August 24-Month Study
Date: August 10, 2012

From: Water Resources Group, Salt Lake City
To: All Colorado River Annual Operating Plan (AOP) Recipients

Current Reservoir Status

Reservoir	July Inflow (unregulated) (acre-feet)	Percent of Average (%)	August 9 Midnight Elevation (feet)	Reservoir Storage (acre-feet)
Fontenelle	92,000	52	6503.16	323,000
Flaming Gorge	95,000	45	6022.81	3,080,000
Blue Mesa	30,000	26	7467.56	420,000
Navajo	10,000	16	6044.16	1,159,000
Powell	154,000	14	3626.99	14,519,000

Expected Operations

The operation of Lake Powell and Lake Mead in this August 2012 24-Month Study is pursuant to the December 2007 Record of Decision on Colorado River Interim Guidelines for Lower Basin Shortages and the Coordinated Operations of Lake Powell and Lake Mead (Interim Guidelines), and reflects the 2012 Annual Operating Plan (AOP). Pursuant to the Interim Guidelines, the August 2011 24-Month Study projections of the January 1, 2012, system storage and reservoir water surface elevations set the operational tier for the coordinated operation of Lake Powell and Lake Mead during 2012.

Consistent with Section 6.A of the Interim Guidelines, the Lake Powell operational tier for water year 2012 is the Equalization Tier. The August 2012 24-Month Study projects the water year release volume from Lake Powell for 2012 to be 9.46 maf.

Consistent with Section 2.B.5 of the Interim Guidelines, the Intentionally Created Surplus (ICS) Surplus Condition is the criterion governing the operation of Lake Mead for calendar year 2012.

The Interim Guidelines are available for download at
http://www.usbr.gov/lc/region/programs/strategies/RecordofDecision.pdf.
The 2012 AOP is available for download at
http://www.usbr.gov/lc/region/g4000/aop/AOP12.pdf.

Fontenelle Reservoir – Inflows to Fontenelle Reservoir for the month of July were 92 kaf, or 52% of average. The April through July 2012 runoff season observed inflows totaling 509 kaf, or 70% of average. The reservoir elevation is 6503.16 feet above sea level and 94% of capacity and slowly decreasing. Current inflows are approximately 750 cfs and reservoir releases are 1,100 cfs. Releases will likely be decreased to approximately 975 cfs near the end of August and remain near this level through the fall and winter months.

Inflows for the next three months are projected to be significantly below average: 45 kaf (58%), 35 kaf (76%), 35 kaf (71%) for August, September and October respectively. The Colorado Basin River Forecast Center has also issued the water year 2013 outlook. Inflows for the coming water year are projected to be 955 kaf, or 88% of average.

The next Fontenelle Working Group meeting is scheduled for August 23, 2012 at 10:00 am at the Joint Power's Water Board treatment plant boardroom in Green River, Wyoming. The Fontenelle Working Group is an open public forum for information exchange between Reclamation and other parties associated with the operation of Fontenelle Reservoir. The spring Fontenelle Working Group meeting was held on April 26, 2012 at Seedskadee National Wildlife Refuge. Minutes from the meeting are posted on the Working Group webpages.

Flaming Gorge Reservoir – Unregulated inflow into Flaming Gorge Reservoir during the month of July was 95,000 acre-feet, or 45 percent of average. The reservoir elevation is 6022.9 feet. Flaming Gorge Reservoir is releasing an average daily rate of 1,300 cubic feet per second (cfs), and scheduled to release between 800 to 1,400 cfs through August and September. The releases will be adjusted to meet the target on the Green River at Jensen, Utah of 1,500 cfs in July and August. The target decreases in September to 1,300 cfs. Winter releases are forecasted to drop between 800-850 cfs during October through February.

The current hydrologic classification is moderately dry based on both the observed April through July unregulated inflow volume into Flaming Gorge Reservoir and the August forecast, discussed below. Flaming Gorge is releasing an average daily release of 1,300 cfs with the hourly release pattern approximated below:

Midnight - 6am: 820cfs,
6am – 5pm: 1,350cfs
5pm-10pm- 1,730cfs
10pm –11pm: 1,450cfs
11pm – midnight: 820cfs

The Colorado Basin River Forecast Center and Natural Resources Conservation Service have issued the joint water supply observed April-July unregulated inflow volume into Flaming Gorge Reservoir of 572,000 acre-feet (58% of average). The unregulated inflow

volumes and percent of average for August, September and October are forecasted to be 50 kaf (56%), 38 kaf (69%), and 40 kaf (67%), respectively.

The next Flaming Gorge Working Group meeting is scheduled for August 22, 2012, at 1:00 p.m. at the Western Park Convention Center, 302 East 200 South, Vernal, Utah. The Flaming Gorge Working Group is an open public forum for information exchange between Reclamation and the stake holders of Flaming Gorge Dam. The public is encouraged to attend and comment on the operations and plans presented by Reclamation at these meetings. For more information on this group and these meetings please contact Ed Vidmar at 801-379-1182.

Aspinall Unit Reservoirs – July unregulated inflow into Blue Mesa Reservoir was 30,000 acre-feet or 26 percent of average. Hydrologic conditions in the basin had a break from the dry conditions as summer thunderstorms brought in some much needed precipitation during the month. May, June, and July precipitation was 25, 10, and 150 percent of average respectively. The current inflow rate into Blue Mesa Reservoir is about 700 cfs while reservoir releases are averaging about 1,300 cfs.

Blue Mesa's present elevation is 7468.09 feet, which corresponds to a storage content of about 423,000 acre-feet. The observed April through July runoff into Blue Mesa Reservoir was recorded at 206,500 acre-feet, or 31 percent of average. The reservoir reached a high elevation of 7485.02 feet on April 13, 2012, which was approximately 34.38 feet below "full" pool. Full pool is defined by the top of the spillway gates at elevation 7519.4 feet. Rarely is the reservoir filled to that level due to safety. For practical purposes; the reservoir is considered full at elevations above 7516.4 feet.

Releases from Crystal are currently set at 1350 cfs. The Gunnison Diversion Tunnel is diverting about 800 cfs, which results in a river flow below the diversion tunnel of approximately 550 cfs. These rates will most likely change as conditions warrant, primarily as we respond to changes at the Whitewater gage as flows prescribed in the Aspinall Unit Operations Record of Decision (ROD). The ROD calls for keeping flows at the Whitewater gage at or above 900 cfs.

The next meeting of the "Aspinall Unit Working Group" will be held on Thursday, August 9, 2012 starting at 1:00 PM at the Elk Creek Visitors Center at Blue Mesa Reservoir. At this meeting, review of this spring's reservoir operations, and plans for this summer and fall operations will be discussed. These meetings are open forum discussions on the Aspinall Unit reservoir operations with many interested groups participating. Anyone needing further information about these meetings should contact Dan Crabtree in the Grand Junction Area Office at (970) 248-0652.

Navajo Reservoir – Unregulated inflow into Navajo Reservoir during the month of July was 10,400 acre-feet, or 16 % of average. Unregulated inflow for the April to July 2012 runoff season was 310 kaf, or 42% of average. The reservoir elevation is 6044.16 feet

above sea level and 68% of capacity. Current inflows are approximately 500 cfs and reservoir releases are approximately 850 cfs. Diversions for NIIP are approximately 750 cfs.

Releases are made for the authorized purposes of the Navajo Unit, and to attempt to maintain a target flows through the endangered fish critical habitat reach of the San Juan River (Farmington to Lake Powell). A 7-day spring peak release of 5,000 cfs was achieved during the week of May 21st through June1st. At the end of the peak release period, the release returned to 500 cfs. The goal of the Navajo spring peak release is to match the timing of the peak of the Animas River in Farmington.

Inflows for the next three months are projected to be significantly below average: 12 kaf (27%), 23 kaf (53%), 28 kaf (60%) for August, September and October respectively. The Colorado Basin River Forecast Center has also issued the water year 2013 outlook. Inflows for the coming water year are projected to be 926 kaf, or 86% of average.

A public meeting on Navajo Reservoir operations is scheduled for Tuesday, August 21, 2012 at 1:00 PM at the Civic Center in Farmington, New Mexico (200 West Arrington Street). At this meeting, review of this spring's reservoir operations, and plans for this summer and fall operations will be discussed. These meetings are open forum discussions on the operation of Navajo Reservoir with many interested groups participating. Anyone interested in the general operation of the reservoir is encouraged to attend. Please contact Ryan Christianson in Reclamation's Durango, Colorado Office at (970) 385-6590 for information about these meetings or the daily operation of Navajo Reservoir.

Glen Canyon Dam / Lake Powell – The monthly unregulated inflow volume to Lake Powell for July was 154 thousand acre-feet (kaf) (14% of average). The release volume from Glen Canyon Dam in July was 886 kaf. The end of July elevation and storage of Lake Powell was 3628.45 feet (71.55 feet from full pool) and 14.68 maf (60.4% of full capacity). The reservoir elevation is now declining.

The April through July unregulated inflow volume for 2012 was 2.06 maf (29% of average), placing the 2012 April to July season as the third driest on record since the closure of Glen Canyon Dam in 1963. Only 1977 and 2002 had lower April-July unregulated inflow volumes to Lake Powell than what occurred in 2012. In terms of reservoir elevation and storage, Lake Powell reached its peak for water year 2012 on June 3rd at 3636.90 ft (63.1 feet from full pool) and 15.640 maf (64.30% of capacity), respectively. The peak elevation in 2012 is 24 feet below the 2011 peak elevation of 3660.90ft.

Current Dam Operations

In August 2011, pursuant to the Interim Guidelines, the Operating Tier for Glen Canyon Dam was established to be the Equalization Tier. Under the Equalization Tier when

conditions dry out as they have this year, the minimum annual release from Lake Powell can generally be as low as 8.23 maf. However, water year 2011 was a very wet Equalization year and not all of the Equalization release volume for 2011 could be achieved by September 30, 2011. As a result, 1.233 maf of the 2011 Equalization release volume was actually released after the end of water year 2011. This increased the minimum release volume for water year 2012 under Equalization to 9.463 maf. Under the dry hydrologic conditions currently projected for Lake Powell, the water year 2012 release volume is projected to be at this minimum Equalization level of 9.463 maf. As hydrologic conditions for Lake Powell and Lake Mead change throughout the year, Reclamation will adjust operations of Glen Canyon Dam to release the appropriate annual volume during 2012 to achieve Equalization objectives as practicably as possible by September 30, 2012.

Releases from Glen Canyon Dam are now averaging about 13,500 cfs with fluctuations for power generation throughout the day that peak near 17,000 cfs in the afternoons and with early morning low level releases are about 9,000 cfs and this operation is consistent with the Glen Canyon Operating Criteria (Federal Register, Volume 62, No. 41, March 3, 1997). The release volume for August is scheduled to be 800 kaf and meets the targeted release volume of the 2012 Hydrograph that was approved by the Secretary of the Interior. In September and October, as part of the 2008 FONSI, releases from Glen Canyon Dam will be steady for a steady flow experiment. The targeted release rate for September and October of 2012 is 8,000 cfs, with volumes of 476 kaf and 491kaf, respectively.

In addition to daily scheduled fluctuations for power generation, the instantaneous releases from Glen Canyon Dam may also fluctuate to provide 40 MW of system regulation. These instantaneous release adjustments stabilize the electrical generation and transmission system and translate to a range of about 1100 cfs above or below the hourly scheduled release rate. Typically, fluctuations for system regulation are very short lived and balance out over the hour and do not have noticeable impacts on downstream river flow conditions.

Releases from Glen Canyon Dam can also fluctuate beyond scheduled fluctuations for power generation when called upon as a partner that shares reserve requirements within the electrical generator community (i.e. balancing area). There are many generators that supply electricity to the transmission system within the balancing area. At times, a participating generator may experience operating conditions such that it cannot make its scheduled delivery of electricity to the system (i.e. unscheduled outage). To provide system reliability, all participating electricity generators within the balancing area maintain a specified level of generation capacity (i.e. reserves) that can be called upon when an unscheduled outage occurs. Glen Canyon Dam typically maintains 113 MW of reserves for this purpose.

Reserve agreements allow the controllers of the balancing area to call upon Glen Canyon Dam to produce up to an additional 113 MW of electricity beyond what is originally scheduled for a given hour. Reserve calls can be maintained for a maximum of 2 hours

after which time the generation rate should be returned to the original schedule. The 113 MW reserve requirement for Glen Canyon Dam translates to approximately 2,800 cfs of flow in the river. When the balancing area controllers call for reserve generation from Glen Canyon Dam, releases from the dam can exceed scheduled levels and have a noticeable impact on the river downstream from Glen Canyon Dam. But these calls for reserves are fairly infrequent and typically are for much less than the required level of 113 MW.

Current Inflow Forecasts and Model Projections

The August 24-Month study projects the annual release volume for water year 2012 will be 9.463 maf and the end of water year reservoir elevation and storage for Lake Powell will be 3623.08 (76.92 feet from full pool) and 14.093 maf (57.9% capacity), respectively.

The hydrologic outlook forecast for water year 2013 projects that the most probable (median) unregulated inflow volume will be 8.85maf (82% of average based on the period 1981-2010). Based on this hydrologic outlook, the August 24-Month Study projects the annual release from lake Powell during water year 2013 will be 8.23 maf and the end of water year 2013 reservoir elevation and storage for Lake Powell to be 3618.19 feet (81.8 feet from full pool) and 13.573 maf (55.8% capacity), respectively.

Upper Colorado River Basin Hydrology

Since water year 2005, hydrologic conditions in the Upper Colorado River Basin have been near average with significant variability from year to year. The unregulated inflow to Lake Powell, which is a good measure of the hydrologic condition in the Colorado River Basin, has averaged a water year volume of 10.98 maf (101% of average (period 1981-2010)) during the period from 2005 through 2011. The hydrologic variability during this period has been from a low water year unregulated inflow volume of 8.62 maf (80% of average) in water year 2006 to a high water year unregulated inflow volume of 15.97 maf (147% of average) which occurred in water year 2011. However, based on observed inflows and current forecasts, water year 2012 unregulated inflow is expected to be 5.15 maf (47.6% of average), which would be the lowest water year unregulated inflow volume since 2002.

Overall reservoir storage in the Colorado River Basin has increased by over 8 maf since the beginning of water year 2005 and this is a significant improvement over the drought conditions during water years 2000 through 2004. On October 1, 2004, the beginning of water year 2005, the total reservoir storage in the Colorado River Basin was 29.84 maf (50.2% of capacity). On October 1, 2011, the beginning of water year 2012, the total reservoir storage in the Colorado River Basin was 38.66 maf (64.8% of capacity). As of August 9, 2012 the total reservoir storage in the Colorado River Basin was 35.18 maf (59.0% of capacity).

Processed On: 8/9/2012 10:11:04AM

September 24-Month Study
Date: September 11, 2012

From: Water Resources Group, Salt Lake City
To: All Colorado River Annual Operating Plan (AOP) Recipients

Current Reservoir Status

Reservoir	August Inflow (unregulated) (acre-feet)	Percent of Average (%)	September 10 Midnight Elevation (feet)	Reservoir Storage (acre-feet)
Fontenelle	36,000	47	6498.09	285,000
Flaming Gorge	28,000	31	6021.85	3,045,000
Blue Mesa	28,000	44	7459.91	371,000
Navajo	360	1	6036.25	1,073,000
Powell	101,000	20	3622.87	14,070,000

Expected Operations

The operation of Lake Powell and Lake Mead in this September 2012 24-Month Study is pursuant to the December 2007 Record of Decision on Colorado River Interim Guidelines for Lower Basin Shortages and the Coordinated Operations of Lake Powell and Lake Mead (Interim Guidelines), and reflects the 2012 Annual Operating Plan (AOP). Pursuant to the Interim Guidelines, the August 2011 24-Month Study projections of the January 1, 2012, system storage and reservoir water surface elevations set the operational tier for the coordinated operation of Lake Powell and Lake Mead during 2012.

Consistent with Section 6.A of the Interim Guidelines, the Lake Powell operational tier for water year 2012 is the Equalization Tier. The September 2012 24-Month Study projects the water year release volume from Lake Powell for 2012 to be 9.46 maf.

Consistent with Section 2.B.5 of the Interim Guidelines, the Intentionally Created Surplus (ICS) Surplus Condition is the criterion governing the operation of Lake Mead for calendar year 2012.

The Interim Guidelines are available for download at
http://www.usbr.gov/lc/region/programs/strategies/RecordofDecision.pdf.
The 2012 AOP is available for download at
http://www.usbr.gov/lc/region/g4000/aop/AOP12.pdf.

Fontenelle Reservoir – Inflows to Fontenelle Reservoir for the month of August were 36,000 acre-feet (AF), or 47 percent of average. The reservoir elevation is 6498.25 feet above sea level, 84 percent of capacity and slowly decreasing. Inflows are averaging 350 cubic feet per second (cfs) and reservoir releases are 900 cfs. Releases will likely remain near this level through the fall and winter months.

Inflows for the next three months are projected to be significantly below average: with September, October and November forecasted inflow volumes at 28,000 AF (60% of average), 32,000 AF (65% of average), and 32,000 AF (76% of average), respectively. The Colorado Basin River Forecast Center has also issued the water year 2013 outlook. Based on the August climatology and initial conditions, the forecasted inflows for water year 2013 are 955,000 AF (88% of average).

The next Fontenelle Working Group meeting is scheduled for April 25, 2013, at 10:00 am at the Seedskadee National Wildlife Refuge. The Fontenelle Working Group is an open public forum for information exchange between Reclamation and other parties associated with the operation of Fontenelle Reservoir. The autumn Fontenelle Working Group meeting was held on August 23, 2012 at Joint Powers and Water Board in Green River, Wyoming. Minutes from the meeting are posted on the Working Group webpages.

Flaming Gorge Reservoir – Unregulated inflow into Flaming Gorge Reservoir during the month of August was 28,000 acre-feet, or 31 percent of average. The reservoir elevation is 6022.9 feet and dropping. Observed inflows are approximately 700 cubic feet per second (cfs).

Continued warm and dry weather is impacting the hydrology, which is now in the dry classification. Flaming Gorge Reservoir is releasing an average daily rate of 1,100 cfs through September 30, 2012. Releases are forecasted to decrease to steady releases of 800 cfs during October, November, March and April. The winter months of December, January and February are currently forecasted to release a daily average of 1,200 cfs; however, current forecasts are subject to change based on observed hydrology.

Current Flaming Gorge hourly release pattern with daily average releases 1,100 cfs:

Midnight - 5am: 810cfs,
5am – 5pm: 1,090cfs
5pm-10pm- 1,500cfs
10pm –11pm: 910cfs
11pm – midnight: 810cfs

The Colorado Basin River Forecast Center and Natural Resources Conservation Service have issued the joint water supply forecast for the next three months. The unregulated inflow volumes and percent of average for September, October and November are forecasted to be 22 kaf (40%), 29 kaf (49%), and 32 kaf (62%), respectively.

The next Flaming Gorge Working Group meeting is scheduled for April 24, 2013, at 11:00 a.m. at the new Utah Department of Natural Resources building in Vernal, Utah, located at 318 North Vernal Avenue. The Flaming Gorge Working Group is an open public forum for information exchange between Reclamation and the stake holders of Flaming Gorge Dam. The public is encouraged to attend and comment on the operations and plans presented by Reclamation at these meetings. For more information on this group and these meetings please contact Ed Vidmar at 801-379-1182.

Aspinall Unit Reservoirs – August unregulated inflow into Blue Mesa Reservoir was 28,000 acre-feet or 44 percent of average. Hydrologic conditions continue to be dry in the basin; however precipitation was near normal for the month. June, July, August precipitation was 10, 150, and 95 percent of average respectively. The current inflow rate into Blue Mesa Reservoir is about 450 cfs while reservoir releases are averaging about 1,200 cfs.

Blue Mesa's present elevation is 7461.39 feet, which corresponds to a storage content of about 380,000 acre-feet. The observed April through July runoff into Blue Mesa Reservoir was recorded at 206,500 acre-feet, or 31 percent of average. The reservoir reached a high elevation of 7485.02 feet on April 13, 2012, which was approximately 34.38 feet below "full" pool. Full pool is defined by the top of the spillway gates at elevation 7519.4 feet. Rarely is the reservoir filled to that level due to safety. For practical purposes; the reservoir is considered full at elevations above 7516.4 feet.

Releases from Crystal are currently set at 1250 cfs. The Gunnison Diversion Tunnel is diverting about 750 cfs, which results in a river flow below the diversion tunnel of approximately 500 cfs. These rates will most likely change as conditions warrant, primarily as we respond to changes at the Whitewater gage as flows prescribed in the Aspinall Unit Operations Record of Decision (ROD). The ROD calls for keeping flows at the Whitewater gage at or above 900 cfs.

The last meeting of the "Aspinall Unit Working Group" was held on Thursday, August 9, 2012 starting at 1:00 PM at the Elk Creek Visitors Center at Blue Mesa Reservoir. At this meeting, review of this spring's reservoir operations, and plans for this summer and fall operations were discussed. These meetings are open forum discussions on the Aspinall Unit reservoir operations with many interested groups participating. Anyone needing further information about these meetings should contact Dan Crabtree in the Grand Junction Area Office at (970) 248-0652.

Navajo Reservoir – As a result of low forecasted river flows in the critical habitat area of the San Juan River Basin, Reclamation increased the release from Navajo Reservoir from 900 to 1000 cubic feet per second (cfs) on Saturday, September 1, 2012, beginning at 4:00 a.m. Releases are made for the authorized purposes of the Navajo Unit, and to attempt to maintain a target base flow through the endangered fish critical habitat reach of the San Juan River (Farmington to Lake Powell).

The San Juan River Basin Recovery Implementation Program recommends a target base flow of between 500 cfs and 1,000 cfs through the critical habitat area. The target base flow is calculated as the weekly average of gaged flows throughout the critical habitat area, therefore daily flows of less than 500 cfs may occur at some gages.

Reclamation continues to closely monitor weather and stream flow conditions and make adjustments to the Navajo Reservoir release as necessary.

Unregulated inflow into Navajo Reservoir during the month of August was only 360 acre-feet, or 1% of average. Unregulated inflow for the April to July 2012 runoff season was 310 kaf, or 42% of average. The reservoir had a seasonal peak elevation of 6061.56 feet which occurred on May 20, 2012. The current reservoir elevation is 6037.55 feet above sea level and 64% of capacity. Current inflows are approximately 250 cfs and reservoir releases are approximately 1,000 cfs. Diversions for NIIP are approximately 800 cfs.

Precipitation for the month of August in the San Juan River basin was 55 percent of average. Inflows for the next three months are projected to be significantly below average: 7 kaf (16%), 17 kaf (36%), 19 kaf (56%) for September, October, and November respectively. The Colorado Basin River Forecast Center has also issued the water year 2013 outlook. Inflows for the coming water year are projected to be 926 kaf, or 86% of average.

A public meeting on Navajo Reservoir operations was held Tuesday, August 21, 2012 at 1:00 PM at the Civic Center in Farmington, New Mexico (200 West Arrington Street). At this meeting, review of this spring's reservoir operations, and plans for this summer and fall operations were discussed. These meetings are open forum discussions on the operation of Navajo Reservoir with many interested groups participating. Anyone interested in the general operation of the reservoir is encouraged to attend. Please contact Ryan Christianson in Reclamation's Durango, Colorado Office at (970) 385-6590 for information about these meetings or the daily operation of Navajo Reservoir.

Glen Canyon Dam / Lake Powell – The monthly unregulated inflow volume to Lake Powell for August was 101 thousand acre-feet (kaf) (20% of average). The release volume from Glen Canyon Dam in August was 800 kaf. The end of August elevation and storage of Lake Powell was 3623.82 feet (76.18 feet from full pool) and 14.15 maf (58.2% of full capacity). The reservoir elevation is now declining.
The April through July unregulated inflow volume for 2012 was 2.06 maf (29% of average), placing the 2012 April to July season as the third driest on record since the closure of Glen Canyon Dam in 1963. Only 1977 and 2002 had lower April-July unregulated inflow volumes to Lake Powell than what occurred in 2012. In terms of reservoir elevation and storage, Lake Powell reached its peak for water year 2012 on June 3rd at 3636.90 ft (63.1 feet from full pool) and 15.640 maf (64.30% of capacity),

respectively. The peak elevation in 2012 is 24 feet below the 2011 peak elevation of 3660.90ft.

Current Dam Operations

In August 2011, pursuant to the Interim Guidelines, the Operating Tier for Glen Canyon Dam was established to be the Equalization Tier. Under the Equalization Tier when conditions dry out as they have this year, the minimum annual release from Lake Powell can generally be as low as 8.23 maf. However, water year 2011 was a very wet Equalization year and not all of the Equalization release volume for 2011 could be achieved by September 30, 2011. As a result, 1.233 maf of the 2011 Equalization release volume was actually released after the end of water year 2011. This increased the minimum release volume for water year 2012 under Equalization to 9.463 maf. Under the dry hydrologic conditions currently projected for Lake Powell, the water year 2012 release volume is projected to be at this minimum Equalization level of 9.463 maf. As hydrologic conditions for Lake Powell and Lake Mead change throughout the year, Reclamation will adjust operations of Glen Canyon Dam to release the appropriate annual volume during 2012 to achieve Equalization objectives as practicably as possible by September 30, 2012.

Releases from Glen Canyon Dam are now averaging approximately 8,030 cfs and are steady with no fluctuations for hydropower generation. In September and October, as part of the 2008 FONSI, releases from Glen Canyon Dam will be steady for a steady flow experiment. 2012 is the last year of the 5-year steady flow experiment. The targeted release rate for September and October of 2012 is 8,030 cfs, with volumes of 478 kaf and 494kaf, respectively. The scheduled release volume for September is 478 kaf, resulting in a total scheduled water year 2012 release volume of 9.463 maf. The scheduled release volume for November is 600 kaf with fluctuations for power generation throughout the day consistent with the Glen Canyon Operating Criteria (Federal Register, Volume 62, No. 41, March 3, 1997).

In addition to daily scheduled fluctuations for power generation, the instantaneous releases from Glen Canyon Dam may also fluctuate to provide 40 MW of system regulation. These instantaneous release adjustments stabilize the electrical generation and transmission system and translate to a range of about 1100 cfs above or below the hourly scheduled release rate. Typically, fluctuations for system regulation are very short lived and balance out over the hour and do not have noticeable impacts on downstream river flow conditions.

Releases from Glen Canyon Dam can also fluctuate beyond scheduled fluctuations for power generation when called upon as a partner that shares reserve requirements within the electrical generator community (i.e. balancing area). There are many generators that supply electricity to the transmission system within the balancing area. At times, a participating generator may experience operating conditions such that it cannot make its scheduled delivery of electricity to the system (i.e. unscheduled outage). To provide system reliability, all participating electricity generators within the balancing area

maintain a specified level of generation capacity (i.e. reserves) that can be called upon when an unscheduled outage occurs. Glen Canyon Dam typically maintains 113 MW of reserves for this purpose.

Reserve agreements allow the controllers of the balancing area to call upon Glen Canyon Dam to produce up to an additional 113 MW of electricity beyond what is originally scheduled for a given hour. Reserve calls can be maintained for a maximum of 2 hours after which time the generation rate should be returned to the original schedule. The 113 MW reserve requirement for Glen Canyon Dam translates to approximately 2,800 cfs of flow in the river. When the balancing area controllers call for reserve generation from Glen Canyon Dam, releases from the dam can exceed scheduled levels and have a noticeable impact on the river downstream from Glen Canyon Dam. But these calls for reserves are fairly infrequent and typically are for much less than the required level of 113 MW.

Current Inflow Forecasts and Model Projections

The September 24-Month study projects the annual release volume for water year 2012 will be 9.463 maf and the end of water year reservoir elevation and storage for Lake Powell will be 3622.12 (77.88 feet from full pool) and 13.989 maf (57.5% capacity), respectively.

The hydrologic outlook forecast for water year 2013 projects that the most probable (median) unregulated inflow volume will be 8.83maf (81% of average based on the period 1981-2010). Based on this hydrologic outlook, the September 24-Month Study projects the annual release from lake Powell during water year 2013 will be 8.23 maf and the end of water year 2013 reservoir elevation and storage for Lake Powell to be 3617.51 feet (82.5 feet from full pool) and 13.501 maf (55.5% capacity), respectively.

Upper Colorado River Basin Hydrology

Since water year 2005, hydrologic conditions in the Upper Colorado River Basin have been near average with significant variability from year to year. The unregulated inflow to Lake Powell, which is a good measure of the hydrologic condition in the Colorado River Basin, has averaged a water year volume of 10.98 maf (101% of average (period 1981-2010)) during the period from 2005 through 2011. The hydrologic variability during this period has been from a low water year unregulated inflow volume of 8.62 maf (80% of average) in water year 2006 to a high water year unregulated inflow volume of 15.97 maf (147% of average) which occurred in water year 2011. However, based on observed inflows and current forecasts, water year 2012 unregulated inflow is expected to be 5.00 maf (46.0% of average), which would be the lowest water year unregulated inflow volume since 2002.

Overall reservoir storage in the Colorado River Basin has increased by over 8 maf since the beginning of water year 2005 and this is a significant improvement over the drought conditions during water years 2000 through 2004. On October 1, 2004, the beginning of

water year 2005, the total reservoir storage in the Colorado River Basin was 29.84 maf (50.2% of capacity). On October 1, 2011, the beginning of water year 2012, the total reservoir storage in the Colorado River Basin was 38.66 maf (64.8% of capacity). As of September 11, 2012 the total reservoir storage in the Colorado River Basin was 34.46 maf (57.7% of capacity).

October 24-Month Study
Date: October 12, 2012

From: Water Resources Group, Salt Lake City
To: All Colorado River Annual Operating Plan (AOP) Recipients

Current Reservoir Status

Reservoir	September Inflow (unregulated) (acre-feet)	Percent of Average (%)	October 11 Midnight Elevation (feet)	Reservoir Storage (acre-feet)
Fontenelle	23,000	50	6493.52	252,000
Flaming Gorge	19,000	35	6021.25	3,024,000
Blue Mesa	19,000	50	7452.67	328,000
Navajo	0	0	6030.28	1,011,000
Powell	104,000	25	3620.68	13,835,000

Expected Operations

The operation of Lake Powell and Lake Mead in this October 2012 24-Month Study is pursuant to the December 2007 Record of Decision on Colorado River Interim Guidelines for Lower Basin Shortages and the Coordinated Operations of Lake Powell and Lake Mead (Interim Guidelines), and reflects the 2012 Annual Operating Plan (AOP) and draft 2013 AOP. Pursuant to the Interim Guidelines, the August 2012 24-Month Study projections of the January 1, 2013, system storage and reservoir water surface elevations set the operational tier for the coordinated operation of Lake Powell and Lake Mead during 2013.

Consistent with Section 6.B of the Interim Guidelines, the Lake Powell operational tier for water year 2013 is the Upper Elevation Balancing Tier. The October 2012 24-Month Study projects the water year release volume from Lake Powell for 2013 to be 8.23 million acre-feet (maf).

Consistent with Section 6.B.3 of the Interim Guidelines, if the April 24-Month study projects the September 30 Lake Powell elevation to be greater than the 2013 Equalization elevation of 3,646.0 feet with an annual release from Lake Powell of 8.23 maf, the Equalization Tier will govern operations of Lake Powell for the remainder of the water year. If such an adjustment occurs, the water year release volume from Lake Powell may be greater than 8.23 maf. Based on analysis of a range of inflow scenarios, the current probability of realizing an inflow volume that would trigger Equalization in 2013 is approximately 20 percent.

Consistent with Section 2.B.5 of the Interim Guidelines, the Intentionally Created Surplus (ICS) Surplus Condition is the criterion governing the operation of Lake Mead for calendar years 2012 and 2013.

The Interim Guidelines are available for download at
http://www.usbr.gov/lc/region/programs/strategies/RecordofDecision.pdf.
The 2012 AOP is available for download at
http://www.usbr.gov/lc/region/g4000/aop/AOP12.pdf.
The draft 2013 AOP is available for download at
http://www.usbr.gov/uc/water/rsvrs/ops/aop/AOP13_draft.pdf.

Fontenelle Reservoir – Inflows to Fontenelle Reservoir for the month of September were 23,000 acre-feet (AF), or 50 percent of average. The reservoir elevation is 6494.63 feet above sea level, 75 percent of capacity and will be decreasing over the winter. Inflows are averaging 350 cubic feet per second (cfs) and reservoir releases decreased from 900 cfs to 850 cfs on October 8, 2012. Releases will likely remain near this level through the fall and winter months.

Inflows for the next three months are projected to be below average: with October, November and December forecasted inflow volumes at 27,000 AF (55% of average), 27,000 AF (64% of average), and 25,000 AF (78% of average), respectively. The Colorado Basin River Forecast Center has also issued the water year 2013 outlook. Based on the October climatology and initial conditions, the forecasted inflows for water year 2013 are 860,000 AF (79% of average).

The next Fontenelle Working Group meeting is scheduled for April 25, 2013, at 10:00 am at the Seedskadee National Wildlife Refuge. The Fontenelle Working Group is an open public forum for information exchange between Reclamation and other parties associated with the operation of Fontenelle Reservoir. The autumn Fontenelle Working Group meeting was held on August 23, 2012 at Joint Powers and Water Board in Green River, Wyoming. Minutes from the meeting are posted on the Working Group webpages.

Flaming Gorge Reservoir – Unregulated inflow into Flaming Gorge Reservoir during the month of September was 19,400 acre-feet, or 35 percent of average. The reservoir elevation is 6021.33 feet and dropping. Observed inflows are approximately 700 cubic feet per second (cfs).

Forecasts continue to decrease and Flaming Gorge Dam is in the dry hydrologic classification as outlined in the Record of Decision. Beginning October 1, 2012, Flaming Gorge Dam releases decreased from 1,100 cfs to a steady release of 810 cfs. Releases will continue at a steady 810 cfs until otherwise communicated. Anticipated releases during December through February will increase to an average daily release of 1,200 cfs. However, any change in releases will be officially communicated.

The Colorado Basin River Forecast Center and Natural Resources Conservation Service have issued the joint water supply forecast for the next three months. The unregulated inflow volumes and percent of average for October, November and December are forecasted to be 23 kaf (38%), 27 kaf (53%), and 20 kaf (57%), respectively.

The next Flaming Gorge Working Group meeting is scheduled for April 24, 2013, at 11:00 a.m. at the new Utah Department of Natural Resources building in Vernal, Utah, located at 318 North Vernal Avenue. The Flaming Gorge Working Group is an open public forum for information exchange between Reclamation and the stake holders of Flaming Gorge Dam. The public is encouraged to attend and comment on the operations and plans presented by Reclamation at these meetings. For more information on this group and these meetings please contact Ed Vidmar at 801-379-1182.

Aspinall Unit Reservoirs – September unregulated inflow into Blue Mesa Reservoir was 19,000 acre-feet or 50 percent of average. Precipitation during September was observed to be about 65 percent of average. The current inflow rate into Blue Mesa Reservoir is about 300 cfs and reservoir releases are averaging about 900 cfs. Blue Mesa's present elevation is 7452.91 feet, which corresponds to a storage content of about 329,000 acre-feet. The unregulated reservoir inflow into Blue Mesa Reservoir during water year 2011 was 426,500 acre-feet, or about 45 percent of average.

Releases from Crystal are currently set at 1000 cfs. The current diversion rate through the Gunnison Diversion Tunnel is about 700 cfs, which results in a river flow below the diversion tunnel of approximately 300 cfs. As the irrigation season comes to a close decreases in Crystal releases will occur as the demand for irrigation water is reduced and the Gunnison Tunnel flows are shut off. Flows in the Gunnison River below the tunnel will remain close to minimum low flow of 300 cfs through the late fall and the winter months in order to conserver reservoir storage.

The last meeting of the "Aspinall Unit Working Group" was held on Thursday, August 9, 2012 starting at 1:00 PM at the Elk Creek Visitors Center at Blue Mesa Reservoir. At this meeting, review of this spring's reservoir operations, and plans for this summer and fall operations were discussed. These meetings are open forum discussions on the Aspinall Unit reservoir operations with many interested groups participating. Anyone needing further information about these meetings should contact Dan Crabtree in the Grand Junction Area Office at (970) 248-0652.

Navajo Reservoir – As a result of increased river flows and milder temperatures in the San Juan River Basin, Reclamation decreased the release from Navajo Reservoir from 800 to 650 cubic feet per second (cfs) on Tuesday, October 9, 2012, beginning at 8:00 a.m. Releases are made for the authorized purposes of the Navajo Unit, and to attempt to maintain a target base flow through the endangered fish critical habitat reach of the San Juan River (Farmington to Lake Powell).

The San Juan River Basin Recovery Implementation Program recommends a target base flow of between 500 cfs and 1,000 cfs through the critical habitat area. The target base

flow is calculated as the weekly average of gaged flows throughout the critical habitat area.

This scheduled release change is subject to changes in river flows and weather conditions. Reclamation will continue to closely monitor weather and stream flow conditions and make adjustments to the Navajo Reservoir release as necessary.

Precipitation for the month of September in the San Juan River basin was about 45 percent of average. Unregulated inflow into Navajo Reservoir during the month of September was 780 acre-feet, or 19 percent of average. Currently, the daily reservoir inflow is averaging about 60 cfs. Diversions for NIIP are currently 300 cfs. The reservoir water surface elevation is at 6030.91 feet, which corresponds to a storage content of about 1,018,000 acre-feet or about 60% of capacity.

The unregulated reservoir inflow into Navajo Reservoir during water year 2012 was recorded at 522,000 acre-feet, or about 49 percent of average. The reservoir had a seasonal peak elevation of 6061.56 feet on May 20, 2012.

A public meeting on Navajo Reservoir operations was held Tuesday, August 21, 2012 at 1:00 PM at the Civic Center in Farmington, New Mexico (200 West Arrington Street). At this meeting, review of this spring's reservoir operations, and plans for this summer and fall operations were discussed. These meetings are open forum discussions on the operation of Navajo Reservoir with many interested groups participating. Anyone interested in the general operation of the reservoir is encouraged to attend. Please contact Ryan Christianson in Reclamation's Durango, Colorado Office at (970) 385-6590 for information about these meetings or the daily operation of Navajo Reservoir.

Glen Canyon Dam / Lake Powell – The unregulated inflow volume to Lake Powell in September was 104 thousand acre-feet (kaf) (25% of average). The release volume from Glen Canyon Dam in September was 481 kaf. The end of September elevation and storage of Lake Powell were 3621.6 feet (78.4 feet from full pool) and 13.93 maf (57.3% of full capacity). The reservoir elevation is now declining.
The water year unregulated inflow volume for 2012 was 4.91maf (45.3% of average), placing the 2012 as the third driest on record since the closure of Glen Canyon Dam in 1963. Only 2002 and 1977 were drier, receiving 2.64 maf and 3.53 maf, respectively. In terms of reservoir elevation and storage, Lake Powell reached its peak for water year 2012 on June 3rd at 3636.9 ft (63.1 feet from full pool) and 15.64 maf (64.3% of capacity), respectively. The peak elevation in 2012 was 24 feet below the 2011 peak elevation of 3660.9 ft.

Releases for Water Year 2012 totaled 9.466 maf. Pursuant to the 2007 Interim Guidelines, Lake Powell operated under the Equalization Tier in 2012. Due to the dry hydrologic conditions experienced in 2012, the Equalization release objective was 9.463 maf, which is 8.23 maf plus 1.233 maf (the Equalization release volume from 2011 that could not be achieved by September 30, 2011). Throughout water year 2012,

Reclamation adjusted operations of Glen Canyon Dam to release the appropriate annual volume during 2012 to achieve Equalization objectives as practicably as possible by September 30, 2012.

Current Dam Operations

The operating tier for 2013 is the Upper Elevation Balancing Tier, as establish in August 2012 and pursuant to the Interim Guidelines. However, if hydrologic conditions and projections become wetter, it is possible that beginning in April, the Equalization tier will govern the operations of Lake Powell for the remainder of the water year. Based on analysis of a range of inflow scenarios, the current probability of realizing an inflow volume that would trigger Equalization in 2013 is approximately 20 percent. As hydrologic conditions for Lake Powell and Lake Mead change throughout the year, Reclamation will adjust operations of Glen Canyon Dam to release the appropriate annual volume during 2013 to achieve the governing operating tier objectives as practicably as possible by September 30, 2013.

Releases from Glen Canyon Dam in October are averaging approximately 8,030 cfs and are steady with no fluctuations for hydropower generation. The scheduled release volume for October is 494 kaf. In September and October, as part of the 2008 FONSI, releases from Glen Canyon Dam will be steady for a steady flow experiment. 2012 is the last year of the 5-year steady flow experiment.

The anticipated release volume for November is 600 kaf with fluctuations for power generation throughout the day consistent with the Glen Canyon Operating Criteria (Federal Register, Volume 62, No. 41, March 3, 1997). However, the release volume may be adjusted in the event of a High Flow Experiment. This fall marks the first season of a multi-year High-Flow Protocol, under which high flow releases are linked to sediment input and other resource conditions below Glen Canyon Dam. Preliminary analysis appears favorable for a high flow experimental release to occur during the period of November 18 – 25, 2012. During the High Flow Experiment, total releases from Glen Canyon Dam at full bypass may reach approximately 42,000 cfs. The total experiment, including ramping, could last anywhere from one and a half to six and a half days. In the event of a high flow experiment, releases from Glen Canyon Dam prior to and after the high flow experiment are anticipated to fluctuate between 5,000cfs and 8,000cfs.

In December, the release volume will likely be about 800 kaf, with fluctuations throughout the day from about 8,000 cfs in the early morning to about 16,000cfs in the early evening.

In addition to daily scheduled fluctuations for power generation, the instantaneous releases from Glen Canyon Dam may also fluctuate to provide 40 MW of system regulation. These instantaneous release adjustments stabilize the electrical generation and transmission system and translate to a range of about 1,100 cfs above or below the hourly scheduled release rate. Typically, fluctuations for system regulation are very short lived and balance out over the hour and do not have noticeable impacts on downstream river flow conditions.

Releases from Glen Canyon Dam can also fluctuate beyond scheduled fluctuations for power generation when called upon as a partner that shares reserve requirements within the electrical generator community (i.e. balancing area). To provide system reliability, all participating electricity generators within the balancing area maintain a specified level of generation capacity (i.e. reserves) that can be called upon when an unscheduled outage occurs. Glen Canyon Dam typically maintains 43 MW of reserves (approximately 1,100 cfs) for this purpose. Reserve calls can be maintained for a maximum of 2 hours after which time the generation rate should be returned to the original schedule. If reserves from Glen Canyon Dam are called upon, releases from the dam can exceed scheduled levels and can have a noticeable impact on the river downstream from Glen Canyon Dam. Calls for reserves are fairly infrequent and typically are for much less than 43 MW.

Current Inflow Forecasts and Model Projections

The hydrologic outlook forecast for water year 2013 projects that the most probable (median) unregulated inflow volume will be 7.60 maf (70% of average based on the period 1981-2010). Based on this hydrologic outlook, the October 24-Month study projects the annual release volume for water year 2013 will be 8.23 maf and the end of water year reservoir elevation and storage for Lake Powell will be 3608.52 (91.48 feet from full pool) and 12.582 maf (51.7% capacity), respectively.

If hydrologic conditions and projections become wetter, it is possible that beginning in April, the Equalization tier will govern the operations of Lake Powell for the remainder of the water year and the release volume for 2013 could be greater than 8.23 maf. Based on analysis of a range of inflow scenarios, the current probability of realizing an inflow volume that would trigger Equalization in 2013 is approximately 20 percent.

Upper Colorado River Basin Hydrology - Since water year 2005, hydrologic conditions in the Upper Colorado River Basin have resulted in significant year to year variability. The unregulated inflow to Lake Powell, which is a good measure of the hydrologic condition in the Colorado River Basin, has averaged a water year volume of 10.22 maf (94% of average (period 1981-2010)) during the period from 2005 through 2012. The hydrologic variability during this period has been from a low water year unregulated inflow volume of 4.91 maf (45% of average) in water year 2012 to a high water year unregulated inflow volume of 15.97 maf (147% of average) in water year 2011. Based on observed inflows and current forecasts, water year 2013 unregulated inflow is expected to be 7.60 maf (70% of average).

Overall reservoir storage in the Colorado River Basin has increased by over 4 maf since the beginning of water year 2005 and this is an improvement over the drought conditions during water years 2000 through 2004. On October 1, 2004, the beginning of water year 2005, the total reservoir storage in the Colorado River Basin was 29.8 maf (50% of capacity). On October 1, 2012, the beginning of water year 2013, the total reservoir storage in the Colorado River Basin was 33.9 maf (57 % of capacity).

November 24-Month Study
Date: November 9, 2012

From: Water Resources Group, Salt Lake City
To: All Colorado River Annual Operating Plan (AOP) Recipients

Current Reservoir Status

Reservoir	October Inflow (unregulated) (acre-feet)	Percent of Average (%)	November 7 Midnight Elevation (feet)	Reservoir Storage (acre-feet)
Fontenelle	29,000	60	6490.96	234,000
Flaming Gorge	24,000	41	6021.15	3,020,000
Blue Mesa	20,000	53	7452.25	325,000
Navajo	3,400	7	6027.18	981,000
Powell	189,000	37	3619.04	13,662,000

Expected Operations

The operation of Lake Powell and Lake Mead in this November 2012 24-Month Study is pursuant to the December 2007 Record of Decision on Colorado River Interim Guidelines for Lower Basin Shortages and the Coordinated Operations of Lake Powell and Lake Mead (Interim Guidelines), and reflects the 2012 Annual Operating Plan (AOP) and draft 2013 AOP. Pursuant to the Interim Guidelines, the August 2012 24-Month Study projections of the January 1, 2013, system storage and reservoir water surface elevations set the operational tier for the coordinated operation of Lake Powell and Lake Mead during 2013.

Consistent with Section 6.B of the Interim Guidelines, the Lake Powell operational tier for water year 2013 is the Upper Elevation Balancing Tier. The November 2012 24-Month Study projects the water year release volume from Lake Powell for 2013 to be 8.23 million acre-feet (maf).

Consistent with Section 6.B.3 of the Interim Guidelines, if the April 24-Month study projects the September 30 Lake Powell elevation to be greater than the 2013 Equalization elevation of 3,646.0 feet with an annual release from Lake Powell of 8.23 maf, the Equalization Tier will govern operations of Lake Powell for the remainder of the water year. If such an adjustment occurs, the water year release volume from Lake Powell may be greater than 8.23 maf. Based on analysis of a range of inflow scenarios, the current probability of realizing an inflow volume that would trigger Equalization in 2013 is approximately 20 percent.

Consistent with Section 2.B.5 of the Interim Guidelines, the Intentionally Created Surplus (ICS) Surplus Condition is the criterion governing the operation of Lake Mead for calendar years 2012 and 2013.

The Interim Guidelines are available for download at
http://www.usbr.gov/lc/region/programs/strategies/RecordofDecision.pdf.
The 2012 AOP is available for download at
http://www.usbr.gov/lc/region/g4000/aop/AOP12.pdf.
The draft 2013 AOP is available for download at
http://www.usbr.gov/uc/water/rsvrs/ops/aop/AOP13_draft.pdf.

Fontenelle Reservoir – Inflows to Fontenelle Reservoir for the month of October were 29,000 acre-feet (AF), or 60 percent of average. The reservoir elevation is 6491.48 feet above sea level, 69 percent of capacity and will be decreasing over the winter. Inflows are averaging 600 cubic feet per second (cfs). Reservoir releases remained steady at 850 cfs and will likely remain near this level through the fall and winter months.

Inflows for the next three months are projected to be below average: with November, December and January forecasted inflow volumes at 29,000 AF (69% of average), 25,000 AF (78% of average), and 23,000 AF (76% of average), respectively. The Colorado Basin River Forecast Center has also issued the water year 2013 outlook. Based on the October climatology and initial conditions, the forecasted inflows for water year 2013 are 860,000 AF (79% of average).

The next Fontenelle Working Group meeting is scheduled for April 25, 2013, at 10:00 am at the Seedskadee National Wildlife Refuge. The Fontenelle Working Group is an open public forum for information exchange between Reclamation and other parties associated with the operation of Fontenelle Reservoir. The autumn Fontenelle Working Group meeting was held on August 23, 2012 at Joint Powers and Water Board in Green River, Wyoming. Minutes from the meeting are posted on the Working Group webpages.

Flaming Gorge Reservoir – Unregulated inflow into Flaming Gorge Reservoir during the month of October was 24,000 acre-feet, or 41 percent of average. The reservoir elevation is 6021.15 feet and dropping. Observed inflows are approximately 800 cubic feet per second (cfs).

Forecasts continue to decrease and Flaming Gorge Dam is in the dry hydrologic classification as outlined in the Record of Decision. Beginning December 1, 2012, Flaming Gorge Dam releases will increase from minimum 800 cfs steady releases to a double peak pattern daily average release of 1,200 cfs.

The Colorado Basin River Forecast Center and Natural Resources Conservation Service have issued the joint water supply forecast for the next three months. The unregulated

inflow volumes and percent of average for November, December and January are forecasted to be 29 kaf (57%), 20 kaf (57%), and 25 kaf (62%), respectively.

The next Flaming Gorge Working Group meeting is scheduled for April 24, 2013, at 11:00 a.m. at the new Utah Department of Natural Resources building in Vernal, Utah, located at 318 North Vernal Avenue. The Flaming Gorge Working Group is an open public forum for information exchange between Reclamation and the stake holders of Flaming Gorge Dam. The public is encouraged to attend and comment on the operations and plans presented by Reclamation at these meetings. For more information on this group and these meetings please contact Ed Vidmar at 801-379-1182.

Aspinall Unit Reservoirs – October unregulated inflow into Blue Mesa Reservoir was 20,000 acre-feet or 53 percent of average. Precipitation during October was observed to be about 40 percent of average. The current inflow rate into Blue Mesa Reservoir is about 350 cfs while reservoir releases are averaging about 300 cfs. Blue Mesa's present elevation is 7452.49 feet, which corresponds to a storage content of about 327,000 acre-feet. The unregulated reservoir inflow into Blue Mesa Reservoir during water year 2012 was 426,500 acre-feet, or about 45 percent of average.

Releases from Crystal are currently set at 350 cfs. The Gunnison Diversion Tunnel was shut down for the season on October 16th, with exception of some small 10 to 20 cfs diversions taken bi-weekly for municipal water needs in Montrose, Colorado. River flows below the tunnel are essentially the same as releases from the Dam, with the exception of when the tunnel is taking water to refill Fairfield Reservoir for Montrose municipal water needs.

On November 1, 2012, the National Weather Service's River Forecasting Center issued its forecasted inflow into Blue Mesa for the next 3 months. The unregulated inflow forecast for November, December, and January is for 52,000 acre-feet, which is 64% of average for these months.

The next meeting of the "Aspinall Unit Working Group" will be held on Thursday January 24th in the Montrose, Colorado, starting at 1:00 PM. At this meeting, review of last summer and fall reservoir operations, and plans for this winter and next spring 2013 operations will be discussed. These meetings are open forum discussions on the Aspinall Unit reservoir operations with many interested groups participating. Anyone needing further information about these meetings should contact Dan Crabtree in the Grand Junction Area Office at (970) 248-0652.

Navajo Reservoir – As a result of increased river flows and decreased irrigation demand in the San Juan River Basin, Reclamation decreased the release from Navajo Reservoir from 500 to 350 cubic feet per second (cfs) on Tuesday, November 6, 2012. Releases are made for the authorized purposes of the Navajo Unit, and to attempt to maintain a target

base flow through the endangered fish critical habitat reach of the San Juan River (Farmington to Lake Powell).

The San Juan River Basin Recovery Implementation Program recommends a target base flow of between 500 cfs and 1,000 cfs through the critical habitat area. The target base flow is calculated as the weekly average of gaged flows throughout the critical habitat area.

Precipitation for the month of October in the San Juan River basin was about 20 percent of average. Unregulated inflow into Navajo Reservoir during the month of September was 3400 acre-feet, or 7 percent of average. Currently, the daily reservoir inflow is averaging about 60 cfs. Diversions for NIIP have shut down for the season. The reservoir water surface elevation is at 6027.31 feet, which corresponds to a storage content of about 982,000 acre-feet or about 58% of capacity.

The unregulated reservoir inflow into Navajo Reservoir during water year 2012 was recorded at 522,000 acre-feet, or about 49 percent of average. The reservoir had a seasonal peak elevation of 6061.56 feet on May 20, 2012.

A public meeting on Navajo Reservoir operations was held Tuesday, August 21, 2012 at 1:00 PM at the Civic Center in Farmington, New Mexico (200 West Arrington Street). At this meeting, review of this spring's reservoir operations, and plans for this summer and fall operations were discussed. These meetings are open forum discussions on the operation of Navajo Reservoir with many interested groups participating. Anyone interested in the general operation of the reservoir is encouraged to attend. Please contact Ryan Christianson in Reclamation's Durango, Colorado Office at (970) 385-6590 for information about these meetings or the daily operation of Navajo Reservoir.

Glen Canyon Dam / Lake Powell – The unregulated inflow volume to Lake Powell in October was 189 thousand acre-feet (kaf) (37% of average). The release volume from Glen Canyon Dam in October was 498 kaf. The end of October elevation and storage of Lake Powell were 3619.5 feet (80.5 feet from full pool) and 13.71 maf (56.4% of full capacity). The reservoir elevation will continue to decline through the fall and winter months.
The water year unregulated inflow volume for 2012 was 4.91maf (45.3% of average), placing the 2012 as the third lowest on record since the closure of Glen Canyon Dam in 1963. Releases for Water Year 2012 totaled 9.466 maf. Pursuant to the 2007 Interim Guidelines, Lake Powell operated under the Equalization Tier in 2012.

Current Dam Operations
The operating tier for 2013 is the Upper Elevation Balancing Tier, as establish in August 2012 and pursuant to the Interim Guidelines. However, if hydrologic conditions and projections become wetter, it is possible that beginning in April, the Equalization tier will govern the operations of Lake Powell for the remainder of the water year. Based on analysis of a range of inflow scenarios, the current probability of realizing an inflow

volume that would trigger Equalization in 2013 is approximately 20 percent. As hydrologic conditions for Lake Powell and Lake Mead change throughout the year, Reclamation will adjust operations of Glen Canyon Dam to release the appropriate annual volume during 2013 to achieve the governing operating tier objectives as practicably as possible by September 30, 2013.

Releases from Glen Canyon Dam in November are currently averaging approximately 8,020 cfs with daily fluctuations between 7,000cfs and 9,000cfs and consistent with the Glen Canyon Operating Criteria (Federal Register, Volume 62, No. 41, March 3, 1997). The scheduled release volume for November 2012, including the High Flow Experiment described below, is approximately 724 kaf.

From November 18-23, 2012, the Department of Interior will conduct the first High Flow Experiment under a multi-year High Flow Protocol announced earlier this year by Secretary Salazar. Under this Protocol, high flow releases are linked to sediment input and other resource conditions below Glen Canyon Dam. Beginning on the evening of November 18th, releases from Glen Canyon Dam will begin ramping up to full power plant capacity (approximately 27,300 cfs). At midday on November 19th, bypass tubes at Glen Canyon Dam will be opened and releases will continue to increase up to full power plant and bypass capacity (approximately 42,300 cfs) by the evening of November 19th. Releases will be maintained at peak release for 24 hours and then begin ramping back down. Releases will return to normal operations in the evening of November 23rd. The entire experiment, including ramping is expected to last 5 days, with 24 hours at peak release. November releases from Glen Canyon Dam prior to and after the High Flow Experiment are expected to fluctuate between 7,000cfs and 9,000cfs. The elevation of Lake Powell is expected to decrease approximately 2 ½ feet during the 5-day experiment.

In December, the release volume will likely be about 800 kaf, with fluctuations throughout the day from about 8,250 cfs in the early morning to about 16,250 cfs in the early evening. In January, the release volume will likely be about 800 kaf with daily fluctuations for hydropower.

In addition to daily scheduled fluctuations for power generation, the instantaneous releases from Glen Canyon Dam may also fluctuate to provide 40 MW of system regulation. These instantaneous release adjustments stabilize the electrical generation and transmission system and translate to a range of about 1,100 cfs above or below the hourly scheduled release rate. Typically, fluctuations for system regulation are very short lived and balance out over the hour and do not have noticeable impacts on downstream river flow conditions.

Releases from Glen Canyon Dam can also fluctuate beyond scheduled fluctuations for power generation when called upon as a partner that shares reserve requirements within the electrical generator community (i.e. balancing area). To provide system reliability, all participating electricity generators within the balancing area maintain a specified level of generation capacity (i.e. reserves) that can be called upon when an unscheduled outage occurs. Glen Canyon Dam typically maintains 43 MW of reserves (approximately 1,100

cfs) for this purpose. Reserve calls can be maintained for a maximum of 2 hours after which time the generation rate should be returned to the original schedule. If reserves from Glen Canyon Dam are called upon, releases from the dam can exceed scheduled levels and can have a noticeable impact on the river downstream from Glen Canyon Dam. Calls for reserves are fairly infrequent and typically are for much less than 43 MW.

Current Inflow Forecasts and Model Projections

The hydrologic outlook forecast for water year 2013 projects that the most probable (median) unregulated inflow volume will be 7.59 maf (70% of average based on the period 1981-2010). Based on this hydrologic outlook, the November 24-Month study projects the annual release volume for water year 2013 will be 8.23 maf and the end of water year reservoir elevation and storage for Lake Powell will be 3608.4 and 12.57 maf (51.7% capacity), respectively.

If hydrologic conditions and projections become wetter, it is possible that beginning in April, the Equalization tier will govern the operations of Lake Powell for the remainder of the water year and the release volume for 2013 could be greater than 8.23 maf. Based on analysis of a range of inflow scenarios, the current probability of realizing an inflow volume that would trigger Equalization in 2013 is approximately 20 percent.

Upper Colorado River Basin Hydrology - Since water year 2005, the Upper Colorado River Basin has experienced significant year to year hydrologic variability. The unregulated inflow to Lake Powell, which is a good measure of hydrologic conditions in the Colorado River Basin, has averaged a water year volume of 10.22 maf (94% of average (period 1981-2010)) during the period from 2005 through 2012. The hydrologic variability during this period has been from a low water year unregulated inflow volume of 4.91 maf (45% of average) in water year 2012 to a high water year unregulated inflow volume of 15.97 maf (147% of average) in water year 2011. Based on observed inflows and current forecasts, water year 2013 unregulated inflow is expected to be 7.59 maf (70% of average).

Overall reservoir storage in the Colorado River Basin has increased by over 4 maf since the beginning of water year 2005 and this is an improvement over the persistent drought conditions during water years 2000 through 2004. From the beginning of water year 2005 to the beginning of water year 2013, the total reservoir storage in the Colorado River Basin increased from 29.8 maf (50% of capacity) to 33.9 maf (57 % of capacity). However, this period experienced increases and decreases in total Colorado Basin storage in response to wet and dry hydrology.

December 24-Month Study
Date: December 12, 2012

From: Water Resources Group, Salt Lake City
To: All Colorado River Annual Operating Plan (AOP) Recipients

Current Reservoir Status

Reservoir	November Inflow (unregulated) (acre-feet)	Percent of Average (%)	December 10 Midnight Elevation (feet)	Reservoir Storage (acre-feet)
Fontenelle	35,000	83	6488.02	214,000
Flaming Gorge	39,000	76	6021.15	3,020,000
Blue Mesa	19,000	60	7452.48	326,000
Navajo	9,100	27	6025.60	965,000
Powell	246,000	52	3613.50	13,086,000

Expected Operations

The operation of Lake Powell and Lake Mead in this December 2012 24-Month Study is pursuant to the December 2007 Record of Decision on Colorado River Interim Guidelines for Lower Basin Shortages and the Coordinated Operations of Lake Powell and Lake Mead (Interim Guidelines), and reflects the 2012 Annual Operating Plan (AOP) and draft 2013 AOP. Pursuant to the Interim Guidelines, the August 2012 24-Month Study projections of the January 1, 2013, system storage and reservoir water surface elevations set the operational tier for the coordinated operation of Lake Powell and Lake Mead during 2013.

Consistent with Section 6.B of the Interim Guidelines, the Lake Powell operational tier for water year 2013 is the Upper Elevation Balancing Tier. The December 2012 24-Month Study projects the water year release volume from Lake Powell for 2013 to be 8.23 million acre-feet (maf).

Consistent with Section 6.B.3 of the Interim Guidelines, if the April 24-Month study projects the September 30 Lake Powell elevation to be greater than the 2013 Equalization elevation of 3,646.0 feet with an annual release from Lake Powell of 8.23 maf, the Equalization Tier will govern operations of Lake Powell for the remainder of the water year. If such an adjustment occurs, the water year release volume from Lake Powell may be greater than 8.23 maf. Based on analysis of a range of inflow scenarios, the current probability of realizing an inflow volume that would trigger Equalization in 2013 is less than 5 percent.

Consistent with Section 2.B.5 of the Interim Guidelines, the Intentionally Created Surplus (ICS) Surplus Condition is the criterion governing the operation of Lake Mead for calendar years 2012 and 2013.

The Interim Guidelines are available for download at
http://www.usbr.gov/lc/region/programs/strategies/RecordofDecision.pdf.
The 2012 AOP is available for download at
http://www.usbr.gov/lc/region/g4000/aop/AOP12.pdf.
The draft 2013 AOP is available for download at
http://www.usbr.gov/uc/water/rsvrs/ops/aop/AOP13_draft.pdf.

Fontenelle Reservoir – Inflows to Fontenelle Reservoir for the month of November were 35,000 acre-feet (AF), or 83 percent of average. The reservoir elevation is 6488.6 feet above sea level, 63 percent of capacity and will be decreasing over the winter. Inflows are averaging 600 cubic feet per second (cfs). Reservoir releases remained steady at 850 cfs and will likely remain near this level through the fall and winter months.

Inflows for the next three months are projected to be below average: with December, January and February forecasted inflow volumes at 30,000 AF (94% of average), 25,000 AF (82% of average), and 22,000 AF (80% of average), respectively. The Colorado Basin River Forecast Center has also issued the water year 2013 outlook. Based on the December climatology and initial conditions, the forecasted inflows for water year 2013 are 795,000 AF (73% of average).

The next Fontenelle Working Group meeting is scheduled for April 25, 2013, at 10:00 am at the Seedskadee National Wildlife Refuge. The Fontenelle Working Group is an open public forum for information exchange between Reclamation and other parties associated with the operation of Fontenelle Reservoir. The autumn Fontenelle Working Group meeting was held on August 23, 2012 at Joint Powers and Water Board in Green River, Wyoming. Minutes from the meeting are posted on the Working Group webpages.

Flaming Gorge Reservoir – Unregulated inflow into Flaming Gorge Reservoir during the month of November was 39,000 acre-feet, or 76 percent of average. The reservoir elevation is 6021.25 feet and dropping. Observed inflows are approximately 1,300 cubic feet per second (cfs).

Forecasts continue to decrease and Flaming Gorge Dam is in the moderately dry hydrologic classification as outlined in the Record of Decision. Beginning December 1, 2012, Flaming Gorge Dam releases increases from minimum 800 cfs steady releases to a double peak pattern daily average release of 1,200 cfs.

The Colorado Basin River Forecast Center and Natural Resources Conservation Service have issued the joint water supply forecast for the next three months. The unregulated

inflow volumes and percent of average for December, January and February are forecasted to be 29 kaf (83%), 29 kaf (72%), and 32 kaf (72%), respectively. Based on the December climatology and initial conditions, the forecasted inflows for water year 2013 are 949,000 AF (65% of average).

The next Flaming Gorge Working Group meeting is scheduled for April 24, 2013, at 11:00 a.m. at the new Utah Department of Natural Resources building in Vernal, Utah, located at 318 North Vernal Avenue. The Flaming Gorge Working Group is an open public forum for information exchange between Reclamation and the stake holders of Flaming Gorge Dam. The public is encouraged to attend and comment on the operations and plans presented by Reclamation at these meetings. For more information on this group and these meetings please contact Ed Vidmar at 801-379-1182.

Aspinall Unit Reservoirs – November unregulated inflow into Blue Mesa Reservoir was 19,000 acre-feet or 60 percent of average. Precipitation during November was observed to be about 35 percent of average. The current inflow rate into Blue Mesa Reservoir is about 300 cfs while reservoir releases are averaging about 300 cfs. Blue Mesa's present elevation is 7452.49 feet, which corresponds to a storage content of about 327,000 acre-feet. The unregulated reservoir inflow into Blue Mesa Reservoir during water year 2012 was 426,500 acre-feet, or about 45 percent of average.

Releases from Crystal are currently set at 350 cfs. The Gunnison Diversion Tunnel was shut down for the season on October 16th, with exception of some small 10 to 20 cfs diversions taken bi-weekly for municipal water needs in Montrose, Colorado. River flows below the tunnel are essentially the same as releases from the Dam, with the exception of when the tunnel is taking water to refill Fairfield Reservoir for Montrose municipal water needs.

On December 1, 2012, the National Weather Service's River Forecasting Center issued its forecasted inflow into Blue Mesa for the next 3 months. The unregulated inflow forecast for December, January, and February is for 47,000 acre-feet, which is 65% of average for these months.

The next meeting of the "Aspinall Unit Working Group" will be held on Thursday January 24th in the Montrose, Colorado, starting at 1:00 PM. At this meeting, review of last summer and fall reservoir operations, and plans for this winter and next spring 2013 operations will be discussed. These meetings are open forum discussions on the Aspinall Unit reservoir operations with many interested groups participating. Anyone needing further information about these meetings should contact Dan Crabtree in the Grand Junction Area Office at (970) 248-0652.

Navajo Reservoir – Navajo Reservoir release rate is currently set at 350 cfs. Releases are made for the authorized purposes of the Navajo Unit, and to attempt to maintain a target base flow through the endangered fish critical habitat reach of the San Juan River (Farmington to Lake Powell).

The San Juan River Basin Recovery Implementation Program recommends a target base flow of between 500 cfs and 1,000 cfs through the critical habitat area. The target base flow is calculated as the weekly average of gaged flows throughout the critical habitat area.

Precipitation for the month of November in the San Juan River basin was about 45 percent of average. Unregulated inflow into Navajo Reservoir during the month of November was 9100 acre-feet, or 27 percent of average. Currently, the daily reservoir inflow is averaging about 100 cfs. Diversions for NIIP have shut down for the season. The reservoir water surface elevation is at 6025.54 feet, which corresponds to a storage content of about 964,000 acre-feet or about 57% of capacity.

The unregulated reservoir inflow into Navajo Reservoir during water year 2012 was recorded at 522,000 acre-feet, or about 49 percent of average. The reservoir had a seasonal peak elevation of 6061.56 feet on May 20, 2012.

A public meeting on Navajo Reservoir operations will be held Tuesday, January 15, 2013 at 1:00 PM at the Civic Center in Farmington, New Mexico (200 West Arrington Street). At this meeting, review of last summer and fall reservoir operations, and plans for this winter and spring 2013 operations will be discussed. These meetings are open forum discussions on the operation of Navajo Reservoir with many interested groups participating. Anyone interested in the general operation of the reservoir is encouraged to attend. Please contact Ryan Christianson in Reclamation's Durango, Colorado Office at (970) 385-6590 for information about these meetings or the daily operation of Navajo Reservoir.

Glen Canyon Dam / Lake Powell – **Recent Reservoir Operations**

The unregulated inflow volume to Lake Powell in November was 246 thousand acre-feet (kaf) (52% of average). The release volume from Glen Canyon Dam in November was 730 kaf. The end of November elevation and storage of Lake Powell were 3615.1 feet (85 feet from full pool) and 13.25 maf (54% of full capacity). The reservoir elevation will continue to decline through the fall and winter months.

From November 18-23, 2012, the Department of Interior conducted the first High Flow Experiment under a multi-year High Flow Protocol announced earlier this year by Secretary Salazar. Under this Protocol, high flow releases are linked to sediment input and other resource conditions below Glen Canyon Dam. Beginning on the evening of November 18th, releases from Glen Canyon Dam began ramping up to full power plant capacity (approximately 28,000 cfs). At midday on November 19th, bypass tubes at Glen Canyon Dam were opened and releases continued to increase up to full power plant and bypass capacity (approximately 43,000 cfs) by the evening of November 19th. Releases

were maintained at peak release for 24 hours and then began ramping back down. Releases returned to normal operations in the evening of November 23rd. The entire experiment, including ramping lasted 5 days, with 24 hours at peak release. November releases from Glen Canyon Dam prior to and after the High Flow Experiment fluctuated between 7,000cfs and 9,000cfs. The elevation of Lake Powell is decreased approximately 2.75 feet during the 5-day experiment. Approximately 77,800 acre-feet was bypassed during the experiment. The total annual release from Glen Canyon Dam in water year 2013 will not change as a result of the High Flow Experiment.

Current and Planned Reservoir Operations

The operating tier for 2013 is the Upper Elevation Balancing Tier, as establish in August 2012 and pursuant to the Interim Guidelines. However, if hydrologic conditions and projections become wetter, it is possible that beginning in April, the Equalization tier will govern the operations of Lake Powell for the remainder of the water year. Based on analysis of a range of inflow scenarios, however, the current probability of realizing an inflow volume that would trigger Equalization in 2013 is less than 5 percent. As hydrologic conditions for Lake Powell and Lake Mead change throughout the year, Reclamation will adjust operations of Glen Canyon Dam to release the appropriate annual volume during 2013 to achieve the governing operating tier objectives as practicably as possible by September 30, 2013.

Releases from Glen Canyon Dam in December are currently averaging approximately 13,000 cfs with daily fluctuations between 8,250cfs and 16,250cfs and consistent with the Glen Canyon Operating Criteria (Federal Register, Volume 62, No. 41, March 3, 1997). The scheduled release volume for December 2012 is 800 kaf.

In January, the release volume will likely be about 800 kaf, with fluctuations throughout the day from about 8,500 cfs in the early morning to about 16,500 cfs in the evening. In February, the release volume will likely be about 600 kaf with daily fluctuations for hydropower between approximately 8,000 cfs and 14,000 cfs.

In addition to daily scheduled fluctuations for power generation, the instantaneous releases from Glen Canyon Dam may also fluctuate to provide 40 MW of system regulation. These instantaneous release adjustments stabilize the electrical generation and transmission system and translate to a range of about 1,100 cfs above or below the hourly scheduled release rate. Typically, fluctuations for system regulation are very short lived and balance out over the hour and do not have noticeable impacts on downstream river flow conditions.

Releases from Glen Canyon Dam can also fluctuate beyond scheduled fluctuations for power generation when called upon as a partner that shares reserve requirements within the electrical generator community (i.e. balancing area). Reserves provide system reliability in the event of an unscheduled outage. Glen Canyon Dam typically maintains 43 MW of reserves (approximately 1,100 cfs). Reserve calls can be maintained for a maximum of 2 hours after which time the generation rate should be returned to the original schedule. If reserves from Glen Canyon Dam are called upon, releases from the

dam can exceed scheduled levels and can have a noticeable impact on the river downstream from Glen Canyon Dam. Calls for reserves are fairly infrequent and typically are for much less than 43 MW.

Current Inflow Forecasts and Model Projections

The hydrologic forecast for Lake Powell for water year 2013 projects that the most probable (median) unregulated inflow volume will be 5.76 maf (53% of average based on the period 1981-2010). Based on this hydrologic outlook, the December 24-Month study projects the annual release volume for water year 2013 will be 8.23 maf and the end of water year reservoir elevation and storage for Lake Powell will be 3594.8 and 11.26 maf (48% capacity), respectively.

If hydrologic conditions and projections become significantly wetter, it is possible that beginning in April, the Equalization tier will govern the operations of Lake Powell for the remainder of the water year and the release volume for 2013 could be greater than 8.23 maf. However, based on analysis of a range of inflow scenarios, the current probability of realizing an inflow volume that would trigger Equalization in 2013 is less than 5 percent.

Upper Colorado River Basin Hydrology - Since water year 2005, the Upper Colorado River Basin has experienced significant year to year hydrologic variability. The unregulated inflow to Lake Powell, which is a good measure of hydrologic conditions in the Colorado River Basin, has averaged a water year volume of 10.22 maf (94% of average (period 1981-2010)) during the period from 2005 through 2012. The hydrologic variability during this period has been from a low water year unregulated inflow volume of 4.91 maf (45% of average) in water year 2012 to a high water year unregulated inflow volume of 15.97 maf (147% of average) in water year 2011. Based on observed inflows and current forecasts, water year 2013 unregulated inflow is expected to be 5.76 maf (53% of average).

Overall reservoir storage in the Colorado River Basin has increased by over 4 maf since the beginning of water year 2005 and this is an improvement over the persistent drought conditions during water years 2000 through 2004. From the beginning of water year 2005 to the beginning of water year 2013, the total reservoir storage in the Colorado River Basin increased from 29.8 maf (50% of capacity) to 33.9 maf (57 % of capacity). However, this period experienced year to year increases and decreases in total Colorado Basin storage in response to wet and dry hydrology.

February 24-Month Study
Date: February 12, 2013

From: Water Resources Group, Salt Lake City
To: All Colorado River Annual Operating Plan (AOP) Recipients

Current Reservoir Status

Reservoir	January Inflow (unregulated) (acre-feet)	Percent of Average (%)	February 10 Midnight Elevation (feet)	Reservoir Storage (acre-feet)
Fontenelle	23,000	76	6478.27	157,000
Flaming Gorge	24,000	60	6019.91	2,976,000
Blue Mesa	16,000	65	7452.80	328,000
Navajo	14,000	64	6023.50	945,000
Powell	168,000	47	3603.48	12,085,000

Expected Operations

The operation of Lake Powell and Lake Mead in this February 2013 24-Month Study is pursuant to the December 2007 Record of Decision on Colorado River Interim Guidelines for Lower Basin Shortages and the Coordinated Operations of Lake Powell and Lake Mead (Interim Guidelines), and reflects the 2013 Annual Operating Plan (AOP). Pursuant to the Interim Guidelines, the August 2012 24-Month Study projections of the January 1, 2013, system storage and reservoir water surface elevations set the operational tier for the coordinated operation of Lake Powell and Lake Mead during 2013.

Consistent with Section 6.B of the Interim Guidelines, the Lake Powell operational tier for water year 2013 is the Upper Elevation Balancing Tier. The February 2013 24-Month Study projects the water year release volume from Lake Powell for 2013 to be 8.23 million acre-feet (maf).

Consistent with Section 6.B.3 of the Interim Guidelines, if the April 24-Month study projects the September 30 Lake Powell elevation to be greater than the 2013 Equalization elevation of 3,646.0 feet with an annual release from Lake Powell of 8.23 maf, the Equalization Tier will govern operations of Lake Powell for the remainder of the water year. If such an adjustment occurs, the water year release volume from Lake Powell may be greater than 8.23 maf. Based on analysis of a range of inflow scenarios, the current probability of realizing an inflow volume that would trigger Equalization in 2013 is less than 5 percent.

Consistent with Section 2.B.5 of the Interim Guidelines, the Intentionally Created Surplus (ICS) Surplus Condition is the criterion governing the operation of Lake Mead for calendar year 2013.

The Interim Guidelines are available for download at http://www.usbr.gov/lc/region/programs/strategies/RecordofDecision.pdf.
The 2013 AOP is available for download at
http://www.usbr.gov/uc/water/rsvrs/ops/aop/AOP13_final.pdf
.

Fontenelle Reservoir – Inflows to Fontenelle Reservoir for the month of January were 23,000 acre-feet (AF), or 76 percent of average. The reservoir elevation is 6478.2 feet, 55 percent of live capacity and will be decreasing over the winter. Inflows are averaging 300 cubic feet per second (cfs). Reservoir releases remain at 850 cfs and will likely remain near this level through the fall and winter months.

Inflows for the next three months are projected to be below average: with February, March and April forecasted inflow volumes at 22,000 AF (80% of average), 41,000 AF (78% of average), and 65,000 AF (76% of average), respectively. The Colorado Basin River Forecast Center has issued the official water supply forecast for the April through July unregulated inflow volume which is 495,000 af or 68 percent of the 1981-2010 thirty-year average.

The next Fontenelle Working Group meeting is scheduled for April 25, 2013, at 10:00 am at the Seedskadee National Wildlife Refuge. The Fontenelle Working Group is an open public forum for information exchange between Reclamation and other parties associated with the operation of Fontenelle Reservoir. The autumn Fontenelle Working Group meeting was held on August 23, 2012 at Joint Powers and Water Board in Green River, Wyoming. Minutes from the meeting are posted on the Working Group webpages.

Flaming Gorge Reservoir – Unregulated inflow into Flaming Gorge Reservoir during the month of January was 24,000 acre-feet (af), or 60 percent of average. The reservoir elevation is 6019.9 feet and dropping. Observed inflows are approximately 800 cubic feet per second (cfs).

Forecasts remain below average and Flaming Gorge Dam is in the moderately dry hydrologic classification as outlined in the Record of Decision. Flaming Gorge Dam releases are current 1,200 cfs with hourly releases following a double peak pattern. Releases will remain at 1,200 cfs through the end of February, and will decrease to steady 800 cfs releases beginning March 5, 2013.

The Colorado Basin River Forecast Center has issued the official water supply forecast for the April through July unregulated inflow volume which is 640,000 af or 65 percent of the 1981-2010 thirty-year average. The spring hydrologic classification would be

moderately dry if the May 1 final unregulated inflow forecast into Flaming Gorge Reservoir remains in the range of 428,000 af and 779,000 af. The hydrologic conditions would be dry if the May 1 forecast decreases below 428,000 af, and would move into average (below median) if the May 1 final forecast increased above 779,000 af.

The next Flaming Gorge Working Group meeting is scheduled for April 24, 2013, at 11:00 a.m. at the new Utah Department of Natural Resources building in Vernal, Utah, located at 318 North Vernal Avenue. The Flaming Gorge Working Group is an open public forum for information exchange between Reclamation and the stake holders of Flaming Gorge Dam. The public is encouraged to attend and comment on the operations and plans presented by Reclamation at these meetings. For more information on this group and these meetings please contact Ed Vidmar at 801-379-1182.

Aspinall Unit Reservoirs – January unregulated inflow into Blue Mesa Reservoir was 16,000 acre-feet or 65 percent of average. On February 8th the basin snowpack was averaging 76 percent, which has increased about 10 percent from a month ago. Precipitation during January was about 110 percent of average, while December's precipitation was recorded at 115 percent of average. The current inflow rate into Blue Mesa Reservoir is about 300 cfs while reservoir releases are averaging about 300 cfs. This past fall and early winter months has seen below average reservoir inflows. Blue Mesa Reservoir current elevation is 7452.73 feet, which corresponds to a storage content of about 328,000 acre-feet. This elevation is about 32.0 feet lower than the elevation was from a year ago.

The Colorado Basin River Forecast Center's February water supply forecast for Blue Mesa for the April to July runoff season is 385,000 acre-feet (57% of average) which is slightly lower from last month's forecast. Based on this forecast, Blue Mesa Reservoir is not projected to fill this runoff season.

Releases from Crystal Dam have been kept at just about minimum flow of 350 cfs since the end of irrigation season because of drought conditions. Reservoir releases will most likely remain at these levels since Blue Mesa Reservoir content is extremely low.

The last meeting of the "Aspinall Unit Working Group" was held on January 24, 2013 in Montrose, Colorado. At this meeting, review of last summer and fall reservoir operations, and plans for this winter and next spring 2013 operations were discussed. These meetings are open forum discussions on the Aspinall Unit reservoir operations with many interested groups participating. For more information about these meetings please contact Dan Crabtree in the Grand Junction Area Office at (970) 248-0652.

Navajo Reservoir – Navajo Reservoir release rate is currently set at 350 cfs. This temporary, lower release is made in collaboration with the San Juan River Basin Recovery Implementation Program (SJRIP) for a project taking place at the PNM diversion dam. The SJRIP has requested this temporary decrease in the release and

temporary suspension of the target base flow in order to complete this project. The release will be increased as required to resume meeting downstream target base flows starting at 7:00 am on Friday, February 15th, 2013. This scheduled increase may change, or be reduced, depending on river conditions. Releases are made for the authorized purposes of the Navajo Unit, and to attempt to maintain a target base flow through the endangered fish critical habitat reach of the San Juan River (Farmington to Lake Powell). This release is subject to changes in river flows and weather conditions.

The current San Juan River basin snowpack is 78% of average snow water equivalent (SWE). For the Animas River Basin it is 81%. Precipitation for the month of January in the San Juan River basin was about 130 percent of average. Unregulated inflow into Navajo Reservoir during the month of Janaury was 14,000 acre-feet, or 64 percent of average. Currently, the daily reservoir inflow is averaging about 200 cfs. Diversions for NIIP have currently been shut down for the winter. The reservoir water surface elevation is at 6023.58 feet, which corresponds to a storage content of about 946,000 acre-feet.

A public meeting on Navajo Reservoir operations was held Tuesday, January 15, 2013 at 1:00 PM at the Civic Center in Farmington, New Mexico (200 West Arrington Street). At this meeting, review of last summer and fall reservoir operations, and plans for this winter and spring 2013 operations were discussed. These meetings are open forum discussions on the operation of Navajo Reservoir with many interested groups participating. Anyone interested in the general operation of the reservoir is encouraged to attend. Please contact Ryan Christianson in Reclamation's Durango, Colorado Office at (970) 385-6590 for information about these meetings or the daily operation of Navajo Reservoir.

Glen Canyon Dam / Lake Powell

Current Status

The unregulated inflow volume to Lake Powell in January was 168 thousand acre-feet (kaf) (47% of average). The release volume from Glen Canyon Dam in January was 801 kaf. The end of January elevation and storage of Lake Powell were 3604.4 feet (95.6 feet from full pool) and 12.18 maf (50% of full capacity). The reservoir elevation will continue to decline through the winter months.

Current Operations

The operating tier for 2013 is the Upper Elevation Balancing Tier, as establish in August 2012 and pursuant to the Interim Guidelines. However, if hydrologic conditions and projections become wetter, it is possible that beginning in April, the Equalization tier will govern the operations of Lake Powell for the remainder of the water year. Based on analysis of a range of inflow scenarios, however, the current probability of realizing an inflow volume that would trigger Equalization in 2013 is less than 5 percent. As hydrologic conditions for Lake Powell and Lake Mead change throughout the year, Reclamation will adjust operations of Glen Canyon Dam to release the appropriate annual volume during 2013 to achieve the governing operating tier objectives as practicably as possible by September 30, 2013.

Releases from Glen Canyon Dam in February are currently averaging approximately 11,000 cfs with daily fluctuations between approximately 8,000cfs and 14,000cfs and consistent with the Glen Canyon Operating Criteria (Federal Register, Volume 62, No. 41, March 3, 1997). Releases in February are currently fluctuating between a nighttime low with a peak in the mid-morning and again in the evening. The scheduled release volume for February 2013 is 600 kaf.

In March, the release volume will likely be about 600 kaf, with fluctuations for hydropower of approximately 7,000 cfs in the nighttime and double peaking up to 13,000 cfs during the mid-morning and evening hours. In April, the release volume will likely be about 550 kaf with double-peaking fluctuations between approximately 6,500 cfs and 11,500 cfs.

In addition to daily scheduled fluctuations for power generation, the instantaneous releases from Glen Canyon Dam may also fluctuate to provide 40 MW of system regulation. These instantaneous release adjustments stabilize the electrical generation and transmission system and translate to a range of about 1,100 cfs above or below the hourly scheduled release rate. Typically, fluctuations for system regulation are very short lived and balance out over the hour and do not have noticeable impacts on downstream river flow conditions.

Releases from Glen Canyon Dam can also fluctuate beyond scheduled fluctuations for power generation when called upon as a partner that shares reserve requirements within the electrical generator community (i.e. balancing area). Reserves provide system reliability in the event of an unscheduled outage. Glen Canyon Dam typically maintains 43 MW of reserves (approximately 1,100 cfs). Reserve calls can be maintained for a maximum of 2 hours after which time the generation rate should be returned to the original schedule. If reserves from Glen Canyon Dam are called upon, releases from the dam can exceed scheduled levels and can have a noticeable impact on the river downstream from Glen Canyon Dam. Calls for reserves are fairly infrequent and typically are for much less than 43 MW.

Inflow Forecasts and Model Projections

The hydrologic forecast for Lake Powell for the April to July water supply season projects that the most probable (median) unregulated inflow volume will be 3.85 maf (54% of average based on the period 1981-2010). Based on this hydrologic outlook, the January 24-Month study projects the annual release volume for water year 2013 will be 8.23 maf and the end of water year reservoir elevation and storage for Lake Powell will be 3593.3 and 11.12 maf (46% capacity), respectively.

If hydrologic conditions and projections become significantly wetter, it is possible that beginning in April, the Equalization tier will govern the operations of Lake Powell for the remainder of the water year and the release volume for 2013 could be greater than 8.23 maf. However, based on analysis of a range of inflow scenarios, the current probability of realizing an inflow volume that would trigger Equalization in 2013 is less than 5 percent.

Upper Colorado River Basin Hydrology - Since water year 2005, the Upper Colorado River Basin has experienced significant year to year hydrologic variability. The unregulated inflow to Lake Powell, which is a good measure of hydrologic conditions in the Colorado River Basin, has averaged a water year volume of 10.22 maf (94% of average (period 1981-2010)) during the period from 2005 through 2012. The hydrologic variability during this period has been from a low water year unregulated inflow volume of 4.91 maf (45% of average) in water year 2012 to a high water year unregulated inflow volume of 15.97 maf (147% of average) in water year 2011. Based on observed inflows and current forecasts, water year 2013 unregulated inflow is expected to be 5.81 maf (54% of average).

Overall reservoir storage in the Colorado River Basin has increased by over 4 maf since the beginning of water year 2005 and this is an improvement over the persistent drought conditions during water years 2000 through 2004. From the beginning of water year 2005 to the beginning of water year 2013, the total reservoir storage in the Colorado River Basin increased from 29.8 maf (50% of capacity) to 33.9 maf (57 % of capacity). However, during this time, total Colorado Basin storage experienced year to year increases and decreases in response to wet and dry hydrology.

January 24-Month Study
Date: January 11, 2013

From: Water Resources Group, Salt Lake City
To: All Colorado River Annual Operating Plan (AOP) Recipients

Current Reservoir Status

Reservoir	December Inflow (unregulated) (acre-feet)	Percent of Average (%)	January 19 Midnight Elevation (feet)	Reservoir Storage (acre-feet)
Fontenelle	28,000	88	6483.51	186,000
Flaming Gorge	26,000	74	6020.47	2,996,000
Blue Mesa	18,000	69	7452.68	328,000
Navajo	12,000	47	6024.24	952,000
Powell	195,000	54	3607.78	12,508,000

Expected Operations

The operation of Lake Powell and Lake Mead in this January 2013 24-Month Study is pursuant to the December 2007 Record of Decision on Colorado River Interim Guidelines for Lower Basin Shortages and the Coordinated Operations of Lake Powell and Lake Mead (Interim Guidelines), and reflects the draft 2013 AOP. Pursuant to the Interim Guidelines, the August 2012 24-Month Study projections of the January 1, 2013, system storage and reservoir water surface elevations set the operational tier for the coordinated operation of Lake Powell and Lake Mead during 2013.

Consistent with Section 6.B of the Interim Guidelines, the Lake Powell operational tier for water year 2013 is the Upper Elevation Balancing Tier. The January 2013 24-Month Study projects the water year release volume from Lake Powell for 2013 to be 8.23 million acre-feet (maf).

Consistent with Section 6.B.3 of the Interim Guidelines, if the April 24-Month study projects the September 30 Lake Powell elevation to be greater than the 2013 Equalization elevation of 3,646.0 feet with an annual release from Lake Powell of 8.23 maf, the Equalization Tier will govern operations of Lake Powell for the remainder of the water year. If such an adjustment occurs, the water year release volume from Lake Powell may be greater than 8.23 maf. Based on analysis of a range of inflow scenarios, the current probability of realizing an inflow volume that would trigger Equalization in 2013 is less than 5 percent.

Consistent with Section 2.B.5 of the Interim Guidelines, the Intentionally Created Surplus (ICS) Surplus Condition is the criterion governing the operation of Lake Mead for calendar year 2013.

The Interim Guidelines are available for download at http://www.usbr.gov/lc/region/programs/strategies/RecordofDecision.pdf.
The draft 2013 AOP is available for download at http://www.usbr.gov/uc/water/rsvrs/ops/aop/AOP13_draft.pdf.

Fontenelle Reservoir – Inflows to Fontenelle Reservoir for the month of December were 28,000 acre-feet (af), or 88 percent of average. The reservoir elevation is 6484.2 feet above sea level, 55 percent of live capacity and will be decreasing over the winter. Inflows are averaging 300 cubic feet per second (cfs). Reservoir releases remain at 850 cfs and will likely remain near this level through the fall and winter months.

Inflows for the next three months are projected to be below average: with January, February and March forecasted inflow volumes at 25,000 AF (82% of average), 22,000 AF (80% of average), and 43,000 AF (82% of average), respectively. The Colorado Basin River Forecast Center has issued the official water supply forecast for the April through July unregulated inflow volume which is 555,000 af or 76 percent of the 1981-2010 thirty-year average.

The next Fontenelle Working Group meeting is scheduled for April 25, 2013, at 10:00 am at the Seedskadee National Wildlife Refuge. The Fontenelle Working Group is an open public forum for information exchange between Reclamation and other parties associated with the operation of Fontenelle Reservoir. The autumn Fontenelle Working Group meeting was held on August 23, 2012 at Joint Powers and Water Board in Green River, Wyoming. Minutes from the meeting are posted on the Working Group webpages.

Flaming Gorge Reservoir – Unregulated inflow into Flaming Gorge Reservoir during the month of December was 25,000 acre-feet af, or 73 percent of average. The reservoir elevation is 6020.5 feet and dropping. Observed inflows are approximately 300 cubic feet per second (cfs).

Forecasts remain below average and Flaming Gorge Dam is in the moderately dry hydrologic classification as outlined in the Record of Decision. Flaming Gorge Dam releases are current 1,200 cfs with hourly releases following a double peak pattern. It is anticipated that releases will remain at 1,200 cfs through the end of February.

The Colorado Basin River Forecast Center has issued the official water supply forecast for the April through July unregulated inflow volume which is 754,000 af or 76 percent of the 1981-2010 thirty-year average. The spring hydrologic classification would be average (below median) if the May 1 final forecast remains in the range between 779,000

af to 1,045,000 af. The hydrologic classification would be average (above median) if the May 1 final forecast remains in the range between 1,331,001 af and 1,513,000 af.

The next Flaming Gorge Working Group meeting is scheduled for April 24, 2013, at 11:00 a.m. at the new Utah Department of Natural Resources building in Vernal, Utah, located at 318 North Vernal Avenue. The Flaming Gorge Working Group is an open public forum for information exchange between Reclamation and the stake holders of Flaming Gorge Dam. The public is encouraged to attend and comment on the operations and plans presented by Reclamation at these meetings. For more information on this group and these meetings please contact Ed Vidmar at 801-379-1182.

Aspinall Unit Reservoirs – December unregulated inflow into Blue Mesa Reservoir was 18,000 acre-feet or 69 percent of average. Precipitation during December was observed to be about 110 percent of average. The Gunnison River basin snowpack as of January 8th was averaging about 67 percent. The current inflow rate into Blue Mesa Reservoir is about 250 cfs while reservoir releases are averaging about 250 cfs. The present reservoir elevation is 7452.64 feet, which corresponds to a storage content of about 327,000 acre-feet.

Releases from Crystal Dam have been kept at just about minimum flow of 350 cfs since the end of irrigation season because of drought conditions. Reservoir releases will most likely remain at these levels since Blue Mesa Reservoir content is extremely low.

The first Water Supply Forecast for Water Year 2013 has been issued and the April through July unregulated inflow is forecasted to be at 390,000 acre-feet (58% of average). Based on this forecast, Blue Mesa Reservoir is not projected to fill by the end of this 2013 runoff season.

The next meeting of the "Aspinall Unit Working Group" will be held on Thursday January 24th in the Montrose, Colorado, starting at 1:00 PM. At this meeting, review of last summer and fall reservoir operations, and plans for this winter and next spring 2013 operations will be discussed. These meetings are open forum discussions on the Aspinall Unit reservoir operations with many interested groups participating. Anyone needing further information about these meetings should contact Dan Crabtree in the Grand Junction Area Office at (970) 248-0652.

Navajo Reservoir – Navajo Reservoir release rate is currently set at 350 cfs. Releases are made for the authorized purposes of the Navajo Unit, and to attempt to maintain a target base flow through the endangered fish critical habitat reach of the San Juan River (Farmington to Lake Powell).

The San Juan River Basin Recovery Implementation Program recommends a target base flow of between 500 cfs and 1,000 cfs through the critical habitat area. The target base

flow is calculated as the weekly average of gaged flows throughout the critical habitat area.

The current San Juan River basin snowpack is 57% of average snow water equivalent (SWE). For the Animas River Basin it is 55%. Precipitation for the month of December in the San Juan River basin was about 100 percent of average. Unregulated inflow into Navajo Reservoir during the month of December was 12,000 acre-feet, or 47 percent of average. Currently, the daily reservoir inflow is averaging about 100 cfs. Diversions for NIIP have currently been shut down for the winter. The reservoir water surface elevation is at 6024.39 feet, which corresponds to a storage content of about 953,000 acre-feet.

A public meeting on Navajo Reservoir operations will be held Tuesday, January 15, 2013 at 1:00 PM at the Civic Center in Farmington, New Mexico (200 West Arrington Street). At this meeting, review of last summer and fall reservoir operations, and plans for this winter and spring 2013 operations will be discussed. These meetings are open forum discussions on the operation of Navajo Reservoir with many interested groups participating. Anyone interested in the general operation of the reservoir is encouraged to attend. Please contact Ryan Christianson in Reclamation's Durango, Colorado Office at (970) 385-6590 for information about these meetings or the daily operation of Navajo Reservoir.

Glen Canyon Dam / Lake Powell –

Recent Reservoir Operations

The unregulated inflow volume to Lake Powell in December was 195 thousand acre-feet (kaf) (54% of average). The release volume from Glen Canyon Dam in December was 801 kaf. The end of December elevation and storage of Lake Powell were 3609.8 feet (90 feet from full pool) and 12.71 maf (52% of full capacity). The reservoir elevation will continue to decline through the winter months.

Current and Planned Reservoir Operations

The operating tier for 2013 is the Upper Elevation Balancing Tier, as establish in August 2012 and pursuant to the Interim Guidelines. However, if hydrologic conditions and projections become wetter, it is possible that beginning in April, the Equalization tier will govern the operations of Lake Powell for the remainder of the water year. Based on analysis of a range of inflow scenarios, however, the current probability of realizing an inflow volume that would trigger Equalization in 2013 is less than 5 percent. As hydrologic conditions for Lake Powell and Lake Mead change throughout the year, Reclamation will adjust operations of Glen Canyon Dam to release the appropriate annual volume during 2013 to achieve the governing operating tier objectives as practicably as possible by September 30, 2013.

Releases from Glen Canyon Dam in January are currently averaging approximately 13,000 cfs with daily fluctuations between approximately 8,500cfs and 16,500cfs and consistent with the Glen Canyon Operating Criteria (Federal Register, Volume 62, No. 41, March 3, 1997). The scheduled release volume for January 2013 is 800 kaf.

In February, the release volume will likely be about 600 kaf, with fluctuations throughout the day from about 8,000 cfs in the early morning to about 14,000 cfs in the evening. In March, the release volume will likely be about 600 kaf with daily fluctuations for hydropower between approximately 7,000 cfs and 13,000 cfs.

In addition to daily scheduled fluctuations for power generation, the instantaneous releases from Glen Canyon Dam may also fluctuate to provide 40 MW of system regulation. These instantaneous release adjustments stabilize the electrical generation and transmission system and translate to a range of about 1,100 cfs above or below the hourly scheduled release rate. Typically, fluctuations for system regulation are very short lived and balance out over the hour and do not have noticeable impacts on downstream river flow conditions.

Releases from Glen Canyon Dam can also fluctuate beyond scheduled fluctuations for power generation when called upon as a partner that shares reserve requirements within the electrical generator community (i.e. balancing area). Reserves provide system reliability in the event of an unscheduled outage. Glen Canyon Dam typically maintains 43 MW of reserves (approximately 1,100 cfs). Reserve calls can be maintained for a maximum of 2 hours after which time the generation rate should be returned to the original schedule. If reserves from Glen Canyon Dam are called upon, releases from the dam can exceed scheduled levels and can have a noticeable impact on the river downstream from Glen Canyon Dam. Calls for reserves are fairly infrequent and typically are for much less than 43 MW.

Current Inflow Forecasts and Model Projections

The hydrologic forecast for Lake Powell for the April to July water supply season projects that the most probable (median) unregulated inflow volume will be 4.4 maf (61% of average based on the period 1981-2010). Based on this hydrologic outlook, the January 24-Month study projects the annual release volume for water year 2013 will be 8.23 maf and the end of water year reservoir elevation and storage for Lake Powell will be 3600.8 and 11.83 maf (49% capacity), respectively.

If hydrologic conditions and projections become significantly wetter, it is possible that beginning in April, the Equalization tier will govern the operations of Lake Powell for the remainder of the water year and the release volume for 2013 could be greater than 8.23 maf. However, based on analysis of a range of inflow scenarios, the current probability of realizing an inflow volume that would trigger Equalization in 2013 is less than 5 percent.

Upper Colorado River Basin Hydrology - Since water year 2005, the Upper Colorado River Basin has experienced significant year to year hydrologic variability. The unregulated inflow to Lake Powell, which is a good measure of hydrologic conditions in the Colorado River Basin, has averaged a water year volume of 10.22 maf (94% of average (period 1981-2010)) during the period from 2005 through 2012. The hydrologic variability during this period has been from a low water year unregulated inflow volume of 4.91 maf (45% of average) in water year 2012 to a high water year unregulated inflow

volume of 15.97 maf (147% of average) in water year 2011. Based on observed inflows and current forecasts, water year 2013 unregulated inflow is expected to be 6.57 maf (61% of average).

Overall reservoir storage in the Colorado River Basin has increased by over 4 maf since the beginning of water year 2005 and this is an improvement over the persistent drought conditions during water years 2000 through 2004. From the beginning of water year 2005 to the beginning of water year 2013, the total reservoir storage in the Colorado River Basin increased from 29.8 maf (50% of capacity) to 33.9 maf (57 % of capacity). However, during this time, total Colorado Basin storage experienced year to year increases and decreases in response to wet and dry hydrology.

March 24-Month Study
Date: March 11, 2013

From: Water Resources Group, Salt Lake City
To: All Colorado River Annual Operating Plan (AOP) Recipients

Current Reservoir Status

Reservoir	February Inflow (unregulated) (acre-feet)	Percent of Average (%)	March 10 Midnight Elevation (feet)	Reservoir Storage (acre-feet)
Fontenelle	23,000	83	6473.39	133,000
Flaming Gorge	30,000	68	6019.75	2,971,000
Blue Mesa	16,000	71	7453.04	330,000
Navajo	13,000	42	6022.56	936,000
Powell	262,000	67	3600.68	11,815,000

Expected Operations

The operation of Lake Powell and Lake Mead in this March 2013 24-Month Study is pursuant to the December 2007 Record of Decision on Colorado River Interim Guidelines for Lower Basin Shortages and the Coordinated Operations of Lake Powell and Lake Mead (Interim Guidelines), and reflects the 2013 Annual Operating Plan (AOP). Pursuant to the Interim Guidelines, the August 2012 24-Month Study projections of the January 1, 2013, system storage and reservoir water surface elevations set the operational tier for the coordinated operation of Lake Powell and Lake Mead during 2013.

Consistent with Section 6.B of the Interim Guidelines, the Lake Powell operational tier for water year 2013 is the Upper Elevation Balancing Tier. The March 2013 24-Month Study projects the water year release volume from Lake Powell for 2013 to be 8.23 million acre-feet (maf).

Consistent with Section 6.B.3 of the Interim Guidelines, if the April 24-Month study projects the September 30 Lake Powell elevation to be greater than the 2013 Equalization elevation of 3,646.0 feet with an annual release from Lake Powell of 8.23 maf, the Equalization Tier will govern operations of Lake Powell for the remainder of the water year. If such an adjustment occurs, the water year release volume from Lake Powell may be greater than 8.23 maf. Based on analysis of a range of inflow scenarios, an adjustment to Equalization is not anticipated in 2013.

Consistent with Section 2.B.5 of the Interim Guidelines, the Intentionally Created Surplus (ICS) Surplus Condition is the criterion governing the operation of Lake Mead for calendar year 2013.

The Interim Guidelines are available for download at
http://www.usbr.gov/lc/region/programs/strategies/RecordofDecision.pdf.

Fontenelle Reservoir – Inflows to Fontenelle Reservoir for the month of February were 23,000 acre-feet (AF), or 83 percent of average. The reservoir elevation is 6474.3 feet, 40 percent of live capacity and will be decreasing over the winter. Inflows are averaging 300 cubic feet per second (cfs). Reservoir releases remain at 850 cfs and will likely remain near this level through the fall and winter months.

Inflows for the next three months are projected to be below average: with March, April and May forecasted inflow volumes at 38,000 AF (72% of average), 60,000 AF (70% of average), and 90,000 AF (55% of average), respectively. The Colorado Basin River Forecast Center has issued the official water supply forecast for the April through July unregulated inflow volume which is 435,000 af or 56 percent of the 1981-2010 thirty-year average.

The next Fontenelle Working Group meeting is scheduled for April 25, 2013, at 10:00 am at the Seedskadee National Wildlife Refuge. The Fontenelle Working Group is an open public forum for information exchange between Reclamation and other parties associated with the operation of Fontenelle Reservoir. The autumn Fontenelle Working Group meeting was held on August 23, 2012 at Joint Powers and Water Board in Green River, Wyoming. Minutes from the meeting are posted on the Working Group webpages.

Flaming Gorge Reservoir – Unregulated inflow into Flaming Gorge Reservoir during the month of February was 30,000 acre-feet (af), or 68 percent of average. The reservoir elevation is 6019.7 feet and dropping. Observed inflows are approximately 800 cubic feet per second (cfs).

Forecasts remain below average and Flaming Gorge Dam is in the moderately dry hydrologic classification as outlined in the Record of Decision. Flaming Gorge Dam releases are currently steady at approximately 820 cfs, and are expected to remain at this level until spring runoff begins sometime in late May or early June. Information on spring releases will be updated throughout the next few months.

The Colorado Basin River Forecast Center has issued the official March water supply forecast for the April through July unregulated inflow volume which is 550,000 af or 56 percent of the 1981-2010 thirty-year average. The spring hydrologic classification would be moderately dry if the May 1 final unregulated inflow forecast into Flaming Gorge Reservoir remains in the range between 428,000 and 779,000 af. If conditions decrease

and the May 1 final forecast drops below 428,000 af, the hydrologic condition will be dry. Alternatively, if conditions improve and the May final forecast increases above 779,000 af, the hydrologic classification would be average (below median). into average (below median) if the May 1 final forecast increased above 779,000 af.

The next Flaming Gorge Working Group meeting is scheduled for April 24, 2013, at 11:00 a.m. at the new Utah Department of Natural Resources building in Vernal, Utah, located at 318 North Vernal Avenue. The Flaming Gorge Working Group is an open public forum for information exchange between Reclamation and the stake holders of Flaming Gorge Dam. The public is encouraged to attend and comment on the operations and plans presented by Reclamation at these meetings. For more information on this group and these meetings please contact Ed Vidmar at 801-379-1182.

Aspinall Unit Reservoirs – February unregulated inflow into Blue Mesa Reservoir was 16,000 acre-feet or 71 percent of average. On March 7, 2013 the basin snowpack was 78 percent of average, which is a slight increase of 1.0 percent from a month earlier. Precipitation during February was only 65 percent of average. The current inflow rate into Blue Mesa Reservoir is about 300 cfs while reservoir releases are averaging about 275 cfs. The reservoir elevation is currently at 7452.99 feet, which corresponds to a storage content of about 529,000 acre-feet. This elevation is about 30 foot lower than last year's March elevation.

The latest Water Supply Forecast for Water Year 2013 has been issued and the April through July unregulated inflow is forecasted to be at 360,000 acre-feet (53% of normal), this is 10,000 acre-feet lower than last month's forecast. If this forecast holds through May 1st, the Black Canyon Water Right would call for a one day peak flow of 638 cfs. At this time Reclamation plans to continue to operate the Aspinall Unit to allow the water right to be met. Based on this forecast and the combination of meeting the Black Canyon Water this coming spring, Blue Mesa Reservoir is projected to not fill this runoff season. The projected fill is calculated to be about 7471.0 feet, or about 48.0 feet short of top of active conservation pool.

Releases from Crystal are currently set at 350 cfs. The Gunnison Diversion Tunnel is currently shut down for the season, with the exception of some small 20 to 30 cfs diversions taken for municipal water needs in Montrose, Colorado. The tunnel is expected to reopen for irrigation season sometime during the last week of March.

Reservoir releases are likely to change during March into May as we respond to changing forecasts and runoff conditions.

The next meeting of the "Aspinall Unit Working Group" will be held on Thursday, April 25, 2013 starting at 1:00 PM in Reclamation's Grand Junction Office. At this meeting, review of this winter's reservoir operations, and plans for this spring and summer operations will be discussed. These meetings are open forum discussions on the Aspinall Unit reservoir operations with many interested groups participating. Anyone needing

further information about these meetings should contact Dan Crabtree in the Grand Junction Area Office at (970) 248-0652.

Navajo Reservoir **–** Releases from Navajo Reservoir remain near a constant 350 cfs. Reservoir releases are made for the authorized purposes of the Navajo Unit, and to attempt to maintain a target base flow through the endangered fish critical habitat reach of the San Juan River (Farmington to Lake Powell).

The San Juan River Basin Recovery Implementation Program recommends a target base flow of between 500 cfs and 1,000 cfs through the critical habitat area. The target base flow is calculated as the weekly average of gaged flows throughout the critical habitat area, therefore daily flows of less than 500 cfs may occur at some gages.

The current San Juan River basin snowpack as of March 7th is 79% of average snow water equivalent (SWE). For the Animas River Basin it is 81%. Pending significant changes in the weather and stream flow conditions, the reservoir release will likely remain at 350 cfs until further notice.

Precipitation for the month of February in the San Juan River basin was only 65% of average as compared to January's 130% and December's 100% of average. Unregulated inflow into Navajo Reservoir during the month of February was 12,600 acre-feet, or 42 percent of average. Currently, the daily reservoir inflow is averaging about 300 cfs. Diversions for NIIP have recently restarted and have been as high as 150 cfs. The reservoir water surface elevation is at 6022.56 feet, which corresponds to a storage content of about 936,000 acre-feet.

A public meeting on Navajo Reservoir operations will be held on Tuesday, April 23, 2013, starting at 1:00 pm at the Civic Center in Farmington, New Mexico (200 West Arrington Street). At this meeting, review of this winter's reservoir operations, and plans for this spring and summer operations will be discussed. These meetings are open forum discussions on the operation of Navajo Reservoir with many interested groups participating. Anyone interested in the general operation of the reservoir is encouraged to attend. Please contact Ryan Christianson in Reclamation's Durango, Colorado Office at (970) 385-6590 for information about these meetings or the daily operation of Navajo Reservoir.

Glen Canyon Dam / Lake Powell **–**

Current Status

The unregulated inflow volume to Lake Powell in February was 262 thousand acre-feet (kaf) (67% of average). The release volume from Glen Canyon Dam in February was 600 kaf. The end of February elevation and storage of Lake Powell were 3601.5 feet (98.5 feet from full pool) and 11.89 maf (49% of full capacity). The reservoir elevation will continue to decline until snowmelt and spring runoff begin to fill the reservoir in late spring.

Current Operations

The operating tier for 2013 is the Upper Elevation Balancing Tier, as establish in August 2012 and pursuant to the Interim Guidelines. However, if the April 24-Month study projects the September 30 Lake Powell elevation to be greater than the 2013 Equalization elevation of 3,646.0 feet, the Equalization Tier will govern operations of Lake Powell for the remainder of the water year and the water year release volume from Lake Powell may be greater than 8.23 maf. Based on analysis of a range of inflow scenarios, an adjustment to Equalization is not anticipated in 2013. As hydrologic conditions for Lake Powell and Lake Mead change throughout the year, Reclamation will adjust operations of Glen Canyon Dam to release the appropriate annual volume during 2013 to achieve the governing operating tier objectives as practicably as possible by September 30, 2013.

Releases from Glen Canyon Dam in March are currently averaging approximately 10,000 cfs with daily fluctuations between approximately 7,000cfs and 13,000cfs and consistent with the Glen Canyon Operating Criteria (Federal Register, Volume 62, No. 41, March 3, 1997). Releases in March are currently fluctuating between a nighttime low with a peak in the mid-morning and again in the evening. The scheduled release volume for March 2013 is 600 kaf.

In April, the release volume will likely be about 550 kaf, with fluctuations for hydropower of approximately 6,500 cfs in the nighttime and double peaking up to 11,500 cfs during the mid-morning and evening hours. In May, the release volume will likely be about 600 kaf with double-peaking fluctuations between approximately 7,000 cfs and 13,000 cfs.

In addition to daily scheduled fluctuations for power generation, the instantaneous releases from Glen Canyon Dam may also fluctuate to provide 40 MW of system regulation. These instantaneous release adjustments stabilize the electrical generation and transmission system and translate to a range of about 1,100 cfs above or below the hourly scheduled release rate. Typically, fluctuations for system regulation are very short lived and balance out over the hour and do not have noticeable impacts on downstream river flow conditions.

Releases from Glen Canyon Dam can also fluctuate beyond scheduled fluctuations for power generation when called upon as a partner that shares reserve requirements within the electrical generator community (i.e. balancing area). Reserves provide system reliability in the event of an unscheduled outage. Glen Canyon Dam typically maintains 43 MW of reserves (approximately 1,100 cfs). Reserve calls can be maintained for a maximum of 2 hours after which time the generation rate should be returned to the original schedule. If reserves from Glen Canyon Dam are called upon, releases from the dam can exceed scheduled levels and can have a noticeable impact on the river downstream from Glen Canyon Dam. Calls for reserves are fairly infrequent and typically are for much less than 43 MW.

Inflow Forecasts and Model Projections
The hydrologic forecast for Lake Powell for the April to July water supply season projects that the most probable (median) unregulated inflow volume will be 3.4 maf (47% of average based on the period 1981-2010). The forecast has continued to decrease throughout the winter season. Based on the current forecast, the March 24-Month study projects the annual release volume for water year 2013 will be 8.23 maf and the end of water year reservoir elevation and storage for Lake Powell will be 3589.5 and 10.78 maf (44% capacity), respectively.

Consistent with Section 6.B.3 of the Interim Guidelines, if hydrologic conditions and projections become dramatically wetter, it is possible that beginning in April, the Equalization tier will govern the operations of Lake Powell for the remainder of the water year and the release volume for 2013 could be greater than 8.23 maf. However, given current conditions and observed inflows, the Powell unregulated inflow forecast would need to increase by over 7 maf over the next several weeks to trigger an adjustment to equalization this year. Based on analysis of a range of inflow scenarios and forecasts, an adjustment to equalization is not anticipated in 2013.

Upper Colorado River Basin Hydrology – Since 2005, the Upper Colorado River Basin has experienced significant year to year hydrologic variability. The unregulated inflow to Lake Powell, which is a good measure of hydrologic conditions in the Colorado River Basin, has averaged a water year volume of 10.22 maf (94% of average (period 1981-2010)) during the period from 2005 through 2012. The hydrologic variability during this period has been from a low water year unregulated inflow volume of 4.91 maf (45% of average) in water year 2012 to a high water year unregulated inflow volume of 15.97 maf (147% of average) in water year 2011. Based on observed inflows and current forecasts, water year 2013 unregulated inflow is expected to be 5.31 maf (49% of average).

Overall reservoir storage in the Colorado River Basin has increased by approximately 4 maf since the beginning of water year 2005 and this is an improvement over the persistent drought conditions during water years 2000 through 2004. From the beginning of water year 2005 to the beginning of water year 2013, the total reservoir storage in the Colorado River Basin increased from 29.8 maf (50% of capacity) to 33.9 maf (57 % of capacity). However, during this time, total Colorado Basin storage experienced year to year increases and decreases in response to wet and dry hydrology. Given observed inflows and current forecasts, the projected end of water year 2013 total reservoir storage is approximately 29.7 maf (50% of capacity).

April 24-Month Study
Date: April 11, 2013

From: Water Resources Group, Salt Lake City
To: All Colorado River Annual Operating Plan (AOP) Recipients

Current Reservoir Status

Reservoir	March Inflow (unregulated) (acre-feet)	Percent of Average (%)	April 9 Midnight Elevation (feet)	Reservoir Storage (acre-feet)
Fontenelle	41,000	78	6473.42	133,000
Flaming Gorge	64,000	63	6020.39	2,993,000
Blue Mesa	23,000	64	7454.76	340,000
Navajo	31,000	34	6022.33	934,000
Powell	362,000	54	3598.16	11,575,000

Expected Operations

The operation of Lake Powell and Lake Mead in this April 2013 24-Month Study is pursuant to the December 2007 Record of Decision on Colorado River Interim Guidelines for Lower Basin Shortages and the Coordinated Operations of Lake Powell and Lake Mead (Interim Guidelines), and reflects the 2013 Annual Operating Plan (AOP). Pursuant to the Interim Guidelines, the August 2012 24-Month Study projections of the January 1, 2013, system storage and reservoir water surface elevations set the operational tier for the coordinated operation of Lake Powell and Lake Mead during 2013.

Consistent with Section 6.B of the Interim Guidelines, the Lake Powell operational tier for water year 2013 is the Upper Elevation Balancing Tier. The April 2013 24-Month Study projects the end of water year elevation at Lake Powell to be 3,584.13 feet and Lake Mead to be 1,104.18 feet. Since the projected end of water year elevation at Lake Powell is below the 2013 Equalization Elevation of 3,646.0 feet and the projected end of water year elevation at Lake Mead is above elevation 1,075.0 feet, Section 6.B.1 of the Interim Guidelines provide for an annual release volume of 8.23 million acre-feet (maf) from Lake Powell during water year 2013.

Consistent with Section 2.B.5 of the Interim Guidelines, the Intentionally Created Surplus (ICS) Surplus Condition is the criterion governing the operation of Lake Mead for calendar year 2013.

Consistent with Section 6.C.1 of the Interim Guidelines, if the August 24-Month study projects the January 1, 2014, Lake Powell elevation to be less than 3,575.0 feet and at or above 3,525.0 feet and the Lake Mead elevation to be at or above 1,025.0 feet, the operational tier for Lake Powell in water year 2014 will be the Mid-Elevation Release Tier and the water year release volume from Lake Powell will be 7.48 maf. This April 2013 24-Month study projects that, with an 8.23 maf annual release pattern in water year 2014, the January 1, 2014, Lake Powell elevation would be 3,573.66 feet and the Lake Mead elevation would be 1,107.60 feet. Therefore, the 2014 Lake Powell operational tier is currently projected to be the Mid-Elevation Release Tier with an annual release volume of 7.48 maf. Based on analysis of a range of inflow scenarios, the current probability of realizing an inflow volume that would result in the Mid-Elevation Release Tier and a 7.48 maf annual release from Lake Powell in 2014 is approximately 65 percent.

The Interim Guidelines are available for download at
http://www.usbr.gov/lc/region/programs/strategies/RecordofDecision.pdf.
The 2013 AOP is available for download at
http://www.usbr.gov/uc/water/rsvrs/ops/aop/AOP13_final.pdf

Fontenelle Reservoir – Inflows to Fontenelle Reservoir for the month of March were 41,000 acre-feet (AF), or 78 percent of average. The reservoir elevation is 6472.9 feet, 38 percent of live capacity and increasing. Inflows are averaging 1,000 cubic feet per second (cfs). Reservoir releases remain at 850 cfs and will likely decrease this spring.

Inflows for the next three months are projected to be below average: with April, May and June forecasted inflow volumes at 70,000 AF (82% of average), 85,000 AF (52% of average), and 175,000 AF (58% of average), respectively. The Colorado Basin River Forecast Center has issued the official water supply forecast for the April through July unregulated inflow volume which is 405,000 af or 56 percent of the 1981-2010 thirty-year average.

The next Fontenelle Working Group meeting is scheduled for April 25, 2013, at 10:00 am at the Seedskadee National Wildlife Refuge. The Fontenelle Working Group is an open public forum for information exchange between Reclamation and other parties associated with the operation of Fontenelle Reservoir. The autumn Fontenelle Working Group meeting was held on August 23, 2012 at Joint Powers and Water Board in Green River, Wyoming. Minutes from the meeting are posted on the Working Group webpages.

Flaming Gorge Reservoir – Unregulated inflow into Flaming Gorge Reservoir during the month of March was 64,000 acre-feet (af), or 63 percent of average. The reservoir elevation is 6020.2 feet and increasing. Observed inflows are approximately 1,250 cubic feet per second (cfs).

Forecasts remain below average and Flaming Gorge Dam is in the moderately dry hydrologic classification as outlined in the Record of Decision. Flaming Gorge Dam releases are currently steady at approximately 820 cfs, and are expected to remain at this

level until spring runoff begins sometime in late May or early June. Information on spring releases will be updated throughout the next few months.

The Colorado Basin River Forecast Center has issued the official April water supply forecast for the April through July unregulated inflow volume which is 490,000 af or 50 percent of the 1981-2010 thirty-year average. The spring hydrologic classification would be moderately dry if the May 1 final unregulated inflow forecast into Flaming Gorge Reservoir remains in the range between 428,000 and 779,000 af. If conditions decrease and the May 1 final forecast drops below 428,000 af, the hydrologic condition will be dry. Alternatively, if conditions improve and the May final forecast increases above 779,000 af, the hydrologic classification would be average (below median).

The next Flaming Gorge Working Group meeting is scheduled for April 24, 2013, at 11:00 a.m. at the new Utah Department of Natural Resources building in Vernal, Utah, located at 318 North Vernal Avenue. The Flaming Gorge Working Group is an open public forum for information exchange between Reclamation and the stake holders of Flaming Gorge Dam. The public is encouraged to attend and comment on the operations and plans presented by Reclamation at these meetings. For more information on this group and these meetings please contact Ed Vidmar at 801-379-1182.

Aspinall Unit Reservoirs – March unregulated inflow into Blue Mesa Reservoir was 23,000 acre-feet or 64 percent of average. On March 10, 2013 the basin snowpack was 71 percent of average; which is a decrease of 9 percent from a month ago. Precipitation during March was 75 percent of average. The current inflow rate into Blue Mesa Reservoir is about 800 cfs while reservoir releases are averaging about 650 cfs. The reservoir elevation is currently at 7454.76 feet, which corresponds to a storage content of about 340,000 acre-feet.

The latest Water Supply Forecast for Water Year 2013 has been issued and the April through July unregulated inflow is forecasted to be at 315,000 acre-feet (47% of average), this is 45,000 acre-feet lower than last month's forecast. If this forecast holds through May 1st, the Black Canyon Water Right and Aspinall ROD would call for a one day peak flow of 640 cfs, and 900 cfs respectively. At this time Reclamation plans to continue to operate the Aspinall Unit to meet both the water right and ROD recommendations. Based on this forecast and the combination of meeting water right and ROD this coming spring, Blue Mesa Reservoir is projected to not fill this runoff season. The projected fill is calculated to be about 7466.4 feet, or about 53 feet and 418,000 acre-feet short of top of active conservation pool.

Releases from Crystal are currently set at 850 cfs. The Gunnison Diversion Tunnel is currently diverting about 500 cfs, which results in a river flow below the diversion tunnel of approximately 350 cfs. This lower flow is a result of Reclamation trying to conserve reservoir storage for what is forecasted to be a very dry year.

The next meeting of the "Aspinall Unit Working Group" will be held on Thursday, April 25, 2013 starting at 1:00 PM in Reclamation's Grand Junction Office. At this meeting, review of this winter's reservoir operations, and plans for this spring and summer operations will be discussed. These meetings are open forum discussions on the Aspinall Unit reservoir operations with many interested groups participating. Anyone needing further information about these meetings should contact Dan Crabtree in the Grand Junction Area Office at (970) 248-0652.

Navajo Reservoir – As a result of a lower river flows in the San Juan River Basin, the Bureau of Reclamation increased the release from Navajo Reservoir from 350 to 500 cubic feet per second (cfs) on Monday, March 25, 2013. Releases are made for the authorized purposes of the Navajo Unit, and to attempt to maintain a target base flow through the endangered fish critical habitat reach of the San Juan River (Farmington to Lake Powell).

The San Juan River Basin Recovery Implementation Program recommends a target base flow of between 500 cfs and 1,000 cfs through the critical habitat area. The target base flow is calculated as the weekly average of gaged flows throughout the critical habitat area.

The current San Juan River basin snowpack is 79% of average snow water equivalent (SWE). For the Animas River Basin it is 77%. Precipitation for the month of March in the San Juan River basin was less than 50 percent of average. Observed inflow into Navajo Reservoir during the month of March was 26,000 acre-feet. Modified-unregulated inflow volume was 31,000 af, or 29 percent of average. Currently, the daily observed inflow is averaging about 1600 cfs. NIIP has been diverting 480 cfs for the previous week, but is currently temporarily shut down. The reservoir water surface elevation is at 6022.40 feet, which corresponds to a storage content of about 934,336 acre-feet.

The next public meeting will be held April 23rd, 2013 at 1:00 PM at the Civic Center in Farmington, New Mexico (200 West Arrington Street). At this meeting, a review of forecasted hydrology, and plans for this spring and summer 2013 operations will be discussed. These meetings are open forum discussions on the operation of Navajo Reservoir with many interested groups participating. Anyone interested in the general operation of the reservoir is encouraged to attend. Please contact Ryan Christianson in Reclamation's Durango, Colorado Office at (970) 385-6590 for information about these meetings or the daily operation of Navajo Reservoir.

***Glen Canyon Dam / Lake Powell* –**

Current Status

The unregulated inflow volume to Lake Powell in March was 362 thousand acre-feet (kaf) (54% of average). The release volume from Glen Canyon Dam in March was 601 kaf. The end of March elevation and storage of Lake Powell were 3599.0 feet (101 feet from full pool) and 11.65 million acre-feet (maf) (48% of full capacity). The reservoir

elevation will continue to decline until snowmelt and spring runoff begin to fill the reservoir in late spring.

Current Operations

The operating tier for 2013 is the Upper Elevation Balancing Tier, as establish in August 2012 and pursuant to the Interim Guidelines. The April 24-Month Study projects the end of water year elevation at Lake Powell to be 3,584.13 feet and Lake Mead to be 1,104.18 feet. Since the projected end of water year elevation at Lake Powell is below the 2013 Equalization Elevation of 3,646.0 feet and the projected end of water year elevation at Lake Mead is above elevation 1,075.0 feet, Section 6.B.1 of the Interim Guidelines provide for an annual release volume of 8.23 maf from Lake Powell during water year 2013. Reclamation will schedule operations at Glen Canyon Dam to achieve as practicably as possible an 8.23 maf annual release volume by September 30, 2013.

Releases from Glen Canyon Dam in April are currently averaging approximately 9,600 cfs with daily fluctuations between approximately 6,500 cfs at nighttime and approximately 11,500 cfs during the daytime and consistent with the Glen Canyon Operating Criteria (Federal Register, Volume 62, No. 41, March 3, 1997). The scheduled release volume for April 2013 is 550 kaf.

In May, the release volume will likely be about 600 kaf, with fluctuations for hydropower between approximately 7,000 cfs in the nighttime and approximately 13,000 cfs in the daytime the mid-morning and evening hours. In addition, to accommodate airborne data collection, steady releases of approximately 8,000 cfs are tentatively planned near the end of May, beginning on or about Saturday May 25th and lasting for about one week. In June, the release volume will likely be about 800 kaf with fluctuations between approximately 9,000 cfs and 17,000 cfs.

In addition to daily scheduled fluctuations for power generation, the instantaneous releases from Glen Canyon Dam may also fluctuate to provide 40 MW of system regulation. These instantaneous release adjustments stabilize the electrical generation and transmission system and translate to a range of about 1,100 cfs above or below the hourly scheduled release rate. Typically, fluctuations for system regulation are very short lived and balance out over the hour and do not have noticeable impacts on downstream river flow conditions.

Releases from Glen Canyon Dam can also fluctuate beyond scheduled fluctuations for power generation when called upon as a partner that shares reserve requirements within the electrical generator community (i.e. balancing area). Reserves provide system reliability in the event of an unscheduled outage. Glen Canyon Dam typically maintains 43 MW of reserves (approximately 1,100 cfs). Reserve calls can be maintained for a maximum of 2 hours after which time the generation rate should be returned to the original schedule. If reserves from Glen Canyon Dam are called upon, releases from the dam can exceed scheduled levels and can have a noticeable impact on the river downstream from Glen Canyon Dam. Calls for reserves are fairly infrequent and typically are for much less than 43 MW.

Inflow Forecasts and Model Projections
The hydrologic forecast for Lake Powell for the April to July water supply season projects that the most probable (median) unregulated inflow volume will be 2.7 maf (38% of average based on the period 1981-2010). The forecast has continued to decrease throughout the winter and spring season. Based on the current forecast, the April 24-Month study projects the end of water year reservoir elevation and storage for Lake Powell will be 3584.1 and 10.30 maf (42% capacity), respectively, which is below the 2013 Equalization Elevation of 3,646feet. Therefore, consistent with the Interim Guidelines, the annual release volume from Lake Powell during water year 2013 is scheduled to be 8.23 maf. Reclamation will schedule operations at Glen Canyon Dam to achieve as practicably as possible an 8.23 maf annual release volume by September 30, 2013.

Consistent with the Interim Guidelines, if the August 24-Month study projects the January 1, 2014, Lake Powell elevation to be less than 3,575.0 feet and at or above 3,525.0 feet and the Lake Mead elevation to be at or above 1,025.0 feet, the operational tier for Lake Powell in water year 2014 will be the Mid-Elevation Release Tier and the water year release volume from Lake Powell will be 7.48 maf. This April 2013 24-Month study projects that, with an 8.23 maf annual release pattern in water year 2014, the January 1, 2014, Lake Powell elevation would be 3,573.66 feet and the Lake Mead elevation would be 1,107.60 feet. Therefore, the 2014 Lake Powell operational tier is currently projected to be the Mid-Elevation Release Tier with an annual release volume of 7.48 maf. Based on analysis of a range of inflow scenarios, the current probability of realizing an inflow volume that would result in the Mid-Elevation Release Tier and a 7.48 maf annual release from Lake Powell in 2014 is approximately 65 percent.

Upper Colorado River Basin Hydrology – Since 2005, the Upper Colorado River Basin has experienced significant year to year hydrologic variability. The unregulated inflow to Lake Powell, which is a good measure of hydrologic conditions in the Colorado River Basin, has averaged a water year volume of 10.22 maf (94% of average (period 1981-2010)) during the period from 2005 through 2012. The hydrologic variability during this period has been from a low water year unregulated inflow volume of 4.91 maf (45% of average) in water year 2012 to a high water year unregulated inflow volume of 15.97 maf (147% of average) in water year 2011. Based on observed inflows and current forecasts, water year 2013 unregulated inflow is expected to be 4.53 maf (42% of average), which would be the second below-average year in a row.

At the beginning of water year 2013, overall reservoir storage in the Colorado River Basin had increased by approximately 4 maf compared with water year 2005, which was an improvement over the persistent drought conditions of 2000 through 2004. Total reservoir storage in the Colorado River Basin had increased from 29.8 maf (50% of capacity) at the beginning of 2005 to 33.9 maf (57 % of capacity) at the beginning of 2013. However, during this period, total Colorado Basin storage experienced year to year increases and decreases in response to wet and dry hydrology. In addition, conditions in 2013 have been drier than average and given observed inflows and current forecasts, the

projected end of water year 2013 total reservoir storage is approximately 29.1 maf (49% of capacity).

May 24-Month Study
Date: May 9, 2013

From: Water Resources Group, Salt Lake City
To: All Colorado River Annual Operating Plan (AOP) Recipients

Current Reservoir Status

Reservoir	April Inflow (unregulated) (acre-feet)	Percent of Average (%)	May 8 Midnight Elevation (feet)	Reservoir Storage (acre-feet)
Fontenelle	51,000	60	6472.10	127,000
Flaming Gorge	69,000	51	6020.63	3,002,000
Blue Mesa	43,000	56	7454.99	341,000
Navajo	71,000	42	6023.41	944,000
Powell	353,000	33	3596.04	11,376,000

Expected Operations

The operation of Lake Powell and Lake Mead in this May 2013 24-Month Study is pursuant to the December 2007 Record of Decision on Colorado River Interim Guidelines for Lower Basin Shortages and the Coordinated Operations of Lake Powell and Lake Mead (Interim Guidelines), and reflects the 2013 Annual Operating Plan (AOP). Pursuant to the Interim Guidelines, the August 2012 24-Month Study projections of the January 1, 2013, system storage and reservoir water surface elevations set the operational tier for the coordinated operation of Lake Powell and Lake Mead during 2013.

Consistent with Section 6.B of the Interim Guidelines, the Lake Powell operational tier for water year 2013 is the Upper Elevation Balancing Tier. Since the April 2013 24-Month Study projected end of water year elevation at Lake Powell was below the 2013 Equalization Elevation of 3,646.0 feet and the projected end of water year elevation at Lake Mead was above elevation 1,075.0 feet, Section 6.B.1 and 6.B.4. of the Interim Guidelines provide for an annual release volume of 8.23 million acre-feet (maf) from Lake Powell during water year 2013.

Consistent with Section 2.B.5 of the Interim Guidelines, the Intentionally Created Surplus (ICS) Surplus Condition is the criterion governing the operation of Lake Mead for calendar year 2013.

Consistent with Section 6.C.1 of the Interim Guidelines, if the August 24-Month study projects the January 1, 2014, Lake Powell elevation to be less than 3,575.0 feet and at or above 3,525.0 feet and the Lake Mead elevation to be at or above 1,025.0 feet, the operational tier for Lake Powell in water year 2014 would be the Mid-Elevation Release Tier and the water year release volume from Lake Powell would be 7.48 maf. This May 2013 24-Month study projects that, with an 8.23 maf annual release pattern in water year 2014, the January 1, 2014, Lake Powell elevation would be 3,577.27 feet and the Lake Mead elevation would be 1,107.47 feet. Therefore, the 2014 Lake Powell operational tier is not currently projected to be the Mid-Elevation Release Tier. Based on analysis of a range of inflow scenarios, the current probability of realizing an inflow volume that would result in the Mid-Elevation Release Tier in 2014 is approximately 45 percent.

The Interim Guidelines are available for download at http://www.usbr.gov/lc/region/programs/strategies/RecordofDecision.pdf.
The 2013 AOP is available for download at http://www.usbr.gov/uc/water/rsvrs/ops/aop/AOP13_final.pdf.

Fontenelle Reservoir – Inflows to Fontenelle Reservoir for the month of April were 50,600 acre-feet (AF), or 78 percent of average. The reservoir elevation is 6472.2 feet, 38 percent of live capacity and decreasing. Inflows are averaging 750 cubic feet per second (cfs) and are expected to increase over the next few weeks as spring runoff flows enter the reservoir. Reservoir releases remain at 850 cfs and will likely remain close to this level this spring, with a small possibility of a spring peak occurring sometime in July.

Inflows for the next three months are projected to be below average: with May, June and July forecasted inflow volumes at 80,000 AF (49% of average), 165,000 AF (55% of average), and 85,000 AF (48% of average), respectively. The Colorado Basin River Forecast Center has issued the official water supply forecast for the April through July unregulated inflow volume which is 380,000 af or 52 percent of the 1981-2010 thirty-year average.

The next Fontenelle Working Group meeting is scheduled for August 22, 2013, at 10:00 am at the Joint Powers and Water Board in Green River, Wyoming. The Fontenelle Working Group is an open public forum for information exchange between Reclamation and other parties associated with the operation of Fontenelle Reservoir. The spring Fontenelle Working Group meeting was held on April 25, 2013 at Seedskadee National Wildlife Refuge. Minutes from the meeting will be posted on the Working Group webpages.

Flaming Gorge Reservoir – Unregulated inflow into Flaming Gorge Reservoir during the month of April was 68,700 acre-feet (af), or 63 percent of average. The reservoir elevation is 6020.57 feet and increasing. Observed inflows are approximately 1,025 cubic feet per second (cfs).

Forecasts remain below average and Flaming Gorge Dam is in the moderately dry hydrologic classification as outlined in the Record of Decision. Flaming Gorge Dam releases are currently steady at approximately 820 cfs, and are expected to remain at this level until spring runoff begins sometime in late May or early June. Information on spring releases will be updated throughout the next few months.

The Colorado Basin River Forecast Center has issued the official May water supply forecast for the April through July unregulated inflow volume which is 480,000 af or 49 percent of the 1981-2010 thirty-year average.

Reclamation will be involved in a cooperative experimental program this year where the capture of endangered larval razorback sucker is the "trigger" to increase releases from Flaming Gorge Dam this spring. Reclamation plans to coordinate with scientists involved in real-time monitoring on the river to determine the first appearance of larval razorback sucker. Reclamation anticipates at least 2 days notification in the event larval presence is reported and Flaming Gorge Dam releases are increased.

The spring hydrologic classification is officially in the moderately dry classification. Snowpack continues to be below average in both basins and spring weather has large impacts on runoff. Additionally, timing of the Yampa River spring peak flows and emergence of larval razor fish may not occur simultaneously, as evidenced by larval presence historically occurring as the Yampa River decreases to base flows. At this time, Reclamation is recommending operating conservatively and continuing to exercise the flexibility in the Record of Decision to operate one classification lower than indicated in the Flow Recommendations while being prepared to adjust if conditions warrant. Reclamation is currently operating in the dry hydrologic classification.

The next Flaming Gorge Working Group meeting is scheduled for August 21, 2013, at 11:00 a.m. at the new Utah Department of Natural Resources building in Vernal, Utah, located at 318 North Vernal Avenue. The Flaming Gorge Working Group is an open public forum for information exchange between Reclamation and the stake holders of Flaming Gorge Dam. The public is encouraged to attend and comment on the operations and plans presented by Reclamation at these meetings. For more information on this group and these meetings please contact Ed Vidmar at 801-379-1182.

Aspinall Unit Reservoirs – April unregulated inflow into Blue Mesa Reservoir was 43,000 acre-feet or 56 percent of average. Precipitation during April was 120 percent of average. The current inflow rate into Blue Mesa Reservoir is about 1200 cfs while reservoir releases are averaging about 1100 cfs. The reservoir elevation is currently at 7455.00 feet, which corresponds to a storage content of about 341,000 acre-feet.

The latest Water Supply Forecast for Water Year 2013 has been issued and the April through July unregulated inflow is forecasted to be at 335,000 acre-feet (50% of average), this is 20,000 acre-feet higher than last month's forecast. The May 1st forecast officially set the senior Black Canyon Water Right. Using this forecast calls for a one

day spring peak flow of 685 cfs below the tunnel diversion. Also using this same forecast for the determining the flow recommendations from the Aspinall ROD at Whitewater gage, the peak flow at that point should be 900 cfs for one day.

At this time Reclamation plans to continue to operate the Aspinall Unit to meet both the Black Canyon water right and ROD recommendations. Based on this forecast and the combination of meeting water right and ROD this coming spring, Blue Mesa Reservoir is projected to not fill this runoff season. The projected fill is calculated to be about 7466.7 feet, or about 53 feet and 418,000 acre-feet short of top of active conservation pool, elevation 7519.4 feet.

Releases from Crystal are currently set at 1300 cfs. The Gunnison Diversion Tunnel is currently diverting about 1,000 cfs, which results in a river flow below the diversion tunnel of approximately 300 cfs. This lower flow is a result of Reclamation trying to conserve reservoir storage for what is forecasted to be a very dry year.

The last meeting of the "Aspinall Unit Working Group" was held on Thursday, April 25, 2013 starting at 1:00 PM in Reclamation's Grand Junction Office. At this meeting, review of this winter's reservoir operations, and plans for this spring and summer operations were discussed. These meetings are open forum discussions on the Aspinall Unit reservoir operations with many interested groups participating. Anyone needing further information about these meetings should contact Dan Crabtree in the Grand Junction Area Office at (970) 248-0652.

Navajo Reservoir – As a result of increased runoff in the San Juan River Basin, the Bureau of Reclamation decreased the release from Navajo Reservoir from 350 cubic feet per second (cfs) to 250 cfs on Tuesday, May 7th. Releases are made for the authorized purposes of the Navajo Unit, and to attempt to maintain a target base flow through the endangered fish critical habitat reach of the San Juan River (Farmington to Lake Powell).

The San Juan River Basin Recovery Implementation Program recommends a target base flow of between 500 cfs and 1,000 cfs through the critical habitat area. The target base flow is calculated as the weekly average of gaged flows throughout the critical habitat area.

As of May 9th, the San Juan River basin above Navajo snowpack is 37% of average snow water equivalent (SWE). For the Animas River Basin it is 36%. Precipitation for the month of April throughout the San Juan River basin ranged from 50% to 70% of average. The seasonal peak SWE above Navajo was reached on March 13th and was 13.9 inches (74% of average). Observed inflow into Navajo Reservoir during the month of April was 52,524 acre-feet. Modified-unregulated inflow volume was 71,104 af, which was 49% of average. Currently, the daily observed inflow is averaging 2000 cfs. NIIP is diverting 550 cfs per day (average of the past week). The reservoir water surface elevation is at 6023 feet, which corresponds to a storage content of about 939,500 acre-feet (55% full).

The most probable modified unregulated inflow forecast for April through July at Navajo is 325,000 acre-ft (44% of average). The minimum probable modified unregulated inflow forecast for April through July at Navajo is 265,000 acre-ft (36% of average). The maximum probable modified unregulated inflow forecast for April through July at Navajo is 420,000 acre-ft (56% of average). No spring peak release will be conducted in 2013.

The most recent public meeting was held April 23rd, 2013 at 1:00 PM at the Civic Center in Farmington, New Mexico (200 West Arrington Street). At this meeting, a review of forecasted hydrology, and plans for this spring and summer 2013 operations were discussed. The next public meeting is scheduled for August 27th, 2013. These meetings are open forum discussions on the operation of Navajo Reservoir with many interested groups participating. Anyone interested in the general operation of the reservoir is encouraged to attend. Please contact Ryan Christianson in Reclamation's Durango, Colorado Office at (970) 385-6590 for information about these meetings or the daily operation of Navajo Reservoir.

***Glen Canyon Dam / Lake Powell* –**

Current Status

The unregulated inflow volume to Lake Powell in April was 355 thousand acre-feet (kaf) (34% of average). The release volume from Glen Canyon Dam in March was 551 kaf. The end of April elevation and storage of Lake Powell were 3596.5 feet (103.5 feet from full pool) and 11.42 million acre-feet (maf) (47% of full capacity). The reservoir elevation is expected to remain within several feet of the current elevation throughout spring and summer as inflow from runoff roughly matches reservoir releases. In late summer, the reservoir elevation will begin to decline again.

Current Operations

The operating tier for 2013 is the Upper Elevation Balancing Tier, as establish in August 2012 and pursuant to the Interim Guidelines. Since the April projected end of water year elevation at Lake Powell was below the 2013 Equalization Elevation of 3,646.0 feet and the projected end of water year elevation at Lake Mead was above elevation 1,075.0 feet, Section 6.B.1 and 6.B.4 of the Interim Guidelines provide for an annual release volume of 8.23 maf from Lake Powell during water year 2013. Reclamation will schedule operations at Glen Canyon Dam to achieve as practicably as possible an 8.23 maf annual release volume by September 30, 2013.

Releases from Glen Canyon Dam in May are currently averaging approximately 10,000 cfs with daily fluctuations between approximately 7,500 cfs at nighttime and approximately 13,000 cfs during the daytime and consistent with the Glen Canyon Operating Criteria (Federal Register, Volume 62, No. 41, March 3, 1997). The scheduled release volume for May 2013 is 600 kaf. To accommodate airborne data collection, steady releases of approximately 8,000 cfs are planned to begin the evening of Friday May 24th and last for about one week, depending on weather and the progress of the data collection.

In June, the release volume will likely be about 800 kaf, with daily fluctuations for hydropower between approximately 9,000 cfs in the nighttime and approximately 17,000 cfs in the daytime. In July, the release volume will likely be about 848 kaf with daily fluctuations between approximately 10,000 cfs and 18,000 cfs.

In addition to daily scheduled fluctuations for power generation, the instantaneous releases from Glen Canyon Dam may also fluctuate to provide 40 MW of system regulation. These instantaneous release adjustments stabilize the electrical generation and transmission system and translate to a range of about 1,100 cfs above or below the hourly scheduled release rate. Typically, fluctuations for system regulation are very short lived and balance out over the hour and do not have noticeable impacts on downstream river flow conditions.

Releases from Glen Canyon Dam can also fluctuate beyond scheduled fluctuations for power generation when called upon as a partner that shares reserve requirements within the electrical generator community (i.e. balancing area). Reserves provide system reliability in the event of an unscheduled outage. Glen Canyon Dam typically maintains 43 MW of reserves (approximately 1,100 cfs). Reserve calls can be maintained for a maximum of 2 hours after which time the generation rate should be returned to the original schedule. If reserves from Glen Canyon Dam are called upon, releases from the dam can exceed scheduled levels and can have a noticeable impact on the river downstream from Glen Canyon Dam. Calls for reserves are fairly infrequent and typically are for much less than 43 MW.

Inflow Forecasts and Model Projections

The hydrologic forecast for Lake Powell for the April to July water supply season projects that the most probable (median) unregulated inflow volume will be 3.0 maf (42% of average based on the period 1981-2010). Due to late season snow storms over the region, the forecast increased slightly (by 0.3 maf) from last month; however, the overall water supply outlook remains significantly below average this year. The minimum probable and maximum probable forecasts are 1.75 maf (24%) and 4.25 maf (59%), respectively. Based on the current forecast, the May 24-Month study projects Lake Powell elevation will decline approximately 10 feet throughout the spring and summer and end the water year at 3587.7 feet with 10.60 maf in storage (44% capacity). The annual release volume from Lake Powell during water year 2013 is scheduled to be 8.23 maf. Reclamation will schedule operations at Glen Canyon Dam to achieve as practicably as possible an 8.23 maf annual release volume by September 30, 2013.

Consistent with Section 6.C.1 of the Interim Guidelines, if the August 2013 24-Month study projects the January 1, 2014, Lake Powell elevation to be at or above 3,575.00 feet and below the equalization level of 3648.00 feet and the Lake Mead elevation to be at or above 1,075.00 feet, the operational tier for Lake Powell in water year 2014 will be the Upper Elevation Balancing Tier and the water year release volume from Lake Powell will be 8.23 maf. This May 2013 24-Month study projects that, with an 8.23 maf annual release pattern in water year 2014, the January 1, 2014 Lake Powell elevation would be 3,577.27 feet and the Lake Mead elevation would be 1,107.47 feet. Therefore, the 2014

Lake Powell operational tier is currently projected to be the Upper Elevation Balancing Tier with an annual release volume of 8.23 maf and no projected shift in April to the Equalization Tier. However, if hydrology should become slightly drier than is currently projected and the August 24-Month Study projects the January 1, 2013 Lake Powell elevation to be less than 3,575.00 feet, the Mid-Elevation Release Tier will govern and the annual release volume from Lake Powell will be 7.48 maf. Based on analysis of a range of inflow scenarios, the current probability of realizing an inflow volume that would result in the Upper Elevation Balancing Tier and an 8.23 maf annual release is approximately 55 percent and the probability for the Mid-Elevation Release Tier and a 7.48 maf annual release is approximately 45 percent.

Upper Colorado River Basin Hydrology – Since 2005, the Upper Colorado River Basin has experienced significant year to year hydrologic variability. The unregulated inflow to Lake Powell, which is a good measure of hydrologic conditions in the Colorado River Basin, has averaged a water year volume of 10.22 maf (94% of average (period 1981-2010)) during the period from 2005 through 2012. The hydrologic variability during this period has been from a low water year unregulated inflow volume of 4.91 maf (45% of average) in water year 2012 to a high water year unregulated inflow volume of 15.97 maf (147% of average) in water year 2011. Based on observed inflows and current forecasts, water year 2013 unregulated inflow is expected to be 4.83 maf (45% of average), which would be the second below-average year in a row.

At the beginning of water year 2013, overall reservoir storage in the Colorado River Basin had increased by approximately 4 maf compared with water year 2005, which was an improvement over the persistent drought conditions of 2000 through 2004. Total reservoir storage in the Colorado River Basin had increased from 29.8 maf (50% of capacity) at the beginning of 2005 to 33.9 maf (57 % of capacity) at the beginning of 2013. However, during this period, total Colorado Basin storage experienced year to year increases and decreases in response to wet and dry hydrology. In addition, conditions in both 2012 and 2013 have been significantly drier than average and given observed inflows and current forecasts, the projected end of water year 2013 total reservoir storage is approximately 29.4 maf (49% of capacity).

June 24-Month Study
Date: June 11, 2013

From: Water Resources Group, Salt Lake City
To: All Colorado River Annual Operating Plan (AOP) Recipients

Current Reservoir Status

Reservoir	May Inflow (unregulated) (acre-feet)	Percent of Average (%)	June 10 Midnight Elevation (feet)	Reservoir Storage (acre-feet)
Fontenelle	108,000	66	6484.58	192,000
Flaming Gorge	135,000	55	6018.75	2,936,000
Blue Mesa	133,000	60	7469.33	431,000
Navajo	154,000	57	6029.20	1,001,000
Powell	1,122,000	48	3600.36	11,784,000

Expected Operations

The operation of Lake Powell and Lake Mead in this June 2013 24-Month Study is pursuant to the December 2007 Record of Decision on Colorado River Interim Guidelines for Lower Basin Shortages and the Coordinated Operations of Lake Powell and Lake Mead (Interim Guidelines), and reflects the 2013 Annual Operating Plan (AOP). Pursuant to the Interim Guidelines, the August 2012 24-Month Study projections of the January 1, 2013, system storage and reservoir water surface elevations set the operational tier for the coordinated operation of Lake Powell and Lake Mead during 2013.

Consistent with Section 6.B of the Interim Guidelines, the Lake Powell operational tier for water year 2013 is the Upper Elevation Balancing Tier. Since the April 2013 24-Month Study projected end of water year elevation at Lake Powell was below the 2013 Equalization Elevation of 3,646.0 feet and the projected end of water year elevation at Lake Mead was above elevation 1,075.0 feet, Section 6.B.1 and 6.B.4 of the Interim Guidelines provide for an annual release volume of 8.23 million acre-feet (maf) from Lake Powell during water year 2013.

Consistent with Section 2.B.5 of the Interim Guidelines, the Intentionally Created Surplus (ICS) Surplus Condition is the criterion governing the operation of Lake Mead for calendar year 2013.

Consistent with Section 6.C.1 of the Interim Guidelines, if the August 24-Month study projects the January 1, 2014, Lake Powell elevation to be less than 3,575.0 feet and at or above 3,525.0 feet and the Lake Mead elevation to be at or above 1,025.0 feet, the operational tier for Lake Powell in water year 2014 would be the Mid-Elevation Release Tier and the water year release volume from Lake Powell would be 7.48 maf. This June 2013 24-Month study projects that, with an 8.23 maf annual release pattern in water year 2014, the January 1, 2014, Lake Powell elevation would be 3,577.05 feet and the Lake Mead elevation would be 1,105.27 feet. Therefore, the 2014 Lake Powell operational tier is currently projected to be the Upper Elevation Balancing Tier. However, based on analysis of a range of inflow scenarios, the current probability of realizing an inflow volume that would result in the Mid-Elevation Release Tier in 2014 is approximately 45 percent.

The Interim Guidelines are available for download at
http://www.usbr.gov/lc/region/programs/strategies/RecordofDecision.pdf.
The 2013 AOP is available for download at
http://www.usbr.gov/uc/water/rsvrs/ops/aop/AOP13_final.pdf.

Fontenelle Reservoir – Inflows to Fontenelle Reservoir for the month of May were 51,000 acre-feet (AF), or 59 percent of average. The reservoir elevation is 6484.35 feet, 55 percent of live capacity and decreasing. Inflows are averaging 1,100 cubic feet per second (cfs) and are expected to increase over the next few weeks as spring runoff flows enter the reservoir. Reservoir releases are currently at 800 cfs, and will likely remain at that level through the summer.

Inflows for the next three months are projected to be below average: with June, July and August forecasted inflow volumes at 140,000 AF (47% of average), 50,000 AF (28% of average), and 30,000 AF (39% of average), respectively. The Colorado Basin River Forecast Center has issued the official June water supply forecast for the April through July unregulated inflow volume which is 350,000 af or 48 percent of the 1981-2010 thirty-year average.

The next Fontenelle Working Group meeting is scheduled for August 22, 2013, at 10:00 am at the Joint Powers and Water Board in Green River, Wyoming. The Fontenelle Working Group is an open public forum for information exchange between Reclamation and other parties associated with the operation of Fontenelle Reservoir. The spring Fontenelle Working Group meeting was held on April 25, 2013 at Seedskadee National Wildlife Refuge. Minutes from the meeting will be posted on the Working Group webpages.

Flaming Gorge Reservoir – Unregulated inflow into Flaming Gorge Reservoir during the month of May was 135,000 acre-feet (af), or 55 percent of average. The reservoir elevation is 6018.87 feet and increasing. Observed inflows are approximately 1,000 cubic feet per second (cfs).

Forecasts remain below average and Flaming Gorge Dam is in the moderately dry hydrologic classification as outlined in the Record of Decision. Beginning on June 7th, Flaming Gorge releases will be reduced at a rate of 350 cfs/day to an average daily release of 1,100 cfs by June 16, 2013. Releases are anticipated to remain at a daily average release of 1,100 cfs through September 30, 2013, whereupon they will decrease to steady releases of approximately 820 cfs.

The Colorado Basin River Forecast Center has issued the official June water supply forecast for the April through July unregulated inflow volume which is 440,000 af or 45 percent of the 1981-2010 thirty-year average.

Reclamation has completed its involvement in a cooperative experimental program this year where the capture of endangered larval razorback sucker is the "trigger" to increase releases from Flaming Gorge Dam this spring. The moderately dry classification requirements are Green River flows measured at Jensen, Utah at or above 8,300 cfs for 7 to 14 days. Green River flows measured at Jensen, Utah were at or above 8,300 cfs for at least 10 days during larval drift with the peak flow of 10,100 cfs occurring on June 6, 2013.

The next Flaming Gorge Working Group meeting is scheduled for August 21, 2013, at 11:00 a.m. at the new Utah Department of Natural Resources building in Vernal, Utah, located at 318 North Vernal Avenue. The Flaming Gorge Working Group is an open public forum for information exchange between Reclamation and the stake holders of Flaming Gorge Dam. The public is encouraged to attend and comment on the operations and plans presented by Reclamation at these meetings. For more information on this group and these meetings please contact Ed Vidmar at 801-379-1182.

Aspinall Unit Reservoirs – May unregulated inflow into Blue Mesa Reservoir was 133,000 acre-feet or 60 percent of average. Precipitation during May was near normal at about 95 percent of average. The current inflow rate into Blue Mesa Reservoir is about 2,900 cfs while reservoir releases are averaging about 800 cfs. Blue Mesa's present elevation is 7469.33 feet, which corresponds to a storage content of about 431,000 acre-feet.

The latest Water Supply Forecast for Water Year 2013 has been issued and the April through July unregulated inflow is forecasted to be at 370,000 acre-feet (55% of average). This is a 35,000 acre-feet increase from last month's forecast. Based on this runoff forecast and the current elevation of Blue Mesa Reservoir, the reservoir will not fill, but is expected to fill to elevations between 7472 and 7478 feet.

The May 1st forecast officially sets the senior Black Canyon Water Right. Using this forecast (335,000 acre-feet) calls for a one day spring peak flow of 685 cfs below the tunnel diversion. Also using this same forecast for the determining the flow recommendations from the Aspinall ROD at Whitewater gage, the peak flow at that point should be 900 cfs for one day.

Releases from Crystal are currently set at 1300 cfs. The Gunnison Diversion Tunnel is diverting about 1,000 cfs, which results in a river flow below the diversion tunnel of approximately 300 cfs. These rates will most likely change as conditions warrant, primarily as we respond to changes at the Whitewater gage as flows prescribed in the Aspinall Unit Operations Record of Decision (ROD). The ROD calls for keeping flows at the Whitewater gage at or above 900 cfs.

The next meeting of the "Aspinall Unit Working Group" will be held on Thursday, September 5, 2013 starting at 1:00 PM at the Elk Creek Visitors Center at Blue Mesa Reservoir. At this meeting, review of this spring's reservoir operations, and plans for this summer and fall operations will be discussed. These meetings are open forum discussions on the Aspinall Unit reservoir operations with many interested groups participating. Anyone needing further information about these meetings should contact Dan Crabtree in the Grand Junction Area Office at (970) 248-0652.

Navajo Reservoir – As a result of increased runoff in the San Juan River Basin, the Bureau of Reclamation decreased the release from Navajo Reservoir from 350 cubic feet per second (cfs) to 250 cfs on Tuesday, May 7th. Releases are made for the authorized purposes of the Navajo Unit, and to attempt to maintain a target base flow through the endangered fish critical habitat reach of the San Juan River (Farmington to Lake Powell).

The San Juan River Basin Recovery Implementation Program recommends a target base flow of between 500 cfs and 1,000 cfs through the critical habitat area. The target base flow is calculated as the weekly average of gaged flows throughout the critical habitat area.

As of June 6th, the San Juan River basin above Navajo has 0.2 inches snow water equivalent (SWE) (6% of average). The Animas River Basin has melted out. Precipitation for the month of May throughout the San Juan River basin was well below average. The seasonal peak SWE above Navajo was reached on March 13th and was 13.9 inches (74% of average). Observed inflow into Navajo Reservoir during the month of May was 117,820 acre-feet. Modified-unregulated inflow volume was 154,495 af, which was 56% of average. The observed inflow into Navajo as of June 6th is 1,666 cfs. NIIP is diverting at a rate of 461 cfs. The reservoir water surface elevation is at 6028.78 feet, which corresponds to a storage content of about 996,345 acre-feet (59% full).

The most probable modified unregulated inflow forecast for April through July at Navajo is 300,000 acre-ft (40% of average). The minimum probable modified unregulated inflow forecast for April through July at Navajo is 265,000 acre-ft (36% of average). The maximum probable modified unregulated inflow forecast for April through July at Navajo is 340,000 acre-ft (46% of average). No spring peak release was conducted in 2013.

The most recent public meeting was held April 23rd, 2013 at 1:00 PM at the Civic Center in Farmington, New Mexico (200 West Arrington Street). At this meeting, a review of forecasted hydrology, and plans for this spring and summer 2013 operations were discussed. The next public meeting is scheduled for August 27th, 2013. These meetings are open forum discussions on the operation of Navajo Reservoir with many interested groups participating. Anyone interested in the general operation of the reservoir is encouraged to attend. Please contact Ryan Christianson in Reclamation's Durango, Colorado Office at (970) 385-6590 for information about these meetings or the daily operation of Navajo Reservoir.

***Glen Canyon Dam / Lake Powell* –**

Current Status

The unregulated inflow volume to Lake Powell in May was 1,121 thousand acre-feet (kaf) (48% of average). The release volume from Glen Canyon Dam in May was 602 kaf. The end of May elevation and storage of Lake Powell were 3599.4 feet (100.6 feet from full pool) and 11.68 million acre-feet (maf) (48% of full capacity). The reservoir elevation is expected to remain within several feet of the current elevation throughout spring and summer as inflow from runoff roughly matches reservoir releases. In late summer, the reservoir elevation will begin to decline again.

Current Operations

The operating tier for 2013 is the Upper Elevation Balancing Tier, as establish in August 2012 and pursuant to the Interim Guidelines. Since the April 2103 projected end of water year elevation at Lake Powell was below the 2013 Equalization Elevation of 3,646.0 feet and the projected end of water year elevation at Lake Mead was above elevation 1,075.0 feet, Section 6.B.1 and 6.B.4 of the Interim Guidelines provide for an annual release volume of 8.23 maf from Lake Powell during water year 2013. Reclamation will schedule operations at Glen Canyon Dam to achieve as practicably as possible an 8.23 maf annual release volume by September 30, 2013.

Releases from Glen Canyon Dam in June are currently averaging approximately 13,000 cfs with daily fluctuations between approximately 9,000 cfs at nighttime and approximately 17,000 cfs during the daytime and consistent with the Glen Canyon Operating Criteria (Federal Register, Volume 62, No. 41, March 3, 1997). The scheduled release volume for June 2013 is 800 kaf.

In July, the release volume will likely be about 847 kaf, with daily fluctuations for hydropower between approximately 10,000 cfs in the nighttime and approximately 18,000 cfs in the daytime. In August, the release volume will likely be about 800 kaf with daily fluctuations between approximately 9,000 cfs and 17,000 cfs.

In addition to daily scheduled fluctuations for power generation, the instantaneous releases from Glen Canyon Dam may also fluctuate to provide 40 MW of system regulation. These instantaneous release adjustments stabilize the electrical generation and transmission system and translate to a range of about 1,100 cfs above or below the hourly scheduled release rate. Typically, fluctuations for system regulation are very short

lived and balance out over the hour and do not have noticeable impacts on downstream river flow conditions.

Releases from Glen Canyon Dam can also fluctuate beyond scheduled fluctuations for power generation when called upon as a partner that shares reserve requirements within the electrical generator community (i.e. balancing area). Reserves provide system reliability in the event of an unscheduled outage. Glen Canyon Dam typically maintains 43 MW of reserves (approximately 1,100 cfs). Reserve calls can be maintained for a maximum of 2 hours after which time the generation rate should be returned to the original schedule. If reserves from Glen Canyon Dam are called upon, releases from the dam can exceed scheduled levels and can have a noticeable impact on the river downstream from Glen Canyon Dam. Calls for reserves are fairly infrequent and typically are for much less than 43 MW.

Inflow Forecasts and Model Projections

The hydrologic forecast for Lake Powell for the April to July water supply season projects that the most probable (median) unregulated inflow volume will be 3.0 maf (42% of average based on the period 1981-2010). The April-July most probable forecast did not change from last month and the overall water supply outlook remains significantly below average. The minimum probable and maximum probable forecasts are 2.48 maf (35%) and 3.48 maf (49%), respectively. Based on the current forecast, the June 24-Month study projects Lake Powell elevation will decline approximately 11 feet from June to September and end the water year at 3588.8 feet with 10.71 maf in storage (44% capacity). The annual release volume from Lake Powell during water year 2013 is scheduled to be 8.23 maf. Reclamation will schedule operations at Glen Canyon Dam to achieve as practicably as possible an 8.23 maf annual release volume by September 30, 2013.

Consistent with Section 6.C.1 of the Interim Guidelines, if the August 24-Month study projects the January 1, 2014, Lake Powell elevation to be less than 3,575.0 feet and at or above 3,525.0 feet and the Lake Mead elevation to be at or above 1,025.0 feet, the operational tier for Lake Powell in water year 2014 would be the Mid-Elevation Release Tier and the water year release volume from Lake Powell would be 7.48 maf. This June 2013 24-Month study projects that, with an 8.23 maf annual release pattern in water year 2014, the January 1, 2014, Lake Powell elevation would be 3,577.05 feet and the Lake Mead elevation would be 1,105.27 feet. Therefore, the 2014 Lake Powell operational tier is currently projected to be the Upper Elevation Balancing Tier with an annual release volume of 8.23 maf and no projected shift in April to the Equalization Tier. However, if hydrology should become slightly drier than is currently projected and the August 24-Month Study projects the January 1, 2014 Lake Powell elevation to be less than 3,575.00 feet, the Mid-Elevation Release Tier will govern and the annual release volume from Lake Powell will be 7.48 maf. Based on analysis of a range of inflow scenarios, the current probability of realizing an inflow volume that would result in the Mid-Elevation Release Tier and a 7.48 maf annual release is approximately 45 percent.

Upper Colorado River Basin Hydrology – Since 2005 the Upper Colorado River Basin has experienced significant year to year hydrologic variability. During the period 2005 through 2012, the unregulated inflow to Lake Powell, which is a good measure of hydrologic conditions in the Colorado River Basin, averaged a water year volume of 10.22 maf (94% of average (period 1981-2010)). The unregulated inflow has ranged from a low of 4.91 maf (45% of average) in water year 2012 to a high of 15.97 maf (147% of average) in water year 2011. This has been an improvement over the persistent drought conditions of 2000 to 2004, which averaged a water year unregulated inflow of 5.73 maf. However, based on observed inflows and current forecasts, water year 2013 unregulated inflow is expected to be 4.77 maf (44% of average), which would be a second below-average year in a row.

At the beginning of water year 2013, total system storage in the Colorado River Basin was 33.9 maf (57 % of capacity), which was an increase of about 4 maf since water year 2005 which began at 29.8 maf (50% of capacity). Since 2005, however, total Colorado Basin storage has experienced year to year increases and decreases in response to wet and dry hydrology. In addition, conditions in both 2012 and 2013 have been significantly drier than average and given observed inflows and current forecasts, the current projected end of water year 2013 total reservoir storage is approximately 29.3 maf (49% of capacity).

Model Run ID: 2147

Processed On: 6/11/2013 10:07:01AM

July 24-Month Study
Date: July 10, 2013

From: Water Resources Group, Salt Lake City
To: All Colorado River Annual Operating Plan (AOP) Recipients

Current Reservoir Status

Reservoir	June Inflow (unregulated) (acre-feet)	Percent of Average (%)	July 7 Midnight Elevation (feet)	Reservoir Storage (acre-feet)
Fontenelle	91,000	30	6490.85	233,000
Flaming Gorge	100,000	26	6017.71	2,900,000
Blue Mesa	126,000	48	7468.76	427,000
Navajo	39,000	17	6023.00	940,000
Powell	939,000	35	3598.89	11,644,000

Expected Operations

The operation of Lake Powell and Lake Mead in this July 2013 24-Month Study is pursuant to the December 2007 Record of Decision on Colorado River Interim Guidelines for Lower Basin Shortages and the Coordinated Operations of Lake Powell and Lake Mead (Interim Guidelines), and reflects the 2013 Annual Operating Plan (AOP). Pursuant to the Interim Guidelines, the August 2012 24-Month Study projections of the January 1, 2013, system storage and reservoir water surface elevations set the operational tier for the coordinated operation of Lake Powell and Lake Mead during 2013.

Consistent with Section 6.B of the Interim Guidelines, the Lake Powell operational tier for water year 2013 is the Upper Elevation Balancing Tier. Since the April 2013 24-Month Study projected end of water year elevation at Lake Powell was below the 2013 Equalization Elevation of 3,646.0 feet and the projected end of water year elevation at Lake Mead was above elevation 1,075.0 feet, Section 6.B.1 and 6.B.4 of the Interim Guidelines provide for an annual release volume of 8.23 million acre-feet (maf) from Lake Powell during water year 2013.

Consistent with Section 2.B.5 of the Interim Guidelines, the Intentionally Created Surplus (ICS) Surplus Condition is the criterion governing the operation of Lake Mead for calendar year 2013.

Consistent with Section 6.C.1 of the Interim Guidelines, if the August 24-Month study projects the January 1, 2014, Lake Powell elevation to be less than 3,575.0 feet and at or above 3,525.0 feet and the Lake Mead elevation to be at or above 1,025.0 feet, the operational tier for Lake Powell in water year 2014 will be the Mid-Elevation Release Tier and the water year release volume from Lake Powell will be 7.48 maf. This July 2013 24-Month study projects that, with an 8.23 maf annual release pattern in water year 2014, the January 1, 2014, Lake Powell elevation would be 3,574.97 feet and the Lake Mead elevation would be 1,105.73 feet. Therefore, the 2014 Lake Powell operational tier is currently projected to be the Mid-Elevation Release Tier with an annual release volume of 7.48 maf. Based on analysis of a range of inflow scenarios, the current probability of realizing an inflow volume that would result in the Mid-Elevation Release Tier in 2014 is slightly greater than 50 percent.

The Interim Guidelines are available for download at
http://www.usbr.gov/lc/region/programs/strategies/RecordofDecision.pdf.
The 2013 AOP is available for download at
http://www.usbr.gov/uc/water/rsvrs/ops/aop/AOP13_final.pdf.

Fontenelle Reservoir **–** Inflows to Fontenelle Reservoir for the month of May were 91,000 acre-feet (AF), or 30 percent of average. The reservoir elevation is 6490.02 feet, 66 percent of live capacity. Inflows are averaging 1,400 cubic feet per second (cfs) and are expected to decrease over the next few weeks as base flows enter the reservoir. The peak reservoir elevation based on current projected inflows is approximately 6491 feet. Reservoir releases are currently at 800 cfs, and are projected to decrease to 700 cfs at midmonth. There is the potential for an additional decrease below 700 cfs in September with continued dry conditions. All data is provisional and projections are based on the current forecasted inflow into Flaming Gorge Reservoir. Projections are updated monthly and new projections will be posted as Reclamation acquires additional information.

Inflows for the next three months are projected to be below average: with July, August and September forecasted inflow volumes at 41,000 AF (23% of average), 28,000 AF (37% of average), and 25,000 AF (55% of average), respectively. The Colorado Basin River Forecast Center has issued the official July water supply forecast for the April through July unregulated inflow volume which is 290,000 af or 40 percent of the 1981-2010 thirty-year average.

The next Fontenelle Working Group meeting is scheduled for August 22, 2013, at 10:00 am at the Joint Powers and Water Board in Green River, Wyoming. The Fontenelle Working Group is an open public forum for information exchange between Reclamation and other parties associated with the operation of Fontenelle Reservoir. The spring Fontenelle Working Group meeting was held on April 25, 2013 at Seedskadee National Wildlife Refuge. Minutes from the meeting are posted on the Working Group webpages.

Flaming Gorge Reservoir – Unregulated inflow into Flaming Gorge Reservoir during the month of June was 100,000 acre-feet (af), or 26 percent of average. The reservoir elevation is 6017.85 feet and decreasing. Observed inflows are approximately 500 cubic feet per second (cfs).

Forecasts remain below average and Flaming Gorge Dam is in the dry hydrologic classification for the base flow period as outlined in the Record of Decision (ROD). Flaming Gorge releases are currently 1,100 cfs following a single-peak fluctuation pattern and are anticipated to remain at this level through September 30, 2013, whereupon they will decrease to steady releases of approximately 820 cfs. The minimum reservoir elevation is projected to reach 6013 feet by October and remain close to that level through the winter before increasing next spring to approximately 6016 feet. All data is provisional and projections are based on the current forecasted inflow into Flaming Gorge Reservoir. Projections are updated monthly and new projections will be posted as Reclamation acquires additional information.

Inflows for the next three months are projected to be below average: with July, August and September forecasted inflow volumes at 43,000 AF (20% of average), 28,000 AF (32% of average), and 24,000 AF (44% of average), respectively. The Colorado Basin River Forecast Center has issued the official June water supply forecast for the April through July unregulated inflow volume which is 345,000 af or 35 percent of the 1981-2010 thirty-year average.

Reclamation has completed its involvement in a cooperative experimental program this year where the capture of endangered larval razorback sucker is the "trigger" to increase releases from Flaming Gorge Dam this spring. The official spring hydrologic classification based on the ROD Flow Recommendation was moderately dry. The ROD and experimental targets for Green River flows measured at Jensen, Utah were at or above 8,300 cfs for 7 to 14 days. Green River flows measured at Jensen, Utah were at or above 8,300 cfs for a total of 25 days, 18 days of which days occurred during larval drift. The peak flow at Jensen, Utah was 10,700 cfs occurring on June 6, 2013.

The next Flaming Gorge Working Group meeting is scheduled for August 21, 2013, at 11:00 a.m. at the new Utah Department of Natural Resources building in Vernal, Utah, located at 318 North Vernal Avenue. The Flaming Gorge Working Group is an open public forum for information exchange between Reclamation and the stake holders of Flaming Gorge Dam. The public is encouraged to attend and comment on the operations and plans presented by Reclamation at these meetings. For more information on this group and these meetings please contact Ed Vidmar at 801-379-1182.

Aspinall Unit Reservoirs – June unregulated inflow into Blue Mesa Reservoir was 126,000 acre-feet or 48 percent of average. Hydrologic conditions in the basin continued to be very dry during June. Precipitation during June was only 20 percent of average. The basin snowpack has for the most part has been totally depleted. The current inflow rate into Blue Mesa Reservoir is about 700 cfs while reservoir releases are averaging about 1,700 cfs. Blue Mesa's present elevation is 7468.76 feet, which corresponds to a storage content of about 427,000 acre-feet.

The latest Water Supply Forecast for Water Year 2013 has been issued and the April through July unregulated inflow is forecasted to be at 349,000 acre-feet (52% of average). This is a 21,000 acre-feet decrease from last month's forecast. Based on this runoff forecast and the current elevation of Blue Mesa Reservoir, the reservoir is not expected to fill nor is it expected to gain any further elevation raise this year until winter. This year's peak elevation was recorded on June 20th when the reservoir reached elevation 7472.32 feet.

Releases from Crystal are currently set at 1700 cfs. The Gunnison Diversion Tunnel is diverting about 1,000 cfs, which results in a river flow below the diversion tunnel of approximately 700 cfs. These rates will most likely change as conditions warrant, primarily as we respond to changes at the Whitewater gage as flows prescribed in the Aspinall Unit Operations Record of Decision (ROD). The ROD calls for keeping flows at the Whitewater gage at or above 900 cfs.

The next meeting of the "Aspinall Unit Working Group" will be held on Thursday, September 5, 2013 starting at 1:00 PM at the Elk Creek Visitors Center at Blue Mesa Reservoir. At this meeting, review of this spring's reservoir operations, and plans for this summer and fall operations will be discussed. These meetings are open forum discussions on the Aspinall Unit reservoir operations with many interested groups participating. Anyone needing further information about these meetings should contact Dan Crabtree in the Grand Junction Area Office at (970) 248-0652.

Navajo Reservoir – As a result of decreasing tributary inflows into the San Juan River, along with a hot and dry forecast, the Bureau of Reclamation increased the release from Navajo Reservoir to 1,000 cfs on Friday, June 28th. Releases are made for the authorized purposes of the Navajo Unit, and to attempt to maintain a target base flow through the endangered fish critical habitat reach of the San Juan River (Farmington to Lake Powell).

The San Juan River Basin Recovery Implementation Program recommends a target base flow of between 500 cfs and 1,000 cfs through the critical habitat area. The target base flow is calculated as the weekly average of gaged flows throughout the critical habitat area.

Navajo was at 6024.88 ft of pool elevation and 958,077 acre-ft of storage by the end of June, the lowest end-of-June storage since 2003, and the 2nd lowest since 1981. Total observed inflow for the month of June was 46,114 acre-ft, which was 25% of average

(modified-unregulated inflow volume of 39.686 acre-ft, or 17% of average). Calculated evaporation for the month was 3,253 acre-ft. The reservoir gained an an average of 1067 acre-ft per day throughout June. SNOTEL sites above Navajo officially melted out on June 14th. A seasonal peak SWE of 13.9 inches (74% of average seasonal peak) was recorded on March 13th. NIIP diverted a total of 42,120 acre-ft in the month of June. Modified unregulated inflow from April 1st through June 30th into Navajo Reservoir has totaled 265,285 acre-ft.

As of July 7th, the release at Navajo is 1000 cfs, and the weekly averaged observed inflow is 397 cfs. The pool elevation is 6023.0 ft and the content is 940,038 acre-ft, or 55% full. NIIP is diverting at a weekly averaged rate of 588 cfs. The San Juan River at Four Corners is averaging 564 cfs and the Animas River at Farmington is averaging 43 cfs

The most probable modified unregulated inflow forecast for April through July at Navajo is 270,000 acre-ft (36% of average). The minimum probable modified unregulated inflow forecast for April through July at Navajo is 264,000 acre-ft (36% of average). The maximum probable modified unregulated inflow forecast for April through July at Navajo is 278,000 acre-ft (37% of average). No spring peak release was conducted in 2013.

The most recent public meeting was held April 23rd, 2013 at 1:00 PM at the Civic Center in Farmington, New Mexico (200 West Arrington Street). At this meeting, a review of forecasted hydrology, and plans for this spring and summer 2013 operations were discussed. The next public meeting is scheduled for August 27th, 2013. These meetings are open forum discussions on the operation of Navajo Reservoir with many interested groups participating. Anyone interested in the general operation of the reservoir is encouraged to attend. Please contact Ryan Christianson in Reclamation's Durango, Colorado Office at (970) 385-6590 for information about these meetings or the daily operation of Navajo Reservoir.

***Glen Canyon Dam / Lake Powell* –**

Current Status
The unregulated inflow volume to Lake Powell in June was 939 thousand acre-feet (kaf) (35% of average). The release volume from Glen Canyon Dam in June was 800 kaf. The end of June elevation and storage of Lake Powell were 3600.1 feet (99.9 feet from full pool) and 11.76 million acre-feet (maf) (48% of full capacity), respectively. The reservoir elevation peaked in mid-June at 3601.2 ft and is now declining. The elevation will continue to decline through the fall and winter until spring runoff in 2014.

Current Operations
The operating tier for 2013 is the Upper Elevation Balancing Tier, as established in August 2012 and pursuant to the Interim Guidelines. Since the April 2013 projected end of water year elevation at Lake Powell was below the 2013 Equalization Elevation of

3,646.0 feet and the projected end of water year elevation at Lake Mead was above elevation 1,075.0 feet, Section 6.B.1 and 6.B.4 of the Interim Guidelines provide for an annual release volume of 8.23 maf from Lake Powell during water year 2013. Reclamation will schedule operations at Glen Canyon Dam to achieve as practicably as possible an 8.23 maf annual release volume by September 30, 2013.

Releases from Glen Canyon Dam in July are currently averaging approximately 14,000 cfs with daily fluctuations between approximately 10,000 cfs at nighttime and approximately 18,000 cfs during the daytime and consistent with the Glen Canyon Operating Criteria (Federal Register, Volume 62, No. 41, March 3, 1997). The scheduled release volume for July 2013 is 847 kaf.

In August, the release volume will likely be about 800 kaf, with daily fluctuations for hydropower between approximately 9,000 cfs in the nighttime and approximately 17,000 cfs in the daytime. In September, the release volume will likely be about 600 kaf with daily fluctuations between approximately 7,000 cfs and 13,000 cfs.

In addition to daily scheduled fluctuations for power generation, the instantaneous releases from Glen Canyon Dam may also fluctuate to provide 40 MW of system regulation. These instantaneous release adjustments stabilize the electrical generation and transmission system and translate to a range of about 1,200 cfs above or below the hourly scheduled release rate. Typically, fluctuations for system regulation are short lived and generally balance out over the hour with minimal or no noticeable impacts on downstream river flow conditions.

Releases from Glen Canyon Dam can also fluctuate beyond scheduled fluctuations for power generation when called upon as a partner that shares reserve requirements within the electrical generator community (i.e. balancing area). Reserves provide system reliability in the event of an unscheduled outage. Glen Canyon Dam typically maintains 43 MW of reserves (approximately 1,200 cfs). Reserve calls can be maintained for a maximum of 2 hours after which time the generation rate should be returned to the original schedule. If reserves from Glen Canyon Dam are called upon, releases from the dam can exceed scheduled levels and can have a noticeable impact on the river downstream from Glen Canyon Dam. Calls for reserves are fairly infrequent and typically are for much less than 43 MW.

Inflow Forecasts and Model Projections

The hydrologic forecast for Lake Powell for the April to July water supply season projects that the most probable (median) unregulated inflow volume will be 2.67 maf (37% of average based on the period 1981-2010). The April-July most probable forecast decreased from last month and the overall water supply outlook remains significantly below average. Based on the current forecast, the July 24-Month study projects Lake Powell elevation will decline approximately 13 feet from July to September and end the water year at 3587.0 feet with 10.5 maf in storage (43% capacity). The annual release volume from Lake Powell during water year 2013 is scheduled to be 8.23 maf.

Reclamation will schedule operations at Glen Canyon Dam to achieve as practicably as possible an 8.23 maf annual release volume by September 30, 2013.

Consistent with Section 6.C.1 of the Interim Guidelines, if the August 24-Month study projects the January 1, 2014, Lake Powell elevation to be less than 3,575.0 feet and at or above 3,525.0 feet and the Lake Mead elevation to be at or above 1,025.0 feet, the operational tier for Lake Powell in water year 2014 will be the Mid-Elevation Release Tier and the water year release volume from Lake Powell would be 7.48 maf. This July 2013 24-Month study projects that, with an 8.23 maf annual release pattern in water year 2014, the January 1, 2014 Lake Powell elevation would be 3,574.97 feet and the Lake Mead elevation would be 1,105.73 feet. Therefore, the 2014 Lake Powell operational tier is currently projected to be the Mid-Elevation Release Tier with an annual release volume of 7.48 maf. However, if hydrology should become slightly wetter than is currently projected and the August 24-Month Study projects the January 1, 2014 Lake Powell elevation to be more than 3,575.00 feet, the Upper Elevation Balancing Tier will govern and the annual release volume from Lake Powell will be 8.23 maf or possibly greater. Based on analysis of a range of inflow scenarios, the current probability of realizing an inflow volume that would result in the Upper Elevation Balancing Tier is slightly less than 50 percent.

Upper Colorado River Basin Hydrology – Since 2005 the Upper Colorado River Basin has experienced significant year to year hydrologic variability. During the period 2005 through 2012, the unregulated inflow to Lake Powell, which is a good measure of hydrologic conditions in the Colorado River Basin, averaged a water year volume of 10.22 maf (94% of average (period 1981-2010)). The unregulated inflow has ranged from a low of 4.91 maf (45% of average) in water year 2012 to a high of 15.97 maf (147% of average) in water year 2011. This has been an improvement over the persistent drought conditions of 2000 to 2004, which averaged a water year unregulated inflow of 5.73 maf. However, based on observed inflows and current forecasts, water year 2013 unregulated inflow is expected to be 4.43 maf (41% of average), which would be a second below-average year in a row.

At the beginning of water year 2013, total system storage in the Colorado River Basin was 33.9 maf (57 % of capacity), which was an increase of about 4 maf since water year 2005 which began at 29.8 maf (50% of capacity). Since 2005, however, total Colorado Basin storage has experienced year to year increases and decreases in response to wet and dry hydrology. In addition, conditions in both 2012 and 2013 have been significantly drier than average and given observed inflows and current forecasts, the current projected end of water year 2013 total reservoir storage is approximately 22.6 maf (45% of capacity).

August 24-Month Study
Date: August 16, 2013

From: Water Resources Group, Salt Lake City
To: All Colorado River Annual Operating Plan (AOP) Recipients

Current Reservoir Status

Reservoir	July Inflow (unregulated) (acre-feet)	Percent of Average (%)	August 11 Midnight Elevation (feet)	Reservoir Storage (acre-feet)
Fontenelle	67,000	38	6491.83	239,000
Flaming Gorge	66,000	31	6016.53	2,859,000
Blue Mesa	44,000	38	7461.50	381,000
Navajo	2,000	3	6016.36	878,000
Powell	143,000	13	3592.53	11,051,000

Expected Operations

The operation of Lake Powell and Lake Mead in this August 2013 24-Month Study is pursuant to the December 2007 Record of Decision on Colorado River Interim Guidelines for Lower Basin Shortages and the Coordinated Operations of Lake Powell and Lake Mead (Interim Guidelines), and reflects the 2013 Annual Operating Plan (AOP). Pursuant to the Interim Guidelines, the August 2012 24-Month Study projections of the January 1, 2013, system storage and reservoir water surface elevations set the operational tier for the coordinated operation of Lake Powell and Lake Mead during 2013.

Consistent with Section 6.B of the Interim Guidelines, the Lake Powell operational tier for water year 2013 is the Upper Elevation Balancing Tier. Since the April 2013 24-Month Study projected end of water year elevation at Lake Powell was below the 2013 Equalization Elevation of 3,646.0 feet and the projected end of water year elevation at Lake Mead was above elevation 1,075.0 feet, Section 6.B.1 and 6.B.4 of the Interim Guidelines provide for an annual release volume of 8.23 million acre-feet (maf) from Lake Powell during water year 2013.

Consistent with Section 2.B.5 of the Interim Guidelines, the Intentionally Created Surplus (ICS) Surplus Condition is the criterion governing the operation of Lake Mead for calendar year 2013.

Consistent with Section 6.C.1 of the Interim Guidelines, if the August 24-Month study projects the January 1, 2014, Lake Powell elevation to be less than 3,575.0 feet and at or above 3,525.0 feet and the Lake Mead elevation to be at or above 1,025.0 feet, the operational tier for Lake Powell in water year 2014 will be the Mid-Elevation Release Tier and the water year release volume from Lake Powell will be 7.48 maf. This August 2013 24-Month study projects that, with an 8.23 maf annual release pattern in water year 2014, the January 1, 2014, Lake Powell elevation would be 3,573.69 feet and the Lake Mead elevation would be 1,107.39 feet. Therefore, consistent with Section 6.C.1 of the Interim Guidelines, the Lake Powell operational tier for water year 2014 is the Mid-Elevation Release Tier with an annual release volume of 7.48 maf. This determination will be documented in the 2014 AOP, which is currently in the final stages of development.

The Interim Guidelines are available for download at
http://www.usbr.gov/lc/region/programs/strategies/RecordofDecision.pdf.
The 2013 AOP is available for download at
http://www.usbr.gov/uc/water/rsvrs/ops/aop/AOP13.pdf.
The Draft 2014 AOP is available for download at
http://www.usbr.gov/lc/region/g4000/AOP2014/AOP14_draft.pdf.

Fontenelle Reservoir **–** Inflows to Fontenelle Reservoir for the month of July were 67,000 acre-feet (AF), or 38 percent of average. The reservoir elevation is 6492.02 feet, 70 percent of live capacity. Inflows are averaging 600 cubic feet per second (cfs) and are expected to continue to decrease over the next month. The peak reservoir elevation occurred on July 22 at elevation 6492.29 feet. Reservoir releases are currently at 700 cfs and are projected to remain at this level through the winter and next spring.

Inflows for the next three months are projected to be below average: with August, September and October forecasted inflow volumes at 30,000 AF (39% of average), 25,000 AF (55% of average), and 30,000 AF (62% of average), respectively. The observed April through July unregulated inflow volume is 317,000 af or 44 percent of the 1981-2010 thirty-year average.

The next Fontenelle Working Group meeting is scheduled for August 22, 2013, at 10:00 am at the Joint Powers and Water Board in Green River, Wyoming. The Fontenelle Working Group is an open public forum for information exchange between Reclamation and other parties associated with the operation of Fontenelle Reservoir. The spring Fontenelle Working Group meeting was held on April 25, 2013 at Seedskadee National Wildlife Refuge. Minutes from the meeting are posted on the Working Group webpages.

Flaming Gorge Reservoir – Unregulated inflow into Flaming Gorge Reservoir during the month of July was 66,000 acre-feet (AF), or 31 percent of average. The reservoir elevation is 6016.63 feet and decreasing. Observed inflows are approximately 500 cubic feet per second (cfs).

Forecasts remain below average and Flaming Gorge Dam is in the dry hydrologic classification for the base flow period as outlined in the Record of Decision (ROD). Flaming Gorge releases are currently 1,100 cfs following a single-peak fluctuation pattern and are anticipated to remain at this level through September 30, 2013, whereupon they will decrease to steady releases of approximately 820 cfs. The minimum reservoir elevation is projected to reach 6014 feet by October and remain close to that level through the winter before increasing to a peak elevation next year of 6020.94 feet.

Inflows for the next three months are projected to be below average: with August, September and October forecasted inflow volumes at 30,000 AF (34% of average), 24,000 AF (44% of average), and 28,000 AF (47% of average), respectively. The observed April through July unregulated inflow volume is 361,000 AF or 37 percent of the 1981-2010 thirty-year average.

The next Flaming Gorge Working Group meeting is scheduled for August 21, 2013, at 11:00 a.m. at the new Utah Department of Natural Resources building in Vernal, Utah, located at 318 North Vernal Avenue. The Flaming Gorge Working Group is an open public forum for information exchange between Reclamation and the stake holders of Flaming Gorge Dam. The public is encouraged to attend and comment on the operations and plans presented by Reclamation at these meetings. For more information on this group and these meetings please contact Ed Vidmar at 801-379-1182.

Aspinall Unit Reservoirs – July unregulated inflow into Blue Mesa Reservoir was 44,000 acre-feet or 38 percent of average. Hydrologic conditions in the basin had a break from the dry conditions as summer thunderstorms brought in some much needed precipitation during the month. May, June, and July precipitation was 95, 15, and 150 percent of average respectively. The current inflow rate into Blue Mesa Reservoir is about 1100 cfs while reservoir releases are averaging about 1,600 cfs.

Blue Mesa's present elevation is 7461.89 feet, which corresponds to a storage content of about 383,000 acre-feet. The observed April through July runoff into Blue Mesa Reservoir was recorded at 346,500 acre-feet, or 51 percent of average. The reservoir reached a high elevation of 7472.32 feet on June 20, 2013, which was approximately 47.1 feet below "full" pool. Full pool is defined by the top of the spillway gates at elevation 7519.4 feet. Rarely is the reservoir filled to that level due to safety. For practical purposes; the reservoir is considered full at elevations above 7516.4 feet.

Releases from Crystal are currently set at 1450 cfs. The Gunnison Diversion Tunnel is diverting about 950 cfs, which results in a river flow below the diversion tunnel of approximately 500 cfs. These rates will most likely change as conditions warrant,

primarily as we respond to changes at the Whitewater gage as flows prescribed in the Aspinall Unit Operations Record of Decision (ROD). The ROD calls for keeping flows at the Whitewater gage at or above 900 cfs.

The next meeting of the "Aspinall Unit Working Group" will be held on Thursday, September 5, 2013 starting at 1:00 PM at the Elk Creek Visitors Center at Blue Mesa Reservoir. At this meeting, review of this spring's reservoir operations, and plans for this summer and fall operations will be discussed. These meetings are open forum discussions on the Aspinall Unit reservoir operations with many interested groups participating. Anyone needing further information about these meetings should contact Dan Crabtree in the Grand Junction Area Office at (970) 248-0652.

Navajo Reservoir – As a result of increasing flows in the San Juan River Basin, and continued forecasted precipitation, the Bureau of Reclamation decreased the release from Navajo Reservoir from 600 cfs (cubic feet per second) to 500 cfs on Thursday, August 8th at 7:00 a.m. Releases are made for the authorized purposes of the Navajo Unit, and to attempt to maintain a target base flow through the endangered fish critical habitat reach of the San Juan River (Farmington to Lake Powell).

The San Juan River Basin Recovery Implementation Program recommends a target base flow of between 500 cfs and 1,000 cfs through the critical habitat area. The target base flow is calculated as the weekly average of gaged flows throughout the critical habitat area.

Navajo was at 6017.5 feet of pool elevation and 889,119 acre-feet of storage by the end of July, the lowest end-of-July storage since 2003, and the 2nd lowest since 1981. Total observed inflow for the month of July was 25,167 acre-feet, which was 24% of average (modified-unregulated inflow volume of 1,880 acre-feet, or 3% of average). Calculated evaporation for the month was 3,238 acre-ft. The reservoir lost an average of 2200 acre-feet per day throughout July, including NIIP and evaporation. The outlet works release ranged from 1000 cfs at the beginning of the month to as low as 500 cfs by mid-month as monsoonal moisture picked up. NIIP diverted a total of 39,993 acre-feet in the month of July. Modified unregulated inflow for April-July totaled 267,000 which is 36% of average.

As of August 5th, the release at Navajo is 750 cfs, and the observed inflow is 1,100 cfs. The pool elevation is 6016.53 feet and the content is 879,920 acre-feet, or 52% full. NIIP is diverting at a rate of 725 cfs. The San Juan River at Four Corners USGS gage is at 703 cfs and the Animas River at Farmington USGS gage is reading 230 cfs.

The most probable modified-unregulated inflow forecast for August at Navajo is 16,000 acre-feet (36% of average), for September is 19,000 acre-feet (45% of average), and for October is 20,000 acre-feet (42% of average). Modified unregulated inflow is defined as the predicted hydrologic inflow volume into Navajo plus the change in storage at Vallecito Reservoir and the San-Juan Chama diversion volume.

The next public meeting is scheduled for August 27th, 2013. These meetings are open forum discussions on the operation of Navajo Reservoir with many interested groups participating. Anyone interested in the general operation of the reservoir is encouraged to attend. Please contact Ryan Christianson in Reclamation's Durango, Colorado Office at (970) 385-6590 for information about these meetings or the daily operation of Navajo Reservoir.

***Glen Canyon Dam / Lake Powell* –**

Current Status
The unregulated inflow volume to Lake Powell in July was 143 thousand acre-feet (kaf) (13% of average). The release volume from Glen Canyon Dam in July was 848 kaf. The end of July elevation and storage of Lake Powell were 3594.2 feet (106 feet from full pool) and 11.20 million acre-feet (maf) (46% of full capacity), respectively. The reservoir elevation peaked in mid-June at 3601.2 ft and is now declining. The elevation will continue to decline through the fall and winter until spring runoff in 2014.

Current Operations
The operating tier for 2013 is the Upper Elevation Balancing Tier, as established in August 2012 and pursuant to the Interim Guidelines. Since the April 2013 projected end of water year elevation at Lake Powell was below the 2013 Equalization Elevation of 3,646.0 feet and the projected end of water year elevation at Lake Mead was above elevation 1,075.0 feet, Section 6.B.1 and 6.B.4 of the Interim Guidelines provide for an annual release volume of 8.23 maf from Lake Powell during water year 2013. Reclamation will schedule operations at Glen Canyon Dam to achieve as practicably as possible an 8.23 maf annual release volume by September 30, 2013.

Releases from Glen Canyon Dam in August are currently averaging approximately 13,000 cfs with daily fluctuations between approximately 9,000 cfs at nighttime and approximately 17,000 cfs during the daytime and consistent with the Glen Canyon Operating Criteria (Federal Register, Volume 62, No. 41, March 3, 1997). The scheduled release volume for August 2013 is 800 kaf.

In September, the release volume will likely be about 600 kaf, with daily fluctuations for hydropower between approximately 7,000 cfs in the nighttime and approximately 13,000 cfs in the daytime. In October, the release volume will likely be about 480 kaf with daily fluctuations between approximately 5,000 cfs and 10,000 cfs. In addition to daily scheduled fluctuations for power generation, the instantaneous releases from Glen Canyon Dam may also fluctuate to provide 40 MW of system regulation. These instantaneous release adjustments stabilize the electrical generation and transmission system and translate to a range of about 1,200 cfs above or below the hourly scheduled release rate. Under system normal conditions, fluctuations for regulation are typically short lived and generally balance out over the hour with minimal or no noticeable impacts on downstream river flow conditions.

Releases from Glen Canyon Dam can also fluctuate beyond scheduled fluctuations for power generation when called upon as a partner that shares reserve requirements within the electrical generator community (i.e. balancing area). Reserves provide system reliability in the event of an unscheduled outage. Glen Canyon Dam typically maintains 43 MW of reserves (approximately 1,200 cfs). Reserve calls can be maintained for a maximum of 2 hours after which time the generation rate should be returned to the original schedule. If reserves from Glen Canyon Dam are called upon, releases from the dam can exceed scheduled levels and can have a noticeable impact on the river downstream from Glen Canyon Dam. Calls for reserves are fairly infrequent and typically are for much less than 43 MW.

Inflow Forecasts and Model Projections

The hydrologic forecast for Lake Powell, issued by the Colorado Basin River Forecast Center, projects that the most probable (median) unregulated inflow volume for water year 2013 will be 4.33 maf (40% of average based on the period 1981-2010). The water year 2013 forecast decreased from last month, due to significantly below average inflows in July. Based on the current forecast, the August 24-Month study projects Lake Powell elevation will decline approximately 8 feet through August and September and end the water year at 3585.7 feet with 10.4 maf in storage (43% capacity). The annual release volume from Lake Powell during water year 2013 is scheduled to be 8.23 maf. Reclamation will schedule operations at Glen Canyon Dam to achieve as practicably as possible an 8.23 maf annual release volume by September 30, 2013.

The hydrologic forecast for Lake Powell for water year 2014 projects that the most probable (median) unregulated inflow volume will be 8.32 maf (77% of average based on the period 1981-2010). At this early point in the season, there is significant uncertainty regarding next year's water supply. The forecast ranges from a minimum probable (90% exceedence) of 5.0 maf (46% of average) to a maximum probable (10% exceedence) of 15.5 maf (143% of average). There is a 10% chance that inflows could be higher than the maximum probable and a 10% chance they could be lower than the minimum probable.

Consistent with Section 6.C.1 of the Interim Guidelines, if the August 24-Month study projects the January 1, 2014, Lake Powell elevation to be less than 3,575.0 feet and at or above 3,525.0 feet and the Lake Mead elevation to be at or above 1,025.0 feet, the operational tier for Lake Powell in water year 2014 will be the Mid-Elevation Release Tier and the water year release volume from Lake Powell would be 7.48 maf. The August 2013 24-Month study projects that, with an 8.23 maf annual release pattern in water year 2014, the January 1, 2014, Lake Powell elevation would be 3,573.69 feet and the Lake Mead elevation would be 1,107.39 feet. Therefore, consistent with Section 6.C.1 of the Interim Guidelines, the Lake Powell operational tier for water year 2014 is the Mid-Elevation Release Tier with an annual release volume of 7.48 maf. This determination will be documented in the 2014 AOP, which is currently in the final stages of development.

Upper Colorado River Basin Hydrology – Since 2005 the Upper Colorado River Basin has experienced significant year to year hydrologic variability. During the period 2005 through 2012, the unregulated inflow to Lake Powell, which is a good measure of hydrologic conditions in the Colorado River Basin, averaged a water year volume of 10.22 maf (94% of average (period 1981-2010)). The unregulated inflow has ranged from a low of 4.91 maf (45% of average) in water year 2012 to a high of 15.97 maf (147% of average) in water year 2011. This has been an improvement over the persistent drought conditions of 2000 to 2004, which averaged a water year unregulated inflow of 5.73 maf. However, based on observed inflows and current forecasts, water year 2013 unregulated inflow is expected to be 4.33 maf (40% of average), which would be a second significantly below-average year in a row. If this occurs, the period 2000-2013 would be the driest 14-year period on record with an average annual unregulated inflow of 8.20 maf per year. (For comparison, the standard 1981-2010 period average is 10.83 maf).

At the beginning of water year 2013, total system storage in the Colorado River Basin was 33.9 maf (57 % of capacity), which was an increase of about 4 maf since water year 2005 which began at 29.8 maf (50% of capacity). Since 2005, however, total Colorado Basin storage has experienced year to year increases and decreases in response to wet and dry hydrology. In addition, conditions in both 2012 and 2013 have been significantly drier than average and based on observed inflows and current forecasts, the current projected end of water year 2013 total Colorado Basin reservoir storage is approximately 29.0 maf (49% of capacity).

September 24-Month Study
Date: September 13, 2013

From: Water Resources Group, Salt Lake City
To: All Colorado River Annual Operating Plan (AOP) Recipients

Current Reservoir Status

Reservoir	August Inflow (unregulated) (acre-feet)	Percent of Average (%)	September 11 Midnight Elevation (feet)	Reservoir Storage (acre-feet)
Fontenelle	32,000	42	6489.48	224,000
Flaming Gorge	22,000	25	6015.35	2,819,000
Blue Mesa	46,000	72	7454.62	339,000
Navajo	43,000	95	6013.77	855,000
Powell	273,000	55	3589.93	10,814,000

Expected Operations

The operation of Lake Powell and Lake Mead in this September 2013 24-Month Study is pursuant to the December 2007 Record of Decision on Colorado River Interim Guidelines for Lower Basin Shortages and the Coordinated Operations of Lake Powell and Lake Mead (Interim Guidelines), and reflects the 2013 Annual Operating Plan (AOP). Pursuant to the Interim Guidelines, the August 2012 24-Month Study projections of the January 1, 2013, system storage and reservoir water surface elevations set the operational tier for the coordinated operation of Lake Powell and Lake Mead during 2013.

Consistent with Section 6.B of the Interim Guidelines, the Lake Powell operational tier for water year 2013 is the Upper Elevation Balancing Tier. Since the April 2013 24-Month Study projected end of water year elevation at Lake Powell was below the 2013 Equalization Elevation of 3,646.0 feet and the projected end of water year elevation at Lake Mead was above elevation 1,075.0 feet, Section 6.B.1 and 6.B.4 of the Interim Guidelines provide for an annual release volume of 8.23 million acre-feet (maf) from Lake Powell during water year 2013.

Consistent with Section 2.B.5 of the Interim Guidelines, the Intentionally Created Surplus (ICS) Surplus Condition is the criterion governing the operation of Lake Mead for calendar year 2013.

Consistent with Section 6.C.1 of the Interim Guidelines, the Lake Powell operational tier for water year 2014 is the Mid-Elevation Release Tier with an annual release volume of 7.48 maf. This was determined in the August 2013 24-Month study which projected that, with an 8.23 maf annual release pattern in water year 2014, the January 1, 2014, Lake Powell elevation would be below 3,575.0 feet and the Lake Mead elevation would be above 1,025.0 feet.

Consistent with the August 2013 24-Month Study and with Section 2.B.5 of the Interim Guidelines, the Intentionally Created Surplus (ICS) Surplus Condition is the criterion governing the operation of Lake Mead for calendar year 2014.

The tier determinations will be documented in the 2014 AOP, which is currently in the final stages of development.

The Interim Guidelines are available for download at
http://www.usbr.gov/lc/region/programs/strategies/RecordofDecision.pdf.
The 2013 AOP is available for download at
http://www.usbr.gov/uc/water/rsvrs/ops/aop/AOP13.pdf.
The Draft 2014 AOP is available for download at
http://www.usbr.gov/lc/region/g4000/AOP2014/AOP14_draft.pdf.

Fontenelle Reservoir – Inflows to Fontenelle Reservoir for the month of August were 32,000 acre-feet (AF), or 42 percent of average. The reservoir elevation is 6489.48 feet, 65 percent of live capacity. Inflows are averaging 500 cubic feet per second (cfs) and are expected to be close to this value over the next month. The peak reservoir elevation occurred on July 22 at elevation 6492.29 feet. Reservoir releases are currently at 700 cfs and are projected to remain at this level through the winter and next spring.

Inflows for the next three months are projected to be below average: with August, September and October forecasted inflow volumes at 25,000 AF (54% of average), 30,000 AF (61% of average), and 30,000 AF (71% of average), respectively. The observed April through July unregulated inflow volume was 317,000 af or 44 percent of the 1981-2010 thirty-year average.

The next Fontenelle Working Group meeting is scheduled for April 23, 2014, at 10:00 am at the Seedskadee National Wildlife Refuge. The Fontenelle Working Group is an open public forum for information exchange between Reclamation and other parties associated with the operation of Fontenelle Reservoir. The autumn Fontenelle Working Group meeting was held on August 23, 2013 at the Joint Powers Water Board in Green River. Minutes from past meetings are posted on the Working Group webpages.

Flaming Gorge Reservoir – Unregulated inflow into Flaming Gorge Reservoir during the month of August was 22,000 acre-feet (AF), or 25 percent of average. The reservoir elevation is 6015.35 feet and decreasing. Observed inflows are approximately 600 cubic feet per second (cfs).

Forecasts remain below average and Flaming Gorge Dam is in the dry hydrologic classification for the base flow period as outlined in the Record of Decision (ROD). Flaming Gorge releases are currently 1,100 cfs following a single-peak fluctuation pattern and are anticipated to remain at this level through September 30, 2013, whereupon they will decrease to steady releases of approximately 820 cfs. The minimum reservoir elevation is projected to reach 6014 feet by October and remain close to that level through the winter before increasing to a peak elevation next year of approximately 6020 feet.

Inflows for the next three months are projected to be below average: with August, September and October forecasted inflow volumes at 19,000 AF (35% of average), 27,000 AF (46% of average), and 31,000 AF (61% of average), respectively. The observed April through July unregulated inflow volume is 361,000 AF or 37 percent of the 1981-2010 thirty-year average.

The next Flaming Gorge Working Group meeting is scheduled for April 2014, at the Utah Department of Natural Resources building in Vernal, Utah. The Flaming Gorge Working Group is an open public forum for information exchange between Reclamation and the stake holders of Flaming Gorge Dam. The public is encouraged to attend and comment on the operations and plans presented by Reclamation at these meetings. Meeting notes from past Working Group meetings are posted on the Working Group webpage. For more information on this group and these meetings please contact Ed Vidmar at 801-379-1182.

Aspinall Unit Reservoirs – August unregulated inflow into Blue Mesa Reservoir was 46,000 acre-feet or 72 percent of average. Hydrologic conditions continue to be dry in the basin; however precipitation was slightly above average for the month. June, July, August precipitation was 15, 160, and 125 percent of average respectively. The current inflow rate into Blue Mesa Reservoir is about 700 cfs while reservoir releases are averaging about 1,200 cfs.

Blue Mesa's present elevation is 7454.62 feet, which corresponds to a storage content of about 339,000 acre-feet. The observed April through July runoff into Blue Mesa Reservoir was recorded at 346,500 acre-feet, or 51 percent of average. The reservoir reached a high elevation of 7472.32 feet on June 20, 2013, which was approximately 47.1 feet below "full" pool. Full pool is defined by the top of the spillway gates at elevation 7519.4 feet. Rarely is the reservoir filled to that level due to safety. For practical purposes; the reservoir is considered full at elevations above 7516.4 feet.

Releases from Crystal are currently set at 1250 cfs. The Gunnison Diversion Tunnel is diverting about 800 cfs, which results in a river flow below the diversion tunnel of approximately 500 cfs. These rates will most likely change as conditions warrant, primarily as we respond to changes at the Whitewater gage as flows prescribed in the Aspinall Unit Operations Record of Decision (ROD). The ROD calls for keeping flows at the Whitewater gage at or above 900 cfs.

The last meeting of the "Aspinall Unit Working Group" was held on Thursday, September 5, 2013 at the Elk Creek Visitors Center at Blue Mesa Reservoir. At this meeting, review of this spring's reservoir operations, and plans for this summer and fall operations were discussed. These meetings are open forum discussions on the Aspinall Unit reservoir operations with many interested groups participating. Anyone needing further information about these meetings should contact Dan Crabtree in the Grand Junction Area Office at (970) 248-0652.

Navajo Reservoir – As a result of increasing flows in the San Juan River Basin, and continued forecasted precipitation, the Bureau of Reclamation decreased the release from Navajo Reservoir from 500 cfs (cubic feet per second) to 350 cfs on Thursday, September 12, at 10:00 a.m. Releases are made for the authorized purposes of the Navajo Unit, and to attempt to maintain a target base flow through the endangered fish critical habitat reach of the San Juan River (Farmington to Lake Powell).

The San Juan River Basin Recovery Implementation Program recommends a target base flow of between 500 cfs and 1,000 cfs through the critical habitat area. The target base flow is calculated as the weekly average of gaged flows throughout the critical habitat area.

Navajo was at 6014.89 ft of pool elevation and 865,126 acre-ft of storage by the end of August, the lowest end-of-August storage since 2003, and the 2nd lowest since 1981. Total observed inflow for the month of August was 53,221 acre-ft, which was 86% of average (modified-unregulated inflow volume of 42,699 acre-ft, or 95% of average). Calculated evaporation for the month was 2,551 acre-ft. The reservoir lost an average of 783 acre-ft per day throughout August, including NIIP diversions and evaporation. The outlet works release ranged from 900 cfs to 500 cfs. NIIP diverted a total of 33,705 acre-ft in the month of August. Modified unregulated inflow for April-July totaled 267,178 which is 36% of average.

As of September 5th, the release at Navajo is 500 cfs, and the observed inflow is 548 cfs. The pool elevation is 6014.23 ft and the content is 859,221 acre-ft, or 51% full (19% of Active). NIIP is diverting at a rate of 627 cfs. The San Juan River at Four Corners USGS gage is at 656 cfs and the Animas River at Farmington USGS gage is at 162 cfs.

The most probable modified-unregulated inflow forecast for September at Navajo is 32,000 acre-ft (76% of average), for October is 30,000 acre-ft (64% of average), and for November is 25,000 acre-ft (75% of average). Modified unregulated inflow is defined as

the predicted hydrologic inflow volume into Navajo plus the change in storage at Vallecito Reservoir and the San-Juan Chama diversion volume.

The next public meeting is scheduled for January 21st, 2014. These meetings are open forum discussions on the operation of Navajo Reservoir with many interested groups participating. Anyone interested in the general operation of the reservoir is encouraged to attend. Please contact Ryan Christianson in Reclamation's Durango, Colorado Office at (970) 385-6590 for information about these meetings or the daily operation of Navajo Reservoir.

Glen Canyon Dam / Lake Powell – **Current Status**

The unregulated inflow volume to Lake Powell in August was 273 thousand acre-feet (kaf) (55% of average). The release volume from Glen Canyon Dam in August was 801 kaf. The end of August elevation and storage of Lake Powell were 3589.6 feet (110 feet from full pool) and 10.79 million acre-feet (maf) (44% of full capacity), respectively. The reservoir elevation peaked in mid-June at 3601.2 ft and is now declining. The elevation will continue to decline through the fall and winter until spring runoff in 2014.

Current Operations

The operating tier for water year 2013 is the Upper Elevation Balancing Tier, as established in August 2012 and pursuant to the Interim Guidelines. Since the April 2013 projected end of water year elevation at Lake Powell was below the 2013 Equalization Elevation of 3,646.0 feet and the projected end of water year elevation at Lake Mead was above elevation 1,075.0 feet, Section 6.B.1 and 6.B.4 of the Interim Guidelines provide for an annual release volume of 8.23 maf from Lake Powell during water year 2013. Reclamation will schedule operations at Glen Canyon Dam to achieve as practicably as possible an 8.23 maf annual release volume by September 30, 2013.

Releases from Glen Canyon Dam in September are currently averaging approximately 10,600 cfs with daily fluctuations between approximately 6,600 cfs at nighttime and approximately 12,600 cfs during the daytime and consistent with the Glen Canyon Operating Criteria (Federal Register, Volume 62, No. 41, March 3, 1997). The scheduled release volume for September 2013 is 600 kaf.

In October, the release volume will likely be about 480 kaf, with daily fluctuations for hydropower between approximately 5,000 cfs in the nighttime and approximately 10,000 cfs in the daytime. The anticipated release volume for November is 500 kaf with fluctuations for power generation throughout the day consistent with the Glen Canyon Operating Criteria (Federal Register, Volume 62, No. 41, March 3, 1997). However, the release volume may be adjusted in November in the event of a high flow experimental release.

In addition to daily scheduled fluctuations for power generation, the instantaneous releases from Glen Canyon Dam may also fluctuate to provide 40 MW of system regulation. These instantaneous release adjustments stabilize the electrical generation

and transmission system and translate to a range of about 1,200 cfs above or below the hourly scheduled release rate. Under system normal conditions, fluctuations for regulation are typically short lived and generally balance out over the hour with minimal or no noticeable impacts on downstream river flow conditions.

Releases from Glen Canyon Dam can also fluctuate beyond scheduled fluctuations for power generation when called upon as a partner that shares reserve requirements within the electrical generator community (i.e. balancing area). Reserves provide system reliability in the event of an unscheduled outage. Glen Canyon Dam typically maintains 43 MW of reserves (approximately 1,200 cfs). Reserve calls can be maintained for a maximum of 2 hours after which time the generation rate should be returned to the original schedule. If reserves from Glen Canyon Dam are called upon, releases from the dam can exceed scheduled levels and can have a noticeable impact on the river downstream from Glen Canyon Dam. Calls for reserves are fairly infrequent and typically are for much less than 43 MW.

Inflow Forecasts and Model Projections

The hydrologic forecast for Lake Powell, issued by the Colorado Basin River Forecast Center, projects that the most probable (median) unregulated inflow volume for water year 2013 will be 4.46 maf (41% of average based on the period 1981-2010). The water year 2013 forecast increased slightly from last month, due to higher than expected inflows in August. Based on the current forecast, the September 24-Month study projects Lake Powell elevation will decline approximately 3 feet through September and end the water year at 3586.4 feet with 10.5 maf in storage (43% capacity). The annual release volume from Lake Powell during water year 2013 is scheduled to be 8.23 maf. Reclamation will schedule operations at Glen Canyon Dam to achieve as practicably as possible an 8.23 maf annual release volume by September 30, 2013.

The hydrologic forecast for water year 2014 for Lake Powell, issued by the Colorado Basin River Forecast Center, projects that the most probable (median) unregulated inflow volume will be 8.41 maf (78% of average based on the period 1981-2010). At this early point in the season, there is significant uncertainty regarding next year's water supply. The forecast ranges from a minimum probable of 5.0 maf (46% of average) to a maximum probable of 15.5 maf (143% of average). There is a 10% chance that inflows could be higher than the maximum probable and a 10% chance they could be lower than the minimum probable.

Consistent with Section 6.C.1 of the Interim Guidelines, the Lake Powell operational tier for water year 2014 is the Mid-Elevation Release Tier with an annual release volume of 7.48 maf. This was determined in the August 2013 24-Month study tier determination run which projected that, with an 8.23 maf annual release pattern in water year 2014, the January 1, 2014, Lake Powell elevation would be below 3,575.0 feet and the Lake Mead elevation would be above 1,025.0 feet. This determination will be documented in the 2014 AOP, which is currently in the final stages of development.

Upper Colorado River Basin Hydrology –

Since 2005 the Upper Colorado River Basin has experienced significant year to year hydrologic variability. During the period 2005 through 2012, the unregulated inflow to Lake Powell, which is a good measure of hydrologic conditions in the Colorado River Basin, averaged a water year volume of 10.22 maf (94% of average (period 1981-2010)). The unregulated inflow has ranged from a low of 4.91 maf (45% of average) in water year 2012 to a high of 15.97 maf (147% of average) in water year 2011. This has been an improvement over the persistent drought conditions of 2000 to 2004, which averaged a water year unregulated inflow of 5.73 maf. However, based on observed inflows and current forecasts, water year 2013 unregulated inflow is expected to be 4.46 maf (41% of average), which would be a second significantly below-average year in a row. If this occurs, the period 2000-2013 would be the driest 14-year period on record with an average annual unregulated inflow of 8.20 maf per year. (For comparison, the standard 1981-2010 period average is 10.83 maf).

At the beginning of water year 2013, total system storage in the Colorado River Basin was 33.9 maf (57 % of capacity), which was an increase of about 4 maf since water year 2005 which began at 29.8 maf (50% of capacity). Since 2005, however, total Colorado Basin storage has experienced year to year increases and decreases in response to wet and dry hydrology. In addition, conditions in both 2012 and 2013 have been significantly drier than average and based on observed inflows and current forecasts, the current projected end of water year 2013 total Colorado Basin reservoir storage is approximately 27.1 maf (45% of capacity).

October 24-Month Study
Date: October 21, 2013

From: Water Resources Group, Salt Lake City
To: All Colorado River Annual Operating Plan (AOP) Recipients

Current Reservoir Status

Reservoir	September Inflow (unregulated) (acre-feet)	Percent of Average (%)	October 20 Midnight Elevation (feet)	Reservoir Storage (acre-feet)
Fontenelle	47,000	102	6491.90	240,000
Flaming Gorge	67,000	122	6015.27	2,816,000
Blue Mesa	57,000	150	7456.56	350,000
Navajo	151,000	350	6023.70	947,000
Powell	857,000	210	3591.08	10,919,000

Expected Operations

The operation of Lake Powell and Lake Mead in this October 2013 24-Month Study is pursuant to the December 2007 Record of Decision on Colorado River Interim Guidelines for Lower Basin Shortages and the Coordinated Operations of Lake Powell and Lake Mead (Interim Guidelines), and reflects the 2013 Annual Operating Plan (AOP) and draft 2014 AOP. Pursuant to the Interim Guidelines, the August 2013 24-Month Study projections of the January 1, 2014, system storage and reservoir water surface elevations set the operational tier for the coordinated operation of Lake Powell and Lake Mead during 2014.

Consistent with Section 6.C.1 of the Interim Guidelines, the Lake Powell operational tier for water year 2014 is the Mid-Elevation Release Tier with an annual release volume of 7.48 maf. This was determined in the August 2013 24-Month study which projected that, with an 8.23 maf annual release pattern in water year 2014, the January 1, 2014, the Lake Powell elevation would be below 3,575.0 feet and the Lake Mead elevation would be above 1,025.0 feet.

Consistent with Section 2.B.5 of the Interim Guidelines, the Intentionally Created Surplus (ICS) Surplus Condition is the criterion governing the operation of Lake Mead for calendar years 2013 and 2014.

The tier determinations will be documented in the 2014 AOP, which is currently in the final stages of development.

The Interim Guidelines are available for download at
http://www.usbr.gov/lc/region/programs/strategies/RecordofDecision.pdf.
The 2013 AOP is available for download at
http://www.usbr.gov/uc/water/rsvrs/ops/aop/AOP13_final.pdf.
The Draft 2014 AOP is available for download at
http://www.usbr.gov/lc/region/g4000/AOP2014/AOP14_draft.pdf.

Fontenelle Reservoir – Inflows to Fontenelle Reservoir for the month of September were 47,000 acre-feet (AF), or 102 percent of average. The reservoir elevation is 6491.23 feet, 65 percent of live capacity. Inflows are averaging 500 cubic feet per second (cfs) and are expected to be close to this value over the next month. The peak reservoir elevation occurred on July 22 at elevation 6492.29 feet. Reservoir releases are currently at 700 cfs and are projected to remain at this level through the winter and next spring.

Inflows for the next three months are projected to be below average: with October, November and December forecasted inflow volumes at 46,000 AF (94% of average), 36,000 AF (86% of average), and 28,000 AF (88% of average), respectively. The observed April through July unregulated inflow volume was 317,000 af or 44 percent of the 1981-2010 thirty-year average.

The next Fontenelle Working Group meeting is scheduled for April 23, 2014, at 10:00 am at the Seedskadee National Wildlife Refuge. The Fontenelle Working Group is an open public forum for information exchange between Reclamation and other parties associated with the operation of Fontenelle Reservoir. The autumn Fontenelle Working Group meeting was held on August 23, 2013 at the Joint Powers Water Board in Green River. Minutes from past meetings are posted on the Working Group webpages.

Flaming Gorge Reservoir – Unregulated inflow into Flaming Gorge Reservoir during the month of September was 67,000 acre-feet (AF), or 122 percent of average. The reservoir elevation is 6015.3 feet and decreasing. Observed inflows are averaging 990 cubic feet per second (cfs).

Forecasts remain below average and Flaming Gorge Dam is in the dry hydrologic classification for the base flow period as outlined in the Record of Decision (ROD). Flaming Gorge releases are currently 1,100 cfs following a single-peak fluctuation pattern and are anticipated to remain at this level through September 30, 2013, whereupon they will decrease to steady releases of approximately 820 cfs. The minimum reservoir elevation is projected to reach 6014 feet by October and remain close to that level through the winter before increasing to a peak elevation next year of approximately 6024 feet.

Inflows for the next three months are projected to be below average: with October, November and December forecasted inflow volumes at 54,000 AF (92% of average), 42,000 AF (82% of average), and 29,000 AF (83% of average), respectively. The observed April through July unregulated inflow volume is 361,000 AF or 37 percent of the 1981-2010 thirty-year average.

The next Flaming Gorge Working Group meeting is scheduled for April 24, 2014, at 11:00 a.m. to be held in the Utah Department of Natural Resources building in Vernal, Utah. The Flaming Gorge Working Group is an open public forum for information exchange between Reclamation and the stake holders of Flaming Gorge Dam. The public is encouraged to attend and comment on the operations and plans presented by Reclamation at these meetings. Meeting notes from past Working Group meetings are posted on the Working Group webpage. For more information on this group and these meetings please contact Ed Vidmar at 801-379-1182.

Aspinall Unit Reservoirs – September unregulated inflow into Blue Mesa Reservoir was 57,000 acre-feet or 150 percent of average. Precipitation during September was observed to be about 195 percent of average, a welcome relief. The current inflow rate into Blue Mesa Reservoir is about 850 cfs and reservoir releases are averaging about 800 cfs. Blue Mesa's present elevation is 7456.46 feet, which corresponds to a storage content of about 350,000 acre-feet. The unregulated reservoir inflow into Blue Mesa Reservoir during water year 2013 was 561,000 acre-feet, or about 59 percent of average.

Releases from Crystal have recently been reduced from 1,000 down to 900 cfs as a result of higher flows at the Whitewater gage allowing for additional water conservation in the Aspinall reservoirs. The diversion tunnel is diverting approximately 600 cfs. Flows in the Gunnison River below the tunnel are about 300 cfs which is the set minimum flow for the canyon. This minimum flow of 300 cfs will most likely continue through the fall and early winter months in order to conserver reservoir storage.

The last meeting of the "Aspinall Unit Working Group" was held on Thursday, September 5, 2013 at the Elk Creek Visitors Center at Blue Mesa Reservoir. At this meeting, review of this spring's reservoir operations, and plans for this summer and fall operations were discussed. These meetings are open forum discussions on the Aspinall Unit reservoir operations with many interested groups participating. Anyone needing further information about these meetings should contact Dan Crabtree in the Grand Junction Area Office at (970) 248-0652.

Navajo Reservoir – As a result of increasing flows in the San Juan River Basin, the Bureau of Reclamation decreased the release from Navajo Reservoir from 350 cfs (cubic feet per second) to 250 cfs on Tuesday, September 24th at 10:00 am. Releases are made for the authorized purposes of the Navajo Unit, and to attempt to maintain a target base flow through the endangered fish critical habitat reach of the San Juan River (Farmington to Lake Powell).

The San Juan River Basin Recovery Implementation Program recommends a target base flow of between 500 cfs and 1,000 cfs through the critical habitat area. The target base flow is calculated as the weekly average of gaged flows throughout the critical habitat area.

Navajo was at 6022.28 feet of pool elevation and 933,199 acre-feet of storage by the end of September, a raise of nearly 7.5 feet in a month. Total observed inflow for the month of September was 110,081 acre-feet, modified-unregulated inflow volume of 151,458 acre-feet, or 351% of average. Calculated evaporation for the month was 1,986 acre-ft. The outlet works release ranged from 650 cfs down to 250 cfs. NIIP diverted a total of 14,782 acre-feet in the month of August. Modified unregulated inflow for April-July totaled 267,178 which is 36% of average. The Modified unregulated inflow for water year 2013 is 543,041 acre-feet, which is 51% of average.

As of October 15th, the release at Navajo is 250 cfs, and the observed inflow is 674 cfs. The pool elevation is 6023.48 feet and the content is 944,618 acre-feet, or 56% full. NIIP is diverting at a rate of 200 cfs. The San Juan River at Four Corners USGS gage is at 777 cfs and the Animas River at Farmington USGS gage is at 696 cfs.

The most probable modified-unregulated inflow forecast for October at Navajo is 65,000 acre-feet (138% of average), for November is 38,000 acre-feet (112% of average), and for December is 25,000 acre-feet (100% of average). Modified unregulated inflow is defined as the predicted hydrologic inflow volume into Navajo plus the change in storage at Vallecito Reservoir and the San-Juan Chama diversion volume.

The next public meeting is scheduled for January 21st, 2014. These meetings are open forum discussions on the operation of Navajo Reservoir with many interested groups participating. Anyone interested in the general operation of the reservoir is encouraged to attend. Please contact Ryan Christianson in Reclamation's Durango, Colorado Office at (970) 385-6590 for information about these meetings or the daily operation of Navajo Reservoir.

Glen Canyon Dam / Lake Powell –

Current Status

The unregulated inflow volume to Lake Powell in September was 857 thousand acre-feet (kaf) (210% of average). The release volume from Glen Canyon Dam in September was 600 kaf. The end of September elevation and storage of Lake Powell were 3591.3 feet (108.7 feet from full pool) and 10.93 million acre-feet (maf) (45% of full capacity), respectively. Due to above average runoff from monsoonal activity in September, Lake Powell elevation increased by about 2 feet over an 11-day period in September. The reservoir elevation is now declining and will continue to decline through the fall and winter until spring runoff in 2014.

The water year 2013 unregulated inflow volume was 5.12 maf (47% of average), placing 2013 as the fourth driest on record since the closure of Glen Canyon Dam in 1963. Water years 2002, 1977, and 2012 were drier, receiving 2.64 maf, 3.53 maf, and 4.91 maf, respectively. In terms of reservoir elevation and storage, Lake Powell reached its peak for water year 2013 on June 18th at 3,601.2 ft (98.8 feet from full pool) which is 35.7 feet lower than last year's peak elevation of 3636.9 ft. The end of water year 2013 elevation and storage of Lake Powell were 3591.3 feet (108.7 feet from full pool) and 10.93maf (45% of capacity), respectively. This is 3.0 maf less than 2012 end of water year storage which was 13.93 maf (57% of capacity).

Releases for Water Year 2013 totaled 8.232 maf. Pursuant to the Interim Guidelines, Lake Powell operated under the Upper Elevation Balancing Tier in 2013. Throughout water year 2013, Reclamation adjusted operations of Glen Canyon Dam to release the appropriate annual volume during 2013 to achieve Upper Elevation Balancing Tier objectives as practicably as possible by September 30, 2012.

Current Operations

The operating tier for water year 2014 is the Mid-Elevation Release Tier with an annual release volume of 7.48 maf, as established in August 2013 and pursuant to the Interim Guidelines, Section 6.C.1. Reclamation will schedule operations at Glen Canyon Dam to achieve as practicably as possible a 7.48 maf annual release volume by September 30, 2014.

Releases from Glen Canyon Dam in October are currently averaging approximately 8,000 cfs with daily fluctuations between approximately 5,000 cfs at nighttime and approximately 10,000 cfs during the daytime and consistent with the Glen Canyon Operating Criteria (Federal Register, Volume 62, No. 41, March 3, 1997). The scheduled release volume for October 2013 is 480 kaf.

The anticipated release volume for November is 500 kaf with fluctuations for power generation throughout the day consistent with the Glen Canyon Operating Criteria (Federal Register, Volume 62, No. 41, March 3, 1997). However, the release volume may be adjusted in the event of a High Flow Experiment. Under the High-Flow Protocol, high flow releases are linked to sediment input and other resource conditions below Glen Canyon Dam. Preliminary analysis appears favorable for a high flow experimental release to occur during the period of November 8 – 18, 2013. During the High Flow Experiment, total releases from Glen Canyon Dam at full bypass may reach approximately 37,200 cfs. The total experiment, including ramping, could last up to about five and a half days. In the event of a high flow experiment, releases from Glen Canyon Dam prior to and after the high flow experiment are anticipated to fluctuate between 5,000cfs and 8,000cfs.

In December, the release volume will likely be about 600 kaf, with fluctuations throughout the day for hydropower generation.

In addition to daily scheduled fluctuations for power generation, the instantaneous releases from Glen Canyon Dam may also fluctuate to provide 40 MW of system

regulation. These instantaneous release adjustments stabilize the electrical generation and transmission system and translate to a range of about 1,200 cfs above or below the hourly scheduled release rate. Under system normal conditions, fluctuations for regulation are typically short lived and generally balance out over the hour with minimal or no noticeable impacts on downstream river flow conditions.
Releases from Glen Canyon Dam can also fluctuate beyond scheduled fluctuations for power generation when called upon as a partner that shares reserve requirements within the electrical generator community (i.e. balancing area). Reserves provide system reliability in the event of an unscheduled outage. Glen Canyon Dam typically maintains 43 MW of reserves (approximately 1,200 cfs). Reserve calls can be maintained for a maximum of 2 hours after which time the generation rate should be returned to the original schedule. If reserves from Glen Canyon Dam are called upon, releases from the dam can exceed scheduled levels and can have a noticeable impact on the river downstream from Glen Canyon Dam. Calls for reserves are fairly infrequent and typically are for much less than 43 MW.

Inflow Forecasts and Model Projections
The hydrologic forecast for water year 2014 for Lake Powell, issued by the Colorado Basin River Forecast Center, projects that the most probable (median) unregulated inflow volume will be 9.65 maf (78% of average based on the period 1981-2010). The water year 2013 forecast increased by 1.24 maf since last month, primarily due to much higher than expected monsoonal precipitation and runoff in September. At this early point in the season, there is significant uncertainty regarding next year's water supply. The forecast ranges from a minimum probable of 6.5 maf (60% of average) to a maximum probable of 16.5 maf (162% of average). There is a 10% chance that inflows could be higher than the maximum probable and a 10% chance they could be lower than the minimum probable.

Based on the current forecast, the October 24-Month study projects Lake Powell elevation will peak near approximately 3,604 ft next summer and end the water year near 3,598 feet with approximately 11.6 maf in storage (48% capacity). Note that projections of elevation and storage have significant uncertainty at this point in the season, primarily due to uncertainty regarding next season's snowpack and resulting inflow to Lake Powell. Under the minimum probable inflow scenario, the projected summer peak is 3,586 ft and end of water year storage is 9.3 maf (38% capacity). Under the maximum probable inflow scenario the projected summer peak is 3,661 ft and end of water year storage is 18.4 maf (76% capacity). There is a 10% chance that inflows will be higher, resulting in higher elevation and storage, and 10% chance that inflows will be lower, resulting in lower elevation and storage. The annual release volume from Lake Powell during water year 2014 is projected to be 7.48 maf under all inflow scenarios.

Consistent with Section 6.C.1 of the Interim Guidelines, the Lake Powell operational tier for water year 2014 is the Mid-Elevation Release Tier with an annual release volume of 7.48 maf. This was determined in the August 2013 24-Month study tier determination run which projected that, with an 8.23 maf annual release pattern in water year 2014, the January 1, 2014, Lake Powell elevation would be below 3,575.0 feet and the Lake Mead

elevation would be above 1,025.0 feet. This determination will be documented in the 2014 AOP, which is currently in the final stages of development.

Upper Colorado River Basin Hydrology

The Upper Colorado River Basin regularly experiences significant year to year hydrologic variability. During the 14-year period 2000 to 2013, however, the unregulated inflow to Lake Powell, which is a good measure of hydrologic conditions in the Colorado River Basin, was above average in only 3 out of the past 14 years. The period 2000-2014 is the lowest 14-year period since the closure of Glen Canyon Dam in 1963, with an average unregulated inflow of 8.25 maf, or 76% of the 30-year average (1981-2010). (For comparison, the 1981-2010 average is 10.83maf.) The unregulated inflow during the 2000-2013 period has ranged from a low of 2.64 maf (24% of average) in water year 2002 to a high of 15.97 maf (147% of average) in water year 2011. One wet year can significantly increase total system reservoir storage, just as persistent dry years can draw down the system storage.

At the beginning of water year 2014, total system storage in the Colorado River Basin was 29.9 maf (50% of 59.6 maf total system capacity). This is about 4 maf less than the total storage at the beginning of water year 2013 which began at 34.0 maf (57% of capacity). Since the beginning of water year 2000, total Colorado Basin storage has experienced year to year increases and decreases in response to wet and dry hydrology, ranging from a high of 94% of capacity at the beginning of 2000 to a low of 50% of capacity at the beginning of water year 2014. Based on current forecasts, the current projected end of water year 2014 total Colorado Basin reservoir storage is approximately 29.6 maf (50% of capacity).

November 24-Month Study
Date: November 14, 2013

From: Water Resources Group, Salt Lake City
To: All Colorado River Annual Operating Plan (AOP) Recipients

Current Reservoir Status

Reservoir	October Inflow (unregulated) (acre-feet)	Percent of Average (%)	November 13 Midnight Elevation (feet)	Reservoir Storage (acre-feet)
Fontenelle	53,000	109	6491.83	239,000
Flaming Gorge	68,000	115	6015.37	2,819,000
Blue Mesa	48,000	126	7457.43	356,000
Navajo	57,000	122	6024.39	953,000
Powell	549,000	107	3589.18	10,746,000

Expected Operations

The operation of Lake Powell and Lake Mead in this November 2013 24-Month Study is pursuant to the December 2007 Record of Decision on Colorado River Interim Guidelines for Lower Basin Shortages and the Coordinated Operations of Lake Powell and Lake Mead (Interim Guidelines), and reflects the 2013 Annual Operating Plan (AOP) and draft 2014 AOP. Pursuant to the Interim Guidelines, the August 2013 24-Month Study projections of the January 1, 2014, system storage and reservoir water surface elevations set the operational tier for the coordinated operation of Lake Powell and Lake Mead during 2014.

Consistent with Section 6.C.1 of the Interim Guidelines, the Lake Powell operational tier for water year 2014 is the Mid-Elevation Release Tier with an annual release volume of 7.48 maf. This was determined in the August 2013 24-Month study which projected that, with an 8.23 maf annual release pattern in water year 2014, the January 1, 2014, the Lake Powell elevation would be below 3,575.0 feet and the Lake Mead elevation would be above 1,025.0 feet.

Consistent with Section 2.B.5 of the Interim Guidelines, the Intentionally Created Surplus (ICS) Surplus Condition is the criterion governing the operation of Lake Mead for calendar years 2013 and 2014.

The tier determinations will be documented in the 2014 AOP, which is currently in the final stages of development.

The Interim Guidelines are available for download at
http://www.usbr.gov/lc/region/programs/strategies/RecordofDecision.pdf.
The 2013 AOP is available for download at
http://www.usbr.gov/uc/water/rsvrs/ops/aop/AOP13_final.pdf.
The Draft 2014 AOP is available for download at
http://www.usbr.gov/lc/region/g4000/AOP2014/AOP14_draft.pdf.

Fontenelle Reservoir – Inflows to Fontenelle Reservoir for the month of October were 53,000 acre-feet (AF), or 109 percent of average. The reservoir elevation is 6491.8 feet, 70 percent of live capacity. Inflows are averaging 800 cubic feet per second (cfs) and are expected to remain steady or decrease over the next month. The fall and winter season continues to be wetter than forecasted and forecasted continue to increase. Fontenelle releases are currently at 990 cfs and are expected to remain at that level for the remainder of the winter, but releases may be revised to respond to significant changes in hydrology. Projected are updated monthly and new projections will be posted.

Inflows for the next three months are projected to be below average: with November, December and January forecasted inflow volumes at 42,000 AF (95% of average), 30,000 AF (94% of average), and 27,000 AF (90% of average), respectively. The observed April through July unregulated inflow volume was 317,000 af or 44 percent of the 1981-2010 thirty-year average.

The next Fontenelle Working Group meeting is scheduled for April 23, 2014, at 10:00 am at the Seedskadee National Wildlife Refuge. The Fontenelle Working Group is an open public forum for information exchange between Reclamation and other parties associated with the operation of Fontenelle Reservoir. The autumn Fontenelle Working Group meeting was held on August 23, 2013 at the Joint Powers Water Board in Green River. Minutes from past meetings are posted on the Working Group webpages.

Flaming Gorge Reservoir – Unregulated inflow into Flaming Gorge Reservoir during the month of October was 68,000 acre-feet (AF), or 115 percent of average. The reservoir elevation is 6015.3 feet and holding steady. Observed inflows are averaging 900 cubic feet per second (cfs).

Flaming Gorge releases are currently 800 cfs steady minimum releases and are anticipated to remain at this level through winter until spring runoff beings sometime in May or June 2014. The reservoir elevation is projected to reach 6015 feet remain close to that level through the winter before increasing to a peak elevation next year of approximately 6026 feet.

Inflows for the next three months are projected to be below average: with November, December and January forecasted inflow volumes at 50,000 AF (98% of average), 33,000 AF (94% of average), and 34,000 AF (85% of average), respectively. The observed April

through July unregulated inflow volume is 361,000 AF or 37 percent of the 1981-2010 thirty-year average.

The next Flaming Gorge Working Group meeting is scheduled for April 24, 2014, at 11:00 a.m. to be held in the Utah Department of Natural Resources building in Vernal, Utah. The Flaming Gorge Working Group is an open public forum for information exchange between Reclamation and the stake holders of Flaming Gorge Dam. The public is encouraged to attend and comment on the operations and plans presented by Reclamation at these meetings. Meeting notes from past Working Group meetings are posted on the Working Group webpage. For more information on this group and these meetings please contact Ed Vidmar at 801-379-1182.

Aspinall Unit Reservoirs – October unregulated inflow into Blue Mesa Reservoir was 48,000 acre-feet or 126 percent of average. Precipitation during October was observed to be about 110 percent of average. The current inflow rate into Blue Mesa Reservoir is about 650 cfs while reservoir releases are averaging about 300 cfs. Blue Mesa's present elevation is 7456.64 feet, which corresponds to a storage content of about 351,000 acre-feet. The unregulated reservoir inflow into Blue Mesa Reservoir during water year 2013 was 560,500 acre-feet, or about 59 percent of average.

Releases from Crystal are currently set at 300 cfs. The Gunnison Diversion Tunnel was shut down for the season on October 30th, with exception of some small 50 to 100 cfs diversions taken bi-weekly for municipal water needs in Montrose, Colorado. River flows below the tunnel are essentially the same as releases from the Dam, with the exception of when the tunnel is taking water to refill Fairfield Reservoir for Montrose municipal water needs.

On November 1, 2013, the National Weather Service's River Forecasting Center issued its forecasted inflow into Blue Mesa for the next 3 months. The unregulated inflow forecast for November, December, and January is for 52,000 acre-feet, which is 95% of average for these months.

The next operation meeting is scheduled for 1:00 p.m., Thursday, January 23rd, 2014 at the Holiday Inn Express in Montrose, Colorado. At this meeting, review of last summer and fall reservoir operations, and plans for this winter and next spring 2014 operations will be discussed. These meetings are open forum discussions on the Aspinall Unit reservoir operations with many interested groups participating. Anyone needing further information about these meetings should contact Dan Crabtree in the Grand Junction Area Office at (970) 248-0652.

Navajo Reservoir – As a result of increasing flows in the San Juan River Basin, Reclamation decreased the release from Navajo Reservoir from 350 cfs (cubic feet per second) to 250 cfs on Tuesday, September 24th. Releases are made for the authorized purposes of the Navajo Unit, and to attempt to maintain a target base flow through the

endangered fish critical habitat reach of the San Juan River (Farmington to Lake Powell).

The San Juan River Basin Recovery Implementation Program recommends a target base flow of between 500 cfs and 1,000 cfs through the critical habitat area. The target base flow is calculated as the weekly average of gaged flows throughout the critical habitat area.

Navajo was at 6024.13 feet of pool elevation and 950,849 acre-feet of storage by the end of October, which was 69% of average for the end of the month. Modified unregulated inflow was 57,475 acre-feet, which was 122% of average for October. Calculated evaporation for the month was 1,307 acre-ft. The reservoir gained an average of 576 acre-feet per day throughout October, including NIIP diversions and evaporation. An average of 250 cfs was maintained from the auxiliary outlet works throughout all of October. NIIP diverted a total of 3,623 acre-ft. Navajo Reservoir recorded 1.05 inches of precipitation (85% of average).

As of November 4th, the release at Navajo is 250 cfs, and the observed inflow is 445 cfs. The reservoir elevation is 6024.24 feet and the content is 951,906 acre-feet, or 56% full (28% of Active). NIIP has ceased diverting for the season as of October 21st. The San Juan River at Four Corners USGS gage is at 756 cfs and the Animas River at Farmington USGS gage is at 432 cfs. The reservoir began storing water as of September 9th and continues to gain storage at present.

The most probable modified-unregulated inflow forecast* for November at Navajo is 34,000 acre-feet (102% of average), for December is 24,000 acre-feet (96% of average), and for January is 21,000 acre-feet (96% of average). Modified unregulated inflow is defined as the predicted hydrologic inflow volume into Navajo plus the change in storage at Vallecito Reservoir and the San-Juan Chama diversion volume.

The Fall Operations Meeting was held on August 27th at the Farmington Civic Center. The next Public Operations meeting is scheduled for January 21st 2014.These meetings are open forum discussions on the operation of Navajo Reservoir with many interested groups participating. Anyone interested in the general operation of the reservoir is encouraged to attend. Please contact Ryan Christianson in Reclamation's Durango, Colorado Office at (970) 385-6590 for information about these meetings or the daily operation of Navajo Reservoir.

Glen Canyon Dam / Lake Powell –

Current Status

The unregulated inflow volume to Lake Powell in October was 549 thousand acre-feet (kaf) (107% of average). The release volume from Glen Canyon Dam in October was 481 kaf. The end of October elevation and storage of Lake Powell were 3590.9 feet (109.1 feet from full pool) and 10.90 million acre-feet (maf) (45% of full capacity),

respectively. The reservoir elevation is now declining and will continue to decline through the fall and winter until spring runoff in 2014.

Current Operations

The operating tier for water year 2014 is the Mid-Elevation Release Tier with an annual release volume of 7.48 maf, as established in August 2013 and pursuant to the Interim Guidelines, Section 6.C.1. Reclamation will schedule operations at Glen Canyon Dam to achieve as practicably as possible a 7.48 maf annual release volume by September 30, 2014.

From November 11-16, 2013, the Department of Interior is conducting a High Flow Experiment (HFE). Under the HFE Protocol, high flow releases are linked to sediment input and other resource conditions below Glen Canyon Dam. During the HFE, total releases from Glen Canyon Dam at full powerplant capacity and bypass may reach approximately 34,100 cfs. Releases will be maintained at peak release for 4 days (96 hours). The total experiment, including ramping, is expected to last just over five days. November releases from Glen Canyon Dam prior to and after the HFE are expected to fluctuate between 5,000cfs and 8,000cfs. The elevation of Lake Powell is expected to decrease approximately 2 ½ feet during the 5 day experiment. The total release volume in November, including the HFE, will be approximately 670 kaf. The annual release volume from Lake Powell remains 7.48 maf and will not change as a result of the HFE. In December, the release volume will likely be about 600 kaf, with fluctuations from about 6,000 cfs in the daytime to about 12,000 cfs in the nighttime and consistent with the Glen Canyon Operating Criteria (Federal Register, Volume 62, No. 41, March 3, 1997). In January, the release volume will likely be about 800 kaf with daily fluctuations for hydropower.

In addition to daily scheduled fluctuations for power generation, the instantaneous releases from Glen Canyon Dam may also fluctuate to provide 40 MW of system regulation. These instantaneous release adjustments stabilize the electrical generation and transmission system and translate to a range of about 1,200 cfs above or below the hourly scheduled release rate. Under system normal conditions, fluctuations for regulation are typically short lived and generally balance out over the hour with minimal or no noticeable impacts on downstream river flow conditions.

Releases from Glen Canyon Dam can also fluctuate beyond scheduled fluctuations for power generation when called upon as a partner that shares reserve requirements within the electrical generator community (i.e. balancing area). Reserves provide system reliability in the event of an unscheduled outage. Glen Canyon Dam typically maintains 41 MW of reserves (approximately 1,200 cfs). Reserve calls can be maintained for a maximum of 2 hours after which time the generation rate should be returned to the original schedule. If reserves from Glen Canyon Dam are called upon, releases from the dam can exceed scheduled levels and can have a noticeable impact on the river downstream from Glen Canyon Dam. Calls for reserves are fairly infrequent and typically are for much less than 41 MW.

Inflow Forecasts and Model Projections

The hydrologic forecast for water year 2014 for Lake Powell, issued by the Colorado Basin River Forecast Center, projects that the most probable (median) unregulated inflow volume will be 9.75 maf (90% of average based on the period 1981-2010). The water year 2014 forecast increased slightly (100 kaf) since last month. At this early point in the season, there is significant uncertainty regarding next year's water supply. The forecast ranges from a minimum probable of 6.5 maf (60% of average) to a maximum probable of 16.5 maf (162% of average). There is a 10 percent chance that inflows could be higher than the maximum probable and a 10 percent chance they could be lower than the minimum probable.

Based on the current forecast, the November 24-Month study projects Lake Powell elevation will peak near approximately 3,605 ft next summer and end the water year near 3,599 feet with approximately 11.68 maf in storage (48% capacity). Note that projections of elevation and storage have significant uncertainty at this point in the season, primarily due to uncertainty regarding next season's snowpack and resulting inflow to Lake Powell. Under the minimum probable inflow scenario, last run in October, the projected summer peak is 3,586 ft and end of water year storage is 9.3 maf (38% capacity). Under the maximum probable inflow scenario, last run in October, the projected summer peak is 3,661 ft and end of water year storage is 18.4 maf (76% capacity). There is a 10 percent chance that inflows will be higher, resulting in higher elevation and storage, and 10 percent chance that inflows will be lower, resulting in lower elevation and storage. The annual release volume from Lake Powell during water year 2014 is projected to be 7.48 maf under all inflow scenarios.

Consistent with Section 6.C.1 of the Interim Guidelines, the Lake Powell operational tier for water year 2014 is the Mid-Elevation Release Tier with an annual release volume of 7.48 maf. This was determined in the August 2013 24-Month study tier determination run which projected that, with an 8.23 maf annual release pattern in water year 2014, the January 1, 2014, Lake Powell elevation would be below 3,575.0 feet and the Lake Mead elevation would be above 1,025.0 feet. This determination will be documented in the 2014 AOP, which is currently in the final stages of development.

Upper Colorado River Basin Hydrology

The Upper Colorado River Basin regularly experiences significant year to year hydrologic variability. During the 14-year period 2000 to 2013, however, the unregulated inflow to Lake Powell, which is a good measure of hydrologic conditions in the Colorado River Basin, was above average in only 3 out of the past 14 years. The period 2000-2014 is the lowest 14-year period since the closure of Glen Canyon Dam in 1963, with an average unregulated inflow of 8.25 maf, or 76% of the 30-year average (1981-2010). (For comparison, the 1981-2010 average is 10.83maf.) The unregulated inflow during the 2000-2013 period has ranged from a low of 2.64 maf (24% of average) in water year 2002 to a high of 15.97 maf (147% of average) in water year 2011. Under the current forecast, water year 2014 inflows to Lake Powell are expected to range between a minimum probable of 6.5 maf (60% of average) and a maximum probable of

16.5 maf (162% of average) with a most probable projection of 9.75 maf (90% of average).

At the beginning of water year 2014, total system storage in the Colorado River Basin was 29.9 maf (50% of 59.6 maf total system capacity). This is about 4 maf less than the total storage at the beginning of water year 2013 which began at 34.0 maf (57% of capacity). Since the beginning of water year 2000, total Colorado Basin storage has experienced year to year increases and decreases in response to wet and dry hydrology, ranging from a high of 94% of capacity at the beginning of 2000 to a low of 50% of capacity at the beginning of water year 2014. One wet year can significantly increase total system reservoir storage, just as persistent dry years can draw down the system storage. Based on current inflow forecasts, the current projected end of water year 2014 total Colorado Basin reservoir storage is approximately 29.6 maf (50% of capacity). The actual end of water year storage may vary significantly from this projection, primarily due to uncertainty regarding next season's snowpack and resulting runoff.

December 24-Month Study
Date: December 11, 2013

From: Water Resources Group, Salt Lake City
To: All Colorado River Annual Operating Plan (AOP) Recipients

Current Reservoir Status

Reservoir	November Inflow (unregulated) (acre-feet)	Percent of Average (%)	December 10 Midnight Elevation (feet)	Reservoir Storage (acre-feet)
Fontenelle	41,000	97	6488.32	216,000
Flaming Gorge	42,000	82	6015.51	2,824,000
Blue Mesa	33,000	106	7459.95	371,000
Navajo	35,000	103	6025.29	962,000
Powell	460,000	97	3586.91	10,543,000

Expected Operations

The operation of Lake Powell and Lake Mead in this December 2013 24-Month Study is pursuant to the December 2007 Record of Decision on Colorado River Interim Guidelines for Lower Basin Shortages and the Coordinated Operations of Lake Powell and Lake Mead (Interim Guidelines), and reflects the 2013 Annual Operating Plan (AOP) and draft 2014 AOP. Pursuant to the Interim Guidelines, the August 2013 24-Month Study projections of the January 1, 2014, system storage and reservoir water surface elevations set the operational tier for the coordinated operation of Lake Powell and Lake Mead during 2014.

Consistent with Section 6.C.1 of the Interim Guidelines, the Lake Powell operational tier for water year 2014 is the Mid-Elevation Release Tier with an annual release volume of 7.48 maf. This was determined in the August 2013 24-Month study which projected that, with an 8.23 maf annual release pattern in water year 2014, the January 1, 2014, the Lake Powell elevation would be below 3,575.0 feet and the Lake Mead elevation would be above 1,025.0 feet.

Consistent with Section 2.B.5 of the Interim Guidelines, the Intentionally Created Surplus (ICS) Surplus Condition is the criterion governing the operation of Lake Mead for calendar years 2013 and 2014.

The tier determinations will be documented in the 2014 AOP, which is currently in the final stages of development.

The Interim Guidelines are available for download at http://www.usbr.gov/lc/region/programs/strategies/RecordofDecision.pdf.
The 2013 AOP is available for download at http://www.usbr.gov/uc/water/rsvrs/ops/aop/AOP13_final.pdf.
The Draft 2014 AOP is available for download at http://www.usbr.gov/lc/region/g4000/AOP2014/AOP14_draft.pdf.

Fontenelle Reservoir – Inflows to Fontenelle Reservoir for the month of November were 41,000 acre-feet (AF), or 97 percent of average. The reservoir elevation is 6488.70 feet, 63 percent of live capacity. Inflows are averaging 350 cubic feet per second (cfs) and are expected to remain steady or decrease over the next month. Fontenelle releases are currently at 990 cfs and are expected to remain at that level for the remainder of the winter, but releases may be revised to respond to significant changes in hydrology. Projected are updated monthly and new projections will be posted.

Inflows for the next three months are projected to be below average: with December, January and February forecasted inflow volumes at 30,000 AF (94% of average), 27,000 AF (89% of average), and 25,000 AF (90% of average), respectively.

The next Fontenelle Working Group meeting is scheduled for April 23, 2014, at 10:00 am at the Seedskadee National Wildlife Refuge. The Fontenelle Working Group is an open public forum for information exchange between Reclamation and other parties associated with the operation of Fontenelle Reservoir. The autumn Fontenelle Working Group meeting was held on August 23, 2013 at the Joint Powers Water Board in Green River. Minutes from past meetings are posted on the Working Group webpages.

Flaming Gorge Reservoir – Unregulated inflow into Flaming Gorge Reservoir during the month of November was 42,000 acre-feet (AF), or 82 percent of average. The reservoir elevation is 6015.5 feet and holding steady. Observed inflows are averaging 900 cubic feet per second (cfs).

Flaming Gorge releases are currently 800 cfs steady minimum releases and are anticipated to remain at this level through winter until spring runoff beings sometime in May or June 2014. The reservoir elevation is projected to reach 6015 feet remain close to that level through the winter before increasing to a peak elevation next year of approximately 6026 feet.

Inflows for the next three months are projected to be below average: with December, January and February forecasted inflow volumes at 30,000 AF (86% of average), 32,000 AF (79% of average), and 35,000 AF (79% of average), respectively.

The next Flaming Gorge Working Group meeting is scheduled for April 24, 2014, at 11:00 a.m. to be held in the Utah Department of Natural Resources building in Vernal, Utah. The Flaming Gorge Working Group is an open public forum for information

exchange between Reclamation and the stake holders of Flaming Gorge Dam. The public is encouraged to attend and comment on the operations and plans presented by Reclamation at these meetings. Meeting notes from past Working Group meetings are posted on the Working Group webpage. For more information on this group and these meetings please contact Ed Vidmar at 801-379-1182.

Aspinall Unit Reservoirs – November unregulated inflow into Blue Mesa Reservoir was 33,000 acre-feet or 106 percent of average. Precipitation during November was observed to be about 95 percent of average. The current inflow rate into Blue Mesa Reservoir is about 500 cfs while reservoir releases are averaging about 300 cfs. Blue Mesa's present elevation is 7459.77 feet, which corresponds to a storage content of about 370,000 acre-feet. The unregulated reservoir inflow into Blue Mesa Reservoir during water year 2013 was 560,500 acre-feet, or about 59 percent of average.

Releases from Crystal are currently set at 300 cfs. The Gunnison Diversion Tunnel was shut down for the season on October 30th, with exception of some small 50 to 100 cfs diversions taken bi-weekly for municipal water needs in Montrose, Colorado. River flows below the tunnel are essentially the same as releases from the Dam, with the exception of when the tunnel is taking water to refill Fairfield Reservoir for Montrose municipal water needs.

On December 1, 2013, the National Weather Service's River Forecasting Center issued its forecasted inflow into Blue Mesa for the next 3 months. The unregulated inflow forecast for December, January, and February is for 68,000 acre-feet, which is 94% of average for these months.

The next meeting of the "Aspinall Unit Working Group" will be held on Thursday January 23rd in the Montrose, Colorado, starting at 1:00 PM. At this meeting, review of last summer and fall reservoir operations, and plans for this winter and next spring 2014 operations will be discussed. These meetings are open forum discussions on the Aspinall Unit reservoir operations with many interested groups participating. Anyone needing further information about these meetings should contact Dan Crabtree in the Grand Junction Area Office at (970) 248-0652.

Navajo Reservoir – Reclamation has been releasing 250 cfs from Navajo Reservoir since September 24th, 2013. Releases are made for the authorized purposes of the Navajo Unit, and to attempt to maintain a target base flow through the endangered fish critical habitat reach of the San Juan River (Farmington to Lake Powell). The San Juan River Basin Recovery Implementation Program recommends a target base flow of between 500 cfs and 1,000 cfs through the critical habitat area. The target base flow is calculated as the weekly average of gaged flows throughout the critical habitat area.

Navajo was at 6025.11 ft of pool elevation and 960,302 acre-ft of storage by the end of November, which was 70% of average for the end of the month. Modified unregulated

inflow was 34,974 acre-ft, which was 107% of average for November. Calculated evaporation for the month was 690 acre-ft. The reservoir gained an an average of 315 acre-ft per day throughout November, including NIIP diversions and evaporation. An average of 250 cfs was maintained from the auxiliary outlet works throughout all of November. Navajo Reservoir recorded 0.78 inches of liquid precipitation (70% of average).

As of December 2nd, the release at Navajo is 250 cfs, and the observed inflow is 503 cfs. The reservoir elevation is 6025.18 ft and the content is 960,980 acre-ft, or 56% full (29% of Active). NIIP has ended diverting for the season as of October 21st. The San Juan River at Four Corners USGS gage is at 673 cfs and the Animas River at Farmington USGS gage is at 381 cfs. See the Navajo Notices webpage for up-to-date release information and notices. The reservoir began storing water as of September 9th and continues to gain storage at present. SNOTEL sites above Navajo are showing 6.0 inches of snow water equivalent (SWE), which is 126% of average (1987-present).

The most probable modified-unregulated inflow forecast for December at Navajo is 26,000 acre-ft (104% of average), for January is 23,000 acre-ft (106% of average), and for February is 29,000 acre-ft (96% of average). Modified-unregulated inflow is defined as the predicted hydrologic inflow volume into Navajo adjusted for the change in storage at Vallecito Reservoir and the San-Juan Chama diversion volume.

The Fall Operations Meeting was held on August 27th at the Farmington Civic Center. The next Public Operations meeting is scheduled for January 21st 2014.These meetings are open forum discussions on the operation of Navajo Reservoir with many interested groups participating. Anyone interested in the general operation of the reservoir is encouraged to attend. Please contact Ryan Christianson in Reclamation's Durango, Colorado Office at (970) 385-6590 for information about these meetings or the daily operation of Navajo Reservoir.

Glen Canyon Dam / Lake Powell –

Current Status

The unregulated inflow volume to Lake Powell in November was 460 thousand acre-feet (kaf) (97% of average). The release volume from Glen Canyon Dam in November was 680 kaf. On November 11-16 a high flow experimental release was conducted from Glen Canyon Dam in accordance with the High Flow Protocol. Reclamation released the maximum available capacity (35,000 cfs) during the 5-day experiment. The end of November elevation and storage of Lake Powell were 3587.9 feet (112.1 feet from full pool) and 10.63 million acre-feet (maf) (44% of full capacity), respectively. The annual release volume from Lake Powell remains 7.48 maf and will not change as a result of the HFE. The reservoir elevation is now declining and will continue to decline through the fall and winter until spring runoff in 2014.

Current Operations
The operating tier for water year 2014 is the Mid-Elevation Release Tier with an annual release volume of 7.48 maf, as established in August 2013 and pursuant to the Interim Guidelines, Section 6.C.1. Reclamation will schedule operations at Glen Canyon Dam to achieve as practicably as possible a 7.48 maf annual release volume by September 30, 2014.

In December, the release volume will likely be about 600 kaf, with fluctuations from about 6,000 cfs in the daytime to about 12,000 cfs in the nighttime and consistent with the Glen Canyon Operating Criteria (Federal Register, Volume 62, No. 41, March 3, 1997). In January, the release volume will likely be about 800 kaf with daily fluctuations for hydropower.

In addition to daily scheduled fluctuations for power generation, the instantaneous releases from Glen Canyon Dam may also fluctuate to provide 40 MW of system regulation. These instantaneous release adjustments stabilize the electrical generation and transmission system and translate to a range of about 1,200 cfs above or below the hourly scheduled release rate. Under system normal conditions, fluctuations for regulation are typically short lived and generally balance out over the hour with minimal or no noticeable impacts on downstream river flow conditions.
Releases from Glen Canyon Dam can also fluctuate beyond scheduled fluctuations for power generation when called upon as a partner that shares reserve requirements within the electrical generator community (i.e. balancing area). Reserves provide system reliability in the event of an unscheduled outage. Glen Canyon Dam typically maintains 41 MW of reserves (approximately 1,200 cfs). Reserve calls can be maintained for a maximum of 2 hours after which time the generation rate should be returned to the original schedule. If reserves from Glen Canyon Dam are called upon, releases from the dam can exceed scheduled levels and can have a noticeable impact on the river downstream from Glen Canyon Dam. Calls for reserves are fairly infrequent and typically are for much less than 41 MW.

Inflow Forecasts and Model Projections
The hydrologic forecast for water year 2014 for Lake Powell, issued by the Colorado Basin River Forecast Center, projects that the most probable (median) unregulated inflow volume will be 10.21 maf (94% of average based on the period 1981-2010). The water year 2014 forecast increased by 560 kaf since last month. At this early point in the season, there is still significant uncertainty regarding next year's water supply. The forecast ranges from a minimum probable of 6.5 maf (60% of average) to a maximum probable of 16.5 maf (162% of average). There is a 10 percent chance that inflows could be higher than the maximum probable and a 10 percent chance they could be lower than the minimum probable.

Based on the current forecast, the December 24-Month study projects Lake Powell elevation will peak near approximately 3,608 ft next summer and end the water year near 3,603 feet with approximately 12.08 maf in storage (50% capacity). Note that projections of elevation and storage have significant uncertainty at this point in the season, primarily

due to uncertainty regarding the upcoming winter's total snowfall and the resulting inflow to Lake Powell. Under the minimum probable inflow scenario, last run in October, the projected summer peak is 3,586 ft and end of water year storage is 9.3 maf (38% capacity). Under the maximum probable inflow scenario, last run in October, the projected summer peak is 3,661 ft and end of water year storage is 18.4 maf (76% capacity). There is a 10 percent chance that inflows will be higher, resulting in higher elevation and storage, and 10 percent chance that inflows will be lower, resulting in lower elevation and storage. The minimum and maximum probable model runs will be updated in January. The annual release volume from Lake Powell during water year 2014 is projected to be 7.48 maf under all inflow scenarios.

Consistent with Section 6.C.1 of the Interim Guidelines, the Lake Powell operational tier for water year 2014 is the Mid-Elevation Release Tier with an annual release volume of 7.48 maf. This was determined in the August 2013 24-Month study tier determination run which projected that, with an 8.23 maf annual release pattern in water year 2014, the January 1, 2014, Lake Powell elevation would be below 3,575.0 feet and the Lake Mead elevation would be above 1,025.0 feet. This determination will be documented in the 2014 AOP, which is currently in the final stages of development.

Upper Colorado River Basin Hydrology –
The Upper Colorado River Basin regularly experiences significant year to year hydrologic variability. During the 14-year period 2000 to 2013, however, the unregulated inflow to Lake Powell, which is a good measure of hydrologic conditions in the Colorado River Basin, was above average in only 3 out of the past 14 years. The period 2000-2014 is the lowest 14-year period since the closure of Glen Canyon Dam in 1963, with an average unregulated inflow of 8.25 maf, or 76% of the 30-year average (1981-2010). (For comparison, the 1981-2010 average is 10.83maf.) The unregulated inflow during the 2000-2013 period has ranged from a low of 2.64 maf (24% of average) in water year 2002 to a high of 15.97 maf (147% of average) in water year 2011. Under the current forecast, water year 2014 inflows to Lake Powell are expected to range between a minimum probable of 6.5 maf (60% of average) and a maximum probable of 16.5 maf (162% of average) with a most probable projection of 10.21 maf (94% of average).

At the beginning of water year 2014, total system storage in the Colorado River Basin was 29.9 maf (50% of 59.6 maf total system capacity). This is about 4 maf less than the total storage at the beginning of water year 2013 which began at 34.0 maf (57% of capacity). Since the beginning of water year 2000, total Colorado Basin storage has experienced year to year increases and decreases in response to wet and dry hydrology, ranging from a high of 94% of capacity at the beginning of 2000 to a low of 50% of capacity at the beginning of water year 2014. One wet year can significantly increase total system reservoir storage, just as persistent dry years can draw down the system storage. Based on current inflow forecasts, the current projected end of water year 2014 total Colorado Basin reservoir storage is approximately 31.1 maf (51% of capacity). The actual end of water year storage may vary significantly from this projection, primarily due to uncertainty regarding next season's snowpack and resulting runoff.

Processed On: 12/9/2013 12:10:19PM

January 24-Month Study
Date: January 13, 2014

From: Water Resources Group, Salt Lake City
To: All Colorado River Annual Operating Plan (AOP) Recipients

Current Reservoir Status

Reservoir	December Inflow (unregulated) (acre-feet)	Percent of Average (%)	January 12 Midnight Elevation (feet)	Reservoir Storage (acre-feet)
Fontenelle	30,000	94	6482.91	183,000
Flaming Gorge	32,000	91	6015.89	2,837,000
Blue Mesa	25,000	98	7462.14	385,000
Navajo	25,000	100	6025.54	964,000
Powell	294,000	81	3582.15	10,125,000

Expected Operations

The operation of Lake Powell and Lake Mead in this January 2014 24-Month Study is pursuant to the December 2007 Record of Decision on Colorado River Interim Guidelines for Lower Basin Shortages and the Coordinated Operations of Lake Powell and Lake Mead (Interim Guidelines), and reflects the 2014 Annual Operating Plan (AOP). Pursuant to the Interim Guidelines, the August 2013 24-Month Study projections of the January 1, 2014, system storage and reservoir water surface elevations set the operational tier for the coordinated operation of Lake Powell and Lake Mead during 2014.

Consistent with Section 6.C.1 of the Interim Guidelines, the Lake Powell operational tier for water year 2014 is the Mid-Elevation Release Tier with an annual release volume of 7.48 maf. .

Consistent with Section 2.B.5 of the Interim Guidelines, the Intentionally Created Surplus (ICS) Surplus Condition is the criterion governing the operation of Lake Mead for calendar year 2014.

The Interim Guidelines are available for download at
http://www.usbr.gov/lc/region/programs/strategies/RecordofDecision.pdf.
The 2014 AOP is available for download at
http://www.usbr.gov/lc/region/g4000/aop/AOP14.pdf.

Fontenelle Reservoir – Inflows to Fontenelle Reservoir for the month of December were 30,000 acre-feet (AF), or 94 percent of average. The reservoir elevation is 6483.64 feet, 54 percent of live capacity. Inflows are averaging 400 cubic feet per second (cfs). Fontenelle releases are currently at 990 cfs and are expected to remain at that level for the remainder of the winter.

Inflows for the next three months are projected to be below average: with January, February and March forecasted inflow volumes at 27,000 AF (89% of average), 25,000 AF (90% of average), and 44,000 AF (84% of average), respectively.

The next Fontenelle Working Group meeting is scheduled for April 23, 2014, at 10:00 am at the Seedskadee National Wildlife Refuge. The Fontenelle Working Group is an open public forum for information exchange between Reclamation and other parties associated with the operation of Fontenelle Reservoir.

Flaming Gorge Reservoir – Unregulated inflow into Flaming Gorge Reservoir during the month of December was 32,000 acre-feet (AF), or 91 percent of average. The reservoir elevation is 6015 feet. Observed inflows are averaging 300 cubic feet per second (cfs).

Flaming Gorge releases are currently 800 cfs steady minimum releases and are anticipated to remain at this level through winter until spring runoff beings sometime in May or June 2014. The reservoir elevation is projected to reach 6015 feet remain close to that level through the winter before increasing to a peak elevation next year of approximately 6021 feet.

Inflows for the next three months are projected to be below average: with January, February and March forecasted inflow volumes at 34,000 AF (84% of average), 36,000 AF (81% of average), and 8835,000 AF (86% of average), respectively.

The next Flaming Gorge Working Group meeting is scheduled for April 24, 2014, at 11:00 a.m. to be held in the Utah Department of Natural Resources building in Vernal, Utah. The Flaming Gorge Working Group is an open public forum for information exchange between Reclamation and the stake holders of Flaming Gorge Dam. The public is encouraged to attend and comment on the operations and plans presented by Reclamation at these meetings. Meeting notes from past Working Group meetings are posted on the Working Group webpage. For more information on this group and these meetings please contact Ed Vidmar at 801-379-1182.

Aspinall Unit Reservoirs – December unregulated inflow into Blue Mesa Reservoir was 25,000 acre-feet or 98 percent of average. Precipitation during December was observed to be about 85 percent of average. The Gunnison River basin snowpack as of January 9th was averaging about 101 percent. The current inflow rate into Blue Mesa Reservoir is about 350 cfs while reservoir releases are averaging about 225 cfs. The present reservoir elevation is 7461.9 feet, which corresponds to a storage content of about 383,000 acre-feet.

Releases from Crystal Dam have been kept at just about minimum flow of 315 cfs since the end of irrigation season because of drought conditions. Reservoir releases will most likely remain at these levels since Blue Mesa Reservoir content is extremely low.

The first Water Supply Forecast for Water Year 2014 has been issued and the April through July unregulated inflow is forecasted to be at 660,000 acre-feet (98% of average). Based on this forecast, Blue Mesa Reservoir is not projected to fill by the end of this 2014 runoff season.

The next meeting of the "Aspinall Unit Working Group" will be held on Thursday January 23rd in the Montrose, Colorado, starting at 1:00 PM. At this meeting, review of last summer and fall reservoir operations, and plans for this winter and next spring 2014 operations will be discussed. These meetings are open forum discussions on the Aspinall Unit reservoir operations with many interested groups participating. Anyone needing further information about these meetings should contact Erik Knight in the Grand Junction Area Office at (970) 248-0629.

Navajo Reservoir – Reclamation has been releasing 250 cfs from Navajo Reservoir since September 24th, 2013. Releases are made for the authorized purposes of the Navajo Unit, and to attempt to maintain a target base flow through the endangered fish critical habitat reach of the San Juan River (Farmington to Lake Powell). The San Juan River Basin Recovery Implementation Program recommends a target base flow of between 500 cfs and 1,000 cfs through the critical habitat area. The target base flow is calculated as the weekly average of gaged flows throughout the critical habitat area.

Navajo was at 6025.59 ft of pool elevation and 964,959 acre-ft of storage by the end of December, which was 72% of average for the end of the month. Modified unregulated inflow was 24,984 acre-ft, which was 100% of average for December. Calculated evaporation for the month was 482 acre-ft. An average release of 250 cfs was maintained from the auxiliary outlet works throughout all of December. Navajo Reservoir recorded 0.38 inches of liquid precipitation (36% of average).

As of January 6th, the release at Navajo is 250 cfs, and the observed inflow is 306 cfs. The reservoir elevation is 6025.6 ft and the content is 965,056 acre-ft, or 57% full (29% of Active). The San Juan River at Four Corners USGS gage is at 598 cfs and the Animas River at Farmington USGS gage is at 272 cfs. SNOTEL sites above Navajo are showing 7.8 inches of snow water equivalent (SWE), which is 87% of average (1987-present).

The most probable modified-unregulated inflow forecast for January at Navajo is 26,000 acre-ft (106% of average), for February is 26,000 acre-ft (86% of average), and for March is 85,000 acre-ft (91% of average). The April-July total inflow forecasts are as follows: Min Probable: 480,000 acre-ft (65% of average), Most Probable: 690,000 acre-ft (93% of average), Max Probable: 990,000 acre-ft (133% of average). Modified unregulated inflow is defined as the predicted hydrologic inflow volume into Navajo plus the change in storage at Vallecito Reservoir and the San-Juan Chama diversion volume.

The next coordination meeting for the operation of the Navajo Unit will be on Tuesday, January 21, 2014, from 1:00-3:00 p.m. It will be held at the Farmington Civic Center, 200 West Arrington, in Farmington, New Mexico. These meetings are open forum discussions on the operation of Navajo Reservoir with many interested groups participating. Anyone interested in the general operation of the reservoir is encouraged to attend. Please contact Ryan Christianson in Reclamation's Durango, Colorado Office at (970) 385-6590 for information about these meetings or the daily operation of Navajo Reservoir.

Glen Canyon Dam / Lake Powell –

Current Status

The unregulated inflow volume to Lake Powell in December was 294 thousand acre-feet (kaf) (81% of average). The release volume from Glen Canyon Dam in December was 601 kaf. The end of December elevation and storage of Lake Powell were 3584.4 feet (115.6 feet from full pool) and 10.16 million acre-feet (maf) (42% of full capacity), respectively. The reservoir elevation is now declining and will continue to decline through the winter until spring runoff. Snowpack is currently about 96% of median for this time of year.

Current Operations

The operating tier for water year 2014 is the Mid-Elevation Release Tier with an annual release volume of 7.48 maf, as established in August 2013 and pursuant to the Interim Guidelines, Section 6.C.1. Reclamation will schedule operations at Glen Canyon Dam to achieve as practicably as possible a 7.48 maf annual release volume by September 30, 2014.

In January, the release volume will likely be about 800 kaf, with fluctuations from about 8,500 cfs in the nighttime to about 16,500 cfs in the daytime and consistent with the Glen Canyon Operating Criteria (Federal Register, Volume 62, No. 41, March 3, 1997). In February, the release volume will likely be about 600 kaf with daily fluctuations for hydropower.

In addition to daily scheduled fluctuations for power generation, the instantaneous releases from Glen Canyon Dam may also fluctuate to provide 40 MW of system regulation. These instantaneous release adjustments stabilize the electrical generation

and transmission system and translate to a range of about 1,200 cfs above or below the hourly scheduled release rate. Under system normal conditions, fluctuations for regulation are typically short lived and generally balance out over the hour with minimal or no noticeable impacts on downstream river flow conditions.

Releases from Glen Canyon Dam can also fluctuate beyond scheduled fluctuations for power generation when called upon as a partner that shares reserve requirements within the electrical generator community (i.e. balancing area). Reserves provide system reliability in the event of an unscheduled outage. Glen Canyon Dam typically maintains 41 MW of reserves (approximately 1,200 cfs). Reserve calls can be maintained for a maximum of 2 hours after which time the generation rate should be returned to the original schedule. If reserves from Glen Canyon Dam are called upon, releases from the dam can exceed scheduled levels and can have a noticeable impact on the river downstream from Glen Canyon Dam. Calls for reserves are fairly infrequent and typically are for much less than 41 MW.

Inflow Forecasts and Model Projections

The forecast for the 2014 April to July water supply season for Lake Powell, issued by the Colorado Basin River Forecast Center, projects that the most probable (median) unregulated inflow volume will be 6.81 maf (95% of average based on the period 1981-2010). The water year 2014 forecast increased by 560 kaf since last month. The winter snow accumulation season has started off near average (currently 96% of median), however, at this early point in the season, there is still significant uncertainty regarding the final snowpack and resulting runoff. The April-July forecast ranges from a minimum probable of 4.0 maf (56% of average) to a maximum probable of 10.2 maf (142% of average). (For reference, the 30-year April-July average is 7.16 maf.) There is a 10 percent chance that inflows could be higher than the maximum probable and a 10 percent chance they could be lower than the minimum probable.

Based on the current forecast, the January 24-Month study projects Lake Powell elevation will peak near approximately 3,608 ft next summer and end the water year near 3,603 feet with approximately 12.04 maf in storage (50% capacity). Note that projections of elevation and storage have significant uncertainty at this point in the season, primarily due to uncertainty regarding the season's total snowpack and the resulting inflow to Lake Powell. Under the minimum probable inflow scenario, updated in January, the projected summer peak is 3,592 ft and end of water year storage is 9.7 maf (40% capacity). Under the maximum probable inflow scenario, updated in January, the projected summer peak is 3,631 ft and end of water year storage is 15.0 maf (62% capacity). There is a 10 percent chance that inflows will be higher, resulting in higher elevation and storage, and 10 percent chance that inflows will be lower, resulting in lower elevation and storage. The minimum and maximum probable model runs will be updated again in April. The annual release volume from Lake Powell during water year 2014 is projected to be 7.48 maf under all inflow scenarios.

Consistent with Section 6.C.1 of the Interim Guidelines, the Lake Powell operational tier for water year 2014 is the Mid-Elevation Release Tier with an annual release volume of

7.48 maf. This was determined in the August 2013 24-Month study tier determination run and documented in the 2014 Annual Operating Plan signed by Secretary Jewell in December 2013.

Upper Colorado River Basin Hydrology

The Upper Colorado River Basin regularly experiences significant year to year hydrologic variability. During the 14-year period 2000 to 2013, however, the unregulated inflow to Lake Powell, which is a good measure of hydrologic conditions in the Colorado River Basin, was above average in only 3 out of the past 14 years. The period 2000-2014 is the lowest 14-year period since the closure of Glen Canyon Dam in 1963, with an average unregulated inflow of 8.25 maf, or 76% of the 30-year average (1981-2010). (For comparison, the 1981-2010 total water year average is 10.83maf.) The unregulated inflow during the 2000-2013 period has ranged from a low of 2.64 maf (24% of average) in water year 2002 to a high of 15.97 maf (147% of average) in water year 2011. Under the current forecast, total water year 2014 inflows to Lake Powell are expected to range between a minimum probable of 6.9 maf (64% of average) and a maximum probable of 14.1 maf (130% of average) with a most probable projection of 10.09 maf (93% of average).

At the beginning of water year 2014, total system storage in the Colorado River Basin was 29.9 maf (50% of 59.6 maf total system capacity). This is about 4 maf less than the total storage at the beginning of water year 2013 which began at 34.0 maf (57% of capacity). Since the beginning of water year 2000, total Colorado Basin storage has experienced year to year increases and decreases in response to wet and dry hydrology, ranging from a high of 94% of capacity at the beginning of 2000 to a low of 50% of capacity at the beginning of water year 2014. One wet year can significantly increase total system reservoir storage, just as persistent dry years can draw down the system storage. Based on current inflow forecasts, the current projected end of water year 2014 total Colorado Basin reservoir storage is approximately 29.9 maf (50% of capacity). The actual end of water year storage may vary significantly from this projection, primarily due to uncertainty regarding next season's snowpack and resulting runoff. Based on January minimum and maximum probable inflow forecasts and modeling the range is approximately 26.9 maf (45%) to 33.6 maf (56%), respectively

Model Run ID: 2161

Processed On: 1/9/2014 4:30:58PM

February 24-Month Study
Date: February 14, 2014

From: Water Resources Group, Salt Lake City
To: All Colorado River Annual Operating Plan (AOP) Recipients

Current Reservoir Status

Reservoir	January Inflow (unregulated) (acre-feet)	Percent of Average (%)	February 12 Midnight Elevation (feet)	Reservoir Storage (acre-feet)
Fontenelle	29,000	96	6476.95	150,000
Flaming Gorge	33,000	82	6016.31	2,851,000
Blue Mesa	22,000	92	7463.38	392,000
Navajo	19,000	88	6025.31	962,000
Powell	270,000	75	3577.37	9,716,000

Expected Operations

The operation of Lake Powell and Lake Mead in this February 2014 24-Month Study is pursuant to the December 2007 Record of Decision on Colorado River Interim Guidelines for Lower Basin Shortages and the Coordinated Operations of Lake Powell and Lake Mead (Interim Guidelines), and reflects the 2014 Annual Operating Plan (AOP). Pursuant to the Interim Guidelines, the August 2013 24-Month Study projections of the January 1, 2014, system storage and reservoir water surface elevations set the operational tier for the coordinated operation of Lake Powell and Lake Mead during 2014.

Consistent with Section 6.C.1 of the Interim Guidelines, the Lake Powell operational tier for water year 2014 is the Mid-Elevation Release Tier with an annual release volume of 7.48 maf.

Consistent with Section 2.B.5 of the Interim Guidelines, the Intentionally Created Surplus (ICS) Surplus Condition is the criterion governing the operation of Lake Mead for calendar year 2014.

The Interim Guidelines are available for download at
http://www.usbr.gov/lc/region/programs/strategies/RecordofDecision.pdf.
The 2014 AOP is available for download at
http://www.usbr.gov/lc/region/g4000/aop/AOP14.pdf.

Fontenelle Reservoir – Inflows to Fontenelle Reservoir for the month of January were 29,000 acre-feet (AF), or 96 percent of average. The reservoir elevation is 6476.73 feet, 44 percent of live capacity. Inflows are averaging 460 cubic feet per second (cfs). Fontenelle releases are currently at 990 cfs and are expected to remain at that level for the remainder of the winter.

Inflows for the next three months are projected to be below average: with February, March and April forecasted inflow volumes at 25,000 AF (90% of average), 42,000 AF (80% of average), and 72,000 AF (84% of average), respectively. The February final forecast of the April-July inflow volume is 655,000 AF (90% of average).

The next Fontenelle Working Group meeting is scheduled for April 23, 2014, at 10:00 am at the Seedskadee National Wildlife Refuge. The Fontenelle Working Group is an open public forum for information exchange between Reclamation and other parties associated with the operation of Fontenelle Reservoir.

Flaming Gorge Reservoir – Unregulated inflow into Flaming Gorge Reservoir during the month of January was 33,000 acre-feet (AF), or 82 percent of average. The reservoir elevation is 6016 feet. Observed inflows are averaging 1,100 cubic feet per second (cfs).

Flaming Gorge releases are currently 800 cfs steady minimum releases and are anticipated to remain at this level through winter until spring runoff beings sometime in May or June 2014. The reservoir elevation is projected to reach 6016 feet or remain close to that level through the winter before increasing to a peak elevation next year of approximately 6023 feet.

Inflows for the next three months are projected to be below average: with February, March and April forecasted inflow volumes at 36,000 AF (81% of average), 84,000 AF (82% of average), and 115,000 AF (86% of average), respectively. The February final forecast of the April-July unregulated inflow volume into Flaming Gorge Reservoir is 815,000 AF (83% of average).

The next Flaming Gorge Working Group meeting is scheduled for April 24, 2014, at 11:00 a.m. to be held in the Utah Department of Natural Resources building in Vernal, Utah. The Flaming Gorge Working Group is an open public forum for information exchange between Reclamation and the stake holders of Flaming Gorge Dam. The public is encouraged to attend and comment on the operations and plans presented by Reclamation at these meetings. Meeting notes from past Working Group meetings are posted on the Working Group webpage. For more information on this group and these meetings please contact Ed Vidmar at 801-379-1182.

Aspinall Unit Reservoirs – January unregulated inflow into Blue Mesa Reservoir was 22,000 acre-feet or 92 percent of average. On February 11th the basin snowpack was averaging 118 percent, which has increased about 14 percent from a month ago. Precipitation during January was about 110 percent of average, while December's

precipitation was recorded at 90 percent of average. The current inflow rate into Blue Mesa Reservoir is about 450 cfs while reservoir releases are averaging about 250 cfs. This past fall and early winter months has seen about average reservoir inflows. Blue Mesa Reservoir current elevation is 7463.32 feet, which corresponds to a storage content of about 392,000 acre-feet. This elevation is about 10.0 feet higher than the elevation was from a year ago.

The Colorado Basin River Forecast Center's February water supply forecast for Blue Mesa for the April to July runoff season is 755,000 acre-feet (112% of average) which is 95,000 acre-feet higher from last month's forecast. Based on this forecast, Blue Mesa Reservoir is projected to fill this runoff season.

Releases from Crystal Dam have been kept at just about minimum flow of 320 cfs since the end of irrigation season because of drought conditions. Reservoir releases will most likely remain at these levels for a while longer, but may increase if the favorable hydrologic conditions persist.

The last meeting of the "Aspinall Unit Working Group" was held on January 23, 2014 in Montrose, Colorado. At this meeting, review of last summer and fall reservoir operations, and plans for this winter and next spring 2014 operations were discussed. These meetings are open forum discussions on the Aspinall Unit reservoir operations with many interested groups participating. For more information about these meetings please contact Erik Knight in the Grand Junction Area Office at (970) 248-0629.

Navajo Reservoir – Reclamation released 250 cfs from Navajo Reservoir from September 24th, 2013 through January 24th 2014. Releases are currently at 300 cfs. Releases are made for the authorized purposes of the Navajo Unit, and to attempt to maintain a target base flow through the endangered fish critical habitat reach of the San Juan River (Farmington to Lake Powell). The San Juan River Basin Recovery Implementation Program recommends a target base flow of between 500 cfs and 1,000 cfs through the critical habitat area. The target base flow is calculated as the weekly average of gaged flows throughout the critical habitat area.

Navajo was at 6025.41 ft of pool elevation and 963,211 acre-ft of storage by the end of January, which was 74% of average for the end of the month. Modified unregulated inflow was 19,275 acre-ft, which was 88% of average for January. Calculated evaporation for the month was 483 acre-ft. An average release of 250 cfs was maintained from the auxiliary outlet works throughout most of January, and increased to 350 at the end of the month. Navajo Reservoir recorded 0.00 inches of liquid precipitation (0% of average).

As of February 4th, the release at Navajo is 300 cfs, and the observed inflow is 249 cfs. The reservoir elevation is 6025.36 ft and the content is 962,725 acre-ft, or 57% full (29% of Active). The San Juan River at Four Corners USGS gage is at 631 cfs and the Animas River at Farmington USGS gage is at 245 cfs. SNOTEL sites above Navajo are showing 10.4 inches of snow water equivalent (SWE), which is 83% of average (1987-present).

The most probable modified-unregulated inflow forecast* for February at Navajo is 23,000 acre-ft (76% of average), for March is 74,000 acre-ft (80% of average), and for April is 150,000 acre-ft (88% of average). The April-July total inflow forecasts are as follows: min probable is 410,000 acre-ft (56% of average), most probable is 660,000 acre-ft (90% of average), and max probable is 950,000 acre-ft (129% of average). Modified unregulated inflow is defined as the predicted hydrologic inflow volume into Navajo plus the change in storage at Vallecito Reservoir and the San-Juan Chama diversion volume.

The most recent coordination meeting for the operation of the Navajo Unit was on Tuesday, January 21, 2014. The next meeting is scheduled for April 22. It will be held at the Farmington Civic Center, 200 West Arrington, in Farmington, New Mexico. These meetings are open forum discussions on the operation of Navajo Reservoir with many interested groups participating. Anyone interested in the general operation of the reservoir is encouraged to attend. Please contact Ryan Christianson in Reclamation's Durango, Colorado Office at (970) 385-6590 for information about these meetings or the daily operation of Navajo Reservoir.

Glen Canyon Dam / Lake Powell

Current Status

The unregulated inflow volume to Lake Powell in January was 270 thousand acre-feet (kaf) (75% of average). The release volume from Glen Canyon Dam in January was 800 kaf. The end of January elevation and storage of Lake Powell were 3578.7 feet (121 feet from full pool) and 9.83 million acre-feet (maf) (40% of full capacity), respectively. The reservoir elevation is now declining and will continue to decline until spring runoff. Snowpack is currently about 111% of median for this time of year.

Current Operations

The operating tier for water year 2014 is the Mid-Elevation Release Tier with an annual release volume of 7.48 maf, as established in August 2013 and pursuant to the Interim Guidelines, Section 6.C.1. Reclamation will schedule operations at Glen Canyon Dam to achieve as practicably as possible a 7.48 maf annual release by September 30, 2014. In February, the release volume will likely be about 600 kaf, with fluctuations from about 8,000 cfs in the nighttime to about 14,000 cfs in the daytime and consistent with the Glen Canyon Operating Criteria (Federal Register, Volume 62, No. 41, March 3, 1997). In March, the release volume will likely be about 505 kaf with daily fluctuations for hydropower.

In addition to daily scheduled fluctuations for power generation, the instantaneous releases from Glen Canyon Dam may also fluctuate to provide 40 MW of system regulation. These instantaneous release adjustments stabilize the electrical generation and transmission system and translate to a range of about 1,200 cfs above or below the hourly scheduled release rate. Under system normal conditions, fluctuations for regulation are typically short lived and generally balance out over the hour with minimal or no noticeable impacts on downstream river flow conditions.

Releases from Glen Canyon Dam can also fluctuate beyond scheduled fluctuations for power generation when called upon as a partner that shares reserve requirements within the electrical generator community (i.e. balancing area). Reserves provide system reliability in the event of an unscheduled outage. Glen Canyon Dam typically maintains 41 MW of reserves (approximately 1,200 cfs). Reserve calls can be maintained for a maximum of 2 hours after which time the generation rate should be returned to the original schedule. If reserves from Glen Canyon Dam are called upon, releases from the dam can exceed scheduled levels and can have a noticeable impact on the river downstream from Glen Canyon Dam. Calls for reserves are fairly infrequent and typically are for much less than 41 MW.

Inflow Forecasts and Model Projections

The forecast for the 2014 April to July water supply season for Lake Powell, issued on Feb 4th by the Colorado Basin River Forecast Center, projects that the most probable (median) unregulated inflow volume will be 7.25 maf (101% of average based on the period 1981-2010). The April-July forecast increased by 440 kaf since last month. The winter snow accumulation season has tracked near average so far (currently 111% of median), however we are currently roughly two-thirds of the way through the snow accumulation season and there is still uncertainty regarding the final snowpack and resulting runoff. The April-July forecast ranges from a minimum probable of 4.75 maf (66% of average) to a maximum probable of 10.3 maf (144% of average). (For reference, the 30-year April-July average is 7.16 maf.) There is a 10 percent chance that inflows could be higher than the maximum probable and a 10 percent chance they could be lower than the minimum probable.

Based on the current forecast, the February 24-Month study projects Lake Powell elevation will peak near approximately 3,611 ft next summer and end the water year near 3,604 feet with approximately 12.16 maf in storage (50% capacity). Note that projections of elevation and storage have significant uncertainty at this point in the season, primarily due to uncertainty regarding the season's total snowpack and the resulting inflow to Lake Powell. Under the minimum probable inflow scenario, updated in January, the projected summer peak is 3,592 ft and end of water year storage is 9.7 maf (40% capacity). Under the maximum probable inflow scenario, updated in January, the projected summer peak is 3,631 ft and end of water year storage is 15.0 maf (62% capacity). There is a 10 percent chance that inflows will be higher, resulting in higher elevation and storage, and 10 percent chance that inflows will be lower, resulting in lower elevation and storage. The minimum and maximum probable model runs will be updated again in April. The annual release volume from Lake Powell during water year 2014 is projected to be 7.48 maf under all inflow scenarios.

Consistent with Section 6.C.1 of the Interim Guidelines, the Lake Powell operational tier for water year 2014 is the Mid-Elevation Release Tier with an annual release volume of 7.48 maf. This was determined in the August 2013 24-Month Study and documented in the 2014 Annual Operating Plan signed by Secretary Jewell in December 2013.

Upper Colorado River Basin Hydrology

The Upper Colorado River Basin regularly experiences significant year to year hydrologic variability. During the 14-year period 2000 to 2013, however, the unregulated inflow to Lake Powell, which is a good measure of hydrologic conditions in the Colorado River Basin, was above average in only 3 out of the past 14 years. The period 2000-2014 is the lowest 14-year period since the closure of Glen Canyon Dam in 1963, with an average unregulated inflow of 8.25 maf, or 76% of the 30-year average (1981-2010). (For comparison, the 1981-2010 total water year average is 10.83maf.) The unregulated inflow during the 2000-2013 period has ranged from a low of 2.64 maf (24% of average) in water year 2002 to a high of 15.97 maf (147% of average) in water year 2011. Under the current forecast, total water year 2014 inflows to Lake Powell are expected to range between a minimum probable of 7.92 maf (73% of average) and a maximum probable of 13.47 maf (124% of average) with a most probable projection of 10.42 maf (96% of average).

At the beginning of water year 2014, total system storage in the Colorado River Basin was 29.9 maf (50% of 59.6 maf total system capacity). This is about 4 maf less than the total storage at the beginning of water year 2013 which began at 34.0 maf (57% of capacity). Since the beginning of water year 2000, total Colorado Basin storage has experienced year to year increases and decreases in response to wet and dry hydrology, ranging from a high of 94% of capacity at the beginning of 2000 to a low of 50% of capacity at the beginning of water year 2014. One wet year can significantly increase total system reservoir storage, just as persistent dry years can draw down the system storage. Based on current inflow forecasts, the current projected end of water year 2014 total Colorado Basin reservoir storage is approximately 30.1 maf (51% of capacity). The actual end of water year storage may vary significantly from this projection, primarily due to uncertainty regarding this season's snowpack and resulting runoff. Based on January minimum and maximum probable inflow forecasts and modeling the range is approximately 26.9 maf (45%) to 33.6 maf (56%), respectively

March 24-Month Study
Date: March 14, 2014

From: Water Resources Group, Salt Lake City
To: All Colorado River Annual Operating Plan (AOP) Recipients

Current Reservoir Status

Reservoir	February Inflow (unregulated) (acre-feet)	Percent of Average (%)	March 13 Midnight Elevation (feet)	Reservoir Storage (acre-feet)
Fontenelle	29,000	105	6473.26	133,000
Flaming Gorge	46,000	104	6016.95	2,873,000
Blue Mesa	23,000	103	7464.03	397,000
Navajo	24,000	79	6027.07	979,000
Powell	329,000	84	3575.45	9,555,000

Expected Operations

The operation of Lake Powell and Lake Mead in this March 2014 24-Month Study is pursuant to the December 2007 Record of Decision on Colorado River Interim Guidelines for Lower Basin Shortages and the Coordinated Operations of Lake Powell and Lake Mead (Interim Guidelines), and reflects the 2014 Annual Operating Plan (AOP). Pursuant to the Interim Guidelines, the August 2013 24-Month Study projections of the January 1, 2014, system storage and reservoir water surface elevations set the operational tier for the coordinated operation of Lake Powell and Lake Mead during 2014.

Consistent with Section 6.C.1 of the Interim Guidelines, the Lake Powell operational tier for water year 2014 is the Mid-Elevation Release Tier with an annual release volume of 7.48 maf.

Consistent with Section 2.B.5 of the Interim Guidelines, the Intentionally Created Surplus (ICS) Surplus Condition is the criterion governing the operation of Lake Mead for calendar year 2014.

The Interim Guidelines are available for download at
http://www.usbr.gov/lc/region/programs/strategies/RecordofDecision.pdf.
The 2014 AOP is available for download at
http://www.usbr.gov/lc/region/g4000/aop/AOP14.pdf.

Fontenelle Reservoir – Inflows to Fontenelle Reservoir for the month of February were 29,000 acre-feet (AF), or 105 percent of average. The reservoir elevation is 6473.27 feet, 38 percent of live capacity. Inflows are averaging 900 cubic feet per second (cfs). Fontenelle releases are currently at 990 cfs and are expected to begin increasing in anticipation of spring runoff toward the end of March.

Inflows for the next three months are projected to be above average: with March, April and May forecasted inflow volumes at 61,000 AF (116% of average), 115,000 AF (135% of average), and 260,000 AF (159% of average), respectively. The March final forecast of the April-July inflow volume is 1,210,000 AF (167% of average).

The next Fontenelle Working Group meeting is scheduled for April 23, 2014, at 10:00 am at the Seedskadee National Wildlife Refuge. The Fontenelle Working Group is an open public forum for information exchange between Reclamation and other parties associated with the operation of Fontenelle Reservoir.

Flaming Gorge Reservoir – Unregulated inflow into Flaming Gorge Reservoir during the month of February was 46,000 acre-feet (AF), or 104 percent of average. The reservoir elevation is 6017 feet. Observed inflows are averaging 900 cubic feet per second (cfs).

Flaming Gorge releases are currently 800 cfs steady minimum releases and are anticipated to remain at this level through winter until spring runoff beings sometime in April or May.

Inflows for the next three months are projected to be above average: with March, April and May forecasted inflow volumes at 115,000 AF (112% of average), 160,000 AF (120% of average), and 350,000 AF (143% of average), respectively. The March final forecast of the April-July unregulated inflow volume into Flaming Gorge Reservoir is 1,430,000 AF (146% of average). Based on the March final forecast, the spring hydrologic classification will be moderately wet.

The next Flaming Gorge Working Group meeting is scheduled for April 24, 2014, at 11:00 a.m. to be held in the Utah Department of Natural Resources building in Vernal, Utah. The Flaming Gorge Working Group is an open public forum for information exchange between Reclamation and the stake holders of Flaming Gorge Dam. The public is encouraged to attend and comment on the operations and plans presented by Reclamation at these meetings. Meeting notes from past Working Group meetings are posted on the Working Group webpage. For more information on this group and these meetings please contact Ed Vidmar at 801-379-1182.

Aspinall Unit Reservoirs – February unregulated inflow into Blue Mesa Reservoir was 23,000 acre-feet or 103 percent of average. On March 11th the basin snowpack was 111 percent of average, which is a 7 percent decrease from a month earlier. Precipitation during February was 145 percent of average. The current inflow rate into Blue Mesa Reservoir is about 400 cfs while reservoir releases are averaging about 300 cfs. The

reservoir elevation is currently at 7464.81 feet, which corresponds to a storage content of about 402,000 acre-feet. This elevation is about 12 feet higher than last year's March elevation.

The latest Water Supply Forecast for Water Year 2014 has been issued and the April through July unregulated inflow is forecasted to be at 850,000 acre-feet (126% of average), this is 95,000 acre-feet higher than last month's forecast. If this forecast holds through May 1st, the Black Canyon Water Right would call for a one day peak flow of 6,427 cfs. At this time Reclamation plans to operate the Aspinall Unit to allow the water right to be met. Also using this same forecast for the determining the flow recommendations from the Aspinall ROD at Whitewater gage, the peak flow at that point should be 14,350 cfs for 10 days.

Based on this forecast and the combination of meeting the ROD and the Black Canyon Water Right this coming spring, Blue Mesa Reservoir is projected to fill this runoff season. The projected fill is calculated to be about 7516.4 feet, or about 3.0 feet short of top of active conservation pool.

Releases from Crystal are currently set at 800 cfs. The Gunnison Diversion Tunnel is currently shut down for the season, with the exception of some small 50 to 100 cfs diversions taken for municipal water needs in Montrose, Colorado. The tunnel is expected to reopen for irrigation season sometime between the last week of March and the first week of April.

Reservoir releases are likely to change during March into May as we respond to changing forecasts and runoff conditions.

The next meeting of the "Aspinall Unit Working Group" will be held on Thursday, April 24, 2014 starting at 1:00 PM in Reclamation's Grand Junction Office. At this meeting, review of this winter's reservoir operations, and plans for this spring and summer operations will be discussed. These meetings are open forum discussions on the Aspinall Unit reservoir operations with many interested groups participating. Anyone needing further information about these meetings should contact Erik Knight in the Grand Junction Area Office at (970) 248-0629.

Navajo Reservoir – Reclamation has been releasing 300 cfs from Navajo Reservoir since February 4th, 2014. Releases are made for the authorized purposes of the Navajo Unit, and to attempt to maintain a target base flow through the endangered fish critical habitat reach of the San Juan River (Farmington to Lake Powell). The San Juan River Basin Recovery Implementation Program recommends a target base flow of between 500 cfs and 1,000 cfs through the critical habitat area. The target base flow is calculated as the weekly average of gaged flows throughout the critical habitat area.

Navajo was at 6025.70 ft of pool elevation and 99,828 acre-ft of storage by the end of February, which was 74% of average for the end of the month. Modified unregulated

inflow was 23,567 acre-ft, which was 78% of average for February. Calculated evaporation for the month was 607 acre-ft. An average release of 300 cfs was maintained throughout most of February. Navajo Reservoir recorded 0.74 inches of liquid precipitation (70% of average).

As of March 4th, the release at Navajo is 300 cfs, and the observed inflow is 708 cfs. The reservoir elevation is 6026.09 ft and the content is 969,828 acre-ft, or 57% full (30% of Active). The San Juan River at Four Corners USGS gage is at 708 cfs and the Animas River at Farmington USGS gage is at 332 cfs. SNOTEL sites above Navajo are showing an average of 13.30 inches of snow water equivalent (SWE) above Navajo, which is 81% of average (1987-present).

The most probable modified-unregulated inflow forecast* for March at Navajo is 80,000 acre-ft (87% of average), for April is 145,000 acre-ft (85% of average), and for May is 260,000 acre-ft (94% of average). The April-July total inflow forecasts are as follows: Min Probable: 420,000 acre-ft (57% of average), Most Probable: 630,000 acre-ft (85% of average), Max Probable: 885,000 acre-ft (120% of average). Modified unregulated inflow is defined as the predicted hydrologic inflow volume into Navajo plus the change in storage at Vallecito Reservoir and the San-Juan Chama diversion volume.

The next coordination meeting for the operation of the Navajo Unit will be on Tuesday, April 22, 2014, from 1:00-3:00 p.m. It will be held at the Farmington Civic Center, 200 West Arrington, in Farmington, New Mexico. These meetings are open forum discussions on the operation of Navajo Reservoir with many interested groups participating. Anyone interested in the general operation of the reservoir is encouraged to attend. Please contact Ryan Christianson in Reclamation's Durango, Colorado Office at (970) 385-6590 for information about these meetings or the daily operation of Navajo Reservoir.

Glen Canyon Dam / Lake Powell

Current Status

The unregulated inflow volume to Lake Powell in February was 330 thousand acre-feet (kaf) (84% of average). The release volume from Glen Canyon Dam in February was 600 kaf. The end of February elevation and storage of Lake Powell were 3575.6 feet (125 feet from full pool) and 9.56 million acre-feet (maf) (39% of full capacity), respectively. The reservoir elevation is nearing the anticipated seasonal low and will likely remain near the current elevation until increasing when runoff begins in late spring. Snowpack is currently about 115% of median for this time of year.

Current Operations

The operating tier for water year 2014 is the Mid-Elevation Release Tier with an annual release volume of 7.48 maf, as established in August 2013 and pursuant to the Interim Guidelines, Section 6.C.1. Reclamation will schedule operations at Glen Canyon Dam to achieve as practicably as possible a 7.48 maf annual release by September 30, 2014.

In March, the release volume will likely be approximately 505 kaf, with fluctuations between about 6,000 cfs in the nighttime to about 11,000 cfs in the daytime and consistent with the Glen Canyon Operating Criteria (Federal Register, Volume 62, No. 41, March 3, 1997). In April, the release volume will likely be approximately 500 kaf with daily fluctuations between about 6,000 cfs and 11,000 cfs.

In addition to daily scheduled fluctuations for power generation, the instantaneous releases from Glen Canyon Dam may also fluctuate to provide 40 MW of system regulation. These instantaneous release adjustments stabilize the electrical generation and transmission system and translate to a range of about 1,200 cfs above or below the hourly scheduled release rate. Under system normal conditions, fluctuations for regulation are typically short lived and generally balance out over the hour with minimal or no noticeable impacts on downstream river flow conditions.

Releases from Glen Canyon Dam can also fluctuate beyond scheduled fluctuations for power generation when called upon as a partner that shares reserve requirements within the electrical generator community (i.e. balancing authority). Reserves provide system reliability in the event of an unscheduled outage. Glen Canyon Dam typically maintains 41 MW of reserves (approximately 1,200 cfs). Reserve calls can be maintained for a maximum of 2 hours after which time the generation rate should be returned to the original schedule. If reserves from Glen Canyon Dam are called upon, releases from the dam can exceed scheduled levels and can have a noticeable impact on the river downstream from Glen Canyon Dam. Calls for reserves are fairly infrequent and typically are for much less than 41 MW.

Inflow Forecasts and Model Projections

The forecast for the 2014 April to July water supply season for Lake Powell, issued on March 4, 2014 by the Colorado Basin River Forecast Center, projects that the most probable (median) unregulated inflow volume will be 8.30 maf (116% of average based on the period 1981-2010). The April-July forecast increased by 1.05 million acre-feet since last month. The winter snow accumulation season has tracked near average to slightly above average in the past month (currently 115% of median). There is currently about one more month remaining for the typical snow accumulation season so there is still uncertainty regarding the final snowpack and resulting runoff. The April-July forecast ranges from a minimum probable of 6.00 maf (84% of average) to a maximum probable of 11.1 maf (155% of average). (For reference, the 30-year April-July average is 7.16 maf.) There is a 10 percent chance that inflows could be higher than the maximum probable and a 10 percent chance they could be lower than the minimum probable.

Based on the current forecast, the March 24-Month study projects Lake Powell elevation will peak near approximately 3,619 feet near the end of June and end the water year near 3,615 feet with approximately 13.28 maf in storage (56% capacity). Note that projections of elevation and storage have uncertainty at this point in the season, primarily due to uncertainty regarding the season's total snowpack and the resulting inflow to Lake Powell. Under the minimum probable inflow scenario, updated in January, the projected

summer peak is 3,592 ft and end of water year storage is 9.7 maf (40% capacity). Under the maximum probable inflow scenario, updated in January, the projected summer peak is 3,631 ft and end of water year storage is 15.0 maf (62% capacity). There is a 10 percent chance that inflows will be higher, resulting in higher elevation and storage, and 10 percent chance that inflows will be lower, resulting in lower elevation and storage. The minimum and maximum probable model runs will be updated again in April. The annual release volume from Lake Powell during water year 2014 is projected to be 7.48 maf under all inflow scenarios.

Consistent with Section 6.C.1 of the Interim Guidelines, the Lake Powell operational tier for water year 2014 is the Mid-Elevation Release Tier with an annual release volume of 7.48 maf. This was determined in the August 2013 24-Month Study and documented in the 2014 Annual Operating Plan signed by Secretary Jewell in December 2013.

Upper Colorado River Basin Hydrology

The Upper Colorado River Basin regularly experiences significant year to year hydrologic variability. During the 14-year period 2000 to 2013, however, the unregulated inflow to Lake Powell, which is a good measure of hydrologic conditions in the Colorado River Basin, was above average in only 3 out of the past 14 years. The period 2000-2014 is the lowest 14-year period since the closure of Glen Canyon Dam in 1963, with an average unregulated inflow of 8.25 maf, or 76% of the 30-year average (1981-2010). (For comparison, the 1981-2010 total water year average is 10.83maf.) The unregulated inflow during the 2000-2013 period has ranged from a low of 2.64 maf (24% of average) in water year 2002 to a high of 15.97 maf (147% of average) in water year 2011. Under the current forecast, total water year 2014 inflows to Lake Powell are expected to range between a minimum probable of 9.50 maf (88% of average) and a maximum probable of 14.6 maf (135% of average) with a most probable projection of 11.80 maf (109% of average).

At the beginning of water year 2014, total system storage in the Colorado River Basin was 29.9 maf (50% of 59.6 maf total system capacity). This is about 4 maf less than the total storage at the beginning of water year 2013 which began at 34.0 maf (57% of capacity). Since the beginning of water year 2000, total Colorado Basin storage has experienced year to year increases and decreases in response to wet and dry hydrology, ranging from a high of 94% of capacity at the beginning of 2000 to a low of 50% of capacity at the beginning of water year 2014. One wet year can significantly increase total system reservoir storage, just as persistent dry years can draw down the system storage. Based on current inflow forecasts, the current projected end of water year 2014 total Colorado Basin reservoir storage is approximately 31.3 maf (53% of capacity). The actual end of water year storage may vary significantly from this projection, primarily due to uncertainty regarding this season's snowpack and resulting runoff. Based on January minimum and maximum probable inflow forecasts and modeling the range is approximately 26.9 maf (45%) to 33.6 maf (56%), respectively. The minimum and maximum probable model runs will be updated again in April.

April 24-Month Study
Date: April 10, 2014

From: Water Resources Group, Salt Lake City
To: All Colorado River Annual Operating Plan (AOP) Recipients

Current Reservoir Status

Reservoir	March Inflow (unregulated) (acre-feet)	Percent of Average (%)	April 9 Midnight Elevation (feet)	Reservoir Storage (acre-feet)
Fontenelle	56,000	106	6468.70	113,000
Flaming Gorge	86,000	84	6018.59	2,930,000
Blue Mesa	32,000	89	7466.56	413,000
Navajo	52,000	56	6029.43	1,003,000
Powell	509,000	76	3574.31	9,460,000

Expected Operations

The operation of Lake Powell and Lake Mead in this April 2014 24-Month Study is pursuant to the December 2007 Record of Decision on Colorado River Interim Guidelines for Lower Basin Shortages and the Coordinated Operations of Lake Powell and Lake Mead (Interim Guidelines), and reflects the 2014 Annual Operating Plan (AOP). Pursuant to the Interim Guidelines, the August 2013 24-Month Study projections of the January 1, 2014, system storage and reservoir water surface elevations set the operational tier for the coordinated operation of Lake Powell and Lake Mead during 2014.

Consistent with Section 6.C.1 of the Interim Guidelines, the Lake Powell operational tier for water year 2014 is the Mid-Elevation Release Tier with an annual release volume of 7.48 maf.

Consistent with Section 2.B.5 of the Interim Guidelines, the Intentionally Created Surplus (ICS) Surplus Condition is the criterion governing the operation of Lake Mead for calendar year 2014.

The Interim Guidelines are available for download at
http://www.usbr.gov/lc/region/programs/strategies/RecordofDecision.pdf.
The 2014 AOP is available for download at
http://www.usbr.gov/lc/region/g4000/aop/AOP14.pdf.

Fontenelle Reservoir – Inflows to Fontenelle Reservoir for the month of March were 56,000 acre-feet (AF), or 106 percent of average. The reservoir elevation is 6469 feet, 33 percent of live capacity. Inflows are averaging 1,000 cubic feet per second (cfs). Fontenelle releases are currently at 1,420 cfs and are expected to begin increasing in anticipation of spring runoff toward the end of April.

Inflows for the next three months are projected to be above average: with April, May and June forecasted inflow volumes at 105,000 AF (123% of average), 260,000 AF (159% of average), and 515,000 AF (172% of average), respectively. The April final forecast of the April-July inflow volume is 1,210,000 AF (167% of average).

The next Fontenelle Working Group meeting is scheduled for April 23, 2014, at 10:00 am at the Seedskadee National Wildlife Refuge. The Fontenelle Working Group is an open public forum for information exchange between Reclamation and other parties associated with the operation of Fontenelle Reservoir.

Flaming Gorge Reservoir – Unregulated inflow into Flaming Gorge Reservoir during the month of March was 86,000 acre-feet (AF), or 84 percent of average. The reservoir elevation is 6018.6 feet. Observed inflows are averaging 2,000 cubic feet per second (cfs).

Flaming Gorge releases are currently 830 cfs steady minimum releases and are anticipated to remain at this level through winter until spring runoff beings sometime in April or May.

Inflows for the next three months are projected to be above average: with April, May and June forecasted inflow volumes at 140,000 AF (105% of average), 340,000 AF (139% of average), and 570,000 AF (146% of average), respectively. The April final forecast of the April-July unregulated inflow volume into Flaming Gorge Reservoir is 1,400,000 AF (143% of average). Based on the April final forecast, the spring hydrologic classification will be moderately wet.

The next Flaming Gorge Working Group meeting is scheduled for April 24, 2014, at 11:00 a.m. to be held in the Utah Department of Natural Resources building in Vernal, Utah. The Flaming Gorge Working Group is an open public forum for information exchange between Reclamation and the stake holders of Flaming Gorge Dam. The public is encouraged to attend and comment on the operations and plans presented by Reclamation at these meetings. Meeting notes from past Working Group meetings are posted on the Working Group webpage. For more information on this group and these meetings please contact Ed Vidmar at 801-379-1182.

Aspinall Unit Reservoirs – March unregulated inflow into Blue Mesa Reservoir was 32,000 acre-feet or 89 percent of average. On April 8, 2014 the basin snowpack was 108 percent of average; which is a decrease of about 6 percent from last month. Precipitation during March was 80 percent of average. The current inflow rate into Blue Mesa

Reservoir is about 900 cfs while reservoir releases are averaging about 700 cfs. The reservoir elevation is currently at 7466.41 feet, which corresponds to a storage content of about 412,000 acre-feet.

The latest Water Supply Forecast for Water Year 2014 has been issued and the April through July unregulated inflow is forecasted to be at 850,000 acre-feet (126% of average), this is the same as last month's forecast. If this forecast holds through May 1st, the Black Canyon Water Right would call for a one day peak flow of 6,400 cfs, and the Aspinall ROD would call for a 10 day peak flow of 14,350 cfs. At this time Reclamation plans to continue to operate the Aspinall Unit to meet both the water right and ROD recommendations. Based on this forecast and the combination of meeting water right and ROD this coming spring, Blue Mesa Reservoir is projected fill this runoff season. The projected fill is calculated to be between 7516.4 feet and 7519.4 feet. Any elevation above 7516.00 is considered a fill for the season.

Releases from Crystal are currently set at 850 cfs. The Gunnison Diversion Tunnel started taking water for the new season on March 27, 2014. The current diversion rate in the tunnel is 400 cfs, which results in a river flow below the diversion tunnel of approximately 450 cfs. These rates will most likely change as conditions warrant, primarily as we respond to changes in the forecasted spring inflows.

The next meeting of the "Aspinall Unit Working Group" will be held on Thursday, April 24, 2014 starting at 1:00 PM in Reclamation's Grand Junction Office. At this meeting, review of this winter's reservoir operations, and plans for this spring and summer operations will be discussed. These meetings are open forum discussions on the Aspinall Unit reservoir operations with many interested groups participating. Anyone needing further information about these meetings should contact Erik Knight in the Grand Junction Area Office at (970) 248-0629.

Navajo Reservoir – Reclamation has been releasing 350 cfs from Navajo Reservoir since April 3rd, 2014. Releases are made for the authorized purposes of the Navajo Unit, and to attempt to maintain a target base flow through the endangered fish critical habitat reach of the San Juan River (Farmington to Lake Powell). The San Juan River Basin Recovery Implementation Program recommends a target base flow of between 500 cfs and 1,000 cfs through the critical habitat area. The target base flow is calculated as the weekly average of gaged flows throughout the critical habitat area.

Navajo was at 6028.76 ft of pool elevation and 996,146 acre-ft of storage by the end of March, which was 76% of average for the end of the month. Modified unregulated inflow was 52,373 acre-ft, which was 57% of average for March. Calculated evaporation for the month was 1257 acre-ft. Navajo released 300 cfs through March 17th, and then reduced to 250 cfs for the rest of the month. Navajo Reservoir recorded 1.07 inches of liquid precipitation (99% of average).

As of April 6th, the release at Navajo is 250 cfs, and the observed inflow is 898 cfs. The reservoir elevation is 6028.98 ft and the content is 998,338 acre-ft, or 59% full (32% of Active). The San Juan River at Four Corners USGS gage is at 584 cfs and the Animas River at Farmington USGS gage is at 112 cfs.

The most probable modified-unregulated inflow forecast for April at Navajo is 112,000 acre-ft (66% of average), for May is 220,000 acre-ft (79% of average), and for June is 150,000 acre-ft (67% of average). The April-July total inflow forecasts are as follows: Min Probable: 370,000 acre-ft (50% of average), Most Probable: 510,000 acre-ft (69% of average), Max Probable: 660,000 acre-ft (90% of average).

Under the San Juan River Basin Recovery Implementation Program (SJRIP) Flow Recommendations (1999), a spring peak release of 5,000 cfs for 1 week (80,000 acre-ft) is recommended for 2014. However, Reclamation and SJRIP have agreed to forego the spring peak release for 2014 in the interests of recovering the reservoir and reducing the risk of a shortage.

The next coordination meeting for the operation of the Navajo Unit will be on Tuesday, April 22, 2014, from 1:00-3:00 p.m. It will be held at the Farmington Civic Center, 200 West Arrington, in Farmington, New Mexico. These meetings are open forum discussions on the operation of Navajo Reservoir with many interested groups participating. Anyone interested in the general operation of the reservoir is encouraged to attend. Please contact Ryan Christianson in Reclamation's Durango, Colorado Office at (970) 385-6590 for information about these meetings or the daily operation of Navajo Reservoir.

Glen Canyon Dam / Lake Powell

Current Status

The unregulated inflow volume to Lake Powell in March was 509 thousand acre-feet (kaf) (76% of average). The release volume from Glen Canyon Dam in March was 504 kaf. The end of March elevation and storage of Lake Powell were 3,574.8 feet (125 feet from full pool) and 9.50 million acre-feet (maf) (39% of full capacity), respectively. The reservoir elevation is nearing the anticipated seasonal low and will likely remain near the current elevation until increasing when runoff begins in late spring. Snowpack is currently about 112% of median for this time of year and is likely nearing the seasonal peak.

Current Operations

The operating tier for water year 2014 is the Mid-Elevation Release Tier with an annual release volume of 7.48 maf, as established in August 2013 and pursuant to the Interim Guidelines, Section 6.C.1. Reclamation will schedule operations at Glen Canyon Dam to achieve as practicably as possible a 7.48 maf annual release by September 30, 2014.
In April, the release volume will likely be approximately 500 kaf, with fluctuations between about 6,000 cfs in the nighttime to about 11,000 cfs in the daytime and

consistent with the Glen Canyon Operating Criteria (Federal Register, Volume 62, No. 41, March 3, 1997). In May, the release volume will likely be approximately 510 kaf with daily fluctuations between about 6,000 cfs and 11,000 cfs. The anticipated release volume for June is about 600 kaf with fluctuations between approximately 7,000 cfs and 13,000 cfs.

In addition to daily scheduled fluctuations for power generation, the instantaneous releases from Glen Canyon Dam may also fluctuate to provide 40 MW of system regulation. These instantaneous release adjustments stabilize the electrical generation and transmission system and translate to a range of about 1,200 cfs above or below the hourly scheduled release rate. Under system normal conditions, fluctuations for regulation are typically short lived and generally balance out over the hour with minimal or no noticeable impacts on downstream river flow conditions.

Releases from Glen Canyon Dam can also fluctuate beyond scheduled fluctuations for power generation when called upon as a partner that shares reserve requirements within the electrical generator community (i.e. balancing authority). Reserves provide system reliability in the event of an unscheduled outage. Glen Canyon Dam typically maintains 41 MW of reserves (approximately 1,200 cfs). Reserve calls can be maintained for a maximum of 2 hours after which time the generation rate should be returned to the original schedule. If reserves from Glen Canyon Dam are called upon, releases from the dam can exceed scheduled levels and can have a noticeable impact on the river downstream from Glen Canyon Dam. Calls for reserves are fairly infrequent and typically are for much less than 41 MW.

Inflow Forecasts and Model Projections

The forecast for the 2014 April to July water supply season for Lake Powell, issued on April 2, 2014 by the Colorado Basin River Forecast Center, projects that the most probable (median) unregulated inflow volume will be 7.85 maf (110% of average based on the period 1981-2010). The April-July forecast decreased by 0.45 million acre-feet since last month. The winter snow accumulation season has tracked slightly above average over the past month (currently 112% of median). We are nearing the end of the typical snow accumulation season and spring runoff is expected to begin in many subbasins over the next month. However, the timing and final volume of spring runoff is still uncertain. The April-July forecast ranges from a minimum probable of 5.80 maf (81% of average) to a maximum probable of 10.3 maf (144% of average). (For reference, the 30-year April-July average is 7.16 maf.) There is a 10 percent chance that inflows could be higher than the maximum probable and a 10 percent chance they could be lower than the minimum probable.

Based on the current forecast, the April 24-Month study projects Lake Powell elevation will peak near approximately 3,614 feet near the end of June and end the water year near 3,610 feet with approximately 12.71 maf in storage (52% capacity). Note that projections of elevation and storage have uncertainty at this point in the season, primarily due to uncertainty regarding the spring runoff and resulting inflow to Lake Powell. Under the minimum probable inflow scenario, updated in April, the projected summer peak is 3,599

ft and end of water year storage is 10.98 maf (45% capacity). Under the maximum probable inflow scenario, updated in April, the projected summer peak is 3,631 ft and end of water year storage is 14.93 maf (61% capacity). There is a 10 percent chance that inflows will be higher, resulting in higher elevation and storage, and 10 percent chance that inflows will be lower, resulting in lower elevation and storage. The annual release volume from Lake Powell during water year 2014 is projected to be 7.48 maf under all inflow scenarios.

Consistent with Section 6.C.1 of the Interim Guidelines, the Lake Powell operational tier for water year 2014 is the Mid-Elevation Release Tier with an annual release volume of 7.48 maf. This was determined in the August 2013 24-Month Study and documented in the 2014 Annual Operating Plan signed by Secretary Jewell in December 2013.

The Lake Powell operational tier for water year 2015 under the most probable inflow scenario is the Upper Elevation Balancing Tier with a 9.0 maf annual release volume. Under the minimum probable inflow scenario, the water year 2015 operating tier is the Upper Elevation Balancing Tier with an 8.23 maf annual release volume. Under the maximum probable inflow scenario, the water year 2015 operating tier is the Upper Elevation Balancing Tier with a projected April shift to Equalization and a 10.82 maf annual release volume.

Upper Colorado River Basin Hydrology

The Upper Colorado River Basin regularly experiences significant year to year hydrologic variability. During the 14-year period 2000 to 2013, however, the unregulated inflow to Lake Powell, which is a good measure of hydrologic conditions in the Colorado River Basin, was above average in only 3 out of the past 14 years. The period 2000-2013 is the lowest 14-year period since the closure of Glen Canyon Dam in 1963, with an average unregulated inflow of 8.25 maf, or 76% of the 30-year average (1981-2010). (For comparison, the 1981-2010 total water year average is 10.83maf.) The unregulated inflow during the 2000-2013 period has ranged from a low of 2.64 maf (24% of average) in water year 2002 to a high of 15.97 maf (147% of average) in water year 2011. Under the current forecast, total water year 2014 unregulated inflows to Lake Powell are expected to range between a minimum probable of 8.8 maf (82% of average) and a maximum probable of 13.8 maf (128% of average) with a most probable projection of 11.11 maf (103% of average).

At the beginning of water year 2014, total system storage in the Colorado River Basin was 29.9 maf (50% of 59.6 maf total system capacity). This is about 4 maf less than the total storage at the beginning of water year 2013 which began at 34.0 maf (57% of capacity). Since the beginning of water year 2000, total Colorado Basin storage has experienced year to year increases and decreases in response to wet and dry hydrology, ranging from a high of 94% of capacity at the beginning of 2000 to a low of 50% of capacity at the beginning of water year 2014. One wet year can significantly increase total system reservoir storage, just as persistent dry years can draw down the system storage. Based on current inflow forecasts, the current projected end of water year 2014 total Colorado Basin reservoir storage is approximately 30.6 maf (51% of capacity). The

actual end of water year storage may vary significantly from this projection, primarily due to uncertainty regarding this season's runoff. Based on April minimum and maximum probable inflow forecasts and modeling the range is approximately 28.4 maf (48%) to 33.2 maf (56%), respectively.

May 24-Month Study
Date: May 12, 2014

From: Water Resources Group, Salt Lake City
To: All Colorado River Annual Operating Plan (AOP) Recipients

Current Reservoir Status

Reservoir	April Inflow (unregulated) (acre-feet)	Percent of Average (%)	May 11 Midnight Elevation (feet)	Reservoir Storage (acre-feet)
Fontenelle	101,000	118	6469.75	165,000
Flaming Gorge	128,000	96	6020.89	3,011,000
Blue Mesa	129,000	129	7486.81	557,000
Navajo	123,000	72	6036.10	1,071,000
Powell	964,000	91	3580.37	9,971,000

Expected Operations

The operation of Lake Powell and Lake Mead in this May 2014 24-Month Study is pursuant to the December 2007 Record of Decision on Colorado River Interim Guidelines for Lower Basin Shortages and the Coordinated Operations of Lake Powell and Lake Mead (Interim Guidelines), and reflects the 2014 Annual Operating Plan (AOP). Pursuant to the Interim Guidelines, the August 2013 24-Month Study projections of the January 1, 2014, system storage and reservoir water surface elevations set the operational tier for the coordinated operation of Lake Powell and Lake Mead during 2014.

Consistent with Section 6.C.1 of the Interim Guidelines, the Lake Powell operational tier for water year 2014 is the Mid-Elevation Release Tier with an annual release volume of 7.48 maf.

Consistent with Section 2.B.5 of the Interim Guidelines, the Intentionally Created Surplus (ICS) Surplus Condition is the criterion governing the operation of Lake Mead for calendar year 2014.

The Interim Guidelines are available for download at:
http://www.usbr.gov/lc/region/programs/strategies/RecordofDecision.pdf.
The 2014 AOP is available for download at:
http://www.usbr.gov/lc/region/g4000/aop/AOP14.pdf.

Fontenelle Reservoir – Inflows to Fontenelle Reservoir for the month of April were 101,000 acre-feet (AF), or 119 percent of average. The reservoir elevation is 6480 feet, 48 percent of live capacity. Inflows are averaging 3,488 cubic feet per second (cfs). Fontenelle releases are currently at 3,000 cfs and will continue increasing during May to a high of 6,500 cfs to accommodate 156 percent of median snowpack.

Inflows for the next three months are projected to be above average: with May, June and July forecasted inflow volumes at 240,000 AF (147% of average), 485,000 AF (162% of average), and 304,000 AF (171% of average), respectively. The May final forecast of the April-July inflow volume is 1,130,000 AF (156% of average).

The next Fontenelle Working Group meeting is scheduled for August 20, 2014, at 10:00 am at the Joint Powers Water Board in Green River, Wyoming. The Fontenelle Working Group is an open public forum for information exchange between Reclamation and other parties associated with the operation of Fontenelle Reservoir.

Flaming Gorge Reservoir – Unregulated inflow into Flaming Gorge Reservoir during the month of April was 128,000 acre-feet (AF), or 96 percent of average. The reservoir elevation is 6,020.9 feet. Observed inflows are averaging 6,200 cubic feet per second (cfs).

Flaming Gorge releases are currently 830 cfs steady minimum releases and are anticipated to remain at this level through winter until spring runoff beings sometime in late May or early June.

Inflows for the next three months are projected to be above average: with May, June and July forecasted inflow volumes at 305,000 AF (124% of average), 550,000 AF (141% of average), and 337,000 AF (160% of average), respectively. The May final forecast of the April-July unregulated inflow volume into Flaming Gorge Reservoir is 1,320,000 AF (135% of average). Based on the May final forecast, the spring hydrologic classification will be average.

The next Flaming Gorge Working Group meeting is scheduled for August 21, 2014, at 11:00 a.m. to be held in the Utah Department of Natural Resources building in Vernal, Utah. The Flaming Gorge Working Group is an open public forum for information exchange between Reclamation and the stake holders of Flaming Gorge Dam. The public is encouraged to attend and comment on the operations and plans presented by Reclamation at these meetings. Meeting notes from past Working Group meetings are posted on the Working Group webpage. For more information on this group and these meetings please contact Ed Vidmar at 801-379-1182.

Aspinall Unit Reservoirs – April unregulated inflow into Blue Mesa Reservoir was 129,000 acre-feet or 167 percent of average. On May 8, 2011 the basin snowpack was 85 percent of average. Precipitation during April was 80 percent of average. The current inflow rate into Blue Mesa Reservoir is over 3500 cfs while reservoir releases are

averaging about 600 cfs. Lately the weather pattern has been wetter and colder than average with occasional short-lived warm periods that have resulted in brief episodes of higher flows on the rivers. The reservoir elevation is currently at 7484.25 feet, which corresponds to a storage content of about 537,000 acre-feet. This elevation is about 30 feet higher, or about 200,000 acre-feet more than a year ago.

The latest Water Supply Forecast for Water Year 2014 was issued on May 1st and the April through July unregulated inflow is forecasted to be at 850,000 acre-feet (126% of normal). This sets the senior Black Canyon Water Right call for a one day spring peak flow of 6,400 cfs, and the Aspinall ROD target at a 10 day peak flow of 14,350 cfs, and 40 day half-bank flow of 8,070 cfs. At this time Reclamation plans to operate the Aspinall Unit to meet both the water right and ROD recommendations. Based on this forecast and the combination of meeting water right and ROD this coming spring, Blue Mesa Reservoir is not projected fill this runoff season. The projected fill is calculated to be between 7493 feet and 7505 feet. Any elevation above 7516.00 is considered a fill for the season.

Releases from Crystal are currently set at 1300 cfs. The Gunnison Diversion Tunnel started taking water for the new season on March 27, 2014. The current diversion rate in the tunnel is 800 cfs, which results in a river flow below the diversion tunnel of approximately 500 cfs. River flows will start to increase in the next 5 to 10 days. Peak flows in the canyon will be substantial this year in order to meet the downstream ROD targets at the Whitewater gage. Peak flows could reach as much as 9,000 to 11,000 cfs by late May to early June and should hold steady after that until the ROD targets have been reached. However, these rates will most likely change as conditions warrant, primarily as we respond to changes in hydrologic conditions.

The next meeting of the "Aspinall Unit Working Group" will be held on Thursday, September 4, 2014 starting at 1:00 PM at the Elk Creek Visitor Center at Blue Mesa Reservoir. At this meeting, review of this spring's reservoir operations, and plans for this fall and winter operations will be discussed. These meetings are open forum discussions on the Aspinall Unit reservoir operations with many interested groups participating. Anyone needing further information about these meetings should contact Erik Knight in the Grand Junction Area Office at (970) 248-0629.

Navajo Reservoir – Reclamation has been releasing 250 cfs from Navajo Reservoir since April 21st, 2014. Releases are made for the authorized purposes of the Navajo Unit, and to attempt to maintain a target base flow through the endangered fish critical habitat reach of the San Juan River (Farmington to Lake Powell). The San Juan River Basin Recovery Implementation Program recommends a target base flow of between 500 cfs and 1,000 cfs through the critical habitat area. The target base flow is calculated as the weekly average of gaged flows throughout the critical habitat area.

Navajo was at 6034.45 ft of pool elevation and 1,052,666 acre-ft of storage by the end of April, which was 77% of average for the end of the month. Modified unregulated inflow was 123,117 acre-ft, which was 72% of average for April. Calculated evaporation for the month was 1977 acre-ft. Navajo released 350 cfs through the middle of the month, and then reduced to 250 cfs for the rest April. Navajo Reservoir recorded 0.41 inches of liquid precipitation (39% of average).

As of May 5th, the release at Navajo is 250 cfs, and the observed inflow averages 1,400 cfs. The reservoir elevation is 6034.87 ft and the content is 1,058,383 acre-ft, or 62% full (38% of Active). The San Juan River at Four Corners USGS gage is averaging 700 cfs and the Animas River at Farmington USGS gage is averaging 1,100 cfs.

SNOTEL sites above Navajo are showing an average of 8.3 inches of snow water equivalent (SWE) above Navajo, which is 57% of average (1987-present) for this time of year. The current SWE is the 7th lowest for this date since 1987. Peak SWE above Navajo was 14.0 inches, and was reached on 4/9. Years with the closest SWE on this date resulted in April-July modified unregulated inflow ranging from 275,589 af (1996) to 472,055 af (1988).

The most probable modified-unregulated inflow forecast for May at Navajo is 190,000 acre-ft (69% of average), for June is 124,000 acre-ft (55% of average), and for July is 23,000 acre-ft (35% of average). The April-July total inflow forecasts are as follows: Min Probable forecast is 370,000 acre-ft (50% of average), Most Probable forecast is 460,000 acre-ft (62% of average), and Max Probable forecast is 540,000 acre-ft (73% of average)

Reclamation and SJRIP have agreed to forego a spring peak release for 2014 in the interests of recovering the reservoir and reducing the risk of a shortage. The release will continue to be that which is required to maintain the target base flows downstream.

Glen Canyon Dam / Lake Powell

Current Status

The unregulated inflow volume to Lake Powell in April was 964 thousand acre-feet (kaf) (91% of average). The release volume from Glen Canyon Dam in April was 502 kaf. The end of April elevation and storage of Lake Powell were 3,577.6 feet (122 feet from full pool) and 9.73 million acre-feet (maf) (40% of full capacity), respectively. The reservoir elevation is now increasing as spring runoff begins to enter the reservoir. Basin-wide snowpack peaked at 111% of median on April 7th and now snowmelt has begun across much of the basin, with roughly two-thirds of the snowpack remaining.

Current Operations

The operating tier for water year 2014 is the Mid-Elevation Release Tier with an annual release volume of 7.48 maf, as established in August 2013 and pursuant to the Interim Guidelines, Section 6.C.1. Reclamation will schedule operations at Glen Canyon Dam to achieve as practicably as possible a 7.48 maf annual release by September 30, 2014.

In May, the release volume will be approximately 500 kaf, with fluctuations between about 5,500 cfs in the nighttime to about 10,500 cfs in the daytime and consistent with the Glen Canyon Operating Criteria (Federal Register, Volume 62, No. 41, March 3, 1997). In June, the release volume will likely be approximately 600 kaf with daily fluctuations between about 7,000 cfs and 13,000 cfs. The anticipated release volume for July is about 800 kaf with fluctuations between approximately 10,000 cfs and 18,000 cfs.

In addition to daily scheduled fluctuations for power generation, the instantaneous releases from Glen Canyon Dam may also fluctuate to provide 40 MW of system regulation. These instantaneous release adjustments stabilize the electrical generation and transmission system and translate to a range of about 1,200 cfs above or below the hourly scheduled release rate. Under system normal conditions, fluctuations for regulation are typically short lived and generally balance out over the hour with minimal or no noticeable impacts on downstream river flow conditions.

Releases from Glen Canyon Dam can also fluctuate beyond scheduled releases when called upon to respond to unscheduled power outages or power system emergencies. Depending on the severity of the system emergency, the response from Glen Canyon Dam can be significant, within the full range of the operating capacity of the power plant for as long as is necessary to maintain balance in the transmission system. Glen Canyon Dam typically maintains 41MW (approximately 1,200 cfs) of generation capacity in reserve in order to respond to a system emergency even when generation rates are already high. System emergencies occur fairly infrequently and typically require small responses from Glen Canyon Dam. However, these responses can have a noticeable impact on the river downstream of Glen Canyon Dam.

Inflow Forecasts and Model Projections

The forecast for the 2014 April to July water supply season for Lake Powell, issued on May 2, 2014 by the Colorado Basin River Forecast Center, projects that the most probable (median) unregulated inflow volume will be 7.55 maf (105% of average based on the period 1981-2010). The April-July forecast decreased by 300 kaf since last month. The seasonal snowpack peaked on April 7, 2014 at 111% of median and runoff has begun across much of the basin. The April-July forecast ranges from a minimum probable of 6.30 maf (88% of average) to a maximum probable of 9.46 maf (132% of average). (For reference, the 30-year April-July average is 7.16 maf.) There is a 10 percent chance that inflows could be higher than the maximum probable and a 10 percent chance they could be lower than the minimum probable.

Based on the current forecast, the May 24-Month study projects Lake Powell elevation will peak near approximately 3,616 feet near the end of June and end the water year near 3,610 feet with approximately 12.8 maf in storage (53% capacity). Note that projections of elevation and storage have uncertainty at this point in the season, primarily due to uncertainty regarding the spring runoff and resulting inflow to Lake Powell. Under the minimum probable inflow scenario, last updated in April, the projected summer peak is 3,599 ft and end of water year storage is 11.0 maf (45% capacity). Under the maximum

probable inflow scenario, updated in April, the projected summer peak is 3,632 ft and end of water year storage is 14.9 maf (61% capacity). There is a 10 percent chance that inflows will be higher, resulting in higher elevation and storage, and 10 percent chance that inflows will be lower, resulting in lower elevation and storage. The annual release volume from Lake Powell during water year 2014 is projected to be 7.48 maf under all inflow scenarios.

Consistent with Section 6.C.1 of the Interim Guidelines, the Lake Powell operational tier for water year 2014 is the Mid-Elevation Release Tier with an annual release volume of 7.48 maf. This was determined in the August 2013 24-Month Study and documented in the 2014 Annual Operating Plan signed by Secretary Jewell in December 2013.

Upper Colorado River Basin Hydrology

The Upper Colorado River Basin regularly experiences significant year to year hydrologic variability. During the 14-year period 2000 to 2013, however, the unregulated inflow to Lake Powell, which is a good measure of hydrologic conditions in the Colorado River Basin, was above average in only 3 out of the past 14 years. The period 2000-2013 is the lowest 14-year period since the closure of Glen Canyon Dam in 1963, with an average unregulated inflow of 8.25 maf, or 76% of the 30-year average (1981-2010). (For comparison, the 1981-2010 total water year average is 10.83 maf.) The unregulated inflow during the 2000-2013 period has ranged from a low of 2.64 maf (24% of average) in water year 2002 to a high of 15.97 maf (147% of average) in water year 2011. Under the current forecast, total water year 2014 unregulated inflows to Lake Powell are expected to range between a minimum probable of 9.6 maf (88% of average) and a maximum probable of 12.7 maf (118% of average) with a most probable projection of 10.83 maf (100% of average).

At the beginning of water year 2014, total system storage in the Colorado River Basin was 29.9 maf (50% of 59.6 maf total system capacity). This is about 4 maf less than the total storage at the beginning of water year 2013 which began at 34.0 maf (57% of capacity). Since the beginning of water year 2000, total Colorado Basin storage has experienced year to year increases and decreases in response to wet and dry hydrology, ranging from a high of 94% of capacity at the beginning of 2000 to a low of 50% of capacity at the beginning of water year 2014. One wet year can significantly increase total system reservoir storage, just as persistent dry years can draw down the system storage. Based on current inflow forecasts, the current projected end of water year 2014 total Colorado Basin reservoir storage is approximately 30.4 maf (51% of capacity). The actual end of water year storage may vary significantly from this projection, primarily due to uncertainty regarding this season's runoff. Based on April minimum and maximum probable inflow forecasts and modeling the range is approximately 28.4 maf (48%) to 33.2 maf (56%), respectively.

June 24-Month Study
Date: June 13, 2014

From: Water Resources Group, Salt Lake City
To: All Colorado River Annual Operating Plan (AOP) Recipients

Current Reservoir Status

Reservoir	May Inflow (unregulated) (acre-feet)	Percent of Average (%)	June 11 Midnight Elevation (feet)	Reservoir Storage (acre-feet)
Fontenelle	272,000	166	6490.47	230,000
Flaming Gorge	333,000	137	6026.43	3,213,000
Blue Mesa	242,000	109	7503.99	695,000
Navajo	176,000	64	6046.77	1,188,000
Powell	2,082,000	89	3600.15	11,764,000

Expected Operations

The operation of Lake Powell and Lake Mead in this June 2014 24-Month Study is pursuant to the December 2007 Record of Decision on Colorado River Interim Guidelines for Lower Basin Shortages and the Coordinated Operations of Lake Powell and Lake Mead (Interim Guidelines), and reflects the 2014 Annual Operating Plan (AOP). Pursuant to the Interim Guidelines, the August 2013 24-Month Study projections of the January 1, 2014, system storage and reservoir water surface elevations set the operational tier for the coordinated operation of Lake Powell and Lake Mead during 2014.

Consistent with Section 6.C.1 of the Interim Guidelines, the Lake Powell operational tier for water year 2014 is the Mid-Elevation Release Tier with an annual release volume of 7.48 maf.

Consistent with Section 2.B.5 of the Interim Guidelines, the Intentionally Created Surplus (ICS) Surplus Condition is the criterion governing the operation of Lake Mead for calendar year 2014.

The Interim Guidelines are available for download at:
http://www.usbr.gov/lc/region/programs/strategies/RecordofDecision.pdf.
The 2014 AOP is available for download at:
http://www.usbr.gov/lc/region/g4000/aop/AOP14.pdf.

Fontenelle Reservoir – Inflows to Fontenelle Reservoir for the month of May were 272,000 acre-feet (AF), or 166 percent of average. The reservoir elevation is 6490 feet, 67 percent of live capacity. Inflows are averaging 8,000 cubic feet per second (cfs). Fontenelle releases are currently at 7,000 cfs and will continue decreasing throughout June and July to base flow levels.

Inflows for the next three months are projected to be above average: with June, July and August forecasted inflow volumes at 550,000 AF (184% of average), 207,000 AF (117% of average), and 85,000 AF (111% of average), respectively.

The next Fontenelle Working Group meeting is scheduled for August 20, 2014, at 10:00 am at the Joint Powers Water Board in Green River, Wyoming. The Fontenelle Working Group is an open public forum for information exchange between Reclamation and other parties associated with the operation of Fontenelle Reservoir.

Flaming Gorge Reservoir – Unregulated inflow into Flaming Gorge Reservoir during the month of May was 333,000 acre-feet (AF), or 137 percent of average. The reservoir elevation is 6,026 feet. Observed inflows are averaging 9,000 cubic feet per second (cfs).

Flaming Gorge releases are currently 8,600 cfs steady maximum releases and are anticipated to remain at this level through June 20, 2014, when releases will begin decreasing to base flows.

Inflows for the next three months are projected to be above average: with June, July and August forecasted inflow volumes at 640,000 AF (164% of average), 219,000 AF (104% of average), and 92,000 AF (104% of average), respectively. The May final forecast of the April-July unregulated inflow volume into Flaming Gorge Reservoir is 1,320,000 AF (135% of average). Based on the May final forecast, the spring hydrologic classification will be average.

The next Flaming Gorge Working Group meeting is scheduled for August 21, 2014, at 11:00 a.m. to be held in the Utah Department of Natural Resources building in Vernal, Utah. The Flaming Gorge Working Group is an open public forum for information exchange between Reclamation and the stake holders of Flaming Gorge Dam. The public is encouraged to attend and comment on the operations and plans presented by Reclamation at these meetings. Meeting notes from past Working Group meetings are posted on the Working Group webpage. For more information on this group and these meetings please contact Ed Vidmar at 801-379-1182.

Aspinall Unit Reservoirs – May unregulated inflow into Blue Mesa Reservoir was 242,000 acre-feet or 109 percent of average. The Gunnison River Basin spring peak occurred later than normal this year. Blue Mesa reached a peak inflow of 8,900 cfs on June 2nd. The basin snowpack is melting very rapidly. The current inflow rate into Blue Mesa Reservoir is about 5,000 cfs while reservoir releases are averaging about 6,500 cfs.

Blue Mesa's present elevation is 7504.00 feet, which corresponds to a storage content of about 695,000 acre-feet. Precipitation during May was 125 percent of average.

The May 1st Water Supply Forecast issued from the River Forecast Center called for a April-July inflow into Blue Mesa Reservoir of 850,000 acre-feet (126% of normal). This set the senior Black Canyon Water Right call for a one day spring peak flow of 6,400 cfs, and the Aspinall ROD target at a 10 day peak flow of 14,350 cfs, and 40 day half-bank flow of 8,070 cfs. At this time Reclamation is attempting to operate the Aspinall Unit to meet both the water right and ROD recommendations. Based on this forecast and the combination of meeting water rights and ROD targets this spring, Blue Mesa Reservoir is not projected fill this runoff season. The projected fill is calculated to be about 7505.00 feet. Any elevation above 7516.00 is considered a fill for the season.

Reservoir releases (Blue Mesa, Morrow, and Crystal) have been set according to reaching ROD flow targets down at the Whitewater gage. System releases started increasing on May 23rd. The current total release from Crystal Dam is now 7,300 cfs. The Gunnison Diversion Tunnel started taking water for the new season on March 27th with the current diversion rate in the tunnel at about 1,000 cfs. This results in a river flow below the diversion tunnel of approximately 6,300 cfs. System releases started to decrease on June 10th. Peak flows in the canyon reached about 9,300 cfs, while peak flows at the Whitewater gage reached 12,500 cfs for about 3-days.

The Black Canyon Water Right was met on June 4th, when releases from Crystal averaged more than 8,400 cfs. The Gunnison Diversion Tunnel was diverting about 1,000 cfs, which resulted in a river flow below the diversion tunnel of approximately 7,400 cfs. Flows at Delta, Colorado reached 10,500 cfs on that same day.

The next meeting of the "Aspinall Unit Working Group" will be held on Thursday, September 4, 2014 starting at 1:00 PM at the Elk Creek Visitor Center at Blue Mesa Reservoir. At this meeting, review of this spring's reservoir operations, and plans for this fall and winter operations will be discussed. These meetings are open forum discussions on the Aspinall Unit reservoir operations with many interested groups participating. Anyone needing further information about these meetings should contact Erik Knight in the Grand Junction Area Office at (970) 248-0629.

Navajo Reservoir – Reclamation has been releasing 300 cfs from Navajo Reservoir since May 27th, 2014. Releases are made for the authorized purposes of the Navajo Unit, and to attempt to maintain a target base flow through the endangered fish critical habitat reach of the San Juan River (Farmington to Lake Powell). The San Juan River Basin Recovery Implementation Program recommends a target base flow of between 500 cfs and 1,000 cfs through the critical habitat area. The target base flow is calculated as the weekly average of gaged flows throughout the critical habitat area.

Navajo was at 6042.68 ft of pool elevation and 1,142,085 acre-ft of storage by the end of May, which was 80% of average for the end of the month. Observed inflow into Navajo

was 140,668 af, (modified-unregulated inflow volume of 175,919 af) which was 65% of average for May. Calculated evaporation for the month was 2,957 acre-ft. Navajo released 250 cfs through the end of the month, and then increased to 300 cfs for mechanical reasons. Navajo Reservoir recorded 0.15 inches of liquid precipitation (15% of average).

As of June 8th, the release at Navajo is 300 cfs, and the observed inflow is 2,147 cfs. The reservoir elevation is 6046.31 ft and the content is 1,182,839 acre-ft, or 70% full (50% of Active) and is still rising. The San Juan River at Four Corners USGS gage is at 3,520 cfs and the Animas River at Farmington USGS gage is at 3,290 cfs.

SNOTEL sites above Navajo are showing an average of 2.10 inches of snow water equivalent (SWE) above Navajo, which is 4% of average (1987-present) for this time of year. SNOTEL data has been erratic and appears to be faulty at this point, however. It is more likely that the SNOTEL gages have melted out at this point.

The most probable modified-unregulated inflow forecast for June at Navajo is 136,000 acre-ft (61% of average), for July is 20,000 acre-ft (30% of average), and for August is 23,000 acre-ft (51% of average). The April-July total inflow forecasts are as follows: min probable inflow forecast is 430,000 acre-ft (58 of average), most probable inflow forecast is 455,000 acre-ft (62% of average), and the max probable inflow forecast is 495,000 acre-ft (67% of average).

Reclamation and SJRIP have agreed to forego a spring peak release for 2014 in the interests of recovering the reservoir and reducing the risk of a shortage. The release will continue to be that which is required to maintain the target base flows downstream.

Glen Canyon Dam / Lake Powell

Current Status

The unregulated inflow volume to Lake Powell in May was 2,082 thousand acre-feet (kaf) (89% of average). The release volume from Glen Canyon Dam in May was 493 kaf. The end of May elevation and storage of Lake Powell were 3,589.4 feet (111 feet from full pool) and 10.76 million acre-feet (maf) (44% of full capacity), respectively. The reservoir elevation is increasing as spring runoff begins to enter the reservoir. Basin-wide snowpack peaked at 111% of median on April 7th and runoff is well underway with less than 10% of the measurable snowpack remaining.

Current Operations

The operating tier for water year 2014 is the Mid-Elevation Release Tier with an annual release volume of 7.48 maf, as established in August 2013 and pursuant to the Interim Guidelines, Section 6.C.1. Reclamation will schedule operations at Glen Canyon Dam to achieve as practicably as possible a 7.48 maf annual release by September 30, 2014.
In June, the release volume will be approximately 600 kaf, with fluctuations between about 7,000 cfs in the nighttime to about 13,000 cfs in the daytime and consistent with

the Glen Canyon Operating Criteria (Federal Register, Volume 62, No. 41, March 3, 1997). In July, the release volume will likely be approximately 800 kaf with daily fluctuations between about 10,000 cfs and 18,000 cfs. The anticipated release volume for August is about 800 kaf with fluctuations between approximately 9,000 cfs and 17,000 cfs.

In addition to daily scheduled fluctuations for power generation, the instantaneous releases from Glen Canyon Dam may also fluctuate to provide 40 MW of system regulation. These instantaneous release adjustments stabilize the electrical generation and transmission system and translate to a range of about 1,200 cfs above or below the hourly scheduled release rate. Under system normal conditions, fluctuations for regulation are typically short lived and generally balance out over the hour with minimal or no noticeable impacts on downstream river flow conditions.

Releases from Glen Canyon Dam can also fluctuate beyond scheduled releases when called upon to respond to unscheduled power outages or power system emergencies. Depending on the severity of the system emergency, the response from Glen Canyon Dam can be significant, within the full range of the operating capacity of the power plant for as long as is necessary to maintain balance in the transmission system. Glen Canyon Dam typically maintains 41MW (approximately 1,200 cfs) of generation capacity in reserve in order to respond to a system emergency even when generation rates are already high. System emergencies occur fairly infrequently and typically require small responses from Glen Canyon Dam. However, these responses can have a noticeable impact on the river downstream of Glen Canyon Dam.

Inflow Forecasts and Model Projections

The forecast for the 2014 April to July water supply season for Lake Powell, issued on June 2, 2014 by the Colorado Basin River Forecast Center, projects that the most probable (median) unregulated inflow volume will be 7.55 maf (105% of average based on the period 1981-2010). The April-July most probable forecast remained the same as last month. The seasonal snowpack peaked on April 7, 2014 at 111% of median and nearly all of the measurable snowpack has now melted. The April-July forecast ranges from a minimum probable of 6.60 maf (92% of average) to a maximum probable of 8.45 maf (118% of average). (For reference, the 30-year April-July average is 7.16 maf.) There is a 10 percent chance that inflows could be higher than the maximum probable and a 10 percent chance they could be lower than the minimum probable.

Based on the current forecast, the June 24-Month study projects Lake Powell elevation will peak near approximately 3,614 feet near the end of July and end the water year near 3,610 feet with approximately 12.7 maf in storage (52% capacity). Note that projections of elevation and storage have uncertainty, primarily due to uncertainty regarding the spring runoff and resulting inflow to Lake Powell. Under the minimum probable inflow scenario, last updated in April, the projected summer peak is 3,599 ft and end of water year storage is 11.0 maf (45% capacity). Under the maximum probable inflow scenario, updated in April, the projected summer peak is 3,632 ft and end of water year storage is 14.9 maf (61% capacity). There is a 10 percent chance that inflows will be higher,

resulting in higher elevation and storage, and 10 percent chance that inflows will be lower, resulting in lower elevation and storage. The annual release volume from Lake Powell during water year 2014 is projected to be 7.48 maf under all inflow scenarios. Consistent with Section 6.C.1 of the Interim Guidelines, the Lake Powell operational tier for water year 2014 is the Mid-Elevation Release Tier with an annual release volume of 7.48 maf. This was determined in the August 2013 24-Month Study and documented in the 2014 Annual Operating Plan signed by Secretary Jewell in December 2013.

Upper Colorado River Basin Hydrology

The Upper Colorado River Basin regularly experiences significant year to year hydrologic variability. During the 14-year period 2000 to 2013, however, the unregulated inflow to Lake Powell, which is a good measure of hydrologic conditions in the Colorado River Basin, was above average in only 3 out of the past 14 years. The period 2000-2013 is the lowest 14-year period since the closure of Glen Canyon Dam in 1963, with an average unregulated inflow of 8.25 maf, or 76% of the 30-year average (1981-2010). (For comparison, the 1981-2010 total water year average is 10.83 maf.) The unregulated inflow during the 2000-2013 period has ranged from a low of 2.64 maf (24% of average) in water year 2002 to a high of 15.97 maf (147% of average) in water year 2011. Under the current forecast, total water year 2014 unregulated inflows to Lake Powell are expected to range between a minimum probable of 9.8 maf (91% of average) and a maximum probable of 11.7 maf (108% of average) with a most probable projection of 10.78 maf (100% of average).

At the beginning of water year 2014, total system storage in the Colorado River Basin was 29.9 maf (50% of 59.6 maf total system capacity). This is about 4 maf less than the total storage at the beginning of water year 2013 which began at 34.0 maf (57% of capacity). Since the beginning of water year 2000, total Colorado Basin storage has experienced year to year increases and decreases in response to wet and dry hydrology, ranging from a high of 94% of capacity at the beginning of 2000 to a low of 50% of capacity at the beginning of water year 2014. One wet year can significantly increase total system reservoir storage, just as persistent dry years can draw down the system storage. Based on current inflow forecasts, the current projected end of water year 2014 total Colorado Basin reservoir storage is approximately 30.4 maf (51% of capacity). The actual end of water year storage may vary significantly from this projection, primarily due to uncertainty regarding this season's runoff. Based on April minimum and maximum probable inflow forecasts and modeling the range is approximately 28.4 maf (48%) to 33.2 maf (56%), respectively.

Navajo	116,000	52	6044.84	1,166,000
Powell	3,039,000	114	3609.61	12,691,000

Expected Operations

The operation of Lake Powell and Lake Mead in this July 2014 24-Month Study is pursuant to the December 2007 Record of Decision on Colorado River Interim Guidelines for Lower Basin Shortages and the Coordinated Operations of Lake Powell and Lake Mead (Interim Guidelines), and reflects the 2014 Annual Operating Plan (AOP). Pursuant to the Interim Guidelines, the August 2013 24-Month Study projections of the January 1, 2014, system storage and reservoir water surface elevations set the operational tier for the coordinated operation of Lake Powell and Lake Mead during 2014.

Consistent with Section 6.C.1 of the Interim Guidelines, the Lake Powell operational tier for water year 2014 is the Mid-Elevation Release Tier with an annual release volume of 7.48 maf.

Consistent with Section 2.B.5 of the Interim Guidelines, the Intentionally Created Surplus (ICS) Surplus Condition is the criterion governing the operation of Lake Mead for calendar year 2014.

The Interim Guidelines are available for download at:
http://www.usbr.gov/lc/region/programs/strategies/RecordofDecision.pdf.
The 2014 AOP is available for download at:
http://www.usbr.gov/lc/region/g4000/aop/AOP14.pdf.

Fontenelle Reservoir – Inflows to Fontenelle Reservoir for the month of June were 427,000 acre-feet (AF), or 143 percent of average. The reservoir elevation is 6500 feet, 86 percent of live capacity. Inflows are averaging 4,000 cubic feet per second (cfs). Fontenelle releases are currently at 1,750 cfs.

Inflows for the next three months are projected to be above average: with July, August and September forecasted inflow volumes at 250,000 AF (141% of average), 80,000 AF (105% of average), and 59,000 AF (129% of average), respectively.

The next Fontenelle Working Group meeting is scheduled for August 20, 2014, at 10:00 am at the Joint Powers Water Board in Green River, Wyoming. The Fontenelle Working Group is an open public forum for information exchange between Reclamation and other parties associated with the operation of Fontenelle Reservoir.

Flaming Gorge Reservoir – Unregulated inflow into Flaming Gorge Reservoir during the month of June was 427,000 acre-feet (AF), or 121 percent of average. The reservoir elevation is 6,028.5 feet. Observed inflows are averaging 2,000 cubic feet per second (cfs).

Flaming Gorge releases are currently 1,675 cfs average daily release with hourly fluctuations for hydropower. The base flow target is to maintain 2,400 cfs on the Green River measured at Jensen, UT. Releases will be increased through September 30th as the Yampa River decreases this summer to maintain flows of 2,400 cfs.

Inflows for the next three months are projected to be above or close to average: with July, August and September forecasted inflow volumes at 257,000 AF (122% of average), 85,000 AF (96% of average), and 62,000 AF (113% of average), respectively. The July final forecast of the April-July unregulated inflow volume into Flaming Gorge Reservoir is 1,190,000 AF (121% of average). .

The next Flaming Gorge Working Group meeting is scheduled for August 21, 2014, at 11:00 a.m. to be held in the Utah Department of Natural Resources building in Vernal, Utah. The Flaming Gorge Working Group is an open public forum for information exchange between Reclamation and the stake holders of Flaming Gorge Dam. The public is encouraged to attend and comment on the operations and plans presented by Reclamation at these meetings. Meeting notes from past Working Group meetings are posted on the Working Group webpage. For more information on this group and these meetings please contact Ed Vidmar at 801-379-1182.

Aspinall Unit Reservoirs – June unregulated inflow into Blue Mesa Reservoir was 361,000 acre-feet or 138 percent of average. Hydrologic conditions in the basin have drier during June. Precipitation during June was only 20 percent of average. The basin snowpack has for the most part has been totally depleted. The current inflow rate into

Blue Mesa Reservoir is about 2,300 cfs while reservoir releases are averaging about 2,200 cfs. Blue Mesa's present elevation is 7500.23 feet, which corresponds to a storage content of about 663,000 acre-feet.

The latest Water Supply Forecast for Water Year 2014 has been issued and the April through July unregulated inflow is forecasted to be at 846,000 acre-feet (125% of average). This is a 4,000 acre-feet decrease from last month's forecast. Based on this runoff forecast and the current elevation of Blue Mesa Reservoir, the reservoir is not expected to fill this year. This year's peak elevation was recorded on June 6th when the reservoir reached elevation 7505.06 feet and a content of 704,000 acre-feet.

Releases from Crystal are currently set at 1,900 cfs. The Gunnison Diversion Tunnel is diverting about 1,000 cfs, which results in a river flow below the diversion tunnel of approximately 900 cfs. These rates will most likely change as conditions warrant, primarily as we respond to changes at the Whitewater gage as flows prescribed in the Aspinall Unit Operations Record of Decision (ROD). The ROD calls for keeping summer base flows at the Whitewater gage at or above 1,500 cfs.

The next meeting of the "Aspinall Unit Working Group" will be held on Thursday, September 4, 2014 starting at 1:00 PM at the Elk Creek Visitor Center at Blue Mesa Reservoir. At this meeting, review of this spring's reservoir operations, and plans for this fall and winter operations will be discussed. These meetings are open forum discussions on the Aspinall Unit reservoir operations with many interested groups participating. Anyone needing further information about these meetings should contact Erik Knight in the Grand Junction Area Office at (970) 248-0629.

Navajo Reservoir – Reclamation has been releasing 350 cfs from Navajo Reservoir since June 23rd, 2014. A shift in the USGS gage at Archuleta, measured by the USGS on July 1st, shows the release to now be 400 cfs. The release was not decreased back to 350 cfs due to forecasted decreasing tributary inflows into the San Juan River. Releases are made for the authorized purposes of the Navajo Unit, and to attempt to maintain a target base flow through the endangered fish critical habitat reach of the San Juan River (Farmington to Lake Powell). The San Juan River Basin Recovery Implementation Program recommends a target base flow of between 500 cfs and 1,000 cfs through the critical habitat area. The target base flow is calculated as the weekly average of gaged flows throughout the critical habitat area.

Navajo was at 6045.8 ft of pool elevation and 1,176,697 acre-ft of storage by the end of June, which was 81% of average for the end of the month. Observed inflow into Navajo was 97,789 af, (modified-unregulated inflow volume of 115,708 af) which was 53% of average for June. Calculated evaporation for the month was 3,745 acre-ft. Navajo released 300 cfs through the end of the month, and then increased to 350 cfs on June 23rd. The USGS made a physical measurement at the Archuleta gage, and updated the gage shift on June 30th, showing the flows to be closer to 400 cfs. Navajo Reservoir recorded 0.04 inches of liquid precipitation (6% of average).

As of June 16th, the release at Navajo (as measured at the USGS at Archuleta gage) is 398 cfs, and the observed inflow is 466 cfs. The reservoir elevation is 6045.64 ft and the content is 1,175,223 acre-ft, or 69% full (49% of Active). The San Juan River at Four Corners USGS gage is at 868 cfs and the Animas River at Farmington USGS gage is at 1,040 cfs. So far, modified unregulated inflow volume into Navajo since April 1 has totaled 415,505 af.

The most probable modified-unregulated inflow forecast for July at Navajo is 10,000 acre-ft (15% of average), for August is 17,000 acre-ft (38% of average), and for September is 23,000 acre-ft (53% of average). The April-July total inflow forecasts are as follows: Min Probable: 420,000 acre-ft (57% of average),Most Probable: 425,000 acre-ft (58% of average), and Max Probable: 445,000 acre-ft (60% of average).

Reclamation and SJRIP agreed to forego a spring peak release for 2014 in the interests of recovering the reservoir and reducing the risk of a shortage. The release will continue to be that which is required to maintain the target base flows downstream.

Glen Canyon Dam / Lake Powell

Current Status
The unregulated inflow volume to Lake Powell in June was 3,039 thousand acre-feet (kaf) (114% of average). The release volume from Glen Canyon Dam in June was 598 kaf. The end of June elevation and storage of Lake Powell were 3,609.2 feet (91 feet from full pool) and 12.65 million acre-feet (maf) (52% of full capacity), respectively. The reservoir elevation is nearing its seasonal peak and will begin decreasing as inflow from spring runoff transitions to baseflows.

Current Operations
The operating tier for water year 2014 is the Mid-Elevation Release Tier with an annual release volume of 7.48 maf, as established in August 2013 and pursuant to the Interim Guidelines, Section 6.C.1. Reclamation will schedule operations at Glen Canyon Dam to achieve as practicably as possible a 7.48 maf annual release by September 30, 2014.

In July, the release volume will be approximately 800 kaf, with fluctuations between about 10,000 cfs in the nighttime to about 18,000 cfs in the daytime and consistent with the Glen Canyon Operating Criteria (Federal Register, Volume 62, No. 41, March 3, 1997). In August, the release volume will likely be approximately 800 kaf with daily fluctuations between about 9,000 cfs and 17,000 cfs. The anticipated release volume for September is about 600 kaf with fluctuations between approximately 7,000 cfs and 13,000 cfs.

In addition to daily scheduled fluctuations for power generation, the instantaneous releases from Glen Canyon Dam may also fluctuate to provide 40 MW of system regulation. These instantaneous release adjustments stabilize the electrical generation and transmission system and translate to a range of about 1,200 cfs above or below the

hourly scheduled release rate. Under system normal conditions, fluctuations for regulation are typically short lived and generally balance out over the hour with minimal or no noticeable impacts on downstream river flow conditions.

Releases from Glen Canyon Dam can also fluctuate beyond scheduled releases when called upon to respond to unscheduled power outages or power system emergencies. Depending on the severity of the system emergency, the response from Glen Canyon Dam can be significant, within the full range of the operating capacity of the power plant for as long as is necessary to maintain balance in the transmission system. Glen Canyon Dam typically maintains 41MW (approximately 1,200 cfs) of generation capacity in reserve in order to respond to a system emergency even when generation rates are already high. System emergencies occur fairly infrequently and typically require small responses from Glen Canyon Dam. However, these responses can have a noticeable impact on the river downstream of Glen Canyon Dam.

Inflow Forecasts and Model Projections

The forecast for the 2014 April to July water supply season for Lake Powell, issued on July 1, 2014, by the Colorado Basin River Forecast Center, projects that the most probable (median) unregulated inflow volume will be 7.09 maf (99% of average based on the period 1981-2010). The April-July most probable forecast decreased by 460 kaf since last month. The seasonal snowpack peaked on April 7, 2014 at 111% of median and now all of the measurable snowpack has now melted.

Based on the current forecast, the July 24-Month study projects Lake Powell elevation will peak near approximately 3,610 feet in July and end the water year near 3,605 feet with approximately 12.25 maf in storage (50% capacity). Note that projections of elevation and storage have uncertainty, primarily due to uncertainty regarding the inflow to Lake Powell. Under the minimum probable inflow scenario, last updated in April, the projected summer peak was 3,599 ft and end of water year storage was 11.0 maf (45% capacity). Under the maximum probable inflow scenario, updated in April, the projected summer peak was 3,632 ft and end of water year storage was 14.9 maf (61% capacity). Under these scenarios, there is a 10 percent chance that inflows will be higher, resulting in higher elevation and storage, and 10 percent chance that inflows will be lower, resulting in lower elevation and storage. The minimum and maximum probable model runs will be updated in August. The annual release volume from Lake Powell during water year 2014 is projected to be 7.48 maf under all inflow scenarios.

Consistent with Section 6.C.1 of the Interim Guidelines, the Lake Powell operational tier for water year 2014 is the Mid-Elevation Release Tier with an annual release volume of 7.48 maf. This was determined in the August 2013 24-Month Study and documented in the 2014 Annual Operating Plan signed by Secretary Jewell in December 2013.

Upper Colorado River Basin Hydrology

The Upper Colorado River Basin regularly experiences significant year to year hydrologic variability. During the 14-year period 2000 to 2013, however, the unregulated inflow to Lake Powell, which is a good measure of hydrologic conditions in

the Colorado River Basin, was above average in only 3 out of the past 14 years. The period 2000-2013 is the lowest 14-year period since the closure of Glen Canyon Dam in 1963, with an average unregulated inflow of 8.25 maf, or 76% of the 30-year average (1981-2010). (For comparison, the 1981-2010 total water year average is 10.83 maf.) The unregulated inflow during the 2000-2013 period has ranged from a low of 2.64 maf (24% of average) in water year 2002 to a high of 15.97 maf (147% of average) in water year 2011. Under the current most probable forecast, total water year 2014 unregulated inflows to Lake Powell is projected to be 10.31 maf (95% of average).

At the beginning of water year 2014, total system storage in the Colorado River Basin was 29.9 maf (50% of 59.6 maf total system capacity). This is about 4 maf less than the total storage at the beginning of water year 2013 which began at 34.0 maf (57% of capacity). Since the beginning of water year 2000, total Colorado Basin storage has experienced year to year increases and decreases in response to wet and dry hydrology, ranging from a high of 94% of capacity at the beginning of 2000 to a low of 50% of capacity at the beginning of water year 2014. One wet year can significantly increase total system reservoir storage, just as persistent dry years can draw down the system storage. Based on current inflow forecasts, the current projected end of water year 2014 total Colorado Basin reservoir storage is approximately 29.8 maf (50% of capacity). The actual end of water year storage may vary from this projection, primarily due to uncertainty regarding inflow to Lake Powell. Based on April minimum and maximum probable inflow forecasts and modeling the range is approximately 28.4 maf (48%) to 33.2 maf (56%), respectively.

August 24-Month Study
Date: August 13, 2014

From: Water Resources Group, Salt Lake City
To: All Colorado River Annual Operating Plan (AOP) Recipients

Current Reservoir Status

Reservoir	July Inflow (unregulated) (acre-feet)	Percent of Average (%)	August 12 Midnight Elevation (feet)	Reservoir Storage (acre-feet)
Fontenelle	220,000	124	6505.65	342,000
Flaming Gorge	226,000	107	6028.67	3,298,000
Blue Mesa	117,000	118	7499.36	656,000
Navajo	13,000	20	6040.40	1,117,000
Powell	838,000	77	3607.34	12,464,000

Expected Operations

The operation of Lake Powell and Lake Mead in this August 2014 24-Month Study is pursuant to the December 2007 Record of Decision on Colorado River Interim Guidelines for Lower Basin Shortages and the Coordinated Operations of Lake Powell and Lake Mead (Interim Guidelines), and reflects the 2014 Annual Operating Plan (AOP). Pursuant to the Interim Guidelines, the August 2013 24-Month Study projections of the January 1, 2014, system storage and reservoir water surface elevations set the operational tier for the coordinated operation of Lake Powell and Lake Mead during 2014.

Consistent with Section 6.C.1 of the Interim Guidelines, the Lake Powell operational tier for water year 2014 is the Mid-Elevation Release Tier with an annual release volume of 7.48 maf.

Consistent with Section 2.B.5 of the Interim Guidelines, the Intentionally Created Surplus (ICS) Surplus Condition is the criterion governing the operation of Lake Mead for calendar year 2014.

This August 24-Month study projects the January 1, 2015 Lake Powell elevation will be 3,596.62 feet, which is below the 2015 Equalization Elevation of 3,649 feet and above elevation 3,575 feet. Consistent with Section 6.B of the Interim Guidelines, Lake Powell's operations in water year 2015 will be governed by the Upper Elevation Balancing Tier, with an initial water year release volume of 8.23 maf and the potential for

an April adjustment to equalization or balancing releases in April 2015. Consistent with Section 6.B.4 of the Interim Guidelines, an April adjustment to balancing releases is projected to occur and Lake Powell is currently projected to release 9.0 maf in water year 2015. This determination will be documented in the 2015 AOP, which is currently in the final stages of development.

The Interim Guidelines are available for download at:
http://www.usbr.gov/lc/region/programs/strategies/RecordofDecision.pdf.
The 2014 AOP is available for download at:
http://www.usbr.gov/lc/region/g4000/aop/AOP14.pdf.

Fontenelle Reservoir – Inflows to Fontenelle Reservoir for the month of July were 220,000 acre-feet (AF), or 124 percent of average. The reservoir elevation is 6505.6 feet, 99 percent of live capacity. Inflows are averaging 1,800 cubic feet per second (cfs). Fontenelle releases are currently at 1,750 cfs.

Inflows for the next three months are projected to be above average: with August, September and October forecasted inflow volumes at 85,000 AF (111% of average), 59,000 AF (129% of average), and 55,000 AF (113% of average), respectively.

The next Fontenelle Working Group meeting is scheduled for August 20, 2014, at 10:00 am at the Joint Powers Water Board in Green River, Wyoming. The Fontenelle Working Group is an open public forum for information exchange between Reclamation and other parties associated with the operation of Fontenelle Reservoir.

Flaming Gorge Reservoir – Unregulated inflow into Flaming Gorge Reservoir during the month of July was 226,000 acre-feet (AF), or 107 percent of average. The reservoir elevation is 6,028.7 feet. Observed inflows are averaging 2,600 cubic feet per second (cfs).

Flaming Gorge releases are currently 2,000 cfs average daily release with hourly fluctuations for hydropower. The base flow target is to maintain 2,400 cfs on the Green River measured at Jensen, UT.

Inflows for the next three months are projected to be above or close to average: with August, September and October forecasted inflow volumes at 90,000 AF (102% of average), 60,000 AF (109% of average), and 61,000 AF (103% of average), respectively. The August preliminary observed forecast of the April-July unregulated inflow volume into Flaming Gorge Reservoir is 1,159,000 AF (118% of average).

The next Flaming Gorge Working Group meeting is scheduled for August 21, 2014, at 11:00 a.m. to be held in the Utah Department of Natural Resources building in Vernal, Utah. The Flaming Gorge Working Group is an open public forum for information exchange between Reclamation and the stake holders of Flaming Gorge Dam. The public is encouraged to attend and comment on the operations and plans presented by

Reclamation at these meetings. Meeting notes from past Working Group meetings are posted on the Working Group webpage. For more information on this group and these meetings please contact Ed Vidmar at 801-379-1182.

Aspinall Unit Reservoirs – July unregulated inflow into Blue Mesa Reservoir was 117,000 acre-feet or 100 percent of average. Hydrologic conditions in the basin had a break from the dry conditions as summer thunderstorms brought in some much needed precipitation during the latter part of the month. May, June, and July precipitation was 130, 20, and 95 percent of average respectively. The current inflow rate into Blue Mesa Reservoir is about 1600 cfs while reservoir releases are averaging about 1,700 cfs.

Blue Mesa's present elevation is 7500.15 feet, which corresponds to a storage content of about 663,000 acre-feet. The observed April through July runoff into Blue Mesa Reservoir was recorded at 849,000 acre-feet, or 126 percent of average. The reservoir reached a high elevation of 7505.06 feet on June 6, 2014, which was approximately 14.4 feet below "full" pool. Full pool is defined by the top of the spillway gates at elevation 7519.4 feet. Rarely is the reservoir filled to that level due to safety. For practical purposes; the reservoir is considered full at elevations above 7516.4 feet.

Releases from Crystal are currently set at 1800 cfs. The Gunnison Diversion Tunnel is diverting about 1050 cfs, which results in a river flow below the diversion tunnel of approximately 750 cfs. These rates will most likely change as conditions warrant, primarily as we respond to changes at the Whitewater gage as flows prescribed in the Aspinall Unit Operations Record of Decision (ROD). The ROD calls for keeping flows at the Whitewater gage at or above 1500 cfs until the end of August.

The next meeting of the "Aspinall Unit Working Group" will be held on Thursday, September 4, 2014 starting at 1:00 PM at the Elk Creek Visitor Center at Blue Mesa Reservoir. At this meeting, review of this spring's reservoir operations, and plans for this fall and winter operations will be discussed. These meetings are open forum discussions on the Aspinall Unit reservoir operations with many interested groups participating. Anyone needing further information about these meetings should contact Erik Knight in the Grand Junction Area Office at (970) 248-0629.

Navajo Reservoir – Reclamation has been releasing 550 cfs from Navajo Reservoir since August 5th, 2014. Releases are made for the authorized purposes of the Navajo Unit, and to attempt to maintain a target base flow through the endangered fish critical habitat reach of the San Juan River (Farmington to Lake Powell). The San Juan River Basin Recovery Implementation Program recommends a target base flow of between 500 cfs and 1,000 cfs through the critical habitat area. The target base flow is calculated as the weekly average of gaged flows throughout the critical habitat area.

Navajo was at 6042.0 ft of pool elevation and 1,134,920 acre-ft of storage by the end of July, which was 80% of average for the end of the month. Observed inflow into Navajo was 33,941 af, (modified-unregulated inflow volume of 13,102 af) which was 46% of average for July. Calculated evaporation for the month was 3,868 acre-ft. Navajo

released 350 cfs through mid-month, and then increased to a high of 750 cfs by the end of July. Navajo Reservoir recorded 0.48 inches of liquid precipitation (39% of average). NIIP diverted a total of 44,119 in July (134% of average for July) and has diverted a total of 140,215 since the beginning of the year. Total April-July modified-unregulated inflow into Navajo was 428,086 af (58% of average).

As of August 4th, the release at Navajo (as measured at the USGS at Archuleta gage) was 706 cfs, and the observed inflow was 574 cfs. NIIP is diverting 662 cfs. The reservoir elevation was 6041.55 ft and the content is 1,129,654 acre-ft, or 66% full (45% of Active). The San Juan River at Four Corners USGS gage was at 1170 cfs and the Animas River at Farmington USGS gage was at 529 cfs. The release decreased to 550 cfs on August 4th at 11pm.

The most probable modified-unregulated inflow forecast for August at Navajo is 23,000 acre-ft (51% of average), for September is 25,000 acre-ft (58% of average), and for October is 29,000 acre-ft (62% of average).

Reclamation and SJRIP agreed to forego a spring peak release for 2014 in the interests of recovering the reservoir and reducing the risk of a shortage. The release will continue to be that which is required to maintain the target base flows downstream. The next public operations meeting will be held on Tuesday, August 26th, 2014 at the Farmington Civic Center at 1pm.

Glen Canyon Dam / Lake Powell

Current Status

The unregulated inflow volume to Lake Powell in July was 838 thousand acre-feet (kaf) (77% of average). The release volume from Glen Canyon Dam in July was 800 kaf. The end of July elevation and storage of Lake Powell were 3,608.1 feet (92 feet from full pool) and 12.54 million acre-feet (maf) (52% of full capacity), respectively. The reservoir elevation reached it seasonal peak of 3,609.7 feet on July 7, 2014 and is now declining. The reservoir elevation is expected to continue to decline until spring 2015. The April to July unregulated inflow volume to Lake Powell was 6,923 kaf (97% of average).

Current Operations

The operating tier for water year 2014 is the Mid-Elevation Release Tier with an annual release volume of 7.48 maf, as established in August 2013 and pursuant to the Interim Guidelines, Section 6.C.1. Reclamation will schedule operations at Glen Canyon Dam to achieve as practicably as possible a 7.48 maf annual release by September 30, 2014. In August, the release volume will be approximately 800 kaf, with fluctuations between about 9,000 cfs in the nighttime to about 17,000 cfs in the daytime and consistent with the Glen Canyon Operating Criteria (Federal Register, Volume 62, No. 41, March 3, 1997). In September, the release volume will likely be approximately 600 kaf with daily fluctuations between about 7,000 cfs and 13,000 cfs. The anticipated release volume for

October is about 600 kaf with fluctuations between approximately 7,000 cfs and 13,000 cfs.

In addition to daily scheduled fluctuations for power generation, the instantaneous releases from Glen Canyon Dam may also fluctuate to provide 40 MW of system regulation. These instantaneous release adjustments stabilize the electrical generation and transmission system and translate to a range of about 1,200 cfs above or below the hourly scheduled release rate. Under system normal conditions, fluctuations for regulation are typically short lived and generally balance out over the hour with minimal or no noticeable impacts on downstream river flow conditions.

Releases from Glen Canyon Dam can also fluctuate beyond scheduled releases when called upon to respond to unscheduled power outages or power system emergencies. Depending on the severity of the system emergency, the response from Glen Canyon Dam can be significant, within the full range of the operating capacity of the power plant for as long as is necessary to maintain balance in the transmission system. Glen Canyon Dam typically maintains 41MW (approximately 1,200 cfs) of generation capacity in reserve in order to respond to a system emergency even when generation rates are already high. System emergencies occur fairly infrequently and typically require small responses from Glen Canyon Dam. However, these responses can have a noticeable impact on the river downstream of Glen Canyon Dam.

Inflow Forecasts and Model Projections

The forecast for water year 2014 unregulated inflow to Lake Powell, issued on August 1, 2014, by the Colorado Basin River Forecast Center, projects that the most probable (median) unregulated inflow volume will be 10.15 maf (94% of average based on the period 1981-2010). The April to July unregulated inflow volume was 6,923 kaf (97% of average).

Based on the current forecast, the August 24-Month study projects Lake Powell elevation will end the water year near 3,604 feet with approximately 12.11 maf in storage (50% capacity). Note that projections of elevation and storage have uncertainty, primarily due to uncertainty regarding the inflow to Lake Powell. Under these scenarios, there is a 10 percent chance that inflows will be higher, resulting in higher elevation and storage, and 10 percent chance that inflows will be lower, resulting in lower elevation and storage. The annual release volume from Lake Powell during water year 2014 is projected to be 7.48 maf under all inflow scenarios.

Consistent with Section 6.C.1 of the Interim Guidelines, the Lake Powell operational tier for water year 2014 is the Mid-Elevation Release Tier with an annual release volume of 7.48 maf. This was determined in the August 2013 24-Month Study and documented in the 2014 Annual Operating Plan signed by Secretary Jewell in December 2013.
This August 24-Month study projects the January 1, 2015 Lake Powell elevation will be 3,596.62 feet, which is below the 2015 Equalization Elevation of 3,649 feet and above elevation 3,575 feet. Consistent with Section 6.B of the Interim Guidelines, Lake Powell's operations in water year 2015 will be governed by the Upper Elevation

Balancing Tier, with an initial water year release volume of 8.23 maf and the potential for an April adjustment to equalization or balancing releases in April 2015. Consistent with Section 6.B.4 of the Interim Guidelines, an April adjustment to balancing releases is projected to occur and Lake Powell is currently projected to release 9.0 maf in water year 2015. This determination will be documented in the 2015 AOP, which is currently in the final stages of development.

Upper Colorado River Basin Hydrology

The Upper Colorado River Basin regularly experiences significant year to year hydrologic variability. During the 14-year period 2000 to 2013, however, the unregulated inflow to Lake Powell, which is a good measure of hydrologic conditions in the Colorado River Basin, was above average in only 3 out of the past 14 years. The period 2000-2013 is the lowest 14-year period since the closure of Glen Canyon Dam in 1963, with an average unregulated inflow of 8.25 maf, or 76% of the 30-year average (1981-2010). (For comparison, the 1981-2010 total water year average is 10.83 maf.) The unregulated inflow during the 2000-2013 period has ranged from a low of 2.64 maf (24% of average) in water year 2002 to a high of 15.97 maf (147% of average) in water year 2011. Under the current most probable forecast, total water year 2014 unregulated inflows to Lake Powell is projected to be 10.15 maf (94% of average).

At the beginning of water year 2014, total system storage in the Colorado River Basin was 29.9 maf (50% of 59.6 maf total system capacity). This is about 4 maf less than the total storage at the beginning of water year 2013 which began at 34.0 maf (57% of capacity). Since the beginning of water year 2000, total Colorado Basin storage has experienced year to year increases and decreases in response to wet and dry hydrology, ranging from a high of 94% of capacity at the beginning of 2000 to a low of 50% of capacity at the beginning of water year 2014. One wet year can significantly increase total system reservoir storage, just as persistent dry years can draw down the system storage. Based on current inflow forecasts, the current projected end of water year 2014 total Colorado Basin reservoir storage is approximately 29.7 maf (50% of capacity). The actual end of water year storage may vary from this projection, primarily due to uncertainty regarding inflow to Lake Powell.

September 24-Month Study
Date: September 11, 2014

From: Water Resources Group, Salt Lake City
To: All Colorado River Annual Operating Plan (AOP) Recipients

Current Reservoir Status

Reservoir	August Inflow (unregulated) (acre-feet)	Percent of Average (%)	September 8 Midnight Elevation (feet)	Reservoir Storage (acre-feet)
Fontenelle	98,000	128	6503.60	326,000
Flaming Gorge	126,000	142	6028.39	3,287,000
Blue Mesa	64,000	101	7494.60	618,000
Navajo	15,800	35	6036.33	1,074,000
Powell	517,000	103	3605.70	12,302,000

Expected Operations

The operation of Lake Powell and Lake Mead in this September 2014 24-Month Study is pursuant to the December 2007 Record of Decision on Colorado River Interim Guidelines for Lower Basin Shortages and the Coordinated Operations of Lake Powell and Lake Mead (Interim Guidelines), and reflects the 2014 Annual Operating Plan (AOP). Pursuant to the Interim Guidelines, the August 2013 24-Month Study projections of the January 1, 2014, system storage and reservoir water surface elevations set the operational tier for the coordinated operation of Lake Powell and Lake Mead during 2014.

Consistent with Section 6.C.1 of the Interim Guidelines, the Lake Powell operational tier for water year 2014 is the Mid-Elevation Release Tier with an annual release volume of 7.48 maf.

Consistent with Section 2.B.5 of the Interim Guidelines, the Intentionally Created Surplus (ICS) Surplus Condition is the criterion governing the operation of Lake Mead for calendar year 2014.

The August 2014 24-Month study projected the January 1, 2015 Lake Powell elevation to be 3,596.62 feet, which is below the 2015 Equalization Elevation of 3,649 feet and above elevation 3,575 feet. Consistent with Section 6.B of the Interim Guidelines, Lake Powell's operations in water year 2015 will be governed by the Upper Elevation

Balancing Tier, with an initial water year release volume of 8.23 maf and the potential for an April adjustment to equalization or balancing releases in April 2015.

This September 2014 24-Month Study projects that, consistent with Section 6.B.4 of the Interim Guidelines, an April adjustment to balancing releases is likely to occur and Lake Powell is currently projected to release 9.0 maf in water year 2015.

Consistent with the August 2014 24-Month Study and with Section 2.B.5 of the Interim Guidelines, the Intentionally Created Surplus (ICS) Surplus Condition is the criterion governing the operation of Lake Mead for calendar year 2015.

The tier determinations will be documented in the 2015 AOP, which is currently in the final stages of development.

The Interim Guidelines are available for download at:
http://www.usbr.gov/lc/region/programs/strategies/RecordofDecision.pdf.
The 2014 AOP is available for download at:
http://www.usbr.gov/lc/region/g4000/aop/AOP14.pdf.

Fontenelle Reservoir – Inflows to Fontenelle Reservoir for the month of August were 98,000 acre-feet (AF), or 128 percent of average. The reservoir elevation is 6503.6 feet, 96 percent of live capacity. Inflows are averaging 1,100 cubic feet per second (cfs). Fontenelle releases are currently at 1,750 cfs.

Inflows for the next three months are projected to be above average: with September, October and November forecasted inflow volumes at 62,000 AF (135% of average), 58,000 AF (119% of average), and 51,000 AF (121% of average), respectively.

The next Fontenelle Working Group meeting is scheduled for April 22, 2015, at 10:00 am at Seedskadee Wildlife Refuge in Green River, Wyoming. The Fontenelle Working Group is an open public forum for information exchange between Reclamation and other parties associated with the operation of Fontenelle Reservoir.

Flaming Gorge Reservoir – Unregulated inflow into Flaming Gorge Reservoir during the month of August was 126,000 acre-feet (AF), or 142 percent of average. The reservoir elevation is 6,028.3 feet. Observed inflows are averaging 1,500 cubic feet per second (cfs).

Flaming Gorge releases are currently 2,000 cfs average daily release with hourly fluctuations for hydropower. The base flow target is to maintain 2,400 cfs on the Green River measured at Jensen, UT.

Inflows for the next three months are projected to be above average: with September, October and November forecasted inflow volumes at 72,000 AF (131% of average), 66,000 AF (112% of average), and 62,000 AF (121% of average), respectively. The

August observed forecast of the April-July unregulated inflow volume into Flaming Gorge Reservoir is 1,159,000 AF (118% of average).

The next Flaming Gorge Working Group meeting is scheduled for April 23, 2015, at 11:00 a.m. to be held in the Utah Department of Natural Resources building in Vernal, Utah. The Flaming Gorge Working Group is an open public forum for information exchange between Reclamation and the stake holders of Flaming Gorge Dam. The public is encouraged to attend and comment on the operations and plans presented by Reclamation at these meetings. Meeting notes from past Working Group meetings are posted on the Working Group webpage. For more information on this group and these meetings please contact Heather Patno at 801-524-3883.

Aspinall Unit Reservoirs – August unregulated inflow into Blue Mesa Reservoir was 64,000 acre-feet or 101 percent of average. Hydrologic conditions continue to improve across the basin with above average precipitation for the month. June, July, August precipitation was 20, 110, and 135 percent of average respectively. The current inflow rate into Blue Mesa Reservoir is about 800 cfs while reservoir releases are averaging about 1,300 cfs.

Blue Mesa's present elevation is 7494.60 feet, which corresponds to a storage content of about 618,000 acre-feet. The observed April through July runoff into Blue Mesa Reservoir was recorded at 849,000 acre-feet, or 126 percent of average. The reservoir reached a high elevation of 7505.06 feet on June 6, 2014, which was approximately 14.4 feet below "full" pool. Full pool is defined by the top of the spillway gates at elevation 7519.4 feet. Rarely is the reservoir filled to that level due to safety. For practical purposes; the reservoir is considered full at elevations above 7516.4 feet.

Releases from Crystal are currently set at 1450 cfs. The Gunnison Diversion Tunnel is diverting about 1050 cfs, which results in a river flow below the diversion tunnel of approximately 400 cfs. These rates will most likely change as conditions warrant, primarily as we respond to changes at the Whitewater gage as flows prescribed in the Aspinall Unit Operations Record of Decision (ROD). The ROD calls for keeping base flows at the Whitewater gage at or above 1050 cfs during September through April.

The last meeting of the "Aspinall Unit Working Group" was held on Thursday, September 4, 2014 at the Elk Creek Visitors Center at Blue Mesa Reservoir. At this meeting, review of this spring's reservoir operations, and plans for this summer and fall operations were discussed. These meetings are open forum discussions on the Aspinall Unit reservoir operations with many interested groups participating. Anyone needing further information about these meetings should contact Erik Knight in the Grand Junction Area Office at (970) 248-0629.

Navajo Reservoir – Reclamation has been releasing 650 cfs from Navajo Reservoir since September 2nd, 2014. Releases are made for the authorized purposes of the Navajo Unit, and to attempt to maintain a target base flow through the endangered fish critical habitat reach of the San Juan River (Farmington to Lake Powell). The San Juan River Basin

Recovery Implementation Program recommends a target base flow of between 500 cfs and 1,000 cfs through the critical habitat area. The target base flow is calculated as the weekly average of gaged flows throughout the critical habitat area.

Navajo was at 6037.7 ft of pool elevation and 1,088,371 acre-ft of storage by the end of August, which was 78% of average for the end of the month. Observed inflow into Navajo was 33,660 af, (modified-unregulated inflow volume of 15,800 af) which was 54% of average for August. Calculated evaporation for the month was 3,052 acre-ft. Navajo's releases varied between 550 cfs and 750cfs, taking advantage of rainstorms when possible to save water. Over the month, the released averaged out at 700 cfs. Navajo Reservoir recorded 1.40 inches of liquid precipitation (74% of average). NIIP diverted a total of 36,695 and has diverted a total of 176,910 af since the beginning of the year. Total April-July modified-unregulated inflow into Navajo was 428,086 af (58% of average).

As of September 2nd, the release at Navajo (as measured at the USGS at Archuleta gage) was 558 cfs, and the observed inflow was 351 cfs. NIIP was diverting 606 cfs. The reservoir elevation is 6037.40 ft and the content is 1,084,973 acre-ft, or 64% full (41% of Active). The San Juan River at Four Corners USGS gage is at 484 cfs, and the Animas River at Farmington USGS gage is at 173 cfs. The release at Navajo was increased to 650cfs at 11pm on September 2nd.

The most probable modified-unregulated inflow forecast for September at Navajo is 17,000 acre-ft (39% of average), for October is 25,000 acre-ft (53% of average), and for November is 25,000 acre-ft (75% of average). The reservoir is forecast to reach a minimum overwinter storage level of:

- Minimum Probable: 6024 ft/954,027 af
- Most Probable: 6035 ft/1,056,731 af
- Max Probable: 6037 ft/1,075,809 af

Reclamation and SJRIP agreed to forego a spring peak release for 2014 in the interests of recovering the reservoir and reducing the risk of a shortage. The release will continue to be that which is required to maintain the target base flows downstream. The last public operations meeting was held on August 26th at the Farmington Civic Center. Meeting notes are available on the USBR website. The next operations meeting is scheduled for Tuesday, January 20th 2015.

Glen Canyon Dam / Lake Powell

Current Status

The unregulated inflow volume to Lake Powell in August was 517 thousand acre-feet (kaf) (103% of average). The release volume from Glen Canyon Dam in August was 801 kaf. The end of August elevation and storage of Lake Powell were 3,605.8 feet (94 feet from full pool) and 12.31 million acre-feet (maf) (51% of full capacity), respectively. The reservoir elevation reached it seasonal peak of 3,609.7 feet on July 7, 2014 and is

now declining. The reservoir elevation is expected to continue to decline until spring 2015. The April to July unregulated inflow volume to Lake Powell was 6,923 kaf (97% of average).

Current Operations

The operating tier for water year 2014 is the Mid-Elevation Release Tier with an annual release volume of 7.48 maf, as established in August 2013 and pursuant to the Interim Guidelines, Section 6.C.1. Reclamation will schedule operations at Glen Canyon Dam to achieve as practicably as possible a 7.48 maf annual release by September 30, 2014. In September, the release volume will be approximately 600 kaf, with fluctuations between about 6,500 cfs in the nighttime to about 12,500 cfs in the daytime and consistent with the Glen Canyon Operating Criteria (Federal Register, Volume 62, No. 41, March 3, 1997). In October, the release volume will likely be approximately 600 kaf with daily fluctuations between about 7,000 cfs and 13,000 cfs. The anticipated release volume for November is about 600 kaf with fluctuations between approximately 7,000 cfs and 13,000 cfs.

In addition to daily scheduled fluctuations for power generation, the instantaneous releases from Glen Canyon Dam may also fluctuate to provide 40 MW of system regulation. These instantaneous release adjustments stabilize the electrical generation and transmission system and translate to a range of about 1,200 cfs above or below the hourly scheduled release rate. Under system normal conditions, fluctuations for regulation are typically short lived and generally balance out over the hour with minimal or no noticeable impacts on downstream river flow conditions.

Releases from Glen Canyon Dam can also fluctuate beyond scheduled releases when called upon to respond to unscheduled power outages or power system emergencies. Depending on the severity of the system emergency, the response from Glen Canyon Dam can be significant, within the full range of the operating capacity of the power plant for as long as is necessary to maintain balance in the transmission system. Glen Canyon Dam typically maintains 41MW (approximately 1,200 cfs) of generation capacity in reserve in order to respond to a system emergency even when generation rates are already high. System emergencies occur fairly infrequently and typically require small responses from Glen Canyon Dam. However, these responses can have a noticeable impact on the river downstream of Glen Canyon Dam.

Inflow Forecasts and Model Projections

The forecast for water year 2014 unregulated inflow to Lake Powell, issued on September 1, 2014, by the Colorado Basin River Forecast Center, projects that the most probable (median) unregulated inflow volume will be 10.27 maf (95% of average based on the period 1981-2010). The April to July unregulated inflow volume was 6,923 kaf (97% of average).

Based on the current forecast, the September 24-Month study projects Lake Powell elevation will end the water year near 3,605 feet with approximately 12.19 maf in storage (50% capacity). Note that projections of elevation and storage have uncertainty,

primarily due to uncertainty regarding the inflow to Lake Powell. The annual release volume from Lake Powell during water year 2014 is projected to be 7.48 maf under all inflow scenarios.

Consistent with Section 6.C.1 of the Interim Guidelines, the Lake Powell operational tier for water year 2014 is the Mid-Elevation Release Tier with an annual release volume of 7.48 maf. This was determined in the August 2013 24-Month Study and documented in the 2014 Annual Operating Plan signed by Secretary Jewell in December 2013.

The August 2014 24-Month study projected the January 1, 2015 Lake Powell elevation will be below the 2015 Equalization Elevation feet and above elevation 3,575 feet. Therefore, consistent with Section 6.B of the Interim Guidelines, Lake Powell's operations in water year 2015 will be governed by the Upper Elevation Balancing Tier, with an initial water year release volume of 8.23 maf and the potential for an April adjustment to equalization or balancing releases in April 2015. An April adjustment to balancing releases is projected to occur and Lake Powell is currently projected to release 9.0 maf in water year 2015. This determination will be documented in the 2015 AOP, which is currently in the final stages of development.

Upper Colorado River Basin Hydrology

The Upper Colorado River Basin regularly experiences significant year to year hydrologic variability. During the 14-year period 2000 to 2013, however, the unregulated inflow to Lake Powell, which is a good measure of hydrologic conditions in the Colorado River Basin, was above average in only 3 out of the past 14 years. The period 2000-2013 is the lowest 14-year period since the closure of Glen Canyon Dam in 1963, with an average unregulated inflow of 8.25 maf, or 76% of the 30-year average (1981-2010). (For comparison, the 1981-2010 total water year average is 10.83 maf.) The unregulated inflow during the 2000-2013 period has ranged from a low of 2.64 maf (24% of average) in water year 2002 to a high of 15.97 maf (147% of average) in water year 2011. Under the current most probable forecast, total water year 2014 unregulated inflows to Lake Powell is projected to be 10.27 maf (95% of average).

At the beginning of water year 2014, total system storage in the Colorado River Basin was 29.9 maf (50% of 59.6 maf total system capacity). This is about 4 maf less than the total storage at the beginning of water year 2013 which began at 34.0 maf (57% of capacity). Since the beginning of water year 2000, total Colorado Basin storage has experienced year to year increases and decreases in response to wet and dry hydrology, ranging from a high of 94% of capacity at the beginning of 2000 to a low of 50% of capacity at the beginning of water year 2014. One wet year can significantly increase total system reservoir storage, just as persistent dry years can draw down the system storage. Based on current inflow forecasts, the current projected end of water year 2014 total Colorado Basin reservoir storage is approximately 29.8 maf (50% of capacity). The actual end of water year storage may vary from this projection, primarily due to uncertainty regarding inflow to Lake Powell.

October 24-Month Study
Date: October 10, 2014

From: Water Resources Group, Salt Lake City
To: All Colorado River Annual Operating Plan (AOP) Recipients

Current Reservoir Status

Reservoir	September Inflow (unregulated) (acre-feet)	Percent of Average (%)	October 7 Midnight Elevation (feet)	Reservoir Storage (acre-feet)
Fontenelle	69,000	150	6503.06	322,000
Flaming Gorge	103,000	187	6028.39	3,287,000
Blue Mesa	48,000	126	7491.53	593,000
Navajo	41,000	95	6038.04	1,092,000
Powell	511,000	125	3606.10	12,342,000

Expected Operations

The operation of Lake Powell and Lake Mead in this October 2014 24-Month Study is pursuant to the December 2007 Record of Decision on Colorado River Interim Guidelines for Lower Basin Shortages and the Coordinated Operations of Lake Powell and Lake Mead (Interim Guidelines), and reflects the 2014 Annual Operating Plan (AOP) and the draft 2015 AOP. Pursuant to the Interim Guidelines, the August 2014 24-Month Study projections of the January 1, 2015, system storage and reservoir water surface elevations set the operational tier for the coordinated operation of Lake Powell and Lake Mead during 2015.

Consistent with Section 6.B of the Interim Guidelines, the Lake Powell operational tier for water year 2015 is the Upper Elevation Balancing Tier, with an initial water year release volume of 8.23 maf and the potential for an April adjustment to equalization or balancing releases in April 2015. This October 2014 24-Month Study projects that, consistent with Section 6.B.4 of the Interim Guidelines, an April adjustment to balancing releases is likely to occur and Lake Powell is currently projected to release 9.0 maf in water year 2015.

Consistent with Section 2.B.5 of the Interim Guidelines, the Intentionally Created Surplus (ICS) Surplus Condition is the criterion governing the operation of Lake Mead for calendar years 2014 and 2015.

The tier determinations will be documented in the 2015 AOP, which is currently in the final stages of development.

The Interim Guidelines are available for download at:
http://www.usbr.gov/lc/region/programs/strategies/RecordofDecision.pdf.
The 2014 AOP is available for download at:
http://www.usbr.gov/lc/region/g4000/aop/AOP14.pdf.
The draft 2015 AOP is available for download at
http://www.usbr.gov/uc/water/rsvrs/ops/aop/AOP15_draft.pdf.

Fontenelle Reservoir – Inflows to Fontenelle Reservoir for the month of September were 69,000 acre-feet (AF), or 150 percent of average. The reservoir elevation is 6503.0 feet, 93 percent of live capacity. Inflows are averaging 1,500 cubic feet per second (cfs). Fontenelle releases are currently at 1,550 cfs and will be decreased to base flow releases of approximately 1,300 cfs by the end of October.

Inflows for the next three months are projected to be above average: with October, November and December forecasted inflow volumes at 85,000 AF (175% of average), 60,000 AF (143% of average), and 40,000 AF (125% of average), respectively.

The next Fontenelle Working Group meeting is scheduled for April 22, 2015, at 10:00 am at Seedskadee Wildlife Refuge in Green River, Wyoming. The Fontenelle Working Group is an open public forum for information exchange between Reclamation and other parties associated with the operation of Fontenelle Reservoir.

Flaming Gorge Reservoir – Unregulated inflow into Flaming Gorge Reservoir during the month of September was 103,000 acre-feet (AF), or 187 percent of average. The reservoir elevation is 6,028.4 feet. Observed inflows are averaging 1,900 cubic feet per second (cfs).

Flaming Gorge releases are decreasing to 1,300 cfs average daily release with hourly fluctuations for hydropower through November. Releases will be increased to an average daily release of approximately 2,000 cfs with fluctuations for hydropower during December through February.

Inflows for the next three months are projected to be above average: with October, November and December forecasted inflow volumes at 105,000 AF (178% of average), 72,000 AF (141% of average), and 48,000 AF (138% of average), respectively. The August observed forecast of the April-July unregulated inflow volume into Flaming Gorge Reservoir is 1,159,000 AF (118% of average).

The next Flaming Gorge Working Group meeting is scheduled for April 23, 2015, at 11:00 a.m. to be held in the Utah Department of Natural Resources building in Vernal, Utah. The Flaming Gorge Working Group is an open public forum for information exchange between Reclamation and the stake holders of Flaming Gorge Dam. The public

is encouraged to attend and comment on the operations and plans presented by Reclamation at these meetings. Meeting notes from past Working Group meetings are posted on the Working Group webpage. For more information on this group and these meetings please contact Heather Patno at 801-524-3883.

Aspinall Unit Reservoirs – September unregulated inflow into Blue Mesa Reservoir was 48,000 acre-feet or 126 percent of average. Precipitation during September was observed to be about 160 percent of average, a welcome relief. The current inflow rate into Blue Mesa Reservoir is about 900 cfs and reservoir releases are averaging about 1300 cfs. Blue Mesa's present elevation is 7491.71 feet, which corresponds to a storage content of about 595,000 acre-feet. The unregulated reservoir inflow into Blue Mesa Reservoir during water year 2014 was 1.145 million acre-feet, or about 120 percent of average.

Releases from Crystal have recently increased to help with the trout survey in the Gunnison River. After the fish survey, Crystal releases will be reduced from 1,550 down to 1350 cfs. Current diversions into the Gunnison Tunnel are approximately 950 cfs. Flows in the Gunnison River below the tunnel are about 650 cfs and will be returning to 450 cfs by October 10th.

Pursuant to the Aspinall Unit Operations Record of Decision (ROD), the baseflow target in the lower Gunnison River, as measured at the Whitewater gage, is 1050 cfs for September through December. Flows in the lower Gunnison River are currently above the baseflow target of 1050 cfs. River flows have remained relatively high due to the September rains and flows are expected to stay above the October baseflow target for the foreseeable future.

The last meeting of the "Aspinall Unit Working Group" was held on Thursday, September 4, 2014 at the Elk Creek Visitors Center at Blue Mesa Reservoir. At this meeting, review of this spring's reservoir operations, and plans for this summer and fall operations were discussed. These meetings are open forum discussions on the Aspinall Unit reservoir operations with many interested groups participating. Anyone needing further information about these meetings should contact Erik Knight in the Grand Junction Area Office at (970) 248-0629.

Navajo Reservoir – Reclamation has been releasing 350 cfs from Navajo Reservoir since September 24th, 2014. Releases are made for the authorized purposes of the Navajo Unit, and to attempt to maintain a target base flow through the endangered fish critical habitat reach of the San Juan River (Farmington to Lake Powell). The San Juan River Basin Recovery Implementation Program recommends a target base flow of between 500 cfs and 1,000 cfs through the critical habitat area. The target base flow is calculated as the weekly average of gaged flows throughout the critical habitat area.

Navajo was at 6037.0 ft of pool elevation and 1,080,632 acre-ft of storage by the end of September, which was 78% of average for the end of the month. Observed inflow into Navajo was 46,919 af, (modified-unregulated inflow volume of 22,978 af) which was 88% of average for September. Calculated evaporation for the month was 2,296 acre-

ft. Navajo's releases varied between 650 cfs at the beginning of the month to a reduction to 350 cfs by the end of the month. Over the month, the released averaged out at 513 cfs. Navajo Reservoir recorded 1.22 inches of liquid precipitation (84% of average). NIIP diverted a total of 21,847 and has diverted a total of 198,757 af since the beginning of the year.

As of October 5th, the release at Navajo (as measured at the USGS at Archuleta gage) was 323 cfs, and the observed inflow is 1074 cfs. NIIP is diverting 144 cfs. The reservoir elevation is 6037.88 ft and the content is 1,090,073 acre-ft, or 64% full (41% of Active). The San Juan River at Four Corners USGS gage is at 1,100 cfs, and the Animas River at Farmington USGS gage is at 1,080 cfs.

The most probable modified-unregulated inflow forecast for October at Navajo is 35,000 acre-ft (74% of average), for November is 25,000 acre-ft (75% of average), and for December is 20,000 acre-ft (80% of average). The reservoir is forecast to reach a minimum overwinter storage level of 6033.98 ft (1,049,232 af) in mid-February.

The last public operations meeting was held on August 26th at the Farmington Civic Center. Meeting notes are available on the USBR website. The next operations meeting is scheduled for Tuesday, January 20th 2015.

Glen Canyon Dam / Lake Powell

Current Status

The unregulated inflow volume to Lake Powell in September was 511 thousand acre-feet (kaf) (125% of average). The release volume from Glen Canyon Dam in September was 604 kaf. The end of September elevation and storage of Lake Powell were 3,605.5 feet (94 feet from full pool) and 12.29 million acre-feet (maf) (51% of full capacity), respectively. The reservoir elevation is now declining and is expected to continue to decline until spring 2015.

The water year 2014 unregulated inflow volume to Lake Powell was 10.381 maf (96% of average), which was significantly higher than inflows observed in 2012 and 2013 (45% and 47% of average, respectively). The end of water year 2014 elevation and storage of Lake Powell were 3,605.5 feet (94 feet from full pool) and 12.29 million acre-feet (maf) (51% of full capacity), respectively. This is 1.4 maf more than the 2013 end of water year storage which was 10.93 maf (45% of capacity), and 14.2 feet higher than the end of 2013 elevation, which was 3591.3 feet.

Releases for water year 2014 totaled 7.480 maf. Pursuant to the Interim Guidelines, Lake Powell operated under the Mid-Elevation Release Tier in 2014. Throughout water year 2014, Reclamation adjusted operations of Glen Canyon Dam to release the appropriate annual volume during 2014 to achieve Mid-Elevation Release Tier objectives as practicably as possible by September 30, 2014.

Current Operations

The operating tier for water year 2015 was established in August 2014 as the Upper Elevation Balancing Tier, with an initial water year release volume of 8.23 maf and the potential for an April adjustment to equalization or balancing releases in April 2015. An April adjustment to balancing releases is projected to occur and Lake Powell is currently projected to release 9.0 maf in water year 2015. Reclamation will schedule operations at Glen Canyon Dam to achieve as practicably as possible the appropriate total annual release volume by September 30, 2014.

In October, the release volume will be approximately 600 kaf, with fluctuations between about 7,000 cfs in the nighttime to about 13,000 cfs in the daytime and consistent with the Glen Canyon Operating Criteria (Federal Register, Volume 62, No. 41, March 3, 1997).

The anticipated release volume for November is 600 kaf with fluctuations for power generation throughout the day consistent with the Glen Canyon Operating Criteria (Federal Register, Volume 62, No. 41, March 3, 1997). However, the release volume may be adjusted in the event of a High Flow Experiment. Under the High-Flow Protocol, high flow releases are linked to sediment input and other resource conditions below Glen Canyon Dam. Preliminary analysis appears favorable for a high flow experimental release to occur during the week of November 9th, 2014. During the High Flow Experiment, total releases from Glen Canyon Dam at full bypass may reach approximately 37,500 cfs for up to 96 hours. The total experiment, including ramping, could last up to about five and a half days. In the event of a high flow experiment, releases from Glen Canyon Dam prior to and after the high flow experiment are anticipated to fluctuate between about 7,000cfs and 9,000cfs. Further data collection, modeling, and analysis prior to the end of October may modify the expected duration and/or magnitude of the HFE. A final determination on the timing, magnitude and duration of a potential fall 2014 HFE will likely be made near the end of October.

In addition to daily scheduled fluctuations for power generation, the instantaneous releases from Glen Canyon Dam may also fluctuate to provide 40 MW of system regulation. These instantaneous release adjustments stabilize the electrical generation and transmission system and translate to a range of about 1,200 cfs above or below the hourly scheduled release rate. Under system normal conditions, fluctuations for regulation are typically short lived and generally balance out over the hour with minimal or no noticeable impacts on downstream river flow conditions.

Releases from Glen Canyon Dam can also fluctuate beyond scheduled releases when called upon to respond to unscheduled power outages or power system emergencies. Depending on the severity of the system emergency, the response from Glen Canyon Dam can be significant, within the full range of the operating capacity of the power plant for as long as is necessary to maintain balance in the transmission system. Glen Canyon Dam typically maintains 41MW (approximately 1,200 cfs) of generation capacity in reserve in order to respond to a system emergency even when generation rates are already high. System emergencies occur fairly infrequently and typically require small responses

from Glen Canyon Dam. However, these responses can have a noticeable impact on the river downstream of Glen Canyon Dam.

Inflow Forecasts and Model Projections

The forecast for water year 2015 unregulated inflow to Lake Powell, issued on October 1, 2014, by the Colorado Basin River Forecast Center, projects that the most probable (median) unregulated inflow volume will be 10.63 maf (98% of average based on the period 1981-2010). At this early point in the season, there is significant uncertainty regarding next year's water supply. The forecast ranges from a minimum probable of 7.4 maf (68% of average) to a maximum probable of 18.6 maf (172% of average). There is 10% chance that inflows could be higher than the maximum probable and a 10% chance they could be lower than the minimum probable.

As determined in the August 2014 24-Month study, Lake Powell's operations in water year 2015 will be governed by the Upper Elevation Balancing Tier, with an initial water year release volume of 8.23 maf and the potential for an April adjustment to equalization or balancing releases in April 2015. An April adjustment to balancing releases is projected to occur and Lake Powell is currently projected to release 9.0 maf in water year 2015. This determination will be documented in the 2015 AOP, which is currently in the final stages of development.

Based on the current forecast, the October 24-Month study projects Lake Powell elevation will end water year 2015 near 3,614 feet with approximately 13.12 maf in storage (54% capacity). Note that projections of elevation and storage have significant uncertainty at this early point in the season, primarily due to uncertainty regarding next season's snowpack and the resulting inflow to Lake Powell. Under the minimum probable inflow scenario, which was updated in October, the projected end of water year elevation and storage are 3589 feet and 10.71 maf (44% capacity), respectively. Under the maximum probable inflow scenario, which was updated in October, the projected end of water year elevation and storage are 3649 feet and 17.09 maf (70% capacity), respectively. The annual release volume from Lake Powell during water year 2015 is projected to be 9.0 maf under the minimum and most probable inflow scenarios and 12.1 maf under the maximum probable inflow scenario. There is a 10% chance that inflows will be higher, potentially resulting in higher releases; and 10% chance that inflows will be lower, potentially resulting in lower releases. If inflows are less than the current forecasted minimum probable inflow, the water year 2015 annual release could be as low as 8.23 maf. If inflows are greater than the current forecasted maximum probable inflow, the annual release could be greater than 12.1 maf.

Upper Colorado River Basin Hydrology

The Upper Colorado River Basin regularly experiences significant year to year hydrologic variability. During the 15-year period 2000 to 2014, however, the unregulated inflow to Lake Powell, which is a good measure of hydrologic conditions in the Colorado River Basin, was above average in only 3 out of the past 15 years. The period 2000-2014 is the lowest 15-year period since the closure of Glen Canyon Dam in 1963, with an average unregulated inflow of 8.20 maf, or 76% of the 30-year average

(1981-2010). (For comparison, the 1981-2010 total water year average is 10.83 maf.) The unregulated inflow during the 2000-2014 period has ranged from a low of 2.64 maf (24% of average) in water year 2002 to a high of 15.97 maf (147% of average) in water year 2011. Under the current most probable forecast, total water year 2015 unregulated inflows to Lake Powell is projected to be 10.63 maf (98% of average).

At the beginning of water year 2015, total system storage in the Colorado River Basin was 30.0 maf (50% of 59.6 maf total system capacity). This is nearly the same as the total storage at the beginning of water year 2014 which began at 29.9 maf (50% of capacity). Since the beginning of water year 2000, total Colorado Basin storage has experienced year to year increases and decreases in response to wet and dry hydrology, ranging from a high of 94% of capacity at the beginning of 2000 to a low of 50% of capacity at the beginning of water year 2014. One wet year can significantly increase total system reservoir storage, just as persistent dry years can draw down the system storage. Based on current inflow forecasts, the current projected end of water year 2015 total Colorado Basin reservoir storage is approximately 30.6 maf (51% of capacity). The actual end of water year storage may vary from this projection, primarily due to uncertainty regarding next season's snowpack and resulting runoff. Based on October minimum and maximum probable inflow forecasts and modeling the range is approximately 27.4 maf (46%) to 38.1 maf (64%), respectively.

November 24-Month Study
Date: November 13, 2014

From: Water Resources Group, Salt Lake City
To: All Colorado River Annual Operating Plan (AOP) Recipients

Current Reservoir Status

Reservoir	October Inflow (unregulated) (acre-feet)	Percent of Average (%)	November 12 Midnight Elevation (feet)	Reservoir Storage (acre-feet)
Fontenelle	85,000	175	6501.08	306,000
Flaming Gorge	105,000	178	6028.65	3,297,000
Blue Mesa	55,000	145	7491.36	592,000
Navajo	68,000	145	6038.58	1,098,000
Powell	715,000	140	3603.92	12,128,000

Expected Operations

The operation of Lake Powell and Lake Mead in this November 2014 24-Month Study is pursuant to the December 2007 Record of Decision on Colorado River Interim Guidelines for Lower Basin Shortages and the Coordinated Operations of Lake Powell and Lake Mead (Interim Guidelines), and reflects the 2014 Annual Operating Plan (AOP) and the draft 2015 AOP. Pursuant to the Interim Guidelines, the August 2014 24-Month Study projections of the January 1, 2015, system storage and reservoir water surface elevations set the operational tier for the coordinated operation of Lake Powell and Lake Mead during 2015.

Consistent with Section 6.B of the Interim Guidelines, the Lake Powell operational tier for water year 2015 is the Upper Elevation Balancing Tier, with an initial water year release volume of 8.23 maf and the potential for an April adjustment to equalization or balancing releases in April 2015. This November 2014 24-Month Study projects that, consistent with Section 6.B.4 of the Interim Guidelines, an April adjustment to balancing releases is likely to occur and Lake Powell is currently projected to release 9.0 maf in water year 2015.

Consistent with Section 2.B.5 of the Interim Guidelines, the Intentionally Created Surplus (ICS) Surplus Condition is the criterion governing the operation of Lake Mead for calendar years 2014 and 2015.

The tier determinations will be documented in the 2015 AOP, which is currently in the final stages of development.

The Interim Guidelines are available for download at:
http://www.usbr.gov/lc/region/programs/strategies/RecordofDecision.pdf.
The 2014 AOP is available for download at:
http://www.usbr.gov/lc/region/g4000/aop/AOP14.pdf.
The draft 2015 AOP is available for download at
http://www.usbr.gov/uc/water/rsvrs/ops/aop/AOP15_draft.pdf.

Fontenelle Reservoir – Inflows to Fontenelle Reservoir for the month of October were 85,000 acre-feet (AF), or 175 percent of average. The reservoir elevation is 6501 feet, 89 percent of live capacity. Inflows are averaging 1,000 cubic feet per second (cfs). Fontenelle releases are currently at 1,250 cfs and will remain at this level through spring.

Inflows for the next three months are projected to be above average: with November, December and January forecasted inflow volumes at 58,000 AF (138% of average), 42,000 AF (131% of average), and 40,000 AF (132% of average), respectively.

The next Fontenelle Working Group meeting is scheduled for April 22, 2015, at 10:00 am at Seedskadee Wildlife Refuge in Green River, Wyoming. The Fontenelle Working Group is an open public forum for information exchange between Reclamation and other parties associated with the operation of Fontenelle Reservoir.

Flaming Gorge Reservoir – Unregulated inflow into Flaming Gorge Reservoir during the month of October was 105,000 acre-feet (AF), or 178 percent of average. The reservoir elevation is 6,028.6 feet. Observed inflows are averaging 1,200 cubic feet per second (cfs).

Flaming Gorge releases are currently 1,300 cfs average daily release with hourly fluctuations for hydropower through November. Releases will be increased to an average daily release of approximately 2,000 cfs with fluctuations for hydropower during December through February.

Inflows for the next three months are projected to be above average: with November, December and January forecasted inflow volumes at 72,000 AF (141% of average), 50,000 AF (143% of average), and 50,000 AF (124% of average), respectively.

The next Flaming Gorge Working Group meeting is scheduled for April 23, 2015, at 11:00 a.m. to be held in the Utah Department of Natural Resources building in Vernal, Utah. The Flaming Gorge Working Group is an open public forum for information exchange between Reclamation and the stake holders of Flaming Gorge Dam. The public is encouraged to attend and comment on the operations and plans presented by Reclamation at these meetings. Meeting notes from past Working Group meetings are

posted on the Working Group webpage. For more information on this group and these meetings please contact Heather Patno at 801-524-3883.

Aspinall Unit Reservoirs – October unregulated inflow into Blue Mesa Reservoir was 55,000 acre-feet or 145 percent of average. Precipitation during October was observed to be about 60 percent of average. The current inflow rate into Blue Mesa Reservoir is about 650 cfs while reservoir releases are averaging about 400 cfs. Blue Mesa's present elevation is 7491.36 feet, which corresponds to a storage content of about 592,000 acre-feet. The unregulated reservoir inflow into Blue Mesa Reservoir during water year 2014 was 1.145 million acre-feet, or about 120 percent of average.

Releases from Crystal are currently set at 350 cfs. The Gunnison Diversion Tunnel was shut down for the season on October 31st, with exception of some small 50 to 100 cfs diversions taken bi-weekly for municipal water needs in Montrose, Colorado. River flows below the tunnel are essentially the same as releases from the Dam. With Blue Mesa Reservoir being above the winter target elevation of 7490 feet, Aspinall reservoir releases maybe increasing over the remainder of November through December to help meet icing target.

Pursuant to the Aspinall Unit Operations Record of Decision (ROD), the baseflow target in the lower Gunnison River, as measured at the Whitewater gage, is 1050 cfs for September through December. Flows in the lower Gunnison River are currently above the baseflow target of 1050 cfs. River flows have remained relatively high due to the September rains and flows are expected to stay above the October baseflow target for the foreseeable future.

On November 3, 2014, the National Weather Service's River Forecasting Center issued its forecasted inflow into Blue Mesa for the next 3 months. The unregulated inflow forecast for November, December, and January is for 90,000 acre-feet, which is 111% of average for these months.

The next operation meeting is scheduled for 1:00 p.m., Thursday, January 22rd, 2015 at the Holiday Inn Express in Montrose, Colorado. At this meeting, review of last summer and fall reservoir operations, and plans for this winter and next spring 2015 operations will be discussed. These meetings are open forum discussions on the Aspinall Unit reservoir operations with many interested groups participating. Anyone needing further information about these meetings should contact Erik Knight in the Grand Junction Area Office at (970) 248-0629.

Navajo Reservoir – Reclamation has been releasing 350 cfs from Navajo Reservoir since September 24th, 2014. Releases are made for the authorized purposes of the Navajo Unit, and to attempt to maintain a target base flow through the endangered fish critical habitat reach of the San Juan River (Farmington to Lake Powell). The San Juan River Basin Recovery Implementation Program recommends a target base flow of between 500 cfs and 1,000 cfs through the critical habitat area. The target base flow is calculated as the weekly average of gaged flows throughout the critical habitat area.

Navajo was at 6038.5 ft of pool elevation and 1,096,364 acre-ft of storage by the end of October, which was 80% of average for the end of the month. Observed inflow into Navajo was 45,972 af, (modified-unregulated inflow volume of 67,803 af) which was 91% of average for October. Calculated evaporation for the month was 1,459 acre-ft. Navajo's release was 350 cfs for the duration of the month. Navajo Reservoir recorded 0.24 inches of liquid precipitation (20% of average). NIIP ceased diversions for the year on October 20th.

As of November 4th, the release at Navajo (as measured at the USGS at Archuleta gage) was 356 cfs, and the observed inflow is 574 cfs. The reservoir elevation is 6038.53 ft and the content is 1,097,005 acre-ft, or 64% full (42% of Active). The San Juan River at Four Corners USGS gage is at 940 cfs, and the Animas River at Farmington USGS gage is at 508 cfs

The most probable modified-unregulated inflow forecast* for November at Navajo is 30,000 acre-ft (90% of average), for December is 22,000 acre-ft (88% of average), and for January is 19,000 acre-ft (87% of average). The reservoir is forecast to reach a minimum overwinter storage level of 6037.38 ft (1,084,755 af) in mid-February.

The last public operations meeting was held on August 26th at the Farmington Civic Center. Meeting notes are available on the USBR website. The next operations meeting is scheduled for Tuesday, January 20th 2015.

Glen Canyon Dam / Lake Powell

Current Status
The unregulated inflow volume to Lake Powell in October was 716 thousand acre-feet (kaf) (140% of average). The release volume from Glen Canyon Dam in October was 598 kaf. The end of October elevation and storage of Lake Powell were 3,605.6 feet (94 feet from full pool) and 12.29 million acre-feet (maf) (51% of full capacity), respectively. The reservoir elevation is now declining and is expected to continue to decline until spring 2015.

Current Operations
The operating tier for water year 2015 was established in August 2014 as the Upper Elevation Balancing Tier, with an initial water year release volume of 8.23 maf and the potential for an April adjustment to equalization or balancing releases in April 2015. An April adjustment to balancing releases is projected to occur and Lake Powell is currently projected to release 9.0 maf in water year 2015. Reclamation will schedule operations at Glen Canyon Dam to achieve as practicably as possible the appropriate total annual release volume by September 30, 2015.

On November 10-15, 2014, the Department of Interior is conducting a high flow experimental (HFE) release from Glen Canyon Dam in accordance with the High Flow Protocol (Protocol). Under this Protocol, high flow releases are linked to sediment input

and other resource conditions below Glen Canyon Dam. This HFE will be the third conducted under the Protocol. Beginning on the morning of November 10th, releases from Glen Canyon Dam were increased up to full power plant capacity (approximately 22,500 cfs). At midday on November 10th, bypass tubes at Glen Canyon Dam were opened and releases continued to increase up to full power plant and bypass capacity (approximately 37,500 cfs) by the evening of November 10th. Releases will be maintained at peak release for 4 days (96 hours) and then begin ramping back down. Releases will return to normal operations in the afternoon of November 15th. The entire experiment, including ramping is expected to last 5 and a half days. November releases from Glen Canyon Dam prior to and after the HFE are expected to fluctuate between 6,500cfs and 9,000cfs. The elevation of Lake Powell is expected to decrease approximately 2 ½ to 3 feet during the 5 and a half day experiment. The total release in November, including the HFE, is anticipated to be approximately 770 kaf. The annual release volume from Lake Powell will not change as a result of the HFE.

In December, the release volume will be approximately 866 kaf, with fluctuations anticipated between about 9,500 cfs in the nighttime to about 17,500 cfs in the daytime and consistent with the Glen Canyon Operating Criteria (Federal Register, Volume 62, No. 41, March 3, 1997). The anticipated release volume for January is 866 kaf.

In addition to daily scheduled fluctuations for power generation, the instantaneous releases from Glen Canyon Dam may also fluctuate to provide 40 MW of system regulation. These instantaneous release adjustments stabilize the electrical generation and transmission system and translate to a range of about 1,200 cfs above or below the hourly scheduled release rate. Under system normal conditions, fluctuations for regulation are typically short lived and generally balance out over the hour with minimal or no noticeable impacts on downstream river flow conditions.

Releases from Glen Canyon Dam can also fluctuate beyond scheduled releases when called upon to respond to unscheduled power outages or power system emergencies. Depending on the severity of the system emergency, the response from Glen Canyon Dam can be significant, within the full range of the operating capacity of the power plant for as long as is necessary to maintain balance in the transmission system. Glen Canyon Dam typically maintains 41MW (approximately 1,200 cfs) of generation capacity in reserve in order to respond to a system emergency even when generation rates are already high. System emergencies occur fairly infrequently and typically require small responses from Glen Canyon Dam. However, these responses can have a noticeable impact on the river downstream of Glen Canyon Dam.

Inflow Forecasts and Model Projections

The forecast for water year 2015 unregulated inflow to Lake Powell, issued on November 1, 2014, by the Colorado Basin River Forecast Center, projects that the most probable (median) unregulated inflow volume will be 9.55 maf (88% of average based on the period 1981-2010). This is about a 1 maf decrease from the forecast issued last month. At this early point in the season, there is significant uncertainty regarding next year's water supply. The forecast ranges from a minimum probable of 7.4 maf (68% of

average) to a maximum probable of 18.6 maf (172% of average). There is 10% chance that inflows could be higher than the maximum probable and a 10% chance they could be lower than the minimum probable.

As determined in the August 2014 24-Month Study, Lake Powell's operations in water year 2015 will be governed by the Upper Elevation Balancing Tier, with an initial water year release volume of 8.23 maf and the potential for an April adjustment to equalization or balancing releases in April 2015. An April adjustment to balancing releases is projected to occur and Lake Powell is currently projected to release 9.0 maf in water year 2015. This determination will be documented in the 2015 Annual Operating Plan, which is currently in the final stages of development.

Based on the current forecast, the November 24-Month Study projects Lake Powell elevation will end water year 2015 near 3,603 feet with approximately 12.08 maf in storage (50% capacity). Note that projections of elevation and storage have significant uncertainty at this early point in the season, primarily due to uncertainty regarding next season's snowpack and the resulting inflow to Lake Powell. Under the minimum probable inflow scenario, which was updated in October, the projected end of water year elevation and storage are 3589 feet and 10.71 maf (44% capacity), respectively. Under the maximum probable inflow scenario, which was updated in October, the projected end of water year elevation and storage are 3649 feet and 17.09 maf (70% capacity), respectively. The annual release volume from Lake Powell during water year 2015 is projected to be 9.0 maf under the minimum and most probable inflow scenarios and 12.1 maf under the maximum probable inflow scenario. There is a 10% chance that inflows will be higher, potentially resulting in higher releases; and 10% chance that inflows will be lower, potentially resulting in lower releases. If inflows are less than the current forecasted minimum probable inflow, the water year 2015 annual release could be as low as 8.23 maf. If inflows are greater than the current forecasted maximum probable inflow, the annual release could be greater than 12.1 maf.

Upper Colorado River Basin Hydrology

The Upper Colorado River Basin regularly experiences significant year to year hydrologic variability. During the 15-year period 2000 to 2014, however, the unregulated inflow to Lake Powell, which is a good measure of hydrologic conditions in the Colorado River Basin, was above average in only 3 out of the past 15 years. The period 2000-2014 is the lowest 15-year period since the closure of Glen Canyon Dam in 1963, with an average unregulated inflow of 8.39 maf, or 78% of the 30-year average (1981-2010). (For comparison, the 1981-2010 total water year average is 10.83 maf.) The unregulated inflow during the 2000-2014 period has ranged from a low of 2.64 maf (24% of average) in water year 2002 to a high of 15.97 maf (147% of average) in water year 2011. The water year 2014 unregulated inflow volume to Lake Powell was 10.381 maf (96% of average), which was significantly higher than inflows observed in 2012 and 2013 (45% and 47% of average, respectively). Under the current most probable forecast, total water year 2015 unregulated inflows to Lake Powell is projected to be 9.55 maf (88% of average).

At the beginning of water year 2015, total system storage in the Colorado River Basin was 30.0 maf (50% of 59.6 maf total system capacity). This is nearly the same as the total storage at the beginning of water year 2014 which began at 29.9 maf (50% of capacity). Since the beginning of water year 2000, total Colorado Basin storage has experienced year to year increases and decreases in response to wet and dry hydrology, ranging from a high of 94% of capacity at the beginning of 2000 to a low of 50% of capacity at the beginning of water year 2014. One wet year can significantly increase total system reservoir storage, just as persistent dry years can draw down the system storage. Based on current inflow forecasts, the current projected end of water year 2015 total Colorado Basin reservoir storage is approximately 29.5 maf (50% of capacity). The actual end of water year storage may vary from this projection, primarily due to uncertainty regarding next season's snowpack and resulting runoff. Based on October minimum and maximum probable inflow forecasts and modeling the range is approximately 27.4 maf (46%) to 38.1 maf (64%), respectively.

December 24-Month Study
Date: December 10, 2014

From: Water Resources Group, Salt Lake City
To: All Colorado River Annual Operating Plan (AOP) Recipients

Current Reservoir Status

Reservoir	November Inflow (unregulated) (acre-feet)	Percent of Average (%)	December 8 Midnight Elevation (feet)	Reservoir Storage (acre-feet)
Fontenelle	53,000	126	6498.71	289,000
Flaming Gorge	65,000	126	6028.65	3,297,000
Blue Mesa	37,000	119	7491.59	594,000
Navajo	28,000	84	6038.38	1,095,000
Powell	418,000	88	3600.81	11,828,000

Expected Operations

The operation of Lake Powell and Lake Mead in this December 2014 24-Month Study is pursuant to the December 2007 Record of Decision on Colorado River Interim Guidelines for Lower Basin Shortages and the Coordinated Operations of Lake Powell and Lake Mead (Interim Guidelines), and reflects the 2014 Annual Operating Plan (AOP) and the draft 2015 AOP. Pursuant to the Interim Guidelines, the August 2014 24-Month Study projections of the January 1, 2015, system storage and reservoir water surface elevations set the operational tier for the coordinated operation of Lake Powell and Lake Mead during 2015.

Consistent with Section 6.B of the Interim Guidelines, the Lake Powell operational tier for water year 2015 is the Upper Elevation Balancing Tier, with an initial water year release volume of 8.23 maf and the potential for an April adjustment to equalization or balancing releases in April 2015. This December 2014 24-Month Study projects that, consistent with Section 6.B.4 of the Interim Guidelines, an April adjustment to balancing releases is likely to occur and Lake Powell is currently projected to release 9.0 maf in water year 2015.

Consistent with Section 2.B.5 of the Interim Guidelines, the Intentionally Created Surplus (ICS) Surplus Condition is the criterion governing the operation of Lake Mead for calendar years 2014 and 2015.

The tier determinations will be documented in the 2015 AOP, which is currently in the final stages of development.

The Interim Guidelines are available for download at:
http://www.usbr.gov/lc/region/programs/strategies/RecordofDecision.pdf.
The 2014 AOP is available for download at:
http://www.usbr.gov/lc/region/g4000/aop/AOP14.pdf.
The draft 2015 AOP is available for download at
http://www.usbr.gov/uc/water/rsvrs/ops/aop/AOP15_draft.pdf.

Fontenelle Reservoir – Inflows to Fontenelle Reservoir for the month of November were 53,000 acre-feet (AF), or 126 percent of average. The reservoir elevation is 6498 feet, 84 percent of live capacity. Inflows are averaging 1,000 cubic feet per second (cfs). Fontenelle releases are currently 1,250 cfs and will remain at this level through spring.

Inflows for the next three months are projected to be above average: with December, January and February forecasted inflow volumes at 41,000 AF (128% of average), 40,000 AF (132% of average), and 35,000 AF (127% of average), respectively.

The next Fontenelle Working Group meeting is scheduled for April 22, 2015, at 10:00 am at Seedskadee Wildlife Refuge in Green River, Wyoming. The Fontenelle Working Group is an open public forum for information exchange between Reclamation and other parties associated with the operation of Fontenelle Reservoir.

Flaming Gorge Reservoir – Unregulated inflow into Flaming Gorge Reservoir during the month of November was 65,000 acre-feet (AF), or 126 percent of average. The reservoir elevation is 6,028.6 feet. Observed inflows are averaging 1,200 cubic feet per second (cfs).

Flaming Gorge releases are currently increasing to a 2,000 cfs daily release with hourly fluctuations for hydropower beginning in mid-December and scheduled through February.

Inflows for the next three months are projected to be above average: with December, January and February forecasted inflow volumes at 45,000 AF (129% of average), 50,000 AF (124% of average), and 50,000 AF (112% of average), respectively.

The next Flaming Gorge Working Group meeting is scheduled for April 23, 2015, at 11:00 a.m. to be held in the Utah Department of Natural Resources building in Vernal, Utah. The Flaming Gorge Working Group is an open public forum for information exchange between Reclamation and the stake holders of Flaming Gorge Dam. The public is encouraged to attend and comment on the operations and plans presented by Reclamation at these meetings. Meeting notes from past Working Group meetings are posted on the Working Group webpage. For more information on this group and these meetings please contact Heather Patno at 801-524-3883.

Aspinall Unit Reservoirs – November unregulated inflow into Blue Mesa Reservoir was 37,000 acre-feet or 119 percent of average. Precipitation during November was observed to be about 115 percent of average. The current inflow rate into Blue Mesa Reservoir is about 600 cfs while reservoir releases are averaging about 300 cfs. Blue Mesa's present elevation is 7491.61 feet, which corresponds to a storage content of about 594,000 acre-feet. The unregulated reservoir inflow into Blue Mesa Reservoir during water year 2014 was 1.145 million acre-feet, or about 120 percent of average.

Releases from Crystal are currently set at 800 cfs. The Gunnison Diversion Tunnel was shut down for the season on October 31st, with exception of some small 50 to 100 cfs diversions taken bi-weekly for municipal water needs in Montrose, Colorado. River flows below the tunnel are essentially the same as releases from the Dam, with the exception of when the tunnel is taking water to refill Fairfield Reservoir for Montrose municipal water needs.

Pursuant to the Aspinall Unit Operations Record of Decision (ROD), the baseflow target in the lower Gunnison River, as measured at the Whitewater gage, is 1050 cfs for September through December. Flows in the lower Gunnison River are currently above the baseflow target of 1050 cfs. River flows have remained relatively high due to late summer and early fall rains and flows are expected to stay above the December baseflow target for the foreseeable future.

On December 1, 2014, the National Weather Service's River Forecasting Center issued its forecasted inflow into Blue Mesa for the next 3 months. The unregulated inflow forecast for December, January, and February is for 76,000 acre-feet, which is 106% of average for these months.

The next meeting of the "Aspinall Unit Working Group" will be held on Thursday January 22rd in the Montrose, Colorado, starting at 1:00 PM. At this meeting, review of last summer and fall reservoir operations, and plans for this winter and next spring 2015 operations will be discussed. These meetings are open forum discussions on the Aspinall Unit reservoir operations with many interested groups participating. Anyone needing further information about these meetings should contact Erik Knight in the Grand Junction Area Office at (970) 248-0629.

Navajo Reservoir – Reclamation has been releasing 350 cfs from Navajo Reservoir since September 24th, 2014. Releases are made for the authorized purposes of the Navajo Unit, and to attempt to maintain a target base flow through the endangered fish critical habitat reach of the San Juan River (Farmington to Lake Powell). The San Juan River Basin Recovery Implementation Program recommends a target base flow of between 500 cfs and 1,000 cfs through the critical habitat area. The target base flow is calculated as the weekly average of gaged flows throughout the critical habitat area.

Navajo was at 6038.4 ft of pool elevation and 1,096,936 acre-ft of storage by the end of November, which was 80% of average for the end of the month. Observed inflow into

Navajo was 21,553 af and the modified-unregulated inflow volume was 28,426 af which was 84% of average for November. Calculated evaporation for the month was 765 acre-ft. Navajo's release was 350 cfs for the duration of the month. Navajo Reservoir recorded 0.41 inches of liquid precipitation (39% of average).

As of December 3rd, the release at Navajo (as measured at the USGS at Archuleta gage) was 358 cfs, and the observed inflow is 314 cfs. The reservoir elevation is 6038.39 ft and the content is 1,095,509 acre-ft, or 64% full (42% of Active). The San Juan River at Four Corners USGS gage is at 794 cfs, and the Animas River at Farmington USGS gage is at 375 cfs.

The most probable modified-unregulated inflow forecast* for December at Navajo is 20,000 acre-ft (80% of average), for January is 17,000 acre-ft (78% of average), and for February is 22,000 acre-ft (73% of average). The reservoir is forecast to reach a minimum overwinter storage level of 6037 ft (1,080,600 af) in mid-February.

The last public operations meeting was held on August 26th at the Farmington Civic Center. Meeting notes are available on the USBR website. The next operations meeting is scheduled for Tuesday, January 20th 2015.

Glen Canyon Dam / Lake Powell

Current Status

The unregulated inflow volume to Lake Powell in November was 418 thousand acre-feet (kaf) (88% of average). The release volume from Glen Canyon Dam in November was 772 kaf. The end of November elevation and storage of Lake Powell were 3,601.9 feet (98 feet from full pool) and 12.93 million acre-feet (maf) (49% of full capacity), respectively. The reservoir elevation is now declining and is expected to continue to decline until spring 2015.

Current Operations

The operating tier for water year 2015 was established in August 2014 as the Upper Elevation Balancing Tier. In the Upper Elevation Balancing Tier the initial water year release volume is 8.23 maf; however, there is the possibility for an April adjustment to equalization or balancing operations to govern for the remainder of the water year. Under the most probable inflow scenario, an April adjustment to balancing releases is projected to occur and Lake Powell is currently projected to release 9.0 maf in water year 2015. Reclamation will schedule operations at Glen Canyon Dam to achieve as practicably as possible the appropriate total annual release volume by September 30, 2015.

In December, the release volume will be approximately 866 kaf, with fluctuations anticipated between about 9,500 cfs in the nighttime to about 17,500 cfs in the daytime and consistent with the Glen Canyon Operating Criteria (Federal Register, Volume 62, No. 41, March 3, 1997). The anticipated release volume for January is 860 kaf.

In addition to daily scheduled fluctuations for power generation, the instantaneous releases from Glen Canyon Dam may also fluctuate to provide 40 MW of system regulation. These instantaneous release adjustments stabilize the electrical generation and transmission system and translate to a range of about 1,200 cfs above or below the hourly scheduled release rate. Under system normal conditions, fluctuations for regulation are typically short lived and generally balance out over the hour with minimal or no noticeable impacts on downstream river flow conditions.

Releases from Glen Canyon Dam can also fluctuate beyond scheduled releases when called upon to respond to unscheduled power outages or power system emergencies. Depending on the severity of the system emergency, the response from Glen Canyon Dam can be significant, within the full range of the operating capacity of the power plant for as long as is necessary to maintain balance in the transmission system. Glen Canyon Dam typically maintains 27MW (approximately 800 cfs) of generation capacity in reserve in order to respond to a system emergency even when generation rates are already high. System emergencies occur fairly infrequently and typically require small responses from Glen Canyon Dam. However, these responses can have a noticeable impact on the river downstream of Glen Canyon Dam.

Inflow Forecasts and Model Projections

The forecast for water year 2015 unregulated inflow to Lake Powell, issued on December 1, 2014, by the Colorado Basin River Forecast Center, projects that the most probable (median) unregulated inflow volume will be 9.78 maf (90% of average based on the period 1981-2010). This is about a 200 kaf increase from the forecast issued last month. At this early point in the season, there is significant uncertainty regarding next year's water supply. The forecast ranges from a minimum probable of 7.4 maf (68% of average) to a maximum probable of 18.6 maf (172% of average). There is 10% chance that inflows could be higher than the maximum probable and a 10% chance they could be lower than the minimum probable.

As determined in the August 2014 24-Month Study, Lake Powell's operations in water year 2015 will be governed by the Upper Elevation Balancing Tier. In this tier, the initial water year release volume is 8.23 maf, however, there is the potential for an April adjustment to equalization or balancing releases in April 2015. An April adjustment to balancing releases is projected to occur and Lake Powell is currently projected to release 9.0 maf in water year 2015. This determination will be documented in the 2015 Annual Operating Plan, which is currently in the final stages of development.

Based on the current forecast, the December 24-Month Study projects Lake Powell elevation will end water year 2015 near 3,606 feet with approximately 12.35 maf in storage (51% capacity). Note that projections of elevation and storage have significant uncertainty at this early point in the season, primarily due to uncertainty regarding next season's snowpack and the resulting inflow to Lake Powell. Under the minimum probable inflow scenario, which was updated in October, the projected end of water year elevation and storage are 3589 feet and 10.71 maf (44% capacity), respectively. Under the maximum probable inflow scenario, which was updated in October, the projected end

of water year elevation and storage are 3649 feet and 17.09 maf (70% capacity), respectively. The annual release volume from Lake Powell during water year 2015 is projected to be 9.0 maf under the minimum and most probable inflow scenarios and 12.1 maf under the maximum probable inflow scenario. There is a 10% chance that inflows will be higher, potentially resulting in higher releases; and 10% chance that inflows will be lower, potentially resulting in lower releases. If inflows are less than the current forecasted minimum probable inflow, the water year 2015 annual release could be as low as 8.23 maf. If inflows are greater than the current forecasted maximum probable inflow, the annual release could be greater than 12.1 maf.

Upper Colorado River Basin Hydrology

The Upper Colorado River Basin regularly experiences significant year to year hydrologic variability. During the 15-year period 2000 to 2014, however, the unregulated inflow to Lake Powell, which is a good measure of hydrologic conditions in the Colorado River Basin, was above average in only 3 out of the past 15 years. The period 2000-2014 is the lowest 15-year period since the closure of Glen Canyon Dam in 1963, with an average unregulated inflow of 8.39 maf, or 78% of the 30-year average (1981-2010). (For comparison, the 1981-2010 total water year average is 10.83 maf.) The unregulated inflow during the 2000-2014 period has ranged from a low of 2.64 maf (24% of average) in water year 2002 to a high of 15.97 maf (147% of average) in water year 2011. The water year 2014 unregulated inflow volume to Lake Powell was 10.381 maf (96% of average), which was significantly higher than inflows observed in 2012 and 2013 (45% and 47% of average, respectively). Under the current most probable forecast, total water year 2015 unregulated inflows to Lake Powell is projected to be 9.78 maf (90% of average).

At the beginning of water year 2015, total system storage in the Colorado River Basin was 30.0 maf (50% of 59.6 maf total system capacity). This is nearly the same as the total storage at the beginning of water year 2014 which began at 29.9 maf (50% of capacity). Since the beginning of water year 2000, total Colorado Basin storage has experienced year to year increases and decreases in response to wet and dry hydrology, ranging from a high of 94% of capacity at the beginning of 2000 to a low of 50% of capacity at the beginning of water year 2014. One wet year can significantly increase total system reservoir storage, just as persistent dry years can draw down the system storage. Based on current inflow forecasts, the current projected end of water year 2015 total Colorado Basin reservoir storage is approximately 29.8 maf (50% of capacity). The actual end of water year storage may vary from this projection, primarily due to uncertainty regarding next season's snowpack and resulting runoff. Based on October minimum and maximum probable inflow forecasts and modeling the range is approximately 27.4 maf (46%) to 38.1 maf (64%), respectively.

February 24-Month Study
Date: February 12, 2015

From: Water Resources Group, Salt Lake City
To: All Colorado River Annual Operating Plan (AOP) Recipients

Current Reservoir Status

Reservoir	January Inflow (unregulated) (acre-feet)	Percent of Average (%)	February 11, Midnight Elevation (feet)	Reservoir Storage (acre-feet)
Fontenelle	46,000	152	6489.59	224,000
Flaming Gorge	68,000	169	6026.79	3,227,000
Blue Mesa	30,000	123	7485.35	546,000
Navajo	23,000	105	6038.10	1,092,000
Powell	355,000	98	3593.13	11,106,000

Expected Operations

The operation of Lake Powell and Lake Mead in this February 2015 24-Month Study is pursuant to the December 2007 Record of Decision on Colorado River Interim Guidelines for Lower Basin Shortages and the Coordinated Operations of Lake Powell and Lake Mead (Interim Guidelines) and reflects the 2015 Annual Operating Plan (AOP). Pursuant to the Interim Guidelines, the August 2014 24-Month Study projections of the January 1, 2015, system storage and reservoir water surface elevations set the operational tier for the coordinated operation of Lake Powell and Lake Mead during 2015.

Consistent with Section 6.B of the Interim Guidelines, the Lake Powell operational tier for water year 2015 is the Upper Elevation Balancing Tier, with an initial water year release volume of 8.23 maf, and the potential for an April adjustment to equalization or balancing releases for the remainder of the water year. If the April 2015 24-Month Study projects Lake Powell's September 30, 2015, elevation to be greater than 3,649 feet, the Equalization Tier would govern Lake Powell's operations for the remainder of water year 2015. Based on analysis of a range of forecasted inflow scenarios, the current probability of realizing an inflow volume that would trigger equalization in 2015 is approximately 5 percent. If the April 2015 24-Month Study projects Lake Powell's September 30, 2015, elevation to be equal to or greater than 3,575 feet and equal to or less than 3,649 feet, and Lake Mead's elevation to be less than 1,075 feet, Lake Powell's annual release volume would be increased to balance the contents of Lake Mead and Lake Powell up to 9.0 maf. Based on analysis of a range of forecasted inflow scenarios, the current probability of realizing an inflow volume that would trigger balancing releases of up to 9.0 maf in 2015

is approximately 90 percent. This February 2015 24-Month Study projects that, consistent with Section 6.B.4 of the Interim Guidelines, an April 2015 adjustment to balancing releases is likely to occur and Lake Powell is currently projected to release 9.0 maf in water year 2015.

Consistent with Section 2.B.5 of the Interim Guidelines, the Intentionally Created Surplus (ICS) Surplus Condition is the criterion governing the operation of Lake Mead for calendar year 2015.

The Interim Guidelines are available for download at:
http://www.usbr.gov/lc/region/programs/strategies/RecordofDecision.pdf.
The 2015 AOP is available for download at:
http://www.usbr.gov/uc/water/rsvrs/ops/aop/AOP15.pdf.

Fontenelle Reservoir – Inflows to Fontenelle Reservoir for the month of January were 46,000 acre-feet (AF), or 152 percent of average. The reservoir elevation is 6489 feet, 65 percent of live capacity. Inflows are averaging 850 cubic feet per second (cfs). Fontenelle releases are currently 1,250 cfs and will remain at this level through spring.

Inflows for the next three months are projected to be above average: with February, March and April forecasted inflow volumes at 35,000 AF (127% of average), 55,000 AF (105% of average), and 90,000 AF (105% of average), respectively.

The next Fontenelle Working Group meeting is scheduled for April 15, 2015, at 10:00 am at Seedskadee Wildlife Refuge in Green River, Wyoming. The Fontenelle Working Group is an open public forum for information exchange between Reclamation and other parties associated with the operation of Fontenelle Reservoir.

Flaming Gorge Reservoir – Unregulated inflow into Flaming Gorge Reservoir during the month of January was 68,000 acre-feet (AF), or 169 percent of average. The reservoir elevation is 6,026.8 feet. Observed inflows are averaging 1,850 cubic feet per second (cfs).

Flaming Gorge releases are currently 2,000 cfs daily release with hourly fluctuations for hydropower beginning in mid-December and scheduled through February. Forecasts have decreased and releases are anticipated to remain at 2,000 cfs in March and April in order to obtain the May 1 reservoir elevation target of 6,027 feet.

Inflows for the next three months are projected to be close to average: with February, March and April forecasted inflow volumes at 53,000 AF (119% of average), 100,000 AF (98% of average), and 120,000 AF (90% of average), respectively.

The next Flaming Gorge Working Group meeting is scheduled for April 30, 2015, at 11:00 a.m. to be held in the Utah Department of Natural Resources building in Vernal,

Utah. The Flaming Gorge Working Group is an open public forum for information exchange between Reclamation and the stake holders of Flaming Gorge Dam. The public is encouraged to attend and comment on the operations and plans presented by Reclamation at these meetings. Meeting notes from past Working Group meetings are posted on the Working Group webpage. For more information on this group and these meetings please contact Heather Patno at 801-524-3883.

Aspinall Unit Reservoirs – January unregulated inflow into Blue Mesa Reservoir was 30,000 acre-feet or 123 percent of average. On February 10th the basin snowpack was averaging 77 percent, which has decreased about 13 percent from a month ago. Precipitation during January was about 45 percent of average, while December's precipitation was recorded at 125 percent of average. The current inflow rate into Blue Mesa Reservoir is about 500 cfs while reservoir releases are averaging about 550 cfs. This past fall and early winter months has seen about average to a little above average reservoir inflows. Blue Mesa Reservoir current elevation is 7485.35 feet, which corresponds to a storage content of about 546,000 acre-feet. This elevation is about 20.0 feet higher than the elevation was from a year ago.

The February Water Supply Forecast for Water Year 2015 has been issued and the April through July unregulated inflow is forecasted to be at 620,000 acre-feet (92% of average). Based on this forecast, Blue Mesa Reservoir is not projected to fill by the end of this 2015 runoff season.

Releases from Crystal Dam have been reduced as hydrologic conditions have been drying. The current release has been set at 600 cfs, down from 1,100 cfs a month ago. Reservoir releases will most likely change as the current hydrologic conditions change through the snow accumulation season. River flows below the tunnel are essentially the same as releases from the Dam, with the exception of when the tunnel is taking water to refill Fairfield Reservoir for Montrose municipal water needs.

The last meeting of the "Aspinall Unit Working Group" was held on January 22, 2015 in Montrose, Colorado. At this meeting, review of last summer and fall reservoir operations, and plans for this winter and next spring 2015 operations were discussed. These meetings are open forum discussions on the Aspinall Unit reservoir operations with many interested groups participating. For more information about these meetings please contact Erik Knight in the Grand Junction Area Office at (970) 248-0629.

Navajo Reservoir – Reclamation has been releasing 350 cfs from Navajo Reservoir since September 24th, 2014. Releases are made for the authorized purposes of the Navajo Unit, and to attempt to maintain a target base flow through the endangered fish critical habitat reach of the San Juan River (Farmington to Lake Powell). The San Juan River Basin Recovery Implementation Program recommends a target base flow of between 500 cfs and 1,000 cfs through the critical habitat area. The target base flow is calculated as the weekly average of gaged flows throughout the critical habitat area.

Navajo was at 6037.9 ft of pool elevation and 1,090,285 acre-ft of storage by the end of January, which was 83% of average for the end of the month. Modified unregulated inflow into Navajo was 22,583 af, which was 103% of average for the month. Calculated evaporation for the month was 529 acre-ft. Navajo's release was 350 cfs for the duration of the month. Navajo Reservoir recorded 0.41 inches of liquid precipitation (41% of average).

As of February 3rd, the release at Navajo (as measured at the USGS at Archuleta gage) was 357 cfs, and the observed inflow is 475 cfs. The reservoir elevation is 6037.98 ft and the content is 1,091,137 acre-ft, or 64% full (41% of Active). The San Juan River at Four Corners USGS gage is at 791 cfs, and the Animas River at Farmington USGS gage is at 273 cfs. Snotel sites above Navajo are well below average with only 8.0 inches of SWE (59% of median on this date).

The most probable modified-unregulated inflow forecast for February at Navajo is 30,000 acre-ft (99% of average), for March is 48,000 acre-ft (52% of average), and for April is 90,000 acre-ft (53% of average). The most probable forecast shows the reservoir will reach a minimum overwinter storage level of 6038 ft (1,092,000 af) in mid-February. The April-July modified unregulated inflow forecasts are as follows:

Min Probable: 240,000 acre-ft (32% of average, a decrease of 10,000 af)
Most Probable: 400,000 acre-ft (54% of average, a decrease of 50,000 af)
Max Probable: 660,000 acre-ft (90% of average, a decrease of 90,000 af)

The last public operations meeting was held on January 20th at the Farmington Civic Center. Meeting notes are available on the USBR website. The next operations meeting is scheduled for Tuesday, April 28th 2015.

Glen Canyon Dam / Lake Powell

Current Status
The unregulated inflow volume to Lake Powell in January was 355 thousand acre-feet (kaf) (98% of average). The release volume from Glen Canyon Dam in January was 862 kaf. The end of January elevation and storage of Lake Powell were 3,593.6 feet (106 feet from full pool) and 11.15 million acre-feet (maf) (46% of full capacity), respectively. The reservoir elevation is now declining and is expected to continue to decline until spring 2015.

Current Operations
The operating tier for water year 2015 was established in August 2014 as the Upper Elevation Balancing Tier. In the Upper Elevation Balancing Tier the initial water year release volume is 8.23 maf; however, there is the possibility for an April adjustment to equalization or balancing operations to govern for the remainder of the water year. Under the minimum, most, and maximum probable inflow scenarios an April adjustment to balancing releases is projected to occur and Lake Powell is currently projected to release 9.0 maf in water year 2015. The minimum and maximum release projections, last

updated in January, will be updated again in April. Reclamation will schedule operations at Glen Canyon Dam to achieve as practicably as possible the appropriate total annual release volume by September 30, 2015.

In February, the release volume will be approximately 600 kaf, with fluctuations anticipated between about 6,500 cfs in the nighttime to about 12,500 cfs in the daytime and consistent with the Glen Canyon Operating Criteria (Federal Register, Volume 62, No. 41, March 3, 1997). The anticipated release volume for March and April are 650 kaf and 600 kaf, respectively.

In addition to daily scheduled fluctuations for power generation, the instantaneous releases from Glen Canyon Dam may also fluctuate to provide 40 MW of system regulation. These instantaneous release adjustments stabilize the electrical generation and transmission system and translate to a range of about 1,200 cfs above or below the hourly scheduled release rate. Under system normal conditions, fluctuations for regulation are typically short lived and generally balance out over the hour with minimal or no noticeable impacts on downstream river flow conditions.

Releases from Glen Canyon Dam can also fluctuate beyond scheduled releases when called upon to respond to unscheduled power outages or power system emergencies. Depending on the severity of the system emergency, the response from Glen Canyon Dam can be significant, within the full range of the operating capacity of the power plant for as long as is necessary to maintain balance in the transmission system. Glen Canyon Dam typically maintains 27MW (approximately 800 cfs) of generation capacity in reserve in order to respond to a system emergency even when generation rates are already high. System emergencies occur fairly infrequently and typically require small responses from Glen Canyon Dam. However, these responses can have a noticeable impact on the river downstream of Glen Canyon Dam.

Inflow Forecasts and Model Projections

The April to July 2015 water supply forecast for unregulated inflow to Lake Powell, issued on February 3, 2015, by the Colorado Basin River Forecast Center, projects that the most probable (median) unregulated inflow volume will be 5.2 maf (73% of average based on the period 1981-2010). The forecast decreased by 1.3 maf over the past month. At this early point in the season, there is still significant uncertainty regarding this year's water supply. The forecast ranges from a minimum probable of 3.4 maf (47% of average) to a maximum probable of 8.35 maf (117% of average). There is 10% chance that inflows could be higher than the maximum probable and a 10% chance they could be lower than the minimum probable.

As determined in the August 2014 24-Month Study, and documented in the 2015 Annual Operating Plan, Lake Powell's operations in water year 2015 will be governed by the Upper Elevation Balancing Tier. In this tier, the initial water year release volume is 8.23 maf, however, there is the potential for an April adjustment to equalization or balancing releases in April 2015. If the April 2015 24-Month Study projects Lake Powell's September 30, 2015, elevation to be greater than 3,649 feet, the Equalization Tier would

govern Lake Powell's operations for the remainder of water year 2015 and releases could be approximately 10.8 maf or greater. Based on analysis of a range of forecasted inflow scenarios, the current probability of realizing an inflow volume that would trigger equalization in 2015 is approximately 5 percent. If the April 2015 24-Month Study projects Lake Powell's September 30, 2015, elevation to be between 3,575 feet and 3,649 feet, and Lake Mead's elevation to be less than 1,075 feet, Lake Powell's annual release volume would be increased to balance the contents of Lake Mead and Lake Powell up to 9.0 maf. Based on analysis of a range of forecasted inflow scenarios, the current probability of realizing an inflow volume that would trigger balancing releases of up to 9.0 maf in 2015 is approximately 90 percent. The February 2015 24-Month Study projects that an April adjustment to balancing releases is likely to occur and Lake Powell is currently projected to release 9.0 maf in water year 2015.

Based on the current forecast, the February 24-Month Study projects Lake Powell elevation will end water year 2015 near 3,597 feet with approximately 11.47 maf in storage (47% capacity). Note that projections of elevation and storage have significant uncertainty at this early point in the season, primarily due to uncertainty regarding this season's final snowpack and the resulting inflow to Lake Powell. Under the minimum probable inflow scenario, last updated in January, the projected end of water year elevation and storage are 3589 feet and 10.73 maf (44% capacity), respectively. Under the maximum probable inflow scenario, last updated in January, the projected end of water year elevation and storage are 3639 feet and 15.94 maf (66% capacity), respectively. The annual release volume from Lake Powell during water year 2015 is projected to be 9.0 maf under all three inflow scenarios. However, there is a 10% chance that inflows will be higher, potentially resulting in higher releases; and 10% chance that inflows will be lower, potentially resulting in lower releases. If inflows are less than the current forecasted minimum probable inflow, the water year 2015 annual release could be as low as 8.23 maf. If inflows are greater than the current forecasted maximum probable inflow, the annual release could be 10.8 maf or greater. Modeling of projected reservoir operations based on the minimum and maximum scenarios will be updated again in April.

Upper Colorado River Basin Hydrology

The Upper Colorado River Basin regularly experiences significant year to year hydrologic variability. During the 15-year period 2000 to 2014, however, the unregulated inflow to Lake Powell, which is a good measure of hydrologic conditions in the Colorado River Basin, was above average in only 3 out of the past 15 years. The period 2000-2014 is the lowest 15-year period since the closure of Glen Canyon Dam in 1963, with an average unregulated inflow of 8.39 maf, or 78% of the 30-year average (1981-2010). (For comparison, the 1981-2010 total water year average is 10.83 maf.) The unregulated inflow during the 2000-2014 period has ranged from a low of 2.64 maf (24% of average) in water year 2002 to a high of 15.97 maf (147% of average) in water year 2011. The water year 2014 unregulated inflow volume to Lake Powell was 10.381 maf (96% of average), which, though still below average, was significantly higher than inflows observed in 2012 and 2013 (45% and 47% of average, respectively). Under the current most probable forecast, total water year 2015 unregulated inflows to Lake Powell is projected to be 10.08 maf (93% of average).

At the beginning of water year 2015, total system storage in the Colorado River Basin was 30.0 maf (50% of 59.6 maf total system capacity). This is nearly the same as the total storage at the beginning of water year 2014 which began at 29.9 maf (50% of capacity). Since the beginning of water year 2000, total Colorado Basin storage has experienced year to year increases and decreases in response to wet and dry hydrology, ranging from a high of 94% of capacity at the beginning of 2000 to a low of 50% of capacity at the beginning of water year 2014. One wet year can significantly increase total system reservoir storage, just as persistent dry years can draw down the system storage. Based on current inflow forecasts, the current projected end of water year 2015 total Colorado Basin reservoir storage is approximately 28.7 maf (48% of capacity). The actual end of water year storage may vary from this projection, primarily due to uncertainty regarding next season's snowpack and resulting runoff. Based on January minimum and maximum probable inflow forecasts and modeling the range is approximately 27.5 maf (46%) to 33.6 maf (56%), respectively.

January 24-Month Study
Date: January 15, 2015

From: Water Resources Group, Salt Lake City
To: All Colorado River Annual Operating Plan (AOP) Recipients

Current Reservoir Status

Reservoir	December Inflow (unregulated) (acre-feet)	Percent of Average (%)	January 12, Midnight Elevation (feet)	Reservoir Storage (acre-feet)
Fontenelle	51,000	159	6493.77	253,000
Flaming Gorge	53,000	152	6027.35	3,248,000
Blue Mesa	34,000	133	7487.76	564,000
Navajo	19,000	75	6037.78	1,089,000
Powell	396,000	109	3595.79	11,353,000

Expected Operations

The operation of Lake Powell and Lake Mead in this January 2015 24-Month Study is pursuant to the December 2007 Record of Decision on Colorado River Interim Guidelines for Lower Basin Shortages and the Coordinated Operations of Lake Powell and Lake Mead (Interim Guidelines) and reflects the 2015 Annual Operating Plan (AOP). Pursuant to the Interim Guidelines, the August 2014 24-Month Study projections of the January 1, 2015, system storage and reservoir water surface elevations set the operational tier for the coordinated operation of Lake Powell and Lake Mead during 2015.

Consistent with Section 6.B of the Interim Guidelines, the Lake Powell operational tier for water year 2015 is the Upper Elevation Balancing Tier, with an initial water year release volume of 8.23 maf, and the potential for an April adjustment to equalization or balancing releases for the remainder of the water year. If the April 2015 24-Month Study projects Lake Powell's September 30, 2015, elevation to be greater than 3,649 feet, the Equalization Tier would govern Lake Powell's operations for the remainder of water year 2015. Based on analysis of a range of forecasted inflow scenarios, the current probability of realizing an inflow volume that would trigger equalization in 2015 is approximately 5 percent. If the April 2015 24-Month Study projects Lake Powell's September 30, 2015, elevation to be equal to or greater than 3,575 feet and equal to or less than than 3,649 feet, and Lake Mead's elevation to be less than 1,075 feet, Lake Powell's annual release volume would be increased to balance the contents of Lake Mead and Lake Powell up to 9.0 maf. Based on analysis of a range of forecasted inflow scenarios, the current probability of realizing an inflow volume that would trigger balancing releases of up to

9.0 maf in 2015 is approximately 90 percent. This January 2015 24-Month Study projects that, consistent with Section 6.B.4 of the Interim Guidelines, an April 2015 adjustment to balancing releases is likely to occur and Lake Powell is currently projected to release 9.0 maf in water year 2015.

Consistent with Section 2.B.5 of the Interim Guidelines, the Intentionally Created Surplus (ICS) Surplus Condition is the criterion governing the operation of Lake Mead for calendar year 2015.

The Interim Guidelines are available for download at:
http://www.usbr.gov/lc/region/programs/strategies/RecordofDecision.pdf.
The 2015 AOP is available for download at:
http://www.usbr.gov/uc/water/rsvrs/ops/aop/AOP15.pdf.

Fontenelle Reservoir – Inflows to Fontenelle Reservoir for the month of December were 51,000 acre-feet (AF), or 159 percent of average. The reservoir elevation is 6493 feet, 73 percent of live capacity. Inflows are averaging 840 cubic feet per second (cfs). Fontenelle releases are currently 1,250 cfs and will remain at this level through spring.

Inflows for the next three months are projected to be above average: with January, February and March forecasted inflow volumes at 40,000 AF (132% of average), 35,000 AF (127% of average), and 57,000 AF (108% of average), respectively.

The next Fontenelle Working Group meeting is scheduled for April 15, 2015, at 10:00 am at Seedskadee Wildlife Refuge in Green River, Wyoming. The Fontenelle Working Group is an open public forum for information exchange between Reclamation and other parties associated with the operation of Fontenelle Reservoir.

Flaming Gorge Reservoir – Unregulated inflow into Flaming Gorge Reservoir during the month of December was 53,000 acre-feet (AF), or 152 percent of average. The reservoir elevation is 6,027 feet. Observed inflows are averaging 2,000 cubic feet per second (cfs).

Flaming Gorge releases are currently 2,000 cfs daily release with hourly fluctuations for hydropower beginning in mid-December and scheduled through February. Releases are anticipated to increase to approximately 2,250 cfs in March and April in order to obtain the May 1 reservoir elevation target of 6,027 feet.

Inflows for the next three months are projected to be above average: with January, February and March forecasted inflow volumes at 50,000 AF (124% of average), 50,000 AF (112% of average), and 105,000 AF (103% of average), respectively.

The next Flaming Gorge Working Group meeting is scheduled for April 30, 2015, at 11:00 a.m. to be held in the Utah Department of Natural Resources building in Vernal, Utah. The Flaming Gorge Working Group is an open public forum for information

exchange between Reclamation and the stake holders of Flaming Gorge Dam. The public is encouraged to attend and comment on the operations and plans presented by Reclamation at these meetings. Meeting notes from past Working Group meetings are posted on the Working Group webpage. For more information on this group and these meetings please contact Heather Patno at 801-524-3883.

Aspinall Unit Reservoirs – December unregulated inflow into Blue Mesa Reservoir was 34,000 acre-feet or 133 percent of average. Precipitation during December was observed to be about 130 percent of average. The Gunnison River basin snowpack as of January 13th was averaging about 92 percent. The current inflow rate into Blue Mesa Reservoir is about 500 cfs while reservoir releases are averaging about 900 cfs. The present reservoir elevation is 7487.76 feet, which corresponds to a storage content of about 564,000 acre-feet.

Releases from Crystal Dam have been kept at just about the same release rate since early December, with a set release rate of 1,100 cfs. Reservoir releases will most likely change as the current hydrologic conditions change through the snow accumulation season. River flows below the tunnel are essentially the same as releases from the Dam, with the exception of when the tunnel is taking water to refill Fairfield Reservoir for Montrose municipal water needs.

The first Water Supply Forecast for Water Year 2015 has been issued and the April through July unregulated inflow is forecasted to be at 690,000 acre-feet (102% of average). Based on this forecast, Blue Mesa Reservoir is projected to fill by the end of this 2015 runoff season.

The next meeting of the "Aspinall Unit Working Group" will be held on Thursday January 23rd in the Montrose, Colorado, starting at 1:00 PM. At this meeting, review of last summer and fall reservoir operations, and plans for this winter and next spring 2014 operations will be discussed. These meetings are open forum discussions on the Aspinall Unit reservoir operations with many interested groups participating. Anyone needing further information about these meetings should contact Erik Knight in the Grand Junction Area Office at (970) 248-0629.

Navajo Reservoir – Reclamation has been releasing 350 cfs from Navajo Reservoir since September 24th, 2014. Releases are made for the authorized purposes of the Navajo Unit, and to attempt to maintain a target base flow through the endangered fish critical habitat reach of the San Juan River (Farmington to Lake Powell). The San Juan River Basin Recovery Implementation Program recommends a target base flow of between 500 cfs and 1,000 cfs through the critical habitat area. The target base flow is calculated as the weekly average of gaged flows throughout the critical habitat area.

Navajo was at 6037.9 ft of pool elevation and 1,090,711 acre-ft of storage by the end of December, which was 81% of average for the end of the month. Observed inflow into Navajo was 16,806 af, (modified-unregulated inflow volume of 18,867 af) which was 69% of average for November. Calculated evaporation for the month was 530 acre-

ft. Navajo's release was 350 cfs for the duration of the month. Navajo Reservoir recorded 0.86 inches of liquid precipitation (82% of average).

As of January 5th, the release at Navajo (as measured at the USGS at Archuleta gage) was 354 cfs, and the observed inflow is 201 cfs. The reservoir elevation is 6037.81 ft and the content is 1,089,328 acre-ft, or 64% full (41% of Active). The San Juan River at Four Corners USGS gage is at 650 cfs, and the Animas River at Farmington USGS gage is at 240 cfs.

The most probable modified-unregulated inflow forecast for January at Navajo is 17,000 acre-ft (78% of average), for February is 20,000 acre-ft (66% of average), and for March is 50,000 acre-ft (54% of average). The reservoir is forecast to reach a minimum overwinter storage level of 6037 ft (1,080,800 af) in mid-February. The April-July modified unregulated inflow forecasts are as follows:

Min Probable: 250,000 acre-ft (34% of average)
Most Probable: 450,000 acre-ft (61% of average)
Max Probable: 750,000 acre-ft (102% of average)

The last public operations meeting was held on August 26th at the Farmington Civic Center. Meeting notes are available on the USBR website. The next operations meeting is scheduled for Tuesday, January 20th 2015.

Glen Canyon Dam / Lake Powell

Current Status

The unregulated inflow volume to Lake Powell in December was 409 thousand acre-feet (kaf) (113% of average). The release volume from Glen Canyon Dam in December was 864 kaf. The end of December elevation and storage of Lake Powell were 3,597.8 feet (102 feet from full pool) and 11.54 million acre-feet (maf) (47% of full capacity), respectively. The reservoir elevation is now declining and is expected to continue to decline until spring 2015.

Current Operations

The operating tier for water year 2015 was established in August 2014 as the Upper Elevation Balancing Tier. In the Upper Elevation Balancing Tier the initial water year release volume is 8.23 maf; however, there is the possibility for an April adjustment to equalization or balancing operations to govern for the remainder of the water year. Under the minimum, most, and maximum probable inflow scenarios, an April adjustment to balancing releases is projected to occur and Lake Powell is currently projected to release 9.0 maf in water year 2015. Reclamation will schedule operations at Glen Canyon Dam to achieve as practicably as possible the appropriate total annual release volume by September 30, 2015.

In January, the release volume will be approximately 860 kaf, with fluctuations anticipated between about 10,000 cfs in the nighttime to about 18,000 cfs in the daytime and consistent with the Glen Canyon Operating Criteria (Federal Register, Volume 62, No. 41, March 3, 1997). The anticipated release volume for February and March are 600 kaf and 650 kaf, respectively.

In addition to daily scheduled fluctuations for power generation, the instantaneous releases from Glen Canyon Dam may also fluctuate to provide 40 MW of system regulation. These instantaneous release adjustments stabilize the electrical generation and transmission system and translate to a range of about 1,200 cfs above or below the hourly scheduled release rate. Under system normal conditions, fluctuations for regulation are typically short lived and generally balance out over the hour with minimal or no noticeable impacts on downstream river flow conditions.

Releases from Glen Canyon Dam can also fluctuate beyond scheduled releases when called upon to respond to unscheduled power outages or power system emergencies. Depending on the severity of the system emergency, the response from Glen Canyon Dam can be significant, within the full range of the operating capacity of the power plant for as long as is necessary to maintain balance in the transmission system. Glen Canyon Dam typically maintains 27MW (approximately 800 cfs) of generation capacity in reserve in order to respond to a system emergency even when generation rates are already high. System emergencies occur fairly infrequently and typically require small responses from Glen Canyon Dam. However, these responses can have a noticeable impact on the river downstream of Glen Canyon Dam.

Inflow Forecasts and Model Projections

The April to July 2015 water supply forecast for unregulated inflow to Lake Powell, issued on January 5, 2015, by the Colorado Basin River Forecast Center, projects that the most probable (median) unregulated inflow volume will be 6.5 maf (91% of average based on the period 1981-2010). At this early point in the season, there is still significant uncertainty regarding this year's water supply. The forecast ranges from a minimum probable of 4.4 maf (61% of average) to a maximum probable of 9.8 maf (137% of average). There is 10% chance that inflows could be higher than the maximum probable and a 10% chance they could be lower than the minimum probable.

As determined in the August 2014 24-Month Study, and document in the 2015 Annual Operating Tier, Lake Powell's operations in water year 2015 will be governed by the Upper Elevation Balancing Tier. In this tier, the initial water year release volume is 8.23 maf, however, there is the potential for an April adjustment to equalization or balancing releases in April 2015. If the April 2015 24-Month Study projects Lake Powell's September 30, 2015, elevation to be greater than 3,649 feet, the Equalization Tier would govern Lake Powell's operations for the remainder of water year 2015 and releases could be approximately 10.8 maf or greater. Based on analysis of a range of forecasted inflow scenarios, the current probability of realizing an inflow volume that would trigger equalization in 2015 is approximately 5 percent. If the April 2015 24-Month Study projects Lake Powell's September 30, 2015, elevation to be equal to or greater than 3,575

feet and equal to or less than 3,649 feet, and Lake Mead's elevation to be less than 1,075 feet, Lake Powell's annual release volume would be increased to balance the contents of Lake Mead and Lake Powell up to 9.0 maf. Based on analysis of a range of forecasted inflow scenarios, the current probability of realizing an inflow volume that would trigger balancing releases of up to 9.0 maf in 2015 is approximately 90 percent. The January 2015 24-Month Study projects that an April 2015 adjustment to balancing releases is likely to occur and Lake Powell is currently projected to release 9.0 maf in water year 2015.

Based on the current forecast, the January 24-Month Study projects Lake Powell elevation will end water year 2015 near 3,609 feet with approximately 12.63 maf in storage (52% capacity). Note that projections of elevation and storage have significant uncertainty at this early point in the season, primarily due to uncertainty regarding this season's final snowpack and the resulting inflow to Lake Powell. Under the minimum probable inflow scenario, last updated in January, the projected end of water year elevation and storage are 3589 feet and 10.73 maf (44% capacity), respectively. Under the maximum probable inflow scenario, last updated in January, the projected end of water year elevation and storage are 3639 feet and 15.94 maf (66% capacity), respectively. The annual release volume from Lake Powell during water year 2015 is projected to be 9.0 maf under all three inflow scenarios. However, there is a 10% chance that inflows will be higher, potentially resulting in higher releases; and 10% chance that inflows will be lower, potentially resulting in lower releases. If inflows are less than the current forecasted minimum probable inflow, the water year 2015 annual release could be as low as 8.23 maf. If inflows are greater than the current forecasted maximum probable inflow, the annual release could be 10.8 maf or greater.

Upper Colorado River Basin Hydrology

The Upper Colorado River Basin regularly experiences significant year to year hydrologic variability. During the 15-year period 2000 to 2014, however, the unregulated inflow to Lake Powell, which is a good measure of hydrologic conditions in the Colorado River Basin, was above average in only 3 out of the past 15 years. The period 2000-2014 is the lowest 15-year period since the closure of Glen Canyon Dam in 1963, with an average unregulated inflow of 8.39 maf, or 78% of the 30-year average (1981-2010). (For comparison, the 1981-2010 total water year average is 10.83 maf.) The unregulated inflow during the 2000-2014 period has ranged from a low of 2.64 maf (24% of average) in water year 2002 to a high of 15.97 maf (147% of average) in water year 2011. The water year 2014 unregulated inflow volume to Lake Powell was 10.381 maf (96% of average), which, though still below average, was significantly higher than inflows observed in 2012 and 2013 (45% and 47% of average, respectively). Under the current most probable forecast, total water year 2015 unregulated inflows to Lake Powell is projected to be 10.08 maf (93% of average).

At the beginning of water year 2015, total system storage in the Colorado River Basin was 30.0 maf (50% of 59.6 maf total system capacity). This is nearly the same as the total storage at the beginning of water year 2014 which began at 29.9 maf (50% of capacity). Since the beginning of water year 2000, total Colorado Basin storage has

experienced year to year increases and decreases in response to wet and dry hydrology, ranging from a high of 94% of capacity at the beginning of 2000 to a low of 50% of capacity at the beginning of water year 2014. One wet year can significantly increase total system reservoir storage, just as persistent dry years can draw down the system storage. Based on current inflow forecasts, the current projected end of water year 2015 total Colorado Basin reservoir storage is approximately 29.9 maf (50% of capacity). The actual end of water year storage may vary from this projection, primarily due to uncertainty regarding next season's snowpack and resulting runoff. Based on January minimum and maximum probable inflow forecasts and modeling the range is approximately 27.5 maf (46%) to 33.6 maf (56%), respectively.

Model Run ID: 2186

Processed On: 1/13/2015 2:58:49PM

March 24-Month Study
Date: March 11, 2015

From: Water Resources Group, Salt Lake City
To: All Colorado River Annual Operating Plan (AOP) Recipients

Current Reservoir Status

Reservoir	February Inflow (unregulated) (acre-feet)	Percent of Average (%)	March 9, Midnight Elevation (feet)	Reservoir Storage (acre-feet)
Fontenelle	46,000	166	6485.89	200,000
Flaming Gorge	63,000	142	6025.97	3,196,000
Blue Mesa	28,000	125	7485.45	546,000
Navajo	29,000	96	6038.80	1,100,000
Powell	423,000	108	3591.98	11,001,000

Expected Operations

The operation of Lake Powell and Lake Mead in this March 2015 24-Month Study is pursuant to the December 2007 Record of Decision on Colorado River Interim Guidelines for Lower Basin Shortages and the Coordinated Operations of Lake Powell and Lake Mead (Interim Guidelines) and reflects the 2015 Annual Operating Plan (AOP). Pursuant to the Interim Guidelines, the August 2014 24-Month Study projections of the January 1, 2015, system storage and reservoir water surface elevations set the operational tier for the coordinated operation of Lake Powell and Lake Mead during 2015.

Consistent with Section 6.B of the Interim Guidelines, the Lake Powell operational tier for water year 2015 is the Upper Elevation Balancing Tier, with an initial water year release volume of 8.23 maf, and the potential for an April adjustment to equalization or balancing releases for the remainder of the water year. Based on a range of forecasted inflow scenarios, equalization is not likely to occur. If the April 2015 24-Month Study projects Lake Powell's September 30, 2015, elevation to be equal to or greater than 3,575 feet and equal to or less than 3,649 feet, and Lake Mead's elevation to be less than 1,075 feet, Lake Powell's annual release volume would be increased to balance the contents of Lake Mead and Lake Powell up to 9.0 maf. Based on analysis of a range of forecasted inflow scenarios, the current probability of realizing an inflow volume that would trigger balancing releases of up to 9.0 maf in 2015 is approximately 95 percent. This March 2015 24-Month Study projects that, consistent with Section 6.B.4 of the Interim Guidelines, an April 2015 adjustment to balancing releases is likely to occur and Lake Powell is currently projected to release 9.0 maf in water year 2015.

Consistent with Section 2.B.5 of the Interim Guidelines, the Intentionally Created Surplus (ICS) Surplus Condition is the criterion governing the operation of Lake Mead for calendar year 2015.

The Interim Guidelines are available for download at:
http://www.usbr.gov/lc/region/programs/strategies/RecordofDecision.pdf.
The 2015 AOP is available for download at:
http://www.usbr.gov/uc/water/rsvrs/ops/aop/AOP15.pdf.

Fontenelle Reservoir – Inflows to Fontenelle Reservoir for the month of February were 46,000 acre-feet (AF), or 166 percent of average. The reservoir elevation is 6486 feet, 58 percent of live capacity. Inflows are averaging 740 cubic feet per second (cfs). Fontenelle releases are currently 1,250 cfs and are expected to begin increasing in anticipation of spring runoff toward the end of March.

Inflows for the next three months are projected to be above average: with March, April, and May forecasted inflow volumes at 55,000 AF (105% of average), and 90,000 AF (105% of average), and 160,000 AF (98 % of average), respectively. The March final forecast of the April-July inflow volume is 710,000 AF (98% of average).

The next Fontenelle Working Group meeting is scheduled for April 15, 2015, at 10:00 am at Seedskadee Wildlife Refuge in Green River, Wyoming. The Fontenelle Working Group is an open public forum for information exchange between Reclamation and other parties associated with the operation of Fontenelle Reservoir.

Flaming Gorge Reservoir – Unregulated inflow into Flaming Gorge Reservoir during the month of February was 63,000 acre-feet (AF), or 141 percent of average. The reservoir elevation is 6,026 feet. Observed inflows are averaging 1,500 cubic feet per second (cfs).

Flaming Gorge releases are currently 2,000 cfs daily release with hourly fluctuations for hydropower. Forecasts have decreased and releases are anticipated to decrease to 1,500 cfs in March and April in order to obtain the May 1 reservoir elevation target of 6,027 feet.

Inflows for the next three months are projected to be below average: with March, April and May forecasted inflow volumes at 95,000 AF (93% of average), 120,000 AF (90% of average), and 210,000 AF (86% of average), respectively.

The next Flaming Gorge Working Group meeting is scheduled for April 30, 2015, at 11:00 a.m. to be held in the Utah Department of Natural Resources building in Vernal, Utah. The Flaming Gorge Working Group is an open public forum for information exchange between Reclamation and the stake holders of Flaming Gorge Dam. The public is encouraged to attend and comment on the operations and plans presented by Reclamation at these meetings. Meeting notes from past Working Group meetings are

posted on the Working Group webpage. For more information on this group and these meetings please contact Heather Patno at 801-524-3883.

Aspinall Unit Reservoirs – February unregulated inflow into Blue Mesa Reservoir was 28,000 acre-feet or 125 percent of average. On March 6th the basin snowpack was 84 percent of average, which is a 4 percent decrease from a month earlier. Precipitation during February was 75 percent of average. The current inflow rate into Blue Mesa Reservoir is about 400 cfs while reservoir releases are averaging about 500 cfs. The reservoir elevation is currently at 7464.81 feet, which corresponds to a storage content of about 402,000 acre-feet. This elevation is about 20 feet higher than last year's March elevation.

The latest Water Supply Forecast for Water Year 2015 has been issued and the April through July unregulated inflow is forecasted to be at 600,000 acre-feet (89% of average), this is 20,000 acre-feet lower than last month's forecast. If this forecast holds through May 1st, the Black Canyon Water Right would call for a one day peak flow of 4,492 cfs. Also using this same forecast for the determining the flow recommendations from the Aspinall ROD at Whitewater gage, the peak flow at that point would be 8,070 cfs for 10 days.

Based on this forecast and the combination of meeting the ROD and the Black Canyon Water Right this coming spring, Blue Mesa Reservoir is projected to fill up to about elevation 7509 feet this runoff season. A Blue Mesa "fill" is calculated to be about 7516.4 feet, or about 3.0 feet short of top of active conservation pool.

Releases from Crystal are currently set at 600 cfs. The Gunnison Diversion Tunnel is currently shut down for the season, with the exception of some small 50 to 100 cfs diversions taken for municipal water needs in Montrose, Colorado. The tunnel is expected to reopen for irrigation season sometime between the last week of March and the first week of April.

Reservoir releases are likely to change during March into May as we respond to changing forecasts and runoff conditions.

The next meeting of the "Aspinall Unit Working Group" will be held on Thursday, April 23, 2015 starting at 1:00 PM in Reclamation's Grand Junction Office. At this meeting, review of this winter's reservoir operations, and plans for this spring and summer operations will be discussed. These meetings are open forum discussions on the Aspinall Unit reservoir operations with many interested groups participating. Anyone needing further information about these meetings should contact Erik Knight in the Grand Junction Area Office at (970) 248-0629.

Navajo Reservoir – Reclamation has been releasing 350 cfs from Navajo Reservoir since September 24th, 2014. Releases are made for the authorized purposes of the Navajo Unit, and to attempt to maintain a target base flow through the endangered fish critical habitat reach of the San Juan River (Farmington to Lake Powell). The San Juan River Basin

Recovery Implementation Program recommends a target base flow of between 500 cfs and 1,000 cfs through the critical habitat area. The target base flow is calculated as the weekly average of gaged flows throughout the critical habitat area.

Navajo was at 6038.5 feet of pool elevation and 1,095,936 acre-feet (AF) of storage by the end of February, which was 85% of average for the end of the month. Modified unregulated inflow into Navajo was 28,513 AF, which was 94% of average for the month. Calculated evaporation for the month was 666 AF. The release was reduced to 250 cfs for five days in early February to assist in-stream work by the SJRIP, and was otherwise 350 cfs throughout the rest of February. Navajo Reservoir recorded 1.26 inches of liquid precipitation (135% of average).

As of March 3rd, the release at Navajo (as measured at the USGS at Archuleta gage) was 357 cfs, and the observed inflow is 752 cfs. The reservoir elevation is 6038.57 feet and the content is 1,097,433 AF, or 65% full (42% of Active). The San Juan River at Four Corners USGS gage is at 1,190 cfs (last reading March 2nd), and the Animas River at Farmington USGS gage is at 379 cfs. Snotel sites above Navajo improved drastically from the last two storms and are showing 12.6 inches of SWE (81% of median on this date).

The most probable modified-unregulated inflow forecast for March at Navajo is 54,000 AF (58% of average), for April is 92,000 AF (54% of average), and for May is 195,000 acre-feet (70% of average). The April-July modified unregulated inflow forecasts are as follows:

Min Probable: 215,000 AF (29% of average, an increase of 85,000 AF from the mid-February forecast)
Most Probable: 415,000 AF (56% of average, an increase of 85,000 AF from the mid-February forecast)
Max Probable: 650,000 AF (88% of average, an increase of 100,000 AF from the mid-February forecast)

Navajo Operations for 2015 were discussed at a workshop in February with the SJRIP and modifications to the forecast operations have been made based on this discussion. Under all three forecast probabilities, no spring peak release is expected in 2015. The most probable forecast shows the reservoir will reach a minimum overwinter storage level of 6047 feet (1,190,000 AF) in February 2016.

Glen Canyon Dam / Lake Powell

Current Status
The unregulated inflow volume to Lake Powell in February was 424 thousand acre-feet (kaf) (108% of average). The release volume from Glen Canyon Dam in February was 589 kaf. The end of February elevation and storage of Lake Powell were 3,592.2 feet (108 feet from full pool) and 11.02 million acre-feet (maf) (45% of full capacity),

respectively. The reservoir elevation is now declining and is expected to continue to decline until runoff in late spring.

Current Operations

The operating tier for water year 2015 was established in August 2014 as the Upper Elevation Balancing Tier. In the Upper Elevation Balancing Tier the initial water year release volume is 8.23 maf; however, there is the possibility for an April adjustment to equalization or balancing operations to govern for the remainder of the water year. Under the minimum, most, and maximum probable inflow scenarios an April adjustment to balancing releases is projected to occur and Lake Powell is currently projected to release 9.0 maf in water year 2015. The minimum and maximum release projections, last updated in January, will be updated again in April. Reclamation will schedule operations at Glen Canyon Dam to achieve as practicably as possible the appropriate total annual release volume by September 30, 2015.

In March, the release volume will be approximately 650 kaf, with fluctuations anticipated between about 7,500 cfs in the nighttime to about 13,500 cfs in the daytime and consistent with the Glen Canyon Operating Criteria (Federal Register, Volume 62, No. 41, March 3, 1997). The anticipated release volume for April and May are 600 kaf and 700 kaf, respectively.

In addition to daily scheduled fluctuations for power generation, the instantaneous releases from Glen Canyon Dam may also fluctuate to provide 40 MW of system regulation. These instantaneous release adjustments stabilize the electrical generation and transmission system and translate to a range of about 1,200 cfs above or below the hourly scheduled release rate. Under system normal conditions, fluctuations for regulation are typically short lived and generally balance out over the hour with minimal or no noticeable impacts on downstream river flow conditions.

Releases from Glen Canyon Dam can also fluctuate beyond scheduled releases when called upon to respond to unscheduled power outages or power system emergencies. Depending on the severity of the system emergency, the response from Glen Canyon Dam can be significant, within the full range of the operating capacity of the power plant for as long as is necessary to maintain balance in the transmission system. Glen Canyon Dam typically maintains 27MW (approximately 800 cfs) of generation capacity in reserve in order to respond to a system emergency even when generation rates are already high. System emergencies occur fairly infrequently and typically require small responses from Glen Canyon Dam. However, these responses can have a noticeable impact on the river downstream of Glen Canyon Dam.

Inflow Forecasts and Model Projections

The April to July 2015 water supply forecast for unregulated inflow to Lake Powell, issued on March 3, 2015, by the Colorado Basin River Forecast Center, projects that the most probable (median) unregulated inflow volume will be 5.1 maf (71% of average based on the period 1981-2010). The forecast decreased by 0.1 kaf since last month. At this early point in the season, there is still significant uncertainty regarding this year's

water supply. The forecast ranges from a minimum probable of 3.47 maf (48% of average) to a maximum probable of 7.20 maf (101% of average). There is 10% chance that inflows could be higher than the maximum probable and a 10% chance they could be lower than the minimum probable.

As determined in the August 2014 24-Month Study, and documented in the 2015 Annual Operating Plan, Lake Powell's operations in water year 2015 will be governed by the Upper Elevation Balancing Tier. In this tier, the initial water year release volume is 8.23 maf, however, there is the potential for an April adjustment to equalization or balancing releases in April 2015. If the April 2015 24-Month Study projects Lake Powell's September 30, 2015, elevation to be greater than 3,649 feet, the Equalization Tier would govern Lake Powell's operations for the remainder of water year 2015 and releases could be approximately 10.8 maf or greater. Based on analysis of a range of forecasted inflow scenarios, equalization in 2015 is not projected to occur. If the April 2015 24-Month Study projects Lake Powell's September 30, 2015, elevation to be between 3,575 feet and 3,649 feet, and Lake Mead's elevation to be less than 1,075 feet, Lake Powell's annual release volume would be increased to balance the contents of Lake Mead and Lake Powell up to 9.0 maf. Based on analysis of a range of forecasted inflow scenarios, the current probability of realizing an inflow volume that would trigger balancing releases of up to 9.0 maf in 2015 is approximately 95 percent. This March 2015 24-Month Study projects that an April adjustment to balancing releases is likely to occur and Lake Powell is currently projected to release 9.0 maf in water year 2015.

Based on the current forecast, the March 24-Month Study projects Lake Powell elevation will end water year 2015 near 3,596 feet with approximately 11.38 maf in storage (47% capacity). Note that projections of elevation and storage have significant uncertainty at this early point in the season, primarily due to uncertainty regarding this season's final snowpack and the resulting inflow to Lake Powell. Under the minimum probable inflow scenario, last updated in January, the projected end of water year elevation and storage are 3589 feet and 10.73 maf (44% capacity), respectively. Under the maximum probable inflow scenario, last updated in January, the projected end of water year elevation and storage are 3639 feet and 15.94 maf (66% capacity), respectively. The annual release volume from Lake Powell during water year 2015 is projected to be 9.0 maf under all three inflow scenarios. However, there is a 10% chance that inflows will be higher, potentially resulting in higher releases; and 10% chance that inflows will be lower, potentially resulting in lower releases. If inflows are less than the current forecasted minimum probable inflow, the water year 2015 annual release could be as low as 8.23 maf. If inflows are greater than the current forecasted maximum probable inflow, the annual release could be 10.8 maf or greater. Modeling of projected reservoir operations based on the minimum and maximum scenarios will be updated again in April.

Upper Colorado River Basin Hydrology

The Upper Colorado River Basin regularly experiences significant year to year hydrologic variability. During the 15-year period 2000 to 2014, however, the unregulated inflow to Lake Powell, which is a good measure of hydrologic conditions in the Colorado River Basin, was above average in only 3 out of the past 15 years. The

period 2000-2014 is the lowest 15-year period since the closure of Glen Canyon Dam in 1963, with an average unregulated inflow of 8.39 maf, or 78% of the 30-year average (1981-2010). (For comparison, the 1981-2010 total water year average is 10.83 maf.) The unregulated inflow during the 2000-2014 period has ranged from a low of 2.64 maf (24% of average) in water year 2002 to a high of 15.97 maf (147% of average) in water year 2011. The water year 2014 unregulated inflow volume to Lake Powell was 10.381 maf (96% of average), which, though still below average, was significantly higher than inflows observed in 2012 and 2013 (45% and 47% of average, respectively). Under the current most probable forecast, total water year 2015 unregulated inflows to Lake Powell is projected to be 8.61 maf (79% of average).

At the beginning of water year 2015, total system storage in the Colorado River Basin was 30.0 maf (50% of 59.6 maf total system capacity). This is nearly the same as the total storage at the beginning of water year 2014 which began at 29.9 maf (50% of capacity). Since the beginning of water year 2000, total Colorado Basin storage has experienced year to year increases and decreases in response to wet and dry hydrology, ranging from a high of 94% of capacity at the beginning of 2000 to a low of 50% of capacity at the beginning of water year 2014. One wet year can significantly increase total system reservoir storage, just as persistent dry years can draw down the system storage. Based on current inflow forecasts, the current projected end of water year 2015 total Colorado Basin reservoir storage is approximately 28.7 maf (48% of capacity). The actual end of water year storage may vary from this projection, primarily due to uncertainty regarding this season's final snowpack and resulting runoff. Based on January minimum and maximum probable inflow forecasts and modeling the range is approximately 27.5 maf (46%) to 33.6 maf (56%), respectively.

Model Run ID: 2192

Processed On: 3/10/2015 2:22:33PM

April 24-Month Study
Date: April 15, 2015

From: Water Resources Group, Salt Lake City
To: All Colorado River Annual Operating Plan (AOP) Recipients

Current Reservoir Status

Reservoir	March Inflow (unregulated) (acre-feet)	Percent of Average (%)	April 13, Midnight Elevation (feet)	Reservoir Storage (acre-feet)
Fontenelle	70,000	133	6484.54	192,000
Flaming Gorge	77,000	76	6025.53	3,180,000
Blue Mesa	54,000	150	7491.72	595,000
Navajo	90,000	97	6045.25	1,171,000
Powell	552,000	83	3590.86	10,899,000

Expected Operations

The operation of Lake Powell and Lake Mead in this April 2015 24-Month Study is pursuant to the December 2007 Record of Decision on Colorado River Interim Guidelines for Lower Basin Shortages and the Coordinated Operations of Lake Powell and Lake Mead (Interim Guidelines) and reflects the 2015 Annual Operating Plan (AOP). Pursuant to the Interim Guidelines, the August 2014 24-Month Study projections of the January 1, 2015, system storage and reservoir water surface elevations set the operational tier for the coordinated operation of Lake Powell and Lake Mead during 2015.

Consistent with Section 6.B of the Interim Guidelines, the Lake Powell operational tier for water year 2015 is the Upper Elevation Balancing Tier. The April 2015 24-Month Study projects the end of water year elevation at Lake Powell to be above 3,575 feet and the end of water year elevation at Lake Mead to be below elevation 1,075.0 feet. Therefore, in accordance with Section 6.B.4 of the 2007 Interim Guidelines, Lake Powell operations will shift to "balancing releases" for the remainder of water year 2015. Under Section 6.B.4, the contents of Lake Powell and Lake Mead will be balanced by the end of the water year, but not more than 9.0 maf and not less than 8.23 maf shall be released from Lake Powell. Based on the most probable inflow forecast, this April 24-Month Study projects a balancing release of 9.0 maf in water year 2015; the actual release in water year 2015, however, will depend on hydrology in the remainder of water year and will range from 8.23 to 9.0 maf. The projected release from Lake Powell in water year 2015 will be updated each month throughout the remainder of the water year.

Consistent with Section 2.B.5 of the Interim Guidelines, the Intentionally Created Surplus (ICS) Surplus Condition is the criterion governing the operation of Lake Mead for calendar year 2015.

The Interim Guidelines are available for download at:
http://www.usbr.gov/lc/region/programs/strategies/RecordofDecision.pdf.
The 2015 AOP is available for download at:
http://www.usbr.gov/uc/water/rsvrs/ops/aop/AOP15.pdf.

Fontenelle Reservoir – Inflows to Fontenelle Reservoir for the month of March were 70,000 acre-feet (AF), or 133 percent of average. The current reservoir elevation is 6486 feet, which amounts to 57 percent of live storage capacity. Over the past week the average inflow rate was 1,490 cubic feet per second (cfs), with daily averages ranging from 1,290 cfs to 1,940 cfs. Fontenelle releases were increased from 1,250 cfs to 1,700 cfs at the end of March, and are expected to remain at this level through the month of April.

Inflows for the next three months are projected to be near-to-below average, with April, May, and June forecasted inflow volumes at 90,000 AF (105% of average), 140,000 AF (85% of average), and 240,000 AF (80% of average), respectively. The April final forecast of the April-July inflow volume is 580,000 AF (80% of average).

The next Fontenelle Working Group meeting is scheduled for April 15, 2015, at 10:00 am at Seedskadee Wildlife Refuge in Green River, Wyoming. The Fontenelle Working Group is an open public forum for information exchange between Reclamation and other parties associated with the operation of Fontenelle Reservoir.

Flaming Gorge Reservoir – Unregulated inflow into Flaming Gorge Reservoir during the month of February was 77,000 acre-feet (AF), or 76 percent of average. The reservoir elevation is 6,025 feet. Observed inflows are averaging 2,200 cubic feet per second (cfs).

Flaming Gorge releases are currently 1,000 cfs daily release with hourly fluctuations for hydropower. Inflows for the next three months are projected to be below average: with April, May and June forecasted inflow volumes at 120,000 AF (90% of average), 160,000 AF (65% of average), and 240,000 AF (64% of average), respectively.

The next Flaming Gorge Working Group meeting is scheduled for April 30, 2015, at 11:00 a.m. to be held in the Utah Department of Natural Resources building in Vernal, Utah. The Flaming Gorge Working Group is an open public forum for information exchange between Reclamation and the stake holders of Flaming Gorge Dam. The public is encouraged to attend and comment on the operations and plans presented by Reclamation at these meetings. Meeting notes from past Working Group meetings are posted on the Working Group webpage. For more information on this group and these meetings please contact Peter Crookston at 801-379-1152 or Heather Patno at 801-524-3883.

Aspinall Unit Reservoirs – March unregulated inflow into Blue Mesa Reservoir was 54,000 acre-feet or 150 percent of average. On April 9, 2015 the basin snowpack was 56 percent of average; which is a decrease of about 30 percent from last month. Precipitation during March was 60 percent of average. The current inflow rate into Blue Mesa Reservoir is about 1200 cfs while reservoir releases are zero because of maintenance activities. The reservoir elevation is currently at 7490.30 feet, which corresponds to a storage content of about 584,000 acre-feet.

The latest Water Supply Forecast for Water Year 2015 has been issued and the April through July unregulated inflow is forecasted to be at 480,000 acre-feet (71% of average), this is 120,000 acre-feet lower than last month's forecast. If this forecast holds through May 1st, the Black Canyon Water Right and Aspinall ROD would call for a one day peak flow of 2,660 cfs, and 6,600 cfs respectively. Based on this forecast and the combination of meeting water right and ROD this coming spring, Blue Mesa Reservoir is projected to fill this runoff season. The projected fill is calculated to be about 7516.4 feet, or about 3 feet and 26,500 acre-feet short of top of active conservation pool.

Releases from Crystal are currently set at 750 cfs. The Gunnison Diversion Tunnel is currently diverting about 400 cfs, which results in a river flow below the diversion tunnel of approximately 350 cfs. This lower flow is a result of Reclamation trying to conserve reservoir storage for what is forecasted to be a very dry year.

The next meeting of the "Aspinall Unit Working Group" will be held on Thursday, April 23, 2015 starting at 1:00 PM in Reclamation's Grand Junction Office. At this meeting, review of this winter's reservoir operations, and plans for this spring and summer operations will be discussed. These meetings are open forum discussions on the Aspinall Unit reservoir operations with many interested groups participating. Anyone needing further information about these meetings should contact Erik Knight in the Grand Junction Area Office at (970) 248-0629.

Navajo Reservoir – Reclamation is currently releasing 350 cfs. Releases are made for the authorized purposes of the Navajo Unit, and to attempt to maintain a target base flow through the endangered fish critical habitat reach of the San Juan River (Farmington to Lake Powell). The San Juan River Basin Recovery Implementation Program recommends a target base flow of between 500 cfs and 1,000 cfs through the critical habitat area. The target base flow is calculated as the weekly average of gaged flows throughout the critical habitat area.

Navajo was at 6043.4 feet of pool elevation and 1,150,403 acre-feet of storage by the end of March, which was 88% of average for the end of the month. Modified unregulated inflow into Navajo was 89,891 acre-feet, which was 97% of average for the month. Calculated evaporation for the month was 1,384 acre-ft. The release remained 350 cfs throughout the month of March. Navajo Reservoir recorded 0.99 inches of liquid precipitation (82% of average).

As of April 6th, the release at Navajo (as measured at the USGS at Archuleta gage) was 373 cfs, and the observed inflow is 1,361 cfs. The reservoir elevation is 6044.35 feet and the content is 1,160,679 acre-feet, or 68% full (48% of Active). The San Juan River at Four Corners USGS gage is at 824 cfs, and the Animas River at Farmington USGS gage is at 537 cfs. Snotel sites above Navajo are showing 8.6 inches of SWE (47% of median on this date). Runoff appears to be 4 to 6 weeks early due to the unseasonably warm temperatures.

The most probable modified-unregulated inflow forecast for April at Navajo is 110,000 acre-feet (65% of average), for May is 126,000 acre-feet (45% of average), and for June is 63,000 acre-feet (28% of average). The April-July modified unregulated inflow forecasts are as follows:

Min Probable: 225,000 acre-feet (31% of average, an increase of 5,000 acre-feet from Mid-March)
Most Probable: 310,000 acre-feet (42% of average, a decrease of 90,000 acre-feet from Mid-March)
Max Probable: 490,000 acre-feet (66% of average, a decrease of 60,000 acre-feet from Mid-March)

Under all three forecast probabilities, no spring peak release is expected in 2015. The most probable forecast shows the reservoir will reach a minimum overwinter storage level of 6042 feet (1,134,700 acre-feet) in winter of 2016.

Glen Canyon Dam / Lake Powell

Current Status

The unregulated inflow volume to Lake Powell in March was 552 thousand acre-feet (kaf) (83% of average). The release volume from Glen Canyon Dam in March was 649 kaf. The end of March elevation and storage of Lake Powell were 3,591.0 feet (109 feet from full pool) and 10.91 million acre-feet (maf) (45% of full capacity), respectively. The reservoir elevation is near the anticipated seasonal low and will soon begin increasing as spring runoff enters the reservoir.

Current Operations

The operating tier for water year 2015 was established in August 2014 as the Upper Elevation Balancing Tier. In the Upper Elevation Balancing Tier the initial water year release volume is 8.23 maf; however, there is the possibility for an April adjustment to equalization or balancing operations to govern for the remainder of the water year. This April 2015 24-Month Study establishes that Lake Powell operations will shift to "balancing releases" for the remainder of water year 2015. Under Balancing, the contents of Lake Powell and Lake Mead will be balanced by the end of the water year, but not more than 9.0 maf and not less than 8.23 maf shall be released from Lake Powell. Based on the most probable inflow forecast, this April 24-Month Study projects a balancing release of 9.0 maf in water year 2015; the actual release in water year 2015,

however, will depend on hydrology in the remainder of water year and will range from 8.23 to 9.0 maf. The projected release from Lake Powell in water year 2015 will be updated each month throughout the remainder of the water year. Reclamation will schedule operations at Glen Canyon Dam to achieve as practicably as possible the appropriate total annual release volume by September 30, 2015.

In April, the release volume will be approximately 600 kaf, with fluctuations anticipated between about 7,500 cfs in the nighttime to about 13,000 cfs in the daytime and consistent with the Glen Canyon Operating Criteria (Federal Register, Volume 62, No. 41, March 3, 1997). The anticipated release volume for May is 700 kaf with daily fluctuations between approximately 8,500 cfs and 14,500 cfs . The expected release for June is 800 kaf with daily fluctuations between approximately 10,000 cfs and 18,000 cfs. In addition to daily scheduled fluctuations for power generation, the instantaneous releases from Glen Canyon Dam may also fluctuate to provide 40 MW of system regulation. These instantaneous release adjustments stabilize the electrical generation and transmission system and translate to a range of about 1,200 cfs above or below the hourly scheduled release rate. Under system normal conditions, fluctuations for regulation are typically short lived and generally balance out over the hour with minimal or no noticeable impacts on downstream river flow conditions.

Releases from Glen Canyon Dam can also fluctuate beyond scheduled releases when called upon to respond to unscheduled power outages or power system emergencies. Depending on the severity of the system emergency, the response from Glen Canyon Dam can be significant, within the full range of the operating capacity of the power plant for as long as is necessary to maintain balance in the transmission system. Glen Canyon Dam typically maintains 27 MW (approximately 800 cfs) of generation capacity in reserve in order to respond to a system emergency even when generation rates are already high. System emergencies occur fairly infrequently and typically require small responses from Glen Canyon Dam. However, these responses can have a noticeable impact on the river downstream of Glen Canyon Dam.

Inflow Forecasts and Model Projections

The April to July 2015 water supply forecast for unregulated inflow to Lake Powell, issued on April 2, 2015, by the Colorado Basin River Forecast Center, projects that the most probable (median) unregulated inflow volume will be 3.75 maf (52% of average based on the period 1981-2010). The forecast decreased by 135 kaf since last month. At this point in the season, there is still uncertainty regarding this year's water supply and the total inflow to Lake Powell. The spring runoff forecast ranges from a minimum probable of 2.60 maf (36% of average) to a maximum probable of 5.70 maf (80% of average). There is 10% chance that inflows could be higher than the maximum probable and a 10% chance they could be lower than the minimum probable.

As determined in the August 2014 24-Month Study, and documented in the 2015 Annual Operating Plan, Lake Powell's operations in water year 2015 will be governed by the Upper Elevation Balancing Tier. In this tier, the initial water year release volume is 8.23 maf, however, there is the potential for an April adjustment to equalization or balancing

releases in April 2015. This April 2015 24-Month Study projects the end of water year elevation at Lake Powell to be above 3,575 feet and the end of water year elevation at Lake Mead to be below elevation 1,075.0 feet. Therefore, in accordance with Section 6.B.4 of the 2007 Interim Guidelines, Lake Powell operations will shift to "balancing releases" for the remainder of water year 2015. Under Section 6.B.4, the contents of Lake Powell and Lake Mead will be balanced by the end of the water year, but not more than 9.0 maf and not less than 8.23 maf shall be released from Lake Powell.

Based on the April most probable inflow forecast, the annual release volume from Lake Powell during water year 2015 is projected to be 9.0 maf. Under the minimum probable inflow scenario, the water year release is projected to be 8.9 maf. Under the maximum probable inflow scenario, the release is projected to be 9.0 maf. There 10% chance that inflows will be lower than the current minimum probable forecast, potentially resulting in lower releases. If inflows are less than the minimum probable forecast, the water year 2015 annual release could be as low as 8.23 maf. If inflows are greater than the current forecasted maximum probable inflow, the annual release will be 9.0 maf. The projected release from Lake Powell in water year 2015 will be updated each month throughout the remainder of the water year.

Based on the current forecast, the April 24-Month Study projects Lake Powell elevation will end water year 2015 near 3,583 feet with approximately 10.24 maf in storage (42% capacity). Projections of elevation and storage still have significant uncertainty at this point in the season, primarily due to uncertainty regarding spring runoff and the resulting inflow to Lake Powell. Under the minimum probable inflow scenario, updated in April, the projected end of water year elevation and storage are 3574 feet and 9.45 maf (39% capacity), respectively. Under the maximum probable inflow scenario, updated in April, the projected end of water year elevation and storage are 3603 feet and 12.02 maf (49% capacity), respectively. Modeling of projected reservoir operations based on the minimum and maximum scenarios will be updated again in August.

Upper Colorado River Basin Hydrology

The Upper Colorado River Basin regularly experiences significant year to year hydrologic variability. During the 15-year period 2000 to 2014, however, the unregulated inflow to Lake Powell, which is a good measure of hydrologic conditions in the Colorado River Basin, was above average in only 3 out of the past 15 years. The period 2000-2014 is the lowest 15-year period since the closure of Glen Canyon Dam in 1963, with an average unregulated inflow of 8.39 maf, or 78% of the 30-year average (1981-2010). (For comparison, the 1981-2010 total water year average is 10.83 maf.) The unregulated inflow during the 2000-2014 period has ranged from a low of 2.64 maf (24% of average) in water year 2002 to a high of 15.97 maf (147% of average) in water year 2011. The water year 2014 unregulated inflow volume to Lake Powell was 10.381 maf (96% of average), which, though still below average, was significantly higher than inflows observed in 2012 and 2013 (45% and 47% of average, respectively). Under the current most probable forecast, total water year 2015 unregulated inflows to Lake Powell is projected to be 7.18 maf (66% of average), and ranges from a minimum probable inflow of 5.9 maf (55%) and maximum probable inflow of 9.4 maf (87%).

At the beginning of water year 2015, total system storage in the Colorado River Basin was 30.0 maf (50% of 59.6 maf total system capacity). This is nearly the same as the total storage at the beginning of water year 2014 which began at 29.9 maf (50% of capacity). Since the beginning of water year 2000, total Colorado Basin storage has experienced year to year increases and decreases in response to wet and dry hydrology, ranging from a high of 94% of capacity at the beginning of 2000 to a low of 50% of capacity at the beginning of water year 2014. One wet year can significantly increase total system reservoir storage, just as persistent dry years can draw down the system storage. Based on current inflow forecasts, the current projected end of water year 2015 total Colorado Basin reservoir storage is approximately 27.4 maf (47% of capacity). The actual end of water year storage may vary from this projection, primarily due to uncertainty regarding this season's runoff and resulting reservoir inflow. Based on the April minimum and maximum probable inflow forecasts and modeling the range is approximately 26.1 maf (44%) to 29.5 maf (50%), respectively.
