May 24-Month Study
Date: May 18, 2015

From: Water Resources Group, Salt Lake City
To: All Colorado River Annual Operating Plan (AOP) Recipients

Current Reservoir Status

Reservoir	April Inflow (unregulated) (acre-feet)	Percent of Average (%)	May 17, Midnight Elevation (feet)	Reservoir Storage (acre-feet)
Fontenelle	87,000	102	6491.56	238,000
Flaming Gorge	112,000	84	6026.07	3,200,000
Blue Mesa	73,000	95	7493.94	612,000
Navajo	80,000	47	6047.11	1,192,000
Powell	639,000	61	3592.18	11,019,000

Expected Operations

The operation of Lake Powell and Lake Mead in this May 2015 24-Month Study is pursuant to the December 2007 Record of Decision on Colorado River Interim Guidelines for Lower Basin Shortages and the Coordinated Operations of Lake Powell and Lake Mead (Interim Guidelines) and reflects the 2015 Annual Operating Plan (AOP). Pursuant to the Interim Guidelines, the August 2014 24-Month Study projections of the January 1, 2015, system storage and reservoir water surface elevations set the operational tier for the coordinated operation of Lake Powell and Lake Mead during 2015.

Consistent with Section 6.B of the Interim Guidelines, the Lake Powell operational tier for water year 2015 is the Upper Elevation Balancing Tier. The April 2015 24-Month Study projected the end of water year elevation at Lake Powell to be above 3,575 feet and the end of water year elevation at Lake Mead to be below elevation 1,075.0 feet. Therefore, in accordance with Section 6.B.4 of the 2007 Interim Guidelines, Lake Powell operations shifted to "balancing releases" for the remainder of water year 2015. Under Section 6.B.4, the contents of Lake Powell and Lake Mead will be balanced by the end of the water year, but not more than 9.0 maf and not less than 8.23 maf shall be released from Lake Powell. Based on the most probable inflow forecast, this May 24-Month Study projects a balancing release of 9.0 maf in water year 2015; the actual release in water year 2015, however, will depend on hydrology in the remainder of water year and will range from 8.23 to 9.0 maf. The projected release from Lake Powell in water year 2015 will be updated each month throughout the remainder of the water year.

Consistent with Section 2.B.5 of the Interim Guidelines, the Intentionally Created Surplus (ICS) Surplus Condition is the criterion governing the operation of Lake Mead for calendar year 2015.

The Interim Guidelines are available for download at:
http://www.usbr.gov/lc/region/programs/strategies/RecordofDecision.pdf.
The 2015 AOP is available for download at:
http://www.usbr.gov/uc/water/rsvrs/ops/aop/AOP15.pdf.

Fontenelle Reservoir – Inflows to Fontenelle Reservoir for the month of April were 87,000 acre-feet (AF), or 102 percent of average. The current reservoir elevation is 6489 feet, which amounts to 64 percent of live storage capacity. This leaves a volume of 125,000 AF yet to be filled. Over the past week the average inflow rate was 4,010 cubic feet per second (cfs), with daily averages ranging from 2,730 cfs to 5,080 cfs. These flows are exceptionally high for early May and reflect this year's early spring runoff, as well as recent storm activity.

Fontenelle releases were increased from 1,250 cfs to ~1,700 cfs at the end of March, and have been held steady since that time. It is currently anticipated that releases will be reduced to 1,500 cfs on Thursday, May 21st, in response to a significant reduction in the April-July inflow forecast. However, this is subject to change with information provided in the mid-month forecast (expected Monday, May 18th), which will include the impacts of recent regional storm activity.

Reservoir inflows for the next three months are projected to be well below average with May, June, and July forecasted inflow volumes at 158,000 AF (96% of average), 175,000 AF (58% of average), and 75,000 AF (42% of average), respectively. The May final forecast of the April-July inflow volume is 495,000 AF (68% of average). This represents an 85,000 AF reduction since publication of the April final forecast.

The next Fontenelle Working Group meeting is scheduled for 10:00 am, August 26, 2015, at the Joint Powers Water Board, in Green River, Wyoming. The Fontenelle Working Group is an open public forum for information exchange between Reclamation and other parties associated with the operation of Fontenelle Reservoir.

Flaming Gorge Reservoir – Unregulated inflow into Flaming Gorge Reservoir during the month of April was 112,000 acre-feet (AF), or 84 percent of average. The reservoir elevation is 6,027 feet. Observed inflows are averaging 2,600 cubic feet per second (cfs).

Razorback sucker larvae were confirmed Friday, May 8, 2015, and Flaming Gorge Dam releases began increasing May 11, 2015. Releases will remain at full power plant (4,600 cfs) and bypass capacity (4,000 cfs) for a total release of 8,600 cfs for a maximum of five days. Flaming Gorge releases will begin decreasing once connection to the nursery floodplain habitat no longer exists or releases have been at 8,600 cfs for five days.

Once decreasing releases have reached power plant capacity (4,600 cfs) the decrease will continue at 350 cfs/day to base flows. The projected base flow release rate varies between 1,100 cfs to 1,540 cfs based on the +/- 40% flexibility outlined in the 2006 Record of Decision.

Inflows for the next three months are projected to be below average: with May, June and July forecasted inflow volumes at 185,000 AF (75% of average), 190,000 AF (49% of average), and 83,000 AF (39% of average), respectively.

The next Flaming Gorge Working Group meeting is scheduled for April 30, 2015, at 11:00 a.m. to be held in the Utah Department of Natural Resources building in Vernal, Utah. The Flaming Gorge Working Group is an open public forum for information exchange between Reclamation and the stake holders of Flaming Gorge Dam. The public is encouraged to attend and comment on the operations and plans presented by Reclamation at these meetings. Meeting notes from past Working Group meetings are posted on the Working Group webpage. For more information on this group and these meetings please contact Peter Crookston at 801-379-1152 or Heather Patno at 801-524-3883.

Aspinall Unit Reservoirs – April unregulated inflow into Blue Mesa Reservoir was 73,000 acre-feet or 95 percent of average. On May 5, 2015 the basin snowpack was 51 percent of average. One week later on May 11, 2015 the basin snowpack was 69 percent of average. This week was very productive with much needed rain and snow. However, the overall winter weather pattern has been dry and warmer than average. Precipitation during April was 80 percent of average. The current inflow rate into Blue Mesa Reservoir is averaging 2,200 cfs while reservoir releases are averaging about 1,800 cfs. The reservoir elevation is currently at 7492.95 feet, which corresponds to a storage content of about 604,000 acre-feet. This elevation is about 6.0 feet higher, or about 47,000 acre-feet more than a year ago.

The latest Water Supply Forecast for Water Year 2015 was issued on May 1st and the April through July unregulated inflow is forecasted to be at 440,000 acre-feet (65% of normal). This sets the senior Black Canyon Water Right call for a one day spring peak flow of 2,054 cfs, and the Aspinall ROD target at an instantaneous peak flow of 4,991 cfs. Reclamation has just completed meeting both of these target flows based on the water right and ROD recommendations. Given this operation and future forecasted flows, Blue Mesa Reservoir is not projected fill this runoff season. The projected fill is calculated to be between 7510 feet and 7512 feet. Any elevation above 7516.00 is considered a fill for the season.

Releases from Crystal are currently ramping down from meeting target peak flows and is scheduled to reach a flow of 1,400 cfs for the rest of May. The Gunnison Diversion Tunnel started taking water for the new season on March 31, 2015. The current diversion rate in the tunnel is 1,000 cfs, which will result in a river flow below the diversion tunnel of approximately 400 cfs. However, these rates will most likely change as conditions warrant, primarily as we respond to changes in hydrologic conditions.

The next meeting of the "Aspinall Unit Working Group" will be held on Thursday, August 13, 2015 starting at 1:00 PM at the Elk Creek Visitor Center at Blue Mesa Reservoir. At this meeting, review of this spring's reservoir operations, and plans for this fall and winter operations will be discussed. These meetings are open forum discussions on the Aspinall Unit reservoir operations with many interested groups participating. Anyone needing further information about these meetings should contact Erik Knight in the Grand Junction Area Office at (970) 248-0629.

Navajo Reservoir – Reclamation is currently releasing 350 cfs. Releases are made for the authorized purposes of the Navajo Unit, and to attempt to maintain a target base flow through the endangered fish critical habitat reach of the San Juan River (Farmington to Lake Powell). The San Juan River Basin Recovery Implementation Program recommends a target base flow of between 500 cfs and 1,000 cfs through the critical habitat area. The target base flow is calculated as the weekly average of gaged flows throughout the critical habitat area.

Navajo was at 6045.2 feet of pool elevation and 1,170,470 acre-feet of storage by the end of April, which was 86% of average for the end of the month. Modified unregulated inflow into Navajo was 80,166 acre-feet, which was 47% of average for the month. Calculated evaporation for the month was 2,199 acre-ft. NIIP diverted a total of 19,793 acre-ft. The release averaged close to 350 cfs throughout the month. Precipitation at the dam totaled 0.65 inches (61% of average).

As of May 7th, the release at Navajo (as measured at the USGS at Archuleta gage) was 350 cfs, and the observed inflow is 2,288 cfs. The reservoir elevation is 6045.95 feet and the content is 1,178,742 acre-feet, or 69% full (50% of Active). The San Juan River at Four Corners USGS gage is at 1,130 cfs, and the Animas River at Farmington USGS gage is at 1,230 cfs. Snotel sites above Navajo are showing 3.3 inches of SWE (22% of median on this date).

The most probable modified-unregulated inflow forecast for May at Navajo is 100,000 acre-feet (36% of average), for June is 40,000 acre-ft (18% of average), and for July is 10,000 acre-feet (15% of average). The April-July modified unregulated inflow forecasts are as follows:

Min Probable: 170,000 acre-feet (23% of average, a decrease of 3,000 af from mid-April)
Most Probable: 230,000 acre-ft (31% of average, a decrease of 50,000 af from mid-April)
Max Probable: 300,000 acre-ft (41% of average, a decrease of 95,000 af from mid-April)

Under all three forecast probabilities, no spring peak release is expected in 2015. The most probable forecast shows the reservoir will peak in early June at an elevation just under 6047 feet (1,190,000 acre-feet), and reach a minimum overwinter storage level near 6035 feet (1,060,000 acre-feet) in winter of 2016.

Glen Canyon Dam / Lake Powell

Current Status

The unregulated inflow volume to Lake Powell in April was 639 thousand acre-feet (kaf) (61% of average). The release volume from Glen Canyon Dam in April was 600 kaf. The end of April elevation and storage of Lake Powell were 3,590.2 feet (110 feet from full pool) and 10.84 million acre-feet (maf) (44% of full capacity), respectively. The reservoir elevation began increasing over the past week as the first of the spring runoff is now entering the reservoir.

Current Operations

The operating tier for water year 2015 was established in August 2014 as the Upper Elevation Balancing Tier. The April 2015 24-Month Study established that Lake Powell operations will be governed by balancing for the remainder of water year 2015. Under balancing, the contents of Lake Powell and Lake Mead will be balanced by the end of the water year, but not more than 9.0 maf and not less than 8.23 maf shall be released from Lake Powell. Based on the most probable inflow forecast, this May 24-Month Study projects a balancing release of 9.0 maf in water year 2015; the actual release in water year 2015, however, will depend on hydrology in the remainder of water year and will range from 8.23 to 9.0 maf. The projected release from Lake Powell in water year 2015 will be updated each month throughout the remainder of the water year. Reclamation will schedule operations at Glen Canyon Dam to achieve as practicably as possible the appropriate total annual release volume by September 30, 2015.

In May, the release volume will be approximately 700 kaf, with fluctuations anticipated between about 8,500 cfs in the nighttime to about 14,500 cfs in the daytime and consistent with the Glen Canyon Operating Criteria (Federal Register, Volume 62, No. 41, March 3, 1997). The anticipated release volume for June is 800 kaf with daily fluctuations between approximately 10,000 cfs and 15,000 cfs . The expected release for July is 1,050 kaf with daily fluctuations between approximately 14,000 cfs and 22,000 cfs.

In addition to daily scheduled fluctuations for power generation, the instantaneous releases from Glen Canyon Dam may also fluctuate to provide 40 MW of system regulation. These instantaneous release adjustments stabilize the electrical generation and transmission system and translate to a range of about 1,200 cfs above or below the hourly scheduled release rate. Under system normal conditions, fluctuations for regulation are typically short lived and generally balance out over the hour with minimal or no noticeable impacts on downstream river flow conditions.

Releases from Glen Canyon Dam can also fluctuate beyond scheduled releases when called upon to respond to unscheduled power outages or power system emergencies. Depending on the severity of the system emergency, the response from Glen Canyon Dam can be significant, within the full range of the operating capacity of the power plant

for as long as is necessary to maintain balance in the transmission system. Glen Canyon Dam typically maintains 27 MW (approximately 800 cfs) of generation capacity in reserve in order to respond to a system emergency even when generation rates are already high. System emergencies occur fairly infrequently and typically require small responses from Glen Canyon Dam. However, these responses can have a noticeable impact on the river downstream of Glen Canyon Dam.

Inflow Forecasts and Model Projections

The April to July 2015 water supply forecast for unregulated inflow to Lake Powell, issued on May 4, 2015, by the Colorado Basin River Forecast Center, projects that the most probable (median) unregulated inflow volume will be 3.00 maf (42% of average based on the period 1981-2010). The forecast decreased by 750 kaf since last month. At this point in the season, there is still uncertainty regarding the spring runoff and resulting inflow to Lake Powell. The spring runoff forecast ranges from a minimum probable of 2.25 maf (31% of average) to a maximum probable of 4.22 maf (59% of average). There is 10% chance that inflows could be higher than the maximum probable and a 10% chance they could be lower than the minimum probable.

As determined in the August 2014 24-Month Study, and documented in the 2015 Annual Operating Plan, Lake Powell's operations in water year 2015 will be governed by the Upper Elevation Balancing Tier. Because the April 2015 24-Month Study projected the end of water year elevation at Lake Powell to be above 3,575 feet and the end of water year elevation at Lake Mead to be below elevation 1,075.0 feet, Lake Powell operations shifted to balancing (Section 6.B.4 of the 2007 Interim Guidelines) for the remainder of water year 2015. Under balancing, the contents of Lake Powell and Lake Mead will be balanced by the end of the water year, but not more than 9.0 maf and not less than 8.23 maf shall be released from Lake Powell.

Based on the May most probable inflow forecast, the annual release volume from Lake Powell during water year 2015 is projected to be 9.0 maf. Under the minimum probable inflow scenario, last update in April, the water year release is projected to be 8.9 maf. Under the maximum probable inflow scenario, last updated in April, the release is projected to be 9.0 maf. There 10% chance that inflows will be lower than the minimum probable forecast, potentially resulting in lower releases. If inflows are less than the minimum probable forecast, the water year 2015 annual release could be as low as 8.23 maf. If inflows are greater than the forecasted maximum probable inflow, the annual release will be 9.0 maf. The projected release from Lake Powell in water year 2015 will be updated each month throughout the remainder of the water year.

Based on the current forecast, the May 24-Month Study projects Lake Powell's end of water year 2015 elevation to be near 3,578 feet with approximately 9.78 maf in storage (40% capacity). Projections of elevation and storage still have uncertainty at this point in the season, primarily due to uncertainty regarding spring runoff and the resulting inflow to Lake Powell. Under the minimum probable inflow scenario, last updated in April, the projected end of water year elevation and storage are 3,574 feet and 9.45 maf (39% capacity), respectively. Under the maximum probable inflow scenario, last updated in

April, the projected end of water year elevation and storage are 3,603 feet and 12.02 maf (49% capacity), respectively. Modeling of projected reservoir operations based on the minimum and maximum scenarios will be updated again in August.

Upper Colorado River Basin Hydrology

The Upper Colorado River Basin regularly experiences significant year to year hydrologic variability. During the 15-year period 2000 to 2014, however, the unregulated inflow to Lake Powell, which is a good measure of hydrologic conditions in the Colorado River Basin, was above average in only 3 out of the past 15 years. The period 2000-2014 is the lowest 15-year period since the closure of Glen Canyon Dam in 1963, with an average unregulated inflow of 8.39 maf, or 78% of the 30-year average (1981-2010). (For comparison, the 1981-2010 total water year average is 10.83 maf.) The unregulated inflow during the 2000-2014 period has ranged from a low of 2.64 maf (24% of average) in water year 2002 to a high of 15.97 maf (147% of average) in water year 2011. The water year 2014 unregulated inflow volume to Lake Powell was 10.381 maf (96% of average), which, though still below average, was significantly higher than inflows observed in 2012 and 2013 (45% and 47% of average, respectively). Under the current most probable forecast, total water year 2015 unregulated inflows to Lake Powell is projected to be 6.40 maf (59% of average), and ranges from a minimum probable inflow of 5.9 maf (54%) and maximum probable inflow of 7.9 maf (73%).

At the beginning of water year 2015, total system storage in the Colorado River Basin was 30.0 maf (50% of 59.6 maf total system capacity). This is nearly the same as the total storage at the beginning of water year 2014 which began at 29.9 maf (50% of capacity). Since the beginning of water year 2000, total Colorado Basin storage has experienced year to year increases and decreases in response to wet and dry hydrology, ranging from a high of 94% of capacity at the beginning of 2000 to a low of 50% of capacity at the beginning of water year 2015. One wet year can significantly increase total system reservoir storage, just as persistent dry years can draw down the system storage. Based on current inflow forecasts, the current projected end of water year 2015 total Colorado Basin reservoir storage is approximately 27.4 maf (45% of total system capacity). The actual end of water year system storage may vary from this projection, primarily due to uncertainty regarding this season's runoff and resulting reservoir inflow. Based on the April minimum and maximum probable inflow forecasts and modeling the range is approximately 26.1 maf (44%) to 29.5 maf (50%), respectively.

June 24-Month Study
Date: June 15, 2015

From: Water Resources Group, Salt Lake City
To: All Colorado River Annual Operating Plan (AOP) Recipients

Current Reservoir Status

Reservoir	May Inflow (unregulated) (acre-feet)	Percent of Average (%)	June 14, Midnight Elevation (feet)	Reservoir Storage (acre-feet)
Fontenelle	223,000	136	6505.05	337,000
Flaming Gorge	333,000	137	6029.83	3,342,000
Blue Mesa	136,000	62	7515.84	797,000
Navajo	180,000	65	6064.08	1,401,000
Powell	1,613,000	69	3605.60	12,293,000

Expected Operations

The operation of Lake Powell and Lake Mead in this June 2015 24-Month Study is pursuant to the December 2007 Record of Decision on Colorado River Interim Guidelines for Lower Basin Shortages and the Coordinated Operations of Lake Powell and Lake Mead (Interim Guidelines) and reflects the 2015 Annual Operating Plan (AOP). Pursuant to the Interim Guidelines, the August 2014 24-Month Study projections of the January 1, 2015, system storage and reservoir water surface elevations set the operational tier for the coordinated operation of Lake Powell and Lake Mead during 2015.

Consistent with Section 6.B of the Interim Guidelines, the Lake Powell operational tier for water year 2015 is the Upper Elevation Balancing Tier. The April 2015 24-Month Study projected the end of water year elevation at Lake Powell to be above 3,575 feet and the end of water year elevation at Lake Mead to be below elevation 1,075.0 feet. Therefore, in accordance with Section 6.B.4 of the 2007 Interim Guidelines, Lake Powell operations shifted to "balancing releases" for the remainder of water year 2015. Under Section 6.B.4, the contents of Lake Powell and Lake Mead will be balanced by the end of the water year, but not more than 9.0 maf and not less than 8.23 maf shall be released from Lake Powell. Based on the most probable inflow forecast, this June 24-Month Study projects a balancing release of 9.0 maf in water year 2015; the actual release in water year 2015, however, will depend on hydrology in the remainder of water year and will range from 8.23 to 9.0 maf. The projected release from Lake Powell in water year 2015 will be updated each month throughout the remainder of the water year.

Consistent with Section 2.B.5 of the Interim Guidelines, the Intentionally Created Surplus (ICS) Surplus Condition is the criterion governing the operation of Lake Mead for calendar year 2015.

The Interim Guidelines are available for download at:
http://www.usbr.gov/lc/region/programs/strategies/RecordofDecision.pdf.
The 2015 AOP is available for download at:
http://www.usbr.gov/uc/water/rsvrs/ops/aop/AOP15.pdf.

Fontenelle Reservoir – Inflows to Fontenelle Reservoir for the month of May were 223,000 acre-feet (AF), or 136 percent of average. The current reservoir elevation is 6505 feet, which amounts to 97 percent of live storage capacity. Over the past week the average inflow rate was 6,860 cubic feet per second (cfs), with daily averages ranging from 6,440 cfs to 7,120 cfs. These high flows reflect this year's early spring runoff, as well as recent storm activity. Reservoir inflows are forecast to remain above 7,000 cfs through the weekend of June 12th, when they will likely peak between 7,500 and 8,000 cfs.

Between Monday, June 1st and Tuesday, June 9th, releases from Fontenelle were increased from power plant capacity (between 1,750 cfs and 1,850 cfs) to 7,000 cfs in order to manage increased runoff. Releases will likely vary throughout June in response to observed hydrology. Current weather forecasts suggest that above average precipitation may continue for the foreseeable future, and reservoir releases may remain elevated as a result. This is subject to change as additional information becomes available.

Seasonal reservoir inflows from April through June are projected to be near-to-below average, with June and July forecasted inflow volumes at 255,000 AF (85% of average) and 110,000 AF (62% of average), respectively. The June forecast of April-July inflow is for 675,000 AF (93% of average). This represents an increase of 180,000 AF since publication of the May final forecast.

The next Fontenelle Working Group meeting is scheduled for 10:00 am, August 26, 2015, at the Joint Powers Water Board, in Green River, Wyoming. The Fontenelle Working Group is an open public forum for information exchange between Reclamation and other parties associated with the operation of Fontenelle Reservoir.

Flaming Gorge Reservoir – Flaming Gorge Dam is currently releasing an average daily base flow of 1,700 cfs. It is anticipated that releases will remain at 1,700 cfs through September 30, 2015. There is the possibility that releases may increase to assist with the Colorado Pikeminnow spawn, one of four endangered species in the Green River. Information regarding revised releases will be distributed as early as possible. Base flow releases are subject to observed hydrology and all projections may change.

The above-average precipitation during May increased the projected Flaming Gorge unregulated inflow volume for the April-July period from 690,000 acre-feet (70% of average) to 910,000 acre-feet (93% of average) in the June forecast.

Unregulated inflow into Flaming Gorge Reservoir during the month of May was 333,000 acre-feet (AF), or 137 percent of average. The reservoir elevation is 6,028.29 feet. Observed inflows are averaging 5,000 cubic feet per second (cfs).

Inflows for the next three months are projected to be below average: with June, July and August forecasted inflow volumes at 330,000 AF (85% of average), 135,000 AF (64% of average), and 60,000 AF (68% of average), respectively.

The next Flaming Gorge Working Group meeting is scheduled for April 30, 2015, at 11:00 a.m. to be held in the Utah Department of Natural Resources building in Vernal, Utah. The Flaming Gorge Working Group is an open public forum for information exchange between Reclamation and the stake holders of Flaming Gorge Dam. The public is encouraged to attend and comment on the operations and plans presented by Reclamation at these meetings. Meeting notes from past Working Group meetings are posted on the Working Group webpage. For more information on this group and these meetings please contact Peter Crookston at 801-379-1152 or Heather Patno at 801-524-3883.

Aspinall Unit Reservoirs – May unregulated inflow into Blue Mesa Reservoir was 136,000 acre-feet or 62 percent of average. The Gunnison River Basin spring peak was thought to have occurred in early May, however with the onset of very heavy and frequent rainstorms, the basin inflows have been on the rise for the early part of June. So far this season Blue Mesa has seen peak flows of over 7,000 cfs and may even be higher over the mid-part of the month. Blue Mesa's present elevation is 7511.20 feet, which corresponds to a storage content of about 756,000 acre-feet. Precipitation during May was a whopping 255 percent of average.

The June 1st Water Supply Forecast issued from the River Forecast Center called for an April-July inflow into Blue Mesa Reservoir of 570,000 acre-feet (84% of normal). This is an increase of 130,000 acre-feet from last month. With the extra ordinary rain the basin has seen and continues to see, the forecast will probably increase again. At this time Reclamation is attempting to operate the Aspinall Unit to avoid spills and bypasses as much as possible. However, Crystal Dam is already in bypass mode, with a total release of 3,400 cfs set for June 4th and beyond. Under these conditions, Blue Mesa Reservoir is projected fill just below its top capacity of elevation 7519.4 feet this runoff season. Any elevation above 7516.00 is considered a fill for the season.

Pursuant to the Aspinall Unit Operations Record of Decision (ROD), the baseflow target in the lower Gunnison River, as measured at the Whitewater gage, is 1500 cfs for June. Flows in the lower Gunnison River are currently above the baseflow target. River flows are expected to stay above the baseflow target for the foreseeable future.

The next meeting of the "Aspinall Unit Working Group" will be held on Thursday, August 13, 2015 starting at 1:00 PM at the Elk Creek Visitor Center at Blue Mesa Reservoir. At this meeting, review of this spring's reservoir operations, and plans for this fall and winter operations will be discussed. These meetings are open forum discussions on the Aspinall Unit reservoir operations with many interested groups participating. Anyone needing further information about these meetings should contact Erik Knight in the Grand Junction Area Office at (970) 248-0629.

Navajo Reservoir – Reclamation is currently releasing 350 cfs. Releases are made for the authorized purposes of the Navajo Unit, and to attempt to maintain a target base flow through the endangered fish critical habitat reach of the San Juan River (Farmington to Lake Powell). The San Juan River Basin Recovery Implementation Program recommends a target base flow of between 500 cfs and 1,000 cfs through the critical habitat area. The target base flow is calculated as the weekly average of gaged flows throughout the critical habitat area.

Navajo was at 6053.4 feet of pool elevation and 1,266,532 acre-feet of storage by the end of May, which was 89% of average for the end of the month. Modified unregulated inflow into Navajo was 178,822 acre-feet, which was 65% of average for the month. Calculated evaporation for the month was 380 acre-ft. NIIP diverted a total of 23,357 acre-ft. The release averaged close to 350 cfs throughout the month. Precipitation at the dam totaled 3.02 inches (290% of average).

As of June 4, the release at Navajo (as measured at the USGS at Archuleta gage) was 329 cfs (the release will be adjusted on Monday to more closely match the scheduled release of 350 cfs), and the observed inflow is 4,369 cfs. NIIP is diverting 415 cfs. The reservoir elevation is 6055.7 feet and the content is 1,293,577 acre-feet, or 76% full (61% of Active). The San Juan River at Four Corners USGS gage is at 4,000 cfs, and the Animas River at Farmington USGS gage is at 4,070 cfs. Snotel sites above Navajo are showing 2.4 inches of SWE (106% of median on this date).

The most probable modified-unregulated inflow forecast for June at Navajo is 125,000 acre-feet (56% of average), for July is 20,000 acre-ft (30% of average), and for August is 18,000 acre-feet (40% of average). The April-July modified unregulated inflow forecasts are as follows:

Min Probable: 370,000 acre-feet (50% of average, an increase of 140,000 acre-feet from the last forecast)
Most Probable: 405,000 acre-feet (55% of average, an increase of 100,000 acre-feet from the last forecast)
Max Probable: 470,000 acre-feet (64% of average, an increase of 65,000 acre-feet from the last forecast)

The most probable forecast shows the reservoir will peak in mid-June near 6057.7 feet (1,319,000 acre-feet), end the water year (Sept 30th) near 6049.3 feet (1,218,000 acre-

feet), and reach a minimum overwinter storage level near 6048.7 feet (1,210,000 acre-feet) in February of 2016.

Glen Canyon Dam / Lake Powell

Current Status

The unregulated inflow volume to Lake Powell in May was 1,613 thousand acre-feet (kaf) (69% of average). The release volume from Glen Canyon Dam in May was 699 kaf. The end of May elevation and storage of Lake Powell were 3,597.3 feet (103 feet from full pool) and 11.49 million acre-feet (maf) (47% of full capacity), respectively. The reservoir elevation is increasing and will continue to increase throughout mid-summer as runoff from snowmelt and precipitation enters the reservoir.

Current Operations

The operating tier for water year 2015 was established in August 2014 as the Upper Elevation Balancing Tier. The April 2015 24-Month Study established that Lake Powell operations will be governed by balancing for the remainder of water year 2015. Under balancing, the contents of Lake Powell and Lake Mead will be balanced by the end of the water year, but not more than 9.0 maf and not less than 8.23 maf shall be released from Lake Powell. Based on the most probable inflow forecast, this June 24-Month Study projects a balancing release of 9.0 maf in water year 2015; the actual release in water year 2015, however, will depend on hydrology in the remainder of water year and will range from 8.23 to 9.0 maf. The projected release from Lake Powell in water year 2015 will be updated each month throughout the remainder of the water year. Reclamation will schedule operations at Glen Canyon Dam to achieve as practicably as possible the appropriate total annual release volume by September 30, 2015.

In June, the release volume will be approximately 800 kaf, with fluctuations anticipated between about 10,000 cfs in the nighttime to about 18,000 cfs in the daytime and consistent with the Glen Canyon Operating Criteria (Federal Register, Volume 62, No. 41, March 3, 1997). The anticipated release volume for July is 1,050 kaf with daily fluctuations between approximately 12,000 cfs and 20,000 cfs during the first part of the month and 14,000 cfs and 22,000 cfs during the latter part of the month. The expected release for August is 800 kaf with daily fluctuations between approximately 9,000 cfs and 17,000 cfs.

In addition to daily scheduled fluctuations for power generation, the instantaneous releases from Glen Canyon Dam may also fluctuate to provide 40 MW of system regulation. These instantaneous release adjustments stabilize the electrical generation and transmission system and translate to a range of about 1,200 cfs above or below the hourly scheduled release rate. Under system normal conditions, fluctuations for regulation are typically short lived and generally balance out over the hour with minimal or no noticeable impacts on downstream river flow conditions.

Releases from Glen Canyon Dam can also fluctuate beyond scheduled releases when called upon to respond to unscheduled power outages or power system emergencies. Depending on the severity of the system emergency, the response from Glen Canyon Dam can be significant, within the full range of the operating capacity of the power plant for as long as is necessary to maintain balance in the transmission system. Glen Canyon Dam typically maintains 27 MW (approximately 800 cfs) of generation capacity in reserve in order to respond to a system emergency even when generation rates are already high. System emergencies occur fairly infrequently and typically require small responses from Glen Canyon Dam. However, these responses can have a noticeable impact on the river downstream of Glen Canyon Dam.

Inflow Forecasts and Model Projections

The April to July 2015 water supply forecast for unregulated inflow to Lake Powell, issued on June 3, 2015, by the Colorado Basin River Forecast Center, projects that the most probable (median) unregulated inflow volume will be 5.00 maf (70% of average based on the period 1981-2010). Due to significantly above average precipitation in May, the forecast increased significantly (by 2,000 kaf) since last month. There is still uncertainty regarding the runoff and resulting inflow to Lake Powell. The April to July forecast ranges from a minimum probable of 4.45 maf (62% of average) to a maximum probable of 6.00 maf (84% of average). There is 10% chance that inflows could be higher than the maximum probable and a 10% chance they could be lower than the minimum probable.

As determined in the August 2014 24-Month Study, and documented in the 2015 Annual Operating Plan, Lake Powell's operations in water year 2015 will be governed by the Upper Elevation Balancing Tier. Because the April 2015 24-Month Study projected the end of water year elevation at Lake Powell to be above 3,575 feet and the end of water year elevation at Lake Mead to be below elevation 1,075.0 feet, Lake Powell operations shifted to balancing (Section 6.B.4 of the 2007 Interim Guidelines) for the remainder of water year 2015. Under balancing, the contents of Lake Powell and Lake Mead will be balanced by the end of the water year, but not more than 9.0 maf and not less than 8.23 maf shall be released from Lake Powell.

Based on the June most probable inflow forecast, the annual release volume from Lake Powell during water year 2015 is projected to be 9.0 maf. Under the minimum probable inflow scenario, last update in April, the water year release is projected to be 8.9 maf. Under the maximum probable inflow scenario, last updated in April, the release is projected to be 9.0 maf. There 10% chance that inflows will be lower than the minimum probable forecast, potentially resulting in lower releases. If inflows are less than the minimum probable forecast, the water year 2015 annual release could be as low as 8.23 maf. If inflows are greater than the forecasted maximum probable inflow, the annual release will be 9.0 maf. The projected release from Lake Powell in water year 2015 will be updated each month throughout the remainder of the water year.

Based on the current forecast, the June 24-Month Study projects Lake Powell's end of water year 2015 elevation to be near 3,596 feet with approximately 11.34 maf in storage

(47% capacity). Projections of elevation and storage still have uncertainty at this point in the season, primarily due to uncertainty regarding runoff and the resulting inflow to Lake Powell. Under the minimum probable inflow scenario, last updated in April, the projected end of water year elevation and storage are 3,574 feet and 9.45 maf (39% capacity), respectively. Under the maximum probable inflow scenario, last updated in April, the projected end of water year elevation and storage are 3,603 feet and 12.02 maf (49% capacity), respectively. Modeling of projected reservoir operations based on the minimum and maximum scenarios will be updated again in August.

Upper Colorado River Basin Hydrology

The Upper Colorado River Basin regularly experiences significant year to year hydrologic variability. During the 15-year period 2000 to 2014, however, the unregulated inflow to Lake Powell, which is a good measure of hydrologic conditions in the Colorado River Basin, was above average in only 3 out of the past 15 years. The period 2000-2014 is the lowest 15-year period since the closure of Glen Canyon Dam in 1963, with an average unregulated inflow of 8.39 maf, or 78% of the 30-year average (1981-2010). (For comparison, the 1981-2010 total water year average is 10.83 maf.) The unregulated inflow during the 2000-2014 period has ranged from a low of 2.64 maf (24% of average) in water year 2002 to a high of 15.97 maf (147% of average) in water year 2011. The water year 2014 unregulated inflow volume to Lake Powell was 10.381 maf (96% of average), which, though still below average, was significantly higher than inflows observed in 2012 and 2013 (45% and 47% of average, respectively). Under the current most probable forecast, total water year 2015 unregulated inflows to Lake Powell is projected to be 8.54 maf (79% of average), and ranges from a minimum probable inflow of 8.0 maf (74%) and maximum probable inflow of 9.5 maf (88%).

At the beginning of water year 2015, total system storage in the Colorado River Basin was 30.0 maf (50% of 59.6 maf total system capacity). This is nearly the same as the total storage at the beginning of water year 2014 which began at 29.9 maf (50% of capacity). Since the beginning of water year 2000, total Colorado Basin storage has experienced year to year increases and decreases in response to wet and dry hydrology, ranging from a high of 94% of capacity at the beginning of 2000 to a low of 50% of capacity at the beginning of water year 2015. One wet year can significantly increase total system reservoir storage, just as persistent dry years can draw down the system storage. Based on current inflow forecasts, the current projected end of water year 2015 total Colorado Basin reservoir storage is approximately 28.8 maf (48% of total system capacity). The actual end of water year system storage may vary from this projection, primarily due to uncertainty regarding this season's runoff and resulting reservoir inflow. Based on the April minimum and maximum probable inflow forecasts and modeling the range is approximately 26.1 maf (44%) to 29.5 maf (50%), respectively.

July 24-Month Study
Date: July 14, 2015

From: Water Resources Group, Salt Lake City
To: All Colorado River Annual Operating Plan (AOP) Recipients

Current Reservoir Status

Reservoir	June Inflow (unregulated) (acre-feet)	Percent of Average (%)	July 12, Midnight Elevation (feet)	Reservoir Storage (acre-feet)
Fontenelle	332,000	111	6500.63	303,000
Flaming Gorge	434,000	111	6034.79	3,538,000
Blue Mesa	368,000	141	7518.77	824,000
Navajo	285,000	127	6069.34	1,471,000
Powell	3,389,000	127	3614.25	13,163,000

Expected Operations

The operation of Lake Powell and Lake Mead in this July 2015 24-Month Study is pursuant to the December 2007 Record of Decision on Colorado River Interim Guidelines for Lower Basin Shortages and the Coordinated Operations of Lake Powell and Lake Mead (Interim Guidelines) and reflects the 2015 Annual Operating Plan (AOP). Pursuant to the Interim Guidelines, the August 2014 24-Month Study projections of the January 1, 2015, system storage and reservoir water surface elevations set the operational tier for the coordinated operation of Lake Powell and Lake Mead during 2015.

Consistent with Section 6.B of the Interim Guidelines, the Lake Powell operational tier for water year 2015 is the Upper Elevation Balancing Tier. The April 2015 24-Month Study projected the end of water year elevation at Lake Powell to be above 3,575 feet and the end of water year elevation at Lake Mead to be below elevation 1,075.0 feet. Therefore, in accordance with Section 6.B.4 of the 2007 Interim Guidelines, Lake Powell operations shifted to "balancing releases" for the remainder of water year 2015. Under Section 6.B.4, the contents of Lake Powell and Lake Mead will be balanced by the end of the water year, but not more than 9.0 maf and not less than 8.23 maf shall be released from Lake Powell. Based on the most probable inflow forecast, this July 24-Month Study projects a balancing release of 9.0 maf in water year 2015.

Consistent with Section 2.B.5 of the Interim Guidelines, the Intentionally Created Surplus (ICS) Surplus Condition is the criterion governing the operation of Lake Mead for calendar year 2015.

The Interim Guidelines are available for download at:
http://www.usbr.gov/lc/region/programs/strategies/RecordofDecision.pdf.
The 2015 AOP is available for download at:
http://www.usbr.gov/uc/water/rsvrs/ops/aop/AOP15.pdf.

Fontenelle Reservoir – Inflows to Fontenelle Reservoir for the month of June were 332,000 acre-feet (AF), or 111 percent of average. The current reservoir elevation is 6500.6 feet, which amounts to 88 percent of live storage capacity. Spring runoff inflows peaked above 7,500 cfs in mid-June. The current rate of inflow is roughly 3,340 cubic feet per second (cfs), having recently increased due to storm activity. Recent daily inflow averages have ranged from 2,150 cfs to 3,440 cfs.

Reservoir releases varied throughout June in response to observed hydrology, and are currently at 2,900 cfs. While weather conditions are expected to be relatively cool and wet this week, the forecasted inflow volume for July has decreased significantly, as indicated by the Colorado Basin River Forecast Center. Fontenelle will be operated to accommodate the anticipated hydrologic conditions. As such, releases will be reduced to 1,200 cfs by Friday, July 10, 2015, where they may remain until mid-August, when releases will be further reduced to a winter baseflow level of 1,000 cfs. This is subject to change based on observed hydrology.

The official July forecast of April-July inflow is for 730,000 AF (101% of average). While seasonal reservoir inflows from April through July are projected to be near average, forecasted inflow volume for July is expected to be well below average at 88,000 AF (49% of average).

The next Fontenelle Working Group meeting is scheduled for 10:00 am, August 26, 2015, at the Joint Powers Water Board, in Green River, Wyoming. The Fontenelle Working Group is an open public forum for information exchange between Reclamation and other parties associated with the operation of Fontenelle Reservoir.

Flaming Gorge Reservoir – Flaming Gorge Dam is currently releasing an average daily base flow of 1,700 cfs. It is anticipated that releases will remain at 1,700 cfs through October 31, 2015. There is the possibility that releases may increase to assist with the Colorado Pikeminnow spawn, one of four endangered species in the Green River. Information regarding revised releases will be distributed as early as possible. Base flow releases are subject to observed hydrology and all projections may change.

Unregulated inflow into Flaming Gorge Reservoir during the month of June was 434,000 acre-feet (AF), or 111 percent of average. The reservoir elevation is 6,034.8 feet. Observed inflows are averaging 3,000 cubic feet per second (cfs).

Inflows for the next three months are projected to be below average: with July, August and September forecasted inflow volumes at 111,000 AF (53% of average), 60,000 AF (68% of average), and 43,000 AF (78% of average), respectively.

The next Flaming Gorge Working Group meeting is scheduled for April 30, 2015, at 11:00 a.m. to be held in the Utah Department of Natural Resources building in Vernal, Utah. The Flaming Gorge Working Group is an open public forum for information exchange between Reclamation and the stake holders of Flaming Gorge Dam. The public is encouraged to attend and comment on the operations and plans presented by Reclamation at these meetings. Meeting notes from past Working Group meetings are posted on the Working Group webpage. For more information on this group and these meetings please contact Peter Crookston at 801-379-1152 or Heather Patno at 801-524-3883.

Aspinall Unit Reservoirs – June unregulated inflow into Blue Mesa Reservoir was 368,000 acre-feet or 141 percent of average. Hydrologic conditions in the basin have been wet during the months of May and June. Precipitation monthly averages during this period were 265 percent for May and 150 percent for June. The current inflow rate into Blue Mesa Reservoir is about 3,000 cfs while reservoir releases are averaging about 2,600 cfs. Blue Mesa's present elevation is 7518.51 feet, which corresponds to a storage content of about 822,000 acre-feet.

The latest Water Supply Forecast for Water Year 2014 has been issued and the April through July unregulated inflow is forecasted to be at 700,000 acre-feet (104% of average). This is a 130,000 acre-feet increase from last month's forecast. The Aspinall Unit reservoirs have already been at full capacity during June and are nearly full during the first part of July. This year's peak elevation was recorded on June 20th when the reservoir reached elevation 7519.40 feet and a content of 829,500 acre-feet.

Releases from Crystal are currently set at 3,000 cfs. The Gunnison Diversion Tunnel is diverting about 1,000 cfs, which results in a river flow below the diversion tunnel of approximately 2,000 cfs. These rates will most likely change as conditions warrant, primarily as we respond to changes in hydrology and flows at the Whitewater gage as prescribed in the Aspinall Unit Operations Record of Decision (ROD). The ROD calls for keeping summer base flows at the Whitewater gage at or above 1,500 cfs.

The next meeting of the "Aspinall Unit Working Group" will be held on Thursday, August 13, 2015 starting at 1:00 PM at the Elk Creek Visitor Center at Blue Mesa Reservoir. At this meeting, review of this spring's reservoir operations, and plans for this fall and winter operations will be discussed. These meetings are open forum discussions on the Aspinall Unit reservoir operations with many interested groups participating. Anyone needing further information about these meetings should contact Erik Knight in the Grand Junction Area Office at (970) 248-0629.

Navajo Reservoir – Reclamation is currently releasing 350 cfs. Releases are made for the authorized purposes of the Navajo Unit, and to attempt to maintain a target base flow through the endangered fish critical habitat reach of the San Juan River (Farmington to Lake Powell). The San Juan River Basin Recovery Implementation Program recommends a target base flow of between 500 cfs and 1,000 cfs through the critical habitat area. The target base flow is calculated as the weekly average of gaged flows throughout the critical habitat area.

Navajo was at 6068.60 feet of pool elevation and 1,461,273 acre-feet of storage by the end of June, which was 101% of average for the end of the month. Modified unregulated inflow into Navajo was 285,292 acre-feet, which was 128% of average for the month. Calculated evaporation for the month was 4,312 acre-ft. NIIP diverted a total of 20,389 acre-ft. The release averaged close to 350 cfs throughout the month. Precipitation at the dam totaled 1.66 inches (244% of average).

As of July 6th, the release at Navajo (as measured at the USGS at Archuleta gage) was 345 cfs, and the observed inflow is 1,163 cfs. NIIP is diverting 670 cfs. The reservoir elevation is 6068.79 feet and the content is 1,463,876 acre-feet, or 86% full (77% of Active). The San Juan River at Four Corners USGS gage is at 2,010 cfs, and the Animas River at Farmington USGS gage is at 1,710 cfs.

The most probable modified-unregulated inflow forecast for July at Navajo is 55,000 acre-feet (83% of average), for August is 33,000 acre-feet (73% of average), and for September is 31,000 acre-feet (72% of average). The April-July modified unregulated inflow forecasts are as follows:

Min Probable: 580,000 acre-feet (80% of average, an increase of 65,000 acre-feet from the last forecast)
Most Probable: 600,000 acre-feet (81% of average, an increase of 55,000 acre-feet from the last forecast)
Max Probable: 635,000 acre-feet (86% of average, an increase of 45,000 acre-feet from the last forecast)

The most probable forecast shows the reservoir will peak in the next few days near 6069 feet (1,465,000 acre-feet), end the water year (Sept 30th) near 6063 feet (1,385,000 acre-feet), and reach a minimum overwinter storage level near 6059 feet (1,340,000 acre-feet) in February of 2016.

Glen Canyon Dam / Lake Powell

Current Status
The unregulated inflow volume to Lake Powell in June was 3,389 thousand acre-feet (kaf) (127% of average). The release volume from Glen Canyon Dam in June was 800 kaf. The end of June elevation and storage of Lake Powell were 3,613.5 feet (86 feet from full pool) and 13.09 million acre-feet (maf) (54% of full capacity), respectively.

The reservoir elevation has been increasing through spring and early summer and is likely near its seasonal peak. In the next few weeks, the reservoir will likely begin its typical seasonal decline through the fall and winter months.

Current Operations

The operating tier for water year 2015 was established in August 2014 as the Upper Elevation Balancing Tier. The April 2015 24-Month Study established that Lake Powell operations will be governed by balancing for the remainder of water year 2015. Under balancing, the contents of Lake Powell and Lake Mead will be balanced by the end of the water year, but not more than 9.0 maf and not less than 8.23 maf shall be released from Lake Powell. Based on the most probable inflow forecast, this July 24-Month Study projects a balancing release of 9.0 maf in water year 2015. Reclamation will schedule operations at Glen Canyon Dam to achieve as practicably as possible the appropriate total annual release volume by September 30, 2015.

In July, the release volume will be approximately 1,050 kaf, with fluctuations anticipated between approximately 12,000 cfs and 20,000 cfs during the first part of the month and 14,000 cfs and 22,000 cfs during the latter part of the month and consistent with the Glen Canyon Operating Criteria (Federal Register, Volume 62, No. 41, March 3, 1997). The anticipated release volume for August is 800 kaf with daily fluctuations between approximately 9,000 cfs and 17,000 cfs during the first part of the month and 14,000 cfs and 22,000 cfs during the latter part of the month. The expected release for September is approximately 710 kaf with daily fluctuations between approximately 9,000 cfs and 15,000 cfs.

In addition to daily scheduled fluctuations for power generation, the instantaneous releases from Glen Canyon Dam may also fluctuate to provide 40 MW of system regulation. These instantaneous release adjustments stabilize the electrical generation and transmission system and translate to a range of about 1,200 cfs above or below the hourly scheduled release rate. Under system normal conditions, fluctuations for regulation are typically short lived and generally balance out over the hour with minimal or no noticeable impacts on downstream river flow conditions.

Releases from Glen Canyon Dam can also fluctuate beyond scheduled releases when called upon to respond to unscheduled power outages or power system emergencies. Depending on the severity of the system emergency, the response from Glen Canyon Dam can be significant, within the full range of the operating capacity of the power plant for as long as is necessary to maintain balance in the transmission system. Glen Canyon Dam typically maintains 27 MW (approximately 800 cfs) of generation capacity in reserve in order to respond to a system emergency even when generation rates are already high. System emergencies occur fairly infrequently and typically require small responses from Glen Canyon Dam. However, these responses can have a noticeable impact on the river downstream of Glen Canyon Dam.

Inflow Forecasts and Model Projections

The April to July 2015 water supply forecast for unregulated inflow to Lake Powell,

issued on July 1, 2015, by the Colorado Basin River Forecast Center, projects that the most probable (median) unregulated inflow volume will be 6.29 maf (88% of average based on the period 1981-2010). The forecast increased by 1,290 kaf since last month. There is still uncertainty regarding the runoff and resulting inflow to Lake Powell through the end of the water year.

As determined in the August 2014 24-Month Study, and documented in the 2015 Annual Operating Plan, Lake Powell's operations in water year 2015 will be governed by the Upper Elevation Balancing Tier. Because the April 2015 24-Month Study projected the end of water year elevation at Lake Powell to be above 3,575 feet and the end of water year elevation at Lake Mead to be below elevation 1,075.0 feet, Lake Powell operations shifted to balancing (Section 6.B.4 of the 2007 Interim Guidelines) for the remainder of water year 2015. Under balancing, the contents of Lake Powell and Lake Mead will be balanced by the end of the water year, but not more than 9.0 maf and not less than 8.23 maf shall be released from Lake Powell. Based on the July most probable inflow forecast, the annual release volume from Lake Powell during water year 2015 is projected to be 9.0 maf.

Based on the current forecast, the July 24-Month Study projects Lake Powell's end of water year 2015 elevation to be near 3,604 feet with approximately 12.15 maf in storage (50% capacity). Projections of elevation and storage still have uncertainty at this point in the season, primarily due to uncertainty regarding runoff and the resulting inflow to Lake Powell. The maximum and minimum probable inflow scenarios were last updated in April. Under the minimum probable inflow scenario, last updated in April, the projected end of water year elevation and storage are 3,574 feet and 9.45 maf (39% capacity), respectively. Under the maximum probable inflow scenario, last updated in April, the projected end of water year elevation and storage are 3,603 feet and 12.02 maf (49% capacity), respectively. Modeling of projected reservoir operations based on the minimum and maximum scenarios will be updated again in August.

Upper Colorado River Basin Hydrology

The Upper Colorado River Basin regularly experiences significant year to year hydrologic variability. During the 15-year period 2000 to 2014, however, the unregulated inflow to Lake Powell, which is a good measure of hydrologic conditions in the Colorado River Basin, was above average in only 3 out of the past 15 years. The period 2000-2014 is the lowest 15-year period since the closure of Glen Canyon Dam in 1963, with an average unregulated inflow of 8.39 maf, or 78% of the 30-year average (1981-2010). (For comparison, the 1981-2010 total water year average is 10.83 maf.) The unregulated inflow during the 2000-2014 period has ranged from a low of 2.64 maf (24% of average) in water year 2002 to a high of 15.97 maf (147% of average) in water year 2011. The water year 2014 unregulated inflow volume to Lake Powell was 10.381 maf (96% of average), which, though still below average, was significantly higher than inflows observed in 2012 and 2013 (45% and 47% of average, respectively). Under the current most probable forecast, total water year 2015 unregulated inflows to Lake Powell is projected to be 9.83 maf (91% of average).

At the beginning of water year 2015, total system storage in the Colorado River Basin was 30.0 maf (50% of 59.6 maf total system capacity). This is nearly the same as the total storage at the beginning of water year 2014 which began at 29.9 maf (50% of capacity). Since the beginning of water year 2000, total Colorado Basin storage has experienced year to year increases and decreases in response to wet and dry hydrology, ranging from a high of 94% of capacity at the beginning of 2000 to a low of 50% of capacity at the beginning of water year 2015. One wet year can significantly increase total system reservoir storage, just as persistent dry years can draw down the system storage. Based on current inflow forecasts, the current projected end of water year 2015 total Colorado Basin reservoir storage is approximately 30.0 maf (50% of total system capacity). The actual end of water year system storage may vary from this projection, primarily due to uncertainty regarding this season's runoff and resulting reservoir inflow. Based on the April minimum and maximum probable inflow forecasts and modeling the range is approximately 26.1 maf (44%) to 29.5 maf (50%), respectively.

August 24-Month Study
Date: August 17, 2015

From: Water Resources Group, Salt Lake City
To: All Colorado River Annual Operating Plan (AOP) Recipients

Current Reservoir Status

Reservoir	July Inflow (unregulated) (acre-feet)	Percent of Average (%)	August 16, Midnight Elevation (feet)	Reservoir Storage (acre-feet)
Fontenelle	126,000	71	6499.19	292,000
Flaming Gorge	157,000	74	6034.35	3,520,000
Blue Mesa	131,000	112	7515.47	794,000
Navajo	76,000	115	6067.01	1,440,000
Powell	1,072,000	98	3611.27	12,859,000

Expected Operations

The operation of Lake Powell and Lake Mead in this August 2015 24-Month Study is pursuant to the December 2007 Record of Decision on Colorado River Interim Guidelines for Lower Basin Shortages and the Coordinated Operations of Lake Powell and Lake Mead (Interim Guidelines), and reflects the 2015 Annual Operating Plan (AOP). Pursuant to the Interim Guidelines, the August 2014 24-Month Study projections of the January 1, 2015, system storage and reservoir water surface elevations set the operational tier for the coordinated operation of Lake Powell and Lake Mead during 2015.

Consistent with Section 6.B of the Interim Guidelines, the Lake Powell operational tier for water year 2015 is the Upper Elevation Balancing Tier. The April 2015 24-Month Study projected the end of water year elevation at Lake Powell to be above 3,575 feet and the end of water year elevation at Lake Mead to be below elevation 1,075.0 feet. Therefore, in accordance with Section 6.B.4 of the 2007 Interim Guidelines, Lake Powell operations shifted to "balancing releases" for the remainder of water year 2015. Based on the most probable inflow forecast, this August 24-Month Study projects the balancing release will be 9.0 maf in water year 2015.

Consistent with Section 2.B.5 of the Interim Guidelines, the Intentionally Created Surplus (ICS) Surplus Condition is the criterion governing the operation of Lake Mead for calendar year 2015.

This August 24-Month study projects the January 1, 2016 Lake Powell elevation will be 3,602.46 feet, which is below the 2016 Equalization Elevation of 3,651 feet and above elevation 3,575 feet. Consistent with Section 6.B of the Interim Guidelines, Lake Powell's operations in water year 2016 will be governed by the Upper Elevation Balancing Tier, with an initial water year release volume of 8.23 maf and the potential for an April adjustment to equalization or balancing releases in April 2016. Consistent with Section 6.B.4 of the Interim Guidelines, an April adjustment to balancing releases is currently projected to occur and Lake Powell is projected to release 9.0 maf in water year 2016.

Consistent with the August 2015 24-Month Study and Section 2.B.5 of the Interim Guidelines, the Intentionally Created Surplus (ICS) Surplus Condition is the criterion governing the operation of Lake Mead for calendar year 2016.

The tier determinations will be documented in the 2016 AOP, which is currently in development.

The Interim Guidelines are available for download at:
http://www.usbr.gov/lc/region/programs/strategies/RecordofDecision.pdf.
The 2015 AOP is available for download at:
http://www.usbr.gov/uc/water/rsvrs/ops/aop/AOP15.pdf.

Fontenelle Reservoir –The current reservoir elevation is 6500.0 feet, which amounts to 87 percent of live storage capacity. The total 2015 April-July inflow volume was 768,000 AF, or 106% of average. While the seasonal inflow volume was above average, inflows to Fontenelle for the month of July were only 126,000 acre-feet (AF), or 71 percent of average. Recent daily inflow averages have ranged from 860 cfs to 1,020 cfs.

Reservoir releases have been held steady at 1,500 cfs since mid-July. August weather conditions are expected to be relatively cool and dry, though strong storms continue to track southeast of the basin. The Colorado Basin River Forecast Center has forecasted late summer inflows that are below average. Releases will be reduced to 1,200 cfs on Monday, August 17, 2015. At the end of the month, releases will be further reduced to a winter baseflow level near 1,000 cfs. This is subject to change based on observed hydrology.

The next Fontenelle Working Group meeting is scheduled for 10:00 am, August 26, 2015. The meeting location has been changed to the Wyoming Game and Fish Department in Green River, Wyoming (351 W. Astle Avenue). The Fontenelle Working Group is an open public forum for information exchange between Reclamation and other parties associated with the operation of Fontenelle Reservoir.

Flaming Gorge Reservoir – Flaming Gorge Dam is currently releasing an average daily base flow of 1,700 cfs. It is anticipated that releases will remain at 1,700 cfs through October 31, 2015. Base flow releases are subject to observed hydrology and all projections may change.

Unregulated inflow into Flaming Gorge Reservoir during the month of July was 157,000 acre-feet (AF), or 75 percent of average. The reservoir elevation is 6,034.4 feet. Observed inflows are averaging 1,700 cubic feet per second (cfs).

Inflows for the next three months are projected to be below average: with August, September and October forecasted inflow volumes at 62,000 AF (70% of average), 50,000 AF (91% of average), and 55,000 AF (93% of average), respectively.

The next Flaming Gorge Working Group meeting is scheduled for August 27, 2015, at 11:00 a.m. to be held in the Utah Department of Natural Resources building in Vernal, Utah. The Flaming Gorge Working Group is an open public forum for information exchange between Reclamation and the stake holders of Flaming Gorge Dam. The public is encouraged to attend and comment on the operations and plans presented by Reclamation at these meetings. Meeting notes from past Working Group meetings are posted on the Working Group webpage. For more information on this group and these meetings please contact Peter Crookston at 801-379-1152 or Heather Patno at 801-524-3883.

Aspinall Unit Reservoirs – July unregulated inflow into Blue Mesa Reservoir was 131,000 acre-feet or 112 percent of average. Hydrologic conditions in the basin continue to be favorable with summer thunderstorms bringing above average precipitation. May, June, and July precipitation was 265, 160, and 130 percent of average respectively. The current inflow rate into Blue Mesa Reservoir is about 1400 cfs while reservoir releases are averaging about 1,700 cfs. Blue Mesa's present elevation is 7516.19 feet, which corresponds to a storage content of about 801,000 acre-feet.

The observed April through July runoff into Blue Mesa Reservoir was recorded at 708,000 acre-feet, or 105 percent of average. The Aspinall Unit reservoirs have already been at full capacity during June and nearly full during most of July. This year's peak elevation was recorded on June 20th when the reservoir reached elevation 7519.40 feet and a content of 829,500 acre-feet.

Releases from Crystal are currently set at 1800 cfs. The Gunnison Diversion Tunnel is diverting about 1050 cfs, which results in a river flow below the diversion tunnel of approximately 750 cfs. These rates will most likely change as conditions warrant, primarily as we respond to changes at the Whitewater gage as flows prescribed in the Aspinall Unit Operations Record of Decision (ROD). This year's ROD Baseflow calls for 1050 cfs at the Whitewater gage from August through next April.

The next meeting of the "Aspinall Unit Working Group" will be held on Thursday, August 13, 2015 starting at 1:00 PM at the Elk Creek Visitor Center at Blue Mesa

Reservoir. At this meeting, review of this spring's reservoir operations, and plans for this fall and winter operations will be discussed. These meetings are open forum discussions on the Aspinall Unit reservoir operations with many interested groups participating. Anyone needing further information about these meetings should contact Erik Knight in the Grand Junction Area Office at (970) 248-0629.

Navajo Reservoir – Due to the recent mine accident high in the Animas River Basin, the SJRIP requested a shift in the timing of the release of their available water. The reservoir release was increased from 650 cfs to 1300 cfs Friday (August 7th) in the morning. This release was held over the weekend in an attempt by the SJRIP to dilute and move the contaminant plume through the critical habitat reach more quickly. The release was reduced to 650 cfs again on Monday August 10th.

Releases are made for the authorized purposes of the Navajo Unit, and to attempt to maintain a target base flow through the endangered fish critical habitat reach of the San Juan River (Farmington to Lake Powell). The San Juan River Basin Recovery Implementation Program recommends a target base flow of between 500 cfs and 1,000 cfs through the critical habitat area. The target base flow is calculated as the weekly average of gaged flows throughout the critical habitat area.

Navajo was at 6068.7 feet of pool elevation and 1,462,883 acre-feet of storage by the end of July, which was 103% of average for the end of the month. Modified unregulated inflow into Navajo was 77,057 acre-feet, which was 117% of average for the month. Calculated evaporation for the month was 4,754 acre-ft. NIIP diverted a total of 38,605 acre-ft. The release averaged close to 468 cfs throughout the month. Precipitation at the dam totaled 1.7 inches (127% of average). The April-July inflow total this year was 619,000 acre-feet (84% of average). The reservoir peaked on July 20th at 6069.6 ft.

As of August 6th, the release at Navajo (as measured at the USGS at Archuleta gage) was 669 cfs, and the observed inflow is 473 cfs. NIIP is diverting 632 cfs. The reservoir elevation is 6068.26 feet and the content is 1,457,035 acre-feet, or 86% full (77% of Active). The San Juan River at Four Corners USGS gage is at 1,540 cfs, and the Animas River at Farmington USGS gage is at 593 cfs.

The most probable modified-unregulated inflow forecast for August at Navajo is 30,000 acre-feet (68% of average), for September is 30,000 acre-ft (69% of average), and for October is 36,000 acre-feet (76% of average).

The most probable forecast shows the reservoir will end the water year (Sept 30th) near 6063 feet (1,385,000 acre-feet), and reach a minimum overwinter storage level near 6060 feet (1,343,500 acre-feet) in February of 2016.

Glen Canyon Dam / Lake Powell

Current Status

The April to July 2015 unregulated inflow to Lake Powell was 6.71 million acre-feet (maf) (94% of average). The unregulated inflow in July was 1.072 maf (98% of average). The release volume from Glen Canyon Dam in July was 1.048 maf. The end of July elevation and storage of Lake Powell were 3,612.6 feet (87 feet from full pool) and 13.00 maf (53% of full capacity), respectively. The reservoir elevation peaked at 3,614 feet on July 14 and is now in its seasonal decline through the fall and winter months.

Current Operations

The operating tier for water year 2015, established in August 2014, is the Upper Elevation Balancing Tier. The April 2015 24-Month Study established that Lake Powell operations will be governed by balancing for the remainder of water year 2015. Based on the most probable inflow forecast, this August 24-Month Study projects a balancing release of 9.0 maf in water year 2015. Reclamation will schedule operations at Glen Canyon Dam to achieve as practicably as possible the appropriate total annual release volume by September 30, 2015.

The operating tier for water year 2016, established this August 2015, is the Upper Elevation Balancing Tier, with an initial water year release volume of 8.23 maf and the potential for an April 2016 adjustment to equalization or balancing releases. Based on the current forecast, an April adjustment to balancing releases is projected to occur and Lake Powell is currently projected to release 9.0 maf in water year 2016. This projection will be updated each month throughout the water year.

In August 2015, the release volume will be approximately 800 thousand acre-feet (kaf), with fluctuations anticipated between approximately 9,000 cfs and 17,000 cfs and consistent with the Glen Canyon Operating Criteria (Federal Register, Volume 62, No. 41, March 3, 1997). The anticipated release volume for September is approximately 710 kaf with daily fluctuations between approximately 9,000 cfs and 15,000 cfs. The expected release for October is 600 kaf with daily fluctuations between approximately 7,000 cfs and 13,000 cfs.

In addition to daily scheduled fluctuations for power generation, the instantaneous releases from Glen Canyon Dam may also fluctuate to provide 40 MW of system regulation. These instantaneous release adjustments stabilize the electrical generation and transmission system and translate to a range of about 1,200 cfs above or below the hourly scheduled release rate. Under system normal conditions, fluctuations for regulation are typically short lived and generally balance out over the hour with minimal or no noticeable impacts on downstream river flow conditions.

Releases from Glen Canyon Dam can also fluctuate beyond scheduled releases when called upon to respond to unscheduled power outages or power system emergencies. Depending on the severity of the system emergency, the response from Glen Canyon Dam can be significant, within the full range of the operating capacity of the power plant

for as long as is necessary to maintain balance in the transmission system. Glen Canyon Dam currently maintains 27 MW (approximately 800 cfs) of generation capacity in reserve in order to respond to a system emergency even when generation rates are already high. System emergencies occur fairly infrequently and typically require small responses from Glen Canyon Dam. However, these responses can have a noticeable impact on the river downstream of Glen Canyon Dam.

Inflow Forecasts and Model Projections

The forecast for water year 2016 unregulated inflow to Lake Powell, issued on August 3, 2015, by the Colorado Basin River Forecast Center, projects that the most probable (median) unregulated inflow volume next year will be 9.54 maf (88% of average). There is significant uncertainty regarding next season's snow pack development and resulting runoff into Lake Powell. The forecast ranges from a minimum probable of 6.4 maf (59%) to a maximum probable of 16.9 maf (156%). There is a 10% chance that inflows could be higher than the current maximum probable forecast and a 10% chance that inflows could be lower than the minimum probable forecast.

Based on the current forecast, the August 24-Month study projects Lake Powell elevation will end water year 2015 near 3,608 feet with approximately 12.51 maf in storage (51% capacity) and water year 2016 near 3,610 feet with approximately 12.71 maf in storage (52% capacity). Note that projections of elevation and storage for water year 2016 have significant uncertainty at this point in the season. Projections of elevation and storage using the minimum and maximum probable inflow forecast are 3,585 feet (10.4 maf, 43% capacity) and 3,648 feet (17.0 maf, 70% capacity), respectively. Under these scenarios, there is a 10 percent chance that inflows will be higher, resulting in higher elevation and storage, and 10 percent chance that inflows will be lower, resulting in lower elevation and storage. The annual release volume from Lake Powell during water year 2016 is projected to be 9.0 maf under the minimum and most probable inflow scenarios and 11.4 maf under the maximum probable inflow scenario. There is a chance that inflows could be higher or lower, potentially resulting in releases greater than 11.4 maf or as low as 8.23 maf in water year 2016.

Upper Colorado River Basin Hydrology

The Upper Colorado River Basin regularly experiences significant year to year hydrologic variability. During the 15-year period 2000 to 2014, however, the unregulated inflow to Lake Powell, which is a good measure of hydrologic conditions in the Colorado River Basin, was above average in only 3 out of the past 15 years. The period 2000-2014 is the lowest 15-year period since the closure of Glen Canyon Dam in 1963, with an average unregulated inflow of 8.39 maf, or 78% of the 30-year average (1981-2010). (For comparison, the 1981-2010 total water year average is 10.83 maf.) The unregulated inflow during the 2000-2014 period has ranged from a low of 2.64 maf (24% of average) in water year 2002 to a high of 15.97 maf (147% of average) in water year 2011. The water year 2014 unregulated inflow volume to Lake Powell was 10.381 maf (96% of average), which, though still below average, was significantly higher than inflows observed in 2012 and 2013 (45% and 47% of average, respectively). Under the

current most probable forecast, total water year 2015 unregulated inflows to Lake Powell is projected to be 10.33 maf (95% of average).

At the beginning of water year 2015, total system storage in the Colorado River Basin was 30.0 maf (50% of 59.6 maf total system capacity). This is nearly the same as the total storage at the beginning of water year 2014 which began at 29.9 maf (50% of capacity). Since the beginning of water year 2000, total Colorado Basin storage has experienced year to year increases and decreases in response to wet and dry hydrology, ranging from a high of 94% of capacity at the beginning of 2000 to a low of 50% of capacity at the beginning of water year 2015. One wet year can significantly increase total system reservoir storage, just as persistent dry years can draw down the system storage. Based on current inflow forecasts, the current projected end of water year total Colorado Basin reservoir storage for water year 2015 is approximately 30.55 maf (51% of total system capacity) and for water year 2016 is approximately 30.24 maf (51% of total system capacity). The actual end of water year 2016 system storage may vary from this projection, primarily due to uncertainty regarding next season's snowpack and resulting runoff and reservoir inflow. Based on the August minimum and maximum probable inflow forecasts and modeling, the range of end of water year 2016 total system capacity is approximately 27.2 maf (46%) to 37.3 maf (63%), respectively.

September 24-Month Study
Date: September 14, 2015

From: Water Resources Group, Salt Lake City
To: All Colorado River Annual Operating Plan (AOP) Recipients

Current Reservoir Status

Reservoir	August Inflow (unregulated) (acre-feet)	Percent of Average (%)	September 13, Midnight Elevation (feet)	Reservoir Storage (acre-feet)
Fontenelle	53,000	69	6495.63	266,000
Flaming Gorge	56,000	63	6033.25	3,476,000
Blue Mesa	59,000	93	7510.65	751,000
Navajo	15,000	33	6064.52	1,406,000
Powell	312,000	62	3607.70	12,500,000

Expected Operations

The operation of Lake Powell and Lake Mead in this September 2015 24-Month Study is pursuant to the December 2007 Record of Decision on Colorado River Interim Guidelines for Lower Basin Shortages and the Coordinated Operations of Lake Powell and Lake Mead (Interim Guidelines), and reflects the 2015 Annual Operating Plan (AOP) and the draft 2016 AOP. Pursuant to the Interim Guidelines, the August 2014 24-Month Study projections of the January 1, 2015, system storage and reservoir water surface elevations set the operational tier for the coordinated operation of Lake Powell and Lake Mead during 2015.

Consistent with Section 6.B of the Interim Guidelines, the Lake Powell operational tier for water year 2015 is the Upper Elevation Balancing Tier. The April 2015 24-Month Study projected the end of water year elevation at Lake Powell to be above 3,575 feet and the end of water year elevation at Lake Mead to be below elevation 1,075.0 feet. Therefore, in accordance with Section 6.B.4 of the 2007 Interim Guidelines, Lake Powell operations shifted to "balancing releases" for the remainder of water year 2015. Based on the most probable inflow forecast, this September 24-Month Study projects the balancing release will be 9.0 maf in water year 2015.

Consistent with Section 2.B.5 of the Interim Guidelines, the Intentionally Created Surplus (ICS) Surplus Condition is the criterion governing the operation of Lake Mead for calendar year 2015.

The August 2015 24-Month study projects the January 1, 2016 Lake Powell elevation will be 3,602.46 feet, which is below the 2016 Equalization Elevation of 3,651 feet and above elevation 3,575 feet. Consistent with Section 6.B of the Interim Guidelines, Lake Powell's operations in water year 2016 will be governed by the Upper Elevation Balancing Tier, with an initial water year release volume of 8.23 maf and the potential for an April adjustment to equalization or balancing releases in April 2016. Consistent with Section 6.B.4 of the Interim Guidelines, an April adjustment to balancing releases is currently projected to occur and Lake Powell is projected to release 9.0 maf in water year 2016.

Consistent with the August 2015 24-Month Study and Section 2.B.5 of the Interim Guidelines, the Intentionally Created Surplus (ICS) Surplus Condition is the criterion governing the operation of Lake Mead for calendar year 2016.

The tier determinations will be documented in the 2016 AOP, which is currently in the final stages of development.

The Interim Guidelines are available for download at:
http://www.usbr.gov/lc/region/programs/strategies/RecordofDecision.pdf.
The 2015 AOP is available for download at:
http://www.usbr.gov/uc/water/rsvrs/ops/aop/AOP15.pdf.
The draft 2016 AOP is available for download at
http://www.usbr.gov/lc/region/g4000/AOP2016/AOP16_draft.pdf.

Fontenelle Reservoir – The current reservoir elevation is 6496.4 feet, which amounts to 79 percent of live storage capacity. The total 2015 April-July inflow volume was 768,000 acre-feet (AF), or 106% of average. While the seasonal inflow volume was above average, inflow to Fontenelle for the month of July was only 126,000 AF, or 71 percent of average. Similarly, inflow for the month of August was limited to 53,000 AF, or 69 percent of average. Recent daily inflow averages have ranged from 540 cfs to 650 cfs.

Reservoir releases were reduced to 1,020 cfs on Monday, August 31, 2015. September weather conditions have been relatively warm and dry, and the Colorado Basin River Forecast Center has forecasted late summer inflows that are below average. Depending on observed hydrology, releases may be further reduced to a winter baseflow level below 1,000 cfs.

The next Fontenelle Working Group meeting is scheduled for 10:00 am, April 20, 2016. The meeting will be held at the Seedskadee Wildlife Refuge in Green River, Wyoming. The Fontenelle Working Group is an open public forum for information exchange between Reclamation and other parties associated with the operation of Fontenelle Reservoir.

Flaming Gorge Reservoir – Flaming Gorge Dam is currently releasing an average daily base flow of 1,700 cfs. It is anticipated that releases will remain at 1,700 cfs through October 31, 2015. Base flow releases are subject to observed hydrology and all projections may change.

Unregulated inflow into Flaming Gorge Reservoir during the month of August was 56,000 acre-feet (AF), or 63 percent of average. The reservoir elevation is 6,033.5 feet and decreasing. Observed inflows are averaging 1,700 cubic feet per second (cfs).

Inflows for the next three months are projected to be below average: with September, October and November forecasted inflow volumes at 40,000 AF (73% of average), 46,000 AF (78% of average), and 48,000 AF (94% of average), respectively.

The next Flaming Gorge Working Group meeting is scheduled for April 21, 2016, at 11:00 a.m. to be held in the Utah Department of Natural Resources building in Vernal, Utah. The Flaming Gorge Working Group is an open public forum for information exchange between Reclamation and the stake holders of Flaming Gorge Dam. The public is encouraged to attend and comment on the operations and plans presented by Reclamation at these meetings. Meeting notes from past Working Group meetings are posted on the Working Group webpage. For more information on this group and these meetings please contact Peter Crookston at 801-379-1152 or Heather Patno at 801-524-3883.

Aspinall Unit Reservoirs – August unregulated inflow into Blue Mesa Reservoir was 59,000 acre-feet or 93 percent of average. Hydrologic conditions remain favorable across the basin with near average precipitation for the month. June, July, August precipitation was 160, 130, and 90 percent of average respectively. The current inflow rate into Blue Mesa Reservoir is about 900 cfs while reservoir releases are averaging about 1,700 cfs.

Blue Mesa's present elevation is 7511.69 feet, which corresponds to a storage content of about 761,000 acre-feet. The observed April through July runoff into Blue Mesa Reservoir was recorded at 708,000 acre-feet, or 105 percent of average. The Aspinall Unit reservoirs have already been at full capacity during June and nearly full during most of July. This year's peak elevation was recorded on June 20th when the reservoir reached elevation 7519.40 feet and a content of 829,500 acre-feet. Full pool is defined by the top of the spillway gates at elevation 7519.4 feet. Rarely is the reservoir filled to that level due to safety. For practical purposes; the reservoir is considered full at elevations above 7516.4 feet.

Releases from Crystal are currently set at 1800 cfs. The Gunnison Diversion Tunnel is diverting about 1050 cfs, which results in a river flow below the diversion tunnel of approximately 750 cfs. These rates will most likely change as conditions warrant, primarily as we respond to changes at the Whitewater gage as flows prescribed in the Aspinall Unit Operations Record of Decision (ROD). The ROD calls for keeping base flows at the Whitewater gage at or above 1050 cfs during September through April.

The last meeting of the "Aspinall Unit Working Group" was held on Thursday, August 13, 2015 at the Elk Creek Visitors Center at Blue Mesa Reservoir. At this meeting, review of this spring's reservoir operations, and plans for this summer and fall operations were discussed. These meetings are open forum discussions on the Aspinall Unit reservoir operations with many interested groups participating. Anyone needing further information about these meetings should contact Erik Knight in the Grand Junction Area Office at (970) 248-0629.

Navajo Reservoir – Navajo is currently releasing 650 cfs. Releases are made for the authorized purposes of the Navajo Unit, and to attempt to maintain a target base flow through the endangered fish critical habitat reach of the San Juan River (Farmington to Lake Powell). The San Juan River Basin Recovery Implementation Program recommends a target base flow of between 500 cfs and 1,000 cfs through the critical habitat area. The target base flow is calculated as the weekly average of gaged flows throughout the critical habitat area.

Navajo was at 6065.5 feet of pool elevation and 1,419,656 acre-feet of storage by the end of August, which was 102% of average for the end of the month. Modified unregulated inflow into Navajo was 15,257 acre-feet, which was 34% of average for the month. Calculated evaporation for the month was 3,818 acre-ft. NIIP diverted a total of 32,885 acre-ft. The release averaged close to 680 cfs throughout the month. Precipitation at the dam totaled 1.09 inches (58% of average). The April-July inflow total this year was 618,760 acre-feet (84% of average).

As of September 2nd, the release at Navajo (as measured at the USGS at Archuleta gage) was 600 cfs, and the observed inflow is 983 cfs. NIIP is diverting 463 cfs. The reservoir elevation is 6065.5 feet and the content is 1,419,389 acre-feet, or 83% full (73% of Active). The San Juan River at Four Corners USGS gage is at 725 cfs, and the Animas River at Farmington USGS gage is at 189 cfs.

The most probable modified-unregulated inflow forecast for September at Navajo is 20,000 acre-feet (46% of average), for October is 30,000 acre-feet (64% of average), and for November is 29,000 acre-feet (87% of average).

The most probable forecast shows the reservoir will end the water year (Sept 30th) near 6063 feet (1,385,000 acre-feet), and reach a minimum overwinter storage level near 6058 feet (1,324,000 acre-feet) in February of 2016.

Glen Canyon Dam / Lake Powell

Current Status

The unregulated inflow to Lake Powell in August was 314 thousand acre-feet (kaf) (62% of average). The release volume from Glen Canyon Dam in August was 799 kaf. The end of August elevation and storage of Lake Powell were 3,609.1 feet (91 feet from full pool) and 12.6 maf (52% of full capacity), respectively. The April to July 2015 unregulated inflow to Lake Powell was 6.71 million acre-feet (maf) (94% of average).

The reservoir elevation peaked at 3,614 feet on July 14 and is now in its seasonal decline through the fall and winter months.

Current Operations

The operating tier for water year 2015, established in August 2014, is the Upper Elevation Balancing Tier. The April 2015 24-Month Study established that Lake Powell operations will be governed by balancing for the remainder of water year 2015. Based on the most probable inflow forecast, this September 24-Month Study projects a balancing release of 9.0 maf in water year 2015. Reclamation will schedule operations at Glen Canyon Dam to achieve as practicably as possible the appropriate total annual release volume by September 30, 2015.

The operating tier for water year 2016, established in August 2015, is the Upper Elevation Balancing Tier, with an initial water year release volume of 8.23 maf and the potential for an April 2016 adjustment to equalization or balancing releases. Based on the current forecast, an April adjustment to balancing releases is projected to occur and Lake Powell is currently projected to release 9.0 maf in water year 2016. This projection will be updated each month throughout the water year.

In September 2015, the release volume will be approximately 714 thousand acre-feet (kaf), with fluctuations anticipated between approximately 9,000 cfs and 15,000 cfs and consistent with the Glen Canyon Operating Criteria (Federal Register, Volume 62, No. 41, March 3, 1997). The anticipated release volume for October is approximately 600 kaf with daily fluctuations between approximately 7,000 cfs and 13,000 cfs. The expected release for November is 600 kaf with daily fluctuations between approximately 7,000 cfs and 13,000 cfs.

In addition to daily scheduled fluctuations for power generation, the instantaneous releases from Glen Canyon Dam may also fluctuate to provide 40 MW of system regulation. These instantaneous release adjustments stabilize the electrical generation and transmission system and translate to a range of about 1,200 cfs above or below the hourly scheduled release rate. Under system normal conditions, fluctuations for regulation are typically short lived and generally balance out over the hour with minimal or no noticeable impacts on downstream river flow conditions.

Releases from Glen Canyon Dam can also fluctuate beyond scheduled releases when called upon to respond to unscheduled power outages or power system emergencies. Depending on the severity of the system emergency, the response from Glen Canyon Dam can be significant, within the full range of the operating capacity of the power plant for as long as is necessary to maintain balance in the transmission system. Glen Canyon Dam currently maintains 27 MW (approximately 800 cfs) of generation capacity in reserve in order to respond to a system emergency even when generation rates are already high. System emergencies occur fairly infrequently and typically require small responses from Glen Canyon Dam. However, these responses can have a noticeable impact on the river downstream of Glen Canyon Dam.

Inflow Forecasts and Model Projections
The forecast for water year 2016 unregulated inflow to Lake Powell, issued on september 1, 2015, by the Colorado Basin River Forecast Center, projects that the most probable (median) unregulated inflow volume next year will be 9.29 maf (86% of average). There is significant uncertainty regarding next season's snow pack development and resulting runoff into Lake Powell. The forecast ranges from a minimum probable of 6.2 maf (57%) to a maximum probable of 16.5 maf (152%). There is a 10% chance that inflows could be higher than the current maximum probable forecast and a 10% chance that inflows could be lower than the minimum probable forecast.

Based on the current forecast, the September 24-Month Study projects Lake Powell elevation will end water year 2015 near 3,606.5 feet with approximately 12.38 maf in storage (51% capacity) and water year 2016 near 3,607.1 feet with approximately 12.43 maf in storage (52% capacity). Note that projections of elevation and storage for water year 2016 have significant uncertainty at this point in the season. Projections of elevation and storage using the minimum and maximum probable inflow forecast, last updated in August, are 3,585 feet (10.4 maf, 43% capacity) and 3,648 feet (17.0 maf, 70% capacity), respectively. Under these scenarios, there is a 10 percent chance that inflows will be higher, resulting in higher elevation and storage, and 10 percent chance that inflows will be lower, resulting in lower elevation and storage. The annual release volume from Lake Powell during water year 2016 is projected to be 9.0 maf under the minimum and most probable inflow scenarios and 11.4 maf under the maximum probable inflow scenario. There is a chance that inflows could be higher or lower, potentially resulting in releases greater than 11.4 maf or as low as 8.23 maf in water year 2016. The minimum and maximum probable scenarios will be updated again in October.

Upper Colorado River Basin Hydrology
The Upper Colorado River Basin regularly experiences significant year to year hydrologic variability. During the 15-year period 2000 to 2014, however, the unregulated inflow to Lake Powell, which is a good measure of hydrologic conditions in the Colorado River Basin, was above average in only 3 out of the past 15 years. The period 2000-2014 is the lowest 15-year period since the closure of Glen Canyon Dam in 1963, with an average unregulated inflow of 8.39 maf, or 78% of the 30-year average (1981-2010). (For comparison, the 1981-2010 total water year average is 10.83 maf.) The unregulated inflow during the 2000-2014 period has ranged from a low of 2.64 maf (24% of average) in water year 2002 to a high of 15.97 maf (147% of average) in water year 2011. The water year 2014 unregulated inflow volume to Lake Powell was 10.381 maf (96% of average), which, though still below average, was significantly higher than inflows observed in 2012 and 2013 (45% and 47% of average, respectively). Under the current most probable forecast, total water year 2015 unregulated inflows to Lake Powell is projected to be 10.20 maf (94% of average) and total water year 2016 inflows are projected to be 9.29 maf (86% of average).

At the beginning of water year 2015, total system storage in the Colorado River Basin was 30.0 maf (50% of 59.6 maf total system capacity). This is nearly the same as the total storage at the beginning of water year 2014 which began at 29.9 maf (50% of

capacity). Since the beginning of water year 2000, total Colorado Basin storage has experienced year to year increases and decreases in response to wet and dry hydrology, ranging from a high of 94% of capacity at the beginning of 2000 to a low of 50% of capacity at the beginning of water year 2005. One wet year can significantly increase total system reservoir storage, just as persistent dry years can draw down the system storage. Based on current inflow forecasts, the current projected end of water year total Colorado Basin reservoir storage for water year 2015 is approximately 30.36 maf (51% of total system capacity) and for water year 2016 is approximately 29.82 maf (50% of total system capacity). The actual end of water year 2016 system storage may vary from this projection, primarily due to uncertainty regarding next season's snowpack and resulting runoff and reservoir inflow. Based on the August minimum and maximum probable inflow forecasts and modeling, the range of end of water year 2016 total system capacity is approximately 27.2 maf (46%) to 37.3 maf (63%), respectively.

October 24-Month Study
Date: October 14, 2015

From: Water Resources Group, Salt Lake City
To: All Colorado River Annual Operating Plan (AOP) Recipients

Current Reservoir Status

Reservoir	September Inflow (unregulated) (acre-feet)	Percent of Average (%)	October 13, Midnight Elevation (feet)	Reservoir Storage (acre-feet)
Fontenelle	37,000	81	6492.85	247,000
Flaming Gorge	39,000	71	6031.91	3,423,000
Blue Mesa	39,000	103	7504.31	697,000
Navajo	18,000	41	6062.71	1,383,000
Powell	276,000	68	3606.11	12,343,000

Expected Operations

The operation of Lake Powell and Lake Mead in this October 2015 24-Month Study is pursuant to the December 2007 Record of Decision on Colorado River Interim Guidelines for Lower Basin Shortages and the Coordinated Operations of Lake Powell and Lake Mead (Interim Guidelines), and reflects the 2015 Annual Operating Plan (AOP) and the draft 2016 AOP. Pursuant to the Interim Guidelines, the August 2015 24-Month Study projections of the January 1, 2016, system storage and reservoir water surface elevations set the operational tier for the coordinated operation of Lake Powell and Lake Mead during 2016.

Consistent with Section 6.B of the Interim Guidelines, Lake Powell's operations in water year 2016 will be governed by the Upper Elevation Balancing Tier, with an initial water year release volume of 8.23 maf and the potential for an April adjustment to equalization or balancing releases in April 2016. This October 2015 24-Month Study indicates that, consistent with Section 6.B.4 of the Interim Guidelines, an April adjustment to balancing releases is projected to occur and Lake Powell is projected to release 9.0 maf in water year 2016.

Consistent with Section 2.B.5 of the Interim Guidelines, the Intentionally Created Surplus (ICS) Surplus Condition is the criterion governing the operation of Lake Mead for calendar years 2015 and 2016.

The 2016 operating determinations for Lake Powell and Lake Mead will be documented in the 2016 AOP, which is currently in the final stages of development.

The Interim Guidelines are available for download at:
http://www.usbr.gov/lc/region/programs/strategies/RecordofDecision.pdf.
The 2015 AOP is available for download at:
http://www.usbr.gov/uc/water/rsvrs/ops/aop/AOP15.pdf.
The draft 2016 AOP is available for download at:
http://www.usbr.gov/lc/region/g4000/AOP2016/AOP16_draft.pdf.

Fontenelle Reservoir – Fontenelle Reservoir is currently at elevation 6492.8 feet, which amounts to 72 percent of live storage capacity. Inflow for the month of September was limited to 37,000 AF, or 81 percent of average. Recent daily inflow averages have ranged from 660 cfs to 870 cfs.

Reservoir releases were reduced to 1,020 cfs on Monday, August 31, 2015. Weather conditions have been relatively warm and dry, and the Colorado Basin River Forecast Center has forecasted fall inflows that are below average. October, November and December forecasted inflow volumes amount to 40,000 AF (82% of average), 40,000 AF (95% of average), and 30,000 AF (94% of average), respectively. As a result, releases will be further decreased to 950 cfs on Monday, October 19, 2015. It is currently anticipated that releases will be maintained at a baseflow of 950 cfs until Spring 2016.

The next Fontenelle Working Group meeting is scheduled for 10:00 am, April 20, 2016. The meeting will be held at the Seedskadee Wildlife Refuge in Green River, Wyoming. The Fontenelle Working Group is an open public forum for information exchange between Reclamation and other parties associated with the operation of Fontenelle Reservoir.

Flaming Gorge Reservoir – Flaming Gorge Dam is currently releasing an average daily base flow of 2,200 cfs. It is anticipated that releases will remain at 2,200 cfs through February 29, 2016. Base flow releases are subject to observed hydrology and all projections may change.

Unregulated inflow into Flaming Gorge Reservoir during the month of September was 39,000 acre-feet (AF), or 70 percent of average. The reservoir elevation is 6,032 feet and decreasing. Observed inflows are averaging 1,150 cubic feet per second (cfs).

Inflows for the next three months are projected to be below average: with October, November and December forecasted inflow volumes at 44,000 AF (75% of average), 41,000 AF (80% of average), and 30,000 AF (86% of average), respectively.

The next Flaming Gorge Working Group meeting is scheduled for April 21, 2016, at 11:00 a.m. to be held in the Utah Department of Natural Resources building in Vernal, Utah. The Flaming Gorge Working Group is an open public forum for information

exchange between Reclamation and the stake holders of Flaming Gorge Dam. The public is encouraged to attend and comment on the operations and plans presented by Reclamation at these meetings. Meeting notes from past Working Group meetings are posted on the Working Group webpage. For more information on this group and these meetings please contact Peter Crookston at 801-379-1152 or Heather Patno at 801-524-3883.

Aspinall Unit Reservoirs – September unregulated inflow into Blue Mesa Reservoir was 39,000 acre-feet or 103 percent of average. Precipitation during September was observed to be about 55 percent of average. The current inflow rate into Blue Mesa Reservoir is about 500 cfs and reservoir releases are averaging about 1,800 cfs. Blue Mesa's present elevation is 7504.31 feet, which corresponds to a storage content of about 697,000 acre-feet. The unregulated reservoir inflow into Blue Mesa Reservoir during water year 2015 was 1.04 million acre-feet, or about 109 percent of average.

Releases from Crystal Dam are scheduled to decrease during the brown trout spawn. The target flow will be about 500 cfs in Gunnison River below the tunnel. The spawn period will be about a month or through mid-November. After the spawn the release rate will be increased again from Crystal Dam in order to help bring Blue Mesa Reservoir down to its end of December icing target elevation of 7490 feet.

Pursuant to the Aspinall Unit Operations Record of Decision (ROD), the baseflow target in the lower Gunnison River, as measured at the Whitewater gage, is 1,050 cfs for September through December. Flows in the lower Gunnison River are currently above the baseflow target of 1,050 cfs. River flows have remained relatively high due to favorable hydrology. Flows are expected to stay above the October baseflow target for the foreseeable future.

The last meeting of the "Aspinall Unit Working Group" was held on Thursday, August 13, 2015 at the Elk Creek Visitors Center at Blue Mesa Reservoir. At this meeting, review of this spring's reservoir operations, and plans for this summer and fall operations were discussed. These meetings are open forum discussions on the Aspinall Unit reservoir operations with many interested groups participating. Anyone needing further information about these meetings should contact Erik Knight in the Grand Junction Area Office at (970) 248-0629.

Navajo Reservoir – Navajo is currently releasing 600 cfs. Releases are made for the authorized purposes of the Navajo Unit, and to attempt to maintain a target base flow through the endangered fish critical habitat reach of the San Juan River (Farmington to Lake Powell). The San Juan River Basin Recovery Implementation Program recommends a target base flow of between 500 cfs and 1,000 cfs through the critical habitat area. The target base flow is calculated as the weekly average of gaged flows throughout the critical habitat area.

Navajo was at 6063.41 feet of pool elevation and 1,391,776 acre-feet of storage by the end of September, which was 101% of average for the end of the month. Modified

unregulated inflow into Navajo was 17,581 acre-feet, which was 41% of average for the month. Calculated evaporation for the month was 2887 acre-ft. NIIP diverted a total of 12,357 acre-ft. The release averaged close to 600 cfs throughout the month. Precipitation at the dam totaled 2.53 inches (174% of average).

As of October 1st, the release at Navajo (as measured at the USGS at Archuleta gage) was 544 cfs (the release was increased to 600 cfs Oct 2nd), and the observed inflow is 540 cfs. NIIP is diverting 354 cfs. The reservoir elevation is 6063.35 feet and the content is 1,390,990 acre-feet, or 82% full (70% of Active), and losing storage. The San Juan River at Four Corners USGS gage is at 541 cfs, and the Animas River at Farmington USGS gage is at 182 cfs. SNOTEL sites above Navajo are showing 0 inches of SWE.

The most probable modified-unregulated inflow forecast for October at Navajo is 25,000 acre-feet (53% of average), for November is 27,000 acre-feet (81% of average), and for December is 22,000 acre-feet (88% of average).

The most probable forecast shows the reservoir will reach a minimum overwinter storage level near 6061.2 feet (1,362,500 acre-feet) in February of 2016.

Glen Canyon Dam / Lake Powell

Current Status

The unregulated inflow to Lake Powell in September was 276 kaf (68% of average). The release volume from Glen Canyon Dam in August was 714 kaf. The end of September elevation and storage of Lake Powell were 3,606.1 feet (94 feet from full pool) and 12.3 maf (51% of full capacity), respectively. The water year 2015 unregulated inflow to Lake Powell was 10.17 million acre-feet (maf) (94% of average). The water year 2015 release from Lake Powell was 9.0 maf. The reservoir elevation peaked at 3,614 feet on July 14, 2015 and is now in its seasonal decline through the fall and winter months.

Current Operations

The operating tier for water year 2016, established in August 2015, is the Upper Elevation Balancing Tier, with an initial water year release volume of 8.23 maf and the potential for an April 2016 adjustment to equalization or balancing releases. Based on the current forecast, an April adjustment to balancing releases is projected to occur and Lake Powell is currently projected to release 9.0 maf in water year 2016. This projection will be updated each month throughout the water year.

In October 2015, the release volume will be approximately 600 thousand acre-feet (kaf), with fluctuations anticipated between approximately 7,000 cfs and 13,000 cfs and consistent with the Glen Canyon Operating Criteria (Federal Register, Volume 62, No. 41, March 3, 1997). The anticipated release volume for November is approximately 600 kaf with daily fluctuations between approximately 7,000 cfs and 13,000 cfs. The expected release for December is 800 kaf with daily fluctuations between approximately 9,000 cfs and 17,000 cfs.

In addition to daily scheduled fluctuations for power generation, the instantaneous releases from Glen Canyon Dam may also fluctuate to provide 40 MW of system regulation. These instantaneous release adjustments stabilize the electrical generation and transmission system and translate to a range of about 1,200 cfs above or below the hourly scheduled release rate. Under system normal conditions, fluctuations for regulation are typically short lived and generally balance out over the hour with minimal or no noticeable impacts on downstream river flow conditions.

Releases from Glen Canyon Dam can also fluctuate beyond scheduled releases when called upon to respond to unscheduled power outages or power system emergencies. Depending on the severity of the system emergency, the response from Glen Canyon Dam can be significant, within the full range of the operating capacity of the power plant for as long as is necessary to maintain balance in the transmission system. Glen Canyon Dam currently maintains 27 MW (approximately 800 cfs) of generation capacity in reserve in order to respond to a system emergency even when generation rates are already high. System emergencies occur fairly infrequently and typically require small responses from Glen Canyon Dam. However, these responses can have a noticeable impact on the river downstream of Glen Canyon Dam.

Inflow Forecasts and Model Projections

The forecast for water year 2016 unregulated inflow to Lake Powell, issued on October 1, 2015, by the Colorado Basin River Forecast Center, projects that the most probable (median) unregulated inflow volume next year will be 8.45 maf (78% of average). This is a decrease of 840 kaf since the September forecast for water year 2016. There is significant uncertainty regarding next season's snow pack development and resulting runoff into Lake Powell. The forecast ranges from a minimum probable of 6.2 maf (57%) to a maximum probable of 16.0 maf (148%). There is a 10% chance that inflows could be higher than the current maximum probable forecast and a 10% chance that inflows could be lower than the minimum probable forecast.

Based on the current forecast, the October 24-Month Study projects Lake Powell elevation will end water year 2016 near 3,600 feet with approximately 11.8 maf in storage (48% capacity). Note that projections of elevation and storage for water year 2016 have significant uncertainty at this point in the season. Projections of elevation and storage using the minimum and maximum probable inflow forecast, updated in October, are 3,581 feet (10.0 maf, 43% capacity) and 3,639 feet (15.9 maf, 65% capacity), respectively. Under these scenarios, there is a 10 percent chance that inflows will be higher, resulting in higher elevation and storage, and 10 percent chance that inflows will be lower, resulting in lower elevation and storage. The annual release volume from Lake Powell during water year 2016 is projected to be 9.0 maf under the minimum and most probable inflow scenarios and 11.4 maf under the maximum probable inflow scenario. There is a chance that inflows could be higher or lower, potentially resulting in releases greater than 11.4 maf or as low as 8.23 maf in water year 2016. The minimum and maximum probable scenarios will be updated again in January.

Upper Colorado River Basin Hydrology

The Upper Colorado River Basin regularly experiences significant year to year hydrologic variability. During the 16-year period 2000 to 2015, however, the unregulated inflow to Lake Powell, which is a good measure of hydrologic conditions in the Colorado River Basin, was above average in only 3 out of the past 16 years. The period 2000-2015 is the lowest 16-year period since the closure of Glen Canyon Dam in 1963, with an average unregulated inflow of 8.51 maf, or 79% of the 30-year average (1981-2010). (For comparison, the 1981-2010 total water year average is 10.83 maf.) The unregulated inflow during the 2000-2015 period has ranged from a low of 2.64 maf (24% of average) in water year 2002 to a high of 15.97 maf (147% of average) in water year 2011. The water year 2015 unregulated inflow volume to Lake Powell was 10.17 maf (94% of average), which, though still below average, was significantly higher than inflows observed in 2012 and 2013 (45% and 47% of average, respectively). Under the current most probable forecast, total water year 2016 unregulated inflows to Lake Powell is projected to be 8.45 maf (78% of average).

At the beginning of water year 2016, total system storage in the Colorado River Basin was 30.3 maf (51% of 59.6 maf total system capacity). This is nearly the same as the total storage at the beginning of water years 2014 and 2015 which began at 29.9 maf and 30.0 maf, respectively, both of which were 50% of capacity. Since the beginning of water year 2000, total Colorado Basin storage has experienced year to year increases and decreases in response to wet and dry hydrology, ranging from a high of 94% of capacity at the beginning of 2000 to a low of 50% of capacity at the beginning of water year 2005. One wet year can significantly increase total system reservoir storage, just as persistent dry years can draw down the system storage. Based on current inflow forecasts, the current projected end of water year total Colorado Basin reservoir storage for water year 2016 is approximately 28.9 maf (49% of total system capacity).The actual end of water year 2016 system storage may vary from this projection, primarily due to uncertainty regarding next season's snowpack and resulting runoff and reservoir inflow. Based on the October minimum and maximum probable inflow forecasts and modeling, the range of end of water year 2016 total system capacity is approximately 26.8 maf (45%) to 36.4 maf (61%), respectively.

November 24-Month Study
Date: November 12, 2015

From: Water Resources Group, Salt Lake City
To: All Colorado River Annual Operating Plan (AOP) Recipients

Current Reservoir Status

Reservoir	October Inflow (unregulated) (acre-feet)	Percent of Average (%)	November 11, Midnight Elevation (feet)	Reservoir Storage (acre-feet)
Fontenelle	46,000	95	6490.95	233,000
Flaming Gorge	47,000	80	6030.03	3,350,000
Blue Mesa	33,000	87	7501.45	673,000
Navajo	42,000	90	6063.71	1,396,000
Powell	535,000	104	3606.22	12,354,000

Expected Operations

The operation of Lake Powell and Lake Mead in this November 2015 24-Month Study is pursuant to the December 2007 Record of Decision on Colorado River Interim Guidelines for Lower Basin Shortages and the Coordinated Operations of Lake Powell and Lake Mead (Interim Guidelines), and reflects the 2015 Annual Operating Plan (AOP) and the draft 2016 AOP. Pursuant to the Interim Guidelines, the August 2015 24-Month Study projections of the January 1, 2016, system storage and reservoir water surface elevations set the operational tier for the coordinated operation of Lake Powell and Lake Mead during 2016.

Consistent with Section 6.B of the Interim Guidelines, Lake Powell's operations in water year 2016 will be governed by the Upper Elevation Balancing Tier, with an initial water year release volume of 8.23 maf and the potential for an April adjustment to equalization or balancing releases in April 2016. This November 2015 24-Month Study indicates that, consistent with Section 6.B.4 of the Interim Guidelines, an April adjustment to balancing releases is projected to occur and Lake Powell is projected to release 9.0 maf in water year 2016.

Consistent with Section 2.B.5 of the Interim Guidelines, the Intentionally Created Surplus (ICS) Surplus Condition is the criterion governing the operation of Lake Mead for calendar years 2015 and 2016.

The 2016 operating determinations for Lake Powell and Lake Mead will be documented in the 2016 AOP, which is currently in the final stages of development.

The Interim Guidelines are available for download at:
http://www.usbr.gov/lc/region/programs/strategies/RecordofDecision.pdf.
The 2015 AOP is available for download at:
http://www.usbr.gov/uc/water/rsvrs/ops/aop/AOP15.pdf.
The draft 2016 AOP is available for download at:
http://www.usbr.gov/lc/region/g4000/AOP2016/AOP16_draft.pdf.

Fontenelle Reservoir – Fontenelle is currently at elevation 6491.0 feet, which amounts to 68 percent of live storage capacity. Inflows for the month of October totaled 46,000 AF, or 95 percent of average. Recent daily inflow averages have ranged from 620 cfs to 860 cfs.

Reservoir releases were reduced to 950 cfs on Monday, October 19, 2015. The Colorado Basin River Forecast Center has forecasted winter inflows that are slightly below average. November, December and January forecasted inflow volumes amount to 38,000 AF (90% of average), 30,000 AF (94% of average), and 27,000 AF (89% of average), respectively. It is anticipated that releases will be maintained at a baseflow of 950 cfs until Spring 2016.

The next Fontenelle Working Group meeting is scheduled for 10:00 am, April 20, 2016. The meeting will be held at the Seedskadee Wildlife Refuge in Green River, Wyoming. The Fontenelle Working Group is an open public forum for information exchange between Reclamation and other parties associated with the operation of Fontenelle Reservoir.

Flaming Gorge Reservoir – Flaming Gorge Dam is currently releasing an average daily base flow of 2,200 cfs. It is anticipated that releases will remain at 2,200 cfs through February 29, 2016. Base flow releases are subject to observed hydrology and all projections may change.

Unregulated inflow into Flaming Gorge Reservoir during the month of October was 47,000 acre-feet (AF), or 80 percent of average. The reservoir elevation is 6,030 feet and decreasing. Observed inflows are averaging 1,190 cubic feet per second (cfs).
Inflows for the next three months are projected to be below average: with November, December and January forecasted inflow volumes at 44,000 AF (86% of average), 30,000 AF (86% of average), and 35,000 AF (87% of average), respectively.

The next Flaming Gorge Working Group meeting is scheduled for April 21, 2016, at 11:00 a.m. to be held in the Utah Department of Natural Resources building in Vernal, Utah. The Flaming Gorge Working Group is an open public forum for information exchange between Reclamation and the stake holders of Flaming Gorge Dam. The public

is encouraged to attend and comment on the operations and plans presented by Reclamation at these meetings. Meeting notes from past Working Group meetings are posted on the Working Group webpage. For more information on this group and these meetings please contact Peter Crookston at 801-379-1152 or Heather Patno at 801-524-3883.

Aspinall Unit Reservoirs – October unregulated inflow into Blue Mesa Reservoir was 33,000 acre-feet or 87 percent of average. Precipitation during October was observed to be about 95 percent of average. The current inflow rate into Blue Mesa Reservoir is about 600 cfs while reservoir releases are averaging about 500 cfs. Blue Mesa's present elevation is 7501.43 feet, which corresponds to a storage content of about 673,000 acre-feet. The unregulated reservoir inflow into Blue Mesa Reservoir during water year 2015 was 1.04 million acre-feet, or about 109 percent of average.

Releases from Crystal are currently set at 600 cfs. The Gunnison Diversion Tunnel was shut down for the season on October 31st, with exception of some small 50 to 100 cfs diversions taken bi-weekly for municipal water needs in Montrose, Colorado. River flows below the tunnel are essentially the same as releases from the Dam. With Blue Mesa Reservoir being above the winter target elevation of 7490 feet, Aspinall reservoir releases maybe increasing over the remainder of November through December to help meet icing target.

Pursuant to the Aspinall Unit Operations Record of Decision (ROD), the baseflow target in the lower Gunnison River, as measured at the Whitewater gage, is 1050 cfs for September through December. Flows in the lower Gunnison River are currently above the baseflow target of 1050 cfs.

On November 2, 2015, the National Weather Service's River Forecasting Center issued its forecasted inflow into Blue Mesa for the next 3 months. The unregulated inflow forecast for November, December, and January is for 80,000 acre-feet, which is 99% of average for these months.

The next operation meeting is scheduled for 1:00 p.m., Thursday, January 21st, 2016 at the Holiday Inn Express in Montrose, Colorado. At this meeting, review of last summer and fall reservoir operations, and plans for this winter and next spring 2016 operations will be discussed. These meetings are open forum discussions on the Aspinall Unit reservoir operations with many interested groups participating. Anyone needing further information about these meetings should contact Erik Knight in the Grand Junction Area Office at (970) 248-0629.

Navajo Reservoir – Navajo Reservoir - As of November 12th, Navajo is releasing 350 cfs. Releases are made for the authorized purposes of the Navajo Unit, and to attempt to maintain a target base flow through the endangered fish critical habitat reach of the San Juan River (Farmington to Lake Powell). The San Juan River Basin Recovery

Implementation Program recommends a target base flow of between 500 cfs and 1,000 cfs through the critical habitat area. The target base flow is calculated as the weekly average of gaged flows throughout the critical habitat area.

Navajo was at 6063.4 ft of pool elevation and 1,392,037 acre-feet of storage by the end of October, which was 101% of average for the end of the month. Modified unregulated inflow into Navajo was 42,061 acre-feet, which was 89% of average for the month. Calculated evaporation for the month was 1,784 acre-ft. NIIP diverted a total of 9,179 acre-ft. The release averaged close to 470 cfs throughout the month. Precipitation at the dam totaled 2.59 inches (211% of average).

As of November 2nd, the release at Navajo (as measured at the USGS at Archuleta gage) was 438 cfs, and the observed inflow is 790 cfs. NIIP has shut off diversions for the season. The reservoir elevation is 6063.53 feet and the content is 1,393,348 acre-feet, or 82% full (70% of Active), and gaining storage. The San Juan River at Four Corners USGS gage is at 799 cfs, and the Animas River at Farmington USGS gage is at 453 cfs. SNOTEL sites above Navajo are showing 0.4 inches of SWE (25% of median on this date).

The most probable modified-unregulated inflow forecast for November at Navajo is 32,000 acre-feet (89% of average), for December is 23,000 acre-feet (92% of average), and for January is 20,000 acre-feet (91% of average).

The most probable forecast shows the reservoir will reach a minimum overwinter storage level near 6062.63 feet (1,382,000 acre-feet) in February of 2016.

Glen Canyon Dam / Lake Powell

Current Status

The unregulated inflow to Lake Powell in October was 535 kaf (104% of average). The release volume from Glen Canyon Dam in October was 600 kaf. The end of October elevation and storage of Lake Powell were 3,606.4 feet (94 feet from full pool) and 12.4 maf (51% of full capacity), respectively. The water year 2015 unregulated inflow to Lake Powell was 10.17 million acre-feet (maf) (94% of average). The water year 2015 release from Lake Powell was 9.0 maf. The reservoir elevation peaked at 3,614 feet on July 14, 2015 and is now in its seasonal decline through the fall and winter months.

Current Operations

The operating tier for water year 2016, established in August 2015, is the Upper Elevation Balancing Tier, with an initial water year release volume of 8.23 maf and the potential for an April 2016 adjustment to equalization or balancing releases. Based on the current forecast, an April adjustment to balancing releases is projected to occur and Lake Powell is currently projected to release 9.0 maf in water year 2016. This projection will be updated each month throughout the water year.

In November 2015, the release volume will be approximately 600 thousand acre-feet (kaf), with fluctuations anticipated between approximately 7,000 cfs and 13,000 cfs and consistent with the Glen Canyon Operating Criteria (Federal Register, Volume 62, No. 41, March 3, 1997). The anticipated release volume for December is approximately 900 kaf with daily fluctuations between approximately 11,000 cfs and 19,000 cfs. The expected release for January is 900 kaf with daily fluctuations between approximately 11,000 cfs and 19,000 cfs.

In addition to daily scheduled fluctuations for power generation, the instantaneous releases from Glen Canyon Dam may also fluctuate to provide 40 MW of system regulation. These instantaneous release adjustments stabilize the electrical generation and transmission system and translate to a range of about 1,200 cfs above or below the hourly scheduled release rate. Under system normal conditions, fluctuations for regulation are typically short lived and generally balance out over the hour with minimal or no noticeable impacts on downstream river flow conditions.

Releases from Glen Canyon Dam can also fluctuate beyond scheduled releases when called upon to respond to unscheduled power outages or power system emergencies. Depending on the severity of the system emergency, the response from Glen Canyon Dam can be significant, within the full range of the operating capacity of the power plant for as long as is necessary to maintain balance in the transmission system. Glen Canyon Dam currently maintains 27 MW (approximately 800 cfs) of generation capacity in reserve in order to respond to a system emergency even when generation rates are already high. System emergencies occur fairly infrequently and typically require small responses from Glen Canyon Dam. However, these responses can have a noticeable impact on the river downstream of Glen Canyon Dam.

Inflow Forecasts and Model Projections

The forecast for water year 2016 unregulated inflow to Lake Powell, issued on November 2, 2015, by the Colorado Basin River Forecast Center, projects that the most probable (median) unregulated inflow volume next year will be 8.39 maf (77% of average). This is a slight decrease (60 kaf) from the October forecast for water year 2016. There is significant uncertainty regarding next season's snow pack development and resulting runoff into Lake Powell. The forecast ranges from a minimum probable of 6.2 maf (57%) to a maximum probable of 16.0 maf (148%). There is a 10% chance that inflows could be higher than the current maximum probable forecast and a 10% chance that inflows could be lower than the minimum probable forecast.

Based on the current forecast, the November 24-Month Study projects Lake Powell elevation will end water year 2016 near 3,598 feet with approximately 11.6 maf in storage (46% capacity). Note that projections of elevation and storage for water year 2016 have significant uncertainty at this point in the season. Projections of elevation and storage using the minimum and maximum probable inflow forecast, updated in October, are 3,581 feet (10.0 maf, 43% capacity) and 3,639 feet (15.9 maf, 65% capacity), respectively. Under these scenarios, there is a 10 percent chance that inflows will be higher, resulting in higher elevation and storage, and 10 percent chance that inflows will

be lower, potentially in lower elevation and storage. The annual release volume from Lake Powell during water year 2016 is projected to be 9.0 maf under the minimum and most probable inflow scenarios and 11.4 maf under the maximum probable inflow scenario. There is a chance that inflows could be higher or lower, potentially resulting in releases greater than 11.4 maf or as low as 8.23 maf in water year 2016. The minimum and maximum probable scenarios will be updated again in January.

Upper Colorado River Basin Hydrology

The Upper Colorado River Basin regularly experiences significant year to year hydrologic variability. During the 16-year period 2000 to 2015, however, the unregulated inflow to Lake Powell, which is a good measure of hydrologic conditions in the Colorado River Basin, was above average in only 3 out of the past 16 years. The period 2000-2015 is the lowest 16-year period since the closure of Glen Canyon Dam in 1963, with an average unregulated inflow of 8.51 maf, or 79% of the 30-year average (1981-2010). (For comparison, the 1981-2010 total water year average is 10.83 maf.) The unregulated inflow during the 2000-2015 period has ranged from a low of 2.64 maf (24% of average) in water year 2002 to a high of 15.97 maf (147% of average) in water year 2011. The water year 2015 unregulated inflow volume to Lake Powell was 10.17 maf (94% of average), which, though still below average, was significantly higher than inflows observed in 2012 and 2013 (45% and 47% of average, respectively). Under the current most probable forecast, total water year 2016 unregulated inflows to Lake Powell is projected to be 8.39 maf (77% of average).

At the beginning of water year 2016, total system storage in the Colorado River Basin was 30.3 maf (51% of 59.6 maf total system capacity). This is nearly the same as the total storage at the beginning of water years 2014 and 2015 which began at 29.9 maf and 30.0 maf, respectively, both of which were 50% of capacity. Since the beginning of water year 2000, total Colorado Basin storage has experienced year to year increases and decreases in response to wet and dry hydrology, ranging from a high of 94% of capacity at the beginning of 2000 to a low of 50% of capacity at the beginning of water year 2005. One wet year can significantly increase total system reservoir storage, just as persistent dry years can draw down the system storage. Based on current inflow forecasts, the current projected end of water year total Colorado Basin reservoir storage for water year 2016 is approximately 29.0 maf (49% of total system capacity).The actual end of water year 2016 system storage may vary from this projection, primarily due to uncertainty regarding next season's snowpack and resulting runoff and reservoir inflow. Based on the October minimum and maximum probable inflow forecasts and modeling, the range of end of water year 2016 total system capacity is approximately 26.8 maf (45%) to 36.4 maf (61%), respectively.

January 24-Month Study
Date: January 15, 2016

From: Water Resources Group, Salt Lake City
To: All Colorado River Annual Operating Plan (AOP) Recipients

Current Reservoir Status

Reservoir	December Inflow (unregulated) (acre-feet)	Percent of Average (%)	January 14, Midnight Elevation (feet)	Reservoir Storage (acre-feet)
Fontenelle	36,000	113	6483.31	185,000
Flaming Gorge	38,000	109	6025.89	3,193,000
Blue Mesa	27,000	105	7493.33	607,000
Navajo	22,000	88	6063.78	1,397,000
Powell	294,000	81	3598.75	11,631,000

Expected Operations

The operation of Lake Powell and Lake Mead in this January 2015 24-Month Study is pursuant to the December 2007 Record of Decision on Colorado River Interim Guidelines for Lower Basin Shortages and the Coordinated Operations of Lake Powell and Lake Mead (Interim Guidelines) and reflects the 2015 Annual Operating Plan (AOP). Pursuant to the Interim Guidelines, the August 2014 24-Month Study projections of the January 1, 2015, system storage and reservoir water surface elevations set the operational tier for the coordinated operation of Lake Powell and Lake Mead during 2015.

Consistent with Section 6.B of the Interim Guidelines, the Lake Powell operational tier for water year 2015 is the Upper Elevation Balancing Tier, with an initial water year release volume of 8.23 maf, and the potential for an April adjustment to equalization or balancing releases for the remainder of the water year. If the April 2015 24-Month Study projects Lake Powell's September 30, 2015, elevation to be greater than 3,649 feet, the Equalization Tier would govern Lake Powell's operations for the remainder of water year 2015. Based on analysis of a range of forecasted inflow scenarios, the current probability of realizing an inflow volume that would trigger equalization in 2015 is approximately 5 percent. If the April 2015 24-Month Study projects Lake Powell's September 30, 2015, elevation to be equal to or greater than 3,575 feet and equal to or less than than 3,649 feet, and Lake Mead's elevation to be less than 1,075 feet, Lake Powell's annual release volume would be increased to balance the contents of Lake Mead and Lake Powell up to 9.0 maf. Based on analysis of a range of forecasted inflow scenarios, the current probability of realizing an inflow volume that would trigger balancing releases of up to

9.0 maf in 2015 is approximately 90 percent. This January 2015 24-Month Study projects that, consistent with Section 6.B.4 of the Interim Guidelines, an April 2015 adjustment to balancing releases is likely to occur and Lake Powell is currently projected to release 9.0 maf in water year 2015.

Consistent with Section 2.B.5 of the Interim Guidelines, the Intentionally Created Surplus (ICS) Surplus Condition is the criterion governing the operation of Lake Mead for calendar year 2015.

The Interim Guidelines are available for download at:
http://www.usbr.gov/lc/region/programs/strategies/RecordofDecision.pdf.
The 2015 AOP is available for download at:
http://www.usbr.gov/uc/water/rsvrs/ops/aop/AOP15.pdf.

Fontenelle Reservoir – Fontenelle Reservoir is currently at elevation 6483 feet, which amounts to 54 percent of live storage capacity. Inflows for the month of December totaled 36,000 AF, or 113 percent of average. Recent daily inflow averages have ranged from 460 cfs to 660 cfs.

The Colorado Basin River Forecast Center has forecasted winter inflows that are slightly below average. January, February, and March forecasted inflow volumes amount to 29,000 AF (96% of average), 26,000 AF (94% of average), and 43,000 AF (82% of average) respectively. It is anticipated that releases will be maintained at a baseflow of 950 cfs until Spring 2016.

The next Fontenelle Working Group meeting is scheduled for 10:00 am, April 20, 2016. The meeting will be held at the Seedskadee Wildlife Refuge in Green River, Wyoming. The Fontenelle Working Group is an open public forum for information exchange between Reclamation and other parties associated with the operation of Fontenelle Reservoir.

Flaming Gorge Reservoir – Flaming Gorge Dam is currently releasing an average daily base flow of 2,200 cfs. It is anticipated that releases will remain at 2,200 cfs through February 29, 2016. Base flow releases are subject to observed hydrology and all projections may change.

Unregulated inflow into Flaming Gorge Reservoir during the month of December was 38,000 acre-feet (AF), or 110 percent of average. The reservoir elevation is 6,026 feet and decreasing. Observed inflows are averaging 1,100 cubic feet per second (cfs).

Inflows for the next three months are projected to be at or below average: with January, February and March forecasted inflow volumes at 39,000 AF (97% of average), 38,000 AF (85% of average), and 87,000 AF (85% of average), respectively.

The next Flaming Gorge Working Group meeting is scheduled for April 21, 2016, at 11:00 a.m. to be held in the Utah Department of Natural Resources building in Vernal, Utah. The Flaming Gorge Working Group is an open public forum for information exchange between Reclamation and the stake holders of Flaming Gorge Dam. The public is encouraged to attend and comment on the operations and plans presented by Reclamation at these meetings. Meeting notes from past Working Group meetings are posted on the Working Group webpage. For more information on this group and these meetings please contact Peter Crookston at 801-379-1152 or Heather Patno at 801-524-3883.

Aspinall Unit Reservoirs – December unregulated inflow into Blue Mesa Reservoir was 27,000 acre-feet or 105 percent of average. Precipitation during December was observed to be about 140 percent of average. The Gunnison River basin snowpack as of January 13th was averaging about 108 percent. The current inflow rate into Blue Mesa Reservoir is about 400 cfs while reservoir releases are averaging about 1,000 cfs. The present reservoir elevation is 7493.65 feet, which corresponds to a storage content of about 610,000 acre-feet.

Releases from Crystal Dam have been kept at just about the same release rate since early December, with a set release rate of 1,100 cfs. Reservoir releases will most likely change as the current hydrologic conditions change through the snow accumulation season. River flows below the tunnel are essentially the same as releases from the Dam, with the exception of when the tunnel is taking water to refill Fairfield Reservoir for Montrose municipal water needs.

The first Water Supply Forecast for Water Year 2016 has been issued and the April through July unregulated inflow is forecasted to be at 610,000 acre-feet (90% of average). Based on this forecast, Blue Mesa Reservoir is projected to fill by the end of this 2016 runoff season.

The next meeting of the "Aspinall Unit Working Group" will be held on Thursday January 21rd in the Montrose, Colorado, starting at 1:00 PM. At this meeting, review of last summer and fall reservoir operations, and plans for this winter and next spring 2016 operations will be discussed. These meetings are open forum discussions on the Aspinall Unit reservoir operations with many interested groups participating. Anyone needing further information about these meetings should contact Erik Knight in the Grand Junction Area Office at (970) 248-0629.

Navajo Reservoir – Navajo is currently releasing 350 cfs. Releases are made for the authorized purposes of the Navajo Unit, and to attempt to maintain a target base flow through the endangered fish critical habitat reach of the San Juan River (Farmington to Lake Powell). The San Juan River Basin Recovery Implementation Program recommends a target base flow of between 500 cfs and 1,000 cfs through the critical habitat area. The target base flow is calculated as the weekly average of gaged flows throughout the critical habitat area.

Navajo was at 6063.8 feet of pool elevation and 1,397,022 acre-feet of storage by the end of December, which was 104% of average for the end of the month. Modified unregulated inflow into Navajo was 22,399 acre-feet, which was 89% of average for the month. Calculated evaporation for the month was 654 acre-ft. The release averaged close to 350 cfs throughout the month.

As of January 6th, the San Juan River at the USGS Archuleta gage was 266 cfs, and the observed inflow is 544 cfs. Note that at very low releases, Archuleta's shift migrates due to sediment and moss issues. The scheduled release is 350 cfs, measured using the gate curves and reservoir elevation head. The reservoir elevation is 6063.81 feet and the content is 1,397,022 acre-feet, or 82% full (71% of Active). The San Juan River at Four Corners USGS gage is at 730 cfs, and the Animas River at Farmington USGS gage is at 343 cfs. Snotel sites above Navajo are showing 11.5 inches of SWE (112% of median on this date).

The most probable modified-unregulated inflow forecast for January at Navajo is 19,000 acre-feet (87% of average), for February is 24,000 acre-feet (79% of average), and for March is 80,000 acre-feet (87% of average). The April-July modified unregulated inflow forecasts are as follows:

Min Probable: 550,000 acre-feet (75% of average)
Most Probable: 770,000 acre-feet (104% of average)
Max Probable: 1,120,000 acre-feet (152% of average)

Glen Canyon Dam / Lake Powell

Current Status
The unregulated inflow to Lake Powell in December was 266 kaf (73% of average). The release volume from Glen Canyon Dam in December was 858 kaf. The end of December elevation and storage of Lake Powell were 3,600 feet (100 feet from full pool) and 11.8 maf (49% of full capacity), respectively. The reservoir is declining and will continue to decline until spring runoff begins to enter the reservoir. The current snowpack above Lake Powell is 101% of average.

Current Operations
The operating tier for water year 2016, established in August 2015, is the Upper Elevation Balancing Tier, with an initial water year release volume of 8.23 maf and the potential for an April 2016 adjustment to equalization or balancing releases. Based on the current forecast, an April adjustment to balancing releases is projected to occur and Lake Powell is currently projected to release 9.0 maf in water year 2016. This projection will be updated each month throughout the water year.

In January 2015, the release volume will be approximately 900 thousand acre-feet (kaf), with fluctuations anticipated between approximately 11,000 cfs and 19,000 cfs and consistent with the Glen Canyon Operating Criteria (Federal Register, Volume 62, No.

41, March 3, 1997). The anticipated release volume for February is approximately 700 kaf with daily fluctuations between approximately 9,000 cfs and 15,000 cfs. The expected release for March is 650 kaf with daily fluctuations between approximately 7,000 cfs and 13,000 cfs.

In addition to daily scheduled fluctuations for power generation, the instantaneous releases from Glen Canyon Dam may also fluctuate to provide 40 MW of system regulation. These instantaneous release adjustments stabilize the electrical generation and transmission system and translate to a range of up to about 1,200 cfs above or below the hourly scheduled release rate. Under system normal conditions, fluctuations for regulation are typically short lived and generally balance out over the hour with minimal or no noticeable impacts on downstream river flow conditions.

Releases from Glen Canyon Dam can also fluctuate beyond scheduled releases when called upon to respond to unscheduled power outages or power system emergencies. Depending on the severity of the system emergency, the response from Glen Canyon Dam can be significant, within the full range of the operating capacity of the power plant for as long as is necessary to maintain balance in the transmission system. Glen Canyon Dam currently maintains 27 MW (approximately 800 cfs) of generation capacity in reserve in order to respond to a system emergency even when generation rates are already high. System emergencies occur fairly infrequently and typically require small responses from Glen Canyon Dam. However, these responses can have a noticeable impact on the river downstream of Glen Canyon Dam.

Inflow Forecasts and Model Projections

The April to July 2016 water supply forecast for unregulated inflow to Lake Powell, issued on January 5, 2016, by the Colorado Basin River Forecast Center, projects that the most probable (median) unregulated inflow volume will be 6.4 maf (89% of average based on the period 1981-2010). The projected water year 2016 inflow is 9.6 maf (89%). At this early point in the season, there is still significant uncertainty regarding this year's water supply. The April-July forecast ranges from a minimum probable of 4.1 maf (57%) to a maximum probable of 9.9 maf (138%). There is a 10% chance that inflows could be higher than the current maximum probable forecast and a 10% chance that inflows could be lower than the minimum probable forecast.

Based on the current forecast, the January 24-Month Study projects Lake Powell elevation will end water year 2016 near 3,609 feet with approximately 12.7 maf in storage (52% capacity). Note that projections of elevation and storage for water year 2016 have significant uncertainty at this point in the season. Projections of elevation and storage using the minimum and maximum probable inflow forecast, updated in January, are 3,587 feet (10.5 maf, 43% capacity) and 3,642 feet (16.3 maf, 67% capacity), respectively. Under these scenarios, there is a 10 percent chance that inflows will be higher, resulting in higher elevation and storage, and 10 percent chance that inflows will be lower, potentially in lower elevation and storage. The annual release volume from Lake Powell during water year 2016 is projected to be 9.0 maf under the minimum, most, and maximum probable inflow scenarios. There is a chance that inflows could be higher

or lower, potentially resulting in releases greater than 9.0 maf or as low as 8.23 maf in water year 2016. The minimum and maximum probable scenarios will be updated again in April.

Upper Colorado River Basin Hydrology

The Upper Colorado River Basin regularly experiences significant year to year hydrologic variability. During the 16-year period 2000 to 2015, however, the unregulated inflow to Lake Powell, which is a good measure of hydrologic conditions in the Colorado River Basin, was above average in only 3 out of the past 16 years. The period 2000-2015 is the lowest 16-year period since the closure of Glen Canyon Dam in 1963, with an average unregulated inflow of 8.51 maf, or 79% of the 30-year average (1981-2010). (For comparison, the 1981-2010 total water year average is 10.83 maf.) The unregulated inflow during the 2000-2015 period has ranged from a low of 2.64 maf (24% of average) in water year 2002 to a high of 15.97 maf (147% of average) in water year 2011. The water year 2015 unregulated inflow volume to Lake Powell was 10.17 maf (94% of average), which, though still below average, was significantly higher than inflows observed in 2012 and 2013 (45% and 47% of average, respectively). Under the current most probable forecast, the total water year 2016 unregulated inflow to Lake Powell is projected to be 9.59 maf (89% of average).

At the beginning of water year 2016, total system storage in the Colorado River Basin was 30.0 maf (50% of 59.6 maf total system capacity). This is nearly the same as the total storage at the beginning of water years 2014 and 2015 which began at 29.9 maf and 30.0 maf, respectively, both of which were 50% of capacity. Since the beginning of water year 2000, total Colorado Basin storage has experienced year to year increases and decreases in response to wet and dry hydrology, ranging from a high of 94% of capacity at the beginning of 2000 to a low of 50% of capacity at the beginning of water year 2005. One wet year can significantly increase total system reservoir storage, just as persistent dry years can draw down the system storage. Based on current inflow forecasts, the current projected end of water year total Colorado Basin reservoir storage for water year 2016 is approximately 30.0 maf (50% of total system capacity). The actual end of water year 2016 system storage may vary from this projection, primarily due to uncertainty regarding the season's snowpack and resulting runoff and reservoir inflow. Based on the January minimum and maximum probable inflow forecasts and modeling, the range of end of water year 2016 total system capacity is approximately 27.4 maf (46%) to 34.1 maf (57%), respectively.

Model Run ID: 3001

Processed On: 1/15/2016 10:27:17AM

February 24-Month Study
Date: February 12, 2016

From: Water Resources Group, Salt Lake City
To: All Colorado River Annual Operating Plan (AOP) Recipients

Current Reservoir Status

Reservoir	January Inflow (unregulated) (acre-feet)	Percent of Average (%)	February 11, Midnight Elevation (feet)	Reservoir Storage (acre-feet)
Fontenelle	32,000	106	6478.81	160,000
Flaming Gorge	44,000	110	6024.43	3,139,000
Blue Mesa	27,000	111	7489.60	578,000
Navajo	21,000	96	6063.64	1,395,000
Powell	300,000	83	3595.56	11,331,000

Expected Operations

The operation of Lake Powell and Lake Mead in this February 2016 24-Month Study is pursuant to the December 2007 Record of Decision on Colorado River Interim Guidelines for Lower Basin Shortages and the Coordinated Operations of Lake Powell and Lake Mead (Interim Guidelines), and reflects the draft 2016 Annual Operating Plan (AOP). Pursuant to the Interim Guidelines, the August 2015 24-Month Study projections of the January 1, 2016, system storage and reservoir water surface elevations set the operational tier for the coordinated operation of Lake Powell and Lake Mead during 2016.

Consistent with Section 6.B of the Interim Guidelines, Lake Powell's operations in water year 2016 will be governed by the Upper Elevation Balancing Tier, with an initial water year release volume of 8.23 maf and the potential for an April adjustment to equalization or balancing releases in April 2016. This February 2016 24-Month Study indicates that, consistent with Section 6.B.4 of the Interim Guidelines, an April adjustment to balancing releases is projected to occur and Lake Powell is projected to release 9.0 maf in water year 2016.

Consistent with Section 2.B.5 of the Interim Guidelines, the Intentionally Created Surplus (ICS) Surplus Condition is the criterion governing the operation of Lake Mead for calendar year 2016.

The 2016 operating determinations for Lake Powell and Lake Mead will be documented in the 2016 AOP, which is currently in the final stages of development.

The Interim Guidelines are available for download at:
http://www.usbr.gov/lc/region/programs/strategies/RecordofDecision.pdf.
The draft 2016 AOP is available for download at:
http://www.usbr.gov/lc/region/g4000/AOP2016/AOP16_draft.pdf.

Fontenelle Reservoir – Fontenelle Reservoir is currently at elevation 6479 feet, which amounts to 47 percent of live storage capacity. Inflows for the month of January totaled 32,000 AF, or 106 percent of average. Recent daily inflow averages have ranged from 450 cfs to 510 cfs.

The Colorado Basin River Forecast Center has forecasted winter inflows that are slightly below average. February, March and April forecasted inflow volumes amount to 26,000 AF (94% of average), 43,000 AF (82% of average), and 65,000 AF (76% of average), respectively. It is anticipated that releases will be maintained at a baseflow of 950 cfs until Spring 2016.

The next Fontenelle Working Group meeting is scheduled for 10:00 am, April 20, 2016. The meeting will be held at the Seedskadee Wildlife Refuge in Green River, Wyoming. The Fontenelle Working Group is an open public forum for information exchange between Reclamation and other parties associated with the operation of Fontenelle Reservoir.

Flaming Gorge Reservoir – Flaming Gorge Dam is currently releasing an average daily release of 2,200 cfs. The February forecast for unregulated inflow into Flaming Gorge for the April-July period is continuing to decrease and is currently at 70% of average. Dry conditions are forecasted this spring. Beginning February 15, 2016, Flaming Gorge Dam will decrease from 2,200 cfs to minimum releases of 800 cfs.

It is anticipated that releases will remain at 800 cfs until the beginning of spring runoff sometime in May or June. Base flow releases are subject to observed hydrology and all projections may change.

Unregulated inflow into Flaming Gorge Reservoir during the month of December was 44,000 acre-feet (AF), or 108 percent of average. The reservoir elevation is 6,024 feet and decreasing.

Inflows for the next three months are projected to be at or below average: with February, March forecasted inflow volumes at 40,000 AF (90% of average), 90,000 AF (88% of average), and 110,000 AF (82% of average), respectively.

The Flaming Gorge Working Group is an open public forum for information exchange between Reclamation and the stakeholders of Flaming Gorge Dam. The public is

encouraged to attend and comment on the operations and plans presented by Reclamation at these meetings. Meeting notes from past Working Group meetings are posted on the Working Group webpage. For more information on this group and these meetings please contact Dale Hamilton at 801-379-1186 or Heather Patno at 801-524-3883.

Reclamation will be holding two Flaming Gorge Working Group meetings this year. The first meeting will be held on March 22, 2016, at 6:00 p.m. in Green River, Utah at the Green River High School.

Reclamation will be holding the second Flaming Gorge Working Group meeting on Tuesday, April 19, 2016, at 11:00 a.m. at the Utah Division of Wildlife Resources offices located at 318 North Vernal Avenue, Vernal, Utah. . Base flow releases are subject to observed hydrology and all projections may change.

Aspinall Unit Reservoirs – January unregulated inflow into Blue Mesa Reservoir was 27,000 acre-feet or 111 percent of average. On February 10th the basin snowpack was averaging 113 percent, which has increased slightly by 2 percent from a month ago. Precipitation during January was about 110 percent of average, while December's precipitation was recorded at 140 percent of average. The current inflow rate into Blue Mesa Reservoir is about 500 cfs while reservoir releases are averaging about 1,000 cfs. Reservoir inflows this past fall and early winter months are about average to slightly below average. Blue Mesa Reservoir current elevation is 7489.60 feet, which corresponds to a storage content of about 578,000 acre-feet. This elevation is about 5.0 feet higher than the elevation was from a year ago.

The February Water Supply Forecast for Water Year 2016 has been issued and the April through July unregulated inflow is forecasted to be at 640,000 acre-feet (95% of average). Based on this forecast, Blue Mesa Reservoir is projected to fill by the end of this 2016 runoff season.

Releases from Crystal Dam have been remained steady as favorable hydrologic conditions have prevailed through the early winter months. The current release is set at 1,100 cfs. Reservoir releases will most likely change as the current hydrologic conditions change through the snow accumulation season. River flows below the tunnel are essentially the same as releases from the Dam, with the exception of when the tunnel is taking water to refill Fairfield Reservoir for Montrose municipal water needs.

The last meeting of the "Aspinall Unit Working Group" was held on January 21, 2016 in Montrose, Colorado. At this meeting, review of last summer and fall reservoir operations, and plans for this winter and next spring 2016 operations were discussed. These meetings are open forum discussions on the Aspinall Unit reservoir operations with many interested groups participating. For more information about these meetings please contact Erik Knight in the Grand Junction Area Office at (970) 248-0629.

Navajo Reservoir – Navajo is currently releasing 550 cfs. Releases are made for the authorized purposes of the Navajo Unit, and to attempt to maintain a target base flow

through the endangered fish critical habitat reach of the San Juan River (Farmington to Lake Powell). The San Juan River Basin Recovery Implementation Program recommends a target base flow of between 500 cfs and 1,000 cfs through the critical habitat area. The target base flow is calculated as the weekly average of gaged flows throughout the critical habitat area.

Navajo was at 6063.8 feet of pool elevation and 1,396,496 acre-feet of storage by the end of January, which was 107% of average for the end of the month. Modified unregulated inflow into Navajo was 22,126 acre-feet, which was 101% of average for the month. Calculated evaporation for the month was 653 acre-ft. NIIP diverted a total of 0 acre-ft. The release averaged close to 350 cfs throughout the month. Precipitation at the dam totaled 1.97 inches (198% of average).

As of February 7th, the release at Navajo was 550 cfs, (USGS at Archuleta gage is showing 479 cfs) and the observed inflow is 287 cfs. NIIP is diverting 0 cfs. The reservoir elevation is 6063.73 feet and the content is 1,395,971 acre-feet, or 82% full (71% of Active). The San Juan River at Four Corners USGS gage is at 728 cfs, and the Animas River at Farmington USGS gage is at 405 cfs. Snotel sites above Navajo are showing 15.5 inches of SWE (114% of median on this date).

The most probable modified-unregulated inflow forecast for February at Navajo is 25,000 acre-feet (83% of average), for March is 85,000 acre-feet (92% of average), and for April is 171,000 acre-feet (100% of average). The April-July modified unregulated inflow forecasts are as follows:

Min Probable: 500,000 acre-feet (68% of average, a decrease of 30,000 acre-feet from the last forecast). Under this forecast, a Type 3 (3-week) spring peak release is expected using the end of water year storage target alternate of 6050 ft.

Most Probable: 735,000 acre-feet (100% of average, an increase of 10,000 acre-feet from the last forecast). Under this forecast a Type 4 (3-week plus long ramps) spring peak release is expected using the end of water year storage target of 6063 ft.

Max Probable: 1,080,000 acre-feet (147% of average, an increase of 60,000 acre-feet from the last forecast). Under this forecast, a Type 4 spring peak release plus a 5,000 cfs nose up to April 1st, and a 1,000 cfs nose back to March 1st is expected using the end of water year storage target of 6063 ft.

Glen Canyon Dam / Lake Powell

Current Status

The unregulated inflow to Lake Powell in January was 300 kaf (83% of average). The release volume from Glen Canyon Dam in January was 857 kaf. The end of January elevation and storage of Lake Powell were 3,597 feet (103 feet from full pool) and 11.4 maf (47% of full capacity), respectively. The reservoir is declining and will continue to

decline until spring runoff begins to enter the reservoir. The current snowpack above Lake Powell is 107% of average.

Current Operations

The operating tier for water year 2016, established in August 2015, is the Upper Elevation Balancing Tier, with an initial water year release volume of 8.23 maf and the potential for an April 2016 adjustment to equalization or balancing releases. Based on the current forecast, an April adjustment to balancing releases is projected to occur and Lake Powell is currently projected to release 9.0 maf in water year 2016. This projection will be updated each month throughout the water year.

In February 2016, the release volume will be approximately 700 thousand acre-feet (kaf), with fluctuations anticipated between approximately 9,000 cfs and 15,000 cfs and consistent with the Glen Canyon Operating Criteria (Federal Register, Volume 62, No. 41, March 3, 1997). The anticipated release volume for March is approximately 700 kaf with daily fluctuations between approximately 8,000 cfs and 14,000 cfs. The expected release for April is 658 kaf with daily fluctuations between approximately 8,000 cfs and 14,000 cfs.

In addition to daily scheduled fluctuations for power generation, the instantaneous releases from Glen Canyon Dam may also fluctuate to provide 40 MW of system regulation. These instantaneous release adjustments stabilize the electrical generation and transmission system and translate to a range of up to about 1,200 cfs above or below the hourly scheduled release rate. Under system normal conditions, fluctuations for regulation are typically short lived and generally balance out over the hour with minimal or no noticeable impacts on downstream river flow conditions.

Releases from Glen Canyon Dam can also fluctuate beyond scheduled releases when called upon to respond to unscheduled power outages or power system emergencies. Depending on the severity of the system emergency, the response from Glen Canyon Dam can be significant, within the full range of the operating capacity of the power plant for as long as is necessary to maintain balance in the transmission system. Glen Canyon Dam currently maintains 27 MW (approximately 800 cfs) of generation capacity in reserve in order to respond to a system emergency even when generation rates are already high. System emergencies occur fairly infrequently and typically require small responses from Glen Canyon Dam. However, these responses can have a noticeable impact on the river downstream of Glen Canyon Dam.

Inflow Forecasts and Model Projections

The April to July 2016 water supply forecast for unregulated inflow to Lake Powell, issued on February 2, 2016, by the Colorado Basin River Forecast Center, projects that the most probable (median) unregulated inflow volume will be 6.7 maf (94% of average based on the period 1981-2010). The projected water year 2016 inflow is 9.9 maf (92%). At this early point in the season, there is still significant uncertainty regarding this year's water supply. The April-July forecast ranges from a minimum probable of 5.0 maf (70%) to a maximum probable of 10.3 maf (144%). There is a 10% chance that inflows could

be higher than the current maximum probable forecast and a 10% chance that inflows could be lower than the minimum probable forecast.

Based on the current forecast, the February 24-Month Study projects Lake Powell elevation will end water year 2016 near 3,613 feet with approximately 13.0 maf in storage (53% capacity). Note that projections of elevation and storage for water year 2016 have significant uncertainty at this point in the season. Projections of elevation and storage using the minimum and maximum probable inflow forecast, updated in January, are 3,587 feet (10.5 maf, 43% capacity) and 3,642 feet (16.3 maf, 67% capacity), respectively. Under these scenarios, there is a 10 percent chance that inflows will be higher, resulting in higher elevation and storage, and 10 percent chance that inflows will be lower, potentially in lower elevation and storage. The annual release volume from Lake Powell during water year 2016 is projected to be 9.0 maf under the minimum, most, and maximum probable inflow scenarios. There is a chance that inflows could be higher or lower, potentially resulting in releases greater than 9.0 maf or as low as 8.23 maf in water year 2016. The minimum and maximum probable scenarios will be updated again in April.

Upper Colorado River Basin Hydrology

The Upper Colorado River Basin regularly experiences significant year to year hydrologic variability. During the 16-year period 2000 to 2015, however, the unregulated inflow to Lake Powell, which is a good measure of hydrologic conditions in the Colorado River Basin, was above average in only 3 out of the past 16 years. The period 2000-2015 is the lowest 16-year period since the closure of Glen Canyon Dam in 1963, with an average unregulated inflow of 8.51 maf, or 79% of the 30-year average (1981-2010). (For comparison, the 1981-2010 total water year average is 10.83 maf.) The unregulated inflow during the 2000-2015 period has ranged from a low of 2.64 maf (24% of average) in water year 2002 to a high of 15.97 maf (147% of average) in water year 2011. The water year 2015 unregulated inflow volume to Lake Powell was 10.17 maf (94% of average), which, though still below average, was significantly higher than inflows observed in 2012 and 2013 (45% and 47% of average, respectively). Under the current most probable forecast, the total water year 2016 unregulated inflow to Lake Powell is projected to be 9.92 maf (92% of average).

At the beginning of water year 2016, total system storage in the Colorado River Basin was 30.0 maf (50% of 59.6 maf total system capacity). This is nearly the same as the total storage at the beginning of water years 2014 and 2015 which began at 29.9 maf and 30.0 maf, respectively, both of which were 50% of capacity. Since the beginning of water year 2000, total Colorado Basin storage has experienced year to year increases and decreases in response to wet and dry hydrology, ranging from a high of 94% of capacity at the beginning of 2000 to a low of 50% of capacity at the beginning of water year 2005. One wet year can significantly increase total system reservoir storage, just as persistent dry years can draw down the system storage. Based on current inflow forecasts, the current projected end of water year total Colorado Basin reservoir storage for water year 2016 is approximately 30.3 maf (51% of total system capacity). The actual end of water year 2016 system storage may vary from this projection, primarily due to uncertainty

regarding the season's snowpack and resulting runoff and reservoir inflow. Based on the January minimum and maximum probable inflow forecasts and modeling, the range of end of water year 2016 total system capacity is approximately 27.4 maf (46%) to 34.1 maf (57%), respectively. The minimum and maximum probable scenarios will be updated again in April.

March 24-Month Study
Date: March 11, 2016

From: Water Resources Group, Salt Lake City
To: All Colorado River Annual Operating Plan (AOP) Recipients

Current Reservoir Status

Reservoir	February Inflow (unregulated) (acre-feet)	Percent of Average (%)	March 10, Midnight Elevation (feet)	Reservoir Storage (acre-feet)
Fontenelle	34,000	123	6475.88	145,000
Flaming Gorge	63,000	142	6024.55	3,144,000
Blue Mesa	26,000	116	7486.93	558,000
Navajo	41,000	136	6065.30	1,417,000
Powell	396,000	101	3593.87	11,174,000

Expected Operations

The operation of Lake Powell and Lake Mead in this March 2016 24-Month Study is pursuant to the December 2007 Record of Decision on Colorado River Interim Guidelines for Lower Basin Shortages and the Coordinated Operations of Lake Powell and Lake Mead (Interim Guidelines), and reflects the 2016 Annual Operating Plan (AOP). Pursuant to the Interim Guidelines, the August 2015 24-Month Study projections of the January 1, 2016, system storage and reservoir water surface elevations set the operational tier for the coordinated operation of Lake Powell and Lake Mead during 2016.

Consistent with Section 6.B of the Interim Guidelines, Lake Powell's operations in water year 2016 will be governed by the Upper Elevation Balancing Tier, with an initial water year release volume of 8.23 maf and the potential for an April adjustment to equalization or balancing releases in April 2016. This March 2016 24-Month Study indicates that, consistent with Section 6.B.4 of the Interim Guidelines, an April adjustment to balancing releases is projected to occur and Lake Powell is projected to release 9.0 maf in water year 2016.

Consistent with Section 2.B.5 of the Interim Guidelines, the Intentionally Created Surplus (ICS) Surplus Condition is the criterion governing the operation of Lake Mead for calendar year 2016.

The Interim Guidelines are available for download at:
http://www.usbr.gov/lc/region/programs/strategies/RecordofDecision.pdf.
The 2016 AOP is available for download at:
http://www.usbr.gov/lc/region/g4000/aop/AOP16.pdf.

Fontenelle Reservoir – Fontenelle Reservoir is currently at elevation 6475 feet, which amounts to 42 percent of live storage capacity. Inflows for the month of February totaled 34,000 AF, or 123 percent of average. Recent daily inflow averages are fairly steady around 800 cfs.

The Colorado Basin River Forecast Center has forecasted spring inflows that are slightly below average. March, April and May forecasted inflow volumes amount to 51,000 AF (97% of average), 65,000 AF (76% of average), and 100,000 AF (61% of average), respectively. It is anticipated that releases will be maintained at a baseflow of 950 cfs until Spring 2016.

The next Fontenelle Working Group meeting is scheduled for 10:00 am, April 20, 2016. The meeting will be held at the Seedskadee Wildlife Refuge in Green River, Wyoming. The Fontenelle Working Group is an open public forum for information exchange between Reclamation and other parties associated with the operation of Fontenelle Reservoir.

Flaming Gorge Reservoir – Flaming Gorge Dam is currently releasing steady minimum releases of 800 cfs. The March for unregulated inflow into Flaming Gorge for the April-July period is continuing to decrease and is currently at 67% of average. Dry conditions are forecasted this spring.

It is anticipated that releases will remain at 800 cfs until the beginning of spring runoff sometime in May or June. Base flow releases are subject to observed hydrology and all projections may change.

Unregulated inflow into Flaming Gorge Reservoir during the month of February was 63,000 acre-feet (AF), or 142 percent of average. The reservoir elevation is 6,024 feet and increasing.

Inflows for the next three months are projected to be below average: with March, April and May forecasted inflow volumes at 102,000 AF (100% of average), 105,000 AF (79% of average), and 160,000 AF (65% of average), respectively.

The Flaming Gorge Working Group is an open public forum for information exchange between Reclamation and the stakeholders of Flaming Gorge Dam. The public is encouraged to attend and comment on the operations and plans presented by Reclamation at these meetings. Meeting notes from past Working Group meetings are posted on the Working Group webpage. For more information on this group and these meetings please contact Dale Hamilton at 801-379-1186 or Heather Patno at 801-524-3883.

Reclamation will be holding two Flaming Gorge Working Group meetings this year. The first meeting will be held on March 23, 2016, at 6:00 p.m. in Green River, Utah at the Green River High School.

Reclamation will be holding the second Flaming Gorge Working Group meeting on Tuesday, April 19, 2016, at 11:00 a.m. at the Utah Division of Wildlife Resources offices located at 318 North Vernal Avenue, Vernal, Utah.

Aspinall Unit Reservoirs – February unregulated inflow into Blue Mesa Reservoir was 26,000 acre-feet or 118 percent of average. Hydrologic and snowpack conditions in the Gunnison River Basin (basin) declined during the month of February and are 94% of the seasonal median (historic middle value of 30 years of record during the period from 1981 through 2010) for March 11, 2016. Precipitation during February in the basin was well below average at about 46 percent of average, while January's precipitation was about 106 percent of average. Reservoir inflows this past fall and early winter months have been about average to slightly below average.

The March Water Supply Forecast for Water Year 2016 has been issued and the April through July unregulated inflow to Blue Mesa is forecasted to be at 580,000 acre-feet (86% of average). Based on this forecast, Blue Mesa Reservoir is projected to be nearly full by the end of this 2016 runoff season.

Inflow to Blue Mesa is currently about 600 cfs and the elevation of Blue Mesa 7486.9 feet above sea level (about 2.5 feet higher than one year ago at this time). This elevation corresponds to Blue Mesa storage of about 558,000 acre-feet. Releases from Crystal Dam are currently 600 cfs. Gunnison River flows in the Black Canyon below the Gunnison Tunnel are essentially the same as releases from the Crystal Dam, with the exception of when the tunnel is taking water to refill Fairfield Reservoir for Montrose municipal water needs. Irrigation season is approaching and in late March the Uncompahgre Water Users Association will begin operating the Gunnison Tunnel to divert water from the Gunnison River. When this occurs, Crystal Dam releases will be coordinate with diversions to the Gunnison Tunnel to maintain river flows in the Black Canyon as well as along the Gunnison River below the Black Canyon.

Pursuant to the Aspinall Unit Operations Record of Decision (ROD), the baseflow target in the lower Gunnison River, as measured at the Whitewater gage, is 1,050 cfs. Flows in the lower Gunnison River are currently above the baseflow target of 1,050 cfs.

The next meeting of the "Aspinall Unit Working Group" will be held on Thursday April 28th in the Grand Junction, Colorado at the Western Colorado Area Office (445 West Gunnison Avenue - Suite 221). At this meeting, Reclamation will present hydrologic conditions of the Gunnison Basin and the projected 2016 operational plan for the Aspinall Unit during the spring and summer months. These meetings are hosted by Reclamation and are open forum discussions to share information among Reclamation, stakeholders and the public regarding past and future operations of the Aspinall Unit.

Anyone needing further information about these meetings should contact Erik Knight in the Grand Junction Area Office at (970) 248-0629.

Navajo Reservoir – Navajo is currently releasing 350 cfs. Releases are made for the authorized purposes of the Navajo Unit, and to attempt to maintain a target base flow through the endangered fish critical habitat reach of the San Juan River (Farmington to Lake Powell). The San Juan River Basin Recovery Implementation Program recommends a target base flow of between 500 cfs and 1,000 cfs through the critical habitat area. The target base flow is calculated as the weekly average of gaged flows throughout the critical habitat area.

Navajo was at 6064.4 ft of pool elevation and 1,404,661 acre-ft of storage by the end of February, which was 109% of average for the end of the month. Modified unregulated inflow into Navajo was 41,518 af, which was 137% of average for the month. Calculated evaporation for the month was 861 acre-ft. NIIP diverted a total of 1,457 acre-ft. The release averaged out to 480 cfs throughout the month. Precipitation at the dam totaled 0.33 inches (31% of average).

As of March 3rd, the release at Navajo was 450 cfs, (USGS at Archuleta gage is showing 484 cfs) and the observed inflow is 1,387 cfs. NIIP is diverting 149 cfs. The reservoir elevation is 6064.68 ft and the content is 1,408,495 acre-ft, or 83% full (72% of Active). The San Juan River at Four Corners USGS gage is at 1,180 cfs, and the Animas River at Farmington USGS gage is at 828 cfs (Animas at Farmington is estimated as there is a gage malfunction). Snotel sites above Navajo are showing 15.7 inches of SWE (93% of median on this date).

The most probable modified-unregulated inflow forecast for March at Navajo is 82,000 acre-ft (89% of average), for April is 150,000 acre-ft (88% of average), and for May is 265,000 acre-ft (96% of average). The April-July modified unregulated inflow forecasts are as follows:

Min Probable: 380,000 acre-ft (52% of average, a decrease of 100,000 af from the last forecast). Under this forecast, no spring peak release is expected.

Most Probable: 650,000 acre-ft (88% of average, a decrease of 85,000 af from the last forecast). Under this forecast, a spring peak release of 5,000 cfs for 40 days is expected beginning in early May.

Max Probable: 910,000 acre-ft (123% of average, a decrease of 140,000 af from the last forecast). Under this forecast, a spring peak release of 5,000 cfs for 60 days is expected beginning in late April.

The shape of the spring peak release has been coordinated with the SJRIP and will be an attempt to maximize the number of days at 5,000 cfs by reducing the ramp-up to three days. The ramp down will be 2-weeks to prevent fish stranding. Note that the final shape and volume of these hydrographs are subject to change.

Glen Canyon Dam / Lake Powell

Current Status

The unregulated inflow to Lake Powell in February was 396 kaf (101% of average). The release volume from Glen Canyon Dam in February was 700 kaf. The end of February elevation and storage of Lake Powell were 3,594 feet (106 feet from full pool) and 11.2 maf (46% of full capacity), respectively. The reservoir is declining and will continue to decline until spring runoff begins to enter the reservoir. The current snowpack above Lake Powell is 92% of average.

Current Operations

The operating tier for water year 2016, established in August 2015, is the Upper Elevation Balancing Tier, with an initial water year release volume of 8.23 maf and the potential for an April 2016 adjustment to equalization or balancing releases. Based on the current forecast, an April adjustment to balancing releases is projected to occur and Lake Powell is currently projected to release 9.0 maf in water year 2016. This projection will be updated each month throughout the water year.

In March 2016, the release volume will be approximately 693 thousand acre-feet (kaf), with fluctuations anticipated between approximately 8,000 cfs and 14,000 cfs and consistent with the Glen Canyon Operating Criteria (Federal Register, Volume 62, No. 41, March 3, 1997). The anticipated release volume for April is approximately 665 kaf with daily fluctuations between approximately 8,000 cfs and 14,000 cfs. The expected release for May is 700 kaf with daily fluctuations between approximately 8,000 cfs and 14,000 cfs.

In addition to daily scheduled fluctuations for power generation, the instantaneous releases from Glen Canyon Dam may also fluctuate to provide 40 MW of system regulation. These instantaneous release adjustments stabilize the electrical generation and transmission system and translate to a range of up to about 1,200 cfs above or below the hourly scheduled release rate. Under system normal conditions, fluctuations for regulation are typically short lived and generally balance out over the hour with minimal or no noticeable impacts on downstream river flow conditions.

Releases from Glen Canyon Dam can also fluctuate beyond scheduled releases when called upon to respond to unscheduled power outages or power system emergencies. Depending on the severity of the system emergency, the response from Glen Canyon Dam can be significant, within the full range of the operating capacity of the power plant for as long as is necessary to maintain balance in the transmission system. Glen Canyon Dam currently maintains 27 MW (approximately 800 cfs) of generation capacity in reserve in order to respond to a system emergency even when generation rates are already high. System emergencies occur fairly infrequently and typically require small responses from Glen Canyon Dam. However, these responses can have a noticeable impact on the river downstream of Glen Canyon Dam.

Inflow Forecasts and Model Projections

The April to July 2016 water supply forecast for unregulated inflow to Lake Powell, issued on March 2, 2016, by the Colorado Basin River Forecast Center, projects that the most probable (median) unregulated inflow volume will be 5.7 maf (80% of average based on the period 1981-2010). The projected water year 2016 inflow is 9.0 maf (83%). The forecast decreased by 1.0 maf since last month due to February hydrology being abnormally dry. At this early point in the season, there is still significant uncertainty regarding this year's water supply. The April-July forecast ranges from a minimum probable of 3.8 maf (53%) to a maximum probable of 8.0 maf (112%). There is a 10% chance that inflows could be higher than the current maximum probable forecast and a 10% chance that inflows could be lower than the minimum probable forecast.
Based on the current forecast, the March 24-Month Study projects Lake Powell elevation will end water year 2016 near 3,607 feet with approximately 12.0 maf in storage (51% capacity). Note that projections of elevation and storage for water year 2016 have significant uncertainty at this point in the season. Projections of elevation and storage using the minimum and maximum probable inflow forecast, updated in January, are 3,587 feet (10.5 maf, 43% capacity) and 3,642 feet (16.3 maf, 67% capacity), respectively. Under these scenarios, there is a 10 percent chance that inflows will be higher, resulting in higher elevation and storage, and 10 percent chance that inflows will be lower, potentially in lower elevation and storage. The annual release volume from Lake Powell during water year 2016 is projected to be 9.0 maf under the minimum, most, and maximum probable inflow scenarios. There is a chance that inflows could be higher or lower, potentially resulting in releases greater than 9.0 maf or as low as 8.23 maf in water year 2016. The minimum and maximum probable scenarios will be updated again in April.

Upper Colorado River Basin Hydrology

The Upper Colorado River Basin regularly experiences significant year to year hydrologic variability. During the 16-year period 2000 to 2015, however, the unregulated inflow to Lake Powell, which is a good measure of hydrologic conditions in the Colorado River Basin, was above average in only 3 out of the past 16 years. The period 2000-2015 is the lowest 16-year period since the closure of Glen Canyon Dam in 1963, with an average unregulated inflow of 8.51 maf, or 79% of the 30-year average (1981-2010). (For comparison, the 1981-2010 total water year average is 10.83 maf.) The unregulated inflow during the 2000-2015 period has ranged from a low of 2.64 maf (24% of average) in water year 2002 to a high of 15.97 maf (147% of average) in water year 2011. The water year 2015 unregulated inflow volume to Lake Powell was 10.17 maf (94% of average), which, though still below average, was significantly higher than inflows observed in 2012 and 2013 (45% and 47% of average, respectively). Under the current most probable forecast, the total water year 2016 unregulated inflow to Lake Powell is projected to be 9.02 maf (92% of average).

At the beginning of water year 2016, total system storage in the Colorado River Basin was 30.0 maf (50% of 59.6 maf total system capacity). This is nearly the same as the

total storage at the beginning of water years 2014 and 2015 which began at 29.9 maf and 30.0 maf, respectively, both of which were 50% of capacity. Since the beginning of water year 2000, total Colorado Basin storage has experienced year to year increases and decreases in response to wet and dry hydrology, ranging from a high of 94% of capacity at the beginning of 2000 to a low of 50% of capacity at the beginning of water year 2005. One wet year can significantly increase total system reservoir storage, just as persistent dry years can draw down the system storage. Based on current inflow forecasts, the current projected end of water year total Colorado Basin reservoir storage for water year 2016 is approximately 29.4 maf (49% of total system capacity). The actual end of water year 2016 system storage may vary from this projection, primarily due to uncertainty regarding the season's snowpack and resulting runoff and reservoir inflow. Based on the January minimum and maximum probable inflow forecasts and modeling, the range of end of water year 2016 total system capacity is approximately 27.4 maf (46%) to 34.1 maf (57%), respectively. The minimum and maximum probable scenarios will be updated again in April.

April 24-Month Study
Date: April 14, 2016

From: Water Resources Group, Salt Lake City
To: All Colorado River Annual Operating Plan (AOP) Recipients

Current Reservoir Status

Reservoir	March Inflow (unregulated) (acre-feet)	Percent of Average (%)	April 13, Midnight Elevation (feet)	Reservoir Storage (acre-feet)
Fontenelle	50,000	97	6476.22	147,000
Flaming Gorge	84,000	78	6025.55	3,180,000
Blue Mesa	41,000	117	7487.86	565,000
Navajo	50,000	29	6068.70	1,463,000
Powell	553,000	83	3591.20	10,930,000

Expected Operations

The operation of Lake Powell and Lake Mead in this April 2016 24-Month Study is pursuant to the December 2007 Record of Decision on Colorado River Interim Guidelines for Lower Basin Shortages and the Coordinated Operations of Lake Powell and Lake Mead (Interim Guidelines) and reflects the 2016 Annual Operating Plan (AOP). Pursuant to the Interim Guidelines, the August 2015 24-Month Study projections of the January 1, 2016, system storage and reservoir water surface elevations set the operational tier for the coordinated operation of Lake Powell and Lake Mead during 2016.

Consistent with Section 6.B of the Interim Guidelines, the Lake Powell operational tier for water year 2016 is the Upper Elevation Balancing Tier. The April 2016 24-Month Study projects the end of water year elevation at Lake Powell to be above 3,575 feet above sea level (ft) and the end of water year elevation at Lake Mead to be below elevation 1,075.0 ft. Therefore, in accordance with Section 6.B.4 of the Interim Guidelines, Lake Powell operations will shift to "balancing releases" for the remainder of water year 2016. Under Section 6.B.4, the contents of Lake Powell and Lake Mead will be balanced by the end of the water year, but not more than 9.0 million acre-feet (maf) and not less than 8.23 maf shall be released from Lake Powell. Based on the most probable inflow forecast, this April 24-Month Study projects a balancing release of 9.0 maf in water year 2016; the actual release in water year 2016, however, will depend on hydrology in the remainder of water year and will range from 8.23 to 9.0 maf. The projected release from Lake Powell in water year 2016 will be updated each month throughout the remainder of the water year.

Consistent with Section 2.B.5 of the Interim Guidelines, the Intentionally Created Surplus (ICS) Surplus Condition is the criterion governing the operation of Lake Mead for calendar year 2016.

The Interim Guidelines are available for download at:
http://www.usbr.gov/lc/region/programs/strategies/RecordofDecision.pdf.
The 2016 AOP is available for download at:
http://www.usbr.gov/lc/region/g4000/aop/AOP16.pdf.

Fontenelle Reservoir – Fontenelle Reservoir is currently at elevation 6475 ft, which amounts to 42 percent of live storage capacity. Inflows for the month of March totaled 50,000 acre-feet (af), or 95 percent of average. Recent daily inflow averages are increasing with the beginning of spring runoff and rain events with a seven-day average of 1,330 cubic feet per second (cfs).

The Colorado Basin River Forecast Center has forecasted spring inflows that are below average. April, May and June forecasted inflow volumes amount to 70,000 af (82 percent of average), 110,000 af (67 percent of average), and 250,000 af (84 percent of average), respectively. It is anticipated that releases will be maintained at a baseflow of 950 cfs until May 2016.

The next Fontenelle Working Group meeting is scheduled for 10:00 a.m., April 20, 2016. The meeting will be held at the Seedskadee Wildlife Refuge in Green River, Wyoming. The Fontenelle Working Group is an open public forum for information exchange between Reclamation and other parties associated with the operation of Fontenelle Reservoir.

Flaming Gorge Reservoir –Flaming Gorge Dam is currently releasing steady minimum releases of 800 cfs. The April unregulated inflow forecast into Flaming Gorge for the April-July period has improved and is currently at 76 percent of average. This falls under the moderately dry hydrologic condition of the Record of Decision.

It is anticipated that releases will remain at 800 cfs until the beginning of spring runoff sometime in May or June. Base flow releases are subject to observed hydrology and all projections may change.

Unregulated inflow into Flaming Gorge Reservoir during the month of March was 84,000 af, or 83 percent of average. The reservoir elevation is 6,025.5 ft and increasing.

Inflows for the next three months are projected to be below average: with April, May and June forecasted inflow volumes at 110,000 af (82 percent of average), 175,000 af (71 percent of average), and 300,000 af (77 percent of average), respectively.

The Flaming Gorge Working Group is an open public forum for information exchange between Reclamation and the stakeholders of Flaming Gorge Dam. The public is encouraged to attend and comment on the operations and plans presented by Reclamation

at these meetings. Meeting notes from past Working Group meetings are posted on the Working Group webpage. For more information on this group and these meetings please contact Dale Hamilton at 801-379-1186 or Heather Patno at 801-524-3883.

Reclamation will be holding the Flaming Gorge Working Group meeting on Tuesday, April 19, 2016, at 11:00 a.m. at the Utah Division of Wildlife Resources offices located at 318 North Vernal Avenue, Vernal, Utah.

Aspinall Unit Reservoirs – Crystal Dam is currently releasing 1600 cfs with 1,100 cfs being diverted through the Gunnison Tunnel and 500 cfs flowing through the Black Canyon. The April forecast for the April-July period for Blue Mesa was reduced from March to 515 kaf (76 percent of average). Under the Aspinall Record of Decision, if this forecast volume is forecasted in May, the spring operational targets would fall into the moderately dry hydrologic classification. In terms of the Black Canyon water right, the peak flow target in the Black Canyon would be 3,197 cfs.

Crystal Dam operations are anticipated to maintain Black Canyon flows of 500 cfs until May when runoff conditions are expected to peak. At that time, spring peak operations will occur to provide a peak flow in the Gunnison River to attempt to meet the spring operational targets of the Aspinall ROD and also to meet the Black Canyon water right. Unregulated inflow into Blue Mesa during the month of March were 41,000 af (117 percent of average) and the reservoir elevation is 7487.9 ft and is increasing.

Inflows to Blue Mesa for the next three months are projected to be below average: with April, May and June forecasted inflow volumes of 55,000 af (71 percent of average), 161,000 af (73 percent of average) and 215,000 af (82 percent of average), respectively.

The Aspinall Unit Working Group is an open public forum for information exchange between Reclamation and the stakeholders of the Aspinall Unit. The public is encouraged to attend and comments on the operations and plans presented by Reclamation at these meetings. Meeting notes from past working Group meetings are posted on the Working Group webpage. For more information on this group and these meetings please contact Erik Knight in the Grand Junction Area Office at (970) 248-0629.

The next meeting of the Aspinall Unit Working Group will be held on Thursday April 28th in the Grand Junction, Colorado at the Western Colorado Area Office (445 West Gunnison Avenue - Suite 221).

Navajo Reservoir – Navajo is currently releasing 350 cfs. Releases are made for the authorized purposes of the Navajo Unit, and to attempt to maintain a target base flow through the endangered fish critical habitat reach of the San Juan River (Farmington to Lake Powell). The San Juan River Basin Recovery Implementation Program (SJRIP) recommends a target base flow of between 500 cfs and 1,000 cfs through the critical habitat area. The target base flow is calculated as the weekly average of gaged flows throughout the critical habitat area.

Modified unregulated inflow into Navajo during the month of March was 83,316 af, which was 90 percent of average. The reservoir elevation is 6,067.4 ft and increasing. Inflows for the next three months are projected to be below average: with April, May and June forecasted inflow volumes at 120,000 af (70 percent of average), 220,000 af (79 percent of average), 160,000 af (72 percent of average), respectively. The most probable April through July forecast is for 530,000 af (72 percent of average). Under this forecast, a spring peak release of 5,000 cfs for 33 days is expected beginning in early-to-mid May. Until the spring peak release begins, Navajo is expected to release 350 cfs.

Reclamation conducts Public Operations Meetings three times per year to gather input for determining upcoming operations for Navajo Reservoir. Input from individuals, organizations, and agencies along with other factors such as weather, water rights, endangered species requirements, flood control, hydro power, recreation, fish and wildlife management, and reservoir levels, will be considered in the development of these reservoir operation plans. In addition, the meetings are used to coordinate activities and exchange information among agencies, water users, and other interested parties concerning the San Juan River and Navajo Reservoir.

The next Navajo Public Operations Meeting is scheduled for April 26th at 1pm at the Farmington Civic Center, Farmington, NM.

Glen Canyon Dam / Lake Powell

Current Status

The unregulated inflow volume to Lake Powell in March was 553 thousand acre-feet (kaf) (83 percent of average). The release volume from Glen Canyon Dam in March was 694 kaf. The end of March elevation and storage of Lake Powell were 3,592 ft (108 feet from full pool) and 11.02 maf (45% of full capacity), respectively. The reservoir elevation is near the anticipated seasonal low and will soon begin increasing as spring runoff enters the reservoir.

Current Operations

The operating tier for water year 2016 was established in August 2015 as the Upper Elevation Balancing Tier. In the Upper Elevation Balancing Tier the initial water year release volume is 8.23 maf; however, there is the possibility for an April adjustment to equalization or balancing operations to govern for the remainder of the water year. This April 2016 24-Month Study establishes that Lake Powell operations will shift to "balancing releases" for the remainder of water year 2016. Under Balancing, the contents of Lake Powell and Lake Mead will be balanced by the end of the water year, but not more than 9.0 maf and not less than 8.23 maf shall be released from Lake Powell. Based on the most probable inflow forecast, this April 24-Month Study projects a balancing release of 9.0 maf in water year 2016; the actual release in water year 2016, however, will depend on hydrology in the remainder of water year and will range from 8.23 to 9.0 maf. The projected release from Lake Powell in water year 2016 will be updated each month throughout the remainder of the water year. Reclamation will

schedule operations at Glen Canyon Dam to achieve as practicably as possible the appropriate total annual release volume by September 30, 2015.

In April, the release volume will be approximately 664 kaf, with fluctuations anticipated between about 8,000 cfs in the nighttime to about 14,000 cfs in the daytime and consistent with the Glen Canyon Operating Criteria (Federal Register, Volume 62, No. 41, March 3, 1997). The anticipated release volume for May is 700 kaf with daily fluctuations between approximately 8,000 cfs and 14,000 cfs. The expected release for June is 800 kaf with daily fluctuations between approximately 9,000 cfs and 17,000 cfs.

In addition to daily scheduled fluctuations for power generation, the instantaneous releases from Glen Canyon Dam may also fluctuate to provide 40 megawatts (mw) of system regulation. These instantaneous release adjustments stabilize the electrical generation and transmission system and translate to a range of about 1,200 cfs above or below the hourly scheduled release rate. Under system normal conditions, fluctuations for regulation are typically short lived and generally balance out over the hour with minimal or no noticeable impacts on downstream river flow conditions.

Releases from Glen Canyon Dam can also fluctuate beyond scheduled releases when called upon to respond to unscheduled power outages or power system emergencies. Depending on the severity of the system emergency, the response from Glen Canyon Dam can be significant, within the full range of the operating capacity of the power plant for as long as is necessary to maintain balance in the transmission system. Glen Canyon Dam typically maintains 27 mw (approximately 800 cfs) of generation capacity in reserve in order to respond to a system emergency even when generation rates are already high. System emergencies occur fairly infrequently and typically require small responses from Glen Canyon Dam. However, these responses can have a noticeable impact on the river downstream of Glen Canyon Dam.

Inflow Forecasts and Model Projections

The April to July 2016 water supply forecast for unregulated inflow to Lake Powell, issued on April 4, 2016, by the Colorado Basin River Forecast Center, projects that the most probable (median) unregulated inflow volume will be 5.3 maf (74 percent of average based on the period 1981-2010). The forecast decreased by 400 kaf since last month. At this point in the season, there is still uncertainty regarding this year's water supply and the total inflow to Lake Powell. The spring runoff forecast ranges from a minimum probable of 3.85 maf (54 percent of average) to a maximum probable of 7.65 maf (107 percent of average). There is 10% chance that inflows could be higher than the maximum probable and a 10% chance they could be lower than the minimum probable.

As determined in the August 2015 24-Month Study, and documented in the 2016 Annual Operating Plan, Lake Powell's operations in water year 2016 will be governed by the Upper Elevation Balancing Tier. In this tier, the initial water year release volume is 8.23 maf, however, there is the potential for an April adjustment to equalization or balancing releases in April 2016. This April 2016 24-Month Study projects the end of water year elevation at Lake Powell to be above 3,575 ft and the end of water year elevation at Lake

Mead to be below elevation 1,075.0 ft. Therefore, in accordance with Section 6.B.4 of the 2007 Interim Guidelines, Lake Powell operations will shift to "balancing releases" for the remainder of water year 2016. Under Section 6.B.4, the contents of Lake Powell and Lake Mead will be balanced by the end of the water year, but not more than 9.0 maf and not less than 8.23 maf shall be released from Lake Powell.

Based on the April most probable inflow forecast, the annual release volume from Lake Powell during water year 2016 is projected to be 9.0 maf. Under the minimum probable inflow scenario, the water year release is projected to be 9.0 maf. Under the maximum probable inflow scenario, the release is projected to be 9.0 maf. There 10% chance that inflows will be lower than the current minimum probable forecast, potentially resulting in lower releases. If inflows are less than the minimum probable forecast, the water year 2016 annual release could be as low as 8.23 maf. If inflows are greater than the current forecasted maximum probable inflow, the annual release will be 9.0 maf. The projected release from Lake Powell in water year 2016 will be updated each month throughout the remainder of the water year.

Based on the current forecast, the April 24-Month Study projects Lake Powell elevation will end water year 2016 near 3,600 ft with approximately 11.75 maf in storage (48% capacity). Projections of elevation and storage still have significant uncertainty at this point in the season, primarily due to uncertainty regarding spring runoff and the resulting inflow to Lake Powell. Under the minimum probable inflow scenario, updated in April, the projected end of water year elevation and storage are 3585 ft and 10.35 maf (43% capacity), respectively. Under the maximum probable inflow scenario, updated in April, the projected end of water year elevation and storage are 3622 ft and 14.01 maf (58% capacity), respectively. Modeling of projected reservoir operations based on the minimum and maximum scenarios will be updated again in August.

Upper Colorado River Basin Hydrology

The Upper Colorado River Basin regularly experiences significant year to year hydrologic variability. During the 16-year period 2000 to 2015, however, the unregulated inflow to Lake Powell, which is a good measure of hydrologic conditions in the Colorado River Basin, was above average in only 3 out of the past 16 years. The period 2000-2015 is the lowest 16-year period since the closure of Glen Canyon Dam in 1963, with an average unregulated inflow of 8.39 maf, or 78% of the 30-year average (1981-2010). (For comparison, the 1981-2010 total water year average is 10.83 maf.) The unregulated inflow during the 2000-2015 period has ranged from a low of 2.64 maf (24 percent of average) in water year 2002 to a high of 15.97 maf (147 percent of average) in water year 2011. The water year 2015 unregulated inflow volume to Lake Powell was 10.174 maf (94 percent of average), which, though still below average, was significantly higher than inflows observed in 2012 and 2013 (45% and 47 percent of average, respectively). Under the current most probable forecast, total water year 2016 unregulated inflows to Lake Powell is projected to be 8.44 maf (78 percent of average), and ranges from a minimum probable inflow of 6.86 maf (63%) and maximum probable inflow of 11.13 maf (103%).

At the beginning of water year 2016, total system storage in the Colorado River Basin was 30.3 maf (51% of 59.6 maf total system capacity). This is nearly the same as the total storage at the beginning of water year 2015 which began at 30.1 maf (50% of capacity). Since the beginning of water year 2000, total Colorado Basin storage has experienced year to year increases and decreases in response to wet and dry hydrology, ranging from a high of 94% of capacity at the beginning of 2000 to a low of 50% of capacity at the beginning of water year 2014. One wet year can significantly increase total system reservoir storage, just as persistent dry years can draw down the system storage. Based on current inflow forecasts, the current projected end of water year 2016 total Colorado Basin reservoir storage is approximately 29.0 maf (49% of capacity). The actual end of water year storage may vary from this projection, primarily due to uncertainty regarding this season's runoff and resulting reservoir inflow. Based on the April minimum and maximum probable inflow forecasts and modeling the range is approximately 27.6 maf (46%) to 31.4 maf (53%), respectively.

May 24-Month Study
Date: May 13, 2016

From: Water Resources Group, Salt Lake City
To: All Colorado River Annual Operating Plan (AOP) Recipients

Current Reservoir Status

Reservoir	April Inflow (unregulated) (acre-feet)	Percent of Average (%)	May 10, Midnight Elevation (feet)	Reservoir Storage (acre-feet)
Fontenelle	91,000	107	6485.91	201,000
Flaming Gorge	140,000	105	6028.07	3,275,000
Blue Mesa	75,000	97	7489.91	581,000
Navajo	120,000	70	6072.36	1,514,000
Powell	814,000	77	3593.12	11,105000

Expected Operations

The operation of Lake Powell and Lake Mead in this May 2016 24-Month Study is pursuant to the December 2007 Record of Decision on Colorado River Interim Guidelines for Lower Basin Shortages and the Coordinated Operations of Lake Powell and Lake Mead (Interim Guidelines) and reflects the 2016 Annual Operating Plan (AOP). Pursuant to the Interim Guidelines, the August 2015 24-Month Study projections of the January 1, 2016, system storage and reservoir water surface elevations set the operational tier for the coordinated operation of Lake Powell and Lake Mead during 2016.

Consistent with Section 6.B of the Interim Guidelines, the Lake Powell operational tier for water year 2016 is the Upper Elevation Balancing Tier. The April 2016 24-Month Study projected the end of water year elevation at Lake Powell to be above 3,575 feet and the end of water year elevation at Lake Mead to be below elevation 1,075.0 feet. Therefore, in accordance with Section 6.B.4 of the Interim Guidelines, Lake Powell operations shifted to "balancing releases" for the remainder of water year 2016. Under Section 6.B.4, the contents of Lake Powell and Lake Mead will be balanced by the end of the water year, but not more than 9.0 million acre-feet (maf) and not less than 8.23 maf shall be released from Lake Powell. Based on the most probable inflow forecast, this May 24-Month Study projects a balancing release of 9.0 maf in water year 2016; the actual release in water year 2016, however, will depend on hydrology in the remainder of the water year and will range from 8.23 to 9.0 maf. The projected release from Lake Powell in water year 2016 will be updated each month throughout the remainder of the water year.

Consistent with Section 2.B.5 of the Interim Guidelines, the Intentionally Created Surplus (ICS) Surplus Condition is the criterion governing the operation of Lake Mead for calendar year 2016.

The Interim Guidelines are available for download at:
http://www.usbr.gov/lc/region/programs/strategies/RecordofDecision.pdf.
The 2016 AOP is available for download at:
http://www.usbr.gov/lc/region/g4000/aop/AOP16.pdf.

Fontenelle Reservoir – Fontenelle Reservoir is currently at elevation 6483 ft, which amounts to 57 percent of live storage capacity. Inflows for the month of April totaled 91,000 acre-feet (af), or 107 percent of average. Significant storm activity in the Upper Green River has increased the forecast and this will be seen in the June 24-Month Study.

The Colorado Basin River Forecast Center has forecasted spring inflows that are below average. May, June and July forecasted inflow volumes amount to 110,000 af (67 percent of average), 215,000 af (72 percent of average), and 114,000 af (64 percent of average), respectively.

The next Fontenelle Working Group meeting is scheduled for 10:00 a.m., August 23, 2016. The meeting will be held at the Joint Powers Water Board offices in Green River, Wyoming. The Fontenelle Working Group is an open public forum for information exchange between Reclamation and other parties associated with the operation of Fontenelle Reservoir.

Flaming Gorge Reservoir – Flaming Gorge Dam is currently releasing steady minimum releases of 800 cubic feet per second (cfs). The May unregulated inflow forecast into Flaming Gorge for the April-July period has improved and is currently at 79 percent of average. This is on the cusp between the moderately dry and average hydrologic conditions of the Record of Decision and the average (below median) hydrologic condition on the Larval Trigger Study Plan. Reclamation will operate Flaming Gorge under the average (below median) hydrologic classification.

It is anticipated that releases will remain at 800 cfs until the beginning of spring runoff sometime in late May or June. Base flow releases are subject to observed hydrology and all projections may change.

Unregulated inflow into Flaming Gorge Reservoir during the month of April was 140,000 af, or 105 percent of average. The reservoir elevation is 6,027.31 ft and increasing.

The May final forecast for inflows for the next three months projects below average: with May, June and July forecasted inflow volumes at 175,000 af (71 percent of average), 300,000 af (77 percent of average), and 155,000 af (74 percent of average), respectively. However, significant storm activity in the Upper Green River has increased the forecast and this will be seen in the June 24-Month Study.

The Flaming Gorge Working Group is an open public forum for information exchange between Reclamation and the stakeholders of Flaming Gorge Dam. The public is encouraged to attend and comment on the operations and plans presented by Reclamation at these meetings. Meeting notes from past Working Group meetings are posted on the Working Group webpage. For more information on this group and these meetings please contact Dale Hamilton at 801-379-1186 or Heather Patno at 801-524-3883.

Reclamation will be holding the Flaming Gorge Working Group meeting on Tuesday, August 25, 2016, at 11:00 a.m. at the Utah Division of Wildlife Resources offices located at 318 North Vernal Avenue, Vernal, Utah.

Aspinall Unit Reservoirs – Crystal Dam is currently releasing 1500 cfs with 850 cfs being diverted through the Gunnison Tunnel and approximately 850 cfs flowing through the Black Canyon. The May forecast for the April-July period for Blue Mesa was increased from April to 525,000 af (78 percent of average). Under the Aspinall Record of Decision (ROD) the operational targets for the spring peak are in the average dry hydrologic classification which calls for a 10 day duration peak of 8,070 cfs at the Whitewater reach of the Gunnison River. In terms of the Black Canyon water right, the peak flow target in the Black Canyon, based on the May forecast, will be 3,349 cfs.

Crystal Dam operations will begin ramping up releases on May 11, 2016 to a maximum release of 4,100 cfs by May 15, 2016. On that day, Morrow Point releases will also be increased to fill the remaining space in Crystal Reservoir. By late afternoon on May 15, 2016, depending on side inflow conditions at Crystal Reservoir, spillway releases are anticipated to begin. These spillway releases will be controlled by releases from Morrow Point Dam to control peak releases in the Gunnison River to attempt achieve the ROD operational targets at Whitewater. These operations will exceed the Black Canyon water right peak flow target.

Inflows to Blue Mesa for the next three months are projected to be below average: with May, June and July forecasted inflow volumes of 155,000 af (74 percent of average), 210,000 af (80 percent of average) and 155,000 af (132 percent of average), respectively.

The Aspinall Unit Working Group is an open public forum for information exchange between Reclamation and the stakeholders of the Aspinall Unit. The public is encouraged to attend and comments on the operations and plans presented by Reclamation at these meetings. Meeting notes from past working Group meetings are posted on the Working Group webpage. For more information on this group and these meetings please contact Erik Knight in the Grand Junction Area Office at (970) 248-0629.

The next meeting of the Aspinall Unit Working Group will be held on Thursday August 18th at 1:00 pm at the Elk Creek Visitor Center at Blue Mesa Reservoir.

Navajo Reservoir – Navajo is currently releasing 350 cfs. Releases are made for the authorized purposes of the Navajo Unit, and to attempt to maintain a target base flow

through the endangered fish critical habitat reach of the San Juan River (Farmington to Lake Powell). The San Juan River Basin Recovery Implementation Program (SJRIP) recommends a target base flow of between 500 cfs and 1,000 cfs through the critical habitat area. The target base flow is calculated as the weekly average of gaged flows throughout the critical habitat area.

Modified unregulated inflow into Navajo during the month of April was 120,175 af, which was 71% of average. The reservoir elevation is 6070.8 ft and increasing.

Inflows for the next three months are projected to be below average: with May, June and July forecasted inflow volumes at 195,000 af (70% of average), 170,000 af (76% of average), and 35,000 af (53% of average), respectively. The most probable April through July forecast is for 515,000 af (71% of average). Under this forecast, a spring peak release of 5,000 cfs for 31 days is expected this year. The spring peak release will begin in mid-to-late May. Until the spring peak release begins, Navajo is expected to release 350 cfs.

Reclamation conducts Public Operations Meetings three times per year to gather input for determining upcoming operations for Navajo Reservoir. Input from individuals, organizations, and agencies along with other factors such as weather, water rights, endangered species requirements, flood control, hydro power, recreation, fish and wildlife management, and reservoir levels, will be considered in the development of these reservoir operation plans. In addition, the meetings are used to coordinate activities and exchange information among agencies, water users, and other interested parties concerning the San Juan River and Navajo Reservoir.

The next Navajo Public Operations Meeting is scheduled for August 23rd at 1pm at the Farmington Civic Center, Farmington, NM.

Glen Canyon Dam / Lake Powell

Current Status

The unregulated inflow volume to Lake Powell in April was 814 thousand acre-feet (kaf) (77 percent of average). The release volume from Glen Canyon Dam in April was 665 kaf. The end of April elevation and storage of Lake Powell were 3,592 ft (108 feet from full pool) and 11.01 maf (45% of full capacity), respectively. The reservoir reached a seasonal low elevation on April 15th near elevation 3591.14 feet. Since that time the reservoir has been increasing as the first of the spring runoff is now entering the reservoir.

Current Operations

The operating tier for water year 2016 was established in August 2015 as the Upper Elevation Balancing Tier. The April 2016 24-Month Study established that Lake Powell operations will be governed by balancing for the remainder of water year 2016. Under balancing, the contents of Lake Powell and Lake Mead will be balanced by the end of the water year, but not more than 9.0 maf and not less than 8.23 maf shall be released from

Lake Powell. Based on the most probable inflow forecast, this May 24-Month Study projects a balancing release of 9.0 maf in water year 2016; the actual release in water year 2016, however, will depend on hydrology in the remainder of water year and will range from 8.23 to 9.0 maf. The projected release from Lake Powell in water year 2016 will be updated each month throughout the remainder of the water year. Reclamation will schedule operations at Glen Canyon Dam to achieve as practicably as possible the appropriate total annual release volume by September 30, 2016.

In May, the release volume will be approximately 700 kaf, with fluctuations anticipated between about 8,000 cfs in the nighttime to about 14,000 cfs in the daytime and consistent with the Glen Canyon Operating Criteria (Federal Register, Volume 62, No. 41, March 3, 1997). The anticipated release volume for June is 800 kaf with daily fluctuations between approximately 9,000 cfs and 17,000 cfs. The expected release for July is 950 kaf with daily fluctuations between approximately 11,500 cfs and 19,500 cfs.

In addition to daily scheduled fluctuations for power generation, the instantaneous releases from Glen Canyon Dam may also fluctuate to provide 40 megawatts (mw) of system regulation. These instantaneous release adjustments stabilize the electrical generation and transmission system and translate to a range of about 1,200 cfs above or below the hourly scheduled release rate. Under normal system conditions, fluctuations for regulation are typically short lived and generally balance out over the hour with minimal or no noticeable impacts on downstream river flow conditions.

Releases from Glen Canyon Dam can also fluctuate beyond scheduled releases when called upon to respond to unscheduled power outages or power system emergencies. Depending on the severity of the system emergency, the response from Glen Canyon Dam can be significant, within the full range of the operating capacity of the power plant for as long as is necessary to maintain balance in the transmission system. Glen Canyon Dam typically maintains 30 mw (approximately 880 cfs) of generation capacity in reserve in order to respond to a system emergency even when generation rates are already high. System emergencies occur fairly infrequently and typically require small responses from Glen Canyon Dam. However, these responses can have a noticeable impact on the river downstream of Glen Canyon Dam.

Inflow Forecasts and Model Projections

The April to July 2016 water supply forecast for unregulated inflow to Lake Powell, issued on May 3, 2016, by the Colorado Basin River Forecast Center, projects that the most probable (median) unregulated inflow volume will be 5.5 maf (77 percent of average based on the period 1981-2010). The forecast increased 200 kaf from what was forecasted in April. At this point in the season, there is still uncertainty regarding this year's water supply and the total inflow to Lake Powell. The spring runoff forecast ranges from a minimum probable of 3.85 maf (54 percent of average) to a maximum probable of 7.65 maf (107 percent of average). There is 10% chance that inflows could be higher than the maximum probable and a 10% chance they could be lower than the minimum probable.

As determined in the August 2015 24-Month Study, and documented in the 2016 Annual Operating Plan, Lake Powell's operations in water year 2016 will be governed by the Upper Elevation Balancing Tier. Because the April 2016 24-Month Study projected the end of water year elevation at Lake Powell to be above 3,575 feet and the end of water year elevation at Lake Mead to be below elevation 1,075.0 feet, Lake Powell operations shifted to balancing (Section 6.B.4 of the 2007 Interim Guidelines) for the remainder of water year 2016. Under balancing, the contents of Lake Powell and Lake Mead will be balanced by the end of the water year, but no more than 9.0 maf and no less than 8.23 maf shall be released from Lake Powell.

Based on the May most probable inflow forecast, the annual release volume from Lake Powell during water year 2016 is projected to be 9.0 maf. Under the minimum probable inflow scenario, the water year release is projected to be 9.0 maf. Under the maximum probable inflow scenario, the release is projected to be 9.0 maf. There is 10% chance that inflows will be lower than the current minimum probable forecast, potentially resulting in lower releases. If inflows are less than the minimum probable forecast, the water year 2016 annual release could be as low as 8.23 maf. If inflows are greater than the current forecasted maximum probable inflow, the annual release will be 9.0 maf. The projected release from Lake Powell in water year 2016 will be updated each month throughout the remainder of the water year.

Based on the current forecast, the May 24-Month Study projects Lake Powell elevation will end water year 2016 near 3,603 ft with approximately 12.06 maf in storage (50% capacity). Projections of elevation and storage still have significant uncertainty at this point in the season, primarily due to uncertainty regarding spring runoff and the resulting inflow to Lake Powell. Under the minimum probable inflow scenario, updated in April, the projected end of water year elevation and storage are 3585 ft and 10.35 maf (43% capacity), respectively. Under the maximum probable inflow scenario, updated in April, the projected end of water year elevation and storage are 3622 ft and 14.01 maf (58% capacity), respectively. Modeling of projected reservoir operations based on the minimum and maximum scenarios will be updated again in August.

Upper Colorado River Basin Hydrology

The Upper Colorado River Basin regularly experiences significant year to year hydrologic variability. During the 16-year period 2000 to 2015, however, the unregulated inflow to Lake Powell, which is a good measure of hydrologic conditions in the Colorado River Basin, was above average in only 3 out of the past 16 years. The period 2000-2015 is the lowest 16-year period since the closure of Glen Canyon Dam in 1963, with an average unregulated inflow of 8.51 maf, or 79% of the 30-year average (1981-2010). (For comparison, the 1981-2010 total water year average is 10.83 maf.) The unregulated inflow during the 2000-2015 period has ranged from a low of 2.64 maf (24 percent of average) in water year 2002 to a high of 15.97 maf (147 percent of average) in water year 2011. The water year 2015 unregulated inflow volume to Lake Powell was 10.174 maf (94 percent of average), which, though still below average, was significantly higher than inflows observed in 2012 and 2013 (45% and 47 percent of average, respectively). Under the current most probable forecast, total water year 2016

unregulated inflows to Lake Powell is projected to be 8.71 maf (80 percent of average), and ranges from a minimum probable inflow of 6.86 maf (63%) and maximum probable inflow of 11.13 maf (103%).

At the beginning of water year 2016, total system storage in the Colorado River Basin was 30.3 maf (51% of 59.6 maf total system capacity). This is nearly the same as the total storage at the beginning of water year 2015 which began at 30.1 maf (50% of capacity). Since the beginning of water year 2000, total Colorado Basin storage has experienced year to year increases and decreases in response to wet and dry hydrology, ranging from a high of 94% of capacity at the beginning of 2000 to a low of 50% of capacity at the beginning of water year 2014. One wet year can significantly increase total system reservoir storage, just as persistent dry years can draw down the system storage. Based on current inflow forecasts, the current projected end of water year 2016 total Colorado Basin reservoir storage is approximately 29.3 maf (49% of capacity). The actual end of water year storage may vary from this projection, primarily due to uncertainty regarding this season's runoff and resulting reservoir inflow. Based on the April minimum and maximum probable inflow forecasts and modeling the range is approximately 27.6 maf (46%) to 31.4 maf (53%), respectively.

June 24-Month Study
Date: June 13, 2016

From: Water Resources Group, Salt Lake City
To: All Colorado River Annual Operating Plan (AOP) Recipients

Current Reservoir Status

Reservoir	May Inflow (unregulated) (acre-feet)	Percent of Average (%)	June 12, Midnight Elevation (feet)	Reservoir Storage (acre-feet)
Fontenelle	186,000	113	6502.61	318,000
Flaming Gorge	362,000	148	6031.75	3,417,000
Blue Mesa	161,000	73	7503.68	692,000
Navajo	209,000	75	6075.49	1,558,000
Powell	2,294,000	98	3610.83	12,814,000

Expected Operations

The operation of Lake Powell and Lake Mead in this June 2016 24-Month Study is pursuant to the December 2007 Record of Decision on Colorado River Interim Guidelines for Lower Basin Shortages and the Coordinated Operations of Lake Powell and Lake Mead (Interim Guidelines) and reflects the 2016 Annual Operating Plan (AOP). Pursuant to the Interim Guidelines, the August 2015 24-Month Study projections of the January 1, 2016, system storage and reservoir water surface elevations set the operational tier for the coordinated operation of Lake Powell and Lake Mead during 2016.

Consistent with Section 6.B of the Interim Guidelines, the Lake Powell operational tier for water year 2016 is the Upper Elevation Balancing Tier. The April 2016 24-Month Study projected the end of water year elevation at Lake Powell to be above 3,575 feet and the end of water year elevation at Lake Mead to be below elevation 1,075.0 feet. Therefore, in accordance with Section 6.B.4 of the Interim Guidelines, Lake Powell operations shifted to "balancing releases" for the remainder of water year 2016. Under Section 6.B.4, the contents of Lake Powell and Lake Mead will be balanced by the end of the water year, but not more than 9.0 million acre-feet (maf) and not less than 8.23 maf shall be released from Lake Powell. Based on the most probable inflow forecast, this June 24-Month Study projects a balancing release of 9.0 maf in water year 2016.

Consistent with Section 2.B.5 of the Interim Guidelines, the Intentionally Created Surplus (ICS) Surplus Condition is the criterion governing the operation of Lake Mead for calendar year 2016.

The Interim Guidelines are available for download at:
http://www.usbr.gov/lc/region/programs/strategies/RecordofDecision.pdf.
The 2016 AOP is available for download at:
http://www.usbr.gov/lc/region/g4000/aop/AOP16.pdf.

Fontenelle Reservoir – Fontenelle Reservoir is currently at elevation 6496 ft, which amounts to 79 percent of live storage capacity. Inflows for the month of May totaled 186,000 acre-feet (af), or 114 percent of average.

The Colorado Basin River Forecast Center has forecasted spring inflows that are below average. June, July and August forecasted inflow volumes amount to 280,000 af (94 percent of average), 93,000 af (52 percent of average), and 50,000 af (65 percent of average), respectively.

The next Fontenelle Working Group meeting is scheduled for 10:00 a.m., August 23, 2016. The meeting will be held at the Joint Powers Water Board offices in Green River, Wyoming. The Fontenelle Working Group is an open public forum for information exchange between Reclamation and other parties associated with the operation of Fontenelle Reservoir.

Flaming Gorge Reservoir – Flaming Gorge Dam is currently releasing 8,600 cubic feet per second (cfs). May precipitation was significantly above average and the June unregulated inflow forecast into Flaming Gorge for the April-July period has improved from 79 to 108 percent of average over a one month period.

The Record of Decision outlines spring operations based on the final May spring runoff forecast. The May forecast of 79 percent of average was on the cusp between the moderately dry and average hydrologic conditions of the Record of Decision and the average (below median) hydrologic condition on the Larval Trigger Study Plan. Reclamation will operate Flaming Gorge under the average (below median) hydrologic classification.

Unregulated inflow into Flaming Gorge Reservoir during the month of May was 362,000 af, or 149 percent of average. The reservoir elevation is 6,031.91 ft and decreasing.

The June final forecast for inflows for the next three months projects above and below average: with June, July and August forecasted inflow volumes at 418,000 af (107 percent of average), 140,000 af (67 percent of average), and 68,000 af (77 percent of average), respectively.

The Flaming Gorge Working Group is an open public forum for information exchange between Reclamation and the stakeholders of Flaming Gorge Dam. The public is encouraged to attend and comment on the operations and plans presented by Reclamation at these meetings. Meeting notes from past Working Group meetings are posted on the Working Group webpage. For more information on this group and these meetings please contact Dale Hamilton at 801-379-1186 or Heather Patno at 801-524-3883.

Reclamation will be holding the Flaming Gorge Working Group meeting on Tuesday, August 25, 2016, at 11:00 a.m. at the Utah Division of Wildlife Resources offices located at 318 North Vernal Avenue, Vernal, Utah.

Aspinall Unit Reservoirs – Crystal Dam is currently releasing 1500 cfs with 850 cfs being diverted through the Gunnison Tunnel and approximately 850 cfs flowing through the Black Canyon. The May forecast for the April-July period for Blue Mesa was increased from April to 525 kaf (78 percent of average). Under the Aspinall Record of Decision (ROD) the operational targets for the spring peak are in the average dry hydrologic classification which calls for a 10 day duration peak of 8,070 cfs at the Whitewater reach of the Gunnison River. In terms of the Black Canyon water right, the peak flow target in the Black Canyon, based on the May forecast, will be 3,349 cfs.

Crystal Dam operations will begin ramping up releases on May 11, 2016 to a maximum release of 4,100 cfs by May 15, 2016. On that day, Morrow Point releases will also be increased to fill the remaining space in Crystal Reservoir. By late afternoon on May 15, 2016, depending on side inflow conditions at Crystal Reservoir, spillway releases are anticipated to begin. These spillway releases will be controlled by releases from Morrow Point Dam to control peak releases in the Gunnison River to attempt achieve the ROD operational targets at Whitewater. These operations will exceed the Black Canyon water right peak flow target.

Inflows to Blue Mesa for the next three months are projected to be below average: with May, June and July forecasted inflow volumes of 155,000 af (74 percent of average), 210,000 af (80 percent of average) and 155,000 af (132 percent of average), respectively.

The Aspinall Unit Working Group is an open public forum for information exchange between Reclamation and the stakeholders of the Aspinall Unit. The public is encouraged to attend and comments on the operations and plans presented by Reclamation at these meetings. Meeting notes from past working Group meetings are posted on the Working Group webpage. For more information on this group and these meetings please contact Erik Knight in the Grand Junction Area Office at (970) 248-0629.

The next meeting of the Aspinall Unit Working Group will be held on Thursday August 18th at 1:00 pm at the Elk Creek Visitor Center at Blue Mesa Reservoir.

Navajo Reservoir – Navajo is currently releasing 4,000 cfs and is conducting a spring peak release. Releases are made for the authorized purposes of the Navajo Unit, and to attempt to maintain a target base flow through the endangered fish critical habitat reach of the San Juan River (Farmington to Lake Powell). The San Juan River Basin Recovery Implementation Program (SJRIP) recommends a target base flow of between 500 cfs and 1,000 cfs through the critical habitat area. The target base flow is calculated as the weekly average of gaged flows throughout the critical habitat area.

Modified unregulated inflow into Navajo during the month of May was 209 kaf, which was 75% of average. The reservoir elevation is 6075.3 ft and increasing.

Inflows for the next three months are projected to be below average: with June, July, and August forecasted inflow volumes at 186 kaf (83% of average), 31 kaf (47% of average), and 27 kaf (60% of average), respectively. The most probable April through July forecast is for 545 kaf (74% of average).

The spring peak release began May 18th. The release was reduced to 2000 cfs at the request of the San Juan County office of Emergency Management on May 25th due to safety and property concerns. Since that time, Reclamation has coordinated daily with the OEM to slowly increase releases with the goal of reaching 5,000 cfs. The ramp-down is scheduled to begin June 23rd, though the schedule may change if circumstances warrant.

Reclamation conducts Public Operations Meetings three times per year to gather input for determining upcoming operations for Navajo Reservoir. Input from individuals, organizations, and agencies along with other factors such as weather, water rights, endangered species requirements, flood control, hydro power, recreation, fish and wildlife management, and reservoir levels, will be considered in the development of these reservoir operation plans. In addition, the meetings are used to coordinate activities and exchange information among agencies, water users, and other interested parties concerning the San Juan River and Navajo Reservoir.

The next Navajo Public Operations Meeting is scheduled for August 23rd at 1pm at the Farmington Civic Center, Farmington, NM.

Glen Canyon Dam / Lake Powell

Current Status

The unregulated inflow volume to Lake Powell in May was 2,294 thousand acre-feet (kaf) (98 percent of average). The release volume from Glen Canyon Dam in May was 700 kaf. The end of May elevation and storage of Lake Powell were 3,604 ft (96 feet from full pool) and 12.1 maf (50% of full capacity), respectively. The reservoir reached a seasonal low elevation on April 15th near elevation 3591.14 feet. Since that time the reservoir elevation has been increasing and will continue to increase throughout mid-summer as runoff from snowmelt and precipitation enter the reservoir.

Current Operations

The operating tier for water year 2016 was established in August 2015 as the Upper Elevation Balancing Tier. The April 2016 24-Month Study established that Lake Powell operations will be governed by balancing for the remainder of water year 2016. Under balancing, the contents of Lake Powell and Lake Mead will be balanced by the end of the water year, but not more than 9.0 maf and not less than 8.23 maf shall be released from Lake Powell. Based on the most probable inflow forecast, this June 24-Month Study projects a balancing release of 9.0 maf in water year 2016; the actual release in water year 2016, however, will depend on hydrology in the remainder of water year and will

range from 8.23 to 9.0 maf. The projected release from Lake Powell in water year 2016 will be updated each month throughout the remainder of the water year. Reclamation will schedule operations at Glen Canyon Dam to achieve as practicably as possible the appropriate total annual release volume by September 30, 2016.

In June, the release volume will be approximately 800 kaf, with fluctuations anticipated between about 9,000 cfs in the nighttime to about 17,000 cfs in the daytime and consistent with the Glen Canyon Operating Criteria (Federal Register, Volume 62, No. 41, March 3, 1997). The anticipated release volume for July is 950 kaf with daily fluctuations between approximately 11,500 cfs and 19,500 cfs. The expected release for August is 900 kaf with daily fluctuations between approximately 10,000 cfs and 18,000 cfs.

In addition to daily scheduled fluctuations for power generation, the instantaneous releases from Glen Canyon Dam may also fluctuate to provide 40 megawatts (mw) of system regulation. These instantaneous release adjustments stabilize the electrical generation and transmission system and translate to a range of about 1,200 cfs above or below the hourly scheduled release rate. Under system normal conditions, fluctuations for regulation are typically short lived and generally balance out over the hour with minimal or no noticeable impacts on downstream river flow conditions.

Releases from Glen Canyon Dam can also fluctuate beyond scheduled releases when called upon to respond to unscheduled power outages or power system emergencies. Depending on the severity of the system emergency, the response from Glen Canyon Dam can be significant, within the full range of the operating capacity of the power plant for as long as is necessary to maintain balance in the transmission system. Glen Canyon Dam typically maintains 30 mw (approximately 880 cfs) of generation capacity in reserve in order to respond to a system emergency even when generation rates are already high. System emergencies occur fairly infrequently and typically require small responses from Glen Canyon Dam. However, these responses can have a noticeable impact on the river downstream of Glen Canyon Dam.

Inflow Forecasts and Model Projections

The April to July 2016 water supply forecast for unregulated inflow to Lake Powell, issued on June 3, 2016, by the Colorado Basin River Forecast Center, projects that the most probable (median) unregulated inflow volume will be 6.5 maf (91 percent of average based on the period 1981-2010). The forecast increased by 1,000 kaf since last month. There is still uncertainty regarding this year's water supply and the total inflow to Lake Powell. The spring runoff forecast ranges from a minimum probable of 3.85 maf (54 percent of average) to a maximum probable of 7.65 maf (107 percent of average). There is 10% chance that inflows could be higher than the maximum probable and a 10% chance they could be lower than the minimum probable.

As determined in the August 2015 24-Month Study, and documented in the 2016 Annual Operating Plan, Lake Powell's operations in water year 2016 will be governed by the Upper Elevation Balancing Tier. Because the April 2016 24-Month Study projected the

end of water year elevation at Lake Powell to be above 3,575 feet and the end of water year elevation at Lake Mead to be below elevation 1,075.0 feet, Lake Powell operations shifted to balancing (Section 6.B.4 of the 2007 Interim Guidelines) for the remainder of water year 2016. Under balancing, the contents of Lake Powell and Lake Mead will be balanced by the end of the water year, but not more than 9.0 maf and not less than 8.23 maf shall be released from Lake Powell.

Based on the June most probable inflow forecast, the annual release volume from Lake Powell during water year 2016 is projected to be 9.0 maf. Under the minimum probable inflow scenario, the water year release is projected to be 9.0 maf. Under the maximum probable inflow scenario, the release is projected to be 9.0 maf. There is 10% chance that inflows will be lower than the current minimum probable forecast, potentially resulting in lower releases. If inflows are less than the minimum probable forecast, the water year 2016 annual release could be as low as 8.23 maf. If inflows are greater than the current forecasted maximum probable inflow, the annual release will be 9.0 maf. The projected release from Lake Powell in water year 2016 will be updated each month throughout the remainder of the water year.

Based on the current forecast, the June 24-Month Study projects Lake Powell elevation will end water year 2016 near 3,611 ft with approximately 12.82 maf in storage (53% capacity). Projections of elevation and storage still have significant uncertainty at this point in the season, primarily due to uncertainty regarding runoff and the resulting inflow to Lake Powell. Under the minimum probable inflow scenario, updated in April, the projected end of water year elevation and storage are 3585 ft and 10.35 maf (43% capacity), respectively. Under the maximum probable inflow scenario, updated in April, the projected end of water year elevation and storage are 3622 ft and 14.01 maf (58% capacity), respectively. Modeling of projected reservoir operations based on the minimum and maximum scenarios will be updated again in August.

Upper Colorado River Basin Hydrology

The Upper Colorado River Basin regularly experiences significant year to year hydrologic variability. During the 16-year period 2000 to 2015, however, the unregulated inflow to Lake Powell, which is a good measure of hydrologic conditions in the Colorado River Basin, was above average in only 3 out of the past 16 years. The period 2000-2015 is the lowest 16-year period since the closure of Glen Canyon Dam in 1963, with an average unregulated inflow of 8.51 maf, or 79% of the 30-year average (1981-2010). (For comparison, the 1981-2010 total water year average is 10.83 maf.) The unregulated inflow during the 2000-2015 period has ranged from a low of 2.64 maf (24 percent of average) in water year 2002 to a high of 15.97 maf (147 percent of average) in water year 2011. The water year 2015 unregulated inflow volume to Lake Powell was 10.174 maf (94 percent of average), which, though still below average, was significantly higher than inflows observed in 2012 and 2013 (45% and 47 percent of average, respectively). Under the current most probable forecast, total water year 2016 unregulated inflows to Lake Powell is projected to be 9.70 maf (90 percent of average), and ranges from a minimum probable inflow of 6.86 maf (63%) and maximum probable inflow of 11.13 maf (103%).

At the beginning of water year 2016, total system storage in the Colorado River Basin was 30.3 maf (51% of 59.6 maf total system capacity). This is nearly the same as the total storage at the beginning of water year 2015 which began at 30.1 maf (50% of capacity). Since the beginning of water year 2000, total Colorado Basin storage has experienced year to year increases and decreases in response to wet and dry hydrology, ranging from a high of 94% of capacity at the beginning of 2000 to a low of 50% of capacity at the beginning of water year 2014. One wet year can significantly increase total system reservoir storage, just as persistent dry years can draw down the system storage. Based on current inflow forecasts, the current projected end of water year 2016 total Colorado Basin reservoir storage is approximately 30.3 maf (51% of capacity). The actual end of water year storage may vary from this projection, primarily due to uncertainty regarding this season's runoff and resulting reservoir inflow. Based on the April minimum and maximum probable inflow forecasts and modeling the range is approximately 27.6 maf (46%) to 31.4 maf (53%), respectively.

July 24-Month Study
Date: July 13, 2016

From: Water Resources Group, Salt Lake City
To: All Colorado River Annual Operating Plan (AOP) Recipients

Current Reservoir Status

Reservoir	June Inflow (unregulated) (acre-feet)	Percent of Average (%)	July 11, Midnight Elevation (feet)	Reservoir Storage (acre-feet)
Fontenelle	293,000	98	6501.19	307,000
Flaming Gorge	455,000	116	6029.51	3,330,000
Blue Mesa	285,000	107	7515.74	797,000
Navajo	213,000	95	6064.27	1,403,000
Powell	2,907,000	109	3621.37	13,909,000

Expected Operations

The operation of Lake Powell and Lake Mead in this July 2016 24-Month Study is pursuant to the December 2007 Record of Decision on Colorado River Interim Guidelines for Lower Basin Shortages and the Coordinated Operations of Lake Powell and Lake Mead (Interim Guidelines) and reflects the 2016 Annual Operating Plan (AOP). Pursuant to the Interim Guidelines, the August 2015 24-Month Study projections of the January 1, 2016, system storage and reservoir water surface elevations set the operational tier for the coordinated operation of Lake Powell and Lake Mead during 2016.

Consistent with Section 6.B of the Interim Guidelines, the Lake Powell operational tier for water year 2016 is the Upper Elevation Balancing Tier. The April 2016 24-Month Study projected the end of water year elevation at Lake Powell to be above 3,575 feet above sea level (feet) and the end of water year elevation at Lake Mead to be below elevation 1,075.0 feet. Therefore, in accordance with Section 6.B.4 of the Interim Guidelines, Lake Powell operations shifted to "balancing releases" for the remainder of water year 2016. Under Section 6.B.4, the contents of Lake Powell and Lake Mead will be balanced by the end of the water year, but not more than 9.0 million acre-feet (maf) and not less than 8.23 maf shall be released from Lake Powell. Based on the most probable inflow forecast, this July 24-Month Study projects a balancing release of 9.0 maf in water year 2016.

Consistent with Section 2.B.5 of the Interim Guidelines, the Intentionally Created Surplus (ICS) Surplus Condition is the criterion governing the operation of Lake Mead for calendar year 2016.

The Interim Guidelines are available for download at:
http://www.usbr.gov/lc/region/programs/strategies/RecordofDecision.pdf.
The 2016 AOP is available for download at:
http://www.usbr.gov/lc/region/g4000/aop/AOP16.pdf.

Fontenelle Reservoir – Fontenelle Reservoir is currently at elevation 6501 feet, which amounts to 89 percent of live storage capacity. Inflows for the month of June totaled 293,000 acre-feet (af), or 98 percent of average. Releases have been decreased to base flow levels of 1,000 cfs and are forecasted to remain at this level through the winter, subject to hydrology.

The Colorado Basin River Forecast Center has forecasted spring inflows that are much below average. July, August and September forecasted inflow volumes amount to 80,000 af (51 percent of average), 48,000 af (63 percent of average), and 36,000 af (78 percent of average), respectively.

The next Fontenelle Working Group meeting is scheduled for 10:00 a.m., August 23, 2016. The meeting will be held at the Joint Powers Water Board offices in Green River, Wyoming. The Fontenelle Working Group is an open public forum for information exchange between Reclamation and other parties associated with the operation of Fontenelle Reservoir.

Flaming Gorge Reservoir – Flaming Gorge Dam is currently 1,100 cubic feet per second (cfs) and will be increasing to 1,700 cfs by the end of July. July unregulated inflow forecast into Flaming Gorge for the April-July period has improved from 79 to 108 percent of average.

The Record of Decision outlines spring operations based on the final May spring runoff forecast. The May forecast of 79 percent of average was on the cusp between the moderately dry and average hydrologic conditions of the Record of Decision and the average (below median) hydrologic condition on the Larval Trigger Study Plan. Reclamation will operate Flaming Gorge under the average (below median) hydrologic classification.

Unregulated inflow into Flaming Gorge Reservoir during the month of June was 455,000 af, or 116 percent of average. The reservoir elevation is 6,029.53 ft and decreasing.

The July final forecast for inflows for the next three months projects much below average: with July, August and September forecasted inflow volumes at 108,000 af (51 percent of average), 65,000 af (73 percent of average), and 47,000 af (85 percent of average), respectively.

The Flaming Gorge Working Group is an open public forum for information exchange between Reclamation and the stakeholders of Flaming Gorge Dam. The public is encouraged to attend and comment on the operations and plans presented by Reclamation

at these meetings. Meeting notes from past Working Group meetings are posted on the Working Group webpage. For more information on this group and these meetings please contact Dale Hamilton at 801-379-1186 or Heather Patno at 801-524-3883.

Reclamation will be holding the Flaming Gorge Working Group meeting on Tuesday, August 25, 2016, at 11:00 a.m. at the Utah Division of Wildlife Resources offices located at 318 North Vernal Avenue, Vernal, Utah.

Aspinall Unit Reservoirs – Crystal Dam is currently releasing 1850 cfs with 1050 cfs being diverted through the Gunnison Tunnel and approximately 930 cfs flowing through the Black Canyon. The June unregulated inflow to Blue Mesa Reservoir, 285,000 af (109 percent of average) was well above the forecasted volume of 225,000 af (86 percent of average). As a result, the end of June reservoir elevation for Blue Mesa was 7414.84 feet and this was about 5 feet higher than was projected in the June 24-Month Study. By mid-July, the elevation of Blue Mesa is projected to peak at approximately 7416 feet with a corresponding storage level of approximately 799,000 af (about 96 percent of full capacity).

Inflows to Blue Mesa for the next three months are projected to be below average: with July, August and September forecasted inflow volumes of 94,000 af (83 percent of average), 50,000 af (79 percent of average) and 35,000 af (92 percent of average), respectively.

The Aspinall Unit Working Group is an open public forum for information exchange between Reclamation and the stakeholders of the Aspinall Unit. The public is encouraged to attend and comments on the operations and plans presented by Reclamation at these meetings. Meeting notes from past working Group meetings are posted on the Working Group webpage. For more information on this group and these meetings please contact Erik Knight in the Grand Junction Area Office at (970) 248-0629.

The next meeting of the Aspinall Unit Working Group will be held on Thursday August 18th at 1:00 pm at the Elk Creek Visitor Center at Blue Mesa Reservoir.

Navajo Reservoir – Navajo is currently releasing 2,300 cfs and is in the midst of ramping down the spring peak release. Releases are made for the authorized purposes of the Navajo Unit, and to attempt to maintain a target base flow through the endangered fish critical habitat reach of the San Juan River (Farmington to Lake Powell). The San Juan River Basin Recovery Implementation Program (SJRIP) recommends a target base flow of between 500 cfs and 1,000 cfs through the critical habitat area. The target base flow is calculated as the weekly average of gaged flows throughout the critical habitat area.

Modified unregulated inflow into Navajo during the month of June was 213,000 af, which was 95 percent of average. The reservoir elevation is 6065.6 feet and declining.

Inflows for the next three months are projected to be below average: with July, August, and September forecasted inflow volumes at 34,000 af (52 percent of average), 26,000 af (58 percent of average), and 30,000 af (69 percent of average), respectively. The most probable April through July forecast is for 575,000 af (78 percent of average).

The spring peak release began May 18th. The release was reduced to 2,000 cfs at the request of the San Juan County office of Emergency Management (OEM) on May 25th due to safety and property concerns. Reclamation coordinated daily with OEM to safely increase the release with the goal of reaching 5,000 cfs. The maximum release reached was 4,720 cfs on June 5th, then decreasing to 4,300 cfs for most of the remainder of the spring peak release. Ramp-down for the spring peak release began on July 1st and will be complete by July 12th. Releases will be made to maintain target baseflows in the critical habitat reach for the remainder of the year.

Reclamation conducts Public Operations Meetings three times per year to gather input for determining upcoming operations for Navajo Reservoir. Input from individuals, organizations, and agencies along with other factors such as weather, water rights, endangered species requirements, flood control, hydro power, recreation, fish and wildlife management, and reservoir levels, will be considered in the development of these reservoir operation plans. In addition, the meetings are used to coordinate activities and exchange information among agencies, water users, and other interested parties concerning the San Juan River and Navajo Reservoir.

The next Navajo Public Operations Meeting is scheduled for August 23rd at 1pm at the Farmington Civic Center, Farmington, NM.

Glen Canyon Dam / Lake Powell

Current Status

The unregulated inflow volume to Lake Powell in June was 2,907 thousand acre-feet (kaf) (109 percent of average). The release volume from Glen Canyon Dam in June was 800 kaf. The end of June elevation and storage of Lake Powell were 3620.01 feet (80 feet from full pool) and 13.76 maf (57 percent of full capacity), respectively. The reservoir elevation has been increasing through spring and early summer and is likely near its seasonal peak. In the next few weeks, the reservoir will likely begin its typical seasonal decline through the fall and winter months.

Current Operations

The operating tier for water year 2016 was established in August 2015 as the Upper Elevation Balancing Tier. The April 2016 24-Month Study established that Lake Powell operations will be governed by balancing for the remainder of water year 2016. Under balancing, the contents of Lake Powell and Lake Mead will be balanced by the end of the water year, but not more than 9.0 maf and not less than 8.23 maf shall be released from Lake Powell. Based on the most probable inflow forecast, this July 24-Month Study projects a balancing release of 9.0 maf in water year 2016. Reclamation will schedule operations at Glen Canyon Dam to achieve as practicably as possible the appropriate total annual release volume by September 30, 2016.

In July, the release volume will be approximately 950 kaf, with fluctuations anticipated between approximately 11,500 cfs during the nighttime and 19,500 cfs during the daytime and consistent with the Glen Canyon Operating Criteria (Federal Register, Volume 62, No. 41, March 3, 1997). The anticipated release volume for August is 900 kaf with daily fluctuations between approximately 10,000 cfs and 18,000 cfs. The expected release for September is approximately 700 kaf with daily fluctuations between approximately 8,500 cfs and 14,500 cfs.

In addition to daily scheduled fluctuations for power generation, the instantaneous releases from Glen Canyon Dam may also fluctuate to provide 40 mega-watts (mw) of system regulation. These instantaneous release adjustments stabilize the electrical generation and transmission system and translate to a range of about 1,200 cfs above or below the hourly scheduled release rate. Under system normal conditions, fluctuations for regulation are typically short lived and generally balance out over the hour with minimal or no noticeable impacts on downstream river flow conditions.

Releases from Glen Canyon Dam can also fluctuate beyond scheduled releases when called upon to respond to unscheduled power outages or power system emergencies. Depending on the severity of the system emergency, the response from Glen Canyon Dam can be significant, within the full range of the operating capacity of the power plant for as long as is necessary to maintain balance in the transmission system. Glen Canyon Dam typically maintains 30 mw (approximately 880 cfs) of generation capacity in reserve in order to respond to a system emergency even when generation rates are already high. System emergencies occur fairly infrequently and typically require small responses from Glen Canyon Dam. However, these responses can have a noticeable impact on the river downstream of Glen Canyon Dam.

Inflow Forecasts and Model Projections

The April to July 2016 water supply forecast for unregulated inflow to Lake Powell, issued on July 1, 2016, by the Colorado Basin River Forecast Center, projects that the most probable (median) unregulated inflow volume will be 6.72 maf (94 percent of average based on the period 1981-2010). The forecast increased by 2,200 kaf since last month. There is still uncertainty regarding the runoff and resulting inflow to Lake Powell through the end of the water year.

As determined in the August 2015 24-Month Study, and documented in the 2016 Annual Operating Plan, Lake Powell's operations in water year 2016 will be governed by the Upper Elevation Balancing Tier. Because the April 2016 24-Month Study projected the end of water year elevation at Lake Powell to be above 3,575 feet and the end of water year elevation at Lake Mead to be below elevation 1,075.0 feet, Lake Powell operations shifted to balancing (Section 6.B.4 of the 2007 Interim Guidelines) for the remainder of water year 2016. Under balancing, the contents of Lake Powell and Lake Mead will be balanced by the end of the water year, but not more than 9.0 maf and not less than 8.23 maf shall be released from Lake Powell.

Based on the current forecast, the July 24-Month Study projects Lake Powell's end of water year 2016 elevation to be near 3,612 feet with approximately 12.97 maf in storage (53 percent capacity). Projections of elevation and storage still have significant

uncertainty at this point in the season, primarily due to uncertainty regarding runoff and the resulting inflow to Lake Powell. Under the minimum probable inflow scenario, updated in April, the projected end of water year elevation and storage are 3585 ft and 10.35 maf (43 percent capacity), respectively. Under the maximum probable inflow scenario, updated in April, the projected end of water year elevation and storage are 3622 ft and 14.01 maf (58 percent capacity), respectively. Modeling of projected reservoir operations based on the minimum and maximum scenarios will be updated again in August.

Upper Colorado River Basin Hydrology

The Upper Colorado River Basin regularly experiences significant year to year hydrologic variability. During the 16-year period 2000 to 2015, however, the unregulated inflow to Lake Powell, which is a good measure of hydrologic conditions in the Colorado River Basin, was above average in only 3 out of the past 16 years. The period 2000-2015 is the lowest 16-year period since the closure of Glen Canyon Dam in 1963, with an average unregulated inflow of 8.51 maf, or 79 percent of the 30-year average (1981-2010). (For comparison, the 1981-2010 total water year average is 10.83 maf.) The unregulated inflow during the 2000-2015 period has ranged from a low of 2.64 maf (24 percent of average) in water year 2002 to a high of 15.97 maf (147 percent of average) in water year 2011. The water year 2015 unregulated inflow volume to Lake Powell was 10.174 maf (94 percent of average), which, though still below average, was significantly higher than inflows observed in 2012 and 2013 (45 percent and 47 percent of average, respectively). Under the current most probable forecast, total water year 2016 unregulated inflows to Lake Powell is projected to be 9.90 maf (92 percent of average), and ranges from a minimum probable inflow of 6.86 maf (63 percent of average) and maximum probable inflow of 11.13 maf (103 percent of average).

At the beginning of water year 2016, total system storage in the Colorado River Basin was 30.3 maf (51 percent of 59.6 maf total system capacity). This is nearly the same as the total storage at the beginning of water year 2015 which began at 30.1 maf (50 percent of capacity). Since the beginning of water year 2000, total Colorado Basin storage has experienced year to year increases and decreases in response to wet and dry hydrology, ranging from a high of 94 percent of capacity at the beginning of 2000 to a low of 50 percent of capacity at the beginning of water year 2014. One wet year can significantly increase total system reservoir storage, just as persistent dry years can draw down the system storage. Based on current inflow forecasts, the current projected end of water year 2016 total Colorado Basin reservoir storage is approximately 30.5 maf (51 percent of capacity). The actual end of water year storage may vary from this projection, primarily due to uncertainty regarding this season's runoff and resulting reservoir inflow. Based on the April minimum and maximum probable inflow forecasts and modeling the range is approximately 27.6 maf (46 percent of capacity) to 31.4 maf (53 percent of capacity), respectively.

August 24-Month Study
Date: August 12, 2016

From: Water Resources Group, Salt Lake City
To: All Colorado River Annual Operating Plan (AOP) Recipients

Current Reservoir Status

Reservoir	July Inflow (unregulated) (acre-feet)	Percent of Average (%)	August 10, Midnight Elevation (feet)	Reservoir Storage (acre-feet)
Fontenelle	80,000	37	6498.86	290,000
Flaming Gorge	91,000	35	6028.57	3,294,000
Blue Mesa	81,000	61	7510.79	753,000
Navajo	24,000	29	6061.00	1,361,000
Powell	595,000	55	3617.00	13,448,000

Expected Operations

The operation of Lake Powell and Lake Mead in this August 2016 24-Month Study is pursuant to the December 2007 Record of Decision on Colorado River Interim Guidelines for Lower Basin Shortages and the Coordinated Operations of Lake Powell and Lake Mead (Interim Guidelines) and reflects the 2016 Annual Operating Plan (AOP). Pursuant to the Interim Guidelines, the August 2015 24-Month Study projections of the January 1, 2016, system storage and reservoir water surface elevations set the operational tier for the coordinated operation of Lake Powell and Lake Mead during 2016.

Consistent with Section 6.B of the Interim Guidelines, the Lake Powell operational tier for water year 2016 is the Upper Elevation Balancing Tier. The April 2016 24-Month Study projected the end of water year elevation at Lake Powell to be above 3,575 feet above sea level (feet) and the end of water year elevation at Lake Mead to be below elevation 1,075 feet. Therefore, in accordance with Section 6.B.4 of the Interim Guidelines, Lake Powell operations shifted to "balancing releases" for the remainder of water year 2016. Based on the most probable inflow forecast, this August 24-Month Study projects a balancing release of 9.0 maf in water year 2016.

Consistent with Section 2.B.5 of the Interim Guidelines, the Intentionally Created Surplus (ICS) Surplus Condition is the criterion governing the operation of Lake Mead for calendar year 2016.

The August 2016 24-Month Study projects the January 1, 2017 Lake Powell elevation to be below the 2017 Equalization Elevation of 3,652 feet and above elevation 3,575 feet.

Consistent with Section 6.B of the Interim Guidelines, Lake Powell's operations in water year 2017 will be governed by the Upper Elevation Balancing Tier, with an initial water year release volume of 8.23 maf and the potential for an April adjustment to equalization or balancing releases in April 2017. Consistent with Section 6.B.4 of the Interim Guidelines, an April adjustment to balancing releases is currently projected to occur and Lake Powell is projected to release 9.0 maf in water year 2017.

The August 2016 24-Month Study projects the January 1, 2017 Lake Mead elevation to be above 1,075 feet. Consistent with Section 2.B.5 of the Interim Guidelines, the Intentionally Created Surplus (ICS) Surplus Condition is the criterion governing the operation of Lake Mead for calendar year 2017.

The operational tier determinations will be documented in the 2017 AOP, which is currently in development.

The Interim Guidelines are available for download at:
http://www.usbr.gov/lc/region/programs/strategies/RecordofDecision.pdf.
The 2016 AOP is available for download at:
http://www.usbr.gov/lc/region/g4000/aop/AOP16.pdf.

Fontenelle Reservoir – Fontenelle Reservoir is currently at elevation 6500 feet, which amounts to 87 percent of live storage capacity. Inflows for the month of July totaled 80,000 acre-feet (af), or 45 percent of average. Releases will be decreased to base flow levels of approximately 960 cubic feet per second (cfs) sometime in September and are forecasted to remain at this level through the winter, subject to hydrology.

The Colorado Basin River Forecast Center has forecasted spring inflows that are much below average. August, September and October forecasted inflow volumes amount to 44,000 af (58 percent of average), 36,000 af (78 percent of average), and 40,000 af (82 percent of average), respectively.

The next Fontenelle Working Group meeting is scheduled for 10:00 a.m., August 23, 2016. The meeting will be held at the Joint Powers Water Board offices in Green River, Wyoming. The Fontenelle Working Group is an open public forum for information exchange between Reclamation and other parties associated with the operation of Fontenelle Reservoir.

Flaming Gorge Reservoir – Flaming Gorge Dam is currently 1,800 cfs. Releases during the base flow period through September 30, 2016, will be modified regularly to provide for Colorado Pikeminnow flows in Reach 2 of the Green River. Targeted flow levels in Reach 2 will vary between approximately 2,000 cfs to 2,400 cfs.

The observed April-July unregulated inflow volume into Flaming Gorge Dam was 1.048 million acre-feet (maf). This volume falls in the average (above median) hydrologic classification at 49 percent exceedance for the base flow period. The base flow

hydrologic classification may change based on observed hydrology through the end of February 2017.

Unregulated inflow into Flaming Gorge Reservoir during the month of July was 455,000 af, or 91 percent of average. The reservoir elevation is 6,028.97 feet (88 percent of live capacity) and is decreasing.

The August final forecast for inflows for the next three months projects much below average: with August, September and October forecasted inflow volumes at 50,000 af (56 percent of average), 42,000 af (76 percent of average), and 50,000 af (85 percent of average), respectively.

The Flaming Gorge Working Group is an open public forum for information exchange between Reclamation and the stakeholders of Flaming Gorge Dam. The public is encouraged to attend and comment on the operations and plans presented by Reclamation at these meetings. Meeting notes from past Working Group meetings are posted on the Working Group webpage. For more information on this group and these meetings please contact Dale Hamilton at 801-379-1186 or Heather Patno at 801-524-3883.

Reclamation will be holding the Flaming Gorge Working Group meeting on Tuesday, August 25, 2016, at 11:00 a.m. at the Utah Division of Wildlife Resources offices located at 318 North Vernal Avenue, Vernal, Utah.

Aspinall Unit Reservoirs – Crystal Dam is currently releasing 1800 cfs with 1000 cfs being diverted through the Gunnison Tunnel and approximately 850 cfs flowing through the Black Canyon. The July unregulated inflow to Blue Mesa Reservoir was 81,000 af (69 percent of average) was below the forecasted volume of 94,000 af (80 percent of average). As a result, the end of July reservoir elevation for Blue Mesa was 7512.31 feet and this was about 2 feet lower than was projected in the July 24-Month Study. The peak elevation of Blue Mesa Reservoir for Water Year 2016 occurred on July 7, 2016 when the elevation reached 7515.98 feet above sea level. This elevation corresponds to a live storage level of 798,702 acre-feet (96 percent of full capacity).

Inflows to Blue Mesa for the next three months are projected to be below average: with August, September and October forecasted inflow volumes of 45,000 af (71 percent of average), 34,000 af (89 percent of average) and 35,000 af (92 percent of average), respectively.

The Aspinall Unit Working Group is an open public forum for information exchange between Reclamation and the stakeholders of the Aspinall Unit. The public is encouraged to attend and comments on the operations and plans presented by Reclamation at these meetings. Meeting notes from past working Group meetings are posted on the Working Group webpage. For more information on this group and these meetings please contact Erik Knight in the Grand Junction Area Office at (970) 248-0629.

The next meeting of the Aspinall Unit Working Group will be held on Thursday August 18th at 1:00 pm at the Elk Creek Visitor Center at Blue Mesa Reservoir.

Navajo Reservoir – As of August 4, 2016, Navajo reservoir elevation is 6061 ft (1.359 maf live storage) and is releasing 600 cfs. Releases are made for the authorized purposes of the Navajo Unit, and to attempt to maintain a target base flow through the endangered fish critical habitat reach of the San Juan River (Farmington to Lake Powell). The San Juan River Basin Recovery Implementation Program (SJRIP) recommends a target base flow of between 500 cfs and 1,000 cfs through the critical habitat area. The target base flow is calculated as the weekly average of gaged flows throughout the critical habitat area.

Modified unregulated inflow into Navajo during the month of July was 24,000 af, which was 36 percent of average. The total April-July modified unregulated inflow into Navajo for 2016 was 564 kaf, 77% of average.

Inflows for the next three months are projected to be below average: with August, September, and October forecasted inflow volumes at 23,000 af (50 percent of average), 27,000 af (63 percent of average), and 26,000 af (55 percent of average), respectively.

Reclamation conducts Public Operations Meetings three times per year to gather input for determining upcoming operations for Navajo Reservoir. Input from individuals, organizations, and agencies along with other factors such as weather, water rights, endangered species requirements, flood control, hydro power, recreation, fish and wildlife management, and reservoir levels, will be considered in the development of these reservoir operation plans. In addition, the meetings are used to coordinate activities and exchange information among agencies, water users, and other interested parties concerning the San Juan River and Navajo Reservoir.

The next Navajo Public Operations Meeting is scheduled for August 23rd at 1pm at the Farmington Civic Center, Farmington, NM.

An additional special meeting will be held the same day (August 23rd) at 6pm at the Farmington Civic Center to discuss the 2016 Spring Peak Release. The agenda will include a recap of 2016 Spring Peak Operations, a discussion of flood risk management and safe channel capacity, the nature of sedimentation and bank erosion in the San Juan River Basin, and floodplain risk issues. The meeting will include talks and representation from several agencies, including Reclamation, US Army Corps of Engineers, Fish and Wildlife Service, and San Juan County (NM) Office of Emergency Management. There will be opportunities for questions, comments, and discussion with the public during the meeting.

Glen Canyon Dam / Lake Powell

Current Status
April to July 2016 unregulated inflow to Lake Powell was 6.61 maf (92 percent of

average). The unregulated inflow in July was 0.595 maf (55 percent of average). The release volume from Glen Canyon Dam in July was 0.950 maf. The end of July elevation and storage of Lake Powell were 3,618.22 feet (82 feet from full pool) and 13.58 maf (56% of full capacity), respectively. The reservoir elevation peaked at 3,621.5 feet on July 9th and is now in its seasonal decline through the fall and winter months.

Current Operations

The operating tier for water year 2016 was established in August 2015 as the Upper Elevation Balancing Tier. The April 2016 24-Month Study established that Lake Powell operations would be governed by balancing for the remainder of water year 2016. Based on the most probable inflow forecast, this August 24-Month Study projects a balancing release of 9.0 maf in water year 2016. Reclamation will schedule operations at Glen Canyon Dam to achieve as practicably as possible the appropriate total annual release volume by September 30, 2016.

The operating tier for water year 2017, established by the August 2016 24-Month Study, is the Upper Elevation Balancing Tier under Section 6.B.1 of the Interim Guidelines. Operations under Section 6.B.1 initially schedules an annual release volume of 8.23 maf with potential operating adjustments occurring in April 2017 to either equalization or balancing based on specific projected conditions at the end of the water year. Based on the current forecast for water year 2017, an April adjustment to balancing is projected to occur in the August 2016 24-Month Study with Lake Powell projected to release 9.0 maf in water year 2017. This projection will be updated each month throughout the water year.

In August 2016, the release volume will be approximately 900 thousand acre-feet (kaf), with fluctuations anticipated between approximately 10,000 cfs and 18,000 cfs. These fluctuations are consistent with the Glen Canyon Operating Criteria (Federal Register, Volume 62, No. 41, March 3, 1997). The anticipated release volume for September is approximately 700 kaf with daily fluctuations between approximately 8,500 cfs and 14,500 cfs. Release for October are anticipated to be 600 kaf with daily fluctuations between approximately 7,000 cfs and 13,000 cfs.

In addition to daily scheduled fluctuations for power generation, the instantaneous releases from Glen Canyon Dam may also fluctuate to provide 40 mega-watts (mw) of system regulation. These instantaneous release adjustments stabilize the electrical generation and transmission system and translate to a range of about 1,200 cfs above or below the hourly scheduled release rate. Under normal conditions, fluctuations for regulation are typically short lived and generally balance out over the hour with minimal noticeable impacts on downstream river flow conditions.

Releases from Glen Canyon Dam can also fluctuate beyond scheduled releases when called upon to respond to unscheduled power outages or power system emergencies. Depending on the severity of system emergencies, Glen Canyon Dam can respond to these emergencies within the full range of the operating capacity of the power plant to maintain balance in the transmission system. Glen Canyon also maintains 30 mw (approximately 880 cfs) of generation capacity at all times in reserve in order to respond to system emergencies. System emergencies occur fairly infrequently and typically

require small responses from Glen Canyon Dam. These responses, however, can have noticeable impacts on the river downstream of Glen Canyon Dam.

Inflow Forecasts and Model Projections

The forecast for water year 2017 unregulated inflow to Lake Powell, issued on August 1, 2016, by the Colorado Basin River Forecast Center, projects that the most probable (median) unregulated inflow volume next year will be 9.63 maf (89% of average). There is significant uncertainty regarding next season's snow pack development and resulting runoff into Lake Powell. The forecast ranges from a minimum probable of 6.6 maf (61%) to a maximum probable of 17.0 maf (157%). There is a 10% chance that inflows could be higher than and a 10% chance that inflows could be lower than the minimum and maximum probable forecasts.

Based on the current forecast, the August 24-Month Study projects Lake Powell elevation will end water year 2016 near 3,612 feet with approximately 12.95 maf in storage (53% capacity) and water year 2017 near 3,613 feet with approximately 13.04 maf in storage (54% capacity). Note that projections of elevation and storage for water year 2017 have significant uncertainty at this point in the season. Projections of elevation and storage using the minimum and maximum probable inflow forecast are 3,589 feet (10.71 maf, 44% capacity) and 3,645 feet (16.64 maf, 68% capacity), respectively.

The annual release volume from Lake Powell during water year 2017 is projected to be in the range from 9.0 maf, under the minimum probable inflow scenario, to 11.9 maf, under the maximum probable inflow scenario. It is possible for the annual release volume from Lake Powell to be less than, or greater than this most probable range, however the probability of this occurring is less than 20 percent.

Upper Colorado River Basin Hydrology

During the 16-year period 2000 to 2015 the unregulated inflow to Lake Powell, which is a good measure of the hydrological conditions in the Colorado River Basin, was above average in only 3 out of the past 16 years. This period, with an average unregulated inflow of 8.51 maf (79 percent of average), was the lowest 16-year period in terms of unregulated inflow to Lake Powell since the closure of Glen Canyon Dam in 1963, ranging from 2.64 maf (2002) to 15.97 maf (2011).

At the beginning of water year 2016, total system storage in the Colorado River Basin was 30.3 maf (51 percent of 59.6 maf total system capacity). This is nearly the same as the total storage at the beginning of water year 2015 which began at 30.1 maf (50 percent of capacity). Since the beginning of water year 2000, total Colorado Basin storage has experienced year to year increases and decreases in response to wet and dry hydrology, ranging from a high of 94 percent of capacity at the beginning of 2000 to a low of 50 percent of capacity at the beginning of water year 2014. One wet year can significantly increase total system reservoir storage, just as persistent dry years can draw down the system storage. Based on current inflow forecasts, the current projected end of water year 2017 total Colorado Basin reservoir storage is approximately 30.0 maf (50 percent of capacity). The actual end of water year storage may vary from this projection, primarily due to uncertainty regarding this season's runoff and resulting reservoir inflow. Based on the August minimum and maximum probable inflow forecasts and modeling

the range is approximately 27.3 maf (46 percent of capacity) to 34.1 maf (57 percent of capacity), respectively.

September 24-Month Study
Date: September 12, 2016

From: Water Resources Group, Salt Lake City
To: All Colorado River Annual Operating Plan (AOP) Recipients

Current Reservoir Status

Reservoir	August Inflow (unregulated) (acre-feet)	Percent of Average (%)	September 11, Midnight Elevation (feet)	Reservoir Storage (acre-feet)
Fontenelle	80,000	37	6,492.83	246,000
Flaming Gorge	91,000	35	6,026.97	3,233,000
Blue Mesa	81,000	61	7,504.62	700,000
Navajo	24,000	29	6,058.38	1,327,000
Powell	595,000	55	3,612.43	13,448,000

Expected Operations

The operation of Lake Powell and Lake Mead in this September 2016 24-Month Study is pursuant to the December 2007 Record of Decision on Colorado River Interim Guidelines for Lower Basin Shortages and the Coordinated Operations of Lake Powell and Lake Mead (Interim Guidelines) and reflects the 2016 Annual Operating Plan (AOP) and the draft 2017 AOP. Pursuant to the Interim Guidelines, the August 2015 24-Month Study projections of the January 1, 2016, system storage and reservoir water surface elevations set the operational tier for the coordinated operation of Lake Powell and Lake Mead during 2016.

Consistent with Section 6.B of the Interim Guidelines, the Lake Powell operational tier for water year 2016 is the Upper Elevation Balancing Tier. The April 2016 24-Month Study projected the end of water year elevation at Lake Powell to be above 3,575 feet above mean sea level (feet) and the end of water year elevation at Lake Mead to be below elevation 1,075 feet. Therefore, in accordance with Section 6.B.4 of the Interim Guidelines, Lake Powell operations shifted to "balancing releases" for the remainder of water year 2016. Based on the most probable inflow forecast, this September 24-Month Study projects a balancing release of 9.0 maf in water year 2016.

Consistent with Section 2.B.5 of the Interim Guidelines, the Intentionally Created Surplus (ICS) Surplus Condition is the criterion governing the operation of Lake Mead for calendar year 2016.

The August 2016 24-Month Study projects the January 1, 2017 Lake Powell elevation to be below the 2017 Equalization Elevation of 3,652 feet and above elevation 3,575 feet. Consistent with Section 6.B of the Interim Guidelines, Lake Powell's operations in water year 2017 will be governed by the Upper Elevation Balancing Tier, with an initial water year release volume of 8.23 maf and the potential for an April adjustment to equalization or balancing releases in April 2017. Consistent with Section 6.B.4 of the Interim Guidelines, an April adjustment to balancing releases is currently projected to occur and Lake Powell is projected to release 9.0 maf in water year 2017.

The August 2016 24-Month Study projects the January 1, 2017 Lake Mead elevation to be above 1,075 feet. Consistent with Section 2.B.5 of the Interim Guidelines, the ICS Surplus Condition is the criterion governing the operation of Lake Mead for calendar year 2017.

The operational tier determinations will be documented in the 2017 AOP, which is currently in the final stages of development.

The Interim Guidelines are available for download at:
http://www.usbr.gov/lc/region/programs/strategies/RecordofDecision.pdf.
The 2016 AOP is available for download at:

The draft 2017 AOP is available for download at
http://www.usbr.gov/uc/water/rsvrs/ops/aop/2017AOP_2016-09-02_Consultation-3.pdf

Fontenelle Reservoir – Fontenelle Reservoir is currently at elevation 6494.83 feet above sea level (feet), which amounts to 76 percent of live storage capacity. Inflows for the month of August totaled 29,000 acre-feet (af), or 37 percent of average. Releases will be decreased to base flow levels of approximately 900 cubic feet per second (cfs) sometime in September and are forecasted to remain at this level through the winter, subject to hydrology.

The Colorado Basin River Forecast Center has forecasted spring inflows that are much below average. September, October and November forecasted inflow volumes amount to 30,000 af (65 percent of average), 40,000 af (82 percent of average), and 40,000 af (95 percent of average), respectively.

The next Fontenelle Working Group meeting is scheduled for 10:00 a.m., April 19, 2017. The meeting will be held at Seedskadee Wildlife Refuge Headquarters, Wyoming. The Fontenelle Working Group is an open public forum for information exchange between Reclamation and other parties associated with the operation of Fontenelle Reservoir.

Flaming Gorge Reservoir – Flaming Gorge Dam is currently releasing 1,800 cfs on average each day. Releases during the base flow period through September 30, 2016, will be modified regularly to provide for Colorado Pikeminnow flows in Reach 2 of the Green River. Targeted flow levels in Reach 2 will vary between approximately 2,000 cfs to 2,400 cfs.

The observed April-July unregulated inflow volume into Flaming Gorge Dam was 1.048 million acre-feet (maf). This volume falls in the average (above median) hydrologic classification at 49 percent exceedance for the base flow period. Base flow hydrologic classification may change based on observed hydrology through the end of February 2017.

Unregulated inflow into Flaming Gorge Reservoir during the month of August was 28,000 af, or 32 percent of average. The reservoir elevation is 6,027.49 feet (87 percent of live capacity) and decreasing.

The September final forecast for inflows for the next three months projects much below average trending to above average: with September, October and November forecasted inflow volumes at 35,000 af (64 percent of average), 50,000 af (85 percent of average), and 59,000 af (115 percent of average), respectively.

The Flaming Gorge Working Group is an open public forum for information exchange between Reclamation and the stakeholders of Flaming Gorge Dam. The public is encouraged to attend and comment on the operations and plans presented by Reclamation at these meetings. Meeting notes from past Working Group meetings are posted on the Working Group webpage. For more information on this group and these meetings please contact Dale Hamilton at 801-379-1186 or Heather Patno at 801-524-3883.

Reclamation will be holding the Flaming Gorge Working Group meeting on Thursday, April 20, 2017, at 10:00 a.m. at the Utah Division of Wildlife Resources offices located at 318 North Vernal Avenue, Vernal, Utah.

Aspinall Unit Reservoirs – Crystal Dam is currently releasing 1800 cfs with 1000 cfs being diverted through the Gunnison Tunnel and approximately 850 cfs flowing through the Black Canyon. The August unregulated inflow to Blue Mesa Reservoir was 57,000 af (90 percent of average) which was above the forecasted volume of 45,000 af (71 percent of average). The end of August reservoir elevation for Blue Mesa was 7506.19 feet. The peak elevation of Blue Mesa Reservoir for Water Year 2016 occurred on July 7, 2016 when the elevation reached 7515.98 feet above sea level. This elevation corresponds to a live storage level of 799,000 acre-feet (96 percent of full capacity).

Inflows to Blue Mesa for the next three months are projected to be below average: with September, October and November forecasted inflow volumes of 35,000 af (92 percent of average), 35,000 af (92 percent of average) and 30,000 af (68 percent of average), respectively.

The Aspinall Unit Working Group is an open public forum for information exchange between Reclamation and the stakeholders of the Aspinall Unit. The public is encouraged to attend and comments on the operations and plans presented by Reclamation at these meetings. Meeting notes from past working Group meetings are posted on the Working Group webpage. For more information on this group and these

meetings please contact Erik Knight in the Grand Junction Area Office at (970) 248-0629.

The next meeting of the Aspinall Unit Working Group will be held on Thursday, January 19th, 2017 at 1:00 pm at the Holiday Inn Express located in Montrose, Colorado.

Navajo Reservoir – As of September 1st, 2016, Navajo reservoir elevation is 6059 feet (1.336 maf live storage) and is releasing 500 cfs. Releases are made for the authorized purposes of the Navajo Unit, and to attempt to maintain a target base flow through the endangered fish critical habitat reach of the San Juan River (Farmington to Lake Powell). The San Juan River Basin Recovery Implementation Program (SJRIP) recommends a target base flow of between 500 cfs and 1,000 cfs through the critical habitat area. The target base flow is calculated as the weekly average of gaged flows throughout the critical habitat area.

Modified unregulated inflow into Navajo (unregulated inflow into Navajo, adjusted to account for the trans-basin diversion through the Azotea Tunnel) during the month of August was 30,000 af, which was 67 percent of average. The total April-July modified unregulated inflow into Navajo for 2016 was 566,000 af (77 percent of average).

Inflows for the next three months are projected to be below average: with September, October, and November forecasted inflow volumes at 23,000 af (55 percent of average), 30,000 af (64 percent of average), and 31,000 af (93 percent of average), respectively.

The spring peak release began May 18th. The release was reduced to 2,000 cfs at the request of the San Juan County office of Emergency Management (OEM) on May 25th due to safety and property concerns. Reclamation coordinated daily with OEM to safely increase the release with the goal of reaching 5,000 cfs. The maximum release reached was 4,720 cfs on June 5th. The release was decreased to 4,200 cfs for most of the remainder of the spring peak release. Ramp-down for the spring peak release began on July 1st and was complete by July 11th. Releases will be made to maintain target baseflows in the critical habitat reach for the remainder of the year.

Reclamation conducts Public Operations Meetings three times per year to gather input for determining upcoming operations for Navajo Reservoir. Input from individuals, organizations, and agencies along with other factors such as weather, water rights, endangered species requirements, flood control, hydro power, recreation, fish and wildlife management, and reservoir levels, will be considered in the development of these reservoir operation plans. In addition, the meetings are used to coordinate activities and exchange information among agencies, water users, and other interested parties concerning the San Juan River and Navajo Reservoir.

The next Navajo Public Operations Meeting is scheduled for January 24th, 2017, at 1pm at the Farmington Civic Center, Farmington, NM.

Glen Canyon Dam / Lake Powell

Current Status

The unregulated inflow to Lake Powell in August was 253 thousand acre-feet (kaf) (51 percent of average). The release volume from Glen Canyon Dam in August was 900 kaf. The end of August elevation and storage of Lake Powell were 3,613.55 feet (86 feet from full pool) and 13.1 maf (54 percent of full capacity), respectively. The April to July 2016 unregulated inflow to Lake Powell was 6.61 maf (92 percent of average). The reservoir elevation peaked at 3,621.5 feet on July 9 and is now in its seasonal decline through the fall and winter months.

Current Operations

The operating tier for water year 2016, established in August 2015, is the Upper Elevation Balancing Tier. The April 2016 24-Month Study established that Lake Powell operations will be governed by balancing for the remainder of water year 2016. Based on the most probable inflow forecast, this September 24-Month Study projects a balancing release of 9.0 maf in water year 2016. Reclamation will schedule operations at Glen Canyon Dam to achieve as practicably as possible the appropriate total annual release volume by September 30, 2016.

The operating tier for water year 2017, established in August 2016, is the Upper Elevation Balancing Tier, with an initial water year release volume of 8.23 maf and the potential for an April 2017 adjustment to equalization or balancing releases. Based on the current forecast, an April adjustment to balancing releases is projected to occur and Lake Powell is currently projected to release 9.0 maf in water year 2017. This projection will be updated each month throughout the water year.

In September 2016, the release volume will be approximately 699 kaf, with fluctuations anticipated between approximately 8,500 cfs and 14,500 cfs and consistent with the Glen Canyon Operating Criteria (Federal Register, Volume 62, No. 41, March 3, 1997). The anticipated release volume for October is approximately 600 kaf with daily fluctuations between approximately 7,000 cfs and 13,000 cfs. The expected release for November is 600 kaf with daily fluctuations between approximately 7,000 cfs and 13,000 cfs.

In addition to daily scheduled fluctuations for power generation, the instantaneous releases from Glen Canyon Dam may also fluctuate to provide 40 mega-watts (mw) of system regulation. These instantaneous release adjustments stabilize the electrical generation and transmission system and translate to a range of about 1,200 cfs above or below the hourly scheduled release rate. Under system normal conditions, fluctuations for regulation are typically short lived and generally balance out over the hour with minimal or no noticeable impacts on downstream river flow conditions.

Releases from Glen Canyon Dam can also fluctuate beyond scheduled releases when called upon to respond to unscheduled power outages or power system emergencies. Depending on the severity of the system emergency, the response from Glen Canyon Dam can be significant, within the full range of the operating capacity of the power plant for as long as is necessary to maintain balance in the transmission system. Glen Canyon Dam currently maintains 27 mw (approximately 800 cfs) of generation capacity in

reserve in order to respond to a system emergency even when generation rates are already high. System emergencies occur fairly infrequently and typically require small responses from Glen Canyon Dam. However, these responses can have a noticeable impact on the river downstream of Glen Canyon Dam.

Inflow Forecasts and Model Projections

The forecast for water year 2016 unregulated inflow to Lake Powell, issued on September 1, 2016, by the Colorado Basin River Forecast Center, projects that the most probable (median) unregulated inflow volume next year will be 9.53 maf (88 percent of average). There is significant uncertainty regarding next season's snow pack development and resulting runoff into Lake Powell. The forecast ranges from a minimum probable of 6.6 maf (61 percent of average) to a maximum probable of 17.0 maf (157 percent of average). There is a 10 percent chance that inflows could be higher than the current maximum probable forecast and a 10 percent chance that inflows could be lower than the minimum probable forecast.

Based on the current forecast, the September 24-Month Study projects Lake Powell elevation will end water year 2016 near 3,611.0 feet with approximately 12.83 maf in storage (53 percent capacity) and water year 2017 near 3,611.0 feet with approximately 12.83 maf in storage (53 percent capacity). Note that projections of elevation and storage for water year 2017 have significant uncertainty at this point in the season. Projections of elevation and storage using the minimum and maximum probable inflow forecast, last updated in August, are 3,589 feet (10.7 maf, 44 percent of capacity) and 3,645 feet (16.6 maf, 68 percent of capacity), respectively. Under these scenarios, there is a 10 percent chance that inflows will be higher, resulting in higher elevation and storage, and 10 percent chance that inflows will be lower, resulting in lower elevation and storage. The annual release volume from Lake Powell during water year 2017 is projected to be 9.0 maf under the minimum and most probable inflow scenarios and 11.9 maf under the maximum probable inflow scenario. There is a chance that inflows could be higher or lower, potentially resulting in releases greater than 11.9 maf or as low as 8.23 maf in water year 2017. The minimum and maximum probable scenarios will be updated again in October.

Upper Colorado River Basin Hydrology

The Upper Colorado River Basin regularly experiences significant year to year hydrologic variability. During the 16-year period 2000 to 2015, however, the unregulated inflow to Lake Powell, which is a good measure of hydrologic conditions in the Colorado River Basin, was above average in only 3 out of the past 16 years. The period 2000-2015 is the lowest 16-year period since the closure of Glen Canyon Dam in 1963, with an average unregulated inflow of 8.51 maf, or 79 percent of the 30-year average (1981-2010). (For comparison, the 1981-2010 total water year average is 10.83 maf.) The unregulated inflow during the 2000-2015 period has ranged from a low of 2.64 maf (24 percent of average) in water year 2002 to a high of 15.97 maf (147 percent of average) in water year 2011. The water year 2015 unregulated inflow volume to Lake Powell was 10.174 maf (94 percent of average), which, though still below average, was significantly higher than inflows observed in 2012 and 2013 (45 percent and 47 percent

of average, respectively). Under the current most probable forecast, total water year 2016 unregulated inflows to Lake Powell is projected to be 9.64 maf (89 percent of average).

At the beginning of water year 2016, total system storage in the Colorado River Basin was 30.3 maf (51 percent of 59.6 maf total system capacity). This is nearly the same as the total storage at the beginning of water year 2015 which began at 30.1 maf (50 percent of capacity). Since the beginning of water year 2000, total Colorado Basin storage has experienced year to year increases and decreases in response to wet and dry hydrology, ranging from a high of 94 percent of capacity at the beginning of 2000 to a low of 50 percent of capacity at the beginning of water year 2014. One wet year can significantly increase total system reservoir storage, just as persistent dry years can draw down the system storage. Based on current inflow forecasts, the current projected end of water year 2017 total Colorado Basin reservoir storage is approximately 29.8 maf (50 percent of capacity). The actual end of water year storage may vary from this projection, primarily due to uncertainty regarding this season's runoff and resulting reservoir inflow. Based on the August minimum and maximum probable inflow forecasts and modeling the range is approximately 27.3 maf (46 percent of capacity) to 34.1 maf (57 percent of capacity), respectively.

November 24-Month Study
Date: November 14, 2016

From: Water Resources Group, Salt Lake City
To: All Colorado River Annual Operating Plan (AOP) Recipients

Current Reservoir Status

Reservoir	October Inflow (unregulated) (acre-feet)	Percent of Average (%)	November 13, Midnight Elevation (feet)	November 13, Reservoir Storage (acre-feet)
Fontenelle	57,000	45	6,491.23	235,000
Flaming Gorge	70,000	43	6,025.57	3,181,000
Blue Mesa	32,000	69	7,493.02	605,000
Navajo	11,000	4	6,056.02	1,298,000
Powell	381,000	55	3,606.53	12,384,000

Expected Operations

The operation of Lake Powell and Lake Mead in this November 2016 24-Month Study is pursuant to the December 2007 Record of Decision on Colorado River Interim Guidelines for Lower Basin Shortages and the Coordinated Operations of Lake Powell and Lake Mead (Interim Guidelines) and reflects the 2016 Annual Operating Plan (AOP) and the draft 2017 AOP. Pursuant to the Interim Guidelines, the August 2016 24-Month Study projections of the January 1, 2017, system storage and reservoir water surface elevations set the operational tier for the coordinated operation of Lake Powell and Lake Mead during 2017.

Consistent with Section 6.B of the Interim Guidelines, Lake Powell's operations in water year 2017 will be governed by the Upper Elevation Balancing Tier, with an initial water year release volume of 8.23 maf and the potential for an April adjustment to equalization or balancing releases in April 2017. This November 2016 24-Month Study indicates that, consistent with Section 6.B.4 of the Interim Guidelines, an April adjustment to balancing releases is projected to occur and Lake Powell is projected to release 9.0 maf in water year 2017.

Consistent with Section 2.B.5 of the Interim Guidelines, the Intentionally Created Surplus (ICS) Surplus Condition is the criterion governing the operation of Lake Mead for calendar years 2016 and 2017.

The 2017 operational tier determinations will be documented in the 2017 AOP, which is currently in the final stages of development.

The Interim Guidelines are available for download at:
http://www.usbr.gov/lc/region/programs/strategies/RecordofDecision.pdf.
The 2016 AOP is available for download at:
http://www.usbr.gov/lc/region/g4000/aop/AOP16.pdf.
The draft 2017 AOP is available for download at:
http://www.usbr.gov/uc/water/rsvrs/ops/aop/2017AOP_2016-09-02_Consultation-3.pdf.

Fontenelle Reservoir – Fontenelle Reservoir is currently at elevation 6491 feet above sea level (feet), which amounts to 68 percent of live storage capacity. Inflows for the month of October totaled 57,000 acre-feet (af), or 117 percent of average. Above average inflows are forecasted over the next few months and releases have been increased in order to meet the spring elevation target. Releases have been increased to base flow levels of 1,025 cubic feet per second (cfs) and are forecasted to remain at this level through the winter, subject to hydrology.

The Colorado Basin River Forecast Center has forecasted spring inflows that are above average. November, December January forecasted inflow volumes amount to 58,000 af (138 percent of average), 38,000 af (119 percent of average), and 30,000 af (99 percent of average), respectively.

The next Fontenelle Working Group meeting is scheduled for 10:00 a.m., April 19, 2017. The meeting will be held at Seedskadee Wildlife Refuge Headquarters, Wyoming. The Fontenelle Working Group is an open public forum for information exchange between Reclamation and other parties associated with the operation of Fontenelle Reservoir.

Flaming Gorge Reservoir – Flaming Gorge Dam is currently 1,300 cubic cfs. Releases are anticipated to increase to 1,800 cfs during the December through February base flow period.

Unregulated inflow into Flaming Gorge Reservoir during the month of October was 70,000 af, or 119 percent of average. The reservoir elevation is 6,025.6 feet (85 percent of live capacity) and decreasing.

The November final forecast for inflows for the next three months projects above average conditions: November, December and January forecasted inflow volumes at 70,000 af (137 percent of average), 39,000 af (112 percent of average), and 43,000 af (112 percent of average), respectively.

The Flaming Gorge Working Group is an open public forum for information exchange between Reclamation and the stakeholders of Flaming Gorge Dam. The public is encouraged to attend and comment on the operations and plans presented by Reclamation at these meetings. Meeting notes from past Working Group meetings are posted on the

Working Group webpage. For more information on this group and these meetings please contact Dale Hamilton at 801-379-1186 or Heather Patno at 801-524-3883.

Reclamation will be holding the Flaming Gorge Working Group meeting on Thursday, April 20, 2017, at 10:00 a.m. at the Utah Division of Wildlife Resources offices located at 318 North Vernal Avenue, Vernal, Utah.

Aspinall Unit Reservoirs – Crystal Dam is currently releasing 600 cfs and the Gunnison Tunnel diversion is shut down for the 2016 irrigation season. The average flow through the Black Canyon is measuring approximately 600 cfs at the stream gage below Gunnison Tunnel. The October unregulated inflow to Blue Mesa Reservoir was 32,500 af (105 percent of average) which was slightly below the forecasted volume of 34,000 af (89 percent of average). The end of October reservoir elevation for Blue Mesa was 7493.44 feet. The peak elevation of Blue Mesa Reservoir for Water Year 2016 occurred on July 7, 2016 when the elevation reached 7515.98 feet above sea level. This elevation corresponds to a live storage level of 799,000 acre-feet (96 percent of full capacity).

Inflows to Blue Mesa for the next three months are projected to be below average: with November, December and January forecasted unregulated inflow volumes of 27,000 af (87 percent of average), 25,000 af (96 percent of average) and 23,000 af (96 percent of average), respectively.

The Aspinall Unit Working Group is an open public forum for information exchange between Reclamation and the stakeholders of the Aspinall Unit. The public is encouraged to attend and comments on the operations and plans presented by Reclamation at these meetings. Meeting notes from past working Group meetings are posted on the Working Group webpage. For more information on this group and these meetings please contact Erik Knight in the Grand Junction Area Office at (970) 248-0629.

The next meeting of the Aspinall Unit Working Group will be held on Thursday, January 19, 2017 at 1:00 pm at the Holiday Inn Express located in Montrose, Colorado.

Navajo Reservoir – As of November 2, 2016, Navajo reservoir elevation was 6056.1 feet (1.299 maf live storage) and is releasing 400 cfs. Releases are made for the authorized purposes of the Navajo Unit, and pursuant to the 2006 Record of Decision, in an attempt to maintain a target base flow through the endangered fish critical habitat reach of the San Juan River (Farmington to Lake Powell). The San Juan River Basin Recovery Implementation Program (SJRIP) recommends a target base flow of between 500 cfs and 1,000 cfs through the critical habitat area. The target base flow is calculated as the weekly average of gaged flows throughout the critical habitat area.

Modified unregulated inflow into Navajo during the month of October was 27,000 af, which was 58 percent of average. The total April-July modified unregulated inflow into Navajo for 2016 was 566,000 af (77 percent of average).

Inflows for the next three months are projected to be below average: with November, December, and January forecasted inflow volumes at 21,000 af (63 percent of average), 20,000 af (63 percent of average), and 18,000 af (82 percent of average), respectively.

Releases will be made to maintain target baseflows in the critical habitat reach for the remainder of the year.

Reclamation conducts Public Operations Meetings three times per year to gather input for determining upcoming operations for Navajo Reservoir. Input from individuals, organizations, and agencies along with other factors such as weather, water rights, endangered species requirements, flood control, hydropower, recreation, fish and wildlife management, and reservoir levels, will be considered in the development of these reservoir operation plans. In addition, the meetings are used to coordinate activities and exchange information among agencies, water users, and other interested parties concerning the San Juan River and Navajo Reservoir.

The next Navajo Public Operations Meeting is scheduled for January 24, 2017, at 1:00 pm at the Farmington Civic Center, Farmington, NM.

Glen Canyon Dam / Lake Powell

Current Status

The unregulated inflow volume to Lake Powell in October was 381 thousand acre-feet (kaf) (74 percent of average). The release volume from Glen Canyon Dam in October was 601 kaf. The end of October elevation and storage of Lake Powell were 3,609.48 feet (91 feet from full pool) and 12.68 million acre-feet (maf) (52 percent of full capacity), respectively. The reservoir elevation is now declining and is expected to continue to decline until spring 2017.

Current Operations

The operating tier for water year 2017 was established in August 2016 as the Upper Elevation Balancing Tier, with an initial water year release volume of 8.23 maf and the potential for an April adjustment to equalization or balancing releases in April 2017. An April adjustment to balancing releases is projected to occur and Lake Powell is currently projected to release 9.0 maf in water year 2017. Reclamation will schedule operations at Glen Canyon Dam to achieve as practicably as possible the appropriate total annual release volume by September 30, 2017.

On November 7-12, 2016, the Department of Interior conducted a high flow experimental release (HFE) from Glen Canyon Dam in accordance with the High Flow Protocol (Protocol). Under this Protocol, high flow releases are linked to sediment input and other resource conditions below Glen Canyon Dam. This HFE will be the fourth conducted under the Protocol. Beginning on the morning of November 7, 2016, releases from Glen Canyon Dam were increased to full powerplant capacity (approximately 21,000 cfs). At 9:00 am on November 7, 2016, the bypass tubes at Glen Canyon Dam were opened and releases were gradually increased to full powerplant and bypass capacity (approximately

36,000 cfs) by noon on November 7, 2016. Peak releases were maintained at 36,000 cfs for 4 days (96 hours) before being gradually reduced. Releases were reduced to normal operational levels by the early morning hours of November 12, 2016. The entire experiment, including ramping lasted about 5 days. November releases from Glen Canyon Dam prior to and after the HFE will fluctuate for power production between 6,500 cfs and 9,000 cfs each day. The elevation of Lake Powell decreased approximately 2.4 feet during the 5 day experiment. The total release in November, including the HFE, is anticipated to be approximately 744 kaf. The annual release volume from Lake Powell will not change as a result of the HFE.

In December, the release volume will be approximately 800 kaf, with fluctuations anticipated between about 11,000 cfs in the nighttime to about 19,000 cfs in the daytime and consistent with the Glen Canyon Operating Criteria (Federal Register, Volume 62, No. 41, March 3, 1997). The anticipated release volume for January is 800 kaf.

In addition to daily scheduled fluctuations for power generation, the instantaneous releases from Glen Canyon Dam may also fluctuate to provide 40 mega-watts (mw) of system regulation. These instantaneous release adjustments stabilize the electrical generation and transmission system and translate to a range of about 1,200 cfs above or below the hourly scheduled release rate. Under system normal conditions, fluctuations for regulation are typically short lived and generally balance out over the hour with minimal or no noticeable impacts on downstream river flow conditions.

Releases from Glen Canyon Dam can also fluctuate beyond scheduled releases when called upon to respond to unscheduled power outages or power system emergencies. Depending on the severity of the system emergency, the response from Glen Canyon Dam can be significant, within the full range of the operating capacity of the power plant for as long as is necessary to maintain balance in the transmission system. Glen Canyon Dam currently maintains 27 mw (approximately 800 cfs) of generation capacity in reserve in order to respond to a system emergency even when generation rates are already high. System emergencies occur fairly infrequently and typically require small responses from Glen Canyon Dam. However, these responses can have a noticeable impact on the river downstream of Glen Canyon Dam.

Inflow Forecasts and Model Projections

The forecast for water year 2017 unregulated inflow to Lake Powell, issued on November 1, 2016, by the Colorado Basin River Forecast Center, projects that the most probable (median) unregulated inflow volume will be 7.85 maf (72 percent of average based on the period 1981-2010). This is about a 1.4 maf decrease from the forecast issued last month. At this early point in the season, there is significant uncertainty regarding next year's water supply. The forecast ranges from a minimum probable of 6.0 maf (55 percent of average) to a maximum probable of 17.0 maf (157 percent of average). There is 10 percent chance that inflows could be higher than the maximum probable and a 10 percent chance they could be lower than the minimum probable.

Based on the current forecast, the November 24-Month Study projects Lake Powell elevation will end water year 2017 near 3,595 feet with approximately 11.25 maf in storage (46 percent of capacity). Note that projections of elevation and storage have significant uncertainty at this early point in the season, primarily due to uncertainty regarding next season's snowpack and the resulting inflow to Lake Powell. Projections of elevation and storage using the minimum and maximum probable inflow forecast, last updated in October, are 3,581 feet (10.0 maf, 41 percent of capacity) and 3,641 feet (16.1 maf, 66 percent of capacity), respectively. Under these scenarios, there is a 10 percent chance that inflows will be higher, resulting in higher elevation and storage, and 10 percent chance that inflows will be lower, resulting in lower elevation and storage. The annual release volume from Lake Powell during water year 2017 is projected to be 9.0 maf under the minimum and most probable inflow scenarios and 12.0 maf under the maximum probable inflow scenario. There is a chance that inflows could be higher or lower, potentially resulting in releases greater than 12.0 maf or as low as 8.23 maf in water year 2017. The minimum and maximum probable scenarios will be updated again in January.

Upper Colorado River Basin Hydrology

The Upper Colorado River Basin regularly experiences significant year to year hydrologic variability. During the 17-year period 2000 to 2016, however, the unregulated inflow to Lake Powell, which is a good measure of hydrologic conditions in the Colorado River Basin, was above average in only 3 out of the past 17 years. The period 2000-2016 is the lowest 17-year period since the closure of Glen Canyon Dam in 1963, with an average unregulated inflow of 8.57 maf, or 79 percent of the 30-year average (1981-2010). (For comparison, the 1981-2010 total water year average is 10.83 maf.) The unregulated inflow during the 2000-2016 period has ranged from a low of 2.64 maf (24 percent of average) in water year 2002 to a high of 15.97 maf (147 percent of average) in water year 2011. The water year 2016 unregulated inflow volume to Lake Powell was 9.62 maf (89 percent of average), which, though still below average, was higher than the water year release of 9.0 maf, which allowed Lake Powell to increase approximately 4.9 feet in elevation over the last water year. Under the current most probable forecast, total water year 2017 unregulated inflows to Lake Powell is projected to be 7.85 maf (72 percent of average).

At the beginning of water year 2017, total system storage in the Colorado River Basin was 30.7 maf (51 percent of 59.6 maf total system capacity). This is nearly the same as the total storage at the beginning of water year 2016 which began at 30.8 maf (52 percent of capacity). Since the beginning of water year 2000, total Colorado Basin storage has experienced year to year increases and decreases in response to wet and dry hydrology, ranging from a high of 94 percent of capacity at the beginning of 2000 to a low of 50 percent of capacity at the beginning of water year 2014. One wet year can significantly increase total system reservoir storage, just as persistent dry years can draw down the system storage. Based on current inflow forecasts, the current projected end of water year 2017 total Colorado Basin reservoir storage is approximately 28.5 maf (48 percent of capacity). The actual end of water year storage may vary from this projection, primarily due to uncertainty regarding this season's runoff and resulting reservoir inflow.

Based on the October minimum and maximum probable inflow forecasts and modeling the range is approximately 26.6 maf (45 percent of capacity) to 33.5 maf (56 percent of capacity), respectively.

October 24-Month Study
Date: October 14, 2016

From: Water Resources Group, Salt Lake City
To: All Colorado River Annual Operating Plan (AOP) Recipients

Current Reservoir Status

Reservoir	September Inflow (unregulated) (acre-feet)	Percent of Average (%)	October 12, Midnight Elevation (feet)	October 12, Reservoir Storage (acre-feet)
Fontenelle	26,000	45	6,489.74	225,000
Flaming Gorge	36,000	43	6,025.97	3,196,000
Blue Mesa	38,000	69	7,497.49	641,000
Navajo	21,000	37	6,056.78	1,307,000
Powell	281,000	55	3,610.59	12,790,000

Expected Operations

The operation of Lake Powell and Lake Mead in this October 2016 24-Month Study is pursuant to the December 2007 Record of Decision on Colorado River Interim Guidelines for Lower Basin Shortages and the Coordinated Operations of Lake Powell and Lake Mead (Interim Guidelines) and reflects the 2016 Annual Operating Plan (AOP) and the draft 2017 AOP. Pursuant to the Interim Guidelines, the August 2016 24-Month Study projections of the January 1, 2017, system storage and reservoir water surface elevations set the operational tier for the coordinated operation of Lake Powell and Lake Mead during 2017.

Consistent with Section 6.B of the Interim Guidelines, Lake Powell's operations in water year 2017 will be governed by the Upper Elevation Balancing Tier, with an initial water year release volume of 8.23 million acre-feet (maf) and the potential for an April adjustment to equalization or balancing releases in April 2017. This October 2016 24-Month Study indicates that, consistent with Section 6.B.4 of the Interim Guidelines, an April adjustment to balancing releases is projected to occur and Lake Powell is projected to release 9.0 maf in water year 2017.

Consistent with Section 2.B.5 of the Interim Guidelines, the Intentionally Created Surplus (ICS) Surplus Condition is the criterion governing the operation of Lake Mead for calendar year 2016.

The August 2016 24-Month Study projects the January 1, 2017 Lake Mead elevation to be above 1,075 feet above sea level (feet). Consistent with Section 2.B.5 of the Interim

Guidelines, the ICS Surplus Condition is the criterion governing the operation of Lake Mead for calendar year 2017.

The operational tier determinations will be documented in the 2017 AOP, which is currently in the final stages of development.

The Interim Guidelines are available for download at:
http://www.usbr.gov/lc/region/programs/strategies/RecordofDecision.pdf.
The 2016 AOP is available for download at:
http://www.usbr.gov/lc/region/g4000/aop/AOP16.pdf.
The draft 2017 AOP is available for download at
http://www.usbr.gov/uc/water/rsvrs/ops/aop/2017AOP_2016-09-02_Consultation-3.pdf

Fontenelle Reservoir – Fontenelle Reservoir is currently at elevation 6490 feet, which amounts to 65 percent of live storage capacity. Inflows for the month of September totaled 26,000 acre-feet (af), or 57 percent of average. Releases have been decreased to base flow levels of 920 cubic feet per second (cfs) and are forecasted to remain at this level through the winter, subject to hydrology.

The Colorado Basin River Forecast Center has forecasted spring inflows that are below average. October, November and December forecasted inflow volumes amount to 40,000 af (82 percent of average), 40,000 af (95 percent of average), and 40,000 af (100 percent of average), respectively.

The next Fontenelle Working Group meeting is scheduled for 10:00 a.m., April 19, 2017. The meeting will be held at Seedskadee Wildlife Refuge Headquarters, Wyoming. The Fontenelle Working Group is an open public forum for information exchange between Reclamation and other parties associated with the operation of Fontenelle Reservoir.

Flaming Gorge Reservoir – Flaming Gorge Dam is currently 1,300 cfs. Releases are anticipated to increase to 1,800 cfs during the December through February base flow period.

Unregulated inflow into Flaming Gorge Reservoir during the month of September was 36,000 af, or 65 percent of average. The reservoir elevation is 6,025.9 feet (85 percent of live capacity) and decreasing.

The September final forecast for inflows for the next three months projects much below average trending to above average: October, November and December forecasted inflow volumes at 50,000 af (85 percent of average), 50,000 af (98 percent of average), and 34,000 af (98 percent of average), respectively.

The Flaming Gorge Working Group is an open public forum for information exchange between Reclamation and the stakeholders of Flaming Gorge Dam. The public is encouraged to attend and comment on the operations and plans presented by Reclamation at these meetings. Meeting notes from past Working Group meetings are posted on the

Working Group webpage. For more information on this group and these meetings please contact Dale Hamilton at 801-379-1186 or Heather Patno at 801-524-3883.

Reclamation will be holding the Flaming Gorge Working Group meeting on Thursday, April 20, 2017, at 10:00 a.m. at the Utah Division of Wildlife Resources offices located at 318 North Vernal Avenue, Vernal, Utah.

Aspinall Unit Reservoirs – Crystal Dam is currently releasing 1500 cfs with 900 cfs being diverted through the Gunnison Tunnel and approximately 600 cfs flowing through the Black Canyon. The September unregulated inflow to Blue Mesa Reservoir was 38,000 af (100 percent of average) which was above the forecasted volume of 35,000 af (92 percent of average). The end of September reservoir elevation for Blue Mesa was 7500.48 feet. The peak elevation of Blue Mesa Reservoir for Water Year 2016 occurred on July 7, 2016 when the elevation reached 7515.98 feet above sea level. This elevation corresponds to a live storage level of 799,000 acre-feet (96 percent of full capacity).

Inflows to Blue Mesa for the next three months are projected to be below average: with October, November and December forecasted unregulated inflow volumes of 34,000 af (89 percent of average), 29,000 af (94 percent of average) and 25,000 af (96 percent of average), respectively.

The Aspinall Unit Working Group is an open public forum for information exchange between Reclamation and the stakeholders of the Aspinall Unit. The public is encouraged to attend and comments on the operations and plans presented by Reclamation at these meetings. Meeting notes from past working Group meetings are posted on the Working Group webpage. For more information on this group and these meetings please contact Erik Knight in the Grand Junction Area Office at (970) 248-0629.

The next meeting of the Aspinall Unit Working Group will be held on Thursday, January 19th, 2017 at 1:00 p.m. at the Holiday Inn Express located in Montrose, Colorado.

Navajo Reservoir – As of October 4, 2016, the water surface elevation of Navajo Reservoir is 6057 feet, which corresponds to a live storage content of 1.309 maf. Navajo Dam is releasing 450 cfs. Releases are being made for the authorized purposes of the Navajo Unit, and to attempt to maintain a target base flow through the endangered fish critical habitat reach of the San Juan River (Farmington to Lake Powell). The San Juan River Basin Recovery Implementation Program (SJRIP) recommends a target base flow of between 500 cfs and 1,000 cfs through the critical habitat area. The target base flow is calculated as the weekly average of gaged flows throughout the critical habitat area.

Modified unregulated inflow into Navajo during the month of September was 21,000 af, which was 49 percent of average. The total April-July modified unregulated inflow into Navajo for 2016 was 566,000 af, 77 percent of average.

Inflows for the next three months are projected to be below average: with October, November, and December forecasted inflow volumes at 27,000 af (57 percent of average), 29,000 af (87 percent of average), and 22,000 af (88 percent of average), respectively.

Releases will be made to maintain target baseflows in the critical habitat reach for the remainder of the year.

Reclamation conducts Public Operations Meetings three times per year to gather input for determining upcoming operations for Navajo Reservoir. Input from individuals, organizations, and agencies along with other factors such as weather, water rights, endangered species requirements, flood control, hydro power, recreation, fish and wildlife management, and reservoir levels, will be considered in the development of these reservoir operation plans. In addition, the meetings are used to coordinate activities and exchange information among agencies, water users, and other interested parties concerning the San Juan River and Navajo Reservoir.

The next Navajo Public Operations Meeting is scheduled for January 24, 2017, at 1:00 p.m. at the Farmington Civic Center, Farmington, NM.

Glen Canyon Dam / Lake Powell

Current Status

High-Flow Experiments (HFE) below Glen Canyon Dam are driven by weather, sediment inputs, and other resource conditions, in accordance with the Finding of No Significant Impact (FONSI) for the "Environmental Assessment of Development and Implementation of a Protocol for High-Flow Experimental Releases from Glen Canyon Dam, Arizona, 2011- 2020" (HFE Protocol).

When sediment conditions during the summer and fall meet specific thresholds as described in the HFE Protocol, a fall HFE can occur. Fall HFEs can be scheduled to occur anytime during the months of October and November, however under the HFE Protocol, HFEs have historically always occurred in November. Our best preliminary data and models runs indicate we now have enough sediment input from the Paria River for an HFE to occur at Glen Canyon Dam under the HFE Protocol. The HFE Technical Team will be meeting to begin planning for a possible HFE and reviewing the status of resources and potential resource impacts.

At this time we do not have a firm date for a fall HFE. However, further data collection, modeling, and analysis prior to the end of October may modify the expected duration and/or magnitude of a HFE. A final determination on the timing, magnitude and duration of a potential fall 2016 HFE will likely be made near the end of October.

The unregulated inflow to Lake Powell in September was 281 thousand acre-feet (kaf) (69 percent of average). The release volume from Glen Canyon Dam in September was 699 kaf. The end of September elevation and storage of Lake Powell was 3,610.93 feet (89 feet from full pool) and 12.8 maf (53% of full capacity), respectively. The water year

2016 unregulated inflow to Lake Powell was 9.62 maf (89% of average). The water year 2016 release from Lake Powell was 9.0 maf. The reservoir elevation peaked at 3,621.5 feet on July 9 and is now in its seasonal decline through the fall and winter months.

Current Operations

The operating tier for water year 2017, established in August 2016, is the Upper Elevation Balancing Tier, with an initial water year release volume of 8.23 maf and the potential for an April 2017 adjustment to equalization or balancing releases. Based on the current forecast, an April adjustment to balancing is projected to occur and Lake Powell is currently projected to release 9.0 maf in water year 2017. This projection will be updated each month throughout the water year. Reclamation will schedule operations at Glen Canyon Dam to achieve as practicably as possible the appropriate total annual release volume by September 30, 2017.

In October 2016, the release volume will be approximately 600 kaf, with fluctuations anticipated between approximately 7,000 cfs and 13,000 cfs and consistent with the Glen Canyon Operating Criteria (Federal Register, Volume 62, No. 41, March 3, 1997). The anticipated release volume for November is approximately 600 kaf with daily fluctuations between approximately 7,000 cfs and 13,000 cfs. The expected release for December is 900 kaf with daily fluctuations between approximately 11,000 cfs and 19,000 cfs.

In addition to daily scheduled fluctuations for power generation, the instantaneous releases from Glen Canyon Dam may also fluctuate to provide 40 megawatts (mw) of system regulation. These instantaneous release adjustments stabilize the electrical generation and transmission system and translate to a range of about 1,200 cfs above or below the hourly scheduled release rate. Under normal conditions, fluctuations for regulation are typically short lived and generally balance out over the hour with minimal or no noticeable impacts on downstream river flow conditions.

Releases from Glen Canyon Dam can also fluctuate beyond scheduled releases when called upon to respond to unscheduled power outages or power system emergencies. Depending on the severity of the system emergency, the response from Glen Canyon Dam can be significant, within the full range of the operating capacity of the power plant for as long as is necessary to maintain balance in the transmission system. Glen Canyon Dam currently maintains 27 mw (approximately 800 cfs) of generation capacity in reserve in order to respond to a system emergency even when generation rates are already high. System emergencies occur fairly infrequently and typically require small responses from Glen Canyon Dam. However, these responses can have a noticeable impact on the river downstream of Glen Canyon Dam.

Inflow Forecasts and Model Projections

The forecast for water year 2017 unregulated inflow to Lake Powell, issued on October 1, 2016, by the Colorado Basin River Forecast Center, projects that the most probable (median) unregulated inflow volume next year will be 9.24 maf (85% of average). There is significant uncertainty regarding next season's snow pack development and resulting

runoff into Lake Powell. The forecast ranges from a minimum probable of 6.0 maf (55%) to a maximum probable of 17.0 maf (157%). There is a 10% chance that inflows could be higher than the current maximum probable forecast and a 10% chance that inflows could be lower than the minimum probable forecast.

Based on the current forecast, the October 24-Month Study projects Lake Powell elevation will end water year 2017 near 3,609 feet with approximately 12.6 maf in storage (52% capacity). Note that projections of elevation and storage for water year 2017 have significant uncertainty at this point in the season. Projections of elevation and storage using the minimum and maximum probable inflow forecast, last updated in October, are 3,581 feet (10.0 maf, 41% capacity) and 3,641 feet (16.1 maf, 66% capacity), respectively. Under these scenarios, there is a 10 percent chance that inflows will be higher, resulting in higher elevation and storage, and 10 percent chance that inflows will be lower, resulting in lower elevation and storage. The annual release volume from Lake Powell during water year 2017 is projected to be 9.0 maf under the minimum and most probable inflow scenarios and 12.4 maf under the maximum probable inflow scenario. There is a chance that inflows could be higher or lower, potentially resulting in releases greater than 12.4 maf or as low as 8.23 maf in water year 2017. The minimum and maximum probable scenarios will be updated again in January.

Upper Colorado River Basin Hydrology

The Upper Colorado River Basin regularly experiences significant year to year hydrologic variability. During the 17-year period 2000 to 2016, however, the unregulated inflow to Lake Powell, which is a good measure of hydrologic conditions in the Colorado River Basin, was above average in only 3 out of the past 17 years. The period 2000-2016 is the lowest 17-year period since the closure of Glen Canyon Dam in 1963, with an average unregulated inflow of 8.57 maf, or 79 percent of the 30-year average (1981-2010). (For comparison, the 1981-2010 total water year average is 10.83 maf.) The unregulated inflow during the 2000-2016 period has ranged from a low of 2.64 maf (24 percent of average) in water year 2002 to a high of 15.97 maf (147 percent of average) in water year 2011. The water year 2016 unregulated inflow volume to Lake Powell was 9.62 maf (89 percent of average), which, though still below average, was higher than the water year release of 9.0 maf, which allowed Lake Powell to increase approximately 4.9 feet in elevation over the last water year. Under the current most probable forecast, total water year 2017 unregulated inflows to Lake Powell is projected to be 9.24 maf (85 percent of average).

At the beginning of water year 2017, total system storage in the Colorado River Basin was 30.7 maf (51 percent of 59.6 maf total system capacity). This is nearly the same as the total storage at the beginning of water year 2016 which began at 30.8 maf (52 percent of capacity). Since the beginning of water year 2000, total Colorado Basin storage has experienced year to year increases and decreases in response to wet and dry hydrology, ranging from a high of 94 percent of capacity at the beginning of 2000 to a low of 50 percent of capacity at the beginning of water year 2014. One wet year can significantly increase total system reservoir storage, just as persistent dry years can draw down the system storage. Based on current inflow forecasts, the current projected end of water

year 2017 total Colorado Basin reservoir storage is approximately 29.5 maf (50 percent of capacity). The actual end of water year storage may vary from this projection, primarily due to uncertainty regarding this season's runoff and resulting reservoir inflow. Based on the October minimum and maximum probable inflow forecasts and modeling the range is approximately 26.6 maf (45 percent of capacity) to 33.5 maf (56 percent of capacity), respectively.

December 24-Month Study
Date: December 9, 2016

From: Water Resources Group, Salt Lake City
To: All Colorado River Annual Operating Plan (AOP) Recipients

Current Reservoir Status

Reservoir	November Inflow (unregulated) (acre-feet)	Percent of Average (%)	December 8, Midnight Elevation (feet)	December 8, Midnight Reservoir Storage (acre-feet)
Fontenelle	62,000	148	6,489.06	221,000
Flaming Gorge	73,000	143	6,025.13	3,165,000
Blue Mesa	26,000	83	7,492.14	598,000
Navajo	24,000	58	6,055.75	1,295,000
Powell	383,000	81	3,606.53	12,384,000

Expected Operations

The operation of Lake Powell and Lake Mead in this December 2016 24-Month Study is pursuant to the December 2007 Record of Decision on Colorado River Interim Guidelines for Lower Basin Shortages and the Coordinated Operations of Lake Powell and Lake Mead (Interim Guidelines) and reflects the 2016 Annual Operating Plan (AOP) and the draft 2017 AOP. Pursuant to the Interim Guidelines, the August 2016 24-Month Study projections of the January 1, 2017, system storage and reservoir water surface elevations set the operational tier for the coordinated operation of Lake Powell and Lake Mead during 2017.

Consistent with Section 6.B of the Interim Guidelines, Lake Powell's operations in water year 2017 will be governed by the Upper Elevation Balancing Tier, with an initial water year release volume of 8.23 maf and the potential for an April adjustment to equalization or balancing releases in April 2017. This December 2016 24-Month Study indicates that, consistent with Section 6.B.4 of the Interim Guidelines, an April adjustment to balancing releases is projected to occur and Lake Powell is projected to release 9.0 maf in water year 2017.

Consistent with Section 2.B.5 of the Interim Guidelines, the Intentionally Created Surplus (ICS) Surplus Condition is the criterion governing the operation of Lake Mead for calendar years 2016 and 2017.

The 2017 operational tier determinations will be documented in the 2017 AOP, which is currently in the final stages of development.

The Interim Guidelines are available for download at:
https://www.usbr.gov/lc/region/programs/strategies/RecordofDecision.pdf.
The 2016 AOP is available for download at:
https://www.usbr.gov/lc/region/g4000/aop/AOP16.pdf.
The draft 2017 AOP is available for download at:
https://www.usbr.gov/uc/water/rsvrs/ops/aop/2017AOP_2016-09-02_Consultation-3.pdf.

Fontenelle Reservoir – Fontenelle Reservoir is currently at elevation 6489 feet above sea level (feet), which amounts to 66 percent of live storage capacity. Inflows for the month of November totaled 62,000 acre-feet (af), or 147 percent of average. Average to above average inflows are forecasted over the next few months and releases have been increased in order to meet the spring elevation target. Releases have been increased to base flow levels of 1,025 cubic feet per second (cfs) and are forecasted to remain at this level through the winter, subject to hydrology.

The Colorado Basin River Forecast Center has forecasted spring inflows that are above average. December, January and February forecasted inflow volumes amount to 38,000 af (119 percent of average), 32,000 af (107 percent of average), and 28,000 af (101 percent of average), respectively.

The next Fontenelle Working Group meeting is scheduled for 10:00 a.m., April 19, 2017. The meeting will be held at Seedskadee Wildlife Refuge Headquarters, Wyoming. The Fontenelle Working Group is an open public forum for information exchange between Reclamation and other parties associated with the operation of Fontenelle Reservoir.

Flaming Gorge Reservoir – Releases are increasing to 1,800 cfs from 1,300 cfs during the December through February base flow period, subject to hydrology.

Unregulated inflow into Flaming Gorge Reservoir during the month of November was 73,000 af, or 142 percent of average. The reservoir elevation is 6,025.25 feet (85 percent of live capacity) and decreasing.

The December final forecast for inflows for the next three months projects above average conditions: December, January and February forecasted inflow volumes at 40,000 af (115 percent of average), 43,000 af (107 percent of average), and 45,000 af (101 percent of average), respectively.

The Flaming Gorge Working Group is an open public forum for information exchange between Reclamation and the stakeholders of Flaming Gorge Dam. The public is encouraged to attend and comment on the operations and plans presented by Reclamation at these meetings. Meeting notes from past Working Group meetings are posted on the

Working Group webpage. For more information on this group and these meetings please contact Dale Hamilton at 801-379-1186 or Heather Patno at 801-524-3883.

Reclamation will be holding the Flaming Gorge Working Group meeting on Thursday, April 20, 2017, at 10:00 a.m. at the Utah Division of Wildlife Resources offices located at 318 North Vernal Avenue, Vernal, Utah.

Aspinall Unit Reservoirs – Crystal Dam is currently releasing 600 cfs and the Gunnison Tunnel diversion is shut down for the 2016 irrigation season. The average flow through the Black Canyon is measuring approximately 600 cfs at the stream gage below Gunnison Tunnel. The November unregulated inflow to Blue Mesa Reservoir was 26,000 af (84 percent of average) which was nearly equal to the forecasted volume of 27,000 af (87 percent of average). The end of November reservoir elevation for Blue Mesa was 7492.53 feet. The peak elevation of Blue Mesa Reservoir for Water Year 2016 occurred on July 7, 2016 when the elevation reached 7515.98 feet. This elevation corresponds to a live storage level of 799,000 af (96 percent of full capacity).

Inflows to Blue Mesa for the next three months are projected to be below average: with December, January and February forecasted unregulated inflow volumes of 24,000 af (92 percent of average), 22,000 af (92 percent of average) and 19,000 af (86 percent of average), respectively.

The Aspinall Unit Working Group is an open public forum for information exchange between Reclamation and the stakeholders of the Aspinall Unit. The public is encouraged to attend and comments on the operations and plans presented by Reclamation at these meetings. Meeting notes from past working Group meetings are posted on the Working Group webpage. For more information on this group and these meetings please contact Erik Knight in the Grand Junction Area Office at (970) 248-0629.

The next meeting of the Aspinall Unit Working Group will be held on Thursday, January 19th, 2017 at 1:00 pm at the Holiday Inn Express located in Montrose, Colorado.

Navajo Reservoir – As of November 30th, 2016, Navajo reservoir elevation is 6055.9 feet (1,296,000 af live storage) and is releasing 350 cfs. Releases are made for the authorized purposes of the Navajo Unit, and pursuant to the 2006 Record of Decision, in an attempt to maintain a target base flow through the endangered fish critical habitat reach of the San Juan River (Farmington to Lake Powell). The San Juan River Basin Recovery Implementation Program (SJRIP) recommends a target base flow of between 500 cfs and 1,000 cfs through the critical habitat area. The target base flow is calculated as the weekly average of gaged flows throughout the critical habitat area.

Modified unregulated inflow into Navajo during the month of November was 24,000 af, which was 71 percent of average. The total April-July modified unregulated inflow into Navajo for 2016 was 566,000 af, 77% of average.

Inflows for the next three months are projected to be below average: with December, January, and February forecasted inflow volumes at 20,000 af (80 percent of average), 18,000 af (82 percent of average), and 21,000 af (69 percent of average), respectively.

Releases will be made to maintain target baseflows in the critical habitat reach for the remainder of the year.

Reclamation conducts Public Operations Meetings three times per year to gather input for determining upcoming operations for Navajo Reservoir. Input from individuals, organizations, and agencies along with other factors such as weather, water rights, endangered species requirements, flood control, hydro power, recreation, fish and wildlife management, and reservoir levels, will be considered in the development of these reservoir operation plans. In addition, the meetings are used to coordinate activities and exchange information among agencies, water users, and other interested parties concerning the San Juan River and Navajo Reservoir.

The next Navajo Public Operations Meeting is scheduled for January 24th, 2017, at 1pm at the Farmington Civic Center, Farmington, NM.

Glen Canyon Dam / Lake Powell

Current Status

The unregulated inflow volume to Lake Powell in November was 383 thousand acre-feet (kaf) (81 percent of average). The release volume from Glen Canyon Dam in November was 750 kaf. The end of November elevation and storage of Lake Powell were 3,605.81 feet (94 feet from full pool) and 12.3 million acre-feet (maf) (51 percent of full capacity), respectively. The reservoir elevation is now declining and is expected to continue to decline until spring 2017.

Current Operations

The operating tier for water year 2017 was established in August 2016 as the Upper Elevation Balancing Tier, with an initial water year release volume of 8.23 maf and the potential for an April adjustment to equalization or balancing releases in April 2017. An April adjustment to balancing releases is projected to occur and Lake Powell is currently projected to release 9.0 maf in water year 2017. Reclamation will schedule operations at Glen Canyon Dam to achieve as practicably as possible the appropriate total annual release volume by September 30, 2017.

In December, the release volume will be approximately 900 kaf, with fluctuations anticipated between about 11,000 cfs in the nighttime to about 19,000 cfs in the daytime and consistent with the Glen Canyon Operating Criteria (Federal Register, Volume 62, No. 41, March 3, 1997). The anticipated release volume for January is 900 kaf.

In addition to daily scheduled fluctuations for power generation, the instantaneous releases from Glen Canyon Dam may also fluctuate to provide 40 mega-watts (mw) of system regulation. These instantaneous release adjustments stabilize the electrical generation and transmission system and translate to a range of about 1,200 cfs above or

below the hourly scheduled release rate. Under system normal conditions, fluctuations for regulation are typically short lived and generally balance out over the hour with minimal or no noticeable impacts on downstream river flow conditions.

Releases from Glen Canyon Dam can also fluctuate beyond scheduled releases when called upon to respond to unscheduled power outages or power system emergencies. Depending on the severity of the system emergency, the response from Glen Canyon Dam can be significant, within the full range of the operating capacity of the power plant for as long as is necessary to maintain balance in the transmission system. Glen Canyon Dam typically maintains 27 mw (approximately 800 cfs) of generation capacity in reserve in order to respond to a system emergency even when generation rates are already high. System emergencies occur fairly infrequently and typically require small responses from Glen Canyon Dam. However, these responses can have a noticeable impact on the river downstream of Glen Canyon Dam.

Inflow Forecasts and Model Projections

The forecast for water year 2017 unregulated inflow to Lake Powell, issued on December 1, 2016, by the Colorado Basin River Forecast Center, projects that the most probable (median) unregulated inflow volume will be 7.83 maf (72 percent of average based on the period 1981-2010). This is about a 20 kaf decrease from the forecast issued last month. At this early point in the season, there is significant uncertainty regarding next year's water supply. The forecast ranges from a minimum probable of 6.0 maf (55 percent of average) to a maximum probable of 17.0 maf (157 percent of average). There is 10 percent chance that inflows could be higher than the maximum probable and a 10 percent chance they could be lower than the minimum probable.

Based on the current forecast, the December 24-Month Study projects Lake Powell elevation will end water year 2017 near 3,595 feet with approximately 11.24 maf in storage (46 percent of capacity). Note that projections of elevation and storage have significant uncertainty at this early point in the season, primarily due to uncertainty regarding next season's snowpack and the resulting inflow to Lake Powell. Projections of elevation and storage using the minimum and maximum probable inflow forecast, last updated in October, are 3,581 feet (10.0 maf, 41 percent of capacity) and 3,641 feet (16.1 maf, 66 percent of capacity), respectively. Under these scenarios, there is a 10 percent chance that inflows will be higher, resulting in higher elevation and storage, and 10 percent chance that inflows will be lower, resulting in lower elevation and storage. The annual release volume from Lake Powell during water year 2017 is projected to be 9.0 maf under the minimum and most probable inflow scenarios and 12.0 maf under the maximum probable inflow scenario. There is a chance that inflows could be higher or lower, potentially resulting in releases greater than 12.0 maf or as low as 8.23 maf in water year 2017. The minimum and maximum probable scenarios will be updated again in January.

Upper Colorado River Basin Hydrology

The Upper Colorado River Basin regularly experiences significant year to year hydrologic variability. During the 17-year period 2000 to 2016, however, the unregulated inflow to Lake Powell, which is a good measure of hydrologic conditions in

the Colorado River Basin, was above average in only 3 out of the past 17 years. The period 2000-2016 is the lowest 17-year period since the closure of Glen Canyon Dam in 1963, with an average unregulated inflow of 8.57 maf, or 79 percent of the 30-year average (1981-2010). (For comparison, the 1981-2010 total water year average is 10.83 maf.) The unregulated inflow during the 2000-2016 period has ranged from a low of 2.64 maf (24 percent of average) in water year 2002 to a high of 15.97 maf (147 percent of average) in water year 2011. The water year 2016 unregulated inflow volume to Lake Powell was 9.62 maf (89 percent of average), which, though still below average, was higher than the water year release of 9.0 maf, which allowed Lake Powell to increase approximately 4.9 feet in elevation over the last water year. Under the current most probable forecast, total water year 2017 unregulated inflows to Lake Powell is projected to be 7.83 maf (72 percent of average).

At the beginning of water year 2017, total system storage in the Colorado River Basin was 30.7 maf (51 percent of 59.6 maf total system capacity). This is nearly the same as the total storage at the beginning of water year 2016 which began at 30.8 maf (52 percent of capacity). Since the beginning of water year 2000, total Colorado Basin storage has experienced year to year increases and decreases in response to wet and dry hydrology, ranging from a high of 94 percent of capacity at the beginning of 2000 to a low of 50 percent of capacity at the beginning of water year 2014. One wet year can significantly increase total system reservoir storage, just as persistent dry years can draw down the system storage. Based on current inflow forecasts, the current projected end of water year 2017 total Colorado Basin reservoir storage is approximately 28.5 maf (48 percent of capacity). The actual end of water year storage may vary from this projection, primarily due to uncertainty regarding this season's runoff and resulting reservoir inflow. Based on the October minimum and maximum probable inflow forecasts and modeling the range is approximately 26.6 maf (45 percent of capacity) to 33.5 maf (56 percent of capacity), respectively.

Expected Operations

The operation of Lake Powell and Lake Mead in this January 2017 24-Month Study is pursuant to the December 2007 Record of Decision on Colorado River Interim Guidelines for Lower Basin Shortages and the Coordinated Operations of Lake Powell and Lake Mead (Interim Guidelines), and reflects the 2017 Annual Operating Plan (AOP). Pursuant to the Interim Guidelines, the August 2016 24-Month Study projections of the January 1, 2017, system storage and reservoir water surface elevations set the operational tier for the coordinated operation of Lake Powell and Lake Mead during 2017.

Consistent with Section 6.B of the Interim Guidelines, Lake Powell's operations in water year 2017 will be governed by the Upper Elevation Balancing Tier, with an initial water year release volume of 8.23 million acre-feet (maf) and the potential for an April adjustment to equalization or balancing releases in April 2017. This January 2017 24-Month Study indicates that, consistent with Section 6.B.4 of the Interim Guidelines, an April adjustment to balancing releases is projected to occur and Lake Powell is projected to release 9.0 maf in water year 2017.

Consistent with Section 2.B.5 of the Interim Guidelines, the Intentionally Created Surplus (ICS) Surplus Condition is the criterion governing the operation of Lake Mead for calendar year 2017.

The Interim Guidelines are available for download at:
https://www.usbr.gov/lc/region/programs/strategies/RecordofDecision.pdf.
The 2017 AOP is available for download at:
https://www.usbr.gov/uc/water/rsvrs/ops/aop/AOP17.pdf.

Fontenelle Reservoir – Fontenelle Reservoir is currently at elevation 6485 feet above sea level (feet), which amounts to 57 percent of live storage capacity. Inflows for the month of December totaled 37,000 acre-feet (af), or 147 percent of average. Average to above average inflows are forecasted over the next few months and releases have been increased in order to meet the spring elevation target. Releases have been increased to base flow levels of 1,025 cubic feet per second (cfs) and are forecasted to remain at this level through the winter, subject to hydrology.

The Colorado Basin River Forecast Center has forecasted spring inflows that are at or above average. January, February, and March forecasted inflow volumes amount to 30,000 af (105 percent of average), 28,000 af (101 percent of average), and 50,000 af (95 percent of average), respectively.

The next Fontenelle Working Group meeting is scheduled for 10:00 a.m., April 19, 2017. The meeting will be held at Seedskadee Wildlife Refuge Headquarters, Wyoming. The Fontenelle Working Group is an open public forum for information exchange between Reclamation and other parties associated with the operation of Fontenelle Reservoir.

Flaming Gorge Reservoir – Releases are currently 1,800 cfs and expected to remain at this level through February, subject to hydrology.

Unregulated inflow into Flaming Gorge Reservoir during the month of December was 35,000 af, or 100 percent of average. The reservoir elevation is 6,023.7 feet (83 percent of live capacity) and is decreasing.

The January final forecast for inflows for the next three months projects average conditions: January, February and March forecasted inflow volumes at 43,000 af (107 percent of average), 45,000 af (101 percent of average), and 100,000 af (98 percent of average), respectively.

The January water supply forecast of the April through July unregulated inflow volume into Flaming Gorge Reservoir is 1.23 maf (126 percent of average). This forecast was issued prior to significant storm activity within the basin and the February forecast is anticipated to be much above average. Current snowpack is 173 percent of median for the Upper Green Basin with additional storm systems anticipated toward the end of January.

The Flaming Gorge Working Group is an open public forum for information exchange between Reclamation and the stakeholders of Flaming Gorge Dam. The public is encouraged to attend and comment on the operations and plans presented by Reclamation

at these meetings. Meeting notes from past Working Group meetings are posted on the Working Group webpage. For more information on this group and these meetings please contact Dale Hamilton at 801-379-1186 or Heather Patno at 801-524-3883.

Reclamation will be holding the Flaming Gorge Working Group meeting on Thursday, April 20, 2017, at 10:00 a.m. at the Utah Division of Wildlife Resources offices located at 318 North Vernal Avenue, Vernal, Utah.

Aspinall Unit Reservoirs – Crystal Dam is currently releasing 600 cfs and the Gunnison Tunnel diversion is shut down accept for occasional diversions to fill Fairview Resevoir. The average flow through the Black Canyon is measuring approximately 600 cfs at the stream gage below Gunnison Tunnel. The December unregulated inflow to Blue Mesa Reservoir was 26,000 af (100 percent of average). The end of December reservoir elevation for Blue Mesa was 7491.43 feet. This was 1.43 feet above the end of December icing target elevation due to low inflow forecasts Reclamation was receiving during the fall. It was decided at that time to allow the elevation of Blue Mesa to remain slightly fuller based on these forecasts to conserve water for next year.

During December and early January, the snowpack conditions in the Gunnison Basin increased significantly. On December 1, 2016 the Upper Gunnison Basin percent of median snow water equivalent was 69%. On December 31, 2016 that percentage had increased to 119%. As of January 13, 2017 the Upper Gunnison Basin percent of median snow water equivalent was 171% of median. This significant increase was well above expected levels and is very good news for the 2017 runoff season.

Unregulated Inflows to Blue Mesa for the next three months (January, February and March) are projected to be: 23,000 af (96 percent of average), 20,000 af (91 percent of average) and 32,000 af (100 percent of average), respectively. The April through July unregulated inflow forecast is currently 575,000 af (86% of average), however this will likely increase significantly due to the recent increases in the snowpack conditions.

The Aspinall Unit Working Group is an open public forum for information exchange between Reclamation and the stakeholders of the Aspinall Unit. The public is encouraged to attend and comments on the operations and plans presented by Reclamation at these meetings. Meeting notes from past working Group meetings are posted on the Working Group webpage. For more information on this group and these meetings please contact Erik Knight in the Grand Junction Area Office at (970) 248-0629.

The next meeting of the Aspinall Unit Working Group will be held on Thursday, January 19th, 2017 at 1:00 pm at the Holiday Inn Express located in Montrose, Colorado.

Navajo Reservoir – As of January 5th, 2017, Navajo reservoir elevation is 6055.96 feet (1.297 maf live storage) and is releasing 350 cfs. Releases are made for the authorized purposes of the Navajo Unit, and pursuant to the 2006 Record of Decision, in an attempt to maintain a target base flow through the endangered fish critical habitat reach of the

San Juan River (Farmington to Lake Powell). The San Juan River Basin Recovery Implementation Program (SJRIP) recommends a target base flow of between 500 cfs and 1,000 cfs through the critical habitat area. The target base flow is calculated as the weekly average of gaged flows throughout the critical habitat area.

Modified unregulated inflow into Navajo during the month of November was 26,000 af, which was 97 percent of average.

Inflows for the next three months are projected to be below average: with January, February, and March forecasted inflow volumes at 22,000 af (100 percent of average), 23,000 af (76 percent of average), and 68,000 af (74 percent of average), respectively.

The Most Probable April-July runoff forecast is 580,000 af (79 percent of average). Under this forecast, no spring peak release is expected in 2017.

Releases will be made to maintain target baseflows in the critical habitat reach for the remainder of the year.

Reclamation conducts Public Operations Meetings three times per year to gather input for determining upcoming operations for Navajo Reservoir. Input from individuals, organizations, and agencies along with other factors such as weather, water rights, endangered species requirements, flood control, hydro power, recreation, fish and wildlife management, and reservoir levels, will be considered in the development of these reservoir operation plans. In addition, the meetings are used to coordinate activities and exchange information among agencies, water users, and other interested parties concerning the San Juan River and Navajo Reservoir.

The next Navajo Public Operations Meeting is scheduled for January 24th, 2017, at 1:00 pm at the Farmington Civic Center, Farmington, NM.

Glen Canyon Dam / Lake Powell

Current Status

The unregulated inflow to Lake Powell in December was 300 thousand acre-feet (kaf) (83% of average). The release volume from Glen Canyon Dam in December was 898 kaf. The end of December elevation and storage of Lake Powell were 3,600 feet (100 feet from full pool) and 11.8 maf (49% of full capacity), respectively. The reservoir is declining and will continue to decline until spring runoff begins to enter the reservoir. The current snowpack above Lake Powell is 166% of average.

Current Operations

The operating tier for water year 2017, established in August 2016, is the Upper Elevation Balancing Tier, with an initial water year release volume of 8.23 maf and the potential for an April 2017 adjustment to equalization or balancing releases. Based on the current forecast, an April adjustment to balancing releases is projected to occur and Lake Powell is currently projected to release 9.0 maf in water year 2017. This projection will be updated each month throughout the water year.

In January 2017, the release volume will be approximately 880 thousand acre-feet (kaf), with fluctuations anticipated between approximately 10,000 cfs and 18,000 cfs and consistent with the Glen Canyon Dam, Record of Decision (dated December 2016). The anticipated release volume for February is approximately 715 kaf with daily fluctuations between approximately 9,000 cfs and 15,000 cfs. The expected release for March is 728 kaf with daily fluctuations between approximately 9,000 cfs and 15,000 cfs.

In addition to daily scheduled fluctuations for power generation, the instantaneous releases from Glen Canyon Dam may also fluctuate to provide 40 mega-watts (MW) of system regulation. These instantaneous release adjustments stabilize the electrical generation and transmission system and translate to a range of up to about 1,200 cfs above or below the hourly scheduled release rate. Under system normal conditions, fluctuations for regulation are typically short lived and generally balance out over the hour with minimal or no noticeable impacts on downstream river flow conditions.

Releases from Glen Canyon Dam can also fluctuate beyond scheduled releases when called upon to respond to unscheduled power outages or power system emergencies. Depending on the severity of the system emergency, the response from Glen Canyon Dam can be significant, within the full range of the operating capacity of the power plant for as long as is necessary to maintain balance in the transmission system. Glen Canyon Dam currently maintains 27 MW (approximately 800 cfs) of generation capacity in reserve in order to respond to a system emergency even when generation rates are already high. System emergencies occur fairly infrequently and typically require small responses from Glen Canyon Dam. However, these responses can have a noticeable impact on the river downstream of Glen Canyon Dam.

Inflow Forecasts and Model Projections

The April to July 2017 water supply forecast for unregulated inflow to Lake Powell, issued on January 4, 2017, by the Colorado Basin River Forecast Center, projects that the most probable (median) unregulated inflow volume will be 6.5 maf (91 percent of average based on the period 1981-2010). The projected water year 2017 inflow is 9.5 maf (88 percent of average). At this early point in the season, there is still significant uncertainty regarding this year's water supply. The April-July forecast ranges from a minimum probable of 4.1 maf (57 percent of average) to a maximum probable of 9.8 maf (137 percent of average). There is a 10 percent chance that inflows could be higher than the current maximum probable forecast and a 10 percent chance that inflows could be lower than the minimum probable forecast.

Based on the current forecast, the January 24-Month Study projects Lake Powell elevation will end water year 2017 near 3,608 feet with approximately 12.5 maf in storage (51 percent of capacity). Note that projections of elevation and storage for water year 2017 have significant uncertainty at this point in the season. Projections of elevation and storage using the minimum and maximum probable inflow forecast, updated in January, are 3,586 feet (10.4 maf, 43 percent of capacity) and 3,640 feet (16.0 maf, 66 percent of capacity), respectively. Under these scenarios, there is a 10 percent chance that inflows will be higher, resulting in higher elevation and storage, and 10 percent chance that inflows will be lower, potentially in lower elevation and storage. The annual

release volume from Lake Powell during water year 2017 is projected to be 9.0 maf under the minimum, most, and maximum probable inflow scenarios. There is a chance that inflows could be higher or lower, potentially resulting in releases greater than 9.0 maf or as low as 8.23 maf in water year 2017. The minimum and maximum probable scenarios will be updated again in April.

Upper Colorado River Basin Hydrology

The Upper Colorado River Basin regularly experiences significant year to year hydrologic variability. During the 17-year period 2000 to 2016, however, the unregulated inflow to Lake Powell, which is a good measure of hydrologic conditions in the Colorado River Basin, was above average in only 3 out of the past 17 years. The period 2000-2016 is the lowest 17-year period since the closure of Glen Canyon Dam in 1963, with an average unregulated inflow of 8.57 maf, or 79 percent of the 30-year average (1981-2010). (For comparison, the 1981-2010 total water year average is 10.83 maf.) The unregulated inflow during the 2000-2016 period has ranged from a low of 2.64 maf (24 percent of average) in water year 2002 to a high of 15.97 maf (147 percent of average) in water year 2011. The water year 2016 unregulated inflow volume to Lake Powell was 9.62 maf (89 percent of average), which, though still below average, was significantly higher than inflows observed in 2012 and 2013 (45 percent and 47 percent of average, respectively). Under the current most probable forecast, the total water year 2017 unregulated inflow to Lake Powell is projected to be 9.51 maf (88 percent of average).

At the beginning of water year 2017, total system storage in the Colorado River Basin was 30.2 maf (50 percent of 59.6 maf total system capacity). This is nearly the same as the total storage at the beginning of water years 2015 and 2016 which began at 30.1 maf and 30.3 maf, respectively, both of which were 50 percent of capacity. Since the beginning of water year 2000, total Colorado Basin storage has experienced year to year increases and decreases in response to wet and dry hydrology, ranging from a high of 94 percent of capacity at the beginning of 2000 to a low of 50 percent of capacity at the beginning of water year 2005. One wet year can significantly increase total system reservoir storage, just as persistent dry years can draw down the system storage. Based on current inflow forecasts, the current projected end of water year total Colorado Basin reservoir storage for water year 2017 is approximately 29.8 maf (50 percent of total system capacity). The actual end of water year 2017 system storage may vary from this projection, primarily due to uncertainty regarding the season's snowpack and resulting runoff and reservoir inflow. Based on the January minimum and maximum probable inflow forecasts and modeling, the range of end of water year 2017 total system capacity is approximately 27.3 maf (46 percent of capacity) to 33.5 maf (56 percent of capacity), respectively.

February 24-Month Study
Date: February 13, 2017

From: Water Resources Group, Salt Lake City
To: All Colorado River Annual Operating Plan (AOP) Recipients

Current Reservoir Status

Reservoir	January Inflow (unregulated) (acre-feet)	Percent of Average (%)	February 12, Midnight Elevation (feet)	February 12, Midnight Reservoir Storage (acre-feet)
Fontenelle	45,000	145	6,482.17	178,000
Flaming Gorge	49,000	107	6,022.91	3,084,000
Blue Mesa	29,000	114	7,490.16	583,000
Navajo	35,000	104	6,057.39	1,315,000
Powell	359,000	89	3,594.58	11,240,000

Expected Operations

The operation of Lake Powell and Lake Mead in this February 2017 24-Month Study is pursuant to the December 2007 Record of Decision on Colorado River Interim Guidelines for Lower Basin Shortages and the Coordinated Operations of Lake Powell and Lake Mead (Interim Guidelines), and reflects the 2017 Annual Operating Plan (AOP). Pursuant to the Interim Guidelines, the August 2016 24-Month Study projections of the January 1, 2017, system storage and reservoir water surface elevations set the operational tier for the coordinated operation of Lake Powell and Lake Mead during 2017.

Consistent with Section 6.B of the Interim Guidelines, Lake Powell's operations in water year 2017 will be governed by the Upper Elevation Balancing Tier, with an initial water year release volume of 8.23 million acre-feet (maf) and the potential for an April adjustment to equalization or balancing releases in April 2017. This February 2017 24-Month Study indicates that, consistent with Section 6.B.4 of the Interim Guidelines, an April adjustment to balancing releases is projected to occur and Lake Powell is projected to release 9.0 maf in water year 2017.

Consistent with Section 2.B.5 of the Interim Guidelines, the Intentionally Created Surplus (ICS) Surplus Condition is the criterion governing the operation of Lake Mead for calendar year 2017.

The Interim Guidelines are available for download at:
https://www.usbr.gov/lc/region/programs/strategies/RecordofDecision.pdf.
The 2017 AOP is available for download at:
https://www.usbr.gov/uc/water/rsvrs/ops/aop/AOP17.pdf.

Fontenelle Reservoir – Fontenelle Reservoir is currently at elevation 6,483 feet above sea level (feet), which amounts to 53 percent of live storage capacity. Inflows for the month of January totaled 44,600 acre-feet (af), or 148 percent of average. Average to above average inflows are forecasted over the next few months and releases have been increased in order to meet the spring elevation target. Releases have been set to base flow levels of 1,025 cubic feet per second (cfs) and are forecasted to remain at this level through the winter. Flows are anticipated to increase to 1,750 cfs on March 1, 2017 or whenever downstream icing threats have passed.

The Colorado Basin River Forecast Center has forecasted spring inflows that are above average. February, March, and April forecasted inflow volumes amount to 35,000 af (126 percent of average), 60,000 af (114 percent of average), and 120,000 af (140 percent of average), respectively.

The next Fontenelle Working Group meeting is scheduled for 10:00 a.m., April 19, 2017. The meeting will be held at Seedskadee Wildlife Refuge Headquarters, Wyoming. The Fontenelle Working Group is an open public forum for information exchange between Reclamation and other parties associated with the operation of Fontenelle Reservoir.

Flaming Gorge Reservoir – Releases are currently 1,800 cfs and expected to increase within the allowable parameters of the ROD up to 2,950 cfs through the end of February.

Unregulated inflow into Flaming Gorge Reservoir during the month of January was 49,000 af, or 122 percent of average. The reservoir elevation is 6,022.9 feet (82 percent of live capacity) and decreasing.

The February final forecast for inflows for the next three months projects above average conditions: February, March and April forecasted inflow volumes at 50,000 af (112 percent of average), 135,000 af (132 percent of average), and 225,000 af (169 percent of average), respectively.

The February water supply forecast of the April through July unregulated inflow volume into Flaming Gorge Reservoir is 1.65 maf (169 percent of average). Additional storms throughout the basin increased the current projection to 2 maf (~200 percent of average). Current snowpack is 180 percent of median and we have received 117 percent of the season peak for the Upper Green Basin with additional storm systems anticipated through February.

The Flaming Gorge Working Group is an open public forum for information exchange between Reclamation and the stakeholders of Flaming Gorge Dam. The public is

encouraged to attend and comment on the operations and plans presented by Reclamation at these meetings. Meeting notes from past Working Group meetings are posted on the Working Group webpage. For more information on this group and these meetings please contact Dale Hamilton at 801-379-1186 or Heather Patno at 801-524-3883.

Reclamation will be holding the Flaming Gorge Working Group meeting on Thursday, April 20, 2017, at 10:00 a.m. at the Utah Division of Wildlife Resources offices located at 318 North Vernal Avenue, Vernal, Utah.

Aspinall Unit Reservoirs – Crystal Dam is currently releasing 1,200 cfs and the Gunnison Tunnel diversion is shut down for the 2016 irrigation season. The average flow through the Black Canyon is measuring approximately 1,200 cfs at the stream gage below Gunnison Tunnel. The January unregulated inflow to Blue Mesa Reservoir was 28,600 af (119 percent of average). The end of January reservoir elevation for Blue Mesa was 7,490.68 feet with a live storage content in Blue Mesa of 584,000 af (70.4 percent full).

January was significantly wet in the Gunnison River Basin and the snowpack conditions increased significantly. On January 1, 2017 the Upper Gunnison Basin percent of median snow water equivalent was 117 percent of median for that date. On January 31, 2017 that percentage had increased to 167 percent of median for that date. As of the timing of this update (February 9, 2017) the snowpack is 163 percent of median for that date.

Unregulated Inflows to Blue Mesa for the next three months (February, March and April) are projected to be: 21,000 af (96 percent of average), 36,000 af (91 percent of average) and 95,000 af (100 percent of average), respectively. The April through July unregulated inflow forecast increased from 575,000 af (86 percent of average) for January to 925,000 af (137 percent of average) for February. The February 24-Month Study is reflective of this new forecast.

The Aspinall Unit Working Group is an open public forum for information exchange between Reclamation and the stakeholders of the Aspinall Unit. The public is encouraged to attend and comments on the operations and plans presented by Reclamation at these meetings. Meeting notes from past working Group meetings are posted on the Working Group webpage. For more information on this group and these meetings please contact Erik Knight in the Grand Junction Area Office at (970) 248-0629.

The next meeting of the Aspinall Unit Working Group will be held on Thursday, April 27th, 2017 at 1:00 pm at the Western Colorado Area Office located at 445 West Gunnison Avenue in Grand Junction, Colorado.

Navajo Reservoir – As of February 6, 2017, Navajo reservoir elevation is 6,056.9 feet (1.306 maf live storage) and is releasing 500 cfs. Releases are made for the authorized purposes of the Navajo Unit, and pursuant to the 2006 Record of Decision, in an attempt to maintain a target base flow through the endangered fish critical habitat reach of the

San Juan River (Farmington to Lake Powell). The San Juan River Basin Recovery Implementation Program (SJRIP) recommends a target base flow of between 500 cfs and 1,000 cfs through the critical habitat area. The target base flow is calculated as the weekly average of gaged flows throughout the critical habitat area.

Modified unregulated inflow into Navajo in January was 35,192 af, which was 161 percent of average for the month. Releases in January averaged 376 cfs and totaled 23,092 af, or 59 percent of average.

Inflows for the next three months are projected to be below average: with February, March, and April forecasted inflow volumes at 35,000 af (116 percent of average), 120,000 af (130 percent of average), and 190,000 af (111 percent of average), respectively.

The Most Probable April-July runoff forecast is 880,000 af (119 percent of average). Under the current Most Probable forecast, Navajo has enough available water for a spring peak release of 60 days at 5,000 cfs.

Releases will be made to maintain the target baseflow in the critical habitat reach for the remainder of the fall and winter and will likely range between 350 and 500 cfs. Under the most probable forecast, Navajo will peak at an elevation of 6,071 feet in early May.

Reclamation conducts Public Operations Meetings three times per year to gather input for determining upcoming operations for Navajo Reservoir. Input from individuals, organizations, and agencies along with other factors such as weather, water rights, endangered species requirements, flood control, hydro power, recreation, fish and wildlife management, and reservoir levels, will be considered in the development of these reservoir operation plans. In addition, the meetings are used to coordinate activities and exchange information among agencies, water users, and other interested parties concerning the San Juan River and Navajo Reservoir.

The next Navajo Public Operations Coordination Meeting is scheduled for April 25th, 2017, at 1pm at the Farmington Civic Center, Farmington, NM.

Glen Canyon Dam / Lake Powell

Current Status

The unregulated inflow to Lake Powell in January was 359 thousand acre-feet (kaf) (99 percent of average). The release volume from Glen Canyon Dam in January was 880 kaf. The end of January elevation and storage of Lake Powell were 3,596 feet (104 feet from full pool) and 11.4 maf (47 percent of full capacity), respectively. The reservoir is declining and will continue to decline until spring runoff begins to enter the reservoir. The current snowpack above Lake Powell is 159 percent of median.

Current Operations

The operating tier for water year 2017, established in August 2016, is the Upper Elevation Balancing Tier, with an initial water year release volume of 8.23 maf and the

potential for an April 2017 adjustment to equalization or balancing releases. Based on the current forecast, an April adjustment to balancing releases is projected to occur and Lake Powell is currently projected to release 9.0 maf in water year 2017. This projection will be updated each month throughout the water year.

In February 2017, the release volume will be approximately 715 kaf, with fluctuations anticipated between approximately 9,000 cfs and 15,000 cfs and consistent with the Glen Canyon Operating Criteria (Federal Register, Volume 62, No. 41, March 3, 1997). The anticipated release volume for March is approximately 720 kaf with daily fluctuations between approximately 8,000 cfs and 14,000 cfs. The expected release for April is 645 kaf with daily fluctuations between approximately 8,000 cfs and 14,000 cfs.

In addition to daily scheduled fluctuations for power generation, the instantaneous releases from Glen Canyon Dam may also fluctuate to provide 40 megawatts (mw) of system regulation. These instantaneous release adjustments stabilize the electrical generation and transmission system and translate to a range of up to about 1,200 cfs above or below the hourly scheduled release rate. Under system normal conditions, fluctuations for regulation are typically short lived and generally balance out over the hour with minimal or no noticeable impacts on downstream river flow conditions.

Releases from Glen Canyon Dam can also fluctuate beyond scheduled releases when called upon to respond to unscheduled power outages or power system emergencies. Depending on the severity of the system emergency, the response from Glen Canyon Dam can be significant, within the full range of the operating capacity of the power plant for as long as is necessary to maintain balance in the transmission system. Glen Canyon Dam currently maintains 27 mw (approximately 800 cfs) of generation capacity in reserve in order to respond to a system emergency even when generation rates are already high. System emergencies occur fairly infrequently and typically require small responses from Glen Canyon Dam. However, these responses can have a noticeable impact on the river downstream of Glen Canyon Dam.

Inflow Forecasts and Model Projections

The April to July 2017 water supply forecast for unregulated inflow to Lake Powell, issued on February 2, 2017, by the Colorado Basin River Forecast Center, projects that the most probable (median) unregulated inflow volume will be 9.6 maf (134 percent of average based on the period 1981-2010). The projected water year 2017 inflow is 13.2 maf (122 percent of average). At this early point in the season, there is still significant uncertainty regarding this year's water supply. The April-July forecast ranges from a minimum probable of 6.6 maf (92 percent of average) to a maximum probable of 13.5 maf (189 percent of average). There is a 10 percent chance that inflows could be higher than the current maximum probable forecast and a 10 percent chance that inflows could be lower than the minimum probable forecast.

Based on the current forecast , the February 24-Month Study projects Lake Powell elevation will end water year 2017 near 3,640 feet with approximately 16.0 maf in storage (66 percent of capacity). Note that projections of elevation and storage for water year 2017 have significant uncertainty at this point in the season. Projections of elevation and storage using the minimum and maximum probable inflow forecast, updated in

January, are 3,586 feet (10.4 maf, 43 percent of capacity) and 3,640 feet (16.0 maf, 66 percent of capacity), respectively. One thing to point out here, the February most probable has increased to the January maximum probable in just one month. Under these scenarios, there is a 10 percent chance that inflows will be higher, resulting in higher elevation and storage, and 10 percent chance that inflows will be lower, potentially in lower elevation and storage. The annual release volume from Lake Powell during water year 2017 is projected to be 9.0 maf under the minimum, most, and maximum probable inflow scenarios. There is a chance that inflows could be higher or lower, potentially resulting in releases greater than 9.0 maf or as low as 8.23 maf in water year 2017. Modeling of projected reservoir operations based on the minimum and maximum scenarios will be updated again in April.

Upper Colorado River Basin Hydrology

The Upper Colorado River Basin regularly experiences significant year to year hydrologic variability. During the 17-year period 2000 to 2015, however, the unregulated inflow to Lake Powell, which is a good measure of hydrologic conditions in the Colorado River Basin, was above average in only 3 out of the past 17 years. The period 2000-2016 is the lowest 17-year period since the closure of Glen Canyon Dam in 1963, with an average unregulated inflow of 8.57 maf, or 79 percent of the 30-year average (1981-2010). (For comparison, the 1981-2010 total water year average is 10.83 maf.) The unregulated inflow during the 2000-2016 period has ranged from a low of 2.64 maf (24 percent of average) in water year 2002 to a high of 15.97 maf (147 percent of average) in water year 2011. In water year 2016 unregulated inflow volume to Lake Powell was 9.62 maf (89 percent of average), which, though still below average, was significantly higher than inflows observed in 2012 and 2013 (45 percent and 47 percent of average, respectively). Under the current most probable forecast, the total water year 2017 unregulated inflow to Lake Powell is projected to be 13.5 maf (189 percent of average).

At the beginning of water year 2017, total system storage in the Colorado River Basin was 30.2 maf (50 percent of 59.6 maf total system capacity). This is nearly the same as the total storage at the beginning of water years 2015 and 2016 which began at 30.1 maf and 30.3 maf, respectively, both of which were 50 percent of capacity. Since the beginning of water year 2000, total Colorado Basin storage has experienced year to year increases and decreases in response to wet and dry hydrology, ranging from a high of 94 percent of capacity at the beginning of 2000 to a low of 50 percent of capacity at the beginning of water year 2005. One wet year can significantly increase total system reservoir storage, just as persistent dry years can draw down the system storage. Based on current inflow forecasts, the current projected end of water year total Colorado Basin reservoir storage for water year 2017 is approximately 29.8 maf (50 percent of total system capacity). The actual end of water year 2017 system storage may vary from this projection, primarily due to uncertainty regarding the season's snowpack and resulting runoff and reservoir inflow. Based on the January minimum and maximum probable inflow forecasts and modeling, the range of end of water year 2017 total system capacity is approximately 27.3 maf (46 percent of capacity) to 33.5 maf (56 percent of capacity), respectively.

March 24-Month Study
Date: March 14, 2017

From: Water Resources Group, Salt Lake City
To: All Colorado River Annual Operating Plan (AOP) Recipients

Current Reservoir Status

Reservoir	February Inflow (unregulated) (acre-feet)	Percent of Average (%)	March 13, Midnight Elevation (feet)	March 13, Midnight Reservoir Storage (acre-feet)
Fontenelle	51,000	184	6,483.38	185,000
Flaming Gorge	106,000	236	6,022.93	3,084,000
Blue Mesa	28,000	127	7,486.31	553,000
Navajo	55,000	161	6,060.55	1,355,000
Powell	555,000	141	3,593.90	11,180,000

Expected Operations

The operation of Lake Powell and Lake Mead in this March 2017 24-Month Study is pursuant to the December 2007 Record of Decision on Colorado River Interim Guidelines for Lower Basin Shortages and the Coordinated Operations of Lake Powell and Lake Mead (Interim Guidelines), and reflects the 2017 Annual Operating Plan (AOP). Pursuant to the Interim Guidelines, the August 2016 24-Month Study projections of the January 1, 2017, system storage and reservoir water surface elevations set the operational tier for the coordinated operation of Lake Powell and Lake Mead during 2017.

Consistent with Section 6.B of the Interim Guidelines, Lake Powell's operations in water year 2017 will be governed by the Upper Elevation Balancing Tier, with an initial water year release volume of 8.23 million acre-feet (maf) and the potential for an April adjustment to equalization or balancing releases in April 2017. The March 2017 24-Month Study projects an April adjustment to equalization, consistent with Section 6.B.3 of the Interim Guidelines, with a projected release of 11.1 maf in water year 2017.

Since the March final forecast was issued on March 2, 2017, the Colorado Basin River Forecast Center Ensemble Streamflow Prediction indicates a decrease in the forecasted inflow. It is unlikely that the March final forecasted inflow will be sustained in the April final forecast. The April 24-Month Study projections are used to determine whether there is an adjustment to equalization or balancing under the

Interim Guidelines governing Lake Powell releases for the remainder of water year 2017.

Consistent with Section 2.B.5 of the Interim Guidelines, the Intentionally Created Surplus (ICS) Surplus Condition is the criterion governing the operation of Lake Mead for calendar year 2017.

The Interim Guidelines are available for download at:
https://www.usbr.gov/lc/region/programs/strategies/RecordofDecision.pdf.
The 2017 AOP is available for download at:
https://www.usbr.gov/uc/water/rsvrs/ops/aop/AOP17.pdf.

Fontenelle Reservoir – Fontenelle Reservoir is currently at elevation 6482 feet above sea level (feet), which amounts to 51 percent of live storage capacity. Inflows for the month of January totaled 44,600 acre-feet (af), or 148 percent of average. Above average inflows are forecasted over the next few months and releases have been increased in order to meet the spring elevation target. Releases have been set to base flow levels of 1,025 cubic feet per second (cfs) and are anticipated to increase to 2,025 cfs whenever downstream icing threats have passed.

The Colorado Basin River Forecast Center has forecasted spring inflows that are significantly above average. March, April, and May forecasted inflow volumes amount to 88,000 af (167 percent of average), 200,000 af (234 percent of average), and 410,000 af (250 percent of average), respectively.

The next Fontenelle Working Group meeting is scheduled for 10:00 a.m., April 19, 2017. The meeting will be held at Seedskadee Wildlife Refuge Headquarters, Wyoming. The Fontenelle Working Group is an open public forum for information exchange between Reclamation and other parties associated with the operation of Fontenelle Reservoir.

Flaming Gorge Reservoir – Releases are currently increasing to power plant capacity (~4,600 cfs) by March 9, 2017, and are expected to remain at this level through March.

Unregulated inflow into Flaming Gorge Reservoir during the month of February was 105,000 af, or 236 percent of average. The reservoir elevation is 6,022.7 feet (82 percent of live capacity) and decreasing.

The March final forecast for inflows for the next three months projects above average conditions: March, April and May forecasted inflow volumes at 250,000 af (244 percent of average), 340,000 af (255 percent of average), and 615,000 af (251 percent of average), respectively.

The March water supply forecast of the April through July unregulated inflow volume into Flaming Gorge Reservoir is 2.26 maf (231 percent of average). Current snowpack is 176 percent of median and we have received 146 percent of the season peak for the Upper Green Basin with additional storm systems anticipated.

The Flaming Gorge Working Group is an open public forum for information exchange between Reclamation and the stakeholders of Flaming Gorge Dam. The public is encouraged to attend and comment on the operations and plans presented by Reclamation at these meetings. Meeting notes from past Working Group meetings are posted on the Working Group webpage. For more information on this group and these meetings please contact Dale Hamilton at 801-379-1186 or Heather Patno at 801-524-3883.

Reclamation will be holding the Flaming Gorge Working Group meeting on Thursday, April 20, 2017, at 10:00 a.m. at the Utah Division of Wildlife Resources offices located at 318 North Vernal Avenue, Vernal, Utah.

Aspinall Unit Reservoirs – Crystal Dam is currently releasing 1,200 cfs and the Gunnison Tunnel diversion is shut down for the 2016 irrigation season. The average flow through the Black Canyon is measuring approximately 1,200 cfs at the stream gage below Gunnison Tunnel. The February unregulated inflow to Blue Mesa Reservoir was 28,000 af (127 percent of average). The end of February reservoir elevation for Blue Mesa was 7,488.71 feet with live storage in Blue Mesa measuring approximately 571,400 af (68.9 percent full).

For the Gunnison River Basin, February was a continuation of the wet conditions observed in January. On January 31, 2017, the snow pack in the basin measured approximately 167 percent of the median for that date. At the end of February, on February 28, 2017, the snowpack in the basin was still well above normal with 152 percent of median for that date. As of the timing of this update (March 14, 2017) the snowpack is 140 percent of median for this date.

Unregulated Inflows to Blue Mesa for the next three months (March, April and May) are forecasted to be: 40,000 af (111 percent of average), 100,000 af (130 percent of average) and 300,000 af (149 percent of average), respectively. The April through July unregulated inflow forecast increased from 925,000 af (137 percent of average) for February to 970,000 af (144 percent of average) for March. The March 24-Month Study is reflective of this new forecast.

The Aspinall Unit Working Group is an open public forum for information exchange between Reclamation and the stakeholders of the Aspinall Unit. The public is encouraged to attend and comments on the operations and plans presented by Reclamation at these meetings. Meeting notes from past working Group meetings are posted on the Working Group webpage. For more information on this group and these meetings please contact Erik Knight in the Grand Junction Area Office at (970) 248-0629.

The next meeting of the Aspinall Unit Working Group will be held on Thursday, April 27th, 2017 at 1:00 pm at the Western Colorado Area Office located at 445 West Gunnison Avenue in Grand Junction, Colorado.

Navajo Reservoir – As of March 7th, 2017, Navajo reservoir elevation is 6059.7 feet (1.344 maf live storage) and is releasing 500 cfs. Releases are made for the authorized purposes of the Navajo Unit, and pursuant to the 2006 Record of Decision, in an attempt to maintain a target base flow through the endangered fish critical habitat reach of the San Juan River (Farmington to Lake Powell). The San Juan River Basin Recovery Implementation Program (SJRIP) recommends a target base flow of between 500 cfs and 1,000 cfs through the critical habitat area. The target base flow is calculated as the weekly average of gaged flows throughout the critical habitat area.

Modified unregulated inflow into Navajo in January was 55,418 af, which was 183 percent of average for the month. Releases in January averaged 476 cfs and totaled 26,456 af, or 56 percent of average.

Inflows for the next three months are projected to be below average: with March, April, and May forecasted inflow volumes at 120 kaf (134 percent of average), 182 kaf (107 percent of average), and 320 kaf (115 percent of average), respectively.

The Most Probable April-July runoff forecast is 840,000 af (114 percent of average). Under the current Most Probable forecast, Navajo has enough available water for a spring peak release of 50 days at 5,000 cfs. The ramp-up lasting 2-3 weeks would likely begin the last week of April. A public informational meeting regarding the spring peak release is scheduled for April 5th, 2017, at 6pm at the Farmington Civic Center, Farmington, NM.

Releases will be made to maintain the target baseflow in the critical habitat reach for the remainder of the fall and winter and will likely range between 350 and 500 cfs. Under the most probable forecast, Navajo will peak at an elevation of 6073 ft in late April.

Reclamation conducts Public Operations Meetings three times per year to gather input for determining upcoming operations for Navajo Reservoir. Input from individuals, organizations, and agencies along with other factors such as weather, water rights, endangered species requirements, flood control, hydro power, recreation, fish and wildlife management, and reservoir levels, will be considered in the development of these reservoir operation plans. In addition, the meetings are used to coordinate activities and exchange information among agencies, water users, and other interested parties concerning the San Juan River and Navajo Reservoir.

The next Navajo Public Operations Coordination Meeting is scheduled for April 25th, 2017, at 1pm at the Farmington Civic Center, Farmington, NM.

Glen Canyon Dam / Lake Powell

Current Status

The unregulated inflow volume to Lake Powell in February was 555 thousand acre-feet (kaf) (141 percent of average). The release volume from Glen Canyon Dam in February was 711 kaf. The end of February elevation and storage of Lake Powell were 3,594 feet

(106 feet from full pool) and 11.2 maf (46 percent of full capacity), respectively. The reservoir is declining and will continue to decline until spring runoff begins to enter the reservoir. The current snowpack above Lake Powell is 147 percent of median.

Current Operations

The operating tier for water year 2017, established in August 2016, is the Upper Elevation Balancing Tier, with an initial water year release volume of 8.23 maf and the potential for an April 2017 adjustment to equalization or balancing releases. Based on the March 1 forecast, an April adjustment to equalization releases is projected to occur and Lake Powell is currently projected to release 11.1 maf in water year 2017. This is only a projection, the actual April forecast and 24 Month Study will determine the final 2017 volume release from Glen Canyon Dam.

It should be noted that since the March final forecast was issued on March 2, 2017, the Colorado Basin River Forecast Center Ensemble Streamflow Prediction indicates a decrease in the forecasted inflow. It is unlikely that the March final forecasted inflow will be sustained in the April final forecast. The April 24-Month Study projections are used to determine whether there is an adjustment to equalization or balancing under the Interim Guidelines governing Lake Powell releases for the remainder of water year 2017.

In March 2017, the release volume will be approximately 720 thousand acre-feet (kaf), with fluctuations anticipated between approximately 8,000 cfs and 14,000 cfs and consistent with the Glen Canyon Operating Criteria (Federal Register, Volume 62, No. 41, March 3, 1997). The anticipated release volume for April is approximately 710 kaf with daily fluctuations between approximately 9,000 cfs and 15,000 cfs. The expected release for May is 1,020 kaf with daily fluctuations between approximately 12,300 cfs and 20,300 cfs.

In addition to daily scheduled fluctuations for power generation, the instantaneous releases from Glen Canyon Dam may also fluctuate to provide 40 mega-watts (mw) of system regulation. These instantaneous release adjustments stabilize the electrical generation and transmission system and translate to a range of up to about 1,200 cfs above or below the hourly scheduled release rate. Under system normal conditions, fluctuations for regulation are typically short lived and generally balance out over the hour with minimal or no noticeable impacts on downstream river flow conditions.

Releases from Glen Canyon Dam can also fluctuate beyond scheduled releases when called upon to respond to unscheduled power outages or power system emergencies. Depending on the severity of the system emergency, the response from Glen Canyon Dam can be significant, within the full range of the operating capacity of the power plant for as long as is necessary to maintain balance in the transmission system. Glen Canyon Dam currently maintains 27 mw (approximately 800 cfs) of generation capacity in reserve in order to respond to a system emergency even when generation rates are already high. System emergencies occur fairly infrequently and typically require small responses

from Glen Canyon Dam. However, these responses can have a noticeable impact on the river downstream of Glen Canyon Dam.

Inflow Forecasts and Model Projections

The April to July 2017 water supply forecast for unregulated inflow to Lake Powell, issued on March 2, 2017, by the Colorado Basin River Forecast Center, projects that the most probable (median) unregulated inflow volume will be 10.4 maf (145 percent of average based on the period 1981-2010). The projected water year 2017 inflow is 14.3 maf (132 percent). At this early point in the season, there is still significant uncertainty regarding this year's water supply. The April-July forecast ranges from a minimum probable of 7.6 maf (106 percent) to a maximum probable of 13.8 maf (193 percent). There is a 10 percent chance that inflows could be higher than the current maximum probable forecast and a 10 percent chance that inflows could be lower than the minimum probable forecast.

Based on the current forecast , the March 24-Month Study projects Lake Powell to operate for equalization, resulting in a 2017 end of water year elevation near 3,632 feet with approximately 15.0 maf in storage (62 percent capacity). Note that projections of elevation and storage for water year 2017 have significant uncertainty at this point in the season. Projections of elevation and storage using the minimum and maximum probable inflow forecast, updated in January, are 3,586 feet (10.4 maf, 43 percent capacity) and 3,640 feet (16.0 maf, 66 percent capacity), respectively. Under these scenarios, there is a 10 percent chance that inflows will be higher, resulting in higher elevation and storage, and 10 percent chance that inflows will be lower, potentially in lower elevation and storage. The annual release volume from Lake Powell during water year 2017 is projected to be 11.1 maf under the most and maximum probable inflow, and 9.0 maf under the minimum scenarios. There is a chance that inflows could be higher or lower, potentially resulting in releases greater than 11.1 maf or as low as 8.23 maf in water year 2017. Modeling of projected reservoir operations based on the minimum and maximum scenarios will be updated again in April.

Upper Colorado River Basin Hydrology

The Upper Colorado River Basin regularly experiences significant year to year hydrologic variability. During the 17-year period 2000 to 2016, however, the unregulated inflow to Lake Powell, which is a good measure of hydrologic conditions in the Colorado River Basin, was above average in only 3 out of the past 17 years. The period 2000-2016 is the lowest 17-year period since the closure of Glen Canyon Dam in 1963, with an average unregulated inflow of 8.57 maf, or 79 percent of the 30-year average (1981-2010). (For comparison, the 1981-2010 total water year average is 10.83 maf.) The unregulated inflow during the 2000-2016 period has ranged from a low of 2.64 maf (24 percent of average) in water year 2002 to a high of 15.97 maf (147 percent of average) in water year 2011. In water year 2016 unregulated inflow volume to Lake Powell was 9.62 maf (89 percent of average), which, though still below average, was significantly higher than inflows observed in 2012 and 2013 (45 percent and 47 percent of average, respectively). Under the current most probable forecast, the total water year

2017 unregulated inflow to Lake Powell is projected to be 14.3 maf (132 percent of average).

At the beginning of water year 2017, total system storage in the Colorado River Basin was 30.2 maf (50 percent of 59.6 maf total system capacity). This is nearly the same as the total storage at the beginning of water years 2015 and 2016 which began at 30.1 maf and 30.3 maf, respectively, both of which were 50 percent of capacity. Since the beginning of water year 2000, total Colorado Basin storage has experienced year to year increases and decreases in response to wet and dry hydrology, ranging from a high of 94% of capacity at the beginning of 2000 to a low of 50 percent of capacity at the beginning of water year 2005. One wet year can significantly increase total system reservoir storage, just as persistent dry years can draw down the system storage. Based on current inflow forecasts, the current projected end of water year total Colorado Basin reservoir storage for water year 2017 is approximately 32.8 maf (55 percent of total system capacity). The actual end of water year 2017 system storage may vary from this projection, primarily due to uncertainty regarding the season's snowpack and resulting runoff and reservoir inflow. Based on the January minimum and maximum probable inflow forecasts and modeling, the range of end of water year 2017 total system capacity is approximately 27.3 maf (46 percent) to 33.5 maf (56 percent), respectively.

April 24-Month Study
Date: April 17, 2017

From: Water Resources Group, Salt Lake City
To: All Colorado River Annual Operating Plan (AOP) Recipients

Current Reservoir Status

Reservoir	March Inflow (unregulated) (acre-feet)	Percent of Average (%)	April 16, Midnight Elevation (feet)	April 16, Midnight Reservoir Storage (acre-feet)
Fontenelle	180,000	343	6,476.25	148,000
Flaming Gorge	400,000	391	6,024.27	3,133,000
Blue Mesa	74,000	205	7,493.08	606,000
Navajo	177,000	185	6,073.79	1,534,000
Powell	1,109,000	167	3,599.67	11,718,000

Expected Operations

The operation of Lake Powell and Lake Mead in this April 2017 24-Month Study is pursuant to the December 2007 Record of Decision on Colorado River Interim Guidelines for Lower Basin Shortages and the Coordinated Operations of Lake Powell and Lake Mead (Interim Guidelines), and reflects the 2017 Annual Operating Plan (AOP). Pursuant to the Interim Guidelines, the August 2016 24-Month Study projections of the January 1, 2017, system storage and reservoir water surface elevations set the operational tier for the coordinated operation of Lake Powell and Lake Mead during 2017.

Consistent with Section 6.B of the Interim Guidelines, the Lake Powell operational tier for water year 2017 is the Upper Elevation Balancing Tier. With an 8.23 million acre-feet (maf) release from Lake Powell in water year 2017, the April 2017 24-Month Study projects the end of water year elevation at Lake Powell to be above 3,575 feet above sea level (feet), and the end of water year elevation at Lake Mead to be below 1,075 feet. Therefore, in accordance with Section 6.B.4 of the Interim Guidelines, Lake Powell operations will shift to balancing releases for the remainder of water year 2017. Under Section 6.B.4, the contents of Lake Powell and Lake Mead will be balanced by the end of the water year, but not more than 9.0 maf and not less than 8.23 maf shall be released from Lake Powell. Based on the most probable inflow forecast, this April 24-Month Study projects a balancing release of 9.0 maf in water year 2017; however, the actual release in water year 2017 will depend on hydrology in the remainder of water year and

will range from 8.23 to 9.0 maf. The projected release from Lake Powell in water year 2017 will be updated each month throughout the remainder of the water year.

Consistent with Section 2.B.5 of the Interim Guidelines, the Intentionally Created Surplus (ICS) Surplus Condition is the criterion governing the operation of Lake Mead for calendar year 2017.

The Interim Guidelines are available for download at:
https://www.usbr.gov/lc/region/programs/strategies/RecordofDecision.pdf.
The 2017 AOP is available for download at:
https://www.usbr.gov/uc/water/rsvrs/ops/aop/AOP17.pdf.

Fontenelle Reservoir – Fontenelle Reservoir is currently at elevation 6478 feet, which amounts to 46 percent of live storage capacity. Inflows for the month of March totaled 180,360 acre-feet (af), or 343 percent of average. Significantly above average inflows are forecasted over the next few months and releases have been adjusted to meet the spring elevation target. Releases have been set to 5,000 cubic feet per second (cfs) and are anticipated to remain steady until inflows into the reservoir increase.

The Colorado Basin River Forecast Center has forecasted spring inflows that are significantly above average. April, May, and June forecasted inflow volumes amount to 240,000 af (280 percent of average), 390,000 af (238 percent of average), and 650,000 af (214 percent of average), respectively.

The next Fontenelle Working Group meeting is scheduled for 10:00 a.m., April 19, 2017. The meeting will be held at Seedskadee Wildlife Refuge Headquarters, Wyoming. The Fontenelle Working Group is an open public forum for information exchange between Reclamation and other parties associated with the operation of Fontenelle Reservoir.

Flaming Gorge Reservoir – Releases are currently at full power plant capacity (~4,600 cfs) and full bypass capacity (4,000 cfs) for a total release of ~8,600 cfs, and are expected to remain at this level through June.

Unregulated inflow into Flaming Gorge Reservoir during the month of March was 400,000 af, or 392 percent of average, and constitutes the new record inflow for the historic period of record. The reservoir elevation is 6,024.7 (84 percent of live capacity) and decreasing.

The April final forecast for inflows for the next three months projects above average conditions: April, May and June forecasted inflow volumes at 430,000 af (322 percent of average), 615,000 af (251 percent of average), and 750,000 af (192 percent of average), respectively.

The April water supply forecast of the April through July unregulated inflow volume into Flaming Gorge Reservoir is 2.26 million acre-feet (231 percent of average). Current

snowpack is 164 percent of median and we have received 159 percent of the season peak for the Upper Green Basin with additional storm systems anticipated.

The Flaming Gorge Working Group is an open public forum for information exchange between Reclamation and the stakeholders of Flaming Gorge Dam. The public is encouraged to attend and comment on the operations and plans presented by Reclamation at these meetings. Meeting notes from past Working Group meetings are posted on the Working Group webpage. For more information on this group and these meetings please contact Dale Hamilton at 801-379-1186 or Heather Patno at 801-524-3883.

Reclamation will be holding the Flaming Gorge Working Group meeting on Thursday, April 20, 2017, at 10:00 a.m. at the Utah Division of Wildlife Resources offices located at 318 North Vernal Avenue, Vernal, Utah.

Aspinall Unit Reservoirs – Crystal Dam is currently releasing 1,300 cfs and the Uncompahgre Valley Water Users Association has started diverting water through the Gunnison Tunnel. Currently, tunnel diversions are approximately 700 cfs and the flows in the Black Canyon are approximately 600 cfs. The March unregulated inflow to Blue Mesa Reservoir was 74,000 af (205 percent of average). The end of February reservoir elevation for Blue Mesa was 7,488.71 feet with live storage in Blue Mesa measuring approximately 571,400 af (69 percent full).

For the Gunnison River Basin, the first half of March was very dry and warm resulting in decreased snowpack levels. However, conditions improved during the second half of March and the snowpack nearly recovered to the level it was at the beginning of March. On April 1, 2017 the snowpack above Crystal Reservoir measured 123 percent of median. As of the timing of this update (April 17, 2017) the melting of the snowpack has begun and currently measures 108 percent of median for this date.

Unregulated Inflows to Blue Mesa for the next three months (April, May and June) are projected to be: 130,000 af (168 percent of average), 305,000 af (138 percent of average) and 365,000 af (140 percent of average), respectively. The April through July unregulated inflow forecast decreased from 970,000 af (144 percent of average) for March to 930,000 af (138 percent of average) for April. The April 24-Month Study is reflective of this new forecast.

The Aspinall Unit Working Group is an open public forum for information exchange between Reclamation and the stakeholders of the Aspinall Unit. The public is encouraged to attend and comments on the operations and plans presented by Reclamation at these meetings. Meeting notes from past working Group meetings are posted on the Working Group webpage. For more information on this group and these meetings please contact Erik Knight in the Grand Junction Area Office at (970) 248-0629.

The next meeting of the Aspinall Unit Working Group will be held on Thursday, April 27th, 2017 at 1:00 pm at the Western Colorado Area Office located at 445 West Gunnison Avenue in Grand Junction, Colorado.

Navajo Reservoir – As of April 6, 2017, Navajo reservoir elevation is 6070.6 feet (1.489 maf live storage) and is releasing 500 cfs. Releases are made for the authorized purposes of the Navajo Unit, and pursuant to the 2006 Record of Decision, in an attempt to maintain a target base flow through the endangered fish critical habitat reach of the San Juan River (Farmington to Lake Powell). The San Juan River Basin Recovery Implementation Program (SJRIP) recommends a target base flow of between 500 cfs and 1,000 cfs through the critical habitat area. The target base flow is calculated as the weekly average of gaged flows throughout the critical habitat area.

Modified unregulated inflow into Navajo for March was 176,809 af, which was 191percent of average for the month. Releases averaged 500 cfs and totaled 29,913 af.

The most probable modified-unregulated inflow forecast for April at Navajo is 200,000 af (119 percent of average), for May is 270,000 af (97 percent of average), and for June is 240,000 af (107 percent of average).

Under the current Most Probable April-July inflow forecast of 760,000 af (103 percent of average), Navajo has enough available water for a spring peak release of 40 days at 5,000 cfs. The ramp-up lasting 2-3 weeks will most likely begin between April 26th and May 3rd. The date will be finalized in the coming weeks. The start date is an estimate and will be entirely dependent on spring temperatures and the runoff timing of the Animas River, as Navajo releases are timed to match the peak on the Animas. Navajo reservoir elevaton is currently expected to peak at 6077 feet in late April just before the spring peak release begins.

Reclamation conducts Public Operations Meetings three times per year to gather input for determining upcoming operations for Navajo Reservoir. Input from individuals, organizations, and agencies along with other factors such as weather, water rights, endangered species requirements, flood control, hydro power, recreation, fish and wildlife management, and reservoir levels, will be considered in the development of these reservoir operation plans. In addition, the meetings are used to coordinate activities and exchange information among agencies, water users, and other interested parties concerning the San Juan River and Navajo Reservoir.

The next Navajo Public Operations Coordination Meeting is scheduled for April 25, 2017, at 1p.m. at the Farmington Civic Center, Farmington, NM.

Glen Canyon Dam / Lake Powell

Current Status
The unregulated inflow volume to Lake Powell in March was 1,110 thousand acre-feet (kaf) (167 percent of average). The release volume from Glen Canyon Dam in March was 720 kaf. The end of March elevation and storage of Lake Powell were 3,596 feet

(104 feet from full pool) and 11.4 maf (47 percent of full capacity), respectively. The reservoir reached a seasonal low elevation on March 15th near elevation 3593.85 feet. Since that time the reservoir has been increasing as the first of the spring runoff is now entering the reservoir. The current snowpack above Lake Powell is 119 percent of median.

Current Operations

The operating tier for water year 2017 was established in August 2016 as the Upper Elevation Balancing Tier. In the Upper Elevation Balancing Tier the initial water year release volume is 8.23 maf; however, there is the possibility for an April adjustment to equalization or balancing operations to govern for the remainder of the water year. This April 2017 24-Month Study establishes that Lake Powell operations will shift to "balancing releases" for the remainder of water year 2017. Under Balancing, the contents of Lake Powell and Lake Mead will be balanced by the end of the water year, but not more than 9.0 maf and not less than 8.23 maf shall be released from Lake Powell. Based on the most probable inflow forecast, this April 24-Month Study projects a balancing release of 9.0 maf in water year 2017; the actual release in water year 2017, however, will depend on hydrology in the remainder of water year and will range from 8.23 to 9.0 maf. The projected release from Lake Powell in water year 2017 will be updated each month throughout the remainder of the water year. Reclamation will schedule operations at Glen Canyon Dam to achieve as practicably as possible the appropriate total annual release volume by September 30, 2017.

In April, the release volume will be approximately 620 kaf, with fluctuations anticipated between about 7,500 cfs in the nighttime to about 13,500 cfs in the daytime and consistent with the Glen Canyon Operating Criteria (Federal Register, Volume 62, No. 41, March 3, 1997). The anticipated release volume for May is 650 kaf with daily fluctuations between approximately 8,000 cfs and 14,000 cfs. The expected release for June is 750 kaf with daily fluctuations between approximately 9,000 cfs and 17,000 cfs.

In addition to daily scheduled fluctuations for power generation, the instantaneous releases from Glen Canyon Dam may also fluctuate to provide 40 megawatts (MW) of system regulation. These instantaneous release adjustments stabilize the electrical generation and transmission system and translate to a range of up to about 1,200 cfs above or below the hourly scheduled release rate. Under system normal conditions, fluctuations for regulation are typically short lived and generally balance out over the hour with minimal or no noticeable impacts on downstream river flow conditions.

Releases from Glen Canyon Dam can also fluctuate beyond scheduled releases when called upon to respond to unscheduled power outages or power system emergencies. Depending on the severity of the system emergency, the response from Glen Canyon Dam can be significant, within the full range of the operating capacity of the power plant for as long as is necessary to maintain balance in the transmission system. Glen Canyon Dam currently maintains 27 MW (approximately 800 cfs) of generation capacity in reserve in order to respond to a system emergency even when generation rates are already high. System emergencies occur fairly infrequently and typically require small responses

from Glen Canyon Dam. However, these responses can have a noticeable impact on the river downstream of Glen Canyon Dam.

Inflow Forecasts and Model Projections

The April to July 2017 water supply forecast for unregulated inflow to Lake Powell, issued on April 4, 2017, by the Colorado Basin River Forecast Center, projects that the most probable (median) unregulated inflow volume will be 9.3 maf (130 percent of average based on the period 1981-2010). The projected water year 2017 inflow is 13.5 maf (124 percent of average). At this early point in the season, there is still significant uncertainty regarding this year's water supply. The April-July forecast ranges from a minimum probable of 7.5 maf (105 percent of average) to a maximum probable of 12.0 maf (168 percent of average). There is a 10 percent chance that inflows could be higher than the current maximum probable forecast and a 10 percent chance that inflows could be lower than the minimum probable forecast.

As determined in the August 2016 24-Month Study, and documented in the 2017 Annual Operating Plan, Lake Powell's operations in water year 2017 will be governed by the Upper Elevation Balancing Tier. In this tier, the initial water year release volume is 8.23 maf, however, there is the potential for an April adjustment to equalization or balancing releases in April 2017. This April 2017 24-Month Study projects the end of water year elevation at Lake Powell to be above 3,575 feet and the end of water year elevation at Lake Mead to be below elevation 1,075 feet. Therefore, in accordance with Section 6.B.4 of the 2007 Interim Guidelines, Lake Powell operations will shift to "balancing releases" for the remainder of water year 2017. Under Section 6.B.4, the contents of Lake Powell and Lake Mead will be balanced by the end of the water year, but not more than 9.0 maf and not less than 8.23 maf shall be released from Lake Powell.

Based on the April most probable inflow forecast, the annual release volume from Lake Powell during water year 2017 is projected to be 9.0 maf. Under the minimum probable inflow scenario, the water year release is projected to be 9.0 maf. Under the maximum probable inflow scenario, the release is projected to be 9.0 maf. There 10 percent chance that inflows will be lower than the current minimum probable forecast, potentially resulting in lower releases. If inflows are less than the minimum probable forecast, the water year 2017 annual release could be as low as 8.23 maf. If inflows are greater than the current forecasted maximum probable inflow, the annual release will be 9.0 maf. The projected release from Lake Powell in water year 2017 will be updated each month throughout the remainder of the water year.

Based on the current forecast, the April 24-Month Study projects Lake Powell elevation will end water year 2017 near 3,641 feet with approximately 16.12 maf in storage (66 percent of capacity). Projections of elevation and storage still have significant uncertainty at this point in the season, primarily due to uncertainty regarding spring runoff and the resulting inflow to Lake Powell. Under the minimum probable inflow scenario, updated in April, the projected end of water year elevation and storage are 3,625 feet and 14.25 maf (59 percent of capacity), respectively. Under the maximum probable inflow scenario, updated in April, the projected end of water year elevation and storage are 3661 feet and 18.62 maf (77 percent of capacity), respectively. Modeling of

projected reservoir operations based on the minimum and maximum scenarios will be updated again in August.

Upper Colorado River Basin Hydrology

The Upper Colorado River Basin regularly experiences significant year to year hydrologic variability. During the 17-year period 2000 to 2016, however, the unregulated inflow to Lake Powell, which is a good measure of hydrologic conditions in the Colorado River Basin, was above average in only 3 out of the past 17 years. The period 2000-2016 is the lowest 17-year period since the closure of Glen Canyon Dam in 1963, with an average unregulated inflow of 8.57 maf, or 79 percent of the 30-year average (1981-2010). (For comparison, the 1981-2010 total water year average is 10.83 maf.) The unregulated inflow during the 2000-2016 period has ranged from a low of 2.64 maf (24% of average) in water year 2002 to a high of 15.97 maf (147 percent of average) in water year 2011. In water year 2016 unregulated inflow volume to Lake Powell was 9.62 maf (89 percent of average), which, though still below average, was significantly higher than inflows observed in 2012 and 2013 (45 and 47 percent of average, respectively). Under the current most probable forecast, the total water year 2017 unregulated inflow to Lake Powell is projected to be 13.47 maf (124 percent of average).

At the beginning of water year 2017, total system storage in the Colorado River Basin was 30.2 maf (51 percent of the 59.6 maf total system capacity). This is nearly the same as the total storage at the beginning of water years 2015 and 2016 which began at 30.1 maf and 30.3 maf, respectively, both of which were 51 percent of capacity. Since the beginning of water year 2000, total Colorado Basin storage has experienced year to year increases and decreases in response to wet and dry hydrology, ranging from a high of 94 percent of capacity at the beginning of 2000 to a low of 50 percent of capacity at the beginning of water year 2005. One wet year can significantly increase total system reservoir storage, just as persistent dry years can draw down the system storage. Based on current inflow forecasts, the current projected end of water year total Colorado Basin reservoir storage for water year 2017 is approximately 34.3 maf (58 percent of total system capacity). The actual end of water year 2017 system storage may vary from this projection, primarily due to uncertainty regarding the season's snowpack and resulting runoff and reservoir inflow. Based on the January minimum and maximum probable inflow forecasts and modeling, the range of end of water year 2017 total system capacity is approximately 32.43 maf (54 percent of capacity) to 37.0 maf (62 percent of capacity), respectively.

May 24-Month Study
Date: May 12, 2017

From: Water Resources Group, Salt Lake City
To: All Colorado River Annual Operating Plan (AOP) Recipients

Current Reservoir Status

Reservoir	April Inflow (unregulated) (acre-feet)	Percent of Average (%)	May 10, Midnight Elevation (feet)	May 10, Midnight Reservoir Storage (acre-feet)
Fontenelle	225,000	343	6,468.66	113,000
Flaming Gorge	350,000	391	6,022.27	3,061,000
Blue Mesa	145,000	193	7,502.33	681,000
Navajo	235,000	185	6,087.24	1,737,000
Powell	1,607,000	167	3,606.92	12,422,000

Expected Operations

The operation of Lake Powell and Lake Mead in this May 2017 24-Month Study is pursuant to the December 2007 Record of Decision on Colorado River Interim Guidelines for Lower Basin Shortages and the Coordinated Operations of Lake Powell and Lake Mead (Interim Guidelines), and reflects the 2017 Annual Operating Plan (AOP). Pursuant to the Interim Guidelines, the August 2016 24-Month Study projections of the January 1, 2017, system storage and reservoir water surface elevations set the operational tier for the coordinated operation of Lake Powell and Lake Mead during 2017.

Consistent with Section 6.B of the Interim Guidelines, the Lake Powell operational tier for water year 2017 is the Upper Elevation Balancing Tier. With an 8.23 million acre-feet (maf) release from Lake Powell in water year 2017, the April 2017 24-Month Study projected the end of water year elevation at Lake Powell to be above 3,575 feet above sea level (feet) and the end of water year elevation at Lake Mead to be below 1,075 feet. Therefore, in accordance with Section 6.B.4 of the Interim Guidelines, Lake Powell operations shifted to balancing releases for the remainder of water year 2017. Under Section 6.B.4, the contents of Lake Powell and Lake Mead will be balanced by the end of the water year, but not more than 9.0 maf and not less than 8.23 maf shall be released from Lake Powell. Based on the most probable inflow forecast, this May 24-Month Study projects a balancing release of 9.0 maf in water year 2017; however, the actual release in water year 2017 will depend on hydrology in the remainder of water year and

will range from 8.23 to 9.0 maf. The projected release from Lake Powell in water year 2017 will be updated each month throughout the remainder of the water year.

Consistent with Section 2.B.5 of the Interim Guidelines, the Intentionally Created Surplus (ICS) Surplus Condition is the criterion governing the operation of Lake Mead for calendar year 2017.

The Interim Guidelines are available for download at:
https://www.usbr.gov/lc/region/programs/strategies/RecordofDecision.pdf.
The 2017 AOP is available for download at:
https://www.usbr.gov/uc/water/rsvrs/ops/aop/AOP17.pdf.

Fontenelle Reservoir – Fontenelle Reservoir is currently at elevation 6471 feet, which amounts to 37 percent of live storage capacity. Inflows for the month of April totaled 225,000 acre-feet (af), or 263 percent of average. Above average inflows are occurring and releases are being adjusted to keep the reservoir elevation low in anticipation of a large runoff. Releases are currently set at 7,000 cubic feet per second (cfs) as of May 10, 2017.

The Colorado Basin River Forecast Center has forecasted spring and summer inflows that are significantly above average. May, June and July forecasted inflow volumes amount to 435,000 af (266 percent of average), 640,000 af (211 percent of average), and 380,000 af (201 percent of average), respectively.

The next Fontenelle Working Group meeting is scheduled for 10:00 a.m., August 28, 2017. The meeting will be held at the Wyoming Game and Fish Department office in Green River, Wyoming. The Fontenelle Working Group is an open public forum for information exchange between Reclamation and other parties associated with the operation of Fontenelle Reservoir.

Flaming Gorge Reservoir – Releases are currently at full power plant capacity (~4,600 cfs) and full bypass capacity (4,000 cfs) for a total release of ~8,600 cfs, and are expected to remain at this level through June.

Unregulated inflow into Flaming Gorge Reservoir during the month of April was 350,000 af, or 263 percent of average. The reservoir elevation is 6,022.31 feet (82 percent of live capacity) and increasing.

The May final forecast for inflows for the next three months projects above average conditions: May, June and July forecasted inflow volumes at 640,000 af (261 percent of average), 810,000 af (208 percent of average), and 460,000 af (219 percent of average), respectively.

The May water supply forecast of the April through July unregulated inflow volume into Flaming Gorge Reservoir is 2.26 maf (231 percent of average). Current snowpack is 170

percent of median and we have received 119 percent of the season peak for the Upper Green Basin with additional storm systems anticipated over the next week.

The Flaming Gorge Working Group is an open public forum for information exchange between Reclamation and the stakeholders of Flaming Gorge Dam. The public is encouraged to attend and comment on the operations and plans presented by Reclamation at these meetings. Meeting notes from past Working Group meetings are posted on the Working Group webpage. For more information on this group and these meetings please contact Dale Hamilton at 801-379-1186 or Heather Patno at 801-524-3883.

Reclamation will be holding the Flaming Gorge Working Group meeting on Monday, August 14, 2017, at 7:00 p.m. at the Uinta Conference Center, 313 East 200 South, Vernal, Utah.

Aspinall Unit Reservoirs – Crystal Dam is currently releasing 1,900 cfs and the Uncompahgre Valley Water Users Association has started diverting water through the Gunnison Tunnel. Currently, tunnel diversions are near capacity at approximately 1000 cfs and the flows in the Black Canyon are approximately 900 cfs. Beginning on May 14, 2017, release from Aspinall will be increased in preparation for a peak release to meet the flow objectives of the Aspinall Record of Decision (2012). Releases from Aspinall will be managed to attempt to achieve a full bank flow of 14,350 cfs for at least 10 days inclusively with a half bank flow of 8,070 for at least 40 days. Releases from Aspinall are projected to be greater 10,000 cfs for several days during this operation. High releases from Aspinall, greater than 5,000 cfs, will likely continue into early June.

The April unregulated inflow to Blue Mesa Reservoir was 145,000 af (193 percent of average). The end of April reservoir elevation for Blue Mesa was 7,499.55 feet with live storage in Blue Mesa measuring approximately 657,600 af (79 percent full).

Unregulated Inflows to Blue Mesa for the next three months (May, June and July) are projected to be: 265,000 af (120 percent of average), 320,000 af (121 percent of average) and 120,000 af (103 percent of average), respectively. The April through July unregulated inflow forecast decreased from 930,000 af (138 percent of average) for April to 850,000 af (126 percent of average) for April. The April 24-Month Study is reflective of this new forecast.

The Aspinall Unit Working Group is an open public forum for information exchange between Reclamation and the stakeholders of the Aspinall Unit. The public is encouraged to attend and comments on the operations and plans presented by Reclamation at these meetings. Meeting notes from past working Group meetings are posted on the Working Group webpage. For more information on this group and these meetings please contact Erik Knight in the Grand Junction Area Office at (970) 248-0629.

The next meeting of the Aspinall Unit Working Group will be held on Thursday, August 17th, 2017 at 1:00 pm at the Elk Creek Visitor Center at Blue Mesa Reservoir.

Navajo Reservoir – As of May 3rd, 2017, Navajo reservoir elevation is 6078.4 feet (1.6 maf live storage) and is releasing 1260 cfs. The spring peak release is starting ramp-up on this date. Releases are made for the authorized purposes of the Navajo Unit, and pursuant to the 2006 Record of Decision, in an attempt to maintain a target base flow through the endangered fish critical habitat reach of the San Juan River (Farmington to Lake Powell). The San Juan River Basin Recovery Implementation Program (SJRIP) recommends a target base flow of between 500 cfs and 1,000 cfs through the critical habitat area. The target base flow is calculated as the weekly average of gaged flows throughout the critical habitat area.

Modified unregulated inflow for April for Navajo Reservoir was 236,000 af, which was 139% of average. Releases averaged 582 cfs and the total volume released in April was 34,650 af.

The most probable modified-unregulated inflow forecast for the next three months (May, June, July) are 250,000 af (88 percent of average), 170,000 af (76 percent of average) and 41,000 af (62 percent of average), respectively.

Under the current Most Probable April-July inflow forecast of 695,000 af (94 percent of average), Navajo has enough available water for a spring peak release of 35 days at 5,000 cfs. The ramp-up lasting 2-3 weeks began on May 3rd. Navajo releases are timed to match the peak on the Animas River.

Reclamation conducts Public Operations Meetings three times per year to gather input for determining upcoming operations for Navajo Reservoir. Input from individuals, organizations, and agencies along with other factors such as weather, water rights, endangered species requirements, flood control, hydro power, recreation, fish and wildlife management, and reservoir levels, will be considered in the development of these reservoir operation plans. In addition, the meetings are used to coordinate activities and exchange information among agencies, water users, and other interested parties concerning the San Juan River and Navajo Reservoir.

The next Navajo Public Operations Coordination Meeting is scheduled for August 22nd, 2017, at 1pm at the Farmington Civic Center, Farmington, NM.

Glen Canyon Dam / Lake Powell

Current Status

The unregulated inflow volume to Lake Powell in April was 1.61 maf (152 percent of average). The release volume from Glen Canyon Dam in April was 621 thousand acre-feet (kaf). The end of April elevation and storage of Lake Powell were 3,604 feet (96 feet from full pool) and 12.15 maf (50 percent of full capacity), respectively. The reservoir reached a seasonal low elevation on March 15th near elevation 3593.85 feet. Since that time the reservoir has been increasing as the first of the spring runoff is now entering the reservoir.

Current Operations

The operating tier for water year 2017 was established in August 2016 as the Upper Elevation Balancing Tier. The April 2017 24-Month Study established that Lake Powell operations will be governed by balancing for the remainder of water year 2017. Under balancing, the contents of Lake Powell and Lake Mead will be balanced by the end of the water year, but not more than 9.0 maf and not less than 8.23 maf shall be released from Lake Powell. Based on the most probable inflow forecast, this May 24-Month Study projects a balancing release of 9.0 maf in water year 2017; the actual release in water year 2017, however, will depend on hydrology in the remainder of water year and will range from 8.23 to 9.0 maf. The projected release from Lake Powell in water year 2017 will be updated each month throughout the remainder of the water year. Reclamation will schedule operations at Glen Canyon Dam to achieve as practicably as possible the appropriate total annual release volume by September 30, 2017.

In May, the release volume will be approximately 650 kaf, with fluctuations anticipated between about 7,000 cfs in the nighttime to about 13,000 cfs in the daytime and consistent with the Glen Canyon Operating Criteria (Federal Register, Volume 62, No. 41, March 3, 1997). The anticipated release volume for June is 750 kaf with daily fluctuations between approximately 9,000 cfs and 15,000 cfs. The expected release for July is 850 kaf with daily fluctuations between approximately 9,500 cfs and 17,500 cfs.

In addition to daily scheduled fluctuations for power generation, the instantaneous releases from Glen Canyon Dam may also fluctuate to provide 40 megawatts (mw) of system regulation. These instantaneous release adjustments stabilize the electrical generation and transmission system and translate to a range of about 1,200 cfs above or below the hourly scheduled release rate. Under system normal conditions, fluctuations for regulation are typically short lived and generally balance out over the hour with minimal or no noticeable impacts on downstream river flow conditions.

Releases from Glen Canyon Dam can also fluctuate beyond scheduled releases when called upon to respond to unscheduled power outages or power system emergencies. Depending on the severity of the system emergency, the response from Glen Canyon Dam can be significant, within the full range of the operating capacity of the power plant for as long as is necessary to maintain balance in the transmission system. Glen Canyon Dam currently maintains 27 mw (approximately 800 cfs) of generation capacity in reserve in order to respond to a system emergency even when generation rates are already high. System emergencies occur fairly infrequently and typically require small responses from Glen Canyon Dam. However, these responses can have a noticeable impact on the river downstream of Glen Canyon Dam.

Inflow Forecasts and Model Projections

The April through July 2017 water supply forecast for unregulated inflow to Lake Powell, issued on May 3, 2017, by the Colorado Basin River Forecast Center, projects that the most probable (median) unregulated inflow volume will be 8.8 maf (123 percent of average based on the period 1981-2010). The forecast decreased by 500 kaf since last

month. At this point in the season, there is still uncertainty regarding this year's water supply and the total inflow to Lake Powell. The spring runoff forecast ranges from a minimum probable of 7.2 maf (101 percent of average) to a maximum probable of 11.0 maf (154 percent of average). There is 10 percent chance that inflows could be higher than the maximum probable and a 10 percent chance they could be lower than the minimum probable.

As determined in the August 2016 24-Month Study, and documented in the 2017 Annual Operating Plan, Lake Powell's operations in water year 2017 will be governed by the Upper Elevation Balancing Tier. Starting with an 8.23 maf release from Lake Powell in water year 2017, the April 2017 24-Month Study projected the end of water year elevation at Lake Powell to be above 3,575 feet and the end of water year elevation at Lake Mead to be below 1,075 feet. Therefore, in accordance with Section 6.B.4 of the Interim Guidelines, Lake Powell operations shifted to balancing releases for the remainder of water year 2017. Under balancing, the contents of Lake Powell and Lake Mead will be balanced by the end of the water year, but not more than 9.0 maf and not less than 8.23 maf shall be released from Lake Powell.

Based on the May most probable inflow forecast, the annual release volume from Lake Powell during water year 2017 is projected to be 9.0 maf. Under the minimum probable inflow scenario, the water year release is projected to be 9.0 maf. Under the maximum probable inflow scenario, the release is projected to be 9.0 maf. There is 10 percent chance that inflows will be lower than the current minimum probable forecast, potentially resulting in lower releases. If inflows are less than the minimum probable forecast, the water year 2017 annual release could be as low as 8.23 maf. If inflows are greater than the current forecasted maximum probable inflow, the annual release will be 9.0 maf. The projected release from Lake Powell in water year 2017 will be updated each month throughout the remainder of the water year.

Based on the current forecast, the May 24-Month Study projects Lake Powell elevation will end water year 2017 near 3,638 feet with approximately 15.72 maf in storage (65 percent capacity). Projections of elevation and storage still have significant uncertainty at this point in the season, primarily due to uncertainty regarding spring runoff and the resulting inflow to Lake Powell. Under the minimum probable inflow scenario, updated in April, the projected end of water year elevation and storage are 3,625 feet and 14.25 maf (59 percent capacity), respectively. Under the maximum probable inflow scenario, updated in April, the projected end of water year elevation and storage are 3661 feet and 18.62 maf (77 percent capacity), respectively. Modeling of projected reservoir operations based on the minimum and maximum scenarios will be updated again in August.

Upper Colorado River Basin Hydrology

The Upper Colorado River Basin regularly experiences significant year to year hydrologic variability. During the 17-year period 2000 to 2016, however, the unregulated inflow to Lake Powell, which is a good measure of hydrologic conditions in the Colorado River Basin, was above average in only 3 out of the past 17 years. The

period 2000-2016 is the lowest 17-year period since the closure of Glen Canyon Dam in 1963, with an average unregulated inflow of 8.57 maf, or 79 percent of the 30-year average (1981-2010). (For comparison, the 1981-2010 total water year average is 10.83 maf.) The unregulated inflow during the 2000-2016 period has ranged from a low of 2.64 maf (24 percent of average) in water year 2002 to a high of 15.97 maf (147 percent of average) in water year 2011. In water year 2016 unregulated inflow volume to Lake Powell was 9.62 maf (89 percent of average), which, though still below average, was significantly higher than inflows observed in 2012 and 2013 (45 percent and 47 percent of average, respectively). Under the current most probable forecast, the total water year 2017 unregulated inflow to Lake Powell is projected to be 12.93 maf (119 percent of average).

At the beginning of water year 2017, total system storage in the Colorado River Basin was 30.2 maf (51 percent of 59.6 maf total system capacity). This is nearly the same as the total storage at the beginning of water years 2015 and 2016 which began at 30.1 maf and 30.3 maf, respectively, both of which were 51 percent of capacity. Since the beginning of water year 2000, total Colorado Basin storage has experienced year to year increases and decreases in response to wet and dry hydrology, ranging from a high of 94 percent of capacity at the beginning of 2000 to a low of 50 percent of capacity at the beginning of water year 2005. One wet year can significantly increase total system reservoir storage, just as persistent dry years can draw down the system storage. Based on current inflow forecasts, the current projected end of water year total Colorado Basin reservoir storage for water year 2017 is approximately 33.8 maf (57 percent of total system capacity). The actual end of water year 2017 system storage may vary from this projection, primarily due to uncertainty regarding the season's snowpack and resulting runoff and reservoir inflow. Based on the April minimum and maximum probable inflow forecasts and modeling, the range of end of water year 2017 total system capacity is approximately 32.47 maf (54 percent) to 37.0 maf (62 percent), respectively.

June 24-Month Study
Date: June 12, 2017

From: Water Resources Group, Salt Lake City
To: All Colorado River Annual Operating Plan (AOP) Recipients

Current Reservoir Status

Reservoir	May Inflow (unregulated) (acre-feet)	Percent of Average (%)	June 11, Midnight Elevation (feet)	June 11, Midnight Reservoir Storage (acre-feet)
Fontenelle	430,000	219	6,488.20	215,000
Flaming Gorge	582,000	192	6,028.15	3,278,000
Blue Mesa	244,000	112	7,798.30	647,000
Navajo	264,000	138	6,072.38	1,514,000
Powell	2,377,000	103	3,625.89	14,398,000

Expected Operations

The operation of Lake Powell and Lake Mead in this June 2017 24-Month Study is pursuant to the December 2007 Record of Decision on Colorado River Interim Guidelines for Lower Basin Shortages and the Coordinated Operations of Lake Powell and Lake Mead (Interim Guidelines), and reflects the 2017 Annual Operating Plan (AOP). Pursuant to the Interim Guidelines, the August 2016 24-Month Study projections of the January 1, 2017, system storage and reservoir water surface elevations set the operational tier for the coordinated operation of Lake Powell and Lake Mead during 2017.

Consistent with Section 6.B of the Interim Guidelines, the Lake Powell operational tier for water year 2017 is the Upper Elevation Balancing Tier. With an 8.23 million acre-feet (maf) release from Lake Powell in water year 2017, the April 2017 24-Month Study projected the end of water year elevation at Lake Powell to be above 3,575 feet above sea level (feet) and the end of water year elevation at Lake Mead to be below 1,075 feet. Therefore, in accordance with Section 6.B.4 of the Interim Guidelines, Lake Powell operations shifted to balancing releases for the remainder of water year 2017. Under Section 6.B.4, the contents of Lake Powell and Lake Mead will be balanced by the end of the water year, but not more than 9.0 maf and not less than 8.23 maf shall be released from Lake Powell. Based on the most probable inflow forecast, this June 24-Month Study projects a balancing release of 9.0 maf in water year 2017.

Consistent with Section 2.B.5 of the Interim Guidelines, the Intentionally Created Surplus (ICS) Surplus Condition is the criterion governing the operation of Lake Mead for calendar year 2017.

The Interim Guidelines are available for download at:
https://www.usbr.gov/lc/region/programs/strategies/RecordofDecision.pdf.
The 2017 AOP is available for download at:
https://www.usbr.gov/uc/water/rsvrs/ops/aop/AOP17.pdf.

Fontenelle Reservoir – Fontenelle Reservoir is currently at elevation 6476 feet, which amounts to 42 percent of live storage capacity. Inflows for the month of May totaled 430,000 acre-feet (af), or 263 percent of average. Above average inflows are occurring and releases are being adjusted to keep the reservoir elevation low in anticipation of a large runoff. Releases are currently set at 8,000 cubic feet per second (cfs) (06/06/2017).

The Colorado Basin River Forecast Center has forecasted summer inflows that are significantly above average. June, July, and August forecasted inflow volumes amount to 710,000 af (234 percent of average), 315,000 af (167 percent of average), and 125,000 af (161 percent of average), respectively.

The next Fontenelle Working Group meeting is scheduled for 10:00 a.m., August 28, 2017. The meeting will be held at the Wyoming Game and Fish Department office in Green River, Wyoming. The Fontenelle Working Group is an open public forum for information exchange between Reclamation and other parties associated with the operation of Fontenelle Reservoir.

Flaming Gorge Reservoir – Releases are currently at full power plant capacity (~4,600 cfs) and full bypass capacity (4,000 cfs) for a total release of ~8,600 cfs, and are expected to remain at this level through June.

Unregulated inflow into Flaming Gorge Reservoir during the month of May was 582,000 af, or 239 percent of average. The reservoir elevation is 6,027.53 feet (86 percent of live capacity) and increasing.

The June final forecast for inflows for the next three months projects above average conditions: June, July and August forecasted inflow volumes at 870,000 af (223 percent of average), 378,000 af (180 percent of average), and 150,000 af (169 percent of average), respectively.

The May water supply forecast of the April through July unregulated inflow volume into Flaming Gorge Reservoir is 2.26 maf (232 percent of average). The hydrologic classification based on the May final forecast would be wet. However, the Yampa River forecast falls in the average (below median) hydrologic classification. The Record of Decision allows for flexibility to implement hydrologic classification two higher or one lower than the official forecast. Utilizing the flexibility within the ROD, the hydrologic

classification is moderately wet. It is unlikely that Reclamation will meet the moderately wet hydrologic targets with the current Yampa River flows.

The Flaming Gorge Working Group is an open public forum for information exchange between Reclamation and the stakeholders of Flaming Gorge Dam. The public is encouraged to attend and comment on the operations and plans presented by Reclamation at these meetings. Meeting notes from past Working Group meetings are posted on the Working Group webpage. For more information on this group and these meetings please contact Dale Hamilton at 801-379-1186 or Heather Patno at 801-524-3883.

Reclamation will be holding the Flaming Gorge Working Group meeting on Monday, August 14, 2017, at 7:00 p.m. at the Uinta Conference Center, 313 East 200 South, Vernal, Utah.

Aspinall Unit Reservoirs – Aspinall is currently operating to meet the spring flow objectives of the 2012 Aspinall Record of Decision (Aspinall ROD). Releases from Crystal Dam are approximately 5,500 cfs and are being reduced each day as part of a gradual ramp down to terminate the peaking operations. By June 19, 2017, releases from Crystal Dam will be 1,950 cfs which is the full capacity of Crystal Powerplant.

The Uncompahgre Valley Water Users Association is diverting approximately 1,000 cfs through the Gunnison Tunnel and Black Canyon Flows will be about 950 cfs for the remainder of the summer and early fall. Blue Mesa Dam is likely to be very nearly full by the end of July based on the most recent April-July unregulated inflow forecast.

The May unregulated inflow to Blue Mesa Reservoir was 244,000 af (112 percent of average). Unregulated Inflows to Blue Mesa for the next three months (June, July and August) are projected to be: 335,000 af (128 percent of average), 116,000 af (99 percent of average) and 61,000 af (97 percent of average), respectively. The April through July unregulated inflow forecast decreased from 850,000 af (126 percent of average) for May to 840,000 af (124 percent of average) for June. The June 24-Month Study is reflective of this new forecast.

The Aspinall Unit Working Group is an open public forum for information exchange between Reclamation and the stakeholders of the Aspinall Unit. The public is encouraged to attend and comments on the operations and plans presented by Reclamation at these meetings. Meeting notes from past working Group meetings are posted on the Working Group webpage. For more information on this group and these meetings please contact Erik Knight in the Grand Junction Area Office at (970) 248-0629.

The next meeting of the Aspinall Unit Working Group will be held on Thursday, August 17th, 2017 at 1:00 pm at the Elk Creek Visitor Center at Blue Mesa Reservoir.

Navajo Reservoir – As of June 8th, 2017, Navajo reservoir elevation is 6072.87 feet (1.5 maf live storage) and is releasing 4,770 cfs. Releases are made for the authorized

purposes of the Navajo Unit, and pursuant to the 2006 Record of Decision, in an attempt to maintain a target base flow through the endangered fish critical habitat reach of the San Juan River (Farmington to Lake Powell). The San Juan River Basin Recovery Implementation Program (SJRIP) recommends a target base flow of between 500 cfs and 1,000 cfs through the critical habitat area. The target base flow is calculated as the weekly average of gaged flows throughout the critical habitat area.

Modified unregulated inflow into Navajo was 267,000 af, which was 96 percent of average for the month. Releases averaged 3,800 cfs and totaled 24,500 af.

The most probable modified-unregulated inflow forecast for June at Navajo is 177,000 af (79 percent of average), for July is 34,000 af (52 percent of average), and for August is 27,000 af (27 percent of average). The most probable April-July total runoff forecast is 710,000 af (96 percent of average).

The spring peak release is underway. Ramp down is expected to begin June 23rd, or when the average of the Shiprock and Four Corners gage average is 6,500 cfs or less for five days. The release plan is subject to change due to river conditions and evolving forecasts.

Reclamation conducts Public Operations Meetings three times per year to gather input for determining upcoming operations for Navajo Reservoir. Input from individuals, organizations, and agencies along with other factors such as weather, water rights, endangered species requirements, flood control, hydro power, recreation, fish and wildlife management, and reservoir levels, will be considered in the development of these reservoir operation plans. In addition, the meetings are used to coordinate activities and exchange information among agencies, water users, and other interested parties concerning the San Juan River and Navajo Reservoir.

The next Navajo Public Operations Coordination Meeting is scheduled for August 22nd, 2017, at 1p.m. at the Farmington Civic Center, Farmington, NM.

Glen Canyon Dam / Lake Powell

Current Status

The unregulated inflow volume to Lake Powell in May was 2,377 thousand acre-feet (kaf) (101 percent of average). The release volume from Glen Canyon Dam in May was 652 kaf. The end of May elevation and storage of Lake Powell were 3619 feet (81 feet from full pool) and 13.67 maf (56 percent of full capacity), respectively. The reservoir reached a seasonal low elevation on March 15th near elevation 3593.85 feet. Since that time the reservoir elevation has been increasing and will continue to increase throughout mid-summer as runoff from snowmelt and precipitation enter the reservoir.

Current Operations

The operating tier for water year 2017 was established in August 2016 as the Upper Elevation Balancing Tier. The April 2017 24-Month Study established that Lake Powell

operations will be governed by balancing for the remainder of water year 2017. Under balancing, the contents of Lake Powell and Lake Mead will be balanced by the end of the water year, but not more than 9.0 maf and not less than 8.23 maf shall be released from Lake Powell. Based on the most probable inflow forecast, this May 24-Month Study projects a balancing release of 9.0 maf in water year 2017. Reclamation will schedule operations at Glen Canyon Dam to achieve as practicably as possible the appropriate total annual release volume by September 30, 2017.

In June, the release volume will be approximately 750 kaf, with fluctuations anticipated between about 9,000 cfs in the nighttime to about 15,000 cfs in the daytime and consistent with the Glen Canyon Operating Criteria (Federal Register, Volume 62, No. 41, March 3, 1997). The anticipated release volume for July is 850 kaf with daily fluctuations between approximately 9,500 cfs and 17,500 cfs. The expected release for August is 900 kaf with daily fluctuations between approximately 10,000 cfs and 18,000 cfs.

In addition to daily scheduled fluctuations for power generation, the instantaneous releases from Glen Canyon Dam may also fluctuate to provide 40 megawatts (mw) of system regulation. These instantaneous release adjustments stabilize the electrical generation and transmission system and translate to a range of about 1,200 cfs above or below the hourly scheduled release rate. Under system normal conditions, fluctuations for regulation are typically short lived and generally balance out over the hour with minimal or no noticeable impacts on downstream river flow conditions.

Releases from Glen Canyon Dam can also fluctuate beyond scheduled releases when called upon to respond to unscheduled power outages or power system emergencies. Depending on the severity of the system emergency, the response from Glen Canyon Dam can be significant, within the full range of the operating capacity of the power plant for as long as is necessary to maintain balance in the transmission system. Glen Canyon Dam currently maintains 27 mw (approximately 800 cfs) of generation capacity in reserve in order to respond to a system emergency even when generation rates are already high. System emergencies occur fairly infrequently and typically require small responses from Glen Canyon Dam. However, these responses can have a noticeable impact on the river downstream of Glen Canyon Dam.

Inflow Forecasts and Model Projections

The April to July 2017 water supply forecast for unregulated inflow to Lake Powell, issued on June 5, 2017, by the Colorado Basin River Forecast Center, projects that the most probable (median) unregulated inflow volume will be 8.3 maf (116 percent of average based on the period 1981-2010). The forecast decreased by 500 kaf since last month. There is still uncertainty regarding this year's water supply and the total inflow to Lake Powell. The spring runoff forecast ranges from a minimum probable of 7.4 maf (103 percent of average) to a maximum probable of 9.2 maf (129 percent of average). There is 10 percent chance that inflows could be higher than the maximum probable and a 10 percent chance they could be lower than the minimum probable.

As determined in the August 2016 24-Month Study, and documented in the 2017 Annual Operating Plan, Lake Powell's operations in water year 2017 will be governed by the Upper Elevation Balancing Tier. Starting with an 8.23 million acre-feet (maf) release from Lake Powell in water year 2017, the April 2017 24-Month Study projected the end of water year elevation at Lake Powell to be above 3,575 feet and the end of water year elevation at Lake Mead to be below 1,075 feet. Therefore, in accordance with Section 6.B.4 of the Interim Guidelines, Lake Powell operations shifted to balancing releases for the remainder of water year 2017. Under balancing, the contents of Lake Powell and Lake Mead will be balanced by the end of the water year, but not more than 9.0 maf and not less than 8.23 maf shall be released from Lake Powell.

Based on the June most probable inflow forecast, the annual release volume from Lake Powell during water year 2017 is projected to be 9.0 maf. Under the minimum probable inflow scenario, the water year release is projected to be 9.0 maf. Under the maximum probable inflow scenario, the release is projected to be 9.0 maf. There is 10 percent chance that inflows will be lower than the current minimum probable forecast, potentially resulting in lower releases. However, inflows to Lake Powell so far this water year have been sufficient enough to preclude any release less than 9.0 maf. If inflows are greater than the current forecasted maximum probable inflow, the annual release will be 9.0 maf.

Based on the current forecast, the June 24-Month Study projects Lake Powell elevation will end water year 2017 near 3,632 feet with approximately 15.1 maf in storage (62 percent capacity). Projections of elevation and storage still have significant uncertainty at this point in the season, primarily due to uncertainty regarding spring runoff and the resulting inflow to Lake Powell. Under the minimum probable inflow scenario, updated in April, the projected end of water year elevation and storage are 3,625 feet and 14.25 maf (59 percent capacity), respectively. Under the maximum probable inflow scenario, updated in April, the projected end of water year elevation and storage are 3661 feet and 18.62 maf (77 percent capacity), respectively. Modeling of projected reservoir operations based on the minimum and maximum scenarios will be updated again in August.

Upper Colorado River Basin Hydrology

The Upper Colorado River Basin regularly experiences significant year to year hydrologic variability. During the 17-year period 2000 to 2016, however, the unregulated inflow to Lake Powell, which is a good measure of hydrologic conditions in the Colorado River Basin, was above average in only 3 out of the past 17 years. The period 2000-2016 is the lowest 17-year period since the closure of Glen Canyon Dam in 1963, with an average unregulated inflow of 8.57 maf, or 79 percent of the 30-year average (1981-2010). (For comparison, the 1981-2010 total water year average is 10.83 maf.) The unregulated inflow during the 2000-2016 period has ranged from a low of 2.64 maf (24 percent of average) in water year 2002 to a high of 15.97 maf (147 percent of average) in water year 2011. In water year 2016 unregulated inflow volume to Lake Powell was 9.62 maf (89 percent of average), which, though still below average, was significantly higher than inflows observed in 2012 and 2013 (45 percent and 47 percent of average, respectively). Under the current most probable forecast, the total water year

2017 unregulated inflow to Lake Powell is projected to be 12.36 maf (114 percent of average).

At the beginning of water year 2017, total system storage in the Colorado River Basin was 30.2 maf (51 percent of 59.6 maf total system capacity). This is nearly the same as the total storage at the beginning of water years 2015 and 2016 which began at 30.1 maf and 30.3 maf, respectively, both of which were 51 percent of capacity. Since the beginning of water year 2000, total Colorado Basin storage has experienced year to year increases and decreases in response to wet and dry hydrology, ranging from a high of 94 percent of capacity at the beginning of 2000 to a low of 50 percent of capacity at the beginning of water year 2005. One wet year can significantly increase total system reservoir storage, just as persistent dry years can draw down the system storage. Based on current inflow forecasts, the current projected end of water year total Colorado Basin reservoir storage for water year 2017 is approximately 33.3 maf (56 percent of total system capacity). The actual end of water year 2017 system storage may vary from this projection, primarily due to uncertainty regarding the season's snowpack and resulting runoff and reservoir inflow. Based on the April minimum and maximum probable inflow forecasts and modeling, the range of end of water year 2017 total system capacity is approximately 32.47 maf (54 percent) to 37.0 maf (62 percent), respectively.

July 24-Month Study
Date: July 13, 2017

From: Water Resources Group, Salt Lake City
To: All Colorado River Annual Operating Plan (AOP) Recipients

Current Reservoir Status

Reservoir	June Inflow (unregulated) (acre-feet)	Percent of Average (%)	July 11, Midnight Elevation (feet)	July 11, Midnight Reservoir Storage (acre-feet)
Fontenelle	732,000	245	6,501.42	309,000
Flaming Gorge	895,000	230	6,032.37	3,441,000
Blue Mesa	392,000	150	7,516.29	801,000
Navajo	230,000	104	6,062.50	1,380,000
Powell	3,115,000	117	3,635.74	15,506,000

Expected Operations

The operation of Lake Powell and Lake Mead in this July 2017 24-Month Study is pursuant to the December 2007 Record of Decision on Colorado River Interim Guidelines for Lower Basin Shortages and the Coordinated Operations of Lake Powell and Lake Mead (Interim Guidelines), and reflects the 2017 Annual Operating Plan (AOP). Pursuant to the Interim Guidelines, the August 2016 24-Month Study projections of the January 1, 2017, system storage and reservoir water surface elevations set the operational tier for the coordinated operation of Lake Powell and Lake Mead during 2017.

Consistent with Section 6.B of the Interim Guidelines, the Lake Powell operational tier for water year 2017 is the Upper Elevation Balancing Tier. With an 8.23 million acre-feet (maf) release from Lake Powell in water year 2017, the April 2017 24-Month Study projected the end of water year elevation at Lake Powell to be above 3,575 feet above sea level (feet) and the end of water year elevation at Lake Mead to be below 1,075 feet. Therefore, in accordance with Section 6.B.4 of the Interim Guidelines, Lake Powell operations shifted to balancing releases for the remainder of water year 2017. Under Section 6.B.4, the contents of Lake Powell and Lake Mead will be balanced by the end of the water year, but not more than 9.0 maf and not less than 8.23 maf shall be released from Lake Powell. Based on the most probable inflow forecast, this July 24-Month Study projects a balancing release of 9.0 maf in water year 2017.

Consistent with Section 2.B.5 of the Interim Guidelines, the Intentionally Created Surplus (ICS) Surplus Condition is the criterion governing the operation of Lake Mead for calendar year 2017.

The Interim Guidelines are available for download at:

https://www.usbr.gov/lc/region/programs/strategies/RecordofDecision.pdf

The 2017 AOP is available for download at:

https://www.usbr.gov/uc/water/rsvrs/ops/aop/AOP17.pdf

Fontenelle Reservoir – Fontenelle Reservoir is currently at elevation 6501 feet, which amounts to 89 percent of live storage capacity. Inflows for the month of June totaled 732,400 acre-feet (af), or 241 percent of average. Above average inflows are continuing to occur. Releases are currently set at 5,600 cubic feet per second (cfs) (07/10/2017).

The Colorado Basin River Forecast Center has forecasted summer and fall inflows that are above average. July, August, and September forecasted inflow volumes amount to 338,000 af (179 percent of average), 125,000 af (161 percent of average), and 80,000 af (174 percent of average), respectively.

The next Fontenelle Working Group meeting is scheduled for 10:00 a.m., August 28, 2017. The meeting will be held at the Wyoming Game and Fish Department office in Green River, Wyoming. The Fontenelle Working Group is an open public forum for information exchange between Reclamation and other parties associated with the operation of Fontenelle Reservoir.

Flaming Gorge Reservoir – Releases are currently decreasing to base flow release of 2,400 cfs/day, and are expected to remain at this level through the end of September.

Unregulated inflow into Flaming Gorge Reservoir during the month of June was 895,000 af, or 229 percent of average. The reservoir elevation is 6,032.21 (91 percent of live capacity) and increasing.

The July final forecast for inflows for the next three months projects above average conditions: July, August and September forecasted inflow volumes at 383,000 af (182 percent of average), 150,000 af (169 percent of average), and 95,000 af (172 percent of average), respectively.

The May water supply forecast of the April through July unregulated inflow volume into Flaming Gorge Reservoir is 2.26 maf (232 percent of average). The hydrologic classification based on the May final forecast would be wet. However, the Yampa River forecast falls in the average (below median) hydrologic classification. The Record of Decision allows for flexibility to implement hydrologic classification two higher or one lower than the official forecast. Utilizing the flexibility within the ROD, the hydrologic

classification is moderately wet. It is unlikely that Reclamation will meet the moderately wet hydrologic targets with the current Yampa River flows.

The Flaming Gorge Working Group is an open public forum for information exchange between Reclamation and the stakeholders of Flaming Gorge Dam. The public is encouraged to attend and comment on the operations and plans presented by Reclamation at these meetings. Meeting notes from past Working Group meetings are posted on the Working Group webpage. For more information on this group and these meetings please contact Dale Hamilton at 801-379-1186 or Heather Patno at 801-524-3883.

Reclamation will be holding the Flaming Gorge Working Group meeting on Monday, August 14, 2017, at 7:00 p.m. at the Uinta Conference Center, 313 East 200 South, Vernal, Utah.

Aspinall Unit Reservoirs – Releases from Crystal Dam are approximately 1,900 cfs. Blue Mesa Reservoir is nearly full at 7516. 6 feet which corresponds to a storage content 804,000 acre-feet (97 percent of full capacity). Releases from Crystal are anticipated to remain near this level through July and August. With Uncompahgre Valley Water Users Association is diverting approximately 1,000 cfs through the Gunnison Tunnel the river flows through the Black Canyon are anticipated to remain near 900 cfs for the remainder of the summer.

The June unregulated inflow to Blue Mesa Reservoir was 392,000 af (150 percent of average). Unregulated Inflows to Blue Mesa for the next three months (July, August and September) are projected to be: 119,000 af (102 percent of average), 64,000 af (102 percent of average) and 43,000 af (113 percent of average), respectively. The April through July unregulated inflow forecast increased from 850,000 af (126 percent of average) for June to 900,000 af (133 percent of average) for July. The July 24-Month Study is reflective of this new forecast.

The Aspinall Unit Working Group is an open public forum for information exchange between Reclamation and the stakeholders of the Aspinall Unit. The public is encouraged to attend and comments on the operations and plans presented by Reclamation at these meetings. Meeting notes from past working Group meetings are posted on the Working Group webpage at:

https://www.usbr.gov/uc/wcao/water/rsvrs/mtgs/amcurrnt.html

For more information on this group and these meetings please contact Erik Knight in the Grand Junction Area Office at (970) 248-0629.

The next meeting of the Aspinall Unit Working Group will be held on Thursday, August 17th, 2017 at 1:00 pm at the Elk Creek Visitor Center at Blue Mesa Reservoir.

Navajo Reservoir – As of July 9th, 2017, Navajo reservoir elevation is 6062.58 feet (1.38 maf live storage) and is releasing 500 cfs. Releases are made for the authorized purposes

of the Navajo Unit, and pursuant to the 2006 Record of Decision, in an attempt to maintain a target base flow through the endangered fish critical habitat reach of the San Juan River (Farmington to Lake Powell). The San Juan River Basin Recovery Implementation Program (SJRIP) recommends a target base flow of between 500 cfs and 1,000 cfs through the critical habitat area. The target base flow is calculated as the weekly average of gaged flows throughout the critical habitat area.

Modified unregulated inflow into Navajo was 233,000 af, which was 104 percent of average for the month of June.

The spring peak release ramped up from May 3rd to May 18th. A short decrease occurred on May 9th, due to heavy rains in the San Juan River Basin that had the potential to add significant inflows into the channel. Ramp up resumed May 10th. On May 19th, the release was reduced for 3 days to allow the San Juan County Office of Emergency Management to reduce flood risk on some properties downstream. The peak flow of 4,800 cfs (on average) continued through June 23rd. The release peaked at 4,900 cfs on July 15th. The spring peak release ramped down at the end of June, and was back to base flows by July 5th. The preliminary calculations show that the release volume (over a 500 cfs base flow) totaled 438,000 af.

The most probable modified-unregulated inflow forecast for July at Navajo is 33,000 acre-ft (50 percent of average), for August is 27,000 acre-ft (60 percent of average), and for September is 32,000 acre-ft (74 percent of average). The most probable April-July total runoff forecast is 765,000 af (104 percent of average). Releases over the summer will likely range between 400 cfs and 650 cfs, and will be made to maintain the target baseflow downstream.

Reclamation conducts Public Operations Meetings three times per year to gather input for determining upcoming operations for Navajo Reservoir. Input from individuals, organizations, and agencies along with other factors such as weather, water rights, endangered species requirements, flood control, hydro power, recreation, fish and wildlife management, and reservoir levels, will be considered in the development of these reservoir operation plans. In addition, the meetings are used to coordinate activities and exchange information among agencies, water users, and other interested parties concerning the San Juan River and Navajo Reservoir.

The next Navajo Public Operations Coordination Meeting is scheduled for August 22nd, 2017, at 1pm at the Farmington Civic Center, Farmington, NM.

Glen Canyon Dam / Lake Powell

Current Status

The unregulated inflow volume to Lake Powell in June was 3.12 maf (117 percent of average). The release volume from Glen Canyon Dam in June was 749 thousand acre-feet (kaf). The end of June elevation and storage of Lake Powell were 3635 feet (65 feet from full pool) and 15.41 maf (63 percent of full capacity), respectively. The reservoir

elevation has been increasing through spring and early summer and is likely near its seasonal peak. In the next few weeks, the reservoir will likely begin its typical seasonal decline through the fall and winter months.

Current Operations

The operating tier for water year 2017 was established in August 2016 as the Upper Elevation Balancing Tier. The April 2017 24-Month Study established that Lake Powell operations will be governed by balancing for the remainder of water year 2017. Under balancing, the contents of Lake Powell and Lake Mead will be balanced by the end of the water year, but not more than 9.0 maf and not less than 8.23 maf shall be released from Lake Powell. Based on the most probable inflow forecast, this May 24-Month Study projects a balancing release of 9.0 maf in water year 2017. Reclamation will schedule operations at Glen Canyon Dam to achieve as practicably as possible the appropriate total annual release volume by September 30, 2017.

In July, the release volume will be approximately 850 kaf, with fluctuations anticipated between about 9,500 cfs in the nighttime to about 17,500 cfs in the daytime and consistent with the Glen Canyon Operating Criteria (Federal Register, Volume 62, No. 41, March 3, 1997). The anticipated release volume for August is 900 kaf with daily fluctuations between approximately 10,000 cfs and 18,000 cfs. The expected release for September is 663 kaf with daily fluctuations between approximately 8,500 cfs and 14,500 cfs.

In addition to daily scheduled fluctuations for power generation, the instantaneous releases from Glen Canyon Dam may also fluctuate to provide 40 megawatts (mw) of system regulation. These instantaneous release adjustments stabilize the electrical generation and transmission system and translate to a range of about 1,200 cfs above or below the hourly scheduled release rate. Under system normal conditions, fluctuations for regulation are typically short lived and generally balance out over the hour with minimal or no noticeable impacts on downstream river flow conditions.

Releases from Glen Canyon Dam can also fluctuate beyond scheduled releases when called upon to respond to unscheduled power outages or power system emergencies. Depending on the severity of the system emergency, the response from Glen Canyon Dam can be significant, within the full range of the operating capacity of the power plant for as long as is necessary to maintain balance in the transmission system. Glen Canyon Dam currently maintains 27 mw (approximately 800 cfs) of generation capacity in reserve in order to respond to a system emergency even when generation rates are already high. System emergencies occur fairly infrequently and typically require small responses from Glen Canyon Dam. However, these responses can have a noticeable impact on the river downstream of Glen Canyon Dam.

Inflow Forecasts and Model Projections

The April to July 2017 water supply forecast for unregulated inflow to Lake Powell, issued on July 5, 2017, by the Colorado Basin River Forecast Center, projects that the most probable (median) unregulated inflow volume will be 8.15 maf (114 percent of

average based on the period 1981-2010). The forecast decreased by 150 kaf since last month. There is still uncertainty regarding this year's water supply and the total inflow to Lake Powell.

As determined in the August 2016 24-Month Study, and documented in the 2017 Annual Operating Plan, Lake Powell's operations in water year 2017 will be governed by the Upper Elevation Balancing Tier. Starting with an 8.23 million acre-feet (maf) release from Lake Powell in water year 2017, the April 2017 24-Month Study projected the end of water year elevation at Lake Powell to be above 3,575 feet and the end of water year elevation at Lake Mead to be below 1,075 feet. Therefore, in accordance with Section 6.B.4 of the Interim Guidelines, Lake Powell operations shifted to balancing releases for the remainder of water year 2017. Under balancing, the contents of Lake Powell and Lake Mead will be balanced by the end of the water year, but not more than 9.0 maf and not less than 8.23 maf shall be released from Lake Powell.

Based on the July most probable inflow forecast, the annual release volume from Lake Powell during water year 2017 is projected to be 9.0 maf. Under the minimum probable inflow scenario, the water year release is projected to be 9.0 maf. Under the maximum probable inflow scenario, the release is projected to be 9.0 maf. There is 10 percent chance that inflows will be lower than the current minimum probable forecast, potentially resulting in lower releases. However, inflows to Lake Powell so far this water year have been sufficient enough to preclude any release less than 9.0 maf. If inflows are greater than the current forecasted maximum probable inflow, the annual release will be 9.0 maf.

Based on the current forecast, the July 24-Month Study projects Lake Powell elevation will end water year 2017 near 3,631 feet with approximately 15.0 maf in storage (62 percent capacity). Projections of elevation and storage still have significant uncertainty at this point in the season, primarily due to uncertainty regarding spring runoff and the resulting inflow to Lake Powell. Under the minimum probable inflow scenario, updated in April, the projected end of water year elevation and storage are 3,625 feet and 14.25 maf (59 percent of capacity), respectively. Under the maximum probable inflow scenario, updated in April, the projected end of water year elevation and storage are 3661 feet and 18.62 maf (77 percent of capacity), respectively. Modeling of projected reservoir operations based on the minimum and maximum scenarios will be updated again in August.

Upper Colorado River Basin Hydrology

The Upper Colorado River Basin regularly experiences significant year to year hydrologic variability. During the 17-year period 2000 to 2016, however, the unregulated inflow to Lake Powell, which is a good measure of hydrologic conditions in the Colorado River Basin, was above average in only 3 out of the past 17 years. The period 2000-2016 is the lowest 17-year period since the closure of Glen Canyon Dam in 1963, with an average unregulated inflow of 8.57 maf, or 79 percent of the 30-year average (1981-2010). (For comparison, the 1981-2010 total water year average is 10.83 maf.) The unregulated inflow during the 2000-2016 period has ranged from a low of 2.64 maf (24 percent of average) in water year 2002 to a high of 15.97 maf (147 percent

of average) in water year 2011. In water year 2016 unregulated inflow volume to Lake Powell was 9.62 maf (89 percent of average), which, though still below average, was significantly higher than inflows observed in 2012 and 2013 (45 percent and 47 percent of average, respectively). Under the current most probable forecast, the total water year 2017 unregulated inflow to Lake Powell is projected to be 12.21 maf (113 percent of average).

At the beginning of water year 2017, total system storage in the Colorado River Basin was 30.2 maf (51 percent of 59.6 maf total system capacity). This is nearly the same as the total storage at the beginning of water years 2015 and 2016 which began at 30.1 maf and 30.3 maf, respectively, both of which were 51 percent of capacity. Since the beginning of water year 2000, total Colorado Basin storage has experienced year to year increases and decreases in response to wet and dry hydrology, ranging from a high of 94 percent of capacity at the beginning of 2000 to a low of 50 percent of capacity at the beginning of water year 2005. One wet year can significantly increase total system reservoir storage, just as persistent dry years can draw down the system storage. Based on current inflow forecasts, the current projected end of water year total Colorado Basin reservoir storage for water year 2017 is approximately 33.2 maf (56 percent of total system capacity). The actual end of water year 2017 system storage may vary from this projection, primarily due to uncertainty regarding the season's snowpack and resulting runoff and reservoir inflow. Based on the April minimum and maximum probable inflow forecasts and modeling, the range of end of water year 2017 total system capacity is approximately 32.47 maf (54 percent) to 37.0 maf (62 percent), respectively.

August 24-Month Study
Date: August 14, 2017

From: Water Resources Group, Salt Lake City
To: All Colorado River Annual Operating Plan (AOP) Recipients

Current Reservoir Status

Reservoir	July Inflow (unregulated) (acre-feet)	Percent of Average (%)	August 13, Midnight Elevation (feet)	August 13, Midnight Reservoir Storage (acre-feet)
Fontenelle	332,000	187	6,500.11	299,000
Flaming Gorge	387,000	184	6,035.19	3,554,000
Blue Mesa	135,000	116	7,518.29	820,000
Navajo	49,000	74	6,060.21	1,350,000
Powell	1,073,000	98	3,633.40	15,237,000

Expected Operations

The operation of Lake Powell and Lake Mead in this August 2017 24-Month Study is pursuant to the December 2007 Record of Decision on Colorado River Interim Guidelines for Lower Basin Shortages and the Coordinated Operations of Lake Powell and Lake Mead (Interim Guidelines) and reflects the 2017 Annual Operating Plan (AOP). Pursuant to the Interim Guidelines, the August 2016 24-Month Study projections of the January 1, 2017, system storage and reservoir water surface elevations set the operational tier for the coordinated operation of Lake Powell and Lake Mead during 2017.

Consistent with Section 6.B of the Interim Guidelines, the Lake Powell operational tier for water year 2017 is the Upper Elevation Balancing Tier. With an 8.23 million acre-feet (maf) release from Lake Powell in water year 2017, the April 2017 24-Month Study projected the end of water year elevation at Lake Powell to be above 3,575 feet above sea level (feet) and the end of water year elevation at Lake Mead to be below 1,075 feet. Therefore, in accordance with Section 6.B.4 of the Interim Guidelines, Lake Powell operations shifted to balancing releases for the remainder of water year 2017. Under Section 6.B.4, the contents of Lake Powell and Lake Mead will be balanced by the end of the water year, but not more than 9.0 maf and not less than 8.23 maf shall be released from Lake Powell. Based on the most probable inflow forecast, this August 24-Month Study projects a balancing release of 9.0 maf in water year 2017.

Consistent with Section 2.B.5 of the Interim Guidelines, the Intentionally Created Surplus (ICS) Surplus Condition is the criterion governing the operation of Lake Mead for calendar year 2017.

The August 2017 24-Month Study projects the January 1, 2018 Lake Powell elevation to be below the 2018 Equalization Elevation of 3,654 feet and above elevation 3,575 feet. Consistent with Section 6.B of the Interim Guidelines, Lake Powell's operations in water year 2018 will be governed by the Upper Elevation Balancing Tier, with an initial water year release volume of 8.23 maf and the potential for an April adjustment to equalization or balancing releases in April 2018. Consistent with Section 6.B.4 of the Interim Guidelines, an April adjustment to balancing releases is currently projected to occur and Lake Powell is projected to release 9.0 maf in water year 2018.

The August 2017 24-Month Study projects the January 1, 2018 Lake Mead elevation to be above 1,075 feet. Consistent with Section 2.B.5 of the Interim Guidelines, the Intentionally Created Surplus (ICS) Surplus Condition is the criterion governing the operation of Lake Mead for calendar year 2018.

The operational tier determinations will be documented in the 2018 AOP, which is currently in development.

The Interim Guidelines are available for download at:

https://www.usbr.gov/lc/region/programs/strategies/RecordofDecision.pdf

The 2017 AOP is available for download at:

https://www.usbr.gov/uc/water/rsvrs/ops/aop/AOP17.pdf

Fontenelle Reservoir – Fontenelle Reservoir is currently at elevation 6503 feet, which amounts to 95 percent of live storage capacity. Inflows for the month of July totaled 331,800 acre-feet (af), or 175 percent of average. Above average inflows are continuing to occur. Releases are currently set at 2,800 cubic feet per second (cfs) (08/13/2017).

The Colorado Basin River Forecast Center has forecasted summer and fall inflows that are above average. August, September, and October forecasted inflow volumes amount to 125,000 af (161 percent of average), 80,000 af (174 percent of average), and 70,000 af (145 percent of average), respectively.

The next Fontenelle Working Group meeting is scheduled for 10:00 a.m., August 23, 2017. The meeting will be held at the Wyoming Game and Fish Department office in Green River, Wyoming. The Fontenelle Working Group is an open public forum for information exchange between Reclamation and other parties associated with the operation of Fontenelle Reservoir.

Flaming Gorge Reservoir – Releases are currently decreasing to base flow release of 2,400 cfs on average each day, and are expected to remain at this level through the end of September.

Unregulated inflow into Flaming Gorge Reservoir during the month of July was 387,000 af, or 183 percent of average. The reservoir elevation is 6,034.75 (94 percent of live capacity) and increasing. The observed April-July unregulated inflow volume into Flaming Gorge Reservoir was 2.21 maf (226 percent of average). This is the second highest inflow volume into Flaming Gorge with the record volume inflow in 1986 at 2.26 maf (232 percent of average).

The August final forecast for inflows for the next three months projects above average conditions: August, September and October forecasted inflow volumes at 145,000 af (164 percent of average), 92,000 af (167 percent of average), and 85,000 af (144 percent of average), respectively.

The May water supply forecast of the April through July unregulated inflow volume into Flaming Gorge Reservoir is 2.26 million acre-feet (232 percent of average). The hydrologic classification based on the May final forecast would be wet. However, the Yampa River forecast falls in the average (below median) hydrologic classification. The Record of Decision allows for flexibility to implement hydrologic classification two higher or one lower than the official forecast. Utilizing the flexibility within the ROD, the hydrologic classification is moderately wet. It is unlikely that Reclamation will meet the moderately wet hydrologic targets with the current Yampa River flows.

The Flaming Gorge Working Group is an open public forum for information exchange between Reclamation and the stakeholders of Flaming Gorge Dam. The public is encouraged to attend and comment on the operations and plans presented by Reclamation at these meetings. Meeting notes from past Working Group meetings are posted on the Working Group webpage. For more information on this group and these meetings please contact Dale Hamilton at 801-379-1186 or Heather Patno at 801-524-3883.

Reclamation will be holding the Flaming Gorge Working Group meeting on Monday, August 14, 2017, at 7:00 p.m. at the Uinta Conference Center, 313 East 200 South, Vernal, Utah.

Aspinall Unit Reservoirs – Releases from Crystal Dam are approximately 1,950 cfs. Blue Mesa Reservoir is nearly full at 7518. 3 feet which corresponds to a storage content 820,000 af (99 percent of full capacity). Releases from Crystal are anticipated to remain near this level through August and September. With Uncompahgre Valley Water Users Association is diverting approximately 1,000 cfs through the Gunnison Tunnel the river flows through the Black Canyon are anticipated to remain near 900 cfs for the remainder of the summer.

The July unregulated inflow to Blue Mesa Reservoir was 135,000 af (116 percent of average). The April through July observed unregulated inflow for 2017 was 919,000 af

(135 percent of average). The forecasted unregulated inflows to Blue Mesa for the next three months (August, September and October) are projected to be: 72,000 af (114 percent of average), 50,000 af (132 percent of average) and 45,000 af (118 percent of average), respectively. For water year 2018, the forecasted annual unregulated inflow volume is 955,000 af (100 percent of average) with 657,000 af (97 percent of average) forecasted volume occurring during the April through July period. The July 24-Month Study is reflective of this new forecast.

The Aspinall Unit Working Group is an open public forum for information exchange between Reclamation and the stakeholders of the Aspinall Unit. The public is encouraged to attend and comments on the operations and plans presented by Reclamation at these meetings. Meeting notes from past working Group meetings are posted on the Working Group webpage. For more information on this group and these meetings please contact Erik Knight in the Grand Junction Area Office at (970) 248-0629.

Meeting notes from past working Group meetings are posted on the Working Group webpage at:

https://www.usbr.gov/uc/wcao/water/rsvrs/mtgs/amcurrnt.html

For more information on this group and these meetings please contact Erik Knight in the Grand Junction Area Office at (970) 248-0629.

The next meeting of the Aspinall Unit Working Group will be held on Thursday, August 17th, 2017 at 1:00 pm at the Elk Creek Visitor Center at Blue Mesa Reservoir.

Navajo Reservoir – As of August 3, 2017, Navajo reservoir elevation is 6060.75 feet (1.36 maf live storage) and is releasing 500 cfs. Releases are made for the authorized purposes of the Navajo Unit, and pursuant to the 2006 Record of Decision, in an attempt to maintain a target base flow through the endangered fish critical habitat reach of the San Juan River (Farmington to Lake Powell). The San Juan River Basin Recovery Implementation Program (SJRIP) recommends a target base flow of between 500 cfs and 1,000 cfs through the critical habitat area. The target base flow is calculated as the weekly average of gaged flows throughout the critical habitat area.

Modified unregulated inflow into Navajo was 48,800 af, which was 74 percent of average for the month of July. Final April-July modified unregulated inflow into Navajo Reservoir totaled 775,000 af (105 percent of average).

The spring peak release ramped up from May 3rd to May 18th. A short decrease occurred on May 9th, due to heavy rains in the San Juan River Basin that had the potential to add significant inflows into the channel. Ramp up resumed May 10th. On May 19th, the release was reduced for 3 days to allow the San Juan County Office of Emergency Management to reduce flood risk on some properties downstream. The peak flow of 4,800 cfs (on average) continued through June 23rd. The release peaked at 4,900 cfs on

July 15th. The spring peak release ramped down at the end of June, and was back to base flows by July 5th. The preliminary calculations show that the release volume (over a 500 cfs base flow) totaled 438,000 af.

The most probable modified unregulated inflow forecast for August at Navajo is 37,000 af (82 percent of average), for September is 35,000 af (81 percent of average), and for October is 42,000 af (89 percent of average). Releases for the remainder of the summer and fall will be made to maintain the target baseflow in the critical habitat reach and will likely range between 400 and 650 cfs. Navajo reservoir elevation is currently expected to reach 6058 feet at the end of the water year.

Reclamation conducts Public Operations Meetings three times per year to gather input for determining upcoming operations for Navajo Reservoir. Input from individuals, organizations, and agencies along with other factors such as weather, water rights, endangered species requirements, flood control, hydro power, recreation, fish and wildlife management, and reservoir levels, will be considered in the development of these reservoir operation plans. In addition, the meetings are used to coordinate activities and exchange information among agencies, water users, and other interested parties concerning the San Juan River and Navajo Reservoir.

The next Navajo Public Operations Coordination Meeting is scheduled for August 22, 2017, at 1:00 pm at the Farmington Civic Center, Farmington, NM.

Glen Canyon Dam / Lake Powell

Current Status

The April to July 2017 unregulated inflow to Lake Powell was 8.17 maf (114 percent of average. The unregulated inflow in July was 1.07 maf (117 percent of average). The release volume from Glen Canyon Dam in July was 0.850 maf. The end of July elevation and storage of Lake Powell were 3,634.69 feet (65 feet from full pool) and 15.38 maf (63 percent of full capacity), respectively. The reservoir elevation peaked at 3,635.80 feet on July 11th and is now in its seasonal decline through the fall and winter months.

Current Operations

The operating tier for water year 2017 was established in August 2016 as the Upper Elevation Balancing Tier. The April 2017 24-Month Study established that Lake Powell operations will be governed by balancing for the remainder of water year 2017. Under balancing, the contents of Lake Powell and Lake Mead will be balanced by the end of the water year, but not more than 9.0 maf and not less than 8.23 maf shall be released from Lake Powell. Based on the most probable inflow forecast, this August 24-Month Study projects a balancing release of 9.0 maf in water year 2017. Reclamation will schedule operations at Glen Canyon Dam to achieve as practicably as possible the appropriate total annual release volume by September 30, 2017.

The operating tier for water year 2018, established this August 2017, is the Upper Elevation Balancing Tier, with an initial water year release volume of 8.23 maf and the

potential for an April 2018 adjustment to equalization or balancing releases. Based on the current forecast, an April adjustment to balancing releases is projected to occur and Lake Powell is currently projected to release 9.0 maf in water year 2018. This projection will be updated each month throughout the water year.

In August, the release volume will be approximately 900 kaf, with fluctuations anticipated between about 10,000 cfs in the nighttime to about 18,000 cfs in the daytime and consistent with the Glen Canyon Operating Criteria (Federal Register, Volume 62, No. 41, March 3, 1997). The anticipated release volume for September is 663,000 af with daily fluctuations between approximately 8,500 cfs and 14,500 cfs. The expected release for October is 630,000 af with daily fluctuations between approximately 7,300 cfs and 13,000 cfs.

In addition to daily scheduled fluctuations for power generation, the instantaneous releases from Glen Canyon Dam may also fluctuate to provide 40 megawatts (mw) of system regulation. These instantaneous release adjustments stabilize the electrical generation and transmission system and translate to a range of about 1,200 cfs above or below the hourly scheduled release rate. Under system normal conditions, fluctuations for regulation are typically short lived and generally balance out over the hour with minimal or no noticeable impacts on downstream river flow conditions.

Releases from Glen Canyon Dam can also fluctuate beyond scheduled releases when called upon to respond to unscheduled power outages or power system emergencies. Depending on the severity of the system emergency, the response from Glen Canyon Dam can be significant, within the full range of the operating capacity of the power plant for as long as is necessary to maintain balance in the transmission system. Glen Canyon Dam currently maintains 27 mw (approximately 800 cfs) of generation capacity in reserve in order to respond to a system emergency even when generation rates are already high. System emergencies occur fairly infrequently and typically require small responses from Glen Canyon Dam. However, these responses can have a noticeable impact on the river downstream of Glen Canyon Dam.

Inflow Forecasts and Model Projections

The forecast for water year 2018 unregulated inflow to Lake Powell, issued on August 1, 2017, by the Colorado Basin River Forecast Center, projects that the most probable (median) unregulated inflow volume next year will be 9.76 maf (90 percent of average). There is significant uncertainty regarding next season's snow pack development and resulting runoff into Lake Powell. The forecast ranges from a minimum probable of 6.0 maf (55 percent of average) to a maximum probable of 17.5 maf (162 percent of average). There is a 10 percent chance that inflows could be higher than the current maximum probable forecast and a 10 percent chance that inflows could be lower than the minimum probable forecast.

Based on the current forecast, the August 24-Month Study projects Lake Powell elevation will end water year 2017 near 3,631 feet with approximately 15.0 maf in storage (62 percent capacity) and water year 2018 near 3,635 feet with approximately 15.4 maf in

storage (63 percent capacity). Note that projections of elevation and storage for water year 2018 have significant uncertainty at this point in the season. Projections of elevation and storage using the minimum and maximum probable inflow forecast are 3,607 feet (12.4 maf, 51 percent capacity) and 3,654 feet (17.7 maf, 73 percent capacity), respectively. Under these scenarios, there is a 10 percent chance that inflows will be higher, resulting in higher elevation and storage, and 10 percent chance that inflows will be lower, resulting in lower elevation and storage. The annual release volume from Lake Powell during water year 2018 is projected to be 9.0 maf under the minimum and most probable inflow scenarios and 13.8 maf under the maximum probable inflow scenario. There is a chance that inflows could be higher or lower, potentially resulting in releases greater than 13.8 maf or as low as 8.23 maf in water year 2018.

Upper Colorado River Basin Hydrology

The Upper Colorado River Basin regularly experiences significant year to year hydrologic variability. During the 17-year period 2000 to 2016, however, the unregulated inflow to Lake Powell, which is a good measure of hydrologic conditions in the Colorado River Basin, was above average in only 3 out of the past 17 years. The period 2000-2016 is the lowest 17-year period since the closure of Glen Canyon Dam in 1963, with an average unregulated inflow of 8.57 maf, or 79 percent of the 30-year average (1981-2010). (For comparison, the 1981-2010 total water year average is 10.83 maf.) The unregulated inflow during the 2000-2016 period has ranged from a low of 2.64 maf (24 percent of average) in water year 2002 to a high of 15.97 maf (147 percent of average) in water year 2011. In water year 2016 unregulated inflow volume to Lake Powell was 9.62 maf (89 percent of average). Under the current most probable forecast, the total water year 2017 unregulated inflow to Lake Powell is projected to be 12.21 maf (113 percent of average).

At the beginning of water year 2017, total system storage in the Colorado River Basin was 30.2 maf (51 percent of 59.6 maf total system capacity). This is nearly the same as the total storage at the beginning of water years 2015 and 2016 which began at 30.1 maf and 30.3 maf, respectively, both of which were 51 percent of capacity. Since the beginning of water year 2000, total Colorado Basin storage has experienced year to year increases and decreases in response to wet and dry hydrology, ranging from a high of 94% of capacity at the beginning of 2000 to a low of 50 percent of capacity at the beginning of water year 2005. One wet year can significantly increase total system reservoir storage, just as persistent dry years can draw down the system storage. Based on current inflow forecasts, the current projected end of water year total Colorado Basin reservoir storage for water year 2018 is approximately 32.85 maf (55 percent of total system capacity). The actual end of water year 2018 system storage may vary from this projection, primarily due to uncertainty regarding this season's runoff and reservoir inflow. Based on the August minimum and maximum probable inflow forecasts and modeling, the range of end of water year 2018 total system capacity is approximately 29.4 maf (49 percent of capacity) to 35.6 maf (60 percent of capacity), respectively.

September 24-Month Study
Date: August 13, 2017

From: Water Resources Group, Salt Lake City
To: All Colorado River Annual Operating Plan (AOP) Recipients

Current Reservoir Status

Reservoir	August Inflow (unregulated) (acre-feet)	Percent of Average (%)	September 13, Midnight Elevation (feet)	September 13, Midnight Reservoir Storage (acre-feet)
Fontenelle	102,000	133	6,494.83	260,000
Flaming Gorge	120,000	136	6,034.35	3,520,000
Blue Mesa	84,000	132	7,512.95	772,000
Navajo	29,000	65	6,056.05	1,298,000
Powell	446,000	89	3,629.60	14,808,000

Expected Operations

The operation of Lake Powell and Lake Mead in this September 2017 24-Month Study is pursuant to the December 2007 Record of Decision on Colorado River Interim Guidelines for Lower Basin Shortages and the Coordinated Operations of Lake Powell and Lake Mead (Interim Guidelines) and reflects the 2017 Annual Operating Plan (AOP). Pursuant to the Interim Guidelines, the August 2016 24-Month Study projections of the January 1, 2017, system storage and reservoir water surface elevations set the operational tier for the coordinated operation of Lake Powell and Lake Mead during 2017.

Consistent with Section 6.B of the Interim Guidelines, the Lake Powell operational tier for water year 2017 is the Upper Elevation Balancing Tier. With an 8.23 million acre-feet (maf) release from Lake Powell in water year 2017, the April 2017 24-Month Study projected the end of water year elevation at Lake Powell to be above 3,575 feet above sea level (feet) and the end of water year elevation at Lake Mead to be below 1,075 feet. Therefore, in accordance with Section 6.B.4 of the Interim Guidelines, Lake Powell operations shifted to balancing releases for the remainder of water year 2017. Under Section 6.B.4, the contents of Lake Powell and Lake Mead will be balanced by the end of the water year, but not more than 9.0 maf and not less than 8.23 maf shall be released from Lake Powell. Based on the most probable inflow forecast, this September 24-Month Study projects a balancing release of 9.0 maf in water year 2017.

Consistent with Section 2.B.5 of the Interim Guidelines, the Intentionally Created Surplus (ICS) Surplus Condition is the criterion governing the operation of Lake Mead for calendar year 2017.

The August 2017 24-Month Study projected the January 1, 2018 Lake Powell elevation to be below the 2018 Equalization Elevation of 3,654 feet and above elevation 3,575 feet. Consistent with Section 6.B of the Interim Guidelines, Lake Powell's operations in water year 2018 will be governed by the Upper Elevation Balancing Tier, with an initial water year release volume of 8.23 maf and the potential for an April adjustment to equalization or balancing releases in April 2018. Consistent with Section 6.B.4 of the Interim Guidelines, an April adjustment to balancing releases is currently projected to occur and Lake Powell is projected to release 9.0 maf in water year 2018.

The August 2017 24-Month Study projected the January 1, 2018 Lake Mead elevation to be above 1,075 feet. Consistent with Section 2.B.5 of the Interim Guidelines, the Intentionally Created Surplus (ICS) Surplus Condition is the criterion governing the operation of Lake Mead for calendar year 2018.

The operational tier determinations will be documented in the 2018 AOP, which is currently in the final stages of development.

The Interim Guidelines are available for download at:

The 2017 AOP is available for download at:
http://www.usbr.gov/lc/region/g4000/aop/AOP17.pdf
The draft 2018 AOP is available for download at:
https://www.usbr.gov/lc/region/g4000/AOP2018/AOP18_draft.pdf

Fontenelle Reservoir – Fontenelle Reservoir is currently at elevation 6501.56 feet, which amounts to 77 percent of live storage capacity. Inflows for the month of August totaled 101,930 acre-feet (af), or 133 percent of average. Above average inflows are continuing to occur. Releases are currently set at 1,200 cubic feet per second (cfs).

The Colorado Basin River Forecast Center has forecasted fall inflows that are above average. September, October, and November forecasted inflow volumes amount to 64,000 af (140 percent of average), 63,000 af (130 percent of average), and 58,000 af (138 percent of average), respectively.

The next Fontenelle Working Group meeting is scheduled for 10:00 a.m., April 17, 2018 and will be held at the Seedskadee National Wildlife Refuge. The Fontenelle Working Group is an open public forum for information exchange between Reclamation and other parties associated with the operation of Fontenelle Reservoir.

Flaming Gorge Reservoir – Releases are currently 2,400 cfs/day and are expected to remain at this level through the end of November.

Unregulated inflow into Flaming Gorge Reservoir during the month of August was 120,000 af, or 135 percent of average. The reservoir elevation is 6,034.53 feet (94 percent of live capacity) and decreasing. The observed April-July unregulated inflow volume into Flaming Gorge Reservoir was 2.214 maf (226 percent of average). This is the second highest inflow volume into Flaming Gorge with the record volume inflow in 1986 at 2.26 maf (232 percent of average).

The September final forecast for inflows for the next three months projects above average conditions: September, October and November forecasted inflow volumes at 76,000 af (138 percent of average), 80,000 af (135 percent of average), and 75,000 af (147 percent of average), respectively.

The Flaming Gorge Working Group is an open public forum for information exchange between Reclamation and the stakeholders of Flaming Gorge Dam. The public is encouraged to attend and comment on the operations and plans presented by Reclamation at these meetings. Meeting notes from past Working Group meetings are posted on the Working Group webpage. For more information on this group and these meetings please contact Dale Hamilton at 801-379-1186 or Heather Patno at 801-524-3883.

Reclamation will be holding the next Flaming Gorge Working Group meeting on Thursday, March 8, 2018, at 7:00 p.m. at the Lighthouse Learning Center High School (gymnasium), 251 West 400 North, Price, Utah, and the next on April 19, 2018, at 11:00 a.m. at the UDWR offices 318 North Vernal Ave, Vernal, Utah.

Aspinall Unit Reservoirs – Releases from Crystal Dam are approximately 1,950 cfs. Blue Mesa Reservoir elevation is 7512. 95 feet which corresponds to a storage content 772,000 af (93 percent of full capacity). Releases from Crystal are anticipated to remain near this level through August and September. With Uncompahgre Valley Water Users Association is diverting approximately 1,000 cfs through the Gunnison Tunnel the river flows through the Black Canyon are anticipated to remain near 900 cfs for the remainder of the summer.

The August unregulated inflow to Blue Mesa Reservoir was 84,000 af (132 percent of average). The April through July unregulated inflow for 2017 was 919,000 af (135 percent of average). Unregulated Inflows to Blue Mesa for the next three months (September, October and November) are projected to be: 47,000 af (124 percent of average), 45,000 af (118 percent of average) and 35,000 af (113 percent of average), respectively. For water year 2018, the unregulated inflow volume is forecasted to be 945,000 af (99 percent of average) with 652,000 af (96 percent of average) forecasted unregulated inflow during the April through July period. The September 24-Month Study is reflective of this new forecast.

The Aspinall Unit Working Group is an open public forum for information exchange between Reclamation and the stakeholders of the Aspinall Unit. The public is encouraged to attend and comments on the operations and plans presented by Reclamation at these meetings. Meeting notes from past working Group meetings are

posted on the Working Group webpage. For more information on this group and these meetings please contact Erik Knight in the Grand Junction Area Office at (970) 248-0629.

Meeting notes from past working Group meetings are posted on the Working Group webpage at:

https://www.usbr.gov/uc/wcao/water/rsvrs/mtgs/amcurrnt.html

The next meeting of the Aspinall Unit Working Group will be held on Thursday, January 18th, 2018 at 1:00 pm at the Holiday Inn Express located in Montrose, Colorado.

Navajo Reservoir – As of September 6th, the daily average release at Navajo, as measured at the USGS Archuleta gage, is 761 cfs, and the observed inflow is 293 cfs. Navajo Indian Irrigation Project (NIIP) is diverting 610 cfs. The reservoir elevation is 6057.12 feet (1.3 maf of live storage), and is 77 percent full (63 percent of active storage). Releases are made for the authorized purposes of the Navajo Unit, and pursuant to the 2006 Record of Decision, in an attempt to maintain a target base flow through the endangered fish critical habitat reach of the San Juan River (Farmington to Lake Powell). The San Juan River Basin Recovery Implementation Program (SJRIP) recommends a target base flow of between 500 cfs and 1,000 cfs through the critical habitat area. The target base flow is calculated as the weekly average of gaged flows throughout the critical habitat area.

In August, the modified unregulated inflow into Navajo was 29,382 af, which was 65 percent of average for the month. Final April-July modified unregulated inflow into Navajo Reservoir was 775,000 af (105 percent of average).

The most probable modified-unregulated inflow forecast for September at Navajo is 28,000 af (65 percent of average), for October is 37,000 af (79 percent of average), and for November is 33,000 af (99 percent of average). Releases outside of the spring peak release will be made to maintain the target baseflow in the critical habitat reach and will likely range between 500 and 800 cfs. Due to the warm dry weather, releases to meet target baseflows have increased. Navajo reservoir elevation is currently expected to reach 6055 feet at the end of the water year.

Reclamation conducts Public Operations Meetings three times per year to gather input for determining upcoming operations for Navajo Reservoir. Input from individuals, organizations, and agencies along with other factors such as weather, water rights, endangered species requirements, flood control, hydro power, recreation, fish and wildlife management, and reservoir levels, will be considered in the development of these reservoir operation plans. In addition, the meetings are used to coordinate activities and exchange information among agencies, water users, and other interested parties concerning the San Juan River and Navajo Reservoir.

The next Navajo Public Operations Coordination Meeting is scheduled for January 23, 2018, at 1:00 pm at the Farmington Civic Center, Farmington, NM.

Glen Canyon Dam / Lake Powell

Current Status

The unregulated inflow to Lake Powell in August was 446 thousand acre-feet (kaf) (89 percent of average). The release volume from Glen Canyon Dam in August was 900 kaf. The end of August elevation and storage of Lake Powell were 3,630.88 feet (69 feet from full pool) and 14.95 maf (61 percent of full capacity), respectively. The reservoir elevation peaked at 3,635.80 feet on July 11th and is now in its seasonal decline through the fall and winter months.

Current Operations

The operating tier for water year 2017 was established in August 2016 as the Upper Elevation Balancing Tier. The April 2017 24-Month Study established that Lake Powell operations will be governed by balancing for the remainder of water year 2017. Under balancing, the contents of Lake Powell and Lake Mead will be balanced by the end of the water year, but not more than 9.0 maf and not less than 8.23 maf shall be released from Lake Powell. Based on the most probable inflow forecast, this August 24-Month Study projects a balancing release of 9.0 maf in water year 2017. Reclamation will schedule operations at Glen Canyon Dam to achieve as practicably as possible the appropriate total annual release volume by September 30, 2017.

The operating tier for water year 2018, established this August 2017, is the Upper Elevation Balancing Tier, with an initial water year release volume of 8.23 maf and the potential for an April 2018 adjustment to equalization or balancing releases. Based on the current forecast, an April adjustment to balancing releases is projected to occur and Lake Powell is currently projected to release 9.0 maf in water year 2018. This projection will be updated each month throughout the water year.

In September 2017, the release volume will be approximately 663 kaf, with fluctuations anticipated between about 8,500 cfs in the nighttime to about 14,500 cfs in the daytime and consistent with the Glen Canyon Operating Criteria (Federal Register, Volume 62, No. 41, March 3, 1997). The anticipated release volume for October is 630 kaf with daily fluctuations between approximately 7,300 cfs and 13,000 cfs. The expected release for November is 630 kaf with daily fluctuations between approximately 8,000 cfs and 13,700 cfs.

In addition to daily scheduled fluctuations for power generation, the instantaneous releases from Glen Canyon Dam may also fluctuate to provide 40 megawatts (mw) of system regulation. These instantaneous release adjustments stabilize the electrical generation and transmission system and translate to a range of about 1,200 cfs above or below the hourly scheduled release rate. Under system normal conditions, fluctuations for regulation are typically short lived and generally balance out over the hour with minimal or no noticeable impacts on downstream river flow conditions.

Releases from Glen Canyon Dam can also fluctuate beyond scheduled releases when called upon to respond to unscheduled power outages or power system emergencies. Depending on the severity of the system emergency, the response from Glen Canyon Dam can be significant, within the full range of the operating capacity of the power plant for as long as is necessary to maintain balance in the transmission system. Glen Canyon Dam currently maintains 27 mw (approximately 800 cfs) of generation capacity in reserve in order to respond to a system emergency even when generation rates are already high. System emergencies occur fairly infrequently and typically require small responses from Glen Canyon Dam. However, these responses can have a noticeable impact on the river downstream of Glen Canyon Dam.

Inflow Forecasts and Model Projections

The forecast for water year 2018 unregulated inflow to Lake Powell, issued on August 1, 2017, by the Colorado Basin River Forecast Center, projects that the most probable (median) unregulated inflow volume next year will be 9.71 maf (90 percent of average). There is significant uncertainty regarding next season's snow pack development and resulting runoff into Lake Powell. The forecast ranges from a minimum probable of 6.0 maf (55 percent of average) to a maximum probable of 17.5 maf (162 percent of average). There is a 10 percent chance that inflows could be higher than the current maximum probable forecast and a 10 percent chance that inflows could be lower than the minimum probable forecast.

Based on the current forecast, the September 24-Month Study projects Lake Powell elevation will end water year 2017 near 3,629 feet with approximately 14.8 maf in storage (61 percent of capacity) and water year 2018 near 3,632 feet with approximately 15.0 maf in storage (62 percent of capacity). Note that projections of elevation and storage for water year 2018 have significant uncertainty at this point in the season. Projections of elevation and storage using the minimum and maximum probable inflow forecast are 3,607 feet (12.4 maf, 51 percent of capacity) and 3,654 feet (17.7 maf, 73 percent of capacity), respectively. Under these scenarios, there is a 10 percent chance that inflows will be higher, resulting in higher elevation and storage, and 10 percent chance that inflows will be lower, resulting in lower elevation and storage. The annual release volume from Lake Powell during water year 2018 is projected to be 9.0 maf under the minimum and most probable inflow scenarios and 13.8 maf under the maximum probable inflow scenario. There is a chance that inflows could be higher or lower, potentially resulting in releases greater than 13.8 maf or as low as 8.23 maf in water year 2018.

Upper Colorado River Basin Hydrology

The Upper Colorado River Basin regularly experiences significant year to year hydrologic variability. During the 17-year period 2000 to 2016, however, the unregulated inflow to Lake Powell, which is a good measure of hydrologic conditions in the Colorado River Basin, was above average in only 3 out of the past 17 years. The period 2000-2016 is the lowest 17-year period since the closure of Glen Canyon Dam in 1963, with an average unregulated inflow of 8.57 maf, or 79 percent of the 30-year

average (1981-2010). (For comparison, the 1981-2010 total water year average is 10.83 maf.) The unregulated inflow during the 2000-2016 period has ranged from a low of 2.64 maf (24 percent of average) in water year 2002 to a high of 15.97 maf (147 percent of average) in water year 2011. In water year 2016 unregulated inflow volume to Lake Powell was 9.62 maf (89 percent of average). Under the current most probable forecast, the total water year 2017 unregulated inflow to Lake Powell is projected to be 12.07 maf (111 percent of average).

At the beginning of water year 2017, total system storage in the Colorado River Basin was 30.2 maf (51 percent of 59.6 maf total system capacity). This is nearly the same as the total storage at the beginning of water years 2015 and 2016 which began at 30.1 maf and 30.3 maf, respectively, both of which were 51 percent of capacity. Since the beginning of water year 2000, total Colorado Basin storage has experienced year to year increases and decreases in response to wet and dry hydrology, ranging from a high of 94 percent of capacity at the beginning of 2000 to a low of 50 percent of capacity at the beginning of water year 2005. One wet year can significantly increase total system reservoir storage, just as persistent dry years can draw down the system storage. Based on current inflow forecasts, the current projected end of water year total Colorado Basin reservoir storage for water year 2018 is approximately 32.64 maf (55 percent of total system capacity). The actual end of water year 2018 system storage may vary from this projection, primarily due to uncertainty regarding this season's runoff and reservoir inflow. Based on the August minimum and maximum probable inflow forecasts and modeling, the range of end of water year 2018 total system capacity is approximately 29.4 maf (49 percent of capacity) to 35.6 maf (60 percent of capacity), respectively.

October 24-Month Study
Date: October 12, 2017

From: Water Resources Group, Salt Lake City
To: All Colorado River Annual Operating Plan (AOP) Recipients

Current Reservoir Status

Reservoir	September Inflow (unregulated) (acre-feet)	Percent of Average (%)	October 11, Midnight Elevation (feet)	October 11, Midnight Reservoir Storage (acre-feet)
Fontenelle	66,000	144	6,495.48	265,000
Flaming Gorge	87,000	157	6,033.23	3,475,000
Blue Mesa	35,000	94	7,505.61	708,000
Navajo	9,000	21	6,056.81	1,308,000
Powell	196,000	48	3,628.07	14,638,000

Expected Operations

The operation of Lake Powell and Lake Mead in this October 2017 24-Month Study is pursuant to the December 2007 Record of Decision on Colorado River Interim Guidelines for Lower Basin Shortages and the Coordinated Operations of Lake Powell and Lake Mead (Interim Guidelines) and reflects the 2017 Annual Operating Plan (AOP) and draft 2018 AOP. Pursuant to the Interim Guidelines, the August 2017 24-Month Study projections of the January 1, 2018, system storage and reservoir water surface elevations set the operational tier for the coordinated operation of Lake Powell and Lake Mead during 2018.

Consistent with Section 6.B of the Interim Guidelines, the Lake Powell operational tier for water year 2018 will be governed by the Upper Elevation Balancing Tier, with an initial water year release volume of 8.23 million acre-feet (maf) and the potential for an April adjustment to equalization or balancing releases in April 2018. This October 2017 24-Month Study indicates that, consistent with Section 6.B.4 of the Interim Guidelines, an April adjustment to balancing releases is projected to occur and Lake Powell is projected to release 9.0 maf in water year 2018.

Consistent with Section 2.B.5 of the Interim Guidelines, the Intentionally Created Surplus (ICS) Surplus Condition is the criterion governing the operation of Lake Mead for calendar years 2017 and 2018.

The 2018 operational tier determinations will be documented in the 2018 AOP, which is currently in the final stages of development.

The Interim Guidelines are available for download at:
http://www.usbr.gov/lc/region/programs/strategies/RecordofDecision.pdf
The 2017 AOP is available for download at:
http://www.usbr.gov/lc/region/g4000/aop/AOP17.pdf
The draft 2018 AOP is available for download at:
https://www.usbr.gov/lc/region/g4000/AOP2018/AOP18_draft.pdf

Fontenelle Reservoir – Fontenelle Reservoir is currently at elevation 6495.41 feet above sea level (feet), which amounts to 77 percent of live storage capacity. Inflows for the month of September totaled 66,061 acre-feet (af), or 144 percent of average. Above average inflows are continuing to occur. Releases are currently set at 1,300 cubic feet per second (cfs).

The Colorado Basin River Forecast Center has forecasted fall and winter inflows that are above average. October, November, and December forecasted inflow volumes amount to 90,000 af (185 percent of average), 66,000 af (157 percent of average), and 50,000 af (156 percent of average), respectively.

The next Fontenelle Working Group meeting is scheduled for 10:00 a.m., April 17, 2018 and will be held at the Seedskadee National Wildlife Refuge. The Fontenelle Working Group is an open public forum for information exchange between Reclamation and other parties associated with the operation of Fontenelle Reservoir.

Flaming Gorge Reservoir – Releases are currently averaging 2,400 cfs. Unexpected maintenance issues will decrease releases to steady 1,550 cfs in October with an increase in November to accommodate the decrease and meet the May 1 elevation target of 6,027 feet.

Unregulated inflow into Flaming Gorge Reservoir during the month of September was 87,000 af, or 158 percent of average. The reservoir elevation is 6,033.45 feet (93 percent of live capacity) and decreasing. The observed April-July unregulated inflow volume into Flaming Gorge Reservoir was 2.214 maf (226 percent of average). This is the second highest inflow volume into Flaming Gorge with the record volume inflow in 1986 at 2.26 maf (232 percent of average).

The October final forecast for inflows for the next three months projects above average conditions: October, November and December forecasted inflow volumes at 110,000 af (186 percent of average), 85,000 af (166 percent of average), and 56,000 af (161 percent of average), respectively.

The Flaming Gorge Working Group is an open public forum for information exchange between Reclamation and the stakeholders of Flaming Gorge Dam. The public is encouraged to attend and comment on the operations and plans presented by Reclamation

at these meetings. Meeting notes from past Working Group meetings are posted on the Working Group webpage. For more information on this group and these meetings please contact Dale Hamilton at 801-379-1186 or Heather Patno at 801-524-3883.

Reclamation will be holding the next Flaming Gorge Working Group meeting on Thursday, March 8, 2018, at 7:00 p.m. at the Lighthouse Learning Center High School (gymnasium), 251 West 400 North, Price, Utah, and the next on April 19, 2018, at 11:00 a.m. at the UDWR offices 318 North Vernal Ave, Vernal, Utah.

Aspinall Unit Reservoirs – Releases from Crystal Dam are approximately 1,850 cfs. Blue Mesa Reservoir elevation is currently 7505. 89 feet which corresponds to a storage content 710,500 acre-feet (86 percent of full capacity). Releases from Crystal will likely be reduced to 1,600 cfs by mid-October and will remain at that level to the end of the month. It is anticipated that the Uncompahgre Valley Water Users Association will stop diverting water through the Gunnison Tunnel at the end of October. Current diversions through the Gunnison Tunnel are approximately 875 cfs.

The September unregulated inflow to Blue Mesa Reservoir was 34,850 af (94 percent of average). The April through July unregulated inflow for 2017 was 919,000 af (135 percent of average). Unregulated Inflows to Blue Mesa for the next three months (October, November and December) are projected to be: 40,000 af (105 percent of average), 35,000 af (113 percent of average) and 29,000 af (112 percent of average), respectively. For water year 2018, the unregulated inflow volume is forecasted to be 900,000 af (94 percent of average) with 607,000 af (90 percent of average) forecasted unregulated inflow during the April through July period. The October 24-Month Study is reflective of this new forecast.

The Aspinall Unit Working Group is an open public forum for information exchange between Reclamation and the stakeholders of the Aspinall Unit. The public is encouraged to attend and comments on the operations and plans presented by Reclamation at these meetings. Meeting notes from past working Group meetings are posted on the Working Group webpage. For more information on this group and these meetings please contact Erik Knight in the Grand Junction Area Office at (970) 248-0629.

Meeting notes from past working Group meetings are posted on the Working Group webpage at:

https://www.usbr.gov/uc/wcao/water/rsvrs/mtgs/amcurrnt.html

The next meeting of the Aspinall Unit Working Group will be held on Thursday, January 18th, 2018 at 1:00 p.m. at the Holiday Inn Express located in Montrose, Colorado.

Navajo Reservoir – As of October 11th, the daily average release at Navajo, as measured at the USGS Archuleta gage, is 512 cfs, and the observed inflow is 1051 cfs. NIIP is diverting 9 cfs. The reservoir elevation is 6056.81 feet (1.3 maf of live storage), and is 77

percent full (62 percent of active storage). Releases are made for the authorized purposes of the Navajo Unit, and pursuant to the 2006 Record of Decision, in an attempt to maintain a target base flow through the endangered fish critical habitat reach of the San Juan River (Farmington to Lake Powell). The San Juan River Basin Recovery Implementation Program (SJRIP) recommends a target base flow of between 500 cfs and 1,000 cfs through the critical habitat area. The target base flow is calculated as the weekly average of gaged flows throughout the critical habitat area.

Modified unregulated inflow into Navajo was 8,679 af, which was 20 percent of average for the month. Navajo reservoir elevation at the end of the water year (September 30th) was 6055.3 ft.

The most probable modified-unregulated inflow forecast for October at Navajo is 25,000 acre-ft (56 percent of average), for November is 25,000 acre-ft (75 percent of average), and for December is 20,000 acre-ft (80 percent of average). Releases for the remainder of the year will be made to maintain the target baseflow in the critical habitat reach and will likely range between 400 and 600 cfs.

Reclamation conducts Public Operations Meetings three times per year to gather input for determining upcoming operations for Navajo Reservoir. Input from individuals, organizations, and agencies along with other factors such as weather, water rights, endangered species requirements, flood control, hydro power, recreation, fish and wildlife management, and reservoir levels, will be considered in the development of these reservoir operation plans. In addition, the meetings are used to coordinate activities and exchange information among agencies, water users, and other interested parties concerning the San Juan River and Navajo Reservoir.

The next Navajo Public Operations Coordination Meeting is scheduled for January 23rd, 2018, at 1:00 p.m. at the Farmington Civic Center, Farmington, NM.

Glen Canyon Dam / Lake Powell

Current Status

High-Flow Experiments (HFE) below Glen Canyon Dam are driven by weather, sediment inputs, and other resource conditions, in accordance with the Glen Canyon Dam Long-Term Experimental and Management Plan Record of Decision (LTEMP).

When sediment conditions during the summer and fall meet specific thresholds as described in the LTEMP HFE Protocol, a fall HFE can occur. Fall HFEs can be scheduled to occur anytime during the months of October and November. In order to facilitate advance planning for a potential HFE this fall, the HFE technical team determined that October 9th was the latest date for which sediment inputs could be considered for a potential HFE this fall. Grand Canyon Monitoring and Research Center (GCMRC) scientists and Reclamation modelers considered cumulative sediment inputs from July 1 through midnight October 9th. Based on these data it has been determined that there is not sufficient sediment to support implementing a high flow experiment (HFE) at

Glen Canyon Dam during the fall 2017 planning window; therefore an HFE will not be tested this fall.

The unregulated inflow to Lake Powell in September was 196 thousand acre-feet (kaf) (48 percent of average). The release volume from Glen Canyon Dam in September was 663 kaf. The end of September elevation and storage of Lake Powell were 3,628.31 feet (72 feet from full pool) and 14.66 maf (60 percent of full capacity), respectively. The water year 2017 unregulated inflow to Lake Powell was 11.90 maf (110 percent of average). The water year 2017 release from Lake Powell was 9.0 maf. The reservoir elevation peaked at 3,635.80 feet on July 11th and is now in its seasonal decline through the fall and winter months.

Current Operations

The operating tier for water year 2018 was established in August 2017 as the Upper Elevation Balancing Tier, with an initial water year release volume of 8.23 maf and the potential for an April 2018 adjustment to equalization or balancing releases. Based on the current forecast, an April adjustment to balancing is projected to occur and Lake Powell is currently projected to release 9.0 maf in water year 2018. This projection will be updated each month throughout the water year. Reclamation will schedule operations at Glen Canyon Dam to achieve as practicably as possible the appropriate total annual release volume by September 30, 2018.

In October 2018, the release volume will be approximately 667 kaf, with fluctuations anticipated between about 8,300 cfs in the nighttime to about 14,000 cfs in the daytime and consistent with the Glen Canyon Operating Criteria (Federal Register, Volume 62, No. 41, March 3, 1997). The anticipated release volume for November is 630 kaf with daily fluctuations between approximately 8,000 cfs and 13,700 cfs. The expected release for December is 740 kaf with daily fluctuations between approximately 7,300 cfs and 14,000 cfs.

In addition to daily scheduled fluctuations for power generation, the instantaneous releases from Glen Canyon Dam may also fluctuate to provide 40 megawatts (mw) of system regulation. These instantaneous release adjustments stabilize the electrical generation and transmission system and translate to a range of about 1,200 cfs above or below the hourly scheduled release rate. Under system normal conditions, fluctuations for regulation are typically short lived and generally balance out over the hour with minimal or no noticeable impacts on downstream river flow conditions.

Releases from Glen Canyon Dam can also fluctuate beyond scheduled releases when called upon to respond to unscheduled power outages or power system emergencies. Depending on the severity of the system emergency, the response from Glen Canyon Dam can be significant, within the full range of the operating capacity of the power plant for as long as is necessary to maintain balance in the transmission system. Glen Canyon Dam currently maintains 27 mw (approximately 800 cfs) of generation capacity in reserve in order to respond to a system emergency even when generation rates are already high. System emergencies occur fairly infrequently and typically require small responses

from Glen Canyon Dam. However, these responses can have a noticeable impact on the river downstream of Glen Canyon Dam.

Inflow Forecasts and Model Projections

The forecast for water year 2018 unregulated inflow to Lake Powell, issued on October 1, 2017, by the Colorado Basin River Forecast Center, projects that the most probable (median) unregulated inflow volume next year will be 9.71 maf (90 percent of average). There is significant uncertainty regarding next season's snow pack development and resulting runoff into Lake Powell. The forecast ranges from a minimum probable of 7.0 maf (65 percent of average) to a maximum probable of 17.5 maf (162 percent of average). There is a 10 percent chance that inflows could be higher than the current maximum probable forecast and a 10 percent chance that inflows could be lower than the minimum probable forecast.

Based on the current forecast, the October 24-Month Study projects Lake Powell elevation will end water year 2018 near 3,631 feet with approximately 14.9 maf in storage (61 percent of capacity). Note that projections of elevation and storage for water year 2018 have significant uncertainty at this point in the season. Projections of elevation and storage using the minimum and maximum probable inflow forecast are 3,612 feet (12.9 maf, 53 percent of capacity) and 3,654 feet (17.7 maf, 73 percent of capacity), respectively. Under these scenarios, there is a 10 percent chance that inflows will be higher, resulting in higher elevation and storage, and 10 percent chance that inflows will be lower, resulting in lower elevation and storage. The annual release volume from Lake Powell during water year 2018 is projected to be 9.0 maf under the minimum and most probable inflow scenarios and 13.56 maf under the maximum probable inflow scenario. There is a chance that inflows could be higher or lower, potentially resulting in releases greater than 13.56 maf or as low as 8.23 maf in water year 2018.

Upper Colorado River Basin Hydrology

The Upper Colorado River Basin regularly experiences significant year to year hydrologic variability. During the 18-year period 2000 to 2017, however, the unregulated inflow to Lake Powell, which is a good measure of hydrologic conditions in the Colorado River Basin, was above average in only 4 out of the past 18 years. The period 2000-2017 is the lowest 18-year period since the closure of Glen Canyon Dam in 1963, with an average unregulated inflow of 8.76 maf, or 81 percent of the 30-year average (1981-2010). (For comparison, the 1981-2010 total water year average is 10.83 maf.) The unregulated inflow during the 2000-2017 period has ranged from a low of 2.64 maf (24 percent of average) in water year 2002 to a high of 15.97 maf (147 percent of average) in water year 2011. In water year 2017 unregulated inflow volume to Lake Powell was 11.9 maf (110 percent of average), the fourth year to be above average. Under the current most probable forecast, the total water year 2018 unregulated inflow to Lake Powell is projected to be 9.71 maf (90 percent of average).

At the beginning of water year 2018, total system storage in the Colorado River Basin was 32.9 maf (55 percent of 59.6 maf total system capacity). This is an increase of 2.2 maf over the total storage at the beginning of water year 2016 when total system storage was 30.7 maf (51 percent of capacity). Since the beginning of water year 2000, total

Colorado Basin storage has experienced year to year increases and decreases in response to wet and dry hydrology, ranging from a high of 94 percent of capacity at the beginning of 2000 to a low of 50 percent of capacity at the beginning of water year 2005. One wet year can significantly increase total system reservoir storage, just as persistent dry years can draw down the system storage. Based on current inflow forecasts, the current projected end of water year total Colorado Basin reservoir storage for water year 2018 is approximately 32.52 maf (55 percent of total system capacity). The actual end of water year 2018 system storage may vary from this projection, primarily due to uncertainty regarding this season's runoff and reservoir inflow. Based on the October minimum and maximum probable inflow forecasts and modeling, the range of end of water year 2018 total system capacity is approximately 30.06 maf (50 percent of capacty) to 35.47 maf (59 percent of capacity), respectively.

November 24-Month Study
Date: November 14, 2017

From: Water Resources Group, Salt Lake City
To: All Colorado River Annual Operating Plan (AOP) Recipients

Current Reservoir Status

Reservoir	October Inflow (unregulated) (acre-feet)	Percent of Average (%)	November 13, Midnight Elevation (feet)	November 13, Midnight Reservoir Storage (acre-feet)
Fontenelle	73,000	150	6,492.85	247,000
Flaming Gorge	88,000	149	6,033.03	3,467,000
Blue Mesa	37,000	96	7,500.29	664,000
Navajo	38,000	82	6,055.50	1,292,000
Powell	449,000	88	3,626.27	14,439,000

Expected Operations

The operation of Lake Powell and Lake Mead in this November 2017 24-Month Study is pursuant to the December 2007 Record of Decision on Colorado River Interim Guidelines for Lower Basin Shortages and the Coordinated Operations of Lake Powell and Lake Mead (Interim Guidelines) and reflects the 2017 Annual Operating Plan (AOP) and draft 2018 AOP. Pursuant to the Interim Guidelines, the August 2017 24-Month Study projections of the January 1, 2018, system storage and reservoir water surface elevations set the operational tier for the coordinated operation of Lake Powell and Lake Mead during 2018.

Consistent with Section 6.B of the Interim Guidelines, the Lake Powell operational tier for water year 2018 will be governed by the Upper Elevation Balancing Tier, with an initial water year release volume of 8.23 million acre-feet (maf) and the potential for an April adjustment to equalization or balancing releases in April 2018. This November 2017 24-Month Study indicates that, consistent with Section 6.B.4 of the Interim Guidelines, an April adjustment to balancing releases is projected to occur and Lake Powell is projected to release 9.0 maf in water year 2018.

Consistent with Section 2.B.5 of the Interim Guidelines, the Intentionally Created Surplus (ICS) Surplus Condition is the criterion governing the operation of Lake Mead for calendar years 2017 and 2018.

The 2018 operational tier determinations will be documented in the 2018 AOP, which is currently in the final stages of development.

The Interim Guidelines are available for download at:
http://www.usbr.gov/lc/region/programs/strategies/RecordofDecision.pdf
The 2017 AOP is available for download at:
http://www.usbr.gov/lc/region/g4000/aop/AOP17.pdf
The draft 2018 AOP is available for download at:
https://www.usbr.gov/lc/region/g4000/AOP2018/AOP18_draft.pdf

Fontenelle Reservoir – Fontenelle Reservoir is currently at elevation 6493.5 feet above sea level (feet), which amounts to 73 percent of live storage capacity. Inflows for the month of October totaled 73,000 acre-feet (af), or 150 percent of average. Above average inflows are forecasted over the next few months and releases have been adjusted in order to meet the spring elevation target. Releases have been increased to base flow levels of 1,300 cubic feet per second (cfs) and are forecasted to remain at this level through the winter, subject to hydrology.

The Colorado Basin River Forecast Center has forecasted spring inflows that are above average. November, December, and January forecasted inflow volumes amount to 60,000 af (143 percent of average), 46,000 af (144 percent of average), and 45,000 af (148 percent of average), respectively.

The next Fontenelle Working Group meeting is scheduled for 10:00 a.m., April 17, 2018. The meeting will be held at Seedskadee Wildlife Refuge Headquarters, Wyoming. The Fontenelle Working Group is an open public forum for information exchange between Reclamation and other parties associated with the operation of Fontenelle Reservoir.

Flaming Gorge Reservoir – Releases have been steady 1,500 cfs with one generating unit available, and are increasing to steady 2,800 cfs with two generating units available.

Unregulated inflow into Flaming Gorge Reservoir during the month of October was 88,000 af, or 149 percent of average. The reservoir elevation is 6,033.17 feet (93 percent of live capacity) and decreasing. The observed April-July unregulated inflow volume into Flaming Gorge Reservoir was 2.214 maf (226 percent of average). This is the second highest inflow volume into Flaming Gorge with the record volume inflow in 1986 at 2.26 maf (232 percent of average). March 2017 was approximately 400 percent of average and the March-July volume sets a historic inflow volume for Flaming Gorge.

The November final forecast for inflows for the next three months projects above average conditions: November, December and January forecasted inflow volumes at 77,000 af (151 percent of average), 52,000 af (149 percent of average), and 60,000 af (149 percent of average), respectively.

The Flaming Gorge Working Group is an open public forum for information exchange between Reclamation and the stakeholders of Flaming Gorge Dam. The public is

encouraged to attend and comment on the operations and plans presented by Reclamation at these meetings. Meeting notes from past Working Group meetings are posted on the Working Group webpage. For more information on this group and these meetings please contact Dale Hamilton at 801-379-1186 or Heather Patno at 801-524-3883.

Reclamation will be holding the next Flaming Gorge Working Group meeting on Thursday, March 8, 2018, at 7:00 p.m. at the Lighthouse Learning Center High School (gymnasium), 251 West 400 North, Price, Utah, and the next on April 19, 2018, at 11:00 a.m. at the UDWR offices 318 North Vernal Ave, Vernal, Utah.

Aspinall Unit Reservoirs – Releases from Crystal Dam are approximately 750 cfs. Uncompahgre Valley Water Users Association shut down the Gunnison Tunnel on November 1, 2017 so all releases from Crystal are now flowing through the Black Canyon. Blue Mesa Reservoir elevation is 7500. 29 feet which corresponds to a storage content 663,700 acre-feet (80 percent of full capacity). Releases from Crystal will remain at the current level to the end of November. In December, releases will be increased to approximately 1,700 cfs for power production during the winter high power demand period.

The October unregulated inflow to Blue Mesa Reservoir was 33,773 af (97 percent of average). The April through July unregulated inflow for 2017 was 919,000 af (135 percent of average). Unregulated Inflows to Blue Mesa for the next three months (November, December and January) are projected to be: 35,000 af (113 percent of average), 30,000 af (115 percent of average) and 26,000 af (108 percent of average), respectively. For water year 2018, the unregulated inflow volume is forecasted to be 836,000 af (88 percent of average) with 570,000 af (84 percent of average) forecasted unregulated inflow during the April through July period. The November 24-Month Study is reflective of this new forecast.

The Aspinall Unit Working Group is an open public forum for information exchange between Reclamation and the stakeholders of the Aspinall Unit. The public is encouraged to attend and comments on the operations and plans presented by Reclamation at these meetings. Meeting notes from past working Group meetings are posted on the Working Group webpage. For more information on this group and these meetings please contact Erik Knight in the Grand Junction Area Office at (970) 248-0629.

Meeting notes from past working Group meetings are posted on the Working Group webpage at:

https://www.usbr.gov/uc/wcao/water/rsvrs/mtgs/amcurrnt.html

The next meeting of the Aspinall Unit Working Group will be held on Thursday, January 18th, 2018 at 1:00 p.m. at the Holiday Inn Express located in Montrose, Colorado.

Navajo Reservoir – As of November 1st, the daily average release at Navajo is 500 cfs, and the observed inflow is 309 cfs. The reservoir elevation is 6055.85 feet (1,295,913 af), and is 76 percent full (61 percent of active storage). The San Juan River at Four Corners USGS gage is at 665 cfs. The Animas River at Farmington USGS gage is at 246 cfs. Releases are made for the authorized purposes of the Navajo Unit, and pursuant to the 2006 Record of Decision, in an attempt to maintain a target base flow through the endangered fish critical habitat reach of the San Juan River (Farmington to Lake Powell). The San Juan River Basin Recovery Implementation Program (SJRIP) recommends a target base flow of between 500 cfs and 1,000 cfs through the critical habitat area. The target base flow is calculated as the weekly average of gaged flows throughout the critical habitat area.

Modified unregulated inflow into Navajo was 38,403 af, which was 82 percent of average for the month. Navajo reservoir elevation at the end of the water year (September 30th) was 6055.3 feet.

The most probable modified-unregulated inflow forecast for November at Navajo is 28,000 af (84 percent of average), for December is 24,000 af (96 percent of average), and for January is 21,000 af (96 percent of average). Releases for the remainder of the year will be made to maintain the target baseflow in the critical habitat reach and will likely range between 400 and 600 cfs.

Reclamation conducts Public Operations Meetings three times per year to gather input for determining upcoming operations for Navajo Reservoir. Input from individuals, organizations, and agencies along with other factors such as weather, water rights, endangered species requirements, flood control, hydro power, recreation, fish and wildlife management, and reservoir levels, will be considered in the development of these reservoir operation plans. In addition, the meetings are used to coordinate activities and exchange information among agencies, water users, and other interested parties concerning the San Juan River and Navajo Reservoir.

The next Navajo Public Operations Coordination Meeting is scheduled for January 23rd, 2018, at 1p.m. at the Farmington Civic Center, Farmington, NM.

Glen Canyon Dam / Lake Powell

Current Status

High-Flow Experiments (HFE) below Glen Canyon Dam are driven by weather, sediment inputs, and other resource conditions, in accordance with the Glen Canyon Dam Long-Term Experimental and Management Plan Record of Decision (LTEMP). Grand Canyon Monitoring and Research Center (GCMRC) scientists and Reclamation modelers considered cumulative sediment inputs from July 1st through midnight October 9th. Based on these data it has been determined that there is not sufficient sediment to support implementing a high flow experiment (HFE) at Glen Canyon Dam during the fall 2017 planning window; therefore an HFE will not be tested this fall.

The unregulated inflow to Lake Powell in October was 449 thousand acre-feet (kaf) (88 percent of average). The release volume from Glen Canyon Dam in October was 640 kaf. The end of October elevation and storage of Lake Powell were 3,627.09 feet (73 feet below full pool) and 14.53 maf (60 percent of full capacity), respectively. The reservoir elevation is now in its seasonal decline through the fall and winter months until spring runoff starts.

Current Operations

The operating tier for water year 2018 was established in August 2017 as the Upper Elevation Balancing Tier, with an initial water year release volume of 8.23 maf and the potential for an April 2018 adjustment to equalization or balancing releases. Based on the current forecast, an April adjustment to balancing is projected to occur and Lake Powell is currently projected to release 9.0 maf in water year 2018. This projection will be updated each month throughout the water year. Reclamation will schedule operations at Glen Canyon Dam to achieve as practicably as possible the appropriate total annual release volume by September 30, 2018.

In November 2018, the release volume will be approximately 630 kaf, with fluctuations anticipated between about 7,000 cfs in the nighttime to about 12,600 cfs in the daytime and consistent with the revised Glen Canyon Operating Criteria (27-Sep-2017) (https://www.usbr.gov/uc/water/crsp/studies/GCOC.pdf). The anticipated release volume for December is 740 kaf with daily fluctuations between approximately 7,300 cfs and 14,000 cfs. The expected release for January is 860 kaf with daily fluctuations between approximately 9,100 cfs and 16,850 cfs.

In addition to daily scheduled fluctuations for power generation, the instantaneous releases from Glen Canyon Dam may also fluctuate to provide 40 megawatts (mw) of system regulation. These instantaneous release adjustments stabilize the electrical generation and transmission system and translate to a range of about 1,200 cfs above or below the hourly scheduled release rate. Under system normal conditions, fluctuations for regulation are typically short lived and generally balance out over the hour with minimal or no noticeable impacts on downstream river flow conditions.

Releases from Glen Canyon Dam can also fluctuate beyond scheduled releases when called upon to respond to unscheduled power outages or power system emergencies. Depending on the severity of the system emergency, the response from Glen Canyon Dam can be significant, within the full range of the operating capacity of the power plant for as long as is necessary to maintain balance in the transmission system. Glen Canyon Dam currently maintains 27 mw (approximately 800 cfs) of generation capacity in reserve in order to respond to a system emergency even when generation rates are already high. System emergencies occur fairly infrequently and typically require small responses from Glen Canyon Dam. However, these responses can have a noticeable impact on the river downstream of Glen Canyon Dam.

Inflow Forecasts and Model Projections

The forecast for water year 2018 unregulated inflow to Lake Powell, issued on November

1, 2017, by the Colorado Basin River Forecast Center, projects that the most probable (median) unregulated inflow volume next year will be 8.90 maf (82 percent of average). There is significant uncertainty regarding next season's snow pack development and resulting runoff into Lake Powell. The forecast ranges from a minimum probable of 7.0 maf (65 percent of average) to a maximum probable of 17.5 maf (162 percent of average). There is a 10 percent chance that inflows could be higher than the current maximum probable forecast and a 10 percent chance that inflows could be lower than the minimum probable forecast.

Based on the current forecast, the November 24-Month Study projects Lake Powell elevation will end water year 2018 near 3,624 feet with approximately 14.2 maf in storage (58 percent of capacity). Note that projections of elevation and storage for water year 2018 have significant uncertainty at this point in the season. Projections of elevation and storage using the minimum and maximum probable inflow forecast are 3,612 feet (12.9 maf, 53 percent of capacity) and 3,654 feet (17.7 maf, 73 percent of capacity), respectively. Under these scenarios, there is a 10 percent chance that inflows will be higher, resulting in higher elevation and storage, and 10 percent chance that inflows will be lower, resulting in lower elevation and storage. The annual release volume from Lake Powell during water year 2018 is projected to be 9.0 maf under the minimum and most probable inflow scenarios and 13.56 maf under the maximum probable inflow scenario. There is a chance that inflows could be higher or lower, potentially resulting in releases greater than 13.56 maf or as low as 8.23 maf in water year 2018.

Upper Colorado River Basin Hydrology

The Upper Colorado River Basin regularly experiences significant year to year hydrologic variability. During the 18-year period 2000 to 2017, however, the unregulated inflow to Lake Powell, which is a good measure of hydrologic conditions in the Colorado River Basin, was above average in only 4 out of the past 18 years. The period 2000-2017 is the lowest 18-year period since the closure of Glen Canyon Dam in 1963, with an average unregulated inflow of 8.76 maf, or 81 percent of the 30-year average (1981-2010). (For comparison, the 1981-2010 total water year average is 10.83 maf.) The unregulated inflow during the 2000-2017 period has ranged from a low of 2.64 maf (24 percent of average) in water year 2002 to a high of 15.97 maf (147 percent of average) in water year 2011. In water year 2017 unregulated inflow volume to Lake Powell was 11.9 maf (110 percent of average), the fourth year to be above average. Under the current most probable forecast, the total water year 2018 unregulated inflow to Lake Powell is projected to be 8.90 maf (82 percent of average).

At the beginning of water year 2018, total system storage in the Colorado River Basin was 32.9 maf (55 percent of 59.6 maf total system capacity). This is an increase of 2.2 maf over the total storage at the beginning of water year 2016 when total system storage was 30.7 maf (51 percent of capacity). Since the beginning of water year 2000, total Colorado Basin storage has experienced year to year increases and decreases in response to wet and dry hydrology, ranging from a high of 94 percent of capacity at the beginning of 2000 to a low of 50 percent of capacity at the beginning of water year 2005. One wet year can significantly increase total system reservoir storage, just as persistent dry years can draw down the system storage. Based on current inflow forecasts, the current

projected end of water year total Colorado Basin reservoir storage for water year 2018 is approximately 31.42 maf (53 percent of total system capacity). The actual end of water year 2018 system storage may vary from this projection, primarily due to uncertainty regarding this season's runoff and reservoir inflow. Based on the October minimum and maximum probable inflow forecasts and modeling, the range of end of water year 2018 total system capacity is approximately 30.06 maf (50 percent of capacity) to 35.47 maf (59 percent of capacity), respectively.

December 24-Month Study
Date: December 8, 2017

From: Water Resources Group, Salt Lake City
To: All Colorado River Annual Operating Plan (AOP) Recipients

Current Reservoir Status

Reservoir	November Inflow (unregulated) (acre-feet)	Percent of Average (%)	December 7, Midnight Elevation (feet)	December 7, Midnight Reservoir Storage (acre-feet)
Fontenelle	62,000	148	6,490.62	231,000
Flaming Gorge	82,000	160	6,031.53	3,408,000
Blue Mesa	32,000	106	7,498.19	647,000
Navajo	19,000	56	6,054.75	1,282,000
Powell	387,000	82	3,624.73	14,271,000

Expected Operations

The operation of Lake Powell and Lake Mead in this December 2017 24-Month Study is pursuant to the December 2007 Record of Decision on Colorado River Interim Guidelines for Lower Basin Shortages and the Coordinated Operations of Lake Powell and Lake Mead (Interim Guidelines) and reflects the 2017 Annual Operating Plan (AOP) and draft 2018 AOP. Pursuant to the Interim Guidelines, the August 2017 24-Month Study projections of the January 1, 2018, system storage and reservoir water surface elevations set the operational tier for the coordinated operation of Lake Powell and Lake Mead during 2018.

Consistent with Section 6.B of the Interim Guidelines, the Lake Powell operational tier for water year 2018 will be governed by the Upper Elevation Balancing Tier, with an initial water year release volume of 8.23 million acre-feet (maf) and the potential for an April adjustment to equalization or balancing releases in April 2018. This December 2017 24-Month Study indicates that, consistent with Section 6.B.4 of the Interim Guidelines, an April adjustment to balancing releases is projected to occur and Lake Powell is projected to release 9.0 maf in water year 2018.

Consistent with Section 2.B.5 of the Interim Guidelines, the Intentionally Created Surplus (ICS) Surplus Condition is the criterion governing the operation of Lake Mead for calendar years 2017 and 2018.

The 2018 operational tier determinations will be documented in the 2018 AOP, which is currently in the final stages of development.

The Interim Guidelines are available for download at:
http://www.usbr.gov/lc/region/programs/strategies/RecordofDecision.pdf
The 2017 AOP is available for download at:
http://www.usbr.gov/lc/region/g4000/aop/AOP17.pdf
The draft 2018 AOP is available for download at:
https://www.usbr.gov/lc/region/g4000/AOP2018/AOP18_draft.pdf

Fontenelle Reservoir – Fontenelle Reservoir is currently at elevation 6491 feet above sea level (feet), which amounts to 67 percent of live storage capacity. Inflows for the month of November totaled 62,100 acre-feet (af), or 148 percent of average. Average to above average inflows are forecasted over the next few months and releases have been increased in order to meet the spring elevation target. Releases have been increased to base flow levels of 1,300 cubic feet per second (cfs) and are forecasted to remain at this level through the winter, subject to hydrology.

The Colorado Basin River Forecast Center has forecasted spring inflows that are above average. December, January and February forecasted inflow volumes amount to 50,000 af (156 percent of average), 45,000 af (148 percent of average), and 40,000 af (145 percent of average), respectively.

The next Fontenelle Working Group meeting is scheduled for 10:00 a.m., April 17, 2018. The meeting will be held at Seedskadee Wildlife Refuge Headquarters, Wyoming. The Fontenelle Working Group is an open public forum for information exchange between Reclamation and other parties associated with the operation of Fontenelle Reservoir.

Flaming Gorge Reservoir – Releases increased from 1,500 cfs to steady 2,800 cfs with two generating units available.

Unregulated inflow into Flaming Gorge Reservoir during the month of November was 82,000 af, or 159 percent of average. The reservoir elevation is 6,031.69 (91 percent of live capacity) and decreasing. The observed April-July unregulated inflow volume into Flaming Gorge Reservoir was 2.214 maf (226 percent of average). This is the second highest inflow volume into Flaming Gorge with the record volume inflow in 1986 at 2.26 maf (232 percent of average). March 2017 was approximately 400 percent of average and the March-July volume sets a historic inflow volume for Flaming Gorge.

The December final forecast for inflows for the next three months projects above average conditions: December, January, and February forecasted inflow volumes at 56,000 af (161 percent of average), 62,000 af (154 percent of average), and 60,000 af (135 percent of average), respectively.

The Flaming Gorge Working Group is an open public forum for information exchange between Reclamation and the stakeholders of Flaming Gorge Dam. The public is

encouraged to attend and comment on the operations and plans presented by Reclamation at these meetings. Meeting notes from past Working Group meetings are posted on the Working Group webpage. For more information on this group and these meetings please contact Dale Hamilton at 801-379-1186 or Heather Patno at 801-524-3883.

Reclamation will be holding the next Flaming Gorge Working Group meeting on Thursday, March 8, 2018, at 7:00 p.m. at the Lighthouse Learning Center High School (gymnasium), 251 West 400 North, Price, Utah, and the next on April 19, 2018, at 11:00 a.m. at the UDWR offices 318 North Vernal Ave, Vernal, Utah.

Aspinall Unit Reservoirs – Releases from Crystal Dam are approximately 1600 cfs. Uncompahgre Valley Water Users Association shut down the Gunnison Tunnel on November 1, 2017 so all releases from Crystal are now flowing through the Black Canyon. Blue Mesa Reservoir elevation is 7598.19 feet which corresponds to a storage content 646,500 acre-feet (78 percent of full capacity). Releases from Crystal will remain at the current level to the end of December. In January, releases will likely be decreased to approximately 1,100 cfs.

The November unregulated inflow to Blue Mesa Reservoir was 32,464 af (105 percent of average). Unregulated Inflows to Blue Mesa for the next three months (December, January and February) are projected to be: 31,000 af (119 percent of average), 26,000 af (100 percent of average) and 23,000 af (96 percent of average), respectively. For water year 2018, the unregulated inflow volume is forecasted to be 754,000 af (78 percent of average) with 490,000 af (72 percent of average) forecasted unregulated inflow during the April through July period. The December 24-Month Study is reflective of this new forecast.

The Aspinall Unit Working Group is an open public forum for information exchange between Reclamation and the stakeholders of the Aspinall Unit. The public is encouraged to attend and comments on the operations and plans presented by Reclamation at these meetings. Meeting notes from past working Group meetings are posted on the Working Group webpage. For more information on this group and these meetings please contact Erik Knight in the Grand Junction Area Office at (970) 248-0629.

Meeting notes from past working Group meetings are posted on the Working Group webpage at:

https://www.usbr.gov/uc/wcao/water/rsvrs/mtgs/amcurrnt.html

The next meeting of the Aspinall Unit Working Group will be held on Thursday, January 18, 2018 at 1:00 p.m. at the Holiday Inn Express located in Montrose, Colorado.

Navajo Reservoir – As of December 6, 2017, the daily average release at Navajo is 389 cfs, and the observed inflow is 92 cfs. The reservoir elevation is 6054.81 feet (1,283,166 af), and is 75 percent full (60 percent of active storage). The San Juan River at Four

Corners USGS gage is at 665 cfs. The Animas River at Farmington USGS gage is at 230 cfs. Releases are made for the authorized purposes of the Navajo Unit, and pursuant to the 2006 Record of Decision, in an attempt to maintain a target base flow through the endangered fish critical habitat reach of the San Juan River (Farmington to Lake Powell). The San Juan River Basin Recovery Implementation Program (SJRIP) recommends a target base flow of between 500 cfs and 1,000 cfs through the critical habitat area. The target base flow is calculated as the weekly average of gaged flows throughout the critical habitat area.

Modified unregulated inflow into Navajo for November was 18,900 af, which was 57 percent of average for the month. The most probable modified-unregulated inflow forecast for December at Navajo is 19,000 af (76 percent of average), for January is 18,000 af (82 percent of average), and for January is 20,800 af (69 percent of average). Releases for the remainder of the winter will be made to maintain the target baseflow in the critical habitat reach and will likely range between 400 and 600 cfs.

Reclamation conducts public operations meetings three times per year to gather input for determining upcoming operations for Navajo Reservoir. Input from individuals, organizations, and agencies along with other factors such as weather, water rights, endangered species requirements, flood control, hydro power, recreation, fish and wildlife management, and reservoir levels, will be considered in the development of these reservoir operation plans. In addition, the meetings are used to coordinate activities and exchange information among agencies, water users, and other interested parties concerning the San Juan River and Navajo Reservoir.

The next Navajo Public Operations Coordination Meeting is scheduled for January 23, 2018, at 1:00 p.m. at the Farmington Civic Center, Farmington, NM.

Glen Canyon Dam / Lake Powell

Current Status

The unregulated inflow volume to Lake Powell in November was 388 thousand acre-feet (kaf) (82 percent of average). The release volume from Glen Canyon Dam in November was 630 kaf. The end of November elevation and storage of Lake Powell were 3,625.29 feet (75 feet from full pool) and 14.33 maf (59 percent of full capacity), respectively. The reservoir elevation is now declining and is expected to continue to decline until spring 2018.

Current Operations

The operating tier for water year 2018 was established in August 2017 as the Upper Elevation Balancing Tier, with an initial water year release volume of 8.23 maf and the potential for an April 2018 adjustment to equalization or balancing releases. Based on the current forecast, an April adjustment to balancing is projected to occur and Lake Powell is currently projected to release 9.0 maf in water year 2018. This projection will be updated each month throughout the water year. Reclamation will schedule operations

at Glen Canyon Dam to achieve as practicably as possible the appropriate total annual release volume by September 30, 2018.

In December 2018, the release volume will be approximately 740 kaf, with fluctuations anticipated between about 7,300 cfs in the nighttime to about 14,000 cfs in the daytime and consistent with the revised Glen Canyon Operating Criteria (27-Sep-2017) (https://www.usbr.gov/uc/water/crsp/studies/GCOC.pdf). The anticipated release volume for January is 860 kaf with daily fluctuations between approximately 9,100 cfs and 16,850 cfs. The expected release for February is 730 kaf with daily fluctuations between approximately 10,500 cfs and 13,900 cfs.

In addition to daily scheduled fluctuations for power generation, the instantaneous releases from Glen Canyon Dam may also fluctuate to provide 40 megawatts (mw) of system regulation. These instantaneous release adjustments stabilize the electrical generation and transmission system and translate to a range of about 1,200 cfs above or below the hourly scheduled release rate. Under system normal conditions, fluctuations for regulation are typically short lived and generally balance out over the hour with minimal or no noticeable impacts on downstream river flow conditions.

Releases from Glen Canyon Dam can also fluctuate beyond scheduled releases when called upon to respond to unscheduled power outages or power system emergencies. Depending on the severity of the system emergency, the response from Glen Canyon Dam can be significant, within the full range of the operating capacity of the power plant for as long as is necessary to maintain balance in the transmission system. Glen Canyon Dam currently maintains 27 mw (approximately 800 cfs) of generation capacity in reserve in order to respond to a system emergency even when generation rates are already high. System emergencies occur fairly infrequently and typically require small responses from Glen Canyon Dam. However, these responses can have a noticeable impact on the river downstream of Glen Canyon Dam.

Inflow Forecasts and Model Projections

The forecast for water year 2018 unregulated inflow to Lake Powell, issued on December 1, 2017, by the Colorado Basin River Forecast Center, projects that the most probable (median) unregulated inflow volume next year will be 7.64 maf (71 percent of average). There is significant uncertainty regarding next season's snow pack development and resulting runoff into Lake Powell. The forecast ranges from a minimum probable of 7.0 maf (65 percent of average) to a maximum probable of 17.5 maf (162 percent of average). There is a 10 percent chance that inflows could be higher than the current maximum probable forecast and a 10 percent chance that inflows could be lower than the minimum probable forecast.

Based on the current forecast, the December 24-Month Study projects Lake Powell elevation will end water year 2018 near 3,614 feet with approximately 13.2 maf in storage (54 percent of capacity). Note that projections of elevation and storage for water year 2018 have significant uncertainty at this point in the season. Projections of elevation and storage using the minimum and maximum probable inflow forecast are 3,612 feet

(12.9 maf, 53 percent of capacity) and 3,654 feet (17.7 maf, 73 percent of capacity), respectively. Under these scenarios, there is a 10 percent chance that inflows will be higher, resulting in higher elevation and storage, and 10 percent chance that inflows will be lower, resulting in lower elevation and storage. The annual release volume from Lake Powell during water year 2018 is projected to be 9.0 maf under the minimum and most probable inflow scenarios and 13.56 maf under the maximum probable inflow scenario. There is a chance that inflows could be higher or lower, potentially resulting in releases greater than 13.56 maf or as low as 8.23 maf in water year 2018.

Upper Colorado River Basin Hydrology

The Upper Colorado River Basin regularly experiences significant year to year hydrologic variability. During the 18-year period 2000 to 2017, however, the unregulated inflow to Lake Powell, which is a good measure of hydrologic conditions in the Colorado River Basin, was above average in only 4 out of the past 18 years. The period 2000-2017 is the lowest 18-year period since the closure of Glen Canyon Dam in 1963, with an average unregulated inflow of 8.76 maf, or 81 percent of the 30-year average (1981-2010). (For comparison, the 1981-2010 total water year average is 10.83 maf.) The unregulated inflow during the 2000-2017 period has ranged from a low of 2.64 maf (24 percent of average) in water year 2002 to a high of 15.97 maf (147 percent of average) in water year 2011. In water year 2017 unregulated inflow volume to Lake Powell was 11.9 maf (110 percent of average), the fourth year to be above average. Under the current most probable forecast, the total water year 2018 unregulated inflow to Lake Powell is projected to be 7.64 maf (71 percent of average).

At the beginning of water year 2018, total system storage in the Colorado River Basin was 32.9 maf (55 percent of 59.6 maf total system capacity). This is an increase of 2.7 maf over the total storage at the beginning of water year 2017 when total system storage was 30.2 maf (51 percent of capacity). Since the beginning of water year 2000, total Colorado Basin storage has experienced year to year increases and decreases in response to wet and dry hydrology, ranging from a high of 94 percent of capacity at the beginning of 2000 to a low of 50 percent of capacity at the beginning of water year 2005. One wet year can significantly increase total system reservoir storage, just as persistent dry years can draw down the system storage. Based on current inflow forecasts, the current projected end of water year total Colorado Basin reservoir storage for water year 2018 is approximately 30.7 maf (52 percent of total system capacity). The actual end of water year 2018 system storage may vary from this projection, primarily due to uncertainty regarding this season's runoff and reservoir inflow. Based on the October minimum and maximum probable inflow forecasts and modeling, the range of end of water year 2018 total system capacity is approximately 30.06 maf (50 percent of capacity) to 35.47 maf (59 percent of capacity), respectively.

January 24-Month Study
Date: January 12, 2018

From: Water Resources Group, Salt Lake City
To: All Colorado River Annual Operating Plan (AOP) Recipients

Current Reservoir Status

Reservoir	December Inflow (unregulated) (acre-feet)	Percent of Average (%)	January 11, Midnight Elevation (feet)	January 11, Midnight Reservoir Storage (acre-feet)
Fontenelle	46,000	144	6,484.14	190,000
Flaming Gorge	52,000	150	6,029.05	3,312,000
Blue Mesa	25,000	102	7,489.45	577,000
Navajo	10,000	39	6,053.26	1,264,000
Powell	299,000	82	3,621.63	13,937,000

Expected Operations

The operation of Lake Powell and Lake Mead in this January 2018 24-Month Study is pursuant to the December 2007 Record of Decision on Colorado River Interim Guidelines for Lower Basin Shortages and the Coordinated Operations of Lake Powell and Lake Mead (Interim Guidelines), and reflects the 2018 Annual Operating Plan (AOP). Pursuant to the Interim Guidelines, the August 2017 24-Month Study projections of the January 1, 2018, system storage and reservoir water surface elevations set the operational tier for the coordinated operation of Lake Powell and Lake Mead during 2018.

Consistent with Section 6.B of the Interim Guidelines, Lake Powell's operations in water year 2018 will be governed by the Upper Elevation Balancing Tier, with an initial water year release volume of 8.23 million acre-feet (maf) and the potential for an April adjustment to equalization or balancing releases in April 2018. This January 2018 24-Month Study indicates that, consistent with Section 6.B.4 of the Interim Guidelines, an April adjustment to balancing releases is projected to occur and Lake Powell is projected to release 9.0 maf in water year 2018.

Consistent with Section 2.B.5 of the Interim Guidelines, the Intentionally Created Surplus (ICS) Surplus Condition is the criterion governing the operation of Lake Mead for calendar year 2018.

The Interim Guidelines are available for download at:
https://www.usbr.gov/lc/region/programs/strategies/RecordofDecision.pdf.
The 2018 AOP is available for download at:
https://www.usbr.gov/lc/region/g4000/aop/AOP18.pdf

Fontenelle Reservoir – Fontenelle Reservoir is currently at elevation 6484 feet above sea level (feet), which amounts to 56 percent of live storage capacity. Inflows for the month of December totaled 46,000 acre-feet (af), or 144 percent of average. Releases have been set to 1,300 cubic feet per second (cfs) and are forecasted to remain at this level through the winter.

The Colorado Basin River Forecast Center has forecasted spring inflows that are above average. January, February, and March forecasted inflow volumes amount to 44,000 af (145 percent of average), 40,000 af (145 percent of average), and 60,000 af (114 percent of average), respectively.

The next Fontenelle Working Group meeting is scheduled for 10:00 a.m., April 17, 2018. The meeting will be held at Seedskadee Wildlife Refuge Headquarters, Wyoming. The Fontenelle Working Group is an open public forum for information exchange between Reclamation and other parties associated with the operation of Fontenelle Reservoir.

Flaming Gorge Reservoir – Releases are currently 2,800 cfs and expected to remain at this level through February, subject to hydrology.

Unregulated inflow into Flaming Gorge Reservoir during the month of December was 52,000 af, or 149 percent of average. The reservoir elevation is 6,029 feet (89 percent of live storage capacity) and decreasing.

The January final forecast for inflows for the next three months projects above average conditions: January, February and March forecasted inflow volumes at 59,000 af (146 percent of average), 57,000 af (128 percent of average), and 106,000 af (104 percent of average), respectively.

The January water supply forecast of the April through July unregulated inflow volume into Flaming Gorge Reservoir is 1 million acre-feet (102 percent of average). Current snowpack is 97 percent of median for the Upper Green Basin. The Upper Green is doing well compared against the southern portion of the Upper Colorado River Basin.

The Flaming Gorge Working Group is an open public forum for information exchange between Reclamation and the stakeholders of Flaming Gorge Dam. The public is encouraged to attend and comment on the operations and plans presented by Reclamation at these meetings. Meeting notes from past Working Group meetings are posted on the Working Group webpage. For more information on this group and these meetings please contact Dale Hamilton at 801-379-1186 or Heather Patno at 801-524-3883.

Reclamation will be holding the next Flaming Gorge Working Group meeting on Thursday, March 8, 2018, at 7:00 p.m. at the Lighthouse Learning Center High School (gymnasium), 251 West 400 North, Price, Utah, and the next on April 19, 2018, at 11:00 a.m. at the UDWR offices 318 North Vernal Ave, Vernal, Utah.

Aspinall Unit Reservoirs – Releases from Crystal Dam are approximately 900 cfs. Uncompahgre Valley Water Users Association shut down the Gunnison Tunnel on November 1, 2017 so all releases from Crystal are now flowing through the Black Canyon. Blue Mesa Reservoir elevation is 7589 feet which corresponds to a storage content 577,000 acre-feet (69 percent of live storage capacity). Releases from Crystal will remain at the current level to the end of January. In February, releases will likely be decreased to approximately 750 cfs.

The December unregulated inflow to Blue Mesa Reservoir was 24,636 af (102 percent of average). Unregulated Inflows to Blue Mesa for the next three months (January, February and March) are projected to be: 24,000 af (100 percent of average), 21,000 af (95 percent of average) and 31,000 af (86 percent of average), respectively.

Snow accumulation so far this winter has been well below normal for this time of year. As of January 11, 2018 the snowpack above Crystal Reservoir is 48 percent of median. For water year 2018, the unregulated inflow volume is forecasted to be 679,000 af (71 percent of average) with 435,000 af (64 percent of average) forecasted unregulated inflow during the April through July period. The January 24-Month Study is reflective of this new forecast.

The Aspinall Unit Working Group is an open public forum for information exchange between Reclamation and the stakeholders of the Aspinall Unit. The public is encouraged to attend and comments on the operations and plans presented by Reclamation at these meetings. Meeting notes from past working Group meetings are posted on the Working Group webpage. For more information on this group and these meetings please contact Erik Knight in the Grand Junction Area Office at (970) 248-0629.

Meeting notes from past working Group meetings are posted on the Working Group webpage at:

https://www.usbr.gov/uc/wcao/water/rsvrs/mtgs/amcurrnt.html

The next meeting of the Aspinall Unit Working Group will be held on Thursday, January 18th, 2018 at 1:00 p.m. at the Holiday Inn Express located in Montrose, Colorado.

Navajo Reservoir – The daily average release from Navajo is 380 cfs, and the observed inflow is 210 cfs. The reservoir elevation is 6053.4 feet (1,265,600 af), and is 74 percent full (58 percent of active storage). The San Juan River at Four Corners USGS gage is at 690 cfs. The Animas River at Farmington USGS gage is at 230 cfs. Releases are made for the authorized purposes of the Navajo Unit, and pursuant to the 2006 Record of Decision,

in an attempt to maintain a target base flow through the endangered fish critical habitat reach of the San Juan River (Farmington to Lake Powell). The San Juan River Basin Recovery Implementation Program (SJRIP) recommends a target base flow of between 500 cfs and 1,000 cfs through the critical habitat area. The target base flow is calculated as the weekly average of gaged flows throughout the critical habitat area.

Currently SNOTEL sites are showing an average of 2.7 inches of SWE above Navajo, which is 26 percent of the median and 13 percent of the seasonal median peak. Currently the closest comparable years are 2000, 2002, and 2006.

Modified unregulated inflow into Navajo for November was 10,440 af, which was 42 percent of average for the month. The most probable modified-unregulated inflow forecast for January at Navajo is 14,000 af (64 percent of average), for February is 16,000 af (53 percent of average), and for March is 40,000 af (43 percent of average). Releases for the remainder of the winter will be made to maintain the target baseflow in the critical habitat reach and will likely range between 400 and 600 cfs.

Reclamation conducts Public Operations Meetings three times per year to gather input for determining upcoming operations for Navajo Reservoir. Input from individuals, organizations, and agencies along with other factors such as weather, water rights, endangered species requirements, flood control, hydro power, recreation, fish and wildlife management, and reservoir levels, will be considered in the development of these reservoir operation plans. In addition, the meetings are used to coordinate activities and exchange information among agencies, water users, and other interested parties concerning the San Juan River and Navajo Reservoir.

The next Navajo Public Operations Coordination Meeting is scheduled for January 23rd, 2018, at 1:00 p.m. at the Farmington Civic Center, Farmington, NM.

Glen Canyon Dam / Lake Powell

Current Status
The unregulated inflow to Lake Powell in December was 299 thousand acre-feet (kaf) (82 percent of average). The release volume from Glen Canyon Dam in December was 740 kaf. The end of December elevation and storage of Lake Powell were 3,623 feet (77 feet from full pool) and 13.7 maf (56 percent of full capacity), respectively. The reservoir is declining and will continue to decline until spring runoff begins to enter the reservoir. The current snowpack above Lake Powell is 64 percent of average.

Current Operations
The operating tier for water year 2018 was established in August 2017 as the Upper Elevation Balancing Tier, with an initial water year release volume of 8.23 maf and the potential for an April 2018 adjustment to equalization or balancing releases. Based on the current forecast, an April adjustment to balancing is projected to occur and Lake Powell is currently projected to release 9.0 maf in water year 2018. This projection will be updated each month throughout the water year. Reclamation will schedule operations

at Glen Canyon Dam to achieve as practicably as possible the appropriate total annual release volume by September 30, 2018.

In January 2018, the release volume will be approximately 860 kaf, with fluctuations anticipated between approximately 9,100 cfs and 16,850 cfs and consistent with the Glen Canyon Dam, Record of Decision (dated December 2016). The anticipated release volume for February is approximately 730 kaf with daily fluctuations between approximately 10,500 cfs and 13,900 cfs. The expected release for March is 800 kaf with daily fluctuations between approximately 7,200 cfs and 16,000 cfs.

In addition to daily scheduled fluctuations for power generation, the instantaneous releases from Glen Canyon Dam may also fluctuate to provide 40 MW of system regulation. These instantaneous release adjustments stabilize the electrical generation and transmission system and translate to a range of up to about 1,200 cfs above or below the hourly scheduled release rate. Under system normal conditions, fluctuations for regulation are typically short lived and generally balance out over the hour with minimal or no noticeable impacts on downstream river flow conditions.

Releases from Glen Canyon Dam can also fluctuate beyond scheduled releases when called upon to respond to unscheduled power outages or power system emergencies. Depending on the severity of the system emergency, the response from Glen Canyon Dam can be significant, within the full range of the operating capacity of the power plant for as long as is necessary to maintain balance in the transmission system. Glen Canyon Dam currently maintains 27 MW (approximately 800 cfs) of generation capacity in reserve in order to respond to a system emergency even when generation rates are already high. System emergencies occur fairly infrequently and typically require small responses from Glen Canyon Dam. However, these responses can have a noticeable impact on the river downstream of Glen Canyon Dam.

Inflow Forecasts and Model Projections

The April to July 2018 water supply forecast for unregulated inflow to Lake Powell, issued on January 3, 2018, by the Colorado Basin River Forecast Center, projects that the most probable (median) unregulated inflow volume will be 3.9 maf (54 percent of average based on the period 1981-2010). The projected water year 2018 inflow is 6.75 maf (62 percent of average). At this early point in the season, there is still significant uncertainty regarding this year's water supply. The April-July forecast ranges from a minimum probable of 2.11 maf (29 percent of average) to a maximum probable of 9.8 maf (90 percent of average). There is a 10 percent chance that inflows could be higher than the current maximum probable forecast and a 10 percent chance that inflows could be lower than the minimum probable forecast.

Based on the current forecast, the January 24-Month Study projects Lake Powell elevation will end water year 2018 near 3,607 feet with approximately 12.4 maf in storage (51 percent of capacity). Note that projections of elevation and storage for water year 2018 have significant uncertainty at this point in the season. Projections of elevation and storage using the minimum and maximum probable inflow forecast, updated in January, are 3,591 feet (10.9 maf, 45 percent of capacity) and 3,628 feet (14.7 maf, 60 percent of capacity), respectively. Under these scenarios, there is a 10 percent chance

that inflows will be higher, resulting in higher elevation and storage, and 10 percent chance that inflows will be lower, potentially in lower elevation and storage. The annual release volume from Lake Powell during water year 2018 is projected to be 9.0 maf under the minimum, most, and maximum probable inflow scenarios. There is a chance that inflows could be higher or lower, potentially resulting in releases greater than 9.0 maf or as low as 8.23 maf in water year 2018. The minimum and maximum probable scenarios will be updated again in April.

Upper Colorado River Basin Hydrology

The Upper Colorado River Basin regularly experiences significant year to year hydrologic variability. During the 18-year period 2000 to 2017, however, the unregulated inflow to Lake Powell, which is a good measure of hydrologic conditions in the Colorado River Basin, was above average in only 4 out of the past 18 years. The period 2000-2017 is the lowest 18-year period since the closure of Glen Canyon Dam in 1963, with an average unregulated inflow of 8.76 maf, or 81percent of the 30-year average (1981-2010). (For comparison, the 1981-2010 total water year average is 10.83 maf.) The unregulated inflow during the 2000-2017 period has ranged from a low of 2.64 maf (24 percent of average) in water year 2002 to a high of 15.97 maf (147 percent of average) in water year 2011. In water year 2017 unregulated inflow volume to Lake Powell was 11.9 maf (110 percent of average), the fourth year to be above average. Under the current most probable forecast, the total water year 2018 unregulated inflow to Lake Powell is projected to be 6.75 maf (62 percent of average).

At the beginning of water year 2018, total system storage in the Colorado River Basin was 32.9 maf (55 percent of 59.6 maf total system capacity). This is an increase of 2.7 maf over the total storage at the beginning of water year 2017 when total system storage was 30.2 maf (51 percent of capacity). Since the beginning of water year 2000, total Colorado Basin storage has experienced year to year increases and decreases in response to wet and dry hydrology, ranging from a high of 94 percent of capacity at the beginning of 2000 to a low of 50 percent of capacity at the beginning of water year 2005. One wet year can significantly increase total system reservoir storage, just as persistent dry years can draw down the system storage. Based on current inflow forecasts, the current projected end of water year total Colorado Basin reservoir storage for water year 2018 is approximately 29.9 maf (50 percent of total system capacity). The actual end of water year 2018 system storage may vary from this projection, primarily due to uncertainty regarding this season's runoff and reservoir inflow. Based on the January minimum and maximum probable inflow forecasts and modeling, the range of end of water year 2018 total system capacity is approximately 28.0 maf (47 percent of capacity) to 32.7 maf (55 percent of capacity), respectively.
