February 24-Month Study
Date: February 13, 2018

From: Water Resources Group, Salt Lake City
To: All Colorado River Annual Operating Plan (AOP) Recipients

Current Reservoir Status

Reservoir	January Inflow (unregulated) (acre-feet)	Percent of Average (%)	February 12, Midnight Elevation (feet)	February 12, Midnight Reservoir Storage (acre-feet)
Fontenelle	42,000	139	6,477.31	152,000
Flaming Gorge	52,000	129	6,026.95	3,233,000
Blue Mesa	20,000	84	7,486.15	552,000
Navajo	12,000	56	6,052.15	1,251,000
Powell	262,000	72	3,617.89	13,541,000

Expected Operations

The operation of Lake Powell and Lake Mead in this February 2018 24-Month Study is pursuant to the December 2007 Record of Decision on Colorado River Interim Guidelines for Lower Basin Shortages and the Coordinated Operations of Lake Powell and Lake Mead (Interim Guidelines), and reflects the 2018 Annual Operating Plan (AOP). Pursuant to the Interim Guidelines, the August 2017 24-Month Study projections of the January 1, 2018, system storage and reservoir water surface elevations set the operational tier for the coordinated operation of Lake Powell and Lake Mead during 2018.

Consistent with Section 6.B of the Interim Guidelines, Lake Powell's operations in water year 2018 will be governed by the Upper Elevation Balancing Tier, with an initial water year release volume of 8.23 million acre-feet (maf) and the potential for an April adjustment to equalization or balancing releases in April 2018. This February 2018 24-Month Study indicates that, consistent with Section 6.B.4 of the Interim Guidelines, an April adjustment to balancing releases is projected to occur and Lake Powell is projected to release 9.0 maf in water year 2018.

Consistent with Section 2.B.5 of the Interim Guidelines, the Intentionally Created Surplus (ICS) Surplus Condition is the criterion governing the operation of Lake Mead for calendar year 2018.

The Interim Guidelines are available for download at:
https://www.usbr.gov/lc/region/programs/strategies/RecordofDecision.pdf.
The 2018 AOP is available for download at:
https://www.usbr.gov/lc/region/g4000/aop/AOP18.pdf

Fontenelle Reservoir – Fontenelle Reservoir is currently at elevation 6479 feet above sea level (feet), which amounts to 47 percent of live storage capacity. Inflows for the month of January totaled 42,100 acre-feet (af), or 139 percent of average. Average to above average inflows are forecasted over the next few months and releases have been increased in order to meet the spring elevation target. Releases have been set to base flow levels of 1,300 cubic feet per second (cfs) and are forecasted to remain at this level through the winter.

The Colorado Basin River Forecast Center has forecasted spring inflows that are above average. February, March, and April forecasted inflow volumes amount to 38,000 af (137 percent of average), 58,000 af (110 percent of average), and 85,000 af (100 percent of average), respectively.

The next Fontenelle Working Group meeting is scheduled for 10:00 a.m., April 17, 2018. The meeting will be held at Seedskadee Wildlife Refuge Headquarters, Wyoming. The Fontenelle Working Group is an open public forum for information exchange between Reclamation and other parties associated with the operation of Fontenelle Reservoir.

Flaming Gorge Reservoir – Releases are currently 2,800 cfs and expected to remain at this level through February, subject to hydrology. Current estimates are for releases to decrease to 1,750 cfs beginning in March through the beginning of spring runoff.

Unregulated inflow into Flaming Gorge Reservoir during the month of January was 52,000 af, or 130 percent of average. The reservoir elevation is 6,027.39 feet (87 percent of live capacity) and decreasing.

The February final forecast for inflows for the next three months projects above average conditions: February, March and April forecasted inflow volumes at 55,000 af (123 percent of average), 104,000 af (102 percent of average), and 125,000 af (94 percent of average), respectively.

The January water supply forecast of the April through July unregulated inflow volume into Flaming Gorge Reservoir is 890,000 acre-feet (91 percent of average). Current snowpack is 102 percent of median for the Upper Green Basin. The Upper Green is doing well compared against the southern portion of the Upper Colorado River Basin. The Yampa River forecast for Deerlodge is 790,000 acre-feet (64 percent of average).

The Flaming Gorge Working Group is an open public forum for information exchange between Reclamation and the stakeholders of Flaming Gorge Dam. The public is encouraged to attend and comment on the operations and plans presented by Reclamation

at these meetings. Meeting notes from past Working Group meetings are posted on the Working Group webpage. For more information on this group and these meetings please contact Dale Hamilton at 801-379-1186 or Heather Patno at 801-524-3883.

Reclamation will be holding the next Flaming Gorge Working Group meeting on Thursday, March 8, 2018, at 7:00 p.m. at the Lighthouse Learning Center High School (gymnasium), 251 West 400 North, Price, Utah, and the next on April 19, 2018, at 11:00 a.m. at the UDWR offices 318 North Vernal Ave, Vernal, Utah.

Aspinall Unit Reservoirs – Releases from Crystal Dam are approximately 650 cfs. Uncompahgre Valley Water Users Association shut down the Gunnison Tunnel on November 1, 2017 so all releases from Crystal are now flowing through the Black Canyon. Blue Mesa Reservoir elevation is 7586.15 feet which corresponds to a storage content 552,000 acre-feet (67 percent of full capacity). Releases from Crystal are likely to be reduced in the near future if hydrologic conditions do not improve.

The January unregulated inflow to Blue Mesa Reservoir was 20,355 af (84 percent of average). Unregulated Inflows to Blue Mesa for the next three months (February, March and April) are projected to be: 20,000 af (91 percent of average), 30,000 af (83 percent of average) and 48,000 af (62 percent of average), respectively. For water year 2018, the unregulated inflow volume is forecasted to be 627,000 af (66 percent of average) with 400,000 af (59 percent of average) forecasted unregulated inflow during the April through July period. The February 24-Month Study is reflective of this new forecast.

The Aspinall Unit Working Group is an open public forum for information exchange between Reclamation and the stakeholders of the Aspinall Unit. The public is encouraged to attend and comments on the operations and plans presented by Reclamation at these meetings. Meeting notes from past working Group meetings are posted on the Working Group webpage. For more information on this group and these meetings please contact Erik Knight in the Grand Junction Area Office at (970) 248-0629.

Meeting notes from past working Group meetings are posted on the Working Group webpage at:

https://www.usbr.gov/uc/wcao/water/rsvrs/mtgs/amcurrnt.html

The next meeting of the Aspinall Unit Working Group will be held on Thursday, April 17th, 2018 at 1:00 pm at the at the Western Colorado Area Office located at 445 West Gunnison Avenue in Grand Junction, Colorado.

Navajo Reservoir – As of February 5, 2018, the daily average release at Navajo is 360 cfs, and the observed inflow is 190 cfs. The reservoir elevation is 6052.3 feet (1,253,100 af), and is 74 percent full (57 percent of active storage). The San Juan River at Four Corners USGS gage is at 580 cfs. The Animas River at Farmington USGS gage is at 190

cfs. Releases are made for the authorized purposes of the Navajo Unit, and pursuant to the 2006 Record of Decision, in an attempt to maintain a target base flow through the endangered fish critical habitat reach of the San Juan River (Farmington to Lake Powell). The San Juan River Basin Recovery Implementation Program (SJRIP) recommends a target base flow of between 500 cfs and 1,000 cfs through the critical habitat area. The target base flow is calculated as the weekly average of gaged flows throughout the critical habitat area.

Currently SNOTEL sites are showing an average of 4.3 inches of snow water equivalent (swe) above Navajo, which is 32% of the median and 21% of the seasonal median peak.

Modified unregulated inflow into Navajo was 12,194 af, which was 56% of average for the month. The most probable modified-unregulated inflow forecast for February at Navajo is 16,000 af (53% of average), for March is 35,000 af (38% of average), and for April is 53,000 af (31% of average).

The April through July runoff forecasts are as follows:
Min Probable: 120,000 af (16% of average)
Most Probable: 260,000 af (35% of average)
Max Probable: 500,000 af (68% of average)

Under the current soil moisture conditions, snowpack, and inflow forecast for the runoff season, there are no current plans for a spring peak release at Navajo Reservoir. Releases for the remainder of the winter will be made to maintain the target baseflow in the critical habitat reach and will range from 300 and 500 cfs.

Reclamation conducts Public Operations Meetings three times per year to gather input for determining upcoming operations for Navajo Reservoir. Input from individuals, organizations, and agencies along with other factors such as weather, water rights, endangered species requirements, flood control, hydro power, recreation, fish and wildlife management, and reservoir levels, will be considered in the development of these reservoir operation plans. In addition, the meetings are used to coordinate activities and exchange information among agencies, water users, and other interested parties concerning the San Juan River and Navajo Reservoir.

The next Navajo Public Operations Coordination Meeting is scheduled for February 13, 2018, at 1:00 p.m. at the Farmington Civic Center, Farmington, NM.

Glen Canyon Dam / Lake Powell

Current Status
The unregulated inflow to Lake Powell in January was 262 thousand acre-feet (kaf) (72 percent of average). The release volume from Glen Canyon Dam in January was 860 kaf. The end of January elevation and storage of Lake Powell were 3,619 feet (81 feet from full pool) and 13.7 maf (56 percent of full capacity), respectively. The reservoir is

declining and will continue to decline until spring runoff begins to enter the reservoir. The current snowpack above Lake Powell is 66 percent of average.

Current Operations

The operating tier for water year 2018 was established in August 2017 as the Upper Elevation Balancing Tier, with an initial water year release volume of 8.23 maf and the potential for an April 2018 adjustment to equalization or balancing releases. Based on the current forecast, an April adjustment to balancing is projected to occur and Lake Powell is currently projected to release 9.0 maf in water year 2018. This projection will be updated each month throughout the water year. Reclamation will schedule operations at Glen Canyon Dam to achieve as practicably as possible the appropriate total annual release volume by September 30, 2018.

In February 2018, the release volume will be approximately 730 kaf, with fluctuations anticipated between approximately 10,500 cfs and 13,900 cfs and consistent with the Glen Canyon Dam, Record of Decision (dated December 2016). The anticipated release volume for March is approximately 800 kaf with daily fluctuations between approximately 7,200 cfs and 16,000 cfs. The expected release for April is 705 kaf with daily fluctuations between approximately 8,650 cfs and 15,000 cfs.

In addition to daily scheduled fluctuations for power generation, the instantaneous releases from Glen Canyon Dam may also fluctuate to provide 40 MW of system regulation. These instantaneous release adjustments stabilize the electrical generation and transmission system and translate to a range of up to about 1,200 cfs above or below the hourly scheduled release rate. Under system normal conditions, fluctuations for regulation are typically short lived and generally balance out over the hour with minimal or no noticeable impacts on downstream river flow conditions.

Releases from Glen Canyon Dam can also fluctuate beyond scheduled releases when called upon to respond to unscheduled power outages or power system emergencies. Depending on the severity of the system emergency, the response from Glen Canyon Dam can be significant, within the full range of the operating capacity of the power plant for as long as is necessary to maintain balance in the transmission system. Glen Canyon Dam currently maintains 27 MW (approximately 800 cfs) of generation capacity in reserve in order to respond to a system emergency even when generation rates are already high. System emergencies occur fairly infrequently and typically require small responses from Glen Canyon Dam. However, these responses can have a noticeable impact on the river downstream of Glen Canyon Dam.

Inflow Forecasts and Model Projections

The April to July 2018 water supply forecast for unregulated inflow to Lake Powell, issued on February 2, 2018, by the Colorado Basin River Forecast Center, projects that the most probable (median) unregulated inflow volume will be 3.4 maf (47 percent of average based on the period 1981-2010). The projected water year 2018 inflow is 6.1 maf (56 percent of average). At this early point in the season, there is still significant uncertainty regarding this year's water supply. The April-July forecast ranges from a minimum probable of 2.11 maf (29 percent of average) to a maximum probable of 6.5 maf (90 percent of average). There is a 10 percent chance that inflows could be higher

than the current maximum probable forecast and a 10 percent chance that inflows could be lower than the minimum probable forecast.

Based on the current forecast, the February 24-Month Study projects Lake Powell elevation will end water year 2018 near 3,603 feet with approximately 12.0 maf in storage (49 percent of capacity). Note that projections of elevation and storage for water year 2018 have significant uncertainty at this point in the season. Projections of elevation and storage using the minimum and maximum probable inflow forecast, updated in January, are 3,591 feet (10.9 maf, 45 percent of capacity) and 3,628 feet (14.7 maf, 60 percent of capacity), respectively. Under these scenarios, there is a 10 percent chance that inflows will be higher, resulting in higher elevation and storage, and 10 percent chance that inflows will be lower, potentially in lower elevation and storage. The annual release volume from Lake Powell during water year 2018 is projected to be 9.0 maf under the minimum, most, and maximum probable inflow scenarios. There is a chance that inflows could be higher or lower, potentially resulting in releases greater than 9.0 maf or as low as 8.23 maf in water year 2018. The minimum and maximum probable scenarios will be updated again in April.

Upper Colorado River Basin Hydrology

The Upper Colorado River Basin regularly experiences significant year to year hydrologic variability. During the 18-year period 2000 to 2017, however, the unregulated inflow to Lake Powell, which is a good measure of hydrologic conditions in the Colorado River Basin, was above average in only 4 out of the past 18 years. The period 2000-2017 is the lowest 18-year period since the closure of Glen Canyon Dam in 1963, with an average unregulated inflow of 8.76 maf, or 81 percent of the 30-year average (1981-2010). (For comparison, the 1981-2010 total water year average is 10.83 maf.) The unregulated inflow during the 2000-2017 period has ranged from a low of 2.64 maf (24 percent of average) in water year 2002 to a high of 15.97 maf (147 percent of average) in water year 2011. In water year 2017 unregulated inflow volume to Lake Powell was 11.9 maf (110 percent of average), the fourth year to be above average. Under the current most probable forecast, the total water year 2018 unregulated inflow to Lake Powell is projected to be 6.1 maf (56 percent of average).

At the beginning of water year 2018, total system storage in the Colorado River Basin was 32.9 maf (55 percent of 59.6 maf total system capacity). This is an increase of 2.7 maf over the total storage at the beginning of water year 2017 when total system storage was 30.2 maf (51 percent of capacity). Since the beginning of water year 2000, total Colorado Basin storage has experienced year to year increases and decreases in response to wet and dry hydrology, ranging from a high of 94 percent of capacity at the beginning of 2000 to a low of 50 percent of capacity at the beginning of water year 2005. One wet year can significantly increase total system reservoir storage, just as persistent dry years can draw down the system storage. Based on current inflow forecasts, the current projected end of water year total Colorado Basin reservoir storage for water year 2018 is approximately 29.3 maf (49 percent of total system capacity). The actual end of water year 2018 system storage may vary from this projection, primarily due to uncertainty regarding this season's runoff and reservoir inflow. Based on the January minimum and maximum probable inflow forecasts and modeling, the range of end of water year 2018

total system capacity is approximately 28.0 maf (47 percent of capacity) to 32.7 maf (55 percent of capacity), respectively.

March 24-Month Study
Date: March 13, 2018

From: Water Resources Group, Salt Lake City
To: All Colorado River Annual Operating Plan (AOP) Recipients

Current Reservoir Status

Reservoir	February Inflow (unregulated) (acre-feet)	Percent of Average (%)	March 12, Midnight Elevation (feet)	March 12, Midnight Reservoir Storage (acre-feet)
Fontenelle	38,000	138	6,469.79	117,000
Flaming Gorge	57,000	128	6,025.81	3,190,000
Blue Mesa	23,000	102	7,484.55	540,000
Navajo	15,000	48	6,051.35	1,241,000
Powell	269,000	69	3,614.63	13,202,000

Expected Operations

The operation of Lake Powell and Lake Mead in this March 2018 24-Month Study is pursuant to the December 2007 Record of Decision on Colorado River Interim Guidelines for Lower Basin Shortages and the Coordinated Operations of Lake Powell and Lake Mead (Interim Guidelines), and reflects the 2018 Annual Operating Plan (AOP). Pursuant to the Interim Guidelines, the August 2017 24-Month Study projections of the January 1, 2018, system storage and reservoir water surface elevations set the operational tier for the coordinated operation of Lake Powell and Lake Mead during 2018.

Consistent with Section 6.B of the Interim Guidelines, Lake Powell's operations in water year 2018 will be governed by the Upper Elevation Balancing Tier, with an initial water year release volume of 8.23 maf and the potential for an April adjustment to equalization or balancing releases in April 2018. This March 2018 24-Month Study indicates that, consistent with Section 6.B.4 of the Interim Guidelines, an April adjustment to balancing releases is projected to occur and Lake Powell is projected to release 9.0 maf in water year 2018.

Consistent with Section 2.B.5 of the Interim Guidelines, the Intentionally Created Surplus (ICS) Surplus Condition is the criterion governing the operation of Lake Mead for calendar year 2018.

The Interim Guidelines are available for download at:
https://www.usbr.gov/lc/region/programs/strategies/RecordofDecision.pdf.
The 2018 AOP is available for download at:
https://www.usbr.gov/lc/region/g4000/aop/AOP18.pdf

Fontenelle Reservoir – Fontenelle Reservoir is currently at elevation 6472 feet above sea level (feet), which amounts to 37 percent of live storage capacity. Inflows for the month of February totaled 38,300 acre-feet (af), or 138 percent of average. Above average inflows are forecasted over the next few months and releases have been increased in order to meet the spring elevation target. Releases have been set to base flow levels of 1,300 cubic feet per second (cfs) and are anticipated to change when downstream icing threats have passed.

The Colorado Basin River Forecast Center has forecasted spring inflows that are significantly above average. March, April, and May forecasted inflow volumes amount to 55,000 af (105 percent of average), 95,000 af (111 percent of average), and 175,000 af (107 percent of average), respectively.

The next Fontenelle Working Group meeting is scheduled for 10:00 a.m., April 17, 2018. The meeting will be held at Seedskadee Wildlife Refuge Headquarters, Wyoming. The Fontenelle Working Group is an open public forum for information exchange between Reclamation and other parties associated with the operation of Fontenelle Reservoir.

Flaming Gorge Reservoir – Releases are currently 1,700 cfs with fluctuations for hydropower, and will increase or decrease throughout the spring season to meet the May 1 elevation target of 6,027 feet.

Unregulated inflow into Flaming Gorge Reservoir during the month of February was 57,000 af, or 128 percent of average. The reservoir elevation currently is 6,025.9 feet (85 percent of live capacity) and increasing.

The March final forecast for inflows for the next three months projects near to below average conditions: March, April and May forecasted inflow volumes at 108,000 af (106 percent of average), 125,000 af (94 percent of average), and 220,000 af (90 percent of average), respectively.

The March water supply forecast of the April through July unregulated inflow volume into Flaming Gorge Reservoir is 940,000 acre-feet (96 percent of average). Current snowpack is 108 percent of median and we have received 89 percent of the season peak for the Upper Green Basin with additional storm systems anticipated.

The Flaming Gorge Working Group is an open public forum for information exchange between Reclamation and the stakeholders of Flaming Gorge Dam. The public is encouraged to attend and comment on the operations and plans presented by Reclamation at these meetings. Meeting notes from past Working Group meetings are posted on the

Working Group webpage. For more information on this group and these meetings please contact Dale Hamilton at 801-379-1186 or Heather Patno at 801-524-3883.

Reclamation will be holding the Flaming Gorge Working Group meeting on Thursday, April 19, 2018, at 11:00 a.m. at the Utah Division of Wildlife Resources offices located at 318 North Vernal Avenue, Vernal, Utah.

Aspinall Unit Reservoirs – Releases from Crystal Dam are approximately 650 cfs. Uncompahgre Valley Water Users Association will likely begin diverting water through the Gunnison Tunnel by mid-March 2018. When this occurs, releases from Crystal will likely be adjusted to maintain flows in the Black Canyon at or above 650 cfs until such time that a spring operation plan is initiated which will likely occur near mid-May. Blue Mesa Reservoir elevation is 7586.51 feet which corresponds to a storage content 539,000 af (65 percent of full capacity).

The February unregulated inflow to Blue Mesa Reservoir was 22,899 af (102 percent of average). Unregulated Inflows to Blue Mesa for the next three months (March, April and May) are projected to be: 27,000 af (75 percent of average), 46,000 af (60 percent of average) and 130,000 af (59 percent of average), respectively. For water year 2018, the unregulated inflow volume is forecasted to be 627,000 af (66 percent of average) with 395,000 af (58 percent of average) forecasted unregulated inflow during the April through July period. The March 24-Month Study is reflective of this new forecast.

The Aspinall Unit Working Group is an open public forum for information exchange between Reclamation and the stakeholders of the Aspinall Unit. The public is encouraged to attend and comments on the operations and plans presented by Reclamation at these meetings. Meeting notes from past working Group meetings are posted on the Working Group webpage. For more information on this group and these meetings please contact Erik Knight in the Grand Junction Area Office at (970) 248-0629.

Meeting notes from past working Group meetings are posted on the Working Group webpage at:

https://www.usbr.gov/uc/wcao/water/rsvrs/mtgs/amcurrnt.html

The next meeting of the Aspinall Unit Working Group will be held on Thursday, April 17th, 2018 at 1:00 pm at the at the Western Colorado Area Office located at 445 West Gunnison Avenue in Grand Junction, Colorado.

Navajo Reservoir – As of March 5th, 2018, the daily average release at Navajo is 325 cfs, and the observed inflow is 217 cfs. The reservoir elevation is 6052.5 feet (1,243,000 af), and is 73 percent full (56 percent of active storage). The San Juan River at Four Corners USGS gage is at 541 cfs. The Animas River at Farmington USGS gage is at 145 cfs. Releases are made for the authorized purposes of the Navajo Unit, and pursuant to the 2006 Record of Decision, in an attempt to maintain a target base flow through the

endangered fish critical habitat reach of the San Juan River (Farmington to Lake Powell). The San Juan River Basin Recovery Implementation Program (SJRIP) recommends a target base flow of between 500 cfs and 1,000 cfs through the critical habitat area. The target base flow is calculated as the weekly average of gaged flows throughout the critical habitat area.

Currently SNOTEL sites are showing an average of 9.9 inches of SWE above Navajo, which is 53 percent of the median and 49 percent of the seasonal median peak.

Modified unregulated inflow into Navajo in February was 15,200 af (50 percent of average). The Navajo Reservoir most probable modified-unregulated inflow forecast for March, April and May is 30,000 af (32 percent of average), 60,000 af (35 percent of average), and 125,000 af (45% of average), respectively.

The April-July runoff forecasts are as follows:

Min Prob: 150,000 af (20% avg, no change since the last forecast)
Most Prob: 285,000 af (39% avg, an increase of 25,000 af since the last forecast)
Max Prob: 470,000 af (64% avg, no change since the last forecast)

Under the current soil moisture conditions, snowpack, and inflow forecast for the runoff season, there are no current plans for a spring peak release at Navajo Reservoir.

Releases for the remainder of the winter will be made to maintain the minimum target baseflow in the critical habitat reach and will likely range from 300 and 500 cfs.

Reclamation conducts Public Operations Meetings three times per year to gather input for determining upcoming operations for Navajo Reservoir. Input from individuals, organizations, and agencies along with other factors such as weather, water rights, endangered species requirements, flood control, hydro power, recreation, fish and wildlife management, and reservoir levels, will be considered in the development of these reservoir operation plans. In addition, the meetings are used to coordinate activities and exchange information among agencies, water users, and other interested parties concerning the San Juan River and Navajo Reservoir.

The next Navajo Public Operations Coordination Meeting is scheduled for February 13, 2018, at 1:00 p.m. at the Farmington Civic Center, Farmington, NM.

Glen Canyon Dam / Lake Powell

Current Status
The unregulated inflow to Lake Powell in February was 269 thousand acre-feet (kaf) (69 percent of average). The release volume from Glen Canyon Dam in February was 730 kaf. The end of February elevation and storage of Lake Powell were 3,616 feet (84 feet from full pool) and 13.3 maf (55 percent of full capacity), respectively. The reservoir is

declining and will continue to decline until spring runoff begins to enter the reservoir. The current snowpack above Lake Powell is 71 percent of average.

Current Operations

The operating tier for water year 2018 was established in August 2017 as the Upper Elevation Balancing Tier, with an initial water year release volume of 8.23 maf and the potential for an April 2018 adjustment to equalization or balancing releases. Based on the current forecast, an April adjustment to balancing is projected to occur and Lake Powell is currently projected to release 9.0 maf in water year 2018. This projection will be updated each month throughout the water year. Reclamation will schedule operations at Glen Canyon Dam to achieve as practicably as possible the appropriate total annual release volume by September 30, 2018.

In March 2018, the release volume will be approximately 800 kaf, with fluctuations anticipated between approximately 7,200 cfs and 16,000 cfs and consistent with the Glen Canyon Dam, Record of Decision (dated December 2016). The anticipated release volume for April is approximately 705 kaf with daily fluctuations between approximately 8,650 cfs and 15,000 cfs. The expected release for May is 705 kaf with daily fluctuations between approximately 7,050 cfs and 13,390 cfs.

In addition to daily scheduled fluctuations for power generation, the instantaneous releases from Glen Canyon Dam may also fluctuate to provide 40 MW of system regulation. These instantaneous release adjustments stabilize the electrical generation and transmission system and translate to a range of up to about 1,200 cfs above or below the hourly scheduled release rate. Under system normal conditions, fluctuations for regulation are typically short lived and generally balance out over the hour with minimal or no noticeable impacts on downstream river flow conditions.

Releases from Glen Canyon Dam can also fluctuate beyond scheduled releases when called upon to respond to unscheduled power outages or power system emergencies. Depending on the severity of the system emergency, the response from Glen Canyon Dam can be significant, within the full range of the operating capacity of the power plant for as long as is necessary to maintain balance in the transmission system. Glen Canyon Dam currently maintains 27 MW (approximately 800 cfs) of generation capacity in reserve in order to respond to a system emergency even when generation rates are already high. System emergencies occur fairly infrequently and typically require small responses from Glen Canyon Dam. However, these responses can have a noticeable impact on the river downstream of Glen Canyon Dam.

Inflow Forecasts and Model Projections

The April to July 2018 water supply forecast for unregulated inflow to Lake Powell, issued on March 2, 2018, by the Colorado Basin River Forecast Center, projects that the most probable (median) unregulated inflow volume will be 3.4 maf (47 percent of average based on the period 1981-2010). The projected water year 2018 inflow is 6.0 maf (55 percent of average). At this early point in the season, there is still significant uncertainty regarding this year's water supply. The April-July forecast ranges from a minimum probable of 2.2 maf (31 percent of average) to a maximum probable of 5.7 maf (80 percent of average). There is a 10 percent chance that inflows could be higher than

the current maximum probable forecast and a 10 percent chance that inflows could be lower than the minimum probable forecast.

Based on the current forecast, the March 24-Month Study projects Lake Powell elevation will end water year 2018 near 3,601 feet with approximately 11.8 maf in storage (49 percent of capacity). Note that projections of elevation and storage for water year 2018 have significant uncertainty at this point in the season. Projections of elevation and storage using the minimum and maximum probable inflow forecast, updated in January, are 3,591 feet (10.9 maf, 45 percent of capacity) and 3,628 feet (14.7 maf, 60 percent of capacity), respectively. Under these scenarios, there is a 10 percent chance that inflows will be higher, resulting in higher elevation and storage, and 10 percent chance that inflows will be lower, potentially in lower elevation and storage. The annual release volume from Lake Powell during water year 2018 is projected to be 9.0 maf under the minimum, most, and maximum probable inflow scenarios. There is a chance that inflows could be higher or lower, potentially resulting in releases greater than 9.0 maf or as low as 8.23 maf in water year 2018. The minimum and maximum probable scenarios will be updated again in April.

Upper Colorado River Basin Hydrology

The Upper Colorado River Basin regularly experiences significant year to year hydrologic variability. During the 18-year period 2000 to 2017, however, the unregulated inflow to Lake Powell, which is a good measure of hydrologic conditions in the Colorado River Basin, was above average in only 4 out of the past 18 years. The period 2000-2017 is the lowest 18-year period since the closure of Glen Canyon Dam in 1963, with an average unregulated inflow of 8.76 maf, or 81percent of the 30-year average (1981-2010). (For comparison, the 1981-2010 total water year average is 10.83 maf.) The unregulated inflow during the 2000-2017 period has ranged from a low of 2.64 maf (24 percent of average) in water year 2002 to a high of 15.97 maf (147 percent of average) in water year 2011. In water year 2017 unregulated inflow volume to Lake Powell was 11.9 maf (110 percent of average), the fourth year to be above average. Under the current most probable forecast, the total water year 2018 unregulated inflow to Lake Powell is projected to be 6.0 maf (55 percent of average).

At the beginning of water year 2018, total system storage in the Colorado River Basin was 32.9 maf (55 percent of 59.6 maf total system capacity). This is an increase of 2.7 maf over the total storage at the beginning of water year 2017 when total system storage was 30.2 maf (51 percent of capacity). Since the beginning of water year 2000, total Colorado Basin storage has experienced year to year increases and decreases in response to wet and dry hydrology, ranging from a high of 94 percent of capacity at the beginning of 2000 to a low of 50 percent of capacity at the beginning of water year 2005. One wet year can significantly increase total system reservoir storage, just as persistent dry years can draw down the system storage. Based on current inflow forecasts, the current projected end of water year total Colorado Basin reservoir storage for water year 2018 is approximately 29.3 maf (49 percent of total system capacity). The actual end of water year 2018 system storage may vary from this projection, primarily due to uncertainty regarding this season's runoff and reservoir inflow. Based on the January minimum and maximum probable inflow forecasts and modeling, the range of end of water year 2018

total system capacity is approximately 28.0 maf (47 percent of capacity) to 32.7 maf (55 percent of capacity), respectively.

April 24-Month Study
Date: April 16, 2018

From: Water Resources Group, Salt Lake City
To: All Colorado River Annual Operating Plan (AOP) Recipients

Current Reservoir Status

Reservoir	March Inflow (unregulated) (acre-feet)	Percent of Average (%)	April 15, Midnight Elevation (feet)	April 15, Midnight Reservoir Storage (acre-feet)
Fontenelle	58,000	110	6,470.73	121,000
Flaming Gorge	86,000	84	6,025.49	3,178,000
Blue Mesa	28,000	78	7,480.78	512,000
Navajo	24,000	26	6,050.82	1,235,000
Powell	332,000	50	3,610.84	12,815,000

Expected Operations

The operation of Lake Powell and Lake Mead in this April 2018 24-Month Study is pursuant to the December 2007 Record of Decision on Colorado River Interim Guidelines for Lower Basin Shortages and the Coordinated Operations of Lake Powell and Lake Mead (Interim Guidelines), and reflects the 2018 Annual Operating Plan (AOP). Pursuant to the Interim Guidelines, the August 2017 24-Month Study projections of the January 1, 2018, system storage and reservoir water surface elevations set the operational tier for the coordinated operation of Lake Powell and Lake Mead during 2018.

Consistent with Section 6.B of the Interim Guidelines, Lake Powell's operations in water year 2018 will be governed by the Upper Elevation Balancing Tier. With an 8.23 million acre-feet (maf) release from Lake Powell in water year 2018, the April 2018 24-Month Study projects the end of water year elevation at Lake Powell to be above 3,575 feet above sea level (feet), and the end of water year elevation at Lake Mead to be below 1,075 feet. Therefore, in accordance with Section 6.B.4 of the Interim Guidelines, Lake Powell operations will shift to balancing releases for the remainder of water year 2018. Under Section 6.B.4, the contents of Lake Powell and Lake Mead will be balanced by the end of the water year, but not more than 9.0 maf and not less than 8.23 maf shall be released from Lake Powell. Based on the most probable inflow forecast, this April 24-Month Study projects a balancing release of 9.0 maf in water year 2018; however, the actual release in water year 2018 will depend on hydrology in the remainder of water

year and will range from 8.23 to 9.0 maf. The projected release from Lake Powell in water year 2018 will be updated each month throughout the remainder of the water year.

Consistent with Section 2.B.5 of the Interim Guidelines, the Intentionally Created Surplus (ICS) Surplus Condition is the criterion governing the operation of Lake Mead for calendar year 2018.

The Interim Guidelines are available for download at:
https://www.usbr.gov/lc/region/programs/strategies/RecordofDecision.pdf.
The 2018 AOP is available for download at:
https://www.usbr.gov/lc/region/g4000/aop/AOP18.pdf

Fontenelle Reservoir – Fontenelle Reservoir is currently at elevation 6470 feet, which amounts to 35 percent of live storage capacity. Inflows for the month of March totaled 58,000 acre-feet (af), or 110 percent of average. Above average inflows are forecasted over the next few months and releases have been adjusted to meet the spring elevation target. Releases have been set to 1,500 cfs and are anticipated to increase as inflows into the reservoir increase.

The Colorado Basin River Forecast Center has forecasted above average inflows into the reservoir this spring. April, May, and June forecasted inflow volumes amount to 95,000 af (111 percent of average), 205,000 af (125 percent of average), and 370,000 af (124 percent of average), respectively.

The next Fontenelle Working Group meeting is scheduled for 10:00 a.m., April 17, 2018. The meeting will be held at Seedskadee Wildlife Refuge Headquarters, Wyoming. The Fontenelle Working Group is an open public forum for information exchange between Reclamation and other parties associated with the operation of Fontenelle Reservoir.

Flaming Gorge Reservoir – Releases are currently 1,700 cfs with fluctuations for hydropower, and will increase or decrease throughout the spring season to meet the May 1 elevation target of 6,027 feet.

Unregulated inflow into Flaming Gorge Reservoir during the month of March was 98,864 af, or 97 percent of average. The reservoir elevation is 6,025.53 feet (85 percent of live capacity) and decreasing.

The April final forecast for inflows for the next three months projects near average conditions: April, May, and June forecasted unregulated inflow volumes at 125,000 af (94 percent of average), 240,000 af (98 percent of average), and 400,000 af (102 percent of average), respectively.

The April water supply forecast of the April through July unregulated inflow volume into Flaming Gorge Reservoir is 1,000,000 af (102 percent of average). Current snowpack is 117 percent of median and we have received 117 percent of the season peak for the

Upper Green Basin with additional storm systems anticipated through the remainder of April.

The Flaming Gorge Working Group is an open public forum for information exchange between Reclamation and the stakeholders of Flaming Gorge Dam. The public is encouraged to attend and comment on the operations and plans presented by Reclamation at these meetings. Meeting notes from past Working Group meetings are posted on the Working Group webpage. For more information on this group and these meetings please contact Dale Hamilton at 801-379-1186 or Jed Parker at 801-524-3816.

Reclamation will be holding the Flaming Gorge Working Group meeting on Thursday, April 19, 2018, at 11:00 a.m. at the Utah Division of Wildlife Resources offices located at 318 North Vernal Avenue, Vernal, Utah.

Aspinall Unit Reservoirs – Releases from Crystal Dam are approximately 1,500 cfs. Uncompahgre Valley Water Users Association is diverting approximately 1,050 cfs through the Gunnison Tunnel and flows through the Black Canyon are approximately 450 cfs. Blue Mesa Reservoir elevation is 7580.78 feet which corresponds to a storage content 511,000 af (62 percent of capacity).

The March unregulated inflow to Blue Mesa Reservoir was 27,739 af (78 percent of average). Unregulated Inflows to Blue Mesa for the next three months (April, May and June) are projected to be: 41,000 af (53 percent of average), 127,000 af (57 percent of average) and 129,000 af (49 percent of average), respectively. For water year 2018, the unregulated inflow volume is forecasted to be 574,000 af (60 percent of average) with 345,000 af (51 percent of average) forecasted unregulated inflow during the April through July period. The April 24-Month Study is reflective of this new forecast.

The Aspinall Unit Working Group is an open public forum for information exchange between Reclamation and the stakeholders of the Aspinall Unit. The public is encouraged to attend and comments on the operations and plans presented by Reclamation at these meetings. Meeting notes from past working Group meetings are posted on the Working Group webpage. For more information on this group and these meetings please contact Erik Knight in the Grand Junction Area Office at (970) 248-0629.

Meeting notes from past working Group meetings are posted on the Working Group webpage at:

https://www.usbr.gov/uc/wcao/water/rsvrs/mtgs/amcurrnt.html

The next meeting of the Aspinall Unit Working Group will be held on Thursday, April 17th, 2018 at 1:00 pm at the at the Western Colorado Area Office located at 445 West Gunnison Avenue in Grand Junction, Colorado.

Navajo Reservoir – On April 2nd, the release was increased to 550 cfs. The observed inflow is 338 cfs. The reservoir elevation is 6050.88 feet (1,235,927 af), and is 73 percent full (55 percent of active storage). The San Juan River at Four Corners USGS gage is at 483 cfs. The Animas River at Farmington USGS gage is at 80 cfs. Releases are made for the authorized purposes of the Navajo Unit, and pursuant to the 2006 Record of Decision, in an attempt to maintain a target base flow through the endangered fish critical habitat reach of the San Juan River (Farmington to Lake Powell). The San Juan River Basin Recovery Implementation Program (SJRIP) recommends a target base flow of between 500 cfs and 1,000 cfs through the critical habitat area. The target base flow is calculated as the weekly average of gaged flows throughout the critical habitat area.

Currently SNOTEL sites are showing an average of 10.7 inches of snow water equivalent (swe) above Navajo, which is 54 percent of the median for this time of year. So far the snowpack has peaked at 11.1 inches of swe.

Preliminary modified unregulated inflow into Navajo was 24,176 af, which was 26 percent of average for the month. The most probable modified-unregulated inflow forecast for April at Navajo is 54,000 af (32 percent of average), for May is 105,000 af (38 percent of average), and for June is 51,000 af (23 percent of average).
The April-July runoff forecasts are as follows:

Min Prob: 168,000 af (23 percent of average, an increase of 38,000 af since the last forecast)
Most Prob: 235,000 af (32 percent of average, a decrease of 30,000 af since the last forecast)
Max Prob: 350,000 af (47 percent of average, a decrease of 60,000 af since the last forecast)

Under the current soil moisture conditions, snowpack, and inflow forecast for the runoff season, there are no current plans for a spring peak release at Navajo Reservoir.

Releases for the remainder of the runoff season will be made to maintain the minimum target baseflow in the critical habitat reach and will likely range from 300 to 700 cfs.

As there is no appreciable precipitation on the horizon, the forecasts are expected to continue to trend somewhere between the Min and Most Probable forecasts.

Reclamation conducts Public Operations Meetings three times per year to gather input for determining upcoming operations for Navajo Reservoir. Input from individuals, organizations, and agencies along with other factors such as weather, water rights, endangered species requirements, flood control, hydro power, recreation, fish and wildlife management, and reservoir levels, will be considered in the development of these reservoir operation plans. In addition, the meetings are used to coordinate activities and exchange information among agencies, water users, and other interested parties concerning the San Juan River and Navajo Reservoir.

The next Navajo Public Operations Coordination Meeting is scheduled for Tuesday, April 24th 2018, at 1:00 p.m. at the Farmington Civic Center, Farmington, NM.

Glen Canyon Dam / Lake Powell

Current Status
The 2016 LTEMP ROD provides the framework for implementing flow-based experiments at Glen Canyon Dam when resource conditions warrant. The purpose of LTEMP experiments is to learn, through adaptive management, how to better protect, mitigate adverse effects to, and improve resources downstream of Glen Canyon Dam, while complying with relevant laws. Ongoing research and monitoring through the Glen Canyon Dam Adaptive Management Program ensures the best science and data is available for making decisions related to experimental releases.

Under the LTEMP, the Department may conduct flow-based experiments (High Flow Experiments, Bug Flows, Trout Management Flows, and Low Summer Flows) at Glen Canyon Dam when resource conditions warrant and if it is determined that there will not be unacceptable adverse impacts on other resources. This is the first year of implementing flow-based experiments under LTEMP, and Reclamation has been following a process similar to that established for High Flow Experiments under prior operational decisions.

The Glen Canyon Dam Experimental Technical Team (Technical Team) recommends that experimental Macroinvertebrate Production Flows (Bug Flows) be implemented at Glen Canyon Dam beginning May 1 through August 31, 2018.

The Bug Flow experiment consists of steady weekend releases from Glen Canyon Dam and normal fluctuating releases during the weekdays. The steady weekend flows are expected to provide favorable conditions for insects to lay eggs along the Colorado River downstream of Glen Canyon Dam, while the minimum flows on weekdays are designed to be similar to flows on the weekends, thus preventing the eggs from drying out. Performing this experiment will not affect the Monthly or Weekly planned release volumes. The affect will only be to the daily distribution volumes, and the peak and low daily flow rates.

At this time we do not have a firm confirmation for a Bug Flow event. However, a final determination for this experiment will likely be made near the end of April.

The unregulated inflow volume to Lake Powell in March was 332 thousand acre-feet (kaf) (50 percent of average). The release volume from Glen Canyon Dam in March was 800 kaf. The end of March elevation and storage of Lake Powell were 3,612 feet (88 feet from full pool) and 13.0 million acre-feet (maf) (53 percent of full capacity), respectively. With a much below average snowpack this water year, the anticipated spring inflows will not be enough to arrest the falling elevation levels on the lake. The reservoir is projected to reach new seasonal low elevations as time progresses on through the end of this year. The basin snowpack reached a peak of 72 percent of the seasonal medium peak on April 10th.

Current Operations

The operating tier for water year 2018 was established in August 2017 as the Upper Elevation Balancing Tier. In the Upper Elevation Balancing Tier the initial water year release volume is 8.23 maf; however, there is the possibility for an April adjustment to equalization or balancing operations to govern for the remainder of the water year. This April 2018 24-Month Study establishes that Lake Powell operations will shift to "balancing releases" for the remainder of water year 2018. Under Balancing, the contents of Lake Powell and Lake Mead will be balanced by the end of the water year, but not more than 9.0 maf and not less than 8.23 maf shall be released from Lake Powell. Based on the most probable inflow forecast, this April 24-Month Study projects a balancing release of 9.0 maf in water year 2018; the actual release in water year 2018, however, will depend on hydrology in the remainder of water year and will range from 8.23 to 9.0 maf. The projected release from Lake Powell in water year 2018 will be updated each month throughout the remainder of the water year. Reclamation will schedule operations at Glen Canyon Dam to achieve as practicably as possible the appropriate total annual release volume by September 30, 2018.

In April, the release volume will be approximately 705 kaf, with fluctuations anticipated between about 8,650 cfs in the nighttime to about 15,000 cfs in the daytime and consistent with the Glen Canyon Dam, Record of Decision (dated December 2016). The anticipated release volume for May is 705 kaf with daily fluctuations between approximately 7,050 cfs and 13,390 cfs. The expected release for June is 760 kaf with daily fluctuations between approximately 8,850 cfs and 16,450 cfs.

In addition to daily scheduled fluctuations for power generation, the instantaneous releases from Glen Canyon Dam may also fluctuate to provide 40 MW of system regulation. These instantaneous release adjustments stabilize the electrical generation and transmission system and translate to a range of up to about 1,200 cfs above or below the hourly scheduled release rate. Under system normal conditions, fluctuations for regulation are typically short lived and generally balance out over the hour with minimal or no noticeable impacts on downstream river flow conditions.

Releases from Glen Canyon Dam can also fluctuate beyond scheduled releases when called upon to respond to unscheduled power outages or power system emergencies. Depending on the severity of the system emergency, the response from Glen Canyon Dam can be significant, within the full range of the operating capacity of the power plant for as long as is necessary to maintain balance in the transmission system. Glen Canyon Dam currently maintains 27 mw (approximately 800 cfs) of generation capacity in reserve in order to respond to a system emergency even when generation rates are already high. System emergencies occur fairly infrequently and typically require small responses from Glen Canyon Dam. However, these responses can have a noticeable impact on the river downstream of Glen Canyon Dam.

Inflow Forecasts and Model Projections

The April to July 2018 water supply forecast for unregulated inflow to Lake Powell, issued on April 3, 2018, by the Colorado Basin River Forecast Center, projects that the most probable (median) unregulated inflow volume will be 3.1 maf (43 percent of

average based on the period 1981-2010). The projected water year 2018 inflow is 5.6 maf (124 percent). At this early point in the season, there is still significant uncertainty regarding this year's water supply. The April-July forecast ranges from a minimum probable of 1.9 maf (27 percent) to a maximum probable of 4.9 maf (68 percent). There is a 10percent chance that inflows could be higher than the current maximum probable forecast and a 10 percent chance that inflows could be lower than the minimum probable forecast.

As determined in the August 2017 24-Month Study, and documented in the 2018 Annual Operating Plan, Lake Powell's operations in water year 2018 will be governed by the Upper Elevation Balancing Tier. In this tier, the initial water year release volume is 8.23 maf, however, there is the potential for an April adjustment to equalization or balancing releases in April 2018. This April 2018 24-Month Study projects the end of water year elevation at Lake Powell to be above 3,575 feet and the end of water year elevation at Lake Mead to be below elevation 1,075.0 feet. Therefore, in accordance with Section 6.B.4 of the 2007 Interim Guidelines, Lake Powell operations will shift to "balancing releases" for the remainder of water year 2018. Under Section 6.B.4, the contents of Lake Powell and Lake Mead will be balanced by the end of the water year, but not more than 9.0 maf and not less than 8.23 maf shall be released from Lake Powell.

Based on the April most probable inflow forecast, the annual release volume from Lake Powell during water year 2018 is projected to be 9.0 maf. Under the minimum probable inflow scenario, the water year release is projected to be 9.0 maf. Under the maximum probable inflow scenario, the release is projected to be 9.0 maf. There is a 10 percent chance that inflows will be lower than the current minimum probable forecast, potentially resulting in lower releases. If inflows are less than the minimum probable forecast, the water year 2018 annual release could be as low as 8.23 maf. If inflows are greater than the current forecasted maximum probable inflow, the annual release will be 9.0 maf. The projected release from Lake Powell in water year 2018 will be updated each month throughout the remainder of the water year.

Based on the current forecast, the April 24-Month Study projects Lake Powell elevation will end water year 2018 near 3,598 feet with approximately 11.6 maf in storage (48 percent capacity). Projections of elevation and storage still have significant uncertainty at this point in the season, primarily due to uncertainty regarding spring runoff and the resulting inflow to Lake Powell. Under the minimum probable inflow scenario, updated in April, the projected end of water year elevation and storage are 3,589 feet and 10.7 maf (44 percent capacity), respectively. Under the maximum probable inflow scenario, updated in April, the projected end of water year elevation and storage are 3616 feet and 13.3 maf (55 percent capacity), respectively. Modeling of projected reservoir operations based on the minimum and maximum scenarios will be updated again in August.

Upper Colorado River Basin Hydrology

The Upper Colorado River Basin regularly experiences significant year to year hydrologic variability. During the 18-year period 2000 to 2017, however, the unregulated inflow to Lake Powell, which is a good measure of hydrologic conditions in the Colorado River Basin, was above average in only 4 out of the past 18 years. The

period 2000-2017 is the lowest 18-year period since the closure of Glen Canyon Dam in 1963, with an average unregulated inflow of 8.76 maf, or 81percent of the 30-year average (1981-2010). (For comparison, the 1981-2010 total water year average is 10.83 maf.) The unregulated inflow during the 2000-2017 period has ranged from a low of 2.64 maf (24 percent of average) in water year 2002 to a high of 15.97 maf (147 percent of average) in water year 2011. In water year 2017 unregulated inflow volume to Lake Powell was 11.9 maf (110 percent of average), the fourth year to be above average. Under the current most probable forecast, the total water year 2018 unregulated inflow to Lake Powell is projected to be 5.6 maf (52 percent of average).

At the beginning of water year 2018, total system storage in the Colorado River Basin was 32.9 maf (55 percent of 59.6 maf total system capacity). This is an increase of 2.7 maf over the total storage at the beginning of water year 2017 when total system storage was 30.2 maf (51 percent of capacity). Since the beginning of water year 2000, total Colorado Basin storage has experienced year to year increases and decreases in response to wet and dry hydrology, ranging from a high of 94 percent of capacity at the beginning of 2000 to a low of 50 percent of capacity at the beginning of water year 2005. One wet year can significantly increase total system reservoir storage, just as persistent dry years can draw down the system storage. Based on current inflow forecasts, the current projected end of water year total Colorado Basin reservoir storage for water year 2018 is approximately 28.9 maf (48 percent of total system capacity). The actual end of water year 2018 system storage may vary from this projection, primarily due to uncertainty regarding this season's runoff and reservoir inflow. Based on the April minimum and maximum probable inflow forecasts and modeling, the range of end of water year 2018 total system capacity is approximately 27.7 maf (46 percent of capacity) to 30.9 maf (52 percent of capacity), respectively.

May 24-Month Study
Date: May 10, 2018

From: Water Resources Group, Salt Lake City
To: All Colorado River Annual Operating Plan (AOP) Recipients

Current Reservoir Status

Reservoir	April Inflow (unregulated) (acre-feet)	Percent of Average (%)	May 9, Midnight Elevation (feet)	May 9, Midnight Reservoir Storage (acre-feet)
Fontenelle	101,000	118	6,476.68	149,000
Flaming Gorge	121,000	91	6,026.03	3,198,000
Blue Mesa	48,000	62	7,478.33	494,000
Navajo	70,000	41	6,049.61	1,221,000
Powell	382,000	36	3,609.35	12,665,000

Expected Operations

The operation of Lake Powell and Lake Mead in this May 2018 24-Month Study is pursuant to the December 2007 Record of Decision on Colorado River Interim Guidelines for Lower Basin Shortages and the Coordinated Operations of Lake Powell and Lake Mead (Interim Guidelines), and reflects the 2018 Annual Operating Plan (AOP). Pursuant to the Interim Guidelines, the August 2017 24-Month Study projections of the January 1, 2018, system storage and reservoir water surface elevations set the operational tier for the coordinated operation of Lake Powell and Lake Mead during 2018.

Consistent with Section 6.B of the Interim Guidelines, the Lake Powell's operational tier in water year 2018 is the Upper Elevation Balancing Tier. With an 8.23 million acre-feet (maf) release from Lake Powell in water year 2018, the April 2018 24-Month Study projected the end of water year elevation at Lake Powell to be above 3,575 feet, and the end of water year elevation at Lake Mead to be below 1,075 feet. Therefore, in accordance with Section 6.B.4 of the Interim Guidelines, Lake Powell operations shifted to balancing releases for the remainder of water year 2018. Under Section 6.B.4, the contents of Lake Powell and Lake Mead will be balanced by the end of the water year, but not more than 9.0 maf and not less than 8.23 maf shall be released from Lake Powell. Based on the most probable inflow forecast, this May 24-Month Study projects a balancing release of 9.0 maf in water year 2018; however, the actual release in water year 2018 will depend on hydrology in the remainder of water year and will range from 8.23

to 9.0 maf. The projected release from Lake Powell in water year 2018 will be updated each month throughout the remainder of the water year.

Consistent with Section 2.B.5 of the Interim Guidelines, the Intentionally Created Surplus (ICS) Surplus Condition is the criterion governing the operation of Lake Mead for calendar year 2018.

The Interim Guidelines are available for download at:
https://www.usbr.gov/lc/region/programs/strategies/RecordofDecision.pdf.
The 2018 AOP is available for download at:
https://www.usbr.gov/lc/region/g4000/aop/AOP18.pdf

Fontenelle Reservoir – Fontenelle Reservoir is currently at elevation 6475 feet, which amounts to 41 percent of live storage capacity. Inflows for the month of April totaled 101,000 acre-feet (af), or 118 percent of average. Above average inflows are occurring and releases are being adjusted to keep the reservoir elevation low in anticipation of a large runoff. Releases are currently set at 2,400 cfs (05/08/2018).

The Colorado Basin River Forecast Center has forecasted spring and summer inflows that are above average. May, June and July forecasted inflow volumes amount to 235,000 af (144 percent of average), 350,000 af (117 percent of average), and 214,000 af (121 percent of average), respectively.

The next Fontenelle Working Group meeting is scheduled for 10:00 a.m., August 23, 2018. The meeting will be held at the Joint Powers Water Board in Green River, Wyoming. The Fontenelle Working Group is an open public forum for information exchange between Reclamation and other parties associated with the operation of Fontenelle Reservoir.

Flaming Gorge Reservoir – Releases are currently set at 1,700 cfs with fluctuations for hydropower. Releases will likely be increasing to power plant capacity (4,600 cfs) when the spring peak releases is initiated, likely in later May.

Unregulated inflow into Flaming Gorge Reservoir during the month of April was 121,000 af, or 90 percent of average. The reservoir elevation is 6025.93 feet (85 percent of live capacity) and increasing.

The May final forecast for inflows for the next three months projects average to above average conditions: May, June and July forecasted inflow volumes at 280,000 af (114 percent of average), 375,000 af (96 percent of average), and 224,000 af (107 percent of average), respectively.

The May water supply forecast of the April through July unregulated inflow volume into Flaming Gorge Reservoir is 1.0 maf (102 percent of average). Current snowpack is at 99 percent of median.

The Flaming Gorge Working Group is an open public forum for information exchange between Reclamation and the stakeholders of Flaming Gorge Dam. The public is encouraged to attend and comment on the operations and plans presented by Reclamation at these meetings. Meeting notes from past Working Group meetings are posted on the Working Group webpage. For more information on this group and these meetings please contact Dale Hamilton at 801-379-1186 or Jed Parker at 801-524-3816.

Reclamation will be holding the Flaming Gorge Working Group meeting on Tuesday, August 28, 2018 at 11:00 a.m. at the DWR Office, 318 North Vernal Avenue, Vernal, Utah.

Aspinall Unit Reservoirs – Releases from Crystal Dam are approximately 1,650 cfs. Uncompahgre Valley Water Users Association is diverting approximately 1,000 cfs through the Gunnison Tunnel and flows through the Black Canyon are approximately 650 cfs. Blue Mesa Reservoir elevation is 7578.71 feet which corresponds to a storage content 492,000 af (59 percent of capacity).

The April unregulated inflow to Blue Mesa Reservoir was 48,056 af (62 percent of average). Unregulated Inflows to Blue Mesa for the next three months (May, June and July) are projected to be: 124,000 af (56 percent of average), 130,000 af (50 percent of average) and 48,000 af (41 percent of average), respectively. For water year 2018, the unregulated inflow volume is forecasted to be 576,000 af (60 percent of average) with 350,000 af (52 percent of average) forecasted unregulated inflow during the April through July period. The April 24-Month Study is reflective of this new forecast.

The Aspinall Unit Working Group is an open public forum for information exchange between Reclamation and the stakeholders of the Aspinall Unit. The public is encouraged to attend and comments on the operations and plans presented by Reclamation at these meetings. Meeting notes from past working Group meetings are posted on the Working Group webpage. For more information on this group and these meetings please contact Erik Knight in the Grand Junction Area Office at (970) 248-0629.

Meeting notes from past working Group meetings are posted on the Working Group webpage at:

https://www.usbr.gov/uc/wcao/water/rsvrs/mtgs/amcurrnt.html

The next meeting of the Aspinall Unit Working Group will be held on Thursday, April 17th, 2018 at 1:00 pm at the at the Western Colorado Area Office located at 445 West Gunnison Avenue in Grand Junction, Colorado.

Navajo Reservoir – On May 3rd, the release is 650 cfs. The observed inflow is 980 cfs. The reservoir elevation is 6049.7 feet (1,221,400 af), and is 72 percent full (54 percent of active storage). The San Juan River at Four Corners USGS gage is at 790 cfs. The Animas River at Farmington USGS gage is at 260 cfs. Releases are made for the authorized purposes of the Navajo Unit, and pursuant to the 2006 Record of Decision, in an attempt to maintain a target base flow through the endangered fish critical habitat reach of the San Juan River (Farmington to Lake Powell). The San Juan River Basin Recovery Implementation Program (SJRIP) recommends a target base flow of between 500 cfs and 1,000 cfs through the critical habitat area. The target base flow is calculated as the weekly average of gaged flows throughout the critical habitat area.

Currently SNOTEL sites are showing an average of 3.4 inches of SWE above Navajo, which is 18 percent of the median for this time of year. The snowpack peaked at 11.1 inches on March 28th.

Preliminary modified unregulated inflow into Navajo in April was 70,194 af, which was 41 percent of average for the month. The most probable modified-unregulated inflow forecast for May at Navajo is 92,000 af (34 percent of average), for June is 23,000 af (10 percent of average), and for July is 15,000 af (23 percent of average).

The April-July runoff forecasts are as follows:
Min Prob: 147,000 af (20 percent of average, an increase of 2,000 af since the last forecast)
Most Prob: 200,000 af (27 percent of average, a decrease of 20,000 af since the last forecast)
Max Prob: 280,000 af (38 percent of average, a decrease of 45,000 af since the last forecast)

A short release of 2,000 cfs for 2 hours was requested by the NM Department of Game and Fish to aid in a habitat project in the tailwater reach below Navajo Dam. One of the purposes of this project is to curb sediment input entering the San Juan River in this area. Reclamation plans to comply with this request by ramping up beginning in the evening on June 5th, peaking at 2,000 cfs for two hours mid-day on June 6th, and ramping down by the afternoon of June 7th. Total release over base releases will total approximately 2300 af. Reclamation is coordinating with state and local agencies during this event for awareness and safety. Releases for the remainder of the runoff season will be made to maintain the minimum target baseflow in the critical habitat reach and will likely range from 300 to 700 cfs.

Reclamation conducts Public Operations Meetings three times per year to gather input for determining upcoming operations for Navajo Reservoir. Input from individuals, organizations, and agencies along with other factors such as weather, water rights, endangered species requirements, flood control, hydro power, recreation, fish and wildlife management, and reservoir levels, will be considered in the development of these

reservoir operation plans. In addition, the meetings are used to coordinate activities and exchange information among agencies, water users, and other interested parties concerning the San Juan River and Navajo Reservoir.

The next Navajo Public Operations Coordination Meeting is scheduled for Tuesday, August 21st 2018, at 1p.m. at the Farmington Civic Center, Farmington, NM.

Glen Canyon Dam / Lake Powell

Current Status

The Department of the Interior is conducting the first experimental flow at Glen Canyon Dam since implementing its Long-Term Experimental and Management Plan (LTEMP). The goal is to provide enhanced habitat for the lifecycle of aquatic insects that are the primary food source for fish in the Colorado River.

Experiments under LTEMP consist of four different flow regimes: high flows, bug flows, trout management flows, and low summer flows. Collaborative discussions among technical experts resulted in a decision to begin this first experiment on May 1 and continue through August 31, 2018. It will slightly modify the schedule and flow rates of water releases from Lake Powell through Glen Canyon Dam, Arizona. The normally scheduled monthly and weekly release volumes will not be affected.

Flows during the experiment will include steady weekend water releases with routine hydropower production flows on weekdays that include normal hourly changes in release rates. Those steady weekend flows are expected to provide favorable conditions for aquatic insects to lay and cement their eggs to rocks, vegetation, and other materials near the river's edge. Steady weekend flows will be relatively low, within four inches of typical weekday low water levels. It is unlikely casual recreational river users will notice the changes in water levels.

Insects expected to benefit from this experiment are an important food source for many species of fish, birds, and bats in the canyon. Beyond expected resource benefits, this experiment will also provide scientific information that will be used in future decision making.

The unregulated inflow volume to Lake Powell during April was 382 thousand acre-feet (kaf) (36 percent of average). The release volume from Glen Canyon Dam in April was 705 kaf. The end of April elevation and storage of Lake Powell were 3,609 ft (91 feet from full pool) and 12.7 maf (52 percent of full capacity), respectively. The reservoir is projected to decline each month this water year with some reprieve during the smaller than normal spring runoff period.

Current Operations

The operating tier for water year 2018 was established in August 2017 as the Upper Elevation Balancing Tier. The April 2018 24-Month Study established that Lake Powell operations will be governed by balancing for the remainder of water year 2018. Under

balancing, the contents of Lake Powell and Lake Mead will be balanced by the end of the water year, but not more than 9.0 maf and not less than 8.23 maf shall be released from Lake Powell. Based on the most probable inflow forecast, this May 24-Month Study projects a balancing release of 9.0 maf in water year 2018; the actual release in water year 2018, however, will depend on hydrology in the remainder of water year and will range from 8.23 to 9.0 maf. The projected release from Lake Powell in water year 2018 will be updated each month throughout the remainder of the water year. Reclamation will schedule operations at Glen Canyon Dam to achieve as practicably as possible the appropriate total annual release volume by September 30, 2018.

In May, the release volume will be approximately 705 kaf, with fluctuations anticipated between about 8,060 cfs in the nighttime to about 14,260 cfs in the daytime and consistent with the Glen Canyon Dam, Record of Decision (dated December 2016). The anticipated release volume for June is 760 kaf with daily fluctuations between approximately 8,850 cfs and 16,450 cfs. The expected release for July is 860 kaf with daily fluctuations between approximately 10,180 cfs and 18,180 cfs.

In addition to daily scheduled fluctuations for power generation, the instantaneous releases from Glen Canyon Dam may also fluctuate to provide 40 megawatts (mw) of system regulation. These instantaneous release adjustments stabilize the electrical generation and transmission system and translate to a range of about 1,200 cfs above or below the hourly scheduled release rate. Under system normal conditions, fluctuations for regulation are typically short lived and generally balance out over the hour with minimal or no noticeable impacts on downstream river flow conditions.

Releases from Glen Canyon Dam can also fluctuate beyond scheduled releases when called upon to respond to unscheduled power outages or power system emergencies. Depending on the severity of the system emergency, the response from Glen Canyon Dam can be significant, within the full range of the operating capacity of the power plant for as long as is necessary to maintain balance in the transmission system. Glen Canyon Dam currently maintains 27 mw (approximately 800 cfs) of generation capacity in reserve in order to respond to a system emergency even when generation rates are already high. System emergencies occur fairly infrequently and typically require small responses from Glen Canyon Dam. However, these responses can have a noticeable impact on the river downstream of Glen Canyon Dam.

Inflow Forecasts and Model Projections

The April to July 2018 water supply forecast for unregulated inflow to Lake Powell, issued on May 2, 2018, by the Colorado Basin River Forecast Center, projects that the most probable (median) unregulated inflow volume will be 3.0 maf (42 percent of average based on the period 1981-2010). The forecast decreased by 100 kaf since last month. At this point in the season, there is still uncertainty regarding this year's water supply and the total inflow to Lake Powell. The spring runoff forecast ranges from a minimum probable of 2.1 maf (29 percent of average) to a maximum probable of 4.2 maf (58 percent of average). There is 10% chance that inflows could be higher than the maximum probable and a 10% chance they could be lower than the minimum probable.

As determined in the August 2017 24-Month Study, and documented in the 2018 Annual Operating Plan, Lake Powell's operations in water year 2018 will be governed by the Upper Elevation Balancing Tier. Starting with an 8.23 million acre-feet (maf) release from Lake Powell in water year 2018, the April 2018 24-Month Study projected the end of water year elevation at Lake Powell to be above 3,575 feet and the end of water year elevation at Lake Mead to be below 1,075 feet. Therefore, in accordance with Section 6.B.4 of the Interim Guidelines, Lake Powell operations shifted to balancing releases for the remainder of water year 2018. Under balancing, the contents of Lake Powell and Lake Mead will be balanced by the end of the water year, but not more than 9.0 maf and not less than 8.23 maf shall be released from Lake Powell.

Based on the May most probable inflow forecast, the annual release volume from Lake Powell during water year 2018 is projected to be 9.0 maf. Under the minimum probable inflow scenario, the water year release is projected to be 9.0 maf. Under the maximum probable inflow scenario, the release is projected to be 9.0 maf. There is 10% chance that inflows will be lower than the current minimum probable forecast, potentially resulting in lower releases. If inflows are less than the minimum probable forecast, the water year 2018 annual release could be as low as 8.23 maf. If inflows are greater than the current forecasted maximum probable inflow, the annual release will be 9.0 maf. The projected release from Lake Powell in water year 2018 will be updated each month throughout the remainder of the water year.

Based on the current forecast, the May 24-Month Study projects Lake Powell elevation will end water year 2018 near 3,598 feet with approximately 11.59 maf in storage (48 percent capacity). Projections of elevation and storage still have significant uncertainty at this point in the season, primarily due to uncertainty regarding spring runoff and the resulting inflow to Lake Powell. Under the minimum probable inflow scenario, updated in April, the projected end of water year elevation and storage are 3,589 feet and 10.7 maf (44 percent capacity), respectively. Under the maximum probable inflow scenario, updated in April, the projected end of water year elevation and storage are 3616 feet and 13.3 maf (55 percent capacity), respectively. Modeling of projected reservoir operations based on the minimum and maximum scenarios will be updated again in August.

Upper Colorado River Basin Hydrology

The Upper Colorado River Basin regularly experiences significant year to year hydrologic variability. During the 18-year period 2000 to 2017, however, the unregulated inflow to Lake Powell, which is a good measure of hydrologic conditions in the Colorado River Basin, was above average in only 4 out of the past 18 years. The period 2000-2017 is the lowest 18-year period since the closure of Glen Canyon Dam in 1963, with an average unregulated inflow of 8.76 maf, or 81percent of the 30-year average (1981-2010). (For comparison, the 1981-2010 total water year average is 10.83 maf.) The unregulated inflow during the 2000-2017 period has ranged from a low of 2.64 maf (24 percent of average) in water year 2002 to a high of 15.97 maf (147 percent of average) in water year 2011. In water year 2017 unregulated inflow volume to Lake Powell was 11.9 maf (110 percent of average), the fourth year to be above average.

Under the current most probable forecast, the total water year 2018 unregulated inflow to Lake Powell is projected to be 5.6 maf (52 percent of average).

At the beginning of water year 2018, total system storage in the Colorado River Basin was 32.9 maf (55 percent of 59.6 maf total system capacity). This is an increase of 2.7 maf over the total storage at the beginning of water year 2017 when total system storage was 30.2 maf (51 percent of capacity). Since the beginning of water year 2000, total Colorado Basin storage has experienced year to year increases and decreases in response to wet and dry hydrology, ranging from a high of 94 percent of capacity at the beginning of 2000 to a low of 50 percent of capacity at the beginning of water year 2005. One wet year can significantly increase total system reservoir storage, just as persistent dry years can draw down the system storage. Based on current inflow forecasts, the current projected end of water year total Colorado Basin reservoir storage for water year 2018 is approximately 29.0 maf (49 percent of total system capacity). The actual end of water year 2018 system storage may vary from this projection, primarily due to uncertainty regarding this season's runoff and reservoir inflow. Based on the April minimum and maximum probable inflow forecasts and modeling, the range of end of water year 2018 total system capacity is approximately 27.8 maf (47 percent of capacity) to 31.0 maf (52 percent of capacity), respectively.

June 24-Month Study
Date: June 14, 2018

From: Water Resources Group, Salt Lake City
To: All Colorado River Annual Operating Plan (AOP) Recipients

Current Reservoir Status

Reservoir	May Inflow (unregulated) (acre-feet)	Percent of Average (%)	June 13, Midnight Elevation (feet)	June 13, Midnight Reservoir Storage (acre-feet)
Fontenelle	354,000	216	6,499.23	292,000
Flaming Gorge	422,000	172	6,031.53	3,408,000
Blue Mesa	112,000	51	7,479.58	503,000
Navajo	88,000	32	6,047.83	1,200,000
Powell	1,214,000	52	3,612.02	12,935,000

Expected Operations

The operation of Lake Powell and Lake Mead in this June 2018 24-Month Study is pursuant to the December 2007 Record of Decision on Colorado River Interim Guidelines for Lower Basin Shortages and the Coordinated Operations of Lake Powell and Lake Mead (Interim Guidelines), and reflects the 2018 Annual Operating Plan (AOP). Pursuant to the Interim Guidelines, the August 2017 24-Month Study projections of the January 1, 2018, system storage and reservoir water surface elevations set the operational tier for the coordinated operation of Lake Powell and Lake Mead during 2018.

Consistent with Section 6.B of the Interim Guidelines, the Lake Powell's operational tier in water year 2018 is the Upper Elevation Balancing Tier. With an 8.23 million acre-feet (maf) release from Lake Powell in water year 2018, the April 2018 24-Month Study projected the end of water year elevation at Lake Powell to be above 3,575 feet above sea level (feet), and the end of water year elevation at Lake Mead to be below 1,075 feet. Therefore, in accordance with Section 6.B.4 of the Interim Guidelines, Lake Powell operations shifted to balancing releases for the remainder of water year 2018. Under Section 6.B.4, the contents of Lake Powell and Lake Mead will be balanced by the end of the water year, but not more than 9.0 maf and not less than 8.23 maf shall be released from Lake Powell. Based on the most probable inflow forecast, this June 24-Month Study projects a balancing release of 9.0 maf in water year 2018.

Consistent with Section 2.B.5 of the Interim Guidelines, the Intentionally Created Surplus (ICS) Surplus Condition is the criterion governing the operation of Lake Mead for calendar year 2018.

The Interim Guidelines are available for download at:
https://www.usbr.gov/lc/region/programs/strategies/RecordofDecision.pdf.
The 2018 AOP is available for download at:
https://www.usbr.gov/lc/region/g4000/aop/AOP18.pdf

Fontenelle Reservoir – Fontenelle Reservoir is currently at elevation 6499.23 feet, which corresponds to a live storage content of 292,000 acre-feet (af) (85 percent of capacity). Inflows for the month of May were 354,440 af, or 216 percent of average. Above average inflows are occurring and releases are being adjusted to maintain capacity in the reservoir. Releases are currently (as of June 10, 2018) 7,000 cubic feet per second (cfs).

The Colorado Basin River Forecast Center has forecasted summer inflows that are above average. Inflows to Fontenelle Reservoir for the next 3 months (June, July, and August) are projected to be: 350,000 af (117 percent of average), 179,000 af (101 percent of average), and 80,000 af (105 percent of average), respectively.

The Fontenelle Working Group is an open public forum for information exchange between Reclamation and other parties associated with the operation of Fontenelle Reservoir. For more information on this group and these meetings please contact Dale Hamilton at 801-379-1186 or Jed Parker at 801-524-3816.

Meeting notes from past Working Group meetings are posted on the Working Group webpage at:

https://www.usbr.gov/uc/wcao/water/rsvrs/mtgs/ftcurrnt.html

The next Fontenelle Working Group meeting is scheduled for 10:00 a.m., August 23, 2018. The meeting will be held at the Joint Powers Water Board located at 2 Telephone Canyon Road in Green River, WY.

Flaming Gorge Reservoir – Releases are currently set at 1,800 cfs with fluctuations for hydropower. Average daily releases will likely remain at 1,800 cfs through the coming months.

Unregulated inflow into Flaming Gorge Reservoir during the month of May was 422,000 af, or 172 percent of average. The current (as of June 12, 2018) reservoir elevation is 6,031.27 which corresponds to a live storage content of 3.399 maf (91 percent of capacity) and is increasing. Unregulated inflow to Flaming Gorge over the next three months (June, July, and August) are projected to be: 425,000 af (109 percent of average), 152,000 af (72 percent of average), and 75,000 af (84 percent of average), respectively.

The June water supply forecast of the April through July unregulated inflow volume into Flaming Gorge Reservoir is 1.120 maf (114 percent of average).

The Flaming Gorge Working Group is an open public forum for information exchange between Reclamation and the stakeholders of Flaming Gorge Dam. The public is encouraged to attend and comment on the operations and plans presented by Reclamation at these meetings. For more information on this group and these meetings please contact Dale Hamilton at 801-379-1186 or Jed Parker at 801-524-3816.

Meeting notes from past Working Group meetings are posted on the Working Group webpage at:

https://www.usbr.gov/uc/wcao/water/rsvrs/mtgs/fgcurrnt.html

The next meeting of the Flaming Gorge Working Group will be held on Tuesday, August 28, 2018 at 11:00 a.m. at the DWR Office, 318 North Vernal Avenue, Vernal, Utah.

Aspinall Unit Reservoirs – Releases from Crystal Dam are approximately 1,750 cfs. Uncompahgre Valley Water Users Association is diverting approximately 1,050 cfs through the Gunnison Tunnel and flows through the Black Canyon are approximately 750 cfs. There currently is about a 50 cfs gain to the Gunnison River between Crystal Dam and the Gunnison Tunnel Diversion. Blue Mesa Reservoir elevation is 7579.82 feet which corresponds to live storage content of 505,000 acre-feet (61 percent of capacity).

The May unregulated inflow to Blue Mesa Reservoir was 112,301 af (51 percent of average). Unregulated Inflows to Blue Mesa for the next three months (June, July and August) are projected to be: 77,000 af (30 percent of average), 33,000 af (28 percent of average) and 28,000 af (44 percent of average), respectively. For water year 2018, the unregulated inflow volume is forecasted to be 487,000 af (51 percent of average) with 270,000 af (40 percent of average) forecasted unregulated inflow during the April through July period. The June 24-Month Study is reflective of this new forecast.

Conditions are clearly very dry and Blue Mesa Reservoir will not fill this year. Current projections indicate Blue Mesa storage will continue to decrease through the rest of water year 2018 ending on September 30, 2018 with a projected elevation and storage of approximately 7455.7 feet and 345,000 af, respectively.

The Aspinall Unit Working Group is an open public forum for information exchange between Reclamation and the stakeholders of the Aspinall Unit. The public is encouraged to attend and comments on the operations and plans presented by Reclamation at these meetings. Meeting notes from past working Group meetings are posted on the Working Group webpage. For more information on this group and these meetings please contact Erik Knight in the Grand Junction Area Office at (970) 248-0629.

Meeting notes from past working Group meetings are posted on the Working Group webpage at:

https://www.usbr.gov/uc/wcao/water/rsvrs/mtgs/amcurrnt.html

The next meeting of the Aspinall Unit Working Group will be held on Thursday, August 16, 2018 at 1:00 pm at the at the Elk Creek Visitor Center at Blue Mesa Reservoir, Colorado.

Navajo Reservoir – The current (June 13, 2018) release rate from Navajo Dam is 650 cfs and the observed inflow to Navajo Reservoir is 180 cfs. The Navajo Indian Irrigation Project (NIIP) is diverting 810 cfs. The reservoir elevation is 6047.8 feet which corresponds to a live storage of 1.201 maf (71 percent of live storage capacity). This elevation also corresponds to an active storage of 0.538 maf (52 percent of active storage capacity). The river flow measured at the San Juan River at Four Corners USGS gage is 570 cfs. River flow at the Animas River at Farmington USGS gage is at 240 cfs. Releases from Navajo Dam are made for the authorized purposes of the Navajo Unit, and pursuant to the 2006 Record of Decision, to attempt to maintain a target base flow through the endangered fish critical habitat reach of the San Juan River (Farmington to Lake Powell). The San Juan River Basin Recovery Implementation Program (SJRIP) recommends a target base flow of between 500 cfs and 1,000 cfs through the critical habitat area. The target base flow is calculated as the weekly average of gaged flows throughout the critical habitat area.

Preliminary modified-unregulated inflow into Navajo in April was 88,244 acre-feet, which was 86 percent of average for the month. Modified-unregulated inflow to Navajo over the next three months (June, July, and August) are projected to be: 10,000 af (5 percent of average), 6,000 af (9 percent of average), and 25,000 af (55 percent of average), respectively.

The April-July modified-unregulated inflow runoff forecasts are as follows:

Min Probable: 161,000 acre-feet (22 percent of average, a decrease of 5,000 acre-feet since the last forecast)
Most Probable: 174,000 acre-feet (24 percent of average, a decrease of 11,000 acre-feet since the last forecast)
Max Probable: 191,000 acre-feet (26 percent of average, a decrease of 24,000 acre-feet since the last forecast

A short release of 2,000 cfs for 2 hours was requested by the NM Department of Game and Fish to aid in a habitat project in the tailwater reach below Navajo Dam. One of the purposes of this project is to curb sediment input entering the San Juan River in this area. Reclamation complied with this request by ramping up in the evening of June 5, 2018 and then peaking at 2,000 cfs for two hours mid-day on June 6, 2018 and ramping down of June 7, 2018. Total release over base releases was approximately 2300 af. Reclamation also coordinated with state and local agencies during this event for awareness and safety. Releases for the remainder of the runoff season will be made to

maintain the minimum target baseflow in the critical habitat reach and will likely range from 300 to 700 cfs.

Reclamation conducts Public Operations Meetings three times per year to gather input for determining upcoming operations for Navajo Reservoir. Input from individuals, organizations, and agencies along with other factors such as weather, water rights, endangered species requirements, flood control, hydro power, recreation, fish and wildlife management, and reservoir levels, will be considered in the development of these reservoir operation plans. In addition, the meetings are used to coordinate activities and exchange information among agencies, water users, and other interested parties concerning the San Juan River and Navajo Reservoir.

The next Navajo Public Operations Coordination Meeting is scheduled for Tuesday, August 21, 2018, at 1:00 p.m. at the Farmington Civic Center, Farmington, NM.

Glen Canyon Dam / Lake Powell

Current Status

The Department of the Interior is conducting the first experimental flow at Glen Canyon Dam since implementing its Long-Term Experimental and Management Plan (LTEMP). Experiments under LTEMP consist of four different flow regimes: high flows, bug flows, trout management flows, and low summer flows. The goal of this first experiment under LTEMP (a bug flow experiment) is to provide enhanced habitat for the lifecycle of aquatic insects that are the primary food source for fish in the Colorado River.

Collaborative discussions among technical experts resulted in a decision to begin this year's experiment on May 1 and to continue through August 31, 2018. The experiment will slightly modify the hourly and weekly patterns of scheduled water releases through Glen Canyon Dam however the projected monthly release volumes will not be altered.

During this experiment, releases during weekends will be steady (i.e. no hourly fluctuations) while releases on weekdays will fluctuate for power production as prescribed under LTEMP. Steady weekend releases are expected to provide favorable conditions for aquatic insects to lay and cement their eggs to rocks, vegetation, and other materials near the river's edge. The steady weekend release rate will be relatively low resulting in a river stage that is within four inches of the weekday low water stage level. Recreational river users will not likely notice the difference in stage levels that will occur during the experiment as compared to normal LTEMP operations.

Insects expected to benefit from this experiment are an important food source for many species of fish, birds, and bats in lower Glen Canyon and the Grand Canyon. Beyond expected resource benefits, this experiment will also provide scientific information that will be used in future decision making.

The unregulated inflow volume to Lake Powell during May was 1.21 (maf) (52 percent of average). The release volume from Glen Canyon Dam in May was 705 thousand acre-feet (kaf). The end of May elevation of Lake Powell was 3,611.54 feet (88.46 feet from

full pool) and this corresponds to a live storage volume of 12.90 maf (53 percent of live storage capacity). Lake Powell elevation is projected to decline each month this water year with some reprieve during the smaller than normal spring runoff period.

Current Operations

Under the Interim Guidelines, the operating Tier for water year 2018 was established in August 2017 as the Upper Elevation Balancing Tier with 8.23 maf projected as the annual release volume for water year 2018. As provided under this operational Tier, however, the April 2018 24-Month Study projected Lake Powell's end of water year elevation to be above 3575 feet and Lake Mead's end of water year elevation to be below 1075 feet with a projected release volume of 8.23 maf. This projected condition resulted in a shift to a Balancing which reset the annual release volume for Lake Powell. Under a Balancing condition, the storage levels of Lake Powell and Lake Mead are to be balanced by the end of the water year, but not more than 9.0 maf and not less than 8.23 maf shall be released from Lake Powell during the water year.

Based on the most probable inflow forecast, the June 24-Month Study projects the annual release volume, as determined under the Balancing provisions of the Interim Guidelines, to be 9.0 maf for water year 2018. The annual release volume for water year 2018 will be dependent upon hydrologic conditions and will be adjusted each month as necessary to meet the Balancing condition within the range from 8.23 to 9.0 maf. Reclamation will make operational adjustments at Glen Canyon Dam throughout water year 2018 to achieve as practicably as possible the appropriate annual release volume by September 30, 2018.

In June, the release volume will be approximately 760 kaf, with fluctuations anticipated between about 8,850 cfs in the nighttime to about 16,450 cfs in the daytime and consistent with the Glen Canyon Dam, LTEMP Record of Decision (December, 2016). The anticipated release volume for July is 860 kaf with daily fluctuations between approximately 10,180 cfs and 18,180 cfs. The expected release for August is 900 kaf with daily fluctuations between approximately 10,500 cfs and 18,500 cfs.

In addition to daily scheduled fluctuations for power generation, the instantaneous releases from Glen Canyon Dam may also fluctuate to provide 40 megawatts (MW) of system regulation. These instantaneous release adjustments stabilize the electrical generation and transmission system and translate to a range of about 1,200 cfs above or below the hourly scheduled release rate. In most cases, fluctuations for regulation are short lived and generally balance out over the hour with minimal impacts on downstream river conditions.

Releases from Glen Canyon Dam can also fluctuate when called upon to respond to unscheduled power outages or power system emergencies. Depending on the severity of the system emergency, the response from Glen Canyon Dam can be significant, within the full range of the operating capacity of the power plant for as long as is necessary to maintain balance in the transmission system. Glen Canyon Dam maintains at least 30 MW (approximately 800 cfs) of generation capacity at all times in reserve in order to

respond to system emergencies. Release fluctuations resulting from unscheduled power outages or system emergencies occur infrequently but can have a noticeable impact on the river downstream of Glen Canyon Dam.

Inflow Forecasts and Model Projections

The most probable unregulated inflow volume to Lake Powell for April through July is currently forecasted to be 2.8 maf (39 percent of average). This is 200 kaf less than the forecast issued last month. There is still uncertainty regarding what the unregulated inflow volume to Lake Powell will be during the April through July period. The minimum probable April through July unregulated inflow volume is forecasted to be 2.34 maf (33 percent of average) and the maximum probable April through July unregulated inflow volume is forecasted to be 3.37 maf (47 percent of average). There is 10 percent probability the April through July unregulated inflow volume could be higher than the maximum probable forecast and a 10 percent probability the April through July unregulated inflow volume could be lower than the minimum probable forecast.

The June 24-Month Study projects Lake Powell elevation will end water year 2018 near 3,597 feet with approximately 11.47 maf in storage (47 percent capacity). To put this projected condition in context with the level of uncertainty for this point in time, the minimum probable inflow scenario would result an end of water year elevation and storage of approximately 3,589 feet and 10.7 maf (44 percent capacity), respectively. The maximum probable inflow scenario would result in an end of water year elevation and storage of approximately 3616 feet and 13.3 maf (55 percent capacity), respectively.

Upper Colorado River Basin Hydrology

The Upper Colorado River Basin regularly experiences significant year to year hydrologic variability. During the 18-year period 2000 to 2017, however, the unregulated inflow to Lake Powell, which is a good measure of hydrologic conditions in the Colorado River Basin, was above average in only 4 out of the past 18 years. The period 2000-2017 is the lowest 18-year period since the closure of Glen Canyon Dam in 1963, with an average unregulated inflow of 8.76 maf, or 81percent of the 30-year average (1981-2010). (For comparison, the 1981-2010 total water year average is 10.83 maf.) The unregulated inflow during the 2000-2017 period has ranged from a low of 2.64 maf (24 percent of average) in water year 2002 to a high of 15.97 maf (147 percent of average) in water year 2011. In water year 2017 unregulated inflow volume to Lake Powell was 11.9 maf (110 percent of average), the fourth year to be above average. Under the current most probable forecast, the total water year 2018 unregulated inflow to Lake Powell is projected to be 5.25 maf (48 percent of average).

At the beginning of water year 2018, total system storage in the Colorado River Basin was 32.9 maf (55 percent of 59.6 maf total system capacity). This is an increase of 2.7 maf over the total storage at the beginning of water year 2017 when total system storage was 30.2 maf (51 percent of capacity). Since the beginning of water year 2000, total Colorado Basin storage has experienced year to year increases and decreases in response to wet and dry hydrology, ranging from a high of 94 percent of capacity at the beginning of 2000 to a low of 50 percent of capacity at the beginning of water year 2005. One wet year can significantly increase total system reservoir storage, just as persistent dry years

can draw down the system storage. Based on current inflow forecasts, the current projected end of water year total Colorado Basin reservoir storage for water year 2018 is approximately 29.0 maf (48 percent of total system capacity). The actual end of water year 2018 system storage may vary from this projection, primarily due to uncertainty regarding this season's runoff and reservoir inflow. Based on the April minimum and maximum probable inflow forecasts and modeling, the range of end of water year 2018 total system capacity is approximately 27.8 maf (47 percent of capacity) to 31.0 maf (52 percent of capacity), respectively.

July 24-Month Study
Date: July 13, 2018

From: Water Resources Group, Salt Lake City
To: All Colorado River Annual Operating Plan (AOP) Recipients

Current Reservoir Status

Reservoir	June Inflow (unregulated) (acre-feet)	Percent of Average (%)	July 12, Midnight Elevation (feet)	July 12, Midnight Reservoir Storage (acre-feet)
Fontenelle	404,000	135	6,502.21	315,000
Flaming Gorge	435,000	112	6,034.97	3,545,000
Blue Mesa	56,000	21	7,470.91	442,000
Navajo	5,000	2	6,041.81	1,126,000
Powell	883,000	33	3,607.58	12,488,000

Expected Operations

The operation of Lake Powell and Lake Mead in this July 2018 24-Month Study is pursuant to the December 2007 Record of Decision on Colorado River Interim Guidelines for Lower Basin Shortages and the Coordinated Operations of Lake Powell and Lake Mead (Interim Guidelines), and reflects the 2018 Annual Operating Plan (AOP). Pursuant to the Interim Guidelines, the August 2017 24-Month Study projections of the January 1, 2018, system storage and reservoir water surface elevations set the operational tier for the coordinated operation of Lake Powell and Lake Mead during 2018.

Consistent with Section 6.B of the Interim Guidelines, the Lake Powell's operational tier in water year 2018 is the Upper Elevation Balancing Tier. With an 8.23 million acre-feet (maf) release from Lake Powell in water year 2018, the April 2018 24-Month Study projected the end of water year elevation at Lake Powell to be above 3,575 feet above sea level (feet), and the end of water year elevation at Lake Mead to be below 1,075 feet. Therefore, in accordance with Section 6.B.4 of the Interim Guidelines, Lake Powell operations shifted to balancing releases for the remainder of water year 2018. Under Section 6.B.4, the contents of Lake Powell and Lake Mead will be balanced by the end of the water year, but not more than 9.0 maf and not less than 8.23 maf shall be released from Lake Powell. Based on the most probable inflow forecast, this July 24-Month Study projects a balancing release of 9.0 maf in water year 2018.

Consistent with Section 2.B.5 of the Interim Guidelines, the Intentionally Created Surplus (ICS) Surplus Condition is the criterion governing the operation of Lake Mead for calendar year 2018.

The Interim Guidelines are available for download at:
https://www.usbr.gov/lc/region/programs/strategies/RecordofDecision.pdf.
The 2018 AOP is available for download at:
https://www.usbr.gov/lc/region/g4000/aop/AOP18.pdf

Fontenelle Reservoir – Fontenelle Reservoir is currently at elevation 6500.80 feet, which amounts to 88 percent of live storage capacity. Inflows for the month of June totaled 403,585 acre-feet (af), or 135 percent of average. Average inflows are occurring and releases are being adjusted to maintain capacity in the reservoir. Releases are currently (July 9, 2018) 1,200 cfs.

The Colorado Basin River Forecast Center has forecasted summer inflows that are below average. July, August, and September forecasted inflow volumes amount to 136,000 af (77 percent of average), 70,000 af (91 percent of average), and 48,000 af (105 percent of average), respectively.

The Fontenelle Working Group is an open public forum for information exchange between Reclamation and other parties associated with the operation of Fontenelle Reservoir. For more information on this group and these meetings please contact Dale Hamilton at 801-379-1186 or Jed Parker at 801-524-3816.

The next Fontenelle Working Group meeting is scheduled for 10:00 a.m., August 23, 2018. The meeting will be held at the Joint Powers Water Board at 2 Telephone Canyon Road in Green River, WY

Flaming Gorge Reservoir – Releases are currently 2,000 cfs with fluctuations for hydropower occurring between approximately 1,400 cfs and approximately 2,200 cfs. Average daily releases will likely remain at 2,000 cfs through the coming months.

Unregulated inflow into Flaming Gorge Reservoir during the month of June was 401,300 af, or 103 percent of average. The current reservoir elevation is 6,035.10 feet (95 percent of live capacity) and is decreasing.

The July final forecast for inflows for the next three months projects below conditions: July, August, and September forecasted inflow volumes at 142,000 af (68 percent of average), 73,000 af (82 percent of average), and 51,000 af (93 percent of average), respectively. The July water supply forecast of the April through July unregulated inflow volume into Flaming Gorge Reservoir is 1,120 thousand acre-feet (kaf) which is 114 percent of average.

The Flaming Gorge Working Group is an open public forum for information exchange between Reclamation and the stakeholders of Flaming Gorge Dam. The public is

encouraged to attend and comment on the operations and plans presented by Reclamation at these meetings. For more information on this group and these meetings please contact Dale Hamilton at 801-379-1186 or Jed Parker at 801-524-3816.

The next Flaming Gorge Working Group meeting on Tuesday, August 28, 2018 at 11:00 a.m. at the DWR Office, 318 North Vernal Avenue, Vernal, Utah.

Aspinall Unit Reservoirs – Releases from Crystal Dam are approximately 1,700 cfs. Uncompahgre Valley Water Users Association is diverting approximately 1,050 cfs through the Gunnison Tunnel and flows through the Black Canyon are approximately 730 cfs. There currently is about a 80 cfs gain to the Gunnison River between Crystal Dam and the Gunnison Tunnel Diversion. Blue Mesa Reservoir elevation is 7573.37 feet (as of July 5, 2018) which corresponds to storage content of 458,849 acre-feet (55 percent of capacity).

The June unregulated inflow to Blue Mesa Reservoir was 55,795 af (51 percent of average). Unregulated Inflows to Blue Mesa for the next three months (July, August and September) are projected to be: 28,000 af (24 percent of average), 26,000 af (41 percent of average) and 24,000 af (63 percent of average), respectively. For water year 2018, the unregulated inflow volume is forecasted to be 459,000 af (48 percent of average) with 244,000 af (36 percent of average) forecasted unregulated inflow during the April through July period. The July 24-Month Study is reflective of this new forecast. Conditions are clearly very dry and Blue Mesa Reservoir will not fill this year. Current projections indicate Blue Mesa storage will continue to decrease through the rest of water year 2018 ending on September 30, 2018 with a projected elevation and storage of 7450.5 feet and 315,000 af (38 percent of capacity), respectively.

The Aspinall Unit Working Group is an open public forum for information exchange between Reclamation and the stakeholders of the Aspinall Unit. The public is encouraged to attend and comments on the operations and plans presented by Reclamation at these meetings. Meeting notes from past working Group meetings are posted on the Working Group webpage. For more information on this group and these meetings please contact Erik Knight at 970-248-0629 or Rick Clayton at 801-524-3710.

Meeting notes from past working Group meetings are posted on the Working Group webpage at:

https://www.usbr.gov/uc/wcao/water/rsvrs/mtgs/amcurrnt.html

The next meeting of the Aspinall Unit Working Group will be held on Thursday, August 16, 2018 at 1:00 p.m. at the at the Elk Creek Visitor Center at Blue Mesa Reservoir.

Navajo Reservoir – The current (July 2, 2018) release rate from Navajo Dam is 950 cfs and the observed inflow to Navajo Reservoir is 240 cfs. The Navajo Indian Irrigation Project (NIIP) is diverting 650 cfs. The reservoir elevation is 6043.7 feet which corresponds to a live storage of 1.154 maf (68 percent of live storage capacity). This

elevation also corresponds to an active storage of 0.485 maf (47 percent of active storage capacity). The river flow measured at the San Juan River at Four Corners USGS gage is 535 cfs. River flow at the Animas River at Farmington USGS gage is at 5 cfs. Releases from Navajo Dam are made for the authorized purposes of the Navajo Unit, and pursuant to the 2006 Record of Decision, to attempt to maintain a target base flow through the endangered fish critical habitat reach of the San Juan River (Farmington to Lake Powell). The San Juan River Basin Recovery Implementation Program (SJRIP) recommends a target base flow of between 500 cfs and 1,000 cfs through the critical habitat area. The target base flow is calculated as the weekly average of gaged flows throughout the critical habitat area.

Preliminary modified-unregulated inflow into Navajo in June was 5,819 af, which was 2 percent of average for the month. Modified-unregulated inflow to Navajo over the next three months (July, August, and September) are projected to be: 4,000 af (6 percent of average), 25,000 af (55 percent of average), and 25,000 af (58 percent of average), respectively.

The April-July modified-unregulated inflow runoff forecasts are as follows:

Min Probable: 165,000 af (22 percent of average, an increase of 4,000 af since the last forecast)
Most Probable: 168,000 af (23 percent of average, a decrease of 6,000 af since the last forecast)
Max Probable: 179,000 af (24 percent of average, a decrease of 12,000 af since the last forecast)

Releases for the remainder of the summer will be made to maintain the minimum target baseflow in the critical habitat reach and will likely range between 700 and 1,100 cfs.

Reclamation conducts Public Operations Meetings three times per year to gather input for determining upcoming operations for Navajo Reservoir. Input from individuals, organizations, and agencies along with other factors such as weather, water rights, endangered species requirements, flood control, hydro power, recreation, fish and wildlife management, and reservoir levels, will be considered in the development of these reservoir operation plans. In addition, the meetings are used to coordinate activities and exchange information among agencies, water users, and other interested parties concerning the San Juan River and Navajo Reservoir. For more information regarding these meetings contact Susan Behery at 970- 385-6560.

The next Navajo Public Operations Coordination Meeting is scheduled for Tuesday, August 21, 2018, at 1:00 p.m. at the Farmington Civic Center, Farmington, NM.

Glen Canyon Dam / Lake Powell

Current Status
The Department of the Interior is conducting the first experimental flow at Glen Canyon Dam since implementing its Long-Term Experimental and Management Plan (LTEMP).

The goal is to provide enhanced habitat for the lifecycle of aquatic insects that are the primary food source for fish in the Colorado River. Experiments under LTEMP consist of four different flow regimes: high flows, bug flows, trout management flows, and low summer flows. Collaborative discussions among technical experts resulted in a decision to begin this first experiment on May 1 and continue through August 31, 2018. It will slightly modify the schedule and flow rates of water releases from Lake Powell through Glen Canyon Dam, Arizona. The normally scheduled monthly and weekly release volumes will not be affected.

Flows during the experiment will include steady weekend water releases with routine hydropower production flows on weekdays that include normal hourly changes in release rates. Those steady weekend flows are expected to provide favorable conditions for aquatic insects to lay and cement their eggs to rocks, vegetation, and other materials near the river's edge. Steady weekend flows will be relatively low, within four inches of typical weekday low water levels. It is unlikely casual recreational river users will notice the changes in water levels.

Insects expected to benefit from this experiment are an important food source for many species of fish, birds, and bats in the canyon. Beyond expected resource benefits, this experiment will also provide scientific information that will be used in future decision making.

The unregulated inflow volume to Lake Powell during June was 883 kaf (33 percent of average). The release volume from Glen Canyon Dam in June was 760 kaf. The end of June elevation and storage of Lake Powell were 3,610 ft (90 feet from full pool) and 12.7 maf (52 percent of full capacity), respectively. The reservoir is projected to decline each month this water year with some reprieve during the smaller than normal spring runoff period.

Current Operations

The operating tier for water year 2018 was established in August 2017 as the Upper Elevation Balancing Tier. The April 2018 24-Month Study established that Lake Powell operations will be governed by balancing for the remainder of water year 2018. Under balancing, the contents of Lake Powell and Lake Mead will be balanced by the end of the water year, but not more than 9.0 maf and not less than 8.23 maf shall be released from Lake Powell. Based on the most probable inflow forecast, this June 24-Month Study projects a balancing release of 9.0 maf in water year 2018; the actual release in water year 2018, however, will depend on hydrology in the remainder of water year and will range from 8.23 to 9.0 maf. The projected release from Lake Powell in water year 2018 will be updated each month throughout the remainder of the water year. Reclamation will schedule operations at Glen Canyon Dam to achieve as practicably as possible the appropriate total annual release volume by September 30, 2018.

In July, the release volume will be approximately 860 kaf, with fluctuations anticipated between about 10,180 cfs in the nighttime to about 18,180 cfs in the daytime and consistent with the Glen Canyon Dam, Record of Decision (dated December 2016). The

anticipated release volume for August is 900 kaf with daily fluctuations between approximately 10,500 cfs and 18,500 cfs.

In addition to daily scheduled fluctuations for power generation, the instantaneous releases from Glen Canyon Dam may also fluctuate to provide 40 megawatts (mw) of system regulation. These instantaneous release adjustments stabilize the electrical generation and transmission system and translate to a range of about 1,200 cfs above or below the hourly scheduled release rate. Under system normal conditions, fluctuations for regulation are typically short lived and generally balance out over the hour with minimal or no noticeable impacts on downstream river flow conditions.

Releases from Glen Canyon Dam can also fluctuate beyond scheduled releases when called upon to respond to unscheduled power outages or power system emergencies. Depending on the severity of the system emergency, the response from Glen Canyon Dam can be significant, within the full range of the operating capacity of the power plant for as long as is necessary to maintain balance in the transmission system. Glen Canyon Dam currently maintains 30 mw (approximately 800 cfs) of generation capacity in reserve in order to respond to a system emergency even when generation rates are already high. System emergencies occur fairly infrequently and typically require small responses from Glen Canyon Dam. However, these responses can have a noticeable impact on the river downstream of Glen Canyon Dam.

Inflow Forecasts and Model Projections

The April to July 2018 water supply forecast for unregulated inflow to Lake Powell, issued on July 2, 2018, by the Colorado Basin River Forecast Center, projects that the most probable (median) unregulated inflow volume will be 2.675 maf (37 percent of average based on the period 1981-2010). The forecast decreased by 125 kaf since last month. There is still uncertainty regarding this year's water supply and the total inflow to Lake Powell. The spring runoff forecast ranges from a minimum probable of 2.34 maf (33 percent of average) to a maximum probable of 3.37 maf (47 percent of average). There is 10 percent chance that inflows could be higher than the maximum probable and a 10 percent chance they could be lower than the minimum probable.

As determined in the August 2017 24-Month Study, and documented in the 2018 Annual Operating Plan, Lake Powell's operations in water year 2018 will be governed by the Upper Elevation Balancing Tier. Starting with an 8.23 million acre-feet (maf) release from Lake Powell in water year 2018, the April 2018 24-Month Study projected the end of water year elevation at Lake Powell to be above 3,575 feet and the end of water year elevation at Lake Mead to be below 1,075 feet. Therefore, in accordance with Section 6.B.4 of the Interim Guidelines, Lake Powell operations shifted to balancing releases for the remainder of water year 2018. Under balancing, the contents of Lake Powell and Lake Mead will be balanced by the end of the water year, but not more than 9.0 maf and not less than 8.23 maf shall be released from Lake Powell.

Based on the July most probable inflow forecast, the annual release volume from Lake Powell during water year 2018 is projected to be 9.0 maf. Under the minimum probable

inflow scenario, the water year release is projected to be 9.0 maf. Under the maximum probable inflow scenario, the release is projected to be 9.0 maf. There is 10 percent chance that inflows will be lower than the current minimum probable forecast, potentially resulting in lower releases. However, inflows to Lake Powell so far this water year have been sufficient enough to preclude any release less than 9.0 maf. If inflows are greater than the current forecasted maximum probable inflow, the annual release will be 9.0 maf.

Based on the current forecast, the July 24-Month Study projects Lake Powell elevation will end water year 2018 near 3,596 feet with approximately 11.36 maf in storage (47 percent capacity). Projections of elevation and storage still have significant uncertainty at this point in the season, primarily due to uncertainty regarding spring runoff and the resulting inflow to Lake Powell. Under the minimum probable inflow scenario, updated in April, the projected end of water year elevation and storage are 3,589 feet and 10.7 maf (44 percent capacity), respectively. Under the maximum probable inflow scenario, updated in April, the projected end of water year elevation and storage are 3616 feet and 13.3 maf (55 percent capacity), respectively. Modeling of projected reservoir operations based on the minimum and maximum scenarios will be updated again in August.

Upper Colorado River Basin Hydrology

The Upper Colorado River Basin regularly experiences significant year to year hydrologic variability. During the 18-year period 2000 to 2017, however, the unregulated inflow to Lake Powell, which is a good measure of hydrologic conditions in the Colorado River Basin, was above average in only 4 out of the past 18 years. The period 2000-2017 is the lowest 18-year period since the closure of Glen Canyon Dam in 1963, with an average unregulated inflow of 8.76 maf, or 81percent of the 30-year average (1981-2010). (For comparison, the 1981-2010 total water year average is 10.83 maf.) The unregulated inflow during the 2000-2017 period has ranged from a low of 2.64 maf (24 percent of average) in water year 2002 to a high of 15.97 maf (147 percent of average) in water year 2011. In water year 2017 unregulated inflow volume to Lake Powell was 11.9 maf (110 percent of average), the fourth year to be above average. Under the current most probable forecast, the total water year 2018 unregulated inflow to Lake Powell is projected to be 5.25 maf (48 percent of average).

At the beginning of water year 2018, total system storage in the Colorado River Basin was 32.9 maf (55 percent of 59.6 maf total system capacity). This is an increase of 2.7 maf over the total storage at the beginning of water year 2017 when total system storage was 30.2 maf (51 percent of capacity). Since the beginning of water year 2000, total Colorado Basin storage has experienced year to year increases and decreases in response to wet and dry hydrology, ranging from a high of 94 percent of capacity at the beginning of 2000 to a low of 50 percent of capacity at the beginning of water year 2005. One wet year can significantly increase total system reservoir storage, just as persistent dry years can draw down the system storage. Based on current inflow forecasts, the current projected end of water year total Colorado Basin reservoir storage for water year 2018 is approximately 29.0 maf (48 percent of total system capacity). The actual end of water year 2018 system storage may vary from this projection, primarily due to uncertainty regarding this season's runoff and reservoir inflow. Based on the April minimum and maximum probable inflow forecasts and modeling, the range of end of water year 2018

total system capacity is approximately 27.8 maf (47 percent of capacity) to 31.0 maf (52 percent of capacity), respectively.

September 24-Month Study
Date: September 14, 2018

From: Water Resources Group, Salt Lake City
To: All Colorado River Annual Operating Plan (AOP) Recipients

Current Reservoir Status

Reservoir	August Inflow (unregulated) (acre-feet)	Percent of Average (%)	Sep 13, Midnight Elevation (feet)	Sep 13, Midnight Reservoir Storage (acre-feet)
Fontenelle	50,000	66	6,497.99	283,000
Flaming Gorge	42,000	47	6,031.91	3,323,000
Blue Mesa	19,000	29	7,448.74	306,000
Navajo	-7,000	-	6,024.88	958,000
Powell	11,000	2	3,595.10	11,289,000

Expected Operations

The operation of Lake Powell and Lake Mead in this September 2018 24-Month Study is pursuant to the December 2007 Record of Decision on Colorado River Interim Guidelines for Lower Basin Shortages and the Coordinated Operations of Lake Powell and Lake Mead (Interim Guidelines) and reflects the 2018 Annual Operating Plan (AOP) and draft 2019 AOP. Pursuant to the Interim Guidelines, the August 2017 24-Month Study projections of the January 1, 2018, system storage and reservoir water surface elevations set the operational tier for the coordinated operation of Lake Powell and Lake Mead during 2018.

Consistent with Section 6.B of the Interim Guidelines, the Lake Powell operational tier for water year 2018 is the Upper Elevation Balancing Tier. With an 8.23 million acre-feet (maf) release from Lake Powell in water year 2018, the April 2018 24-Month Study projected the end of water year elevation at Lake Powell to be above 3,575 feet above sea level (feet) and the end of water year elevation at Lake Mead to be below 1,075 feet. Therefore, in accordance with Section 6.B.4 of the Interim Guidelines, Lake Powell operations shifted to balancing releases for the remainder of water year 2018. Under Section 6.B.4, the contents of Lake Powell and Lake Mead will be balanced by the end of the water year, but not more than 9.0 maf and not less than 8.23 maf shall be released from Lake Powell. Based on the most probable inflow forecast, this September 24-Month Study projects a balancing release of 9.0 maf in water year 2018.

Consistent with Section 2.B.5 of the Interim Guidelines, the Intentionally Created Surplus (ICS) Surplus Condition is the criterion governing the operation of Lake Mead for calendar year 2018.

The August 2018 24-Month Study projects the January 1, 2019 Lake Powell elevation to be below the 2019 Equalization Elevation of 3,655 feet and above elevation 3,575 feet. Consistent with Section 6.B of the Interim Guidelines, Lake Powell's operations in water year 2019 will be governed by the Upper Elevation Balancing Tier, with an initial water year release volume of 8.23 maf and the potential for an April adjustment to equalization or balancing releases in April 2019. Consistent with Section 6.B.4 of the Interim Guidelines, an April adjustment to balancing releases is currently projected to occur and Lake Powell is projected to release 9.0 maf in water year 2019.

The August 2018 24-Month Study projects the January 1, 2019 Lake Mead elevation to be above 1,075 feet. Consistent with Section 2.B.5 of the Interim Guidelines, the Intentionally Created Surplus (ICS) Surplus Condition is the criterion governing the operation of Lake Mead for calendar year 2019. The 2019 operational tier determinations will be documented in the 2019 AOP, which is currently in development.

The Interim Guidelines are available for download at:
https://www.usbr.gov/lc/region/programs/strategies/RecordofDecision.pdf.
The 2018 AOP is available for download at:
https://www.usbr.gov/lc/region/g4000/aop/AOP18.pdf
The 2019 AOP Third Consultation draft is available for download at:
https://www.usbr.gov/uc/water/rsvrs/ops/aop/AOP19_Third_Consultation_draft.pdf

Fontenelle Reservoir – Fontenelle Reservoir is currently at elevation 6498.50 feet, which amounts to 83 percent of live storage capacity. Inflows for the month of August totaled 50,100 acre-feet (af), or 66 percent of average. Average inflows are occurring and releases are being adjusted to maintain capacity in the reservoir. Releases as of September 10, 2018 are 1,125 cubic feet per second (cfs).

The Colorado Basin River Forecast Center has forecasted inflows that are at or near average. September, October, and November forecasted inflow volumes are 43,000 af (94 percent of average), 47,000 af (97 percent of average), and 47,000 af (112 percent of average), respectively.

The next Fontenelle Working Group meeting is scheduled for 10:00 a.m., April 24, 2019. The meeting will be held at the Seedskadee National Wildlife Refuge. The Fontenelle Working Group is an open public forum for information exchange between Reclamation and other parties associated with the operation of Fontenelle Reservoir.

Flaming Gorge Reservoir – Daily average releases as of September 10, 2018 are 2,000 cfs with fluctuations for hydropower occurring each day. Releases will likely remain at this daily average rate through the end of September.

Unregulated inflow into Flaming Gorge Reservoir during the month of August was 42,000 af which was 77 percent of average. The current reservoir elevation is 6,032.10 feet (92 percent of live capacity) and is decreasing.

The September final forecast for inflows for the next three months projects at or below average conditions with September, October, and November forecasted inflow volumes of 43,000 af (78 percent of average), 49,000 af (83 percent of average), and 53,000 af (104 percent of average), respectively.

The Flaming Gorge Working Group is an open public forum for information exchange between Reclamation and the stakeholders of Flaming Gorge Dam. The public is encouraged to attend and comment on the operations and plans presented by Reclamation at these meetings. Meeting notes from past Working Group meetings are posted on the Working Group webpage. For more information on this group and these meetings please contact Dale Hamilton at 801-379-1186 or Jed Parker at 801-524-3816.

Reclamation will be holding the Flaming Gorge Working Group meeting on Thursday, March 14, 2019 at 10:00 a.m. at the Uintah Conference Center, 313 E 200 S, Vernal, Utah.

Aspinall Unit Reservoirs – As of September 12, 2018 releases from Crystal Dam are approximately 1,450 cfs. The Uncompahgre Valley Water Users Association is diverting approximately 1,000 cfs through the Gunnison Tunnel and flows through the Black Canyon are approximately 500 cfs. There is about a 50 cfs gain to the Gunnison River between Crystal Dam and the Gunnison Tunnel Diversion. As of September 12, 2018, Blue Mesa Reservoir elevation is 7448.99 feet which corresponds to storage content of 306,938 af (37 percent of capacity).

The August unregulated inflow to Blue Mesa Reservoir was 18,571 af (19 percent of average). Unregulated Inflows to Blue Mesa for the next three months (September, October and November) are projected to be: 19,000 af (50 percent of average), 20,000 af (52 percent of average) and 19,000 af (61 percent of average), respectively. For water year 2018, the unregulated inflow volume is forecasted to be 440,000 af (46 percent of average) with 238,000 af (35 percent of average) of unregulated inflow occurring during the April through July period. The September 24-Month Study is reflective of this new forecast. Conditions are clearly very dry and Blue Mesa Reservoir will not fill this year. Current projections indicate Blue Mesa storage will continue to decrease through the rest of water year 2018 ending on September 30, 2018 with a projected elevation and storage of 7444.7 feet and 284,000 af (34 percent of capacity), respectively.

The Aspinall Unit Working Group is an open public forum for information exchange between Reclamation and the stakeholders of the Aspinall Unit. The public is encouraged to attend and comments on the operations and plans presented by Reclamation at these meetings. Meeting notes from past working Group meetings are posted on the Working Group webpage. For more information on this group and these meetings please contact Erik Knight in the Grand Junction Area Office at (970) 248-0629.

Meeting notes from past working Group meetings are posted on the Working Group webpage at:

https://www.usbr.gov/uc/wcao/water/rsvrs/mtgs/amcurrnt.html

The next meeting of the Aspinall Unit Working Group will be held on Thursday, January 17, 2019 at 1:00 pm at the Holiday Inn Express located in Montrose, Colorado.

Navajo Reservoir – As of September 6, 2018, releases from Navajo Dam are 750 cfs and the inflow to Navajo Reservoir is 73 cfs. The Navajo Indian Irrigation Project (NIIP) is diverting 734 cfs from Navajo Reservoir. The reservoir elevation is 6026.7 feet which corresponds to a live storage of 0.976 maf (57 percent of capacity). This elevation also corresponds to an active storage of 0.314 maf (30 percent of capacity). The river flow measured at the San Juan River at Four Corners USGS gage is 560 cfs. River flow at the Animas River at Farmington USGS gage is at 16 cfs.

Releases from Navajo Dam are made for the authorized purposes of the Navajo Unit, and pursuant to the 2006 Record of Decision, to attempt to maintain a target base flow through the endangered fish critical habitat reach of the San Juan River (Farmington to Lake Powell). The San Juan River Basin Recovery Implementation Program (SJRIP) recommends a target base flow of between 500 cfs and 1,000 cfs through the critical habitat area. The target base flow is calculated as the weekly average of gaged flows throughout the critical habitat area.

Modified unregulated inflow into Navajo (inflow adjusted for upstream change in storage, reservoir evaporation and exportation from the basin) in August was -6,552 af. For the month of August, this value falls within the bottom 5 percent of all historical modified unregulated inflows to Navajo Reservoir. In dry years during irrigation season, the modified-unregulated inflow to Navajo Reservoir may calculate to a negative value when observed inflow value to Navajo Reservoir is small and the concurrent change in storage value at Vallecito Reservoir is large as has been the case on many days this summer. The modified unregulated inflow during the April through July period was 156,959 af, which was 21 percent of average.

The projected modified unregulated inflow volumes for Navajo Reservoir over the next three months (September, October, and November) are projected to be: 5,000 af (12 percent of average), 10,000 af (21 percent of average), and 10,000 af (30 percent of average), respectively.

Releases for the fall and winter will be made to maintain the minimum target baseflow in the critical habitat reach and will decrease as irrigation in the basin decreases. When conditions allow, the release will be reduced to as low as the minimum release of 250 cfs, so long as the target baseflow downstream is still met.

Reclamation conducts Public Operations Meetings three times per year to gather input for determining upcoming operations for Navajo Reservoir. Input from individuals, organizations, and agencies along with other factors such as weather, water rights, endangered species requirements, flood control, hydro power, recreation, fish and wildlife management, and reservoir levels, will be considered in the development of these reservoir operation plans. In addition, the meetings are used to coordinate activities and exchange information among agencies, water users, and other interested parties concerning the San Juan River and Navajo Reservoir.

The next Navajo Public Operations Coordination Meeting is scheduled for Tuesday, January 29th, 2018, at 1:00 p.m. at the Farmington Civic Center, Farmington, NM.

Glen Canyon Dam / Lake Powell

Current Status

The Department of the Interior is exploring the possibility of a High Flow Experiment from Glen Canyon Dam to be conducted in November 2018. High Flow Experiments (HFE) below Glen Canyon Dam are driven by weather, sediment inputs, and other resource conditions, in accordance with the Long-Term Experimental and Management Plan (LTEMP).

When sediment conditions during the summer and fall meet specific thresholds as described in the LTEMP, a fall HFE can occur. Fall HFEs can be scheduled to occur anytime during the months of October and November; however, under the LTEMP, HFEs have historically always occurred in November. Our best preliminary data and model runs indicate we now have enough sediment input from the Paria River for an HFE to occur at Glen Canyon Dam. The HFE Technical Team will be meeting to begin planning for a possible HFE and reviewing the status of resources and potential resource impacts.

The HFE will likely begin on November 5, 2018. The duration of the HFE is dependent upon further data collection, modeling, and analysis prior to the end of October. A final determination on the timing, magnitude and duration of a potential fall 2018 HFE will likely be made in mid- to late-October.

The April to July 2018 unregulated inflow to Lake Powell was 2.6 maf (36 percent of average). The unregulated inflow in August was 11.2 thousand acre-feet (kaf) (2 percent of average). The is the second lowest unregulated inflow to occur in August. The lowest occurred in August 2002 when the volume was negative 50 kaf. The release volume from Glen Canyon Dam in August was 900 kaf. The end of August elevation and storage of Lake Powell were 3,597 feet (103 feet from full pool) and 11.2 maf (47 percent of capacity), repectively.

Current Operations

The operating tier for water year 2018 was established in August 2017 as the Upper Elevation Balancing Tier. The April 2018 24-Month Study established that Lake Powell operations would be governed by balancing for the remainder of water year 2018. As described in the Interim Guidelines, under balancing, the contents of Lake Powell and

Lake Mead are to be balanced by the end of the water year, but not more than 9.0 maf and not less than 8.23 maf is to be released from Lake Powell. Based on the most probable inflow forecast, the September 24-Month Study projects a balancing release of 9.0 maf for water year 2018. Reclamation will schedule operations at Glen Canyon Dam to achieve as practicably as possible the appropriate total annual release volume by September 30, 2018.

The operating tier for water year 2019, established by the August 2018 24-Month Study, is the Upper Elevation Balancing Tier. Under this Tier the initial annual water year release volume is 8.23 maf but there is potential for an April 2019 adjustment to equalization or balancing releases. Based on the current forecast, an April adjustment to balancing releases is projected and Lake Powell is currently projected to release 9.0 maf in water year 2019. This projection will be updated each month throughout the water year.

In September, the release volume will be approximately 671 kaf, with fluctuations anticipated between about 7,600 cfs in the nighttime to about 13,640 cfs in the daytime and consistent with the Glen Canyon Dam, Record of Decision on LTEMP (December 2016). The anticipated release volume for October is 625 kaf with daily fluctuations between approximately 7,070 cfs and 12,700 cfs. The expected release for November is 625 kaf, unless an HFE is implemented. Once the timing, magnitude and duration of an HFE has been determined, a release volume will be available.

In addition to daily scheduled fluctuations for power generation, the instantaneous releases from Glen Canyon Dam may also fluctuate to provide 40 megawatts (mw) of system regulation. These instantaneous release adjustments stabilize the electrical generation and transmission system and translate to a range of about 1,200 cfs above or below the hourly scheduled release rate. Under normal conditions, fluctuations for regulation are typically short lived and generally balance out over the hour with minimal or no noticeable impacts on downstream river flow conditions.

Releases from Glen Canyon Dam can also fluctuate beyond scheduled releases when called upon to respond to power system emergencies. Depending on the severity of the system emergency, the response from Glen Canyon Dam can be significant and within the full range of the operating capacity of the power plant for as long as is necessary to maintain balance in the transmission system. Glen Canyon Dam currently maintains 27 mw (approximately 800 cfs) of generation capacity in reserve in order to respond to a system emergency even when generation rates are already high. System emergencies occur fairly infrequently and typically require small responses from Glen Canyon Dam. However, these responses can have a noticeable impact on the river downstream of Glen Canyon Dam.

Inflow Forecasts and Model Projections

The forecast for water year 2019 unregulated inflow to Lake Powell, issued on August 1, 2018, by the Colorado Basin River Forecast Center, projects that the most probable (median) unregulated inflow volume next year will be 8.1 maf (75 percent of average).

There is significant uncertainty regarding next season's snow pack development and resulting runoff into Lake Powell. The forecast ranges from a minimum probable of 4.8 maf (44 percent of average) to a maximum probable of 15.6 maf (144 percent of average). There is a 10 percent chance that inflows could be higher than the current maximum probable forecast and a 10 percent chance that inflows could be lower than the minimum probable forecast.

Based on the current forecast, the September 24-Month Study projects Lake Powell elevation will end water year 2018 near 3,595 feet with approximately 11.29 maf in storage (49 percent of capacity) and water year 2019 near 3,577 feet with approximately 9.734 maf in storage (40 percent of capacity). Note that projections of elevation and storage for water year 2019 have significant uncertainty at this point in the season. Projections of end of water year 2019 elevation and storage using the minimum and maximum probable inflow forecast from August 2018 are 3,562 feet (8.494 maf, 35 percent of capacity) and 3,641 feet (16.13 maf, 66 percent of capacity), respectively. Under these scenarios, there is a 10 percent chance that inflows will be higher, resulting in higher elevation and storage, and 10 percent chance that inflows will be lower, resulting in lower elevation and storage. The annual release volume from Lake Powell during water year 2019 is projected to be 9.0 maf under the most probable and maximum probable inflow scenarios and 8.23 maf under the minimum probable inflow scenario.

Upper Colorado River Basin Hydrology

The Upper Colorado River Basin regularly experiences significant year to year hydrologic variability. During the 18-year period 2000 to 2017, however, the unregulated inflow to Lake Powell, which is a good measure of hydrologic conditions in the Colorado River Basin, was above average in only 4 of these years and had the lowest average annual (based on water year) unregulated inflow volume of any 18 year period since the closure of Glen Canyon Dam in 1963. The average annual unregulated inflow volume during this period was 8.76 maf, or 81 percent of the official average which is based on the period from 1981 through 2010 and is 10.83 maf. During the 2000 to 2017 period, the annual unregulated inflow volume has ranged from a low of 2.64 maf (24 percent of average) in 2002 to a high of 15.97 maf (147 percent of average) in 2011. In water year 2017 unregulated inflow volume was 11.9 maf (110 percent of average). Under the current forecast, the annual unregulated inflow volume for water year 2018 is projected to be 5.25 maf (48 percent of average).

At the beginning of water year 2018, total system storage in the Colorado River Basin was 32.9 maf (55 percent of the 59.6 maf in total system capacity). This was an increase of 2.7 maf over the total storage at the beginning of water year 2017. Since the beginning of water year 2000, total Colorado Basin storage has experienced year to year increases and decreases in response to wet and dry hydrology, ranging from a high of 94 percent of capacity at the beginning of 2000 to a low of 50 percent of capacity at the beginning of water year 2005. One wet year can significantly increase total system reservoir storage, just as persistent dry years can draw down the system storage. Based on current inflow forecasts, the current projected end of water year total Colorado Basin reservoir storage for water year 2018 is approximately 29.0 maf (48 percent of total system capacity). The actual end of water year 2018 system storage may vary from this projection, primarily

due to uncertainty regarding this season's runoff and reservoir inflow. Based on the April minimum and maximum probable inflow forecasts and modeling, the range of end of water year 2018 total system capacity is approximately 27.8 maf (47 percent of capacity) to 31.0 maf (52 percent of capacity), respectively.

Aug 24-Month Study
Date: August 13, 2018

From: Water Resources Group, Salt Lake City
To: All Colorado River Annual Operating Plan (AOP) Recipients

Current Reservoir Status

Reservoir	July Inflow (unregulated) (acre-feet)	Percent of Average (%)	Aug 13, Midnight Elevation (feet)	Aug 13, Midnight Reservoir Storage (acre-feet)
Fontenelle	138,000	78	6,502.63	318,000
Flaming Gorge	140,000	66	6,033.67	3,493,000
Blue Mesa	21,000	19	7,460.40	374,000
Navajo	-9,000	-	6,033.38	1,043,000
Powell	123,000	11	3,600.90	11,836,000

Expected Operations

The operation of Lake Powell and Lake Mead in this August 2018 24-Month Study is pursuant to the December 2007 Record of Decision on Colorado River Interim Guidelines for Lower Basin Shortages and the Coordinated Operations of Lake Powell and Lake Mead (Interim Guidelines) and reflects the 2018 Annual Operating Plan (AOP). Pursuant to the Interim Guidelines, the August 2017 24-Month Study projections of the January 1, 2018, system storage and reservoir water surface elevations set the operational tier for the coordinated operation of Lake Powell and Lake Mead during 2018.

Consistent with Section 6.B of the Interim Guidelines, the Lake Powell operational tier for water year 2018 is the Upper Elevation Balancing Tier. With an 8.23 million acre-feet (maf) release from Lake Powell in water year 2018, the April 2018 24-Month Study projected the end of water year elevation at Lake Powell to be above 3,575 feet above sea level (feet) and the end of water year elevation at Lake Mead to be below 1,075 feet. Therefore, in accordance with Section 6.B.4 of the Interim Guidelines, Lake Powell operations shifted to balancing releases for the remainder of water year 2018. Under Section 6.B.4, the contents of Lake Powell and Lake Mead will be balanced by the end of the water year, but not more than 9.0 maf and not less than 8.23 maf shall be released from Lake Powell. Based on the most probable inflow forecast, this August 24-Month Study projects a balancing release of 9.0 maf in water year 2018.

Consistent with Section 2.B.5 of the Interim Guidelines, the Intentionally Created Surplus (ICS) Surplus Condition is the criterion governing the operation of Lake Mead for calendar year 2018.

The August 2018 24-Month Study projects the January 1, 2019 Lake Powell elevation to be below the 2019 Equalization Elevation of 3,655 feet and above elevation 3,575 feet. Consistent with Section 6.B of the Interim Guidelines, Lake Powell's operations in water year 2019 will be governed by the Upper Elevation Balancing Tier, with an initial water year release volume of 8.23 maf and the potential for an April adjustment to equalization or balancing releases in April 2019. Consistent with Section 6.B.4 of the Interim Guidelines, an April adjustment to balancing releases is currently projected to occur and Lake Powell is projected to release 9.0 maf in water year 2019.

The August 2018 24-Month Study projects the January 1, 2019 Lake Mead elevation to be above 1,075 feet. Consistent with Section 2.B.5 of the Interim Guidelines, the Intentionally Created Surplus (ICS) Surplus Condition is the criterion governing the operation of Lake Mead for calendar year 2019.

The 2019 operational tier determinations will be documented in the 2019 AOP, which is currently in development.

The Interim Guidelines are available for download at:
https://www.usbr.gov/lc/region/programs/strategies/RecordofDecision.pdf.
The 2018 AOP is available for download at:
https://www.usbr.gov/lc/region/g4000/aop/AOP18.pdf

Fontenelle Reservoir – Fontenelle Reservoir is currently at elevation 6503.73 feet, which amounts to 94 percent of live storage capacity. Inflows for the month of July totaled 138,000 acre-feet (af), or 78 percent of average. Average inflows are occurring and releases are being adjusted to maintain capacity in the reservoir. As of August 1, 2018, releases are 1,300 cubic feet per second (cfs).

The Colorado Basin River Forecast Center has forecasted inflows that are at or near average. August, September, and October forecasted inflow volumes amount to 70,000 af (91 percent of average), 50,000 af (109 percent of average), and 53,000 af (109 percent of average), respectively.

The next Fontenelle Working Group meeting is scheduled for 10:00 a.m., August 23, 2018. The meeting will be held at the Joint Powers Water Board at 2 Telephone Canyon Road in Green River, WY. The Fontenelle Working Group is an open public forum for information exchange between Reclamation and other parties associated with the operation of Fontenelle Reservoir.

Flaming Gorge Reservoir – As of August 1, 2018 releases are 2,000 cfs with fluctuations for hydropower. Average daily releases will likely remain at 2,000 cfs through the coming months.

Unregulated inflow into Flaming Gorge Reservoir during the month of July was 102,000 af, or 48 percent of average. As of August 1, 2018, the reservoir elevation is 6,034.40 feet (94 percent of live capacity) and decreasing.

The August final forecast for inflows for the next three months projects at or below average conditions: August, September, and October forecasted inflow volumes at 72,000 af (81 percent of average), 52,000 af (94 percent of average), and 58,000 af (98 percent of average), respectively.

The Flaming Gorge Working Group is an open public forum for information exchange between Reclamation and the stakeholders of Flaming Gorge Dam. The public is encouraged to attend and comment on the operations and plans presented by Reclamation at these meetings. Meeting notes from past Working Group meetings are posted on the Working Group webpage. For more information on this group and these meetings please contact Dale Hamilton at 801-379-1186 or Jed Parker at 801-524-3816.

Reclamation will be holding the Flaming Gorge Working Group meeting on Monday, August 27, 2018 at 10:00 a.m. at the Uintah Conference Center, 313 E 200 S, Vernal, Utah.

Aspinall Unit Reservoirs – As of August 13, 2018 releases from Crystal Dam are approximately 1,600 cfs. Uncompahgre Valley Water Users Association is diverting approximately 1,060 cfs through the Gunnison Tunnel and flows through the Black Canyon are approximately 590 cfs. There is about a 40 cfs gain to the Gunnison River between Crystal Dam and the Gunnison Tunnel Diversion. As of August 13, 2018, Blue Mesa Reservoir elevation is 7460.40 feet which corresponds to storage content of 373,714 af (45 percent of capacity).

The July unregulated inflow to Blue Mesa Reservoir was 21,352 af (19 percent of average). Unregulated Inflows to Blue Mesa for the next three months (August, September, October) are projected to be: 21,000 af (33 percent of average), 22,000 af (58 percent of average) and 22,000 af (63 percent of average), respectively. For water year 2018, the unregulated inflow volume is forecasted to be 445,000 af (47 percent of average) with 238,000 af (35 percent of average) of unregulated inflow during the April through July period. The August 24-Month Study is reflective of this new forecast. Conditions are clearly very dry and Blue Mesa Reservoir will not fill this year. Current projections indicate Blue Mesa storage will continue to decrease through the rest of water year 2018 ending on September 30, 2018 with a projected elevation and storage of 7443.8 feet and 279,000 af (34 percent of capacity), respectively.

The Aspinall Unit Working Group is an open public forum for information exchange between Reclamation and the stakeholders of the Aspinall Unit. The public is encouraged to attend and comments on the operations and plans presented by Reclamation at these meetings. Meeting notes from past working Group meetings are posted on the Working

Group webpage. For more information on this group and these meetings please contact Erik Knight in the Grand Junction Area Office at (970) 248-0629.

Meeting notes from past working Group meetings are posted on the Working Group webpage at:

https://www.usbr.gov/uc/wcao/water/rsvrs/mtgs/amcurrnt.html

The next meeting of the Aspinall Unit Working Group will be held on Thursday, August 16th, 2018 at 1:00 pm at the at the Elk Creek Visitor Center at Blue Mesa Reservoir.

Navajo Reservoir – As of August 14, 2018 releases from Navajo Dam are 850 cfs and observed inflow is 135 cfs. The Navajo Indian Irrigation Project (NIIP) is diverting 537 cfs. The reservoir elevation is 6033.4 feet which corresponds to a live storage of 1.043 maf (61 percent of live storage capacity). This elevation also corresponds to an active storage of 0.381 maf (37 percent of active storage capacity). The river flow measured at the San Juan River at Four Corners USGS gage is 603 cfs. River flow at the Animas River at Farmington USGS gage is at 7 cfs.

Releases from Navajo Dam are made for the authorized purposes of the Navajo Unit, and pursuant to the 2006 Record of Decision, to attempt to maintain a target base flow through the endangered fish critical habitat reach of the San Juan River (Farmington to Lake Powell). The San Juan River Basin Recovery Implementation Program (SJRIP) recommends a target base flow of between 500 cfs and 1,000 cfs through the critical habitat area. The target base flow is calculated as the weekly average of gaged flows throughout the critical habitat area.

Preliminary modified-unregulated inflow into Navajo (inflow adjusted for upstream change in storage, reservoir evaporation and exportation from the basin) in June was -8,731 af. For the month of June, this value falls within the bottom 5 percent of all historical modified-unregulated inflows to Navajo Reservoir. In dry years during irrigation season, the modified-unregulated inflow to Navajo Reservoir may be calculated as negative values when observed inflow values to Navajo Reservoir are small and concurrent change in storage values at Vallecito Reservoir are large as is the case that has occurred this summer. The modified-unregulated inflow during the April through July period was 154,852 af, which was 21 percent of average.

Forecast modified-unregulated inflow to Navajo over the next three months (August, September, and October) are projected to be: 3,000 af (5 percent of average), 10,000 af (23 percent of average), and 15,000 af (32 percent of average), respectively.

Releases for the remainder of the summer will be made to maintain the minimum target baseflow in the critical habitat reach and will likely range between 700 and 1,100 cfs. Reclamation conducts Public Operations Meetings three times per year to gather input for determining upcoming operations for Navajo Reservoir. Input from individuals, organizations, and agencies along with other factors such as weather, water rights,

endangered species requirements, flood control, hydro power, recreation, fish and wildlife management, and reservoir levels, will be considered in the development of these reservoir operation plans. In addition, the meetings are used to coordinate activities and exchange information among agencies, water users, and other interested parties concerning the San Juan River and Navajo Reservoir.

The next Navajo Public Operations Coordination Meeting is scheduled for Tuesday, August 21, 2018, at 1:00 p.m. at the Farmington Civic Center, Farmington, NM.

Glen Canyon Dam / Lake Powell

Current Status
The Department of the Interior is conducting the first experimental flow at Glen Canyon Dam since implementing its Long-Term Experimental and Management Plan (LTEMP). The goal is to provide enhanced habitat for the lifecycle of aquatic insects that are the primary food source for fish in the Colorado River.

Experiments under LTEMP consist of four different flow regimes: high flows, bug flows, trout management flows, and low summer flows. Collaborative discussions among technical experts resulted in a decision to begin this first experiment on May 1 and continue through August 31, 2018. It will slightly modify the schedule and flow rates of water releases from Lake Powell through Glen Canyon Dam, Arizona. The normally scheduled monthly and weekly release volumes will not be affected.

Flows during the experiment will include steady weekend water releases with routine hydropower production flows on weekdays that include normal hourly changes in release rates. Those steady weekend flows are expected to provide favorable conditions for aquatic insects to lay and cement their eggs to rocks, vegetation, and other materials near the river's edge. Steady weekend flows will be relatively low, within four inches of typical weekday low water levels. It is unlikely casual recreational river users will notice the changes in water levels.

Insects expected to benefit from this experiment are an important food source for many species of fish, birds, and bats in the canyon. Beyond expected resource benefits, this experiment will also provide scientific information that will be used in future decision making.

The April to July 2018 unregulated inflow to Lake Powell was 2.6 maf (36 percent of average). The unregulated inflow in July was 123 thousand acre-feet (kaf) (11 percent of average). The release volume from Glen Canyon Dam in July was 860 kaf. The end of July elevation and storage of Lake Powell were 3,603.8 feet (96 feet from full pool) and 12.12 maf (49 percent of full capacity), respectively.

Current Operations
The operating tier for water year 2018 was established in August 2017 as the Upper Elevation Balancing Tier. The April 2018 24-Month Study established that Lake Powell

operations would be governed by balancing for the remainder of water year 2018. As described in the Interim Guidelines, under balancing, the contents of Lake Powell and Lake Mead are to be balanced by the end of the water year, but not more than 9.0 maf and not less than 8.23 maf is to be released from Lake Powell. Based on the most probable inflow forecast, the August 24-Month Study projects a balancing release of 9.0 maf for water year 2018. Reclamation will schedule operations at Glen Canyon Dam to achieve as practicably as possible the appropriate total annual release volume by September 30, 2018.

The operating tier for water year 2019, established by the August 2018 24-Month Study, is the Upper Elevation Balancing Tier. Under this Tier the initial annual water year release volume is 8.23 maf but there is potential for an April 2019 adjustment to equalization or balancing releases. Based on the current forecast, an April adjustment to balancing releases is projected and Lake Powell is currently projected to release 9.0 maf in water year 2019. This projection will be updated each month throughout the water year.

In August, the release volume will be approximately 900 kaf, with fluctuations anticipated between about 10,180 cfs in the nighttime to about 18,180 cfs in the daytime and consistent with the Glen Canyon Dam, Record of Decision (dated December, 2016). The anticipated release volume for September is 670 kaf with daily fluctuations between approximately 7,600 cfs and 13,645 cfs. The expected release for October is 625 kaf.

In addition to daily scheduled fluctuations for power generation, the instantaneous releases from Glen Canyon Dam may also fluctuate to provide 40 megawatts (mw) of system regulation. These instantaneous release adjustments stabilize the electrical generation and transmission system and translate to a range of about 1,200 cfs above or below the hourly scheduled release rate. Under normal conditions, fluctuations for regulation are typically short lived and generally balance out over the hour with minimal or no noticeable impacts on downstream river flow conditions.

Releases from Glen Canyon Dam can also fluctuate beyond scheduled releases when called upon to respond to power system emergencies. Depending on the severity of the system emergency, the response from Glen Canyon Dam can be significant and within the full range of the operating capacity of the power plant for as long as is necessary to maintain balance in the transmission system. Glen Canyon Dam currently maintains 27 mw (approximately 800 cfs) of generation capacity in reserve in order to respond to a system emergency even when generation rates are already high. System emergencies occur fairly infrequently and typically require small responses from Glen Canyon Dam. However, these responses can have a noticeable impact on the river downstream of Glen Canyon Dam.

Inflow Forecasts and Model Projections

The forecast for water year 2019 unregulated inflow to Lake Powell, issued on August 1, 2018, by the Colorado Basin River Forecast Center, projects that the most probable (median) unregulated inflow volume next year will be 8.1 maf (75 percent of average).

There is significant uncertainty regarding next season's snow pack development and resulting runoff into Lake Powell. The forecast ranges from a minimum probable of 4.8 maf (44 percent of average) to a maximum probable of 15.6 maf (144 percent of average). There is a 10 percent chance that inflows could be higher than the current maximum probable forecast and a 10 percent chance that inflows could be lower than the minimum probable forecast.

Based on the current forecast, the August 24-Month Study projects Lake Powell elevation will end water year 2018 near 3,595 feet with approximately 11.29 maf in storage (49 percent of capacity) and water year 2019 near 3,581 feet with approximately 10.07 maf in storage (43 percent of capacity). Note that projections of elevation and storage for water year 2019 have significant uncertainty at this point in the season. Projections of end of water year 2019 elevation and storage using the minimum and maximum probable inflow forecast are 3,562 feet (8.494 maf, 35 percent of capacity) and 3,641 feet (16.13 maf, 66 percent of capacity), respectively. Under these scenarios, there is a 10 percent chance that inflows will be higher, resulting in higher elevation and storage, and 10 percent chance that inflows will be lower, resulting in lower elevation and storage. The annual release volume from Lake Powell during water year 2019 is projected to be 9.0 maf under the most probable and maximum probable inflow scenarios and 8.23 maf under the minimum probable inflow scenario.

Upper Colorado River Basin Hydrology

The Upper Colorado River Basin regularly experiences significant year to year hydrologic variability. During the 18-year period 2000 to 2017, however, the unregulated inflow to Lake Powell, which is a good measure of hydrologic conditions in the Colorado River Basin, was above average in only 4 out of the past 18 years. The period 2000-2017 is the lowest 18-year period since the closure of Glen Canyon Dam in 1963, with an average unregulated inflow of 8.76 maf, or 81percent of the 30-year average (1981-2010). (For comparison, the 1981-2010 total water year average is 10.83 maf.) The unregulated inflow during the 2000-2017 period has ranged from a low of 2.64 maf (24 percent of average) in water year 2002 to a high of 15.97 maf (147 percent of average) in water year 2011. In water year 2017 unregulated inflow volume to Lake Powell was 11.9 maf (110 percent of average), the fourth year to be above average. Under the current most probable forecast, the total water year 2018 unregulated inflow to Lake Powell is projected to be 5.25 maf (48 percent of average).

At the beginning of water year 2018, total system storage in the Colorado River Basin was 32.9 maf (55 percent of 59.6 maf total system capacity). This is an increase of 2.7 maf over the total storage at the beginning of water year 2017 when total system storage was 30.2 maf (51 percent of capacity). Since the beginning of water year 2000, total Colorado Basin storage has experienced year to year increases and decreases in response to wet and dry hydrology, ranging from a high of 94 percent of capacity at the beginning of 2000 to a low of 50 percent of capacity at the beginning of water year 2005. One wet year can significantly increase total system reservoir storage, just as persistent dry years can draw down the system storage. Based on current inflow forecasts, the current projected end of water year total Colorado Basin reservoir storage for water year 2018 is approximately 29.0 maf (48 percent of total system capacity). The actual end of water

year 2018 system storage may vary from this projection, primarily due to uncertainty regarding this season's runoff and reservoir inflow. Based on the April minimum and maximum probable inflow forecasts and modeling, the range of end of water year 2018 total system capacity is approximately 27.8 maf (47 percent of capacity) to 31.0 maf (52 percent of capacity), respectively.

October 24-Month Study
Date: October 12, 2018

From: Water Resources Group, Salt Lake City
To: All Colorado River Annual Operating Plan (AOP) Recipients

Current Reservoir Status

Reservoir	September Inflow (unregulated) (acre-feet)	Percent of Average (%)	October 11, Midnight Elevation (feet)	October 11, Midnight Reservoir Storage (acre-feet)
Fontenelle	30,000	66	6,493.89	254,000
Flaming Gorge	17,000	31	6,030.51	3,369,000
Blue Mesa	12,000	30	7,440.59	263,000
Navajo	2,000	6	6,019.23	905,000
Powell	1,000	>1	3,591.96	10,999,000

Expected Operations

The operation of Lake Powell and Lake Mead in this October 2018 24-Month Study is pursuant to the December 2007 Record of Decision on Colorado River Interim Guidelines for Lower Basin Shortages and the Coordinated Operations of Lake Powell and Lake Mead (Interim Guidelines),and reflects the 2018 Annual Operating Plan (AOP) and draft 2019 AOP. Pursuant to the Interim Guidelines, the August 2018 24-Month Study projections of the January 1, 2019, system storage and reservoir water surface elevations set the operational tier for the coordinated operation of Lake Powell and Lake Mead during 2019.

Consistent with Section 6.B of the Interim Guidelines, the Lake Powell operational tier for water year 2019 will be governed by the Upper Elevation Balancing Tier, with an initial water year release volume of 8.23 maf and the potential for an April adjustment to equalization or balancing releases in April 2019. This October 2018 24-Month Study indicates that, consistent with Section 6.B.4 of the Interim Guidelines, an April adjustment to balancing releases is projected to occur and the contents of Lake Powell and Lake Mead will be balanced by the end of the water year, but not more than 9.0 maf and not less than 8.23 maf shall be released from Lake Powell. Based on the most probable inflow forecast, this October 24-Month Study projects a balancing release of 8.92 maf in water year 2019.

Consistent with Section 2.B.5 of the Interim Guidelines, the Intentionally Created Surplus (ICS) Surplus Condition is the criterion governing the operation of Lake Mead for calendar years 2018 and 2019.

The 2019 operational tier determinations will be documented in the 2019 AOP, which is currently in development.

The Interim Guidelines are available for download at:
https://www.usbr.gov/lc/region/programs/strategies/RecordofDecision.pdf.
The 2018 AOP is available for download at:
https://www.usbr.gov/lc/region/g4000/aop/AOP18.pdf
The draft 2019 AOP is available for download at:
https://www.usbr.gov/uc/water/rsvrs/ops/aop/AOP19_Third_Consultation_draft.pdf

Fontenelle Reservoir – Fontenelle Reservoir is currently at elevation 6494.2 feet above sea level (feet), which amounts to 74 percent of live storage capacity. Inflows for the month of September totaled 30,400 acre-feet (af), or 88 percent of average. Average inflows are occurring and releases are being adjusted to maintain capacity in the reservoir. Releases are currently set at 1,075 cubic feet per second (cfs) (10/09/2018).

The Colorado Basin River Forecast Center has forecasted inflows that are at or near average. October, November, and December forecasted inflow volumes amount to 50,000 af (88 percent of average), 47,000 af (112 percent of average), and 36,000 af (147 percent of average), respectively.

The next Fontenelle Working Group meeting is scheduled for 10:00 a.m., April 24, 2019. The meeting will be held at the Seedskadee National Wildlife Refuge. The Fontenelle Working Group is an open public forum for information exchange between Reclamation and other parties associated with the operation of Fontenelle Reservoir.

Flaming Gorge Reservoir – Releases are currently set at 1,500 cfs with fluctuations for hydropower. Average daily releases will likely remain at 1,500 cfs through the end of November.

Inflow into Flaming Gorge Reservoir during the month of September was 52,100 af, or 95 percent of average. The current reservoir elevation is 6,030.60 feet (90 percent of live capacity) and decreasing.

The October final forecast for inflows for the next three months projects at or below average conditions: October, November, and December forecasted inflow volumes at 67,400 af (114 percent of average), 67,900 af (133 percent of average), and 66,100 af (190 percent of average), respectively.

The Flaming Gorge Working Group is an open public forum for information exchange between Reclamation and the stakeholders of Flaming Gorge Dam. The public is encouraged to attend and comment on the operations and plans presented by Reclamation

at these meetings. Meeting notes from past Working Group meetings are posted on the Working Group webpage. For more information on this group and these meetings please contact Dale Hamilton at 801-379-1186 or Jed Parker at 801-524-3816.

Reclamation will be holding the Flaming Gorge Working Group meeting on Thursday, March 14, 2019 at 10:00 a.m. at the Uintah Conference Center, 313 E 200 S, Vernal, Utah.

Aspinall Unit Reservoirs – As of October 11, 2018 releases from Crystal Dam are approximately 1,050 cfs. Uncompahgre Valley Water Users Association is diverting approximately 450 cfs through the Gunnison Tunnel and flows through the Black Canyon are approximately 600 cfs. There is roughly about a 50 cfs gain to the Gunnison River between Crystal Dam and the Gunnison Tunnel Diversion. As of October 11, 2018, Blue Mesa Reservoir elevation is 7440.59 feet which corresponds to storage content of 262,561 af (32 percent of capacity).

The September unregulated inflow to Blue Mesa Reservoir was 11,577 af (30 percent of average). Unregulated Inflows to Blue Mesa for the next three months (October, November and December) are projected to be: 20,000 af (52 percent of average), 20,000 af (65 percent of average) and 17,000 af (65 percent of average), respectively. For water year 2019, the unregulated inflow volume is forecasted to be 725,000 af (46 percent of average) with 535,000 af (44 percent of average) of unregulated inflow occurring during the April through July period. The October 24-Month Study is reflective of this new forecast.

Conditions are clearly very dry. Blue Mesa Reservoir did not fill in water year 2018 and will most likely not fill in water year 2019 either. Current projections indicate Blue Mesa storage will continue to decrease from now till April of 2019 before rebounding during the spring runoff. Current projections show Blue Mesa will reach a low elevation for water year 2019 of about 7,428 feet in early June 2019 and a peak elevation for water year 2019 of about 7458 feet in August 2019. The projected end of water year 2019 elevation of Blue Mesa is 7450.3 feet which corresponds to a live storage content of 314,230 acre-feet (38 percent of full capacity).

The Aspinall Unit Working Group is an open public forum for information exchange between Reclamation and the stakeholders of the Aspinall Unit. The public is encouraged to attend and comments on the operations and plans presented by Reclamation at these meetings. Meeting notes from past working Group meetings are posted on the Working Group webpage. For more information on this group and these meetings please contact Erik Knight in the Grand Junction Area Office at (970) 248-0629.

Meeting notes from past working Group meetings are posted on the Working Group webpage at:

https://www.usbr.gov/uc/wcao/water/rsvrs/mtgs/amcurrnt.html

The next meeting of the Aspinall Unit Working Group will be held on Thursday, January 17, 2019 at 1:00 pm at the Holiday Inn Express located in Montrose, Colorado.

Navajo Reservoir – The current (October 10th) daily average release rate from Navajo Dam is 590 cfs and the observed inflow to Navajo Reservoir is 200 cfs. The Navajo Indian Irrigation Project (NIIP) is diverting 336 cfs. The reservoir elevation is 6019.4 feet which corresponds to a live storage of 0.906 maf (53 percent of live storage capacity). This elevation also corresponds to an active storage of 0.244 maf (23 percent of active storage capacity). The river flow measured at the San Juan River at Four Corners USGS gage is 630 cfs. River flow at the Animas River at Farmington USGS gage is at 176 cfs. Releases from Navajo Dam are made for the authorized purposes of the Navajo Unit, and pursuant to the 2006 Record of Decision, to attempt to maintain a target base flow through the endangered fish critical habitat reach of the San Juan River (Farmington to Lake Powell). The San Juan River Basin Recovery Implementation Program (SJRIP) recommends a target base flow of between 500 cfs and 1,000 cfs through the critical habitat area. The target base flow is calculated as the weekly average of gaged flows throughout the critical habitat area.

Preliminary modified-unregulated inflow into Navajo (inflow adjusted for upstream change in storage, reservoir evaporation and exportation from the basin) in August was 2,469 af (6 percent of average) The modified-unregulated inflow during the April through July period was 156,959 af, which was 21 percent of average.

Forecast modified-unregulated inflow to Navajo over the next three months (October, November, and December) are projected to be: 17,000 af (36 percent of average), 15,000 af (45 percent of average), and 14,000 af (56 percent of average), respectively.

Releases for the fall and winter will be made to maintain the minimum target baseflow in the critical habitat reach and will decrease as irrigation in the basin decreases. When conditions allow, the release will be reduced to as low as the minimum release of 250 cfs, so long as the target baseflow downstream is still met.

Reclamation conducts Public Operations Meetings three times per year to gather input for determining upcoming operations for Navajo Reservoir. Input from individuals, organizations, and agencies along with other factors such as weather, water rights, endangered species requirements, flood control, hydro power, recreation, fish and wildlife management, and reservoir levels, will be considered in the development of these reservoir operation plans. In addition, the meetings are used to coordinate activities and exchange information among agencies, water users, and other interested parties concerning the San Juan River and Navajo Reservoir.

The next Navajo Public Operations Coordination Meeting is scheduled for Tuesday, January 29th, 2018, at 1:00 p.m. at the Farmington Civic Center, Farmington, NM.

Glen Canyon Dam / Lake Powell

Current Status
The Department of the Interior is exploring the possibility of a High Flow Experiment from Glen Canyon Dam to be conducted in November 2018. High Flow Experiments (HFE) below Glen Canyon Dam are driven by weather, sediment inputs, and other resource conditions, in accordance with the Long-Term Experimental and Management Plan (LTEMP).

When sediment conditions during the summer and fall meet specific thresholds as described in the LTEMP, a fall HFE can occur. Fall HFEs can be scheduled to occur anytime during the months of October and November; however, under the LTEMP, HFEs have historically always occurred in November. Our best preliminary data and model runs indicate we now have enough sediment input from the Paria River for an HFE to occur at Glen Canyon Dam. The HFE Technical Team completed its final analysis and has provided a technical report to the Reclamation Leadership Team, which will decide whether to implement an HFE by the end of October.

If the HFE is implemented, the HFE will begin on November 5, 2018, for a duration of 60 hours with flows surrounding the HFE fluctuating between 6,500 and 9,000 cfs during the evening and daylight hours for hydropower.

The April to July 2018 unregulated inflow to Lake Powell was 2.6 maf (36 percent of average). The unregulated inflow in August was 1 thousand acre-feet (kaf) (0 percent of average). This is the lowest unregulated inflow to occur in September. The next lowest occurred in September 2012 when the volume was negative 104 kaf. The release volume from Glen Canyon Dam in September was 670 kaf. The end of September elevation and storage of Lake Powell were 3,592.28 feet (108 feet from full pool) and 11 maf (45 percent of full capacity).

Current Operations
The operating tier for water year 2019 was established in August 2018 as the Upper Elevation Balancing Tier. As described in the Interim Guidelines, under balancing, the contents of Lake Powell and Lake Mead are to be balanced by the end of the water year, but not more than 9.0 maf and not less than 8.23 maf is to be released from Lake Powell. Under this Tier the initial annual water year release volume is 8.23 maf but there is potential for an April 2019 adjustment to equalization or balancing releases. Based on the current forecast, an April adjustment to balancing releases is projected and Lake Powell is currently projected to release 8.92 maf in water year 2019. This projection will be updated each month throughout the water year.

In October, the release volume will be approximately 625 kaf, with fluctuations anticipated between about 7,070 cfs in the nighttime to about 12,700 cfs in the daytime and consistent with the Glen Canyon Dam, Record of Decision on LTEMP (dated December, 2016). The anticipated release volume for November is 625 kaf if an HFE unless an HFE is implemented, in which case the monthly volume release would be 664 kaf.

In addition to daily scheduled fluctuations for power generation, the instantaneous releases from Glen Canyon Dam may also fluctuate to provide 40 megawatts (mw) of system regulation. These instantaneous release adjustments stabilize the electrical generation and transmission system and translate to a range of about 1,200 cfs above or below the hourly scheduled release rate. Under normal conditions, fluctuations for regulation are typically short lived and generally balance out over the hour with minimal or no noticeable impacts on downstream river flow conditions.

Releases from Glen Canyon Dam can also fluctuate beyond scheduled releases when called upon to respond to power system emergencies. Depending on the severity of the system emergency, the response from Glen Canyon Dam can be significant and within the full range of the operating capacity of the power plant for as long as is necessary to maintain balance in the transmission system. Glen Canyon Dam currently maintains 28 mw (approximately 830 cfs) of generation capacity in reserve in order to respond to a system emergency even when generation rates are already high. System emergencies occur fairly infrequently and typically require small responses from Glen Canyon Dam. However, these responses can have a noticeable impact on the river downstream of Glen Canyon Dam.

Inflow Forecasts and Model Projections

The forecast for water year 2019 unregulated inflow to Lake Powell, issued on October 1, 2018, by the Colorado Basin River Forecast Center, projects that the most probable (median) unregulated inflow volume next year will be 7.6 maf (70 percent of average). There is significant uncertainty regarding next season's snow pack development and resulting runoff into Lake Powell. The forecast ranges from a minimum probable of 4.6 maf (42 percent of average) to a maximum probable of 15.4 maf (142 percent of average). There is a 10 percent chance that inflows could be higher than the current maximum probable forecast and a 10 percent chance that inflows could be lower than the minimum probable forecast.

Based on the current forecast, the October 24-Month Study projects Lake Powell elevation will end water year 2019 near 3,573.15 feet with approximately 9.36 maf in storage (39 percent of capacity). Note that projections of elevation and storage for water year 2019 have significant uncertainty at this point in the season. Projections of end of water year 2019 elevation and storage using the minimum and maximum probable inflow forecast from October 2018 are 3,556 feet (8.027 maf, 33 percent of capacity) and 3,636 feet (15.54 maf, 64 percent of capacity), respectively. Under these scenarios, there is a 10 percent chance that inflows will be higher, resulting in higher elevation and storage, and 10 percent chance that inflows will be lower, resulting in lower elevation and storage. The annual release volume from Lake Powell during water year 2019 is projected to be 8.922 maf under the most probable scenario, and 9.0 maf under the maximum probable inflow scenarios and 8.23 maf under the minimum probable inflow scenario.

Upper Colorado River Basin Hydrology

The Upper Colorado River Basin regularly experiences significant year to year hydrologic variability. During the 19-year period 2000 to 2018, however, the

unregulated inflow to Lake Powell, which is a good measure of hydrologic conditions in the Colorado River Basin, was above average in only 4 out of the past 19 years. The period 2000-2018 is the lowest 19-year period since the closure of Glen Canyon Dam in 1963, with an average unregulated inflow of 8.54 maf, or 79 percent of the 30-year average (1981-2010). (For comparison, the 1981-2010 total water year average is 10.83 maf.) The unregulated inflow during the 2000-2018 period has ranged from a low of 2.64 maf (24 percent of average) in water year 2002 to a high of 15.97 maf (147 percent of average) in water year 2011. In water year 2018 unregulated inflow volume to Lake Powell was 4.6 maf (43 percent of average), the third driest year on record above 2002 and 1977. Under the current most probable forecast, the total water year 2019 unregulated inflow to Lake Powell is projected to be 7.6 maf (70 percent of average).

At the beginning of water year 2019, total system storage in the Colorado River Basin was 20.9 maf (35 percent of 59.6 maf total system capacity). This is a decrease of 10 maf over the total storage at the beginning of water year 2018 when total system storage was 30.9 maf (52 percent of capacity). Since the beginning of water year 2000, total Colorado Basin storage has experienced year to year increases and decreases in response to wet and dry hydrology, ranging from a high of 94 percent of capacity at the beginning of 2000 to a low of 50 percent of capacity at the beginning of water year 2005. One wet year can significantly increase total system reservoir storage, just as persistent dry years can draw down the system storage. Based on current inflow forecasts, the current projected end of water year total Colorado Basin reservoir storage for water year 2019 is approximately 18.73 maf (31 percent of total system capacity). The actual end of water year 2019 system storage may vary from this projection, primarily due to uncertainty regarding this season's runoff and reservoir inflow.

November 24-Month Study
Date: November 14, 2018

From: Water Resources Group, Salt Lake City
To: All Colorado River Annual Operating Plan (AOP) Recipients

Current Reservoir Status

Reservoir	October Inflow (unregulated) (acre-feet)	Percent of Average (%)	November 12, Midnight Elevation (feet)	November 12, Midnight Reservoir Storage (acre-feet)
Fontenelle	41,900	86	6,490.29	229,000
Flaming Gorge	53,700	91	6,029.63	3,334,000
Blue Mesa	22,900	60	7,438.05	250,000
Navajo	22,500	48	6,018.01	893,000
Powell	350,900	68	3,587.70	10,614,000

Expected Operations

The operation of Lake Powell and Lake Mead in this November 2018 24-Month Study is pursuant to the December 2007 Record of Decision on Colorado River Interim Guidelines for Lower Basin Shortages and the Coordinated Operations of Lake Powell and Lake Mead (Interim Guidelines), and reflects the 2018 Annual Operating Plan (AOP) and draft 2019 AOP. Pursuant to the Interim Guidelines, the August 2018 24-Month Study projections of the January 1, 2019, system storage and reservoir water surface elevations set the operational tier for the coordinated operation of Lake Powell and Lake Mead during 2019.

Consistent with Section 6.B of the Interim Guidelines, the Lake Powell operational tier for water year 2019 will be governed by the Upper Elevation Balancing Tier, with an initial water year release volume of 8.23 million acre-feet (maf) and the potential for an April adjustment to equalization or balancing releases in April 2019. This November 2018 24-Month Study indicates that, consistent with Section 6.B.4 of the Interim Guidelines, an April adjustment to balancing releases is projected to occur and the contents of Lake Powell and Lake Mead will be balanced by the end of the water year, but not more than 9.0 maf and not less than 8.23 maf shall be released from Lake Powell. Based on the most probable inflow forecast, this November 24-Month Study projects a balancing release of 8.86 maf in water year 2019.

Consistent with Section 2.B.5 of the Interim Guidelines, the Intentionally Created Surplus (ICS) Surplus Condition is the criterion governing the operation of Lake Mead for calendar years 2018 and 2019.

The 2019 operational tier determinations will be documented in the 2019 AOP, which is currently in development.

The Interim Guidelines are available for download at:
https://www.usbr.gov/lc/region/programs/strategies/RecordofDecision.pdf.
The 2018 AOP is available for download at:
https://www.usbr.gov/lc/region/g4000/aop/AOP18.pdf
The draft 2019 AOP is available for download at:
https://www.usbr.gov/uc/water/rsvrs/ops/aop/AOP19_Third_Consultation_draft.pdf

Fontenelle Reservoir – Fontenelle Reservoir is currently at elevation 6490.1 feet above sea level (feet), which amounts to 66 percent of live storage capacity. Inflows for the month of October totaled 41,900 acre-feet (af), or 86 percent of average. Average inflows are occurring and releases are being adjusted to maintain capacity in the reservoir. Releases are currently set at 1,000 cubic feet per second (cfs) (11/12/2018).

The Colorado Basin River Forecast Center has forecasted inflows that are at or above average. November, December, and January forecasted inflow volumes amount to 43,000 af (102 percent of average), 33,000 af (103 percent of average), and 32,000 af (106 percent of average), respectively.

The next Fontenelle Working Group meeting is scheduled for 10:00 a.m., April 24, 2019. The meeting will be held at the Seedskadee National Wildlife Refuge. The Fontenelle Working Group is an open public forum for information exchange between Reclamation and other parties associated with the operation of Fontenelle Reservoir.

Flaming Gorge Reservoir – Releases are currently set at 1,500 cfs with fluctuations for hydropower. Average daily releases will likely remain at 1,500 cfs through the end of November.

Unregulated Inflow into Flaming Gorge Reservoir during the month of October was 53,700 af, or 130 percent of average. The current reservoir elevation is 6029.6 feet (89 percent of live capacity) and decreasing.

The November final unregulated inflow forecast for the next three months projects near average conditions: November, December, and January forecasted inflow volumes at 48,000 af (94 percent of average), 34,000 af (98 percent of average), and 39,000 af (97 percent of average), respectively.

The Flaming Gorge Working Group is an open public forum for information exchange between Reclamation and the stakeholders of Flaming Gorge Dam. The public is encouraged to attend and comment on the operations and plans presented by Reclamation

at these meetings. Meeting notes from past Working Group meetings are posted on the Working Group webpage. For more information on this group and these meetings please contact Dale Hamilton at 801-379-1186 or Jed Parker at 801-524-3816.

Reclamation will be holding the Flaming Gorge Working Group meeting on Thursday, March 14, 2019 at 10:00 a.m. at the Uintah Conference Center, 313 E 200 S, Vernal, Utah.

Aspinall Unit Reservoirs – As of November 12, 2018 releases from Crystal Dam are approximately 330 cfs. Uncompahgre Valley Water Users Association has stopped diversions through the Gunnison Tunnel for the irrigation season. Occasional diversions through the tunnel are occurring to fill Fairview Reservoir as needed. Flows through the Black Canyon are approximately 310 cfs. There is currently about a 20 cfs loss to the Gunnison River between Crystal Dam and the Gunnison Tunnel Diversion. As of November 12, 2018, Blue Mesa Reservoir elevation is 7438.05 feet which corresponds to storage content of 249,932 af (30 percent of capacity).

The October unregulated inflow to Blue Mesa Reservoir was 22,900 af (60 percent of average). Unregulated Inflows to Blue Mesa for the next three months (November, December and January) are projected to be: 20,000 af (64 percent of average), 17,000 af (65 percent of average) and 15,000 af (63 percent of average), respectively. For water year 2019, the unregulated inflow volume is forecasted to be 722,900 af (75 percent of average) with 530,000 af (78 percent of average) of unregulated inflow occurring during the April through July period. The November 24-Month Study is reflective of this new forecast.

Conditions are clearly very dry. Blue Mesa Reservoir did not fill in water year 2018 and will most likely not fill in water year 2019 either. Current projections indicate Blue Mesa storage will continue to decrease from now till March of 2019 before rebounding during the spring runoff. Current projections show Blue Mesa will reach a low elevation for water year 2019 of about 7,437 feet in early June 2019 and a peak elevation for water year 2019 of about 7465 feet in early August 2019. The projected end of water year 2019 elevation of Blue Mesa is 7456.6 feet which corresponds to a live storage content of 356,620 acre-feet (43 percent of full capacity).

The Aspinall Unit Working Group is an open public forum for information exchange between Reclamation and the stakeholders of the Aspinall Unit. The public is encouraged to attend and comments on the operations and plans presented by Reclamation at these meetings. Meeting notes from past working Group meetings are posted on the Working Group webpage. For more information on this group and these meetings please contact Erik Knight in the Grand Junction Area Office at (970) 248-0629.

Meeting notes from past working Group meetings are posted on the Working Group webpage at:

https://www.usbr.gov/uc/wcao/water/rsvrs/mtgs/amcurrnt.html

The next meeting of the Aspinall Unit Working Group will be held on Thursday, January 17, 2019 at 1:00 p.m. at the Holiday Inn Express located in Montrose, Colorado.

Navajo Reservoir – The current (11/8/2018) daily average release rate from Navajo Dam is 320 cfs and the observed inflow to Navajo Reservoir is 147 cfs. The Navajo Indian Irrigation Project (NIIP) has shut down for the season. The NIIP diversion total for the year was 222,800 af. The reservoir elevation is 6018.1 feet which corresponds to a live storage of 0.895 maf (53 percent of live storage capacity). This elevation also corresponds to an active storage of 0.233 maf (22 percent of active storage capacity). The river flow measured at the San Juan River at Four Corners USGS gage is 650 cfs. River flow at the Animas River at Farmington USGS gage is at 310 cfs. Releases from Navajo Dam are made for the authorized purposes of the Navajo Unit, and pursuant to the 2006 Record of Decision, to attempt to maintain a target base flow through the endangered fish critical habitat reach of the San Juan River (Farmington to Lake Powell). The San Juan River Basin Recovery Implementation Program (SJRIP) recommends a target base flow of between 500 cfs and 1,000 cfs through the critical habitat area. The target base flow is calculated as the weekly average of gaged flows throughout the critical habitat area.

The preliminary modified-unregulated inflow into Navajo (inflow adjusted for upstream change in storage, reservoir evaporation and exportation from the basin) in October was 22,522 af (48 percent of average). This value is subject to change as additional data is collected and revised.

Forecasted modified-unregulated inflow to Navajo over the next three months (November, December, and January) are projected to be: 19,000 af (57 percent of average), 15,000 af (60 percent of average), and 14,000 af (64 percent of average), respectively.

Releases for the fall and winter will be made to maintain the minimum target baseflow in the critical habitat reach and will decrease as irrigation in the basin decreases. When conditions allow, the release will be reduced to as low as the minimum release of 250 cfs, so long as the target baseflow downstream is still met.

Reclamation conducts Public Operations Meetings three times per year to gather input for determining upcoming operations for Navajo Reservoir. Input from individuals, organizations, and agencies along with other factors such as weather, water rights, endangered species requirements, flood control, hydro power, recreation, fish and wildlife management, and reservoir levels, will be considered in the development of these reservoir operation plans. In addition, the meetings are used to coordinate activities and exchange information among agencies, water users, and other interested parties concerning the San Juan River and Navajo Reservoir.

The next Navajo Public Operations Coordination Meeting is scheduled for Tuesday, January 29, 2019, at 1:00 p.m. at the Farmington Civic Center, Farmington, NM.

Glen Canyon Dam / Lake Powell

Current Status

The Department of the Interior completed a High Flow Experiment from Glen Canyon Dam in November 2018. High Flow Experiments (HFE) below Glen Canyon Dam are driven by weather, sediment inputs, and other resource conditions, in accordance with the Long-Term Experimental and Management Plan (LTEMP). The HFE began on November 5, 2018, for a duration of 60 hours with flows surrounding the HFE fluctuating between 6,500 and 9,000 cfs during the evening and daylight hours for hydropower.

The April to July 2018 unregulated inflow to Lake Powell was 2.6 maf (36 percent of average). The unregulated inflow in October was 351 thousand acre-feet (kaf) (69 percent of average). October precipitation in the Upper Colorado Basin was 135 percent of average, but the extremely dry soil conditions decreased the amount of observed runoff. The release volume from Glen Canyon Dam in October was 625 kaf. The end of October elevation and storage of Lake Powell were 3,590.46 feet (110 feet from full pool) 10.86 maf (45 percent of full capacity).

Current Operations

The operating tier for water year 2019 was established in August 2018 as the Upper Elevation Balancing Tier. As described in the Interim Guidelines, under balancing, the contents of Lake Powell and Lake Mead are to be balanced by the end of the water year, but not more than 9.0 maf and not less than 8.23 maf is to be released from Lake Powell. Under this Tier the initial annual water year release volume is 8.23 maf but there is potential for an April 2019 adjustment to equalization or balancing releases. Based on the current forecast, an April adjustment to balancing releases is projected and Lake Powell is currently projected to release 8.85 maf in water year 2019. This projection will be updated each month throughout the water year.

In November, the release volume will be approximately 657 kaf, with fluctuations anticipated between about 6,000 cfs in the nighttime to about 9,000 cfs in the daytime and consistent with the Glen Canyon Dam, Record of Decision on LTEMP (dated December, 2016). The anticipated release volume for December is 740 kaf.

In addition to daily scheduled fluctuations for power generation, the instantaneous releases from Glen Canyon Dam may also fluctuate to provide 40 megawatts (mw) of system regulation. These instantaneous release adjustments stabilize the electrical generation and transmission system and translate to a range of about 1,200 cfs above or below the hourly scheduled release rate. Under normal conditions, fluctuations for regulation are typically short lived and generally balance out over the hour with minimal or no noticeable impacts on downstream river flow conditions.

Releases from Glen Canyon Dam can also fluctuate beyond scheduled releases when called upon to respond to power system emergencies. Depending on the severity of the

system emergency, the response from Glen Canyon Dam can be significant and within the full range of the operating capacity of the power plant for as long as is necessary to maintain balance in the transmission system. Glen Canyon Dam currently maintains 28 mw (approximately 830 cfs) of generation capacity in reserve to respond to system emergencies even when generation rates are already high. System emergencies occur fairly infrequently and typically require small responses from Glen Canyon Dam. However, these responses can have a noticeable impact on the river downstream of Glen Canyon Dam.

Inflow Forecasts and Model Projections

The forecast for water year 2019 unregulated inflow to Lake Powell, issued on November 1, 2018, by the Colorado Basin River Forecast Center, projects that the most probable (median) unregulated inflow volume next year will be 7.5 maf (69 percent of average). There is significant uncertainty regarding next season's snow pack development and resulting runoff into Lake Powell. The forecast ranges from a minimum probable of 4.6 maf (42 percent of average) to a maximum probable of 15.4 maf (142 percent of average). There is a 10 percent chance that inflows could be higher than the current maximum probable forecast and a 10 percent chance that inflows could be lower than the minimum probable forecast.

Based on the current forecast, the November 24-Month Study projects the Lake Powell elevation will end water year 2019 near 3,582.59 feet with approximately 10.16 maf in storage (39 percent of capacity). Note that projections of elevation and storage for water year 2019 have significant uncertainty at this point in the season. Projections of end of water year 2019 elevation and storage using the minimum and maximum probable inflow forecast from October 2018 are 3,556 feet (8.027 maf, 33 percent of capacity) and 3,636 feet (15.54 maf, 64 percent of capacity), respectively. Under these scenarios, there is a 10 percent chance that inflows will be higher, resulting in higher elevation and storage, and 10 percent chance that inflows will be lower, resulting in lower elevation and storage. The annual release volume from Lake Powell during water year 2019 is projected to be 8.85 maf under the November most probable scenario, and 9.0 maf under the October maximum probable inflow scenarios and 8.23 maf under the October minimum probable inflow scenario.

Upper Colorado River Basin Hydrology

The Upper Colorado River Basin regularly experiences significant year to year hydrologic variability. During the 19-year period 2000 to 2018, however, the unregulated inflow to Lake Powell, which is a good measure of hydrologic conditions in the Colorado River Basin, was above average in only 4 out of the past 19 years. The period 2000-2018 is the lowest 19-year period since the closure of Glen Canyon Dam in 1963, with an average unregulated inflow of 8.54 maf, or 79 percent of the 30-year average (1981-2010). (For comparison, the 1981-2010 total water year average is 10.83 maf.) The unregulated inflow during the 2000-2018 period has ranged from a low of 2.64 maf (24 percent of average) in water year 2002 to a high of 15.97 maf (147 percent of average) in water year 2011. In water year 2018 unregulated inflow volume to Lake Powell was 4.6 maf (43 percent of average), the third driest year on record above 2002

and 1977. Under the current most probable forecast, the total water year 2019 unregulated inflow to Lake Powell is projected to be 7.6 maf (70 percent of average).

At the beginning of water year 2019, total system storage in the Colorado River Basin was 28.0 maf (47 percent of 59.6 maf total system capacity). This is a decrease of 4.9 maf over the total storage at the beginning of water year 2018 when total system storage was 32.9 maf (55 percent of capacity). Since the beginning of water year 2000, total Colorado Basin storage has experienced year to year increases and decreases in response to wet and dry hydrology, ranging from a high of 94 percent of capacity at the beginning of 2000 to a low of 50 percent of capacity at the beginning of water year 2005. One wet year can significantly increase total system reservoir storage, just as persistent dry years can draw down the system storage. Based on current inflow forecasts, the current projected end of water year total Colorado Basin reservoir storage for water year 2019 is approximately 25.93 maf (43 percent of total system capacity). The actual end of water year 2019 system storage may vary from this projection, primarily due to uncertainty regarding this season's runoff and reservoir inflow.

December 24-Month Study
Date: December 12, 2018

From: Water Resources Group, Salt Lake City
To: All Colorado River Annual Operating Plan (AOP) Recipients

Current Reservoir Status

Reservoir	November Inflow (unregulated) (acre-feet)	Percent of Average (%)	December 11, Midnight Elevation (feet)	December 11, Midnight Reservoir Storage (acre-feet)
Fontenelle	38,400	91	6,486.43	204,000
Flaming Gorge	39,800	78	6,028.53	3,293,000
Blue Mesa	21,500	69	7,437.70	248,000
Navajo	15,300	46	6,017.11	885,000
Powell	254,400	54	3,584.90	10,365,000

Expected Operations

The operation of Lake Powell and Lake Mead in this December 2018 24-Month Study is pursuant to the December 2007 Record of Decision on Colorado River Interim Guidelines for Lower Basin Shortages and the Coordinated Operations of Lake Powell and Lake Mead (Interim Guidelines) and reflects the 2018 Annual Operating Plan (AOP) and draft 2019 AOP. Pursuant to the Interim Guidelines, the August 2018 24-Month Study projections of the January 1, 2019, system storage and reservoir water surface elevations set the operational tier for the coordinated operation of Lake Powell and Lake Mead during 2019.

Consistent with Section 6.B of the Interim Guidelines, the Lake Powell operational tier for water year 2019 will be governed by the Upper Elevation Balancing Tier, with an initial water year release volume of 8.23 million acre-feet (maf) and the potential for an April adjustment to equalization or balancing releases in April 2019. This December 2018 24-Month Study indicates that, consistent with Section 6.B.4 of the Interim Guidelines, an April adjustment to balancing releases is projected to occur and the contents of Lake Powell and Lake Mead will be balanced by the end of the water year, but not more than 9.0 maf and not less than 8.23 maf shall be released from Lake Powell. Based on the most probable inflow forecast, this December 24-Month Study projects a balancing release of 8.66 maf in water year 2019.

Consistent with Section 2.B.5 of the Interim Guidelines, the Intentionally Created Surplus (ICS) Surplus Condition is the criterion governing the operation of Lake Mead for calendar years 2018 and 2019.

The 2019 operational tier determinations will be documented in the 2019 AOP, which is currently in development.

The Interim Guidelines are available for download at:
https://www.usbr.gov/lc/region/programs/strategies/RecordofDecision.pdf.
The 2018 AOP is available for download at:
https://www.usbr.gov/lc/region/g4000/aop/AOP18.pdf
The draft 2019 AOP is available for download at:
https://www.usbr.gov/lc/region/g4000/AOP2019/AOP19_draft.pdf

Fontenelle Reservoir – Fontenelle Reservoir is currently at elevation 6486.8 feet above sea level (feet), which amounts to 60 percent of live storage capacity. Inflows for the month of November totaled 38,500 acre-feet (af), or 91 percent of average. Average inflows are occurring and releases are being adjusted to maintain capacity in the reservoir. Releases are currently set at 1,000 cubic feet per second (cfs) (12/10/2018).

The Colorado Basin River Forecast Center has forecasted inflows that are at or above average. December, January, and February forecasted inflow volumes amount to 31,000 af (97 percent of average), 30,000 af (99 percent of average), and 28,000 af (101 percent of average), respectively.

The next Fontenelle Working Group meeting is scheduled for 10:00 a.m., April 24, 2019. The meeting will be held at the Seedskadee National Wildlife Refuge. The Fontenelle Working Group is an open public forum for information exchange between Reclamation and other parties associated with the operation of Fontenelle Reservoir.

Flaming Gorge Reservoir – Releases are currently set at 2,000 cfs with fluctuations for hydropower. Average daily releases will likely remain at 2,000 cfs through the end of February.

Inflow into Flaming Gorge Reservoir during the month of November was 61,300 af, or 95 percent of average. The current reservoir elevation is 6028.7 feet (88 percent of live capacity) and decreasing.

The December final forecast for inflows for the next three months projects near average conditions: December, January, and February forecasted inflow volumes at 61,500 af (105 percent of average), 67,500 af (104 percent of average), and 66,500 af (100 percent of average), respectively.

The Flaming Gorge Working Group is an open public forum for information exchange between Reclamation and the stakeholders of Flaming Gorge Dam. The public is encouraged to attend and comment on the operations and plans presented by Reclamation

at these meetings. Meeting notes from past Working Group meetings are posted on the Working Group webpage. For more information on this group and these meetings please contact Dale Hamilton at 801-379-1186 or Jed Parker at 801-524-3816.

Reclamation will be holding the Flaming Gorge Working Group meeting on Thursday, March 14, 2019 at 10:00 a.m. at the Uintah Conference Center, 313 E 200 S, Vernal, Utah.

Aspinall Unit Reservoirs – As of December 11, 2018 releases from Crystal Dam are approximately 340 cfs. Uncompahgre Valley Water Users Association has stopped diversions through the Gunnison Tunnel except for periodic diversions to fill Fairview Reservoir. Flows through the Black Canyon are approximately 320 cfs. There is currently about a 20 cfs loss to the Gunnison River between Crystal Dam and the Gunnison Tunnel Diversion. As of December 11, 2018, Blue Mesa Reservoir elevation is 7437.70 feet which corresponds to storage content of 248,220 af (30 percent of capacity).

The November unregulated inflow to Blue Mesa Reservoir was 21,500 af (69 percent of average). Unregulated Inflows to Blue Mesa for the next three months (December, January and February) are projected to be: 18,000 af (69 percent of average), 15,000 af (62 percent of average) and 14,000 af (63 percent of average), respectively. For water year 2019, the unregulated inflow volume is forecasted to be 684,400 af (71 percent of average) with 490,000 af (72 percent of average) of unregulated inflow occurring during the April through July period. The December 24-Month Study is reflective of this new forecast.

Conditions are clearly very dry. Blue Mesa Reservoir did not fill in water year 2018 and will most likely not fill in water year 2019 either. Current projections indicate Blue Mesa storage will remain near the current level till March of 2019 before rebounding during the spring runoff. Current projections show Blue Mesa will reach a low elevation for water year 2019 of about 7,436.5 feet near the end of February 2019 and a peak elevation for water year 2019 of about 7472 feet in late July 2019. The projected end of water year 2019 elevation of Blue Mesa is 7464.3 feet which corresponds to a live storage content of 398,300 acre-feet (48 percent of full capacity).

The Aspinall Unit Working Group is an open public forum for information exchange between Reclamation and the stakeholders of the Aspinall Unit. The public is encouraged to attend and comments on the operations and plans presented by Reclamation at these meetings. Meeting notes from past working Group meetings are posted on the Working Group webpage. For more information on this group and these meetings please contact Erik Knight in the Grand Junction Area Office at (970) 248-0629.

Meeting notes from past working Group meetings are posted on the Working Group webpage at:

https://www.usbr.gov/uc/wcao/water/rsvrs/mtgs/amcurrnt.html

The next meeting of the Aspinall Unit Working Group will be held on Thursday, January 17, 2019 at 1:00 pm at the Holiday Inn Express located in Montrose, Colorado.

Navajo Reservoir – The current (December 10th) daily average release rate from Navajo Dam is 289 cfs and the observed inflow to Navajo Reservoir is 205 cfs. The Navajo Indian Irrigation Project (NIIP) has shut down for the season. The NIIP diversion total for the year was 222,800 af. The reservoir elevation is 6017.17 feet which corresponds to a live storage of 0.886 maf (52 percent of live storage capacity). This elevation also corresponds to an active storage of 0.224 maf (22 percent of active storage capacity). The river flow measured at the San Juan River at Four Corners USGS gage is 565 cfs. River flow at the Animas River at Farmington USGS gage is at 225 cfs. Releases from Navajo Dam are made for the authorized purposes of the Navajo Unit, and pursuant to the 2006 Record of Decision, to attempt to maintain a target base flow through the endangered fish critical habitat reach of the San Juan River (Farmington to Lake Powell). The San Juan River Basin Recovery Implementation Program (SJRIP) recommends a target base flow of between 500 cfs and 1,000 cfs through the critical habitat area. The target base flow is calculated as the weekly average of gaged flows throughout the critical habitat area.

Preliminary modified-unregulated inflow into Navajo (inflow adjusted for upstream change in storage, reservoir evaporation and exportation from the basin) in November was 15,278 af (46 percent of average).

Forecast modified-unregulated inflow to Navajo over the next three months (December, January, and February are projected to be: 13,000 af (52 percent of average), 13,000 af (59 percent of average), and 16,000 af (53 percent of average), respectively.

Releases for the winter will be made to maintain the minimum target baseflow in the critical habitat reach and will decrease as irrigation in the basin decreases. When conditions allow, the release will be reduced to as low as the minimum release of 250 cfs, so long as the target baseflow downstream is still met.
Reclamation conducts Public Operations Meetings three times per year to gather input for determining upcoming operations for Navajo Reservoir. Input from individuals, organizations, and agencies along with other factors such as weather, water rights, endangered species requirements, flood control, hydro power, recreation, fish and wildlife management, and reservoir levels, will be considered in the development of these reservoir operation plans. In addition, the meetings are used to coordinate activities and exchange information among agencies, water users, and other interested parties concerning the San Juan River and Navajo Reservoir.

The next Navajo Public Operations Coordination Meeting is scheduled for Tuesday, January 29th, 2019, at 1:00 p.m. at the Farmington Civic Center, Farmington, NM.

Glen Canyon Dam / Lake Powell

Current Status

The unregulated inflow in November was 253 thousand acre-feet (kaf) (54 percent of average). November precipitation in the Upper Colorado Basin was 100 percent of average, but the extremely dry soil conditions decreased the amount of observed runoff. The release volume from Glen Canyon Dam in November was 661 kaf. The end of November elevation and storage of Lake Powell were 3,586.50 feet (113.5 feet from full pool) 10.50 maf (43 percent of full capacity).

Current Operations

The operating tier for water year 2019 was established in August 2018 as the Upper Elevation Balancing Tier. As described in the Interim Guidelines, under balancing, the contents of Lake Powell and Lake Mead are to be balanced by the end of the water year, but not more than 9.0 maf and not less than 8.23 maf is to be released from Lake Powell. Under this Tier the initial annual water year release volume is 8.23 maf but there is potential for an April 2019 adjustment to equalization or balancing releases. Based on the current forecast, an April adjustment to balancing releases is projected and Lake Powell is currently projected to release 8.66 maf in water year 2019. This projection will be updated each month throughout the water year.

In December, the release volume will be approximately 740 kaf, with fluctuations anticipated between about 8,415 cfs in the nighttime to about 15,165 cfs in the daytime and consistent with the Glen Canyon Dam, Record of Decision on LTEMP (dated December, 2016). The anticipated release volume for January is 860 kaf.

In addition to daily scheduled fluctuations for power generation, the instantaneous releases from Glen Canyon Dam may also fluctuate to provide 40 megawatts (mw) of system regulation. These instantaneous release adjustments stabilize the electrical generation and transmission system and translate to a range of about 1,200 cfs above or below the hourly scheduled release rate. Under normal conditions, fluctuations for regulation are typically short lived and generally balance out over the hour with minimal or no noticeable impacts on downstream river flow conditions.

Releases from Glen Canyon Dam can also fluctuate beyond scheduled releases when called upon to respond to power system emergencies. Depending on the severity of the system emergency, the response from Glen Canyon Dam can be significant and within the full range of the operating capacity of the power plant for as long as is necessary to maintain balance in the transmission system. Glen Canyon Dam currently maintains 28 mw (approximately 830 cfs) of generation capacity in reserve in order to respond to a system emergency even when generation rates are already high. System emergencies occur fairly infrequently and typically require small responses from Glen Canyon Dam. However, these responses can have a noticeable impact on the river downstream of Glen Canyon Dam.

Inflow Forecasts and Model Projections

The forecast for water year 2019 unregulated inflow to Lake Powell, issued on December 1, 2018, by the Colorado Basin River Forecast Center, projects that the most probable (median) unregulated inflow volume next year will be 7.1 maf (66 percent of average). There is significant uncertainty regarding next season's snow pack development and resulting runoff into Lake Powell. The forecast ranges from a minimum probable of 4.6 maf (42 percent of average) to a maximum probable of 15.4 maf (142 percent of average). There is a 10 percent chance that inflows could be higher than the current maximum probable forecast and a 10 percent chance that inflows could be lower than the minimum probable forecast.

Based on the current forecast, the December 24-Month Study projects Lake Powell elevation will end water year 2019 near 3,571.23 feet with approximately 9.21 maf in storage (38 percent of capacity). Note that projections of elevation and storage for water year 2019 have significant uncertainty at this point in the season. Projections of end of water year 2019 elevation and storage using the minimum and maximum probable inflow forecast from October 2018 are 3,556 feet (8.027 maf, 33 percent of capacity) and 3,636 feet (15.54 maf, 64 percent of capacity), respectively. Under these scenarios, there is a 10 percent chance that inflows will be higher, resulting in higher elevation and storage, and 10 percent chance that inflows will be lower, resulting in lower elevation and storage. The annual release volume from Lake Powell during water year 2019 is projected to be 8.66 maf under the December most probable scenario, and 9.0 maf under the October maximum probable inflow scenarios and 8.23 maf under the October minimum probable inflow scenario.

Upper Colorado River Basin Hydrology

Upper Colorado River Basin regularly experiences significant year to year hydrologic variability. During the 19-year period 2000 to 2018, however, the unregulated inflow to Lake Powell, which is a good measure of hydrologic conditions in the Colorado River Basin, was above average in only 4 out of the past 19 years. The period 2000-2018 is the lowest 19-year period since the closure of Glen Canyon Dam in 1963, with an average unregulated inflow of 8.54 maf, or 79 percent of the 30-year average (1981-2010). (For comparison, the 1981-2010 total water year average is 10.83 maf.) The unregulated inflow during the 2000-2018 period has ranged from a low of 2.64 maf (24 percent of average) in water year 2002 to a high of 15.97 maf (147 percent of average) in water year 2011. In water year 2018 unregulated inflow volume to Lake Powell was 4.6 maf (43 percent of average), the third driest year on record above 2002 and 1977. Under the current most probable forecast, the total water year 2019 unregulated inflow to Lake Powell is projected to be 7.6 maf (70 percent of average).

At the beginning of water year 2019, total system storage in the Colorado River Basin was 28.01 maf (47 percent of 59.6 maf total system capacity). This is a decrease of 4.91 maf over the total storage at the beginning of water year 2018 when total system storage was 32.92 maf (55 percent of capacity). Since the beginning of water year 2000, total Colorado Basin storage has experienced year to year increases and decreases in response to wet and dry hydrology, ranging from a high of 94 percent of capacity at the beginning of 2000 to the now current level of 47 percent of capacity at the beginning of water year

2019. Based on current inflow forecasts, the current projected end of water year total Colorado Basin reservoir storage for water year 2019 is approximately 25.14 maf (42 percent of total system capacity). The actual end of water year 2019 system storage may vary from this projection, primarily due to uncertainty regarding this season's runoff and reservoir inflow.

January 24-Month Study
Date: January 14, 2019

From: Water Resources Group, Salt Lake City
To: All Colorado River Annual Operating Plan (AOP) Recipients

Current Reservoir Status

Reservoir	December Inflow (unregulated) (acre-feet)	Percent of Average (%)	January 13, Midnight Elevation (feet)	January 13, Midnight Reservoir Storage (acre-feet)
Fontenelle	30,500	95	6,480.61	169,000
Flaming Gorge	29,100	83	6,026.87	3,230,000
Blue Mesa	19,500	76	7,438.26	251,000
Navajo	12,500	50	6,015.87	874,000
Powell	228,200	63	3,579.02	9,856,000

Expected Operations

The operation of Lake Powell and Lake Mead in this January 2019 24-Month Study is pursuant to the December 2007 Record of Decision on Colorado River Interim Guidelines for Lower Basin Shortages and the Coordinated Operations of Lake Powell and Lake Mead (Interim Guidelines) and reflects the draft 2019 Annual Operating Plan (AOP). Pursuant to the Interim Guidelines, the August 2018 24-Month Study projections of the January 1, 2019, system storage and reservoir water surface elevations set the operational tier for the coordinated operation of Lake Powell and Lake Mead during 2019.

Consistent with Section 6.B of the Interim Guidelines, the Lake Powell operational tier for water year 2019 will be governed by the Upper Elevation Balancing Tier, with an initial water year release volume of 8.23 million acre-feet (maf) and the potential for an April adjustment to equalization or balancing releases in April 2019. This January 2019 24-Month Study indicates that, consistent with Section 6.B.4 of the Interim Guidelines, an April adjustment to balancing releases is projected to occur and the contents of Lake Powell and Lake Mead will be balanced by the end of the water year, but not more than 9.0 maf and not less than 8.23 maf shall be released from Lake Powell. Based on the most probable inflow forecast, this January 24-Month Study projects a balancing release of 8.625 maf in water year 2019.

Consistent with Section 2.B.5 of the Interim Guidelines, the Intentionally Created Surplus (ICS) Surplus Condition is the criterion governing the operation of Lake Mead for calendar year 2019.

The 2019 operational tier determinations will be documented in the 2019 AOP, which is currently in development.

The Interim Guidelines are available for download at:
https://www.usbr.gov/lc/region/programs/strategies/RecordofDecision.pdf.
The draft 2019 AOP is available for download at:
https://www.usbr.gov/lc/region/g4000/AOP2019/AOP19_draft.pdf

Fontenelle Reservoir – Fontenelle Reservoir is currently at elevation 6481.1 feet above sea level (feet), which amounts to 50 percent of live storage capacity. Inflows for the month of December totaled 30,500 acre-feet (af), or 95 percent of average. Average inflows are occurring and releases are being adjusted to increase available capacity in the reservoir. Releases are currently set at 1,000 cubic feet per second (cfs).

The Colorado Basin River Forecast Center has forecasted inflows that are near average. January, February, and March forecasted inflow volumes amount to 28,000 af (92 percent of average), 26,000 af (94 percent of average), and 43,000 af (82 percent of average), respectively.

The next Fontenelle Working Group meeting is scheduled for 10:00 a.m., April 24, 2019. The meeting will be held at the Seedskadee National Wildlife Refuge. The Fontenelle Working Group is an open public forum for information exchange between Reclamation and other parties associated with the operation of Fontenelle Reservoir.

Flaming Gorge Reservoir – Releases are currently set at 2,000 cfs with fluctuations for hydropower. Average daily releases will likely remain at 2,000 cfs through the end of February.

Inflow into Flaming Gorge Reservoir during the month of December was 60,000 af, or 104 percent of average. The current reservoir elevation is 6027.0 feet (86 percent of live capacity) and decreasing.

The January final forecast for unregulated inflows into Flaming Gorge for the next three months projects near average conditions: January, February, and March forecasted unregulated inflow volumes at 34,000 af (84 percent of average), 36,000 af (81 percent of average), and 80,000 af (78 percent of average), respectively.

The Flaming Gorge Working Group is an open public forum for information exchange between Reclamation and the stakeholders of Flaming Gorge Dam. The public is encouraged to attend and comment on the operations and plans presented by Reclamation at these meetings. Meeting notes from past Working Group meetings are posted on the

Working Group webpage. For more information on this group and these meetings please contact Dale Hamilton at 801-379-1186 or Jed Parker at 801-524-3816.

Reclamation will be holding the Flaming Gorge Working Group meeting on Thursday, March 7, 2019 at 11:00 a.m. at the Carbon County Event Center, 310 South Fairground Road, Price Utah.

Aspinall Unit Reservoirs – As of January 10, 2019 releases from Crystal Dam are approximately 345 cfs. Uncompahgre Valley Water Users Association has stopped diversions through the Gunnison Tunnel except for periodic diversions to fill Fairview Reservoir. Flows through the Black Canyon are approximately 325 cfs. There is currently about a 20 cfs loss to the Gunnison River between Crystal Dam and the Gunnison Tunnel Diversion. As of January 10, 2019, Blue Mesa Reservoir elevation is 7438.02 feet which corresponds to storage content of 249,785 af (30 percent of capacity).

The December unregulated inflow to Blue Mesa Reservoir was 19,500 af (75 percent of average). Unregulated Inflows to Blue Mesa for the next three months (January, February and March) are projected to be: 16,000 af (67 percent of average), 14,000 af (64 percent of average) and 25,000 af (69 percent of average), respectively. For water year 2019, the unregulated inflow volume is forecasted to be 697,900 af (73 percent of average) with 500,000 af (74 percent of average) of unregulated inflow occurring during the April through July period. The January 24-Month Study is reflective of this new forecast.

Conditions are clearly very dry. Blue Mesa Reservoir did not fill in water year 2018 and will most likely not fill in water year 2019 either. Current projections indicate Blue Mesa storage will remain near the current level till March of 2019 before rebounding during the spring runoff. Current projections indicate Blue Mesa is at or near its low elevation for this year. The peak elevation for this water year will occur in or around late July when the elevation is projected to be 7475 feet. The projected end of water year 2019 elevation of Blue Mesa is 7467.15 feet which corresponds to a live storage content of 423,000 acre-feet (49 percent of full capacity).

The Aspinall Unit Working Group is an open public forum for information exchange between Reclamation and the stakeholders of the Aspinall Unit. The public is encouraged to attend and comments on the operations and plans presented by Reclamation at these meetings. Meeting notes from past working Group meetings are posted on the Working Group webpage. For more information on this group and these meetings please contact Erik Knight in the Grand Junction Area Office at (970) 248-0629.

Meeting notes from past working Group meetings are posted on the Working Group webpage at:

https://www.usbr.gov/uc/wcao/water/rsvrs/mtgs/amcurrnt.html

The next meeting of the Aspinall Unit Working Group will be held on Thursday, January 17, 2019 at 1:00 pm at the Holiday Inn Express located in Montrose, Colorado.

Navajo Reservoir – As of January 8, 2019, daily average release rate from Navajo Dam is 367 cfs and the observed inflow to Navajo Reservoir is 237 cfs. The reservoir elevation is 6016.04 feet which corresponds to a live storage of 875 thousand acre-feet (kaf) (51 percent of live storage capacity). This elevation also corresponds to an active storage of 214 kaf (21 percent of active storage capacity). The river flow measured at the San Juan River at Four Corners USGS gage is 650 cfs. River flow at the Animas River at Farmington USGS gage is at 235 cfs. Releases from Navajo Dam are made for the authorized purposes of the Navajo Unit, and pursuant to the 2006 Record of Decision, to attempt to maintain a target base flow through the endangered fish critical habitat reach of the San Juan River (Farmington to Lake Powell). The San Juan River Basin Recovery Implementation Program (SJRIP) recommends a target base flow of between 500 cfs and 1,000 cfs through the critical habitat area. The target base flow is calculated as the weekly average of gaged flows throughout the critical habitat area.

Preliminary modified-unregulated inflow into Navajo (inflow adjusted for upstream change in storage, reservoir evaporation and exportation from the basin) in December was 12,548 af (50 percent of average). SNOTEL sites above Navajo are at 73 percent of average with 7.6 inches of SWE.

Forecast modified-unregulated inflow to Navajo over the next three months (January, February, and March) are projected to be: 13,000 af (59 percent of average), 15,000 af (50 percent of average), and 38,000 af (41 percent of average), respectively.

The April through July runoff forecasts are as follows:
Min Probable: 230,000 af (31 percent of average)
Most Probable: 370,000 af (50 percent of average)
Max Probable: 700,000 af (95 percent of average)

The winter release will target the minimum baseflow in the critical habitat reach and may be reduced to as low as the minimum release of 250 cfs, so long as the target baseflow downstream is still met. Releases will remain as low as possible over the winter in an effort to conserve water in the reservoir.

Based on current storage and long-term projections, Navajo has a 10 percent chance of filling to at least 6050 ft and a 3 percent chance of filling to at least 6060 ft in the spring of 2019. Based on current projections there are no plans for a spring peak release.

Reclamation conducts Public Operations Meetings three times per year to gather input for determining upcoming operations for Navajo Reservoir. Input from individuals, organizations, and agencies along with other factors such as weather, water rights, endangered species requirements, flood control, hydro power, recreation, fish and wildlife management, and reservoir levels, will be considered in the development of these reservoir operation plans. In addition, the meetings are used to coordinate activities and

exchange information among agencies, water users, and other interested parties concerning the San Juan River and Navajo Reservoir.

The next Navajo Public Operations Coordination Meeting is scheduled for Tuesday, January 29th, 2019, at 1:00 p.m. at the Farmington Civic Center, Farmington, NM.

Glen Canyon Dam / Lake Powell

Current Status

The unregulated inflow in December was 228 thousand acre-feet (63 percent of average). December precipitation in the Upper Colorado Basin was 65 percent of average. The release volume from Glen Canyon Dam in December was 740 kaf. The end of December elevation and storage of Lake Powell were 3,581.85 feet (118.15 feet from full pool) 10.10 maf (42 percent of full capacity).

Current Operations

The operating tier for water year 2019 was established in August 2018 as the Upper Elevation Balancing Tier. As described in the Interim Guidelines, under balancing, the contents of Lake Powell and Lake Mead are to be balanced by the end of the water year, but not more than 9.0 maf and not less than 8.23 maf is to be released from Lake Powell. Under this Tier the initial annual water year release volume is 8.23 maf but there is potential for an April 2019 adjustment to equalization or balancing releases. Based on the current forecast, an April adjustment to balancing releases is projected and Lake Powell is currently projected to release 8.625 maf in water year 2019. This projection will be updated each month throughout the water year.

In January, the release volume will be approximately 806 kaf, with fluctuations anticipated between about 8,500 cfs in the nighttime to about 16,240 cfs in the daytime and consistent with the Glen Canyon Dam, Record of Decision on LTEMP (dated December, 2016). The anticipated release volume for February is 740 kaf.

In addition to daily scheduled fluctuations for power generation, the instantaneous releases from Glen Canyon Dam may also fluctuate to provide 40 megawatts (mw) of system regulation. These instantaneous release adjustments stabilize the electrical generation and transmission system and translate to a range of about 1,200 cfs above or below the hourly scheduled release rate. Under normal conditions, fluctuations for regulation are typically short lived and generally balance out over the hour with minimal or no noticeable impacts on downstream river flow conditions.

Releases from Glen Canyon Dam can also fluctuate beyond scheduled releases when called upon to respond to power system emergencies. Depending on the severity of the system emergency, the response from Glen Canyon Dam can be significant and within the full range of the operating capacity of the power plant for as long as is necessary to maintain balance in the transmission system. Glen Canyon Dam currently maintains 28 mw (approximately 830 cfs) of generation capacity in reserve in order to respond to a system emergency even when generation rates are already high. System emergencies

occur fairly infrequently and typically require small responses from Glen Canyon Dam. However, these responses can have a noticeable impact on the river downstream of Glen Canyon Dam.

Inflow Forecasts and Model Projections

The forecast for water year 2019 unregulated inflow to Lake Powell, issued on January 1, 2019, by the Colorado Basin River Forecast Center, projects that the most probable (median) unregulated inflow volume next year will be 6.98 maf (64 percent of average). There is significant uncertainty regarding next season's snow pack development and resulting runoff into Lake Powell. The forecast ranges from a minimum probable of 4.81 maf (44 percent of average) to a maximum probable of 10.38 maf (96 percent of average). There is a 10 percent chance that inflows could be higher than the current maximum probable forecast and a 10 percent chance that inflows could be lower than the minimum probable forecast.

Based on the current forecast, the January 24-Month Study projects Lake Powell elevation will end water year 2019 near 3,571.07 feet with approximately 9.19 maf in storage (38 percent of capacity). Note that projections of elevation and storage for water year 2019 have significant uncertainty at this point in the season. Projections of end of water year 2019 elevation and storage using the minimum and maximum probable inflow forecast from January 2019 are 3,543.56 feet (7.992 maf, 33 percent of capacity) and 3,588.09 feet (11.366 maf, 47 percent of capacity), respectively. Under these scenarios, there is a 10 percent chance that inflows will be higher, resulting in higher elevation and storage, and 10 percent chance that inflows will be lower, resulting in lower elevation and storage. The annual release volume from Lake Powell during water year 2019 is projected to be 8.625 maf under the January most probable scenario, and 9.0 maf under the January maximum probable inflow scenarios and 8.23 maf under the January minimum probable inflow scenario.

Upper Colorado River Basin Hydrology

Upper Colorado River Basin regularly experiences significant year to year hydrologic variability. During the 19-year period 2000 to 2018, however, the unregulated inflow to Lake Powell, which is a good measure of hydrologic conditions in the Colorado River Basin, was above average in only 4 out of the past 19 years. The period 2000-2018 is the lowest 19-year period since the closure of Glen Canyon Dam in 1963, with an average unregulated inflow of 8.54 maf, or 79 percent of the 30-year average (1981-2010). (For comparison, the 1981-2010 total water year average is 10.83 maf.) The unregulated inflow during the 2000-2018 period has ranged from a low of 2.64 maf (24 percent of average) in water year 2002 to a high of 15.97 maf (147 percent of average) in water year 2011. In water year 2018 unregulated inflow volume to Lake Powell was 4.6 maf (43 percent of average), the third driest year on record above 2002 and 1977. Under the current most probable forecast, the total water year 2019 unregulated inflow to Lake Powell is projected to be 6.98 maf (64 percent of average).

At the beginning of water year 2019, total system storage in the Colorado River Basin was 28.01 maf (47 percent of 59.6 maf total system capacity). This is a decrease of 4.91 maf over the total storage at the beginning of water year 2018 when total system storage

was 32.92 maf (55 percent of capacity). Since the beginning of water year 2000, total Colorado Basin storage has experienced year to year increases and decreases in response to wet and dry hydrology, ranging from a high of 94 percent of capacity at the beginning of 2000 to the now current level of 47 percent of capacity at the beginning of water year 2019. Based on current inflow forecasts, the current projected end of water year total Colorado Basin reservoir storage for water year 2019 is approximately 25.220 maf (42 percent of total system capacity). The actual end of water year 2019 system storage may vary from this projection, primarily due to uncertainty regarding this season's runoff and reservoir inflow.

* Based on the Colorado River Basin Forecast Center's Most Probable Water Supply Forecast

Model Run ID: 3082

Processed On: 1/14/2019 11:15:55AM

February 24-Month Study
Date: February 15, 2019

From: Water Resources Group, Salt Lake City
To: All Colorado River Annual Operating Plan (AOP) Recipients

Current Reservoir Status

Reservoir	January Inflow (unregulated) (acre-feet)	Percent of Average (%)	February 14, Midnight Elevation (feet)	February 14, Midnight Reservoir Storage (acre-feet)
Fontenelle	27,500	91	6,473.68	134,600
Flaming Gorge	34,000	84	6,025.33	3,172,400
Blue Mesa	19,900	82	7,437.99	249,600
Navajo	13,200	60	6,014.99	866,000
Powell	212,500	59	3,574.17	9,448,300

Expected Operations

The operation of Lake Powell and Lake Mead in this February 2019 24-Month Study is pursuant to the December 2007 Record of Decision on Colorado River Interim Guidelines for Lower Basin Shortages and the Coordinated Operations of Lake Powell and Lake Mead (Interim Guidelines) and reflects the draft 2019 Annual Operating Plan (AOP). Pursuant to the Interim Guidelines, the August 2018 24-Month Study projections of the January 1, 2019, system storage and reservoir water surface elevations set the operational tier for the coordinated operation of Lake Powell and Lake Mead during 2019.

Consistent with Section 6.B of the Interim Guidelines, the Lake Powell operational tier for water year 2019 will be governed by the Upper Elevation Balancing Tier, with an initial water year release volume of 8.23 million acre-feet (maf) and the potential for an April adjustment to equalization or balancing releases in April 2019. This February 2019 24-Month Study indicates that, consistent with Section 6.B.4 of the Interim Guidelines, an April adjustment to balancing releases is projected to occur and the contents of Lake Powell and Lake Mead will be balanced by the end of the water year, but not more than 9.0 maf and not less than 8.23 maf shall be released from Lake Powell. Based on the most probable inflow forecast, this February 24-Month Study projects a balancing release of 8.91 maf in water year 2019.

Consistent with Section 2.B.5 of the Interim Guidelines, the Intentionally Created Surplus (ICS) Surplus Condition is the criterion governing the operation of Lake Mead for calendar year 2019.

The Interim Guidelines are available for download at:
https://www.usbr.gov/lc/region/programs/strategies/RecordofDecision.pdf.
The draft 2019 AOP is available for download at:
https://www.usbr.gov/lc/region/g4000/AOP2019/AOP19_draft.pdf

Fontenelle Reservoir – Fontenelle Reservoir is currently at elevation 6475.5 feet above sea level (feet), which amounts to 41 percent of live storage capacity. Inflows for the month of January totaled 27,500 acre-feet (af), or 91 percent of average. Average inflows are occurring and releases are being adjusted to increase available capacity in the reservoir. Releases are currently set at 1,000 cubic feet per second (cfs).

The Colorado Basin River Forecast Center has forecasted inflows that are near average. February, March, and April forecasted inflow volumes amount to 26,000 af (94 percent of average), 43,000 af (82 percent of average), and 60,000 af (70 percent of average), respectively.

The next Fontenelle Working Group meeting is scheduled for 10:00 a.m., April 24, 2019. The meeting will be held at the Seedskadee National Wildlife Refuge. The Fontenelle Working Group is an open public forum for information exchange between Reclamation and other parties associated with the operation of Fontenelle Reservoir.

Flaming Gorge Reservoir – Releases are currently set at 2,000 cfs with fluctuations for hydropower. Average daily releases will likely remain at 2,000 cfs through the end of February.

Inflow into Flaming Gorge Reservoir during the month of January was 60,000 af, or 92 percent of average. The current reservoir elevation is 6025.8 feet (85 percent of live capacity) and decreasing.

The January final forecast for unregulated inflows into Flaming Gorge for the next three months projects near average conditions: February, March, and April forecasted unregulated inflow volumes at 36,000 af (81 percent of average), 80,000 af (78 percent of average), and 95,000 af (71 percent of average), respectively.

The Flaming Gorge Working Group is an open public forum for information exchange between Reclamation and the stakeholders of Flaming Gorge Dam. The public is encouraged to attend and comment on the operations and plans presented by Reclamation at these meetings. Meeting notes from past Working Group meetings are posted on the Working Group webpage. For more information on this group and these meetings please contact Dale Hamilton at 801-379-1186 or Paul Davidson at 801-524-3847.

Reclamation will be holding the Flaming Gorge Working Group meeting on Thursday, March 7, 2019 at 11:00 a.m. at the Carbon County Event Center, 310 South Fairground Road, Price Utah.

Aspinall Unit Reservoirs – As of February 14, 2019 releases from Crystal Dam are approximately 485 cfs. Uncompahgre Valley Water Users Association has stopped diversions through the Gunnison Tunnel except for periodic diversions to fill Fairview Reservoir. Flows through the Black Canyon are approximately 475 cfs. There is currently about a 10 cfs loss to the Gunnison River between Crystal Dam and the Gunnison Tunnel Diversion. As of February 14, 2019, Blue Mesa Reservoir elevation is 7437.99 feet which corresponds to storage content of 249,638 af (30 percent of capacity).

The January unregulated inflow to Blue Mesa Reservoir was 19,900 af (82 percent of average). Unregulated Inflows to Blue Mesa for the next three months (February, March and April) are projected to be: 14,000 af (63 percent of average), 26,000 af (72 percent of average) and 57,000 af (74 percent of average), respectively. For water year 2019, the unregulated inflow volume is forecasted to be 754,800 af (78 percent of average) with 550,000 af (81 percent of average) of unregulated inflow occurring during the April through July period. The February 24-Month Study is reflective of this new forecast.

Conditions are clearly very dry. Blue Mesa Reservoir did not fill in water year 2018 and will most likely not fill in water year 2019 either. Current projections indicate Blue Mesa storage will remain near the current level till March of 2019 before rebounding during the spring runoff. Current projections indicate Blue Mesa is at or near its low elevation for this year. The peak elevation for this water year will occur in or around late July when the elevation is projected to be 7480 feet. The projected end of water year 2019 elevation of Blue Mesa is 7473 feet which corresponds to a live storage content of 458,000 acre-feet (55 percent of full capacity).

The Aspinall Unit Working Group is an open public forum for information exchange between Reclamation and the stakeholders of the Aspinall Unit. The public is encouraged to attend and comments on the operations and plans presented by Reclamation at these meetings. Meeting notes from past working Group meetings are posted on the Working Group webpage. For more information on this group and these meetings please contact Erik Knight in the Grand Junction Area Office at (970) 248-0629.

Meeting notes from past working Group meetings are posted on the Working Group webpage at:

https://www.usbr.gov/uc/wcao/water/rsvrs/mtgs/amcurrnt.html

The next meeting of the Aspinall Unit Working Group will be held on Tuesday, April 23, 2019 at 1:00 pm at the at the Western Colorado Area Office located at 445 West Gunnison Avenue in Grand Junction, Colorado.

Navajo Reservoir – On February 11, 2019, the daily average release rate from Navajo Dam is 283 cfs and the observed inflow to Navajo Reservoir is 159 cfs. The reservoir elevation is 6015.03 feet which corresponds to a live storage of 0.866 maf (51 percent of live storage capacity). This elevation also corresponds to an active storage of 0.206 maf (20 percent of active storage capacity). The river flow measured at the San Juan River at Four Corners USGS gage is 494 cfs. River flow at the Animas River at Farmington USGS gage is at 224 cfs. Releases from Navajo Dam are made for the authorized purposes of the Navajo Unit, and pursuant to the 2006 Record of Decision, to attempt to maintain a target base flow through the endangered fish critical habitat reach of the San Juan River (Farmington to Lake Powell). The San Juan River Basin Recovery Implementation Program (SJRIP) recommends a target base flow of between 500 cfs and 1,000 cfs through the critical habitat area. The target base flow is calculated as the weekly average of gaged flows throughout the critical habitat area.

Preliminary modified-unregulated inflow into Navajo (inflow adjusted for upstream change in storage, reservoir evaporation and exportation from the basin) in January was 13,177 af (60 percent of average). SNOTEL sites above Navajo are at 92% of average with 12.3 inches of SWE.

Forecast modified-unregulated inflow to Navajo over the next three months (February, March, and April) are projected to be: 15,000 af (50 percent of average), 40,000 af (43 percent of average), and 78,000 af (46 percent of average), respectively.

The April through July runoff forecasts are as follows:
Min Probable: 275,000 af (37 percent of average)
Most Probable: 430,000 af (58 percent of average)
Max Probable: 750,000 af (102 percent of average)

The winter release will target the minimum baseflow in the critical habitat reach and may be reduced to as low as the minimum release of 250 cfs, so long as the target baseflow downstream is still met. Releases will remain as low as possible over the winter in an effort to conserve water in the reservoir.

Based on current storage and long-term projections, Navajo has a 15% chance of filling to at least 6050 ft and a 5% chance of filling to at least 6060 ft in the spring of 2019. Based on current projections there are no plans for a spring peak release, though a short-duration maintenance release is under consideration.

Reclamation conducts Public Operations Meetings three times per year to gather input for determining upcoming operations for Navajo Reservoir. Input from individuals, organizations, and agencies along with other factors such as weather, water rights, endangered species requirements, flood control, hydro power, recreation, fish and wildlife management, and reservoir levels, will be considered in the development of these reservoir operation plans. In addition, the meetings are used to coordinate activities and exchange information among agencies, water users, and other interested parties concerning the San Juan River and Navajo Reservoir.

The next Navajo Public Operations Coordination Meeting is scheduled for Tuesday, April 23rd, 2019, at 1:00 p.m. at the Farmington Civic Center, Farmington, NM.

The next Navajo Public Operations Coordination Meeting is scheduled for Tuesday, January 29th, 2019, at 1:00 p.m. at the Farmington Civic Center, Farmington, NM.

Glen Canyon Dam / Lake Powell

Current Status

The unregulated inflow in January was 210 thousand acre-feet (kaf) (58 percent of average). January precipitation in the Upper Colorado Basin was 120 percent of average. The release volume from Glen Canyon Dam in December was 803 kaf. The end of January elevation and storage of Lake Powell were 3,576.34 feet (123.66 feet from full pool) 9.64 maf (41 percent of full capacity).

Current Operations

The operating tier for water year 2019 was established in August 2018 as the Upper Elevation Balancing Tier. As described in the Interim Guidelines, under balancing, the contents of Lake Powell and Lake Mead are to be balanced by the end of the water year, but not more than 9.0 maf and not less than 8.23 maf is to be released from Lake Powell. Under this Tier the initial annual water year release volume is 8.23 maf but there is potential for an April 2019 adjustment to equalization or balancing releases. Based on the current forecast, an April adjustment to balancing releases is projected and Lake Powell is currently projected to release 8.91 maf in water year 2019. This projection will be updated each month throughout the water year.

In February, the release volume will be approximately 735 kaf, with fluctuations anticipated between about 9,360 cfs in the nighttime to about 16,065 cfs in the daytime and consistent with the Glen Canyon Dam, Record of Decision on LTEMP (dated December, 2016). The anticipated release volume for March is 790 kaf.

In addition to daily scheduled fluctuations for power generation, the instantaneous releases from Glen Canyon Dam may also fluctuate to provide 40 megawatts (mw) of system regulation. These instantaneous release adjustments stabilize the electrical generation and transmission system and translate to a range of about 1,200 cfs above or below the hourly scheduled release rate. Under normal conditions, fluctuations for regulation are typically short lived and generally balance out over the hour with minimal or no noticeable impacts on downstream river flow conditions.

Releases from Glen Canyon Dam can also fluctuate beyond scheduled releases when called upon to respond to power system emergencies. Depending on the severity of the system emergency, the response from Glen Canyon Dam can be significant and within the full range of the operating capacity of the power plant for as long as is necessary to maintain balance in the transmission system. Glen Canyon Dam currently maintains 28 mw (approximately 830 cfs) of generation capacity in reserve in order to respond to a system emergency even when generation rates are already high. System emergencies

occur fairly infrequently and typically require small responses from Glen Canyon Dam. However, these responses can have a noticeable impact on the river downstream of Glen Canyon Dam.

Inflow Forecasts and Model Projections

The forecast for water year 2019 unregulated inflow to Lake Powell, issued on February 1, 2019, by the Colorado Basin River Forecast Center, projects that the most probable (median) unregulated inflow volume next year will be 7.7 maf (74 percent of average). There is significant uncertainty regarding next season's snow pack development and resulting runoff into Lake Powell. The forecast ranges from a minimum probable of 4.81 maf (44 percent of average) to a maximum probable of 10.38 maf (96 percent of average). There is a 10 percent chance that inflows could be higher than the current maximum probable forecast and a 10 percent chance that inflows could be lower than the minimum probable forecast.

Based on the current forecast, the February 24-Month Study projects Lake Powell elevation will end water year 2019 near 3,576.08 feet with approximately 9.61 maf in storage (40 percent of capacity). Note that projections of elevation and storage for water year 2019 have significant uncertainty at this point in the season. Projections of end of water year 2019 elevation and storage using the minimum and maximum probable inflow forecast from January 2019 are 3,543.56 feet (7.992 maf, 33 percent of capacity) and 3,588.09 feet (11.366 maf, 47 percent of capacity), respectively. Under these scenarios, there is a 10 percent chance that inflows will be higher, resulting in higher elevation and storage, and 10 percent chance that inflows will be lower, resulting in lower elevation and storage. The annual release volume from Lake Powell during water year 2019 is projected to be 8.91 maf under the February most probable scenario, and 9.0 maf under the January maximum probable inflow scenarios and 8.23 maf under the January minimum probable inflow scenario.

Upper Colorado River Basin Hydrology

Upper Colorado River Basin regularly experiences significant year to year hydrologic variability. During the 19-year period 2000 to 2018, however, the unregulated inflow to Lake Powell, which is a good measure of hydrologic conditions in the Colorado River Basin, was above average in only 4 out of the past 19 years. The period 2000-2018 is the lowest 19-year period since the closure of Glen Canyon Dam in 1963, with an average unregulated inflow of 8.54 maf, or 79 percent of the 30-year average (1981-2010). (For comparison, the 1981-2010 total water year average is 10.83 maf.) The unregulated inflow during the 2000-2018 period has ranged from a low of 2.64 maf (24 percent of average) in water year 2002 to a high of 15.97 maf (147 percent of average) in water year 2011. In water year 2018 unregulated inflow volume to Lake Powell was 4.6 maf (43 percent of average), the third driest year on record above 2002 and 1977. Under the current most probable forecast, the total water year 2019 unregulated inflow to Lake Powell is projected to be 7.7 maf (74 percent of average).

At the beginning of water year 2019, total system storage in the Colorado River Basin was 28.01 maf (47 percent of 59.6 maf total system capacity). This is a decrease of 4.91 maf over the total storage at the beginning of water year 2018 when total system storage

was 32.92 maf (55 percent of capacity). Since the beginning of water year 2000, total Colorado Basin storage has experienced year to year increases and decreases in response to wet and dry hydrology, ranging from a high of 94 percent of capacity at the beginning of 2000 to the now current level of 47 percent of capacity at the beginning of water year 2019. Based on current inflow forecasts, the current projected end of water year total Colorado Basin reservoir storage for water year 2019 is approximately 25.60 maf (43 percent of total system capacity). The actual end of water year 2019 system storage may vary from this projection, primarily due to uncertainty regarding this season's runoff and reservoir inflow.

Model Run ID: 3085

Processed On: 2/13/2019 11:47:29AM

March 24-Month Study
Date: March 11, 2019

From: Water Resources Group, Salt Lake City
To: All Colorado River Annual Operating Plan (AOP) Recipients

Current Reservoir Status

Reservoir	February Inflow (unregulated) (acre-feet)	Percent of Average (%)	March 10, Midnight Elevation (feet)	March 10, Midnight Reservoir Storage (acre-feet)
Fontenelle	26,300	95	6,467.98	110,000
Flaming Gorge	34,100	77	6,024.69	3,148,700
Blue Mesa	19,900	89	7,437.18	245,700
Navajo	17,600	58	6,016.17	876,700
Powell	255,400	65	3,571.12	9,197,900

Expected Operations

The operation of Lake Powell and Lake Mead in this March 2019 24-Month Study is pursuant to the December 2007 Record of Decision on Colorado River Interim Guidelines for Lower Basin Shortages and the Coordinated Operations of Lake Powell and Lake Mead (Interim Guidelines) and reflects the draft 2019 Annual Operating Plan (AOP). Pursuant to the Interim Guidelines, the August 2018 24-Month Study projections of the January 1, 2019, system storage and reservoir water surface elevations set the operational tier for the coordinated operation of Lake Powell and Lake Mead during 2019.

Consistent with Section 6.B of the Interim Guidelines, the Lake Powell operational tier for water year 2019 will be governed by the Upper Elevation Balancing Tier, with an initial water year release volume of 8.23 million acre-feet (maf) and the potential for an April adjustment to equalization or balancing releases in April 2019. This March 2019 24-Month Study indicates that, consistent with Section 6.B.4 of the Interim Guidelines, an April adjustment to balancing releases is projected to occur and the contents of Lake Powell and Lake Mead will be balanced by the end of the water year, but not more than 9.0 maf and not less than 8.23 maf shall be released from Lake Powell. Based on the most probable inflow forecast, this March 24-Month Study projects a balancing release of 9.0 maf in water year 2019.

Consistent with Section 2.B.5 of the Interim Guidelines, the Intentionally Created Surplus (ICS) Surplus Condition is the criterion governing the operation of Lake Mead for calendar year 2019.

The Interim Guidelines are available for download at:
https://www.usbr.gov/lc/region/programs/strategies/RecordofDecision.pdf.
The draft 2019 AOP is available for download at:
https://www.usbr.gov/lc/region/g4000/AOP2019/AOP19_draft.pdf

Fontenelle Reservoir – Fontenelle Reservoir is currently at elevation 6468.7.5 feet above sea level (feet), which amounts to 33 percent of live storage capacity. Inflows for the month of February totaled 26,300 acre-feet (af), or 95 percent of average. Average inflows are occurring and releases are being held constant due to ice in the river reach below. Releases are currently set at 1,000 cubic feet per second (cfs).

The Colorado Basin River Forecast Center has forecasted inflows that are near average. March, April and May forecasted inflow volumes amount to 43,000 af (82 percent of average), 75,000 af (88 percent of average), and 120,000 af (73 percent of average), respectively.

The next Fontenelle Working Group meeting is scheduled for 10:00 a.m., April 24, 2019. The meeting will be held at the Seedskadee National Wildlife Refuge. The Fontenelle Working Group is an open public forum for information exchange between Reclamation and other parties associated with the operation of Fontenelle Reservoir.

Flaming Gorge Reservoir – Releases are currently set at 800 cfs. Average daily releases will likely remain at 800 cfs through the end of March.

Unregulated Inflow into Flaming Gorge Reservoir during the month of February was 34,100 af, or 77 percent of average. As of March 10th, 2019, the reservoir elevation is 6024.69 feet (84 percent of live capacity) and increasing.

The March final forecast for unregulated inflows into Flaming Gorge for the next three months projects near average conditions: March, April, and May forecasted unregulated inflow volumes at 80,000 af (78 percent of average), 125,000 af (94 percent of average), and 180,000 af (73 percent of average), respectively.

The Flaming Gorge Working Group is an open public forum for information exchange between Reclamation and the stakeholders of Flaming Gorge Dam. The public is encouraged to attend and comment on the operations and plans presented by Reclamation at these meetings. Meeting notes from past Working Group meetings are posted on the Working Group webpage. For more information on this group and these meetings please contact Dale Hamilton at 801-379-1186 or Paul Davidson at 801-524-3847.

Reclamation will be holding the Flaming Gorge Working Group meeting on April 18th at the Uintah Conference Center, 313 E 200 S, Vernal, UT, from 10 am to 1 pm

Aspinall Unit Reservoirs – As of March 10, 2019 releases from Crystal Dam are approximately 485 cfs. Uncompahgre Valley Water Users Association has stopped diversions through the Gunnison Tunnel except for periodic diversions to fill Fairview Reservoir. Flows through the Black Canyon are approximately 475 cfs. There is currently about a 10 cfs loss to the Gunnison River between Crystal Dam and the Gunnison Tunnel Diversion. As of March 10, 2019, Blue Mesa Reservoir elevation is 7437.18 feet which corresponds to storage content of 245,690 af (30 percent of capacity).

The February unregulated inflow to Blue Mesa Reservoir was 19,900 af (89 percent of average). Unregulated Inflows to Blue Mesa for the next three months (March, April and May) are projected to be: 26,000 af (72 percent of average), 72,000 af (94 percent of average) and 220,000 af (100 percent of average), respectively. For water year 2019, the unregulated inflow volume is forecasted to be 928,800 af (98 percent of average) with 740,000 af (109 percent of average) of unregulated inflow occurring during the April through July period. The March 24-Month Study is reflective of this new forecast.

Conditions are clearly very dry. Blue Mesa Reservoir did not fill in water year 2018 and will most likely not fill in water year 2019 either. Current projections indicate Blue Mesa storage will remain near the current level till March of 2019 before rebounding during the spring runoff. Current projections indicate Blue Mesa is at or near its low elevation for this year. The peak elevation for this water year will occur in or around late July when the elevation is projected to be 7494 feet. The projected end of water year 2019 elevation of Blue Mesa is 7487.5 feet which corresponds to a live storage content of 462,000 acre-feet (68 percent of full capacity).

The Aspinall Unit Working Group is an open public forum for information exchange between Reclamation and the stakeholders of the Aspinall Unit. The public is encouraged to attend and comments on the operations and plans presented by Reclamation at these meetings. Meeting notes from past working Group meetings are posted on the Working Group webpage. For more information on this group and these meetings please contact Erik Knight in the Grand Junction Area Office at (970) 248-0629.

Meeting notes from past working Group meetings are posted on the Working Group webpage at:

https://www.usbr.gov/uc/wcao/water/rsvrs/mtgs/amcurrnt.html

The next meeting of the Aspinall Unit Working Group will be held on Tuesday, April 23, 2019 at 1:00 pm at the at the Western Colorado Area Office located at 445 West Gunnison Avenue in Grand Junction, Colorado.

Navajo Reservoir – As of March 10, 2019 the daily average release rate from Navajo Dam is approximately 280 cfs while reservoir inflow is averaging approximately 1020 cfs. The water surface elevation is 6016.17 feet above sea level and is steadily

increasing. At this elevation the live storage is 0.877 maf (52 percent of live storage capacity) and the active storage is 0.215 maf (21 percent of active storage capacity). The river flow measured at the San Juan River at Four Corners USGS gage is 830 cfs. River flow at the Animas River at Farmington USGS gage is at 354 cfs.

Releases from Navajo Dam are made for authorized purposes of the Navajo Unit and also pursuant to the Record of Decision for the Navajo Reservoir Operations, Navajo Unit – San Juan River New Mexico, Colorado, Utah Final Environmental Impact Statement. Releases from Navajo Dam are managed to attempt to maintain a target base flow through the endangered fish critical habitat reach of the San Juan River (Farmington to Lake Powell). The San Juan River Basin Recovery Implementation Program (SJRIP) recommends a target base flow of between 500 cfs and 1,000 cfs through the critical habitat area. The target base flow is calculated as the weekly average of gaged flows throughout the critical habitat area.

Preliminary modified-unregulated inflow into Navajo (inflow adjusted for upstream change in storage, reservoir evaporation and exportation from the basin) in February was 17,433 af (58 percent of average). SNOTEL sites above Navajo are at 137% of average with 24.1 inches of SWE on average per site.

Forecast modified-unregulated inflow to Navajo over the next three months (March, April and May) are projected to be: 55,000 af (60 percent of average), 132,000 af (77 percent of average), and 265,000 af (96 percent of average), respectively.

The April through July runoff forecasts are as follows:
Min Probable: 455,000 af (62 percent of average)
Most Probable: 690,000 af (94 percent of average)
Max Probable: 1,010,000 af (137 percent of average)

The winter release will target the minimum baseflow in the critical habitat reach and may be reduced to as low as the minimum release of 250 cfs, so long as the target baseflow downstream is still met. Releases will remain as low as possible over the winter in an effort to conserve water in the reservoir.

Based on current storage and long-term projections, Navajo has a 30% chance of filling to at least 6050 ft and a 10% chance of filling to at least 6060 ft in the spring of 2019. Based on current projections there are no plans for a spring peak release, though a short-duration maintenance release is under consideration.

Reclamation conducts Public Operations Meetings three times per year to gather input for determining upcoming operations for Navajo Reservoir. Input from individuals, organizations, and agencies along with other factors such as weather, water rights, endangered species requirements, flood control, hydro power, recreation, fish and wildlife management, and reservoir levels, will be considered in the development of these reservoir operation plans. In addition, the meetings are used to coordinate activities and

exchange information among agencies, water users, and other interested parties concerning the San Juan River and Navajo Reservoir.

The next Navajo Public Operations Coordination Meeting is scheduled for Tuesday, April 23rd, 2019, at 1:00 p.m. at the Farmington Civic Center, Farmington, NM.

Glen Canyon Dam / Lake Powell

Current Status

The unregulated inflow in February was 256 thousand acre-feet (kaf) (65 percent of average). February precipitation in the Upper Colorado Basin was 150 percent of average. The release volume from Glen Canyon Dam in January was 730 kaf. The end of February elevation and storage of Lake Powell were 3,571.89 feet (128.11 feet from full pool) 9.21 maf (38 percent of full capacity).

Current Operations

The operating tier for water year 2019 was established in August 2018 as the Upper Elevation Balancing Tier. As described in the Interim Guidelines, under balancing, the contents of Lake Powell and Lake Mead are to be balanced by the end of the water year, but not more than 9.0 maf and not less than 8.23 maf is to be released from Lake Powell. Under this Tier the initial annual water year release volume is 8.23 maf but there is potential for an April 2019 adjustment to equalization or balancing releases. Based on the current forecast, an April adjustment to balancing releases is projected and Lake Powell is currently projected to release 9.0 maf in water year 2019. This projection will be updated each month throughout the water year.

In March, the release volume will be approximately 790 kaf, with fluctuations anticipated between about 8,500 cfs in the nighttime to about 15,700 cfs and consistent with the Glen Canyon Dam, Record of Decision on LTEMP (dated December, 2016). The anticipated release volume for April is 720 kaf.

In addition to daily scheduled fluctuations for power generation, the instantaneous releases from Glen Canyon Dam may also fluctuate to provide 40 megawatts (mw) of system regulation. These instantaneous release adjustments stabilize the electrical generation and transmission system and translate to a range of about 1,200 cfs above or below the hourly scheduled release rate. Under normal conditions, fluctuations for regulation are typically short lived and generally balance out over the hour with minimal or no noticeable impacts on downstream river flow conditions.

Releases from Glen Canyon Dam can also fluctuate beyond scheduled releases when called upon to respond to power system emergencies. Depending on the severity of the system emergency, the response from Glen Canyon Dam can be significant and within the full range of the operating capacity of the power plant for as long as is necessary to maintain balance in the transmission system. Glen Canyon Dam currently maintains 28 mw (approximately 830 cfs) of generation capacity in reserve in order to respond to a system emergency even when generation rates are already high. System emergencies

occur fairly infrequently and typically require small responses from Glen Canyon Dam. However, these responses can have a noticeable impact on the river downstream of Glen Canyon Dam.

Inflow Forecasts and Model Projections

The forecast for water year 2019 unregulated inflow to Lake Powell, issued on March 1, 2019, by the Colorado Basin River Forecast Center, projects that the most probable (median) unregulated inflow volume next year will be 9.93 maf (92 percent of average). There is significant uncertainty regarding next season's snow pack development and resulting runoff into Lake Powell. Reclamation updates the minimum and maximum probable forecasts four times a year: January, April, August and October. The January forecast ranges from a minimum probable of 4.81 maf (44 percent of average) to a maximum probable of 10.38 maf (96 percent of average). There is a 10 percent chance that inflows could be higher than the current maximum probable forecast and a 10 percent chance that inflows could be lower than the minimum probable forecast.

Based on the current forecast, the March 24-Month Study projects Lake Powell elevation will end water year 2019 near 3,592.84 feet with approximately 11.08 maf in storage (47 percent of capacity). Note that projections of elevation and storage for water year 2019 have significant uncertainty at this point in the season. Projections of end of water year 2019 elevation and storage using the minimum and maximum probable inflow forecast from January 2019 are 3,543.56 feet (7.992 maf, 33 percent of capacity) and 3,588.09 feet (11.366 maf, 47 percent of capacity), respectively. Under these scenarios, there is a 10 percent chance that inflows will be higher, resulting in higher elevation and storage, and 10 percent chance that inflows will be lower, resulting in lower elevation and storage. The annual release volume from Lake Powell during water year 2019 is projected to be 9.0 maf under the March most probable scenario, and 9.0 maf under the January maximum probable inflow scenarios and 8.23 maf under the January minimum probable inflow scenario.

Upper Colorado River Basin Hydrology

Upper Colorado River Basin regularly experiences significant year to year hydrologic variability. During the 19-year period 2000 to 2018, however, the unregulated inflow to Lake Powell, which is a good measure of hydrologic conditions in the Colorado River Basin, was above average in only 4 out of the past 19 years. The period 2000-2018 is the lowest 19-year period since the closure of Glen Canyon Dam in 1963, with an average unregulated inflow of 8.54 maf, or 79 percent of the 30-year average (1981-2010). (For comparison, the 1981-2010 total water year average is 10.83 maf.) The unregulated inflow during the 2000-2018 period has ranged from a low of 2.64 maf (24 percent of average) in water year 2002 to a high of 15.97 maf (147 percent of average) in water year 2011. In water year 2018 unregulated inflow volume to Lake Powell was 4.6 maf (43 percent of average), the third driest year on record above 2002 and 1977. Under the current most probable forecast, the total water year 2019 unregulated inflow to Lake Powell is projected to be 9.93 maf (92 percent of average).

At the beginning of water year 2019, total system storage in the Colorado River Basin was 28.01 maf (47 percent of 59.6 maf total system capacity). This is a decrease of 4.91

maf over the total storage at the beginning of water year 2018 when total system storage was 32.92 maf (55 percent of capacity). Since the beginning of water year 2000, total Colorado Basin storage has experienced year to year increases and decreases in response to wet and dry hydrology, ranging from a high of 94 percent of capacity at the beginning of 2000 to the now current level of 47 percent of capacity at the beginning of water year 2019. Based on current inflow forecasts, the current projected end of water year total Colorado Basin reservoir storage for water year 2019 is approximately 27.45 maf (46 percent of total system capacity). The actual end of water year 2019 system storage may vary from this projection, primarily due to uncertainty regarding this season's runoff and reservoir inflow.

Processed On: 3/8/2019 3:02:16PM

April 24-Month Study
Date: April 15, 2019

From: Water Resources Group, Salt Lake City
To: All Colorado River Annual Operating Plan (AOP) Recipients

Current Reservoir Status

Reservoir	March Inflow (unregulated) (acre-feet)	Percent of Average (%)	April 14, Midnight Elevation (feet)	April 14, Midnight Reservoir Storage (acre-feet)
Fontenelle	36,900	70	6,467.88	110,000
Flaming Gorge	74,300	73	6,027.45	3,251,700
Blue Mesa	27,800	77	7,440.52	262,200
Navajo	112,900	123	6,030.35	1,009,400
Powell	623,800	94	3,568.71	9,003,200

Expected Operations

The operation of Lake Powell and Lake Mead in this April 2019 24-Month Study is pursuant to the December 2007 Record of Decision on Colorado River Interim Guidelines for Lower Basin Shortages and the Coordinated Operations of Lake Powell and Lake Mead (Interim Guidelines) and reflects the draft 2019 Annual Operating Plan (AOP). Pursuant to the Interim Guidelines, the August 2018 24-Month Study projections of the January 1, 2019, system storage and reservoir water surface elevations set the operational tier for the coordinated operation of Lake Powell and Lake Mead during 2019.

Consistent with Section 6.B of the Interim Guidelines, the Lake Powell operational tier for water year 2019 will be governed by the Upper Elevation Balancing Tier. With an 8.23 million acre-foot (maf) release from Lake Powell in water year 2019, the April 2019 24-Month Study projects the end of water year elevation at Lake Powell to be above 3,575 feet, and the end of water year elevation at Lake Mead to be below 1,075 feet. Therefore, in accordance with Section 6.B.4 of the Interim Guidelines, Lake Powell operations will shift to balancing releases for the remainder of water year 2019. Under Section 6.B.4, the contents of Lake Powell and Lake Mead will be balanced by the end of the water year, but not more than 9.0 maf and not less than 8.23 maf shall be released from Lake Powell. Based on the most probable inflow forecast, this April 24-Month Study projects a balancing release of 9.0 maf in water year 2019; however, the actual release in water year 2019 will depend on hydrology in the remainder of the water year

and will range between 8.23 and 9.0 maf. The projected release from Lake Powell in water year 2019 will be updated each month throughout the remainder of the water year.

Consistent with Section 2.B.5 of the Interim Guidelines, the Intentionally Created Surplus (ICS) Surplus Condition is the criterion governing the operation of Lake Mead for calendar year 2019.

The Interim Guidelines are available for download at:
https://www.usbr.gov/lc/region/programs/strategies/RecordofDecision.pdf.
The draft 2019 AOP is available for download at:
https://www.usbr.gov/lc/region/g4000/AOP2019/AOP19_draft.pdf

Fontenelle Reservoir – As of April 9, 2019, Fontenelle Reservoir's pool elevation is 6465.95 feet, which amounts to 30 percent of live storage capacity. Inflows for the month of March totaled 36,925 acre-feet (af), or 70 percent of average. Releases are currently set to 1,000 cfs but will likely be increased as soon as inflows increase.

The Colorado Basin River Forecast Center has forecasted inflows that are near average. April, May and June forecasted inflow volumes amount to 80,000 af (94 percent of average), 130,000 af (79 percent of average), and 255,000 af (85 percent of average), respectively.

The next Fontenelle Working Group meeting is scheduled for 10:00 a.m., April 24, 2019. The meeting will be held at the Seedskadee National Wildlife Refuge. The Fontenelle Working Group is an open public forum for information exchange between Reclamation and other parties associated with the operation of Fontenelle Reservoir.

Flaming Gorge Reservoir – As of April 9. 2019, Flaming Gorge Reservoir's pool elevation is 6026.91 feet (85 percent of live capacity) and increasing. Inflow into Flaming Gorge Reservoir during the month of March was 98,811 af, or 92 percent of average.

Average daily releases will likely remain at 950 cfs through the end of April, however, releases of 1600 cfs are scheduled for April 22nd and 23rd to facilitate the Utah Division of Wildlife Resources' fishery monitoring program's fish population assessment.

The April final forecast for unregulated inflows into Flaming Gorge for the next three months projects near average conditions: April, May, and June forecasted unregulated inflow volumes at 145,000 af (108 percent of average), 180,000 af (73 percent of average), and 310,000 af (79 percent of average), respectively.

Reclamation will be holding the Flaming Gorge Working Group meeting on April 18th at the Uintah Conference Center, 313 E 200 S, Vernal, UT, from 10 am to 1 pm

The Flaming Gorge Working Group is an open public forum for information exchange between Reclamation and the stakeholders of Flaming Gorge Dam. The public is

encouraged to attend and comment on the operations and plans presented by Reclamation at these meetings. Meeting notes from past Working Group meetings are posted on the Working Group webpage. For more information on this group and these meetings please contact Dale Hamilton at 801-379-1186.

Aspinall Unit Reservoirs – As of April 10, 2019 releases from Crystal Dam are approximately 850 cfs. Uncompahgre Valley Water Users Association has begun diversions through the Gunnison Tunnel and flows through the tunnel as of April 10, 2019 are 400 cfs. Flows through the Black Canyon are approximately 430 cfs. There is currently about a 20 cfs loss to the Gunnison River between Crystal Dam and the Gunnison Tunnel Diversion. As of April 10, 2019, Blue Mesa Reservoir elevation is 7439.74 feet which corresponds to storage content of 258,294 af (31 percent of capacity). The elevation of Blue Mesa is beginning to rise as inflows due to run off are increasing.

The March unregulated inflow to Blue Mesa Reservoir was 27,700 af (77 percent of average). Unregulated Inflows to Blue Mesa for the next three months (April, May and June) are projected to be: 83,000 af (108 percent of average), 270,000 af (122 percent of average) and 420,000 af (161 percent of average), respectively. For water year 2019, the unregulated inflow volume is forecasted to be 1,169,500 af (122 percent of average) with 925,000 af (137 percent of average) of unregulated inflow occurring during the April through July period. The April 24-Month Study is reflective of this new forecast.

Current projections indicate Blue Mesa storage will steadily increase as spring runoff begins. Snowpack conditions in the Gunnison River Basin are well above normal at 143 percent of median above the Aspinall Unit. Current projections indicate Blue Mesa will nearly fill by late summer if current inflow forecasts come to fruition. The peak elevation for this water year will occur in or around late July and is projected to be about 7515 feet. The projected end of water year 2019 elevation of Blue Mesa is 7507.5 feet which corresponds to a live storage content of about 724,000 acre-feet (87 percent of full capacity).

The Aspinall Unit Working Group is an open public forum for information exchange between Reclamation and the stakeholders of the Aspinall Unit. The public is encouraged to attend and comment on the operations and plans presented by Reclamation at these meetings. Meeting notes from past working Group meetings are posted on the Working Group webpage. For more information on this group and these meetings please contact Erik Knight in the Grand Junction Area Office at (970) 248-0629.

Meeting notes from past working Group meetings are posted on the Working Group webpage at:

https://www.usbr.gov/uc/wcao/water/rsvrs/mtgs/amcurrnt.html

The next meeting of the Aspinall Unit Working Group will be held on Tuesday, April 23, 2019 at 1:00 pm at the at the Western Colorado Area Office located at 445 West Gunnison Avenue in Grand Junction, Colorado.

Navajo Reservoir – As of April 9th, 2019, the daily average release rate from Navajo Dam is approximately 298 cfs while reservoir inflow is averaging approximately 2300 cfs. The water surface elevation is 6028.17 feet above sea level and is steadily increasing. At this elevation the live storage is 0.990 maf (58 percent of live storage capacity) and the active storage is 0.328 maf (32 percent of active storage capacity). The river flow measured at the San Juan River at Four Corners USGS gage is 1,310 cfs. River flow at the Animas River at Farmington USGS gage is at 1,120 cfs.

Releases from Navajo Dam are made for authorized purposes of the Navajo Unit and are pursuant to the Record of Decision for the Navajo Reservoir Operations, Navajo Unit – San Juan River New Mexico, Colorado, Utah Final Environmental Impact Statement. Releases from Navajo Dam are managed to attempt to maintain a target base flow through the endangered fish critical habitat reach of the San Juan River (Farmington to Lake Powell). The San Juan River Basin Recovery Implementation Program (SJRIP) recommends a target base flow of between 500 cfs and 1,000 cfs through the critical habitat area. The target base flow is calculated as the weekly average of gaged flows throughout the critical habitat area.

Preliminary modified-unregulated inflow into Navajo (inflow adjusted for upstream change in storage, reservoir evaporation and exportation from the basin) in March was 113,738 af (123 percent of average for the month). SNOTEL sites above Navajo are at 150% of average with 29.8 inches of SWE on average per site.

Forecast modified-unregulated inflow to Navajo over the next three months (April, May and June) are projected to be: 198,000 af (116 percent of average), 340,000 af (123 percent of average), and 315,000 af (141 percent of average), respectively.

The April through July runoff forecasts are as follows:
Min Probable: 780,000 af (106 percent of average)
Most Probable: 920,000 af (125 percent of average)
Max Probable: 1,170,000 af (159 percent of average)

Based on current storage and long-term projections, Navajo has a 95% chance of filling to at least 6050 ft and a 50% chance of filling to at least 6060 ft in the spring of 2019. Based on current projections there are still no plans for a spring peak release, though a short-duration maintenance release is being planned. This proposed release would include a 5-7 day ramp up to 5,000 cfs, five days at 5,000 cfs, and a 3-day ramp back down to base release. The release would likely be timed to coincide with the peak on the Animas River. This proposed release is under consideration but has not been firmly scheduled and may change shape and timing.
Reclamation conducts Public Operations Meetings three times per year to gather input for determining upcoming operations for Navajo Reservoir. Input from individuals,

organizations, and agencies along with other factors such as weather, water rights, endangered species requirements, flood control, hydro power, recreation, fish and wildlife management, and reservoir levels, will be considered in the development of these reservoir operation plans. In addition, the meetings are used to coordinate activities and exchange information among agencies, water users, and other interested parties concerning the San Juan River and Navajo Reservoir.

The next Navajo Unit Coordination Meeting will be held Tuesday, April 23rd at 1pm at the Farmington Civic Center (200 West Arrington, Farmington, NM). A public information meeting has also been scheduled for April 30th at 6pm in Bloomfield (915 North First Street, Bloomfield, NM).

Glen Canyon Dam / Lake Powell

Current Status
The unregulated inflow in March was 624 thousand acre-feet (kaf) (94 percent of average). March precipitation in the Upper Colorado Basin was 175 percent of average. The release volume from Glen Canyon Dam in March was 790 kaf. The end of March elevation and storage of Lake Powell were 3,569.28 feet (130.72 feet from full pool) 9.05 maf (38 percent of full capacity).

Current Operations
The operating tier for water year 2019 was established in August 2018 as the Upper Elevation Balancing Tier. As described in the Interim Guidelines, under balancing, the contents of Lake Powell and Lake Mead are to be balanced by the end of the water year, but not more than 9.0 maf and not less than 8.23 maf is to be released from Lake Powell. Under this Tier the initial annual water year release volume is 8.23 maf, and the April 2019 24-Month Study projects the end of water year elevation at Lake Powell to be above 3,575 feet, and the end of water year elevation at Lake Mead to be below 1,075 feet. Lake Powell operations will shift to balancing releases for the remainder of water year 2019. Lake Powell is currently projected to release 9.0 maf in water year 2019; and this projection will be updated each month throughout the remainder of the water year.

In April, the release volume will be approximately 720 kaf, with fluctuations anticipated between about 8,500 cfs in the nighttime to about 15,000 cfs and consistent with the Glen Canyon Dam, Record of Decision on LTEMP (dated December, 2016). The anticipated release volume for May is 720 kaf.

In addition to daily scheduled fluctuations for power generation, the instantaneous releases from Glen Canyon Dam may also fluctuate to provide 40 megawatts (mw) of system regulation. These instantaneous release adjustments stabilize the electrical generation and transmission system and translate to a range of about 1,200 cfs above or below the hourly scheduled release rate. Under normal conditions, fluctuations for regulation are typically short lived and generally balance out over the hour with minimal or no noticeable impacts on downstream river flow conditions.

Releases from Glen Canyon Dam can also fluctuate beyond scheduled releases when called upon to respond to power system emergencies. Depending on the severity of the system emergency, the response from Glen Canyon Dam can be significant and within the full range of the operating capacity of the power plant for as long as is necessary to maintain balance in the transmission system. Glen Canyon Dam currently maintains 28 mw (approximately 830 cfs) of generation capacity in reserve in order to respond to a system emergency even when generation rates are already high. System emergencies occur fairly infrequently and typically require small responses from Glen Canyon Dam. However, these responses can have a noticeable impact on the river downstream of Glen Canyon Dam.

Inflow Forecasts and Model Projections

The forecast for water year 2019 unregulated inflow to Lake Powell, issued on April 1, 2019, by the Colorado Basin River Forecast Center, projects that the most probable (median) unregulated inflow volume this year will be 12.11 maf (112 percent of average). There is significant uncertainty regarding this season's snow pack development and resulting runoff into Lake Powell. Reclamation updates the minimum and maximum probable forecasts four times a year: January, April, August and October. The April forecast ranges from a minimum probable of 9.68 maf (89 percent of average) to a maximum probable of 15.26 maf (141 percent of average). There is a 10 percent chance that inflows could be higher than the current maximum probable forecast and a 10 percent chance that inflows could be lower than the minimum probable forecast.

Based on the current forecast, the April 24-Month Study projects Lake Powell elevation will end water year 2019 near 3,561.59 feet with approximately 12.89 maf in storage (55 percent of capacity). Note that projections of elevation and storage for water year 2019 have significant uncertainty at this point in the season. Projections of end of water year 2019 elevation and storage using the minimum and maximum probable inflow forecast from April 2019 are 3,590.25 feet (10.84 maf, 46 percent of capacity) and 3,632.38 feet (15.12 maf, 65 percent of capacity), respectively. Under these scenarios, there is a 10 percent chance that inflows will be higher, resulting in higher elevation and storage, and 10 percent chance that inflows will be lower, resulting in lower elevation and storage. The annual release volume from Lake Powell during water year 2019 is projected to be 9.0 maf under the April most probable scenario, and 9.0 maf under the April maximum and minimum probable inflow scenarios.

Upper Colorado River Basin Hydrology

Upper Colorado River Basin regularly experiences significant year to year hydrologic variability. During the 19-year period 2000 to 2018, however, the unregulated inflow to Lake Powell, which is a good measure of hydrologic conditions in the Colorado River Basin, was above average in only 4 out of the past 19 years. The period 2000-2018 is the lowest 19-year period since the closure of Glen Canyon Dam in 1963, with an average unregulated inflow of 8.54 maf, or 79 percent of the 30-year average (1981-2010). (For comparison, the 1981-2010 total water year average is 10.83 maf.) The unregulated inflow during the 2000-2018 period has ranged from a low of 2.64 maf (24 percent of average) in water year 2002 to a high of 15.97 maf (147 percent of average) in water year

2011. In water year 2018 unregulated inflow volume to Lake Powell was 4.6 maf (43 percent of average), the third driest year on record above 2002 and 1977. Under the current most probable forecast, the total water year 2019 unregulated inflow to Lake Powell is projected to be 12.11 maf (112 percent of average).

At the beginning of water year 2019, total system storage in the Colorado River Basin was 28.01 maf (47 percent of 59.6 maf total system capacity). This is a decrease of 4.91 maf over the total storage at the beginning of water year 2018 when total system storage was 32.92 maf (55 percent of capacity). Since the beginning of water year 2000, total Colorado Basin storage has experienced year to year increases and decreases in response to wet and dry hydrology, ranging from a high of 94 percent of capacity at the beginning of 2000 to the now current level of 47 percent of capacity at the beginning of water year 2019. Based on current inflow forecasts, the current projected end of water year total Colorado Basin reservoir storage for water year 2019 is approximately 30.62 maf (51 percent of total system capacity). The actual end of water year 2019 system storage may vary from this projection, primarily due to uncertainty regarding this season's runoff and reservoir inflow.

May 24-Month Study
Date: May 14, 2019

From: Water Resources Group, Salt Lake City
To: All Colorado River Annual Operating Plan (AOP) Recipients

Current Reservoir Status

Reservoir	April Inflow (unregulated) (acre-feet)	Percent of Average (%)	May 13, Midnight Elevation (feet)	May 13, Midnight Reservoir Storage (acre-feet)
Fontenelle	113,500	133	6,476.92	150,200
Flaming Gorge	239,900	180	6,027.45	3,324,000
Blue Mesa	121,300	157	7,440.52	399,100
Navajo	230,300	135	6,030.35	1,189,100
Powell	1,243,600	118	3,568.71	9,696,500

Expected Operations

The operation of Lake Powell and Lake Mead in this May 2019 24-Month Study is pursuant to the December 2007 Record of Decision on Colorado River Interim Guidelines for Lower Basin Shortages and the Coordinated Operations of Lake Powell and Lake Mead (Interim Guidelines) and reflects the draft 2019 Annual Operating Plan (AOP). Pursuant to the Interim Guidelines, the August 2018 24-Month Study projections of the January 1, 2019, system storage and reservoir water surface elevations set the operational tier for the coordinated operation of Lake Powell and Lake Mead during 2019.

Consistent with Section 6.B of the Interim Guidelines, the Lake Powell operational tier for water year 2019 will be governed by the Upper Elevation Balancing Tier. With an 8.23 million acre-foot (maf) release from Lake Powell in water year 2019, the April 2019 24-Month Study projects the end of water year elevation at Lake Powell to be above 3,575 feet above sea level (feet), and the end of water year elevation at Lake Mead to be below 1,075 feet. Therefore, in accordance with Section 6.B.4 of the Interim Guidelines, Lake Powell operations will shift to balancing releases for the remainder of water year 2019. Under Section 6.B.4, the contents of Lake Powell and Lake Mead will be balanced by the end of the water year, but not more than 9.0 maf and not less than 8.23 maf shall be released from Lake Powell. Based on the most probable inflow forecast, this May 24-Month Study projects a balancing release of 9.0 maf in water year 2019; however, the actual release in water year 2019 will depend on hydrology in the remainder of the water

year and will range between 8.23 and 9.0 maf. The projected release from Lake Powell in water year 2019 will be updated each month throughout the remainder of the water year.

Consistent with Section 2.B.5 of the Interim Guidelines, the Intentionally Created Surplus (ICS) Surplus Condition is the criterion governing the operation of Lake Mead for calendar year 2019.

The Interim Guidelines are available for download at:
https://www.usbr.gov/lc/region/programs/strategies/RecordofDecision.pdf.
The draft 2019 AOP is available for download at:
https://www.usbr.gov/lc/region/g4000/AOP2019/AOP19_draft.pdf

Fontenelle Reservoir – As of May 13, 2019, Fontenelle Reservoir's pool elevation is 6476.73 feet, which amounts to 43 percent of live storage capacity. Inflows for the month of April totaled 113,540 acre-feet (af), or 132 percent of average. Releases are currently set to full power plant generation or roughly 1,600 cubic feet per second (cfs).

The Colorado Basin River Forecast Center has forecasted inflows that are near average. May, June and July forecasted inflow volumes amount to 166,000 af (98 percent of average), 270,000 af (90 percent of average), and 190,000 af (106 percent of average), respectively.

The next Fontenelle Working Group meeting is scheduled for August 22, 2019. The meeting will be held at the Water Treatment Facility, 3 Telephone Canyon Road, Green River, WY 82935. The Fontenelle Working Group is an open public forum for information exchange between Reclamation and other parties associated with the operation of Fontenelle Reservoir.

Flaming Gorge Reservoir – As of May 10, 2019, Flaming Gorge Reservoir's pool elevation is 6029.91 feet (88 percent of live capacity) and increasing. Inflow into Flaming Gorge Reservoir during the month of April was 197,774 af or 153 percent of average.

Average daily releases will likely remain at 1600 cfs through the end of May, or until the Larval Trigger Study Plan Razorback sucker spring peak releases are needed to supplement Yampa River peaks with a combined discharge of 18,600 cfs in Reach 2. The mean calendar date of the first capture of razorback sucker larvae (i.e., the "larval trigger") is May 28 (median May 27) and ranges from May 7 to June 24. Historically, 50% of first captures occurred between May 21 and June 2; 75 percent occurred between May 16 and June 4.

The April final forecast for unregulated inflows into Flaming Gorge for the next three months projects near average conditions: May, June July forecasted unregulated inflow volumes at 235,000 af (96 percent of average), 360,000 af (92 percent of average), and 215,000 af (102 percent of average), respectively.

Reclamation will be holding the Flaming Gorge Working Group meeting on August 15th at 10 a.m. in Price, Utah County Event Center (310 South Fairgrounds Road).

The Flaming Gorge Working Group is an open public forum for information exchange between Reclamation and the stakeholders of Flaming Gorge Dam. The public is encouraged to attend and comment on the operations and plans presented by Reclamation at these meetings. Meeting notes from past Working Group meetings are posted on the Working Group webpage. For more information on this group and these meetings please contact Dale Hamilton at 801-379-1186.

Aspinall Unit Reservoirs – As of May 6, 2019 releases from Crystal Dam are approximately 1,630 cfs. Uncompahgre Valley Water Users Association is diverting approximately 680 cfs through the Gunnison Tunnel and flows in the Black Canyon are about 950 cfs. Inflows to Blue Mesa have increased and Blue Mesa Reservoir elevation has increased about 20 feet over the past month and is currently 7458.3 feet above sea level. Storage in Blue Mesa Reservoir is currently 360,870 acre-feet which is 43 percent of full capacity.

The April unregulated inflow to Blue Mesa Reservoir was 121,280 af (157 percent of average). Unregulated Inflows to Blue Mesa for the next three months (May, June and July) are projected to be: 310,000 af (140 percent of average), 385,000 af (148 percent of average) and 215,000 af (183 percent of average), respectively. The May 24-Month Study is reflective of these new forecasts.

Current projections indicate Blue Mesa storage will steadily increase as spring runoff begins. Snowpack conditions in the Gunnison River Basin reached a peak that was well above normal at 143 percent of median above the Aspinall Unit. Current projections indicate Blue Mesa will nearly fill by late summer if current inflow forecasts come to fruition. The peak elevation for this water year will occur in or around late July and is projected to be about 7515 feet. The projected end of water year 2019 elevation of Blue Mesa is 7507.5 feet which corresponds to a live storage content of about 724,000 af (87 percent of full capacity).

During May and into June, releases from Aspinall will be made to achieve a spring peak flow in the Gunnison River as described in the Aspinall Record of Decision. This year, the peak flow target is likely to be 14,350 cfs measured at the Gunnison River streamgage located near Grand Junction, Colorado. Reclamation will attempt to maintain this peak flow target for 10 days if possible. It is not known if this peak magnitude or this duration will be possible given current hydrologic conditions and forecasted weather patterns. Timing of the ramp up and peaking operations is unknown at this time and will coincide with the peak flows of the North Fork of the Gunnison River. Typically, the North Fork of the Gunnison River peaks in the mid to late May timeframe. It is expected that higher than normal flows will occur in the Gunnison River between mid-May and possibly as late as mid-June.

The Aspinall Unit Working Group is an open public forum for information exchange between Reclamation and the stakeholders of the Aspinall Unit. The public is encouraged to attend and comments on the operations and plans presented by Reclamation at these

meetings. Meeting notes from past working Group meetings are posted on the Working Group webpage. For more information on this group and these meetings please contact Erik Knight in the Grand Junction Area Office at (970) 248-0629.

Meeting notes from past working Group meetings are posted on the Working Group webpage at:

https://www.usbr.gov/uc/wcao/water/rsvrs/mtgs/amcurrnt.html

The next meeting of the Aspinall Unit Working Group will be held on Tuesday, August 15, 2019 at 1:00 pm at the Elk Creek Visitor Center at Blue Mesa Reservoir.

Navajo Reservoir – As of May 6th, 2019, the daily average release rate from Navajo Dam is approximately 400 cfs while reservoir inflow is averaging approximately 3,370 cfs. The water surface elevation is 6043.59 feet above sea level and is steadily increasing. At this elevation the live storage is 1.15 maf (68 percent of live storage capacity) and the active storage is 0.490 maf (47 percent of active storage capacity). The river flow measured at the San Juan River at Four Corners USGS gage is 2,430 cfs. River flow at the Animas River at Farmington USGS gage is at 1,980 cfs.

Releases from Navajo Dam are made for authorized purposes of the Navajo Unit and are pursuant to the Record of Decision for the Navajo Reservoir Operations, Navajo Unit – San Juan River New Mexico, Colorado, Utah Final Environmental Impact Statement. Releases from Navajo Dam are managed to attempt to maintain a target base flow through the endangered fish critical habitat reach of the San Juan River (Farmington to Lake Powell). The San Juan River Basin Recovery Implementation Program (SJRIP) recommends a target base flow of between 500 cfs and 1,000 cfs through the critical habitat area. The target base flow is calculated as the weekly average of gaged flows throughout the critical habitat area.

Preliminary modified-unregulated inflow into Navajo (inflow adjusted for upstream change in storage, reservoir evaporation and exportation from the basin) in April was 230 kaf (135 percent of average for the month). SNOTEL sites above Navajo are at 143 percent of median for this day with 25.6 inches of SWE on average per site. The SWE above Navajo peaked at 29.9 inches (148 percent of historical median peak) on April 5th.

Forecast modified-unregulated inflow to Navajo over the next three months (May, June, and July) are projected to be: 345,000 af (125 percent of average), 290,000 af (130 percent of average), and 65,000 af (99 percent of average), respectively.

The April through July runoff forecasts are as follows:
Min Probable: 810,000 af (110 percent of average)
Most Probable: 930,000 af (126 percent of average)
Max Probable: 1,060,000 af (144 percent of average)

Based on current storage and long-term projections, Navajo is nearly certain to fill to at least 6050 ft and has a 70 percent chance of filling to at least 6060 ft in the spring of 2019. Based on the current Most Probable projection there are no plans for a spring peak release, though a short-duration maintenance release is being planned. This planned release will include a 5-7 day ramp up to 5,000 cfs, five days at 5,000 cfs, and a 3-day ramp back down to base release. The release timing will target the peak date on the Animas River. Most likely ramp-up will begin near the end of May, but a notice will be sent out a week prior to the start of the release.

Reclamation conducts Public Operations Meetings three times per year to gather input for determining upcoming operations for Navajo Reservoir. Input from individuals, organizations, and agencies along with other factors such as weather, water rights, endangered species requirements, flood control, hydro power, recreation, fish and wildlife management, and reservoir levels, will be considered in the development of these reservoir operation plans. In addition, the meetings are used to coordinate activities and exchange information among agencies, water users, and other interested parties concerning the San Juan River and Navajo Reservoir.

The next Navajo Unit Coordination Meeting will be held Tuesday, August 20th at 1pm at the Farmington Civic Center (200 West Arrington, Farmington, NM).

Glen Canyon Dam / Lake Powell

Current Status

The Department of the Interior is conducting the third experimental flow at Glen Canyon Dam since implementing its Long-Term Experimental and Management Plan (LTEMP). The goal is to provide enhanced habitat for the lifecycle of aquatic insects that are the primary food source for fish in the Colorado River.

Experiments under LTEMP consist of four different flow regimes: high flows, bug flows, trout management flows, and low summer flows. Collaborative discussions among technical experts resulted in a decision to begin this first experiment on May 1 and continue through August 31, 2019. It will slightly modify the schedule and flow rates of water releases from Lake Powell through Glen Canyon Dam, Arizona. The normally scheduled monthly and weekly release volumes will not be affected.

Flows during the experiment will include steady weekend water releases with routine hydropower production flows on weekdays that include normal hourly changes in release rates. Those steady weekend flows are expected to provide favorable conditions for aquatic insects to lay and cement their eggs to rocks, vegetation, and other materials near the river's edge. Steady weekend flows will be relatively low, within four inches of typical weekday low water levels. It is unlikely casual recreational river users will notice the changes in water levels.

Insects expected to benefit from this experiment are an important food source for many species of fish, birds, and bats in the canyon. Beyond expected resource benefits, this

experiment will also provide scientific information that will be used in future decision making.

The unregulated inflow in April was 1.24 thousand acre-feet (kaf) (118 percent of average). April precipitation in the Upper Colorado Basin was 105 percent of average. The release volume from Glen Canyon Dam in April was 720 kaf. The end of April elevation and storage of Lake Powell were 3,571.12 feet (128.88 feet from full pool) 9.20 maf (38 percent of full capacity).

Current Operations

The operating tier for water year 2019 was established in August 2018 as the Upper Elevation Balancing Tier. As described in the Interim Guidelines, under balancing, the contents of Lake Powell and Lake Mead are to be balanced by the end of the water year, but not more than 9.0 maf and not less than 8.23 maf is to be released from Lake Powell. Under this Tier the initial annual water year release volume is 8.23 maf, and the April 2019 24-Month Study projects the end of water year elevation at Lake Powell to be above 3,575 feet, and the end of water year elevation at Lake Mead to be below 1,075 feet. Lake Powell operations will shift to balancing releases for the remainder of water year 2019. Lake Powell is currently projected to release 9.0 maf in water year 2019; and this projection will be updated each month throughout the remainder of the water year.

In May, the release volume will be approximately 720 kaf, with fluctuations anticipated between about 10,095 cfs in the nighttime to about 15,077 cfs and consistent with the Glen Canyon Dam, Record of Decision on LTEMP (dated December, 2016). The anticipated release volume for June is 765 kaf with fluctuations anticipated between about 9,490 cfs in the nighttime to about 17,140 cfs.

In addition to daily scheduled fluctuations for power generation, the instantaneous releases from Glen Canyon Dam may also fluctuate to provide 40 megawatts (mw) of system regulation. These instantaneous release adjustments stabilize the electrical generation and transmission system and translate to a range of about 1,200 cfs above or below the hourly scheduled release rate. Under normal conditions, fluctuations for regulation are typically short lived and generally balance out over the hour with minimal or no noticeable impacts on downstream river flow conditions.

Releases from Glen Canyon Dam can also fluctuate beyond scheduled releases when called upon to respond to power system emergencies. Depending on the severity of the system emergency, the response from Glen Canyon Dam can be significant and within the full range of the operating capacity of the power plant for as long as is necessary to maintain balance in the transmission system. Glen Canyon Dam currently maintains 28 mw (approximately 800 cfs) of generation capacity in reserve in order to respond to a system emergency even when generation rates are already high. System emergencies occur fairly infrequently and typically require small responses from Glen Canyon Dam. However, these responses can have a noticeable impact on the river downstream of Glen Canyon Dam.

Inflow Forecasts and Model Projections

The forecast for water year 2019 unregulated inflow to Lake Powell, issued on May 1, 2019, by the Colorado Basin River Forecast Center, projects that the most probable (median) unregulated inflow volume this year will be 12.07 maf (111 percent of average). There is significant uncertainty regarding this season's snow pack development and resulting runoff into Lake Powell. Reclamation updates the minimum and maximum probable forecasts four times a year: January, April, August and October. The April forecast ranges from a minimum probable of 9.68 maf (89 percent of average) to a maximum probable of 15.26 maf (141 percent of average). There is a 10 percent chance that inflows could be higher than the current maximum probable forecast and a 10 percent chance that inflows could be lower than the minimum probable forecast.

Based on the current forecast, the May 24-Month Study projects Lake Powell elevation will end water year 2019 near 3,610.33 feet with approximately 12.76 maf in storage (54 percent of capacity). Note that projections of elevation and storage for water year 2019 have significant uncertainty at this point in the season. Projections of end of water year 2019 elevation and storage using the minimum and maximum probable inflow forecast from April 2019 are 3,590.25 feet (10.84 maf, 46 percent of capacity) and 3,632.38 feet (15.12 maf, 65 percent of capacity), respectively. Under these scenarios, there is a 10 percent chance that inflows will be higher, resulting in higher elevation and storage, and 10 percent chance that inflows will be lower, resulting in lower elevation and storage. The annual release volume from Lake Powell during water year 2019 is projected to be 9.0 maf under the May most probable scenario, and 9.0 maf under the April maximum and minimum probable inflow scenarios.

Upper Colorado River Basin Hydrology

Upper Colorado River Basin regularly experiences significant year to year hydrologic variability. During the 19-year period 2000 to 2018, however, the unregulated inflow to Lake Powell, which is a good measure of hydrologic conditions in the Colorado River Basin, was above average in only 4 out of the past 19 years. The period 2000-2018 is the lowest 19-year period since the closure of Glen Canyon Dam in 1963, with an average unregulated inflow of 8.54 maf, or 79 percent of the 30-year average (1981-2010). (For comparison, the 1981-2010 total water year average is 10.83 maf.) The unregulated inflow during the 2000-2018 period has ranged from a low of 2.64 maf (24 percent of average) in water year 2002 to a high of 15.97 maf (147 percent of average) in water year 2011. In water year 2018 unregulated inflow volume to Lake Powell was 4.6 maf (43 percent of average), the third driest year on record above 2002 and 1977. Under the current most probable forecast, the total water year 2019 unregulated inflow to Lake Powell is projected to be 12.07 maf (111 percent of average).

At the beginning of water year 2019, total system storage in the Colorado River Basin was 28.01 maf (47 percent of 59.6 maf total system capacity). This is a decrease of 4.91 maf over the total storage at the beginning of water year 2018 when total system storage was 32.92 maf (55 percent of capacity). Since the beginning of water year 2000, total Colorado Basin storage has experienced year to year increases and decreases in response to wet and dry hydrology, ranging from a high of 94 percent of capacity at the beginning of 2000 to the now current level of 47 percent of capacity at the beginning of water year

2019. Based on current inflow forecasts, the current projected end of water year total Colorado Basin reservoir storage for water year 2019 is approximately 30.74 maf (51 percent of total system capacity). The actual end of water year 2019 system storage may vary from this projection, primarily due to uncertainty regarding this season's runoff and reservoir inflow.

June 24-Month Study
Date: June 14, 2019

From: Water Resources Group, Salt Lake City
To: All Colorado River Annual Operating Plan (AOP) Recipients

Current Reservoir Status

Reservoir	May Inflow (unregulated) (acre-feet)	Percent of Average (%)	June 13, Midnight Elevation (feet)	June 13, Midnight Reservoir Storage (acre-feet)
Fontenelle	167,000	102	6,498.08	283,800
Flaming Gorge	252,300	103	6,029.47	3,328,600
Blue Mesa	214,400	97	7,474.83	469,000
Navajo	270,200	97	6,060.60	1,355,400
Powell	2,511,300	107	3,595.13	11,291,300

Expected Operations

The operation of Lake Powell and Lake Mead in this June 2019 24-Month Study is pursuant to the December 2007 Record of Decision on Colorado River Interim Guidelines for Lower Basin Shortages and the Coordinated Operations of Lake Powell and Lake Mead (Interim Guidelines) and reflects the draft 2019 Annual Operating Plan (AOP). Pursuant to the Interim Guidelines, the August 2018 24-Month Study projections of the January 1, 2019, system storage and reservoir water surface elevations set the operational tier for the coordinated operation of Lake Powell and Lake Mead during 2019.

Consistent with Section 6.B of the Interim Guidelines, the Lake Powell operational tier for water year 2019 will be governed by the Upper Elevation Balancing Tier. With an 8.23 million acre-foot (maf) release from Lake Powell in water year 2019, the April 2019 24-Month Study projected the end of water year elevation at Lake Powell to be above 3,575 feet above sea level (feet), and the end of water year elevation at Lake Mead to be below 1,075 feet. Therefore, in accordance with Section 6.B.4 of the Interim Guidelines, Lake Powell operations shifted to balancing releases for the remainder of water year 2019. Under Section 6.B.4, the contents of Lake Powell and Lake Mead will be balanced by the end of the water year, but not more than 9.0 maf and not less than 8.23 maf shall be released from Lake Powell. Based on the most probable inflow forecast, this June 24-Month Study projects a balancing release of 9.0 maf in water year 2019; however, the actual release in water year 2019 will depend on hydrology in the remainder of the water

year and will range between 8.23 and 9.0 maf. The projected release from Lake Powell in water year 2019 will be updated each month throughout the remainder of the water year.

Consistent with Section 2.B.5 of the Interim Guidelines, the Intentionally Created Surplus (ICS) Surplus Condition is the criterion governing the operation of Lake Mead for calendar year 2019.

The Interim Guidelines are available for download at:
https://www.usbr.gov/lc/region/programs/strategies/RecordofDecision.pdf.
The draft 2019 AOP is available for download at:
https://www.usbr.gov/lc/region/g4000/AOP2019/AOP19_draft.pdf

Fontenelle Reservoir – Fontenelle Reservoir is currently at elevation 6498 feet, which amounts to 82 percent of live storage capacity. Inflows for the month of May totaled 167,000 acre-feet (af), or 99 percent of average. Releases are currently ramping up to pass the high inflows seen over the past week, expect flows near 6400 cubic feet per second (cfs) to continue through the majority of June.

The Colorado Basin River Forecast Center has forecasted inflows that are near average. June, July and August forecasted inflow volumes amount to 300,000 af (100 percent of average), 199,000 af (112 percent of average), and 77,000 af (101 percent of average), respectively.

The next Fontenelle Working Group meeting is scheduled for August 22, 2019. The meeting will be held at the Water Treatment Facility, 3 Telephone Canyon Road, Green River, WY 82935. The Fontenelle Working Group is an open public forum for information exchange between Reclamation and other parties associated with the operation of Fontenelle Reservoir.

Flaming Gorge Reservoir – As of June 11, 2019, Flaming Gorge Reservoir's pool elevation is 6029.77 feet (89 percent of live capacity) and decreasing. Inflow into Flaming Gorge Reservoir during the month of May was 183,470 af or 89 percent of average.

Reclamation is in the process of conducting the Larval Trigger Study Plan (LTSP) targeted flows. Full powerplant releases and bypass releases are being used to achieve between 18,600 cfs to 20,300 cfs at the Jensen Gage. Full powerplant and bypass releases which range between approximately 7,000 cfs to 8600 cfs and will continue until later next week, the week of June 16, 2019.

Combined with forecasted flows from the Yampa River, which is unregulated and joins the Green River below Flaming Gorge Dam in Dinosaur National Monument, flows near Jensen, Utah are expected to reach above 18,600 cfs and be less than 22,000 cfs. Reclamation will closely monitor actual and forecast flows and will reduce Flaming Gorge Dam release volumes if the Yampa River is projected to considerably exceed current forecasts through the week of June 16, 2019.

The June final forecast for unregulated inflows into Flaming Gorge for the next three months projects near average conditions: June, July, and August forecasted unregulated inflow volumes at 423,000 af (109 percent of average), 255,000 af (121 percent of average), and 95,000 af (107 percent of average), respectively.

Reclamation will be holding the Flaming Gorge Working Group meeting on August 15th at 10 a.m. in Price, Utah County Event Center (310 South Fairgrounds Road).

The Flaming Gorge Working Group is an open public forum for information exchange between Reclamation and the stakeholders of Flaming Gorge Dam. The public is encouraged to attend and comment on the operations and plans presented by Reclamation at these meetings. Meeting notes from past Working Group meetings are posted on the Working Group webpage. For more information on this group and these meetings please contact Dale Hamilton at 801-379-1186.

Aspinall Unit Reservoirs – As of June 13, 2019 releases from Crystal Dam are approximately 5,100 cfs. Uncompahgre Valley Water Users Association is diverting approximately 900 cfs through the Gunnison Tunnel and flows in the Black Canyon are about 4,200 cfs. Releases from Aspinall are currently ramping down from the spring peak operations to meet Aspinall Record of Decision (ROD) peak flow targets for this year. As described in the Aspinall ROD, based on the moderately wet hydrologic category of the forecasted April through July runoff into Blue Mesa Reservoir this year, the ROD peak flow target level this year has been 14,350 cfs measured in the Whitewater Reach of the Gunnison River. Peak releases from Aspinall, timed with peak flows on the North Fork of the Gunnison River achieved 6 days above the peak flow target level this year. Additionally, at least 20 days above half bank full levels (8,070 cfs) are expected to occur in the Whitewater Reach by the end of June.

Inflows to Blue Mesa have been very significant in May and June with the elevation of Blue Mesa Reservoir increasing over 18 feet since May 1, 2019 despite the high releases that have been made from Aspinall during the spring peak operational period. Inflows are expected to be very high for about 6 more weeks into late July. By the end of July, Blue Mesa Reservoir is projected to be very nearly full at an elevation of approximately 7518 feet which is within 1.4 feet of full capacity. This elevation corresponds to a storage level in Blue Mesa Reservoir of approximately 820,000 acre-feet which is 98.7 percent of full capacity.

The May unregulated inflow to Blue Mesa Reservoir was 214,400 af (97 percent of average). Unregulated Inflows to Blue Mesa for the next three months (June, July and August) are projected to be: 480,000 af (183 percent of average), 225,000 af (192 percent of average) and 82,000 af (130 percent of average), respectively. The June 24-Month Study is reflective of these new forecasts. The April through July unregulated inflow forecast volume for 2019 (issued June 4, 2019) is 1,040,000 af which is 154 percent of average. The water year unregulated inflow forecast volume for 2019 is 1,352,000 af which is 142 percent of average.

The Aspinall Unit Working Group is an open public forum for information exchange between Reclamation and the stakeholders of the Aspinall Unit. The public is encouraged to attend and comments on the operations and plans presented by Reclamation at these meetings. Meeting notes from past working Group meetings are posted on the Working Group webpage. For more information on this group and these meetings please contact Erik Knight in the Grand Junction Area Office at (970) 248-0629.

Meeting notes from past working Group meetings are posted on the Working Group webpage at:

https://www.usbr.gov/uc/wcao/water/rsvrs/mtgs/amcurrnt.html

The next meeting of the Aspinall Unit Working Group will be held on Tuesday, August 15, 2019 at 1:00 pm at the Elk Creek Visitor Center at Blue Mesa Reservoir.

Navajo Reservoir – On June 13, 2019, the daily average release rate from Navajo Dam was approximately 4,390 cfs while reservoir inflow (modified unregulated) was averaging approximately 11,150 cfs. The water surface elevation was 6060.60 feet above sea level and is steadily increasing at nearly 0.5 feet per day. At this elevation the live storage is 1.36 maf (80 percent of live storage capacity) and the active storage is 0.70 maf (67 percent of active storage capacity). The river flow measured at the San Juan River at Four Corners USGS gage was 10,500 cfs. River flow at the Animas River at Farmington USGS gage is at 6,190 cfs.

Releases from Navajo Dam are made for authorized purposes of the Navajo Unit and are pursuant to the Record of Decision for the Navajo Reservoir Operations, Navajo Unit – San Juan River New Mexico, Colorado, Utah Final Environmental Impact Statement. Releases from Navajo Dam are managed to attempt to maintain a target base flow through the endangered fish critical habitat reach of the San Juan River (Farmington to Lake Powell). The San Juan River Basin Recovery Implementation Program (SJRIP) recommends a target base flow of between 500 cfs and 1,000 cfs through the critical habitat area. The target base flow is calculated as the weekly average of gaged flows throughout the critical habitat area.

Preliminary modified-unregulated inflow into Navajo (inflow adjusted for upstream change in storage, reservoir evaporation and exportation from the basin) in May was 270 kaf (97 percent of average for the month). The SWE above Navajo peaked at 29.9 inches (148% of historical median peak) on April 5, 2019.

Forecast modified-unregulated inflow to Navajo over the next three months (June, July and August) are projected to be: 400,000 af (178 percent of average), 99,000 af (150 percent of average), and 47,000 af (104 percent of average), respectively.

The April through July runoff forecasts are as follows:

Min Probable: 810,000 af (110 percent of average)

Most Probable: 1,000,000 af (136 percent of average)
Max Probable: 1,060,000 af (144 percent of average)

Based on current storage and long-term projections, Navajo is nearly certain to fill to at least 6050 ft and has a 70% chance of filling to at least 6060 ft in the spring of 2019. Based on the current Most Probable projection there are no plans for a spring peak release, though a short-duration maintenance release is being planned. The short-duration maintenance release is underway and when complete will include a 5-7 day ramp up to 5,000 cfs, five days at 5,000 cfs, and a 3-day ramp back down to base release levels. The timing of this release has accounted for the high flows on the Animas River to best manage potential flooding issues.

Reclamation conducts Public Operations Meetings three times per year to gather input for determining upcoming operations for Navajo Reservoir. Input from individuals, organizations, and agencies along with other factors such as weather, water rights, endangered species requirements, flood control, hydro power, recreation, fish and wildlife management, and reservoir levels, will be considered in the development of these reservoir operation plans. In addition, the meetings are used to coordinate activities and exchange information among agencies, water users, and other interested parties concerning the San Juan River and Navajo Reservoir.

The next Navajo Unit Coordination Meeting will be held Tuesday, August 20, 2019 at 1:00 pm at the Farmington Civic Center (200 West Arrington, Farmington, NM).

Glen Canyon Dam / Lake Powell

Current Status
The Department of the Interior is conducting the first experimental flow at Glen Canyon Dam since implementing its Long-Term Experimental and Management Plan (LTEMP). The goal is to provide enhanced habitat for the lifecycle of aquatic insects that are the primary food source for fish in the Colorado River.

Experiments under LTEMP consist of four different flow regimes: high flows, bug flows, trout management flows, and low summer flows. Collaborative discussions among technical experts resulted in a decision to begin this first experiment on May 1 and continue through August 31, 2018. This experiment is being continued for 2019, same time period, (May – August). It will slightly modify the schedule and flow rates of water releases from Lake Powell through Glen Canyon Dam, Arizona. The normally scheduled monthly and weekly release volumes will not be affected.

Flows during the experiment will include steady weekend water releases with routine hydropower production flows on weekdays that include normal hourly changes in release rates. Those steady weekend flows are expected to provide favorable conditions for aquatic insects to lay and cement their eggs to rocks, vegetation, and other materials near the river's edge. Steady weekend flows will be relatively low, within four inches of

typical weekday low water levels. It is unlikely casual recreational river users will notice the changes in water levels.

Insects expected to benefit from this experiment are an important food source for many species of fish, birds, and bats in the canyon. Beyond expected resource benefits, this experiment will also provide scientific information that will be used in future decision making.

The unregulated inflow volume to Lake Powell during May was 2.51 (maf) (107 percent of average). The release volume from Glen Canyon Dam in May was 720 thousand acre-feet (kaf). The end of May elevation and storage of Lake Powell were 3,585 feet (115 feet from full pool) and 10.3 maf (42 percent of full capacity), respectively. This winter's precipitation has been above average every month starting with January through May at, 120, 150, 175, 105, 175 percent.

Current Operations

The forecast for water year 2019 unregulated inflow to Lake Powell, issued on June 4, 2019, by the Colorado Basin River Forecast Center, projects that the most probable (median) unregulated inflow volume this year will be 13.5 maf (125 percent of average). There is significant uncertainty regarding this season's snow pack development and resulting runoff into Lake Powell. Reclamation updates the minimum and maximum probable forecasts four times a year: January, April, August and October. The April forecast ranges from a minimum probable of 9.68 maf (89 percent of average) to a maximum probable of 15.26 maf (141 percent of average). There is a 10 percent chance that inflows could be higher than the current maximum probable forecast and a 10 percent chance that inflows could be lower than the minimum probable forecast.

Based on the current forecast, the June 24-Month Study projects Lake Powell elevation will end water year 2019 near 3,620.77 feet with approximately 13.85 maf in storage (57 percent of capacity). Note that projections of elevation and storage for water year 2019 have significant uncertainty at this point in the season. Projections of end of water year 2019 elevation and storage using the minimum and maximum probable inflow forecast from April 2019 are 3,590.25 feet (10.84 maf, 46 percent of capacity) and 3,632.38 feet (15.12 maf, 65 percent of capacity), respectively. Under these scenarios, there is a 10 percent chance that inflows will be higher, resulting in higher elevation and storage, and 10 percent chance that inflows will be lower, resulting in lower elevation and storage. The annual release volume from Lake Powell during water year 2019 is projected to be 9.0 maf under the June most probable scenario, and 9.0 maf under the April maximum and minimum probable inflow scenarios.

Inflow Forecasts and Model Projections

The forecast for water year 2019 unregulated inflow to Lake Powell, issued on May 1, 2019, by the Colorado Basin River Forecast Center, projects that the most probable (median) unregulated inflow volume this year will be 12.07 maf (111 percent of average). There is significant uncertainty regarding this season's snow pack development and resulting runoff into Lake Powell. Reclamation updates the minimum and maximum

probable forecasts four times a year: January, April, August and October. The April forecast ranges from a minimum probable of 9.68 maf (89 percent of average) to a maximum probable of 15.26 maf (141 percent of average). There is a 10 percent chance that inflows could be higher than the current maximum probable forecast and a 10 percent chance that inflows could be lower than the minimum probable forecast.

Based on the current forecast, the May 24-Month Study projects Lake Powell elevation will end water year 2019 near 3,610.33 feet with approximately 12.76 maf in storage (54 percent of capacity). Note that projections of elevation and storage for water year 2019 have significant uncertainty at this point in the season. Projections of end of water year 2019 elevation and storage using the minimum and maximum probable inflow forecast from April 2019 are 3,590.25 feet (10.84 maf, 46 percent of capacity) and 3,632.38 feet (15.12 maf, 65 percent of capacity), respectively. Under these scenarios, there is a 10 percent chance that inflows will be higher, resulting in higher elevation and storage, and 10 percent chance that inflows will be lower, resulting in lower elevation and storage. The annual release volume from Lake Powell during water year 2019 is projected to be 9.0 maf under the May most probable scenario, and 9.0 maf under the April maximum and minimum probable inflow scenarios.

Upper Colorado River Basin Hydrology

Upper Colorado River Basin regularly experiences significant year to year hydrologic variability. During the 19-year period 2000 to 2018, however, the unregulated inflow to Lake Powell, which is a good measure of hydrologic conditions in the Colorado River Basin, was above average in only 4 out of the past 19 years. The period 2000-2018 is the lowest 19-year period since the closure of Glen Canyon Dam in 1963, with an average unregulated inflow of 8.54 maf, or 79 percent of the 30-year average (1981-2010). (For comparison, the 1981-2010 total water year average is 10.83 maf.) The unregulated inflow during the 2000-2018 period has ranged from a low of 2.64 maf (24 percent of average) in water year 2002 to a high of 15.97 maf (147 percent of average) in water year 2011. In water year 2018 unregulated inflow volume to Lake Powell was 4.6 maf (43 percent of average), the third driest year on record above 2002 and 1977. Under the current most probable forecast, the total water year 2019 unregulated inflow to Lake Powell is projected to be 13.49 maf (125 percent of average).

At the beginning of water year 2019, total system storage in the Colorado River Basin was 28.01 maf (47 percent of 59.6 maf total system capacity). This is a decrease of 4.91 maf over the total storage at the beginning of water year 2018 when total system storage was 32.92 maf (55 percent of capacity). Since the beginning of water year 2000, total Colorado Basin storage has experienced year to year increases and decreases in response to wet and dry hydrology, ranging from a high of 94 percent of capacity at the beginning of 2000 to the now current level of 47 percent of capacity at the beginning of water year 2019. Based on current inflow forecasts, the current projected end of water year total Colorado Basin reservoir storage for water year 2019 is approximately 31.33 maf (53 percent of total system capacity). The actual end of water year 2019 system storage may vary from this projection, primarily due to uncertainty regarding this season's runoff and reservoir inflow.

July 24-Month Study
Date: July 15, 2019

From: Water Resources Group, Salt Lake City
To: All Colorado River Annual Operating Plan (AOP) Recipients

Current Reservoir Status

Reservoir	June Inflow (unregulated) (acre-feet)	Percent of Average (%)	July 14, Midnight Elevation (feet)	July 14, Midnight Reservoir Storage (acre-feet)
Fontenelle	337,000	113	6,497.24	277,700
Flaming Gorge	460,000	118	6,034.09	3,510,000
Blue Mesa	471,000	180	7,517.08	808,600
Navajo	491,000	220	6,075.19	1,554,000
Powell	4,206,000	158	3,619.66	13,727,000

Expected Operations

The operation of Lake Powell and Lake Mead in this July 2019 24-Month Study is pursuant to the December 2007 Record of Decision on Colorado River Interim Guidelines for Lower Basin Shortages and the Coordinated Operations of Lake Powell and Lake Mead (Interim Guidelines) and reflects the draft 2019 Annual Operating Plan (AOP). Pursuant to the Interim Guidelines, the August 2018 24-Month Study projections of the January 1, 2019, system storage and reservoir water surface elevations set the operational tier for the coordinated operation of Lake Powell and Lake Mead during 2019.

Consistent with Section 6.B of the Interim Guidelines, the Lake Powell operational tier for water year 2019 will be governed by the Upper Elevation Balancing Tier. With an 8.23 million acre-foot (maf) release from Lake Powell in water year 2019, the April 2019 24-Month Study projected the end of water year elevation at Lake Powell to be above 3,575 feet, and the end of water year elevation at Lake Mead to be below 1,075 feet. Therefore, in accordance with Section 6.B.4 of the Interim Guidelines, Lake Powell operations shifted to balancing releases for the remainder of water year 2019. Under Section 6.B.4, the contents of Lake Powell and Lake Mead will be balanced by the end of the water year, but not more than 9.0 maf and not less than 8.23 maf shall be released from Lake Powell. Based on the most probable inflow forecast, this July 24-Month Study projects a balancing release of 9.0 maf in water year 2019; however, the actual release in water year 2019 will depend on hydrology in the remainder of the water year

and will range between 8.23 and 9.0 maf. The projected release from Lake Powell in water year 2019 will be updated each month throughout the remainder of the water year.

Consistent with Section 2.B.5 of the Interim Guidelines, the Intentionally Created Surplus (ICS) Surplus Condition is the criterion governing the operation of Lake Mead for calendar year 2019.

The Interim Guidelines are available for download at:
https://www.usbr.gov/lc/region/programs/strategies/RecordofDecision.pdf.
The draft 2019 AOP is available for download at:
https://www.usbr.gov/lc/region/g4000/AOP2019/AOP19_draft.pdf

Fontenelle Reservoir – Fontenelle Reservoir is currently at elevation 6494.58 feet, which amounts to 75 percent of live storage capacity. Inflows for the month of June totaled 337,000 acre-feet (af) or 113 percent of average. Releases are currently ramping down to pass lower spring runoff and will continue until the middle of July. Releases are expected to be between 1000 cfs – 1500 cfs. This will continue through the later part of July and early part of August to increase the pool elevation to optimize a bathymetric survey.

The Colorado Basin River Forecast Center has forecasted inflows that are near average. July, August, and September forecasted inflow volumes amount to 207,000 af (117 percent of average), 77,000 af (101 percent of average), and 55,000 af (120 percent of average), respectively.

The next Fontenelle Working Group meeting is scheduled for August 22, 2019. The meeting will be held at the Water Treatment Facility, 3 Telephone Canyon Road, Green River, WY 82935. The Fontenelle Working Group is an open public forum for information exchange between Reclamation and other parties associated with the operation of Fontenelle Reservoir.

Flaming Gorge Reservoir – Reclamation has completed the Larval Trigger Study Plan (LTSP) and achieved 10 days at the targeted flows. This was achieved by using full powerplant releases and supplemented with full to partial bypass with most of the flow provided by the Yampa River to attain flows between to 18,600 cfs to 20,300 cfs at the USGS Jensen gage. The Colorado Pikeminnow base flow study will be next and will be initiated in the upcoming weeks. Targeted flows at the USGS Jensen gage with the combination of Flaming Gorge releases and Yampa River flows will be between 2000 cfs to 2600 cfs. Releases from Flaming Gorge Dam will depend on how much flow is provided by the Yampa River.

The July final forecast for unregulated inflows into Flaming Gorge for the next three months projects near average conditions: July, August, and September forecasted unregulated inflow volumes at 268,000 af (128 percent of average), 95,000 af (107 percent of average), and 60,000 af (109 percent of average), respectively.

Reclamation will be holding the Flaming Gorge Working Group meeting on August 15th at 10 a.m. in Price, Utah County Event Center (310 South Fairgrounds Road). The Flaming Gorge Working Group is an open public forum for information exchange between Reclamation and the stakeholders of Flaming Gorge Dam. The public is encouraged to attend and comment on the operations and plans presented by Reclamation at these meetings. Meeting notes from past Working Group meetings are posted on the Working Group webpage. For more information on this group and these meetings please contact Dale Hamilton at 801-379-1186.

Aspinall Unit Reservoirs – As of July 10, 2019 releases from Crystal Dam are approximately 3,000 cfs. Uncompahgre Valley Water Users Association is diverting approximately 875 cfs through the Gunnison Tunnel and flows in the Black Canyon are about 2,170 cfs. Releases from Aspinall are currently being managed to control the storage of water in Blue Mesa Reservoir. By the end of July, Blue Mesa should be very nearly full.

Inflows to Blue Mesa were very significant in May and June and have continued into July. On July 10, 2019, the inflow to Blue Mesa was 4,559 cfs and the water surface elevation of Blue Mesa was 7,515,49 feet which is less than 4 feet from the maximum water surface elevation. By the end of July, Blue Mesa Reservoir is projected to be very nearly full at an elevation of approximately 7519 feet which is within 0.4 feet of full capacity. This elevation corresponds to a storage level in Blue Mesa Reservoir of approximately 826,500 acre-feet which is 99.6 percent of full capacity.

The June unregulated inflow to Blue Mesa Reservoir was 470,900 af (180 percent of average). Unregulated Inflows to Blue Mesa for the next three months (July, August and September) are projected to be: 253,000 af (216 percent of average), 85,000 af (134 percent of average) and 52,000 af (137 percent of average), respectively. The July 24-Month Study is reflective of these new forecasts. The water year unregulated inflow forecast volume for 2019 is 1,328 kaf which is 139 percent of average.

The Aspinall Unit Working Group is an open public forum for information exchange between Reclamation and the stakeholders of the Aspinall Unit. The public is encouraged to attend and comments on the operations and plans presented by Reclamation at these meetings. Meeting notes from past working Group meetings are posted on the Working Group webpage. For more information on this group and these meetings please contact Erik Knight in the Grand Junction Area Office at (970) 248-0629.

Meeting notes from past working Group meetings are posted on the Working Group webpage at:

https://www.usbr.gov/uc/wcao/water/rsvrs/mtgs/amcurrnt.html

The next meeting of the Aspinall Unit Working Group will be held on Tuesday, August 15, 2019 at 1:00 pm at the Elk Creek Visitor Center at Blue Mesa Reservoir.

Navajo Reservoir – On July 7th, the daily average release rate from Navajo Dam was approximately 830 cfs while reservoir inflow (modified unregulated) was averaging approximately 3,150 cfs. The water surface elevation was 6074.3 feet above sea level. At this elevation the live storage is 1.54 maf (91 percent of live storage capacity) and the active storage is 0.88 maf (85 percent of active storage capacity). NIIP was diverting 647 cfs from the reservoir. The river flow measured at the San Juan River at Four Corners USGS gage was 4,280 cfs. River flow at the Animas River at Farmington USGS gage was at 3,340 cfs.

Releases from Navajo Dam are made for authorized purposes of the Navajo Unit and are pursuant to the Record of Decision for the Navajo Reservoir Operations.

Preliminary modified-unregulated inflow into Navajo (inflow adjusted for upstream change in storage, reservoir evaporation and exportation from the basin) in June was 491 kaf (220 percent of average for the month).

Forecast modified-unregulated inflow to Navajo over the next three months (July, August and September) are projected to be: 129 kaf (196 percent of average), 45 kaf (100 percent of average), and 43 kaf (100 percent of average), respectively.

The April through July runoff forecasts are as follows: Min Probable: 1,100 kaf (149 percent of average) Most Probable: 1,120 kaf (152 percent of average) Max Probable: 1,160 kaf (157 percent of average)

A maintenance release was conducted from Navajo Dam from June 3rd through June 15th. The release peaked at 5,000 cfs on June 12th. The reservoir is likely to peak in the next several days at an elevation near 6075.5 ft.

Reclamation conducts Public Operations Meetings three times per year to gather input for determining upcoming operations for Navajo Reservoir. Input from individuals, organizations, and agencies along with other factors such as weather, water rights, endangered species requirements, flood control, hydro power, recreation, fish and wildlife management, and reservoir levels, will be considered in the development of these reservoir operation plans. In addition, the meetings are used to coordinate activities and exchange information among agencies, water users, and other interested parties concerning the San Juan River and Navajo Reservoir. The next Navajo Unit Coordination Meeting will be held Tuesday, August 20, 2019 at 1:00 pm at the Farmington Civic Center (200 West Arrington, Farmington, NM).

Glen Canyon Dam / Lake Powell

Current Status
The Department of the Interior is conducting the first experimental flow at Glen Canyon Dam since implementing its Long-Term Experimental and Management Plan (LTEMP). The goal is to provide enhanced habitat for the lifecycle of aquatic insects that are the primary food source for fish in the Colorado River.

Experiments under LTEMP consist of four different flow regimes: high flows, bug flows, trout management flows, and low summer flows. Collaborative discussions among technical experts resulted in a decision to begin this first experiment on May 1 and continue through August 31, 2018. This experiment is being continued for 2019, same time period, (May – August). It will slightly modify the schedule and flow rates of water releases from Lake Powell through Glen Canyon Dam, Arizona. The normally scheduled monthly and weekly release volumes will not be affected.

Flows during the experiment will include steady weekend water releases with routine hydropower production flows on weekdays that include normal hourly changes in release rates. Those steady weekend flows are expected to provide favorable conditions for aquatic insects to lay and cement their eggs to rocks, vegetation, and other materials near the river's edge. Steady weekend flows will be relatively low, within four inches of typical weekday low water levels. It is unlikely casual recreational river users will notice the changes in water levels.

Insects expected to benefit from this experiment are an important food source for many species of fish, birds, and bats in the canyon. Beyond expected resource benefits, this experiment will also provide scientific information that will be used in future decision making.

The unregulated inflow volume to Lake Powell during June was 4.21 (maf) (158 percent of average). The release volume from Glen Canyon Dam in June was 765 thousand acre-feet (kaf). The end of June elevation and storage of Lake Powell were 3,612 ft (88 feet from full pool) and 12.91 maf (53 percent of full capacity), respectively.

Current Operations

The operating tier for water year 2019 was established in August 2018 as the Upper Elevation Balancing Tier. As described in the Interim Guidelines, under balancing, the contents of Lake Powell and Lake Mead are to be balanced by the end of the water year, but not more than 9.0 maf and not less than 8.23 maf is to be released from Lake Powell. Under this Tier the initial annual water year release volume is 8.23 maf, and the April 2019 24-Month Study projects the end of water year elevation at Lake Powell to be above 3,575 feet, and the end of water year elevation at Lake Mead to be below 1,075 feet. Lake Powell operations have shifted to balancing releases for the remainder of water year 2019. Lake Powell is currently projected to release 9.0 maf in water year 2019; and this projection will be updated each month throughout the remainder of the water year.

In July, the release volume will be approximately 860 kaf, with fluctuations anticipated between about 12,100 cfs in the nighttime to about 15,560 cfs in the daytime with 12,857 cfs steady releases during the weekend, and consistent with the Glen Canyon Dam, Record of Decision (dated December 2016). The anticipated release volume for August is 900 kaf with daily fluctuations between approximately 11,000 cfs and 19,000 cfs with weekend steady flows of 11,750 cfs. The expected release for September is 683 kaf.

In addition to daily scheduled fluctuations for power generation, the instantaneous releases from Glen Canyon Dam may also fluctuate to provide 40 megawatts (mw) of system regulation. These instantaneous release adjustments stabilize the electrical generation and transmission system and translate to a range of about 1,200 cfs above or below the hourly scheduled release rate. Under system normal conditions, fluctuations for regulation are typically short lived and generally balance out over the hour with minimal or no noticeable impacts on downstream river flow conditions.

Releases from Glen Canyon Dam can also fluctuate beyond scheduled releases when called upon to respond to unscheduled power outages or power system emergencies. Depending on the severity of the system emergency, the response from Glen Canyon Dam can be significant, within the full range of the operating capacity of the power plant for as long as is necessary to maintain balance in the transmission system. Glen Canyon Dam currently maintains 30 mw (approximately 800 cfs) of generation capacity in reserve in order to respond to a system emergency even when generation rates are already high. System emergencies occur fairly infrequently and typically require small responses from Glen Canyon Dam. However, these responses can have a noticeable impact on the river downstream of Glen Canyon Dam.

Inflow Forecasts and Model Projections

The forecast for water year 2019 unregulated inflow to Lake Powell, issued on July 2, 2019, by the Colorado Basin River Forecast Center, projects that the most probable (median) unregulated inflow volume this year will be 13.82 maf (128 percent of average). There is significant uncertainty regarding this season's snow pack development and resulting runoff into Lake Powell. Reclamation updates the minimum and maximum probable forecasts four times a year: January, April, August and October. The April forecast ranges from a minimum probable of 9.68 maf (89 percent of average) to a maximum probable of 15.26 maf (141 percent of average). There is a 10 percent chance that inflows could be higher than the current maximum probable forecast and a 10 percent chance that inflows could be lower than the minimum probable forecast.

Based on the current forecast, the July 24-Month Study projects Lake Powell elevation will end water year 2019 near 3,623.86 feet with approximately 14.18 maf in storage (58 percent of capacity). Note that projections of elevation and storage for water year 2019 have significant uncertainty at this point in the season. Projections of end of water year 2019 elevation and storage using the minimum and maximum probable inflow forecast from April 2019 are 3,590.25 feet (10.84 maf, 46 percent of capacity) and 3,632.38 feet (15.12 maf, 65 percent of capacity), respectively. Under these scenarios, there is a 10 percent chance that inflows will be higher, resulting in higher elevation and storage, and 10 percent chance that inflows will be lower, resulting in lower elevation and storage. The annual release volume from Lake Powell during water year 2019 is projected to be 9.0 maf under the July most probable scenario, and 9.0 maf under the April maximum and minimum probable inflow scenarios.

Upper Colorado River Basin Hydrology

Upper Colorado River Basin regularly experiences significant year to year hydrologic

variability. During the 19-year period 2000 to 2018, however, the unregulated inflow to Lake Powell, which is a good measure of hydrologic conditions in the Colorado River Basin, was above average in only 4 out of the past 19 years. The period 2000-2018 is the lowest 19-year period since the closure of Glen Canyon Dam in 1963, with an average unregulated inflow of 8.54 maf, or 79 percent of the 30-year average (1981-2010). (For comparison, the 1981-2010 total water year average is 10.83 maf.) The unregulated inflow during the 2000-2018 period has ranged from a low of 2.64 maf (24 percent of average) in water year 2002 to a high of 15.97 maf (147 percent of average) in water year 2011. In water year 2018 unregulated inflow volume to Lake Powell was 4.6 maf (43 percent of average), the third driest year on record above 2002 and 1977. Under the current most probable forecast, the total water year 2019 unregulated inflow to Lake Powell is projected to be 13.82 maf (128 percent of average).

At the beginning of water year 2019, total system storage in the Colorado River Basin was 28.01 maf (47 percent of 59.6 maf total system capacity). This is a decrease of 4.91 maf over the total storage at the beginning of water year 2018 when total system storage was 32.92 maf (55 percent of capacity). Since the beginning of water year 2000, total Colorado Basin storage has experienced year to year increases and decreases in response to wet and dry hydrology, ranging from a high of 94 percent of capacity at the beginning of 2000 to the now current level of 47 percent of capacity at the beginning of water year 2019. Based on current inflow forecasts, the current projected end of water year total Colorado Basin reservoir storage for water year 2019 is approximately 32.5 maf (54 percent of total system capacity). The actual end of water year 2019 system storage may vary from this projection, primarily due to uncertainty regarding this season’s runoff and reservoir inflow.

RECLAMATION
Managing Water in the West

The operation of Lake Powell and Lake Mead in this August 2019 24-Month Study is pursuant to the December 2007 Record of Decision on Colorado River Interim Guidelines for Lower Basin Shortages and the Coordinated Operations of Lake Powell and Lake Mead (Interim Guidelines), and reflects the 2019 Annual Operating Plan (AOP). Pursuant to the Interim Guidelines, the August 2018 24-Month Study projections of the January 1, 2019, system storage and reservoir water surface elevations set the operational tier for the coordinated operation of Lake Powell and Lake Mead during 2019.

Consistent with Section 6.B of the Interim Guidelines, the Lake Powell operational tier for water year 2019 is the Upper Elevation Balancing Tier. With an 8.23 million acre-feet (maf) release from Lake Powell in water year 2019, the April 2019 24-Month Study projected the end of water year elevation at Lake Powell to be above 3,575 feet and the end of water year elevation at Lake Mead to be below 1,075 feet. Therefore, in accordance with Section 6.B.4 of the Interim Guidelines, Lake Powell operations shifted to balancing releases for the remainder of water year 2019. Under Section 6.B.4, the contents of Lake Powell and Lake Mead will be balanced by the end of the water year, but not more than 9.0 maf and not less than 8.23 maf shall be released from Lake Powell. Based on the most probable inflow forecast, this August 24-Month Study projects a balancing release of 9.0 maf in water year 2019.

Consistent with Section 2.B.5 of the Interim Guidelines, the Intentionally Created Surplus (ICS) Surplus Condition is the criterion governing the operation of Lake Mead for calendar year 2019.

The August 2019 24-Month Study projects the January 1, 2020 Lake Powell elevation to be below the 2019 Equalization Elevation of 3,657 feet and above elevation 3,575 feet. Consistent with Section 6.B of the Interim Guidelines, Lake Powell's operations in water year 2020 will be governed by the Upper Elevation Balancing Tier, with an initial water year release volume of 8.23 maf and the potential for an April adjustment to equalization or balancing releases in April 2020. Based on the most probable inflow forecast, this August 24-Month Study projects an annual release of 8.23 maf in water year 2020.

The August 2019 24-Month Study projects the January 1, 2020 Lake Mead elevation to be above 1,075 feet and below 1,090 feet. Consistent with Section 2.B.5 of the Interim Guidelines, the Intentionally Created Surplus (ICS) Surplus Condition is the criterion governing the operation of Lake Mead for calendar year 2020. In addition, Section III.B of Exhibit 1 to the Lower Basin Drought Contingency Plan (DCP) Agreement will also govern the operation of Lake Mead for calendar year 2020.

The 2020 operational tier determinations for Lake Powell and Lake Mead will be documented in the 2020 AOP, which is currently in development.

The Interim Guidelines are available for download at: https://www.usbr.gov/lc/region/programs/strategies/RecordofDecision.pdf.
The 2019 AOP is available for download at: https://www.usbr.gov/lc/region/g4000/aop/AOP19.pdf.
The Colorado River DCPs are available for download at: https://www.usbr.gov/dcp/finaldocs.html.

Current runoff projections into Lake Powell are provided by the National Weather Service's Colorado Basin River Forecast Center and are as follows: Observed unregulated inflow into Lake Powell for the month of July was 2.451 maf or 225 percent of the 30-year average from 1981 to 2010. The August unregulated inflow forecast for Lake Powell is 0.700 maf or 140 percent of the 30-year average. The preliminary observed 2019 April through July unregulated inflow is 10.410 maf or 145 percent of average.

In this study, the calendar year 2019 diversion for Metropolitan Water District of Southern California (MWD) is forecasted to be 0.548 maf. The calendar year 2019 diversion for the Central Arizona Project (CAP) is forecasted to be 1.393 maf. Consumptive use for Nevada above Hoover (SNWP Use) is forecasted to be 0.218 maf for calendar year 2019.

Due to changing Lake Mead elevations, Hoover's generator capacity is adjusted based on estimated effective capacity and plant availability. The estimated effective capacity is based on projected Lake Mead elevations. Unit capacity tests will be performed as the lake elevation changes. This study reflects these changes in the projections.

Hoover, Davis, and Parker historical gross energy figures come from PO&M reports provided by the Lower Colorado Region's Power Office, Bureau of Reclamation, Boulder City, Nevada. Questions regarding these historical energy numbers can be directed to Cheri Woodward at (702) 293-8101.

August 24-Month Study
Date: August 15, 2019

From: Water Resources Group, Salt Lake City
To: All Colorado River Annual Operating Plan (AOP) Recipients

Current Reservoir Status

Reservoir	July Inflow (unregulated) (acre-feet)	Percent of Average (%)	August 14, Midnight Elevation (feet)	August 14, Midnight Reservoir Storage (acre-feet)
Fontenelle	184,000	104	6,502.60	318,000
Flaming Gorge	227,000	108	6,033.59	3,490,000
Blue Mesa	282,000	241	7,516.66	804,800
Navajo	171,000	259	6,072.30	1,513,000
Powell	2,451,000	225	3,621.04	13,874,000

Expected Operations

The operation of Lake Powell and Lake Mead in this August 2019 24-Month Study is pursuant to the December 2007 Record of Decision on Colorado River Interim Guidelines for Lower Basin Shortages and the Coordinated Operations of Lake Powell and Lake Mead (Interim Guidelines), and reflects the 2019 Annual Operating Plan (AOP). Pursuant to the Interim Guidelines, the August 2018 24-Month Study projections of the January 1, 2019, system storage and reservoir water surface elevations set the operational tier for the coordinated operation of Lake Powell and Lake Mead during 2019.

Consistent with Section 6.B of the Interim Guidelines, the Lake Powell operational tier for water year 2019 is the Upper Elevation Balancing Tier. With an 8.23 million acre-feet (maf) release from Lake Powell in water year 2019, the April 2019 24-Month Study projected the end of water year elevation at Lake Powell to be above 3,575 feet and the end of water year elevation at Lake Mead to be below 1,075 feet. Therefore, in accordance with Section 6.B.4 of the Interim Guidelines, Lake Powell operations shifted to balancing releases for the remainder of water year 2019. Under Section 6.B.4, the contents of Lake Powell and Lake Mead will be balanced by the end of the water year, but not more than 9.0 maf and not less than 8.23 maf shall be released from Lake Powell. Based on the most probable inflow forecast, this August 24-Month Study projects a balancing release of 9.0 maf in water year 2019.

Consistent with Section 2.B.5 of the Interim Guidelines, the Intentionally Created Surplus (ICS) Surplus Condition is the criterion governing the operation of Lake Mead for calendar year 2019.

The August 2019 24-Month Study projects the January 1, 2020 Lake Powell elevation to be below the 2019 Equalization Elevation of 3,657 feet and above elevation 3,575 feet. Consistent with Section 6.B of the Interim Guidelines, Lake Powell's operations in water year 2020 will be governed by the Upper Elevation Balancing Tier, with an initial water year release volume of 8.23 maf and the potential for an April adjustment to equalization or balancing releases in April 2020. Based on the most probable inflow forecast, this August 24-Month Study projects an annual release of 8.23 maf in water year 2020.

The August 2019 24-Month Study projects the January 1, 2020 Lake Mead elevation to be above 1,075 feet and below 1,090 feet. Consistent with Section 2.B.5 of the Interim Guidelines, the Intentionally Created Surplus (ICS) Surplus Condition is the criterion governing the operation of Lake Mead for calendar year 2020. In addition, Section III.B of Exhibit 1 to the Lower Basin Drought Contingency Plan (DCP) Agreement will also govern the operation of Lake Mead for calendar year 2020.

The 2020 operational tier determinations for Lake Powell and Lake Mead will be documented in the 2020 AOP, which is currently in development.

The Interim Guidelines are available for download at:
https://www.usbr.gov/lc/region/programs/strategies/RecordofDecision.pdf.
The 2019 AOP is available for download at:
https://www.usbr.gov/lc/region/g4000/aop/AOP19.pdf.
The Colorado River DCPs are available for download at:
https://www.usbr.gov/dcp/finaldocs.html.

Fontenelle Reservoir – Fontenelle Reservoir is currently at elevation 6502.72 feet, which amounts to 92 percent of live storage capacity. Inflows for the month of July totaled 184,000 acre-feet (af) or 104 percent of average. Releases are steady at 1200 cfs.

The Colorado Basin River Forecast Center has forecasted inflows that are at or near average. August, September, and October forecasted inflow volumes amount to 72,000 af (94 percent of average), 46,000 af (100 percent of average), and 46,000 af (95 percent of average), respectively.

The next Fontenelle Working Group meeting is scheduled for August 22, 2019. The meeting will be held at the Water Treatment Facility, 3 Telephone Canyon Road, Green River, WY 82935. The Fontenelle Working Group is an open public forum for information exchange between Reclamation and other parties associated with the operation of Fontenelle Reservoir.

Flaming Gorge Reservoir – The Colorado Pikeminnow base flow study is in progress. Targeted flows at the USGS Jensen gage with the combination of Flaming Gorge releases

and Yampa River flows is between 2000 cfs to 2600 cfs. Releases from Flaming Gorge Dam will depend on how much flow is provided by the Yampa River.

The August final forecast for unregulated inflows into Flaming Gorge for the next three months projects near average conditions: August, September, and October forecasted unregulated inflow volumes at 85,000 af (96 percent of average), 56,000 af (102 percent of average), and 60,000 af (102 percent of average), respectively.

Reclamation will be holding the Flaming Gorge Working Group meeting on August 15th at 10 a.m. at Carbon County Event Center, 450 S Fairgrounds Rd, Price, UT 84501, USA The Flaming Gorge Working Group is an open public forum for information exchange between Reclamation and the stakeholders of Flaming Gorge Dam. The public is encouraged to attend and comment on the operations and plans presented by Reclamation at these meetings. Meeting notes from past Working Group meetings are posted on the Working Group webpage. For more information on this group and these meetings please contact Dale Hamilton at 801-379-1186.

Aspinall Unit Reservoirs – As of August 6, 2019 releases from Crystal Dam are approximately 3,100 cfs. Uncompahgre Valley Water Users Association is diverting approximately 1,150 cfs through the Gunnison Tunnel and flows in the Black Canyon are about 2,350 cfs. Releases from Crystal are in gradually being reduced as inflows to Blue Mesa steadily decrease. By Thursday, August 8, 2019 releases from Crystal will be set to approximately 2500 cfs and will likely remain at this level for the next 2 weeks.

Blue Mesa did fill this year and achieved a peak elevation on July 25, 2019 of 7519.15 feet above sea level which corresponded to a storage content of 827,000 af (99 percent of full pool). Since this peak filling, Blue Mesa's elevation has declined to 7517.28 feet above sea level on August 8, 2019.

The unregulated inflow volume in July to Blue Mesa was 282 kaf (241 percent of average). Unregulated Inflow volumes forecasted for Blue Mesa for the next three months (August, September and October) are projected to be: 88,000 af (140 percent of average), 53,000 af (140 percent of average) and 47,000 af (124 percent of average), respectively. The August 24-Month Study is reflective of these new forecasts. The water year unregulated inflow forecast volume for 2019 is 1.361 maf which is 143 percent of average.

The Aspinall Unit Working Group is an open public forum for information exchange between Reclamation and the stakeholders of the Aspinall Unit. The public is encouraged to attend and comments on the operations and plans presented by Reclamation at these meetings. Meeting notes from past working Group meetings are posted on the Working Group webpage. For more information on this group and these meetings please contact Erik Knight in the Grand Junction Area Office at (970) 248-0629.

Meeting notes from past working Group meetings are posted on the Working Group webpage at:

https://www.usbr.gov/uc/wcao/water/rsvrs/mtgs/amcurrnt.html

The next meeting of the Aspinall Unit Working Group will be held on Tuesday, August 15, 2019 at 1:00 pm at the Elk Creek Visitor Center at Blue Mesa Reservoir.

Navajo Reservoir – On August 4th, the daily average release rate from Navajo Dam was approximately 1,030 cfs while reservoir inflow (modified unregulated) was averaging approximately 1,160 cfs. The water surface elevation was 6073.6 feet above sea level. At this elevation the live storage is 1.53 maf (90 percent of live storage capacity) and the active storage is 0.86 maf (83 percent of active storage capacity). NIIP was diverting 840 cfs from the reservoir. The river flow measured at the Animas River at Farmington USGS gage was at 1,030 cfs. River flow at the San Juan River at Four Corners USGS gage was 1,640 cfs.

Total April-July modified unregulated inflow totaled 1.16 maf, or 158 percent of average. Releases from Navajo Dam are made for authorized purposes of the Navajo Unit and are pursuant to the Record of Decision for the Navajo Reservoir Operations.

Preliminary modified-unregulated inflow into Navajo (inflow adjusted for upstream change in storage, reservoir evaporation and exportation from the basin) in July was 171 kaf (259 percent of average for the month).

Forecast modified-unregulated inflow to Navajo over the next three months (August, September, and October) are projected to be: 48 kaf (106 percent of average), 42 kaf (97 percent of average), and 45 kaf (96 percent of average), respectively.

A maintenance release was conducted from Navajo Dam from June 3rd through June 15th. The release peaked at 5,000 cfs on June 12th. The reservoir is likely to peak in the next several days at an elevation near 6075.5 ft.

The San Juan River Recovery Implementation Program (SJRIP) has requested Available Water over the End of Water Year Storage Target of 6063 ft be used to augment baseflows in the critical habitat reach (Farmington to Lake Powell), as recommended in the Flow Recommendations decision tree (1999, updated 2016). Available water over this target will be used to increase the downstream target baseflow to 1500 cfs through October, as long as water is available. Starting in November, the target baseflow will be set as low as possible (with a minimum of 500 cfs) for two weeks, by reducing the release as low as possible, as low as 250 cfs (ROD, 2006). By mid-November, the release will resume normal operations, in an attempt to maintain the typical target baseflow range of 500 - 1000 cfs. Releases will likely range from 800 – 1200 cfs throughout the remainder of the summer.

Reclamation conducts Public Operations Meetings three times per year to gather input for determining upcoming operations for Navajo Reservoir. Input from individuals, organizations, and agencies along with other factors such as weather, water rights,

endangered species requirements, flood control, hydro power, recreation, fish and wildlife management, and reservoir levels, will be considered in the development of these reservoir operation plans. In addition, the meetings are used to coordinate activities and exchange information among agencies, water users, and other interested parties concerning the San Juan River and Navajo Reservoir. The next Navajo Unit Coordination Meeting will be held Tuesday, August 20, 2019 at 1:00 pm at the Farmington Civic Center (200 West Arrington, Farmington, NM).

Glen Canyon Dam / Lake Powell

Current Status

The Department of the Interior is conducting the first experimental flow at Glen Canyon Dam since implementing its Long-Term Experimental and Management Plan (LTEMP). The goal is to provide enhanced habitat for the lifecycle of aquatic insects that are the primary food source for fish in the Colorado River.

Experiments under LTEMP consist of four different flow regimes: high flows, bug flows, trout management flows, and low summer flows. Collaborative discussions among technical experts resulted in a decision to begin this first experiment on May 1 and continue through August 31, 2018. This experiment is being continued for 2019, same time period, (May – August). It will slightly modify the schedule and flow rates of water releases from Lake Powell through Glen Canyon Dam, Arizona. The normally scheduled monthly and weekly release volumes will not be affected.

Flows during the experiment will include steady weekend water releases with routine hydropower production flows on weekdays that include normal hourly changes in release rates. Those steady weekend flows are expected to provide favorable conditions for aquatic insects to lay and cement their eggs to rocks, vegetation, and other materials near the river's edge. Steady weekend flows will be relatively low, within four inches of typical weekday low water levels. It is unlikely casual recreational river users will notice the changes in water levels.

Insects expected to benefit from this experiment are an important food source for many species of fish, birds, and bats in the canyon. Beyond expected resource benefits, this experiment will also provide scientific information that will be used in future decision making.

The unregulated inflow volume to Lake Powell during July was 2.45 (maf) (225 percent of average). The release volume from Glen Canyon Dam in July was 857 thousand acre-feet (kaf). The end of July elevation and storage of Lake Powell were 3,622 ft (78 feet from full pool) and 13.93 maf (57 percent of full capacity), respectively.

Current Operations

The operating tier for water year 2019 was established in August 2018 as the Upper Elevation Balancing Tier. As described in the Interim Guidelines, under balancing, the contents of Lake Powell and Lake Mead are to be balanced by the end of the water year,

but not more than 9.0 maf and not less than 8.23 maf is to be released from Lake Powell. Under this Tier the initial annual water year release volume is 8.23 maf, and the April 2019 24-Month Study projects the end of water year elevation at Lake Powell to be above 3,575 feet, and the end of water year elevation at Lake Mead to be below 1,075 feet. Lake Powell operations have shifted to balancing releases for the remainder of water year 2019. Lake Powell is currently projected to release 9.0 maf in water year 2019. Reclamation will schedule operations at Glen Canyon Dam to achieve as practicably as possible the appropriate total annual release volume by September 30, 2019.

In August, the release volume will be approximately 900 kaf, with fluctuations anticipated between about 10,850 cfs in the nighttime to about 18,850 cfs in the daytime with 11,600 cfs steady releases during the weekend, and consistent with the Glen Canyon Dam, Record of Decision (dated December 2016). The anticipated release volume for September is 687 kaf with daily fluctuations between approximately 8.380 cfs and 14,530 cfs. The expected release for October is 640 kaf.

In addition to daily scheduled fluctuations for power generation, the instantaneous releases from Glen Canyon Dam may also fluctuate to provide 40 megawatts (mw) of system regulation. These instantaneous release adjustments stabilize the electrical generation and transmission system and translate to a range of about 1,200 cfs above or below the hourly scheduled release rate. Under system normal conditions, fluctuations for regulation are typically short lived and generally balance out over the hour with minimal or no noticeable impacts on downstream river flow conditions.

Releases from Glen Canyon Dam can also fluctuate beyond scheduled releases when called upon to respond to unscheduled power outages or power system emergencies. Depending on the severity of the system emergency, the response from Glen Canyon Dam can be significant, within the full range of the operating capacity of the power plant for as long as is necessary to maintain balance in the transmission system. Glen Canyon Dam currently maintains 30 mw (approximately 800 cfs) of generation capacity in reserve in order to respond to a system emergency even when generation rates are already high. System emergencies occur fairly infrequently and typically require small responses from Glen Canyon Dam. However, these responses can have a noticeable impact on the river downstream of Glen Canyon Dam.

Inflow Forecasts and Model Projections

The forecast for water year 2020 unregulated inflow to Lake Powell, issued on August 1, 2019, by the Colorado Basin River Forecast Center, projects that the most probable (median) unregulated inflow volume this year will be 10.8 maf (100 percent of average). There is significant uncertainty regarding this season's snow pack development and resulting runoff into Lake Powell. Reclamation updates the minimum and maximum probable forecasts four times a year: January, April, August and October. The August forecast ranges from a minimum probable of 7.0 maf (65 percent of average) to a maximum probable of 19 maf (175 percent of average). There is a 10 percent chance that inflows could be higher than the current maximum probable forecast and a 10 percent chance that inflows could be lower than the minimum probable forecast.

Based on the current forecast, the August 24-Month Study projects Lake Powell elevation will end water year 2020 near 3,640.14 feet with approximately 16.02 maf in storage (66 percent of capacity). Note that projections of elevation and storage for water year 2020 have significant uncertainty at this point in the season. Projections of end of water year 2020 elevation and storage using the minimum and maximum probable inflow forecast from August 2019 are 3,605.03 feet (12.24 maf, 50 percent of capacity) and 3,657 feet (18.10 maf, 74 percent of capacity), respectively. Under these scenarios, there is a 10 percent chance that inflows will be higher, resulting in higher elevation and storage, and 10 percent chance that inflows will be lower, resulting in lower elevation and storage. The annual release volume from Lake Powell during water year 2020 is projected to be 8.23 maf under the August most probable scenario, and 9.0 maf under the minimum probable and 13.49 maf under the maximum probable inflow scenarios.

Upper Colorado River Basin Hydrology

Upper Colorado River Basin regularly experiences significant year to year hydrologic variability. During the 19-year period 2000 to 2018, however, the unregulated inflow to Lake Powell, which is a good measure of hydrologic conditions in the Colorado River Basin, was above average in only 4 out of the past 19 years. The period 2000-2018 is the lowest 19-year period since the closure of Glen Canyon Dam in 1963, with an average unregulated inflow of 8.54 maf, or 79 percent of the 30-year average (1981-2010). (For comparison, the 1981-2010 total water year average is 10.83 maf.) The unregulated inflow during the 2000-2018 period has ranged from a low of 2.64 maf (24 percent of average) in water year 2002 to a high of 15.97 maf (147 percent of average) in water year 2011. In water year 2018 unregulated inflow volume to Lake Powell was 4.6 maf (43 percent of average), the third driest year on record above 2002 and 1977. Under the current most probable forecast, the total water year 2019 unregulated inflow to Lake Powell is projected to be 13.54 maf (125 percent of average).

At the beginning of water year 2019, total system storage in the Colorado River Basin was 28.01 maf (47 percent of 59.6 maf total system capacity). This is a decrease of 4.91 maf over the total storage at the beginning of water year 2018 when total system storage was 32.92 maf (55 percent of capacity). Since the beginning of water year 2000, total Colorado Basin storage has experienced year to year increases and decreases in response to wet and dry hydrology, ranging from a high of 94 percent of capacity at the beginning of 2000 to the now current level of 47 percent of capacity at the beginning of water year 2019. Based on current inflow forecasts, the current projected end of water year total Colorado Basin reservoir storage for water year 2019 is approximately 32.2 maf (54 percent of total system capacity). The actual end of water year 2019 system storage may vary from this projection, primarily due to uncertainty regarding this season's runoff and reservoir inflow.

September 24-Month Study
Date: September 13, 2019

From: Water Resources Group, Salt Lake City
To: All Colorado River Annual Operating Plan (AOP) Recipients

Current Reservoir Status

Reservoir	August Inflow (unregulated) (acre-feet)	Percent of Average (%)	September 13, Midnight Elevation (feet)	September 13, Midnight Reservoir Storage (acre-feet)
Fontenelle	57,000	74	6,498.17	285,000
Flaming Gorge	59,000	67	6,032.33	3,440,000
Blue Mesa	92,000	144	7,512.46	767,000
Navajo	40,000	89	6,065.43	1,418,000
Powell	472,000	94	3,617.22	13,480,000

Expected Operations

The operation of Lake Powell and Lake Mead in this September 2019 24-Month Study is pursuant to the December 2007 Record of Decision on Colorado River Interim Guidelines for Lower Basin Shortages and the Coordinated Operations of Lake Powell and Lake Mead (Interim Guidelines), and reflects the 2019 Annual Operating Plan (AOP). Pursuant to the Interim Guidelines, the August 2018 24-Month Study projections of the January 1, 2019, system storage and reservoir water surface elevations set the operational tier for the coordinated operation of Lake Powell and Lake Mead during 2019.

Consistent with Section 6.B of the Interim Guidelines, the Lake Powell operational tier for water year 2019 is the Upper Elevation Balancing Tier. With an 8.23 million acre-feet (maf) release from Lake Powell in water year 2019, the April 2019 24-Month Study projected the end of water year elevation at Lake Powell to be above 3,575 feet and the end of water year elevation at Lake Mead to be below 1,075 feet. Therefore, in accordance with Section 6.B.4 of the Interim Guidelines, Lake Powell operations shifted to balancing releases for the remainder of water year 2019. Under Section 6.B.4, the contents of Lake Powell and Lake Mead will be balanced by the end of the water year, but not more than 9.0 maf and not less than 8.23 maf shall be released from Lake Powell. Based on the most probable inflow forecast, this September 24-Month Study projects a balancing release of 9.0 maf in water year 2019.

Consistent with Section 2.B.5 of the Interim Guidelines, the Intentionally Created Surplus (ICS) Surplus Condition is the criterion governing the operation of Lake Mead for calendar year 2019.

The August 2019 24-Month Study projects the January 1, 2020 Lake Powell elevation to be below the 2019 Equalization Elevation of 3,657 feet and above elevation 3,575 feet. Consistent with Section 6.B of the Interim Guidelines, Lake Powell's operations in water year 2020 will be governed by the Upper Elevation Balancing Tier, with an initial water year release volume of 8.23 maf and the potential for an April adjustment to equalization or balancing releases in April 2020. Based on the most probable inflow forecast, this September 24-Month Study projects an annual release of 8.23 maf in water year 2020.

The August 2019 24-Month Study projects the January 1, 2020 Lake Mead elevation to be above 1,075 feet and below 1,090 feet. Consistent with Section 2.B.5 of the Interim Guidelines, the Intentionally Created Surplus (ICS) Surplus Condition is the criterion governing the operation of Lake Mead for calendar year 2020. In addition, Section III.B of Exhibit 1 to the Lower Basin Drought Contingency Plan (DCP) Agreement will also govern the operation of Lake Mead for calendar year 2020.

The 2020 operational tier determinations for Lake Powell and Lake Mead will be documented in the 2020 AOP, which is currently in development.

The Interim Guidelines are available for download at:
https://www.usbr.gov/lc/region/programs/strategies/RecordofDecision.pdf.
The 2019 AOP is available for download at:

The Colorado River DCPs are available for download at:
https://www.usbr.gov/dcp/finaldocs.html.

Fontenelle Reservoir – As of September 4, 2019 Fontenelle Reservoir pool elevation is 6499.23 feet, which amounts to 85 percent of live storage capacity. Inflows for the month of August totaled 56,935 acre-feet (af) or 74 percent of average. Releases were changed from 1200 cfs to 1100 cfs and is planned to remain near this release until late March.

The Colorado Basin River Forecast Center has forecasted inflows that are at or near average. September, October and November forecasted inflow volumes amount to 40,000 af (87 percent of average), 45,000 af (93 percent of average), and 44,000 af (105 percent of average), respectively.

The next Fontenelle Working Group meeting is scheduled for April 22, 2020 from 10:00 a.m. to 12:00 p.m. The meeting is planned to held at the 3 Telephone Canyon Road, Green River, WY 82935. The Fontenelle Working Group is an open public forum for

information exchange between Reclamation and other parties associated with the operation of Fontenelle Reservoir.

Flaming Gorge Reservoir – The Colorado Pikeminnow base flow study is in progress. Targeted flows at the USGS Jensen gage with the combination of Flaming Gorge releases and Yampa River flows are between 2000 cfs to 2600 cfs. Releases from Flaming Gorge Dam will depend on how much flow is provided by the Yampa River. This will continue through the end of September.

As of September 4, 2019 Flaming Gorge Reservoir pool elevation is 6032.61 feet, which amounts to 92 percent of live storage capacity. Inflows for the month of August totaled 59,473acre-feet (af) or 74 percent of average. Release will be sustained at 1900 cfs until the end of the Colorado Pikeminnow study, pending the Yampa River contributing flows.

The September final forecast for unregulated inflows into Flaming Gorge for the next three months projects near average conditions: September, October, and November forecasted unregulated inflow volumes at 45,000 af (82 percent of average), 57,000 af (97 percent of average), and 56,000 af (110 percent of average), respectively.

Reclamation is planning to hold the Pre-Flaming Gorge Working Group meeting on March 19, 2020 from 10:00 am to 1:00 pm at the Uintah Conference Center in Vernal UT (313 East 200 South). The Flaming Gorge Working Group meeting to review stakeholders comments and input is scheduled for April 16, 2020 from 10:00 a.m. to 1:00 p.m. at Carbon County Event Center, 450 S Fairgrounds Rd, Price, UT 84501, USA.

The Flaming Gorge Working Group is an open public forum for information exchange between Reclamation and the stakeholders of Flaming Gorge Dam. The public is encouraged to attend and comment on the operations and plans presented by Reclamation at these meetings. Meeting notes from past Working Group meetings are posted on the Working Group webpage. For more information on this group and these meetings please contact Dale Hamilton at 801-379-1186.

Aspinall Unit Reservoirs – As of September 9, 2019 releases from Crystal Dam are approximately 1,600 cfs. Uncompahgre Valley Water Users Association is diverting approximately 1,030 cfs through the Gunnison Tunnel and flows in the Black Canyon are about 600 cfs. Releases from Crystal are projected to remain at about this level throughout the fall.

Blue Mesa did fill this year and achieved a peak elevation on July 25, 2019 of 7519.15 feet above sea level which corresponded to a storage content of 827,000 af (99 percent of full pool). Since this peak filling, Blue Mesa's elevation has declined to 7513.09 feet above sea level on September 9, 2019.

The unregulated inflow volume in August to Blue Mesa was 91.6 kaf (144 percent of average). Unregulated Inflow volumes forecasted for Blue Mesa for the next three months (September, October and November) are projected to be: 88,000 af (140 percent

of average), 50,000 af (132 percent of average) and 46,000 af (121 percent of average), respectively. The September 24-Month Study is reflective of these new forecasts. The water year unregulated inflow forecast volume for 2019 is 1.362 maf which is 143 percent of average.

The Aspinall Unit Working Group is an open public forum for information exchange between Reclamation and the stakeholders of the Aspinall Unit. The public is encouraged to attend and comments on the operations and plans presented by Reclamation at these meetings. Meeting notes from past working Group meetings are posted on the Working Group webpage. For more information on this group and these meetings please contact Erik Knight in the Grand Junction Area Office at (970) 248-0629.

Meeting notes from past working Group meetings are posted on the Working Group webpage at:

https://www.usbr.gov/uc/wcao/water/rsvrs/mtgs/amcurrnt.html

The next meeting of the Aspinall Unit Working Group will be held on Thursday, January 23, 2020 at 1:00 pm at the Holiday Inn Express located in Montrose, Colorado.

Navajo Reservoir – On September 10th, the daily average release rate from Navajo Dam was approximately 1,220 cfs while reservoir inflow (modified unregulated) was averaging approximately -50 cfs. The water surface elevation was 6065.9 feet above sea level. At this elevation the live storage is 1.42 maf (83 percent of live storage capacity) and the active storage is 0.75 maf (72 percent of active storage capacity). NIIP was diverting 625 cfs from the reservoir. The river flow measured at the Animas River at Farmington USGS gage was at 225 cfs. River flow at the San Juan River at Four Corners USGS gage was 1,270 cfs.

Total April-July modified unregulated inflow totaled 1.16 maf, or 158 percent of average. Releases from Navajo Dam are made for authorized purposes of the Navajo Unit and are pursuant to the Record of Decision for the Navajo Reservoir Operations.

Preliminary modified-unregulated inflow into Navajo (inflow adjusted for upstream change in storage, reservoir evaporation and exportation from the basin) in August was 40 kaf (89 percent of average for the month).

Forecast modified-unregulated inflow to Navajo over the next three months (September, October and November) are projected to be: 26 kaf (60 percent of average), 40 kaf (85 percent of average), and 37 kaf (112 percent of average), respectively.

A maintenance release was conducted from Navajo Dam from June 3rd through June 15th. The release peaked at 5,000 cfs on June 12th. Reservoir elevation peaked on July 16th at 6075.27 ft.

The San Juan River Recovery Implementation Program (SJRIP) has requested Available Water over the End of Water Year Storage Target of 6063 ft be used to augment baseflows in the critical habitat reach (Farmington to Lake Powell), as recommended in the Flow Recommendations decision tree (1999, updated 2016). Available water over this target will be used to increase the downstream target baseflow to 1500 cfs through October, as long as water is available. Starting in November, the target baseflow will be set as low as possible (with a minimum of 500 cfs) for two weeks, by reducing the release as low as possible, as low as 250 cfs (ROD, 2006). By mid-November, the release will resume normal operations, in an attempt to maintain the typical target baseflow range of 500 - 1000 cfs. Releases will likely range from 800 – 1200 cfs throughout the remainder of the summer.

Reclamation conducts Public Operations Meetings three times per year to gather input for determining upcoming operations for Navajo Reservoir. Input from individuals, organizations, and agencies along with other factors such as weather, water rights, endangered species requirements, flood control, hydro power, recreation, fish and wildlife management, and reservoir levels, will be considered in the development of these reservoir operation plans. In addition, the meetings are used to coordinate activities and exchange information among agencies, water users, and other interested parties concerning the San Juan River and Navajo Reservoir. The next Navajo Unit Coordination Meeting will be held Tuesday, January 21, 2020 at 1:00 pm at the Farmington Civic Center (200 West Arrington, Farmington, NM).

Glen Canyon Dam / Lake Powell

Current Status

The unregulated inflow volume to Lake Powell during August 472 thousand acre-feet (kaf) (94 percent of average). The release volume from Glen Canyon Dam in August was 900 kaf. The end of August elevation and storage of Lake Powell were 3,619 ft (81 feet from full pool) and 13.61 maf (56 percent of full capacity), respectively.

Current Operations

The operating tier for water year 2019 was established in August 2018 as the Upper Elevation Balancing Tier. As described in the Interim Guidelines, under balancing, the contents of Lake Powell and Lake Mead are to be balanced by the end of the water year, but not more than 9.0 maf and not less than 8.23 maf is to be released from Lake Powell. Under this Tier the initial annual water year release volume is 8.23 maf, and the April 2019 24-Month Study projects the end of water year elevation at Lake Powell to be above 3,575 feet, and the end of water year elevation at Lake Mead to be below 1,075 feet. Lake Powell operations have shifted to balancing releases for the remainder of water year 2019. Lake Powell is currently projected to release 9.0 maf in water year 2019. Reclamation will schedule operations at Glen Canyon Dam to achieve as practicably as possible the appropriate total annual release volume by September 30, 2019.

In September, the release volume will be approximately 686 kaf, with fluctuations anticipated between about 8,380 cfs in the nighttime to about 14,530 cfs in the daytime,

and consistent with the Glen Canyon Dam, Record of Decision (dated December 2016). The anticipated release volume for October is 625 kaf with daily fluctuations between approximately 6,740 cfs and 12,500 cfs. The expected release for November is 625 kaf.

In addition to daily scheduled fluctuations for power generation, the instantaneous releases from Glen Canyon Dam may also fluctuate to provide 40 megawatts (mw) of system regulation. These instantaneous release adjustments stabilize the electrical generation and transmission system and translate to a range of about 1,200 cfs above or below the hourly scheduled release rate. Under system normal conditions, fluctuations for regulation are typically short lived and generally balance out over the hour with minimal or no noticeable impacts on downstream river flow conditions.

Releases from Glen Canyon Dam can also fluctuate beyond scheduled releases when called upon to respond to unscheduled power outages or power system emergencies. Depending on the severity of the system emergency, the response from Glen Canyon Dam can be significant, within the full range of the operating capacity of the power plant for as long as is necessary to maintain balance in the transmission system. Glen Canyon Dam currently maintains 30 mw (approximately 800 cfs) of generation capacity in reserve in order to respond to a system emergency even when generation rates are already high. System emergencies occur fairly infrequently and typically require small responses from Glen Canyon Dam. However, these responses can have a noticeable impact on the river downstream of Glen Canyon Dam.

Inflow Forecasts and Model Projections

The forecast for water year 2020 unregulated inflow to Lake Powell, issued on September 1, 2019, by the Colorado Basin River Forecast Center, projects that the most probable (median) unregulated inflow volume this year will be 10.5 maf (97 percent of average). There is significant uncertainty regarding this season's snowpack development and resulting runoff into Lake Powell. Reclamation updates the minimum and maximum probable forecasts four times a year: January, April, August and October. The August forecast ranges from a minimum probable of 7.0 maf (65 percent of average) to a maximum probable of 19 maf (175 percent of average). There is a 10 percent chance that inflows could be higher than the current maximum probable forecast and a 10 percent chance that inflows could be lower than the minimum probable forecast.

Based on the current forecast, the September 24-Month Study projects Lake Powell elevation will end water year 2020 near 3,634.62 feet with approximately 15.38 maf in storage (63 percent of capacity). Note that projections of elevation and storage for water year 2020 have significant uncertainty at this point in the season. Projections of end of water year 2020 elevation and storage using the minimum and maximum probable inflow forecast from August 2019 are 3,605.03 feet (12.24 maf, 50 percent of capacity) and 3,657 feet (18.10 maf, 74 percent of capacity), respectively. Under these scenarios, there is a 10 percent chance that inflows will be higher, resulting in higher elevation and storage, and 10 percent chance that inflows will be lower, resulting in lower elevation and storage. The annual release volume from Lake Powell during water year 2020 is projected to be 8.23 maf under the September most probable scenario. The August 24-

Month Study determined a 9.0 maf under the minimum probable and 13.49 maf under the maximum probable inflow scenarios.

Upper Colorado River Basin Hydrology

Upper Colorado River Basin regularly experiences significant year to year hydrologic variability. During the 19-year period 2000 to 2018, however, the unregulated inflow to Lake Powell, which is a good measure of hydrologic conditions in the Colorado River Basin, was above average in only 4 out of the past 19 years. The period 2000-2018 is the lowest 19-year period since the closure of Glen Canyon Dam in 1963, with an average unregulated inflow of 8.54 maf, or 79 percent of the 30-year average (1981-2010). (For comparison, the 1981-2010 total water year average is 10.83 maf.) The unregulated inflow during the 2000-2018 period has ranged from a low of 2.64 maf (24 percent of average) in water year 2002 to a high of 15.97 maf (147 percent of average) in water year 2011. In water year 2018 unregulated inflow volume to Lake Powell was 4.6 maf (43 percent of average), the third driest year on record above 2002 and 1977. Under the current most probable forecast, the total water year 2019 unregulated inflow to Lake Powell is projected to be 13.19 maf (122 percent of average).

At the beginning of water year 2019, total system storage in the Colorado River Basin was 28.01 maf (47 percent of 59.6 maf total system capacity). This is a decrease of 4.91 maf over the total storage at the beginning of water year 2018 when total system storage was 32.92 maf (55 percent of capacity). Since the beginning of water year 2000, total Colorado Basin storage has experienced year to year increases and decreases in response to wet and dry hydrology, ranging from a high of 94 percent of capacity at the beginning of 2000 to the now current level of 47 percent of capacity at the beginning of water year 2019. Based on current inflow forecasts, the current projected end of water year total Colorado Basin reservoir storage for water year 2019 is approximately 31.8 maf (53 percent of total system capacity). The actual end of water year 2019 system storage may vary from this projection, primarily due to uncertainty regarding this season's runoff and reservoir inflow.

October 24-Month Study
Date: October 11, 2019

From: Water Resources Group, Salt Lake City
To: All Colorado River Annual Operating Plan (AOP) Recipients

Current Reservoir Status

Reservoir	September Inflow (unregulated) (acre-feet)	Percent of Average (%)	October 10, Midnight Elevation (feet)	October 10, Midnight Reservoir Storage (acre-feet)
Fontenelle	41,000	89	6,495.81	267,000
Flaming Gorge	49,000	90	6,031.21	3,396,000
Blue Mesa	31,500	85	7,506.67	717,000
Navajo	3,400	8	6,062.11	1,375,000
Powell	143,000	35	3,614.52	13,190,000

Expected Operations

The operation of Lake Powell and Lake Mead in this October 2019 24-Month Study is pursuant to the December 2007 Record of Decision on Colorado River Interim Guidelines for Lower Basin Shortages and the Coordinated Operations of Lake Powell and Lake Mead (Interim Guidelines), and reflects the 2019 Annual Operating Plan (AOP) and draft 2020 AOP. Pursuant to the Interim Guidelines, the August 2019 24-Month Study projections of the January 1, 2020, system storage and reservoir water surface elevations set the operational tier for the coordinated operation of Lake Powell and Lake Mead during 2020.

The August 2019 24-Month Study projected the January 1, 2020, Lake Powell elevation to be below the 2019 Equalization Elevation of 3,657 feet and above elevation 3,575 feet. Consistent with Section 6.B of the Interim Guidelines, Lake Powell's operations in water year 2020 will be governed by the Upper Elevation Balancing Tier, with an initial water year release volume of 8.23 maf and the potential for an April adjustment to equalization or balancing releases in April 2020. Based on the most probable inflow forecast, this October 24-Month Study projects an annual release of 8.23 maf in water year 2020.

Consistent with Section 2.B.5 of the Interim Guidelines, the Intentionally Created Surplus (ICS) Surplus Condition is the criterion governing the operation of Lake Mead for calendar year 2019.

The August 2019 24-Month Study projected the January 1, 2020, Lake Mead elevation to be above 1,075 feet and below 1,090 feet. Consistent with Section 2.B.5 of the Interim Guidelines, the Intentionally Created Surplus (ICS) Surplus Condition is the criterion governing the operation of Lake Mead for calendar year 2020. In addition, Section III.B of Exhibit 1 to the Lower Basin Drought Contingency Plan (DCP) Agreement will also govern the operation of Lake Mead for calendar year 2020.

The 2020 operational tier determinations for Lake Powell and Lake Mead will be documented in the 2020 AOP, which is currently in development.

The Interim Guidelines are available for download at:
https://www.usbr.gov/lc/region/programs/strategies/RecordofDecision.pdf.
The 2019 AOP is available for download at:
https://www.usbr.gov/lc/region/g4000/aop/AOP19.pdf.
The draft 2020 AOP is available for download at:
https://www.usbr.gov/lc/region/g4000/AOP2020/2020AOP_2019-08-30_Consultation-3.pdf.
The Colorado River DCPs are available for download at:
https://www.usbr.gov/lc/region/programs/dcp.html.

Fontenelle Reservoir – As of October 2, 2019 Fontenelle Reservoir pool elevation is 6496.30 feet, which amounts to 78 percent of live storage capacity. Inflows for the month of September totaled 40,958 acre-feet (af) or 89 percent of average. Releases remain at 1100 cfs.

The Colorado Basin River Forecast Center has forecasted inflows that are near average. October, November, and December forecasted inflow volumes amount to 45,000 af (93 percent of average), 44,000 af (105 percent of average), and 37,000 af (116 percent of average), respectively.

The next Fontenelle Working Group meeting is scheduled for April 22, 2020 from 10:00 a.m. to 12:00 p.m. The meeting is planned to held at the 3 Telephone Canyon Road, Green River, WY 82935. The Fontenelle Working Group is an open public forum for information exchange between Reclamation and other parties associated with the operation of Fontenelle Reservoir.

Flaming Gorge Reservoir – Flaming Gorge average daily releases are planned to be lowered beginning on October 1st by 50 cfs per day from the currently daily average of 1,900 cfs to a daily average of 1,100 cfs by October 16th. This is the transition from Colorado Pikeminnow Summer/Autumn base flows to (-) 40% base flows according to the 2006 Record of Decision and is identified in the Flaming Gorge Operation Plan May 2019 to April 2020 -- https://www.usbr.gov/uc/water/crsp/cs/pdf/20190500-FlamingGorgeMay2019April2020-OperationPlan-508-PO.pdf.

As of October 2, 2019, Flaming Gorge Reservoir pool elevation is 6031.47 feet, which amounts to 91 percent of live storage capacity. Inflows for the month of September

totaled 74,452 acre-feet (af) or 107 percent of average. The 1,100 cfs average daily release is projected to continue through November.

The October final forecast for unregulated inflows into Flaming Gorge for the next three months projects near average conditions: October, November, and December forecasted unregulated inflow volumes at 57,000 af (97 percent of average), 56,000 af (110 percent of average), and 40,000 af (115 percent of average), respectively.

Reclamation is planning to hold the Pre-Flaming Gorge Working Group meeting on March 19, 2020 from 10:00 am to 1:00 pm at the Uintah Conference Center in Vernal UT (313 East 200 South). The Flaming Gorge Working Group meeting to review stakeholders comments and input is scheduled for April 16, 2020 from 10:00 a.m. to 1:00 p.m. at Carbon County Event Center, 450 S Fairgrounds Rd, Price, UT 84501, USA.

The Flaming Gorge Working Group is an open public forum for information exchange between Reclamation and the stakeholders of Flaming Gorge Dam. The public is encouraged to attend and comment on the operations and plans presented by Reclamation at these meetings. Meeting notes from past Working Group meetings are posted on the Working Group webpage. For more information on this group and these meetings please contact Dale Hamilton at 801-379-1186.

Aspinall Unit Reservoirs – As of October 6, 2019 releases from Crystal Dam are approximately 1,450 cfs. Uncompahgre Valley Water Users Association is diverting approximately 1,040 cfs through the Gunnison Tunnel and flows in the Black Canyon are about 600 cfs. Releases from Crystal are projected to remain at about this level throughout the fall.

Blue Mesa did fill this year and achieved a peak elevation on July 25, 2019 of 7519.15 feet above sea level which corresponded to a storage content of 827,000 af (99 percent of full pool). Since this peak filling, Blue Mesa's elevation has declined to 7507.36 feet above sea level on October 6, 2019.

The unregulated inflow volume in September to Blue Mesa was 31.5 kaf (83 percent of average). Unregulated Inflow volumes forecasted for Blue Mesa for the next three months (October, November, December) are projected to be: 38,000 af (100 percent of average), 34,000 af (110 percent of average) and 29,000 af (112 percent of average), respectively. The October 24-Month Study is reflective of these new forecasts. The water year unregulated inflow forecast volume for 2020 is 0.880 maf which is 92 percent of average.

The Aspinall Unit Working Group is an open public forum for information exchange between Reclamation and the stakeholders of the Aspinall Unit. The public is encouraged to attend and comments on the operations and plans presented by Reclamation at these meetings. Meeting notes from past working Group meetings are posted on the Working Group webpage. For more information on this group and these meetings please contact Erik Knight in the Grand Junction Area Office at (970) 248-0629.

Meeting notes from past working Group meetings are posted on the Working Group webpage at:

https://www.usbr.gov/uc/wcao/water/rsvrs/mtgs/amcurrnt.html

The next meeting of the Aspinall Unit Working Group will be held on Thursday, January 23, 2020 at 1:00 pm at the Holiday Inn Express located in Montrose, Colorado.

Navajo Reservoir – On October 2nd, the daily average release rate from Navajo Dam was approximately 593 cfs while reservoir inflow (modified unregulated) was averaging approximately 27 cfs. The water surface elevation was 6062.9 feet above sea level. At this elevation the live storage is 1.39 maf (81 percent of live storage capacity) and the active storage is 0.72 maf (70 percent of active storage capacity). NIIP was diverting 330 cfs from the reservoir. The river flow measured at the Animas River at Farmington USGS gage was at 203 cfs. River flow at the San Juan River at Four Corners USGS gage was 632 cfs.

Releases from Navajo Dam are made for authorized purposes of the Navajo Unit and are pursuant to the Record of Decision for the Navajo Reservoir Operations.

Preliminary modified-unregulated inflow into Navajo (inflow adjusted for upstream change in storage, reservoir evaporation and exportation from the basin) in September was 3 kaf (8 percent of average for the month).

Forecast modified-unregulated inflow to Navajo over the next three months (October, November and December) are projected to be: 18 kaf (38 percent of average), 25 kaf (75 percent of average), and 24 kaf (96 percent of average), respectively.

Releases for the fall and winter will be made to target the San Juan River Recovery Implementation Program's recommended baseflow range of 500 cfs to 1000 cfs. Releases will likely range between 300 cfs and 600 cfs for the remainder of the calendar year.

Analysis of current carryover storage with 35 years of historical hydrology (1981 - 2015) shows that Navajo has a 60 percent chance of filling to at least 6070 feet, and a 50 percent chance of conducting a spring peak release in the spring of 2020.

Reclamation conducts Public Operations Meetings three times per year to gather input for determining upcoming operations for Navajo Reservoir. Input from individuals, organizations, and agencies along with other factors such as weather, water rights, endangered species requirements, flood control, hydro power, recreation, fish and wildlife management, and reservoir levels, will be considered in the development of these reservoir operation plans. In addition, the meetings are used to coordinate activities and exchange information among agencies, water users, and other interested parties concerning the San Juan River and Navajo Reservoir. The next Navajo Unit Coordination Meeting will be held Tuesday, January 21, 2020 at 1:00 pm at the Farmington Civic Center (200 West Arrington, Farmington, NM).

Glen Canyon Dam / Lake Powell

Current Status

The unregulated inflow volume to Lake Powell during September was 143 thousand acre-feet (kaf) (35 percent of average). The release volume from Glen Canyon Dam in September was 687 kaf. The end of September elevation and storage of Lake Powell were 3,615 ft (85 feet from full pool) and 13.28 maf (55 percent of full capacity), respectively.

Current Operations

The operating tier for water year 2020 (September 2019 through October 2020) was established in August 2019 as the Upper Elevation Balancing Tier, consistent with Section 6.B of the Interim Guidelines. Under this Tier the initial annual water year release volume is 8.23 maf, and the April 2020 24-Month Study projects the end of water year elevation at Lake Powell to be above 3,575 feet, and the end of water year elevation at Lake Mead to be below 1,075 feet. Lake Powell operations will shift to balancing releases for the remainder of water year 2020. If the April 2020 24-Month Study projects the end of water year elevation to be above the 2020 Equalization elevation of 3,657 feet Lake Powell operations will shift to Equalization releases for the remainder of water year 2020. Reclamation will schedule operations at Glen Canyon Dam to achieve as practicably as possible the appropriate total annual release volume by September 30, 2020.

In October, the release volume will be approximately 625 kaf, with fluctuations anticipated between about 6,740 cfs in the nighttime to about 12,500 cfs in the daytime, and consistent with the Glen Canyon Dam, Record of Decision (dated December 2016). The anticipated release volume for November is 625 kaf with daily fluctuations between approximately 7,000 cfs and 12,640 cfs. The expected release for December is 750 kaf.

In addition to daily scheduled fluctuations for power generation, the instantaneous releases from Glen Canyon Dam may also fluctuate to provide 40 megawatts (mw) of system regulation. These instantaneous release adjustments stabilize the electrical generation and transmission system and translate to a range of about 1,200 cfs above or below the hourly scheduled release rate. Under system normal conditions, fluctuations for regulation are typically short lived and generally balance out over the hour with minimal or no noticeable impacts on downstream river flow conditions.

Releases from Glen Canyon Dam can also fluctuate beyond scheduled releases when called upon to respond to unscheduled power outages or power system emergencies. Depending on the severity of the system emergency, the response from Glen Canyon Dam can be significant, within the full range of the operating capacity of the power plant for as long as is necessary to maintain balance in the transmission system. Glen Canyon Dam currently maintains 30 mw (approximately 800 cfs) of generation capacity in reserve in order to respond to a system emergency even when generation rates are already high. System emergencies occur fairly infrequently and typically require small responses

from Glen Canyon Dam. However, these responses can have a noticeable impact on the river downstream of Glen Canyon Dam.

Inflow Forecasts and Model Projections

The forecast for water year 2020 unregulated inflow to Lake Powell, issued on October 1, 2019, by the Colorado Basin River Forecast Center, projects that the most probable (median) unregulated inflow volume this year will be 9.5 maf (88 percent of average). There is significant uncertainty regarding this season's snow pack development and resulting runoff into Lake Powell. Reclamation updates the minimum and maximum probable forecasts four times a year: January, April, August and October. The October forecast ranges from a minimum probable of 6.7 maf (62 percent of average) to a maximum probable of 18 maf (166 percent of average). There is a 10 percent chance that inflows could be higher than the current maximum probable forecast and a 10 percent chance that inflows could be lower than the minimum probable forecast.

Based on the current forecast, the October 24-Month Study projects Lake Powell elevation will end water year 2020 near 3,623.17 feet with approximately 14.10 maf in storage (58 percent of capacity). Note that projections of elevation and storage for water year 2020 have significant uncertainty at this point in the season. Projections of end of water year 2020 elevation and storage using the minimum and maximum probable inflow forecast from October 2019 are 3,595.36 feet (11.31 maf, 47 percent of capacity) and 3,657 feet (18.10 maf, 74 percent of capacity), respectively. Under these scenarios, there is a 10 percent chance that inflows will be higher, resulting in higher elevation and storage, and 10 percent chance that inflows will be lower, resulting in lower elevation and storage. The annual release volume from Lake Powell during water year 2020 is projected to be 8.23 maf under the October most probable scenario, and 9.0 maf under the minimum probable and 11.89 maf under the maximum probable inflow scenarios.

Upper Colorado River Basin Hydrology

Upper Colorado River Basin regularly experiences significant year to year hydrologic variability. During the 20-year period 2000 to 2019, however, the unregulated inflow to Lake Powell, which is a good measure of hydrologic conditions in the Colorado River Basin, was above average in only 4 out of the past 19 years. The period 2000-2019 is the lowest 20-year period since the closure of Glen Canyon Dam in 1963, with an average unregulated inflow of 8.76 maf, or 81 percent of the 30-year average (1981-2010). (For comparison, the 1981-2010 total water year average is 10.83 maf.) The unregulated inflow during the 2000-2019 period has ranged from a low of 2.64 maf (24 percent of average) in water year 2002 to a high of 15.97 maf (147 percent of average) in water year 2011. In water year 2018 unregulated inflow volume to Lake Powell was 4.6 maf (43 percent of average), the third driest year on record above 2002 and 1977. Under the current most probable forecast, the total water year 2020 unregulated inflow to Lake Powell is projected to be 9.5 maf (88 percent of average).

At the beginning of water year 2020, total system storage in the Colorado River Basin was 31.64 maf (53 percent of 59.6 maf total system capacity). This is an increase of 3.64 maf over the total storage at the beginning of water year 2019 when total system storage

was 28 maf (47 percent of capacity). Since the beginning of water year 2000, total Colorado Basin storage has experienced year to year increases and decreases in response to wet and dry hydrology, ranging from a high of 94 percent of capacity at the beginning of 2000 to the now current level of 53 percent of capacity at the beginning of water year 2020. Based on current inflow forecasts, the current projected end of water year total Colorado Basin reservoir storage for water year 2020 is approximately 31.6 maf (53 percent of total system capacity). The actual end of water year 2020 system storage may vary from this projection, primarily due to uncertainty regarding this season's runoff and reservoir inflow.

November 24-Month Study
Date: November 14, 2019

From: Water Resources Group, Salt Lake City
To: All Colorado River Annual Operating Plan (AOP) Recipients

Current Reservoir Status

Reservoir	October Inflow (unregulated) (acre-feet)	Percent of Average (%)	November 13, Midnight Elevation (feet)	November 13, Midnight Reservoir Storage (acre-feet)
Fontenelle	50,800	104	6,493.05	248,000
Flaming Gorge	52,700	89	6,031.25	3,400,000
Blue Mesa	28,200	75	7,500.11	664,000
Navajo	5,800	12	6,060.78	1,360,000
Powell	264,700	52	3,612.23	12,960,000

Expected Operations

The operation of Lake Powell and Lake Mead in this November 2019 24-Month Study is pursuant to the December 2007 Record of Decision on Colorado River Interim Guidelines for Lower Basin Shortages and the Coordinated Operations of Lake Powell and Lake Mead (Interim Guidelines), and reflects the 2019 Annual Operating Plan (AOP) and draft 2020 AOP. Pursuant to the Interim Guidelines, the August 2019 24-Month Study projections of the January 1, 2020, system storage and reservoir water surface elevations set the operational tier for the coordinated operation of Lake Powell and Lake Mead during 2020.

The August 2019 24-Month Study projected the January 1, 2020, Lake Powell elevation to be below the 2019 Equalization Elevation of 3,657 feet and above elevation 3,575 feet. Consistent with Section 6.B of the Interim Guidelines, Lake Powell's operations in water year 2020 will be governed by the Upper Elevation Balancing Tier, with an initial water year release volume of 8.23 maf and the potential for an April adjustment to equalization or balancing releases in April 2020. Based on the most probable inflow forecast, this November 24-Month Study projects an annual release of 8.23 maf in water year 2020.

Consistent with Section 2.B.5 of the Interim Guidelines, the Intentionally Created Surplus (ICS) Surplus Condition is the criterion governing the operation of Lake Mead for calendar year 2019.

The August 2019 24-Month Study projected the January 1, 2020, Lake Mead elevation to be above 1,075 feet and below 1,090 feet. Consistent with Section 2.B.5 of the Interim Guidelines, the Intentionally Created Surplus (ICS) Surplus Condition is the criterion governing the operation of Lake Mead for calendar year 2020. In addition, Section III.B of Exhibit 1 to the Lower Basin Drought Contingency Plan (DCP) Agreement will also govern the operation of Lake Mead for calendar year 2020.

The 2020 operational tier determinations for Lake Powell and Lake Mead will be documented in the 2020 AOP, which is currently in development.

The Interim Guidelines are available for download at:
https://www.usbr.gov/lc/region/programs/strategies/RecordofDecision.pdf.
The 2019 AOP is available for download at:
https://www.usbr.gov/lc/region/g4000/aop/AOP19.pdf.
The draft 2020 AOP is available for download at:
https://www.usbr.gov/lc/region/g4000/AOP2020/AOP20_draft.pdf.
The Colorado River DCPs are available for download at:
https://www.usbr.gov/lc/region/programs/dcp.html.

Fontenelle Reservoir – As of November 3, 2019 Fontenelle Reservoir pool elevation is 6493.54 feet, which amounts to 73 percent of live storage capacity. Inflows for the month of October totaled 50,811 acre-feet (af) or 105 percent of average. Releases remain at 1100 cfs and is planned to be 1025 cfs in early November.

The Colorado Basin River Forecast Center has forecasted inflows that are near average. November, December and January inflow volumes amount to 44,000 af (105 percent of average), 33,000 af (103 percent of average), and 32,000 af (106 percent of average), respectively.

The next Fontenelle Working Group meeting is scheduled for April 22, 2020 from 10:00 a.m. to 12:00 p.m. The meeting is planned to held at the 3 Telephone Canyon Road, Green River, WY 82935. The Fontenelle Working Group is an open public forum for information exchange between Reclamation and other parties associated with the operation of Fontenelle Reservoir.

Flaming Gorge Reservoir – As of November 3, 2019, Flaming Gorge Reservoir pool elevation is 6031.17 feet, which amounts to 91 percent of live storage capacity. Inflows for the month of October totaled 69,564 acre-feet (af) or 95 percent of average. Flaming Gorge average daily releases are planned to be increased beginning in the middle of November at 50 cfs per day from the currently daily average of 1,100 cfs to a daily average of 2150 cfs by December 1st.

The November final forecast for unregulated inflows into Flaming Gorge for the next three months projects near average conditions: November, December and January forecasted unregulated inflow volumes at 50,000 af (98 percent of average), 38,000 af (109 percent of average), and 43,000 af (107 percent of average), respectively.

Reclamation is planning to hold the Pre-Flaming Gorge Working Group meeting on March 19, 2020 from 10:00 am to 1:00 pm at the Uintah Conference Center in Vernal UT (313 East 200 South). The Flaming Gorge Working Group meeting to review stakeholders comments and input is scheduled for April 16, 2020 from 10:00 a.m. to 1:00 p.m. at Carbon County Event Center, 450 S Fairgrounds Rd, Price, UT 84501, USA.

The Flaming Gorge Working Group is an open public forum for information exchange between Reclamation and the stakeholders of Flaming Gorge Dam. The public is encouraged to attend and comment on the operations and plans presented by Reclamation at these meetings. Meeting notes from past Working Group meetings are posted on the Working Group webpage. For more information on this group and these meetings please contact Dale Hamilton at 801-379-1186.

Aspinall Unit Reservoirs – As of November 6, 2019 releases from Crystal Dam are approximately 1,450 cfs. Uncompahgre Valley Water Users Association has terminated diversions through the Gunnison Tunnel for the 2019 irrigation season. Flows in the Black Canyon are about 1,470 cfs. Releases from Crystal are projected to remain at about this level until November 18th and are projected to be reduced to 1,000 cfs for about 2 weeks. In December releases from Crystal will be increased to about 1,500 cfs.

Blue Mesa did fill this year and achieved a peak elevation on July 25, 2019 of 7519.15 feet above sea level which corresponded to a storage content of 827,000 af (99 percent of full pool). Since this peak filling, Blue Mesa's elevation has declined to 7501.40 feet above sea level on November 6, 2019.

The unregulated inflow volume in September to Blue Mesa was 28.2 kaf (75 percent of average). Unregulated Inflow volumes forecasted for Blue Mesa for the next three months (November, December and January) are projected to be: 29,000 af (93 percent of average), 27,000 af (103 percent of average) and 26,000 af (108 percent of average), respectively. The November 24-Month Study is reflective of these new forecasts. The water year unregulated inflow forecast volume for 2020 is 0.813 maf which is 85 percent of average.

The Aspinall Unit Working Group is an open public forum for information exchange between Reclamation and the stakeholders of the Aspinall Unit. The public is encouraged to attend and comments on the operations and plans presented by Reclamation at these meetings. Meeting notes from past working Group meetings are posted on the Working Group webpage. For more information on this group and these meetings please contact Erik Knight in the Grand Junction Area Office at (970) 248-0629.

Meeting notes from past working Group meetings are posted on the Working Group webpage at:

https://www.usbr.gov/uc/wcao/water/rsvrs/mtgs/amcurrnt.html

The next meeting of the Aspinall Unit Working Group will be held on Thursday, January 23, 2020 at 1:00 pm at the Holiday Inn Express located in Montrose, Colorado.

Navajo Reservoir – On November 12th, the daily average release rate from Navajo Dam was approximately 319 cfs while reservoir inflow (modified unregulated) was averaging approximately 141 cfs. The water surface elevation was 6060.81 feet above sea level. At this elevation the live storage is 1.36 maf (80 percent of live storage capacity) and the active storage is 0.70 maf (67 percent of active storage capacity). NIIP has shut down diversions for the season. The river flow measured at the Animas River at Farmington USGS gage was at 296 cfs. River flow at the San Juan River at Four Corners USGS gage was 600 cfs.

Releases from Navajo Dam are made for authorized purposes of the Navajo Unit and are pursuant to the Record of Decision for the Navajo Reservoir Operations.

Preliminary modified-unregulated inflow into Navajo (inflow adjusted for upstream change in storage, reservoir evaporation and exportation from the basin) in September was 6 kaf (12 percent of average for the month).

Forecast modified-unregulated inflow to Navajo over the next three months (November, December and January) are projected to be: 14 kaf (42 percent of average), 15 kaf (60 percent of average), and 17 kaf (78 percent of average), respectively.

Releases for the fall and winter will be made to target the San Juan River Recovery Implementation Program's recommended baseflow range of 500 cfs to 1000 cfs. Releases will likely range between 300 cfs and 600 cfs for the remainder of the calendar year.

Reclamation conducts Public Operations Meetings three times per year to gather input for determining upcoming operations for Navajo Reservoir. Input from individuals, organizations, and agencies along with other factors such as weather, water rights, endangered species requirements, flood control, hydro power, recreation, fish and wildlife management, and reservoir levels, will be considered in the development of these reservoir operation plans. In addition, the meetings are used to coordinate activities and exchange information among agencies, water users, and other interested parties concerning the San Juan River and Navajo Reservoir. The next Navajo Unit Coordination Meeting will be held Tuesday, January 21, 2020 at 1:00 pm at the Farmington Civic Center (200 West Arrington, Farmington, NM).

Glen Canyon Dam / Lake Powell

Current Status

The unregulated inflow volume to Lake Powell during October was 265 thousand acre-feet (kaf) (52 percent of average). The release volume from Glen Canyon Dam in October was 625 kaf. The end of October elevation and storage of Lake Powell were 3,613 ft (87 feet from full pool) and 13 maf (53 percent of full capacity), respectively.

Current Operations
The operating tier for water year 2020 (September 2019 through October 2020) was established in August 2019 as the Upper Elevation Balancing Tier, consistent with Section 6.B of the Interim Guidelines. Under this Tier the initial annual water year release volume is 8.23 maf, and if the April 2020 24-Month Study projects the end of water year elevation at Lake Powell to be above 3,575 feet, and the end of water year elevation at Lake Mead to be below 1,075 feet. Lake Powell operations will shift to balancing releases for the remainder of water year 2020. If the April 2020 24-Month Study projects the end of water year elevation to be above the 2020 Equalization elevation of 3,657 feet Lake Powell operations will shift to Equalization releases for the remainder of water year 2020. Reclamation will schedule operations at Glen Canyon Dam to achieve as practicably as possible the appropriate total annual release volume by September 30, 2020.

In November, the release volume will be approximately 625 kaf, with fluctuations anticipated between about 7,000 cfs in the nighttime to about 12,640 cfs in the daytime, and consistent with the Glen Canyon Dam, Record of Decision (dated December 2016). The anticipated release volume for December is 750 kaf with daily fluctuations between approximately 7,825 cfs and 14,575 cfs. The expected release for January is 760 kaf.

In addition to daily scheduled fluctuations for power generation, the instantaneous releases from Glen Canyon Dam may also fluctuate to provide 40 megawatts (mw) of system regulation. These instantaneous release adjustments stabilize the electrical generation and transmission system and translate to a range of about 1,200 cfs above or below the hourly scheduled release rate. Under system normal conditions, fluctuations for regulation are typically short lived and generally balance out over the hour with minimal or no noticeable impacts on downstream river flow conditions.

Releases from Glen Canyon Dam can also fluctuate beyond scheduled releases when called upon to respond to unscheduled power outages or power system emergencies. Depending on the severity of the system emergency, the response from Glen Canyon Dam can be significant, within the full range of the operating capacity of the power plant for as long as is necessary to maintain balance in the transmission system. Glen Canyon Dam currently maintains 30 mw (approximately 800 cfs) of generation capacity in reserve in order to respond to a system emergency even when generation rates are already high. System emergencies occur fairly infrequently and typically require small responses from Glen Canyon Dam. However, these responses can have a noticeable impact on the river downstream of Glen Canyon Dam.

Inflow Forecasts and Model Projections
The forecast for water year 2020 unregulated inflow to Lake Powell, issued on November 1, 2019, by the Colorado Basin River Forecast Center, projects that the most probable (median) unregulated inflow volume this year will be 8.77 maf (81 percent of average). There is significant uncertainty regarding this season's snow pack development and resulting runoff into Lake Powell. Reclamation updates the minimum and maximum

probable forecasts four times a year: January, April, August and October. The October forecast ranges from a minimum probable of 6.7 maf (62 percent of average) to a maximum probable of 18 maf (166 percent of average). There is a 10 percent chance that inflows could be higher than the current maximum probable forecast and a 10 percent chance that inflows could be lower than the minimum probable forecast.

Based on the current forecast, the November 24-Month Study projects Lake Powell elevation will end water year 2020 near 3,617.91 feet with approximately 13.5 maf in storage (56 percent of capacity). Note that projections of elevation and storage for water year 2020 have significant uncertainty at this point in the season. Projections of end of water year 2020 elevation and storage using the minimum and maximum probable inflow forecast from October 2019 are 3,595.36 feet (11.31 maf, 47 percent of capacity) and 3,657 feet (18.10 maf, 74 percent of capacity), respectively. Under these scenarios, there is a 10 percent chance that inflows will be higher, resulting in higher elevation and storage, and 10 percent chance that inflows will be lower, resulting in lower elevation and storage. The annual release volume from Lake Powell during water year 2020 is projected to be 8.23 maf under the October most probable scenario, and 9.0 maf under the minimum probable and 11.89 maf under the maximum probable inflow scenarios.

Upper Colorado River Basin Hydrology

Upper Colorado River Basin regularly experiences significant year to year hydrologic variability. During the 20-year period 2000 to 2019, however, the unregulated inflow to Lake Powell, which is a good measure of hydrologic conditions in the Colorado River Basin, was above average in only 4 out of the past 19 years. The period 2000-2019 is the lowest 20-year period since the closure of Glen Canyon Dam in 1963, with an average unregulated inflow of 8.76 maf, or 81 percent of the 30-year average (1981-2010). (For comparison, the 1981-2010 total water year average is 10.83 maf.) The unregulated inflow during the 2000-2019 period has ranged from a low of 2.64 maf (24 percent of average) in water year 2002 to a high of 15.97 maf (147 percent of average) in water year 2011. In water year 2018 unregulated inflow volume to Lake Powell was 4.6 maf (43 percent of average), the third driest year on record above 2002 and 1977. Under the current most probable forecast, the total water year 2020 unregulated inflow to Lake Powell is projected to be 8.77 maf (81 percent of average).

At the beginning of water year 2020, total system storage in the Colorado River Basin was 31.64 maf (53 percent of 59.6 maf total system capacity). This is an increase of 3.64 maf over the total storage at the beginning of water year 2019 when total system storage was 28 maf (47 percent of capacity). Since the beginning of water year 2000, total Colorado Basin storage has experienced year to year increases and decreases in response to wet and dry hydrology, ranging from a high of 94 percent of capacity at the beginning of 2000 to the now current level of 53 percent of capacity at the beginning of water year 2020. Based on current inflow forecasts, the current projected end of water year total Colorado Basin reservoir storage for water year 2020 is approximately 31.2 maf (52 percent of total system capacity). The actual end of water year 2020 system storage may vary from this projection, primarily due to uncertainty regarding this season’s runoff and reservoir inflow.

BUREAU OF RECLAMATION

The operation of Lake Powell and Lake Mead in this December 2019 24-Month Study is pursuant to the December 2007 Record of Decision on Colorado River Interim Guidelines for Lower Basin Shortages and the Coordinated Operations of Lake Powell and Lake Mead (Interim Guidelines), and reflects the 2019 Annual Operating Plan (AOP) and draft 2020 AOP. Pursuant to the Interim Guidelines, the August 2019 24-Month Study projections of the January 1, 2020, system storage and reservoir water surface elevations set the operational tier for the coordinated operation of Lake Powell and Lake Mead during 2020.

The August 2019 24-Month Study projected the January 1, 2020, Lake Powell elevation to be below the 2019 Equalization Elevation of 3,657 feet and above elevation 3,575 feet. Consistent with Section 6.B of the Interim Guidelines, Lake Powell's operations in water year 2020 will be governed by the Upper Elevation Balancing Tier, with an initial water year release volume of 8.23 maf and the potential for an April adjustment to equalization or balancing releases in April 2020. Based on the most probable inflow forecast, this December 24-Month Study projects an annual release of 8.23 maf in water year 2020.

Consistent with Section 2.B.5 of the Interim Guidelines, the Intentionally Created Surplus (ICS) Surplus Condition is the criterion governing the operation of Lake Mead for calendar years 2019 and 2020. In addition, Section III.B of Exhibit 1 to the Lower Basin Drought Contingency Plan (DCP) Agreement will also govern the operation of Lake Mead for calendar year 2020.

The 2020 operational tier determinations for Lake Powell and Lake Mead will be documented in the 2020 AOP, which is in the final stage of development.

The Interim Guidelines are available for download at:
https://www.usbr.gov/lc/region/programs/strategies/RecordofDecision.pdf.
The 2019 AOP is available for download at:
https://www.usbr.gov/lc/region/g4000/aop/AOP19.pdf.
The draft 2020 AOP is available for download at:
https://www.usbr.gov/lc/region/g4000/AOP2020/AOP20_draft.pdf.
The Colorado River DCPs are available for download at:
https://www.usbr.gov/lc/region/programs/dcp.html.

Current runoff projections into Lake Powell are provided by the National Weather Service's Colorado Basin River Forecast Center and are as follows: Observed unregulated inflow into Lake Powell for the month of November was 0.402 maf or 85 percent of the 30-year average from 1981 to 2010. The December unregulated inflow forecast for Lake Powell is 0.330 maf or 91 percent of the 30-year average. The observed 2019 April through July unregulated inflow is 10.410 maf or 145 percent of average.

In this study, the calendar year 2019 diversion for Metropolitan Water District of Southern California (MWD) is forecasted to be 0.536 maf. The calendar year 2019 diversion for the Central Arizona Project (CAP) is forecasted to be 1.429 maf. Consumptive use for Nevada above Hoover (SNWP Use) is forecasted to be 0.237 maf for calendar year 2019.

Due to changing Lake Mead elevations, Hoover's generator capacity is adjusted based on estimated effective capacity and plant availability. The estimated effective capacity is based on projected Lake Mead elevations. Unit capacity tests will be performed as the lake elevation changes. This study reflects these changes in the projections.

Hoover, Davis, and Parker historical gross energy figures come from PO&M reports provided by the Lower Colorado Region's Power Office, Bureau of Reclamation, Boulder City, Nevada. Questions regarding these historical energy numbers can be directed to Colleen Dwyer at (702) 293-8420.

BUREAU OF RECLAMATION

The operation of Lake Powell and Lake Mead in this January 2020 24-Month Study is pursuant to the December 2007 Record of Decision on Colorado River Interim Guidelines for Lower Basin Shortages and the Coordinated Operations of Lake Powell and Lake Mead (Interim Guidelines) and reflects the 2020 Annual Operating Plan (AOP). Pursuant to the Interim Guidelines, the August 2019 24-Month Study projections of the January 1, 2020, system storage and reservoir water surface elevations set the operational tier for the coordinated operation of Lake Powell and Lake Mead during 2020.

Consistent with Section 6.B of the Interim Guidelines, Lake Powell's operations in water year 2020 will be governed by the Upper Elevation Balancing Tier, with an initial water year release volume of 8.23 maf and the potential for an April adjustment to equalization or balancing releases in April 2020. Based on the most probable inflow forecast, this January 24-Month Study projects an annual release of 8.23 maf in water year 2020.

Consistent with Section 2.B.5 of the Interim Guidelines, the Intentionally Created Surplus (ICS) Surplus Condition is the criterion governing the operation of Lake Mead for calendar year 2020. In addition, Section III.B of Exhibit 1 to the Lower Basin Drought Contingency Plan (DCP) Agreement will also govern the operation of Lake Mead in calendar year 2020.

The 2020 AOP is available for download at:
https://www.usbr.gov/lc/region/g4000/aop/AOP20.pdf.
The Interim Guidelines are available for download at:
https://www.usbr.gov/lc/region/programs/strategies/RecordofDecision.pdf.
The Colorado River DCPs are available for download at:
https://www.usbr.gov/lc/region/programs/dcp.html.

Current runoff projections into Lake Powell are provided by the National Weather Service's Colorado Basin River Forecast Center and are as follows: Observed unregulated inflow into Lake Powell for the month of December was 0.353 maf or 97 percent of the 30-year average from 1981 to 2010. The January unregulated inflow forecast for Lake Powell is 0.320 maf or 89 percent of the 30-year average. The 2020 April through July unregulated inflow forecast is 5.900 maf or 82 percent of average.

In this study, the calendar year 2020 diversion for Metropolitan Water District of Southern California (MWD) is forecasted to be 0.700 maf. The calendar year 2020 diversion for the Central Arizona Project (CAP) is forecasted to be 1.358 maf. Consumptive use for Nevada above Hoover (SNWP Use) is forecasted to be 0.244 maf for calendar year 2020.

Due to changing Lake Mead elevations, Hoover's generator capacity is adjusted based on estimated effective capacity and plant availability. The estimated effective capacity is based on projected Lake Mead elevations. Unit capacity tests will be performed as the lake elevation changes. This study reflects these changes in the projections.

Hoover, Davis, and Parker historical gross energy figures come from PO&M reports provided by the Lower Colorado Region's Power Office, Bureau of Reclamation, Boulder City, Nevada. Questions regarding these historical energy numbers can be directed to Colleen Dwyer at (702) 293-8420.

February 24-Month Study
Date: February 14, 2020

From: Water Resources Group, Salt Lake City
To: All Colorado River Annual Operating Plan (AOP) Recipients

Current Reservoir Status

Reservoir	January Inflow (unregulated) (acre-feet)	Percent of Average (%)	February 13, Midnight Elevation (feet)	February 13, Midnight Reservoir Storage (acre-feet)
Fontenelle	34,250	113	6,479.57	164,000
Flaming Gorge	49,050	122	6,027.51	3,2554,000
Blue Mesa	24,700	102	7,485.17	544,340
Navajo	15,900	73	6,050.48	1,300,000
Powell	277,400	77	3,604.22	12,157,000

Expected Operations

The operation of Lake Powell and Lake Mead in this February 2020 24-Month Study is pursuant to the December 2007 Record of Decision on Colorado River Interim Guidelines for Lower Basin Shortages and the Coordinated Operations of Lake Powell and Lake Mead (Interim Guidelines) and reflects the 2020 Annual Operating Plan (AOP). Pursuant to the Interim Guidelines, the August 2019 24-Month Study projections of the January 1, 2020, system storage and reservoir water surface elevations set the operational tier for the coordinated operation of Lake Powell and Lake Mead during 2020.

Consistent with Section 6.B of the Interim Guidelines, Lake Powell's operations in water year 2020 will be governed by the Upper Elevation Balancing Tier, with an initial water year release volume of 8.23 maf and the potential for an April adjustment to equalization or balancing releases in April 2020. Based on the most probable inflow forecast, this February 24-Month Study projects an annual release of 8.23 maf in water year 2020.

Consistent with Section 2.B.5 of the Interim Guidelines, the Intentionally Created Surplus (ICS) Surplus Condition is the criterion governing the operation of Lake Mead for calendar year 2020. In addition, Section III.B of Exhibit 1 to the Lower Basin Drought Contingency Plan (DCP) Agreement will also govern the operation of Lake Mead in calendar year 2020.

The 2020 AOP is available for download at:

https://www.usbr.gov/lc/region/g4000/aop/AOP20.pdf.
The Interim Guidelines are available for download at:
https://www.usbr.gov/lc/region/programs/strategies/RecordofDecision.pdf.
The Colorado River DCPs are available for download at:
https://www.usbr.gov/lc/region/programs/dcp.html.

Fontenelle Reservoir – As of January 7, 2020, the Fontenelle Reservoir pool elevation is 6480.86 feet, which amounts to 50 percent of live storage capacity. Inflows for the month of January totaled 34,252 acre-feet (af) or 113 percent of average. Releases remain at 1050 cfs.

The January final forecast for unregulated inflows into Fontenelle for the next three months projects near average conditions. February, March, and April inflow volumes amount to 30,000 af (108 percent of average), 48,000 af (91 percent of average), and 75,000 af (88 percent of average), respectively.

The February water supply forecast of the April through July inflow volume into the Fontenelle Reservoir is 620,000 acre-feet (85 percent of average). Current snowpack is 115 percent of median for the Upper Green Basin.

The next Fontenelle Working Group meeting is scheduled for April 22, 2020 from 10:00 a.m. to 12:00 p.m. The meeting is planned to held at the 3 Telephone Canyon Road, Green River, WY 82935. The Fontenelle Working Group is an open public forum for information exchange between Reclamation and other parties associated with the operation of Fontenelle Reservoir.

Flaming Gorge Reservoir – As of February 6, 2020 Flaming Gorge Reservoir pool elevation is 6027.85 feet, which amounts to 87 percent of live storage capacity. Inflows for the month of January is 79,355 (af) or 122 percent of average. The average daily releases are planned to be sustained at 2,150 cfs until the beginning of March 2020. The February final forecast for unregulated inflows into Flaming Gorge for the next three months projects near average conditions. February, March, and April forecasted unregulated inflow volumes at 46,000 af (103 percent of average), 100,000 af (98 percent of average), and 130,000 af (97 percent of average), respectively.

The February water supply forecast of the April through July unregulated inflow volume into Flaming Gorge Reservoir is 870,000 acre-feet (89 percent of average). Current snowpack is 109 percent of median for the Upper Green Basin.

Reclamation is planning to hold the Pre-Flaming Gorge Working Group meeting on March 19, 2020 from 10:00 am to 1:00 pm at the Uintah Conference Center in Vernal UT (313 East 200 South). The Flaming Gorge Working Group meeting to review stakeholders comments and input is scheduled for April 16, 2020 from 10:00 a.m. to 1:00 p.m. at Carbon County Event Center, 450 S Fairgrounds Rd, Price, UT 84501, USA.

The Flaming Gorge Working Group is an open public forum for information exchange between Reclamation and the stakeholders of Flaming Gorge Dam. The public is encouraged to attend and comment on the operations and plans presented by Reclamation at these meetings. Meeting notes from past Working Group meetings are posted on the Working Group webpage. For more information on this group and these meetings please contact Dale Hamilton at 801-379-1186.

Aspinall Unit Reservoirs – As of February 9, 2020 releases from Crystal Dam are approximately 800 cfs. Gunnison Tunnel diversions are occurring about every 2 weeks to refill Fairview Reservoir. Flows in the Black Canyon are about 780 cfs. Releases from Crystal are projected to remain at about this level for the foreseeable future.

Blue Mesa did fill in 2019 and achieved a peak elevation on July 25, 2019 of 7519.15 feet above sea level which corresponded to a storage content of 827,000 af (99 percent of full pool). Since this peak filling, Blue Mesa's elevation has declined to 7485.04 feet above sea level on February 9, 2020 and this trend will continue until about the beginning of April 2020.

The unregulated inflow volume in January to Blue Mesa was 24.7 kaf (103 percent of average). Unregulated Inflow volumes forecasted for Blue Mesa for the next three months (February, March, April) are projected to be: 23,000 af (105 percent of average), 37,000 af (103 percent of average) and 65,000 af (87 percent of average), respectively. The February 24-Month Study is reflective of these new forecasts. The April through July forecasted most probable unregulated inflow volume to Blue Mesa is 560,000 af (83 percent of average). The 2020 water year forecasted unregulated inflow volume is 818,000 af which is 85 percent of average.

The Aspinall Unit Working Group is an open public forum for information exchange between Reclamation and the stakeholders of the Aspinall Unit. The public is encouraged to attend and comments on the operations and plans presented by Reclamation at these meetings. Meeting notes from past working Group meetings are posted on the Working Group webpage. For more information on this group and these meetings please contact Erik Knight in the Grand Junction Area Office at (970) 248-0629.

The next meeting of the Aspinall Unit Working Group will be held on Thursday, April 23, 2020 at 1:00 pm at the Western Colorado Area Office located at 445 West Gunnison Avenue in Grand Junction, Colorado.

Navajo Reservoir – On February 10th, the daily average release rate from Navajo Dam was approximately 429 cfs while reservoir inflow (modified unregulated) was averaging approximately 288 cfs. The water surface elevation was 6056.35 feet above sea level. At this elevation the live storage is 1.30 maf (77 percent of live storage capacity) and the active storage is 0.64 maf (62 percent of active storage capacity). NIIP is diverting 34 cfs. The river flow measured at the Animas River at Farmington USGS gage was at 202 cfs. River flow at the San Juan River at Four Corners USGS gage was 794 cfs.

Releases from Navajo Dam are made for authorized purposes of the Navajo Unit and are pursuant to the Record of Decision for the Navajo Reservoir Operations.

Preliminary modified-unregulated inflow into Navajo (inflow adjusted for upstream change in storage, reservoir evaporation and exportation from the basin) in December was 16 kaf (77 percent of average for the month).

Forecast modified-unregulated inflow to Navajo over the next three months (February, March, and April) are projected to be: 20 kaf (66 percent of average), 51 kaf (55 percent of average), and 92 kaf (54 percent of average), respectively.

The April through July runoff forecasts are as follows:
Min Probable: 320,000 af (43 percent of average)
Most Probable: 500,000 af (68 percent of average)
Max Probable: 815,000 af (111 percent of average)

Releases for the fall and winter will be made to target the San Juan River Recovery Implementation Program's recommended baseflow range of 500 cfs to 1000 cfs. Releases will likely range between 300 cfs and 600 cfs throughout the winter.

Reclamation conducts Public Operations Meetings three times per year to gather input for determining upcoming operations for Navajo Reservoir. Input from individuals, organizations, and agencies along with other factors such as weather, water rights, endangered species requirements, flood control, hydro power, recreation, fish and wildlife management, and reservoir levels, will be considered in the development of these reservoir operation plans. In addition, the meetings are used to coordinate activities and exchange information among agencies, water users, and other interested parties concerning the San Juan River and Navajo Reservoir. The next Navajo Unit Coordination Meeting will be held Tuesday, April 21, 2020 at 1:00 pm at the Farmington Civic Center (200 West Arrington, Farmington, NM).

Glen Canyon Dam / Lake Powell

Current Status

The unregulated inflow volume to Lake Powell during January was 277 thousand acre-feet (kaf) (77 percent of average). The release volume from Glen Canyon Dam in January was 760 kaf. The end of January elevation and storage of Lake Powell were 3,605 ft (95 feet from full pool) and 12.28 maf (50 percent of full capacity), respectively.

Current Operations
The operating tier for water year 2020 (September 2019 through October 2020) was established in August 2019 as the Upper Elevation Balancing Tier, consistent with Section 6.B of the Interim Guidelines. Under this Tier the initial annual water year release volume is 8.23 maf, and if the April 2020 24-Month Study projects the end of water year elevation at Lake Powell to be above 3,575 feet, and the end of water year

elevation at Lake Mead to be below 1,075 feet, Lake Powell operations will shift to balancing releases for the remainder of water year 2020. If the April 2020 24-Month Study projects the end of water year elevation to be above the 2020 Equalization elevation of 3,657 feet Lake Powell operations will shift to Equalization releases for the remainder of water year 2020. Reclamation will schedule operations at Glen Canyon Dam to achieve as practicably as possible the appropriate total annual release volume by September 30, 2020.

In February, the release volume will be approximately 675 kaf, with fluctuations anticipated between about 8,300 cfs in the nighttime to about 14,370 cfs in the daytime, and consistent with the Glen Canyon Dam, Record of Decision (dated December 2016). The anticipated release volume for March is 700 kaf with daily fluctuations between approximately 7,635 cfs and 13,935 cfs. The expected release for April is 630 kaf.

In addition to daily scheduled fluctuations for power generation, the instantaneous releases from Glen Canyon Dam may also fluctuate to provide 40 megawatts (mw) of system regulation. These instantaneous release adjustments stabilize the electrical generation and transmission system and translate to a range of about 1,200 cfs above or below the hourly scheduled release rate. Under system normal conditions, fluctuations for regulation are typically short lived and generally balance out over the hour with minimal or no noticeable impacts on downstream river flow conditions.

Releases from Glen Canyon Dam can also fluctuate beyond scheduled releases when called upon to respond to unscheduled power outages or power system emergencies. Depending on the severity of the system emergency, the response from Glen Canyon Dam can be significant, within the full range of the operating capacity of the power plant for as long as is necessary to maintain balance in the transmission system. Glen Canyon Dam currently maintains 30 mw (approximately 800 cfs) of generation capacity in reserve in order to respond to a system emergency even when generation rates are already high. System emergencies occur fairly infrequently and typically require small responses from Glen Canyon Dam. However, these responses can have a noticeable impact on the river downstream of Glen Canyon Dam.

Inflow Forecasts and Model Projections

The forecast for water year 2020 unregulated inflow to Lake Powell, issued on February 4, 2020, by the Colorado Basin River Forecast Center, projects that the most probable (median) unregulated inflow volume this year will be 8.64 maf (80 percent of average). There is significant uncertainty regarding this season's snowpack development and resulting runoff into Lake Powell. Reclamation updates the minimum and maximum probable forecasts four times a year: January, April, August and October. The January forecast ranges from a minimum probable of 6.4 maf (59 percent of average) to a maximum probable of 12.82 maf (118 percent of average). There is a 10 percent chance that inflows could be higher than the current maximum probable forecast and a 10 percent chance that inflows could be lower than the minimum probable forecast.

Based on the current forecast, the February 24-Month Study projects Lake Powell elevation will end water year 2020 near 3,617.32 feet with approximately 13.48 maf in storage (55 percent of capacity). Note that projections of elevation and storage for water year 2020 have significant uncertainty at this point in the season. Projections of end of water year 2020 elevation and storage using the minimum and maximum probable inflow forecast from January 2020 are 3,598.83 feet (11.64 maf, 48 percent of capacity) and 3,649.60 feet (17.17 maf, 71 percent of capacity), respectively. Under these scenarios, there is a 10 percent chance that inflows will be higher, resulting in higher elevation and storage, and 10 percent chance that inflows will be lower, resulting in lower elevation and storage. The annual release volume from Lake Powell during water year 2020 is projected to be 8.23 maf under the February most probable and the January minimum and maximum probable inflow scenarios.

Upper Colorado River Basin Hydrology

Upper Colorado River Basin regularly experiences significant year to year hydrologic variability. During the 20-year period 2000 to 2019, however, the unregulated inflow to Lake Powell, which is a good measure of hydrologic conditions in the Colorado River Basin, was above average in only 4 out of the past 19 years. The period 2000-2019 is the lowest 20-year period since the closure of Glen Canyon Dam in 1963, with an average unregulated inflow of 8.76 maf, or 81 percent of the 30-year average (1981-2010). (For comparison, the 1981-2010 total water year average is 10.83 maf.) The unregulated inflow during the 2000-2019 period has ranged from a low of 2.64 maf (24 percent of average) in water year 2002 to a high of 15.97 maf (147 percent of average) in water year 2011. In water year 2018 unregulated inflow volume to Lake Powell was 4.6 maf (43 percent of average), the third driest year on record above 2002 and 1977. Under the current most probable forecast, the total water year 2020 unregulated inflow to Lake Powell is projected to be 8.64 maf (80 percent of average).

At the beginning of water year 2020, total system storage in the Colorado River Basin was 31.64 maf (53 percent of 59.6 maf total system capacity). This is an increase of 3.64 maf over the total storage at the beginning of water year 2019 when total system storage was 28 maf (47 percent of capacity). Since the beginning of water year 2000, total Colorado Basin storage has experienced year to year increases and decreases in response to wet and dry hydrology, ranging from a high of 94 percent of capacity at the beginning of 2000 to the now current level of 53 percent of capacity at the beginning of water year 2020. Based on current inflow forecasts, the current projected end of water year total Colorado Basin reservoir storage for water year 2020 is approximately 30.86 maf (52 percent of total system capacity). The actual end of water year 2020 system storage may vary from this projection, primarily due to uncertainty regarding this season’s runoff and reservoir inflow.

March 24-Month Study
Date: March 11, 2020

From: Water Resources Group, Salt Lake City
To: All Colorado River Annual Operating Plan (AOP) Recipients

Current Reservoir Status

Reservoir	February Inflow (unregulated) (acre-feet)	Percent of Average (%)	March 10, Midnight Elevation (feet)	March 10, Midnight Reservoir Storage (acre-feet)
Fontenelle	31,600	114	6,474.49	138,400
Flaming Gorge	41,700	106	6,026.61	3,220,000
Blue Mesa	23,230	100	7,484.15	536,700
Navajo	17,100	56	6,055.60	1,293,000
Powell	288,400	73	3,601.94	11,936,000

Expected Operations

The operation of Lake Powell and Lake Mead in this March 2020 24-Month Study is pursuant to the December 2007 Record of Decision on Colorado River Interim Guidelines for Lower Basin Shortages and the Coordinated Operations of Lake Powell and Lake Mead (Interim Guidelines) and reflects the 2020 Annual Operating Plan (AOP). Pursuant to the Interim Guidelines, the August 2019 24-Month Study projections of the January 1, 2020, system storage and reservoir water surface elevations set the operational tier for the coordinated operation of Lake Powell and Lake Mead during 2020.

Consistent with Section 6.B of the Interim Guidelines, Lake Powell's operations in water year 2020 will be governed by the Upper Elevation Balancing Tier, with an initial water year release volume of 8.23 maf and the potential for an April adjustment to equalization or balancing releases in April 2020. Based on the most probable inflow forecast, this March 24-Month Study projects an annual release of 8.23 maf in water year 2020.

Consistent with Section 2.B.5 of the Interim Guidelines, the Intentionally Created Surplus (ICS) Surplus Condition is the criterion governing the operation of Lake Mead for calendar year 2020. In addition, Section III.B of Exhibit 1 to the Lower Basin Drought Contingency Plan (DCP) Agreement will also govern the operation of Lake Mead in calendar year 2020.

The 2020 AOP is available for download at:

https://www.usbr.gov/lc/region/g4000/aop/AOP20.pdf.
The Interim Guidelines are available for download at:
https://www.usbr.gov/lc/region/programs/strategies/RecordofDecision.pdf.
The Colorado River DCPs are available for download at:
https://www.usbr.gov/lc/region/programs/dcp.html.

Fontenelle Reservoir – As of March 8, 2020, the Fontenelle Reservoir pool elevation is 6474.69 feet, which amounts to 41 percent of live storage capacity. Inflows for the month of February totaled 31,602 acre-feet (af) or 114 percent of average. Releases remain at 1050 cfs.

The March final forecast for unregulated inflows into Fontenelle for the next three months projects below average conditions. March, April and May inflow volumes amount to 48,000 af (91 percent of average), 75,000 af (88 percent of average), and 135,000 af (82 percent of average), respectively.

The March water supply forecast of the April through July inflow volume into the Fontenelle Reservoir is 620,000 acre-feet (85 percent of average). Current snowpack is 107 percent of median for the Upper Green Basin.

The next Fontenelle Working Group meeting is scheduled for April 22, 2020 from 10:00 a.m. to 12:00 p.m. The meeting is planned to held at the 3 Telephone Canyon Road, Green River, WY 82935. The Fontenelle Working Group is an open public forum for information exchange between Reclamation and other parties associated with the operation of Fontenelle Reservoir.

Flaming Gorge Reservoir – As of March 6, 2020 Flaming Gorge Reservoir pool elevation is 6026.59 feet, which amounts to 86 percent of live storage capacity. Inflows for the month of February is 47,130 acre-feet (af) or 114 percent of average. The average daily releases is 1,950 cfs.

The March final forecast for unregulated inflows into Flaming Gorge for the next three months projects near below average conditions. March, April, and May forecasted unregulated inflow volumes at 90,000 af (88 percent of average), 120,000 af (90 percent of average), and 205,000 af (84 percent of average), respectively.

The March water supply forecast of the April through July unregulated inflow volume into Flaming Gorge Reservoir is 850,000 acre-feet (87 percent of average). Current snowpack is 112 percent of median for the Upper Green Basin.

Reclamation is planning to hold the Pre-Flaming Gorge Working Group meeting on March 19, 2020 from 10:00 am to 1:00 pm at the Uintah Conference Center in Vernal UT (313 East 200 South). The Flaming Gorge Working Group meeting to review stakeholders comments and input is scheduled for April 16, 2020 from 10:00 a.m. to 1:00 p.m. at Carbon County Event Center, 450 S Fairgrounds Rd, Price, UT 84501, USA.

The Flaming Gorge Working Group is an open public forum for information exchange between Reclamation and the stakeholders of Flaming Gorge Dam. The public is encouraged to attend and comment on the operations and plans presented by Reclamation at these meetings. Meeting notes from past Working Group meetings are posted on the Working Group webpage. For more information on this group and these meetings please contact Dale Hamilton at 801-379-1186.

Aspinall Unit Reservoirs – As of March 8, 2020 releases from Crystal Dam are approximately 600 cfs. Gunnison Tunnel diversions are occurring about every 2 weeks to refill Fairview Reservoir. Flows in the Black Canyon are about 580 cfs. Releases from Crystal are projected to remain at about this level for the foreseeable future.

Blue Mesa did fill in 2019 and achieved a peak elevation on July 25, 2019 of 7519.15 feet above sea level which corresponded to a storage content of 827,000 af (99 percent of full pool). Since this peak filling, Blue Mesa's elevation has declined to 7484.12 feet above sea level on March 8, 2020 and this trend will continue until about the beginning of April 2020.

The unregulated inflow volume in February to Blue Mesa was 23.6 kaf (100 percent of average). Unregulated Inflow volumes forecasted for Blue Mesa for the next three months (March, April, May) are projected to be: 35,000 af (97 percent of average), 60,000 af (78 percent of average) and 155,000 af (70 percent of average), respectively. The March 24-Month Study is reflective of these new forecasts. The April through July forecasted most probable unregulated inflow volume to Blue Mesa is 525,000 af (78 percent of average). The 2020 water year forecasted unregulated inflow volume is 779,000 af which is 82 percent of average.

The Aspinall Unit Working Group is an open public forum for information exchange between Reclamation and the stakeholders of the Aspinall Unit. The public is encouraged to attend and comments on the operations and plans presented by Reclamation at these meetings. Meeting notes from past working Group meetings are posted on the Working Group webpage. For more information on this group and these meetings please contact Erik Knight in the Grand Junction Area Office at (970) 248-0629.

The next meeting of the Aspinall Unit Working Group will be held on Thursday, April 23, 2020 at 1:00 pm at the Western Colorado Area Office located at 445 West Gunnison Avenue in Grand Junction, Colorado.

Navajo Reservoir – On March 4th, the daily average release rate from Navajo Dam was approximately 414 cfs while reservoir inflow (modified unregulated) was averaging approximately 338 cfs. The water surface elevation was 6055.65 feet above sea level. At this elevation the live storage is 1.29 maf (76 percent of live storage capacity) and the active storage is 0.3 maf (61 percent of active storage capacity). NIIP is diverting 27 cfs. The river flow measured at the Animas River at Farmington USGS gage was at 180 cfs. River flow at the San Juan River at Four Corners USGS gage was 338 cfs.

Releases from Navajo Dam are made for authorized purposes of the Navajo Unit and are pursuant to the Record of Decision for the Navajo Reservoir Operations.

Preliminary modified-unregulated inflow into Navajo (inflow adjusted for upstream change in storage, reservoir evaporation and exportation from the basin) in December was 17.1 kaf (58 percent of average for the month).

Forecast modified-unregulated inflow to Navajo over the next three months (March, April, and May) are projected to be: 40 kaf (43percent of average), 85 kaf (50 percent of average), and 180 kaf (65 percent of average), respectively.

The April through July runoff forecasts are as follows:

Min Probable: 240,000 af (33% of average, a decrease of 70,000 af since the last forecast)
Most Probable: 440,000 af (60% of average, a decrease of 35,000 af since the last forecast)
Max Probable: 725,000 af (98% of average, an increase of 25,000 af since the last forecast)

Releases for the fall and winter will be made to target the San Juan River Recovery Implementation Program's recommended baseflow range of 500 cfs to 1000 cfs. Releases will likely range between 300 cfs and 600 cfs throughout the winter. Based on current storage levels at Navajo and the range of runoff forecasts, there is a 10% chance of a Spring Peak Release (minimum of 21 days as recommended by the San Juan River Recovery Implementation Program) at Navajo Reservoir this spring.

Reclamation conducts Public Operations Meetings three times per year to gather input for determining upcoming operations for Navajo Reservoir. Input from individuals, organizations, and agencies along with other factors such as weather, water rights, endangered species requirements, flood control, hydro power, recreation, fish and wildlife management, and reservoir levels, will be considered in the development of these reservoir operation plans. In addition, the meetings are used to coordinate activities and exchange information among agencies, water users, and other interested parties concerning the San Juan River and Navajo Reservoir. The next Navajo Unit Coordination Meeting will be held Tuesday, April 21, 2020 at 1:00 pm at the Farmington Civic Center (200 West Arrington, Farmington, NM).

Glen Canyon Dam / Lake Powell

Current Status

The unregulated inflow volume to Lake Powell during February was 288 thousand acre-feet (kaf) (73 percent of average). The release volume from Glen Canyon Dam in February was 675 kaf. The end of February elevation and storage of Lake Powell were 3603 ft (97 feet from full pool) and 12.0 maf (50 percent of full capacity), respectively.

Current Operations

The operating tier for water year 2020 (September 2019 through October 2020) was established in August 2019 as the Upper Elevation Balancing Tier, consistent with

Section 6.B of the Interim Guidelines. Under this Tier the initial annual water year release volume is 8.23 maf, and if the April 2020 24-Month Study projects the end of water year elevation at Lake Powell to be above 3,575 feet, and the end of water year elevation at Lake Mead to be below 1,075 feet, Lake Powell operations will shift to balancing releases for the remainder of water year 2020. If the April 2020 24-Month Study projects the end of water year elevation to be above the 2020 Equalization elevation of 3,657 feet Lake Powell operations will shift to Equalization releases for the remainder of water year 2020. Reclamation will schedule operations at Glen Canyon Dam to achieve as practicably as possible the appropriate total annual release volume by September 30, 2020.

In March, the release volume will be approximately 700 kaf, with fluctuations anticipated between about 7,635 cfs in the nighttime to about 13,935 cfs in the daytime, and consistent with the Glen Canyon Dam, Record of Decision (dated December 2016). The anticipated release volume for April is 630 kaf with daily fluctuations between approximately 7,470 cfs and 12,320 cfs. The expected release for May is 630 kaf with daily fluctuations between approximately 6,990 cfs and 12,660 cfs.

In addition to daily scheduled fluctuations for power generation, the instantaneous releases from Glen Canyon Dam may also fluctuate to provide 40 megawatts (mw) of system regulation. These instantaneous release adjustments stabilize the electrical generation and transmission system and translate to a range of about 1,200 cfs above or below the hourly scheduled release rate. Under system normal conditions, fluctuations for regulation are typically short lived and generally balance out over the hour with minimal or no noticeable impacts on downstream river flow conditions.

Releases from Glen Canyon Dam can also fluctuate beyond scheduled releases when called upon to respond to unscheduled power outages or power system emergencies. Depending on the severity of the system emergency, the response from Glen Canyon Dam can be significant, within the full range of the operating capacity of the power plant for as long as is necessary to maintain balance in the transmission system. Glen Canyon Dam currently maintains 30 mw (approximately 800 cfs) of generation capacity in reserve in order to respond to a system emergency even when generation rates are already high. System emergencies occur fairly infrequently and typically require small responses from Glen Canyon Dam. However, these responses can have a noticeable impact on the river downstream of Glen Canyon Dam.

Inflow Forecasts and Model Projections

The forecast for water year 2020 unregulated inflow to Lake Powell, issued on March 4, 2020, by the Colorado Basin River Forecast Center, projects that the most probable (median) unregulated inflow volume this year will be 8.64 maf (80 percent of average). There is significant uncertainty regarding this season's snowpack development and resulting runoff into Lake Powell. Reclamation updates the minimum and maximum probable forecasts four times a year: January, April, August and October. The January forecast ranges from a minimum probable of 6.4 maf (59 percent of average) to a maximum probable of 12.82 maf (118 percent of average). There is a 10 percent chance

that inflows could be higher than the current maximum probable forecast and a 10 percent chance that inflows could be lower than the minimum probable forecast.

Based on the current forecast, the March 24-Month Study projects Lake Powell elevation will end water year 2020 near 3,615.89 feet with approximately 13.33 maf in storage (55 percent of capacity). Note that projections of elevation and storage for water year 2020 have significant uncertainty at this point in the season. Projections of end of water year 2020 elevation and storage using the minimum and maximum probable inflow forecast from January 2020 are 3,598.83 feet (11.64 maf, 48 percent of capacity) and 3,649.60 feet (17.17 maf, 71 percent of capacity), respectively. Under these scenarios, there is a 10 percent chance that inflows will be higher, resulting in higher elevation and storage, and 10 percent chance that inflows will be lower, resulting in lower elevation and storage. The annual release volume from Lake Powell during water year 2020 is projected to be 8.23 maf under the March most probable and the January minimum and maximum probable inflow scenarios.

Upper Colorado River Basin Hydrology

Upper Colorado River Basin regularly experiences significant year to year hydrologic variability. During the 20-year period 2000 to 2019, however, the unregulated inflow to Lake Powell, which is a good measure of hydrologic conditions in the Colorado River Basin, was above average in only 4 out of the past 19 years. The period 2000-2019 is the lowest 20-year period since the closure of Glen Canyon Dam in 1963, with an average unregulated inflow of 8.76 maf, or 81 percent of the 30-year average (1981-2010). (For comparison, the 1981-2010 total water year average is 10.83 maf.) The unregulated inflow during the 2000-2019 period has ranged from a low of 2.64 maf (24 percent of average) in water year 2002 to a high of 15.97 maf (147 percent of average) in water year 2011. In water year 2018 unregulated inflow volume to Lake Powell was 4.6 maf (43 percent of average), the third driest year on record above 2002 and 1977. Under the current most probable forecast, the total water year 2020 unregulated inflow to Lake Powell is projected to be 8.48 maf (78 percent of average).

At the beginning of water year 2020, total system storage in the Colorado River Basin was 31.64 maf (53 percent of 59.6 maf total system capacity). This is an increase of 3.64 maf over the total storage at the beginning of water year 2019 when total system storage was 28 maf (47 percent of capacity). Since the beginning of water year 2000, total Colorado Basin storage has experienced year to year increases and decreases in response to wet and dry hydrology, ranging from a high of 94 percent of capacity at the beginning of 2000 to the now current level of 53 percent of capacity at the beginning of water year 2020. Based on current inflow forecasts, the current projected end of water year total Colorado Basin reservoir storage for water year 2020 is approximately 30.8 maf (52 percent of total system capacity). The actual end of water year 2020 system storage may vary from this projection, primarily due to uncertainty regarding this season’s runoff and reservoir inflow.
