Date: July 10, 2003

From: Water Resource Group, Salt Lake City

To: All Colorado River Annual Operating Plan (AOP) Recipients

Current Status

	June inflow(unreg) (Acre-Feet)	Percent of normal	Midnight July 9 Elevation	Reservoir Storage (Acre-Feet)
Fontenelle	189,000	53	6,496.81	275,000
Flaming Gorge	244,000	52	6,011.25	2,682,000
Blue Mesa	171,000	59	7,478.72	497,000
Powell	2,003,000	65	3,615.09	13,249,000
Navajo	62,000	24	6,014.68	863,000

Expected Operation

FONTENELLE - Fontenelle Reservoir is currently at a reservoir elevation of 6496.81 feet above sea level and slowly rising. The projected peak elevation will likely be about 6498.5 feet above sea level on or about August 1, 2003 which will be about 7.5 feet below the crest elevation of the spillway. Releases from Fontenelle Dam are currently 750 cfs and will likely remain at or near this level for the foreseeable future. During the spring runoff period (April through July) this year, inflows have been well below what was forecasted earlier in the period. The total inflow volume during the runoff period will likely be about 390,000 acre-feet which is only 45% of normal. The April Water Supply Forecast for Fontenelle was 640,000 acre-feet 74% of normal.

Open forum discussions on Fontenelle operations take place at the "Fontenelle Reservoir Working Group" meetings. The next Working Group meeting is scheduled for August 12th, 2003 at 10:00 a.m. at the Seedskadee National Wildlife Refuge. All those interested in the operation of Fontenelle Reservoir are encouraged to attend this meeting. For more information about the Working Group, contact Ed Vidmar at 801-379-1182.

FLAMING GORGE - Releases from Flaming Gorge Reservoir are currently 800 cfs and will likely remain at this level for the foreseeable future. Drought conditions have persisted through the 2003 spring runoff period in the Green River Basin. Unregulated inflows to Flaming Gorge Reservoir from April 1st to July 31st will most likely be about 500,000 acre-feet which is only 42% of normal. This is a particularly bad inflow result considering that the snowpack levels above Flaming Gorge in early April were about 90% of normal. The reservoir elevation at Flaming Gorge is currently 6011.25 feet above sea level which is 28.75 feet below the top of the spillway gates and is about 3.3 feet above the low elevation of the year. The reservoir elevation is projected to increase slowly during the remainder of the summer and fall.

The next "Flaming Gorge Working Group" meeting is to be held on September 16th, 2003 in Vernal,

Utah at 6:30 p.m. at the Western Park Convention Center. This meeting will include several informative presentations regarding Green River hydrology and recovery of endangered fish in the Green River. All those who are interested in these topics or the Green River in general are encouraged to attend. For more information about the Working Group please contact Ed Vidmar at 801-379-1182.

ASPINALL - June unregulated inflow into Blue Mesa Reservoir was 171,000 acre-feet or 59 percent of average. Drought conditions remain the controlling factor for water management throughout the region. Recorded precipitation during the month of June was below normal. The current inflow rate into Blue Mesa Reservoir is about 700 cfs and reservoir releases are averaging about 1,700 cfs. Blue Mesa's present elevation is 7479.08 feet, which corresponds to a storage content of about 499,000 acre-feet. During the last week of May saw record high temperatures, which quickly melted a majority of the snowpack. This resulted in some very impressive streamflow rates, but which were only of short duration because of the limited snowpack. Blue Mesa had a peak inflow of 6,700 cfs on May 30, 2003. Since that time the spring runoff has receded rather abruptly and is for the most part over. On July 1, 2003, the National Weather Service's River Forecast Center issued their final inflow forecast for Blue Mesa Reservoir for the April through July runoff period. This forecast is projecting a volume runoff into the reservoir of 450,000 acre-feet. This represents a 62 percent of average runoff for this time period.

Releases from Crystal Dam are currently set at 1775 cfs. The Gunnison Diversion Tunnel is currently diverting about 1025 cfs which leaves approximately 750 cfs in the river below the tunnel. Due to the severity of the continuing drought in the Gunnison River Basin, river flows through the Black Canyon of the Gunnison have been set to meet downstream water flow rights. Some fluctuation to river flows may occur as we respond to downstream water needs. However, for the most part the Gunnison River is now flowing at the projected maximum for this summer season. The flows will start to diminish during August and continue into October when we expect to have minimum flows again during the fall and winter season.

The next meeting of the "Aspinall Unit Working Group" will be held on Thursday, August 21, 2003 at 1:00 PM in the National Park Service Elk Creek Visitor Center at Blue Mesa Reservoir. At this meeting, review of last few months of reservoir operations, and plans for this fall 2003 operations will be discussed. These meetings are open forum discussions on the Aspinall Unit reservoir operations with many interested groups participating. Anyone needing further information about these meetings should contact Dan Crabtree in the Grand Junction Area Office at (970) 248-0652.

NAVAJO – Reclamation will be increasing the release from Navajo Reservoir from 900 cubic feet per second (cfs) to 1,000 cfs **on Thursday, July 10, 2003, at 9:00 a.m.** These releases are being made for the authorized purposes of the Navajo Unit, and to attempt to maintain a target base flow through the endangered fish critical habitat reach of the San Juan River (Farmington to Lake Powell).

With the current anticipated shortage of 1% to all users along the San Juan River, the target base flow is 495 cfs (500 cfs less 1%). The target base flow is calculated as the weekly average of gauged flows throughout the critical habitat area, therefore daily flows of less than 495 cfs may

occur at some gages. After a couple of weeks of ramping up the releases, it is anticipated that this latest increase will be sufficient to meet current demands downstream.

The current inflow into Navajo Reservoir is averaging about 200 cfs. Presently, the reservoir water surface elevation is 6015.01 feet, which corresponds to a storage content of about 866,000 acre-feet. The monthly precipitation average in the basin above Bluff was below normal for June. Navajo Reservoir end-of-June content was 884,600 acre-feet, or 62% of average. Inflow to Navajo Reservoir during June was 68,100 acre-feet, 32% of average. Releases to the San Juan River were 29,000 acre-feet (487 cfs). Diversions to NIIP were 35,700 acre-feet. Reservoir releases were increased from 450 cfs to 500 cfs on June 19th, from 500 to 550 on June 26th, from 550 to 750 on June 30th. Minimum releases from the dam will be 450 cfs this summer.

Based on the July 3rd, 2003 Final Forecast provided by the Colorado Basin River Forecast Center in Salt Lake City, the Most Probable modified-unregulated inflow forecast volume is 331,000 acre-feet (41% of the 30-year average) for the April-July period. This is 9,000 acre-feet less than predicted in the June Final Forecast. After adjusting for Vallecito Reservoir operation and diversions to San Juan-Chama Project, the Apr-July inflow is projected to be 289,300 acre-feet, 43% of the 30-year average. This is about 1,000 acre-feet less than predicted in the June Forecast. Releases are estimated to be 338,000 acre-feet for the 2003 WY and are based on forecasted Animas River flows and requirements to satisfy the SJRIP target flows. The September Navajo end-of-month content is projected to be 781,700 acre-feet, or 57% of average. This shows 90,000 acre-feet (10.3%) decrease over September 2002 reservoir contents. This forecast indicates that no shortages would occur to Navajo Reservoir contract users and no Spring Fish Release will be made in 2004.

A public meeting on Navajo Reservoir operations will be held on Tuesday, August 19, 2003 starting at 1:00 PM in Farmington, New Mexico. At this meeting, review of last Spring and Summer reservoir operations, and plans for this Fall 2003 operations will be discussed. These are open forum discussions on the operation of Navajo Reservoir with many interested groups participating. Anyone interested in the general operation of the reservoir is encouraged to attend. Please contact Pat Page in Reclamation's Durango, Colorado Office at (970) 385-6560 for information about these meetings or the daily operation of Navajo Reservoir.

Glen Canyon Dam - Lake Powell

Operations: Releases from Glen Canyon Dam in July will average about 14,600 cubic feet per second (cfs) with a total of 900,000 acre-feet scheduled to be released. On Mondays through Fridays in July, daily fluctuations due to load following will likely vary between a low of about 10,250 cfs (during late evening and early morning off-peak hours) to a high of about 18,250 cfs (during late afternoon and early evening on-peak hours). On Saturdays, releases will likely vary between a low of about 10,250 cfs during off-peak hours to a high of about 17,250 cfs during on-peak hours. On Sundays, releases will likely be steady throughout the day at 10,250 cfs. It should be noted, however, that actual releases will occasionally deviate from those listed here due to real-time power system considerations.

August releases will likely be very similar to July releases. A total of 900,000 acre-feet, the same volume as July, is scheduled to be released in August, 2003. Releases in September, 2003 however, will be significantly lower. A total of 480,000 acre-feet is scheduled to be released in September,

which averages out to about 8,000 cfs.

Because of the draw down condition of Lake Powell , releases from Lake Powell in water year 2003 are being scheduled to meet the minimum objective release of 8.23 million acre-feet. This is consistent with the requirements of the Criteria for Coordinated Long-Range Operation of Colorado River Reservoirs.

Experimental Flows: Daily high fluctuating releases from Glen Canyon Dam, as part of the Glen Canyon Dam experimental flows, were completed on March 31, 2003 . From January through March 2003 releases ranged between a high of 20,000 cfs to a low of 5,000 cfs each day. These same high fluctuating releases are scheduled to be repeated in January through March of 2004.

The January through March high fluctuating releases were intended to benefit the endangered humpback chub. Scientists have recognized that the humpback chub population has been in general decline since highly fluctuating flows were curtailed in November of 1991. Those flows helped keep the non-native fish, especially the rainbow and brown trout, in check. The trout are thought to prey upon and compete with native fish such as the endangered humpback chub. The experimental flows from Glen Canyon Dam received environmental clearances in December 2002. The flows were analyzed in an environmental assessment in accordance with the National Environmental Policy Act. The experimental flows are the result of ongoing studies by scientists from the United States Geological Survey and were recommended by the Glen Canyon Dam Adaptive Management Work Group, a Federal advisory committee. The experimental flows address the decline of two key resources in the Grand Canyon : sediment and population viability of endangered humpback chub. The Finding of No Significant Impact on the experimental flows can be found at http://www.usbr.gov/uc/envprog/amp/pdfs/flow_fonsi.pdf

Basin Hydrology: Unseasonably warm weather was manifest in the Colorado River basin in the latter part of May and early June. This warm weather resulted in substantial late May and early June snowmelt and runoff, especially in the Yampa River basin and the headwaters drainages of the Colorado River . Some streamflow gages even recorded record high daily flows (the Eagle River in Colorado for example). Unfortunately, snow in the basin was about gone by mid-June, and river flows (which in normal years often sustain good flows throughout June) dropped off rapidly. Unless there is significant monsoonal activity this summer, river flows in the basin in July, August and September will be quite low.

Inflow to Lake Powell peaked at 53,000 cfs on June 5, 2003 . The last time inflow to Lake Powell was this high was in June of 1999. As of July 8, 2003 , however, inflow to Lake Powell had dropped to 9,500 cfs, only 35 percent of what would normally be seen on this date.

Inflow volumes are expected to be substantially below average this year with water year 2003 being the 4 th consecutive year with below average inflow to Lake Powell . The July final inflow forecast issued by the National Weather Service is calling for 4.2 million acre-feet of unregulated runoff into Lake Powell during the 2003 April through July runoff period. This equates to 53 percent of average. Total unregulated inflow for water year 2003 will likely be about 56 percent of average.

While inflow to Lake Powell was relatively healthy the a couple of weeks in late May and early June, monthly inflow volumes continue to be significantly below long term averages. Total unregulated inflow in June, 2003 was 2,000,000 acre-feet (65 percent of average). Unregulated

inflow in January, February, March, April, and May was 58, 62, 62, 42, and 50 percent of average, respectively.

Total unregulated inflow into Lake Powell in water years 2000 and 2001 was 62 and 59 percent of average, respectively, and only 25 percent of average in 2002. Inflow in 2002 was the lowest ever observed since the completion of Glen Canyon Dam in 1963. These low inflows have reduced water storage in Lake Powell . Lake Powell reached a low water surface elevation this year of 3605 feet (95 feet from full pool) on May 1, 2003 . Lake Powell reached its peak elevation on June 23, 2003 at 3616.6 feet. The current elevation of Lake Powell is 3,616.3 feet (83.7 feet from full pool). Current storage is approximately 13.4 million acre-feet (55 percent of capacity). The water surface elevation at Lake Powell will likely continue to decrease for the remainder of the year. Under the current inflow forecast, Lake Powell will likely be near elevation 3606 feet on January 1, 2004 .

Date: December 9, 2003

From: Water Resource Group, Salt Lake City

To: All Colorado River Annual Operating Plan (AOP) Recipients

Current Status

	November Inflow (unreg) (Acre-Feet)	Percent of Normal	Midnight December 8 Elevation	Reservoir Storage (Acre-Feet)
Fontenelle	27,000	63	6487.90	214,000
Flaming Gorge	28,000	50	6009.13	2,613,000
Blue Mesa	24,000	77	7460.43	374,000
Powell	353,000	65	3599.64	11,716,000
Navajo	24,000	68	5996.71	713,000

Expected Operation

FONTENELLE - Inflows to Fontenelle Reservoir have been averaging about 540 cfs over the first week of December which is about the average inflow for this time of year. Releases are currently 750 cfs and the reservoir elevation is decreasing at a rate of about 1 foot every 12 days. The current reservoir elevation is 6487.97 feet above sea level. With the projected inflows and releases over the next several months, the reservoir elevation will likely decline 15 to 20 feet between now and the beginning of March, 2004.

Open forum discussions on Fontenelle operations take place at the "Fontenelle Reservoir Working Group" meetings. The Working Group is a forum for information exchange between Reclamation and other parties associated with the operation of Fontenelle Reservoir. The public is encouraged to attend and express their concerns and interests with regard to Fontenelle Reservoir operation. The next Working Group meeting is scheduled for April 14th, 2004 at 10:00 a.m. and will at the Wyoming Fish and Game office located in Green River Wyoming. For more information about the Working Group, contact Ed Vidmar at 801-379-1182.

FLAMING GORGE - Inflows to Flaming Gorge Reservoir are currently averaging about 850 cfs for the first week of December while the unregulated inflow is averaging only 585 cfs (90% of normal). The reservoir elevation is currently 6009.17 feet above sea level and releases are steady at about 850 cfs. Releases will likely remain at the current level until spring of 2004.

The next "Flaming Gorge Working Group" meeting is to be held on April 15th, 2004 in Vernal, Utah at 10:00 a.m. at the Western Park Convention Center. The Working Group a forum for information exchange between Reclamation and all other parties associated with the operation of Flaming Gorge Reservoir. The public is encouraged to attend and express their concerns and interests with regard to the operation of Flaming Gorge Reservoir. For more information about the Working Group please contact Ed Vidmar at 801-379-1182.

ASPINALL – November unregulated inflow into Blue Mesa Reservoir was 24,000 acre-feet or 77 percent of average. Drought conditions still remain the controlling factor for water management throughout the region. Recorded precipitation during the month of November was 140 percent of normal. Average streamflow is still much below normal and will probably stay that way into next spring's runoff. It will take a winter of much above average snowfall to produce an average runoff since the soil moisture profiles are so depleted. The current inflow rate into Blue Mesa Reservoir is about 350 cfs and reservoir releases are averaging about 250 cfs. Blue Mesa's present elevation is 7460.43 feet, which corresponds to a storage content of about 374,000 acre-feet.

Releases from Crystal Dam are currently set at 325 cfs. The Gunnison Diversion Tunnel has been shut down for the winter season with the exception of some small 50 cfs diversions taken bi-weekly for the municipal water needs for the city of Montrose, Colorado. Due to the severity of the continuing drought in the Gunnison River Basin, river flows through the Black Canyon of the Gunnison have been set close to the minimum flow rate. Last year that rate was 250 cfs; currently we have the river flow at 325 cfs. Minimum flow rates between 250 to 350 cfs will remain in place through the rest of the fall and winter months.

On December 4, 2003, the National Weather Service's River Forecast Center issued the forecasted inflow over the next 3 months for continued below normal conditions. The unregulated inflow forecast for December, January, and February is 58,000 acre-feet which is 78% of normal for these months. Based on this forecast, Blue Mesa Reservoir elevation is estimated to increase about 1.35 feet to elevation 7461.78 feet or about 8,000 acre-feet by the end of February 2004.

The next meeting of the "Aspinall Unit Working Group" will be on Thursday, January 22, 2004 at 1:00 PM in Montrose, Colorado. At this meeting, review of last summer and fall reservoir operations, and plans for next winter and spring 2004 operations will be discussed. These meetings are open forum discussions on the Aspinall Unit reservoir operations with many interested groups participating. Anyone needing further information about these meetings should contact Dan Crabtree in the Grand Junction Area Office at (970) 248-0652.

NAVAJO – Reclamation decreased the release from Navajo Reservoir from 400 cubic feet per second (cfs) to 250 cfs, on Monday, November 3, 2003. All reservoir releases are made for the authorized purposes of the Navajo Unit, and to attempt to maintain a target base flow through the endangered fish critical habitat reach of the San Juan River (Farmington to Lake Powell).

Based upon current hydrological conditions and historical hydrologic data, the target base flow should remain above 440 cfs through the critical habitat area. The target base flow is calculated as the weekly average of gauged flows throughout the critical habitat area, therefore daily flows of less than 440 cfs may occur at some gages.

This scheduled release is subject to changes in river flows and weather conditions.

Inflow into Navajo Reservoir continues to be extremely low. The current reservoir inflow is averaging about 250 cfs. Presently, the reservoir water surface elevation is 5996.71 feet, which corresponds to a storage content of about 713,000 acre-feet. The monthly precipitation average in

the basin above Bluff was 120 percent of average for November. Unregulated reservoir inflow for November was 24,000 acre-feet, or 68 percent of average.

The December 1, 2003 forecasted inflow over the next 3 months is for continued below normal conditions. The unregulated inflow forecast for December, January, and February is 52,000 acre-feet which is 66% of normal for these months. Based on this forecast, the reservoir elevation is estimated to decline about 0.7 feet to elevation 5996.02 feet by the end of February 2004.

A public meeting on Navajo Reservoir operations will be held on Tuesday, January 20, 2004 starting at 1:00 PM in Farmington, New Mexico. At this meeting, review of last summer and fall reservoir operations, and plans for next winter and spring 2004 operations will be discussed. These are open forum discussions on the operation of Navajo Reservoir with many interested groups participating. Anyone interested in the general operation of the reservoir is encouraged to attend. Please contact Pat Page in Reclamation's Durango, Colorado Office at (970) 385-6560 for information about these meetings or the daily operation of Navajo Reservoir.

Glen Canyon Dam - Lake Powell

Operations

Releases from Glen Canyon Dam in December will be higher than November. In December, releases will average 9,800 cfs with a total of 600,000 acre-feet scheduled to be released. On Mondays through Saturdays in December, daily fluctuations due to load following will likely vary between a low of 6,500 cfs (during late evening and early morning off-peak hours) to a high of 12,500 cfs (during late afternoon and early evening on-peak hours). On Sundays, releases will likely vary between 6,500 cfs (during off-peak hours), and 8,000 cfs (during on-peak hours).

Releases from Glen Canyon Dam in January of 2004 are currently scheduled to be 788,000 acre-feet, which is an average of 12,800 cfs. Releases in January will be part of the ongoing experimental flows (described below). The fluctuation range will be greater than under normal operations, ranging from a low of 5,000 cfs to a high of 20,000 cfs.

Because of the draw down condition of Lake Powell, releases from Lake Powell in water year 2004 are being scheduled to meet the minimum release objective of 8.23 million acre-feet. This is consistent with the requirements of the Criteria for Coordinated Long-Range Operation of Colorado River Reservoirs.

Experimental Flows

Daily high fluctuating releases from Glen Canyon Dam, as part of the Glen Canyon Dam experimental flows, were implemented from January through March 2003, when releases ranged between a high of 20,000 cfs to a low of 5,000 cfs each day. These same high fluctuating releases are scheduled to be repeated in January through March of 2004.

The January through March high fluctuating releases are intended to benefit the endangered humpback chub. Scientists have recognized that the humpback chub population has been in general

decline since highly fluctuating flows were curtailed in November of 1991. Those flows helped keep the non-native fish, especially the rainbow and brown trout, in check. The trout are thought to prey upon and compete with native fish such as the endangered humpback chub.

The experimental flows from Glen Canyon Dam received environmental clearances in December 2002. The flows were analyzed in an environmental assessment in accordance with the National Environmental Policy Act. The experimental flows are the result of ongoing studies by scientists from the United States Geological Survey and were recommended by the Glen Canyon Dam Adaptive Management Work Group, a Federal advisory committee. The experimental flows address the decline of two key resources in the Grand Canyon: sediment and population viability of endangered humpback chub. The Finding of No Significant Impact on the experimental flows can be found at http://www.uc.usbr.gov/amp/flow_fonsi.pdf.

Basin Hydrology

Severe drought conditions in the Colorado River Basin continue. As we move into a new water year there are really no signals of the drought easing. Water year 2004 began on October 1, 2003 and the first month of the new water year was much warmer and drier than average. Basinwide precipitation in October was only 35 percent of average. November has been more favorable with cooler wetter conditions predominating. Basinwide snowpack is currently at 104 percent of average as of November 26, 2003. Soil moisture levels throughout the basin are very low, however, and the November snow has fallen upon very dry soils. This scenario is not favorable for next spring's runoff, as much of the melting snow will be absorbed by the dry soil. Reclamation is estimating that with average snowpack conditions this winter, runoff next spring would be about 75 percent of average.

The Colorado River Basin is now in its 5th year of drought. Inflow volumes have been below average for 4 consecutive years. Unregulated inflow in water year 2003 was only 53 percent of average. Unregulated inflow in 2000, 2001 and 2002 was 62, 59, and 25 percent of average, respectively. Inflow in 2002 was the lowest ever observed since the completion of Glen Canyon Dam in 1963.

The trend of low inflow continues. Unregulated inflow in November, 2003 will end up being only about 64 percent of average. As of November 25, 2003 observed inflow to Lake Powell is 5,700 cfs, about 55 percent of what is usually seen in late November.

Low inflows have reduced water storage in Lake Powell. The current elevation of Lake Powell is 3,600.9 feet (99.1 feet from full pool). Current storage is approximately 11.8 million acre-feet (49 percent of capacity). The good news is that even after 4 years of severe drought Lake Powell is still storing a large volume of water (nearly 12 million acre-feet).

Date: January 13, 2004

From: Water Resource Group, Salt Lake City

To: All Colorado River Annual Operating Plan (AOP) Recipients

Current Status

	December Inflow (unreg) (Acre-Feet)	Percent of Normal	Midnight January 13 Elevation	Reservoir Storage (Acre-Feet)
Fontenelle	28,000	85	6484.08	190,000
Flaming Gorge	27,000	68	6008.87	2,605,000
Blue Mesa	22,000	85	7461.35	380,000
Powell	296,000	68	3595.07	11,286,000
Navajo	20,000	78	5996.24	709,000

Expected Operation

FONTENELLE - Snowpack conditions above Fontenelle remain near normal through the second week of January. As of January 13, 2004 the snowpack above Fontenelle Reservoir measured 99% of normal. The snowpack building season is about one half complete at this point.

The Colorado Basin River Forecast Center (CBRFC) issued the 2004 Water Supply Forecast for Fontenelle at 680,000 acre-feet (79% of normal) for the period from April through July. Based on this forecast, it is very likely that Fontenelle Reservoir will fill during the summer of 2004. The reservoir elevation is currently 6484 feet above sea level and declining about 1 foot every 9 days. The reservoir elevation will continue to decline until April and will reach a minimum elevation for the year of about 6467 feet above sea level. By late July Fontenelle will be very nearly full depending on the accuracy of the Water Supply Forecast. Releases will likely remain at the current level (750 cfs) until late March when ice cover on the river has subsided.

Open forum discussions on Fontenelle operations take place at the "Fontenelle Reservoir Working Group" meetings. The Working Group is a forum for information exchange between Reclamation and other parties associated with the operation of Fontenelle Reservoir. The public is encouraged to attend and express their concerns and interests with regard to Fontenelle Reservoir operation. The next Working Group meeting is scheduled for April 14th, 2004 at 10:00 a.m. and will at the Wyoming Fish and Game office located in Green River Wyoming. For more information about the Working Group, contact Ed Vidmar at 801-379-1182.

FLAMING GORGE - Due to experimental flows being conducted at Glen Canyon Dam, releases from Flaming Gorge Dam could see some fluctuations during the month of January. Fluctuating releases are being made to assist Western Area Power Administration make up generation that has been lost due to the experimental flows at Glen Canyon Dam. These fluctuations will vary daily

depending on power market conditions but are limited to a peak of 2000 cfs for a maximum duration of 4 hours each day. Minimum flows will remain at the current level which has been about 850 cfs. The additional releases are limited to 8500 acre-feet for the month of January which could impact the reservoir elevation by 2-3 inches.

The Colorado Basin River Forecast Center (CBRFC) has issued the coordinated water supply forecast for Water Year 2004. The official forecast for Flaming Gorge Reservoir has this years unregulated inflow volume for April through July at 930,000 acre-feet (78% of normal). This forecast will be updated twice each month as conditions change. Snow conditions above Flaming Gorge continue to be near normal for this time of year. On January 13th the snowpack above Flaming Gorge measured 96% of normal.

Based on the forecast, Flaming Gorge Reservoir will likely see some filling occur during the spring runoff. By March 1st, the reservoir elevation will likely see its low point for the year at about 6007.9 feet above sea level. By the end of July, the reservoir elevation potentially could rise about 10 feet from this level depending on the accuracy of the current forecast and the level of releases established during the runoff period.

The next "Flaming Gorge Working Group" meeting is to be held on April 15th, 2004 in Vernal, Utah at 10:00 a.m. at the Western Park Convention Center. The Working Group a forum for information exchange between Reclamation and all other parties associated with the operation of Flaming Gorge Reservoir. The public is encouraged to attend and express their concerns and interests with regard to the operation of Flaming Gorge Reservoir. For more information about the Working Group please contact Ed Vidmar at 801-379-1182.

ASPINALL – December unregulated inflow into Blue Mesa Reservoir was 22,000 acre-feet or 85 percent of average. Drought conditions still remain the controlling factor for water management throughout the region, even though we have had a fairly good start to the snowpack building season. Recorded precipitation during the month of December was 105 percent of normal. On January 13, 2004 the basin snowpack was averaging 117 percent. The current inflow rate into Blue Mesa Reservoir is about 325 cfs and reservoir releases are averaging about 225 cfs. Blue Mesa's present elevation is 7461.35 feet, which corresponds to a storage content of about 380,000 acre-feet.

Releases from Crystal Dam are currently set at 325 cfs. The Gunnison Diversion Tunnel has been shut down for the winter season with the exception of some small 100 cfs diversions taken bi-weekly for the municipal water needs for the city of Montrose, Colorado. Due to the severity of the continuing drought in the Gunnison River Basin, river flows through the Black Canyon of the Gunnison have been set close to the minimum flow rate. Last year that rate was 250 cfs; currently we have the river flow at 325 cfs.

On January 6, 2004, the National Weather Service's River Forecast Center issued the forecasted inflow for the April through July runoff period. The forecast is projecting a volume runoff into Blue Mesa Reservoir of 685,000 acre-feet. This represents a 95 percent of average runoff for this time period. Based on this forecast, Blue Mesa Reservoir is estimated to be near full or elevation 7516.4 feet by the end of the runoff period during the month of July 2004.

The next meeting of the "Aspinall Unit Working Group" will be on Thursday, January 22, 2004 at 1:00 PM in Montrose, Colorado. At this meeting, review of last summer and fall reservoir operations, and plans for next winter and spring 2004 operations will be discussed. These meetings are open forum discussions on the Aspinall Unit reservoir operations with many interested groups participating. Anyone needing further information about these meetings should contact Dan Crabtree in the Grand Junction Area Office at (970) 248-0652.

NAVAJO – Reclamation decreased the release from Navajo Reservoir from 400 cubic feet per second (cfs) to 250 cfs, on Monday, November 3, 2003. All reservoir releases are made for the authorized purposes of the Navajo Unit, and to attempt to maintain a target base flow through the endangered fish critical habitat reach of the San Juan River (Farmington to Lake Powell).

Based upon current hydrological conditions and historical hydrologic data, the target base flow should remain above 440 cfs through the critical habitat area. The target base flow is calculated as the weekly average of gauged flows throughout the critical habitat area, therefore daily flows of less than 440 cfs may occur at some gages. This scheduled release is subject to changes in river flows and weather conditions.

Inflow into Navajo Reservoir continues to be very low. Unregulated reservoir inflow for December was 20,000 acre-feet, or 78 percent of average. The current reservoir inflow is averaging about 200 cfs. Presently, the reservoir water surface elevation is 5996.24 feet, which corresponds to a storage content of about 709,000 acre-feet. The monthly precipitation average in the basin above Bluff was 75 percent of average for December. The basin wide snowpack on January 13 was 108 percent of normal for the Animas River basin, and 126 percent of normal for the upper San Juan River basin.

On January 6, 2004, the National Weather Service's River Forecast Center issued an inflow forecast for Navajo Reservoir for the April through July runoff period. This forecast is projecting a volume runoff into the reservoir of 910,000 acre-feet. This represents a 114 percent of normal runoff for the Upper San Juan River Basin. Although this seems like a break from the drought of recent years it is still very early in the snow accumulation season to break us out of drought operation mode.

A public meeting on Navajo Reservoir operations will be held on Tuesday, January 20, 2004 starting at 1:00 PM in Farmington, New Mexico. At this meeting, review of last summer and fall reservoir operations, and plans for next winter and spring 2004 operations will be discussed. These are open forum discussions on the operation of Navajo Reservoir with many interested groups participating. Anyone interested in the general operation of the reservoir is encouraged to attend. Please contact Pat Page in Reclamation's Durango, Colorado Office at (970) 385-6560 for information about these meetings or the daily operation of Navajo Reservoir.

Glen Canyon Dam - Lake Powell

Operations Experimental Flows

Daily high fluctuating releases from Glen Canyon Dam, as part of the Glen Canyon Dam experimental flows, will be implemented from January through March 2003. Releases will range

between a high of 20,000 cubic feet per second (cfs) to a low of 5,000 cfs each day. The 20,000 cfs releases will be maintained for about 9 hours each day (from about 11:00 am until about 8:00 pm), while the 5,000 cfs releases will be maintained for about 8 hours (from about 1:00 am until about 9:00 am). The remainder of the hours will be transition releases where releases will be between the daily high and the daily low. This pattern will be maintained for 7 days a week during the January through March time period. It should be noted that due to real-time power considerations and regulation to stabilize the power system, actual releases may deviate somewhat from this pattern

The January through March high fluctuating releases are intended to benefit the endangered humpback chub. Scientists have recognized that the humpback chub population has been in general decline since highly fluctuating flows were curtailed in November of 1991. Those flows helped keep the non-native fish, especially the rainbow and brown trout, in check. The trout are thought to prey upon and compete with native fish such as the endangered humpback chub. This is the second year of high fluctuating releases as part of the experimental flows. High fluctuating releases were first implemented in January through March of 2003.

Monthly release volumes in January, February, and March 2003 are scheduled to be 788, 737, and 788 thousand acre-feet, respectively, which averages out to 12,800 cfs per day. Because of the draw down condition of Lake Powell, releases from Lake Powell in water year 2004 are being scheduled to meet the minimum release objective of 8.23 million acre-feet. This is consistent with the requirements of the Criteria for Coordinated Long-Range Operation of Colorado River Reservoirs. The experimental flows will not change the total volume of water to be released from Lake Powell in water year 2004.

The experimental flows from Glen Canyon Dam received environmental clearances in December 2002. The flows were analyzed in an environmental assessment in accordance with the National Environmental Policy Act. The experimental flows are the result of ongoing studies by scientists from the United States Geological Survey and were recommended by the Glen Canyon Dam Adaptive Management Work Group, a Federal advisory committee. The experimental flows address the decline of two key resources in the Grand Canyon: sediment and population viability of endangered humpback chub. The Finding of No Significant Impact on the experimental flows can be found at http://www.uc.usbr.gov/amp/flow_fonsi.pdf

Basin Hydrology

Severe drought conditions in the Colorado River Basin continue. As we move into mid-winter, there are no clear signals that the drought is easing. While much of Utah was slammed with a major winter storm the last week of December, snowpack in the Colorado River Basin remains near average. The bulk of the moisture from the Utah storm was in the Wasatch Mountains,west of the Colorado River Basin. As of December 30, 2003, snowpack in the Colorado River Basin is 101 percent of average. Because of the extended drought, the snowpack lies atop a mantle of very dry soil. This scenario is not favorable for next springs runoff, as much of the melting snow will be absorbed by the soil. Reclamation is estimating that with average snowpack conditions this winter, runoff next spring would be about 75 percent of average. The National Weather Service will issue an April through July inflow forecast for Lake Powell on January 5, 2004.

The Colorado River Basin is now in its 5th year of drought. Inflow volumes have been below average for 4 consecutive years. Unregulated inflow in water year 2003 was only 53 percent of

average. Unregulated inflow in 2000, 2001 and 2002 was 62, 59, and 25 percent of average, respectively. Inflow in 2002 was the lowest ever observed since the completion of Glen Canyon Dam in 1963.

The trend of low inflow continues. Unregulated inflow in November, 2003 was 64 percent of average and Decembers will likely end up at about 65 percent of average. On December 29, 2003 observed inflow to Lake Powell was 5,000 cfs, about 60 percent of what is usually seen in late December.

Low inflows have reduced water storage in Lake Powell. On December 5, 2003, the elevation of Lake Powell dropped below 3600 feet. The last time the water surface elevation was this low was in 1973. The current elevation (as of December 30, 2003) of Lake Powell is 3,597 feet (103 feet from full pool). Current storage is 11.5 million acre-feet (47 percent of capacity). The good news is that even after 4 years of severe drought Lake Powell is still storing a large volume of water.

Date: April 12, 2004

From: Water Resource Group, Salt Lake City

To: All Colorado River Annual Operating Plan (AOP) Recipients

Current Status

	March inflow(unreg) (Acre-Feet)	Percent of normal	Midnight April 11 Elevation	Reservoir Storage (Acre-Feet)
Fontenelle	23,000	79	6482.85	183,000
Flaming Gorge	33,000	70	6009.79	2,634,000
Blue Mesa	20,000	88	7470.60	440,000
Powell	245,000	58	3583.02	10,200,000
Navajo	23,000	77	6010.79	829,000

Expected Operation

FONTENELLE – The current elevation of Fontenelle Reservoir is 6483.07 feet above sea level. Releases are steady at about 750 cfs and the inflows are averaging about 1500 cfs.

Snowpack conditions above Fontenelle decreased significantly during the month of March. As of March 1st, 2004 the snowpack above Fontenelle Reservoir measured 88.2% of normal. As of April 1st, the snowpack measured 74.5% of normal and as of April 13th the snowpack now measures 62.7% of normal. The snowpack building season is nearly complete for 2004.

The Colorado Basin River Forecast Center (CBRFC) has updated the 2004 Water Supply Forecast for Fontenelle to 500,000 acre-feet (58% of normal) for the period from April through July. This is down 125,000 acre-feet from on month ago. It is still very likely that Fontenelle Reservoir will fill during the summer of 2004. The reservoir elevation is currently 6483.07 feet above sea level and increasing. Releases are currently near 750 cfs and will likely be increased to about powerplant capacity (~1500 cfs) by the end of April. By late July Fontenelle will be very nearly full depending on how much inflow Fontenelle receives over the next 4 month.

Open forum discussions on Fontenelle operations take place at the "Fontenelle Reservoir Working Group" meetings. The Working Group is a forum for information exchange between Reclamation and other parties associated with the operation of Fontenelle Reservoir. The public is encouraged to attend and express their concerns and interests with regard to Fontenelle Reservoir operation. The next Working Group meeting is scheduled for April 14th, 2004 at 10:00 a.m. and will at the Wyoming Fish and Game office located in Green River Wyoming. For more information about the Working Group, contact Ed Vidmar at 801-379-1182.

FLAMING GORGE – The current elevation of Flaming Gorge (4/13) is about 6009.8 feet above sea level (30.2 feet from full pool elevation). Inflows have been averaging about 1400 cfs over the past 10 days while releases are averaging about 860 cfs.

The Colorado Basin River Forecast Center (CBRFC) has updated the coordinated water supply forecast for Water Year 2004. The official forecast for Flaming Gorge Reservoir was updated during the first week of April to 620,000 acre-feet (52% of normal) of unregulated inflow for the April-July period. This reflects a 205,000 acre-foot decrease from March's forecast. Snow conditions above Flaming Gorge decreased significantly during March. On March 1st the snowpack above Flaming Gorge measured 88.3% of normal. As of April 1st, the snowpack was 70.7% of normal. As of April 13th the snowpack had decreased to 58.7% of normal. The snowpack building season is nearly complete at this point of the year.

Based on the forecast, Flaming Gorge Reservoir will likely see some filling during the spring runoff. Currently the reservoir elevation is 6009.79 feet above sea level (30.21 feet from full pool elevation). Inflows are beginning to increase and the reservoir elevation will likely increase over the next 5 months by 2 to 4 feet.

The next "Flaming Gorge Working Group" meeting is to be held on April 15th, 2004 in Vernal, Utah at 10:00 a.m. at the Western Park Convention Center. The Working Group is a forum for information exchange between Reclamation and all other parties associated with the operation of Flaming Gorge Reservoir. The public is encouraged to attend and express their concerns and interests with regard to the operation of Flaming Gorge Reservoir. For more information about the Working Group please contact Ed Vidmar at 801-379-1182.

ASPINALL - March unregulated inflow into Blue Mesa Reservoir was 46,000 acre-feet or 131 percent of average. This higher than average inflow volume was mainly the result of a much drier and warmer March. Therefore, drought conditions still remain the controlling factor for water management throughout the region. Precipitation during the month of March was only 30 percent of average. On March 10, 2004 the basin snowpack was averaging 99 percent of average, however by April 10th the basin snowpack was only averaging 77 percent of average. With the soil moisture being severely depleted from 4 years of drought, we can expect of much reduced spring runoff from the already below normal snowpack. The current inflow rate into Blue Mesa Reservoir is about 1200 cfs and reservoir releases are averaging about 300 cfs. Blue Mesa's present elevation is 7470.6 feet, which corresponds to a storage content of about 440,000 acre-feet. To view the most current reservoir elevation, content, inflow and release, click on: Blue Mesa Reservoir Data or Crystal Reservoir Data.

On April 5, 2004, the National Weather Service's River Forecast Center issued the forecasted inflow for the April through July runoff period. The forecast is projecting a volume runoff into Blue Mesa Reservoir of 460,000 acre-feet or 64 percent of average. This is a reduction of 160,000 acre-feet from March's seasonal runoff forecast of 620,000 acre-feet. Based on this forecast, Blue Mesa Reservoir is not expected to fill this year.

Uncompahgre Valley Water Users (UVWU) started diverting water through their Gunnison Tunnel on March 23, 2004. Releases from Crystal Dam were increased to correspond to tunnel demands.

Currently, releases from Crystal are set at 700 cfs. The river flows below the tunnel are about 300 cfs. Due to the severity of the continuing drought in the Gunnison River Basin, river flows through the Black Canyon of the Gunnison have been set close to the minimum flow rate of 300 cfs since the close of late season's (2003) irrigation. It is anticipated that canyon flows will start to increase as downstream demands pick up, which should start to increase sometime during the first part of May.

The next meeting of the "Aspinall Unit Working Group" will be held on Thursday, April 22, 2004 at 1:00 PM in Grand Junction, Colorado. At this meeting, review of last autumn and winter reservoir operations, and plans for next spring and summer 2004 operations will be discussed. These meetings are open forum discussions on the Aspinall Unit reservoir operations with many interested groups participating. Anyone needing further information about these meetings should contact Dan Crabtree in the Grand Junction Area Office at (970) 248-0652.

Navajo - Reclamation increased the release from Navajo Reservoir from 250 cubic feet per second (cfs) to 350 cfs on Thursday, April 1, 2004, at 4:00 am. Releases are made for the authorized purposes of the Navajo Unit, and to attempt to maintain a target base flow through the endangered fish critical habitat reach of the San Juan River (Farmington to Lake Powell).

Once again this year, a shortage sharing agreement on the San Juan River has been developed by water users. The agreement calls for users to limit their water use and share in shortages in the event a water shortage is realized.

Minimum Target Base Flows for recovery of endangered fish will be 400 cfs through October based on the 2004 Shortage Sharing Agreement recommendations that target base flows be reduced from 500 cfs to 400 cfs for the April through October period, if the Minimum Probable forecast projects the July End-of-Month Content to be below 1,000,000 acre-feet.

Based on the 2004 Shortage Sharing rules, a shortage does not exist under the April forecast.

Because of gate repair work at Navajo Dam this spring, a spring peak release will not be made for endangered fish this year. The minimum allowable reservoir release will be 350 cfs through October, unless the Record of Decision (ROD) for the Navajo Reservoir EIS is signed before that time.

Unregulated reservoir inflow for March was 119,000 acre-feet, or 133 percent of average. This unexpected above normal inflow was a direct result of much warmer temperatures than usual during March, thus initiating an early start to the annual spring runoff. The current daily reservoir inflow is averaging about 2,000 cfs. Presently, the reservoir water surface elevation is 6010.8 feet, which corresponds to a storage content of about 829,000 acre-feet. The monthly precipitation average in the basin above Bluff was only 20 percent of average for March. The basin wide snowpack on April 10 was 87 percent of normal for the Animas River basin, and 89 percent of normal for the upper San Juan River basin.

On April 5, 2004, the National Weather Service's River Forecast Center issued an inflow forecast for Navajo Reservoir for the April through July runoff period. This forecast is projecting a volume runoff into the reservoir of 600,000 acre-feet. This represents a 75 percent of normal runoff for the Upper San Juan River Basin.

A public meeting on Navajo Reservoir operations will held on Tuesday, April 13, 2004 at 1:00 PM in Farmington, New Mexico. At this meeting, review of last autumn and winter reservoir operations, and plans for next spring and summer 2004 operations will be discussed. These are open forum discussions on the operation of Navajo Reservoir with many interested groups participating. Anyone interested in the general operation of the reservoir is encouraged to attend. Please contact Pat Page in Reclamation's Durango, Colorado Office at (970) 385-6560 for information about these meetings or the daily operation of Navajo Reservoir.

Lake Powell

Glen Canyon Dam Operations - Experimental Flows

In April 2004, a volume of 650,000 acre-feet is scheduled to be released from Lake Powell, which is an average of 10,900 cubic feet per second (cfs). On Mondays through Fridays in April, daily fluctuations due to load following will likely vary between a low of about 7,800 cfs (during late evening and early morning off-peak hours) to a high of about 13,800 cfs (during late afternoon and early evening on-peak hours). On Saturdays, releases will likely vary between a low of about 7,800 cfs during off-peak hours to a high of about 12,500 cfs during on-peak hours. On Sundays, releases will likely vary between a low of about 7,800 cfs during off-peak hours to a high of about 12,000 cfs during on-peak hours. This release pattern is shown in the following graph. It should be noted,however, that actual releases will occasionally deviate somewhat from those displayed due to real-time power system considerations.

A volume of 600,000 acre-feet is scheduled to be released in May which is an average release of 9,760 cfs. Because of the draw down condition of Lake Powell, releases from Lake Powell in water year 2004 are being scheduled to meet the minimum release objective of 8.23 million acre-feet. This is consistent with the requirements of the Criteria for Coordinated Long-Range Operation of Colorado River Reservoirs.

Daily high fluctuating releases from Glen Canyon Dam, as part of the Glen Canyon Dam experimental flows, were implemented from January through March 2004. Releases, each day, varied between a low of 5,000 cfs to a high of 20,000 cfs (except for Sundays in February and March) throughout this period. The experimental flows will not change the total volume of water to be released from Lake Powell in water year 2004.

The January through March high fluctuating releases are intended to benefit the endangered humpback chub. Scientists have recognized that the humpback chub population has been in general decline since highly fluctuating flows were curtailed in November of 1991. Those flows helped keep the non-native fish, especially the rainbow and brown trout, in check. The trout are thought to prey upon and compete with native fish such as the endangered humpback chub. This is the second year of high fluctuating releases as part of the experimental flows. High fluctuating releases were first implemented in January through March of 2003.

The experimental flows from Glen Canyon Dam received environmental clearances in December 2002. The flows were analyzed in an environmental assessment in accordance with the National Environmental Policy Act. The experimental flows are the result of ongoing studies by scientists from the United States Geological Survey and were recommended by the Glen Canyon Dam Adaptive Management Work Group, a Federal advisory committee. The experimental flows address

the decline of two key resources in the Grand Canyon; sediment and population viability of endangered humpback chub. The Finding of No Significant Impact on the experimental flows can be found at http://www.uc.usbr.gov/amp/flow_fonsi.pdf .

Upper Colorado River Basin Hydrology

The month of March pretty much dashed hopes that 2004 would bring relief to the ongoing drought in the Colorado River Basin. Basin snowpack on March 1, 2004 was 96 percent of average. At that time the April through July inflow was forecasted to be 82 percent of average. The weather pattern in March, 2004 was very dry and extremely warm for early spring. Temperatures around the basin for much of the month were 20 degrees above average. As of April 7, 2004 snowpack in the basin has fallen to 65 percent of average, a drop over 30 percentage points in just one month. The low elevation snow (below 6,000 feet) in the basin is now gone and much of the mid-elevation snow (6,000 to 9,000 feet) has melted out as well. While river flows increased in late March and early April, these increases are not nearly enough to offset the early season loss of snow and the possibility of better runoff conditions in May and June. The National Weather Service March final forecast is calling for 4.0 million acre-feet of unregulated inflow to Lake Powell during the April through July runoff period, only 50 percent of average. This is a sizable reduction from the volume forecasted only a month ago. The temperature pattern in April remains above average. There have been several precipitation events, primarily in the southern portions of the basin so far in April, however.

So, the drought continues. The Colorado River Basin is now in its 5th year of drought. Inflow volumes have been below average for 4 consecutive years, with 2004 almost certain to follow suit. Unregulated inflow in water year 2003 was only 53 percent of average. Unregulated inflow in 2000, 2001 and 2002 was 62, 59, and 25 percent of average, respectively. Inflow in 2002 was the lowest ever observed since the completion of Glen Canyon Dam in 1963.

Inflow to Lake Powell in March 2004 picked up as the abnormally warm and dry weather pattern melted out significant amounts of snow in the basin. Even so, March inflow ended up below normal. Unregulated inflow in March was 538,000 acre-feet, 81 percent of average. A large portion of the melting snow last month was absorbed by the dry soils in the basin. As of April 6, 2004 inflow to Lake Powell is 11,700 cfs about 97 percent of what is normally seen in early April. It should be noted that the snow is melting out much earlier than average this year and the flows we are seeing now are likely at the expense flows in May, June and July.

Low inflows the past 5 years have reduced water storage in Lake Powell. The current elevation (as of April 7, 2004) of Lake Powell is 3,583 feet (117 feet from full pool). Current storage is 10.2 million acre-feet (42 percent of live capacity).

The water surface elevation of Lake Powell is at its seasonal low. The water surface elevation will likely increase in April, May and early June. Under the current inflow forecast, Lake Powell is projected to reach an early summer peak elevation of 3,590 feet, probably in mid-June.

Date: July 12, 2004

From: Water Resource Group, Salt Lake City

To: All Colorado River Annual Operating Plan (AOP) Recipients

Current Status

	June inflow(unreg) (Acre-Feet)	Percent of normal	Midnight July 11 Elevation	Reservoir Storage (Acre-Feet)
Fontenelle	181,000	51	6505.08	338,000
Flaming Gorge	201,000	43	6009.65	2,630,000
Blue Mesa	134,000	46	7496.07	629,000
Powell	1,095,000	36	3584.32	10,314,000
Navajo	133,000	51	6030.79	1,017,000

Expected Operation

FONTENELLE – Inflows during June were well above forecasted levels due to increased precipitation in the latter half of the month. Fontenelle Reservoir received 181,000 acre-feet of inflow during the month which was 36,000 acre-feet more than was forecasted on June 1st, 2004. As a result, the reservoir entered July with a reservoir elevation of 6502.7 feet above sea level which was significantly higher than expected. Inflows for the first part of July have continued to be above anticipated levels and as of July 8th, the reservoir elevation had reached a water surface elevation of 6505 feet above sea level which is one foot from the full pool elevation of 6506 feet above sea level.

Releases were increased from 900 cfs to 3000 cfs to control the rate of rise beginning on June 30th, 2004. This required a bypass of approximately 1800 cfs as the powerplant was limited to approximately 1200 cfs due to an equipment malfunction. The powerplant equipment was fixed on July 8th and the powerplant releases were increased to approximately 1500 cfs. Fontenelle is very nearly full and releases continue to include bypass releases as of July 8th, 2004. Releases to draw the reservoir down to the minimum power pool elevation will most likely by about 1000 cfs through the fall and winter months.

Open forum discussions on Fontenelle operations take place at the "Fontenelle Reservoir Working Group" meetings. The Working Group is a forum for information exchange between Reclamation and other parties associated with the operation of Fontenelle Reservoir. The public is encouraged to attend and express their concerns and interests with regard to Fontenelle Reservoir operation. The next Working Group meeting is scheduled for August 18th, 2004 at 10:30 a.m. and will at the Seedskadee Wildlife Refuge below Fontenelle Dam. For more information about the Working Group, contact Ed Vidmar at 801-379-1182.

FLAMING GORGE – Inflows during June were greater than forecasted. The unregulated inflow

volume for the month of June was 201,000 acre-feet while the forecasted volume for June was 158,000 acre-feet. The reservoir elevation as of July 8th is about 6009.29 and slowly increasing. Releases during June averaged 1000 cfs/day with lower levels at night of about 800 cfs and peak levels during the day of approximately 1600 cfs. These fluctuations are within the constraint of the 1992 Biological Opinion.

During the month of July, releases will likely continue to fluctuate between 800 cfs in the evening and morning hours and 1600 cfs during the afternoons. The elevation will remain relatively steady at approximately 6009.3 feet above sea level but could trend upward if inflows remain above forecasted levels.

The next "Flaming Gorge Working Group" meeting is to be held on August 19th, 2004 in Heber, Utah at 10:00 a.m.. The location is yet to be determined. The Working Group is a forum for information exchange between Reclamation and all other parties associated with the operation of Flaming Gorge Reservoir. The public is encouraged to attend and express their concerns and interests with regard to the operation of Flaming Gorge Reservoir. For more information about the Working Group please contact Ed Vidmar at 801-379-1182.

ASPINALL – June unregulated inflow into Blue Mesa Reservoir was 134,000 acre-feet or 46 percent of average. Hydrologic conditions remain dry with drought still the controlling factor for water management throughout the region. June recorded precipitation was 80 percent of average. The current inflow rate into Blue Mesa Reservoir is about 900 cfs and reservoir releases are averaging about 1450 cfs. Blue Mesa's present elevation is 7496.07 feet, which corresponds to a storage content of about 629,000 acre-feet.

Over the last couple of weeks, reservoir releases from Crystal have increased in order to meet contracted water downstream. Currently, releases from Crystal are set at 1700 cfs. The Gunnison Diversion Tunnel is taking about 950 cfs while the river flows below the tunnel are about 750 cfs. It is anticipated that canyon flows will start to decrease as downstream demands slow down, which should happen during the month of August.

The next meeting of the "Aspinall Unit Working Group" will be held on Thursday, August 26, 2004 at 1:00 PM at the National Park Service Elk Creek Visitor Center at Blue Mesa Reservoir. At this meeting, review of last spring and summer reservoir operations, and plans for this autumn 2004 operations will be discussed. These meetings are open forum discussions on the Aspinall Unit reservoir operations with many interested groups participating. Anyone needing further information about these meetings should contact Dan Crabtree in the Grand Junction Area Office at (970) 248-0652.

NAVAJO – On Tuesday, June 29, 2004, releases from Navajo Reservoir were increased from 350 cfs to 500 cfs. Releases are made for the authorized purposes of the Navajo Unit, and to attempt to maintain a target base flow through the endangered fish critical habitat reach of the San Juan River (Farmington to Lake Powell). As downstream tributary inflows to the San Juan River decrease, releases will be increased as necessary. Subject to National Environmental Policy Act (NEPA) compliance, the minimum allowable release of 350 cfs will be in effect until November 1, 2004, or until a Record of Decision is received on the Navajo Reservoir Operations Environmental Impact Statement, whichever comes first. Because of on going gate repair work at Navajo Dam there was no spring peak release made from the reservoir for endangered fish this year.

On July 6, 2004, the National Weather Service's River Forecast Center issued an updated inflow forecast for Navajo Reservoir for the April through July runoff period. This forecast is projecting a volume runoff into the reservoir of 545,000 acre-feet, a decrease of 5,000 acre-feet from last month's forecast. This represents a 68 percent of normal runoff for the Upper San Juan River Basin.

Unregulated inflow for Navajo Reservoir during the month of June was 133,000 acre-feet, or 51 percent of average. The current daily reservoir inflow is averaging about 500 cfs and reservoir releases are set at 500 cfs. Presently, the reservoir water surface elevation is 6030.79 feet, which corresponds to a storage content of about 1,017,000 acre-feet. The monthly precipitation average in the basin above Bluff was 60 percent of average during June.

A public meeting on Navajo Reservoir operations will be held on Tuesday, August 17, 2004 at 1:00 PM in Farmington, New Mexico. At this meeting, review of last spring and summer reservoir operations, and plans for this fall and winter 2004 operations will be discussed. These are open forum discussions on the operation of Navajo Reservoir with many interested groups participating. Anyone interested in the general operation of the reservoir is encouraged to attend. Please contact Pat Page in Reclamation's Durango, Colorado Office at (970) 385-6560 for information about these meetings or the daily operation of Navajo Reservoir.

Lake Powell - Current Status

Glen Canyon Dam Operations

In July 2004, a volume of 900,000 acre-feet is scheduled to be released from Lake Powell, which is an average of 14,600 cubic feet per second (cfs). On Mondays through Fridays in July, daily fluctuations due to load following will likely vary between a low of about 10,500 cfs (during late evening and early morning off-peak hours) to a high of about 18,500 cfs (during late afternoon and early evening on-peak hours). On Saturdays, releases will likely vary between a low of about 10,500 cfs during off-peak hours to a high of about 17,750 cfs during on-peak hours. On Sundays, releases will likely vary between a low of about 10,500 cfs during off-peak hours to a high of about 16,500 cfs during on-peak hours. This release pattern is shown in the following graph. It should be noted, however, that actual releases will occasionally deviate somewhat from those displayed due to real-time power system considerations.

A volume of 900,000 acre-feet is scheduled to be released in August. It is expected that a load following release pattern similar to the one seen in July will be followed in August. Because of the draw down condition of Lake Powell, releases from Lake Powell in water year 2004 are being scheduled to meet the minimum release objective of 8.23 million acre-feet. This is consistent with the requirements of the Criteria for Coordinated Long-Range Operation of Colorado River Reservoirs.

Upper Colorado River Basin Hydrology

The month of June was cooler than average in the Colorado River Basin. Aggregate precipitation in the basin was near average, although there was significant spatial disparity (above average precipitation in the northern areas of the basin and below average levels in the southern areas). Inflow to Lake Powell in June was 65,000 acre-feet above the June 1 projection. In the grand scheme of things, this is not a lot of water, but at least it is a move in the right direction. Inflow projections remain low, however. The National Weather Service's July final forecast is calling for

3.475 million acre-feet of unregulated inflow to Lake Powell during the April through July runoff period, only 44 percent of average.

The month of March pretty much dashed hopes that 2004 would bring relief to the ongoing drought in the Colorado River Basin. Basin snowpack on March 1, 2004 was 96 percent of average. At that time, the April through July inflow was forecasted to be 82 percent of average. The weather pattern in March, 2004 was very dry and extremely warm for early spring. Temperatures around the basin for much of the month were 20 degrees above average. Basinwide snowpack dropped over 30 percentage points in March. Inflow projections to Lake Powell were reduced to 50 percent of average in early April.

The Colorado River Basin is now in its 5th year of drought. In July 1999, Lake Powell was essentially full, with reservoir storage at 97 percent of capacity. Since that time, inflow volumes have been below average for 5 consecutive years. The last month when inflow to Lake Powell was above average was September 1999. Unregulated inflow in water years 2000, 2001, 2002, and 2003 was 62, 59, 25, and 51 percent of average, respectively. Total unregulated inflow for water year 2004 is now forecasted to be 50 percent of average. Inflow in water year 2002 was the lowest ever observed since the completion of Glen Canyon Dam in 1963.

Peak inflow to Lake Powell this year occurred on May 14 (about three weeks earlier than normal) when inflow was 21,400 cfs. As of July 6, 2004 observed inflow to Lake Powell was 9,500 cfs about 35 percent of what is normally seen in early July. Total unregulated inflow to Lake Powell in March, April, and May of this year was 81, 83, and 51 percent of average, respectively. Inflow in June was 1,095,000 acre-feet, or 36 percent of average. Unless there is a summer monsoon in the Colorado River Basin, inflow in July could be less than 30 percent of average. There are only limited amounts of mountain snowpack remaining in the basin.

Low inflows the past 5 years have reduced water storage in Lake Powell. The current elevation (as of July 7, 2004) of Lake Powell is 3,585.2 feet (114.8 feet from full pool). Current storage is 10.4 million acre-feet (43 percent of live capacity).

The water surface elevation at Lake Powell reached a seasonal low of 3,582.7 feet on April 2, 2004 and then increased to a seasonal high on June 14, 2004, reaching an elevation of 3,587.4 feet. The water surface has since begun to decline, and will likely continue to decline for the remainder of the year. Under the current inflow forecast, the water surface elevation of Lake Powell is projected to be about 3,570 feet on January 1, 2005. It should be noted that this projected elevation will likely shift, depending upon weather patterns the remainder of the year.

Date: September 7, 2004

From: Water Resource Group, Salt Lake City

To: All Colorado River Annual Operating Plan (AOP) Recipients

Current Status

	August inflow(unreg) (Acre-Feet)	Percent of normal	Midnight September 6 Elevation	Reservoir Storage (Acre-Feet)
Fontenelle	56,000	61	6500.66	304,000
Flaming Gorge	60,000	56	6011.35	2,685,000
Blue Mesa	28,000	44	7485.75	549,000
Powell	176,000	29	3571.48	9,227,000
Navajo	0	0	6021.42	925,000

Expected Operation

FONTENELLE – Inflows during August were approximately 55,700 acre-feet (61% of normal). The reservoir elevation has decreased about 3 feet during the month of August and releases have been decreased to 950 cfs. The reservoir elevation will continue to decline through the fall and winter months to near the minimum power pool elevation of 6463 feet above sea level. Releases will likely remain steady and the current rate until March or April of 2005.

Open forum discussions on Fontenelle operations take place at the "Fontenelle Reservoir Working Group" meetings. The Working Group is a forum for information exchange between Reclamation and other parties associated with the operation of Fontenelle Reservoir. The public is encouraged to attend and express their concerns and interests with regard to Fontenelle Reservoir operation. The next Working Group meeting will be scheduled for April of 2005 and will likely be held in Green River, WY. At this time the exact time and place have not been scheduled. For more information about the Working Group, contact Ed Vidmar at 801-379-1182.

FLAMING GORGE – During the month of August unregulated inflows to Flaming Gorge Reservoir were approximately 60,100 acre-feet (56% of normal). Forecasted inflows for September through November are for 115,000 acre-feet of unregulated inflow (61% of normal). Releases are currently averaging 1000 cfs each day. Fluctuations are occurring each day with peaks of approximately 1450 cfs during the afternoons and approximately 850 cfs being released during the morning and evening hours. These fluctuations are within the recommended constraints of the 1992 Biological Opinion on the Operation of Flaming Gorge Dam. Projected releases will likely be reduced to 800 cfs near the end of September. The reservoir elevation is currently about 6011.3 feet above sea level and is projected to rise over the fall and winter months.

The next "Flaming Gorge Working Group" meeting is to be held on April 21st, 2005 in Vernal, Utah at 10:00 a.m.. The location will be at the Western Park Convention Center. The Working Group is a

forum for information exchange between Reclamation and all other parties associated with the operation of Flaming Gorge Reservoir. The public is encouraged to attend and express their concerns and interests with regard to the operation of Flaming Gorge Reservoir. For more information about the Working Group please contact Ed Vidmar at 801-379-1182.

ASPINALL – August unregulated inflow into Blue Mesa Reservoir was 28,000 acre-feet or 43 percent of average. Hydrologic conditions remain dry with drought still the controlling factor for water management throughout the region. August recorded precipitation was 50 percent of average. The current inflow rate into Blue Mesa Reservoir is about 450 cfs and reservoir releases are averaging about 1600 cfs. Blue Mesa's present elevation is 7486.85 feet, which corresponds to a storage content of about 557,000 acre-feet.

Currently, releases from Crystal are set at 1,550 cfs. The Gunnison Diversion Tunnel is taking about 1,000 cfs while the river flows below the tunnel are about 550 cfs. Due to the severity of the continuing drought in the Gunnison River Basin, river flows through the Black Canyon of the Gunnison are set to meet downstream water flow rights. It is anticipated that canyon flows will decrease as downstream demands slow down, which has already started and will continue until the first of October when the irrigation season ends. Some fluctuation to river flows may occur as we respond to these downstream water needs.

The last meeting of the "Aspinall Unit Working Group" was held on Thursday, August 26, 2004 at 1:00 PM at the National Park Service Elk Creek Visitor Center at Blue Mesa Reservoir. At this meeting, review of last spring and summer reservoir operations, and plans for this autumn 2004 operations was discussed. These meetings are open forum discussions on the Aspinall Unit reservoir operations with many interested groups participating. Anyone needing further information about these meetings should contact Dan Crabtree in the Grand Junction Area Office at (970) 248-0652.

NAVAJO – Due to recent rainstorm activity and the associated increase in stream flows, the Bureau of Reclamation decreased the release from Navajo Reservoir from 800 cubic feet per second (cfs) to 600 cfs on September 8, 2004, at 9:00 a.m. All reservoir releases are made for the authorized purposes of the Navajo Unit, and to attempt to maintain a target base flow through the endangered fish critical habitat reach of the San Juan River (Farmington to Lake Powell).

As per the recommendations from the San Juan River Basin Recovery Implementation Program for 2004, and with the current forecast, the target base flow for endangered fish is 400 cfs. The target base flow is calculated as the weekly average of gaged flows throughout the critical habitat area, therefore daily flows of less than 400 cfs may occur at some gages.

Reclamation will continue to closely monitor the hydrologic conditions in the basin. As such, this scheduled release change is subject to changes in river flows and weather conditions.

The current daily reservoir inflow is averaging about 350 cfs and reservoir releases are set at 800 cfs. Presently, the reservoir water surface elevation is 6021.63 feet, which corresponds to a storage content of about 927,000 acre-feet. The monthly precipitation average in the basin above Bluff was 45 percent of average during August.

A public meeting on Navajo Reservoir operations was held on Tuesday, August 17, 2004 at 1:00 PM in Farmington, New Mexico. At this meeting, review of last spring and summer reservoir operations,

and plans for this fall and winter 2004 operations were discussed. These are open forum discussions on the operation of Navajo Reservoir with many interested groups participating. Anyone interested in the general operation of the reservoir is encouraged to attend. Please contact Pat Page in Reclamation's Durango, Colorado Office at (970) 385-6560 for information about these meetings or the daily operation of Navajo Reservoir.

Glen Canyon Dam - Lake Powell

Operations

Releases will be lower in September 2004 than in July and August. A volume of 480,000 acre-feet is scheduled to be released from Lake Powell in September, which is an average of 8,070 cubic feet per second (cfs). Releases had been averaging about 14,600 cfs in July and August. On Mondays through Fridays and on Sundays in September, daily fluctuations due to load following will likely vary between a low of about 5,000 cfs (during late evening and early morning off-peak hours) to a high of about 10,000 cfs (during late afternoon and early evening on-peak hours). On Saturdays, releases will likely vary between a low of about 5,000 cfs during off-peak hours to a high of about 9,750 cfs during on-peak hours. The release pattern in October will likely be similar to September. A volume of 492,000 acre-feet is scheduled to be released in October, which is an average of 8,000 cfs.

Because of the draw down condition of Lake Powell, releases from Lake Powell in water year 2004 are being scheduled to meet the minimum release objective of 8.23 million acre-feet. This is consistent with the requirements of the Criteria for Coordinated Long-Range Operation of Colorado River Reservoirs.

Upper Colorado River Basin Hydrology

The Colorado River Basin is completing its 5th year of drought. In July 1999, Lake Powell was essentially full, with reservoir storage at 97 percent of capacity. Since that time, inflow volumes have been below average for 5 consecutive years. The last month when inflow to Lake Powell was above average was September 1999. Unregulated inflow in water years 2000, 2001, 2002, and 2003 was 62, 59, 25, and 51 percent of average, respectively. Total unregulated inflow for water year 2004 is likely to be 51 percent of average, almost the same volume as 2003. Inflow in water year 2002 was the lowest ever observed since the completion of Glen Canyon Dam in 1963.

The summer season in the Colorado River Basin has featured cooler than average temperatures with precipitation at near average levels. With the exception of the Green River Basin above Flaming Gorge, river flows around the basin have been much below average this summer. Unregulated inflow to Lake Powell in July was only 35 percent of average and inflow in August will likely end up being only 29 percent of average. Peak inflow to Lake Powell this year occurred on May 14 (about three weeks earlier than normal) when inflow was 21,400 cfs. As of August 30, 2004 observed inflow to Lake Powell was 4,400 cfs about 45 percent of what is normally seen as August comes to a close.

Low inflows the past 5 years have reduced water storage in Lake Powell. The current elevation (as of August 30, 2004) of Lake Powell is 3,572 feet (128 feet from full pool). Current storage is 9.3 million acre-feet (38 percent of live capacity).

The water surface elevation at Lake Powell reached a seasonal low of 3,582.7 feet on April 2, 2004 and then increased to a seasonal high on June 14, 2004, reaching an elevation of 3,587.4 feet. The water surface has since been declining, and will likely continue to decline for the remainder of the

year. Under the current inflow forecast, the water surface elevation of Lake Powell is projected to be about 3,565 feet on January 1, 2005. It should be noted that this projected elevation will likely shift, depending upon weather patterns the remainder of the year.

Date: October 14, 2004

From: Water Resource Group, Salt Lake City

To: All Colorado River Annual Operating Plan (AOP) Recipients

Current Status

	September inflow(unreg) (Acre-Feet)	Percent of normal	Midnight October 13 Elevation	Reservoir Storage (Acre-Feet)
Fontenelle	41,000	77	6497.82	283,000
Flaming Gorge	46,000	71	6011.23	2,681,000
Blue Mesa	22,000	40	7477.31	487,000
Powell	322,000	68	3570.89	9,179,000
Navajo	58,000	145	6023.15	941,000

Expected Operation

FONTENELLE - Inflows during September were approximately 40,900 acre-feet (77% of normal). The reservoir elevation has decreased about 2.4 feet during the month of September. Releases are steady at 950 cfs and will likely remain at this level until next spring (March 2005). The reservoir elevation will continue to decline through the fall and winter months to near the minimum power pool elevation of 6463 feet above sea level.

Open forum discussions on Fontenelle operations take place at the "Fontenelle Reservoir Working Group" meetings. The Working Group is a forum for information exchange between Reclamation and other parties associated with the operation of Fontenelle Reservoir. The public is encouraged to attend and express their concerns and interests with regard to Fontenelle Reservoir operation. The next Working Group meeting will be scheduled for April of 2005 and will likely be held in Green River, WY. At this time the exact time and place have not been scheduled. For more information about the Working Group, contact Ed Vidmar at 801-379-1182.

FLAMING GORGE – Unregulated Inflows during the month of September were approximately 46,000 acre-feet (71% of normal). Releases during the month averaged about 1000 cfs per day with peak fluctuations occurring each afternoon up to about 1450 cfs. Evening and Morning releases were approximately 850 cfs. The total volume released during September was 60,400 acre-feet. Beginning in October, releases will resume steady flows of 800 cfs. This is the minimum release rate under normal operations based on the 1992 Biological Opinion and the Interim Operating Criteria dated September of 1974. The current reservoir elevation of Flaming Gorge is steady at approximately 6011.2 and will likely remain at this level for the next several months.

The next "Flaming Gorge Working Group" meeting is to be held on April 21th, 2005 in Vernal, Utah at 10:00 a.m.. The location will be at the Western Park Convention Center. The Working Group is a

forum for information exchange between Reclamation and all other parties associated with the operation of Flaming Gorge Reservoir. The public is encouraged to attend and express their concerns and interests with regard to the operation of Flaming Gorge Reservoir. For more information about the Working Group please contact Ed Vidmar at 801-379-1182.

ASPINALL – September unregulated inflow into Blue Mesa Reservoir was 22,000 acre-feet or 60 percent of average. Hydrologic conditions remain dry with drought still the controlling factor for water management throughout the region. September recorded precipitation was 165 percent of average. The current inflow rate into Blue Mesa Reservoir is about 550 cfs and reservoir releases are averaging about 1,200 cfs. Blue Mesa's present elevation is 7477.4 feet, which corresponds to a storage content of about 487,000 acre-feet.

Currently, releases from Crystal are subject to change due to maintenance activities associated with the Powerplant. At the present the total release is 950 cfs. The Gunnison Diversion Tunnel is taking about 450 cfs while the river flows below the tunnel are about 500 cfs. Due to the severity of the continuing drought in the Gunnison River Basin, river flows through the Black Canyon of the Gunnison are set to meet downstream water flow rights. It is anticipated that canyon flows will decrease to a minimum flow rate of 350 cfs later this month and will remain at that level for most of this fall and into the winter months.

The next meeting of the "Aspinall Unit Working Group" will be held on Thursday, January 20, 2005 at 1:00 PM at the Pavilion Center in Montrose, Colorado, review of last summer and fall reservoir operations, and plans for this winter and next spring 2005 operations will be discussed. These meetings are open forum discussions on the Aspinall Unit reservoir operations with many interested groups participating. Anyone needing further information about these meetings should contact Dan Crabtree in the Grand Junction Area Office at (970) 248-0652.

NAVAJO – Reclamation decreased the release from Navajo Reservoir from 400 cubic feet per second (cfs) to 350 cfs on Thursday, October 7, 2004, at 9:00 a.m. Releases are made for the authorized purposes of the Navajo Unit, and to attempt to maintain a target base flow through the endangered fish critical habitat reach of the San Juan River (Farmington to Lake Powell).

As per the recommendations from the San Juan River Basin Recovery Implementation Program for 2004, and with the current forecast, the target base flow for endangered fish is 400 cfs. The target base flow is calculated as the weekly average of gaged flows throughout the critical habitat area, therefore daily flows of less than 400 cfs may occur at some gages.

Reclamation will continue to closely monitor the hydrologic conditions in the basin. As such, this scheduled release change is subject to changes in river flows and weather conditions.

The current daily reservoir inflow is averaging about 600 cfs and reservoir releases are set at 350 cfs. Presently, the reservoir water surface elevation is 6022.8 feet, which corresponds to a storage content of about 938,000 acre-feet. The monthly precipitation average in the basin above Bluff was 210 percent of average during September.

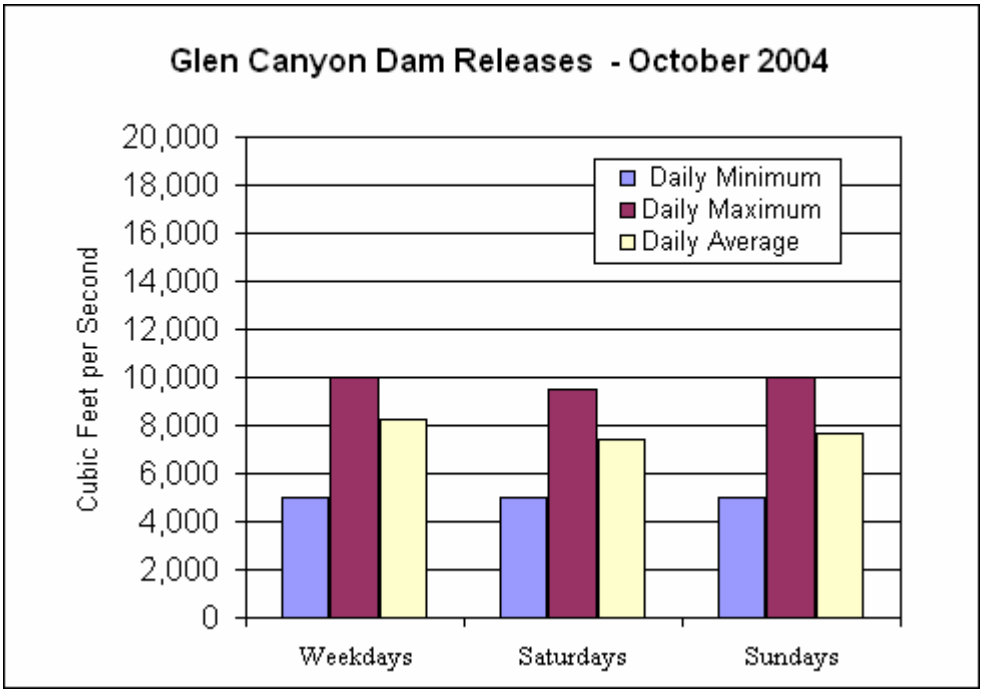
A public meeting on Navajo Reservoir operations was held on Tuesday, August 17, 2004 at 1:00 PM in Farmington, New Mexico. At this meeting, review of last spring and summer reservoir operations, and plans for this fall and winter 2004 operations were discussed. These are open forum discussions

on the operation of Navajo Reservoir with many interested groups participating. Anyone interested in the general operation of the reservoir is encouraged to attend. Please contact Pat Page in Reclamation's Durango, Colorado Office at (970) 385-6560 for information about these meetings or the daily operation of Navajo Reservoir.

Lake Powell Current Status

Glen Canyon Dam Operations

Releases in October 2004 will be similar to those observed in September. A volume of 492,000 acre-feet is scheduled to be released from Lake Powell in September, which is an average of 8,000 cubic feet per second (cfs). On Mondays through Fridays and on Sundays in October, daily fluctuations due to load following will likely vary between a low of about 5,000 cfs (during late evening and early morning off-peak hours) to a high of about 10,000 cfs (during late afternoon and early evening on-peak hours). On Saturdays, releases will likely vary between a low of about 5,000 cfs during off-peak hours to a high of about 9,500 cfs during on-peak hours. However, due to real time power marketing, there may be days in October where on-peak releases are increased to 8,000 cfs, and not raised completely to the scheduled daily peaks listed above. This release pattern is shown in the following graph. It should be noted, however, that actual releases will occasionally deviate somewhat from those displayed due to real-time power system considerations.



The release pattern in November is likely to be similar to the October pattern. Currently, a volume of 476,000 acre-feet is scheduled to be released in November, which is an average of 8,000 cfs. In water year 2004, a total volume of 8.23 million acre-feet was released from Lake Powell.

Upper Colorado River Basin Hydrology

With October 1st comes a new water year. The Colorado River Basin is now entering its 6th year of drought. In July 1999, Lake Powell was essentially full, with reservoir storage at 97 percent of capacity. Since that time, inflow volumes have been below average for 5 consecutive years. The last month when inflow to Lake Powell was above average was September 1999. Total unregulated

inflow to Lake Powell in water year 2004 was only 51 percent of average. Unregulated inflow in water years 2000, 2001, 2002, and 2003 was 62, 59, 25, and 51 percent of average, respectively. Inflow in water year 2002 was the lowest ever observed since the completion of Glen Canyon Dam in 1963.

The summer season in the Colorado River Basin featured cooler than average temperatures with precipitation below average levels. With the exception of the Green River Basin above Flaming Gorge, river flows around the basin were much below average this summer. Unregulated inflow to Lake Powell in July and August was dismal, only 35 and 29 percent of average, respectively. September was a ' wet' month, however, with basinwide precipitation 160 percent of average. It was especially wet in the 4-corners region and the San Juan River Basin during September. River flows increased in response to the September precipitation. Unregulated inflow to Lake Powell in September 2004 was 322,000 acre-feet or 68 percent of average. Inflow to Lake Powell was actually above average for a number of days at the end of September and beginning of October. Unfortunately, there has only been limited precipitation in the basin in October and river flows have receeded. As of October 11, 2004 observed inflow to Lake Powell is running at about 6,900 cfs about 72 percent of what is normally seen in mid-October.

An important factor in reversing the trend of drought is to “wet” the soils in the fall. To increase the efficiency of the snowmelt runoff the following spring, it is necessary to have wetter soils from autumn rains. The past 5 years we have had very dry soils around the basin as we moved into the snow accumulation season. A significant amount of the snowmelt the past 5 years has been absorbed by these dry soils. It will be necessary to have above average precipitation the next two months to reverse this dry soil moisture condition in the Colorado River Basin.

Low inflows the past 5 years have reduced water storage in Lake Powell. The current elevation (as of October 13, 2004) of Lake Powell is 3,571 feet (129 feet from full pool). Current storage is 9.2 million acre-feet (38 percent of live capacity).

Under the current inflow forecast, the water surface elevation of Lake Powell is projected decline the remainder of the year, with current projections showing the lake reaching an elevation of 3,565 feet on January 1, 2005. It should be noted that this projected elevation will likely shift, depending upon weather patterns the remainder of the year.

To: All Annual Operating Plan Recipients

From: Lower Colorado Region
River Operations Group
Attention: BCOO4600
P.O. Box 61470
Boulder City, NV 89006-1470
Phone: 702-293-8190

This operation study reflects the 2004 Annual Operating Plan (AOP) as signed by the Secretary of Interior. The Partial Domestic Surplus condition is the criterion governing the operation of Lake Mead for calendar year 2004. A copy of the 2004 AOP can be obtained by contacting Lorraine Siano, (702)293-8539 or visit our website at www.usbr.gov/lc/region/lcrivops.html.

In this study, the Calendar Year (CY) 2004 diversion for Metropolitan Water District of Southern California (MWD) was assumed to be 0.696 million acre-feet (maf), resulting in total California use of 4.362 maf for the year (4.4 maf less paybacks). The CY 2004 diversion for the Central Arizona Project (CAP) was assumed to be 1.612 maf, resulting in total Arizona use of 2.8 (maf) for the year. Consumptive use for Nevada above Hoover was assumed to be 0.280 maf for CY 2004.

Lake Mead's elevation is projected to be 1125.19 feet at the end of calendar year 2004. Based on this projection and the Interim Surplus Guidelines, we are assuming that the Normal condition will govern the operation of Lake Mead for 2005 and therefore normal diversion and use schedules for CY 2005 were used in this study. The actual determination of the criterion governing the operation of Lake Mead for CY 2005 will be made by the Secretary of the Interior in the 2005 Annual Operating Plan.

Lake Mead's elevation is projected to be 1117.35 feet at the end of calendar year 2005. Based on this projection, we are also assuming normal diversion and use schedules for calendar year 2006.

As of 6/17/04, due to the current elevation of Lake Mead, Hoover's generating plant effective capacity has been changed to 1731 MW. Unit capacity tests will be performed as lake elevation decreases in 2' increments. Davis generating plant effective capacity has changed to 255 MW. This study reflects these changes in the projections.

Current runoff projections into Lake Powell are provided by the National Weather Service, Colorado Basin River Forecast Center and are as follows: observed unregulated inflow into Lake Powell for the month of October was .505 maf or 92% of the 30 year average. The forecast for the month of November unregulated inflow into Lake Powell is .450 maf or 83% of the 30 year average. The actual April through July unregulated inflow for water year 2004 is 3.640 maf or 46% of average. Unregulated inflow into Lake Powell for water year 2005 is assumed to be 81% of average.

Hoover, Davis, and Parker historical gross energy figures come from form PO&M from the Power and O&M Group, Boulder Canyon Operations, Bureau of Reclamation, Boulder City, Nevada. Questions regarding these historical numbers can be directed to Joe Donnelly, (702)293-8607.

(Note: lower basin previous months historical SNWS and flow to Mexico values are preliminary estimates.)

Date: December 9, 2004

From: Water Resource Group, Salt Lake City

To: All Colorado River Annual Operating Plan (AOP) Recipients

Current Status

	November inflow(unreg) (Acre-Feet)	Percent of normal	Midnight December 08 Elevation	Reservoir Storage (Acre-Feet)
Fontenelle	49,000	114	6493.97	255,000
Flaming Gorge	64,000	114	6012.39	2,719,000
Blue Mesa	26,000	82	7477.69	489,000
Powell	558,000	103	3570.47	8,822,000
Navajo	46,000	131	6024.61	979,000

Expected Operation

FONTENELLE - During the month of November, inflows to Fontenelle Reservoir were 49,000 acre-feet (114% of normal). This is the 2nd above normal inflow month in a row. Inflows over the past 2 months were more than expected and the reservoir elevation was relatively steady until releases were increased in mid November. Releases are now 1200 cfs and will likely remain at this level until late March of 2005. The 3 month forecast (December through February) is now 107% of normal (100,000 acre-feet). By April 1st, 2005 the elevation of Fontenelle Reservoir is now projected to be about 6470.4 feet above sea level based on the recent changes to the forecast.

Open forum discussions on Fontenelle operations take place at the "Fontenelle Reservoir Working Group" meetings. The Working Group is a forum for information exchange between Reclamation and other parties associated with the operation of Fontenelle Reservoir. The public is encouraged to attend and express their concerns and interests with regard to Fontenelle Reservoir operation. The next Working Group meeting will be scheduled for April of 2005 and will likely be held in Green River, WY. At this time the exact time and place have not been scheduled. For more information about the Working Group, contact Ed Vidmar at 801-379-1182.

FLAMING GORGE - During the month of October, unregulated inflows reached 105% of normal (68,000 acre-feet). This is the first month where the unregulated inflow was above normal since March of 2001. As a result, forecasts for the 3 month period beginning November 1st were increased significantly. Last month, the 3 month forecast (October through December) was 65% of normal. This month, the 3 month forecast (November through January) is 93% of normal. The effect of this change in the forecast increases the projected elevation of Flaming Gorge by about 1.4 feet over last months projected elevation for April 1st, 2005. At this time no changes have been made to the projected releases but this may be considered if conditions continue to become wetter in the coming months. Releases are currently 800 cfs and are projected to remain at this level until May of 2005.

The next "Flaming Gorge Working Group" meeting is to be held on April 21st, 2005 in Vernal, Utah

at 10:00 a.m.. The location will be at the Western Park Convention Center. The Working Group is a forum for information exchange between Reclamation and all other parties associated with the operation of Flaming Gorge Reservoir. The public is encouraged to attend and express their concerns and interests with regard to the operation of Flaming Gorge Reservoir. For more information about the Working Group please contact Ed Vidmar at 801-379-1182.

ASPINALL – November unregulated inflow into Blue Mesa Reservoir was 26,000 acre-feet or 82 percent of average. Hydrologic conditions remain dry, but seem to be slowly improving. Drought is still the controlling factor for water management throughout the region; however, the last three months have seen above average precipitation. The recorded precipitation for these months was 170, 115, 135 percent of average for September through November respectively. Average stream flow still remains below normal and will most likely stay that way until next spring's runoff. The current inflow rate into Blue Mesa Reservoir is about 400 cfs and reservoir releases are averaging about 300 cfs. Blue Mesa's present elevation is 7477.65 feet, which corresponds to a storage content of about 489,000 acre-feet.

On December 6, 2004, the National Weather Service's River Forecast Center issued the forecasted inflow over the next 3 months for continued below normal conditions. The unregulated inflow forecast for December, January, and February is 63,000 acre-feet which is 86% of normal for these months. Based on this forecast, Blue Mesa Reservoir elevation is estimated to increase 1.7 feet to elevation 7479.3 feet or about 11,500 acre-feet by the end of February 2005.

Releases from Crystal are currently set at 350 cfs. The Gunnison Diversion Tunnel has been shut down for the winter season with the exception of some small 100 cfs diversions taken bi-weekly for municipal water needs in Montrose, Colorado. Due to the severity of the continuing drought in the Gunnison River Basin, river flows through the Black Canyon of the Gunnison have been set close to the minimum flow rate. Current flows in the river are now 350 cfs. This flow rate will most likely be kept at this level for much of this fall and winter months.

The next meeting of the "Aspinall Unit Working Group" will be held on Thursday, January 20, 2005 at 1:00 PM at the Pavilion Center in Montrose, Colorado, review of last summer and fall reservoir operations, and plans for this winter and next spring 2005 operations will be discussed. These meetings are open forum discussions on the Aspinall Unit reservoir operations with many interested groups participating. Anyone needing further information about these meetings should contact Dan Crabtree in the Grand Junction Area Office at (970) 248-0652.

NAVAJO – Reclamation decreased the release from Navajo Reservoir from 350 cubic feet per second (cfs) to 250 cfs, at 9:00 a.m. on Monday, November 1, 2004. This release will remain at 250 cfs throughout the winter, or until further notice. Releases are made for the authorized purposes of the Navajo Unit, and to attempt to maintain a target base flow through the endangered fish critical habitat reach of the San Juan River (Farmington to Lake Powell).

Based upon current hydrological conditions and historical hydrologic data, the target base flow should remain above 500 cfs through the critical habitat area. The target base flow is calculated as the weekly average of gaged flows throughout the critical habitat area, therefore daily flows of less

than 500 cfs may occur at some gages. Navajo release will be increased if the downstream target base flow drops below 500 cfs.

Reclamation will continue to closely monitor the hydrologic conditions in the basin. As such, this scheduled release change is subject to changes in river flows and weather conditions.

The current daily reservoir inflow is averaging about 800 cfs and reservoir releases are set at 250 cfs. Presently, the reservoir water surface elevation is 6027.08 feet, which corresponds to a storage content of about 980,000 acre-feet. The monthly precipitation average in the basin above Bluff for the months of September through November were 220, 85, and 125 percent of average respectively. Corresponding with these rain events the inflow to Navajo Reservoir for the month of November was 46,000 acre-feet or 131 percent of average.

A public meeting on Navajo Reservoir operations will be held on Tuesday, January 18, 2005 at 1:00 p.m. in Farmington, New Mexico. At this meeting, review of last summer and fall reservoir operations, and plans for winter and spring 2005 operations will be discussed. These are open forum discussions on the operation of Navajo Reservoir with many interested groups participating. Anyone interested in the general operation of the reservoir is encouraged to attend. Please contact Pat Page in Reclamation's Durango, Colorado Office at (970) 385-6560 for information about these meetings or the daily operation of Navajo Reservoir.

Lake Powell - Glen Canyon Dam - Current Status

Operations - High Flow Experiment

On Sunday November 21, 2004, releases from Glen Canyon Dam were increased for a high-flow experiment. Releases were increased to powerplant capacity (26,000 cubic feet per second [cfs]) the morning of November 21, 2004. At 7:00 a.m. on November 21, releases greater than powerplant capacity began through the river bypass tubes. Releases from the bypass tubes were increased incrementally for 21 hours until the four river bypass tubes were operating at a combined capacity of 15,000 cfs. At that time (November 22, 2004, at 4:00 a.m.), the total release from Glen Canyon Dam was approximately 41,000 cfs. The 41,000 cfs release was maintained for 60 hours. Releases were then reduced by 1,500 cfs per hour until a release of 8,000 cfs was achieved. Releases remained constant at 8,000 cfs for the remainder of November to facilitate further data collection and monitoring of the Grand Canyon by scientists from the Grand Canyon Monitoring and Research Center and other agencies.

The high-flow experiment does not alter the total volume of water released from Lake Powell in water year 2005. The 2005 Colorado River Annual Operating Plan calls for an annual release of 8.23 million acre-feet from Lake Powell in water year 2005. While the high-flow experiment lowered the level of Lake Powell by about three feet in November, monthly release volumes from Glen Canyon Dam will be adjusted downward over the course of the next 8 months such that the elevation of Lake Powell in the summer of 2005 will be the same, regardless of whether the high flow experiment had taken place.

With the exception of the weekend of December 3-5, releases from Glen Canyon Dam in December will average about 9,800 cfs with a total of 600,000 acre-feet scheduled to be released. Daily fluctuations due to load following will likely vary between a low of about 6,000 cfs (during late

evening and early morning off-peak hours) to a high of about 12,000 cfs (during late afternoon and early evening on-peak hours) on all days of the week.

Releases from Glen Canyon Dam from 2 p.m. on Friday December 3 through midnight on December 5 will be steady at 8,000 cfs. This steady release is being made to support the completion of data collection in Marble Canyon and the Grand Canyon related to the November high-flow experiment.

Upper Colorado River Basin Hydrology

Water year 2005 began on October 1, 2004. The Colorado River Basin has now completed 5 consecutive years of drought. In the summer of 1999 Lake Powell was essentially full, with reservoir storage at 97 percent of capacity. Since that time, inflow volumes have been below average for 5 consecutive water years. Total unregulated inflow to Lake Powell in water year 2004 was only 51 percent of average. Unregulated inflow in water years 2000, 2001, 2002, and 2003 was 62, 59, 25, and 51 percent of average, respectively. Inflow in water year 2002 was the lowest ever observed since the completion of Glen Canyon Dam in 1963.

A favorable trend emerged in September and has continued through November 2004 in the Colorado River Basin. Precipitation in these months was significantly above average. Basinwide precipitation in September was 165 percent of average, October precipitation was 155 percent of average, and November precipitation was 135 percent of average. As of December 9, 2004, basinwide snowpack in the Colorado River Basin is currently 121 percent of average.

Unregulated inflow to Lake Powell in November was 558,000 acre-feet, or 102 percent of average. This is the first month with above average inflow to Lake Powell since September 1999. Inflow, as a percentage of average, has been increasing since the summer in response to the precipitation events this fall. Unregulated inflow was extremely low this past summer (only 35 and 29 percent of average in July and August, respectively), but increased to 68 percent of average in September and 92 percent of average in October.

The fall precipitation has improved soil moisture conditions in the basin. This will favor a more efficient runoff next spring with more snowmelt going to the rivers instead of into the soils as has been the case the past few years. However, drought conditions continue to prevail in the Colorado River Basin. To “break” the drought will require a pattern of above-average precipitation through the winter and into next spring. Water year 2005 is off to a good start, but it is too early to celebrate.

As of December 2, 2004, observed inflow to Lake Powell is 6,900 cfs, about 75 percent of what is normally seen in early December. Cold weather has now settled into the basin. Because of this, inflows are now gradually decreasing.

Low inflows over the past 5 years have reduced water storage in Lake Powell. As of December 1, 2004, the current elevation of Lake Powell is 3,567.1 feet (132.9 feet from full pool). Current storage is 8.9 million acre-feet (37 percent of live capacity).

Under the current inflow forecast, and in combination with scheduled releases, the water surface elevation of Lake Powell is projected to decline the remainder of the month, with current projections showing the lake reaching an elevation of about 3,564 feet on January 1, 2005 .

Navajo	46,000	131	6029.01	999,000

Expected Operation

FONTENELLE - The first Water Supply Forecast for Fontenelle Reservoir is forecasting a spring runoff (April through July) inflow volume of 760,000 acre-feet (88% of normal). Based on this forecast it is very likely that Fontenelle Reservoir will be full by August of 2005. It is also likely that bypass releases will be necessary to control reservoir storage during the spring period. Inflows during the months of January, February and March are forecasted to be 33,000, 30,000 and 55,000 acre-feet. These inflow volumes are all above normal for this time of year.

Releases are currently 1200 cfs and the elevation of Fontenelle Reservoir is decreasing at approximately 6 feet per month. The current elevation (January 11, 2005) is approximately 6487 feet above see level. Fontenelle Reservoir will likely be near the minimum active pool elevation (6463 feet above sea level) by mid April.

Open forum discussions on Fontenelle operations take place at the "Fontenelle Reservoir Working Group" meetings. The Working Group is a forum for information exchange between Reclamation and other parties associated with the operation of Fontenelle Reservoir. The public is encouraged to attend and express their concerns and interests with regard to Fontenelle Reservoir operation. The next Working Group meeting will be scheduled for April of 2005 and will likely be held in Green River, WY. At this time the exact time and place have not been scheduled. For more information about the Working Group, contact Ed Vidmar at 801-379-1182.

FLAMING GORGE - The first Water Supply Forecast for Water Year 2005 has been issued and the April through July unregulated inflow is forecasted to be at 1,100,000 acre-feet (92% of normal). Based on this forecast, Flaming Gorge Reservoir will likely see some significant filling during the spring runoff this year. Inflows during the winter have been near normal so far and are projected to remain above normal for January, February and March as well. The projected April 1st reservoir elevation is now 6017.3 feet above sea level and the August 1st reservoir elevation is now 6026.72.

Snow pack conditions appear to be improving with the basin measuring 104% of normal on January 10, 2005. Conditions in the Yampa River Basin are also improving and currently the snowpack conditions are about 93% of normal.

Releases from Flaming Gorge during the month of January have included some fluctuations. These fluctuations are being made to assist Western Area Power Administration with meeting their customer obligations during a special release regime that is being conducted at Glen Canyon Dam. The fluctuations are limited to a single peak per day of 1600 cfs with base releases of 800 cfs. It is possible that this release regime could continue through the end of March as the special release regime at Glen Canyon is also scheduled through March.

The next "Flaming Gorge Working Group" meeting is to be held on April 21th, 2005 in Vernal, Utah at 10:00 a.m.. The location will be at the Western Park Convention Center. The Working Group is a forum for information exchange between Reclamation and all other parties associated with the operation of Flaming Gorge Reservoir. The public is encouraged to attend and express their concerns and interests with regard to the operation of Flaming Gorge Reservoir. For more information about the Working Group please contact Ed Vidmar at 801-379-1182.

ASPINALL – December unregulated inflow into Blue Mesa Reservoir was 21,000 acre-feet or 81 percent of average. Hydrologic conditions are slowly improving as basin precipitation and snowpack continues to increase. On January 10, 2005 the basin snowpack was averaging 149 percent. For most of the fall month's average precipitation was above normal. The recorded precipitation for these months was 170, 115, and 135 percent of average for September through November respectively. However, precipitation for December was only 80 percent of average. Average stream flow still remains below normal. The current inflow rate into Blue Mesa Reservoir is about 350 cfs and reservoir releases are averaging about 500 cfs. Blue Mesa's present elevation is 7478.21 feet, which corresponds to a storage content of about 493,000 acre-feet.

On January 5, 2005, the National Weather Service's River Forecast Center issued the first seasonal runoff volume forecast for April through July. The forecast is for 720,000 acre-feet, or 100 percent of normal inflow into Blue Mesa for that time period. Based on this forecast, Blue Mesa Reservoir is estimated to fill during this year's spring runoff.

Due to the increase in the projected runoff forecast for the Gunnison River Basin, reservoir releases from Crystal Dam have been increased from 350 cfs to 600 cfs on January 7, 2005. River flows through the Black Canyon of the Gunnison have been set close to the minimum flow rate during the last few winters due to the drought. Current flows in the river are now 600 cfs.

The next meeting of the "Aspinall Unit Working Group" will be held on Thursday, January 20, 2005 at 1:00 PM at the Pavilion Center in Montrose, Colorado, review of last summer and fall reservoir operations, and plans for this winter and next spring 2005 operations will be discussed. These meetings are open forum discussions on the Aspinall Unit reservoir operations with many interested groups participating. Anyone needing further information about these meetings should contact Dan Crabtree in the Grand Junction Area Office at (970) 248-0652.

NAVAJO – Reclamation decreased the release from Navajo Reservoir from 350 cubic feet per

second (cfs) to 250 cfs, at 9:00 a.m. on Monday, November 1, 2004. This release will remain at 250 cfs throughout the winter, or until further notice. Releases are made for the authorized purposes of the Navajo Unit, and to attempt to maintain a target base flow through the endangered fish critical habitat reach of the San Juan River (Farmington to Lake Powell).

Based upon current hydrological conditions and historical hydrologic data, the target base flow should remain above 500 cfs through the critical habitat area. The target base flow is calculated as the weekly average of gaged flows throughout the critical habitat area, therefore daily flows of less than 500 cfs may occur at some gages. Navajo release will be increased if the downstream target base flow drops below 500 cfs.
Reclamation will continue to closely monitor the hydrologic conditions in the basin. As such, this scheduled release change is subject to changes in river flows and weather conditions.

Now the good news, winter storms have been making regular visits into the San Juan Basin during the fall months and are continuing into January. As a direct result of these storms, the inflow into Navajo Reservoir has been 145%, 120%, 131%, and 120% of average for the months of September through December respectively, increasing Navajo Reservoir elevation by 6.66 feet since the end of August.

Currently the upper San Juan basin snowpack stands at 158 percent of average and 159 percent of average for the Animas River basin. The daily reservoir inflow is averaging about 600 cfs and reservoir releases are set at 250 cfs. Presently, the reservoir water surface elevation is 6029.01 feet, which corresponds to a storage content of about 999,000 acre-feet.

On January 5, 2005, the National Weather Service's River Forecast Center issued an inflow forecast for Navajo Reservoir for the April through July runoff period. This forecast is projecting a volume runoff into the reservoir of 925,000 acre-feet, which represents a 114 percent of normal runoff for the upper San Juan Basin.

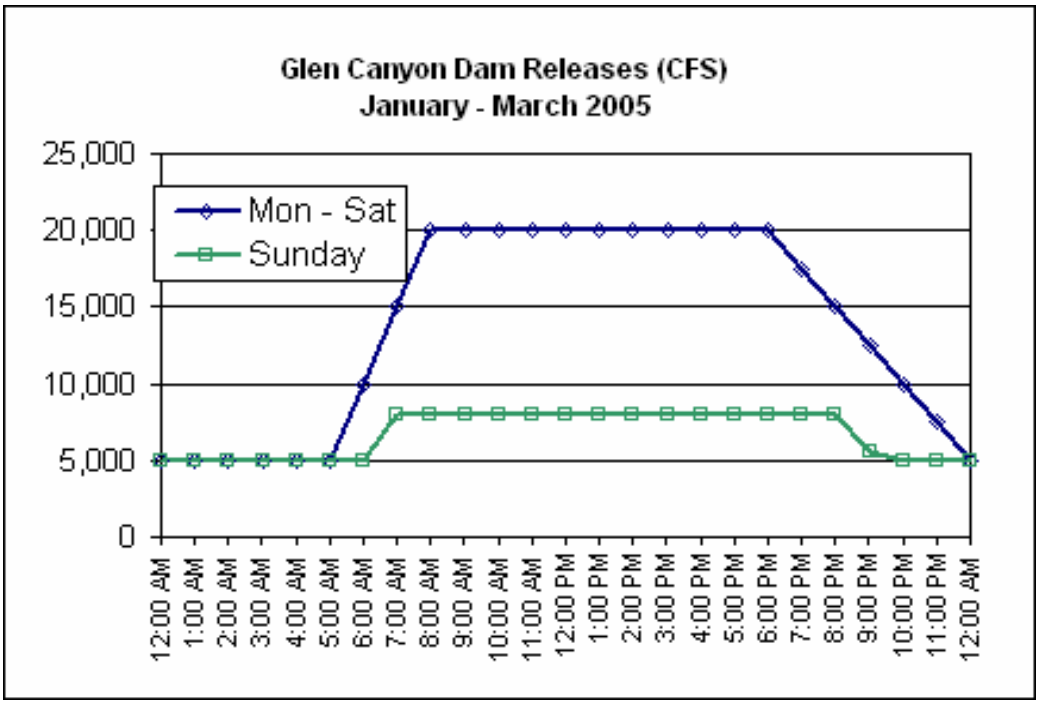
A public meeting on Navajo Reservoir operations will be held on Tuesday, January 18, 2005 at 1:00 p.m. in Farmington, New Mexico. At this meeting, review of last summer and fall reservoir operations, and plans for winter and spring 2005 operations will be discussed. These are open forum discussions on the operation of Navajo Reservoir with many interested groups participating. Anyone interested in the general operation of the reservoir is encouraged to attend. Please contact Pat Page in Reclamation's Durango, Colorado Office at (970) 385-6560 for information about these meetings or the daily operation of Navajo Reservoir.

Lake Powell - Glen Canyon Dam - Current Status

Operations – Experimental Releases

Daily high fluctuating releases from Glen Canyon Dam, as part of the Glen Canyon Dam experimental flows, are being implemented from January 2, 2005 through the first week of April 2005. On Mondays through Saturdays, releases will range between 5,000 cubic feet per second (cfs) and 20,000 cfs. The 20,000 cfs release will be maintained for about 11 hours (from 9:00 am until about 8:00 pm) and the 5,000 cfs release will be maintained for about 6 hours (from 1:00 am until

about 7:00 am). The other hours are transitional, where releases will be between the daily high and the daily low. Releases on Sundays will range between a low of about 5,000 cfs to a high of about 8,000 cfs. The following plot shows the daily scheduled release pattern. It should be noted that actual releases may deviate somewhat from those shown due to real time power systems considerations.



The January through March high fluctuating releases are intended to benefit the endangered humpback chub. Scientists have recognized that the humpback chub population has been in general decline since high fluctuating flows were curtailed in November of 1991. Those flows helped keep the non-native fish, especially the rainbow and brown trout, in check. The trout are thought to prey upon and compete with native fish such as the endangered humpback chub. This is the third consecutive year of high fluctuating winter releases as part of the experimental flows.

Monthly release volumes in January, February, and March 2005 are scheduled to be 779,000, 723,000, and 807,000 acre-feet, respectively, which averages out to about 14,000 cfs per day on Mondays through Saturdays and 6,700 cfs per day on Sundays. On April 8, 2005 high fluctuating releases are scheduled to end.

On November 21, 2004, releases from Glen Canyon Dam were increased for a high-flow experiment. Releases were increased to 41,000 cfs, with this release level maintained for 60 hours. Further information on the high-flow experiment can be found at: http://www.usbr.gov/uc/feature/GCtestflow/index.html.

Because of the draw down condition of Lake Powell, releases from Lake Powell in water year 2005 are being scheduled to meet the minimum release objective of 8.23 million acre-feet. Experimental releases will not change the total volume of water to be released from Lake Powell in water year 2005.

Upper Colorado River Basin Hydrology

Water year 2005 began on October 1, 2004. The Colorado River Basin has now completed 5 consecutive years of drought. In the summer of 1999 Lake Powell was essentially full, with reservoir storage at 97 percent of capacity. Since that time, inflow volumes have been below average for 5 consecutive water years. Total unregulated inflow to Lake Powell in water year 2004 was only 51 percent of average. Unregulated inflow in water years 2000, 2001, 2002, and 2003 was 62, 59, 25, and 51 percent of average, respectively. Inflow in water year 2002 was the lowest ever observed since the completion of Glen Canyon Dam in 1963.

A favorable trend emerged in September 2004 in the Colorado River Basin with a period of three consecutive months of above average precipitation. Basinwide precipitation in September, October and November was 165, 155 and 135 percent of average. Precipitation in December was near average (85 percent), and thus far, the month of January has been very wet in the Colorado River Basin. Basinwide snowpack on January 1, 2005 was 110 percent of average, but has increased to 144 percent of average as of January 11, 2005.

Unregulated inflow to Lake Powell in November was 558,000 acre-feet, or 102 percent of average. This was the first month with above average inflow to Lake Powell since September 1999. Inflow, as a percentage of average, has been increasing since the summer in response to the precipitation events this fall and winter. Unregulated inflow was extremely low this past summer (only 35 and 29 percent of average in July and August, respectively), but increased to 68 percent of average in September, and 92 percent of average in October. Unregulated inflow in December was 87 percent of average. The National Weather Service issued an April through July inflow forecast for Lake Powell on January 4. This forecast is for 7.8 million acre-feet of unregulated inflow (98 percent of average) to Lake Powell in April through July of 2005. A revised forecast (mid-month) will be issued on January 15, and is likely to project above average inflow to Lake Powell due to the persistent storms reaching the basin this month.

The fall precipitation improved soil moisture conditions in the basin. This will favor a more efficient runoff this spring with more snowmelt going to the rivers instead of into the soils as has been the case the past few years. However, drought conditions continue to prevail in the Colorado River Basin. To “break” the drought will require a pattern of above-average precipitation through the winter and into next spring.

Low inflows over the past 5 years have reduced water storage in Lake Powell. As of January 11, 2005, the elevation of Lake Powell is 3,563.7 feet (136.3 feet from full pool). Current storage is 8.6 million acre-feet (36 percent of live capacity). As of January 11, 2005, observed inflow to Lake Powell is about 7,100 cfs, about 85 percent of what is normally seen in mid-January. Inflow is currently rising, however, and will be above average by mid-January.

Under the current inflow forecast, and in combination with scheduled releases, the water surface elevation of Lake Powell is projected to decline until mid-April. The current projections show the lake decreasing to an elevation of about 3,552 feet in early April. The elevation of Lake Powell is projected to increase from April through mid-July of 2005. Current projections show Lake Powell reaching a peak in July 2005 of about 3,590 feet. It should be noted, however, there is considerable uncertainty with these projection. Weather conditions this winter and next spring will

ultimately determine how much runoff there will be into Lake Powell in 2005.

Current Status

	January inflow(unreg) (Acre-Feet)	Percent of normal	Midnight Febraury 08 Elevation	Reservoir Storage (Acre-Feet)
Fontenelle	49,000	114	6481.65	176,000
Flaming Gorge	64,000	114	6014.03	2,774,000
Blue Mesa	26,000	82	7476.68	482,000
Powell	558,000	103	3560.94	8,395,000
Navajo	46,000	131	6032.61	1,035,000

Expected Operation

FONTENELLE - The April through July inflow forecast for Fontenelle Reservoir is now 800,000 acre-feet (93% of average). Based on this forecast it is very likely that Fontenelle Reservoir will be full by August of 2005. It is also likely that bypass releases will be necessary to control reservoir storage during the spring period. Inflows during the months of February, March and April are forecasted to be 30,000, 55,000 and 95,000 acre-feet. These inflow volumes are all above normal for this time of year.

Releases are currently 1200 cfs and the elevation of Fontenelle Reservoir is decreasing at approximately 7 feet per month. On February 8, 2005 the reservoir elevation of Fontenelle was approximately 6481.9 feet above see level. Releases from Fontenelle will likely be increased in March when ice conditions subside. The reservoir elevation will likely be near the minimum active pool elevation (6463 feet above sea level) by late April.

Open forum discussions on Fontenelle operations take place at the "Fontenelle Reservoir Working Group" meetings. The Working Group is a forum for information exchange between Reclamation and other parties associated with the operation of Fontenelle Reservoir. The public is encouraged to attend and express their concerns and interests with regard to Fontenelle Reservoir operation. The next Working Group meeting is scheduled for April 19, 2005 and will be held in Green River, WY at the Wyoming Fish and Game Office. The meeting will begin at 10:00 am. For more information about the Fontenelle Working Group, contact Ed Vidmar at 801-379-1182.

FLAMING GORGE - The April through July Unregulated Inflow forecast was increased to

1,150,000 acre-feet (97% of average) in February. Based on this forecast, Flaming Gorge Reservoir will likely see some significant filling during the spring and summer this year. Inflows during the winter have been near normal and are projected to remain near normal for February, March and April as well. Based on the latest forecast the projected April 1st reservoir elevation is now 6016.7 feet above sea level (23.3 feet from full pool) and the projected August 1st reservoir elevation is now 6027.3 feet above sea level (12.7 feet from full pool). Snow pack conditions above Flaming Gorge are measuring 89% of normal on February 8, 2005. Snowpack conditions in the Yampa River Basin are measuring 89% of normal and the forecasted April through July flow volume is currently 84% of normal.

Releases from Flaming Gorge were increased somewhat in late January as a result of higher inflow forecasts. Releases were increased from an average daily release of 800 cfs to 1000 cfs. At the higher release rate, some hour to hour fluctuations are now occurring. These fluctuations are within the constraints of the Reasonable and Prudent Alternative of the 1992 Biological Opinion on the Operation of Flaming Gorge Dam. These constraints limit fluctuations such that flows of the Green River measured at Jensen, Utah do not deviate outside of a 25% window about the average daily flow measured at this point.

The next "Flaming Gorge Working Group" meeting is to be held on April 20th, 2005 in Vernal, Utah at 10:00 a.m.. Please note that this date has changed from previously published dates. The location of the meeting will be at the Western Park Convention Center. The Working Group is a forum for information exchange between Reclamation and all other parties associated with the operation of Flaming Gorge Reservoir. The public is encouraged to attend and express their concerns and interests with regard to the operation of Flaming Gorge Reservoir. For more information about the Working Group please contact Ed Vidmar at 801-379-1182.

ASPINALL – January unregulated inflow into Blue Mesa Reservoir was 23,000 acre-feet or 90 percent of average. Hydrologic conditions are improving as basin precipitation and snowpack continues to increase. On February 8, 2005 the basin snowpack was averaging 141 percent. For most of the fall month's average precipitation was above normal. The wet trend continued into January, recorded precipitation was almost double the monthly average, which was recorded at 190 percent of average. The current inflow rate into Blue Mesa Reservoir is about 300 cfs and reservoir releases are averaging about 600 cfs. Blue Mesa's present elevation is 7476.73 feet, which corresponds to a storage content of about 482,000 acre-feet.

On February 3, 2005, the National Weather Service's River Forecast Center issued an update for the seasonal runoff volume forecast for April through July. The forecast is for 825,000 acre-feet, or 115 percent of normal inflow into Blue Mesa for that time period. Based on this forecast, Blue Mesa Reservoir is estimated to fill during this year's spring runoff.

Due to the increase in the projected runoff forecast for the Gunnison River Basin, reservoir releases from Crystal Dam have been increasing. The first of these changes occurred on January 7 when releases increased from 350 cfs to 600 cfs, then again on February 8, releases increased from 600 cfs to 800 cfs. Other increases are projected by week's end when total Crystal releases are scheduled to be at 1,000 cfs. Current flows in the river are now 800 cfs. River flows through the Black Canyon of the Gunnison have been set close to the minimum flow rate during the last few winters due to the drought.

The next meeting of the "Aspinall Unit Working Group" will be held on Friday, April 22, 2005 at 1:00 PM at Reclamation's Office in Grand Junction, Colorado. Review of last fall and winter

reservoir operations, and plans for this spring and next summer 2005 operations will be discussed. These meetings are open forum discussions on the Aspinall Unit reservoir operations with many interested groups participating. Anyone needing further information about these meetings should contact Dan Crabtree in the Grand Junction Area Office at (970) 248-0652.

NAVAJO – Reclamation decreased the release from Navajo Reservoir from 350 cubic feet per second (cfs) to 250 cfs, at 9:00 a.m. on Monday, November 1, 2004. This release will remain at 250 cfs throughout the winter, or until further notice. Releases are made for the authorized purposes of the Navajo Unit, and to attempt to maintain a target base flow through the endangered fish critical habitat reach of the San Juan River (Farmington to Lake Powell).

Based upon current hydrological conditions and historical hydrologic data, the target base flow should remain above 500 cfs through the critical habitat area. The target base flow is calculated as the weekly average of gaged flows throughout the critical habitat area, therefore daily flows of less than 500 cfs may occur at some gages. Navajo release will be increased if the downstream target base flow drops below 500 cfs.

Reclamation will continue to closely monitor the hydrologic conditions in the basin. As such, this scheduled release change is subject to changes in river flows and weather conditions.

The current hydrologic conditions continue to be wet. As of February 8, 2005, the upper San Juan basin snowpack stood at 161 percent of average and 181 percent of average for the Animas River basin. Precipitation for the month of January was recorded at 240 percent of average, which resulted in another month of above normal inflow into Navajo Reservoir. Unregulated inflow was 49,000 acre-feet, or 220 percent of average for January. This inflow volume raised the elevation of the reservoir 3.72 feet during the month. Currently, the daily reservoir inflow is averaging about 700 cfs and reservoir releases are set at 250 cfs. The reservoir water surface elevation is 6032.61 feet, which corresponds to a storage content of about 1,035,000 acre-feet.

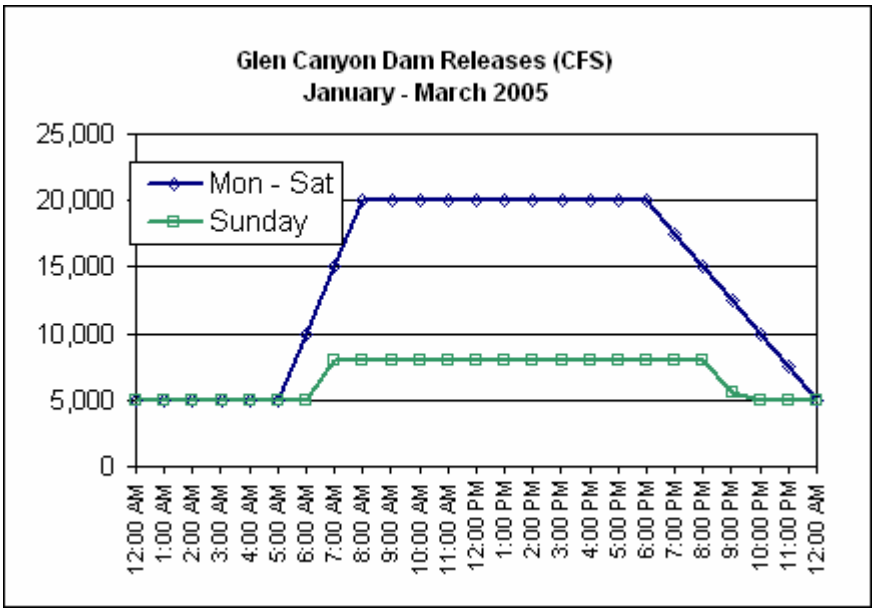
On February 3, 2005, the National Weather Service's River Forecast Center issued an updated unregulated inflow forecast for Navajo Reservoir for the April through July runoff period. This forecast is projecting a volume runoff into the reservoir of 1,230,000 acre-feet, which represents a 154 percent of normal runoff for the upper San Juan Basin. The reservoir is projected to fill, while also providing the maximum spring release rates (21 days at 5,000 cfs) for endangered fish as determined by the Flow Recommendations. Their would be no shortages to Navajo Reservoir water contract users using this forecast.

A public meeting on Navajo Reservoir operations will be held on Tuesday, April 19, 2005 at 1:00 p.m. in Farmington, New Mexico. At this meeting, review of last fall and winter reservoir operations, and plans for spring and summer 2005 operations will be discussed. These are open forum discussions on the operation of Navajo Reservoir with many interested groups participating. Anyone interested in the general operation of the reservoir is encouraged to attend. Please contact Pat Page in Reclamation's Durango, Colorado Office at (970) 385-6560 for information about these meetings or the daily operation of Navajo Reservoir.

Lake Powell - Glen Canyon Dam - Current Status

Operations – Experimental Releases

Daily high fluctuating releases from Glen Canyon Dam, as part of the Glen Canyon Dam experimental flows, are being implemented from January 2, 2005 through the first week of April 2005. On Mondays through Saturdays, releases will range between 5,000 cubic feet per second (cfs) and 20,000 cfs. The 20,000 cfs release will be maintained for about 11 hours (from 9:00 am until about 8:00 pm) and the 5,000 cfs release will be maintained for about 6 hours (from 1:00 am until about 7:00 am). The other hours are transitional, where releases will be between the daily high and the daily low. Releases on Sundays will range between a low of about 5,000 cfs to a high of about 8,000 cfs. The following plot shows the daily scheduled release pattern. It should be noted that actual releases may deviate somewhat from those shown due to real time power systems considerations.



The January through March high fluctuating releases are intended to benefit the endangered humpback chub. Scientists have recognized that the humpback chub population has been in general decline since high fluctuating flows were curtailed in November of 1991. Those flows helped keep the non-native fish, especially the rainbow and brown trout, in check. The trout are thought to prey upon and compete with native fish such as the endangered humpback chub. This is the third consecutive year of high fluctuating winter releases as part of the experimental flows.

Monthly release volumes in January, February, and March 2005 are scheduled to be 779,000, 723,000, and 807,000 acre-feet, respectively, which averages out to about 14,000 cfs per day on Mondays through Saturdays and 6,700 cfs per day on Sundays. On April 8, 2005 high fluctuating releases are scheduled to end. Releases will be lower in April. A volume of 500,000 acre-feet is scheduled to be released in April.

On November 21, 2004, releases from Glen Canyon Dam were increased for a high-flow experiment. Releases were increased to 41,000 cfs, with this release level maintained for 60 hours. For additional information on the high-flow experiment go to: http://137.77.133.1/uc/feature/GCtestflow/index.html

Because of the draw down condition of Lake Powell, releases from Lake Powell in water year 2005 are being scheduled to meet the minimum release objective of 8.23 million acre-feet. Experimental releases will not change the total volume of water to be released from Lake Powell in water year 2005.

Upper Colorado River Basin Hydrology

The Colorado River Basin has now completed 5 consecutive years of severe drought. In the summer of 1999 Lake Powell was essentially full, with reservoir storage at 97 percent of capacity. Since that time, inflow volumes have been below average for 5 consecutive water years. Total unregulated inflow to Lake Powell in water year 2004 was only 51 percent of average. Unregulated inflow in water years 2000, 2001, 2002, and 2003 was 62, 59, 25, and 51 percent of average, respectively. Inflow in water year 2002 was the lowest ever observed since the completion of Glen Canyon Dam in 1963.

Hydrologic conditions have improved in the past 5 months in the Colorado River Basin. Since September 2004, precipitation in the basin has been above average. The Colorado River Basin received extensive precipitation during a two week period which extended from December 28, 2004 through January 12, 2005. Draft data shows that precipitation in the Upper Colorado River Basin was nearly 200 percent of average in January, with almost all of this moisture occurring in the first 12 days of the month. Snowpack in the basin above Lake Powell is currently 121 percent of average (as of February 7, 2005).

Inflow, as a percentage of average, has been increasing since last summer in response to the precipitation events last fall and this winter. November 2004 was the first month with above average inflow to Lake Powell since September 1999. Unregulated inflow in January was 519,000 acre-feet, or 128 percent of average.

As of February 6, 2005, the elevation of Lake Powell is 3,561.3 feet (138.7 feet from full pool). Current storage is 8.42 million acre-feet (35 percent of live capacity).

The National Weather Service (in their February final forecast) is forecasting 9.0 million acre-feet of unregulated inflow to Lake Powell this April through July. This is 113.5 percent of average.

The water surface elevation of Lake Powell is projected to gradually decline until early-April 2005. Current projections show the lake decreasing to an elevation of about 3,556 feet by early April. The elevation of Lake Powell is projected to increase from April through mid-July of 2005. Current projections (using the February final forecast) show Lake Powell reaching a peak in July 2005 of about 3,606 feet.

It should be noted, however, there is uncertainty with these projections. Weather conditions for the remainder of the winter and this spring will ultimately determine how much runoff there will be to Lake Powell in 2005.

To: All Annual Operating Plan Recipients

From: Lower Colorado Region
Boulder Canyon Operations Office
River Operations Group
Attention: BCOO4600
P.O. Box 61470
Boulder City, NV 89006-1470
Phone: 702-293-8190

This operation study reflects the 2005 Annual Operating Plan (AOP) as signed by the Secretary of Interior. The Normal condition is the criterion governing the operation of Lake Mead for calendar year 2005. A copy of the 2005 AOP can be obtained by contacting Lorraine Siano, (702)293-8539 or visit our website at www.usbr.gov/lc/region/riverops.html.

In this study, the Calendar Year (CY) 2005 diversion for Metropolitan Water District of Southern California (MWD) is forecasted to be 0.686 million acre-feet (maf). The CY 2005 diversion for the Central Arizona Project (CAP) is forecasted to be 1.675 maf. Consumptive use for Nevada above Hoover is forecasted to be 0.279 maf for CY 2005.

Lake Mead's elevation is projected to be 1132.00 feet at the end of calendar year 2005. For this model we are assuming partial domestic diversions for calendar year 2006 and normal diversions for calendar year 2007.

As of 2/25/05, due to the current elevation of Lake Mead, Hoover's generating plant effective capacity has been changed from 1767 MW to 1834 MW. Unit capacity tests will be performed as lake elevation change in 2' increments. Davis generating plant effective capacity is 255 MW. Parker generating plant effective capacity is 120 MW. This study reflects these changes in the projections.

Current runoff projections into Lake Powell are provided by the National Weather Service, Colorado Basin River Forecast Center and are as follows: observed unregulated inflow into Lake Powell for the month of February was .497 maf or 118% of the 30 year average. The forecast for the month of March unregulated inflow into Lake Powell is .750 maf or 113% of the 30 year average. The projected April through July unregulated inflow for water year 2005 is 8.6 maf or 108% of average. Unregulated inflow into Lake Powell for water year 2005 is forecasted to be 107% of average.

Hoover, Davis, and Parker historical gross energy figures come from form PO&M from the Power and O&M Group, Boulder Canyon Operations, Bureau of Reclamation, Boulder City, Nevada. Questions regarding these historical numbers can be directed to Joe Donnelly, (702)293-8607.

(Note: lower basin previous months historical SNWS and flow to Mexico values are preliminary estimates.)

To: All Annual Operating Plan Recipients

From: Lower Colorado Region
Boulder Canyon Operations Office
River Operations Group
Attention: BCOO4600
P.O. Box 61470
Boulder City, NV 89006-1470
Phone: 702-293-8190

This operation study reflects the 2005 Annual Operating Plan (AOP) as signed by the Secretary of Interior. The Normal condition is the criterion governing the operation of Lake Mead for calendar year 2005. A copy of the 2005 AOP can be obtained by contacting Lorraine Siano, (702)293-8539 or visit our website at www.usbr.gov/lc/region/riverops.html.

In this study, the Calendar Year (CY) 2005 diversion for Metropolitan Water District of Southern California (MWD) is forecasted to be 0.708 million acre-feet (maf). The CY 2005 diversion for the Central Arizona Project (CAP) is forecasted to be 1.670 maf. Consumptive use for Nevada above Hoover is forecasted to be 0.281 maf for CY 2005.

Lake Mead's elevation is projected to be 1134.21 feet at the end of calendar year 2005. For this model we are assuming partial domestic diversions for calendar year 2006 and normal diversions for calendar year 2007.

Due to declining Lake Mead elevations, Hoover's generator capacity is adjusted based on estimated effective capacity and plant availability. The estimated effective capacity is based on projected Lake Mead elevations. Unit capacity tests will be performed as lake elevation changes in 2' increments.

Current runoff projections into Lake Powell are provided by the National Weather Service, Colorado Basin River Forecast Center and are as follows: observed unregulated inflow into Lake Powell for the month of April was 1.188 maf or 121% of the 30 year average. The forecast for the month of May unregulated inflow into Lake Powell is 2.6 maf or 113% of the 30 year average. The projected April through July unregulated inflow for water year 2005 is 8.6 maf or 108% of average. Unregulated inflow into Lake Powell for water year 2005 is forecasted to be 105% of average.

Hoover, Davis, and Parker historical gross energy figures come from form PO&M from the Power and O&M Group, Boulder Canyon Operations, Bureau of Reclamation, Boulder City, Nevada. Questions regarding these historical numbers can be directed to Joe Donnelly, (702)293-8607.

(Note: lower basin previous months historical SNWS and flow to Mexico values are preliminary estimates.)

To: All Annual Operating Plan Recipients

From: Lower Colorado Region
Boulder Canyon Operations Office
River Operations Group
Attention: BCOO4600
P.O. Box 61470
Boulder City, NV 89006-1470
Phone: 702-293-8190

This operation study reflects the 2006 Annual Operating Plan (AOP) as signed by the Secretary of the Interior. The Partial Domestic Surplus condition is the criterion governing the operation of Lake Mead for calendar year 2006. A copy of the 2006 AOP can be obtained by contacting Lorraine Siano, (702)293-8539 or visit our website at www.usbr.gov/lc/riverops.html.

In this study, the Calendar Year (CY) 2006 diversion for Metropolitan Water District of Southern California (MWD) is forecasted to be 0.638 million acre-feet (maf). The CY 2005 diversion for the Central Arizona Project (CAP) is forecasted to be 1.574 maf. Consumptive use for Nevada above Hoover is forecasted to be 0.283 maf for CY 2006.

At this time, preliminary estimates for water demand schedules for CY 2006 in the Lower Basin do not reflect Partial Domestic schedules. This does not preclude any entity entitled to a Partial Domestic Surplus from requesting it at a later time in CY 2006. Lake Mead's elevation is projected to be 1130.44 feet at the end of CY 2006. According to the Interim Surplus Guidelines, when Lake Mead's elevation is projected to be between elevation 1125 feet and 1145 feet on January 1, the Partial Domestic Surplus will be the criterion governing the operation of Lake Mead. However, for the time being, this model uses preliminary estimates of normal water demands for CY 2007.

Due to declining Lake Mead elevations, Hoover's generator capacity is adjusted based on estimated effective capacity and plant availability. The estimated effective capacity is based on projected Lake Mead elevations. Unit capacity tests will be performed as lake elevation changes in 2' increments. This study reflects these changes in the projections.

Current runoff projections into Lake Powell are provided by the National Weather Service, Colorado Basin River Forecast Center and are as follows: observed unregulated inflow into Lake Powell for the month of December was 0.360 maf or 83% of the 30 year average. The forecast for the month of January unregulated inflow into Lake Powell is 0.375 maf or 93% of the 30 year average. The projected April through July unregulated inflow for water year 2006 is 8.5 maf or 107% of average. The observed unregulated inflow into Lake Powell for water year 2005 is 105% of average.

Hoover, Davis, and Parker historical gross energy figures come from form PO&M from the Power and O&M Group, Boulder Canyon Operations, Bureau of Reclamation, Boulder City, Nevada. Questions regarding these historical numbers can be directed to Joe Donnelly, (702)293-8607.

(Note: lower basin previous months historical SNWS and flow to Mexico values are preliminary estimates.)

To: All Annual Operating Plan Recipients

From: Lower Colorado Region
Boulder Canyon Operations Office
River Operations Group
Doug Blatchford, Manager
P.O. Box 61470
Boulder City, NV 89006-1470
Phone: 702-293-8190

This operation study reflects the 2007 Annual Operating Plan (AOP) as signed by the Secretary of the Interior. The Partial Domestic Surplus condition is the criterion governing the operation of Lake Mead for calendar year 2007. A copy of the 2007 AOP can be obtained by contacting (702)293-8190 or visit our website at www.usbr.gov/lc/riverops.html.

In this study, the Calendar Year (CY) 2007 diversion for Metropolitan Water District of Southern California (MWD) is forecasted to be 0.635 million acre-feet (maf). The CY 2007 diversion for the Central Arizona Project (CAP) is forecasted to be 1.553 maf. Consumptive use for Nevada above Hoover is forecasted to be 0.291 maf for CY 2007.

At this time, preliminary estimates for water demand schedules for CY 2007 in the Lower Basin do not reflect Partial Domestic schedules. This does not preclude any entity entitled to a Partial Domestic Surplus from requesting it at a later time in CY 2007. Lake Mead's elevation is projected to be 1116.60 feet at the end of CY 2007. According to the Interim Surplus Guidelines, when Lake Mead's elevation is projected to be below elevation 1125 feet, the Normal criterion governs the operation of Lake Mead.

Due to declining Lake Mead elevations, Hoover's generator capacity is adjusted based on estimated effective capacity and plant availability. The estimated effective capacity is based on projected Lake Mead elevations. Unit capacity tests will be performed as the lake elevation changes in 2' increments. This study reflects these changes in the projections.

Current runoff projections into Lake Powell are provided by the National Weather Service's Colorado Basin River Forecast Center and are as follows: observed unregulated inflow into Lake Powell for the month of December, 2006 was 0.402 maf or 93% of the 30 year average. The forecast for January, 2007 unregulated inflow into Lake Powell is 0.375 maf or 91% of the 30 year average. The forecast for the April through July unregulated inflow period is projected to be 7.2 maf or 91% of average.

Hoover, Davis, and Parker historical gross energy figures come from PO&M reports provided by the Power and O&M Group, Boulder Canyon Operations, Bureau of Reclamation, Boulder City, Nevada. Questions regarding these historical energy numbers can be directed to Larry Karr at (702) 293-8094.

(Note: Lower Basin previous months' historical SNWP and flow to Mexico values are preliminary estimates.)

To: All Annual Operating Plan Recipients

From: Lower Colorado Region
Boulder Canyon Operations Office
River Operations Group
Doug Blatchford, Manager
P.O. Box 61470
Boulder City, NV 89006-1470
Phone: 702-293-8190

This operation study reflects the 2007 Annual Operating Plan (AOP) as signed by the Secretary of the Interior. The Partial Domestic Surplus condition is the criterion governing the operation of Lake Mead for calendar year 2007. A copy of the 2007 AOP can be obtained by contacting (702)293-8190 or visit our website at www.usbr.gov/lc/riverops.html.

In this study, the Calendar Year (CY) 2007 diversion for Metropolitan Water District of Southern California (MWD) is forecasted to be 0.639 million acre-feet (maf). The CY 2007 diversion for the Central Arizona Project (CAP) is forecasted to be 1.551 maf. Consumptive use for Nevada above Hoover is forecasted to be 0.290 maf for CY 2007.

At this time, preliminary estimates for water demand schedules for CY 2007 in the Lower Basin do not reflect Partial Domestic schedules. This does not preclude any entity entitled to a Partial Domestic Surplus from requesting it at a later time in CY 2007. Lake Mead's elevation is projected to be 1116.76 feet at the end of CY 2007. According to the Interim Surplus Guidelines, when Lake Mead's elevation is projected to be below elevation 1125 feet, the Normal Criterion governs the operation of Lake Mead.

Due to declining Lake Mead elevations, Hoover's generator capacity is adjusted based on estimated effective capacity and plant availability. The estimated effective capacity is based on projected Lake Mead elevations. Unit capacity tests will be performed as the lake elevation changes in 2' increments. This study reflects these changes in the projections.

Current runoff projections into Lake Powell are provided by the National Weather Service's Colorado Basin River Forecast Center and are as follows: observed unregulated inflow into Lake Powell for the month of January, 2007 was 0.315 maf or 78% of the 30 year average. The forecast for February, 2007 unregulated inflow into Lake Powell is 0.375 maf or 89% of the 30 year average. The forecast for the April through July unregulated inflow period is projected to be 5.9 maf or 74% of average.

Hoover, Davis, and Parker historical gross energy figures come from PO&M reports provided by the Power and O&M Group, Boulder Canyon Operations, Bureau of Reclamation, Boulder City, Nevada. Questions regarding these historical energy numbers can be directed to Larry Karr at (702) 293-8094.

(Note: Lower Basin previous months' historical SNWP and flow to Mexico values are preliminary estimates.)

To: All Annual Operating Plan Recipients

From: Lower Colorado Region
Boulder Canyon Operations Office
River Operations Group
Doug Blatchford, Manager
P.O. Box 61470
Boulder City, NV 89006-1470
Phone: 702-293-8190

This operation study reflects the 2007 Annual Operating Plan (AOP) as signed by the Secretary of the Interior. The Partial Domestic Surplus condition is the criterion governing the operation of Lake Mead for calendar year 2007. A copy of the 2007 AOP can be obtained by contacting (702)293-8190 or visit our website at www.usbr.gov/lc/riverops.html.

In this study, the Calendar Year (CY) 2007 diversion for Metropolitan Water District of Southern California (MWD) is forecasted to be 0.639 million acre-feet (maf). The CY 2007 diversion for the Central Arizona Project (CAP) is forecasted to be 1.573 maf. Consumptive use for Nevada above Hoover is forecasted to be 0.295 maf for CY 2007.

At this time, preliminary estimates for water demand schedules for CY 2007 in the Lower Basin do not reflect Partial Domestic schedules. This does not preclude any entity entitled to a Partial Domestic Surplus from requesting it at a later time in CY 2007. Lake Mead's elevation is projected to be 1115.43 feet at the end of CY 2007. According to the Interim Surplus Guidelines, when Lake Mead's elevation is projected to be below elevation 1125 feet, the Normal Criterion governs the operation of Lake Mead.

Due to declining Lake Mead elevations, Hoover's generator capacity is adjusted based on estimated effective capacity and plant availability. The estimated effective capacity is based on projected Lake Mead elevations. Unit capacity tests will be performed as the lake elevation changes in 2' increments. This study reflects these changes in the projections.

Current runoff projections into Lake Powell are provided by the National Weather Service's Colorado Basin River Forecast Center and are as follows: observed unregulated inflow into Lake Powell for the month of February, 2007 was 0.404 maf or 96% of the 30 year average. The forecast for March, 2007 unregulated inflow into Lake Powell is 0.550 maf or 83% of the 30 year average. The forecast for the April through July unregulated inflow period is projected to be 5.6 maf or 71% of average.

Hoover, Davis, and Parker historical gross energy figures come from PO&M reports provided by the Power and O&M Group, Boulder Canyon Operations, Bureau of Reclamation, Boulder City, Nevada. Questions regarding these historical energy numbers can be directed to Larry Karr at (702) 293-8094.

(Note: Lower Basin previous months' historical SNWP and flow to Mexico values are preliminary estimates.)

To: All Annual Operating Plan Recipients

From: Lower Colorado Region
Boulder Canyon Operations Office
River Operations Group
Doug Blatchford, Manager
P.O. Box 61470
Boulder City, NV 89006-1470
Phone: 702-293-8190

This operational study reflects the 2007 Annual Operating Plan (AOP) as signed by the Secretary of the Interior. The Partial Domestic Surplus condition is the criterion governing the operation of Lake Mead for Calendar Year 2007. A copy of the 2007 AOP can be obtained by contacting (702)293-8190 or visiting our website at www.usbr.gov/lc/riverops.html.

In this study, the Calendar Year (CY) 2007 diversion for Metropolitan Water District of Southern California (MWD) is forecasted to be 0.641 million acre-feet (maf). The CY 2007 diversion for the Central Arizona Project (CAP) is forecasted to be 1.554 maf. Consumptive use for Nevada above Hoover is forecasted to be 0.292 maf for CY 2007.

At this time, preliminary estimates for water demand schedules for CY 2007 in the Lower Basin do not reflect Partial Domestic schedules. This does not preclude any entity entitled to a Partial Domestic Surplus from requesting it at a later time in CY 2007. Lake Mead's elevation is projected to be 1115.66 feet at the end of CY 2007. According to the Interim Surplus Guidelines, when Lake Mead's elevation is projected to be below elevation 1125 feet, the Normal Criterion governs the operation of Lake Mead.

Due to declining Lake Mead elevations, Hoover's generator capacity is adjusted based on estimated effective capacity and plant availability. The estimated effective capacity is based on projected Lake Mead elevations. Unit capacity tests will be performed as the lake elevation changes in 2' increments. This study reflects these changes in the projections.

Current runoff projections into Lake Powell are provided by the National Weather Service's Colorado Basin River Forecast Center and are as follows: observed unregulated inflow into Lake Powell for the month of March, 2007 was 0.796 maf or 120% of the 30 year average. The forecast for April, 2007 unregulated inflow into Lake Powell is 0.900 maf or 91% of the 30 year average. The forecast for the April through July unregulated inflow period is 4.0 maf or 50% of average.

Hoover, Davis, and Parker historical gross energy figures come from PO&M reports provided by the Power and O&M Group, Boulder Canyon Operations, Bureau of Reclamation, Boulder City, Nevada. Questions regarding these historical energy numbers can be directed to Larry Karr at (702) 293-8094.

(Note: Lower Basin previous months' historical SNWP and flow to Mexico values are preliminary estimates.)

To: All Annual Operating Plan Recipients

From: Lower Colorado Region
Boulder Canyon Operations Office
River Operations Group
Doug Blatchford, Manager
P.O. Box 61470
Boulder City, NV 89006-1470
Phone: 702-293-8190

This operational study reflects the 2007 Annual Operating Plan (AOP) as signed by the Secretary of the Interior. The Partial Domestic Surplus condition is the criterion governing the operation of Lake Mead for Calendar Year 2007. A copy of the 2007 AOP can be obtained by contacting (702)293-8190 or visiting our website at www.usbr.gov/lc/riverops.html.

In this study, the Calendar Year (CY) 2007 diversion for Metropolitan Water District of Southern California (MWD) is forecasted to be 0.645 million acre-feet (maf). The CY 2007 diversion for the Central Arizona Project (CAP) is forecasted to be 1.555 maf. Consumptive use for Nevada above Hoover is forecasted to be 0.301 maf for CY 2007.

This study uses median values (1976 to 2005) for gains and losses between Glen Canyon and Hoover Dams, Hoover and Davis Dams, and Davis and Parker Dams. Previous studies used mean values (pre-2000).

At this time, preliminary estimates for water demand schedules for CY 2007 in the Lower Basin do not reflect Partial Domestic schedules. This does not preclude any entity entitled to a Partial Domestic Surplus from requesting it at a later time in CY 2007. Lake Mead's elevation is projected to be 1116.07 feet at the end of CY 2007. According to the Interim Surplus Guidelines, when Lake Mead's elevation is projected to be below elevation 1125 feet, the Normal Criterion governs the operation of Lake Mead.

Due to declining Lake Mead elevations, Hoover's generator capacity is adjusted based on estimated effective capacity and plant availability. The estimated effective capacity is based on projected Lake Mead elevations. Unit capacity tests will be performed as the lake elevation changes in 2' increments. This study reflects these changes in the projections.

Current runoff projections into Lake Powell are provided by the National Weather Service's Colorado Basin River Forecast Center and are as follows: observed unregulated inflow into Lake Powell for the month of April, 2007 was 0.802 maf or 81% of the 30 year average. The forecast for May, 2007 unregulated inflow into Lake Powell is 1.000 maf or 43% of the 30 year average. The forecast for the April through July unregulated inflow period is 4.0 maf or 50% of average.

Hoover, Davis, and Parker historical gross energy figures come from PO&M reports provided by the Power and O&M Group, Boulder Canyon Operations, Bureau of Reclamation, Boulder City, Nevada. Questions regarding these historical energy numbers can be directed to Larry Karr at (702) 293-8094.

(Note: Lower Basin previous months' historical SNWP and flow to Mexico values are preliminary estimates.)

To: All Annual Operating Plan Recipients

From: Lower Colorado Region
Boulder Canyon Operations Office
River Operations Group
Doug Blatchford, Manager
P.O. Box 61470
Boulder City, NV 89006-1470
Phone: 702-293-8190

This operational study reflects the 2007 Annual Operating Plan (AOP) as signed by the Secretary of the Interior. The Partial Domestic Surplus condition is the criterion governing the operation of Lake Mead for Calendar Year 2007. A copy of the 2007 AOP can be obtained by contacting (702)293-8190 or visiting our website at www.usbr.gov/lc/riverops.html.

In this study, the Calendar Year (CY) 2007 diversion for Metropolitan Water District of Southern California (MWD) is forecasted to be 0.645 million acre-feet (maf). The CY 2007 diversion for the Central Arizona Project (CAP) is forecasted to be 1.562 maf. Consumptive use for Nevada above Hoover is forecasted to be 0.295 maf for CY 2007.

Side inflows above Lake Mead reflect estimates from the Colorado Basin River Forecast Center through July 2007. Forecasts for future gains and losses reflect median values derived from historical data from 1976 through 2005 between Glen Canyon and Hoover Dams, Hoover and Davis Dams, and Davis and Parker Dams.

At this time, estimates for water demand schedules for CY 2007 in the Lower Basin do not reflect Partial Domestic schedules. This does not preclude any entity entitled to a Partial Domestic Surplus from requesting it at a later time in CY 2007. Lake Mead's elevation is projected to be 1114.85 feet at the end of CY 2007. According to the Interim Surplus Guidelines, when Lake Mead's elevation is projected to be below elevation 1125 feet, the Normal Criterion governs the operation of Lake Mead.

Due to declining Lake Mead elevations, Hoover's generator capacity is adjusted based on estimated effective capacity and plant availability. The estimated effective capacity is based on projected Lake Mead elevations. Unit capacity tests will be performed as the lake elevation changes in 2' increments. This study reflects these changes in the projections.

Current runoff projections into Lake Powell are provided by the National Weather Service's Colorado Basin River Forecast Center and are as follows: observed unregulated inflow into Lake Powell for the month of May, 2007 was 1.578 maf or 69% of the 30 year average. The forecast for June, 2007 unregulated inflow into Lake Powell is 1.100 maf or 36% of the 30 year average. The forecast for the April through July unregulated inflow period is 4.0 maf or 50% of average.

Hoover, Davis, and Parker historical gross energy figures come from PO&M reports provided by the Power and O&M Group, Boulder Canyon Operations, Bureau of Reclamation, Boulder City, Nevada. Questions regarding these historical energy numbers can be directed to Larry Karr at (702) 293-8094.

(Note: Lower Basin previous months' historical SNWP and flow to Mexico values are preliminary estimates.)

Date: June 7, 2007

From: Water Resources Group, Salt Lake City
All Colorado River Annual Operating Plan (AOP) Recipients

Current Status

	May inflow (unreg) (acre-feet)	Percent of Normal	Midnight June 6 Elevation	Reservoir Storage (acre-feet)
Fontenelle	109,000	55	6484.31	192,000
Flaming Gorge	164,000	54	6024.57	3,144,000
Blue Mesa	189,000	87	7504.57	699,000
Powell	1,578,000	69	3610.27	12,757,500
Navajo	258,000	91	6078.67	1,605,000

Expected Operations

FONTENELLE - Releases from Fontenelle Reservoir are currently 800 cfs and steady while inflows are averaging about 1500 cfs. The reservoir elevation is steadily increasing and is currently about 6484.6 feet above sea level which is 19.4 feet from full pool.

The update for June of the Water Supply forecast for Fontenelle Reservoir (Apr-July inflow volume) decreased from 400,000 acre-feet (47 % of average) to 320,000 acre-feet (37% of average). Releases from Fontenelle Reservoir will likely remain at 800 cfs through the summer months and the reservoir will likely not fill this year. not increase from current levels during the spring runoff. Current projections show that Fontenelle Reservoir will only reach about 6492 feet above sea level by mid July which is 14 feet from full pool.

Open forum discussions on Fontenelle operations take place at the "Fontenelle Reservoir Working Group" meetings. The Working Group is a forum for information exchange between Reclamation and other parties associated with the operation of Fontenelle Reservoir. The public is encouraged to attend and express their concerns and interests with regard to Fontenelle Reservoir operation. The next Working Group meeting is now scheduled for August 21, 2007 at 10:00 am at the Wyoming Fish and Game Department office in Green River, Wyoming located at 351 Astle Avenue. For more information about the Fontenelle Working Group, contact Ed Vidmar at 801-379-1182.

FLAMING GORGE – Yampa River Flows decreased significantly beginning on May 6th and will likely begin to rebound on or about May 10th. Depending on the magnitude of the forecasted peak flows of the Yampa River near the end of this week (week of May 7th), releases from Flaming Gorge may be increased to match these peak flows. Notice of any increase will be sent as soon as possible via email and will also be posted on the Reclamation website at the following URL:

http://www.usbr.gov/uc/water/crsp/cs/fgd.html

Reclamation has decided to implement an operation to attempt to achieve the spring flow proposal of the Flaming Gorge Technical Working Group. On April 19, 2007 Reclamation met with the Flaming Gorge Working Group and presented the spring flow proposal and accepted comments from the Flaming Gorge Working Group and the general public through April 26, 2007. Reclamation has considered the comments it has received and has decided to implement an operation to achieve the following:

1. A spring peak release from Flaming Gorge will be scheduled to commence when the peak flows of the Yampa River appear to be eminent. The maximum release rate from Flaming Gorge Dam will be limited to powerplant capacity (approximately 4600 cfs).

2. Powerplant capacity releases will be maintained to achieve flows at the Jensen gauge of 8300 cfs for 7 days. If this flow objective is achieved or if it appears that this magnitude will not be possible for 7 days, then releases will be reduced to base flow levels with a ramp down rate not to exceed 350 cfs per day.

3. If, through implementation of steps 1 and 2, flows at the Jensen gauge achieve 12,000 cfs or greater, Reclamation will consider delaying the downramp if powerplant releases can maintain flows in Reach 2 above 12,000 cfs and the Recovery Program and the Fish and Wildlife Service communicate to Reclamation on a daily basis that floodplain connectivity is sufficient for entrainment and larval fish are being detected in the river channel. If this daily communication is not maintained and steps 1 and 2 have been achieved, Reclamation will schedule releases to be reduced to baseflow levels (approximately 1150 cfs) at a ramp rate not to exceed 350 cfs per day.

Releases from Flaming Gorge are currently steady at 800 cfs. The reservoir elevation of Flaming Gorge is currently 6026.03 feet above sea level and rising. Inflows are averaging about 1700 cfs over the past 10 days. The unregulated inflow to Flaming Gorge in April was well off the forecasted volume. The April forecast volume was 110,000 acre-feet. The actual volume of unregulated inflow in April was only 72,000 acre-feet. Temperatures in the basin were warmer than normal.

The May update of the Water Supply forecast (Apr-Jul Unregulated inflow volume) was reduced from 525 KAF (44% of average) to 500 KAF (42% of average). This is moderately dry in terms of hydrologic classification under the Flaming Gorge Record of Decision.

The next Flaming Gorge Working Group meeting is scheduled for August 23, 2007 in Vernal Utah. The meeting will be held at 10:00 a.m. at the Western Park Convention Center located at 302 East 200 South in Vernal Utah. For directions, please call 435-789-7396. The Flaming Gorge Working Group is an open public forum for information exchange between Reclamation and the stake holders of Flaming Gorge Dam. The public is encouraged to attend and comment on the operations and plans presented by

Reclamation at these meetings. For more information on this group and these meetings please contact Ed Vidmar at 801-379-1182.

ASPINALL – May unregulated inflow into Blue Mesa Reservoir was 189,000 acre-feet or 87 percent of average. Similar to last year's runoff, the spring melt has come early again. On May 6, 2007 the basin snowpack was 52 percent of average, but as of the beginning of June almost all snow in the basin had melted. Precipitation during May improved to almost normal amounts, the month averaged out to about 105. The current inflow rate into Blue Mesa Reservoir is about 3,700 cfs while reservoir releases are averaging about 600 cfs. For the past few days, reservoir inflows have been on the increase in response to warmer temperatures and local rainfall events. Blue Mesa's present elevation is 7503.77 feet, which corresponds to a storage content of about 693,000 acre-feet.

The latest Water Supply Forecast for Water Year 2007 has been issued and the total April through July unregulated inflow is forecasted to be 465,000 acre-feet (65% of normal), an increase of 20,000 acre-feet from last month's forecast. Based on this forecast, Blue Mesa Reservoir is projected to fill to about elevation 7510.0 feet by the end of June 2007. This is about 9.5 feet short from full, or about 84,000 acre-feet.

Releases from Crystal are currently set at 1225 cfs. The Gunnison Diversion Tunnel started taking water for the new season on April 2, 2007. The current diversion rate into the tunnel is 750 cfs, which results in a river flow below the diversion tunnel of approximately 475 cfs. These rates may change as conditions warrant, primarily as we respond to changes in the river inflows.

The last meeting of the "Aspinall Unit Working Group" was held on April 26, 2007 at Reclamation's Grand Junction Office. This meeting reviewed the winter's reservoir operations, and plans for spring and summer operations. The next meeting will start at 1:00 p.m. on Thursday August 30th in the Elk Creek Visitors Center at Blue Mesa Reservoir. Spring and summer operations will be reviewed and future operations discussed. These meetings are open forum discussions on the Aspinall Unit reservoir operations with many interested groups participating. Anyone needing further information about these meetings should contact Dan Crabtree in the Grand Junction Area Office at (970) 248-0652.

NAVAJO – The Navajo Reservoir Spring Release is over. A modified 2nd SJRIP hydrograph was released; a 23 day hydrograph with 14 days at 5,000 cfs. Also, in anticipation of a potential early spring runoff-which did occur, the peak release was begun earlier than in previous years. Ramp up began on Monday, April 30th, reaching 5,000 cfs on Thursday, May 3rd. Ramp down began on Thursday, May 17th, releases were held at 3,400 cfs for the weekend, and then on Monday May 21 releases continued decreasing until reaching 1,250 cfs on Thursday, May 24th. Peak Reservoir Water Surface elevation was reached on May 2nd at 6079.89 feet. No shortages to water users are anticipated through the rest of the irrigation season.

As a result of higher than normal precipitation during May, including an additional 70,000 acre-feet of unanticipated reservoir inflow, Reclamation has maintained the release rate from Navajo Reservoir of approximately 1,200 cubic feet per second (cfs) until further notice.

The basin snowpack has pretty much melted out for elevations below 10500 feet. The snowpack as of June 7th for the upper San Juan River basin was averaging 37 percent while the Animas River basin snowpack was at 14 percent of average. Unregulated inflow into Navajo Reservoir during the month of May was 258,000 acre-feet, or 91 percent of average. Currently, the daily reservoir inflow is averaging about 4,000 cfs while reservoir releases are set at 1,200 cfs. NIIP diversions are currently set at 650 cfs. The reservoir water surface elevation is currently 6078.67 feet, which corresponds to a storage content of about 1,605,000 acre-feet.

On June 5, 2007, the National Weather Service's River Forecast Center issued an updated inflow forecast for Navajo Reservoir for the April through July runoff period. This forecast is projecting a volume runoff into the reservoir of 590,000 acre-feet, an increase of 110,000 acre-feet from the May 3rd forecast. This represents a 74 percent of normal runoff for the Upper San Juan River Basin.

A public meeting on Navajo Reservoir operations will be held on Tuesday, August 21, 2007 at 1:00 p.m. in Farmington, New Mexico. At this meeting, review of last spring and summer reservoir operations, and plans for this fall and winter 2007/2008 operations will be discussed. These are open forum discussions on the operation of Navajo Reservoir with many interested groups participating. Anyone interested in the general operation of the reservoir is encouraged to attend. Please contact Pat Page in Reclamation's Durango, Colorado Office at (970) 385-6560 for information about these meetings or the daily operation of Navajo Reservoir.

Glen Canyon Dam Operations

Releases from Glen Canyon Dam in June 2007 will average 13,400 cubic feet per second (cfs) with a total of 800,000 acre-feet scheduled to be released for the month. On Mondays through Fridays in June, daily release fluctuations due to load following will likely vary between a low of 9,000 cfs (during late evening and early morning off-peak hours) to a high of 17,000 cfs (during daylight and early evening on-peak hours). On Saturdays, release fluctuations will likely vary between a low of 9,000 cfs to a high of 15,500 cfs. On Sundays, release fluctuations will likely vary between a low of 9,000 cfs to a high of 15,000 cfs.

Releases from Glen Canyon Dam in July and August 2007 will be similar to June. A total of 804,000 acre-feet is scheduled to be released in July and August of 2007, which is an average flow of 13,100 cfs.

Upper Colorado River Basin Hydrology

Projections for April through July runoff to Lake Powell in 2007 remain low. The water supply picture in the Colorado River Basin neither improved nor weakened in May. The May final unregulated inflow forecast for April through July runoff into Lake Powell is 4.0 million acre-feet. This is only 50 percent of average.

May was a month with periods of much above average temperatures with higher than expected inflow. Unregulated inflow to Lake Powell in May 2007 was 1,578,000 acre-feet (69 percent of average). The peak snowmelt-runoff inflow to Lake Powell for 2007 occurred on May 23, 2007 when inflow reached 31,600 cfs. The water surface elevation of Lake Powell increased by 9.3 feet in May 2007.

While inflow was higher than projected in May, the projection for inflow to Lake Powell in June is not so bright. There is very little snowpack remaining in the Upper Colorado River Basin and inflow to Lake Powell in June is projected to be only about 35 percent of average.

Reservoir storage is currently 12.74 million acre-feet, or 52 percent of capacity. The current elevation of Lake Powell (June 6, 2007) is 3,610.1 feet, 89.9 feet from full pool elevation of 3,700 feet. The elevation is now likely near the peak for the year. The elevation of Lake Powell is likely to increase until mid-June and then begin to decline. The projected elevation of Lake Powell on July 1, 2007 is 3,610.4 feet.

Upper Colorado River Basin Drought

The Upper Colorado River Basin is experiencing a protracted multi-year drought. Since 1999, inflow to Lake Powell has been below average in every year except one.

In the summer of 1999, Lake Powell was essentially full with reservoir storage at 23.5 million acre-feet, or 97 percent of capacity. Inflow to Lake Powell in 1999 was 109 percent of average. The manifestation of drought conditions in the Upper Colorado River Basin began in the fall months of 1999. A five year period of extreme drought occurred in water years 2000, 2001, 2002, 2003, and 2004 with unregulated inflow to Lake Powell only 62, 59, 25, 51, and 49 percent of average, respectively. Lake Powell storage decreased through this five-year period, with reservoir storage reaching a low of 8.0 million acre-feet (33 percent of capacity) on April 8, 2005.

Drought conditions eased in water year 2005 in the Upper Colorado River Basin. Precipitation was above average in 2005 and unregulated inflow to Lake Powell was 105 percent of average. Lake Powell increased by 2.77 million acre-feet (31 feet in elevation) during water year 2005. But as is often the case, one favorable year does not necessarily end a protracted drought. In 2006, there was a return to

drier conditions in the Colorado River Basin. Unregulated inflow to Lake Powell in water year 2006 was only 73 percent of average.

Water year 2007 will be another year of below average inflow. The current projection for spring runoff into Lake Powell is only 50 percent of average. Projected inflow to Lake Powell for the entire 2007 water year is 68 percent of average. With 2007 projected to be a below average inflow year, one sees that over the past 8 years (2000 through 2007, inclusive) inflow to Lake Powell will have been below average in all but one year (2005).

Reservoir storage in Lake Powell and Lake Mead has decreased over the past 8 years. Reservoir storage in Lake Powell and Lake Mead is currently 52 and 50 percent of capacity, respectively.

To: All Annual Operating Plan Recipients

From: Lower Colorado Region
Boulder Canyon Operations Office
River Operations Group
Douglas B. Blatchford, P.E.
P.O. Box 61470
Boulder City, NV 89006-1470
Phone: 702-293-8190

This operational study reflects the 2007 Annual Operating Plan (AOP) as signed by the Secretary of the Interior. The Partial Domestic Surplus condition is the criterion governing the operation of Lake Mead for Calendar Year 2007. A copy of the 2007 AOP can be obtained by contacting (702)293-8190 or visiting our website at www.usbr.gov/lc/riverops.html.

In this study, the Calendar Year (CY) 2007 diversion for Metropolitan Water District of Southern California (MWD) is forecasted to be 0.625 million acre-feet (maf). The CY 2007 diversion for the Central Arizona Project (CAP) is forecasted to be 1.565 maf. Consumptive use for Nevada above Hoover is forecasted to be 0.292 maf for CY 2007.

According to Sections 2(B)(1) and (7) of the Interim Surplus Guidelines, the Partial Domestic Surplus Condition is the criterion governing the operation of Lake Mead for calendar year 2007 in accordance with Article III(3)(b) of the Operating Criteria, and Article II(B)(2) of the Consolidated Decree. It should be noted, however, that the projected releases in 2007 currently reflect demands under the Normal Condition for the Metropolitan Water District of Southern California (MWD), the Central Arizona Project (CAP), and the Southern Nevada Water Authority (SNWA), per their request. This does not, however, preclude the MWD, CAP, and SNWA from requesting Partial Domestic Surplus water in calendar year 2007.

Due to declining Lake Mead elevations, Hoover's generator capacity is adjusted based on estimated effective capacity and plant availability. The estimated effective capacity is based on projected Lake Mead elevations. Unit capacity tests will be performed as the lake elevation changes in 2' increments. This study reflects these changes in the projections.

Current runoff projections into Lake Powell are provided by the National Weather Service's Colorado Basin River Forecast Center and are as follows: observed unregulated inflow into Lake Powell for the month of June, 2007 was 1.308 maf or 42% of the 30 year average. The forecast for July, 2007 unregulated inflow into Lake Powell is 0.512 maf or 33% of the 30 year average. The forecast for the April through July unregulated inflow period is 4.2 maf or 53% of average.

Hoover, Davis, and Parker historical gross energy figures come from PO&M reports provided by the Power and O&M Group, Boulder Canyon Operations, Bureau of Reclamation, Boulder City, Nevada. Questions regarding these historical energy numbers can be directed to Larry Karr at (702) 293-8094.

(Note: Lower Basin previous months' historical SNWP and flow to Mexico values are preliminary estimates.)

Boulder City, NV 89006-1470
Phone: 702-293-8190

This operational study reflects the 2007 Annual Operating Plan (AOP) as signed by the Secretary of the Interior. The Partial Domestic Surplus condition is the criterion governing the operation of Lake Mead for Calendar Year 2007. A copy of the 2007 AOP can be obtained by contacting (702)293-8190 or visiting our website at www.usbr.gov/lc/riverops.html.

In this study, the Calendar Year (CY) 2007 diversion for Metropolitan Water District of Southern California (MWD) is forecasted to be 0.647 million acre-feet (maf). The CY 2007 diversion for the Central Arizona Project (CAP) is forecasted to be 1.557 maf. Consumptive use for Nevada above Hoover is forecasted to be 0.308 maf for CY 2007.

According to Sections 2(B)(1) and (7) of the Interim Surplus Guidelines, the Partial Domestic Surplus Condition is the criterion governing the operation of Lake Mead for calendar year 2007 in accordance with Article III(3)(b) of the Operating Criteria, and Article II(B)(2) of the Consolidated Decree. It should be noted, however, that the projected releases in 2007 currently reflect demands under the Normal Condition for the Metropolitan Water District of Southern California (MWD), the Central Arizona Project (CAP), and the Southern Nevada Water Authority (SNWA), per their request. This does not, however, preclude the MWD, CAP, and SNWA from requesting Partial Domestic Surplus water in calendar year 2007.

Due to declining Lake Mead elevations, Hoover's generator capacity is adjusted based on estimated effective capacity and plant availability. The estimated effective capacity is based on projected Lake Mead elevations. Unit capacity tests will be performed as the lake elevation changes in 2' increments. This study reflects these changes in the projections.

Current runoff projections into Lake Powell are provided by the National Weather Service's Colorado Basin River Forecast Center and are as follows: observed unregulated inflow into Lake Powell for the month of August, 2007 was 0.378 maf or 62% of the 30 year average. The forecast for September, 2007 unregulated inflow into Lake Powell is 0.375 maf or 79% of the 30 year average. The observed April through July unregulated inflow is 4.051 maf or 51% of average.

Hoover, Davis, and Parker historical gross energy figures come from PO&M reports provided by the Power and O&M Group, Boulder Canyon Operations, Bureau of Reclamation, Boulder City, Nevada. Questions regarding these historical energy numbers can be directed to Larry Karr at (702) 293-8094.

(Note: Lower Basin previous months' historical SNWP and flow to Mexico values are preliminary estimates.)

Boulder City, NV 89006-1470
Phone: 702-293-8190

This operational study reflects the 2007 Annual Operating Plan (AOP) as signed by the Secretary of the Interior. The Partial Domestic Surplus condition is the criterion governing the operation of Lake Mead for Calendar Year 2007. A copy of the 2007 AOP can be obtained by contacting (702)293-8190 or visiting our website at www.usbr.gov/lc/riverops.html.

In this study, the Calendar Year (CY) 2007 diversion for Metropolitan Water District of Southern California (MWD) is forecasted to be 0.647 million acre-feet (maf). The CY 2007 diversion for the Central Arizona Project (CAP) is forecasted to be 1.604 maf. Consumptive use for Nevada above Hoover is forecasted to be 0.303 maf for CY 2007.

According to Sections 2(B)(1) and 7 of the Interim Surplus Guidelines, the Partial Domestic Surplus Condition is the criterion governing the operation of Lake Mead for calendar year 2007 in accordance with Article III(3)(b) of the Operating Criteria, and Article II(B)(2) of the Consolidated Decree. It should be noted, however, that the projected releases in 2007 currently reflect demands under the Normal Condition for the Metropolitan Water District of Southern California (MWD), the Central Arizona Project (CAP), and the Southern Nevada Water Authority (SNWA), per their request. This does not, however, preclude the MWD, CAP, and SNWA from requesting Partial Domestic Surplus water in calendar year 2007.

Due to declining Lake Mead elevations, Hoover's generator capacity is adjusted based on estimated effective capacity and plant availability. The estimated effective capacity is based on projected Lake Mead elevations. Unit capacity tests will be performed as the lake elevation changes in 2' increments. This study reflects these changes in the projections.

Current runoff projections into Lake Powell are provided by the National Weather Service's Colorado Basin River Forecast Center and are as follows: observed unregulated inflow into Lake Powell for the month of July, 2007 was 0.363 maf or 23% of the 30 year average. The forecast for August, 2007 unregulated inflow into Lake Powell is 0.375 maf or 61% of the 30 year average. The observed April through July unregulated inflow is 4.051 maf or 51% of average.

Hoover, Davis, and Parker historical gross energy figures come from PO&M reports provided by the Power and O&M Group, Boulder Canyon Operations, Bureau of Reclamation, Boulder City, Nevada. Questions regarding these historical energy numbers can be directed to Larry Karr at (702) 293-8094.

(Note: Lower Basin previous months' historical SNWP and flow to Mexico values are preliminary estimates.)

To: All Annual Operating Plan Recipients

From: Lower Colorado Region
Boulder Canyon Operations Office
River Operations Group
Douglas B. Blatchford, P.E.
P.O. Box 61470
Boulder City, NV 89006-1470
Phone: 702-293-8190

This operational study reflects the 2007 Annual Operating Plan (AOP) as signed by the Secretary of the Interior. The Partial Domestic Surplus condition is the criterion governing the operation of Lake Mead for Calendar Year 2007. A copy of the 2007 AOP can be obtained by contacting (702)293-8190 or visiting our website at www.usbr.gov/lc/riverops.html.

In this study, the Calendar Year (CY) 2007 diversion for Metropolitan Water District of Southern California (MWD) is forecasted to be 0.697 million acre-feet (maf). The CY 2007 diversion for the Central Arizona Project (CAP) is forecasted to be 1.569 maf. Consumptive use for Nevada above Hoover is forecasted to be 0.297 maf for CY 2007.

According to Sections 2(B)(1) and (7) of the Interim Surplus Guidelines, the Partial Domestic Surplus Condition is the criterion governing the operation of Lake Mead for calendar year 2007 in accordance with Article III(3)(b) of the Operating Criteria, and Article II(B)(2) of the Consolidated Decree. It should be noted, however, that the projected releases in 2007 currently reflect demands under the Normal Condition for the Metropolitan Water District of Southern California (MWD), the Central Arizona Project (CAP), and the Southern Nevada Water Authority (SNWA), per their request. This does not, however, preclude the MWD, CAP, and SNWA from requesting Partial Domestic Surplus water in calendar year 2007.

Due to declining Lake Mead elevations, Hoover's generator capacity is adjusted based on estimated effective capacity and plant availability. The estimated effective capacity is based on projected Lake Mead elevations. Unit capacity tests will be performed as the lake elevation changes in 2' increments. This study reflects these changes in the projections.

Current runoff projections into Lake Powell are provided by the National Weather Service's Colorado Basin River Forecast Center and are as follows: observed unregulated inflow into Lake Powell for the month of September, 2007 was 0.296 maf or 62% of the 30 year average. The forecast for October, 2007 unregulated inflow into Lake Powell is 0.425 maf or 78% of the 30 year average. The observed 2007 April through July unregulated inflow is 4.051 maf or 51% of average.

Hoover, Davis, and Parker historical gross energy figures come from PO&M reports provided by the Power and O&M Group, Boulder Canyon Operations, Bureau of Reclamation, Boulder City, Nevada. Questions regarding these historical energy numbers can be directed to Larry Karr at (702) 293-8094.

(Note: Lower Basin previous months' historical SNWP and flow to Mexico values are preliminary estimates.)

To: All Annual Operating Plan Recipients

From: Lower Colorado Region
Boulder Canyon Operations Office
River Operations Group
Douglas B. Blatchford, P.E.
P.O. Box 61470
Boulder City, NV 89006-1470
Phone: 702-293-8190

This operational study reflects the 2007 Annual Operating Plan (AOP) as signed by the Secretary of the Interior. The Partial Domestic Surplus condition is the criterion governing the operation of Lake Mead for Calendar Year 2007. A copy of the 2007 AOP can be obtained by contacting (702)293-8190 or visiting our website at www.usbr.gov/lc/riverops.html.

In this study, the Calendar Year (CY) 2007 diversion for Metropolitan Water District of Southern California (MWD) is forecasted to be 0.713 million acre-feet (maf). The CY 2007 diversion for the Central Arizona Project (CAP) is forecasted to be 1.576 maf. Consumptive use for Nevada above Hoover is forecasted to be 0.296 maf for CY 2007.

According to Sections 2(B)(1) and (7) of the Interim Surplus Guidelines, the Partial Domestic Surplus Condition is the criterion governing the operation of Lake Mead for calendar year 2007 in accordance with Article III(3)(b) of the Operating Criteria, and Article II(B)(2) of the Consolidated Decree. It should be noted, however, that the projected releases in 2007 currently reflect demands under the Normal Condition for the Metropolitan Water District of Southern California (MWD), the Central Arizona Project (CAP), and the Southern Nevada Water Authority (SNWA), per their request. This does not, however, preclude the MWD, CAP, and SNWA from requesting Partial Domestic Surplus water in calendar year 2007.

Due to declining Lake Mead elevations, Hoover's generator capacity is adjusted based on estimated effective capacity and plant availability. The estimated effective capacity is based on projected Lake Mead elevations. Unit capacity tests will be performed as the lake elevation changes in 2' increments. This study reflects these changes in the projections.

Current runoff projections into Lake Powell are provided by the National Weather Service's Colorado Basin River Forecast Center and are as follows: observed unregulated inflow into Lake Powell for the month of October, 2007 was 0.468 maf or 85% of the 30 year average. The forecast for November, 2007 unregulated inflow into Lake Powell is 0.400 maf or 74% of the 30 year average.

Hoover, Davis, and Parker historical gross energy figures come from PO&M reports provided by the Power and O&M Group, Boulder Canyon Operations, Bureau of Reclamation, Boulder City, Nevada. Questions regarding these historical energy numbers can be directed to Larry Karr at (702) 293-8094.

(Note: Lower Basin previous months' historical SNWP and flow to Mexico values are preliminary estimates.)

Boulder City, NV 89006-1470
Phone: 702-293-8190

This operational study reflects the 2007 Annual Operating Plan (AOP) as signed by the Secretary of the Interior. The Partial Domestic Surplus condition is the criterion governing the operation of Lake Mead for Calendar Year 2007. A copy of the 2007 AOP can be obtained by contacting (702)293-8190 or visiting our website at www.usbr.gov/lc/riverops.html.

In this study, the Calendar Year (CY) 2007 diversion for Metropolitan Water District of Southern California (MWD) is forecasted to be 0.729 million acre-feet (maf). The CY 2007 diversion for the Central Arizona Project (CAP) is forecasted to be 1.585 maf. Consumptive use for Nevada above Hoover is forecasted to be 0.299 maf for CY 2007.

According to Sections 2(B)(1) and (7) of the Interim Surplus Guidelines, the Partial Domestic Surplus Condition is the criterion governing the operation of Lake Mead for calendar year 2007 in accordance with Article III(3)(b) of the Operating Criteria, and Article II(B)(2) of the Consolidated Decree. It should be noted, however, that the projected releases in 2007 currently reflect demands under the Normal Condition for the Metropolitan Water District of Southern California (MWD), the Central Arizona Project (CAP), and the Southern Nevada Water Authority (SNWA), per their request. This does not, however, preclude the MWD, CAP, and SNWA from requesting Partial Domestic Surplus water in calendar year 2007.

Due to declining Lake Mead elevations, Hoover's generator capacity is adjusted based on estimated effective capacity and plant availability. The estimated effective capacity is based on projected Lake Mead elevations. Unit capacity tests will be performed as the lake elevation changes in 2' increments. This study reflects these changes in the projections.

Current runoff projections into Lake Powell are provided by the National Weather Service's Colorado Basin River Forecast Center and are as follows: observed unregulated inflow into Lake Powell for the month of November, 2007 was 0.397 maf or 73% of the 30 year average. The forecast for December, 2007 unregulated inflow into Lake Powell is 0.325 maf or 75% of the 30 year average.

Hoover, Davis, and Parker historical gross energy figures come from PO&M reports provided by the Power and O&M Group, Boulder Canyon Operations, Bureau of Reclamation, Boulder City, Nevada. Questions regarding these historical energy numbers can be directed to Larry Karr at (702) 293-8094.

(Note: Lower Basin previous months' historical SNWP and flow to Mexico values are preliminary estimates.)

The operation of Lake Powell and Lake Mead in this 24 Month Study is pursuant to the December 2007 Record of Decision on Colorado River Interim Guidelines for Lower Basin Shortages and the Coordinated Operations of Lake Powell and Lake Mead (Interim Guidelines). The Interim Guidelines are available for download at:
http://www.usbr.gov/lc/region/programs/strategies/RecordofDecision.pdf

The Interim Guidelines contain provisions for specific April adjustments of the release from Lake Powell and the operation reflected in this 24 Month Study is consistent with such adjustments. It should be noted that such adjustments, as well as the coordinated operations in general, are sensitive to current inflow projections and may therefore change from month to month as new inflow projections are incorporated.

In this study, the Calendar Year (CY) 2008 diversion for Metropolitan Water District of Southern California (MWD) is forecasted to be 0.778 million acre-feet (maf). The CY 2008 diversion for the Central Arizona Project (CAP) is forecasted to be 1.569 maf. Consumptive use for Nevada above Hoover is forecasted to be 0.298 maf for CY 2008.

Due to declining Lake Mead elevations, Hoover's generator capacity is adjusted based on estimated effective capacity and plant availability. The estimated effective capacity is based on projected Lake Mead elevations. Unit capacity tests will be performed as the lake elevation changes in 2' increments. This study reflects these changes in the projections.

Current runoff projections into Lake Powell are provided by the National Weather Service's Colorado Basin River Forecast Center and are as follows: observed unregulated inflow into Lake Powell for the month of December, 2007 was 0.398 maf or 92% of the 30 year average. The forecast for January, 2008 unregulated inflow into Lake Powell is 0.375 maf or 93% of the 30 year average. The forecast for the April through July unregulated inflow period is projected to be 8.0 maf or 101% of average.

Hoover, Davis, and Parker historical gross energy figures come from PO&M reports provided by the Power and O&M Group, Boulder Canyon Operations, Bureau of Reclamation, Boulder City, Nevada. Questions regarding these historical energy numbers can be directed to Larry Karr at (702) 293-8094.

(Note: Lower Basin previous months' historical SNWP and flow to Mexico values are preliminary estimates.)

Boulder City, NV 89006-1470
Phone: 702-293-8190

The operation of Lake Powell and Lake Mead in this 24 Month Study is pursuant to the December 2007 Record of Decision on Colorado River Interim Guidelines for Lower Basin Shortages and the Coordinated Operations of Lake Powell and Lake Mead (Interim Guidelines). The Interim Guidelines are available for download at http://www.usbr.gov/lc/region/programs/strategies/RecordofDecision.pdf

The Interim Guidelines contain provisions for specific April adjustments of the release from Lake Powell and the operation reflected in this 24 Month Study is consistent with such adjustments. It should be noted that such adjustments, as well as the coordinated operations in general, are sensitive to current inflow projections and may therefore change from month to month as new inflow projections are incorporated.

The February 24 Month study indicates that an April adjustment, with a change to the Equalization Tier, on April 1, 2008 would occur under the most probable forecasted April through July unregulated inflow into Lake Powell This adjustment would result in additional releases from Lake Powell which are reflected in the study. However, it is possible that the forecasted inflow on April 1 may be such that an April adjustment is not required, and the 2008 water year release from Lake Powell is maintained at 8.23 million acre-feet.

In this study, the Calendar Year (CY) 2008 diversion for Metropolitan Water District of Southern California (MWD) is forecasted to be 0.777 million acre-feet (maf). The CY 2008 diversion for the Central Arizona Project (CAP) is forecasted to be 1.563 maf. Consumptive use for Nevada above Hoover is forecasted to be 0.292 maf for CY 2008.

Due to declining Lake Mead elevations, Hoover's generator capacity is adjusted based on estimated effective capacity and plant availability. The estimated effective capacity is based on projected Lake Mead elevations. Unit capacity tests will be performed as the lake elevation changes in 2' increments. This study reflects these changes in the projections.

Current runoff projections into Lake Powell are provided by the National Weather Service's Colorado Basin River Forecast Center and are as follows: observed unregulated inflow into Lake Powell for the month of January, 2008 was 0.336 maf or 83% of the 30 year average. The forecast for February, 2008 unregulated inflow into Lake Powell is 0.475 maf or 113% of the 30 year average. The forecast for the April through July unregulated inflow period is projected to be 9.5 maf or 120% of average.

Hoover, Davis, and Parker historical gross energy figures come from PO&M reports provided by the Power and O&M Group, Boulder Canyon Operations, Bureau of Reclamation, Boulder City, Nevada. Questions regarding these historical energy numbers can be directed to Larry Karr at (702) 293-8094.

(Note: Lower Basin previous months' historical SNWP and flow to Mexico values are preliminary estimates.)

To: All Annual Operating Plan Recipients

From: Lower Colorado Region
Boulder Canyon Operations Office
River Operations Group
Douglas B. Blatchford, P.E.
P.O. Box 61470
Boulder City, NV 89006-1470
Phone: 702-293-8190

The operation of Lake Powell and Lake Mead in this 24 Month Study is pursuant to the December 2007 Record of Decision on Colorado River Interim Guidelines for Lower Basin Shortages and the Coordinated Operations of Lake Powell and Lake Mead (Interim Guidelines). The Interim Guidelines are available for download at http://www.usbr.gov/lc/region/programs/strategies/RecordofDecision.pdf

The Interim Guidelines contain provisions for specific April adjustments of the release from Lake Powell and the operation reflected in this 24 Month Study is consistent with such adjustments.

The April 24 Month study projects an end of water year elevation at Lake Powell of 3639.81 feet, with an annual release volume of 8.23 million acre-feet, which is above the equalization level for 2008 of 3636 feet. In accordance with Section 6.B.3 of the Interim Guidelines, the operation of Glen Canyon Dam will be governed by Section 6.A (Equalization Tier) for the remainder of Water Year 2008. Under the Equalization Tier, it is likely that the annual release from Glen Canyon Dam for Water Year 2008 will be greater than 8.23 million acre-feet. The April 24 Month Study projects the annual release to be 8.88 million acre-feet; however, the projected annual release will be updated each month throughout the remainder of the Water Year to achieve the operation specified in Section 6.A.1.

In this study, the Calendar Year (CY) 2008 diversion for Metropolitan Water District of Southern California (MWD) is forecasted to be 0.798 million acre-feet (maf). The CY 2008 diversion for the Central Arizona Project (CAP) is forecasted to be 1.556 maf. Consumptive use for Nevada above Hoover is forecasted to be 0.282 maf for CY 2008.

Due to declining Lake Mead elevations, Hoover’s generator capacity is adjusted based on estimated effective capacity and plant availability. The estimated effective capacity is based on projected Lake Mead elevations. Unit capacity tests will be performed as the lake elevation changes in 2' increments. This study reflects these changes in the projections.

Current runoff projections into Lake Powell are provided by the National Weather Service’s Colorado Basin River Forecast Center and are as follows: observed unregulated inflow into Lake Powell for the month of March, 2008 was 0.589 maf or 89% of the 30 year average. The forecast for April, 2008 unregulated inflow into Lake Powell is 1.400 maf or 142% of the 30 year average. The forecast for the April through July unregulated inflow period is projected to be 9.7 maf or 122% of average.

Hoover, Davis, and Parker historical gross energy figures come from PO&M reports provided by the Power and O&M Group, Boulder Canyon Operations, Bureau of Reclamation, Boulder City, Nevada. Questions regarding these historical energy numbers can be directed to Larry Karr at (702) 293-8094.

Boulder City, NV 89006-1470
Phone: 702-293-8190

The operation of Lake Powell and Lake Mead in this 24 Month Study is pursuant to the December 2007 Record of Decision on Colorado River Interim Guidelines for Lower Basin Shortages and the Coordinated Operations of Lake Powell and Lake Mead (Interim Guidelines). The Interim Guidelines are available for download at http://www.usbr.gov/lc/region/programs/strategies/RecordofDecision.pdf

Based on the April 24 Month study and Section 6.B.3 of the Interim Guidelines, the operation of Glen Canyon Dam will be governed by Section 6.A (Equalization Tier) for the remainder of Water Year 2008. Under the Equalization Tier, it is likely that the annual release from Glen Canyon Dam for Water Year 2008 will be greater than 8.23 million acre-feet. The May 24 Month Study projects the annual release to be 8.95 million acre-feet; however, the projected annual release will be updated each month throughout the remainder of the Water Year to achieve the operation specified in Section 6.A.1 of the Interim Guidelines.

In this study, the Calendar Year (CY) 2008 diversion for Metropolitan Water District of Southern California (MWD) is forecasted to be 0.840 million acre-feet (maf). The CY 2008 diversion for the Central Arizona Project (CAP) is forecasted to be 1.576 maf. Consumptive use for Nevada above Hoover is forecasted to be 0.278 maf for CY 2008.

Due to declining Lake Mead elevations, Hoover's generator capacity is adjusted based on estimated effective capacity and plant availability. The estimated effective capacity is based on projected Lake Mead elevations. Unit capacity tests will be performed as the lake elevation changes in 2' increments. This study reflects these changes in the projections.

Current runoff projections into Lake Powell are provided by the National Weather Service's Colorado Basin River Forecast Center and are as follows: observed unregulated inflow into Lake Powell for the month of April, 2008 was 1.0 maf or 102% of the 30 year average. The forecast for May, 2008 unregulated inflow into Lake Powell is 3.2 maf or 139% of the 30 year average. The forecast for the April through July unregulated inflow period is projected to be 9.2 maf or 116% of average.

Hoover, Davis, and Parker historical gross energy figures come from PO&M reports provided by the Power and O&M Group, Boulder Canyon Operations, Bureau of Reclamation, Boulder City, Nevada. Questions regarding these historical energy numbers can be directed to Larry Karr at (702) 293-8094.

Boulder City, NV 89006-1470
Phone: 702-293-8190

The operation of Lake Powell and Lake Mead in this 24 Month Study is pursuant to the December 2007 Record of Decision on Colorado River Interim Guidelines for Lower Basin Shortages and the Coordinated Operations of Lake Powell and Lake Mead (Interim Guidelines). The Interim Guidelines are available for download at http://www.usbr.gov/lc/region/programs/strategies/RecordofDecision.pdf

The Interim Guidelines contain provisions for specific April adjustments of the release from Lake Powell and the operation reflected in this 24 Month Study is consistent with such adjustments.

The April 24 Month study projected an end of water year elevation at Lake Powell of 3639.81 feet, with an annual release volume of 8.23 million acre-feet, which is above the equalization level for 2008 of 3636 feet. In accordance with Section 6.B.3 of the Interim Guidelines, the operation of Glen Canyon Dam will be governed by Section 6.A (Equalization Tier) for the remainder of Water Year 2008. Under the Equalization Tier, it is likely that the annual release from Glen Canyon Dam for Water Year 2008 will be greater than 8.23 million acre-feet. The June 24 Month Study projects the annual release to be 8.96 million acre-feet; however, the projected annual release will be updated each month throughout the remainder of the Water Year to achieve the operation specified in Section 6.A.1.

In this study, the Calendar Year (CY) 2008 diversion for Metropolitan Water District of Southern California (MWD) is forecasted to be 0.848 million acre-feet (maf). The CY 2008 diversion for the Central Arizona Project (CAP) is forecasted to be 1.559 maf. Consumptive use for Nevada above Hoover is forecasted to be 0.277 maf for CY 2008.

Due to declining Lake Mead elevations, Hoover’s generator capacity is adjusted based on estimated effective capacity and plant availability. The estimated effective capacity is based on projected Lake Mead elevations. Unit capacity tests will be performed as the lake elevation changes in 2' increments. This study reflects these changes in the projections.

Current runoff projections into Lake Powell are provided by the National Weather Service’s Colorado Basin River Forecast Center and are as follows: observed unregulated inflow into Lake Powell for the month of May, 2008 was 2.645 maf or 115% of the 30 year average. The forecast for June, 2008 unregulated inflow into Lake Powell is 3.8 maf or 123% of the 30 year average. The forecast for the April through July unregulated inflow period is projected to be 9.2 maf or 116% of average.

Hoover, Davis, and Parker historical gross energy figures come from PO&M reports provided by the Power and O&M Group, Boulder Canyon Operations, Bureau of Reclamation, Boulder City, Nevada. Questions regarding these historical energy numbers can be directed to Larry Karr at (702) 293-8094.

Boulder Canyon Operations Office
River Operations Group
Douglas B. Blatchford, P.E.
P.O. Box 61470
Boulder City, NV 89006-1470
Phone: 702-293-8190

The operation of Lake Powell and Lake Mead in this 24 Month Study is pursuant to the December 2007 Record of Decision on Colorado River Interim Guidelines for Lower Basin Shortages and the Coordinated Operations of Lake Powell and Lake Mead (Interim Guidelines). The Interim Guidelines are available for download at http://www.usbr.gov/lc/region/programs/strategies/RecordofDecision.pdf

The Interim Guidelines contain provisions for specific April adjustments of the release from Lake Powell and the operation reflected in this 24 Month Study is consistent with such adjustments.

The April 24 Month study projected an end of water year elevation at Lake Powell of 3639.81 feet, with an annual release volume of 8.23 million acre-feet, which is above the equalization level for 2008 of 3636 feet. In accordance with Section 6.B.3 of the Interim Guidelines, the operation of Glen Canyon Dam will be governed by Section 6.A (Equalization Tier) for the remainder of Water Year 2008. Under the Equalization Tier, it is likely that the annual release from Glen Canyon Dam for Water Year 2008 will be greater than 8.23 million acre-feet. The July 24 Month Study projects the annual release to be 8.97 million acre-feet; however, the projected annual release will be updated each month throughout the remainder of the Water Year to achieve the operation specified in Section 6.A.1.

In this study, the Calendar Year (CY) 2008 diversion for Metropolitan Water District of Southern California (MWD) is forecasted to be 0.850 million acre-feet (maf). The CY 2008 diversion for the Central Arizona Project (CAP) is forecasted to be 1.570 maf. Consumptive use for Nevada above Hoover is forecasted to be 0.274 maf for CY 2008.

Due to declining Lake Mead elevations, Hoover’s generator capacity is adjusted based on estimated effective capacity and plant availability. The estimated effective capacity is based on projected Lake Mead elevations. Unit capacity tests will be performed as the lake elevation changes in 2' increments. This study reflects these changes in the projections.

Current runoff projections into Lake Powell are provided by the National Weather Service’s Colorado Basin River Forecast Center and are as follows: observed unregulated inflow into Lake Powell for the month of June, 2008 was 3.614 maf or 117% of the 30 year average. The forecast for July, 2008 unregulated inflow into Lake Powell is 1.535 maf or 98% of the 30 year average. The forecast for the April through July unregulated inflow period is projected to be 8.8 maf or 111% of average.

Hoover, Davis, and Parker historical gross energy figures come from PO&M reports provided by the Power and O&M Group, Boulder Canyon Operations, Bureau of Reclamation, Boulder City, Nevada. Questions regarding these historical energy numbers can be directed to Larry Karr at (702) 293-8094.

Boulder City, NV 89006-1470
Phone: 702-293-8190

The operation of Lake Powell and Lake Mead in this 24 Month Study is pursuant to the December 2007 Record of Decision on Colorado River Interim Guidelines for Lower Basin Shortages and the Coordinated Operations of Lake Powell and Lake Mead (Interim Guidelines). The Interim Guidelines are available for download at http://www.usbr.gov/lc/region/programs/strategies/RecordofDecision.pdf

The April 24 Month study projected an end of water year elevation at Lake Powell of 3639.81 feet, with an annual release volume of 8.23 million acre-feet, which was above the equalization level for 2008 (3636 feet above sea level). In accordance with Section 6.B.3 of the Interim Guidelines, the operation of Glen Canyon Dam will be governed by Section 6.A (Equalization Tier) for the remainder of Water Year 2008. Under the Equalization Tier, it is likely that the annual release from Glen Canyon Dam for Water Year 2008 will be greater than 8.23 million acre-feet. The August 24 Month Study projects the annual release from Glen Canyon Dam to be 8.972 million acre-feet; however, the projected annual release will be updated each month throughout the remainder of the Water Year to achieve the operation specified in Section 6.A.1.

In this study, the Calendar Year (CY) 2008 diversion for Metropolitan Water District of Southern California (MWD) is forecasted to be 0.877 million acre-feet (maf). The CY 2008 diversion for the Central Arizona Project (CAP) is forecasted to be 1.509 maf. Consumptive use for Nevada above Hoover is forecasted to be 0.279 maf for CY 2008.

Due to declining Lake Mead elevations, Hoover’s generator capacity is adjusted based on estimated effective capacity and plant availability. The estimated effective capacity is based on projected Lake Mead elevations. Unit capacity tests will be performed as the lake elevation changes in 2' increments. This study reflects these changes in the projections.

Current runoff projections into Lake Powell are provided by the National Weather Service’s Colorado Basin River Forecast Center and are as follows: Observed unregulated inflow into Lake Powell for the month of July, 2008 was 1.672 maf or 107% of the 30 year average. The forecast for August, 2008 unregulated inflow into Lake Powell is 0.700 maf or 114% of the 30 year average. The preliminary forecast volume for the April through July unregulated inflow period is 8.85 maf or 111% of average.

Hoover, Davis, and Parker historical gross energy figures come from PO&M reports provided by the Power and O&M Group, Boulder Canyon Operations, Bureau of Reclamation, Boulder City, Nevada. Questions regarding these historical energy numbers can be directed to Larry Karr at (702) 293-8094.

Boulder City, NV 89006-1470
Phone: 702-293-8190

The operation of Lake Powell and Lake Mead in this 24 Month Study is pursuant to the December 2007 Record of Decision on Colorado River Interim Guidelines for Lower Basin Shortages and the Coordinated Operations of Lake Powell and Lake Mead (Interim Guidelines). The Interim Guidelines are available for download at http://www.usbr.gov/lc/region/programs/strategies/RecordofDecision.pdf

In April 2008, the 24-month study projected that the end of water year elevation at Lake Powell would be 3639.81 feet above sea level (asl) with the annual water year release volume set to 8.23 million acre-feet (maf). This projected elevation was above the equalization level for 2008 (3636 feet asl). As a result of this projected condition, in accordance with Section 6.B.3 (Upper Elevation Balancing Tier) of the Interim Guidelines, the operation of Glen Canyon Dam was to be governed by Section 6.A (Equalization Tier) for the remainder of water year 2008. Under the Equalization Tier, the annual release from Glen Canyon Dam for Water Year 2008 was projected to be greater than 8.23 maf. The September 24 Month Study projects the annual release from Glen Canyon Dam will be approximately 8.974 maf.

The monthly release from Glen Canyon Dam for September 2008 was determined on August 27 by Reclamation's Upper Colorado (UC) and Lower Colorado (LC) Regions, consistent with the Interim Guidelines. This monthly release will not be adjusted during September. This was necessary to implement steady flows from Glen Canyon Dam starting on September 1, consistent with the Final Environmental Assessment for Experimental Releases from Glen Canyon Dam, Arizona, 2008 through 2012.

In this study, the Calendar Year (CY) 2008 diversion for Metropolitan Water District of Southern California (MWD) is forecasted to be 0.866 maf. The CY 2008 diversion for the Central Arizona Project (CAP) is forecasted to be 1.503 maf. Consumptive use for Nevada above Hoover is forecasted to be 0.281 maf for CY 2008.

Due to declining Lake Mead elevations, Hoover's generator capacity is adjusted based on estimated effective capacity and plant availability. The estimated effective capacity is based on projected Lake Mead elevations. Unit capacity tests will be performed as the lake elevation changes in 2-foot increments. This study reflects these changes in the projections.

Current runoff projections into Lake Powell are provided by the National Weather Service's Colorado Basin River Forecast Center and are as follows: Observed unregulated inflow into Lake Powell for the month of August, 2008 was 0.479 maf or 78% of the 30 year average. The forecast for September, 2008 unregulated inflow into Lake Powell is 0.450 maf or 95% of the 30 year average. The observed volume for the April through July unregulated inflow period is 8.846 maf or 112% of average.

Hoover, Davis, and Parker historical gross energy figures come from PO&M reports provided by the Power and O&M Group, Boulder Canyon Operations, Bureau of Reclamation, Boulder City, Nevada. Questions regarding these historical energy numbers can be directed to Larry Karr at (702) 293-8094.

The operation of Lake Powell and Lake Mead in this 24 Month Study is pursuant to the December 2007 Record of Decision on Colorado River Interim Guidelines for Lower Basin Shortages and the Coordinated Operations of Lake Powell and Lake Mead (Interim Guidelines). The Interim Guidelines are available for download at http://www.usbr.gov/lc/region/programs/strategies/RecordofDecision.pdf

In April 2008, consistent with Section 6.B.3 of the Interim Guidelines, forecasted inflows to Lake Powell projected the September 30, 2008, Lake Powell elevation to be above 3,636 feet (the equalization level for water year 2008). This triggered Section 6.A (Equalization Tier) of the Interim Guidelines to govern the operation of Glen Canyon Dam for the remainder of water year 2008. Under the Equalization Tier, the annual release volume during water year 2008 from Glen Canyon Dam was 8.978 maf. The monthly release volume from Glen Canyon Dam for October 2008 was determined on August 27 by Reclamation's Upper Colorado (UC) and Lower Colorado (LC) Regions. This is a continuation of the steady flow experiment currently being conducted, consistent with the Final Environmental Assessment for Experimental Releases from Glen Canyon Dam, Arizona, 2008 through 2012.

In this study, the Calendar Year (CY) 2008 diversion for Metropolitan Water District of Southern California (MWD) is forecasted to be 0.842 maf. The CY 2008 diversion for the Central Arizona Project (CAP) is forecasted to be 1.505 maf. Consumptive use for Nevada above Hoover is forecasted to be 0.282 maf for CY 2008.

Due to declining Lake Mead elevations, Hoover's generator capacity is adjusted based on estimated effective capacity and plant availability. The estimated effective capacity is based on projected Lake Mead elevations. Unit capacity tests will be performed as the lake elevation changes in 2-foot increments. This study reflects these changes in the projections.

Current runoff projections into Lake Powell are provided by the National Weather Service's Colorado Basin River Forecast Center and are as follows: Observed unregulated inflow into Lake Powell for the month of September 2008 was 0.374 maf or 79% of the 30 year average. The forecast for October 2008 unregulated inflow into Lake Powell is 0.450 maf or 81% of the 30 year average. The observed volume for the April through July unregulated inflow period is 8.906 maf or 112% of average.

Hoover, Davis, and Parker historical gross energy figures come from PO&M reports provided by the Power and O&M Group, Boulder Canyon Operations, Bureau of Reclamation, Boulder City, Nevada. Questions regarding these historical energy numbers can be directed to Larry Karr at (702) 293-8094.

The operation of Lake Powell and Lake Mead in this 24 Month Study is pursuant to the December 2007 Record of Decision on Colorado River Interim Guidelines for Lower Basin Shortages and the Coordinated Operations of Lake Powell and Lake Mead (Interim Guidelines). Pursuant to the Interim Guidelines, the Upper Elevation Balancing Tier is the operational tier for water year 2009 for Glen Canyon Dam. The Interim Guidelines are available for download at http://www.usbr.gov/lc/region/programs/strategies/RecordofDecision.pdf.

The November 24-month study projects that the annual release volume from Glen Canyon Dam for water year 2009 will likely be 8.23 million acre-feet (maf) consistent with Section 6.B.1 of the Interim Guidelines.

In this study, the Calendar Year (CY) 2008 diversion for Metropolitan Water District of Southern California (MWD) is forecasted to be 0.887 maf. The CY 2008 diversion for the Central Arizona Project (CAP) is forecasted to be 1.513 maf. Consumptive use for Nevada above Hoover is forecasted to be 0.269 maf for CY 2008.

Due to declining Lake Mead elevations, Hoover’s generator capacity is adjusted based on estimated effective capacity and plant availability. The estimated effective capacity is based on projected Lake Mead elevations. Unit capacity tests will be performed as the lake elevation changes in 2-foot increments. This study reflects these changes in the projections.

Current runoff projections into Lake Powell are provided by the National Weather Service’s Colorado Basin River Forecast Center and are as follows: Observed unregulated inflow into Lake Powell for the month of October 2008 was 0.372 maf or 67% of the 30 year average. The forecast for November 2008 unregulated inflow into Lake Powell is 0.375 maf or 68% of the 30 year average.

Hoover, Davis, and Parker historical gross energy figures come from PO&M reports provided by the Power and O&M Group, Boulder Canyon Operations Office, Bureau of Reclamation, Boulder City, Nevada. Questions regarding these historical energy numbers can be directed to Larry Karr at (702) 293-8094.

To: All Annual Operating Plan Recipients

From: Lower Colorado Region
Boulder Canyon Operations Office
River Operations Group
Bruce Williams
P.O. Box 61470
Boulder City, NV 89006-1470
Phone: 702-293-8571

The operation of Lake Powell and Lake Mead in this 24 Month Study is pursuant to the December 2007 Record of Decision on Colorado River Interim Guidelines for Lower Basin Shortages and the Coordinated Operations of Lake Powell and Lake Mead (Interim Guidelines). Pursuant to the Interim Guidelines, the Upper Elevation Balancing Tier is the operational tier for water year 2009 for Glen Canyon Dam. The Interim Guidelines are available for download at http://www.usbr.gov/lc/region/programs/strategies/RecordofDecision.pdf.

The December 24-month study projects that the annual release volume from Glen Canyon Dam for water year 2009 will likely be 8.23 million acre-feet (maf) consistent with Section 6.B.1 of the Interim Guidelines.

In this study, the Calendar Year (CY) 2008 diversion for Metropolitan Water District of Southern California (MWD) is forecasted to be 0.894 maf. The CY 2008 diversion for the Central Arizona Project (CAP) is forecasted to be 1.535 maf. Consumptive use for Nevada above Hoover is forecasted to be 0.263 maf for CY 2008.

Due to declining Lake Mead elevations, Hoover’s generator capacity is adjusted based on estimated effective capacity and plant availability. The estimated effective capacity is based on projected Lake Mead elevations. Unit capacity tests will be performed as the lake elevation changes in 2-foot increments. This study reflects these changes in the projections.

Current runoff projections into Lake Powell are provided by the National Weather Service’s Colorado Basin River Forecast Center and are as follows: Observed unregulated inflow into Lake Powell for the month of November 2008 was 0.413 maf or 75% of the 30 year average. The forecast for December 2008 unregulated inflow into Lake Powell is 0.350 maf or 80% of the 30 year average.

Hoover, Davis, and Parker historical gross energy figures come from PO&M reports provided by the Power and O&M Group, Boulder Canyon Operations Office, Bureau of Reclamation, Boulder City, Nevada. Questions regarding these historical energy numbers can be directed to Larry Karr at (702) 293-8094.

Boulder City, NV 89006-1470
Phone: 702-293-8571

The operation of Lake Powell and Lake Mead in this January 2009 24-Month Study is pursuant to the December 2007 Record of Decision on Colorado River Interim Guidelines for Lower Basin Shortages and the Coordinated Operations of Lake Powell and Lake Mead (Interim Guidelines), and reflects the 2009 Annual Operating Plan (AOP). Pursuant to the Interim Guidelines, the Upper Elevation Balancing Tier is the operational tier for water year 2009 for Glen Canyon Dam. The Intentionally Created Surplus (ICS) Surplus condition is the criterion governing the operation of Lake Mead for calendar year 2009.

The Interim Guidelines are available for download at http://www.usbr.gov/lc/region/programs/strategies/RecordofDecision.pdf. The 2009 AOP is available for download at http://www.usbr.gov/uc/water/rsvrs/ops/aop/AOP09_final.pdf.

This January 24-Month Study projects that the annual release volume from Glen Canyon Dam for water year 2009 will be 9.326 million acre-feet (maf) consistent with Sections 6.B.3 and 6.A.1 of the Interim Guidelines. The Interim Guidelines contain a provision for an April adjustment to the operational parameters for Lake Powell when specific conditions occur. The operations reflected in this January 24-Month Study are consistent with this provision. It should be noted that such adjustments, as well as the coordinated operations in general, are sensitive to current inflow projections and may therefore change from month to month as new inflow projections are incorporated.

In this study, the Calendar Year (CY) 2009 diversion for Metropolitan Water District of Southern California (MWD) is forecasted to be 0.805 maf. The CY 2009 diversion for the Central Arizona Project (CAP) is forecasted to be 1.508 maf. Consumptive use for Nevada above Hoover is forecasted to be 0.323 maf for CY 2009.

Due to declining Lake Mead elevations, Hoover’s generator capacity is adjusted based on estimated effective capacity and plant availability. The estimated effective capacity is based on projected Lake Mead elevations. Unit capacity tests will be performed as the lake elevation changes in 2-foot increments. This study reflects these changes in the projections.

Current runoff projections into Lake Powell are provided by the National Weather Service’s Colorado Basin River Forecast Center and are as follows: Observed unregulated inflow into Lake Powell for the month of December 2008 was 0.344 maf or 79% of the 30 year average. The forecast for January 2009 unregulated inflow into Lake Powell is 0.350 maf or 86% of the 30 year average.

Hoover, Davis, and Parker historical gross energy figures come from PO&M reports provided by the Power and O&M Group, Boulder Canyon Operations Office, Bureau of Reclamation, Boulder City, Nevada. Questions regarding these historical energy numbers can be directed to Larry Karr at (702) 293-8094.

To: All Annual Operating Plan Recipients

From: Lower Colorado Region
Boulder Canyon Operations Office
River Operations Group
Bruce Williams
P.O. Box 61470
Boulder City, NV 89006-1470
Phone: 702-293-8571

The operation of Lake Powell and Lake Mead in this February 2009 24-Month Study is pursuant to the December 2007 Record of Decision on Colorado River Interim Guidelines for Lower Basin Shortages and the Coordinated Operations of Lake Powell and Lake Mead (Interim Guidelines), and reflects the 2009 Annual Operating Plan (AOP). Pursuant to the Interim Guidelines, the Upper Elevation Balancing Tier is the operational tier for water year 2009 for Glen Canyon Dam. The Intentionally Created Surplus (ICS) Surplus condition is the criterion governing the operation of Lake Mead for calendar year 2009.

The Interim Guidelines are available for download at http://www.usbr.gov/lc/region/programs/strategies/RecordofDecision.pdf. The 2009 AOP is available for download at http://www.usbr.gov/uc/water/rsvrs/ops/aop/AOP09_final.pdf.

This February 24-Month Study projects that the annual release volume from Glen Canyon Dam for water year 2009 will be 9.431 million acre-feet (maf) consistent with Sections 6.B.3 and 6.A.1 of the Interim Guidelines. The Interim Guidelines contain a provision for an April adjustment to the operational parameters for Lake Powell when specific conditions occur. The operations reflected in this February 24-Month Study are consistent with this provision. It should be noted that such adjustments, as well as the coordinated operations in general, are sensitive to current inflow projections and may therefore change from month to month as new inflow projections are incorporated.

In this study, the Calendar Year (CY) 2009 diversion for Metropolitan Water District of Southern California (MWD) is forecasted to be 0.851 maf. The CY 2009 diversion for the Central Arizona Project (CAP) is forecasted to be 1.506 maf. Consumptive use for Nevada above Hoover is forecasted to be 0.321 maf for CY 2009.

Due to declining Lake Mead elevations, Hoover's generator capacity is adjusted based on estimated effective capacity and plant availability. The estimated effective capacity is based on projected Lake Mead elevations. Unit capacity tests will be performed as the lake elevation changes in 2-foot increments. This study reflects these changes in the projections.

Current runoff projections into Lake Powell are provided by the National Weather Service's Colorado Basin River Forecast Center and are as follows: Observed unregulated inflow into Lake Powell for the month of January 2009 was 0.329 maf or 81% of the 30 year average. The forecast for February 2009 unregulated inflow into Lake Powell is 0.375 maf or 89% of the 30 year average. The forecast for the April through July unregulated inflow is projected to be 8.0 maf or 101% of average.

Hoover, Davis, and Parker historical gross energy figures come from PO&M reports provided by the Power and O&M Group, Boulder Canyon Operations Office, Bureau of Reclamation, Boulder City, Nevada. Questions regarding these historical energy numbers can be directed to Larry Karr at (702) 293-8094.

To: All Annual Operating Plan Recipients

From: Lower Colorado Region
Boulder Canyon Operations Office
River Operations Group
Bruce Williams
P.O. Box 61470
Boulder City, NV 89006-1470
Phone: 702-293-8571

The operation of Lake Powell and Lake Mead in this March 2009 24-Month Study is pursuant to the December 2007 Record of Decision on Colorado River Interim Guidelines for Lower Basin Shortages and the Coordinated Operations of Lake Powell and Lake Mead (Interim Guidelines), and reflects the 2009 Annual Operating Plan (AOP). Pursuant to the Interim Guidelines, the Upper Elevation Balancing Tier is the operational tier for water year 2009 for Glen Canyon Dam. The Intentionally Created Surplus (ICS) Surplus condition is the criterion governing the operation of Lake Mead for calendar year 2009.

The Interim Guidelines are available for download at http://www.usbr.gov/lc/region/programs/strategies/RecordofDecision.pdf. The 2009 AOP is available for download at http://www.usbr.gov/uc/water/rsvrs/ops/aop/AOP09_final.pdf.

This March 24-Month Study projects that the annual release volume from Glen Canyon Dam for water year 2009 will be 9.394 million acre-feet (maf) consistent with Sections 6.B.3 and 6.A.1 of the Interim Guidelines. The Interim Guidelines contain a provision for an April adjustment to the operational parameters for Lake Powell when specific conditions occur. The operations reflected in this March 24-Month Study are consistent with this provision. It should be noted that such adjustments, as well as the coordinated operations in general, are sensitive to current inflow projections and may therefore change from month to month as new inflow projections are incorporated.

Current runoff projections into Lake Powell are provided by the National Weather Service's Colorado Basin River Forecast Center and are as follows: Observed unregulated inflow into Lake Powell for the month of February 2009 was 0.331 maf or 79% of the 30 year average. The forecast for March 2009 unregulated inflow into Lake Powell is 0.575 maf or 87% of the 30 year average. The forecast for the April through July unregulated inflow is 7.80 maf or 98% of average.

In this study, the Calendar Year (CY) 2009 diversion for Metropolitan Water District of Southern California (MWD) is forecasted to be 0.860 maf. The CY 2009 diversion for the Central Arizona Project (CAP) is forecasted to be 1.501 maf. Consumptive use for Nevada above Hoover is forecasted to be 0.322 maf for CY 2009.

Due to declining Lake Mead elevations, Hoover's generator capacity is adjusted based on estimated effective capacity and plant availability. The estimated effective capacity is based on projected Lake Mead elevations. Unit capacity tests will be performed as the lake elevation changes in 2-foot increments. This study reflects these changes in the projections.

Hoover, Davis, and Parker historical gross energy figures come from PO&M reports provided by the Power and O&M Group, Boulder Canyon Operations Office, Bureau of Reclamation, Boulder City, Nevada. Questions regarding these historical energy numbers can be directed to Larry Karr at (702) 293-8094.

To: All Annual Operating Plan Recipients

From: Lower Colorado Region
Boulder Canyon Operations Office
River Operations Group
Bruce Williams
P.O. Box 61470
Boulder City, NV 89006-1470
Phone: 702-293-8571

The operation of Lake Powell and Lake Mead in this April 2009 24-Month Study is pursuant to the December 2007 Record of Decision on Colorado River Interim Guidelines for Lower Basin Shortages and the Coordinated Operations of Lake Powell and Lake Mead (Interim Guidelines), and reflects the 2009 Annual Operating Plan (AOP). Pursuant to the Interim Guidelines, the Upper Elevation Balancing Tier is the operational tier for water year 2009 for Glen Canyon Dam. The Intentionally Created Surplus (ICS) Surplus condition is the criterion governing the operation of Lake Mead for calendar year 2009.

The Interim Guidelines are available for download at http://www.usbr.gov/lc/region/programs/strategies/RecordofDecision.pdf. The 2009 AOP is available for download at http://www.usbr.gov/uc/water/rsvrs/ops/aop/AOP09_final.pdf.

The April 24-Month study projects the end of water year elevation at Lake Powell to be 3637.13 feet and Lake Mead to be 1092.04 feet. Since the projected end of water year elevation at Lake Powell is below the 2009 Equalization Elevation of 3639 feet and the projected end of water year elevation at Lake Mead is above elevation 1075 feet, Sections 6.B.1. and 6.B.4. of the Interim Guidelines provide for an annual release volume of 8.23 million acre-feet from Glen Canyon Dam during water year 2009.

Current runoff projections into Lake Powell are provided by the National Weather Service's Colorado Basin River Forecast Center and are as follows: Observed unregulated inflow into Lake Powell for the month of March 2009 was 0.468 maf or 71% of the 30 year average. The forecast for April 2009 unregulated inflow into Lake Powell is 0.900 maf or 91% of the 30 year average. The forecast for the April through July unregulated inflow is 7.20 maf or 91% of average.

In this study, the Calendar Year (CY) 2009 diversion for Metropolitan Water District of Southern California (MWD) is forecasted to be 0.880 maf. The CY 2009 diversion for the Central Arizona Project (CAP) is forecasted to be 1.513 maf. Consumptive use for Nevada above Hoover is forecasted to be 0.322 maf for CY 2009.

Due to declining Lake Mead elevations, Hoover's generator capacity is adjusted based on estimated effective capacity and plant availability. The estimated effective capacity is based on projected Lake Mead elevations. Unit capacity tests will be performed as the lake elevation changes in 2-foot increments. This study reflects these changes in the projections.

Hoover, Davis, and Parker historical gross energy figures come from PO&M reports provided by the Power and O&M Group, Boulder Canyon Operations Office, Bureau of Reclamation, Boulder City, Nevada. Questions regarding these historical energy numbers can be directed to Larry Karr at (702) 293-8094.

To: All Annual Operating Plan Recipients

From: Lower Colorado Region
Boulder Canyon Operations Office
River Operations Group
Bruce Williams
P.O. Box 61470
Boulder City, NV 89006-1470
Phone: 702-293-8571

The operation of Lake Powell and Lake Mead in this May 2009 24-Month Study is pursuant to the December 2007 Record of Decision on Colorado River Interim Guidelines for Lower Basin Shortages and the Coordinated Operations of Lake Powell and Lake Mead (Interim Guidelines), and reflects the 2009 Annual Operating Plan (AOP). Pursuant to the Interim Guidelines, the Upper Elevation Balancing Tier is the operational tier for water year 2009 for Glen Canyon Dam. The Intentionally Created Surplus (ICS) Surplus condition is the criterion governing the operation of Lake Mead for calendar year 2009.

The Interim Guidelines are available for download at http://www.usbr.gov/lc/region/programs/strategies/RecordofDecision.pdf. The 2009 AOP is available for download at http://www.usbr.gov/uc/water/rsvrs/ops/aop/AOP09_final.pdf.

The April 24-Month Study projected the end of water year elevation at Lake Powell to be below the 2009 Equalization Elevation of 3639 feet and the projected end of water year elevation at Lake Mead to be above elevation 1075 feet. Pursuant to Sections 6.B.1. and 6.B.4. of the Interim Guidelines, the annual release volume will be 8.23 million acre-feet from Glen Canyon Dam during water year 2009 which is reflected in the May 24-Month Study.

Current runoff projections into Lake Powell are provided by the National Weather Service's Colorado Basin River Forecast Center and are as follows: Observed unregulated inflow into Lake Powell for the month of April 2009 was 0.772 maf or 78% of the 30 year average. The forecast for May 2009 unregulated inflow into Lake Powell is 2.500 maf or 108% of the 30 year average. The forecast for the April through July unregulated inflow is 7.30 maf or 92% of average.

In this study, the Calendar Year (CY) 2009 diversion for Metropolitan Water District of Southern California (MWD) is forecasted to be 0.939 maf. The CY 2009 diversion for the Central Arizona Project (CAP) is forecasted to be 1.515 maf. Consumptive use for Nevada above Hoover is forecasted to be 0.319 maf for CY 2009.

Due to declining Lake Mead elevations, Hoover's generator capacity is adjusted based on estimated effective capacity and plant availability. The estimated effective capacity is based on projected Lake Mead elevations. Unit capacity tests will be performed as the lake elevation changes in 2-foot increments. This study reflects these changes in the projections.

Hoover, Davis, and Parker historical gross energy figures come from PO&M reports provided by the Power and O&M Group, Boulder Canyon Operations Office, Bureau of Reclamation, Boulder City, Nevada. Questions regarding these historical energy numbers can be directed to Larry Karr at (702) 293-8094.

To: All Annual Operating Plan Recipients

From: Lower Colorado Region
Boulder Canyon Operations Office
River Operations Group
Bruce Williams
P.O. Box 61470
Boulder City, NV 89006-1470
Phone: 702-293-8571

The operation of Lake Powell and Lake Mead in this June 2009 24-Month Study is pursuant to the December 2007 Record of Decision on Colorado River Interim Guidelines for Lower Basin Shortages and the Coordinated Operations of Lake Powell and Lake Mead (Interim Guidelines), and reflects the 2009 Annual Operating Plan (AOP). Pursuant to the Interim Guidelines, the August 24-Month Study projections of the January 1 system storage and reservoir water surface elevations set the operational tier for the coordinated operation of Lake Powell and Lake Mead. If the operating tier for the year is the Upper Elevation Balancing Tier, an adjustment may be made in April based on the April 24-Month Study projection of the September 30 system storage and reservoir water surface elevations.

The Upper Elevation Balancing Tier is the operational tier for water year 2009 for Glen Canyon Dam. The Intentionally Created Surplus (ICS) Surplus condition is the criterion governing the operation of Lake Mead for calendar year 2009.

The April 24-Month Study projected the end of water year elevation at Lake Powell to be below the 2009 Equalization Elevation of 3639 feet and the projected end of water year elevation at Lake Mead to be above elevation 1075 feet. Pursuant to Sections 6.B.1. and 6.B.4. of the Interim Guidelines, the annual release volume will be 8.23 million acre-feet from Glen Canyon Dam during water year 2009 which is reflected in this June 24-Month Study.

The Interim Guidelines are available for download at http://www.usbr.gov/lc/region/programs/strategies/RecordofDecision.pdf. The 2009 AOP is available for download at http://www.usbr.gov/uc/water/rsvrs/ops/aop/AOP09_final.pdf.

Current runoff projections into Lake Powell are provided by the National Weather Service's Colorado Basin River Forecast Center and are as follows: Observed unregulated inflow into Lake Powell for the month of May 2009 was 2.928 maf or 127% of the 30 year average. The forecast for June 2009 unregulated inflow into Lake Powell is 2.300 maf or 75% of the 30 year average. The forecast for the April through July unregulated inflow is 7.097 maf or 90% of average.

In this study, the Calendar Year (CY) 2009 diversion for Metropolitan Water District of Southern California (MWD) is forecasted to be 0.975 maf. The CY 2009 diversion for the Central Arizona Project (CAP) is forecasted to be 1.510 maf. Consumptive use for Nevada above Hoover is forecasted to be 0.323 maf for CY 2009.

Due to declining Lake Mead elevations, Hoover's generator capacity is adjusted based on estimated effective capacity and plant availability. The estimated effective capacity is based on projected Lake Mead elevations. Unit capacity tests will be performed as the lake elevation changes in 2-foot increments. This study reflects these changes in the projections.

Hoover, Davis, and Parker historical gross energy figures come from PO&M reports provided by the Power and O&M Group, Boulder Canyon Operations Office, Bureau of Reclamation, Boulder City, Nevada. Questions regarding these historical energy numbers can be directed to Larry Karr at (702) 293-8094.

Boulder City, NV 89006-1470
Phone: 702-293-8571

The operation of Lake Powell and Lake Mead in this August 2009 24-Month Study is pursuant to the December 2007 Record of Decision on Colorado River Interim Guidelines for Lower Basin Shortages and the Coordinated Operations of Lake Powell and Lake Mead (Interim Guidelines), and reflects the 2009 Annual Operating Plan (AOP). Pursuant to the Interim Guidelines, the August 24-Month Study projections of the January 1 system storage and reservoir water surface elevations set the operational tier for the coordinated operation of Lake Powell and Lake Mead. If the operating tier for the year is the Upper Elevation Balancing Tier, an adjustment may be made in April based on the April 24-Month Study projection of the September 30 system storage and reservoir water surface elevations.

The Upper Elevation Balancing Tier is the operational tier for water year 2009 for Glen Canyon Dam. The Intentionally Created Surplus (ICS) Surplus condition is the criterion governing the operation of Lake Mead for calendar year 2009.

The April 24-Month Study projected the end of water year elevation at Lake Powell to be below the 2009 Equalization Elevation of 3639 feet and the projected end of water year elevation at Lake Mead to be above elevation 1075 feet. Pursuant to Sections 6.B.1. and 6.B.4. of the Interim Guidelines, the annual release volume will be 8.23 million acre-feet from Glen Canyon Dam during water year 2009 which is reflected in this August 24-Month Study.

This 24-Month Study currently projects Lake Powell's 2010 end of water year elevation to be above the 2010 Equalization Elevation of 3642 feet under an 8.23 maf release. Pursuant to the Interim Guidelines, an April 2010 adjustment is projected such that operating tier at Lake Powell would shift to the Equalization Tier during 2010. Based on analysis of inflow scenarios, currently the probability of an April adjustment in 2010 is approximately 70 percent.

The Interim Guidelines are available for download at http://www.usbr.gov/lc/region/programs/strategies/RecordofDecision.pdf. The 2009 AOP is available for download at http://www.usbr.gov/uc/water/rsvrs/ops/aop/AOP09_final.pdf.

Current runoff projections into Lake Powell are provided by the National Weather Service's Colorado Basin River Forecast Center and are as follows: Observed unregulated inflow into Lake Powell for the month of July 2009 was 1.401 maf or 90% of the 30 year average. The forecast for August 2009 unregulated inflow into Lake Powell is 0.550 maf or 90% of the 30 year average. The observed April through July unregulated inflow is 7.814 maf or 99% of average.

In this study, the Calendar Year (CY) 2009 diversion for Metropolitan Water District of Southern California (MWD) is forecasted to be 1.043 maf. The CY 2009 diversion for the Central Arizona Project (CAP) is forecasted to be 1.563 maf. Consumptive use for Nevada above Hoover is forecasted to be 0.318 maf for CY 2009.

Due to declining Lake Mead elevations, Hoover's generator capacity is adjusted based on estimated effective capacity and plant availability. The estimated effective capacity is based on projected Lake Mead elevations. Unit capacity tests will be performed as the lake elevation changes in 2-foot increments. This study reflects these changes in the projections.

Hoover, Davis, and Parker historical gross energy figures come from PO&M reports provided by the Power and O&M Group, Boulder Canyon Operations Office, Bureau of Reclamation, Boulder City, Nevada. Questions regarding these historical energy numbers can be directed to Larry Karr at (702) 293-8094.

Boulder City, NV 89006-1470
Phone: 702-293-8571

The operation of Lake Powell and Lake Mead in this July 2009 24-Month Study is pursuant to the December 2007 Record of Decision on Colorado River Interim Guidelines for Lower Basin Shortages and the Coordinated Operations of Lake Powell and Lake Mead (Interim Guidelines), and reflects the 2009 Annual Operating Plan (AOP). Pursuant to the Interim Guidelines, the August 24-Month Study projections of the January 1 system storage and reservoir water surface elevations set the operational tier for the coordinated operation of Lake Powell and Lake Mead. If the operating tier for the year is the Upper Elevation Balancing Tier, an adjustment may be made in April based on the April 24-Month Study projection of the September 30 system storage and reservoir water surface elevations.

The Upper Elevation Balancing Tier is the operational tier for water year 2009 for Glen Canyon Dam. The Intentionally Created Surplus (ICS) Surplus condition is the criterion governing the operation of Lake Mead for calendar year 2009.

The April 24-Month Study projected the end of water year elevation at Lake Powell to be below the 2009 Equalization Elevation of 3639 feet and the projected end of water year elevation at Lake Mead to be above elevation 1075 feet. Pursuant to Sections 6.B.1. and 6.B.4. of the Interim Guidelines, the annual release volume will be 8.23 million acre-feet from Glen Canyon Dam during water year 2009 which is reflected in this July 24-Month Study.

The Interim Guidelines are available for download at http://www.usbr.gov/lc/region/programs/strategies/RecordofDecision.pdf. The 2009 AOP is available for download at http://www.usbr.gov/uc/water/rsvrs/ops/aop/AOP09_final.pdf.

Current runoff projections into Lake Powell are provided by the National Weather Service's Colorado Basin River Forecast Center and are as follows: Observed unregulated inflow into Lake Powell for the month of June 2009 was 2.709 maf or 88% of the 30 year average. The forecast for July 2009 unregulated inflow into Lake Powell is 1.130 maf or 72% of the 30 year average. The forecast for the April through July unregulated inflow is 7.550 maf or 95% of average.

In this study, the Calendar Year (CY) 2009 diversion for Metropolitan Water District of Southern California (MWD) is forecasted to be 1.000 maf. The CY 2009 diversion for the Central Arizona Project (CAP) is forecasted to be 1.518 maf. Consumptive use for Nevada above Hoover is forecasted to be 0.322 maf for CY 2009.

Due to declining Lake Mead elevations, Hoover's generator capacity is adjusted based on estimated effective capacity and plant availability. The estimated effective capacity is based on projected Lake Mead elevations. Unit capacity tests will be performed as the lake elevation changes in 2-foot increments. This study reflects these changes in the projections.

Hoover, Davis, and Parker historical gross energy figures come from PO&M reports provided by the Power and O&M Group, Boulder Canyon Operations Office, Bureau of Reclamation, Boulder City, Nevada. Questions regarding these historical energy numbers can be directed to Larry Karr at (702) 293-8094.
