the 50,000 acre-feet was being exceeded. And I have confirmed this with our Washington office, and I know it to be so and our understandings all the way through in our negotiations.

MR. GOSLIN: That is what you wanted, wasn't it?

CHAIRMAN DUGAN: Yes. Thank you, Mr. Crandall.

Any further discussions on the motion?

COM. BLISS: Mr. Chairman, so I can clarify this in my own mind, I wonder if I may restate this motion as it has developed? May I ask the mover the question: Is it your desire or motion that the secretary be directed --

COM. PERSON: Asked.

COM. BLISS: Be asked. I mean the secretary of our Commission.

COM. PERSON: Oh, he is directed. (Laughter.)

COM. BLISS: To contact the Secretary of the Interior and the appropriate Chairmen of the Congressional Committees, setting forth the reasons why we feel that the contract at the present time is not adequate to protect either the Upper Basin States or, for that matter, the power contractees, and requesting that the contract be reviewed and amended.

COM. PERSON: Yes.

COM. BLISS: That is basically it?

COM. PERSON: Yes, basically, that is what we intended.

CHAIRMAN DUGAN: Any further discussion?

(No response.)

I think Mr. Bliss' remarks might clarify the nature of the communications that are proposed in the motion.

COM. BLISS: Do you want some clarification of those now?

CHAIRMAN DUGAN: No, I think you have clarified it.

COM. BLISS: I think they have been pretty obvious from the discussions this morning and from the Report of the Secretary, and if you will, from the Report of the Engineering Committee, which went forward to the Secretary in December.

CHAIRMAN DUGAN: Any further discussion?

(No response.)

COM. BLISS: Question.

CHAIRMAN DUGAN: Colorado?

MR. SPARKS: Aye.

CHAIRMAN DUGAN: New Mexico?

COM. BLISS: Aye.

CHAIRMAN DUGAN: Utah?

COM. WADDINGHAM: Aye.

CHAIRMAN DUGAN: Wyoming?

COM. PERSON: Aye.

CHAIRMAN DUGAN: The motion is carried.

Is there any further discussion of the Executive Director's report?

COM. PERSON: Ival, would you give me your reason you suggested may be we should get somebody to evaluate the water consumption in the coal-fueled plant? What was your thinking on this? Why?

MR. GOSLIN: Well, I tried to bring out in the report, Prof, the fact that there is a lot of confusion about how much water is actually consumed by a thermal-electric generating plant. There is confusion among the various authorities with regard to how much water a cooling tower uses. As I mentioned, a design figure of about 20 acre-feet per megawatt is usually assumed when you're beginning to design a project of this type. But, also, I ran into the situation where it's known that a lot of thermal-electric generating plants with cooling towers consume only about 18 or maybe as low as 16 acre-feet per megawatt. This particular one that is being talked about, the capacity of three 853 megawatt units, is based upon the assumption that it will only use about 13 and a third acre-feet per megawatt, and I could find no authority that would say that they had any experience with a powerplant of that magnitude using that little water, so that the question came to my mind immediately, "Well, maybe this should be investigated."

Now, I know this much about these powerplants, that the design of the cooling towers is a very important factor. You can design cooling towers that are much more highly efficient than other cooling towers, but at some point you have to draw the line because of the economics.

Another aspect of the situation that made me think the way I did was that there seems to be a lot of difference of opinion among authorities as to how much water is lost by induced evaporation from the surface of the lake, if one of these 800 megawatt units were to be a flow-through unit. So that all these things combined lead me to make the suggestion, I guess you wish to call it, that I had in the report.

COM. PERSON: Actually, what are we going to use this for? To try to convince the Secretary that this contract needs to be amended, is that the purpose?

MR. GOSLIN: Well, this might be a purpose. On the other hand, if the Indians would come through with the proper type of resolution, you wouldn't need this information because it would be immaterial whether they had a plant that used 13 acre-feet per megawatt or 20 feet per megawatt. We could still say to the Indians, "You have abrogated your Winters doctrine rights, and you have to cut back in order to make the total consumption of water come under the ceiling of 50,000 acre-feet." But if you are going to have hearings on this issue, and if you are going to be talking to other experts about it, then it was my feeling that we should be armed with the very best evidence that we could get, and the way to get it would be through having a first class investigation made by a qualified engineering firm or other organization that someone might wish to suggest. Certainly, our staff is not a staff that is qualified to make the investigation by ourselves. We are none of us power-plant designers. None of us are thermal dynamic experts, either.

COM. PERSON: Well, I think in all this fillibuster, Ival, you have finally told me what we are going to use it for, and I would be inclined to agree with you. (Laughter.)

CHAIRMAN DUGAN: Is there further discussion?

MR. BISHOP: Floyd Bishop from Wyoming. I would make one point and take a minor exception with one thing that Ival has just said. He said if the Indians are willing to limit their uses, then there would be no reason to object on the basis of the power use, but from his own figures, if 20 acre-feet per megawatt is a valid figure, you're going to exceed the 50,000 acre-feet without any Indian uses. So I think we should be concerned, and I think we should make a determination of what these power uses really are going to be.

CHAIRMAN DUGAN: Commissioner Bliss?

COM. BLISS: Mr. Chairman, I don't know what the timing is on this. From my own personal standpoint, I would hope that Ival would let me see a draft of his letter before it goes forward to the various interested parties.

(Off the record discussion.)

MR. GOSLIN: Certainly, I would want to clear it with some experts on this problem.

CHAIRMAN DUGAN: It would seem appropriate, Mr. Goslin, that all of the Commissioners be afforded this opportunity. I am sure they would all want to be.

MR. GOSLIN: That is right.

MR. HALE: Mr. Chairman, might I ask Mr. Crandall to comment on the uses by a powerplant of this size? What are your computations on consumptive use of an 800 megawatt plant? We have got one in the process in New Mexico, and this is why I raise the question.

MR. CRANDALL: Well, this is a matter that is being very thoroughly analyzed and studied. I don't have any real professional outside determination as related to these particular plants.

As everyone knows, there has been a Steering Committee working for some time on siting new thermal-electric generation in the Southwest, and from their study of this matter, they show water requirements for cooling and the associated uses in a plant of something with little safety factor in it of over 30,000 acre-feet. So they have satisfied themselves to the extent that their planning has progressed that this amount of 34,100, though it is a very close amount, austere amount, it is workable. The portion of the calculation that is less precise is the so-called "sensible heat" in the cooling tower. That is the amount of air it carries out of the cooling tower rather than the water vapor, and I think the companies are going to study some existing plants to get a better definition of that amount. But that is all I can tell you now. We put together a little study on our own. Which I think all the people interested in this have, and it is certainly something we would like to comment on, and it is not final, but there is good engineering judgment that this is an amount that can work.

CHAIRMAN DUGAN: Any further discussion from the Commission?

(No response.)

MR. CRANDALL: Excuse me. Then the second part of it, the amount of evaporation induced by putting warmer water into a reservoir like Lake Powell. There has been some research, but it hasn't been translated to a situation like this, and as Ival pointed out here, there needs to be some very comprehensive investigation into this part of the determination.

MR. HALE: Your 30,000 was with cooling towers?

MR. CRANDALL: Yes, that is cooling towers, and then if you have a flow-through unit in that plant, just how much of it is caused by induced evaporation from the reservoirs still needs a lot of study.

MR. GOSLIN: Is this 30,000 acre-feet you're talking about for an 800 megawatt nominal, or is this for an 853 megawatt plant such as they are talking about?

MR. CRANDALL: Ival, it is based on an 800 megawatt nominal unit. It can operate at a peak of 850 in round numbers, but then there is a certain amount of down time every year that offsets that. So the figures would be 800, 800 megawatts nominal.

MR. JACOBSON: Is that three units?

MR. GOSLIN: Is that three units?

MR. CRANDALL: Yes.

MR. GOSLIN: I have a document here that says it takes about 34,000 acre-feet.

MR. CRANDALL: Well, I said 30, plus an allowance for safety factor and outside use, so it's within the 34,100. I wasn't attempting to be real precise because it isn't real precise.

COM. BLISS: Mr. Chairman.

CHAIRMAN DUGAN: Yes, Mr. Bliss.

COM. BLISS: It seems to me that in addition to the action taken here directing our secretary to transmit certain letters, it seems to me that each of the states should, and I am sure they have it in mind, if they would contact their own representatives about this problem and give all the support -- get all the support from them that they can for getting this matter straightened out. I don't know that that requires any motion or needs a motion, but I think each Commissioner, each state, should take it upon themselves to take appropriate action.

CHAIRMAN DUGAN: All right, sir. Thank you.

MR. GOSLIN: Mr. Chairman, I assume that it is the general consensus that we continue to cooperate with the interested parties with respect to trying to obtain the proper type of resolution from the Indian Tribe. Am I correct in this assumption, or not?

COM. BLISS: Mr. Chairman, it seems to me that there is no objection to getting a better agreement with the Indians, but it seems to me that, basically, this is a matter between the State of Arizona and the Indian Tribe because the State of Arizona is the one that is under the obligation not to exceed their contract supply, and, of course, with the Secretary himself and his relation to the Indian Tribe in arriving at this contract.

CHAIRMAN DUGAN: I know that the Executive Director has been extremely active in attempting to see that an adequate agreement is reached with the Indians, and I am sure he would like to have the consensus of the Commission as to whether he should pursue these efforts.

MR. GOSLIN: As I understand you, Commissioner Bliss, it would be all right for us to cooperate but not take the lead in doing it.

COM. BLISS: I am sure this is right. In other words, the obligation is between the Secretary, the Indians, and the State of Arizona, basically. And any cooperating help that we can give them, I am sure they will appreciate.

CHAIRMAN DUGAN: I think that should clarify the matter, and it is agreed by all the Commissioners.

Now, is there any further discussion of the Director's Report?

(No response.)

COM. PERSON: Mr. Chairman, I am not quite through with this yet. I move we ask the Engineering Committee to investigate the possibility, and soon, of getting this analysis that the Secretary discusses in his report on the water consumption by a coal-fired powerplant of this size at this location. I would like to know how much this is going to cost.

COM. BLISS: Are you saying -- you're talking about hiring an outside firm of consultants?

COM. PERSON: Yes.

COM. BLISS: Well, I would think that it would be very proper that this be investigated and we find out how much it is going to cost.

COM. PERSON: Yes.

CHAIRMAN DUGAN: Does your position go to asking the Engineering Committee to explore this with a consulting firm?

COM. PERSON: Yes. How much would it cost?

CHAIRMAN DUGAN: I believe you made a motion, Mr. Person, to the effect that the Engineering Committee investigate the cost of having a consulting firm evaluate the water uses of steam-fired plants?

COM. PERSON: Yes, at this location.

CHAIRMAN DUGAN: All right.

COM. BLISS: I will second the motion, and then let me observe that this would take very little action on the part of the Engineering Committee. Perhaps they could take it upon themselves to make some study on their own.

COM. PERSON: Yes.

COM. BLISS: Otherwise, there would be little point in giving the problem to them.

CHAIRMAN DUGAN: Does the Chairman of the Engineering Committee have any comment on the motion?

MR. GOSLIN: I suspect I should say I am a little confused as to whether the Engineering Committee is to investigate the cost of hiring an outside consulting firm, or whether we are to make a study of water consumption at the powerplant ourselves.

COM. PERSON: Well, I think you ought to do both. (Laughter.)

MR. GOSLIN: All I can say is we are willing to try, but I am not sure we are qualified to make a study ourselves.

MR. BISHOP: Mr. Chairman, as a member of the Engineering Committee, maybe I can speak to that point. I don't think the Engineering Committee has the expertise that Ival is talking of for a study of this

kind. I personally feel we need to go to a consulting firm that has the expertise in this field that is necessary to make us an accurate and reliable study of the amount of water we are talking about.

MR. GOSLIN: Mr. Chairman, may I suggest this as a procedure: Why not ask the Engineering Committee first to investigate the cost of hiring such an outside consulting firm, and then meet and decide what recommendations it wishes to make to the Commission with regards to hiring it. As a matter of fact, if the Commission wished to so direct, the staff could investigate these costs of the consulting firm and then call a meeting of the Engineering Committee and discuss it with them. I don't believe this would take the whole Engineering Committee to talk with various firms.

CHAIRMAN DUGAN: I think there may be some merit in that procedure. I think it would be a valuable contribution of the Engineering Committee to define the scope of any study an engineering firm might make and would provide a consensus among the engineers themselves as to what was requested.

Is there further discussion on the motion?

COM. PERSON: You mean the Engineering Committee is going to recommend to the Commission whether or not we should do this? This is really what we want, how much it is going to cost and whether or not you should do it?

CHAIRMAN DUGAN: And what will be done.

COM. PERSON: And what will be done, that is right.

CHAIRMAN DUGAN: In essence, as I understand the motion, it charges the Engineering Committee with evaluating the scope of a study by a consulting firm, determining the cost, and reporting to the Commission on their findings, with recommendations. Does that seem to be the consensus?

COM. BLISS: I would second the amendment.

CHAIRMAN DUGAN: Is there a second to Mr. Person's motion?

COM. WADDINGHAM: I thought Mr. Bliss seconded it.

COM. BLISS: Yes, I did.

CHAIRMAN DUGAN: Question. Colorado?

MR. SPARKS: Aye.

CHAIRMAN DUGAN: New Mexico?

COM. BLISS: Aye.

CHAIRMAN DUGAN: Utah?

COM. WADDINGHAM: Aye.

CHAIRMAN DUGAN: Wyoming?

COM. PERSON: Aye.

CHAIRMAN DUGAN: The motion is passed. I hope it's clear to the Chairman of the Engineering Committee.

MR. GOSLIN: Mr. Chairman, as I interpret the motion, and please correct me if I am wrong. We would have a meeting of the Engineering Committee, as the first step, to define the scope of the study that we might wish to have made. The second step would be to find the cost of such a study under the auspices of some competent engineering firm. Third, the Engineering Committee then would recommend to the Commission whether it should or should not make such a study. Is this a correct understanding?

CHAIRMAN DUGAN: That is the Chairman's understanding. Any objection?

(No response.)

MR. GOSLIN: I just wanted to know what I had to do.

CHAIRMAN DUGAN: I guess you know. (Laughter.)

Is there further discussion of the Director's Report?

(No response.)

If not, we will move to unfinished business.

At this time, could we have a report from the Regional Director Crandall?

MR. CRANDALL: Mr. Chairman, Members of the Commission, and guests, I have in somewhat of a departure from my custom assembled the Report of Region 4 of the Bureau of Reclamation in outline form, condensing the key facts. I will speak to this outline, and if you will follow it, then the statistics which tend to make a dreary subject more dreary will be available under your eyes, and for later reference.

An item of good news in the Colorado Basin is the amount of water supply that is available, based on the February 1st forecast. For the first time since I have been with you, we are predicting an above-average run-off for the April-July period at Lee Ferry, and we hope that Mother Nature continues to confer her favors for the remainder of the snow accumulation season.

I'll begin with the situation in our storage project reservoirs, starting at Glen Canyon. Lake Powell is now at about elevation 3541. With the run-off predicted it will go above rated head for the first time and allow us to test the units in the powerplant, and we will be in that comfortable position of having the full rated capacity to operate with.

The key factor on the Lake Powell operation, of course, is the delivery to the Lower Basin. The amounts that have been delivered up to now, plus 35,000,000 acre-feet for the next four years, will bring us right to 75,000,000 acre-feet, which is the ten year compact requirement.

At Flaming Gorge Reservoir, we should get a rise there by the end of the spring. We have been moving water out of Flaming Gorge, but we will move it with full recognition of the multipurpose values there, the most significant of which is the amount required to preserve the very valuable fishery resource. More than a million people visit Flaming Gorge every year, and much of the attraction is due to the scenic and recreational opportunities, including fishing.

Navajo Reservoir - we will be above the recreation elevation formerly worked out with New Mexico and Colorado at elevation 6,030. Then the reservoir will recede to 6,030 and be held as constant as practical for the coming summer season. This is in turn based on the 630,000 acre-feet of water expected.

Blue Mesa Reservoir - We will have the spring recession and then will refill the reservoir back to the normal maximum level. We have been studying very extensively the relationship of this new Reservoir to ice jam flooding problems that have been epidemic along the

Gunnison River above there. Just a couple of weeks ago during the freezing weather, one of the ranches with some cabins had four feet of water through the buildings. Then it froze. It has been a very difficult situation. We are proceeding with a program of easements and acquisition, hopefully to minimize and control this problem in the future, working, of course, with the Corps of Engineers and the local interests.

Lake Mead has been accumulating storage because the deliveries of water to meet the Compact 10-year total have been exceeding releases there. The amounts are, as you see them in the summary.

Now, moving on to our construction program, the construction at Glen Canyon Unit is substantially finished. We have some rather minor modification programs that relate to the community at Page and to the unit itself. We had a ravelling from the surface of the concrete on the dam roadway area near the Visitors' Center exit. It is being repaired, because of the rather heavy foot traffic that takes place.

Curecanti - it is satisfying to announce to you that we have awarded the powerplant completion contract. This is the key contract that puts the Morrow Point powerplant in operation when it is finished. The items involved are listed for you. The generators, turbines, and major machinery items are fabricated and will be delivered as needed.

Bonneville Unit of the Central Utah Project - the work at the Starvation Dam Complex is proceeding somewhat ahead of schedule, as you will note. We had been concerned that the capibility to reroute traffic around the Starvation Reservoir would be available to us this spring before the peak run-off. The combination of capacity to release water at the dam and a very high flow from all the snow in the hills could cause the level of the reservoir to cover the present highway 40 bridge crossing over Strawberry River. So we have had an accelerated program to get the highway relocation in shape so it could be used as a rerouting or a detour, if necessary.

The Strawberry Reservoir and Collection Works is moving along well. We have a mole that is digging away under the mountain for the Water Hollow Tunnel, having gone along almost 2,500 feet since last November.

We have started -- or awarded a contract for the Fish and Wildlife Mitigation Reservoir at Bottle Hollow, which is near Fort Duchesne.

Emery County - a small project there, minor clean-up and repair work.

The same at Flaming Gorge.

Bostwick Park Project is somewhat ahead of schedule. We did have a slide above a spillway excavation that has required some special treatment and scheduling of our construction activities. It appears well controlled now, so we look forward to substantial progress on the remainder of the work this coming summer.

The Lyman Project - the work status is as you see it, no particular concern. The contractor had a little difficulty finding working weather all last year. It seems a combination of the late spring, an early fall, and a rainy summer didn't help.

Paonia Project - we have had a small problem there with rock falls on the main road around the reservoir, which is well on its way to being taken care of.

Seedskadee Project - the Fontenelle powerplant is now operating. I noticed in the Daily Report that the peak power production has been 11 megawatts, which is one megawatt above plant capacity. When we had the water bypass through the abutment of the Fontenelle Dam, the reservoir was dropped very abruptly after being at a high level. This caused some earth slides and settlement contributory to some instability in the relocated highway. With the agreement of the Wyoming Highway Department, we are going to observe a few cycles of filling and withdrawal, followed by a correction program.

We are continuing our program of drains and minor construction work on Hammond project.

Eden Project - the water supply improvement program is continuing with the items that are listed. We are meeting with the Eden Project people and their board, looking forward to first payments on construction now due under the terms of the contract. We are hopeful that some solution can be worked out to the rather difficult financial circumstances that relate to repayment of the Eden Project.

I have included in my report here, on pages 9 and 10, the construction status of the Fry-Ark Project, the Navajo Irrigation Project, and the San Juan-Chama Project. I am personally not well conversant with these construction programs, since they are under the administration of other regions. On the Fry-Ark Project we are working very closely with the people on both sides of the Continental Divide that have an interest in Ruedi, and with Region 7, to work out the water marketing, utilization

of the reservoir, the amount required for replacement, and the assignment of costs, and so on. So that work is being actively pursued now.

Next the general investigation program. The Ute Indian Unit was converted from a reconnaissance to a feasibility study by the Colorado River Basin Project Act. We look forward to putting out some kind of a status report before the end of the calendar year to serve the State of Utah in their consideration of the wilderness relationship to development in that area.

The Green River Project - we have mobilized a study team in Rock Springs and have been gathering basic information, conferring with state and local interests, and have scheduled the completion of what we view as a very significant reconnaissance report in FY-1971.

The Paria-San Rafael Investigation is being worked on in cooperation with the State of Utah to assess the development opportunities of this arid, southern portion of Utah and to aid the State in development of their state water plan.

I have a rough draft of the San Juan County reconnaissance report on my desk now, so it will not be too long before we have it available for the people in Utah that are interested in it.

Mr. Goslin is the Chairman of the Upper Colorado River Comprehensive Basin Study group and the work is therefore well understood by this Commission so I will not elaborate.

Feasibility Investigations - the work on the Basalt Project is coming along, leading to a report completion in '71.

Battlement Mesa, we have had a preliminary report out for review Obtaining all the comments and putting them into a final report is still work that is pending.

Bluestone Project is scheduled for completion in the near future, and, likewise, the Uintah Unit will be finished by the end of this fiscal year.

The other investigations are as you see them outlined in your summary. We are getting started on the Juniper with somewhat different delineations than presented in the earlier report of quite some time ago.

I might comment briefly on the Yellow Jacket Project. We are working closely with the State Fish, Game, and Parks Department, the

U.S. Fish and Wildlife Service, the local Conservancy District, and other people who are interested in the big game mitigation features of the Yellow Jacket Project. There has been concern about the conversion of private lands to big game mitigation, and I report to you very active, cooperative, and harmonious treatment of this particular problem, looking at various alternatives to see what we can put together.

Our cooperative quality of water study with the Federal Water Pollution Control Administration continues. The pilot program of well plugging did reduce the salt contribution to the Colorado River rather appreciably, considering the amount of investment. Of course, the general aim of this program is to minimize salt in the river to make way for additional depletions and water uses without aggravating the salinity problem.

COM. BLISS: May I interrupt? Is that the plugging of old oil wells?

MR. CRANDALL: Yes, old oil wells that have been abandoned. In one case, I think the land had reverted back to the state. The salt was flowing uncontrolled into the river.

The Advance Planning Program - we are winding up our report on the Jensen Unit. The Upalco Unit report is drafted and it is in the internal review process now.

Fruitland Mesa - our preconstruction activities have been proceeding, mostly in the area of settlement plans and repayment contract negotiations. Our repayment contract has been recently approved as to form.

Savery-Pot Hook Project - we are entering the final phases of the investigation. We have meetings scheduled there with representatives of both states and the local people and our cooperating agencies to consider the economic factors that relate largely to the agricultural features of Savery-Pot Hook. The development of agriculture in the high altitude areas present the very challenging problem of formulating a plan that meets the economic criteria.

Power Operations - I will not review all these statistics. You might find them interesting, but coming back to the conclusive part of it (which is the repayment), we have received revenues at a rate in the past fiscal year which allowed us to meet for the first time all our operating costs, all of the accumulated interest for that year, and have a surplus to apply to back interest. There is about $3,364,000 of back interest yet to be repaid.

The twelfth annual report, which is the report on the status of the storage projects and the financial and operating picture, has been finished and distributed. A few of the highlights from it are tabulated for you, along with the succeeding paragraphs on the amount of power generation and transmission capacity now installed.

So, gentlemen, that concludes the Reclamation Program summary. In addition we have continued our water service contracting activities. More recently, the El Paso Natural Gas and Consolidated Coal Company of Gallup, New Mexico, have renewed their interest in obtaining water from the San Juan system, as controlled by storage in the Navajo Reservoir. The amount that is being sought is 27,500 acre-feet, which with the other commitments, comes up pretty close to the 100,000 acre-feet that has been determined as available for this interim contracting out of the San Juan and Navajo.

We have been negotiating water service for a long period of time with Resources, Inc., on the development at Kapairowitz. The company has been working on final details directly with the Department, and it is my understanding that most of the contract specifics have been settled. There remains just the general subject of power coordination, which applies across the board to all of these power developments where the Department has an interest in the lands and waters.

The water service contract for the proposed Page-Navajo Plant has been well covered here. I would like to say something about the present water use feature of it, as related to the Indian interests, prefacing that by acknowledging that the principal responsibility I have, of course, is to the Upper Basin. It is one I cherish and feel very strongly about. These determinations that were presented to the Tribal Council are those that our Regional staff worked out and that I personally was very much involved in. So I am saying this not in apology at all but to convey to you that your interests are certainly the Bureau's and mine.

We were not trying to put together estimates of present water use that would necessarily meet a predefined conclusion. But the objective was to make a determination of the amount of water that the Indian people had consumed for agriculture in the greatest year that we could make such a determination as an actual fact of their having experienced the consumption. It was not intended as a determination of what was a consumption opportunity or what, presuming coincident peak demands or a full water supply they would use, or perhaps what might be a proper reservation for their potentials. I wouldn't argue

that point. Our effort was to try to define by our best judgment what they actually had consumed. We presented this to the Tribe, perhaps not as effectively as it should have been to gain that understanding, so we could then say to them: "If you use no more than you have used, there is this amount remaining, when you consider the opportunities for other uses." It was done to give them a bench mark for understanding.

Now, our hydrologic judgment is that with the system for use that they have, the manner in which they use water (which is rather erratic), the precipitation and cropping patterns, the type of crops, the way their cultivation practices, plus our own experience in studying many, many supplemental water projects under circumstances that have a relationship, was that they did not, in this peak year of cultivation, have a full water supply. So we discounted it, as Mr. Goslin has shown in his tabulation, to attempt to arrive at a realistic figure. So that is how this estimate of consumption on the reservation came about.

I will conclude by saying that we recognized, as you all have, that one of the promising avenues for a solution to this question of water uses fitting under the 50,000 acre-foot entitlement, including the steam plant, is a limitation agreement by the Indian people. We expect we may be going back to them because their limitation excludes the uses for the Glen Canyon Unit. When we go back to them, I pledge to you a most specific and conscientious effort to clarify and be sure that the Indian people have a full understanding of the basis for the factors presented to them. We fully subscribe to the team Engineering Report, in which we participated.

So with that, Mr. Chairman, I will conclude. I have probably taken more time than I should have, anyway.

CHAIRMAN DUGAN: Thank you, Mr. Crandall. Do you have any questions?

(No response.)

MR. SPARKS: I have one, Mr. Crandall, you made reference to this flood condition on the Gunnison River, that flooding which occurred in the last few weeks. Is that attributable to the Blue Mesa Reservoir?

MR. CRANDALL: Larry, that is a question we have asked ourselves and studied quite extensively. The record this year, and it is my understanding last year too, was that the freezing started at the upper margin of the reservoir, creating an ice jam at the head of this frozen perimeter as it moved upstream. In the autumn and early winter, when we had the steep gradient of the river without the reservoir, this slush

ice went on down. You didn't get the jams and floods until in the spring when the ice break-up took place, clogging the channel at the islands, and other restricted locations. So we feel we would be in a rather difficult and precarious situation trying to defend ourselves against not having made a contribution to the trouble.

MR. SPARKS: Having lived in that country for some years, I know that was always a chronic problem on the Gunnison River, and I wondered whether or not Blue Mesa had aggravated it, because this has come to our attention with great frequency.

MR. CRANDALL: And intensity.

MR. SPARKS: I have been arguing that the reservoir was not the cause of it. I just wanted to get our story straight here. (Laughter.)

MR. CRANDALL: Well, we place a limit on how far this influence goes, and there are certain areas that are subject to flooding far beyond any reasonable application of this. The Corps of Engineers is studying it, and perhaps their program can be helpful in complementing what we do plus what the Fish and Wildlife Service may do, and perhaps we can get rid of the difficulty.

CHAIRMAN DUGAN: Any further questions?

MR. GOSLIN: Have you determined how far back up the river you would have to purchase easements in order to keep this on federal property, or is that part of the investigation that is now going on?

MR. CRANDALL: I can give you just an off-the-cuff figure, and I hope off-the-record here, because we are involved in negotiations that involve purchases of something like two and a half or three miles, I think, Ival. That is the figure that comes to mind. It's not a great distance upstream.

CHAIRMAN DUGAN: Thank you very much, Mr. Crandall. Any other unfinished business? Do you have any Ival?

MR. GOSLIN: Mr. Chairman, that is the only item I hadn't listed, unless the Commission has something else. (No response.)

CHAIRMAN DUGAN: We will move on to new business. Does the Director care to discuss the Appropriation Committee's hearings at this time?

MR. GOSLIN: Mr. Chairman, as I mentioned in my report, we have requested time for witnesses to appear before the Appropriations Committee. We have not received a reply back from the Chairman of the Appropriations Committee at this time, probably because they don't know themselves when they are going to schedule these hearings. Ordinarily, they come the last part of April or the first part of May. And the question, of course, that I had was: Does the Commission wish to operate as we have in the past and attempt to coordinate this testimony of the various states and also, of course, before the Appropriations Committee? There has always been a lot of work that has to be done after the hearings, talking to various members of the Appropriations Committees, and so on, and this would not need to be covered with a motion because we do that as part of our regular job. But the hearings themselves, if you wish to proceed as you have in the past, I think the Commission should say so.

COM. WADDINGHAM: We do, don't we, Dick?

CHAIRMAN DUGAN: What is your feeling on this, Mr. Sparks?

MR. SPARKS: Well, I think this testimony presented by the Commission has been extremely valuable in the past, and I believe it should be continued. We, of course, like the other states here, we have a considerable interest in those appropriations, and this year a particular interest; although, we are all being cut down on funds, which is understandable because of the national fiscal situation.

As a result of the passage of the Colorado River Basin Project legislation last year, we were constantly assured by officials of the Department of Interior that there would be no problem in getting some funds to commence definite plan reports on the Colorado Projects authorized in that legislation if, in fact, funds were going to be sought for the State of Arizona. We were, therefore, somewhat annoyed when the President's Budget was released, and Arizona -- there was some $900,000 budgeted for Arizona and none for Colorado. We have taken slight issue with that budget, and we intend to press it at these hearings and at other places.

CHAIRMAN DUGAN: Mr. Bliss?

COM. BLISS: Well, I think my only observation is I think we should continue to work together toward the obtaining of adequate funds for the operation of the project, and I think we should continue this.

CHAIRMAN DUGAN: Mr. Waddingham?

COM. WADDINGHAM: Utah concurs that we should continue the activities as we have in the past with each state to work with Ival on who should present what part of the picture.

CHAIRMAN DUGAN: Mr. Person?

COM. PERSON: Yes, that is okay.

CHAIRMAN DUGAN: The consensus is that the Director should continue as he has in the past.

MR. GOSLIN: I guess that is instruction enough.

CHAIRMAN DUGAN: Any other new business?

COM. BLISS: Mr. Chairman, when the Governor was here, he announced that Governor Ed Johnson has submitted his resignation, and I am sure I express the opinion of everyone here that we certainly appreciate the work that he has done over the years and the help he has been to the Commission, and I feel it only fitting and proper that the Commission should prepare a proper resolution which would go to Mr. Johnson. I suggest that since our secretary has nothing else to do, that we direct him to prepare such a resolution and that it be sent to Governor Johnson and Governor Love. (See Page 59)

CHAIRMAN DUGAN: Would you care to put that in the form of a motion, Mr. Bliss?

COM. BLISS: I thought I did. I will so move.

COM. PERSON: Second.

CHAIRMAN DUGAN: Question. All in favor say "Aye." (Ayes.)

You are so directed, Mr. Goslin.

MR. GOSLIN: Yes, sir.

CHAIRMAN DUGAN: Any other new business?

(No response.)

If not, I will entertain a motion for adjournment.

MR. SPARKS: I move we adjourn, Mr. Chairman.

COM. PERSON: Second.

CHAIRMAN DUGAN: All in favor please say "Aye."

(Ayes.)

Adjourned.

(Whereupon, the Special Meeting was adjourned at 2:40 p.m. of the same day.)

RESOLUTION
by
UPPER COLORADO RIVER COMMISSION

108-59

WHEREAS, the Hon. Edwin C. Johnson was appointed Commissioner on the Upper Colorado River Commission for the State of Colorado on April 8, 1957 by Governor Stephen L. R. McNichols and served as Colorado's Commissioner until he retired in February, 1969 in order to preserve his health; and

WHEREAS, the Hon. Edwin C. Johnson, prior to said appointment, had served in the General Assembly of the State of Colorado for four terms and as an outstanding Governor of Colorado for three terms; and

WHEREAS, the Hon. Edwin C. Johnson had faithfully served the State of Colorado as one of the most able and respected Members of the United States Senate for a period of 18 years; and

WHEREAS, the Hon. Edwin C. Johnson throughout his entire career always maintained a keen interest in all matters pertaining to the development, conservation, and utilization of the water and related resources of the State of Colorado and the Upper Colorado River Basin; and

WHEREAS, the Hon. Edwin C. Johnson brought to the Upper Colorado River Commission a special expertise which resulted from his unique experience as a member of State and National legislative bodies and public administrator in his beloved State of Colorado; and

WHEREAS, the Hon. Edwin C. Johnson vigorously and honorably performed his duties as a Commissioner for the State of Colorado with a deep respect for the integrity and abilities of his fellow Commissioners, staff members, and other interested parties with whom he was related in Commission affairs; and

WHEREAS, the Hon. Edwin C. Johnson after devoting so much of his efforts, abilities and time to the welfare of Colorado and of the Nation has more than earned his retirement, and his vivid personality and voice of experience are going to be greatly missed by all of his friends and associates;

NOW, THEREFORE, BE IT RESOLVED that the Upper Colorado River Commission at a Special Meeting held in Denver, Colorado on February 13, 1969, does hereby express the gratitude and appreciation of the Commission and its staff for the untiring service and wise counsel rendered by the Honorable Edwin C. Johnson in solving the many technical and political resource problems which have confronted the Commission during his tenure as Colorado's Commissioner, and the Upper Colorado River Commission, its advisers, and staff sincerely wish him and his family the best of health, happiness, and prosperity in all of his future endeavors;

BE IT FURTHER RESOLVED that the Secretary of the Upper Colorado River Commission is hereby directed to forward a copy of this Resolution to the Hon. Edwin C. Johnson and to the Governor of the State of Colorado.

UPPER COLORADO RIVER COMMISSION

1969

OFFICIAL RECORD

Volume 21

UPPER COLORADO RIVER COMMISSION

1969

EXPLANATORY NOTE

This document consists of a series of verbatim transcripts of meetings of the Upper Colorado River Commission. The records for each calendar year are in a separate volume.

The meetings of each Volume are separated by blue insert sheets.

A subject index is to be found at the beginning of each Volume with an explanation of its use.

At the beginning of the transcript of each meeting, there is a Table of Contents that refers to the major actions or decisions of the Commission.

Volume 21 includes transcripts of the following meetings of the UPPER COLORADO RIVER COMMISSION

Meeting No.	City and State	Month, Day, Year
108	Denver, Colorado	February 13, 1969
109	Salt Lake City, Utah	March 17, 1969
110	Salt Lake City, Utah	September 15, 1969
111	Denver, Colorado	October 1, 1969
112	Denver, Colorado	December 5, 1969

FOREWORD

The Upper Colorado River Commission is an interstate administrative agency created under the terms of the Upper Colorado River Basin Compact executed at Santa Fe, New Mexico, on October 11, 1948, and subsequently ratified by each of the legislatures of the states and by the Congress of the United States. The Commission represents the states of Colorado, New Mexico, Utah and Wyoming and the Federal Government.

The major purposes of the Upper Colorado River Basin Compact are: (1) to provide for the equitable division of the use of water of the Colorado River System among the Upper Basin States, namely, Arizona, Colorado, New Mexico, Utah and Wyoming; (2) to establish obligations of each state with respect to the delivery of water to the Lower Basin; (3) to promote interstate harmony; (4) to remove causes of controversies; (5) to secure the expeditious agricultural and industrial development of the Upper Basin states, the storage of waters, and the protection of life and property from floods.

The Commission, in order to fulfill the major purposes of the Compact, has been granted broad and comprehensive powers and charged with well-defined duties and responsibilities. Among its powers and duties are: adopting rules and regulations; locating and establishing water-gaging stations; making forecasts of water runoff; engaging in cooperative studies of water supplies; collecting, analyzing, correlating and preserving all types of water supply data; determining the quantity of water used each year in the Upper Colorado River Basin and in each state, and delivered to the Lower Basin; determining extent of curtailment of use, if necessary; determining reservoir losses and their apportionment; making findings of fact concerning obligations under the Mexican Treaty; acquiring and holding property; performing all functions required of it under the Upper Colorado River Basin Compact; reporting annually on its activities to the Governors of the signatory states and to the President of the United States.

This volume contains the transcripts of all meetings of the Commission during the 1969 calendar year.

SUBJECT INDEX

This subject Index is prepared according to a code number system in this manner: 21:108:5; 21:109:34-40; 21:110:11, 14, 28. Interpreted, this code means: Volume 21, Meeting 108, Page 5; Volume 21, Meeting 109, pages 34 to 40; Volume 21, Meeting 110, Pages 11, 14, and 28.

In brief, the code is:

PROCEEDINGS

THE CHAIRMAN: The Adjourned Regular and Annual Meetings of the Upper Colorado River Commission will come to order.

Secretary Goslin, would you state the documents that are necessary to conform the meeting?

MR. GOSLIN: Mr. Chairman, yes, sir, I will do so.

I think the record should show that all the Commissioners are present with the exception of Commissioner Love who, I understand, will be here later, and that Mr. Sparks, Director of the Colorado Water Conservation Board, will act as his proxy.

Also, we have been officially notified by Governor Love that he is personally going to fill the vacancy created on the Upper Colorado River Commission by the resignation of former Commissioner Edwin C. Johnson.

The necessary documents to conform this meeting to the By-Laws consist of the following: Unless there is objection from the Commission, I will not read these but will merely submit them to the reporter to be included in the proceedings of this meeting.

First, there is a Notice of Regular Meeting, dated February 28, 1969.

NOTICE OF REGULAR MEETING

In accordance with Article IV, paragraph 4, of the By-Laws, notice is hereby given that the Regular Meeting of the Upper Colorado River Commission will be held, beginning at 8:00 o'clock a.m., on Monday, March 17, 1969 in the principal office of the Commission located at 355 South Fourth East Street in Salt Lake City, Utah.

/s/ IVAL V. GOSLIN
Secretary

Second, there is an Agreement to Extend Adjournment of the Regular Meeting that was signed by all five Commissioners in compliance with Article IV, paragraph 12 of the By-Laws.

AGREEMENT TO EXTEND ADJOURNMENT OF THE REGULAR MEETING

In compliance with Article IV (12) of the By-Laws of the Upper Colorado River Commission, I hereby agree that the Regular Meeting

of the Commission, formerly scheduled on March 17, 1969 in Salt Lake City, Utah and adjourned for lack of a quorum, shall be adjourned beyond the 30-day limit for such adjournment to a date and place to be determined by the Chairman and Secretary after consultation with each Commissioner.

(Documents reading as above, dated April 8, 1969, signed by the following: H. P. Dugan, Commissioner for the United States; John A. Love, Commissioner for the State of Colorado; John H. Bliss, Commissioner for the State of New Mexico; Thorpe Waddingham, Commissioner for the State of Utah; and H. T. Person, Commissioner for the State of Wyoming.)

There was then a Notice of Annual Meeting that was dated August 28, 1969.

NOTICE OF ANNUAL MEETING

In accordance with Article IV, paragraph 4, of the By-Laws, notice is hereby given that the Annual Meeting of the Upper Colorado River Commission will be held, beginning at 8:00 o'clock a.m., on Monday, September 15, 1969 in the principal office of the Commission located at 355 South Fourth East Street in Salt Lake City, Utah.

/s/ IVAL V. GOSLIN
Secretary

Next, there was an Agreement to Establish Time and Place of 1969 Adjourned Regular and Annual Meetings, also signed in person by each of the five Commissioners.

AGREEMENT TO ESTABLISH TIME AND PLACE
OF 1969 ADJOURNED REGULAR AND ANNUAL MEETINGS
UPPER COLORADO RIVER COMMISSION

In accordance with Article IV of the By-Laws, I, the undersigned, Commissioner for the _____, agree that the Adjourned Annual Meeting of the Upper Colorado River Commission shall be held in Denver, Colorado on Wednesday, October 1, 1969, and that the Adjourned Regular Meeting for 1969 shall be held concurrently with the Adjourned Annual Meeting.

(Documents reading as above, dated September 12, 1969, signed by the following: H. P. Dugan, Commissioner for the United States of America; John A. Love, Commissioner for the State of Colorado; John H. Bliss, Commissioner for the State of New Mexico; Thorpe Waddingham, Commissioner for the State of Utah; and H. T. Person, Commissioner for the State of Wyoming.)

And last, a Notice of this meeting, which was dated September 19, 1969, and reads as follows:

NOTICE OF ADJOURNED REGULAR AND ANNUAL MEETINGS
OF THE UPPER COLORADO RIVER COMMISSION

In accordance with Article IV of the By-Laws, notice is hereby given that the Adjourned Regular and Annual meetings of the Upper Colorado River Commission will be held, commencing at 10:00 o'clock a.m., on Wednesday, October 1, 1969, in Room 320-E of the Colorado State Capitol in Denver, Colorado.

/s/ IVAL V. GOSLIN
Secretary

Mr. Chairman, that constitutes the submission of all the documents.

THE CHAIRMAN: Thank you, Mr. Goslin.

Do you have the minutes?

MR. GOSLIN: The Minutes of the Special Meeting of the Upper Colorado River Commission of February 13, 1969, were distributed to all of the Commissioners soon after that date. Do the Commissioners wish to have them read?

COM. PERSON: I move the minutes be approved as submitted.

COM. BLISS: Second the motion.

THE CHAIRMAN: Question? (Question) All in favor say "Aye." Opposed. They are approved.

The minutes of March 17.

MR. GOSLIN: Mr. Chairman, the minutes of the Regular Meeting of the Upper Colorado River Commission of March 17, 1969, have also been distributed. In order to have a record of this meeting, I would like to ask the reporter to include a copy in the proceedings. Do you wish these read?

COM. WADDINGHAM: I move that they be approved as submitted.

COM. BLISS: I will second that motion.

THE CHAIRMAN: All in favor say "Aye." Opposed? Carried.

MINUTES OF REGULAR MEETING
of
UPPER COLORADO RIVER COMMISSION
March 17, 1969

Upon arriving at the place of the Regular Meeting of the Upper Colorado River Commission at the appointed hour the Secretary observed that there were no members of the Commission present, prepared these minutes to make a record of the situation, and noted that arrangements will be made to hold an adjourned regular meeting at a time and place to be determined by the members of the Commission.

/s/ Ival V. Goslin
Secretary

MR. GOSLIN: Mr. Chairman, the minutes of the Annual Meeting of the Upper Colorado River Commission of September 15, 1969, have likewise been distributed, and I would like to ask the reporter to include a copy of these minutes in the proceedings in order that we have a record of that meeting. Do you wish to have these read?

COM. WADDINGHAM: I move the same motion as to the previous minutes.

COM. BLISS: Second the motion.

THE CHAIRMAN: All in favor? Opposed? Approved.

MINUTES OF ANNUAL MEETING
of
UPPER COLORADO RIVER COMMISSION
September 15, 1969

No members of the Upper Colorado River Commission were present at the appointed hour. The Secretary immediately commenced arrangements for the holding of an Adjourned Annual Meeting at a time and place to be determined by members of the Commission.

/s/ Ival V. Goslin
Secretary

THE CHAIRMAN: We are, indeed, fortunate today to have Governor Clyde present, former member of the Commission. We are all very happy to see you here, Governor.

The Chairman has no report to make at this meeting and I would like to move on to the report of the Director, Mr. Goslin.

MR. GOSLIN: Mr. Chairman, each member of the Commission has a copy of this report in his folder, and the rest of the copies have been distributed to the people who are present. There are a few left on the table if anybody desires a copy.

Seven months have elapsed since the last official meeting of the Upper Colorado River Commission. During that period we have attempted to keep our Commissioners and their advisers informed through memoranda and correspondence.

Appropriations of Funds by the Congress for the CRSP

President Johnson's budget request for fiscal year 1970 was transmitted to the Congress on January 15, 1969. The total recommended to be appropriated to the Bureau of Reclamation for its construction program on the Colorado River Storage Project amounted to $26,000,000, which, when considered together with reductions due to anticipated delays and financing from other sources was supposed to initially finance a program amounting to $29,447,000. The largest items included in the budget were $8,000,000 for the Bonneville Unit of the Central Utah Project, $6,300,000 for the San Juan-Chama Project, $3,672,000 for transmission lines, and $3,500,000 for the Curecanti Storage Unit. The budget also contained $3,500,000 to be appropriated to the Bureau of Indian Affairs for continuing construction of the Navajo Indian Irrigation Project.

The Operation and Maintenance Program for the Colorado River Storage Project to be financed through the Upper Colorado River Basin Fund amounted to $7,551,800. In addition to the operation and maintenance activities on the Flaming Gorge, Glen Canyon, Navajo, and Curecanti Storage Units, the power transmission division, and Emery County, Florida, and Seedskadee participating projects, the 1970 program also provided for the continued purchase of power to cover requirements caused by diminutions in energy generation and capacity impairment created at Hoover Dam powerplants as the result of operations of dams and reservoirs of the Colorado River Storage Project, and provided for quality-of-water studies.

The total fiscal year 1970 program of $7,551,800 will be funded with $15,000 advanced by the water users and $7,536,800 by revenues received from the sale of electric energy and water.

The Upper Colorado River Commission and the State of New Mexico on April 1, 1969 submitted testimony to the Subcommittee of the Department of the Interior and Related Agencies of the Committee on Appropriations of the House of Representatives in support of construction funds for the Navajo Indian Irrigation Project. The need for accelerating the construction of this project at a rate greater than that of the past five years was emphasized in the statements to the Subcommittee.

Witnesses representing the Upper Colorado River Commission and various water agencies in the States of Colorado, New Mexico, Utah, and Wyoming on June 2 and 3, 1969 testified before the subcommittees of the House and Senate Appropriations Committees.

On April 15, 1969, President Nixon sent his recommendation to the Congress for reductions to be applied to the proposed federal budget. Under these recommendations the Bureau of Reclamation's budget was reduced $39,720,000 from $289,200,000 to $249,480,000, but the budget item for the Colorado River Storage Project was not reduced. Early last month the President made known his recommendation that new federal public works construction would be reduced 75%.

At the time of writing this statement the Interior Department Bill has been passed by the House and has been reported to the Senate. The Public Works appropriation bill containing the Bureau of Reclamation and Corps of Engineers funds has not been "marked up" by the subcommittee of the House. It is anticipated that the consideration of this House Bill will be further delayed pending information from the Bureau of the Budget concerning how the 75% new construction slice is to be applied. The Bureau of the Budget has asked most federal agencies for a temporary freeze on new contracts until it can formulate guidelines. Currently, Congress is working on several appropriation bills for different government agencies. What action the committees will take is not known. They could either accept the reductions or base their recommended legislation on the original budget and ignore the cut backs.

On the salmon-colored sheets in each Commissioner's folder is a resume' of the Bureau of the Budget Bulletin No. 70-5, which describes the Construction Reduction Plan. Copies are available for others in the room who may find this information useful or interesting.

Currently, Congress is working on several appropriation bills for different government agencies. What action the Committees will take is not known. They could either accept the reductions or base their recommended legislation on the original budget and ignore the recommended cutback.

Type I Comprehensive River Basin Study

The Upper Colorado River Commission is the lead agency for the Upper Colorado Region Type I Study. Representatives of the five upper basin States and about 20 federal agencies are participating. This study is progressing, but not at the rate initially anticipated. Reductions in funds and personnel for the federal agencies have caused, and will continue to cause, delays. Innumerable meetings at the State-Federal Interagency level, staff level, and of the various task forces are requiring a lot of time and energy of our staff.

When completed, the Type I study report will consist of a main report document and 18 appendices, and an analytical summary report. The appendices will contain an inventory of resources of the Upper Colorado Region, and projections of resource development for the years 1980 - 2000 - and 2020. A plan of development based upon economic projections made by the Office of Business Economics of the Department of Commerce and the Economic Research Service of the Department of Agriculture will be described and evaluated. In addition, it is anticipated that an alternative plan of development, based upon more accelerated rates of water resource usage, will also be outlined and evaluated.

Inputs of data, other basic information, ideas, and opinions are being contributed by each State and federal agency.

The Type I Study is not the "full and complete reconnaissance investigations for the purpose of developing a general plan to meet the future water needs of the Western United States" required to be conducted by the Secretary of the Interior by title II of P.L. 90-537, the Colorado River Basin Project Act of 1968. The Type I Study is under the auspices of the national Water Resources Council and was authorized by the Water Resources Planning Act. It is hoped that some of the information developed by the Type I Study can be used for the westwide study.

Colorado River Development Fund

Section 2 (d) of the Boulder Canyon Project Adjustment Act created a $500,000 per year fund from Hoover Dam power revenues for the years ending May 31, 1938 to May 31, 1987. This fund is known as the Colorado River Development Fund. The first $1,500,000 of this CRD Fund was earmarked for comprehensive Colorado River Basin studies by the Secretary of the Interior.

The next receipts to the end of fiscal 1955 were specified to be used "for the investigation and construction" of projects in the Upper Colorado River Basin. In 1948 Senator Barrett of Wyoming sponsored an amendment (P. L. 570 of the 80th Congress, 2d Session) requiring an equal division of the $500,000 among the Upper Division States for the years 1949-1955. After 1955 the law provides that the CRD Fund is to be used "equitably" in all seven States of the Basin for the investigation and construction of projects.

In accordance with P. L. 90-537, the Colorado River Basin Project Act of September 30, 1968, the annual $500,000 payment will be transferred to the Upper Colorado River Basin Fund, beginning with fiscal year 1970, as reimbursement "for the money expended heretofore or hereafter from the Upper Colorado River Basin Fund to meet deficiencies in generation at Hoover Dam during the filling period of storage units of the Colorado River Storage Project pursuant to the criteria for the filling of Glen Canyon Reservoir."

On the attached blue sheets are tables showing the distribution of the CRD Fund among the basin States for fiscal year 1969, the distribution of all CRD Fund revenues since 1938, and a summary showing its division between the Upper and Lower Divisions.

I thought these sheets would be of interest to you, certainly from a historical viewpoint.

You might, as a matter of interest, take a look at the next to the last blue sheet, which is sort of a summary. You will get an idea of what has happened to this CRD Fund up until June 1st of 1969.

You will notice that in the last column, the "Total" column, that the Upper Basin has received from this fund about $11,828,229, and across the bottom the distribution of this percentage is shown, so far as each State is concerned.

In the lower part of the page, the "Total" column shows that the Lower Basin has received slightly over three and a third million dollars, and the bottom line shows the distribution of that among the Lower Division States, and as mentioned in the body of my report, from now on this Fund will all go to the Upper Colorado River Basin Fund to help pay for these deficiencies in generation that have been charged against that Fund as a result of filling the Upper Basin Reservoirs.

UPPER COLORADO RIVER COMMISSION

355 South Fourth East Street
Salt Lake City, Utah 84111

October 1, 1969

MEMORANDUM

TO: Upper Colorado River Commissioners

FROM: Ival V. Goslin, Executive Director

SUBJECT: Distribution of CRD Fund Revenues

Section 2 (d) of the Boulder Canyon Project Adjustment Act created a $500,000 per year fund from Hoover Dam power revenues for the years ending May 31, 1938 to May 31, 1987. This fund is known as the Colorado River Development Fund. The first $1,500,000 of this CRD Fund was earmarked for comprehensive Colorado River Basin studies by the Secretary of the Interior.

The next receipts to the end of fiscal 1955 were specified to be used "for the investigation and construction" of projects in the Upper Colorado River Basin. In 1948 Senator Barrett of Wyoming sponsored an amendment (P. L. 570 of the 80th Congress, 2d Session) requiring an equal division of the $500,000 among the Upper Division States for the years 1949-1955. After 1955 the law provides that the CRD Fund is to be used "equitably" in all seven States of the Basin for the investigation and construction of projects.

In accordance with P.L. 90-537, the Colorado River Basin Project Act of September 30, 1968, the Annual $500,000 payment will be transferred to the Upper Colorado River Basin Fund, beginning with fiscal year 1970, as reimbursement "for the money expended heretofore or hereafter from the Upper Colorado River Basin Fund to meet deficiencies in generation at Hoover Dam during the filling period of storage units of the Colorado River Storage Project pursuant to the criteria for the filling of Glen Canyon Reservoir."

Table I shows the distribution of the CRD Fund among the states for fiscal year 1969. Table II shows the distribution of all CRD Fund revenues to the end of June 1969. Table III is a summary showing the division of the CRD Fund between the Upper Division and Lower Division States.

TABLE I

Distribution of Colorado River Development Fund Costs to States for fiscal year 1969

Regions 4, 5, and 7 [1] Upper Division States					
Grouping	Colorado	New Mexico	Utah	Wyoming	Total
FY 1969 Totals	$ 81,527	$ 25,449	$ 97,915	$ 45,109	$250,000
Percent of TOTAL	32.6%	10.2%	39.2%	18.0%	100.0%

*The figures reflect information received by letter of October 22, 1969 from Mr. Wilbur Kane, Assistant Commissioner of Reclamation, advising that costs allocated for the CRD Fund through June 30, 1969 had been revised to include a Region 3 transfer to a construction project. IVG

TABLE III

Summary

Upper Division States		
Colorado River Development Fund Investigations		
Region 4	$7,138,084	
Region 5 (Colorado Rio Grande Diversion, Colorado)	75,204	
		$ 7,213,288
Construction Projects		
Region 4	3,436,236	
Region 5 (Navajo Indian Irrigation and San Juan-Chama Projects, New Mexico)	984,721	
Region 7 (Fryingpan - Arkansas Project)	203,984	
		4,624,941
Total Upper Division States		$11,838,229
Lower Division States		
Colorado River Development Fund, Region 3	3,095,974	
Construction Projects, Region 3	543,223*	
Total Lower Division States		3,639,197*
GRAND TOTAL		$15,477,426*

* The figures reflect information received by letter of October 22, 1969 from Mr. Wilbur Kane, Assistant Commissioner of Reclamation, advising that costs allocated for the CRD Fund through June 30, 1969 had been revised to include a Region 3 transfer to a construction project. --IVG

Long-Range Reservoir Operating Criteria

The Colorado River Basin Project Act of last year (P.L. 90-537), which authorized the Central Arizona Project, also established legislative guidelines for the operation of certain reservoirs of the Colorado River system. Section 602 of the Act in paragraph (a) states in part that ". . . the Secretary (of the Interior) shall propose criteria for the coordinated long-range operation of the reservoirs constructed and operated under the authority of the Colorado River Storage Project Act, the Boulder Canyon Project Act, and the Boulder Canyon Project Adjustment Act. To effect in part the purposes expressed in this paragraph, the criteria shall make provision for the storage of water in storage units of the Colorado River Storage Project and releases of water from Lake Powell in the following listed order of priority."

(1) releases to supply 1/2 the deficiency in delivery of water to Mexico under the Mexican Water Treaty, if any such deficiency exists and is chargeable to this Commission's four member States;

(2) releases to supply 75,000,000 acre-feet of water in any period of 10 consecutive years at Lee Ferry under Article III (d) of the Colorado River Compact of 1922;

(3) storage of water not required for (1) and (2) above to the extent that the Secretary, ". . . after consultation with the Upper Colorado River Commission and representatives of the three Lower Division States. . ." shall find such storage to be reasonably necessary to assure deliveries for supplying 1/2 the deficiency in the Mexican Treaty burden and for the delivery of the 75,000,000 acre-feet of water at Lee Ferry in every period of 10 consecutive years without impairment of consumptive uses of water in the upper basin that were apportioned to it by the Colorado River Compact. It is further provided that water not required to be stored shall be released from Lake Powell:

(i) to the extent that it can be reasonably used in the Lower Division States for domestic and agricultural purposes (Article III (e)), but no such releases can be made when the active storage in Lake Powell is less than the active storage in Lake Mead;

(ii) to maintain, as nearly as practicable, active storage in Lake Mead equal to that in Lake Powell; and

(iii) to avoid anticipated spills from Lake Powell.

Section 602 (b) directs that "not later than January 1, 1970, the criteria proposed in accordance with the foregoing subsection (a) of this section shall be submitted to the governors of the seven Colorado River Basin States and to such parties and agencies as the Secretary may deem appropriate for their review and comment. After receipt of comments on the proposed criteria, but not later than July 1, 1970, the Secretary shall adopt appropriate criteria in accordance with this section and publish the same in the Federal Register. Beginning January 1, 1972, and yearly thereafter, the Secretary shall transmit to the Congress and to the governors of the Colorado River Basin States a report describing the actual operation under the adopted criteria for the preceding compact water year and the projected operation for the current year."

Late in 1968 the Bureau of Reclamation established a task force within its own organization to formulate a preliminary draft of proposed criteria. Under the auspices of the Department of the Interior a meeting of Federal and State representatives was held in Denver on July 25, 1969 for the purpose of reviewing basic data pertinent to the preparation of operating criteria for the Colorado River pursuant to section 602 of P. L. 90-537. The most important developments to emerge from this meeting were:

(a) the formation of a small working group of State and Federal technicians to review the Bureau's draft of criteria, to consider all problems related to reservoir operations, and to suggest additional or alternative information and studies;

(b) a review and explanations by USBR personnel of the data presented by the Bureau at the meeting;

(c) a beginning of recognition of the principal issues between the Upper and Lower basins concerning the proper operation of the river.

Subsequent meetings of the main Task Force on Reservoir Operating Criteria have been held on August 7, 1969 in Salt Lake City, and on September 15, 1969 in Los Angeles.

The Salt Lake City meeting was held for the purpose of obtaining the views of the States on the Bureau's draft of criteria. At this session the issues associated with the criteria became more apparent. Representatives of the Lower Basin raised questions about the amounts of bank storage, reservations for flood control, estimates of lower basin stream depletions, upper basin depletions, etc., that had been used in studies upon which the Bureau's original draft was based. The Upper Basin raised questions concerning the definition of such terms as "excess," "surplus," and "spill" used in the criteria; and releases of water from Lake Powell used in the Bureau's study. We also pointed out that the 1962 Lake Powell reservoir filling criteria should be terminated in their entirety, particularly the payments for the so-called "deficiencies" in generation at Hoover Dam, with the advent of the long-range operating criteria. The filling criteria can be terminated by the Secretary under any one of three conditions: (1) when Lake Powell is completely full at elevation 3700 feet and Lake Mead is at elevation 1146 feet; (2) on May 31, 1987; or (3) by declaration of the Secretary when he determines that conditions warrant. It appears that condition (1) may not be possible due to the mandatory equalizing of active storage in the two reservoirs and the releases to avoid anticipated spills from Lake Powell. Condition (2) has never been satisfactory because its effect is that the upper basin is forced to submit to a priority for power generation at Hoover Dam. The Secretary should now invoke condition (3) and operate the reservoirs under the long-range criteria of P. L. 90-537 since both reservoirs are now above rated head elevation.

We were told that the matter of terminating the "deficiency" payments is beyond the assignment of the Task Force and that this was not the proper forum for considering this problem. I disagree with this conclusion for several reasons: (1) the "deficiency" payments were a part of the 1962 reservoir filling criteria which will be superseded by the new long-range operating criteria, therefore, this must be the proper time to polish the whole ball of wax; (2) the nature of the guidelines for criteria in P. L. 90-537 could be interpreted to preclude the termination of the "deficiency" payments; (3) when new long-range operating criteria are put into effect is the logical time to abandon the "deficiency" payments; (4) both reservoirs are now at elevations above rated head, and, therefore, possess their full generating capacity; (5) water that is now in storage in the two reservoirs is not being held there for the exclusive benefit of the Upper Basin; firm power could be generated at Hoover Dam by releasing water from Lake Mead in a manner similar to that before the construction of Lake Powell and there would be no deficiency, but this type of operation would be impractical from the standpoint of water conservation; (6) there is no precedent for the so-called "deficiency" charges;

(7) continuation of the policy of charging the Upper Basin Fund for "deficiencies" will continue to have an adverse effect on the future Upper Basin water resource development by depriving that fund of many millions of dollars in the form of revenue foregone by the use of upper basin energy and capacity to fill the "deficiencies" and by associated interest costs over and above the dollar amounts that will be returned to the Upper Basin Fund under the terms of P.L. 90-537; and (8) the decision to continuously charge the Upper Basin Fund for "deficiencies" in power generation was not based upon justice and equity but has always appeared to the Upper Basin to be a form of "political blackmail" which should now be stopped.

At the Salt Lake City meeting it became evident that differences in interpretation of section 602 of P.L. 90-537 were the causes of differences of opinion concerning what should and should not be the terms of the operating criteria. It should be remembered that the language of section 602 provides guidelines for criteria. The manner of implementing section 602 and the nature and manner of application of the basic data in studies upon which the final terms of the criteria will be based will determine whether the operating rules will accomplish what the Upper Division States were seeking to accomplish when we insisted that section 602 be included in the legislation. It has become obvious that there is a wide spectrum of possible implementations of section 602 and basic data applications that can influence the outcome.

A number of small committees were appointed at the Salt Lake City meeting to study various aspects of the overall operations problem about which there are differences of opinion. Some of these items were: (a) losses and consumptive uses along the reach of the river Hoover Dam to Mexico; (b) reservoir bank storage; (c) upper basin depletions; (d) definitions of terms; (e) test studies and probabilities.

At the Los Angeles meeting on September 15th the above committees reported their findings, and certain parameters were defined for 26 computer studies to be run on the weekend of September 20-21. The results of these computer studies have been analyzed, and another group of analyses was to be run through the computers on this past weekend.

In summary, the differences between the Upper and Lower Basins as related to the long-range operating criteria are as follows:

Upper Basin

1. One objective is to maintain the required stored water in Colorado River Storage Project reservoirs to guarantee that 75,000,000

acre-feet of water can be delivered at Lee Ferry in every period of ten consecutive years without impeding the desired rate of resource development in the Upper Basin or curtailing consumptive uses of water. This objective was the primary principle underlying the authorization of the CRSP and the primary purpose of section 602 of P. L. 90-537. Section 602 was also designed for the purpose of guiding the Secretary of the Interior in his operations under Article III (e) of the Colorado River Compact.

2. Another objective - which I regard as secondary to No. 1 above - is to produce sufficient power revenues in the basin fund to pay for costs of water development projects beyond the ability of water users to pay.

Lower Basin

To be explicit, the lower basin objectives are to maximize water deliveries at Lee Ferry and to maximize power production at Hoover Dam powerplants. In attempts to satisfy these objectives the lower basin is trying to show the highest possible demands for water. One means being employed is to shift as much of the lower basin depletions as possible into the "river losses" column. Then the total downstream demands, which are being construed as the sum of the court-approved apportionments (4.4 maf to California, 2.8 to Arizona, and 0.3 maf to Nevada), and Mexican Treaty burden, and river losses are increased by the amount shifted to the loss category.

Another part of the lower basin strategy is to minimize upper basin water-in-storage requirements, because water not stored in upper basin reservoirs can be used in the lower basin under Article III (e) of the compact. More specifically the strategy here is (1) to decrease Upper Basin demands on storage by assuming that in the future, as in the past without reservoirs, less water will be used in the upper basin in dry years than during wet years; (2) to build into the computer studies increases in the allowable "probability" of an upper basin shortage; and (3) overemphasize the possibility of "spills" (undefined) which would result from a higher probability of satisfying the upper basin objective of delivering 75,000,000 acre-feet in ten years without impairing consumptive uses.

In my opinion the proper interpretation of section 602 of P.L. 90-537 and long-range reservoir operating criteria based thereon to implement it is one of the most important problems to face our Commission and its member States in a long time. The effects will be felt into the indefinite future. My recommendation is that the member States of this Commission should

formulate a well-defined set of objectives concerning the items related to the reservoir operating criteria and should pursue those objectives with a solidly united front. This will take some work, but past history has demonstrated that it can be done.

Legal

The legal staff has continued to collect the necessary information for the production of a water newsletter. The letter has been limited to the interests of the four states of this Commission. Suggestions for the making of the letter more useful will be gladly received.

A great deal of time has been spent in bringing together the necessary material for the "Legal and Institutional Appendix" for the Upper Colorado Region Type I Study. The first draft of this work is now in its final stages of preparation.

Other Activities

Regional Director Crandall's report will cover progress of the Bureau of Reclamation on the construction, advance planning, and investigations related to the Colorado River Storage Project and the present status of plans for the construction of a powerplant at Page, Arizona as part of the Central Arizona Project.

MR. GOSLIN: Mr. Chairman, the report was rather long, but there it is.

THE CHAIRMAN: Thank you, Mr. Goslin.

Are there comments on the Director's report?

COM. BLISS: Mr. Chairman, I move that it be received and at the proper time in the minutes we will discuss the items he has brought out for action.

COM. PERSON: Second the motion.

THE CHAIRMAN: It has been moved and seconded that we receive the report and take up the items that may require action at a later point in the meeting. Is there discussion? Are you ready for the question? (Question) All those in favor say "Aye." The motion is carried.

The next item on the agenda is the report of the Treasurer, Mr. Coury.

MR. COURY: Mr. Chairman, this is the report of the Treasurer for the period ending August 31, 1969.

REPORT OF THE TREASURER

The following figures summarize the financial transactions of the Upper Colorado River Commission for the period July 1, 1969 through August 31, 1969.

Balance on Deposit per bank statement July 1, 1969		$ 19,972.67
Less outstanding checks at July 1, 1969		7,397.00
		$ 12,575.67
Cash received during period:		
Assessments	$ 97,625.00	
Redemption of certificate of deposit - principal + interest	66,625.00	
Sale of surplus property	15.00	
		$164,265.00
		$176,840.67
Less cash disbursements during period:		
For expenses of prior year	$ 500.93	
For operating expenses	11,420.63	
Purchase of Time Certificates of Deposit	123,000.00	
	$134,921.56	
Deduct:		
Cash disbursements charged to operating expenses above but actually paid out prior to July 1, 1969 $409.98		
Amounts withheld from employees for payroll taxes and insurance 330.88		
	$ 740.86	
		$134,180.70
		$ 42,659.97
Add outstanding checks, August 31, 1969		2,528.60
Balance per bank statement, August 31, 1969		$ 45,188.57

The Operating Cash Statement and the Financial Statement prepared in the office of the Executive Director of the Upper Colorado River Commission for the period ending August 31, 1969, have been distributed to the Commissioners, Treasurer, Assistant Treasurer, and the Finance Committee Chairman.

/s/ I. J. COURY
Treasurer

MR. COURY: I might say, too, Mr. Chairman, $45,188.57 is the amount in the checking account and the Commission has a time certificate deposit in the amount of $123,000. I think every Commissioner has been supplied with a copy of this statement.

THE CHAIRMAN: Any comments on the report of the Treasurer?

COM. BLISS: I move it be received and filed.

COM. PERSON: Second.

THE CHAIRMAN: All those in favor? Approved.

Mr. Coury, may we move to the Report of the Auditor.

MR. COURY: Have the Commissioners been given a copy?

MR. GOSLIN: No, that is yours to distribute, not mine.

MR. COURY: This audit was made by McNulty, Chadwick & Steinkirchner of Grand Junction, Colorado, who have prepared the audit for the Commission for a great number of years, and this is the audit that covers the period of the fiscal year ending June 30, 1969.

It has been my custom, Mr. Chairman, whenever I get the audit, to skip everything and see what the comments are and see if there is anything wrong. I noted that the Auditor's comments were practically zero and the audit speaks for itself, unless you want me, Mr. Chairman, to go through this in detail, but I think it is unnecessary unless some member of the Commission would like to ask a question.

(Commissioner John A. Love enters the hearing room.)

THE CHAIRMAN: We will entertain questions in a moment.

It is a pleasure to welcome Governor Love to our meeting today and also to welcome the Governor as a Commissioner.

COM. LOVE: Thank you very much. I am sorry to be late. It just takes a little time to get here from Durango is all.

THE CHAIRMAN: Are there any comments on the Auditors' report?

MR. COURY: I might say, Mr. Chairman, that the assets and liabilities and reserve funds and the inventory of the assets of the Commission are all listed out and itemized.

There is a note on the Pension Trust Fund, where the revenue came from, and the expenses. I might mention this, too, for the benefit of the audience, that the budget for fiscal year June 30, 1969, is $115,000. The actual amount spent was $97,485.03. We under-spent, which is, in my opinion, Mr. Chairman, one of the rare things to find in this day and age, we under-spent it by $17,514. We very seldom see a budget that is under-spent. Most of them are always over-spent. I would like to congratulate the Executive Director for the fine job that he does in operating the money for the Commission.

THE CHAIRMAN: We have a very efficient Executive Director.

Are there any further comments or observations on the Auditor's report?

MR. COURY: I have none, Mr. Chairman.

MR. GOSLIN: Mr. Chairman, I would like to add this comment, that if any member of the Commission, after he has taken this home and examines it, has any questions, if he will write either to the Auditor or to my office or to Mr. Coury, we will be happy to answer the questions, or at least attempt to.

MR. COURY: Of course, you know every Commissioner gets a copy of the Treasurer's report every month. You get them by the quarter, also. This is just really a compilation of what you get. It is just audited on a CPA basis in order to check it out.

THE CHAIRMAN: Thank you, Mr. Coury. Do I hear a motion that the report be accepted?

COM. PERSON: I so move.

COM. WADDINGHAM: Second.

THE CHAIRMAN: All in favor say "Aye." Approved.

The next item on the agenda is the report from Mr. Crandall, Regional Director of Region Number 4.

I understand, Mr. Crandall, you have some slides to show. Would you like the Commission to move into the audience?

MR. CRANDALL: Perhaps they can see the screen from where they are. Governor Love and Larry might want to take another seat.

Members of the Commission, and gentlemen: I have prepared in outline form the basic facts that constitute my report to you. I will comment on the items as we go through and have a few slides to give you a picture of some of the physical settings that are involved. This is printed in bold type, as you will notice, and I hope there is enough light for you to follow it and at the same time to make the pictures worthwhile.

Mr. Ivar, who is from Region 7, is helping me with the projection and we will see how it goes.

For Item I here, we vary between high hopes and despair, as usual, on the water supply. The early part of the season was excellent. We had a very dry period after mid-March, and then we got bailed out by some fine late spring rainstorms, and all in all, in the four years I have been here, this is the best water supply year, we also made average.

The amounts are as you see them here, and the disposition of the water supply, the total for the year adds up to 11,500,000 acre-feet.

Now, at Lake Powell we reached another milestone of getting up to and exceeding slightly the rated head on the power plant.

I will proceed along, maybe we will have to dispense with the illustration portion of this. Why don't we turn it off, Mr. Ivar, and we will go along.

Lake Powell is now dropping and will continue to diminish slightly in elevation until we reach our buildup of runoff again this spring. We have, of course, the continuing requirement to deliver to the Lower Basin the amount of water necessary to meet the 75 million acre-foot commitment in the ten-year period that started when they closed the gates in 1963. We were able to provide 8.9 million acre-feet consistent with our power operations this past year, and we will have to continue for the remainder of this period at about that level.

Flaming Gorge has dropped into an annual operating pattern of filling to the amounts roughly that you see here, and then subsiding in the spring to the minimum -- not the minimum in the reservoir, but the low point you see, then building back up again. We do not contemplate accumulating more storage in Flaming Gorge.

Fontenelle -- I am very pleased to report our troubles are over there. The reservoir is completely restored. We are doing some repairs

in the powerplant and will be operating in the pattern of fill and release seasonally. Because of the relationship of the reservoir capacity to the annual runoff, we will have to bypass water almost every year at Fontenelle.

We have, with all the interests in the Colorado Basin, worked to optimize the non-consumptive uses. We have adopted criteria at Fontenelle to preserve uniformity in the stream flows, to recognize wild life values, and I hope that this will be one place where we can demonstrate some of these very exceptional values of storage on the unregulated streams for the public purposes.

Navajo Reservoir reached an all-time high and we are shooting for the basic criteria worked out with New Mexico and Colorado. We are going up to about 6030, then not coming back below 5990, which gives an adequate recreation pool but doesn't build up an amount of storage, that to do so would impair our head at Lake Powell.

Curecanti Unit. Blue Mesa has reached an all-time high. The reservoir will be operated through this annual cycle of fill and withdrawal to the amounts that are indicated here.

Morrow Point has been filled and spilled. There have been certain tests made there and the rest of that impoundment has been drawn down now to complete some grouting and to do some vibration testing.

Lake Mead, because of the delivery to meet the seventy-five and ten has been receiving more water than released from it each year. So there has been a gradual buildup in the water levels at Lake Mead, and this will continue.

Now, the operating criteria for the Colorado River, I will skip past that. Mr. Goslin gave you a very comprehensive report on that situation, and we, of course, are proceeding as rapidly as we can with the completion of the basic computer studies which will provide the input information to the determination of the criteria.

Status of Construction. This is over on page 5. Region 4 as a whole is at a low construction ebb because of the austere budgetary situation. We are completing the powerplant at Morrow Point. The machinery is now being installed and we expect to have the first unit ready to operate late next spring or early summer, the second unit following after that.

Glen Canyon Unit. We have what are relatively minor construction units going on in the powerplant and in the community at Page.

Bonneville Unit. We are making progress there at a much slower rate than development really warrants, but at Starvation Dam there are some milestones that are being reached. Starvation Dam is about finished, the Water Hollow tunnel is well along.

Bottle Hollow. The two dams that provide the fish and wild life replacement reservoir are well underway.

Bostwick Park. We had a rather severe land-slide in the right abutment since I reported to you last, which required a relocation of the spillway and other remedial work draining the slide area, and so on, which was set back at some additional cost, but the work is proceeding. The contractor likely will not be as far along with the embankment as we had hoped by the end of this working season.

Paonia. The corrective work on the roadway that parallels the reservoir on the right side is finished and there is some minor work being done there. This, incidentally, will eliminate a rather nasty problem of rock slides interfering with the roadway in the winter and the movement of the school children from that area down to Paonia.

Lyman Project is moving along very well. We expect that the dam will not be topped out before weather forces the contractor out, although there is a possibility with a little bit of luck he will make it.

We do have as part of that project the establishment of gaging stations within the water delivery area, and that is getting underway.

The Fryingpan-Arkansas Project. I have included the facts concerning it. This is not in our region but it does concern the Colorado River, of course.

The same with the Navajo Indian Irrigation Project and the San Juan-Chama Project.

This will give you a capsule of where those individual projects stand.

The Transmission Division of the Storage Project, on page 10, is essentially completed. A series of capacitator work being done on the 345 line south and the Midway Substation, has been finished and energized in the summer.

Now, moving on to page 11, the status of our power operations. This is very significant in that this is where the project revenue comes from, and I would make the general observation that the marketing of the storage project is basically committed. We have in the past few months advised all of the people who had allotments that were made initially, that these allotments were being withdrawn unless then contracted for them.

In addition to that, we have placed a deadline for the customers to contract for their '75-'76 requirements, and the applications that we have received in our perspective I think will more than match our capability up through '75-'76. So the marketing and the employment of this important part of the overall project is going along very well.

The accumulated revenue through the 1st of September this year is $71-1/2 million. We are paying for back interest now. We expect to have the back interest paid up by 1970, and then we will begin to retire capital cost.

Our Project Planning Activities. This summary is broken down by our reconnaissance investigations and our basin and feasibility studies. We are cooperating with the State of Colorado in their State water plan, presuming, of course, that FY-70 appropriations include this item.

There is the very important Green River Project study. Reconnaissance investigation being conducted to determine the needs and resources in the Green River Basin in Wyoming is moving into the stages of analysis and compilation. Coordination, of course, with the State in their water plan is an implicit and a very important part of this study.

We have basically finished the reconnaissance on the Paria-San Rafael area, mostly in -- excuse me, our San Juan County Study. It is basically finished and a report should be available soon.

Paria-San Rafael is getting underway.

Basin Surveys. We are continuing, of course, with the Type I Comprehensive Studies.

The Feasibility Investigations. Basalt is generally on schedule. This project, of course, is to make use of water out of Ruedi Reservoir and is one of the participating projects. We recently somewhat enlarged the scope of it to include the M & I water supply for the community of Aspen.

Bluestone Project is well along in its final stages.

Central Utah Project, which is a very broad complex investigation, which relates to the utilization of the remainder of Utah's share of Colorado River water, has been carefully coordinated with the development of the State water plan and the Conservation District has recently voted to contribute $100,000 to expediting this rather important investigation for Utah.

The Uintah Unit is very well along. This is the feasibility study being made to satisfy the requirement of the Colorado River Basin Act, which gave a conditional authorization to this study but required a feasibility report from the Secretary.

Grand Mesa Project is well along. We are in the estimating and analysis stage.

Lower Yampa is getting underway. We have contributions from the State to initiate this study, and they have been received and contracted for and we are moving into this very extensive investigation.

Yellow Jacket. The report has been finished and we are working with state and local interests in the resolution of a problem relating to the use of lands for mitigation of the impact on big game values.

We have the special study in Colorado for salinity amelioration, or determining ways and means of reducing the salt contribution to the river to make way for new development; this in cooperation with FWPCA is in its final stages of compilation and review and should be available for you in the not too near distant future.

We are embarking on a rather intriguing study of impacts on salinity from the application of irrigation water in the Vernal area. I think this will provide a very needed and basic data, considering this overall salinity problem in the Colorado Basin and elsewhere.

Advance planning is finished on the Jensen Unit and the Upalco Unit and the Fruitland Mesa. On the Fruitland Mesa the repayment contract has been executed, and we are continuing preconstruction activities and are prepared, as soon as funds become available, to begin construction there.

Savery-Pot Hook. We are into the more final stages of that definite plan investigation and should have a report about a year from now.

The Five Western Colorado Projects. We are anticipating that these will move into the advance planning stage sometime, hopefully in the not too distant future when funds become available.

On page 17 are the items of general interest and water service contracts, which is that part of our business that concerns the disposition of water from the storage project reservoirs. Utah Mining and Construction Company has been negotiating with us for some time for a short-term contract for the use of water out of the San Juan River that occurs in the form of accretions below. This contract does not increase the amount of consumption that was provided for under their basic Congressionally approved contract, but it does allow them to fill in the gaps in times of shortage. Actually, it allows us to deliver water out of the stream and thus maximize the use of the reservoir to store water.

Emery County. This is a rather interesting, perhaps, sign of the times. The Utah Power and Light Company is very actively working to define a water supply out of that project area, which was basically set up for thermal power development.

The Kaiparowits service contract. I think, as has been publicly announced, its terms are pretty well agreed to and the execution of the contract shouldn't be too far away. This is between Southern California Edison, Arizona Public Service Company, and San Diego Gas and Electric Company, as a joint effort, for 102,000 acre-feet out of Lake Powell in Utah.

I have a statement here concerning the status of the Navajo Plant, which is a thermal-electric joint venture development in which the United States is a participant, that would provide the power supply for the Central Arizona Project. This possibility was anticipated in Public Law 90-537, and I will read through this for you since the statement in itself is in the nature of a summary.

Public Law 90-537 provides the authority for the Secretary to enter into agreements with non-federal interests to acquire, for the CAP, the rights to a portion of thermal plants constructed by the non-federal interests. The plan which the Secretary has developed involves federal participation in a thermal-electric plant being planned by various southwest utility companies. The plant will be located on Navajo Indian Reservation near Page, Arizona, and will consist of three 770-megawatt units. Coal will be obtained from the reservation about 80 miles southeast of Page under lease from Navajo and Hopi tribes. Transportation will be required to move the coal from mine to plant site.

Water would be provided from Lake Powell under the January 17, 1969, contract between the Secretary and Salt River Project. The Navajo tribe has adopted two resolutions which give priority against their future uses of Arizona's 50,000 acre-foot upper basin entitlement for 34,100 acre-feet for the plant and 3,000 acre-feet for Glen Canyon Unit. Prospective rights are not relinquished and transfer of about 750 acres of project land is involved. Air pollution equipment would be installed with a design standard of 99.5 percent removal and a 97 percent performance limit. Ash would be disposed of either by the participants or Peabody Coal Company in a disposal site near the plant.

Some of the documents which are being negotiated prior to plant construction are as follows:

1. Principles of Participation: A document to be signed by all parties including the United States which commits all the parties to proceed with construction of Navajo Powerplant.

2. Coal Supply Agreement: A contract between participants (excluding United States who will be represented in this contract by Salt River Project) and Peabody Coal Company for a coal supply for plant throughout its lifetime.

3. Memorandum of Agreement between participants (excluding United States) and Peabody which provides for execution of coal supply agreement as soon as certain precedent conditions are met or waived. This would probably precede the coal supply agreement since some of the conditions included in Coal Supply Agreement may require some time to complete. This document also provides for formation of a transportation company to deliver coal about 80 miles from mine to plant site.

4. Water Service Contract. A contract for water service from Lake Powell for cooling water for plant between United States and Salt River Project. This contract has been executed. Salt River will assign its interest to participants (of which the United States is one.)

5. Navajo Plant Indenture of Lease: This is lease with tribe covering the Navajo Plant site and associated transmission facilities. It was signed by Navajo tribal representatives 9/29/69. Departmental approval pending.

6. Section 323 Grant: This has been approved by Navajos and will be approved by Secretary as soon as or with the understanding that final surveys are acceptable.

7. Power Coordination Contract: This agreement is a precedent condition to taking water under the water contract and provides for the coordination between the United States and participants.

8. Principles of Interconnected Operation: This document is basically an operating agreement covering requirements of all parties to maintain proper amounts of reserve capacity and capacity for unforeseen future load growth. Special provisions are made for purchase and sale of emergency energy.

9. Memorandum Transmission Agreement -- Moenkopi: This document will also be signed by all participants and Southern California Edison Company. Southern California is a party to Four Corners Project which will connect with the Navajo Project Transmission system at Moenkopi near Tuba City, Arizona. The two sources of power will, therefore, become commingled and all systems essentially will be operating a common high-voltage transmission system.

10. Interim Use of United States Entitlement in Navajo Project-- (Layoff Contracts): During period from time the Navajo Plant is operative until the Central Arizona Project requires power, the Bureau must dispose of its share of power. The amounts of power to be sold and purchases are as follows: -- and you see those numbers there, I will not repeat them.

The documents that I have outlined here are in the final stages of negotiation by the Steering Committee consisting of representatives of Arizona Public Service Company, Salt River Project, City of Los Angeles, Nevada Power Company, Tucson Gas & Electric, and Department of the Interior. When finalized, they will be forwarded to Washington for final approval.

Mr. Chairman, that constitutes my report.

THE CHAIRMAN: Thank you.

MR. COURY: May I ask the gentleman a question?

MR. CRANDALL: Yes, sir.

MR. COURY: Under the contract signed the 29th of September, 1969, the Navajos retain their rights under the Winters Doctrine?

MR. CRANDALL: This is the one that was signed, yes, sir, day before yesterday. I haven't seen that document and I can't answer your

question specifically, but my impression is, this dealt with the land matters, the lease and use of the lands and did not relate to water service or the water interests of the tribe. But when we get that, I have every intention of getting copies of these documents to Ival for distribution to the Commission members.

COM. LOVE: Let me make sure -- I would like to come back to that water service contract, but first on a broader basis I want to make sure I understand. You mentioned, of course, the 75 million feet over a ten-year period, but what have we delivered to the Lower Basin over the past ten years?

MR. CRANDALL: I would guess something around 26 million.

MR. L. E. HOLMES: You mean the ten years including this particular year?

COM. LOVE: Yes.

MR. CRANDALL: Excuse me, we have 26 remaining out of the 75. I misunderstood.

COM. LOVE: My point being, when you report out of the 11.5 million acre-feet the delivery of 8.9, the 8.9 is not necessary to satisfy our obligation under the Compact, is it?

MR. CRANDALL: Not as an annual amount, but as an accumulated amount over this ten-year period we have to deliver 8.8 for the four-year period, including this year, to make the total equal 75.

COM. LOVE: This was the question I was asking; that is, we are above the 75 million, or we are not above?

MR. CRANDALL: No, in a sense, we have to rush to make it.

MR. GOSLIN: As of this time, this moment, we have delivered 75 million acre-feet.

COM. LOVE: That is what I want to know, just 75 million on the nose?

MR. GOSLIN: No, it is in excess, but here is the problem, Governor, that Dave was trying to bring out. In the next three years, between now and 1972, we have to deliver about 8.8 million acre-feet per year in order to have the ten years, including 1972, show 75 million acre-feet in ten years.

COM. LOVE: I see. There were the low production years that we are going to have to look ahead and catch up.

MR. CRANDALL: But this year and every year up to that, we will be well over.

MR. SPARKS: On the initial figure it was less than 4 million feet released. We got way behind.

COM. LOVE: The other question I wanted to ask, I assume, if I understand, the water service contract is the contract on the powerplant at Page to provide water for cooling and for other purposes.

MR. CRANDALL: Yes, sir.

COM. LOVE: Does it specify the amount?

MR. CRANDALL: Yes, sir. It is limited to a consumption of 34,100 acre-feet.

COM. LOVE: There has been concern expressed in the past, in any event, that this, indeed, would not be sufficient to do the job. Are you satisfied that that will, indeed, take care of the powerplant needs?

MR. CRANDALL: Yes. This question was thoroughly considered by the plant participants and they had two studies made, which went into this from a technical viewpoint very thoroughly, and they did satisfy themselves that the 34,100 would be adequate to operate the plant with three, at that time, 800 megawatt units. But they have since reduced the capacity to 770. So there is a little more leeway.

COM. LOVE: It is my understanding that Arizona is entitled to 50,000 acre-feet of Upper Basin water.

MR. CRANDALL: Yes, sir, that is correct.

COM. LOVE: Is it true, too, that there is documentation which does assign Arizona entitlement in the Upper Basin water to this purpose to the extent necessary?

MR. CRANDALL: The contract with the Secretary identifies 34,100 acre-feet. There are two resolutions which have been executed by the Navajo people, and all of this Upper Basin portion of Arizona is within

the reservation, with minor exceptions, down around the Paria River, which said that the Indians will limit their future uses of this 50,000 feet to the degree they have entitlement of this 50,000, so that the 34,100 will be there for the powerplant and so there will be 3,000 acre-feet for the community of Page and its associated recreational development.

COM. LOVE: State that again. The Indians have agreed to relinquish their right in this regard to this extent, it that right?

MR. CRANDALL: Right, to the 50,000. But they also have said that this is not to constitute a relinquishment of their prospective rights.

COM. PERSON: What does this mean, Dave? I am completely confused on this. The Indian use today, just the 34,100 acre-feet, will use all of the 50,000?

MR. CRANDALL: The Indian use plus Page, so on. That adds up to 50,000. But there is the question of whether, under the Winters Doctrine or other prospective rights that the Indians might acquire, that they would not want this resolution to act as a relinquishment against that opportunity.

COM. PERSON: Didn't the State of Arizona, in the Upper River Compact, agree to provide the Indians under the 50,000 granted?

MR. CRANDALL: I would guess that was the intention. I am not an expert on this, as you know. But all of the Upper Basin portion of Arizona is in the Reservation, so you can conclude from that fact that this was intended to be an Indian water supply.

COM. PERSON: I am a little puzzled; that is, the Indians, the Navajo Tribe, have not agreed to limit their use, so the total use will be 50,000. In fact, I think they have done just the opposite, haven't they?

MR. CRANDALL: They have said so far as their uses of the 50,000 are concerned, they will stay within it.

COM. PERSON: They will stay within the 50,000.

MR. CRANDALL: Yes.

COM. PERSON: Then there wouldn't be any water for the powerplant, would there?

MR. CRANDALL: No. They will limit their uses of the 50,000 so the powerplant and the community of Page will have a supply. But they have not gone beyond and said that they, in a sense, forego any opportunities to work out the water that is different than the 50,000 acre-feet.

MR. GOSLIN: As a matter of fact, they made it very plain that they intend to assert this Winters Doctrine rights in the future. So that there is a distinct possibility of having the 50,000 acre-feet used by the steam plant, by the City of Page, by Indian uses on the reservation, and having uses over and above the 50,000 by the Indians up to an unlimited extent if they assert their Winters right.

MR. CRANDALL: To the extent they would be successful in asserting such a claim, but they don't limit themselves on this assertion.

MR. COURY: The point I am trying to bring out --

(Off the record.)

COM. PERSON: Why don't we build a powerplant some place where there is water that can be used without violating the Compact, Dave? You can build a powerplant in Wyoming. We will give you water and you won't violate the Compact.

MR. CRANDALL: The water service contract with Salt River requires that it be in conformance with the terms of the Compact and the various rules and laws that apply.

COM. PERSON: I can't agree with this 34,100 in view of the Navajo resolution and the Navajo statements, and they are clear, that they are going to use whatever water they need, even if it is in violation of the Compact; this contract is a violation of the Compact.

MR. CRANDALL: Would it not seem that when uses got to 50,000, that they would have to take what action is necessary to perfect a claim for the use of more than that? We have always had that threat and that possibility, and this doesn't change it.

COM. PERSON: Shouldn't there be a provision in this contract that the use in Arizona will never be more than 50,000 acre-feet in accordance with the Compact?

COM. LOVE: I think you would have to go beyond that and say if it does exceed that, it can be charged against the amount that the Upper Basin is required to deliver.

MR. COURY: The point I am trying to bring out, the State of New Mexico, when they authorized the Navajo Indian Irrigation Project, demanded of the tribe that they relinquish any rights under the Winters Doctrine, which they did. They cannot exceed it. They cannot ask for any more water. In the State of Arizona it is the reverse. They have not relinquished their rights under the Winters Doctrine. So the State of Arizona agrees she will limit herself to 50,000 acre-feet, but the Navajo tribe have not said that. That is the point I am trying to get across.

COM. PERSON: By Compact, hasn't the State of Arizona already said they will limit the use in Arizona to 50,000 acre-feet? So if the Indians use 40,000, you have 10,000 acre-feet for a powerplant and that won't be a very good powerplant.

MR. CRANDALL: Then the burden goes to the State to keep the uses within 50,000 acre-feet.

COM. PERSON: I think it does according to the Compact.

COM. BLISS: Mr. Chairman, may I ask a couple of questions? One, as I understand what the Indians have done, they have agreed, in effect, that for the time being, and possibly for the life of the powerplant, that they can assure the powerplant the 34,000 that will serve its needs but that they do not give up their right, at some future time possibly, to exercise the Winters Doctrine?

MR. CRANDALL: Yes.

COM. BLISS: In that event, then, if something occurs in the construction, chiefly, which, added to the uses of the water plant in the Paria area, would exceed 50,000, would the Bureau be willing to cut down on the uses at the powerplant so that Arizona would not exceed their 50,000 acre-feet allotment? Something's got to give.

MR. CRANDALL: Yes, it surely has. I'm not trying to be evasive here at all. That is a very profound question. It goes right to the heart of the whole problem. But if they would be able to develop this kind of construction, would there not have to be a clarification of their entitlement to the use beyond 50,000, and that being the case, then the total would be over 50,000 and the administration of the Compact would take effect and the State would have to follow whatever they determine to be a proper order of curtailment, come down to meet it. I think the administration of the Compact is something that rests with this Commission, in compliance with its terms, and the Secretary surely would be responsive to that administration.

MR. COURY: Let me call your attention --

MR. CRANDALL: Whether it would be the steam plant or what would have to give would be a matter to be worked out within the State's use of that water to comply with the Compact.

THE CHAIRMAN: Mr. Crandall, it seems to me that in this instance, if the United States has ratified this Compact, the United States is bound to respect and honor the Compact and the Secretary of the Interior, in carrying out his administration, is bound also.

MR. CRANDALL: Right.

COM. PERSON: This is a precarious investment, I am going to tell you, in view of the Indian and the Navajo Tribe's stand, and I suggest we build a powerplant some place else to have a safe investment.

MR. COURY: I just want to call his attention to the five signatory States to the Upper Basin Compact agreeing that they would take responsibility for any uses the Indians have within their allocation.

MR. CRANDALL: Right.

MR. COURY: That is the reason the State of New Mexico insisted that the tribe waive any rights under the Winters Doctrine before the authorization of the Navajo Indian Irrigation Project, so that they can never come back to the State of New Mexico and say, "We need more water." We foreclosed that door. That is what we are asking, why don't they do the same thing to Arizona?

MR. BILLHYMER: Mr. Chairman, may I add a caveat to Mr. Coury's remarks? He ought to read the recent brief that the Navajo lawyers are putting out now. They intend to abdicate on that agreement with New Mexico, too. The effect of it will be they will get all the water of the San Juan anyway, so they won't have to abide by their New Mexico agreement.

MR. COURY: I have to answer you that way, that they will still have to fight the Congress of the United States, because they authorized the project under those premises.

MR. BILLHYMER: They recognize that in the brief.

MR. GOSLIN: They will have to go to the Supreme Court, won't they Paul?

MR. BILLHYMER: I am not sure they will go to the Court, but they are advocating a quiet title action to establish their rights on the Colorado and its tributaries.

COM. LOVE: Mr. Chairman, if I understand this thing right, I think it should be made abundantly clear to the Department, to the State of Arizona, and to anybody else a party in interest, that our obligation in the Upper Basin is to deliver the 75 million, and that, of course, was based on an erroneous estimate of what the river produces, actually, and we are on the short end to begin with. I don't see that it should concern us, if I understand it, that it should be our business so long as anything in excess, whether it is Indian or Arizona or powerplant or whatever, in excess of the 50,000 that is the entitlement of Arizona under the Upper Basin allotment, anything above that must be credited against our obligation to deliver the 75 million acre-feet.

MR. CRANDALL: Incidentally, this was an avenue that Mr. Goslin suggested might be pursued to solve this problem.

MR. GOSLIN: This is one suggestion that we made last winter, but it was never consummated.

COM. PERSON: Isn't that a means of starting eroding this Compact? Just because Arizona agrees to limit themselves to 50,000, and I think this is important, I think it is important that the Bureau of Reclamation, the Department of the Interior, realize this and they should limit themselves. Now, if the Indians try to go over the 50,000, of course that will have to be settled at that time, but if they use more than the seventeen or sixteen thousand that you say they are using at the present time, then the powerplant has to cut down, and I think this should be abundantly clear in the contract.

MR. CRANDALL: The Indians have agreed to limit themselves so the powerplant will have 34,000 acre-feet.

MR. GOSLIN: Of the 50,000.

MR. CRANDALL: Of the 50,000.

MR. GOSLIN: Not of the total; of the 50,000.

COM. PERSON: That isn't the way I read their resolution, Dave.

MR. CRANDALL: That was the very clear intention of the fifty, the Indians will limit their uses so thirty-four one will be there for the

plant, but at the same time they did not go the next step and say that they would not assert prospective claims under future circumstances.

COM. BLISS: Mr. Chairman.

THE CHAIRMAN: Mr. Bliss.

COM. BLISS: Following the Governor's statement, it seems to me this would be a violation of the Compact if, in effect, if I understand the Governor's statement, we allowed Arizona to run over their 50,000 Compact allowable and simply charge the overrun to the Lower Basin. I believe that was your statement.

COM. LOVE: Yes. I think that probably would be a technical violation, but at the same time it is my belief that, practically, once that water is in Lake Powell, we are not going to use it in Colorado or New Mexico or anywhere, and the thing that makes the difference to us is the amount we have to deliver on a ten-year running basis.

MR. GOSLIN: Mr. Chairman.

THE CHAIRMAN: Mr. Goslin.

MR. GOSLIN: The suggestion that Governor Love made about crediting us against our delivery at Lee Ferry is the suggestion that you will recall I made about a year ago, and I am like the Governor, it looks as if it might be a practical solution to it, but when we tried to implement it, we ran into the fact we had to amend the Upper Colorado River Basin Compact and perhaps the Colorado River Compact in order to make it workable. So what "Prof" says is true there, this would involve a violation of the Compact, certainly until we had some other agreement or means of implementing.

COM. LOVE: Larry suggests there may be legal concepts, or whatever, that in terms of constructive delivery would perhaps allow it.

MR. BILLHYMER: I think you would not get California to accept constructive delivery.

COM. BLISS: To go to another subject here, an inquiry of Mr. Crandall, in speaking of the powerplant, at the top of page 18, "Air pollution equipment would be installed with a design standard of 99.5 percent removal and 97 percent performance limit"; would you explain how this works?

MR. CRANDALL: The equipment would be designed -- that would be the way it was built and designed to operate, but it is recognized that they have mechanical failures and maintenance and other things come along. So if you take the total performance over a period of time, like a year, that you don't one hundred percent achieve your design standard. But there should be an absolute floor on performance, and that's the thought that this is intended to convey.

MR. COURY: I wish you would come down and testify before the Air Pollution Committee of the State of New Mexico because they have got it 99.5, period.

MR. CRANDALL: Have they? That's the upper limit of practicability, I understand, I. J.

COM. LOVE: How do you explain that plant outside of Farmington?

MR. GOSLIN: Good question.

MR. COURY: Governor, at the Constitutional Convention I am known as "the fly-ash delegate."

THE CHAIRMAN: Any further questions?

MR. SPARKS: I might observe, obviously we are going to have trouble with the noble Red Skin, but aside from that, the State of Colorado is conducting a trip to Glen Canyon in about two weeks now and some of our legislators object to those water stains on the canyon wall and we would therefore appreciate it if you would slow down your releases of water for the next two weeks.

MR. GOSLIN: Somebody should take a paint brush down there and obliterate them.

MR. CRANDALL: Well, we have the man that operates the reservoir right here and I am sure he is taking it all in.

THE CHAIRMAN: Thank you very much, Mr. Crandall.

MR. CRANDALL: Thank you, gentlemen.

COM. LOVE: I don't know whether this is the proper gentleman to answer, but I am not up to date on the current status of the appropriation.

THE CHAIRMAN: I think Mr. Goslin has some current information.

MR. GOSLIN: This is covered in the first part of my report, Governor. It was given before you arrived, of course.

COM. LOVE: I am sorry.

MR. GOSLIN: First, the bill that covers the Navajo Indian Projects has been passed by both the House and the Senate. There are some big differences between the House and the Senate Bills, so they have had to appoint conferees. Each side is insisting on its amendments, and, incidentally, in this bill there is one increase that I know about and in which we are interested. That is for the Navajo Indian Irrigation Project. They did insert some extra money, I have forgotten the exact amount. I think it is about two million dollars.

The Public Works Appropriation Bill is the one in which we are primarily interested because it has all the Reclamation projects and flood control projects. It is in a real state of flux back there. President Nixon, as you know, ordered this 75 percent cutback, and consequently, because the Congressional Committees have not been sufficiently informed about how this cutback shall be applied to the new construction, they are sitting there awaiting instructions from the Bureau of Budget. They haven't even marked the bill up in the Subcommittee. It will be one of the last bills marked up in the session of Congress, I presume, as it usually is.

COM. LOVE: I believe the order of the President went out on September 4, and subsequent to that the Bureau of the Budget sent communications to the various operating agencies, the Corps of Engineers, the Bureau, HEW, and everybody engaged, and asked them within the limits of that 75 percent-25 percent, to identify the projects which should go ahead and those which should not, and I don't believe the answers on that have come back or will for perhaps another week or so.

MR. GOSLIN: I think this is correct. Incidentally, there is a copy of the Bureau of the Budget's Bulletin No. 70-5 here, that is, a resume' of it, that gives instructions to these various departments. You may be interested in that, especially here in Colorado.

MR. CRANDALL: There is one statement I can give. In answer to the Governor's question there, I have the amounts by each of the years that we have delivered at Lee Ferry.

MR. GOSLIN: Do you want to include that in the record, Mr. Crandall, so it will be available to everybody, and we will send the Governor a special copy of it.

MR. CRANDALL: Right. In 1968 the accumulated total was 77 million acre-feet. These are round numbers. In 1969, 79 million, and then delivering our projected eighty-eight, in 1970 it will be about seventy-nine, in '71 about eighty-one, then '72, the critical year, will be seventy-five. That is the way the numbers add up.

MR. FLINT: I thought it might be helpful, in view of Mr. Billhymer's reference to that legal brief, to point out that it was a brief prepared by an O.E.O.-sponsored group of lawyers on the Reservation who travel under the name of DNA. So it shouldn't be made to appear that the Tribal Council itself has officially taken this position. As a matter of fact, there is quite a bit of legal conflict between the Tribal attorney, official Tribal attorney, and this DNA.

THE CHAIRMAN: Thank you.

MR. GOSLIN: Off the record for just a moment.

(Discussion off the record.)

THE CHAIRMAN: We will recess at this point and reconvene at 1:15.

(At 11:45 a.m. the meeting was recessed until 1:15 p.m.)

AFTERNOON SESSION 1:15 p.m.

THE CHAIRMAN: The meeting will reconvene.

The next item is the Report of the Committees. Chairman Goslin, do you have a report for the Engineering Committee?

MR. GOSLIN: Yes, sir. There are copies of it on yellow paper in each Commissioner's packet and copies are available for others who want them.

Mr. Chairman, the report of the Engineering Committee dated October 1, 1969, is as follows:

Report of Engineering Committee
Upper Colorado River Commission
October 1, 1969

The Commission's engineering committee has met twice since our last Commission meeting.

Pursuant to instructions of the Commission the committee met in Denver on March 12, 1969 to define the parameters for a study by a consulting firm of the consumptive use of water by a large powerplant such as that proposed to be constructed at Page, Arizona, to investigate the cost of such a study, and to report its findings to the Commission with recommendations.

Persons present at the meeting were:

Dan Lawrence	Utah
Burt Page	Utah
David Hale	New Mexico
Larry Morrill	Colorado
Floyd Bishop	Wyoming
Cecil B. Jacobson	Upper Colorado River Commission
Ival V. Goslin	Upper Colorado River Commission

The Engineering Committee concluded: (1) the question of use of water by such a powerplant warranted close scrutiny because Arizona may be reaching the limits of that State's upper basin apportionment of water; (2) attempts should be made to secure all of the information obtainable; (3) that to outline parameters for such a study would be impossible without having the design of the powerplant; and (4) that the making of such a study by consultants should not be recommended at this time.

The committee also discussed the desirability of making an analysis of a future projected level of water resource development for the Type I comprehensive study of the Upper Colorado region as an alternate to the study being made based upon projections of economic growth forecast by the Department of Commerce and the Department of Agriculture. It was the consensus of the committee that in order to reflect a more rapid and rational rate of development for the Upper Colorado region the representatives of the States involved in the Type I study should decide on such a "regional choice" alternative analysis.

At the request of its chairman, the Engineering Committee convened again on July 31, 1969 at the Commission office in Salt Lake City, Utah.

The following were present:

S. E. Reynolds	New Mexico
David Hale	New Mexico
Carl Slingerland	New Mexico
Barry Saunders	Utah
Larry Morrill	Colorado
H. T. Person	Wyoming
Floyd Bishop	Wyoming
Cecil B. Jacobson	Upper Colorado River Commission
Ival V. Goslin	Upper Colorado River Commission

The following paragraphs briefly describe the problems discussed and their disposition:

1. A proposal had been received from the Chief Engineer of the Colorado River Board of California that the seven States of the Colorado River Basin should join in hiring consultants to monitor the Bureau of Reclamation's Project Skywater which is a Colorado River pilot project concerned with precipitation management, commonly referred to as weather modification. After a detailed examination of the proposal and supporting materials the Engineering Committee decided that it would recommend against the Commission's participation in such monitoring activities.

2. Various proposals for a "regional choice" alternative plan for the Type I Study of the Upper Colorado Region were again discussed. It was the consensus of the committee that a study involving three levels of ultimate water resource development at an upper basin consumptive use of 7.5 million acre-feet of water, 6.3 maf, and some level greater than 7.5 maf should be considered. It was agreed that the States would submit the necessary information for such a study.

3. The Pacific Southwest Inter-Agency Committee had requested information for the Pacific Southwest Region Type I studies on possibilities for desalting water in the Upper Colorado Region. The consensus of the Engineering Committee was that except for small isolated desalting plants for specific purposes such as for industries or improving the water supply for small municipalities there is little opportunity for desalination of water in the Upper Division States under present technology and economics.

4. A preliminary discussion was held on the long-range operating criteria required under section 602 of P.L. 90-537. A detailed study made by Chief Engineer Jacobson showing the relationship of payments from the Upper Colorado River Basin Fund for diminutions in power generation at Hoover Dam powerplants, attributed to the filling of Storage Project reservoirs, to reservoir operating criteria was examined and discussed. It was the opinion of the committee that diligent attention should be given by the Commission, its staff, and member States to the matter of long-range reservoir operating criteria, and that the Upper Division States should adopt a firm and united position with reference to the criteria.

COM. PERSON: The last sentence, Ival, "It was the opinion of the committee that diligent attention should be given by the Commission, its staff, and member States to the matter of long-range reservoir operating criteria, and that the Upper Division States should adopt a firm and united position with reference to the criteria," what do you mean by that "and member States to the matter of long-range reservoir operating criteria"?

MR. GOSLIN: Well, I thought the statement was self-explanatory, but certainly I think we should adopt a firm position and we should pursue it in the interests of the Upper Basin, by seeing that Section 602 of Public Law 90-537 is interpreted to do the things that we expected it to do when that piece of legislation was insisted upon by the Upper Division States.

COM. PERSON: On page six of your report this morning, the second paragraph, "We were told that the matter of terminating the 'deficiency' payments is beyond the assignment of the Task Force and that this was not the proper forum for considering this problem" What is the proper forum?

MR. GOSLIN: Well, I think that inasmuch as the Task Force is involved in the formulating of new long-range operating criteria, that that is the proper forum because the deficiency payments are tied directly to the filling criteria that are supposed to be superseded by the long-range operating criteria. I would propose that we take this back to the Task Force in rather firm tones and say it is going to be considered. If the Task Force continues to say that it cannot consider that item, then I say let's take it directly to the Secretary of Interior's office in Washington.

COM. PERSON: Are there other items in this operating criteria as important as this one, or probably more important?

MR. GOSLIN: Well, there are several other matters in there. The relative importance of each matter is difficult to weigh, but another matter that is being discussed at the present time that I could mention is this idea that the Lower Basin has of introducing into the studies probabilities, and thereby eroding away the rule curve under which the reservoirs would be operated. That's an important item, certainly.

COM. PERSON: I happen to agree with you, Ival, very much, but I don't know what we should do now. That is what I am trying to find out. Certainly I think the Commission should take a firm stand on this deficiency payment. I think it is high time these stopped.

MR. GOSLIN: Of course, what I was seeking to do here, Prof, was to get an expression from the Commission. I think we should have

some instructions from the Commission or perhaps they don't want to give us any specific instructions. The Commissioners could say, "Pursue this thing to the bitter end and see what you can get out of it."

COM. BLISS: Mr. Chairman.

THE CHAIRMAN: Yes, Mr. Bliss.

COM. BLISS: I would like to hear the arguments as to why, or what the reason is that this is not a function of the Committee in determining permanent operating procedure, why the termination of these deficiency power productions is not part of the function of this group.

MR. GOSLIN: Well, perhaps it goes back to the fact that in the Committee reports there were statements put in there at the insistence of the Lower Basin and with which, of course, we certainly did not and could not agree, that the deficiency payments could be continued in spite of adopting some long-range operating criteria.

COM. BLISS: Try that again. I missed it.

MR. GOSLIN: In the reports on the bill, both the House and Senate Reports, as I recall it, there were statements put in at the insistence of the Lower Basin that the deficiency payments could be continued even under long-range operating criteria. I am not sure that the wording is "could" or "might be" expected to continue, but it is something of that nature.

Steve, maybe you can clarify it.

MR. REYNOLDS: I think the wording was, it was contemplated that the filling criteria would be continued. I don't think it had a specific reference to the term "deficiency" and the word was "contemplated," which clearly does not require that those filling criteria be continued.

Mr. Chairman, further, Mr. Bliss expressed an interest in the arguments as to why this was not a proper subject for the operating criteria committee. When he is interested in the other half of the argument, I will volunteer.

THE CHAIRMAN: Thank you, Mr. Reynolds.

COM. LOVE: Is there anyone who wants to make the argument on the other side?

MR. GOSLIN: There better not be anybody in this crowd.

MR. RITER: I am Chairman of that Task Force. As I construe my job, it is a technical job or not administrative or policy job. In the opening statement in Denver on July 25, Assistant Secretary Smith made the statement that "We assume that the filling criteria will continue to be in operation until they terminate by their own terms."

So, as I view my charge as a member of a technical committee, I am not to get involved in policy problems. That's the reason I say you are in the wrong forum. As a technician, if you will give me some studies, I will be glad to work out and develop the facts for you as a technician, but on the policy you'll have to go to somebody else besides me. I am not a policymaker.

COM. BLISS: Mr. Chairman.

THE CHAIRMAN: Yes.

COM. BLISS: Would Randy object to being overriden by the Commission?

MR. RITER: The Commission can make any recommendations they want. Assistant Secretary Smith invited all the States to come in with what you want us to study.

COM. BLISS: Seriously, I think the Commission should take some action on this matter. Before we adjourn I suggest that maybe we should recess for a short while and draft a resolution regarding this. I feel it is highly important for the Commission to take a stand on this, a firm stand in favor of eliminating the deficiency payments as soon as the long-range operating criteria go into effect.

THE CHAIRMAN: Thank you, Mr. Bliss.

COM. PERSON: I have a question. Has the Engineering Committee been following these operating criteria closely?

MR. GOSLIN: Well, I think it probably has, as individuals.

COM. PERSON: I wish the Engineering Committee had come in here with some recommendations to us. This is what I am feeling for, and I think this is why John says we ought to have a short recess.

COM. BLISS: Mr. Chairman, I may suggest that the Secretary stated rather strongly in his report, although that does not appear in the Engineering Committee Report, I think the call for some action in this connection is indicated.

I would move, Mr. Chairman, that at the proper time - now, if not later - that we recess for a short time and draft a resolution in this regard.

COM. PERSON: I second the motion.

THE CHAIRMAN: It has been moved and seconded that we recess for a discussion and drafting of a resolution on this matter of deficiencies. Any discussion?

COM. BLISS: And return in not later than 15 minutes.

THE CHAIRMAN: Let's not put on a time limit.

MR. GOSLIN: Mr. Chairman, I would suggest, also, that you may wish to express yourselves with reference to the long-range reservoir operating criteria at the same time and as a whole.

COM. BLISS: Well, I would certainly have no objection to amending the motion to that extent.

MR. GOSLIN: Also, Mr. Chairman, if you would like, I will read into the record the language in the report that Mr. Reynolds and I were discussing so that you all know what it actually says:

> "To the extent that it is possible to foresee, reservoir operations under Section 602 will not be inconsistent with reservoir operations permitted under the Glen Canyon filling criteria, promulgated by the Secretary of the Interior and printed in the Federal Register on July 19, 1962 (27 F.R. 6851). Thus, it is expected that the criteria established pursuant to this section will permit the filling criteria to be continued until terminated at some later date.
>
> "No change in the manner of determining deficiencies in Hoover Dam during the remainder of the filling period is anticipated, but the matter of payments for such deficiencies will be governed by Section 502 of this Act."

Maybe you'd like to know something about what the effect of continuing these deficiencies might be on the Upper Colorado River Basin Fund as well as what it has been. I think Mr. Jacobson is rather well prepared to discuss that point if you would like to have it discussed.

COM. BLISS: I would like to hear from him.

MR. RITER: Do you have some written material for us peons?

MR. JACOBSON: To date, as of May 31, 1969, the total effect of deficiency charges on the Upper Colorado River Basin Fund, totals $44,136,418, based on an application of an energy rate of three mills to the energy which had been delivered direct from Glen Canyon powerplant into the Lower Basin System. And the expenditures, actual dollar expenditures from the Fund, both for deficiency energy and impairment energy and impairment capacity, the amount of dollars expended directly from the Fund to purchase energy and capacity to make these replacements, totaled $7,700,156. This is the amount that will be replaced under the procedure of the new bill from the $500,000 per year into the Fund from the Colorado River Development Fund, which is rather insignificant compared with the amount of energy that has been supplied direct, totaling over $18,901,000, and the interest effect in the account of over $25,234,000.

As an added note, had the same rate been applied to this energy which was supplied and fitted into the Lower Basin pool, as that which was sold by the Upper Colorado River Project on the open market, this effect would be over double the 44 million, or approximately $80 million. In other words, this energy valued at three mills, in the Bureau's calculation, its companion energy sold at around six mills, which is also approximately the rate that is used in the repayment studies of the Bureau.

So the effect, actually, would be - on the account - would be in closer to $80 million to date. Now, should this continue at the same rate over the period between now and 1987, when the criteria would automatically cease, the effect on the Upper Basin Fund could be as much as $200 million.

COM. BLISS: No one knows, of course, what the hydrology is going to be, as far as that goes.

MR. JACOBSON: The hydrology has very little to do with it. Actually, it is a misconception to attach the deficiency charges to

the filling process at Glen Canyon, because the amounts of the charges are determined on the difference between contracted firm energy in Hoover Dam and that which was actually delivered. In other words, it is based largely on how much water do you release from Hoover Dam to fulfill downstream consumptive uses, and the balance, which is not generated, is charged to the Upper Basin as deficiencies. So if you increase the deliveries at Hoover Dam, the deficiencies would automatically decrease regardless of how much water you stored at Glen Canyon.

COM. BLISS: I was thinking of the ultimate possibility of filling. Maybe this is beyond the realm of possibility in the immediate future.

MR. JACOBSON: Under the new criteria it is impossible to fill Glen Canyon Dam, because the criteria are based on an equation of the system, Hoover and Glen, and release of water from Glen Canyon as soon as you get equated storage or anything above Hoover's active storage. Also, the criteria require advance releases out of Glen Canyon to prevent spills. So it is impossible to negate the criteria under that one particular phase or aid under which the Secretary can cancel them.

COM. BLISS: I understand that.

THE CHAIRMAN: Mr. Reynolds.

MR. REYNOLDS: Mr. Chairman, Ival's report this morning mentioned one or more of the incompatibilities that Jake is now talking about between the filling criteria and long-term operating criteria. There is one thing I think may have escaped our attention until this point. I would read just briefly to you from the Act. This is Section 602, which outlines the priorities for releases:

> ". . . provided that water not so required to be stored shall be released from Lake Powell (1) to the extent that it can be reasonably applied in the States of the Lower Division to the uses specified in Article III of the Colorado River Compact."

Now, the only way you can make contract firm power at Hoover is to release water and let it run to Mexico. This is where the basic problem arises. This, of course, would be a rather foolish thing to do, but that's the only way, under the method of computing deficiencies now used, that you can make your contract firm power at Hoover, is to release it and let it run to Mexico. I think this could be done. But as soon as you do that, then the Lower Basin could call on no releases from the Upper Basin, because of the provision that says you first store everything needed to protect the Upper Basin's delivery and consumptive uses.

Next, you let water down to the Lower Basin to the extent required for III (e) uses, which does not include power and releases to Mexico. Therefore, I think the operating criteria and the filling criteria are absolutely incompatible, and you must consider the filling criteria if you are going to come to any reasonable result on the operating criteria.

THE CHAIRMAN: Thank you, Mr. Reynolds.

We have a motion before us. (Question called for.) All in favor say "Aye." (Ayes) We will recess for, hopefully, 15 minutes.

(Recess taken.)

THE CHAIRMAN: The Commission will reconvene.

COM. BLISS: Mr. Chairman.

THE CHAIRMAN: Yes, Mr. Bliss.

COM. BLISS: We have come back with a motion or resolution here, which I will not attempt to read. I will hand it over to your amanuensis.

THE CHAIRMAN: Can't you read his handwriting?

COM. BLISS: I can't read it.

MR. GOSLIN: The motion would read: It is the consensus of the Commission that the reservoir filling criteria promulgated by the Secretary of the Interior and printed in the Federal Register on July 19, 1962 (27 FR 6851) should be terminated in their entirety, including payments for the deficiencies in generation at the Hoover Dam with the advent of the long-range operating criteria under Section 602 of Public Law 90-537, and that the Commission's staff be directed to participate in concert with the Commission's Committees in the formulation of the long-range operating criteria in a manner consistent with this consensus.

COM. PERSON: I second the motion.

THE CHAIRMAN: That is a resolution. Do you put that in the form of a motion that this resolution be adopted?

COM. BLISS: I so move.

COM. PERSON: I second the motion.

THE CHAIRMAN: Any discussion? Are you ready for the question?

(Commission members polled individually.)

THE CHAIRMAN: The resolution is adopted unanimously.

Any further discussion of the Engineering Committee report?

MR. RITER: May I ask Mr. Goslin a question?

Ival, will you see that I get a copy of that? I couldn't follow your reading that fast.

MR. GOSLIN: Yes, sir, we will send you a copy.

THE CHAIRMAN: Thank you for your report, Mr. Goslin. Apparently your report passed muster.

MR. GOSLIN: I think it passed muster with everybody except Prof.

THE CHAIRMAN: We are still on the Engineering Report.

COM. PERSON: Well, I put my complaint in. There weren't any positive recommendations. I was disappointed, I still am. As far as I am concerned, we can drop it.

THE CHAIRMAN: Chairman Sparks, does the Legal Committee have a report?

MR. SPARKS: No, we have no report. Mr. Chairman, I will point out, however, I think the Legal Committee is going to have to take a pretty hard look at this proposed criteria. The disturbing thing about this criteria is that it makes little note of the Colorado River Compact. By that I mean this criteria assumes certain releases for Lower Basin purposes without regard to whether it is within the allocation of the Lower Basin States or not. It assumes certain releases for the Mexican Treaty application, regardless of whether or not there is any deficiency chargeable to the Upper Basin States, and it does not follow the criteria specified in last year's Act, because this criteria is proposed entirely to satisfy the requirements of the Lower Basin, and this is all that is mentioned primarily in the criteria, to satisfy certain uses in the Lower Basin, and it assumes that the Lower Basin is going to get seven and a half million plus the river losses, the reservoir losses, and satisfy the Mexican Treaty, all of which has to come at the expense of the Upper Basin. I don't think it complies to any extent

with the Act that Congress passed last year. I think in the State of Colorado we are going to enter some strenuous objection to it until it is based upon what is contained in the Act last year. I think the Legal Committee will have to take a hard look at this.

COM. LOVE: Mr. Chairman, may I ask Mr. Sparks, that being true, what participation, what appellate procedure is there for this Commission, or must it be the individual States to take action to attempt to make certain that the operating criteria do conform to, (1) our Compact, and (2), the Act?

MR. SPARKS: Governor, this is difficult. It is difficult for the Bureau to figure out this operating criteria at this time and try to generalize it later. The problem that occurs is that if the Upper Basin were using all of the water that it was entitled to under the Compact at this time, I am sure the Bureau would have come out -- the Department of the Interior would have come out with somewhat different filling criteria.

What this criteria does, really, is skip the question of what happens when the Upper Basin is using its full allocation of water, just simply ignores that proposition and is directed to satisfying the requirements of the Lower Basin to the extent that the water supply is available. It is a perplexing thing.

For instance, the criteria provides and contemplates a release of the 8.2 million or 8.3 million -- 8.23, I believe it is, from here on out.

Well, this, in our opinion, is in excess of the Compact requirements. At the same time, the argument can be used with some validity, it is not necessary for us to store all of the remaining flow in view of the fact that our consumptive use requirements now are less than five million acre-feet, probably in the neighborhood of four million or something in that magnitude.

COM. LOVE: If they do the 8.2, is this on the basis of allocation of our commitment which has not arisen under the Mexican Treaty?

MR. SPARKS: That 8.2 is arrived at in the computation of the Lower Basin demands, and the fulfillment of the Mexican Treaty and the satisfaction of losses downstream.

COM. LOVE: But my point is, what mechanically, legally, in procedure, is open to us as far as attempting to bring it into line with what we think is right?

MR. SPARKS: I think the first thing, in January of this year, not later than January 1st, I think the law states, the Secretary has to submit these proposed criteria to the Governors of the seven Basin States, and at that time the Governors will submit their comments on the criteria. If they are not revised to reflect what we think the Compact states, I am not sure that at that time any legal remedy is available to us because Congress has charged the Secretary with the responsibility of promulgating these criteria. They have also given him very specific guidelines in the Act of last year to follow out, and any references to the Mexican Treaty obligations and what is a deficiency are completely ignored in these criteria, and they will not become critical, actually, until the Upper Basin has increased its depletion of water, and we have got this interim period that is going to cause us all a great deal of difficulty, and the real crux of the problem is when does the Upper Basin have to have maximum storage in Glen Canyon to protect itself?

The history of the river has shown that if you store all of the water in Glen Canyon and release only seven and a half million or seventy-five million to the Lower Basin in any ten-year period, the Upper Basin only comes up with around 6.2 million acre-feet of water. We are short over a million and a half acre-feet of water if we take every drop of water in Glen Canyon with the exception of releasing 75 million acre-feet. So when you increase the release anything over 75 million feet in any ten-year period, as this criteria clearly contemplates, the eventual shortage of the Upper Basin is considerably more and it brings us way below 6.2. So what you have is a situation where the Lower Basin is getting all the water it is entitled to and the Upper Basin will be shorted in excess of 2 million acre-feet of water.

I don't know at what point in time we are going to be able to demonstrate actual damage as a result of this operation. We certainly are being damaged today by these power deficiencies, there is no question about it. It depletes our Basin Fund to a major extent.

COM. LOVE: But, basically, what you are saying is, we probably, in your opinion at this moment, can't get into court if it becomes necessary prior to the time that we can demonstrate damage?

MR. SPARKS: I think that's the case.

MR. CLYDE: May I ask a question of Mr. Sparks? Do you suppose it is possible to write into this criteria, as written here, tie it to the Compact so that the purposes of this operating criteria is geared to the implementation of the Compact?

MR. SPARKS: Yes, and particularly, Governor, the specific criteria that was contained in the bill enacted last year about these deficiencies. This proposed criteria, while it is attempting to carry it out on a form, really attempts to evade the problems and one of these days we have to come to grips with these problems. It is really an attempt -- not only an attempt, it does evade the problem by trying to satisfy the Lower Basin requirements, and that's about all these criteria do, is satisfy the Lower Basin requirements.

THE CHAIRMAN: Mr. Reynolds.

MR. REYNOLDS: Mr. Chairman, if I may. It seems to me it is not quite that simple at this point. Certainly it is in the Upper Basin's interest to release more than 75 million each period of ten consecutive years for some years to come in order that we give full benefit of the power facilities at Glen Canyon and benefits that we need in our Project Fund. So I agree with Felix, there comes a time when we have to cut off this eight and a quarter million release, but I think the people who are promulgating these criteria have not yet told us that they think the eight and a quarter is our delivery obligation, and I think they will not tell us that.

MR. SPARKS: This is very true. As I say, at this time our consumptive use is not to the point where we can actually argue that we have to store all the excess water in Lake Powell, but, unfortunately, for a long-range operating criteria this does not meet the problem, in my opinion, because it is tied to the powerhead at Hoover Dam, and the powerhead at Hoover Dam has nothing to do with the operation of the Colorado River Compact, and this is what it does, it ties it to the powerhead at Hoover Dam.

MR. RITER: May I ask Mr. Sparks a question, or this Commission a question? Does this Commission have some alternative -- the gate was opened by Secretary Smith to get your bids on what you want; what alternative criteria would you suggest we study?

MR. SPARKS: Well, we have listened with some interest -- of course, I think maybe the Commission may be aware, the main thrust -- what Randy says is entirely true, the gate is open for us to propose alternative criteria -- the main thrust of the negotiations so far have been by the Lower Basin to try to get around the provisions of the Act passed last year, and they do this by coming up with various probabilities. But when you start out with a hundred percent probability that the Upper Basin is not going to get its water, I don't see how they can come up with any other probability and say that we are. This is an acknowledged fact. We have a hundred percent

probability of shortage, to start with, and the thrust of the Lower Basin negotiations to date have been to show that there is a probability that they can get more water, and how they can do that without taking it up from the Upper Basin is beyond me.

COM. LOVE: Well, I would say with the fact that we have been asked to comment and to suggest, that we would be negligent in our duties if we did not devise the appropriate technical staff or whatever is needed to actually propose some operating criteria.

MR. GOSLIN: Mr. Chairman, as another member of the Task Force, I would like to assure Randy that we will have some proposals for you to study at an early date.

MR. RITER: Fine.

MR. SPARKS: I might state as an interim operation these criteria for some period of time to a considerable extent are adequate, but they are supposed to be long-range criteria, and what they do is, they go into the immediate future only and they do not go into the long-term future, and the problem that we always have with this type of operation is what becomes a temporary operation very often is pushed over on somebody as being a long-term operation somewhere down the line, and this is a danger, as I see it. I think these things are adequate, we will say, for 15 to 20 years, or at least until the Central Arizona Project comes on the line, but from there on they are silent, they are not long-range operating criteria, they are very short-range operating criteria.

COM. LOVE: If I understand it correctly, Governor Clyde's suggestion that in any event any criteria carry the reservation that in no event shall the operating criteria be held to nullify or to set aside the terms of the Compact, this would be necessary and would be satisfactory except for the problem that Larry raises, that even without violating the terms of the Compact, that we as a matter of discretion are going to have to seek to store against future deliveries in the Upper Basin in order to protect ourselves, and even though this operating criteria in that sense wouldn't violate the Compact, we need to have that kind of discretion and flexibility; isn't that right?

MR. JACOBSON: One of the areas where they are deficient in the trial runs, and of course the Committee has not completed its work by any means, is, they shut the operations off in the Year 2000, with an upper basin depletion of five-eight, I believe is the maximum that the trial runs are used so far. One of the recommendations I am sure we

are going to come up with, that they go beyond the Year 2000 and go beyond the 5.8, get a little closer to the ultimate use of the Upper Basin. These are merely test trials to see how various aspects of the rule curves and the applications that they are making in the criteria fit the various hydrologic conditions and time periods. So I think they should go a little beyond what some of the studies would run so far.

MR. CLYDE: Mr. Chairman.

THE CHAIRMAN: Governor Clyde.

MR. CLYDE: Has the Commission accepted this position, that the Upper Basin States forever in the future take a second cut on the waters of the Colorado? You see, when this Compact was drawn, it was supposed to be an equal division in the first approximation, seven and a half million acre-feet. But we find ourselves taking the second seven and a half million or such portion thereof as it exists. The Lower Basin takes their initial cut first and we take what's left. Maybe we ought to go on the offensive and challenge that thing. There is no equity.

MR. SPARKS: Governor, there is one angle there we have not previously discussed that I recall to any extent, that offers us, I think, some protection. This is a big source of worry that we have all had. That is, what is a Mexican Treaty deficiency? Now, I know what the Lower Basin is thinking in terms of -- well, they use seven and a half million feet, and there is a deficiency that they are going to have to make up, part of it, out of the seven and a half million feet. In other words, they would reduce their use below the seven and a half million to make up their deficiency. At the same time we may only be able to get, because of the 75 million delivery -- well, we could get only 6.2 million. What we have to argue, and argue hard, and I think it is correct, that no deficiency is ever chargeable to the Upper Basin until the Lower Basin uses are down to ours. In that case, if they are using seven and a half million and we are only getting 6.2, the entire Mexican Treaty burden, the entire million and a half, must come from the Lower Basin under the Compact, as I read it. They are arguing the other way. But this, then, would bring them down pretty close to what we are getting.

I know people like Mike Ely are worried about this particular thing, the parity that you mentioned, and this parity is going to have to come into effect when you start computing this Mexican deficiency, or the Compact means nothing, in my opinion, and this, I think, is one of the things. This criteria, as I say, I think is fine for a short-term basis, but it creates an impression that it is a long-range criteria and this thing is not a long-range criteria, it is short-term.

COM. LOVE: Will the criteria deal with the Mexican Treaty deficiency or the possibility thereof?

MR. JACOBSON: They kind of skirt around that in this way. They say by the year 2000 or 1990, somewhere along there, we are going to be out of water and the river has got to be augmented and that that will be automatically taken care of. But I don't believe that will answer the question. It may answer the Lower Basin situation.

COM. LOVE: Wouldn't this be a good place to raise that Mexican Treaty water at the time we submit our suggestions on operating criteria?

MR. GOSLIN: I think we ought to raise it every time we get a chance.

MR. SPARKS: Even if the criteria adopted by the Congress last year were incorporated into this criteria, the Bureau is not in a position at this time, I don't think, to make a determination as to who has to provide the deficiency. But the criteria itself does hit that question, that is, the bill itself last year touched on that question, and the criteria, I think to a considerable extent -- not only considerable extent, I think the criteria has to incorporate everything that is in this bill.

COM. LOVE: Why do you say the Bureau is not in a position to make a determination on that, that is, isn't the Bureau charged with establishing operating criteria to comply with the Compact and the statutes?

MR. SPARKS: Governor, they could do it, yes. I think that is a responsibility of the Secretary of the Interior. I speak from long experience in saying he will not do it, because one major factor is the great controversy on the Gila River and Arizona's contention that the Gila is not included in the Compact.

COM. LOVE: I flew over it recently. It does flow into the Colorado.

MR. SPARKS: That is what we have argued, it is a tributary of the Colorado River, enters the Colorado River in the United States.

MR. GOSLIN: I think it is inevitable that this problem of accounting for the Mexican Treaty burden is going to have to go to court. I see no other solution to it unless by luck we get a river augmentation program that will wipe it out.

COM. LOVE: It may be, but I think as a matter of posture this Commission is better off to be aggressive than to say the Secretary is not going to settle it for us and they won't make it a part of the operating criteria; I think we should press it, even so.

MR. SPARKS. The Secretary has to make that decision at some time to operate the river. I don't know how else he is going to do it.

THE CHAIRMAN: Mr. Reynolds.

MR. REYNOLDS: Mr. Chairman, I think it might be worthwhile to see that this issue need not be determined for some 20 to 30 years apparently; it could come earlier than that, because your best estimates indicate that the crucial point is two or three decades down the line.

With that thought in mind, looking at the proposed criteria, one can see that there will be more water in Lake Powell if we contemplate an eight and a quarter million delivery than if we contemplate a seven and a half million delivery, and at the time that our differences develop enough, with an eight and a quarter million we have got the reservoir full, will be the time to argue whether our obligation is seven and a half or eight and a quarter.

I think what is tremendously important at this point is that the Upper Basin States make very clear, while they acquiesce in the use of eight and a quarter in establishing the amount of water to be stored in Lake Powell, we do not concede that that bears any relation to our obligation to deliver to the Lower Basin.

One further point. While I think I arrive at the same result that Felix does, I get there a little differently. I think the numbers will show closely enough that the entire Mexican Treaty burden can be met with 75 million in each ten years from the Upper Basin without decreasing the Lower Basin below eight and a half million.

COM. LOVE: Say that again. I can't put that together.

MR. REYNOLDS: The Lower Basin is entitled from the system, including the Gila, to eight and a half million acre-feet.

COM. LOVE: I see.

MR. REYNOLDS: And I say, if we deliver 75 million, if they control the losses on the river reasonably and if you count the evaporation

as beneficial consumptive use, as you should, and you take into account all the uses of the Gila and the other tributaries in the Lower Basin, the full delivery to Mexico can be made without reducing the Lower Basin to less than eight and a half million, with us enjoying 6.3 million.

COM. LOVE: Is there a million generated below the Glen?

MR. REYNOLDS: Yes.

MR. GOSLIN: With the Gila River, more than that.

MR. SPARKS: Considerably more than that if you count the Gila River.

MR. JACOBSON: About 700,000 between Glen and Mead.

MR. SPARKS: I think this is the point. These criteria, I think with some additions to spell out what we consider the long-term obligation, that for some interim period, it seems, as far as I can see, these criteria do the job but they leave too much hanging and they create an impression that this in itself is a long-range operating criteria, which it is not.

THE CHAIRMAN: Any other comments on the Legal Committee's activities?

I think, gentlemen, this serves to point out the great importance of active participation on the part of engineering advisers and legal advisers to the State Commissioners, and Mr. Goslin needs all the help he can get, I know. So I hope he'll have that support forthcoming.

Let's move on to the next agenda item, Unfinished Business.

MR. GOSLIN: Mr. Chairman, I don't think of anything, but I left a couple of blanks here in case some of the Commissioners had something.

THE CHAIRMAN: If not, we will move on to New Business.

Item (a) is listed here as Long-range reservoir operating criteria. I believe we have exhausted that subject.

COM. WADDINGHAM: Mr. Chairman, much of what has been said here I am certain most of the member States will agree with. I am inquiring now as to whether or not it is contemplated that the Commission

will meet again between now and the end of the year to consider and formalize our opinions after we have had the benefit of the Engineering Committee's reports from the contemplated study.

MR. GOSLIN: Mr. Chairman, may I speak to that point?

THE CHAIRMAN: Yes, please.

MR. GOSLIN: I think the answer to the question is yes, certainly it is going to meet again, and I would also like to add to this that I would like very much to see this Commission meet more often than it has been meeting. I don't know whether you realize it or not, but I feel, well, quite flattered, maybe is the word, with the confidence that the Commission places in its staff, but at the same time I find myself very often floundering around in the dark, wondering just exactly how far I should go until I have an opportunity to talk to the Commissioners. I much prefer talking to and with the Commissioners in a group such as this meeting rather than having to talk to them individually on the telephone.

Now, this is a personal reaction on my part, probably it shouldn't be mentioned here, but I have mentioned it. I would like to reiterate, I would like to see the Commission meet oftener if it is possible to do so.

MR. COURY: Mr. Chairman, at the next meeting I would like to invite you to come down to Farmington and show you that fly-ash plant, which will probably be the largest thermal powerplant in continental United States.

THE CHAIRMAN: Thank you, sir.

MR. COURY: I would be happy to be your host.

MR. GOSLIN: I would be happy to schedule the next meeting there if the Commissioners all agree.

THE CHAIRMAN: I share the Director's views that we should have more frequent meetings of the Commission, and I am certain from the business that now is in front of us there is going to be a real need to have them at regular intervals.

COM. WADDINGHAM: I think that answers my inquiry and that was the answer I was hopeful was forthcoming.

The next item on the agenda is hearings by National Water Commission. I think the Director has communicated with all the Commissioners

in regard to a request from the National Water Commission to participate in their conferences and hearings, and so far as I know, the Commissioners have not responded, have they, Mr. Goslin?

MR. GOSLIN: You did.

THE CHAIRMAN: In any event, I am in receipt of a letter dated September 29 from Theodore M. Shad, Executive Director of the National Water Commission, and he says, "We are sorry not to hear the views of the Upper Colorado River Commission at our Denver Conference. We still want your views, however. It has been found advantageous to us in the conferences we have held to have such views presented in person so that they can be discussed directly with the Commissioners.

"If this is also your desire, we would accept a personal presentation at any of our remaining conferences. However, it would fit in best with our schedule if the personal presentation were made at the Los Angeles Conference to be held at the Hotel Intercontinental on Monday, October 27, starting at 9:00 a.m. The presentation at this conference will cover the States of Arizona, California, Hawaii, and Nevada. If you should find that you are unable to make a personal presentation at any of the conferences, we will accept a written statement for the record at any time until about November 15. Such material will be treated the same as the transcript of the conferences in terms of its use by the National Water Commission."

Now, it would seem to me, gentlemen, this Commission should express itself to this National water policy-making body and that we should have some proper representation to do that job, and I would suggest that our Executive Director be licensed to attend this meeting in Los Angeles. I would like your views.

COM. LOVE: I would think if he were to attend and present a position, a policy paper, it should be one that is prepared and circulated to the Commission before the time that he does present it.

THE CHAIRMAN: New Mexico, your views?

COM. BLISS: That sounds good to me.

COM. WADDINGHAM: Utah would be in agreement with the same provision that Governor Love made.

MR. SPARKS: I think some guidance is already available to the Director in that the four States have presented individual statements to the Commission here in Denver last week.

THE CHAIRMAN: Wyoming?

COM. PERSON: We agree to that, but, as you say, I think all the States presented their own position at Denver here.

MR. SPARKS: In looking them over I saw some rather remarkable unanimity among those States.

MR. LAWRENCE: Mr. Chairman, I believe it would be proper for each of the States to furnish the Director, make sure he has the comments, and he could, as Larry says, kind of draw from there. There may be some areas that we didn't completely agree.

MR. GOSLIN: If I am going to do it, I would certainly like to have a copy of each State's statement. Otherwise, I am sure I would be in trouble.

THE CHAIRMAN: It seems to be the consensus that we should have that representation by Mr. Goslin. Mr. Goslin, will you undertake it and advise the States in advance of what your statement will be?

MR. GOSLIN: Certainly, if this is what the Commission wants done.

MR. COURY: I would suggest if the Executive Director is going to go to the meeting, each one of the respective States, if possible, ought to have a representative to go along with him.

THE CHAIRMAN: I am sure he would appreciate that.

MR. GOSLIN: Surely.

THE CHAIRMAN: I am sure that would be welcomed.

COM. BLISS: Mr. Chairman, I move that our Executive Director be authorized to make a presentation at the meeting in Los Angeles and that each State be invited to send a representative, one or more representatives, to that meeting at that time if they so desire.

COM. WADDINGHAM: I will second that motion.

COM. PERSON: Would you include those statements ought to be sent to the Commissioners for approval before being sent?

COM. BLISS: Each State's statement?

COM. PERSON: No. He is going to prepare a statement. It seems to me the Commission should approve it as individuals.

MR. GOSLIN: That was understood.

COM. BLISS: That would be understood in the motion, yes.

THE CHAIRMAN: Any discussion? Are you ready for the question? All in favor say "Aye"? The motion is passed.

MR. GOSLIN: This is late to ask the question, but does this have to be at the Los Angeles meeting?

THE CHAIRMAN: The motion did not say. I think we have to leave it up to our Executive Director to ascertain what his time needs are and to make arrangements to attend one of these meetings. There is another meeting in Washington in November.

MR. BILLHYMER: That is the last one. There is one Friday in Chicago, then the next one is in New Orleans, the next one in Los Angeles, and the one following is in Washington, D. C

COM. LOVE: You better go to Los Angeles.

THE CHAIRMAN: We have left you a free agent on that.

The next agenda item is election of officers, and at this Annual Meeting I believe it is in order to elect the Vice-Chairman. Mr. Goslin?

MR. GOSLIN: This is correct.

THE CHAIRMAN: I will entertain nominations at this time.

COM. PERSON: Mr. Chairman, I nominate Governor Love as Vice-Chairman of the Commission.

COM. LOVE: Mr. Chairman, does this imply in the procedures that you succeed to Chairman? No? My only reason for questioning is that I have some other obligations and I don't want to unknowingly get involved in a position where I take on some more that I won't have time to adequately fulfill.

THE CHAIRMAN: The By-Laws of the Commission provide that the Vice Chairman is elected from the State membership and that he serves as Chairman in case of the inability of the Chairman to serve.

MR. GOSLIN: The Chairman is appointed by the President.

THE CHAIRMAN: Any other nominations?

COM. WADDINGHAM: Mr. Chairman, I move the nominations cease and Governor Love be elected to the position by acclamation.

COM. BLISS: Second the motion.

THE CHAIRMAN: It has been moved and seconded that Governor Love be nominated as Vice Chairman unanimously. All in favor? It is unanimous, Governor.

COM. LOVE: How did Colorado vote?

MR. SPARKS: I voted as the alternate.

THE CHAIRMAN: The next office is the office of the Treasurer, and at this time I will entertain nominations for Treasurer.

COM. PERSON: I nominate Mr. Coury for Treasurer.

COM. BLISS: I second the motion.

THE CHAIRMAN: It has been moved and seconded Mr. Coury be nominated as Treasurer. I presume he is unanimously elected. (Ayes)

MR. COURY: At the same salary?

THE CHAIRMAN: Same salary with the same degree.

MR. COURY: I just want to be sure there is no diminution of salary.

MR. GOSLIN: Mr. Chairman, the By-Laws provide that the Treasurer shall appoint, with the concurrence of the Commission, an Assistant Treasurer, and in order to complete this business, if Mr. Coury would appoint the Assistant Treasurer at this time it would save me a lot of correspondence, and so on, and if the Commission would agree.

MR. COURY: I would like to nominate William Homer, Vice President of First Security Bank of Utah as Assistant Treasurer.

COM. BLISS: To continue to serve?

MR. COURY: To continue to serve.

COM. PERSON: I move we approve this nomination.

COM. LOVE: Second.

THE CHAIRMAN: Moved and seconded. All in favor say "Aye." Unanimous.

MR. COURY: I think one more thing is to designate the depository so there is no argument. The depository is First Security Bank of Salt Lake City, and I think it should be in the minutes to designate that as the depository.

COM. LOVE: So moved.

COM. BLISS: Second.

THE CHAIRMAN: It has been moved and seconded that that be the designation. All in favor say "Aye." Carried.

MR. SPARKS: I hate to see this Commission moved to Southern Utah.

MR. COURY: Larry, you don't hate it any more than I do. I would like to move it down to New Mexico, but I can't.

MR. GOSLIN: I might say both these fellows tried.

THE CHAIRMAN: Any other new business?

MR. GOSLIN: I have no other business, Mr. Chairman.

COM. BLISS: You have no suggestion for the next meeting, Ival?

MR. GOSLIN: If the Commission would like to set a time and place for the next meeting, it would be fine so far as I am concerned. On the other hand, one of the principal items of business would probably be these long-range reservoir operating criteria and it is hard to predict right at this time when the opportune time would be.

COM. BLISS: It just appeals to me you have a great deal of difficulty, and I suppose you would even if you had a set date, to get

everyone there, if we could agree tentatively on a date at the present time maybe we could hold our schedules open for such a meeting.

MR. GOSLIN: I certainly appreciate your statement about having trouble getting meetings set up. I have all the trouble there is. If the Commission wants to set a tentative date, this is fine with me.

MR. COURY: I would still like the invitation to stand that I made a while ago.

MR. GOSLIN: Mr. Chairman, Mr. Jacobson has a suggestion here.

MR. JACOBSON: When will we have an interim report on these criteria, Randy?

MR. RITER: Our next meeting is scheduled October 30. I am hopeful that at that time we won't have to meet any more, the Task Force can work up something and give it to the Secretary. My schedule is to get it to him December 1st so he can meet the January 1st deadline. We may have to have another meeting of the Task Force after October 30, particularly if Ival comes in with criteria that have not been exposed to the members of the Task Force. Our deadline is December 1st to submit the draft to the Secretary.

COM. BLISS: Mr. Chairman, on that basis it seems to me we ought to meet about the middle of November, after you have at least had your last of October meeting, and we may not have all the criteria complete but it should be before the 1st of December, I am quite sure.

MR. GOSLIN: Maybe the thing to do would be to set it for the first week in November, and if there is another meeting of this Task Force, then we might want one at the end of November, too.

MR. JACOBSON: We are going to have our criteria in to this work group committee, this Task Force, in just a matter of a week or so, aren't we?

MR. RITER: The shorter the better.

MR. GOSLIN: We should have.

MR. RITER: Otherwise, it might get neglected.

MR. JACOBSON: We are going to have another meeting on the 17th of that work group, so it is possible we may have something to report by that time, the 1st of November.

COM. LOVE: I think the first week of November is all right.

THE CHAIRMAN: Does that sound as if we might set a date for the first week in November?

COM. BLISS: That would be all right with me.

(Off the record.)

MR. GOSLIN: The Commission left the matter of establishing the time and place of the next meeting at the determination of the Secretary after consultation with members of the Commission.

MR. LAWRENCE: The Utah Board of Water Resources ordinarily would meet the first Thursday and Friday of the month. If you are going to use the 6th or the 7th, I ought to know by this Friday so I could reschedule them.

MR. GOSLIN: It would be impossible to let you know, Dan.

MR. LAWRENCE: Could you kind of skirt around those two days, if possible.

MR. GOSLIN: I will try my best to, yes.

THE CHAIRMAN: Do I hear a motion for adjournment?

COM. PERSON: I so move.

THE CHAIRMAN: Do I hear a second?

COM. WADDINGHAM: Second.

THE CHAIRMAN: Adjourned.

(Meeting adjourned at 3:10 p.m.)

COMMENTS AND RECOMMENDATIONS
of
COLORADO, NEW MEXICO, UTAH, AND WYOMING
on
THE SECRETARY OF THE INTERIOR'S DECEMBER 16, 1969 PROPOSED LONG-RANGE OPERATING CRITERIA FOR COLORADO RIVER RESERVOIRS

March 26, 1970

A. TERMINATION OF GENERAL PRINCIPLES FOR RESERVOIR FILLING INCLUDING "DEFICIENCY" PAYMENTS

It is the unalterable position of the four States of the Upper Division that the "General Principles To Govern, And Operating Criteria For, Glen Canyon Reservoir (Lake Powell) And Lake Mead During The Lake Powell Filling Period," and particularly the charging of the so-called "deficiencies" in firm energy generation at Hoover Dam to the Upper Colorado River Basin Fund in terms of dollars, electric energy, or generating capacity must be terminated simultaneously with the adoption on July 1, 1970 of the long-range reservoir operating criteria of Section 602 of P. L. 90-537.

1. The Colorado River Compact contemplated storage of water in and for both the Upper and Lower Basins. Article I clearly lists the storage of water as one of its major purposes. The compact (Art. IV) also recognizes that water will be used for power generation. Power generation requires water storage. The compact recognizes that due to the erratic flows of the river the Upper Basin without storage cannot use consumptively its full apportionment of water, or so much of it as may be available, and at the same time deliver an average of 7.5 million acre-feet of water per year to the Lower Basin.

2. Art. IV of the compact makes the use of water for power generation subservient to its use for domestic and agricultural purposes. This subserviency is effectuated by Art. III (e) which provides that:

> "The States of the Upper Division shall not withhold water, and the States of the Lower Division shall not require the delivery of water, which cannot reasonably be applied to domestic and agricultural uses."

Even if it is conceded that the Art. III (d) obligation of the Upper Division States to deliver an average of 7.5 million acre-feet of water per year at Lee Ferry gives the Lower Division a priority on the available water supply, that priority is certainly limited by Art. III (e) to domestic and agricultural purposes. The Lower Basin is not entitled to the release of any water from Upper Basin reservoirs except for agricultural and domestic uses. If water is released from the Upper Basin for power generation in the Lower Basin, or if another Upper Basin resource (energy or money) is substituted for water, the effect is to give a priority to the generation of power in the Lower Basin over the storage of water in the Upper Basin for domestic and agricultural purposes. This is clearly inconsistent with the intent of the compact.

3. Hoover Dam, authorized under Section 1 of the Boulder Canyon Project Act, was constructed primarily for the purposes of flood control and water supply. The generation and sale of energy was for the purpose of paying for the project.

> "Sec. 1. That for the purposes of controlling floods, improving navigation and regulating the flow of the Colorado River, providing for storage and for the delivery of the stored waters thereof for reclamation of public lands and other beneficial uses exclusively within the United States, and for the generation of electrical energy as a means of making the project herein authorized a self-supporting and financially solvent undertaking, the Secretary of the Interior, subject to the terms of the Colorado River Compact hereinafter mentioned is hereby authorized to construct, operate, and maintain. . . ." (emphasis supplied)

Section 14 (a) of the Secretary's regulations promulgated under the Boulder Canyon Project Adjustment Act provides for adjustments in energy rates due to shortages of water in order to meet the primary purpose for having a powerplant at Hoover Dam, i.e., the repayment of project costs.

> Section 14 (a) . . .
>
> "In the event of a deficiency in the amount of defined firm energy due to shortage of water available for the generation of firm energy, reduction in the amount to be amortized within the period ending May 31, 1987, will be made, . . . in the manner and to the extent provided in this article 14 (a) . . . ."

The last sentence of Section 1 of the Boulder Canyon Project Adjustment Act also gives the Secretary authority to adjust power rates. It says:

> "Such charges may be made subject to revisions and adjustments at such times, to such extent, and in such manner, as by the terms of their promulgation the Secretary shall prescribe."

Article 14 (e) of the Secretary's general regulations further verifies that the primary purpose of the Hoover Dam powerplant was not the generation of cheap hydro-energy and that the Secretary has the authority to meet shortages of water (and energy) situations.

> "(e) As of June 1, 1987, adjustments shall be made, through refunds or collections as the Secretary may find necessary to achieve consummation of the principle that the revenues shall be sufficient but not more than sufficient to provide the amounts set forth in Article 6 of these regulations (project repayment) as modified by the provisions of Articles 14 (a) and 15 (c) hereof."

The charging of Hoover generation "deficiency" costs to the Upper Basin Fund places paramount importance on the energy generated instead of upon the primary purpose of the generation. The laws relating to the authorization and operation of Hoover Dam have provided for adjustments, including adjustments due to water shortage, necessary to accomplish the real purpose of the Hoover powerplant; i.e., the repayment of project costs. Such adjustments are applicable and adequate to cover the situation now facing the Secretary with reference to the termination of the filling criteria.

The operations of the Hoover power facilities are also subject to the Colorado River Compact [Sections 8 (a), 8 (b), 13 (b), 13 (c), and 13 (d) of the Boulder Canyon Project Act]. In Arizona v. California the federal government argued the position that Sections 8 (a) and 13 (b) are for the protection of the Upper Basin to insure that the Boulder Canyon Project does not encroach upon Upper Basin rights (p. 18, U.S. Rebuttal Brief).

As emphasized above, the Colorado River Compact contemplated future resource development in the Upper Basin. When the generation of firm energy at Hoover Dam was first computed, a progressive reduction in power generation to take into account future Upper Basin development was made (House Doc. No. 717). The reduction was on a straight-line, annual basis. This computation had to be made with the knowledge that

such development could not follow a straight-line progression. Since, as the Department of Justice has contended, Sections 8 (a) and 13 (b) of the Project Act were included for the protection of the Upper Basin, the power contracts executed by the Secretary cannot have the effect of limiting Upper Basin development. Therefore, charging the Upper Basin for any "deficiencies" in firm power generation at Hoover Dam attributed to Upper Basin development has no justification and must be stopped.

4. The report of the House Committee on Interior and Insular Affairs (Report No. 1312, 90th Congress, Second Session, on H.R. 3300, Colorado River Basin Project Act) at page 84 states:

> "To the extent that it is possible to foresee, reservoir operations under Section 602 will not be inconsistent with reservoir operations permitted under the Glen Canyon filling criteria promulgated by the Secretary of the Interior and printed in the Federal Register on July 19, 1962 (27 F.R. 6851). Thus, it is expected that criteria established pursuant to this section will permit the filling criteria to be continued until terminated at some later date. No change in the manner of determining deficiencies in Hoover generation during the remainder of the filling period is anticipated, but the matter of payments for such deficiencies will be governed by Section 502 of this Act."

This language does not preclude modification or termination by the Secretary of the 1962 filling criteria, including the cessation of charges for "deficiencies" against the Upper Basin Fund. Since it is now clear that the filling criteria are inconsistent with an Act of Congress, the filling criteria should be terminated.

5. The procedures used to charge the Hoover powerplant "deficiencies" under the 1962 filling criteria are demonstrably detrimental to Upper Basin interests. They are not consistent with the equitable arrangement prescribed by the long-range operating criteria defined by Section 602 of P.L. 90-537. It has been determined that to September 30, 1969 the replacement of these "deficiencies" under the 1962 filling criteria has depleted the Upper Colorado River Basin Fund by $45.4 million, computing Glen Canyon energy transferred to the Hoover power contractors at 3.0 mills per kwhr.

6. Unless the filling criteria are terminated, Section 602 will extend the adverse effects of the filling criteria to the further detriment of the Upper Division. Clause (3)(i) and clause (3)(ii) of Section 602 (a), which have the effect of equating active storage in Lake Powell and Lake Mead after the water required to insure the Upper Division's compact

deliveries and consumptive uses has been stored at Lake Powell, would defer the time at which Lake Powell is full (elevation 3700 ft) and Lake Mead storage is simultaneously at or above elevation 1146 ft -- one of the conditions which would terminate the 1962 filling criteria. Furthermore, clause (3)(iii) of Section 602 (a), which requires releases to avoid anticipated spills from Lake Powell, would also defer the filling of Lake Powell and consequently the termination of the 1962 filling criteria.

To bring Lake Powell to elevation 3700 ft, there would be required an acquisition of 15.5 million acre-feet more storage than is presently in Lake Powell. Lake Mead is above elevation 1146 ft. Under the principle of equalization of storage (P.L. 90-537), an additional 11 million acre-feet must be stored in Lake Mead making a total acquisition of 26.5 million acre-feet necessary to trigger the termination of the filling criteria. In the seven-year period since closure of Glen Canyon dam, 11.5 million acre-feet of surface storage have been acquired at Lake Powell, about 4.0 million acre-feet in the other Upper Basin reservoirs, and Lake Mead has been drawn down 5.5 million acre-fee . Thus, the seven-year net acquisition is approximately 10 million acre-feet of surface storage. With no change in the amount of water in reservoirs above Lake Powell and hydrologic conditions similar to those of the past seven years, 18-1/2 years (1-1/2 years beyond 1987) would be required to acquire the 26.5 million acre-feet in Lake Powell and Lake Mead. It is obvious that extending the filling criteria into the longtime operations of the Colorado River reservoir system is not a "matter seperate and apart from the issuance of operating criteria." The two sets of criteria are not consistent since the operating criteria add an additional 11.0 million acre-feet burden to the filling criteria, a condition that was never contemplated. Therefore, the Secretary should take prompt action to terminate the filling criteria.

7. With demands for water from Lake Mead for domestic and agricultural uses in the Lower Basin and for delivery to Mexico at current levels (about 8.5 million acre-feet annually), contract firm energy cannot be generated at the Hoover powerplant until Lake Mead is nearly full (23.8 million acre-feet at elevation 1206 ft). Even after the Central Arizona Project water requirement is added to the Hoover releases it will still not be possible to generate contract firm energy at Hoover Dam unless the reservoir is at or above elevation 1146 ft. Under the Secretary's formula for determining and charging Hoover powerplant "deficiencies" to the Upper Basin Fund, the amount of energy generated (corrected to 83% efficiency) with releases limited to downstream water requirements, including the Mexican Treaty obligation, is deducted from the amount of energy that would have been generated had releases sufficient to generate contract firm energy been made. The "deficiency" is attributed to Upper Basin water storage and is replaced by purchase of energy with

Upper Basin funds or by energy generated at Glen Canyon Dam. The hypothetical part of this operation implies delivery of water to Mexico in excess of the minimum required by the Treaty.

8. The Hoover power "deficiency," as presently computed, could be eliminated or greatly reduced by releasing water in excess of the downstream requirements. If the 1962 filling criteria, including the replacement of Hoover "deficiencies," are to continue after the Section 602 operating criteria are imposed, the Upper Division could reasonably take the position that the Section 602 criteria should provide for releases sufficient to generate contract firm energy at the Hoover powerplant, although additional releases to Mexico would result. This procedure would conserve financial resources needed for development of Upper Basin water resources.

9. It would not be wise to waste water that ultimately will be needed for beneficial use in the Lower Basin in order to arbitrarily generate contract firm energy. The policy of restricting releases from Lake Mead to the amount of downstream consumptive-use requirements causes the "deficiencies" attributed by the Secretary to Upper Basin storage. The restriction of releases has the desirable effect of salvaging water for Lower Basin use. The inequity of operating Lake Mead to salvage water for the Lower Basin and charging the Upper Basin Fund for Hoover power "deficiencies" resulting from such an operation cannot be allowed to continue.

10. Equity also requires that the filling criteria be terminated at the earliest possible time. Paragraph 5 of the filling criteria says:

> ". . . For each operating year [the Hoover Powerplant] deficiency in firm energy [to be replaced with the Upper Basin funds or Glen Canyon Powerplant energy] shall be computed as the difference between firm energy which, assuming an overall efficiency of 83%, would have been generated and delivered at transmission voltage at Hoover Powerplant in that year if water has not been impounded in the reservoirs of the Colorado River Storage Project storage units. . . ."

This provision is inconsistent with the terms of the Colorado River Compact unless read as if the words "for power" appear after the word "impounded." For purposes of discussion only, let us assume that it is equitable to replace with Upper Basin resources the Hoover powerplant "deficiencies" caused by the storage of water below minimum power head in Upper Basin storage units because that water will never be applied to beneficial consumptive use or delivered to meet compact obligations.

Water thus stored in the Upper Basin reservoirs, including bank storage, aggregates about 8.5 million acre-feet. Hoover powerplant "deficiencies" replaced with Upper Basin resources aggregate to May 31, 1969 about 4.9 billion kilowatt hours. To generate this amount of energy at the Hoover powerplant at rated head would require the release of about 12 million acre-feet of water. Therefore, the Upper Division, having replaced "deficiency" energy equivalent to 12 million acre-feet of water while storing 8.5 million acre-feet below minimum power head, has already more than met any obligation to replace Hoover "deficiencies" caused by the storage of water in the Upper Basin.

11. The intent of Section 602 of P. L. 90-537 is to provide for that amount of water in storage in the Upper Basin reasonably necessary to insure that the Upper Division meets its compact delivery obligations without impairment of the consumptive uses to which it is entitled under the Colorado River Compact. Section 602 is also intended to overcome the ambiguity of Article III (e) of the compact by apportioning water in excess of the amount required to be stored in the Upper Basin between the Upper Basin and the Lower Basin to improve power head in both basins.

To continue the filling criteria has the effect of charging the Upper Division for that to which it is entitled under the compact and the provisions of Section 602.

12. In the event the filling criteria are not terminated, and the Secretary continues to require that the "deficiencies" be replaced, such replacement should come from some source other than Upper Colorado River Basin resources. Since the water between the amount necessary for downstream consumptive uses and that necessary for firm power generation is being stored for future Lower Basin consumptive uses, Lower Basin interests should bear the cost of the "deficiencies."

13. The May 1966 statement of Commissioner Dominy before the House Subcommittee on H. R. 4671 and similar bills (Serial No. 89-17-Part II) contains the following language (page 1358):

> "It is noted, however, that the filling criteria provide greater flexibility to the Secretary in reservoir operations than does Section 601 and this could result in an earlier termination of the filling criteria."*

This statement acknowledges that the Section 602 criteria might restrict operations under the 1962 filling criteria in such a way that the Secretary would find it necessary to exercise his discretion to terminate the latter.

---

*Sec. 601 of H.R. 4671 later became Sec. 602 of H.R. 3300 and of P. L. 90-537.

Summary

a. The 1962 reservoir filling criteria must be terminated in their entirety because they are not compatible with operating criteria to be adopted under Section 602 of P. L. 90-537.

b. To continue charging Hoover power generation "deficiencies" to the Upper Colorado River Basin Fund gives a priority to power generation in the Lower Basin over storage of water in the Upper Basin for agricultural and domestic uses, a clear violation of the Colorado River Compact.

c. The purpose of the Hoover Dam powerplant is to generate energy, the proceeds from which are to pay assigned costs of the Boulder Canyon Project. The purpose was not, and should not be, the perpetuation of a cheap supply of firm power--especially at the expense of the Upper Basin.

d. Making Hoover Dam power contracts whole at the expense of the Upper Basin Fund is inequitable and unnecessary. The Secretary of the Interior, under the Boulder Canyon Project Act, Boulder Canyon Project Adjustment Act, and his own regulations, has the authority to make any necessary adjustments to meet the primary purpose of the Hoover powerplant.

e. Neither the Colorado River Basin Project Act nor the Congressional Committee reports preclude the prompt termination by the Secretary of the 1962 filling criteria.

f. Procedures used to charge the "deficiencies" to the Upper Colorado River Basin Fund are detrimental to the resource development program of the Upper Division, adversely affect payment of project costs, and are not consistent with the equitable operation intended under Section 602. For example, due to a shortage of anticipated revenues in the Upper Colorado River Basin Fund, water resource development in Colorado and Wyoming was adversely affected for a number of years because Wyoming's share of the Basin Fund was insufficient to show payout of her share of the Savery-Pot Hook Project; and now the State of Colorado is facing a difficult situation for an indeterminate number of years so far as future project authorizations are concerned because her share of anticipated Basin Fund revenues is committed to repayment of currently authorized projects.

g. If filling criteria are retained along with the operating criteria of Section 602 the adverse effects of the "deficiency" charges will be prolonged.

h. Contract firm energy cannot be generated by the Hoover powerplant with current releases of water limited to downstream consumptive-use requirements. If water were to be released from Lake Mead in sufficient quantities to make contract firm power, the "deficiencies" could be eliminated or greatly reduced -- but such releases would waste water.

i. Limiting releases of water from Lake Mead to consumptive-use requirements salvages water for future use in the Lower Basin. Charging the Upper Basin Fund for such salvage is inequitable.

j. If it is assumed to be equitable to replace with Upper Basin resources the Hoover powerplant "deficiencies" attributed to storage of water in Upper Basin reservoirs below minimum power head. the Upper Division has already more than met any obligation to replace "deficiencies" caused by storage of water in Upper Basin reservoirs.

k. In the event the filling criteria are not terminated, replacement of the "deficiencies" should be charged to Lower Basin interests because the water between the amount necessary for downstream consumptive uses and that necessary for Hoover firm energy generation is being stored for the benefit of Lower Basin consumers.

l. To continue the filling criteria and the charging of "deficiencies" thereunder to the Upper Basin Fund in terms of dollars, electric energy, or generating capacity has the effect of charging the Upper Division for that to which it is entitled under the Colorado River Compact and the provisions of Section 602 of P. L. 90-537.

B. PROPOSED LONG-RANGE RESERVOIR OPERATING CRITERIA

PREAMBLE

1. In order to express the indispensable reason for the long-range reservoir operating criteria under Section 602 of Public Law 90-537 the first sentence of the preamble of the Secretary's proposed criteria should be changed to read:

> "These operating criteria are promulgated in compliance with Section 602 of Public Law 90-537 in order to assure that Upper Colorado River Basin consumptive uses of water will not be impaired because of failure to store sufficient water to make deliveries of water under Section 602 (a)(1) and (2) of Public Law 90-537."

(Also, see discussion of Article II (1)(f) in paragraph 2. on page 13 of this statement.)

2. The last sentence of par. 1, p. 1 of the proposed criteria says, "The Operating Criteria will be administered consonant with applicable Federal laws, contracts, the Mexican Water Treaty, interstate compacts, and decrees relating to the use of the waters of the Colorado River." In contrast, Public Law 90-537 confines compliance to three basic documents, as stated:

> "Sec. 602. (a) In order to comply with and carry out the provisions of the Colorado River Compact, the Upper Colorado River Basin Compact, and the Mexican Water Treaty, the Secretary shall propose criteria for the coordinated long-range operation of the reservoirs constructed and operated under the authority of the Colorado River Storage Project Act, the Boulder Canyon Project Act and the Boulder Canyon Project Adjustment Act."

This Section requires that operations under the three designated Acts must carry out and comply with the provisions of those three basic documents.

Inclusion of the terms "contracts," "Federal Laws," and "decrees" as elements of the "law of the river," to which the Secretary in his transmittal letter said he would conform operations, is not appropriate. The contracts are not a part of the "law of the river." They are subservient to the "law of the river." All water-using entities in the Upper and Lower Basins are subject to the "law of the river." All of those entities are not parties to all contracts. Water or power contracts certainly should not be elevated to the stature of interstate compacts or an international treaty to which they are subservient. Further, every Federal law and decree involving use of Colorado River waters is not applicable to all water-user entities in the Colorado River Basin. Had P. L. 90-537 intended such stature for water and power contracts, Federal laws, and decrees, it would have so stated.

It is obvious that the attempt to upgrade "contracts" in the reservoir operating criteria to the point where the Secretary would administer the criteria "consonant with" or in conformity with the contracts as well as with the basic documents is an attempt to upgrade the Hoover Dam water and power contracts to a position that might lead to their enforcement under Lower Basin pressures against the best interests of the Upper Division States. For instance, the indefinite continued use of 700,000 - 800,000 acre-feet of water now being diverted under contracts by California in excess of the 4.4 million acre-feet annually to which she is entitled under court decree, might be considered under the operating criteria as being "administered consonant with" a contract. The same danger is inherent in the contract for 2.8 million acre-feet that Arizona has with the Secretary. The facts show that in a short time after the Central Arizona Project begins using water there will be shortages in the contract amount.

Contracts, Federal laws, and non-applicable decrees should not be elevated to a position from which they might be enforced against the Upper Division States. The experience of the Upper Division States with the Hoover Power contracts and Boulder Canyon Project Act and Adjustment Act and the "deficiencies" in generation at Hoover Dam should be lesson enough.

The Act speaks for itself, and the last sentence of par. 1 on page 1 of the criteria should be changed to read:

> "The Operating Criteria will be administered for the purpose of carrying out the provisions of the Colorado River Compact, the Upper Colorado River Basin Compact, the Mexican Water Treaty and court decrees pertaining to such compacts and treaty, which taken together constitute 'the law of the river.' Under and subject to this authority the criteria will be administered consonant with applicable federal laws and decrees relating to the use of the waters of the Colorado River."

3. The second paragraph of the preamble of the Secretary's December 16, 1969 proposal says that the Secretary "reserves the right to modify the Operating Criteria . . . ," and that formal reviews will be made "with participation by the States, and such other parties and agencies as the Secretary may deem appropriate. . . ."

Under the law it is not by his own reservation that the Secretary has the right to modify the criteria. Sec. 602 (b) authorizes the Secretary to do so. Also, Sec. 602 (b) does not give the Secretary the right to "deem appropriate" those who shall participate in the consultations concerning modifications. The statute says, ". . . but only after correspondence with the Governors . . . and appropriate consultation with such State representatives as each Governor may designate." In order to conform to the law, the second paragraph of the preamble should be changed to read as follows:

> "The Secretary of the Interior (hereinafter the "Secretary") may modify the Operating Criteria from time to time in accordance with Section 602 (b) of P. L. 90-537. The Secretary will sponsor a formal review of the Operating Criteria at least once every five years with participation by State representatives as each Governor may designate."

I. ANNUAL REPORT

1. The Secretary's annual report to be transmitted to the Congress and to the Governors each January 1, beginning January 1, 1972, is to contain information on the operations of the preceding water year and of the projected operation for the current year.

The proposed operating criteria state that the plan of operation shall include such detailed rules and quantities as may be necessary and consistent -- and shall also reflect consideration of the uses of the reservoirs for all purposes including flood control, river regulation, beneficial consumptive uses, power production, water quality, recreation, enhancement of fish and wildlife, and other environmental factors.

The criteria should distinguish between their primary purpose, meeting the objectives of Section 602 (a) which are directly concerned with consumptive uses, and uses of the reservoirs for other purposes, such as flood control, river regulation, power production, water quality control, recreation, enhancement of fish and wildlife, and other environmental factors. The first full paragraph on page 2 of the criteria (2d paragraph under I. ANNUAL REPORT) should be rewritten to say:

> "Such plan of operation shall include such detailed rules and quantities as may be necessary and consistent with the criteria in meeting the primary objectives of Section 602 (a) of P. L. 90-537 and shall reflect appropriate consideration of the uses of the reservoirs for other purposes, including flood control, river regulation, power production, water quality control, recreation, enhancement of fish and wildlife, and other environmental factors. The projected plan of operation may be revised as necessary to reflect the current hydrologic conditions, and the Congress and the Governors of the Colorado River Basin States and their designated representatives advised of any changes by June of each year."

II. OPERATION OF UPPER BASIN RESERVOIRS

1. The Secretary's proposed criteria state "(1) The annual plan of operation shall include a determination by the Secretary of the quantity of water considered necessary as of September 30 of that year to be in storage after consideration of and compliance with the provisions of Section 602 (a) of P. L. 90-537 . . . ." The proposed criteria further state that the quantity of 602 (a) storage shall be determined by the Secretary after consideration of all applicable laws and relevant factors including "(e) The 'Report of the Committee on Probabilities and Test Studies to the Task Force on Operating Criteria for the Colorado River,' dated October 20, 1969, and such additional studies as the Secretary deems necessary;".

This report is a dissertation on a study of relevant factors under a number of assumed parameters. All four States of the Upper Division were in disagreement with the Lower Division States and the Department of the Interior on the application of many of the parameters used. The results of the studies in the report are not conclusive. The results and their interpretation merely constitute an indication of conditions under assumptions pertaining to projected rates of resource development, study periods, probabilities of water supply, etc., with some of which the Upper Division States cannot agree.

The Lower Basin task force members argued that under almost all trial studies of the report, the Upper Division suffered no shortages of water. The lack of Upper Division shortages resulted from the fact that an unreasonably slow rate of Upper Basin growth was assumed and that present reservoir contents were used to commence the studies giving an added advantage of reservoir drawdowns in critical water supply periods. The studies covered only 31 years. If the drawdown-refill cycle had been completed the story would have been different. Also, during the critical periods a "built in shortage" was employed by assuming that the Upper Division water consumption with storage would be less than normal during dry years, as it may have been before storage reservoirs were provided. These assumptions all have the tendency to produce a false finding of "no shortage" in the studies made and thereby to increase the risk of future water shortages to the Upper Division States.

The fact that many of the studies were based upon "probabilities" that obviously place an unwarranted risk upon the Upper Division is ample reason to de-emphasize the report in order to preclude it from attaining undeserved weight in the making of future decisions. Article II (1) (e) on page 3 of the criteria should be eliminated except for the purpose set out in paragraph 4. below. Article II (1)(e) should be modified to read:

> "(e) The 'Report of the Committee on Probabilities and Test Studies to the Task Force on Operating Criteria for the Colorado River,' dated October 30, 1969, to the extent it is applicable to the 98.4+% rule curve developed therein, and such future studies as the Secretary deems necessary;"

2. Another factor listed in the proposed criteria and included for consideration in determining the amount of water to have in storage in Upper Basin reservoirs is: "(f) The necessity to assure that upper basin consumptive uses not be impaired because of failure to store sufficient water to assure deliveries under Section 602 (a)(1) and (2) of P. L. 90-537." Paragraph (f) is of such basic importance that its concept should be expressed as part of the first sentence of the preamble to the criteria. (See p. 9, par. 1 under PREAMBLE.)

3. (a) In the third line of Article II (2)(b) on page 3 of the proposed criteria the word "minimum," as used, is improper because it could prevent the attainment of the objectives of the legislation. If either the active storage forecast of paragraph (2)(a) for Upper Basin reservoirs is less than the 602 (a) storage, or, if the active storage of paragraph (2)(b) for Lake Powell is less than Lake Mead active storage, the objective is to reduce releases from Lake Powell below the Secretary's figure of 8.23 million acre-feet per year in order to fulfill the objective of Section 602 (a). The Upper Division cannot agree to the adoption of any minimum release from Lake Powell except to fulfill the obligation fixed by the Colorado River Compact.

(b) In his letter of transmittal the Secretary stated, "We wish to make clear that the objective of a minimum release of 8.23 million acre-feet annually does not in any way prejudice the position of either the upper or lower basin interests with respect to required deliveries at Lee Ferry pursuant to the Colorado River Compact and the Colorado River Basin Project Act." The Colorado River Basin Project Act should not have been included in the above sentence. This Act does not define the obligation of the Upper Division at Lee Ferry. Only the Colorado River Compact does that. Deliveries of water under the Act must be within the compact-defined amount of water that the Upper Division is obligated to deliver at Lee Ferry, whatever that amount may be determined to be. Furthermore, a statement disclaiming prejudice to the position of either the Upper or Lower Divisions with respect to required water deliveries at Lee Ferry should appear in the criteria.

Article II (2) of the proposed criteria should be rewritten, as follows:

> "(2) The interim releases from Lake Powell pursuant to these criteria are estimated at eight million acre-feet of water annually, but said releases shall be increased or decreased in any water year in conformity with the controlling factors set forth in Section 602 (a) of Public Law 90-537. These releases shall not in any way prejudice the position of either the Upper or Lower Basin interests with respect to required deliveries at Lee Ferry pursuant to the Colorado River Compact.
>
> "If, in the plan of operation, either
>
> (a) the Upper Basin Storage Reservoirs active storage forecast for September 30 of the current year is less than the quantity of 602 (a) storage determined by the Secretary under Article II (1) hereof, for that date, or

(b) the Lake Powell active storage forecast for that date is less than the Lake Mead active storage forecast for that date.

the objective shall be to attain such storage by reducing the release of water from Lake Powell to eight million acre-feet or less for that year. For the years ending September 30, 1971 and 1972, the release may be greater than eight million acre-feet if necessary to deliver 75,000,000 acre-feet at Lee Ferry for the 10-year period ending September 30, 1972."

(c) The figure "8.23" in line 5 of Article II (3) on page 4 of the proposed criteria should be changed to the word "eight."

4. The concept of an Upper Basin rule curve has been eliminated from the Secretary's December 16, 1969 proposed criteria on the grounds that a rule curve under the studies made would not govern operations for many years. It should be emphasized that before a rule curve becomes mandatory, while consumptive use demands are low, it is highly desirable to adopt and begin using a rule curve in order to assure the filling of Upper Basin reservoirs to adequate storage levels. One of the primary purposes of the Colorado River Storage Project was to provide long-term storage to meet compact commitments during periods of low flow. Witnesses for the Department of the Interior, in testimony on the Colorado River Storage Project bill, emphasized the need for Upper Basin storage capacity sufficient to hold over water for as long as 25 or 30 years in order to make optimum use of its compact allotment and to meet its obligation under the Colorado River Compact. They emphasized the need for early filling of the reservoirs for protection during critical water supply periods. Congress, relying on this testimony, approved the Colorado River Storage Project Act.

The objective of Section 602 is to provide for equitable reservoir operations which will comply with the "law of the river" and at the same time protect the Upper Basin's ability to meet its Lee Ferry obligation, including its share, if any, of the Mexican Treaty burden, while making optimum use of its compact apportionment of water. Holdover storage necessary to meet such objective requires the adherence to a rule curve with not less than 98.4+% probability, as defined under the Task Force on Reservoir Operating Criteria studies. A rule curve with a lesser probability designation under those studies will not be acceptable.

The essence of Section 602 requires a rule curve with the characteristics of the one designated 98.4+%. Section 602 was designed specifically to remove some of the unlimited flexibility from the Secretary's powers. If too much flexibility leads to a mistake by the Secretary and there is insufficient water in reservoirs to meet the objective, the water is gone, the damage is done, and the Upper Division has little recourse. There are going to be great pressures from the Lower Basin to use water from Lake Powell on the Central Arizona Project or in California which is required to remain in storage to assure Upper Basin deliveries under Section 602. The Central Arizona Project aqueduct and the Metropolitan Water District aqueduct are designed specifically for conveying excess water. A 98.4+% rule curve would act as an effective check on overuses of water in the Lower Basin to the detriment of the Upper Basin. A 98.4+% rule curve would prevent both mistakes and arbitrary adverse decisions, and would tend to protect the Secretary against the consequences of both.

Section 602 recognizes the need for a certain amount of flexibility in order to benefit from operating experience and to meet unforeseen circumstances. The Secretary's criteria provide the flexibility necessary to alter reservoir operations as experience dictates. Lacking the guidance of an adequate rule curve, there is danger that the Secretary may maintain insufficient storage in Upper Basin reservoirs to supply compact requirements during future periods of critical water supply without curtailment of Upper Division uses or retarding resource growth.

A 98.4+% rule curve for Upper Basin reservoir storage would tend to provide equity with Lower Basin uses. The Lower Basin has always had the benefit of operations under the "rule curve" imposed by the Colorado River Compact on the Upper Basin to deliver 75 million acre-feet every 10 years at Lee Ferry. The Upper Basin expects no less protection.

Should the Secretary fail to adopt a 98.4+% rule curve, the Upper Division States will insist that the Secretary achieve the objectives of Section 602 by operating the reservoirs in essentially the same manner they would be operated under such rule curve.

III. OPERATION OF LAKE MEAD

P. L. 90-537 does not contain guide lines for the operation of Lake Mead. It is appropriate that the Secretary's December 16, 1969 proposed criteria cover operations of Lake Mead. This part of the criteria is of interest to the Upper Division to the extent that it will affect operations of the Upper Basin reservoirs. In this respect the criteria provide that a drawdown of Lake Mead automatically places one-half of the quantity

of the drawdown on Upper Basin reservoirs. As soon as the active storage in Lake Powell becomes less than that in Lake Mead the releases from Lake Powell should be reduced to equalize storage. Also, Lake Powell is not supposed to be drawn below an amount necessary to meet the objectives of Section 602. The problem here is associated with the fact that the Secretary is advocating no rule to define the point above which Lake Powell should be held. This is to be left to the discretion of the Secretary under his annual determinations.

The criteria provide no rule curve for Lake Mead. In the event the charges against the Upper Basin Fund for the so-called "deficiencies" in generation of power at Hoover Dam are not eliminated, a rule curve for Lake Mead should be adopted to require that reservoir to be operated to minimize the "deficiency" charges.

IV. DEFINITIONS

The definition of the word "surplus" should include a statement that it shall not be construed as relating to the word "surplus" in the Colorado River Compact. The following sentence should be added to Article IV (1)(b) of the criteria:

> "The term 'surplus' as used in these criteria is not to be construed as applying to, being interpretive of, or in any manner having reference to the term 'surplus' in the Colorado River Compact."

COLORADO RIVER STORAGE PROJECT

MONDAY, JANUARY 18, 1954

HOUSE OF REPRESENTATIVES, SUBCOMMITTEEE ON
IRRIGATION AND RECLAMATION OF THE COMMITTEE
ON INTERIOR AND INSULAR AFFAIRS,
Washington, D. C.

The subcommittee met, pursuant to call, at 9:35 a. m. in the committee room, New House Office Building, William H. Harrison (chairman) presiding.

Mr. HARRISON. The Subcommittee on Irrigation and Reclamation will come to order.

We have hearings on three identical bills, H. R. 4449, by Mr. Dawson of Utah, H. R. 4443, by Mr. Aspinall of Colorado, and H. R. 4463, by Mr. Stringfellow of Utah.

Mr. ASPINALL. Mr. Chairman, I wish to correct the opening statement. My bill is not exactly identical, it is a similar bill, but not exactly identical.

Mr. HARRISON. The Chair will stand corrected. I thought they were identical bills. We will change that to similar bills.

(H. R. 4449, H. R. 4443, and H. R. 4463 read as follows:)

[H R 4449, 83d Cong., 1st sess.]

A BILL To authorize the Secretary of the Interior to construct, operate, and maintain the Colorado River storage project and participating projects, and for other purposes

Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled, That, in order to initiate the comprehensive development of the water resources of the Upper Colorado River Basin, the Congress, in the exercise of its constitutional authority to provide for the general welfare, to regulate commerce among the States, and to make all needful rules and regulations respecting property belonging to the United States, and for the purposes, among others, of regulating the flow of the Colorado River, storing water for beneficial consumptive use, making it possible for the States of the Upper Basin to utilize, consistently with the obligation undertaken by the States of the upper division in article III of the Colorado River Compact, the apportionments made to and among them in the Colorado River Compact and the Upper Colorado River Basin Compact, respectively, providing for the control of floods and for the improvement of navigation, and generating hydroelectric power, hereby authorizes the Secretary of the Interior (1) to construct, operate, and maintain the following initial units of the Colorado River storage project, consisting of dams, reservoirs, power plants, transmission facilities, and appurtenant works: Echo Park, Flaming Gorge, Glen Canyon, Navaho, and Curecanti: *Provided, however*, That the Curecanti Dam shall be constructed to a height which will impound not less than nine hundred and forty thousand acre-feet of water or will create a reservoir of such greater capacity as can be obtained by a high water line located at seven thousand five hundred and twenty feet above mean sea level; and (2) to construct, operate, and maintain the following additional reclamation projects (including power generating and transmission facilities related thereto), hereinafter referred to as participating projects: Central Utah, Emery County, Gooseberry, Florida, San Juan-Chama, Shiprock-South San Juan Indian irrigation, Hammond, LaBarge, Lyman, Paonia (including the Minnesota unit, a dam and reservoir on Muddy Creek just above its confluence

Mr. HARRISON. Mr. Larson.

Mr. ASPINALL. Mr. Chairman, I wish we could have the statement before Mr. Larson begins so that we can follow him right along.

Mr. DAWSON. I would like to suggest before you proceed, if you are going to use Mr. Jacobson, it might be a good idea to introduce him.

STATEMENT OF E. O. LARSON, REGIONAL DIRECTOR, BUREAU OF RECLAMATION, ACCOMPANIED BY C. B. JACOBSON, ENGINEER IN CHARGE OF COLORADO RIVER STORAGE PROJECT STUDIES; W. B. HUFFMAN, ENGINEER; AND PAUL SANT, ECONOMIST, FOURTH REGIONAL OFFICE, SALT LAKE CITY, UTAH

Mr. LARSON. I have with me Mr. Jacobson, the engineer in charge of the Colorado River project storage studies, and Mr. Huffman, engineer engaged in those studies, and Mr. Sant, from our regional office, to aid me in furnishing technical information and answering questions and getting facts before this committee.

I shall cover in a general way the basinwide plan of the Colorado River storage project and participating projects and briefly explain the Glen Canyon and Echo Park storage units and 12 irrigation and multiple-purpose participating projects recommended for authorization in the supplemental report of the Secretary of Interior, October 1953

I shall also briefly describe units not contained in the Secretary's supplemental report, but included in the bill now before you.

The plan initiated in the bills is one through which the States of the upper basin of the Colorado River could eventually use all the water of the Colorado River system allotted to them. It would make utilization of the region's abundant natural resources possible and enrich the economy of the area and the Nation.

Without it, development of these valuable resources will be hampered, and the growth of the upper basin States will be stunted.

Through this plan, water would be made available for irrigation, municipal, and industrial use, and power generation. It would create vast new recreational facilities and substantial benefits to fish and wildlife.

It would make possible river regulation and sediment control which are needed at an early date to assure maximum utilization of important power potentialities on the Colorado River below Lee Ferry and above Lake Mead.

It is no exaggeration to say that on it depends the future of the upper Colorado River Basin, and that it would make a material contribution to the lower basin.

The basin plan on which these bills are based is the result of many years of investigation by the Bureau of Reclamation in cooperation with the upper basin States and other agencies of the Federal Government.

In 1946 the Colorado River Basin report was issued by the Bureau of Reclamation, covering potential developments on the entire Colo-

rado River system. Among these developments were over 100 potential irrigation and power projects that could use upper basin water.

This report was an inventory which served as a guide for future planning and compact negotiations. No specific plan of full development was possible in the upper basin until 1948, when the water was apportioned among the upper basin States through the upper Colorado River Basin compact.

With this compact as a foundation, the Bureau of Reclamation in 1950 issued the report on the Colorado River storage project and participating projects with supplements. This constituted a start on a comprehensive plan for the upper Colorado River Basin and was submitted to the President on December 4, 1952.

In December 1953, the Secretary of the Interior submitted a supplemental report to the President which proposed authorization of a part of the total plan consisting of 2 units of the storage project and 12 participating projects.

Some knowledge of the history of Colorado River development is necessary for an understanding of the Colorado River storage project. The early settlements along the river were established in the valleys and desert areas where tributary waters and the main stream flow could be easily controlled and used for irrigation. The deeply entrenched sections of the river, typical of much of its course, could not be used without large and costly works.

The great development in the Imperial Valley and other irrigation projects in California and Arizona made increasing demands on the waters of the Colorado River.

In contrast, the upper basin lagged far behind the lower basin in population increase and irrigation developments. An impending conflict between upstream and downstream use was recognized, and in 1922 the Colorado River compact became the law of the Colorado River. This compact made a division of water between the upper and lower basins.

Projects were soon constructed on the lower river capable of using most of the water allotted to the lower basin. No comparable development took place in the upper basin, and at the present time the upper basin States have works capable of using less than one-third of the water to which they are entitled.

There are serious problems confronting the States of the upper basin in any plan for using their share of Colorado River water which can be resolved only through the comprehensive basinwide plan now proposed.

Paramount among them is the compact requirement that the upper basin States deliver to the lower basin not less than 75 million acre-feet over any period of 10 successive years.

The uneven flow of the river, with its erratic periods of drought and flood, makes the fulfillment of the commitment to the lower basin and substantial development in the upper basin impossible without river regulation. Such regulation would require additional storage facilities on a scale that dwarfs past developments in the upper basin.

In selecting storage sites for river regulation in the plan of full development, we have striven to obtain at the lowest cost the largest yield of water, the maximum power output of the river, and the minimum evaporation from the reservoirs.

There is also the need to design works to make water available to each of the upper basin States in accordance with its allotment under the upper Colorado River compact.

In addition the plan must allow for the changing needs of the upper basin and be flexible enough to meet developments in farming, municipal, and industrial uses, and recreation which cannot be accurately predicted at this time.

Features in the plan for developing the upper Colorado River Basin are broadly divided into two categories: (1) storage project units, and (2) participating projects.

The Colorado River storage project is the backbone of the plan. It comprises a system of nine dams, reservoirs, and powerplants at strategic points above Lee Ferry, on the main stem of the Colorado River and its important tributaries. These nine storage reservoirs would provide the regulation necessary in the discharge of the upper basin's responsibility to the lower basin, thereby permitting uncurtailed use of apportioned Colorado River water in the upper basin.

Bureau of Reclamation studies show that development in the upper basin could proceed with some risk without the benefit of such storage regulation to a limitation of approximately 58 percent of its apportioned water.

In other words, 42 percent of the upper basin's apportioned water cannot be put to use unless excess waters are impounded during periods of prolonged high flows in a system of long-time holdover reservoirs for release during prolonged periods of low flows.

The element of time for construction and initial filling of these reservoirs requires initiation of the work sufficient in advance of the time the actual need is present for supplementing Lee Ferry flows.

During the interim period, however, the powerplants at storage sites would be supplying a large power-deficient area with low-cost hydroelectric energy. When it becomes necessary to operate the reservoirs to supplement the flows at Lee Ferry, the powerplants would continue to service the power demands of the area. This would be possible because there is a high degree of compatability in the functions of river regulation for power and for fulfillment of the compact commitments at Lee Ferry.

The estimated market demands for hydroelectric energy in the upper basin would require the total proposed installed capacity in all 9 powerplants within a 20-year period.

The anticipated net revenues from the sale of energy generated by the storage project would be sufficient under the plan to retire the entire construction cost of the storage project with interest on all features chargeable to power.

In addition these revenues would furnish financial assistance to irrigation under projects known as participating projects and make possible complete repayment of their interest-free construction costs. The repayment studies are based on complete reimbursement of all features of the Colorado River storage project. No nonreimbursable allocations were made in the initial units of the storage project to fish and wildlife conservation, flood control, recreation, sediment retention, and other purposes, although in the future such allocation may be found desirable and justified.

Although the storage project would provide for complete utilization of the waters apportioned the upper basin, full development would

necessarily extend over a great number of years. It has taken 100 years to develop existing projects in the upper basin—allowing for authorized projects and projects under construction—with a total consumptive use of about 2½ million acre-feet, or one-third of the 7½ million acre-foot annual allotment to the upper basin.

The 12 new participating projects being recommended by the Department of the Interior would increase present consumptive uses by an additional 640,000 acre-feet of water annually.

The bill suggests additional participating projects which would require an additional consumptive use of 360,000 acre-feet annually.

With an expedited program in the future, it may be possible in the next 75 years to place the remainder of the upper basin's share of Colorado River water in use.

To accomplish the function of river regulation, the Colorado River storage project would require an aggregate gross capacity of approximately 48 million acre-feet. This is half again as large as the capacity of Lake Mead.

In addition to a necessary 23 million acre-feet of storage capacity for river regulation, the reservoir would provide minimum power heads, capacity for fish propagation, and space for 200 years of sediment deposition. No single site on the upper Colorado River or its tributaries is capable of storing that amount of water.

In selecting a team of nine reservoirs out of a great many possibilities, careful consideration was given to important factors such as physical condition, water supply and its utilization, power production and its distribution, recreation, sedimentation, and reservoir evaporation.

In these respects we have painstakingly examined many combinations. The team of nine selected units would provide maximum water utilization and power production with a minimum loss of water from evaporation at the lowest cost.

Two of the essential units would inundate a portion of the Dinosaur National Monument. We have been unable to find any substitutes for these units that would not materially diminish the effectiveness of the nine-reservoir system. Reservoir evaporation is a very important item in this determination since it constitutes a charge against the upper basin's allotment of Colorado River water.

From the standpoint of evaporation, it is advantageous to store water in large reservoirs, in confined canyons and at high elevations on the river system to hold this loss to a minimum.

The project's power potentials are chiefly dependent on two factors: the quantity of regulated water, and the power head.

The first is related to the size of the reservoir and the magnitude of natural flow.

The second is related to the height of the dam above the river. The power head would not be diminished by sediment deposition, but the power output would be affected by upstream consumptive uses of water. The annual energy output of the system would be reduced from an initial 9 billion kilowatt-hours to an ultimate 6 billion kilowatt-hours annually.

The plan in the supplemental report proposes construction of the Echo Park and Glen Canyon units and an interconnecting basic transmission system. Records over a long period show that there is an

adequate water supply to assure initial filling of these reservoirs even though adverse drought conditions should prevail. Transmission costs and the estimated average rate of 6 mills per kilowatt-hour for the sale of system energy are based on a delivery of power to load centers by either Federal or other means of transmission.

In addition to the Glen Canyon and Echo Park units, the bills contain authorization of other reservoirs and participating projects which would serve as points of regulation, diversions, and sources of local benefits.

The Navaho Dam and Reservoir, formerly considered a potential unit of the storage project, are now included under the Navaho participating project.

The Glen Canyon Dam would be located on the Colorado River in northern Arizona about 13 miles downstream from the Utah-Arizona State line, and 15 miles upstream from Lee Ferry. It would be a concrete curbed gravity-type structure rising 700 feet above bedrock.

The reservoir would offer final regulation for deliveries to the lower basin under the Colorado River compact.

Out of a total capacity of 26 million acre-feet, 20 million acre-feet initially would be active capacity. The reservoir when filled would have a maximum water surface area of 153,000 acres and would extend about 187 miles up the Colorado River, nearly to the mouth of the Green River, and 71 miles up the San Juan River.

The reservoir would be the principal sediment depository in the upper basin.

In 200 years at the present rate of sediment flow in the river and with upstream storage developed as planned, sediment deposits would fill all inactive storage space and reduce the active storage space by more than half.

The powerplant would be located near the toe of the dam. It would consist of 7 generating units for a total installed capacity of 800,000 kilowatts which is approximately one-half the total installed capacity contemplated for the entire Colorado River storage project. The plant would operate under a mean powerhead of 480 feet. The total construction cost of the Glen Canyon unit, with an appropriate assignment of transmission costs, would be approximately $421,300,000.

Although a capacity in excess of 26 million acre-feet is physically possible at the Glen Canyon site, addition in water elevation at Glen Canyon Reservoir might jeopardize the Rainbow Natural Bridge National Monument.

The Echo Park Dam would be located in Colorado on the Green River about 3 miles east of the Utah-Colorado State line and 3 miles below the junction of two major tributaries, the Green and Yampa Rivers, in the tricorner area of Colorado, Wyoming, and Utah.

Percentagewise, the evaporation losses from the remarkable storage vessel at Echo Park would be exceeded by those at all other sites possessing major storage possibilities in the upper basin. Echo Park Reservoir is second only in size and importance to Glen Canyon. Being less subject to the toll of sediment deposition, this disparity in size would diminish with age.

The power potential at Echo Park also is second only to that at Glen Canyon. This difference is actually smaller than it appears considering the great contribution from Echo Park's regulated flows

to increased future production at the downstream Split Mountain and Gray Canyon sites.

Just as Glen Canyon's position favors power markets in the lower part of the upper basin, Echo Park is strategically situated in the heart of the power market in the upper end of the basin. The Echo Park unit, because of its position of strategic control of the Green and Yampa Rivers, would make feasible the storage and power developments of the Flaming Gorge, Cross Mountain, Split Mountain, and Gray Canyon units.

Echo Park Dam would be a concrete curved gravity-type structure rising 690 feet from bedrock. The reservoir would have a storage capacity of 6,460,000 acre-feet, including 5,460,000 acre-feet of live capacity. When filled to capacity, the reservoir would have a surface area of 43,000 acres and would extend 63 miles up the Green River and 44 miles up the Yampa River.

The powerplant at the dam would operate under a mean head of 475 feet and would consist of 50,000 kilowatt units for a total capacity of 200,000 kilowatts. The construction cost of the Echo Park unit is estimated at $176,400,000, including an appropriate part of the basic transmission system.

In addition to the Glen Canyon and Echo Park units of the storage project, the Secretary of the Interior has recommended 12 participating projects for construction in the initial phase. A thirteenth project, the Eden project in Wyoming, was authorized in 1949, and is now nearing completion. The authorization of the Eden project, however, provided that the project be assisted by means of power revenues from the Colorado River storage project.

I will not attempt to go into the details of each of these participating projects except for a brief reference to the attached summary table. However, statements on each of the initial participating projects are attached and further details can be found in the supplements to the Colorado River storage-project report.

In addition, among the attached statements are brief summaries of the LaPlata project, the San Juan-Chama project, and the balance of the Navaho project, namely, the South San Juan Division, all of which are contained in the bill, but on which substantiating information as to feasibility is not available at this time.

For the Gooseberry project, also contained in the bill, a complete feasibility report has been submitted and a statement is included herein. Careful study of all available data shows that the depletions resulting from all the projects contained in the bill would have no appreciable effect on the quality of the streamflow passing Lee Ferry.

Before closing this general statement in which I have attempted to give you an overall picture of the basinwide plan and that part of it for which authorization is now being sought, there are two important phases which should be emphasized, the legal framework and the repayment schedule.

In a plan of this magnitude the authorities and laws under which the various features would be constructed, administered, and operated, would normally present almost unsurmountable problems and certainly would raise some grave questions of jurisdiction. The plan before you is happily free of such complications.

The storage project with its regulatory reservoirs is of interstate significance, and each unit of this part of the plan would be so treated. These units as far as water is concerned could be operated in strict conformance with the upper Colorado River Basin compact, a document so comprehensive that its provisions cover all necessary aspects of such operation.

The participating projects are consumptive-use projects intrastate in character. In the proposed plan, these projects would be constructed, operated, and maintained under reclamation law.

Water rights would, therefore, be obtained and administered under the water code of the State in which the project would be built.

A clear distinction would be maintained between the two categories in the plan. Should it become necessary at some future time for a State to make consumptive use of a portion of the water in one of the regulatory reservoirs in the storage project, the compact provides for such a contingency.

The plan requires payment against irrigation costs by the irrigators up to their ability to repay in 50 years, and the formation of appropriate districts preferably of the water-conservancy type which would assure local participation to the greatest extent in the repayment of construction costs prior to the irrigators' acceptance of assistance from power revenues.

The power features of the project would be repaid with interest to the United States Treasury at 2½ percent on unpaid power investments by project power revenues within a specified 50-year repayment period for individual generating units. The power features recommended in the Secretary's supplemental report would be paid out completely in the first 44 years of operation.

Subsequent power revenues would be sufficient to retire the irrigation costs of the storage project prior to the 50th year of operation of the storage project.

In addition, power revenues would retire in the 50th year of the irrigator's repayment period all irrigation costs in excess of the irrigator's ability to pay for each of the participating projects recommended in the Secretary's supplemental report.

The additional storage units and participating projects recommended in the bill, namely, the Curecanti—940,000 acre-feet capacity—and Flaming Gorge storage units, the Gooseberry, La Plata, San Juan-Chama, and total Navaho participating projects, would require either a slightly longer period of repayment or a slightly higher power rate to supply the necessary irrigation assistance.

The plan also provides for submission to the Congress from time to time of additional storage project units and additional participating projects. These submissions will be made as the needs for such units and projects arise, and when investigations are complete and feasibility reports are available.

Such a procedure, in our opinion, will provide for the greatest possible development of the water and related resources of the Upper Colorado River Basin and will offer sufficient flexibility for future change in economic conditions.

With this statement, Mr. Chairman, I have a summary table of the Colorado River storage project and participating projects, listing first

the Echo Park and Glen Canyon unit, showing the generating capacity and the stream depletion of water, the total cost and the reimbursable allocations, irrigation allocations, and the irrigation allocations assigned to the repayment from net power revenues.

Shown next on the table is the same information for the two additional units included in the bills, namely, the small Curecanti and the Flaming Gorge units.

Then, third, we have the information for the 12 participating projects recommended for authorization in the supplemental report, and the table shows in what State they are located, the acres of new land, the land receiving a supplemental water supply, the generating capacity of powerplants, if any, attached to the participating projects, the amount of municipal water where it applies, the stream depletion amounts, the total cost, the amount of nonreimbursable allocation, and the reimbursable allocations for power, municipal water, and irrigation, and the irrigation allocation repayable by the water users and the irrigation allocation assigned for repayment from net power revenues.

The same information is shown for the additional participating projects in the bill over and above those recommended in the supplemental report of the Secretary, namely, for the Edan, La Plata, San Juan unit of the Navaho and the San Juan-Chama participating projects.

The Eden project is recommended by the Secretary for participation in net revenues, but is not recommended for authorization for the reason that it already has been authorized along those lines.

(The information referred to follows:)

SUMMARY TABLE—*Colorado River storage project and participating projects*

Project	State	Land to be irrigated		Power		Municipal water annually	Stream depletion annually
		New	Supplemental	Generating capacity	Annual generation		
		Acres	*Acres*	*Kilowatts*	*Million kilowatt-hours*	*Acre-feet*	*Acre-feet*
Colorado River storage project:							
Initial units							
Echo Park unit	Colorado, Utah			200,000	1,094		87,000
Glen Canyon unit	Arizona, Utah			800,000	4,100		526,000
Subtotal initial units				1,000,000	5,194		613,000
Additional units in the bill							
Curecanti unit (940,000 acre-feet)	Colorado			40,000	225		18,000
Flaming Gorge unit	Utah, Wyoming			72,000	417		56,000
Subtotal additional units				112,000	642		74,000
12 participating projects							
Central Utah (initial phase)	Utah	28,540	131,840	61,000	373	48,800	189,400
Emery County	do	3,630	20,450				15,500

Grand total		1,518,096,300	7,714,700	712,762,000	100,874,000	691,245,600	91,941,500	599,304,100

[1] Exclusive of $37,825,000 for required additional capacities in Navajo Reservoir and main highline canal for the South San Juan division
[2] Includes costs only of required facilities additional to facilities of Shiprock division (See also footnote 1)
[3] Allocations of Colorado River storage project costs to units are only for the purpose of facilitating a payout analysis for the initial units and only illustrative for other units
[4] Repayment by irrigation water users toward construction costs over 50-year repayment period beyond a reasonable development period except 60-year period for Eden project and 68-year period for Paonia project
[5] Exclusive of $5,500,000 allocable to purposes of the ultimate phase of Central Utah project.

I have with me, also, brief statements, 16 of them all told, of the participating projects I named in the table—1 or 2 or 3 or 4 pages—of all the participating projects recommended by the Secretary and additional ones in the bill, for filing with your committee.

I do not know whether you wanted them read.

It would probably take 2 or 3 hours to read them. That is subject to what is desired by the chairman.

Mr. HARRISON. Do any members of the committee want the reports read at this time.

Mr. D'EWART. No.

Mr. ASPINALL. Mr. Larson, do these supplemental statements of participating projects differ materially from the statements that have been made in the previous reports?

Mr. LARSON. I did not hear that.

Mr. ASPINALL. I say, do these supplemental statements of participating projects differ materially from the statements to be found in the previous reports?

Mr. LARSON. They are really summaries of what is contained in the supplemental reports of 1950 except that the costs are brought up to date, 1953 index, and some of the economics are brought up to date on our new procedures.

Mr. REGAN. I would like to know one feature of the report. It says on page 11 that—

> The San Juan-Chama project and the balance of the Navaho project, namely, the South San Juan Division, all of which are contained in the bill, but on which substantiating information as to feasibility is not available at this time.

I want to know if he is putting a report on this San Juan-Chama at this time when he says the feasibility is not yet available.

Mr. LARSON. The San Juan-Chama project is in region 5 of the Bureau of Reclamation. The engineer is here.

I believe this statement is a general statement of all the projects as previously reported.

Mr. REGAN. Is it your idea that you are now asking authorization for the San Juan-Chama project?

Mr. LARSON. As I explained, the Secretary recommends in his supplemental report the authorization of 12 participating projects. The bills contain additional participating projects not in the Secretary's recommendation and the San Juan-Chama I believe is one of those.

Mr. REGAN. You are not at this time recommending the authorization of the San Juan-Chama project?

Mr. LARSON. No. I said I was including statements that would explain the units recommended by the Secretary, the 12, and the 4 additional ones contained in the bill.

Mr. REGAN. Is the San Juan-Chama in the 12, or in the 4 additional?

Mr. LARSON. It is in the four additional.

Mr. HOSMER. Mr. Chairman, I would like to ask a question or two.

Mr. HARRISON. Is it a question as to the introduction of this?

Mr. HOSMER. Yes. It is under date of January 4, 1954; is that the document you are talking about?

Mr. LARSON. Yes.

Mr. HOSMER. This was prepared by the Interior Department; is that right?

Mr. LARSON. Yes; Interior Department, region 5 of the Bureau of Reclamation.

Mr. HOSMER. When was it prepared?

Mr. LARSON. These statements I am filing now, most of them were just prepared recently.

Mr. HOSMER. For what purpose were they prepared?

Mr. LARSON. Informing this committee to give them an idea of the general description, the writeup of the participating projects recommended by the Secretary and the four additional ones included in the bill.

Mr. HOSMER. It is a document of the different regions of the Bureau of Reclamation?

Mr. LARSON. It is an explanation of the project.

Mr. HOSMER. And not of the Department in Washington; is that right?

Mr. LARSON. I would say this is a Department of Interior presentation, the whole thing.

Mr. HOSMER. What I am trying to find out is whether it is a document that has the stamp of approval of the headquarters or was it a document that was prepared and submitted to Washington and the Department simultaneously with its submission here?

Mr. DEXHEIMER. Mr. Chairman, I would like to point out that this particular project is outside of Mr. Larson's regional boundaries. It is in region 5. The document on San Juan-Chama was prepared by region 5 with headquarters in Amarillo. It is only a statement of the information we presently have available on the San Juan-Chama.

It is not one which is included for recommendation by the Secretary at this time.

Mr. HOSMER. In other words, this is the result of the regional office and the information in their file?

Mr. DEXHEIMER. Information that we have up to this time; yes, sir.

Mr. HOSMER. It has not been screened or evaluated by Washington, by the Department in Washington?

Mr. DEXHEIMER. It has been screened, but we don't have enough information yet to recommend it for authorization.

Mr. REGAN. Is it then necessary to incorporate it in any of these hearings?

Mr. DEXHEIMER. It is included in the bill, sir, and for that reason we have given you the information we have available.

Mr. HOSMER. Just one more question.

Are you talking about this whole document, or just San Juan-Chama?

Mr. DEXHEIMER. Just San Juan-Chama.

Mr. HOSMER. What about this whole document? Do you have any information on that?

Mr. DEXHEIMER. Which one do you have?

Mr. HOSMER. The one that Mr. Larson is asking be introduced in the record, dated January 4, 1954. It does not contain any statement as to whom it is from or any identifying features.

I am trying to find out the authority and background.

Mr. LARSON. It is an attachment to my statement which has been approved.

Mr. DEXHEIMER. This statement was prepared to give you all the information that we presently have available on all the projects which are included in the bill. It was for the purpose of giving you all the information which we presently have on all the projects that are included in the bill as differentiated from those projects which are included in the Secretary's report.

Mr. HOSMER. It was prepared in the regional offices and not in the Washington office; is that correct?

Mr. LARSON. All of these reports are prepared in the regional offices and reviewed in our Washington office.

Mr. REGAN. I would like to ask, Mr. Commissioner, was this report of the San Juan-Chama prepared in your Amarillo office?

Mr. DEXHEIMER. Yes.

Mr. REGAN. Region 5?

Mr. DEXHEIMER. Yes.

Mr. REGAN. Will the man in charge of the Amarillo office present his views at this hearing at a subsequent time? Is the man who is responsible for preparing this proposal going to present it?

Mr. DEXHEIMER. We didn't plan that he would, but if the committee wishes, we would be glad to have him here to do that.

Mr. REGAN. But he is in region 5, so Mr. Larson in charge of region 4 is going to present it in his stead; is that right?

Mr. DEXHEIMER. No, sir; we are just attaching it to Mr. Larson's overall reports on the upper Colorado project. We would be very happy to have someone from region 5 present the detailed information to the committee if they so desire.

Mr. REGAN. As one member of the committee, I so desire.

Mr. HOSMER. Mr. Chairman, may I inquire if we are going to go into all these projects and explain them in detail, the information that is in here?

Mr. HARRISON. I rather imagine so. They are part of the projects that come under the terms of the bill and it seems to me we would have to have some testimony regarding those projects, not just the statement that the whole thing should be approved without going into the individual projects.

I think the Department is planning to present testimony regarding at least the individual projects they have recommended. Twelve are for the inclusion in this overall picture and for that reason they are submitting the information for the committee.

Mr. HOSMER. This is not all the information that will be submitted?

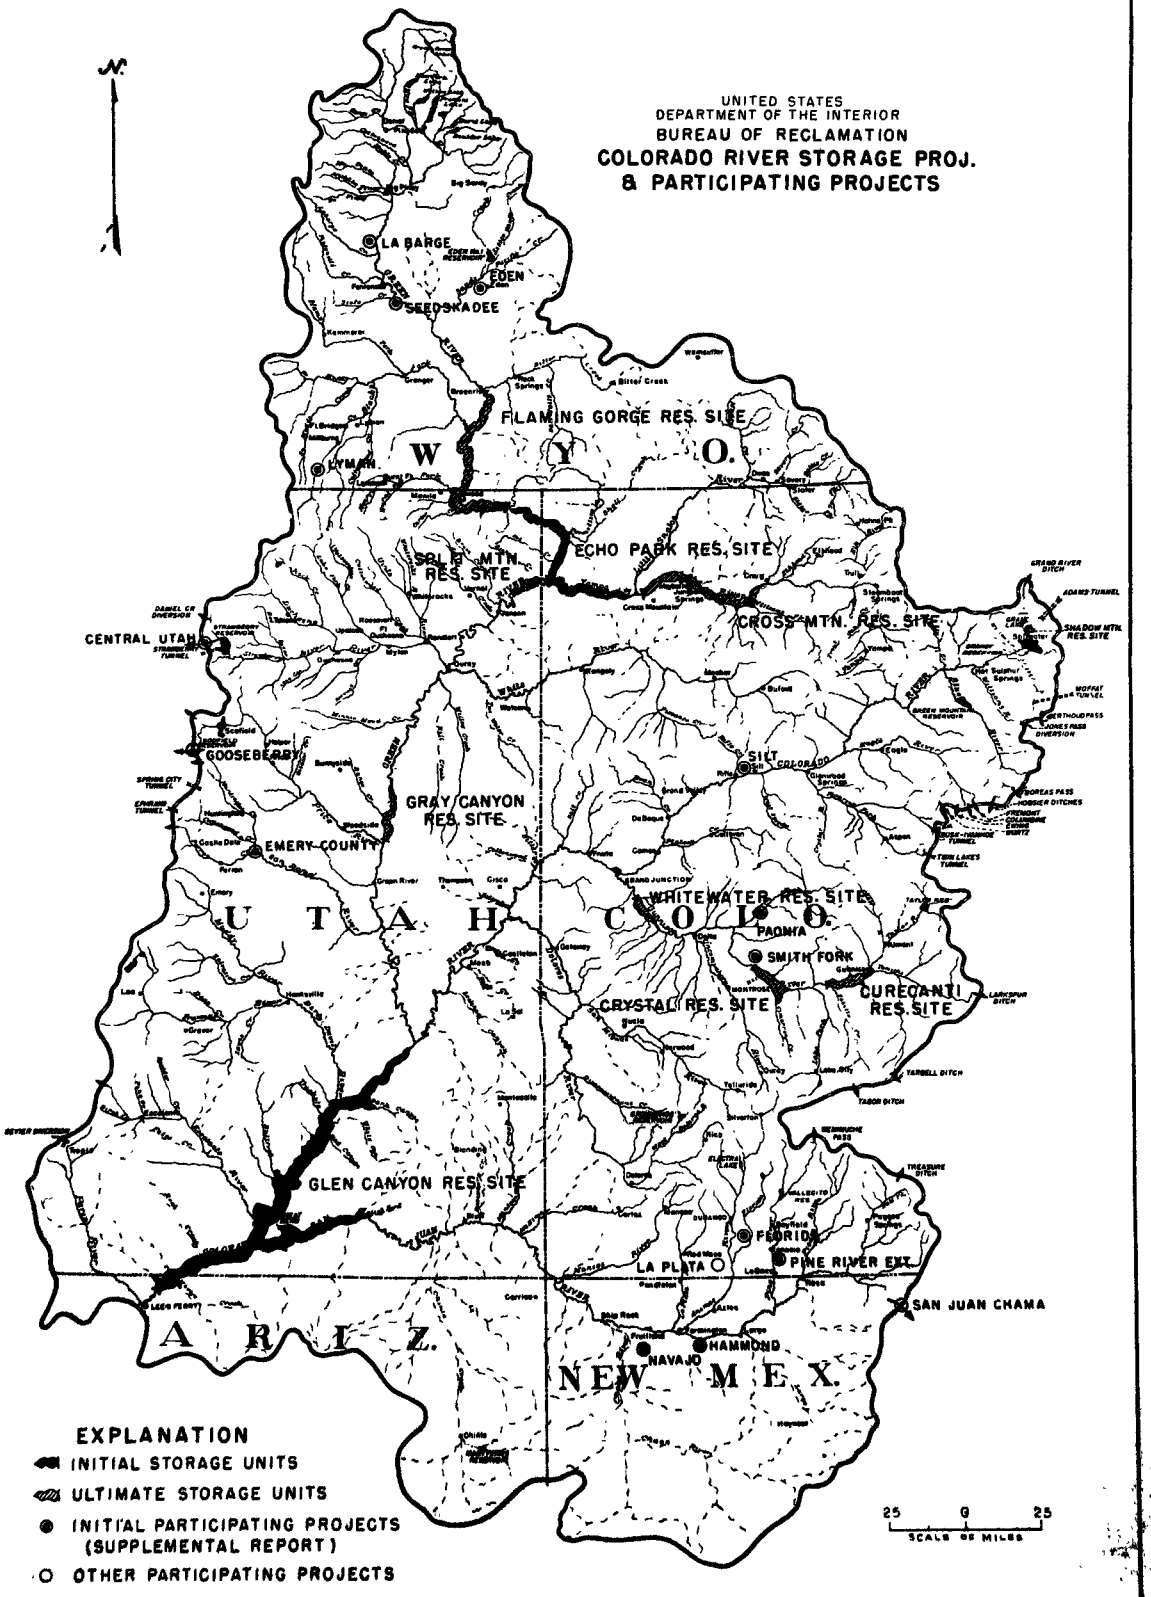
Mr. HARRISON. Mr. Hosmer, I could not tell you. I will have to wait until the Department puts on its testimony. I have no way of anticipating what they are going to put on, except that I say I think they will put on testimony covering the terms of the bill.

In my opinion that is customary.

Mr. HOSMER. Mr. Regan and I would appreciate hearing some more of the details.

Mr. HARRISON. If there is no objection to the introduction of this as part of the record, it will be so ordered.

Mr. ENGLE. May I suggest, Mr. Chairman, that rather than have the court reporter write all this, which means a repetition of copying it in the record, that it be made a part of the record to be included not in the transcript, but in the final printing of the record so that when the record is printed this information will go direct to the Printing



42366 O - 54 Face p. 60

Office. It will not require the court reporter to copy it all into the transcript and thereby run up the bill and result in unnecessary work.

Mr. HARRISON. If there is no objection to that, it will be adopted.

(The document referred to is as follows:)

STATEMENT ON CENTRAL PROJECT, UTAH

The potential central Utah project would provide for the multiple-purpose use in Utah of water tributary to the Colorado River. Under the general plan of development streams, draining the southern slope of the Uinta Mountains in the Uinta Basin in northeastern Utah would be intercepted and conveyed westerly by gravity flow through the Wasatch Mountains to the Bonneville Basin. The water would be collected by an aqueduct leading to a storage reservoir high in the Wasatch Mountains. From the reservoir the water would drop through a series of hydroelectric powerplants before being used for irrigation, municipal, and industrial purposes. Replacement water and water for additional development in the Uinta Basin would be provided by a major diversion from the Green River and by smaller developments on local streams.

The project is of such magnitude it has been planned in two parts—the initial phase, a unified portion that could be developed and operate independently, and the ultimate phase. The two phases combined make up the comprehensive plan. Sufficient investigations have been made of the comprehensive plan to show its physical feasibility. Detailed investigations have been made only on the initial phase.

This statement on the central Utah project, except as otherwise noted herein, is based on the physical plan of development presented in the Bureau of Reclamation report on central Utah project, Utah, dated February 1951—a supplement to the Colorado River storage project report, dated December 1950. It is possible that significant modifications in the project plan may be found desirable during the definite planning stage of the investigation of the project.

THE AREA AND ITS NEEDS

The project area includes land on both sides of the Great Basin Divide, the high mountain series consisting of the Wasatch Mountains and continuing ranges, that extends north and south across the center of the State. To the east of the divide, within the Colorado River Basin, are the Uinta Basin lands that would be served by the project. This area includes the communities of Vernal, Roosevelt, and Duchesne. To the west of the divide is the Bonneville Basin. The project would serve an area along the eastern border of this basin. This area, the most highly developed region in Utah, includes the communities of Salt Lake City, Provo, Heber, Spanish Fork, Payson, Nephi, Richfield, Delta, and Fillmore.

The need for water and electric energy in the Bonneville Basin is intensified by expanding industrial activities. The new Geneva steel plant near Provo, the largest fully integrated steel plant west of the Mississippi, and the Kennecott Copper Co.'s electrolytic refinery, recently constructed near Salt Lake City, are important industrial additions. Finished steel and copper are attracting satellite industries. Largely as a result of the industrial expansion, the population of the Bonneville Basin portion of the project area increased 29 percent from 1940 to 1950. The area's demand for food and for municipal, industrial, and miscellaneous water supplies has increased accordingly. The Basin contains vast areas of rich alluvial soil, but irrigation is generally required to mature crops. The flow of small local streams, practically the only source of water, falls far short of irrigation requirements. Importation of a substantial amount of water into the basin is essential to the basin's agricultural and industrial expansion but can be accomplished only through development of the central Utah project. Without the importation contemplated under the project, future municipal and industrial expansion in Salt Lake City and areas to the south will require a reduction in the use of water for irrigation. Also, without the importation of water and without an increased supply of electric energy, further development of the Bonneville Basin's rich resources of land, minerals, and chemicals will be slowed.

In contrast to the Bonneville Basin, the Uinta Basin has abundant water resources as compared with the land resources. Streams flowing south from the Uinta Mountains—the Duchesne River and its major tributaries, together with Ashley Creek and Brush Creek—produce more than ample water for

irrigation. Most of the stream runoff, however, is uncontrolled and as summer progresses the supply diminishes below the requirements of the land. The Moon Lake and Midview Reservoirs constructed by the Bureau of Reclamation to a combined capacity of 55,300 acre-feet, together with many small privately and Indian-owned reservoirs, provide valuable but insufficient regulation of water resources. With further regulation of water resources, agriculture, the principal enterprise, could continue to expand. Industrial development based on deposits of petroleum, other hydrocarbons, and phosphates, would be encouraged. Development of the petroleum industry is now getting under way. Several oil wells recently have been brought into commercial production.

THE COMPREHENSIVE PLAN

When fully developed the central Utah project would provide a full irrigation water supply for 200,000 acres of new land. It would also provide a supplemental supply for 239,900 acres now inadequately irrigated. It would provide 48,800 acre-feet of water to meet foreseeable demands for municipal, industrial, and other miscellaneous purposes, and it could provide additional water for these purposes as future requirements developed. Project powerplants tentatively planned would have an installed capacity of 249,000 kilowatts and would generate almost 1.2 billion kilowatt-hours of electric energy annually. Additional power potentialities exist and as investigations of the ultimate phase are continued the planned capacity of the powerplants may increase materially.

The flow of all important streams on the south slope of the Uinta Mountains as far east as Brush Creek would be intercepted by the potential Strawberry aqueduct and conveyed to the Strawberry Reservoir in the Wasatch Mountains. The flow of Carter Creek on the Uintas' northern slope would be brought to the southern slope for conveyance to the reservoir. The aqueduct, 110 miles long, would consist largely of tunnels through mountain ridges separating the parallel streams. Inflow to the tunnels would be regulated in small reservoirs on the mountain streams The western 36.8 miles of the aqueduct, extending from Rock Creek to the Strawberry Reservoir, would consist of two parallel bores. Power developments would be made on the various streams where practicable.

Strawberry Reservoir, a feature of the Strawberry Valley reclamation project, would be enlarged from its present capacity of 283,000 acre-feet to a capacity of 1,370,000 acre-feet by construction of Soldier Creek Dam on Strawberry River 9 miles below the existing dam. The enlarged reservoir would regulate (1) water delivered through the aqueduct, estimated to average 563,000 acre-feet annually; (2) additional water developed on Strawberry River between the existing and new dams, estimated to average 18,000 acre-feet annually; and (3) the present Strawberry Valley project supply, averaging about 69,000 acre-feet annually. Water in nearly uniform annual quantities would be released from the reservoir to the Bonneville Basin through 2 almost parallel tunnels, approximately 4 and 5 miles long, and then would be conveyed down the western slope of the Wasatch Mountains through Diamond Fork and Spanish Fork Canyons. In its descent from the reservoir to near the floor of the Bonneville Basin, a drop of about 2,600 feet, the water would pass through a series of hydroelectric powerplants with a combined capacity of 231,000 kilowatts, capable of producing 1.1 billion kilowatt-hours of energy annually. The water would pass first through the Old West and Fifth Water powerplants located near the outlets of the two tunnels. Water released from these plants would flow through the Sixth Water and Fifth Water aqueducts to a common surge pipe. The water would flow successively through the Hammock and Tanner powerplants to the Monks Hollow Reservoir. From Monks Hollow Reservoir the water would enter the Wasatch aqueduct. Eight miles down the aqueduct line, high on the wall of Spanish Fork Canyon, the water would be divided, part continuing in the aqueduct and extensions to the south and part being diverted to the north.

During the irrigation season the water continuing south in the Wasatch aqueduct would be distributed for irrigation and other purposes in the area from Salem to Levan. Part of the aqueduct water would be regulated in the Goosenest Reservoir and other reservoirs and distributed to lands that are above canals of the Strawberry Valley project in an area between Salem and York Ridge, a ridge south of Santaquin. At York Ridge, part of the water would be diverted into the potential Mona-Nephi Canal and used as far south as Levan. Some of the water would replace that now supplied for irrigation from Salt Creek near Nephi, thus permitting more of the spring water tributary to Salt

Creek to be used for municipal, industrial, and other miscellaneous purposes in the Nephi area. Return flows from irrigation in the Nephi area would be utilized on agricultural lands in the vicinity of Elberta. These flows would be regulated in the existing Mona Reservoir that would be enlarged under the project. During the nonirrigation season water continuing south in the Wasatch aqueduct beyond York Ridge would be conveyed to the 530,000 acre-foot Dyer Reservoir and stored for irrigation of lands near Holden and Fillmore. Some of the water from Dyer Reservoir would be used near Delta for irrigation of lands now supplied from the lower Sevier River. Thus more water of the Sevier River could be stored in existing upstream reservoirs and used for irrigation of lands along the upper reaches of the river, principally near Richfield.

Water diverted to the north from the Wasatch aqueduct, including the present Strawberry Valley project supply, would drop through the Castilla powerplant. It would then be used for supplemental irrigation and other purposes in the area from Santaquin to Springville now partially served by the Strawberry Valley project During the nonirrigation season releases from the Castilla plant would flow down Spanish Fork River to Utah Lake, relieving the obligation of Provo River to deliver water to the lake. So far as practicable throughout the year releases from the Castilla plant would be routed through existing powerplants of the Strawberry Valley project, thus providing a much needed firm water supply for operation of these plants.

Provo River water replaced in Utah Lake by water from the central Utah project would be stored in the potential 65,000 acre-foot Bates Reservoir on the Provo River and the potential 850 acre-foot Hobble Creek Reservoir on a tributary of Round Valley Creek. The operation of these reservoirs would be correlated with that of the Deer Creek Reservoir and other existing reservoirs on the Provo River system to the mutual advantage of present and potential water users. The central Utah project water from the Provo River would be used for irrigation, municipal, and industrial purposes in the Heber-Francis-Wallsburg areas and in the Provo-Salt Lake City region. A portion of this water would be conveyed to lands in the western part of the Jordan River Valley through the existing Provo Reservoir Canal and the potential West Valley Canal. Another portion would be conveyed by the Provo Reservoir Canal and used for irrigation and other purposes in the area from Provo to Lehi. The remainder would be utilized for municipal, industrial, and other miscellaneous purposes in areas between Lehi and Salt Lake City. This water would be conveyed from Provo River through the Salt Lake aqueduct, constructed by the Bureau of Reclamation as a part of the Provo River project. Central Utah project water conveyed in the aqueduct would be regulated to meet fluctuating demands in the potential 490 acre-foot Front Reservoir located one-half mile south of the mouth of Big Cottonwood Creek near Salt Lake City. As an addition to use of the Salt Lake aqueduct, a potential mine-drainage tunnel that would serve the important Park City-Alta mining district also could be utilized for the delivery of central Utah project water in the Provo River to the vicinity of Salt Lake City. Use of the tunnel, however, is not included in present plans of the Bureau of Reclamation. Existing irrigation distribution systems would be rehabilitated and extended in the Heber and Wallsburg areas.

Dams would be constructed where practicable to impound water for recreational and fish and wildlife purposes, thus providing partial compensation for damages to these purposes from the construction of some other project features. Included would be a dam forming Round Knoll Lake near Wallsburg, which would provide a constant water surface of 300 acres. Fish hatcheries would be constructed to provide fish for stocking streams as further compensation for damage resulting from the project.

A dike 6 7 miles long and 20 feet high would be constructed across the mouth of Provo Bay, an arm of Utah Lake. The bay would then be drained to reduce evaporation losses and to reclaim 9,340 acres of land for irrigation farming. An irrigation supply for the area would be pumped from Utah Lake and would consist of water saved from evaporation in the bay area and increased return flows reaching the lake from project lands Drainage water would be pumped from the bay area to Utah Lake. Plans are reported for a new State highway alinement across Provo Bay in the vicinity of the potential dike. Plans for the two structures could be correlated, resulting in a substantial saving in cost and other advantages.

The diking of Goshen Bay of Utah Lake, authorized as a part of the Provo River project but not yet undertaken, would become a part of the central Utah

project. The dike 22 feet high and 5.5 miles long would permit the south 26,000 acres of Utah Lake to be drained and would thereby reduce the average annual evaporation by 60,000 acre-feet. The water thus saved could be used for irrigation either in Cedar, Tooele, or West Jordan Valley.

A 7-mile section of the Jordon River channel between Utah Lake and Jordan Narrows would be enlarged. The channel improvement also was authorized as a part of the Provo River project. Improvement of the river channel from Jordan Narrows to Great Salt Lake is being investigated by the Corps of Engineers as a flood-control project

In order to replace water now used in the Uinta Basin that would be exported and to provide additional water for further development within this basin, water would be diverted from the Flaming Gorge Reservoir that would be constructed on the Green River as a feature of the Colorado River storage project. The water would be conveyed from the reservoir through the Flaming Gorge aqueduct, a structure 120 miles long, including an 18-mile tunnel through the Uinta Mountains. Under an alternative plan of development Green River water could be supplied to the Uinta Basin from Echo Park Reservoir, another potential feature of the Colorado River storage project. If the Echo Park Reservoir were used as the Uinta Basin source of supply, the Flaming Gorge aqueduct would be eliminated and the water would be distributed by an aqueduct generally parallel to, but 160 feet lower than, the Flaming Gorge aqueduct. Central Utah project water from the Echo Park Reservoir would be pumped an average lift of 170 feet.

Green River water would be supplemented in the Unita Basin by some water released from the Strawberry aqueduct and water developing below the Strawberry aqueduct. Supplies from the three sources would be coordinated for most efficient use and regulated in existing reservoirs, including the Moon Lake and Midview Reservoirs of the Moon Lake project, and several reservoirs that would be constructed under the project, including the Tyzack, Stanaker, Maeser, Halfway Hollow, Hancock, Altonah, Upalco, Starvation, and Hanna.

Project powerplants and transmission systems would be interconnected with the system proposed for transmission of electric energy produced by plants of the Colorado River storage project.

Water rights

Rights to flows of Uinta Basin streams have been acquired by both white settlers and Indians. These rights, evidenced by court decrees and by applications to appropriate water filed with the State engineer, cover all late-season waters carried by the streams. Nevertheless, surplus water beyond capacities of diversion works normally waste from almost all streams in the spring and early summer. Local interests, municipalities, and public agencies have filed applications to appropriate some surplus waters for local storage or exportation to the Bonneville Basin. The Bureau of Reclamation has filed applications to appropriate water for the project from the Green River and Uinta Basin streams.

The central Utah project would largely control the Uinta Basin's surplus waters. Much of the water would be exported, but that needed for further development in the Uinta Basin would be provided either directly or by exchange. Regulation of the water to furnish a full season supply would be advantageous to all present claimants and therefore no serious difficulty is expected in obtaining surplus waters for project purposes. Some water now used beneficially in the Uinta Basin could be exported in exchange for a regulated supply from the Green River without prejudice to existing water rights.

Annual depletions to the Colorado River at the sites of use resulting from the central Utah project are expected to average 189,400 acre-feet under the initial phase and 800,600 acre-feet under the comprehensive development. Depletions resulting from the comprehensive development would amount to approximately two-thirds of the water made available to Utah for future development under the terms of the upper Colorado River Basin compact. Sufficient water would be available in the Green River for the planned diversion to the Uinta Basin after completion of all potential upstream projects for use of water in Wyoming. The water exchanges involving Provo and Sevier Rivers and other lesser exchanges necessary to obtain potable water for domestic use could be made under the laws of Utah without impairment of existing rights. Present diversions from Strawberry River watershed would not be adversely affected.

Through its participation in the Provo River project the Metropolitan Water District of Salt Lake City has acquired water for future city growth. Although all of this water is not needed in the district immediately, an urgent requirement for water for municipal and irrigation use exists in areas outside of the district boundaries. Temporary use of the district's reserve water in adjoining

areas would lead only to intensified difficulties unless an additional source of water were assured for the future As the central Utah project would provide the additional source of water, its authorization would justify immediate leasing of the district's reserve water for use outside of the district

INITIAL PHASE OF PROJECT

In the initial phase of the project only Rock Creek and Uinta Basin streams west of Rock Creek would be diverted into the Bonneville Basin where development would be limited to areas between Salt Lake City and Nephi. Initial phase development in the Uinta Basin would include the Jensen, Vernal, and Upalco areas and lands along the Duchesne River.

The initial phase of the project would provide for the irrigation of 28,500 acres of new land and 132,000 acres now irrigated but in need of more water. Part of the water exported to the Bonneville Basin would be acquired by exchanges involving water for 42,600 acres of land in the Uinta Basin, more than half of which is owned by Indians or has been acquired from them. These exchanges may result in benefits to the Uinta Basin lands through improved water regulation Available data do not permit an evaluation of such benefits; consequently, they are not claimed in this report but they will be determined and evaluated in the preconstruction planning. The initial phase would also provide 48,800 acre-feet of water annually for municipal, industrial, and other miscellaneous uses. Initial phase powerplants with an installed capacity of 61,000 kilowatts would generate approximately 373 million kilowatt-hours of electric energy annually. Approximately 2.2 million kilowatt-hours of energy would be required by the project for irrigation and drainage pumping. Energy produced at central Utah project powerplants would be firmed by interconnections with plants of the Colorado River storage project.

Project works

Under the initial phase 1 of the 2 parallel aqueducts comprising the western 36.8 miles of the Strawberry aqueduct would be constructed. This aqueduct would intercept flows of Rock Creek, Hades Creek, Wolf Creek, West Fork of the Duchesne River, Currant Creek, Layout Creek, and Water Hollow. Reservoirs to regulate inflow to the aqueduct would be provided on Rock Creek (Upper Stillwater), West Fork of the Duchesne River (Vat) and Currant Creek (Currant Creek).

The Strawberry Reservoir would be enlarged through construction of the Soldier Creek Dam. The dam would be constructed in the initial phase to the full height required for the comprehensive development. One-stage construction to ultimate capacity would cost considerably less than initial construction and later enlargement. One-stage construction also would obviate interference with initial phase operation that otherwise would result while the dam was being enlarged.

The existing outlet tunnel from the Strawberry Reservoir would be enlarged. Below the tunnel outlet, in succession down the west slope of the Wasatch Mountains, would be constructed the Old West powerplant, Sixth Water aqueduct, Hammock powerplant, Tanner powerplant, Monks Hollow Dam, the Wasatch aqueduct as far as York Ridge near Santaquin, and the Castilla powerplant. The Mona-Nephi Canal would be constructed from York Ridge as far south as Salt Creek near Nephi. The Mona Reservoir would be enlarged, the Elberta Service Pipe would be constructed, and the existing Elberta Canal would be enlarged to distribute water from Mona Reservoir.

Use of Provo River water through exchange in the initial phase would require construction of Bates Dam on Provo River, Hobble Creek Dam on Little Hobble Creek, the West Valley Canal, and the Front Dam. Provo Bay would be diked and drained and the upper 7 miles of the Jordan River channel would be enlarged.

An exchange of water between the Bates Reservoir and numerous small storage reservoirs on the upper Provo River would be made to provide supplemental water to areas in the vicinity of Francis and Heber City. Water developing between Bates Reservoir and Hobble Creek Reservoir would be used for supplemental irrigation in the Wallsburg area in exchange for Strawberry Reservoir water delivered to Utah Lake. A dam would be constructed creating Round Knoll Lake for recreational and fish and wildlife purposes.

New project works to provide water for replacement and expanded irrigation and municipal use in the Uinta Basin would include Hanna Reservoir on the North Fork of Duchesne River, Starvation Reservoir on Strawberry River with a 6.8-mile feeder canal from the Duchesne River, the Upalco Reservoir offstream from Lakefork River, the Stanaker Reservoir with a 3.6-mile feeder canal from Ashley Creek, and the Tyzack Reservoir on Brush Creek.

Existing drains and irrigation laterals generally would be adequate for the project but some rehabilitation of drainage systems would be required in the Spanish Fork and Nephi areas, and new drains would be required in the Provo Bay, Lehi, Vernal, and Jensen areas. Construction of some new distribution laterals and rehabilitation of others would be required in nearly all major irrigation areas.

A pipeline would be required to convey water to communities in eastern Duchesne County. Necessary distribution facilities within the communities would be constructed and financed by local interests. The existing municipal distribution system in the Vernal area would be used to distribute the additional municipal water. Necessary extensions would be constructed by local interests. In the Bonneville Basin municipal water would be delivered at turnouts from principal project works. Additional facilities for treatment and distribution of the water would be provided by the water users.

Transmission lines for delivery of project power would be constructed to Salt Lake City on the north and to Manti on the south.

Facilities would be constructed for development of fish and wildlife, recreation, and forest resources in general as recommended in accompanying reports of the Fish and Wildlife, National Park, and Forest Services.

Construction schedule

Initial phase work would be constructed in steps extending over a period of about 16 years. Thus irrigation development would be undertaken at different times in 13 areas or blocks. First features constructed would include the portion of the Strawberry aqueduct from the West Fork of the Duchesne River to the Strawberry Reservoir. The initial program also would include construction of the Vat, Currant Creek, Bates, Hobble Creek, Round Knoll, Front, Upalco, and Stanaker Dams, enlargement of the Strawberry tunnel, construction of the Old West powerplant, and improvement of the Jordan River channel. Construction would next be undertaken on the Soldier Creek, Starvation, Upper Stillwater, and Hanna Dams, the Strawberry aqueduct from the West Fork of the Duchesne River to Rock Creek, initial portions of the Wasatch aqueduct, Starvation feeder canal, Sixth Water aqueduct, Hammock powerplant, and transmission lines. Last initial phase features to be constructed would be the Castilla and Tanner powerplants, Tanner diversion dam, Mona-Nephi Canal, Monks Hollow and Mona Dams, Goosenest Reservoir, Provo Bay development, and Elberta Service Pipe and Canal.

Effect on existing facilities

The operation of various existing facilities would require modification for correlation with the construction and operation of works planned for the central Utah project. Among the principal features in the Bonneville Basin affected by the initial phase would be the Strawberry Reservoir outlet tunnel, canals, and powerplants of the Strawberry Valley project; Deer Creek Reservoir, Provo Reservoir Canal, and Salt Lake aqueduct of the Provo River project; Utah Lake; and Mona Reservoir. Principal facilities in the Uinta Basin similarly affected would include Strawberry Reservoir of the Strawberry Valley project, Moon Lake and Midview Reservoirs and canals of the Moon Lake project, works of the Uinta Indian irrigation project, and various other structures on the Duchesne River, Ashley Creek, and Brush Creek systems. Public and private power facilities in both basins also would be affected. It is anticipated that agreements between present interests and potential project interests can be reached to mutual advantage concerning such matters as correlated operation of existing and potential facilities, construction of new facilities or modification of existing structures, and the acquisition of necessary rights-of-way or lands and interests in lands.

Project lands

Preliminary land classification surveys of the project lands indicate that they would be suitable for sustained crop production under irrigation farming. Detailed classification of most of the land areas in the project would be required during the definite planning stage of the investigation to confirm the suitability of the lands.

Revisions in initial phase plan

Since preparation of the 1951 report, the communities in eastern Duchesne County have constructed a municipal water pipeline and this feature would therefore be excluded from the project. As a result of eliminating the pipeline, about 2,300 acre-feet of Upalco Reservoir water is considered as a supplemental supply to 2,300 additional acres of land in the Upalco area. A refinement of the

water supply studies for lands in the Duchesne River area—Indian and white owned—shows that 4,070 acres of white lands formerly considered as receiving replacement water would receive supplemental water instead. Allowances for these revisions in plan are incorporated in the results of current estimates covered in the following paragraph.

Economic analysis

Results of current (1953) estimates by the Bureau of Reclamation on costs, repayment and benefit-cost ratio are summarized in the following tabulation:

Costs and preliminary allocations

Total construction cost (January 1953 prices, exclusive of interest during construction for any of the purposes)	$231,647,000
Nonreimbursable allocations:	
Recreation	2,830,000
Forest resource development	48,000
Flood control	3,113,000
Project investigations (Colorado River development fund)	603,000
Total nonreimbursable	6,594,000
Reimbursable allocations:	
Ultimate phase allocation	[1] 5,500,000
Initial phase allocation	219,553,000
Irrigation $127,354,000	
Municipal water 45,500,000	
Power 46,699,000	
Total reimbursable allocations	225,053,000
Total allocations	231,647,000
Annual operation, maintenance and replacement costs	[2] 768,990
Allocations:	
Irrigation	253,930
Municipal water	69,160
Power	445,900
Total allocations	768,990

[1] Cost of constructing Soldier Creek Dam to the ultimate height in the initial phase construction.

[2] Estimated at a price level of 180 (1939=100), for all except power facilities which were estimated at current prices Replacement costs estimated on a 50-year sinking fund basis with interest at 2½ percent.

Repayment of construction costs

[Thousands of dollars]

Purpose	Reimbursable allocation	Revenues [1]			
		Irrigation water users	Municipal water users	Initial phase power [2]	Required from net power revenues [3]
Ultimate phase	$5,500				$5,500
Irrigation	127,354	$15,191			112,163
Municipal water	45,500		$45,500		
Power	46,699			$46,699	
Total	225,053	15,191	45,500	46,699	117,663

[1] Irrigation and municipal payments toward construction cost in 50 years Initial phase power revenues paid toward construction cost extending over period from beginning of first power operation to 47 years after last power installation Municipal water and power allocations repaid with interest at 2½ percent on the unpaid balances with interest returns during the payout period amounting to $34,712,000 for municipal water and $33,819,000 for power excluding interest during construction

[2] Power revenues estimated at 6 mills a kilowatt-hour for firm energy, 3 5 mills for nonfirm and 3 mills for irrigation pumping energy.

[3] Required from net revenues from Colorado River storage project, including initial phase central Utah project power, following payout of power allocations under the general repayment plan of the Colorado River storage project.

Benefit-cost ratio

Average annual equivalent benefits	$9,590,400
Average annual equivalent costs	7,827,000
Ratio of benefits to costs	1.23 to 1

STATEMENT ON EMERY COUNTY PROJECT, UTAH

The potential Emery County project is planned primarily to improve the irrigation water supply and thus better the agricultural production of 24,080 acres of lands in Emery County in east central Utah near the towns of Huntington, Castle Dale, and Orangeville. The project is in the Green River Basin, a part of the upper Colorado River Basin.

The general type of farming now practiced in the area would be continued with project development. Agriculture would continue to center around the livestock industry with more than 90 percent of the irrigated area producing hay and grains. The increased production in livestock feed would permit increased production on the farm of beef, sheep, pork, and dairy products.

Principal construction features of the project would be Joes Valley Dam and Reservoir, with a total capacity of 57,000 acre-feet, to store water on Cottonwood Creek, the Swasey diversion dam on Cottonwood Creek, 10 miles downstream from Joes Valley, and the 17-mile Cottonwood Creek-Huntington Canal, with an initial capacity of 250 second-feet, heading at the Swasey diversion dam. Some canal laterals and drains would be constructed. Existing irrigation facilities in the area would be utilized as fully as practicable. Recreational facilities would be provided at the Joes Valley Reservoir.

The project would make available an average of 31,400 acre-feet of water annually for 24,080 acres of land in Emery County, including 20,450 acres now irrigated with only a partial supply and 3,630 acres not now irrigated. In addition, about 1,000 acre-feet of late-season water annually would be made available by exchange for transmountain diversion to lands in the Bonneville Basin now partially irrigated by the Ephraim and Spring City divisions of the existing Sanpete project. Recreational and scenic attractions at Joes Valley Reservoir site would be developed as planned by the National Park Service.

A preliminary land classification survey indicates that the project lands would be suitable for sustained production of crops under irrigation farming. A detailed classification would be necessary to confirm the suitability of the lands.

Water supply studies, based on records of streamflows as they have occurred in the past, indicate that an adequate irrigation supply would be available for the project with permissible shortages in occasional drought years. Water rights for the project can be obtained under Utah State law.

A construction period of 3 to 5 years, including completion of definite plan investigations, would be required to complete construction of the project.

This statement is based on the physical plan of project development presented in the Bureau of Reclamation report on the Emery County project, Utah, dated February 1951, a supplement to the Colorado River storage project report dated December 1950. Results of current (1953) Bureau of Reclamation estimates for this project plan are summarized in the following tabulation:

SUMMARY, EMERY COUNTY PROJECT, UTAH

Location: East central Utah on the eastern slope of the Wasatch Plateau near the towns of Huntington, Castle Dale, and Orangeville, upper Colorado River Basin.

Irrigation water supply

	Acre-feet
Increase in annual direct-flow diversions	3,900
Annual storage supply	[1] 28,500
Total project supply	32,400
Annual stream depletion	15,500

[1] Includes an increase of 1,000 acre-feet annually in the water supply available for exportation to the Bonneville Basin for the Ephraim and Spring City divisions of the existing Sanpete project.

Irrigated acreage

	Acres
Supplemental irrigation service lands	20,450
New irrigation service lands	3,630
Total	[1] 24,080

[1] Exclusive of lands to receive water exported to Bonneville Basin.

Costs

Construction cost (exclusive of $17,500 nonreimbursable past expenditures for investigations from Colorado River development fund, and includes Forest Service proposal for road relocation)	$9,865,500
Annual operation, maintenance, and replacement costs	36,980

Allocations and repayment

Purpose	Cost allocation	Source of repayment		
		Irrigators (50 years)	Required from net power revenues of Colorado River storage project	Nonreimbursable
Construction costs				
Irrigation	$9,636,500	$3,715,000	$5,921,500	
Recreation	229,000			$229,000
Total	9,865,500	3,715,000	5,921,500	229,000
Operation, maintenance, and replacement costs:				
Irrigation	21,870	21,870		
Recreation	15,100			15,100
Total	36,980	21,870		15,110

NOTE.—Benefit-cost ratio 1.38 to 1.

STATEMENT ON EDEN PROJECT, WYOMING

When completed the Eden project in southwestern Wyoming will divert water from the Big and Little Sandy Creeks in the upper Colorado River Basin to irrigate 10,660 acres of arable lands not now irrigated and will replace or otherwise rehabilitate the major features of the irrigation system that heretofore was utilized to irrigate 9,540 acres.

Climatically adapted crops in the area such as alfalfa, pasture grasses, and small grains, will be produced on the project lands largely in conjunction with livestock operations centered around dairy cows and farm flocks of sheep and of chickens.

Construction of the Eden project was originally approved by the President on September 18, 1940, as a water conservation and utilization project under the act of August 11, 1939 (53 Stat. 1418). Work on the project was about 16 percent completed when stopped by order of the War Production Board in December 1942. Completion of the project was subsequently authorized by act of June 28, 1949 (Public Law 132, 81st Cong., 1st sess.). Construction of the project under the latter authorization is now well advanced with two major features of the project already completed and work currently underway on some of the other project features. The latter act provided for "such modification in the physical features as the Secretary of the Interior may find will result in greater engineering and economic feasibility: *Provided*, That of the construction costs of the irrigation features of the project not less than $1,500,000 for the project of 20,000 irrigable acres, or a proportionate part thereof based on the actual irrigable area as determined and announced by the Secretary of the Interior upon completion of the project, shall be reimbursed by the water users in not to exceed 60 years. * * * *Provided further*, That construction costs of the irrigation fea-

tures of the project which are not hereby made reimbursable by the water users shall be set aside in a special account against which net revenues derived from the sale of power generated at the hydroelectric plants of the Colorado River storage project in the upper basin shall be charged when such plants are constructed."

The current plan of the project is covered in a definite plan report prepared by the Bureau of Reclamation and dated May 1953. Construction features of the project include:

Big Sandy dam and dikes (now completed) on Big Sandy Creek to form Big Sandy Reservoir of 39,700 acre-feet total storage capacity.

Means Canal (now completed) to convey water from Big Sandy Reservoir to the west-side lateral and to the existing Eden Canal.

West-side lateral to serve lands on the west side of Big Sandy Creek.

Eden Creek enlargement and relocation below the terminus of the Means Canal to serve lands east of Big Sandy Creek.

Little Sandy Canal rehabilitation and extension to connect with the upper section of the Eden Canal.

Enlargement of existing lateral system served by Eden Canal to serve both presently irrigated and new lands under that canal.

Project drainage system.

Project construction costs based on January 1953 prices are currently estimated at $7,287,000 The project repayment was established by the project authorizing act of June 28, 1949, as $1,500,000 to be repaid over 60 years. This amount deducted from total project costs leaves $5,787,000 to be repaid from Colorado River storage project net power revenues under the general repayment plan of the latter project and in accordance with the Eden project authorizing act of 1949.

STATEMENT ON FLORIDA PROJECT, COLORADO

The potential Florida project is planned primarily to supply irrigation water to, and thus increase the agricultural production on, 18,950 acres of Florida Mesa and Florida River Valley lands in the upper Colorado River Basin in southwestern Colorado. The lands include 12,650 acres presently irrigated with only a partial supply and 6,300 acres presently not irrigated. Approximately 1,000 acres of the land, including 100 acres partially irrigated and 900 acres now unirrigated, are owned by Indians. In addition to irrigation values, the project would provide some enhancement in fish and wildlife values in the area and affect some decrease in flood damages along Florida River.

With project development, the irrigated lands would be utilized largely for the support of livestock enterprises as now practiced in the area Climatically adaptable crops, such as small grains, hay, pasture, and some pinto beans, potatoes, apples, vegetables, and berries, would be produced Analyses made indicate that a family-size farm would provide the farm family with a reasonable standard of living, provide employment for the available labor, and permit payment of operation, maintenance, and replacement costs of project facilities and some payment toward the construction costs of project facilities.

Preliminary land-classification surveys indicate that project lands would be suitable for sustained production of crops under irrigation farming. Detailed land classification would be required to confirm the suitability of all the lands. Water-supply studies based on records of streamflows as they have occurred in the past indicate that an adequate irrigation supply would be available for the project with permissible shortages in occasional drought years. Water rights for the project could be obtained under Colorado State law

Construction features of the project would include the Lemon Dam and Reservoir with a total capacity of 23,300 acre-feet to store water on Florida River, construction of a new diversion dam on Florida River at the head of the existing Florida farmers ditch, enlargement and extension of the existing Florida farmers ditch diverting from Florida River, and some distribution and drainage facilities. Water would be released from the reservoir as needed and conveyed in the natural river channel to heads of various downstream canals and ditches that would divert the flow for distribution to project lands.

This statement is based on the physical plan of project development presented in the Bureau of Reclamation report on the Florida project, Colorado, dated January 1951, a supplement to the Colorado River storage project report dated December 1950. Results of current (1953) Bureau of Reclamation estimates for this project plan are summarized in the following tabulation.

SUMMARY, FLORIDA PROJECT, COLORADO

Location: Southwestern Colorado on Florida Mesa and in Florida River Valley, about 9 miles southeast of Durango, upper Colorado River Basin.

Irrigation water supply

	Acre-feet
Annual increase in direct flow diversions	6,900
Annual storage supply	16,300
Total project supply	23,200
Annual stream depletion	12,900

Irrigated acreage

	Indian-owned (acres)	Non-Indian-owned (acres)	Total (acres)
Supplemental irrigation service land	100	12,550	12,650
New irrigation service land	900	5,400	6,300
Total	1,000	17,950	18,950

Costs

Construction costs (exclusive of $20,400 nonreimbursable past expenditures for investigations from Colorado River development fund)	$6,941,500
Annual project operation, maintenance, and replacement costs	12,600

Allocations and repayment

Purpose	Cost allocation	Source of repayment		
		Irrigators (50 years)	Required from net power revenues of Colorado River storage project	Nonreimbursable
Construction costs.				
Irrigation	$6,503,600	$1,711,500	$4,792,100	
Indian	(618,000)	[1](126,000)		
Non-Indian	(5,885,600)	(1,585,500)		
Fish and wildlife	208,700			$208,700
Flood control	229,200			229,200
Total	6,941,500	1,711,500	4,792,100	437,900
Annual operation, maintenance, and replacement costs				
Irrigation	12,100	12,100		
Indian	(1,100)	[1](1,100)		
Non-Indian	(11,000)	(11,000)		
Fish and wildlife	500			500
Total	12,600	12,100		500

[1] Subject to elimination or adjustment under an extension of the Leavitt Act of July 1, 1932 (47 Stat. 564) authorizing the Secretary of the Interior to adjust reimbursable debts of Indians.

NOTE.—Benefit-cost ratio, 1.4 to 1.

STATEMENTS ON GOOSEBERRY PROJECT, UTAH

The potential Gooseberry project would divert water from a headwater tributary in the Colorado River Basin to improve the irrigation water supply and thus the agricultural production of 16,400 acres of arable lands in the Bonneville Basin in Sanpete County, central Utah. The project would also enhance recreational values for the population in the general vicinity of the project. A small

net loss would probably result in fish and wildlife values. A net benefit to forest resource development would result from relocation of roads in connection with construction of project storage facilities.

The general type of farming now practiced in the area would be continued with project development. Agriculture would continue to center around the livestock industry with more than 95 percent of the irrigated area producing hay and small grains for livestock feed.

Under the project plan surplus flows of Gooseberry Creek would be regulated at the 17,200 acre-feet capacity reservoir that would be constructed at the Mammoth site on the creek and would then be conveyed in the potential 2.4-mile Mammoth tunnel through the Colorado-Bonneville Basin Divide to Cottonwood Creek. The water would be diverted from Cottonwood Creek into existing canals and the potential Gooseberry Highline Canal for conveyance to project lands. The water would be distributed to individual farm tracts by existing laterals that would be rehabilitated as necessary as a part of the project development. Usable return flow would be collected in natural channels that would be cleaned and improved as part of the project. Drains would be provided for land with a high water table and the San Pitch River Channel would be improved as necessary to provide an outlet for the drainage system. Boating, camping, and picnicking facilities would be provided at Mammoth Reservoir as recreational features of the project. As part of the reservoir construction, 3 miles of forest roads and a sheep corral would be relocated and 2 miles of connecting roads would be constructed.

Water-supply studies based on records of streamflows as they have occurred in the past indicate that with project development the irrigation supply for project lands would be increased by an average of 14,000 acre-feet annually including 11,700 acre-feet of direct diversion and an increase of 2,300 acre-feet of usable return flows. Water rights for the project can be obtained under Utah State law.

A preliminary land classification survey indicates that the project lands would be suitable for sustained production of crops under irrigation farming.

Results of current (1953) Bureau of Reclamation estimates for the physical plan of the project, as covered in the Gooseberry project report dated January 1953, are summarized in the following tabulation.

SUMMARY, GOOSEBERRY PROJECT, UTAH

Location: In Sanpete County in the central portion of Utah.

Plan of development: Transmountain diversion of surplus flows of Price River in Colorado River Basin to Cottonwood Creek in Bonneville Basin for irrigation use.

Irrigation water supply

	Acre-feet annually
Mammoth Reservoir releases	11,700
Usable return flow	2,300
Total new irrigation supply	14,000
Depletion of Colorado River flow	12,500

Irrigated acreage: Land that would relieve supplemental irrigation water, 16,400 acres.

Costs

Construction costs	[1] $5,760,500
Annual operation, maintenance, and replacement costs	13,560

[1] Exclusive of past expenditures for investigations from nonreimbursable Colorado River development fund and inclusive of $116,000 cost chargeable to the Gooseberry project, under terms of an existing contract to which the United States is a party, for benefits to the project resulting from construction of the now existing Scofield Reservoir on Price River downstream from the Mammoth Reservoir site.

Allocations and repayment

Purpose	Cost allocation	Source of payment revenue		
		Irrigators	Net power revenues Colorado River storage project	Nonreimbursable
Construction cost:				
Irrigation	$5,727,500	$2,375,000	$3,352,500	
Recreation	33,000			$33,000
Total	5,760,500	2,375,000	3,352,500	33,000
Operation, maintenance, and replacement costs:				
Irrigation	11,020	11,020		
Recreation	2,540			2,540
Total	13,560	11,020		2,540

NOTE.—Project benefit-cost ratio 1.2 to 1

STATEMENT ON HAMMOND PROJECT, NEW MEXICO

The potential Hammond project would divert waters of San Juan River to provide an irrigation supply for 3,670 acres of arable land now unirrigated. The lands lie along the south side of the river in a narrow 20-mile strip opposite the towns of Blanco, Bloomfield, and Farmington, in northwestern New Mexico.

Project works would include the Hammond diversion dam on San Juan River, a main gravity canal, a hydraulic turbine-driven pumping plant, the East Highline lateral, the West Highline lateral, minor distribution ditches, and a drainage system.

The principal crops that would be grown on the lands with project development would be alfalfa, apples, corn, beans, and barley. Most of the farms are of the fruit-crop and dairy-field crop types.

Preliminary land classification surveys indicate that the lands would be suitable for sustained crop production under irrigation farming. A detailed classification would be necessary to confirm the suitability of all the lands

Water-supply studies, based on records of streamflows as they have occurred in the past, indicate that an adequate irrigation supply would be available for the project with permissible shortages occurring in occasional drought years. A water right for the project can be obtained under New Mexico State law.

A period of about 2 or 3 years would be required to complete definite plan investigations and construction of project works except the drains. A few years operation of the project would be necessary to determine the extent of drainage actually required.

This statement is based on the physical plan of project development presented in the Bureau of Reclamation report on the Hammond project, New Mexico dated November 1950, a supplement to the Colorado River storage project report dated December 1950. Results of current (1953) estimates for this project plan are summarized in the following tabulation. Studies of the potential nearby Navaho project subsequent to 1950 indicate that it might be found desirable to materially modify the plan for serving the Hammond project lands during the definite plan investigations.

SUMMARY, HAMMOND PROJECT, NEW MEXICO

Location: Northwestern New Mexico along south side of Navaho River opposite towns of Blanco, Bloomfield, and Farmington, upper Colorado River Basin.

Irrigation water supply

	Acre-feet annually
Irrigation diversion requirement	18,400
Stream depletion	7,900

Irrigated area: Full irrigation service lands, 3,670 acres.

Costs and repayment

Project construction cost (exclusive of $7,700 past expenditures for investigations from nonreimbursable Colorado River development fund)	$2,302,000
Allocable to irrigation	2,302,000
Payable by water users in 50 years	370,000
Required from net power revenues of Colorado River storage project	1,932,000
Annual operation, maintenance, and replacement costs	16,100
Payable annually by water users	16,100

Benefit-cost ratio: 2.8 to 1.

STATEMENT ON LA BARGE PROJECT, WYOMING

The potential La Barge project would make a direct flow diversion from Green River, a principal tributary of the Colorado River, to provide for the irrigation of 7,970 acres of desert lands in Sublette and Lincoln Counties in southwestern Wyoming. Only about 300 acres of these lands receive any irrigation water at the present time. Their meager supply would likely be used on other lands outside the project area if the project was constructed. Water for domestic and stock-watering use on farms in the project area would be taken from project canals and from shallow wells that would be developed by the water users.

Project lands would generally be utilized for the support of livestock enterprises. Climatically adaptable crops, such as hay, small grain, pasture, and some garden crops would be produced. Analyses made indicate that an average farm of about 210 irrigated acres in the project area would provide the farm family with a reasonable standard of living, provide employment for the available family labor, and permit payment of operation, maintenance, and replacement costs and some payment toward construction costs of project facilities.

Detailed land-classification surveys show the project lands to be suitable for sustained production of crops under irrigation farming. Water-supply studies, based on records of streamflows as they have occurred in the past, indicate that an adequate irrigation supply would be available for the project with permissible shortages in occasional drought years. A water right for the project can be obtained under Wyoming State law.

Construction features of the project would include a main diversion and distribution canal with an initial capacity of 175 second-feet and extending approximately 40 miles along the west side of Green River, a few short laterals, and a few short drains as required. Construction of the main canal and the laterals would require about 2 years. Drains would not be completed until a few years after application of water to the land so that the extent of works required could be determined.

This statement is based on the physical plan of project development presented in the Bureau of Reclamation report on the La Barge project, Wyoming dated January 1951, a supplement to the Colorado River storage project report dated December 1950. Results of current (1953) estimates for this project plan are summarized in the following tabulation.

SUMMARY, LA BARGE PROJECT, WYOMING

Location: Southwestern Wyoming along west bank of Green River, about 50 miles northeast of Kemmerer, Wyo., upper Colorado River Basin

Irrigation water supply

	Acre-feet
Annual diversion requirement	24,300
Annual stream depletion	14,200

Irrigated area: New irrigation service lands, 7,970 acres.[1]

[1] Includes about 300 acres presently irrigated with meager water supply that would likely be used on other lands outside the project area if the project were constructed

Costs and repayment

Project construction cost (exclusive of $76,000 nonreimbursable past expenditures for investigations from the Colorado River development fund)	$1,673,300
Allocable to irrigation	1,673,300
Payable by water users in 50 years	495,000
Required from net power revenues of Colorado River storage project	1,178,300
Annual operation, maintenance, and replacement costs	14,700
Payable anually by water users	14,700

Benefit-cost ratio: 2.12 to 1.

STATEMENT ON LAPLATA PROJECT, COLORADO, NEW MEXICO

The potential LaPlata project would store and divert waters of the LaPlata River to improve the irrigation water supply, and thus the agricultural production of 9,800 acres of arable lands in southwestern Colorado and northwestern New Mexico now irrigated with an inadequate supply. Of the total area, 6,000 acres are in Colorado and 3,800 acres are in New Mexico. The project would also decrease flood damages along the lower stretch of LaPlata River. LaPlata River is a tributary of the San Juan River in the upper Colorado River Basin.

The general type of farming now practiced in the area would be continued with project development. Agriculture would continue to center around the livestock industry with most of the irrigated area producing livestock feeds.

Features of the project would include construction of a 12,000 acre-foot reservoir at the offstream Long Hollow site and a reservoir at the State Line site on LaPlata River with a normal capacity of 17,000 acre-feet, of which 12,000 acre-feet would be active for water conservation and 5,000 acre-feet would be dead storage, and a surcharge capacity of 15,000 acre-feet for flood control. A 400 second-foot feeder canal would be constructed to divert surplus LaPlata River flows to the Long Hollow Reservoir and a 70 second-foot outlet canal would deliver storage water from Long Hollow Reservoir to existing irrigation canals. Project water would be distributed to individual farm tracts by existing irrigation systems.

Water supply studies based on records of stream flows as they have occurred in the past indicate that the project would increase the irrigation supply at canal headgates by an average of 12,000 acre-feet annually. Water rights could be obtained under Colorado and New Mexico State laws. Under project operation the average annual increase in stream depletion would be about 5,800 acre-feet in Colorado and 3,200 acre-feet in New Mexico.

Preliminary land classification surveys indicate that the project lands would be suitable for sustained crop production under irrigation farming.

Results of preliminary estimates, made at 1953 construction prices, at a projected long term price level of 180 (1939=100) for operation, maintenance, and replacements costs, and at a price level of 215 (1910–14=100) for benefits and repayment, are summarized as follows:

Costs

Construction (exclusive of past expenditures for investigations from nonreimbursable Colorado River development fund)	$9,958,500
Annual operation, maintenance, and replacement costs	14,080

Cost allocations		*Operation, maintenance, and replacement costs*
Irrigation (reimbursable)	$9,184,700	$14,080
Flood control (nonreimbursable)	773,800	-------
Total allocations	9,958,500	14,080

Repayment of construction costs

Irrigation water users (50 years)	$1,245,000
Required from net power revenues of Colorado River storage project	7,939,700
Total repayment	9,184,700

Benefit-cost ratio

Average annual equivalent benefits	$260,000
Average annual equivalent costs	324,000
Ratio of benefits to costs	0.8 to 1

The foregoing plan for the potential LaPlata project could be undertaken as a first stage of development of the potential larger Animas-LaPlata project. The latter project would develop the Animas River waters as well as the LaPlata River waters for irrigation of the LaPlata project lands and a considerable additional acreage of supplemental and new lands in the same vicinity. Current reconnaissance investigations of the Animas-LaPlata project indicate that this project would be more economical under a plan which would not include the Long Hollow and State Line Reservoirs. Completion of the current investigations of the Animas-LaPlata project is necessary to determine which of the alternative possibilities offers the most economical means of development.

STATEMENT ON LYMAN PROJECT, WYOMING

The potential Lyman project is contemplated as a means of improving the late-season irrigation water supply and thus of bettering agricultural production on 40,600 acres of land near the town of Lyman in Bridger Valley, a part of the upper Colorado River Basin in southwestern Wyoming. The lands are now irrigated with only a partial supply.

Because of the semiarid climate in the area, irrigation is necessary for successful crop production. Only grasses for hay and pasture, alfalfa, and some small grains can be produced to any extent as the growth of most other crops is precluded by a short growing season and untimely summer frosts that characterize the high 6,500- to 7,000-foot elevations of the project lands. Additional late-season irrigation water is needed to increase yields of the forage and grain crops to bolster the all-important local livestock industry.

The Lyman project would provide late-season irrigation water through construction of a dam and reservoir with 43,000 acre-feet total capacity at the Bridger site on Willow Creek to store the spring flood flows of Blacks Fork and its tributary, West Fork of Smiths Fork. Surplus flows of these streams, now largely used for excessive irrigation in the spring runoff season, would be conveyed to the reservoir by two feeder canals, one diverting from each of the streams. The water would be retained in the reservoir until needed and then released to the Willow Creek channel. Enlargement of a few miles of this channel and construction of three canals to divert from this enlarged channel would provide the necessary facilities along with the existing irrigation systems in the area to effect the distribution of the water to project lands. The existing canal systems would be improved and extended as necessary. Drains would be provided where necessary to improve the removal of unavoidable waste and excess surface waters on the irrigated lands and to protect the lands from accumulations of harmful salts.

Preliminary land classification surveys indicate that project lands would be suitable for sustained irrigation farming although detailed surveys will be necessary to firmly establish their suitability. Some presently irrigated lands that may be found to be nonarable could be abandoned and their water supply transferred to readily accessible arable lands now idle.

Water supply studies, based on records and estimates of stream flows as they have occurred in the past, indicate that a total irrigation supply averaging 114,300 acre-feet annually within ideal requirements would be available to project lands under the plan of project operation. With project development, the lands would still be short by an average of 15,700 acre-feet, or 12 percent, of meeting the ideal irrigation requirement of 130,000 acre-feet annually. Without the project, the available irrigation supply to the lands within ideal demands averages 81,800 acre-feet or 37 percent short of a full supply. Thus, the project would increase the irrigation supply by an average of 32,500 acre-feet annually

and reduce the average irrigation shortages from 37 percent to 12 percent. A water right for the project can be obtained for the project as planned under Wyoming State law provided the necessary agreements and adjustments in water rights can be negotiated with holders of prior natural flow rights in the project area.

A period of 5 or 6 years would be required to complete definite plan investigations and construction of the project facilities excepting the drains. The drains would not be completed until a few years after operation of the project and the actual extent of drainage required could be determined.

This statement is based on the physical plan of project development presented in the Bureau of Reclamation report on the Lyman project, Wyoming, dated October 1950, a supplement to the Colorado River storage project report dated December 1950. Results of current (1953) Bureau of Reclamation estimates for this project plan are summarized in the following tabulation.

SUMMARY, LYMAN PROJECT, WYOMING

Location: Southwestern Wyoming on Blacks Fork, its tributaries and Willow Creek, in the vicinity of the town of Lyman, upper Colorado River Basin.

Irrigation water supply

	Acre-feet annually
Total ideal requirement at canal heads	130,000
Direct flow diversions	70,700
Bridger Reservoir releases	32,500
Useable return flows in project area	11,100
Total supplied under project operation	114,300
Total presently supplied without project	81,800
Increase due to project	32,500
Project stream depletion	0

(Additional water consumed on cropped lands would be offset by water saved through improved irrigation and drainage.)

Irrigated acreage: Lands to receive supplemental water, 40,600 acres (Some presently irrigated nonarable lands may be abandoned and their water supply transferred to now idle arable lands.)

Cost and repayment

Total construction cost (exclusive of $58,000 past expenditures for investigations from nonreimbursable Colorado River development fund)	$10,564,000
Allocable to irrigation	10,564,000
Repayable by water users in 50 years	2,255,000
Required from net power revenues of upper Colorado River storage project	8,309,000
Total annual increase in operation, maintenance, and replacement costs	45,900
Payable annually by water users	45,900

Benefit-cost ratio: 1.01 to 1.

Remarks: Project is dependent on more efficient irrigation than that now practiced in the area. Adjustment in water rights is required to permit storage of surplus spring flows now accruing to direct flow rights. Amendment to Wyoming water law is required to permit transfer of water from one land tract to another.

STATEMENT ON NAVAHO PROJECT, NEW MEXICO

The potential Navaho project (formerly called the Shiprock and South San Juan projects) would provide for the irrigation of about 151,000 acres of arable dry lands lying along the south side of San Juan River, a principal tributary of

Colorado River, near the towns of Bloomfield, Farmington, and Shiprock in northwestern New Mexico. Of the lands that would be irrigated 122,000 acres are located in the Navaho Indian Reservation and 29,000 acres are outside the reservation. All the lands within the reservation and some of the project lands outside the reservation are Indian owned. Remaining lands outside the reservation are publicly owned or privately owned by non-Indians.

The general plan of the project includes the Navaho Dam and Reservoir on San Juan River and a main highline canal to divert from the reservoir at a point near the dam and at an elevation well above the stream bed. This main highline canal would divert the water to a point about 28 miles downstream from Navaho Dam where the water would be dropped through a direct connected turbine pumping plant to a lower main canal that would extend westerly about 60 miles to serve the major portion of the project lands by gravity. The dropping water would energize the pump to lift a part of the water to serve the portion of the project lands inside and outside of the reservation that are too high to be served by the gravity diversion. A distribution system would extend beyond the pump lift to deliver the pumped water to the high lands. A system of drains would be provided as required to prevent seepage of project lands. A certain balance between the various canal elevations and the acreages to be served by gravity and by pumping is necessary in properly planning and designing the project.

Planning investigations of the Navaho project are being carried on jointly by the Bureau of Indian Affairs and region 4 of the Bureau of Reclamation. The project is an integral part of the Indian Affairs program to bring relief to the Navaho Indians from their very low family incomes and to make them self-sustaining.

The active storage capacity required for the Navaho project at Navaho Reservoir is dependent on the scale of development of the potential San Juan-Chama project. The latter project is a potential transmountain diversion to the Rio Grande Basin from the headwaters of San Juan River. This diversion project is being investigated by region 5 of the Bureau of Reclamation Coordination of the Navaho and San Juan-Chama project investigations are being made by the two regions of the Bureau of Reclamation and the Bureau of Indian Affairs in cooperation with the State of New Mexico.

Navaho project lands range from about 5,200 to 6,100 feet in elevation and have a semiarid to arid climate with an average frost-free season of about 150 to 160 days Annual precipitation averages less than 9 inches with about half occurring during the growing season, making irrigation necessary for successful crop production. With irrigation climatic conditions are favorable for growing most field crops, a variety of garden crops, and such fruits as apples, pears, peaches, cherries, and apricots. Most of the project acreage would be utilized for production of livestock feeds with smaller acreages being utilized for fruit and garden crops.

The 151,000-acre project would require an average annual irrigation diversion of about 630,000 acre-feet. Permissible shortages in meeting this requirement would occur in occasional drought years under project operation. The average annual stream depletion that would result from the development would be about 341,000 acre-feet.

Preliminary estimates to date indicate that the total construction cost of the 151,000-acre Navaho project would be about $232,650,000 exclusive of added storage replacement costs at Navaho Reservoir that would be required with upstream diversions to the San Juan-Chama project. Essentially all of the construction cost would be allocable to irrigation. Annual operation, maintenance, and replacement costs would approximate $563,000 and would be allocable to irrigation. Preliminary studies also indicate that the farm income would be sufficient for project water users, after meeting operation, maintenance and replacement costs and maintaining a reasonable standard of living to repay about 8 percent of the construction cost without interest in 50 years after delivery of water and following a suitable farm development period. This would leave about $213,210,000 of the construction cost to be met from net power revenues of the Colorado River storage project under the general repayment plan of that project. The payment capacity of the Indian owned land is estimated as being equal to that of the lands under non-Indian farming. The collection of construction costs which could be repaid from farm income would be deferred under the provision of the Leavitt Act of July 1, 1932 (47 Stat 564), authorizing the Secretary of the Interior to adjust reimbursable debts of Indians.

The estimates to date indicate a project benefit-cost ratio approximating 1.2 to 1.

A construction period of about 15 years would be required for efficiently completing definite plan investigations and construction of the project excepting the completion of drains. The desirable construction period, however, would be affected by the actual rate of land settlement as the construction progresses. A development period of 5 to 10 years would be desirable following delivery of water to the various land tracts before making assessments for construction costs.

STATEMENT ON PAONIA PROJECT, COLORADO

The potential Paonia project would divert water from the North Fork of the Gunnison River in the upper Colorado River Basin to improve the irrigation water supply, and thus the agricultural production, of 17,040 acres of land in west-central Colorado. Of these lands 14,830 acres are presently irrigated and 2,210 acres are arable but not now irrigated. Fish and wildlife values in the area would be enhanced and flood damages would be decreased.

The general type of farming now practiced in the area would be continued with project development but the additional irrigation supplies would make possible a more intensive crop production. Production of livestock foods and fruit, such as apples, peaches, and cherries, would continue to be the major crops grown.

Under the project plan, the Spring Creek Dam and Reservoir would be constructed at a site on Muddy Creek 1 mile above its junction with the North Fork River. The reservoir would have a capacity of 18,000 acre-feet, of which 11,000 acre-feet would be active and 7,000 acre-feet would be reserved for sediment retention and dead storage The existing Fire Mountain Canal diverting from the North Fork River 5 miles below the Spring Creek Dam would be enlarged and extended. The enlarged canal would be capable of diverting an increased amount of natural streamflow during the early irrigation season and in the late season its supply would be supplemented by water released from the reservoir. In this manner the irrigation water supply for lands under the Fire Mountain Canal would be improved and through its extension the canal would also serve lands on Rogers Mesa that heretofore have been irrigated from Leroux Creek, a tributary of the North Fork River. The Leroux Creek water thus released from Rogers Mesa would be diverted into the higher Overland Canal, which would be improved and enlarged for this purpose, and used to augment the present irrigation supply for lands on Redlands Mesa. Beginning at a point on the Fire Mountain Canal 9 miles below its head, the Minnesota siphon would be constructed to convey part of the water southward 12,000 feet across the North Fork River to the existing Minnesota Canal

Water supply studies based on records of stream flows as they have occurred in the past indicate that with project development the irrigation supply for project lands would be increased by 18,500 acre-feet annually The increase in stream depletion attributable to the development is estimated at an average of 9,000 acre-feet annually.

Land classification surveys indicate that the lands would be suitable for sustained crop production under irrigation farming. Some further detailed classification would be required to confirm the suitability of all the lands, particularly in the Leroux Creek and Minnesota areas.

The project was authorized by act of Congress on June 25, 1947. Enlargement and extension of the Fire Mountain Canal has been essentially completed under this authorization but modification of the authorization as described above is required to enable completion of the project. Reauthorization of the project, under the revised plan described above, was recommended in the Bureau of Reclamation report on the Paonia project, Colorado, dated February 1951, a supplement to the Colorado River storage project report dated December 1950.

Results of current (1953) Bureau of Reclamation estimates for the physical plan of the project as covered in the Paonia project report of February 1951 are summarized in the following tabulation:

SUMMARY, PAONIA PROJECT, COLORADO

Location: West-central Colorado on North Fork of Gunnison River (North Fork River) 50 miles southeast of Grand Junction, upper Colorado River Basin.

Irrigated area (acres)

	Receiving supplemental supply	New land
Fire Mountain division	8,110	810
Leroux Creek division	4,710	1,400
Minnesota division	2,010	
Total	14,830	2,210

Water supply

	Acre-feet
Average annual increase in usable irrigation water supply within ideal demands	18,500
Average annual increase in stream depletion	9,000

Costs

Project construction costs	[1] $6,936,500
Increase in annual operation, maintenance, and replacement costs attributable to project	11,100

[1] Exclusive of $67,500 past expenditures for investigations from the nonreimbursable Colorado River development fund and exclusive of $7,500 recreation facility costs.

Allocation and repayment

Purpose	Cost allocation	Source of payment revenues		
		Irrigators	Required from net power revenues of Colorado River storage project	Nonreimbursable
Construction costs:				
Irrigation	$6,791,600	[1] $2,414,000	$4,377,600	
Fish and wildlife	70,800			$70,800
Flood control	74,100			74,100
	6,936,500	2,414,000	4,377,600	144,900
Operation, maintenance, and replacement costs, Irrigation	11,100	11,100		

[1] Repayment in 68-year period as provided in 1947 act authorizing Paonia project.

Benefit-cost ratio. Ratio for overall project, 1.6 to 1

STATEMENT ON PINE RIVER PROJECT EXTENSION, COLORADO AND NEW MEXICO

The potential Pine River project extension would provide distribution canals to deliver water made available by the existing Pine River project to irrigate 15,150 acres of land now unirrigated in southwestern Colorado and northwestern New Mexico. Of this acreage 1,940 acres are within the boundaries of the existing Pine River Indian irrigation project.

The Pine River project, consisting of Vallecito Dam and Reservoir on Pine River, was authorized for construction in 1937 to provide storage water for 69,000 acres and was substantially completed and placed in operation by the Bureau of Reclamation in 1941. About half of the lands to be served were under canals and partially irrigated at the time of construction and now receive supplemental water from Vallecito Reservoir. The remaining lands had no distribution facilities at the time of construction. Facilities for these lands were not included as part of the original project as it was thought that the works required were relatively minor and could be undertaken by the water

users with private capital. The required works proved so costly, however, that they have not been privately constructed. As a result, canal systems for the lands that can be economically developed at the present time are planned for Federal construction as the Pine River project extension.

With development of the extension the irrigated lands would be utilized largely for the support of livestock enterprises as now practiced in the general locality. Major crops that would be produced on the extension lands are hay and small grains with some potatoes, pinto beans, and early maturing vegetables, and berries also grown.

The project extension would consist of the enlargement and extension of eight major canals and ditches diverting from Pine River, the construction of one new diversion dam on Pine River, and the construction of a number of small distribution laterals. Over half the extension lands would be served by enlargement and extension of the existing King consolidated canal and construction of a new diversion dam at the head of this canal. The other canals and ditches to be enlarged and extended include the Pine River canal and the Myers-Asher, Bennet and Myers, Bear Creek, and Pine River, Sullivan, Shroder extension, and Thompson Epperson ditches. A period of 3 to 4 years would be required to complete definite plan investigations and construction of the extension works.

Preliminary land classification surveys indicate the extension lands to be suitable for sustained crop production under irrigation farming. A detailed classification is necessary to confirm the suitability of all the lands. Water supply studies, based on records of stream flows as they have occurred in the past, indicate that an adequate water supply would be available for the development with permissible shortages on occasional drought years. A water right for the project can be obtained under Colorado and New Mexico State laws.

This statement is based on the physical plan of development presented in the report on Pine River project extension, Colorado and New Mexico, dated January 1951—a supplement to the Colorado River storage project report dated December 1950. Results of current (1953) Bureau of Reclamation estimates for this development plan are summarized in the following tabulation.

SUMMARY, PINE RIVER PROJECT EXTENSION, COLORADO AND NEW MEXICO

Location: Southwestern Colorado and northwestern New Mexico on Pine River, about 20 miles east of Durango, Colo., upper Colorado River Basin.

Irrigation water supply

	Acre-feet
Average annual supply	45,450
Average annual stream depletion:	
Colorado	27,200
New Mexico	1,100
Total	28,300

Irrigated acreage

	Colorado	New Mexico	Total
New irrigation service lands:			
Indian [1]	1,940		1,940
Non-Indian	12,580	630	13,210
Total	14,520	630	15,150

[1] Includes some land in non-Indian ownership within boundaries of Pine River Indian irrigation project.

Costs

Construction cost (exclusive of $53,360 past expenditures for investigations from nonreimbursable Colorado River development fund)	$5,027,000
Annual operation, maintenance, and replacement costs	18,950

Allocations and repayment

Construction costs:	
Allocable to irrigation	$5,027,000
Assigned to Indians	644,000
Payable by Indians in 50 years or subject to adjustment under an extension of the Leavitt Act [1]	262,000
Assigned to non-Indians	4,383,000
Payable in 50 years by non-Indian water users	1,783,000
Required from net power revenues of Colorado River storage project	2,982,000
Annual operation, maintenance, and replacement costs:	
Allocable to irrigation	18,950
Assigned to Indians	2,400
Payable by Indians or subject to adjustment under an extension of the Leavitt Act [1]	2,400
Assigned to non-Indians	16,550
Payable by non-Indian water users	16,550
Benefit-cost ratio: 2.2 to 1.	

[1] Act of July 1, 1932 (47 Stat. 564), authorizing the Secretary of the Interior to adjust or eliminate reimbursable debts of Indians.

STATEMENT ON SAN JUAN-CHAMA PROJECT, COLORADO AND NEW MEXICO

The San Juan-Chama project would divert water from the headwaters of San Juan River, a principal tributary of the Colorado River, into the Rio Grande Basin for the purposes of providing supplemental water for existing irrigation projects and of providing water for municipal and industrial uses and for development of hydroelectric power. Although water for diversion would be collected from tributaries of the San Juan located in both Colorado and New Mexico all of the water would be used in New Mexico in the Rio Grande Basin. By exchange the project would also increase the use of water in New Mexico in the Canadian River Basin. The present plan provides for the diversion of 235,000 acre-feet of Colorado River Basin water annually out of the total amount allocated to New Mexico under the provisions of the upper Colorado River Basin compact.

With project development an adequate supply of excellent quality water would be available to satisfy the rapidly growing municipal and industrial requirements of the cities and towns in the middle Rio Grande Valley area. In addition water would be available to supplement the now deficient supply to over 200,000 acres of irrigated land in the area. Hydroelectric power would be developed to aid in supplying electrical energy for the development of the resources in the basin. The plants would be designed and operated primarily to meet peak loads and to permit efficient operation of an integrated fuel and hydropower system. In addition the project would provide an opportunity for further development of recreation, fish and wildlife facilities in the center of one of the more important tourist and recreational areas of the country.

Construction features of the project are described under the following three subparagraphs:

1. Collection and diversion element—Three reservoirs having a total capacity of 190,000 acre-feet located on the West Fork, East Fork, and Rio Blanco tributaries of the San Juan River. A feeder canal and conduit system to collect and transport the water to the head of Willow Creek in the Rio Grande Basin. The conduit system would be about 48 miles in length and would have a terminal capacity at the outlet of the tunnel through the Continental Divide of 1,000 cubic feet per second.

2. Regulation and power production element—Three reservoirs would be constructed on Willow Creek and the Rio Chama which, when integrated with the existing El Vado Reservoir and the authorized Chamita Reservoir, would provide facilities needed to regulate water releases for irrigation and municipal and industrial uses and for generation of hydroelectric power. Power development would comprise the installation of 145,000 kilowatts of plant capacity of which 95,000 would be utilized for peaking power and 50,000 for base power. The capacities of the 3 new reservoirs would be 228,000, 400,000, and 40,000 acre-feet. This capacity would be supplemented by the existing 198,000 acre-feet of capacity at El Vado and an additional 85,000 acre-feet planned to be provided in connection with construction of a multiple-purpose reservoir at a site

toward the lower end of the Rio Chama as part of the authorized middle Rio Grande project.

3. Water-use element.—Construction features for irrigation purposes would comprise regulatory reservoirs, rehabilitation of distribution systems, and some relocation and extension of canals and laterals on existing irrigation projects on Rio Grande tributaries. Water for these projects would be made available by operation under exchange agreements. The present plan does not include construction features for delivery of municipal and industrial water to the cities and towns beyond the reservoirs on the Rio Chama Such features could be added later as part of the project if the local interests desire Federal construction and financing.

Construction of project features would be accomplished over a period of about 15 years including the installation of all power units

This statement is based on the physical plan presented in Bureau of Reclamations interim report on the San Juan-Chama project, dated March 1952. The financial data and analysis of the projects were revised in December 1953 to conform to current policy and procedure. Project investigations to date are of reconnaissance degree of detail and the construction costs used, which are based on December 1951 prices, were prepared sufficiently conservative as to require no readjustment for the small change in construction prices since that date Results of the estimates along with other project data are summarized in the attached table.

SUMMARY, SAN JUAN-CHAMA PROJECT, NEW MEXICO

Location: Primarily in northern New Mexico involving project features in the San Juan River Basin in southern Colorado and northern New Mexico and in the Rio Grande, and Canadian River Basins in northern New Mexico.

Water supply: Diversion of 235,000 acre-feet of water annually from the San Juan Basin to the Rio Grande and Canadian River Basins for irrigation, municipal and industrial water and hydroelectric power. Average annual stream depletion in Colorado River—235,000 acre-feet.

Costs and repayment

Project construction cost	[1] $228,141,000
Allocations (including interest during construction on power and municipal water features):	
Power	75,855,000
Irrigation	99,308,000
Municipal and industrial water	59,402,000
Total allocations	234,565,000
Repayment:	
Power (42 years after completion of last unit)	75,855,000
Municipal and industrial water (50 years)	59,402,000
Irrigation:	
Water users (50 years)	32,335,000
Required from net power revenues after repayment of power allocation	66,973,000
Total repayment	234,565,000
Total annual operation, maintenance and replacement costs	1,272,000

Project benefit-cost ratio: 1.6 to 1.

[1] Exclusive of replacement storage costs required for the potential Navaho project in the San Juan River Basin and also exclusive of past expenditures for investigations from the nonreimbursable Colorado River development fund.

STATEMENT ON SEEDSKADEE PROJECT, WYOMING

The potential Seedskadee project would divert water from Green River, a principal tributary of the Colorado River, to provide for the irrigation of 60,720 acres of arable dry lands lying along both sides of the river in Lincoln and Sweetwater Counties in southwestern Wyoming. Of the total area 51,960 acres would be

included in family-sized farm units and 9,030 acres would be used for community pasture. Water for domestic and stock watering use in the project area would be obtained from project canals and from shallow wells that would be developed by the water users.

Fish and wildelife values in the area would probably suffer minor damage as a result of project development. Recreation values would not be materially affected.

With project development, the irrigated lands would be utilized primarily for the support of livestock enterprises, particularly dairying. Climatically adaptable crops, such as pasture, small grain, hay, and some garden crops would be produced. Analyses made indicate that an average farm of about 200 irrigated acres in the Seedskadee area would be required to provide the farm family with a reasonable standard of living, provide employment for the available family labor, and permit payment of operation, maintenance, and replacement costs of project facilities and some payment toward construction costs of project facilities.

Detailed land classification surveys show the project lands to be suitable for sustained production of crops under irrigation farming. Water supply studies based on records of streamflows as they have occurred in the past indicate that an adequate irrigation supply would be available for the project with permissible shortages in occasional drought years. A water right for the project can be obtained under Wyoming State law.

Principal construction features of the project would include a diversion dam on Green River, a system of main canals and laterals to convey water from the diversion dam and distribute it to project lands, two hydraulic driven pumps at drops in the distribution canals to lift water to some of the lands, and a few miles of artificial drains.

The Seedskadee diversion dam would consist of a low ogee overflow section 400 feet long, canal headworks, a sluiceway, and a dike 1,000 feet long. The Seedskadee diversion canal would extend along the west of Green River and would convey water from the river to the project lands. It would be 19 miles in length and would have an initial capacity of 1,350 second-feet. The diversion canal would terminate at a bifurcation structure at the headings of the two main canal distribution systems, one serving lands west of the river and the other serving lands east of the river. Main canals in the distribution system would total about 160 miles in length. A lateral system would be constructed to deliver water from the main canals to individual farm tracts.

A construction period of about 8 years, including the completion of definite plan investigations, would be required to complete all project facilities except the drains. Drains would not be completed until several years after application of water to the lands so that the actual extent of drainage works required could be determined.

This statement is based on the physical plan of project development presented in the Bureau of Reclamation report on the Seedskadee project, Wyoming, dated November 1950, a supplement to the Colorado River storage project, dated December 1950. Results of current (1953) Bureau of Reclamation estimates for this project plan are summarized in the following tabulation. Studies of the upper Green River Basin made subsequent to 1950 indicate that significant modifications in the project plan may be found desirable during the definite planning stage of the investigation.

SUMMARY, SEEDSKADEE PROJECT, WYOMING

Location: Southwestern Wyoming along Green River, about 14 miles northwest of the town of Green River, Wyo., and 35 miles east of Kemmerer, Wyo.

Irrigation water supply

	Acre-feet
Annual irrigation net diversion requirement	225,800
Annual stream depletion	110,400

Irrigated area

	Acres
New irrigation service land in farm units	51,690
New service land in community pasture	9,030
Total new land	60,720
Supplemental service land	0

Costs and repayment

Project construction cost (exclusive of nonreimbursable past expenditures for investigations from Colorado River Development Fund)	$23,272,000
Allocable to irrigation	23,272,000
Repayable by water users in 50 years	4,785,000
Required from net power revenues of Colorado River storage project	18,487,000
Total annual operation, maintenance, and replacement costs	136,600
Payable annually by water users	136,600

Benefit-cost ratio: Ratio of average annual equivalent benefits to average annual equivalent costs, 1.46 to 1.

STATEMENT ON SILT PROJECT, COLORADO

The potential Silt project would provide for the full irrigation of 1,900 acres of new land and provide supplemental water to 5,400 acres of partially irrigated land, all in the vicinity of Rifle and Silt, communities in Garfield County of west central Colorado. The lands are situated in three compact blocks north of the Colorado River between Rifle and Elk Creeks, tributaries of the Colorado River. The project would also provide some enhancement in fish and wildlife values in the area.

The basic type of agriculture in the area would remain unchanged with project development because of climatic and soil conditions. With late season water provided by the project, however, the plantings of row crops would be increased somewhat as would the yield of livestock feeds. Alfalfa, small grains, sugar beets, and potatoes would continue to be the principal crops grown.

Principal construction features include the Rifle Gap Dam and Reservoir of 10,000 acre-feet total capacity on Rifle Creek, a small hydraulic turbine and direct-connected pump at the dam, reconstruction of one presently abandoned ditch, rehabilitation of the existing Grass Valley Canal and construction of some laterals and drains. Except for minor drainage work, about 3 years would be required for construction of project features, including the completion of definite plan investigations.

Preliminary land-classification surveys indicate that the lands would be suitable for sustained crop production under irrigation farming. Water-supply studies based on records of stream flows as they have occurred in the past indicate that an adequate irrigation supply would be available for the project with permissible shortages in occasional drought years. A water right for the project can be obtained under Colorado State law.

This statement is based on the physical plan of project development presented in the Bureau of Reclamation report on the Silt project, Colorado, dated January 1951—a supplement to the Colorado River storage project report dated December 1950. Results of current (1953) Bureau of Reclamation estimates for this project plan are summarized in the following tabulation:

SUMMARY, SILT PROJECT, COLORADO

Location: In upper Colorado River Basin in vicinity of towns of Rifle and Silt, Garfield County, west central Colorado.

Irrigation water supply

	Acre-feet
Increase in annual irrigation supply	10,100
Increase in stream depletion	5,800

Irrigated acreage

	New irrigation service land	Supplemental irrigation service land	Total
Harvey Mesa	290	4,760	5,050
Dry Elk Valley	690	640	1,330
Under Davie ditch	920		920
Total	1,900	5,400	7,300

Cost and repayment

Construction cost (exclusive of $15,000 past expenditures for investigations from nonreimbursable Colorado River development fund)	$3,356,000
Allocable to fish and wildlife (nonreimbursable)	73,600
Allocable to irrigation	3,282,400
Payable by water users in 50 years	1,020,000
Required from net power revenues of Colorado River Storage project	2,262,400
Annual increase in operation, maintenance, and replacement costs	8,400
Payable annually by water users	8,400

Benefit-cost ratio: 1.71 to 1.

STATEMENT ON SMITH FORK PROJECT, COLORADO

The potential Smith Fork project in west central Colorado would regulate surplus flows of Iron Creek and the Smith Fork of the Gunnison River, a tributary of the upper Colorado River, to increase the irrigation supply for 8,160 acres of land now partially irrigated and provide a new supply for 2,270 acres now unirrigated.

Although an improved irrigation supply would permit new lands to be cultivated and result in better crop yields on presently irrigated lands, the cropping program is largely controlled by climatic soil and topographic conditions. Most of the acreage would continue to be utilized for the production of livestock feeds with hay, small grains, and pasture predominating. Increased feed production in the area would result mostly in increased dairy cows with some increase also in beef cattle, hogs, and poultry.

Detailed land-classification surveys show the project lands to be suitable for sustained production of crops under irrigation farming. Water-supply studies, based on records of streamflows as they have occurred in the past, indicate that an adequate irrigation supply would be available for the project with permissible shortages in occasional drought years. A water right for the project can be obtained under Colorado State law.

Construction features of the project include a storage dam and reservoir with 14,000 acre-feet total capacity at the Crawford site on Iron Creek, the Smith Fork diversion dam, the 2.7-mile-long Smith Fork feeder canal of 100 second-feet, to divert from Smith Fork to Crawford Reservoir, the 6.6-mile Aspen Canal of 145 second-feet initial capacity to convey water from Crawford Reservoir to part of the project lands and feed existing ditches and four small lateral canals. Existing irrigation facilities in the area would be utilized as fully as practicable. A period of 3 to 4 years would be required to complete definite plan investigations and construct the project works.

This statement is based on the physical plan of project development presented in the Bureau of Reclamation report on the Smith Fork project, Colorado, a supplement to the Colorado River storage project report dated December 1950. Results of current (1953) Bureau of Reclamation estimates for this project plan are summarized in the following tabulation.

SUMMARY, SMITH FORK PROJECT, COLORADO

Location: West central Colorado along Smith Fork in the vicinity of Crawford, Colo., and 73 miles southeast of Grand Junction, Colo., upper Colorado River Basin.

Irrigation water supply

	Acre-feet
Annual increase in direct-flow diversions	4,450
Annual storage supply	11,200
Total project supply	13,650
Increase in annual stream depletion	7,500

Irrigated acreage

	Acres
New irrigation service land	2,270
Supplemental irrigation service land	8,160
Total	10,430

Costs and repayment

Construction costs (exclusive of $75,000 past expenditures for investigations from nonreimbursable Colorado River development fund and exclusive of recreation development costs)	$3,343,000
Allocable to irrigation	3,343,000
Repayable by water users in 50 years	1,045,000
Required from net power revenues of Colorado River storage project	2,298,000
Total annual operation, maintenance, and replacement costs	8,400
Payable annually by water users	8,400

Benefit-cost ratio: 1.27 to 1.

Mr. MILLER. I first want to say, Mr. Larson, I appreciate your broad, general statement about the upper Colorado River projects. Looking over the chart, summary table, the two additional units at Echo Park and Glen Canyon, they show their cost and generating capacity, and items that are necessary.

It shows there that there are no nonreimbursable funds in the two projects, Echo Park and Glen Canyon.

In other words, there is no sediment control or recreation or flood control that might be considered nonreimbursable.

Mr. LARSON. As I stated in my statment here, we did not attempt to evaluate the benefits from sediment control, flood control, or other uses like that.

Mr. MILLER. Then on the item under "Irrigation," I suppose the $48,043,000 under the Echo Park unit, it would be estimated that the $48,043,000 out of the sale of electric energy would go to help pay for irrigation cost under reclamation law.

Mr. LARSON. Yes, that is the allocation under irrigation—the $48,043,000 for Echo Park and $50,296,000 for Glen Canyon—and that would be paid off after the 44 years.

Mr. MILLER. And in the system of the nine dams and reservoirs that you mention on page 4 of your prepared statement. I suppose the order of importance and priority would be the Echo Park and the Glen Canyon units?

Mr. LARSON. The Echo Park and Glen Canyon are the only two units recommended in the Secretary's supplemental report for authorization at this time.

Mr. MILLER. And you feel that the introduction of power from these two units will be sufficient to amortize the cost and pay off the cost in, I believe the statement says, 44 years at 2½ percent interest?

Mr. LARSON. Yes, sir.

If you would like to see a chart, how that would work, we have a chart here to show exactly how that works out.

Mr. MILLER. Is that figure on a 6-mill-per-kilowatt-hour basis?

Mr. LARSON. Average of 6 mills per kilowatt-hour.

Mr. MILLER. After 44 years it would still be used to help pay irrigation costs?

Mr. LARSON. Yes, and those would be paid out very rapidly. Of the participating projects starting out for construction, the larger ones take anywhere from 12 to 15 years to build and they pay on to their 50th year. They would pay all they could within the irrigator's ability to pay. The power revenues on the 50th year would pay for any balance.

The municipal water users, if any, would pay the cost plus interest to go in the Treasury.

That is true of all 12 of the participating projects recommended by the Secretary.

Mr. MILLER. This estimated generating capacity is 1 million kilowatts from the two units, Echo Park and Glen Canyon?

Mr. LARSON. That is correct.

Mr. MILLER. Do you see sufficient outlet for the sale of the million kilowatt-hours in that immediate area?

Mr. LARSON. Yes, sir.

Mr. MILLER. It goes clear to the west coast?

Mr. LARSON. Our power market studies and those of the Federal Power Commission and others show that all of the power can be absorbed if we build on an orderly construction schedule.

Mr. MILLER. And you feel that there will be a sale—the power market studies show there will be a sale for a million kilowatt-hours when these dams are built?

Mr. LARSON. A million kilowatts?

Mr. MILLER. Yes, when the dams are completed?

Mr. LARSON. Yes.

Mr. MILLER. Do your studies show that in the construction of Echo Park and Glen Canyon there is sufficient water runoff to fill those reservoirs in a reasonable length of time so that they will be usable?

Mr. LARSON. Yes, sir; but because of the large capacity in Glen Canyon reserved for silt retention, it is important to fill Glen Canyon ahead of when it would ultimately be needed for regulatory storage for the upper basin States.

Mr. MILLER. Then you think that would help us to meet our commitments to the lower basin States and to Mexico by the construction of Glen Canyon Reservoir?

Mr. LARSON. Glen Canyon would be necessary for that purpose if the upper basin States are to use their 7½ million acre-feet.

Mr. MILLER. What is the position of the Echo Park site?

Mr. LARSON. That is next in capacity and next in importance to Glen Canyon.

Mr. MILLER. Would it help also to supply waters to the lower States and to Mexico?

Mr. LARSON. It is for exactly the same purpose.

Mr. MILLER. There is no land directly under this that will be irrigated. From your chart there is no new or supplemental water for irrigation purposes?

Mr. LARSON. No; these two reservoirs and the rest that will follow are necessary to provide the long-time holdover from wet cycles to dry cycles to permit diversion high up on the tributaries by the upper basin States, that capacity being set, by our investigations, at a total of 48 million acre-feet.

So it is just as necessary to have the reservoirs below as it would be if they were above the diversion.

Mr. MILLER. The number of new acres to be brought under the 12 participating projects named in your report shows 236,360 acres and 233,930 are supplemental acres.

Mr. LARSON. That is correct.

Mr. HARMISON. Mr. Engle.

Mr. ENGLE. Mr. Larson, looking at this table which Dr. Miller referred to your attention, do I understand that the Department is reporting on the 2 initial units plus the 13 participating units; is that the part that is covered in the Department recommendations?

What I am trying to straighten out in my mind is the difference between what the Department is recommending and what is in the bill.

As I understand, there is more in the bill than you people recommend at this time; is that right?

Mr. LARSON. Yes, Mr. Engle. I am confining my statement to the bills in this way, that I am reporting on the 2 storage units and the 12 participating projects recommended by the Secretary in his report and then we are showing what information we have on the additional units and participating projects that have been included in the bill by the States—upper basin States.

Mr. ENGLE. Directing your attention to the compilation "Summary table," which is attached to your statement, you are directing your testimony, then, to all of those projects which appear in that summary table down to and including what is called subtotal initial projects, and just above where the table says "Additional participating projects in the bill"; is that right? Do you follow me?

Mr. LARSON. No, that is not correct, Mr. Engle. If you will look at the top we have treated the Colorado storage project units up at the top by themselves.

First are the Echo Park and Glen Canyon units, recommended by the Secretary. If you look at the left side near the top you will see additional units in the bill.

The Secretary did not recommend those, but they are in the bill—Curecanti and Flaming Gorge. Then going on down, we have next the 12 participating projects shown by the Secretary in his supplemental report, and then down below the additional participating projects in the bill over and above what we recommend, plus Eden.

Mr. ENGLE. That is what I want to know. In other words, the additional units in the bill which are the two you have mentioned, Curecanti unit and Flaming Gorge unit, are not recommended by Interior, nor are Eden, Gooseberry, LaPlata, Navaho, South San

Juan, and San Juan-Chama. Those are not in the Secretary's recommendation, is that correct, although they are in the bill?

Mr. LARSON. That is right. He mentions them in there, but Eden, as I tried to explain a little while ago, was previously authorized.

It does make statements on these other projects.

Mr. ENGLE. If we were to vote today on the project the Secretary has recommended we would be required to take out of the bill the Curecanti unit, Flaming Gorge unit, and the five mentioned at the bottom of your table; is that right?

Mr. LARSON. Except Eden.

Mr. ENGLE. Well, it is already authorized; taking it out would not make any difference. The testimony now being presented by you and the other Interior witnesses is related to those projects which you have mentioned and not the ones that are in the bill, but not recommended by the Interior: is that right?

Mr. LARSON. Yes, but he has made statements concerning these other projects—he may have no objection or something like that, I don't recall all the statements, but you have the statements, I assume.

Mr. ENGLE. Just two other questions.

You may not be able to answer this one. As I read the statement made by Mr. Tudor, he states that the report of the Interior has not had the clearance of the executive office, referring to the budget, and he says:

> Accordingly, while we are not in a position at this time to make any recommendation for authorization of the project, we will in response to the request of the chairman of the Interior and Insular Affairs Committee, present our planning report.

Now, in the light of that statement, although you are not at the present time making any recommendation with regard to authorization, you do say, do you not, that these projects which you have recommended are economically feasible, is that right, as projects?

Mr. LARSON. These 12, yes, and some of the others for that matter. We have given you the best information we have and each one of those statements will state that, what the benefit-cost ratio is, on each one of them, both the 12 and the others.

Mr. ENGLE. Do you concur in the statement made by Mr. Tudor this morning that if we took Echo Park unit out of authorization that we would in effect take the cylinders out of the engine as far as economic feasibility of this Colorado Basin project is concerned.

Mr. LARSON. You would certainly badly damage the plan because Echo Park is the wheel horse in the upper basin, for the reason that the Split Mountain potential powerplant right below is simply another wheel onto Echo Park.

It has very little storage, 335,000 acre-feet, and whatever the release through Echo Park is, it is automatically through Split Mountain and almost automatically through Gray Canyon right on down below.

Echo Park also affects the feasibility of the Flaming Gorge on the Green River above Echo Park and on the Cross Mountain. It is larger and if it were used to a large extent for peaking, it would assist the other plants.

So if Echo Park goes out of the picture it does affect the feasibility of both Flaming Gorge and Cross Mountain.

Mr. ENGLE. Thank you very much.

Mr. HARRISON. Any further questions, Mr. Engle?

Mr. ENGLE. No.

Mr. HARRISON. Mr. D'Ewart.

Mr. D'EWART. Would you like to tell the committee why Gray Canyon was left out? I remember looking at that site. It looked like an excellent one for us on the committee outside of accessibility. Why was it left out?

Mr. LARSON. It is not left out. It was one of the team of nine, but it was not selected initially because we can't justify it initially without Echo Park.

With only 2 million acre-feet of storage and without regulation above, the cost of power generation would be more than steam.

Mr. D'EWART. What is the argument for leaving out Split Mountain?

Mr. LARSON. Split Mountain is retained in the group of nine until such time as the power is needed. It is left out now. We have taken the two best units.

The most feasible plan to set up is the two cheapest units first, so that all these other seven dams could be added on an incremental basis.

In other words, the bulk of the initial transmission system has to be paid for by Glen Canyon (four-fifths), and Echo Park (one-fifth), or we just don't have a plan which will produce power and deliver to load centers less than the alternative source—from steam.

Mr. D'EWART. I have one brief question as to rates. Your 6-mill rate includes the transmission facilities that are authorized in this bill?

Mr. LARSON. Yes. I can explain that if you like. We have taken the estimates of the nine dams and added a transmission grid system to the market centers on the basis of marketing all the power in the upper basin. We start on that basis. That would average about a 6-mill rate. That is regardless of whether the Government builds the whole transmission system, or whether it is built by private concerns. It all comes to the same place.

Mr. D'EWART. Do you happen to know what the cost of generating power in this area is from coal or oil or gas?

Mr. LARSON. Yes. There are several new steam plants near Salt Lake City, and, of course, in Denver, and we have taken the cost of producing power steam, built now at the time these were built, as more than six mills, possibly 7, but at least more than 6.

Mr. D'EWART. That is all I have.

Mr. REGAN. Mr. Larson, I would like to get back to page 11 of your statement.

In addition, among the attached statements are brief summaries of the LaPlata project, the San Juan-Chama project, and the balance of the Navajo project, namely the South San Juan division, all of which are contained in the bill, but on which substantiating information as to feasibility is not available at this time.

Then you come on down in the next paragraph and say "For which authorization is now being sought".

Now, are you now seeking authorization for those three projects in this bill, or should they be deleted from the bill?

Mr. LARSON. When I say authorization is being sought, I am, of course, referring to the bill. Personally I am not making any recommendations. I am simply reporting information on all the projects contained in the bill.

Mr. REGAN. I understand, but you say in your statement here that the feasibility has not been established and you are asking for authorization on that part that has been declared feasible.

Now, if we have 3 or 4 projects that are not feasible, why should they be included in the bill if you are not seeking authorization on them?

Mr. LARSON. Are you referring to the Gooseberry project?

Mr. REGAN. No, those to which you refer to here "as to feasibility is not available at this time."

You follow that for Gooseberry, also contained in the bill, you have a complete feasibility report.

Mr. LARSON. That is right.

Mr. REGAN. But you do not have on those three I have named.

Mr. LARSON. That is right.

Mr. REGAN. So, therefore, I ask you if they should be deleted from the bill that we are now considering for authorization?

Mr. LARSON. I don't think that is a question for me to answer.

Mr. HARRISON. Mr. Dexheimer, would you like to clarify that?

Mr. DEXHEIMER. I would like to say that the Department is now preparing a supplemental report on these bills in the light of very recent comments which we had from the various States. In that report, assuming that the Secretary approves what we are planning to do, it will say essentially this: that the States have asked that these be included and that we would have no objection if the Congress sees fit to so authorize them although our studies are not complete on them.

Mr. REGAN. Thank you, Mr. Dexheimer.

Mr. HARRISON. Is that all, Mr. Regan?

Mr. REGAN. Yes.

Mr. HARRISON. Senator Watkins is with us this afternoon. He has to leave shortly and he would like to ask some questions here. I want him to know he is welcome. We will be glad to have him participate in these hearings with us.

Senator WATKINS. Thank you, Mr. Chairman.

Mr. Larson, I note you say certain of these projects are not ready for authorization.

Mr. LARSON. I did not say that.

Senator WATKINS. That is what I understood you to say. I think you misspoke yourself.

Mr. LARSON. I did not mean it if I inferred that.

Senator WATKINS. When you say they are not ready, you mean they are not ready for immediate construction; isn't that the fact? I call your attention to Flaming George unit in Utah and Wyoming. What is the status of that one with respect to the rest of the project? What place does it have in the rest of the projects?

Mr. LARSON. It is 1 of the 9 dams as a team selected for completely regulating the river.

Senator WATKINS. It will be eventually necessary to regulate the water to deliver the water to the lower States and permit some to be used upstream?

Mr. LARSON. Yes, sir.

Senator WATKINS. Is that true of the Curecanti unit?

Mr. LARSON. Curecanti, or some other one.

Senator WATKINS. In other words, that is the amount of storage that is necessary to regulate the river?

Mr. LARSON. Yes. We had three on the Gunnison, Whitewater, Crystal, and the large Curecanti. Then the bill contained nothing on the Yampa.

Senator WATKINS. I would like you to explain if you will, irrespective of what is in the bill, because finally the House and the Senate can write into the bill what is necessary to make a project—we are not necessarily bound by what we introduce if the investigations and the facts later on show that there ought to be changes in the bill.

Now, as I understand it, what you are saying is that this will be a completely regulated river and it must be in the upper basin in order to deliver the water under the Colorado River compact of 1922, to the lower users and to Mexico, and at the same time to have some water in the amount that should come to the upper basin States.

Mr. LARSON. Yes, our estimate is the total of 48 million acre-feet required to regulate the river if the upper basin States fully utilize the water allotted to them under the 1922 compact and the upper basin compact.

Senator WATKINS. Tell us what projects will be needed eventually to make that complete regulation. I think the committee ought to know that and I certainly want to know. Through the courtesy of the chairman I am asking that question. Probably you can show it on the map if you have them all indicated. We can see what we have to do to regulate that river to accomplish the object.

Mr. SAYLOR. I hope you can get it. I tried this morning to get the answer and I could not.

Senator WATKINS. I think I understand what they are trying to get at.

Mr. LARSON. Starting at the top we have the Flaming Gorge Reservoir, with a capacity of 3,940,000 acre-feet.

The next one down is Echo Park at the junction of the Green and Yampa Rivers, with a capacity of 6,460,000 acre-feet.

Above Echo Park on the Yampa River is the Cross Mountain Reservoir of 5,200,000 acre-feet.

Going on down to Green, we have the Split Mountain with 335,000 acre-feet immediately downstream from Echo Park.

Further down the Green River, just above Green River, is the Gray Canyon Reservoir site with 2 million acre-feet.

Over on the Gunnison River, the high reservoir was the Curecanti of either two and a half million acre-feet which we selected in the first place, and the States later selected 940,000, and right below that, which is more or less a power dam, would be the Crystal Reservoir of 40,000 acre-feet.

Down near the mouth of the Gunnison River where it joins the Colorado near Grand Junction is the Whitewater site which has 880,000 acre-feet.

Then going on downstream at the end of the lower basin, we have the large Glen Canyon site with a capacity of 26 million acre-feet.

Making a total of 48,555,000 acre-feet.

Senator WATKINS. When you are talking about the 48 million acre-feet that is necessary to regulate the river, you are not now stating that all of that is necessary in the beginning or initial phase of construction?

Mr. LARSON. What is that?

Senator WATKINS. You are not claiming that all of that is necessary now, to begin construction now, of that number of reservoirs?

Mr. LARSON. No. In my statement I stated that theoretically the upper basin States could use 58 percent of its apportioned water without storage, but they would only get into difficulty. They could not fill the reservoirs and they ultimately could never use 42 percent of their water allotment.

Now, Mr. Chairman, I must correct my statement on the 48,550,000. That also included the Navajo Reservoir, which in our report of 1950 we had as 1 of the team of 10 dams.

Since that time, with the cooperation of New Mexico and working out the Navaho project with the Indians, and the San Juan-Chama, the Secretary is recommending in his report, which is agreeable to New Mexico, a transfer of the Navaho Reservoir out of the team of 10 dams. Now it is called a participating project for the benefit of the three that I mentioned, the San Juan-Chama, south San Juan division, and the Shiprock division of the Navaho project.

Senator WATKINS. What you are now recommending for authorization for the initial phase are two projects. Those are Echo Park and the Glen Canyon on the main stem of one of the large tributaries.

Mr. LARSON. Yes, those were the two in the Secretary's supplemental report.

Senator WATKINS. But if this program is worked out to take care of the waters of the river and to regulate it so that we can deliver to Mexico and to the lower basin States, the water they are entitled to under the compact of 1922, and still leave some for the upper States you must have all of these dams; is that right?

Mr. LARSON. That is correct. They may change the capacity of some like Curecanti. If the large Curecanti is not built, storage has to be found somewhere else.

Senator WATKINS. What you are planning is an overall development that will completely regulate the river and make it possible for the lower basin users to get their right and at the same time get as much as possible of the right given by the compact with the upper basin States.

Mr. LARSON. And at the same time provide for sediment deposition for 200 years.

Senator WATKINS. Your answer is largely yes to what I asked?

Mr. LARSON. Yes.

Senator WATKINS. I noticed you did not say yes, but you went off with a qualification.

Are there any other reasons why this overall program must be adopted before the full use of the regulation of the river upstream can be had?

I direct your attention to what I have in mind, which is the power to be developed. What part does that play in it?

Mr. LARSON. The power from these nine dams could certainly all be used in a comparatively short time. I think it is very fortunate to have a long-range plan that is feasible.

So whatever is authorized now will fit in with the ultimate picture and every step would be feasible as we go along.

Senator WATKINS. Would this program be feasible without the power revenue that would come from the building of all these dams?

Mr. LARSON. I know of no other way to finance the irrigation projects because they are all in excess of the water users ability to repay in a reasonable period of time which we have used in this plan as 50 years.

Senator WATKINS. In order to implement the 1922 compact, you certainly would have to have some way of financing the building of all these dams?

Mr. LARSON. That is correct.

Senator WATKINS. Is the fact that these reservoirs are made necessary by the terms of the treaty with Mexico keeping in mind the supply of the water as indicated in the records over the years?

Mr. LARSON. They are absolutely necessary if the upper basin States are to use their alloted water.

Senator WATKINS. Is there any other way they could get the water without the power project being built?

Mr. LARSON. They could go along for a while, as I stated in my statement there, and then they could divert no more, and meet the commitment under the 1922 compact which requires the upper basin States to deliver not less than 75 million acre-feet in any consecutive 10-year period. There may be some surplus that would have to be delivered.

Senator WATKINS. Now, has there been a period of time within the last 10 or 15 years when the flow in the river has been below what was anticipated at the time the 1922 compact was framed?

Mr. LARSON. The lowest cycle we have on record is the 10-year low cycle of 1931 to 1940, when the historical flow of the river was 10,151,000 acre-feet at Lee Ferry.

Senator WATKINS. For a 10-year period?

Mr. LARSON. Yes. And that shows the necessity for carrying water over long periods of time, 20, 25 years, or even maybe longer.

Senator WATKINS. This ought to be obvious, but I am going to ask the question anyway, because we do not always see the obvious, that a program which does not take into consideration the lowest water supply would not be worth anything at all; would it?

In other words, you could not build powerplants when you would not have any power, and have 1 year when you wouldn't have any water to deliver to plants?

Mr. LARSON. The low cycles are the determining factor in establishing the capacities of reservoirs.

Senator WATKINS. Referring to Echo Park Dam, how far above stream bed would it actually rise?

Mr. LARSON. What is it?

Senator WATKINS. How far above the stream bed will it actually rise?

Mr. LARSON. It is 690 feet above bed rock and 520 feet above stream bed.

Senator WATKINS. So it is important to know the difference that there is considerable space below stream bed down to bed rock.

Mr. HARRISON. Senator Bennett is also with us, but he says he does not want to ask any questions at this time.

Senator BENNETT. A Senator always changes his mind. While we have the map before us, and that long pointer, would you point out to the group where Browns Park and Lodore Canyon is? That came into the discussion this morning.

Mr. LARSON. If it is all right, Mr. Chairman, I will have Mr. Jacobson point that out, because he has gone through all the canyons.

Mr. JACOBSON. The section here [indicating] is the gateway to Lodore, and it is near the boundary of the monument. The capacity of the reservoir above that point lies largely in Browns Park.. This is the boundary of the monument at this point here [indicating].

Mr. HARRISON. Can you identify that sufficiently so it will be distinguishable on the record as printed?

Senator BENNETT. If the dam had been built in Lodore Canyon, would the body of the lake that backed up behind it have been in Dinosaur National Park or would it have been outside of it?

Mr. JACOBSON. Can I have the question again?

Senator BENNETT. I was asking if the dam had been built approximately, to use the general term, in Lodore Canyon, would the lake backed up behind it have been within the boundary of the Dinosaur Monument or outside of it?

Mr. JACOBSON. There were two sites involved in that particular withdrawal. One was about 3 miles below the boundary, and the other one about 6 miles. Both are inside the monument. The monument boundary is 23 river miles above Echo Park damsite, so it will extend possibly one fourth the way.

Senator BENNETT. So the dam would have been within the boundaries of the monument and part of the lake would have been within the monument?

Mr. JACOBSON. Yes.

Mr. ASPINALL. What would have happened to the rapids, Mr. Jacobson, if the Browns Park project had been built? What would have happened to the rapids?

Mr. JACOBSON. The liveliness of the rapids, of course, is due largely to the volume of the water that passes over them.

Mr. ASPINALL. At what time of the year?

Mr. JACOBSON. In the flood season of the year. During the low-flow season it is very difficult to maneuver between the rocks. A dam at that point, providing capacity above for power and river regulation would cause an equated river, and the rapids would not be what they are today.

Senator BENNETT. I would like to ask one more question on that same point. Can you give us any estimate of the approximate volume of water that would have been stored had that dam been built instead of the recommended Echo point? I realize that is a hypothetical question because the dam was not built and probably the studies were not made out to the end.

Mr. LARSON. The capacity is very, very much smaller. We can get that, but I do not recall it.

Mr. HARRISON. Is that all, Senator?

Senator BENNETT. Yes.

Mr. HARRISON. Mr. Saylor?

Mr. SAYLOR. Mr. Larson, the nine sites which have been specified by you in response to Senator Watkins are not all of the available sites in the Upper Colorado River Basin; are they?

Mr. LARSON. No, there are 2 or 3 more sizable sites.

Mr. SAYLOR. You are familiar, I believe, Mr. Larson, with House Document 419 of the 80th Congress, called The Colorado River?

Mr. LARSON. Yes.

Mr. SAYLOR. Your name appears in there quite frequently.

Mr. LARSON. I have not looked at it for a few years.

Mr. SAYLOR. Well, there is in this survey in House Document 419 a number of other sites in the upper basin that are specified, other than the ones that have been designated here on the map.

Mr. LARSON. Yes, there are others mentioned in there.

Mr. SAYLOR. Yes. You are still the director of region No. 4; is that correct?

Mr. LARSON. Yes, sir.

Mr. SAYLOR. And as director of region No. 4, this area comes within your jurisdiction?

Mr. LARSON. Yes, sir.

Mr. SAYLOR. Have you made the same kind of survey on the other available damsites that are referred to in House Document 419 that you have made so far on the nine which you have testified to here under the proposed plan now for the development of the upper Colorado River Basin?

Mr. LARSON. Some of them. We have drilled Dewey, for example, and went over it. We have a detailed topographic map and so on. We did not drill New Moab site because the reservoir would extend into the Arches National Monument.

Mr. SAYLOR. What others have you drilled or done work on besides those two?

Mr. LARSON. We have made some studies at Bluff but of course, we do not have much water there after the upstream projects are built; also the Desolation site. We studied the Dark Canyon site, but that is down in the Glen Canyon area, so that was eliminated for being within the Glen Canyon Reservoir site.

Mr. SAYLOR. So that in the upper Colorado River Basin there are sites wherein water could be stored for the purpose of enabling the upper basin States to use the water allocated to them in the compact of 1922, and in furtherance of their compact between the upper basin States dividing the water that has been allocated to them in 1948. Is that correct?

Mr. LARSON. There is, but not without material loss in evaporation and increase in cost of power generation.

Mr. SAYLOR. We will come to those points in a minute. The thing that I am trying to bring out is that you have not, by selecting these nine sites, wanted this committee or the general public to come to the conclusion that these are the only available sites in the upper Colorado River Basin wherein water can be stored?

Mr. LARSON. That is true. But we certainly mean to leave the impression that these are the best ones by far.

Mr. SAYLOR. That may be. That is a matter now of your opinion, that these are the best sites, is that correct?

Mr. LARSON. Yes, sir.

Mr. SAYLOR. Now, none of these nine projects which you have designated as storage areas have any irrigation features connected with them directly, is that correct?

Mr. LARSON. Yes, some of them may have. At Whitewater, water can be diverted from there, and Curecanti and Flaming Gorge also. You can say directly or indirectly that the storage project provides regulation so that the water-use projects can divert higher up on the tributaries. To me they are all directly connected with irrigation. Although they do not divert out of all of them, they are directly connected with them just the same. Whether the reservoir is above the lands or below the lands, if you get water by replacement, it still serves the same purpose.

Mr. SAYLOR. There will be power generated at each one of these nine sites, is that correct?

Mr. LARSON. Yes, sir.

Mr. SAYLOR. You, I think, signed the regional directors' report of December 1950, on the Colorado River storage project and participating projects?

Mr. LARSON. Yes, sir.

Mr. SAYLOR. Do you have a copy of that available there?

Mr. HARRISON. Might I suggest at this time that if there are any other reports which you would like to have reference to, Mr. Saylor, that you give some information on them so that they may be sure to have them here?

Mr. SAYLOR. The only other reports that I wanted are the participating reports which were submitted to supplement this, and I think Mr. Larson is familiar with them all because he signed them.

They are the participating reports for the projects on the basin, which in 1950 were 11 in number.

Mr. LARSON. Yes. I have the 1950 report on the Colorado River storage project, and the supplemental project reports. We may not have them all, but we can have them tomorrow.

Mr. SAYLOR. Is it now true, Mr. Larson, that you, as the director of that area, look at this entire unit as one, that you look at the overall picture as one unit?

Mr. LARSON. Well, as a comprehensive plan.

Mr. SAYLOR. That is right. It is a comprehensive plan. So that when you said that there were wheels that participated in this thing, the wheels that you had specified will all have to turn eventually in each one of these nine projects?

Mr. LARSON. Yes, sir.

Mr. SAYLOR. And if you moved your dams to other sites to gain additional storage, you would have additional wheels that would be a part of this whole overall program, would you not?

Mr. LARSON. Maybe. There might be places where it would cost more than steam and they would not be authorized.

Mr. SAYLOR. But the important thing that you are interested in, you have stated here, is that you want the upper Colorado River to be able to store its water and to use that water not just for the creation of power—that is not the principal reason for your recommending all of these dams—you are recommending them, are you not, so that the upper Colorado River will be able to deliver and fulfill its obligation to deliver water at Lee Ferry?

Mr. LARSON. No. The primary purpose is to develop agriculture, industry, and serve municipal populations, and at the same time meet delivery of water at Lee Ferry with the water to which the

lower basin is entitled; to use power as the vehicle to pay those costs that are over and above the ability of the irrigators to repay.

Mr. SAYLOR. Well, the irrigators have no duty in the upper basin to deliver water, do they?

Mr. LARSON. Not unless they should take what belongs to the lower basin or try to take it. It is the States' responsibility.

Mr. SAYLOR. The compact says that the upper basin had 7½ million acre-feet of water, is that not right?

Mr. LARSON. No. The compact said that the upper basin States can deplete the river, or words to that effect, up to 7½ million acre-feet annually, providing they do not cause the flow of water at Lee Ferry to be less than 75 million acre-feet in any consecutive 10 year period. That is what it says to me.

Mr. SAYLOR. Well, then, if we develop parts of the upper Colorado River, you can do it in some of the places you specified, and there may be other places that could be eliminated. One I have referred to in particular is Echo Park, Split Mountain. In other words, you have said, have you not, that there are other places in the upper Colorado River that you could store water? Is that not right?

Mr. LARSON. We have not found where we can replace that——

Mr. SAYLOR. Answer yes or no. Are there not other places in the upper Colorado River other than the nine that you have designated that you can store water in?

Mr. LARSON. Yes; like Dewey.

Mr. SAYLOR. There may be some features about them that are not as desirable. Is that not true?

Mr. LARSON. That is true.

Mr. SAYLOR. So that this theory that you have of being part of an integral plan, that plan is principally the brain child of yourself as director of region No. 4, is it not?

Mr. LARSON. No, sir; Echo Park was selected before I became regional director in 1943. It was drilled before that by another man in charge of planning.

However, I will admit that the longer I have gotten into it, the better it looks to me.

Mr. SAYLOR. I am delighted to find that the Bureau drilled as far back as 1943, because it seems there was nothing said in the President's order which withdrew this area in which Echo Park Reservoir site is located. If this was such an excellent site, and the Bureau knew so much about it, could you tell us if you know any reason why the President would not have included it in his withdrawal order?

Mr. LARSON. They did not know as much about it when the withdrawal was made, but soon after that, in 1939 or 1940 they drilled it. But our thinking after we got into the Colorado River has changed quite a bit when we realize the problems that we have making delivery at Lee Ferry, silt retention, and the fact that there are more projects, potentialities, than we have water, how valuable it is, and the toll of evaporation, and the lack of attractive large reservoir sites. We have learned a lot since 1938.

Mr. SAYLOR. In your report of 1950, you can tell me where in that report you have estimated the costs of building these nine reservoir sites?

Mr. LARSON. What is it you want, the cost estimates?

Mr. SAYLOR. Yes. I want to know where you have the cost estimates of the nine reservoir sites which have been testified to here this afternoon.

Mr. DAWSON. I refer the gentleman to the report here that is before you. I can give you the page number.

Mr. SAYLOR. I do not want your testimony, Mr. Dawson, I am only trying to find out from the man who drew it up, so that the record can clearly show where they are. I think they are just ahead of page 50.

Mr. LARSON. Page 7?

Mr. SAYLOR. I think on page 50 you will find the chart.

Mr. LARSON. On page 7 are the 10 dams, estimated construction cost, as a summary.

Mr. SAYLOR. Is that in the letter of transmittal?

Mr. LARSON. The regional director's letter. In our explanations here today, we have brought these costs up to the 1953 index, and made some changes, some other changes.

Mr. SAYLOR. Those 10 projects that appear on page 7 of the letter of transmittal, are the same 9 which you referred to in your testimony here this afternoon, and include Navaho, which you explained to Mr. Regan in his questioning as to why it was eliminated and now instead of being a storage project is a participating project?

Mr. LARSON. That is correct.

Mr. SAYLOR. I believe in addition you have the estimates of the total costs of these 10 projects which are a part of this report? Is that correct?

Mr. LARSON. That is the same table. It is just a duplication. In one case it is pulled up into the regional director's report. On page 49, there is a duplicate table.

Mr. SAYLOR. Now, following page 49, you have an itemized breakdown of these various projects, is that correct?

Mr. LARSON. Yes, sir.

Mr. SAYLOR. Now, have you ever made a similar breakdown for the other dam sites which you have referred to here in your testimony?

Mr. LARSON. Yes, sir.

Mr. SAYLOR. Such as Desolation?

Mr. LARSON. I don't know the details. The chief engineer worked up many estimates, such estimates on Dewey, and our own office has made up estimates on Desolation, and we have it also at New Moab.

Mr. HOSMER. I wonder if while he has that table there we can get the total 1950 costs on Glen Canyon and Echo Park?

Mr. SAYLOR. I am going to get to that. Now, would you make available for the members of this committee the other reports which you have made, the surveys you have made, for additional storage areas in the upper Colorado River Basin?

Mr. LARSON. We can produce that, but I do not think we have all of this with us from Salt Lake City.

Mr. SAYLOR. There is no need, sir, to have them here today or within the next week. It is just something that the committee would like to have. I know those of us who are interested in the upper Colorado River would like to see all of the studies that have been made.

Mr. ASPINALL. Do I understand that my colleague is asking for reports on some 253 reservoir sites?

Mr. SAYLOR. No, sir; I did not ask for that. I only asked for the information that was available upon studies that have already been made. If there are 2, 3, 4, 250 or 5,000, I do not care. I think we ought to have them.

Mr. ASPINALL. I thought you ought to know that there are approximately 253.

Mr. SAYLOR. I have not heard anything like 253 referred to this afternoon. But if there are 253, I am satisfied that Echo Park becomes much more easily replaceable by 253 than it is by 2, 3, or 5 that I heard tell about before.

(The information requested is as follows:)

DESCRIPTION OF MAJOR STORAGE AND POWER SITES IN UPPER COLORADO RIVER BASIN

Over the past half century a large number of storage and power sites in the upper Colorado River Basin have been investigated by private concerns, State organizations, and Federal agencies such as the Geological Survey and the Bureau of Reclamation. In each investigation the purposes to be served controlled the extent of study at each site. For the most part the primary objective was to provide storage of spring floods for direct application to lands during summer periods when the streamflow decreased below the rights of earlier appropriators.

Early in the Bureau of Reclamation's search for sites to store excess river runoff in years of high flow for subsequent release in compliance with article III (d) of the Colorado River compact it became apparent that development of smaller reservoirs for this purpose was more costly and extremely wasteful of water through evaporation. It was evident that long-time holder storage should be accomplished by storage in large reservoirs at higher elevations where evaporation rates were lower. It was also necessary in the consideration of potential sites to select developments which would serve purposes other than river regulation to assure feasibility and provide for maximum repayment since irrigators and other upper basin water users could not stand all of the costs of this long-time holdover storage in addition to the expensive facilities required for individual project service.

The following discussions of individual sites are separated by tributary basins and river profiles are attached to assist in following the narrative.

GREEN RIVER BASIN

Kendell Dam and Reservoir site is located at the headwaters of the Green River about 120 miles north and east of Green River, Wyo. The site is limited in economical storage to approximately 500,000 acre-feet. Because of its size and since its storage is closely tied in with irrigation developments downstream any use for long-time storage would be of little value. Site investigations have been made in connection with the Seedskadee and other small potential irrigation projects in that area.

Flaming Gorge Dam and Reservoir site: A number of dam sites have been investigated in the canyon section of the Green River from near the Wyoming-Utah State line to the Ashley Dam site 28 miles downstream. Several sites in the Flaming Gorge and Horseshoe Canyon section were drilled by the Bureau of Reclamation in 1907 and 1908 (21 holes) and by the Utah Power & Light Co. (31 holes), under a preliminary power permit issued by the Federal Power Commission in 1923. This company also cooperated with the Geological Survey during the period 1918–22 in making a plan and profile survey of the Green and Yampa Rivers from Greenriver, Utah, to Green River, Wyo., to be used for studies of potential hydroelectric developments

Studies in conjunction with central Utah project investigations led to the selection of the Ashley Dam site and plans for a reservoir with nearly 4 million acre-feet of capacity from which a gravity diversion could be made to the south slope of the Uinta Mountains. This reservoir would extend upstream nearly to Green River, Wyo., inundating such dam sites as Horseshoe Canyon and the original Flaming Gorge and utilize the same reservoir basin as the Red Canyon site.

Other sites in upper Green River Basin between Green River, Wyo., and the Kendall Dam site such as Big Basin, Fontenelle, and Riview are limited by terrain

or streamflow to capacities of considerably less than one-half million acre-feet and are therefore of value primarily for direct water-use project service.

Swallow Canyon Dam and Reservoir was suggested in USGS Water Supply Paper 618 by Ralf Wooley (1930) as an alternate to the Browns Park (Lodore) site since the geological exploration by the Bureau of Reclamation in 1907–9 (31 holes at 2 sites) indicated serious foundation difficulties and since the added storage possible with a high dam at Lodore would be of little value with regulation upstream by Flaming Gorge Reservoir. The Swallow Canyon development would be essentially a power drop with capacity only for reregulation.

Echo Park Dam and Reservoir: Mr. Wooley in his report points out the advantage of a storage and power development to regulate and use the combined flows of the Green and Yampa Rivers. Although he suggests a dam of 300 feet at the site, which was probably considered to be a very high dam at the time, later studies indicate that an economical dam over 500 feet high could be built at the site to furnish long-time holdover storage capacity. The reservoir formed by a 300-foot dam would have contained less than 1 million acre-feet and would have been of little value as a long-term holdover site. The investigations of this site are outlined in the Colorado River storage project report. Echo Park Reservoir would inundate both the Swallow Canyon and Lodore Dam sites.

Split Mountain Dam and Reservoir is essentially a second power drop below Echo Park Dam. Investigations are outlined in the Colorado River storage project report, and Mr. Wooley's report.

Juniper Dam and Reservoir was studied in considerable detail. Dam and reservoir topography was obtained and three holes were drilled in 1915. The reservoir capacity was limited to about 1½ million acre-feet by the town of Craig, Colo. The dam site and nearly all of the reservoir basin would be inundated by the Cross Mountain Reservoir.

Cross Mountain Dam and Reservoir has long been recognized as a good power development and was considered as a secondary power drop below Juniper. The reservoir capacity would be limited by the Juniper Dam to about 1 million acre-feet. Recent studies under the Colorado River storage project have indicated that the cost of a single dam at Cross Mountain to store 5,200,000 acre-feet is less than the cost of a combination of a small dam at Cross Mountain and a dam at Juniper to store about 2½ million acre-feet. The investigations of this site are outlined in the Colorado River storage project report.

Little Snake River Basin has inadequate runoff and lacks good sites for long-time storage.

Blue Mountain Dam and Reservoir has been given preliminary study as a power site. It is located in the canyon section of the Yampa River just downstream from the confluence of the Little Snake and Yampa Rivers. Storage at the site would be limited by the Cross Mountain powerplant to about 115,000 acre-feet. Because of its small size it would be of negligible value as a holdover storage reservoir.

Duchesne River Basin: The streamflow and storage sites in this basin are included under the central Utah projects for irrigation development. No significant contribution to long-time holdover storage can be developed.

White River Basin: The Buford site is the only significant storage site on the White River and is being considered for development in connection with irrigation in the White and Yampa River Basins. It is located upstream from Meeker, Colo., and is limited to about one-quarter million acre-feet It would make little contribution to long-time holdover storage

Desolation and Gray Canyon dam and reservoir sites offer the only large-capacity storage alternative in the Green River Basin. Development of the Desolation site would limit Gray Canyon storage to 490,000 acre-feet instead of the 2 million acre-feet presently planned. The Desolation Reservoir to replace Echo Park and the reduction in capacity at Gray Canyon would have a total capacity of 7,800,000 acre-feet and would extend upstream nearly to Jensen, Utah. The reservoir would have a maximum area of 113,000 acres and would result in added evaporation averaging 200,000 acre-feet annually. System power would be reduced by 242,000 kilowatts. Under present procedures for analysis development of this site would not be economically feasible. Status of investigations and a cost estimate are attached.

UPPER COLORADO RIVER BASIN

Depletions by existing and potential water-use projects in the headwaters area of the Colorado River and its tributaries upstream from the Roaring Fork River rule out any possibility of major long-term holdover storage. The location of

the main line of the Denver and Rio Grande Railroad in the canyon bottom further complicates any possibility for power development when the high cost of railroad relocation is considered. The Roaring Fork River Canyon is too precipitous to permit development of large capacity storage. Between the Roaring Fork confluence and Grand Junction, Colo., is the DeBeque dam and reservoir site identified in the Bureau of Reclamation reconnaissance report on the Cliffs-Divide project.

DeBeque dam and reservoir site development is complicated by the high cost of relocating about 30 miles of main line Denver & Rio Grande Western Railroad Co. railroad track. The dam site is located on the Colorado River about 20 miles northeast of Grand Junction, Colo Preliminary study indicates that about 2¼ million acre-feet of storage could be obtained, however, at a very high cost Economic feasibility will be dependent upon the use of site storage for future irrigation and industrial purposes as well as power production. The limited capacity of the site, its high streamflow, and its competitive uses makes any holdover storage contribution very minor.

Gunnison River Basin storage sites have been studied quite extensively. Of the many sites investigated all but the potential 2½ million acre-foot Curecanti Reservoir have only local regulatory values. The potential Whitewater Reservoir located near the confluence of the Gunnison with the Colorado River is also included as a Colorado River storage project unit but has only a limited value as a holdover storage site Date on these two sites are included in the Colorado River storage project report.

Dolores River Basin Limited streamflow, present in-basin irrigation, and present and potential water exports to the San Juan Basin for irrigation rule out any possibility for economical longtime holdover storage in this basin.

Dewey dam and reservoir site on the Colorado River 3 miles downstream from the Dolores River confluence is the best alternate for Echo Park since the New Moab site downstream would encroach upon the Arches National Monument. The reservoir capacity to replace storage at Echo Park would total 6,100,000 acre-feet. The maximum water surface area of 64,000 acres is 21,000 acres greater than at Echo Park, and the added reservoir evaporation loss would average 120,000 acre-feet annually. System power output would be reduced by 188,000 kilowatts. Status of investigations and a cost estimate are attached.

New Moab Dam and reservoir site is located 24 miles downstream from the Dewey Dam site and about 6 miles upstream from Moab, Utah. This site is more favorable than Dewey but would encroach into the Arches National Monument System storage would be replaced by a 6 million acre-foot reservoir. The maximum water surface area would be 55,000 acres and the added loss over that at Echo Park and Split Mountain would average about 100,000 acre-feet annually. System power output would be reduced by about 149,000 kilowatts. Status of investigations and a cost estimate are attached.

SAN JUAN RIVER BASIN

Large existing and potential water uses in this basin restrict the storable runoff. The only feasible site on the San Juan River which might develop a significant amount of holdover storage is the Chinle (Bluff) site.

Chinle Dam and Reservoir is located on the San Juan River about 12 miles downstream from Bluff, Utah, and 132 miles upstream from its confluence with the Colorado River. With development of the Navajo, San Juan-Chama and other smaller projects, the streamflow at this site would be reduced by nearly 40 percent. The principal advantage of storage at this site would be as a sediment trap upstream from Glen Canyon Reservoir. About one-third of the sediment now passing Lees Ferry originates upstream from Chinle Dam site. To replace Echo Park storage a 7 million acre-foot reservoir would be required. The maximum water surface area would be 70,000 acres and the added evaporation loss about 100,000 acre-feet if vegetal growth on the silt beds on the reservoir fringes could be controlled. However, the high cost of site development together with small streamflow and low power head combine to make this development infeasible under present procedures for project analysis.

Status of investigations and a cost estimate are attached.

Goosenecks and Slickhorn sites downstream from Chinle on the San Juan are limited storage sites of value only as secondary power drops if storage and sediment retention is provided at Chinle.

Navajo Dam and Reservoir is described in the Colorado River storage project report. The entire storage capacity possible at the site would be required for

direct water supply by the Navajo project and replacement storage required by the San Juan-Chama project.

COLORADO RIVER BELOW GREEN RIVER CONFLUENCE

Development of the Glen Canyon Dam and Reservoir as described in the Colorado River storage project report to a total capacity of 26 million acre-feet would back water upstream from the dam site (15 miles above Lees Ferry) 186 miles up the Colorado River and 71 miles up the San Juan River. This reservoir would inundate the Great Bend power site on the San Juan River and the Dark Canyon site on the Colorado River. The remaining possibility for storage and power in this reach of the river is at the Junction site.

Junction Dam and Reservoir site is located on the Colorado River just below the confluence of the Green River and at the head of Cataract Canyon. An attempt to drill the site in 1914 was not successful. Holes were put down in 4 places, 1 to a depth of 125 feet but bedrock was never reached. Subsequent planning was limited to consideration of a low rock fill structure to provide reregulation for power development by tunnels through Cataract Canyon. The reservoir would be limited in upstream extent by the town of Moab, Utah, to a total capacity of about one-half million acre-feet. This limited capacity would not contribute to long-time river regulation.

Status of investigations—new Moab unit

1. Engineering surveys.—Topographic surveys have been made of the new Moab (Nigger bill) Dam site and part of the reservoir by the Geological Survey and the Bureau of Reclamation and maps have been prepared at a scale of 1:24,000 with a contour interval of 20 feet up to elevation 4,400 feet.

2. Power surveys.—Preliminary power production and rate studies have been made for the new Moab unit.

3. Water supply studies.—Hydrologic data recorded near the Dewey site is applicable to the new Moab unit. Preliminary reservoir operation studies have been made to determine the value of storage at this site as an alternative to Echo Park. Studies of sediment inflow and evaporation at the site have been made.

4. Geology and exploration.—No geologic exploration work has been done at the new Moab site.

5. Economic studies.—Preliminary economic studies have been made for the new Moab unit.

6. Plans and estimates.—Preliminary designs and estimates have been prepared for various sizes of dams at the new Moab site Preliminary estimates of railroad location have been made.

Status of investigations—Dewey unit

1. Engineering surveys.—A preliminary dam site survey has been completed for the Dewey unit. Reservoir topographic survey maps have been prepared to elevation 4,300, at a scale of 1 inch = 2,640 feet and from elevation 4,300 to 4,430 at a scale of 1 inch = 1,000 feet.

2. Power surveys.—Preliminary power production, transmission, rate, and market studies have been made for the Dewey unit both as an independent unit and as an integrated part of the Colorado River storage project.

3. Water supply studies.—Hydrologic data have been recorded near the Dewey site and preliminary reservoir operation studies have been made to determine the value of storage at this site in the formulation of the plan of the Colorado River storage project and as an alternative storage site to Echo Park. Studies of sediment inflow and evaporation have been made.

4. Geology and exploration.—The Dewey Dam site was first drilled in 1918. Later during 1941, 1942, and 1943 preliminary type foundation and materials explorations were completed. The extent of these investigations is adequate for project report purposes.

5. Economic studies.—Preliminary economic studies have been made for the Dewey unit.

6. Plans and estimates.—Preliminary designs and estimates have been prepared for various sizes of dams at the Dewey site. Preliminary estimates of railroad relocation have been made.

Status of investigations—Desolation unit

1. Engineering surveys.—USGS river sheets have been prepared for the reach of the Green River which includes the Desolation Dam site and reservoir. No detailed dam-site topography has been prepared.

2. Power surveys.—Preliminary power production and rate studies have been made on the Desolation unit.

3. Water supply studies.—Hydrologic records have been computed and preliminary reservoir operation studies have been made to determine the value of storage at Desolation as an alternative to Echo Park. Studies of sediment inflow and evaporation have been made.

4. Geology and exploration.—No geology exploration work has been done at the Desolation site.

5. Economic studies.—Preliminary economic studies have been made for the Desolation unit.

6. Plans and estimates.—Preliminary designs and estimates have been prepared for various sizes of dams at the Desolation site.

Status of investigations—Chinle (Bluff) unit

1 Engineering surveys.—In 1914 the Bureau of Reclamation conducted limited field investigations at the Chinle site, including the preparation of a rough topographic map of the dam site at a scale of 1 inch=100 feet In 1921 the Geological Survey made a survey of the lower San Juan River from its mouth to the mouth of Chinle Creek, 133 miles upstream, and prepared topographic maps (3 sheets) at a scale of 1 inch= one-half mile, with contour intervals of 5 feet on the river and 20 feet on land. The upper end of this survey covered the Chinle site. In 1946 the Bureau of Reclamation completed an aerial survey of the San Juan River from its mouth to near the 4-corner intersection of the Utah, Colorado, New Mexico, and Arizona State lines to a scale of 1 inch= 1,000 feet.

2. Power surveys.—Preliminary power production, transmission, rate, and market studies have been made for the Chinle unit both as an independent unit and as an integrated part of the Colorado River storage project.

3. Water supply studies.—Hydrologic data have been recorded at the Bluff site, and preliminary reservoir operation studies have been made to determine the value of storage at this site in meeting the Lee Ferry flow compact commitment. Studies of sediment inflow and evaporation have been made.

4. Geology and exploration.—No geologic exploration work has been done at the Chinle site.

5. Economic studies.—Preliminary economic analyses have been made for the Chinle unit during the formulation of the Colorado River storage project and later in searching for an alternative to replace Echo Park.

6. Plans and estimates.—Preliminary designs and estimates have been prepared for various sizes of concrete and earth dams at the Chinle site.

OFFICIAL ESTIMATE—Continued

Project: Colorado River storage project alternative—Date, January 1954—Con.

DESOLATION UNIT—Continued

Uniform cost classification	Description	Total estimate
11	POWERPLANTS—HYDRO—continued	
13	Transmission system Transmission lines, switchyards, substations, etc.	28,200,000
15	General property Towns, utilities, and general service facilities	2,700,000
	Total, all classes	201,000,000

Mr. SAYLOR. Now on your project breakdowns which appear between pages 49 and 50 of your preliminary report, would you turn to the breakdown of Glen Canyon Reservoir site? Will you give us for the record your estimates as of August 14, 1950, which, according to that sheet, shows the prices which you used in arriving at the cost of the Glen Canyon unit? Tell me what is the total cost of the Glen Canyon unit as of that time?

Mr. LARSON. The total cost of the Glen Canyon unit, with its appropriate share of the transmission system as listed, was $363,900,000, and it was prepared from detailed estimates prepared by the chief engineer in Denver. This is a summary of his studies.

Mr. SAYLOR. And the figures which you have used in your statement today show what as the estimated cost of the Glen Canyon unit today?

Mr. LARSON. I did not get your question, sir.

Mr. SAYLOR. According to the statement which you submitted in the record today, what is the estimated cost of the Glen Canyon unit?

Mr. LARSON. $421,270,000.

Mr. SAYLOR. And that was made up in the same manner in which your report was made in 1950, and just brought up to date?

Mr. LARSON. The costs were brought up to date, but the allocation to transmission system is different.

Mr. SAYLOR. What is the difference in the allocation of transmission?

Mr. LARSON. Well, we have been refining our studies and some of the procedures somewhat in our work so the allocations may be a little different. The transmission system is somewhat different, which affects the estimated cost. I would have to go into that to determine what that is. Out of the $421,270,000 cost in this table submitted with my statement today, $133,600,000 is for transmission, and you will note from the table following page 49 in the report, to which you referred, the transmission costs there are $108 million.

Mr. SAYLOR. Now, this Glen Canyon unit would produce power at approximate what per kilowatt-hour?

Mr. LARSON. I cannot give you that for Glen, because we were working the whole system into a rate of 6 mills to keep a fairly uniform average rate that the other units can come on incrementally as time goes on, and we would still have a uniform rate less than steam.

Mr. SAYLOR. In other words, you are not able to tell this committee, the Department is not able to tell this committee, whether or not Glen Canyon can produce power for 2 mills a kilowatt-hour or for 10 mills a kilowatt-hour?

Mr. LARSON. Yes; I can tell you that. It produces 800,000 kilowatts. That is approximately half of the output of the total, for about one-third of the cost.

The information contained in the Secretary's report shows the cost of power delivered to the market at Glen Canyon as 4.7 mills.

Mr. SAYLOR. Will all of the power produced in the Glen Canyon Reservoir site be marketed in the upper Colorado Basin?

Mr. LARSON. That I do not know. But it could be. The upper basin from our forecast shows that in 20 or 25 years it can use the total output from all 9 plants. Whether any will go down to California and Arizona in the meantime is not for me to say.

Mr. RHODES. Mr. Larson, for some purposes, Arizona is deemed to be an upper basin State. You make a point there that is rather interesting to me. The way I read this bill, the power is to be marketed in the upper basin States insofar as possible. If the power is marketed in the lower basin States or in other States, the contract would be of irrevocable nature so that the power may be recaptured in the event the power is needed in the upper basin States. Is that your understanding?

Mr. LARSON. I believe that is a paragraph in the bill that you referred to. It will come back or, if that is not practicable, there would be an adjustment of rates or something.

Mr. RHODES. As I read the bill, it provides that the contracts must state that the power may be recaptured if it is needed in the upper basin which sort of sets up a priority customer of the upper basin States. Is that your understanding of it?

Mr. LARSON. I think the bill purports to be that, but I think it speaks for itself. I would not want to interpret it.

Mr. RHODES. I would like to have you interpret it, because I am wondering if you think of Arizona in this particular instance as an upper basin State or a lower basin State? In other words, is the State of Arizona, which is partially in the upper basin, a preferred customer or is it not a preference customer insofar as this power is concerned?

Mr. LARSON. I think the way the bill is written it gives preference to the upper basin States. That is what it says to me.

Mr. RHODES. In your planning, now, you mentioned that there was $130 million in here for transmission from Glen Canyon. I presume you have a transmission grid for marketing the power from Glen Canyon. Might I ask you whether or not in planning that grid you have plans to transport any considerable amounts of power into the State of Arizona?

Mr. LARSON. I will have to swallow before I answer that, but I will do it. We have done it this way, Mr. Rhodes. We have figured on a transmission system in the upper basin to deliver kilowatt-hours to four States of the upper division, on this basis: If some power should go down, we will say, to Arizona, and if you do not deliver 800,000 kilowatts from Glen Canyon upstream, you immediately reduce the cost of your transmission, and by whatever that reduction was in our studies, it would be applied either in rates or lines to any power going down. That is the way we have assumed it.

In other words, we have assumed our studies on a complete transmission system in the four States of the upper division as a basis for arriving at a mill rate.

Mr. RHODES. Then I guess your answer to me as to whether you planned a transmission grid from Glen Canyon into the State of Arizona would be no?

Mr. LARSON. It is flexible. There is enough money in our estimates to go down there some distance. I do not know how far. It depends on how much power goes down.

Mr. RHODES. In your planning as to the marketability of this power, you stated that in 25 years all of the power can be marketed in the upper basin States. In that planning, do you have in mind marketing that power in the State of Arizona as well as the other upper basin States?

Mr. HARRISON. Will the gentleman yield there? Possibly on page 13 of the bill, where Arizona is definitely stated to be on in the upper Colorado Basin, I think that will cover that point as clearly as can be done.

Mr. RHODES. I agree with the chairman that it seems to so state, but I would like to have the Department's planning according to the testimony of this witness. I would like to have the Department's planning in the record. In other words, you are planning as to the places in which this marketing will take place in the next 25 years.

Mr. LARSON. Yes. Our planning was to base the rate on all the power being delivered to the upper basin so that if power went down below, to Arizona, the upper basin States or the lower basin, then the transmission system going from Glen upstream would be reduced by a certain amount of money, and whatever it was it could be applied below or an adjustment of rates made.

Mr. RHODES. As I interpret your testimony, then, you would say that only that part of Arizona which geographically lies within the upper basin would be considered as being within the upper basin?

Mr. LARSON. No, I did not say that. I said we have based our market studies on the other, and what goes down certainly is not for me to say—I mean the Bureau of Reclamation office.

Mr. RHODES. Of course, all I am trying to do is to get the basis on which you planned this project. I know you have made plans, and I know that you have considered certain basic fundamental data.

Mr. LARSON. Yes, we have. In my statement, we have assumed how much could go downstream without adversely affecting the transmission upstream. Well, certainly you cannot put less than half of Glen Canyon upstream to finance a transmission line. By the same token, you have to have quite a major demand downstream to finance a transmission line from Glen Canyon downstream.

Now, what will finally be done is not for region 4 or the Bureau to say, I do not think.

Mr. YORTY. Would the gentleman yield?

Mr. SAYLOR. I yielded for only one question.

Mr. YORTY. I wonder if my friend from Arizona will stipulate for power sale purposes that California also be considered as being in the upper basin?

Mr. SAYLOR. I thought at one point, Mr. Yorty, California might desire to see Arizona in all places.

Mr. RHODES. I am not sure that is where California would like Arizona to be at all.

Mr. YORTY. We do not like to be on both sides of all questions.

Mr. SAYLOR. In your original estimates in 1950 for the Glen Canyon unit, what did you figure power would sell for if the total cost of your project was $363,900,000?

Mr. LARSON. There again we had a pool rate. It is in the report here, I believe, as 5½ mills.

Mr. SAYLOR. In other words, you were going to sell Glen Canyon power at 5½ mills; is that correct?

Mr. LARSON. We were going to sell it all at 5½ regardless of which plant; that is a pool rate.

Mr. SAYLOR. In other words, the Department's thinking in this matter is that from Glen Canyon site to Flaming Gorge Reservoir Dam site, and all of the intermittent ones, regardless of what the costs were to produce power, you were going to sell it at a figure which would pay out overall; is that correct?

Mr. LARSON. Yes, except that each opportunity would be less than developing power at alternative sources. But where they are in a team like this, one dependent upon the other, one enhances the output of another, then we have used the one rate because, as we see it, unless the plants are tied together, almost as one plant, we do not have all firm power, and if we do not have practically all firm power, we do not have a plan.

Mr. SAYLOR. You do not mean to sit there and tell this committee that you expect to build all of these nine dams at one time; do you?

Mr. LARSON. No.

Mr. SAYLOR. All right, then. What you intend to do is to tell the committee that eventually you hope to be able to sell all the power at one figure?

Mr. LARSON. What I want to tell this committee is that this plan is based on selling it at an average rate of about 6 mills right at the beginning and Echo Park and Glen Canyon are so big in comparison to the rest that when the rest are added, whatever they are, the ones we have planned it will not change the setup.

Mr. SAYLOR. Mr. Larson, since 1950 to 1954, the cost of Glen Canyon has increased over $60 million. What effect has that had upon the figures of the Bureau as to what the costs are to produce power at Glen Canyon?

Mr. LARSON. All of our costs, since the 1950 report up to now, have been increased, I believe, about 12.8 percent, and we move the mill rate up from 5½ to an average of 6 mills.

Mr. SAYLOR. Could you tell this committee what it will cost today to produce power at Glen Canyon providing you can build Glen Canyon for $421,270,000?

Mr. LARSON. That is the cost I gave you at 4.7 mills.

Mr. SAYLOR. That was the figure you gave us at which you could produce power in 1949.

Mr. LARSON. No, that is the cost we are using in the statement here today.

Mr. SAYLOR. Then if 4.7 mills is what it will cost to produce that power today, what would it have cost in 1950, when you submitted your original report?

Mr. LARSON. 4.2. I am just recalling that from memory, but it is less than 4.7.

Mr. SAYLOR. Now, if Glen Canyon were authorized by this committee alone, and no other participating projects were authorized or

no other river storage projects were authorized, what would the Department's policy be with regard to selling that power? Would you still want to sell it at 6 mills or would you sell it at 4.7 mills?

Mr. LARSON. I cannot speak for the Department. My own opinion is that if you sold it for 4.7 mills your upper basin planning is gone. You have no plan. If you are going to build the other regulatory reservoirs, that is.

Mr. SAYLOR. How long would it take to pay out the Glen Canyon project if you would charge 4.7 mills?

Mr. LARSON. I think that is 50 years.

Mr. SAYLOR. 50 years?

Mr. LARSON. Based on 50 years.

Mr. SAYLOR. That 50 years is from the time construction is started, or is that an overall 50 years?

Mr. LARSON. That is 50 years, I believe, after the last unit is in operation. But all of our costs include interest during construction on these powerplants.

Mr. SAYLOR. If there were no other projects authorized, and only the Glen Canyon Reservoir site was authorized to be built, that is, at the end of 50 years where would the revenues from the power produced at Glen Cayon Reservoir site go?

Mr. LARSON. That all depends on the legislation under which it is authorized. I would not know.

Mr. SAYLOR. Suppose there is nothing said in the legislation. At the end of 50 years when the project is paid for, what happens to the money?

Mr. LARSON. I assume it would go into the Treasury of the United States.

Mr. SAYLOR. It goes into the Treasury of the United States, and the Treasury of the United States is represented not just by the upper basin States, but it is representative of all the 48 States and Territories and possessions; is that right?

Mr. LARSON. That is correct.

Mr. SAYLOR. So that hereafter, when any moneys are taken, after that project is paid for, it becomes necessary to look at things very factually and determine whether or not the money should be turned in to the Treasury or used for some other purpose; is that right?

Mr. LARSON. It depends on the benefits you expect to get if you use it for some other purpose, or which we think is greater than 1 to 1.

Mr. SAYLOR. Now, does the Department or the Bureau have any formula wherein they can tell this committee how much they think any one of the participating projects in the upper Colorado River Basin should be subsidized by power?

Mr. LARSON. All we can do is tell you, using the procedures that we do use in the Bureau, what the outcome is, and the benefit-cost ratio, how much is repayable by water users and how much by municipal users, if there are any, how much by power, if there are local powerplants on the participating projects, which there are in the case of 2 or 3, and what the balance is that the irrigators cannot pay that we have set aside to be repaid from power revenues. We can tell you what that is for each one of those 12 participating projects and for some of the others.

Mr. SAYLOR. In other words, we have not gotten into participating projects, but the same thing that you have said with regard to storage

projects is also true for participating projects? The Bureau has made plans for more than 12 participating projects?

Mr. LARSON. My statement said that the plan was based on whatever participating projects were authorized now. As the needs arise and the reports are available, the States would come in for more projects as time goes on, and we have estimated that would go on for at least the 75 years before the upper basin States eventually use the water to which they are entitled.

Mr. SAYLOR. Let me ask you, in making these plans for storage and participation in the upper basin, how much water did you figure was available in the upper basin?

Mr. LARSON. Our studies are based on 7½ million acre-feet.

Mr. SAYLOR. You, Mr. Larson, I am sure, are familiar with the report published by the Colorado Water Conservation Board in October of 1953?

Mr. LARSON. Yes, sir.

Mr. SAYLOR. And that report was prepared by Mr. Hill of Leeds, Hill & Juett, is that correct?

Mr. LARSON. That is right.

Mr. SAYLOR. This report shows that there is not 7½ million acre-feet available for the upper Colorado River.

Mr. LARSON. It does not show that to us, or to me. Shall I give you the reason?

Mr. SAYLOR. Well, let me first ask you if that is not what the report says, that you are approximately 1,300,000 acre-feet short right now in the upper Colorado River Basin?

Mr. LARSON. The report was based on——

Mr. SAYLOR. Answer the question, sir. Is not that what that report says?

Mr. HARRISON. I think you can answer the question, but you always have the right to explain your answer.

Mr. LARSON. May I have the question again?

Mr. SAYLOR. Does not this report show that the upper Colorado River Basin is short 1,300,000 acre-feet per year?

Mr. LARSON. Yes, based on carrying water only over 20 years, an erroneous assumption. The mass curve was based on historical flow, instead of virgin flow, which does not present a true picture.

Mr. SAYLOR. In other words, it is your opinion that the Colorado Water Conservation Board did not get a very good report?

Mr. LARSON. No, that is a good report. Mr. Hill has assumed that the reservoir should fill every 20 years. We have assumed we can carry over water over a longer period than 20 years. The past records indicate that to us. The next few years will tell.

Mr. SAYLOR. How long can you carry water? You said you could carry it longer than 20 years. I want to know how long you can carry it.

Mr. LARSON. In an efficient reservoir, with not too high evaporation, you can carry water fully 30 years, and these reservoirs, Glen Canyon and Echo, will do it.

Mr. SAYLOR. Will you still have enough to produce all of this power that you say is available?

Mr. LARSON. Yes, I think our estimates of the power production are very conservative. I would not be surprised if the power is not greater than we figured.

Mr. SAYLOR. All right. Will you tell this committee the next reservoir up the river? That is the Whitewater Reservoir. Can you tell us what the cost of that reservoir was in 1949 or 1950?

Mr. LARSON. $40 million.

Mr. SAYLOR. Are you in a position to tell the committee what it would cost to build that reservoir today?

Mr. LARSON. Our cost brought up to date is $44,291,000.

Mr. SAYLOR. And the next reservoir is Crystal Reservoir site. Will you tell us the cost of that reservoir in 1950?

Mr. LARSON. $37,900,000.

Mr. SAYLOR. And the cost of it as of today?

Mr. LARSON. $40,952,000.

Mr. SAYLOR. And the next reservoir is Curecanti. Can you tell us the cost in 1950?

Mr. LARSON. $80,400,000.

Mr. SAYLOR. And the cost in 1954?

Mr. LARSON. The 2½ million acre-foot reservoir is $85,972,000.

Mr. SAYLOR. Now, if you build a high dam at Curecanti Reservoir site, what would it cost in 1950?

Mr. LARSON. 1950? I just gave you that. $80,400,000.

Mr. SAYLOR. And the figure that you gave us——

Mr. LARSON. We did not have a small Curecanti in 1950, only the large one.

Mr. SAYLOR. What would it cost to build that same dam in 1954?

Mr. LARSON. 1953? The small one or the large one? $85,972,000.

Mr. SAYLOR. The next reservoir site is Gray Canyon. Tell us what it would cost to build that in 1950.

Mr. LARSON. 1950 was $178,400,000.

Mr. SAYLOR. And the cost in 1954?

Mr. LARSON. $190,854,000.

Mr. SAYLOR. And the next reservoir is Split Mountain.

What was the cost of that project in 1950?

Mr. LARSON. 1950, $76,400,000.

Mr. SAYLOR. And the cost in 1954.

Mr. LARSON. $84,417,000.

Mr. SAYLOR. Now, the cost of Echo Park Reservoir site in 1950?

Mr. LARSON. $165,400,000.

Mr. SAYLOR. And the cost in 1954?

Mr. LARSON. $176,426,000.

Mr. SAYLOR. The next one is Flaming Gorge. What was the cost of that in 1950?

Mr. LARSON. $82,700,000.

Mr. SAYLOR. And the cost in 1954 of that same project?

Mr. LARSON. $82,942,000.

Mr. SAYLOR. I think the last one is the Cross Mountain Reservoir. What was the cost of that in 1950?

Mr. LARSON. $51 million in 1950.

Mr. SAYLOR. And in 1954?

Mr. LARSON. $50,225,000.

Mr. SAYLOR. Could you give the committee the total cost of those 9 reservoirs in 1950?

Mr. LARSON. $1,031,500,000 in 1950, for the 9.

Mr. SAYLOR. Can you give us the cost of those same 9 reservoirs in 1954, assuming that Curecanti is built as a high dam?

Mr. LARSON. I will have to correct the last figure. I was subtracting a little fast here. In 1950 it is $1,076,100,000. In 1953, it is $1,177,349,000.

Mr. SAYLOR. Assuming the change of plans from a high dam at Curecanti to a low dam at Curecanti, would you tell us the costs in 1954?

Mr. LARSON. Take $37 million off the 1953 figure. Of course, we do not have the 1950 figure.

One billion, one hundred forty million dollars in 1953.

Mr. SAYLOR. Of that $1,140 million, how much has the Bureau of Reclamation allocated to nonreimbursibles?

Mr. LARSON. Not a dollar; nothing yet. Some day they might on some of them, but they have not yet. Our plan has not evaluated any nonreimbursables to this date.

Mr. SAYLOR. In other words, I gather that the committee is to be forewarned that there is in the minds of at least certain people that some part of it should be classified as nonreimbursible?

Mr. LARSON. No, but I think we should recognize that there are fish and wildlife, recreation, benefits of a national nature, silt retention, and things like that, that may be evaluated in the future. What will be done then for nonreimbursables, I would not know. But we have not tried to evaluate them or ask for nonreimbursables in this plan to date.

Mr. SAYLOR. But is it not a matter of fact that committees of Congress have already recognized that certain of the items which you have just mentioned are already nonreimbursable, and should be so designated? Do you mean to tell me that the Bureau has absolutely nothing in its plans so far considering the fact that we have flood control, recreation, and wildlife, and they have not taken any money into consideration in writing it off?

Mr. LARSON. We have some nonreimbursables in the participating projects, but there is very little flood control on the main stem of the Colorado River. There are some, possibly, but it is not large compared with the total costs that we are talking about of a billion dollars or more. So we did not attempt to evaluate them for the dams which authorization is being asked for in the bills at this time.

Mr. SAYLOR. Now, of the nine projects that have been specified here as reservoir sites, what is the longest period after construction during which the sale of power at 6 mills will pay out that project?

Do this for me, Mr. Larson. Can you go right up the river as I did in asking you about the costs of the dams, and give us the payout period for each one of them?

Mr. LARSON. I can give you that now. The payout period for all the power allocations for the Echo Park and Glen Canyon, those 2 units would pay out in 44 years at an average rate of 6 mills, and if the others are added to the lines, they would pay out in 50 years after the last unit is on the line. The scheme is based on all of them paying out in 50 years, the first 2 in 44. It will be 50 years after the units come on the line.

Mr. SAYLOR. So that if Whitewater Reservoir were built in 1970, the first unit went into effect that year, 50 years later that project would be paid for?

Mr. LARSON. Yes.

Mr. SAYLOR. And the same for Crystal——

Mr. LARSON. Of course, if it was not started until then, there would be so much revenue in the pool I do not know how you would do it then.

Mr. SAYLOR. What was that?

Mr. LARSON. I said if it was not started for 70 years——

Mr. SAYLOR. No, I said that we were going to build that one and have it finished by 1970.

Mr. LARSON. 1970?

Mr. SAYLOR. Yes.

Mr. LARSON. I beg your pardon. I thought you said 70 years.

Mr. SAYLOR. No, my statement is that in 1970 we would complete Whitewater Reservoir and 50 years thereafter that project would be paid for.

Mr. LARSON. That is right.

Mr. SAYLOR. And the same is true for Crystal, Curecanti and the others?

Mr. LARSON. If nothing happens in the meantime, or prices change, it might change conditions some. But at our present day prices, it shows that with our estimated cost it would pay out in 50 years after the last unit is on the line, in blocks as they come on.

Mr. DAWSON. You are referring to Whitewater. He mentioned Curecanti along with it. Do you qualify that with the rate of either a high or low dam?

Mr. LARSON. Any of them that are found that can produce power at less than the alternative cost of steam. That is the way our plan is set up.

Mr. SAYLOR. Would the same thing be true for any other project which you built in Desolation Canyon, for example, one of the two hundred-odd sites referred to by Mr. Aspinall?

Mr. LARSON. Probably not, because if you assumed that if you build Desolation, you would not build Echo Park, then I do not think that would be feasible at all. It is just like Gray Canyon which would not be feasible without Echo Park.

Mr. SAYLOR. In other words, according to you, Gray Canyon would not be feasible if Echo Park were not built?

Mr. LARSON. I doubt that it will be.

Mr. SAYLOR. Will you tell us why?

Mr. LARSON. Because it needs major regulation upstream to take peaking loads that would be possible at Echo Park Reservoir. What Echo Park does is to make Split Mountain and Gray Canyon feasible.

Mr. SAYLOR. Well, suppose you built one at Flaming Gorge and one at Browns Park. Then what would be the effect?

Mr. LARSON. You would still have the Yampa River unregulated.

Mr. SAYLOR. Are there any other dam sites on the Yampa River?

Mr. LARSON. There are smaller ones, but nothing like Cross Mountain, for example.

Mr. SAYLOR. What are the projects that are available on the Yampa River?

Mr. LARSON. What is it?

Mr. SAYLOR. What are the available sites on the Yampa River?

Mr. LARSON. There was a Juniper site, but that is submerged by Cross Mountain. There are no other large sites.

Mr. SAYLOR. After the initial phase of establishing these nine power-producing projects on the river, how many participating projects does the Bureau have in mind?

Mr. LARSON. The initial phase that would come along with the Echo Park-Glen Canyon unit, there are 12, and then these additional ones asked for by the States. To us, additional——

Mr. SAYLOR. Those additional ones are Eden, Gooseberry, La Plata, Navaho, and San Juan-Chama.

Mr. LARSON. Yes. You can exclude Eden because it is already authorized and nearly built. The Shiprock division of the Navaho project, that is an Indian project, and not a Bureau of Reclamation project. That is for the Navaho and Hopi Indians.

Mr. SAYLOR. But it must be considered by the Bureau of Reclamation if they are going to develop the river, whether they build it or whether they do not?

Mr. LARSON. It comes into the scheme as a participating project from the Indian Bureau just like the other ones were investigated by the Bureau of Reclamation, two Interior agencies, with separate things to do. But the plan as I mentioned in my statement is one that would go along over a long period of years. Participating projects would come in as they are needed, and desired, and approved by Congress.

Mr. SAYLOR. I think you have shown in your original statement here that in the 12 participating projects which you have recommended, there would be 236,360 acres of new land brought into production, is that right?

Mr. LARSON. That is correct, for the first 12.

Mr. SAYLOR. And in additional participating projects, there would be 57,660 acres of new land?

Mr. LARSON. Yes, sir.

Mr. SAYLOR. Making a total of new lands in these 17 projects of 294,020 acres; is that right?

Mr. LARSON. Yes, sir.

Mr. SAYLOR. Now, could you give a supplemental water supply for the sum of these projects?

Mr. LARSON. Yes, sir. The acreage is given for the supplemental supply lands.

Mr. SAYLOR. And the total amount of supplemental or acreage to receive a supplemental supply of water in the 12 participating projects is what?

Mr. LARSON. 233,930 acres.

Mr. SAYLOR. And what acreage is there that would receive a supplemental supply of water in the five additional participating projects asked for in the bill?

Mr. LARSON. 235,740 acres.

Mr. SAYLOR. Making a total acreage in the 12 participating projects and the projects authorized in the bill of what acreage to receive a supplemental supply of water?

Mr. LARSON. 469,670 acres.

Mr. SAYLOR. Can you tell the committee the total new lands receiving water and supplemental water?

Mr. LARSON. Well, under the 12 participating projects, and any additional participating projects, there are 294,020 acres of new land, and 469,670 acres of supplemental land. Is that what you asked for?

Mr. SAYLOR. Yes.

Mr. LARSON. Or a total in both categories of 763,690 acres.

Mr. SAYLOR. Now, in addition to these projects, Mr. Larson. can you tell the committee how many other projects are in the upper Colorado River Basin that might apply for and use water? If you do not have the answer, can you get it?

Mr. LARSON. As I explained in my statement, our 1946 report inventory of projects, included some 100 irrigation and power projects in the 4 States of the upper division, that is, the upper Colorado River Basin. That included projects outside of the natural basin entitled to use Colorado water. In other words, they were within the States of Utah, New Mexico, Colorado, and Wyoming. A lot of those, of course, will probably go out of the picture on detailed investigation. But it does seem reasonable from the studies made that there are more potentialities in the future than there is water to which the upper basin States are entitled. That may be 40 or 50 additional projects, depending upon the size.

Mr. HARRISON. Do you want any additional information on that?

Mr. SAYLOR. No, sir.

Mr. HARRISON. We have reached the time or adjournment. We will start again at 9:30 in the morning.

We will ask Mr. Larson to be present, and we will take up where we left off this afternoon.

(Thereupon, at 4:30 p. m., a recess was taken until Tuesday, January 19, 1954, at 9:30 a. m.)

COLORADO RIVER STORAGE PROJECT

HEARINGS

BEFORE THE

SUBCOMMITTEE ON IRRIGATION AND RECLAMATION

OF THE

COMMITTEE ON INTERIOR AND INSULAR AFFAIRS HOUSE OF REPRESENTATIVES

EIGHTY-THIRD CONGRESS

SECOND SESSION

ON

H. R. 4449, H. R. 4443, and H. R. 4463

TO AUTHORIZE THE SECRETARY OF THE INTERIOR TO CONSTRUCT, OPERATE, AND MAINTAIN THE COLORADO RIVER STORAGE PROJECT AND PARTICIPATING PROJECTS, AND FOR OTHER PURPOSES

JANUARY 18, 19, 20, 21, 22, 23, 25, 26, 27, AND 28, 1954

COLORADO RIVER STORAGE PROJECT

TUESDAY, JANUARY 26, 1954

HOUSE OF REPRESENTATIVES,
SUBCOMMITTEE ON IRRIGATION AND RECLAMATION
OF THE COMMITTEE ON INTERIOR AND INSULAR AFFAIRS,
Washington, D. C.

The subcommittee met, pursuant to recess, at 9:30 a. m. in the committee room, New House Office Building, Hon. William H. Harrison (chairman) presiding.

Mr. HARRISON. The committee will come to order.

The first witnesses this morning will be Mr. Northcutt Ely, special counsel for the Colorado River Board of California, and Mr. Raymond Matthew, chief engineer for the Colorado River Board of California.

Do you want to proceed first, Mr. Ely?

Mr. ELY. Mr. Matthew will proceed.

Mr. HARRISON. As you remember yesterday you asked for 45 minutes and that was the time allotted. It is not a question of trying to cut you down but that is the schedule we arranged, and we hope you can finish.

Mr. ELY. We will do our best.

Mr. HARRISON. You may proceed.

STATEMENT OF RAYMOND MATTHEW, CHIEF ENGINEER, COLORADO RIVER BOARD OF CALIFORNIA

Mr. MATTHEW. Mr. Chairman and gentlemen of the committee, my name is Raymond Matthew. I am chief engineer of the Colorado River Board of California, which is a State agency created by act of the legislature in 1937. The board is charged with the responsibility for protecting the interests of California in the waters of the Colorado River. It is composed of 6 members appointed by the Governor, each representing one of the public agencies having established rights to the use of water or power from the Colorado River.

PROPOSAL BEFORE THE COMMITTEE

The bill H. R. 4449 now pending before the committee seeks to authorize certain specified initial units of the so-called Colorado River storage project and certain specified participating projects with certain qualifications. It also contains provisions covering the operation, administration, and management of the project including a proposal that the storage project and participating projects shall be treated and accounted for as one project.

Mr. ENGLE. The proponents have the burden on this legislation. If you do not propose to do it with adequate time and adequate opportunity for these people to be heard, then naturally they will fail to meet the burden which is placed on them.

Mr. HARRISON. I suggest the gentleman from California make the motion that all of these witnesses be heard for the proponents first, and that later, when we can get to it, we take up the opponents some time in the future. If you will make that as a motion and the committee sustains you, you have that responsibility on your own shoulders, and it is agreeable to the chairman. Do you care to make the motion, Mr. Engle?

Mr. ENGLE. No.

Mr. HARRISON. You may proceed, Mr. Ely.

STATEMENT OF NORTHCUTT ELY, SPECIAL COUNSEL, THE COLORADO RIVER BOARD OF CALIFORNIA, WASHINGTON, D. C.

Mr. ELY. My name is Northcutt Ely. I am an attorney, with offices in the Tower Building, Washington 5, D. C., and appear here as special counsel to the Colorado River Board of California, a branch of the State government.

California, as a party to the Colorado River compact, is affected by this bill in the respects which I shall outline. California is also a party to the pending suit in the Supreme Court entitled *Arizona* v. *California, et al.*, No. 10 Original, October term, 1953, as are Nevada, Arizona, and the United States. I have the honor to represent California in that action, under the direction of Attorney General Brown of California. Certain of the issues in that suit are directly involved in the assumptions made by the Bureau of Reclamation in planning the project now before you. These will be identified during the course of my statement.

THE PENDING PROJECT

The legislation now before the committee, as modified by the explanations given here by the Interior Department, would accomplish four general objectives:

1. It would authorize in section 1, page 2, line 23, the construction of 15 reclamation projects. The aggregate consumptive use of these projects is said to be about 1,700,000 acre-feet, which added to about 2,500,000 acre-feet said to be required by projects already constructed or authorized, would represent a total of about 4,200,000 acre-feet. This total is well within the quantity of 7,500,000 acre-feet per annum, the use of which is apportioned to the upper basin by article III (a) of the Colorado River compact, to which I shall presently refer. Moreover, the engineering studies indicate that this total could be put permanently to use without the construction of any new holdover storage whatever, and that no holdover storage would be required for about 50 years, even if other projects were added.

2. The bill nevertheless authorizes, in section 1, page 2, line 12, the construction of four storage reservoirs (reduced to two, Glen Canyon and Echo Park, by the Department's testimony). The whole storage program amounts to over 48 million acre-feet. The purpose of au-

thorizing construction of these reservoirs now, instead of many years from now, is twofold:

(*a*) Electric energy would be generated and sold and the proceeds pooled to subsidize the construction of the power and reclamation projects previously referred to in section 1.

(*b*) If built now, the reservoirs could accumulate water with less interference with consumptive uses in both the lower and upper basins than if their construction were delayed until a later time when consumptive uses will be larger.

3. The bill authorizes, in section 5, page 8, the construction of other projects, unnamed, provided they meet certain criteria. These are not designated in the bill, but the Department has inventoried over 100 projects in various publications, particularly House Document 419, 80th Congress. It is not clear from section 5 whether these projects must be brought back to Congress for further authorization, or whether the Secretary is authorized by section 5 to build them; but in any event, when they are built, the new power projects and the new reclamation projects covered in section 5 will share in the subsidies afforded by the sale of power to be generated at Glen Canyon; and, in addition, and for the first time, a fourth function of the holdover storage at Glen Canyon and Echo Park will then come into existence. Thus:

4. When, as, and if the additional projects referred to in section 5 are built, it will be necessary to store water in Glen Canyon, or some equivalent storage capacity, not for use by these projects (Glen Canyon Reservoir is so far downstream that no water stored there can ever be used for irrigation or domestic purposes in the upper basin), but for quite a different reason: To enable these section 5 projects to increase the consumptive use in the upper basin above the 4,200,000 acre-feet required by existing projects plus the section 1 projects, without violating the provisions of article III (d) of the Colorado River compact, which stipulates that the States of the upper division (Colorado, Utah, New Mexico, Wyoming) will not cause the flow of the river at Lee Ferry to be depleted below an aggregate of 75 million acre-feet for any period of 10 consecutive years. In the driest decade so far, the flow at Lee Ferry was well over 100 million acre-feet, when the upper basin projects were using about 2 million acre-feet per year; and engineers tell us that the upper basin uses can rise to about 4,300,000 acre-feet, which is more than the total of existing uses plus the section 1 projects, before this 100 million total would shrink to 75 million.

Thus the ultimate purpose of Glen Canyon Reservoir, and other holdover storage, is to enable the upper basin to build the section 5 projects without violating article III (d) of the compact, and the immediate reason for constructing Glen Canyon Dam now instead of waiting until the section 5 projects are built is, first, to immediately subsidize the section 1 projects and, second, to fill Glen Canyon during a time when the filling is easier, presumably, than it will be later on.

As all of the foregoing involves the Colorado River compact, and as California is a party to that compact, California is directly concerned by the interpretations of the compact implicit in the bill, and in the interpretations of the compact which will control the administration of these reservoirs. This is readily apparent when it is realized that

the total storage capacity planned is over 48 million acre-feet, enough to intercept the whole flow of the river for several years, and that it is planned to hold over storage in these reservoirs for more than 20 years, or five Presidential administrations, in order to deliver to the lower basin under article III (d) in the year 2000 water that flows into the reservoir in 1980 for example. Some rather firm understandings as to the meaning of the compact are required, especially as the bill now make no provision for enforcement of the compact by any State against the United States, which will hold this water in its reservoirs and release it subject to the decision of a long succession of Secretaries of the Interior as to what the document means.

The meaning of the document is now in sharp controversy in the Supreme Court, in respects which affect the measure now before you. To these issues I now turn.

II. Interpretations of the Colorado River compact involved in the upper storage project legislation and the pending litigation:

1. THE MEANING OF "PER ANNUM" IN ARTICLE III

Article III (a): Does the apportionment of the use of 7,500,000 acre-feet per annum mean an average of that amount over a period of years, or a maximum in any one year?

The Reclamation Bureau, in submitting this upper basin storage project, makes the assumption that the apportionment means an average, so that the upper basin may use 9 million acre-feet or more of water in 1 year, and consider it as apportioned under article III (a) if it uses 6 million or less in some other year, to average 7,500,000 acre-feet.

California alleges in the pending lawsuit that the apportionment means a maximum, like speed limit on a highway, not an average. If the speed limit says 50 miles per hour, that doesn't mean an average of 50. We allege (Answer to Arizona, par. 8) that the words "per annum" in the compact mean "each year," and not an average of uses over a period of years, whether they are our uses or anyone else's. Arizona admits this, but says that the issue is not yet material in the lower basin (Reply, par. 8). The United States position is not clearly stated. The effect, if California is right, is not necessarily to deny the upper basin the right to use 9 million acre-feet, but to characterize the excess, 1,500,000 acre-feet, as unapportioned surplus, dedicated to Mexico under article III (c) of the compact or subject to competitive appropriation in the lower basin. The amount involved in this particular issue is very large, of the order of 1,250,000 acre-feet per year. That is, if the compact means what we think it means, the Reclamation Bureau is in error that much in its assumptions as to the quantity of water the upper basin can lawfully use of III (a) water each year, and by the same token that much more water must be let down to satisfy the Mexican Water Treaty and prior appropriations of surplus in the lower basin. The same problem arises in the lower basin, but there the Reclamation Bureau has assumed that the limitation imposed upon California's uses by the Boulder Canyon Project Act is a maximum, not an average; so also with its assumptions as to the deliveries under the Mexican Water Treaty and the amounts to be delivered under its water contracts with Arizona, California, and Nevada. Both assumptions cannot be correct.

2. THE METHOD OF MEASUREMENT OF CONSUMPTIVE USE

Article III (a): Does the apportionment of "beneficial consumptive use" mean the quantity in fact used, measured at the place of use, or does it mean the effect of that use measured in terms of stream depletion at some point hundreds of miles downstream, in this instance at Lee Ferry? This question of interpretation of the Colorado River compact and the Mexican Water Treaty is directly at issue in the present Supreme Court case. The quantity involved in this dispute, so far as the planning of the upper basin storage project is concerned, is 300,000 to 500,000 acre-feet, according to engineers' estimates. The Reclamation Bureau assumes that the measurement is to be in terms of downstream depletion in the case of the upper basin project and the central Arizona project, but in terms of diversion minus return flow, measured at the place of use, with respect to California. The Boulder Canyon Project Act so defines it, and the Mexican Water Treaty says (art. I (j)):

> "Consumptive use" means the use of water by evaporation, plant transportation or other manner whereby the water is consumed and does not return to its source of supply. In general it is measured by the amount of water diverted less the part thereof which returns to the stream.

That corresponds with California's allegation of the meaning of the term in *Arizona* v. *California* (Answer to Arizona, par. 8). Arizona denies that this definition applies to her uses, (Reply, par. 8) and the Reclamation Bureau, in the project before you, assumes that it does not apply to the upper basin, although in section 2, page 4, line 21, the projects to be built under the bill are recognized as being subject to the terms of the Mexican Water Treaty, as they of course are.

Another problem arises if the depletion theory prevails. One of its postulates is that when water is stored in a reservoir, the stream below is depleted, as of course it is, and therefore that the consumptive use of the stored water takes place then and there, in the year when the water is put in storage, not when it is taken out and used. On that premise, how is the 48 million acre-feet of holdover storage, that is, of stream depletion, to be charged? And, in future operation, how is the storage of more than 7,500,000 acre-feet in any one year to be charged? Is the same principle, whatever it may be, applicable to the lower basin reservoirs?

3. "RIGHTS WHICH MAY NOW EXIST"

Article III (a): Does the statement in article III (a) that the apportionment of the use of 7,500,000 acre-feet per annum "shall include all water necessary for the supply of any rights which may now exist" include two categories of uses in dispute in *Arizona* v. *California*: (1) The uses on the lower basin tributaries, particularly those of Arizona on the Gila River, which she says are not to be charged against the lower basin's apportionment of III (a) water, and (2) Indian uses in both basins? The significance of the Gila appears in connection with the upper basin's obligations under article III (c) and III (d) of the compact and that of the Indian uses in connection with article VII, and will be outlined when we reach those articles in numerical order.

4. THE MEXICAN BURDEN

Articles III (c) and III (d): Article III (c) provides that the Mexican burden, which is a minimum of $1,500,000 acre-feet per annum measured at the border, (more than that measured at Lee Ferry) shall be borne first out of surplus, over amounts specified in articles III (a) and III (b) and, if that is insufficient, then the burden of the deficiency shall be equally borne by the upper basin and the lower basin, and whenever necessary the States of the upper division shall deliver at Lee Ferry water to supply one-half of the deficiency, in addition to that provided in article III (d).

Article III (d) provides that the States of the upper division, that is, Colorado, Utah, Wyoming, and New Mexico, will not cause the flow of the Colorado River at Lee Ferry to be depleted below an aggregate of 75 million acre-feet for any period of 10 consecutive years.

The interpretation of these two clauses is at issue in Arizona versus California and is involved in the present bill. The Reclamation Bureau apparently assumes in its presentation here that there will be available at Lee Ferry, after the section 5 projects are built, only about 75 million acre-feet every 10 years. Arizona says (Reply, pars. 8, 11) that all this 75 million is III (a) water, that is, that this figure is merely 10 times the quantity apportioned to the lower basin by article III (a) of the compact, and that all of the lower basin's III (a) uses can be made from the main stream. California (Answer, to Arizona pars. 8, 11) and Nevada (Petition, par. XIV) deny this, and say that Arizona's uses on the Gila, and the uses of Nevada and Utah on the Virgin River, are "rights which may now exist," in the language of article III (a), hence chargeable to (and protected by) article III (a). Arizona retorts that her uses on the Gila are covered by article III (b) of the compact, an article which says that, in addition to the apportionment in article III (a), the lower basin is given the right to increase its beneficial consumptive use by 1 million acre-feet per annum. If Arizona is sustained by the Court in this position, there is no water for Mexico in the 75 million acre-feet at Lee Ferry referred to in article III (d), and the upper basin, under article III (c), must, in addition, release water to supply one-half of any deficiency in meeting the Mexican burden.

When the Reclamation Bureau reported favorably on the central Arizona project, it was on the assumption that Arizona's interpretations were correct, without, however, endorsing them. If California and Nevada are correct, a portion of the 75 million acre-feet at Lee Ferry referred to in III (d), a portion equal to the total of the uses on the Gila, Virgin, and other tributaries under III (a), is excess or surplus water unapportioned by the compact, available in part for the service of the Mexican Water Treaty and in part for use in the lower basin. We view the 75 million as a minimum, unrelated to article III (a), and to be met whether or not there remains available to the upper basin, after meeting that obligation, water to sustain a maximum use of 7,500,000 acre-feet per annum of water apportioned by article III (a).

42366—54——45

5. RESERVOIR LOSSES

Nowhere in the compact is specific provision made for accounting for reservoir losses. Arizona says that they are all chargeable against the apportionments made by article III (a). Nevada says that they are all chargeable to surplus. California says that Basin versus Basin, they are to be charged with other uses to the basin in which they occur, in the order in which they accrue, whether to III (a), III (b), or other surplus, and that none are chargeable against present perfected rights existing in the lower basin before storage was provided. The upper basin compact (art. IV) charges them against apportionments under article III (a) of the Colorado River compact.

6. THE RIGHT TO DEMAND OR WITHHOLD WATER

Article III (e) of the Colorado River compact provides that the States of the upper division shall not withhold water, and the States of the lower division shall not require the delivery of water, which cannot reasonably be applied to domestic and agricultural use. Glen Canyon Reservoir and certain other proposed upper basin main stream reservoirs will be so located, physically, that no water stored therein can ever be applied to domestic or agricultural uses in the upper basin. All of the water stored in such reservoirs will be required for domestic and agricultural uses in the lower basin and Mexico. If the 1953 Hill report to the State of Colorado is correct, the engineers say that if the Hoover Dam's reservoir, Lake Mead, is not filled on the day when the gates are closed at Glen Canyon, it may never fill again.

Who is to determine how rapidly storage in these upper basin reservoirs is to be built up, or, putting it another way, to what extent water which would otherwise flow into Lake Mead is to be intercepted and withheld? Who is to determine how rapidly and on what terms releases are to be made? Presumably, the Secretary of the Interior. Since the United States cannot be sued without its consent, manifestly some controls are necessary here if the States, both upper and lower, are not to abdicate the administration of their compact to the United States. Such controls are proposed in the final portion of this statement.

7. APPROPRIATION OF SURPLUS

Article III (f): Does the provision for a further apportionment, by unanimous consent after October 1, 1963, mean that no State may validly appropriate surplus until a new compact is made? California alleges, in the pending litigation, that any State, including the upper basin States, may appropriate surplus waters unapportioned by the compact, subject to their being divested but only by a new compact to which such a State is party, or by Court decree. That has been the position maintained by representatives of some, at least, of the upper basin States in previous hearings. Arizona and Nevada say that no State may acquire any right in surplus until a new compact is made. If they are sustained, then the upper basin can acquire no right in the waters it may use in any year in excess of 7,500,000 acre-feet.

8. IMPOUNDING OF WATER FOR POWER GENERATION

Article IV (b) of the Colorado River compact authorizes the impounding and use of water for generation of power, but stipulates that—

such impounding and use shall be subservient to the use and consumption of such water for agricultural and domestic purposes and shall not interfere with or prevent use for such dominant purposes.

As elsewhere noted, no water stored in Glen Canyon Dam and certain other mainstream reservoirs can ever be used, physically, for agricultural or domestic uses in the upper basin. Such water is the residue after the uses in the upper basin. It will be stored and used at such reservoirs to generate power to be sold to subsidize irrigation and power projects in the upper basin. The use of such reservoirs appears to be squarely controlled by article IV (b), and the right of the Reclamation Bureau to so manipulate them as to maintain power generation, if the waters stored therein are in fact needed for agricultural and domestic use in the lower basin, appears questionable. The sole function of Glen Canyon Reservoir is as part of a hydroelectric project, unless and until the section 5 projects are built, and for a period of 50 years or more even if they are built. Only thereafter does it assume any function under article III (d) of the compact.

9. INDIAN RIGHTS

Article VII of the Colorado River compact provides that nothing in the compact shall be construed as affecting the obligations of the United States to Indian tribes. The upper basin compact (art. VII) provides that use by the United States or its wards shall be charged as a use by the State in which the use is made. California, in the pending suit, takes the same position (Answer, par. 14). The United States denies this (Petition of Intervention, par. XXXVII), and says that—

the rights to the use of water of the Indians and Indian tribes are in no way subject to or affected by the Colorado River compact.

The Government's petition tabulates (appendix II) 1,747,250 acre-feet of "diversion" claims of Indians in the lower basin, of which 1,556,250 are in Arizona. Arizona says (Reply, par. 14), that—

the obligations of the United States to the Indians or Indian tribes are not material or relevant * * *

It is known that the Office of Indian Affairs construes article VII of the compact as meaning that (1) the Indian claims come ahead of the compact, are not chargeable to any State, and the compacting States simply divide the residue after the Indian claims; (2) Indian claims relate back to the date of establishment of the reservation, even though not put to use, and take priority over uses by non-Indians even though the uses by non-Indians may in fact long antedate the actual putting of water to use by the Indians. The Government's pleadings leave it free to make both these assertions. As to the first, Arizona has refused, so far, to disagree with the Indian Bureau's position. Naturally, if Arizona can hope for 1,500,000 acre-feet for Indian diversions, outside the compact, in addition to the 3,800,000

acre-feet she demands under the compact, there is a temptation to try to get it. Just where the water would come from is not very clear.

Arizona, at a meeting with the Attorney General of the United States on December 3, 1953, was invited to join the upper basin States, California and Nevada in a common statement of position that Indian uses are to be charged under the compact against the State in which they are situated, but she declined to do so. The existence of the Indian claims, and uncertainty as to their accounting, raises serious questions as to the water supply for the projects in both the upper and lower basins. Those questions will not be resolved until this suit is decided.

10. PRESENT PERFECTED RIGHTS

Article VIII provides that "present perfected rights to the beneficial use of waters of the Colorado River system are unimpaired by this compact." In the present suit California alleges (answer to Arizona, par. 15) that "unimpaired" as used in this article means unimpaired as to both the quantity and the quality of the waters to which these perfected rights relate. As of the effective date of the compact, California's present perfected rights were not less than 4,950,000 acre-feet (answer to Arizona, par. 28). The report of the Reclamation Bureau contains no data on the effect of large transmountain diversions on the quality of water. Such a study should obviously be made. We know that when the compact was ratified, the Colorado commissioner's formal report stated that—

natural limitations upon the use of the waters within each of the upper States will always afford ample assurance against undue encroachment upon the flow at Lee's Ferry by any 1 of the 4 upper States. Colorado cannot divert 5 percent of its portion of the river flow to regions outside the river basin. (Hoover Dam Documents, H. Doc. 717, 80th Cong., p. A79.)

Elsewhere he testified that Colorado's transmountain diversions could not exceed 300,000 acre-feet per annum. By contrast, the Colorado transmountain diversion projects inventoried in the Reclamation Bureau's various reports aggregate 2 million acre-feet, or 52 percent of the water allocated to Colorado by the upper basin compact. There would be that much less water to absorb an increasing quantity of salts in passage to Lee Ferry. The effect on the lower basin is one which the lower-basin States are entitled to have studied and reported upon, to the end that their present perfected rights, in the language of article VIII, shall remain unimpaired.

III. The effects of the Colorado River controversies upon the upper basin developments:

California's basic position is that we are conforming to the Colorado River compact and that we must insist that the Reclamation Bureau and States of the upper division do so in the planning and administration of the upper basin storage project and participating projects. If the States differ as to the compact's meaning, the differences must be resolved. There are manifestly at least 10 serious questions of interpretation of the Colorado River compact which affect all the States involved in the present lawsuit and in the bill before the committee. There are others, affecting only the lower basin, which I have not enumerated.

As to some of these issues, the alinement of the various States' interests is quite different from the alinement on others. For example,

as to the question of whether the 75 million acre-feet at Lee Ferry, referred to in article III (d) of the Colorado River compact, is identical with the 7,500,000 acre-feet apportioned to the lower basin, the position of California is more advantageous to the upper basin than is Arizona's. So also, perhaps, with the Indian question.

In the pending suit, the Court may dispose of some or all of these issues. If so, the United States, as an intervening party, will presumably be bound by the decree. Or the Court may refuse to pass upon some or even all of them, as it has done three times in the past.

In any event, the administration of the great holdover storage reservoirs, and hence of the Colorado River compact, will be in the hands of the United States.

In view of the obviously important differences of interpretation of the Colorado River compact among the States of the Colorado River Basin, the question arises whether they are content to concede that the United States is to control, without recourse, the water held in these great reservoirs in the canyons midway between the users in the upper and lower basin, where it can be used by neither, and be sole arbiter of the conditions on which it shall be stored and released? If so, the compact is of doubtful protection to either group of States, because no State can sue the United States without its consent.

Manifestly, some controls are required to enable both the States of the upper division and the States of the lower division to obtain some protection in the administration of the holdover storage reservoirs. If the Secretary of the Interior should accumulate water in storage too rapidly, the whole lower basin water system would be in jeopardy. If he released it too freely, the upper basin would be adversely affected. Too much depends upon the interpretation the Secretary of the Interior gives to the Colorado River compact. The States are entitled to be consulted.

Mr. HARRISON. Mr. Ely, I would suggest, if it is agreeable, as our time is limited, that we will want you back before the committee again, which will give the committee members a chance to study these amendments, and when you come back we will discuss those amendments at that time.

Mr. ELY. That is agreeable. However, they are summarized in two pages. Perhaps I could do that and leave the text to be discussed later.

Mr. HARRISON. If they are part of the text, go ahead.

Mr. ELY. IV. Proposed amendments.

In the light of the foregoing, the following amendments to the bill are suggested (their full text is annexed. See p. 706):

1. At page 8, line 1—delete section 5. The unnamed, undescribed future participating projects can be individually authorized by Congress on their merits, after submission of reports to the affected States as required by the Flood Control Act of 1944.

2. At page 12, line 24, insert a new section to disclaim any intent to construe or interpret or amend the documents now before the Supreme Court.

3. At page 13, line 2—insert a new section to prohibit the exchange of Colorado River system water with States outside the Colorado River Basin. There is not enough to go around as it is, and not enough to enable the eastern slope of Colorado to compose its differences with Nebraska and Kansas.

4. At page 13, line 9—insert a new section to require a study and report on the effect of transmountain diversions in the upper basin on the quality of water at Lee Ferry.

5. At page 13, line 9—insert a new section to authorize State participation with the Secretary of the Interior in the programing of storage and release of water, and to authorize suit by any State against him if necessary to compel compliance with the Colorado River compact in the operation of the holdover storage reservoirs.

6. At page 13, line 9—insert a new section subjecting all uses under this Act to covenants, such as the upper basin States insisted be insisted be inserted in the bill authorizing the San Diego Aqueduct (Public, No. 171, 82d Cong.), to respect the Colorado River compact, the Boulder Canyon Project Act, the Mexican Water Treaty, and upper basin compact.

7. At page 13, line 9—insert a new section, again drawn directly from the upper basin amendments to the San Diego Aqueduct bill, subjecting the act and all works constructed thereunder to the Colorado River compact and the other documents comprising the Law of the River.

I close, as I began, by reaffirming the necessity under which California finds herself of insisting that the proposed project conform to the Colorado River compact, and as long as the meaning of that compact is in litigation, of urging this committee to include in the bill the safeguards we have suggested against any impairment of the position of the lower basin. Finally, we ask that in the operation of the holdover storage features of the project the States, upper as well as lower, have adequate assurance that their rights will not only be respected but be enforceable against the changing succession of Federal officials who will control those reservoirs, and, with them, the destiny of the Colorado River Basin.

(The amendments submitted by Mr. Ely follow:)

AMENDMENT No. 1

DELETION OF SECTION 5

Page 8, line 1. Strike all of section 5, and substitute:

"SEC. 5. The Congress reserves the right to add other participating projects to those listed in section 1, and to delete any now listed therein."

AMENDMENT No. 2

ASSURANCE AGAINST INTERPRETATIONS

Page 12, line 24. Substitute for section 11:

"SEC. 11. Nothing in this Act shall be so construed as to amend, construe, interpret, modify, or be in conflict with, any provision of the Colorado River Compact, the Boulder Canyon Project Act, the Boulder Canyon Project Adjustment Act, or the Treaty with the United Mexican States."

AMENDMENT No. 3

TRANSMOUNTAIN DIVERSIONS

Page 13, line 2. Add a new section:

"SEC. —. (a) All of the waters of the Colorado River System exported from the natural basin of that system by means of works constructed hereunder, and extensions and enlargements of such works, to the drainage basin of any other river system, shall be consumptively used in States of the Colorado River Basin,

and will not be made available by exchange, substitution, or use of return flow, or otherwise, for consumptive use in any State not a party to the Colorado River Compact.

"(b) Nothing in this Act, by implication or otherwise, shall commit the United States to the further exportation of water from the Colorado River System."

AMENDMENT No. 4

STUDIES OF SALINITY

Page 13, line 9. Insert a new section:

"SEC. —. The Secretary of the Interior is directed to institute studies and to make a report to the Congress and to the States of the Colorado River Basin of the effect upon the quality of water available at Lee Ferry, of all transmountain diversions of water of the Colorado River System and of all other storage and reclamation projects, existing and proposed to be made in the Upper Colorado River Basin under full practicable development and use of water apportioned by the Colorado River Compact, including those proposed to be made under the authority of this Act."

AMENDMENT No. 5

STATE REPRESENTATIONS IN OPERATION OF RESERVOIRS

Page 13, line 9. Insert a new section:

"SEC. —. (a) Each State of the Colorado River Basin is authorized to appoint one representative to an Integrating Committee, to advise with the Secretary of the Interior in programing the storage and release of water from main stream reservoirs located in the Upper Basin, for use in the Lower Basin.

"(b) The Secretary of the Interior is directed to comply with the applicable provisions of the Colorado River Compact, the Boulder Canyon Project Act, the Boulder Canyon Project Adjustment Act, and the Treaty with the United Mexican States, in the storage and release of water from reservoirs in the Upper Basin for use in the Lower Basin, and, in the event of his failure to so comply, any State of the Colorado River Basin may maintain an action in the Supreme Court of the United States against him to enforce the provisions of this Section, and consent is given to the joinder of the United States as a party in such suit or suits."

AMENDMENT No. 6

COVENANTS

Page 13, line 9. Insert a new section:

"SEC. —. The United States and the States of Colorado, Wyoming, Utah, New Mexico, and Arizona, and their respective permittees, licensees, and contractees and all users and appropriators of water of the Colorado River System diverted or delivered through the works herein authorized and any enlargements or additions thereto shall observe and be subject to the Colorado River Compact, the Upper Colorado River Compact, the Boulder Canyon Project Act, and the Mexican Water Treaty (Treaty Series 994) in the diversion, delivery and use of water of the Colorado River System, and such condition and covenant shall attach as a matter of law whether or not set out or referred to in the instrument evidencing such permit, license, or contract and shall be deemed to be for the benefit of and be available to the States of Arizona, California, Colorado, Nevada, New Mexico, Utah, and Wyoming and the users of water therein or thereunder by way of suit, defense, or otherwise in any litigation respecting the waters of the Colorado River System: *Provided*, That the Congress does not, by the enactment of this Act, construe or interpret any provision of the Colorado River Compact, the Upper Colorado River Basin Compact, the Boulder Canyon Project Act, or the Mexican Water Treaty, nor subject the United States to, nor approve nor disapprove, any interpretation of said compacts, statute or treaty, anything in this Act to the contrary notwithstanding."

AMENDMENT No. 7

SUBJECTION TO LAW OF THE RIVER

Page 13, line 9. Insert:
"SEC. —. This Act and all works constructed hereunder shall be subject to and controlled by the Colorado River Compact, proclaimed effective by the President June 25, 1929; the Boulder Canyon Project Act approved December 21, 1928; the Upper Colorado River Basin Compact, to which the Congress gave consent (Public 37, 81st Cong., approved April 6, 1949); and the Mexican Water Treaty (Treaty Series 994); and no right or claim of right to the use of the waters of the Colorado River System shall be aided or prejudiced hereby: *Provided*, That the Congress does not hereby interpret or construe said documents nor subject the United States to, nor approve nor disapprove, any interpretation or construction thereof."

Mr. HARRISON. Thank you very much, Mr. Ely, and we will contact you at the first opportunity, and we will have you back before the committee. If it is necessary for Mr. Matthew to come back, we will see he has sufficient notice. We regret that our time was limited this morning.

Mr. ELY. Thank you, Mr. Chairman. I appreciate the committee's courtesy.

Mr. HARRISON. The first witness for those who are in opposition to part or all of the legislation will be Gen. U. S. Grant 3d, of the American Planning and Civic Association.

I have been given five names, including Mr. Grant, Mr. Joe Penfold, Mr. Fred Packard, Mr. Dave Brower, Mr. Kenneth Morrison, in that order. Unless I receive a request, I will call them in the order I have read.

STATEMENT OF U. S. GRANT 3D, AMERICAN PLANNING AND CIVIC ASSOCIATION

Mr. GRANT. On behalf of the American Planning and Civic Association, of which I am president, I have the honor to appear before you in protest against the inclusion in the upper Colorado storage project of the Echo Park Dam, or any other dam inside of the Dinosaur National Monument, or in any other monument or national park in the region. In case you are not familiar with our association and its work, let me add that, starting with the Park and Outdoor Art Association in 1897 and its merger with the American League for Civic Improvement in 1904 to form the American Civic Association, by a succession of affiliations with others in the same field the association has for 57 years now been in the forefront of the fight for the conservation of our natural resources, the preservation of our marvels of scenic beauty, and for the protection of national parks and state parks against commercial and other encroachments that violate the primary purpose for which they were set apart. It is proud to claim having had an effective part in securing the establishment of the National Park Service.

It is therefore with a background of more than half a century's connection with the citizens' efforts to make our country a more attractive and agreeable place in which to work and live, and to save for future generations those natural areas and formations from which we have drawn improved health and inspiration, and with a sincere desire to provide for the sound economic development of

COLORADO RIVER STORAGE PROJECT

COLORADO RIVER STORAGE PROJECT

FRIDAY, JULY 2, 1954

UNITED STATES SENATE,
SUBCOMMITTEE OF THE COMMITTEE ON
INTERIOR AND INSULAR AFFAIRS,
Washington, D. C.

The subcommittee met, pursuant to recess, at 9:30 a. m., in room 457, Senate Office Building, Senator Arthur V. Watkins, of Utah, presiding.

Present: Senators Arthur V. Watkins, Utah (presiding), Thomas H. Kuchel, California and Clinton P. Anderson, New Mexico.

Present also: Elmer K. Nelson, staff consultant engineer, and N. D. McSherry, assistant chief clerk.

Senator WATKINS. The subcommittee will be in session.

It has been suggested by our chairman, Senator Millikin, and concurred in by the present chairman, that we stand in silence for 1 minute out of respect to our late chairman, Hugh Butler.

(A minute of silence was observed in memory of the late chairman, Hon. Hugh Butler.)

Senator WATKINS. Under ordinary circumstances, the committee would recess out of respect to our late chairman, but I am quite certain from what I knew of Senator Butler during his lifetime, his devotion to duty, and his interest in getting the legislative program taken care of, that he would be one of the first to suggest that we do not recess, that we carry on with the work. The best respect we can show to him is to carry on the work of this committee as he wanted it carried on. I am sure he would not think it wise for us to take a recess at this time. So, under those circumstances, we will carry on with the hearing.

There may be some interruptions during the morning. The Senate goes in session at 10 o'clock, and it is possible that the members of this committee may be called to the Senate from time to time, but we will attempt to keep this hearing moving along so that we can give each of the witnesses who have been scheduled an opportunity to be heard. It is the hope of the acting chairman that we will be able to finish at least by tomorrow at noon.

We will call General Grant for further questions.

General, had you finished your statement in chief last night, or had we interrupted?

STATEMENT OF U. S. GRANT 3D, FOR THE AMERICAN PLANNING AND CIVIC ASSOCIATION—Continued

Mr. GRANT. There was about one paragraph more, sir.

Senator WATKINS. We will let you give that last paragraph before I ask you further questions.

board and a member of the Western Colorado Water Association which is a committee representing all of western Colorado.

The State of Colorado supplys practically three-fourths of the water that makes up the Colorado River. And by compact agreement Colorado has been allocated over one-half of the total volume of water from the Colorado River allocated to the four upper basin States. I know by experience that without storage reservoirs it matters not how much water is allocated to us by compacts and agreements, we cannot make future use of any part of the allocation as our streams are overdecreed on direct flow. In other words, we cannot even obtain the water we are allowed under present decrees without storage reservoirs as the minimum flows will not provide the necessary water.

If our thousands of acres of fertile soil are to be irrigated and if our vast deposits of oil shale, coal, and uranium are to be processed for the benefit of mankind, we must have storage reservoirs.

In S. 1555 there is one project which is the keystone to the development of water resources in western Colorado and that project is the Curecanti on the Gunnison River. It will store approximately a million acre-feet of water. The percentage of evaporation is less on this proposed reservoir than on any reservoir proposed in the upper Colorado River storage project. Curecanti is located high up on the Gunnison River nearest to the Continental Divide where the waters of the Colorado River originate. This then, means that as the water stored in Curecanti is diverted downstream from the dam, it can be used over and over again, providing the most good to the greatest number of people. Both the water and the power developed from Curecanti can be used to a good advantage in developing and processing of natural resources vital to the safety and success of the United States.

We in western Colorado do not believe the Bureau of Reclamation has investigated all of the possibilities and benefits attributed to the proposed Curecanti project. We know that there are many irrigation, recreation, and flood-control benefits that would be realized if the Curecanti Dam were built. We also feel certain that additional electric-power development can be obtained by utilization of an additional 295 feet of head in the 9-mile stretch between the Curecanti Dam site and the high-water line of the proposed Crystal Reservoir. The utilization of this additional power head and the benefits to irrigation, flood control, and recreation make Curecanti a very desirable project and one that will be economically feasible.

We in Delta County are fully familiar with the necessity of the Paonia participating unit of the upper Colorado River storage project. The project has been authorized in part at two different times in the past. Construction has been completed on the canal to carry water to the farms. The question most often asked locally is, "What water will the canal carry?" Without a reservoir to supply water for the canal, the canal is of no material benefit. We therefore request that favorable action be given the Paonia project now before your committee.

Although I have only set forth a few of the benefits that would result in the authorization and subsequent construction of the Curecanti and Paonia units of the upper Colorado River storage project, we in western Colorado are very anxious to see all of the units, in Senate bill S. 1555, authorized, and we hope the committee will act favorably on this bill as the benefits will accrue to everyone in our great Nation.

Very truly yours,

F. M. PETERSON, *Superintendent.*

Mr. PATTERSON. Thank you, sir.

Senator WATKINS. Thank you, gentlemen. I think we have had all the witnesses now except the witnesses from California. Are they here?

Mr. Ely, would you please come forward.

STATEMENT OF NORTHCUTT ELY, SPECIAL COUNSEL, THE COLORADO RIVER BOARD OF CALIFORNIA

Senator WATKINS. May I inquire how long you will take, Mr. Ely?

Mr. ELY. My statement will take perhaps three-quarters of an hour to present; short of questions, that is.

I am accompanied by Mr. Raymond Matthew, the chief engineer of the Colorado River board. His statement will take about the same time.

I also have a statement to present for Mr. Morris, who is unable to be here, and that will take less time.

Senator WATKINS. The reason I am inquiring is because I must consider, unfortunately, a personal matter affecting me. The session lasted until 12 o'clock last night, and I did not get home until 1 o'clock so I could retire. I have had a long day.

If it is going to take that length of time, I think in the interest of everybody we should recess until tomorrow. Did you want to read it?

Mr. ELY. I will prefer to read it.

Senator WATKINS. It looks like we will have to go until tomorrow. I have taken just about everything that I can take today.

Mr. ELY. Whatever suits you, Mr. Chairman.

Senator KUCHEL. Could we run an hour, Mr. Chairman, and perhaps hear Mr. Ely?

Senator WATKINS. Well, I will do that.

Mr. ELY. Whatever suits you, Senator.

Senator WATKINS. You may proceed, Mr. Ely.

Mr. ELY. Mr. Chairman, my name is Northcutt Ely. I am an attorney, with offices in the Tower Building, Washington, D. C., and appear here as special counsel to the Colorado River Board of California, a branch of the State government.

California, as a party to the Colorado River compact, is affected by this bill in the respects which I shall outline. California is also a party to the pending suit in the Supreme Court entitled "*Arizona* v. *California et al.*, No. 10 Original, October Term, 1953," as are Nevada, Arizona, and the United States.

I have the honor to represent California in that action as an assistant attorney general, under the direction of Attorney General Edmund G. Brown, of California. Certain of the issues in that suit are directly involved in the assumptions made by the Bureau of Reclamation in planning the project now before you. These will be identified during the course of my statement.

I. The pending project:

The legislation now before the committee, as modified by the explanations given by the Interior Department, would accomplish four general objectives:

First: It would authorize in section 1, page 2, line 19, the construction of 15 reclamation projects—reduced to 11 as recommended to this committee by Under Secretary Tudor. The aggregate consumptive use of these 11 irrigation projects is said to be about 400,000 acre-feet. The evaporation loss on the storage reservoirs, referred to below, is another 600,000 to 700,000 acre-feet. These quantities, added to about 2,500,000 acre-feet, said to be required by projects already constructed or authorized, would represent a total of about 3,500,000 acre-feet in the upper basin.

This total is well within the quantity of 7,500,000 acre-feet per annum, the use of which is apportioned to the upper basin by article III (a) of the Colorado River compact.

Moreover, the engineering studies indicate that this total could be put permanently to use without the construction of any new holdover

storage whatever, and that no holdover storage would be required for about 50 years, even if other projects were added.

Second: The bill nevertheless authorizes, in section 1, page 2, line 12, the construction of 5 storage reservoirs: Echo Park, Flaming Gorge, Glen Canyon, Navaho, and Curecanti—reduced to 3, Glen Canyon, Echo Park, and Curecanti, in Under Secretary Tudor's statement here. The ultimate storage program amounts to over 48 million acre-feet, and these 3 dams account for about 33 million. The purpose of authorizing construction of these reservoirs now, instead of many years from now, is twofold:

(*a*) Electric energy would be generated and sold and the proceeds pooled to pay out the cost of the storage dams, and thereafter, starting 44 years from completion of Glen Canyon, to subsidize the construction of the power and reclamation projections previously referred to in section 1.

(*b*) And the proponents of the measure say, if built now the reservoirs could accumulate water with less interference with consumptive uses in both the lower and upper basins than if their construction were delayed until a later time when consumptive uses will be larger.

Third: The bill authorizes, in section 5, page 8, line 1, the construction of other projects, unnamed, provided they meet certain criteria. These are not designated in the bill, but the Department has inventoried over 100 projects in various publications, particularly House Document 419, 80th Congress.

It is not clear from section 5 whether these projects must be brought back to Congress for further authorization, or whether the Secretary is authorized by section 5 to build them.

The House bill, H. R. 4449, in section 1, page 17, line 2, provides that the Secretary need not submit his reports on these projects to the affected States for comment.

In any event, when they are built, the new power projects and the new reclamation projects covered in section 5, commencing some 45 to 50 or more years in the future, will share in the subsidies afforded by the sale of power to be generated at Glen Canyon; and, in addition, and for the first time, a fourth function of the great holdover storage reservoirs will then come into existence. Thus:

Fourth: When, as, and if the additional projects referred to in section 5 are built, it will be necessary to store water in these reservoirs, not for use by these projects—Glen Canyon Reservoir, for example, is so far downstream that no water stored there can ever be used for irrigation or domestic purposes in the upper basin—but for quite a different reason: to enable these section 5 projects to increase the consumptive use in the upper basin above the 3,500,000 acre-feet required by existing projects plus the section 1 projects, without violating the provisions of article III (d) of the Colorado River compact.

That article of the compact stipulates that the States of the upper division—Colorado, Utah, New Mexico, Wyoming—will not cause the flow of the river at Lees Ferry to be depleted below an aggregate of 75 million acre-feet for any period of 10 consecutive years.

In the driest decade so far, the flow at Lees Ferry was well over 100 million acre-feet, during a time when the upper basin projects were using about 2 million acre-feet per year; and engineers tell us

that the upper basin uses can rise to about 4,300,000 acre-feet, which is more than the total of existing uses plus the uses of all the section 1 projects, plus all the projects that the Interior Department testimony has eliminated, before this 100 million total would shrink to 75 million.

Thus the ultimate purpose of Glen Canyon Reservoir, and the other holdover storage reservoirs, is to enable the section 5 projects to be built in the upper basin without violating article III (d) of the compact, and the immediate reason for constructing Glen Canyon Dam now instead of waiting until the section 5 projects are built is (according to proponents of the measure) first, to start paying out the cost of the big reservoirs, then to subsidize the section 1 projects and, second, to fill Glen Canyon and other reservoirs during a time when the filling is easier, presumably, than it will be later on.

The bill, and the testimony here, make clear that this measure is intended to commit Congress to a program for the full utilization of all the water which the upper basin claims under the Colorado River compact. Otherwise, the storage reservoirs are not needed for any water conservation purpose, and are strictly power dams.

As all of the foregoing involves the Colorado River compact, and as California is a party to that compact, California is directly concerned by the interpretations of the compact implicit in the Interior Department's reports which this bill would effectuate, and in the interpretations of the compact which will control the administration of these reservoirs.

This is apparent when it is realized that the total storage capacity planned is enough to intercept the whole flow of the river for several years, and that it is planned to hold over storage in these reservoirs, for more than 20 years, or 5 presidential administrations, in order, for example, to deliver water to the lower basin under article III (d) in the year A. D. 2000 which, in fact, flows into the reservoir in 1980.

During the 50 years that these reservoirs will serve no function except to generate power, they will evaporate some 30 million acre-feet of water.

Some rather firm understandings as to the meaning of the compact are required, especially as the bill now makes no provision for enforcement of the compact by any State against the United States, which will accumulate and hold this water in its reservoirs and release it subject to the decision of a long succession of Secretaries of the Interior as to what the document means.

The meaning of the document is now in controversy in the Supreme Court, in respects which affect the measure now before you. To these issues I now turn.

II. Interpretations of the Colorado River compact involved in the upper storage project legislation and the pending litigation:

1. The method of measurement of consumptive use:

Article III (a) of the Colorado River compact, in a single sentence, apportions from the Colorado River system in perpetuity to the upper basin and to the lower basin, respectively, the exclusive beneficial consumptive use of 7,500,000 acre-feet per annum, which it states shall include all water necessary for the supply of any rights which may now exist.

Manifestly this one sentence must have the same meaning in both the basins to which it refers.

Senator ANDERSON. Do I understand by that that you mean the upper basin has just as much right to 7,500,000 acre-feet as the lower basin has?

Mr. ELY. To 7,500,000 acre-feet, yes, sir.

But there is sharp controversy over the meaning of the term "beneficial consumptive use." The question is whether it means the quantity in fact used, measured at the place of use, or whether it means the effect of that use measured in terms of stream depletion at some point hundreds of miles downstream, in this case Lees Ferry.

The same question arises under the Mexican water treaty's so-called escape clause. This question of interpretation of the Colorado River compact and the Mexican water treaty is directly at issue in the present Supreme Court case. The quantity involved in this dispute, so far as the planning of the upper basin storage project is concerned, is 300,000 to 500,000 acre-feet, according to engineers' estimates.

The Reclamation Bureau assumes that the measurement is to be in terms of downstream depletion in the case of the upper basin project and the central Arizona project, but in terms of diversion minus return flow, measured at the place of use, with respect to California. The Boulder Canyon Project Act defines it in the latter terms, and the Mexican water treaty says (article I (j)):

> "Consumptive use" means the use of water by evaporation, plant transpiration, or other manner whereby the water is consumed and does not return to its source of supply. In general it is measured by the amount of water diverted less the part thereof which returns to the stream.

That corresponds with California's allegation of the meaning of the term in *Arizona* v. *California* (answer to Arizona, par. 8). Arizona denies that this definition applies to her uses (reply, par. 8), and the Reclamation Bureau, in the project before you, assumes that it does not apply to the upper basin, although in section 2, page 4, line 21, the projects to be built under the bill are recognized as being subject to the terms of the Mexican Water Treaty.

Another problem arises if the depletion theory prevails. One of its postulates is that when water is stored in a reservoir the stream below is depleted, and therefore that the consumptive use takes place then and there, in the year when the water is put in storage, not when it is taken out and used.

On that premise, to what years is the 48 million acre-feet of hold-over storage, i. e., of stream depletion, to be charged? And in future operations, how is the storage of more than 7,500,000 acre-feet in any one year to be charged? Is the same principle, whatever it may be, applicable to the lower basin reservoirs?

Senator ANDERSON. How are they done now?

Mr. ELY. Our uses are charged on a per annum basis in the year in which the water is taken out and used, and not the year in which it is put in storage.

In further answer to your question of a moment ago, as to the right of each basin to the use of 7,500,000 acre-feet, Senator Anderson, I should have qualified it to say that I will come to the provisions of article III (d), which contains the 75-million-acre-foot provision, and will comment then, if I may, in answer to the questions you asked me earlier.

2. The meaning of "per annum" in article III.

Article III (a): Does the apportionment of the use of 7,500,000 acre-feet "per annum" mean an average of that amount over a period of years, or a maximum in any one year? Manifestly, as in the interpretation of "consumptive use," the compact must be given the same interpretation in both basins.

The Reclamation Bureau, in submitting this upper basin storage project, makes the assumption that the apportionment means an average over an extended period, apparently 35 years or more. The effect of this theory is that the upper basin may use, say, 9 million acre-feet or more of water in 1 year, and consider it as apportioned under article III (a), if it uses, say, 6 million or less in some other year, to average 7,500,000 acre-feet.

California alleges in the pending lawsuit that the apportionment means a maximum, like a speed limit on a highway, not an average. If the speed limit says 50 miles per hour, that doesn't mean an average of 50.

We allege (answer to Arizona, par. 8) that the words "per annum" in the compact mean "each year," and not an average of uses over a period of years, whether they are our uses or anyone else's.

Senator ANDERSON. Why didn't they set it that the lower basin would get 7,500,000 acre-feet each year and if the maximum fell below that, well and good? The effect of what you are saying is that California's 7,500,000 feet per year is fixed, and definite, but that 7,500,000 feet for the upper basin States is a maximum, and that deficiencies in dry years must be theirs and not the lower basin's.

Mr. ELY. What I am saying is that identically the same rule must apply to both basins.

Senator ANDERSON. Yes, but because there is a difference of guaranties, they don't apply to both basins if you carry them out. Isn't that right?

Mr. ELY. I will come to the guaranty in a moment.

I am talking about III (a), which, in our opinion, has no relation to the guaranty in III (d).

Senator ANDERSON. You think not?

Mr. ELY. I think not.

Senator ANDERSON. Quite obviously, it has to, if you are guaranteeing 7,500,000 to the lower basin States, and the others must deliver 75 million in 10 years, and they may never use more than the 7 million and a half in their big years and must make up the deficits in the small years, then the treatment is not the same and the guaranty does make some difference; doesn't it?

Mr. ELY. May I postpose comment on that until I come to article III (d)? I will try to answer you then.

Senator ANDERSON. Yes.

Arizona admits that "per annum" means "each year," not "average," but says that the issue is not yet material in the lower basin (reply, par. 8). The effect, if California is right, is that if the upper basin should use in a given year any quantity in excess of 7,500,000 acre-feet, it is using that excess out of unapportioned surplus, in competition with the appropriations of unapportioned excess or surplus waters which may have been made in the lower basin, and subject to the Mexican Treaty burden, which, under article III (c) of the compact, is to be first supplied out of surplus.

The amount involved in this particular issue is very large, of the order of 1,250,000 acre-feet per year. That is, if the compact means what we think it means, the Reclamation Bureau is in error that much in its assumptions as to the quantity of water which the upper basin can lawfully claim under article III (a), and, by the same token, that much more water must be let down to satisfy the Mexican Water Treaty and prior appropriations of surplus in the lower basin.

The same problem arises in the lower basin, but there the Reclamation Bureau has assumed that the limitation imposed upon California's uses by the Boulder Canyon Project Act is a maximum, not an average; so also with its assumptions as to the deliveries to be made under the Mexican Water Treaty and the amounts to be delivered under its water contracts with Arizona, California, and Nevada.

Both assumptions cannot be correct.

This problem of whether the apportionment under article III (a) is of an annual amount, or of an average available over a 20- to 35-year period, has no relation at all to the guaranty in article III (d) that the States of the upper division will not deplete the flow at Lees Ferry below 75 million in each 10 years. That problem is discussed below, in connection with the Mexican Treaty burden.

3. "Rights which may now exist"——

Senator WATKINS. Excuse me, sir. At this moment, Senator Anderson will take over, and we will conclude with the other witnesses tomorrow morning.

I regret having to leave.

Senator ANDERSON. You may proceed.

Mr. ELY. Article III (a): Does the statement in article III (a) that the apportionment of the use of 7,500,000 acre-feet per annum "shall include all water necessary for the supply of any rights which may now exist" include 2 categories of uses in dispute in *Arizona* v. *California:* (1) the uses on the lower basin tributaries, particularly those of Arizona on the Gila River, which she says are not to be charged against the lower basin's apportionment of III (a) water, and (2) Indian uses in both basins?

The significance of the Gila appears in connection with the upper basin's obligations under articles III (c) and III (d) of the compact, and that of the Indian uses in connection with article VII, and will be outlined when those articles are reached in numerical order.

4. The Mexican burden:

Articles III (c) and III (d): Article III (c) provides that the Mexican burden, which is a minimum of 1,500,000 acre-feet per annum measured at the border (and more than that, measured at Lees Ferry), shall be borne first out of surplus, over amounts specified in articles III (a) and III (b) and, if that is insufficient, that the burden of the deficiency shall be equally borne by the upper basin and the lower basin, and whenever necessary the States of the upper division shall deliver at Lees Ferry water to supply one-half of the deficiency, in addition to that provided in article III (d).

Article III (d) provides that the States of the upper division, that is, Colorado, Utah, Wyoming, and New Mexico, will not cause the flow of the Colorado River at Lees Ferry to be depleted below an aggregate of 75 million acre-feet for any period of 10 consecutive years.

The interpretation of these two clauses is at issue in *Arizona* v. *California* and is involved in the present bill. The Reclamation

Bureau apparently assumes in its presentation here that there will be available at Lees Ferry, after the section 5 projects are built, only about 75 million acre-feet every 10 years.

Arizona says (reply, pars. 8, 11) that all this 75 million is III (a) water, that is, that this figure is merely 10 times the quantity apportioned to the lower basin by article III (a) of the compact, and that all of the lower basin's III (a) uses can be made from the main stream.

California (answers to Arizona, pars. 8, 11) and Nevada (petition, par. XIV) deny this, and say that Arizona's uses on the Gila, and the uses of Nevada and Utah on the Virgin River, are "rights which may now exist," in the language of article III (a), hence chargeable to (and protected by) article III (a).

Arizona retorts that her uses on the Gila are covered by article III (b) of the compact, an article which says that, in addition to the apportionment in article III (a), the lower basin is given the right to increase its beneficial consumptive use by 1 million acre-feet per annum.

If Arizona is sustained by the court in this position, there is no water for Mexico in the 75 million acre-feet at Lees Ferry referred to in article III (d), and the upper basin, under article III (c), must, in addition, release water to supply one-half of any deficiency in meeting the Mexican burden.

When the Reclamation Bureau reported favorably on the central Arizona project, it was on the assumption that Arizona's interpretations were correct, without, however, indorsing them.

If California and Nevada are correct, a portion of the 75 million acre-feet at Lees Ferry referred to in III (d), equal to the total of the water supply available and used on the Gila, Virgin, and other tributaries under III (a), is excess or surplus water unapportioned by the compact, available in part for the service of the Mexican water treaty and in part for appropriation, contract and use in the lower basin.

We view the 75 million as a minimum of "wet water," unclassified and unrelated to article III (a), and to be met whether or not there remains available to the upper basin, after meeting that obligation, water to sustain a maximum use of 7,500,000 acre-feet per annum of water apportioned by article III (a).

Senator ANDERSON. Isn't that what I was saying a minute ago? That you view this as an obligation whether or not it means any water to the upper basin? If they had to cut off every irrigation project that has prior appropriation, you still think it has to be done to deliver to the lower basin, don't you?

Mr. ELY. The lower basin and Mexico; yes, sir.

Article III (d) takes precedence over III (a); yes, sir.

Senator ANDERSON. In other words, the rights of California to 75 million feet are superior to any of the allocation to the States of Colorado, New Mexico, and Utah?

Mr. ELY. No, sir.

A lot of the water apportioned by III (a) never passes Lees Ferry at all. It appears in the Gila River and other tributaries that enter below Lees Ferry.

Senator ANDERSON. How much is in the Gila?

Mr. ELY. By our reckoning, in excess of 2 million acre-feet, and on the Virgin River in Utah and Nevada, approximately 300,000, and

the Little Colorado, and other tributaries entering below Lees Ferry, perhaps another 300,000.

Senator ANDERSON. Out of the Little Colorado?

Mr. ELY. Yes, sir.

Senator ANDERSON. Have you seen the Little Colorado?

Mr. ELY. Yes.

Senator ANDERSON. How much was in it when you saw it? Was it absolutely dry?

Mr. ELY. It is a highly variable stream, obviously, but it is one of the resources of the lower basin, with whose use we are charged, Senator.

My point is that not all of the lower basin's 7½ million acre-feet per annum is found at Lees Ferry. That is Nevada's position, that is California's position. Arizona says to the contrary, that all of the lower basin's III (a) water is found at Lees Ferry.

If Arizona is right, the upper basin must deliver not only 75 million, but half of the Mexican deficiency. If we are right, the 75 million includes some water for Mexico.

Senator ANDERSON. In either event, the 75 million comes first before any water in the upper basin?

Mr. ELY. Yes, sir.

The upper division's guaranty under article III (d) comes ahead of the upper division's right under III (a) according to our view.

On the other hand, the Under Secretary of the Interior, in response to a question by a Senator in these hearings, appeared to agree that the compact means that if the upper basin lets down 75 million acre-feet in each 10-year period, it is entitled to keep and use what is left. This, in our view, illustrates the erroneous interpretations of the Colorado River compact built into the planning of the Colorado River storage project.

Senator ANDERSON. Are you raising that question to the Supreme Court? Will that question come squarely before the Supreme Court?

Mr. ELY. It will come before the Court, yes, sir. Not directed squarely to the position of the upper basin, as I have stated in answer to your question, but it is involved. The problem is what are the excess and surplus waters of the Colorado River system and what are the rights to appropriate them. That does involve the question of whether the waters above uses of 15 million of apportioned water are subject to appropriation.

Senator ANDERSON. This question of whether or not the compact means if the upper basin lets down 75 million acre-feet each 10-year period it fulfills its obligation is a very important question.

Mr. ELY. Very important, yes, sir.

Senator ANDERSON. Up to the next 75 million acre-feet, the upper Basin States surely do believe that it belongs to them, but no more is guaranteed because there is a provision for the distribution of surplus waters beyond that. But in recent years there certainly have been no surplus waters beyond that, and as far as we can tell from looking at charts now, there probably will never be.

Don't you think this is a very important thing to consider?

Mr. ELY. It is indeed, sir.

Senator ANDERSON. You don't think it will be settled by the current litigation?

Mr. ELY. We would like to have it settled. We hope it will be.

Senator ANDERSON. If California's position is right, then all of these other States that want water, might as well pack up and go home.

Mr. ELY. No, it develops to this, that in our view, to the degree that the upper basin or, for that matter, the lower basin, uses in any year water in excess of 7½ million acre-feet, it is using water which is not reserved by article III (a) as apportioned water, reserved against the law of appropriation, but is using excess or surplus waters to which it can claim a right only by appropriation.

And consequently if in any year the upper Basin States use more than 7½ million acre-feet, which is all that the compact reserved as against the law of competitive appropriation, it is competing for that water as against appropriations in the lower basin.

Senator ANDERSON. I hope you get it to the Supreme Court.

Mr. ELY. I hope you are right, Senator. We would like to get all of these questions disposed of.

Senator ANDERSON. I thought when we had the central Arizona hearing, it was a pretty general understanding that before the matter got to Court we would settle this question. I am shocked to know that we have not settled it, because that means we will not know where we are for another 20 years.

Mr. ELY. I agree with you. It may be that in order to settle all of the questions in the compact that the States—all of them—are necessary and indispensable parties.

Senator ANDERSON. The other way would be to pass the Colorado upper basin bill and let the State of California come in and tackle it. I think I like that better.

Mr. ELY. I think I differ with you as to the route to be followed. I may say after reading Judge Brietenstein's testimony I am rather convinced that the four upper basin States are necessary and indispensable parties to the present litigation and it is probably to the interest of the entire basin that the upper basin States be included and brought into this suit.

Senator ANDERSON. There is nothing about that in the central Arizona bill. I thought we should all be in the suit in the beginning, and I still think so, but that doesn't matter.

Mr. ELY. Litigation is not a happy method of settling any controversy, but, if it is needed, one lawsuit is better than a series.

5. Reservoir losses:

Nowhere in the compact is specific provision made for accounting for reservoir losses. Arizona says that they are all chargeable against the apportionments made under article III (a). Nevada says that they are all chargeable to surplus. California says that, basin versus basin, they are to be charged with other uses to the basin in which they occur, in the order in which they accrue, whether to III (a), III (b), or other surplus, and that none are chargeable against present perfected rights existing in the lower basin before storage was provided. The upper basin compact (art. IV) charges them against apportionments under article III (a) of the Colorado River compact.

6. The right to demand or withhold water:

Article III (e) of the Colorado River compact provides that the States of the upper division shall not withhold water, and the States of the lower division shall not require the delivery of water, which

cannot reasonably be applied to domestic and agricultural use. Glen Canyon Reservoir and certain other proposed upper basin mainstream reservoirs will be so located physically that no water stored therein can ever be applied to domestic or agricultural uses in the upper basin. All of the water stored in such reservoirs will be required for domestic and agricultural use in the lower basin and Mexico. The 1953 engineering report by Raymond A. Hill to the State of Colorado implies that, if Hoover Dam's reservoir, Lake Mead, is not filled on the day when the gates are closed at Glen Canyon, it may never fill again.

Who is to determine how rapidly storage in these upper basin reservoirs is to be built up, or, putting it another way, to what extent water which would otherwise flow into Lake Mead is to be intercepted and withheld? Who is to determine how rapidly and on what terms releases are to be made? Presumably the Secretary of the Interior. Since the United States cannot be sued without its consent, manifestly some controls are necessary here if the States, both upper and lower, are not to abdicate the administration of their compact to the United States.

Senator ANDERSON. Is this unusual?

What happened when the lower basin would appropriate it? Who decides when water would flow into Lake Mead? I presume it would be the Secretary of the Interior?

Mr. ELY. The inflow into Lake Mead at present is simply the natural flow of the stream.

Senator ANDERSON. Would not the natural flow still flow in the Grand Canyon, then?

Mr. ELY. Yes; at present, but that is the problem, Senator. It flows into Glen Canyon, and when the dam is built, would stop there.

Senator ANDERSON. Isn't it stopped in Lake Mead?

Mr. ELY. Lake Mead is in the lower basin.

Senator ANDERSON. Do you mean it is all right to have rules on stopping the water in the upper basin but no rules on stopping the water in the lower basins?

Mr. ELY. No; I am speaking of a potential conflict, through the Secretary's determination as to how much to let down from the upper basin to the lower, out of Glen Canyon. I would like to avoid those conflicts. If the Secretary of the Interior should decide, for example, that the compact means what some witnesses here have said it means, that if 75 million is let down, that is the end of the matter, and all else can be retained upstream——

Senator ANDERSON. What about that?

Mr. ELY. We would have a very difficult time getting into court to test that question. He is administering property of the United States, the dam, and I think it is likely that the United States would be a necessary party under the ruling in *Arizona* v. *California* (298 U. S.). Conversely, if the Secretary of the Interior decided that he didn't want to accumulate water as rapidly in Green Canyon as you would like to have him do, that the water ought to come down, I think the upper basin States would have great difficulty getting into court to test whether he was performing the compact or not, for the reason that the United States is a necessary party, and without the consent of Congress cannot be sued.

Senator KUCHEL. To that extent you disagree with the testimony of the Federal judge the other day?

Mr. ELY. Completely.

Senator ANDERSON. And with almost every lawyer who handled this.

Mr. ELY. No. The United States in *Arizona* v. *California* (298 U. S.) held that the United States was a necessary party in any suit in the lower basin involving Lake Mead.

Senator ANDERSON. Did they rule in that case with reference to the regulation of water where an officer was performing an administerial act, that he could not be brought into court without the consent of the United States Government?

Mr. ELY. It ruled that whatever was done was all subject to the rights of the United States.

Senator ANDERSON. This is a Cabinet officer, performing an administerial act, and it is your contention that nobody can question the performance without the consent of the United States?

Mr. ELY. I do not say it is an administerial act. If the Secretary of the Interior is managing Government property, that dam——

Senator ANDERSON. He is administering the compact between the States.

Mr. ELY. Yes; and if there is a conflict as to whether the compact requires him to let down 75 million or let down more, I would say that a suit to determine how the property of the United States should be administered is one that requires the presence of the United States in court.

Senator KUCHEL. In other words——

Mr. ELY. It is not a matter——

Senator ANDERSON. I think we differ completely as to whether the dam, the water in the dam, and everything connected with it would be the property of the United States. I would think the Secretary would be properly performing an administerial act. If I remember my own personal interest, I found one occasion at that time where a Cabinet officer can be brought into court.

Mr. ELY. The recent decisions with respect to the control of property of the United States, to my mind, confirm the intervals to be drawn from the decision in *Arizona* v. *California* (298 U. S.) that the United States would be a necessary party.

Senator KUCHEL. Let me make one more comment. If there were dispute on this point, and this constituted one of the questions for the committee to determine in its executive committee meetings on this bill, obviously, this would have to be cleared by an appropriate defense.

Mr. ELY. May I resume?

7. Appropriation of surplus:

Does the provision for a further apportionment, by unanimous consent after October 1, 1963, mean that no State may validly appropriate surplus until a new compact is made? California alleges, in the pending litigation, that any State, including the upper basin States, may appropriate surplus waters unapportioned by the compact, subject only to their being divested by a new compact to which such a State is party, or by court decree.

Senator ANDERSON. How about if they had not acquired them but put them to beneficial use?

Mr. ELY. The United States Supreme Court held in the Hinderliter case that a State may, by compact with another State, restrict the use of its own citizens even though they are valid under its laws.

To continue: That surplus waters are subject to appropriation has been the position maintained by representatives of some, at least, of the upper Basin States in previous hearings. Arizona and Nevada say that no State may acquire any right in surplus until a new compact is made. If they are sustained, then the upper basin can acquire no right in the waters it may use in any year in excess of 7,500,000 acre-feet. Actually, under the compact, the Boulder Canyon Project Act and the Mexican water treaty, all excess and surplus water of the Colorado River system has already been appropriated or obligated to uses in the lower basin and Mexico.

Senator ANDERSON. Does that mean that this provision for a further apportionment is void?

Mr. ELY. No; it is entirely permissive, Senator.

No State is required——

Senator ANDERSON. Would it require a unanimous consent among the States?

Mr. ELY. Yes, sir.

Senator ANDERSON. And since California wouldn't give it, it is a null provision?

Mr. ELY. It might be California or any other State. I can't imagine your State, for example, if you had appropriated and put to use certain waters, agreeing to give them up, any more than we would.

Senator ANDERSON. Certainly, when that provision was put in, it was understood that there would be another meeting, and if they figured out what would be done, the water would be divided again. You are not going to try to rewrite the history, are you?

Mr. ELY. No, quite the contrary. But the record is also clear that intervening appropriations would be valid although at the risk of a subsequent reapportionment.

Senator ANDERSON. If the subsequent reapportionment required the unanimous consent of California you know it could never be given in God's green earth.

Mr. ELY. And also if it is attempted to take from New Mexico water appropriated in New Mexico.

Senator ANDERSON. Does any State other than California contend that they all did not agree that in 1963 they would meet again to try to divide up the surplus?

Mr. ELY. What the ultimate position of the other States will be, I don't know. I have been asked at the witness table here at previous hearings whether I conceded the right of the upper basin States to appropriate surplus, and my answer was "Yes."

Senator ANDERSON. How could they appropriate surplus when they are not even starting to get any part of their 7,500,000. You would have to get up to that first, wouldn't you?

Mr. ELY. That is correct.

Senator ANDERSON. And, therefore, it is a foolish thing to talk about going beyond that.

Mr. ELY. My point is, Senator Anderson, that you are going beyond that, on the theory of the Reclamation Bureau's report underlying this bill, because if you use more than 7½ million in any 1 year,

you are using excess or surplus waters and establishing a right thereto by appropriation, not by apportionment.

Senator ANDERSON. Well, they would never put to actual use more than 7½ million. They certainly would have a right to store in order to deliver in their compact.

Mr. ELY. There you put your finger on one of the points which disturbs us. We contend that our right in the lower basin to claim apportioned water, water reserved against competitive appropriation, is a right to use up to 7½ million acre-feet in any 1 year, not an average of that quantity over a period of years. We can't claim in the lower basin 9 million of apportioned water in 1 year, because in some other year we used only 6 million. If we use only 6 million in 1 year, that is too bad. If we use 9 million in some other, then a million and a half of that is excess or surplus waters which we are using at our own risk, acquiring the right by appropriation.

Senator ANDERSON. Let me see if I get that straight.

Mr. ELY. We say the same rule applies exactly in the upper basin. If you use 9 million acre-feet in some year, you are using a million and a half of excess or surplus waters; you are not using 9½ million acre-feet of apportioned waters simply because in some other year you happened to use less than 7½ million.

Senator ANDERSON. Let's see if I can say it another way. If for 10 straight years the upper basin States deliver 7½ million acre-feet of water to you without fail every year, and in 1 of those years they use, say, 6 million acre-feet of water and the next year they use 6 million acre-feet of water but they have a very heavy runoff, and they store another 3 million acre-feet, you contend that that extra million and a half acre-feet, then, is a use of a surplus water to which they are not entitled.

Mr. ELY. No. There we fall apart on two differences, Senator Anderson. First, the 75-million-acre-feet guaranty at Lees Ferry in our mind has no relation whatever to article III (a) in either basin. It includes some III (a) water for the lower basin, it may include III (b) water, it includes water for Mexico, it may include some other surplus. It is so much wet water. It is a floor. It has nothing to do with the apportionment. The lower basin is charged in each of those years with the waters it uses on the Gila River, for example, and whether you measure the Gila at 1 million, 2 million, or some other figure, that is III (a) water, and so also are the old uses on the Virgin River. Consequently, the 75 million referred to in III (d) is just so much wet water, that includes a part of the Mexican burden.

That has nothing to do with how the upper basin uses are to be charged under article III (a). We say, as to article III (a): Charge the uses in the upper basin and in the lower basin exactly alike. Whatever rule you decide on for one applies to the other.

The rule already decided on for the lower basin, by statute, spelled out in the Boulder Canyon Project Act, is the aggregate annual consumptive use. If we use more than 7½ million in the lower basin, that excess is excess or surplus. We say that rule applies in the upper basin.

Senator ANDERSON. You recognize no difference between the two areas, one supplying water and the other receiving it, and if they supply you with 75 million they probably figure they are fulfilling their contract with you.

And if they store in periods of good runoff in order to make water available to you, you think that would be wrong?

Mr. ELY. That is not the problem. There is no relation between III (a) and III (d) in that sense. The water delivered to us under article III (d), the 75 million acre-feet, is not identical with the III (a) water. But the point you raise illustrates the gravity of the problem of interpretation that I am trying to put before you. I am, of course, arguing my side.

Senator ANDERSON. I think what you are trying to say is that no matter how badly the upper basin needs this water, there ought to be some way of interpreting compacts so they can't get it.

Mr. ELY. Not at all. We want to have the compact interpreted so you operate under exactly the same ground rules we do.

Senator ANDERSON. But you don't have the ground rules when you are upper State.

Mr. ELY. We think the interpretation of the compact should be the same in both basins.

Senator ANDERSON. You can turn the world upside down and start pouring a little water in our direction, and we will show you that it doesn't work very well.

Go ahead.

Mr. ELY. Thank you.

8. The impounding of water for power generation:

Article IV (b) of the Colorado River compact authorizes the impounding and use of water for generation of power, but stipulates that—

such impounding and use shall be subservient to the use and consumption of such water for agricultural and domestic purposes and shall not interfere with or prevent use for such dominant purposes.

As elsewhere noted, no water stored in Glen Canyon Dam and certain other main stream reservoirs can ever be used, physically, for agricultural or domestic purposes in the upper basin. Such water is the residue after the uses in the upper basin. It will be stored and used at such reservoirs to generate power to be sold to subsidize irrigation and power projects in the upper basin. The use of these reservoirs appears to be squarely controlled by articles IV (b) and III (e), previously referred to. The right of the Reclamation Bureau to so manipulate them as to maintain power generation, if the waters stored therein are in fact needed for agricultural and domestic use in the lower basin, is subject to challenge.

Senator ANDERSON. That is the first place I have agreed with you for a long time.

Mr. ELY. Thank you, sir.

The sole function of Glen Canyon Reservoir is as part of a hydroelectric project, unless and until the section 5 projects are built, and for a period of 50 years or more even if they are built. Only thereafter does it assume any function under article III (d) of the compact.

As elsewhere pointed out, during this 50-year period, when the sole function of the reservoir is to generate power, they will evaporate over 30 million acre-feet of water, at the cost of power generation and agricultural use in the lower basin. The notion that Glen Canyon is to be built to accommodate the lower basin, and that the lower basin should bear the evaporation losses there, is a little farfetched.

Senator ANDERSON. You say "as elsewhere pointed out, during this 50-year period when the sole function of the reservoir is to generate power." Can you imagine a stretch of 50 years when the sole function will be to generate power?

Mr. ELY. That appears to be the case, Senator, from a Reclamation Bureau study. They concede that for 25 years these dams would not be necessary for any conceivable development in the upper basin. They stop at that point. Our engineers say most likely the period is 50 years, even if all of the projects contemplated in both section 1 and section 5 were built. That is to say that without any regulation at all, the upper basin could deliver 75 million acre-feet every 10 years and retain something like 4,300,000 acre-feet for itself, without Glen Canyon or Echo at all.

Senator ANDERSON. And retain how much for itself?

Mr. ELY. Retain approximately 4,300,000. Beyond that point you need storage of the type contemplated here. The Reclamation Bureau's program of development apparently indicates it is about 25 to 50 years off before anyone would have to build Glen Canyon to perform the obligation of III (d).

Senator ANDERSON. But from the flow of the river, it doesn't look to be 50 years off, does it? That is, if you look at the flow for the last 15 or 20 years.

Mr. ELY. I am speaking of the hydrograph over the last thirty-odd years. If that were repeated again, you still could use 4,300,000 acre-feet, the engineers say, without holdover at all. That is more than existing uses plus all projects referred to in this bill. On these engineering questions, I am a layman and Mr. Matthew will follow me with the figures.

Senator ANDERSON. Along the line of Hoover Dam being useful for 200 years, would that be of any benefit to the lower basin?

Mr. ELY. I think unquestionably.

Senator ANDERSON. If it did prolong the life for Hoover Dam of 200 years, then would the opinions be different?

Mr. ELY. A benefit starting 200 years in the future, Senator, is a little hard to evaluate.

Senator ANDERSON. That is exactly the way I feel about your 50 years.

Mr. ELY. 9. Indian rights:

Article VII of the Colorado River compact provides that nothing in the compact shall be construed as affecting the obligations of the United States to Indian tribes. The upper basin compact provides that use by the United States or its wards shall be charged as a use by the State in which the use is made. California, in the pending suit, takes the same position. The United States denies this and says that—

the rights to use the water of the Indians and Indian tribes are in no way subject to or affected by the Colorado River compact.

The Government's petition tabulates 1,747,250 acre-feet of "diversion" claims of Indians in the lower basin of which 1,556,250 are in Arizona.

There are large Indian claims in the upper basin, but they have not been tabulated so far in this suit. Arizona says that—

the obligations of the United States to the Indians or Indian tribes are not material or relevant.

It is known that the Office of Indian Affairs construes article VII of the compact as meaning that (1) the Indian claims come ahead of the compact, are not chargeable to any State, and the compacting States simply divided the residue after the Indian claims; (2) Indian claims relate back to the date of establishment of the reservation, even though not put to use, and take priority over uses by non-Indians even though the uses by non-Indians may in fact long antedate the actual putting of water to use by the Indians.

The Government's pleadings leave it free to make both these assertions. As to the first, Arizona has refused, so far, to disagree with the Indian Bureau's position. Naturally, if Arizona can hope for 1,500,000 acre-feet for Indian diversions, outside the compact, in addition to the 3,800,000 acre-feet she demands under the compact, there is a temptation to try to get it. Just where the water would come from is not very clear. Arizona, at a meeting with the Attorney General of the United States on December 3, 1953, was invited to join the upper Basin States, California and Nevada, in a common statement of position that Indian uses are to be charged under the compact against the State in which they are situated, but declined to do so.

Senator ANDERSON. You would recognize that the State of New Mexico has agreed that the Navaho use, nearly all of our use, is properly chargeable against the State of New Mexico.

Mr. ELY. Yes; I think you are correct. Our uses of Indians in California, which are not large, are charged against our State and required to be so charged under the regulations of the Secretary of the Interior. The existence of the Indian claims, and uncertainty as to their accounting, raises serious questions as to the water supply for the projects in both the upper and lower basins. The United States, in this suit, also claims independent rights for the use of the Bureau of Land Management, the Forest Service, the Park Service, for fish and wildlife, et cetera, and denies that all of its rights are subject to the Colorado River compact. The magnitude of these additional claims is not stated. Those questions will not be resolved until this suit is decided.

10. Present perfected rights:

Article VIII provides that—

present perfected rights to the beneficial use of waters of the Colorado River system are unimpaired by this compact.

In the present suit California alleges that "unimpaired" as used in this article means unimpaired as to both the quantity and the quality of the waters to which these perfected rights relate. California alleges that as of the effective date of the compact, her present perfected rights were not less than 4,950,000 acre-feet.

Senator ANDERSON. What was the figure in the so-called Self-Limitation Act?

Mr. ELY. 4,400,000 acre-feet of the waters apportioned by article III (a), plus not to exceed one-half of the excess of surplus waters unapportioned by the Colorado River compact.

The report of the Reclamation Bureau contains no data on the effect of large transmountain diversions coupled with other upper basin uses on the quality of water. Such a study should obviously be made. We know that when the compact was ratified, the Colorado Commissioner's formal report stated that—

natural limitations upon the use of the waters within each of the upper States will always afford ample assurance against undue encroachment upon the flow of Lees Ferry by any one of the four upper States. Colorado cannot divert 5 percent of its portion of the river flow to regions outside the river basin.

Elsewhere he testified that Colorado's transmountain diversions could not exceed 300,000 acre-feet per annum. By contrast, the Colorado transmountain diversion projects inventoried in the Reclamation Bureau's various reports aggregate 2 million acre-feet, or 52 percent of the water allocated to Colorado by the upper basin compact. There would be that much less water to absorb an increasing quantity of salts in passage to Lees Ferry. The effect on the lower basin is one which the lower basin States are entitled to have studied and reported upon, to the end that their present perfected rights, in the language of article VIII, shall remain unimpaired.

Senator ANDERSON. Did you feel that the discussion we had on that, in which we thought it would be interesting to have a study of this question of salinity on other projects was sufficiently broad compared to what you had in mind?

Mr. ELY. I don't think I heard all of that discussion.

Senator ANDERSON. It wasn't completely settled, but I think most of us agreed that it would be desirable to find out what the actual facts were.

Mr. ELY. The suggestion has been made that that study should go throughout the entire basin. I have no objection to that. We just want to know the facts.

III. CONCLUSION

California's basic position is that our State is conforming to the Colorado River compact, the Boulder Canyon Project Act, and the other enactments which comprise the law of the river, and we must insist that the Reclamation Bureau and the upper basin States do likewise in the planning and administration of the Colorado River storage project. The Colorado River storage project, as now planned, is based upon interpretations of the compact which, in our view, are wrong and constitute encroachments upon the compact for the benefit of the upper basin to the extent of about 1,500,000 acre-feet per year. The fact that the initial stages of this project will not use all the water claimed by the upper basin is not important. Thirty-three to forty-eight million acre-feet of storage is to be built now only on the premise that all the water claimed will be ultimately used, and the bill proclaims that it will be so used.

Because the legislation before you encroaches upon the Colorado River compact and upon California's water supply, the Colorado River Board of California has adopted the following resolution, which summarizes our position:

The Colorado River Board of California opposes the enactment of S. 1555 and H. R. 4449, 83d Congress, bills to authorize the Secretary of the Interior to construct, operate, and maintain initial units of the Colorado River storage project and participating projects, and for other purposes.

California favors the continuation of the development of the water resources of the Colorado River Basin on a sound economic basis, as the need for such development occurs. This State recognizes the right of the upper basin States to so utilize the waters apportioned to that basin by the Colorado River compact as approved by the Boulder Canyon Project Act, but subject to the terms and

conditions of those documents as the Supreme Court may construe them in the cas of *Arizona* v. *California*, now pending.

By the same token, California, in the protection of its investment of nearly $700 million in water-development projects which it has made in reliance upon the Colorado River compact and the Boulder Canyon Project Act, and the economy and population of more than 4 million people dependent upon these works, must resist legislation which would encroach upon the rights recognized in the lower basin States by those documents.

The proposed Colorado River storage project legislation adversely affects the lower basin States in much the same way as would the proposed central Arizona project legislation. Both are based upon interpretations of the Colorado River compact and the Boulder Canyon Project Act, with which California cannot agree and which are now at issue in the United States Supreme Court.

Each of them contemplates developments which would encroach upon the compact and project act, as interpreted at the time of enactment of those laws, to the extent of more than a million acre-feet per year. Both proposals are based upon unrealistic water-supply estimates. Each is in conflict with the presentation made to the Senate by the supporters of the Mexican Water Treaty. Each ignores the legal claims which are in conflict with it, and both ignore the damage which their construction would cause to the investments already made by their neighbors. Each of these proposals is dependent upon Federal subsidies for irrigation amounting to many times the value of the land when fully developed, and most of these subsidies are concealed. Both would commit the Congress to new feasibility standards and pay-out formulas with which this board and other California State agencies have officially expressed disapproval.

Senator ANDERSON. Do you think that is a valid objection to a project of this nature, where one State can get off by itself and say, "We don't approve of the basinwide pool, and, therefore, it is improper for the Federal Government to have that type of legislation"?

Mr. ELY. Aside from the right of any State to express its views, and I suppose we all have a right to do that, in this case our particular objection is that by the aid of these particular subsidies, the overdraft of the water is increased.

The Colorado River storage project would intercept the lower basin's water supply with giant reservoirs at Glen Canyon, Echo Park, and Curecanti, capable of storing several years' flow of the river. In the absence of statutory controls of the operation of such reservoirs designed to protect the output of firm power at Hoover Dam, upon which the United States and the power contractors relied, the use of such large storage could result in seriously curtailing the revenues at Hoover Dam and other dams on the lower river and upon which these lower projects depend for financing. It is against the best interest of both the power users in the lower basin and the Federal Treasury to so legislate.

Both Glen Canyon and Echo Park Reservoirs would be located downstream from any point of use by the proposed irrigation projects in the upper basin and their major purpose would be to provide revenues, commencing almost 50 years hence, to pay the capital cost without interest of the irrigation projects proposed for construction now. This postponement of nearly 50 years of the commencement of repayment of irrigation would result in a Federal subsidy amounting to over $2,500 per acre of irrigated land—an unwarranted and unjustified burden on the Nation's taxpayers.

California, as a major taxpaying State, is doubly affected, for the amount of the overdraft on the water supply of the Colorado River Basin is directly related to the amount of Federal subsidy to the irrigation projects creating the overdraft.

The bills delegate to the Secretary of the Interior power to resolve the feasibility of the participating irrigation projects. If reclamation

feasibility standards are to be changed, that should be done by Congress, in general legislation after the Hoover Commission has had an opportunity to report upon this very matter, heretofore committed to their study.

The proposed legislation includes some, and foreshadows others, large transmountain diversion projects in the upper basin using several million acre-feet of water annually, thereby impairing the quality as well as the quantity of the water available to the lower basin and to which the lower basin is entitled under the Colorado River compact.

For all these reasons, the Colorado River Board of California respectfully requests the representatives of this State in the Senate and House of Representatives of the United States to oppose the enactment of legislation to authorize construction of the Colorado River storage project and participating projects as proposed in these bills—S. 1555 and H. R. 4449—or similar legislation, and instructs its officers and staff to make the appropriate presentation of the views of this board to the congressional committees and executive agencies concerned with such legislation.

Mr. Chairman, may I ask permission to have printed as a part of my statement (1) the document which comprises the views of the State of California on the proposed Colorado River storage project which was submitted under the provisions of the Flood Control Act of 1944, and (2) a document which is a summary of the controversy in *Arizona* v. *California et al.*, comprising a portion of our pleadings in that case.

Senator ANDERSON. That will be made a part of the record.

Mr. ELY. And a number of resolutions by California cities and districts, and others, in opposition to this legislation.

Senator ANDERSON. They will be received.

(The documents referred to appear at the end of Mr. Ely's testimony.)

Senator ANDERSON. Senator Kuchel.

Senator KUCHEL. Mr. Chairman, the record so far in the Senate subcommittee apparently lacks some important information about what is involved in irrigation costs. May I, therefore, Mr. Chairman, request that this committee request the Bureau of Reclamation to file for inclusion into the record the following information:

(*a*) For each participating project included in the bill the average cost per acre, regardless of who pays the cost, for land which would be newly irrigated, for land to be supplied with supplemental water, for the total of the two kinds of lands——

Senator ANDERSON. Do you mean that? The first part is all right, where you say the total for the two kinds of lands per acre. I do not know how can you add new land and supplemental water on the same piece of land.

Senator KUCHEL. For land to be newly irrigated and lands to be supplied with supplemental water.

Senator ANDERSON. When you figure your per-acre cost, you can't figure the per-acre cost of new land and the per-acre cost of supplemental water on land that is not new and say that both go to the same acre, because they cannot be new and supplemental at the same time.

Mr. ELY. I think it would be useful to have the statistics on each type.

Senator ANDERSON. I don't object to that. He said the total of the per-acre cost of new and supplemental water, and they cannot be new and supplemental on the same piece of ground.

Mr. ELY. I think if that were shown for each class it would be the statistics required.

Senator KUCHEL. May that request be made, Mr. Chairman?

Senator ANDERSON. Yes; for each. I am not trying to be critical; I am just saying that it is impossible the other way.

Senator KUCHEL. Mr. Chairman, I would on that point like, with your assistance, to acquaint the representatives of the Bureau of Reclamation with just what is desired.

Senator ANDERSON. Let it be understood that Senator Kuchel will discuss it with Mr. Larson; and if it is possible to furnish the figures he has requested, even though I think they would be difficult to furnish, they will be furnished.

(The following was subsequently received for the record:)

Estimated cost allocated to irrigation projected on an average acre basis for project total, supplemental, and new lands

Participating project	Project area (acres)		Total	Irrigation allocation total
	New	Supplemental		
Central Utah	28,540	131,840	160,380	$127,354,000
Emery County	3,630	20,450	24,080	9,636,500
Florida	6,300	12,650	18,950	6,503,600
Hammond	3,670		3,670	2,302,000
LaBarge	7,970		7,970	1,673,300
Lyman		40,600	40,600	10,564,000
Navaho [1]	151,000		151,000	232,650,000
Paonia	2,210	14,830	17,040	6,791,600

[1] Navaho not included in the Department's recommendation in report on the bill.
[2] All new land.
[3] All supplemental land.

Senator KUCHEL. Now, Mr. Chairman, just 1 or 2 questions.

Can you inform the committee, Mr. Ely, of the status of the lawsuit in the Supreme Court? When might a decision be anticipated?

Mr. ELY. The status of the case is this: Arizona filed a bill of complaint against California and the water using agencies in California. She did not join the United States and did not join any other State as defendants. The State of California answered. The United States intervened. The State of Nevada was allowed permission by the court to intervene and is now a party. Arizona has not answered Nevada. Nevada has not answered the United States. A master has been appointed by the court and the case refrred to the master. The procedure from now on is in the hands of the master.

How the master will set the case up or how long it will take him to try it and render his report and thereafter for argument to be heard upon it, and an opinion of the court to be handed down is a matter of conjecture.

One of the problems involved, I may say, is as to just what parties are necessary to the determination of this controversy. The State of Nevada has raised the point that Utah and New Mexico are indispensable parties, as being in part within the lower basin. We think Nevada is right about that. From Judge Breitenstein's testimony I draw the conclusion that all four States may very well be indispensable parties. His views and ours as to the interpretation of this document are obviously poles apart. It may consequently be necessary to implead all four of them.

Senator KUCHEL. You are just in the preliminary stages so it would be futile, even, to try to estimate when a decision would be reached?

Mr. ELY. That is correct, sir.

Senator ANDERSON. I think, Mr. Ely, that in the central Arizona hearing, unless my memory is playing me a trick, I was one of those that kept insisting that all of the States had to come in. I desire that.

Mr. ELY. I think that is correct, Senator Anderson.

Senator ANDERSON. I certainly subscribe to that point of view. We might as well all get into court anyway.

Mr. ELY. We do not want a protracted lawsuit and then end up with a decree that we find does not settle the questions, and that sometime in the distant future there is to be another lawsuit involving the upper basin. Let's get it all settled at one time.

Senator KUCHEL. Basically is it the position of the attorney general of California and the Colorado River Board of California that this legislation would violate the rights of California under the Colorado River compact?

Mr. ELY. That is the opinon and view of the Colorado River Board of California and of the State as expressed through the department of public works, which is delegated by the Governor as the responsible agency to render the State's reports under the procedure of the Flood Control Act of 1944.

Attorney General Brown has direction of the lawsuit; and so far as possible, the legislation and the lawsuit have been kept in separate compartments. We have not desired to have the problems of the legislation affect the lawsuit or vice versa, any more than we can help. They converge here in my testimony, as I represent the State's department of justice in our supreme court and represent another branch of the State, the Colorado River Board, with respect to this legislation.

Senator KUCHEL. And it is also the position of the State government that there is no present avenue by which the people of our State could bring into court and have a judicial decision rendered on the alleged violations of the Colorado River project?

Mr. ELY. If this bill should be enacted, without provision for some way to get into court to test the questions I have mentioned, our view is that without an act of Congress granting the consent to join the United States, it is highly doubtful whether any of the seven States could get the matter before the court as to the proper operation of these giant reservoirs.

Senator ANDERSON. I noticed in the House hearings you submitted some amendments.

Mr. ELY. We did, Senator Anderson. I am not submitting them here because of the fact that the bill seems to have taken a considerably different course. It is a little difficult to see just what final form it will have. I don't think any useful service would be performed by my submitting amendments at this stage.

Senator ANDERSON. In the House hearings, you expressed your disapproval of transmountain diversions. When the Colorado-Big Thompson project was constructed, did California object to that in any way?

Mr. ELY. No.

Senator ANDERSON. Has California objected to any of the other transmountain diversions until the State of New Mexico wanted to have a little tiny one?

Mr. ELY. No, Senator. We have, with growing concern, watched the mounting list of transmountain diversions.

Senator ANDERSON. As long as you had a big State like Colorado doing it, you never raised a voice; did you?

Mr. ELY. That is not it. I think that we have taken on the big powerful State of Colorado in connection with the Fryingpan-Arkansas project. It was the first time in which we have seriously raised this question of the effect of transmountain diversions.

Senator ANDERSON. I went through the Fryingpan hearings in the Senate. Did you testify?

Mr. ELY. Yes, sir. I am not sure you were there that day, Senator.

Senator ANDERSON. I may have missed that day. Therefore, you are strongly opposed to the transmountain diversion in Colorado as you are to the one in New Mexico?

Mr. ELY. Yes. There is no distinction between one of the upper States and the others, Senator. We have been reluctant to object to any upper-basin State projects until we felt that this bill presented us with the necessity, whether we like it or not, of raising the issues I have now raised. I would like this opportunity to place in the record a memorandum that summarizes the bills for development in the upper basin and the lower basin that have gone through in the last several years with California's acquiescence. It is frequently said by uninformed people that California's position is to oppose development through the basin; that is not true.

Senator ANDERSON. I say that you pick out your opponents that only have two Congressmen and not very strong representation. We feel kind of sorry that you picked out on us.

Mr. ELY. If we were looking for easy opponents, I think the State of New Mexico would be the last that we would pick, so long as it is represented in the Senate with the representation it has, to say nothing of its representation in the House. I would go a long way to avoid a row with you, Senator.

Senator ANDERSON. I recognize it is a very difficult thing for a State to watch a trend and finally some day speak about it.

Mr. ELY. That is our feeling; yes.

Senator ANDERSON. Revert for us a minute to the House bill, because it will have to be before us some time, either as a document we will consider on the floor or as a matter that might go to conference.

Mr. ELY. Might I interrupt to ask if this could go into the record; this memorandum?

Senator ANDERSON. Yes. That could go into the record at this point.

(The data referred to follow:)

MEMORANDUM—CALIFORNIA AND UPPER BASIN PROJECTS

An idea has been implanted in the minds of some Members of Congress from the States in the upper basin of the Colorado River to the general effect that California has consistently obstructed or opposed the approval of reclamation projects in the upper basin.

California has not only failed to oppose upper basin development; it has in repeated instances supported such development. That fact can be demonstrated.

I. Boulder Project Adjustment Act (54 Stat. 744): In the year 1940 the Boulder Project Adjustment Act was adopted by Congress with the active support of California, and its delegation in both Houses. That act provides that for 15 years there shall be paid out for investigation and construction of projects located exclusively in the upper basin States (Colorado, New Mexico, Utah, and Wyoming) the sum of $500,000 per year, a total of $7,500,000. Further, for the next 35 years a like sum each year shall be equitably distributed for the same purposes among the 7 States of the Colorado River Basin. From this it will follow that at least another $8 or $9 million will fall to the share of the upper basin States. This money is being derived and will be derived from the rates paid for power produced at Hoover Dam. More than 90 percent of the money is being taken from the pockets of the household and commercial power users in California.

These provisions of the act were not only agreed to by California but vigorously supported in Congress by the California delegation. They confer a special benefit upon the upper basin States, which have these funds available in addition to their fair share of the funds appropriated to the Bureau of Reclamation in general for general investigation of projects throughout the West.

II. Furthermore, in each of the following named projects, the California representatives on the congressional committees voted for the projects and either supported and voted for them on the floor or permitted them to be adopted without objection by unanimous consent. In no case did California oppose any of these projects. The record so shows.

1. Provo (Deer Creek) project, Utah (62 Stat. 92).
2. Mancos project, Colorado (61 Stat. 176). (In this instance, the Colorado River Board of California affirmatively supported reauthorization of the project before congressional committees and with the California delegation.)
3. Paonia project, Colorado (61 Stat. 181). (In this instance California took the same affirmative position as in the case of the Mancos project.)
4. Eden project, Wyoming (Public Law 132, 81st Cong.).
5. Weber Basin project, Utah (Public Law 273, 81st Cong.).
6. Fort Sumner project, New Mexico (Public Law 192, 81st Cong.).
7. Vermejo project, New Mexico (H. R. 3788, 81st Cong.).
8. Big Thompson project, Colorado (H. R. 5134, 81st Cong.).

III. Upper Basin Compact Act (Public Law 37, 81st Cong.): California officially joined with representatives of other States in commending the efforts of the upper basin States to come to an agreement upon an upper basin compact and repeatedly expressed the hope that they would be able to harmonize their views and make such a compact. When the compact had been made and ratified by the legislatures of the upper basin States, it came here for the consent of the Congress. The bill sets up certain criteria for the measurement and administration of the waters of the upper basin States which are distinctly different from those which are applicable to all seven Colorado Basin States under the original Colorado River compact of 1922. In the hearings which were held on the upper basin compact bill before the House Committee on Public Lands representatives of California appeared and testified on one point only. They stated that California had no interest whatever in how the upper basin States proposed to handle their affairs among themselves, but they asked that it be made crystal clear that the action of Congress should not be taken so as to interpret or vary the terms of the original Colorado River Basin compact. It developed then that the official representatives of the upper basin States disclaimed having any such idea, and language was agreed upon between California and the upper basin States which appeared in the House committee report, and properly preserves all questions of interpretation of the Colorado River com-

pact. This being settled, California approved the passage of the bill and it was passed on the Consent Calendar in both Houses.

Certainly no fair-minded person would consider that there was anything in the nature of obstruction or opposition on the part of California in these proceedings. The suggestion made by California was promptly and frankly accepted and agreed to by the upper basin States as being in proper order. The bill was not delayed nor was it jeopardized nor lost.

Senator ANDERSON. Can you show us where in the House bill as it was reported, the bill authorizes anything except the projects and units that are specifically listed?

Mr. ELY. Section 2 of the House bill, H. R. 4449, corresponds in general to section 5 of the Senate bill. It appears at page 17 of the House bill.

Senator ANDERSON. No; I am saying as reported.

Mr. ELY. This is as reported, sir.

Do you have it before you?

Senator ANDERSON. Yes; I do have it.

Mr. ELY. It reads:

In order to achieve such comprehensive development as will assure the consumptive use in the State of the upper Colorado River Basin of waters of the Colorado River system, the use of which is apportioned to the upper Colorado River Basin by the Colorado River compact, and to each State thereof, by the upper Colorado River Basin compact, it is the intent of the Congress in the future to authorize the construction, operation, and maintenance of further units of the Colorado River storage project, of additional phases of participating projects, authorized in this act, and of new participating projects as additional information becomes available and additional needs are indicated.

Thereafter, follow two criteria. There is also in the bill a provision——

Senator ANDERSON. Yes; but that does not authorize it.

Mr. ELY. It is a declaration of intent.

Senator ANDERSON. That is right. I can say that at some future time I intend to pay a certain amount of money to my bank, but unless I come forward with the money, the bank is never going to mark my note paid.

Mr. ELY. My point is there is no need for spending several hundred million dollars for Glen Canyon and Echo Park unless the section 2 projects are going to be built. The section 1 projects require only a half million feet of consumptive use and no storage.

Senator ANDERSON. We do want to get a point in there that we can use if we need to, to build additional projects. May I say, Mr. Ely, I don't know what is in the minds of anybody else, but as far as I am concerned, I do not desire to see the State of California deprived of one drop of water to which it is properly entitled, and I think if we had the cooperation instead of difficulties, I am not referring to the difficulties, it is in the testimony, it would be possible to construct the projects in the upper Colorado River Basin and provide sufficient storage so that when the river was well managed we would have all the water necessary to take care of the lower basin and all of the projects that the upper basin thus far, at least, can envision.

We would do it on the basis of us all being friends together, instead of on a basis where it will develop into a row between the upper and lower basins. I think it can be done. I have been trying during the days of this hearing, to assure other parts of the basins that my State does not have any designs on anybody, on the water of anybody, including either Arizona, California, or Nevada, and I think it might

be possible so to pass this bill and so to word it that those fears ought to be to some degree dissipated.

I do have some pretty strong convictions on what the Colorado compact means. I think anybody that was around at the time it was written can remember some of the history pretty clearly. I can't realize that was thirty-some-odd years ago. Maybe it was. I still like to think it was a short time ago.

I remember the enthusiasm with which Mr. Hoover and others announced the signing of that document.

Mr. ELY. Senator Anderson, I appreciate what you say, and I certainly accept at full value your assurance that you don't want to take water that belongs to California, and we don't want to take water that belongs to you, either. But unhappily we have a disagreement as to what the rights are. If I may make two additional comments——

Senator ANDERSON. Could I say, still with a smile on my face, that we believe in our State, that you don't want to take it away from us, but you certainly would enjoy delaying our getting it.

Mr. ELY. No, I would rather see you get it. I would like to see the meaning of the compact determined and have you, as well as us, get exactly the water we are entitled to. I might make these two comments, and I know it is late:

One is that the House bill on page 17, line 2, contains language that section 1 (c) of the Flood Control Act of 1944 shall not be applicable to such supplemental reports.

In other words, the Secretary does not have to submit to the affected States, including California, the reports on the proposed section 2 projects.

Senator ANDERSON. That is correct. And all that I can say is that so far as the Senate bill is concerned, as to the projects in New Mexico, he does have to submit them to the affected States and he does have to submit them back to the Congress.

Mr. ELY. The other comment I would like to make is that in closing, I think a great deal of the difficulties that we face are due to the Mexican Water Treaty. We said so in 1944. California and Nevada opposed that treaty. As a matter of fact, the water users throughout the Colorado Basin overwhelmingly opposed it, that is, the actual irrigation districts. It was unhappily supported by the State governments of five of the States at that time, in response to a plea of the State Department that they do so, recognizing the Mexican Water Treaty as a war-time agreement, and many considerations supposing to influence it.

To our mind it was the same unhappy breed as a number of wartime agreements: Yalta, on a small scale.

The results of the treaty are absolutely disastrous. They guarantee to Mexico twice what that country has ever used in the state of nature and as you pointed out, Senator, a guaranty on the Colorado River is a very difficult burden to undertake.

How we are going to solve that, I don't know.

Senator ANDERSON. I don't suppose there is any way to solve it. I have said that I think it is one of thhe most serious mistakes that has ever been made. I think it is the one thing that seems to make difficult the solution of the problems of the Colorado River. At one time, in discussing the Polish Corridor, I said that it wasn't very wide but so long as it was there it was wide enough to bar forever the peace in Europe. And the Mexican treaty, while not very big, is big enough

almost to destroy the hope for peace on the Colorado River as long as it is there. I think it would be well, even at this late date, to try to buy back some of the water bargained away. I think we would have to buy it back, but I would be happy to buy it back. It is worth millions and millions of dollars to us in buying back peace.

Mr. ELY. The treaty is a whole lot worse in operation than it is on its face. It guarantees a million and a half acre-feet and requires us to meet Mexico's nominations of the rate in cubic feet per second at which water shall reach the border, up to 3,500 second-feet. Actually, our Government has found it impossible to gage the releases from Hoover and Davis so as to even approximate the 3,500 second-foot figure. The water reaching the Mexican border, even at times when storage in Lake Mead is being drawn down, when it should not be drawn down, has far exceeded it. There has never been a time when the Mexicans have not received more water than the treaty entitled them to.

What will happen if Lake Mead continues to be drawn down, I cannot tell. I think that is a serious problem that deserves the attention of Congress.

Senator ANDERSON. I think that is one which the upper and lower division might well reach an agreement on.

Thank you.

We will recess now until 9 o'clock tomorrow morning.

Mr. ELY. Before I leave the stand, Senator Anderson, may I express my deep appreciation for the courtesy which I have received at the hands of yourself and the committee. While we may not agree, you have been most attentive and considerate of what I have had to say, and I appreciate it.

(The exhibits accompanying Mr. Ely's testimony are as follows:)

EXHIBIT A

IN THE SUPREME COURT OF THE UNITED STATES

October term, 1953

No. 10 Original

State of Arizona, Complainant, v. *State of California, Palo Verde Irrigation District, Imperial Irrigation District, Coachella Valley County Water District, Metropolitan Water District of Southern California, City of Los Angeles, Calif., City of San Diego, Calif., and County of San Diego, Calif., Defendants*

United States of America, Intervener

SUMMARY OF THE CONTROVERSY (EXHIBIT A)

(As appended to answer of California defendants to petition of intervention tion on behalf of the United States)

Edmund G. Brown, Attorney General of the State of California, 600 State Building, San Francisco, Calif.,
Northcutt Ely,
Robert L. McCarty, Assistant Attorney General, 1200 Tower Building, Washington 5, D. C.,
Prentiss Moore, Assistant Attorney General, 417 South Hill Street, Los Angeles 13, Calif.,
Gilbert Nelson, Deputy Attorney General,
Irving Jaffee, Deputy Attorney General,
Robert Sterling Wolf, Deputy Attorney General, 315 South Broadway, Los Angeles 13, Calif.,
Attorneys for defendant, State of California.

Francis E. Jenney, Attorney for defendant, Palo Verde Irrigation District.
Harry W. Horton, Chief Counsel,
R. L. Knox, Jr., 218 Rehkopf Building, El Centro, Calif.,
Attorneys for defendant, Imperial Irrigation District.

Earl Redwine, 3610 Eighth Street, Riverside, Calif.,
Attorney for defendant Coachella Valley County Water District.

James H. Howard, General Counsel,
Charles C. Cooper, Jr., Assistant General Counsel,
Donald M. Keith, Deputy General Counsel,
Alan Patten, Deputy General Counsel,
Frank P. Doherty, 306 West Third Street, Los Angeles 13, Calif.,
Attorneys for defendant, The Metropolitan Water District of Southern California.

Roger Arnebergh, City Attorney,
Gilmore Tillman, Chief Assistant City Attorney for Water and Power,
John H. Mathews, Deputy City Attorney, 207 South Broadway, Los Angeles 12, Calif.,
Attorneys for defendant, City of Los Angeles, Calif.

J. F. Du Paul City Attorney,
Shelley J. Higgins, Assistant City Attorney, Civic Center, San Diego, Calif.,
T. B. Cosgrove, 1031 Rowan Building, Los Angeles 13, Calif.,
Attorneys for defendant, The City of San Diego, Calif.

James Don Keller, District Attorney, Court House, San Diego, Calif.,
Attorney for defendant, County of San Diego, Calif.

EXHIBIT A

SUMMARY OF THE CONTROVERSY

The pleadings filed by Arizona, Nevada, the United States and California, to date, disclose complex questions of fact and law, many of which are interrelated. The summary of principal questions presented below is divided into four parts: (I) the quantities of water in controversy; (II) the ultimate issues, from the standpoint of the respective prayers; (III) a tabulation of factual issues; and (IV) the issues of interpretation of the basic documents involved. Under this division, certain questions reappear and to this extent reflect the interlocking nature of the problem.

I. THE QUANTITIES OF WATER IN CONTROVERSY

The United States seeks to quiet title to rights to the use of water, consumptive and otherwise, "as against the parties to this cause," for federal purposes, in unstated amounts.

Arizona seeks to quiet title to the beneficial consumptive use of 3,800,000 acre-feet per annum of the waters of the Colorado River System (measured by "man-made depletion of the virgin flow of the main stream") and to enjoin California's right to permanently use any water in excess of approximately 3,800,000 acre-feet per annum (measured by "diversions less returns to the river"), that being the effect of (1) reducing 4,400,000 acre-feet of III (a) water by reservoir losses, and (2) denying California any permanent right to use excess or surplus waters.

California asserts a right to the beneficial consumptive use in California of 5,362,000 acre-feet per annum of the waters of the Colorado River System (measured by "diversions less returns to the river") under contracts with the United States, comprising 4,400,000 acre-feet of the waters apportioned by Article III (a) of the Colorado River Compact and 962,000 acre-feet per annum of the excess or surplus waters unapportioned by the Compact, including in such excess or surplus the "increase of use" permitted to the Lower Basin by Article III (b) of the Compact.

Nevada seeks to quiet title to 539,100 acre-feet per annum (measured in part by both methods) of the beneficial consumptive uses apportioned by Article III (a) of the Colorado River Compact, and to not less than a total of 900,000 acre-feet from all classes of water.

As the States differ in their definition of "beneficial consumptive use," their claims require restatement in terms of a common denominator in order to evaluate their effects. Thus:

The quantity to which Arizona seeks to quiet title, 3,800,000 acre-feet per annum, measured by the method she urges, "depletion of the virgin flow of the main stream occasioned by the activities of man," is equivalent to more than 5,000,000 acre-feet measured by consumption at the site of use, or "diversions less returns to the river," the standard established by the Boulder Canyon Project Act and asserted by California. The difference is due primarily to the fact that under Arizona's interpretation, the Compact deals with the virgin flow in the main stream only and that the use of water "salvaged by man" is not charged as a beneficial consumptive use, whereas under California's interpretation the Compact deals with the waters of the entire river system and such salvage is so charged.

Conversely, the aggregate of the California contracts, 5,362,000 acre-feet per annum, measured by "diversions less returns to the river," is equivalent to only about 4,500,000 acre-feet measured by "man-made depletion" (without charge for salvaged water). If Arizona's prayer should be granted, California's rights would be reduced to about 3,800,000 acre-feet per annum, measured by "diversion less returns to the river," or to about 3,000,000 acre-feet measured in terms of "depletion of the virgin flow of the main stream."

The impact of Nevada's claims on those of the other states is not readily evaluted.

II. ULTIMATE ISSUES

The ultimate issues, in the sense of the results sought by each party, may be grouped as follows:

The United States

Does the United States have rights, "as against the parties to this cause, to the use of water in the Colorado River and its tributaries" in the following categories?

(1) for consumptive use of all projects in the Lower Basin, which it asserts independently of any rights claimed by the States in which such projects are located;

(2) to fulfill its obligations arising from international treaties and conventions; but this involves, with respect to the burden of the Mexican Water Treaty, the obligations as between the States of the Upper Division and the States of the Lower Division under Articles III (c) and III (d) of the Colorado River Compact, and involves also the effect of the so-called "escape clause" of Article 10 of that Treaty, which allows reduction in the guaranteed deliveries to Mexico, in the event of extraordinary drought, in the same proportion as consumptive uses in the United States are reduced, "consumptive uses" being defined in Article I of the Treaty;

(3) to fulfill all its contracts for the delivery of water and electric power, *i. e.*, with or in Arizona, California, and Nevada; but it alleges that the water available is not sufficient to satisfy all these obligations;

(4) to fulfill the Government's obligations to Indians and Indian Tribes; but this involves not only the questions of the magnitude and priorities of these claims but the questions of whether or not they are chargeable under the Colorado River Compact to the Basin and State in which such uses are made, what the obligation of the Upper Division States may be to release water for use by Indians in the Lower Basin, and what rights the United States may have to withhold water in reservoirs in the Upper Basin for use by Indians in both Basins;

(5) to protect its interests in fish and wildlife, flood control and navigation; but such rights as it may have for these purposes may require the impounding and release of water from reservoirs in both Basins, and not merely reservoirs bordering or within Arizona and California, and again involves the question of accounting under the Compact; and

(6) for use of the National Park Service, Bureau of Land Management, and Forest Service; but if the United States has claims "as against the parties to this cause" for these functions, such claims apply to all the waters of the Colorado River System in both Basins.

The adjudication of these claims of the United States requires consideration and resolutions of: questions of fact, referred to later; the power of the United States to impound and dispose of water independently of rights derived from the States; the extent of its obligations under treaties and contracts; the impact and effect of its treaties upon rights of domestic water users; how its claims to the use of water shall be measured; the location, magnitude and priorities of In-

dian claims, and claims for other alleged federal purposes; the extent to which its rights and obligations are controlled by the Colorado River Compact; and the extent to which its claims may be exercised *in futuro* in derogation of intervening rights and uses.

Arizona

Is Arizona entitled to a decree:

(1) Quieting title to 2,800,000 acre-feet per annum of the beneficial consumptive uses apportioned to the Lower Basin by Article III (a) of the Colorado River Compact, substantially all to be taken from the main stream, and measured in terms of man-made depletion of the virgin flow of the main stream?

(2) Quieting title to all of the 1,000,000 acre-feet per annum by which the Lower Basin is permitted to "increase its use" by Article III (b) of the Colorado River Compact (notwithstanding the decision of this Court in *Arizona* v. *California et al.*, 292 U. S. 341 (1934)), to the exclusion of the other States of the Lower Basin, all to be taken from the waters flowing in the Gila River, and to be measured in terms of man-made depletion of the virgin flow of the main stream?

(3) Reducing California's right to the uses apportioned by Article III (a) of the Colorado River Compact to approximately 3,800,000 acre-feet per annum, in consequence of reservoir losses?

(4) Enjoining California's right to receive and permanently use under its government contracts 962,000 acre-feet per annum, or any part thereof, in excess of 4,400,000 acre-feet per annum?

The determination of Arizona's claims involves: the questions of fact, later referred to; the standing of Arizona to seek a declaratory decree quieting title to a "block" of water for projects not yet constructed or authorized (about 1,600,000 acre-feet per annum of the 2,800,000 claimed from the main stream); the source of title to Arizona's claims to 2,800,000 acre-feet of III (a) water and 1,000,000 acre-feet of III (b) water; the status of the uses on the Gila; the measurement of uses thereof and of the main stream; whether Arizona's status is that of a party to the Colorado River Compact or that of a third party beneficiary of the Statutory Compact between the United States and California, and if so, whether Arizona is bound by the interpretations placed thereon by the principal parties thereto in its formulation and administration; and the validity and effect of Arizona's water delivery contract with the United States.

Most of the questions posed by Arizona's claims revolve around the issue of whether the Gila River shall be treated as a part of the Colorado River System for all purposes, or shall receive special treatment in respect of (1) the identification of uses thereon with the waters referred to in Article III (b); (2) the corollary exemption of "rights which may now exist" on the Gila from any charge under Article III (a); and (3) the devaluation of the charge for beneficial consumptive uses from the quantity which is in fact consumed on the Gila (alleged by California to be about 2,000,000 acre-feet per annum) to the lesser quantity represented by the resulting depletion in the virgin flow of the main stream (alleged by Arizona to be about 1,000,000 acre-feet per annum).

California

Are the contracts between the United States and the defendant public agencies of California for the storage and delivery of water valid and enforceable? Inasmuch as these contracts are, in terms, for permanent service but subject to the Colorado River Compact, the Boulder Canyon Project Act and the California Limitation Act, the issue is whether these enactments, considered together as a Statutory Compact established by reciprocal legislation, authorize and permit the Secretary of the Interior to presently contract for the storage and delivery for permanent beneficial consumptive use in California, of 4,400,000 acre-feet per annum of the waters apportioned by Article III (a) of the Colorado River Compact plus one-half of the excess or surplus waters unapportioned by the Compact, including in such excess or surplus the "increase of use" permitted to the Lower Basin by Article III (b) of the Compact. The aggregate of these contracted quantities, subject to physical availability of the amounts of excess or surplus waters, which vary from year to year, is 5,362,000 acre-feet per annum.

The determination of California's claims involves: the questions of fact, later referred to; the extent to which rights have vested in both the United States and California under the Statutory Compact; whether Arizona is estopped by her previous conduct from asserting her present position; whether the limitation is net of reservoir losses; how California's uses shall be measured; whether California is chargeable with the use of salvaged water; the effect of California's

appropriations, in their relation to the expressions "rights which may now exist" and "present perfected rights" in the Compact and Project Act; the definition of the Project Act term, "excess or surplus waters unapportioned by" the Colorado River Compact; the availability of such waters for permanent service; the intent of Congress with respect to the waters referred to in Article III (b); and the relation between California's contracts and the later agreements which the Secretary of the Interior has entered into with others.

Nevada

Is Nevada entitled to a decree:

(1) Quieting title to 539,100 acre-feet per annum of the beneficial consumptive uses apportioned to the Lower Basin by Article III (a) of the Colorado River Compact?

(2) Reserving for a future agreement the disposition of the use of the 1,000,000 acre-feet referred to in Article III (b) of the Colorado River Compact, and preserving to Nevada an equitable share thereof?

(3) Assuring Nevada the ultimate beneficial consumptive use of not less than 900,000 acre-feet per annum, from all classes of water?

The determination of Nevada's claims requires the consideration and resolution of: the questions of fact later referred to; the questions of interpretation previously mentioned; the question of whether Nevada's share of III (a) waters has been determined or limited to 300,000 acre-feet per annum; whether, as to stored waters, Nevada may claim any quantity in excess of her contracts with the United States; and the source of title to her claims to 539,100 acre-feet per annum of III (a) water and not less than 900,000 acre-feet per annum from all sources.

Interests of other States

There remains the question whether the claims of the United States, Arizona, California, and Nevada can be effectively determined without concurrently determining the rights and obligations of Utah and New Mexico with respect to the waters of the Lower Basin, and the rights and obligations of those states and Colorado and Wyoming with respect to other waters of the Colorado River System, to the extent that they are affected by the issues in controversy here.

In more detail, these "ultimate issues" depend upon the resolution of the following questions of fact and of the interpretation of the Colorado River Compact, the Boulder Canyon Project Act, the Statutory Compact between the United States and California, and the Mexican Water Treaty.

III. FACTUAL ISSUES

There are substantial issues of fact, raised by the pleadings to date. These include, but are not limited to, determination of:

(1) the investments and obligations undertaken by the parties in the construction of works and in the performance of their contracts with the United States, and the investments and obligations undertaken by the United States in reliance upon such contracts;

(2) the location, magnitude and priorities of the water rights necessary to enable the United States to perform its obligations to Indians and Indian tribes pursuant to Article VII of the Compact;

(3) the requirements of the United States for (a) flood control, (b) navigation, (c) fish and wildlife, and (d) the other claims which it makes;

(4) the quantities of water physically available for beneficial consumptive use in the Lower Basin, assuming full use by the Upper Basin of its Compact apportionment, full regulation of the supply available to the Lower Basin, and full performance of the Mexican Water Treaty;

(5) the uses, present and potential, on the main stream and on each tributary, determined as of the place of use, as California contends is the proper method, and the effect of those uses in terms of manmade depletion of the virgin flow of the main stream as Arizona contends is the proper method;

(6) the quantities of water "salvaged" by the activities of man, on the main stream and on the tributaries;

(7) reservoir losses, present and potential, gross and net;

(8) appropriative rights, priorities, and uses thereunder, on the main stream and tributaries;

(9) the extent and place of use of "rights which may now exist" and which, under Article III (a) of the Compact, are to be charged as uses of water appor-

tioned by Article III (a), and of "rights which may now exist" in California, within the meaning of Section 4 (a) of the Project Act; and

(10) the extent and place of use of "present perfected rights" protected by Article VIII of the Compact and directed by the Boulder Canyon Project Act to be satisfied in the operation and management of the Project.

IV. THE ISSUES OF INTERPRETATION OF THE COLORADO RIVER COMPACT, THE BOULDER CANYON PROJECT ACT, THE STATUTORY COMPACT, AND THE MEXICAN WATER TREATY

Questions relating primarily to Article III (a) of the Colorado River Compact include the following: Whether the Colorado River Compact deals only with the main stream or treats with Colorado River System waters wherever they may be found; whether the uses apportioned by Article III (a) to the Lower Basin are to be taken only from "water present in the main stream and flowing at Lee Ferry," as Arizona contends, or from the tributaries as well, as California and Nevada contend; whether the 7,500,000 acre-feet referred to in Article III (a) is related to the 75,000,000 acre-feet referred to in Article III (d), as Arizona contends, or whether the latter figure includes excess or surplus waters unapportioned by the Compact, as California contends; by what process Arizona claims to have acquired an apportionment of 2,800,000 acre-feet of III (a) water, to be taken from the main stream; whether the apportionment of 7,500,000 acre-feet "per annum" is a statement of a maximum, or of an average, and, if the latter, over what period of years; the definition and measurement of "beneficial consumptive use"; the accounting for water added to and withdrawn from storage on the main stream and tributaries; whether the use of water salvaged by man on the main stream and tributaries is to be charged under the Compact; the definition of "rights which may now exist," which are to be included in charges to water apportioned by Article III (a) and their magnitude on the main stream and tributaries; the date to which this last expression refers; whether, in the absence of a compact among the Lower Basin States, the division of water among them is to be affected by appropriative rights, *i. e.*, "rights which may now exist"; whether Indian rights, and other federal claims to consumptive use, are included within that expression and are to be charged under the Compact; whether reservoir losses are chargeable as beneficial consumptive uses, and if so, their classification under the Compact and their relation to other uses.

Questions relating primarily to Article III (b) of the Colorado River Compact include the following: The questions relating to the definition of "beneficial consumptive use" and "per annum" previously stated in connection with Article III (a); whether the "increase of use" permitted to the Lower Basin by Article III (b) is an apportionment in perpetuity as in Article III (a), as Arizona contends, or a license to acquire rights by appropriation and contracts under the Project Act in excess or surplus waters unapportioned by the Compact, as California contends; whether this right to increased use is identified solely with the water found flowing in the Gila River, as Arizona contends, or is identified with the first 1,000,000 acre-feet of increased use (above 7,500,000) per annum throughout the Lower Basin, as California and Nevada contend; whether this right is available to all five States of the Lower Basin, or to Arizona alone, as she contends (notwithstanding the decision of this court in Arizona v. California *et al.*, 292 U. S. 341 (1934)); the status of uses in New Mexico on the Gila; the status of uses on other tributaries; and to what degree reservoir losses are chargeable to this increase of use. Reference to the relation of the Mexican Treaty burden to the uses under Article III (b) appears below in connection with Article III (c).

Questions relating primarily to Article III (c) of the Colorado River Compact include the following: Whether the waters to be supplied Mexico are "apportioned" thereby (this bears upon the determination of the meaning of the expression "excess or surplus waters unapportioned by" the Colorado River Compact, appearing in the Boulder Canyon Project Act, *infra*); whether, if the quantities in excess of those specified in Articles III (a) and III (b) are insufficient to supply the deliveries to Mexico, the burden, with respect to the Lower Basin, falls first upon the uses referred to in Article III (b), as California contends, or upon those referred to in Article III (a), as Arizona contends; and the relation of the "escape clause" in Article 10 of the Treaty, which permits reduction in deliveries to Mexico in case of extraordinary drought in proportion to the reduction in consumptive uses in the United States. The relation of

Article III (c) to Articles III (d) and III (a), with respect to the obligations of the Upper Division States, is referred to below in connection with Article III (d).

Questions relating primarily to Article III (d) of the Colorado River Compact include the following: As a corollary to one of the questions stated with reference to Article III (a), whether the 75,000,000 acre-feet referred to in Article III (d) is related to the 7,500,000 acre-feet apportioned by Article III (a) to the Lower Basin, or whether the 75,000,000 acre-feet include excess or surplus waters available for delivery to Mexico or use in the Lower Basin; the resulting effect on the obligation of the States of the Upper Division stated in Article III (c) to furnish additional water to meet the deficiency if surplus above the quantities specified in Articles III (a) and III (b) is insufficient to supply Mexico; and whether the Lower Basin is entitled to demand release of this 75,000,000 acre-feet notwithstanding the consequent inability of the Upper Basin to make beneficial consumptive use of 7,500,000 acre-feet per annum.

Questions relating primarily to Article III (e) of the Colorado River Compact include the following: Whether, if excess or surplus waters are appropriated (or contracted for) in the Lower Basin, their release from storage in the Upper Basin may be required; whether, if Indians uses are not subject to the Colorado River Compact, the United States may require release of water from reservoirs in the Upper Basin to satisfy them, in addition to the water which the States of the Upper Division are required to release in performance of Articles III (c) and III (d) of the Compact; so also with respect to the other federal claims asserted by the United States "as against the parties to this cause," for use of water in the Lower Basin.

Questions relating primarily to Articles III (f) and III (g) of the Colorado River Compact include the following: Whether the provisions in these articles with reference to a compact to be made after October 1, 1963, are permissive or mandatory; whether, in the light of the Statutory Compact, these provisions preclude the acquisition of rights in excess or surplus waters by appropriation and by contract with the United States in the interim, subject only to further apportionment as between Basins by such a future compact; and whether, in the event of competing interstate claims to such excess or surplus waters, in the absence of a compact apportioning them, priority of appropriation, including contracts with the United States, controls.

Questions relating to Article VII of the Colorado River Compact include the following: Whether uses by Indians are subject to the Colorado River Compact; whether Indian uses are chargeable under the Compact to the Basin and the State in which they are situate; if not, whether they are prior and superior to the apportionments made by the Compact, or are in competition with appropriations of others which are subject to the Compact; the location, magnitude, and asserted priority of Indian claims; their effect upon the quantities available to non-Indian users under Articles III (a), III (b), etc.; their effect on the distribution of the Mexican Treaty burden; and their effect on the obligations of the States of the Upper Division under Articles III (c) and III (d).

Questions relating primarily to Article VIII of the Colorado River Compact include the following: The date to which the expression "present perfected rights" relates, *i. e.*, 1922, 1929, or some other date; the definition of said term; whether such definition is to be determined under the law of the State under which the right arose; whether the assurance against impairment extends to quality as well as quantity; the extent of these rights in each State; their relation to the expression "rights which may now exist," as used in Article III (a) of the Compact and Section 4 (a) of the Project Act; and the impact of reservoir losses when present "perfected rights" attach to, and are satisfied from stored waters, pursuant to the direction in Article VIII.

Questions relating primarily to the Boulder Canyon Project Act and the resulting Statutory Compact between the United States and California include the following: Whether the alternative consent given in the Project Act to a Seven-State or Six-State Compact became final on June 25, 1929, in establishing the latter; whether Arizona could, or did, effectively ratify a Seven-State Compact thereafter; if so, whether the Statutory Compact authorized by the Project Act as a corollary to a Six-State Compact remains in effect; if it does, whether Arizona can claim the benefits of both; whether the Statutory Compact authorized contracts to be made with the California defendants for the permanent service (in addition to 4,400,000 acre-feet of III (a) waters) of one-half of the excess or surplus waters unapportioned by the Compact for use in California; whether it included therein the waters referred to in Article III (b), or precluded California from use of such waters; whether the "excess or surplus," of which

California may use one-half, is to be reckoned before or after deduction of the quantity required to be delivered to Mexico; the effect on California's right to "excess or surplus" of a future compact apportioning such waters; whether the limitation "for use in California" is net of reservoir losses, or is subject to further reduction in consequence of such losses; whether the definition of consumptive uses applicable to California is applicable to Arizona, and vice versa; whether California is free to make use of salvaged waters without charge under the Compact or the Limitation Act; the effect of California's appropriations; the meaning and effect of the reference to "rights which may now exist" in Section 4 (a) of the Project Act; the extent of California's "present perfected rights" as referred to in Section 6 of the Project Act; whether by the Project Act, or otherwise, the shares of Nevada or Arizona in the waters of the Colorado River System have been determined; and the construction and effect of the water delivery contracts held by those States.

GOODWIN J. KNIGHT, GOVERNOR, STATE OF CALIFORNIA

DEPARTMENT OF PUBLIC WORKS,
OFFICE OF THE DIRECTOR,
Sacramento, February 15, 1954.

Hon. DOUGLAS MCKAY,
Secretary of the Interior, Department of the Interior,
Washington, D. C.

DEAR SIR: Your proposed supplemental report on the Colorado River storage project and participating projects, transmitted to the President on December 10, 1953, was received in this office on December 28, 1953, with letter of transmittal from the Acting Commissioner of Reclamation to Governor Goodwin J. Knight, and forwarded to the division of water resources of this department for study and review.

On February 2, 1954, a request was sent to you for additional detailed substantiating information in order to permit a thorough analysis and appraisal of the proposed developments.

Since it appears that the proposed developments are now under active consideration by the executive departments and the Congress, looking toward an early decision, it is understood that comments of all interested States are desired without delay. Accordingly, a report has been prepared by the division of water resources in collaboration with the Colorado River Board of California, setting forth the general views of the State of California; subject, however, to such modifications as are deemed necessary when and if detailed substantiating information has been received and the proposals have been given further consideration. This report has been received and is transmitted herewith.

I concur in the comments submitted and request that they be considered as expressing the views of the State of California on your proposed report. It is further respectfully requested that the report, dated February 15, 1954, on this subject, be transmitted to the President of the United States and to the Congress along with the other material that may be so transmitted.

Very truly yours,

FRANK B. DURKEE, *Director of Public Works.*

STATEMENT OF THE STATE OF CALIFORNIA ON PROPOSED SUPPLEMENTAL REPORT OF THE SECRETARY OF THE INTERIOR ON COLORADO RIVER STORAGE PROJECT AND PARTICIPATING PROJECTS, DATED DECEMBER 10, 1953

INTRODUCTION

Reference is made to letter of December 15, 1953, by Acting Commissioner of Reclamation H. F. McPhail to Gov. Goodwin J. Knight, of California, transmitting copies of a supplemental report of the Secretary of the Interior, dated December 10, 1953, on the Colorado River storage project and participating projects, and inviting comments. The project was originally reported upon by the Bureau of Reclamation in Project Planning Report No. 4–8a.81–1 dated December 1950. That report is incorporated, with modifications, in the Secretary's supplemental report.

The 1950 report presented a plan of development of the upper Colorado River Basin comprising 10 major dams and reservoirs with hydroelectric plants on the Colorado River and principal tributaries above Lee Ferry, and an indefinite

number of water-using projects designated "participating propects." That report recommended approval of the overall plan and initial authorization and construction of 5 units of the storage project and 10 new participating projects, and inclusion as participating projects of 2 irrigation developments already authorized and under construction.

The supplemental report of December 1953 recommends approval of the overall plan, initial authorization and construction of the Glen Canyon and Echo Park units of the storage project, authorization for immediate construction of the same 10 new participating projects, inclusion of the same 2 previously authorized projects as participating projects and authorization of the Shiprock division of the Navaho project, including Navaho Dam and Reservoir, with actual construction of the Navaho project to be referred until a report thereon has been approved by the Congress.

Cost estimates for the storage units and the participating projects in the Secretary's supplemental report are revised upward as compared to the estimates in the 1950 report. There also appears to be some revision in the assumptions as to power output and revenues and allocation of costs of the storage project, although no explanation is given.

A proposed repayment program is recommended which would involve postponement of repayment of the irrigation costs beyond the ability of the water users to repay until after the power investment in the storage units is repaid with interest. It is estimated in the financial operation study attached to the report that it would take 56 years to pay off the power investment with interest.

This proposal differs from the repayment program proposed in the 1950 report, under which it was planned to divert and use the interest charged on power investment to repay the portion of the irrigation costs beyond the ability of the water users to repay.

PREVIOUS VIEWS AND RECOMMENDATIONS

Under date of June 14, 1951, the State of California submitted to former Secretary of the Interior Oscar L. Chapman its views and recommendations on the original project planning report dated December 1950. From those views and recommendations the following is quoted:

"Therefore, the State of California favors congressional authorization of the specific projects set forth in the proposed report of the Secretary of the Interior or as may be modified, and their construction with Federal funds consistent with national welfare if (*a*) such projects qualify under criteria, policies, and procedures of the Congress, and (*b*) the diversion and utilization of the waters of the Colorado River system by and through these projects will not impair the rights of the State of California or any of its agencies to the waters of that system as defined and set forth in the Colorado River compact and related laws and documents."

It was further stated that the phrase "criteria, policies, and procedures of the Congress" was intended to refer to "uniform criteria, policies, and procedures to be established by the Congress."

COMMENTS ON SUPPLEMENTAL REPORT

California agencies have rights established by prior appropriation and by contract with the Secretary of the Interior under the authority of the Boulder Canyon Project Act, providing for the use in California of 5,362,000 acre-feet annually of water from the Colorado River system. It is the duty of the State to protect and preserve those rights of its citizens. California is, therefore, rightfully concerned in proposals for the further development of the water resources of the Colorado River Basin wherever such developments may be. For this reason it is necessary for the State to analyze thoroughly any proposals for further development and take whatever steps appear required to insure that such developments would not impair the rights of California and its agencies in and to the waters of the Colorado River system.

The Colorado River storage project and participating projects as proposed in the report under review would obviously have substantial effect upon the available water supply and the operation of facilities in the lower basin and California. Furthermore, the plan of financial operation of the project as proposed by the Department of the Interior departs materially from existing reclamation law and is not in accordance with sound standards and policies.

The comments herein are directed, first, to the effects of the proposed project on California's rights to Colorado River water and, secondly, to basic questions of criteria, policies, and procedures involved in the proposals. These have been prepared by the division of water resources in collaboration with the Colorado River Board of California.

Because of the lack of supporting detail in the supplemental report under review, the comments are necessarily based largely on the substantiating material presented in the original 1950 report and the accompanying special reports on individual participating projects.

Effects on California's rights to Colorado River water

The engineering studies presented in the original 1950 report and the related special reports on participating projects and the supplemental report of the Secretary of the Interior are vague and uncertain with respect to the effects of proposed upper basin developments on the water supply available to the lower basin, the rights of California thereto, and the operation of facilities in the lower basin. The plans for construction and operation of the proposed developments, insofar as revealed in these reports, give no proper or adequate consideration to the interests of the lower basin States. Furthermore, the studies involve or imply what California considers to be erroneous interpretations of the Colorado River compact.

The erroneous interpretations of the compact include: (1) that article III (a) apportions to the upper basin a water use of 7,500,000 acre-feet a year in terms of depletion of the virgin flow at Lee Ferry instead of a beneficial consumptive use of 7,500,000 acre-feet a year at places of use; (2) that the upper basin would be entitled to the consumptive use of an average annual amount of 7,500,000 acre-feet instead of a maximum of 7,500,000 acre-feet in any one year. Because of these erroneous interpretations, the report is invalid as regards the showing of how soon and how much holdover storage will be needed and as regards the ultimate quantity and pattern of residual flow into the lower basin at Lee Ferry.

There are at least 10 serious questions of interpretation of the compact which would be involved in and affect the proposed storage project and related reclamation developments. (See statement of Northcutt Ely on behalf of Colorado River Board of California at hearings on H. R. 4449 before Subcommittee on Irrigation and Reclamation of Committee on Interior and Insular Affairs of House of Representatives, January 26, 1954.) All of these questions are at issue in the pending case of *Arizona* v. *California, et al.;* United States Supreme Court, October term, 1953, No. 10 original.

California's basic position is that this State is conforming to the Colorado River compact and must insist that the Bureau of Reclamation and the States of the upper basin do so in the planning and administration of the Colorado River storage project and participating projects.

As to annual variation in consumptive use requirements, there appears to be no justification for the assumption in the report that under full development, with a regulated water supply and with practically all the irrigated land receiving a full supply each year, the water requirement and use would be highest in wet years and lowest in dry years. This assumption cannot be reconciled with the results of the latest scientific investigations of the subject, and therefore is a probable source of further error in the findings in the reports on the storage project and participating projects.

It is evident that the building, filling and operation of the proposed main-stream reservoirs, with an ultimate total capacity of about 48 million acre-feet, would have substantial effect upon lower basin facilities and operations. Even the filling of the two reservoirs, Glen Canyon and Echo Park, now proposed for initial authorization with combined capacity of 32 million acre-feet, would have a material effect and would present serious problems.

Who is to have the final decision and control as to the operation of these holdover reservoirs, including storage and release of water? Article III (e) of the Colorado River compact provides that the States of the upper division shall not withhold water and the States of the lower division shall not require the delivery of water which cannot reasonably be applied to domestic and agricultural use. Glen Canyon Reservoir and certain other proposed upper basin main-stream reservoirs will be so located physically that no water stored therein can ever be applied to domestic or agricultural uses in the upper basin. All of the water stored in such reservoirs will be required for domestic and agricultural use in the lower basin and Mexico. Furthermore, consideration

must be given to the Government's obligations to maintain the contracted firm power output at Hoover Dam.

No discussion of such problems, including the inevitable reduction in power output at lower basin plants and its economic effect from a national standpoint, is presented in the reports. Insofar as the original basic report or the 1953 supplement indicate, there is no evidence that the effects on operation of lower basin storage and power facilities have been given due consideration in planning the schedules of constructing, filling, and operating the proposed upper basin storage and power facilities.

Of equal concern to the problems of quantity and fluctuation of flow into the lower basin at Lee Ferry is the problem of quality of water. This problem concerns water users throughout the basin, but especially those in the lower basin States. Increased consumptive use of the waters of the Colorado River and its tributaries in the upper basin, particularly the relatively pure water of the headwater streams, will result in higher concentrations of mineral salts in the residual flow downstream.

The provisions in the Colorado River compact of water for the lower basin would be largely nullified if the supply were unsuited in quality for all beneficial purposes. Furthermore, article VIII of the compact provides: "Present perfected rights to the beneficial use of waters of the Colorado River system are unimpaired by this compact." Certainly, this means unimpaired in quality as well as quantity.

The reports are completely lacking of information that would provide answers to the questions concerning quality of water. It is California's position that before development proceeds on any additional large scale consumptive use projects in the upper basin, the entire problem of quality of water should be fully explored; that determination should be made as to the effects of increased upper basin uses up to full development, upon the quality of the flow at Lee Ferry; and that authorization of such additional projects, particularly transmountain diversion projects, in the upper basin should be deferred until satisfactory evidence is presented that such projects, in combination with existing projects and other projects contemplated under full development, would not have harmful effects on the quality of water remaining for use in the lower basin.

It is evident from the foregoing that there are a number of unknowns remaining to be determined as to water supply and use in the upper basin, and as to the amount of water that would be expected to be available to the lower basin passing Lee Ferry under conditions of ultimate development in the upper basin with full practicable utilization of the water supply apportioned to the upper basin under the Colorado River compact. This points up the need for a comprehensive system of gaging and sampling stations to measure both quantity and quality of water throughout the basin in order to determine the water supply available and the actual use of water. It is considered essential that more adequate measurements and records of water supply and use be obtained which will permit reliable studies to be made of the operation of existing and proposed developments in the upper basin and of the resulting available water supply, both as to quantity and quality, passing Lee Ferry for the lower basin.

Criteria, policies, and procedures

The laws governing Federal reclamation development are embodied in the original Reclamation Project Act of 1902 and the Reclamation Project Act of 1939, as amended. Therein are set forth the criteria, policies, and procedures of general application which may be collectively designated as existing reclamation law. For the purposes of this review, only certain features of the law will be referred to.

Existing reclamation law provides that the reimbursable construction costs of irrigation reclamation projects shall be repaid within a period of 40 years, without interest, in 40 equal annual installments. In the case of a project for irrigation of new lands, it permits a development period not to exceed 10 years, during which no repayment may be required.

Where a project includes facilities for municipal water supplies, the law provides that the reimbursable cost chargeable thereto shall be repaid in 40 years, with interest if deemed proper by the Secretary of the Interior.

Where a reclamation project includes hydroelectric power features, the law provides for reimbursable cost to be repaid with interest within a period of 40 to 50 years.

Present law permits nonreimbursable allocations of reclamation project costs for flood control, navigation, and fish and wildlife in the case of projects which include features to perform these purposes.

The repayment program recommended by the Secretary in the supplemental report constitutes a material departure from established criteria, policies, and procedures of general application in existing reclamation law.

It appears to be similar to that authorized by the Congress specifically for the Collbran project, Colorado (Public Law 445, 82d Cong., approved July 3, 1952). The special repayment provisions in that act are set forth as exceptions to existing reclamation law. It was stated at recent hearings before the House Interior and Insular Affairs Committee that at the time the committee passed upon the Collbran project bill, approval of the repayment formula therein was specifically for that project alone and was not to be considered as establishing a precedent for other reclamation projects.

The proposed repayment program, if adopted, would involve the postponement of the repayment of the costs allocated to irrigation on the storage units and on a major portion of the irrigation costs of the participating projects, for a period of about 50 years. These irrigation costs for which repayment would be deferred would comprise, according to the report, a minimum of about $268 million, plus an unknown amount for the Navaho project.

Studies of the original reports on the participating projects indicate that about 85 percent of the irrigation costs would be repaid without interest by power revenues. Considering the time value of money, the postponement for about 50 years of repayment of a large part of the construction cost of the proposed development would obviously require a subsidy from the Federal Treasury that would have to be paid out of Federal taxes. The interest charges on the funds borrowed by the Federal Government to defray the irrigation costs of the project would never be repaid from project revenues and would have to be paid out of taxes even if the capital investments were eventually repaid.

It is recognized that the provision, under existing law, of interest-free money for irrigation reclamation projects involves a substantial subsidy from the Federal Treasury which must be borne out of taxes, comprising the cost of interest on funds advanced, which in a period of 40 years would aggregate an amount almost equal to the original capital investment even though the principal be fully repaid in equal annual installments during the 40-year period.

It would appear that the Secretary's proposal in the report under review, for repayment would in effect extend the development period, during which no repayment would be made on a major portion of the investment, to about 50 years for both new land and old lands receiving a supplemental water supply. Such a postponement in repayment obviously would greatly multiply the amount of the Federal subsidy involved.

Owing to the lack of detailed information on the revised costs, no exact figure for the amount of the subsidy that would be involved in the proposed repayment program can be given. However, it could be readily calculated if detailed information on costs were available. In any case, the accumulated debt or total subsidy would amount to several times the original investment. Whether this would be in the national interest is for the Executive and the Congress to determine. However, it is believed that a report should be made as to the true cost of the Federal subsidy involved under the proposed repayment program, so that the Executive and the Congress will be fully informed before making a decision with respect thereto.

Under the proposed program and method of financing, it appears that justification of the initially proposed participating irrigation projects and future decisions to build additional participating irrigation projects would depend not so much upon the merits of the individual projects as upon the availability of revenues, 50 or more years in the future, from power projects generally unrelated thereto physically. None of the participating projects recommended for initial construction would be in themselves financially sound according to information in the basic storage project report and the reports of 1950 and 1951 on the individual participating projects.

On the average the water users would be able to pay only about 15 percent of the irrigation investment on the 12 participating projects. The balance of the cost would have to be subsidized—the capital investment by power revenue and the interest charges in even greater amount for an indefinite period by the Federal Treasury through taxes.

To the extent that high power rates could and would be maintained for the next 75 to 100 years or more to subsidize additional participating irrigation projects, authorization of the overall plan of upper basin development as proposed in the report, with such program and procedure would constitute an advance appropriation of funds for the construction of future projects of unknown engineering and financial feasibility.

The Colorado River storage project appears to be basically a hydroelectric power project. The only showing of economic justification in the report is based solely on power revenues. Considered in this light, the financial feasibility of the storage project appears open to question for several reasons. Repayment of the reimbursable construction costs within the periods and at the power rates proposed would depend entirely upon: (1) Allocation of a large portion of the construction cost to irrigation on an interest-free basis; (2) postponement of the starting of repayment of the irrigation allocation for about 50 years; and (3) subsidization of the more costly units with surplus power revenues earned by the less costly units.

No clear and adequate justification is shown in support of the allocation of a large part of the cost of the storage project to irrigation. Justification for the allocation to irrigation of several hundred million dollars (over $98 million for the initial 2 units) depends upon the future authorization of projects for consumptive use of water in the upper basin. Only minor use could be made of the regulatory reservoirs of the storage project directly for water-consuming projects. Future irrigation projects as a rule would require individual storage facilities.

The one reason given for the proposed allocation to irrigation on the storage project is that the storage units would provide holdover capacity so that the upper basin can proceed with the development and use of water without violating the Colorado River compact. Information in the basic report shows that at the present and anticipated future rate of upper basin development, Glen Canyon alone would suffice for this purpose for 40 to 50 years hence. Furthermore, it appears that the additional consumptive use estimated for the participating reclamation projects proposed for initial authorization in the Secretary's report could be made even without Glen Canyon Reservoir.

However, the early construction of Glen Canyon Reservoir would be justified from other considerations and advantages. Based upon the cost analyses in the report, the Glen Canyon Reservoir and power development could be constructed and operated on a sound financial basis and, therefore, merits authorization at this time.

Analyses indicate that the cost of power from most of the other proposed units of the storage project, considered individually and on the basis of either the total cost or the power allocations alone, would be greater than the proposed selling price, and that, in fact, power revenues from the Glen Canyon unit would have to subsidize most, if not all, of the other storage units in addition to subsidizing participating irrigation projects. It appears questionable, therefore, whether certain of the storage units would be justified or needed, from the standpoint of either the holdover storage requirements or the value of the power produced.

The original 1950 report indicates an intent to market the power output of the upper-basin storage and power units in the upper-basin States, with little regard to potential market and needs for electric power in the lower-basin States. This question of power disposal is referred to in the supplemental report as a matter of policy to be determined.

There appears to be some question in the report as to the ability of the power market in the upper-basin States to absorb all of the power output, even of the initial two storage and power units, for a number of years in the future. Glen Canyon power could be readily disposed of in the lower basin, where there is a great need for additional power. It is believed that the question of policy on disposal of power, particularly from Glen Canyon, merits the special consideration of the Executive and the Congress.

CONCLUDING COMMENTS

1. California agencies have established rights in and to the waters of the Colorado River system under the Colorado River compact and related documents. The State of California has the duty of protecting and preserving those rights. Obviously, construction and operation of the proposed Colorado River storage project and participating projects would have substantial effect upon the quantity and quality of the available water supply and the operation of facilities in the lower basin and in California. The State is concerned that such developments shall not impair the established rights of California and its agencies in and to Colorado River water.

2. There are at least 10 major questions of interpretation of the compact which would be involved in and affect the proposed storage project and related reclamation developments. With respect to several of these questions the report under review is based upon what California believes are erroneous inter-

pretations of the compact. All of the questions are at issue in the pending case of *Arizona* v. *California et al.*, in the United States Supreme Court. California's basic position is that this State is conforming to the Colorado River compact and must insist that the Bureau of Reclamation and the States of the upper basin do so in the planning and administration of the Colorado River storage project and participating projects.

3. Revised analyses should be made and reported upon, based upon proper interpretation of the Colorado River compact, as to the need for holdover storage and as to the probable effects of its construction, filling, and operation upon the quantity and pattern of flow into the lower basin at Lee Ferry and upon the operation of lower-basin facilities.

4. Before development proceeds on any additional large-scale consumptive-use projects in the upper basin, a determination should be made as to the effects of increased upper-basin uses up to full development, upon the quality of the flow at Lee Ferry; and authorization of such additional projects, particularly transmountain diversion projects, in the upper basin should be deferred until satisfactory evidence is presented that such projects, in combination with existing projects and other projects contemplated under full development, would not have harmful effects on the quality of water remaining for use in the lower basin.

5. The plans for construction and operation of the upper-basin storage project and related reclamation projects, insofar as revealed in the original 1950 report and the Secretary's supplemental report under review, give no proper or adequate consideration to the effect of the proposals on the lower-basin developments and evidence little, if any, regard to the interests of the lower basin. Moreover, the engineering studies are vague and uncertain with respect to the effect of proposed upper-basin developments on the lower basin and additional studies are essential with respect thereto. The State of California desires full information as to what the effect of the proposed plan will be on existing and future developments below Lee Ferry and particularly on the quality and quantity of water available for use in California.

6. There are many problems that should and must be carefully studied and solved before authorizing or proceeding with any overall plan of development in the upper basin. In the meantime, some additional development could proceed if found justified for authorization by the Congress. However, it is the position of the State of California that the interests of the lower basin, and of California in particular, must be fully protected with proper safeguards in connection with any legislation for authorizing of additional development in the upper basin to the end that the construction and operation of the proposed projects shall fully conform with the Colorado River compact and related laws and documents.

7. The plan of financial operation of the project recommended by the Secretary departs materially from existing reclamation law and is not in accord with sound standards and policies. The proposed postponement for about 50 years of the repayment of a large part of the cost would result in a substantial increase in the national debt, constituting a subsidy to irrigation on the part of the Nation's taxpayers far beyond the subsidy contemplated under existing law. The magnitude of such subsidy should be clearly stated and explained in the report.

8. None of the participating reclamation projects recommended for initial authorization would be in themselves financially feasible. The water users could repay only small proportions of the reimbursable construction costs. The balance of the cost would have to be subsidized—the capital investment by power revenue and the interest charges in even greater amount for an indefinite period by the Federal Treasury through taxes.

9. No clear and adequate justification is shown in support of the allocation of a large part of the storage-project cost to irrigation on an interest-free basis. Only minor use could be made of the regulatory reservoirs of the storage project directly for water-consuming projects. The report indicates that the proposed allocation to irrigation on the storage project is based upon the need of holdover capacity to permit the upper basin to develop and use the water without violating the compact. However, it appears from the report that the additional consumptive use estimated for the reclamation projects proposed for initial authorization could be made without holdover storage, and that at the anticipated rate of development Glen Canyon Reservoir alone would suffice for this purpose for 40 to 50 years hence. Therefore, the justification for immediate construction of initial units of the storage project would be based upon other considerations and purposes to be served.

10. The early construction of Glen Canyon Reservoir would be justified from the standpoint of other immediate advantages. Based upon the cost analyses in the report, the Glen Canyon Reservoir and power development could be constructed and operated on a sound financial basis and therefore merits authorization at this time.

11. Glen Canyon power could be readily disposed of in the lower basin where there is a great need for additional power. The question of policy regarding its disposal merits the special consideration of the Executive and the Congress.

12. The cost of power for most of the proposed major storage and power units, other than Glen Canyon, would be greater than the proposed selling price for power, and interunit subsidies would be required principally from Glen Canyon power revenues to support the other units. It appears questionable, therefore, whether certain of the storage units would be justified or needed, from the standpoint of either the holdover storage requirements or the value of the power produced.

13. The proposal recommended by the Secretary for the Colorado River storage project and participating projects raises basic questions as to the proper criteria to determine the financial feasibility and economic justification of new reclamation developments, and particularly the criteria, policies, and procedures for repayment, and the amount of Federal subsidy that is justified. These basic questions are a matter of national policy which must and should be decided by the Executive and the Congress.

14. The State of California, in analyzing its own projects and in reviewing proposed Federal reclamation projects in California, has consistently stood for sound financial and economic standards upon which proposed developments should be evaluated and qualified for approval and authorization. It is the view of the State of California that all water-development projects, including the proposed projects under review herein, should qualify under sound criteria of feasibility and repayment as a matter of national policy in the best public interest.

EXHIBIT C

(Accompanying testimony of Northcutt Ely)

Resolutions opposing S. 1555 and H. R. 4449, the Colorado River storage project bills in the 83d Congress, have been adopted by the following:

Colorado River Board of California
Imperial Irrigation District
Metropolitan Water District of Southern California
Los Angeles City Council
Central Labor Council of Los Angeles
Department of Water and Power of the City of Los Angeles
San Diego County Water Authority
San Diego City Council
Imperial County Board of Supervisors
Imperial County Farm Bureau
Holtville, Calif., Chamber of Commerce
Calexico, Calif., Chamber of Commerce
Calexico City Council
Coachella Valley County Water District
Rainbow Municipal Water District, San Diego County, Calif.
California State Chamber of Commerce, southern California council
Brawley, Calif., Chamber of Commerce
Brawley City Council
Calipatria, Calif., Chamber of Commerce

Westmorland, Calif., City Council
Council of the City of Burbank
Board of Supervisors of Orange County
Board of Directors of the City of Pasadena.

RESOLUTION OF COLORADO RIVER BOARD OF CALIFORNIA OPPOSING PENDING LEGISLATION AUTHORIZING COLORADO RIVER STORAGE PROJECT AND PARTICIPATING PROJECTS

The Colorado River Board of California opposes the enactment of S. 1555 and H. R. 4449, 83d Congress, bills to authorize the Secretary of the Interior to construct, operate, and maintain initial units of the Colorado River storage project and participating projects, and for other purposes.

California favors the continuation of the development of the water resources of the Colorado River Basin on a sound economic basis, as the need for such development occurs. This State recognizes the right of the upper-basin States to so utilize the waters apportioned to that basin by the Colorado River compact as approved by the Boulder Canyon Project Act, but subject to the terms and conditions of those documents as the Supreme Court may construe them in the case of *Arizona* v. *California* now pending.

By the same token, California, in the protection of its investment of nearly $700 million in water-development projects which it has made in reliance upon the Colorado River compact and the Boulder Canyon Project Act, and the economy and population of more than 4 million people dependent upon these works, must resist legislation which would encroach upon the rights recognized in the lower basin States by those documents.

The proposed Colorado River storage project legislation adversely affects the lower basin States in much the same way as would the proposed central Arizona project legislation. Both are based upon interpretations of the Colorado River Compact and the Boulder Canyon Project Act with which California cannot agree and which are now at issue in the United States Supreme Court. Each of them contemplates developments which would encroach upon the compact and project act, as interpreted at the time of enactment of those laws, to the extent of more than a million acre-feet per year. Both proposals are based upon unrealistic water supply estimates. Each is in conflict with the presentation made to the Senate by the supporters of the Mexican Water Treaty. Each ignores the legal claims which are in conflict with it, and both ignore the damage which their construction would cause to the investments already made by their neighbors. Each of these proposals is dependent upon Federal subsidies for irrigation amounting to many times the value of the land when fully developed, and most of these subsidies are concealed. Both would commit the Congress to new feasibility standards and payout formulas with which this board and other California State agencies have officially expressed disapproval.

The Colorado River storage project would intercept the lower basin's water supply with giant reservoirs at Glen Canyon, Echo Park, and Curecanti, capable of storing several years' flow of the river. In the absence of statutory controls of the operation of such reservoirs designed to protect the output of firm power at Hoover Dam, upon which the United States and the power contractors relied, the use of such large storage could result in seriously curtailing the revenues at Hoover Dam and other dams on the lower river and upon which these lower projects depend for financing. It is against the best interest of both the power users in the lower basin and the Federal Treasury to so legislate.

Both Glen Canyon and Echo Park Reservoirs would be located downstream from any point of use by the proposed irrigation projects in the upper basin, and their major purpose would be to provide revenues, commencing almost 50 years hence, to pay the capital cost without interest of the irrigation projects proposed for construction now. This postponement for nearly 50 years of the commencement of repayment of irrigation would result in a Federal subsidy amounting to over $2,500 per acre of irrigated land—an unwarranted and unjustified burden on the Nation's taxpayers.

California, as a major taxpaying State, is doubly affected, for the amount of the overdraft on the water supply of the Colorado River Basin is directly related to the amount of Federal subsidy to the irrigation projects creating the overdraft.

The bills delegate to the Secretary of the Interior power to resolve the feasibility of the participating irrigation projects. If reclamation feasibility standards are to be changed, that should be done by Congress, in general legislation.

after the Hoover Commission has had an opportunity to report upon this very matter, heretofore committed to their study.

The proposed legislation includes some, and foreshadows other, large transmountain diversion projects in the upper basin using several million acre-feet of water annually, thereby impairing the quality as well as the quantity of the water available to the lower basin, and to which the lower basin is entitled under the Colorado River compact.

For all these reasons, the Colorado River Board of California respectfully requests the Representatives of this State in the Senate and House of Representatives of the United States to oppose the enactment of legislation to authorize construction of the Colorado River storage project and participating projects as proposed in these bills, S. 1555 and H. R. 4449, or similar legislation, and instructs its officers and staff to make the appropriate presentation of the views of this board to the congressional committees and executive agencies concerned with such legislation.

STATE OF CALIFORNIA,
County of Los Angeles, ss:

I, Harold F. Pellegrin, executive secretary of the Colorado River Board, do hereby certify that the foregoing is a true copy of a resolution unanimously adopted by said board at a regular meeting thereof, duly convened and held at its office in Los Angeles on the 2d day of June 1954, at which a quorum of said board was present and acting throughout.

Dated this 2d day of June 1954.

HAROLD F. PELLEGRIN,
Executive Secretary.

RESOLUTION OF IMPERIAL IRRIGATION DISTRICT, APPROVING TWO RESOLUTIONS OF COLORADO RIVER BOARD OF CALIFORNIA, AND EXPRESSING CONFIDENCE IN SAID BOARD AND ITS REPRESENTATIVES AND ADVISERS

RESOLUTION NO. 137–54

Whereas there has been called to the attention of the directors of Imperial Irrigation District, an irrigation district organized and existing under the laws of California, and serving in excess of one-half million acres of land in Imperial County, Calif., two certain resolutions of Colorado River Board of California, passed and adopted on June 2, 1954, which resolutions oppose S. 964 and H. R. 236, and S. 1555 and H. R. 4449, 83d Congress; and

Whereas Imperial Irrigation District is a member agency and represented upon said Colorado River Board, and said Colorado River Board is an agency created by the legislature of the State of California to protect the interests of the State of California in and to the use and uses of waters of the Colorado River system: and

Whereas said two resolutions opposing Senate bills 964 and 1555 and House of Representative bills 236 and 4449, 83d Congress, which bills would authorize that certain project in California designated as the Frying Pan-Arkansas project, and would authorize a Colorado River storage project and participating project, all as more particularly outlined in said bills; and

Whereas the State of California and the Colorado River Board, representing the water users in California of the waters of the Colorado River system, have a vital interest in the waters of the Colorado River system; and

Whereas it is the honest belief of the board of directors of Imperial Irrigation District that said two resolutions of June 2, 1954, of the Colorado River Board opposing said pending legislation for the reasons and to the extent in said resolutions indicated are not only justified but are essential to the protection of the interests of the State of California and California's use of the waters of the Colorado River system; and

Whereas the board of directors is fully familiar with the organization and activities of said Colorado River Board, and has full confidence in this district's representation upon said Colorado River Board and in the advisers and representatives of this district, cooperating with and advising said Colorado River Board;

Now, therefore, on motion of Director Watton and seconded by Director McFarland, be it hereby resolved as follows:

1. That this board of directors does hereby go on record as expressing its confidence in the sincerity and purpose and activities of said Colorado River Board of California.

2. That this board expressed its confidence in the sincerity and purpose and activities of its representatives and advisers on and to said Colorado River Board of California.

3. That this board expresses its approval of said two resolutions which are hereto attached as passed by said Colorado River Board, and does hereby authorize and direct the secretary of this board to give full distribution to this resolution, including the mailing of copies of said resolutions to all Members of Congress in the State of California.

Passed and adopted June 8, 1954, by unanimous vote of this body.

IMPERIAL IRRIGATION DISTRICT,
By EVAN T. HEWES, *President.*
[SEAL] By MAHLON I. MATHIS, *Secretary.*

IMPERIAL IRRIGATION DISTRICT,
Office of the Secretary, ss:

This is to certify that the foregoing is a full, true, and correct copy of resolution No. 137–54 passed by the board of directors of Imperial Irrigation District at its regular session on the 8th day of June 1954.

In witness whereof, I have hereunto set my hand and affixed my seal of said district this 8th day of June 1954.

[SEAL] MAHLON I. MATHIS, *Secretary.*

BOARD OF DIRECTORS, THE METROPOLITAN WATER DISTRICT OF SOUTHERN CALIFORNIA

RESOLUTION 4433

Whereas the Metropolitan Water District of Southern California is one of the principal contractors, under the Boulder Canyon Project Act, for the storage and delivery of water from Lake Mead and for the delivery of electrical energy from the Hoover powerplant, and has a vital interest in the water available to the lower basin of the Colorado River under the Colorado River Compact, both as to quality and quantity, and also has a vital interest in the continued production of electrical energy from the Hoover powerplant in accord with estimates upon which the United States and California agencies relied in financing the project; and

Whereas there are pending in the Congress of the United States certain bills, to wit, S. 1555, H. R. 4449, S. 964, and H. R. 236, which, if enacted, would authorize large storage reservoirs and irrigation works in the upper basin of the Colorado River; and

Whereas the estimates of water available for the projects so sought to be authorized are based on erroneous interpretations of the Colorado River compact—these erroneous interpretations are adverse to the interests of millions of people in southern California whose lives and economy have been established upon the assurance that they would retain their share of Colorado River water; these erroneous interpretations are now under attack in the Supreme Court of the United States; and

Whereas said bills do not contain adequate provisions safeguarding the quality of water in the lower basin and do not contain adequate controls of the operation of the vast storage reservoirs proposed needed to protect the energy output from the Hoover power project; and

Whereas the Colorado River Board of California has adopted resolutions opposing the said bills and stating the reasons for its opposition: Now, therefore, be it

Resolved, That the enactment of said bills is against the interests of the Metropolitan Water District and other California agencies, and should be opposed; be it further

Resolved, That the Metropolitan Water District respectfully requests the representatives of the State of California in the Congress of the United States to oppose the enactment of the said bills or similar legislation, and further requests the municipalities and other agencies constituting the area of the Metropolitan Water District to join in requesing and urging such opposition.

I hereby certify, that the foregoing is a full, true, and correct copy of a resolution adopted by the board of directors of the Metropolitan Water District of Southern California, at its meeting held June 9, 1954.

A. L. GRAM,
Executive Secretary,
The Metropolitan Water District of Southern California.

CITY OF LOS ANGELES

RESOLUTION

Whereas the city of Los Angeles and the more than 2 million persons who now reside here are dependent upon the Colorado River for vitally important quantities of water and power for civic needs, as well as for residential and industrial uses; and

Whereas the share of Colorado River water and power for which this city has contracted and which it must continue to have to sustain its economy is threatened under the provisions of bills S. 1555 and H. R. 4449 now pending in Congress, which bills would authorize the initial units of the Colorado River storage project and participating projects: Now, therefore, be it

Resolved, That the Los Angeles City Council, acting for the welfare of the city and its residents, expresses its strong opposition to bills S. 1555 and H. R. 4449 and urges the Senators and Representatives in Congress from the State of California to oppose the enactment of that legislation; be it further

Resolved, That a copy of this resolution be sent to Vice President Richard M. Nixon, Senators William F. Knowland, and Thomas H. Kuchel, all Members of Congress from the State of California, and all members of the Rules Committee of the House of Representatives.

HAROLD A. HENRY,
CHARLES NAVARRO.

JUNE 23, 1954.

RESOLUTION

Whereas the Central Labor Council has consistently opposed legislation injurious to the welfare of the citizens of this city and the Nation; and

Whereas the Colorado River storage project bill (H. R. 4449), now pending before the Congress, would inflict on all American taxpayers an unjustifiable new burden; and

Whereas the economy of this city, the State of California, and the Nation would be seriously impaired by this costly and unnecessary project: Now, therefore, be it

Resolved, That the Central Labor Council vigorously oppose passage of H. R. 4449 by the Congress.

Adopted in regular session of the Los Angeles Central Labor Council, June 21, 1954.

[SEAL] W. J. BASSETT, *Secretary.*

RESOLUTION No. 1003

Whereas the Department of Water and Power of the City of Los Angeles has the obligation to provide for the water and power needs of the present population of this city, now numbering more than 2 million persons, and for the additional population that will have to be served as the city continues to grow; and

Whereas the Colorado River is depended upon as the sole source of water supply available now to meet that daily increasing need, all other sources of supply available to Los Angeles already being used to their limits; and

Whereas the Colorado River, through the Hoover Dam powerplant, is the largest single source of power supply for the city of Los Angeles and, in addition, generates hydroelectric power for other cities and utilities of this State, including the Metropolitan Water District, as well as for the States of Arizona and Nevada; and

Whereas the long-planned use by California of its fair share of the natural resources of the Colorado River is jeopardized by bills S. 1555 and H. R. 4449

now pending in Congress, which bills would "authorize the Secretary of the Interior to construct, operate, and maintain initial units of the Colorado River storage project and participating projects, and for other purposes"; and

Whereas premature and hasty action on those bills, while the Hoover Commission is still conducting its comprehensive studies on a national water resources policy program, would make drastic and piecemeal changes in reclamation law and would deprive the Congress of the benefit of a "yardstick" to measure the true economic costs and values of the proposed projects; and

Whereas California is vitally concerned with the proper management of the Colorado River so that all of the States entitled to share in its resources, under the terms of the "law of the river," may do so with greatest possible benefits to the respective States and to the United States: Now, therefore, be it

Resolved, That bills S. 1555 and H. R. 4449 in their present form be opposed because further engineering, legal, and economic studies, including the findings of the Hoover Commission, are essential for the guidance of all interests, local and national, that have the responsibility of making sound decisions respecting the future development of the resources of the Colorado River.

I hereby certify that the foregoing is a full, true, and correct copy of a resolution adopted by the Board of Water and Power Commissioners of the City of Los Angeles at its meeting held June 15, 1954.

JOSEPH L. WILLIAMS, *Secretary.*

A RESOLUTION OF MEMBERS OF THE BOARD OF DIRECTORS OF THE SAN DIEGO COUNTY WATER AUTHORITY OPPOSING COLORADO RIVER STORAGE PROJECT AND FRYINGPAN-ARKANSAS PROJECT, AND ENDORSING ACTION OF COLORADO RIVER BOARD OF CALIFORNIA IN RESPECT THERETO

RESOLUTION NO. 318

The San Diego County Water Authority is the distributor of Colorado River water to the city and county of San Diego, Calif. Its citizens and taxpayers have obligated themselves for the payment of many millions of dollars the full cost of the works constructed for that purpose. The economy of the area and the water supply of its inhabitants depend upon the continued availability of water from the Colorado River in the quantity and of the quality to which California is entitled under the Colorado River compact and the Boulder Canyon Project Act.

The citizens of San Diego County, and, in fact, all of California, pay a very large proportion of taxes collected by the Federal Government, and consequently have a serious concern that Federal funds be not expended on projects of questionable economic feasibility or which must be financed by heavily subsidized formulas—with the result that California taxpayers are financing both their own projects and those for other areas that may result in diminishing the quantity and quality of the water upon which large sections of the State must depend.

The Colorado River Board of California opposes the enactment of the acts authorizing the Colorado River storage project (S. 1555 and H. R. 4449, 83d Cong.) and the Fryingpan-Arkansas project (S. 964 and H. R. 236, 83d Cong.) for the reasons that the projects would adversely affect the quantity and quality of the water to which this State is entitled, and could not be constructed without unwarranted Federal subsidies and financed upon a formula lacking economic feasibility.

The San Diego County Water Authority endorses and approves the position taken by the Colorado River Board, and joins in respectfully urging the representatives of this State in the Senate and House of Representatives to stand united in opposition to the enactment of legislation authorizing these projects—and to exert every effort to protect the people of this State from improper invasion of their water rights and unfair tax burdens to finance unsound projects.

STATE OF CALIFORNIA,
County of San Diego, ss:

I, Dorothy D. Miller, executive secretary of the San Diego County Water Authority, hereby certify that the foregoing is a true copy of a resolution approved by a majority of the members of the board of directors of said San Diego County Water Authority this 9th day of June 1954.

Executive Secretary of the Board of Directors, San Diego County Water Authority.

RESOLUTION No. 118512

Whereas the city of San Diego is a member of the San Diego County Water Authority and as such is a distributor of water to the city of San Diego, Calif. Its citizens and taxpayers have obligated themselves for the payment of many millions of dollars as the full cost of the works constructed for that purpose. The economy of the area and the water supply of its inhabitants depend upon the continued availability of water from the Colorado River in the quantity and of the quality to which California is entitled under the Colorado River compact and the Boulder Canyon Project Act.

Whereas the citizens of San Diego and, in fact, all of California, pay a very large proportion of taxes collected by the Federal Government, and consequently have a serious concern that Federal funds be not expended on projects of questionable economic feasibility or which must be financed by heavily subsidized formulas—with the result that California taxpayers are financing both their own projects and those for other areas that may result in diminishing the quantity and quality of the water upon which large sections of the State must depend.

Whereas the Colorado River Board of California opposes the enactment of the acts authorizing the Colorado River storage project (S. 1555 and H. R. 4449, 83d Cong.) and the Fryingpan-Arkansas project (S. 964 and H. R. 236, 83d Cong.) for the reasons that the projects would adversely affect the quantity and quality of the water to which this State is entitled, and could not be constructed without unwarranted Federal subsidies and financed upon a formula lacking economic feasibility: Now, therefore, be it

Resolved by the Council of the City of San Diego, as follows:

That the city of San Diego endorses and approves the position taken by the Colorado River Board, and joins in respectfully urging the representatives of this State in the Senate and House of Representatives to stand united in opposition to the enactment of legislation authorizing these projects—and to exert every effort to protect the people of this State from improper invasion of their water rights and unfair tax burdens to finance unsound projects.

Adopted June 10, 1954.

RESOLUTION APPROVING THE COLORADO RIVER BOARD OF CALIFORNIA AND ITS POSITION OPPOSING PENDING LEGISLATION AUTHORIZING THE FRYINGPAN-ARKANSAS PROJECT IN COLORADO AND ITS RESOLUTION OPPOSING PENDING LEGISLATION RELATIVE TO COLORADO RIVER STORAGE POJECTS

Whereas two resolutions have been called to the attention of the Board of Supervisors of the County of Imperial, State of California, copies of which are hereto attached and which have been passed by the Colorado River Board of California on June 2, 1954, opposing S. 964 and H. R. 236, and S. 1555 and H. R. 4449, 83d Congress; and

Whereas this body is familiar with the organization, functions, and activities of the Colorado River Board of California and its representation of California in connection with matters relating to the Colorado River system; and

Whereas said two resolutions oppose Senate bills 964 and 1555, and House of Representatives bills 236 and 4449, 83d Congress, which bills would authorize that certain project in Colorado designated as the Fryingpan-Arkansas project and would authorize a Colorado River storage project and participating projects, more particularly set forth in said bills; and

Whereas the State of California has a vital interest in the waters of the Colorado River system and said Colorado River Board was authorized and created and provided for by the Legislature of the State of California as an agency to protect the interests of the State of California in and to the waters of the Colorado River system; and

Whereas as evidenced by the said two resolutions of June 2, 1954, of the Colorado River Board, said board opposes said pending legislation for the reasons and to the extent as in said resolution indicated, and this body feels that said Colorado River Board is justified in its position: Now, therefore, on motion of Supervisor Snyder, seconded by Supervisor Cavanah, there is hereby

Resolved as follows, on the affirmative rollcall vote of Supervisors Cavanah, Boley, Fifield, and Snyder, Supervisor Osborne being absent, 1. That we do

hereby express our confidence in the Colorado River Board of California as representing the interests of California as to the Colorado River system and the waters thereof.

2. We do hereby expressly approve said two resolutions which are hereto attached as the action of said Colorado River Board, and authorize the county clerk to mail copies of said resolution to all California Members of Congress.

Passed and adopted this 21st day of June 1954, by the unanimous action of this body.

BOARD OF SUPERVISORS OF THE COUNTY OF IMPERIAL,
STATE OF CALIFORNIA,
By THOMAS J. BOLEY, *Chairman.*
By HARRY M. FREE, *County Clerk.*

The foregoing is a correct copy of a resolution adopted by the board of supervisors, Imperial County, Calif., on June 21, 1954.

Dated June 22, 1954.

HARRY M. FREE,
Clerk of Said Board of Supervisors.
By E. W. DEMONEY, *Deputy.*

RESOLUTION APPROVING THE COLORADO RIVER BOARD OF CALIFORNIA AND ITS POSITION OPPOSING PENDING LEGISLATION AUTHORIZING THE FRYINGPAN-ARKANSAS PROJECT IN COLORADO AND ITS RESOLUTION OPPOSING PENDING LEGISLATION RELATIVE COLORADO RIVER STORAGE PROJECTS

Whereas two resolutions have been called to the attention of the Imperial County Farm Bureau, copies of which are hereto attached and which have been passed by the Colorado River Board of California on June 2, 1954, opposing S. 964 and H. R. 236, and S. 1555 and H. R. 4449, 83d Congress; and

Whereas this body is familiar with the organization, functions, and activities of the Colorado River Board of California and its representation of California in connection with matters relating to the Colorado River system; and

Whereas said two resolutions oppose Senate bills 964 and 1555 and House of Representatives bills 236 and 4449, 83d Congress, which bills would authorize that certain project in Colorado designated as the Fryingpan-Arkansas project and would authorize a Colorado River storage project and participating projects, more particularly set forth in said bills; and

Whereas the State of California has a vital interest in the waters of the Colorado River system and said Colorado River board was authorized and created and provided for by the Legislature of the State of California as an agency to protect the interests of the State of California in and to the waters of the Colorado River system; and

Whereas as evidenced by the said two resolutions of June 2, 1954, of the Colorado River board, said board opposes said pending legislation for the reasons and to the extent as in said resolutions indicated, and this body feels that said Colorado River board is justified in its position: Now, therefore,

On motion of Baxter Loveland, there is hereby resolved as follows:

1. That we do hereby express our confidence in the Colorado River Board of California as representing the interests of California as to the Colorado River system and the waters thereof.

2. We do hereby expressly approve said two resolutions which are hereto attached as the action of said Colorado River board, and authorize the secretary to mail copies of said resolution to all California Members of Congress.

Passed and adopted June 1954, by the unanimous action of this body.

IMPERIAL COUNTY FARM BUREAU,
By D. M. MIDDLETON, *President.*
By VERA PARKER, *Acting Secretary.*

RESOLUTION APPROVING THE COLORADO RIVER BOARD OF CALIFORNIA AND ITS POSITION OPPOSING PENDING LEGISLATION AUTHORIZING THE FRYINGPAN-ARKANSAS PROJECT IN COLORADO AND ITS RESOLUTION OPPOSING PENDING LEGISLATION RELATIVE TO COLORADO RIVER STORAGE PROJECTS

Whereas two resolutions have been called to the attention of the chamber of commerce of the city of Holtville, county of Imperial, State of California, copies of which are hereto attached and which have been passed by the Colorado River

Board of California on June 2, 1954, opposing S. 964 and H. R. 236, and S. 1555 and H. R. 4449, 83d Congress; and

Whereas this body is familiar with the organization, functions, and activities of the Colorado River Board of California and its representation of California in connection with matters relating to the Colorado River system; and

Whereas said two resolutions oppose Senate bills 964 and 1555 and House of Representatives bills 236 and 4449, 83d Congress, which bills would authorize that a certain project in Colorado designated as the Fryingpan-Arkansas project and would authorize a Colorado River storage project and participating projects, more particularly set forth in said bills; and

Whereas the State of California has a vital interest in the waters of the Colorado River system and said Colorado River Board was authorized and created and provided for by the Legislature of the State of California as an agency to protect the interests of the State of California in and to the waters of the Colorado River system; and

Whereas, as evidenced by the said two resolutions of June 2, 1954, of the Colorado River Board, said board opposes said pending legislation for the reasons and to the extent as in said resolutions indicated, and this body feels that said Colorado River Board is justified in its position: Now, therefore,

On motion of Arthur Lockie, seconded by C. L. Martin, there is hereby resolved as follows:

1. That we do hereby express our confidence in the Colorado River Board of California as representing the interests of California as to the Colorado River system and the waters thereof.

2. We do hereby expressly approve said two resolutions which are hereto attached as the action of said Colorado River Board, and authorize the secretary of this body to mail copies of said resolution to all California Members of Congress.

Passed and adopted this 21st day of June 1954, by the unanimous action of this body.

CHAMBER OF COMMERCE OF THE CITY OF HOLTVILLE,
COUNTY OF IMPERIAL, STATE OF CALIFORNIA,
PAULE J. NICK, *Secretary.*

I, Paule J. Nick, secretary of the Holtville Chamber of Commerce, do hereby certify that the foregoing resolution was unanimously passed and adopted by the board of directors of the Holtville Chamber of Commerce, at a regular meeting thereof, held the 21st day of June 1954, at which a quorum of said board was present and acting throughout.

Dated June 21, 1954.

PAULE J. NICK, *Secretary.*

RESOLUTION APPROVING THE COLORADO RIVER BOARD OF CALIFORNIA AND ITS POSITION OPPOSING PENDING LEGISLATION AUTHORIZING THE FRYINGPAN-ARKANSAS PROJECT IN COLORADO AND ITS RESOLUTION OPPOSING PENDING LEGISLATION RELATIVE TO COLORADO RIVER STORAGE PROJECTS

Whereas two resolutions have been called to the attention of the chamber of commerce of the city of Calexico, county of Imperial, State of California, copies of which are hereto attached and which have been passed by the Colorado River Board of California on June 2, 1954, opposing S. 964 and H. R. 236, and S. 1555 and H. R. 4449, 83d Congress; and

Whereas this body is familiar with the organization, functions, and activities of the Colorado River Board of California and its representation of California in connection with matters relating to the Colorado River system; and

Whereas said two resolutions oppose Senate bills 964 and 1555, and House of Representatives bills 236 and 4449, 83d Congress, which bills would authorize that certain project in Colorado designated as the Fryingpan-Arkansas project and would authorize a Colorado River storage project and participating projects, more particularly set forth in said bills; and

Whereas the State of California has a vital interest in the waters of the Colorado River system and said Colorado River Board was authorized and created and provided for by the Legislature of the State of California as an agency to protect the interests of the State of California in and to the waters of the Colorado River system; and

Whereas, as evidenced by the said two resolutions of June 2, 1954, of the Colorado River Board, said board opposes said pending legislation for the

reasons and to the extent as in said resolutions indicated, and this body feels that said Colorado River Board is justified in its position: Now, therefore,

On motion of Earl Cavanah, seconded by Dexter Wright, there is hereby resolved as follows:

1. That we do hereby express our confidence in the Colorado River Board of California as representing the interests of California as to the Colorado River system and the waters thereof.

2. We do hereby expressly approve said two resolutions which are hereto attached as the action of said Colorado River Board, and authorize the secretary of this body to mail copies of said resolution to all California Members of Congress.

Passed and adopted this 17th day of June 1954, by the unanimous action of this body.

RESOLUTION NO. 1251, CITY OF CALEXICO, CALIF.

RESOLUTION APPROVING THE COLORADO RIVER BOARD OF CALIFORNIA AND ITS POSITION OPPOSING PENDING LEGISLATION AUTHORIZING THE FRYINGPAN-ARKANSAS PROJECT IN COLORADO AND ITS RESOLUTION OPPOSING PENDING LEGISLATION RELATIVE COLORADO RIVER STORAGE PROJECTS

Whereas two resolutions have been called to the attention of the city council of the city of Calexico, county of Imperial, State of California, copies of which are hereto attached and which have been passed by the Colorado River Board of California on June 2, 1954, opposing S. 964 and H. R. 236, and S. 1555 and H. R. 4449, 83d Congress, and

Whereas this body is familiar with the organization, functions, and activities of the Colorado River Board of California and its representation of California in connection with matters relating to the Colorado River System, and

Whereas said two resolutions oppose Senate bills 964 and 1555 and House of Representatives bills 236 and 4449, 83d Congress, which bills would authorize that certain project in Colorado designated as the Fryingpan-Arkansas project and would authorize a Colorado River storage project and participating projects, more particularly set forth in said bills, and

Whereas the State of California has a vital interest in the waters of the Colorado River system and said Colorado River board was authorized and created and provided for by the Legislature of the State of California as an agency to protest the interests of the State of California in and to the waters of the Colorado River system, and

Whereas as evidenced by the said two resolutions of June 2, 1954, of the Colorado River board, said board opposes said pending legislation for the reasons and to the extent as in said resolutions indicated, and this body feels that said Colorado River board is justified in its position;

Now, therefore, on motion of Carrillo, seconded by Barnes, there is hereby resolved as follows:

1. That we do hereby express our confidence in the Colorado River Board of California as representing the interests of California as to the Colorado River system and the waters thereof.

2. We do hereby expressly approve said two resolutions which are hereto attached as the action of said Colorado River board, and authorize the city clerk to mail copies of said resolution to all California Members of Congress.

Passed and adopted this 15th day of June 1954, by the unanimous action of this body.

CITY COUNCIL OF THE CITY OF CALIFORNIA, COUNTY OF IMPERIAL, STATE OF CALIFORNIA,

By WM J. OSBORN, *Mayor.*

By RICHARD S. EMERSON, *City Clerk.*

49500—54——41

STATE OF CALIFORNIA,
County of Imperial, ss:

I, Richard S. Emerson, city clerk of the city of Calexico do hereby certify that the above and foregoing Resolution No. 1251 was duly passed and adopted by the city council of the city of Calexico in regular session on the 15th day of June 1954 by the following vote to wit:

Ayes: Osborn, Reed, Barnes, Carillo.
Noes: None.
Absent: Jackson.
[SEAL]

RICHARD S. EMERSON,
City Clerk, City of Calexico.

RESOLUTION NO. 54–29 OF THE BOARD OF DIRECTORS OF COACHELLA VALLEY COUNTY WATER DISTRICT

Be it resolved by the board of directors of the Coachella Valley County Water District, as a public agency of the State of California and a user of Colorado River water, in regular meeting assembled this 8th day of June 1954, That those two certain resolutions adopted by the Colorado River Board of the State of California on the 2d day of June 1954, entitled "Resolution of Colorado River Board of California Opposing Pending Legislation Authorizing Colorado River Storage Project and Participating Projects" and "Resolution of Colorado River Board of California Opposing Pending Legislation Authorizing Fryingpan-Arkansas Project in Colorado" be and the same are hereby approved and concurred in by this district with the same force and effect as if set out verbatim herein: Be it further

Resolved, That the secretary of this district be and she is hereby instructed to immediately forward to each Member of the United States Congress representing the State of California a certified copy of this resolution, together with a copy of each of the two resolutions of the Colorado River Board of the State of California, as hereinabove mentioned, attached hereto.

STATE OF CALIFORNIA,
County of Riverside, ss:

I, Barbara K. Schmid, secretary of the Coachella Valley County Water District, hereby certify that the foregoing is a true copy of a resolution unanimously adopted by the board of directors of said district at a regular meeting of said board of directors held on the 8th day of June 1954.

Dated this 10th day of June 1954.
[SEAL]

BARBARA K. SCHMID,
Secretary, Coachella Valley County Water District.

RESOLUTION OF THE RAINBOW MUNICIPAL WATER DISTRICT OPPOSING THE COLORADO RIVER STORAGE PROJECT AND FRYINGPAN-ARKANSAS PROJECT, AND ENDORSING THE ACTION OF THE COLORADO RIVER BOARD OF CALIFORNIA IN RESPECT THERETO

RESOLUTION NO. 8

Whereas the Rainbow Municipal Water District is a distributor of Colorado River water to the residents, citizens, and taxpayers located within the corporate area of the Rainbow Municipal Water District, and its citizens and taxpayers have obligated themselves for the payment of large sums of money used and to be used to defray the cost of works constructed for that purpose; and

Whereas the economy of its area and the water supply of its inhabitants depend upon the continued availability of water from the Colorado River in a quantity and of a quality to which California is entitled under the Colorado River compact and the Boulder Canyon Project Act; and

Whereas the citizens of the Rainbow Municipal Water District pay taxes collected by the Federal Government, and consequently have a serious concern that Federal funds be not expended on projects of questionable economic feasibility or which must be financed by heavily subsidized formulas with the result that its taxpayers are financing both their own projects and those of other areas, that may result in diminishing the quantity and quality of the water upon which this district and large sections of the county of San Diego and the State of California must depend; and

Whereas the Colorado River Board of California opposes the enactment of the acts authorizing the Colorado River storage project (S. 1555 and H. R. 4449, 83d Cong.) and the Fryingpan-Arkansas project (S. 964 and H. R. 236, 83d Cong.) for the reasons that the projects would adversely affect the quantity and quality of the water to which the State of California is entitled, and could not be constructed without unwarranted Federal subsidies and financed upon a formula lacking economic feasibility: Now, therefore, it is

Resolved, That the Rainbow Municipal Water District endorses and approves the position taken by the Colorado River Board of California, and joins in respectfully urging the representatives of this State in the Senate and House of Representatives to stand united in opposition to the enactment of legislation authorizing these projects, and to exert every effort to protect the people of this district, of the county of San Diego and of the State of California from improper invasion of their water rights and unfair tax burdens to finance unsound projects.

STATE OF CALIFORNIA,
County of San Diego, Rainbow Municipal Water District, ss:

I, Ben G. Martin, secretary of the Rainbow Municipal Water District, hereby certify that the foregoing is a true and correct copy of a resolution duly and regularly passed by unanimous vote of all of the directors of said district at a meeting held on the 11th day of June 1954.

BEN G. MARTIN,
Secretary of the Board of Directors and of the Rainbow Municipal Water District.

CALIFORNIA STATE CHAMBER OF COMMERCE,
Los Angeles, Calif., June 1954.

RECOMMENDATIONS OF THE SOUTHERN CALIFORNIA COUNCIL SEMIANNUAL MEETING AT LOS ANGELES, MAY 26, 1954

Twenty subjects of current concern to business were considered by seven committees of the Southern California Council meeting at the Statler Hotel, Los Angeles, on May 26, 1954. Following are recommendations of the council adopted at the general luncheon session, which are referred to the appropriate statewide committees and to the board of directors for approval and final implementation by the State chamber organization.

Background data respecting any of these recommendations or other items on the program sent to council members may be obtained by contacting the southern California regional office.

The agricultural committee, Donald A. Stevning, chairman, considered problems in the marketing of agricultural products and discussion of possible entry into the United States from northern Mexico of the Mexican fruitfly resulted in the following recommendation:

That the appropriate committees of Congress be fully advised of this situation with the request that funds be made aavilable to carry on the work of the United States Department of Agriculture in attempting to prevent entry of this pest into California; and, further, that the United States Government urge the Government of Mexico to instigate adequate control measures against this pest in Mexico.

The natural resources committee, Frederick W. Simpson, chairman, heard comment on offshore oil development and the current thinking on best use of State tidelands funds. Regarding the threat to southern California's Colorado River water supply contained in two legislative bills now before Congress calling for almost complete development of the upper Colorado River Basin in Wyoming, Utah, and Colorado, and the proposed creation of a new State water department, the committee made the following recommendations:

That the State chamber of commerce support the position of the Colorado River Board of California and oppose the present upper Colorado River Basin projects as provided in H. R. 4449 and S. 1555 and the so-called Arkansas-Fryingpan project in H. R. 236 and S. 964.

That the State chamber of commerce support legislation in the next session of the legislature to create a new and independent State water department.

The highway committee, Frank G. Forward, chairman, was informed of State freeway location policies and studied assembly constitutional amendment 32, which proposes use of highway-tax funds for parking facilities, and problems

in connection with proposed bus turnouts on freeways, resulting in the following recommendations:

That the Southern California Council recommends that the California State Chamber of Commerce oppose assembly constitutional amendment No. 32, which will appear as a ballot proposition at the November 1954 general election.

That the Southern California Council recommends that the California State Chamber of Commerce set up a special study committee within the statewide highway committee for the purpose of studying all aspects of the proposal that bus turnouts be provided upon metropolitan freeways.

The tax committee, Clarence A. Rogers, vice chairman, regarded the State budget for 1954–55, separation of taxation from liquor administration (S. C. A. 4), and State finance of public-school construction (S. C. A. 3), adopting the following recommendations:

That the Southern Council approve senate constitutional amendment No. 4, which would establish a department of alcoholic-beverage control and an appeal board.

That the Southern Council approve the senate constitutional amendment No. 3 which will authorize the issuance of $100 million by the State for grants and loans to school districts for school construction.

The travel and recreation committee, H. H. (Bob) Roberts, chairman, received reports on the 1953–54 southern California winter-sports season, some proposals for development of beaches and parks with State tidelands funds, southern California's current roadside-cleanup and roadside-rests programs, and developed the following recommendations:

That the Southern California Council urge the State chamber to continue to give top priority to the roadside cleanup campaign.

That the Southern California Council urge the State chamber to take steps to get house action on bills now before the House Committee on Agriculture to provide funds for sanitation and improved recreation facilities in national forests.

The industrial and industrial insurance committees (in joint session), Edward Mills, chairman of latter group, presiding, reviewed pension plans and collective bargaining, legislative studies on unemployment insurance, and the future of workmen's compensation insurance, and discussed trends in Federal and State labor-management legislation. No recommendations were made.

An industrial survey workshop, George N. Hawley presiding, was held to provide chamber of commerce managers and local industrial development interests with practical aids and answers on the best procedures and methods to employ in compiling community industrial surveys.

RESOLUTION APPROVING THE COLORADO RIVER BOARD OF CALIFORNIA AND ITS POSITION OPPOSING PENDING LEGISLATION AUTHORIZING THE FRYINGPAN-ARKANSAS PROJECT IN COLORADO AND ITS RESOLUTION OPPOSING PENDING LEGISLATION RELATIVE TO COLORADO RIVER STORAGE PROJECTS

Whereas two resolutions have been called to the attention of the Chamber of Commerce of the City of Brawley, County of Imperial, State of California, copies of which are hereto attached and which have been passed by the Colorado River Board of California on June 2, 1954, opposing S. 964 and H. R. 236, and S. 1555 and H. R. 4449, 83d Congress; and

Whereas this body is familiar with the organization, functions, and activities of the Colorado River Board of California and its representation of California in connection with matters relating to the Colorado River system; and

Whereas said two resolutions oppose Senate bills 964 and 1555 and House of Representatives bills 236 and 4449, 83d Congress, which bills would authorize that certain project in Colorado designated as the Fryingpan-Arkansas project and would authorize a Colorado River storage project and participating projects, more particularly set forth in said bills; and

Whereas the State of California has a vital interest in the waters of the Colorado River system and said Colorado River Board was authorized and created and provided for by the Legislature of the State of California as an agency to protect the interests of the State of California in and to the waters of the Colorado River system; and

Whereas as evidenced by the said two resolutions of June 2, 1954, of the Colorado River Board, said board opposes said pending legislation for the reasons and to the extent as in said resolutions indicated, and this body feels that said Colorado River Board is justified in its position: Now, therefore,

On motion of William Dillard, seconded by Gene Bryant, there is hereby resolved as follows:

1. That we do hereby express our confidence in the Colorado River Board of California as representing the interests of California as to the Colorado River system and the waters thereof.

2. We do hereby expressly approve said two resolutions which are hereto attached as the action of said Colorado River Board, and authorize the secretary of this body to mail copies of said resolution to all California Members of Congress.

Passed and adopted this 10th day of June 1954 by the unanimous action of this body.

CHAMBER OF COMMERCE OF THE CITY OF BRAWLEY, COUNTY OF IMPERIAL, STATE OF CALIFORNIA,

R. 236, and S. 1555 and H. R. .449, 83d Congress; and

Whereas this body is familiar with the organization, functions and activities of the Colorado River Board of California and its representation of California in connection with matters relating to the Colorado River system; and

Whereas said two resolutions oppose Senate bills 964 and 1555 and House of Representatives bills 236 and 4449, 83d Congress, which bills would authorize that certain project in Colorado designated at the Fryingpan-Arkansas project and would authorize a Colorado River storage project and participating projects, more particularly set forth in said bills; and

Whereas the State of California has a vital interest in the waters of the Colorado River system and said Colorado River Board was authorized and created and provided for by the Legislature of the State of California as an agency to protest the interests of the State of California in and to the waters of the Colorado River System; and

Whereas as evidenced by the said two resolutions of June 2, 1954, of the Colorado River Board, said board opposes said pending legislation for the reasons and to the extent as in said resolutions indicated, and this body feels that said Colorado River Board is justified in its position.

Now, therefore, on motion of William H. Sorenson, seconded by Harry Momita, there is hereby resolved as follows:

1. That we do hereby express our confidence in the Colorado River Board of California as representing the interests of California as to the Colorado River system and the waters thereof.

2. We do hereby expressly approve said two resolutions which are hereto attached as the action of said Colorado River Board, and authorize the secretary of this body to mail copies of said resolution to all California Members of Congress.

Passed and adopted this 16th day of June 1954, by the unanimous action of this body.

CHAMBER OF COMMERCE OF THE CITY OF CALIPATRIA, COUNTY OF IMPERIAL, STATE OF CALIFORNIA.
By GORDON B. BARRINGTON, *President.*
By R. M. CHAPMAN, *Secretary.*

RESOLUTION APPROVING THE COLORADO RIVER BOARD OF CALIFORNIA AND ITS POSITION OPPOSING PENDING LEGISLATION AUTHORIZING THE FRYINGPAN-ARKANSAS PROJECT IN COLORADO AND ITS RESOLUTION OPPOSING PENDING LEGISLATION RELATIVE COLORADO RIVER STORAGE PROJECTS

Whereas two resolutions have been called to the attention of the City Council of the City of Westmorland, County of Imperial, State of California, copies of which are hereto attached, and which have been passed by the Colorado River Board of California on June 2, 1954, opposing S. 964 and H. R. 236, and S. 1555 and H. R. 4449, 83d Congress; and

Whereas this body is familiar with the organization, functions, and activities of the Colorado River Board of California and its representation of California in connection with matters relating to the Colorado River system; and

Whereas said two resolutions oppose Senate bills 964 and 1555 and House of Representatives bills 236 and 4449, 83d Congress, which bills would authorize that certain project in Colorado designated as the Fryingpan-Arkansas project and would authorize a Colorado River storage project and participating projects, more particularly set forth in said bills; and

Whereas the State of California has a vital interest in the waters of the Colorado River system and said Colorado River Board was authorized and created and provided for by the Legislature of the State of California as an agency to protect the interests of the State of California in and to the waters of the Colorado River system; and

Whereas, as evidenced by the said two resolutions of June 2, 1954, of the Colorado River Board, said board opposes said pending legislation for the reasons and to the extent as in said resolutions indicated, and this body feels that said Colorado River Board is justified in its position: Now, therefore, on motion of Councilman Stuart, seconded by Councilman Martin, there is hereby resolved as follows:

1. That we do hereby express our confidence in the Colorado River Board of California as representing the interests of California as to the Colorado River system and the waters thereof.

2. We do hereby expressly approve said two resolutions which are hereto attached as the action of said Colorado River Board and authorize the city clerk to mail copies of said resolution to all California Members of Congress.

Passed and adopted this 14th day of June 1954 by the unanimous action of this body.

CITY COUNCIL OF THE CITY OF WESTMORLAND,
COUNTY OF IMPERIAL, STATE OF CALIFORNIA,
By BEULA A. RUSSELL, *Mayor.*
By ELIZABETH HUFFINER, *City Clerk.*

RESOLUTION No. 9780, OPPOSING SENATE BILL 1555; HOUSE BILL 4449; S. 964 AND H. R. 236 OR SIMILAR LEGISLATION PENDING IN THE CONGRESS OF THE UNITED STATES

Whereas the city of Burbank is vitally dependent upon a water supply obtained from the Colorado River; and

Whereas the Colorado River storage project as proposed in S. 1555 and H. R. 4449 and the Fryingpan-Arkansas project as proposed in S. 964 and H. R. 236, now pending in the Congress of the United States of America, would jeopardize the water rights and the water supply of the city of Burbank, Calif.; and

Whereas the aforementioned projects would inflict on the taxpayers of the city of Burbank and on the entire Nation an unjustifiable burden: Therefore be it

Resolved, That the enactment of these project bills is against the interest of the city of Burbank and should be opposed; and be it further

Resolved, That the city council of the city of Burbank, Calif., respectfully request the representatives of the State of California in the Congress of the United States to oppose the enactment of the above-mentioned bills or any similar legislation and that copies of this resolution be forwarded by the city clerk forthwith to the Hon. William F. Knowland and Hon. Thomas H. Kuchel, United

States Senators, and to all the California Representatives in the Congress of the United States.

Passed and adopted this 25th day of June 1954.

CARL M. KING,
President of the Council of the City of Burbank.

Attest:

NAOMI G. PUTNAM,
City Clerk.

STATE OF CALIFORNIA,
County of Los Angeles, City of Burbank, ss:

I, Naomi G. Putnam, city clerk of the city of Burbank, do hereby certify that the foregoing resolution was duly and regularly passed and adopted by the council of the city of Burbank at its regular adjourned meeting held on the 25th day of June 1954 by the following votes:

Ayes: Councilmen Bank, Blais, Hilton, and King.

Noes: None.

Absent: Councilman Jolley.

NAOMI G. PUTNAM,
City Clerk.

RESOLUTION OF THE BOARD OF SUPERVISORS OF ORANGE COUNTY, CALIF., JUNE 15, 1954

On motion of supervisor Featherly, duly seconded and carried, the following resolution was adopted:

Whereas the county of Orange in the State of California is vitally dependent on a water supply obtained from the Colorado River;

Whereas the Colorado River storage project bill (H. R. 4449), now pending in the Congress, would jeopardize the water rights and the water supply of the county of Orange;

Whereas the Colorado River storage project would inflict on the taxpayers of this county and the Nation an unjustifiable burden: Therefore be it

Resolved by the Board of Supervisors of Orange County, That the enactment of the Colorado River storage project bill is against the interests of the county of Orange and should be opposed; be it further

Resolved, That the county of Orange respectfully requests the representatives of the State of California in the Congress of the United States to oppose the enactment of this bill or any similar legislation.

Ayes: Supervisors C. M. Featherly, Willard Smith, Ralph J. McFadden, Heinz Kaiser, and Willis H. Warner.

Noes: None.

Absent: None.

STATE OF CALIFORNIA,
County of Orange, ss:

I, B. J. Smith, county clerk and ex-officio clerk of the Board of Supervisors of Orange County, Calif., hereby certify that the above and foregoing resolution was duly and regularly adopted by the said board at a regular meeting thereof held on the 15th day of June 1954 and passed by a unanimous vote of said board.

In witness whereof, I have hereunto set my hand and seal this 15th day of June 1954.

B. J. SMITH,
County Clerk and ex-officio Clerk of the Board of Supervisors of Orange County, Calif.

A RESOLUTION OF THE BOARD OF DIRECTORS OF THE CITY OF PASADENA OPPOSING FEDERAL LEGISLATION AUTHORIZING COLORADO RIVER STORAGE PROJECTS

Whereas the city of Pasadena is dependent on a water supply obtained from the Colorado River; and

Whereas the Colorado River storage project as proposed in S. 1555 and H. R. 4449 and the Fryingpan-Arkansas project as proposed in S. 964 and H. R. 236, now pending in the Congress, would jeopardize the water rights and the water supply of the city of Pasadena; and

Whereas the projects aforesaid would inflict on the taxpayers of this city and the Nation an unjustifiable burden: Therefore be it

Resolved, That the enactment of these project bills is against the interest of the city of Pasadena and should be opposed: be it further

Resolved, That the city of Pasadena respectfully requests the representatives of the State of California in the Congress of the United States to oppose the enactment of the bills aforesaid or any similar legislation.

EXHIBIT D

RESOLUTIONS OF THE AMERICAN PUBLIC POWER ASSOCIATION, MAY 1954, OPPOSING THE USE OF THE COLLBRAN FORMULA AND EXCESSIVE SUBSIDIES TO IRRIGATION

RESOLUTION NO. 8.—INTEREST COMPONENT—COLLBRAN FORMULA

Whereas the American Public Power Association, composed of the principal locally owned public power systems of the United States, has a direct concern in the standard of financial operations established for Federal power projects, as any public discredit resulting from uneconomic Federal power policies reflects in a degree upon the locally owned public power systems; and

Whereas the American Public Power Association disapproves the Federal power practice of diverting from the Federal Treasury the interest component of revenues derived from the power investment portion of Bureau of Reclamation projects, and using the interest so collected for retirement of capital amounts invested in irrgation projects instead of for paying interest on the resulting national debt; and

Whereas the Collbran formula proposed by the Bureau of Reclamation indirectly effects the same result, by postponing the commencement of repayment of the irrigation investment until the power investment is first retired, and is equally unsound; and

Whereas in the aggregate the sums involved in diversion of the interest component and Collbran formula would require the replacement through added taxes of many billions of dollars for the numerous reclamation projects now proposed, and

Whereas this association has been on record since 1946 as not opposing a reasonable subsidy to irrigation from power revenues, but insists as a matter of principle and sound economics, that any irrigation subsidy believed to be in the public interest should be clearly set forth and be specifically recognized and approved as such in authorization of the project by the Congress; and

Whereas as stated in this association's statement of power policy, total capital costs paid from power revenues shall not exceed the amount for which a comparable supply of power could have been developed had irrigation not been one of the purposes of the project: Now, therefore, be it

Resolved, That the American Public Power Association condemns these practices and recommends that they not be employed in future Reclamation Bureau projects. This recommendation is made in the best interests of the American taxpayer, of the public power industry, and of the public it serves. Adoption of such a reform would avoid a concealed subsidy, the benefits of which go to only a limited number of persons at the expense of the Federal Treasury.

RESOLUTION NO. 8 (A)—EXCESSIVE SUBSIDIES TO RECLAMATION

Be it resolved, The American Public Power Association is opposed to the increasing burden which is being placed upon the power users in order to subsidize irrigation projects. In some projects recently proposed by the Bureau of Reclamation the irrigators are required to pay less than 15 percent of the costs allocated to irrigation, and the power users are required to pay more than 85 percent thereof plus all the costs allocated to power. In other cases the subsidy to be exacted from the power users would amount to the equivalent of nearly $100,000 for each 160-acre farm. This practice is not in the public interest.

This association's declaration of "Federal power policy" states that when irrigation is one of the joint purposes of a project, power revenues may be used to pay that portion of the capital costs properly chargeable to irrigation which is beyond the ability of the irrigators to pay, but that the total capital

costs to be paid from power revenues shall never exceed the amount for which a comparable supply of power could have been developed had irrigation not been one of the purposes of the project. This formula concedes fair and adequate subsidies to irrigation from the power users. If a reclamation project is sufficiently meritorious to justify greater subsidies, they should be fully disclosed, and paid from the general treasury.

(Copied from Public Power, vol. 12, No. 6, dated June, 1954.)

CITY OF SAN JACINTO

RESOLUTION NO. 448—A RESOLUTION OF THE CITY COUNCIL OF THE CITY OF SAN JACINTO, RESPECTING SENATE BILL 1555 AND H. R. 4449 IN RESPECT TO STORAGE WATER PROJECTS IN THE COLORADO RIVER BASIN

Whereas the city of San Jacinto is vitally dependent on a water supply obtained from the Colorado River;

Whereas the Colorado River storage project as proposed in S. 1555 and H. R. 4449 and the Fryingpan-Arkansas project as proposed in S. 964 and H. R. 236, now pending in the Congress, would jeopardize the water rights and the water supply of the city of San Jacinto;

Whereas the aforementioned projects would inflict on the taxpayers of this city and the Nation an unjustifiable burden: Therefore be it

Resolved, That the enactment of these project bills is against the interest of the city of San Jacinto and should be opposed; and be it further

Resolved, That the city of San Jacinto respectfully requests the representatives of the State of California in the Congress of the United States to oppose the enactment of the above-mentoned bills or any similar legislation.

Moved, passed, and adopted at a special meeting of the City Council of the City of San Jacinto, a California municipality, duly called and held on June 30, 1954.

Dated June 30, 1954.

W. M. KOLB,
Mayor, City of San Jacinto.

Attest:

MARGARET D. BELTZNER,
City Clerk, City of San Jacinto.

RESOLUTION NO. 54-91—EXPRESSING OPPOSITION TO H. R. 4449

Whereas the city of Santa Ana, Calif., is vitally dependent on a water supply obtained from the Colorado River;

Whereas the Colorado River storage project bill (H. R. 4449), now pending in the Congress, would jeopardize the water rights and the water supply of the city of Santa Ana;

Whereas the Colorado River storage project would inflict on the taxpayers of this city and the Nation an unjustifiable burden: Therefore be it

Resolved by the City Council of the City of Santa Ana, That the enactment of the Colorado River storage project bill is against the interests of of the city of Santa Ana and the county of Orange and should be opposed; be it further

Resolved, That the city of Santa Ana respectfully requests the representatives of the State of California in the Congress of the United States to oppose the enactment of this bill or any similar legislation.

Passed and adopted by the City Council of the City of Santa Ana at its regular meeting held on the 21st day of June 1954.

COURTNEY R. CHANDLER, *Mayor.*

Attest:
[SEAL]

ERMA KEELER,
Clerk of the Council.

RESOLUTION NO. 2595

RESOLUTION OF THE CITY COUNCIL OF THE CITY OF TORRANCE OPPOSING S. 1555 AND H. R. 4449 AND THE FRYINGPAN-ARKANSAS PROJECT AS PROPOSED IN S. 964 AND H. R. 236, NOW PENDING IN THE CONGRESS

The City Council of the City of Torrance does resolve as follows:

Whereas the city of Torrance is vitally dependent on a water supply obtained from the Colorado River; and

Whereas the Colorado River storage project as proposed in S. 1555 and H. R. 4449 and the Fryingpan-Arkansas project as proposed in S. 964 and H. R. 236, now pending in the Congress, would jeopardize the water rights and the water supply of the city of Torrance; and

Whereas the aforementioned projects would inflict on the taxpayers of this city and the Nation an unjustifiable burden: Now, therefore, be it

Resolved by the City Council of the City of Torrance, That the enactment of these project bills is against the interest of the city of Torrance and should be opposed; be it further

Resolved, That the City Council of the City of Torrance respectfully requests the representatives of the State of California in the Congress of the United States to oppose the enactment of the above-mentioned bills or any similar legislation.

Introduced, approved, and adopted this 29th day of June 1954.

NICKOLAS O. DRALE,
Mayor of the City of Torrance.

Attest:

A. H. BARTLETT,
City Clerk of the City of Torrance.

RESOLUTION No. 541—A RESOLUTION OF THE CITY COUNCIL OF THE CITY OF HEMET, RESPECTING SENATE BILL 1555 AND H. R. 4449 IN RESPECT TO STORAGE WATER PROJECTS IN THE COLORADO RIVER BASIN

Whereas the city of Hemet is vitally dependent on a water supply obtained from the Colorado River;

Whereas the Colorado River storage project as proposed in S. 1555 and H. R. 4449 and the Fryingpan-Arkansas project as proposed in S. 964 and H. R. 236, now pending in the Congress, would jeopardize the water rights and the water supply of the city of Hemet;

Whereas the aforementioned projects would inflict on the taxpayers of this city and the Nation an unjustifiable burden: Therefore be it

Resolved, That the enactment of these project bills is against the interest of the city of Hemet and should be opposed; be it further

Resolved, That the city of Hemet respectfully requests the representatives of the State of California in the Congress of the United States to oppose the enactment of the above-mentioned bills or any similar legislation.

Moved, passed, and adopted at a special meeting of the City Council of the City of Hemet, a California municipality, duly called and held on July 2, 1954.

Dated July 2, 1954.

JAMES S. SIMPSON,
Mayor, City of Hemet.

Attest:
[SEAL]

MARY E. HENLEY,
City Clerk, City of Hemet.

A RESOLUTION OF THE COUNCIL OF THE CITY OF GLENDALE OPPOSING PENDING LEGISLATION AUTHORIZING COLORADO RIVER STORAGE PROJECT AND PARTICIPATING PROJECTS

Whereas the city of Glendale is vitally dependent on a water supply obtained from the Colorado River; and

Whereas the Colorado River storage project as proposed in S. 1555 and H. R. 4449 and the Fryingpan-Arkansas project as proposed in S. 964 and H. R. 236, now pending in the Congress, would jeopardize the water rights and the water supply of the city of Glendale; and

Whereas the aforementioned projects would inflict on the taxpayers of this city and the Nation an unjustifiable burden: Now, therefore, be it

Resolved by the Council of the City of Glendale, That the enactment of these project bills is against the interest of the city of Glendale and should be opposed, and that the Council of the City of Glendale respectfully request the representatives of the State of California in the Congress of the United States to oppose the enactment of the above mentioned bills or any similar legislation; and be it further

Resolved, That the city clerk be and is hereby instructed to transmit copies of this resolution to the Senators and Representatives of the State of California in the Congress of the United States.

I, G. E. Chapman, city clerk of the city of Glendale, do hereby certify that the foregoing is a true and correct copy of resolution adopted by the Council of the City of Glendale, Calif., on the 24th day of June 1954.

[SEAL]

G. E. CHAPMAN,
City Clerk of the City of Glendale.

THE RAILROAD BROTHERHOODS
JOINT LEGISLATURE COUNCIL OF CALIFORNIA,
Los Angeles, Calif., June 21, 1954.

MY DEAR MR. CONGRESSMAN: The Railroad Brotherhoods Joint Legislative Council of California, after due consideration of the effects of the enactment of the Colorado River storage bill (H. R. 4449), feel that the enactment of this legislation would not be in the public interest, and I am therefore directed to advise you of the position of our membership as outlined in the following resolution setting forth our position on this matter:

Whereas the Railroad Brotherhoods Joint Legislative Council is vitally interested in any legislation affecting the welfare of the citizens of this country; and

Whereas the Colorado River storage project bill (H. R. 4449), now pending before the Congress, would impose upon all American taxpayers an enormous additional burden; and

Whereas the economy of the Nation would be seriously impaired by construction of this expensive and unjustifiable project: Now, therefore, be it

Resolved, That the Railroad Brotherhoods Joint Legislative Council vigorously opposes passage of H. R. 4449 by the Congress;

And we further urge that you do all possible to prevent this legislation from being enacted.

Adopted June 21, 1954, by the legislative representatives of the several organizations of the Railroad Brotherhoods Joint Legislative Council of California, upon behalf of the organizations and the membership thereof.

LEROY H. MORGAN,
Chairman, Railroad Brotherhoods Joint Legislative Council of California.

(Whereupon, at 6:35 p. m., the committee was recessed, to reconvene at 9 a. m. the following day, Saturday, July 3, 1954.)

COLORADO RIVER STORAGE PROJECT

WEDNESDAY, JUNE 30, 1954

UNITED STATES SENATE,
SUBCOMMITTEE OF THE COMMITTEE ON
INTERIOR AND INSULAR AFFAIRS,
Washington, D. C.

The subcommittee met, pursuant to recess, at 10 a. m., in room 457, Senate Office Building, Washington, D. C., Senator Arthur V. Watkins, Utah, presiding.

Present: Senators Arthur V. Watkins, Utah, and Clinton P. Anderson, New Mexico.

Present also: Senator Thomas H. Kuchel, California; Elmer K. Nelson, staff consulting engineer; and N. D. McSherry, assistant chief clerk.

Senator WATKINS. The committee will come to order.

The first witness this morning will be the Honorable Ivan C. Crawford, director, Colorado Water Conservation Board.

STATEMENT OF IVAN C. CRAWFORD, DIRECTOR, COLORADO WATER CONSERVATION BOARD

Mr. CRAWFORD. Mr. Chairman and members of the committee, my name is Ivan C. Crawford. I am the director of the Colorado Water Conservation Board, an official State agency. On behalf of the board, I appear here in support of the bill authorizing the upper Colorado storage projects and participating projects generally but particularly in support of the five participating projects located in the State of Colorado.

Four of these projects—Paonia, Smith Fork, Florida, and Silt—have a common characteristic: They are primarily projects which seek to bring a supplemental supply of water ot land already under irrigation and, in addition, each one brings in some new land, smaller in area than the portion securing supplemental water. The Pine River extension project, the exception in this respect, brings new land under irrigation; however, the project is, as the name implies, an extension of a project already in existence.

I should like to present the salient characteristics of these projects. They have all been investigated and reported on by the Bureau of Reclamation. In each case the benefit-cost ratio has been found to be greater than 1; in each case it has been found that it will be necessary for the proposed upper Colorado River storage account to furnish a considerable portion of the funds required to bring the projects into existence.

The Paonia project: Studies were initiated on this project by the Bureau in 1936. It was authorized for construction on March 18, 1939,

Upon the condition that the legal availability of a reasonable quantity of water for the Denver-Blue River diversion be established, either by litigation or some other arrangement, and the condition that such project be otherwise feasible, the board approves the Denver-Blue River project for inclusion as a participating project in the authorization of the Colorado River storage project or for such other Federal legislative or administrative action as may be requested by Denver.

12. The board recommends that Denver and the representatives of the west slope in Colorado make every effort to arrive at a harmonious solution of the unfortunate transmountain diversion controversy which for years has created dissention in Colorado. The board pledges that it and its staff will be ready to assist in the amicable settlement of this prolonged conflict.

13. The director of the board and the Colorado member of the Upper Colorado River Commission are directed to do all things necessary and proper to effectuate this resolution.

14. Copies of this resolution shall be forthwith transmitted to the Governor of Colorado and to the members of the Colorado congressional delegation.

Senator WATKINS. Any questions, Senator Anderson?

Senator ANDERSON. No questions.

Senator WATKINS. I have no questions. Thank you very much for your statement.

Judge Breitenstein will you come forward please?

STATEMENT OF JEAN S. BREITENSTEIN, DENVER, COLO.

Mr. BREITENSTEIN. My name is Jean S. Breitenstein and my address is 2501 Albion Street, Denver.

At the outset, Mr. Chairman, I have one thing which embarrasses me. The young lady who mimeographed my statement put my new title at the head of it. There should be no implication at all that I am testifying here in any official capacity. I am here as a private citizen, on my own time and my own expense.

I might say that after I was confirmed for the office which I now hold, the question arose as to my testifying in support of this legislation. I submitted to the chief judge for the Court of Appeals of the Tenth Circuit the question as to whether or not I should take my oath of office or defer until I appeared before your committee. I secured from him a letter, signed by the Judicial Council of the Court of Appeals of the Tenth Circuit, in which they unanimously say that I should take the oath of office and there would be no impropriety in my appearing here and testifying.

I have a photostatic copy of that letter which I would like to submit for your files so there will be no question raised.

Senator WATKINS. That will be received.

(The letter referred to follows:)

UNITED STATES COURT OF APPEALS, TENTH CIRCUIT,
Denver 1, Colo., June 2, 1954.

JEAN S. BREITENSTEIN, *Denver, Colo.*

DEAR MR. BREITENSTEIN: The Circuit Council of the United States Court of Appeals, Tenth Circuit, composed of the five circuit judges of the circuit, has given consideration to the inquiry in your letter of June 1, 1954, addressed to me as chief judge of the circuit. You asked the circuit council to advise you of its opinion with respect to the propriety of your testifying before the Subcommittee on Irrigation and Reclamation of the Senate Interior and Insular Affairs Committee, relative to a bill now pending for the authorization of the Colorado River storage project, after having qualified as United States district judge for the District of Colorado.

We understand that for many years you have been attorney for the Colorado Water Conservation Board and for the Colorado member of the Upper Colorado River Commission; that you have resigned as attorney for such board and member; that because of your long connection, as attorney for such board and member, with Colorado River Basin problems, you have acquired a knowledge of pertinent matters of fact and law especially qualifying you to give valuable testimony to such subcommittee—testimony with respect to matters peculiarly within your knowledge and not obtainable from any other witness.

We further understand if you do appear before such subcommittee and testify, you will receive no compensation of any kind therefor and will personally pay expenses of travel and maintenance incurred in connection therewith.

We understand no matter of disqualification is involved, because you will be disqualified to sit in matters involving the Colorado River Basin, with respect to which you have acted as counsel in the past.

The council has carefully considered your inquiry and, in the light of what we regard as pertinent facts, it is our considered judgment that you should immediately qualify as United States district judge for the District of Colorado; that you should testify, when requested, before the Subcommittee of the Senate Interior and Insular Affairs Committee, and that there will be no impropriety in your so testifying after you have qualified as United States district judge for the District of Colorado.

Respectfully,

SAM G. BRATTON,
Circuit Judge.
WALTER A. HUXMAN,
Circuit Judge.
ALFRED P. MURRAH,
Circuit Judge.
JOHN C. PICKETT,
Circuit Judge.
ORIE L. PHILLIPS,
Chief Judge.

Senator WATKINS. I might say your reputation in the field of water development is so well known that I think the committee might have considered subpenaing you if you had not voluntarily appeared. We want to get the benefit of what you know about this upper Colorado River Storage and just because you were put on the bench, do not think you can deprive the committee of having your valuable information on this legislation.

I am sure you have not been in a judicial term long enough to feel that it would be anything which would disqualify you in making your statement.

Mr. BREITENSTEIN. That is right, Mr. Chairman, and I might say just to get into the record the experience I have had, I worked on Colorado River matters with some continuity since 1927.

For many years I was the attorney for the Colorado Water Conservation Board and also I have been the Colorado member of the Upper Colorado River Commission.

Before I go into the prepared statement that I have, I would request that the statements which I gave before the House committee in hearings on H. R. 4449, be made part of the record here. I think I will not read them so there will be no duplication, but if they could be put into the record as they appear at pages 308 to 313, I believe it might be helpful.

Senator WATKINS. Mr. Breitenstein, in view of the fact that the information referred to is already available is the House Hearings. I think it advisable to make the information part of this committee's files rather than to duplicate it here.

Mr. BREITENSTEIN. In the prepared statement that I have, the matter covered by subdivision 2 has been gone into by other witnesses and it would be repetition for me to mention that. Accordingly, I would like to begin on page 3, subdivision 111, that is, that the project is within the spirit and intent of the reclamation laws.

As the project is planned, the principal holdover reservoirs will not store and release water for downstream consumptive uses in the upper basin. Their function rather will be to regulate the streamflows and to generate power. However, the stream regulation, which is so provided, will make possible consumptive use projects for agricultural and municipal purposes which could not exist without the stream regulation provided by the holdover reservoirs.

Senator WATKINS. You have in mind, of course, the use of that water by exchange?

Mr. BREITENSTEIN. That is correct, sir.

The engineers have estimated that under historical streamflow records the available firm water supply for the upper basin is only about 4,200,000 acre-feet annually. The compact apportions to the upper basin beneficial consumptive use of 7,500,000 acre-feet annually. The difference between the 2 figures, or 3,300,000 acre-feet, represents the quantity of water which will become available for consumptive use in the upper basin by the stream regulation provided by the large reservoirs. The application of this additional 3,300,000 acre-feet of water annually to beneficial consumptive use is beyond doubt a reclamation project.

The generation and sale of hydroelectric power from the units of the storage project is clearly within the Reclamation Act. The April 16, 1906, amendment (34 Stat. 116) to the Reclamation Act of 1902 (32 Stat. 388) shows that Congress contemplated and authorized the development of the power features of reclamation projects. Other amendatory or supplementary legislation shows that throughout the years Congress has authorized, and appropriated funds for the construction of, hydroelectric projects. There are outstanding examples such as Hoover Dam, Parker Dam, and Davis Dam in the lower basin. Section 9 (c) of the Reclamation Project Act of 1939 makes specific reference to the sale or lease of power.

The Colorado River storage project is within the traditional concept of a reclamation project. The primary difference between it and the reclamation project of the past is its size.

In supporting the Colorado River project the upper basin States believe that they are carrying into effect the principle of the regional water development.

Senator WATKINS. May I go back for a moment, Judge?

You said the primary difference between this and other projects in the past was one of size. It is because of the large size that the development has not taken place in the past.

Mr. BREITENSTEIN. That is absolutely correct, Senator, yes. I agree with that.

Senator WATKINS. In other words, if we had gone along piecemeal and gotten an authorization for each project year by year, it would appear to be not as large a project as it now appears.

Mr. BREITENSTEIN. If we had been as fortunate as other areas and developed these small projects in the past, this would not be the size that it is.

Senator WATKINS. And it is the first time, is it not, within your memory, that we have proposed a comprehensive program for a river system?

Mr. BREITENSTEIN. That is correct. This is a comprehensive program for the upper basin.

Senator WATKINS. It shows the development and complete utilization of the water, not only for consumptive uses but also for power and any other uses to which water can be put.

Mr. BREITENSTEIN. Yes, and it is a use which affects four States. Four States have joined in supporting this project.

Senator WATKINS. When I divide it into four, it is not so large, either, is it?

Mr. BREITENSTEIN. That is correct.

Senator WATKINS. I am asking these questions for the benefit of the other Members of the Senate who may not understand that the way we in the West do.

Mr. BREITENSTEIN. Mr. Chairman, next in my statement I have analyzed the two pertinent compacts, the 1922 compact and the 1948 compact. Those have been discussed by others, and if the material appears in the record, I think it would not be necessary to read it at this time.

Senator WATKINS. We will have it all appear in the large type.

Mr. BREITENSTEIN. Thank you.

On page 8, I refer to pending litigation in the lower basin. In August 1952 Arizona brought suit against California and certain public entities of the State concerned with the use of Colorado River water. Later the United States intervened. Nevada has filed a motion for leave to intervene and such motion has been granted. This case, *Arizona* v. *California* (No. 10 original, 1953 term, Supreme Court of the United States of America), involves controversies of long standing as to the rights of the lower basin States to the use of Colorado River water. The States of Colorado, New Mexico, Utah, and Wyoming are not parties to, or involved in, this lawsuit.

In its complaint Arizona presented three basic issues, viz:

1. How is beneficial consumptive use measured?

2. Is water covered by article III (b) of the 1922 compact apportioned water or unapportioned water?

3. How are reservoir losses from lower basin main stream reservoirs to be charged?

In their answers and other pleading the defendants have asserted a multitude of issues which appear to be immaterial and irrelevant with perhaps two exceptions, which are:

1. Is Arizona a party to and bound by the 1922 compact?

2. If Arizona is a party to the 1922 compact, does it have any rights under, or may it receive any benefits by reason of, the so-called California Self-Limitation Act (act of March 4, 1929; ch. 16, 48th sess.; Statutes and Amendments to the Codes, 1929, pp. 38–39)?

The defendants in this case have requested the Court to appoint a special master to conduct hearings on the controverted issues and to make a report to the Court with recommendations. Arizona opposed this and requested if a special master was appointed, he be limited to the five issues which I have enumerated. However, the Court appointed a master under a general reference. It is not clear at this time whether the master will restrict or limit the hearings in the first

instance. Should he follow such a course, that is, restricting his first consideration to the issues mentioned, then it is possible that the case may be effectively posted within a year or two. On the other hand, it is possible since the reference to the master is general, that it will be necessary to hear evidence on controverted facts and the determination of the case may be indefinitely prolonged.

The pendency of the *Arizona* v. *California* case has no effect whatsoever upon the authorization of the Colorado River storage project. All parties to that case assert and rely upon the 1922 compact, the Boulder Canyon Project Act, the Mexican Water Treaty, and the other laws and instruments which constitute the recognized and admitted law of the river. Similarly, the authorization of the Colorado River storage project is predicated upon the validity and integrity of the law of the river. While it is true that in the lower basin there has been a prolonged controversy over the application and construction of certain specific terms and provisions, these controversies do not affect the upper States or the availability of water for the Colorado River storage project.

Any insinuation that the authorization of the Colorado River storage project should be delayed until the *Arizona* v. *California* case is decided is an attempt to defeat upper basin development. There is no legitimate reason for any delay in this project because of the lower basin controversy.

Senator WATKINS. May I ask this question, Judge: Is it not true that there is no responsible decision the Court could make under the issues raised in this case which would make it impossible for the upper basin States to use a large percentage of the waters which are given to them under the 1922 compact?

Mr. BREITENSTEIN. That is correct, Mr. Chairman, and I go into that a little later in the statement.

Senator WATKINS. Then I will not ask you any further questions on that.

Mr. BREITENSTEIN. I would like to interpolate here that if the development in the lower basin had been deferred until there was a settlement of all the controversies down there, you would never have had the Hoover Dam, the All American Canal, Parker Dam, or the Davis Dam or any other of the great developments which they have down there, because while Congress was authorizing and appropriating funds for those projects, there were in existence these controversies which have now come to a head in the present lawsuit. While those projects were under construction, there were three United States Supreme Court lawsuits between Arizona and California. So if their development had to wait until all the controversies were settled, they would not have the projects which they now have.

Senator WATKINS. Of course one of the fundamentals for this project is the water supply. If there is available water supply regardless of the suits and issues involved, there should be no reason for delay.

Mr. BREITENSTEIN. That is correct.

Senator WATKINS. I note reference among the resolution just read to some controversies in Colorado. I am sure the Colorado people would not want this held up until all the controversies in that State have been settled.

Mr. BREITENSTEIN. That is correct.

Senator WATKINS. We do not happen to have any in Utah now, but we do not know when they might break loose.

Mr. BREITENSTEIN. You are fortunate.

Senator WATKINS. I think as we go through these projects, the people are usually able to adjust themselves, and ultimately the controversies will be settled, probably not to the complete satisfaction of everybody, but to the satisfaction of the majority, at least.

Mr. BREITENSTEIN. Yes.

In the next portion of my statement, Senator, I discuss certain legal points which have been raised. In doing this, I am not raising strawmen and knocking them down. Each one of these points has been asserted by people who have testified, either in the House hearings on this project or in hearings on the Fryingpan-Arkansas project. I thought the record should contain at least my answer to these points. The first point, one raised by a Senator earlier this week, is the meaning of per annum in article III of the 1922 compact. It has been urged that the apportionment of the 7,500,000 acre feet of water per annum as made by article III (a) of the 1922 compact means a maximum in any one year and not an average over any period of years. This is a theoretical issue which may some day have to be decided.

Most obviously if the 7½ million is a maximum, the average will be less than that unless there is complete stream regulation. At the moment the assertion of the issue does not even raise a material hypothetical question. The same witness who has raised this point quotes engineering reports as stating that the aggregate consumptive use of the reclamation projects included within the Colorado River storage project is about 1,700,000 acre-feet a year. When this is added to the 2,500,000 acre-feet required by projects already constructed, there will be 4,200,000 acre-feet of water put to consumptive use in the upper basin. See statement of Northcut Ely, hearings on H. R. 4449, H. R. 4443, and H. R. 4463 before the Subcommittee on Irrigation and Reclamation of the House Committee on Interior and Insular Affairs, 83d Congress, 2d session, page 697.

Hence, the upper basin will have to increase its use by 3,300,000 acre-feet before it approaches the figure which is said to be the maximum. The point, if it is worth consideration at all, becomes important only when some other project is up for authorization. It does not and cannot affect the Colorado River storage project.

THE MEASUREMENT OF CONSUMPTIVE USE

The 1922 compact does not define the method of measurement of consumptive use. For a number of years there have been controversies over this point. California has always contended that the measurement is by the "diversions-less-return method." The four upper division States and Arizona have contended that the measurement is in terms of "manmade depletion of main stream virgin flow." In its tendered petition in intervention in the *Arizona* v. *California* case Nevada has asserted a modification of the mainstream depletion theory.

The upper basin States in the 1948 compact adopted the main stream depletion method unless the administrative agency created by that compact should, by unanimous action, adopt some other method. Hence, so far as the area in which the Colorado River storage project

is located is concerned, the method of measurement is settled. There can be no doubt as to the right of the upper basin States to agree upon a method of measurement which is binding upon them. In this connection it should be pointed out that the California theory of measurement in terms of diversion-less-returns is thoroughly impractical in the upper basin because in that area, instead of there being a very few large diversions such as exist in California, there are literally thousands of diversions. It is utterly unreasonable and impractical to provide automatic measuring devices for all these diversions. Even if the diversions could be measured, no engineer has yet come forward with any reasonable method of determining return flows.

In the statement of Mr. Ely above referred to (House Hearings on H. R. 4449, p. 700) it is asserted that the quantity of water involved in this dispute over the method of measuring "so far as the planning of the upper basin storage project is concerned, is 300,000 to 500,000 acre-feet, according to engineers' estimates." As has previously been pointed out in discussing Mr. Ely's statement, the estimated total consumptive use of water in the upper basin which will result after this project is in operation will amount to about 4,200,000 acre-feet of water annually. If, because of the adoption of a different method of measurement, an additional 500,000 acre-feet must be added to this, the total is still well within the allocation made to the upper basin by the 1922 compact. Hence, the issue is entirely immaterial so far as this project is concerned.

E. RIGHTS WHICH MAY NOW EXIST

The assertion is made that the apportionment made by article III (a) "shall include all water necessary for the supply of any rights which may now exist." The pertinency of this assertion is obscure. The States involved in the Colorado River project recognize fully that the apportionment included rights then existing. This point may possibly have some application in the lower basin controversy, but has no application so far as the Colorado River storage project is concerned.

It should be clearly understood that the 1948 compact gives full recognition to the validity of the 1922 compact. Further in requesting the authorization of the Colorado River storage project the affected States have taken the unequivocal position that the authorization, construction, and operation of the project must be in conformity with the law of the river.

THE MEXICAN BURDEN

Article III (c) of the 1922 compact provides that any right to water recognized in Mexico shall be satisfied first out of surplus over the amounts specified in article III (a) and III (b) and if that is insufficient, then the deficiency shall be borne equally by the two basins and the upper division States are required to deliver at Lees Ferry water to supply one-half of the deficiency. The 1944 Mexican Water Treaty, Treaty Series 944, obligates the United States to deliver to Mexico 1,500,000 acre-feet annually subject to diminution under certain conditions. The adequacy of the water supply to satisfy this

obligation out of surplus has been the subject of prolonged contention for a number of years. At the moment the argument is entirely theoretical because some 8 or 9 million acre-feet of water annually is being discharged by the Colorado River into the Gulf of California. Report of Senate Committee on Foreign Relations, Executive Report No. 2, 79th Congress, 1st session, page 4.

It is conceivable that under conditions of ultimate development there may be an issue as to the responsibilities of the two basins in regard to the satisfaction of the Mexican right. Under existing conditions the issue is entirely hypothetical. As has been mentioned before, the consumptive use of water in the upper division States after the Colorado River storage project is in operation will amount to about 4,200,000 acre-feet. Hence, there is an adequate cushion to supply any potential obligation of the upper division States.

The obligation to deliver water to Mexico may at some future time become pertinent but it has no materiality so far as the authorization of the Colorado River storage project is concerned.

RESERVOIR LOSSES

The 1922 compact makes no provision for the charging of reservoir losses. The method to be applied is one of the issues in the pending *Arizona* v. *California* case.

So far as the upper basin is concerned, the 1948 compact sets up in its article V a definite procedure for the charging of these reservoir losses. The Colorado River storage project is an upper basin project. The upper basin States have agreed upon how they will charge reservoir losses. They have no concern whatsoever with the unfortunate lower basin controversy on this point. It has no materiality to them or the project which they desire.

Senator ANDERSON. Does it have anything to do with the amount of water the upper basin States can deliver at Lees Ferry?

Mr. BREITENSTEIN. Not in my opinion, Senator. They are obligated under III (d) to deliver 75 million every 10-year period.

Senator ANDERSON. If the evaporation losses were to be charged against that, however, it would make some difference.

Mr. BREITENSTEIN. That is true, Senator. There are people who feel that because the Glen Canyon Reservoir is of tremendous benefit to the lower basin, that the lower basin should share some of the reservoir losses of Glen Canyon. However, I apprehend that it would take voluntary agreement by the lower basin in order to bring that about.

The next is the right to demand or withhold water, article III (e), of the 1922 compact provides that the States of the upper division shall not withhold water and the States of the lower division shall not require the delivery of water which cannot reasonably be applied to the domestic and agricultural uses. This must be considered in connection with article II (h) which defines "domestic use" as including the use of water for certain purposes but specifically excluding the generation of electrical power and with article IV (b) which provides that water may be impounded and used for power generation but such impoundment and use shall be subservient to the use of water for agricultural and domestic purposes which are declared to be dominant.

Under these provisions of the compact water may be withheld by the upper basin and stored in the reservoirs contemplated by the Colorado River storage project so long as the water so stored is not required for domestic and agricultural uses in the lower basin. The mere fact that water so stored can be used for the generation of hydroelectric power in the lower basin does not impose any obligation upon the upper basin to deliver it for that purpose.

Indeed, one significant reason for the authorization and construction of this project at this time is that the immediate construction of the main stream holdover reservoirs will permit them to accumulate water with less interference with uses in both the lower and upper basins than if their construction is delayed until a later date.

In the lower basin the United States has constructed immense dams and powerplants. The United States is interested in securing the production of power and its resulting share of power revenues. By running this water not only through the lower basin plants but also the upper basin generators contemplated by this project, more power will be produced to add to the wealth of our Nation. It is to be presumed that the United States, the upper basin States, and the Upper Colorado River Commission will comply with the compact and will so operate the reservoirs as to attain the greatest possible benefit within the terms of the 1922 compact.

APPROPRIATION OF SURPLUS

Another question which has been raised is whether or not article III (f) of the 1922 compact intends that no State may validly appropriate surplus water until a new compact is made for the allocation of surplus. The pertinency of this point is beclouded. Except for California, there has been general agreement among the Colorado River Basin States that no firm right to any surplus waters may be obtained until there is an allocation after October 1, 1963. The position of California has been that a right to use a portion of such surplus may be obtained subject to possible divestment after October 1, 1963. It has never been explained how the validity or invalidity of either position has any bearing upon the authorization of the Colorado River storage project.

IMPOUNDMENT OF WATER FOR POWER GENERATION

As has heretofore been mentioned, article IV (b) of the 1922 compact makes the impoundment and use of water for power generation subservient to agricultural and domestic uses. This is recognized by the upper basin States who do not deny that the project is squarely controlled by the 1922 compact. This provision, however, does not affect the feasibility of the Colorado River storage project. Water needed for agricultural and domestic purposes in the lower basin must be passed downstream to the full extent of the apportionment made to the lower basin by article III (a) of the compact and in accordance with the delivery obligation contained in article III (d) of the compact.

Public officials are presumed to do their duties. Sovereigns, such as the United States, and quasi-sovereigns, such as the States, are presumed to comply with the law. It is not reasonable to object to the

Colorado River storage project upon the ground that in the future the persons in official control of the reservoirs will violate the law of the river.

INDIAN RIGHTS

The 1922 compact provides in its article VII that nothing therein shall be construed as affecting the obligations of the United States to Indian tribes. Article VII of the upper basin compact of 1948 requires that uses of water by the United States and its wards shall be charged as a use by the State in which the use is made.

It is true that in the pending suit of *Arizona* v. *California* there is an issue as to the method of charging Indian uses of water. This does not concern the upper basin. The omission in the 1922 compact of any provision for the charging of uses of water by the United States or its wards has been supplied so far as the upper basin is concerned, by the 1948 compact.

A California spokesman in the House hearings on this project has stated that the Bureau of Indian Affairs has construed the compact as meaning that the Indian claims in effect are prior and constitute the first demand upon the water supply. If such a theory should be upheld, then every right to the use of water of the Colorado River and its tributaries is of doubtful validity. It is inconceivable that the United States as the guardian of the Indians will ever assert that the rights of the Indians come ahead of the use of water on the great reclamation projects which the United States has constructed on the Colorado River such as Hoover Dam, the All-American Canal, the Salt River project, the Gila project, the Colorado-Big Thompson project, and many others.

Senator ANDERSON. Did the California spokesman give his authority for that statement?

Mr. BREITENSTEIN. He did not. However, I may say from conferences which I have had with representatives of the Bureau of Indian Affairs, that is the position which they have taken in statements to me.

Senator ANDERSON. They have construed the Winter's case pretty liberally with respect to that?

Mr. BREITENSTEIN. Yes; they rely on the Winter's case, Senator.

And adjudication of the Indian rights in the Colorado River Basin would require a consideration of every right to the use of the waters of the Colorado River and its tributaries in each of the seven basin States. Such procedure would cost millions of dollars and require years of time. It should be mentioned in passing that there are Indian reservoirs on many other streams. There is nothing unique about the Colorado River. If the Indians have a prior right to the use of the water of all of our streams, then indeed the Nation is in a most grievous condition.

In this regard it should be pointed out that the upper basin States have always had a deep concern over the welfare of the Indians. The apportionment to New Mexico, as made in the 1948 compact, was substantially increased because of a recognition of the Indian rights. The upper basin States desire to have the lot of the Indians improved by the construction of water use projects which are reasonably adapted to serve the Indian needs. In connection with the investigation of the

Colorado River storage project much consideration has been given to the Shiprock project in New Mexico. It is to be hoped that these studies will soon be completed and a project report submitted to the Congress so that the Indians may benefit therefrom. It should be understood that the upper basin States wish to help the Indians. At the same time they protest against any delay in the authorization of the Colorado River storage project by reason of the assertion of fantastic, unrealistic, and groundless claims of Indian rights.

PRESENT PERFECTED RIGHTS

California has asserted that the word "unimpaired" as used in article VIII of the 1922 compact means unimpaired as to both quantity and quality. California then suggests that the upper basin development will cause the quality of water delivered at Lee Ferry to deteriorate and, hence, constitute a violation of the compact. This is a denial of the validity of the apportionment made by article III (a) of the 1922 compact, because, if the California theory is correct, any impairment in quality would render the use of the water apportioned to the upper basin impossible. Such was never the intent of those who drafted the 1922 compact. Nowhere in that compact is any reference made to quality of water.

The statements of California witnesses are based upon no engineering studies supporting the theory that the quality of water will be impaired by upstream development. The assertions are based upon speculation and conjecture and constitute but another example of the extreme positions asserted to prevent and embarrass an upper basin development.

It is an elementary principle of the construction of statutes, treaties, and compacts that a document must be taken and considered as a whole. When the Colorado River compact of 1922 is so taken and considered, the conclusion will be inevitably reached that article III (a) is effective as to the apportionment of water and may not be destroyed by the legalistic and unwarranted insertion in article VIII of the compact after the word "unimpaired" the phrase "either in quantity or in quality."

California spokesmen, in discussing this subject, make reference to proposed transmountain diversions of water in the upper basin. Here again the 1922 compact is explicit. The definitions of the basins as stated in article II (f) and article III (g) clearly contemplate the transmountain diversion of water because they include within those basins all parts of the mentioned States without the drainage area which "are now, or shall hereafter be, beneficially served by waters diverted from the system."

It is, of course, well known that the California uses in the Imperial Valley, the Los Angeles area, and the San Diego area are all transmountain diversions.

It is respectfully submitted that the upper basin States have the right to make use of their apportioned share of the water at any place within such States, provided only that the Lee Ferry delivery obligations are maintained.

Suggested amendments:

PRELIMINARY AMENDMENTS

In the hearings before the House Committee on the Colorado River storage project bill, Mr. Ely, attorney for California, suggested certain amendments. These will be grouped for discussion.

PROPOSED AMENDMENTS PERTAINING TO THE LAW OF THE RIVER

The upper basin States recognize that the Colorado River project must be authorized, constructed, operated, and maintained in accordance with the law of the river. Further, any uses of water under any units of the project must conform to the law of the river. It is desirable to have this made clear in the bill but undue and unnecessary repetition should be avoided.

In this same regard the upper basin States recognize that there is the pending lawsuit involving uses of the Colorado River water in the lower basin. It is not the intent of the upper basin States, in urging the authorization of the Colorado River storage project, to influence the course of that litigation.

If amendments are thought necessary on these points, then the language employed in section 7 (a), (b), and (d) of the May 6, 1954, committee print on S. 964 to authorize the Fryingpan-Arkansas project is acceptable and adequate.

TRANSMOUNTAIN DIVERSIONS

Amendment No. 3 offered by Mr. Ely relates to transmountain diversion—see hearings on H. R. 4449, supra, pages 706, 707. This amendment requires that all Colorado River system water exported out of the natural basin of that system must be consumptively used in a Colorado River Basin State. In support of this proposal Mr. Ely merely stated that there is not enough water to enable the eastern slope of Colorado to compose its differences with Nebraska and Kansas.

Colorado has already composed its differences with both Nebraska and Kansas. On the North Platte River there is a Supreme Court decree (325 U. S. 589, 665). On the South Platte there is an interstate compact with Nebraska (44 Stat. 195). On the Republican there is a compact with Nebraska and Kansas (57 Stat. 86). On the Arkansas there is a compact with Kansas (81st Cong., 1st sess., ch. 155, Public Law 82. Hence, there is no reason for Colorado to have any desire whatsoever to pass any Colorado River water out of its borders. Indeed, the need for water in Colorado is so serious that it is inconceivable that Colorado would voluntarily permit any of its apportioned water exported from the Colorado River Basin to be used anywhere except in Colorado.

Be that as it may, the position taken by Mr. Ely does not accord with the Colorado River compact and does not accord with the uses of Colorado River water made in California. There is nothing in the Colorado River compact of 1922 which requires that water taken out of the natural basin must be consumptively used in a Colorado River Basin State. From a practical standpoint it would be impossible to give an assurance that Colorado River water would not pass out of the borders of a Colorado River Basin State. This results from the fact that Colorado River water is commingled with natural basin water and cannot be identified after such commingling.

Under the existing court decree and interstate compacts, Colorado is under no obligation to pass any imported water to any downstream State—for example, North Platte decree, article XII (c), 325 United States 671; South Platte compact, article IV, Arkansas River compact, article III B and article IV A.

If the theory for which Mr. Ely contends is the law, then the State of California is required to use consumptively all the water diverted from the Colorado River system for use in the Los Angeles and San Diego areas, because if it is not so used but discharged into the Pacific Ocean, there will be a compact violation. This situation in and of itself shows the fallacy of the contention.

If it is determined that some protective amendment should cover this point, then section 7 (c) of the committee print of S. 964, above referred to, is satisfactory.

SALINITY

Mr. Ely's amendment No. 4 relates to studies of salinity. The question of quality of water has heretofore been discussed. If the Congress wishes to authorize the Secretary of the Interior to make salinity studies, the upper States have no objections. But there is no reason whatsoever for an amendment to a bill for the authorization of the Colorado River storage project requiring salinity investigations. If this is to be done at all, it should be done under a general authorization applying to all western streams; and, so far as the Colorado River is concerned, it should apply to the upper basin as well as the lower basin.

The next subject is: Operation of reservoirs.

Senator ANDERSON. Where is most of the water being diverted from now?

Mr. BREITENSTEIN. The lower basin.

Senator ANDERSON. If this is to apply, surely we ought to go back and start testing that first.

Mr. BREITENSTEIN. I should think so, yes.

Senator ANDERSON. The point of the greatest use is the point of the greatest benefit to the greatest number of people. The Republic of Mexico might object to the use of this water by the State of California, for example.

Mr. BREITENSTEIN. That is right, sir.

The next refers to operation of reservoirs.

Amendment No. 5 proposed by Mr. Ely authorizes the creation of an "integrating committee" to advise with the Secretary of the Interior on the storage in, and release of water from, main stream upper basin reservoirs. The first obvious thought is that if such an integrating committee is to be created, then it should have control over not only the upper basin reservoirs, but also the lower basin reservoirs.

As has heretofore been pointed out, the officers of the United States and the States are presumed to do their duty. If in the performance of any ministerial act they violate the law of the river, they may be held to account in a proper legal manner.

It may be eventually desirable to have some such committee as has been suggested, but when and if that time arises, its responsibility should encompass both basins and not just the upper basin. Moreover, if it is to be created, it should be brought into existence by a statute designed for that purpose and not an amendment to a bill

for the authorization of an upper basin storage project. In other words, if you have a committee of that kind at all, it should be a general committee applying to every project on the entire stream, and not a selected group of projects.

Senator ANDERSON. Why not have that on the Columbia River as well?

Mr. BREITENSTEIN. If it is desirable at all, you might have a committee on the Columbia, Missouri, Sacramento, and so on, over the western part of the United States.

Senator WATKINS. As you have suggested, the time may arrive when we may have to have some water masters on the river.

Mr. BREITENSTEIN. That may eventually be necessary.

Senator WATKINS. It may be done by creation of a committee or by naming a water commission, but that has nothing to do with this bill at the present time.

Mr. BREITENSTEIN. No, sir; not in my opinion.

The next topic relates to waiver of immunity to suit.

Mr. Ely also suggests in his proposed amendment No. 5 that the United States give consent to suit in the event of the failure of the Secretary of the Interior to comply with the law of the river. This request assumes improperly that the Secreary of the Interior will not comply.

If the United States is to grant any general waiver of immunity to suit in matters affecting the Colorado River Basin, it should be done by a statute especially intended for that purpose. It should not be done in legislation to authorize the Colorado River storage project.

I would like to add, if you do it at all, it should be by such general legislation that it will apply to both basins.

Senator KUCHEL. Would you mind developing the reasons a little bit, Judge?

Mr. BREITENSTEIN. Because, Senator, if you do that, it should be of general application. We have here a project for the upper basin of the river. In the first place, I think any consent by the Congress to suit should be in a bill by itself, so that particular consideration may be given to that one point.

Second, I say that if you are going to waive immunity to suit, consent to suit, then it should be as to matters affecting the entire stream, and not just the upper basin.

It is conceivable, Senator, that we in the upper basin might want to sue you folks in the lower basin. Why should you have a preference over us here?

Senator KUCHEL. My only point is, assuming an amendment were drafted in keeping with the suggestion that you just made, could it not legally and in parliamentary fashion be attached to this vehicle?

Mr. BREITENSTEIN. It could, if it was thought necessary. I think you will have better consideration of that point if it is in specific legislation.

As you no doubt remember, several years ago there were prolonged hearings, both on the Senate and the House side, on proposed legislation granting immunity to suit in Colorado River matters. None of those bills ever passed, but there were hearings which went on for weeks on that one specific point.

Senator ANDERSON. Judge, when we were struggling with the central Arizona bill, which authorized dams down below the Grand

Canyon, Bridge Canyon, and others, a great deal of attention was given to the question of the right of the Government to be sued in this Colorado River matter. It seems to me—and I am sure you remember a lot better than I—it seems to me the State of California proposed at that time, as a compromise, that the central Arizona project be passed, but that before it was to be operative or effective there had to be this suit entered into and tried in the courts of the country. It was a general provision for that.

Mr. BREITENSTEIN. That is correct, yes.

The next material that I have here, beginning at the bottom of page 28, refers specifically to Colorado.

Senator WATKINS. May I ask you about another matter for a moment. I notice in the waiver of immunity to sue, that if it is as general as you have stated it there, the right to sue the Secretary of the Interior to compel the enforcement of the law of the river might be a very effective way to stop this project. One can say the Secretary is violating the law of the river in doing this or that, and a suit could be brought and an injunction sought. That would end progress on the river until that suit was disposed of.

Mr. BREITENSTEIN. That is right. There is another point I would like to make there. I am not trying to express any judicial opinions here, but in my opinion, if the Secretary of the Interior or any of those under him, in constructing or operating this project, violated the law of the river, I think that they could be stopped, and the question of waiver of immunity by the United States would be immaterial to that suit.

Senator KUCHEL. You think they could be what, Judge? I did not hear you.

Mr. BREITENSTEIN. Could be restrained from violating the law of the river.

Senator KUCHEL. By judicial process?

Mr. BREITENSTEIN. Yes.

Senator KUCHEL. In the absence of an immunity provision in the statute?

Mr. BREITENSTEIN. Yes; because when they violate the law of the river, they would not have about them the cloak of protection which the United States has. When an officer violates a ministerial duty, he can be called to task for that, Senator, and there is no question of suit against the State.

Senator KUCHEL. Your point would be, then, that you would urge there is no necessity for an immunity provision to be added to this bill to compel the Secretary of the Interior to comply with the law of the river, because you would urge that that right would be available even in the absence of an immunity provision.

Mr. BREITENSTEIN. That is my opinion, sir, because of the nature of this project and the nature of the responsibilities, duties, and obligations of the Secretary of the Interior in regard to it. You do not have the same situation here that you had in the lower basin. That related to the right to the use of the water, the availability of water. That is a different situation, in my opinion, than would arise in the operation of this project.

Senator WATKINS. As a matter of fact, frequent suits are filed against Federal officials here in the District of Columbia to compel them to do their duty.

Mr. BREITENSTEIN. That is correct.

Senator KUCHEL. So, in a word, your objection to this specific proposal of Mr. Ely's is that it would be surplusage?

Mr. BREITENSTEIN. In my opinion, it would, yes. If the Secretary violates the law of the river, I apprehend that your State or mine or any other could sue him and compel him to comply with the law of the river.

Senator KUCHEL. The only thing that occurred to me, if the position you take is correct and it would be merely surplusage to add it, then I can see no violent objection to it if it would not otherwise impair the legislation.

Senator ANDERSON. If it would not otherwise impair the legislation, yes, but that is the very point.

Senator KUCHEL. The judge has not suggested that it would otherwise impair the legislation, Senator. I do not think he has.

Mr. BREITENSTEIN. The difficulty, Senator, is that it is an encouragement to litigation. We in the upper basin do not like litigation. Colorado has had more unfortunate experiences with water litigation than any other State. I have participated in some.

For example, the Arkansas River was in Federal court litigation from 1901 until 1943; the Laramie River from 1913 to 1940; the North Platte from 1934 to 1945. We in the upper basin try and settle our problems—and we have had a lot of them—without going to court, because of the length of time and the troubles you get into. It is better to do it across the table than it is in court, in my humble judgment.

I would like now, if I may, to pass to the top of page 31. The other material in there will be covered by other witnesses from Colorado. So, if I may, I will turn to the top of page 31.

The subject there is: Curtailment of USE.

Article IV of the 1948 compact provides for the curtailment of use to satisfy the delivery obligation imposed by article III (d) of the 1922 compact. The State of Colorado is bound by this provision and it is to be presumed that it will comply therewith. However, there appears to be some misunderstanding as to the application of this provision and the provisions of article III (a) of the 1948 compact. In his testimony before the House committee on H. R. 4449, Mr. Raymond Matthew stated, at page 691, that the upper basin States should be required to set up priorities for existing and potential projects such as has been done in California. While he has not enlarged upon this, his idea evidently is that this must be done in order to fix responsibility in the event any curtailment of use ever becomes necessary. So far as Colorado is concerned, the answer is that Colorado now has, and at least ever since the adoption of its constitution has had, the priority system whereby each and every decreed water use is given a priority number and in times of curtailment the uses are shut down in the inverse order of their priority.

Certain of the testimony presented in the House hearings is based upon the theory that the percentage apportionment of use made to Colorado by the 1948 compact applies not to the Colorado River system as a whole in Colorado, but as to each tributary. The idea is that Colorado can use but 51.75 percent of the water of each tributary. There is nothing in the 1948 compact which even hints at such a principle. The allocation to Colorado is 51.75 percent of—

the total quantity of consumptive use per annum apportioned in perpetuity to and available for use each year by the upper basin under the Colorado River compact.

This is a general and not a specific apportionment. There is nothing in the Colorado River compact of 1922 which in any way limits the amount of water that Colorado and its water users may take and divert from any tributary. The apportionment is a percentage of all available water. In the upper basin compact of 1948, certain conditions are placed on Colorado so far as the use of water from the San Juan and Yampa River is concerned. These conditions are in no way related to the apportionment percentage of Colorado.

That concludes my statement, and I am grateful for your giving me the opportunity to appear here.

Senator WATKINS. Do you have any questions?

Senator ANDERSON. I think we should be grateful to you, Judge, for coming here and giving us the benefit of your long experience in this matter.

Mr. BREITENSTEIN. Thank you.

Senator WATKINS. Senator Kuchel?

Senator KUCHEL. Judge, I am a new Member of the Senate. I come from California. The representatives of the State of California have been apprehensive that there might be in the legislation something which would effectively violate the 1922 Colorado River compact, and to that extent would interfere with the legal rights of California under that compact.

I would like, if I may, by a few questions to inquire and get a little background so far as your thinking is concerned, as a lawyer and as a distinguished judge.

I was most interested in your statement. First of all, on page 20 where you discuss Indian rights, and then over on page 21 you suggested that a California spokesman in the House hearings on the project stated that the Office of Indian Affairs has construed the compact—that is, the 1922 compact—as meaning that the Indian claims in effect are prior and constitute the first demand upon the water supply.

Senator Anderson asked a question or two at that point relative to the authority with which the California spokesman made that statement.

Did I understand you, Judge, to say that the statement is based on the Office of Indian Affairs taking that very position?

Mr. BREITENSTEIN. That is correct, sir. I may say that California attorneys have just as vigorously opposed that theory as have those representing the upper basin States.

Senator KUCHEL. I see. So we have the situation where one of the agencies of the Department of the Interior has in effect ruled that Indian claims constitute a first—I was almost going to use the word "paramount"—a first right with respect to the waters of the river.

Mr. BREITENSTEIN. They have made that claim; yes, sir.

Senator KUCHEL. Has that ruling been acceded to by the Secretary of the Interior? Has it been applied by the Department of the Interior?

Mr. BREITENSTEIN. That is a controversial subject, Senator. So far as I know, the present Secretary of the Interior has never agreed to it, nor has the Department of Justice.

Senator KUCHEL. Meanwhile, however, it still is the basis on which the Office of Indian Affairs has conducted its business?

Mr. BREITENSTEIN. It has repeatedly made that assertion. There is no doubt of that.

Senator KUCHEL. If that decision in favor of Indian claims priority were to continue, would that have any effect upon the bill before us if it were adopted and enacted into law?

Mr. BREITENSTEIN. It might have a very grievous effect, sir, but if it is so adopted, it would not only affect the Colorado River—it would affect the Sacramento River, Columbia River, Snake River, Yellowstone River—all the western streams where there were any Indians at all.

Senator KUCHEL. So would it not be proper for this committee to hear from a representative of the Department with respect to a ruling of one of its offices, and have the matter clearly brought before the committee, either indicating that the Department would continue to abide by that decision on the part of its Office of Indian Affairs, or that it now repudiates it and changes it?

Mr. BREITENSTEIN. That is a matter of policy for the committee, Senator.

Senator KUCHEL. At least it would be your statement that the present construction of the compact which the Office of Indian Affairs has made would have a marked and, I think you said, grievous effect on the legislation?

Mr. BREITENSTEIN. It would also affect the operation of the Hoover Dam, the Metropolitan Aqueduct, the All-American Canal, and all of them.

Senator ANDERSON. There are as many Indians along the Colorado River as there are in the State of California.

Mr. BREITENSTEIN. Yes, there are Indians in every Colorado River Basin State except Wyoming. Wyoming does not have any. All the rest of us do.

Senator WATKINS. As a matter of fact, we are not having any arguments with the Indians respecting this project. They are in favor of it just as we non-Indians are.

Mr. BREITENSTEIN. That is correct, sir. And may I point out, as I did before Senator Kuchel came in, that in the upper basin compact, we took care of all that. We have specific provisions in the upper basin compact that all uses of water by the United States or its wards are chargeable to the State in which they occur. As I said then, the other States increased the allotment to New Mexico in order to take care of the Shiprock project.

Senator ANDERSON. And did not the people participating in that conference steadily represent the desire to have a large supply of water devoted to the Navaho Indians?

Mr. BREITENSTEIN. May I say, Senator, they did that very vigorously.

Senator WATKINS. As a matter of fact, the United States has already adopted a policy, in authorizing projects downstream, of not letting any so-called Indian rights affect, in any way, the policy of building these projects.

Mr. BREITENSTEIN. That is correct. You have the reservations below Hoover Dam on the Colorado River.

Senator KUCHEL. Then we have a case here of the right hand not knowing what the left hand is doing, because—and I am trying only to develop the facts here—if the Office of Indian Affairs ruled one way and the Government of the United States on occasion ruled otherwise, then we have diametrically opposite decisions by the Federal Government with respect to prior rights of Indians on waters.

Mr. BREITENSTEIN. That is correct, sir, and that is involved in the pending Rio Grande lawsuit between Texas and New Mexico.

Senator KUCHEL. It does point up one of the problems that ought to be solved, at least administratively and perhaps subsequently judicially.

Mr. BREITENSTEIN. I don't disagree with that at all, sir. I do want to emphasize that the upper basin States have shown a concern over the Indians. It is our desire to help the Indians.

Senator KUCHEL. I think I quote correctly one of the able witnesses who testified yesterday or the day before, when I say that in the law of water, and particularly when there are exchanges of water, the exchanges must constitute an exchange of water not alone alike in quantity, but also in quality.

If that is true, I would like to refer to your testimony on page 23, where you say that the statements of California witnesses are based upon no engineering theory that the quality of the water will be impaired by upstream development.

Mr. BREITENSTEIN. Yes.

Senator KUCHEL. Would it be correct, Judge, for me to state your position to be that, while there is a responsibility of delivering on any exchanges water of equal quantity and quality, it is your position that the people from California have not successfully urged that there would be a lack of quality in any exchange?

Mr. BREITENSTEIN. That is partly it; and, Senator, I should say first, with all due regard to George Clyde—and I have the utmost respect for him—I heard him make that statement yesterday, and I frankly disagree with the part on quality of water. In Colorado on the eastern plains there are exchanges of water every year—it is a practice of long standing—where I am sure there is different quality in the exchange. But it is usable water. The ultimate question is whether or not the water is usable.

Senator KUCHEL. And by usable, you mean from the chemical standpoint, capable of being used for the various consumptive purposes that the compact would require?

Mr. BREITENSTEIN. For the purpose intended; yes.

On the other matter that you raised, Senator——

Senator KUCHEL. May I pursue that a moment.

Mr. BREITENSTEIN. Surely.

Senator KUCHEL. With respect to usability, can you state to the committee who would determine the quality of exchanged water under this legislation?

Mr. BREITENSTEIN. Sir, I don't think that under the legislation here there would be any necessity of determining the quality of water, because it seems to me that, if anything, the quality—I am speaking as a layman, please understand me—will be improved. So far as exchanges in Colorado are concerned—they have been going on on the

eastern plains for years—I have never yet heard the question of quality of water raised.

I might say, Senator, that when you get into quality of water, the quality of water on such streams as the Pecos, the Rio Grande, the Arkansas, and part of the south Platte, is much less than that of the Colorado. Yet that water is being used and has been used for years for irrigation and municipal purposes.

Senator KUCHEL. I suppose the question of the quality of water or usability of water is a matter of judgment.

Mr. BREITENSTEIN. It is to a great extent.

Senator KUCHEL. There was some testimony in the House of Representatives in the hearing on the bill which would indicate that under this legislation the quality of water would be affected. I suppose if that testimony were correct, the question of proper quality or usability again would be a question of judgment. Reasonable people might disagree.

Mr. BREITENSTEIN. That is correct.

Senator KUCHEL. Again I ask, suppose under this legislation, and in good faith, the contention were made that the quality of water delivered at Lee's Ferry after the present legislation were adopted into law was not usable. Who would sit in judgment as between the different opinions?

Mr. BREITENSTEIN. Senator, if that should come about, I apprehend that the final decision would be by the Supreme Court of the United States on the basis of the conflicting claims of the parties.

Senator KUCHEL. How would the Supreme Court of the United States have jurisdiction to decide that question?

Mr. BREITENSTEIN. I apprehend that some lower basin State or States would sue the upper basin State or States and claim that there was a violation of the compact because the water delivered at Lee's Ferry is inferior in quality.

Senator KUCHEL. Would the Supreme Court gain jurisdiction of that merely by the filing of the suit in the Supreme Court by one State against another?

Mr. BREITENSTEIN. Yes. The Court has original jurisdiction of such suits.

Senator KUCHEL. Would the Department of the Interior have the responsibility of determining whether or not the quality of the exchange water was the same?

Mr. BREITENSTEIN. Frankly, Senator, I doubt whether or not the Secretary of the Interior would. There is nothing in the 1922 compact which relates to the quality of water. If there is a violation of that compact, the violation, in my judgment, would occur by a State because of our existing system of apportionment and allocation of water in the West. If it would be contended by a State that another State, or States is violating the law in any way, the United States Supreme Court would have jurisdiction to determine that issue.

Senator KUCHEL. Is it your testimony, then, that the bill in its present wording does not clothe the Secretary of the Interior with the responsibility of administering the projects provided for in this bill as to the determination of quality and quantity of water?

Mr. BREITENSTEIN. As to quantity, I think the bill does give him that power, because it gives him the power to operate these reservoirs.

Senator KUCHEL. As to quality?

Mr. BREITENSTEIN. Quantity.

Senator KUCHEL. But not as to quality?

Mr. BREITENSTEIN. No, sir.

Senator KUCHEL. So if there ever were a question, as respects the delivery below Lee's Ferry, as to the quality of the water, it would be your statement that under the bill those who contended they were aggrieved would have to look to the specific State——

Mr. BREITENSTEIN. State or States; yes.

Senator KUCHEL. Or States to satisfy their grievance?

Mr. BREITENSTEIN. Yes, Senator, because the rights would be those alleged to exist under the 1922 compact. That compact has been signed by the States. I apprehend if that situation ever developed one State would say that another State has violated the compact. That is the way it would arise. And the Court would take, I assume, original jurisdiction of the case.

Senator KUCHEL. And no action by the Congress would be necessary to approve the jurisdiction?

Mr. BREITENSTEIN. Not in my opinion, sir.

Senator WATKINS. Would it be proper for Congress to take away the right of any State to sue another State?

Mr. BREITENSTEIN. I think it has been held that Congress cannot do that, Senator.

Senator WATKINS. That is right.

Senator KUCHEL. On page 24, in discussing the recommendations which Mr. Ely made to the House committee, you describe his amendments under numeral 2, "Proposed amendments pertaining to the law of the river," and you find yourself in agreement with the first suggestion he made.

Mr. BREITENSTEIN. Oh, yes. We say here, Senator, that this project must be authorized, constructed, and operated under the law of the river. We are relying on that just as much as the lower basin is.

Senator, in that regard, I do not know whether you have seen it or not, but there have been suggested amendments to the bill to authorize the Fryingpan-Arkansas project, that is, S. 964.

Senator KUCHEL. I was going to ask you, do you have that language?

Mr. BREITENSTEIN. Yes, I have it here.

Senator KUCHEL. Could it be made a part of the record, Mr. Chairman? That would be in connection with the Judge's recommendations.

Senator WATKINS. We will receive it as a part of your testimony. Will you identify it?

Mr. BREITENSTEIN. I have it copied on a piece of paper here. These are taken from the committee print on S. 964.

Senator WATKINS. If you will make a notation that you offered it as a part of your testimony.

Senator KUCHEL. On S. 964.

Senator ANDERSON. Could we not ask Mr. Nelson to put into the record at this point the suggested amendments to the Fryingpan-Arkansas bill, and we will have them all in the record at this point.

Senator WATKINS. Since he has it already, let us do it this way.

Mr. BREITENSTEIN. These cover the points Mr. Ely was testifying to and, so far as I am concerned, I have no objection to them. They

do not go into the waiver of immunity to suit, but they do go into the law of the river and matters like that.

If the committee saw fit to put similar provisions in this bill, so far as Colorado is concerned I am sure it would have no objection.

(The document referred to follows:)

SEC. 7. (a) The use of water diverted from the Colorado River to the Arkansas River Basin through works constructed under authority of this Act, shall be subject to and controlled by the Colorado River Compact, the Upper Colorado River Basin Compact, the Boulder Canyon Project Act, and the Mexican Water Treaty (Treaty Series 994), as hereinbefore provided, and shall be included within and shall in no way increase the total quantity of water to the use of which the State of Colorado is entitled and limited under said compacts, statute, and treaty, and every contract entered into under this Act for the storage, use, and delivery of such water shall so recite.

(b) All works constructed under authority of this Act, and all officers, employees, permittees, licensees, and contractors of the United States and of the State of Colorado acting pursuant thereto, and all users and appropriators of water of the Colorado River system diverted or delivered through the works constructed under authority of this Act and any enlargements or additions thereto shall observe and be subject to said compacts, statute, and treaty, as hereinbefore provided, in the diversion, delivery, and use of water of the Colorado system, and such condition and covenant shall attach as a matter of law whether or not set out or referred to in the instrument evidencing such permit, license, or contract and shall be deemed to be for the benefit of and be available to the States of Arizona, California, Colorado, Nevada, New Mexico, Utah, and Wyoming and the users of water therein or thereunder by way of suit, defense, or otherwise in any litigation respecting the waters of the Colorado River System.

(c) None of the waters of the Colorado River System shall be exported from the natural basis of that system by means of works constructed under authority of this Act, or extensions and enlargements of such works, to the Arkansas River Basin for consumptive use outside of the State of Colorado, and no such waters shall be made available for consumptive use in any State not a party to the Colorado River Compact by exchange or substitution or, as far as the same is controllable through the operation of works herein or hereafter authorized, by use of return flow.

(d) No right or claim of right to the use of the waters of the Colorado River System shall be aided or prejudiced by this Act, and the Congress does not, by its enactment, construe or interpret any provision of the Colorado River Compact, the Upper Colorado River Basin Compact, the Boulder Canyon Project Act, or the Mexican Water Treaty or subject the United States to, or approve or disapprove any interpretation of said compacts, statute, or treaty, anything in this Act to the contrary, notwithstanding.

Senator ANDERSON. The Fryingpan-Arkansas project is a diversion of water from one water slope to another, is it not?

Mr. BREITENSTEIN. Yes, sir, it is a transmountain diversion of water from a tributary of the Colorado River to the headwaters of the Arkansas River, in Colorado.

Senator ANDERSON. With the greatest use being domestic in this case.

Mr. BREITENSTEIN. That is correct, yes, sir.

Senator ANDERSON. The provision of a water supply for a great city like Colorado Springs, and so forth——

Mr. BREITENSTEIN. Pueblo, and other cities.

Senator ANDERSON. Is regarded as a very proper use of that water if the State of Colorado wants to do it that way.

Mr. BREITENSTEIN. That is right.

Senator KUCHEL. In your testimony on page 27 with respect to salinity and the recommendation made about salinity, you state you have no objection to Congress authorizing the Secretary of the In-

terior to make salinity studies, but that if it were done at all, it should be under a general authorization applying to all western streams.

Mr. BREITENSTEIN. Yes.

Senator KUCHEL. Since here we deal with a contractual arrangement by which a number of States have entered into an agreement on the waters of the Colorado River, what would your objection be if an amendment were suggested requiring studies of salinity merely as a part of this project?

Mr. BREITENSTEIN. Senator, I personally would have no objection to that if the authorization was general all the way up and down the stream from the headwaters clear down to the Gulf of California. However, if there is to be such a salinity investigation, it should be under general legislation applying to all the western streams.

Senator WATKINS. As a matter of fact, Judge, the Geological Survey is now authorized to make that study.

Mr. BREITENSTEIN. It makes some studies, Senator. I think those might well be broadened to include streams in areas which are not now included.

Senator WATKINS. I understood from one of the previous witnesses that such a study was being made out in Colorado.

Mr. BREITENSTEIN. I understand that salinity studies have been made on the Colorado by the USGS for some time. I don't know how long they have been made.

Senator KUCHEL. My only point is that if the question of professional studies on the salinity of the water in this river were deemed to be important, it seems to me it would be easier to discuss the possibility of amending this legislation with respect to studies of salinity on the water covered by this bill rather than by urging in a separate piece of legislation that that study be extended to waters in all rivers.

Mr. BREITENSTEIN. That may be true, Senator, but certainly as a minimum it should include the entire length of the Colorado River system. You will recall the testimony of Mr. Clyde yesterday, that during the period before the regulation of the stream by Boulder Dam, the quality of water at Yuma, Ariz., at times of low flow was much worse than it is now with regulation.

Senator ANDERSON. It is your testimony that this means a concentration of solids of about seventy-eight one hundredths ton per acre-foot, and might rise as high as eighty-eight one hundredths of a ton. I have never had any expert advise that I should not put water on my land that had eighty-eight one hundredths of a ton in it. As a matter of fact, we have not had any water now for 10 or 12 days.

The Pecos River is dry. Rivers are dry that have never been dry before. We would like to get water that went as far as permissive drainage, which is two full tons per acre-foot.

I do think if we are going to have some studies, I would like to know what eighty-eight one hundredths does to your soil if it is, as Mr. Clyde pointed out, regularly flowing on and not just flushing it out at one time and then leaving it very dry at another. It seems to me in the hearings on the central Arizona project, the discussion with reference to the Gila River pretty clearly brought out the difference between a well-regulated river and one that is dry and then has flood periods.

Mr. BREITENSTEIN. That was gone into quite thoroughly in those hearings, as I recall.

Senator KUCHEL. Senator Anderson, may I ask if you would like to know what effect that amount of salinity or liquid solids, as you suggest, would have on your land, would you like to know sufficiently to consider an amendment in this legislation to provide the technical and professional facilities?

Senator ANDERSON. We have had many discussions of the Winters case. As a layman, I have many times asked my legal friends if one of them sometime would sit down and tell me in pretty simple language what the implications of the Winters case are and what was decided by the Winters case, so that I might know more about it than the Bureau of Indian Affairs seems to know, I will put it that way. But at least I would like to know in general what the Winters case means as applied to all rivers in the United States, and not just to the Colorado.

By the same token, I would like to know what salinity means and what these solids mean across the country, not only as far as the upper Colorado River is concerned, but what the lower basin is doing to the poor Republic of Mexico, which stands by and has no defense because it may be getting some awful water. I do not think it is. I think water is pretty good if you can have it for irrigation even if it has salinity up to ninety-nine one-hundredths of a ton per acre-foot.

Senator KUCHEL. Senator, are you suggesting that the Republic of Mexico has made any representations that its receipt of Colorado River water is not of the quality——

Senator WATKINS. Gentlemen——

Senator ANDERSON. No. It is delighted to get hold of some water.

Senator WATKINS. We are not going to settle any arguments affecting Mexio here. I would like to suggest that since one of the United States agencies which is studying water problems is already making that investigation, and apparently has authority to do it or it would not be doing it, that any amendment of that kind here would be absolutely unnecessary. If a problem arises the United States Geodetic Survey can take care of it. It would be better for them to do it, anyway, than to have the Bureau of Reclamation making the study. The Bureau of Reclamation is too much mixed up in it. It would be better to have an independent agency making that study.

I cannot see any reason or necessity for such an amendment in this legislation. I do not believe it wise for one department to attempt to do what some other department is equipped to do and has already begun.

Senator KUCHEL. Mr. Chairman, with all due respect to the chairman—and the chairman may be completely right—I think the fact remains that in the testimony yesterday or the day before, it was indicated that there is hardly any professional conclusions in this field, and that therefore it is impossible for a technically qualified witness to bring to this committee any professional or expert testimony on that very question.

Senator WATKINS. As of now. But they are making the study. It was started recently, as I understood the statement of one of the witnesses. They are going on with that.

Senator KUCHEL. Just one final question. Perhaps I should not ask you this, Judge. This is one which is of legal nature. I would like to ask whether, in your judgment, questions of the usability of

water ought to be pretty well determined before any legislation providing for the exchange of water is enacted?

Mr. BREITENSTEIN. No, I dont think so, Senator. If you waited for that to be determined, you would postpone all development.

May I point out this: In the lower basin they didn't wait to have those questions determined. When they put in the Metropolitan aqueduct or when they put in the All-American Canal or when they developed the Salt River project or the Gila project, they did all those things with these questions undetermined, and they did all of them while there were controversies in the lower basin as to the rights of the lower basin States.

We want to get it developed. We want to comply with the compact. We intend to comply with the compact. We recognize the lower basin has rights under that compact which we respect.

Senator WATKINS. But if we violate their rights, they always have their remedy.

Mr. BREITENSTEIN. That is correct, sir.

Senator WATKINS. We cannot anticipate breaches.

Mr. BREITENSTEIN. No. The presumption is that officials will comply with the law.

Senator WATKINS. Thank you, Judge.

Mr. BREITENSTEIN. Thank you, Mr. Chairman.

Senator WATKINS. Sam Ahkeah, chairman of the Tribal Council of the Navaho Indians is our next witness.

STATEMENT OF SAM AHKEAH, CHAIRMAN, NAVAHO TRIBAL COUNCIL, ACCOMPANIED BY NORMAN M. LITTELL, GENERAL COUNSEL, NAVAHO TRIBE

Senator WATKINS. We are glad to have you with us, Mr. Ahkeah. Do you desire to have your attorney sit by you during your testimony?

Mr. AHKEAH. Yes, sir.

Senator WATKINS. He may come forward.

Will you state your name for the record?

Mr. LITTELL. Norman M. Littell, 1826 Jefferson Place NW., Washington. I am general counsel of the Navaho Tribe.

Mr. AHKEAH. Mr. Chairman and gentlemen of the committee, I am Sam Ahkeah, chairman of the Navaho Tribal Council, now living in Window Rock, Ariz., and my home is at Shiprock, N. Mex., on the San Juan River. I make this statement on behalf of about 75,000 Navahos who live on some of the most arid lands in the North American Continent, embracing the Navaho Reservation having within its boundaries about 24,000 square miles or roughly 16 million acres of land.

The San Juan River flows along our northern boundary. In fact, until the United States acquired this territory from Mexico by the Treaty of Guadalupe Hidalgo, we owned land on both sides of the river. When the white settlers and military expeditions came to New Mexico in the 1840's and 1850's, they found our ancestors growing wheat, corn, beans, and other crops. They had well-developed peach orchards, and on one occasion carried blankets of peaches to a friendly military expedition.

We knew what the use of water would do to our land and in a primitive way used it. Kit Carson tells how our fields, crops, and

COLORADO RIVER STORAGE PROJECT

FRIDAY, MARCH 4, 1955

UNITED STATES SENATE,
SUBCOMMITTEE ON IRRIGATION AND RECLAMATION OF THE
COMMITTEE ON INTERIOR AND INSULAR AFFAIRS,
Washington, D. C.

The subcommittee met at 10 a. m., pursuant to recess, in the committee room, 224 Senate Office Building, Senator Clinton P. Anderson (New Mexico), presiding.

Present: Senators Clinton P. Anderson (New Mexico); Joseph C. O'Mahoney (Wyoming); Alan Bible (Nevada); Eugene D. Millikin (Colorado); Arthur V. Watkins (Utah).

Also present: Senator Thomas H. Kuchel (California); Gordon Allott (Colorado).

Present also: Stewart French, staff director and chief counsel; Goodrich W. Lineweaver, staff member for reclamation; William K. Coburn, staff member for public lands; James Gamble, staff member for Indian affairs; Richard L. Callaghan, chief clerk; N. D. McSherry, assistant chief clerk; and Elmer Bennett, office of legislative counsel, Department of the Interior.

Senator ANDERSON. Mr. Griffith, please. You may proceed, sir.

Senator KUCHEL. Mr. Chairman, I take great pleasure in introducing Hon. Ben P. Griffith, a distinguished citizen of the city of Los Angeles, and presently the president of the board of water and power commissioners of the city.

STATEMENT OF BEN P. GRIFFITH, PRESIDENT OF THE BOARD OF WATER AND POWER COMMISSIONERS OF THE CITY OF LOS ANGELES, CALIF.

Mr. GRIFFITH. My name is Ben P. Griffith, and I am president of the Board of Water and Power Commissioners of the City of Los Angeles. This board consists of five members, appointed by the mayor, with the consent of the city council and is charged with the administration of the water and power department. This department constitutes the largest municipally owned utility in this country. The board members themselves receive no salary, except for a fee of $25 per meeting. Under the charter of the city of Los Angeles, they are clothed with broad powers which make them nearly autonomous, and remove these vital utilities as nearly as possible from political pressures. It is not, and has not been for nearly 30 years supported by taxes but by revenues derived from the rate payers which number some 800,000. As a result, the department has been able to plan for a prudent period ahead of its current needs, and to finance and construct its distribution and storage

STATEMENT OF NORTHCUTT ELY, SPECIAL COUNSEL, THE COLORADO RIVER BOARD OF CALIFORNIA

Mr. ELY. Mr. Chairman, my name is Northcutt Ely. I am an attorney, with offices in the Tower Building, Washington 5, D. C., and appear here as special counsel to the Colorado River Board of California, a branch of the State government.

California, as a party to the Colorado River compact, and with heavy investments made under the Boulder Canyon Project Act, is seriously affected by this bill in the respects which I shall outline. California is also a party to the pending suit in the Supreme Court entitled *Arizona* v. *California et al.*, No. 10 Original, October term, 1953, as are Nevada, Arizona and the United States. I have the honor to represent California in that action as an assistant attorney general of my State, under the direction of Attorney General Edmund G. Brown of California.

The Bureau of Reclamation and the upper basin States, in planning the project now before you, have made interpretations of the compact and the project act which we challenge in the pending Supreme Court action, and which have necessitated our motion to implead these States in that suit. The Supreme Court, on February 28, 1955, referred that motion to the special master, Hon. George I. Haight, whom it had previously appointed, with instructions "to hear the parties and report with all convenient speed his opinion and recommendation as to whether the motion should be granted."

I shall discuss the pending project, our own projects which are affected, the conflicting interpretations of the compact and project act upon which the existing lower basin projects and the proposed upper basin projects are respectively based, and the effect upon our very large investments if the pending upper basin project were built and operated in the manner proposed.

I. THE PENDING PROJECT

The Colorado River storage project is variously described in bills now before Congress, but all of them have the four following objectives:

(1) Authorization of the construction of 11 to 30-odd reclamation projects. The aggregate consumptive use of these projects, including the evaporation loss, is said to range from about 1 million to about 2 million acre-feet. These quantities, when added to about 2,500,000 acre-feet, said to be required by projects already constructed or authorized, would represent a total use of say 3,500,000 to 4,500,000 acre-feet in the upper basin. The larger of these figures is still within the quantity of 7,500,000 acre-feet per annum, the use of which is apportioned to the upper basin by article III (a) of the Colorado River compact. Moreover, the engineering studies indicate that this total could be put permanently to use without the construction of any new holdover storage whatever, and that no holdover storage would be required for nearly a half century, even if other projects were added.

(2) Nevertheless, these bills authorize the immediate construction of 2 to 6 storage reservoirs: Echo Park, Flaming Gorge, Glen Canyon, Cross Mountain, Navaho, and Curecanti. The ultimate storage program amounts to over 48 million acre-feet. These storage dams are

far downstream from the irrigation projects. They would not store water to be used on these projects. They would, instead, store the water which is not used on the irrigation projects in the upper basin, but which is destined for use in the lower basin and in Mexico. It is proposed that this lower basin water, so intercepted, be used to generate electric energy, the power sold, and the proceeds used to pay out the cost of the storage dams, and thereafter, starting 44 years from completion of Glen Canyon, to pay for the reclamation projects named in section 1 of the bill. The irrigation projects thus subsidized are called participating projects, and the subsidy is over 85 percent of their construction cost. The power would be sold to 10 privately owned utilities at a rate in excess of 6 mills per kilowatt-hour, in contrast with Hoover Dam, where 91 percent of the firm energy is sold to public agencies at a switchboard cost of about 2 mills per kilowatt-hour.

Senator ANDERSON. Are the figures comparable? Is this 6 mills a switchboard price?

Mr. ELY. That is not clear from the material here. I take it that it is a postage stamp rate available wherever the power may be taken.

Senator ANDERSON. Therefore, the two figures are not comparable?

Mr. ELY. That I cannot tell you, sir.

Senator ANDERSON. If it was a postage stamp figure, it is not comparable to the switchboard cost, is it?

Mr. ELY. You are correct to the extent it includes the transmission cost. Whether the 6 mills would be charged to a user near the dam is not clear.

(3) These bills all authorize; for example, S. 500, section 2, the future construction of other projects. These are not designated in the bill, but the Department of the Interior has inventoried over 100 projects in various publications, particularly House Document 419, 80th Congress. It is not clear from section 2 whether these projects must be brought back to Congress for further authorization, or whether the Secretary is authorized by section 2 to build them. Except as to two projects, the O'Mahoney-Millikin amendment to the Flood Control Act of 1944 is waived, and the Secretary need not submit his feasibility reports to the affected States for comment.

(4) When, as, and if the additional irrigation projects referred to in section 2 are built, it will be necessary to store water in downstream storage reservoirs, not for use by the reclamation projects—all of the storage reservoirs, as previously stated, are so far downstream that no water stored there can be used for irrigation or domestic purpose in the upper basin—but for quite a different reason: To enable these section 2 projects to increase the consumptive use in the upper basin above the 4,500,000 acre-feet required by existing projects plus all the section 1 projects, without violating the provisions of article III (d) of the Colorado River compact.

That article of the Compact stipulates that the States of the upper division (Colorado, Utah, New Mexico, Wyoming) will not cause the flow of the river at Lee Ferry to be depleted below an aggregate of 75 million acre-feet for any period of 10 consecutive years. In the driest decade so far, the flow at Lee Ferry was more than 100 million acre-feet, during a time when the upper basin projects were using about 2,500,000 acre-feet per year; and engineers tell us that the upper basin uses can safely rise to about 4,500,000 acre-feet (which is about

the total of existing uses plus all the uses of all the section 1 projects proposed in the most ambitious of these bills), before this 100 million total would shrink to 75 million.

Senator ANDERSON. Would you pause there? It is not an extremely important matter, and I do not wish to dwell on it, but the statement that you have that all these reservoirs are so far downstream that no water stored there can ever be used for irrigation or domestic purposes in the upper basin—and you mentioned the Navaho Dam, and that is above the Navaho-Shiprock project, so called. But I think the statement is true as to the vast majority of them.

Mr. ELY. Yes, your correction is in order, I think.

Senator ANDERSON. Thank you.

Mr. ELY. Thus the ultimate purpose of Glen Canyon Reservoir, and the other holdover storage reservoirs, is to enable the unnamed section 2 projects to be built in the upper basin at some remote time in the future without violating article III (d) of the compact.

The bills all make clear that this measure is intended to commit Congress to a program for the full utilization of all the water which the upper basin claims under the Colorado River compact. Such a declaration of policy appears in section 2. Otherwise, the storage reservoirs are not needed for any water conservation purpose, and are strictly power dams.

The total storage capacity proposed is enough to intercept the whole flow of the river for several years, and it is planned to hold over storage in these reservoirs for 20 to 35 years, or 5 to 9 presidential administrations. This is like holding back from the lower basin water which reached Glen Canyon in 1920 in order to release it to Hoover Dam in 1955. During the 50 years that these reservoirs will serve no necessary function except to generate power, they will evaporate some 30 million acre-feet of water. The evaporation loss from these power reservoirs will be over 600,000 acre-feet per year, enough for a city of 3 million people.

II. THE HISTORICAL BACKGROUND

The dispute, which brings us here and into the Supreme Court, turns primarily upon conflicting interpretations of the Colorado River compact and the Boulder Canyon Project Act, which, ironically enough, were themselves supposed to settle the conflict between the upper basin and the lower.

The chronology is as follows:

Developments prior to 1922

Irrigation in the lower basin developed much more rapidly than in the upper. Palo Verde Valley commenced irrigation in 1877; Imperial Valley's appropriations date from 1891; those of the Yuma project in Arizona from 1904. By 1916 the whole natural flow had been appropriated, and the river was dry for long periods in the summer at the Mexican boundary. Nevertheless, the spring floods, depositing great quantities of silt and raising the river bed several feet in some years, were an increasing menace to lands in Imperial Valley, lying below sea level, and to lands in the Yuma Valley in Arizona. Junior appropriators in the upper basin faced a probable lawsuit by senior appropriators in the lower basin. A great storage dam was a necessity not only for flood control, but also to make possible any

further development at all in either the upper basin or the lower, and for power generation.

But the upper basin, knowing that the lower had a 2-to-1 population ratio (now over 4 to 1), better lands, flatter contours, lower capital costs, and a longer growing season, rightly feared that if the flood-waters were stored, the lower basin would appropriate and use them, unless in some way the upper basin could be insulated against the law of priority of appropriation, which is "first in time, first in right." The United States Supreme Court, in 1922, in the case of *Wyoming* v. *Colorado* (259 U. S. 419), applied this rule on an interstate stream, regardless of State lines.

The Colorado River compact

The Colorado River compact was signed by representatives of all seven States at Santa Fe, N. Mex., November 24, 1922, subject to ratification by their legislatures and the consent of Congress, the latter being a constitutional requirement.

Article II defined the Colorado River system as including the main stream and its tributaries, the upper basin as being the drainage area above Lee Ferry, a point on the river in northwest Arizona, and the lower basin as the drainage area below that point. The 4 States of Colorado, Utah, New Mexico, and Wyoming were defined as the "States of the upper division" and the 3 States of Arizona, California, and Nevada as the "States of the lower division." The terms "division" and "basin" are not quite the same. Utah, New Mexico, and Arizona have areas in both basins.

The negotiators gave up any attempt to allocate all the water, or to allocate to individual States. They agreed on the idea of allocating "beneficial consumptive uses" instead of the flow of a stream, and made a general division as between upper and lower basins, leaving to the future any allocation to States as such. Nor did they attempt to dispose of all the water supply, leaving, as they thought, about 25 percent of it unallocated and untouched by the compact. The mechanics were as follows:

In article III (a) the compact apportioned in perpetuity the "beneficial consumptive use" of 15 million acre-feet per annum of the waters of the Colorado River system, one-half to each basin, to include any rights which "may now exist." This was the protection against the law of priority of appropriation demanded by the upper basin. As article II defined the system to include the tributaries, the apportionment in article III (a) includes the uses on the tributaries as well as on the main stream. The compact did not define the term "beneficial consumptive use."

Article III (b) permitted the lower basin to "increase its use" of waters of the system by 1 million acre-feet per annum.

These 2 paragraphs thus disposed of 16 million acre-feet per annum of which 15 million was insulated against the law of appropriation, basin versus basin, by a perpetual apportionment. A compact title to the other 1 million acre-feet could be obtained by "increase of use" in the lower basin, but not by apportionment irrespective of use.

These two paragraphs did not dispose of all the water available throughout the system. This total was estimated, in reports of the negotiators to Congress, as over 20 million acre-feet.

Article III (c) provided that if the American Government should recognize rights in Mexico, the Mexican burden should be met first out of any water in excess of the 16 million acre-feet, and if that was insufficient, the deficiency should be equally borne by the two basins. The four States of the upper division agreed to deliver water at Lee Ferry to supply one-half of the deficiency in addition to their obligation under article III (d).

In article III (d) the 4 upper States promised that they would not deplete the flow at Lee Ferry below 75 million acre-feet in any 10-year period.

Article III (e) provided that the States of the upper division would not withhold water, and the States of the lower division would not require the delivery of water, which could not reasonably be applied to domestic and agricultural uses.

Article III (f) provided that further equitable apportionment of the beneficial uses of the system unapportioned by paragraphs (a), (b), and (c) might be made after October 1, 1963, if and when the upper basin should have reached a beneficial consumptive use of 7,500,000 acre-feet per annum, or the lower basin 8,500,000 acre-feet.

Article III (g) provided the mechanics for calling such a future conference.

Article IV provided that water might be impounded for power generation, but "Such impounding and use shall be subservient to the use and consumption of such water for agricultural and domestic purposes and shall not interfere with or prevent use for such dominant purposes."

Article VII provided that "nothing in this compact shall be construed as affecting the obligations of the United States to Indian tribes."

Article VIII provided that "present perfected rights to the beneficial use of waters of the Colorado River system are unimpaired by this compact."

Article XI provided that the compact should become binding when ratified by the legislatures of all seven States and when Congress should give its consent.

Ratification by six States, rejection by Arizona

In 1923 all States but Arizona ratified. Her legislature rejected the compact, after one house or the other had adopted reservations excluding the Gila River and subjecting all power development to a $5 per horsepower royalty.

In 1925, at the suggestion of Colorado, the other 6 States ratified it again, as a 6-State document, waiving 7-State ratification, and presented it to Congress in that form.

The Boulder Canyon Project Act

The Boulder Canyon Project Act was enacted in December 1928, but section 4 (a) provided that it should not take effect unless, at the end of 6 months, the President should proclaim either that the Colorado River compact had been ratified by 7 States, or, failing that, had been ratified by 6 States including California, and, in the latter event, California's Legislature had enacted a statute, in terms prescribed by Congress, limiting California's rights in the Colorado River. The upper basin, in other words, had demanded in 1922 a seven-State compact as the price for the construction of Hoover Dam. Failing to get

Arizona's ratification, they demanded (and got) a second price from California: the enactment of the Limitation Act, to avoid the possibility that California and Nevada might use all the water apportioned to the lower basin, and that Arizona would "raid the river" outside the Compact, i. e., establish priorities against slower upper basin development.

The Boulder Canyon Project Act, in granting consent to a 6-State compact, cut across the 7-State compact in several particulars, in addition, of course, to the change in the number of parties.

Whereas the 7-State compact made no allocations to individual States, but only to basins, the project act recognized California's right to specified quantities—and required her to limit herself thereto—that is, 4.4 million acre-feet of the waters apportioned by article III (a), plus one-half of the excess of surplus waters unapportioned by the compact. As to the latter, whereas the compact, in article III (b), had recognized the lower basin's right to appropriate 1 million acre-feet of surplus, the project act recognized California's right to appropriate one-half of the excess or surplus, which might be more or less than 1 million acre-feet. The project act makes no specific reference to article III (b). The compact did not define "consumptive use," but the project act did, as "diversions less returns to the river." Whereas article IV (c) speaks of State "regulation and control," the project act, in section 5, directed that no one should have the use of stored waters except by contract with the Secretary, but directed him to make contracts in accordance with the Limitation Act; that is, in accordance with section III (a), and section 6 directed him to use the reservoir, among other purposes, for satisfaction of present perfected rights in pursuance of article VIII of the Colorado River compact. (For brevity, the term "appropriation" is used throughout this discussion as including not only rights acquired by appropriation under State law, but rights in waters stored by the United States acquired or confirmed by contract with the United States.) Elsewhere, in section 13, the statute subjected all rights of the United States and of those claiming under it to the compact. Whereas article IV of the compact had declared the Colorado River to be nonnavigable, sections 1 and 6 of the project act directed the dam and reservoir to be used in aid of navigation and flood control.

California passed the required Limitation Act in 1929 to take effect only in the absence of 7-State ratification. The resulting agreement with Congress is referred to in our discussions as the statutory compact between the United States and California, to distinguish it from the Colorado River compact.

The President, on June 25, 1929, proclaimed the failure of 7-State ratification, and the completion of 6-State ratification.

The 6-State compact and the project act thereupon became effective, authorizing the construction of Hoover Dam and the All-American Canal, on the further condition that the beneficiaries contract in advance to repay their cost. Water and power users in California did so in 1930–34. The water contracts now under attack by Arizona in Supreme Court disposed of 5,362,000 acre-feet per annum, equal to 4.4 million acre-feet of water available under article III (a) of the Colorado River compact, and about 1 million of "excess or surplus" available in accord with the Limitation Act.

III. THE PROJECTS PAID FOR BY CALIFORNIA

California is deeply concerned by this proposed interception of the water supply upon which projects costing the people of this State more than a half billion dollars are dependent.

From north to south, these are:

(1) Hoover Dam, whose cost was underwritten by the water and power users of southern California under the authority of the Boulder Canyon Project Act, plus the transmission lines built by California agencies to bring Hoover Dam power to the people in this State (Arizona and Nevada subsequently withdrew 36 percent of the power underwritten by California power contractors);

(2) Parker Dam, about 155 miles below Hoover Dam, paid for by the Metropolitan Water District of Southern California;

(3) The Colorado River aqueduct, built and paid for by the Metropolitan Water District, which carries Colorado River water over 300 miles from Parker Dam to some 60 cities and districts on the coastal plain, of which the largest are Los Angeles and San Diego;

(4) The Palo Verde Irrigation District, an area about 212 miles below Hoover Dam, which has the oldest rights on the river and has been diverting water there since about 1877;

(5) The All-American Canal, which diverts water at Imperial Dam, 303 miles below Hoover Dam and 22 miles above the Mexican border, and transports it into the Imperial Irrigation District and Coachella Valley County Water District. This dam and canal were built by the United States, along with Hoover Dam, as part of the Boulder Canyon project, but these districts were required to underwrite the cost in advance. Imperial Valley's appropriations date back to 1891.

I have omitted from this tabulation the Headgate Lock Dam and the Davis Dam, because their cost was not underwritten by California. I might have included Laguna Dam, because we paid for that, although it served only Arizona.

The quantity of Colorado River water which California claims, for which her public agencies hold contracts with the United States, and which the Colorado River aqueduct, the All-American Canal, and the Palo Verde works have been built to use, is 5,362,000 acre-feet per year. California is not seeking more water for new projects, but to defend the water supply of these three old projects.

More than 5 million people live within the areas served by the Colorado River in California. The assessed valuation exceeds $12 billion. The economy of southern California is dependent on the permanent availability of these waters. California could, in fact, use a great deal more than this, if it were available. The Metropolitan Water District will outgrow its present Colorado River supply, which is 1,212,000 acre-feet per year, in about 25 years on present forecasts, and must look elsewhere for additional water.

These works were built in reliance upon the Colorado River compact and the Boulder Canyon Project Act.

The meaning of both these documents is now in sharp controversy in the Supreme Court in *Arizona* v. *California et al.*, in respects which affect the measure now before you, in the following way:

IV. INTERPRETATIONS OF THE COLORADO RIVER COMPACT INVOLVED IN THE UPPER BASIN STORAGE PROJECT LEGISLATION AND THE PENDING LITIGATION

I am taking these up in the order in which they first appear in the Colorado River compact and not necessarily in the order of first importance, although this first one happens to be a very important one.

1. The method of measurement of consumptive use

Article III (a) of the Colorado River compact, in a single sentence, apportions from the Colorado River system in perpetuity to the upper basin and to the lower basin, respectively, the exclusive beneficial consumptive use of 7,500,000 acre-feet per annum, which it states shall include all water necessary for the supply of any rights which may now exist. Manifestly this one sentence must have the same meaning in both the basins to which it refers. But there is sharp controversy over the meaning of the term "beneficial consumptive use." The question is whether it means the quantity in fact used, measured at the place of use, or whether it means the effect of that use measured in terms of stream depletion at some point hundreds of miles downstream, in this case Lee Ferry. The same question arises under the Mexican Water Treaty's so-called escape clause.

This question of interpretation of the Colorado River compact and the Mexican Water Treaty is directly at issue in the present Supreme Court cases. The quantity involved in this dispute, so far as the planning of the upper basin storage project is concerned, is 300,000 to 500,000 acre-feet per annum, according to engineers' estimates. The Reclamation Bureau assumes that the measurement is to be in terms of downstream depletion in the case of the upper basin project, but in terms of diversion minus return flow, measured at the place of use, with respect to California. The Boulder Canyon Project Act (sec. 4 (a)) defines it in the latter terms, and the Mexican Water Treaty says (art. I (j)):

> "Consumptive use" means the use of water by evaporation, plant transpiration, or other manner whereby the water is consumed and does not return to its sources of supply. In general it is measured by the amount of water diverted less the part thereof which returns to the stream.

That corresponds with California's allegation of the meaning of the term in *Arizona* v. *California* (answer to Arizona, par. 8). Arizona denies that this definition applies to her uses (reply, par. 8), and the Reclamation Bureau, in the project before you, assumes that it does not apply to the upper basin, although the projects to be built under these bills are recognized as being subject to the terms of the Mexican Water Treaty (e. g., S. 500, sec. 12).

Another problem arises if the depletion theory prevails. One of its postulates is that when water is stored in a reservoir, the stream below is depleted, and therefore that the consumptive use takes place then and there, in the year when the water is put in storage, not when it is taken out and used. On that premise, to what years is the 48 million acre-feet of holdover storage, i. e., of stream depletion, to be charged? And, in future operations, how is the storage of more than 7,500,000 acre-feet in any one year to be charged? Is the same principle, whatever it may be, applicable to the lower basin reservoirs?

2. The meaning of "per annum" in article III

Article III (a): Does the apportionment of the use of 7,500,000 acre-feet "per annum" mean an average of that amount over a period of years, or a maximum in any one year? Manifestly, as in the interpretation of "consumptive use," the compact must be given the same interpretation in both basins.

The Reclamation Bureau, in submitting this upper basin storage project, makes the assumption that the apportionment means an average over an extended period, apparently 35 years or more. The effect of this theory is that the upper basin may use, say, 9 million acre-feet or more of water in one year, and consider it as apportioned under article III (a), if it uses, say, 6 million or less in some other years, to average 7,500,000 acre-feet.

California alleges in the pending lawsuit that the apportionment means a maximum, like a speed limit on a highway, not an average. If the speed limit says 50 miles per hour, that doesn't mean an average of 50. We allege (answer to Arizona, par. 8) that the words "per annum" in the compact mean "each year," and not an average of uses over a period of years, whether they are our uses or anyone else's. Arizona admits this, but says that the issue is not yet material in the lower basin (reply, par. 8).

The effect, if California is right, is that if the upper basin should use in a given year any quantity in excess of 7,500,000 acre-feet, it is using that excess out of unapportioned surplus, in competition with the appropriations of unapportioned excess or surplus waters which may have been made in the lower basin, and subject to the Mexican treaty burden, which, under article III (c) of the compact, is to be first supplied out of surplus. The amount involved in this particular issue is very large of the order of 1,250,000 acre-feet per year. That is, if the compact means what we think it means, the Reclamation Bureau is in error that much in its assumptions as to the quantity of water which the upper basin can lawfully claim under article III (a), and, by the same token, that much more water must be let down to satisfy the Mexican Water Treaty and prior appropriations of surplus in the lower basin. The same problem arises in the lower basin, but there the Reclamation Bureau has assumed that the limitation imposed upon California's uses by the Boulder Canyon Project Act is a maximum, not an average; so also with its assumptions as to the deliveries to be made under the Mexican Water Treaty and the amounts to be delivered under its water contracts with Arizona, California, and Nevada.

Both assumptions cannot be correct.

This problem of whether the apportionment under article III (a) is of an annual amount, or of an average available over a 20- to 35-year period, has no relation at all to the guaranty in article III (d) that the States of the upper division will not deplete the flow at Lee Ferry below 75 million acre-feet in each 10 years. That problem is discussed below in connection with the Mexican treaty burden.

3. "Rights which may now exist"

Article III (a): Does the statement in article III (a) that the apportionment of the use of 7,500,000 acre-feet per annum "shall include all water necessary for the supply of any rights which may now exist" include two categories or uses in dispute in *Arizona* v. *Califor-*

nia: (1) the uses on the lower basin tributaries, particularly those of Arizona on the Gila River, which she says are not to be charged against the lower basin's apportionment of III (a) water, and (2) Indian uses in both basins? The significance of the Gila appears in connection with the upper basin's obligations under article III (c) and III (d) of the compact, and that of the Indian uses in connection with article VII, and will be outlined when those articles are reached in numerical order.

4. The lower basin's rights under article III (b)

Article III (b) of the compact permits the lower basin "to increase its beneficial consumptive use" by 1 million acre-feet per annum. Arizona says that this is an "apportionment," good in perpetuity against the upper basin. California says that it is not an apportionment, but a license to appropriate. Arizona says all the III (b) water is in the Gila. California says that article III (b) is applicable to the main stream and all the tributaries in the lower basin.

5. The guaranties in articles III (c) and III (d)

Article III (c) provides that the Mexican burden, which is a minimum of 1,500,000 acre-feet per annum measured at the border (and more than that, measured at Lee Ferry), shall be borne first out of surplus, over amounts specified in articles III (a) and III (b) and, if that is insufficient, that the burden of the deficiency shall be equally borne by the upper basin and the lower basin, and whenever necessary the States of the upper division shall deliver at Lee Ferry water to supply one-half of the deficiency, in addition to that provided in article III (d).

Article III (d) provides that the States of the upper division, i. e., Colorado, Utah, Wyoming, and New Mexico, will not cause the flow of the Colorado River at Lee Ferry to be depleted below an aggregate of 75 million acre-feet for any period of 10 consecutive years.

The interpretation of these two clauses is at issue in *Arizona* v. *California* and is involved in the present bill. The Reclamation Bureau apparently assumes in its presentation here that there will be available at Lee Ferry, after the section 2 projects are built, only about 75 million acre-feet every 10 years. Arizona says (Reply, par. 8, 11) that all this 75 million is III (a) water, that is, that this figure is merely 10 times the quantity apportioned to the lower basin by article III (a) of the compact, and that all of the lower basin's III (a) uses can be made from the main stream. California (Answer to Arizona, par. 8, 11) and Nevada (Petition, par. XIV) deny this, and say that Arizona's uses on Gila, and the uses of Nevada and Utah on the Virgin River, are "rights which may now exist," in the language of article III (a), hence chargeable to (and protected by) article III (a). That would include also New Mexico's uses on the Gila.

Arizona retorts that her uses on the Gila are covered by article III (b) of the compact, an article which says that, in addition to the apportionment in article III (a), the lower basin is given the right to increase its beneficial consumptive use by 1 million acre-feet per annum. If Arizona is sustained by the Court in this position, there is no water for Mexico in the 75 million acre-feet at Lee Ferry referred to in article III (d), and the upper basin, under article III (c), must, in addition, release water to supply one-half of any deficiency in meet-

ing the Mexican burden. When the Reclamation Bureau reported favorably on the central Arizona project, it was on the assumption that Arizona's interpretations were correct, without, however, endorsing them. If California and Nevada are correct, a portion of the 75 million acre-feet at Lee Ferry referred to in III (d), equal to the total of the water supply available and used on the Gila, Virgin, and other tributaries under III (a), is excess or surplus water unapportioned by the compact, available in part for the service of the Mexican Water Treaty and in part for appropriation, contract, and use in the lower basin.

We view the 75 million as a minimum of "wet water," unclassified and unrelated to article III (a), and to be met whether or not there remains available to the upper basin, after meeting that obligation, water to sustain a maximum use of 7,500,000 acre-feet per annum of water apportioned by article III (a).

On the other hand, the upper basin view appears to be that the compact means that if the upper basin lets down 75 million acre-feet in each 10-year period, it is entitled to keep and use what is left. Moreover, the view of some upper basin spokesmen apparently now is that the covenant in article III (d) is not a guaranty at all, and that the apportionment to the upper basin in article III (a) takes precedence over it. We vigorously challenge that interpretation.

6. The right to demand or withhold water

Article III (e) of the Colorado River compact provides that the States of the upper division shall not withhold water, and the States of the lower division shall not require the delivery of water, which cannot reasonably be applied to domestic and agricultural use.

Article IV (b) provides that the impounding and use of water for power generation shall be subservient to the use and consumption of water for agricultural and domestic purposes.

Glen Canyon Reservoir and the other proposed upper basin mainstream reservoirs will be so located, physically, that no water stored therein can ever be applied to domestic or agricultural uses in the upper basin.

I should correct that with respect to the Navaho, Senator Anderson.

All of the water stored in such reservoirs will be required for domestic and agricultural use in the lower basin and Mexico.

It seems to be the position of the upper basin States that the water which escapes consumptive use in the upper basin may be impounded downstream at Glen Canyon or other dams, and withheld there for power generation, even though required for irrigation and domestic use in the lower basin, so long as 75 million acre-feet are allowed to flow past Lee Ferry in each 10-year period. We deny this, and say that under articles III (b), III (e), and IV of the compact, water appropriated in the lower basin, even though excess or surplus waters, may not be withheld from us, in the upper basin, for the generation of power.

On some of these points, it was refreshing to read the candid statement of Gov. Ed Johnson, of Colorado, released December 20, 1954. After quoting from the reports of the compact negotiators to Congress and the legislatures in 1923, Governor Johnson said:

> I am compelled to keep emphasizing that whatever water is stored in the Glen Canyon and Echo Park Reservoirs will be surplus to the agricultural and

domestic needs of the upper basin, and must be delivered to the lower basin to satisfy the award of 1.5 million acre-feet to Mexico and 1 million acre-feet to the lower basin. Furthermore, should the lower basin require an additional supply of water for agricultural and domestic purposes the water stored in these reservoirs must be released.

Under the 7-State compact the upper States must deliver at Lee Ferry in each 10-year period 75 million acre-feet to the lower States and 7½ million acre-feet to Mexico before they can use one drop of water themselves beyond what they used before the 7-State compact was ratified. In the current 10-year period that will leave only 3,250,000 acre-feet per year for their total use. In the previous 10-year period they would have had 4,150,000 acre-feet a year. In 1902 the upper basin States under this formula would have had no water at all.

The project is planned by the Reclamation Bureau on just the opposite of Governor Johnson's assumptions: namely, the claim of a right to deprive the lower basin of all waters in the main stream in excess of 75 million acre-feet in each 10-year period, which is about 25 percent less than the expectation under the interpretations of the Compact and Project Act on which this same Reclamation Bureau relied in making water and power contracts in the lower basin, and in recommending the Mexican Water Treaty to the Senate.

7. Appropriation of surplus

Article III (f): Does the provision for a further apportionment, by unanimous consent after October 1, 1963, mean that no State may validly appropriate surplus until a new compact is made? California alleges, in the pending litigation, that any State, including the upper basin States, may appropriate surplus waters unapportioned by the compact, subject only to their being divested by a new compact to which such a State is party, or by court decree.

Arizona and Nevada say that no State may acquire any right in surplus until a new compact is made. If they are sustained, then the upper basin can acquire no right in the waters it may use in any year in excess of 7,500,000 acre-feet. Actually, under the compact, the Boulder Canyon Project Act and the Mexican Water Treaty, all excess and surplus water of the Colorado River system has already been appropriated or obligated to uses in the lower basin and Mexico.

8. Indian rights

Article VII of the Colorado River compact provides that nothing in the compact shall be construed as affecting the obligations of the United States to Indian tribes. The upper basin compact (art. VII) provides that use by the United States or its wards shall be charged as a use by the State in which the use is made. California, in the pending suit, takes the same position (answer, par. 14).

The United States denies this (petition of intervention, par. XXXVII), and says that "the rights to the use of water of the Indians and Indian tribes are in no way subject to or affected by the Colorado River compact." The Government's petition tabulates (appendix II) 1,747,250 acre-feet of diversion claims of Indians in the lower basin, of which 1,556,250 are in Arizona. There are Indian claims in the upper basin not tabulated in the petition, to diversion rights exceeding 1 million acre-feet per year.

Arizona says (reply, par. 1) that—

the obligations of the United States to the Indians or Indian tribes are not material or relevant * * *

It is known that the Office of Indian Affairs construes article VII of the compact as meaning that (1) the Indian claims come ahead of the compact, are not chargeable to any State, and the compacting States simply divided the residue after the Indian claims; (2) Indian claims relate back to the date of establishment of the reservation, even though not put to use, and take priority over uses by non-Indians even though the uses by non-Indians may in fact long antedate the actual putting of water to use by the Indians. The Government's pleadings leave it free to make both these assertions. As to the first, Arizona has refused, so far, to disagree with the Indian Bureau's position. Naturally, if Arizona can hope for 1.5 million acre-feet for Indian diversions, outside the compact, in addition to the 3.8 million acre-feet she demands under the compact, there is a temptation to try to get it. Just where the water would come from is not very clear.

Arizona, at a meeting with the Attorney General of the United States on December 3, 1953, was invited to join the upper basin States, California and Nevada in a common statement of position that Indian uses are to be charged under the compact against the State in which they are situated, but declined to do so.

I might add that at the first proceedings before the master on August 5 of this year, the same issue arose and again remained unanswered.

The existence of the Indian claims, and uncertainty as to their accounting, raises serious questions as to the water supply for the projects in both the upper and lower basins. The United States, in this suit, also claims independent rights for the use of the Bureau of Land Management, the Forest Service, the Park Service, for fish and wildlife, and so forth, and denies that all of its rights are subject to the Colorado River compact. The magnitude of these additional claims is not stated.

Those questions will not be resolved until this suit is decided.

9. Present perfected rights: Quality of water

Article VIII provides that "present perfected rights to the beneficial use of waters of the Colorado River system are unimpaired by this compact." In the present suit California alleges (answer to Arizona, par. 15) that "unimpaired" as used in this article means unimpaired as to both the quantity and the quality of the waters to which these perfected rights relate. California alleges that, as of the effective date of the compact, her present perfected rights were not less than 4,950,000 acre-feet (answer to Arizona, par. 28).

Senator ANDERSON. Perfected?

Mr. ELY. Present perfected rights. I should say that Arizona admitted present perfected rights in California of approximately 3 million acre-feet per annum measured by depletion, which is the equivalent of a larger quantity measured by diversion less return flow.

The report of the Reclamation Bureau contains no data on the effect of large transmountain diversions coupled with other upper basin uses on the quality of water. Such a study should obviously be made. We know that when the compact was ratified, the report of the Colorado commissioner, Delph Carpenter, stated that—

natural limitations upon the use of the waters within each of the upper States will always afford ample assurance against undue encroachment upon the flow of Lee's Ferry by any one of the four upper States. Colorado cannot divert

5 percent of its portion of the river flow to regions outside the river basin (Hoover Dam documents, H. Doc. 717, 80th Cong., p. A79).

Elsewhere it was testified at that time that Colorado's feasible transmountain diversions could not exceed 300,000 acre-feet per annum. By contrast, the Colorado transmountain diversion projects inventoried in the Reclamation Bureau's various reports aggregate 2 million acre-feet, or over 50 percent of the water allocated to Colorado by the upper basin compact. There would be that much less water to absorb an increasing quantity of salts in passage to Lee's Ferry. The effect on the lower basin is one which the lower basin States are entitled to have studied and reported upon, to the end that their present perfected rights, in the language of article VIII, shall remain unimpaired.

Senator ANDERSON. Before you leave that, you heard my questioning of Mr. Matthew this morning about the Fryingpan-Arkansas. His position was that California was opposed to all diversions outside the basin. Is it still there that way?

Mr. ELY. We feel that before any major transmountain diversions are authorized, this question of quality of water should be thoroughly explored. The Arkansas-Fryingpan project as authorized in the pending legislation (S. 300, I believe) involves a small quantity of water, something under 100,000 acre-feet. However, it is the forerunner and first unit of a 900,000 acre-foot diversion.

When we testified—I testified with Mr. Matthew on the Fryingpan-Arkansas project before this committee in the spring of 1953—the Colorado River storage project had not at that time been recommended by the Bureau of the Budget, and we did not oppose the Fryingpan-Arkansas project. We called attention to its implications; that when the 900,000-acre-foot phase of the project was brought back to Congress we might have to do so. We asked for a study of this quality of water question. Your committee kept the Fryingpan bill for several months. In the meantime, the Colorado River storage project was cleared by the Bureau of the Budget. Consequently, we are now faced with this problem of large transmountain diversions. The effect is primarily with respect to the quality of water.

Senator ANDERSON. Would that reverse your position or keep it the same?

Mr. ELY. No. I would say that it is the same, Mr. Chairman. If the Fryingpan-Arkansas bill for 100,000 acre-feet were all that were before the committee, we would probably react to it as we have to each of the other upper basin bills during the past several years. We have not objected to any of them. All have gone through on the Consent Calendar, as a matter of fact—and this one did through the Senate—and it was not until the Colorado River storage project became active and we realized that we were confronted simultaneously by both that we became seriously concerned about the implications of the Fryingpan-Arkansas bill as involved here.

V. CONCLUSION

California's basic position is that our State is conforming to the Colorado River compact, the Boulder Canyon Project Act, and the other enactments which comprise the "law of the river," and we must insist that the Reclamation Bureau and the upper basin States do

likewise in the planning and administration of the Colorado River storage project.

The Colorado River storage project, as now planned, is based upon interpretations of the compact which, in our view, are wrong and constitute encroachments upon the compact for the benefit of the upper basin to the extent of more than 2 million acre-feet per year.

Essentially, the proposed Colorado River storage project implies the destruction of a substantial portion of the value of the Boulder Canyon project, in terms of water and power production, to enable construction of a new project in the upper basin which will generate power at twice the cost and irrigate lands at many times the cost of the power and irrigation furnished by Hoover Dam and in violation of the Colorado River compact.

We say that the water and power users of California, who have invested more than a half-billion dollars upon the faith of the Colorado River compact, the Boulder Canyon Project Act, and their agreements with the Federal Government, are entitled to the protection of their stake in the Colorado River, both in Congress and the Supreme Court.

Thank you, Mr. Chairman.

Senator ANDERSON. Senator Millikin, I had a great many questions, but I do not have the ability to phrase them in proper legal language, and I have asked Mr. Bennett to handle some of those for me. Do you mind?

Senator MILLIKIN. That is agreeable to me.

Senator ANDERSON. Mr. Ely, I will let Mr. Bennett ask some questions because when it comes to examination between lawyers you are completely out of my element.

Mr. ELY. That is perfectly all right, but from previous experience I would say that you don't need any help.

Mr. BENNETT. To begin with, I would like to say that I feel a little awed because Mr. Ely is a good friend of mine—at least, I have counted him so for many years and we have many common interests. Of course, I have some pretty strong ties in California myself. I went to law school there. So this is a rather interesting position to be in at the moment.

Mr. ELY. I reciprocate all that has been said and I have great respect for Mr. Bennett's judgment and ability, and we will remain good friends even though we meet here on the plains of Philippi.

Senator ANDERSON. We are honored to have you before the committee, Mr. Ely.

Mr. ELY. I may say I have received nothing but courtesy from this committee, notwithstanding that its members, I know, are committed the other way.

Mr. BENNETT. To begin with, to get a common ground here on the facts which the committee is dealing with, is it your understanding that the present uses of water in California are somewhere in the neighborhood of 6 million acre-feet?

Mr. ELY. No; I think that they are slightly over 5 million, Mr. Bennett.

Mr. BENNETT. Is it also your understanding that the uses of water in the upper basin at the present time are something in the neighborhood of 2 million acre-feet?

Mr. ELY. Between 2 and 2½, I understand.

Mr. BENNETT. Is it your understanding further that the authorized projects in the upper basin, such as the Collbran, which have not been constructed, might add three or four or five hundred thousand acre-feet to that total?

Mr. ELY. I think that is probably correct.

Mr. BENNETT. Then we are dealing with a bill which affects a water situation involving present uses of something over 6 million, if we count Arizona. I assume it would be in that neighborhood, in the lower basin?

Mr. ELY. Arizona's existing and authorized projects, as I understand it, will require all together about 1,200,000 acre-feet from the main stream. California's existing and authorized projects would require 5,362,000. The Nevada uses are as yet relatively minor, from the main stream. As to the upper basin uses, I will accept your statement as to what they are.

Mr. BENNETT. Then we have lower basin uses somewhere in the neighborhood of 6½ million acre-feet of water, counting Arizona and California?

Mr. ELY. From the main stream.

Mr. BENNETT. Yes.

Mr. ELY. And from the waters of the Colorado River system, including the Gila, measured as we measure those uses, something over 8 million; measured as Arizona measures them, something over 7 million.

Mr. BENNETT. I believe your statement uses the figure 4½ million acre-feet as being the potential uses in the upper basin if the projects named in this bill were authorized.

Mr. ELY. That is correct. It is an upper figure.

Another figure used here in testimony has been 4,300,000. And I have included in mine the 600,000 acre-feet of evaporation losses, which are, however, on the great reservoirs. So that if the participating projects were built without storage reservoirs, the aggregate would be somewhat less than the figure I have used.

Mr. BENNETT. Would it be a fair statement, Mr. Ely, to say that your opposition to this bill is predicated more on what you fear the Congress will do in the future rather than what the Congress actually does in this bill itself?

Mr. ELY. No; Mr. Bennett. Our concern is twofold, related to the two aspects of the bill. If the particpating projects were all that were involved, what you say would be correct; we would be disturbed by the interpretations of the compact implicit in the bill, and deeply concerned by the effect of transmountain diversions, but we would recognize that the total quantity is within the apportionment. And the danger might be a long time off, as you say.

But we are immediately concerned by the immediate effect upon us of the construction of the storage reservoirs. These confront us with a likelihood that immediately upon the completion of Glen Canyon Dam, when the gates are closed there, as one engineer has said, if Lake Mead is not full on that day it will never fill again, if the upper basin reservoirs are operated as the Reclamation Bureau apparently intends. And that is a calamity that happens to us not in the distant future but happens at once. Glen Canyon Dam will be the first great structure built, and the impact is immediate.

Mr. BENNETT. Then you do not feel that your legal rights are adequately protected by section 8 of this bill and section 12 of this bill?

Mr. ELY. No. May I have a copy of the bill?

Mr. BENNETT. Surely.

I would like to point out that section 8 of the bill reads as follows:

Nothin contained in this Act shall be construed to alter, amend, repeal, construe, interpret, modify, or be in conflict with any provisions of the Boulder Canyon Project Act, the Boulder Canyon Project Adjustment Act, the Colorado River Compact, the Upper Colorado River Basin Compact, the Rio Grande Compact of 1938, or the Treaty with the United Mexican States.

Section 12, to use the exact language, in order to avoid any possible misinterpretations through paraphrasing, opens this way:

In the operaton and maintenance of all facilities, authorized by Federal law and under the jurisdiction and supervision of the Secretary of the Interior, in the basin of the Colorado River, the Secretary of the Interior is directed to comply with the applicable provisions of the Colorado River compact, the Boulder Canyon Project Act, the Boulder Canyon Project Adjusment Act, and the Treaty with the United Mexican States, in the storage and release of water from reservoirs in the Colorado River Basin.

Would you care to comment on why those provisions are inadequate, in your judgment, Mr. Ely?

Mr. ELY. Yes, sir. Section 8 contains a very estimable disclaimer of intent to construe any of these documents, but, as is true of so much of this bill, Mr. Chairman, the operation of the project therein proposed has to be discovered from reading the underlying Reclamation Bureau reports. And from those, it is perfectly plain that they do construe the Colorado River compact, and in a way that is intolerable to us, in the two respects that I outlined early in my statement; first, with respect to the measurement of beneficial consumptive use; second, with respect to the averaging of the apportionment of seven and a half million, instead of treating it as a maximum entitlement in any one year; the combined effect of the two being to enable the Bureau under that interpretation—and it would be in control of Glen Canyon Dam as well as the other dams—to withhold from us the water that we think the lower basin is entitled to and upon which all the lower basin projects have been designed, and, for that matter, upon which the calculation of the system's ability to sustain the Mexican Water Treaty was based.

Now, the fact that the statute might disclaim any attempt to interpret does us no good if the Secretary of the Interior, with the control of these dams in his hand, is in fact interpreting the law of the river, and he is placing Congress on notice, in this report printed as a Senate document, that that is how he intends to operate.

Furthermore, it would appear, from what the engineers tell me, that the financial operations of Glen Canyon are based on the assumption of the availability to the upper basin power dams of water based upon that calculation.

So I would have to answer with respect to section 8, that it is totally ineffective. We would have to see the ground rules spelled out, and to spell them out would mean virtually reversing many assumptions of the Bureau in the underlying report.

With respect to section 12, the direction to the Secretary that he shall conform to all the law of the river is, of course, estimable. He should. But, again, when we differ by 2 million acre-feet as to what

these documents mean with respect to the obligation at Lee Ferry, it doesn't mean very much. He is already placing Congress on notice how he interprets these documents. We do not agree with the interpretation. I suppose if he had this mandate before him, he would go ahead and do just as he has told he is going to do in the underlying report, and we could not tolerate it.

I know we come next, Mr. Bennett, to the authorization for suit against the Secretary in section 12 if he does not comply, but we run into precisely the same trouble all over again. The danger to us—Do you want to take this up and state your own questions in your own way?

Mr. BENNETT. No. That is all right. Go ahead.

Mr. ELY. The language of section 12 in that respect is that:

> In the event of the failure of the Secretary of the Interior to so comply, any State of the Colorado River Basin may maintain an action in the Supreme Court of the United States to enforce the provisions of this section, and consent is given to the joinder of the United States as a party in such suit or suits.

That goes part way, and I do not mean to discredit the effort to write workable language here, because the intention is good. But the damage to us occurs in two ways: one, that the consumptive use projects when, as, and if built, upstream, are not covered by this mandate at all. They can go ahead and expand to the point where they are using, by our calculation, 9 million acre-feet or more per year, because, by the interpretation of the Secretary, that shall be averaged with years of lesser use and equal only seven and a half.

Also, since there are no ground rules whatever laid down as to storage reservoirs or participating projects, we are not eager to buy a second lawsuit. One is enough. We would much prefer to have the ground rules spelled out than to simply have a license to sue the Secretary at some future time.

Mr. BENNETT. Then the underlying documents constitute a good part of your fears here.

Mr. ELY. That is correct.

Mr. BENNETT. And you feel that Congress in S. 500 has not declared its intention to have the project operated otherwise.

Mr. ELY. That is correct, Mr. Bennett.

Mr. BENNETT. I don't believe that is the committee's intention, and we will proceed. At least, I know it was not the Department's intention.

Mr. ELY. Thank you.

Mr. BENNETT. Secondly, in your statement I believe you used the figure that the project plans contemplate the use on occasion of as much as 9 million acre-feet of water in any given year, in some years at least, in the upper basin. My information is that the project plans do not contemplate any such use, and I wonder if you or any of the engineers with you are in any position to point out where the project plans provide for the use of any more than 7½ million acre-feet of water in any given year.

Mr. ELY. Not being an engineer, I will give you an engineering opinion very freely, as we lawyers do.

At page 152 of House Document No. 364, which is captioned "Colorado River storage project," appears a table captioned "Determination of active storage requirement to permit full utilization of apportioned consumptive use." And that is in six columns; the first being a

tabulation by years from 1914 to 1947; the next being captioned "Virgin flow of Colorado River at Lee Ferry"; the next, "Ultimate use of upper basin apportionment." That is the column to which I shall turn back in a moment. The next is "Ultimate depleted unregulated flow at Lee Ferry." The next is "10-year moving total flow at Lee Ferry." And the final column is "10-year variation from 75 million acre-feet."

In the column captioned "Ultimate use of upper basin apportionment," for the years 1914–47, it shows, for example, for 1914, 9,030,000 acre-feet. For 1915, it shows 6,910,000 acre-feet; for 1916, 8,860,000 acre-feet; for 1917, 9,530,000 acre-feet; for 1918, 7,920,000 acre-feet; for 1919, 6,560,000 acre-feet; for 1920, 9,370,000 acre-feet; for 1921, 9,470,000 acre-feet; and so on; with the other years shown as materially less, ranging down to 6 million, 5 million, and 4 million.

The right to calculate the apportionment on an average basis rather than an annual basis was asserted by the negotiators of the upper Colorado River Basin compact, without translating their assertion into figures, in the hearings of the House Committee on Public Lands on H. R. 2325, 81st Congress, 1st session, at page 57. That was in answer to a questionnaire of the committee directed to the negotiators as to how they interpreted their compact, in answer to question No. 3.

As I have stated, the result of this contention in figures appears in the document to which I have just referred. This shows uses by proposed upper basin projects of more than 7½ million acre-feet in each of the 17 years corresponding to the historical years 1914, 1916, 1917, 1918, 1920, 1921, 1922, 1923, 1926, 1927, 1928, 1929, 1930, 1932, 1938, 1941, and 1942, ranging from an excess of 90,000 acre-feet in a year like 1930 to an excess of 2,030,000 in a year like 1917.

The aggregate use in these 17 years in excess of 7,500,000 acre-feet per annum is 15,680,000 acre-feet, and the average excess for each of the 17 years is 920,000 acre-feet. The average excess for the whole 32-year period is 490,000 acre-feet per annum.

I have been reading from a portion of the brief of the California defendants in support of their motion to join these four States as parties in the present suit.

Mr. BENNETT. Well, is it your contention, then, that there are possible participating projects for consumptive uses in the upper basin that are reflected in this table and which might someday be authorized and constructed?

Mr. ELY. Yes; section 2 declares the intention to put all of the upper basin water to use, and this table shows the Bureau's calculation of how much water is available to put to use.

Mr. BENNETT. However, the project plan for the Colorado River storage project and participating projects has never made recommendations to construct projects to use anywhere near the maximum figures that are reflected here; is that not so, Mr. Ely?

Mr. ELY. S. 500, you mean?

Mr. BENNETT. No, not S. 500. I am thinking in terms of the project plan which was prepared in 1950 or thereabouts. Is this chart not a study of water availability, rather than a reflection of project recommendations made by the Department.

Mr. ELY. These recommendations for projects come forth from time to time. They are inventoried in House Document No. 419, about a hundred projects, which all together, if they were all built, would

come to more than this. Some, such as the Fryingpan Arkansas, are in other bills.

Mr. BENNETT. That is what I wanted to find out.

Mr. ELY. As Mr. Morris referred to this morning, section 2 authorizes unborn projects. We don't know what they are. But they are authorized, and it is declared to be the intention that they will be built in that general way, with this underlying document confronting us, with an assertion of claim to water amounting to over 9 million acre-feet a year.

Mr. BENNETT. I want to get back again to the fact, though, that this was a water availability study rather than being a reflection of any table of uses which the Bureau of Reclamation or anyone else has ever approved.

Mr. ELY. I will take your word for that, Mr. Bennett.

Mr. BENNETT. Well, I mean, the heading is "Determination of Active Storage Requirement to Permit Full Utilization of Apportioned Consumptive Use."

Mr. ELY. The column from which I have read is captioned "Ultimate Use of Upper Basin Apportionment."

Senator ANDERSON. May I ask just a question on that? Actually, that was the exact amount that would be available to the upper basin States if the compact were absolutely strictly applied, is it not?

Mr. ELY. We think that that would be far in excess of the amount lawfully available to you.

Senator ANDERSON. The flow in that year was somewhat in excess of 21 million acre-feet. In reaching this calculation they gave the upper basin States 7½ million acre-feet, the lower basin States 8½ million acre-feet, and they made an allocation for the Mexican Treaty water, and they made an allocation of the million acre-feet, and they divided the surplus that was left. Does not the compact provide for that?

Mr. ELY. Let me take that point by point. The 21 million to which you refer includes the water available on the Gila River and other tributaries.

Senator ANDERSON. I am sorry. It does not. It is virgin flow at Lee Ferry.

Mr. ELY. Are you referring to this table? I am referring to the reports of the negotiators. We are speaking at cross purposes.

Senator ANDERSON. No. You brought this table up.

Mr. ELY. I thought your 21 million was referring to the one used earlier in these hearings as being the report of the negotiators. I am sorry, sir. We are speaking at cross purposes. Would you identify to me what you are speaking of?

Senator ANDERSON. I am talking about the very first column, or rather the second column, 21,220,000 acre-feet. Now, they arrived at this figure by saying if they gave the lower basin 8½ million acre-feet and the upper basin 7½ million acre-feet, and they took the Mexican water and divided it, and so forth, and gave you everything you could possibly imagine under the compact, there was some surplus water remaining, and they divided that between the two basins. What is wrong with that?

Mr. ELY. I would have to say that is not what they did, Senator Anderson.

Senator ANDERSON. How did they get the figure of 21,220,000, then?

Mr. ELY. How did the Bureau of Reclamation? These are Bureau figures. I don't know how.

Senator ANDERSON. Then why do you say it was not the way I said it was.

Mr. ELY. I would be glad to show you how the compact negotiators arrived at the figures, if you would like to have it.

Senator ANDERSON. I am not interested in them. They did not prepare these figures.

Mr. ELY. I thought you were saying: Is this not what the compact did?

Senator ANDERSON. No. we started with 21 million acre-feet, and we take away from it 16 million acre-feet——

Mr. ELY. No. We have to break apart right there. Because the 16 million acre-feet—I take it you are including the III (a) and III (b) water in that?

Senator ANDERSON. The maximum that you could possibly ask for.

Mr. ELY. That must include under the compact uses on the Gila. So right at that point, we come apart.

Senator ANDERSON. Well, if you do, that gives me a half million extra feet advantage which I was trying not to take.

Mr. ELY. Yes, quite so. You have some more surplus in the whole system.

Senator ANDERSON. I agree with that. I was trying to be extremely cautious about it. Take off 15 million acre-feet from 21 million acre-feet, and you have some 6 million acre-feet left.

Mr. ELY. Again, sir, we break at that point each time, because the Colorado River compact divided the waters of the system, not of the main stream. And you must include the waters of the Gila River. This table deals with only the virgin flow of the Colorado River at Lee Ferry, which is one of the assets of the Colorado River system. Other assets are the Gila River, the Virgin River, and other lower basin tributaries, which, under the compact, must be taken into account.

Senator ANDERSON. What is your objection to the 9 million acre-feet?

Mr. ELY. Because the caption is "Ultimate Use of Upper Basin Apportionment." We say the ultimate use of upper basin apportionment to which you are entitled in any 1 year is not to exceed 7½ million acre-feet, not 9,030,000 acre-feet.

Senator ANDERSON. Plus anything? Plus some surplus water if it was there?

Mr. ELY. For our part, we concede the right of the upper Basin States to appropriate surplus. Arizona does not.

Senator ANDERSON. We have your more liberal contention, then, and start with that.

Mr. BENNETT. There are several of them.

Mr. ELY. But I must put a caveat right there.

Senator ANDERSON. We will take care of ourselves against Arizona if we can just get by with California.

Mr. ELY. You are not in too good shape as against us, sir, because we say that all of the excess and surplus has either been dedicated to Mexico or appropriated in the lower basin; so that our concession of your right to appropriate surplus must not be taken as too wide a concession.

Senator ANDERSON. You say that all the surplus is either taken for the Mexican Treaty or is appropriated to the lower basin States?

Mr. ELY. That might not be true in every year.

Senator ANDERSON. Then what is the provision of paragraph (f) under III, that says, at some later date, 1963, they shall get together and divide up this surplus? If it is already gone, why divide it?

Mr. ELY. The problem there is one that I mentioned in my prepared statement and is at issue in the Supreme Court. Does or does not the compact withhold from appropriation in the upper basin and the lower the unapportioned surplus, in the sense that no one can acquire rights in it, and that they all must depend upon unanimous consent at some future day after 1963. We say no, that the unapportioned surplus may be appropriated by any State, surely by California, under the terms of the limitation act, up to one-half of the excess or surplus and no more.

Senator ANDERSON. I am not trying to take your half away from you. I am just trying to get our half.

Mr. ELY. We think you gave your half to Mexico.

Senator ANDERSON. Well, that is extremely broadminded of you.

Mr. ELY. We urged you not to do it.

Senator ANDERSON. I think it is unfortunate. I only wanted to say that it seems to me perfectly natural that they might set up this 9 million acre-feet, because every test I see in the compact was met. There is more than enough water to deliver the appropriate amount of acre-feet, more than enough water to take care of the Mexican Treaty, more than enough water to take care of everything California is entitled to, under the plain language here.

Mr. ELY. Speaking in a general way, you are quite correct, yes.

Senator ANDERSON. And we thought we had a chance at some of that extra water.

Mr. ELY. I am willing to give you the chance. But we say it is not apportioned water. It is excess or surplus.

Senator ANDERSON. I do not say it is apportioned. I say when it becomes surplus, we have a right to divide it with you.

Mr. ELY. We go further. We say you have a right to go ahead and use it if your appropriation of it is senior to ours. You do not have to wait for us to agree that you can use it after 1963. You can appropriate it right now. We say we have appropriated it. If you have senior appropriations to ours, they would be sustained, I suppose, in the present lawsuit. That is one of the issues in the suit.

Arizona denies to all of us the right to make any present appropriations of surplus. She says you cannot acquire any right to it at all until after 1963, and then only by unanimous consent. That is, with Arizona's consent.

Senator ANDERSON. That is what I was trying to get to. Because that is the point that you made in your paper, that there cannot be any surplus water; there is no point in meeting in 1963; if there was any, you have already gobbled it up. And we do not agree with that. We think we have a crack at it yet.

Mr. ELY. We are willing that you should have a crack at it, Senator, but Arizona does not agree that you should have a crack at it.

Mr. BENNETT. Now that we have dealt with the future possible development in the upper basin, I would like to come back again to the provisions of S. 500, which the committee has before it.

Senator ALLOTT. Mr. Chairman and Mr. Bennett, may I ask a question? I want to get out here the plain effect of what you have just said.

In other words, it is your position and your contention that as long as California can withhold any development in the upper Colorado, by way of dams or reservoirs, the water which flows down the river would be California's as long as she keeps devoting it to a consumptive use, and we can acquire no rights under it.

Mr. ELY. Not at all, Senator.

Senator ALLOTT. That is the substance of what you have said.

Senator ANDERSON. That is the only conclusion you can draw from what you have said.

Mr. ELY. Let us come right to grips on that. That is not what I have said, sir. We recognize your apportionment in perpetuity, insulated, which is the expression I have used, against the law of priority of appropriation. You have the right to the beneficial consumptive use of up to 7,500,000 feet in any 1 year. You may take that starting 100 years in the future or take that starting 1 year in the future. The fact that we have in the meantime built up uses which would have to be cut back to enable you to do so is immaterial. That is the intent of the compact, to insulate the upper basin against the law of priority of appropriation in the lower, to the extent, but to the extent only, of the consumptive use of 7,500,000 acre-feet in any 1 year.

The objection we have is that this 7,500,000 foot protection is expanded and ballooned by the Bureau of Reclamation's interpretatiton, which treats it not as a limit in any 1 year but as an average over a 35-year period, with the effect that if they are correct, you could take away from us, from established appropriations in the lower basin, not up to 7,500,000 but up to whatever the figure might be, 9,400,000, nearly 2 million acre-feet more, in any particular year, because in some other year you had used less than 7,500,000.

Senator ALLOTT. That, I think, sir, if I may say so, is begging the question, because under Senator Anderson's question, if I understood your answer to it—I would like to bring you back to that. Is it your feeling that as long as there are no upper Colorado River projects constructed, California can keep on using this water, and by doing so acquire vested rights—and I suppose that you use those terms in the same sense that I do—in the water thereto?

Mr. ELY. No, not under the intent of article III (a). Just the reverse. At any time in perpetuity, whenever you get around to it, you may put that to use, regardless of the quantity in the lower basin that is put to use.

Senator ALLOTT. With that plus your Mexican Treaty water plus your million acre-feet, it is your contention that above that you have acquired vested rights by appropriation and conversion to beneficial consumptive use of the additional waters, and that therefore, the water which Senator Anderson spoke of could not be divided with the upper basin, in such a hypothetical situation?

Mr. ELY. Are you speaking of excess, or surplus?

Senator ALLOTT. Surplus above that.

Mr. ELY. Excess or surplus above the apportioned water?

Senator ALLOTT. That is right.

Mr. ELY. We will put to one side for the moment the relation of the III (b) water, and we will speak of apportioned water on the one hand and the excess or surplus water on the other hand. I say that your right reserved by the compact in perpetuity is to use up to seven and a half million acre-feet, irrespective of the law of appropriation; that if you seek to go beyond that, your are appropriating waters in competition with us.

If you seek to use more than seven and a half million acre-feet in any 1 year, you must acquire the right thereto by appropriation or by further interstate compact or court decree; you are not getting it under article III of the compact as this report attempts to give it to you.

Senator ALLOTT. Are you referring to a year such as Senator Anderson described, when there would be as much as 21 million, using that as the criterion?

Mr. ELY. If there were in a year such an amount as 21 million, there would be water available in that year for appropriation in both the upper basin and the lower. It is a tremendous year. But they cannot build projects upon the availability of water at long intervals like that.

Senator ALLOTT. Yes; but while we would not build a project, neither you nor myself or anyone else, I presume, under such an assumption, the point I am trying to get at is: In such an instance and in such a year, what is your position with respect to this surplus water? Have you then, in that instance, in your mind, acquired such vested rights that none of that water would be available to the upper basin?

Mr. ELY. It would depend entirely, Senator, upon the stated appropriations at that time. So far as we are concerned, our claim is to 5,365,000 acre-feet per year and no more.

Senator ALLOTT. Are you making a difference between appropriations and diversions in your own mind?

Mr. ELY. No. We are entitled to the beneficial consumptive use, diversions less returns to the river, of 5,365,000 acre-feet per year, and no more. In a year such as you are describing, we do not claim and do not have the facilities to use water beyond that. We were required by the Limitation Act to cut ourselves back to 4,400,000 acre-feet of the waters apportioned by article III (a) plus one-half of the excess or surplus. We have built our works to use approximately 1 million acre-feet per year of that excess or surplus, on the expectation that the excess or surplus to which that fraction is applicable would average more than 2 million acre-feet in most years.

Consequently, the case you are posing is entirely hypothetical, as far as we are concerned. We do not have the works to use it. We scrapped and had to scuttle fine projects, such as the Chuckawalla Valley, for which Congress had authorized diversion of water as early as 1910. We abandoned it, because there was not enough water for it under the Limitation Act. The only projects saved by California in consequence of the Limitation Act are the three great diversions, the one of the metropolitan water district at Parker through the Colorado River Aqueduct, the Palo Verde diversion, and the All-American Canal and the total of their water contracts is 5,362,000 acre-feet per year.

Senator ALLOTT. I think by your answer you have convinced me of what your position is, and that is sufficient.

May I ask one more question, Senator Anderson?

Senator ANDERSON. Surely.

Senator ALLOTT. On page 22 of your statement, under article 7, you say:

> California alleges, in the pending litigation, that any State, including the upper basin States, may appropriate surplus waters unapportioned by the compact, subject only to their being divested by a new compact to which such a State is party, or by court decree. Arizona and Nevada say that no State may acquire any right. * * *

Now, did you, in your own mind, have a difference in the use of the words "may appropriate surplus waters," as you used them for California, and "acquire any right" as you used them with relation to Arizona and Nevada?

Mr. ELY. No, not intentionally. We use the word "appropriate" in this discussion as a shorthand way of describing either appropriations under State law or rights acquired or confirmed by contract with the United States to waters stored by the United States.

Senator ALLOTT. That is what I wanted to get at. You meant the same thing in these two instances.

Mr. ELY. Yes, if I understand your question correctly.

Senator ALLOTT. I am asking you in a sense for your evaluation of those terms.

Mr. ELY. Yes, that is correct. We say that California, Arizona, Nevada, the four upper basin States, can appropriate surplus. We say that our appropriations are old and good up to the extent of the Limitation Act, one-half of excess or surplus.

If you would like to have for the record some of the contemporary reports on that, I would be glad to supply them.

Senator ALLOTT. No; the reason I was questioning you was because I wanted to know if there was any reason why you changed your terminology in the two instances.

Mr. ELY. No. The bill, so far as I understand it, does not contain the provision in the Project Act that the right to the use of stored water can be acquired only by contract with the United States; I suppose because with the exception of the Navaho Dam, there are no storage dams above the point of diversion. I suppose it is planned to acquire rights for participating projects directly by appropriation under State laws rather than by contract with the United States.

In our case, as I say, we have the complication that no one can use the stored water except by contract with the Government.

Senator ANDERSON. If I may follow up the questioning for just a second: The phrase I was looking for when you were reading this was on page 22, which is similar to what he was discussing. You say:

> Actually, under the compact, the Boulder Canyon Project Act and the Mexican Water Treaty, all excess and surplus water of the Colorado River system, has already been appropriated or obligated to uses in the lower basin and Mexico.

Now, what you are actually saying is that if we had a wet cycle, and the Colorado River water at Lee Ferry measured 25 million acre-feet a year, for 10 straight years, giving 250 million acre-feet, and we are only obligated to deliver 75 million acre-feet, it is your contention that all of that excess and surplus water has already been appropriated to obligation and uses in the lower basin and Mexico?

Mr. ELY. No; in the light of your analysis, my statement is too broad; California is limited to half the excess of surplus, and our total right is 5,362,000 acre-feet.

Senator ANDERSON. Well, I go back to what I tried to get you to a moment ago.

Mr. ELY. What I mean to say is that as a practical matter, you cannot put the excess to use except by storage.

Senator ANDERSON. That is why we try to build the storage dams. We know that.

Mr. ELY. If all of the waters of the river were salvaged and used, the representation of the Bureau of Reclamation during the Mexican Water Treaty was that the yield available for the lower basin plus Mexico is approximately 9 million acre-feet per year. That is accomplished by a drawdown of Lake Mead of a million and a half acre-feet per year for 10 years, which presupposes that in some other 10 years you are going to get it back from some other place, the upper basin. Consequently, there must be an average of something on the order of 9 million acre-feet coming down. Otherwise your books won't balance for the Mexican Water Treaty.

I have started with the assumption, that you arrive at the 9 million by assuming enough storage on the river to put these great flood years to use. If we did not have it and had "wild water" in some year, then my statement here is not accurate.

Mr. BENNETT. Your statement about the potential uses of 9 million acre-feet of water as having been accepted with approval by the Bureau of Reclamation also carried with it an assumption of fully developed storage in the upper basin, did it not?

Mr. ELY. I assume that they are talking about a fully developed river; yes sir.

Mr. BENNETT. Well, this bill does not authorize the construction of the storage necessary to accomplish that purpose even as described in the reports of the Bureau of Reclamation, does it?

Mr. ELY. There you get into an engineering field, where I hate to step into the flypaper. There is available, as you know, a report by Raymond Hill to the State of Colorado, as to the amount of storage required to fully control the river down to economic limits. My recollection is that the maximum figure that he comes up with is of the order of 23 million acre-feet of storage. That much storage would be provided by Glen alone. As a matter of fact, again going outside my field, I have heard some engineers say that but for the fact that the compact takes Lee Ferry as the point of division, you could perform the 75 million "nondepletion" guaranty and meet the requirements of the Mexican Water Treaty by reckoning the deliveries below Hoover Dam instead of at Lee Ferry; that is, that Hoover alone will accomplish substantially all the regulation required. That may or may not be a sound engineering statement. But the justification for 48 million acre-feet of storage is seriously challenged by any number of engineers, as contemplating a 35-year carryover.

Whether the Bureau assumes, on this table to which you and I have been referring, on page 152 of House Document 364, storage of 44 or 48 million, or 23 million feet, I cannot say.

Mr. BENNETT. As I recall it, the Colorado River storage project contemplated either 9 or 10 storage reservoirs, did it not, for full development of the upper basin apportionment?

Mr. ELY. I think you are correct.

Excuse me. The 48 million acre-feet? There you run into the question of how much was required for full development. I do not know.

Mr. BENNETT. At any rate, this bill does not authorize that amount of storage, does it?

Mr. ELY. Six reservoirs with an aggregate capacity of 44 million, I believe.

Mr. BENNETT. Now, of course, part of the capacity of those reservoirs, if I remember correctly, such as Navaho and Curecanti, is scheduled for actual agricultural and perhaps domestic use; is that not correct?

Mr. ELY. I take your word for that.

Mr. BENNETT. Now, I noticed that the statement is made that these bills all authorize the future construction of other projects. I am a little troubled about that, in two ways. Do you feel that the language of section 2 authorizes the Secretary of the Interior to build any projects which are not specifically referred to in section 1 of this bill?

Mr. ELY. I cannot give you a clear answer on that, because to me, the language is not clear.

Mr. BENNETT. Would you say that you would feel the language was clear if the words "in the future" followed the words "to authorize" instead of preceding them?

Mr. ELY. The matter of language does not concern me particularly. I think that a decision should be made either that they are authorized if the Secretary finds these projects feasible, since the Millikin-O'Mahoney amendment is waived with respect to the necessity for concurrence by the affected States, or prohibit that and tell him to come back and bring in his reports, and Congress will authorize them as they feel like it.

Mr. BENNETT. At any rate, the language on which your interpretation is based is this:

> It is the intent of the Congress in the future to authorize * * *.

and so forth. Of course, I know that the Department has not construed that language as authorizing the Secretary to do anything until Congress tells them to.

Secondly, could you tell me what language in this bill waives the requirements of the Millikin-O'Mahoney amendment as to any of these unnamed projects that you refer to?

Mr. ELY. That is in the bill which Congressman Rogers introduced, and which Governor Johnson had here the other day.

It was in the legislation last year also. As I have said, I do not know which of these various bills you are going to act on.

Senator ANDERSON. We are holding hearings on S. 500.

Mr. ELY. Which will finally emerge, I don't know; whether Governor Johnson's recommendations for amendments are going to be approved or not. I don't know. If they are, that is one that is involved.

Senator ANDERSON. Frankly, I was not conscious that we were approving any propects other than those named in the bill.

Mr. BENNETT. I would like to ask, Mr. Ely, whether you know of any of the named projects in section 1 of this bill, other than the

Gooseberry, San Juan-Chama, and Navaho, where feasibility reports have not already been reviewed by the States of the basin?

Mr. ELY. That I could not tell you.

Mr. BENNETT. You are also familiar with the proviso in section 1 of the bill which requires that the San Juan-Chama and the Navaho projects be submitted in the form of coordinated reports to the States of the Colorado River Basin, and also Texas?

Mr. ELY. Yes, sir. Pardon me. You asked where in this bill there was a waiver of the O'Mahoney-Millikin amendment. Right in section 1 of this bill there is express direction to the Secretary to make supplemental reports on the named participating projects which, as to some of these, are bound to be rather extensive. These projects must need them badly or the Secretary would not be told to make supplemental feasibility findings; and as to those supplemental reports, the language is quite explicit on page 4, line 7:

> Section 1 (c) of the Flood Control Act of 1944 shall, except as hereinafter provided for the San Juan-Chama and the Navaho participating projects, not be applicable to such supplemental reports.

I do not know why not.

Senator ANDERSON. Those are named projects in the bill on which there exist good reports. The Navaho and San Juan-Chama products do not have feasibility reports.

Mr. ELY. I suppose they all are not good enough or they would not be sent back to the Secretary.

Senator ANDERSON. I can recall the Eklutna project in Alaska, with which Senator Millikin and I wrestled for a long time, and I took a look at it a while back and there were many supplemental reports necessary on it, and when we got into the mountain we found rock of a wholly different substance than we thought to be there.

I think that is all that is intended here, that there be options to do that. In other words, I do not believe this is language designed to permit a whole series of new projects to be pulled in under the tent, and if it helps any to clear that up by some sort of statement that would effect legislative intent, I would have no objection to doing it.

Mr. ELY. I am getting now somewhat outside of my field trying to answer that question, but on page 3, line 15, is the direction that—

> construction of the participating projects set forth in this clause shall not be undertaken until the Secretary has reexamined the economic justification of such projects—

and so on, and render such supplemental report.

Senator ANDERSON. Are not all those referring to the named projects?

Mr. ELY. Yes; but I do not know why the O'Mahoney-Millikin amendment to the 1944 Flood Control Act should not apply to such supplemental reports, since they deal with economic justification.

Mr. BENNETT. At one point—I believe it was on page 4 of your statement, Mr. Ely, at the bottom of the page—you make the statement that the bills all make clear that this measure is intended to commit Congress to a program for the full utilization of all the water which the upper basin claims under the Colorado River compact.

At that point I would like to call your attention to clause 1 of section 2 of the bill which, after the declaration of intent of the Congress as to its future action, says that it contemplates the use of waters of

the upper Colorado River system, the consumptive use of which is apportioned to those States by article III of the compact.

That being the case, is it a fair statement that Congress is here declaring its policy to build whatever projects might be necessary to use up whatever the upper basin States may claim as their interpretation of the compact?

Mr. ELY. Yes; I would think that mine is a fair statement.

Section 2, page 5, line 4, says:

> In order to achieve such comprehensive development as will assure the consumptive use in the States of the upper Colorado River Basin of waters of the Colorado River system, the use of which is apportioned to the upper Colorado River Basin by the Colorado River compact, and to each State thereof by the upper Colorado River Basin compact, it is the intent of the Congress in the future to authorize the construction, operation, and maintenance of further units of the Colorado River storage project, of additional phases of participating projects authorized in this act, and of new participating projects, as additional information becomes available and additional needs are indicated.

House Document 364 at the table on page 152, to which we referred, gives, I suppose, the Bureau's interpretation of what that "use which is apportioned" is. The column entitled "Ultimate Use of Upper Basin Apportionment," tabulates that "apportionment" on the average method and shows uses in excess of 9 million acre-feet of the so-called apportionment. That is to be read in the light of a specific claim of the right to do so by the upper basin compact negotiators, made in answer to the House committee, in hearings on H. R. 2325 of the 81st Congress, to which I referred.

Mr. BENNETT. Your quotation from S. 500 is the first sentence of section 2 and, as I pointed out before, the second sentence of section 2 explicitly refers to the uses of water apportioned by article III of the compact.

Could you be any more explicit, Mr. Ely, in telling us how the named projects authorized in section 1 of this bill would impair the water supply for the contracts in California?

Mr. ELY. Yes, sir.

Mr. BENNETT. In the light of our beginning understanding that the consumptive uses or the depletions involved in these named projects would not amount to more than 1,800,000 acre-feet of water, added to the existing 2,500,000.

Mr. ELY. I would be glad to try to.

Let us put aside for the moment the effect of the participating projects; I shall refer now only to the effect of the construction of these storage projects, which is an immediate effect.

These storage projects will intercept some 3 years' flow of the river. The water they are storing is not, as has been said erroneously here from time to time, "upper basin water." The compact apportions to the upper basin, as it apportions to the lower basin, only the right to the beneficial consumptive use of the water, not the right to the flow of the stream. It is an apportionment of the right to use.

When it is stored at Glen Canyon or elsewhere, that is water that can only be used in the lower basin and in Mexico. It is not the property of the upper basin.

Commencing when the Glen Canyon Dam is closed, at once, and thereafter for a protracted period of filling, ranging in last year's testimony from 20 to 25 years—I do not know where the Bureau

got the figure this year of 5 years to fill those dams—as of last year it was 20 to 25 years, and we think the larger figure is correct—you are impounding water there and releasing to us only such water as the Secretary of the Interior thinks he is obligated to release under the compact.

If he believes the Bureau's interpretation he is going to release 75 million acre-feet every 10 years, and no more.

If he believes that the upper basin is correct, that the 75 million is subject further to a prior right to their apportionment of 7,500,000 then, when the time comes that projects are built up to use all that, is going to release less than 75 million in each 10 years.

Starting in 1960, or whenever Glen Canyon is finished, our water supply will be cut that year and for the 10 years to follow by 25 to 35 percent, and at once our power production, as Mr. Tillman has demonstrated here, is cut back. So also with the Davis and Parker Dam power.

As Mr. Matthews indicated, the total loss in power in the lower basin during this 20- to 25-year period approaches $200 million, which has not been taken into account in evaluating the upper basin project. But the loss of power is not so important in the long run as the loss of water. If you do that to us lawfully in the filling period, you can do it lawfully at any time in the future, and we no longer have permanent water rights, which were good on the interpretation of the compact which we had assumed. We can expect only the 75 million every 10 years, which is a reduction of 25 percent of the quantity of water upon which both the Interior Department and ourselves relied. The Mexican water was based on a much larger expectation than 75 million, something over 90 million.

Mr. BENNETT. Is it true, Mr. Ely, that your answer to the last question presupposes that the upper basin States have no right to store water, even temporarily, for the generation of power under the compact?

Mr. ELY. We say that the upper basin States and the United States have no right to retain in Glen Canyon or other reservoirs for power generation water which is required for beneficial consumptive use in the lower basin, even though it is excess or surplus water. That statement is derived from our rights under the Colorado River compact and the Boulder Canyon Project Act.

We say second that neither the United States nor the upper basin States have a right to impound and withhold from us water for power generation which is required for power generation at Hoover Dam or elsewhere under contract with the United States in the lower basin.

The right is derived not from the compact, but from the Boulder Canyon Project Act terms of the contract.

Mr. BENNETT. It is derived from the terms of the contract, but certainly you would not say that the Secretary could contract to do anything he was not authorized to do by the Boulder Canyon Project Act, would you?

Mr. ELY. No. He was clearly authorized by the Project Act to make these contracts with respect to the sale of firm and secondary energy. The Project Act required that he obtain in that manner the revenues required to amortize the cost of the Hoover Dam. He is not authorized by any statute—and I do not think he constitutionally

could be—to interfere with his own performance of those contracts by intercepting that water to use it for power generation upstream. He can intercept it for consumptive use, in the upper basin, but not for power generation, as such.

Mr. BENNETT. Is it your contention, then, Mr. Ely, that the generation of power in the lower basin has a priority or preference somehow, under the compact, over power generation in the upper basin, assuming that the rights to the use of the water were on a par otherwise?

Mr. ELY. I cannot answer it in quite that way. We say that the rights established under the Boulder Canyon Project Act, and power contracts made thereunder cannot be lawfully interfered with by the withholding of water at Glen Canyon or other upstream dams, solely for power generation.

Mr. BENNETT. Would you say that that would depend on the interpretation of article IV (b) of the compact?

Mr. ELY. No.

Mr. BENNETT. Even in view of the limitations in the Boulder Canyon Project Act with respect to the applicability of the compact?

Mr. ELY. Let me look at article IV again before I answer it.

No. I take it your question relates to competing claims solely for power generation at Hoover Dam, and, let us say, Glen Canyon?

Mr. BENNETT. Yes.

Mr. ELY. The compact is perfectly blank on that point. The compact would require the water at Glen Canyon be released for beneficial consumptive use in the lower basin in competition with the claim of right to withhold for power generation at Glen, but the right of the Hoover Dam power contractors to have the power delivered to them at Hoover and not interfered with by retention of the water at Glen Canyon for power generation derives from the terms of the Project Act and their contracts, I would say, and not from the terms of the Colorado River compact.

Mr. BENNETT. That again, of course, depends on whether or not the section of the Boulder Canyon Project Act incorporating the terms of the compact is so construed; is that correct?

Mr. ELY. Yes; but there is nothing in the compact which gives to the Secretary or to the upper-basin States, in our view, the right to withhold water for power generation, as against the right for power generation established by Government contract in the lower basin. We deny the right of the Secretary to withhold that water from power generation at Hoover for power generation at Glen, based upon any right that he may claim derived from the Colorado River compact.

Mr. BENNETT. Then also do I understand that you deny the right of the upper-basin States to build storage reservoirs for holdover purposes, in order to make possible the use of the apportionments made to them, whatever those apportionments may be under your definition or anyone else's definition?

Mr. ELY. No; we do not. We don't reach that problem in this bill, if we assume correctly that the total consumptive use of the section 1 projects may be accomplished without any holdover storage whatever.

Mr. BENNETT. In your statement you made considerable reference to the varying theories of measurement of the uses of water under the compact.

That is a very serious problem as between California and Arizona. I think everyone on the committee recognizes that. However, I would like again to emphasize that, even according to your own engineers' estimates, the maximum amount of difference that that would make in use of the upper-basin apportionment is no more than 300,000 to 500,000 acre-feet of water per annum. Is that correct?

Mr. ELY. I think that is substantially correct. I have heard larger figures, but I think that range is fair enough.

Mr. BENNETT. Is it not true that the principal impact of that varying interpretation is wrapped up in the issue of the Gila water uses in Arizona?

Mr. ELY. That is where the big dispute is. The dispute on that river, however, affects the upper basin. I will not attempt to spell it out here, but the question of how much of the 75 million III (d) water is surplus is affected by the question of whether the III (a) uses on the Gila are measured at 1 million or 2 million.

Mr. BENNETT. You will concede then that there are no projects authorized for construction in S. 500 which would push the consumptive uses of water in the upper basin above the 7,500,000 apportionment, even after taking into account all the limitations and restrictions under the compact?

Mr. ELY. I think that is what I said in my prepared statement.

Mr. BENNETT. Is it your understanding that the plan of the Bureau with respect to the storage units involved in this bill is based on supplying average figures over a 20- to 35-year period, derived from this table to which you referred earlier?

Mr. ELY. I think maybe we are talking about two different things. The holdover storage, as I understand it, is calculated on the assumption that water could be successfully held over from 20 to 35 years. Is that your question?

Mr. BENNETT. Yes.

Mr. ELY. However, I don't want to get in too much detail in trying to amplify that answer. It is an engineering subject and is rather complicated.

Mr. BENNETT. But it is your contention that the project before this committee involves an assumption that supplying 7½ million acre-feet of water on a 20- to 35-year average is what the Bureau claims it can do and still meet its obligations to the lower basin? Is that your contention?

Mr. ELY. No. I think we are at cross purposes here. If I understand correctly, the Bureau now assumes that the obligation under the contract of the lower basin at Lee Ferry is only 75 million acre-feet every 10 years, and that the upper basin may keep and use everything else. It proposes to use, as "apportioned," as much as 9,400,000 in some years.

We say the reverse; that the upper basin may use up to 7½ million in any 1 year and everything else must come downstream.

As I mentioned earlier, the contention of some upper basin spokesmen seems to go further, that they are not obligated to deliver 75 million acre-feet in 10 years if that would interfere with their use of 7,500,000 per annum.

Mr. BENNETT. Here again we come back to the point that the section 1 projects would not come anywhere near using 7,500,000 acre-feet of water in the upper basin; is that correct?

Mr. ELY. There is no argument about that. The trouble is with the built-in assumptions and interpretations that go with those projects. If this bill involved only the section 1 projects, and stopped at that point, much of this discussion would not be necessary.

Mr. BENNETT. You indicate your fears arising out of the present litigation between Arizona and California. With respect to the burden both on California and the upper basin in meeting the Mexican Treaty obligations. Would you say that on the average that burden would be anything like 750,000 acre-feet per year, so far as the upper basin is concerned?

Mr. ELY. If Arizona wins the lawsuit, it is. If Arizona is right, the 75 million is the same as the 7,500,000. It is all apportioned. There is no water for Mexico in it. At once the upper basin has to add 750,000 acre-feet or more per year.

Mr. BENNETT. Does that assume there would be no return flow at the Mexican border?

Mr. ELY. We think that that is why Arizona is wrong, that you cannot identify the 75 million and the 7,500,000 that way because, if the lower basin diverts 75 million in 10 years, we surely are not charged with all that, because we are entitled to credit for return flow, and if that was the full resource of the lower basin, then by diverting 75 million in 10 years we would not get the beneficial consumptive use of 7,500,000 per year. The Bureau of Reclamation and the State Department told the Senate that they expected, I think, 900,000 acre-feet per annum of return flow at the Mexican border. You cannot make the books come out right on Arizona's theory, no matter how you treat the Gila, but there is no use arguing the case here.

Mr. BENNETT. On page 20 of your statement, you repeat, for I think the second time, the allegation that the upper basin view is that if it allows 75 million acre-feet of water each 10-year period to pass Lee Ferry, it is entitled to keep and use what is left.

Are you aware of any responsible water authorities in the States, or say, members of responsible congressional committees, who assert that broad a claim in the upper basin?

Mr. ELY. Yes, I have heard much broader claims asserted here in the last few days, namely, that you do not even have to let down the 75 million if it encroaches upon the upper basin use of 7,500,000 per year.

While you were not speaking from manuscript the other day, I gathered that your interpretation was that the 75-million guaranty in III (d) and the 7,500,000 apportionment to the upper basin in III (a) had to be read together, and that the 75 million did not necessarily take preference over the 7,500,000. So I would say that the answer to your question is "Yes," there are responsible spokesmen who do go this far, and further.

Mr. BENNETT. If there was any lack of clarification in my statement, I would like to point out that I was directing myself to only one point; namely, the effect of article III (e) on article III (d). I was pointing out that your interpretation placed on article III (e) would make the accomplishment of article III (d) impossible, so far as

the upper basin was concerned, without charging some water to meet that III (d) requirement to the upper basin's own water apportionment of 7,500,000.

I did not intend by any means to express any opinion that the commitment in article III (d) is not an independent commitment. I was not dealing with that point.

Mr. ELY. I am glad to hear that.

Mr. BENNETT. Is it your contention that this bill would authorize the operation of the projects in such a manner as to permit anyone to hold back water for the generation of power, even though there were needs for that water for domestic or agricultural purposes in the lower basin?

Mr. ELY. Yes, if the proponents say the obligation is only to let down 75 million in every 10-year period, and withhold the balance for power generation. The requirements in the lower basin are in excess of 75 million every 10 years for agricultural and domestic use. Part of it is admittedly excess or surplus.

Mr. BENNETT. We are speaking here of course of the projects which would be authorized in this bill.

Mr. ELY. I suppose by that you mean the six storage dams, as well as the participating projects, and my answer is related primarily to the storage projects.

Mr. BENNETT. Then again you would want to reiterate your position that you do not think section 12 of this bill is actual protection for agricultural and domestic users in the lower basin even though the total uses out of the main stem of the river are only around 6 million acre-feet of water at the present time.

Mr. ELY. Yes; it is not adequate protection, in my view.

Mr. BENNETT. You say "Not adequate protection"?

Mr. ELY. I said "Not adequate protection."

Mr. BENNETT. I think the committee is probably very much interested in having your ideas with respect to what would be adequate protection, since a good deal of the language of section 8 and section 12 is paraphrased from amendments which California people suggested last year.

I know we would be interested at the Department. I cannot speak for the committee.

Senator ANDERSON. I would supplement that and say that the committee would be very happy to have suggestions on it. The other day Governor Johnson opened up a whole new field when he suggested that there was no way to get the money out of the pot after it was put in there. That possibility had never occurred to me, certainly, and I doubt if it occurred to anybody else on the committee. There surely is no objection in trying to clarify it. There may be some points here that we can clarify without too great difficulty.

Mr. ELY. What we had in mind was that we would submit to Senator Kuchel, language which, if he approves it, he might take up with the committee at an appropriate time, to take care of some of these points. I would not want to attempt to spell them out off the cuff, but in general, what we are seeking is the language which will carry out what our witnesses have said here today, the adequate and, so far as we can, complete protection of our water rights.

Senator ANDERSON. In order that there may be no misunderstanding on the time schedule, may I say to you that I hope to have

the transcript ready for the printer within 10 days or possibly within 1 week from the present time, and to start having subcommittee consideration of it afterward. Senator Kuchel is not a member of this subcommittee, and he might ordinarily miss those things. We will try to make sure that he does have it, but, in any event, when you submit them to Senator Kuchel, will you make sure that the clerk of our committee has a copy of them as well, if that is agreeable to you.

Senator KUCHEL. What do you do then? Do you have executive hearings of your subcommittee?

Senator ANDERSON. Yes.

Mr. ELY. If Senator Kuchel approves, he can pass them on.

When I answered before "to protect our water rights," I should have included there and would like to amend my answer to say "and the rights under our power contract."

Mr. BENNETT. On page 21 your attention was called previously to the statement that the upper basin claims a right to deprive the lower basin of all waters in the main stream in excess of 75 million acre-feet each 10-year period. This appears several times in your statement, and for that reason I bring it up again.

Senator KUCHEL. Where are you reading?

Mr. BENNETT. The bottom of page 21 and the top of page 22. It is not your contention, however, that the projects authorized in section 1 would in anyway involve using all the water in the river in excess of 75 million acre-feet in any 10-year period. In fact they will not come anywhere near using 75 million.

Mr. ELY. Let me emphasize that this result would happen to us at once in consequence of the construction of storage reservoirs. It would persist for a protracted period of filling and thereafter would be a continuing and recurring threat against the permanency of our water rights. If it can be done once, it can be done again, and the bill declares the intention to do it again through the completion of more participating projects, at a later time.

Senator ANDERSON. I do want to put in the record at that point, however, that the Upper Colorado River Basin Commission has never made any such claim, and I just asked Mr. Wood, to be sure that we had it. So far as I know, no State official has made it and no Commission has made it. I realize your anticipation that it possibly could be made at a future date.

Mr. ELY. Of course, without protracting the discussion, we all realize that was said here the other day by some of the upper basin spokesmen present, that the 75 million acre-feet guaranty does not take precedence over the 7,500,000 apportionment of the upper basin, carries with it that implication.

Mr. BENNETT. Could the statements to which you refer also have means merely that the upper basin was asserting a right to use the full 7,500,000 if there were adequate storage to meet the commitments to the lower basin, whatever they might be?

Mr. ELY. What the ultimate position of the upper basin States may be, I am unable to say. We hope to find out, if we can force them to file pleadings in our lawsuit.

Mr. BENNETT. However we are trying to find out here just one question, and that is whether we have to find out all those things in order to authorize the projects named in section No. 1.

Mr. ELY. If I may say so, I think it is to the interest of the Congress to wait until you do see the formal position of the upper basin States in their pleadings.

Mr. BENNETT. At one point your fears with respect to section 2 of the bill, the declaration of policy, led you to point out the possibility of transmountain diversions of 2 million acre-feet per year in the State of Colorado alone, if I remember correctly?

Mr. ELY. Yes, sir.

Mr. BENNETT. None of these projects to which you refer here are authorized in this bill, are they?

Mr. ELY. I think you are correct. I am referring to the inventory in House Document 419. Some of them are built or building or pending under other acts of Congress.

Mr. BENNETT. On page 25, in your conclusion, you summarize by saying that "The Colorado River storage project, as now planned"—and I assume that does not refer to just the projects in section 1 of this bill, but is the entire project plan as it was reported in 1950; is that correct?

Mr. ELY. That is correct, including the immediate impact of the withholding of the water in storage dams during the filling period.

Mr. BENNETT. Could you break down your estimate of the encroachments upon the compact amounting to 2 million acre-feet per year, so far as these individual issues are concerned? I believe we started with somewhere between 300,000 and 500,000 on the basis of different methods of measurement.

Mr. ELY. While there are others, there are two that make up the major part of that. Roughly 500,000 acre-feet is on account of the difference in measurement of consumptive use as between the depletion theory and measurement at the site of use. The other major item is the substitution of the average for the annual limitation of 7,500,000 acre-feet. I should say with respect to the latter that there is a further complication, that the assumption of the Bureau, I understand, from our engineers, is apparently that the use of water in the upper basin will be higher in the wet years and lower in the dry years, which we do not completely follow, and which makes it rather difficult to evaluate the forecasts of actual use.

I should add that the immediate impact, as compared with the long-term effect, results from the apparent intention to release to use only 7,500,000 acre-feet per year from Glen Canyon during the filling period instead of the quantity assumed in our power and water contracts and the Mexican Water Treaty, which approximates 10 million a year.

Mr. BENNETT. In the driest 10-year cycle so far, you referred to in your statement, the flow at Lee Ferry was more than 100 million acre-feet of water over a 10-year period; is that correct?

Mr. ELY. That is correct.

Mr. BENNETT. That assumes a depletion of around 2,500,000 acre-feet per year at that time in the upper basin?

Mr. ELY. 2 million to 2,500,000.

Mr. BENNETT. In which decade was that?

Mr. ELY. 1931 to 1940.

Mr. BENNETT. In that period, presumably you would have had 25 million acre-feet available for storage. Is that your deduction?

Mr. ELY. 100 million came past Lee Ferry after the upper basin used during that period 20 million to 25 million.

Mr. BENNETT. One other point:

Some emphasis was given to Indian rights in your statement. You are aware of the fact, are you not, that there was a schedule of Indian claims attached to the pleading of the United States in the litigation, *Arizona* v. *California*?

Mr. ELY. Yes, sir.

Mr. BENNETT. Do you recall offhand the approximate total of diversions claimed on tributaries of that stream which would never be available in the main stream?

Mr. ELY. I do not have the Government petition here. Do you have a copy?

Mr. BENNETT. I do not have a copy of the petition. I understand this is the same chart, but I am not certain of that.

However, if these figures are accurate, which I have in front of me, and which were supplied by the Office of Indian Affairs, the diversions on the Gila River Basin would be 740,000 acre-feet of water.

Would you say that those diversions could in any way affect the uses of water in the upper basin, even if the United States contentions were sustained?

Mr. ELY. Yes, I do. The whole business of Indian claims is highly dangerous, whether the claims are on the tributaries or the main stream.

If the United States can claims water for the Indians outside the compact and ahead of it, then it is entitled to that much water irrespective of the claims of the State of Arizona.

Arizona seeks to acquire title to 3,800,000 acre-feet of water. She says 1 million of that is III (b) water, all in the Gila, and 2,800,000 in the main stream, all III (a) water.

The question squarely came up before the master in our one meeting with him when we insisted that the United States make its position clear, either that these claims are in or out of the compact, and we wanted them proven along with Arizona's claims, before we had to answer the case of either of them.

The Arizona representative at that time indicated—and I am referring to memory, not to anything written before me—that Arizona could not live with the result if the Indian claims were chargeable against her share of compact water, unless she got the full amount she was claiming. Consequently the question of whether Indian claims on the Gila are or are not counted in the total uses, which in turn determines the total amount of surplus—does affect the upper basin, with respect to the Mexican burden.

Mr. BENNETT. At the most that would be half of 1,500,000 acre-feet of water per year.

Mr. ELY. I do not have the tabulation before me.

Mr. BENNETT. I am speaking of the Mexican burden, since the impact presumably is on the Mexican burden. I am thinking that the maximum would be 750,000 that it might cost the upper basin.

Mr. ELY. I just would not attempt to translate it. The effect of the Indian claims is too large an enigma.

In the lower basin we know the claims of diversion rights, whatever that means, are 1,700,000, and in the upper basin we have seen

tabulations running about 1 million. What they will claim I do not know.

Senator ANDERSON. Before Senator Kuchel starts in I want to say, Mr. Ely, that I appreciate very much your courtesy in permitting me to have Mr. Bennett make these interrogatories. Unfortunately the chairman of the subcommittee this year is not a lawyer, and when it came to these legal questions I felt that I could not do it.

The matter of the Department of the Interior and the Bureau of Reclamation is involved, and I thought that the legal counsel might properly do it.

I think if you wanted to properly insist upon your rights, you could have refused to answer the questions, and I therefore appreciate your courtesy in allowing us to develop information on this. That is the purpose of the questions, and I just wanted the record to show that I appreciated very much your courtesy in this matter.

Mr. ELY. Thank you, Senator Anderson. From the way you have cross-examined me and other California witnesses, I think you are a highly competent cross-examiner. Mr. Bennett's questions have been very courteous and fair, and it has been a pleasure to try to answer them. The proceeding has been entirely in order.

Senator ANDERSON. Senator Kuchel?

Senator KUCHEL. I have a request to make of the chairman, but, first, I am going to say, Mr. Ely, I think not only your statement but the discussion here has pretty well indicated the thoroughness on which you and the people of our State base their contentions in this case. It will be of extreme help to me in presenting those views later on.

Senator ANDERSON. With reference to the request made by Senator Kuchel in this morning's session for certain material from the Department of the Interior and the Bureau of Reclamation, in order that the fullest possible information shall be available, the request can be modified or extended by Mr. Ely, representing the State of California when the request is made of the Department.

Senator KUCHEL. Can that be done by letter form, with a copy sent to the committee for its records? Then we will be specific.

Mr. ELY. We will do it in that way. What we would like to specifically request to have amplified is to include the dates when construction would be started on each unit, including not only the storage dams but the participating projects. If other participating projects are to be considered by way of amendment, then we would like to have the same information on that. We would like to have the date of construction to be completed, and operations started, as well as the allocation information requested this morning, and we particularly want to see the payout schedules, as to how the expectation will be carried out that Mr. Larson expressed, the power and irrigational allocations should be repaid concurrently.

Senator ANDERSON. If there is no objection to those requests, they will be made a part of the record.

Mr. BENNETT. I want to make one statement. I do not know that we necessarily have all that information, for all of the storage units in this bill, for the reason that the Department recommended authorization of 2 of those 6. I am not sure that we can have all that information available in the time that Senator Anderson wants it, but we will certainly give you everything we have.

Senator ANDERSON. All we can request is what information you can supply. Angels can do no more. And if any additional information is desired, Senator Kuchel, it shall be done by letter addressed to me, so that there will not be any question as to what has been requested and what we supplied.

Mr. ELY. We may have some supplemental questions on water operations of the project, which we will try to cover by letter.

Senator KUCHEL. Just one more thing that I think we can clear up now, because one of the agencies in Los Angeles is most interested in the data respecting Glen Canyon Dam.

Mr. Larson very graciously had photostated a copy of the December 5, 1949, Bureau of Reclamation report from Denver, Colo., on Glen Canyon, including certain technical data.

I wanted to be sure that if there was anything in addition to this subsequent to this report that was available, the record would have it included in it.

If the field reports are not to be reduced to writing, we cannot have them. I reacognize the burden placed on the Department in this request, but to the extent that there might be any more additional. I would like to ask for them.

Frankly, I do it because of the apprehension that was raised by the letter of the Secretary to which I referred the other day.

May I then request, Mr. Chairman, that if there are any further data in any of the field offices that can be made a part of the record, that they likewise be included?

Mr. BENNETT. I do not know whether we have any more or not, but we will look for it.

Is that all?

Senator KUCHEL. This is all I have, what is right in front of me, and I would like to submit this, Mr. Chairman, for the record, and then repeat my request that if there is any further information on Glen Canyon by way of reports or otherwise that could be added to the record, I would like that the Department furnish those to the committee for the hearing and the report.

Senator ANDERSON. I do not wish to object to this, but are we going to put the reports on every one of these projects in the record?

Senator KUCHEL. No; this is on Glen Canyon only. It was raised primarily by reason of the Secretary's letter in which he raised some serious questions, we thought, with respect to Glen Canyon.

Senator ANDERSON. Very well. I announced before these reports came in when I hoped to go to press with this report, and if we get caught in furnishing materials that run beyond that date it is just too late, because we are trying to get these things underway.

Senator KUCHEL. I would like to ask the chairman if the information is not available at printtime, that it be made available to the chairman and thus to the Members of the Senate.

Senator ANDERSON. With that understanding, these things will be done.

(See letter, p. 555.)

Mr. ELY. Mr. Chairman, may I add as exhibits to my statement a number of items?

I would like to include, if you will be so indulgent, a copy of our motion to join the upper States, our brief in support of that position, our reply brief, a resolution of the Colorado River board in opposi-

tion to the legislation of last year, and a list of the organizations which have filed resolutions in opposition.

Senator ANDERSON. Let me understand. If we start in, do we put in all the pleadings in this case, or how much?

Mr. ELY. That is up to you, of course, Mr. Chairman.

Senator ANDERSON. I have tried, Mr. Ely, to not burden these records with a lot of material that is available elsewhere. I am not trying to shut you off.

Mr. ELY. I realize that.

Senator ANDERSON. If you will try to see that we get in here material that is not easily available elsewhere, then I have no objection to it, but I would hate to reprint documents because it just leads to going back and forth. You put yours in and Arizona puts in theirs and you say "We subsequently issued another brief on that."

Mr. ELY. I think your comment is perfectly fair. Suppose we furnish you for each member of the committee, copies of our briefs. If the other side wants to do the same, they are welcome to do so, and I would suggest that we simply ask to have printed here the statement of issues which attempts to summarize it.

Senator ANDERSON. I appreciate that, and it will be done in that fashion.

IN THE SUPREME COURT OF THE UNITED STATES

OCTOBER TERM, 1953—NO. 10 ORIGINAL

STATE OF ARIZONA, Complainant, *vs.* STATE OF CALIFORNIA, PALO VERDE IRRIGATION DISTRICT, IMPERIAL IRRIGATION DISTRICT, COACHELLA VALLEY COUNTY WATER DISTRICT, METROPOLITAN WATER DISTRICT OF SOUTHERN CALIFORNIA, CITY OF LOS ANGELES, CALIFORNIA, CITY OF SAN DIEGO, CALIFORNIA, AND COUNTY OF SAN DIEGO, CALIFORNIA, Defendants. UNITED STATES OF AMERICA, Intervener.

SUMMARY OF THE CONTROVERSY (EXHIBIT A)

(As appended to Answer of California Defendants to Petition of Intervention on Behalf of the United States.)

The pleadings filed by Arizona, Nevada, the United States, and California, to date, disclose complex questions of fact and law, many of which are interrelated. The summary of principal questions presented below is divided into four parts: (I) the quantities of water in controversy; (II) the ultimate issues, from the standpoint of the respective prayers; (III) a tabulation of factual issues; and (IV) the issues of interpretation of the basic documents involved. Under this division, certain questions reappear and to this extent reflect the interlocking nature of the problem.

I. THE QUANTITIES OF WATER IN CONTROVERSY

The United States seeks to quiet title to rights to the use of water, consumptive and otherwise, "as against the parties to this cause," for federal purposes, in unstated amounts.

Arizona seeks to quiet title to the beneficial consumptive use of 3,800,000 acre-feet per annum of the waters of the Colorado River System (measured by "man-made depletion of the virgin flow of the main stream") and to enjoin California's right to permanently use any water in excess of approximately 3,800,000 acre-feet per annum (measured by "diversions less returns to the river"), that being the effect of (1) reducing 4,400,000 acre-feet of III (a) water by reservoir losses, and (2) denying California any permanent right to use excess or surplus waters.

California asserts a right to the beneficial consumptive use in California of 5,362,000 acre-feet per annum of the waters of the Colorado River System (measured by "diversions less returns to the river") under contracts with the United

States, comprising 4,400,000 acre-feet of the waters apportioned by Article III (a) of the Colorado River Compact and 962,000 acre-feet per annum of the excess or surplus waters unapportioned by the Compact, including in such excess or surplus the "increase of use" permitted to the Lower Basin by Article III (b) of the Compact.

Nevada seeks to quiet title to 539,100 acre-feet per annum (measured in part by both methods) of the beneficial consumptive uses apportioned by Article III (a) of the Colorado River Compact, and to not less than a total of 900,000 acre-feet from all classes of water.

As the States differ in their definition of "beneficial consumptive use," their claims require restatement in terms of a common denominator in order to evaluate their effects. Thus:

The quantity to which Arizona seeks to quiet title, 3,800,000 acre-feet per annum, measured by the method she urges, "depletion of the virgin flow of the main stream occasioned by the activities of man," is equivalent to more than 5,000,000 acre-feet measured by consumption at the site of use or "diversions less returns to the river," the standard established by the Boulder Canyon Project Act and asserted by California. The difference is due primarily to the fact that under Arizona's interpretation, the Compact deals with the virgin flow in the main stream only and that the use of water "salvaged by man' is not charged as a beneficial consumptive use, whereas under California's interpretation the Compact deals with the waters of the entire river system and such salvage is so charged.

Conversely, the aggregate of the California contracts, 5,362,000 acre-feet per annum, measured by "diversions less returns to the river," is equivalent to only about 4,500,000 acre-feet measured by "man-made depletion" (without charge for salvaged water). If Arizona's prayer should be granted, California's rights would be reduced to about 3,800,000 acre-feet per annum, measured by "diversions less returns to the river," or to about 3,000,000 acre-feet measured in terms of "depletion of the virgin flow of the main stream."

The impact of Nevada's claims on those of othe other states is not readily evaluated.

II. ULTIMATE ISSUES

The ultimate issues, in the sense of the results sought by each party, may be grouped as follows:

The United States

Does the United States have rights, "as against the parties to this cause, to the use of water in the Colorado River and its tributaries" in the following categories?

(1) for consumptive use of all projects in the Lower Basin, which it asserts independently of any rights claimed by the States in which such projects are located;

(2) to fulfill its obligations arising from international treaties and conventions; but this involves, with respect to the burden of the Mexican Water Treaty, the obligations as between the States of the Upper Division and the States of the Lower Division under Articles III(c) and III(d) of the Colorado River Compact, and involves also the effect of the so-called "escape clause" of Article 10 of that Treaty, which allows reduction in the guaranteed deliveries to Mexico, in the event of extraordinary drought, in the same proportion as consumptive uses in the United States are reduced, "consumptive uses" being defined in Article 1 of the Treaty;

(3) to fulfill all its contracts for the delivery of water and electric power, i. e., with or in Arizona, California, and Nevada; but it alleges that the water available is not sufficient to satisfy all these obligations;

(4) to fulfill the Government's obligations to Indians and Indian Tribes; but this involves not only the questions of the magnitude and priorties of these claims but the questions of whether or not they are chargeable under the Colorado River Compact to the Basin and State in which such uses are made, what the obligation of the Upper Division States may be to release water for use by Indians in the Lower Basin, and what rights the United States may have to withhold water in reservoirs in the Upper Basin for use by Indians in both Basins;

(5) to protect its interests in fish and wildlife, flood control and navigation; but such rights as it may have for these purposes may require the impounding and release of water from reservoirs in both Basins, and not

merely reservoirs bordering or within Arizona and California, and again involves the question of accounting under the Compact; and

(6) for use of the National Park Service, Bureau of Land Management, and Forest Service; but if the United States has claims " as against the parties to this cause" for these functions, such claims apply to all the waters of the Colorado River System in both Basins.

The adjudication of these claims of the United States requires consideration and resolution of: questions of fact, referred to later; the power of the United States to impound and dispose of water independently of rights derived from the States; the extent of its obligations under treaties and contracts; the impact and effect of its treaties upon rights of domestic water users; how its claims to the use of water shall be measured; the location, magnitude and priorities of Indian claims, and claims for other alleged federal purposes; the extent to which its rights and obligations are controlled by the Colorado River Compact; and the extent to which its claims may be exercised in futuro in derogation of intervening rights and uses.

Arizona

Is Arizona entitled to a decree?

(1) Quieting title to 2,800,000 acre-feet per annum of the beneficial consumptive uses apportioned to the Lower Basin by Article III (a) of the Colorado River Compact, substantially all to be taken from the main stream, and measured in terms of man-made depletion of the virgin flow of the main stream?

(2) Quieting title to all of the 1,000,000 acre-feet per annum by which the Lower Basin is permitted to "increase its use" by Article III (b) of the Colorado River Compact (notwithstanding the decision of this Court in *Arizona* v. *California et al.*, 292 U. S. 341 (1934)), to the exclusion of the other States of the Lower Basin, all to be taken from the waters flowing in the Gila River, and to be measured in terms of man-made depletion of the virgin flow of the main stream?

(3) Reducing California's right to the uses apportioned by Article III (a) of the Colorado River Compact to approximately 3,800,000 acre-feet per annum, in consequence of reservoir losses?

(4) Enjoining California's right to receive and permanently use under its government contracts 962,000 acre-feet per annum, or any part thereof, in excess of 4,400,000 acre-feet per annum?

The determination of Arizona's claims involves: the questions of fact, later referred to; the standing of Arizona to seek a declaratory decree quieting title to a "block" of water for projects not yet constructed or authorized (about 1,600,000 acre-feet per annum of the 2,800,000 claimed from the main stream); the source of title to Arizona's claims to 2,800,000 acre-feet of III (a) water and 1,000,000 acre-feet of III (b) water; the status of the uses on the Gila; the measurement of uses thereof and of the main stream; whether Arizona's status is that of a party to the Colorado River Compact or that of a third party beneficiary of the Statutory Compact between the United States and California, and if so, whether Arizona is bound by the interpretations placed thereon by the principal parties thereto in its formulation and administration; and the validity and effect of Arizona's water delivery contract with the United States.

Most of the questions posed by Arizona's claims revolve around the issue of whether the Gila River shall be treated as a part of the Colorado River System for all purposes, or shall receive special treatment in respect of (1) the identification of uses thereon with the waters referred to in Article III (b); (2) the corollary exemption of "rights which may now exist" on the Gila from any charge under Article III (a); and (3) the devaluation of the charge for beneficial consumptive uses from the quantity which is in fact consumed on the Gila (alleged by California to be about 2,000,000 acre-feet per annum) to the lesser quantity represented by the resulting depletion in the virgin flow of the main stream (alleged by Arizona to be about 1,000,000 acre-feet per annum).

California

Are the contracts between the United States and the defendant public agencies of California for the storage and delivery of water valid and enforceable? Inasmuch as these contracts are, in terms, for permanent service but subject to the Colorado River Compact, the Boulder Canyon Project Act and the California Limitation Act, the issue is whether these enactments, considered together as a Statutory Compact established by reciprocal legislation, authorize and permit the Secretary of the Interior to presently contract for the storage and delivery for permanent beneficial consumptive use in California, of 4,400,000

acre-feet per annum of the waters apportioned by Article III(a) of the Colorado River Compact plus one-half of the excess or surplus waters unapportioned by the Compact, including in such excess or surplus the "increase of use" permitted to the Lower Basin by Article III(b) of the Compact. The aggregate of these contracted quantities, subject to physical availability of the amounts of excess or surplus waters, which vary from year to year, is 5,362,000 acre-feet per annum.

The determination of California's claims involves: the questions of fact, later referred to; the extent to which rights have vested in both the United States and California under the Statutory Compact; whether Arizona is estopped by her previous conduct from asserting her present position; whether the limitation is net of reservoir losses; how California's uses shall be measured; whether California is chargeable with the use of salvaged water; the effect of California's appropriations in their relation to the expressions "rights which may now exist" and "present perfected rights" in the Compact and Project Act; the definition of the Project Act term, "excess or surplus waters unapportioned by" the Colorado River Compact; the availability of such waters for permanent service; the intent of Congress with respect to the waters referred to in Article III(b); and the relation between California's contracts and the later agreements which the Secretary of the Interior has entered into with others.

Nevada

Is Nevada entitled to a decree:

(1) Quieting title to 539,100 acre-feet per annum of the beneficial consumptive uses apportioned to the Lower Basin by Article III(a) of the Colorado River Compact?

(2) Reserving for a future agreement the disposition of the use of the 1,000,000 acre-feet referred to in Article III(b) of the Colorado River Compact, and preserving to Nevada an equitable share thereof?

(3) Assuring Nevada the ultimate beneficial consumptive use of not less than 900,000 acre-feet per annum, from all classes of water?

The determination of Nevada's claims requires the consideration and resolution of: the questions of fact later referred to; the questions of interpretation previously mentioned; the question of whether Nevada's share of III (a) waters has been determined or limited to 300,000 acre-feet per annum; whether, as to stored waters, Nevada may claim any quantity in excess of her contracts with the United States; and the source of title to her claims to 539,100 acre-feet per annum of III (a) water and not less than 900,000 acre-feet per annum from all sources.

Interests of other States

There remains the question whether the claims of the United States, Arizona, California, and Nevada can be effectively determined without concurrently determining the rights and obligations of Utah and New Mexico with respect to the waters of the Lower Basin, and the rights and obligations of those States and Colorado and Wyoming with respect to other waters of the Colorado River System, to the extent that they are affected by the issues in controversy here.

In more detail, these "ultimate issues" depend upon the resolution of the following questions of fact and of the interpretation of the Colorado River Compact, the Boulder Canyon Project Act, the Statutory Compact between the United States and California, and the Mexican Water Treaty.

III. FACTUAL ISSUES

There are substantial issues of fact, raised by the pleadings to date. These include, but are not limited to, determination of:

(1) the investments and obligations undertaken by the parties in the construction of works and in the performance of their contracts with the United States, and the investments and obligations undertaken by the United States in reliance upon such contracts;

(2) the location, magnitude and priorities of the water rights necessary to enable the United States to perform its obligations to Indians and Indian tribes pursuant to Article VII of the Compact;

(3) the requirements of the United States for (a) flood control, (b) navigation, (c) fish and wild life, and (d) the other claims which it makes;

(4) the quantities of water physically available for beneficial consumptive use in the Lower Basin, assuming full use by the Upper Basin of its Compact apportionment, full regulation of the supply available to the Lower Basin, and full performance of the Mexican Water Treaty;

(5) the uses, present and potential, on the main stream and on each tributary, determined as of the place of use, as California contends is the proper method, and the effect of those uses in terms of man-made depletion of the virgin flow of the main stream, as Arizona contends is the proper method;

(6) the quantities of water "salvaged" by the activities of man, on the main stream and on the tributaries;

(7) reservoir losses, present and potential, gross and net;

(8) appropriative rights, priorities, and uses thereunder, on the main stream and tributaries;

(9) the extent and place of use of "rights which may now exist" and which, under Article III (a) of the Compact, are to be charged as uses of water apportioned by Article III (a), and of "rights which may now exist" in California, within the meaning of Section 4 (a) of the Project Act; and

(10) the extent and place of use of "present perfected rights" protected by Article VIII of the Compact and directed by the Boulder Canyon Project Act to be satisfied in the operation and management of the Project.

IV. THE ISSUES OF INTERPRETATION OF THE COLORADO RIVER COMPACT, THE BOULDER CANYON PROJECT ACT, THE STATUTORY COMPACT, AND THE MEXICAN WATER TREATY

Questions relating primarily to Article III (a) of the Colorado River Compact include the following: Whether the Colorado River Compact deals only with the main stream or treats with Colorado River System waters wherever they may be found; whether the uses apportioned by Article III (a) to the Lower Basin are to be taken only from "water present in the main stream and flowing at Lee Ferry," as Arizona contends, or from the tributaries as well, as California and Nevada contend; whether the 7,500,000 acre-feet referred to in Article III (a) is related to the 75,000,000 acre-feet referred to in Article III (d), as Arizona contends, or whether the latter figure includes excess or surplus waters, unapportioned by the Compact, as California contends; by what process Arizona claims to have acquired an apportionment of 2,800,000 acre-feet of Article III (a) water, to be taken from the main stream; whether the apportionment of 7,500,000 acre-feet "per annum" is a statement of a maximum, or of an average, and, if the latter, over what period of years; the definition and measurement of "beneficial consumptive use"; the accounting for water added to and withdrawn from storage on the main stream and tributaries; whether the use of water salvaged by man on the main stream and tributaries is to be charged under the Compact; the definition of "rights which may now exist," which are to be included in charges to water apportioned by Article III (a) and their magnitude on the main stream and tributaries; the date to which this last expresson refers; whether, in the absence of a compact among the Lower Basin States, the division of water among them is to be affected by appropriated rights, i. e., "rights which may now exist"; whether Indian rights, and other federal claims to consumptive use, are included within that expression and are to be charged under the Compact; whether reservoir losses are chargeable as beneficial consumptive uses, and if so, their classification under the Compact and their relation to other uses.

Questions relating primarily to Article III (b) of the Colorado River Compact include the following: The questions relating to the definition of "beneficial consumptive use" and "per annum" previously stated in connection with Article III (a); whether the "increase of use" permitted to the Lower Basin by Article III (b) is an apportionment in perpetuity as in Article III (a), as Arizona contends, or a license to acquire rights by appropriation and contracts under the Project Act in excess or surplus waters unapportioned by the Compact, as California contends; whether this right to increased use is identified solely with the water found flowing in the Gila River, as Arizona contends, or is identified with the first 1,000,000 acre-feet of increased use (above 7,500,000) per annum throughout the Lower Basin, as California and Nevada contend; whether this right is available to all five States of the Lower Basin, or to Arizona alone, as she contends (notwithstanding the decision of this court in *Arizona* v. *California et al.*, 292 U. S. 341 (1934)); the status of uses in New Mexico on the Gila; the status of uses on other tributaries; and to what degree reservoir losses are chargeable to this increase of use. Reference to the relation of the Mexican Treaty burden to the uses under Article III (b) appears below in connection with Article III (c).

Questions relating primarily to Article III (c) of the Colorado River Compact include the following: Whether the waters to be supplied Mexico are "apportioned" thereby (this bears upon the determination of the meaning of the

expression "excess or surplus waters unapportioned by" the Colorado River Compact, appearing in the Boulder Canyon Project Act, *infra*); whether, if the quantities in excess of those specified in Articles III (a) and III (b) are insufficient to supply the deliveries to Mexico, the burden, with respect to the Lower Basin, falls first upon the uses referred to in Article III (b), as California contends, or upon those referred to in Article III (a), as Arizona contends; and the relation of the "escape clause" in Article 10 of the Treaty, which permits reduction in deliveries to Mexico in case of extraordinary drought in proportion to the reduction in consumptive uses in the United States. The relation of Article III (c) to Articles III (d) and III (a), with respect to the obligations of the Upper Division States, is referred to below in connnection with Article III (d).

Questions relating primarily to Article III (d) of the Colorado River Compact include the following: As a corollary to one of the questions stated with reference to Article III (a), whether the 75,000,000 acre-feet referred to in Article III (d) is related to the 7,500,000 acre-feet apportioned by Article III (a) to the Lower Basin, or whether the 75,000,000 acre-feet include excess or surplus waters available for delivery to Mexico or use in the Lower Basin; the resulting effect on the obligation of the States of the Upper Division stated in Article III (c) to furnish additional water to meet the deficiency if surplus above the quantities specified in Articles III (a) and III (b) is insufficient to supply Mexico; and whether the Lower Basin is entitled to demand release of this 75,000,000 acre-feet notwithstanding the consequent inability of the Upper Basin to make beneficial consumptive use of 7,500,000 acre-feet per annum.

Questions relating primarily to Article III (e) of the Colorado River Compact include the following: whether, if excess or surplus waters are appropriated (or contracted for) in the Lower Basin, their release from storage in the Upper Basin may be required; whether, if Indian uses are not subject to the Colorado River Compact, the United States may require release of water from reservoirs in the Upper Basin to satisfy them, in addition to the water which the States of the Upper Division are required to release in performance of Articles III (c) and III (d) of the Compact; so also with respect to the other federal claims asserted by the United States "as against the parties to this cause," for use of water in the Lower Basin.

Questions relating primarily to Articles III (f) and III (g) of the Colorado River Compact include the following: whether the provisions in these articles with reference to a compact to be made after October 1, 1963, are permissive or mandatory; whether, in the light of the Statutory Compact, these provisions preclude the acquisition of rights in excess or surplus waters by appropriation and by contract with the United States in the interim, subject only to further apportionment as between Basins by such a future compact; and whether, in the event of competing interstate claims to such excess or surplus waters, in the absence of a compact apportioning them, priority of appropriation, including contracts with the United States, controls.

Questions relating to Article VII of the Colorado River Compact include the following: Whether uses by Indians are subject to the Colorado River Compact; whether Indian uses are chargeable under the Compact to the Basin and the State in which they are situate; if not, whether they are prior and superior to the apportionments made by the Compact, or are in competition with appropriations of others which are subject to the Compact; the location, magnitude, and asserted priority of Indian claims; their effect upon the quantities available to non-Indian users under Articles III (a), III (b), etc.; their effect on the distribution of the Mexican Treaty burden; and their effect on the obligations of the States of the Upper Division under Articles III (c) and III (d).

Questions relating primarily to Article VIII of the Colorado River Compact include the following: The date to which the expression "present perfected rights" relates, i. e., 1922, 1929, or some other date; the definition of said term; whether such definition is to be determined under the law of the State under which the right arose; whether the assurance against impairment extends to quality as well as quantity; the extent of these rights in each State; their relation to the expression "rights which may now exist," as used in Article III (a) of the Compact and Section 4 (a) of the Project Act; and the impact of reservoir losses when present "perfected rights" attach to, and are satisfied from stored waters, pursuant to the direction in Article VIII.

Questions relating primarily to the Boulder Canyon Project Act and the resulting Statutory Compact between the United States and California include the following: Whether the alternative consent given in the Project Act to a Seven-State or Six-State Compact became final on June 25, 1929, in establishing the latter; whether Arizona could, or did, effectively ratify a Seven-State Compact thereafter; if so, whether the Statutory Compact authorized by the Project Act as a corollary to a Six-State Compact remains in effect; if it does, whether Arizona can claim the benefits of both; whether the Statutory Compact authorized contracts to be made with the California defendants for the permanent service (in addition to 4,400,000 acre-feet of III (a) waters) of one-half of the excess or surplus waters unapportioned by the Compact for use in California; whether it included therein the waters referred to in Article III (b), or precluded California from use of such waters; whether the "excess or surplus," of which California may use one-half, is to be reckoned before or after deduction of the quantity required to be delivered to Mexico; the effect on California's right to "excess or surplus" of a future compact apportioning such waters; whether the limitation "for use in California" is net of reservoir losses, or is subject to further reduction in consequence of such losses; whether the definition of consumptive uses applicable to California is applicable to Arizona, and vice versa; whether California is free to make use of salvaged waters without charge under the Compact or the Limitation Act; the effect of California's appropriations; the meaning and effect of the reference to "rights which may now exist" in Section 4 (a) of the Project Act; the extent of California's "present perfected rights" as referred to in Section 6 of the Project Act; whether by the Project Act, or otherwise, the shares of Nevada or Arizona in the waters of the Colorado River System have been determined; and the construction and effect of the water delivery contracts held by those States.

Mr. ELY. We will not ask to have reprinted the many resolutions offered against this project when it was before you last year as S. 1555, but do ask that a list of the organizations on record as opposed to some if not all of the features or policies of this legislation be printed. Many of the resolutions were printed last year.

We also ask that you print the resolution of the Colorado River Board.

Senator ANDERSON. All right.

(The material referred to follows:)

OPPOSITION TO COLORADO RIVER STORAGE PROJECT (S. 1555, 83D CONG.)

At least some one, if not all, of the features or policies of this legislation have been opposed either during the course of the hearings, or through the submission of statements, the enactment of resolutions, or other pronouncements by the following:

Engineers Joint Council (a federation of the eight major engineering societies: American Society of Civil Engineers, American Institute of Mining and Metallurgical Engineers, the American Society of Mechanical Engineers, the American Water Works Association, American Institute of Electrical Engineers, the Society of Naval Architects and Marine Engineers, American Society for Engineering Education, and American Institute of Chemical Engineers)
American Public Power Association
Izaak Walton League
National Parks Association
The Wilderness Society
Sierra Club
The American Planning and Civic Association
National Wildlife Federation
Wildlife Management Institute

And the following California entities:

Colorado River Board of California
Imperial Irrigation District
Metropolitan Water District of Southern California
Los Angeles City Council
Department of Water and Power of the City of Los Angeles

San Diego County Water Authority
San Diego City Council
Imperial County Board of Supervisors
Imperial County Farm Bureau
Holtville Chamber of Commerce
Calexico Chamber of Commerce
Calexico City Council
Coachella Valley County Water District
Rainbow Municipal Water District, San Diego County
California State Chamber of Commerce, Southern California Council
Brawley Chamber of Commerce
Brawley City Council
Calipatria Chamber of Commerce
Westmorland City Council
Council of the City of Burbank
Board of Supervisors of Orange County
Board of Directors of the City of Pasadena
City Council of San Jacinto
City Council of Santa Ana
City Council of Torrance
City Council of Hemet
City Council of Glendale
City Council of Costa Mesa
City Council of Laguna Beach
City of Beverly Hills
City Council of Chino
City Council of Newport Beach
City Council of Compton
City Council of Ontario
City Council of Long Beach
City Council of Fullerton
City Council of Perris
Board of Supervisors of Los Angeles County
Council of the City of Anaheim
City Council of Santa Monica
City Council of San Marino
City Council of Fontana
City Council of Upland
Council of the City of Pomona
City Council of El Centro

Also:

Central Labor Council of Los Angeles
Railroad Brotherhood's Joint Legislative Council of California
Executive Committee, California State Grange
Property Owners' Association of California, Inc.
And the Los Angeles Clearing House Association

In addition, taxpayers' associations throughout the country have expressed alarm at the tremendous burden this legislation will place upon citizens everywhere to subsidize this project.

RESOLUTION OF THE COLORADO RIVER BOARD OF CALIFORNIA, JUNE 2, 1954

The Colorado River Board of California opposes the enactment of S. 1555 and H. R. 4449, 83d Congress, bills to authorize the Secretary of the Interior to construct, operate, and maintain initial units of the Colorado River storage project and participating projects, and for other purposes.

California favors the continuation of the development of the water resources of the Colorado River Basin on a sound economic basis, as the need for such development occurs. This State recognizes the right of the upper basin States to so utilize the waters apportioned to that basin by the Colorado River compact as approved by the Boulder Canyon Project Act, but subject to the terms and conditions of those documents as the Supreme Court may construe them in the case of *Arizona* v. *California* now pending.

By the same token, California, in the protection of its investment of nearly $700 million in water development projects which it has made in reliance upon the Colorado River compact and the Boulder Canyon Project Act, and the economy

and population of more than 4 million people dependent upon these works, must resist legislation which would encroach upon the rights recognized in the lower basin States by those documents.

The proposed Colorado River storage project legislation adversely affects the lower basin States in much the same way as would the proposed central Arizona project legislation. Both are based upon interpretations of the Colorado River compact and the Boulder Canyon Project Act with which California cannot agree and which are now at issue in the United States Supreme Court. Each of them contemplates developments which would encroach upon the Compact and Project Act, as interpreted at the time of enactment of those laws, to the extent of more than a million acre-feet per year. Both proposals are based upon unrealistic water supply estimates. Each is in conflict with the presentation made to the Senate by the supporters of the Mexican Water Treaty. Each ignores the legal claims which are in conflict with it, and both ignore the damage which their construction would cause to the investments already made by their neighbors. Each of these proposals is dependent upon Federal subsidies for irrigation amounting to many times the value of the land when fully developed, and most of these subsidies are concealed. Both would commit the Congress to new feasibility standards and pay-out formulas with which this Board and other California State agencies have officially expressed disapproval.

The Colorado River storage project would intercept the lower basin's water supply with giant reservoirs at Glen Canyon, Echo Park, and Curecanti, capable of storing several years' flow of the river. In the absence of statutory controls of the operation of such reservoirs designed to protect the output of firm power at Hoover Dam, upon which the United States and the power contractors relied, the use of such large storage could result in seriously curtailing the revenues at Hoover Dam and other dams on the lower river and upon which these lower projects depend for financing. It is against the best interest of both the power users in the lower basin and the Federal Treasury to so legislate.

Both Glen Canyon and Echo Park Reservoirs would be located downstream from any point of use by the proposed irrigation projects in the upper basin and their major purpose would be to provide revenues, commencing almost 50 years hence, to pay the capital cost, without interest, of the irrigation projects proposed for construction now. This postponement for nearly 50 years from the commencement of repayment of irrigation would result in a Federal subsidy amounting to over $2,500 per acre of irrigated land—an unwarranted and unjustified burden on the Nation's taxpayers.

California, as a major taxpaying State, is doubly affected, for the amount of the overdraft on the water supply of the Colorado River Basin is directly related to the amount of Federal subsidy to the irrigation projects creating the overdraft.

The bills delegate to the Secretary of the Interior power to resolve the feasibility of the participating irrigation projects. If reclamation feasibility standards are to be changed, that should be done by Congress, in general legislation, after the Hoover Commission has had an opportunity to report upon this very matter, heretofore committed to their study.

The proposed legislation includes some, and foreshadows other, large transmountain diversion projects in the upper basin using several million acre-feet of water annually, thereby impairing the quality as well as the quantity of the water available to the lower basin and to which the lower basin is entitled under the Colorado River compact.

For all these reasons, the Colorado River Board of California respectfully requests the representatives of this State in the Senate and House of Representatives of the United States to oppose the enactment of legislation to authorize construction of the Colorado River storage project and participating projects as proposed in these bills—S. 1555 and H. R. 4449—or similar legislation, and instructs its officers and staff to make the appropriate presentation of the views of this board to the congressional committees and executive agencies concerned with such legislation.

Senator ANDERSON. In that connection, I have here a telegram that came in this afternoon from Governor Johnson and some people from Colorado.

If they all want these to go in the record, I must say we have a lot of them, and I think we would like to take a look at the final printing

and if it looks to be too expensive we would just say that resolutions had been received, and if they are not too voluminous we might print some of them. These things cost money even though they go straight to the Government Printing Office, and they come out of your pocket and mine in the last analysis.

Mr. ELY. If you decide to print resolutions, we would like to have ours printed.

Senator ANDERSON. I have a folder full of them about this thing and I have not brought them into the record because a thousand dollars is a thousand dollars, I think, saved.

Mr. ELY. Some questions have been asked here about the Central Valley project. I have telegraphed for the figures and will ask you to include a summary of that in the record.

Senator ANDERSON. They will be placed in the record at this point.

(The material referred to follows:)

CENTRAL VALLEY PROJECT DATA

1. Total investment

A. As of Jan. 1, 1955 (From Bureau report released Mar. 3, 1955. This figure does not include expenditures by Corps of Engineers to Jan. 1, 1955, on Folsom Dam of $60,669,000. If added, this would bring total project investment as of Jan. 1, 1955, to $496,074,525.)	$435,405,525
B. Estimated investment for completed project (Including all authorized units such as Trinity. This figure latest released by Bureau for total cost but no breakdown of it available at this moment. Accordingly, figures which follow based on reports as identified.)	$750,071,106

2. Date of final payout

For initial units	Year 2006.
Including Trinity and Sacramento Canals	Year 2013.

3. Surplus

$170,678,200 (With Trinity and Sacramento Canals)	Through year 2013.

4. Use of interest component or Collbran formula

The interest component is not being applied on the Central Valley project. It was shown on Bureau reports through 1953. The three most recent reports on project units (Trinity, March 1954; San Luis, August 1954; Folsom South, February 1955), however, do not show any of the interest ($101,508,300) on power or interest ($21,326,500) on municipal and industrial water as used for the repayment of any capital costs.

The Reclamation Bureau reports show that the Collbran formula is now incorporated in the planning to the extent that power and municipal and industrial revenues may be used, after allocations to these purposes have been paid out with interest to repay about 17 percent of the irrigation allocation. (See 5 and 6 below.)

5. Allocations and manner of repayment with percentages

Purposes	1 Allocations	2 Percent of total cost	3 Amount to be repaid by each purpose	4 Percent of total to be repaid (col. 3)	5 Percent of repayment to total cost
Nonreimbursable:					
Navigation	$8,055,000				
Flood control	44,999,000				
Fish	1,478,000				
Total	54,532,000	6.7	0	0	0
Reimbursable:					
Irrigation	399,378,000	49.5	$324,392,500	43.2	40.2
Power	280,221,000	34.8	346,856,600	46.1	43.1
Municipal and industrial	20,782,000	2.6	29,131,900	3.9	3.6
Total	700,381,000		700,381,000		
Distribution systems	51,455,000	6.4	51,455,000	6.8	6.4
Grand total	806,368,000	100.0	751,836,000	100.0	93.3

6. Percentage to be paid by irrigators of amount allocated to irrigation, including distribution works

	Cost	Repay
Irrigation	$399,378,000	$324,392,500
Distribution systems	51,455,000	51,455,000
Total	450,833,000	375,847,500

Percentage of repayment, to cost, by irrigators equals 83.3 percent.

Source: Foregoing material re Central Valley project based upon information received by teletype dated Mar. 4, 1955, from the office of the executive officer, water project authority, State of California.

Mr. ELY. May I ask whether the Hill report has been printed in a form that is available for the Congress? We do not agree in all respects with it, but it is highly informative. It is 61 pages long, double spaced. I think it would be an informative part of your record.

Senator ANDERSON. I surely hate to put 61 pages into the record in one big batch.

Suppose we consider it?

Before we complete, I want to just read one sentence of a letter from Herbert Hoover to Delph Carpenter. I do not say this is of extreme importance, but it is on page A–103 of the Hoover Dam documents.

Delph Carpenter was asking about the use of the additional million acre-feet and no more:

> There is nothing in the compact to prevent the States of either basin using more water than the amount apportioned under paragarphs (a) and (b) of article III, but such use would be subject to the further apportionment provided for in paragraph (f) of article III, and would vest no rights under the present compact.

That is why I sort of questioned the statement about the upper States having no rights.

Mr. ELY. There is a somewhat similar statement in Mr. Hoover's answer to Senator Hayden's questionnaire of January 1923, with which you are familiar, and I will supply that citation for the record.

(For the citation referred to, see answers to questions 10 and 16 at pp. A36 and A39 of Hoover Dam documents (H. Doc. 717, 80th Cong.).)

Senator ANDERSON. Are there any more questions?

Senator KUCHEL. No, Mr. Chairman.

Senator ANDERSON. Thank you very much, Mr. Ely, for a very fine presentation of this whole question, and I appreciate the way in which you handled it.

Mr. ELY. Thank you, Mr. Chairman, and the committee, for your patience and courtesy, as always.

Senator ANDERSON. We will meet at 10:15 in the morning.

(Whereupon at 5:20 p. m., Friday, March 4, 1955, the committee recessed until 10:15 a. m., Saturday, March 5, 1955.)

Storage below the State of Colorado is not the answer—by Hon. E. C. Johnson, former United States Senator, Colorado 251
Upper Colorado River Basin Compact of 1948 136

built. These cities as well as other cities use much water. The only solution is more water.

The San Juan-Chama project plan would provide a supplemental water supply for some 40,000 acres out of a total of about 75,000 acres in the upper reaches of the Rio Grande. It would provide a supplemental supply of water to about 24,000 acres of lands in the upper Canadian Basin; it would provide a supplemental water supply to about 180,000 acres of land along the Rio Grande from Espanola to the Texas-New Mexico State line; and it would provide a municipal and industrial water supply for cities such as Los Alamos and Albuquerque where we have large atomic energy and defense installations.

The project would also provide a domestic supply of water for the many Indians as well as whites living within the Rio Grande and upper Canadian Basins. It would enable the people living on many of the small irrigated farms to receive a full water supply for their small farms, thereby improving their standards of living. In producing more feed for their livestock on irrigated farms, it would relieve the overgrazed condition of the pasturelands which is recognized as one of the principal causes of erosion.

There are many more things that I could say about the need for constructing the Navaho and San Juan-Chama projects, but I do not wish to take up any more of your time. The upper Colorado project is vitally important to the upper Colorado Basin States, and I will lend my full support to its authorization, and I strongly urge you to include the two small projects, Hammond and Pine River extension, as well as the much-needed Navaho and San Juan-Chama projects.

Senator ANDERSON. Are there any other Members of the Senate that desire to make statements before we start our regular program?

Senator Millikin, I regret to say, is detained for a short time. We all appreciate the very wonderful work which he did in the preparation of the hearings 7 or 8 months ago and the very fine work which he did in working out an acceptable bill to be reported to the floor. I am sure he will be with us shortly again, and we will have the benefit of his advice and counsel.

Without objections at this point, I will put in the record a copy of Senate bill 500, introduced on January 18.

(Senate bill 500 is as follows:)

[S. 500, 84th Cong., 1st sess.]

A BILL To authorize the Secretary of the Interior to construct, operate, and maintain the Colorado River storage project and participating projects, and for other purposes

Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled, That, in order to initiate the comprehensive development of the water resources of the Upper Colorado River Basin, the Congress, in the exercise of its constitutional authority to provide for the general welfare, to regulate commerce among the States and with the Indian tribes, and to make all needful rules and regulations respecting property belonging to the United States, and for the purposes, among others, of regulating the flow of the Colorado River, storing water for beneficial consumptive use, making it possible for the States of the Upper Basin to utilize, consistently with the provisions of the Colorado River Compact, the apportionments made to and among them in the Colorado River Compact and the Upper Colorado River Basin Compact, respectively, providing for the reclamation of arid and semiarid land, for the control of floods and for the improvement of navigation, and the generation of hydroelectric power, as an incident of the foregoing purposes, hereby authorizes the Secretary of the Interior (1) to construct, operate, and maintain the following initial units of the Colorado River storage project, consisting of dams,

reservoirs, powerplants, transmission facilities and appurtenant works: Cross Mountain, Curecanti, Echo Park, Flaming Gorge, Glen Canyon, and Navajo: *Provided*, That the Curecanti Dam shall be constructed to a height which will impound not less than nine hundred and forty thousand acre-feet of water or will create a reservoir of such greater capacity as can be obtained by a high waterline located at seven thousand five hundred and twenty feet above mean sea level and that construction thereof shall not be undertaken until the Secretary has, on the basis of further engineering and economic investigations, reexamined the economic justification of such unit and, accompanied by appropriate documentation in the form of a supplemental report, has certified to the Congress and to the President that, in his judgment, the benefits of such unit will exceed its costs; and (2) to construct, operate, and maintain the following additional reclamation projects (including power-generating and transmission facilities related thereto), hereinafter referred to as participating projects: Central Utah (initial phase); Emery County, Florida, Gooseberry, Hammond, La Barge, Lyman, Paonia (including the Minnesota unit, a dam and reservoir on Muddy Creek just above its confluence with the North Fork of the Gunnison River, and other necessary works), Pine River Extension, Seedskadee, Silt, Smith Fork, San Juan-Chama, Navajo: *Provided*, That (a) construction of the participating projects set forth in this clause (2) shall not be undertaken until the Secretary has reexamined the economic justification of such project and, accompanied by appropriate documentation in the form of a supplemental report, has certified to the Congress, through the President, that, in his judgment, the benefits of such project will exceed its costs, and that the financial reimbursability requirements set forth in section 4 of this Act can be met. The Secretary's supplemental report for each such project shall include, among other things, (i) a reappraisal of the prospective direct agricultural benefits of the project made by the Secretary after consultation with the Secretary of Agriculture; (ii) a reevaluation of the nondirect benefits of the project; and (iii) allocations of the total cost of construction of each participating project or separable features thereof, excluding any expenditures authorized by section 7 of this Act, to power, irrigation, municipal water supply, flood control or navigation, or any other purpose authorized under reclamation law. Section 1 (c) of the Flood Control Act of 1944 shall, except as hereinafter provided for the San Juan-Chama and the Navajo participating projects, not be applicable to such supplemental reports; and, (b) that no appropriation for or construction of the San Juan-Chama project or the Navajo participating project shall be made or begun until coordinated reports thereon shall have been submitted to the affected States, including (but without limiting the generality of the foregoing) the State of Texas, pursuant to the Act of December 22, 1944, and said projects shall have been approved and authorized by the Congress: *Provided further*, That with reference to the San Juan-Chama project, it shall be limited to a single offstream dam and reservoir on a tributary of the Chama River to be used solely for the control and regulation of water imported from the San Juan River, that no power facilities shall be established, installed, or operated along the diversion or on the reservoir or dam, and such dam and reservoir shall at all times be operated by the Bureau of Reclamation of the Department of the Interior in strict compliance with the Rio Grande Compact as administered by the Rio Grande Compact Commission.

SEC. 2. In order to achieve such comprehensive development as will assure the consumptive use in the States of the Upper Colorado River Basin of waters of the Colorado River system the use of which is apportioned to the Upper Colorado River Basin by the Colorado River Compact and to each State thereof by the Upper Colorado River Basin Compact, it is the intent of the Congress in the future to authorize the construction, operation, and maintenance of further units of the Colorado River storage project, of additional phases of participating projects authorized in this Act, and of new participating projects as additional information becomes available and additional needs are indicated. It is hereby declared to be the purpose of the Congress to authorize as participating projects only projects (including units or phases thereof)—

(1) for the use, in one or more of the States designated in article III of the Upper Colorado River Basin Compact, of waters of the Upper Colorado River system the consumptive use of which is apportioned to those States by that article; and

(2) for which pertinent data sufficient to determine their probable engineering and economic justification and feasibility shall be available. It is likewise declared to be the policy of the Congress that the costs of any par-

ticipating project authorized in the future shall be amortized from its own revenues to the fullest extent consistent with the provisions of this Act and Federal reclamation law.

SEC. 3. Except as otherwise provided in this Act, in constructing, operating, and maintaining the units of the Colorado River storage project and the participating projects listed in section 1 of this Act, the Secretary shall be governed by the Federal reclamation laws (Act of June 17, 1902, 32 Stat. 338, and Acts amendatory thereof or supplementary thereto): *Provided*, That (a) irrigation repayment contracts shall be entered into which, except as otherwise provided for the Paonia and Eden projects, provide for repayment of the obligation assumed thereunder with respect to any project contract unit over a period of not more than fifty years exclusive of any development period authorized by law; (b) prior to construction of irrigation distribution facilities, repayment contracts shall be made with an "organization" as defined in paragraph 2 (g) of the Reclamation Project Act of 1939 (53 Stat. 1187) which has the capacity to levy assessments upon all taxable real property located within its boundaries to assist in making repayments, except where a substantial proportion of the lands to be served are owned by the United States; (c) contracts relating to municipal water supply may be made without regard to the limitations of the last sentence of section 9 (c) of the Reclamation Project Act of 1939; and (d), as to Indian lands within, under, or served by any participating project, payment of construction costs within the capability of the land to repay shall be subject to the Act of July 1, 1932 (47 Stat. 564). All units and participating projects shall be subject to the apportionments of the use of water between the Upper and Lower Basins of the Colorado River and among the States of the Upper Basin fixed in the Colorado River Compact and the Upper Colorado River Basin Compact, respectively, and to the terms of the treaty with the United Mexican States (Treaty Series 994).

SEC. 4. (a) There is hereby authorized a separate fund in the Treasury of the United States to be known as the Upper Colorado River Basin Fund (hereinafter referred to as the Basin Fund), which shall remain available until expended, as hereafter provided, for carrying out provisions of this Act other than section 7.

(b) All appropriations made for the purpose of carrying out the provisions of this Act, other than section 7, shall be credited to the Basin Fund as advances from the general fund of the Treasury.

(c) All revenues collected in connection with the operation of the Colorado River storage project and participating projects shall be credited to the Basin Fund, and shall be available, without further appropriation, for (1) defraying the costs of operation, maintenance, and replacements of, and emergency expenditures for, all facilities of the Colorado River storage project and participating projects, within such separate limitations as may be included in annual appropriation acts, (2) payment as required by subsection (d) of this section, (3) payment of the reimbursable construction costs of the Paonia project which are beyond the ability of the water users to repay within the period prescribed in the Act of June 25, 1947 (61 Stat. 181), said payment to be made within fifty years after completion of that portion of the project which has not been constructed as of the date of this Act, and (4) payment in connection with the irrigation features of the Eden project as specified in the Act of June 28, 1949 (63 Stat. 277): *Provided*, That revenues credited to the Basin Fund shall not be available for appropriation for construction of the units and participating projects authorized by or pursuant to this Act.

(d) Revenues in the Basin Fund in excess of operating needs shall be paid annually to the general fund of the Treasury to return—

(1) the costs of each unit, participating project, or any separable feature thereof which are allocated to power pursuant to section 5 of this Act, within a period not exceeding fifty years from the date of completion of such unit, participating project, or separable feature thereof;

(2) the costs of each unit, participating project, or any separable feature thereof which are allocated to municipal water supply pursuant to section 5 of this Act, within a period not exceeding fifty years from the date of completion of such unit, participating project, or separable feature thereof;

(3) interest on the unamortized balance of the investment (including interest during construction) in the power and municipal water supply features of each unit, participating project, or any separable feature thereof, at a rate determined by the Secretary of the Treasury as provided in subsection (e), and interest due shall be a first charge; and

(4) the costs of each unit, participating project, or any separable feature thereof which are allocated to irrigation pursuant to section 5 of this Act within a period not exceeding fifty years, in addition to any development period authorized by law, from the date of completion of such unit, participating project of separable feature thereof, or, in the cases of the Paonia project and of Indian lands, within a period consistent with other provisions of law applicable thereto.

(e) The interest rate applicable to each unit of the storage project and each participating project shall be determined by the Secretary of the Treasury as of the time the first advance is made for initiating construction of said unit or project. Such interest rate shall be determined by calculating the average yield to maturity on the basis of daily closing market bit quotations during the month of June next preceding the fiscal year in which said advance is made, on all interest-bearing marketable public debt obligations of the United States having a maturity date of fifteen or more years from the first day of said month, and by adjusting such average annual yield to the nearest one-eighth of 1 per centum.

(f) Business-type budgets shall be submitted to the Congress annually for all operations financed by the Basin Fund.

SEC. 5. Upon completion of each unit, participating project or separable feature thereof the Secretary shall allocate the total costs (excluding any expenditures authorized by section 7 of this Act) of constructing said unit, project or feature to power, irrigation, municipal water supply, flood control, navigation, or any other purposes authorized under reclamation law. Allocations of construction, operation and maintenance costs to authorized nonreimbursable purposes shall be nonreturnable under the provisions of this Act. On January 1 of each year the Secretary shall report to the Congress for the previous fiscal year, beginning with the fiscal year 1955, upon the status of the revenues from and the cost of constructing, operating, and maintaining the Colorado River storage project and the participating projects. The Secretary's report shall be prepared to reflect accurately the Federal investment allocated at that time to power, to irrigation, and to other purposes, the progress of return and repayment thereon, and the estimated rate of progress, year by year, in accomplishing full repayment.

SEC. 6. The hydroelectric powerplants authorized by this Act to be constructed, operated, and maintained by the Secretary shall be operated in conjunction with other Federal powerplants, present and potential, so as to produce the greatest practicable amount of power and energy that can be sold at firm power and energy rates, but no exercise of the authority hereby granted shall affect or interfere with the operation of any provision of the Colorado River Compact, the Upper Colorado River Basin Compact, or the Boulder Canyon Project Act.

SEC. 7. In connection with the development of the Colorado River storage project and of the participating projects, the Secretary is authorized and directed to investigate, plan, construct, operate, and maintain (1) public recreational facilities on lands withdrawn or acquired for the development of said project or of said participating projects, to conserve the scenery, the natural, historic, and archeologic objects, and the wildlife on said lands, and to provide for public use and enjoyment of the same and of the water areas created by these projects by such means as are consistent with the primary purposes of said projects; and (2) facilities to mitigate losses of and improve conditions for the propagation of fish and wildlife. The Secretary is authorized to acquire lands and to withdraw public lands from entry or other disposition under the public land laws necessary for the construction, operation, and maintenance of the facilities herein provided, and to dispose of them to Federal, State, and local governmental agencies by lease, transfer, exchange, or conveyance upon such terms and conditions as will best promote their development and operation in the public interest. All costs incurred pursuant to this section shall be nonreimbursable and nonreturnable.

SEC. 8. Nothing contained in this Act shall be construed to alter, amend, repeal, construe, interpret, modify, or be in conflict with any provision of the Boulder Canyon Project Act (45 Stat. 1057), the Boulder Canyon Project Adjustment Act (54 Stat. 774), the Colorado River Compact, the Upper Colorado River Basin Compact, the Rio Grande Compact of 1938, or the Treaty With the United Mexican States (Treaty Series 994).

SEC. 9. Expenditures for the Cross Mountain, Flaming Gorge, Glen Canyon, Navajo and Echo Park initial units of the Colorado River storage project may be made without regard to the soil survey and land classification requirements of the Interior Department Appropriation Act, 1954.

59762—55——2

SEC. 10. There are hereby authorized to be appropriated such sums as may be required to carry out the purposes of this Act.

SEC. 11. The appropriate agencies of the United States are authorized to convey to the city and county of Denver, Colorado, for use as a part of its municipally owned water system, such interests in lands and water rights used or acquired by the United States solely for the generation of power and other property of the United States as shall be required in connection with the development or use of its Blue River project, upon payment by Denver for any such interest of the value thereof at the time of its acquisition by Denver, and provided that any such transfer shall be so limited as not to preclude the use of the property other than water rights for the necessary functions of the United States Government.

SEC. 12. In the operation and maintenance of all facilities, authorized by Federal law and under the jurisdiction and supervision of the Secretary of the Interior, in the basin of the Colorado River, the Secretary of the Interior is directed to comply with the applicable provisions of the Colorado River Compact, the Boulder Canyon Project Act, the Boulder Canyon Project Adjustment Act, and the Treaty with the United Mexican States, in the storage and release of water from reservoirs in the Colorado River Basin. In the event of the failure of the Secretary of the Interior to so comply, any State of the Colorado River Basin may maintain an action in the Supreme Court of the United States to enforce the provisions of this section, and consent is given to the joinder of the United States as a party in such suit or suits. No right to impound or use water for the generation of power or energy, created or established by the building, operation or use of any of the powerplants authorized by this Act, shall be deemed to have priority over or otherwise operate to preclude or impair any use, regardless of the date of origin of such use, of the waters of the Colorado River and its tributaries for domestic or agricultural purposes within any of the States of the Upper Colorado River Basin.

SEC. 13. As used in this Act—

The terms "Colorado River Basin," "Colorado River Compact," "Colorado River System," "Lee Ferry," "States of the Upper Division," "Upper Basin," and "domestic use" shall have the meaning ascribed to them in article II of the Upper Colorado River Basin Compact;

The term "States of the Upper Colorado River Basin" shall mean the States of Arizona, Colorado, New Mexico, Utah, and Wyoming;

The term "Upper Colorado River Basin" shall have the same meaning as the term "Upper Basin";

The term "Upper Colorado River Basin Compact" shall mean that certain compact executed on October 11, 1948, by commissioners representing the States of Arizona, Colorado, New Mexico, Utah, and Wyoming, and consented to by the Congress of the United States of America by Act of April 6, 1949 (63 Stat. 31);

The term "Rio Grande Compact" shall mean that certain compact executed on March 18, 1938, by commissioners representing the States of Colorado, New Mexico, and Texas and consented to by the Congress of the United States of America by Act of May 31, 1939 (53 Stat. 785); and

The term "treaty with the United Mexican States" shall mean that certain treaty between the United States of America and the United Mexican States signed at Washington, District of Columbia, February 3, 1944, relating to the utilization of the waters of the Colorado River and other rivers, as amended and supplemented by the protocol dated November 14, 1944, and the understandings recited in the Senate resolution of April 18, 1945, advising and consenting to ratification thereof.

Senator ANDERSON. I will also put in the record the report of the Department of the Interior to the chairman of the committee, Senator Murray, dated February 25, 1955.

(The report is as follows:)

DEPARTMENT OF THE INTERIOR,
OFFICE OF THE SECRETARY,
Washington D. C., February 25, 1955.

Hon. JAMES E. MURRAY,
Chairman, Committee on Interior and Insular Affairs,
United States Senate, Washington, D. C.

MY DEAR SENATOR MURRAY: A report has been requested from this Department on S. 500, a bill to authorize the Secretary of the Interior to construct, operate, and maintain the Colorado River storage project and participating projects, and for other purposes.

COLORADO RIVER STORAGE PROJECT

TUESDAY, MARCH 1, 1955

UNITED STATES SENATE,
SUBCOMMITTEE ON IRRIGATION AND RECLAMATION OF THE
COMMITTEE ON INTERIOR AND INSULAR AFFAIRS,
Washington, D. C.

The subcommittee met at 10 a. m., pursuant to recess, in the committee room, 224 Senate Office Building, Senator Clinton P. Anderson (New Mexico), presiding.

Present: Senators Clinton P. Anderson (New Mexico); Joseph C. O'Mahoney (Wyoming); Eugene D. Millikin (Colorado), and Arthur V. Watkins (Utah).

Present also: Senators Alan Bible, Nevada; Thomas H. Kuchel, California; Frank A. Barrett, Wyoming; Barry Goldwater, Arizona; Gordon Allott, Colorado; and Wallace F. Bennett, Utah.

Representative at large Keith B. Thompson of Wyoming; Representative Byron G. Rogers, Colorado.

Present also: Stewart French, staff director and chief counsel; Goodrich W. Lineweaver, staff member for reclamation; William K. Coburn, staff member for public lands; James Gamble, staff member for Indian Affairs; Richard L. Callaghan, chief clerk; N. D. McSherry, assistant chief clerk.

Senator ANDERSON. In view of the fact that some members may have obligations to other committees, I thought we would try to accommodate them in order that they may get to other hearings.

Senator ANDERSON. Senator Allott, would you like to present your statement at this time?

Senator ALLOTT. Yes, I would.

STATEMENT OF HON. GORDON ALLOTT, UNITED STATES SENATOR FROM THE STATE OF COLORADO

As previously stated in open hearing, I do unqualifiedly endorse the upper Colorado River project and urge its passage by Congress. It is a necessity for the development of the West; it is a necessity for the development of the upper Colorado River Basin and the upper Colorado River States; it is a necessity if we are to meet the demands for electric power now existing within the Western States; it is a necessity if we are to have available for our national economy the future development which the next 20 years of construction will make possible; it is a necessity if there is ever going to be any justice in a division of the water of the upper States basin, and any attempt to thwart the upper Colorado River project in its development is an attempt to continue the injustice which goes on daily.

I must admit that I had written so previously, but I must also admit that I was wrong in doing so. Seeing the country in which the canyon waters will be impounded we also saw the good that such stored waters could do to this arid, but fertile, region.

It was proven to us beyond doubt that many of the arguments that had been advanced by conservation groups opposing the dam were without basis in fact and the opposition unjustified.

The Dinosaur Monument and adjacent beauty spots will not be spoiled by this dam and its impounded waters. In fact, the development of this lake will make the area 100 times more accessible to those who would like to see it, and the water will cover only 500 feet of a dangerous canyon bottom that is more than 2,700 feet deep.

It seems as though 3 or 4 Far Western States are confusing the issue in their efforts to permit more water from the upper Colorado River to reach their own home States before it is distributed.

The effect of the position taken by conservationist leaders is to urge that the United States Government break faith with the people of Utah and the upper basin and repudiate solemn promises as well as President Roosevelt's Executive order.

Since the Echo Park Dam is obviously neither an invasion nor a precedent, the discussion about alternate sites should be centered only on selecting the best sites. Competent engineers after years of study testify that the Echo Park Dam best meets the needs of the project and the area from all points of view.

In conclusion, the project is needed to protect the safety of the United States to assure a safe source of supply of uranium and the vast storehouse of other essential defense metals. The project is essential to enable Utah and the upper basin to share in the future growth of the Nation.

Since southern California has had first turn on the river, she has enjoyed an incalculable advantage. The upper basin States have pledged to honor the compact. Southern California, as a signatory to that same compact, should, in the interest of fair play, adopt a more cooperative attitude, rather than one of obstruction.

Lastly, the cry that Echo Park Dam is an invasion of the national-park system is unfounded in fact.

I am sure that this committee will again report the project favorably to the Senate, and I hope that the Senate, relying on the judgment of this committee, will approve the project by a substantial majority.

Senator ANDERSON. Is there anyone here who has a committee assignment?

If not, we will continue the hearings with the statement from our long-time colleague and personal friend of so many of us, Governor Johnson.

Governor, we welcome you back. We are happy to have you as a witness now.

STATEMENT OF HON. EDWIN C. JOHNSON, GOVERNOR OF THE STATE OF COLORADO

Governor JOHNSON. Thank you, Mr. Chairman and members of the committee. This is a very important committee to the Western States, especially, and to the country as a whole.

A long time ago I was a member of this committee. I regret that I do not have my statement reduced to writing altogether.

I am familiar with the rules, but I just have not had an opportunity to get the job done, Mr. Chairman.

Senator ANDERSON. I am happy to say that our former colleague from Colorado, when he was presiding last year, was courteous to some of us who had not observed the rules. I guess we can take care of you on the same basis.

Governor JOHNSON. Well, that is being very generous. I apologize to you, but I am a little bit short on written material.

I have been disappointed, too, in one matter. I have some suggested amendments or, at least, some references to the language in the bill which I want to call to your attention for whatever merit it may deserve.

And in order to get a quick job of printing, Congressman Rogers volunteered to help me out by inserting my suggested amendments in the form of a bill. It went down to the Public Printer with a request that it be an expedited job, but Mr. Rogers tells me that the Public Printer has fallen down on the job and does not have the material here. It may be here before we get through, but I want to make that statement so that you will not think that I am totally disregarding the rules of this committee to have written statements before the committee.

I do, however, have one copy, Mr. Chairman, of part of my statement.

Senator ANDERSON. We are not worried about that at all, Governor Johnson. You just go right ahead.

Governor JOHNSON. I do have copies of some statistics I expect to offer and plenty of them.

Now, Mr. Chairman, I wish to make a statement concerning the 18 participating projects in Colorado which the Upper Colorado River Commission, the Colorado Water Conservation Board, and the Colorado General Assembly have recommended for inclusion by amendment in S. 500.

As this bill was introduced in the previous bill, Senate bill 1555, 83d Congress, 2d session, provision was made for only 5 participating projects in Colorado, the total cost of which was estimated by the Bureau of Reclamation at $25,635,500. And the depletion of the stream by these 5 projects was something in the neighborhood of 62,000 acre-feet annually.

Unfortunately, Colorado was unable to secure even reconnaissance reports on the units of the Cliffs-Divide project until the spring of 1954. These reports are now available and although they are not of feasibility grade, they cover the subjects in sufficient detail to enable the State to request inclusion in the bill on the same basis as similar projects in other States.

It is estimated total cost of the 18 additional participating units and projects comes to $218,175,500. The total for all these participating projects in Colorado, therefore, will amount to $244,811,000.

Inasmuch as Colorado is to receive 15.75 percent of the water allotted to the upper basin States, this sum in comparison is not out of line. The 18 projects with data concerning their costs and benefit-cost ratio and stream depletion are shown in the following table. You have the table before you.

59762—55——11

(The table referred to is as follows:)

Additional Colorado participating projects, Colorado River storage project

	Capacity of project reservoirs	Construction cost	Average annual stream depletion	Benefit-cost ratio
Gunnison River project units:	*Acre-feet*		*Acre-feet*	
Fruitgrowers extension	6,900	$1,783,000	5,540	2.4
Tomichi Creek	60,000	11,996,000	17,700	6
East River	0	209,000	2,100	2.5
Ohio Creek	10,000	3,526,000	9,300	1.0
Fruitland Mesa	41,000	11,331,000	25,100	1.2
Bostwick Park	9,000	2,753,000	4,800	1.7
Grand Mesa	71,000	20,630,000	24,700	1.4
Dallas Creek	41,200	10,760,000	31,000	1.5
Total	239,100	62,988,000	120,240	.....
Cliffs-Divide project units:				
Parshall	43,000	12,026,100	28,600	1.0
Troublesome	20,100	5,387,700	13,000	1.2
Rabbit Ear	22,500	4,846,600	16,400	1.3
Eagle Divide	12,800	3,498,200	12,000	1.1
Woody Creek	0	184,400	1,400	3.9
West Divide	118,000	84,676,900	88,100	.9
Bluestone unit (without DeBeque)	0	3,445,600	19,900	2.0
Battlement Mesa	25,000	5,987,400	10,700	1.1
Total	241,400	120,052,900	190,100	.....
San Juan Dolores: Dolores	153,000	26,179,000	69,370	1.1
White-Yampa: Savery-Pot-Hook (Colorado)	65,000	8,956,000	+20,000	1.21
Total	698,500	218,175,900	399,710	.....

Governor JOHNSON. The first column indicates the capacity of project reservoirs in acre-feet.

The second column represents the construction costs.

The third column represents the average annual stream depletion in acre-feet.

The fourth column represents the benefit-cost ratio.

I think you are all familiar with the benefit-cost ratio.

For instance, the first project, the Fruitgrowers Extension, shows a cost ratio of 2.4. That means that the benefits in that project are 2.4 times the cost.

These projects, as you will note, are divided into four general projects:

The Gunnison River project units, consisting of eight projects.

The Cliffs-Divide project units, consisting of eight projects.

The San Juan-Dolores project, under Dolores River.

And in the White-Yampa area, the Savery-Pot Hook.

It will be noted from the last column in the table that all but two have benefit-cost ratios greater than 1.30.

The Tomichi Creek unit of the Gunnison project is below par in this respect. However, it is thought that a restudy may bring the ratio up to the desired value. The Tomichi Creek reservoir is a reservoir of very great importance in the upper Gunnison River Valley and we hope that it may prove to be up to the standard which is required.

Further surveys will have to determine that fact.

The West Divide unit of the Cliffs-Divide project occupies a most commanding position in an area which promises startling industrial development within the next decade. An inspection of the proposed project indicates alterations in the preliminary plan which in all probability raise the benefit-cost ratio considerably above 1.0 to 1.

Senator MILLIKIN. What project is that, Senator?

Governor JOHNSON. That is the West Divide unit in the Cliffs-Divide project. You will find West Divide sixth down in the second set of units.

Senator ANDERSON. From a money standpoint it represents two-thirds of all the money set forth.

Governor JOHNSON. That is right. It is an important project and, of course, from a money point of view, it represents a very large investment.

Whether that project will finally measure up or not remains for further study.

The topography of western Colorado in the basins of the Colorado and Gunnison Rivers is such that, with one exception, the possible irrigation projects are all small in size and the land involved is located in discontinuous areas. For this reason it is not possible to build 1 or 2 large structures which will store water for the use of the several potential irrigation units.

Each must have its own storage reservoir.

This viewpoint was evidently held by the Bureau of Reclamation officials when they made their studies on these two rivers because the project study in one case is known as the Gunnison River project, and in the other the study on the main stem of the Colorado River as the Cliffs-Divide project, each embracing the entire stream concerned. Each project is made up of numerous units, so really, the State of Colorado is asking for the inclusion of only 4 additional projects, rather than 18. These additional projects are portions of, first, the Gunnison River project, and, second, the Cliffs-Divide project; third, the Dolores project, and, fourth, the Savery-Pot Hook project.

The large downstream reservoirs, in addition to furnishing cyclic storage, are a means of earning money to pay for the construction in a large measure of the upstream participating projects.

It should be clear in everyone's mind that the latter, the participating projects, cannot come into existence until the small upstream reservoirs are constructed to hold back the spring runoff and, thus, afford water supplies for irrigation of the land.

Last spring in my appearance before the Senate Subcommittee on Irrigation and Reclamation of the Committee on Interior and Insular Affairs, I stated that the maximum quantity of unallocated waters available for consumptive use in Colorado was 1,347,000 acre-feet.

In the table on the previous page, you will note that the 18 units and projects suggested would deplete the several streams in a total amount of approximately 400,000 acre-feet. This is less than a third of the unallocated water available for consumptive use in Colorado.

The five participating projects mentioned in Senate bill S. 1555 and again in this bill, would deplete the streams in the amount of only 62,400 acre-feet, a total of 462,000 acre-feet for all Colorado participating projects, only a fraction of Colorado's allocation.

In summation, may I emphasize the fact that all of these additional participating units and projects are located high up on the mountain streams where the flood flows can be conserved and used for irrigation on adjacent lands. They are all necessary elements in the economy of Colorado and will contribute in a large measure to the economy of the Nation.

The Fruitgrowers Extension project and the Savery-Pot Hook project have feasibility reports which as yet have not been released by the Interior Department. All other units have reconnaissance reports which indicate that feasibility studies will show them well within the requirements set up by the Bureau of Reclamation and the Congress for such projects.

The addition of these units to the upper Colorado River storage bill places the State of Colorado in its rightful position when compared with other States of the upper basin.

Now, Mr. Chairman, before we add these projects to the bill, this is the percentage of the expenditures which will be used by each of the four upper basin States. Colorado will receive 3½ percent. I am talking about participating project only, not storage project.

Colorado, 3½ percent; Utah, 37 percent; Wyoming, 6 percent; New Mexico, 53½ percent.

After these bills are added, if they are added, and I most sincerely hope that they are and urge that they be made a part of this bill, Colorado will have 28 percent instead of 3½ percent; Utah will have 27 percent; Wyoming 5 percent, and New Mexico, 40 percent.

I don't mean to indicate that anything is to be taken away from New Mexico or Utah, but by adding Colorado the percentage becomes more balanced and that is the reason for the change in the percentage ratios between the States concerned.

Senator MILLIKIN. Would you mind repeating again, Senator, what percentage of the water from the streams originates in Colorado?

Governor JOHNSON. 72.18 percent of the upper Colorado River is produced by Colorado.

Senator MILLIKIN. How much water was allocated to the upper basin compact?

Governor JOHNSON. 51.75 was allocated to Colorado. Twenty-three percent to Utah; 14 percent to Wyoming, and 11.25 to New Mexico.

Colorado, of course, produces most of the water of the upper Colorado River. Colorado and Wyoming produce a great deal of the water in the upper Colorado.

But under the compact that has been entered into, among the upper basin States Colorado shares still 51.75. So it seems very much in point that Colorado's participating projects should be raised from the extreme low of 3½ percent to something that is more in line with the other States when it is pushed up to 28 percent.

Senator O'MAHONEY. Governor, may I ask you what is the basis of this latest percentage figure you gave? Percent of what?

Governor JOHNSON. That is the percentage of the money that is estimated will be required to build these projects in the various States.

Senator O'MAHONEY. You are not suggesting any change of the compact division of the water?

Governor JOHNSON. No, sir; that is irrevocable and fixed. The only percentage that I am talking about is the percentage of the money that Senate bill 500 is estimated to use in the building of the various projects which are included in this bill, the participating projects.

I want to say that the Savery-Pot Hook project in northern Colorado is also a Wyoming project. It irrigates land in both States and

adds supplemental water in both States. It adds more supplemental water in Wyoming than it does in Colorado, but it is included here.

There is no division made with respect to the cost of building that project as between the State of Colorado and the State of Wyoming.

Now, Mr. Chairman, if you have Senate bill 500 before you and if you will turn to page 2 of that bill, line 15, I am urging that Cross Mountain be stricken and that after "Glen Canyon," "Juniper," be added.

Now, these printed copies have come. These are the amendments which I will recommend be inserted in H. R. 4488, by Congressman Rogers.

You can find the language in each one of them that I am bringing up for your consideration.

(The bill introduced by Representative Rogers, H. R. 4488, follows:)

[H. R. 4488, 84th Cong., 1st sess.]

A BILL To authorize the Secretary of the Interior to construct, operate, and maintain the Colorado River storage project and participating projects, and for other purposes

Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled, That, in order to initiate the comprehensive development of the water resources of the Upper Colorado River Basin, the Congress, in the exercise of its constitutional authority to provide for the general welfare, to regulate commerce among the States and with the Indian tribes, and to make all needful rules and regulations respecting property belonging to the United States, and for the purposes, among others, of regulating the flow of the Colorado River, storing water for beneficial consumptive use, making it possible for the States of the upper basin to utilize, consistently with the provisions of the Colorado River Compact, the apportionment made to and among them in the Colorado River Compact and the Upper Colorado River Basin Compact, respectively, providing for the reclamation of arid and semiarid land, for the control of floods and for the improvement of navigation, and the generation of hydroelectric power, as an incident of the foregoing purposes, hereby authorizes the Secretary of the Interior (1) to construct, operate, and maintain the following initial units of the Colorado River storage project, consisting of dams, reservoirs, powerplants, tranmission facilities and appurtenant works: Curecanti, Echo Park, Flaming Gorge, Glen Canyon, Juniper, and Navajo: *Provided*, That the Curecanti Dam shall be constructed to a height which will impound not less than nine hundred and forty thousand acre-feet of water or a reservoir of such greater capacity as may be acceptable to local interests in the vicinity of the city of Gunnison, Colo., and that construction thereof shall not be undertaken until the Secretary has, on the basis of further engineering and economic investigations, reexamined the economic justification of such unit and, accompanied by appropriate documentation in the form of a supplemental report, has certified to the Congress and to the President that, in his judgment, the benefits of such unit will exceed its costs; and (2) to construct, operate, and maintain the following additional reclamation projects (including power-generating and transmission facilities related thereto), hereinafter referred to as participating projects: Central Utah (initial phase): Cliff-Divide (consisting of eight project units), Dolores, Emery County, Elkhorn, Florida, Gooseberry, Gunnison River (consisting of eigth project units), Hammond, Kendall, La Barge, Lyman, Paonia (including the Minnesota unit, a dam and reservoir on Muddy Creek just above its confluence with the North Fork of the Gunnison River, and other necessary works), Pine River Extension, Savery-Pot Hook, Seedskadee, Silt, Smith Fork, San Juan-Chama, Navajo: *Provided*, That (a) construction of a participating project set forth in this clause (2) shall not be undertaken until the Secretary has reexamined the economic justification of such project and, accompanied by appropriate documentation in the form of a supplemental report, has certified to the Congress, through the President, that, in his judgment, the benefits of such project will exceed its costs, and that the financial reimbursability requirements set forth in section 4 of this Act can be met. The Secretary's supplemental report for each such project shall include, among other things, (i) a reappraisal of the prospective direct agricultural benefits of the project made by the Secretary

after consultation with the Secretary of Agriculture; (ii) a reevaluation of the nondirect benefits of the project; and (iii) allocations of the total cost of construction of each participating project or separable features thereof, excluding any expenditures authorized by section 7 of this Act, to power, irrigation, municipal water supply, flood control or navigation, or any other purpose authorized under reclamation law. Section 1 (c) of the Flood Control Act of 1944 shall, except as hereinafter provided for the San Juan-Chama and the Navajo participating projects, not be applicable to such supplemental reports; and, (b) that no appopriation for or construction of the San Juan-Chama project or the Navajo participating project shall be made or begun until coordinated reports thereon shall have been submitted to the affected States, including (but without limiting the generality of the foregoing) the State of Texas, pursuant to the Act of December 22, 1944, and said projects shall have been approved and authorized by the Congress: *Provided further*, That with reference to the San Juan-Chama project, it shall be limited to a single off-stream dam and reservoir on a tributary of the Chama River to be used solely for the control and regulation of water imported from the San Juan River, that no power facilities shall be established, installed, or operated along the diversion or on the reservoir or dam, and such dam and reservoir shall at all times be operated by the Bureau of Reclamation of the Department of the Interior in strict compliance with the Rio Grande Compact as administered by the Rio Grande Compact Commission.

SEC. 2. In order to achieve such comprehensive development as will assure the consumptive use in the States of the Upper Colorado River Basin of waters of the Colorado River system the use of which is apportioned to the Upper Colorado River Basin by the Colorado River Compact and to each State thereof by the Upper Colorado River Basin Compact, it is the intent of the Congress in the future to authorize the construction, operation, and maintenance of further units of the Colorado River storage project, of additional phases of participating projects authorized in this Act, and of new participating projects as additional information becomes available and additional needs are indicated. It is hereby declared to be the purpose of the Congress to authorize as participating projects only projects (including units or phases thereof)—

(1) for the use, in one or more of the States designated in article III of the Upper Colorado River Basin Compact, of waters of the Upper Colorado River system the consumptive use of which is apportioned to those States by that article; and

(2) for which pertinent data sufficient to determine their probable engineering and economic justification and feasibility shall be available. It is likewise declared to be the policy of the Congress that the costs of any participating project authorized herein or in the future shall be amortized from its own revenues to the fullest extent consistent with the provisions of this Act and Federal reclamation law. Furthermore, participating projects authorized in the future shall be on a full equality with participating projects authorized herein with respect to all considerations including economic justification, appraisal of agricultural and other benefits, irrigation repayment contracts and obligations, interest charges, financial reimbursability requirements and payment, allocation of costs of construction to power, irrigation, municipal water supply, flood control and any other purpose or benefit authorized under reclamation law.

SEC. 3. Except as otherwise provided in this Act, in constructing, operating, and maintaining the units of the Colorado River storage project and the participating projects listed in section 1 of this Act, the Secretary shall be governed by the Federal reclamation laws (Act of June 17, 1902, 32 Stat. 388, and Acts amendatory thereof or supplementary thereto): *Provided*, That (a) contracts shall be entered into which (except as otherwise provided for the Paonia and Eden projects) provide for repayment of the irrigation obligation assumed thereunder with respect to any project contract unit over a period of not more than fifty years exclusive of any development period authorized by law; (b) prior to construction of irrigation distribution facilities, repayment contracts shall be made with an "organization" as defined in paragraph 2 (g) of the Reclamation Project Act of 1939 (53 Stat. 1187) which has the capacity to levy assessments upon all taxable real property located within its boundaries to assist in making repayments, except where a substantial proportion of the lands to be served are owned by the United States; (c) contracts relating to municipal water supply may be made without regard to the limitations of the last sentence of section 9 (c) of the Reclamation Project Act of 1939; and (d), as to Indian lands within, under or served by any participating project, payment of construction costs

within the capability of the land to repay shall be subject to the Act of July 1, 1932 (47 Stat. 564). All units and participating projects shall be subject to the apportionments of the use of water between the upper and lower basins of the Colorado River and among the States of the upper basin fixed in the Colorado River Compact and the Upper Colorado River Basin Compact, respectively, and to the terms of the treaty with the United Mexican States) (Treaty Series 994).

SEC. 4. (a) There is hereby authorized a separate fund in the Treasury of the United States to be known as the Upper Colorado River Basin Fund (hereinafter referred to as the Basin Fund), which shall remain available until expended, as hereafter provided, for carrying out provisions of this Act other than section 7.

(b) All appropriations made for the purpose of carrying out the provisions of this Act, other than section 7, shall be credited to the Basin Fund as advances from the general fund of the Treasury, and such funds shall be available for expenditures within the limitations of the provisions of this act and of the provisions of the appropriations.

(c) All revenues collected in connection with the operation of the Colorado River storage project and participating projects shall be credited to the Basin Fund, and shall be available, without further appropriation, for (1) defraying the costs of operation, maintenance, and replacements of and emergency expenditures for, all facilities of the Colorado River storage project and participating projects, within such separate limitations as may be included in annual appropriation acts, (2) payment as required by subsection (d) of this section, (3) payment of the reimbursable construction costs of the Paonia project which are beyond the ability of the water users to repay within the period prescribed in the Act of June 25, 1947 (61 Stat. 181), said payment to be made within fifty years after completion of that portion of the project which has not been constructed as of the date of this Act, (4) payment in connection with the irrigation features of the Eden project as specified in the Act of June 28, 1949 (63 Stat. 277); and (5) any remaining surplus to be available only for appropriation for construction of the units and participating projects authorized by or pursuant to this act.

(d) Revenues in the Basin Fund in excess of operating needs shall be paid annually to the general fund of the Treasury to the extent required to return for that year—

(1) the costs of each unit, participating project, or any separable feature thereof which are allocated to power pursuant to section 5 of this Act, within a period not exceeding fifty years from the date of completion of such unit, participating project, or separable feature thereof;

(2) the costs of each unit, participating project, or any separable feature thereof which are allocated to irrigation pursuant to section 5 of this Act of this Act, within a period not exceeding fifty years from the date of completion of such unit, participating project, or separable feature thereof;

(3) interest on the unamortized balance of the investment (including interest during construction) in the power and municipal water supply features of each unit, participating project, or any separable feature thereof, at a rate determined by the Secretary of the Treasury as provided in subsection (e), and interest due shall be a first charge; and

(4) the costs of each unit, participating project, or any separable feature thereof which are allocated to irrigation pursuant to section 5 of this Act within a period not exceeding fifty years, in addition to any development period authorized by law, from the date of completion of such unit, participating project, or separable feature thereof, or, in the cases of the Paonia project and of the Indian lands, within a period consistent with other provisions of law applicable thereto.

(e) The interest rate applicable to each unit of the storage project and each participating project shall be determined by the Secretary of the Treasury as of the time the first advance is made for initating construction of said unit or project. Such interest rate shall be determined by calculating the average yield to maturity on the basis of daily closing market bid quotations during the month of June next preceding the fiscal year in which said advance is made, on all interest-bearing marketable public debt obligations of the United States having a maturity date of fifteen or more years from the first day of said month, and by adjusting such average annual yield to the nearest one-eighth of 1 per centum.

(f) Business-type budgets shall be submitted to the Congress annually for all operations financed by the Basin Fund.

SEC. 5. Upon completion of each unit, participating project, or separable feature thereof the Secretary shall allocate the total costs (excluding any expenditures authorized by section 7 of this Act) of constructing said unit, project or feature to power, irrigation, municipal water supply, flood control, navigation, or any other purposes authorized under reclamation law. Allocations of construction, operation, and maintenance costs to authorized nonreimbursable purposes shall be nonreturnable under the provisions of this Act. On January 1 of each year the Secretary shall report to the Congress for the previous fiscal year, beginning with the fiscal year 1955, upon the status of the revenues from and the cost of constructing, operating, and maintaining the Colorado River storage project and the participating projects. The Secretary's report shall be prepared to reflect accurately the Federal investment allocated at that time to power, to irrigation, and to other purposes, the progress of return and repayment thereon, and the estimated rate of progress, year by year, in accomplishing full repayment.

SEC. 6. The hydroelectric powerplants and transmission facilities authorized by this Act to be constructed, operated, and maintained by the Secretary shall be operated in conjunction with other Federal powerplants, present and potential, so as to produce the greatest practicable amount of power and energy that can be sold at firm power and energy rates, but no exercise of the authority hereby granted shall affect or interfere with the operation of any provision of the Colorado River Compact, the Upper Colorado River Basin Compact, or the Boulder Canyon Project Act: *Provided*, That power produced pursuant to this Act shall be sold at the highest practicable price to enhance the development of the Upper Colorado River Basin and operation in conjunction with other powerplants shall not deprive the Basin Fund of revenues which it would receive in the absence of such joined operation.

SEC. 7. In connection with the development of the Colorado River storage project and of the participating projects, the Secretary is authorized and directed to investigate, plan, construct, operate, and maintain (1) public recreational facilities on lands withdrawn or acquired for the development of said project or of said participating projects, to conserve the scenery, the natural, historic, and archeologic objects, and the wildlife on said lands, and to provide for public use and enjoyment of the same and of the water areas created by these projects by such means as are consistent with the primary purposes of said projects; and (2) faciilties to mitigate losses of and improve conditions for the propagation of fish and wildlife. The Secretary is authorized to acquire lands and to withdraw public lands from entry or other disposition under the public land laws necessary for the construction, operation, and maintenance of the facilities herein provided, and to dispose of them to Federal, State, and local governmental agencies by lease, transfer, exchange, or conveyance upon such terms and conditions as will best promote their development and operation in the public interest, and with due regard for any change in use that may occur at some future time. All costs incurred pursuant to this section shall be nonreimbursable and nonreturnable.

SEC. 8. Nothing contained in this Act shall be construed to alter, amend, repeal, construe, interpret, modify, or be in conflict with any provision of the Boulder Canyon Project Act (45 Stat. 1057), the Boulder Canyon Project Adjustment Act (54 Stat. 774), the Colorado River Compact, the Upper Colorado River Basin Compact, the Rio Grande Compact of 1938, or the Treaty With the United Mexican States (Treaty Series 994).

SEC. 9. Expenditures for the Curecanti, Echo Park, Flaming Gorge, Glen Canyon, Juniper, and Navajo initial units of the Colorado River storage project may be made without regard to the soil survey and land classification requirements of the Interior Department Appropriation Act, 1954.

SEC. 10. There are hereby authorized to be appropriated such sums as may be required to carry out the purposes of this Act.

SEC. 11. The appropriate agencies of the United States are authorized to convey to the city and county of Denver, Colorado,, for use as a part of its municipally owned water system, such interests in lands and water rights used or acquired by the United States solely for the generation of power and other property of the United States as shall be required in connection with the development or use of its Blue River project, upon payment by Denver for any such interest of the value thereof at the time of its acquisition by Denver, and provided that any such transfer shall be so limited as not to preclude the use of the property other than water rights for the necessary functions of the United States Government.

SEC. 12. In the operation and maintenance of all facilities, authorized by Federal law and under the jurisdiction and supervision of the Secretary of the Interior, in the basin of the Colorado River, the Secretary of the Interior is directed to comply with the applicable provisions of the Colorado River Compact, the Upper Colorado River Basin Compact, the Boulder Canyon Project Act, the Boulder Canyon Project Adjustment Act, and the Treaty with the United Mexican States, in the storage and release of water from reservoirs in the Colorado River Basin. In the event of the failure of the Secretary of the Interior to so comply, any State of the Colorado River Basin may maintain an action in the Supreme Court of the United States to enforce the provisions of this section, and consent is given to the joinder of the United States as a party in such suit or suits. No agency or official of the United States shall seek or accept a right to impound or use water for the generation of power or energy, created or established by the building, operation, or use of any of the powerplants authorized by this Act.

SEC. 13. As used in this Act—

The terms "Colorado River Basin", "Colorado River Compact", "Colorado River System", "Lee Ferry", "States of the Upper Division", "upper basin", and "domestic use" shall have the meaning ascribed to them in article II of the Upper Colorado River Basin Compact.

The term "States of the Upper Colorado River Basin" shall mean the States of Arizona, Colorado, New Mexico, Utah, and Wyoming;

The term "Upper Colorado River Basin" shall have the same meaning as the term "upper basin";

The term "Upper Colorado River Basin Compact" shall mean that certain compact executed on October 11, 1948, by commissioners representing the States of Arizona, Colorado, New Mexico, Utah, and Wyoming, and consented to by the Congress of the United States of America by Act of April 6, 1949 (63 Stat. 31);

The term "Rio Grande Compact" shall mean that certain compact executed on March 18, 1938, by commissioners representing the States of Colorado, New Mexico, and Texas and consented to by the Congress of the United States of America by Act of May 31, 1939 (53 Stat. 785); and

The term "treaty with the United Mexican States" shall mean that certain treaty between the United States of America and the United Mexican States signed at Washington, District of Columbia, February 3, 1944, relating to the utilization of the waters of the Colorado River and other rivers, as amended and supplemented by the protocol dated November 14, 1944, and the understandings recited in the Senate resolution of April 18, 1945, advising and consenting to ratification thereof.

Governor JOHNSON. I want to say that I got some of my early training under Governor Adams of Colorado, who saw 50 years of public service, most of it in the Colorado Senate. I was his secretary at one time, and while Governor Adams was not an attorney, he rendered a great service to Colorado by studying every bill that came before the general assembly with great patience and thoroughness. He would go over every bill line by line and word by word and try to find anything that wasn't clear or that might, in his opinion, not be good policy.

I have attempted to do that same thing for this bill. You will note on page 2, line 19 in the bill, in the proviso, I have suggested that in line 19 that "will create" be stricken out.

Senator MILLIKIN. What bill are you referring to, Governor?

Governor JOHNSON. I am talking about Senate bill 500. This is an amendment to Curecanti.

That the words "will create" be stricken out on line 19, so that it will read—

forty thousand acre-feet of water or reservoir of such greater capacity as may be acceptable to local interests in the vicinity of the city of Gunnison, Colorado.

Then drop down to line 22—

and that construction thereof shall not be undertaken until the Secretary has, on the basis of further engineering and economic investigations, reexamined the

economic justification of such unit and, accompanied by appropriate documentation.

and so on.

In the Rogers bill that will be found on lines 17, 18, and 19, on page 2. That amendment which I have suggested gives a little more leeway to work out the problems of the Curecanti project at Gunnison.

As you know, the people of Gunnison have objected to the large Curecanti, so-called, inasmuch as at low-water time it would leave a lot of muddy flats in the area of the city of Gunnison.

This amendment which I have offered is expected to make the project when it is finally agreed upon, acceptable to Gunnison County and the town of Gunnison.

On page 5, on line 19, there is a typographical mistake. I suppose you have found it. It says "for the use in one of more" and it means "for the use in one or more". "Of" is changed to "or".

In the same section, section 2, on page 6, line 3, it reads, "Any participating project authorized in the future".

I have inserted "herein or in the future".

I am sorry I have not had time to mark these proposed amendments out on the Rogers bill.

Now, the object of that amendment is to make the participating projects which are to be approved in the future, according to the same standards as the participating projects which are approved in this bill.

We have a great many potential participating projects in the State of Colorado in addition to the 18 which have been suggested.

When the upper basin is finally developed, all of these participating projects will most certainly be improved and be developed.

But we do not want—it does not seem to me that it would be wise to enact a bill today having one standard and one standard for the participating projects that are provided for in this bill, in section 1 of this bill, and then to have a different standard apply to the projects that are to come in the future.

So I have suggested in line 3 "participating projects authorized herein or in the future". And you will find that same language in the Rogers bill on page 6, line 6, beginning at line 6. You will find that language which I want to read into the bill after "reclamation law". It reads as follows:

Furthermore, participating projects authorized in the future shall be on a full equility with participating projects authorized herein with respect to all considerations including economic justification, appraisal of agricultural and other benefits, irrigation repayment contracts and obligations, interest charges, financial reimbursability requirements and payment, allocation of costs of construction to power, irrigation, municipal water supply, flood control, and any other purpose or benefit authorized under reclamation law.

You will find that language printed in the Rogers bill on page 6, beginning with line 6, and ending on line 15.

It seems to me that that proposed amendment ought to have serious consideration by this committee.

Now, on page 7 of the bill, first, we go now to section 4. I have read section 4 over very carefully a good many times. While I have not had an opportunity of discussing section 4 with a water attorney, it seems to me that there is something missing in section 4.

Now, perhaps I am mistaken. I have been mistaken a good many times, but I have read it over carefully and it just seems to me that there is something that needs to be added to section 4. For instance, turn to paragraph (b) of section 5, on line 21, page 7.

May I say that the purpose of section 4 is to set up a separate fund in the Treasury of the United States which may be known as the upper Colorado River Basin fund. And that is a very important step to be taken.

Now, on line 21 (b) it says that:

(b) All appropriations made for the purpose of carrying out the provisions of this act, other than section 7, shall be credited to the basin fund as advances from the general fund of the Treasury.

Now, that does not say part of the appropriations; that says all of the appropriations, all of the appropriations that are made for the purpose of carrying out the provisions of this bill shall go into this fund.

But I cannot find any place in section 4, or any other part of the bill, that provides for the use of the appropriations which are made to carry out the objectives of this bill. I cannot find where there is any provision at all made for such appropriations to come out of the bill for construction purposes.

Senator ANDERSON. I do not follow you there.

Governor JOHNSON. You put money in the fund. You have a basin fund and you put money into that fund. (b) says:

All appropriations made for the purpose of carrying out the provisions of this act, other than section 7, shall be credited to the basin fund as advances from the general fund of the Treasury.

Now, would you think that if all appropriations which are made have to go into that fund there ought to be some place for the funds to come back out for construction.

Senator ANDERSON. Other than section 7?

Governor JOHNSON. Other than section 7, which is a recreation section.

Senator O'MAHONEY. What is the meaning of the conclusion of that sentence beginning with the word "and" after the word "Treasury" in line 8?

and such funds shall be available for expenditures within the limitation of the provisions of this act and the provisions of the appropriation

Governor JOHNSON. That is the language which I propose to be added.

Senator O'MAHONEY. I was reading from the Rogers bill.

Governor JOHNSON. Yes. The purpose of that is to make the appropriations available for expenditures within the limitations of the provisions of this act, Senate bill 500, and of the appropriation bill.

Senator WATKINS. Does it not seem to you that it is implicit in the statement:

All appropriations made for the purpose of carrying out the provisions of this act, other than section 7, shall be credited to the basin fund?

The appropriations for carrying out this act, and appropriations can be used from the basin fund, it seems to me that is implicit?

Governor JOHNSON. You don't say so.

Senator WATKINS. Well, you do not spell out every power in minute language.

Governor JOHNSON. It says:

All appropriations made for the purpose of carrying out the provisions of this act shall be credited to the basin fund as advances from the general fund to the Treasury.

Then you go on with the rest of the bill and you make your provisions for taking money out of the basin fund and after you take the money out for the purposes that are set up in the bill, then the rest of the money goes back into the Treasury.

Senator WATKINS. One of the purposes is the construction of these projects.

Governor JOHNSON. That is right.

Senator WATKINS. For the purpose of carrying out the provisions of this act.

Governor JOHNSON. That is right.

Of course, all appropriations go in here.

Senator WATKINS. To me it seems to say so in very plain language that the money is available for the purpose of this act even though it is in that fund.

But if there is any doubt in anybody's mind, if we have to put in 3 or 4 words to get it out of that fund, I am for it.

Senator ANDERSON. Does not section (a) take it out:

There is hereby authorized a separate fund in the Treasury of the United States to be known as the Upper Colorado River Basin (hereinafter referred to as the basin fund), which shall remain available until expended, as hereafter provided, for carrying out provisions of this act other than section 7.

So whatever is done, to build dams or anything else, is taken out of the basin fund.

Governor JOHNSON. I cannot see it the way you do, but I cannot argue the matter with you. The money goes into that fund and it remains in that fund——

Senator ANDERSON. Until it is expended for the purposes of the act.

Governor JOHNSON. If you stop right there that might be all right, but you go on with all of these provisions on pages 8 and 9 and 10 and 11, and you list the expenditures from this fund in detail and there is nothing in any of them that says anything about construction cost.

Senator ANDERSON. Except section (a).

Governor JOHNSON. Which doesn't say anything about it. It says:

There is hereby authorized a separate fund in the Treasury of the United States to be known as the Upper Colorado River Basin fund which shall remain available until expended as hereafter provided.

Now, "hereafter provided" means (b), (c), (d), and all these other arrangements that go clear to page 11, line 11.

Can you find any place in that bill where any money can be expended for construction? It has everything else in there, but not for construction.

Then down here on page 8, line 17, it says:

Provided, That revenues created to the basin fund shall not be available for appropriation for construction of the units and participating projects authorized by or pursuant to this Act.

Now, I would like to know what that language may mean.

Senator O'MAHONEY. Where is that language?

Governor JOHNSON. On page 8, line 17, proviso.

Senator ANDERSON. Do you recognize the difference between revenues and appropriations?

Governor JOHNSON. Well, I think an appropriation becomes revenues after it goes in the fund. I think it is an appropriation until after it gets in the fund and then after that it becomes a revenue.

Senator MILLIKIN. Could that not be cleared up with some language?

Governor JOHNSON. Yes.

Senator MILLIKIN. I suggest that it be done.

Governor JOHNSON. All I am doing is calling attention to it. I have prepared language which may not be appropriate.

On the other hand, it may be appropriate.

Senator O'MAHONEY. Governor, I think there is a difference in the meaning of revenues and appropriations. If you look on page 7, beginning with line 21, it says specifically:

All appropriations made for the purpose of carrying out the provisions of this Act.

Now, the provisions of the act include construction.

Governor JOHNSON. That describes the appropriation.

Senator O'MAHONEY. Then this other provides that revenue—the word "revenue" does not include appropriations.

Governor JOHNSON. It does after they get into the fund, they become revenues.

Senator O'MAHONEY. No: appropriations are one thing; revenues are another. Revenues arise from the sale of power, for example.

Then on line 24:

The cost of each unit, participating project, or any separable feature.

I do not believe there was any intention on the part of anybody drafting this bill to make the distinction that you point out. I am sure that nobody on the committee would hesitate to clarify the matter.

Governor JOHNSON. All I am doing it for, Senator, and I am sure you know that, is to be helpful and constructive. I tell you why I was so anxious about it. I was anxious to know whether the funds that were appropriated could be used for the building of participating projects, and especially whether the funds that were earned by the projects could be used for the building of participating projects in the upper Colorado River Basin.

When I read section 4 I was surprised to find that you can take the money out of the basin fund for any number of purposes except construction. And there is no way of taking any money out of that fund for construction. At least it is not written out here.

Senator MILLIKIN. Mr. Chairman, I think the Senator has brought up a very important point. On that there ought not to be the slightest possibility of argument.

Therefore, I suggest that the committee agree that that should be clarified so that there cannot be any question about it.

Senator WATKINS. Mr. Chairman, there will be a number of matters in connection with the draftsmanship of the bill. I take it they will be considered by the committee when it comes time to mark up the bill and that suggestion will be considered at the same time.

To me it means that the money can be taken out, but if there is any doubt in anybody's mind I would not go through all the pains of getting the bill passed and find out we cannot spend the money.

Senator MILLIKIN. It will take only a few words to clarify it and I suggest we clarify it.

Governor JOHNSON. I thank my former colleague.

Senator ANDERSON. I want to call Governor Johnson's attention to the fact that this is set up precisely as the Colorado River Dam fund was set up, the same general language of putting money in the fund, and there have been expenditures from that fund in his State and other States. That was the intention of this.

Governor JOHNSON. I am sure that that was the intention.

Senator ANDERSON. The same happened on the Bonneville Dam and the expense money on the Bonneville Dam.

Governor JOHNSON. I am positive that that is the intention.

Now, in section 6, I think this is a typographical change on line 12, "the hydroelectic powerplants and transmission facilities," "and transmission facilities" were left out at that particular point.

In other places in the bill it occurs. That is on page 11, "the hydroelectric powerplants." Other places in the bill whenever you say "the hydroelectric powerplants" you add "and transmission facilities" but in this the "and transmission facilities" is left out.

Senator ANDERSON. Perhaps it is due to the fact that transmission facilities do not generate any power and this is dealing only with generation of power in such ways as will be most useful.

Governor JOHNSON. If it is operated and maintained, then your transmission facilities are needed at that time.

On page 11, line 21, I added a proviso there. You will find on the Rogers bill on page 12, line 9;

Provided, That power produced pursuant to this Act shall be sold at the highest practicable price to enhance the development of the Upper Colorado River Basin and operation in conjunction with other powerplants shall not deprive the basin fund of revenues which it would receive in the absence of such joined operations.

Section 6 deals with cooperation with other powerplants on the river and the proviso which I have offered I would like to have you give what consideration it merits.

As I say, you will find the language of it on page 12, line 9.

On page 12 of the bill I inserted an amendment, line 17. Following "interest" change the period to a comma and add "and with due regard for any change in use that may occur at some future time."

That is on the exchange of land and is meant to provide for a recovery of land that might be disposed of.

Now, section 12 on page 14, beginning with line 14, the bill says:

No right to impound or use water for the generation of power or energy, created or established by the building, operation or use of any of the powerplants authorized by this Act, shall be deemed to have priority over or otherwise operate to preclude or impair any use, regardless of the date of origin of such use, of the waters of the Colorado River and its tributaries for domestic or agricultural purposes within any of the states of the upper Colorado River Basin.

I think the last part of that proviso beginning on line 17 is in conflict with the Boulder Canyon Project Act and the seven-State compact.

In article 4 of that compact there is a proviso (c) that says:

That the provisions of this article shall not apply to or interfere with the regulation and control by any State within its boundaries of the appropriation, use, and distribution of water.

It seems to me that that proviso there on page 14 interferes with paragraph (c) of article 4 of the compact and in the first part on page 14 you state that this bill S. 500 complies with the Colorado River compact and the Boulder Canyon Project Act and so on.

So I am proposing that the language be changed which will give the same effect, but which will not fly in the face of the seven-State compact.

After the word "no" in line 14 of page 14, I suggest that you add this language:

No agency or official of the United States shall seek or accept a right to impound or use water for the generation of power or energy, created or established by the building, operation, or use of any of the powerplants authorized by this Act.

Senator O'MAHONEY. Will you read that again, please.

Governor JOHNSON. You will find that on page 15 of the Rogers bill, lines 9 to 13.

Article 4 of the compact makes a distinction between powerplants used for storage which are interstate and those which are used intrastate.

(b) Provides for your interstate.

Senator WATKINS. Where are you reading?

Governor JOHNSON. Do you want the place in the bill? Do you have the Rogers bill, Senator?

Senator WATKINS. Yes.

Governor JOHNSON. Now, look at lines 9 to 13 on page 15. Article 4 of the compact is divided into three paragraphs, (a), (b), and (c); (b) has to do with the power rights on interstate reservoirs; (c) has to do only with intrastate projects.

Now, I might give you a good example of what I am talking about. In Colorado we have the Green Mountain Reservoir. The Green Mountain Reservoir is completely an intrastate power project. The Interior Department, the Reclamation Bureau through an agent, filed on the power rights on the Green Mountain Reservoir. That is an intrastate reservoir in every way and they had a right to do that.

I do not think that this proviso on page 14, beginning with line 14, as it is written here, will stand up against paragraph (c). I am just calling your attention to what I think is very important, that you ought to take a pretty good look at that and see whether it does the job that it is supposed to do in connection with paragraph (c) of article 4 of the compact.

Senator KUCHEL. How do you interpret the language in S. 500 beginning at line 14 on page 14? What do you think that language attempts or purports to accomplish?

Governor JOHNSON. I think its intent is clear enough, but I do not think it can fly in the face of the seven-State compact.

You say right up there on top of page 14 that:

The Secretary of the Interior is directed to comply with the applicable provisions of the Colorado River compact, Boulder Canyon Project Act, the Boulder Canyon Project Adjustment Act—

and so on.

Yet you go down here and you fly right in the face of paragraph (c) and make a provision that I do not think does comply because paragraph (c) says:

The provisions of this article shall not apply to or interfere with the regulations and control of any State within its boundaries, of the appropriation, use, and distribution of water.

On an interstate reservoir I am very sure that the Department of Interior and the reclamation people can file on reservoir rights.

Senator O'MAHONEY. May I interrupt you at this point?

Governor JOHNSON. Yes.

Senator O'MAHONEY. I am calling your attention now to page 15 of the Rogers bill, the new language that you are proposing for the language beginning on line 14, of page 14, of S. 500.

Governor JOHNSON. Yes.

Senator O'MAHONEY. I want to be sure that I understand what you believe this new language to mean. It says:

No agency or official of the United States shall seek or accept a right to impound or use water for the generation of power or energy, created or established by the building, operation, or use of any of the power plants authorized by this Act.

Now, I take it that those words beginning in line 11 "by the building, operation or use of any of the powerplants authorized by this Act," are intended to convey the meaning that you believe that any agency or official of the United States properly authorized to do so may build, may operate and may use any of the powerplants authorized in the act?

Governor JOHNSON. Yes, that is right.

Senator O'MAHONEY. You do not intend to deny that?

Governor JOHNSON. I do not intend to deny that at all.

Senator O'MAHONEY. You are merely trying to deny impounding or using water for the exclusive purpose of filing?

Governor JOHNSON. No, what I am trying to do is what the Interior Department is permitted to do under the seven-State compact, to do what the Interior Department did do in Green Mountain Reservoir. They went in there and filed on the power rights. They had a right to do it.

Senator O'MAHONEY. They had or had not a right to do it?

Governor JOHNSON. They did have a right, because they were given that right by the seven-State compact, article 4, because the Green Mountain Reservoir is an intrasate reservoir and because it was an intrastate reservoir, under paragraph (c) they had a right to go in there and file on the power rights, and they did file.

And there is a lawsuit pending because they did file, now.

I do not think you can do what you say you want to do here in the rest of the language.

Senator O'MAHONEY. I am trying to find out what you want to do.

Governor JOHNSON. I don't want them to file on the power. I don't want the Federal Government to file on the power in any of the reservoirs in this development plan.

I don't want them to do that.

Senator O'MAHONEY. You do not believe that the Colorado River compact is not an interstate compact, do you?

Governor JOHNSON. Well, some of the projects are not interstate. The Green Mountain Reservoir is not interstate.

Senator ANDERSON. How do you make that distinction, just because it is within a State?

Governor JOHNSON. It is within a State and all the uses of the water which it impounds is within the State.

Senator ANDERSON. Is not it part of an interstate stream?

Governor JOHNSON. That is right. It is part of an interstate stream.

Senator O'MAHONEY. Now, we have created an interstate system, have we not? Congress has done that over a period of more than 30 years now, dating from 1922. The whole purpose of the compact was to create an interstate agreement whereby the waters of the Colorado River Basin could be utilized in 2 segments, 1 segment for the lower basin and 1 segment for the upper basin.

Governor JOHNSON. But the compact has been very careful to state that it was not interfering with the States appropriation of water or the use of its water, its allocation; it did not go into that matter at all.

Senator O'MAHONEY. I think we may be just talking about words. I understand your intent to be like that of the rest, to make the best possible division in fairness and in accordance with the terms of the compact of the waters of the whole system among those States involved.

Governor JOHNSON. And I do not want any State to be able to file on the power rights on any intrastate reservoir. That is what I am talking about.

I do not believe you can do what you are attempting to do.

Senator O'MAHONEY. You said no State. You meant no agency?

Governor JOHNSON. I meant no official of the United States; that is what I mean.

Senator KUCHEL. Governor, if I may interrupt you, what your fear is of the present language of the bill S. 500 is that you might create a right on the part of the Federal Government to file on power in connection with an intrastate dam, and to that extent interfere or deny your State the right to use those waters for its own beneficial use; is not that it?

Governor JOHNSON. That is right; and to get a power right in a reservoir just as the Federal Government claims to have a power right by filing on the power in the Green Mountain Reservoir.

Senator MILLIKIN. Governor Johnson, is the following language of article 4 of the compact that to which you are referring?

(b) Subject to the provisions of this compact, water of the Colorado River system may be impounded and used in the generation of electric power, but such impounding and use shall be subservient to the use and consumption of such water for agricultural and domestic purposes and shall not interfere with or prevent use for such dominant purposes.

Is your point the way the bill is drawn that there is a conflict between that part of article 4 and the way the bill talks?

Governor JOHNSON. No; there is no conflict with paragraph (b). But there is a conflict with the next paragraph, (c), which says: "The provisions of this article"—that means article 4—

shall not apply to or interfere with the regulation and control by any State within its boundaries of the appropriation, use, and distribution of water.

Senator ANDERSON. Does that not deal only with compliance with the State law in the acquisition of rights to use water?

Governor JOHNSON. No; I don't think so. I think it applies to intrastate reservoirs.

Senator ANDERSON. How can it be an intrastate reservoir on an interstate stream once the stream has been taken into an interstate system?

Governor JOHNSON. Because paragraph (c) gives it that right.

Senator ANDERSON. This gives it the right to have an intrastate reservoir?

Governor JOHNSON. Well, it evidently takes that possibility into consideration because it says:

> The provisions of this article shall not apply to or interfere with the regulations and control by any State within its boundaries of the appropriation, use, and distribution of water.

And yet the Federal Government or an agent of the Reclamation Bureau filed on the power rights in Green Mountain Dam because that was an intrastate reservoir.

Senator ANDERSON. We have a whole list of projects up there. Some of them are inside the States. That does not make them intrastate projects; does it?

Governor JOHNSON. I think it would if all the use of the water that they impounded was to be used within the State because the compact itself——

Senator ANDERSON. The Eden project is all within the State of Wyoming. Is that an intrastate project?

Governor JOHNSON. It is if all the waters that are impounded are used in the State of Wyoming.

Senator ANDERSON. And the Seedskadee project is also within the State. All the water is within the State of Wyoming.

Governor JOHNSON. I don't know whether all the waters that it impounds are used in Wyoming, but if that is so, I think it would come under the description of paragraph (c) in article 4.

Senator O'MAHONEY. Assuming that a certain project for irrigation and reclamation, that is to say, for agricultural use, could not be built by the State within the borders of which the possibility exists, there would be a logical possibility; suppose the water could be irrigated only through the reclamation law and by the appropriation of Federal money, and suppose that Federal money were expended to build such a reservoir and that the land to be irrigated could not possibly be paid for unless you had power revenues, would you say by the argument that you are making here that that reservoir could not be built; that that power could not be used, and therefore, that the water could not be put upon any land for reclamation?

Governor JOHNSON. Well, I would like to have you use the Green Mountain Reservoir.

Senator O'MAHONEY. I do not know anything about the Green Mountain Reservoir.

Governor JOHNSON. The Green Mountain Reservoir is a compensating reservoir that was built in connection with the Big Thompson. It is a compensating reservoir. It provides water for agricultural uses and for other industrial uses in the State of Colorado, including the development of oil shale and so on.

Senator O'MAHONEY. Is not that power developed by the construction for which the Federal Government made appropriation?

Governor JOHNSON. The Federal Government made the appropriation and built that. And filed on the power.

Senator O'MAHONEY. Then do you say to this committee that the Federal Government was wrong in filing on that power?

Governor JOHNSON. No, sir; I do not say it was wrong in filing on that power.

Senator O'MAHONEY. Do you say that that power use is subservient to agricultural uses on the west slope of Colorado?

Governor JOHNSON. I don't say that because I don't know.

Senator O'MAHONEY. Would not you have to say that if you continue the argument?

Governor JOHNSON. No, I wouldn't have to say that because I just don't know.

I know that they filed on that power.

Let me ask you a question. Why do you have this proviso in here at all?

Senator WATKINS. The one you are objecting to?

Governor JOHNSON. I am not objecting to it. I am trying to make it in harmony with the 7-State compact, but beginning on line 14, down to line 22, why do you have that provision there?

Senator O'MAHONEY. I had nothing to do, Governor, with the drawing of this bill, but I assume on reading this, without having had a chance to talk with the engineers with respect to the meaning of this precise language, I assume that it is intended to protect upstate water users.

Governor JOHNSON. Exactly. That is exactly what it was put in there for.

Senator O'MAHONEY. I think we are just debating about words and not about substance.

Governor JOHNSON. No.

Senator WATKINS. May I ask you a question about your interpretation of the language you propose, and I will read it again:

> No agency or official of the United States shall seek or accept the right to impound or use water for the generation of power or energy created or established by the building, operation or use of any of the powerplants authorized by this act.

With respect to Glen Canyon, what is your interpretation with respect to that project?

Governor JOHNSON. Glen Canyon is an intrastate reservoir.

Senator WATKINS. But it is one being built under this act.

Governor JOHNSON. Sure it is being built, but you do not want Uncle Sam to go in there and file on that power in Glen Canyon.

Senator WATKINS. He files on the power in behalf of the project as a trustee for the project, just as he has done in my State numerous times as a trustee for the benefit of the project itself on the water applications.

Governor JOHNSON. That is a different thing.

Senator WATKINS. That is the way they operate. They are trustees for the people under an arrangement of that kind.

Governor JOHNSON. That is right, but that is not the way it was filed on Green Mountain Dam.

Senator WATKINS. It seems to me, Governor, that language you propose would prohibit the generation of electricity in any of these plants. Every one of these on the main stem as well as everywhere else on the project.

Governor JOHNSON. I am sure not, but I am submitting it for what it may be worth.

Now, going back to section 4 again, I want to call your attention to the Boulder Canyon project, and this is the way it is handled in the law.

I want to say this, Senators, that I have been quite disturbed about the possibilities that the profits that are earned from the sale of power on the storage projects may not be dedicated to the development of the Upper Colorado River Basin. It think it is exteremely important that that money be dedicated for that purpose. That is one of the principal arguments for building the reservoirs on the river, that is, the large storage reservoirs.

This is the way the Boulder Canyon project handled the matter. I am reading from the act:

After the repayments to the United States of all money advanced with interest charges shall be on such basis and the revenues derived therefrom shall be kept in a separate fund to be expended within the Colorado River Basin as may hereafter be prescribed by the Congress.

I want to read from the bill on page 8, line 17, in which it says,

Provided, That revenues credited to the basin fund shall not be available for appropriation for construction of the units and participating projects authorized by or pursuant to this act.

To me there is a vast difference between the two texts. One of them says it is to be used and the other says it cannot be used.

So I have suggested an amendment on line 17, and add a "fifth" there. There are four paragraphs. I add a fifth.

Any remaining surplus to be available for appropriation for construction of the units and participating projects authorized by or pursuant to this act.

It seems to me that it is very important that in this great project with all of the storage reservoirs and all of the participating projects and all, that the power money ought to be used for the construction of the participating projects remaining in this basin.

Senator WATKINS. As I understand it, the money goes to the United States Treasury, and it is reappropriated under the theory of this bill for this fund. You are doing away with this idea of interest that we had so many arguments about in the past.

Governor JOHNSON. You set up ways that the money can be used, but when you get down to the building of reservoirs, you say, "*Provided*, That revenues credited to the basin fund shall not be available for appropriation for construction of the units and participating projects authorized by or pursuant to this act."

I am making this comparison with the language in the Boulder Canyon Project Act:

After the repayment to the United States of all money advanced with interest, charges shall be on such basis and the revenues derived therefrom shall be kept in a separate fund to be expended within the Colorado River Basin as may hereafter be prescribed by the Congress.

Senator ANDERSON. Of course, that is what was intended by this. This is the same language exactly in the bill introduced by Senator Millikin, and on which you were a joint author last year and designed to make sure that you cannot come ahead and the man administering the fund out there can build the reservoirs wherever he wishes without submitting the projects to the adjoining States.

This merely requires that you have to come back for the same kind of approval by the Congress, and to permit the other States to register their objections to building reservoirs we now have in the law. Otherwise you would have a tremendous amount of money rolling into the Department of the Interior and they could build reservoirs wherever they wished without reference to the desires of the people of that State or the people of the adjoining States.

Governor JOHNSON. But listen to the proposed amendment that I suggest for it. I suggest in line 17 of the bill after the semicolon, you add this language:

(5) Any remaining surplus to be available only for appropriation for construction of the units and participating projects authorized by or pursuant to this act.

What I am trying to do in that is to tie the profits on the power projects in this bill to a development of the projects in the upper basin. It is my opinion—and my opinion is not expert by any means—that the money that is earned by these powerplants in the upper Colorado River Basin can be used in any reclamation project in any basin outside of the Colorado River. I think it goes into the reclamation fund.

Senator ANDERSON. You understand, of course, that we are now dealing with something in the neighborhood of 2050 as far as years are concerned, because it would take at least that long to finish all the projects that might be available under this out of the earnings. It was our thought at least that probably it could wait and find out if some new source of energy might come in that would reduce the value of some of these water plants. I see no objection to saying that is to be spent within the area. That certainly is contemplated. But it would be a long, long time before all of these projects will have been paid out.

Senator MILLIKIN. Mr. Chairman, it seems to me that that very fact requires some protection that there will be money available to build them when the time comes no matter how far removed. I think the Senator has a good point.

Senator WATKINS. May I call to your attention that there have been many objections to the reclamation program and the interest increment and other things that were converted to the use of the projects. There was an attempt made in this bill to turn all the money in the United States Treasury except certain phases of it, and it was named on page 8, starting in line 3:

These revenues shall be available for defraying the cost of operation, maintenance, and replacements of, and emergency expenditures for, all facilities of the Colorado River storage project and participating projects within such separate limitations as may be included in annual appropriation payments.

What they are attempting to do is not to make available this revenue for the construction purposes, but a limited use for matters I have just mentioned, operation, maintenance, and replacements.

That was to make a clear-cut program in which the money is all appropriated from the United States Treasury for construction purposes and none of this money is converted under any kind of a theory into construction that comes from the operation of the program. That was the attempt made and it was an attempt to meet the objections that were raised time and time again that we were doing some-

thing here that we should not do. Congress took vigorous exception to that interest increment.

Governor JOHNSON. Do you not believe, Senator, that the power profits from the Glen Canyon project should be used for the construction of participating projects in the basin?

Senator WATKINS. If it goes into the Treasury and the United States appropriates the money directly, I have no objection to that program. I have an idea when the thing is finished and paid for, yes, but while it is under operation I think this program meets the objections that were made by so many people to the financing that had been in operation on other projects. That came under violent attack and opposition in the United States Congress.

Governor JOHNSON. I call your attention to the fact that in the Boulder Canyon Project Act, it says after the repayments to the United States of all moneys advanced with interest charges shall be on such basis and the revenues derived therefrom shall be kept in a separate fund to be expended in the Colorado River Basin as may hereafter be prescribed by Congress. You think that was a bad arrangement?

Senator WATKINS. No, I do not. The fact is that a number of years ago I introduced a bill that would accomplish the same purpose on all the reclamation projects after the United States had been made whole. That is not taken care of in this bill. You are aiming at the time if and when the thing is paid for. That is what you are quoting.

Governor JOHNSON. So is this other proposal.

Senator WATKINS. No, this other proposal leaves it wide open what is paid for after the profits come in.

Senator MILLIKIN. This is an evolutionary program. As you pointed out a while ago, Mr. Chairman, it may be a hundred years before we finish the participating projects. What is the matter with the Senator's suggestion?

Senator WATKINS. It brings us right back to the interest increment.

Senator MILLIKIN. I do not see where the interest increment comes in.

Senator ANDERSON. I think there is no objection to a declaration of policy at all if it is necessary. We tried by section 2 to say that in order to achieve such comprehensive developments as will assure the consumptive use in the States of the upper Colorado River Basin of waters and so forth, Congress pledges itself to the construction and operation of all these projects. As I have tried to say, I know that there are projects which will not be paid out and all this money is going to be required until after 2050. If it is necessary to say after 2050, no money shall come out of there, but it shall stay in the Treasury and be used for the development of the upper Colorado River Basin. I have no objection.

Senator WATKINS. I do not either. I did not want to cross that bridge now.

Governor JOHNSON. The difficulty is that this bill, S. 500, takes care of the other States in the upper basin, but Colorado, the State that produces 71.18 percent of the water in the upper basin, has a great many participating projects that are not included in the bill and will not be included in the bill even if the 18 which I have suggested go in.

The other States have had their needs completed by the bill, but we are going to have participating projects in Colorado for a good long time.

My purpose is to get some of that money in the way of profits flowing back for the building of these participating projects.

This comes from the Reclamation Bureau. It shows this. They have a column here, and this was prepared by Mr. Jacobson and presented to the Upper Colorado River Commission, and has a column showing irrigation costs to be repaid from Glen Canyon and Echo Park power. It shows in Utah $90,246,500. For Colorado, it shows $16,595,700.

Senator WATKINS. Is not that reference to the first stages, Governor? You realize that this is a comprehensive program for the development of the waters of the upper Colorado which are allocated under the compact of 1922, and that there had to be various stages of preparation. As I understand it, the projects you recently mentioned you are adding to the bill are ones which have not been developed or investigated to the point where reports have been made on them. They are all contemplated to be under the same sort of a help from the revenues going into the Treasury or whatever it is to make the balance come up to the point where the project will practically pay for itself.

You mentioned several times about the percentage that Colorado gets out of this. I think you overlooked, and probably not purposely, a chart here showing what Colorado has already had in the way of development. I have the Fruitgrowers Dam, $200,741; Grand Valley, $5,667,000. That is, they already have had it or it is provided under the program of construction now underway. Mancos, $3,875,797; Panonia, $1,886,700; Pine River project, over $3,382,000. Another one, $10,663,000. And Colorado-Big Thompson, $159,461,000. A total of $185,137,000.

The other States—Utah has had $17,761,000; Wyoming, 5,989,000; and New Mexico has had $104,000 on the development of the Colorado River.

I know you did not intend to make this misleading but you left out all the projects Colorado has had for the development of the upper basin and the Colorado water rights. I do not know the total amount of water that is being developed or taken care of in this program that I have just read to you, but I do know that apparently in the figures you gave earlier, you left out the evaporation charges on the major dams that should be charged to Colorado. That would be Colorado water, too.

Governor JOHNSON. Colorado, of course, will be charged for the evaporation on the dams that you are reluctant to give us any profits from the production of power. For instance, on Glen Canyon, the evaporation is 626,000 acre-feet plus another 100,000 of silt that otherwise would be measured as water at Lee Ferry. I misstated that. It is 526,000 of evaporation and 100,000 of silt, that otherwise would be measured as water and 51.75 percent evaporation is charged to the State of Colorado under the upper States compact.

Senator WATKINS. Each State gets its proportionate share of the charge.

Governor JOHNSON. That is right. We are not kicking about that, but we think as long as we have to pay for the evaporation of these

reservoirs, that our participating projects ought to receive some of the revenues or profits from them.

Senator WATKINS. I would say that the same fellow that takes in the revenue and keeps it during the period until the time they are paid for is the fellow who appropriates the money for the construction. The revenues from the operation and maintenance can be used for those purposes. What we are trying to do in this bill is to meet the objection—it is somewhat a matter of bookkeeping—if we put the money into the United States Treasury and the payouts come in and are credited to the fund, and the revenues are credited to the extent that we use them for operation and maintenance. Then to make a clean-cut operation, we appropriate directly from the United States Treasury to this project until it is finished.

Now, when it is finished, I will agree with you. My own personal view is after these projects have been paid for, the people who have paid for them should own them. They should pay the United States in full, and the United States should get out except for the protection of whatever rights it has for navigation and wildlife and other things of that sort. That is not here. Nobody approved my bill when I introduced it.

Senator ANDERSON. Governor, may I say this, that I do not believe there is anybody concerned in this problem who does not want Colorado to have the fullest possible development of its resources, who does not want Colorado to get participating projects up to the full amount that it is entitled to. We are only trying in this bill to dispose of about 1,700,000 acre-feet out of some 4 or 5 million acre-feet available to the upper basin States. I do not believe there is the slightest wish on anybody's part to keep Colorado from having participating projects and have them paid for. You recognize that there was a long time a little difficulty in Colorado in deciding just how the water resources of that State should be done. Perhaps that has delayed to some degree the preparation of eligible projects. But we are as happy as we can be to see proper projects come in from Colorado. There is not anybody I know of on this committee or in Congress that would like those shunted to one side.

Senator MILLIKIN. I understand the Senator's point. He wants to be sure that there is money available to build those projects.

Senator ANDERSON. I think some declaration can be put in there to cover that.

Senator MILLIKIN. We are not at the early end of the construction. The Senator, as I understand his point, is looking forward to the day when it will take money to do the job, and he wants to be sure there are normal safeguards there.

Senator ANDERSON. I think that is a proper precaution.

Senator WATKINS. There is one thing we should keep in mind, that the repayment contracts even on the small projects contain a provision subject to the appropriations by the Congress. No future Congress can be bound to make appropriations. If they should suddenly stop making those appropriations, we would all be in the same spot.

Senator MILLIKIN. That would wash out the whole project.

Senator WATKINS. It might.

Senator MILLIKIN. We are not going to work here and build up an act on the theory that it is going to be wiped out by a future Congress.

Senator WATKINS. We do not expect it to be. That is why I say, if this program which comprehends the full development, including all States——

Senator MILLIKIN. Governor Johnson is making the point, as I understand it, that when the time comes that Colorado comes in with its participating projects, where is the money coming from? He wants the language in the bill to assure it coming from the basin.

Governor JOHNSON. That is correct.

Senator WATKINS. Then you have to change the whole theory of this repayment setup.

Senator MILLIKIN. I do not think so.

Senator ANDERSON. I think you might be able to protect that point without too much trouble, and as far as I am concerned, I am not opposed to protecting it.

Senator WATKINS. I am not either, as far as we can do it.

Governor JOHNSON. The point is that in this bill the participating projects of Wyoming, Utah, and New Mexico are included. The projects for the State of Colorado are not included, and we have many participating projects. It would just seem to me that it would be only fair to assure these participating projects in Colorado which are left out of this bill that they would be taken care of the same as the participating projects that are already listed in the bill.

Senator ANDERSON. I think that might be possible.

Senator WATKINS. I would not object to that.

Senator MILLIKIN. That is all the Governor is trying to do, as I understand it.

Governor JOHNSON. That is correct.

Senator WATKINS. If we modify this language we get back to interest increment.

Senator MILLIKIN. We have to conform the language to the proper concept and the proper concept is the one Governor Johnson has suggested, that since there will be future participating projects out of the river system there should be money to do the business.

Senator WATKINS. We will all agree to that.

Senator MILLIKIN. That is all the Governor is talking about. It is not an unprecedented thing. He has read from the Boulder Canyon Act.

Governor JOHNSON. I would like to call Mr. Larson back to the witness stand, and have him go into more detail about these 18 projects that have been approved by the Upper Colorado River Commission, the Colorado State Board of Water Conservation, the General Assembly of the State of Colorado, and we hope that they will be included by this committee.

Mr. Larson has some additional data that I think ought to go into the record with respect to these 18 projects. I ask that he be called to the witness stand to offer that testimony.

Senator ANDERSON. You will have no difficulty on that. We are very anxious to have that information in the record.

Governor JOHNSON. I am sure you are.

Senator MILLIKIN. Mr. Chairman, I would like to have the Governor emphasize again, if it is not sufficiently emphasized, that these 18 projects have been approved by the Upper Colorado River Commission, by the State water board, by the State Legislature of Colorado.

Senator ANDERSON. I am glad to have that emphasis, because I really believe, Governor Johnson, that one of the reasons why there are more projects from other areas than your State is that there was not for a substantial period of time representations made by your State as to the projects upon which there had been agreement. As rapidly as that agreement comes forward, and the material is ready, we are extremely anxious to add those projects to the bill.

Governor JOHNSON. I want to make one other request. Later on I think this subcommittee is going to hold hearings on Senate bill 300, and I will not be able to come back when you take testimony on S. 300, the so-called Frying Pan-Arkansas, but I would like to hand to you now my testimony with respect to that project, and ask that at the proper time it be added to the testimony.

Senator MILLIKIN. I move that be done.

Senator ANDERSON. I will say to you, Governor Johnson, that we intend to have hearings on the Frying Pan-Arkansas upon the conclusion of these, and a reasonable time for the preparation of the material to go to the printer. Just as soon as that is finished, we intend to go forward with the Frying Pan-Arkansas project, and if you will leave your statement with the committee, it will be put in the record at the opening of the hearings on that.

Governor JOHNSON. Thank you very much, Mr. Chairman. That is all that I have to say.

Senator KUCHEL. Mr. Chairman, there are some questions which, if the Governor would permit, I would like to ask him either now or subsequent to Mr. Larson's statement. Would that be agreeable to you, Governor?

Governor JOHNSON. Yes, sir; if it is agreeable to the committee.

Senator ANDERSON. Do you want to do it now?

Senator KUCHEL. Perhaps it would be better if you heard from Mr. Larson first, Mr. Chairman.

Senator ANDERSON. You may proceed, Mr. Larson.

STATEMENT OF E. O. LARSON, REGIONAL DIRECTOR, BUREAU OF RECLAMATION, REGION 4, SALT LAKE CITY, UTAH

Mr. LARSON. Mr. Chairman, Assistant Secretary Aandahl explained yesterday to the committee that the Department must withhold recommendations on any projects for which reports have not been completed and reviewed by the affected States, the interested Government agencies, and the Bureau of the Budget. It was my purpose to prepare such information as we have on those additional projects referred to in House bill 3384. I did not submit them yesterday because those particular projects were not included in Senate bill 500.

I have with me a short one-page statement and a summary sheet showing the irrigated acreage, the principal agricultural production, the water supply, construction costs, annual operation and maintenance cost, and benefit-cost ratio of the 20 additional projects in House bill 3384, 18 of which I believe were referred to by Governor Johnson in his statement this morning.

Senator O'MAHONEY. Mr. Chairman, may I ask Mr. Larson if this summary includes the Sublette unit in Wyoming.

Mr. LARSON. Yes; I will cover that in just a moment. It does include it.
