Boulder City, NV 89006-1470
Phone: 702-293-8571

The operation of Lake Powell and Lake Mead in this September 2009 24-Month Study is pursuant to the December 2007 Record of Decision on Colorado River Interim Guidelines for Lower Basin Shortages and the Coordinated Operations of Lake Powell and Lake Mead (Interim Guidelines), and reflects the 2009 Annual Operating Plan (AOP). Pursuant to the Interim Guidelines, the August 24-Month Study projections of the January 1 system storage and reservoir water surface elevations set the operational tier for the coordinated operation of Lake Powell and Lake Mead. If the operating tier for the year is the Upper Elevation Balancing Tier, an adjustment may be made in April based on the April 24-Month Study projection of the September 30 system storage and reservoir water surface elevations.

The Upper Elevation Balancing Tier is the operational tier for water year 2009 for Glen Canyon Dam. The Intentionally Created Surplus (ICS) Surplus condition is the criterion governing the operation of Lake Mead for calendar year 2009.

The April 24-Month Study projected the end of water year elevation at Lake Powell to be below the 2009 Equalization Elevation of 3639 feet and the projected end of water year elevation at Lake Mead to be above elevation 1075 feet. Pursuant to Sections 6.B.1. and 6.B.4. of the Interim Guidelines, the annual release volume will be 8.23 million acre-feet from Glen Canyon Dam during water year 2009 which is reflected in this September 24-Month Study.

This 24-Month Study currently projects Lake Powell's 2010 end of water year elevation to be above the 2010 Equalization Elevation of 3642 feet under an 8.23 maf release. Pursuant to the Interim Guidelines, an April 2010 adjustment is projected such that operating tier at Lake Powell would shift to the Equalization Tier during 2010. Based on analysis of inflow scenarios, currently the probability of an April adjustment in 2010 is approximately 65 percent.

The Interim Guidelines are available for download at http://www.usbr.gov/lc/region/programs/strategies/RecordofDecision.pdf. The 2009 AOP is available for download at http://www.usbr.gov/uc/water/rsvrs/ops/aop/AOP09_final.pdf.

Current runoff projections into Lake Powell are provided by the National Weather Service's Colorado Basin River Forecast Center and are as follows: Observed unregulated inflow into Lake Powell for the month of August 2009 was 0.323 maf or 53% of the 30 year average. The forecast for September 2009 unregulated inflow into Lake Powell is 0.400 maf or 84% of the 30 year average. The observed April through July unregulated inflow is 7.814 maf or 99% of average.

In this study, the Calendar Year (CY) 2009 diversion for Metropolitan Water District of Southern California (MWD) is forecasted to be 1.101 maf. The CY 2009 diversion for the Central Arizona Project (CAP) is forecasted to be 1.568 maf. Consumptive use for Nevada above Hoover is forecasted to be 0.318 maf for CY 2009.

Due to declining Lake Mead elevations, Hoover's generator capacity is adjusted based on estimated effective capacity and plant availability. The estimated effective capacity is based on projected Lake Mead elevations. Unit capacity tests will be performed as the lake elevation changes in 2-foot increments. This study reflects these changes in the projections.

Hoover, Davis, and Parker historical gross energy figures come from PO&M reports provided by the Power and O&M Group, Boulder Canyon Operations Office, Bureau of Reclamation, Boulder City, Nevada. Questions regarding these historical energy numbers can be directed to Larry Karr at (702) 293-8094.

Boulder City, NV 89006-1470
Phone: 702-293-8571

The operation of Lake Powell and Lake Mead in this October 2009 24-Month Study is pursuant to the December 2007 Record of Decision on Colorado River Interim Guidelines for Lower Basin Shortages and the Coordinated Operations of Lake Powell and Lake Mead (Interim Guidelines), and reflects the 2009 Annual Operating Plan (AOP) and draft 2010 AOP. Pursuant to the Interim Guidelines, the August 24-Month Study projections of the January 1 system storage and reservoir water surface elevations set the operational tier for the coordinated operation of Lake Powell and Lake Mead. If the operating tier for the year is the Upper Elevation Balancing Tier, an adjustment may be made in April based on the April 24-Month Study projection of the September 30 system storage and reservoir water surface elevations.

The Upper Elevation Balancing Tier is the operational tier for water year 2010 for Glen Canyon Dam. The Intentionally Created Surplus (ICS) Surplus condition is the criterion governing the operation of Lake Mead for calendar years 2009 and 2010.

With a Lake Powell water year release volume of 8.23 million acre-feet (maf), the October 24-Month Study projects Lake Powell's 2010 end of water year elevation to be above the 2010 Equalization Elevation of 3,642 feet. Pursuant to the Interim Guidelines, the October 24-Month Study projects an April adjustment to the Equalization Tier in 2010. The annual release from Glen Canyon Dam under the Equalization Tier is projected to be 10.585 maf. Based on analysis of possible inflow scenarios, the probability of an April adjustment to the Equalization Tier in 2010 is currently 55 percent.

The Interim Guidelines are available for download at http://www.usbr.gov/lc/region/programs/strategies/RecordofDecision.pdf.
The 2009 AOP is available for download at http://www.usbr.gov/uc/water/rsvrs/ops/aop/AOP09_final.pdf.
The draft 2010 AOP is available for download at http://www.usbr.gov/lc/region/g4000/AOP2010/AOP10_draft.pdf.

Current runoff projections into Lake Powell are provided by the National Weather Service's Colorado Basin River Forecast Center and are as follows: Observed unregulated inflow into Lake Powell for the month of September 2009 was 0.265 maf or 56% of the 30 year average. The forecast for October 2009 unregulated inflow into Lake Powell is 0.400 maf or 73% of the 30 year average. The observed April through July unregulated inflow is 7.804 maf or 98% of average.

In this study, the Calendar Year (CY) 2009 diversion for Metropolitan Water District of Southern California (MWD) is forecasted to be 1.106 maf. The CY 2009 diversion for the Central Arizona Project (CAP) is forecasted to be 1.588 maf. Consumptive use for Nevada above Hoover is forecasted to be 0.317 maf for CY 2009.

Due to declining Lake Mead elevations, Hoover's generator capacity is adjusted based on estimated effective capacity and plant availability. The estimated effective capacity is based on projected Lake Mead elevations. Unit capacity tests will be performed as the lake elevation changes in 2-foot increments. This study reflects these changes in the projections.

Hoover, Davis, and Parker historical gross energy figures come from PO&M reports provided by the Lower Colorado Region's Power Management Office, Bureau of Reclamation, Boulder City, Nevada. Questions regarding these historical energy numbers can be directed to Larry Karr at (702) 293-8094.

Boulder City, NV 89006-1470
Phone: 702-293-8571

The operation of Lake Powell and Lake Mead in this November 2009 24-Month Study is pursuant to the December 2007 Record of Decision on Colorado River Interim Guidelines for Lower Basin Shortages and the Coordinated Operations of Lake Powell and Lake Mead (Interim Guidelines), and reflects the 2009 Annual Operating Plan (AOP) and draft 2010 AOP. Pursuant to the Interim Guidelines, the August 24-Month Study projections of the January 1 system storage and reservoir water surface elevations set the operational tier for the coordinated operation of Lake Powell and Lake Mead. If the operating tier for the year is the Upper Elevation Balancing Tier, an adjustment may be made in April based on the April 24-Month Study projection of the September 30 system storage and reservoir water surface elevations.

The Upper Elevation Balancing Tier is the operational tier for water year 2010 for Glen Canyon Dam. The Intentionally Created Surplus (ICS) Surplus condition is the criterion governing the operation of Lake Mead for calendar years 2009 and 2010.

With a Lake Powell water year release volume of 8.23 million acre-feet (maf), the November 24-Month Study projects Lake Powell's 2010 end of water year elevation to be above the 2010 Equalization Elevation of 3,642 feet. Pursuant to the Interim Guidelines, the November 24-Month Study projects an April adjustment to the Equalization Tier in 2010. The annual release from Glen Canyon Dam under the Equalization Tier is projected to be 10.667 maf. Based on analysis of possible inflow scenarios, the probability of an April adjustment to the Equalization Tier in 2010 is approximately 50 percent.

The Interim Guidelines are available for download at http://www.usbr.gov/lc/region/programs/strategies/RecordofDecision.pdf.
The 2009 AOP is available for download at http://www.usbr.gov/uc/water/rsvrs/ops/aop/AOP09_final.pdf.
The draft 2010 AOP is available for download at http://www.usbr.gov/lc/region/g4000/AOP2010/AOP10_draft.pdf.

Current runoff projections into Lake Powell are provided by the National Weather Service's Colorado Basin River Forecast Center and are as follows: Observed unregulated inflow into Lake Powell for the month of November 2009 was 0.374 maf or 68% of the 30 year average. The forecast for November 2009 unregulated inflow into Lake Powell is 0.430 maf or 79% of the 30 year average.

In this study, the Calendar Year (CY) 2009 diversion for Metropolitan Water District of Southern California (MWD) is forecasted to be 1.117 maf. The CY 2009 diversion for the Central Arizona Project (CAP) is forecasted to be 1.626 maf. Consumptive use for Nevada above Hoover is forecasted to be 0.276 maf for CY 2009.

Due to declining Lake Mead elevations, Hoover's generator capacity is adjusted based on estimated effective capacity and plant availability. The estimated effective capacity is based on projected Lake Mead elevations. Unit capacity tests will be performed as the lake elevation changes in 2-foot increments. This study reflects these changes in the projections.

Hoover, Davis, and Parker historical gross energy figures come from PO&M reports provided by the Lower Colorado Region's Power Management Office, Bureau of Reclamation, Boulder City, Nevada. Questions regarding these historical energy numbers can be directed to Larry Karr at (702) 293-8094.

November 24-Month Study
Date: November 10, 2009

From: Water Resources Group, Salt Lake City
To: All Colorado River Annual Operating Plan (AOP) Recipients

Current Reservoir Status

Reservoir	October Inflow (unregulated) (acre-feet)	Percent of Average (%)	November 9 Midnight Elevation (feet)	Reservoir Storage (acre-feet)
Fontenelle	48,000	93	6494.27	257,000
Flaming Gorge	86,000	132	6029.41	3,326,000
Blue Mesa	33,000	91	7492.91	604,000
Powell	374,000	68	3632.84	15,173,000
Navajo	15,200	34	6054.39	1,278,000

Expected Operations

The operation of Lake Powell and Lake Mead in this November 2009 24-Month Study is pursuant to the December 2007 Record of Decision on Colorado River Interim Guidelines for Lower Basin Shortages and the Coordinated Operations of Lake Powell and Lake Mead (Interim Guidelines), and reflects the 2009 Annual Operating Plan (AOP) and draft 2010 AOP. Pursuant to the Interim Guidelines, the August 24-Month Study projections of the January 1 system storage and reservoir water surface elevations set the operational tier for the coordinated operation of Lake Powell and Lake Mead. If the operating tier for the year is the Upper Elevation Balancing Tier, an adjustment may be made in April based on the April 24-Month Study projection of the September 30 system storage and reservoir water surface elevations.

The Upper Elevation Balancing Tier is the operational tier for water year 2010 for Glen Canyon Dam. The Intentionally Created Surplus (ICS) Surplus condition is the criterion governing the operation of Lake Mead for calendar years 2009 and 2010.

With a Lake Powell water year release volume of 8.23 million acre-feet (maf), the November 24-Month Study projects Lake Powell's 2010 end of water year elevation to be above the 2010 Equalization Elevation of 3,642 feet. Pursuant to the Interim Guidelines, the November 24-Month Study projects an April adjustment to the Equalization Tier in 2010. The annual release from Glen Canyon Dam under the Equalization Tier is projected to be 10.667 maf. Based on analysis of possible inflow

scenarios, the probability of an April adjustment to the Equalization Tier in 2010 is approximately 50 percent.

The Interim Guidelines are available for download at
http://www.usbr.gov/lc/region/programs/strategies/RecordofDecision.pdf.
The 2009 AOP is available for download at
http://www.usbr.gov/uc/water/rsvrs/ops/aop/AOP09_final.pdf.
The draft 2010 AOP is available for download at
http://www.usbr.gov/lc/region/g4000/AOP2010/AOP10_draft.pdf.

Fontenelle Reservoir – Inflows for the month of October were 48,000 acre-feet, or 93% of average. The reservoir elevation is 6494.5 feet above sea level and 75% of capacity. The reservoir elevation is declining and will continue to decline through the winter months until spring runoff. Inflows over the next three months are forecasted to be near average: 42,000 acre-ft, 33,000 acre-ft, and 31,000 acre-ft for November, December and January, respectively.

Inflows to Fontenelle Reservoir are currently averaging 800 cfs and releases are 1,000 cfs. It is anticipated that releases will be increased to approximately 1,140 cfs in late November or early December, after maintenance work at the powerplant is complete or before the ice is set on the river, whichever occurs first.

The next Fontenelle Working Group meeting is scheduled for April 27, 2010 at 10:00 am at the Seedskadee National Wildlife Refuge visitor's center. The Fontenelle Working Group is an open public forum for information exchange between Reclamation and other parties associated with the operation of Fontenelle Reservoir.

Flaming Gorge Reservoir – October observed unregulated inflow into Flaming Gorge reservoir was 45,000 acre-feet (AF), or 70 percent of average inflow. The October end of month elevation was 6029.7 feet, which equates to 3.34 million acre-feet or 89 percent of live storage capacity. The observed April through July unregulated inflow volume into Flaming Gorge Reservoir was 1,197,000 (101 percent of average), compared with the 68 percent of average forecasted in April.

The average daily base flow for the base flow period is 1,700 cubic feet per second (cfs) per day. The flexibility outlined in the ROD allows the average daily base flow to vary ± 40% from the average daily base flow for the summer period through November 30, and ± 25% for the winter period from December 1 through the end of February. Releases out of Flaming Gorge are currently fluctuating around a 2,025 cfs daily average and are expected to continue at 2,025 cfs through September. It is anticipated that releases will decrease in October to an average daily release of 1,750 cfs.

The next Flaming Gorge Working Group meeting is scheduled for April 27, 2009, in Vernal, Utah. The meeting will be held at 7:00 p.m. at the Western Park Convention

Center located at 302 East 200 South in Vernal, Utah. For directions, please call 435-789-7396. The Flaming Gorge Working Group is an open public forum for information exchange between Reclamation and the stake holders of Flaming Gorge Dam. The public is encouraged to attend and comment on the operations and plans presented by Reclamation at these meetings. For more information on this group and these meetings please contact Ed Vidmar at 801-379-1182.

Flaming Gorge Dam is currently releasing 1,750 cfs per day in a double peak pattern. The daily minimum and maximum release is approximately 850 cfs and 2,550 cfs, respectively. It is anticipated that releases will follow a double-peak pattern through the end of February.

Aspinall Unit Reservoirs – October unregulated inflow into Blue Mesa Reservoir was 33,000 acre-feet or 91 percent of average. Precipitation during October was observed to be about 90 percent of average. The current inflow rate into Blue Mesa Reservoir is about 550 cfs while reservoir releases are averaging about 500 cfs. Blue Mesa's present elevation is 7492.91 feet, which corresponds to a storage content of about 604,000 acre-feet. The unregulated reservoir inflow into Blue Mesa Reservoir during water year 2009 was 1,018,000 acre-feet, or about 108 percent of average.

Releases from Crystal are currently set at 500 cfs. The Gunnison Diversion Tunnel was shut down for the season on October 30, with exception of some small 50 to 80 cfs diversions taken bi-weekly for municipal water needs in Montrose, Colorado. River flows below the tunnel are essentially the same as releases from the Dam, with the exception of when the tunnel is taking water to refill Fairfield Reservoir for Montrose municipal water needs.

On November 5, 2009, the National Weather Service's River Forecasting Center issued its forecasted inflow into Blue Mesa for the next 3 months. The unregulated inflow forecast for November, December, and January is for 82,000 acre-feet, which is 102% of average for these months.

The next meeting of the "Aspinall Unit Working Group" will be held on Thursday January 21st in the Montrose, Colorado, starting at 1:00 PM. At this meeting, review of last summer and fall reservoir operations, and plans for this winter and next spring 2010 operations will be discussed. These meetings are open forum discussions on the Aspinall Unit reservoir operations with many interested groups participating. Anyone needing further information about these meetings should contact Dan Crabtree in the Grand Junction Area Office at (970) 248-0652.

Navajo Reservoir - As a result of improved stream flow conditions, Reclamation decreased the release from Navajo Reservoir to 500 cubic feet per second (cfs) on Tuesday, October 20th . Releases are made for the authorized purposes of the Navajo

Unit, and to attempt to maintain a target base flow through the endangered fish critical habitat reach of the San Juan River (Farmington to Lake Powell).

The San Juan River Basin Recovery Implementation Program recommends a target base flow of between 500 cfs and 1,000 cfs through the critical habitat area. The target base flow is calculated as the weekly average of gaged flows throughout the critical habitat area, therefore daily flows of less than 500 cfs may occur at some gages.

Pending significant changes in the weather and stream flow conditions, the reservoir release will likely remain at 500 cfs until next spring (2010).

Precipitation for the month of October in the San Juan River basin was about 80 percent of average. Unregulated inflow into Navajo Reservoir during the month of October was 15,200 acre-feet, or 34 percent of average. Currently, the daily reservoir inflow is averaging about 250 cfs. Diversions for NIIP have currently been shut down for the winter. The reservoir water surface elevation is at 6054.39 feet, which corresponds to a storage content of about 1,278,000 acre-feet.

The unregulated reservoir inflow into Navajo Reservoir during water year 2009 was recorded at 744,000 acre-feet, or about 68 percent of average. The reservoir had a seasonal peak elevation of 6073.01 feet on May 28, 2009. Navajo Reservoir also provided a spring peak hydrograph of 5,000 cfs during the fist week of June.

A public meeting on Navajo Reservoir operations was held on Tuesday, January 26, 2010 at 1:00 p.m. in Farmington, New Mexico. At this meeting, review of last summer and fall reservoir operations, and plans for this winter and spring 2010 operations will be discussed. These are open forum discussions on the operation of Navajo Reservoir with many interested groups participating. Anyone interested in the general operation of the reservoir is encouraged to attend. Please contact Pat Page in Reclamation's Durango, Colorado Office at (970) 385-6560 for information about these meetings or the daily operation of Navajo Reservoir.

Glen Canyon Dam / Lake Powell – The unregulated inflow volume into Lake Powell for October was 374,000 acre-feet ((80% of average). This was 26,000 acre-feet below what was forecasted at the beginning of the month. Consequently, the elevation of Lake Powell at the end of October was somewhat below what was projected in the October 24-month study. The end of October elevation of Lake Powell was 3633.52 feet above sea level. The October 24-month study projected the elevation would end October at 3634.06. So the initial conditions for the November 24-month study are reduced by about 0.5 feet from what was expected in the October 24-month study.

The updated forecast for the unregulated inflow volume to Lake Powell during November is now 430,000 acre-feet (92% of average).

Beginning on November 1, 2009, releases from Glen Canyon Dam will resume normal daily fluctuation consistent with the Glen Canyon Dam Operating Criteria (Federal Register, Volume 62, No. 41, March 3, 1997). The scheduled release volume for November is 690,000 acre-feet. Hourly releases during November will peak during daylight hours into the evening to approximately 13,500 cfs and decrease during early morning hours to approximately 7,500 cfs. Currently, it is projected that the release volume for December will be scheduled to be 855,000 acre-feet. At this volume, it is estimated that the hourly releases during December would peak during daylight hours to approximately 17,000 cfs and decrease during early morning hours to approximately 9,000 cfs. These estimated release rates will be updated towards the end of November.

As of October 1, 2009, the unregulated inflow to Lake Powell during water year 2010 is projected to have an 80% probability of being within the range between 4.7 maf and 16.5 maf. There is an estimated 10% probability that the water year 2010 unregulated inflow volume will be below 4.7 maf and there is also an estimated 10% probability that the water year 2010 unregulated inflow volume will be greater than 16.5 maf.

Based on the range of probable inflow volumes and through implementation of the Interim Guidelines, there is approximately a 50% probability that Equalization will occur in 2010. The determination of whether or not Equalization will occur in 2010 will be based on the projected September 30 Lake Powell water surface elevations of the 2010 April 24-Month Study. If Equalization does occur in 2010, the water year release volume is projected to be approximately 10.7 maf. If however, Equalization does not occur in 2010 (50% probability), the water year release volume could be as low as 8.23 maf. Each month these forecasted probabilities will be updated as hydrologic conditions change in the Upper Colorado River Basin.

Upper Colorado River Basin Hydrology

In the Upper Colorado River Basin during water year 2009, the overall precipitation accumulated through September 30, 2009 is approximately 95% of average based on the 30 year average for the period from 1971 through 2000. The final 3 months of water year 2009 all had accumulated precipitation rates that were all below average with 60, 45 and 75% of average occurring in July, August and September respectively. Precipitation for October 2009 was 90% of average.

The Climate Prediction Center outlook (dated October 15, 2009) for temperature over the next 3 months indicates that temperatures in the southwest have an increased probability of being above average while accumulated precipitation is projected to be near average in the Upper Colorado River Basin.

Upper Colorado River Basin Drought

The Upper Colorado River Basin continues to experience a protracted multi-year drought. Since 1999, inflow to Lake Powell has been below average in every year except water years 2005 and 2008. In the summer of 1999, Lake Powell was close to full with

reservoir storage at 23.5 million acre-feet, or 97 percent of capacity. During the next 5 years (2000 through 2004) unregulated inflow to Lake Powell was well below average. This resulted in Lake Powell storage decreasing during this period to 8.0 million acre-feet (33 percent of capacity) which occurred on April 8, 2005. During 2005, 2008 and 2009, drought conditions eased somewhat with net gains in storage to Lake Powell. As of October 28, 2009 the storage in Lake Powell was 15.38 million acre-feet (63.25 percent of capacity) which is still below desired levels while the overall reservoir storage in the Colorado River Basin as of October 28, 2009 is 34.1 million acre-feet (57.26 percent of capacity).

The operation of Lake Powell and Lake Mead in this December 2009 24-Month Study is pursuant to the December 2007 Record of Decision on Colorado River Interim Guidelines for Lower Basin Shortages and the Coordinated Operations of Lake Powell and Lake Mead (Interim Guidelines), and reflects the 2009 Annual Operating Plan (AOP) and draft 2010 AOP. Pursuant to the Interim Guidelines, the August 24-Month Study projections of the January 1 system storage and reservoir water surface elevations set the operational tier for the coordinated operation of Lake Powell and Lake Mead. If the operating tier for the year is the Upper Elevation Balancing Tier, an adjustment may be made in April based on the April 24-Month Study projection of the September 30 system storage and reservoir water surface elevations.

The Upper Elevation Balancing Tier is the operational tier for water year 2010 for Glen Canyon Dam. The Intentionally Created Surplus (ICS) Surplus condition is the criterion governing the operation of Lake Mead for calendar years 2009 and 2010.

With a Lake Powell water year release volume of 8.23 million acre-feet (maf), the December 24-Month Study projects Lake Powell's 2010 end of water year elevation to be above the 2010 Equalization Elevation of 3,642 feet. Pursuant to the Interim Guidelines, the December 24-Month Study projects an April adjustment to the Equalization Tier in 2010. The annual release from Glen Canyon Dam under the Equalization Tier is projected to be 10.765 maf. Based on analysis of recently updated possible inflow scenarios, the probability of an April adjustment to the Equalization Tier in 2010 is currently 36 percent.

During the fall and early winter months, inflow forecasting capability can be highly variable with limited accuracy. Traditionally, Reclamation incorporates the first official water supply forecast (forecast that extends through July of the current water year) into the January 24-Month Study. This forecast will likely be more consistent with the inflow scenarios used this month to analyze the current probability of equalization projection.

The Interim Guidelines are available for download at http://www.usbr.gov/lc/region/programs/strategies/RecordofDecision.pdf.
The 2009 AOP is available for download at http://www.usbr.gov/uc/water/rsvrs/ops/aop/AOP09_final.pdf.
The draft 2010 AOP is available for download at http://www.usbr.gov/lc/region/g4000/AOP2010/AOP10_draft.pdf.

Current runoff projections into Lake Powell are provided by the National Weather Service's Colorado Basin River Forecast Center and are as follows: Observed unregulated inflow into Lake Powell for the month of November 2009 was 0.417 maf or 77% of the 30 year average. The forecast for December 2009 unregulated inflow into Lake Powell is 0.375 maf or 86% of the 30 year average.

In this study, the Calendar Year (CY) 2009 diversion for Metropolitan Water District of Southern California (MWD) is forecasted to be 1.118 maf. The CY 2009 diversion for the Central Arizona Project (CAP) is forecasted to be 1.660 maf. Consumptive use for Nevada above Hoover is forecasted to be 0.243 maf for CY 2009.

Due to declining Lake Mead elevations, Hoover's generator capacity is adjusted based on estimated effective capacity and plant availability. The estimated effective capacity is based on projected Lake Mead elevations. Unit capacity tests will be performed as the lake elevation changes in 2-foot increments. This study reflects these changes in the projections.

Hoover, Davis, and Parker historical gross energy figures come from PO&M reports provided by the Lower Colorado Region's Power Management Office, Bureau of Reclamation, Boulder City, Nevada. Questions regarding these historical energy numbers can be directed to Larry Karr at (702) 293-8094.

December 24-Month Study
Date: December 9, 2009

From: Water Resources Group, Salt Lake City
To: All Colorado River Annual Operating Plan (AOP) Recipients

Current Reservoir Status

Reservoir	November Inflow (unregulated) (acre-feet)	Percent of Average (%)	December 8 Midnight Elevation (feet)	Reservoir Storage (acre-feet)
Fontenelle	42,000	98	6490.02	228,000
Flaming Gorge	47,000	85	6028.23	3,281,000
Blue Mesa	27,000	87	7491.75	595,000
Powell	422,000	77	3630.01	14,854,000
Navajo	13,500	40	6052.87	1,260,000

Expected Operations

The operation of Lake Powell and Lake Mead in this December 2009 24-Month Study is pursuant to the December 2007 Record of Decision on Colorado River Interim Guidelines for Lower Basin Shortages and the Coordinated Operations of Lake Powell and Lake Mead (Interim Guidelines), and reflects the 2009 Annual Operating Plan (AOP) and draft 2010 AOP. Pursuant to the Interim Guidelines, the August 24-Month Study projections of the January 1 system storage and reservoir water surface elevations set the operational tier for the coordinated operation of Lake Powell and Lake Mead. If the operating tier for the year is the Upper Elevation Balancing Tier, an adjustment may be made in April based on the April 24-Month Study projection of the September 30 system storage and reservoir water surface elevations.

The Upper Elevation Balancing Tier is the operational tier for water year 2010 for Glen Canyon Dam. The Intentionally Created Surplus (ICS) Surplus condition is the criterion governing the operation of Lake Mead for calendar years 2009 and 2010.

With a Lake Powell water year release volume of 8.23 million acre-feet (maf), the December 24-Month Study projects Lake Powell's 2010 end of water year elevation to be above the 2010 Equalization Elevation of 3,642 feet. Pursuant to the Interim Guidelines, the December 24-Month Study projects an April adjustment to the Equalization Tier in 2010. The annual release from Glen Canyon Dam under the Equalization Tier is projected to be 10.764 maf. Based on analysis of recently updated possible inflow

scenarios, the probability of an April adjustment to the Equalization Tier in 2010 is currently 36 percent.

During the fall and early winter months, inflow forecasting capability can be highly variable with limited accuracy. Traditionally, Reclamation incorporates the first official water supply forecast (forecast that extends through July of the current water year) into the January 24-Month Study. This forecast will likely be more consistent with the inflow scenarios used this month to analyze the current probability of equalization projection.

The Interim Guidelines are available for download at
http://www.usbr.gov/lc/region/programs/strategies/RecordofDecision.pdf.
The 2009 AOP is available for download at
http://www.usbr.gov/uc/water/rsvrs/ops/aop/AOP09_final.pdf.
The draft 2010 AOP is available for download at
http://www.usbr.gov/lc/region/g4000/AOP2010/AOP10_draft.pdf.

Fontenelle Reservoir – Inflows for the month of November were 42,000 acre-feet, or 98% of average. The reservoir elevation is 6490 feet above sea level and 66% of capacity. The reservoir elevation is declining and will continue to decline through the winter months until spring runoff. Inflows over the next three months are forecasted to be slightly below average: 33,000 acre-ft, 31,000 acre-ft, and 29,000 acre-ft for November, December and January, respectively.

Inflows to Fontenelle Reservoir are currently averaging 500 cfs and releases are 1,130 cfs. It is anticipated that releases will remain at 1,130 cfs through the winter months.

The next Fontenelle Working Group meeting is scheduled for April 27, 2010 at 10:00 am at the Seedskadee National Wildlife Refuge visitor's center. The Fontenelle Working Group is an open public forum for information exchange between Reclamation and other parties associated with the operation of Fontenelle Reservoir.

Flaming Gorge Reservoir – November observed unregulated inflow into Flaming Gorge reservoir was 47,000 acre-feet (AF), or 85 percent of average inflow. The November end of month elevation was 6028.7 feet, which equates to 3.30 million acre-feet or 88 percent of live storage capacity.

The average daily base flow for the base flow period is 1,700 cubic feet per second (cfs) per day. The flexibility outlined in the ROD allows the average daily base flow to vary ± 40% from the average daily base flow for the summer period through November 30, and ± 25% for the winter period from December 1 through the end of February. Releases out of Flaming Gorge are currently fluctuating around a 1,750 cfs daily average and are expected to continue through the end of February, at which time they are expected to decrease. Releases are also expected to follow a double peak pattern through February. December releases will include one week of single peak flows for research purposes and two days of flows at 800 cfs for maintenance.

The next Flaming Gorge Working Group meeting is scheduled for April 27, 2009, in Vernal, Utah. The meeting will be held at 7:00 p.m. at the Western Park Convention Center located at 302 East 200 South in Vernal, Utah. For directions, please call 435-789-7396. The Flaming Gorge Working Group is an open public forum for information exchange between Reclamation and the stake holders of Flaming Gorge Dam. The public is encouraged to attend and comment on the operations and plans presented by Reclamation at these meetings. For more information on this group and these meetings please contact Ed Vidmar at 801-379-1182.

Aspinall Unit Reservoirs – November unregulated inflow into Blue Mesa Reservoir was 27,000 acre-feet or 86 percent of average. Precipitation during November was observed to be about 40 percent of average. The current inflow rate into Blue Mesa Reservoir is about 350 cfs while reservoir releases are averaging about 850 cfs. Blue Mesa's present elevation is 7491.91 feet, which corresponds to a storage content of about 596,000 acre-feet. The unregulated reservoir inflow into Blue Mesa Reservoir during water year 2009 was 1,018,000 acre-feet, or about 108 percent of average.

Releases from Crystal Dam were increased from 600 cfs to 900 cfs on December 1st to help meet the Blue Mesa Reservoir icing elevation target for December 31st in conjunction to help meet higher winter hydropower demands.

The Gunnison Diversion Tunnel was shut down for the season on October 30, with exception of some small 50 to 80 cfs diversions taken bi-weekly for municipal water needs in Montrose, Colorado. River flows below the tunnel are essentially the same as releases from the Dam, with the exception of when the tunnel is taking water to refill Fairfield Reservoir for Montrose municipal water needs.

On December 7, 2009, the National Weather Service's River Forecasting Center issued its forecasted inflow into Blue Mesa for the next 3 months. The unregulated inflow forecast for December, January, and February is for 73,000 acre-feet, which is 102% of average for these months.

The next meeting of the "Aspinall Unit Working Group" will be held on Thursday January 21st in the Montrose, Colorado, starting at 1:00 PM. At this meeting, review of last summer and fall reservoir operations, and plans for this winter and next spring 2010 operations will be discussed. These meetings are open forum discussions on the Aspinall Unit reservoir operations with many interested groups participating. Anyone needing further information about these meetings should contact Dan Crabtree in the Grand Junction Area Office at (970) 248-0652.

Navajo Reservoir - As a result of improved stream flow conditions, Reclamation decreased the release from Navajo Reservoir to 500 cubic feet per second (cfs) on Tuesday, October 20th . Releases are made for the authorized purposes of the Navajo

Unit, and to attempt to maintain a target base flow through the endangered fish critical habitat reach of the San Juan River (Farmington to Lake Powell).

The San Juan River Basin Recovery Implementation Program recommends a target base flow of between 500 cfs and 1,000 cfs through the critical habitat area. The target base flow is calculated as the weekly average of gaged flows throughout the critical habitat area, therefore daily flows of less than 500 cfs may occur at some gages.

Pending significant changes in the weather and stream flow conditions, the reservoir release will likely remain at 500 cfs until next spring (2010).

Precipitation for the month of November in the San Juan River basin was about 35 percent of average. Unregulated inflow into Navajo Reservoir during the month of November was 13,600 acre-feet, or 39 percent of average. Currently, the daily reservoir inflow is averaging about 120 cfs. Diversions for NIIP have currently been shut down for the winter. The reservoir water surface elevation is at 6052.92 feet, which corresponds to a storage content of about 1,260,000 acre-feet.

A public meeting on Navajo Reservoir operations will be held on Tuesday, January 26, 2010 at 1:00 p.m. in Farmington, New Mexico. At this meeting, review of last summer and fall reservoir operations, and plans for this winter and spring 2010 operations will be discussed. These are open forum discussions on the operation of Navajo Reservoir with many interested groups participating. Anyone interested in the general operation of the reservoir is encouraged to attend. Please contact Pat Page in Reclamation's Durango, Colorado Office at (970) 385-6560 for information about these meetings or the daily operation of Navajo Reservoir.

Glen Canyon Dam / Lake Powell – The unregulated inflow volume into Lake Powell for November was 417,000 acre-feet ((90% of average). This was 13,000 acre-feet below what was forecasted at the beginning of the month. Consequently, the elevation of Lake Powell at the end of November was somewhat below what was projected in the November 24-Month Study. The end of November elevation of Lake Powell was 3631.10 feet above sea level. The November 24-Month Study projected the elevation would end November at 3631.56. So the initial condition for Lake Powell elevation for the December 24-Month Study is 0.46 feet below what was projected to occur in the November 24-Month Study. The forecasted unregulated inflow volume to Lake Powell for December is 375,000 acre-feet (104% of average) which has been reduced by 25,000 acre-feet from what was forecasted one month ago.

The scheduled release volume for December was increased from 855,000 acre-feet to 900,000 acre-feet due to a revision of the projected unit maintenance outage schedule in February. It is possible that only 4 of the 8 generating units at Glen Canyon Power Plant will be available during much of February 2010. The projected release volume for February was reduced from 800,000 acre-feet to 700,000 acre-feet so that the volume can be released through the 4 available units in a manner that will allow a load following

pattern of generation within the allowances of the Glen Canyon Dam Operating Criteria (Federal Register, Volume 62, No. 41, March 3, 1997). Redistribution of the 100,000 acre-foot reduction in February included an increase to the scheduled release volume for December.

Hourly releases during December will peak during daylight hours into the evening to approximately 18,000 cfs and decrease during early morning hours to approximately 10,000 cfs. Currently, it is projected that the release volume for January will be scheduled to be 955,000 acre-feet. At this volume, it is estimated that the hourly release rates during January would peak during daylight hours to approximately 19,000 cfs and decrease during early morning hours to approximately 11,000 cfs.

As of October 1, 2009, the unregulated inflow to Lake Powell during water year 2010 is projected to have an 80% probability of being within the range between 4.7 maf and 16.5 maf. There is an estimated 10% probability that the water year 2010 unregulated inflow volume will be below 4.7 maf and there is also an estimated 10% probability that the water year 2010 unregulated inflow volume will be greater than 16.5 maf.

Based on a recently updated range of possible inflow volumes for water year 2010 and through implementation of the Interim Guidelines, there is approximately a 36% probability that Equalization will occur in water year 2010. The determination of whether or not Equalization will occur in 2010 will be based on the projected September 30 Lake Powell water surface elevations of the 2010 April 24-Month Study. If Equalization does occur in 2010, the water year release volume is projected to be approximately 10.765 maf. If however, Equalization does not occur in 2010 (64% probability), the water year release volume could be as low as 8.23 maf. Each month these forecasted probabilities will be updated as hydrologic conditions change in the Upper Colorado River Basin.

Upper Colorado River Basin Hydrology

In the Upper Colorado River Basin during water year 2009, the overall precipitation accumulated through September 30, 2009 was approximately 95% of average based on the 30 year average for the period from 1971 through 2000. The final 3 months of water year 2009 all had accumulated precipitation rates that were all below average with 60, 45 and 75% of average occurring in July, August and September respectively. For water year 2010 the dry conditions have continued. Precipitation for October 2009 was 85% of average and for November, precipitation was estimated to be only 40% of average.

The Climate Prediction Center outlook (dated November 19, 2009) for temperature over the next 3 months indicates that temperatures in the southwest have an increased probability of being above average while accumulated precipitation is projected to be near average in the Upper Colorado River Basin.

Upper Colorado River Basin Drought

The Upper Colorado River Basin continues to experience a protracted multi-year drought. Since 1999, inflow to Lake Powell has been below average in every year except water years 2005 and 2008. In the summer of 1999, Lake Powell was close to full with reservoir storage at 23.5 million acre-feet, or 97 percent of capacity. During the next 5 years (2000 through 2004) unregulated inflow to Lake Powell was well below average. This resulted in Lake Powell storage decreasing during this period to 8.0 million acre-feet (33 percent of capacity) which occurred on April 8, 2005. During 2005, 2008 and 2009, drought conditions eased somewhat with net gains in storage to Lake Powell. As of December 6, 2009 the storage in Lake Powell was 14.88 million acre-feet (61.20 percent of capacity) which is still below desired levels while the overall reservoir storage in the Colorado River Basin as of December 6, 2009 is 33.4 million acre-feet (56.14 percent of capacity).

January 24-Month Study
Date: January 13, 2010

From: Water Resources Group, Salt Lake City
To: All Colorado River Annual Operating Plan (AOP) Recipients

Current Reservoir Status

Reservoir	December Inflow (unregulated) (acre-feet)	Percent of Average (%)	January 12 Midnight Elevation (feet)	Reservoir Storage (acre-feet)
Fontenelle	31,000	94	6482.76	182,000
Flaming Gorge	19,000	48	6026.95	3,233,000
Blue Mesa	21,000	81	7488.78	572,000
Powell	309,000	71	3624.23	14,217,000
Navajo	10,000	40	6050.97	1,237,000

Expected Operations

The operation of Lake Powell and Lake Mead in this January 2010 24-Month Study is pursuant to the December 2007 Record of Decision on Colorado River Interim Guidelines for Lower Basin Shortages and the Coordinated Operations of Lake Powell and Lake Mead (Interim Guidelines), and reflects the 2010 Annual Operating Plan (AOP). Pursuant to the Interim Guidelines, the August 2009 24-Month Study projections of the January 1, 2010 system storage and reservoir water surface elevations set the operational tier for the coordinated operation of Lake Powell and Lake Mead.

The operational tier for water year 2010 for the coordinated operation of Lake Powell and Lake Mead is the Upper Elevation Balancing Tier with a corresponding annual release from Lake Powell of 8.23 maf. Under this operational tier, an adjustment to the water year operation of Lake Powell can occur in April based on the April 24-Month Study projection of the September 30 system storage and reservoir water surface elevations.

The January 2010 24-Month Study, with a water year release volume from Lake Powell of 8.23 million acre-feet (maf), projects that the Lake Powell end of water year 2010 water surface elevation will be 3638.31 feet above sea level which is below the 2010 Equalization Elevation of 3642 feet. For this reason, the January 2010 24-Month Study projects that an April adjustment to the Equalization Tier in 2010 is not likely to occur under the currently forecasted most probable hydrologic conditions.

Basin hydrology can vary significantly through the winter and there is uncertainty in forecasting snow pack conditions. An April adjustment to the Equalization Tier is still possible if forecasted runoff conditions become significantly wetter between now and April. Based on analysis of recently updated possible inflow scenarios, the probability of an April adjustment to the Equalization Tier in 2010 is approximately 21 percent.

The Intentionally Created Surplus (ICS) Surplus condition is the

The average daily base flow for the base flow period is 1,700 cubic feet per second (cfs) per day. The flexibility outlined in the ROD allows the average daily base flow to vary ± 40% from the average daily base flow for the summer period through November 30, and ± 25% for the winter period from December 1 through the end of February. Releases out of Flaming Gorge are currently fluctuating around a 1,750 cfs daily average. The final January forecast for April through July unregulated inflow into Flaming Gorge Reservoir was 65 percent of average. With the low unregulated inflow observed in December and forecasted for April through July, February releases will be decreased to 1,550 cfs daily average and March releases decreased to 1,275 cfs daily average. Releases are also expected to follow a double peak pattern through February.

The next Flaming Gorge Working Group meeting is scheduled for April 27, 2009, in Vernal, Utah. The meeting will be held at 7:00 p.m. at the Western Park Convention Center located at 302 East 200 South in Vernal, Utah. For directions, please call 435-789-7396. The Flaming Gorge Working Group is an open public forum for information exchange between Reclamation and the stake holders of Flaming Gorge Dam. The public is encouraged to attend and comment on the operations and plans presented by Reclamation at these meetings. For more information on this group and these meetings please contact Ed Vidmar at 801-379-1182.

Aspinall Reservoir Unit – December unregulated inflow into Blue Mesa Reservoir was 21,000 acre-feet or 81 percent of average. Precipitation during December was observed to be about 90 percent of average. The Gunnison River basin snowpack as of January 12th was averaging about 82 percent. The current inflow rate into Blue Mesa Reservoir is about 350 cfs while reservoir releases are averaging about 750 cfs. The past four months have seen below average inflow into Blue Mesa Reservoir of about 83 percent. The present reservoir elevation is 7488.90 feet, which corresponds to a storage content of about 573,000 acre-feet.

The first Water Supply Forecast for Water Year 2010 has been issued and the April through July unregulated inflow is forecasted to be at 575,000 acre-feet (80% of normal). Based on this forecast, Blue Mesa Reservoir is projected to fill by July 2010.

Releases from Crystal Dam are steady at 800 cfs. Reservoir releases will most likely change as hydrologic conditions warrant, primarily as we respond to changes in forecasted inflows.

The next meeting of the "Aspinall Unit Working Group" will be held on Thursday January 21st in the Montrose, Colorado, starting at 1:00 PM. At this meeting, review of last summer and fall reservoir operations, and plans for this winter and next spring 2010 operations will be discussed. These meetings are open forum discussions on the Aspinall Unit reservoir operations with many interested groups participating. Anyone needing further information about these meetings should contact Dan Crabtree in the Grand Junction Area Office at (970) 248-0652.

Navajo Reservoir - Reclamation decreased the release from Navajo Reservoir to 500 cubic feet per second (cfs) on Tuesday, October 20th , which is still in effect. Releases are made for the authorized purposes of the Navajo Unit, and to attempt to maintain a target base flow through the endangered fish critical habitat reach of the San Juan River (Farmington to Lake Powell).

The San Juan River Basin Recovery Implementation Program recommends a target base flow of between 500 cfs and 1,000 cfs through the critical habitat area. The target base flow is calculated as the weekly average of gaged flows throughout the critical habitat area, therefore daily flows of less than 500 cfs may occur at some gages.

Pending significant changes in the weather and stream flow conditions, the reservoir release will likely remain at 500 cfs through this spring (2010).

Precipitation for the month of December in the San Juan River basin was about 155 percent of average. Unregulated inflow into Navajo Reservoir during the month of December was 10,000 acre-feet, or 40 percent of average. Currently, the daily reservoir inflow is averaging about 110 cfs. Diversions for NIIP have currently been shut down for the winter. The reservoir water surface elevation is at 6050.97 feet, which corresponds to a storage content of about 1,237,000 acre-feet.

A public meeting on Navajo Reservoir operations will be held on Tuesday, January 26, 2010 at 1:00 p.m. in Farmington, New Mexico. At this meeting, review of last summer and fall reservoir operations, and plans for this winter and spring 2010 operations will be discussed. These are open forum discussions on the operation of Navajo Reservoir with many interested groups participating. Anyone interested in the general operation of the reservoir is encouraged to attend. Please contact Pat Page in Reclamation's Durango, Colorado Office at (970) 385-6560 for information about these meetings or the daily operation of Navajo Reservoir.

Glen Canyon Dam / Lake Powell –The unregulated inflow volume into Lake Powell in December 2009 was 309,000 acre-feet which was 71% of average. This was about 66,000 acre-feet below the unregulated inflow volume that was projected in the December 2009 24-Month Study. For this reason, the elevation of Lake Powell at the end of December was 1.1 feet lower than what it was projected to be in the December 2009 24-Month Study which was 3627.33 feet above sea level. The end of December 2009 reservoir elevation was 3626.22 feet above sea level.

The release volume for December 2009 was 901,000 acre-feet. In January 2010 the scheduled release volume for the month is now 900,000 acre-feet which reflects a reduction in the scheduled release volume of 55,000 acre-feet. Beginning on January 13, 2010 hourly releases will peak in the late morning and late afternoon to approximately 17,500 cfs and reach the daily low hourly release rate of approximately 9,500 cfs in the early morning hours. The release volume for February is yet to be determined and will be based on snowpack conditions as well as forecasted inflows to Lake Powell. If the

Water Supply Forecast update for February remains near the current level, the most likely release volume in February will be 640,000 acre-feet but could be as high as 850,000 acre-feet if inflow forecast conditions increase significantly.

In addition to the daily fluctuation pattern, instantaneous releases from Glen Canyon Dam also fluctuate to provide approximately 40 megawatts of system regulation to maintain stable conditions within the electrical generation and transmission system. These momentary fluctuations for regulation are very short lived and typically balance out over the hour. Glen Canyon Dam also provides a level of reserve generation that can be called upon when unanticipated outages occur within the generation system. When an outage event occurs, reserve generation at Glen Canyon Dam can be called upon and this additional reserve generation is typically maintained for 2 hours or less.

The official Water Supply Forecast (April-July Unregulated Inflow Volume) for Lake Powell issued by the Colorado Basin River Forecast Center for January was 6.2 million acre-feet (maf) which is 78% of average for the period from 1971 to 2000. Based on this forecast, the January 2010 24-Month Study, with a projected water release volume of 8.23 maf pursuant to the Interim Guidelines, projects the end of water year elevation of Lake Powell to be 3638.31 feet above sea level. This projected elevation is below the Equalization Elevation for 2010 which is 3642 feet above sea level. For this reason, the January 2010 24-Month Study does not project an April adjustment to the Equalization Tier and the projected water year release from Lake Powell is 8.23 maf.

In 2010, through the implementation of the Interim Guidelines, there is still a possibility that the April 2010 24-Month Study could project the end of water year 2010 elevation of Lake Powell to be above the 2010 Equalization Elevation (3642 feet). For this to happen, the Water Supply Forecast in April for Lake Powell would have to be somewhat higher than the current level of 6.2 maf (78% of average) and more in the range of 90 to 95% of average. If this were to occur, an April adjustment to the Equalization Tier is possible and under that scenario, the water year release volume from Lake Powell could be as high as 10.8 maf.

As of early January, given the hydrologic conditions within the Colorado River Basin and the range of possible inflow scenarios that could occur in 2010, Reclamation estimates that there is now about a 21% probability that an April adjustment to the Equalization Tier will occur in April 2010. This estimate is based on many factors that are changing through time. Reclamation will update this estimated probability each month to provide stakeholders some probabilistic estimate of the possibility that Equalization will occur in water year 2010.

In 2010, through the implementation of the Interim Guidelines, it is also possible that Balancing could occur if the April 2010 24-Month Study projects the end of water year elevation of Lake Mead to be below 1075. The January 2010 24-Month Study projected the end of water year 2010 elevation of Lake Mead to be 1077.02. If this projection drops by 2 feet or more over the next 2 months such that the April 2010 24-Month Study projects an end of water year 2010 elevation of Lake Mead that is below 1075 feet,

pursuant to the Interim Guidelines the projected water year release from Lake Powell could be increased above 8.23 maf to a maximum of 9.0 maf in order to balance the storage volumes of Lake Powell with Lake Mead at the end of the water year.

Upper Colorado River Basin Hydrology

In the Upper Colorado River Basin during water year 2009, the overall precipitation accumulated through September 30, 2009 was approximately 95% of average based on the 30 year average for the period from 1971 through 2000. For water year 2010 the dry conditions have continued. Precipitation for October 2009 was 85% of average and for November, precipitation was estimated to be only 40% of average. In December 2009, the estimated precipitation above Lake Powell was 115% of average.

The Climate Prediction Center outlook (dated December 17, 2009) for temperature over the next 3 months indicates that temperatures in the northern reaches of the Upper Colorado River Basin have an increased probability of being above average. Accumulated precipitation over the next 3 months has an increased probability of being above average in the southern reaches of the Upper Colorado River Basin.

Upper Colorado River Basin Drought

The Upper Colorado River Basin continues to experience a protracted multi-year drought. Since 1999, inflow to Lake Powell has been below average in every year except water years 2005 and 2008. In the summer of 1999, Lake Powell was close to full with reservoir storage at 23.5 million acre-feet, or 97 percent of capacity. During the next 5 years (2000 through 2004) unregulated inflow to Lake Powell was well below average. This resulted in Lake Powell storage decreasing during this period to 8.0 million acre-feet (33 percent of capacity) which occurred on April 8, 2005. During 2005, 2008 and 2009, drought conditions eased somewhat with net gains in storage to Lake Powell. As of January 12, 2010 the storage in Lake Powell was 14.23 million acre-feet (58.53 percent of capacity) which is still below desired levels while the overall reservoir storage in the Colorado River Basin as of January 12, 2010 is 33.0 million acre-feet (55.54 percent of capacity).

February 24-Month Study
Date: February 11, 2010

From: Water Resources Group, Salt Lake City
To: All Colorado River Annual Operating Plan (AOP) Recipients

Current Reservoir Status

Reservoir	January Inflow (unregulated) (acre-feet)	Percent of Average (%)	February 10 Midnight Elevation (feet)	Reservoir Storage (acre-feet)
Fontenelle	28,000	90	6475.77	145,000
Flaming Gorge	27,000	60	6025.99	3,197,000
Blue Mesa	22,000	88	7486.28	553,000
Powell	304,000	75	3621.52	13,925,000
Navajo	14,000	62	6049.66	1,222,000

Expected Operations

The operation of Lake Powell and Lake Mead in this February 2010 24-Month Study is pursuant to the December 2007 Record of Decision on Colorado River Interim Guidelines for Lower Basin Shortages and the Coordinated Operations of Lake Powell and Lake Mead (Interim Guidelines), and reflects the 2010 Annual Operating Plan (AOP). Pursuant to the Interim Guidelines, the August 2009 24-Month Study projections of the January 1, 2010 system storage and reservoir water surface elevations set the operational tier for the coordinated operation of Lake Powell and Lake Mead.

The operational tier for water year 2010 for the coordinated operation of Lake Powell and Lake Mead is the Upper Elevation Balancing Tier with a corresponding annual release from Lake Powell of 8.23 maf. Under this operational tier, an adjustment to the water year operation of Lake Powell can occur in April based on the April 24-Month Study projection of the September 30 system storage and reservoir water surface elevations.

The February 2010 24-Month Study, with a water year release volume from Lake Powell of 8.23 million acre-feet (maf), projects that the Lake Powell end of water year 2010 water surface elevation will be 3,634.80 feet above sea level which is below the 2010 Equalization Elevation of 3,642 feet. For this reason, the February 2010 24-Month Study projects that an April adjustment to the Equalization Tier in 2010 is not likely to occur under the currently forecasted most probable hydrologic conditions.

Basin hydrology can vary significantly through the winter and there is uncertainty in forecasting snow pack conditions. An April adjustment to the Equalization Tier is still possible if forecasted runoff conditions improve significantly between now and April. Based on analysis of recently updated possible inflow scenarios, the probability of an April adjustment to the Equalization Tier in 2010 is approximately 25 percent.

The Intentionally Created Surplus (ICS) Surplus condition is the criterion governing the operation of Lake Mead for calendar year 2010.

The Interim Guidelines are available for download at
http://www.usbr.gov/lc/region/programs/strategies/RecordofDecision.pdf.
The 2010 AOP is available for download at
http://www.usbr.gov/lc/region/g4000/AOP2010/AOP10.pdf

Fontenelle Reservoir – Inflows for the month of January were 28,000 acre-feet, or 91% of average. The reservoir elevation is 6477 feet above sea level and 44% of capacity. The reservoir elevation is declining and will continue to decline through the winter months until spring runoff. Inflows to Fontenelle Reservoir are currently averaging 400 cfs and releases are 980 cfs. Basin snowpack is 56% of average for this time of year.

The 2010 water supply forecast for the April to July runoff season is 525,000 acre-feet (61% of average). Inflows over the next three months are forecasted to be below average: 26,000 acre-ft, 44,000 acre-ft, and 70,000 acre-ft for February, March, and April, respectively.

The next Fontenelle Working Group meeting is scheduled for April 27, 2010 at 10:00 am at the Seedskadee National Wildlife Refuge visitor's center. The Fontenelle Working Group is an open public forum for information exchange between Reclamation and other parties associated with the operation of Fontenelle Reservoir.

Flaming Gorge Reservoir – January observed unregulated inflow into Flaming Gorge reservoir was 27,000 acre-feet (AF), or 62 percent of average inflow. The January end of month elevation was 6027.3 feet, which equates to 3.21 million acre-feet or 85 percent of live storage capacity.

Releases out of Flaming Gorge are currently fluctuating around a 1,550 cfs daily average. The final February forecast for April through July unregulated inflow into Flaming Gorge Reservoir was 57 percent of average, a decrease from 65 percent of average in January. Snowpack in the Upper Green River Basin has been hovering around 56 percent. With the current snowpack and decrease forecast, March releases will be decreased to 900 cfs daily average.

The next Flaming Gorge Working Group meeting is scheduled for April 27, 2010, in Vernal, Utah. The meeting will be held at 7:00 p.m. at the Western Park Convention Center located at 302 East 200 South in Vernal, Utah. For directions, please call 435-789-

7396. The Flaming Gorge Working Group is an open public forum for information exchange between Reclamation and the stake holders of Flaming Gorge Dam. The public is encouraged to attend and comment on the operations and plans presented by Reclamation at these meetings. For more information on this group and these meetings please contact Ed Vidmar at 801-379-1182.

Aspinall Reservoir Unit – January unregulated inflow into Blue Mesa Reservoir was 22,000 acre-feet or 87 percent of average. On February 12 the basin snowpack was averaging 89 percent, which is slightly up from 85 percent on January 12th. Precipitation during January was 90 percent of average, while December's precipitation was recorded at 125 percent of average. The current inflow rate into Blue Mesa Reservoir is about 400 cfs while reservoir releases are averaging about 800 cfs. This past fall and early winter months has seen below average reservoir inflows. Blue Mesa's present elevation is 7486.64 feet, which corresponds to a storage content of about 555,000 acre-feet. This elevation is about 7 feet higher than last year's elevation.

The Colorado Basin River Forecast Center's February water supply forecast for Blue Mesa for the April to July runoff season is 600,000 acre-feet (83% of average) which is an increase of 25,000 acre-feet from last month's forecast. Based on this forecast, Blue Mesa Reservoir is projected to fill by early July 2010.

Releases from Crystal are currently set at 800 cfs. The Gunnison Diversion Tunnel was shut down for the season on October 30th, with the exception of some small 50 to 100 cfs diversions taken bi-weekly for municipal water needs in Montrose, Colorado. Reservoir releases may likely change as to changes in forecasted runoff.

The last meeting of the "Aspinall Unit Working Group" was held on January 21, 2010 in Montrose, Colorado. At this meeting, review of last summer and fall reservoir operations, and plans for this winter and next spring 2010 operations were discussed. These meetings are open forum discussions on the Aspinall Unit reservoir operations with many interested groups participating. For more information about these meetings please contact Dan Crabtree in the Grand Junction Area Office at (970) 248-0652.

Navajo Reservoir – Reclamation decreased the release from Navajo Reservoir to 500 cubic feet per second (cfs) on Tuesday, October 20th , which is still in effect. Releases are made for the authorized purposes of the Navajo Unit, and to attempt to maintain a target base flow through the endangered fish critical habitat reach of the San Juan River (Farmington to Lake Powell).

The San Juan River Basin Recovery Implementation Program recommends a target base flow of between 500 cfs and 1,000 cfs through the critical habitat area. The target base flow is calculated as the weekly average of gauged flows throughout the critical habitat area, therefore daily flows of less than 500 cfs may occur at some gages.

Pending significant changes in the weather and stream flow conditions, the reservoir release will likely remain at 500 cfs through this spring (2010).

Precipitation for the month of January in the San Juan River basin was about 150 percent of average. Unregulated inflow into Navajo Reservoir during the month of January was 13,600 acre-feet, or 60 percent of average. Currently, the daily reservoir inflow is averaging about 300 cfs. Diversions for NIIP have currently been shut down for the winter. The reservoir water surface elevation is at 6049.70 feet, which corresponds to a storage content of about 1,222,000 acre-feet.

A public meeting on Navajo Reservoir operations will be held on Tuesday, April 27, 2010 at 1:00 p.m. in Farmington, New Mexico. At this meeting, review of last summer and fall reservoir operations, and plans for this winter and spring 2010 operations will be discussed. These are open forum discussions on the operation of Navajo Reservoir with many interested groups participating. Anyone interested in the general operation of the reservoir is encouraged to attend. Please contact Pat Page in Reclamation's Durango, Colorado Office at (970) 385-6560 for information about these meetings or the daily operation of Navajo Reservoir.

Glen Canyon Dam / Lake Powell –The unregulated inflow volume into Lake Powell in January 2010 was just below what was forecasted at the beginning of January. The unregulated inflow to Lake Powell for the month of January was 304,000 acre-feet (75% of average). This was about 26,000 acre-feet below the unregulated inflow volume that was projected in the January 2010 24-Month Study. For this reason, the elevation of Lake Powell at the end of January was about 2 inches below what was projected in the January 2010 24-Month Study. The end of January Lake Powell elevation was 3622.14 feet above sea level which was over 4 feet lower than the elevation on January 1, 2010.

The release volume for January 2010 was 900,480 acre-feet. Daily peak releases for power generation in January were 17,500 cfs during the morning and afternoon with lows of approximately 9,500 cfs in the very early morning hours. In February 2010 the scheduled release volume for the month is 640,000 acre-feet. Peak releases each day for power generation in February will be approximately 14,000 cfs with lows of about 8,000 cfs.

In addition to the daily fluctuation pattern, instantaneous releases from Glen Canyon Dam also fluctuate to provide approximately 40 megawatts of system regulation to maintain stable conditions within the electrical generation and transmission system. These momentary fluctuations for regulation are very short lived and typically balance out over the hour. Glen Canyon Dam also provides a level of reserve generation that can be called upon when unanticipated outages occur within the generation system. When an outage event occurs, reserve generation at Glen Canyon Dam can be called upon and this additional reserve generation is typically maintained for 2 hours or less.

The official Water Supply Forecast (April-July Unregulated Inflow Volume) for Lake Powell issued by the Colorado Basin River Forecast Center was updated during the first week of February and is now 5.8 million acre-feet (maf) which is 73% of average. The

January official forecast for Lake Powell unregulated inflow was 6.2 maf which was 78% of average.

Based on the updated February forecast, the February 2010 24-Month Study projects that the water year release volume from Lake Powell will likely be 8.23 maf pursuant to the Interim Guidelines. However, the operating tier for Glen Canyon Dam in water year 2010 is Upper Elevation Balancing and under this tier there is a possibility for an April adjustment to the operational plan which could incorporate either Equalization releases or Balancing releases. Given the current conditions of Lake Powell and Lake Mead, it is possible, if hydrologic conditions become wetter than what is currently projected, that an April adjustment to Equalization could occur. If this adjustment were to occur in April, the projected water year release from Glen Canyon Dam could be greater than 10.5 maf.

As of early February, given the hydrologic conditions within the Colorado River Basin and the range of possible inflow scenarios that could occur in 2010, Reclamation estimates that there is about a 25% probability that an April adjustment to Equalization will occur. This estimate is based on many factors that are changing through time. Reclamation will update this estimated probability each month to provide stakeholders some probabilistic estimate of the possibility that Equalization will occur in water year 2010.

Upper Colorado River Basin Hydrology

In the Upper Colorado River Basin during water year 2009, the overall precipitation accumulated through September 30, 2009 was approximately 95% of average based on the 30 year average for the period from 1971 through 2000. For water year 2010 the dry conditions have persisted. Estimated percentages of average precipitation for the months thus far in water year 2010 are as follows: October 85%, November 40%, December 130%, January 100%.

The Climate Prediction Center outlook (dated January 21, 2010) for temperature over the next 3 months indicates that temperatures in the northern reaches of the Upper Colorado River Basin have an increased probability of being above average. Accumulated precipitation over the next 3 months are projected to be near average in the Upper Colorado River Basin (above Lake Powell) while are projected to be above average in the Lower Colorado River Basin (below Lake Powell).

Upper Colorado River Basin Drought

The Upper Colorado River Basin continues to experience a protracted multi-year drought. Since 1999, inflow to Lake Powell has been below average in every year except water years 2005 and 2008. In the summer of 1999, Lake Powell was close to full with reservoir storage at 23.5 million acre-feet, or 97 percent of capacity. During the next 5

years (2000 through 2004) unregulated inflow to Lake Powell was well below average. This resulted in Lake Powell storage decreasing during this period to 8.0 million acre-feet (33 percent of capacity) which occurred on April 8, 2005. During 2005, 2008 and 2009, drought conditions eased somewhat with net gains in storage to Lake Powell. As of February 9, 2010 the storage in Lake Powell was 13.93 million acre-feet (57.29 percent of capacity) which is still below desired levels while the overall reservoir storage in the Colorado River Basin as of February 9, 2010 is 33.14 million acre-feet (55.72 percent of capacity).

February 24-Month Study
Date: February 14, 2020

From: Water Resources Group, Salt Lake City
To: All Colorado River Annual Operating Plan (AOP) Recipients

Current Reservoir Status

Reservoir	January Inflow (unregulated) (acre-feet)	Percent of Average (%)	February 13, Midnight Elevation (feet)	February 13, Midnight Reservoir Storage (acre-feet)
Fontenelle	34,250	113	6,479.57	164,000
Flaming Gorge	49,050	122	6,027.51	3,2554,000
Blue Mesa	24,700	102	7,485.17	544,340
Navajo	15,900	73	6,050.48	1,300,000
Powell	277,400	77	3,604.22	12,157,000

Expected Operations

The operation of Lake Powell and Lake Mead in this February 2020 24-Month Study is pursuant to the December 2007 Record of Decision on Colorado River Interim Guidelines for Lower Basin Shortages and the Coordinated Operations of Lake Powell and Lake Mead (Interim Guidelines) and reflects the 2020 Annual Operating Plan (AOP). Pursuant to the Interim Guidelines, the August 2019 24-Month Study projections of the January 1, 2020, system storage and reservoir water surface elevations set the operational tier for the coordinated operation of Lake Powell and Lake Mead during 2020.

Consistent with Section 6.B of the Interim Guidelines, Lake Powell's operations in water year 2020 will be governed by the Upper Elevation Balancing Tier, with an initial water year release volume of 8.23 maf and the potential for an April adjustment to equalization or balancing releases in April 2020. Based on the most probable inflow forecast, this February 24-Month Study projects an annual release of 8.23 maf in water year 2020.

Consistent with Section 2.B.5 of the Interim Guidelines, the Intentionally Created Surplus (ICS) Surplus Condition is the criterion governing the operation of Lake Mead for calendar year 2020. In addition, Section III.B of Exhibit 1 to the Lower Basin Drought Contingency Plan (DCP) Agreement will also govern the operation of Lake Mead in calendar year 2020.

The 2020 AOP is available for download at:

https://www.usbr.gov/lc/region/g4000/aop/AOP20.pdf.
The Interim Guidelines are available for download at:
https://www.usbr.gov/lc/region/programs/strategies/RecordofDecision.pdf.
The Colorado River DCPs are available for download at:
https://www.usbr.gov/lc/region/programs/dcp.html.

Fontenelle Reservoir – As of January 7, 2020, the Fontenelle Reservoir pool elevation is 6480.86 feet, which amounts to 50 percent of live storage capacity. Inflows for the month of January totaled 34,252 acre-feet (af) or 113 percent of average. Releases remain at 1050 cfs.

The January final forecast for unregulated inflows into Fontenelle for the next three months projects near average conditions. February, March, and April inflow volumes amount to 30,000 af (108 percent of average), 48,000 af (91 percent of average), and 75,000 af (88 percent of average), respectively.

The February water supply forecast of the April through July inflow volume into the Fontenelle Reservoir is 620,000 acre-feet (85 percent of average). Current snowpack is 115 percent of median for the Upper Green Basin.

The next Fontenelle Working Group meeting is scheduled for April 22, 2020 from 10:00 a.m. to 12:00 p.m. The meeting is planned to held at the 3 Telephone Canyon Road, Green River, WY 82935. The Fontenelle Working Group is an open public forum for information exchange between Reclamation and other parties associated with the operation of Fontenelle Reservoir.

Flaming Gorge Reservoir – As of February 6, 2020 Flaming Gorge Reservoir pool elevation is 6027.85 feet, which amounts to 87 percent of live storage capacity. Inflows for the month of January is 79,355 (af) or 122 percent of average. The average daily releases are planned to be sustained at 2,150 cfs until the beginning of March 2020. The February final forecast for unregulated inflows into Flaming Gorge for the next three months projects near average conditions. February, March, and April forecasted unregulated inflow volumes at 46,000 af (103 percent of average), 100,000 af (98 percent of average), and 130,000 af (97 percent of average), respectively.

The February water supply forecast of the April through July unregulated inflow volume into Flaming Gorge Reservoir is 870,000 acre-feet (89 percent of average). Current snowpack is 109 percent of median for the Upper Green Basin.

Reclamation is planning to hold the Pre-Flaming Gorge Working Group meeting on March 19, 2020 from 10:00 am to 1:00 pm at the Uintah Conference Center in Vernal UT (313 East 200 South). The Flaming Gorge Working Group meeting to review stakeholders comments and input is scheduled for April 16, 2020 from 10:00 a.m. to 1:00 p.m. at Carbon County Event Center, 450 S Fairgrounds Rd, Price, UT 84501, USA.

The Flaming Gorge Working Group is an open public forum for information exchange between Reclamation and the stakeholders of Flaming Gorge Dam. The public is encouraged to attend and comment on the operations and plans presented by Reclamation at these meetings. Meeting notes from past Working Group meetings are posted on the Working Group webpage. For more information on this group and these meetings please contact Dale Hamilton at 801-379-1186.

Aspinall Unit Reservoirs – As of February 9, 2020 releases from Crystal Dam are approximately 800 cfs. Gunnison Tunnel diversions are occurring about every 2 weeks to refill Fairview Reservoir. Flows in the Black Canyon are about 780 cfs. Releases from Crystal are projected to remain at about this level for the foreseeable future.

Blue Mesa did fill in 2019 and achieved a peak elevation on July 25, 2019 of 7519.15 feet above sea level which corresponded to a storage content of 827,000 af (99 percent of full pool). Since this peak filling, Blue Mesa's elevation has declined to 7485.04 feet above sea level on February 9, 2020 and this trend will continue until about the beginning of April 2020.

The unregulated inflow volume in January to Blue Mesa was 24.7 kaf (103 percent of average). Unregulated Inflow volumes forecasted for Blue Mesa for the next three months (February, March, April) are projected to be: 23,000 af (105 percent of average), 37,000 af (103 percent of average) and 65,000 af (87 percent of average), respectively. The February 24-Month Study is reflective of these new forecasts. The April through July forecasted most probable unregulated inflow volume to Blue Mesa is 560,000 af (83 percent of average). The 2020 water year forecasted unregulated inflow volume is 818,000 af which is 85 percent of average.

The Aspinall Unit Working Group is an open public forum for information exchange between Reclamation and the stakeholders of the Aspinall Unit. The public is encouraged to attend and comments on the operations and plans presented by Reclamation at these meetings. Meeting notes from past working Group meetings are posted on the Working Group webpage. For more information on this group and these meetings please contact Erik Knight in the Grand Junction Area Office at (970) 248-0629.

The next meeting of the Aspinall Unit Working Group will be held on Thursday, April 23, 2020 at 1:00 pm at the Western Colorado Area Office located at 445 West Gunnison Avenue in Grand Junction, Colorado.

Navajo Reservoir – On February 10th, the daily average release rate from Navajo Dam was approximately 429 cfs while reservoir inflow (modified unregulated) was averaging approximately 288 cfs. The water surface elevation was 6056.35 feet above sea level. At this elevation the live storage is 1.30 maf (77 percent of live storage capacity) and the active storage is 0.64 maf (62 percent of active storage capacity). NIIP is diverting 34 cfs. The river flow measured at the Animas River at Farmington USGS gage was at 202 cfs. River flow at the San Juan River at Four Corners USGS gage was 794 cfs.

Releases from Navajo Dam are made for authorized purposes of the Navajo Unit and are pursuant to the Record of Decision for the Navajo Reservoir Operations.

Preliminary modified-unregulated inflow into Navajo (inflow adjusted for upstream change in storage, reservoir evaporation and exportation from the basin) in December was 16 kaf (77 percent of average for the month).

Forecast modified-unregulated inflow to Navajo over the next three months (February, March, and April) are projected to be: 20 kaf (66 percent of average), 51 kaf (55 percent of average), and 92 kaf (54 percent of average), respectively.

The April through July runoff forecasts are as follows:
Min Probable: 320,000 af (43 percent of average)
Most Probable: 500,000 af (68 percent of average)
Max Probable: 815,000 af (111 percent of average)

Releases for the fall and winter will be made to target the San Juan River Recovery Implementation Program's recommended baseflow range of 500 cfs to 1000 cfs. Releases will likely range between 300 cfs and 600 cfs throughout the winter.

Reclamation conducts Public Operations Meetings three times per year to gather input for determining upcoming operations for Navajo Reservoir. Input from individuals, organizations, and agencies along with other factors such as weather, water rights, endangered species requirements, flood control, hydro power, recreation, fish and wildlife management, and reservoir levels, will be considered in the development of these reservoir operation plans. In addition, the meetings are used to coordinate activities and exchange information among agencies, water users, and other interested parties concerning the San Juan River and Navajo Reservoir. The next Navajo Unit Coordination Meeting will be held Tuesday, April 21, 2020 at 1:00 pm at the Farmington Civic Center (200 West Arrington, Farmington, NM).

Glen Canyon Dam / Lake Powell

Current Status

The unregulated inflow volume to Lake Powell during January was 277 thousand acre-feet (kaf) (77 percent of average). The release volume from Glen Canyon Dam in January was 760 kaf. The end of January elevation and storage of Lake Powell were 3,605 ft (95 feet from full pool) and 12.28 maf (50 percent of full capacity), respectively.

Current Operations
The operating tier for water year 2020 (September 2019 through October 2020) was established in August 2019 as the Upper Elevation Balancing Tier, consistent with Section 6.B of the Interim Guidelines. Under this Tier the initial annual water year release volume is 8.23 maf, and if the April 2020 24-Month Study projects the end of water year elevation at Lake Powell to be above 3,575 feet, and the end of water year

elevation at Lake Mead to be below 1,075 feet, Lake Powell operations will shift to balancing releases for the remainder of water year 2020. If the April 2020 24-Month Study projects the end of water year elevation to be above the 2020 Equalization elevation of 3,657 feet Lake Powell operations will shift to Equalization releases for the remainder of water year 2020. Reclamation will schedule operations at Glen Canyon Dam to achieve as practicably as possible the appropriate total annual release volume by September 30, 2020.

In February, the release volume will be approximately 675 kaf, with fluctuations anticipated between about 8,300 cfs in the nighttime to about 14,370 cfs in the daytime, and consistent with the Glen Canyon Dam, Record of Decision (dated December 2016). The anticipated release volume for March is 700 kaf with daily fluctuations between approximately 7,635 cfs and 13,935 cfs. The expected release for April is 630 kaf.

In addition to daily scheduled fluctuations for power generation, the instantaneous releases from Glen Canyon Dam may also fluctuate to provide 40 megawatts (mw) of system regulation. These instantaneous release adjustments stabilize the electrical generation and transmission system and translate to a range of about 1,200 cfs above or below the hourly scheduled release rate. Under system normal conditions, fluctuations for regulation are typically short lived and generally balance out over the hour with minimal or no noticeable impacts on downstream river flow conditions.

Releases from Glen Canyon Dam can also fluctuate beyond scheduled releases when called upon to respond to unscheduled power outages or power system emergencies. Depending on the severity of the system emergency, the response from Glen Canyon Dam can be significant, within the full range of the operating capacity of the power plant for as long as is necessary to maintain balance in the transmission system. Glen Canyon Dam currently maintains 30 mw (approximately 800 cfs) of generation capacity in reserve in order to respond to a system emergency even when generation rates are already high. System emergencies occur fairly infrequently and typically require small responses from Glen Canyon Dam. However, these responses can have a noticeable impact on the river downstream of Glen Canyon Dam.

Inflow Forecasts and Model Projections

The forecast for water year 2020 unregulated inflow to Lake Powell, issued on February 4, 2020, by the Colorado Basin River Forecast Center, projects that the most probable (median) unregulated inflow volume this year will be 8.64 maf (80 percent of average). There is significant uncertainty regarding this season's snowpack development and resulting runoff into Lake Powell. Reclamation updates the minimum and maximum probable forecasts four times a year: January, April, August and October. The January forecast ranges from a minimum probable of 6.4 maf (59 percent of average) to a maximum probable of 12.82 maf (118 percent of average). There is a 10 percent chance that inflows could be higher than the current maximum probable forecast and a 10 percent chance that inflows could be lower than the minimum probable forecast.

Based on the current forecast, the February 24-Month Study projects Lake Powell elevation will end water year 2020 near 3,617.32 feet with approximately 13.48 maf in storage (55 percent of capacity). Note that projections of elevation and storage for water year 2020 have significant uncertainty at this point in the season. Projections of end of water year 2020 elevation and storage using the minimum and maximum probable inflow forecast from January 2020 are 3,598.83 feet (11.64 maf, 48 percent of capacity) and 3,649.60 feet (17.17 maf, 71 percent of capacity), respectively. Under these scenarios, there is a 10 percent chance that inflows will be higher, resulting in higher elevation and storage, and 10 percent chance that inflows will be lower, resulting in lower elevation and storage. The annual release volume from Lake Powell during water year 2020 is projected to be 8.23 maf under the February most probable and the January minimum and maximum probable inflow scenarios.

Upper Colorado River Basin Hydrology

Upper Colorado River Basin regularly experiences significant year to year hydrologic variability. During the 20-year period 2000 to 2019, however, the unregulated inflow to Lake Powell, which is a good measure of hydrologic conditions in the Colorado River Basin, was above average in only 4 out of the past 19 years. The period 2000-2019 is the lowest 20-year period since the closure of Glen Canyon Dam in 1963, with an average unregulated inflow of 8.76 maf, or 81 percent of the 30-year average (1981-2010). (For comparison, the 1981-2010 total water year average is 10.83 maf.) The unregulated inflow during the 2000-2019 period has ranged from a low of 2.64 maf (24 percent of average) in water year 2002 to a high of 15.97 maf (147 percent of average) in water year 2011. In water year 2018 unregulated inflow volume to Lake Powell was 4.6 maf (43 percent of average), the third driest year on record above 2002 and 1977. Under the current most probable forecast, the total water year 2020 unregulated inflow to Lake Powell is projected to be 8.64 maf (80 percent of average).

At the beginning of water year 2020, total system storage in the Colorado River Basin was 31.64 maf (53 percent of 59.6 maf total system capacity). This is an increase of 3.64 maf over the total storage at the beginning of water year 2019 when total system storage was 28 maf (47 percent of capacity). Since the beginning of water year 2000, total Colorado Basin storage has experienced year to year increases and decreases in response to wet and dry hydrology, ranging from a high of 94 percent of capacity at the beginning of 2000 to the now current level of 53 percent of capacity at the beginning of water year 2020. Based on current inflow forecasts, the current projected end of water year total Colorado Basin reservoir storage for water year 2020 is approximately 30.86 maf (52 percent of total system capacity). The actual end of water year 2020 system storage may vary from this projection, primarily due to uncertainty regarding this season’s runoff and reservoir inflow.

March 24-Month Study
Date: March 9, 2010

From: Water Resources Group, Salt Lake City
To: All Colorado River Annual Operating Plan (AOP) Recipients

Current Reservoir Status

Reservoir	February Inflow (unregulated) (acre-feet)	Percent of Average (%)	March 8 Midnight Elevation (feet)	Reservoir Storage (acre-feet)
Fontenelle	23,000	79	6469.64	118,000
Flaming Gorge	29,000	58	6025.49	3,178,000
Blue Mesa	22,000	97	7485.11	544,000
Powell	298,000	71	3619.96	13,759,000
Navajo	16,000	52	6049.15	1,216,000

Expected Operations

The operation of Lake Powell and Lake Mead in this March 2010 24-Month Study is pursuant to the December 2007 Record of Decision on Colorado River Interim Guidelines for Lower Basin Shortages and the Coordinated Operations of Lake Powell and Lake Mead (Interim Guidelines), and reflects the 2010 Annual Operating Plan (AOP). Pursuant to the Interim Guidelines, the August 2009 24-Month Study projections of the January 1, 2010 system storage and reservoir water surface elevations set the operational tier for the coordinated operation of Lake Powell and Lake Mead.

The operational tier for water year 2010 for the coordinated operation of Lake Powell and Lake Mead is the Upper Elevation Balancing Tier with a corresponding annual release from Lake Powell of 8.23 maf. Under this operational tier, an adjustment to the water year operation of Lake Powell can occur in April based on the April 24-Month Study projection of the September 30 system storage and reservoir water surface elevations.

The March 2010 24-Month Study, with a water year release volume from Lake Powell of 8.23 million acre-feet (maf), projects that the Lake Powell end of water year 2010 water surface elevation will be 3,631.88 feet above sea level which is below the 2010 Equalization Elevation of 3,642 feet. For this reason, the March 2010 24-Month Study projects that an April adjustment to the Equalization Tier in 2010 is not likely to occur under the currently forecasted most probable hydrologic conditions.

Basin hydrology can vary significantly through the winter and there is uncertainty in forecasting snow pack conditions. An April adjustment to the Equalization Tier is not likely unless forecasted runoff conditions improve significantly by April 1. Reclamation estimates that an April adjustment to the Equalization Tier could only occur if the 2010 April-July inflow forecast volume were to increase by approximately 1.2 million acre-feet above the current forecast of 5.4 million acre-feet. In the past 31 years, only once has the forecast increased by at least this volume from one month to the next. For this reason, Reclamation estimates the probability of an April adjustment to the Equalization Tier in 2010 to be approximately 3 percent.

The Intentionally Created Surplus (ICS) Surplus condition is the criterion governing the operation of Lake Mead for calendar year 2010.

The Interim Guidelines are available for download at
http://www.usbr.gov/lc/region/programs/strategies/RecordofDecision.pdf.
The 2010 AOP is available for download at
http://www.usbr.gov/lc/region/g4000/AOP2010/AOP10.pdf

Fontenelle Reservoir – Inflows for the month of February were 23,000 acre-feet, or 79% of average. The reservoir elevation is 6470 feet above sea level and 34% of capacity. The reservoir elevation is expected to decline for another month or two until spring runoff begins. Inflows to Fontenelle Reservoir are currently averaging 500 cfs and releases are 980 cfs. Basin snowpack is 55% of average for this time of year.

The 2010 water supply forecast for the April to July runoff season has decreased to 415,000 acre-feet (48% of average). Inflows over the next three months are forecasted to be below average: 37,000 acre-ft, 65,000 acre-ft, and 105,000 acre-ft for March, April and May respectively.

The next Fontenelle Working Group meeting is scheduled for April 27, 2010 at 10:00 am at the Seedskadee National Wildlife Refuge visitor's center. The Fontenelle Working Group is an open public forum for information exchange between Reclamation and other parties associated with the operation of Fontenelle Reservoir.

Flaming Gorge Reservoir – February observed unregulated inflow into Flaming Gorge reservoir was 29,000 acre-feet (AF), or 58 percent of average inflow. The February end of month elevation was 6025.6 feet, which equates to 3.18 million acre-feet or 85 percent of live storage capacity. Releases out of Flaming Gorge are currently decreasing to a steady release of 800 cfs.

The final March forecast for April through July unregulated inflow into Flaming Gorge Reservoir was 43 percent of average, a decrease from 65 percent of average in January. Snowpack in the Upper Green River Basin has been hovering around 57 percent for the last two months.

The next Flaming Gorge Working Group meeting is scheduled for April 27, 2010, in Vernal, Utah. The meeting will be held at 7:00 p.m. at the Western Park Convention Center located at 302 East 200 South in Vernal, Utah. For directions, please call 435-789-7396. The Flaming Gorge Working Group is an open public forum for information exchange between Reclamation and the stake holders of Flaming Gorge Dam. The public is encouraged to attend and comment on the operations and plans presented by Reclamation at these meetings. For more information on this group and these meetings please contact Ed Vidmar at 801-379-1182.

Aspinall Reservoir Unit – February unregulated inflow into Blue Mesa Reservoir was 22,000 acre-feet or 97 percent of average. On March 9, 2010 the basin snowpack was 96 percent of average. Precipitation during February was 125 percent of average. The current inflow rate into Blue Mesa Reservoir is about 450 cfs while reservoir releases are averaging about 525 cfs. The reservoir elevation is currently at 7485.11 feet, which corresponds to a storage content of about 544,000 acre-feet. This elevation is about the same as of last year's March elevation.

The latest Water Supply Forecast for Water Year 2010 has been issued and the April through July unregulated inflow is forecasted to be at 570,000 acre-feet (79% of normal), this is a decrease of 30,000 acre-feet from last month's forecast. If this forecast holds through May 1st, the Black Canyon Water Right would call for a one day peak flow of 4035 cfs. At this time Reclamation plans to continue to operate the Aspinall Unit to allow the water right to be met. Based on this forecast and the combination of meeting the Black Canyon Water this coming spring, Blue Mesa Reservoir is projected to be short of filling this runoff season. The projected fill is calculated to be about 7512.5 feet, or about 7.0 feet short of full.

Releases from Crystal are currently set at 600 cfs. The Gunnison Diversion Tunnel is currently shut down for the season, with the exception of some small 50 to 100 cfs diversions taken bi-weekly for municipal water needs in Montrose, Colorado. The tunnel is expected to reopen for irrigation season sometime during the last week of March.

Reservoir releases are likely to change during March into May as we respond to changing forecasts and runoff conditions.

The next meeting of the "Aspinall Unit Working Group" will be held on Thursday, April 22, 2010 starting at 1:00 PM in Reclamation's Grand Junction Office. At this meeting, review of this winter's reservoir operations, and plans for this spring and summer operations will be discussed. These meetings are open forum discussions on the Aspinall Unit reservoir operations with many interested groups participating. Anyone needing further information about these meetings should contact Dan Crabtree in the Grand Junction Area Office at (970) 248-0652.

Navajo Reservoir – Reclamation decreased the release from Navajo Reservoir to 500 cubic feet per second (cfs) on Tuesday, October 20th , which is still in effect. Releases are made for the authorized purposes of the Navajo Unit, and to attempt to maintain a target base flow through the endangered fish critical habitat reach of the San Juan River (Farmington to Lake Powell).

The San Juan River Basin Recovery Implementation Program recommends a target base flow of between 500 cfs and 1,000 cfs through the critical habitat area. The target base flow is calculated as the weekly average of gaged flows throughout the critical habitat area, therefore daily flows of less than 500 cfs may occur at some gages.

Snowpack for the upper San Juan basin now stands at 107 percent of average, while the Animas River basin is 97 percent of average. Unregulated inflow into Navajo Reservoir during the month of February was 16,000 acre-feet, or 52 percent of average. Currently, the daily reservoir inflow is averaging about 600 cfs. The reservoir water surface elevation is currently 6049.15 feet, which corresponds to a storage content of about 1,216,000 acre-feet. NIIP usually starts their diversions in early March, which are currently set at 7 cfs.

A public meeting on Navajo Reservoir operations will be held on Tuesday, April 27, 2010 at 1:00 p.m. in Farmington, New Mexico. At this meeting, review of this winter's reservoir operations, and plans for this spring and summer operations will be discussed. These are open forum discussions on the operation of Navajo Reservoir with many interested groups participating. Anyone interested in the general operation of the reservoir is encouraged to attend. Please contact Pat Page in Reclamation's Durango, Colorado Office at (970) 385-6560 for information about these meetings or the daily operation of Navajo Reservoir.

Glen Canyon Dam / Lake Powell –The unregulated inflow volume into Lake Powell in February was 294,000 acre-feet (70% of average). This was 31,000 acre-feet below what was forecasted in the February 2010 24-Month Study. Despite this shortfall, the observed Lake Powell elevation at the end of February was about 3 inches higher than the what was projected in the February 24-Month Study. The end of February water surface elevation of Lake Powell was 3620.16 feet above sea level (79.84 feet from full pool). During the month of February, the elevation of Lake Powell declined by approximately 2 feet.

Releases from Glen Canyon Dam during the month of February have fluctuated each day for power generation between a peak hourly average release of about 14,000 cfs, during the morning and afternoon and a daily low hourly average release of 8,000 cfs during the late evening and early morning hours. The release volume for February was 630,500 acre-feet. For March, the release volume is scheduled to be 600,000 acre-feet. Daily fluctuations in March will have a peak hourly average release each day of approximately 12,000 cfs and a daily low hourly average release of approximately 6,000 cfs. The projected release volume for April is also 600,000 acre-feet.

In addition to the daily fluctuation pattern, instantaneous releases from Glen Canyon Dam also fluctuate to provide approximately 40 megawatts of system regulation to maintain stable conditions within the electrical generation and transmission system. This translates into momentary release fluctuations of about +/- 1100 cfs above or below the hourly average release rate. These momentary fluctuations for regulation are very short lived and typically balance out over the hour. When an unanticipated outage event occurs in the generation system, reserve generation at Glen Canyon Dam can also be called upon up to a limit of 88 megawatts (approximately 2400 cfs of release) for a duration of 2 hours or less. Under normal circumstances, calls for reserve generation occur fairly infrequently and are for much less than the limit of 88 megawatts.

The official Water Supply Forecast for March (April-July Unregulated Inflow Volume) is now 5.4 maf (68% of average). Based on this forecast, the March 2010 24-Month Study projects that the water year release volume from Lake Powell will likely be 8.23 maf pursuant to the Interim Guidelines. However, the operating tier for Glen Canyon Dam in water year 2010 is Upper Elevation Balancing and under this tier there is a possibility for an April adjustment to the operational plan which could incorporate either Equalization releases or Balancing releases. Given the current conditions of Lake Powell and Lake Mead, it is remotely possible, if hydrologic conditions become wetter than what is currently projected, that an April adjustment to Equalization could occur which would require a water year release volume from Glen Canyon Dam on the order of approximately 10.5 maf.

Reclamation estimates that the official Water Supply Forecast for April would have to increase by approximately 1.2 maf above the level forecasted in March in order for an April Adjustment to the Equalization Tier to occur in water year 2010. Over the past 31 years, only once has the Water Supply Forecast increased by at least this volume from one month to the next. For this reason, Reclamation estimates that the probability of an April Adjustment to the Equalization Tier in water year 2010 to be only about 3 percent.

Upper Colorado River Basin Hydrology

In the Upper Colorado River Basin during water year 2009, the overall precipitation accumulated through September 30, 2009 was approximately 95% of average based on the 30 year average for the period from 1971 through 2000. For water year 2010 the dry conditions have persisted. Estimated percentages of average precipitation for the months thus far in water year 2010 are as follows: October 85%, November 40%, December 130%, January 100% and February 100%.

The Climate Prediction Center outlook (dated February 18, 2010) for temperature over the next 3 months indicates that temperatures in the Upper Colorado River Basin are expected to be near average while precipitation over the next 3 months in the Upper Colorado River Basin is projected to be above average.

Upper Colorado River Basin Drought

The Upper Colorado River Basin continues to experience a protracted multi-year drought. Since 1999, inflow to Lake Powell has been below average in every year except water years 2005 and 2008. In the summer of 1999, Lake Powell was close to full with reservoir storage at 23.5 million acre-feet, or 97 percent of capacity. During the next 5 years (2000 through 2004) unregulated inflow to Lake Powell was well below average. This resulted in Lake Powell storage decreasing during this period to 8.0 million acre-feet (33 percent of capacity) which occurred on April 8, 2005. During 2005, 2008 and 2009, drought conditions eased somewhat with net gains in storage to Lake Powell. As of March 8, 2010 the storage in Lake Powell was 13.76 million acre-feet (56.6 percent of capacity) which is still below desired levels while the overall reservoir storage in the Colorado River Basin as of March 8, 2010 is 32.92 million acre-feet (55.4 percent of capacity).

April 24-Month Study
Date: April 8, 2010

From: Water Resources Group, Salt Lake City
To: All Colorado River Annual Operating Plan (AOP) Recipients

Current Reservoir Status

Reservoir	March Inflow (unregulated) (acre-feet)	Percent of Average (%)	April 7 Midnight Elevation (feet)	Reservoir Storage (acre-feet)
Fontenelle	43,000	83	6468.24	112,000
Flaming Gorge	69,000	64	6026.11	3,201,000
Blue Mesa	29,000	82	7484.49	539,000
Powell	467,000	70	3618.99	13,657,000
Navajo	62,000	69	6053.02	1,261,000

Expected Operations

The operation of Lake Powell and Lake Mead in this April 2010 24-Month Study is pursuant to the December 2007 Record of Decision on Colorado River Interim Guidelines for Lower Basin Shortages and the Coordinated Operations of Lake Powell and Lake Mead (Interim Guidelines), and reflects the 2010 Annual Operating Plan (AOP). Pursuant to the Interim Guidelines, the August 2009 24-Month Study projections of the January 1, 2010 system storage and reservoir water surface elevations set the operational tier for the coordinated operation of Lake Powell and Lake Mead.

The operational tier for water year 2010 for the coordinated operation of Lake Powell and Lake Mead is the Upper Elevation Balancing Tier. The April 24-Month study projects the end of water year elevation at Lake Powell to be 3629.20 feet and Lake Mead to be 1082.96 feet. Since the projected end of water year elevation at Lake Powell is below the 2010 Equalization Elevation of 3642 feet and the projected end of water year elevation at Lake Mead is above elevation 1075 feet, Sections 6.B.1. and 6.B.4. of the Interim Guidelines provide for an annual release volume of 8.23 million acre-feet from Glen Canyon Dam during water year 2010.

The Intentionally Created Surplus (ICS) Surplus condition is the criterion governing the operation of Lake Mead for calendar year 2010.

The Interim Guidelines are available for download at http://www.usbr.gov/lc/region/programs/strategies/RecordofDecision.pdf.

The 2010 AOP is available for download at
http://www.usbr.gov/lc/region/g4000/AOP2010/AOP10_draft.pdf.

Fontenelle Reservoir – Inflows for the month of March were 43,000 acre-feet, or 83% of average. The reservoir elevation is 6468 feet above sea level and 32% of capacity. The reservoir elevation is steady and is expected to increase as spring runoff begins to fill the reservoir. Inflows to Fontenelle Reservoir are currently averaging 500 cfs and releases are 800 cfs. Basin snowpack is 62% of average for this time of year.

The 2010 water supply forecast for the April to July runoff season has decreased to 360,000 acre-feet (42% of average). Inflows over the next three months are forecasted to be below average: 60,000 acre-ft, 100,000 acre-ft, and 145,000 acre-ft for April, May, and June respectively.

The next Fontenelle Working Group meeting is scheduled for April 27, 2010 at 10:00 am at the Seedskadee National Wildlife Refuge visitor's center. The Fontenelle Working Group is an open public forum for information exchange between Reclamation and other parties associated with the operation of Fontenelle Reservoir.

Flaming Gorge Reservoir – March observed unregulated inflow into Flaming Gorge reservoir was 69,000 acre-feet (AF), or 64 percent of average inflow. The March end of month elevation was 6026.2 feet, which equates to 3.20 million acre-feet or 86 percent of live storage capacity. Releases out of Flaming Gorge are currently steady at 800 cfs.

The final April forecast for April through July unregulated inflow into Flaming Gorge Reservoir was 38 percent of average, a decrease from 65 percent of average in January. Snowpack in the Upper Green River Basin has increased slightly over the past month to 67 percent of average.

The next Flaming Gorge Working Group meeting is scheduled for April 27, 2010, in Vernal, Utah. The meeting will be held at 7:00 p.m. at the Western Park Convention Center located at 302 East 200 South in Vernal, Utah. For directions, please call 435-789-7396. The Flaming Gorge Working Group is an open public forum for information exchange between Reclamation and the stake holders of Flaming Gorge Dam. The public is encouraged to attend and comment on the operations and plans presented by Reclamation at these meetings. For more information on this group and these meetings please contact Ed Vidmar at 801-379-1182.

Aspinall Reservoir Unit – March unregulated inflow into Blue Mesa Reservoir was 29,000 acre-feet or 82 percent of average. On April 7, 2010 the basin snowpack was 102 percent of average. Precipitation during March was 95 percent of average. The current inflow rate into Blue Mesa Reservoir is about 650 cfs while reservoir releases are averaging about 900 cfs. Lately the weather pattern has been wetter and colder than average, however spring like conditions are returning which will most likely start the annual

spring snowmelt and we expect the elevation at Blue Mesa Reservoir to start increasing. The reservoir elevation is currently at 7484.63 feet, which corresponds to a storage content of about 540,000 acre-feet. This elevation is about the same as of last year's elevation.

The latest Water Supply Forecast for Water Year 2010 has been issued and the April through July unregulated inflow is forecasted to be at 560,000 acre-feet (78% of normal), this is a decrease of 10,000 acre-feet from last month's forecast. If this forecast holds through May 1st, the senior Black Canyon Water Right would call for a one day spring peak flow of 3,883 cfs. At this time, Reclamation plans to operate the Aspinall Unit to allow the water right to be met. Under the proposed operation Blue Mesa is not projected to fill this runoff season. The projected fill is calculated to be about 7512.5, or about 4.0 feet short of our normal fill target.

Releases from Crystal are currently set at 1100 cfs. The Gunnison Diversion Tunnel started taking water for the new season on March 30, 2010. The current diversion rate in the tunnel is 650 cfs, which results in a river flow below the diversion tunnel of approximately 550 cfs. These rates will most likely change as conditions warrant, primarily as we respond to changes in the forecasted spring inflows.

The next meeting of the "Aspinall Unit Working Group" will be held on Thursday, April 22, 2010 starting at 1:00 PM in Reclamation's Grand Junction Office. At this meeting, review of this winter's reservoir operations, and plans for this spring and summer operations will be discussed. These meetings are open forum discussions on the Aspinall Unit reservoir operations with many interested groups participating. Anyone needing further information about these meetings should contact Dan Crabtree in the Grand Junction Area Office at (970) 248-0652.

Navajo Reservoir - Reclamation monetarily decreased the release from Navajo Reservoir from 500 cubic feet per second (cfs) to 300 cfs on Tuesday, March 30th to assist in trout habitat improvement project on the San Juan River. Reservoir releases were increased back to 500 cfs on March 31st, at 7:00 pm. All reservoir releases are made for the authorized purposes of the Navajo Unit, and to attempt to maintain a target base flow through the endangered fish critical habitat reach of the San Juan River (Farmington to Lake Powell).

The San Juan River Basin Recovery Implementation Program recommends a target base flow of between 500 cfs and 1,000 cfs through the critical habitat area. The target base flow is calculated as the weekly average of gaged flows throughout the critical habitat area, therefore daily flows of less than 500 cfs may occur at some gages.

Snowpack for the upper San Juan basin now stands at 100 percent of average, while the Animas River basin is 95 percent of average. Precipitation during March was only 70 percent of average. Unregulated inflow into Navajo Reservoir during the month of March was 62,000 acre-feet, or 69 percent of average. Currently, the daily reservoir inflow is averaging about 1600 cfs. The reservoir water surface elevation is currently

6053.02 feet, which corresponds to a storage content of about 1,261,000 acre-feet. NIIP started their diversions on March 12th, which are currently set at about 100 cfs.

The latest Water Supply Forecast for Water Year 2010 has been issued and the April through July unregulated inflow is forecasted to be at 700,000 acre-feet (89% of normal), this is a decrease of 65,000 acre-feet from last month's forecast. Given this forecast, there will not be a spring peak release which results in an end of water year reservoir elevation estimated to be 6070.53 feet. This elevation is slightly higher than average, but recent history has shown a trend of a lower observed inflow volume than what is forecasted during this time of year, and drier summers have made it necessary to release more water to the critical habitat area. The alternative would include a 1-week spring peak release, however, that would drop the reservoir lower than the end of water year target, which is what happened last year and resulted in much lower reservoir elevations than anticipated.

A public meeting on Navajo Reservoir operations will be held on Tuesday, April 27, 2010 at 1:00 p.m. in Farmington, New Mexico. At this meeting, review of this winter's reservoir operations, and plans for this spring and summer operations will be discussed. These are open forum discussions on the operation of Navajo Reservoir with many interested groups participating. Anyone interested in the general operation of the reservoir is encouraged to attend. Please contact Pat Page in Reclamation's Durango, Colorado Office at (970) 385-6560 for information about these meetings or the daily operation of Navajo Reservoir.

Glen Canyon Dam / Lake Powell – The unregulated inflow volume into Lake Powell in March was 475,000 acre-feet (72% of average). This was 25,000 acre-feet above the level forecasted in the March (Most Probable) 24-Month Study. The current elevation of Lake Powell as of April 8, 2010 is 3618.94 feet above sea level and stable. Inflows to Lake Powell are projected to increase during late April and into May and the reservoir elevation will likely begin to rise during this time. The April (Most Probable) 24-Month Study is projecting that the reservoir elevation will peak later this summer at approximately 3631 feet above sea level which is 69 feet from the full pool elevation of 3700 feet.

Releases from Glen Canyon Dam during the month of April will fluctuate each day for power generation between a peak hourly average release of about 12,500 cfs, during the morning and afternoon and a daily low hourly average release of 6,500 cfs during the late evening and early morning hours. The release volume scheduled for April is 600,000 acre-feet. The release volume projected for May is also 600,000 acre-feet and daily fluctuations in May will likely be very similar to April.

In addition to the daily fluctuation pattern, instantaneous releases from Glen Canyon Dam also fluctuate to provide approximately 40 megawatts of system regulation to maintain stable conditions within the electrical generation and transmission system. This translates into momentary release fluctuations of about +/- 1100 cfs above or below the

hourly average release rate. These momentary fluctuations for regulation are very short lived and typically balance out over the hour. When an unanticipated outage event occurs in the generation system, reserve generation at Glen Canyon Dam can also be called upon up to a limit of 88 megawatts (approximately 2400 cfs of release) for a duration of 2 hours or less. Under normal circumstances, calls for reserve generation occur fairly infrequently and are for much less than the limit of 88 megawatts.

The snowpack conditions in the Upper Colorado River Basin are approximately 88% of average as of April 9, 2010. Typically the snowpack for the Upper Colorado River Basin peaks during the second week of April and begins to decline as temperatures increase and snowmelt begins. The Colorado Basin River Forecast Center (CBRFC) has issued the April Official Water Supply Forecast (April-July Unregulated Inflow Volume) for Lake Powell and it is projecting that the volume of unregulated inflow to Lake Powell for the period from April 1, 2010 through July 31, 2010 will be 5.0 million acre-feet (maf) which is 63% of average for the historic period from 1971-2000.

Based on the April Official Forecast, and a projected Lake Powell release volume of 8.23 maf pursuant to the 2010 Annual Operating Plan and Colorado River Interim Guidelines for Lower Basin Shortages and Coordinated Operations for Lakes Powell and Mead (Interim Guidelines), the April (Most Probable) 24-Month Study projects that the water year ending elevation of Lake Powell will be 3629.20. This elevation is 12.2 feet below the Equalization Level for water year 2010 as established in the Interim Guidelines. This condition does not meet the criteria for an April adjustment to the Equalization Tier for the remainder of water year 2010 (see Section 6.B.3 of the Record of Decision). Therefore, the release volume for water year 2010 will be 8.23 maf and monthly release volume for the remainder of the water year will be scheduled to meet this annual release volume.

Upper Colorado River Basin Hydrology

In the Upper Colorado River Basin during water year 2009, the overall precipitation accumulated through September 30, 2009 was approximately 95% of average based on the 30 year average for the period from 1971 through 2000. For water year 2010 the dry conditions have persisted. Estimated percentages of average precipitation for the months thus far in water year 2010 are as follows: October 85%, November 40%, December 130%, January 100% and February 100%, March 85%.

The Climate Prediction Center outlook (dated March 18, 2010) for temperature over the next 3 months indicates that temperatures in the Upper Colorado River Basin are expected to be above average and precipitation over the next 3 months in the Upper Colorado River Basin is projected to also be above average.

Upper Colorado River Basin Drought

The Upper Colorado River Basin continues to experience a protracted multi-year drought. Since 1999, inflow to Lake Powell has been below average in every year except water

years 2005 and 2008. In the summer of 1999, Lake Powell was close to full with reservoir storage at 23.5 million acre-feet, or 97 percent of capacity. During the next 5 years (2000 through 2004) unregulated inflow to Lake Powell was well below average. This resulted in Lake Powell storage decreasing during this period to 8.0 million acre-feet (33 percent of capacity) which occurred on April 8, 2005. During 2005, 2008 and 2009, drought conditions eased somewhat with net gains in storage to Lake Powell. As of April 8, 2010 the storage in Lake Powell was 13.65 million acre-feet (56.1 percent of capacity) which is still below desired levels while the overall reservoir storage in the Colorado River Basin as of March 23, 2010 is 32.60 million acre-feet (54.8 percent of capacity).

To: All Annual Operating Plan Recipients

From: Lower Colorado Region
Boulder Canyon Operations Office
River Operations Group
Bruce Williams
P.O. Box 61470
Boulder City, NV 89006-1470
Phone: 702-293-8571

The operation of Lake Powell and Lake Mead in this May 2010 24-Month Study is pursuant to the December 2007 Record of Decision on Colorado River Interim Guidelines for Lower Basin Shortages and the Coordinated Operations of Lake Powell and Lake Mead (Interim Guidelines), and reflects the 2010 Annual Operating Plan (AOP). Pursuant to the Interim Guidelines, the August 2009 24-Month Study projections of the January 1, 2010 system storage and reservoir water surface elevations set the operational tier for the coordinated operation of Lake Powell and Lake Mead.

The Lake Powell operational tier for water year 2010 is the Upper Elevation Balancing Tier. The Intentionally Created Surplus (ICS) Surplus condition is the criterion governing the operation of Lake Mead for calendar year 2010.

The April 2010 24-Month study projected the end of water year elevation at Lake Powell to be below the Equalization level of 3642 feet and the projected end of water year 2010 elevation at Lake Mead to be above elevation 1075 feet. Pursuant to Sections 6.B.1. and 6.B.4. of the Interim Guidelines, the annual release volume will be 8.23 million acre-feet from Glen Canyon Dam during water year 2010 which is reflected in the May 24-Month Study.

The Interim Guidelines are available for download at http://www.usbr.gov/lc/region/programs/strategies/RecordofDecision.pdf. The 2010 AOP is available for download at http://www.usbr.gov/lc/region/g4000/AOP2010/AOP10 draft.pdf.

Current runoff projections into Lake Powell are provided by the National Weather Service's Colorado Basin River Forecast Center and are as follows: Observed unregulated inflow into Lake Powell for the month of April 2010 was 0.930 maf or 94% of the 30-year average. The forecast for May 2010 unregulated inflow into Lake Powell is 1.500 maf or 65% of the 30-year average. The forecast for the 2010 April through July unregulated inflow is 5.2 maf or 66% of average.

In this study, the Calendar Year (CY) 2010 diversion for Metropolitan Water District of Southern California (MWD) is forecasted to be 1.068 maf. The CY 2010 diversion for the Central Arizona Project (CAP) is forecasted to be 1.675 maf. Consumptive use for Nevada above Hoover is forecasted to be 0.234 maf for CY 2010.

Due to declining Lake Mead elevations, Hoover's generator capacity is adjusted based on estimated effective capacity and plant availability. The estimated effective capacity is based on projected Lake Mead elevations. Unit capacity tests will be performed as the lake elevation changes in 2-foot increments. This study reflects these changes in the projections.

Hoover, Davis, and Parker historical gross energy figures come from PO&M reports provided by the Lower Colorado Region's Power Management Office, Bureau of Reclamation, Boulder City, Nevada. Questions regarding these historical energy numbers can be directed to Larry Karr at (702) 293-8094.

The operation of Lake Powell and Lake Mead in this June 2010 24-Month Study is pursuant to the December 2007 Record of Decision on Colorado River Interim Guidelines for Lower Basin Shortages and the Coordinated Operations of Lake Powell and Lake Mead (Interim Guidelines), and reflects the 2010 Annual Operating Plan (AOP). Pursuant to the Interim Guidelines, the August 2009 24-Month Study projections of the January 1, 2010 system storage and reservoir water surface elevations set the operational tier for the coordinated operation of Lake Powell and Lake Mead.

The Lake Powell operational tier for water year 2010 is the Upper Elevation Balancing Tier. The Intentionally Created Surplus (ICS) Surplus condition is the criterion governing the operation of Lake Mead for calendar year 2010.

The April 2010 24-Month study projected the end of water year elevation at Lake Powell to be below the Equalization level of 3642 feet and the projected end of water year 2010 elevation at Lake Mead to be above elevation 1075 feet. Pursuant to Sections 6.B.1. and 6.B.4. of the Interim Guidelines, the annual release volume will be 8.23 million acre-feet from Glen Canyon Dam during water year 2010 which is reflected in the June 24-Month Study.

The Interim Guidelines are available for download at http://www.usbr.gov/lc/region/programs/strategies/RecordofDecision.pdf. The 2010 AOP is available for download at http://www.usbr.gov/lc/region/g4000/AOP2010/AOP10.pdf.

Current runoff projections into Lake Powell are provided by the National Weather Service's Colorado Basin River Forecast Center and are as follows: Observed unregulated inflow into Lake Powell for the month of May 2010 was 1.43 maf or 62% of the 30-year average. The forecast for June 2010 unregulated inflow into Lake Powell is 2.05 maf or 66% of the 30-year average. The forecast for the 2010 April through July unregulated inflow is 5.15 maf or 65% of average.

In this study, the Calendar Year (CY) 2010 diversion for Metropolitan Water District of Southern California (MWD) is forecasted to be 1.077 maf. The CY 2010 diversion for the Central Arizona Project (CAP) is forecasted to be 1.689 maf. Consumptive use for Nevada above Hoover is forecasted to be 0.234 maf for CY 2010.

Due to declining Lake Mead elevations, Hoover's generator capacity is adjusted based on estimated effective capacity and plant availability. The estimated effective capacity is based on projected Lake Mead elevations. Unit capacity tests will be performed as the lake elevation changes in 2-foot increments. This study reflects these changes in the projections.

Hoover, Davis, and Parker historical gross energy figures come from PO&M reports provided by the Lower Colorado Region's Power Management Office, Bureau of Reclamation, Boulder City, Nevada. Questions regarding these historical energy numbers can be directed to Larry Karr at (702) 293-8094.

August 24-Month Study
Date: August 11, 2010

From: Water Resources Group, Salt Lake City
To: All Colorado River Annual Operating Plan (AOP) Recipients

Current Reservoir Status

Reservoir	July Inflow (unregulated) (acre-feet)	Percent of Average (%)	August 10 Midnight Elevation (feet)	Reservoir Storage (acre-feet)
Fontenelle	134,000	63	6504.39	333,000
Flaming Gorge	151,000	58	6027.29	3,246,000
Blue Mesa	50,000	37	7503.70	692,000
Navajo	15,400	18	6069.44	1,473,000
Powell	677,000	43	3636.50	15,594,000

Expected Operations

The operation of Lake Powell and Lake Mead in this August 2010 24-Month Study is pursuant to the December 2007 Record of Decision on Colorado River Interim Guidelines for Lower Basin Shortages and the Coordinated Operations of Lake Powell and Lake Mead (Interim Guidelines), and reflects the 2010 Annual Operating Plan (AOP). Pursuant to the Interim Guidelines, the August 2009 24-Month Study projections of the January 1, 2010 system storage and reservoir water surface elevations set the operational tier for the coordinated operation of Lake Powell and Lake Mead.

The Lake Powell operational tier for water year 2010 is the Upper Elevation Balancing Tier. The Intentionally Created Surplus (ICS) Surplus condition is the criterion governing the operation of Lake Mead for calendar year 2010.

The April 2010 24-Month study projected the end of water year elevation at Lake Powell to be below the Equalization level of 3642 feet and the projected end of water year 2010 elevation at Lake Mead to be above elevation 1075 feet. Pursuant to Sections 6.B.1. and 6.B.4. of the Interim Guidelines, the annual release volume will be 8.23 million acre-feet from Glen Canyon Dam during water year 2010 which is reflected in the August 24-Month Study.

This 24-Month Study currently projects Lake Powell's 2011 end of water year elevation to be above the 2011 Equalization Elevation of 3643 feet under an 8.23 maf release. Based on this 24-Month Study and pursuant to the Interim Guidelines, it is projected that in April 2011 the Equalization Tier will govern the operation of Lake Powell for the

remainder of Water Year 2011. Based on analysis of inflow scenarios, currently the probability of an April adjustment in 2011 is approximately 62 percent.

The Interim Guidelines are available for download at
http://www.usbr.gov/lc/region/programs/strategies/RecordofDecision.pdf.
The 2010 AOP is available for download at
http://www.usbr.gov/lc/region/g4000/AOP2010/AOP10.pdf.

Fontenelle Reservoir – Inflows for the month of July were 134,000 acre-feet, or 63% of average. The reservoir elevation is 6504 feet above sea level and 95% of capacity. In July, inflows to Fontenelle Reservoir tapered off significantly from 4,300 cfs to 1,800 cfs as the last of the snowpack entered the reservoir. Reservoir releases peaked at 3,000 cfs for five days early in the month and are currently 1,100 cfs. The reservoir elevation is near its peak for the season and will slowly decline over the remainder of the summer and fall and winter.

The Colorado Basin River Forecast Center has issued the water year 2011 (October 2010 to September 2011) forecast. At this early point, inflows over the next year are expected to be 85% of average. Inflows over the next three months are forecasted to be well below average: 55,000 acre-ft (60%), 40,000 acre-ft (75%), and 40,000 acre-ft (77%) for August, September and October respectively.

The next Fontenelle Working Group meeting is scheduled for August 24, 2010 at 10:00 am at the City of Green River City Hall. The Fontenelle Working Group is an open public forum for information exchange between Reclamation and other parties associated with the operation of Fontenelle Reservoir.

Flaming Gorge Reservoir – July observed unregulated inflow into Flaming Gorge reservoir was 151,000 acre-feet (AF), or 58 percent of average inflow. The July end of month elevation was 6027.5 feet, which equates to 3.25 million acre-feet or 87 percent of live storage capacity. Releases out of Flaming Gorge for the base flow period are currently fluctuating around an average daily release of 1,600 cfs. It is anticipated that they will remain at this level until the end of September, when releases will be reduced to 1,100 cfs average daily release.

The May final forecast was 515,000 AF (43% average). The observed April-July unregulated inflow is 706,000 AF (59% average). The August forecast for April-July unregulated inflows WY 2011 for Flaming Gorge is 890,000 AF (75% average) and for the Yampa is 1,269,000 AF (93% average). The spring hydrologic classification is moderately dry.

Yampa River flows during the base flow period impact the hourly release schedule from Flaming Gorge because flows must remain within 0.1 meter stage change at Jensen, Utah. As Yampa River flows decrease, the Flaming Gorge release schedule will change.

The hourly release schedule will be communicated as it changes throughout the base flow period.

The next Flaming Gorge Working Group meeting is scheduled for August 26, 2010, in Vernal, Utah. The meeting will be held at 11:00 a.m. at the Western Park Convention Center located at 302 East 200 South in Vernal, Utah. For directions, please call 435-789-7396. The Flaming Gorge Working Group is an open public forum for information exchange between Reclamation and the stake holders of Flaming Gorge Dam. The public is encouraged to attend and comment on the operations and plans presented by Reclamation at these meetings. For more information on this group and these meetings please contact Ed Vidmar at 801-379-1182.

ASPINALL – July unregulated inflow into Blue Mesa Reservoir was 50,000 acre-feet or 37 percent of average. The current inflow rate into Blue Mesa Reservoir is approximately 1,100 cfs while reservoir releases are averaging 1,500 cfs. Blue Mesa's present elevation is 7503.73 feet, which corresponds to a storage content of about 692,000 acre-feet. The observed April through July runoff into Blue Mesa Reservoir was recorded at 494,000 acre-feet, or 73 percent of average. The reservoir reached a high elevation of 7508.22 feet on June 27, 2010, which was approximately 11.18 feet below "full" pool. Full pool is actually defined by the top of the spillway gates at elevation 7519.4 feet, but we rarely fill to that level due to safety concerns for the reservoir. For practical purposes; the reservoir is considered full at elevations above 7516.4 feet.

Releases from Crystal are currently set at 1,600 cfs. The Gunnison Diversion Tunnel is currently diverting about 1,100 cfs, which results in a river flow below the diversion tunnel of approximately 600 cfs. As in years past there seems to be about 100 cfs discrepancy between the different gage readings. These reservoir release rates may change as conditions warrant, primarily as we respond to changes in the river inflows.

The next meeting of the "Aspinall Unit Working Group" will be held on Thursday, September 2, 2010 at Elk Creek Visitors Center at Blue Mesa Reservoir. At this meeting, review of this spring's reservoir operations, and plans for this summer and fall operations will be discussed. These meetings are open forum discussions on the Aspinall Unit reservoir operations with many interested groups participating. Anyone needing further information about these meetings should contact Dan Crabtree in the Grand Junction Area Office at (970) 248-0652.

NAVAJO – As a result of warmer and drier conditions returning to the San Juan River Basin, Reclamation increased the release from Navajo Reservoir to 800 cfs on Thursday, August 12, 2010. Releases are made for the authorized purposes of the Navajo Unit, and to attempt to maintain a target base flow through the endangered fish critical habitat reach of the San Juan River (Farmington to Lake Powell).

The San Juan River Basin Recovery Implementation Program recommends a target base flow of between 500 cfs and 1,000 cfs through the critical habitat area. The target base flow is calculated as the weekly average of gauged flows throughout the critical habitat area, therefore daily flows of less than 500 cfs may occur at some gages.

Reclamation will continue to closely monitor weather and stream flow conditions and make adjustments to the Navajo Reservoir release as necessary.

July unregulated inflow into Navajo Reservoir was 15,000 acre-feet, or 18 percent of average. The total runoff for the 2010 season ending July (April-July) was recorded at 654,000 acre-feet, or about 83 percent of average runoff. The reservoir had a seasonal peak elevation of 6075.53 feet on June 15, 2010. There was no spring release provided this runoff season because of low spring inflows.

Currently the daily reservoir inflow is averaging 900 cfs and reservoir releases to the San Juan River are set at 500 cfs. NIIP diversions are approximately 600 cfs. The reservoir water surface elevation is currently 6069.44 feet, which corresponds to a storage content of about 1,473,000 acre-feet.

A public meeting on Navajo Reservoir operations will be held on Tuesday, August 24, 2010 at 1:00 p.m. in Farmington, New Mexico. At this meeting, review of last spring and summer reservoir operations, and plans for this fall and winter 2010/2011 operations will be discussed. These are open forum discussions on the operation of Navajo Reservoir with many interested groups participating. Anyone interested in the general operation of the reservoir is encouraged to attend. Please contact Pat Page in Reclamation's Durango, Colorado Office at (970) 385-6560 for information about these meetings or the daily operation of Navajo Reservoir.

Glen Canyon Dam / Lake Powell –The unregulated inflow volume into Lake Powell for July 2010 was 676 kaf (43% of average). Lake Powell reached a low water surface elevation for water year 2010 on April 15, 2010 when the elevation dipped to 3618.64 feet above sea level. The elevation of Lake Powell reached its peak for the water year on June 30, 2010 which was 3638.82 feet above sea level. On August 1st the elevation of Lake Powell was 3636.52 feet above sea level. The April through July unregulated inflow to Lake Powell was 5.796 maf (73% of average).

Releases from Glen Canyon Dam during the month of August will fluctuate each day for power generation between a peak hourly average release of about 16,500 cfs, during the morning and afternoon and a daily low hourly average release of 8,500 cfs during the late evening and early morning hours. The release volume scheduled for August is 800,000 acre-feet. On August 30th and 31st, the hourly release pattern will be moderated somewhat in order to provide a steady transition the steady flow experiment which begins on September 1, 2010.

On September 1, 2010 and continuing through October 31, 2010, the releases from Glen Canyon Dam will be steady with no fluctuations for power production (excluding system regulation and spinning reserves) for the steady flow experiment pursuant to the February 2008 Finding of No Significant Impact 'Experimental Releases from Glen Canyon Dam, Arizona 2008 through 2012'. This year will be the third year of steady flows of the 5 year experiment. The steady release rate is projected to be 8,000 cfs which is equivalent to a monthly release volume of approximately 476,000 acre-feet in September 2010 and 492,000 acre-feet in October 2010.

During the steady flow experiment the instantaneous releases from Glen Canyon Dam may fluctuate somewhat to provide approximately 40 megawatts (approximately 1,100 cfs) of system regulation to maintain stable conditions within the electrical generation and transmission system. This translates into momentary release fluctuations of about +/- 1100 cfs above or below the targeted steady release target (8000 cfs). These momentary fluctuations for regulation are very short lived and will typically balance out over the hour. Spinning and non-spinning reserve generation will also be carried at Glen Canyon Dam during the steady flow experiment. When an unanticipated outage event occurs in the generation system, reserve generation at Glen Canyon Dam can also be called upon up to a limit of 83 megawatts (approximately 2,250 cfs of release) for a duration of 2 hours or less. Under normal circumstances, calls for reserve generation occur fairly infrequently and are for much less than the limit of 83 megawatts.

Pursuant to the Colorado River Interim Guidelines for Lower Basin Shortages and Coordinated Operations for Lakes Powell and Mead (Interim Guidelines) the operational tier for water year 2010 is Upper Elevation Balancing and the projected water year release volume is 8.23 maf. Under this operational tier there was a possibility that Equalization could occur in 2010 if the April 2010 24-Month Study ,with 8.23 maf projected for release during water year 2010, indicated a Lake Powell projected elevation on September 30 , 2010 greater than 3642 feet above sea level (the Equalization level for water year 2010). This condition was not projected in the April 24-Month Study and for this reason, the release volume for water year 2010 will be 8.23 maf. Monthly release volumes for the remainder of the water year will be scheduled to achieve this water year release volume.

The August 2010 24-Month Study projects that the operation tier for Glen Canyon Dam in water year 2011 will be Upper Elevation Balancing but also projects a shift in operations where Equalization will govern the operation beginning in April 2011. The most probable run of the August 24-Month Study projects the water year 2011 release volume to be 11.58 maf. At this point in time, there is a high level of uncertainty regarding the hydrologic conditions that will be experience in 2011. The August 24-Month Study, which includes analysis of a range of possible inflow scenarios in water year 2011, projects that the most probable range of annual releases from Lake Powell will be from 9.0 maf to approximately 14.1 maf. It is currently forecasted that there is approximately a 62% probability that Equalization will occur in water year 2011 with the annual release being at or above approximately 10.7 maf. This forecast will be updated each month as conditions change.

Upper Colorado River Basin Hydrology

In the Upper Colorado River Basin during water year 2009, the overall precipitation accumulated through September 30, 2009 was approximately 95% of average based on the 30 year average for the period from 1971 through 2000. For water year 2010 dry conditions have persisted. Estimated percentages of average precipitation for the months thus far in water year 2010 are as follows: October 85%, November 40%, December 130%, January 100% and February 100%, March 90%, April 120%, May 75%, June 100%, July 95%. The overall estimated precipitation percentage of average thus far in water year 2010 for the Upper Colorado River Basin is 96% of average.

The Climate Prediction Center outlook (dated July 15, 2010) for temperature over the next 3 months indicates that temperatures in the Upper Colorado River Basin are expected to be above average while precipitation over the next 3 months is projected to be below average.

Upper Colorado River Basin Drought

The Upper Colorado River Basin continues to experience a protracted multi-year drought. Since 1999, inflow to Lake Powell has been below average in every year except water years 2005 and 2008. In the summer of 1999, Lake Powell was close to full with reservoir storage at 23.5 million acre-feet, or 97 percent of capacity. During the next 5 years (2000 through 2004) unregulated inflow to Lake Powell was well below average. This resulted in Lake Powell storage decreasing during this period to 8.0 million acre-feet (33 percent of capacity) which occurred on April 8, 2005. During 2005, 2008 and 2009, drought conditions eased somewhat with net gains in storage to Lake Powell. As of August 10, 2010 the storage in Lake Powell was 15.59 million acre-feet (64.1 % of capacity) which is still below desired levels while the overall reservoir storage in the Colorado River Basin as of August 10, 2010 is 34.14 million acre-feet (57.4 % of capacity).

September 24-Month Study
Date: September 8, 2010

From: Water Resources Group, Salt Lake City
To: All Colorado River Annual Operating Plan (AOP) Recipients

Current Reservoir Status

Reservoir	August Inflow (unregulated) (acre-feet)	Percent of Average (%)	September 7 Midnight Elevation (feet)	Reservoir Storage (acre-feet)
Fontenelle	50,000	55	6500.87	306,000
Flaming Gorge	54,000	50	6026.11	3,201,000
Blue Mesa	56,000	87	7498.87	652,000
Navajo	40,000	92	6066.79	1,437,000
Powell	505,000	82	3634.23	15,332,000

Expected Operations

The operation of Lake Powell and Lake Mead in this September 2010 24-Month Study is pursuant to the December 2007 Record of Decision on Colorado River Interim Guidelines for Lower Basin Shortages and the Coordinated Operations of Lake Powell and Lake Mead (Interim Guidelines), and reflects the 2010 Annual Operating Plan (AOP). Pursuant to the Interim Guidelines, the August 2009 24-Month Study projections of the January 1, 2010 system storage and reservoir water surface elevations set the operational tier for the coordinated operation of Lake Powell and Lake Mead.

The Lake Powell operational tier for water year 2010 is the Upper Elevation Balancing Tier. The Intentionally Created Surplus (ICS) Surplus condition is the criterion governing the operation of Lake Mead for calendar year 2010.

The April 2010 24-Month study projected the end of water year elevation at Lake Powell to be below the Equalization level of 3642 feet and the projected end of water year 2010 elevation at Lake Mead to be above elevation 1075 feet. Pursuant to Sections 6.B.1. and 6.B.4. of the Interim Guidelines, the annual release volume will be 8.23 million acre-feet from Glen Canyon Dam during water year 2010 which is reflected in the September 24-Month Study.

This 24-Month Study currently projects Lake Powell's 2011 end of water year elevation to be above the 2011 Equalization Elevation of 3643 feet under an 8.23 maf release. Based on this 24-Month Study and pursuant to the Interim Guidelines, it is projected that

in April 2011 the Equalization Tier will govern the operation of Lake Powell for the remainder of Water Year 2011. Based on analysis of inflow scenarios, currently the probability of an April adjustment in 2011 is approximately 58 percent.

The Interim Guidelines are available for download at http://www.usbr.gov/lc/region/programs/strategies/RecordofDecision.pdf.
The 2010 AOP is available for download at http://www.usbr.gov/lc/region/g4000/AOP2010/AOP10.pdf.

Fontenelle Reservoir – Inflows for the month of August were 50,000 acre-feet, or 55% of average. The reservoir elevation is 6501 feet above sea level and 89% of capacity. Current inflows are approximately 600cfs and reservoir releases are 1,050 cfs. Releases will likely be close to 1,050 for the fall and winter months. The reservoir elevation will continue to decline through the fall and winter.

The Colorado Basin River Forecast Center has issued the water year 2011 (October 2010 to September 2011) forecast. At this early point, inflows over the next year are expected to be 85% of average. Inflows over the next three months are forecasted to be well below average: 40,000 acre-ft (75%), 40,000 acre-ft (77%) and 34,000 acre-ft (77%), for September, October and November respectively.

The next Fontenelle Working Group meeting is scheduled for April 21, 2011 at 10:00 am at the City of Green River City Hall. The Fontenelle Working Group is an open public forum for information exchange between Reclamation and other parties associated with the operation of Fontenelle Reservoir.

Flaming Gorge Reservoir – August observed unregulated inflow into Flaming Gorge reservoir was 54,000 acre-feet (AF), or 50 percent of average inflow. The August end of month elevation was 6026.5 feet, which equates to 3.21 million acre-feet or 85 percent of live storage capacity. Releases out of Flaming Gorge for the base flow period are currently fluctuating around an average daily release of 1,800 cfs. It is anticipated that they will remain at this level until the end of September, when releases will be reduced to 1,050 cfs average daily release.

Yampa River flows during the base flow period impact the hourly release schedule from Flaming Gorge because flows must remain within 0.1 meter stage change at Jensen, Utah. As Yampa River flows decrease, the Flaming Gorge release schedule will change. The hourly release schedule will be communicated as it changes throughout the base flow period.

The next Flaming Gorge Working Group meeting is scheduled for April 26, 2010 at 7:00 p.m. in a location to be determined. The Flaming Gorge Working Group is an open public forum for information exchange between Reclamation and the stake holders of Flaming Gorge Dam. The public is encouraged to attend and comment on the operations

and plans presented by Reclamation at these meetings. For more information on this group and these meetings please contact Ed Vidmar at 801-379-1182.

Aspinall Reservoirs – August unregulated inflow into Blue Mesa Reservoir was 56,000 acre-feet or 87 percent of average. Precipitation during August was above average, the observed precipitation was about 150 percent of average. The current inflow rate into Blue Mesa Reservoir is about 500 cfs while reservoir releases are averaging about 1,600 cfs. Blue Mesa's current elevation is 7598.87 feet, which corresponds to a storage content of about 652,000 acre-feet. The observed April through July runoff into Blue Mesa Reservoir was recorded at 494,000 acre-feet or about 69 percent of normal runoff. The reservoir reached a high elevation of 7508.22 feet on June 27, 2010, which was approximately 11.18 feet below "full" pool. Full pool is actually defined by the top of the spillway gates at elevation 7519.4 feet, but we rarely fill to that level due to safety concerns for the reservoir. For practical purposes; the reservoir is considered full at elevations above 7516.4 feet.

Releases from Crystal are currently set at 1,600 cfs. The Gunnison Diversion Tunnel is currently diverting about 1,100 cfs, which results in a river flow below the diversion tunnel of approximately 600 cfs. As in years past there seems to be about 100 cfs discrepancy between the different gage readings.

Other changes in reservoir operations are planned towards the end of September in order to accommodate for decreases in tunnel diversions and also to assist in the State of Colorado annual fish survey on the river during the first week of October. These and other changes to reservoir release rates may occur as conditions warrant, primarily as we respond to changes in the river inflows.

The last meeting of the "Aspinall Unit Working Group" was held on Thursday September 2nd in the Elk Creek Visitors Center at Blue Mesa Reservoir. Spring and summer operations were reviewed and future fall and winter reservoir operations were discussed. These meetings are open forum discussions on the Aspinall Unit reservoir operations with many interested groups participating. Anyone needing further information about these meetings should contact Dan Crabtree in the Grand Junction Area Office at (970) 248-0652.

Navajo Reservoir – As a result of warmer and drier conditions returning to the San Juan River Basin, Reclamation increased the release from Navajo Reservoir to 800 cfs on Thursday, August 12th. Reservoir releases are made for the authorized purposes of the Navajo Unit, and to attempt to maintain a target base flow through the endangered fish critical habitat reach of the San Juan River (Farmington to Lake Powell).

The San Juan River Basin Recovery Implementation Program recommends a target base flow of between 500 cfs and 1,000 cfs through the critical habitat area. The target base

flow is calculated as the weekly average of gaged flows throughout the critical habitat area, therefore daily flows of less than 500 cfs may occur at some gages.

Reclamation continues to closely monitor weather and stream flow conditions and make adjustments to the Navajo Reservoir release as necessary.

Precipitation for the month of August in the San Juan River basin was 120 percent of average. Unregulated inflow into Navajo Reservoir during the month of August was 40,000 acre-feet, or about 92 percent of normal. The total runoff for the 2010 season ending July (April-July) was recorded at 654,000 acre-feet, or about 83 percent of average runoff. The reservoir had a seasonal peak elevation of 6075.53 feet on June 15, 2010. There was no spring release provided this runoff season because of low spring inflows.

Currently the daily reservoir inflow is averaging about 750 cfs. NIIP diversions are set at about 350 cfs. The reservoir water surface elevation is currently 6066.79 feet, which corresponds to a storage content of about 1,437,000 acre-feet.

A public meeting on Navajo Reservoir operations was held on Tuesday, August 24, 2010 at 1:00 p.m. in Farmington, New Mexico. At this meeting, review of last spring and summer reservoir operations, and plans for this fall and winter operations were discussed. These are open forum discussions on the operation of Navajo Reservoir with many interested groups participating. Anyone interested in the general operation of the reservoir is encouraged to attend. Please contact Pat Page in Reclamation's Durango, Colorado Office at (970) 385-6560 for information about these meetings or the daily operation of Navajo Reservoir.

Glen Canyon Dam / Lake Powell –The unregulated inflow volume into Lake Powell for August 2010 was 504 kaf (82% of average). This was approximately 75 kaf below what was projected. The elevation of Lake Powell decreased during the month by approximately 2 feet from 3636.5 feet at the beginning of August to 3634.5 feet at the end of August. This elevation is about 0.6 feet below the August end of month elevation that was projected to occur in the August 24-Month Study. This ending elevation corresponds to a live storage of 15.37 maf which is 63.2% of the full capacity.

During August the release volume from Glen Canyon Dam was 801.7 kaf and the hourly releases during most days fluctuated between a peak of 16,500 cfs during the day and a low of 8,500 cfs during the evening and early morning for power generation. On September 1, 2010 and continuing through October 31, 2010, the releases from Glen Canyon Dam will be steady with no fluctuations for power production (excluding system regulation and spinning reserves) for the steady flow experiment pursuant to the February 2008 Finding of No Significant Impact 'Experimental Releases from Glen Canyon Dam, Arizona 2008 through 2012'. This will be the third year of steady flows of the 5 year experiment. The steady release rate is 8,000 cfs which is equivalent to a monthly release

volume of approximately 476,000 acre-feet in September 2010 and 492,000 acre-feet in October 2010.

During the steady flow experiment the instantaneous releases from Glen Canyon Dam may fluctuate somewhat to provide approximately 40 megawatts (approximately 1,100 cfs) of system regulation to maintain stable conditions within the electrical generation and transmission system. This translates into momentary release fluctuations of about +/- 1100 cfs above or below the targeted steady release target (8000 cfs). These momentary fluctuations for regulation are very short lived and will typically balance out over the hour. Spinning and non-spinning reserve generation will also be carried at Glen Canyon Dam during the steady flow experiment. When an unanticipated outage event occurs in the generation system, reserve generation at Glen Canyon Dam can also be called upon up to a limit of 83 megawatts (approximately 2,250 cfs of release) for a duration of 2 hours or less. Under normal circumstances, calls for reserve generation occur fairly infrequently and are for much less than the limit of 83 megawatts.

The August 2010 24-Month Study (most probable inflow scenario) projected the January 1, 2011 elevation of Lake Powell to be 3628.73 feet. Pursuant to the Interim Guidelines, the determination is that the Operational Tier for water year 2011 will be the Upper Elevation Balancing Tier. Under this Operational Tier, there is a possibility that the annual release volume from Lake Powell could be 8.23 maf. There is also a possibility that Equalization or Balancing could occur in 2011 which would result in an annual release volume greater than 8.23 maf. The possibility of Equalization or Balancing in 2011 will depend on the reservoir conditions projected for the end of water year 2011 in the April 2011 24-Month Study with the most probable inflow scenario and 8.23 maf projected for release from Lake Powell. The September 2010 24-Month Study indicates that Equalization is likely to be triggered in April 2011 and the annual release volume for water year 2011 is projected to be 11.28 maf.

There is a high level of uncertainty regarding the hydrologic conditions that will be experienced in water year 2011. Each month, the 24-Month Study will be updated to reflect current reservoir conditions and the most probable inflow forecast. The projected annual release volume for water year 2011 in the 24-Month Study will reflect the implementation of the Upper Elevation Balancing Tier with updated hydrologic conditions and is therefore likely to change each month. It is possible that a relatively small change in the forecast could have a large impact on the projected annual release volume. Based on the current inflow forecast (dated September 1, 2010), there is approximately a 58% probability that Equalization will occur in water year 2011.

The current inflow forecast for Lake Powell projects the most probable unregulated inflow volumes for the next 3 months as follows: Sepember-400 kaf (84% of average); October-475 kaf (87% of average; November-460 kaf (84% of average). The outlook for water year 2011 (dated August 3, 2010) projected the most probable unregulated inflow volume to Lake Powell during water year 2011 to be 10.75 maf (89% of average). It is likely the unregulated volume of inflow to Lake Powell in water year 2011 will be greater than or less than the most probable projection. The range of possible unregulated inflow

volumes to Lake Powell is currently projected to be as dry as 5.0 maf (40% of average) to as wet as 17.1 maf (142% of average). In October, this hydrologic outlook for water year 2011 will be updated.

Upper Colorado River Basin Hydrology

In the Upper Colorado River Basin during water year 2009, the overall precipitation accumulated through September 30, 2009 was approximately 95% of average based on the 30 year average for the period from 1971 through 2000. For water year 2010 dry conditions have persisted. Estimated percentages of average precipitation for the months thus far in water year 2010 are as follows: October 85%, November 40%, December 130%, January 100% and February 100%, March 90%, April 120%, May 75%, June 100%, July 95%, August 135%. The overall estimated precipitation percentage of average thus far in water year 2010 for the Upper Colorado River Basin is 90% of average.

The Climate Prediction Center outlook (dated August 19, 2010) for temperature over the next 3 months indicates that temperatures in the Upper Colorado River Basin are expected to be above average while precipitation over the next 3 months is projected to be below average.

Upper Colorado River Basin Drought

The Upper Colorado River Basin continues to experience a protracted multi-year drought. Since 1999, inflow to Lake Powell has been below average in every year except water years 2005 and 2008. In the summer of 1999, Lake Powell was close to full with reservoir storage at 23.5 million acre-feet, or 97 percent of capacity. During the next 5 years (2000 through 2004) unregulated inflow to Lake Powell was well below average. This resulted in Lake Powell storage decreasing during this period to 8.0 million acre-feet (33 percent of capacity) which occurred on April 8, 2005. During 2005, 2008 and 2009, drought conditions eased somewhat with net gains in storage to Lake Powell. As of September 1, 2010 the storage in Lake Powell was 15.36 million acre-feet (63.1 % of capacity) which is still below desired levels while the overall reservoir storage in the Colorado River Basin as of September 1, 2010 is 33.73 million acre-feet (56.7 % of capacity).

October 24-Month Study
Date: October 8, 2010

From: Water Resources Group, Salt Lake City
To: All Colorado River Annual Operating Plan (AOP) Recipients

Current Reservoir Status

Reservoir	September Inflow (unregulated) (acre-feet)	Percent of Average (%)	October 6 Midnight Elevation (feet)	Reservoir Storage (acre-feet)
Fontenelle	29,000	54	6496.36	272,000
Flaming Gorge	22,000	34	6024.65	3,147,000
Blue Mesa	23,000	63	7491.30	591,000
Navajo	24,000	61	6064.33	1,404,000
Powell	276,000	58	3634.08	15,315,000

Expected Operations

The operation of Lake Powell and Lake Mead in this October 2010 24-Month Study is pursuant to the December 2007 Record of Decision on Colorado River Interim Guidelines for Lower Basin Shortages and the Coordinated Operations of Lake Powell and Lake Mead (Interim Guidelines), and reflects the 2010 Annual Operating Plan (AOP) and draft 2011 AOP. Pursuant to the Interim Guidelines, the August 2010 24-Month Study projections of the January 1, 2011 system storage and reservoir water surface elevations set the operational tier for the coordinated operation of Lake Powell and Lake Mead during 2011.

The Lake Powell operational tier for water year 2011 is the Upper Elevation Balancing Tier. The Intentionally Created Surplus (ICS) Surplus condition is the criterion governing the operation of Lake Mead for calendar years 2010 and 2011.

Consistent with Section 6.B.4 of the Interim Guidelines, if the April 24-Month study projects the September 30 Lake Mead elevation to be below 1,075 feet and the September 30, Lake Powell elevation to be at or above 3,575 feet, the Secretary shall balance the contents of Mead and Powell but release not more than 9.0 maf. Consistent with this provision, the October 24-Month Study projects such an adjustment to occur in April, resulting in a water year release from Lake Powell of 9.0 maf.

Based on analysis of a range of inflow scenarios, the current probability of an April adjustment to operation of Lake Powell being governed by the Equalization Tier in 2011 is approximately 50 percent.

The Interim Guidelines are available for download at
http://www.usbr.gov/lc/region/programs/strategies/RecordofDecision.pdf.
The 2010 AOP is available for download at
http://www.usbr.gov/lc/region/g4000/AOP2010/AOP10.pdf.
The draft 2011 AOP is available for download at
http://www.usbr.gov/uc/water/rsvrs/ops/aop/AOP11_draft.pdf.

Fontenelle Reservoir – Inflows for the month of September were 29,000 acre-feet, or 54% of average. The reservoir elevation is 6496.5 feet above sea level and 81% of capacity. Current inflows are approximately 430cfs and reservoir releases are 1,000 cfs. Releases will likely be close to 1,000 for the fall and winter months. The reservoir elevation will continue to decline through the fall and winter.

The Colorado Basin River Forecast Center has updated the water year 2011 (October 2010 to September 2011) forecast. At this early point, inflows over the next year are expected to be 72% of average. Inflows over the next three months are forecasted to be well below average: 34,000 acre-ft (65%), 31,000 acre-ft (70%) and 27,000 acre-ft (82%), for October, November, and December respectively.

The next Fontenelle Working Group meeting is scheduled for April 21, 2011 at 10:00 am at the Seedskadee National Wildlife Refuge Visitor Center. The Fontenelle Working Group is an open public forum for information exchange between Reclamation and other parties associated with the operation of Fontenelle Reservoir.

Flaming Gorge Reservoir – September observed unregulated inflow into Flaming Gorge reservoir was 22,000 acre-feet (AF), or 34 percent of average inflow. The September end of month elevation was 6024.8 feet, which equates to 3.15 million acre-feet or 84 percent of live storage capacity. Releases out of Flaming Gorge for the base flow period are decreasing to a winter daily average release of 1,050 cfs. It is anticipated that they will remain at this level until the end of February, when releases will be reduced to steady 800 cfs flows from the beginning of March until spring runoff occurs sometime in mid- to late-May 2011.

Yampa River flows during the base flow period impact the hourly release schedule from Flaming Gorge because flows must remain within 0.1 meter stage change at Jensen, Utah. As Yampa River flows decrease, the Flaming Gorge release schedule will change. The hourly release schedule will be communicated as it changes throughout the base flow period.

The next Flaming Gorge Working Group meeting is scheduled for April 26, 2011 at 7:00 p.m. in a location to be determined. The Flaming Gorge Working Group is an open public forum for information exchange between Reclamation and the stake holders of Flaming Gorge Dam. The public is encouraged to attend and comment on the operations and plans presented by Reclamation at these meetings. For more information on this group and these meetings please contact Ed Vidmar at 801-379-1182.

Aspinall Unit Reservoirs - September unregulated inflow into Blue Mesa Reservoir was 23,000 acre-feet or 63 percent of average. Precipitation during September was observed to be about 65 percent of average. The current inflow rate into Blue Mesa Reservoir is about 560 cfs and reservoir releases are averaging about 1,700 cfs. Blue Mesa's present elevation is 7491.3 feet, which corresponds to a storage content of about 591,000 acre-feet. The unregulated reservoir inflow into Blue Mesa Reservoir during water year 2010 was 725,000 acre-feet, or about 77 percent of average.

Releases from Crystal are currently set at 1800 cfs. The current diversion rate through the Gunnison Diversion Tunnel is about 1,000 cfs, which results in a river flow below the diversion tunnel of approximately 800 cfs. As the irrigation season comes to a close decreases in Crystal releases will occur as the demand for irrigation water is reduced and the Gunnison Tunnel flows are shut off. Because of drier than average conditions in the basin, flows in the Gunnison River below the tunnel will be gradually reduced to 500 to 600 cfs through the late fall and early winter months.

The last meeting of the "Aspinall Unit Working Group" was held on Thursday September 2nd in the Elk Creek Visitors Center at Blue Mesa Reservoir. Spring and summer operations were reviewed and future fall and winter reservoir operations discussed. These meetings are open forum discussions on the Aspinall Unit reservoir operations with many interested groups participating. Anyone needing further information about these meetings should contact Dan Crabtree in the Grand Junction Area Office at (970) 248-0652.

Navajo Reservoir - As a result of forecasted cooler, wetter conditions in the San Juan River Basin, the Bureau of Reclamation decreased the release from Navajo Reservoir to 650 cubic cfs on Monday, October 4, 2010. Releases are made for the authorized purposes of the Navajo Unit, and to attempt to maintain a target base flow through the endangered fish critical habitat reach of the San Juan River (Farmington to Lake Powell).

This scheduled release change is subject to changes in river flows and weather conditions. Reclamation will continue to closely monitor weather and stream flow conditions and make adjustments to the Navajo Reservoir release as necessary.

Precipitation for the month of September in the San Juan River basin was about 65 percent of average. Unregulated inflow into Navajo Reservoir during the month of September was 24,000 acre-feet, or 61 percent of average. Currently, the daily reservoir inflow is averaging about 450 cfs. Diversions for NIIP are currently 300 cfs. The reservoir water surface elevation is at 6064.33 feet, which corresponds to a storage content of about 1,404,000 acre-feet.

The unregulated reservoir inflow into Navajo Reservoir during water year 2010 was recorded at 766,000 acre-feet, or about 76 percent of average. The reservoir had a seasonal peak elevation of 6075.53 feet on June 15, 2010. There was no spring peak release provided this runoff season because of low spring inflows.

A public meeting on Navajo Reservoir operations was held on Tuesday, August 24, 2010 at 1:00 p.m. in Farmington, New Mexico. At this meeting, review of last spring and summer reservoir operations, and plans for this fall and winter operations were discussed. These are open forum discussions on the operation of Navajo Reservoir with many interested groups participating. Anyone interested in the general operation of the reservoir is encouraged to attend. Please contact Pat Page in Reclamation's Durango, Colorado Office at (970) 385-6560 for information about these meetings or the daily operation of Navajo Reservoir.

Glen Canyon Dam / Lake Powell –During September 2010 the unregulated inflow volume to Lake Powell was 276 kaf (58% of average). This was be approximately 124 kaf below what was projected in the September 24-Month Study and as a result the elevation of Lake Powell at the end of September was about 1 foot lower than what was projected. The September 30th elevation of Lake Powell was 3633.66 feet above sea level which corresponds to a live storage of approximately 15.27 maf and 62.8% of the full capacity of 24.32 maf.

On September 1, 2010 and continuing through October 31, 2010, the releases from Glen Canyon Dam will be steady with no fluctuations for power production (excluding system regulation and spinning reserves) for the steady flow experiment pursuant to the February 2008 Finding of No Significant Impact 'Experimental Releases from Glen Canyon Dam, Arizona 2008 through 2012'. This will be the third year of steady flows of the 5 year experiment. The steady release rate for this year is 8,000 cfs which is equivalent to a monthly release volume of approximately 476,000 acre-feet in September 2010 and 492,000 acre-feet in October 2010.

During the steady flow experiment the instantaneous releases from Glen Canyon Dam may fluctuate somewhat to provide approximately 40 megawatts of system regulation to maintain stable conditions within the electrical generation and transmission system. This translates into momentary release fluctuations within a range that is 1100 cfs above or below the targeted steady release target of 8000 cfs. These momentary fluctuations for regulation are very short lived and typically balance out over the hour. Spinning and non-spinning reserve generation will also be carried at Glen Canyon Dam during the steady flow experiment. When an unanticipated outage event occurs in the generation system, reserve generation at Glen Canyon Dam can also be called upon up to a limit of 83 megawatts (approximately 2,250 cfs of release) for a duration of 2 hours or less. Under normal circumstances, calls for reserve generation occur fairly infrequently and are for much less than the limit of 83 megawatts.

The August 2010 24-Month Study (most probable inflow scenario) projected the January 1, 2011 elevation of Lake Powell to be 3628.73 feet. Pursuant to the Interim Guidelines and based on this August projection, the operational tier for water year 2011 will be the Upper Elevation Balancing Tier. Under the Upper Elevation Balancing Tier, there is a possibility that the annual release volume from Lake Powell could be 8.23 maf. There is also a possibility under this tier that Equalization or Balancing could occur in 2011 which would result in an annual release volume greater than 8.23 maf.

The possibility of Equalization or Balancing in 2011 is dependent on the reservoir conditions projected in the April 2011 24-Month Study under the most probable inflow scenario and with 8.23 maf projected for release from Lake Powell during water year 2011. For this reason it will not be known for certain whether Equalization or Balancing will occur in water year 2011 until April 2011. 24-Month Studies prior to April 2011 can project that Equalization or Balancing are likely to occur, but these projections are subject to change with changes in the forecasted hydrology of the Colorado River Basin. It is possible that a relatively small change in forecasted hydrology can have a large impact on the projected annual release volume.

The October 2010 24-Month Study with the most probable inflow and an 8.23 maf release does project that a shift to Balancing is likely to occur in April 2011. For this reason, the projected most probable annual release volume for water year 2011in this 24-Month Study is 9.00 maf. However, given the current range of uncertainty of the forecasted hydrology for 2011, it is still possible that Equalization could occur in water year 2011. Analysis of the probable range of inflows that could occur during water year 2011 indicate that the probability of Equalization occurring in 2011 is currently about 50%.

The current inflow forecast for Lake Powell projects the most probable unregulated inflow volumes for the next 3 months as follows: October-375 kaf (69% of average; November-400 kaf (73% of average); December-375 kaf (86% of average). The outlook for water year 2011 (dated October 3, 2010) projected the most probable unregulated inflow volume to Lake Powell during water year 2011 to be 9.60 maf (80% of average). It is possible that the unregulated volume of inflow to Lake Powell in water year 2011 will be greater than or less than the most probable projection. The probable range of unregulated inflow volumes to Lake Powell during water year 2011 is currently projected to be as dry as 4.5 maf (37% of average) to as wet as 15.8 maf (131% of average).

Upper Colorado River Basin Hydrology

In the Upper Colorado River Basin during water year 2009, the overall precipitation accumulated through September 30, 2009 was approximately 95% of average based on the 30 year average for the period from 1971 through 2000. The overall estimated precipitation percentage of average for water year 2010 for the Upper Colorado River Basin is 89% of average.

The Climate Prediction Center outlook (dated September 16, 2010) for temperature over the next 3 months indicates that temperatures in the Upper Colorado River Basin are expected to be above average while precipitation over the next 3 months is projected to be below average.

Upper Colorado River Basin Drought

The Upper Colorado River Basin continues to experience a protracted multi-year drought. Since 1999, inflow to Lake Powell has been below average in every year except water years 2005 and 2008. In the summer of 1999, Lake Powell was close to full with reservoir storage at 23.5 million acre-feet, or 97 percent of capacity. During the next 5 years (2000 through 2004) unregulated inflow to Lake Powell was well below average. This resulted in Lake Powell storage decreasing during this period to 8.0 million acre-feet (33 percent of capacity) which occurred on April 8, 2005. During 2005, 2008 and 2009, drought conditions eased somewhat with net gains in storage to Lake Powell. As of October 1, 2010 the storage in Lake Powell was 15.26 million acre-feet (62.7 % of capacity) which is still below desired levels while the overall reservoir storage in the Colorado River Basin as of October 1, 2010 is 33.05 million acre-feet (55.6 % of capacity).

November 24-Month Study
Date: November 9, 2010

From: Water Resources Group, Salt Lake City
To: All Colorado River Annual Operating Plan (AOP) Recipients

Current Reservoir Status

Reservoir	October Inflow (unregulated) (acre-feet)	Percent of Average (%)	November 7 Midnight Elevation (feet)	Reservoir Storage (acre-feet)
Fontenelle	31,000	60	6492.76	247,000
Flaming Gorge	32,000	49	6024.11	3,127,000
Blue Mesa	29,000	80	7486.38	554,000
Navajo	25,000	57	6063.25	1,390,000
Powell	362,000	66	3633.29	15,225,000

Expected Operations

The operation of Lake Powell and Lake Mead in this November 2010 24-Month Study is pursuant to the December 2007 Record of Decision on Colorado River Interim Guidelines for Lower Basin Shortages and the Coordinated Operations of Lake Powell and Lake Mead (Interim Guidelines), and reflects the 2010 Annual Operating Plan (AOP) and draft 2011 AOP. Pursuant to the Interim Guidelines, the August 2010 24-Month Study projections of the January 1, 2011 system storage and reservoir water surface elevations set the operational tier for the coordinated operation of Lake Powell and Lake Mead during 2011.

The Lake Powell operational tier for water year 2011 is the Upper Elevation Balancing Tier. The Intentionally Created Surplus (ICS) Surplus condition is the criterion governing the operation of Lake Mead for calendar years 2010 and 2011.

Consistent with Section 6.B.4 of the Interim Guidelines, if the April 24-Month study projects the September 30 Lake Mead elevation to be below 1,075 feet and the September 30, Lake Powell elevation to be at or above 3,575 feet, the Secretary shall balance the contents of Mead and Powell but release not more than 9.0 maf. Consistent with this provision, the November 24-Month Study projects such an adjustment to occur in April, resulting in a water year release from Lake Powell of 9.0 maf.

Based on analysis of a range of inflow scenarios, the current probability of realizing an inflow volume that would trigger Equalization in 2011 is approximately 48 percent.

The Interim Guidelines are available for download at
http://www.usbr.gov/lc/region/programs/strategies/RecordofDecision.pdf.
The 2010 AOP is available for download at
http://www.usbr.gov/lc/region/g4000/AOP2010/AOP10.pdf.
The draft 2011 AOP is available for download at
http://www.usbr.gov/uc/water/rsvrs/ops/aop/AOP11_draft.pdf.

Fontenelle Reservoir – Inflows for the month of October were 31,000 acre-feet, or 60% of average. The reservoir elevation is 6493.1 feet above sea level and 72% of capacity. Current inflows are approximately 600cfs and reservoir releases are 900 cfs. Releases will likely be close to 900 cfs for the fall and winter months. The reservoir elevation will continue to decline through the fall and winter.

The Colorado Basin River Forecast Center forecast for water year 2011 (October 2010 to September 2011) shows inflows are expected to be 72% of average. Note that at this time of the year, there is considerable uncertainty in the water year forecast. Inflows over the next three months are forecasted to be below average: 32,000 acre-ft (72%), 27,000 acre-ft (81%) and 24,000 acre-ft (77%), for November, December, and January, respectively.

The next Fontenelle Working Group meeting is scheduled for April 21, 2011 at 10:00 am at the Seedskadee National Wildlife Refuge Visitor Center. The Fontenelle Working Group is an open public forum for information exchange between Reclamation and other parties associated with the operation of Fontenelle Reservoir.

Flaming Gorge Reservoir – October observed unregulated inflow into Flaming Gorge reservoir was 31,000 acre-feet (AF), or 31 percent of average inflow. The October end of month elevation was 6024.2 feet, which equates to 3.13 million acre-feet or 84 percent of live storage capacity. Releases out of Flaming Gorge are a winter daily average release of 1,050 cfs according to a double peak release regime. It is anticipated that they will remain at this level until the end of February, when releases will be reduced to steady 800 cfs flows from the beginning of March until spring runoff occurs sometime in mid- to late-May 2011.

Yampa River flows during the base flow period impact the hourly release schedule from Flaming Gorge because flows must remain within 0.1 meter stage change at Jensen, Utah. As Yampa River flows decrease, the Flaming Gorge release schedule will change. The hourly release schedule will be communicated as it changes throughout the base flow period.

The next Flaming Gorge Working Group meeting is scheduled for April 26, 2011 at 7:00 p.m. in a location to be determined. The Flaming Gorge Working Group is an open public forum for information exchange between Reclamation and the stake holders of Flaming Gorge Dam. The public is encouraged to attend and comment on the operations and plans presented by Reclamation at these meetings. For more information on this group and these meetings please contact Ed Vidmar at 801-379-1182.

Aspinall Unit Reservoirs – October unregulated inflow into Blue Mesa Reservoir was 29,000 acre-feet or 80 percent of average. Precipitation during October was observed to be about 145 percent of average. The current inflow rate into Blue Mesa Reservoir is about 550 cfs while reservoir releases are averaging about 400 cfs. Blue Mesa's present elevation is 7486.38 feet, which corresponds to a storage content of about 554,000 acre-feet. The unregulated reservoir inflow into Blue Mesa Reservoir during water year 2010 was 725,000 acre-feet, or about 77 percent of average.

Releases from Crystal are currently set at 500 cfs. The Gunnison Diversion Tunnel was shut down for the season on November 1st, with exception of some small 50 to 80 cfs diversions taken bi-weekly for municipal water needs in Montrose, Colorado. River flows below the tunnel are essentially the same as releases from the Dam, with the exception of when the tunnel is taking water to refill Fairfield Reservoir for Montrose municipal water needs.

On November 5, 2010, the National Weather Service's River Forecasting Center issued its forecasted inflow into Blue Mesa for the next 3 months. The unregulated inflow forecast for November, December, and January is for 71,000 acre-feet, which is 89% of average for these months.

The next meeting of the "Aspinall Unit Working Group" will be held on Thursday January 20th in the Montrose, Colorado, starting at 1:00 PM. At this meeting, review of last summer and fall reservoir operations, and plans for this winter and next spring 2011 operations will be discussed. These meetings are open forum discussions on the Aspinall Unit reservoir operations with many interested groups participating. Anyone needing further information about these meetings should contact Dan Crabtree in the Grand Junction Area Office at (970) 248-0652.

Navajo Reservoir - As a result of forecasted cooler, wetter conditions in the San Juan River Basin, Reclamation decreased the release from Navajo Reservoir to 500 cfs on October 19, 2010. Reservoir releases are made for the authorized purposes of the Navajo Unit, and to attempt to maintain a target base flow through the endangered fish critical habitat reach of the San Juan River (Farmington to Lake Powell).

The San Juan River Basin Recovery Implementation Program recommends a target base flow of between 500 cfs and 1,000 cfs through the critical habitat area. The target base flow is calculated as the weekly average of gaged flows throughout the critical habitat area, therefore daily flows of less than 500 cfs may occur at some gages.

Pending significant changes in the weather and stream flow conditions, the reservoir release will likely remain at 500 cfs until next spring (2010).

Precipitation for the month of October in the San Juan River basin was about 100 percent of average. Unregulated inflow into Navajo Reservoir during the month of October was 25,000 acre-feet, or 57 percent of average. Currently, the daily reservoir inflow is averaging about 500 cfs. Diversions for NIIP have currently been shut down for the winter. The reservoir water surface elevation is at 6063.25 feet, which corresponds to a storage content of about 1,390,000 acre-feet.

The unregulated reservoir inflow into Navajo Reservoir during water year 2010 was recorded at 766,000 acre-feet, or about 76 percent of average. The reservoir had a seasonal peak elevation of 6075.53 feet on June 15, 2010. There was no spring peak release provided this runoff season because of low spring inflows.

The next public meeting on Navajo Reservoir operations will be held on Tuesday, January 25, 2011 at 1:00 p.m. in Farmington, New Mexico. At this meeting, review of last summer and fall reservoir operations, and plans for this winter and spring 2011 operations will be discussed. These are open forum discussions on the operation of Navajo Reservoir with many interested groups participating. Anyone interested in the general operation of the reservoir is encouraged to attend. Please contact Pat Page in Reclamation's Durango, Colorado Office at (970) 385-6560 for information about these meetings or the daily operation of Navajo Reservoir.

Glen Canyon Dam / Lake Powell –During October 2010 the unregulated inflow volume to Lake Powell was 362 kaf (66% of average). This volume was slightly less than the volume forecasted for October which was 375 kaf (69% of average). However, due to significant local precipitation in the region around Lake Powell, the elevation of Lake Powell at the end of October was 3634.08 feet above sea level which was 1.0 foot above the October 24-Month Study projected elevation for the end of October. This end of October elevation corresponds to a live storage of approximately 15.31 maf and 63.0% of the full capacity of 24.32 maf.

On November 1, 2010, the releases from Glen Canyon Dam will resume normal fluctuations for power generations each day. During September and October 2010, the releases were steady with no fluctuations for power generation as part of a 5 year study of steady flows pursuant to the February 2008 Finding of No Significant Impact 'Experimental Releases from Glen Canyon Dam, Arizona 2008 through 2012'. This was the third year of steady flows of the 5 year study. The steady release rate for this year was 8,000 cfs. The volume released during September was 480 kaf and the volume released in October will be approximately 495 kaf.

The release volume scheduled for November is 810 kaf which is equivelent to an average daily release rate of approximately 13,600 cfs. Daily fluctuations will likely peak near 16,000 cfs during the morning and afternoon and evening hours. Daily low releases will

occur during the early morning hours (i.e. midnight to about 6:00 am) and will be about 8,000 cfs. The projected release volume for December is currently 865 kaf which is equivalent to an average daily release rate of approximately 14,050 cfs. The daily peak and low release rate in December will likely also range from 16,000 cfs to 8,000 cfs respectively.

In addition to the daily fluctuation pattern for power generation, the instantaneous releases from Glen Canyon Dam may also fluctuate somewhat to provide approximately 40 megawatts of system regulation. These instantaneous releases adjustments maintain stable conditions within the electrical generation and transmission system and result in momentary release fluctuations within a range that is about 1100 cfs above or below the targeted release rate for a given hour of the day. These momentary fluctuations for regulation are very short lived and typically balance out over the hour. Spinning and non-spinning reserve generation is also maintained at Glen Canyon Dam. When an unanticipated electrical outage event occur within the electrical transmission system, this reserve generation at Glen Canyon Dam can be called upon up to a limit of 98 megawatts (approximately 2,600 cfs of release) for a duration of up to 2 hours. Under normal circumstances, calls for reserve generation occur fairly infrequently and are for much less than the limit of 98 megawatts.

In August of 2010, the August 2010 24-Month Study Model was used to project the January 1, 2010 elevation of Lake Powell and Lake Mead under the most probable inflow scenario. Pursuant to the Interim Guidelines and based on this August projection, the operational tier for water year 2011 was selected to be the Upper Elevation Balancing Tier. Under the Upper Elevation Balancing Tier, there is a possibility that the annual release volume from Lake Powell could be 8.23 maf. There is also a possibility under this tier that Equalization or Balancing could occur in 2011 which would result in an annual release volume greater than 8.23 maf.

The possibility of Equalization or Balancing in 2011 is dependent on the end of water year 2011 reservoir conditions projected in the April 2011 24-Month Study under the most probable inflow scenario and with 8.23 maf projected for release from Lake Powell during water year 2011. For this reason it will not be known for certain whether Equalization or Balancing will occur in water year 2011 until April 2011. 24-Month Studies prior to April 2011 can project that Equalization or Balancing are likely to occur, but these projections are subject to change with changes in the forecasted hydrology of the Colorado River Basin. It is possible that a relatively small change in forecasted hydrology can have a large impact on the projected annual release volume.

The November 2010 24-Month Study with the most probable inflow and an 8.23 maf release does project that Balancing is likely to occur in 2011. For this reason, the projected most probable annual release volume for water year 2011 in the November 24-Month Study is 9.00 maf. Given the current range of uncertainty of the forecasted hydrology for water year 2011, it is possible that Equalization could occur in water year 2011 which would result if the annual release being greater than about 10.7 maf. Analysis of the probable range of inflows that could occur during water year 2011 indicate that the

probability of realizing the volume of inflow that would trigger Equalization in 2011 is currently about 48%.

The current unregulated inflow forecast for Lake Powell projects the most probable unregulated inflow volumes for the next 3 months as follows: November-425 kaf (78% of average; December-400 kaf (86% of average); January-350 kaf (86% of average). The outlook for water year 2011, incorporating this new forecast, projects the most probable unregulated inflow volume to Lake Powell during water year 2011 to be 9.64 maf (80% of average). It is possible that the unregulated volume of inflow to Lake Powell in water year 2011 will be greater than or less than the most probable projection. The probable range of unregulated inflow volumes to Lake Powell during water year 2011 is currently projected to be as dry as 4.5 maf (37% of average) to as wet as 15.8 maf (131% of average).

Upper Colorado River Basin Hydrology

In the Upper Colorado River Basin during water year 2010, the overall precipitation accumulated through September 30, 2009 was approximately 90% of average based on the 30 year average for the period from 1971 through 2000. For October 2010, the first month of water year 2011, precipitation in the Upper Colorado River Basin was 135% of average basin wide.

The Climate Prediction Center outlook (dated October 21, 2010) for temperature over the next 3 months indicates that temperatures in the Upper Colorado River Basin are expected to be above average while precipitation over the next 3 months is projected to be near average.

Upper Colorado River Basin Drought

The Upper Colorado River Basin continues to experience a protracted multi-year drought. Since 1999, inflow to Lake Powell has been below average in every year except water years 2005 and 2008. In the summer of 1999, Lake Powell was close to full with reservoir storage at 23.5 million acre-feet, or 97 percent of capacity. During the next 5 years (2000 through 2004) unregulated inflow to Lake Powell was well below average. This resulted in Lake Powell storage decreasing during this period to 8.0 million acre-feet (33 percent of capacity) which occurred on April 8, 2005. During 2005, 2008 and 2009, drought conditions eased somewhat with net gains in storage to Lake Powell. As of November 7, 2010 the storage in Lake Powell was 15.22 million acre-feet (62.6 % of capacity) which is still below desired levels while the overall reservoir storage in the Colorado River Basin as of November 7, 2010 is 32.68 million acre-feet (54.9 % of capacity).

December 24-Month Study
Date: December 6, 2010

From: Water Resources Group, Salt Lake City
To: All Colorado River Annual Operating Plan (AOP) Recipients

Current Reservoir Status

Reservoir	Novemeber Inflow (unregulated) (acre-feet)	Percent of Average (%)	December 5 Midnight Elevation (feet)	Reservoir Storage (acre-feet)
Fontenelle	34,000	79	6489.77	247,000
Flaming Gorge	31,000	56	6023.85	3,127,000
Blue Mesa	27,000	86	7486.74	554,000
Navajo	17,000	50	6061.84	1,390,000
Powell	438,000	81	3629.59	14,807,000

Expected Operations

The operation of Lake Powell and Lake Mead in this December 2010 24-Month Study is pursuant to the December 2007 Record of Decision on Colorado River Interim Guidelines for Lower Basin Shortages and the Coordinated Operations of Lake Powell and Lake Mead (Interim Guidelines), and reflects the 2010 Annual Operating Plan (AOP) and draft 2011 AOP. Pursuant to the Interim Guidelines, the August 2010 24-Month Study projections of the January 1, 2011 system storage and reservoir water surface elevations set the operational tier for the coordinated operation of Lake Powell and Lake Mead during 2011.

The Lake Powell operational tier for water year 2011 is the Upper Elevation Balancing Tier. The Intentionally Created Surplus (ICS) Surplus condition is the criterion governing the operation of Lake Mead for calendar years 2010 and 2011.

Consistent with Section 6.B.4 of the Interim Guidelines, if the April 24-Month study projects the September 30 Lake Mead elevation to be below 1,075 feet and the September 30, Lake Powell elevation to be at or above 3,575 feet, the Secretary shall balance the contents of Mead and Powell but release not more than 9.0 maf. Consistent with this provision, the December 24-Month Study projects such an adjustment to occur in April, resulting in a water year release from Lake Powell of 9.0 maf.

Based on analysis of a range of inflow scenarios, the current probability of realizing an inflow volume that would trigger Equalization in 2011 is approximately 48 percent.

The Interim Guidelines are available for download at
http://www.usbr.gov/lc/region/programs/strategies/RecordofDecision.pdf.
The 2010 AOP is available for download at
http://www.usbr.gov/lc/region/g4000/AOP2010/AOP10.pdf.
The draft 2011 AOP is available for download at
http://www.usbr.gov/uc/water/rsvrs/ops/aop/AOP11_draft.pdf.

Fontenelle Reservoir – Inflows for the month of November were 34,000 acre-feet, or 79% of average. The reservoir elevation is 6490 feet above sea level and 66% of capacity. Current inflows are approximately 600cfs and reservoir releases are 900 cfs. Releases will likely be close to 900 cfs for the fall and winter months. The reservoir elevation will continue to decline through the fall and winter.

The Colorado Basin River Forecast Center forecast for water year 2011 (October 2010 to September 2011) shows inflows are expected to be 72% of average. Note that at this time of the year, there is considerable uncertainty in the water year forecast. Inflows over the next three months are forecasted to be below average: 27,000 acre-ft (81%), 24,000 acre-ft (77%), and 25,000 acre-ft (86%) for December, January, and February, respectively.

The next Fontenelle Working Group meeting is scheduled for April 21, 2011 at 10:00 am at the Seedskadee National Wildlife Refuge Visitor Center. The Fontenelle Working Group is an open public forum for information exchange between Reclamation and other parties associated with the operation of Fontenelle Reservoir.

Flaming Gorge Reservoir – November observed unregulated inflow into Flaming Gorge reservoir was 31,000 acre-feet (AF), or 56 percent of average inflow. The November end of month elevation was 6034.8 feet, which equates to 3.12 million acre-feet or 84 percent of live storage capacity. Releases out of Flaming Gorge are following a winter double peak fluctuation pattern with a daily average release rate of 1,150 cfs/day. It is anticipated that they will remain at this level until the end of January, when releases will be reduced to steady 800 cfs flows from the beginning of February until spring runoff occurs sometime in mid- to late-May 2011.

The next Flaming Gorge Working Group meeting is scheduled for April 26, 2011, at 7:00 p.m. in a location to be determined. The Flaming Gorge Working Group is an open public forum for information exchange between Reclamation and the stake holders of Flaming Gorge Dam. The public is encouraged to attend and comment on the operations and plans presented by Reclamation at these meetings. For more information on this group and these meetings please contact Ed Vidmar at 801-379-1182.

Aspinall Unit Reservoirs – November unregulated inflow into Blue Mesa Reservoir was 27,000 acre-feet or 86 percent of average. Precipitation during November was observed to be about 80 percent of average. The current inflow rate into Blue Mesa Reservoir is about 450 cfs while reservoir releases are averaging about 500 cfs. Blue Mesa's present elevation is 7486.74 feet, which corresponds to a storage content of about 556,000 acre-feet. The unregulated reservoir inflow into Blue Mesa Reservoir during water year 2009 was 725,000 acre-feet, or about 77 percent of average.

Releases from Crystal Dam are steady at about 500 cfs. This release rate is expected to stay at this level for the winter months. The Gunnison Diversion Tunnel was shut down for the season on November 1st, with exception of some small 50 to 80 cfs diversions taken bi-weekly for municipal water needs in Montrose, Colorado. River flows below the tunnel are essentially the same as releases from the Dam.

On December 1, 2010, the National Weather Service's River Forecasting Center issued its forecasted inflow into Blue Mesa for the next 3 months. The unregulated inflow forecast for December, January, and February is for 62,000 acre-feet, which is 87% of average for these months.

The next meeting of the "Aspinall Unit Working Group" will be held on Thursday January 20th in the Montrose, Colorado, starting at 1:00 PM. At this meeting, review of last summer and fall reservoir operations, and plans for this winter and next spring 2011 operations will be discussed. These meetings are open forum discussions on the Aspinall Unit reservoir operations with many interested groups participating. Anyone needing further information about these meetings should contact Dan Crabtree in the Grand Junction Area Office at (970) 248-0652.

Navajo Reservoir - As a result of forecasted cooler, wetter conditions in the San Juan River Basin, Reclamation decreased the release from Navajo Reservoir to 500 cfs on October 19, 2010. Reservoir releases are made for the authorized purposes of the Navajo Unit, and to attempt to maintain a target base flow through the endangered fish critical habitat reach of the San Juan River (Farmington to Lake Powell).

The San Juan River Basin Recovery Implementation Program recommends a target base flow of between 500 cfs and 1,000 cfs through the critical habitat area. The target base flow is calculated as the weekly average of gaged flows throughout the critical habitat area, therefore daily flows of less than 500 cfs may occur at some gages.

Pending significant changes in the weather and stream flow conditions, the reservoir release will likely remain at 500 cfs until next spring (2010).

Precipitation for the month of November in the San Juan River basin was about 60 percent of average. Unregulated inflow into Navajo Reservoir during the month of November was 17,200 acre-feet, or 50 percent of average. Currently, the daily reservoir inflow is averaging about 200 cfs. Diversions for NIIP have currently been shut down for

the winter. The reservoir water surface elevation is at 6061.84 feet, which corresponds to a storage content of about 1,371,000 acre-feet.

The next public meeting on Navajo Reservoir operations will be held on Tuesday, January 25, 2011 at 1:00 p.m. in Farmington, New Mexico. At this meeting, review of last summer and fall reservoir operations, and plans for this winter and spring 2011 operations will be discussed. These are open forum discussions on the operation of Navajo Reservoir with many interested groups participating. Anyone interested in the general operation of the reservoir is encouraged to attend. Please contact Pat Page in Reclamation's Durango, Colorado Office at (970) 385-6560 for information about these meetings or the daily operation of Navajo Reservoir.

Glen Canyon Dam / Lake Powell – During November 2010 the unregulated inflow to Lake Powell was 432 kaf (79% of average). This volume was about equal to the forecasted volume for November by the Colorado Basin River Forecast Center on November 1, 2010 which was 425 kaf (78% of average). Although the inflow to Lake Powell during November was near the level forecasted, the water surface elevation of Lake Powell at the end of November was 0.54 feet below what was projected in the November 24-Month Study. The November 24-Month Study projected that Lake Powell would end November at an elevation of 3630.85 feet above sea level. The elevation of Lake Powell at the end of the day on November 30, 2010 was 3630.31 feet above sea level. This 0.54 foot difference is equivalent to about 60,000 acre-feet of storage in Lake Powell. The end of month storage in Lake Powell for November 2010 was 14.888 maf which is 61.2% of the full capacity of 24.32 maf.

The release volume scheduled for December is 845 kaf which is equivalent to an average daily release rate of approximately 13,750 cfs. Daily fluctuations will likely peak near 16,000 cfs during the morning and afternoon and evening hours. Daily low releases will occur during the early morning hours (i.e. midnight to about 6:00 am) and will be about 8,500 cfs. The projected release volume for January is currently 865 kaf which is equivalent to an average daily release rate of approximately 14,050 cfs. The daily peak and low release rate in January will likely also range from 16,000 cfs to 8,500 cfs respectively.

In addition to the daily fluctuation pattern for power generation, the instantaneous releases from Glen Canyon Dam may also fluctuate somewhat to provide approximately 40 megawatts of system regulation. These instantaneous release adjustments maintain stable conditions within the electrical generation and transmission system and result in momentary release fluctuations within a range that is about 1100 cfs above or below the targeted release rate for a given hour of the day. These momentary fluctuations for regulation are very short lived and typically balance out over the hour. Spinning and non-spinning reserve generation is also maintained at Glen Canyon Dam. When an unanticipated electrical outage event occur within the electrical transmission system, this reserve generation at Glen Canyon Dam can be called upon up to a limit of 98 megawatts

(approximately 2,600 cfs of release) for a duration of up to 2 hours. Under normal circumstances, calls for reserve generation occur fairly infrequently and are for much less than the limit of 98 megawatts.

In August of 2010, the August 2010 24-Month Study Model was used to project the January 1, 2010 elevation of Lake Powell and Lake Mead under the most probable inflow scenario. Pursuant to the Interim Guidelines and based on this August projection, the operational tier for water year 2011 was selected to be the Upper Elevation Balancing Tier. Under the Upper Elevation Balancing Tier, there is a possibility that the annual release volume from Lake Powell could be 8.23 maf. There is also a possibility under this tier that Equalization or Balancing could occur in 2011 which would result in an annual release volume greater than 8.23 maf.

The possibility of Equalization or Balancing in 2011 is dependent on the end of water year 2011 reservoir conditions projected in the April 2011 24-Month Study under the most probable inflow scenario and with 8.23 maf projected for release from Lake Powell during water year 2011. For this reason it will not be known for certain whether Equalization or Balancing will occur in water year 2011 until April 2011. 24-Month Studies prior to April 2011 can project that Equalization or Balancing are likely to occur, but these projections are subject to change with changes in the forecasted hydrology of the Colorado River Basin. It is possible that a relatively small change in forecasted hydrology can have a large impact on the projected annual release volume.

The December 2010 24-Month Study with the most probable inflow and an 8.23 maf release does project that Balancing is likely to occur in 2011. For this reason, the projected most probable annual release volume for water year 2011 in the December 24-Month Study is 9.00 maf. Given the current range of uncertainty of the forecasted hydrology for water year 2011, it is possible that Equalization could occur in water year 2011 which would result if the annual release being greater than about 10.7 maf. Analysis of the probable range of inflows that could occur during water year 2011 indicate that the probability of Equalization occurring in 2011 is currently about 48%.

The current unregulated inflow forecast for Lake Powell projects the most probable unregulated inflow volumes for the next 3 months as follows: December-360 kaf (83% of average); January-350 kaf (86% of average); February-350 kaf (83% of average). The outlook for water year 2011, incorporating this new forecast, projects the most probable unregulated inflow volume to Lake Powell during water year 2011 to be 9.66 maf (80% of average). It is possible that the unregulated volume of inflow to Lake Powell in water year 2011 will be greater than or less than the most probable projection. The probable range of unregulated inflow volumes to Lake Powell during water year 2011 is currently projected to be as dry as 4.5 maf (37% of average) to as wet as 15.8 maf (131% of average).

Upper Colorado River Basin Hydrology

In the Upper Colorado River Basin during water year 2010, the overall precipitation accumulated through September 30, 2009 was approximately 90% of average based on the 30 year average for the period from 1971 through 2000. For Water Year 2010 thus far, the estimated monthly precipitation within the Upper Colorado River Basin (above Lake Powell) as a percentage of average has been: (October - 135%, November - 95%).

The Climate Prediction Center outlook (dated November 18, 2010) for temperature over the next 3 months indicates that temperatures in the Upper Colorado River Basin are expected to be above average while precipitation over the next 3 months is projected to be near average.

Upper Colorado River Basin Drought

The Upper Colorado River Basin continues to experience a protracted multi-year drought. Since 1999, inflow to Lake Powell has been below average in every year except water years 2005 and 2008. In the summer of 1999, Lake Powell was close to full with reservoir storage at 23.5 million acre-feet, or 97 percent of capacity. During the next 5 years (2000 through 2004) unregulated inflow to Lake Powell was well below average. This resulted in Lake Powell storage decreasing during this period to 8.0 million acre-feet (33 percent of capacity) which occurred on April 8, 2005. During 2005, 2008 and 2009, drought conditions eased somewhat with net gains in storage to Lake Powell. As of December 6, 2010 the storage in Lake Powell was approximately 14.79 million acre-feet (60.8 % of capacity) which is below desired levels. The overall reservoir storage in the Colorado River Basin as of December 6, 2010 is approximately 32.29 million acre-feet (54.3 % of capacity).

January 24-Month Study
Date: January , 2011

From: Water Resources Group, Salt Lake City
To: All Colorado River Annual Operating Plan (AOP) Recipients

Current Reservoir Status

Reservoir	December Inflow (unregulated) (acre-feet)	Percent of Average (%)	January 10 Midnight Elevation (feet)	Reservoir Storage (acre-feet)
Fontenelle	37,000	113	6485.99	202,000
Flaming Gorge	46,000	116	6023.57	3,108,000
Blue Mesa	30,000	116	7486.62	555,000
Navajo	23,000	92	6060.55	1,355,000
Powell	417,000	96	3624.66	14,263,000

Expected Operations

The operation of Lake Powell and Lake Mead in this January 2011 24-Month Study is pursuant to the December 2007 Record of Decision on Colorado River Interim Guidelines for Lower Basin Shortages and the Coordinated Operations of Lake Powell and Lake Mead (Interim Guidelines), and reflects the draft 2011 AOP. Pursuant to the Interim Guidelines, the Lake Powell operational tier for water year 2011 is the Upper Elevation Balancing Tier. The Intentionally Created Surplus (ICS) Surplus condition is the criterion governing the operation of Lake Mead for calendar year 2011.

Consistent with Section 6.B.3 of the Interim Guidelines, if the April 24-Month study projects the September 30 Lake Powell elevation to be greater than the 2011 Equalization elevation of 3,643.0 feet with an annual release from Lake Powell of 8.23 maf, the Equalization Tier will govern operations of Lake Powell for the remainder of the water year. Consistent with this provision, the January 24-Month Study projects an adjustment to the Equalization Tier will occur in April. If such an adjustment occurs, the water year release volume from Lake Powell is projected to be 11.367 maf.

Based on analysis of a range of inflow scenarios, the current probability of realizing an inflow volume that would trigger Equalization in 2011 is approximately 76 percent.

The Interim Guidelines are available for download at http://www.usbr.gov/lc/region/programs/strategies/RecordofDecision.pdf.

The draft 2011 AOP is available for download at http://www.usbr.gov/uc/water/rsvrs/ops/aop/AOP11_draft.pdf.

Fontenelle Reservoir – Inflows for the month of December were 37,000 acre-feet, or 113% of average. The reservoir elevation is 6487 feet above sea level and 61% of capacity. Current inflows are approximately 560 cfs and reservoir releases are 900 cfs. Releases will likely be close to 900 cfs for the remainder of the winter months. The reservoir elevation will continue to decline until spring runoff begins to fill the reservoir.

The Colorado Basin River Forecast Center and Natural Resources Conservation Service have issued the joint water supply forecast for the 2011 spring runoff. The January official forecast for the April to July runoff period is 870 kaf (101%). Inflows over the next three months are forecasted to be slightly above average: 31,000 acre-ft (103%), 32,000 acre-ft (114%), and 52,000 acre-ft (100%) for January, February, and March respectively.

The next Fontenelle Working Group meeting is scheduled for April 21, 2011 at 10:00 am at the Seedskadee National Wildlife Refuge Visitor Center. The Fontenelle Working Group is an open public forum for information exchange between Reclamation and other parties associated with the operation of Fontenelle Reservoir.

Flaming Gorge Reservoir – December observed unregulated inflow into Flaming Gorge reservoir was 45,000 acre-feet (AF), or 116 percent of average inflow. The December end of month elevation was 6023.6 feet, which equates to 3.10 million acre-feet or 83 percent of live storage capacity. Releases out of Flaming Gorge are following a winter double peak fluctuation pattern with a daily average release rate of 1,150 cfs/day. It is anticipated that they will increase to 1,200 cfs/day beginning February 1 and continue until spring runoff occurs sometime in mid- to late-May 2011. Observed runoff will determine releases during the spring period.

The next Flaming Gorge Working Group meeting is scheduled for April 26, 2011, at 7:00 p.m. in a location to be determined. The Flaming Gorge Working Group is an open public forum for information exchange between Reclamation and the stake holders of Flaming Gorge Dam. The public is encouraged to attend and comment on the operations and plans presented by Reclamation at these meetings. For more information on this group and these meetings please contact Ed Vidmar at 801-379-1182.

Aspinall Unit Reservoirs – December unregulated inflow into Blue Mesa Reservoir was 30,000 acre-feet or 116 percent of average. Precipitation during December was observed to be about 194 percent of average. The Gunnison River basin snowpack as of January 11th was averaging about 146 percent. The current inflow rate into Blue Mesa Reservoir is about 470 cfs while reservoir releases are averaging about 435 cfs. The present

reservoir elevation is 7486.62 feet, which corresponds to a storage content of about 555,000 acre-feet.

Releases from Crystal Dam are steady at 500 cfs. Reservoir releases will most likely change as hydrologic conditions warrant, primarily as we respond to changes in forecasted inflows.

The first Water Supply Forecast for Water Year 2011 has been issued and the April through July unregulated inflow is forecasted to be at 810,000 acre-feet (113% of average). Based on this forecast, Blue Mesa Reservoir is projected to fill by July 2011.

The next meeting of the "Aspinall Unit Working Group" will be held on Thursday January 20st in the Montrose, Colorado, starting at 1:00 PM. At this meeting, review of last summer and fall reservoir operations, and plans for this winter and next spring 2011 operations will be discussed. These meetings are open forum discussions on the Aspinall Unit reservoir operations with many interested groups participating. Anyone needing further information about these meetings should contact Dan Crabtree in the Grand Junction Area Office at (970) 248-0652.

Navajo Reservoir - As a result of forecasted cooler, wetter conditions in the San Juan River Basin, Reclamation decreased the release from Navajo Reservoir to 500 cfs on October 19, 2010. Reservoir releases are made for the authorized purposes of the Navajo Unit, and to attempt to maintain a target base flow through the endangered fish critical habitat reach of the San Juan River (Farmington to Lake Powell).

The San Juan River Basin Recovery Implementation Program recommends a target base flow of between 500 cfs and 1,000 cfs through the critical habitat area. The target base flow is calculated as the weekly average of gaged flows throughout the critical habitat area, therefore daily flows of less than 500 cfs may occur at some gages.

Pending significant changes in the weather and stream flow conditions, the reservoir release will likely remain at 500 cfs until next spring (2011).

Precipitation for the month of December in the San Juan River basin was about 196 percent of average. Unregulated inflow into Navajo Reservoir during the month of December was 23,000 acre-feet, or 92 percent of average. Currently, the daily reservoir inflow is averaging about 200 cfs. Diversions for NIIP have currently been shut down for the winter. The reservoir water surface elevation is at 6060.55 feet, which corresponds to a storage content of about 1,355,000 acre-feet.

A public meeting on Navajo Reservoir operations will be held on Tuesday, January 25, 2011 at 1:00 p.m. in Farmington, New Mexico. At this meeting, review of last summer and fall reservoir operations, and plans for this winter and spring 2011 operations will be discussed. These are open forum discussions on the operation of Navajo Reservoir with

many interested groups participating. Anyone interested in the general operation of the reservoir is encouraged to attend. Please contact Pat Page in Reclamation's Durango, Colorado Office at (970) 385-6560 for information about these meetings or the daily operation of Navajo Reservoir.

Glen Canyon Dam / Lake Powell – During December 2010 the unregulated inflow to Lake Powell was 417 kaf (96% of average). This was 57 kaf above the volume forecasted by the Colorado Basin River Forecast Center (CBRFC) on December 1, 2010 which was 360 kaf (83% of average). The elevation of Lake Powell at the end of the day on December 31, 2010 was 3626.54 feet above sea level (73.46 feet from full pool) which corresponds to a live storage content of 14.44 maf (59.5% of capacity).

During the last half of December, precipitation within the Upper Colorado River Basin was well above average and the snowpack conditions have increased significantly. On December 17, 2010 the snowpack above Lake Powell was estimated to be 102% of average. By December 31, 2010 the snowpack conditions above Lake Powell had increased to an estimated 151% of average. Precipitation above Lake Powell for the first 3 months of water year 2011 has been well above average at nearly 150% of average. Based on these conditions and projected climate conditions over the next several months, the CBRFC has issued the Final Water Supply Forecast (April through July 2011 forecasted unregulated inflow volume) for Lake Powell that is well above average at 9.5 maf which is 120% of average. This forecast translates into an increase to the expected inflow to Lake Powell for water year 2011 that is more than 3 million acre-feet more than what was projected one month ago.

Operation of Glen Canyon Dam during January 2011 has been modified based on this new forecast. On Sunday January 9, 2011, releases from Glen Canyon Dam were increased to an average daily release volume of approximately 34,000 acre-feet which translates to an average daily release of 17,100 cfs. Releases are scheduled to peak for power generation during the afternoon hours for the remainder of January to 20,500 cfs. Releases during the early morning hours are approximately 12,500 cfs. The release volume for February is projected to be 981,000 kaf which the estimated capacity of Glen Canyon Powerplant under the scheduled maintenance unit outage plan with an allowance of capacity to provide spinning reserves and regulation. It is anticipated that fluctuations for power generation will be minimal in February and the estimated release rate will likely be approximately 17,600 cfs.

In addition to the daily fluctuation pattern for power generation, the instantaneous releases from Glen Canyon Dam may also fluctuate somewhat to provide approximately 40 megawatts of system regulation. These instantaneous releases adjustments maintain stable conditions within the electrical generation and transmission system and result in momentary release fluctuations within a range that is about 1100 cfs above or below the targeted release rate for a given hour of the day. These momentary fluctuations for regulation are very short lived and typically balance out over the hour. Spinning and non-spinning reserve generation is also maintained at Glen Canyon Dam. When an unanticipated electrical outage event occur within the electrical transmission system, this

reserve generation at Glen Canyon Dam can be called upon up to a limit of 98 megawatts (approximately 2,600 cfs of release) for a duration of up to 2 hours. Under normal circumstances, calls for reserve generation occur fairly infrequently and are for much less than the limit of 98 megawatts.

In August of 2010, the August 2010 24-Month Study Model was used to project the January 1, 2010 elevation of Lake Powell and Lake Mead under the most probable inflow scenario. Pursuant to the Interim Guidelines and based on this August projection, the operational tier for water year 2011 was determined to be the Upper Elevation Balancing Tier. Under the Upper Elevation Balancing Tier, there is a possibility that the annual release volume from Lake Powell could be 8.23 maf. There is also a possibility under this tier that Equalization or Balancing could occur in 2011 which would result in an annual release volume greater than 8.23 maf.

The possibility of Equalization or Balancing in 2011 is dependent on the end of water year 2011 reservoir conditions projected in the April 2011 24-Month Study under the most probable inflow scenario and with 8.23 maf projected for release from Lake Powell during water year 2011. For this reason it will not be known for certain whether Equalization or Balancing will occur in water year 2011 until April 2011. 24-Month Studies prior to April 2011 can project that Equalization or Balancing are likely to occur, but these projections are subject to change with changes in the forecasted hydrology of the Colorado River Basin. It is possible that a relatively small change in forecasted hydrology can have a large impact on the projected annual release volume.

The January 2011 24-Month Study with the most probable inflow scenario for water year 2011 projects that Equalization is likely to occur in 2011. For this reason, the projected most probable annual release volume for water year 2011 in the January 24-Month Study is 11.367 maf. Given the current range of uncertainty of the forecasted hydrology for water year 2011, it is possible that Balancing could also occur in water year 2011 which would result if the annual release being 9.0 maf. Each month the 24-Month Study is updated to reflect the most probable inflow scenario which is based on the most recent forecast from the Colorado River Basin Forecast Center (CBRFC). Analysis of the probable range of inflows that could occur during water year 2011 indicates that the probability of realizing an inflow volume that would trigger Equalization in 2011 is currently about 76%. This probability will be updated again during the first part of February 2011.

The unregulated inflow forecast for Lake Powell over the next 3 months is as follows: January-380 kaf (94% of average); February-380 kaf (90% of average); March-670 kaf (101% of average). The outlook for water year 2011, incorporating this new forecast and the January Final Water Supply Forecast, the most probable unregulated inflow volume to Lake Powell during water year 2011 is now 13.19 maf (110% of average). It is possible that the unregulated volume of inflow to Lake Powell in water year 2011 will be greater than or less than the most probable projection. The probable range of unregulated inflow volumes to Lake Powell during water year 2011 is currently projected to be as dry as 8.9 maf (74% of average) to as wet as 18.6 maf (154% of average).

Upper Colorado River Basin Hydrology

In the Upper Colorado River Basin during water year 2010, the overall precipitation accumulated through September 30, 2010 was approximately 90% of average based on the 30 year average for the period from 1971 through 2000. For Water Year 2011 thus far, the estimated monthly precipitation within the Upper Colorado River Basin (above Lake Powell) as a percentage of average has been: (October - 135%, November - 95%, December -230%)

The Climate Prediction Center outlook (dated December 16, 2010) for temperature over the next 3 months indicates that temperatures in the Upper Colorado River Basin are expected to be near average while precipitation over the next 3 months is also projected to be near average.

Upper Colorado River Basin Drought

The Upper Colorado River Basin continues to experience a protracted multi-year drought. Since 1999, inflow to Lake Powell has been below average in every year except water years 2005 and 2008. In the summer of 1999, Lake Powell was close to full with reservoir storage at 23.5 million acre-feet, or 97 percent of capacity. During the next 5 years (2000 through 2004) unregulated inflow to Lake Powell was well below average. This resulted in Lake Powell storage decreasing during this period to 8.0 million acre-feet (33 percent of capacity) which occurred on April 8, 2005. During 2005, 2008 and 2009, drought conditions eased somewhat with net gains in storage to Lake Powell. As of January 10, 2011 the storage in Lake Powell was approximately 14.26 million acre-feet (58.6 % of capacity) which is below desired levels. The overall reservoir storage in the Colorado River Basin as of January 10, 2011 is approximately 32.29 million acre-feet (54.3 % of capacity).

RECLAMATION
Managing Water in the West

The operation of Lake Powell and Lake Mead in this February 2011 24-Month Study is pursuant to the December 2007 Record of Decision on Colorado River Interim Guidelines for Lower Basin Shortages and the Coordinated Operations of Lake Powell and Lake Mead (Interim Guidelines), and reflects the 2011 Annual Operating Plan (AOP). Pursuant to the Interim Guidelines, the Lake Powell operational tier for water year 2011 is the Upper Elevation Balancing Tier. The Intentionally Created Surplus (ICS) Surplus condition is the criterion governing the operation of Lake Mead for calendar year 2011.

Consistent with Section 6.B.3 of the Interim Guidelines, if the April 24-Month study projects the September 30 Lake Powell elevation to be greater than the 2011 Equalization elevation of 3,643.0 feet with an annual release from Lake Powell of 8.23 maf, the Equalization Tier will govern operations of Lake Powell for the remainder of the water year. Consistent with this provision, the February 24-Month Study projects an adjustment to the Equalization Tier will occur in April. If such an adjustment occurs, the water year release volume from Lake Powell is projected to be 11.48 maf.

Based on analysis of a range of inflow scenarios, the current probability of realizing an inflow volume that would trigger Equalization in 2011 is approximately 71 percent.

The Interim Guidelines are available for download at http://www.usbr.gov/lc/region/programs/strategies/RecordofDecision.pdf.
The 2011 AOP is available for download at http://www.usbr.gov/uc/water/rsvrs/ops/aop/AOP11_final.pdf.

Current runoff projections into Lake Powell are provided by the National Weather Service's Colorado Basin River Forecast Center and are as follows: Observed unregulated inflow into Lake Powell for the month of January 2011 was 0.380 maf or 94% of the 30-year average. The forecast for February 2011 unregulated inflow into Lake Powell is 0.350 maf or 83% of the 30-year average. Forecasted 2011 April through July unregulated inflow is 9.00 maf or 113% of average.

In this study, the Calendar Year (CY) 2011 diversion for Metropolitan Water District of Southern California (MWD) is forecasted to be 0.914 maf. The CY 2011 diversion for the Central Arizona Project (CAP) is forecasted to be 1.536 maf. Consumptive use for Nevada above Hoover is forecasted to be 0.292 maf for CY 2011.

Due to declining Lake Mead elevations, Hoover's generator capacity is adjusted based on estimated effective capacity and plant availability. The estimated effective capacity is based on projected Lake Mead elevations. Unit capacity tests will be performed as the lake elevation changes in 2-foot increments. This study reflects these changes in the projections.

Hoover, Davis, and Parker historical gross energy figures come from PO&M reports provided by the Lower Colorado Region's Power Management Office, Bureau of Reclamation, Boulder City, Nevada. Questions regarding these historical energy numbers can be directed to Larry Karr at (702) 293-8094.

March 24-Month Study
Date: March 9, 2011

From: Water Resources Group, Salt Lake City
To: All Colorado River Annual Operating Plan (AOP) Recipients

Current Reservoir Status

Reservoir	February Inflow (unregulated) (acre-feet)	Percent of Average (%)	March 8 Midnight Elevation (feet)	Reservoir Storage (acre-feet)
Fontenelle	26,000	90	6476.99	151,000
Flaming Gorge	36,000	72	6023.55	3,107,000
Blue Mesa	21,000	92	7482.16	522,000
Navajo	17,600	58	6058.19	1,325,000
Powell	318,000	76	3613.74	13,110,000

Expected Operations

The operation of Lake Powell and Lake Mead in this March 2011 24-Month Study is pursuant to the December 2007 Record of Decision on Colorado River Interim Guidelines for Lower Basin Shortages and the Coordinated Operations of Lake Powell and Lake Mead (Interim Guidelines), and reflects the 2011 Annual Operating Plan (AOP). Pursuant to the Interim Guidelines, the Lake Powell operational tier for water year 2011 is the Upper Elevation Balancing Tier. The Intentionally Created Surplus (ICS) Surplus condition is the criterion governing the operation of Lake Mead for calendar year 2011.

Consistent with Section 6.B.3 of the Interim Guidelines, if the April 24-Month study projects the September 30 Lake Powell elevation to be greater than the 2011 Equalization elevation of 3,643.0 feet with an annual release from Lake Powell of 8.23 maf, the Equalization Tier will govern operations of Lake Powell for the remainder of the water year. Consistent with this provision, the March 24-Month Study projects an adjustment to the Equalization Tier will occur in April. If such an adjustment occurs, the water year release volume from Lake Powell is projected to be 11.63 maf.

Reclamation estimates that an April adjustment to the Equalization Tier is very likely to occur in 2011. For this adjustment to not occur, the April-July inflow forecast volume would have to decrease from the current level (9.2 maf) to approximately 7.1 maf which would be a decrease of about 2.1 maf. In the past 32 years, only once has the forecast decreased by at least this volume from one month to the next. For this reason, Reclamation estimates the

probability of an April adjustment to the Equalization Tier in 2011 to be approximately 97 percent.

The Interim Guidelines are available for download at http://www.usbr.gov/lc/region/programs/strategies/RecordofDecision.pdf.
The 2011 AOP is available for download at http://www.usbr.gov/uc/water/rsvrs/ops/aop/AOP11_final.pdf.

Fontenelle Reservoir – Inflows for the month of February were 26,000 acre-feet, or 90% of average. The reservoir elevation is 6478 feet above sea level and 45% of capacity. Current inflows are approximately 450 cfs and reservoir releases are 900 cfs. Releases will likely be close to 900 cfs for the remainder of the winter months. The reservoir elevation will continue to decline until spring runoff begins to fill the reservoir.

The Colorado Basin River Forecast Center and Natural Resources Conservation Service have issued the joint water supply forecast for the 2011 spring runoff. The March official forecast for the April to July runoff period is 870 kaf (101%). Given this forecasted inflow, the reservoir is projected to fill late this summer and releases of up to approximately 4,500 cfs will likely be required for a month to safely route the inflow to the reservoir. Note that these projections are provisional and subject to change as forecasts are updated and actual inflows are realized. Inflows over the next three months are forecasted to be near average: 45,000 acre-ft (87%), 105,000 acre-ft (113%), and 230,000 acre-ft (117%) for March, April, and May respectively. Basin snowpack is currently 113% of the average for this time of year.

The next Fontenelle Working Group meeting is scheduled for April 21, 2011 at 10:00 am at the Seedskadee National Wildlife Refuge Visitor Center. The Fontenelle Working Group is an open public forum for information exchange between Reclamation and other parties associated with the operation of Fontenelle Reservoir.

Flaming Gorge Reservoir – February observed unregulated inflow into Flaming Gorge reservoir was 36,000 acre-feet (AF), or 72 percent of average inflow. The February end of month elevation was 6023.5 feet, which equates to 3.10 million acre-feet or 83 percent of live storage capacity. Releases out of Flaming Gorge are following a single peak fluctuation pattern with a daily average release rate of 950 cfs/day. Releases are scheduled to increase to an average daily release rate of 1,100 cfs/day beginning April 1, 2011. The hourly fluctuation pattern is still to be determined. Observed runoff, current conditions and changing forecasts will determine releases during the spring period.

The next Flaming Gorge Working Group meeting is scheduled for April 26, 2011, at 7:00 p.m. at the Western Park Convention Center, 302 East 200 South, Vernal, Utah. The Flaming Gorge Working Group is an open public forum for information exchange between Reclamation and the stake holders of Flaming Gorge Dam. The public is encouraged to attend and comment on the operations and plans presented by Reclamation

at these meetings. For more information on this group and these meetings please contact Heather Patno at 801-524-3883 or Ed Vidmar at 801-379-1182.

Aspinall Unit Reservoirs – February unregulated inflow into Blue Mesa Reservoir was 21,000 acre-feet or 92 percent of average. On March 4, 2011 the basin snowpack was 121 percent of average. Precipitation during February was 105 percent of average. The current inflow rate into Blue Mesa Reservoir is about 550 cfs while reservoir releases are averaging about 525 cfs. The reservoir elevation is currently at 7482.95 feet, which corresponds to a storage content of about 528,000 acre-feet. This elevation is about 2 feet lower than that of last year's March elevation.

The latest Water Supply Forecast for Water Year 2011 has been issued and the April through July unregulated inflow is forecasted to be at 800,000 acre-feet (111% of normal), this is a increase of 25,000 acre-feet from last month's forecast. If this forecast holds through May 1st, the Black Canyon Water Right would call for a one day peak flow of 6,370 cfs. At this time Reclamation plans to continue to operate the Aspinall Unit to allow the water right to be met. Based on this forecast and the combination of meeting the Black Canyon Water this coming spring, Blue Mesa Reservoir is projected to fill this runoff season. The projected fill is calculated to be about 7516.5 feet, or about 3.0 feet short of top of active conservation pool.

Releases from Crystal are currently set at 1100 cfs. The Gunnison Diversion Tunnel is currently shut down for the season, with the exception of some small 50 to 100 cfs diversions taken bi-weekly for municipal water needs in Montrose, Colorado. The tunnel is expected to reopen for irrigation season sometime during the last week of March.

Reservoir releases are likely to change during March into May as we respond to changing forecasts and runoff conditions.

The next meeting of the "Aspinall Unit Working Group" will be held on Thursday, April 21, 2011 starting at 1:00 PM in Reclamation's Grand Junction Office. At this meeting, review of this winter's reservoir operations, and plans for this spring and summer operations will be discussed. These meetings are open forum discussions on the Aspinall Unit reservoir operations with many interested groups participating. Anyone needing further information about these meetings should contact Dan Crabtree in the Grand Junction Area Office at (970) 248-0652.

Navajo Reservoir - As a result of forecasted cooler, wetter conditions in the San Juan River Basin, Reclamation decreased the release from Navajo Reservoir to 500 cfs on October 19, 2010. Reservoir releases are made for the authorized purposes of the Navajo Unit, and to attempt to maintain a target base flow through the endangered fish critical habitat reach of the San Juan River (Farmington to Lake Powell).

The San Juan River Basin Recovery Implementation Program recommends a target base flow of between 500 cfs and 1,000 cfs through the critical habitat area. The target base flow is calculated as the weekly average of gaged flows throughout the critical habitat area, therefore daily flows of less than 500 cfs may occur at some gages.

The current San Juan River basin snowpack is 93% of average snow water equivalent (SWE). For the Animas River Basin it is 103%. Pending significant changes in the weather and stream flow conditions, the reservoir release will likely remain at 500 cfs through this spring (2011).

Precipitation for the month of January in the San Juan River basin was about 75% of average as compared to December's 220% and January's 20 % of average. Unregulated inflow into Navajo Reservoir during the month of February was 17,600 acre-feet, or 58 percent of average. Currently, the daily reservoir inflow is averaging about 300 cfs. Diversions for NIIP have currently been shut down for the winter. The reservoir water surface elevation is at 6058.29 feet, which corresponds to a storage content of about 1,326,000 acre-feet.

A public meeting on Navajo Reservoir operations was held on Wednesday, April 20, 2011 in Farmington, New Mexico. At this meeting, review of this winter's reservoir operations, and plans for this spring and summer operations will be discussed. These are open forum discussions on the operation of Navajo Reservoir with many interested groups participating. Anyone interested in the general operation of the reservoir is encouraged to attend. Please contact Pat Page in Reclamation's Durango, Colorado Office at (970) 385-6560 for information about these meetings or the daily operation of Navajo Reservoir. To view minutes from the last Navajo Operations Meeting, click on: Meeting Notes.

Glen Canyon Dam / Lake Powell – The unregulated inflow volume to Lake Powell for February 2011 was 317 thousand acre-feet (kaf) which was 75% of average. The monthly volume of unregulated inflow to Lake Powell that was forecasted at the beginning of February by the Colorado River Forecast Center (CBRFC) was 350 kaf (83% of average).

Releases from Glen Canyon Dam are currently (as of March 8, 2011) averaging about 15,700 cubic feet per second (cfs) and this is well above the rate of inflow that Lake Powell is receiving. The elevation of Lake Powell is declining and is projected to decline by about 3.5 feet during March 2011 to approximately 3610.2 feet above sea level. When the snowpack begins to melt and inflows increase, which is projected to occur in late March or early April, the elevation of Lake Powell will begin to rise. It is currently projected that by late summer the elevation of Lake Powell will rebound to a peak elevation for water year 2011 of approximately 3638 feet above sea level. This elevation corresponds to a live storage in Lake Powell of approximately 15.8 million acre-feet (maf) which is 65% of capacity. The peak elevation of Lake Powell for water year 2011

will depend largely upon the inflow volume that Lake Powell receives over the next 4 months.

Current Dam Operations

The release volume scheduled for March is 1034 kaf. During the first 18 days of March, daily releases will fluctuate for power production between an afternoon peak of approximately 16,000 cfs and an early morning low release of approximately 14,500 cfs. On or about March 19, 2011, Glen Canyon Powerplant Unit 8 will return to service and 6 of the 8 generators will be available for power generation. When this occurs, daily fluctuations will increase such that afternoon peak releases will be approximately 19,600 cfs and early morning low releases will be approximately 14,000 cfs. This fluctuation pattern will likely remain in place until April 4, 2011. On April 4, 2011, Glen Canyon Powerplant Units 3 and 4 will be taken out of service for approximately 6 weeks for annual maintenance. At that time, releases from Glen Canyon Dam will likely be steady at approximately 16,000 cfs and will be maintained at that level to the end of April. The projected release volume for April, 2011 is 966 kaf.

In addition to daily operations that may or may not include daily fluctuation patterns for load following power generation, the instantaneous releases from Glen Canyon Dam may also fluctuate somewhat to provide approximately 40 megawatts of system regulation. These instantaneous releases adjustments maintain stable conditions within the electrical generation and transmission system and result in momentary release fluctuations within a range that is about 1100 cfs above or below the targeted release rate for a given hour of the day. These momentary fluctuations for regulation are very short lived and typically balance out over the hour. Spinning and non-spinning reserve generation can also occur at Glen Canyon Dam. When an unanticipated electrical outage event occurs within the electrical transmission system, reserve generation at Glen Canyon Dam can be called upon up to a maximum of 98 megawatts (approximately 2,600 cfs of release) for a duration of up to 2 hours. Under normal circumstances, calls for reserve generation occur fairly infrequently and are for much less than the required 98 megawatts.

Annual Operations-Coordinated Operation of Lake Mead and Lake Powell under Interim Guidelines for Water Year 2011

In August of 2010, the 24-Month Study model projected the January 1, 2010 elevation of Lake Powell and Lake Mead under the most probable inflow scenario. Pursuant to the December 2007 Record of Decision on Colorado River Interim Guidelines for Lower Basin Shortages and the Coordinated Operations of Lake Powell and Lake Mead (Interim Guidelines) and based on this August projection, the operational tier for water year 2011 was selected to be the Upper Elevation Balancing Tier. Under this operational tier, there is a possibility that the annual release volume from Lake Powell could be as low as 8.23 maf and there is also a possibility under this tier that Equalization or Balancing could occur which would result in an annual release volume greater than 8.23 maf.

For water year 2011, the possibility of Equalization or Balancing will dependent on the reservoir conditions of Lake Powell and Lake Mead that are projected for the end of water year in the April 24-Month Study. For this reason it will not be known for certain whether Equalization or Balancing will occur in water year 2011 until April. 24-Month Studies prior to April may project annual release volumes that reflect Equalization or Balancing, but these projections are preliminary and subject to change until April. In April, it will be know whether Equalization or Balancing will occur in water year 2011. It is possible that relatively small changes to the inflow forecast can have a large impact on the projected annual release volume.

Current Inflow Forecasts and Model Projections

Snowpack conditions above Lake Powell have persisted to be above average since late December 2010. The overall snowpack above Lake Powell on March 8, 2011 was 121% of average. The current Water Supply forecast for Lake Powell (April through July Unregulated Inflow Volume) is 9.2 maf (116% of average) and this forecast was issued by the CBRFC on March 3, 2011.

The unregulated inflow forecast for Lake Powell over the next 3 months is as follows: March-500 kaf (75% of average); April-1,100 kaf (112% of average) and May-2,900 kaf (126% of average). Incorporating these new forecasts with the current Water Supply forecast, the projected unregulated inflow volume to Lake Powell during water year 2011 is now 12.68 maf (105% of average). This is referred to as the current Most Probable water year unregulated inflow projection and there is a 50% chance that the actual unregulated inflow volume in water year 2011 will be greater than this projected volume. There is also a 50% chance that the actual unregulated inflow volume will be less than this volume. The current Minimum Probable water year unregulated inflow projection for water year 2011 (i.e. volume likely to be exceeded 90% of the time) is 9.7 maf (81% of average). The current Maximum Probable water year unregulated inflow projection for water year 2011 (i.e. volume likely to be exceeded 10% of the time) is 16.0 maf (133% of average).

The March 2011 24-Month Study, with the Most Probable water year unregulated inflow projection, projects that Equalization is likely to occur in 2011. The annual release volume from Lake Powell is projected for water year 2011 to be 11.63 maf. While it is still possible that Equalization will not occur in 2011, the probability that Equalization will occur is quite high. Reclamation estimates the probability that Equalization will be indicated in the April 24-month study to be about 97%.

For Equalization not to occur in 2011, the Water Supply forecast issued in April would have to be about 7.0 maf or less. Given that the current (March) Water Supply forecast is 9.2 maf, this forecast would have to drop by at least 2.2 maf in just one month. In the past 32 years that the CBRFC has been developing the Water Supply forecast for Lake Powell, there has only been one occurrence when the March Water Supply forecast decreased by more than 2.0 maf between March and April and this was in 2004 when the decrease was 2.5 maf.

Upper Colorado River Basin Hydrology

In the Upper Colorado River Basin during water year 2010, the overall precipitation accumulated through September 30, 2010 was approximately 90% of average based on the 30 year average for the period from 1971 through 2000. For Water Year 2011 thus far, the estimated monthly precipitation within the Upper Colorado River Basin (above Lake Powell) as a percentage of average has been: (October - 135%, November - 95%, December - 230%, January - 50%, February - 105%)

The Climate Prediction Center outlook (dated February 17, 2010) for temperature over the next 3 months indicates that temperatures in the Upper Colorado River Basin are expected to be above average while precipitation over the next 3 months is also projected to be below average.

Upper Colorado River Basin Drought

The Upper Colorado River Basin continues to experience a protracted multi-year drought. Since 1999, inflow to Lake Powell has been below average in every year except water years 2005 and 2008. In the summer of 1999, Lake Powell was close to full with reservoir storage at 23.5 million acre-feet, or 97 percent of capacity. During the next 5 years (2000 through 2004) unregulated inflow to Lake Powell was well below average. This resulted in Lake Powell storage decreasing during this period to 8.0 million acre-feet (33 percent of capacity) which occurred on April 8, 2005. During 2005, 2008 and 2009, drought conditions eased somewhat with net gains in storage to Lake Powell. As of March 7, 2011 the storage in Lake Powell was approximately 13.12 million acre-feet (53.9 % of capacity) which is below desired levels. The overall reservoir storage in the Colorado River Basin as of March 7, 2011 is approximately 31.76 million acre-feet (53.4 % of capacity).

May 24-Month Study
Date: May 11, 2011

From: Water Resources Group, Salt Lake City
To: All Colorado River Annual Operating Plan (AOP) Recipients

Current Reservoir Status

Reservoir	April Inflow (unregulated) (acre-feet)	Percent of Average (%)	May 10 Midnight Elevation (feet)	Reservoir Storage (acre-feet)
Fontenelle	92,000	99	6467.30	108,000
Flaming Gorge	159,000	101	6022.69	3,076,000
Blue Mesa	77,000	103	7475.15	471,000
Navajo	115,000	68	6061.42	1,366,000
Powell	980,000	100	3613.04	13,039,000

Expected Operations

The operation of Lake Powell and Lake Mead in this May 2011 24-Month Study is pursuant to the December 2007 Record of Decision on Colorado River Interim Guidelines for Lower Basin Shortages and the Coordinated Operations of Lake Powell and Lake Mead (Interim Guidelines), and reflects the 2011 Annual Operating Plan (AOP). Pursuant to the Interim Guidelines, the Lake Powell operational tier for water year 2011 is the Upper Elevation Balancing Tier. The Intentionally Created Surplus (ICS) Surplus condition is the criterion governing the operation of Lake Mead for calendar year 2011.

The April 2011 24-Month study projected the September 30 Lake Powell elevation to be greater than the 2011 Equalization elevation of 3,643.0 feet with an annual release from Lake Powell of 8.23 maf. Consistent with Section 6.B.3 of the Interim Guidelines, the Equalization Tier governs operations of Lake Powell for the remainder of the water year.

The May 24-Month Study projects a Lake Powell annual release volume of 12.46 maf; however, the projected annual release will be updated each month throughout the remainder of the water year to reflect changing hydrology in order to achieve the operation specified by the Equalization Tier. Due to recent increases to the inflow forecast for Lake Powell, Equalization may not be fully achieved by the end of the water year. Consistent with Section II(4) of the Long Range Operating Criteria, "[a]ny water thus retained [after September 30] in Lake Powell to avoid bypass of water at the Glen Canyon Powerplant will be released through the Glen Canyon Powerplant as soon as

practicable" to achieve Equalization. The May 24-Month Study projects Equalization to be achieved by the end of the calendar year, with a projected WY 2011 Equalization volume of 0.850 maf carried over to WY 2012.

The Interim Guidelines are available for download at
http://www.usbr.gov/lc/region/programs/strategies/RecordofDecision.pdf.

The Long-Range Operating Criteria are available for download at
http://www.usbr.gov/lc/region/pao/pdfiles/opcriter.pdf.

Fontenelle Reservoir – Inflows for the month of April were 92,000 acre-feet, or 99% of average. The reservoir elevation is 6467.5 feet above sea level and 32% of capacity. Current inflows are approximately 1,300 cfs and reservoir releases are 2200 cfs. Releases will likely be increased significantly in May (up to 4,500 cfs or more) as soon as the snow begins to melt and the first of spring runoff begins to fill the reservoir.

The Colorado Basin River Forecast Center and Natural Resources Conservation Service have issued the joint water supply forecast for the 2011 spring runoff. The May official forecast for the April to July runoff period is 1190 kaf (138%). Given this forecasted inflow, the reservoir is projected to fill late this summer and sustained releases of approximately 6,500 cfs or more will likely be required for a month to safely route the inflow to the reservoir. Note that these projections are provisional and subject to change as forecasts are updated and actual inflows are realized. Inflows over the next three months are forecasted to be significantly above average: 225,000 acre-ft (115%), 570,000 acre-ft (161%), and 305,000 acre-ft (144%) for May, June, and July respectively. Basin snowpack is currently 168% of the average for this time of year and just started to melt.

The next Fontenelle Working Group meeting is scheduled for August 18, 2011 at 10:00 am at the Joint Powers Water Board water treatment plant boardroom in Green River, Wyoming. The Fontenelle Working Group is an open public forum for information exchange between Reclamation and other parties associated with the operation of Fontenelle Reservoir.

Flaming Gorge Reservoir – Unregulated inflow into Flaming Gorge Reservoir during the month of April was 159,000 acre-feet (AF), or 101 percent of average inflow. Recent storms over both the Upper Green and Yampa River Basins have significantly increased the potential for high spring flows in 2011. Upper Green River Basin snowpack is currently 175% of the average for this time of year. Yampa River Basin snowpack is currently 174% of the average for this time of year.

The Colorado Basin River Forecast Center and Natural Resources Conservation Service have issued the joint water supply forecast for the 2011 spring runoff. The Flaming Gorge Reservoir May official forecast for the April to July runoff period is 1,660 kaf

(139%). The Yampa River Basin May official forecast for the April to July runoff period is 2,720 kaf (201%).

The Yampa river basin contains unprecedented snowpack, with forecasted flows at 197 percent of average. All peak forecasts for the Yampa River at Deerlodge are above flood stage. Likewise, the Upper Green river basin May final forecast increased 310 thousand acre-feet (KAF) or 26 percent over the April final forecast. The projected May-July volume into Flaming Gorge Reservoir is 146 percent of average. Please be advised that the potential for wet conditions currently exist in the Green and Yampa River Basins.

The next Flaming Gorge Working Group meeting is scheduled for August 23, 2011, at 11:00 a.m. at the Western Park Convention Center, 302 East 200 South, Vernal, Utah. The Flaming Gorge Working Group is an open public forum for information exchange between Reclamation and the stake holders of Flaming Gorge Dam. The public is encouraged to attend and comment on the operations and plans presented by Reclamation at these meetings. For more information on this group and these meetings please contact Heather Hermansen at 801-524-3883 or Ed Vidmar at 801-379-1182.

Aspinall Unit Reservoirs – April unregulated inflow into Blue Mesa Reservoir was 77,000 acre-feet or 102 percent of average. On May 11, 2011 the basin snowpack was 145 percent of average. Precipitation during April was 150 percent of average. The current inflow rate into Blue Mesa Reservoir is over 3000 cfs while reservoir releases are averaging about 2300 cfs. Lately the weather pattern has been wetter and colder than average with occasional short-lived warm periods that have resulted in brief episodes of higher flows on the rivers. With the higher than average snowpack and inflow forecast, we have increased reservoir releases in anticipation of making room for the runoff in Blue Mesa Reservoir. The reservoir elevation is currently at 7475.36 feet, which corresponds to a storage content of about 473,000 acre-feet. This elevation is about 16 feet lower than a year ago.

The latest Water Supply Forecast for Water Year 2011 was issued on May 1st and the April through July unregulated inflow is forecasted to be at 945,000 acre-feet (131% of normal). This sets the senior Black Canyon Water Right call for a one day spring peak flow of 6,793 cfs. At this time, Reclamation plans to operate the Aspinall Unit to allow the water right to be met. Under the proposed operation Blue Mesa is projected to fill this runoff season. The projected fill is calculated to be between 7516.4 feet and 7519.4 feet. Any elevation above 7516.00 is considered a fill for the season.

Releases from Crystal are currently working their way up to a full powerplant and bypass release of 4200 cfs. The Gunnison Diversion Tunnel started taking water for the new season on March 21, 2011. The current diversion rate in the tunnel is 1050 cfs, which results in a river flow below the diversion tunnel of approximately 2450 cfs. River flows will increase to around 3200 cfs by the middle of May and should hold steady after that until the spring peak operation begins sometime in late May or early June.

The next meeting of the "Aspinall Unit Working Group" will be held on Thursday, August 18, 2011 starting at 1:00 PM at the Elk Creek Visitor Center at Blue Mesa Reservoir. At this meeting, review of this spring's reservoir operations, and plans for this fall and winter operations will be discussed. These meetings are open forum discussions on the Aspinall Unit reservoir operations with many interested groups participating. Anyone needing further information about these meetings should contact Dan Crabtree in the Grand Junction Area Office at (970) 248-0652.

Navajo Reservoir - Releases from Navajo Reservoir have been set at 500 cfs since early fall 2010, with exception of two recent periods, April 15 through 20th, and May 5 through 9th when a temporary increase to 650 cfs was required to meet downstream target base flows. All reservoir releases are made for the authorized purposes of the Navajo Unit, and to attempt to maintain a target base flow through the endangered fish critical habitat reach of the San Juan River (Farmington to Lake Powell).

The San Juan River Basin Recovery Implementation Program recommends a target base flow of between 500 cfs and 1,000 cfs through the critical habitat area. The target base flow is calculated as the weekly average of gaged flows throughout the critical habitat area, therefore daily flows of less than 500 cfs may occur at some gages.

Snowpack for the upper San Juan basin now stands at 100 percent of average, while the Animas River basin is 110 percent of average. Precipitation during April was 100 percent of average. Unregulated inflow into Navajo Reservoir during the month of April was 115,000 acre-feet, or 77 percent of average. Currently, the daily reservoir inflow is averaging about 2,500 cfs. The reservoir water surface elevation is currently 6061.42 feet, which corresponds to storage content of about 1,366,000 acre-feet. NIIP started their diversions on March 17th, which are currently set at about 500 cfs.

The latest Water Supply Forecast for Water Year 2011 has been issued and the April through July unregulated inflow is forecasted to be at 545,000 acre-feet (74% of normal), this is a decrease of 5,000 acre-feet from last month's forecast. Given this forecast, there will be a one week spring peak release of 5,000 cfs which results in an end of water year reservoir elevation estimated to be 6059 feet.

A public meeting on Navajo Reservoir operations was held on Wednesday, April 20, 2011 in Farmington, New Mexico. At this meeting, review of this winter's reservoir operations, and plans for this spring and summer operations will be discussed. These are open forum discussions on the operation of Navajo Reservoir with many interested groups participating. Anyone interested in the general operation of the reservoir is encouraged to attend. Please contact Ryan Christianson in Reclamation's Durango, Colorado Office at (970) 385-6590 for information about these meetings or the daily operation of Navajo Reservoir.

Glen Canyon Dam / Lake Powell – The unregulated inflow to Lake Powell for April 2011 was 983 kaf (100% of average) which was 117 kaf below the level forecasted for April by the Colorado Basin River Forecast Center (CBRFC) which was 1100 kaf (112%

of average). On April 9, 2011, the elevation of Lake Powell dropped to 3609.7 feet above sea level which will likely be the lowest elevation that will occur during water year 2011. As of May 10, 2011 the elevation had increased to 3613.3 feet above sea level. Inflows are averaging about 21,400 cfs while releases are averaging about 14,800 cfs so the elevation is increasing at over 1 inch per day. It is projected that the elevation of Lake Powell could increase by more than 50 feet from the low point for the water year to a peak elevation of approximately 3660 feet above sea level by late July or early August which would be approximately 40 feet from the full pool elevation of 3700 feet.

Current Dam Operations

The release volume currently scheduled for May is 1195 kaf and this is estimated to be the maximum release capability of the powerplant at Glen Canyon Dam. Releases in May, from May 1 through May 13 will be near steady at approximately 14,400 cfs. On May 14, 2011, generating units 3 and 4 are projected to be returned to service. When this occurs, releases from Glen Canyon Dam will increase to approximately 23,000 cfs which is estimated to be the maximum release rate from the powerplant. Releases will be near steady at this level to the end of the month. The projected release volume for June is 1369 kaf and the release rate will be near steady at approximately 23,000 cfs. Depending on inflow conditions, releases for July and August could also be near powerplant capacity.

In addition to daily operations that may or may not include daily fluctuation patterns for load following power generation, the instantaneous releases from Glen Canyon Dam may also fluctuate somewhat to provide approximately 40 megawatts of system regulation. These instantaneous release adjustments maintain stable conditions within the electrical generation and transmission system and result in momentary release fluctuations within a range of about 1100 cfs above or below the targeted hourly release rate. The momentary fluctuations for regulation are very short lived and typically balance out over the hour.

Spinning and non-spinning reserve generation is also maintained at Glen Canyon Dam. In order for Glen Canyon Dam (and other Colorado River Storage Project dams) to participate in the electrical generation and transmissions system, Glen Canyon Dam must maintain a level of generation capacity in reserve to assist the local control area to maintain electrical supply when unanticipated generation outages occur within the control area. Glen Canyon is required to maintain 99 megawatts (approximately 2,650 cfs of release) of capacity in reserve for these unanticipated outages. When an electrical outage occurs, Glen Canyon Dam can be called upon to provide up to an additional 99 megawatts of generation above what was originally scheduled for Glen Canyon Dam for a duration of 2 hours or less. Under normal circumstances, calls for reserve generation occur fairly infrequently and are for much less than the required 99 megawatts.

Annual Operations-Coordinated Operation of Lake Mead and Lake Powell under Interim Guidelines for Water Year 2011

In August of 2010, the 24-Month Study was used to project the January 1, 2010 elevations of Lake Powell and Lake Mead. Based on these projected elevations and

pursuant to the December 2007 Record of Decision on Colorado River Interim Guidelines for Lower Basin Shortages and the Coordinated Operations of Lake Powell and Lake Mead (Interim Guidelines), the operating tier for water year 2011 was selected to be Upper Elevation Balancing. Operation of Glen Canyon Dam under Upper Elevation Balancing can result in an annual release as low as 7.0 maf, when Balancing occurs, or as high as would be required to achieve Equalization which could be as low as 8.23 maf or as high as 13 maf or greater depending on system conditions. The operational outcome of Upper Elevation Balancing is largely dependent on projected and actual system conditions at the end of the water year.

Current Inflow Forecasts and Model Projections

Snowpack conditions above Lake Powell have persisted to be above average since late December 2010. The overall snowpack above Lake Powell on May 10, 2011 was 147% of the seasonal average. The snowpack conditions continued to build basin wide throughout April 2011 when typically snowpack normally begins to melt. Temperatures in the Colorado River Basin have remained below average and this has protected the snowpack beyond what was expected. The Water Supply forecast for Lake Powell issued by the CBRFC (April through July Unregulated Inflow Volume) was 9.7 maf (123% of average) at mid April but has been increased significantly for May which is now 11.5 maf (145% of average). The 2011 water year projected unregulated inflow volume was projected in April to be 13.11 maf (109% of average). With the increased forecast for May the 2011 water year projected unregulated inflow volume is now 15.34 maf (127% of average). The last water year where Lake Powell observed that level of unregulated inflow was 1996 when the unregulated inflow volume was 17.05 maf (142% of average) and in the 47 years since the closure of Glen Canyon Dam there have only been 8 years where the unregulated inflow volume was at or above the level projected for this year.

The unregulated inflow forecast for Lake Powell over the next 3 months based on the May final Water Supply forecast is as follows: May-3,000 kaf (130% of average); June-5,200 kaf (169% of average); July-2,300 kaf (148% of average). Incorporating these new forecasts, the most probable Lake Powell unregulated inflow volume projection for water year 2011 is now 15.34 maf (127% of average). This is the median unregulated inflow volume that is forecasted to occur for water year 2011. There is a 50% chance that the unregulated inflow volume will be higher or lower than this volume. A reasonable range of possible inflows is defined by a minimum probable inflow volume and a maximum probable inflow volume. These volumes represent what would be expected to be achieved or exceeded 90% of the time (minimum inflow volume) and 10% of the time (maximum inflow volume). The forecasted water year (2011) minimum probable inflow volume issued for May is 12.4 maf (103% of average). The forecasted water year (2011) maximum probable inflow volume issued for May is 18.1 maf (150% of average). Given this range, there is still a significant amount of uncertainty for how 2011 will play out over the next 5 months.

The May 2011 24-Month Study, with the 2011 most probable inflow condition projects that Equalization will be required under the Interim Guidelines and the projected annual

release volume from this study is projected to be 12.46 maf. This annual release volume is estimated to be the maximum volume that Glen Canyon Powerplant can release given the unit efficiency and unit maintenance outages that are scheduled from now to the end of the water year. As hydrologic conditions change throughout the remaining months of water year 2011, dam operations and the projected annual release volume will be adjusted to achieve as practicably as possible the objectives of the Equalization Tier of the Interim Guidelines.

Upper Colorado River Basin Hydrology

In the Upper Colorado River Basin during water year 2010, the overall precipitation accumulated through September 30, 2010 was approximately 90% of average based on the 30 year average for the period from 1971 through 2000. For Water Year 2011 thus far, the estimated monthly precipitation within the Upper Colorado River Basin (above Lake Powell) as a percentage of average has been: (October - 135%, November - 95%, December - 225%, January - 50%, February - 100%, March - 90%, April – 155%)

The Climate Prediction Center outlook (dated April 21, 2010) for temperature over the next 3 months indicates that temperatures in the Upper Colorado River Basin are expected to be above average while precipitation over the next 3 months is projected to be near average in the northern reaches of the basin while below average in the southern reaches of the basin.

Upper Colorado River Basin Drought

The Upper Colorado River Basin continues to experience a protracted multi-year drought. Since 1999, inflow to Lake Powell has been below average in every year except water years 2005 and 2008. In the summer of 1999, Lake Powell was close to full with reservoir storage at 23.5 million acre-feet, or 97 percent of capacity. During the next 5 years (2000 through 2004) unregulated inflow to Lake Powell was well below average. This resulted in Lake Powell storage decreasing during this period to 8.0 million acre-feet (33 percent of capacity) which occurred on April 8, 2005. During 2005, 2008 and 2009, drought conditions eased somewhat with near or above average inflow conditions and net gains in storage to Lake Powell. 2011 will be another above average inflow year so drought conditions are easing somewhat in the Colorado River Basin. As of May 10, 2011 the storage in Lake Powell was approximately 13.07 million acre-feet (53.7 % of capacity) which is below desired levels. The overall reservoir storage in the Colorado River Basin as of April 18, 2011 is approximately 31.61 million acre-feet (53.2 % of capacity).

April 24-Month Study
Date: April 8, 2011

From: Water Resources Group, Salt Lake City
To: All Colorado River Annual Operating Plan (AOP) Recipients

Current Reservoir Status

Reservoir	March Inflow (unregulated) (acre-feet)	Percent of Average (%)	April 7 Midnight Elevation (feet)	Reservoir Storage (acre-feet)
Fontenelle	36,000	69	6474.35	139,000
Flaming Gorge	101,000	94	6025.41	3,175,000
Blue Mesa	38,000	106	7477.49	488,000
Navajo	41,000	46	6058.85	1,333,000
Powell	595,000	90	3609.84	12,714,000

Expected Operations

The operation of Lake Powell and Lake Mead in this April 2011 24-Month Study is pursuant to the December 2007 Record of Decision on Colorado River Interim Guidelines for Lower Basin Shortages and the Coordinated Operations of Lake Powell and Lake Mead (Interim Guidelines), and reflects the 2011 Annual Operating Plan (AOP). Pursuant to the Interim Guidelines, the Lake Powell operational tier for water year 2011 is the Upper Elevation Balancing Tier. The Intentionally Created Surplus (ICS) Surplus condition is the criterion governing the operation of Lake Mead for calendar year 2011.

Consistent with Section 6.B.3 of the Interim Guidelines, if the April 24-Month study projects the September 30 Lake Powell elevation to be greater than the 2011 Equalization elevation of 3,643.0 feet with an annual release from Lake Powell of 8.23 maf, the Equalization Tier will govern operations of Lake Powell for the remainder of the water year.

The April 24-Month Study with an annual release volume from Glen Canyon Dam of 8.23 maf projects a Lake Powell end of water year elevation of 3,662.63 feet. Based on this projected condition and consistent with the provision in Section 6.B.3 of the Interim Guidelines, a shift in Glen Canyon Dam operations to being governed by the Equalization Tier will occur for the remainder of water year 2011. The April 24-Month Study projects a Lake Powell annual release volume of 11.56 maf; however, the projected annual release

will be updated each month throughout the remainder of the water year to reflect changing hydrology in order to achieve the operation specified by the Equalization Tier.

The Interim Guidelines are available for download at http://www.usbr.gov/lc/region/programs/strategies/RecordofDecision.pdf.
The 2011 AOP is available for download at http://www.usbr.gov/uc/water/rsvrs/ops/aop/AOP11_final.pdf.

Fontenelle Reservoir – Inflows for the month of March were 36,000 acre-feet, or 69% of average. The reservoir elevation is 6474 feet above sea level and 40% of capacity. Current inflows are approximately 1,500 cfs and reservoir releases are 1400 cfs. Releases will likely be increased to 1,700cfs in mid-April and then futher in May. The reservoir elevation has likely reached its lowest level and will begin to rise as the early season snowmelt enters the reservoir.

The Colorado Basin River Forecast Center and Natural Resources Conservation Service have issued the joint water supply forecast for the 2011 spring runoff. The April official forecast for the April to July runoff period is 980 kaf (114%). Given this forecasted inflow, the reservoir is projected to fill late this summer and sustained releases of approximately 4,700 cfs or more will likely be required for a month to safely route the inflow to the reservoir. Note that these projections are provisional and subject to change as forecasts are updated and actual inflows are realized. Inflows over the next three months are forecasted to be near average: 115,000 acre-ft (124%), 250,000 acre-ft (128%), and 410,000 acre-ft (115%) for April, May, and June respectively. Basin snowpack is currently 122% of the average for this time of year.

The next Fontenelle Working Group meeting is scheduled for April 21, 2011 at 10:00 am at the Seedskadee National Wildlife Refuge Visitor Center. The Fontenelle Working Group is an open public forum for information exchange between Reclamation and other parties associated with the operation of Fontenelle Reservoir.

Flaming Gorge Reservoir – Unregulated inflow into Flaming Gorge Reservoir during the month of March was 101,000 acre-feet (AF), or 94 percent of average inflow. Recent storms over both the Upper Green and Yampa River Basins have significantly increased the potential for high spring flows in 2011. Upper Green River Basin snowpack is currently 118% of the average for this time of year. Yampa River Basin snowpack is currently 131% of the average for this time of year.

The Colorado Basin River Forecast Center and Natural Resources Conservation Service have issued the joint water supply forecast for the 2011 spring runoff. The Flaming Gorge Reservoir April official forecast for the April to July runoff period is 1,350 kaf (113%). The Yampa River Basin April official forecast for the April to July runoff period is 2,130 kaf (157%). **Note that these projections are provisional and that observed**

runoff, current conditions and changing forecasts will determine releases during the spring period.

Reclamation acknowledges that April and May temperature and precipitation may provide an average year in both the Green and Yampa River Basins. Current snowpack in both basins are similar to 1983 and 1984. The Yampa River at Deerlodge Park flows in 1984 reached a daily average of 32,300 cfs on May 18, 1984, and maintained 28 days above 18,600 cfs beginning on May 13, 1984. Please be advised that the potential for wet conditions currently exist in the Green and Yampa River Basins.

The next Flaming Gorge Working Group meeting is scheduled for April 26, 2011, at 7:00 p.m. at the Western Park Convention Center, 302 East 200 South, Vernal, Utah. The Flaming Gorge Working Group is an open public forum for information exchange between Reclamation and the stake holders of Flaming Gorge Dam. The public is encouraged to attend and comment on the operations and plans presented by Reclamation at these meetings. For more information on this group and these meetings please contact Heather Hermansen at 801-524-3883 or Ed Vidmar at 801-379-1182.

Aspinall Unit Reservoirs – March unregulated inflow into Blue Mesa Reservoir was 38,000 acre-feet or 106 percent of average. On April 8, 2011 the basin snowpack was 112 percent of average. Precipitation during March was 85 percent of average. The current inflow rate into Blue Mesa Reservoir is about 900 cfs while reservoir releases are averaging about 1700 cfs. Lately the weather pattern has been wetter and colder than average. However, spring conditions can return at anytime which will most likely start the annual spring snowmelt. With the higher than average snowpack and inflow forecast, we have increased reservoir releases in anticipation of making room for the runoff in Blue Mesa Reservoir. The reservoir elevation is currently at 7477.49 feet, which corresponds to a storage content of about 488,000 acre-feet. This elevation is about 12 feet lower than a year ago.

The latest Water Supply Forecast for Water Year 2011 has been issued and the April through July unregulated inflow is forecasted to be at 800,000 acre-feet (111% of normal). If this forecast holds through May 1st, the senior Black Canyon Water Right would call for a one day spring peak flow of 6,369 cfs. At this time, Reclamation plans to operate the Aspinall Unit to allow the water right to be met. Under the proposed operation Blue Mesa is projected to fill this runoff season. The projected fill is calculated to be between 7516.4 feet and 7519.4 feet. Any elevation above 7516.00 is considered a fill for the season.

Releases from Crystal are currently set at 1800 cfs. The Gunnison Diversion Tunnel started taking water for the new season on March 21, 2011. The current diversion rate in the tunnel is 500 cfs, which results in a river flow below the diversion tunnel of approximately 1300 cfs. These rates will most likely change as conditions warrant, primarily as we respond to changes in the forecasted spring inflows.

The next meeting of the "Aspinall Unit Working Group" will be held on Thursday, April 21, 2011 starting at 1:00 PM in Reclamation's Grand Junction Office. At this meeting, review of this winter's reservoir operations, and plans for this spring and summer operations will be discussed. These meetings are open forum discussions on the Aspinall Unit reservoir operations with many interested groups participating. Anyone needing further information about these meetings should contact Dan Crabtree in the Grand Junction Area Office at (970) 248-0652.

Navajo Reservoir - Releases from Navajo Reservoir have been set at 500 cfs since early fall 2010. All reservoir releases are made for the authorized purposes of the Navajo Unit, and to attempt to maintain a target base flow through the endangered fish critical habitat reach of the San Juan River (Farmington to Lake Powell).

The San Juan River Basin Recovery Implementation Program recommends a target base flow of between 500 cfs and 1,000 cfs through the critical habitat area. The target base flow is calculated as the weekly average of gaged flows throughout the critical habitat area, therefore daily flows of less than 500 cfs may occur at some gages.

Snowpack for the upper San Juan basin now stands at 82 percent of average, while the Animas River basin is 79 percent of average. Precipitation during March was only 50 percent of average. Unregulated inflow into Navajo Reservoir during the month of March was 41,000 acre-feet, or 46 percent of average. Currently, the daily reservoir inflow is averaging about 1500 cfs. The reservoir water surface elevation is currently 6058.85 feet, which corresponds to a storage content of about 1,333,000 acre-feet. NIIP started their diversions on March 17th, which are currently set at about 400 cfs.

The latest Water Supply Forecast for Water Year 2011 has been issued and the April through July unregulated inflow is forecasted to be at 550,000 acre-feet (70% of normal), this is a decrease of 100,000 acre-feet from last month's forecast. Given this forecast, there will be a one week spring peak release of 5,000 cfs which results in an end of water year reservoir elevation estimated to be 6058 feet.

A public meeting on Navajo Reservoir operations was held on Wednesday, April 20, 2011 in Farmington, New Mexico. At this meeting, review of this winter's reservoir operations, and plans for this spring and summer operations will be discussed. These are open forum discussions on the operation of Navajo Reservoir with many interested groups participating. Anyone interested in the general operation of the reservoir is encouraged to attend. Please contact Ryan Christianson in Reclamation's Durango, Colorado Office at (970) 385-6590 for information about these meetings or the daily operation of Navajo Reservoir.

Glen Canyon Dam / Lake Powell – The unregulated inflow to Lake Powell for March 2011 was 594 kaf (90% of average). Observed inflows to Lake Powell have increased over the past several weeks and are currently averaging about 10,400 cfs. With daily

average release rate from Glen Canyon Dam that is about 16,000 cfs, the elevation of Lake Powell is still declining , but the rate of decline has been moderated by these increased inflow conditions. The elevation of Lake Powell at midnight on April 7, 2011 was 3609.84 feet above sea level (90.16 feet from full pool). The elevation of Lake Powell will begin to increase later in April when inflows exceed releases. It is projected that the elevation of Lake Powell could increase by more than 30 feet to a peak elevation of approximately 3643 feet above sea level by late July or early August.

Current Dam Operations

The release volume scheduled for April is 966 kaf. During the first 3 days of April, daily releases fluctuates for power production between an afternoon peak of approximately 19,600 cfs and an early morning low release of approximately 14,000 cfs. On April 4, 2011, Glen Canyon Powerplant Units 3 and 4 were taken out of service for approximately 6 weeks for annual maintenance. Releases from Glen Canyon Dam were set to 16,000 cfs with no fluctuations for power generation at that time due to limited capacity of the available generating units at Glen Canyon Power Plant. Releases of 16,000 cfs steady will likely continue until the end of April. In early May, releases will likely be steady at about 15,000 cfs for the first 13 days of the month. On May 14, 2011 it is projected that Units 3 and 4 will be returned to service. When this occurs, releases from Glen Canyon Dam will be increased such that peak releases will be about 22,000 cfs and off peak releases will be about 16,000 cfs. The projected release volume for May is approximately 1.10 maf.

In addition to daily operations that may or may not include daily fluctuation patterns for load following power generation, the instantaneous releases from Glen Canyon Dam may also fluctuate somewhat to provide approximately 40 megawatts of system regulation. These instantaneous releases adjustments maintain stable conditions within the electrical generation and transmission system and result in momentary release fluctuations within a range that is about 1100 cfs above or below the targeted release rate for a given hour of the day. These momentary fluctuations for regulation are very short lived and typically balance out over the hour. Spinning and non-spinning reserve generation can also occur at Glen Canyon Dam. When an unanticipated electrical outage event occurs within the electrical transmission system, reserve generation at Glen Canyon Dam can be called upon up to a maximum of 98 megawatts (approximately 2,600 cfs of release) for a duration of up to 2 hours. Under normal circumstances, calls for reserve generation occur fairly infrequently and are for much less than the required 98 megawatts.

Annual Operations-Coordinated Operation of Lake Mead and Lake Powell under Interim Guidelines for Water Year 2011

In August of 2010, the 24-Month Study model projected the January 1, 2010 elevation of Lake Powell and Lake Mead under the most probable inflow scenario. Pursuant to the December 2007 Record of Decision on Colorado River Interim Guidelines for Lower Basin Shortages and the Coordinated Operations of Lake Powell and Lake Mead (Interim Guidelines) and based on this August projection, the operational tier for water year 2011

was selected to be the Upper Elevation Balancing Tier. Under this operational tier, there is a possibility that the annual release volume from Lake Powell could be as low as 8.23 maf and there is also a possibility under this tier that Equalization or Balancing could occur which would result in an annual release volume greater than 8.23 maf.

The possibility of Equalization or Balancing in water year 2011 is dependent upon the reservoir conditions of Lake Powell and Lake Mead projected at the end of the water year in the Most Probable April 24-Month Study when the projected Glen Canyon Dam annual release condition is 8.23 maf . The April 24-Month Study, with a projected water year release of 8.23 maf projects the elevation of Lake Powell on September 30, 2011 (end of water year 2011) to be 3662.63 feet above sea level which is above the Equalization Level for 2011 (3643 feet). Based on this model projection and consistent with the Interim Guidelines, the Equalization Tier will govern the operation of Lake Powell for the remainder of water year 2011.

Current Inflow Forecasts and Model Projections

Snowpack conditions above Lake Powell have persisted to be above average since late December 2010. The overall snowpack above Lake Powell on April 7, 2011 was 115% of average. The current Water Supply forecast for Lake Powell (April through July Unregulated Inflow Volume) is 9.5 maf (120% of average) and this forecast was issued by the CBRFC on April 4, 2011.

The unregulated inflow forecast for Lake Powell over the next 3 months is as follows: April-1,100 kaf (112% of average); May-3,000 kaf (130% of average); June-3,850 kaf (125% of average). Incorporating these new forecasts with the current Water Supply forecast, the projected unregulated inflow volume to Lake Powell during water year 2011 is now 13.11 maf (109% of average). These forecasts combined with projected inflows in August and September of 2011 make up the 2011 Most Probable water year inflow condition. The Most Probable inflow condition has a statistical probability of being achieved that is 50%. In other words, there is a 50% chance that the unregulated inflow volume for water year 2011 for Lake Powell will be 13.11 maf or greater.

A Minimum Probable water year inflow conditions has also been developed for water year 2011. The Minimum Probable inflow condition has a statistical probability of being achieved that is 90%. The 2011 Minimum Probable water year inflow condition is currently 10.5 maf (87% of average). A Maximum Probable water year inflow condition has also been developed for water year 2011. The 2011 Maximum Probable inflow condition is currently 16.2 maf (135% of average).

The April 2011 24-Month Study, with the 2011 Most Probable inflow condition projects that Equalization will be required under the Interim Guidelines and the projected annual release volume is projected to be 11.56 maf. As hydrologic conditions change during the remainder of the water year, this annual release projection will be adjusted to achieve the Equalization Tier of the Interim Guidelines.

Upper Colorado River Basin Hydrology

In the Upper Colorado River Basin during water year 2010, the overall precipitation accumulated through September 30, 2010 was approximately 90% of average based on the 30 year average for the period from 1971 through 2000. For Water Year 2011 thus far, the estimated monthly precipitation within the Upper Colorado River Basin (above Lake Powell) as a percentage of average has been: (October - 135%, November - 95%, December - 225%, January - 50%, February - 100%, March- 90%)

The Climate Prediction Center outlook (dated March 17, 2010) for temperature over the next 3 months indicates that temperatures in the Upper Colorado River Basin are expected to be above average while precipitation over the next 3 months is projected to be near average in the northern reaches of the basin while below average in the southern reaches of the basin.

Upper Colorado River Basin Drought

The Upper Colorado River Basin continues to experience a protracted multi-year drought. Since 1999, inflow to Lake Powell has been below average in every year except water years 2005 and 2008. In the summer of 1999, Lake Powell was close to full with reservoir storage at 23.5 million acre-feet, or 97 percent of capacity. During the next 5 years (2000 through 2004) unregulated inflow to Lake Powell was well below average. This resulted in Lake Powell storage decreasing during this period to 8.0 million acre-feet (33 percent of capacity) which occurred on April 8, 2005. During 2005, 2008 and 2009, drought conditions eased somewhat with net gains in storage to Lake Powell. As of April 7, 2011 the storage in Lake Powell was approximately 12.71 million acre-feet (52.2 % of capacity) which is below desired levels. The overall reservoir storage in the Colorado River Basin as of April 7, 2011 is approximately 31.42 million acre-feet (52.8 % of capacity).

June 24-Month Study
Date: June 14, 2011

From: Water Resources Group, Salt Lake City
To: All Colorado River Annual Operating Plan (AOP) Recipients

Current Reservoir Status

Reservoir	May Inflow (unregulated) (acre-feet)	Percent of Average (%)	June 13 Midnight Elevation (feet)	Reservoir Storage (acre-feet)
Fontenelle	161,000	82	6469.00	115,000
Flaming Gorge	327,000	108	6026.75	3,225,000
Blue Mesa	168,000	77	7489.50	577,000
Navajo	172,000	63	6067.65	1,448,000
Powell	2,194,000	95	3634.68	15,384,000

Expected Operations

The operation of Lake Powell and Lake Mead in this June 2011 24-Month Study is pursuant to the December 2007 Record of Decision on Colorado River Interim Guidelines for Lower Basin Shortages and the Coordinated Operations of Lake Powell and Lake Mead (Interim Guidelines), and reflects the 2011 Annual Operating Plan (AOP). Pursuant to the Interim Guidelines, the Lake Powell operational tier for water year 2011 is the Upper Elevation Balancing Tier. The Intentionally Created Surplus (ICS) Surplus condition is the criterion governing the operation of Lake Mead for calendar year 2011.

The April 2011 24-Month study projected the September 30 Lake Powell elevation to be greater than the 2011 Equalization elevation of 3,643.0 feet with an annual release from Lake Powell of 8.23 maf. Consistent with Section 6.B.3 of the Interim Guidelines, the Equalization Tier governs operations of Lake Powell for the remainder of the water year.

The June 24-Month Study projects a Lake Powell WY 2011 annual release volume of 12.44 maf. Due to recent increases to the inflow forecast for Lake Powell, Equalization may not be fully achieved by the end of the water year. The projected Lake Powell releases will be updated each month to reflect changing hydrology in order to achieve the operation specified by the Equalization Tier.

The Interim Guidelines are available for download at http://www.usbr.gov/lc/region/programs/strategies/RecordofDecision.pdf.

The 2011 AOP is available for download at
http://www.usbr.gov/uc/water/rsvrs/ops/aop/AOP11_final.pdf.

Fontenelle Reservoir – Inflows for the month of May were 161,000 acre-feet, or 82% of average. The reservoir elevation is 6463.7 feet above sea level and 27% of capacity. Current inflows are approximately 3,400 cfs and reservoir releases are 6,400 cfs. Additional reservoir storage has been maintained in anticipation of significantly above average reservoir inflows in this season. Releases will likely be increased significantly in June as the snowmelt pulse enters the reservoir.

The Colorado Basin River Forecast Center and Natural Resources Conservation Service have issued the joint water supply forecast for the 2011 spring runoff. The June official forecast for the April to July runoff period is 1230 kaf (143%). Given this forecasted inflow, the reservoir is projected to fill late this summer and releases of up to 10,000 cfs or potentially more could be required for two weeks or more to safely route the inflow to the reservoir. Note that these projections are provisional and subject to change as forecasts are updated and actual inflows are realized. Inflows are forecasted to be significantly above average in June and July and below average in August: 575,000 acre-ft (162%) for June, 400,000 acre-ft (189%) for July, and 75,000 acre-ft (82%) for August. Basin snowpack has begun melting, however, well over half of the snowpack still remains.

The next Fontenelle Working Group meeting is scheduled for August 18, 2011 at 10:00 am at the Joint Powers Water Board water treatment plant boardroom in Green River, Wyoming. The Fontenelle Working Group is an open public forum for information exchange between Reclamation and other parties associated with the operation of Fontenelle Reservoir.

Flaming Gorge Reservoir – Unregulated inflow into Flaming Gorge Reservoir during the month of May was 327,000 acre-feet (AF), or 108 percent of average inflow. The Upper Green and Yampa River Basins have record snowpack and high spring flows are expected in 2011. Upper Green River Basin snowpack is currently 441% of the average for this time of year. Yampa River Basin snowpack is currently 272% of the average for this time of year.

The Colorado Basin River Forecast Center and Natural Resources Conservation Service have issued the joint water supply forecast for the 2011 spring runoff. The Flaming Gorge Reservoir June official forecast for the April to July runoff period is 1,890 kaf (159%). The Yampa River Basin May official forecast for the April to July runoff period is 2,875 kaf (212%).

The Yampa river basin contains unprecedented snowpack, with forecasted flows at 212 percent of average. Approximately 60 percent of the Yampa River forecasted volume has melted and the Yampa River was above flood stage from June 4 through June 13. The

highest peak occurred on June 9 at 26,500 cfs. Mother Nature has been kind with the warming and cooling trend over the last few weeks. Yampa River low- and mid-elevation snow has melted in sections, which has meant lower peak flows out of the Yampa River. The peak flows could have been much higher.

The Upper Green river basin June final forecast increased 230 thousand acre-feet (KAF) or 20 percent over the May final forecast. Flaming Gorge Reservoir has 527,000 acre-feet (af) of space (86 percent of live capacity) as of June 13, 2011. The June final forecast estimates 1.89 million acre-feet (maf) of water into Flaming Gorge during the April-July period. Total volume into Flaming Gorge from April 1 through June 13 is 707,000 af, leaving approximately 1.2 maf or 63 percent of the total volume (1.18 maf) expected between now and the end of July.

The next Flaming Gorge Working Group meeting is scheduled for August 23, 2011, at 11:00 a.m. at the Western Park Convention Center, 302 East 200 South, Vernal, Utah. The Flaming Gorge Working Group is an open public forum for information exchange between Reclamation and the stake holders of Flaming Gorge Dam. The public is encouraged to attend and comment on the operations and plans presented by Reclamation at these meetings. For more information on this group and these meetings please contact Heather Hermansen at 801-524-3883 or Ed Vidmar at 801-379-1182.

Aspinall Unit Reservoirs – May unregulated inflow into Blue Mesa Reservoir was 168,000 acre-feet or 77 percent of average. The Gunnison River Basin snowpack is melting out much later this year. As temperatures have warmed has resulted in some fairly high river flows during the first part of June. The current inflow rate into Blue Mesa Reservoir is about 7,000 cfs while reservoir releases are averaging about 2,200 cfs. Blue Mesa's present elevation is 7489.50 feet, which corresponds to a storage content of about 577,000 acre-feet. Precipitation during May was 125 percent of average.

The latest Water Supply Forecast for Water Year 2011 has been issued and the April through July unregulated inflow is forecasted to be at 895,000 acre-feet (124% of average). This is a 50,000 acre-feet decrease from last month's forecast. The May 1 runoff forecast sets the senior Black Canyon Water Right call for a one day spring peak flow of 6,793 cfs. Because of the late snowmelt, Reclamation delayed the spring peak operations until June.

The Black Canyon Water Right was met on June 8th, when releases from Crystal were set at 8,200 cfs. The Gunnison Diversion Tunnel was diverting about 1050 cfs, which resulted in a river flow below the diversion tunnel of approximately 7,200 cfs. Flows at Delta, Colorado reached 13,500 cfs on this same day. Reservoir releases were slowly ramped down from the Aspinall Unit beginning June 9th and stabilizing at around 3,200 cfs in the Canyon and Gorge around June 14th. Blue Mesa Reservoir is expected to top out at or above 7516.00 feet in mid July.

The next meeting of the "Aspinall Unit Working Group" will be held on Thursday, August 18, 2011 at Elk Creek Visitors Center at Blue Mesa Reservoir. At this meeting, review of this spring's reservoir operations, and plans for this summer and fall operations will be discussed. These meetings are open forum discussions on the Aspinall Unit reservoir operations with many interested groups participating. Anyone needing further information about these meetings should contact Dan Crabtree in the Grand Junction Area Office at (970) 248-0652.

Navajo Reservoir - The current snowpack has diminished substantially in the last few weeks. Only the higher elevation SNOTEL stations in the upper San Juan Basin have any significant snowpack. The basin snowpack has pretty much melted out for elevations below 12,000 feet. The snowpack as of June 14th for the upper San Juan River basin was averaging 45 percent while the Animas River basin snowpack now stands at 49 percent of average.

Unregulated inflow into Navajo Reservoir during the month of May was 172,000 acre-feet, or 63 percent of average. Currently, the daily reservoir inflow is averaging about 4,600 cfs. NIIP diversions are currently set at 700 cfs. The reservoir water surface elevation is currently 6067.65 feet, which corresponds to a storage content of about 1,448,000 acre-feet.

On June 3, 2011, the National Weather Service's River Forecast Center issued an updated inflow forecast for Navajo Reservoir for the April through July runoff period. This forecast is projecting a volume runoff into the reservoir of 545,000 acre-feet, or about a 69 percent of average runoff for the Upper San Juan River Basin. Based on this runoff forecast and current reservoir conditions, a one week spring peak release of 5,000 cfs was scheduled for June 8th though June 14th this runoff season.

A public meeting on Navajo Reservoir operations will be held on Tuesday, August 30, 2011 at 1:00 p.m. in Farmington, New Mexico. At this meeting, review of last spring and summer reservoir operations, and plans for this fall and winter 2011/2012 operations will be discussed. These are open forum discussions on the operation of Navajo Reservoir with many interested groups participating. Anyone interested in the general operation of the reservoir is encouraged to attend. Please contact Ryan Christianson in Reclamation's Durango, Colorado Office at (970) 385-6590 for information about these meetings or the daily operation of Navajo Reservoir.

Glen Canyon Dam / Lake Powell –The unregulated inflow volume to Lake Powell for May 2011 was 2.17 maf (94% of average). Inflows have increased due to snowmelt runoff within the basin and observed inflows to Lake Powell are averaging nearly 87,000 cfs (June 14, 2011). Observed inflows will likely remain high through June and into July. The spring runoff is well under way and there is still significant snow yet to melt at the higher elevations within the basis. The forecasted unregulated inflow for June is 6.1 maf

which would be the 2nd wettest June for Lake Powell since the operation of Glen Canyon Dam began in 1963.

The reservoir elevation of Lake Powell will increase significantly during the months of June and July, 2011. As of June 14, 2011 the reservoir elevation of Lake Powell was 3635.75 feet and this is about 26 feet above the low reservoir elevation for 2011 (3609.7 feet on April 9, 2011). The reservoir elevation has been increasing at just over 1 foot per day. The peak reservoir elevation for the summer will likely occur in late July or early August and is projected to be 3660 to 3665 feet above sea level. This would be 35 to 40 feet below the full pool elevation of 3700 feet. The last time Lake Powell's reservoir elevation was at this level was in October of 2001 (over 10 years ago) near the beginning of the recent drought. The peak reservoir elevation for 2011 will be dependent on the actual inflows that Lake Powell receives over the next 2 months.

Current Dam Operations

Releases from Glen Canyon Dam are approximately 22,400 cfs which is very near the full capacity of the powerplant. This release rate includes reserving enough generation capacity for up to 100 MW of reserve generation and 40 MW of system regulation. As the elevation of Lake Powell increases, the capacity of the powerplant will change and operation of Glen Canyon Dam will be adjusted daily to maximize release volumes. It is anticipated that the release volume for June will be approximately 1,332 kaf. The actual release volume for June will largely depend on generation unit efficiencies that occur throughout the month and could be higher or lower than this estimated release volume.

While the release rate over the next several months is likely to be steady, the instantaneous releases from Glen Canyon Dam may fluctuate somewhat to provide 40 MW of system regulation. These instantaneous release adjustments maintain stable conditions within the electrical generation and transmission system and result in momentary release fluctuations within a range of about 1100 cfs above or below the targeted hourly release rate. The momentary fluctuations for regulation are very short lived and typically balance out over the hour.

Spinning and non-spinning reserve generation is also maintained at Glen Canyon Dam. In order for Colorado River Storage Project (CRSP) powerplants to participate in the electrical generation and transmissions system, these powerplants must maintain a level of generation capacity available in reserve to assist the local control area for when unanticipated generation outages occur. The current CRSP powerplant reserve requirement is 100 MW (equivalent to approximately 2,675 cfs of release from Glen Canyon Dam). When an electrical outage occurs within the control area, CRSP powerplants can be called upon to provide up to 100 MW of additional generation for up to 2 hours. Under normal circumstances, calls for reserves infrequent and for much less than the required 100 MW. Because Glen Canyon Powerplant is the largest facility of the CRSP powerplants, most of the CRSP reserve requirement is maintained at Glen Canyon Dam.

Annual Operations-Coordinated Operation of Lake Mead and Lake Powell under Interim Guidelines for Water Year 2011

In August of 2010, the 24-Month Study was used to project the January 1, 2010 elevations of Lake Powell and Lake Mead. Based on these projected elevations and pursuant to the December 2007 Record of Decision on Colorado River Interim Guidelines for Lower Basin Shortages and the Coordinated Operations of Lake Powell and Lake Mead (Interim Guidelines), the operating tier for water year 2011 was selected to be Upper Elevation Balancing. Operation of Glen Canyon Dam under Upper Elevation Balancing can result in annual releases as low as 7.0 maf to as high as 13 maf or greater depending on system conditions. The operational outcome of the Upper Elevation Balancing Tier is largely dependent on system conditions at the end of the water year that are projected in the April 24-Month Study.

The April 2011 24-Month Study projected the end of water year elevation for Lake Powell would be above 3643 feet which is the Equalization Level for 2011. For this reason, pursuant to the Interim Guidelines, Equalization will govern the operation of Glen Canyon Dam for the remaining months of water year 2011.

Current Inflow Forecasts and Model Projections

Below average temperatures in the basin have persisted in May and June and as of June 8, 2011 only about 50% of the accumulated snowpack for 2011 had melted. There is still significant snowpack within the basin which will support high inflow conditions over the next 2 months.

The Water Supply forecast for Lake Powell (April through July Unregulated Inflow Volume) is 12.6 maf (159% of average) and the water year unregulated inflow to Powell for 2011 is projected to be 16.7 maf (138% of average). The last water year where Lake Powell observed that level of unregulated inflow was 1997 when the unregulated inflow volume for the water year was 17.4 maf (145% of average). Since 1963, when Lake Powell/Glen Canyon Dam began operations, only 5 of the 47 water years have had unregulated inflow volumes greater than what is projected for this year.

The unregulated inflow forecasts for Lake Powell over the next 3 months are as follows: June-6,100 kaf (198% of average); July-3,300 kaf (212% of average); August-950 kaf (155% of average). These forecasts were last updated on June 3, 2011. Incorporating these new forecasts, the projected most probable unregulated inflow for water year 2011 is now 16.7 maf (138% of average). This is the median projection for water year 2011. There is a 50% chance that the actual volume could be higher and there is a 50% the actual volume could be lower than this projected volume.

A range of possible unregulated inflow volumes that could still occur this year extend from a projected minimum probable volume to a projected maximum probable volume. These projected volumes represent what would be expected to be statistically exceeded 90% of the time (minimum inflow volume) and 10% of the time (maximum inflow

volume). The projected minimum probable volume is currently 15.1 maf (125% of average) and the projected maximum volume is currently 18.9 maf (157% of average). Given this range, there is still some uncertainty for how 2011 will play out over the next 3 months.

The June 24-Month Study projects a Lake Powell WY 2011 annual release volume of 12.44 maf. Due to recent increases to the inflow forecast for Lake Powell, Equalization may not be fully achieved by the end of the water year. The projected Lake Powell releases will be updated each month to reflect changing hydrology in order to achieve the operation specified by the Equalization Tier.

Upper Colorado River Basin Hydrology

In the Upper Colorado River Basin during water year 2010, the overall precipitation accumulated through September 30, 2010 was approximately 90% of average based on the 30 year average for the period from 1971 through 2000. For Water Year 2011 thus far, the estimated monthly precipitation within the Upper Colorado River Basin (above Lake Powell) as a percentage of average has been: (October - 135%, November - 95%, December - 225%, January - 50%, February - 100%, March - 85%, April - 155%, May - 155%).

The Climate Prediction Center outlook (dated May 19, 2011) for temperature over the next 3 months indicates that temperatures in the Upper Colorado River Basin are expected to be above average while precipitation over the next 3 months is projected to be near average in the northern reaches of the basin while below average in the southern reaches of the basin.

Upper Colorado River Basin Drought

The Upper Colorado River Basin has experienced a protracted multi-year drought since early 2000. During this drought, the inflows to Lake Powell have been below average in every year except water years 2005, 2008 and likely 2011. In the summer of 1999, Lake Powell was close to full with reservoir storage at 23.5 million acre-feet, or 97 percent of capacity. During the next 5 years (2000 through 2004) unregulated inflow to Lake Powell was well below average. This resulted in Lake Powell storage decreasing during this period to 8.0 million acre-feet (33 percent of capacity) which occurred on April 8, 2005.

During 2005, 2008 and 2009, drought conditions eased somewhat with near or above average inflow conditions and net gains in storage to Lake Powell. This year (2011) will likely be another above average inflow year. As of June 14, 2011 the storage in Lake Powell was approximately 15.51 million acre-feet (63.8 % of capacity) which is still below the desired operating level for this time of year. The overall reservoir storage in the Colorado River Basin as of June 14, 2011 is approximately 34.81 million acre-feet (58.5 % of capacity).

July 24-Month Study
Date: July 11, 2011

From: Water Resources Group, Salt Lake City
To: All Colorado River Annual Operating Plan (AOP) Recipients

Current Reservoir Status

Reservoir	June Inflow (unregulated) (acre-feet)	Percent of Average (%)	July 10 Midnight Elevation (feet)	Reservoir Storage (acre-feet)
Fontenelle	429,000	120	6494.50	259,000
Flaming Gorge	667,000	142	6031.73	3,416,000
Blue Mesa	425,000	145	7517.33	811,000
Navajo	254,000	99	6068.19	1,456,000
Powell	5,406,000	175	3655.23	17,876,000

Expected Operations

The operation of Lake Powell and Lake Mead in this July 2011 24-Month Study is pursuant to the December 2007 Record of Decision on Colorado River Interim Guidelines for Lower Basin Shortages and the Coordinated Operations of Lake Powell and Lake Mead (Interim Guidelines), and reflects the 2011 Annual Operating Plan (AOP). Pursuant to the Interim Guidelines, the Lake Powell operational tier for water year 2011 is the Upper Elevation Balancing Tier. The Intentionally Created Surplus (ICS) Surplus condition is the criterion governing the operation of Lake Mead for calendar year 2011.

The April 2011 24-Month study projected the September 30 Lake Powell elevation to be greater than the 2011 Equalization elevation of 3,643.0 feet with an annual release from Lake Powell of 8.23 maf. Consistent with Section 6.B.3 of the Interim Guidelines, the Equalization Tier governs operations of Lake Powell for the remainder of the water year.

The July 24-Month Study projects a Lake Powell WY 2011 annual release volume of 12.45 maf. Due to recent increases to the inflow forecast for Lake Powell, Equalization may not be fully achieved by the end of the water year. The projected Lake Powell releases will be updated each month to reflect changing hydrology in order to achieve the operation specified by the Equalization Tier.

The Interim Guidelines are available for download at http://www.usbr.gov/lc/region/programs/strategies/RecordofDecision.pdf.
The 2011 AOP is available for download at http://www.usbr.gov/uc/water/rsvrs/ops/aop/AOP11_final.pdf.

Fontenelle Reservoir – Inflows for the month of June were 429,000 acre-feet, or 120% of average. The reservoir elevation is 6490.8 feet above sea level and 68% of capacity. Current inflows are approximately 12,500 cfs and reservoir releases are 8,000 cfs. Snowpack is largely gone and the reservoir is filling quickly.

The Colorado Basin River Forecast Center and Natural Resources Conservation Service have issued the joint water supply forecast for the 2011 spring runoff. The July official forecast for the April to July runoff period is 1163 kaf (135%). Forecasted inflows have been shifted into the August and September time period. It is likely peak inflows are currently underway and releases will be decreased in late July. Note that these projections are provisional and subject to change as forecasts are updated and actual inflows are realized. Inflows are forecasted to be significantly above average in June and July and below average in August: 480,000 acre-ft (226%) for July, and 160,000 acre-ft (176%) for August and 80,000 acre-feet (151%) for September.

The next Fontenelle Working Group meeting is scheduled for August 18, 2011 at 10:00 am at the Joint Powers Water Board water treament plant boardroom in Green River, Wyoming. The Fontenelle Working Group is an open public forum for information exchange between Reclamation and other parties associated with the operation of Fontenelle Reservoir.

Flaming Gorge Reservoir – Unregulated inflow into Flaming Gorge Reservoir during the month of June was 668,000 acre-feet (AF), or 142 percent of average inflow. The Yampa River and resulting flows on the Green River at Jensen peaked on June 11, 2011. Flows on the Green River above Flaming Gorge Reservoir have increased over the last few weeks. The current forecast shows the current peak inflows into Flaming Gorge Reservoir decreasing next week. However, inflows are forecasted to continue through August/September and elevation levels are expected to continue increasing.

The Colorado Basin River Forecast Center and Natural Resources Conservation Service have issued the joint water supply forecast for the 2011 spring runoff. The Flaming Gorge Reservoir July official forecast for the April to July runoff period is 1,780 kaf (150%).

The Record of Decision targets have been met and current analysis shows meeting the base flow and May 2012 elevation target. Releases will begin decreasing to base flow levels on July 11, 2011. Yampa River flows during the base flow period impact hourly release schedules because flows must remain within 0.1 meter stage change as measured at the USGS stream gage located on the Green River at Jensen, Utah. As the Yampa River flows decrease, the Flaming Gorge release schedule will change.

The next Flaming Gorge Working Group meeting is scheduled for August 23, 2011, at 11:00 a.m. at the Western Park Convention Center, 302 East 200 South, Vernal, Utah. The Flaming Gorge Working Group is an open public forum for information exchange between Reclamation and the stake holders of Flaming Gorge Dam. The public is encouraged to attend and comment on the operations and plans presented by Reclamation at these meetings. For more information on this group and these meetings please contact Heather Hermansen at 801-524-3883 or Ed Vidmar at 801-379-1182.

Aspinall Unit Reservoirs – June unregulated inflow into Blue Mesa Reservoir was 425,000 acre-feet or 145 percent of average. Hydrologic conditions in the basin have been relatively dry this last month of June. Precipitation during April, May and June was 160, 115 and 40 percent of average respectively. The basin snowpack has for the most part is totally depleted. The current inflow rate into Blue Mesa Reservoir is about 4,800 cfs while reservoir releases are averaging about 1,000 cfs. For the last couple of weeks, reservoir inflows have peaked and are now slowly decreasing in response to the snowpack melt out. Blue Mesa Reservoir is still raising and most likely will reach its annual peak in the next week or two. Its present elevation is 7514.40 feet, which corresponds to a storage content of about 785,000 acre-feet.

On July 5, 2011, the NWS River Forecast Center issued an updated April through July runoff forecast. The forecast is for 840,000 acre-feet, or 117 percent of normal inflow into Blue Mesa Reservoir. This was a reduction of 50,000 acre-feet from the previous month's forecast.

Releases from Crystal Dam are currently set at 2,050 cfs and are scheduled to slowly increase over the next few days as Blue Mesa comes up to full pool. The Gunnison Diversion Tunnel is currently diverting about 900 cfs, which results in a river flow below the diversion tunnel of approximately 1,150 cfs. As in years past there seems to be about 100 cfs discrepancy between the different gage readings. These reservoir release rates are changing as conditions warrant, primarily as we respond to changes in reservoir inflow rates.

The next meeting of the "Aspinall Unit Working Group" will be held on Thursday, August 26, 2011 at Elk Creek Visitors Center at Blue Mesa Reservoir. At this meeting, review of this spring's reservoir operations, and plans for this summer and fall operations will be discussed. These meetings are open forum discussions on the Aspinall Unit reservoir operations with many interested groups participating. Anyone needing further information about these meetings should contact Dan Crabtree in the Grand Junction Area Office at (970) 248-0652.

Navajo Reservoir - Unregulated inflow into Navajo Reservoir during the month of June was 254,000 acre-feet, or 99 percent of average. Precipitation in San Juan River basin for the month of June was very dry, which averaged only 5 percent of average. Currently,

the daily reservoir inflow is averaging about 1,000 cfs. NIIP diversions are currently set at 750 cfs. The reservoir water surface elevation is currently 6068.51 feet, which corresponds to storage content of about 1,460,000 acre-feet.

On July 5, 2011, the NWS River Forecast Center issued an updated inflow forecast for Navajo Reservoir for the April through July runoff period. This forecast is projecting a volume runoff into the reservoir of 575,000 acre-feet, an increase of 30,000 acre-feet from the June forecast. This represents a 73 percent of average runoff for the Upper San Juan River Basin.

This year's spring peak operations happened over June 8th through June 14th when releases of 5,000 cfs were made. Release flows started to decrease on June 15th and reached 500 cfs on Friday, June 17th.

A public meeting on Navajo Reservoir operations will be held on Tuesday, August 30, 2011 at 1:00 p.m. in Farmington, New Mexico. At this meeting, review of last spring and summer reservoir operations, and plans for this fall and winter 2011/2012 operations will be discussed. These are open forum discussions on the operation of Navajo Reservoir with many interested groups participating. Anyone interested in the general operation of the reservoir is encouraged to attend. Please contact Ryan Christianson in Reclamation's Durango, Colorado Office at (970) 385-6590 for information about these meetings or the daily operation of Navajo Reservoir.

Glen Canyon Dam / Lake Powell – The unregulated inflow volume to Lake Powell for June 2011 was 5.40 maf (175% of average). This was below the forecasted volume for June, which was 6.1 maf (198% of average) but was still the third wettest June on record since the closure of Glen Canyon Dam. The observed inflow to Lake Powell peaked on June 11th and 12th at just over 96,000 cfs. Inflows are now declining but are still averaging about 80,000 cfs (as of July 5, 2011). The forecasted unregulated inflow volume for July was increased from 3.30 maf to 3.53 maf (226% of average) which would be the 3rd wettest July for Lake Powell since the operation of Glen Canyon Dam began in 1963.

The reservoir elevation of Lake Powell has increased significantly so far this runoff season. On April 9, 2011 the elevation of Lake Powell was 3609.7 feet above sea level which was the lowest elevation observed so far in 2011. Since that time, the elevation of Lake Powell has increased by 42.7 feet to 3652.4 feet on July 5, 2011. The elevation is projected to continue to rise and should peak near 3660 by the end of July. The last time Lake Powell's reservoir elevation was at this level was in October of 2001 (over 10 years ago) near the beginning of the recent drought.

Current Dam Operations

Releases from Glen Canyon Dam are approximately 25,400 cfs and are being maintained near steady throughout the day. The release rate is very near the full capacity of the

powerplant. The current release rate and capacity of the powerplant allows for up to 100 MW for reserve generation and 40 MW of system regulation if called upon. As the elevation of Lake Powell increases, the capacity of the powerplant will change and operation of Glen Canyon Dam will be adjusted each day to maximize the steady releases being made from Glen Canyon Dam. It is anticipated that the release volume for July will be approximately 1,465 kaf. The actual release volume for July will largely depend on generation unit efficiencies that occur throughout the month and could be higher or lower than this estimated release volume. The release volume for August will likely be similar to the release volume for July.

While the release rate over the next several months is likely to be steady, the instantaneous releases from Glen Canyon Dam may fluctuate somewhat to provide 40 MW of system regulation. These instantaneous release adjustments maintain stable conditions within the electrical generation and transmission system and result in momentary release fluctuations within a range of about 1100 cfs above or below the targeted hourly release rate. The momentary fluctuations for regulation are very short lived and typically balance out over the hour.

Spinning and non-spinning reserve generation is being maintained at Glen Canyon Dam. In order for Colorado River Storage Project (CRSP) powerplants to participate in the electrical generation and transmissions system, these powerplants must maintain a level of generation capacity available in reserve to assist the local control area for when unanticipated generation outages occur. The current CRSP powerplant reserve requirement is 100 MW (equivalent to approximately 2,675 cfs of release from Glen Canyon Dam). When an electrical outage occurs within the control area, CRSP powerplants can be called upon to provide up to 100 MW of additional generation for up to 2 hours. Under normal circumstances, calls for reserves infrequent and for much less than the required 100 MW. Because Glen Canyon Powerplant is the largest facility of the CRSP powerplants, most of the CRSP reserve requirement is maintained at Glen Canyon Dam.

Annual Operations-Coordinated Operation of Lake Mead and Lake Powell under Interim Guidelines for Water Year 2011

In August of 2010, the 24-Month Study was used to project the January 1, 2010 elevations of Lake Powell and Lake Mead. Based on these projected elevations and pursuant to the December 2007 Record of Decision on Colorado River Interim Guidelines for Lower Basin Shortages and the Coordinated Operations of Lake Powell and Lake Mead (Interim Guidelines), the operating tier for water year 2011 was selected to be Upper Elevation Balancing. Operation of Glen Canyon Dam under Upper Elevation Balancing can result in annual releases as low as 7.0 maf to as high as 13 maf or greater depending on system conditions. The operational outcome of the Upper Elevation Balancing Tier is largely dependent on system conditions at the end of the water year that are projected in the April 24-Month Study.

The April 2011 24-Month Study projected the end of water year elevation for Lake Powell would be above 3643 feet which is the Equalization Level for 2011. For this reason, pursuant to the Interim Guidelines, Equalization will govern the operation of Glen Canyon Dam for the remaining months of water year 2011.

Current Inflow Forecasts and Model Projections

The Water Supply forecast for Lake Powell (April through July Unregulated Inflow Volume) is 12.0 maf (151% of average) and the water year unregulated inflow to Powell for 2011 is projected to be 16.2 maf (135% of average). The unregulated inflow forecasts for Lake Powell over the next 3 months are as follows: July-3,530 kaf (226% of average); August-950 kaf (155% of average): September-670 kaf (141% of average). These forecasts were last updated on July 1, 2011. Incorporating these new forecasts, the projected most probable unregulated inflow for water year 2011 is now 16.2 maf (131% of average). This is the median projection for water year 2011. There is a 50% chance that the actual volume could be higher and there is a 50% the actual volume could be lower than this projected volume.

The July 24-Month Study projects a Lake Powell WY 2011 annual release volume of 12.44 maf. Due to recent increases to the inflow forecast for Lake Powell, Equalization may not be fully achieved by the end of the water year. The projected Lake Powell releases will be updated each month to reflect changing hydrology in order to achieve the operation specified by the Equalization Tier.

Upper Colorado River Basin Hydrology

The Upper Colorado River Basin has experienced a protracted multi-year drought since early 2000. During this drought, the inflows to Lake Powell have been below average in every year except water years 2005, 2008 and likely 2011. In the summer of 1999, Lake Powell was close to full with reservoir storage at 23.5 million acre-feet, or 97 percent of capacity. During the next 5 years (2000 through 2004) unregulated inflow to Lake Powell was well below average. This resulted in Lake Powell storage decreasing during this period to 8.0 million acre-feet (33 percent of capacity) which occurred on April 8, 2005.

During 2005, 2008 and 2009, drought conditions eased somewhat with near or above average inflow conditions and net gains in storage to Lake Powell. This year (2011) will likely be another above average inflow year. As of June 14, 2011 the storage in Lake Powell was approximately 15.51 million acre-feet (63.8 % of capacity) which is still below the desired operating level for this time of year. The overall reservoir storage in the Colorado River Basin as of June 14, 2011 is approximately 34.81 million acre-feet (58.5 % of capacity).

August 24-Month Study
Date: August 12, 2011

From: Water Resources Group, Salt Lake City
To: All Colorado River Annual Operating Plan (AOP) Recipients

Current Reservoir Status

Reservoir	July Inflow (unregulated) (acre-feet)	Percent of Average (%)	August 11 Midnight Elevation (feet)	Reservoir Storage (acre-feet)
Fontenelle	539,000	254	6502.49	318,000
Flaming Gorge	772,000	298	6035.85	3,581,000
Blue Mesa	223,000	167	7515.93	798,000
Navajo	40,000	48	6064.52	1,406,000
Powell	4,354,000	280	3659.64	18,446,000

Expected Operations

The operation of Lake Powell and Lake Mead in this August 2011 24-Month Study is pursuant to the December 2007 Record of Decision on Colorado River Interim Guidelines for Lower Basin Shortages and the Coordinated Operations of Lake Powell and Lake Mead (Interim Guidelines), and reflects the 2011 Annual Operating Plan (AOP). Pursuant to the Interim Guidelines, the Lake Powell operational tier for water year 2011 is the Upper Elevation Balancing Tier. The Intentionally Created Surplus (ICS) Surplus condition is the criterion governing the operation of Lake Mead for calendar year 2011.

The April 2011 24-Month study projected the September 30 Lake Powell elevation to be greater than the 2011 Equalization elevation of 3,643.0 feet with an annual release from Lake Powell of 8.23 maf. Consistent with Section 6.B.3 of the Interim Guidelines, the Equalization Tier governs operations of Lake Powell for the remainder of the water year.

The August 24-Month Study projects a Lake Powell water year 2011 annual release volume of 12.45 maf. Due to above average inflows into Lake Powell in 2011, Equalization will not be fully achieved by the end of the water year. The projected Lake Powell releases will be updated each month to reflect changing hydrology in order to achieve the operation specified by the Equalization Tier.

The Interim Guidelines are available for download at http://www.usbr.gov/lc/region/programs/strategies/RecordofDecision.pdf.

The 2011 AOP is available for download at
http://www.usbr.gov/uc/water/rsvrs/ops/aop/AOP11_final.pdf.

Fontenelle Reservoir – Inflows for the month of July were 539 kaf, or 254% of average. Inflows for the April to July runoff period were 1,221 kaf (142%). The reservoir elevation is 6502 feet above sea level and 91% of capacity. Current inflows are approximately 2,700 cfs and reservoir releases are 1,500 cfs. The snowpack has melted, however high soil moisture content continues to contribute to streamflow. The reservoir elevation is slowly rising.

Inflows are forecasted to be significantly above average the next three months in part due to increased soil moisture content: 1,400 kaf (154%) for August, 80 kaf (151%) for September and 65 kaf (135%) for October. The Colorado Basin River Forecast Center has also issued the water year 2012 outlook. Inflows for the coming water year are projected to be 1,170 kaf (94%).

The next Fontenelle Working Group meeting is scheduled for August 18, 2011 at 10:00 am at the Joint Powers Water Board water treatment plant boardroom in Green River, Wyoming. The Fontenelle Working Group is an open public forum for information exchange between Reclamation and other parties associated with the operation of Fontenelle Reservoir.

Flaming Gorge Reservoir – Unregulated inflow into Flaming Gorge Reservoir during the month of June was 772,000 acre-feet (AF), or 298 percent of average inflow. Spring runoff has ended and the Yampa River and Green River above Flaming Gorge Reservoir are at base flows at an average daily release of 2,450 cfs/day. Flaming Gorge reservoir elevation is decreasing and expected to continue decreasing through the winter to meet the May 1 target elevation of 6027 feet.

The Colorado Basin River Forecast Center and Natural Resources Conservation Service have issued the joint water supply forecast for the 2011 spring runoff. The Flaming Gorge Reservoir observed April – July unregulated inflow volume was 1,926 thousand acre-feet (kaf) or 162 percent of average. The August forecast for August and September is 160 kaf (148 percent of average) and 90 kaf (138 percent of average), respectively.

Yampa River flows during the base flow period impact hourly release schedules because flows must remain within 0.1 meter stage change as measured at the USGS stream gage located on the Green River at Jensen, Utah. As the Yampa River flows decrease, the Flaming Gorge release schedule will change.

The next Flaming Gorge Working Group meeting is scheduled for August 23, 2011, at 11:00 a.m. at the Western Park Convention Center, 302 East 200 South, Vernal, Utah. The Flaming Gorge Working Group is an open public forum for information exchange between Reclamation and the stake holders of Flaming Gorge Dam. The public is encouraged to attend and comment on the operations and plans presented by Reclamation

at these meetings. For more information on this group and these meetings please contact Heather Hermansen at 801-524-3883 or Ed Vidmar at 801-379-1182.

Aspinall Unit Reservoirs – Hydrologic conditions were on the wet side during the month of July. Early monsoonal moisture combined with the late season snowmelt runoff to help keep river flows high for much of the month. July unregulated inflow into Blue Mesa Reservoir was 223,000 acre-feet or 145 percent of average. The current inflow rate into Blue Mesa Reservoir is approximately 1,600 cfs while reservoir releases are averaging 1,800 cfs. Blue Mesa's present elevation is 7516.34 feet, which corresponds to a storage content of about 802,000 acre-feet. The observed April through July runoff into Blue Mesa Reservoir was recorded at 893,000 acre-feet, or 124 percent of average. The reservoir reached a high elevation of 7519.21 feet on July 19, 2011, which was approximately 0.19 feet below "full" pool. Full pool is actually defined by the top of the spillway gates at elevation 7519.4 feet, but we rarely fill to that level due to safety concerns for the reservoir. For practical purposes; the reservoir is considered full at elevations above 7516.4 feet. Precipitation during July was 120 percent of average.

Releases from Crystal Dam have recently decreased from 3100 cfs down to 2050 cfs. The Gunnison Diversion Tunnel is currently diverting about 950 cfs, which results in a river flow below the diversion tunnel of approximately 1100 cfs. As in years past there seems to be about 100 cfs discrepancy between the different gage readings. These reservoir release rates are changing as conditions warrant, primarily as we respond to changes in reservoir inflow rates.

The next meeting of the "Aspinall Unit Working Group" will be held on Thursday, August 26, 2011 at Elk Creek Visitors Center at Blue Mesa Reservoir. At this meeting, review of this spring's reservoir operations, and plans for this summer and fall operations will be discussed. These meetings are open forum discussions on the Aspinall Unit reservoir operations with many interested groups participating. Anyone needing further information about these meetings should contact Dan Crabtree in the Grand Junction Area Office at (970) 248-0652.

Navajo Reservoir - Releases from Navajo Reservoir are currently set at 500 cubic feet per second (cfs). Releases are made for the authorized purposes of the Navajo Unit, and to attempt to maintain a target base flow through the endangered fish critical habitat reach of the San Juan River (Farmington to Lake Powell).

The San Juan River Basin Recovery Implementation Program recommends a target base flow of between 500 cfs and 1,000 cfs through the critical habitat area. The target base flow is calculated as the weekly average of gauged flows throughout the critical habitat area, therefore daily flows of less than 500 cfs may occur at some gages.

Reclamation continues to closely monitor weather and stream flow conditions making adjustments to the Navajo Reservoir release as necessary.

July unregulated inflow into Navajo Reservoir was 40,000 acre-feet, or 48 percent of average. The total runoff for the 2011 season ending July (April-July) was recorded at 579,000 acre-feet, or about 74 percent of average runoff. The reservoir had a seasonal peak elevation of 6068.67 feet on July 1, 2011.

This year's spring peak operations happened over June 8th through June 14th when releases of 5,000 cfs were made. Release flows started to decrease on June 15th and reached 500 cfs on Friday, June 17th.

Currently the daily reservoir inflow is averaging 400 cfs while reservoir releases to the San Juan River are set at 500 cfs. NIIP diversions are approximately 700 cfs. The reservoir water surface elevation is currently 6065.19 feet, which corresponds to storage content of about 1,415,000 acre-feet.

A public meeting on Navajo Reservoir operations will be held on Tuesday, August 30, 2011 at 1:00 p.m. in Farmington, New Mexico. At this meeting, review of last spring and summer reservoir operations, and plans for this fall and winter 2011/2012 operations will be discussed. These are open forum discussions on the operation of Navajo Reservoir with many interested groups participating. Anyone interested in the general operation of the reservoir is encouraged to attend. Please contact Ryan Christianson in Reclamation's Durango, Colorado Office at (970) 385-6590 for information about these meetings or the daily operation of Navajo Reservoir.

Glen Canyon Dam / Lake Powell – The unregulated inflow volume to Lake Powell in July was 4.35 maf (279% of average). This year the unregulated inflow in July was the second wettest July since the closure of Glen Canyon Dam (1963). The April through July unregulated inflow to Lake Powell for 2011 was 12.92 maf (163% of average) and this was the third wettest April through July period since the closure of Glen Canyon Dam.

In terms of reservoir elevation and storage, Lake Powell reached its peak for water year 2011 on July 30, 2011 which was 3660.9 feet (39.1 feet from full pool) and 18.61 maf (76.5% of capacity), respectively. Releases now exceed inflows and the elevation and storage are now slowly decreasing each day. The peak reservoir elevation and storage that occurred in water year 2010 was 3638.8 feet (61.2 feet below full pool) and 15.86 maf (65.2% of capacity) and this occurred on July 5, 2010. As of August 11, 2011 the reservoir elevation and storage in Lake Powell was 3659.64 feet (40.36 feet from full pool) and 18.45 maf (75.8% of capacity), respectively.

Current Dam Operations

Releases from Glen Canyon Dam are approximately 24,600 cfs which is very near the full capacity of the powerplant. The release volume for August will likely be about 1.45 maf. In late August, releases from Glen Canyon Dam will be reduced over 3 days to approximately 14,800 cfs on September 1, 2011. During the transition to the lower level, releases will likely fluctuate for power generation.

Beginning on September 1, 2011 a steady flow experiment will begin and releases will be maintained steady at approximately 14,800 cfs until November 1, 2011. This will be the fourth year of a five year program of steady flows in September and October. The targeted release rate of 14,800 cfs is the current estimate of the maximum sustainable release rate for all 61 days during September and October given the current maintenance schedule for Glen Canyon Dam. It is possible that the actual maximum sustainable release rate during September and October could be somewhat higher. Reclamation will attempt to set the targeted release rate for the steady flow experiment at the highest level possible and this will be determined near the end of August.

While the release rate from Glen Canyon Dam over the next several months will likely be near steady, the instantaneous releases from Glen Canyon Dam may fluctuate somewhat to provide 40 MW of system regulation. These instantaneous release adjustments maintain stable conditions within the electrical generation and transmission system and result in momentary release fluctuations within a range of about 1100 cfs above or below the targeted hourly release rate. The momentary fluctuations for regulation are very short lived and typically balance out over the hour.

Spinning and non-spinning reserve generation is also maintained at Glen Canyon Dam. In order for Colorado River Storage Project (CRSP) powerplants to participate in the electrical generation and transmissions system, these powerplants must maintain a level of generation capacity available in reserve to assist the local control area for when unanticipated generation outages occur. The current CRSP powerplant reserve requirement is 100 MW (equivalent to approximately 2,675 cfs of release from Glen Canyon Dam). When an electrical outage occurs within the control area, CRSP powerplants can be called upon to provide up to 100 MW of additional generation for up to 2 hours. Under normal circumstances, calls for reserves are infrequent and for much less than the required 100 MW. Because Glen Canyon Powerplant is the largest facility of the CRSP powerplants, most of the CRSP reserve requirement is maintained at Glen Canyon Dam.

The Operating Tier for coordinated operations of Lake Powell and Lake Mead during water year 2011, pursuant to the Interim Guidelines has been the Upper Elevation Balancing Tier. In April, based on the projected end of water year elevation of Lake Powell, a shift was made such that the Equalization Tier has governed operation of Lake Powell since then. Reclamation has been operating Glen Canyon Dam with the intent of achieving Equalization by September 30, 2011. Due to significantly high inflows this spring and summer however, it is very likely that Equalization will not be fully achieved by September 30, 2011. Reclamation will continue to operate Glen Canyon Dam to release water at near full capacity of the Glen Canyon Powerplant until Equalization is fully achieved for 2011.

Current Inflow Forecasts and Model Projections

The August 24-Month Study projects the annual release volume for water year 2011 will be 12.45 maf and the end of water year reservoir elevation and storage for Lake Powell will be 3656.91 feet (43.09 feet from full pool) and 18.092 maf (74.4% of capacity), respectively.

The hydrologic outlook forecast for water year 2012 projects that the most probable (median) unregulated inflow volume will be 12.6 maf (105% of average based on the period from 1971 through 2000). Based on this hydrologic outlook, the August 24-Month Study projects the annual release from Lake Powell during water year 2012 will be 13.57 maf and the end of water year 2012 reservoir elevation and storage for Lake Powell to be 3646.4 feet (53.6 feet from full pool) and 16.77 maf (69% of capacity), respectively.

Colorado River Basin Hydrology

Since water year 2005, hydrologic conditions in the Upper Colorado River Basin have been slightly below average with significant variability from year to year. The average unregulated inflow to Lake Powell during the period from 2005 through 2011, which is a good measure of the hydrologic conditions in the Colorado River Basin, were 11.2 maf which is slightly below the official average of 12.0 maf (based on the period from 1971 through 2000). The variability during this period has been from a low water year unregulated inflow of 8.4 maf (70% of average) in water year 2006 to a high of over 17.0 maf (141% of average) which is the projected for water year 2011.

Overall reservoir storage in the Colorado River Basin has increased by nearly 10 maf since the beginning of water year 2005 and this is a significant improvement over the drought conditions during water years 2000 through 2004. On October 1, 2004, the beginning of water year 2005, the total reservoir storage in the Colorado River Basin was 29.84 maf (50.2% of capacity). As of August 12, 2011, the total reservoir storage in the Colorado River Basin was 39.28 maf (66.1% of capacity).

September 24-Month Study
Date: September 9, 2011

From: Water Resources Group, Salt Lake City
To: All Colorado River Annual Operating Plan (AOP) Recipients

Current Reservoir Status

Reservoir	August Inflow (unregulated) (acre-feet)	Percent of Average (%)	September 7 Midnight Elevation (feet)	Reservoir Storage (acre-feet)
Fontenelle	118,000	129	6501.87	313,000
Flaming Gorge	144,000	133	6034.67	3,533,000
Blue Mesa	67,000	104	7509.67	743,000
Navajo	3,000	7	6059.53	1,342,000
Powell	859,000	140	3654.60	17,795,000

Expected Operations

The operation of Lake Powell and Lake Mead in this September 2011 24-Month Study is pursuant to the December 2007 Record of Decision on Colorado River Interim Guidelines for Lower Basin Shortages and the Coordinated Operations of Lake Powell and Lake Mead (Interim Guidelines), and reflects the 2011 Annual Operating Plan (AOP). Pursuant to the Interim Guidelines, the Lake Powell operational tier for water year 2011 is the Upper Elevation Balancing Tier. The Intentionally Created Surplus (ICS) Surplus condition is the criterion governing the operation of Lake Mead for calendar year 2011.

The April 2011 24-Month study projected the September 30 Lake Powell elevation to be greater than the 2011 Equalization elevation of 3,643.0 feet with an annual release from Lake Powell of 8.23 maf. Consistent with Section 6.B.3 of the Interim Guidelines, the Equalization Tier governs operations of Lake Powell for the remainder of the water year.

The September 24-Month Study projects a Lake Powell water year 2011 annual release volume of 12.52 maf. Due to above average inflows into Lake Powell in 2011, Equalization will not be fully achieved by the end of the water year.

The Interim Guidelines are available for download at
http://www.usbr.gov/lc/region/programs/strategies/RecordofDecision.pdf.
The 2011 AOP is available for download at
http://www.usbr.gov/uc/water/rsvrs/ops/aop/AOP11_final.pdf.

Fontenelle Reservoir – Inflows for the month of August were 118 kaf, or 129% of average. The reservoir elevation is 6502 feet above sea level and 91% of capacity. Current inflows are approximately 1,000 cfs and reservoir releases are 1,200 cfs. Releases will likely be close to 1,200 cfs for the fall and winter months. The reservoir elevation will continue to decline through the fall and winter.

The Colorado Basin River Forecast Center has issued the water year 2012 (October 2011 to September 2012) forecast. At this early point, inflows over the next year are expected to be 1,170 kaf, or 94% of average. Inflows over the next three months are forecasted to be above average: 75,000 acre-ft (141%), 65,000 acre-ft (125%) and 52,000 acre-ft (118%), for September, October and November respectively

The next Fontenelle Working Group meeting is scheduled for April 26, 2012 at 10:00 am at the Seedskadee National Wildlife Refuge visitor's center. The Fontenelle Working Group is an open public forum for information exchange between Reclamation and other parties associated with the operation of Fontenelle Reservoir.

Flaming Gorge Reservoir – Unregulated inflow into Flaming Gorge Reservoir during the month of August was 144,000 acre-feet (AF), or 133 percent of average inflow. Spring runoff has ended and the Yampa River and Green River above Flaming Gorge Reservoir are at base flows at an average daily release of 2,450 cfs/day. Flaming Gorge reservoir elevation is decreasing and expected to continue decreasing through the winter to meet the May 1 target elevation of 6027 feet.

The Colorado Basin River Forecast Center and Natural Resources Conservation Service have issued the joint water supply forecast for the 2011 spring runoff. The Flaming Gorge Reservoir observed April – July unregulated inflow volume was 1,926 thousand acre-feet (kaf) or 162 percent of average. The September forecast for September and October is 85 kaf (131 percent of average) and 73 kaf (114 percent of average), respectively.

Yampa River flows during the base flow period impact hourly release schedules because flows must remain within 0.1 meter stage change as measured at the USGS stream gage located on the Green River at Jensen, Utah. As the Yampa River flows decrease, the Flaming Gorge release schedule will change.

The next Flaming Gorge Working Group meeting is scheduled for April 18, 2012, at 1:00 p.m. at the Western Park Convention Center, 302 East 200 South, Vernal, Utah. The Flaming Gorge Working Group is an open public forum for information exchange between Reclamation and the stake holders of Flaming Gorge Dam. The public is encouraged to attend and comment on the operations and plans presented by Reclamation at these meetings. For more information on this group and these meetings please contact Heather Hermansen at 801-524-3883 or Ed Vidmar at 801-379-1182.

Aspinall Unit Reservoirs – August unregulated inflow into Blue Mesa Reservoir was 67,000 acre-feet or 104 percent of average. Precipitation during August was below average, the observed precipitation was about 70 percent of average. The current inflow rate into Blue Mesa Reservoir is about 850 cfs while reservoir releases are averaging about 2,100 cfs. Blue Mesa's current elevation is 7509.67 feet, which corresponds to a storage content of about 743,000 acre-feet. The observed April through July runoff into Blue Mesa Reservoir was recorded at 893,000 acre-feet or about 124 percent of average runoff. The reservoir reached a high elevation of 7519.21 feet on July 19, 2011, which was approximately 0.19 feet below "full" pool. Full pool is actually defined by the top of the spillway gates at elevation 7519.4 feet, but we rarely fill to that level due to safety concerns for the reservoir. For practical purposes; the reservoir is considered full at elevations above 7516.4 feet.

Releases from Crystal are currently set at 2100 cfs. The Gunnison Diversion Tunnel is currently diverting about 1,100 cfs, which results in a river flow below the diversion tunnel of approximately 1,000 cfs. As in years past there seems to be about 100 cfs discrepancy between the different gage readings.

Other changes in reservoir operations are planned towards the end of September in order to accommodate for decreases in tunnel diversions. These and other changes to reservoir release rates may occur as conditions warrant, primarily as we respond to changes in the river inflows.

The last meeting of the "Aspinall Unit Working Group" was held on Thursday August 18th in the Elk Creek Visitors Center at Blue Mesa Reservoir. Spring and summer operations were reviewed and future fall and winter reservoir operations were discussed. These meetings are open forum discussions on the Aspinall Unit reservoir operations with many interested groups participating. Anyone needing further information about these meetings should contact Dan Crabtree in the Grand Junction Area Office at (970) 248-0652.

Navajo Reservoir - As a result of warmer and drier conditions returning to the San Juan River Basin, Reclamation increased the release from Navajo Reservoir to 800 cfs on Thursday, August 10th. Reservoir releases are made for the authorized purposes of the Navajo Unit, and to attempt to maintain a target base flow through the endangered fish critical habitat reach of the San Juan River (Farmington to Lake Powell).

The San Juan River Basin Recovery Implementation Program recommends a target base flow of between 500 cfs and 1,000 cfs through the critical habitat area. The target base flow is calculated as the weekly average of gaged flows throughout the critical habitat area, therefore daily flows of less than 500 cfs may occur at some gages.

Reclamation continues to closely monitor weather and stream flow conditions and make adjustments to the Navajo Reservoir release as necessary.

Precipitation for the month of August in the San Juan River basin was 60 percent of average. Unregulated inflow into Navajo Reservoir during the month of August was 3,200 acre-feet, or about 7 percent of average. The total runoff for the 2010 season ending July (April-July) was recorded at 579,000 acre-feet, or about 74 percent of average runoff. The reservoir had a seasonal peak elevation of 6068.67 feet on July 1, 2011.

This year's spring peak operations happened over June 8th through June 14th when releases of 5,000 cfs were made. Release flows started to decrease on June 15th and reached 500 cfs on Friday, June 17th.

Currently the daily reservoir inflow is averaging about 400 cfs. NIIP diversions are set at about 500 cfs. The reservoir water surface elevation is currently 6059.70 feet, which corresponds to a storage content of about 1,342,000 acre-feet.

A public meeting on Navajo Reservoir operations was held on Tuesday, August 30, 2011 at 1:00 p.m. in Farmington, New Mexico. At this meeting, review of last spring and summer reservoir operations, and plans for this fall and winter 2011/2012 operations were discussed. These are open forum discussions on the operation of Navajo Reservoir with many interested groups participating. Anyone interested in the general operation of the reservoir is encouraged to attend. Please contact Ryan Christianson in Reclamation's Durango, Colorado Office at (970) 385-6590 for information about these meetings or the daily operation of Navajo Reservoir.

Glen Canyon Dam / Lake Powell – The unregulated inflow volume to Lake Powell in August was 0.858 maf (140% of average) based on the period from 1971-2000. The Colorado Basin River Forecast Center issued the official forecast for August to be 1.00 maf (162% of average). Inflows in August were somewhat less than what was expected and so the elevation at the end of August was less than what was projected in the August 24-Month Study. The August 24-month study projected the elevation of Lake Powell would be 3657.9 feet above sea level on August 31, 2011. The elevation of Lake Powell that actually occurred on August 31, 2011 was 3655.34 feet above sea level (2.6 feet below projection).

In terms of reservoir elevation and storage, Lake Powell reached its peak for water year 2011 on July 30, 2011 which was 3660.9 feet (39.1 feet from full pool) and 18.61 maf (76.5% of capacity), respectively. For comparison, the peak reservoir elevation and storage that occurred in water year 2010 was 3638.8 feet (61.2 feet below full pool) and 15.86 maf (65.2% of capacity) and this occurred on July 5, 2010. Based on these measured values, the Lake Powell peak elevation increased year over year by 22. 1 feet while peak storage increased year over year by 2.75 maf.

Current Dam Operations

Releases from Glen Canyon Dam are now being made for a steady flow experiment that will continue to the end of October. Releases from Glen Canyon Dam are steady at approximately 15,500 cfs and will likely remain at the level through October 31, 2011 to complete the 2 month steady flow experiment.

In early November through November 10, 2011, releases will likely continue to be steady near 15,500 cfs due to ongoing maintenance work at Glen Canyon Powerplant on units 5 and 6. On or about November 11, 2011 releases will likely be increased to approximately 22,600 cfs when units 5 and 6 are returned to service. The projected release volume for November is 1200 kaf.

While the release rate from Glen Canyon Dam over the next several months will likely be near steady, the instantaneous releases from Glen Canyon Dam may fluctuate somewhat to provide 40 MW of system regulation. These instantaneous release adjustments maintain stable conditions within the electrical generation and transmission system and result in momentary release fluctuations within a range of about 1100 cfs above or below the targeted hourly release rate. The momentary fluctuations for regulation are very short lived and typically balance out over the hour.

Spinning and non-spinning reserve generation is also maintained at Glen Canyon Dam. In order for Colorado River Storage Project (CRSP) powerplants to participate in the electrical generation and transmissions system, these powerplants must maintain a level of generation capacity available in reserve to assist the local control area for when unanticipated generation outages occur. The current CRSP powerplant reserve requirement is 100 MW (equivalent to approximately 2,675 cfs of release from Glen Canyon Dam). When an electrical outage occurs within the control area, CRSP powerplants can be called upon to provide up to 100 MW of additional generation for up to 2 hours. Under normal circumstances, calls for reserves are infrequent and for much less than the required 100 MW. Because Glen Canyon Powerplant is the largest facility of the CRSP powerplants, most of the CRSP reserve requirement is maintained at Glen Canyon Dam.

The Operating Tier for coordinated operations of Lake Powell and Lake Mead during water year 2011, pursuant to the Interim Guidelines has been the Upper Elevation Balancing Tier. In April, based on the projected end of water year elevation of Lake Powell, a shift was made such that the Equalization Tier has governed operation of Lake Powell since then. Reclamation has been operating Glen Canyon Dam with the intent of achieving Equalization by September 30, 2011. Due to significantly high inflows this spring and summer however, it is very likely that Equalization will not be fully achieved by September 30, 2011. Reclamation will continue to operate Glen Canyon Dam to release water at near full capacity of the Glen Canyon Powerplant until Equalization is fully achieved for 2011.

Current Inflow Forecasts and Model Projections

The September 24-Month Study projects the annual release volume for water year 2011 will be 12.52 maf and the end of water year reservoir elevation and storage for Lake Powell will be 3653.93 feet (46.07 feet from full pool) and 17.71 maf (72.8% of capacity), respectively.

The hydrologic outlook forecast for water year 2012 projects that the most probable (median) unregulated inflow volume will be 12.6 maf (105% of average based on the period from 1971 through 2000). Based on this hydrologic outlook, the September 24-Month Study projects the annual release from Lake Powell during water year 2012 will be 13.34 maf and the end of water year 2012 reservoir elevation and storage for Lake Powell to be 3645.41 feet (54.59 feet from full pool) and 16.65 maf (68.5% of capacity), respectively.

Upper Colorado River Basin Hydrology

Since water year 2005, hydrologic conditions in the Upper Colorado River Basin have been slightly below average with significant variability from year to year. The unregulated inflow to Lake Powell, which is a good measure of the hydrologic condition in the Colorado River Basin, has averaged 11.2 maf per year during the period from 2005 through 2011. This is slightly below the official average of 12.0 maf per year. The hydrologic variability during this period has been from a low water year unregulated inflow of 8.4 maf (70% of average) in water year 2006 to a high of over 16.8 maf (140% of average) which is the projected for water year 2011.

Overall reservoir storage in the Colorado River Basin has increased by nearly 10 maf since the beginning of water year 2005 and this is a significant improvement over the drought conditions during water years 2000 through 2004. On October 1, 2004, the beginning of water year 2005, the total reservoir storage in the Colorado River Basin was 29.84 maf (50.2% of capacity). As of September 7, 2011, the total reservoir storage in the Colorado River Basin was 38.90 maf (65.4% of capacity).

October 24-Month Study
Date: October 13, 2011

From: Water Resources Group, Salt Lake City
To: All Colorado River Annual Operating Plan (AOP) Recipients

Current Reservoir Status

Reservoir	September Inflow (unregulated) (acre-feet)	Percent of Average (%)	October 12 Midnight Elevation (feet)	Reservoir Storage (acre-feet)
Fontenelle	49,000	91	6501.87	313,000
Flaming Gorge	58,000	89	6034.67	3,533,000
Blue Mesa	35,000	95	7509.67	743,000
Navajo	16,000	42	6059.53	1,342,000
Powell	547,000	115	3654.60	17,795,000

Expected Operations

The operation of Lake Powell and Lake Mead in this October 2011 24-Month Study is pursuant to the December 2007 Record of Decision on Colorado River Interim Guidelines for Lower Basin Shortages and the Coordinated Operations of Lake Powell and Lake Mead (Interim Guidelines), and reflects the 2011 Annual Operating Plan (AOP) and draft 2012 AOP. Pursuant to the Interim Guidelines, the August 2011 24-Month Study projections of the January 1, 2012 system storage and reservoir water surface elevations set the operational tier for the coordinated operation of Lake Powell and Lake Mead during 2012.

Consistent with Section 6.A of the Interim Guidelines, the Lake Powell operational tier for water year 2012 is the Equalization Tier. The October 2011 24-Month Study projects the water year release volume from Lake Powell for 2012 to be 12.26 maf.

Consistent with Section 2.B.5 of the Interim Guidelines, the Intentionally Created Surplus (ICS) Surplus Condition is the criterion governing the operation of Lake Mead for calendar years 2011 and 2012.

The Interim Guidelines are available for download at
http://www.usbr.gov/lc/region/programs/strategies/RecordofDecision.pdf.
The 2011 AOP is available for download at
http://www.usbr.gov/lc/region/g4000/aop/AOP11.pdf .

The draft 2012 AOP is available for download at http://www.usbr.gov/lc/region/g4000/AOP2012/AOP12_draft.pdf .

Fontenelle Reservoir – Inflows for the month of September were 49 kaf, or 91% of average. The reservoir elevation is 6499 feet above sea level and 84% of capacity. Current inflows are approximately 900 cfs and reservoir releases are 1,200 cfs. Releases will likely be close to 1,200 cfs for the fall and winter months. The reservoir elevation will continue to decline through the fall and winter.

The Colorado Basin River Forecast Center has issued the water year 2012 (October 2011 to September 2012) forecast. At this early point, inflows over the next year are expected to be 1,140 kaf, or 92% of average. Inflows over the next three months are forecasted to be slightly above average: 52,000 acre-ft (100%), 47,000 acre-ft (107%) and 40,000 acre-ft (121%), for October, November, and December respectively.

The next Fontenelle Working Group meeting is scheduled for April 26, 2012 at 10:00 am at the Seedskadee National Wildlife Refuge visitor's center. The Fontenelle Working Group is an open public forum for information exchange between Reclamation and other parties associated with the operation of Fontenelle Reservoir.

Flaming Gorge Reservoir – Unregulated inflow into Flaming Gorge Reservoir during the month of September was 58,000 acre-feet (AF), or 89 percent of average inflow. Spring runoff has ended and the Yampa River and Green River above Flaming Gorge Reservoir are at base flows at an average daily release of 2,000 cfs/day. Releases in November are expected to decrease to an average daily release of approximately 1,500 cfs and remain at this level through the end of February. Flaming Gorge reservoir elevation is decreasing and expected to continue decreasing through the winter to meet the May 1 target elevation of 6027 feet.

The Colorado Basin River Forecast Center and Natural Resources Conservation Service have issued the joint water supply forecast for the next three months. The October forecast for October and November is 62 kaf (97 percent of average) and 57 kaf (104 percent of average), respectively.

Yampa River flows during the base flow period impact hourly release schedules because flows must remain within 0.1 meter stage change as measured at the USGS stream gage located on the Green River at Jensen, Utah. As the Yampa River flows decrease, the Flaming Gorge release schedule will change.

The next Flaming Gorge Working Group meeting is scheduled for April 18, 2012, at 1:00 p.m. at the Western Park Convention Center, 302 East 200 South, Vernal, Utah. The Flaming Gorge Working Group is an open public forum for information exchange between Reclamation and the stake holders of Flaming Gorge Dam. The public is encouraged to attend and comment on the operations and plans presented by Reclamation

at these meetings. For more information on this group and these meetings please contact Heather Hermansen at 801-524-3883 or Ed Vidmar at 801-379-1182.

Aspinall Unit Reservoirs - September unregulated inflow into Blue Mesa Reservoir was 35,000 acre-feet or 95 percent of average. Precipitation during September was observed to be about 70 percent of average. The current inflow rate into Blue Mesa Reservoir is about 700 cfs and reservoir releases are averaging about 1,700 cfs. Blue Mesa's present elevation is 7501.34 feet, which corresponds to a storage content of about 672,000 acre-feet. The unregulated reservoir inflow into Blue Mesa Reservoir during water year 2011 was 1,162,000 acre-feet, or about 123 percent of average.

Releases from Crystal are currently set at 1600 cfs. The current diversion rate through the Gunnison Diversion Tunnel is about 800 cfs, which results in a river flow below the diversion tunnel of approximately 800 cfs. As the irrigation season comes to a close decreases in Crystal releases will occur as the demand for irrigation water is reduced and the Gunnison Tunnel flows are shut off. Flows in the Gunnison River below the tunnel will gradually be reduced to 500 to 600 cfs through the late fall and early winter months.

The last meeting of the "Aspinall Unit Working Group" was held on Thursday August 18th in the Elk Creek Visitors Center at Blue Mesa Reservoir. Spring and summer operations were reviewed and future fall and winter reservoir operations were discussed. These meetings are open forum discussions on the Aspinall Unit reservoir operations with many interested groups participating. Anyone needing further information about these meetings should contact Dan Crabtree in the Grand Junction Area Office at (970) 248-0652.

Navajo Reservoir - As a result of forecasted cooler, wetter conditions in the San Juan River Basin, the Bureau of Reclamation decreased the release from Navajo Reservoir to 500 cubic cfs on Thursday, October 6, 2010. Releases are made for the authorized purposes of the Navajo Unit, and to attempt to maintain a target base flow through the endangered fish critical habitat reach of the San Juan River (Farmington to Lake Powell).

This scheduled release change is subject to changes in river flows and weather conditions. Reclamation will continue to closely monitor weather and stream flow conditions and make adjustments to the Navajo Reservoir release as necessary.

Precipitation for the month of September in the San Juan River basin was about 80 percent of average. Unregulated inflow into Navajo Reservoir during the month of September was 16,000 acre-feet, or 42 percent of average. Currently, the daily reservoir inflow is averaging about 750 cfs. Diversions for NIIP are currently 100 cfs. The reservoir water surface elevation is at 6058.52 feet, which corresponds to a storage content of about 1,329,000 acre-feet.

The unregulated reservoir inflow into Navajo Reservoir during water year 2011 was recorded at 646,000 acre-feet, or about 64 percent of average. The reservoir had a

seasonal peak elevation of 6068.67 feet on July 1, 2011. This year's spring peak operations happened over June 8th through June 14th when releases of 5,000 cfs were made. Release flows started to decrease on June 15th and reached 500 cfs on Friday, June 17th.

A public meeting on Navajo Reservoir operations was held on Tuesday, August 30, 2011 at 1:00 p.m. in Farmington, New Mexico. At this meeting, review of last spring and summer reservoir operations, and plans for this fall and winter 2011/2012 operations were discussed. These are open forum discussions on the operation of Navajo Reservoir with many interested groups participating. Anyone interested in the general operation of the reservoir is encouraged to attend. Please contact Ryan Christianson in Reclamation's Durango, Colorado Office at (970) 385-6590 for information about these meetings or the daily operation of Navajo Reservoir.

Glen Canyon Dam / Lake Powell – During September 2011 the unregulated inflow volume to Lake Powell was 532 kaf (112% of average). This was approximately 93 kaf below what was projected in the September 24-Month Study and resulted in the elevation of Lake Powell ending September about 0.92 feet below what was projected in the September 24-Month Study. The September 30th, 2011 elevation of Lake Powell was 3653.01 feet above sea level which corresponds to a live storage of approximately 17.59 maf and 72.3% of the full capacity of 24.32 maf.

For water year 2011, the observed unregulated inflow volume to Lake Powell was 16.77 maf (139% of average for the 1971-2000 historical period of record). The 2011 water year unregulated inflow volume was the 6th wettest out of 48 years since the closure of Glen Canyon Dam (1963). Water year unregulated inflow volumes of the magnitude observed in water year 2011 (or greater) would statistically be expected to occur in about 12-14% of all years.

The 2011 water year release volume from Glen Canyon Dam was 12.52 maf and this was the largest water year release volume made from Glen Canyon Dam since water year 1998. During water year 2011 the above average inflow volume combined with the large water year release volume from Glen Canyon Dam resulted in Lake Powell realizing a net gain in elevation (year over year) of 19.35 feet which translates to an increase in live storage in Lake Powell of 2.32 maf.

Current Dam Operations

Releases from Glen Canyon Dam are now being made for a steady flow experiment that will continue to the end of October. Releases from Glen Canyon Dam are steady at approximately 15,500 cfs and will likely remain at the level through October 31, 2011 to complete the 2 month steady flow experiment.

In early November through November 10, 2011, releases will likely continue to be steady near 15,500 cfs due to ongoing maintenance work at Glen Canyon Powerplant on units 5

and 6. On or about November 11, 2011 releases will likely be increased to approximately 22,600 cfs when units 5 and 6 are returned to service. The projected release volume for November is 1200 kaf.

While the release rate from Glen Canyon Dam over the next several months will likely be near steady, the instantaneous releases from Glen Canyon Dam may fluctuate somewhat to provide 40 MW of system regulation. These instantaneous release adjustments maintain stable conditions within the electrical generation and transmission system and result in momentary release fluctuations within a range of about 1100 cfs above or below the targeted hourly release rate. The momentary fluctuations for regulation are very short lived and typically balance out over the hour.

Spinning and non-spinning reserve generation is also maintained at Glen Canyon Dam. In order for Colorado River Storage Project (CRSP) powerplants to participate in the electrical generation and transmissions system, these powerplants must maintain a level of generation capacity available in reserve to assist the local control area for when unanticipated generation outages occur. The current CRSP powerplant reserve requirement is 100 MW (equivalent to approximately 2,675 cfs of release from Glen Canyon Dam). When an electrical outage occurs within the control area, CRSP powerplants can be called upon to provide up to 100 MW of additional generation for up to 2 hours. Under normal circumstances, calls for reserves are infrequent and for much less than the required 100 MW. Because Glen Canyon Powerplant is the largest facility of the CRSP powerplants, most of the CRSP reserve requirement is maintained at Glen Canyon Dam.

Current Inflow Forecasts and Model Projections

Over the next three months (October, November and December) the forecasted unregulated inflow to Lake Powell is projected to be above average with monthly percent of average forecasts of 119%, 115% and 120%, respectively. The hydrologic outlook forecast for water year 2012 has been revised in October and now projects that the most probable (median) unregulated inflow volume to be 11.6 maf (96% of average based on the period from 1971 through 2000). Based on this revised hydrologic outlook forecast, the October 24-Month Study projects the annual release volume for water year 2012 will likely be 12.26 maf. The October 24-Month Study also projects that the end of water year reservoir elevation and storage for Lake Powell will likely be 3645.00 feet (55.00 feet from full pool) and 16.60 maf (68% of capacity), respectively.

Upper Colorado River Basin Hydrology

Since water year 2005, hydrologic conditions in the Upper Colorado River Basin have been slightly below average with significant variability from year to year. The unregulated inflow to Lake Powell, which is a good measure of the hydrologic condition in the Colorado River Basin, has averaged 11.15 maf per year during the period from 2005 through 2011. This is slightly below the official average of 12.04 maf per year. The hydrologic variability during this period has been from a low water year unregulated

inflow of 8.40 maf (70% of average) in water year 2006 to a high of over 16.77 maf (139% of average) which occurred in water year 2011.

Overall reservoir storage in the Colorado River Basin has increased by nearly 10 maf since the beginning of water year 2005 and this is a significant improvement over the drought conditions during water years 2000 through 2004. On October 1, 2004, the beginning of water year 2005, the total reservoir storage in the Colorado River Basin was 29.84 maf (50.2% of capacity). As of October 12, 2011, the total reservoir storage in the Colorado River Basin was 38.62 maf (64.9% of capacity).

November 24-Month Study
Date: November 10, 2011

From: Water Resources Group, Salt Lake City
To: All Colorado River Annual Operating Plan (AOP) Recipients

Current Reservoir Status

Reservoir	October Inflow (unregulated) (acre-feet)	Percent of Average (%)	November 9 Midnight Elevation (feet)	Reservoir Storage (acre-feet)
Fontenelle	50,000	96	6495.56	266,000
Flaming Gorge	74,000	113	6032.27	3,437,000
Blue Mesa	36,000	100	7497.79	643,000
Navajo	54,000	123	6058.43	1,328,000
Powell	575,000	105	3649.48	17,151,000

Expected Operations

The operation of Lake Powell and Lake Mead in this November 2011 24-Month Study is pursuant to the December 2007 Record of Decision on Colorado River Interim Guidelines for Lower Basin Shortages and the Coordinated Operations of Lake Powell and Lake Mead (Interim Guidelines), and reflects the 2011 Annual Operating Plan (AOP) and draft 2012 AOP. Pursuant to the Interim Guidelines, the August 2011 24-Month Study projections of the January 1, 2012 system storage and reservoir water surface elevations set the operational tier for the coordinated operation of Lake Powell and Lake Mead during 2012.

Consistent with Section 6.A of the Interim Guidelines, the Lake Powell operational tier for water year 2012 is the Equalization Tier. The November 2011 24-Month Study projects the water year release volume from Lake Powell for 2012 to be 12.04 maf.

Consistent with Section 2.B.5 of the Interim Guidelines, the Intentionally Created Surplus (ICS) Surplus Condition is the criterion governing the operation of Lake Mead for calendar years 2011 and 2012.

The Interim Guidelines are available for download at
http://www.usbr.gov/lc/region/programs/strategies/RecordofDecision.pdf.
The 2011 AOP is available for download at
http://www.usbr.gov/lc/region/g4000/aop/AOP11.pdf.

The draft 2012 AOP is available for download at http://www.usbr.gov/lc/region/g4000/AOP2012/AOP12_ProposedFinal.pdf.

Fontenelle Reservoir – Inflows for the month of October were 50 kaf, or 96% of average. The reservoir elevation is 6496 feet above sea level and 79% of capacity. Current inflows are approximately 850 cfs and reservoir releases are 1,200 cfs. Releases will likely be close to 1,200 cfs for the fall and winter months. The reservoir elevation will continue to decline through the fall and winter.

The Colorado Basin River Forecast Center has issued the water year 2012 (October 2011 to September 2012) forecast. At this early point, inflows over the next year are expected to be 1,140 kaf, or 92% of average. Inflows over the next three months are forecasted to be slightly above average: 47,000 acre-ft (107%), 40,000 acre-ft (121%) and 35,000 acre-ft (113%) for November, December, and January respectively.

The next Fontenelle Working Group meeting is scheduled for April 26, 2012 at 10:00 am at the Seedskadee National Wildlife Refuge visitor's center. The Fontenelle Working Group is an open public forum for information exchange between Reclamation and other parties associated with the operation of Fontenelle Reservoir.

Flaming Gorge Reservoir – Unregulated inflow into Flaming Gorge Reservoir during the month of October was 74,000 acre-feet (AF), or 113 percent of average inflow. Spring runoff has ended and the Yampa River and Green River above Flaming Gorge Reservoir are at base flows at an average daily release of 1,500 cfs/day. Monthly releases during December through February will likely vary across months. Flaming Gorge reservoir elevation is decreasing and expected to continue decreasing through the winter to meet the May 1 target elevation of 6027 feet.

The Colorado Basin River Forecast Center and Natural Resources Conservation Service have issued the joint water supply forecast for the next three months. The November forecast for November and December is 57 kaf (104 percent of average) and 50 kaf (128 percent of average), respectively.

Yampa River flows during the base flow period impact hourly release schedules because flows must remain within 0.1 meter stage change as measured at the USGS stream gage located on the Green River at Jensen, Utah. As the Yampa River flows decrease, the Flaming Gorge release schedule will change.

The next Flaming Gorge Working Group meeting is scheduled for April 18, 2012, at 1:00 p.m. at the Western Park Convention Center, 302 East 200 South, Vernal, Utah. The Flaming Gorge Working Group is an open public forum for information exchange between Reclamation and the stake holders of Flaming Gorge Dam. The public is encouraged to attend and comment on the operations and plans presented by Reclamation at these meetings. For more information on this group and these meetings please contact Heather Hermansen at 801-524-3883 or Ed Vidmar at 801-379-1182.

Aspinall Reservoirs – October unregulated inflow into Blue Mesa Reservoir was 36,000 acre-feet or 100 percent of average. Precipitation during October was observed to be about 145 percent of average. The current inflow rate into Blue Mesa Reservoir is about 500 cfs while reservoir releases are averaging about 500 cfs. Blue Mesa's present elevation is 7497.81 feet, which corresponds to a storage content of about 643,000 acre-feet. The unregulated reservoir inflow into Blue Mesa Reservoir during water year 2011 was 1,162,000 acre-feet, or about 123 percent of average.

Releases from Crystal are currently set at 600 cfs. The Gunnison Diversion Tunnel was shut down for the season on November 1st, with exception of some small 50 to 80 cfs diversions taken bi-weekly for municipal water needs in Montrose, Colorado. River flows below the tunnel are essentially the same as releases from the Dam, with the exception of when the tunnel is taking water to refill Fairfield Reservoir for Montrose municipal water needs.

On November 1, 2011, the National Weather Service's River Forecasting Center issued its forecasted inflow into Blue Mesa for the next 3 months. The unregulated inflow forecast for November, December, and January is for 96,000 acre-feet, which is 120% of average for these months.

The next meeting of the "Aspinall Unit Working Group" will be held on Thursday January 19th in the Montrose, Colorado, starting at 1:00 PM. At this meeting, review of last summer and fall reservoir operations, and plans for this winter and next spring 2012 operations will be discussed. These meetings are open forum discussions on the Aspinall Unit reservoir operations with many interested groups participating. Anyone needing further information about these meetings should contact Dan Crabtree in the Grand Junction Area Office at (970) 248-0652.

Navajo Reservoir - Reclamation decreased the release from Navajo Reservoir to 350 cubic feet per second (cfs) on November 1, 2011 at approximately 8am. This temporary, lower release was made in collaboration with New Mexico Department of Game & Fish's fish habitat project taking place just below the dam. The Department estimates the decreased release will be required for approximately 30 days.

The San Juan River Basin Recovery Implementation Program recommends a target base flow of between 500 cfs and 1,000 cfs through the critical habitat area. The target base flow is calculated as the weekly average of gaged flows throughout the critical habitat area, therefore daily flows of less than 500 cfs may occur at some gages.

Precipitation for the month of October in the San Juan River basin was about 165 percent of average. Unregulated inflow into Navajo Reservoir during the month of October was 54,000 acre-feet, or 123 percent of average. Currently, the daily reservoir inflow is averaging about 500 cfs. Diversions for NIIP have been shut down for the season. The

reservoir water surface elevation is at 6058.32 feet, which corresponds to a storage content of about 1,327,000 acre-feet.

The unregulated reservoir inflow into Navajo Reservoir during water year 2011 was recorded at 646,000 acre-feet, or about 64 percent of average. The reservoir had a seasonal peak elevation of 6068.67 feet on July 1, 2011. This year's spring peak operations happened over June 8th through June 14th when releases of 5,000 cfs were made. Release flows started to decrease on June 15th and reached 500 cfs on Friday, June 17th.

The next public meeting on Navajo Reservoir operations will be held on Tuesday, January 24, 2012 at 1:00 p.m. in Farmington, New Mexico. At this meeting, review of last summer and fall reservoir operations, and plans for this winter and spring 2012 operations will be discussed. These are open forum discussions on the operation of Navajo Reservoir with many interested groups participating. Anyone interested in the general operation of the reservoir is encouraged to attend. Please contact Ryan Christianson in Reclamation's Durango, Colorado Office at (970) 385-6590 for information about these meetings or the daily operation of Navajo Reservoir.

Glen Canyon Dam / Lake Powell – During October 2011 the unregulated inflow volume to Lake Powell was 575 kaf (105% of average). This was approximately 75 kaf below what was projected in the October 24-Month Study and resulted in the elevation of Lake Powell ending October about 1.26 feet below what was projected in the October 24-Month Study. The October 31th, 2011 elevation of Lake Powell was 3650.27 feet above sea level which corresponds to a live storage of approximately 17.25 maf and 70.9% of the full capacity of 24.32 maf.

For water year 2011, the observed unregulated inflow volume to Lake Powell was 16.77 maf (139% of average for the 1971-2000 historical period of record). The 2011 water year unregulated inflow volume was the 6th wettest out of 48 years since the closure of Glen Canyon Dam (1963). Water year unregulated inflow volumes of the magnitude observed in water year 2011 (or greater) would statistically be expected to occur in only about 12-14% of all years.

The 2011 water year release volume from Glen Canyon Dam was 12.52 maf and this was the largest water year release volume made from Glen Canyon Dam since water year 1998. During water year 2011, Lake Powell realized a net gain in elevation of 19.35 feet from September 30, 2010 to September 30, 2011and this translated to an increase in live storage in Lake Powell of 2.32 maf.

Current Dam Operations

Releases from Glen Canyon Dam for the 2011 steady flow experiment ended at midnight on October 31, 2011. Releases from Glen Canyon Dam are now being maximized within

unit availability to release Equalization water for 2011that was not released by September 30, 2011.

At the end of water year 2011 (September 30, 2011) the elevation of Lake Powell was 3653.01 feet above sea level and this was 10.01 feet above the Equalization level for water year 2011 (3643 feet) and translated to a volume of 1.233 maf that was in storage above the 2011 Equalization level. Releases from Glen Canyon Dam are being made at the full capacity of the powerplant to release this additional volume in order to achieve the 2011 Equalization objective. Once this additional volume has been released, releases from Glen Canyon Dam will be reduced from the full capacity of the powerplant. Current projections are that this objective will likely be completed by late December 2011.

While the release rate from Glen Canyon Dam over the next two months will likely be near steady, the instantaneous releases from Glen Canyon Dam may fluctuate somewhat to provide 40 MW of system regulation. These instantaneous release adjustments maintain stable conditions within the electrical generation and transmission system and result in momentary release fluctuations within a range of about 1100 cfs above or below the targeted hourly release rate. The momentary fluctuations for regulation are very short lived and typically balance out over the hour.

Spinning and non-spinning reserve generation may also be maintained at Glen Canyon Dam. In order for Colorado River Storage Project (CRSP) powerplants to participate in the electrical generation and transmissions system, these powerplants must maintain a level of generation capacity available in reserve to assist the local control area for when unanticipated generation outages occur. The current CRSP powerplant reserve requirement is 109 MW (equivalent to approximately 2,675 cfs of release from Glen Canyon Dam). When an electrical outage occurs within the control area, CRSP powerplants can be called upon to provide up to 109 MW of additional generation for up to 2 hours. Under normal circumstances, calls for reserves are infrequent and for much less than the required 109 MW. Because Glen Canyon Powerplant is the largest facility of the CRSP powerplants, typically most of the CRSP reserve requirement is maintained at Glen Canyon Dam but at times this reserve requirement is maintained at other plants within the CRSP system.

Current Inflow Forecasts and Model Projections

Over the next three months (November, December and January) the forecasted unregulated inflow to Lake Powell is projected to be above average with monthly percent of average forecasts of 110%, 115% and 111%, respectively. The hydrologic outlook forecast for water year 2012 has been revised in October and now projects that the most probable (median) unregulated inflow volume to be 11.6 maf (96% of average based on the period from 1971 through 2000). Based on this revised hydrologic outlook forecast, the November 24-Month Study projects the annual release volume for water year 2012 will likely be 12.05 maf. The November 24-Month Study also projects that the

end of water year reservoir elevation and storage for Lake Powell will likely be 3645.00 feet (55.00 feet from full pool) and 16.60 maf (68% of capacity), respectively.

Upper Colorado River Basin Hydrology

Since water year 2005, hydrologic conditions in the Upper Colorado River Basin have been slightly below average with significant variability from year to year. The unregulated inflow to Lake Powell, which is a good measure of the hydrologic condition in the Colorado River Basin, has averaged 11.15 maf per year during the period from 2005 through 2011. This is slightly below the official average of 12.04 maf per year. The hydrologic variability during this period has been from a low water year unregulated inflow of 8.40 maf (70% of average) in water year 2006 to a high of 16.77 maf (139% of average) which occurred in water year 2011.

Overall reservoir storage in the Colorado River Basin has increased by nearly 10 maf since the beginning of water year 2005 and this is a significant improvement over the drought conditions during water years 2000 through 2004. On October 1, 2004, the beginning of water year 2005, the total reservoir storage in the Colorado River Basin was 29.84 maf (50.2% of capacity). As of November 6, 2011, the total reservoir storage in the Colorado River Basin was 38.52 maf (64.8% of capacity).

December 24-Month Study
Date: December 7, 2011

From: Water Resources Group, Salt Lake City
To: All Colorado River Annual Operating Plan (AOP) Recipients

Current Reservoir Status

Reservoir	November Inflow (unregulated) (acre-feet)	Percent of Average (%)	December 6 Midnight Elevation (feet)	Reservoir Storage (acre-feet)
Fontenelle	46,000	106	6491.74	240,000
Flaming Gorge	64,000	114	6032.07	3,430,000
Blue Mesa	29,000	92	7495.45	624,000
Navajo	30,000	86	6058.18	1,325,000
Powell	570,000	105	3644.56	16,548,000

Expected Operations

The operation of Lake Powell and Lake Mead in this December 2011 24-Month Study is pursuant to the December 2007 Record of Decision on Colorado River Interim Guidelines for Lower Basin Shortages and the Coordinated Operations of Lake Powell and Lake Mead (Interim Guidelines), and reflects the 2011 Annual Operating Plan (AOP) and draft 2012 AOP. Pursuant to the Interim Guidelines, the August 2011 24-Month Study projections of the January 1, 2012 system storage and reservoir water surface elevations set the operational tier for the coordinated operation of Lake Powell and Lake Mead during 2012.

Consistent with Section 6.A of the Interim Guidelines, the Lake Powell operational tier for water year 2012 is the Equalization Tier. The December 2011 24-Month Study projects the water year release volume from Lake Powell for 2012 to be 11.91 maf.

Consistent with Section 2.B.5 of the Interim Guidelines, the Intentionally Created Surplus (ICS) Surplus Condition is the criterion governing the operation of Lake Mead for calendar years 2011 and 2012.

The Interim Guidelines are available for download at
http://www.usbr.gov/lc/region/programs/strategies/RecordofDecision.pdf.
The 2011 AOP is available for download at
http://www.usbr.gov/lc/region/g4000/aop/AOP11.pdf.

The draft 2012 AOP is available for download at http://www.usbr.gov/lc/region/g4000/AOP2012/AOP12_ProposedFinal.pdf.

Fontenelle Reservoir – Inflows for the month of November were 46 kaf, or 107% of average. The reservoir elevation is 6492 feet above sea level and 69% of capacity. Current inflows are approximately 600 cfs and reservoir releases are 1,200 cfs. Releases will likely be close to 1,200 cfs through the remainder of the winter and the reservoir elevation will continue to decline until spring runoff begins.

The Colorado Basin River Forecast Center has issued the water year 2012 (October 2011 to September 2012) forecast. At this early point, inflows over the next year are expected to be 1,140 kaf, or 92% of average. Inflows over the next three months are forecasted to be above average: 40,000 acre-ft (121%) 35,000 acre-ft (113%) for November, 34,000 acre-ft (117%) for December, January, and February respectively.

The next Fontenelle Working Group meeting is scheduled for April 26, 2012 at 10:00 am at the Seedskadee National Wildlife Refuge visitor's center. The Fontenelle Working Group is an open public forum for information exchange between Reclamation and other parties associated with the operation of Fontenelle Reservoir.

Flaming Gorge Reservoir – Unregulated inflow into Flaming Gorge Reservoir during the month of November was 64,000 acre-feet (AF), or 114 percent of average inflow. The Flaming Gorge Reservoir is releasing at an average daily release rate of 1,500 cfs/day and will begin increasing at a rate of 50 cfs/day on December 15, 2011 to reach 2,400 cfs/day on January 1, 2011. Releases are expected to remain at 2,400 cfs/day through spring. Flaming Gorge reservoir elevation is decreasing and expected to continue decreasing through the winter to meet the May 1 target elevation of 6027 feet.

The Colorado Basin River Forecast Center and Natural Resources Conservation Service have issued the joint water supply forecast for the next three months. The December forecast for December and January is 50 kaf (126 percent of average) and 45 kaf (100 percent of average), respectively.

The next Flaming Gorge Working Group meeting is scheduled for April 18, 2012, at 1:00 p.m. at the Western Park Convention Center, 302 East 200 South, Vernal, Utah. The Flaming Gorge Working Group is an open public forum for information exchange between Reclamation and the stake holders of Flaming Gorge Dam. The public is encouraged to attend and comment on the operations and plans presented by Reclamation at these meetings. For more information on this group and these meetings please contact Heather Hermansen at 801-524-3883 or Ed Vidmar at 801-379-1182.

Aspinall Reservoirs – November unregulated inflow into Blue Mesa Reservoir was 29,000 acre-feet or 92 percent of average. Precipitation during November was observed to be about 115 percent of average. The current inflow rate into Blue Mesa Reservoir is about 350 cfs while reservoir releases are averaging about 1500 cfs. Blue Mesa's present elevation is 7495.45 feet, which corresponds to a storage content of about 624,000 acre-

feet. The unregulated reservoir inflow into Blue Mesa Reservoir during water year 2011 was 1,162,000 acre-feet, or about 123 percent of average.

Releases from Crystal Dam are steady at about 1,500 cfs. This release rate is expected to stay at this level for the couple of months. The Gunnison Diversion Tunnel was shut down for the season on October 31st, with exception of some small 50 to 80 cfs diversions taken bi-weekly for municipal water needs in Montrose, Colorado. River flows below the tunnel are essentially the same as releases from the Dam, with the exception of when the tunnel is taking water to refill Fairfield Reservoir for Montrose municipal water needs.

On December 1, 2011, the National Weather Service's River Forecasting Center issued its forecasted inflow into Blue Mesa for the next 3 months. The unregulated inflow forecast for December, January, and February is for 83,000 acre-feet, which is 117% of average for these months.

The next meeting of the "Aspinall Unit Working Group" will be held on Thursday January 19th in the Montrose, Colorado, starting at 1:00 PM. At this meeting, review of last summer and fall reservoir operations, and plans for this winter and next spring 2012 operations will be discussed. These meetings are open forum discussions on the Aspinall Unit reservoir operations with many interested groups participating. Anyone needing further information about these meetings should contact Dan Crabtree in the Grand Junction Area Office at (970) 248-0652.

Navajo Reservoir - Reclamation increased the release from Navajo Reservoir to 500 cubic feet per second (cfs) on December 1, 2011 at approximately 4 am. The New Mexico Department of Game & Fish has finished the November work on the trout habitat improvements below the dam.

The San Juan River Basin Recovery Implementation Program recommends a target base flow of between 500 cfs and 1,000 cfs through the critical habitat area. The target base flow is calculated as the weekly average of gaged flows throughout the critical habitat area, therefore daily flows of less than 500 cfs may occur at some gages.

Precipitation for the month of November in the San Juan River basin was about 75 percent of average. Unregulated inflow into Navajo Reservoir during the month of November was 30,000 acre-feet, or 88 percent of average. Currently, the daily reservoir inflow is averaging about 300 cfs. Diversions for NIIP have been shut down for the season. The reservoir water surface elevation is at 6058.18 feet, which corresponds to a storage content of about 1,324,000 acre-feet.

The unregulated reservoir inflow into Navajo Reservoir during water year 2011 was recorded at 646,000 acre-feet, or about 64 percent of average. The reservoir had a seasonal peak elevation of 6068.67 feet on July 1, 2011. This year's spring peak operations happened over June 8th through June 14th when releases of 5,000 cfs were

made. Release flows started to decrease on June 15th and reached 500 cfs on Friday, June 17th.

The next public meeting on Navajo Reservoir operations will be held on Tuesday, January 24, 2012 at 1:00 p.m. in Farmington, New Mexico. At this meeting, review of last summer and fall reservoir operations, and plans for this winter and spring 2012 operations will be discussed. These are open forum discussions on the operation of Navajo Reservoir with many interested groups participating. Anyone interested in the general operation of the reservoir is encouraged to attend. Please contact Ryan Christianson in Reclamation's Durango, Colorado Office at (970) 385-6590 for information about these meetings or the daily operation of Navajo Reservoir.

Glen Canyon Dam / Lake Powell – During November 2011the unregulated inflow volume to Lake Powell was 570 kaf (108% of average). This was very close to the forecast volume issued by the Colorado Basin River Forecast Center on November 1, 2011. The forecast volume was 600 kaf (110% of average). Releases from Glen Canyon Dam during November were 1099 kaf and the elevation of Lake Powell decreased by 4.59 ending November at an elevation of 3645.69 feet above sea level. Releases from Glen Canyon Dam are currently averaging approximately 20,300 cfs and are near steady. This release rate is likely to continue to near the end of December and then will likely be reduced to a daily average release of approximately 16,300 cfs with daily fluctuations for power generation.

Current Dam Operations

Releases from Glen Canyon Dam for the Steady Flow Experiment (see Experimental Releases from Glen Canyon Dam, Arizona 2008 through 2012, Final Environmental Assessment and Finding of No Significant Impact) ended at midnight on October 31, 2011. The steady flow target for 2011 was 15,500 cfs which was the maximum sustainable release rate from Glen Canyon Dam during September and October. Since then, releases from Glen Canyon Dam have been maximized at powerplant capacity which varies depending on unit efficiency and availability. Current releases are approximately 20,300 cfs.

Since March 2011, releases from Glen Canyon Dam have been maximized through the powerplant in order to achieve the Equalization objectives of the Interim Guidelines. The Equalization objective for water year 2011 was to release sufficient volume from Glen Canyon Dam during the water year such that the elevation of Lake Powell would be 3643 feet above sea level on September 30, 2011.

Inflows to Lake Powell during the spring and summer of 2011 were well above average and the 7 months of maximum powerplant capacity releases from Glen Canyon Dam were not sufficient to achieve an elevation of 3643 feet on September 30, 2011. The elevation of Lake Powell on September 30, 2011 was 3653.01 feet above sea level and this translates to a volume of 1.233 maf that was in storage in Lake Powell on September

30, 2011 that would have otherwise been released for Equalization during water year 2011 if the powerplant had the capacity to make these higher releases.

Releases through the powerplant during the first 3 months of water year 2012 (October, November and December, 2011) have continued at powerplant capacity in order to make up for the Equalization releases that were not made in water year 2011 due to the limitations of the powerplant. It is currently projected that the additional release volume will be completed by the end of December 2011 at which time releases from Glen Canyon Dam will be reduced. It is estimated that this release reduction will likely occur on or about December 28, 2011.

The instantaneous release rate from Glen Canyon Dam may fluctuate somewhat to provide 40 MW of system regulation. These instantaneous release adjustments maintain stable conditions within the electrical generation and transmission system and result in momentary release fluctuations within a range of about 1100 cfs above or below the targeted hourly release rate. The momentary fluctuations for regulation are very short lived and typically balance out over the hour.

Spinning and non-spinning reserve generation may also be maintained at Glen Canyon Dam. In order for Colorado River Storage Project (CRSP) powerplants to participate in the electrical generation and transmissions system, these powerplants must maintain a level of generation capacity available in reserve to assist the local control area for when unanticipated generation outages occur. The current CRSP powerplant reserve requirement is 109 MW (equivalent to approximately 2,675 cfs of release from Glen Canyon Dam). When an electrical outage occurs within the control area, CRSP powerplants can be called upon to provide up to 109 MW of additional generation for up to 2 hours. Under normal circumstances, calls for reserves are infrequent and for much less than the required 109 MW. Because Glen Canyon Powerplant is the largest facility of the CRSP powerplants, typically most of the CRSP reserve requirement is maintained at Glen Canyon Dam but at times this reserve requirement is maintained at other plants within the CRSP system.

Current Inflow Forecasts and Model Projections

Over the next three months (December, January and February) the forecasted unregulated inflow to Lake Powell is projected to be above average with monthly percent of average forecasts of 115%, 111% and 107%, respectively. Base on these updated forecast values and the Hydrologic Outlook for water year 2012 (provided in October, 2011) the current projection for the most probable unregulated inflow volume to Lake Powell for water year 2012 is 11.4 maf (95% of average). At this time of year, there is a high level of uncertainty associated with this projection. Based on this projection, the December 2011 24-Month Study projects the water year 2012 most probable release volume will be 11.9 maf under the Equalization Tier of the Interim Guidelines. The December 2011 24-Month Study also projects the elevation condition for Lake Powell and Lake Mead at the end of water year 2012 to be 3645.0 feet and 1139.4 feet, respectively.

Upper Colorado River Basin Hydrology

Since water year 2005, hydrologic conditions in the Upper Colorado River Basin have been slightly below average with significant variability from year to year. The unregulated inflow to Lake Powell, which is a good measure of the hydrologic condition in the Colorado River Basin, has averaged 11.15 maf per year during the period from 2005 through 2011. This is slightly below the official average of 12.04 maf per year. The hydrologic variability during this period has been from a low water year unregulated inflow of 8.40 maf (70% of average) in water year 2006 to a high of over 16.77 maf (139% of average) which occurred in water year 2011.

Overall reservoir storage in the Colorado River Basin has increased by nearly 10 maf since the beginning of water year 2005 and this is a significant improvement over the drought conditions during water years 2000 through 2004. On October 1, 2004, the beginning of water year 2005, the total reservoir storage in the Colorado River Basin was 29.84 maf (50.2% of capacity). As of December 6, 2011, the total reservoir storage in the Colorado River Basin was 38.41 maf (64.6% of capacity).

January 24-Month Study
Date: January 12, 2012

From: Water Resources Group, Salt Lake City
To: All Colorado River Annual Operating Plan (AOP) Recipients

Current Reservoir Status

Reservoir	December Inflow (unregulated) (acre-feet)	Percent of Average (%)	January 11 Midnight Elevation (feet)	Reservoir Storage (acre-feet)
Fontenelle	35,000	109	6484.56	193,000
Flaming Gorge	38,000	109	6030.91	3,384,000
Blue Mesa	24,000	94	7487.17	560,000
Navajo	19,000	76	6056.64	1,306,000
Powell	359,000	99	3638.50	15,827,000

Expected Operations

The operation of Lake Powell and Lake Mead in this January 2012 24-Month Study is pursuant to the December 2007 Record of Decision on Colorado River Interim Guidelines for Lower Basin Shortages and the Coordinated Operations of Lake Powell and Lake Mead (Interim Guidelines), and reflects the 2012 Annual Operating Plan (AOP). Pursuant to the Interim Guidelines, the August 2011 24-Month Study projections of the January 1, 2012 system storage and reservoir water surface elevations set the operational tier for the coordinated operation of Lake Powell and Lake Mead during 2012.

Consistent with Section 6.A of the Interim Guidelines, the Lake Powell operational tier for water year 2012 is the Equalization Tier. The January 2012 24-Month Study projects the water year release volume from Lake Powell for 2012 to be 9.46 maf.

Consistent with Section 2.B.5 of the Interim Guidelines, the Intentionally Created Surplus (ICS) Surplus Condition is the criterion governing the operation of Lake Mead for calendar year 2012.

The Interim Guidelines are available for download at
http://www.usbr.gov/lc/region/programs/strategies/RecordofDecision.pdf.
The 2012 AOP is available for download at
http://www.usbr.gov/lc/region/g4000/aop/AOP12.pdf.

Fontenelle Reservoir – Inflows for the month of December were 35 kaf, or 109% of average. The reservoir elevation is 6485 feet above sea level and 57% of capacity. Current inflows are approximately 5500 cfs and reservoir releases are 1,200 cfs. Releases will likely be close to 1,200 cfs through the remainder of the winter and the reservoir elevation will continue to decline until spring runoff begins. Current snowpack above Fontenelle Reservoir is 64% of average.

The Colorado Basin River Forecast Center and Natural Resources Conservation Service have issued the coordinated forecast for the April to July 2012 runoff season. Inflows forecasted to be 550 kaf, or 76% of average, however it is still early in the snow accumulation season. Inflows over the next three months are forecasted by the River Forecast Center to be: 32,000 acre-ft (107%), 30,000 acre-ft (107%) and 35,000 acre-ft (66%) for January, February and March respectively.

The next Fontenelle Working Group meeting is scheduled for April 26, 2012 at 10:00 am at the Seedskadee National Wildlife Refuge visitor's center. The Fontenelle Working Group is an open public forum for information exchange between Reclamation and other parties associated with the operation of Fontenelle Reservoir.

Flaming Gorge Reservoir – Unregulated inflow into Flaming Gorge Reservoir during the month of December was 38 thousand acre-feet (kaf), or 109 percent of average inflow. The Flaming Gorge Reservoir is releasing at an average daily release rate of 2,400 cfs/day and is expected to remain at 2,400 cfs/day over the coming months in order to observe the hydrology and snowpack accumulation development through spring. Flaming Gorge reservoir elevation is decreasing and expected to continue decreasing through the winter to meet the May 1 target elevation of 6027 feet.

The Colorado Basin River Forecast Center and Natural Resources Conservation Service have issued the joint water supply forecast for the April-July runoff season. The January forecast for April-July unregulated inflow volume is 760 kaf (78 percent of average), which is a decrease of 21 percent from the previous forecast. This volume corresponds with the moderately dry classification within the 2006 Record of Decision. The unregulated inflow volumes and percent of average for January, February and March are forecasted to be 42 kaf (104%), 42 kaf (94%), and 68 kaf (66%), respectively.

The next Flaming Gorge Working Group meeting is scheduled for April 18, 2012, at 1:00 p.m. at the Western Park Convention Center, 302 East 200 South, Vernal, Utah. The Flaming Gorge Working Group is an open public forum for information exchange between Reclamation and the stake holders of Flaming Gorge Dam. The public is encouraged to attend and comment on the operations and plans presented by Reclamation at these meetings. For more information on this group and these meetings please contact Heather Hermansen at 801-524-3883 or Ed Vidmar at 801-379-1182.

Aspinall Reservoirs – December unregulated inflow into Blue Mesa Reservoir was 24,000 acre-feet or 94 percent of average. Precipitation during December was observed to be about 50 percent of average. The Gunnison River basin snowpack as of January

12th was averaging about 57 percent. The current inflow rate into Blue Mesa Reservoir is about 350 cfs while reservoir releases are averaging about 900 cfs. The present reservoir elevation is 7487.17 feet, which corresponds to a storage content of about 560,000 acre-feet.

Releases from Crystal Dam have just been reduced from 1100 cfs down to 800 cfs as a result of very dry hydrologic conditions. Reservoir releases will most likely change as hydrologic conditions warrant, primarily as we respond to changes in forecasted inflows.

The first Water Supply Forecast for Water Year 2012 has been issued and the April through July unregulated inflow is forecasted to be at 450,000 acre-feet (67% of average). Based on this forecast, Blue Mesa Reservoir is not projected to fill by the end of this 2012 runoff season.

The next meeting of the "Aspinall Unit Working Group" will be held on Thursday January 19th in the Montrose, Colorado, starting at 1:00 PM. At this meeting, review of last summer and fall reservoir operations, and plans for this winter and next spring 2012 operations will be discussed. These meetings are open forum discussions on the Aspinall Unit reservoir operations with many interested groups participating. Anyone needing further information about these meetings should contact Dan Crabtree in the Grand Junction Area Office at (970) 248-0652.

Navajo Reservoir - Reclamation increased the release from Navajo Reservoir to 500 cfs on December 1, 2011. The temporary lower release of 350 cfs was in collaboration with New Mexico Department of Game & Fish's fish habitat project, just below the dam. That project is now complete and releases have returned to 500 cfs.

Releases are made for the authorized purposes of the Navajo Unit, and to attempt to maintain a target base flow through the endangered fish critical habitat reach of the San Juan River (Farmington to Lake Powell).

Pending significant changes in the weather and stream flow conditions, the reservoir release will likely remain at 500 cfs until next spring (2012).

Precipitation for the month of December in the San Juan River basin was about 85 percent of average. Unregulated inflow into Navajo Reservoir during the month of December was 19,000 acre-feet, or 76 percent of average. Currently, the daily reservoir inflow is averaging about 200 cfs. Diversions for NIIP have currently been shut down for the winter. The reservoir water surface elevation is at 6056.64 feet, which corresponds to a storage content of about 1,306,000 acre-feet.

A public meeting on Navajo Reservoir operations will be held on Tuesday, January 24, 2012 at 1:00 p.m. in Farmington, New Mexico. At this meeting, review of last summer and fall reservoir operations, and plans for this winter and spring 2012 operations will be discussed. These are open forum discussions on the operation of Navajo Reservoir with many interested groups participating. Anyone interested in the general operation of the

reservoir is encouraged to attend. Please contact Pat Page in Reclamation's Durango, Colorado Office at (970) 385-6560 for information about these meetings or the daily operation of Navajo Reservoir.

Glen Canyon Dam / Lake Powell – During December 2011 the unregulated inflow volume to Lake Powell was 359 kaf (99% of average based on the historic period from 1981 through 2010). This was well below the volume forecasted for the month of December which was 500 kaf (138% of average). As a result, the elevation of Lake Powell at the end of December was 3639.7 feet above sea level which was 1.1 feet lower than projected at the beginning of December.

Snowpack conditions above Lake Powell are well below average for this time of year. As of January 9, 2012 the overall snowpack above Lake Powell was only 60% of average. Reclamation has received the first Water Supply forecast for 2012 and the April through July unregulated inflow to Lake Powell is projected to be 5.05 maf which is 71% of average. Based on this forecast, the projected most probable (i.e. 50% likely to be exceeded) annual release volume from Glen Canyon Dam in water year 2012 will be 9.46 maf. At this time of year however, there is a high level of uncertainty in hydrologic forecasts and the annual release volume from Glen Canyon Dam in WY2012 will ultimately be based on actual hydrology rather than forecasted hydrology.

Current Dam Operations

In August 2011, as part of the Colorado River Annual Operating Plan process, the Operating Tier for Glen Canyon Dam was determined to be the Equalization Tier under the 2008 Interim Guidelines. Under the Equalization Tier, with 1.233 maf of release volume carried over from 2011 to 2012, the annual release volume for WY2012 could be as low as 9.46 maf to as high as 13.1 maf or higher depending on actual inflow conditions. As inflow and storage conditions for Lake Powell and Lake Mead change throughout the year, Reclamation will make practicable adjustments to the operation of Glen Canyon Dam to release the appropriate annual volume during 2012. The overall goal during 2012 in terms of annual release will be to achieve the objectives of the Equalization Tier of the Interim Guidelines.

In response to the Water Supply forecast issued for Lake Powell in January, Reclamation has reduced the release volume for January from 1000 kaf to 850 kaf. This reduction began on January 10, 2012. Releases from Glen Canyon Dam are currently averaging about 13,200 cfs with fluctuations for power generation throughout the day that peak near 17,500 cfs in the afternoons. Early morning low releases are about 9,500 cfs. This operation is consistent with the Glen Canyon Operating Criteria (Federal Register, Volume 62, No. 41, March 3, 1997).

In addition to hourly release fluctuations for load following power generation, the instantaneous releases from Glen Canyon Dam may also fluctuate somewhat to provide 40 MW of system regulation. These instantaneous release adjustments stabilize the electrical generation and transmission system and translate to a range of about 1100 cfs

above or below the hourly release rate that is scheduled for a given hour. Typically, fluctuations for system regulation are very short lived and balance out over the hour and do not have noticeable impacts on river flow conditions.

Releases from Glen Canyon Dam can also fluctuate beyond the typical load following pattern when called upon as a partner that shares reserve requirements within the electrical generator community (i.e. control area). There are many generators that supply electricity to the transmission system within the control area. At times, a participating generator may experience operating conditions such that it cannot make its scheduled delivery of electricity to the system (i.e. outage). To provide system reliability, all participating electricity generators within the control area maintain a specified level of generation capacity (i.e. reserves) that can be called upon when an outage occurs. Glen Canyon Dam typically maintains 109 MW of reserves for this purpose.

Reserve agreements allow the controllers of the transmission system to call upon Glen Canyon Dam for up to 109 MW of additional generation beyond what is originally scheduled for a given hour. These calls for reserve generation can be maintained for up to 2 hours in total duration. The 109 MW reserve requirement for Glen Canyon Dam translates to approximately 2,700 cfs of flow in the river and calls for reserves can have noticeable impacts on river flow conditions. Calls for reserves are fairly infrequent and typically are for much less than the maximum requirement of 109 MW.

Current Inflow Forecasts and Model Projections

Over the next three months (January, February, March) the forecasted unregulated inflow volume to Lake Powell is projected to be 375 kaf (104% of average), 410 kaf (104% of average) and 575 kaf (86% of average), respectively. These percent of averages are all based on the historic period from 1981 through 2010. Combining this forecast with the January Water Supply Forecast and extending projections to the end of WY2012, the most probable (i.e. 50% likely to be exceeded) unregulated inflow volume for WY2012 is now projected to be 8.55 maf (79% of average). The minimum probable (i.e. 90% likely to be exceeded) unregulated inflow volume for WY2012 is now projected to be 5.48 maf (51% of average). The maximum probable (i.e. 10% likely to be exceeded) unregulated inflow volume for WY2012 is now projected to be 12.65 maf (117% of average).

Based on this range of possible inflow conditions, the January 24-Month Study projects the annual release volume for WY2012 to be as lows as 9.46 maf (under the minimum probable inflow condition) to as high as 13.01 maf (under the maximum probable inflow condition). Under the most probable inflow condition, the annual release volume is projected to be 9.46 maf and the elevation of Lake Powell at the end of WY2012 is projected to be 3643.9 feet above sea level. This elevation corresponds to a live storage volume of 16.47 maf (68% of full capacity).

Upper Colorado River Basin Hydrology

Since water year 2005, hydrologic conditions in the Upper Colorado River Basin have been near average with significant variability from year to year. The unregulated inflow to Lake Powell, which is a good measure of the hydrologic condition in the Colorado River Basin, has averaged 10.98 maf (101% of average (period 1981-2010) per year during the period from 2005 through 2011. The hydrologic variability during this period has been from a low water year unregulated inflow of 8.62 maf (80% of average) in water year 2006 to a high of 15.97 maf (147% of average) which occurred in water year 2011.

Overall reservoir storage in the Colorado River Basin has increased by nearly 10 maf since the beginning of water year 2005 and this is a significant improvement over the drought conditions during water years 2000 through 2004. On October 1, 2004, the beginning of water year 2005, the total reservoir storage in the Colorado River Basin was 29.84 maf (50.2% of capacity). As of January 10, 2012 the total reservoir storage in the Colorado River Basin was 38.54 maf (64.8% of capacity).

February 24-Month Study
Date: February 9, 2012

From: Water Resources Group, Salt Lake City
To: All Colorado River Annual Operating Plan (AOP) Recipients

Current Reservoir Status

Reservoir	January Inflow (unregulated) (acre-feet)	Percent of Average (%)	February 7 Midnight Elevation (feet)	Reservoir Storage (acre-feet)
Fontenelle	35,000	106	6484.56	193,000
Flaming Gorge	45,000	112	6030.91	3,384,000
Blue Mesa	22,000	92	7487.17	560,000
Navajo	18,200	83	6056.64	1,306,000
Powell	356,000	99	3638.50	15,827,000

Expected Operations

The operation of Lake Powell and Lake Mead in this February 2012 24-Month Study is pursuant to the December 2007 Record of Decision on Colorado River Interim Guidelines for Lower Basin Shortages and the Coordinated Operations of Lake Powell and Lake Mead (Interim Guidelines), and reflects the 2012 Annual Operating Plan (AOP). Pursuant to the Interim Guidelines, the August 2011 24-Month Study projections of the January 1, 2012 system storage and reservoir water surface elevations set the operational tier for the coordinated operation of Lake Powell and Lake Mead during 2012.

Consistent with Section 6.A of the Interim Guidelines, the Lake Powell operational tier for water year 2012 is the Equalization Tier. The February 2012 24-Month Study projects the water year release volume from Lake Powell for 2012 to be 9.46 maf.

Consistent with Section 2.B.5 of the Interim Guidelines, the Intentionally Created Surplus (ICS) Surplus Condition is the criterion governing the operation of Lake Mead for calendar year 2012.

The Interim Guidelines are available for download at
http://www.usbr.gov/lc/region/programs/strategies/RecordofDecision.pdf.
The 2012 AOP is available for download at
http://www.usbr.gov/lc/region/g4000/aop/AOP12.pdf.

Fontenelle Reservoir – Inflows for the month of January were 32 kaf, or 106% of average. The reservoir elevation is 6478 feet above sea level and 45% of capacity. Current inflows are approximately 500 cfs and reservoir releases are 1,200 cfs. Releases will likely be close to 1,200 cfs through the remainder of the winter and the reservoir elevation will continue to decline until spring runoff begins. Current snowpack above Fontenelle Reservoir is 94% of average.

The Colorado Basin River Forecast Center and Natural Resources Conservation Service have issued the coordinated forecast for the April to July 2012 runoff season. Inflows forecasted to be 685 kaf, or 94% of average, however it is still early in the snow accumulation season. Inflows over the next three months are forecasted by the River Forecast Center to be: 30,000 acre-ft (107%), 45,000 acre-ft (85%) and 80,000 acre-ft (94%) for February, March, and April respectively.

The next Fontenelle Working Group meeting is scheduled for April 26, 2012 at 10:00 am at the Seedskadee National Wildlife Refuge visitor's center. The Fontenelle Working Group is an open public forum for information exchange between Reclamation and other parties associated with the operation of Fontenelle Reservoir.

Flaming Gorge Reservoir – Unregulated inflow into Flaming Gorge Reservoir during the month of January was 45 thousand acre-feet (kaf), or 112 percent of 1981-2010 average inflow. The Flaming Gorge Reservoir is releasing at an average daily release rate of 2,400 cfs/day and is expected to remain at 2,400 cfs/day over the coming months in order to observe the hydrology and snowpack accumulation development through spring. Flaming Gorge reservoir elevation is decreasing and expected to continue decreasing through the winter to meet the May 1 target elevation of 6027 feet.

The Colorado Basin River Forecast Center and Natural Resources Conservation Service have issued the joint water supply forecast for the April-July runoff season. The February forecast for April-July unregulated inflow volume is 880 kaf (90 percent of average), which is an increase of 12 percent from the previous forecast. This volume corresponds with the average classification within the 2006 Record of Decision. The unregulated inflow volumes and percent of average for February, March and April are forecasted to be 45 kaf (108%), 82 kaf (80%), and 130 kaf (97%), respectively.

The next Flaming Gorge Working Group meeting is scheduled for April 18, 2012, at 1:00 p.m. at the Western Park Convention Center, 302 East 200 South, Vernal, Utah. The Flaming Gorge Working Group is an open public forum for information exchange between Reclamation and the stake holders of Flaming Gorge Dam. The public is encouraged to attend and comment on the operations and plans presented by Reclamation at these meetings. For more information on this group and these meetings please contact Heather Hermansen at 801-524-3883 or Ed Vidmar at 801-379-1182.

Aspinall Reservoirs – January unregulated inflow into Blue Mesa Reservoir was 22,000 acre-feet or 90 percent of average. On February 8th the basin snowpack was averaging 71 percent, which has increased a little better than 10 percent from a month ago. Precipitation during January was about 92 percent of average, while December's precipitation was recorded at 49 percent of average. The current inflow rate into Blue Mesa Reservoir is about 350 cfs while reservoir releases are averaging about 700 cfs. This past fall and early winter months has seen just below average reservoir inflows. Blue Mesa Reservoir current elevation is 7484.70 feet, which corresponds to a storage content of about 541,000 acre-feet. This elevation is about 2.0 feet lower than last year's elevation.

The Colorado Basin River Forecast Center's February water supply forecast for Blue Mesa for the April to July runoff season is 450,000 acre-feet (67% of average) which is the same as last month's forecast. Based on this forecast, Blue Mesa Reservoir is not projected to fill this runoff season.

Releases from Crystal have recently been reduced to 600 cfs. Since the Gunnison Diversion Tunnel is off for the season, the river flow downstream in the Black Canyon of the Gunnison is the same as Crystal's release.

The last meeting of the "Aspinall Unit Working Group" was held on January 19, 2012 in Montrose, Colorado. At this meeting, review of last summer and fall reservoir operations, and plans for this winter and next spring 2012 operations were discussed. These meetings are open forum discussions on the Aspinall Unit reservoir operations with many interested groups participating. For more information about these meetings please contact Dan Crabtree in the Grand Junction Area Office at (970) 248-0652.

Navajo Reservoir - Reclamation increased the release from Navajo Reservoir to 500 cfs on December 1, 2011. The temporary lower release of 350 cfs was in collaboration with New Mexico Department of Game & Fish's fish habitat project, just below the dam. That project is now complete and releases have returned to 500 cfs.

Releases are made for the authorized purposes of the Navajo Unit, and to attempt to maintain a target base flow through the endangered fish critical habitat reach of the San Juan River (Farmington to Lake Powell).

The current San Juan River basin snowpack is 78% of average snow water equivalent (SWE). For the Animas River Basin it is 76%. Pending significant changes in the weather and stream flow conditions, the reservoir release will likely remain at 500 cfs through this spring (2012).

Precipitation for the month of January in the San Juan River basin was about 66% of average, while December's was 79% of average. Unregulated inflow into Navajo Reservoir during the month of January was 18,200 acre-feet, or 83 percent of average. Currently, the daily reservoir inflow is averaging about 300 cfs. Diversions for

NIIP have currently been shut down for the winter. The reservoir water surface elevation is at 6055.67 feet, which corresponds to a storage content of about 1,294,000 acre-feet.

A public meeting on Navajo Reservoir operations was held on Tuesday, January 24, 2012 in Farmington, New Mexico. At this meeting, review of last summer and fall reservoir operations, and plans for this winter and spring 2012 operations were discussed. These are open forum discussions on the operation of Navajo Reservoir with many interested groups participating. Anyone interested in the general operation of the reservoir is encouraged to attend. Please contact Pat Page in Reclamation's Durango, Colorado Office at (970) 385-6560 for information about these meetings or the daily operation of Navajo Reservoir.

Glen Canyon Dam / Lake Powell – In January 2012 the unregulated inflow volume to Lake Powell was 356 kaf (99% of average). This volume is very close to the final forecast for January issued by the Colorado Basin River Forecast Center on January 5th which was 375 kaf. The elevation of Lake Powell on January 31st, 2012 was 3636.90 feet above sea level (63.10 feet below full pool). During January, the elevation of Lake Powell decreased by 3.52 feet and it is likely that the elevation will continue to decrease near this rate for approximately 2 more months. By late March or early April, when the snowpack begins to melt, inflows will likely increase to a point where they are greater than releases and the elevation will begin to rise. Snowpack conditions above Lake Powell are 77% of average as of February 8, 2012.

The current Water Supply forecast (April through July Unregulated Inflow Volume) for Lake Powell for 2012 is 5.05 maf which is 71% of average. Based on this inflow forecast, it is currently projected that the most probable annual release from Glen Canyon Dam in water year 2012 will be 9.46 maf. At this time of year however, there is a high level of uncertainty in hydrologic forecasts and the annual release volume from Glen Canyon Dam in WY2012 will ultimately be based on the actual inflows that occur during 2012 rather than this Water Supply forecast.

Current Dam Operations

In August 2011, pursuant to the Interim Guidelines, the Operating Tier for Glen Canyon Dam was established to be the Equalization Tier. Under the Equalization Tier for 2012, with 1.233 maf of release carried over from 2011 to 2012, the annual release volume for 2012 could be as low as 9.46 maf or higher depending on actual inflow conditions. As hydrologic conditions for Lake Powell and Lake Mead change throughout the year, Reclamation will adjust operations of Glen Canyon Dam to release the appropriate annual volume during 2012 to achieve Equalization objectives as practicably as possible by September 30, 2012.

Releases from Glen Canyon Dam are currently averaging about 12,500 cfs with fluctuations for power generation throughout the day that peak near 13,000 cfs in the afternoons and with early morning low level releases are about 7,000 cfs. This operation

is consistent with the Glen Canyon Operating Criteria (Federal Register, Volume 62, No. 41, March 3, 1997). The release volume for February is scheduled to be 650 kaf. In March, the monthly release volume will likely be 600 kaf and fluctuating releases from Glen Canyon Dam will likely average about 10,100 cfs each day with scheduled daily fluctuations occurring within the range from 7,000 cfs to 13,000 cfs.

In addition to daily scheduled fluctuations for power generation, the instantaneous releases from Glen Canyon Dam may also fluctuate to provide 40 MW of system regulation. These instantaneous release adjustments stabilize the electrical generation and transmission system and translate to a range of about 1100 cfs above or below the hourly scheduled release rate. Typically, fluctuations for system regulation are very short lived and balance out over the hour and do not have noticeable impacts on downstream river flow conditions.

Releases from Glen Canyon Dam can also fluctuate beyond scheduled fluctuations for power generation when called upon as a partner that shares reserve requirements within the electrical generator community (i.e. balancing area). There are many generators that supply electricity to the transmission system within the balancing area. At times, a participating generator may experience operating conditions such that it cannot make its scheduled delivery of electricity to the system (i.e. unscheduled outage). To provide system reliability, all participating electricity generators within the balancing area maintain a specified level of generation capacity (i.e. reserves) that can be called upon when an unscheduled outage occurs. Glen Canyon Dam typically maintains 113 MW of reserves for this purpose.

Reserve agreements allow the controllers of the balancing area to call upon Glen Canyon Dam to produce up to an additional 113 MW of electricity beyond what is originally scheduled for a given hour. Reserve calls can be maintained for a maximum of 2 hours after which time the generation rate should be returned to the original schedule. The 113 MW reserve requirement for Glen Canyon Dam translates to approximately 2,800 cfs of flow in the river. When the balancing area controllers call for reserve generation from Glen Canyon Dam, releases from the dam can exceed scheduled levels and have a noticeable impact on the river downstream from Glen Canyon Dam. But these calls for reserves are fairly infrequent and typically are for much less than the required level of 113 MW.

Current Inflow Forecasts and Model Projections

Over the next three months (February, March and April) the forecasted unregulated inflow volume to Lake Powell is projected to be 390 kaf (99% of average), 550 kaf (83% of average) and 800 kaf (76% of average), respectively. These percent of averages are all based on the historic period from 1981 through 2010. Combining this forecast with the February Water Supply Forecast and extending projections to the end of WY2012, the most probable (i.e. 50% likely to be exceeded) unregulated inflow volume for WY2012 is projected to be 8.48 maf (78% of average). There is significant uncertainty associated with this forecast. Recent analysis indicates that it is reasonably possible for the actual

unregulated inflow volume to be as low as 5.48 maf (51% of average) or as high as 12.65 maf (117% of average) depending on the range of precipitation patterns that could occur over the next several months.

Based on the reasonable range inflow conditions that could occur this year, the annual release volume from Glen Canyon Dam could be as low as 9.46 maf to as high as 12.92 maf. Under the most probable inflow condition, the annual release volume is projected to be 9.46 maf and the elevation of Lake Powell at the end of WY2012 is projected to be 3643.2 feet above sea level. This elevation corresponds to a live storage volume of 16.38 maf (67% of full capacity).

Upper Colorado River Basin Hydrology

Since water year 2005, hydrologic conditions in the Upper Colorado River Basin have been near average with significant variability from year to year. The unregulated inflow to Lake Powell, which is a good measure of the hydrologic condition in the Colorado River Basin, has averaged 10.98 maf (101% of average (period 1981-2010)) per year during the period from 2005 through 2011. The hydrologic variability during this period has been from a low water year unregulated inflow of 8.62 maf (80% of average) in water year 2006 to a high of 15.97 maf (147% of average) which occurred in water year 2011.

Overall reservoir storage in the Colorado River Basin has increased by nearly 10 maf since the beginning of water year 2005 and this is a significant improvement over the drought conditions during water years 2000 through 2004. On October 1, 2004, the beginning of water year 2005, the total reservoir storage in the Colorado River Basin was 29.84 maf (50.2% of capacity). As of January 30, 2012 the total reservoir storage in the Colorado River Basin was 38.35 maf (64.3% of capacity).

March 24-Month Study
Date: March 12, 2012

From: Water Resources Group, Salt Lake City
To: All Colorado River Annual Operating Plan (AOP) Recipients

Current Reservoir Status

Reservoir	February Inflow (unregulated) (acre-feet)	Percent of Average (%)	March 11 Midnight Elevation (feet)	Reservoir Storage (acre-feet)
Fontenelle	30,000	108	6468.45	113,000
Flaming Gorge	47,000	106	6027.89	3,268,000
Blue Mesa	21,000	94	7483.33	531,000
Navajo	18,900	62	6054.55	1,280,000
Powell	343,000	87	3634.96	15,416,000

Expected Operations

The operation of Lake Powell and Lake Mead in this March 2012 24-Month Study is pursuant to the December 2007 Record of Decision on Colorado River Interim Guidelines for Lower Basin Shortages and the Coordinated Operations of Lake Powell and Lake Mead (Interim Guidelines), and reflects the 2012 Annual Operating Plan (AOP). Pursuant to the Interim Guidelines, the August 2011 24-Month Study projections of the January 1, 2012 system storage and reservoir water surface elevations set the operational tier for the coordinated operation of Lake Powell and Lake Mead during 2012.

Consistent with Section 6.A of the Interim Guidelines, the Lake Powell operational tier for water year 2012 is the Equalization Tier. The March 2012 24-Month Study projects the water year release volume from Lake Powell for 2012 to be 9.46 maf.

Consistent with Section 2.B.5 of the Interim Guidelines, the Intentionally Created Surplus (ICS) Surplus Condition is the criterion governing the operation of Lake Mead for calendar year 2012.

The Interim Guidelines are available for download at http://www.usbr.gov/lc/region/programs/strategies/RecordofDecision.pdf.
The 2012 AOP is available for download at http://www.usbr.gov/lc/region/g4000/aop/AOP12.pdf.

Fontenelle Reservoir – Inflows for the month of February were 30 kaf, or 108% of average. The reservoir elevation is 6470 feet above sea level and 34% of capacity. Current inflows are approximately 650 cfs and reservoir releases are 1,200 cfs. Releases will likely be close to 1,200 cfs or slightly lower through the early spring months and the reservoir elevation will continue to decline until spring runoff begins. Current snowpack above Fontenelle Reservoir is 103% of average.

The Colorado Basin River Forecast Center and Natural Resources Conservation Service have issued the coordinated forecast for the April to July 2012 runoff season. Inflows forecasted to be 730 kaf, or 101% of average. Inflows over the next three months are forecasted by the River Forecast Center to be: 47 kaf (87%), 82,000 kaf(96%) and 156,000 kaf (95%) for March, April, and May respectively.

The next Fontenelle Working Group meeting is scheduled for April 26, 2012 at 10:00 am at the Seedskadee National Wildlife Refuge visitor's center. The Fontenelle Working Group is an open public forum for information exchange between Reclamation and other parties associated with the operation of Fontenelle Reservoir.

Flaming Gorge Reservoir – Unregulated inflow into Flaming Gorge Reservoir during the month of February was 47 thousand acre-feet (kaf), or 106 percent of 1981-2010 average inflow. Flaming Gorge Reservoir is releasing at an average daily release rate of 2,650 cfs/day and is anticipated to maintain releases during March-May between 2,300 and 2,700 cfs/day. Flaming Gorge reservoir elevation is decreasing and expected to continue decreasing through the winter to meet the May 1 target elevation of 6027 feet.

The Colorado Basin River Forecast Center and Natural Resources Conservation Service have issued the joint water supply forecast for the April-July runoff season. The March forecast for April-July unregulated inflow volume is 945 kaf (96 percent of average), which is an increase of 6 percent from the previous forecast. This volume corresponds with the average classification within the 2006 Record of Decision. The unregulated inflow volumes and percent of average for March, April and May are forecasted to be 98 kaf (96%), 145 kaf (109%), and 240 kaf (98%), respectively.

The next Flaming Gorge Working Group meeting is scheduled for April 18, 2012, at 1:00 p.m. at the Western Park Convention Center, 302 East 200 South, Vernal, Utah. The Flaming Gorge Working Group is an open public forum for information exchange between Reclamation and the stake holders of Flaming Gorge Dam. The public is encouraged to attend and comment on the operations and plans presented by Reclamation at these meetings. For more information on this group and these meetings please contact Heather Hermansen at 801-524-3883 or Ed Vidmar at 801-379-1182.

Aspinall Reservoirs – February unregulated inflow into Blue Mesa Reservoir was 22,000 acre-feet or 92 percent of average. On March 6, 2012 the basin snowpack was 82 percent of average, which is another increase of 10 percent from a month earlier. Precipitation during February was 110 percent of average. The current inflow rate into Blue Mesa Reservoir is about 450 cfs while reservoir releases are averaging about 525 cfs. The reservoir elevation is currently at 7483.47 feet, which corresponds to a storage content of about 532,000 acre-feet. This elevation is about 1 foot higher than last year's March elevation.

The latest Water Supply Forecast for Water Year 2012 has been issued and the April through July unregulated inflow is forecasted to be at 450,000 acre-feet (67% of normal), this is the same as last month's forecast. If this forecast holds through May 1st, the Black Canyon Water Right would call for a one day peak flow of 2,200 cfs. At this time Reclamation plans to continue to operate the Aspinall Unit to allow the water right to be met. Based on this forecast and the combination of meeting the Black Canyon Water this coming spring, Blue Mesa Reservoir is projected to not fill this runoff season. The projected fill is calculated to be about 7506.0 feet, or about 13.0 feet short of top of active conservation pool.

Releases from Crystal are currently set at 600 cfs. The Gunnison Diversion Tunnel is currently shut down for the season, with the exception of some small 50 to 100 cfs diversions taken bi-weekly for municipal water needs in Montrose, Colorado. The tunnel is expected to reopen for irrigation season sometime during the last week of March.

Reservoir releases are likely to change during March into May as we respond to changing forecasts and runoff conditions.

The next meeting of the "Aspinall Unit Working Group" will be held on Thursday, April 26, 2012 starting at 1:00 PM in Reclamation's Grand Junction Office. At this meeting, review of this winter's reservoir operations, and plans for this spring and summer operations will be discussed. These meetings are open forum discussions on the Aspinall Unit reservoir operations with many interested groups participating. Anyone needing further information about these meetings should contact Dan Crabtree in the Grand Junction Area Office at (970) 248-0652.

Navajo Reservoir - Releases from Navajo Reservoir remain near a constant 500 cfs. Reservoir releases are made for the authorized purposes of the Navajo Unit, and to attempt to maintain a target base flow through the endangered fish critical habitat reach of the San Juan River (Farmington to Lake Powell).

The San Juan River Basin Recovery Implementation Program recommends a target base flow of between 500 cfs and 1,000 cfs through the critical habitat area. The target base flow is calculated as the weekly average of gaged flows throughout the critical habitat area, therefore daily flows of less than 500 cfs may occur at some gages.

The current San Juan River basin snowpack as of March 6th is 81% of average snow water equivalent (SWE). For the Animas River Basin it is 84%. Pending significant changes in the weather and stream flow conditions, the reservoir release will likely remain at 500 cfs through this spring (2012).

Precipitation for the month of February in the San Juan River basin was about 125% of average as compared to January's 70% and December's 85% of average. Unregulated inflow into Navajo Reservoir during the month of February was 18,900 acre-feet, or 62 percent of average. Currently, the daily reservoir inflow is averaging about 350 cfs. Diversions for NIIP have currently restarted and have been as high as 200 cfs. The reservoir water surface elevation is at 6054.71 feet, which corresponds to a storage content of about 1,282,000 acre-feet.

A public meeting on Navajo Reservoir operations will be held on Wednesday, April 24, 2012, starting at 1:00 pm at the Civic Center in Farmington, New Mexico (200 West Arrington Street). At this meeting, review of this winter's reservoir operations, and plans for this spring and summer operations will be discussed. These meetings are open forum discussions on the operation of Navajo Reservoir with many interested groups participating. Anyone interested in the general operation of the reservoir is encouraged to attend. Please contact Ryan Christianson in Reclamation's Durango, Colorado Office at (970) 385-6590 for information about these meetings or the daily operation of Navajo Reservoir.

Glen Canyon Dam / Lake Powell –The monthly unregulated inflow volume to Lake Powell for February was 342 thousand acre-feet (kaf) (87% of average). This was 47 kaf below what was forecasted in early February. The release volume from Glen Canyon Dam in February was 652 kaf which was 2 kaf above what was projected for the month. As a result of these differences, the elevation of Lake Powell at the end of February was 0.32 feet (about 4 inches) lower than projected and the end of February elevation of Lake Powell was 3635.28 feet above sea level (64.72 feet below full pool).

Current snowpack conditions above Lake Powell are 80% of average (March 7, 2012) and the current Water Supply Forecast for Lake Powell (April through July Unregulated Inflow Volume) is 5.30 maf 74% of average. This forecast was updated on the March 2, 2012 by the Colorado Basin River Forecast Center.

Current Dam Operations

In August 2011, pursuant to the Interim Guidelines, the Operating Tier for Glen Canyon Dam was established to be the Equalization Tier. Under the Equalization Tier for 2012, with 1.233 maf of release carried over from 2011 to 2012, the annual release volume for 2012 could be as low as 9.46 maf or higher depending on actual inflow conditions. As hydrologic conditions for Lake Powell and Lake Mead change throughout the year, Reclamation will adjust operations of Glen Canyon Dam to release the appropriate annual volume during 2012 to achieve Equalization objectives as practicably as possible by September 30, 2012.

Releases from Glen Canyon Dam are now averaging about 9,750 cfs with fluctuations for power generation throughout the day that peak near 13,000 cfs in the afternoons and with early morning low level releases are about 7,000 cfs and this operation is consistent with the Glen Canyon Operating Criteria (Federal Register, Volume 62, No. 41, March 3, 1997). The release volume for March is scheduled to be 600 kaf. In April, the monthly release volume will likely be 600 kaf as well depending on snowpack and forecast conditions. Release fluctuations in April would likely be similar to March ranging from 7,000 cfs, in the early morning, to 13,000 cfs, in the afternoon.

In addition to daily scheduled fluctuations for power generation, the instantaneous releases from Glen Canyon Dam may also fluctuate to provide 40 MW of system regulation. These instantaneous release adjustments stabilize the electrical generation and transmission system and translate to a range of about 1100 cfs above or below the hourly scheduled release rate. Typically, fluctuations for system regulation are very short lived and balance out over the hour and do not have noticeable impacts on downstream river flow conditions.

Releases from Glen Canyon Dam can also fluctuate beyond scheduled fluctuations for power generation when called upon as a partner that shares reserve requirements within the electrical generator community (i.e. balancing area). There are many generators that supply electricity to the transmission system within the balancing area. At times, a participating generator may experience operating conditions such that it cannot make its scheduled delivery of electricity to the system (i.e. unscheduled outage). To provide system reliability, all participating electricity generators within the balancing area maintain a specified level of generation capacity (i.e. reserves) that can be called upon when an unscheduled outage occurs. Glen Canyon Dam typically maintains 113 MW of reserves for this purpose.

Reserve agreements allow the controllers of the balancing area to call upon Glen Canyon Dam to produce up to an additional 113 MW of electricity beyond what is originally scheduled for a given hour. Reserve calls can be maintained for a maximum of 2 hours after which time the generation rate should be returned to the original schedule. The 113 MW reserve requirement for Glen Canyon Dam translates to approximately 2,800 cfs of flow in the river. When the balancing area controllers call for reserve generation from Glen Canyon Dam, releases from the dam can exceed scheduled levels and have a noticeable impact on the river downstream from Glen Canyon Dam. But these calls for reserves are fairly infrequent and typically are for much less than the required level of 113 MW.

Current Inflow Forecasts and Model Projections

Over the next three months (March, April and May) the forecasted unregulated inflow volume to Lake Powell is projected to be 550 kaf (83% of average), 800 kaf (76% of average) and 1,730 kaf (74% of average), respectively. These percent of averages are all based on the historic period from 1981 through 2010. Combining this forecast with the

February Water Supply Forecast and extending projections to the end of WY2012, the most probable (i.e. 50% likely to be exceeded) unregulated inflow volume for WY2012 is projected to be 8.70 maf (80% of average). There is significant uncertainty associated with this forecast. Recent analysis indicates that it is reasonably possible for the actual unregulated inflow volume for water year 2012 to be as low as 6.6 maf (61% of average) or as high as 11.6 maf (107% of average) depending on the range of precipitation patterns that could occur over the next several months.

Based on the reasonable range inflow conditions that could occur this year, the annual release volume from Glen Canyon Dam could be as low as 9.46 maf to as high as 12.92 maf. Under the most probable inflow condition, the annual release volume is projected to be 9.46 maf and the elevation of Lake Powell at the end of WY2012 is projected to be 3644.3 feet above sea level. This elevation corresponds to a live storage volume of 16.52 maf (68% of full capacity).

Upper Colorado River Basin Hydrology

Since water year 2005, hydrologic conditions in the Upper Colorado River Basin have been near average with significant variability from year to year. The unregulated inflow to Lake Powell, which is a good measure of the hydrologic condition in the Colorado River Basin, has averaged a water year volume of 10.98 maf (101% of average (period 1981-2010)) during the period from 2005 through 2011. The hydrologic variability during this period has been from a low water year unregulated inflow volume of 8.62 maf (80% of average) in water year 2006 to a high water year unregulated inflow volume of 15.97 maf (147% of average) which occurred in water year 2011.

Overall reservoir storage in the Colorado River Basin has increased by over 8 maf since the beginning of water year 2005 and this is a significant improvement over the drought conditions during water years 2000 through 2004. On October 1, 2004, the beginning of water year 2005, the total reservoir storage in the Colorado River Basin was 29.84 maf (50.2% of capacity). On October 1, 2011, the beginning of water year 2012, the total reservoir storage in the Colorado River Basin was 38.66 maf (64.8% of capacity). As of March 7, 2012 the total reservoir storage in the Colorado River Basin was 37.83 maf (63.4% of capacity).

April 24-Month Study
Date: April 10, 2012

From: Water Resources Group, Salt Lake City
To: All Colorado River Annual Operating Plan (AOP) Recipients

Current Reservoir Status

Reservoir	March Inflow (unregulated) (acre-feet)	Percent of Average (%)	April 9 Midnight Elevation (feet)	Reservoir Storage (acre-feet)
Fontenelle	64,000	122	6473.31	134,000
Flaming Gorge	104,000	102	6026.41	3,213,000
Blue Mesa	40,000	111	7484.91	542,000
Navajo	74,000	80	6058.15	1,324,000
Powell	560,000	84	3635.74	15,506,000

Expected Operations

The operation of Lake Powell and Lake Mead in this April 2012 24-Month Study is pursuant to the December 2007 Record of Decision on Colorado River Interim Guidelines for Lower Basin Shortages and the Coordinated Operations of Lake Powell and Lake Mead (Interim Guidelines), and reflects the 2012 Annual Operating Plan (AOP). Pursuant to the Interim Guidelines, the August 2011 24-Month Study projections of the January 1, 2012 system storage and reservoir water surface elevations set the operational tier for the coordinated operation of Lake Powell and Lake Mead during 2012.

Consistent with Section 6.A of the Interim Guidelines, the Lake Powell operational tier for water year 2012 is the Equalization Tier. The April 2012 24-Month Study projects the water year release volume from Lake Powell for 2012 to be 9.46 maf.

Consistent with Section 2.B.5 of the Interim Guidelines, the Intentionally Created Surplus (ICS) Surplus Condition is the criterion governing the operation of Lake Mead for calendar year 2012.

The Interim Guidelines are available for download at
http://www.usbr.gov/lc/region/programs/strategies/RecordofDecision.pdf.
The 2012 AOP is available for download at
http://www.usbr.gov/lc/region/g4000/aop/AOP12.pdf.

Fontenelle Reservoir – Inflows for the month of March were 64 kaf, or 122% of average. The reservoir elevation is 6472 feet above sea level and 37% of capacity. Current inflows are approximately 1,600 cfs and reservoir releases are 1,000 cfs. Releases will likely be close to 1,000 cfs through most of April and the reservoir elevation will continue to increase throughout the spring and summer. Basin snowpack peaked on March 21st, approximately three weeks early, at 84% of average and the low and middle elevation snow has begun to melt. Current snowpack above Fontenelle Reservoir is 78% of average.

The Colorado Basin River Forecast Center and Natural Resources Conservation Service have issued the April coordinated forecast for the April to July 2012 runoff season. Inflows are forecasted to be 665 kaf, or 92% of average. The April forecast decreased by 9% since the March official forecast. Inflows over the next three months are forecasted by the River Forecast Center to be: 90 kaf (106%), 135 kaf (82%) and 280 kaf (94%) for April, May, and June respectively.

The next Fontenelle Working Group meeting is scheduled for April 26, 2012 at 10:00 am at the Seedskadee National Wildlife Refuge visitor's center. The Fontenelle Working Group is an open public forum for information exchange between Reclamation and other parties associated with the operation of Fontenelle Reservoir.

Flaming Gorge Reservoir – Unregulated inflow into Flaming Gorge Reservoir during the month of March was 104 thousand acre-feet (kaf), or 102 percent of 1981-2010 average inflow. Flaming Gorge Reservoir is decreasing releases to an average daily release rate of 1,600 cfs and is anticipated to maintain releases during April and May. Flaming Gorge reservoir elevation has reached the May 1 target elevation of 6027 feet.

The Colorado Basin River Forecast Center and Natural Resources Conservation Service have issued the joint water supply forecast for the April-July runoff season. The April forecast for April-July unregulated inflow volume is 810 kaf (83 percent of average), which is a decrease of 13 percent from the previous forecast. This volume corresponds with the average classification within the 2006 Record of Decision. The unregulated inflow volumes and percent of average for April, May and June are forecasted to be 135 kaf (101%), 195 kaf (80%), and 315 kaf (81%), respectively.

The next Flaming Gorge Working Group meeting is scheduled for April 18, 2012, at 1:00 p.m. at the Western Park Convention Center, 302 East 200 South, Vernal, Utah. The Flaming Gorge Working Group is an open public forum for information exchange between Reclamation and the stake holders of Flaming Gorge Dam. The public is encouraged to attend and comment on the operations and plans presented by Reclamation at these meetings. For more information on this group and these meetings please contact Heather Hermansen at 801-524-3883 or Ed Vidmar at 801-379-1182.

Aspinall Reservoirs – March unregulated inflow into Blue Mesa Reservoir was 40,000 acre-feet or 112 percent of average. On March 10, 2012 the basin snowpack was 78 percent of average; it now stands at 48 percent and falling fast. This is indicative of an early melt with very little snowpack. Precipitation during March was only 30 percent of average. The current inflow rate into Blue Mesa Reservoir is about 750 cfs while reservoir releases are averaging about 850 cfs. The reservoir elevation is currently at 7484.91 feet, which corresponds to a storage content of about 542,000 acre-feet.

The latest Water Supply Forecast for Water Year 2012 has been issued and the April through July unregulated inflow is forecasted to be at 330,000 acre-feet (49% of average), this is 120,000 acre-feet lower than last month's forecast. If this forecast holds through May 1st, the Black Canyon Water Right would call for a one day peak flow of 958 cfs. At this time Reclamation plans to continue to operate the Aspinall Unit to allow the water right to be met. Based on this forecast and the combination of meeting the Black Canyon Water this coming spring, Blue Mesa Reservoir is projected to not fill this runoff season. The projected fill is calculated to be about 7500.0 feet, or about 19.5 feet short of top of active conservation pool.

Releases from Crystal are currently set at 1050 cfs. The Gunnison Diversion Tunnel is currently diverting about 700 cfs, which results in a river flow below the diversion tunnel of approximately 350 cfs. This lower flow is a result of Reclamation trying to conserve reservoir storage for what is forecasted to be a very dry year.

The next meeting of the "Aspinall Unit Working Group" will be held on Thursday, April 26, 2012 starting at 1:00 PM in Reclamation's Grand Junction Office. At this meeting, review of this winter's reservoir operations, and plans for this spring and summer operations will be discussed. These meetings are open forum discussions on the Aspinall Unit reservoir operations with many interested groups participating. Anyone needing further information about these meetings should contact Dan Crabtree in the Grand Junction Area Office at (970) 248-0652.

Navajo Reservoir - Releases from Navajo Reservoir remain near a constant 500 cfs. Reservoir releases are made for the authorized purposes of the Navajo Unit, and to attempt to maintain a target base flow through the endangered fish critical habitat reach of the San Juan River (Farmington to Lake Powell).

The San Juan River Basin Recovery Implementation Program recommends a target base flow of between 500 cfs and 1,000 cfs through the critical habitat area. The target base flow is calculated as the weekly average of gauged flows throughout the critical habitat area, therefore daily flows of less than 500 cfs may occur at some gages.

The current San Juan River basin snowpack as of April 10th is only 45% of average snow water equivalent (SWE), which is down from 81% in one month. For the Animas River Basin it is 43% which is down from 82% from last month. This indicates an early

snowmelt. Pending significant changes in the weather and stream flow conditions, the reservoir release will likely remain at 500 cfs through this spring (2012).

Precipitation for the month of March in the San Juan River basin was about 35% of average as compared to February's 125% and January's 70% average. Unregulated inflow into Navajo Reservoir during the month of March was 74,000 acre-feet, or 80 percent of average. Currently, the daily reservoir inflow is averaging about 1,600 cfs. Diversions for NIIP have currently restarted and have been as high as 450 cfs. The reservoir water surface elevation is at 6058.15 feet, which corresponds to a storage content of about 1,324,000 acre-feet.

A public meeting on Navajo Reservoir operations will be held on Wednesday, April 24, 2012, starting at 1:00 pm at the Civic Center in Farmington, New Mexico (200 West Arrington Street). At this meeting, review of this winter's reservoir operations, and plans for this spring and summer operations will be discussed. These meetings are open forum discussions on the operation of Navajo Reservoir with many interested groups participating. Anyone interested in the general operation of the reservoir is encouraged to attend. Please contact Ryan Christianson in Reclamation's Durango, Colorado Office at (970) 385-6590 for information about these meetings or the daily operation of Navajo Reservoir.

Glen Canyon Dam / Lake Powell – The monthly unregulated inflow volume to Lake Powell for March was 560 thousand acre-feet (kaf) (84% of average). This was 10 kaf above what was forecasted in early March. The release volume from Glen Canyon Dam in March was 600 kaf which was exactly equal to what was projected for release for the month. As a result of the difference between projected and actual inflows during March, the elevation of Lake Powell at the end of March was 0.36 feet (about 4 inches) higher than projected. On March 31, 2012 the elevation of Lake Powell was 3635.33 feet above sea level (64.67 feet below full pool).

Snowpack conditions above Lake Powell are currently 43% of average (April 10, 2012) and this percentage has dropped significantly over the past month. The runoff season appears to have started about one month earlier than normal due to above normal temperatures during March and April. The Colorado Basin River Forecast Center updated their Water Supply Forecast for Lake Powell (April through July Unregulated Inflow Volume) from the March forecast, which was 5.30 maf (74% of average), to the April forecast which is now 3.50 maf (49% of average). This forecast was updated on April 3, 2012.

Current Dam Operations

In August 2011, pursuant to the Interim Guidelines, the Operating Tier for Glen Canyon Dam was established to be the Equalization Tier. Under the Equalization Tier for 2012, with 1.233 maf of release carried over from 2011 to 2012, the annual release volume for 2012 could be as low as 9.46 maf or higher depending on actual inflow conditions. As

hydrologic conditions for Lake Powell and Lake Mead change throughout the year, Reclamation will adjust operations of Glen Canyon Dam to release the appropriate annual volume during 2012 to achieve Equalization objectives as practicably as possible by September 30, 2012.

Releases from Glen Canyon Dam are now averaging about 10,083 cfs with fluctuations for power generation throughout the day that peak near 13,000 cfs in the afternoons and with early morning low level releases are about 7,000 cfs and this operation is consistent with the Glen Canyon Operating Criteria (Federal Register, Volume 62, No. 41, March 3, 1997). The release volume for April is scheduled to be 600 kaf. In May, the monthly release volume will likely be 600 kaf as well depending on snowpack and forecast conditions. Release fluctuations in May would likely be similar to April ranging from 7,000 cfs, in the early morning, to 13,000 cfs, in the afternoon.

In addition to daily scheduled fluctuations for power generation, the instantaneous releases from Glen Canyon Dam may also fluctuate to provide 40 MW of system regulation. These instantaneous release adjustments stabilize the electrical generation and transmission system and translate to a range of about 1100 cfs above or below the hourly scheduled release rate. Typically, fluctuations for system regulation are very short lived and balance out over the hour and do not have noticeable impacts on downstream river flow conditions.

Releases from Glen Canyon Dam can also fluctuate beyond scheduled fluctuations for power generation when called upon as a partner that shares reserve requirements within the electrical generator community (i.e. balancing area). There are many generators that supply electricity to the transmission system within the balancing area. At times, a participating generator may experience operating conditions such that it cannot make its scheduled delivery of electricity to the system (i.e. unscheduled outage). To provide system reliability, all participating electricity generators within the balancing area maintain a specified level of generation capacity (i.e. reserves) that can be called upon when an unscheduled outage occurs. Glen Canyon Dam typically maintains 113 MW of reserves for this purpose.

Reserve agreements allow the controllers of the balancing area to call upon Glen Canyon Dam to produce up to an additional 113 MW of electricity beyond what is originally scheduled for a given hour. Reserve calls can be maintained for a maximum of 2 hours after which time the generation rate should be returned to the original schedule. The 113 MW reserve requirement for Glen Canyon Dam translates to approximately 2,800 cfs of flow in the river. When the balancing area controllers call for reserve generation from Glen Canyon Dam, releases from the dam can exceed scheduled levels and have a noticeable impact on the river downstream from Glen Canyon Dam. But these calls for reserves are fairly infrequent and typically are for much less than the required level of 113 MW.

Current Inflow Forecasts and Model Projections

Over the next three months (April, May and June) the forecasted unregulated inflow volume to Lake Powell is projected to be 800 kaf (76% of average), 1050 kaf (45% of average) and 1,150 kaf (43% of average), respectively. These percent of averages are all based on the historic period from 1981 through 2010. Combining this forecast with the April Water Supply Forecast and extending projections to the end of WY2012, the most probable (i.e. 50% likely to be exceeded) unregulated inflow volume for WY2012 is projected to be 6.79 maf (63% of average). There is still a fair amount of uncertainty associated with this forecast. Recent analysis indicates that it is reasonably possible for the actual unregulated inflow volume for water year 2012 to be as low as 4.89 maf (45% of average) or as high as 9.22 maf (85% of average) depending on the range of precipitation patterns that could occur over the next several months.

Based on the reasonable range of inflow conditions that could occur this year, the annual release volume from Glen Canyon Dam could be as low as 9.46 maf to as high as 9.98 maf. Under the most probable inflow condition, the annual release volume is projected to be 9.46 maf and the elevation of Lake Powell at the end of WY2012 is projected to be 3632.55 feet above sea level. This elevation corresponds to a live storage volume of 15.14 maf (62% of full capacity).

Upper Colorado River Basin Hydrology

Since water year 2005, hydrologic conditions in the Upper Colorado River Basin have been near average with significant variability from year to year. The unregulated inflow to Lake Powell, which is a good measure of the hydrologic condition in the Colorado River Basin, has averaged a water year volume of 10.98 maf (101% of average (period 1981-2010)) during the period from 2005 through 2011. The hydrologic variability during this period has been from a low water year unregulated inflow volume of 8.62 maf (80% of average) in water year 2006 to a high water year unregulated inflow volume of 15.97 maf (147% of average) which occurred in water year 2011.

Overall reservoir storage in the Colorado River Basin has increased by over 8 maf since the beginning of water year 2005 and this is a significant improvement over the drought conditions during water years 2000 through 2004. On October 1, 2004, the beginning of water year 2005, the total reservoir storage in the Colorado River Basin was 29.84 maf (50.2% of capacity). On October 1, 2011, the beginning of water year 2012, the total reservoir storage in the Colorado River Basin was 38.66 maf (64.8% of capacity). As of April 9, 2012 the total reservoir storage in the Colorado River Basin was 37.47 maf (62.8% of capacity).

May 24-Month Study
Date: May 9, 2012

From: Water Resources Group, Salt Lake City
To: All Colorado River Annual Operating Plan (AOP) Recipients

Current Reservoir Status

Reservoir	April Inflow (unregulated) (acre-feet)	Percent of Average (%)	May 8 Midnight Elevation (feet)	Reservoir Storage (acre-feet)
Fontenelle	98,000	115	6480.26	168,000
Flaming Gorge	136,000	102	6026.23	3,206,000
Blue Mesa	57,000	74	7483.26	530,000
Navajo	149,000	87	6060.66	1,356,000
Powell	764,000	72	3635.86	15,520,000

Expected Operations

The operation of Lake Powell and Lake Mead in this May 2012 24-Month Study is pursuant to the December 2007 Record of Decision on Colorado River Interim Guidelines for Lower Basin Shortages and the Coordinated Operations of Lake Powell and Lake Mead (Interim Guidelines), and reflects the 2012 Annual Operating Plan (AOP). Pursuant to the Interim Guidelines, the August 2011 24-Month Study projections of the January 1, 2012 system storage and reservoir water surface elevations set the operational tier for the coordinated operation of Lake Powell and Lake Mead during 2012.

Consistent with Section 6.A of the Interim Guidelines, the Lake Powell operational tier for water year 2012 is the Equalization Tier. The May 2012 24-Month Study projects the water year release volume from Lake Powell for 2012 to be 9.46 maf.

Consistent with Section 2.B.5 of the Interim Guidelines, the Intentionally Created Surplus (ICS) Surplus Condition is the criterion governing the operation of Lake Mead for calendar year 2012.

The Interim Guidelines are available for download at
http://www.usbr.gov/lc/region/programs/strategies/RecordofDecision.pdf.
The 2012 AOP is available for download at
http://www.usbr.gov/lc/region/g4000/aop/AOP12.pdf.

Fontenelle Reservoir – Inflows for the month of April were 98 kaf, or 115% of average. The reservoir elevation is 6480 feet above sea level and 49% of capacity. Current inflows are approximately 1,400 cfs and reservoir releases are 1,000 cfs. Releases will likely remain near 1,000 cfs through the first weeks of May and may be increased to approximately 1,500 cfs near the end of the month. The reservoir elevation will continue to increase throughout the spring and summer. Basin snowpack peaked on March 21st, approximately three weeks early, at 84% of average. Current snowpack above Fontenelle Reservoir is 33% of average and most of the low and middle elevation snow has melted.

The Colorado Basin River Forecast Center and Natural Resources Conservation Service have issued the May coordinated forecast for the April to July 2012 runoff season. As conditions become drier, the forecast continues to decrease. Inflows are forecasted to be 540 kaf, or 74% of average. The May forecast decreased by 18% since the April official forecast. Inflows over the next three months are forecasted by the River Forecast Center to be: 115 kaf (70%), 215 kaf (72%) and 110 kaf (62%) for May, June, and July respectively.

The spring Fontenelle Working Group meeting was held on April 26, 2012 at Seedskadee National Wildlife Refuge. Minutes from the meeting are posted on the Working Group web pages. The next Fontenelle Working Group meeting is scheduled for August 23, 2012 at 10:00 am at the Joint Power's Water Board treatment plant boardroom in Green River, Wyoming. The Fontenelle Working Group is an open public forum for information exchange between Reclamation and other parties associated with the operation of Fontenelle Reservoir.

Flaming Gorge Reservoir – Unregulated inflow into Flaming Gorge Reservoir during the month of April was 136,000 acre-feet, or 101 percent of 1981-2010 average inflow. Flaming Gorge Reservoir is releasing average daily release rate of 1,600 cubic feet per second (cfs). Releases increase from 800 cfs to 1,580 cfs at 6:00 MDT and from 1,580 cfs to 2,490 cfs at 17:00 MDT, returning to 800 cfs at midnight.

The Colorado Basin River Forecast Center and Natural Resources Conservation Service have issued the joint water supply forecast for the April-July runoff season. The unregulated inflow volumes and percent of average for May, June and July are forecasted to be 145 kaf (60%), 230 kaf (58%), and 120 kaf (57%), respectively.

The May forecast for April-July unregulated inflow volume into Flaming Gorge Reservoir is 630,000 acre-feet (64 percent of average), which is a decrease of 16 percent from the previous forecast. This volume corresponds with the moderately dry classification within the 2006 Record of Decision. Because the flow targets measured on the Green River at Jensen, Utah are dependent upon Yampa River flows, flexibility is written into the Record of Decision that allow Reclamation to meet targets up to two classifications higher or one classification lower than the classification under the May final forecast of April through July unregulated inflow into Flaming Gorge Reservoir.

The hydrologic classification has been designated as dry because of the extremely dry conditions on the Yampa River.

Flaming Gorge Dam spring releases coincide with the immediate peak and post-peak of the Yampa River in order to meet flow targets measured at the USGS Green River at Jensen stream gage. The Upper Colorado River Endangered Fish Recovery Program (Recovery Program) this year has requested spring releases timed with the emergence of larval razorback sucker in the upper and middle Green River below Flaming Gorge Dam. The razorback sucker is an endangered fish protected under the 1973 Endangered Species Act.

The Green River at Jensen, Utah spring peak target under the dry hydrologic classification is flows of at least 8,300 cfs for a minimum of two days except in extremely dry years. The addition of the Recovery Program Larval Trigger Study Plan experimental request to shift the timing of releases with the emergence of larval razorback sucker in the upper and middle Green River may have an impact of not meeting the Record of Decision targets during this dry year. The necessary Yampa River flows may not be available during larval presence. The U.S. Fish and Wildlife Service has indicated that the implementation of the Larval Trigger Study Plan experiment meets the necessary requirements under the 1973 Endangered Species Act.

Researchers are on the river monitoring for the presence of larval razorback sucker. Historically, larval presence has been reported to occur as the Yampa River descends from its spring peak. Yampa River snowpack this year is extremely dry with record-breaking low levels of snow throughout the basin. There has been above-average warming and below-average precipitation during the month of March and throughout April. This warming has eroded an already low snowpack and the Colorado Basin River Forecast Center is reporting the peak occurred on the Yampa River at Deerlodge Park on April 29 with flows at 5,360 cfs.

The next Flaming Gorge Working Group meeting is scheduled for August 22, 2012, at 1:00 p.m. at the Western Park Convention Center, 302 East 200 South, Vernal, Utah. The Flaming Gorge Working Group is an open public forum for information exchange between Reclamation and the stake holders of Flaming Gorge Dam. The public is encouraged to attend and comment on the operations and plans presented by Reclamation at these meetings. For more information on this group and these meetings please contact Ed Vidmar at 801-379-1182.

Aspinall Reservoirs – April unregulated inflow into Blue Mesa Reservoir was 57,000 acre-feet or 74 percent of average. On May 10, 2012 the basin snowpack was 14 percent of average. This is indicative of an early melt with very little snowpack left in the mountains. Precipitation during April was only 50 percent of average. The current inflow rate into Blue Mesa Reservoir is about 1200 cfs while reservoir releases are averaging about 1100 cfs. The reservoir elevation is currently at 7483.20 feet, which corresponds to a storage content of about 530,000 acre-feet.

The latest Water Supply Forecast for Water Year 2012 has been issued and the April through July unregulated inflow is forecasted to be at 230,000 acre-feet (34% of average), this is 100,000 acre-feet lower than last month's forecast. This sets the senior Black Canyon Water Right call for a one day spring peak flow of 814 cfs. At this time Reclamation plans to continue to operate the Aspinall Unit to allow the water right to be met. Based on this forecast and the combination of meeting the Black Canyon Water this coming spring, Blue Mesa Reservoir is projected to not fill this runoff season. The projected fill is calculated to be about 7487.0 feet, or about 32 feet below and 270,000 acre-feet short of top of active conservation pool, elevation 7519.40 feet.

Releases from Crystal are currently set at 1400 cfs. The Gunnison Diversion Tunnel is currently diverting about 1,000 cfs, which results in a river flow below the diversion tunnel of approximately 400 cfs. This lower flow is a result of Reclamation trying to conserve reservoir storage for what is forecasted to be a very dry year.

The last meeting of the "Aspinall Unit Working Group" was held on Thursday, April 26, 2012 starting at 1:00 PM in Reclamation's Grand Junction Office. At this meeting, review of this winter's reservoir operations, and plans for this spring and summer operations were discussed. These meetings are open forum discussions on the Aspinall Unit reservoir operations with many interested groups participating. Anyone needing further information about these meetings should contact Dan Crabtree in the Grand Junction Area Office at (970) 248-0652.

Navajo Reservoir – Unregulated inflow into Navajo Reservoir during the month of April was 149,000 acre-feet, or 87 % of average. The reservoir elevation is 6461 feet above sea level and 79% of capacity. Current inflows are approximately 2,000 cfs and reservoir releases are 500 cfs. Diversions for NIIP are currently approximately 650cfs. Basin snowpack peaked on March 9th, approximately four weeks early, at 83% of average. Current snowpack above Navajo Reservoir is 15% of average.

Releases are made for the authorized purposes of the Navajo Unit, and to attempt to maintain a target flows through the endangered fish critical habitat reach of the San Juan River (Farmington to Lake Powell). A 7-day spring peak release of 5,000 cfs is scheduled to begin on or after May 21st, with a ramp up and down over 3 days. At the end of the peak release period, the release is scheduled to return to 500 cfs. The goal of the Navajo spring peak release is to match the timing of the peak of the Animas River in Farmington.

The Colorado Basin River Forecast Center and Natural Resources Conservation Service have issued the May coordinated forecast for inflows to Navajo during the April to July 2012 runoff season. As conditions become drier, the forecast continues to decrease. Unregulated inflows are forecasted to be 345 kaf, or 47% of average. The May forecast decreased by 14% since the April official forecast. Unregulated inflows over the next

three months are forecasted by the River Forecast Center to be: 128 kaf (46%), 58 kaf (26%) and 10 kaf (15%) for May, June and July, respectively.

A public meeting on Navajo Reservoir operations was held on Wednesday, April 24, 2012 in Farmington, New Mexico. At this meeting, a review of this winter's reservoir operations and plans for this spring and summer operations were discussed. The public meetings are open forum discussions on the operation of Navajo Reservoir with many interested groups participating. Anyone interested in the general operation of the reservoir is encouraged to attend. Please contact Ryan Christianson in Reclamation's Durango, Colorado Office at (970) 385-6590 for information about these meetings or the daily operation of Navajo Reservoir.

Glen Canyon Dam / Lake Powell – The monthly unregulated inflow volume to Lake Powell for April was 764 thousand acre-feet (kaf) (72% of average). This was 36 kaf below what was forecasted in early April. The release volume from Glen Canyon Dam in April was 606 kaf which was 6,000 acre-feet above what was scheduled for release during the month. As a result of the difference between the projections made in early April and actual conditions and operations that occurred in April, the elevation of Lake Powell at the end of April was 0.17 feet (about 2 inches) higher than projected. On April 30, 2012 the elevation of Lake Powell was 3635.76 feet above sea level (64.24 feet below full pool).

Snowpack conditions above Lake Powell have been well below average all year and are now nearly melted out. The runoff from the melting snow has been less than impressive and the inflow to Lake Powell so far has peaked at just over 15,000 cfs. It is possible that this peak could be exceeded if temperature conditions warm quickly in the coming weeks. The Water Supply Forecast for Lake Powell (April through July Unregulated Inflow Volume) has been updated for May and the forecasted unregulated inflow volume for the period from April through July for Lake Powell is now 2.36 maf (33% of average). This is the third driest May forecast for Lake Powell since these forecasts began to be issued. Only 1977 and 2002 had lower May forecasts and these years ultimately were the 2 driest water years in the historic record for Lake Powell (1963-2011).

Current Dam Operations

In August 2011, pursuant to the Interim Guidelines, the Operating Tier for Glen Canyon Dam was established to be the Equalization Tier. Under the Equalization Tier when conditions dry out as they have this year, the minimum annual release from Lake Powell can generally be as low as 8.23 maf. However, water year 2011 was a very wet Equalization year and not all of the Equalization release volume for 2011 could be achieved by September 30, 2011. As a result, 1.233 maf of the 2011 Equalization release volume was actually released after the end of water year 2011. This increased the minimum release volume for water year 2012 under Equalization to 9.463 maf. Under the dry hydrologic conditions currently projected for Lake Powell, the water year 2012 release volume is projected to be at this minimum Equalization level of 9.463 maf. As

hydrologic conditions for Lake Powell and Lake Mead change throughout the year, Reclamation will adjust operations of Glen Canyon Dam to release the appropriate annual volume during 2012 to achieve Equalization objectives as practicably as possible by September 30, 2012.

Releases from Glen Canyon Dam are now averaging about 10,050 cfs with fluctuations for power generation throughout the day that peak near 12,500 cfs in the afternoons and with early morning low level releases are about 6,500 cfs and this operation is consistent with the Glen Canyon Operating Criteria (Federal Register, Volume 62, No. 41, March 3, 1997). The release volume for May is scheduled to be 600 kaf. In June, the monthly release volume will likely be about 707 kaf kaf. Release fluctuations in June are projected to be in the range from about 9,000 cfs during the early morning hours to an afternoon peak of about 15,000 cfs.
In addition to daily scheduled fluctuations for power generation, the instantaneous releases from Glen Canyon Dam may also fluctuate to provide 40 MW of system regulation. These instantaneous release adjustments stabilize the electrical generation and transmission system and translate to a range of about 1100 cfs above or below the hourly scheduled release rate. Typically, fluctuations for system regulation are very short lived and balance out over the hour and do not have noticeable impacts on downstream river flow conditions.

Releases from Glen Canyon Dam can also fluctuate beyond scheduled fluctuations for power generation when called upon as a partner that shares reserve requirements within the electrical generator community (i.e. balancing area). There are many generators that supply electricity to the transmission system within the balancing area. At times, a participating generator may experience operating conditions such that it cannot make its scheduled delivery of electricity to the system (i.e. unscheduled outage). To provide system reliability, all participating electricity generators within the balancing area maintain a specified level of generation capacity (i.e. reserves) that can be called upon when an unscheduled outage occurs. Glen Canyon Dam typically maintains 113 MW of reserves for this purpose.

Reserve agreements allow the controllers of the balancing area to call upon Glen Canyon Dam to produce up to an additional 113 MW of electricity beyond what is originally scheduled for a given hour. Reserve calls can be maintained for a maximum of 2 hours after which time the generation rate should be returned to the original schedule. The 113 MW reserve requirement for Glen Canyon Dam translates to approximately 2,800 cfs of flow in the river. When the balancing area controllers call for reserve generation from Glen Canyon Dam, releases from the dam can exceed scheduled levels and have a noticeable impact on the river downstream from Glen Canyon Dam. But these calls for reserves are fairly infrequent and typically are for much less than the required level of 113 MW.

Current Inflow Forecasts and Model Projections

Over the next three months (May, June and July) the forecasted unregulated inflow volume to Lake Powell is projected to be 650 kaf (27% of average), 650 kaf (24% of average) and 300 kaf (27% of average), respectively. These percent of averages are all based on the historic period from 1981 through 2010. Combining this forecast with the April Water Supply Forecast and extending projections to the end of WY2012, the most probable (i.e. 50% likely to be exceeded) unregulated inflow volume for WY2012 is projected to be 5.57 maf (51% of average). Comparing this projected water year unregulated inflow volume to the driest year on record (2002) in which the unregulated inflow volume was only 2.64 maf (24% of average), water year 2012 will likely be very dry, yet not nearly as dry as conditions were in 2002. The currently projected water year unregulated inflow volume of 5.57 maf would rank as the 4th driest year on record since the closure of Glen Canyon Dam (1963) but there is still uncertainty associated with this projection so this ranking could move up or down depending on what happens during the remainder of the water year. Recent analysis indicates that it is reasonably possible for the actual unregulated inflow volume for water year 2012 to be as low as 4.9 maf (45% of average) or as high as 6.5 maf (60% of average) depending on the precipitation patterns over the next several months.

Based on the reasonable range inflow conditions that could occur this year, the annual release volume from Glen Canyon Dam would be 9.463 maf. Under the most probable inflow condition, the annual release volume is projected to be 9.463 maf and the elevation of Lake Powell at the end of WY2012 is projected to be 3625.5 feet above sea level. This elevation corresponds to a live storage volume of 14.35 maf (59 % of full capacity). These projections are based on conditions in the May 24-Months Study

Upper Colorado River Basin Hydrology

Since water year 2005, hydrologic conditions in the Upper Colorado River Basin have been near average with significant variability from year to year. The unregulated inflow to Lake Powell, which is a good measure of the hydrologic condition in the Colorado River Basin, has averaged a water year volume of 10.98 maf (101% of average (period 1981-2010)) during the period from 2005 through 2011. The hydrologic variability during this period has been from a low water year unregulated inflow volume of 8.62 maf (80% of average) in water year 2006 to a high water year unregulated inflow volume of 15.97 maf (147% of average) which occurred in water year 2011.

Overall reservoir storage in the Colorado River Basin has increased by over 8 maf since the beginning of water year 2005 and this is a significant improvement over the drought conditions during water years 2000 through 2004. On October 1, 2004, the beginning of water year 2005, the total reservoir storage in the Colorado River Basin was 29.84 maf (50.2% of capacity). On October 1, 2011, the beginning of water year 2012, the total reservoir storage in the Colorado River Basin was 38.66 maf (64.8% of capacity). As of May 9, 2012 the total reservoir storage in the Colorado River Basin was 37.07 maf (62.2% of capacity).

June 24-Month Study
Date: June 13, 2012

From: Water Resources Group, Salt Lake City
To: All Colorado River Annual Operating Plan (AOP) Recipients

Current Reservoir Status

Reservoir	May Inflow (unregulated) (acre-feet)	Percent of Average (%)	June 12 Midnight Elevation (feet)	Reservoir Storage (acre-feet)
Fontenelle	130,000	79	6500.37	302,000
Flaming Gorge	153,000	63	6023.11	3,091,000
Blue Mesa	74,000	33	7481.88	520,000
Navajo	131,000	47	6055.35	1,290,000
Powell	792,000	34	3636.29	15,569,000

Expected Operations

The operation of Lake Powell and Lake Mead in this June 2012 24-Month Study is pursuant to the December 2007 Record of Decision on Colorado River Interim Guidelines for Lower Basin Shortages and the Coordinated Operations of Lake Powell and Lake Mead (Interim Guidelines), and reflects the 2012 Annual Operating Plan (AOP). Pursuant to the Interim Guidelines, the August 2011 24-Month Study projections of the January 1, 2012 system storage and reservoir water surface elevations set the operational tier for the coordinated operation of Lake Powell and Lake Mead during 2012.

Consistent with Section 6.A of the Interim Guidelines, the Lake Powell operational tier for water year 2012 is the Equalization Tier. The June 2012 24-Month Study projects the water year release volume from Lake Powell for 2012 to be 9.46 maf.

Consistent with Section 2.B.5 of the Interim Guidelines, the Intentionally Created Surplus (ICS) Surplus Condition is the criterion governing the operation of Lake Mead for calendar year 2012.

The Interim Guidelines are available for download at
http://www.usbr.gov/lc/region/programs/strategies/RecordofDecision.pdf.
The 2012 AOP is available for download at
http://www.usbr.gov/lc/region/g4000/aop/AOP12.pdf.

Fontenelle Reservoir – Inflows for the month of May were 130 kaf, or 79% of average. The reservoir elevation is 6499 feet above sea level and 84% of capacity. The reservoir elevation is increasing and will continue to increase throughout the summer. Current inflows are approximately 4,500 cfs and reservoir releases are 1,000 cfs. Releases will be increased to 1,300cfs on June 14th and may be further increased, depending on observed reservoir inflows. Basin snowpack peaked on March 21st, approximately three weeks early, at 84% of average. Although nearly all of the snow reported by snotel stations (which are all below 10,000 ft) has melted, field reports indicate that additional snow remains at the high elevations.

The Colorado Basin River Forecast Center and Natural Resources Conservation Service have issued the June coordinated forecast for the April to July 2012 runoff season to be 490 kaf, or 68% of average. Inflows over the next three months are forecasted by the River Forecast Center to be: 180 kaf (60%), 80 kaf (45%) and 45 kaf (58%) for June, July, and August respectively.

The spring Fontenelle Working Group meeting was held on April 26, 2012 at Seedskadee National Wildlife Refuge. Minutes from the meeting are posted on the Working Group webpages. The next Fontenelle Working Group meeting is scheduled for August 23, 2012 at 10:00 am at the Joint Power's Water Board treatment plant boardroom in Green River, Wyoming. The Fontenelle Working Group is an open public forum for information exchange between Reclamation and other parties associated with the operation of Fontenelle Reservoir.

Flaming Gorge Reservoir – Unregulated inflow into Flaming Gorge Reservoir during the month of May was 153,000 acre-feet, or 63 % percent of average. Flaming Gorge Reservoir is releasing average daily release rate of 1,500 cubic feet per second (cfs). Releases increase from 820 cfs to 1,570 cfs at 6:00am and from 1,570 cfs to 2,070 cfs at 5:00pm, returning to 800 cfs at midnight. The reservoir elevation is 6023.2 feet.

The Colorado Basin River Forecast Center and Natural Resources Conservation Service have issued the joint water supply forecast for the April-July runoff season. The June forecast for April-July unregulated inflow volume into Flaming Gorge Reservoir is 560,000 acre-feet (57% of average). The unregulated inflow volumes and percent of average for June, July and August are forecasted to be 185 kaf (47%), 85 kaf (40%), and 53 kaf (56%), respectively.

The May forecast for April-July unregulated inflow volume into Flaming Gorge Reservoir was 630,000 acre-feet (64 percent of average), which corresponds to a moderately dry classification. However, in accordance with the flexibility written into the 2006 Record of Decision, the hydrologic classification has been designated as dry because of the extremely dry conditions on the Yampa River. The Green River at Jensen, Utah spring peak target under the dry hydrologic classification is flows of at least 8,300

cfs for a minimum of two days except in extremely dry years. Flows at Jensen, Utah were above 8,300cfs for five days in June.

The Upper Colorado River Endangered Fish Recovery Program (Recovery Program) this year requested spring releases timed with the emergence of larval endangered razorback sucker in the upper and middle Green River below Flaming Gorge Dam. In order to meet this request, releases from Flaming Gorge reservoir were increased to 7,400cfs for two days in June with a total of five days of bypass releases (above powerplant capacity of 4,600cfs).

The next Flaming Gorge Working Group meeting is scheduled for August 22, 2012, at 1:00 p.m. at the Western Park Convention Center, 302 East 200 South, Vernal, Utah. The Flaming Gorge Working Group is an open public forum for information exchange between Reclamation and the stake holders of Flaming Gorge Dam. The public is encouraged to attend and comment on the operations and plans presented by Reclamation at these meetings. For more information on this group and these meetings please contact Ed Vidmar at 801-379-1182.

Aspinall Unit Reservoirs – May unregulated inflow into Blue Mesa Reservoir was 74,000 acre-feet or 33 percent of average. The Gunnison River Basin snowpack has mostly melted out this year in early May. This has resulted in some very low river flows during the first part of June. Precipitation during May was also very dry, about 30 percent of average. The current inflow rate into Blue Mesa Reservoir is about 900 cfs while reservoir releases are averaging about 1,600 cfs. Blue Mesa's present elevation is 7482.27 feet, which corresponds to a storage content of about 523,000 acre-feet.

The latest Water Supply Forecast for Water Year 2012 has been issued and the April through July unregulated inflow is forecasted to be at 196,000 acre-feet (29% of average). This is a 34,000 acre-feet decrease from last month's forecast. Based on this runoff forecast and the current elevation of Blue Mesa Reservoir, the reservoir is not expected to fill nor is it expected to gain any further elevation raise this year. This year's high was recorded on April 13th when the reservoir reached elevation 7485.02 feet.

Releases from Crystal are currently set at 1700 cfs. The Gunnison Diversion Tunnel is diverting about 1,000 cfs, which results in a river flow below the diversion tunnel of approximately 700 cfs. These rates will most likely change as conditions warrant, primarily as we respond to changes at the Whitewater gage as flows prescribed in the Aspinall Unit Operations Record of Decision (ROD). The ROD calls for keeping flows at the Whitewater gage at or above 900 cfs.

The next meeting of the "Aspinall Unit Working Group" will be held on Thursday, August 9, 2012 starting at 1:00 PM at the Elk Creek Visitors Center at Blue Mesa Reservoir. At this meeting, review of this spring's reservoir operations, and plans for this summer and fall operations will be discussed. These meetings are open forum discussions on the Aspinall Unit reservoir operations with many interested groups

participating. Anyone needing further information about these meetings should contact Dan Crabtree in the Grand Junction Area Office at (970) 248-0652.

Navajo Reservoir – Unregulated inflow into Navajo Reservoir during the month of May was 131,000 acre-feet, or 47 % of average. The reservoir elevation is 6055.57 feet above sea level and 76% of capacity. Current inflows are approximately 650 cfs and reservoir releases are 500 cfs. Diversions for NIIP are currently approximately 800cfs. Basin snowpack peaked on March 9th, approximately four weeks early, at 83% of average. Current snowpack above Navajo Reservoir is essentially gone, with only typical summer type snow banks in some areas.

Releases are made for the authorized purposes of the Navajo Unit, and to attempt to maintain a target flows through the endangered fish critical habitat reach of the San Juan River (Farmington to Lake Powell). A 7-day spring peak release of 5,000 cfs was achieved during the week of May 21st through June1st. At the end of the peak release period, the release returned to 500 cfs. The goal of the Navajo spring peak release is to match the timing of the peak of the Animas River in Farmington.

The Colorado Basin River Forecast Center and Natural Resources Conservation Service have issued the June coordinated forecast for inflows to Navajo during the April to July 2012 runoff season. As conditions become drier, the forecast continues to decrease. Unregulated inflows are forecasted to be 330 kaf, or 45% of average. This forecast decreased by 15,000 acre-feet or a 2% reduction from last month's official forecast. Unregulated inflows over the next three months are forecasted by the River Forecast Center to be: 41 kaf (20%), 9 kaf (11%) and 15 kaf (25%) for June, July and August, respectively.

A public meeting on Navajo Reservoir operations is scheduled for Tuesday, August 21, 2012 at 1:00 PM at the Civic Center in Farmington, New Mexico (200 West Arrington Street). At this meeting, review of this spring's reservoir operations, and plans for this summer and fall operations will be discussed. These meetings are open forum discussions on the operation of Navajo Reservoir with many interested groups participating. Anyone interested in the general operation of the reservoir is encouraged to attend. Please contact Ryan Christianson in Reclamation's Durango, Colorado Office at (970) 385-6590 for information about these meetings or the daily operation of Navajo Reservoir.

Glen Canyon Dam / Lake Powell – The monthly unregulated inflow volume to Lake Powell for May was 792 thousand acre-feet (kaf) (34% of average). This was 142 kaf above what was forecasted in early May. The release volume from Glen Canyon Dam in May was 601 kaf which was 1,000 acre-feet above what was scheduled for release during the month. As a result of the difference between the projections made in early May and actual conditions and operations that occurred in May, the elevation of Lake Powell at the

end of May was 1.10 feet higher than projected. On May 31, 2012 the elevation of Lake Powell was 3636.83 feet above sea level (63.17 feet below full pool).

The Water Supply Forecast for Lake Powell (April through July Unregulated Inflow Volume) has been updated for June and the forecasted unregulated inflow volume for the period from April through July for Lake Powell is now 2.01 maf (28% of average). This is the third driest June forecast for Lake Powell since these forecasts began to be issued. Only 1977 and 2002 had lower June forecasts and these years ultimately were the 2 driest water years in the historic record for Lake Powell (1963-2011).

Current Dam Operations

In August 2011, pursuant to the Interim Guidelines, the Operating Tier for Glen Canyon Dam was established to be the Equalization Tier. Under the Equalization Tier when conditions dry out as they have this year, the minimum annual release from Lake Powell can generally be as low as 8.23 maf. However, water year 2011 was a very wet Equalization year and not all of the Equalization release volume for 2011 could be achieved by September 30, 2011. As a result, 1.233 maf of the 2011 Equalization release volume was actually released after the end of water year 2011. This increased the minimum release volume for water year 2012 under Equalization to 9.463 maf. Under the dry hydrologic conditions currently projected for Lake Powell, the water year 2012 release volume is projected to be at this minimum Equalization level of 9.463 maf. As hydrologic conditions for Lake Powell and Lake Mead change throughout the year, Reclamation will adjust operations of Glen Canyon Dam to release the appropriate annual volume during 2012 to achieve Equalization objectives as practicably as possible by September 30, 2012.

Releases from Glen Canyon Dam are now averaging about 12,600 cfs with fluctuations for power generation throughout the day that peak near 15,000 cfs in the afternoons and with early morning low level releases are about 9,000 cfs and this operation is consistent with the Glen Canyon Operating Criteria (Federal Register, Volume 62, No. 41, March 3, 1997). The release volume for June is scheduled to be 708 kaf. In July, the monthly release volume will likely be about 889 kaf. Release fluctuations in July are projected to be in the range from about 10,000 cfs during the early morning hours to an afternoon peak of about 18,000 cfs.

In addition to daily scheduled fluctuations for power generation, the instantaneous releases from Glen Canyon Dam may also fluctuate to provide 40 MW of system regulation. These instantaneous release adjustments stabilize the electrical generation and transmission system and translate to a range of about 1100 cfs above or below the hourly scheduled release rate. Typically, fluctuations for system regulation are very short lived and balance out over the hour and do not have noticeable impacts on downstream river flow conditions.

Releases from Glen Canyon Dam can also fluctuate beyond scheduled fluctuations for power generation when called upon as a partner that shares reserve requirements within

the electrical generator community (i.e. balancing area). There are many generators that supply electricity to the transmission system within the balancing area. At times, a participating generator may experience operating conditions such that it cannot make its scheduled delivery of electricity to the system (i.e. unscheduled outage). To provide system reliability, all participating electricity generators within the balancing area maintain a specified level of generation capacity (i.e. reserves) that can be called upon when an unscheduled outage occurs. Glen Canyon Dam typically maintains 113 MW of reserves for this purpose.

Reserve agreements allow the controllers of the balancing area to call upon Glen Canyon Dam to produce up to an additional 113 MW of electricity beyond what is originally scheduled for a given hour. Reserve calls can be maintained for a maximum of 2 hours after which time the generation rate should be returned to the original schedule. The 113 MW reserve requirement for Glen Canyon Dam translates to approximately 2,800 cfs of flow in the river. When the balancing area controllers call for reserve generation from Glen Canyon Dam, releases from the dam can exceed scheduled levels and have a noticeable impact on the river downstream from Glen Canyon Dam. But these calls for reserves are fairly infrequent and typically are for much less than the required level of 113 MW.

Current Inflow Forecasts and Model Projections

Over the next three months (June, July and August) the forecasted unregulated inflow volume to Lake Powell is projected to be 350 kaf (13% of average), 100 kaf (9% of average) and 150 kaf (30% of average), respectively. These percent of averages are all based on the historic period from 1981 through 2010. The most probable (i.e. 50% likely to be exceeded) unregulated inflow volume for WY2012 is projected to be 5.01 maf (46% of average). Comparing this projected water year unregulated inflow volume to the driest year on record (2002) in which the unregulated inflow volume was only 2.64 maf (24% of average), water year 2012 will likely be very dry, yet not nearly as dry as conditions were in 2002. The currently projected water year unregulated inflow volume of 5.01 maf would rank as the 3rd driest year on record since the closure of Glen Canyon Dam (1963).

The annual release volume from Glen Canyon Dam will likely be 9.463 maf and the elevation of Lake Powell at the end of WY2012 is projected to be 3621.3 feet above sea level. This elevation corresponds to a live storage volume of 13.90 maf (57 % of full capacity). These projections are based on conditions in the June 24-Months Study.

Upper Colorado River Basin Hydrology

Since water year 2005, hydrologic conditions in the Upper Colorado River Basin have been near average with significant variability from year to year. The unregulated inflow to Lake Powell, which is a good measure of the hydrologic condition in the Colorado River Basin, has averaged a water year volume of 10.98 maf (101% of average (period

1981-2010)) during the period from 2005 through 2011. The hydrologic variability during this period has been from a low water year unregulated inflow volume of 8.62 maf (80% of average) in water year 2006 to a high water year unregulated inflow volume of 15.97 maf (147% of average) which occurred in water year 2011.

Overall reservoir storage in the Colorado River Basin has increased by over 8 maf since the beginning of water year 2005 and this is a significant improvement over the drought conditions during water years 2000 through 2004. On October 1, 2004, the beginning of water year 2005, the total reservoir storage in the Colorado River Basin was 29.84 maf (50.2% of capacity). On October 1, 2011, the beginning of water year 2012, the total reservoir storage in the Colorado River Basin was 38.66 maf (64.8% of capacity). As of June 12, 2012 the total reservoir storage in the Colorado River Basin was 36.59 maf (61.4% of capacity).

Model Run ID: 2124

Processed On: 6/13/2012 10:49:32AM

July 24-Month Study
Date: July 10, 2012

From: Water Resources Group, Salt Lake City
To: All Colorado River Annual Operating Plan (AOP) Recipients

Current Reservoir Status

Reservoir	June Inflow (unregulated) (acre-feet)	Percent of Average (%)	July 9 Midnight Elevation (feet)	Reservoir Storage (acre-feet)
Fontenelle	189,000	63	6502.32	317,000
Flaming Gorge	188,000	48	6023.53	3,106,000
Blue Mesa	45,000	17	7474.48	467,000
Navajo	20,000	9	6050.04	1,226,000
Powell	354,000	13	3632.19	15,100,000

Expected Operations

The operation of Lake Powell and Lake Mead in this July 2012 24-Month Study is pursuant to the December 2007 Record of Decision on Colorado River Interim Guidelines for Lower Basin Shortages and the Coordinated Operations of Lake Powell and Lake Mead (Interim Guidelines), and reflects the 2012 Annual Operating Plan (AOP). Pursuant to the Interim Guidelines, the August 2011 24-Month Study projections of the January 1, 2012 system storage and reservoir water surface elevations set the operational tier for the coordinated operation of Lake Powell and Lake Mead during 2012.

Consistent with Section 6.A of the Interim Guidelines, the Lake Powell operational tier for water year 2012 is the Equalization Tier. The July 2012 24-Month Study projects the water year release volume from Lake Powell for 2012 to be 9.46 maf.

Consistent with Section 2.B.5 of the Interim Guidelines, the Intentionally Created Surplus (ICS) Surplus Condition is the criterion governing the operation of Lake Mead for calendar year 2012.

The Interim Guidelines are available for download at
http://www.usbr.gov/lc/region/programs/strategies/RecordofDecision.pdf.
The 2012 AOP is available for download at
http://www.usbr.gov/lc/region/g4000/aop/AOP12.pdf.

Fontenelle Reservoir – Inflows to Fontenelle Reservoir for the month of June were 189 kaf, or 63% of average. The reservoir elevation is 6502.4 feet above sea level and 92% of capacity and is slowly increasing. Current inflows are approximately 1,400 cfs and reservoir releases are 1,100 cfs. Releases will likely remain near 1,100 cfs through the remainder of the summer months.

The Colorado Basin River Forecast Center and Natural Resources Conservation Service have issued the July coordinated forecast for the April to July 2012 runoff season to be 480 kaf, or 66% of average. Inflows over the next three months are forecasted by the River Forecast Center to be: 60 kaf (34%), 38 kaf (49%) and 35 kaf (76%) for July, August, and September respectively.

The spring Fontenelle Working Group meeting was held on April 26, 2012 at Seedskadee National Wildlife Refuge. Minutes from the meeting are posted on the Working Group webpages. The next Fontenelle Working Group meeting is scheduled for August 23, 2012 at 10:00 am at the Joint Power's Water Board treatment plant boardroom in Green River, Wyoming. The Fontenelle Working Group is an open public forum for information exchange between Reclamation and other parties associated with the operation of Fontenelle Reservoir.

Flaming Gorge Reservoir – Unregulated inflow into Flaming Gorge Reservoir during the month of June was 188,000 acre-feet, or 48 percent of average. The reservoir elevation is 6023.5 feet. Flaming Gorge Reservoir is releasing an average daily rate of 1,403 cubic feet per second (cfs), and scheduled to release 1,400 to 1,500 cfs through August. The current scheduled for September releases are 1,300 cfs on average, with winter releases dropping between 800-850 cfs between October through February.

July Flaming Gorge hourly release pattern:

Midnight - 6am: 817 cfs
6am - 5pm: 1,463 cfs
5pm - 11pm: 1,894 cfs
11pm - midnight: 1,302 cfs.

The Colorado Basin River Forecast Center and Natural Resources Conservation Service have issued the joint water supply forecast for the April-July runoff season. The July forecast for April-July unregulated inflow volume into Flaming Gorge Reservoir is 540,000 acre-feet (55% of average). The unregulated inflow volumes and percent of average for July, August, and September are forecasted to be 60 kaf (29%), 38 kaf (43%), and 37 kaf (67%), respectively.

The May forecast for April-July unregulated inflow volume into Flaming Gorge Reservoir was 630,000 acre-feet (64 percent of average), which corresponds to a moderately dry classification. However, in accordance with the flexibility written into the 2006 Record of Decision, the hydrologic classification has been designated as dry

because of the extremely dry conditions on the Yampa River. The Green River at Jensen, Utah spring peak target under the dry hydrologic classification is flows of at least 8,300 cfs for a minimum of two days except in extremely dry years. Flows at Jensen, Utah were above 8,300cfs for five days in June.

The Upper Colorado River Endangered Fish Recovery Program (Recovery Program) this year requested spring releases timed with the emergence of larval endangered razorback sucker in the upper and middle Green River below Flaming Gorge Dam. In order to meet this request, releases from Flaming Gorge reservoir were increased to 7,400cfs for two days in June with a total of five days of bypass releases (above powerplant capacity of 4,600cfs).

The next Flaming Gorge Working Group meeting is scheduled for August 22, 2012, at 1:00 p.m. at the Western Park Convention Center, 302 East 200 South, Vernal, Utah. The Flaming Gorge Working Group is an open public forum for information exchange between Reclamation and the stake holders of Flaming Gorge Dam. The public is encouraged to attend and comment on the operations and plans presented by Reclamation at these meetings. For more information on this group and these meetings please contact Ed Vidmar at 801-379-1182.

Aspinall Unit Reservoirs – June unregulated inflow into Blue Mesa Reservoir was 44,500 acre-feet or 17 percent of average. Hydrologic conditions in the basin continued to be very dry during June. Precipitation during April, May and June was 50, 25 and 15 percent of average respectively. The basin snowpack has for the most part has been totally depleted. The current inflow rate into Blue Mesa Reservoir is about 600 cfs while reservoir releases are averaging about 1,500 cfs. For the last couple of months, reservoir inflows have been slowly decreasing in response to the snowpack melt out. Blue Mesa Reservoir present elevation is 7474.66 feet, which corresponds to a storage content of about 468,000 acre-feet.

The latest Water Supply Forecast for Water Year 2012 has been issued and the April through July unregulated inflow is forecasted to be at 196,000 acre-feet (29% of average). This is same runoff volume as from last month's forecast. Based on this runoff forecast and the current elevation of Blue Mesa Reservoir, the reservoir is not expected to fill nor is it expected to gain any further elevation raise this year until winter. This year's high was recorded on April 13th when the reservoir reached elevation 7485.02 feet.

Releases from Crystal are currently set at 1500 cfs. The Gunnison Diversion Tunnel is diverting about 1,000 cfs, which results in a river flow below the diversion tunnel of approximately 500 cfs. These rates will most likely change as conditions warrant, primarily as we respond to changes at the Whitewater gage as flows prescribed in the Aspinall Unit Operations Record of Decision (ROD). The ROD calls for keeping flows at the Whitewater gage at or above 900 cfs.

The next meeting of the "Aspinall Unit Working Group" will be held on Thursday, August 9, 2012 starting at 1:00 PM at the Elk Creek Visitors Center at Blue Mesa Reservoir. At this meeting, review of this spring's reservoir operations, and plans for this summer and fall operations will be discussed. These meetings are open forum discussions on the Aspinall Unit reservoir operations with many interested groups participating. Anyone needing further information about these meetings should contact Dan Crabtree in the Grand Junction Area Office at (970) 248-0652.

Navajo Reservoir – Unregulated inflow into Navajo Reservoir during the month of June was 20,000 acre-feet, or 9 % of average. The reservoir elevation is 6050.13 feet above sea level and 72% of capacity. Current inflows are approximately 900 cfs and reservoir releases are 800 cfs. Diversions for NIIP are about 600cfs. Basin snowpack peaked on March 9th, approximately four weeks early, at 83% of average. Current snowpack above Navajo Reservoir is essentially gone, with only typical summer type snow banks in some areas.

Releases are made for the authorized purposes of the Navajo Unit, and to attempt to maintain a target flows through the endangered fish critical habitat reach of the San Juan River (Farmington to Lake Powell). A 7-day spring peak release of 5,000 cfs was achieved during the week of May 21st through June1st. At the end of the peak release period, the release returned to 500 cfs. The goal of the Navajo spring peak release is to match the timing of the peak of the Animas River in Farmington.

The Colorado Basin River Forecast Center and Natural Resources Conservation Service have issued the July coordinated forecast for inflows to Navajo during the April to July 2012 runoff season. As conditions become drier, the forecast continues to decrease. Unregulated inflows are forecasted to be 305 kaf, or 41% of average. This forecast decreased by 25,000 acre-feet or a 8% reduction from last month's official forecast. Unregulated inflows over the next three months are forecasted by the River Forecast Center to be: 5 kaf (8%), 13 kaf (29%) and 20 kaf (47%) for July, August and September, respectively.

A public meeting on Navajo Reservoir operations is scheduled for Tuesday, August 21, 2012 at 1:00 PM at the Civic Center in Farmington, New Mexico (200 West Arrington Street). At this meeting, review of this spring's reservoir operations, and plans for this summer and fall operations will be discussed. These meetings are open forum discussions on the operation of Navajo Reservoir with many interested groups participating. Anyone interested in the general operation of the reservoir is encouraged to attend. Please contact Ryan Christianson in Reclamation's Durango, Colorado Office at (970) 385-6590 for information about these meetings or the daily operation of Navajo Reservoir.

Glen Canyon Dam / Lake Powell – The monthly unregulated inflow volume to Lake Powell for June was 353 thousand acre-feet (kaf) (13% of average). This was very nearly

equal to the forecasted unregulated inflow volume at the beginning of June which was 350 kaf. The release volume from Glen Canyon Dam in June was 709 kaf which was 1 kaf above what was scheduled for release during the month. The end of June elevation and storage of Lake Powell was 3633.90 feet (66.10 feet from full pool) and 15.29 maf (62.9% of full capacity).

The Water Supply Forecast for Lake Powell (April through July Unregulated Inflow Volume) was updated for July and remained the same as it was in June at 2.01 maf (28% of average). For the Water Supply period, 2012 will most likely be the third driest year on record since the closure of Glen Canyon Dam in 1963. Only 1977 and 2002 will have had lower April-July unregulated inflow volumes to Lake Powell than what is most likely to occur in 2012.

Current Dam Operations

In August 2011, pursuant to the Interim Guidelines, the Operating Tier for Glen Canyon Dam was established to be the Equalization Tier. Under the Equalization Tier when conditions dry out as they have this year, the minimum annual release from Lake Powell can generally be as low as 8.23 maf. However, water year 2011 was a very wet Equalization year and not all of the Equalization release volume for 2011 could be achieved by September 30, 2011. As a result, 1.233 maf of the 2011 Equalization release volume was actually released after the end of water year 2011. This increased the minimum release volume for water year 2012 under Equalization to 9.463 maf. Under the dry hydrologic conditions currently projected for Lake Powell, the water year 2012 release volume is projected to be at this minimum Equalization level of 9.463 maf. As hydrologic conditions for Lake Powell and Lake Mead change throughout the year, Reclamation will adjust operations of Glen Canyon Dam to release the appropriate annual volume during 2012 to achieve Equalization objectives as practicably as possible by September 30, 2012.

Releases from Glen Canyon Dam are now averaging about 14,500 cfs with fluctuations for power generation throughout the day that peak near 18,000 cfs in the afternoons and with early morning low level releases are about 10,000 cfs and this operation is consistent with the Glen Canyon Operating Criteria (Federal Register, Volume 62, No. 41, March 3, 1997). The release volume for July is scheduled to be 889 kaf and this volume is elevated slightly in order to target a release volume in August of 800 kaf under the 2012 Hydrograph that was approved by the Secretary of the Interior. In August, fluctuations are projected to peak near 17,000 cfs during the afternoons with early morning low releases near 9,000 cfs. In September and October, as part of the 2008 FONSI, releases from Glen Canyon Dam will be steady for a steady flow experiment. The targeted release rate for September and October of 2012 is 8,000 cfs.

In addition to daily scheduled fluctuations for power generation, the instantaneous releases from Glen Canyon Dam may also fluctuate to provide 40 MW of system regulation. These instantaneous release adjustments stabilize the electrical generation and transmission system and translate to a range of about 1100 cfs above or below the

hourly scheduled release rate. Typically, fluctuations for system regulation are very short lived and balance out over the hour and do not have noticeable impacts on downstream river flow conditions.

Releases from Glen Canyon Dam can also fluctuate beyond scheduled fluctuations for power generation when called upon as a partner that shares reserve requirements within the electrical generator community (i.e. balancing area). There are many generators that supply electricity to the transmission system within the balancing area. At times, a participating generator may experience operating conditions such that it cannot make its scheduled delivery of electricity to the system (i.e. unscheduled outage). To provide system reliability, all participating electricity generators within the balancing area maintain a specified level of generation capacity (i.e. reserves) that can be called upon when an unscheduled outage occurs. Glen Canyon Dam typically maintains 113 MW of reserves for this purpose.

Reserve agreements allow the controllers of the balancing area to call upon Glen Canyon Dam to produce up to an additional 113 MW of electricity beyond what is originally scheduled for a given hour. Reserve calls can be maintained for a maximum of 2 hours after which time the generation rate should be returned to the original schedule. The 113 MW reserve requirement for Glen Canyon Dam translates to approximately 2,800 cfs of flow in the river. When the balancing area controllers call for reserve generation from Glen Canyon Dam, releases from the dam can exceed scheduled levels and have a noticeable impact on the river downstream from Glen Canyon Dam. But these calls for reserves are fairly infrequent and typically are for much less than the required level of 113 MW.

Current Inflow Forecasts and Model Projections

Over the next three months (July, August and September) the forecasted unregulated inflow volume to Lake Powell is projected to be 100 kaf (9% of average), 150 kaf (30% of average) and 200 kaf (49% of average), respectively. These percent of averages are all based on the historic period from 1981 through 2010. The most probable (i.e. 50% likely to be exceeded) unregulated inflow volume for WY2012 is projected to be 5.0 maf (46% of average). Comparing this projected water year unregulated inflow volume to the driest year on record (2002) in which the unregulated inflow volume was only 2.64 maf (24% of average), water year 2012 will likely be very dry, yet not nearly as dry as conditions were in 2002. The currently projected water year unregulated inflow volume of 5.0 maf would rank as the 3rd driest year on record since the closure of Glen Canyon Dam (1963).

The annual release volume from Glen Canyon Dam will likely be 9.463 maf and the elevation of Lake Powell at the end of WY2012 is projected to be 3622.6 feet above sea level which is 77.4 feet from the full pool elevation of 3700 feet. This elevation corresponds to a live storage volume of 14.04 maf (58 % of full capacity). These projections are based on conditions in the July 24-Months Study

Upper Colorado River Basin Hydrology

Since water year 2005, hydrologic conditions in the Upper Colorado River Basin have been near average with significant variability from year to year. The unregulated inflow to Lake Powell, which is a good measure of the hydrologic condition in the Colorado River Basin, has averaged a water year volume of 10.98 maf (101% of average (period 1981-2010)) during the period from 2005 through 2011. The hydrologic variability during this period has been from a low water year unregulated inflow volume of 8.62 maf (80% of average) in water year 2006 to a high water year unregulated inflow volume of 15.97 maf (147% of average) which occurred in water year 2011.

Overall reservoir storage in the Colorado River Basin has increased by over 8 maf since the beginning of water year 2005 and this is a significant improvement over the drought conditions during water years 2000 through 2004. On October 1, 2004, the beginning of water year 2005, the total reservoir storage in the Colorado River Basin was 29.84 maf (50.2% of capacity). On October 1, 2011, the beginning of water year 2012, the total reservoir storage in the Colorado River Basin was 38.66 maf (64.8% of capacity). As of July 8, 2012 the total reservoir storage in the Colorado River Basin was 35.80 maf (60.0% of capacity).
