The gas-fired electric generating stations proposed for this project to pump water over the continental divide, and other divides of high elevation, will further aggravate the problems of a warming atmosphere on the water supplies of the globe. This cumulative impact must also be analyzed in this EIS for its contribution to diminishing water supplies over time.

Conclusion

It is our hope The Corps will use this opportunity to initiate a programmatic basin-wide EIS and not perform yet another piece-meal EIS that adds another layer of vulnerability to an already over-stretched water delivery system. The Colorado River system, as guided by the Colorado River Compact, is on the brink of collapse, as are the growing number of river reaches now designated as critical habitat. It's time that the federal government exert the leadership necessary to assure the sustainable management of the Colorado River in the 21st century by developing a basin-wide strategy that puts conservation first and resists all efforts to extract more water from this over-taxed river system.

Sincerely,
John Weisheit

WATER TALKS: State might partner with Mexico

Copyright (c) Las Vegas Review-Journal

Shared investment in desalination plants just one proposal being discussed

By HENRY BREAN

LAS VEGAS REVIEW-JOURNAL

If Mexico begins harvesting drinking water from the sea some day, Nevada also might get a taste.

Talks are progressing among officials from both sides of the border over new joint efforts to squeeze more water out of the arid region.

One idea being discussed is U.S. investment in Mexican desalination plants along the Pacific Ocean and Gulf of California.

The jointly funded plants would supply drinking water to growing coastal communities south of the border and thirsty U.S. cities, including Las Vegas.

Mexico might be the new frontier for the seven Western states that share the drought-stricken Colorado River, said Pat Mulroy, general manager of the Southern Nevada Water Authority.

Early this week, Mulroy traveled to San Diego for two days of talks with state and federal officials from both countries.

She said "jointly funded desalt projects in Mexico" are only one element of the discussions. Nevada might find additional opportunities to partner with Mexico on conservation initiatives, such as lining leaky irrigation canals south of the border to save water diverted from the Colorado.

Mexican officials also are interested in cooperating to protect the delta wetlands where the diminished river trickles into the Gulf of California.

"This administration has a huge environmental agenda," Mulroy said, referring not to the Obama White House but to the government of Mexican President Felipe Calderon.

Desalination holds the most promise for Nevada.

For example, if Mexican officials built a desalination plant for the growing city of Rosarito, south of Tijuana, the Southern Nevada Water Authority could buy a piece of that plant in exchange for a portion of Mexico's allocation of Colorado River water, Mulroy said.

Water wholesalers in Phoenix and Los Angeles could strike similar deals, she said.

The major problem with the arrangement, however, is it works only if the Colorado River has enough water to allow an exchange.

"If there's nothing in the river, there's nothing to swap," Mulroy said.

The cross-border water talks were convened in March 2008 by the International Boundary and Water Commission, a bilateral panel that administers the boundary and water treaties between the two nations.

Representatives have been meeting every other month or so to discuss the development of new water resources, the conservation of existing resources, and related operational and environmental issues.

The discussions were dealt a blow in September when the boundary and water commission's top two men, U.S. commissioner Carlos Marin and Mexican commissioner Arturo Herrera, were killed in a plane crash.

This week's meeting was the second for Mulroy, who joined the talks for the first time earlier this year.

She said the meeting held Tuesday and Wednesday in San Diego included officials from the U.S. departments of State and Interior, their Mexican counterparts, and representatives from the seven western states that share the Colorado River.

The boundary and water commission and the Mexican states of Sonora and Baja also were represented, she said.

Under a 1944 treaty, Mexico receives 1.5 million acre-feet of water a year from the Colorado River. That's five times more than Nevada's share, but only about one third of what California gets and about half of what Arizona receives.

There is no set schedule or deadline for the talks, but everyone involved is hoping for meaningful progress "sooner rather than later," said Sally Spener, spokeswoman for the U.S. section of the boundary and water commission.

Ongoing drought on the Colorado is driving the talks.

"We're all assuming the worst. There's a real sense of urgency in the room," Mulroy said.

But there are multiple treaties and a tensely managed international border in play as well, so Mulroy said no one should expect results too quickly.

"It's going to take an enormous amount of work," she said. "We're still a ways away."

Our Water Supply, Down the Drain

Washington Post Op-Ed [Linked here](#)

By Robert Glennon

Sunday, August 23, 2009

TUCSON

In the United States, we constantly fret about running out of oil. But we should be paying more attention to another limited natural resource: water. A water crisis is threatening many parts of the country -- not just the arid West.

In 2008, metro Atlanta (home to nearly 5 million people) came within 90 days of seeing its principal water supply, Lake Lanier, dry up. Rainstorms eased the drought, but last month a federal judge ruled that Georgia may no longer use the lake as a municipal supply. The state is now scrambling to overturn that ruling; but Alabama and Florida will oppose Georgia's efforts.

In Florida, excessive groundwater pumping has dried up scores of lakes. In South Carolina, a paper company recently furloughed hundreds of workers because low river flows prevented the company from discharging its wastewater. That state's battle with North Carolina over the Catawba River has reached the U.S. Supreme Court. Water has become so contentious nationwide that more than 30 states are fighting with their neighbors over water.

Lake Superior, the largest of the Great Lakes, is too shallow to float fully loaded freighters, dramatically increasing shipping costs. North of Boston, the Ipswich River has gone dry in five of the past eight years. In 2007, the hamlet of Orme, Tenn., ran out of water entirely, forcing it to truck in supplies from Alabama.

Droughts make matters worse, but the real problem isn't shrinking water levels. It's population growth. Since California's last major drought ended in 1992, the state's population has surged by a staggering 7 million people. Some 100,000 people move to the Atlanta area every year. Over the next four decades, the country will add 120 million people, the equivalent of one person every 11 seconds.

More people will put a huge strain on our water resources, but another problem comes in something that sounds relatively benign: renewable energy, at least in some forms, such as biofuels. Refining one gallon of ethanol requires four gallons of water. This turns out to be a drop in the bucket compared with how much water it takes to grow enough corn to refine one gallon of ethanol: as much as 2,500 gallons.

In the United States, we've traditionally engineered our way out of water shortages by diverting more from rivers, building dams or drilling groundwater wells. But many rivers, including the Colorado and the Rio Grande, already dry up each year. The dam-building era from the 1930s to the 1960s tamed so many rivers that only 60 in the country

remain free-flowing. Meanwhile, we're pumping so much water from wells that the levels in aquifers are plummeting. We're running out of technological fixes.

Some dreamers gaze upon distant sources of water and imagine that the problem is solved. Plans to divert water from rivers in British Columbia or tow icebergs from Alaska periodically arise. An entrepreneur in Colorado, Aaron Million, recently proposed a \$4 billion, 400-mile pipeline to transport water from the Flaming Gorge Reservoir, located on the Green River in Wyoming and Utah, to Denver and Colorado Springs. But the dreamers tend not to address the immense costs, significant environmental objections or regulatory nightmares associated with such grandiose proposals.

More viable solutions include desalination of ocean water, reuse of municipal waste and aggressive conservation strategies. But none of these is a cure-all. Desalination is expensive, burns energy and generates a thorny waste problem. Nor is reclaiming water -- that is, reusing water from the sewage system -- a silver-bullet answer to the crisis. Aside from the major "yuck" factor associated with the idea of potable toilet water, it's also quite expensive, requiring a set of pipes that is completely separate from the drinking-water system.

Conservation does work. In places such as San Antonio, Albuquerque, Tucson and Long Beach, Calif., aggressive conservation programs have reduced consumption dramatically. But it's not enough.

We need a new water policy in the United States. Americans do not pay the real cost of the water that we use. In fact, we don't pay for water at all. The check that citizens write to their municipal water department or private water company covers only the cost of service, plus a small profit for the private company. There is no charge for the water itself.

Last summer, as the price of gas inched up over \$4 a gallon, Toyota dealers couldn't keep fuel-efficient Priuses in stock. We should apply that pricing lesson if we want to conserve water, using increasing block rates to discourage profligate water use. Tucson does that and adds a surcharge for excessive use in the summer, when water mostly goes to fill swimming pools and irrigate landscaping.

The idea of charging for water offends many people who think that would be like charging for air. Is it immoral to extract fees for an essential resource? Precisely because water is a public -- and exhaustible -- resource, the government has an obligation to manage it wisely.

Think of our water supply as a giant milkshake, and think of each demand for water as a straw in the glass. Most states permit a limitless number of straws -- and that has to change.

The West, one of the thirstiest parts of the country, is developing a system that should lead the way: the use of market forces to reallocate water. In eastern Oregon, along the Middle Fork of the John Day River, the Oregon Water Trust persuaded third-generation ranchers Pat and Hedy Voigt to turn off their irrigation system each year from July 20

until the end of the growing season. The 6.5 million gallons per day that would have been diverted to grow alfalfa now augment river flows and improve the habitat of endangered salmon and steelhead trout. The \$700,000 paid to the Voigts allowed them to make substantial on-farm improvements.

Taking their straw out of the glass is one step toward keeping us from getting parched.

Once a marvel, Soviet-era dam becomes emblem of Russia woes

Times of Malta [Linked here](#)

By Alissa de Carbonnel, AFP

It was a Soviet engineering marvel, a concrete monolith soaring above the canyon, harnessing the might of the Yenisei River to generate power for a swath of southern Siberia.

Today, the dam forming the backbone of the Sayano-Shushenskaya hydroelectric plant is an equally potent symbol of decline, a vital energy source transformed into a watery graveyard and painful reminder of Russia's infrastructure woes.

"We never imagined something like this could happen," said Nina Moskvitinka, 62, a resident of the town of Cheryomushky where many of the station's many hundreds of employees reside.

She recalled the town's pride when construction began in the 1960s on the plant, Russia's largest and among the most powerful on earth with capacity of 6.4 million kilowatts an hour, three times that of the fabled US Hoover Dam.

"It is frightening, of course. But we have to bury our fear," Ms Moskvitinka said. "What would we do without the plant? It is the heart of the region."

That heart however failed spectacularly when a technical mishap during repairs triggered a surge of water pressure that ruptured a generator, destroyed retaining walls and sent water flooding into the turbine hall. A large portion of that hall, at the base of the dam, is now a yawning cacophony of twisted metal, ruptured pipes and fractured slabs of concrete poured when the Soviet Union was at the zenith of its technical prowess. And much of it is under as much as 20 metres of water, where the bodies of 56 plant workers still missing after the accident may be located.

Nineteen people have been confirmed dead in the accident.

"The weight of the water was so heavy and so intense that in mere minutes it surged up 20 metres," said Andrei Mitrofanov, the plant's head engineer who is now helping direct search and rescue efforts.

"It was such a powerful blow," he said, pointing upwards to where there was once a ceiling above the station's turbine room.

"I cannot describe it anymore. I don't want to think about it."

His words are almost inaudible above the screech of electric saws slicing through heaps of metal, part of the effort by 2,000 helmeted search and rescue workers to locate survivors, salvage corpses and clean up the surreal mess.

Prime Minister Vladimir Putin acknowledged that the catastrophe at the Sayano-Shushenskaya hydroelectric plant represented a much more extensive problem with the infrastructure Russia inherited from the Soviet Union. "There is a need to conduct serious inspections of all strategic and vitally important objects of infrastructure," Mr Putin said at a government meeting in Moscow last week.

"The recent tragic events at the Sayano-Shushenskaya hydroelectric plant showed with all clarity how much more we should do to increase reliability of technical constructions on the whole."

But as rescuers continue their work at the stricken plant, water continues to flow unchecked through the wrecked and now silent turbines and officials say it will be several years before the facility can be fully repaired.

Three rescue boats ply slowly through the lake formed at the foot of the 245-metre dam, fielding teams of divers who have been searching round the clock for survivors in the near-freezing water.

"They had no safety plan," said Natalya, one of around 1,500 local residents who turned up in a Cheryomushky public square for the funeral of six workers killed in the disaster.

"People did not know where to run. It is a terrible situation and we will not forget it soon."

As investigators begin to probe the technical reasons for the accident, witnesses and survivors recount their own experiences.

One man says he was at the plant the moment the accident occurred and regained consciousness only to find himself washed up along the riverbank several kilometers downstream from the dam.

Another says he saw an "elephant-sized" rotor weighing several tonnes burst through the thick steel encasing of the wrecked turbine and fly into the air, followed by a wall of water that came crashing down into the chamber. Another local woman present at the funeral, Lyuba Odeyeva, said her son Igor, an employee at the station, was on duty when the accident occurred but declined to attend the ceremony in order to help with the search effort.

"He swam out with three others," Ms Odeyeva explained. "They were in bad shape after the cold water. But he only took the time to come home and have a shower before going back to work to assist in the search," she said.

Soviet-era banners still standing along the road to the Sayano-Shushenskaya plant boast with communist-period triumphalism of what was then the facility's state-of-the-art technology and extraordinary power-generating capacity.

Top officials on the scene this week however, notably Emergency Situations Minister Sergei Shoigu, are only able to offer reassurances that the once-great power station will eventually be restored to its former glory. They have not however, explained to the satisfaction of inhabitants of the region served by the plant, how the energy shortfall will be made up in the meantime without a dramatic increase in electricity prices.

Eyes Turn to Mexico as Drought Drags On

New York Times

By RANDAL C. ARCHIBOLD

[Linked here](#)

YUMA, Ariz. — The Southwest drought has reached the point where even drain water is coveted.

Beginning nearly 40 years ago, the briny runoff from the "salad bowl" of southern Arizona, some of the most productive farmland in the nation, has been channeled into an arid plain of the Sonoran desert in Mexico.

It is an engineered solution to the vexing problem of keeping the nearby Colorado River free of agricultural wastewater too heavy in salt compounds for drinking water and other uses. An accidental result south of the border has been a thriving man-made wetland, the largest in the river's delta, a key stopover for migratory birds and home to a bounty of endangered and threatened species.

But now the protracted drought in the Southwest has led water managers to rethink the possibilities for the wastewater, placing the preservation of the wetland, the Ciénega de Santa Clara, at the center of a delicate balancing act between the growing thirst of California, Nevada and Arizona and the delta's ecology.

The biggest challenge involves a plan to take some of the wastewater, purify it at a desalination plant and direct it to other uses under a treaty that proportions the Colorado River among the Western states and Mexico.

The desalination plant, here in Yuma, about 30 miles north of the Ciénega, is a \$256 million federal facility that although completed 17 years ago, has never run beyond two brief trial periods. It has been long maligned as among the federal government's biggest white elephants, a plant essentially mothballed from the start by budget and technical difficulties and the vagaries of the Colorado River supply.

But so pressed is the region for water that the plant is getting another look. The water the plant could produce — about 100,000 acre feet per year, enough to supply the needs of a half-million people — would allow Western states to preserve that quantity upriver for their use rather than send it to Mexico, as is done now to fulfill treaty requirements.

Like a family tired of fighting at reunions, the effort to revive the plant has brought a concerted effort by the United States, Mexico and some environmentalists on both sides of the border — normally acrimonious over big water decisions — to get along.

A pact among the governments, environmental groups and water agencies calls for a test run of the plant at one-third of its capacity while substituting the lost water flows to the Ciénega through well water and other means.

"This is huge," said Jennifer Pitt of Environmental Defense, a group helping to negotiate the agreement and not often complimentary toward big water interests. "This is the first time anything like this has ever happened."

But other environmental groups are wary, even quietly exploring the possibility of bringing the test to a halt. The government is expected to make a final decision on the test in the coming weeks, with a start date projected early next year.

Critics voice skepticism that the water agencies would make long-term commitments to protect the Ciénega and bristle at the fact that the United States has completed an environmental review of the desalting project without a detailed study of the environmental consequences on the Ciénega.

The United States, through the Bureau of Reclamation, which operates the plant and oversees the distribution of Colorado River water in the West, maintains that there is no legal obligation to do so because the Ciénega is in Mexico.

That environmental review, released Aug. 26, concluded that the plant would pose no significant harm to the environment around it.

"The failure of that plant to run for many years has allowed this tremendous wetlands to survive," said Kieran Suckling, executive director of the Center for Biological Diversity, a Tucson-based environmental group. "To put that water at risk is of tremendous concern."

Although they decline to make any formal long-term commitments to protect the wetland without the results of the test, United States water managers said in interviews that they would like to maintain them.

“This is starting to put pressure on everybody to resolve the issue of the Ciénega and keep the Ciénega in water,” said Pat Mulroy, general manager of the agency that supplies Las Vegas’s water. “There is a little pull and tug to see how much water the Ciénega needs. There is an assumption it needs all the water currently going there and an assumption we have to replace it in its entirety. Somewhere in there is probably a middle road.”

The plant would draw briny water from an agricultural drain that runs next to it on its way to Mexico, providing the wetland’s lifeblood. The drain was built in the early 1970s as a temporary solution to a problem that severely strained relations between the United States and Mexico.

On its 1,450-mile journey from the Rockies to the Gulf of California, the Colorado River decreases in might as Western states tap it, while increasing in salt compounds, partly because of runoff from rocks and soil but also from the waste of some of the largest farming operations in the world.

Mexican farms downriver began suffering and, after heated negotiations, the United States agreed to improve the quality of the water delivered to Mexico by desalinating some of it at the border.

While the plant was being planned and built, the federal government attacked one of the main culprits of the salt problem, by diverting farm wastewater near Yuma south onto sparsely populated land in Mexico.

End result: the Ciénega.

At first blush, the Ciénega seems run of the mill, tule grass the height of a person or taller emerging from a labyrinth of streams and ponds under a brick-oven sun.

But listen closely, Juan Butrón Méndez, a Mexican naturalist advised one recent morning. A trilling sound like a referee not blowing hard enough on his whistle. A willow flycatcher, one of the endangered birds that call this wetland home, was beckoning from the weeds.

“That is something you may not hear anymore if the United States is not careful,” Mr. Méndez said, standing at the edge of the wetland, whose other endangered residents include the Yuma clapper rail and desert pupfish.

Environmental groups, with researchers from the University of Arizona, have begun a more detailed study of the Ciénega, to understand better its water needs and ecology. Every month, researchers from Arizona and Mexico head out in boats to plant and check monitors and other equipment among the thick grass and turbid water.

“If we lose this, we don’t know what will happen to the birds,” said Francisco Zamora Arroyo, a geographer with the Sonoran Institute, a Tucson-based nonprofit organization, who studies the Colorado River Delta. “Some will be able to reach other marshes, some won’t.”

But Mr. Zamora, on a rocking skiff helping colleagues plunge measurements into the swamp, said he sensed a shift in attitude on both sides of the border.

“This comes at a time when we have a lot of hope,” he said. “We have been doing a lot of research in the last 10 years here. At least this time there is a dialogue.”

Interior official: Dry climate puts pressure on Colorado River

Feds to study use of the Colorado

By GARY HARMON

The Grand Junction Daily Sentinel

[Linked here](#)

[Reclamation press release](#)

Population growth, drought, changing environmental needs and climate change are posing new issues in managing the Colorado River Basin.

To deal with them, the U.S. Department of the Interior is conducting a water-supply and demand study of the basin from Wyoming and Colorado to California, an Interior Department official said Friday at the Colorado River District’s water seminar.

The exact form of the study will be shaped by the U.S. Bureau of Reclamation and a variety of stakeholders from around the basin, said Anne Castle, assistant secretary for water and science.

“We all know that every drop of the Colorado River is allocated,” Castle said.

That makes it all the more important to put the water in the river to the best use as the population of people dependent on it grows and the amount of water it carries shrinks as a result of drought and climate change.

About 25 million people from Denver to Los Angeles depend on the river for water.

The Bureau of Reclamation will fund \$1 million, and various participating agencies will contribute money or in-kind services.

“The Colorado River Basin states are making great strides in working together to address our common challenges,” said Harris Sherman, executive director of the Colorado Department of Natural Resources. “We need to be pro-active in developing solutions, and this study is an important step in that direction.”

Castle, who lived for a time in the 1970s on Orchard Mesa, most recently was a partner in the Denver law firm of Holland & Hart.

In her new position, she oversees Reclamation and the U.S. Geological Survey.

The Interior Department also will study the Yakima River Basin in south central Washington and the Milk and St. Mary river systems in north central and southern Montana, Castle said.

Feds: Not Enough Green River Water For Pipeline

BEN NEARY

Associated Press Writer [Linked here](#)

CHEYENNE, Wyo. (AP) - The U.S. Bureau of Reclamation's initial assessment of how much water could be diverted in coming decades from the Green River basin in Wyoming is far less than the amount a private entrepreneur has applied to draw for a planned pipeline to Colorado, agency officials said.

Developer Aaron Million, of Fort Collins, Colo., has proposed building a private pipeline to carry up to 250,000 acre feet of water a year from the Green River. He proposes to move 225,000 acre feet to Colorado's Front Range and 25,000 acre feet to eastern Wyoming.

An acre foot is about 325,000 gallons. Million's \$3 billion proposal has drawn fierce opposition in southwestern Wyoming. Sweetwater County and the cities of Green River and Rock Springs are pooling hundreds of thousands of dollars to fight the project, citing concerns about its effect on fishing and recreation in the area.

The U.S. Army Corps of Engineers is working on an environmental impact study on the likely effects of building the pipeline. Officials say the study should determine exactly how much water is available.

The Bureau of Reclamation, which manages Flaming Gorge Reservoir, conducted a preliminary study in early 2007 in response to Million's proposal to draw water from the reservoir and the river upstream. It pegged the basin's annual water availability at 85,000 acre feet less than what Million proposes to draw.

The study found that up to 165,000 acre feet of water could be drawn from the reservoir each year through 2049 while still allowing enough water to generate hydropower and to meet the needs of endangered fish species downstream.

Drawing 165,000 acre feet a year over 40 years would draw the level of Flaming Gorge Reservoir down from its current elevation of 6,030 feet above sea level to just above 5,900 feet, the study found. According to bureau figures, the reservoir has a surface

area of nearly 30,000 acres when its elevation is at 6,000 feet and its surface area would drop to just under 11,000 acres at the 5,900 foot level.

After 2050, as development in Wyoming increases, the bureau study projected Flaming Gorge Reservoir could sustain an annual diversion rate of 120,000 acre feet. The agency is updating that draft analysis, and agency officials say their projections of the amount of available water may well go lower.

Malcolm Wilson, chief of the Water Resources Group for the Bureau of Reclamation in Salt Lake City, said the bureau's draft study doesn't support Million's plans.

"I think Mr. Million's aware of our numbers, and we're not sure where he gets his," Wilson said. "Certainly what we saw in this study, as you can see, does not support his numbers. But maybe he has something else."

Increased development in Wyoming, climate change and the needs of endangered species downstream all could reduce the agency's final conclusions of how much water would be available for the pipeline, said Dave Trueman, head of the Bureau of Reclamation's Resources Management Division in Salt Lake City.

Million said he believes the bureau's draft water availability report is extremely conservative. He said his own consulting engineers have determined that the Green River basin can support the pipeline project.

"I think the important thing from the public's standpoint is that there's a major surplus of water in the system, above the needs of endangered species, boating and all those things," Million said Wednesday. "And that will either be proven out, or not, in the (environmental review) process."

Million said the amount of water he applied for at first is not an absolute, but an amount he used to start the application process. He said he's considering scaling back his application for water, but hasn't done so yet. He has said that he would cancel the project if its environmental impacts couldn't be mitigated.

Although Million is seeking to draw water in Wyoming, the water itself would come from the state of Colorado's share under the Colorado River Compacts — formal agreements among Western states over how to allocate water on the river system.

Jeff Fassett, a former Wyoming state engineer, is consulting with Million on the diversion project. He said the amount of water available for the pipeline would decrease as Wyoming uses more of its share of water on the Green River. Million anticipates being able to divert higher amounts of water until it's needed elsewhere, Fassett said.

Fassett said that project developers believe that 250,000 acre feet of water per year, "would certainly be available for a great number of years."

Colorado River and U.S. Bass Sexually Confused and Polluted

Dick Kamp/Wick Communications Environmental Liaison [Linked here](#)

A nationwide study of sexual fish aberrations by the US Geological Survey (USGS) found that 40% of smallmouth bass and 1/3 of largemouth bass sampled in the Colorado River had male organs with partially developed female organs inside. This phenomenon, along with occasional female organ growth in males, is called "intersex" and it can be caused by various pollutants, drugs, and cosmetic and household products that impact hormones activity in animals and humans that are collectively called endocrine disruptors or endocrine active compounds (EACs).

There was no consistent linkage in the study between intersex occurrence and, mercury, pesticides, and other metals and chlorinated pollutants monitored in the fish and rivers nationwide and it made no guesses as to why the sexual aberrations occurred where they did. Some of the highest intersex percentages were found in the southeastern U.S.

3080 fish at 111 sites nationwide were examined and all had contaminants in their bodies. Five of the sampling sites along rivers found no detectible contamination. A third of all male smallmouth bass and a fifth of all male largemouth bass were intersex.

40% of largemouth bass examined at Imperial Dam and at the Gila River in Hayden were intersex. 70% of smallmouth bass in the upper Colorado in the Yampa River were intersex. Among other species examined, the only intersex carp found nationwide was at Willow Beach, below Lake Mead. One intersex channel catfish was found in the lower Colorado basin in the Gila River at Phoenix, and one at each of three sites in the upper Colorado.

Lead author of the report, JoEllen Hincke, of the USGS Columbia Missouri Environmental Research Lab said that the report "is the first synthesis of USGS efforts to measure contamination in water, fish and intersex occurrence." The Colorado River data was from 2003, and nationwide it covered the period 1995-2004.

The US Center for Disease Control, and governments worldwide, have gathered substantial evidence that human health is impacted by exposure to hormone-disrupting chemicals. Pregnant women and babies, particularly boys, are considered at highest potential risk but serious conditions affecting women such as infertility, ovarian damage, and adult male hormonal disruption are considered to be likely impacts of the chemicals.

Wastewater discharges into sources of drinking water are one major pathway of contamination that may include bodily discharges of concentrations of chemicals or from pollutants themselves being discharged into surface and groundwater.

USGS Columbia lab biologist Diana Papoulias, has been studying fish exposure to two common hormonal disruptors in the lab and said that very low exposure of 2-5 parts per trillion have caused changes in fish. She added that differences in age, water temperature a large variety of pollutants could be involved in fish intersex occurrence that was first encountered in the 1930s.

Papoulias points out that some of the chemicals present in consumer products are of high enough concern in European Union, Japan and the UK that they are sometimes prohibited or are closely regulated for discharges. "One could make the case that biological monitoring could include placing fish in cages below major sewage discharge points to waterways to see how they are affected," said Papoulias.

The Colorado River Regional Sewage Coalition CRRSCO has been concerned with the presence of endocrine disruptors, particularly since Colorado River water is consumed by millions in Arizona, Nevada, and California. One member of CRRSCO, Southern Nevada Water Authority (SNWA) has been testing for chemicals in Lake Mead and Las Vegas drinking water. Monitoring has shown that levels of a number of endocrine disruptors exist in drinking water for Las Vegas at substantial percentages of levels that are detected in Lake Mead near the sewage outfall. For example, the popular insect repellent DEET and the herbicide atrazine have been detected (at low unregulated levels in parts per trillion) when sampled in both the lake and potable Las Vegas drinking water.

SNWA is also assisting Lake Havasu City Water Resources Coordinator Doyle Wilson to sample for endocrine disruptors in Lake Havasu as well as in water supply wells and a huge sewage storage repository 2 1/2 miles from the lake constructed within the last two years. Doyle said that his principal concern with the USGS study is that the fish data is already dated.

Doyle added that CRRSCO is pinning some of their hopes for future monitoring of endocrine disruptors and many pollutants on the 'Lower Colorado River Protection Act' introduced July 31 by Rep Raul Grijalva (D-Az). The bill would create and implement an EPA-overseen long term plan to protect water quality in the lower Colorado prevent and eliminate pollution with continuous ecosystemic monitoring.

Climate skeptics a challenge for water planners

Brent Gardner-Smith
Aspen Daily News Staff Writer [Linked here](#)

A growing list of studies show that global climate change will mean less water in the Colorado River, but varying perceptions about climate change are a hurdle to making decisions about future water supplies.

That was one message delivered Tuesday evening in Aspen by Dr. Eric Kuhn, general manager of the Colorado River Water Conservation District. Kuhn spoke at the Aspen Global Change Institute, which is hosting a workshop this week to explore how climate scientists and water managers can provide better information to government decision makers.

Kuhn cited a survey done six months ago by the Rocky Mountain Climate Organization of people in the seven states that have a stake in Colorado River water, including Colorado, Utah, Wyoming, Arizona, New Mexico, California and Nevada.

The survey asked residents of those states, "Is climate change an established reality or an unproven myth?"

People in Colorado are split 47 percent to 47 percent on the question.

In Wyoming, only 35 percent of people think climate change is "an established reality," while 62 percent of Californians think it is.

Seventy-four percent of Democrats in those seven states think climate change is a reality, but only 25 percent of Republicans do, the survey found.

Kuhn said another survey found that in the 15 Western Slope counties that make up the Colorado River District, 83 percent of Democrats feel climate change should be given a high priority, while only 40 percent of Republicans felt the same way.

Yet Kuhn said evidence continues to point to a future with hotter temperatures and less water in the Colorado River.

He cited a recent study by the Colorado Water Conservation Board that clearly stated there would be a decline in runoff for most of the Colorado River basin by the mid-21st century.

"It is simple and very straightforward," Kuhn said of the CWCB finding. "You think we should be able to do something based on the advice, but we are not quite there."

A recent preliminary water supply study by the CWCB showed that by 2040, there would likely be an 8 percent reduction in average annual runoff in the Colorado River above Grand Junction. And that the runoff will likely come a week earlier.

"Science is never going to tell us how much water is going to be in the Roaring Fork to the nearest cubic foot per second in December 2020 or 2021, but it is going to tell us there may be less," Kuhn said. "So when do we start making a decision based on evidence that is pretty clear, and pretty overwhelming, yet there is a lot of uncertainty?"

Kuhn said in his position at the river district he is non-political, but also said he is not shy about pointing out how political differences are a hurdle to developing sound water policy.

He said "there is not yet a public consensus on climate change and whether we need to do anything about climate change.

"There may be in some communities like Aspen or Glenwood Springs, where I live, but there is not in places like Grand Junction. There still is a political divide. And if we don't talk about it, we won't bridge that political divide," Kuhn said.

Arizona's water future is cloudy, worried experts agree

By Tom Beal

ARIZONA DAILY STAR [Linked here](#)

Tucson, Arizona

Arizona's water future won't be like its past, and the past is bad enough.

Water managers only recently came to terms with the fact that their predictions of future water supply were based on incomplete historical records that did not reckon with periodic decade-long droughts and at least one that lasted half a century.

At a conference of water and climate scientists put on by the University of Arizona on Wednesday, water managers from Arizona's major cities said the future seems even more uncertain with predictions that climate change will further reduce flow from Arizona's watersheds.

New sources of water will be needed, but they won't be available in time for the coming crunch, said David Modeer, general manager of the Central Arizona Water Conservation District.

"In the West, it's pretty much uncharted territory once you move closer to that abyss of not enough water," Modeer said.

Modeer, former director of Tucson Water, said he didn't think the Colorado River, which supplies 1.5 million acre-feet of water to Arizona communities each year, had a supply problem as recently as 1998.

A 10-year drought and better studies of the hydrological record made it apparent that the flow in the Colorado was historically less than what is promised to the states that border it. "We know it's over-allocated," he said.

Drought and a better understanding of the historical record have changed the game in Arizona's other major watershed.

"Things are upside-down," said John Sullivan of the Salt River Project, which has supplied Phoenix-area farms and communities with water from the Salt and Verde rivers for 106 years. "There are things going on. What it is, I'm not sure."

Sullivan said SRP has had to cut allocations to its customers only three times in its history — but two of them occurred this decade during the extended drought. Sullivan said the SRP commissioned a tree-ring study of the watershed, and researchers at the University of Arizona uncovered a water past much like that of the Colorado — periodic droughts of 12 to 13 years and one in the 1500s that lasted 50 years.

The water managers appeared at the annual meeting of SAHRA (Sustainability of Semi-Arid Hydrology and Riparian Areas), which hosted the event in conjunction with Biosphere 2, the Water Sustainability Program and the Institute of the Environment.

The conference question was how to plan for a future when "stationarity" is dead.

Stationarity, said U.S. Geological Survey senior scientist Julio Betancourt, allows you to predict future natural events "within a fluctuating but well-defined variability." That notion died, he said, with the realization that climate change makes the future unpredictable.

Sharon Megdal, who moderated the panel on the state's water future, said she liked Yogi Berra's definition: "The future ain't what it used to be."

In an earlier presentation, Dennis Lettenmaier, a professor of hydrology at the University of Washington, noted that predictions for reduced flow in the Colorado River by 2050 ranged from 6 percent to 40 percent, depending on the climate models used, and called for better targeted studies of the Colorado's watershed.

"Forecasts are not useful to us. Forecasts are wrong," said Tucson Water's Ralph Marra. "We don't have a good sense of what the future range of credible possibilities is."

Marra, the utility's water administrator, said Tucson Water must plan for a wide range of scenarios. He called for more and better science and for cooperation among water users.

Modeer and Tom Buschatzke of the city of Phoenix also warned of an additional price for climate change. The CAP moves its water uphill to Phoenix and Tucson with energy from a coal-fired plant in northeastern Arizona. A carbon tax could add up to \$200 an acre-foot to his water bill, said Buschatzke. That would trigger a 13 percent rate increase on top of the regular annual increases, he said. "There will be some City Council people twitching," he said.

RENEWABLE ENERGY: Agriculture and algae coexist uneasily in Imperial Valley

(ClimateWire, 10/12/2009)

Debra Kahn, E&E reporter

CALIPATRIA, Calif. -- With 360 days a year of pure, unclouded sun, California's Imperial Valley has the potential to become the Silicon Valley of renewable energy. Assuming, for example, that a technology based on extracting oil from algae proves itself on a commercial scale, this place has much of the right stuff.

It has an overabundance of labor. The arid region bordering Mexico has a 24.5 percent unemployment rate. Of those who are employed, 15 percent work in the agriculture industry, which exists thanks to 1,500 miles of canals and enormous, historic allotments of river water. The main crops are feedstocks like alfalfa and hay and vegetables for human consumption, like lettuce, onions and sweet corn.

"Imperial ranks dead last in terms of economic vitality," Brian Brady, general manager of the Imperial Irrigation District, told potential investors and researchers from China, India, Australia, Spain, France and the United States last week. "We are totally motivated to bring in industry, particularly green industry."

But the key question mark is water. Can the Imperial Valley achieve its goal of becoming the renewable energy capital of the United States while maintaining its farmland?

The challenge for county officials lies in balancing the existing agriculture industry and its defense of entrenched water rights with the desire to draw new jobs in potentially water-heavy industries.

Farmers are leery of their new neighbors. A number of algae companies sprouting up in the area 100 miles east of San Diego are trying to scale up their operations to produce biofuels in mass quantities. While they say they plan to move to wastewater, salt water and other brackish sources, like the nearby Salton Sea, most demonstration and pilot projects are using fresh water, to better identify the hardiest, most oil-rich algae strains. Open-pond operations like Biolight Harvesting also must contend with evaporation rates of up to 5 millimeters per day, or 7 acre-feet a year.

Imperial County is willing to put its water where its mouth is. The Imperial Irrigation District recently approved an allotment of 25,000 acre-feet per year for renewable energy installations over the next five to 10 years, with an additional 75,000 acre-feet possible after five years. That's out of 3 million acre-feet total in water deliveries from the Colorado River -- water rights secured almost a century ago, of which agriculture currently uses 97 percent.

Brady said water was a top concern for foreign investors and businesses. "When we go to China, one of the first questions is, 'Are you sure there's water?'" he said. "We're

really fortunate this allotment off the Colorado was secured way back in the '20s. We're committed to it not changing."

The irrigation district conducted workshops with farmers to gain support. But some are still leery of renewables' effect on land and water.

"Water flows where the money is," said Heidi Kuhn, a cattle and dairy farmer who joined researchers, investors and algae growers on a tour of the valley last week. "If algae farming produces more money than commercial farming, you will see water go to algae farmers."

Tough economic decisions ahead Kuhn warned that farmers might be prickly neighbors. "Stick to the marginal land," she said. "Use our manure; help us deal with the salt.

"If we could look to you as partners in reclaiming dairy runoff, we'd welcome you."

One of the industry's leading scientists, Scripps Research Institute biologist Stephen Mayfield, espoused the same free-market attitude with respect to land-use policy.

"Although it's great for us to sit here and say we're not going to compete with water or food, at \$30,000 an acre, that's an economic decision farmers are going to have to decide on their own," he said at last week's Algae Biomass Summit in San Diego, citing estimates from the University of California, Berkeley's Energy Biosciences Institute. "This is America, it's called capitalism, and these decisions are going to be made by someone other than you and I."

In addition to its burgeoning algae farms, Imperial Valley has 17 geothermal plants currently operating and at least 30 other renewable projects in the pipeline. Investor-owned utility San Diego Gas & Electric is building a 500-kilovolt transmission line, known as the Sunrise Powerlink, to the area and expects to use it to meet a state renewable energy target of 33 percent by 2020.

Stirling Energy Systems, which is planning to start construction next year on a 750-megawatt concentrated solar thermal plant in the Imperial Valley, skirted the water issue by using treated wastewater from the town of Seeley. It agreed to pay for an upgrade of the town's wastewater treatment plant in exchange for the water. Overall, the plant will use 33 acre-feet of water annually, low by solar thermal standards, a company spokesman said.

"This isn't agricultural land, and we're using 1,000 times less water than some of our competitors," said Sean Gallagher.

New storage eyed as Colorado confronts more people & less water

By Allen Best and special to the Summit Daily News

With demographers forecasting 35 percent more people in Colorado by 2035 and climate scientists predicting 15 percent less water available in the Colorado River Basin by mid-century, something has to give.

More and more, public officials, business groups and environmental organization have been talking about additional dams and reservoirs to augment those built in the mid-20th century.

"The water inheritance is running out," said Josh Penry, the minority leader in the Colorado Senate, in a speech at the summer meeting of the Colorado Water Congress, a consortium of water providers. "Colorado needs to embark on a new round" of storage construction.

“We study too much. We analyze too much,” added Penry, who is from Grand Junction and a Republican candidate for governor.

Representatives of environmental groups concede the need for additional storage but also call for restraint.

“There are projects that have significant adverse environmental impact that we could not support,” said Melinda Kassen, managing director of the Western Water Project for Trout Unlimited. “And there are projects that have substantially fewer environmental impacts that we can support,” she said, if mitigation measures are included.

Hovering over these conversations is the ghost of Wayne Aspinall. A one-time schoolteacher and lawyer from the fruit orchards of Palisade, Aspinall possessed neither good looks nor a good speaking voice. He did have a solid command of legislative techniques and an ardent belief in the need to harness and regulate the rivers of the Rockies.

Serving in the U.S. House of Representatives from 1949 to 1973, Aspinall helped obtain authorization and federal funding for a series of major dams in the upper Colorado River Basin. Utah's Lake Powell was the most massive, but a trio of reservoirs on the Gunnison River also resulted from his legislative perseverance. Today, they are collectively designated as the Aspinall Unit.

Growing populations, pending crisis But if Westerners saw the yoking of rivers into submission as the major task of the mid-20th century, today a more nuanced challenge exists. The limits of abundance have become more apparent.

Most, if not all, of the best dam sites have been taken. Little of the reliable water supplies remains unspoken for, and in those few unclaimed instances — such as on the Yampa River of northwestern Colorado — the water is far from population centers.

Coloradans in the future, as is already the case, can be expected to congregate along the urbanized Front Range corridor. More than three-quarters of the state's residents currently live in a narrow swath less than 200 miles long. The State Demographer's Office projects that the population, now at 5 million, by 2035 will nudge 7.8 million — an increase roughly the existing size of metropolitan Denver-Boulder.

Even more staggering population growth has been projected by 2035 for what is called the Colorado River system, an area that includes Denver, Salt Lake City and Los Angeles. The existing population of 24 to 30 million people will grow another 12 to 15 million people. Imagine Las Vegas 11 times over.

In contrast to this uphill climb of population, climate scientists see a downward slope for water. Temperature is the major driver.

Computerized simulations differ substantially whether precipitation will increase or decrease. Further, existing precipitation patterns could be altered as increased planetary heat alters flow of the jet stream. In other words, changes in Vail and Telluride might not be uniform.

There's more certainty about increased heat. Rising temperatures will produce shorter winters, more evaporation and transpiration, and a substantial reduction of total flows in the Colorado River. Scientists in the last two years have settled on a 15 percent reduction as a central figure.

"We are expecting a 39 percent increase in population and, if you want an average, a 15 percent reduction in supplies," said Taylor Hawes, of The Nature Conservancy, describing the seven-state Colorado River Basin.

"By most standards, that's a crisis."

Managing uncertainty planning is the prospect of drought. Colorado had several significant droughts in the 20th century, but all are overshadowed the mega-droughts of the distant past. Studies

of tree rings across the Southwest conducted by Connie Woodhouse of Arizona State University and other dendrochronologists show clear evidence of droughts roughly 1,000 years ago that lasted up to three decades.

The parched summer of 2002, a time of roaring wildfires near Denver, Durango, and Glenwood Springs, caught water managers by surprise. Levels in Lake Powell dropped precipitously in 2003, and by late 2004 had left bathtub rings two-thirds below the high-water mark. Many wondered if the reservoir might actually drop to a dead pool, unable to generate any electricity.

Along Colorado's Front Range, the situation looked equally bleak. Had it not been for a miraculously wet and heavy snowstorm in March 2003, cities and farmers might have faced another withering summer, hot and dry.

Water managers broadly embrace the theory of human-caused global warming. Their meetings for the last several years have focused on the sharp warnings coming from climate scientists.

"The science is all basically pointing in the same direction," says Eric Kuhn, general manager of the Colorado River Water Conservation District.

But if all signs point toward hotter and drier, great uncertainty remains. Faced with that uncertain hydrological future, Marc Waage, manager of water resources planning for Denver Water, says he has been "scratching my head for the last two years" about how to create a long-range water plan.

Before, water planning was a lot easier. There was always population growth, of course, but planners assumed a worse-case scenario that resembled a previous drought. Colorado's documented worst drought came in the mid-1950s — about the time Wayne Aspinall was proposing to dam the Gunnison, San Juan, and Green rivers.

Now, water planners realize much more serious droughts are possible and that even the average amounts of water will be less. Runoff will occur weeks and perhaps months

earlier, leaving to much longer, hotter and drier summers. Combined with population growth, all this suggest that the existing water infrastructure may be inadequate.

The elephant of Colorado Colorado's big question mark remains the urban Front Range corridor, especially Denver's southern suburbs that overwhelmingly rely upon underground water that has become steadily more difficult to extract.

Prairie Waters Project, a major new diversion project to be completed in 2011, will draw water from the South Platte near Brighton several dozen miles south for use in Aurora, located on the eastern flanks of Denver. Short as this pipeline is, this project is expected to cost nearly \$700 million.

Far more ambitious projects have been conceived. The most spectacular, proposed by former Montrose farmer Aaron Million, would draw water from the Green River near Rock Springs, Wyo., and pipe it along Interstate 80 and then down to the Front Range.

More recently, a rival plan employing the same idea has begun to emerge from a consortium of water providers in Denver's southern suburbs.

Another so-called "big straw" would draw water from the Yampa River west of Craig. That idea comes from the Northern Colorado Water Conservancy District, the agency responsible for the Colorado Big Thompson project. The project, which takes water Grand Lake to Estes Park, was described by Telluride native and historian David Lavender as a "massive violation of geography."

These big straws have mostly been painted as saviors of agriculture. The thinking is that without further Western Slope diversions, the cities will end up buying farms for water.

But does the water exist?

Whether Colorado actually has sufficient water under the treaty apportioning the Colorado River Compact is open for debate. Kuhn, for example, has long suggested that Colorado has no more than a few hundred-thousand acre-feet of unallocated water. A study to be completed later this year by the Colorado River Water Board hopes to answer with greater certainty just how close Colorado is to the last drop.

Another set of studies will attempt to push the science of climate change even more rigorously. Tapping the expertise of scientists assembled in the federal laboratories at Boulder, the studies hope to provide a better idea of how much water may exist in a hotter and drier future.

The focus naturally is on the Western Slope, where three-quarters of Colorado's water originates, mostly in the form of snow. The studies will also attempt to predict how much precipitation regimes will change between basins — the San Juan, for example, as distinct from the Eagle.

While this gets sorted out, a set of parallel discussions has been occurring among the state's major river basins. The intent of these roundtables is to reach some larger

consensus about water allocations, perhaps similar to the compacts that govern the Colorado River.

Friction If the roundtables have improved dialogue, friction has occasionally flared. Disagreement was evident in one exchange at last month's meeting of the Colorado Water Congress. Pitkin County Commissioner Rachael Richards complained that Western Slope water had not been given its due in generating revenue in Colorado's second largest economic, tourism and recreation.

She got pushback from Rodney Kuharich, director of the South Metro Water Supply Authority. Aspen, he observed, seem to have done quite well despite the diversion of waters from the Roaring Fork River and its tributaries that began decades ago. Resorts on the Western Slope, he said, have benefited handsomely from customers drawn from along the Front Range.

As for additional storage, future reservoirs will likely be smaller but perhaps at higher-elevation locations, to minimize evaporation. But whereas the reservoirs of Aspinall's day were all about commerce, today they will be judged against a greater matrix of considerations.

Hawes, of the Nature Conservancy, said her group believes that decisions about storage should be guided by multiple uses, "so that the environmental is part of the planning and not an afterthought."

####

OPINION Quillen: The politics of storage

By Ed Quillen The Denver Post POSTED: 10/25/2009 01:00:00 AM MDT

Granted, it's early to be paying much heed to next year's gubernatorial campaign, but there are already candidates out stumping. Among them is Josh Penry, a Republican state senator from Grand Junction.

Last summer, he told the Colorado Water Congress that our "water inheritance is running out," and we need to "embark on a new round" of building reservoirs.

If this sounds familiar, it's likely because you remember the Great Drought of 2002, followed by the Resounding Defeat of Referendum A in 2003.

By the fall of 2002, after some dry years, many Colorado reservoirs set record lows. You could drive for miles along Blue Mesa Reservoir, west of Gunnison, and instead of seeing static stored water, you'd see the river flowing toward a greatly shrunken pool. Some towns banned all outdoor water use. Ancient cottonwoods died along dry ditches.

Faced with such dismal scenes, Gov. Bill Owens promoted Referendum A, which would have authorized \$2 billion in bonds for new water storage. Although most prominent Republicans supported it (Scott McInnis was the rare exception), Referendum A failed in every one of our 64 counties.

Coloradans could see the obvious six years ago. We didn't have a shortage of storage, given all those shriveled reservoirs that had ample room for more water; we had a shortage of water.

It is possible to imagine that Colorado had built even more storage way back when, and that in the last really wet year, like 1983, the state stored every possible drop.

But it is impossible to believe that this 1983 water would have been available 20 years later. With that much water stored and available for distribution, developers would have found uses for it. We'd have had more residents to suffer the drought. That's how water works here.

Even so, we may need more storage because problems loom for our natural storage system — mountain snowpacks that accumulate over the winter then melt to provide water through the summer.

There's climate change. If average temperatures are rising, then the snow will melt sooner in the spring. The water won't sit around in a snowbank until August, but will be gone by June.

On a peak west of Salida sits a snow formation called the Angel of Shavano. Old tourist guidebooks say the Angel is at her best around Independence Day. These days, she peaks around Memorial Day, and frequently vanishes before July 4.

Another factor is dust. The more we disturb the natural ground cover, the more dust there is in the air. When it settles on snow, it makes a dark surface that absorbs more solar radiation. A researcher at the University of Utah found that dust layers caused the snowpack to melt 45 to 48 days earlier this spring.

And there's logging. If shade-providing canopy trees are removed, the snow melts faster in the spring and the water won't be there as summer wears on. This affects Colorado's oldest water right, the 1852 San Luis People's Ditch.

So like it or not, we'll likely need some more storage. Where to get it? We could start by maintaining what we've already built. According to the state engineer's office, which inspects dams, Colorado has lost 117,650 acre-feet of storage because of decrepit dams; they lose reservoir capacity because it's unsafe to put in as much water as the dams were designed to hold.

This seems like a good way to increase storage, even though it could deprive Penry of a chance to cut a ribbon when some pleasant mountain valley gets drowned.

LR Press Release 10/20/09

Living Rivers and Uranium Watch protest water rights transfer for proposed nuclear reactor

October 20, 2009

For immediate release

Contacts:

Sarah M. Fields

435-210-0166

sarah@uraniumwatch.org

John Weisheit

435-259-1063; Mobile - 435-260-2590

john@livingrivers.org

Living Rivers (LR) and Uranium Watch (UW) protested the San Juan County Water Conservancy District (SJCWCD) request to transfer water from the San Juan River to the Green River for a proposed nuclear reactor.

On October 14, 2009, LR and UW joined others, including the Grand County Council, U.S. Fish and Wildlife Service, and Green River ranchers and farmers in questioning the advisability of approving the transfer of 24,000 acre-feet of water, based on a number of environmental and regulatory concerns. SJCWCD lease the water to Transition Power Development LLC—now Blue Castle Holdings Inc. (BCH).

BCH seeks to accumulate assets, including rights to water in the Green River, in order to license the site for the reactor on land that Emery County has leased from the Utah School and Institutional Trust Lands Administration for an industrial park.

BCH press releases (www.bluecastleproject.com) claim that BCH already owns the site for the reactor. This is not true. According to the Emery County Economic Development Director, BCH has not purchased the site and does not have a purchase option. "One can only wonder why BCH feels that they must lie to the press, the public, and their investors about the ownership of the property for the proposed reactor," says Sarah Fields, UW Program Director.

BCH has also leased 29,600 acre feet from the Kane County Water Conservancy District, for a total of 53,600 acre feet of water that would be used for the proposed reactor. The State Engineer, Division of Water Rights, will hold hearings on the protests of both water rights change requests, in the spring of 2010 at the earliest.

There are a number of important reasons why the Division of Water Rights should reject the application to use water from the Green River. Significantly, there was no information in the water right change application that would provide a basis for the required determinations by the State Engineer. There are questions about the projects economic feasibility and whether BCH has the financial resources to complete the

proposed reactor, especially since BCH does not appear to be the one who will actually construct and operate the reactor.

In a time of increasing water scarcity, the availability of water and negative impacts to the endangered and threatened fish species are primary considerations. The US. Fish and Wildlife Service and others are concerned that reducing water quantity in the Green River will result in diminished habitat for endangered species and cause three threatened species being listed as endangered. FWS partners with state and federal agencies to develop and implement conservation plans for fish recovery in the Colorado River Basin.

Also, the seven states of the Colorado River Basin and the Bureau of Reclamation will soon begin a process of determining a water budget for the Colorado River water supply—a program called the Colorado River Basin Study. John Weisheit, Conservation Director of Living Rivers, believes, "The State Engineer should wait for the completion of this study in order to help protect applicants and existing water right holders from future economic burdens based on future water supply uncertainties."

For farm-water rights, planners ready to deal

Agreements help farmers economize, saving water for cities later

By Shaun McKinnon - Oct. 26, 2009 12:00 AM

The Arizona Republic

MARICOPA - The water to grow cotton, wheat and cantaloupes in Dan Thelander's fields doesn't flow down open ditches or spurt from sprinklers or drip from tiny emitters poking up from the cultivated soil.

Thelander pumps the water directly to the roots of the plants through miles of black plastic drip tape buried beneath the ground. The system all but eliminates losses to evaporation or surface runoff and reduces the total amount of water needed for the crops.

The drip tape wasn't cheap to install and required expensive upgrades to tractors, but Thelander believes the investment will pay off, in part because of an agreement that promised a steady supply of water until at least 2030.

The deal, which includes a dozen or more water districts, in effect sets aside water for future growth in Maricopa, Pinal and Pima counties. It follows a well-worn pattern in

Arizona of shifting water from agricultural uses to cities, a pattern that helped Phoenix convert thousands of wide-open fields into a sprawling metropolitan area.

What's different about this agreement is that instead of allocating the water among the cities now, it allows growers to remain in business without feeling as much pressure from thirsty cities.

"It doesn't make any sense to take land out of production just to set aside water for development that won't occur for 20 years," said Brian Betcher, general manager of the Maricopa-Stanfield Irrigation & Drainage District, which serves Thelander's operations. "We needed an orderly transition."

Agriculture as an Arizona industry has been in transition since the 1970s, when rows of new homes started replacing rows of cotton and citrus. Although farms still contribute as much as \$9 billion to the state's economy, the business lacks the power it held when it first claimed the largest share of Arizona's water.

Few people believe there will ever be another large-scale turnover of farmland to homes and business like the one that transformed Phoenix over the past 50 years, but it's likely the water used by agriculture will play a role in meeting Arizona's future water needs.

How that happens will depend on what kind of water is on the table. Irrigation districts along the Colorado River hold rights that are all but impossible to pry loose unless the farmer wants to deal.

Such a deal could look like an ongoing pilot project in Yuma, where the U.S. Bureau of Reclamation offered farmers money to take land out of production for a growing season. The water the farmers didn't use would then be banked in Lake Mead as a hedge against future shortages.

Just one small water district signed on for the test, and participation has been spotty, in part because crop prices were higher for several years than the money offered by the bureau. If crop prices drop below the government's offer, more farmers may decide to cash in.

Farm communities fear the effect on the regional economy if too many growers take the deal. When a farmer fallows ground, he needs fewer workers, buys less seed and consumes less fuel.

The less-abrupt option is unfolding in Pinal County, where the irrigation districts gained a steady supply of water from Central Arizona Project canal in exchange for an expiration date.

A sweeping Indian water settlement in 2004 set aside 400,000 acre-feet for farmers in the three counties the canal serves. The pool will shrink slowly until 2030, when the guarantee expires.

"The overall settlement helped keep our water affordable," said Thelander, who works about 4,000 acres mostly in Pinal County. "It's allowed us to stay in business. Had we

not had the settlement, the cost of water could have been roughly twice as high as it is now. It would have been very difficult to keep our farm growing."

The price of CAP water isn't insulated from outside factors. Costs could rise, for example, as a results of proposed environmental controls at the Navajo Generating Station, the Page power plant that supplies electricity to move water from the Colorado River to the farms. A sudden spike could force growers to back away from the supply.

Still, the relative certainty of the water was equally important. Before the agreement, Pinal farmers drew water from the CAP canal, but with no firm promises of how long the supply would last.

With the deal in place, farmers have invested in equipment that helps stretch water supplies, such as drip systems or laser field leveling, which also reduces runoff. Some irrigation districts have signed deals with cities to store water underground in exchange for price breaks on the CAP water.

Those measures could also help growers who stay in business beyond 2030. If cities begin claiming the CAP water, many agricultural users will resume pumping groundwater, as they did before the canal began delivering Colorado River water. With less groundwater available, they will need to use it more efficiently.

"There's a better understanding of the value of the water," Betcher said. "Sure, ag uses a lot of water, but all of that water, if it's used wisely, goes back into the economy."

What's happening in Pinal County probably can't be duplicated because growers in other areas hold more-secure rights to the water. If cities want the water, they will likely face a steep price tag.

Because of the recession, the demand for more water may not grow as quickly as planners once thought, which could buy Pinal growers even more time. Some experts say that time could give cities a chance to rethink their priorities.

"We could talk about to what degree agriculture could be our open space and a backup water supply in a drought," said Jim Holway, a former state water regulator who now works on water issues for the Sonoran Institute and the Lincoln Institute of Land Policy.

"Maybe we keep agriculture in Pinal. The water's there, the plumbing's there, we get open space and we recharge the aquifers," Holway said. "If we could take the current downturn to stop and think, we might come out of it more thoughtful about what our growth means."

State water agency: Cut would hurt rural areas

By Shaun McKinnon - Oct. 31, 2009 12:00 AM
The Arizona Republic

Projected state budget cuts would all but end Arizona's efforts to secure long-term water supplies, water officials say, a loss that would devastate rural communities already struggling to meet demands.

In a budget scenario requested by the governor, the Department of Water Resources says it would also eliminate its statewide drought and water-conservation programs, cutting off aid to towns and cities at a time when dry conditions have deepened again.

In all, the water agency would be forced to lay off nearly half of its workforce and cut most programs not required by state law.

Gov. Jan Brewer has asked agencies to outline the effects of a 15 percent budget cut. She says deep cuts will be needed if lawmakers decide there is no other way to close the state's spending gap.

"It eviscerates us," said Herb Guenther, the department's director. "We currently have a lot of things on our plate that are very critical to the well-being and prosperity of Arizona's future. There are places with water deficits now, where supplies are inadequate. It's very troubling."

The state faces a \$1.5 billion deficit in the current fiscal spending plan. New estimates say that gap will widen to \$2 billion.

Guenther said the cuts to his agency, \$2.7 million from a 2010 budget of \$18.2 million, would affect every function. As many as 86 people could lose their jobs, cutting the department's workforce from 177 to as few as 91. Lost would be programs that support riparian protection, track river flows, measure groundwater levels and chart unsafe dams.

The department would continue to regulate water in Phoenix, Tucson and other so-called active-management areas, or AMAs, established by state law. In those areas, communities and developers are required to submit proof of a 100-year water supply before building new homes.

But most work with rural communities would abruptly end, leaving those areas with no help to manage existing water supplies and secure sources for the future.

"Rural Arizona, they're on a more critical path than the AMAs," Guenther said. "We've got whatever's left of 100 years to play with in the cities, but you've got a lot less than that in areas like Prescott, areas like Cochise and Yavapai counties. They're already short of water, and they're living on borrowed time."

The department has provided professional support for resident-planning groups that work within watersheds, areas where water use is almost entirely unregulated by state law. In most of rural Arizona, for example, developers can build homes without proving adequate water supplies.

"We have no other place to go," said Jan Holder, executive director of the Gila Watershed Partnership, which works on water issues in east-central Arizona. "The department has been critical for us. They were the ones who convinced us to start doing planning in our area. We don't even know how much water we have under the ground, and now, all of this is being taken away. It's outrageous."

The department increased efforts in recent years to map rural Arizona's water resources and figure out how much water exists in aquifers. Such information can help better plan future use and ensure that communities don't exhaust underground supplies.

"We need more info about our aquifers in order to manage them better, but we can't do it on our own," said David Newlin, watershed-projects director for the Holbrook-based Little Colorado River Watershed Coordinating Council.

"The people who have water rights want to be certain what those rights are going to be there for a long time in the future," Newlin said. "Otherwise, they will lose investments and opportunities for growth. People need that certainty."

Among the cuts identified in the budget plan:

- The department's legal division would be reduced. Guenther said that could put the state at a disadvantage as negotiations continue with the Navajo and Hopi tribes over historic water claims. The cuts could also set back efforts to settle water rights on the Gila River system, which includes wide areas of the state.
- Additional money would be swept from the Arizona Water Banking Authority, which buys excess Colorado River water and stores it underground for future use. The water-banking fund has been all but emptied in the past several budget cycles.
- The drought and conservation offices would be closed because they are not mandated by law, Guenther said. The programs were created by then-Gov. Janet Napolitano during a series of record-dry years, and they have helped the state monitor drought conditions and help communities better prepare for dry spells and develop conservation programs.

Guenther acknowledged that he can't point to as many immediate effects from the budget cuts as some agencies, but he said that doesn't diminish the department's role. Many issues are likely to grow more complicated, such as the demand for more water on the Colorado.

"Our process is long-term," he said. "We've got some challenges that are just huge, and you're not going to resolve them overnight."

Scientists rip lawmakers over climate change

Sunday, November 08, 2009
Associated Press

[Letter](#) by BYU earth scientists.

[Click here](#) to read "Climate Skeptics Call on BYU Scientists to Apologize"

PROVO, Utah (AP) -- A group of scientists from conservative Brigham Young University has criticized state lawmakers over their recent handling of the climate change issue.

The 18 scientists rebuked legislators in a letter sent Oct. 26, five days after the Public Utilities and Technology Interim Committee heard from Roy Spencer, an Alabama climatologist who doubts human activities are largely responsible for climate change. The scientists criticized lawmakers for giving the "fringe" position of Spencer equal weight to that of the broad, scientific consensus that climate change is occurring largely because of human activities.

"We have no specific political agenda to support but agree that whatever action is taken, it should be informed by the best available scientific evidence," the scientists wrote. "We encourage our legislators not to manipulate the scientific evidence to suit any political agenda."

The 18 Ph.D.s at the Mormon church school specifically refuted Spencer's claim that his critics have ignored natural cycles. The scientists called that assertion "patently false," saying natural climate variability has been extensively studied.

They also took issue with Spencer's allegation that researchers were simply "jumping on the climate-change bandwagon for prestige and monetary gain."

"When members of the Legislature give this kind of testimony too much weight, it puts all of us at risk by promoting poorly informed decisions," the letter says.

Rep. Christopher Herrod, a Provo Republican and committee member, said the scientists misunderstood Spencer's science.

"The more they say there is consensus, the more they lose credibility," Herrod, a real estate developer and entrepreneur, told the Salt Lake Tribune.

"There is no consensus. Send us a study that addresses all the points that were made. (Without that) they are hurting their case," he added.

The scientists said they agreed with the scientific consensus, but noted that their political views vary, as do their ideas about "how society ought to respond to threats posed by a warming climate."

Summer Rupper, a BYU climate scientist, led the letter-writing effort.

Las Vegas Gambles With an Uncertain Water Future

By LAUREN MORELLO of ClimateWire

[Link to New York Times](#)

BOULDER CITY, Nev. -- Straddling the border between Nevada and Arizona, the Hoover Dam is a symbol of human engineering might.

For more than 70 years, its massive walls have tamed the flows of the Colorado River, fueling the growth of cities like Las Vegas that depend on it to supply water and power from its generating station.

But these days, what's most striking is the lack of water stored behind the dam's concrete arch. A thick white band of mineral deposits marks the walls of Black Canyon above the water line. Locals call it the "bathtub ring." It's where the water used to be, before the start of the current decade-long drought.

For officials charged with keeping water flowing to Las Vegas and other Colorado River communities, the bathtub ring isn't a curiosity. It's yet another reminder that worries about climate change are reshaping their future.

"Around 2002, we really began to look at whether this was one of those traditional droughts the Colorado River has experienced -- or are we looking at something very different?" said Patricia Mulroy, general manager of the Southern Nevada Water Authority.

Spring warming is coming earlier and harder, evaporating mountain snowpack that feeds the river and its two main reservoirs, Lake Mead and Lake Powell.

Mountain snowpack evaporates

"In two weeks in April, we lost the equivalent of 14 feet of Lake Powell in snowpack," said Mulroy. "So it's a pretty daunting and disconcerting reality that we're beginning to get our heads around."

Mulroy is not alone. Across the United States, water managers are beginning to grapple with climate change. And it's changing the way they think about almost everything.

For the utilities that supply the nation's drinking water, one of the first casualties is the idea that the conditions of the past can predict the future, said David Behar, deputy to the assistant general manager for water at the San Francisco Public Utilities Commission.

"It's a game changer for water managers," he said. "It takes the variability that we understand, and can live with, and amplifies it by an order of magnitude."

For planners who are used to taking the long view -- constructing expensive infrastructure that's expected to last 30, 40, 50 years, or even longer -- climate change is changing their rules, introducing new and hard-to-define levels of risk.

"You have to plan decades ahead, in terms of water supply and source water needs," said Dan Hartnett, director of legislative affairs for the Association of Metropolitan Water Agencies. "It's too late if you wake up one morning and the tap runs dry."

A tale of tree rings and 'Sin City'

Walking along Las Vegas Boulevard, it's hard to believe Sin City is facing a water crisis. The dancing fountains at the Bellagio Hotel and Casino spring to life every half-hour, captivating tourists who gather to gawk.

The nearby Mirage features a lagoon complete with towering waterfalls and a fake volcano. And on a hot summer's day, visitors who find the scorching desert sun discomforting can still have their drinks outside at bars equipped with machines that cool the air with a fine mist.

But those are illusions. For Mulroy, it is Lake Mead that tells the tale of Las Vegas' water future. The reservoir's water level fell this summer to its lowest point since 1965, when officials diverted Colorado River flows to fill the newly constructed Lake Powell. By late August, Lake Mead's elevation hovered at just 1,092 feet above sea level.

Under the complex system of allotments that governs how Colorado River water is distributed to seven U.S. states and Mexico, that leaves just 17 feet of wiggle room before the Southern Nevada Water Authority must, by law, begin seeking alternate sources of water.

If the lake dips to 1,050 feet, the Hoover Dam's hydroelectric power plant will shut down and Las Vegas will have to begin weaning itself off the river. It's hard to tell how soon Lake Mead could hit this ominous milestone.

The pact that governs the Colorado's supply was negotiated early last century, one of the wettest periods in the past 1,200 years, based on climate records drawn from tree rings across the southwestern United States. Many scientists say it's nearly inevitable that the region will become drier, moving closer to the historical average.

Right now, the best climate models predict a drop of anywhere from 5 to 25 percent in the mountain runoff that supplies the Colorado by midcentury. But a recent study by researchers at the University of Colorado suggests that the decisions water managers

make can -- temporarily -- blunt the effects of climate change and continuing population growth.

Bigger mission looms for the wastewater patrol

Under the harshest scenario, in which climate change reduces the runoff that feeds the Colorado by 20 percent midcentury, water managers could cut the risk that the river's reservoirs would run dry by as much as one-third. But they would have to take aggressive steps to cut releases from Lake Mead and Lake Powell in times of drought.

"Until 2026 or 2027, the risk is pretty low ... something water managers can plan for," said the study's lead author, Balaji Rajagopalan, a hydroclimatologist. "But after 2027, through 2050 -- that's when the risk pretty much explodes."

Kevin Perry isn't thinking about the Colorado River's future as he deftly navigates Las Vegas' sprawling web of gated communities and fresh tract houses, symbols of the bygone '90s boom. He's looking for scofflaws.

Perry is part of the Las Vegas Valley Water District's wastewater patrol, looking for businesses and homeowners with sprinklers spraying the sidewalks and streets along with their plants, or evidence that a utility customer is violating the summer ban on midday watering.

The wastewater patrol, more than a decade old, is part of the Southern Nevada Water Authority's efforts to conserve water, which also include recycling wastewater that flows from household drains and a popular new program that pays customers to replace grass with less thirsty trees and plants.

"People like their landscapes to look like where they came from," he said. "They come from somewhere that's far greener, where rain takes care of their needs, and when they get here, they want to green it up."

But converting that greenery to something more appropriate for a city that gets an average of just 4.5 inches a year of precipitation comes with a price. The success of the turf removal program, combined with the local effects of the national economic recession, has reduced the utility's revenues at a time when climate change is prompting new investments in infrastructure.

Preparing the 'third straw'

The water authority has embarked on a massive construction project to build a new intake pipe to pull water from Lake Mead. Known locally as the "third straw," it will ensure the utility can siphon water if the lake level dips below an elevation of 1,000 feet, rendering two existing intakes useless.

SNWA is also seeking permission to build a controversial \$3.5 billion pipeline to transport groundwater from rural eastern Nevada, a plan that has drawn ire from ranchers and environmental groups and is currently tied up in court.

"Right now is the perfect storm," Mulroy said in late August. "You have a daunting drought in the Colorado River that is forcing us to spend \$800 million to build a third intake we never anticipated having to build, which is an excruciatingly difficult construction project. And you have connection charges that were 57 percent of the revenue for our capital funding plan that evaporated. And you have to balance the two, but you have to build the third intake. You don't have a choice ... not without endangering the community as a whole."

If a recent study by two water utility trade groups is correct, Las Vegas' spending could be just an opening wager in a game of climate change poker.

The report, by the Association of Metropolitan Water Agencies and the National Association of Clean Water Agencies, estimates that the United States' drinking water and wastewater utilities will spend \$448 billion to \$944 billion between now and 2050 to adapt their infrastructure and operations to cope with the shifting climate. This estimate, large as it is, doesn't include big societal costs likely to spring from climate-induced changes to the nation's water supply, including impacts on ecosystems and public health.

Living with uncertainty

While the fate of America's energy and transportation systems has dominated the country's climate debate, water utilities have begun making their case on Capitol Hill and in academic circles. "Water utilities, right now, feel like we're going to be among the first sectors affected by climate change," said Marc Waage, manager of water resource planning at Denver Water.

Just two years after AMWA's climate committee met for the first time, between a fifth and a quarter of the group's members serve on the panel. Utilities joining in the climate discussion run the gamut from rural to urban, small to large, east to west, said Erica Brown, AMWA's director of regulatory affairs and scientific program development.

Their concerns range from climate-driven drought to an increase in extreme rainstorms that can overwhelm sewers and impair water quality. "In places like Arkansas, politically, people might not want to talk about climate change," she said, "but you talk to our members there and they say, 'Yeah, we see changes in our watershed. We're aware of this.'"

Meanwhile, a group of larger urban systems -- including Las Vegas, New York, Denver, Seattle and San Francisco -- has formed the Water Utility Climate Alliance. The group is less than 2 years old, and its members' general managers meet every three weeks via conference call as they pursue an aggressive research strategy. WUCA is finishing two white papers: one examining the latest science on how climate change will affect the water cycle, and a second that examines strategies for making decisions in the absence of precise information about what the future will look like.

Said Behar, the San Francisco water official who serves as WUCA's staff chairman, "We're not able to get as specific climate information as we'd like, but we still think that

we are facing a need to make decisions about infrastructure -- in some cases, expensive decisions about infrastructure -- in the context of uncertainty."

What that means is that some timeworn practices in the water business "have to be challenged," concluded Mulroy, Las Vegas' water chief. "I think it's a conversation for the country that's almost unavoidable. ... The worst case, as far as I'm concerned, is if we are surprised by the magnitude of climate change. We can't move fast enough."

Paying for water with power

by Ryan Randazzo
The Arizona Republic
[Linked here](#)

Salt River Project is the largest water supplier in the region, delivering the state's most precious resource from the Salt and Verde rivers to people in the Valley.

Delivering water, however, is not a lucrative business.

SRP lost more than \$33 million in its last fiscal year that ended in April providing water in the desert to farmers and the 10 cities across SRP territory.

That's the smallest loss in several years.

SRP has a financial crutch - electricity - that allows it to provide water for about one-fifth to one-third the actual cost, which benefits farmers and cities such as Phoenix that use the water.

Farmers and cities paid SRP \$14 million in water assessments in fiscal 2009, but it cost SRP \$47 million to deliver all the water. Electricity customers picked up the \$33 million difference.

SRP was set up to ensure a reliable water supply for the Valley, and the electricity it generated - at first as a side benefit - helped Arizona develop during the past 100 years. But use of power revenue to fill the gap between what it costs to deliver water and its price to customers is drawing more attention as SRP's electricity prices rise.

Some observers question the need to subsidize water, especially in a time of frequent electricity-rate increases. Also, they say, low prices encourage wasting water, and higher prices would prompt conservation.

Century-old policy Using electricity revenue to support water dates to 1909, when energy generated at the Roosevelt Dam first was sold to help pay off the dam.

Eventually, SRP took over operations at Roosevelt from the federal government and built three more dams downstream, all producing electricity and storing more water.

Without the ability to store water, and to sell electricity to pay for it, it is unlikely Arizona would have developed as it has, SRP officials said.

"There is a long history of the water side relying on the electricity," SRP Vice President David Rousseau said.

But SRP has raised electricity prices 12 times since 2002, four times for base prices and eight times for the cost of power-plant fuel.

The most recent base-price increase was offset by the declining price of natural gas that customers pay.

And SRP customers could see a recently postponed 11.4 percent electricity base-rate increase come up again this spring.

Paying for water SRP, actually a political subdivision of the state, contracts with a private entity, the Salt River Valley Water Users' Association, to manage its irrigation system. They essentially operate as one.

SRP is not set up to profit from providing water. Delivery is more of a public service to the landowners in its territory that have the water rights.

Last year, SRP residential electricity customers, who generate most of the revenue, paid an average of \$17.60 each for the cost of water delivery. Businesses paid an average of \$113.45 each, and industrial customers averaged \$892 to support water, according to SRP.

Over the past five years, all electricity customers combined paid, on average, \$200 each to fund water delivery.

SRP officials said in a written response to questions that they oppose describing electricity revenue as being used to support water operations. It gives an "incomplete" picture of the issue, they said.

Most of the money electricity customers pay goes toward their electrical service, and about 1.4 percent of the money from electricity customers funds water operations, according to SRP. In 2004, 3.9 percent of the revenue from electricity went to water operations.

The amount changes year to year depending on water-system expenses such as pumping groundwater and buying water from other providers, including the Central Arizona Project.

Not only was this financial arrangement laid out in a Reclamation Act amendment in 1906, but over the years, Congress, the Arizona Supreme Court and state Legislature all have acknowledged the concept of using one resource to pay for another, SRP lawyer Jane Alfano said.

"Over time, this concept became integral to all reclamation projects which generate electricity," she said.

Critics acknowledge how the concept helped the Valley grow but contend that the water users should no longer be supported by electricity.

"We object to the subsidy on behalf of electricity ratepayers," said Tim Hogan, executive director of the Arizona Center for Law in the Public Interest, which frequently questions the necessity of SRP's electricity rate increases.

"It makes no sense to me to take water - what SRP continually tells us is our most precious resource - and subsidize it so people are encouraged to use more of it," he said.

Political decision SRP's management and political leaders decide the balance between the price of water and the price of electricity.

"The amount of contributions in aid of water is a fair target," SRP General Manager Richard Silverman said. "But you are getting into 100 years of how SRP is set up."

SRP is run by a board of 14 directors and a president and vice president who are elected by landowners in SRP territory. Silverman answers to those elected officials.

Landowners' votes are weighted depending how many acres they own.

That voting system gives an advantage to farmers who own large parcels of land. The SRP president, vice president and several board members come from farming families.

Low water prices benefit everyone, not just farmers, SRP officials said.

SRP delivers raw water to cities that treat it and deliver it to their residents for a fee, and those fees are lower thanks to the support from electricity.

The average electric bill for SRP home and apartment customers is about \$130 a month, while the average single-family home in Phoenix pays about \$30 a month for water, not including wastewater, solid-waste disposal and other charges on those bills from the city.

Whenever SRP raises electricity rates, it usually raises water assessments by the same percentage, Silverman said. But even with recent rate hikes, the water rates are not covering expenses.

Hogan said water users, including farmers, should pay the full price for their water and not be subsidized by electricity customers.

"This is irrigation water," Hogan said. "Who is going to stop taking irrigation water? It's so cheap, you could easily recover that (cost) from water users and it won't be a huge leap."

Conservation at issue SRP charges more money for electricity during certain times to encourage customers to conserve power. But Silverman said that charging more for water deliveries would not encourage people to conserve water.

He said that wouldn't work because the cities already mark up the price of water so much from SRP's rates.

For example, SRP provides water for about \$14 an acre-foot (325,851 gallons). The city of Phoenix treats the raw water and prices it at about \$867 to \$1,377 an acre-foot.

The city charges much more because it must treat and deliver the water, and build and maintain all the equipment that requires.

The cost of raw water from SRP and the Central Arizona Project is less than 10 percent of the expense of the city's water operations, said Steve Rossi, Phoenix's principal water-resources planner.

"The raw water from SRP is not a consequential amount," he said. "If they have an increase in that, it is something that has to get pushed out in our capital budget."

SRP critics said that people living in the Valley need both power and water, and that paying the true price for resources encourages people to use only what they need.

"I see no justifiable reason for one class of customers - electric - to subsidize another class - water users," said Amanda Ormond, a former Arizona Energy Office director who runs a Tempe energy consultancy and ran unsuccessfully for a seat on the SRP board in 2008.

"Keeping water rates below their actual costs just encourages consumption of a precious resource," Ormond said. "This practice should have been discontinued long ago."

SRP promotes water-saving devices, including low-flow nozzles for washing restaurant dishes, and advertises conservation.

But SRP officials said that conservation, in fact, is not their responsibility.

"Water conservation is the responsibility of the cities," said John Sullivan, associate general manager of the SRP water group.

Sullivan said SRP has never tried to break even on water operations without money from the electricity business.

"It would be difficult," he said.

Silverman said that someday the water subsidies could be eliminated, given recent debates over SRP's electricity prices that caused postponement of a rate hike and the increased scrutiny on its budget.

"There could be a time in the future when that could occur," Silverman said. "Our obligation to support water is discretionary."

Water, economy: Uncertainties delay farmers' planting plans

California Farm Bureau Federation

By Ron Miller

[Linked here](#)

How does a farmer make planting plans for next year when no one knows if or how much irrigation water will be available? And will the economy begin to grow again? As they await answers to those questions, farmers and ranchers all over California have put off making their crop plans as long as they can, hoping for some solid information about water allocations and the economy.

Mike Young farms in several Kern County locations and obtains most of his irrigation water from the State Water Project. He said he plans to wait as long as he can before he makes decisions about what to plant on his vacant land. He knows he needs to provide water to his permanent crops of cherries, pistachios and almonds, and has some well water.

"After three years of pumping, the quality of that water isn't that great," said Young, who is immediate past president of the Kern County Farm Bureau.

He said at this time of year, he usually negotiates for bank loans and contracts to grow crops on his vacant land, where he typically raises tomatoes, cucumbers and lettuce. But he said it's difficult to obtain a loan or a contract when lender and processor are not certain there will be water to produce a crop.

Other farmers face similar quandaries.

Fresno County Farm Bureau President Dan Errotabere said he has to make decisions now regarding fall planting of crops.

"Garlic is one," he said, "We're on drip irrigation now, so we can manage pretty well, but it's another year of heavy groundwater pumping that I'm a little concerned about."

Errotabere farms within the Westlands Water District, where farmers saw supplies from the federal Central Valley Project cut to just 10 percent of contract amounts this year.

He usually plants cantaloupes in the fall, but isn't certain he will have enough water this autumn. Ground preparation for planting tomatoes next spring needs to be done before rains come, to avoid trying to do the work in mud. He said he hopes he and other farmers on the CVP get a decent water allocation next season, so they can reduce groundwater use.

Errotabere said he hopes to maintain the same cropping pattern in 2010 as this past season but, he added, "that also includes 1,200 acres being fallowed," a third of his ground within the Westlands Water District.

"I hope it won't be that difficult again, but we're prepared if we have to fallow, we have to fallow," he said.

Merced County farmer Pat Borelli has about 120 acres of ground in the CVP service area. He's planted winter oats and hopes there is enough rain to get a crop without irrigation.

"That's about it," he said, "Last year, I worked the ground to plant cotton and then learned I wouldn't have enough water, so I planted 20 acres of beans," which require less water.

If there is water available, he said he could plant beans again after the oats are harvested, planting as late as June.

Merced County Farm Bureau President Peter Koch said the east side of the county has adequate water. Irrigation districts in that part of the county obtain water that does not have to go through the delta and thus avoids restrictions to protect endangered species.

Farmers in that region are able to plan now about how to use their ground next season.

San Diego County Farm Bureau Executive Director Eric Larson said farmers in his county are not planning any crop production expansion this year. He noted that part of the region's water supply comes from the Colorado River, "so it is a little more secure." However, with the weak economy farmers do not anticipate any demand increase.

Irrigation water in San Diego County is among the most expensive in the state. Farmers already know they will receive a 20 percent reduction in their allocation if they buy discounted water, and a 13 percent reduction if they purchase water priced at the regular rate.

Uncertainties about irrigation water supplies also exist in Northern California.

Rice farmer David Dumars, who farms in Yolo and Colusa counties, said he had to leave his land in Yolo County fallow last season because he had no irrigation water allocation. Although he raised a good crop on his Colusa County land, he said he's not certain what the water allocation for next year might be. That makes planning difficult.

Former Glenn County Farm Bureau President Mike Vereschagin also expressed concern about what irrigation water allocations might be for next year. As a member of the Orland-Artois Irrigation District board of directors, he reported that board has not

received any allocation information from the Central Valley Project. Vereschagin said he irrigated his prune and almond orchards last summer by supplementing surface water with water from wells on his land.

"Last year, I had a couple wells go dry," he said, adding that he and all farmers hope for a wet winter to help replenish diminishing groundwater supplies.

However, even a wet winter may not provide much added irrigation water in some regions, because of Endangered Species Act requirements. Those rules and resulting court decisions require operators of both state and federal water projects to reserve more water for delta smelt, salmon and other species.

Fresno County farmer and Westlands Water District spokesperson Sarah Woolf said, "The Bureau of Reclamation (which operates the CVP) has estimated that even with the heaviest rainfall, the highest numbers that we could get would be 40 percent of our water supply allocations."

That equals about 400,000 acre-feet and district farmers need about 750,000 to 800,000 acre-feet to be farming two-thirds of district ground, she said.

"We don't think even with record rainfall we could get anywhere near that," Woolf said.

The CVP said the water year started Oct. 1 with five key reservoirs at 39 percent capacity. The 4.4 million acre-feet available compares with the 15-year average for that time of 6.7 million acre feet, or 59 percent of capacity. That is better than the 3.9 million acre-feet in storage last Oct. 1 and far better than 1977—the driest year on record—when reservoirs held only 1.1 million acre-feet of water.

Woolf said the CVP historically announces its first water allocation about mid-February.

"However, in years past we've had a pretty good ability to guess the range of where the allocation may be, based on what was in the reservoirs and if we added rainfall to that," she said. "What is different this year is we are coming off a zero and then to a 10 percent water allocation."

She added that western San Joaquin Valley farmers know that, because of the regulatory limitations, regardless of what's in the reservoirs they could be at zero again.

North Coast counties have a different problem.

"Most of our farmers irrigate with well water," Humboldt County Farm Bureau Executive Director Katherine Ziemer said. The 35 to 40 inches of rain that the region receives in an average year replenishes the water table. And a dam on the Mad River, built in the 1960s by the Humboldt Bay Municipal Water District, creates Ruth Lake, which is currently overflowing with water.

Two pulp mills that used millions of gallons of water and provided 40 percent of the district's revenue closed. The district's urban and agricultural customers may see higher rates, as the district tries to cope with a 40 percent revenue loss.

Because of the reservoir location on the Mad River, there is no economical way to transport the water to dry locations elsewhere in the state.

Court refuses to tell state to return CAP funds

By Howard Fischer
CAPITOL MEDIA SERVICES
[Linked here](#)

PHOENIX — The Arizona Supreme Court refused Tuesday to order the Legislature to give back money it took in Central Arizona Project funds.

Without comment, the justices rejected a plea by attorney Robert Lynch that the court rule the raids on funds of the Central Arizona Water Conservation District, which administers CAP operations, were illegal. Lynch argued the cash was legally off-limits to lawmakers.

Tuesday's move does not end the matter. It leaves Lynch and the CAWCD board with the option to try again, this time filing the case at the bottom of the legal system, in Maricopa County Superior Court, rather than with a direct claim to the state's top court.

Lynch said the board has not yet decided what to do next.

Lawmakers took a total of \$13.9 million from the district to balance both prior and current state budgets. Lynch, however, asked the high court only for the return of the most recent \$5.4 million taken, as lawmakers had already spent the other cash.

The money at issue actually was part of the money Arizona is getting from Nevada in exchange for being able to use some of Arizona's share of Colorado River water that this state does not need but Nevada needs now and will for years to come.

The cash, said Lynch, is supposed to be used for Arizona to "bank" its excess allocation, above and beyond what both states now need, in underground storage. The idea is to be able to tap those supplies in future years when demand in Arizona exceeds our allocation of Colorado River water.

Lynch said those dollars are being held in trust and, therefore, are off-limits to a legislative raid. Legal issues aside, he said lawmakers, in taking those funds, could leave the state short of the water it needs in the future.

Salazar calls for more Grand Canyon flooding

by Felicia Fonseca
Associated Press Writer
December 12, 2009 12:00AM

FLAGSTAFF, Ariz. - Interior Secretary Ken Salazar is calling for more humanmade floods to be released from Glen Canyon Dam into the Colorado River in an effort to protect wildlife and archaeological sites.

The flooding builds up sandbars and beaches along a 277-mile stretch of the river as it runs through the Grand Canyon. Salazar announced this week that his department would head up an effort to determine when and how high-flow experiments should be conducted.

"We must find a way to protect one of the world's most treasured landscapes - the Grand Canyon - while meeting water and clean energy needs in the face of climate change," Salazar said in a video message to the Colorado River Water Users Association in Las Vegas this week.

The operation of the dam built more than 40 years ago has been controversial.

Since 1963, Glen Canyon Dam has blocked 90 percent of the sediment that provides habitat for plants and animals, beaches for campers and river runners and helped protect archaeological sites from erosion from the downstream Colorado. Several endangered species of fish have declined in numbers.

Environmentalists have decried the high-flow experiments as meaningless without a plan for more steady flows and say the flooding better serves the interests of hydropower than natural resources.

The last high-flow experiment in 2008 sent torrents of water from the dam on the Arizona-Utah line for 60 hours to mimic natural flooding. The results were short-lived, though, and newly built-up sandbars eroded within months.

Compounding the erosion is the practice of sending more water through the dam in the daytime to maximize power generation, then trimming output at night.

The sediment provides a habitat for plants and animals, builds beaches for campers and river runners, and helps protect archaeological sites from erosion and weathering.

John Weisheit, conservation director for the Moab, Utah-based conservation group Living Rivers, said the plan won't work. Aside from getting rid of the dam, the next best thing would be to adjust the flows from the dam to restore the once muddy and warm river that was an ideal habitat, he said.

Salazar must determine if the Grand Canyon or "a few kilowatt hours" is more important, Weisheit said.

The plan for high flows would be developed partly on reports from the U.S. Geological Survey on the effects of the 2008 flood due out next month.

Salazar said high flows could be triggered partly by the sediment deposited when tributaries of the Colorado River downstream from the dam flood. That happens on average every one to two years, said John Hammill, chief of the USGS's Grand Canyon Monitoring and Research Center.

At that rate, it could take more than 30 years to build up sediment to levels existing before the dam was constructed, Hammill said. Keeping flows as low as possible after a manmade flood would help conserve the sandbars, but that flow regime would cut the amount of hydropower produced from the dam, he said.

"Finding that balance has always been a difficult task," he said.

Judge rules against landmark 2003 state water pact

If the tentative ruling is upheld, the agreement aimed at reducing California's reliance on Colorado River water would be voided.

By Bettina Boxall

[Link to story](#)

A state judge appears poised to throw out a landmark pact involving California's use of Colorado River water.

If upheld, Thursday's tentative ruling by a Sacramento County Superior Court judge would unravel a complex 2003 agreement that put the state on a timetable to reduce its reliance on the Colorado River.

Brokered by federal, state and regional officials, the deal also established a program of farm-to-city water sales that are playing a growing role in Southern California's water supply.

"It's very serious," said Jeffrey Kightlinger, general manager of the Metropolitan Water District of Southern California. "There will be appeals. It's going to be some time before we know what it all means and what the impact is."

Ironically, the action comes in a case in which Judge Roland L. Candee was asked to validate the agreement.

Examining the 13 contracts that make up the deal, Candee focused on those involving a state commitment to help fund restoration of the Salton Sea in Imperial County.

The judge concluded that the language amounted to a blank check in which the state was promising to fund restoration, even if it cost billions. Such an open-ended pledge, Candee found, violated the state Constitution.

"The court has no ability to sanction a way to contract around the Constitution," the 27-page ruling states. "It is clear to this court that if this contract language is validated, executive agencies of the state can contract for amounts well over the constitutional debt limit."

Concluding that all the agreements were linked, he invalidated the other contracts as well, even though he seemed to have no quibble with them.

"It certainly was not what we expected," said Kevin Kelley, spokesman for the Imperial Irrigation District, which launched the court action. "While it's clearly a cause for concern in the Imperial Valley, it's also of great concern to Southern California."

Candee set a Dec. 17 hearing for arguments on his tentative ruling, and water officials said this week's opinion was not the final word. "It is not the end of the story," said Dennis Cushman, assistant general manager of the San Diego County Water Authority. "The water is continuing to flow."

San Diego is one of the major beneficiaries of the 2003 agreement, which allows the water-rich Imperial district to sell some of its Colorado River supplies to the authority. Combined with another arrangement, the San Diego region this year is getting nearly a quarter of its supplies through transfers under the accord. Those water sales are scheduled to increase over the years.

The transfers and Salton Sea restoration are intended to help lessen California's dependence on the Colorado River.

For decades the state took more than its legal allotment in the form of surplus deliveries. It agreed to phase out that surplus use over a period of years to free up supplies for other states on the river.

The pact also called for the state to help pick up the tab for restoration of the Salton Sea, an important stop for migrating waterfowl that is fed by irrigation runoff. The water transfers will eventually decrease that runoff, raising the salinity of the sea and compounding its environmental problems.

State of water depends on the Colorado River

Las Vegas Sun

Pat Mulroy

Sunday, Dec. 27, 2009 | 2:01 a.m.

[Linked here](#)

In the coming decade our primary water source, the Colorado River, will have more years with less water than years with more water. Still, I'm optimistic that Las Vegas will be ready for whatever nature throws our way.

If the drought gets very severe in the Colorado River Basin, water should become a national topic, and we'll be talking about retooling the nation's water supply as a whole. A lot depends on whether there's a larger national solution or if Southern Nevada has to take care of itself.

By 2020 I think we will have developed partnerships with Mexican entities for desalination plants and exchanging water on the Colorado River.

As far as the pipeline to bring water from Northern Nevada to Southern Nevada, you tell me what the hydrology in the Snake Valley Basin looks like in 2020 and I'll tell you if we're going there. If Southern Nevada has to fend for itself, I think we'll have no choice but to develop that water supply. We can't desalt our way out of this problem; the solution has to be larger and more dramatic.

As long as water supplies on the Colorado River stay relatively stable, Southern Nevada has lots of opportunities for water exchanges and desalination. But if climate scientists' worst-case scenario on the Colorado River were to materialize and lake levels were to drop significantly, this conversation would change dramatically.

If we see a real downturn in the hydrology, then I'm not sure we have a choice but to begin pursuing the in-state pipeline.

We'll have our third intake at Lake Mead finished in 2013, and that will give us access to better-quality lake water for most of the next decade. Plus, the chances are pretty high that the lake will drop below the level of our two existing intakes, so the third intake will guarantee our access to water for the foreseeable future, barring some catastrophic event.

Water quality is going to continue to be important. Right now we have top-of-the-line treatment facilities. Very few places do this level of treatment on water. But we're not going to keep every little thing out of the water all the time. The desire of some groups to have water with absolutely nothing in it is going to run afoul of available technology. We can't use reverse-osmosis to treat every drop of water that comes into this community. It would cost billions of dollars of investment and it wouldn't mean a drop more water or impact public health.

Regardless, water prices are going to go up gradually in the next 10 years. They have to. I don't know how you avoid it. Whether it's desalination or new water treatment technology or increased conservation, you're going to see prices gradually nudge up.

I think we'll continue to see more conservation. I think the community would resist stricter rules on turf, but there's still a lot of unnecessary turf that can be removed and lots of improvements that can be made. Irrigation technology is going to improve, allowing us to use less water to maintain landscaping in a desert environment. And I see the green building community coming around to crediting us for our water recycling program instead of pushing gray water systems, which don't create a single new drop of water. The only way I see us having to enact more stringent conservation measures would be in case of a resource crisis.

Ten years is a very long time, and I've seen lots of changes occur within a 10-year period, so I think a lot hinges on whether or not the hydrology in the basins really gets bad.

Pat Mulroy is the general manager of the Southern Nevada Water Authority.

Protest Hearings on Water for Nuclear Reactor to be Held January 12 in Green River, Utah

LIVING RIVERS & COLORADO RIVERKEEPER

PO BOX 466

MOAB, UT 84532

PHONE: 435-259-1063

FAX: 435-259-7612

www.livingrivers.org

FOR IMMEDIATE RELEASE

January 7, 2010

Contacts:

Sarah Fields - 435-210-0166; sarah@uraniumwatch.org

John Weisheit - 435-259-1063; Cell: 435-260-2590; john@livingrivers.org

Protest Hearings on Water for Nuclear Reactor to be Held January 12 in Green River, Utah

On January 12, 2010, the Utah Division of Water Rights will hold hearings on the protests of the withdrawal of water from the Green River for a proposed nuclear power plant a few miles west of the City of Green River, Utah. The hearings start at 9:00 a.m. at the John Wesley Powell Museum, 1765 East Main, Green River, Utah.

Living Rivers (LR) and Uranium Watch (UW), along with individuals, organizations, and government representatives will participate in the hearings as parties. The parties include the Grand County Council, U.S. Fish and Wildlife Service (USFWS), Green River ranchers and farmers and a river recreation company, Grand County citizens, Red Rock Forests, HEAL Utah, Center for Biological Diversity, the Uintah Water Conservancy District, Utah Rivers Council, and the Sierra Club.

The hearings will consider the applications by the Kane County and San Juan County Water Conservancy Districts to change the use, place of use, and points of diversion for 53,600 acre feet of water (about 47 million gallons per day) for the reactor planned by

Blue Castle Holdings, Inc. (formerly Transition Power Development LLC). Blue Castle Holdings Inc. (BCH) intends to site the reactor on Utah School and Institutional Trust Lands Administration land that has been leased to Emery County for an industrial park. Although BCH news releases (www.bluecastleproject.com) state that BCH owns the proposed site, BCH has not purchased the land.

The requirements for approval of an application for a new appropriation or a change are found at Utah Code 73-3-8:

http://le.utah.gov/~code/TITLE73/htm/73_03_000800.htm

According to Section 73-3-8, it shall be the duty of the state engineer to approve an application if:

- There is unappropriated water in the proposed source.
- The proposed use will not impair existing rights.
- The proposed use will not interfere with the more beneficial use of the water.
- The proposed plan is physically feasible.
- The proposed plan is economically feasible.
- The proposed plan will not be detrimental to the public welfare.
- The applicant has the financial ability to complete the proposed works.
- The application was filed in good faith and not for purposes of speculation or monopoly.
- The appropriation will not unreasonably affect public recreation.
- The appropriation will not unreasonably affect the natural stream environment.

BCH seeks to accumulate assets, including rights to water in the Green River, in order to develop a "shovel ready" site. There is no information available about who would construct and operate the reactor, where the billions of dollars necessary for such a project would come from, who would purchase the electricity, who would use the electricity, or how, exactly, this very complex project would come together.

Sarah Fields of Uranium Watch says, "This is clearly a speculative venture, which is not permitted when water is appropriated for use in Utah."

There are serious questions about whether the proposed plan is physically and economically feasible. The applicant is supposed to have the financial ability to complete the proposed works; but at this time, the entity that would build and run the proposed reactor is not known. For some reason the DWR has not requested additional information, nor initiated a study of the impacts of the withdrawal of the water to supply the operational and safety related needs of the reactor.

The use of the water would impair existing rights on the Green River, impact public recreation, and damage the natural stream environment. In a time of increasing water scarcity, the availability of water and negative impacts to the endangered and threatened fish species are primary considerations. The USFWS, Center for Biological Diversity, Western Resource Advocates and others are concerned that reducing water quantity and water quality in the Green River will significantly diminish habitat for endangered species and cause three threatened species to be listed as endangered. WRA is a member of the Upper Colorado River Endangered Fish Recovery Program. The program is a collaborative effort with members from four states, federal agencies, and representatives from water users and conservation groups. WRA has requested that the DWR deny the applications or postpone any decision until DWR develops

modeling related to the impacts of the potential depletions on Recovery Flows for endangered and threatened fish in the Upper Colorado River Basin.

John Weisheit of Living Rivers, says, "The Colorado River basin has no water to give anymore. Climate change has already depleted the streamflow of the Colorado River from 15 to 14.1 million acre-feet, and by mid-century streamflow may be a mere 12 million acre-feet."

UW and LR are concerned about the lack of data and information in the applications. The DWR and the public have not been given any of the financial and environmental information that is necessary for the State Engineer to make informed decisions regarding the significant regional impacts of this proposal.

Water experts cautious on CAP

Tony Davis Arizona Daily Star
Tuesday, January 19, 2010 12:00 am
[Linked here](#)

Arizona could face its first Central Arizona Project shortage in 2012, CAP officials said two weeks ago, if this year's Colorado River flows into Lake Powell are as low as forecast - 78 percent of normal - and if next year's river flows are also low.

The shortage would take away less than one-fifth of the CAP's supply, and wouldn't affect cities such as Tucson except for water that the city now sinks into basins for recharge. Full-fledged municipal CAP shortages aren't forecast until 2025.

The Star interviewed six water experts about how people and governments in Arizona are likely to respond to the threat of a shortage:

1. Chris Avery, chief water counsel, city of Tucson: "It will not cause any major changes at the city level. A shortage was much more likely in spring 2006 when Lake Powell was at 33 percent full. We've been trying to make sure that our Colorado River allocation is protected from shortage, so when a shortage hits municipal and industrial users, at that point we are hoping we have enough water stored in the ground in our active

management area to have a backup available. ... We've been concerned about a shortage for a long time. Nobody has been asleep on the wheel on Colorado River issues." 2. Bruce Gungle, Tucson environmentalist, member of city/county Water and Wastewater Study Oversight Committee and a Pima County planning and zoning commissioner: "The committee felt fairly comfortable with Tucson Water's actions on behalf of the community. ... I think it would be premature to act on more aggressive conservation measures. The steps they are asking at this time, given what we know, are adequate. We need to see how things unfold before further steps are taken."

3. Tom McCann, assistant general manager for operations, planning and engineering for the Central Arizona Project: "I would suspect that the type of shortage that we might face in 2012 would generate some media attention but would be unlikely to have any significant impact on municipal water use. ... The looming threat of shortage was not significant enough to stop the state from forcing the layoff of 47 employees at the Department of Water Resources on Jan. 7, more than 25 percent of the department's entire work force."

4. Herb Guenther, director, Arizona Department of Water Resources: "It's something we've been preparing for for some time. We knew that either because of continued overuse, since the Colorado River was overappropriated, and as the Upper Basin grows into their authorized use ... that the water is not going to be there. Based upon the dendrochronology of the tree rings, there will be extended periods of drought we haven't seen in modern history. A shortage in 2012 would be a reminder of how fragile the system is, and we had better accelerate while we still have the opportunities to do initiatives to augment the system with weather modification and desalination."

5. Val Little, director, Water Conservation Alliance of Southern Arizona: "It's definitely already had an impact. I think there's a cumulative effect. Every time there is a newspaper article or a TV story about water levels or shortages, even though people don't understand the details, like a marketing campaign, it does register. Even before the recession started, we were seeing a steady ratcheting down of water use. We have a way to solve the problem. It is just going to cost a lot of money. When people start seeing the cost of desal (desalination), I think they will quickly turn to saying, 'OK, I will use a lot less.' "

6. Sharon Megdal, director, University of Arizona Water Resources Research Center: "I think it will have a significant impact on peoples' thoughts on water supply - that they understand that shortages are real, not something just talked about. Not long ago, people said, 'We know there will be shortages, but not this soon,' so it's earlier than people expected. I think it's important for people not to become alarmed about the magnitude of the shortage that could occur. We could end up having significant storms that help the runoff. But I think people have to be tuned into the fact that we are the lowest priority on the Colorado River and that has implications for us. People are trying to do something about it and stay ahead of the curve. People need to be vigilant. I think people are."

DID YOU KNOW

The Central Arizona Project is a 336-mile collection of pipelines and canals pumping Colorado River uphill from Lake Havasu, in Western Arizona, south and east to Tucson. Its supply is dependent in part on the storage levels in Lake Powell.

The CAP is expected to run short at times in part because the Colorado River is overallocated among seven states: Arizona, California, Colorado, Nevada, New Mexico, Wyoming and Utah.

If the river does run short, the CAP is last on the priority list for water deliveries from the river, under the 1968 law that authorized the \$3.6 billion project's construction.

Colorado pipeline proposal stirs water fears

Green River » Entrepreneur would tap flow before it reaches Utah.
By Brandon Loomis for The Salt Lake Tribune

[Linked here](#)

Seedskaadee National Wildlife Refuge, Wyo. » A big gulp of the little stream that splits these sagebrush prairies might take a \$3 billion detour across the Great Divide and into Colorado's bullish future.

It's one former Utah ranch boy's dream to build a 400-mile pipeline to water the booming Denver suburbs, and beyond to Pueblo, with the glacial and snowmelt waters that course through Wyoming's Green River.

In an audacious test of the Western axiom that water flows toward money, Fort Collins, Colo., entrepreneur Aaron Million wants to tap this Colorado River tributary just downstream from here and send it to faucets in neighborhoods that don't yet exist.

"We certainly don't want to impact the Green River," says Million, who spent his youthful summers shoveling mud to open and close flood-irrigation canals to his grandfather's melon farm in Green River, Utah.

His plan worries Utah and Wyoming officials, who don't dispute that Colorado has a legal right to the water under the Colorado River Compact. They never expected their neighbor to take its share from a river that they consider money in their water banks, but rather thought the diversion would come from the Colorado River to the south.

Million wants to sell up to 250,000 acre-feet, or 81 billion gallons, a year. It's enough to supply perhaps a quarter of Colorado's projected new needs if its population doubles to 10 million as predicted by 2050.

He insists it won't harm boating, fishing, four endangered Utah fish or other states' legal rights to Colorado River Basin flows. And here at Seedskaadee, he sees no reason why

two downstream diversion pipes -- on the river and in Flaming Gorge Reservoir -- should threaten a delicate and dying cottonwood oasis for eagles, ospreys and moose. Ripple effect » Up and down the watershed, doubters fear all of those resources and rights are at risk. They're flooding the U.S. Army Corps of Engineers with critical or skeptical comments as it reviews Million's pipeline proposal with a federal environmental impact statement.

"That river is so quickly impacted by [changing] water conditions," says Mark Forslund, a Heber City fly-fishing guide who has floated the Green here for a dozen years.

Unlike lower stretches, he says, the upper Green is shallow, with no holes to hide fish. When flows shrink in winter, fish die. In summer, the water gets hot.

These are conditions that steel the monstrous brown trout and make valiant fighters of the rainbows and native cutthroats, he says. Tinkering with flows from the Fontenelle Dam, above the refuge, could doom them.

The Corps of Engineers is reviewing Million's proposal to take water from just 200 yards downstream of the refuge boundary. Million now says he'll consider a diversion downstream in siltier waters below the city of Green River, Wyo.

Moving it lower is better, Seedskaadee Refuge Manager Carl Millegan says, but won't fully protect the refuge. Draining the river -- perhaps taking as much as half of its lowest winter flows -- will hinder fish migrations from Flaming Gorge. Kokanee salmon, a major source of nutrients for the refuge's other fish and birds, might not swim up to Fontenelle to spawn and die as they do now, he says.

"I can't see how they'd make it," he says while standing on a cutbank and watching one of the refuge's seven eagle nests on a tree across the ice.

Wherever the pipeline starts, Millegan fears, it could require adjusting Fontenelle Dam's releases and stemming spring floods that scour the riverbanks and help new cottonwoods sprout.

Millegan's view north across the sagebrush finds the ice-capped granite of the Wind River Range, source for both the river and uneasiness about its future. The glaciers there, including seven of the 10 largest in the American Rockies, are shrinking. It's just one reason scientists throughout the Colorado River Basin worry that climate changes will drop water levels well below what the states divvied up on paper with the 1922 compact.

"Whether you believe in climate change or not, every year around here is a struggle" for adequate flows, Millegan says. So far this winter's snowpack in the Winds is about half the historic average.

The glaciers have shrunk by a third or more since 1970, according to Craig Thompson, an associate professor of earth sciences and engineering at Western Wyoming Community College. He and faculty colleague Charlie Love, a geologist, have studied the glaciers since 1985.

The glaciers help maintain year-round flows, Thompson says, because they release meltwater late in the summer and fall, when winter snows are gone. When they disappear, he expects, the year-round supply for Denver or any other big pipe evaporates.

Corralling the river also could degrade municipal supplies here, Thompson says, because lower flows mean higher salinity in this mineral-rich valley. Water into money » All this for private gain?

At current Colorado water prices, Thompson figures the Million Conservation Resource group could make \$250 million a year on the water.

"It looks like a project where Million gets to turn millions into billions," he says, "and Wyoming gets to bear the impacts."

Million views his plan more like his great-grandfather might have, back when he built one of the river's earlier irrigation ditches.

"Water in the Western United States was developed privately, initially, by the farm and ranch and mining communities," he says. It wasn't until later that the federal government stepped in, he says. His pipeline is a return to the principle of private capital serving public demand.

"That's how America was built," Million says.

Utah has long expected the Green River would supply its remaining Colorado Basin right of about 400,000 acre-feet, Assistant State Engineer Matt Lindon said. Million's pipeline is a threat.

"That's less water that Utah has to deal with," Lindon says, noting the state already must let half of the river's water drift on to entitled states downstream.

The U.S. Bureau of Reclamation, which manages the river's reservoirs and dams, has told Million and the Corps of Engineers that there's not 250,000 acre-feet a year to spare in Flaming Gorge.

After reserving Wyoming's and Utah's remaining undeveloped water rights and providing mandated minimum flows for endangered pikeminnows, humpback chubs, bonytails and suckers, the agency has estimated the reservoir has 165,000 acre-feet to spare.

Government hydrologists are running new models to double-check that estimate, said Beverley Heffernan, environmental chief for the bureau's Provo office.

"We really think that that number is pretty close to the ballpark," she says. Penciling out » Million is unfazed.

He can build the pipeline with up to \$3 billion in private financing, he says, if he gets 140,000 acre-feet or more. Despite the loud and broad criticism -- including condemnation by the Green River and Laramie city councils in Wyoming -- Million

believes the project is on course. After all, he notes, Colorado has an absolute right to the water.

"We have found no fatal flaws," he says.

Million must show who will buy his water before the environmental review continues. His deadline to produce a list of users to the Corps of Engineers is today. He says he has that list ready, but critics wonder why anyone would sign on without a firm supply and rates in place.

To get a permit to alter wetlands, Million also will have to prove his plan jibes with the Clean Water Act. That means the corps must determine it's the least damaging plan that can reasonably meet the need. The corps is investigating that question, project manager Rena Brand says, and whether in fact Front Range growth is likely to require so much water.

University of Arizona law professor Robert Glennon sees many obstacles in Million's way, "not the least of which is the Rocky Mountains." Farmers and small towns in western Colorado won't want the Front Range to soak up all of Colorado's rights. Further political complications come from Front Range citizens and water districts who "won't want Aaron Million to hold all of the cards."

Glennon's 2008 book, *Unquenchable: America's Water Crisis and What To Do About It*, groups Million with a host of grand-scheming "water alchemists" who, he writes, "gaze at the Mississippi River, the Columbia River, icebergs in Alaska, and rivers in British Columbia and wistfully imagine the problem is solved."

Still, he says, if Million secures real municipal and agricultural customers, the interstate compact's so-called "law of the river" is with him.

"Sometimes," Glennon says, "dreamers pull off their dreams."

####

Colorado River Compact - annual water rights by 7 states and Mexico:

- » Mexico, 1.5 million acre-feet
- » California, 4.4 million acre-feet
- » Arizona, 2.85 million acre-feet
- » Nevada, 300 acre-feet
- » Colorado, 3.9 million acre-feet*
- » Utah, 1.7 million acre-feet*
- » Wyoming, 1 million acre-feet*
- » New Mexico, 850,000 acre-feet*

* = The amounts of water for the 4 states of the Upper Basin, which are estimates based on an annual percentage of shares for 7.5 million acre-feet, which nature has yet to produce. As of 2007, the upper basin annual average yield is presumed to be only 5.75 million acre-feet. Since Year 2000, this amount has decreased to about 5 million acre-feet.

Green River nuclear power proposal sparks big questions

State water engineer must determine if plan is economically feasible.

By Christopher Smart

The Salt Lake Tribune

Salt Lake Tribune

Updated:01/24/2010 05:22:56 PM MST

A fledgling company's plan to build a 3,000 megawatt nuclear power plant near the Green River in eastern Utah is generating more questions than answers. What would happen to the spent nuclear fuel from the two-reactor plant proposed by Utah-based Blue Castle Holdings?

If the Utah Division of Water Rights deems there is enough water in the Green River for the plan, what happens to 50,000 acre feet of water required each year to cool it?

Who would get the electricity generated by the plant? And last, but not least, is the proposal economically feasible, or would it require federal loan guarantees and tax incentives? And are those means available?

Spent fuel » The spent fuel rods would remain at the proposed site, which is about 5 miles northwest of the small Emery County town that takes its name from the river that runs through it.

Should the Green River plant be built -- a fast-track scenario would put it online in 2020, although historically such projects have taken longer -- spent radioactive rods would be stored in dry casks on a 1.5-acre pad at the plant, said Blue Castle CEO Aaron Tilton.

Although the federal government has struggled for decades to establish a storage site at Yucca Mountain, Nev., it is questionable whether the controversial facility will ever open. The casks could be safely stored at the Green River plant for 100 years, say Blue Castle officials.

The waster's fate » Unlike some nuclear reactors, all the water that would be used annually by the plant -- equal to the capacity of East Canyon Reservoir -- would be given off as steam after cooling the nuclear reactor.

It's unknown as this point which of five reactor designs certified by the federal Nuclear Regulatory Commission would be built by Blue Castle. Some of those designs return heated water to its source.

John Flitton, an attorney representing HEAL Utah, an environmental organization protesting the state water application, argues that 50,000 acre feet is a significant amount for arid Utah and not the best of use of a resource that already may be over-allocated.

Flitton is among dozens of individuals and organizations, including the U.S. Fish and Wildlife Service and the federal Bureau of Reclamation, that are protesting the proposed water diversion.

During 2002, the Green River's second-driest year on record, the proposed 50,000 acre feet would have been equivalent to 10 percent of the river's total flow. But in an average year, the volume required for the plant would be less than 2 percent of the river's water. (An acre foot --- 365,000 gallons -- is enough to supply two typical households for one year.)

During dry years, there may not be enough Green River water to go around, Flitton said. "For water users up and down the Green River, it's not a pretty picture."

But Blue Castle officials counter that 2002 was a "once-in-100-years" occurrence and a planned 2,000-acre foot reservoir on site would mitigate such shortfalls. The planned lifetime of the reactors is 40 to 60 years, after which they would be dismantled.

Construction of the plant depends, at least initially, on whether the Utah Division of Water Rights approves diversion applications by Kane and San Juan counties, which have agreed to lease water to Blue Castle.

"It's one of the very most complicated applications the state engineer will ever work on," said John Mann, assistant state water engineer.

Paying for the plant » The decision hinges on criteria beyond how much of the Green River is already allocated for other water rights or potential environmental impacts. Among them, according to Utah law, is whether the project is economically feasible.

That goes to potential investors and where the electricity would be sold. Presently, Tilton concedes, none of the plant's \$16 billion to \$20 billion construction cost is in hand. Rather, Blue Castle plans to secure the Green River water, then obtain a license from the NRC before it begins to raise money to build the plant.

Nils Diaz, a former chairman of the NRC and a minor stake holder in Blue Castle, said the "step-by-step process" is necessary to reduce financial risk for investors. "No major financial commitments will be made without a [NRC] license."

The issue is further complicated, however, by the fact that Utah law disallows water diversions "for purposes of speculation." That means the state water engineer must

determine whether Blue Castle's multi-faceted, 10- to 20-year business plan makes financial sense in a growing and shifting energy market.

"Some of this stuff is on the subjective side," Mann conceded.

But Jerry Olds, a former state water engineer who is now a consultant for Blue Castle, said the Division of Water Rights does not have to prove beyond a reasonable doubt that the nuclear plant is financially viable.

But rather, "Is it reasonable to believe the applicants have the ability to move the project forward?" Blue Castle officials are optimistic, according to Diaz, because nuclear power plants "are big money makers" and a streamlined NRC licensing process makes them more advantageous for investors.

Supply and demand » The West will be in need of new power sources in the coming decades, Blue Castle officials say. They plan to sell up to 50 percent of the electricity in Utah.

Nuclear power will be at the forefront of the nation's power base, they say, because it doesn't put CO2 into the atmosphere, like coal-fired plants.

Nonetheless, Diaz conceded that the upfront capital cost has to be overcome.

Those construction costs could keep Blue Castle from becoming a reality, said Christopher Paine, nuclear program director at the National Resources Defense Council. Like other nuclear power projects, the huge expense and risks mean banks and other private investors likely won't buy in. That leaves taxpayers to underwrite the plant in federal loan guarantees.

Selling electricity in the West is competitive, Paine noted, because there are many sources, including hydro power.

And the future will include power from wind, solar and geothermal plants.

"It sounds like a high-risk project if they're counting on [electricity] sales in a competitive market," he said of the Blue Castle project. "If federal loan guarantees are not available, it's going nowhere."

Big Gulp

Forget the Green River pipeline

Tribune Editorial

Salt Lake Tribune

Updated:01/25/2010 05:28:32 PM MST

[Linked here](#)

A guy named Million wants to spend billions to pipe part of Wyoming's Green River 400 miles to Denver and beyond. But as global warming threatens the flows in the Green, it would be foolhardy to suck great gulps of water from the stream. To sustain both wildlife and humans, the waters should be left alone.

Aaron Million's idea is to pull up to 250,000 acre-feet of water annually from the Green at two points. One would be Flaming Gorge reservoir, the other would be a point upstream, perhaps just below the Seedskeadee National Wildlife Refuge in Wyoming or maybe closer to the town of Green River (Wyoming, not Utah). He would develop the water with \$3 billion in private funds, then sell it to thirsty Coloradans in the suburbs of Denver and points south. Many of these folks may not live there now, but the population of Colorado is projected to double to 10 million by 2050, so Million is sure the water will be needed. It's a variation on "if you build it, they will come."

Colorado is entitled to develop the water within its allocation under the Colorado River Compact of 1922 and succeeding laws of the river.

It's a scheme worthy of William Mulholland, the engineer who ravaged Southern California water resources for the City of Los Angeles early in the 20th century. But today such thinking is outdated, or at least it should be. One reason is that everyone has seen the environmental devastation in the Owens Valley and elsewhere created by Mulholland's projects and others like it.

The Green is fed by the snows and glaciers of the Wind River range, but those glaciers are shrinking. When they're gone, the winter flows of the river will fall, placing greater pressure on the fish, birds and other wildlife that rely on the river and on the humans who use it, including folks from Green River, Wyo., to Green River, Utah, and farther south to Las Vegas and Los Angeles.

The Colorado River Compact allocates the water in the river, and while it is true that portions of Utah's and Colorado's allocations remain undeveloped, it is doubtful that they should be. The reason is that the compact allocations were based on a historically wet cycle in the river, and it is improbable that the river can supply all of the water that has been allocated, particularly in light of climate change.

So the more sensible thing to do is for the people of the West to better adapt to their arid environment and use less water.

Developing ways to pipe water that probably won't be there in the future just doesn't make sense.

Arizona quits Western climate endeavor

by Shaun McKinnon - Feb. 11, 2010 12:00 AM
The Arizona Republic

Arizona will no longer participate in a groundbreaking attempt to limit greenhouse-gas emissions across the West, a change in policy by Gov. Jan Brewer that will include a review of all the state's efforts to combat climate change.

Brewer stopped short of pulling Arizona out of the multistate coalition that plans to regulate greenhouse gases starting in 2012. But she made it clear in an executive order that Arizona will not endorse the emission-control plan or any program that could raise costs for consumers and businesses.

State officials said the policy shift was rooted in concerns that the controversial emissions plan would slow the state's economic recovery. Brewer says the state should focus less on regulations and more on renewable energy and investments by businesses that can create green jobs.

The governor also ordered the Arizona Department of Environmental Quality to take another look at stricter vehicle-emissions rules set to take effect in 2012. Automakers said the rules, based on those adopted by California, would raise the cost of a new car significantly.

The governor's order is another blow to the Western Climate Initiative, a group of seven states and four Canadian provinces that joined forces in 2007 after growing impatient with the federal government to address climate change.

The coalition agreed to implement a regional "cap and trade" system, which limits how much pollution companies can emit, then allows them to buy and sell pollution credits.

Supporters say the system lets the marketplace make polluting more costly, encouraging emitters - factories, power plants and others - to clean up more quickly. So far, California is the only U.S. state in the Western coalition prepared to start the program on schedule in January 2012. The recession and political opposition has slowed legislation to implement the rules in other states.

The Western group is one of several state-led coalitions formed to regulate greenhouse gases. A group of Northeastern states is in the second year of its cap-and-trade system, one that only regulates electric utilities.

A federal plan has stalled in the Senate and is unlikely to move anytime soon. Arizona's chief environmental regulator said Brewer's order, which was signed last week without fanfare, should be seen as a step forward in Arizona's attempts to foster renewable energy and green jobs.

"Arizona needs a green-and-grow approach rather than a cap-and-trade approach," ADEQ Director Benjamin Grumbles said. "We can make environmental and economic progress, and we can do it by staying engaged and creating green-job opportunities."

Brewer ordered the state to continue converting its vehicle fleet so that by January 2012, all vehicles used by the state are hybrids, meet low greenhouse-gas emission standards or use some form of alternative fuel.

The governor also said Arizona can remain active with the Western coalition by exploring policies related to solar power and other renewable energy sources, growth policies that limit pollution or steps to adapt to the changing climate.

"It's very important for the state to stay engaged, to be at the table, but it's also important to convey clearly our position on how to make progress," Grumbles said.

"Right now, given the economic downturn, given the complexity of the cap-and-trade scheme being developed, we're not going to be supportive of it."

Arizona joined the effort under its previous governor, Janet Napolitano. The states involved agreed to the cap-and-trade idea, but each would have to implement the rules at its own state level.

Brewer said legislative approval would be required for Arizona to participate in the regional cap-and-trade plan. The Legislature has attempted several times to dismantle the state's climate-change programs and forbid its participation in the cap-and-trade system. Leaders said Wednesday that lawmakers are unlikely to reconsider their positions.

"I do not believe they would," said Sen. Carolyn Allen, R-Scottsdale, a member of the Senate's Natural Resources, Infrastructure and Public Debt Committee. "But this Legislature is full of surprises."

Environmental groups expressed disappointment at Brewer's decision. Arizona had been a founding member of the Western climate group and had signed on to the cap-and-trade blueprint released in September 2008.

"I think it's embarrassing for the state of Arizona," said Sandy Bahr of the Sierra Club in Phoenix. "It demonstrates a real lack of understanding of how significant of a threat climate change is to the state. We ought to be standing at the front of the line to look at solutions."

Diane Brown, executive director of the advocacy group Arizona PIRG, said Arizona doesn't have to abandon other policies that could help reduce global-warming emissions, such as efforts to increase energy efficiency and reduce vehicle pollution.

"It is important for Arizona to remain at the table with colleagues in other Western states," she said. "A number of policies can still take place to reduce global-warming emissions and, in a state with increasing population, it's particularly important to get ahold of the situation."

Republic reporter Casey Newton contributed to this article.

Abatti OK with no Quantification Settlement Agreement

By DAVID STEFFEN, Staff Writer
Imperial Valley Press Online
[Linked here](#)

Saturday, February 20, 2010 11:52 PM PST

Imperial Irrigation District Director Michael Abatti said he believes the Quantification Settlement Agreement drains district water at the benefit of the coastal cities.

He said he has no objections to Superior Court Judge Roland Candee's recent ruling that invalidates the QSA.

"If they want to call off the QSA, that's fine," Abatti said. "It should be less water, more money and for a shorter period of time."

Water users on the coast should and would accept higher water rates under any new water transfer, he said. He said desalination is another option at \$700 per acre-foot of water.

"They pay \$3 a gallon for gasoline, and they haven't stopped paying for that," he said.

Abatti said those who crafted the QSA would not be well-suited to prepare any future water transfers.

"They can't fix the problems with the same minds that created them," he said.

Abatti said the Imperial Valley needs to protect the water that it first began using when it brought water from the Colorado River to the Valley.

"We are kings on the river on our priorities and privileged rights with the law of the river," Abatti said in reference to the Imperial Valley. "We should respect those rights that were developed and fought for by our past generations and forefathers and defend those as my oath requires me to."

The Valley's claim to Colorado River water is the basis of his statement about "the kings of the river," he said.

"I consider ourselves the kings of the river because we have the biggest entitlement in California," he said.

Abatti said a lack of urban planning on the coast led the water agencies there to need more water and they should not impose on the Valley for it.

“The other parties brought this thing into the Valley with demands,” Abatti said about the 2003 QSA signing. “It was their lack of planning that resulted in a crisis of ours.”

Abatti also said he did not think the federal government would take over IID. He said he doubted the federal government would take over IID’s water rights, either.

“I don’t know if they could, as long as we’re beneficially using it, which we’ve been doing for the past 100 years,” Abatti said.

Demands were made in 2003 before the QSA was signed, Abatti said, and he cited documents from members of Congress about the matter. He said the big cities have been demanding the water.

“They’re demanding we give them resources to make them a better place, but at the same time we need to continue to grow and be a better place for it,” he said.

Among the positive uses of water would be renewable energy in the Valley, he said.

“Geothermal, solar — these need to be developed,” he said. “We’re a hotspot. It’s going to be good for the Imperial Valley’s economy and for the state and the West to meet their required mandates for renewable efforts.”

The QSA, while serving a beneficial purpose for the coastal cities, infringes on the Valley’s water rights, Abatti said.

“The QSA is a good deal for everyone outside Imperial County lines, but it’s a bad deal for everybody inside Imperial County lines,” he said.

Research: Water imports no shield against drought

The fates of the Colorado, Arkansas river basins are intertwined, researchers find.

[Linked here](#)

By CHRIS WOODKA

THE PUEBLO CHIEFTAIN

Simply bringing water from the Colorado River to the Arkansas River basin in Colorado does not improve protection against drought.

The surprising finding was shared last week at the Arkansas Basin Roundtable by climate researchers from Western Water Assessment, a hybrid agency that combines Nation Oceanic and Atmospheric Administration and University of Colorado resources.

Western Water is studying future water projections for the Colorado Water Conservation Board.

“It has always been thought that if you are bringing in water from both sides of the Continental Divide, you have protection. That is not the case,” said Jeff Lukas, of Western Water. “While they vary from year to year, the dry years and wet years in both basins show a strong correlation.”

The two driest years on record in both basins were 1977 and 2002, and the record of imports into the Arkansas River basin bears out Lukas’ depiction of drought protection — or the lack of it. Other than 1987, when little water was brought over in the Fryingpan-Arkansas Project simply because there was no place to put it, 1977 and 2002 produced the least imported water for the Arkansas Valley. In other words, there wasn’t much water available on the other side of the mountains either.

In 1977, the Fry-Ark Project was just getting ramped up, and Lake Pueblo was still filling. Imports, however, dropped to just 11,400 acre-feet, or less than one-third of the typical year at the time because 1977 was the driest on record for the Western Slope.

In 2002, Fry-Ark flows through Boustead Tunnel totalled just 13,200 acre-feet, or about one-fourth of the long-term average. Basinwide, in 2002, imports totalled just half of the long-term average at 67,224 acre-feet, with projects like Twin Lakes, Homestake and Board of Water Works diversions pulling in every drop available.

The year 2002 was the driest on record for the Arkansas River basin, and second-driest on the Colorado River.

“We only have 104 years of data, but we can look at tree rings and see what happened in the past,” Lukas said.

The news doesn’t get any better when peering at those tree rings.

Scientists are able to correlate the width of bands in tree rings to climate conditions with some certainty, based on comparing the data gleaned from them to observed weather conditions in modern times.

The correlation is strongest, dead-on actually, for dry years.

In the past 500 years, the period of record for tree rings in both basins, there have been about eight annual droughts as severe as 1977 and 2002. All show both basins were equally affected.

“They’re showing the same extreme low-flow years,” Lukas said.

More ominous are long-term drought periods in Colorado, some lasting up to 60 years.

In the Arkansas River basin, the longest period of prolonged drought in recorded years was from the 1950s through the ’70s. While there were wet years and even drier years in the 1930s, the average was far below normal. By comparison, the 1980s and ’90s

were the wettest years since the 1910s and '20s, and the past decade has been relatively average.

The Colorado River basin as a whole — it stretches over seven states — saw its lowest recorded flow period in a century in the first decade of this century. However, its performance in Colorado has essentially mirrored the Arkansas River basin. While there is much more water available every year in the Colorado River basin, its wet and dry years come at the same time as the Arkansas River basin.

The tree-ring data show that has been true for 500 years. Worse than that, the recorded history of the basins has not produced a prolonged dry period like those seen in the past, Lukas said.

“From the past record, in the next 100 years, we should anticipate droughts of more severity,” Lukas said.

The trends observed by climate watchers are more than just scholarly pursuits. They have played a prominent place in real-world water decisions.

The Pueblo water board last year bought 27 percent of the shares on the Bessemer Ditch to reduce its reliance on transmountain water.

The water within the Arkansas River basin would not be subject to the same pressures as imports. California, Arizona and Nevada rely on Colorado River flows both for population and producing electricity, and Colorado water providers on the Front Range fear a call on the river.

Front Range water users have invested in studies aimed at projecting long-term climate trends to incorporate in their ongoing planning.

Entrepreneur Aaron Million has argued that the Upper Green River basin in Wyoming would provide a different climate cycle for Colorado to tap into in making the case for his proposed Flaming Gorge pipeline.

There is a large deal of uncertainty over future climate.

Nearly all climate models agree Colorado is headed into a warmer period in the next 50 years, a rise in average temperature of 4 degrees Fahrenheit, that will at least increase water demand.

The models cannot agree on the trend for precipitation — tracking them on a graph looks like a mess of multicolored spaghetti — because Colorado is located 1,000 miles from its primary water source, the Pacific Ocean, said Joe Barsugli, Lukas' colleague at Western Water.

Slight changes in the weather could mean big impacts on water, he added.

Overall, about 10 million acre-feet of water flow out of Colorado every year, while human diversions total about 5 million acre-feet.

In terms of precipitation, that equates to a total of 3 inches over the state's entire area. The average precipitation on the Eastern plains and foothills is between 14 and 20 inches, and twice that in the mountains. The rest of the water soaks into the ground, evaporates or is used by natural vegetation, Barsugli explained.

Barsugli showed worldwide models that indicated the past winter has been colder in nearly all of the United States, but warmer in almost every other part of the world. The past 40 years, globally, have been among the warmest on record and, yes, greenhouse gases are really increasing at alarming rates — whatever the cause.

Long-term warming will affect the quantity and quality of water that is available in Colorado, regardless of precipitation variability, he added.

"Climate change is much more variable in the local areas," Barsugli said, adding that a new assessment that will be published in the next few months is among the first to look at the Arkansas River basin. "You have to look at the bigger picture, but there is not one correct climate model. It's important to compare the models."

Utah's first N-plant won't float without water rights

By Rachel Waldholz
Salt Lake Tribune

The former uranium boomtown of Green River sits along I-70 in eastern Utah, 100 miles from the closest city. Now it may become the Western outpost of America's nascent nuclear renaissance. Blue Castle Holdings, a three-year-old, politically connected startup, wants to build a nuclear power plant there -- Utah's first, and the first in the West since 1987.

Nuclear power has recently gained cachet -- and the backing of the Obama administration -- for its potential to help avert climate change. Nuclear generation emits a fraction of the greenhouse gases of coal or natural gas generation, and provides a steadier energy supply, at a larger scale, than solar or wind arrays. In January, President Obama made nuclear power the center of his "clean energy" agenda in his State of the Union speech. Two days later, he announced a commission to study nuclear waste solutions, and proposed tripling federal loan guarantees for new plants to \$54 billion.

The Green River proposal has sparked intense skepticism. Critics ask where the funding will come from, where the electricity will go, and, of course, what will happen to the waste. But the first hurdle is more immediate. In the Utah desert, this possible climate change solution is colliding with one of its projected consequences: water scarcity.

Blue Castle needs some 50,000 acre-feet annually -- enough water to supply up to 100,000 homes -- to cool the reactors of its proposed 3,000-megawatt plant, which would produce enough electricity to power nearly 3 million households. In 2007, the company struck a deal to lease 53,600 acre-feet from Utah's San Juan and Kane counties, which are about 150 miles south of the proposed reactor site. Blue Castle has applied to move the counties' diversion points upstream, onto the Green River, from their current locations on the San Juan River and Lake Powell. Aaron Tilton, Blue Castle's CEO and a former Utah state legislator, believes the Green, the Colorado's major tributary, has enough water for the project; in an average year, he says, the plant would lower the river by less than 2 inches.

But the plan has drawn protests from local farm, health and recreation interests, environmental groups, the U.S. Fish and Wildlife Service and the Bureau of Reclamation. "Our main concern is that the water really isn't there," says John Weisheit, conservation director of the nonprofit Living Rivers in Moab. A 2009 study by the National Oceanic and Atmospheric Administration cites estimates that over the next 50 years, the Colorado River system could lose between 6 and 20 percent of its total volume to climate change-induced drought. Fish and Wildlife, the BOR and the Utah Division of Water Resources want the state engineer to wait for the results of several studies on future water levels in the Green River and across the Colorado Basin before allocating any more rights.

If more water is taken from the river, the agencies may not be able to keep stream flow high enough to protect several species of rare and endangered fish, says Wayne Pullan of Reclamation's Provo office.

And if the Green River drops, Blue Castle would have early rights to what remains: While San Juan's rights are junior (2001), Kane County has 1964 rights to 29,600 acre-feet. That places it ahead of many rights holders, including Reclamation's Central Utah Project, which supplies water to much of the Wasatch Front. Pullan says that in a drought, calls from such senior rights could short the project's users, including Salt Lake City.

This is part of a much larger tangle. If Utah develops just 360,000 more acre-feet of Colorado Basin water, it will hit its limit (1.4 million acre-feet) under the Colorado River Compact. But it has handed out paper rights to an additional 1.1 million acre-feet. All those rights holders, like Kane County, still have the right to develop. But Utah will have no excess water to supply them, and so water will be rationed by priority date across the state. In that context, Blue Castle's request is nothing to sniff at. It's a seventh of the water Utah has left.

At times, the Blue Castle proposal looks like a water right in search of a project. Kane County has five more years to prove it is putting its water rights to "beneficial use," or risk forfeiting them, according to Mike Noel, executive director of the Kane County Water Conservancy District. By leasing the water to Blue Castle, the county hopes to meet its deadline -- and earn \$1 million a year once the reactors are constructed. (San Juan County would earn \$800,000 annually.) Noel, a Utah state representative from

Kanab, is the project's unofficial godfather. He was hunting for a use for Kane County's water while serving on the same committee with then-Rep. Tilton.

Even if Blue Castle does get its water rights, though, it's unclear whether the project will ever materialize.

Nuclear power plants require immense up-front funding: at least \$100 million for the Nuclear Regulatory Commission's application process, which could take five to seven years or longer. Estimates for the cost of building the reactors range between \$7 billion and \$15 billion.

And there is the never-ending question of what to do with the high-level nuclear waste -- especially since the Obama administration has essentially pulled the plug on the Yucca Mountain repository.

This story originally ran in the March 1, 2010 issue of High Country News (hcn.org).

Below-average runoff predicted for Farmington (San Juan River)

By Steve Lynn The Daily Times

Posted: 04/15/2010 12:00:00 AM MDT

[Link](#)

FARMINGTON — Below average snowpack in southwest Colorado's San Juan Mountains means less spring runoff for northwest New Mexico rivers, according to the National Weather Service.

Snowpack in the San Juans recently has fallen below average for this time of year, said Bryon Lawrence, service hydrologist for the National Weather Service in Grand Junction, Colo.

The amount of water contained in snow-pack around southwest Colorado rivers, including the San Juan and Animas rivers, has fallen to about 88 percent of average.

The weather service predicts the San Juan River will flow at 70 to 90 percent of its normal volume during the runoff period from April through July, Lawrence said.

In Farmington, the Animas River is expected to run at 3,600 cubic feet per second during the height of the spring runoff period sometime between Memorial Day weekend and mid-June. The volume of the river normally peaks at 4,900 cubic feet per second.

By contrast, Lawrence said last year's peak flow in the Animas River was measured at 5,170 cubic feet per second May 13.

"If we get a really long period of warm weather combined with rain and high freezing levels and high snow levels, then snow is going to melt quicker and we're going to be getting more water through the rivers, and peak flows are going to be higher," he said.

He added that recent storms that have coated the snow on peaks with dirt could hasten snow-melt. The dirt will help the snow absorb heat from the sun; snow normally reflects sun rays.

However, not as much dirt has settled in the high country this year versus last year, he said. The soil in northeastern Arizona and southeastern Utah has retained moisture. The weather service believes those regions are the source of the dirt.

Northwest New Mexico received about 150 percent of average precipitation this winter enhanced by a strong El Niño weather pattern, said Todd Shoemake, a meteorologist for the National Weather Service in Albuquerque.

"We haven't really seen the runoff process really start to kick off in full swing just yet," Shoemake said.

He explained that temperatures were below normal in March and only in the last couple weeks has the region seen higher temperatures.

"As far as the timing of the onset of the spring melt, it's probably running a little bit behind where it normally would," he said. "We haven't really seen much of an up-tick in any of our river gauges."

The amount of runoff affects the city of Farmington's water supply, said Jeff Smaka, the city's Public Works department director.

The city pumps water April through October from the Animas River into Farmington Lake.

Colorado River water policy faces an age of limits

By Dan McCool
Salt Lake Tribune

Change comes hard to Western water policy. The Prior Appropriation Doctrine, interstate compacts, groundwater law, the "law of the river" -- all of these seem set in stone in the minds of the region's policymakers.

Of course, the West's rivers aren't bound by such a static existence. Indeed, they are changing in fundamental ways, opening a wide chasm between our water policy and our water sources. This is particularly true for the Colorado River Basin.

Climate scientists are predicting a 10-to-30 percent reduction in flow for the Colorado -- a stark contrast to the rosy assumptions that underlay the Colorado River Compact when it was signed 88 years ago. Researchers from the Scripps Institution of Oceanography recently predicted that Lake Mead and Lake Powell have a 50 percent chance of going dry by 2021. These days, Lake Mead is at 45 percent capacity and Lake Powell is at 57 percent.

Farther south, water shortages are predicted for northern Arizona communities, including Flagstaff, by 2050. The Central Arizona Project, which provides water to Phoenix and Tucson, may run short of water as early as 2012.

And farther downstream, Mexico is looking at a disaster along its stretch of the river due to inadequate flows, prompting one Mexican official to declare, "We are clearly on a collision course with a catastrophe," according to The Los Angeles Times.

Then there are the numerous environmental problems in the basin. Six aquatic species are threatened or endangered, though the invasive quagga mussels are doing just fine. The river corridor in the Grand Canyon, deprived of sediment and choked with tamarisk, is dying; the river's delta is already on its deathbed. The Colorado is plagued by water quality problems, especially salinity, perchlorate rocket fuel, runoff from agriculture and inadequate sewage treatment.

The shortage of surface water has pushed some communities to mine groundwater. Communities as diverse as Tucson, Las Vegas and Cedar City are experiencing subsidence because of their excessive withdrawals of groundwater.

The sediment that once was the lifeblood of the river now forms a giant plug at the junction of Cataract Canyon and Glen Canyon. It is simply a matter of time before Lake Powell becomes the world's largest mud catchment, rendering the 710-foot-tall dam useless.

Water shortages in the Lower Basin will be greatly exacerbated by proposals to build giant pipelines. Las Vegas, which gets 90 percent of its water from Lake Mead, wants to

build a \$4 billion pipeline to central Nevada to pump groundwater from beneath several valleys in the Great Basin. This 300-mile pipeline is likely to lower groundwater levels, threatening a national park, national wildlife refuges, an Indian reservation, and local ranchers and farmers. The resulting loss of surface flora is not just a cosmetic problem; it could result in huge dust storms that blanket Salt Lake City. St. George, sort of a Las Vegas wannabe in terms of growth rate (but without the sinful fun), wants to build a billion-dollar pipeline that sucks water out of Lake Powell -- despite the imminent demise of the lake. In the Upper Basin, Aaron Million, with dreams to match his name, wants to build a 560-mile pipeline from the Green River to Colorado's Front Range and divert 250,000 acre-feet.

Plus, the city of Denver wants to dramatically increase the water it pumps out of the Colorado River Basin, and the state of Wyoming recently created a new state "Dam and Reservoir Section" to investigate the feasibility of new diversions on the Green River.

These grandiose schemes for new diversions are not "the way of the future," but rather the last gasp of a dying water ethos. The myriad problems of the Colorado River point to one inescapable conclusion: Western water policy is hopelessly, irrevocably unsustainable. Policies that once created stability are now an albatross, preventing the West from making fundamental changes in the way it allocates and uses its water.

It is time for a new era in water management. The first step requires dispensing with the absurd notion that infinite growth can take place in a region with severely constrained resources.

The second step is to realize that agriculture, which uses the lion's share of the river, is going to take a big hit. Many of the crops grown in the basin are low value, such as hay, or are commodity crops that are already over-produced in the United States.

And the third step requires improving the quality of the water by forcing all polluters to clean up their mess. That includes agriculture, mining and municipalities with inadequate urban treatment. These changes will not be easy -- it's like prescribing a root canal for an entire region without offering nitrous oxide. But the longer we wait, the more difficult it will be to make the transition to a policy that meets the reasonable needs of cities, a service economy and the age of limits.

Sipping from the Third Straw

Sipping from the Third Straw

[Water Canada](#)

Posted on 22 April 2010 · Written by Kerry Freek

Patricia Mulroy addresses a rapt WaterTech audience this afternoon.

“I’m not here to steal your water,” joked Patricia Mulroy as she took the stage this afternoon.

Funny she should say so. This year’s WaterTech, taking place in Banff, isn’t too far from Calgary, which is currently experiencing its own water shortage.

Mulroy is the general manager of the Southern Nevada Water Authority (SNWA), and, although she jests, water shortages are no joke to her. “The ten-year drought in the Colorado River has been devastating,” she said.

Southern Nevada relies on the tired, rapidly depleting Lake Mead for 90 per cent of its water (the other 10 per cent comes from groundwater). In just ten years, Mead’s elevation levels have dropped from approximately 1,225 to just over 1,080 feet—and they’re expected to be lower. “At 1,050 feet, we’ll see the end of the Hoover Dam,” said Mulroy.

Already it has two intakes to serve two million residents and 40 million annual visitors, but, due to Mead’s condition, Las Vegas’ first intake may soon be out of business. The SNWA has had no choice but to begin construction on a third “straw” at a lower elevation. The estimated cost? About US\$800 million, including a \$25-million tunnel boring machine. Despite the expense, said Mulroy, “failure is not an option.”

Not only is the first intake at risk, but now they face a new challenge: quagga mussels. The second intake (built in the mid-90s at elevation 1,000 feet) has been infested by this invasive species, she explained, showing images that make a Great Lakes-dweller like me shudder in fear.

In a chat prior to her talk, I asked Pat Mulroy if there were ever any other options for Las Vegas. “There were no other projects. The only other alternative is to diversify where the water comes from, and that’s the next iteration. It’s not as if you could look at alternatives,” she said. “We’re racing the clock.” Prior to beginning work on the third intake, they upgraded pumps on the second to higher capacity to ensure that they’d get through the summers of 2011 and 2012 if the drought beats the completion of the third.

When did real change start to take place? “We transformed everything in 2003,” she said. “We now recycle 100 per cent of all wastewater—whether it goes directly to a reuse facility and is delivered to parks and golf courses, or large tertiary plants that return the flow to Lake Mead. For every gallon of water we put back into Lake Mead, we

can take out an additional gallon over our allotment. Since we can convert all our reuse water, we can increase our diversions to Lake Mead. Everything is reclaimed.”

What is Las Vegas doing to promote water conservation? They have a number of incentive programs, Mulroy told me. For example, for each square foot of grass removed from properties, customers receive US\$1.50 per square foot. They’re also encouraged use desert-appropriate landscaping plans. “To date we’ve spent over US\$130 million rebating to our customers to take turf out,” said Mulroy.

New construction must not have new grass; it must be desert landscaping. If customers want a fountain, they have to remove enough turf to equal 50 times the amount of water that the fountain would use in a year. Everyone is on a strict permanent watering schedule—they even have water cops, Mulroy told me. “We have a hefty fine schedule. You’re fined for every day you violate—if we see water running off your property, or you water on the wrong day, or you have a broken sprinkler head... we’re there to get people’s attention.

Our water enforcement is going out to educate people.” I asked Mulroy how the water shortage and restrictions have changed the behaviour of Las Vegas residents.

“We’ve seen a huge paradigm shift,” she said. “We’ve been able to save 26 billion gallons of water. We drove our per capita consumption down from 365 down to 240 and have set a new goal of 199, and that’s diversion, so it will be way down there by the time we get to 199.”

The Bureau of Reclamation expects that Lake Mead will rebound “somewhat” over the next two years. What does Mulroy think about these claims? “I love it when they say those things because they’re predicting next year’s snowfall,” she said. “They want this [drought] to end just as much as we do. But those kinds of pronouncements are very annoying because they’re not borne in reality. You have to hope for the best and plan for the worst.”

Southern Nevada Water Authority hails benefits of far-flung projects

By HENRY BREAN

LAS VEGAS REVIEW-JOURNAL

[Linked here](#)

Southern Nevada Water Authority officials Kay Brothers, far left, and Bill Rinne take part in a tour Wednesday of a new reservoir in the California desert near the Mexico border. The authority helped pay for the structure in exchange for Colorado River water.

Southern Nevada Water Authority officials traveled to the desert near the Mexico border Wednesday to celebrate two projects they helped pay for even though they are hundreds of miles outside their service area.

The projects, which grew from interstate collaborations that seemed inconceivable just over a decade ago, should help squeeze more water out of the drought-stricken Colorado River.

Wednesday's tour began along the All-American Canal in California, where a new reservoir will soon begin capturing river water that would otherwise flow into Mexico but not count against that country's river allocation.

The water authority picked up roughly 80 percent of the cost for the \$172 million reservoir. In exchange, the authority will be allowed gradually to take an extra 400,000 acre-feet of water out of Lake Mead over the next 25 years as conditions on the river system permit.

One acre-feet of water is enough to supply two average Las Vegas homes for one year. The 300,000 acre-feet Nevada gets from the Colorado River each year is used to supply about 90 percent of the water used in the Las Vegas Valley.

Municipal water purveyors in Arizona and California also bought into the so-called Drop 2 Reservoir, which the U.S. Bureau of Reclamation hopes to begin operating in July.

Lorri Gray-Lee is director for the bureau's lower Colorado River region. She said that a decade ago she never could have talked the region's water managers into paying millions of dollars for such a reservoir.

"They would have laughed me out of the room," she said.

Water authority chief Pat Mulroy said the drought on the Colorado has changed that. It has forced the states that share the river, and the municipal and agricultural interests within those states, to work together in ways they never did before.

It also has led major water purveyors such as the authority to invest directly in far-flung projects such as Drop 2 and a water desalting plant that is now being brought out of mothballs in Yuma, Ariz.

"And our next investment, if you want my prediction, will be in Mexico," said Mulroy, who was in Yuma on Wednesday to mark the reopening of the desalting plant. "So we'll even be leaving the United States and investing in the nation of Mexico."

Specifically, she said Nevada could one day help fund the construction of ocean desalting plants along the Mexican coast in exchange for a share of that country's Colorado River water.

The water authority could also buy into some future program that would pay farmers in Mexico to fallow crops temporarily that would otherwise use water from the Colorado.

Seven states and Mexico share water from the Colorado River under compacts dating back nearly 90 years.

The Yuma Desalting Plant will begin a one-year pilot program next week to test its ability to clean salt from agricultural runoff and deliver the water to Mexico.

The pilot run is expected to produce about 29,000 acre-feet of desalted water and allow an equal amount of Colorado River water to be kept in Lake Mead.

The authority will pay more than \$2 million, or about 10 percent of the cost for the pilot run, in exchange for about 10 percent of the river water the plant's operation is expected save.

Experts predict 'mediocre' runoff for Colorado

JOHN GARDNER

GLENWOOD SPRINGS CORRESPONDENT

[Linked here](#)

GLENWOOD SPRINGS — The spring runoff season is an exciting time for hydrologists.

"This is our favorite time of year," said Bryon Lawrence, a hydrologist with the National Oceanic and Atmospheric Administration office in Grand Junction. "Because this is when things start to happen."

However, Lawrence is not too excited about the spring runoff season this year due to a lack of snow accumulation this winter. He said that this year is shaping up to be a "mediocre" runoff year at best.

"The snowpack has been considerably below normal, and we are not expecting a really good runoff this year," he said.

As of Monday, the Colorado River basin was reportedly at 90 percent of year-to-date precipitation average, according to the Natural Resources Conservation Service.

The recent snowstorms have helped bring the precipitation levels up slightly, but they have not added much to the snowpack, according to Dave Merritt with the Colorado River Water Conservation District.

"They've helped somewhat, but it hasn't changed things much as of [Monday]," he said. "We are still looking pretty dry despite what we are seeing. It hasn't done that much to the snowpack."

According to Merritt the area from Grand Lake to Grand Junction remains at 78 percent of average snowpack levels. And statewide, Colorado is at 84 percent of average, he said. Western Colorado is currently at 80 percent of annual snowpack.

The low snowpack will result in a less-than-average runoff, Lawrence said.

According to the National Weather Service, the Colorado River peaked on May 21 in 2009, running at 10,000 cubic feet per second (CFS) at Dotsero. The average peak runoff for the Colorado River at Dotsero is 9,425 cfs. The weather service predicts the peak runoff to be well below the 2009 levels, at only 4,500 cfs this year at the same location.

Lawrence expected the peak runoff not to occur until the end of May, or even as late as June 20. However, that is the typical time frame for the peak to occur, he said.

The National Water Information System real-time water flows used by the U.S. Geological Survey reported the Colorado near Dotsero at 1,360 cfs on Monday.

In comparison, this year the Roaring Fork River basin is currently at 95 percent of average for precipitation. The Roaring Fork's peak flow is expected to be about 4,200 cfs, just 300 cfs less than experts are expecting for the Colorado River. However, that is still well below the average peak runoff of 6,150 cfs for the Fork.

Of course, predicting the peak runoff flow is a very slippery slope.

"It's really difficult to know the day you will see peak flow because it all depends on weather conditions," Lawrence said.

With warmer weather, peak runoff will occur much more quickly than with lower temperatures.

According to the Bureau of Reclamation, dry conditions for the Upper Colorado River Basin have persisted in 2010. According to the bureau's website, the Climate Prediction Center estimates that temperatures for May, June and July in the Upper Colorado River Basin are expected to be above average, increasing the pace of runoff. However, precipitation is also expected to be above average for the same time period.

But it may not be enough to bring levels up to sufficient amounts.

"It's a little too late," Lawrence said. "It's going to take a lot more to make up that deficit, even with what we've had."

Ariz. desalting plant begins operation, replacement flows for wetland secured

April Reese, E&E reporter

The Bureau of Reclamation this week flipped the switch on the dormant Yuma Desalting Plant in Arizona, launching a yearlong test to determine whether the 18-year-old facility can finally live up to its promise to help solve the Colorado River Basin's water supply challenges.

The pilot run, which began Monday, will also be a test of a landmark agreement involving the United States, Mexico and a coalition of environmental groups to protect a vast Mexican wetland that depends on the salty agricultural runoff that will now be diverted to the plant, where it will be cleaned and released into the Colorado River.

The \$250 million plant was built in 1992 to help meet treaty obligations requiring the United States to send 1.5 million acre-feet of clean Colorado River water to Mexico each year. But nine months after signing the treaty, plant managers shut down the

facility after a flood damaged an intake canal. Ample flows in the Colorado River Basin in the ensuing years rendered the plant unnecessary.

Now, with a prolonged drought parching the Lower Colorado Basin -- and with Arizona, Nevada and California scrambling to avoid water shortages amid rising demand -- the plant has taken on renewed importance (Land Letter, March 22, 2007). Water providers are hoping that the pilot project, which will treat 29,000 acre-feet of runoff from Arizona farms and discharge the cleaned water into the Colorado River just above the U.S.-Mexico border, will demonstrate that the plant can be operated on a long-term basis.

With the plant helping to meet the United States' treaty obligations to Mexico, Reclamation can leave more water upstream in Lake Mead for use by domestic users, including California's Metropolitan Water District, the Southern Nevada Water Authority and the Central Arizona Water Conservation District.

The three entities, which are helping to pay for the \$23 million pilot project, will receive water credits in Lake Mead to help slake the thirst of Las Vegas, Phoenix, Los Angeles and other cities during the pilot run.

The Bureau of Reclamation this week launched a 365-day pilot run of its Yuma Desalting Plant near Yuma, Ariz. If successful, the plant could be restored to full capacity, providing water for municipalities in California, Arizona and Nevada. Photo courtesy of BuRec. "Drought, population growth and the impacts of climate change on water in the Southwest have increased the stress on the Colorado River," said Anne Castle, assistant Interior secretary for water and science, in a statement. "These collaborative undertakings ... exemplify the types of partnerships needed to stretch available supplies to meet both current and future water needs."

Angel Santiago, vice chairman of the Metropolitan Water District's board of directors, said the project "will be critical in conserving supplies for future use," particularly given current drought conditions in California.

The amount of water each entity receives will correlate with its financial contribution to the project. The Metropolitan Water District will pay 80 percent of the cost in return for 80 percent of the water. Arizona and southern Nevada will each get a 10 percent share. In all, the three entities will pay for about \$14 million of the pilot run's cost. The federal government will pay the \$9 million balance.

The plant will run at one-third capacity for 365 days, which could be spread across 18 months depending upon how often the plant needs to be taken offline for maintenance or evaluation, said Jennifer McCloskey, area manager for Reclamation's Yuma, Ariz., office.

BLM conducted a 90-day demonstration run at 10 percent capacity in the spring of 2007 but concluded that a longer test was necessary to determine whether the plant could be operated on a long-term basis. That test run showed encouraging results, McCloskey said, adding that she is optimistic that the plant will prove its mettle in the new, bigger pilot run.

"My confidence level for the operation as a pilot run is very high," she said. "All the work was done up-front, in the planning stage, and now it's just smooth sailing."

Protecting the wetland

Ecologically, however, it remains to be seen whether Reclamation can operate the plant at one-third capacity while still protecting the Cienega de Santa Clara, a vast wetland south of the border.

The closure of the plant, located about 5 miles west of Yuma, Ariz., resulted in an incidental ecological benefit for the wetland. Highly saline agricultural runoff that would have been diverted for treatment was rerouted into the Colorado River Delta, bypassing the Lower Colorado River and expanding the Cienega de Santa Clara to 40,000 acres.

Concerned that the reopening of the plant would destroy the Cienega, which has become an important stopover for migratory birds and provides habitat for 95 species, environmental groups fought the proposal for years. But under the new agreement, parties on both sides of the border will provide 29,000 acre-feet of replacement water to make up for the loss of high-salinity flows to the wetland.

A pair of environmental groups -- Environmental Defense Fund in the United States and ProNatura Noroeste in Mexico -- have purchased water rights from Mexican farmers, freeing up irrigation water. The United States has committed to diverting excess water from the Colorado River during rainstorms to the wetland. Mexico has not yet revealed how it plans to meet its obligations under the agreement.

Jennifer Pitt, a senior resource analyst for Environmental Defense who has worked for years to protect the wetland, said she believes the agreement will ensure that the wetland stays wet while the desalting plant is in operation over the next year or so.

"To me, not only have we achieved important protection, but it's also the first time the U.S. or Mexican governments have, separately or together, sent water resources to an environmental resource in the delta," she said. "That is a really good turn of events, and demonstrates that it can be done -- there's a spirit of cooperation that hasn't been there in the past."

"Two years ago, we didn't dream of this," added McCloskey, the Reclamation manager. "We didn't know this could be done."

That cooperation could also help provide a foundation for future agreements if the plant is fully restored, Pitt and McCloskey said.

But another Lower Colorado River project designed to stretch water supplies in the basin could complicate future efforts to secure water for the delta.

Along with the Yuma Desalting Plant pilot run, Reclamation is also constructing the \$172 million Drop 2 storage reservoir project, located in Southern California about 30 miles west of Yuma. That project will store excess water flowing down the Lower Colorado River during rain events for use by the Imperial Irrigation District.

While that project, like the desalting plant, will allow Reclamation to leave more water in Lake Mead for cities, it will capture the same water that Reclamation is now using to help replenish the Cienega de Santa Clara during the pilot run of the plant.

McCloskey said the Drop 2 reservoir system is complex and it is unclear whether it could be operated to allow for releases to the wetland. "We'd have to think a lot more about it," she said. "We have a lot to learn about how we're going to be able to use Drop 2."

Thanks to recent heavy rains, Reclamation has already met its requirement to send about 10,000 acre-feet to the Cienega to offset the loss from the desalting plant's pilot run, she added.

"We knew once we got Drop 2 completed it would be harder to fulfill our commitment," she said. "But we've had several rain events, and we've already sent the whole amount that the U.S. was required to send."

The water promised by environmental groups and Mexico will be sent to the wetland at a later date during the pilot run, she added.

Looking ahead

If the pilot run is successful, and Reclamation decides to bring the plant online full-time, environmentalists will watch closely to make sure the wetland is fully protected, Pitt said. "If they're going to continue to run the plant, there are a lot of issues to be examined," she said. "I think EDF and our conservation partners will be adamant about making sure the Cienega is protected in the future."

But the Yuma Desalting Plant's long-term cost-effectiveness remains largely unknown. Even if the pilot run at one-third capacity is a success, McCloskey said making the necessary improvements to allow the plant to operate at full capacity would be costly. For example, she said, all of the plant's piping would need to be replaced.

"There's a pretty big capital investment that would need to be made just to address the wear and tear and aging," she said. "I don't know where that money would come from, so that's a pretty big hurdle to wade through in terms of the plant's future."

Reese writes from Santa Fe, N.M.

LR Letter 05/17/10

EA for Green River Pumping Project

May 17, 2010

Mr. W. Russ Findlay
Fish and Wildlife Biologist, PRO-773
Bureau of Reclamation, Provo Area Office

302 East 1860 South
Provo, UT 84606-73 17
Telephone: 801 -379-1 084
Fax: 801-379-1 159
Email: rfindlay@usbr.gov

Subject: Draft Environmental Assessment and Biological Assessment for the
Green River Pumping Plant Project

Dear Mr. Findlay

Thank you for this opportunity for Living Rivers and Center for Biological Diversity to provide comments concerning the Environmental Assessment and Biological Assessment for the Green River Pumping Project.

Our members and staff are concerned about the impairment of critical habitat for endangered species of the Colorado River basin, namely bonytail chub, humpback chub, razorback sucker and Colorado pikeminnow. We regard the river reaches between Flaming Gorge Dam and the Confluence with the Colorado River as the best hope for their recovery, since the mainstream is nearly free-flowing for over 425 miles.

We are also concerned about the 50% decline in the populations of threatened fish species of the Upper Basin, namely bluehead sucker, flannelmouth sucker and roundtail chub. Declines in the populations of threatened and endangered fish species, especially bonytail chub and razorback sucker, indicate that the Upper Basin Recovery Program is not successful despite 32 years of activity. The next 32 years are not likely to be productive either, considering depletions in the Upper Basin will increase in-step with streamflow reductions due to persistent drought and climate change.

Until the endangered fish species are delisted, we respectfully request that all proposed water contracts with the Bureau of Reclamation be suspended. This request is reasonable and prudent considering the two-year Basin Study Initiative now underway by Reclamation and the seven basin states, which will attempt to address the acknowledged, system-wide imbalances of supply and demand. Until the imbalances are mitigated, it is highly likely that legal challenges in the basin will occur over water rights, water quality, and endangered species.

Need and purpose for a basin-wide Programmatic Environmental Impact Statement

We insist that the Department of Interior and its agencies implement a basin-wide Environmental Impact Statement immediately. The key aspect of the study should address the recovery of endangered fish. In so doing, Interior will simultaneously solve the issues of water quantity and quality for both basins and

Mexico.

Specific Concerns for Critical Habitat in Reach Three of Green River

There are both existing and proposed water withdrawals below the US Geological Survey gage at Green River, Utah that do not have contracts with Reclamation for water from Flaming Gorge Reservoir. The critical habitat for endangered fish in Labyrinth and Stillwater Canyons is defined as having low gradient with massive amounts of sediment that create ideal slack water nurseries for endangered fish. However, we have observed on river trips in Labyrinth and Stillwater Canyons that sandbar habitats can entrap juvenile fish, which increases mortality, when the river level drops due to intense evaporation and irrigation in July and August.

We think it is necessary for Reclamation and US Fish and Wildlife Service to make a proper determination of what the summer minimal instream flows should be for Labyrinth and Stillwater Canyons to eliminate mortality caused by increased depletions. We also suggest that the USGS install a gage above Canyonlands National Park so that the instream flows can be properly monitored for compliance. Mineral Bottom at River Mile 52 comes to mind as a potential locality for this stream gage for reasons of accessibility by road.

We also suggest that Tusher Wash Diversion Dam above Green River, Utah be replaced with a dam that allows safe passage of fish and river boats. We also suggest that the diversion have a sophisticated screening device to keep eggs and juvenile fish from being stranded in irrigated fields. This dam was initially constructed with cottonwood cribs filled with rocks and the integrity of the dam is questionable considering the age of the facility.

Thank you again for this opportunity to comment. If we can be of any assistance, please do not hesitate to contact us.

Sincerely yours,

John Weisheit

Development in Colorado going with the flow of water deficit

By Bruce Finley

The Denver Post

POSTED: 06/20/2010 01:00:00 AM MDT

[Linked here](#)

Click on image to enlarge Colorado River water consumed yearly for agriculture and by the 30 million Westerners who rely on it now exceeds the total annual flow.

A growing awareness of that limited flow is leading to increased scrutiny of urban development — especially projects that require diverting more water to the east side of the Continental Divide.

"We're no longer in a surplus situation," said Bill McDonald, the U.S. Bureau of Reclamation's deputy commissioner for policy and budget. "The teeter-totter has tipped."

Federal data show that the average annual use of Colorado River water (15.4 million acre-feet) has surpassed the average annual supply (14.5 million acre-feet) in the river.

Factor in climate change — state officials project a 10 percent or greater reduction in water available — and the specter of scarcity looms even higher.

"We actually have run up against what the river provides," said Bart Miller, water program director for Western Resource Advocates, a law and policy firm. "Our choices moving forward have to be very careful ones. Brand new uses are going to have to be displacing other uses."

Colorado still doesn't use all of its 3.88 million acre-feet allotment under the interstate compact that governs use of the river. An acre-foot contains 325,851 gallons, enough to sustain two families of four for a year. State officials are trying to calculate the unused share. Estimates range up to 300,000 acre-feet.

"Just because the Colorado River as a whole is overused" doesn't necessarily prevent development in Colorado, said Eric Kuhn, manager of the Colorado River Water Conservation District. "The lower states (California, Nevada, Arizona) are using far more than the upper states."

Yet authorities here increasingly ask questions.

This month, the U.S. Army Corps of Engineers stepped up scrutiny of Denver Water's proposed diversion from upper Colorado River tributaries through the Moffat Tunnel to an expanded Gross Reservoir. Federal engineers demanded more data to evaluate environmental impacts.

The American Rivers advocacy group recently cited Denver's project in designating the upper Colorado the nation's sixth- most endangered river.

"We take that seriously," said Scott Franklin, project manager for the federal engineers.

For Denver residents, project delays mean "that we would have less water in storage to cushion us and get us through a drought," Denver Water project director Travis Bray said. "If we don't have that much water in storage, then you could be looking at more severe restraints."

Suburban metro water providers also are planning diversions of water out of the Colorado River Basin to enable population growth.

Energy companies, too, seek water — for drilling in the development of oil shale. Veteran water lawyer Glenn Porzak has recommended that energy executives work in concert to divert and store water they need.

"The state is at that critical juncture where demand is starting to outstrip available water supplies," Porzak said. "Either you need to think about limiting development, or you are going to see massive conversions of agriculture to municipal use. It is going to be a trade-off. The day of reckoning is coming."

Meanwhile, plans to let more river water run its course naturally, for environmental purposes, appear increasingly difficult. At Grand Junction, a stakeholders group last week recommended against a federal "wild and scenic" designation for a stretch of the river before it reaches Utah because this could hurt Colorado's ability to use water.

Even incremental development within the Colorado River Basin on Colorado's Western Slope is running into water sensitivities.

A plan to build a new town of 5,000 on former sheep pastures at Wolcott is up for review.

Developer Rick Hermes carefully converted ranchers' agricultural water rights to municipal rights — and received an Eagle River Water and Sanitation District commitment to serve his "river-centric" town.

The town would be built without a new golf course, breaking the mold for Vail-area development. A new sewage treatment plant is planned, ensuring that water withdrawn for town showers, toilets and lawns could be returned to the Eagle River, which flows into the main stem of the Colorado River.

"In the early 1990s," Hermes said, "water wasn't in the top five items (discussed during permitting). You just assumed you would have the right to develop."

Eagle County commissioners' decision on whether to allow construction also may be based on efficient use of water. State data indicate daily water consumption per person in Colorado River Basin communities currently is 256 gallons per person, compared with 178 gallons in the South Platte River Basin along the Front Range.

Water "is increasingly something that local officials are aware of," commissioner Jon Stavney said. "I have questions about whether we need to create a whole new town. . . . Do we need to create a whole new water service community where none existed?"

Warming Climate Means Trouble For Southwest Plantlife

This month, fires have charred tens of thousands of acres in New Mexico, Colorado and Arizona. After more than a decade of drought, these large seasonal fires are increasingly a part of life in the Southwest, and fire can be revitalizing in many conifer forests.

However, unlike other conifers -- including their larger cousins the Ponderosa pines -- fire hasn't played a fundamental role in many pinyon pine ecosystems. As a result, the trees are easily killed by it.

Between the surrounding high deserts of the Southwest and the ponderosa pine forests of the Colorado Plateau, a transition zone of pinyon pines and juniper trees dominates the landscape. Pinyons are a symbol of life on the plateau. These woodlands hold a wealth of biodiversity, providing homes for a vast array of plant and animal life. Their dry, open forest-floors allow for the growth of desert plants like yucca and prickly pear cactus.

In rockier areas, small plants like lichens, Rockmat and vibrant-red wildflowers called Indian Paintbrush are prevalent. The small, often shrub-like trees can take hundreds of years to grow a six inch trunk and full-grown they can be little more than a bush, or if conditions are favorable they can grow as tall as a five story building.

This reluctant growth has allowed pinyons to thrive in the arid Southwest for millennia, but today the trees are vanishing from the landscape. A decade of drought, which scientists said is a direct result of climate change, has allowed bark beetles to feast on Southwest forests and left them vulnerable to catastrophic wildfires.

"There is little doubt that our current drought has driven processes that resulted in mortality for some plants," said Ken Cole, a researcher with the U.S. Geological Survey in Flagstaff.

Cole's research has shown that bark beetles, catastrophic fires and other unknown causes have resulted in the widespread death of pinyon pines. Climate change is expected to increase the frequency and intensity of drought in the coming decades and ecologists think the changes may be too quick for species occupying the most vulnerable of ecosystems, such as the transition zones.

The history of fire in many pinyon forests is not yet well understood, but studies from many old growth forests and the lack of fire scars indicate that until recently large, stand replacing fires were rare, occurring only once every 400 years or so. So, the last century of fire suppression ethics has had less of an impact on pinyons than it has on many other species. Ecologists say that drought conditions may have shifted the environment in favor of non-native species, so when pinyons do burn, invasive shrubs and grasses often sprout up in their place as well as oak and mahogany trees.

These new invasive plants are much more flammable than natives and are literally adding fuel to the fire. Once an understory of these fire prone plants is in place, it would make it more difficult for pinyons to recover. Post-pinyon woodlands could resemble chaparral or savannah—something like the interior valleys of California.

Rainfall totals in the most recent drought have been comparable to those the Southwest has experienced in the past, but the droughts have been unusually hot. Researchers believe these temperature increases are a direct result of climate change and exactly the type of conditions models have predicted will become more frequent in the Southwest in the coming century. Cole said these conditions will result in widespread reductions in pinyon pines, but scientists are reluctant to speculate on how bad it will be.

"The correlations between these model predictions and our climate trends of the last 20 years should concern everyone," Cole said.

In a paper published in the Proceedings of the National Academy of Sciences, University of Arizona ecologist David Breshears and his colleagues described how pinyons respond to long-term drought. "Lots of attention focuses on the bark beetle effects on pinyon pines, but the pinyon response is also tied tightly to their water response," Breshears said.

And despite the recent wet winter, the Southwest is still firmly in the midst of a drought. The group conducted an experiment at Biosphere 2—a research building containing an artificial, sealed ecosystem outside of Tucson—and found that drought stressed trees exposed to higher temperatures died thirty-percent more often than trees at normal temperatures with identical conditions. This indicates that die-offs could occur five-times more often.

"They are the trees that make it at the lowest, driest areas, below which shrubs and grassland and deserts dominate," said Lisa Floyd-Hanna, an ecologist at Prescott College studying pinyon-juniper woodlands. "Thus, they are tough." In a drought, a pinyon tree will close off its pores to conserve water and try to ride it out.

However, the pores are also necessary for it to breathe in carbon dioxide, and it starves itself waiting for rain. While the tree could last for long periods of time in an average drought, the increased heat makes it die of exhaustion much quicker. Also in response to drought, pinyons stop producing sap, which is the tree's first line of defense against bark beetle invasion. The insects are then free to move in and start their feeding frenzy on the unprotected trees, helping to create the conditions for catastrophic wildfires.

"Since there are only two dominant tree species, near complete loss of one species is indeed devastating," Floyd-Hanna said.

Already, hiking in these forests is like a walk through a graveyard where the dead lay unburied. In areas of Arizona, New Mexico and Colorado there are places where more than half the pinyons are already dead. In Sante Fe, as many as 90 percent are dead.

"Higher temperatures cause more evaporation and the result is less of the moisture being available for plants, animals and municipalities," Cole said.

Despite the last season of wet weather, climate models predict the situation will only get worse in the Southwest in the coming decades. Floyd-Hanna said there is hope that pinyon forests can recover. In other areas in the Southwest, such as the old-growth pinyons around Mesa Verde National Monument, young pinyons are growing up where bark beetles have recently killed off large numbers of trees. And the saplings are outcompeting the invasive species that have plagued similar sites.

Prepare for Hotter and Drier Southwestern US, Climate Experts Urge

ScienceDaily (June 28, 2010)

[Link to article in Science Magazine](#)

Two prominent climate experts, including one from the University of Arizona, are calling for a "no-regrets" strategy for planning for a hotter and drier western North America. Their advice: use water conservatively and continue developing ways to harness energy from the sun, wind and Earth.

Jonathan Overpeck, principal investigator with the Climate Assessment for the Southwest at the UA, and Bradley Udall, director of the Western Water Assessment at the University of Colorado, write in the June 25 issue of the journal Science that such an approach is necessary for coping with a wide range of projected future climate changes in the West and Southwest.

In their overview of shifting climate in the region, Overpeck and Udall cite published findings of prevalent signs of change: rising temperatures, earlier snowmelt, northward-shifting winter storms, increasing precipitation intensity and flooding, record-setting drought, plummeting Colorado River reservoir storage, widespread vegetation mortality and more large wildfires.

"The West, and especially the Southwest, is leading the nation in climate change -- warming, drying, less late-winter snowpack and drought -- as well as the impacts of this change," said Overpeck, a UA professor of geosciences and atmospheric sciences and co-director of the Institute of the Environment.

In the past 10 years, temperatures in almost all areas in western North America have surpassed the 20th century average, many by more than 1 or even 2 degrees Fahrenheit. The warming has decreased late-season snowpack, which serves as a water reservoir, as well as the annual flow of the Colorado River, the researchers said.

Those reductions, combined with the worst drought observed since 1900, haven't helped matters; water storage in Lakes Powell and Mead, the largest southwestern water reservoirs, fell nearly 50 percent between 1999 and 2004 and has not risen significantly since.

In addition to water, vegetation is feeling the effects of climate change. Work by UA's David Breshears and colleagues have already showed that more than 1 million hectares of piñon pine have died in the Southwest in the last few decades from a lethal combination of record-high temperatures and uncommonly severe drought. In addition, the frequency of large wildfires has increased as snowpack has decreased.

While researchers are confident that the higher temperatures and resulting changes in snowpack, Colorado River flow, vegetation mortality and wildfires are human-caused, they don't know whether the drought that has plagued the West for the last 10 years -- the worst since record-keeping began -- is because of humans, Overpeck said.

"It's critical to determine the causes of the observed change, including the drought, because then we will have a much improved ability to say what's coming next, in the future," Overpeck said.

To complicate issues, studies published to date suggest that Colorado River flow could continue to decrease by 20 percent by 2050, with severe implications for cities served by Colorado River water and for agricultural production.

"One thing is for sure," Overpeck said. "The best strategy now -- the no-regrets strategy -- is to prepare for a hotter and drier West, Southwest and Arizona, and to make sure we don't commit water to things now in ways that could make water shortages in the future more difficult to deal with."

Fortunately, Overpeck said, scientists have a better understanding about potential future climate change in western North America than for many other regions around the globe, making it easier for policy makers to plan coping strategies.

The researchers also point to the region's potential wealth of solar, wind and geothermal renewable energy production.

"That offers a way to make up economically for the costs that will be incurred in adapting to the warmer, drier conditions," Overpeck said. "And it will have the side benefit of decreasing the chances, through reducing greenhouse gas emissions, for potentially greater human-caused climate change."

Hoover Dam's false promises

MICHAEL HILTZIK
Los Angeles Times (MCT)
[Linked here](#)

The most striking sight greeting visitors to the Colorado River gorge known as Black Canyon used to be the great wedge of concrete spanning the canyon wall to wall. But in recent years Hoover Dam, that enduring symbol of mankind's ingenuity, has been upstaged by another sight signifying nature's power to resist even the most determined effort to bring it under control: a broad white band stretching along the edge of Lake Mead like a bathtub ring, marking how far the reservoir has fallen below its maximum level.

The nearly decade-long drought in the Colorado River Basin, which has lowered Lake Mead by about 120 feet from its high-water mark, reminds us that the promises made for Hoover Dam were always unrealistic. Delegates from the seven state capitals who met in 1922 to apportion the river's bounty (under the supervision of then-Commerce Secretary Herbert Hoover) were led to believe that the river, once dammed, would provide all the water their states could conceivably need to fulfill their dreams of irrigation, industrial development and urban growth.

To the federal officials anxious to get the dam project approved, this was a necessary subterfuge, for without it the states would never reach agreement and the dam would not be built. But today we must confront the consequences of that founding fiction. Hoover Dam truly made the West, but it has also confined it in the straitjacket of an ever-intensifying water shortage.

Promises based on the seemingly magical power of new technologies are almost always excessive (witness the tragedy in the Gulf of Mexico). This year, as we celebrate the 75th anniversary of President Franklin D. Roosevelt's dedication of "the greatest dam in the world" on Sept. 30, 1935, we should also recognize the dam's equivocal legacy to the West, and to the nation.

Connoisseurs of irony will note that on that day, under a blistering sun and before 10,000 spectators and 20 million radio listeners, FDR claimed as a symbol of the New Deal a public work conceived, designed and launched by his Republican predecessors.

Indeed, during the 1932 presidential campaign, candidate Roosevelt had savagely attacked Hoover, his GOP opponent, for excessive deficit spending on projects like the dam. Once ensconced in the White House, however, he quickly came to appreciate the totemic power of great public works and their effectiveness at representing the benefits that could be bestowed on the citizens by a visionary administration.

In his dedication speech Roosevelt proclaimed that the federal government and the seven states of the Colorado River Basin had jointly ensured that millions of current and

future residents in the West would enjoy "a just, safe and permanent system of water rights." He promised an end to the river's ancient cycle of drought and floods and a bountiful irrigation supply. He called the dam "a splendid symbol" that had turned the unruly Colorado into "a great national possession."

The nation took him at his word. Since that dedication year, the population of California and the six other states of the basin has swelled by some 45 million people. Much of this growth has been fueled by the dam and its precious bounties of water and electrical power.

The promise of abundant water and power took the brakes off the growth of Los Angeles, San Diego and many other western cities; it encouraged farmers to complacently plant the most water-thirsty crops; and it gave us city dwellers the impression that we can water our lawns every day without worrying about waste and runoff.

Yet the world Hoover Dam made is now facing the era of limits. For decades California was able to use Colorado River water formally apportioned to Arizona and Nevada, because those states weren't developed enough to use their full allocations. That condition ended in the mid-1990s, at which point California had to give up nearly 20 percent of its Colorado River supply.

Thus far we've managed a "soft landing" from that shock by crafting intricate reallocations of water among the state's agricultural, urban and ecological interests. But the balancing act is only getting harder, as a long drought shrinks our water-supply cushion and population growth continues almost unabated. Up to now, solutions to our water needs have been worked out in a crisis atmosphere. In the future, they'll take place against a political background too.

In the Central Valley, farmers are already marching to demand the construction of more dams to provide more water for irrigation, as if one can just create abundance out of thin air. There isn't enough water in the Colorado to serve all the demands we place on the river, and there never was. This was evident to some people, like the great Western explorer John Wesley Powell, who at an irrigation congress in 1893 announced, "Gentlemen, you are piling up a heritage of conflict and litigation over water rights, for there is not sufficient water to supply the land."

Powell was driven from the hall by a chorus of boos and catcalls. But time has proved him right. It was thought that Hoover Dam would put an end to 50 years of conflict over the water of the Colorado. It has not. We still delude ourselves into thinking that it will; only a few years ago, in 2003, then-Interior Secretary Gale Norton came out to the dam to sign 24 agreements transferring water rights among various claimants -- Indian tribes, irrigation districts, Western cities, the government of Mexico. And she proclaimed, "With these agreements, conflict on the river is stilled."

The truth is that conflict on the river will never be stilled, because there will always be more demand for the water than there is water.

We should not regret the building of Hoover Dam, which Roosevelt hailed three-quarters of a century ago as a "great achievement of American resourcefulness, skill and determination." It was a bold enterprise for a nation grappling with doubts about its place in the world at a time of crisis. Dealing with the problems of resources and growth bequeathed us in part by that remarkable Depression-era effort will require every bit as much boldness and resourcefulness, or more.

Michael Hiltzik, a Los Angeles Times columnist, is the author of "Colossus: Hoover Dam and the Making of the American Century," just published by Simon & Schuster.

After dam failure, Iowa's nine-mile-long Lake Delhi is gone

By JENNIFER JACOBS • and TONY LEYS • jjacobs@dmreg.com • July 26, 2010
Delhi, Ia. - Gov. Chet Culver vowed Sunday to restore Lake Delhi, a treasured summer retreat that drained away in less than a day this weekend.

The nine-mile-long lake all but disappeared after sudden floodwaters breached its 92-year-old dam Saturday morning. Residents fear millions of dollars in property values also washed away, because about 900 vacation homes and cottages lost their lakefront status.

"It just makes your jaw drop," said Irv Janey, a Marion resident who owns a condominium there. "The lake's gone."

The dam is owned by the local homeowners association, and state officials said the lake's sole purpose was recreation. The Department of Natural Resources said if the homeowners decide to rebuild the dam, it would have to meet modern design requirements.

"We would hold them to a higher standard so this couldn't happen again," said Jon Garton, a dam safety engineer for the department.

Garton said that despite the dam's age, it had been well-maintained. A 2009 state inspection found a few minor problems, but nothing that could have caused its failure, he said.

On Saturday, "there was just more water than it was designed for," he said.

Culver traveled here Sunday to reassure residents that he would do what he could to help restore what they'd lost.

"This is a real landmark, and I think it's in Iowans' best interests to save this lake," Culver said, standing in muddy work boots.

Members of the Lake Delhi Recreation Association, which owns the dam and pays for upkeep of the lake, pleaded with Culver for assistance.

"This is beyond our capacity to take care of ourselves," said association President Jim Willey.

The lake has several public boat landings and two public beaches.

Culver said the 900 area homeowners would not be on their own.

"We're going to throw everything we have at it, in terms of federal and state resources," he said.

Culver said the areas that broke were earthen portions of the dam, next to the main concrete structure. A 300-foot section was breached. Culver said the restoration could include reinstallation of hydroelectric turbines, which could generate power for a quarter of Delaware County.

Maggie Burger, a cabin owner and executive director of the homeowners association, said the Federal Emergency Management Agency agreed to help finance a dredging project to clear silt left by 2008 flooding. She said she hoped FEMA would agree to help again.

U.S. Rep. Bruce Braley, a Democrat who represents the area, said he also would work to obtain government money to help rebuild the dam. Braley said that the lake was the area's top tourist attraction, and that vacation homes there provided 10 percent of the county's tax revenue. FEMA spokesman Bob Josephson said it was too early to speculate about whether a dam rebuilding project could qualify for money from his agency. However, he said, vacation homes damaged by flooding generally are ineligible for such assistance. FEMA often helps people repair or replace their primary homes, he said, but not their second homes.

Several area homeowners said they lacked flood insurance. State officials said they didn't yet have accurate estimates of property damage. Homes along Lake Delhi range from modest cottages worth about \$50,000 to large houses worth hundreds of thousands of dollars.

Property owners pay \$4 extra per \$1,000 of valuation each year to cover the upkeep of the dam and related costs. But the special lake district has no savings account. Instead, it has debt on a \$3.5 million dredging project from 2004-05 that won't be paid off for another 15 or 16 years.

Homeowners expressed amazement at how fast the weekend's events unfolded. On Friday, vacationers floated on inflated tubes, played on beach sand and swam in quiet waters. By Friday night, floodwaters were surging through homes like never before. Then, on Saturday morning, the dam broke and the lake drained away.

"Now, my dock is 20 feet above where it should be," said Jim Kouba, a dentist from Bloomfield.

Several boats were forced ashore near his vacation home in the Hickory Hollow neighborhood, along with wooden docks and a yellow swimming slide. Foundations of nearby cabins blew apart when lake water outside drained away, leaving floodwater trapped inside basements. "Houses just exploded because the water couldn't escape fast enough," Kouba said.

Jamie Ashby's cabin was one of them.

"We heard them going down - boom, boom, boom - along the shore," said Ashby, an engineering manager at Heinz Co. in Cedar Rapids. Windows shattered and interior walls collapsed with the rapid change in water pressure. By Sunday afternoon, the shore of the lake was a steep cliff leading down to mud flats, then a thin channel of running river water. The air reeked of rotting fish. Lawns were muddy messes, laden with soaked furniture, carpet, drywall, insulation, mattresses and other household goods.

Relatives of Cheryl Schatzle were lucky enough to get one of the last available Dumpsters for rent in the area. They lighted a bonfire to get rid of paneling, 2-by-4s and other waterlogged wood from a cedar-sided cabin the family has owned for 40 years. Schatzle, a social worker, was heartsick, but she was keeping perspective. She noted that her family didn't lose its primary home, as so many people did in Cedar Rapids in 2008.

Still, seeing Lake Delhi as a puddle of its former self was troubling, Schatzle said. "What's going to happen to the lake? That's a concern I have. Maybe it'll never be the same," she said.

Garton, the DNR dam safety expert, said Iowa has dozens of dams similar in design to the one at Lake Delhi, though most are smaller. He said most are about 10 feet tall. The one at Lake Delhi was about 50 feet tall. The dam didn't have an emergency spillway to divert water before it could go over the top, he said. The dam had three gates to regulate outflows, and they reportedly were wide open.

But after storms dumped up to a foot of water on areas upstream, the gates apparently couldn't let water out fast enough to keep the lake from pouring over the top of the dam and to keep the breach from happening, he said.

Garton said a few smaller Iowa dams have failed in past years. "This is probably the most significant one we've had in recent history," he said.

Global warming: NASA says it's the hottest year on record

Lulu Liu | Sacramento Bee

[Linked here](#)

Worldwide, 2010 is on track to become the warmest year on record.

Scientists at the NASA Goddard Institute for Space Studies reported recently that the average global temperature was higher over the past 12 months than during any other 12-month period in history. The National Oceanic and Atmospheric Administration has released corroborating data, adding that the past four months, including June, have each individually been the hottest on record as well.

The NASA findings were based on data from 5,000 weather stations around the world, said scientist Reto Ruedy, co-author of the study. Scientists used temperature anomalies, or departures from the baseline, rather than absolute measurements to account for differences in the instruments of individual stations.

The average global temperature, computed over a 12-month period, reached a new record in May and held steady for the month of June, he said. This was despite the recent minimum in solar activity, which should have had a cooling effect on Earth.

Apparently, Ruedy said, the solar cycle "has much less impact than the warming trend."

NOAA research meteorologist Tom Knutson doesn't find that surprising. The trend has existed since records began in the late 1800s.

The new finding comes on the tail of a NASA announcement that 2000 to 2009 was the warmest decade in history.

"This is just the tip of the iceberg," Knutson said. "The models are projecting a substantial warming into the 21st century."

The temperature rise is caused by a fundamental imbalance, Ruedy said: "At this point, the Earth's atmosphere receives more energy from the sun than it emits as heat to the universe." The Earth will continue to warm until balance is re-established, at a higher global temperature.

That's another 1.1 degrees Fahrenheit if atmospheric composition does not change, according to the NASA institute's models. By comparison, global mean temperatures have risen by about 1.5 degrees Fahrenheit since 1880.

Meteorologist David Unger at NOAA's Climate Prediction Center in Maryland said that El Niño is likely a player in this year's record-setting warmth. 2010 began with "large areas of equatorial Pacific Ocean at above normal sea surface temperatures," he said. It's easier to set global temperature records when the tropics are exceptionally warm.

The El Niño phenomenon was also responsible for California's wetter-than-average winter and spring, he said. And its death, as the Pacific began to enter a cooler-than-average pattern, generated the unusually persistent trough that has brought Sacramento all that nice weather, he added.

April this year was 4.9 degrees cooler than average in downtown Sacramento. May was 5.3 degrees cooler. June 5 was the first 90-degree day of the year.

"What it did was it cooled the air over the entire region," said Dan Keeton, a meteorologist at the National Weather Service. "Most importantly for Sacramento, it enhanced the Delta breeze."

The Delta breeze is the region's natural air conditioner, he said. The ocean breeze follows the Sacramento River into the Central Valley.

"The influence can be pretty much Valley-wide in the strongest situations," Keeton said.

According to NOAA, California was one of the few spots in the world reporting below average temperatures from April through June.

On a large scale, only isolated regions in Southeast Asia and South America could say the same.

Groups challenge plans for Utah tar sands mine

By Steven Oberbeck The Salt Lake Tribune
[Linked here](#)

A small Canadian company, in need of millions for its ambitious plans, also is facing stiff opposition from two Utah environmental groups that are trying to thwart its efforts to build one of the first commercial tar sand mines in the country.

Earth Energy Resources, based in Calgary, Alberta, received approval a year ago from the staff of the Utah Division of Oil, Gas and Mining to begin working a 62-acre deposit on the Uintah County-Grand County line.

But opposition from Moab-based Living Rivers and Peaceful Uprising has thrown that decision to Division Director John Baza, who said Tuesday at an informal hearing he anticipates ruling on the company's mining permit within the next 30 days.

John Weisheit of Living Rivers

"Even then, my decision won't necessarily be final," Baza said, indicating that anyone who disagrees with his ruling can appeal to the board of the Division of Oil, Gas and Mining.

Earth Energy Resources contends its process is environmentally friendly and uses citrus-based solvent to recover heavy oil, or bitumen, from tar sands.

“We can extract the bitumen in a far more responsible manner than has been done to date anywhere in the world,” said Barclay Cuthbert, Earth Energy’s vice president of operations. “We are eager to get this project under way.”

Environmentalists such as John Weisheit of Living Rivers aren’t convinced.

Weisheit noted that recovering bitumen from tar sands will require vast water resources and that Earth Energy’s project could be just the beginning of a wave of such development. That could have far-reaching effects on the environment in Utah and other states, he said.

“This type of project isn’t appropriate for the Colorado Plateau. There is just not enough water to develop those resources.”

Earth Energy is facing what may be a far more formidable obstacle than the outrage of Utah environmentalists.

The company needs to raise \$35 million to fund the development of its plant that it projects will turn out 2,000 barrels of oil a day. Included will be \$1.7 million it will need to purchase a bond so the state can be comfortable that adequate financing is available to handle the reclamation of the mining property once all the tar sands have been removed.

“It is a challenge,” Cuthbert said, indicating Earth Energy has some financing commitments in place but that many are contingent on the company raising the money that will put it over the \$35 million mark.

He estimated that it may be 18 months to two years before Earth Energy’s Utah mine is up and running.

Juliana Williams of Peaceful Uprising questioned whether the threat to the environment was worth a plant and mine that over its seven-year life would produce the equivalent of four hours of the nation’s total energy needs.

“They promise there will be zero emissions and zero discharge, but those promises of safety will mean very little if something happens,” she said.

Four Utah refineries already process upward of 5 million barrels of crude a year that are recovered from tar sands in Canada, a figure that could climb by 13 percent if Earth Energy’s project eventually goes online, she said.

####

By PAUL FOY Associated Press Writer 07-27-2010 18:57

SALT LAKE CITY (AP) _ An energy startup from Canada on Tuesday defended its plan to launch the first significant U.S. oil sands project in eastern Utah, after opponents argued it would dig up fragile topsoil and pollute groundwater.

The criticism against the Earth Energy Resources Inc. project came during an informal hearing before the head of the Utah Division of Oil, Gas & Mining, who is considering whether to uphold his staff's approval of the company's operating permit.

The Calgary, Alberta-based company insisted it won't pollute anything and will leave Utah's oil sands as clean as beach sand after processing with a citrus-based solvent.

"It will be a good project for Utah," company vice president Barclay Cuthbert testified. "We'll be providing energy that will be used in the state."

The company has obtained government permits to open the first U.S. oil sands surface mine designed for producing bitumen, a tar-like form of petroleum, at a 62-acre pit in eastern Utah. For decades other Utah operators have used oil sands as a poor-man's asphalt, but nobody has tried to produce petroleum from U.S. oil sands on a scale planned by Earth Energy.

The private company with 411 shareholders says it will turn out 2,000 barrels of oil a day after raising \$35 million from private equity groups for the plant.

The Division of Oil, Gas & Mining approved a permit a year ago, but the company hasn't posted a reclamation bond needed to obtain the permit.

Division head John Baza held a "protest hearing" Tuesday to take objections from Grand County residents and environmental groups. The groups promised not to file a formal appeal to a state board pending Baza's review.

Opponents said an oil-sands operation that produces so little petroleum isn't worth doing, given the potential damage to public lands. State officials responded that their job was simply to ensure Earth Energy follows environmental rules. The company obtained a lease on Utah's trust lands.

Utah's oil sands will never prove economical, argued Tim DeChristopher, an environmental activist who faces a September trial on felony charges of disrupting the Bush administration's final oil-and-gas auction in Utah.

"This project is a bridge to nowhere," DeChristopher said.

Opponents fear Earth Energy's project is the start of widespread development of Utah's spotty oil-sands reserves, which they say can't be developed responsibly in a semiarid desert.

Earth Energy says it will take 4,000 barrels of water a day to make half as many barrels of bitumen and that it can pump the water from deep underground. Even state

regulators questioned whether that much groundwater was available, but said it wasn't their call to make.

The company says it has obtained water rights for the pumping.

John Weisheit, a Colorado River guide and founder of Living Rivers, said the project will be a disaster, and others questioned whether the company could possibly make money on it.

"We're not undertaking this project to go bankrupt," Cuthbert replied. He said the project was profitable with crude prices hovering around \$77 a barrel.

Cuthbert added Earth Energy is hoping to "prove our technology" in its first business venture.

Baza said he will decide whether to uphold his staff's approval within a month.

State officials listen to concerns about proposed tar sands mining project

[Linked here](#)

Published: Tuesday, July 27, 2010 7:34 p.m. MDT

SALT LAKE CITY — Prompted by concerns lodged by environmental groups, the state Division of Oil and Mining held an informal hearing Tuesday to air questions on impacts that could result from a tar sands mining project straddling the borders of Uintah and Grand counties.

Proposed by Canada-based Earth Energy Resources, the operation would take place on 213 acres and involve the open-pit mining of tar sands to extract 2,000 barrels of bitumen per day over a seven-year period.

Although several of the hearing participants questioned the financial viability of the project, even terming it "experimental," Earth Energy Resources Vice President Barclay Cuthbert said the venture would not be pursued if dollars weren't going to follow.

"We're not undertaking this project to go bankrupt," Cuthbert said. "The economics of this project stand on their own."

Timothy DeChristopher, an environmental activist best known for deliberately monkey-wrenching a controversial oil and gas lease auction in December 2008, said he failed to understand why the state would allow the project to move forward given the unknowns.

"I can't understand why the state would allow an unprecedented, experimental project to happen in the Colorado River watershed," DeChristopher said. "This project is a bridge to nowhere."

Groups that include Living Rivers and Peaceful Uprising worry that the operation could contaminate tributaries that feed into the Colorado River and result in dust pollution because of the heavy truck traffic — all for oil that they say generates more greenhouse gas emissions than conventional crude oil.

Aside from those concerns, Living Rivers conservation director John Weisheit said the water taken from an aquifer necessary in the mining process could deplete the aquifer. Weisheit stressed that the value of the Tavaputs Plateau is to "leave it as it is."

"It is inappropriate to do this in the Colorado Plateau," he said. "It cannot go forward."

Carla Knoop, an environmental consultant hired by Earth Energy Resources, said the appropriate controls and safeguards have been implemented in the mining operation's design to catch any runoff in a containment system that includes berms and ditches. The operation, Knoop said, is 25 miles from Willow Creek and 38 miles from the Green River. The area has no "live" water in its vicinity — only an drainage system that has no water in it except during or immediately after a rainstorm, she said.

Tom Munson, a state hydrologist who has reviewed the proposed project, said the company also plans to implement a storm water-containment system, which is "one of the strong things we could ask for."

"We're not dealing with the Colorado River here," Munson said. "I am very certain very little if any runoff will occur."

Division officials said Earth Energy Resources has met the requirements of the permitting process, leading the agency to approve a permit last year, pending receipt of a reclamation surety of nearly \$1.7 million.

Division director John Baza will review a transcript of the hearing and the documents associated with the permitting process. Baza indicated he will issue a final decision within 30 days on whether to grant the permit, seek modifications or remand it for additional review.

The environmental groups and the company then have the option to appeal his decision. That matter would be heard by the state Board of Oil, Gas and Mining.

Suit seeks to halt drilling, expansion of La Sal-area mine

By Amy Joi O'Donoghue
Deseret News

Published: Friday, July 30, 2010 3:35 p.m. MDT MOAB — Three Moab-based conservation groups filed a federal lawsuit this week to halt uranium exploration and the construction of radon vent holes on U.S. Forest Service land in the Manti-La Sal National Forest in La Sal, San Juan County. The complaint filed with the U.S. District Court in Salt Lake City challenges a decision by the Moab/Monticello Ranger District to permit the drilling of 16 exploration drill holes and two radon vent holes as part of the expansion of the Pandora Uranium Mine.

The Pandora Mine is owned by Denison Mines Corp. Uranium ore from the mine is transported to Denison's uranium mill on White Mesa, a few miles south of Blanding in San Juan County.

The groups — Living Rivers, Uranium Watch and the Center for Water Advocacy — also filed a request for a preliminary injunction at the Pandora Mine to stay ground disturbance and construction of the exploration holes and radon vent holes until the case can be fully heard by the federal court.

The citizens' groups challenge the granting of a "categorical exclusion" for the projects and request that the Forest Service develop a full environmental analysis of the projects as part of the proposed expansion of the Pandora Mine.

In December 2009, Denison Mines submitted an amended "plan of operations" to the Forest Service, Bureau of Land Management and the state Division of Oil, Gas & Mining.

The suit asserts the Forest Service approved the new projects without consideration of the cumulative environmental impacts from the expansion of the Pandora Mine. Additionally, it asserts the Pandora Mine is operating under an outdated environmental analysis from 1981. Radon is vented to the surface from the underground mine operations so that the miners will not breathe in the radon gas and be exposed to the short-lived, highly radioactive particles that are produced when radon decays.

The proposed radon vents would add to the amount of radon gas and radioactive particulates released in the vicinity of the community of La Sal, on the south slope of the La Sal Mountains, according to a press release.

A Forest Service official declined comment on the suit, saying it had not been reviewed as of late Friday.

Mining for oil

Salt Lake Tribune Editorial

The strip mining of tar sands deposits for oil in Utah's Book Cliffs will disturb the earth, degrade the environment and disrupt wildlife. It's an energy- and water-intensive way of producing petroleum that could jeopardize water quality and supplies. Plus, the process yields an old-school fossil fuel that produces climate-changing greenhouse gases in abundance. Simply put, tapping tar sands won't yield clean, renewable fuels; instead, it will compound our energy problems.

But common sense hasn't stopped Earth Energy Resources from attempting a demonstration project that could result in a flurry of destructive tar-sands mining on the environmentally sensitive Colorado Plateau. And it didn't stop the Utah School Institutional Trust Lands Administration from leasing the initial 62-acre site, plus nearly 6,000 additional acres in eastern Utah, to the Canadian company. And it didn't keep the Utah Division of Oil, Gas and Mining, which must assure that the mining plan complies with environmental and land-reclamation laws, from issuing a permit to proceed.

Moab-based Living Rivers, an environmental advocacy group, is protesting the mining permit. The Division's board will hear the appeal, a process that can take six months to a year to complete, and a fine-tooth-comb approach is in order.

Living Rivers officials argue that the project will contribute to climate change, and negatively impact water quality and supplies in the Colorado River basin. Due to the lack of storm-water drainage impoundments, the environmental group claims residual petroleum and chemicals from the mine could wash into Willow Creek.

Earth Energy counters that its patented citrus-based solvent is nontoxic, although independent verification by the public is not possible. The company, despite patent protections, considers its solvent to be proprietary, and only state regulators have access to the data.

Plus, the firm counters that it will require just 1.5 barrels of water to produce a barrel of oil. Still, that's a lot of water in the second-driest state, especially if the industry gets its toe in the door and tar-sands mining becomes commonplace.

Even if Earth Energy survives the appeal, the project is not a done deal. The company must also obtain approval from Grand County to proceed, and the county should carefully consider the impact of tar-sands mining on Grand's lucrative tourism and recreation industries.

Also, Earth Energy needs \$35 million to launch the mine, and investors are rightfully skittish. That could be the biggest obstacle to the project, and the Book Cliffs' saving grace, since government seems reluctant to stand in the way despite the threat to the environment and the economy.

Draft Environmental Assessment Development and Implementation of a Protocol for High-flow Experimental Releases from Glen Canyon Dam, Arizona, 2011 - 2020

Note: Comment period extended to March 18th.

[Click here](#) to read Reclamation press release about the extension

The Department of the Interior, acting through the Bureau of Reclamation, is proposing to develop and implement a protocol for high-flow experimental releases from Glen Canyon Dam to better determine whether and how sand conservation can be improved in the Colorado River corridor downstream of Glen Canyon Dam including areas within Grand Canyon National Park. Under the concept of high-flow experimental releases, sand stored in the river channel is suspended by high-volume dam releases and a portion of the sand is redeposited in downstream reaches as sandbars and beaches, while another portion is transported downstream by river flows. These sand features and associated backwater habitats provide key wildlife habitat, protect archaeological sites, enhance riparian vegetation, and provide camping opportunities along the Colorado River in Grand Canyon National Park.

This protocol for high-flow experimental releases from Glen Canyon Dam is part of the ongoing implementation of the Glen Canyon Dam Adaptive Management Program. As part of the GCDAMP, the protocol is a component of Interior's compliance with the Grand Canyon Protection Act of 1992 (Public Law 102-575).

Written comments may be provided to Reclamation through March 18, 2011 to: Bureau of Reclamation, Environmental Resources Division, 125 South State Street, room 7218, Salt Lake City, Utah 84138 or to via e-mail to: protocol@usbr.gov. For more information, please contact Dennis Kubly at (801) 524-3715.

Reclamation Releases Environmental Assessment for Control of Non-Native Fish in the Colorado River to the Public for Review and Comment

Note: Comment period extended to March 18th.

[Click here](#) to read Reclamation press release about the extension

[Click here](#) to read the press release by Reclamation about this EA

[Click here](#) to go to the Reclamation web site for the environmental documents

[Click here](#) to read the scientific study by the USGS.

Written comments may be provided to Reclamation through March 18, 2011 to: Bureau of Reclamation, Environmental Resources Division, 125 South State Street, room 7218, Salt Lake City, Utah 84138 or to via e-mail to: protocol@usbr.gov. For more information, please contact Dennis Kubly at (801) 524-3715.

The Bureau of Reclamation has released a Draft Environmental Assessment for the control of non-native fish in the Colorado River downstream from Glen Canyon Dam to the public for a 30-day review and comment period. The EA analyzes the environmental consequences of a range of specific actions designed to control non-native fish, particularly rainbow and brown trout, known to prey on, and compete with, the endangered humpback chub in Grand Canyon. Some means of control are necessary to satisfy conservation measures contained in the 2008 Biological Opinion issued by the U.S. Fish and Wildlife Service for the Operation of Glen Canyon Dam, and the terms and conditions of a subsequent 2010 biological opinion.

"Protecting endangered native species is a key component of Reclamation's efforts to balance the complex and competing interests in the Colorado River downstream of Glen Canyon Dam," said Assistant Secretary for Water and Science Anne Castle. "The science we are bringing together through this study will help us wisely manage Colorado River flows and meet our water delivery and environmental responsibilities, while protecting the cultural values of native American communities."

Continued mechanical removal through the Glen Canyon Dam Adaptive Management Program was the primary method anticipated in the conservation measure, particularly at the confluence of the Colorado River mainstem and the Little Colorado River. However, several tribes represented on the Adaptive Management Work Group, particularly the Pueblo of Zuni, expressed concerns over the taking of life in a culturally

sacred area and the adverse effect that this action has on the values of the Zuni people. To address these concerns, other potential methods of control are evaluated in the EA.

Reclamation worked with the U.S. Geological Survey Patuxent Wildlife Research Center to conduct a Structured Decision Making project to enlist cooperating agencies and AMP tribes in the development and analysis of potential alternatives to control non-native fish for evaluation in the EA. Government-to-government tribal consultation meetings are on-going and will be concluded prior to completion of a final decision on the proposed action.

Non-native fish control efforts identified in the EA would be focused within Glen Canyon National Recreation Area and Grand Canyon National Park. The proposed action is intended to reduce competition and predation on the humpback chub which threaten the potential recovery of the species, while attempting to address tribal concerns and avoid or minimize effects to other resources. The EA describes the current environmental conditions in Glen, Marble, and Grand canyons downstream from Glen Canyon Dam and discloses the direct, indirect, and cumulative environmental impacts that could result from the proposed action and alternatives.

The draft EA was prepared in accordance with the National Environmental Policy Act and is available on our web site. A printed copy of the report is available at the Bureau of Reclamation Upper Colorado Regional Office, 125 South State Street, room 7218, Salt Lake City, Utah 84138.

BLM begins public hearings in Salt Lake City on oil shale, tar sands development in the West

Associated Press
Chi-Chi Zhang

SALT LAKE CITY — Environmentalists are urging the Bureau of Land Management not to develop nearly 2 million acres of land in Utah, Wyoming and Colorado for oil shale and tar sands use.

The first of seven hearings began on Tuesday in Utah following a decision by Interior Secretary Ken Salazar to take a fresh look at a federal oil shale plan that was released in 2008 by the Bush administration.

That plan would open about 2 million acres of Western public lands to oil shale research and development. The potential impacts include water pollution, huge power needs and boom-bust economic risks.

"The scoping process is designed to explain to the public what we're about to do and gather their input early on," said Mitch Leverette, chief of the Solid Minerals Division for the Bureau of Land Management. "Based on their comments, we hope to offer a range of alternatives in the final report."

A draft of the report is expected to be completed by late September and the final report completed by December 2012, he said.

The report will provide suggestions and examine the potential impact of development, with as much as 1.9 million acres available for commercial oil shale projects and more than 400,000 acres for tar sands leasing and development.

Environmentalists are concerned not only about the impacts of mining in Utah's San Rafael Swell and the scenic Book Cliffs area, but also the potentials risks to air quality and water supplies downstream.

"If they go ahead with this, it means the U.S. is not serious about climate change," said John Weisheit, a Colorado River guide and founder of Living Rivers who spoke at the hearing in Salt Lake City on Tuesday. "This won't help provide more jobs or solve the oil crisis, but it will damage our water resources so why even get started?"

Living Rivers is currently challenging Utah's approval of a proposed commercial tar sands project in the Uinta Basin, which would be the first of its kind in the U.S. The group contends it would dig up fragile topsoil, destroy limestone plateaus formed over thousands of years and pollute groundwater downstream that flows into the Colorado River. Living Rivers filed a complaint with the state, claiming that the Utah Division of Water Quality didn't accurately assess the potential for widespread environmental damage from the PR Springs mine.

But some companies say there are ways to make oil shale development economically viable and technology that will minimize the environmental impact.

"The cleaner we can produce, the more we can produce," said Ray Ridge, founder of Excalibur Industries Inc., an oil shale extraction technology company, at the hearing on Tuesday. "A lot of opponents believe there are no clean methods of oil shale extraction, which is not true and there are alternative solutions."

Another hearing was planned Wednesday in Price.

Hearings will be held in Wyoming on April 29 in Rock Springs and May 5 in Cheyenne and in Colorado on May 3 in Rifle and May 4 in Denver.

SUGGESTED TALKING POINTS FOR COMMENTS:

See also the report called [Fossil Foolishness](#)

BLM needs reliable information on how much oil shale development would change the landscape, and it must understand the potential effects on water supplies, air quality, public health and wildlife before it considers commercial leasing. The BLM does not have enough information to consider dedicating public lands to commercial leasing at this point.

A watershed of two million acres will be destroyed

The BLM plan released in 2008 for oil shale allocated 2 million acres in UT, WY and CO for commercial leasing. This is a massive amount of public, taxpayer land that would be sacrificed for a singular use of the landscape; the BLM should reconsider this decision, and consider alternatives that protect the wildlife habitat, water, and air in the West.

Oil shale is projected to have huge impacts on water supplies in the West.

We don't know about the real impacts of commercial oil shale to water supplies in the West, but we know they will be significant. The latest water use estimates range from 3 times the amount consumed annually in Mesa County, Colorado (110,000 acre ft) to 50% more than the Denver Metro area consumes annually (378,000 acre ft). Either scenario would have enormous impacts on the West. We should not consider commercial development of oil shale before we know those impacts.

Oil shale would require a huge amount of electricity.

Oil shale requires a huge amount of electricity to heat it enough to extract a liquid from the rock. The Bureau of Land Management's (BLM) initial estimates show that producing 1 million barrels per day would require ten new coal-fired power plants, each with a capacity to power a city of 500,000 people. The BLM should very carefully consider the serious impacts of new energy required for oil shale development.

Oil shale would have significant impacts to wildlife and fish populations.

The land overlying oil shale resources in Utah, Colorado and Wyoming is some of the best wildlife habitat in the West. We don't know the true impacts that oil shale could have on wildlife populations, but we know that elk, deer, and aquatic species could be seriously impacted by a full-scale oil-shale industry. BLM estimated in its draft EIS that large-scale oil shale development would result in the permanent loss of up to 50 percent of BLM stream fisheries in the area of development, up to 35 percent of Colorado River cutthroat trout fisheries, and up to 11 percent of available nest and brood range for blue and sage grouse.

Research and development leases have shown us nothing so far.

We have had 6 research and development projects in place on federal lands since 2007, with 3 more recently approved by Secretary Salazar, and tens of thousands of acres of oil shale private lands owned by industry. The BLM should not consider allocating millions of acres of western lands for oil shale without any information from oil shale research and development leases on federal lands.

Oil shale is a dirty fuel of the past. We should be focusing on clean fuels of the future.

Simply put, as a nation we should be investing in clean energy sources of the future, not wasting our time promoting dirty energy sources of the past like oil shale and tar sands.

[CLICK HERE](#) FOR THE REPORT.

The following is the press release from Dept. of Interior:

WASHINGTON, D.C. – Secretary of the Interior Ken Salazar today released a report that assesses climate change risks and how these risks could impact water operations, hydropower, flood control, and fish and wildlife in the western United States. The report to Congress, prepared by Interior's Bureau of Reclamation, represents the first consistent and coordinated assessment of risks to future water supplies across eight major Reclamation river basins, including the Colorado, Rio Grande and Missouri river basins.

"Water is the lifeblood of our communities, rural and urban economies, and our environment," said Secretary Salazar, "and small changes in water supplies or the

timing of precipitation can have a big impact on all of us. This report provides the foundation for understanding the long-term impacts of climate change on Western water supplies and will help us identify and implement appropriate mitigation and adaptation strategies for sustainable water resource management.”

The report, which responds to requirements under the SECURE Water Act of 2009, shows several increased risks to western United States water resources during the 21st century. Specific projections include:

a temperature increase of 5-7 degrees Fahrenheit; a precipitation increase over the northwestern and north-central portions of the western United States and a decrease over the southwestern and south-central areas; a decrease for almost all of the April 1st snowpack, a standard benchmark measurement used to project river basin runoff; and an 8 to 20 percent decrease in average annual stream flow in several river basins, including the Colorado, the Rio Grande, and the San Joaquin. The report notes that projected changes in temperature and precipitation are likely to impact the timing and quantity of stream flows in all western basins, which could impact water available to farms and cities, hydropower generation, fish and wildlife, and other uses such as recreation.

"Impacts to water are on the leading edge of global climate change, and these changes pose a significant challenge and risk to adequate water supplies, which are critical for the health, economy, and ecology of the United States," added Reclamation Commissioner Mike Connor. Reclamation is already working with stakeholders across the West to achieve a sustainable water strategy to meet our nation's water needs. Through the WaterSMART Basin Studies Program, Reclamation is developing and evaluating options for meeting future water demands in river basins where water supply and demand imbalances exist or are projected.

Reclamation is also continuing to implement actions to mitigate and adapt to changing climate. For example, at Hoover Dam, new wide head range turbines are being installed that will allow more efficient power generation over a wider range of lake levels than existing turbines. In addition, through the WaterSMART program, Reclamation continues to work with water users across the West to implement conservation and recycling measures and promote the efficient use of finite water resources. The Department of the Interior has also established Landscape Conservation Cooperatives and Climate Science Centers to help assess vulnerabilities to the natural and cultural resources management by the Department, and spearhead activities to adapt to the stresses of climate change.

“The WaterSMART program provides a strong foundation for the Department's efforts to improve water conservation and help water-resource managers make sound decisions about water use,” said Assistant Secretary of the Interior for Water and Science, Anne Castle. “As climate change adds to the challenges we face in managing our water supply, meaningful engagement between the River Basin states and the Department of the Interior will continue to be essential.”

To develop the report, Reclamation used original research and a literature synthesis of existing peer-reviewed studies. Projections of future temperature and precipitation are based on multiple climate models and various projections of future greenhouse gas emissions, technological advancements, and global population estimates. Reclamation will develop future reports to Congress under the authorities of the SECURE Water Act that will build upon the level of information currently available and the rapidly developing science to address how changes in supply and demands will impact water management.

The Bureau of Reclamation is the largest wholesaler of water in the country, providing water to more than 31 million people and to one out of five Western farmers for irrigation of more than 10 million acres of farmland. Reclamation is also the second largest producer of hydroelectric power in the western United States with 58 power plants generating nearly a billion dollars in power revenues and producing enough electricity to serve 3.5 million homes.

The SECURE Water Act Report, with fact sheets highlighting climate challenges and impacts in the eight western river basins, is available online at <http://www.usbr.gov/climate>.

More information about Reclamation's WaterSMART program is available at <http://www.usbr.gov/WaterSMART>

The draft study documents were submitted by the Utah Division of Water Resources in accordance to the Federal Energy Regulatory Commission (FERC) for the potential licensing of Lake Powell Hydroelectric Project No. 12966, otherwise known as the Lake Powell Pipeline. The proposed project will deliver Colorado River water (100,000 acre-feet per year) from Lake Powell to Kanab, Washington and Iron counties. The project also includes the generation of electricity to defer a portion of the operating costs.

The Utah Board of Water Resources (UBWR) held two initial study report meetings to discuss the draft study report results, one on March 22, 2011 in St. George, Utah and another on March 23, 2011 in Salt Lake City.

Green groups question proposed Utah nuclear plant

By JUDY FAHYS The Salt Lake Tribune

Environmental groups from four states are urging Utah water officials to take a hard look at the proposed Green River nuclear power plant's potential impacts on the environment and human health.

The ten groups say in a letter to State Engineer Kent Jones that, while the likelihood of catastrophe might be low, the consequences of a radiation release at the proposed plant would be enormous for about 30 million people who rely on water from the Green and Colorado rivers downstream, as well as for the ecosystem.

"We urge you to carefully consider that possibility," says the June 29 letter, "given the critical location of the proposed reactors upstream from not just the water supply for tens of millions of Southwestern residents, but for a host of fragile ecosystems, flora and fauna."

At the State Engineer's office, the staff continues to review a pair of applications to divert 53,600-acre-feet of water for the 3,000 megawatt plant, said John Mann, assistant state engineer. The water-rights review is looking at concerns about radiation releases like those at the Fukushima nuclear station in northern Japan, at the possibility that radiation would wind up in the Colorado River system, and that it could affect endangered fish species.

"The issues that are raised in the letter are things we are going to have to consider anyway," Mann said, noting the water-rights decision might not be complete before the summer's end. "The downstream interests of water users are always taken into consideration."

The groups signing onto the letter include Uranium Watch and Living Rivers in Moab. They also include the Grand Canyon Trust, the Sierra Club Grand Canyon Chapter, SafeEnergyAnalyst.org, Environment Nevada, Environment California, Environment Arizona, Don't Waste Arizona and the Arizona Wilderness Coalition.

Aaron Tilton, president and CEO of Blue Castle Holdings, the company proposing the nuclear plant, said the state engineers' water rights review is limited to questions about the availability of water and the project's feasibility. Deeper questions about environmental impacts will be dealt with in-depth by the U.S. Nuclear Regulatory Commission.

"The real forum for that [environmental] discussion is the NRC," he said.

The NRC is not expected to take up the Blue Castle license until the end of next year or the beginning of 2013, said Tilton.

The plant is planned for a location near the junction of Interstate 70 and State Route 6 just west of Green River.

By JOSH LOFTIN Associated Press Posted: 06/29/2011 01:32:25 PM PDT

SALT LAKE CITY—Environmental groups from four states have sent a letter to Utah officials criticizing a request from the owners of a proposed nuclear power plant to use water from the Green River.

The biggest issue for the groups from Arizona, California, Nevada and Utah is the scarcity of water in the Colorado River basin. But they also cite safety concerns in the wake of the Fukushima disaster in Japan, cautioning that a similar disaster could have dire consequences because the radioactive material could flow downstream.

"We urge you to carefully consider that possibility, given the critical location of the proposed reactors upstream from not just the water supply for tens of millions of Southwestern residents, but for a host of fragile ecosystems, flora and fauna," the groups wrote.

The proposed nuclear power plant would be located in eastern Utah. The Utah Division of Water Rights is studying a request for the power plant to use about 17.5 billion gallons of water a year from the Green River, a major tributary of the Colorado River. That's enough to serve about 100,000 households. "Awarding a massive quantity of water ... to nuclear reactors seems a poor choice given the realities of the already over-subscribed Colorado River system," the groups wrote.

The nuclear power plant is being proposed by Blue Castle Holdings, which is managed by President and CEO Aaron Tilton, a former state Republican lawmaker.

Reclamation Releases Environmental Assessment on a Protocol for Experimental High-Flow Releases from Glen Canyon Dam for Second Public Review.

The Bureau of Reclamation has released the revised Draft Environmental Assessment for the Development and Implementation of a Protocol for High-Flow Experimental Releases from Glen Canyon Dam, from 2011 through 2020 for a second two-week public review and comment period.

The EA analyzes the effects of implementing a protocol to conduct multiple high-flow experiments from the dam between 2011 and 2020 to better determine whether and how beach and sandbar building and maintenance can be improved in the Colorado River corridor downstream of the dam. The protocol will provide an adaptive management framework to learn how to better conserve the limited sand supply to the Colorado River below the dam, while ensuring that no significant impacts occur to other downstream resources affected by the high releases.

During a high flow experiment, the high volume of water released from the dam suspends sand stored in the river channel deposited by tributaries. A portion of that sand is re-deposited in the downstream river reaches as sandbars and beaches while another portion is transported downstream by river flows. These sand bars and beaches, and the associated near-shore habitats, are important components of the Colorado River ecosystem in addition to providing camping opportunities for river runners and hikers along the Colorado River within Grand Canyon National Park.

The Department of the Interior initiated development and implementation of the protocol as part of the ongoing Glen Canyon Dam Adaptive Management Program, to build on the knowledge gained from the previous high-flow experiments conducted in 1996, 2004, and 2008, and to comply with requirements and obligations established by the Grand Canyon Protection Act of 1992.

The draft EA was prepared in accordance with the National Environmental Policy Act and is available at www.usbr.gov/uc under the "[Environmental Documents](#)". A printed copy of the report is available at the Bureau of Reclamation Upper Colorado Regional Office, 125 South State Street, room 7218, Salt Lake City, Utah 84138.

Written comments may be provided to Reclamation through July 19, 2011 to the address above or via e-mail at protocol@usbr.gov. For more information, or to request a printed or CD-ROM copy of the EA, please contact Dennis Kubly at (801) 524-3715.

USU scientist to lead Grand Canyon project (GCMRC)

By Cache Valley Daily
August 11, 2011

Utah State University river scientist Jack Schmidt will lead a federal agency focused on providing science to guide management of an iconic region that has been a pivotal part of his research for nearly 30 years.

Starting August 15 Schmidt assumes the post of Chief of the U.S. Geological Survey's Grand Canyon Monitoring and Research Center based in Flagstaff, Arizona. Schmidt, a professor in USU's Department of Watershed Sciences, says the Grand Canyon and the Colorado River that flows through it is where his research life started.

He says he views this as an opportunity for service within the federal government as a way to give back to a river and to a landscape that has been central to his professional career and the education of his students.

Colorado River Protection Coalition Intervenes Against Flaming Gorge Pipeline

Federal Energy Regulatory Commission Should Not Waste Resources On Unbuildable Scheme

Denver, CO – Today a coalition of 10 conservation groups from Colorado, Utah, Wyoming, and Arizona -- the Colorado River Protection Coalition -- moved to intervene in the Federal Energy Regulatory Commission (FERC) review of the Regional Watershed Supply Project (a.k.a., the "Flaming Gorge Pipeline"). FERC is currently evaluating a preliminary permit application for the Flaming Gorge Pipeline from Wyco Power and Water Inc. FERC allows members of the public with a stake in projects to intervene in preliminary permit proceedings, and the Colorado River Protection Coalition, represented by Earthjustice, has called upon FERC to deny the permit on numerous grounds.

"The Flaming Gorge Pipeline would be one of the biggest, most environmentally damaging water projects in the history of the western United States," said McCrystie Adams of Earthjustice, the Coalition's lead attorney. "The Pipeline would devastate the Green River, one of the West's last great rivers and a sanctuary for native fish and wildlife, and severely harm the Colorado River downstream."

In its intervention comments, the Colorado River Protection Coalition asserted that the Flaming Gorge Pipeline is extremely unlikely to be permitted because it would likely violate the Endangered Species Act, would adversely affect four national wildlife refuges, and part of the project would be located in a U.S. Forest Service roadless area. The Coalition also argued that the permit should be denied because the applicant failed to meet various requirements during a previous attempt at permitting a nearly identical project with the U.S. Army Corps of Engineers. Further, the Coalition asserted that the Pipeline is an extremely environmentally damaging water supply project that would irrevocably harm the Green and Colorado Rivers, not a "hydropower project," and thus FERC is not the appropriate agency to lead federal review of the proposal.

"The Flaming Gorge Pipeline would severely harm the Wyoming landscape it crosses," said Steve Jones of the Wyoming Outdoor Council. "Our state's heritage, wildlife, and economy are dependent on protecting roadless and wilderness areas."

“Four endangered fish -- the Colorado pikeminnow, humpback chub, razorback sucker, and bonytail chub -- are dependent on the water this pipeline proposes to drain out of the Green and Colorado Rivers,” said Taylor McKinnon of the Center for Biological Diversity in Flagstaff, Arizona. “The pipeline would spell disaster for those fish and the river ecosystems we and they depend on. It’s a foolish proposal in the face of global warming and projected declines in river flows.”

“The Green River flows through Utah’s largest roadless area, provides 40 percent of the water entering the Colorado River at Lake Powell each year, and supports a world-famous trout fishery averaging 6,000 – 8,000 fish per mile” said Zach Frankel, executive director of the Utah Rivers Council. “This catastrophic proposal would not only mar these treasures, it would forever alter life in Utah.”

The applicant previously sought a permit for the Pipeline from a different federal agency, the U.S. Army Corps of Engineers (Corps). In July of 2011, the Corps terminated its review of the project because the applicant missed multiple deadlines and did not provide information requested by the Corps. A few months later, the applicant redesigned the project to include some incidental hydropower components and requested review through FERC. Despite the modifications, the project remains a huge energy hog -- at least nine air-polluting natural gas-fired pumping stations would be required to pump the water uphill across Wyoming and over the Continental Divide. Wyco’s president has acknowledged that pumping the water uphill would use more energy than the project would create through hydropower.

“We know this project would burn more energy than it produces,” said John Spahr of the Sierra Club. “Claiming it is a hydropower project is nothing more than a thinly veiled attempt to make an end-run around federal law.”

Since its inception, the extremely controversial Flaming Gorge Pipeline has met with great opposition in Colorado, Wyoming, and Utah. The water would go to the Front Range of Colorado which is projected to double in population in the next 50 years. Colorado is already a parched state with severely depleted rivers while the majority of the water in Colorado’s cities is used to keep lawns green for three months in the hot, dry summer across sprawling suburban landscapes.

Duane Short of Biodiversity Conservation Alliance noted, “The Coalition believes that Colorado and other western citizens are beginning to realize that unbridled consumption of water from our rivers and aquifers will leave our precious water resources depleted leading to even more severe water shortages for our children and grandchildren. We hope the public will work with us to prevent this shortsighted and irresponsible water grab.”

“The Flaming Gorge Pipeline would be a flaming disaster for Colorado,” said Gary Wockner of Save the Poudre: Poudre Waterkeeper. “The Pipeline would be a devastating step backwards for water supply policy and river protection in Colorado and the Southwest U.S. -- our coalition will work as long and hard as it takes to stop this project.”

This Coalition's intervention is one of several being filed by public interest groups and local communities. Over a hundred public comments urging FERC to deny the preliminary permit have already been filed before the Dec. 19th deadline. Comments are posted on FERC's website here:

Book Excerpt: A Great Aridness (Debuys)

December 26, 2011

'A Great Aridness'

By SIMON BARON-COHEN (New York Times)

Pages 22-27

THE GOOD NEWS, if you ask Richard Seager, an oceanographer at the Lamont-Doherty Earth Observatory in Palisades, New York, is that the Northern Hemisphere Hadley cell is not expanding as fast as some recent analyses have warned. Those projections, he says, depend upon comprehensive satellite data, which have been available only since the late 1970s, a brief slice of time. He thinks the observed Hadley cell expansion is better attributed to a naturally occurring decadal shift in Pacific Ocean currents.

The bad news, however, is that, because of Hadley cell expansion and other factors, the Southwest is moving — and to some extent has already moved — into a new set of climate conditions “unlike any climate state we have seen in the instrumental record.”

Seager thinks that the droughts of the past, like the Dust Bowl drought of the 1930s and the 2000–2004 drought that killed millions of pinons and ponderosas in New Mexico and Arizona, will be the norm of the future. He is saying, in effect, that what we think of as drought today will cease to be drought in the light of some not-too-distant tomorrow. Drought is relative — and exceptional. One does not say that the Sahara is experiencing drought. The Sahara is dry by nature, not by exception.

According to Seager, the future Southwest will be much drier than the conditions its present inhabitants consider “normal”; it will likely be as dry as its driest recent decades, and people will have to recalibrate their expectations to a new idea of what “normal” stands for. Moreover, he says that the droughts of the future will be superimposed on that dryness and that they will be unlike anything people in the region have known since late medieval times.

Seager holds an endowed position at Lamont-Doherty, a research arm of Columbia University. He’s a Brit who came to the United States for education and stayed. I visited him at his Morningside Heights apartment on a day when the lab was closed and his son Angus was home from school, contending with homework at the dining table. The humid smell of laundry was in the air. We had plenty of time to talk, but not an unlimited amount — an important football game (real football, played with the feet) would be

televised from England that afternoon. Seager lives close to Columbia, only a block from the diner made famous by the sitcom “Seinfeld.”

He takes an amused pride in this link to American pop culture, marveling at the tourists posing for snapshots and the occasional celebrity guiding a tour. Seager is a bit of a cultural sponge. As we talked, he alluded frequently to the intricacies of Colorado River politics and to Dust Bowl histories and books on western water. Except for his accent, he could have been a good-old-boy insider.

Seager calls himself an oceanographer and meteorologist, avoiding the term climatologist, which suggests, to him, a duffer “with a cloth cap and a rain gauge in his garden.” He came to the study of the Southwest “by pure chance, which is the way science goes, you know?” He and his team had been looking at Asian monsoon variability in the nineteenth century, going back to 1856, the year the British and American navies began recording air and sea surface temperatures and winds from all their ships. Other navies and merchant marines eventually followed suit, making it possible to compile a nearly global century-and-a-half record of oceanic weather. Seager and his team drew upon that data to model relationships between sea surface temperature and changes in atmospheric circulation.

In 2004, Siegfried Schubert, a scientist at the nearby NASA Goddard Institute for Space Studies, a leading center for climate science, wrote a paper that linked the Dust Bowl drought to small temperature changes in surface waters of the tropical Pacific. Seager had access to an advance copy. “When Schubert published that paper, and actually before it came out,” says Seager, “I just looked in the model that day and said, well, does our model produce a Dust Bowl drought? And sure enough, it produced a Dust Bowl drought.” Further investigation showed it “made a nice big drought in the Southwest in the 1950s,” which Schubert’s simulation had missed, and it also showed the Southwest turning dry in 1998, the approximate onset of the drought that produced widespread tree die-offs in 2002–2003.

Things were getting interesting. Seager checked the model against a new drought atlas that Lamont-Doherty’s tree-ring researchers had just produced and found that they jibed: the model tracked the wet and dry periods recorded in the tree rings for the mid-to late nineteenth century with high fidelity. “So we just sort of dropped stuff, whatever we had been doing, and misused government funds to fund this research instead of what the government had actually given us funds to do.” His program managers didn’t complain, because they understood the importance and opportunities of the new work. “So we pushed it forward.” The forwardness was in two dimensions: forward in terms of refining an understanding of historical drought records and forward also in time, projecting climate for the Southwest into the twenty-first century.

The Intergovernmental Panel on Climate Change (IPCC), which the United Nations established in 1988, had also done this. Modelers contributing to the IPCC’s “Fourth Assessment Report,” which appeared in 2007, concluded that the North American Southwest would grow appreciably drier in the twenty-first century, but their predictions focused far in the future, past 2080. They also concerned themselves solely with precipitation, not the finer-grained interaction of precipitation less evaporation, which

better describes the moisture available to nourish soil and discharge into streams and rivers. “So there’s a bit more to the story than the precipitation” — and Seager and his team set out to tell it.

Their simulations showed that the Southwest would not have to wait until 2080, or even 2050, to experience drier times; greater aridity was already on its doorstep — hence the considered use of the word imminent in the title of their paper, “Imminent transition to a more arid climate in southwestern North America,” which appeared in the journal *Science* in 2007, attracting considerable attention. Their research also told them that the increase in aridity would not result from the same forces that triggered the droughts of the past. Those droughts, possibly including the extended droughts of medieval times, appear to have occurred when the currents of the tropical Pacific, for whatever reasons, carried relatively cool surface waters far to the east, toward the Americas. This pattern, commonly called La Nina, seems to give a northward push to the winter storm track that brings moisture to western North America. The opposite pattern, El Nino, pulls the storm track southward, bringing winter rain to U.S. deserts and snow to the southern Rockies. (Mexico is not so lucky; it depends principally on summer monsoons.)

Together El Nino, named for the Christmas time arrival of warm waters off the coast of Peru, and La Nina, its contrary sister, are known as the El Nino Southern Oscillation (ENSO). The mnemonic for this relationship, from a southwestern point of view, is sexist: the boy child brings welcome winter precipitation, filling the reservoirs crucial to both cities and agriculture, but the girl brings drought. Or so it has been in the past.

The model simulations analyzed by Seager and his team showed the Southwest to be drying out “for a different reason, and that different reason is just a simple consequence of warming up.” Seager explains that when Earth’s surface and its atmosphere warm up, two things happen. One is the intensification of the hydrologic cycle: warmer air holds more water vapor; more vapor converges in wet regions, and it rains more there.

“The pattern of water vapor transport intensifies. That makes dry regions drier and wet regions wetter. So that’s part of why the Southwest dries, because it’s already in one of these places where important parts of the atmosphere circulation take moisture away.” The other reason Seager cites is the expansion of the subtropical subsidence zone, where the dry, downwelling air of the Hadley cell returns to the surface of the land.

“And that’s not the same as what causes the natural droughts,” he concludes. “The cycle of natural dry periods and wet periods will continue, but they continue around a mean that gets drier. So the depths — the dry parts of the naturally occurring droughts — will be drier than we’re used to, and the wet parts won’t be as wet as we’re used to, because they’re both happening around a mean state that gets drier and drier.”

That new “mean state” is what he calls the new climatology of the Southwest, something similar to the Dust Bowl or the 1950s — a far cry from the anomalously wet period that ran from the late ’70s into the ’90s, which forms many people’s notion of what is “normal” for the region. Not everyone agrees with Seager’s message, and certainly not with the blunt, alarming language in which he delivers it. There are always

cries for more data and improved models, for further analysis at a finer spatial scale, and for the consideration of other possible explanations.

There are also critics who say that even if he is right, he should be more careful: predictions as strident as his risk undermining the public's faith in the scientific community. What if the Southwest enjoys a string of generously wet years? Every system exhibits variation, and all long droughts include wet episodes. What if the new climatology arrives late, or not at all? Perhaps then the urgency he has tried to engender will turn to cynicism, commitment turn to inaction, and the public's grudging acceptance of the reality of climate change degrade into disbelief. Perhaps, in the end, his startling warning might have an effect opposite to the one he intended.

Seager shrugs: "It's because of things like that that the Bureau of Reclamation and their like can sort of throw their hands in the air and say, 'Well, what do we do with these climate model projections? They don't have information at the spatial scale we need to predict what the Colorado River is going to do.' And they're right, strictly speaking — that's correct, but that's not a good excuse for not doing anything, because the chances are, once you get a model with all the right spatial scales to have all the topography, it's probably not going to change the sign of the result."

The sign, plus or minus, would still be a minus in terms of water availability — things will be getting drier. "So if you just do nothing and wait for that, you're just wasting time. . . . It could be ten, fifteen years before you get the models at the resolution you need, by which time you're probably deep into this drying trend."

###

Pages 121-124

LEOPOLD'S PREDICTION WAS correct, except for the prophecy of a tourist road. The integrity of the Gavilan did not last long after his 1936 visit. He came back for a second hunt at the close of 1937, bringing his brother Carl and eldest son Starker, and this experience was as enchanting as the first. He also urged in various quarters that the area be preserved as "an international experiment station" to serve "as a norm for sick land on both sides of the border." 29

But nothing came of his proposal. Game began to decline in the mountains in subsequent years, and the outfitting business in Colonia Pacheco was all but dead by 1941. 30 Shortly after Leopold's death in 1948, his son Starker returned to the Rio Gavilan hoping to initiate some of the ecological studies his father had dreamed of, but the paradise he remembered from a decade earlier was gone. Logging roads threaded through the headwaters and livestock had followed. Many stretches of the formerly moss-hung river had become a scour of cobbles.

The downward ecological spiral of the Rio Gavilan continues to the present. 31 In the all-too-familiar cycle that Leopold in his early days documented throughout Arizona and New Mexico, logging and overgrazing bared the land to the violence of storms. Deprived of its defense of grass, litter, and living roots, the soils of the slopes yielded to the force of downpours, and floods tore every soft thing from the rivers and creeks,

leaving rocky gutters in their place. The damage was a kind of sin against the land, which Leopold captured in one of his best metaphors: "Somehow the watercourse is to dry country what the face is to human beauty. Mutilate it and the whole is gone." 32

MANY ARE THE accounts of southwestern watersheds that unraveled. In one of his essays on Mexico, Leopold cites Will Barnes's telling of the destruction of valley lands along the San Simon River in Arizona. In "Pioneers and Gullies" (1924) Leopold himself describes the loss of 90 percent of the cultivated land along the Blue River in Arizona's White Mountains. Elmer Otis Wootton, in a seminal 1908 monograph, *The Range Problem in New Mexico*, recounts how deepening arroyos cut the life out of the Mangas Valley in the Burro Mountains.

These and other reports point unmistakably to human agency as a trigger for widespread erosion, if not through logging and grazing then as a result of roads, trails, and other disturbances that guttered runoff and initiated the formation of arroyos. Just before his first trip to the Gavilan, Leopold drafted an extensive discussion on this topic, which he titled "The Erosion Cycle in the Southwest."

Dutifully, he sent the essay out for review, including a copy to the eminent Harvard geologist Kirk Bryan, a native of New Mexico who had closely studied arroyos in Chaco Canyon and other southwestern locations. Bryan and many of his colleagues maintained that climate, not human activity, governed arroyo formation and that, independent of human influence, the Southwest had repeatedly undergone alternating periods of degradation — arroyo cutting and stream entrenchment — on the one hand, and aggradation — the building up of alluvial lands — on the other.

Bryan's critique evidently prevented Leopold from settling his mind on the subject of arroyo formation, and "The Erosion Cycle in the Southwest" was never published. But he did not let the matter rest. He urged his son Luna to go to Harvard to study with Bryan and get to the bottom of the issue. 33

Not many families pass intellectual conundrums from one generation to the next, but the Leopold family was in a class by itself. All five of Leopold's children became accomplished naturalists, and three, Starker, Luna, and Estella, achieved election to the National Academy of Sciences. 34

Luna's dissertation, "The Erosion Problem of Southwestern United States," was not completed until after his father's death, but the conclusion he reached neatly bridged the points of view of his father and his mentor. Near the end of his own life, he restated it in a book, *A View of the River*, that sums up his life's work as a hydrologist: "The deep gullies cut by erosion in pre-Columbian time took less than 200 years to evacuate a large part of the early Holocene fill. In the period 1880–1920, overgrazing and climate change repeated the events of A.D. 1200–1400 in a period of less than 50 years." 35

Luna Leopold had concluded that climate and geology control cycles of large-scale erosion, but also that human activity, like an enzyme in a biological reaction, accelerated the process markedly. The relative weights accorded to climatic and human causes of arroyo formation are important. If climate is the sole cause, then clear-cutting

a watershed or grazing it to the point that it can't hide a golf ball might alter its biota and ruin its productivity, but the gullies that subsequently take form would have formed anyway.

Such a view is nonsense, as both Leopolds well knew, and the Rio Gavilan was their proof. The watershed of the Gavilan did not unravel during the arroyo-cutting heyday of 1880–1920. It came apart later, after its timber was cut, its grass removed, and its slopes braided with roads and trails that concentrated the energy of storm runoff on newly exposed targets.

The most reasonable conclusion, in fact, might be stated less conservatively than the restrained scientist Luna Leopold was willing to do: namely, that the way people treat the land influences arroyo-cutting considerably, and that the influence is especially great when climatic factors favor downcutting and degradation. Two key factors are important to understand: effective aridity and storm energy.

In the period 1880–1920, when most of the valley arroyos in the western states were cut, total precipitation did not differ markedly from other periods of similar length, but more precipitation appears to have come from heavy storms, and less as light rain. A light rain — what some Pueblos call a female rain — falls slowly and gently. It soaks the ground, and a large proportion of its water becomes available to plants. Under a regime of abundant light rain, which would normally mean many mild storms, the vegetative cover of the land tends to increase.

By contrast, heavy rains — male rains — quickly saturate the topmost layer of the soil. During the downpours, the water falls so fast that it soon exceeds the absorptive capacity of the soil, and most of it runs off, sometimes in violent flash floods. Only a small portion remains behind to nurture plant growth. As a result, a period with many violent thunderstorms and few light rains is effectively more arid than a period in which light rains produce the same total amount of moisture.

As aridity increases, the protective clothing of the land — in the form of vegetation, leaf litter, and other organic matter — decreases, making the soil more vulnerable to the increased energy of those big, wild, violent male rains. If all this sounds familiar, it should. The prospect of bigger, more violent storms coupled with increased effective aridity is part of the bundle of effects predicted for the Southwest as a result of climate change.

In the early 1990s, Luna Leopold put the matter bluntly: “The climatic changes of the past suggest that if the trend toward a warmer and more arid climate actually continues in the coming decades, the erosion of alluvial valleys seen in the thirteenth century, and again in the nineteenth, will be repeated in many of the semiarid areas of the planet where the rainfall is primarily of the thunderstorm type.”³⁶

Dammed If We Don't

Environmentalism: Essay
Dammed If We Don't
Yvon Chouinard
Mountain 2012

[Click here](#) to read the One-Dam Solution

<http://livingrivers2.org/pdfs/TheOne-DamSolution.pdf>

Environmentalist David Brower was once asked, "Why are you conservationists always against things?" He replied, "If you are against something, you are always for something. If you are against a dam, you are for a river."

I'm also a lover of wild rivers. That's why our company has been involved in trying to take out obsolete and damaging dams since 1993. We've had some success helping take down the Edwards Dam on Maine's Kennebec River in 1999, and the Savage Rapids Dam on Oregon's Rogue River in 2009. As I write this, three large dams are slated to come down on Washington's Elwha and White Salmon Rivers. The United States has more than 82,000 dams in its inventory and researchers estimate there may be at least two million dams of various sizes. So far, at least 836 dams have come down, but 26,000 "hazardous" dams (according to the U.S. Army Corps of Engineers) remain. Many of these dams were built by local irrigation districts, private power companies and local, state and federal governments. When they become obsolete safety hazards, like mines, the owners just walk away and leave the cleanup and restoration to the taxpayers.

When I was 18, I used to go down to the Sea of Cortez to spearfish. Within 15 or 20 minutes, I would spot a 30- to 40-pound grouper. It was like a fishbowl. And now, many of the bottom fish are gone, the shrimp are almost gone, and fishermen are left to eke out a living fishing for low-value skate wings in the winter. This is largely due to overfishing and destructive fishing practices like bottom trawling, but it's also because the mighty Colorado River no longer flows to the Gulf of California. Fewer nutrients support the biota of the gulf because the river and its tributaries are impoverished by more than 100 dams. The Mediterranean is on its way to becoming a dead sea, with the Aswan Dam on the Nile being the last indignity. It's projected that there won't be a single undammed river reaching the sea in China by 2025, only thirteen years from now.

The estuaries and coastal lagoons at the mouths of our planet's rivers are often referred to as the 'nurseries' of our world's fisheries, and many ocean fish need brackish or fresh water to spawn and rear. Four crucial dams to take out if we wish to restore wild Pacific salmon are on the lower Snake River – a tributary to the Columbia River and one of our planet's mightiest salmon producers. Every fisheries biologist not in the pocket of the

Bonneville Power Administration agrees that the dams must come down. But the National Oceanic and Atmospheric Administration and state and local governments in the area lack backbone and refuse to act on good science. The U.S. taxpayer continues to bleed billions of dollars on a failed policy of hatcheries and barging salmon around dams, when President Obama should add basic economics to overwhelming scientific fact and direct federal agencies to remove the lower Snake River dams.

The best chance of restoring wild Atlantic salmon to the United States is taking out two of the three dams (and breaching the third) on the Penobscot River in Maine (scheduled for 2012). The best chance of restoring wild Atlantic salmon in France is to remove the Poutès Dam, built in 1941 on the upper Allier River, the main tributary of the Loire River. (The French government announced the removal of the Poutès Dam as this catalog went to press.)

But if I chose one dam to fall, for me, it is the Matilija Dam, just up the road from Patagonia headquarters, near Ojai, California. In 2000, I watched then U.S. Secretary of the Interior Bruce Babbitt stand on the top of the dam and swear it was going to come down. It's still there.

It was built in 1948 by a few local irrigators and was almost silted up after only 18 years. The dam is an impassable barrier to endangered sea-run steelhead trout migrating home to the Ventura River and prevents much needed sand from nourishing the coastline of Ventura County and beyond. One reason it hasn't come down is a lack of sound planning and leadership on the part of local politicians, water districts and the U.S. Army Corps of Engineers.

The question of how to take down the dam was given to some local grammar school children, and one little girl raised her hand and asked, "Why don't they take a little bitty bite out of the dam every year?" If we had started doing that back in 2000, the Matilija Dam would be gone by now and steelhead would be spawning in Matilija Creek.

According to Bruce Babbitt, we've been building at least one dam a day since the Declaration of Independence was signed in 1776. Building dams is old technology that doesn't fit with 21st century innovation, yet dams are still going up. Brazil is building the Belo Monte Dam, the third largest in the world, that will inundate a large part of the Xingu River basin and force tens of thousands of local people from their land. Argentina is going to dam the Santa Cruz River. The five proposed dams in Patagonia, Chile, would require the longest transmission line in the world to go through most of their national parks. If those dams and transmission lines are built, every other Chilean river to the north can be dammed and plugged into those transmission lines.

When are we going to stop? After we dam every single river in the world?

We are now on the cusp of a multitude of good options for clean energy, like solar, wind, tidal power, wave power, geothermal and energy efficiency. Rather than storing water in on-stream reservoirs, water is best stored in underground aquifers, off-stream reservoirs and restored floodplain basins that also provide flood protection and water quality benefits. Water conservation and efficiency measures alone eliminate the need for new

storage dams, and existing railroads are a viable alternative to shipping produce on barges. I wonder why we are so impatient to destroy our rivers with this outdated technology and why we have to wait so long to tear down these obsolete behemoths.

Even Lake Mead, the biggest reservoir in the U.S., will eventually run dry if its outgo consistently exceeds income

By William deBuys

January 13, 2012, 6:23 p.m.

Southern Californians are used to turning on the tap, or the sprinklers, and getting the water they want. Their ability to do so depends, in large part, on the Colorado River and the reservoir it feeds, Lake Mead.

In 2008, Tim Barnett and David Pierce, scientists at Scripps Institution of Oceanography, wrote that the lake — a lifeline not just for Southern California but for much of the desert Southwest — would soon teeter at the brink of failure. The Review-Journal in Las Vegas, a city especially dependent on that lifeline, responded with predictable bluster: "We'd love to buy some action on the odds provided by Mr. Barnett and Mr. Pierce. They can name the amount at stake. Are they willing to put their money where their mouths are?"

As far as I know, the Scripps scientists didn't take advantage of the Review-Journal's rash offer. Maybe they should have. They knew the odds. So should everyone. There are plenty of reasons the water-happy habits of the modern Southwest are a bad bet:

First, the Lower Basin states of the Colorado River are living beyond their means. The Colorado River Compact of 1922 allocates 7.5 million acre-feet to be divided among California, Arizona and Nevada. Today tens of millions of people from L.A. and San Diego to Las Vegas, Phoenix and Tucson, not to mention agriculture worth billions of dollars, depend on those flows. Trouble is, those Lower Basin states don't budget for evaporative losses, for their proportionate share of the U.S. treaty obligation to Mexico or for other water losses associated with the plumbing of the river. As a result, they consistently overdraft their account by 1.2 million to 1.3 million acre-feet per year. That's an annual deficit of about 17%.

For decades the Lower Basin (mainly California) got away with its profligate habits because the Upper Basin — the states upstream of Arizona — developed more slowly; they didn't have the means to withdraw their share of the river water (theoretically, an additional 7.5 million acre-feet). Not anymore. The Upper Basin now sucks the life out of the river with gusto. No more leftovers.

More bad news for Lake Mead is that the Colorado River Compact incorporates a nettlesome flaw: Its authors divided up more water than the river can provide. Drawing on a small, skewed set of measurements (all that were available in 1922), they thought the river's average flow was about 17 million acre-feet annually. Now the relevant data set is a lot bigger. The most extensive (and most generous) reconstruction of "paleo" flows, going back more than 1,200 years, points to an average annual flow of only 14.7 million acre-feet. Even Lake Mead, the biggest reservoir in the country, will eventually run dry if its outgo consistently exceeds income.

Water managers have known about these problems for a long time, but they consoled themselves that "augmentation" would provide a solution. Diverting the Yukon River in Alaska and Canada to flow to the Southwest is a good example of augmentation, and once upon a time, people gave this flaky idea serious consideration. Desalination on a massive scale constitutes another form of augmentation, but although desalination is politically more palatable than hijacking rivers, it is similarly costly, as well as gluttonous in its consumption of energy. Augmentation at a scale to bail out the sweltering Sun Belt has been a nonstarter.

As if overuse, over-allocation and a dearth of rivers available for theft weren't enough to persuade you to make book on Lake Mead's vulnerability, the climate is changing. OK, so maybe 82 degrees in Los Angeles on New Year's Day is a fluke. And nearly snowless Sierra Nevada and the Rockies are just weird, and last year's shoe-melting temperatures and holocaust fires in Arizona, New Mexico and Texas could have happened any time. But really, the Southwest is getting hotter. And hotter means drier even if precipitation stays steady (but don't bet your house on that) because more heat causes more evaporation. A respected 2005 study predicts that stream flow in the Southwest will probably decline 10% to 30% by mid-century.

Add all of this together and you can see why Barnett and Pierce might have concluded Lake Mead risked failure, which in this context means the lake level drops below Hoover Dam's lowest outlets. Which means no water goes downstream. All you get is seepage.

The Scripps scientists missed some things in the original study. But eventually they, and a second respected team at the University of Colorado, came to pretty much the same conclusion: After 2026, the risk of failure of Lake Mead, in the words of a member of the second team, "just skyrockets."

But that is not what is scary.

What's really scary, according to Jonathan Overpeck, a climatologist at the University of Arizona, "is the possibility that we could trip across a transition into a megadrought." A megadrought lasts multiple decades. It is the kind of drought that caused Ancestral Puebloan civilizations at New Mexico's Chaco Canyon and Colorado's Mesa Verde to collapse and triggered a chain of events that helped do in the Hohokam in central Arizona.

Such droughts, it turns out, are characteristic of semiarid regions around the world, but we've not yet seen one in the Southwest during the American era. The droughts of the

Dust Bowl days in the 1930s, and the even drier 1950s, were comparative child's play. The paleo-climatic record tells us our land can get a whole lot drier than anything we've ever known.

If/when Lake Mead fails, Phoenix will still drink from the Salt River, but the city is now too big to get by on the Salt alone, and besides, whatever causes the Colorado to shrink will surely shrivel the Salt. So groundwater will have to save the day, but only for as long as it holds out. Los Angeles' situation is similar. If the Colorado River Aqueduct goes dry, the California Aqueduct and the Los Angeles Aqueduct, which deliver snowmelt from the Sierra, are unlikely to do much better.

Las Vegas, at least, is taking action. Among other desperation plays, it is building Intake No. 3, a kind of bathtub drain at the bottom of Lake Mead, at a cost of \$800 million. When the lake level falls below Hoover Dam's lowest outlets, Las Vegas will still sip the warm tea of the "dead pool." Las Vegas has put its money where its future is. Although betting on the weather may be akin to playing the lottery, the people responsible for Sin City's water supply know that a wager on a warming climate is, well, not so much of a gamble.

William deBuys is the author of the newly released "A Great Aridness: Climate Change and the Future of the American Southwest."

###

Phoenix in the Climate Crosshairs: We Are Long Past Coal Mine Canaries

By William deBuys

If cities were stocks, you'd want to short Phoenix. Of course, it's an easy city to pick on. The nation's 13th largest metropolitan area (nudging out Detroit) crams 4.3 million people into a low bowl in a hot desert, where horrific heat waves and windstorms visit it regularly. It snuggles next to the nation's largest nuclear plant and, having exhausted local sources, it depends on an improbable infrastructure to suck water from the distant (and dwindling) Colorado River.

In Phoenix, you don't ask: What could go wrong? You ask: What couldn't?

And that's the point, really. Phoenix's multiple vulnerabilities, which are plenty daunting taken one by one, have the capacity to magnify one another, like compounding illnesses. In this regard, it's a quintessentially modern city, a pyramid of complexities requiring large energy inputs to keep the whole apparatus humming. The urban disasters of our time -- New Orleans hit by Katrina, New York City swamped by Sandy -- may arise from single storms, but the damage they do is the result of a chain reaction of failures -- grids going down, levees failing, back-up systems not backing up. As you might expect, academics have come up with a name for such breakdowns: infrastructure failure interdependencies. You wouldn't want to use it in a poem, but it does catch an emerging theme of our time.

Phoenix's pyramid of complexities looks shakier than most because it stands squarely in the crosshairs of climate change. The area, like much of the rest of the American Southwest, is already hot and dry; it's getting ever hotter and drier, and is increasingly battered by powerful storms. Sandy and Katrina previewed how coastal cities can expect to fare as seas rise and storms strengthen. Phoenix pulls back the curtain on the future of inland empires. If you want a taste of the brutal new climate to come, the place to look is where that climate is already harsh, and growing more so -- the aptly named Valley of the Sun.

In Phoenix, it's the convergence of heat, drought, and violent winds, interacting and amplifying each other that you worry about. Generally speaking, in contemporary society, nothing that matters happens for just one reason, and in Phoenix there are all too many "reasons" primed to collaborate and produce big problems, with climate change foremost among them, juicing up the heat, the drought, and the wind to ever greater extremes, like so many sluggers on steroids. Notably, each of these nemeses, in its own way, has the potential to undermine the sine qua non of modern urban life, the electrical grid, which in Phoenix merits special attention.

If, in summer, the grid there fails on a large scale and for a significant period of time, the fallout will make the consequences of Superstorm Sandy look mild. Sure, people will hunt madly for power outlets to charge their cellphones and struggle to keep their milk fresh, but communications and food refrigeration will not top their list of priorities. Phoenix is an air-conditioned city. If the power goes out, people fry.

In the summer of 2003, a heat wave swept Europe and killed 70,000 people. The temperature in London touched 100 degrees Fahrenheit for the first time since records had been kept, and in portions of France the mercury climbed as high as 104°F. Those temperatures, however, are child's play in Phoenix, where readings commonly exceed 100°F for more than 100 days a year. In 2011, the city set a new record for days over 110°F: there were 33 of them, more than a month of spectacularly superheated days ushering in a new era.

In Flight From the Sun

It goes without saying that Phoenix's desert setting is hot by nature, but we've made it hotter. The city is a masonry world, with asphalt and concrete everywhere. The hard, heavy materials of its buildings and roads absorb heat efficiently and give it back more slowly than the naked land. In a sense, the whole city is really a thermal battery, soaking up energy by day and releasing it at night. The result is an "urban heat island," which, in turn, prevents the cool of the desert night from providing much relief.

Sixty years ago, when Phoenix was just embarking on its career of manic growth, nighttime lows never crept above 90°F. Today such temperatures are a commonplace, and the vigil has begun for the first night that doesn't dip below 100°F. Studies indicate that Phoenix's urban-heat-island effect may boost nighttime temperatures by as much as 10°F. It's as though the city has doubled down on climate change, finding a way to magnify its most unwanted effects even before it hits the rest of us full blast.

Predictably, the poor suffer most from the heat. They live in the hottest neighborhoods with the least greenery to mitigate the heat-island effect, and they possess the least resources for combatting high temperatures. For most Phoenixians, however, none of this is more than an inconvenience as long as the AC keeps humming and the utility bill gets paid. When the heat intensifies, they learn to scurry from building to car and into the next building, essentially holding their breaths. In those cars, the second thing they touch after the ignition is the fan control for the AC. The steering wheel comes later.

In the blazing brilliance of July and August, you venture out undefended to walk or run only in the half-light of dawn or dusk. The idea for residents of the Valley of the Sun is to learn to dodge the heat, not challenge it.

Heat, however, is a tricky adversary. It stresses everything, including electrical equipment. Transformers, when they get too hot, can fail. Likewise, thermoelectric generating stations, whether fired by coal, gas, or neutrons, become less efficient as the mercury soars. And the great hydroelectric dams of the Colorado River, including Glen Canyon, which serves greater Phoenix, won't be able to supply the "peaking power" they do now if the reservoirs behind them are fatally shrunk by drought, as multiple studies forecast they will be. Much of this can be mitigated with upgraded equipment, smart grid technologies, and redundant systems. But then along comes the haboob.

A haboob is a dust/sand/windstorm, usually caused by the collapse of a thunderstorm cell. The plunging air hits the ground and roils outward, picking up debris across the open desert. As the Arabic name suggests, such storms are native to arid regions, but -- although Phoenix is no stranger to storm-driven dust -- the term haboob has only lately entered the local lexicon. It seems to have been imported to describe a new class of storms, spectacular in their vehemence, which bring visibility to zero and life to a standstill. They sandblast cars, close the airport, and occasionally cause the lights -- and AC -- to go out. Not to worry, say the two major utilities serving the Phoenix metroplex, Arizona Public Service and the Salt River Project. And the outages have indeed been brief. So far.

Before Katrina hit, the Army Corps of Engineers was similarly reassuring to the people of New Orleans. And until Superstorm Sandy landed, almost no one worried about storm surges filling the subway tunnels of New York. Every system, like every city, has its vulnerabilities. Climate change, in almost every instance, will worsen them. The beefed-up, juiced-up, greenhouse-gassed, overheated weather of the future will give us haboobs of a sort we can't yet imagine, packed with ever greater amounts of energy.

In all likelihood, the emergence of such storms as a feature of Phoenix life results from an overheating environment, abetted by the loose sand and dust of abandoned farmland (which dried up when water was diverted to the city's growing subdivisions).

Water, Water, Everywhere (But Not for Long)

In dystopic portraits of Phoenix's unsustainable future, water -- or rather the lack of it -- is usually painted as the agent of collapse. Indeed, the metropolitan area, a jumble of jurisdictions that includes Scottsdale, Glendale, Tempe, Mesa, Sun City, Chandler, and

15 other municipalities, long ago made full use of such local rivers as the Salt, Verde, and Gila. Next, people sank wells and mined enough groundwater to lower the water table by 400 feet.

Sometimes the land sank, too. Near some wells it subsided by 10 feet or more. All along, everyone knew that the furious extraction of groundwater couldn't last, so they fixed their hopes on a new bonanza called the Central Arizona Project (CAP), a river-sized, open-air canal supported by an elaborate array of pumps, siphons, and tunnels that would bring Colorado River water across the breadth of Arizona to Phoenix and Tucson.

The CAP came on line in the early 1990s and today is the engine of Arizona's growth. Unfortunately, in order to win authorization and funding to build it, state officials had to make a bargain with the devil, which in this case turned out to be California. Arizona's delegation in the House of Representatives was tiny, California's was huge, and its representatives jealously protected their longstanding stranglehold on the Colorado River. The concession California forced on Arizona was simple: it had to agree that its CAP water rights would take second place to California's claims.

This means one thing: once the inevitable day comes when there isn't enough water to go around, the CAP will absorb the shortage down to the last drop before California even begins to turn off its faucets.

A raw deal for Arizona? You bet, but not exactly the end of the line. Arizona has other "more senior" rights to the Colorado, and when the CAP begins to run dry, you may be sure that the masters of the CAP will pay whatever is necessary to lease those older rights and keep the 330-mile canal flowing. Among their targets will be water rights belonging to Indian tribes at the western edge of the state along the lower reaches of the river. The cost of buying tribal water will drive the rates consumers pay for water in Phoenix sky-high, but they'll pay it because they'll have to.

Longer term, the Colorado River poses issues that no amount of tribal water can resolve. Beset by climate change, overuse, and drought, the river and its reservoirs, according to various researchers, may decline to the point that water fails to pass Hoover Dam. In that case, the CAP would dry up, but so would the Colorado Aqueduct which serves greater Los Angeles and San Diego, as well as the All-American Canal, on which the factory farms of California's Imperial and Coachella valleys depend.

Irrigators and municipalities downstream in Mexico would also go dry. If nothing changes in the current order of things, it is expected that the possibility of such a debacle could loom in little more than a decade.

The preferred solution to this crisis among the water mavens of the lower Colorado is augmentation, which means importing more water into the Colorado system to boost native supplies. A recently discussed grandiose scheme to bail out the Colorado's users with a pipeline from the Mississippi River failed to pass the straight-face test and was shot down by then-Secretary of the Interior Ken Salazar.

Meanwhile, the obvious expedient of cutting back on water consumption finds little support in thirsty California, which will watch the CAP go dry before it gets serious about meaningful system-wide conservation.

Burning Uplands

Phoenicians who want to escape water worries, heat waves, and haboobs have traditionally sought refuge in the cool green forests of Arizona's uplands, or at least they did until recently. In 2002, the Rodeo-Chediski fire consumed 469,000 acres of pine and mixed conifer on the Mogollon Rim, not far from Phoenix. It was an ecological holocaust that no one expected to see surpassed. Only nine years later, in 2011, the Wallow fire picked up the torch, so to speak, and burned across the Rim all the way to the New Mexico border and beyond, topping out at 538,000 charred acres.

Now, nobody thinks such fires are one-off flukes. Diligent modeling of forest response to rising temperatures and increased moisture stress suggests, in fact, that these two fires were harbingers of worse to come. By mid-century, according to a paper by an A-team of Southwestern forest ecologists, the "normal" stress on trees will equal that of the worst megadroughts in the region's distant paleo-history, when most of the trees in the area simply died.

Compared to Phoenix's other heat and water woes, the demise of Arizona's forests may seem like a side issue, whose effects would be noticeable mainly in the siltation of reservoirs and the destabilization of the watersheds on which the city depends. But it could well prove a regional disaster. Consider, then, heat, drought, windstorms, and fire as the four horsemen of Phoenix's Apocalypse. As it happens, though, this potential apocalypse has a fifth horseman as well.

Rebecca Solnit has written eloquently of the way a sudden catastrophe -- an earthquake, hurricane, or tornado -- can dissolve social divisions and cause a community to cohere, bringing out the best in its citizenry. Drought and heat waves are different. You don't know that they have taken hold until you are already in them, and you never know when they will end. The unpleasantness eats away at you. It corrodes your state of mind. You have lots of time to meditate on the deficiencies of your neighbors, which loom larger the longer the crisis goes on.

Drought divides people, and Phoenix is already a divided place -- notoriously so, thanks to the brutal antics of Maricopa County Sheriff Joe Arpaio. In *Bird on Fire: Lessons from the World's Least Sustainable City*, Andrew Ross offers a dismal portrait of contemporary Phoenix -- of a city threatened by its particular brand of local politics and economic domination, shaped by more than the usual quotient of prejudice, greed, class insularity, and devotion to raw power.

It is a truism that communities that do not pull together fail to surmount their challenges. Phoenix's are as daunting as any faced by an American city in the new age of climate change, but its winner-take-all politics (out of which has come Arizona's flagrantly repressive anti-immigration law), combined with the fragmentation of the metro-area into nearly two dozen competing jurisdictions, essentially guarantee that, when the worst of

times hit, common action and shared sacrifice will remain as insubstantial as a desert mirage. When one day the U-Haul vans all point away from town and the people of the Valley of the Sun clog the interstates heading for greener, wetter pastures, more than the brutal heat of a new climate paradigm will be driving them away. The breakdown of cooperation and connectedness will spur them along, too.

One day, some of them may look back and think of the real estate crash of 2007-2008 and the recession that followed with fond nostalgia. The city's economy was in the tank, growth had stalled, and for a while business-as-usual had nothing usual about it. But there was a rare kind of potential. That recession might have been the last best chance for Phoenix and other go-go Sunbelt cities to reassess their lamentably unsustainable habits and re-organize themselves, politically and economically, to get ready for life on the front burner of climate change. Land use, transportation, water policies, building codes, growth management -- you name it -- might all have experienced a healthy overhaul. It was a chance no one took. Instead, one or several decades from now, people will bet on a surer thing: they'll take the road out of town.

Water deal big win for nuke plant: Opponents say they'll fight decision over Green River

By Gary Harmon Grand Junction Sentinel

With the state's approval of plans for water to operate a proposed nuclear plant just outside Green River, Utah, the developer cleared a major hurdle.

Opponents of the plant, however, said they would move quickly to reverse the decision by the Utah State Engineer's Office on Friday to approve a request by two counties downstream from Green River to change their points of diversion to accommodate the power plant.

The significance of the approval of the plans by Blue Castle LLC, named for the rock formation on the Book Cliffs that overlooks the site of the proposed plant west of Green River, can hardly be understated, Blue Castle President and CEO Aaron Tilton said.

If the company had to prioritize its assets, "Water would be number one," Tilton said.

Blue Castle faces four more years of regulatory work before it begins construction on the two-generator plant, which is estimated to cost about \$18 billion to construct. Backers of the plan said the plant will mean about 2,000 high-paying jobs.

John Weisheit of LivingRivers.org in Moab, Utah, downstream on the Colorado River, called the state engineer's decision "a tragic mistake" that will force the recognition that there is no water left in the river for the plant.

The decision is "not helping" to quell controversy among the states on the question of how much water remains in the Upper Colorado River Basin and is making issues more contentious, Weisheit said.

Conservation organizations are lining up to ask the state engineer's office to reverse the decision, the first step before it can be appealed to the courts, Weisheit said, noting he is confident of the opposition case.

"I'm going to enjoy this one," Weisheit said.

The 53,600 acre-feet of water expected to be used annually by the nuclear plant already have been set aside for use by coal-fired plants, but the projects never were built. Blue Castle is leasing the rights from San Juan and Kane counties.

The plant will pull water from the Green River and use it to cool the reactors. There are no plans to return the water to the river.

Backers maintain that even in drought conditions the effect of the plant on the level of the Green River will be minimal.

The economies of Emery and Grand counties both stand to be improved by the plant, said Mike McCandless, economic-development director for Emery County, population 1,100, which would be home to the plant. Neighboring Grand County and the town of Moab have served as a wellspring of opposition to the plant, with dozens of residents turning out last year to voice opposition in a public hearing.

Grand County, however, stands to be a "big winner" if the plant moves forward because 30 percent to 40 percent of the employees will come from there, McCandless said.

"I am having more folks from Moab reach out to me in support" of the nuclear plant, McCandless said.

While the nuclear plant is moving toward approval by the U.S. Nuclear Regulatory Commission, another proposal to use Green River water to supply the burgeoning Colorado Front Range also is under study.

Fort Collins businessman Aaron Million, a Green River, Utah, native, said the Blue Castle proposal was "interesting."

It's unlikely that his project will conflict with the nuclear plant, Million said, because he is proposing to use only Colorado's share of water from the Green River, which dips into the northwest corner of Colorado after leaving Wyoming and flowing into Utah.

Scoping Comments: LTEMP EIS on operations of Glen Canyon Dam

[Click here](#) to read the comments by Living Rivers, Colorado Riverkeeper, Center for Biological Diversity and River Runners for Wilderness. The letter is 25 pages.

We have offered two alternatives:

- 1: Mimic the natural hydrograph and other natural processes.
- 2: Dam removal and a management plan based on the precautionary principle.

There are seven tables:

Table No. 1: Two alternatives in brief for consideration of the LTEMP EIS

Table No. 2: Academic reviews of GCD AMP

Table No. 3: Key public interventions on management of Glen Canyon Dam, Glen Canyon National Recreation Area and Grand Canyon National Park.

Table No. 4: References of Table No. 3

Table No. 5: Administrative History of NEPA (1970) compliance below the forebay of Glen Canyon Dam.

Table No. 6: References for Table No. 5.

Table No. 7: Administrative history of Glen Canyon Dam and its features.

CONCLUSION

After four decades of Interior's attempts to address the declining habitat conditions in Grand Canyon National Park's river corridor resulting from Glen Canyon Dam operations, it's critical now to treat this EIS opportunity as the major step forward in what must be a remedy to the ongoing failure of Interior's past ambivalence.

The management process is faulty from both the bottom-up and the top-down. From the bottom lies an AMP process that is guided by the whims of special interest, while the resource itself continues to suffer. From the top there is no clear mandate of what the real objectives are or should be, especially over the medium- and long-term. The ecosystem in Grand Canyon National Park is not WAPA's, trout fishermen's or river runner's playground to do with as they please. Nor is it Glen Canyon Monitoring and Research Center's scientific playground to tinker with trivial actions from a body dominated by these special interests. This is a world renowned riverine resource for which Interior, guided by the most rigorous interpretation of the spirit of those acts governing the National Park System, must step forward and act in the public's interest. If these special interest groups become frustrated with Interior's actions, they can challenge them in the courts and the court of public opinion. There is no substitute for Grand Canyon, and it should be managed in accordance with that principle, now and in the future.

As such, there must be new leadership, and new avenues for administering the will and mandate of this leadership. The GCD AMP has and will continue to be a failure, so the EIS must address how this will be remedied.

Unfortunately, the complexity of water issues in the basin have effectively taken the common citizen out of the process. The issues, policy, laws and science have become too burdensome, too one-sided, and has created a situation of bewilderment or malaise. It has been suggested by many authors and oversight agencies that an independent commission for the Colorado River basin should be established. These issues have arrived to a point in history where it is quite possible that Interior is not the best choice in providing a long-term management proposal for the Colorado River basin, as evidenced by decades of time under its watch having failed to provide the leadership necessary to provide effective change toward greater sustainability on several fronts.

The EIS should therefore evaluate the constraints impairing Interior's ability to address the complex challenges facing the Grand Canyon River ecosystem and Colorado River management as a whole. A key component of any alternative must therefore be mechanisms to give all the funding and authority to an independent commission that

can provide basin-wide and comprehensive analysis of what must be accomplished and in a reasonable time-frame for the benefit of Grand Canyon and the basin as a whole.

The EIS must also address Glen Canyon Dam's operations and impacts, in the full spectrum of its lifespan. All reasonably supported hydrologic and catastrophic scenarios over a century time-window must be explored in conjunction with evaluating alternatives. If climate change has taught us anything, it's that such long-range planning is critical now, something that Reclamation has been slow to recognize. If Glen Canyon Dam fails in a flood, or fails to provide water during a severe and sustained drought, then everybody will lose and this EIS will have been nothing more than stepping stone in that process.

Alternatives must also address specific strategies for habitat restoration in Grand Canyon's river corridor including: natural flow regime with associated temperature changes and sediment transport along with non-native species eradication. Most of these issues and the recommendations surrounding them have been on the table for decades, but it's time they are fully explored consistent with the present and long-term needs of a healthy, natural, Grand Canyon river ecosystem. And in exploring alternatives that can deliver these alternatives, a decommissioned Glen Canyon Dam must be included. As the past decade of inflows has illustrated, the likelihood of a naturally drained reservoir is no longer something water and energy planners can ignore, especially in light of the long-term environmental damage Glen Canyon Dam continues to impose.

Most importantly, it's time for Interior to have some real vision for what can be and should be done when it comes to water management through Grand Canyon. Interior must once and for all abandon its policy of tinkering with knobs and switches and then defend these actions in court explaining how the public should not expect them to achieve a better result.

Waiting Period Ends April 16, 2012

Following conclusion of the waiting period, a Record of Decision (ROD) will be prepared and signed to disclose the BLM's final decision and any project Conditions of Approval.

- [BLM web site for the GASCO Project](#)
- [The alternatives](#)
- [ARCHIVED HERE](#)

Under Alternative F, the Agency Preferred Alternative, up to 1,298 new gas wells would be drilled from 575 well pads over a period of 15 years, resulting in approximately 3,604 acres of disturbance (about 2 percent of the total project area). Water evaporation facilities were reduced to 78 acres. This is adequate for the first 5 years of the project while other disposal options are developed and implemented. The BLM also incorporated the measures to minimize impacts to resources, while allowing for the development of valid existing rights. No surface disturbance would occur below the rim

of Nine Mile Canyon, within one-half mile of the Green River, in 100-year floodplains, or endangered fish critical habitat.

Under the Proposed Action (Alternative A), Gasco Energy Inc. would develop their existing oil and gas leases by drilling 1,491 wells from the same number of well pads over a period of 15 years, and by constructing 143 acres of evaporative ponds to dispose of produced water. The Proposed Action would result in approximately 7,584 acres of surface disturbance.

This Final EIS is not a decision document. Following conclusion of the 30-day availability period, a ROD will be signed to disclose the BLM's final decision and any project Conditions of Approval. Availability of the ROD will be announced through local media, the Vernal BLM Web site, and Utah BLM's Environmental Notification Bulletin Board.

Copies of the Final EIS are available for public inspection at the BLM Vernal Field Office, 170 South 500 East, Vernal, Utah, and at the following Web site:

LTEMP EIS Upcoming Public Meeting to Discuss Alternatives

The public is invited to participate in a two-day meeting on alternatives being considered for inclusion in the Glen Canyon Dam Long Term Experimental and Management Plan Environmental Impact Statement (LTEMP EIS) being prepared by the Bureau of Reclamation (Reclamation) and the National Park Service (NPS).

The meeting will be held on April 4 and 5 at the High Country Conference Center located at 201 West Butler Avenue, Flagstaff, AZ 86001. The meeting is tentatively scheduled for 8 a.m. to 5 p.m. both days.

The preliminary draft alternatives being considered for evaluation will be presented and discussed at this meeting hosted by Reclamation and the NPS. Stakeholders and other attendees who have alternatives to propose should bring those ideas to the meeting.

PowerPoint slides and posters are welcome. To be added to the agenda, register for the meeting as explained below, provide your email address, and indicate that you will be presenting an alternative.

Those wishing to attend the meeting are encouraged to register through the LTEMP EIS Web site at <http://ltempeis.anl.gov/involve/pubschedule/>, but registration is not required.

Alternatives to be considered in the EIS must meet the purpose and need of the LTEMP. The EIS will document and evaluate the impacts of the alternatives carried forward for analysis.

Group battles water rights for Utah nuke plant

State failed to adequately assess impact on river, complaint alleges

Grand Junction Sentinel By Matthew Berger

Thursday, March 29, 2012

A proposal for Utah's first nuclear power plant will face a legal challenge from environmental groups questioning the state review process that resulted in the proposed plant's water rights.

The facility would be located about five miles northwest of the city of Green River, and the water, used to cool the plant's reactors, would be pulled from the city's namesake river.

But HEAL Utah and Uranium Watch say State Engineer Kent Jones did not adequately ensure the company behind the proposal, Blue Castle Holdings, has the necessary funding to complete the project nor sufficiently review the impacts the water withdrawal might have on the river ecosystem and on others with water rights. "We just think that

the state engineer did a really bad job of ensuring this isn't a speculative project," said Matt Pacenza, policy director at HEAL Utah. The case was filed late Tuesday in Emery County district court.

Jones approved requests Jan. 20 by Kane and San Juan counties to lease a portion of their water allotments to the nuclear project. He reaffirmed that decision at the end of last month after opponents requested he reconsider it.

"We assumed and expected this was something they would choose to do," said Blue Castle CEO Aaron Tilton, a former Utah state representative.

He said the plant is necessary because of rising energy needs over the next decade. His company expects the plant to increase the electricity generated with the state by 50 percent.

Contentions that Blue Castle, founded in 2006, has shaky financial backing are "inaccurate," Tilton said, though he declined to elaborate on the privately held firm's revenue other than to say it derives from two segments — this nuclear licensing work and Grand Junction-based Willow Creek Companies, a pipeline business that builds and repairs gas and oil pipelines and facilities.

When Blue Castle acquired Willow Creek in 2010, it said their combined cash flow was anticipated to be enough to complete the Nuclear Regulatory Commission licensing process for the Green River nuclear plant, a process which is expected to take about five years and cost approximately \$100 million.

Willow Creek's financial records are not publicly available, but Pacenza, who has been trying to determine how much money Blue Castle has and where it might be coming from, said all his research has turned up so far is Willow Creek had a gross revenue of only \$5.6 million in 2010.

Tilton emphasized Blue Castle has said all along its finances are sufficient to cover the licensing process. HEAL Utah and the 17 other plaintiffs in the case hope the court challenge will force the 6-year-old company to disclose more about its finances. If approved, the plant is expected to require another five to seven years to build.

LR Event 05/02/12

Protest: No Green River Nuke

Saturday, May 19 at 6:00pm at Green River, UT, just south of I-70 Exit 164
March to Celebrate and Protect the Green River and the Colorado Plateau!

Bring your most colorful street art, banners, costumes, puppets, decorated bicycles, goat-drawn chariots, and enthusiasm for singing and dancing. We'll parade high over the desert in front of the proposed construction site, smile pretty for the cameras, and show potential investors that they don't want to be a part of this bad project. We're specially requesting that people bring a brightly colored umbrella--the sun will backlight it and make our march more beautiful.

For those coming to Moab--a bunch of people will be meeting up at Swanny City Park at 3:30. We'll combine rides to carpool, arrange our costumes, etc., and then motorcade through Main Street on our way to Green River.

For more information, go to www.nogreenrivernuke.org

University of Utah complicit in ignoring climate change

By Hans G Ehrbar

Last Tuesday I attended the "unconventional fuels" conference at the Institute of Clean and Secure Energy of the University of Utah. Unconventional fuels are shale gas, tar sands and oil shale.

The business people, scientists and state employees participating in this conference know that the carbon trapped in Utah oil shale, if released to the atmosphere, will make the planet unlivable for humans. I tried to understand how they can sleep at night. At least seven denial strategies were evident:

- (1) It is not necessary to mention climate change because Utah regulators will only look for "criteria pollutants" and water. Federal CO₂ regulation was a concern, not the CO₂ itself.
- (2) Downplay the potential of renewables so that it seems there are no alternatives. One presenter called solar panels a "niche market."
- (3) Confuse local pollution with global greenhouse gas impacts. Professor David Pershing, a member of the institute who just recently became the university's president, said the environment was one of the ICSE's core concerns, namely contamination of aquifers and seismic issues. If you manage to get the CO₂ into the atmosphere without earthquakes, smog and dirty water, you can call yourself "clean."
- (4) Play one fossil fuel against another. When asked about global warming, Pershing said that natural gas has a lower carbon footprint than coal. A producer of oil from oil shale can call himself "ecological" if he uses less water than other processes.
- (5) Pretend that baby steps are enough. Fuel switching from coal to natural gas is the mildest thing imaginable. Renewables require a re-engineering of the entire energy infrastructure.
- (6) Claim that Utah is too small. Utah tar sands are only 1 percent of the extent of the Alberta tar sands. Don't mention that the energy content of Utah oil shale is about 100 times that of Utah tar sands.
- (7) The conference itself was part of their denial strategy. It had the purpose of opening the work of the ICSE to public discussion. Comments from the audience concerned about future generations were welcome. In this way they can congratulate themselves for being open to debate, as if global warming were still debatable.

These are the thought processes by which decent people justify making big sums of money or accepting grants for doing something destructive of our future. It is difficult to say "no" when such an "opportunity" arises. They all think and say pretty much the same thing, having learned from each other how to navigate this dilemma.

When someone at the conference came up with an especially eloquent excuse, there was general applause.

The ICSE receives much more grant money than the Sustainability Institute or others at the U. trying to research and mitigate climate change.

Atmospheric sciences are running their climate models on the leftover cycles of ICSE's supercomputer purchased from grant money for modeling combustion processes, a sad commentary on how our society addresses humanity's greatest ever problem.

When I mentioned this in a conversation, an ICSE scientist replied that all the good researchers were going into renewable energy, and a good researcher was worth much more than money.

Pershing showed a new advertising movie, "This is not your father's Oldsmobile," about how modern the University of Utah has become. Apparently he did not realize how damning it is for the university that the biggest challenge to humankind ever, global warming, was completely absent in this clip.

For the students it is a warning about how seriously deficient their education will be.

Hans G Ehrbar is an associate professor of economics at the University of Utah. He lives in Salt Lake City. His views are his own and do not represent the university's.

The Glen Canyon Dam Declaration of 3/14/2000

Today people from across the country joined more than 50 organizations and businesses to celebrate and inaugurate "The Century of River Restoration" at Carl Hayden Visitors Center at Glen Canyon Dam, Arizona. Led by longtime Colorado River advocate and environmental leader David Brower, the event was highlighted by a signing ceremony of the "Glen Canyon Declaration," calling for restoration of the Colorado River and Glen Canyon.

David Brower, who has led the fight to save Glen Canyon for 40 years, addressed the festive crowd with his concerns about dam safety, water evaporation, seepage, and sustainable economics. He described Glen Canyon as a rich and beautiful landscape that should have become a national park as early as the Franklin D. Roosevelt administration.

Brower was joined by Thomas Morris, president of the Diné Medicine Men's Association, whose organization unanimously voted to drain "Lake" Powell on Saturday, March 11th, and who gave the invocation at the river rendezvous and celebration. Morris said, "'Lake' Powell Reservoir has submerged our sacred sites and destroyed our ability to communicate with sacred gods. These sites must be restored for our children and grandchildren."

Yvon Chouinard, owner of Patagonia, Inc., the world's leading manufacturer of quality outdoor clothing, stated in a letter read at the celebration, "The construction of Glen Canyon Dam more than any other dam in the United States represented the most blatant disrespect for the planet's sacred landscape -- all for a facility that we know was not needed."

Significant parts of the declaration--presented by John Weisheit of the Moab-based Glen Canyon Action Network, primary sponsor of the celebration, and Phil Williams of International Rivers Network--include:

- The Bureau of Reclamation should begin the process of developing and then implementing a decommissioning plan for Glen Canyon Dam.
- The Bureau of Reclamation should establish a federal laboratory to serve as the nation's primary research facility for river and riverine habitat restoration, and give strong consideration to locating this facility in the town of Page, Arizona.

- All new management plans affecting the Colorado River watershed should undergo rigorous analysis of basinwide impacts.
- No new dams within the Colorado River watershed should be constructed, nor should existing dams be reconstructed in the event of their failure.
- Operating licenses should be required for all federal dams, as has long been the case with all non-federal dams. Federal dams must be subject to periodic relicensing reviews to ensure compliance with all environmental laws and safety standards.
- The Bureau of Reclamation should provide funding to support scientific research on the biological and habitat requirements of the endangered native fish of the Colorado River.
- The National Park Service should implement a program to quantify, monitor, and evaluate the presence of a wide range of pollutants including toxic and radioactive metals, petroleum compounds, bacteria, and other contaminants in Lake Powell Reservoir.

"We're thrilled by the outpouring of support we're seeing from all across the country for restoring Glen Canyon," said John Weisheit, President of Glen Canyon Action Network. "We are on our way to Glen Canyon, a movement of people seeking to restore the world's most beautiful canyons and a world-class river."

The celebration was one of 65 actions taking place in twenty other countries today on this, the Third Annual International Day of Action Against Dams, and For Rivers, Water and Life. "There is a rapidly growing global movement for 'Living Rivers,'" said Juliette Majot, Executive Director of the California-based International Rivers Network. "We're excited to be part of the leadership for restoration. The Colorado, long a symbol of the development of rivers, is now becoming a symbol of society's growing commitment to heal them."

Among the organizations and businesses endorsing the declaration are: Alaska Action Center, American Lands Alliance, Arizona Green Party, Blue Mountains Biodiversity Project, Blue Water Network, Californians For Utah Wilderness, Center for Biological Diversity, Coast Range Association, Colorado Plateau River Guides, Columbia Gorge Audubon Society, Committee for Idaho's High Desert, Diné Medicine Men's Association, Earth First! Journal, Earth Island Institute, Environmental Law Society (Univ. of AZ), Environmental Resource Center (Evergreen Coll.), Escalante Wilderness Project, European Rivers Network, Eyak Preservation Council, Flagstaff Activist Network, Forest Conservation Council, Four Corners School of Outdoor Education, Free The Planet! (N.A.U.), Friends of the Earth, Friends of the Eel River, Friends of the River, Grassroots Environmental Effectiveness Network, Great Basin Mine Watch, Great Old Broads for Wilderness, GreenAction, Green Party Of Utah, Hells Canyon Preservation Council, International Rivers Network, John Muir Project, Living Arts Center For Ecology, National Forest Protection Alliance, Native Environmental Justice Advocacy Fund, Oregon Wildlife Federation, Oregonians for Utah Wilderness, Round River Conservation Studies, Sea Shepherd Conservation Society, Sky Island Watch, Solar Energy

International, Southern Appalachian Biodiversity Project, Terra Firma (Univ. of UT), Utah Environmental Congress, Virginians for Wilderness, Western Land Exchange Project, Wetlands Action Network, Wild Angels, Canyon Voyages & Adventure Company, Back of Beyond Books, Moab Man Construction, Knave of Hearts Bakery, Fry Canyon Lodge, Tag-A-Long Expeditions, The Rio Colorado Restaurant, Wildland Scapes, and North American River Expeditions/O.A.R.S.

Nation's Only Oil Shale Project Hits a Wall

Red Leaf Resources Agrees to Conduct More Research on Water Quality Issues Just Before Scheduled Hearing in Utah

SALT LAKE CITY (June 27, 2012) — The only commercial oil shale project in the United States is now facing a lengthy delay after the company bowed to concerns raised by Western Resource Advocates on behalf of the conservation organization Living Rivers.

Living Rivers, Red Leaf Resources, Inc., and the Utah Division of Oil, Gas and Mining came to an agreement on Tuesday to postpone development plans while more research is done on potential impacts to water quality. Red Leaf agreed to compile more information on potential water contamination for the Utah Division of Water Quality, something that Western Resource Advocates and Living Rivers have pushed for months.

“Everybody agrees that Red Leaf and the State of Utah were trying to do too much, too quickly, and without enough information,” said Rob Dubuc, Staff Attorney for Western Resource Advocates. “This project should not move forward until the company can prove that there are no risks of contaminating groundwater.”

Red Leaf’s EcoShale In-Capsule oil shale proposal theorizes that the company can extract kerogen from shale rock by heating it to extreme temperatures inside massive, 10-acre clay structures (136 feet tall) that would be impermeable to leaking. A mining expert for Western Resource Advocates was prepared to testify in front of the Utah Division of Oil, Gas and Mining that Red Leaf’s proposal is not technologically feasible.

FROM THE EDITORIAL BOARD OF THE SALT LAKE TRIBUNE

Oil and water: Tar mine needs more oversight

A Utah administrative law judge has bought the argument of a tar sands mining company that there's no need to protect or monitor the water that might be affected by a proposed operation in the Book Cliffs area of the state because, well, there isn't any.

Water, that is.

It is a frighteningly shortsighted decision.

There are few places on Earth where there is no water. (We're not even completely sure yet that there isn't any on Mars, for goodness' sake.) And even if the amount of water to be found most of the time in the area targeted by a Canadian-based company that is still called U.S. Oil Sands is minuscule, the admitted fact of the matter is that the miners are going to bring some.

A selling point of the method that U.S. Oil Sands brags about is that, rather than using a witch's brew of scary-sounding chemicals to free the petroleum precursor from the rocks and sand between Moab and Vernal, the company uses a much more benign process that it describes as "citrus based." Lemon juice on steroids.

But that's a liquid. And that liquid, and the substances it liberates from the mineral base, are likely to find their way into the ground, into the (usually dry) creeks and, eventually, into the watershed that leads to the Colorado River. And that river is the source of water — and thus of life — for most of the American Southwest, all the way to California.

The intent of the corporation that is seeking the permit may very well be to capture all the distillate that is produced, if for no other reason than to make sure none of the precious tar is lost. After all, the site, on land to be leased from the Utah School & Institutional Trust Lands Administration, is only expected to produce some 2,000 barrels of oil a day. And that's such a small amount that allowing any of it to seep away would not be in the mine's best interest.

But, then, it wasn't in BP's best interest for the Deepwater Horizon to blow up, either.

Even if Administrative Law Judge Sandra Allen is correct in her view that water is extremely scarce in the area of the proposed mine, the fact that the company isn't even being required to place monitoring equipment in areas where water could be, and satisfy itself and state regulators that no pollution is seeping away from the site, is far too trusting.

There are other administrative hoops that the miners must jump through before they can start production on the site, and environmental advocates are mulling a lawsuit. Somebody, somewhere, needs to give this project a lot more thought. And require a lot more precautions.

LR in the News 10/09/12

Democracy Now interviews Living Rivers about strip mining tar sands in Utah

[Click here](#) to watch the program

TRANSCRIPT:

AMY GOODMAN: We're on the road in Durango, Colorado. With less than 30 days before the election, we turn to look at tar sands oil, the subject of promises by both major presidential campaigns, even as they avoid the issue of climate change.

On Monday, Republican vice-presidential candidate Paul Ryan vowed to approve the Keystone XL pipeline that would run the thick crude oil from Canada to the U.S. refineries in Texas. Addressing supporters in Ohio, he said, if elected, Romney would approve the pipeline on his first day in office, and blamed President Obama for standing in the way of jobs the project could bring.

Obama has delayed a final decision on the pipeline until after the November election. But TransCanada is already clearing the way for its southern leg in Texas, drawing protests from activists who say spills along its path could poison communities. They call the pipeline the fuse to the largest carbon bomb on the planet. For more than two weeks, they've held a tree-sit to block its path near Winnsboro, Texas. Meanwhile, on Thursday, actress Daryl Hannah and a 78-year-old East Texas farmer were arrested while protesting the clearance [of] her land seized by eminent domain. This is Eleanor Fairchild speaking as she stared down one of the TransCanada bulldozers.

ELEANOR FAIRCHILD: I am mad. This land is my land, and it's been our land since '83. Our home is on it. They're going to destroy the woods, and also they could destroy the springs. It's just devastating, but it also is not very good to have the tar sands anywhere in the United States. This is not just about my land; it's about all of our country.

AMY GOODMAN: Well, as the tar sands blockade continues in Texas, we look now at what could be the first actual tar sands and oil shale strip-mining operation in the United States. Not far from where we were yesterday in Moab, Utah, the state has already released land to a Canadian energy development company that recently changed its name to U.S. Oil Sands. The company plans to mine nearly 6,000 acres in an area of unspoiled wilderness that's also the watershed of the Colorado River, which provides water to more than 30 million people. The mine itself would be water-intensive in what's already the second-driest state in the country, and activists say chemicals used in the mine could pollute the water that's left.

For more, we're joined here in Durango, Colorado, just a few hours from the proposed site, from two Moab activists working to block the project. John Weisheit is the longtime conservation director of Living Rivers & Colorado Riverkeeper. And Ashley Anderson is founder and director of Before It Starts, which is leading the fight to stop tar sands drilling in Utah. He's the former director of Peaceful Uprisings, a group he founded with

activist Tim DeChristopher, who I understand is listening to this program on KDUR, the station that broadcasts where he is imprisoned.

But I want to start with John Weisheit. John, explain—when people hear "tar sands," they think Canada, Alberta. They may think dirty oil, or if they're Paul Ryan, they think jobs. But talk about why you're talking about it in Moab.

JOHN WEISHEIT: Well, we're concerned because this particular locality is in a high-elevation place called the Tavaputs Plateau, and it's one of the last wild places in Utah. It's a huge refuge for elk and deer. It's also a beautiful watershed. It not only would affect the Colorado River, but it also—at this particular site, it's at the top of the drainage, so it would also affect the White River and the Green River. And so, this is an inappropriate activity. People probably aren't aware that Utah has a lot of tar sands. It's exposed at the surface. It's easy to get to. This would be a strip-mining project. It would completely deforest this high plateau. It would completely annihilate the vegetation for these animals. And it would actually—once they're done, it would never have any kind of beneficial use whatsoever, besides destroying the watershed.

AMY GOODMAN: So, where did these tar sands come from?

JOHN WEISHEIT: There used to be a lake here. The Colorado River actually was a river system that didn't make it to the ocean. It drained interiorly, and there were these big, huge lake deposits with algae and leaf litter, and these are the organic material that provided these hydrocarbons.

AMY GOODMAN: I want to turn to a clip from the CBC's report on the Utah tar sands. This is a report on the Utah Tar Sands Project. According to Earth Energy Resources—since renamed U.S. Oil Sands—there's now a revolutionary clean technology involving, of all things, oranges.

CBC REPORTER: If you can get all this bitumen out of the ground, separate the oil from the sand, and then put all the land back where it came from—cleanly—that's exactly what the Calgary company behind this project says it can do, with a secret formula, incredibly, involving something you can find at any grocery store: these. That's right, oranges! It's a recipe concocted by the upstart Albertans, who say they can keep Utah beautiful while mining for oil.

GLEN SNARR: That's actually about almost two million barrels a day of—or a year of production using three units out of that pit.

CBC REPORTER: Company president Glen Snarr says his patent-pending process with, yes, citrus extract does the unthinkable: it takes oil from the sand, leaving no pools of toxic waste, and will not permanently scar the land.

GLEN SNARR: Our long-term environmental footprint is almost nil, and I can say that with a high degree of confidence.

CBC REPORTER: This company video shows a test run. The only byproduct: the sand itself, later used to relandscape the pits they dig. Snarr calls it "beach clean."

GLEN SNARR: If we can't do it, then we'll fold up our tent and go back to Canada.

AMY GOODMAN: John Weisheit, can you talk about the citrus solution?

JOHN WEISHEIT: Well, yes. It's called D-limonene. It's a terpene. It's kind of like pine needles make turpentine. And this is the solvent that they want to mix in with hot water to liberate the bitumen in the materials that they strip-mine from the plateau. And what our concern is, is that once this chemical liberates the hydrocarbons, it also liberates all the nasty chemicals and cancer-producing things within the processing system, which are going into the waste sand, which is going into unlined pits. And with all the broken-up sand and rubble and the very intense cloudbursts that are in the area, what happens is, is the rainwater will percolate into these, releasing and picking up the chemicals and putting them into the local aquifers near the surface, and it would also put it into the streams that would carry them to the Green, Colorado or White River, depending on where they're locating their mining operation.

AMY GOODMAN: Are tar sands activists working on the Keystone XL aware of what's going on in Moab? And what do you make of what Paul Ryan says, when he says he will jump-start the Keystone XL pipeline if he were vice president?

JOHN WEISHEIT: Well, I think people are aware of what's going on in Utah, but it is a mining operation that hasn't begun yet. And there are activists working on it, and it is in litigation. But I would like the country to know that we aren't prevailing in the court system, and it is highly likely that this operation will begin in either 2013 or 2014.

AMY GOODMAN: I want to talk about uranium now and uranium mining and uranium milling. Please lay out the story.

JOHN WEISHEIT: Well, Moab used to be called the uranium capital of the world. And in the '50s and '60s, it was our main economic force in Moab. We also have the second-largest uranium waste pile in the United States, and it's right next to the Colorado River. There was a time when the Department of Energy was going to cap this mining activity in place near the Colorado River, but thanks to California water managers, such as the Metropolitan Water District, we were able to convince the Department of Energy to move the pile away from the Colorado River floodplain. But, in 1984, the uranium industry fell, and—but its prices dropped. The government refused to subsidize the industry any further. But there's been a resurgence due to an increase in uranium prices. So there are two companies, Denison and Energy Fuels—they've actually merged. They're currently using a milling facility about 100 miles south of Moab. It's the only uranium-processing facility in the United States, and so whatever uranium mining is happening is happening here in southeastern Utah.

AMY GOODMAN: As Democracy Now! travels on this 100-city tour, we follow the uranium trail from one proposed mine in Virginia, amazingly, to another one near Green River, Utah. Later this week we'll be in Los Alamos, the birthplace of the Nuclear Age, the atomic bombs used in World War II developed there. I want to play a comment from Dan Chancellor, who is running for a seat on the local San Miguel County Commission.

I met him when I was in Telluride, and he was talking about a proposed uranium mill in Paradox, Utah.

DAN CHANCELLOR: Well, we've got some development on the valley floor here that's an issue. And we have the Piñon Ridge mill, the uranium mill. And I've come out very strongly—

AMY GOODMAN: What is it?

DAN CHANCELLOR: The Piñon Ridge uranium mill.

DENIS MOYNIHAN: Piñon.

AMY GOODMAN: Piñon Ridge.

DAN CHANCELLOR: Piñon Ridge.

AMY GOODMAN: What's the uranium mill?

DAN CHANCELLOR: Well, they're getting ready to put a uranium mill near Paradox.

AMY GOODMAN: Why are you against it?

DAN CHANCELLOR: Well, I'm—couple of things. One, I think it's bad for the economy, because typically what happens is they bring—they bring people in from other places. And then, when the mill closes down, we've got that many more unemployed people with no sense of community. But also, the prevailing winds come straight from there to Telluride, and it's less than 60 miles away. Their high-tech solution to keeping those particles from blowing into our lungs is spraying water on them. They're using our water to—you know, they're basically taking our water to do it. My father grew up in a house in Grand Junction that was built on uranium tailings, and he died when he was 58 years old of a type of cancer that's typically associated.

AMY GOODMAN: What kind of cancer?

DAN CHANCELLOR: It was a lung cancer, but it's typically—I mean, that particular type of cancer is typically associated with radiation. I mean, the doctor asked him—his oncologist asked him if he had worked in the uranium industry.

AMY GOODMAN: Wow.

DAN CHANCELLOR: And he hadn't. But I think we need to protect people's health and safety, and save the environment.

JOHN WEISHEIT: Yeah.

AMY GOODMAN: That was Dan Chancellor, running for a seat on the local San Miguel County Commission, speaking about this uranium mill in Paradox, Colorado. He was speaking to us in Telluride. John, the significance of this?

JOHN WEISHEIT: Well, it's on the Dolores River, and it's going to require Colorado River water. It's also a very sensitive area. The Dolores River is basically a river that doesn't flow anymore because of McPhee Reservoir. We're partnering with a group in Telluride called the Sheep Mountain Alliance. We've actually been able to have this under review again. And so, it's—we really don't want to see this. We have a legacy of uranium waste and carnage, and we want—our communities want this out of the way. We want it to be part of the history, not the future.

AMY GOODMAN: Ashley Anderson, the activism you're involved with, from uranium to tar sands? And if you could quickly mention—we have less than a minute—Tim DeChristopher and what's happening with him.

ASHLEY ANDERSON: Sure. Well, I'd just like to say that what we're trying to do is stop the fossil fuel industry in its tracks from spreading the way it's done damage in Canada. There's a great group called Utah Tar Sands Resistance that's working on it in Utah. But nationally, we need a big movement to come in and help in the way that we did with the Keystone XL pipeline. We also need to make it obsolete. So that's how we're going to kind of preserve our future.

And if you want me to mention Tim, he's probably listening, and he'll be getting out on October 24th and serving the rest of his sentence from a halfway house. So, we'll be able to see him.

AMY GOODMAN: And he was sentenced for two years for?

JOHN WEISHEIT: By the Obama administration, basically, for disrupting a BLM oil and gas lease auction.

AMY GOODMAN: A Bureau of Land Management.

JOHN WEISHEIT: Yeah, gas lease auction to sell off our public lands for oil and gas exploration. So, when you talked about the presidential candidates, I don't think we're looking at a good choice when it comes to either candidate preserving a livable future for ourselves.

AMY GOODMAN: Well, Ashley Anderson and John Weisheit, I want to thank you very much for being with us. That does it for our broadcast. We are on our 100-city tour. Tonight we'll be in Taos. Tomorrow we'll be in Santa Fe. And then we'll be in Los Alamos, and we're moving on to Arizona.

PRESS RELEASE

For immediate release

November 27, 2012

The Bureau of Reclamation misses the target for controlling salinity Salinity Control in the Paradox Valley of western Colorado

Contact: John Weisheit at 435-259-1063 or 435-260-2590 (cell) or john@livingrivers.org

Moab, UT - On November 26th, Living Rivers submitted a scoping letter to the Bureau of Reclamation (Reclamation) regarding a salinity control project along the Dolores River in the Paradox Valley of western Colorado in Montrose County; the project is called the Paradox Valley Unit. The Dolores River joins the Colorado River in Grand County, Utah upstream of Moab City.

Below the Paradox Valley lies a huge natural deposit of ocean salt that formed nearly 300 million years ago. Natural groundwater flowing through the Paradox Valley dissolves the salt underneath the alluvium and the heavy brine enters the Dolores River through a series of saline springs.

The Salinity Control Act of 1974 mandates that the Bureau of Reclamation (and other federal agencies) reduce salinity levels in the Colorado River basin to honor a treaty with Mexico (1944) to provide useable irrigation water for their growing fields. The program is also intended to reduce corrosion of infrastructure to other end users of the Colorado River water delivery system, such as the municipalities of Tucson, San Diego and Tijuana.

Most of the salinity problem in the Colorado River basin is derived from human activities, which includes diverting pristine water from the headwaters into the Mississippi River basin (diminishing the benefits of natural dilution), applying irrigation water to fields with salty soils on the Colorado Plateau, and surface evaporation that occurs on nearly 50 water storage reservoirs built by the federal government in the Colorado River basin.

Instead of addressing the human causes of salinity that have occurred in the last 100-years, in this instance Reclamation is targeting an input of salt that will be a problem for millions of years, and with a solution that will only provide benefits that can be measured in decades.

At present, Reclamation is intercepting saline groundwater in the Paradox Valley with nine water pumps, and then injects the treated brine into the earth's crust at a depth of nearly 16,000 feet. Of the 205,000 tons of salt that enter the Dolores River every year in the Paradox Valley, Reclamation removes about 110,000 tons (54%) at the Paradox Valley Unit.

Though the permitted facility became fully operational in 1996, Reclamation has informed the public that the lifespan of the facility is projected to end in about 5-years. Reclamation is proposing to develop a pilot program to investigate the potential of evaporating the collected brine in huge surface ponds. If the pilot program is deemed successful, up to 800 acres (1.25 square miles) of solar ponds would be constructed in this beautiful valley, and at great cost and with cumulative impacts to the environment.

The letter by Living Rivers points attention to the Department of Interior and the Bureau of Reclamation for applying more and more Band-aids to a broken water management system, instead of developing a holistic watershed plan that would secure clean and abundant water supplies for the entire basin and it's future. The letter also explains how in the process of controlling salinity in the Dolores River basin, increases of salinity occur in the San Juan basin.

The Dolores River was dammed in 1984 near Dolores, Colorado (The Dolores Project and McPhee Dam) and the river water is actually diverted across a divide and into the San Juan River basin. The soils of the San Juan river basin are high in salt and selenium. The San Juan River basin transports more sediment into Lake Powell, than the Colorado and Green rivers combined. Had McPhee Dam never been built, the salinity would have been controlled naturally by the dilution factor that occurs after every annual snow melt (817,000 acre-feet on average). This illustrates how typical quid quo pro practices in the Colorado River basin transfers a solution for one basin, to become a problem for another.

Living Rivers is asking the Department of Interior and Reclamation to stop implementing redundant management protocols and instead initiate a basin-wide programmatic Environmental Impact Statement that would initiate watershed resiliency planning throughout the Colorado River basin. Otherwise the Colorado River basin will turn into a train wreck of crisis management and endless litigation.

Controlled Flood in Grand Canyon a Dud

For immediate release:

Contact: John Weisheit @ 435-260-2590 (cell)

Controlled Flood in Grand Canyon a Dud

Federal Scientists Say Sand and Beaches Continue to Erode Away

PHOENIX, Arizona - January 23, 2013 - Just two months after Secretary of Interior Ken Salazar opened the jet tubes at Glen Canyon Dam, launching a five-day (24-hour peak) controlled flood into Grand Canyon, the results are in and they are not positive.

During today's Annual Reporting Review for the Grand Canyon Adaptive Management Program's Technical Working Group, representatives from the Glen Canyon Monitoring and Research Center reported:

Just 55% of the target beaches showed improvements, while 36% remained the same and 9% were worse off. 25% of the sediment scientists had hoped to mobilize and distribute with the flood never moved. No evidence of improved nursery habitat for native fish. Nothing is stopping the long-term erosion of sediment from Grand Canyon's river corridor.

"Ken Salazar claimed that this was going to be 'A milestone in the history of the Colorado River', but like the three previous experiments in 1996, 2004 and 2008, it too has shown that at best some beaches are temporarily improved, but the long-term prognosis for the Grand Canyon is a system without sediment," says Living Rivers Conservation Director John Weisheit

Since 1963, 95% of sediment inflows to Grand Canyon National Park's river corridor have been trapped behind Glen Canyon Dam. This has completely transformed habitat conditions for Grand Canyon native fish, leading to the extinction of the Colorado pikeminnow, razorback sucker, bonytail chub and roundtail chub, and the endangerment of the humpback chub.

The November 19th 2012 flood is the first to occur in a ten-year time window that scientist have been granted to experiment with Glen Canyon Dam operations. Additional controlled floods can be attempted if certain conditions are met, mainly the existence of large amounts of sediment entering the Colorado River from two tributary rivers that feed into the upper part of Grand Canyon, the Paria and Little Colorado.

"Far too much public time and money is wasted on preparing for, publicizing, executing and monitoring these useless floods that do nothing but perpetuate a science welfare program masquerading as an endangered species recovery effort," adds Weisheit. "Scientists know, but won't publicly state, that the only real solution to addressing Grand Canyon's sediment deficit is to transport it around Glen Canyon Dam or decommission the dam altogether."

Commentary @ www.charliechub.com

Scientists studying last fall's experimental flood of the Grand Canyon say it did what it was supposed to do: build sandbars.

Or, at least it built more sandbars than it eroded and generated new Colorado River campsites and fish habitats.

But the question is for how long.

"We'll just have to see," Grand Canyon Monitoring and Research Center Chief Jack Schmidt told participants in an annual canyon work-group session Wednesday. The real results will come over the next year or so, when researchers will know what remains of the newly built sandbars.

Over a 24-hour period in November, the U.S. Bureau of Reclamation cranked Glen Canyon Dam's release from 8,000 cubic feet per second to 42,300 to churn up sand and allow the U.S. Geological Survey and others to track the impact.

Some of the new sandbars and beaches are dramatically larger, nearly doubling, providing rafters a flat overnight perch and young endangered humpback chubs a warm backwater shelter from the pulsing river. The sand washed up by the flood also is meant to provide a wind-borne source of cover for uphill archaeological sites and a purchase for vegetation.

But it's unclear whether the benefits to these and other Grand Canyon National Park resources can withstand longer-term dam releases that fluctuate to meet hydropower or downstream water needs, and a shrinking sand source. After the previous three experiments that started in 1996, the buildup in many parts of the canyon has been on a downward trend as the river swept residual sand to Lake Mead.

Glen Canyon Dam blocks most of the sediment carried downstream by the Colorado River. Among the few remaining sources of sand is the Paria River, which flows into the Colorado about 15 miles below the dam and dumps, on average, about a tenth of the sand that the undammed river used to wash into the Canyon. The flood experiments are meant to find out how to make the best use of it.

Schmidt's staff has reviewed snapshots from remote digital cameras that showed more than half of the monitored sandbars and beaches — 18 — grew substantially after the November flood receded. Twelve sites showed no change and three eroded substantially.

"Every time we do a flood, it builds sandbars," said Paul Grams, a U.S. Geological Survey research hydrologist. "We know the floods build the bars, and they tend to erode in the six months to a year following the floods."

The Canyon's chub numbers have grown threefold, to 12,000 over the past two decades, biologists at this week's meetings estimated, perhaps aided more by warmer water spilling from a low reservoir.

Some river advocates have argued that only frequent artificial floods can approach pre-dam conditions — a possibility that the U.S. Interior Department set up by stripping environmental red tape from experimental releases for the next decade.

But others want more drastic action.

"It's not working," said John Weisheit, conservation director for Living Rivers, a non-profit organization dedicated to Colorado River conservation. The dam blocks too much sand, and the government should either breach the dam, transport sand around it or give up, he said.

"I would hope that this country could solve the health of Grand Canyon National Park," he said.

The Bureau of Reclamation has estimated it would cost more than \$100 million to build a pipeline around the dam to deliver about the same amount of sand that the Paria dumps in the Canyon. Schmidt and his staff advised river managers this week that there's a chance that sand depletion could at some point wipe out gains from these floods — but not yet.

Most of the targeted sandbars in Marble Canyon — the highest stretch of the park affected by the flood — grew in the November flood. But the results downstream were mixed, and USGS scientists said it was because prolonged high flows last year to move water from Lake Powell to Lake Mead washed away sand.

The Colorado River Energy Distributors Association estimates that its cooperative members from Arizona to Wyoming lost about \$1.4 million in power generation as water bypassed turbines during the release. It's unclear whether the canyon got "the bang for the buck," association Executive Director Leslie James said. Each flood introduces new results and variables.

"The more you experiment," she said, "the less you know."

Next fall is the soonest the government could plan another flood, if monsoon rains wash sufficient sediment down the Paria.

LR comments on Basin Study assessing supply and demand in the Colorado River basin to year 2060

[CLICK HERE](#) to read the comments of Living Rivers and the Center for Biological Diversity.

Excerpt from our letter:

5. Conclusion

The Basin Study represents a valuable technical achievement by Reclamation staff in applying contemporary modeling tools to generate predictions regarding future Colorado River flows. But these are just numbers, and they are wrought with uncertainty.

Moreover, how these results were presented shielded the public from attaining an understanding of the real challenges that Colorado River water users may be facing far sooner than the study's findings predict. Therefore, Reclamation should task the authors to begin work on a revision that addresses the following:

- 1) Provide extensive qualitative analysis as to the significant real-world uncertainty associated with the future streamflow predictions.
- 2) Discuss in far more detail the range and probabilities in future streamflows beyond the 10% average reduction projected by 2060.
- 3) Specifically address the new critical period (2000-2013) and the likelihood that it will continue. Moreover, if these conditions do persist for several more years, at what point do the study's future streamflow findings lose relevance and Reclamation's modeling needs recalibrating?
- 4) Detail the history and present status of over-allocation in the Basin, and the strategies that might be pursued to address remedies.
- 5) Eliminate discussion of demand projections that are not directly connected to Colorado River withdrawals and/or Colorado River water delivery obligations with Mexico.
- 6) Restrict discussions of new water supply options to water saved through demand-side management and conservation, and only to the extent necessary to help balance the Colorado River's water supply budget.
- 7) Incorporate an analysis of the Colorado River's long-term needs and potential, relating to issues other than water diversion: critical habitat maintenance and restoration, appropriate recreation and cultural preservation, etc. Explore opportunities for changes in how the river is managed and water is stored and delivered, given the changes in the hydrologic regime, the potential for water conservation, increased instream flows, and the decommissioning of unnecessary storage infrastructure.

This revised effort should be led by a team whose vision for the Colorado River extends beyond the dams and diversions put in place since the signing of the Colorado River Compact. There's more to the future of the Colorado River than how much and where its water can be diverted. Additionally, there's a need for full disclosure about the actual challenges water users may be facing in the near term, and creative discussions about solutions that address the real imbalance on the Colorado: excessive human intervention at the expense of the river's natural integrity. So despite the study's significant shortcomings, it can nonetheless serve as a valuable step in a continuing process that seeks real solution for the whole of the Colorado River, should the Interior Department, and Reclamation specifically, summon the leadership do so.

March 26, 2013

Living Rivers & Colorado Riverkeeper
Before It Starts www.beforeitstarts.org

John Weisheit - 435-259-1063; 435-260-2590; john@livingrivers.org
Ashley Anderson - 801- 652-2971; ashley@beforeitstarts.org

Investors Beware: Utah's Tar Sand Deposits are Duds

MOAB, UT - The Record of Decision issued March 22nd by the Bureau of Land Management concerning the development of TAR SANDS in Utah states the following on page 40:

"[t]his resource is not, at present, a proven commercially viable energy source, and the BLM would like to obtain more information about environmental consequences associated with its development prior to committing to broad-scale commercial development."

http://ostseis.anl.gov/documents/docs/2012_OSTS_ROD.pdf

Activists opposing the development, processing, and refining of Utah's TAR SANDS emphatically concur with this statement. It is well documented in the [geologic literature](#) that the majority of the deposits in Utah will require steam injection to liberate the bitumen ("tar"), in order for this viscous oil to be pumped to the surface for further refining (in-situ). Vast amounts of water will be required for this proposed industry and in the second driest state in the USA (preceded by Nevada).

"Aquifers will be depleted before there is any investment return and depletions of surface water from the Colorado River and its tributaries will be fiercely litigated because current demand outstrips the supply," says John Weisheit, conservation director of Living Rivers and Colorado Riverkeeper.

The Energy Return on Investment (EROI) for in-situ extraction is, under the best of circumstances, 2 to 1, according to respected [energy analysts](#) from the USA. Additionally, [analysts from Canada](#) place the EROI of steam injection at 1 to 1. For comparison, the EROI for the USA oil and gas industry is 10 to 1.

However, there are tar sand deposits near the surface in some localities such as the PR Spring deposit in the Tavaputs Plateau of east-central Utah. It has been speculated that these deposits could be strip-mined and processed on site with just hot water and solvents to liberate the bitumen. Lack of water, none-the-less, is still the #1 heartache of industry speculators such as US Oil Sands, Inc., which is based in Calgary, Alberta. US Oil Sands has leased 30,000 acres from the state of Utah that it considers worthy of strip mining.

Investors must understand that this ore deposit near the surface is by no means a bonanza. The near surface deposits are lens-shaped deposits that have an average thickness of 27 feet and the deposits are interrupted and isolated by a series of incised canyons. The average depth of the overburden and intraburden (rocks with no economic value) is 124 feet. The general standard for economic return is a ratio of waste rock to ore is 2 to 1. In this case the ratio is an exorbitant 5 to 1.

"The strip-mining proposed by US Oil Sands will become the grave of their business. When they declare bankruptcy, the citizens of Utah will have the responsibility to reclaim their damage to the last remaining wild place of the contiguous USA," says Ashley Anderson, co-founder of Before It Starts.

Potential investors should do at least these three things:

1) Ask USOS what it would cost the company to be shut down unexpectedly for a full day of operation, and write that amount down.

2) Take a moment and visit some search engines, such as Keystone XL pipeline protests and mass arrests, which were organized in part by Utah activists. An ever-growing number of people are now blockading construction of the pipeline in multiple states. The CEO of Endinbridge said "We are facing a very strong, almost revolutionary movement."

3) Write down how many days you think USOS can be stopped by a continental movement and multiply those two numbers together.

Now ask yourself, is it worth it?"

###

Supplemental information:

Table One

Analyses of drill records available to the public within a two mile radius of US Oil Sands proposed strip mining project.

Depth below surface for this analysis is 150 feet (as per submitted application).

Standard: uneconomical if ratio of ore to waste is over 1 to 2

Update: Paleoflood Data for the Colorado River above Moab

Letter from Living Rivers and Uranium Watch to the Site Futures Committee regarding proposals to develop the land that is currently occupied by the Atlas Tailings Pile (uranium mill waste) near Moab, Utah, once the site is remediated by the Department of Energy.

The reason why this uranium waste pile is being moved off the Colorado River floodplain is because of its vulnerability to 100-, 500- and 1000-year floods.

The best use of this land is to let it serve the community as a free ecological service to reduce the impacts of catastrophic flooding events, and not to develop it for human habitation or for industrial uses.

Utah Tar Sands, Oil Shale Refinery Challenged

Green River Refinery Would Pollute Air, Enable Dangerous Oil Shale, Tar Sands Mining in Colorado River Basin

SALT LAKE CITY— A coalition of conservation groups today filed a “request for agency action” challenging the Utah Department of Air Quality’s June 21 approval of a new oil refinery in Green River, Utah that would affect local and regional air quality and facilitate oil shale and tar sands mining in the Colorado River Basin’s Green River Formation.

The U.S. Geological Survey estimates that between 353 billion and 1.146 trillion barrels of oil in the Green River Formation “have a high potential for development,” which is 2 to 7 times as much as Alberta’s 170 billion barrels targeted by the Keystone XL pipeline.

“The public needs to understand that the Colorado River Basin’s carbon bomb dwarfs Alberta’s,” said Taylor McKinnon, director of energy with Grand Canyon Trust. “In addition to polluting Utah’s already-dirty air, this refinery is another step toward massive strip mining, greenhouse gas emissions and Colorado River drying.”

The groups are challenging the department’s June 21 issuance of a permit approving the plant over several alleged violations of the Utah Air Conservation Act. The challenge was submitted to the Utah Department of Environmental Quality and will be heard by an administrative law judge, and potentially later the Utah Supreme Court.

“To experience clean and crisp air in the Green River Desert today, you have to wait for an infrequent thunderstorm to sweep the haze, dust and smoke away,” said John Weisheit, conservation director with Living Rivers. “Only then can you actually see the features of the Book Cliffs, the San Rafael Swell, and the Henry and La Sal mountains.”

The refinery would emit volatile organic compounds, other hazardous pollutants and greenhouse gases while creating now-absent local capacity for processing up to 7 million barrels of heavy crude annually in the heart of Utah’s oil shale and tar sands country.

“People travel from all over the world to enjoy the stunning vistas at Arches and Canyonlands national parks as well as Dead Horse Point,” said David Garbett, a staff attorney with the Southern Utah Wilderness Alliance. “It makes no sense to risk compromising the remarkable views this region offers with visibility-reducing pollution from this refinery.”

Oil shale and tar sands development entails strip mining and dangerous energy and chemical inputs to melt and extract fuel. Greenhouse gas emissions stemming from oil shale and tar sands development far exceed that of conventional oil development. In March the Bureau of Land Management allocated more than 800,000 acres of federal public land in the Colorado River Basin to oil shale and tar sands development.

“Given all of Utah’s current pollution problems under the Clean Air Act, it makes no sense to further harm public health and exacerbate climate change,” said Bill Snape, senior counsel at the Center for Biological Diversity.

Groups filing today's request for agency action are Grand Canyon Trust, Living Rivers, Southern Utah Wilderness Alliance and the Center for Biological Diversity.

Lawsuit Challenges 800,000-acre Oil Shale, Tar Sands Plan Across Public Lands in Utah, Colorado and Wyoming

For Immediate Release, July 26, 2013

Contact: Taylor McKinnon, Grand Canyon Trust, (801) 300-2414

John Weisheit, Living Rivers, (435) 259-1063

David Garbett, Southern Utah Wilderness Alliance, (801) 486-3161

Virginia Cramer, Sierra Club, (804) 225-9113 x 102

Lawsuit Challenges 800,000-acre Oil Shale, Tar Sands Plan Across Public Lands in Utah, Colorado and Wyoming

DENVER— A coalition of seven conservation groups sued the Bureau of Land Management on Thursday afternoon in federal district court in Colorado for allocating more than 800,000 acres of federal public land to climate-warming oil shale and tar sands development without undertaking formal consultation to protect endangered species.

The lands due to be mined are in Utah, Colorado and Wyoming within the Green River Formation, which the U.S. Geological Survey states contains between 353 billion and 1.146 trillion barrels of oil with "high potential for development," — in fact, so high it holds 2 to 7 times as much as Alberta's 170 billion barrels targeted by the Keystone XL pipeline.

"Vast mining, carbon emissions and water use will only worsen climate disruption and Colorado River drying," said Taylor McKinnon, director of energy with the Grand Canyon Trust. "This plan opens the door to that kind of development, and it does so while ignoring the plight of the creatures most vulnerable to its many impacts."

"This citizen intervention is necessary because the Department of Interior is sending mixed messages to the public. On one day, the administration issues a statement that the Colorado River's critical water supply will be protected for people and habitat, and then on another day they announce the most carbon intensive mining practice on the planet can move forward," said John Weisheit, conservation director with Living Rivers.

“The two programs are not mutually beneficial. Interior has to protect the Colorado River, there is no other choice.”

In March the BLM amended 10 resource-management plans, making 687,600 acres available for oil shale leasing and 132,100 acres available for tar sands leasing. The agency refused to conduct formal consultation with the U.S. Fish and Wildlife Service to protect endangered species, as required by the Endangered Species Act, despite acknowledging likely impacts to those species.

“The Endangered Species Act requires agencies to consult with the experts at the Fish and Wildlife Service when they know listed species will be impacted,” said Matt Sandler, a staff attorney at Rocky Mountain Wild. “BLM has skipped this step, which will push these species closer to extinction.” Mining for oil shale and tar sands would industrialize backcountry and destroy habitat, pollute and deplete water, and emit greenhouse gases. The allocated lands encompass habitat for several threatened and endangered species, including Colorado pikeminnow, humpback chub, razorback sucker, Mexican spotted owl and many other threatened and endangered species.

“Our public lands should be managed to protect our air, water and wildlife, not auctioned off for dirty and destructive fossil fuel development that will push us ever closer to climate disaster,” said Bill Snape, senior counsel with the Center for Biological Diversity.

Thursday’s lawsuit comes as atmospheric CO₂ concentrations approach 400 parts per million, a milestone in human history. Making fuel from oil shale and tar sands is an energy-intensive process of mining, heating, chemical treatment and refining. Its greenhouse gas emissions would far exceed that of conventional oil. For example, emissions from Alberta’s tar sands development exceed that of conventional oil by several times.

“The BLM should be managing these wild areas for the rich wildlife diversity and recreational opportunities they provide,” said Dan Chu, director of the Sierra Club’s Our Wild America campaign, “not for dirty fuels development on a giant scale.”

The groups filing today’s lawsuit are Grand Canyon Trust, Living Rivers, Southern Utah Wilderness Alliance, Rocky Mountain Wild, Biodiversity Conservation Alliance, the Center for Biological Diversity and Sierra Club. Many of the same groups on [Monday](#) challenged a new oil refinery in Green River, Utah, that could process fuels derived from oil shale and tar sands mined in lands subject to this lawsuit.

[Click here](#) to read the scientific paper by Cross et al.

Living Rivers would like to emphasize to the public that the lack of sediment is not the reason why the endangered fish are suffering. It is the lack on entrained carbon in the sediment that is causing the collapse of the Grand Canyon's ecosystem.

Before Glen Canyon Dam, driftwood and leaf litter provided nutrients and substrate for algae and bacteria to in turn provide food for insects, to in turn provide food for fish.

The only way to get carbon back into the system, is to remove Glen Canyon Dam. Until then, restoring the ecosystem of Grand Canyon National Park is an impossibility.

Company secures financing commitment for first U.S. oil sands mine, drawing the ire of local environmental groups

UPDATE: [Click here](#) to read this story by Steve Horn of DeSmog Blog and how this venture capital move is related to a business partner of former president Bill Clinton Nathanael Massey, E&E reporter

Published: Friday, September 20, 2013

The fight over oil sands just got domestic.

Calgary, Alberta-based U.S. Oil Sands Inc. secured financing this week to begin operations in the Uinta Basin of eastern Utah, in an area it claims contains up to 180 million barrels of discovered bitumen. If realized, the project would be the first oil sands venture on American soil.

Local environmental groups, meanwhile, called the financing announcement "an illusion to investors" and claimed the company has not been upfront about its environmental and economic costs.

While no money has yet changed hands, U.S. Oil Sands Inc. signed a letter of intent this week to sell \$80 million worth of shares to three private investment groups by mid-October. The company plans to use the funds to launch the first phase of commercial development in its PR Springs Project.

The company has a 100 percent interest in 32,000 acres in the PR Springs area. It plans to begin extraction next year at 2,000 barrels per day, and eventually scale up to 20,000 barrels per day.

"Unlike most bitumens, this resource is high in oil and low in sulfur, producing a sweet crude," said Cameron Todd, CEO of U.S. Oil Sands. As such, it benefits from a lower greenhouse gas profile, he said.

Compared to the industrial juggernauts of northern Alberta, U.S. Oil Sands' proposed mine would be a pint-sized operation. The Canadian oil sands industry churns out more than 1.6 million barrels of oil a day; the Utah project's operators hope, someday, to achieve 1.25 percent of that. Where project costs can tally in the billions of dollars for major extractors like Suncor Energy and Syncrude Canada, operator U.S. Oil Sands Inc. hopes to get its project off the ground for a modest \$30 million.

An 'ugly dream'

But those numbers are cold comfort to local environmental groups, which see the project as a threat to regional water supplies and a new front in the oil industry's push toward unconventional fossil fuels.

"U.S. Oil Sands is selling a foolish hope and ugly dream that would deplete and endanger the water resources of the West," said Denise Davis, a member of the group Utah Tar Sands Resistance. "Investors aren't hearing the dangers about water and climate change, and they aren't being honestly briefed on the financial risks."

Environmental groups have opposed the project since it first acquired regulatory approval in 2009. Recently, a coalition of parties has staged sit-ins and protests, even blocking a road used to transport equipment bound for the PR Springs site, according to a report in The Huffington Post. Prescient of the potential for environmental backlash, U.S. Oil Sands has pursued a method of extraction that it claims will mitigate most environmental concerns.

"This oil sands project stands to be the most environmentally responsible ever built," Todd said. "This will be the first commercial development anywhere without tailing ponds," the toxic pools of wastewater that result from conventional extraction processes.

"Our methods cut the surface profile [of the project] by 95 percent so that we can reclaim as we go. They leave clean sand and no sludge tailings," he added

The company has staked those claims, and its fortunes, on a citrus-based biosolvent called d-limonene, an extract pulled from orange peels found commonly in household cleaning products. U.S. Oil Sands claims this miracle fruit can strip oil from sand without leaving a toxic wastewater footprint.

In development since 2003, d-limonene has been tested in pilot projects that ranged from 24 to 500 barrels a day in size. If proven in the field, Todd said the process could be exported to other similarly sized operations.

Water is a major issue for the Uinta Basin region, which receives 8 inches of precipitation annually. Conventional oil sands operations consume vast quantities of water, but U.S. Oil Sands claims it will be able to recycle up to 95 percent of all the water it uses.

Most of the water, the company maintains, will be pumped up from deep underground, well below the level tapped for human consumption.

Environmentalists disagree. "They found water on their fourth drilling attempt, and the pump test was around 93 gallons a minute," said John Weisheit, conservation director with the group Living Rivers. "Phase one of their operations requires 116 gallons per minute." That phase would produce 2,000 barrels of oil per day, or one-tenth of the final proposed production value.

"If they don't get [water] from the ground, where's it going to come from? They're going to have to truck it in," he said.

Colorado River Hydrology at end of Water Year / September 30, 2013

For the first time in history, the Bureau of Reclamation is withholding water from Lake Mead due to 14 years of successive drought.

[CLICK HERE](#) to read this story in the Summit County Citizens Voice, which is followed by the monthly report from the Bureau of Reclamation.

DATA SUMMARY As of December 11, 2013

The end of November elevation and storage of Lake Powell were 3587.9 feet (112.1 feet from full pool) and 10.63 million acre-feet (maf) (44% of full capacity), respectively.

The water year 2013 unregulated inflow volume was 5.12 maf (47% of average), placing 2013 as the fourth driest on record since the closure of Glen Canyon Dam in 1963.

Water years 2002, 1977, and 2012 were drier, receiving 2.64 maf, 3.53 maf, and 4.91 maf, respectively.

In terms of reservoir elevation and storage, Lake Powell reached its peak for water year 2013 on June 18th at 3,601.2 ft (98.8 feet from full pool) which is 35.7 feet lower than last year's peak elevation of 3636.9 ft.

The end of water year 2013 elevation and storage of Lake Powell were 3591.3 feet (108.7 feet from full pool) and 10.93 maf (45% of capacity), respectively.

This is 3.0 maf less than 2012 end of water year storage which was 13.93 maf (57% of capacity).

The period 2000-2014 is the lowest 14-year period since the closure of Glen Canyon Dam in 1963, with an average unregulated inflow of 8.25 maf, or 76% of the 30-year average (1981-2010).

For comparison, the 1981-2010 average is 10.83maf.

The unregulated inflow during the 2000-2013 period has ranged from a low of 2.64 maf (24% of average) in water year 2002 to a high of 15.97 maf (147% of average) in water year 2011.

At the beginning of water year 2014, total system storage in the Colorado River Basin was 29.9 maf (50% of 59.6 maf total system capacity).

This is about 4 maf less than the total storage at the beginning of water year 2013 which began at 34.0 maf (57% of capacity).

Based on current forecasts, the current projected end of water year 2014 total Colorado Basin reservoir storage is approximately 29.6 maf (50% of capacity).

Utah Judge Clears Way for Nuclear Power Plant in Central Utah

[Click here](#) to read this story by Curtis Haring of Utah Political Capitol

[Click here](#) to read this story by Kristen Moulton of the Salt Lake Tribune

[Click here to read the Decision of the Judge](#)

The decision confirms that water, finances and endangered fish will continue to be problematic for the promoters of this project and their intentions to sell their package to a power utility in the future. It affirms that the Blue Castle Project is more about securing water rights, than it is about securing Utah's energy future.

- 1) The water right of the Central Utah Project will NOT be junior to the water right of Kane County, which is year 1965.
 - 2) The year 2000 priority for San Juan County's water is junior to Kane County's water right. Thus the combined water for the proposed project is tiered, and subject to vulnerabilities much like the Central Arizona Project would be in times of declared water shortages.
 - 3) Nuclear power is risky in places where water is abundant, but Judge Harmonds decision makes it clear that nuclear power in the state of Utah is even riskier, simply because the Colorado River basin is over-appropriated and suffering from the impacts of increasing aridity and increased water consumption.

The well has run dry once again for the Southern Nevada Water Authority's controversial pipeline project.

by HENRY BREAN LAS VEGAS REVIEW-JOURNAL

<http://www.reviewjournal.com/news/eastern-nevada-pipeline-opponents-win-court-ruling>

For the second time since 2009, a judge has stripped the authority of permission to siphon billions of gallons of groundwater a year from across eastern Nevada.

In a highly anticipated decision issued Tuesday, Senior District Judge Robert Estes ruled that the state's chief water regulator has more work to do before allowing the authority sink its wells in four lonesome valleys in Lincoln and White Pine counties.

Specifically, Estes ordered the state engineer to recalculate how much the authority can safely be allowed to pump from Spring, Cave, Dry Lake and Delamar valleys to avoid draining the basins and causing conflicts with other water rights holders there and elsewhere.

He also directed the state engineer to develop specific triggers for mitigation measures, should damage from large-scale groundwater pumping occur, and he ordered any mitigation plans to include Millard and Juab counties at the western edge of Utah.

Simeon Herskovits, the lawyer for many of those who officially protested the authority's pipeline, called the decision "a big victory for us."

“The judge ruled in our favor on a host of the core deficits in this project that we’ve been talking about for years,” he said.

If the ruling survives an expected appeal to the Nevada Supreme Court, Herskovits said, it could fundamentally change the way regulators review the authority’s controversial pipeline from now on. The state engineer won’t be allowed to essentially “rubber stamp” the project anymore, he said.

Water authority spokesman Bronson Mack said the agency’s attorneys were still reviewing the document early Wednesday afternoon and could not yet comment on it.

Since the late 1980s, Las Vegas water officials have pushed plans to import groundwater from across eastern Nevada to supply future growth and provide a backup supply to the Las Vegas Valley, which gets 90 percent of its drinking water from an overtaxed and drought-stricken Colorado River.

Water authority officials hope to deliver water to the valley from as far north as Great Basin National Park through a network of pumps and pipelines stretching more than 300 miles and costing as much as \$15 billion.

The valley’s wholesale water supplier — and, ultimately, water ratepayers — have already spent tens of millions of dollars on the pipeline project.

Pipeline opponents filed an appeal last year asking the court to review and overturn State Engineer Jason King’s March 22, 2012, order granting the authority permission to pump up to 84,000 acre-feet of groundwater a year from the four valleys.

King’s decision came roughly two years after the state Supreme Court struck down two previous rulings that gave the authority almost 79,000 acre-feet a year from the same valleys.

One acre-foot of water can supply two average valley homes for one year.

In October 2009, a different district court judge struck down a previous state engineer’s ruling granting the authority water rights in the three Lincoln County watersheds.

The Supreme Court eventually ordered the state engineer to conduct all new hearings on the four valleys, which King did in 2011.

Herskovits, who has been arguing against the pipeline project for years now, acknowledged that opponents still have a long way to go before their fight is done.

Authority officials have said they expect to be defending their project in court for years to come. This particular case was almost guaranteed to wind up in the Supreme Court no matter how Estes ruled on it, Herskovits said. “I have always assumed that.”

When the lawyer got the good news Wednesday morning, he was hard at work on something else: a federal lawsuit against the U.S. Bureau of Land Management for granting a right of way for the authority to build its pipeline.

This is a developing story. Check back for updates.

PRESS RELEASE: Red Leaf Resources

FOR IMMEDIATE RELEASE DECEMBER 20, 2013

Red Leaf Resources Clears Major Permitting Hurdle On the Path to Commercial-Scale Oil Shale Production

SALT LAKE CITY – Utah oil shale development company Red Leaf Resources has cleared a major regulatory hurdle and will soon launch the first commercial-scale oil shale production in North America in decades.

The Utah Division of Water Quality today issued a Groundwater Discharge Permit to Red Leaf Resources, which the company sought despite not producing any discharge water. In 2012, Red Leaf received a Large Mining Operation permit from the Utah Division of Oil, Gas & Mining, contingent upon issuance of the discharge permit.

"We are pleased to finally have the major permits required to move forward with construction of our commercial demonstration project, which will produce more than

300,000 barrels of oil and prove our clean oil shale technology works on a large scale,” said Red Leaf CEO Adolph Lechtenberger. In 2009, Red Leaf successfully completed a pilot project on its lease holdings in Eastern Utah, from which it successfully produced more than 300 barrels of oil.

Red Leaf estimates it has up to 600 million barrels of recoverable oil under leases on school trust lands in Utah, which will be developed under a joint venture with the French energy conglomerate TOTAL SA. Red Leaf has another estimated 750 million barrels on land leased in Wyoming, which will be developed under a joint venture with the Canadian firm Questerre Energy.

“Red Leaf has more than 20 U.S. patents for our EcoShale™ technology, which extracts oil with lower energy consumption, lower emissions, lower water use and less environmental impact than any oil shale technology deployed in the world today.” Lechtenberger continued, “The EcoShale™ process was specifically designed to address traditional environmental challenges of oil shale production.”

“Not only do we have less environmental impact, our oil is of much higher quality than traditional oil shale production, equal to or better than the industry benchmark of light sweet West Texas Intermediate crude,” said Lechtenberger.

OIL SHALE VS. SHALE OIL Oil shale is often confused in the media with shale oil and shale gas production. When traditional oil and gas is extracted from shale rock formations like those in North Dakota, Pennsylvania and Texas, it is correctly called shale oil and shale gas, not oil shale. This extraction process involves drilling for the resource.

By contrast, oil shale development is the process by which a solid organic material rich in hydrocarbons called “kerogen” is converted to crude oil, condensate and natural gas through the application of heat. All traditional oil and gas was once kerogen. Over tens of millions of years, heat from the earth’s core caused deposits of kerogen to transform into oil and natural gas. Modern oil shale production simply speeds up the natural process of turning kerogen into oil and gas, either by mining the ore and heating it at the surface or heating it underground (in-situ). EcoShale™ is a surface mining and processing technology.

OIL SHALE: 'Critical last step' taken to open commercial-scale facility in Utah

Margaret Kriz Hobson, E&E reporter
Published: Tuesday, January 7, 2014

This spring, as the snow melts and ground thaws in eastern Utah, Red Leaf Resources Inc. plans to begin building the first commercial-scale oil shale production facility to operate in the United States in 30 years.

The Utah Division of Water Quality last month granted Red Leaf a long-awaited water discharge permit, clearing the deck for the company's large oil shale demonstration project in the Uinta Basin. The project had been delayed by concerns that it might pollute local water supplies.

"It's hard to overstate how significant it would be to commercialize oil shale in the United States," said company spokesman Jeff Hartley. "This is the last critical step we need to move forward."

The Salt Lake City-based company is proposing to use its EcoShale technology to develop Utah's plentiful supply of oil shale. The procedure entails mining and crushing the kerogen-rich oil shale and dumping it into a massive clay-lined pit. A single rock capsule will be almost a half-mile long and 300 yards wide.

Once sealed, the encased rock will be heated to 700 degrees Fahrenheit over a period of weeks to convert the solid kerogen into oil, natural gas and condensate.

Red Leaf successfully tested the technology in a 2009 smaller-scale demonstration project. Now company officials hope to prove the process can be scaled up for commercial production (EnergyWire, Jan. 11, 2013). They predict that the upcoming demonstration project will produce more than 300,000 barrels of oil, with an initial output estimated at 10,000 barrels a day. Red Leaf predicts that its Utah state trust land leases could contain up to 600 million barrels of recoverable oil.

The large-scale demonstration project is targeted for completion in July 2015. The company must acquire a second water permit before moving to the next stage of broad-scale oil shale development.

As Red Leaf begins the commercial-sized demonstration project, the company plans to monitor rain and well water at the site, as well as the heat distribution in the rock capsule, Hartley said.

"Because this is our first commercial demonstration project, we will be testing throughout the process," he explained. "So this will be a slower construction time frame than when we get into full commercial production."

The Utah project is being underwritten through a joint venture with the U.S. affiliate of French energy company Total SA.

"They brought \$400 million to the table," Hartley said. "We have the technology and the resource. It's a straight-up JV that will split the profits 50-50 and prove the commerciality of oil shale."

Red Leaf also is leasing oil shale-rich lands in Sweetwater Canyon, Wyo. That property is estimated to contain 750 million barrels and is being developed under a joint venture with the Canadian firm Questerre Energy.

The company is also licensing its EcoShale technology to other companies. Hartley said oil shale development projects are moving forward in Morocco and Jordan. In addition,

Red Leaf has licensed its extraction process to another company with state leases in Utah.

Feds begin Colorado River drought action

Ken Ritter and Paul Foy The Associated Press

LAS VEGAS — After back-to-back driest years in a century on the Colorado River, federal water managers are giving Arizona and Nevada a 50-50 chance of having water deliveries cut in 2016, reports the Mohave Valley Daily News.

A U.S. Bureau of Reclamation operations plan made public in August will for the first time slow the flow of water from the Lake Powell reservoir upstream of the Grand Canyon to the huge Lake Mead reservoir that provides almost all of Las Vegas' water.

But a bureau official said Lake Mead won't reach a low point next year that would trigger cuts to Sin City's main drinking water supply.

"What we've seen in the last two years are the worst consecutive years of inflow in the last 100 years," bureau Lower Colorado Regional Director Terry Fulp told The Associated Press.

"We're going to slow Powell's decline. That will hasten Mead's decline," he said. "But next year, we can adjust again."

The bureau that controls the levers at the Glen Canyon and Hoover dams said cities, states, farmers and Indian tribes will get their full Colorado River water deliveries next year — and probably in 2015.

Fulp said a two percent chance of the Lake Mead level dropping in 2015 to the trigger point for a shortage declaration increases to 50 percent in 2016.

Bureau officials and environmentalists have been raising alarms in recent months about demand outstripping supply on the river serving about 40 million people in seven states and cities including Los Angeles, Phoenix, Denver and Las Vegas.

"The problem isn't drought, and a big rain storm or a heavy winter snow season won't fix this," said Bob Irvin, president of American Rivers in Washington. D.C. The advocacy group in April labeled the Colorado River the most endangered waterway in the U.S.

“What we need are fundamental changes in how we manage water in the Colorado basin,” Irvin said. “This is the loudest wake-up call so far.”

Fulp pointed to a federal report issued in December that concluded that the river may not meet the needs of a growing regional population by 2060.

“The study showed very clearly that demand and supply curves are crossing and demand is exceeding supply,” he said.

Fulp compares managing the two largest reservoirs on the Colorado River to pouring tea from one cup to another. He said the usual annual delivery of 8.23 million acre-feet of water from Lake Powell to Lake Mead will be cut next year about 9 percent, to 7.48 million acre-feet. Officials say one acre-foot is enough to serve two Nevada families for a year.

Lake Powell, near the Utah-Arizona state line, would decrease from 45 percent this year to 42 percent next year.

Lake Mead, on the Nevada-Arizona state line, is currently at 47 percent capacity and could drop to 39 percent capacity next year.

Lake Mead on Friday was at 1,106 feet. The low level next year would be about 10 feet above a 1,075-foot elevation trigger point agreed upon in 2007 by the seven U.S. states that share river water under a 1928 allocation agreement. Native American tribes and Mexico also get shares of Colorado River water.

A shortage declaration would mean Arizona would get 11.4 percent less than its 2.8 million acre-foot allocation. Nevada would get 4.3 percent less than its 300,000 acre-foot allotment — a loss equivalent of the amount serving 26,000 homes.

Southern Nevada Water Authority chief Pat Mulroy last week floated the idea of a federal disaster declaration due to drought in the Southwest. Meanwhile, local officials stress conservation, and note that iconic dancing fountains on the Las Vegas Strip use recycled water.

Mulroy called Friday’s projections “an unwelcome development that will demand all the resolve and ingenuity we can muster.”

Reaching the shortage declaration trigger point would prompt a vote by southern Nevada elected officials whether to pursue plans for a massively expensive and controversial pipeline to tap groundwater in rural counties along the Nevada-Utah state line to slake the thirst of 2 million Las Vegas residents and 40 million tourists a year.

In Arizona, a projected loss of 320,000 acre feet in 2016 wouldn’t affect cities like Phoenix, Tucson, and Native American tribes, said Chuck Cullom, Colorado River program manager for the Central Arizona Project. But the agency would cut the amount of water it stores underground and limit the amount available for purchase by agricultural customers.

California, Colorado, Utah, New Mexico and Wyoming wouldn't see direct cuts in their share of river water in 2016 depending on the Lake Mead water level. But officials acknowledged there would be ripple effects.

"Denver Water has a direct interest in these issues because half our supply comes from the Colorado River," said Jim Lochhead, chief executive of the water agency serving Denver and its suburbs. "Issues like compact curtailment or political or legal confrontation along the river will affect that supply."

Southern California gets 25 percent of its water from the Colorado River and 30 percent from drought-stricken in-state sources, said Jeff Kightlinger, Metropolitan Water District of Southern California general manager. The agency serves 19 million customers.

Both sources are threatened by drought, which is evident throughout the region.

"It's serious," Kightlinger said Friday. "The important thing is how well the basin states are working together. We all recognize the immediate impact on southern Nevada. We're not running to the courthouse. We're working together to deal with this."

In Coolidge, Ariz., Hohokam Irrigation District manager Sidney Smith said she's been advising farmers to make sure their wells are working in case they lose Colorado River water and have to revert to pumping groundwater. "Basically if farming stops here, it's going to hurt the whole community," Smith said.

Steve Erickson of the Great Basin Water Network in Salt Lake City, raised the specter of a "panic reaction" and free-for-all to dam and divert water before it reaches lakes Powell and Mead.

"That's always been the Western way — use it or lose it," Erickson said. "Everybody building water diversions — that's old thinking."

Utah Division of Water Resources chief Dennis Strong said his state doesn't currently draw its full 1.4-million acre-foot allotment of river water. He said his concern was for states in the Colorado River's lower basin.

"We've spent 14 years in a drought situation — with only three above-average years — and Lake Powell and Lake Mead are below half full," Strong said.

Old Facilities, Older Rivers, and Arizona Water Legislation Pending At The State Capitol Supports Bringing The Yuma Desalting Project Back Online, But The Federal Government Says That's Not The Answer

By Chris Braswell

Modern Times Magazine

Feb. 17, 2014 — In the high deserts of Arizona and throughout the Southwestern United States, access to water resources seems far closer to mind at a policy level than any wetter or non-landlocked states.

The Colorado River Basin Water Supply and Demand Study released by the U.S. Bureau of Reclamation in December 2012 predicts a future imbalance between the supply and demand for Colorado River water, which, by way of the Central Arizona Project, is where most Arizonans get their water.

The Yuma Desalting Plant is in the southwest corner of Arizona, which today approximates the southernmost extent of the Colorado River flow. The Colorado River Basin Salinity Control Act of 1974 provided for the YDP's construction in order to treat saline agricultural return flows from the Wellton-Mohawk Irrigation and Drainage District in the Yuma area.

During the implementation of the project, a separate canal or "bypass string" was built that takes the salty groundwater and delivers it to the Cienega Santa Clara wetlands, where it serves as a recharge catalyst for the ecological water mixture in the area.

Since the YPD was built, water has been delivered to Mexico from the Colorado River instead of treated flow delivery from the YPD, but that still satisfies the U.S. obligation to the saline-mitigated flow to Mexico, said Rose Davis, a spokeswoman for the Bureau of

Reclamation's Lower Colorado Region. Meanwhile, the bypass string has been used over the years to continue feeding the growing Cienaga Santa Clara ecosystem.

Proposed during the current second session of the 51st Arizona Legislature, Senate Concurrent Memorial 1001 spearheaded by Arizona Senator Gail Griffin, district 14, urges the U.S. Department of the Interior to "immediately take all necessary measures to operate the Yuma Desalting Plant."

The legislation criticizes the DOI for using 100,000 acre-feet of water from Lake Mead to fulfill the treaty's water quality obligations to Mexico rather than conserving an equivalent amount of water through the operation of the Yuma Desalting Plant, and it also notes an ongoing 14-year drought that has led to DOI projections of a shortage of Colorado River water to exceed 50 percent in 2017.

"By abdicating its obligation to operate the Yuma Desalting Plant, the federal government has caused the loss of more than 1,300,000 acre-feet from Lake Mead, placing the state of Arizona at increased risk of water shortage," according to SCM 1001. "If the federal government were to operate the Yuma Desalting Plant, it would conserve 100,000 acre-feet per year, equivalent to the water needed to supply more than 250,000 Arizona residents with water annually."

The USBR holds a different view about the wisdom of bringing YDP back into full operation.

When the complex was built in the 1980s, "it was a low-water period so it made some sense, and we were flushed with the government money at the time," Davis said.

In 1992, the region went into surplus flooding conditions, and the YDP was put into maintenance mode by the USBR. In 2007, the USBR did a 90-day demo run of the facility at one-tenth capacity, to see if it was still being maintained correctly.

"It was still working OK, but we did not really have a call from any of the water stakeholders, the water customers, to use it on a consistent basis," Davis said.

In 2010, as the current drought continued, the Southern Nevada Water Authority and the Central Arizona Project asked the USBR to go ahead with another demo run. Other organizations involved with these recent demonstration and pilot tests at the YDP include University of Arizona Department of Geosciences, as well as some Mexican partners such as the non-governmental agency Podnatura, and the state agency which is responsible for the biosphere preserve status that exists in the northern half of the Gulf of California.

"(In 2010) we looked at the expenditures needed for operations, the chemicals involved, updating the designs, the solid contact reactor, the reverse osmosis pumps, the membranes, the high pressure piping, media filtration, and the instrumentation required to bring the electronic operations up," Davis said. "The initial investment at running it at one-third capacity, would be over \$23 million to fix it up. And if you wanted to operate it at two-thirds capacity, that would be another \$20 million per year. At one-third capacity

you would get 31,361 acre feet, so I don't want to say it is a "drop in the bucket," but that is not a lot of water.

Today, that kind of money is not available in the USBR's budget.

"What would we have to sacrifice to take out \$30 million, out of all of our programs, our conservation programs, our safety of dams programs, our upgrades to our electronic systems and security? The money definitely is an issue," Davis said. "This would be a huge investment. But if things got really worse and worse, then there might be great minds that come together to say, how do we fund bringing it up to this century's standards, and make it work."

There are a couple of plants in California that the USBR has helped get off the ground with some funding through our Water Smart Program, and the technology has improved greatly since the 1980s and the time of the YDP's construction, Davis said.

Bringing the YDP online would also affect the saline water from its bypass stream that currently goes to the Cienaga Santa Clara, according to the USBR. Before the YDP bypass flows began, the Cienaga Santa Clara was "about 10,000 acres or less of pretty poor-quality tidal infill," said Tom McCann, assistant general manager of operations, planning, and engineering for the Central Arizona Project. "Now it's about 40,000 acres, of which about 14,000 is dense, marshy vegetation areas. The remaining acreage is open-water habitat."

Each year, 1.5 million acre feet of water from the Colorado River go into Mexico, McCann said, which satisfies the U.S. treaty obligations. The water crosses the Southwestern border in two places, at its "Northerly International Boundary" near the Morales Dam immediately west of Yuma (at a rate of about 1.35 million acre-feet per year), and at the "Southern International Boundary" near the border at San Luis. The SIB is a far more limited amount of flow of about 150,000 to 160,000 acre-feet per year.

None of the NIB flow continues downstream since it is entirely redirected by Mexico, primarily to irrigated farmland in the Mexicali Valley Irrigation District in Baja State. About 1 or 2 percent of the NIB flow goes to Tijuana by pipeline. The SIB flow goes to San Luis, Sonora.

Weather Patterns

"People may realize that it is a finite resource, you know we have studies out there that are looking out 50 years and looking back 1,200 years, and recognizing the cycles of water. But now we are adding in climate change effects," Davis said.

Ken Waters, Phoenix-based warning coordination meteorologist for the National Oceanic and Atmospheric Administration, consented that the desert Southwest has been under drought conditions for 14 to 15 years, but that the Yuma area itself only typically gets rain about two or three times per year anyway. Rain is rare in greater Yuma, southern Arizona and northern Sonora, and when it does come, it comes fast, resulting in far more groundwater runoff than basin recharge. The seasonal monsoon

precipitation phenomenon in the region is sporadic and does not go as far north into Arizona as it used to.

The headwaters of the Colorado River are fed by snowpack in western Colorado, “and that's been at a deficit for a number of years,” Waters said. “Lake Powell and Lake Mead are also going down again. Las Vegas is very concerned because the Lake Mead levels are going down. It all goes downhill, so to speak, and it's going to eventually get down to Yuma. In the next couple of years, we don't see it turning around.”

Agricultural concerns are a large portion of the water appropriation of the Colorado River and its constituent Central Arizona Project. California's Imperial Valley is a very robust agricultural community, and is largely irrigated from the Colorado River up north all the way to Palm Springs and the Coachella Valley. Still, a significant portion of the Arizona agricultural efforts are irrigated via the Gila River, which eventually merges with the Colorado.

“It's still a desert, but it's irrigated,” Water said. “Four years ago, the decision was made to reduce the Lake Powell release, which even more reduced the supply along the Colorado.”

The climate models are highly variable. It is not simply a matter of how much precipitation may come, but also that the type of precipitation could change from snow to rain for example, or the pattern of precipitation could change to different times in the year.

“There are a number of global climate models out there, and they disagree on what will happen in the Colorado River basin, ranging from zero to 33 percent reduction in river flow,” McCann said. “But, a 10 percent reduction in river flow due to climate change is probably a likely, reasonable, middle-of-the-road expectation for the next 50 years in this basin.”

On Thursday, delegates from the White House Council on Environmental Quality, the Intergovernmental Affairs Office, the U.S. Environmental Protection Agency, and the Department of Energy met with California Governor Jerry Brown, Los Angeles Mayor Eric Garcetti, and state, local, and tribal leaders from across the country at Los Angeles City Hall following the second meeting of President Barack Obama's Task Force on Climate Preparedness and Resilience. The Task Force was established in November to advise the administration of how to respond to needs of communities throughout the nation through the White House's Climate Action Plan. The task force meeting focused on improving the resilience and longevity of our nation's transportation, water, and energy infrastructure in the face of extreme weather, sea level rise, extreme temperatures, drought, and other various effects of global climate change.

On Feb. 4, the U.S. Department of Agriculture announced that it will make \$20 million in assistance available for agricultural water conservation efforts throughout California for producers who are affected by the drought. Interested landowners and managers have until March 3 to apply for funds. The program is also part of the White House's Climate Action Plan, and the funds are appropriated through the Natural Resources

Conservation Service's Environmental Quality Incentives Program. NRCS Service Center locations and more information about the drought initiative can be found at www.ca.nrcs.usda.gov.

Drought Policy

The Arizona Water Settlements Act of 2004 between Arizona and New Mexico gives New Mexico rights to about 14,000 acre-feet of water per year from the Gila River. The end of 2014 is the deadline for the Interstate Stream Commission to decide what to do with the water from the Gila and one of its tributaries, the San Francisco River. Federal funding is available to the state for diversion project construction, or if no decision is made, the water will continue flowing south into Arizona.

The Gila is a tributary of the Colorado that begins in the Gila National Forest in New Mexico. The proposed location for the diversion project is in a pristine roadless area of unblocked wild river. Farmers in the region want the diversion as backup water supply, while conservationists and sports enthusiasts argue that dams and diversions would the ecosystem. In the current New Mexico legislature, Senate Bills 89 and 90 attempt solutions to the issue.

And currently pending in the 51st Arizona Legislature is House Bill 2326 (<http://www.azleg.gov/legtext/51leg/2r/bills/hb2326p.pdf>) would amend the statute related to the Arizona Water Banking Authority in such a way as to make it more water storage/banking credits more fiscally commodifiable, adding language that reinforces water banking credits are purchasable by the authority, and providing for statutory basis for such accounting.

The Central Arizona Project provides water to about 80 percent of the Arizona population through a 336-mile long water delivery system that sources the Colorado River. Its construction was federally approved in 1968 for construction by the USBR, and in 1971, the Central Arizona Water Conservation District, which now manages the CAP, was formed to repay the federal government for certain construction costs once the system was complete. Construction began at Lake Havasu in 1973 and was completed 20 years later south of Tucson.

"We run 40 to 50 percent in the Phoenix area, and if you add in agricultural and the reservations that we also serve, about 80 percent of the population of the state takes CAP in some form or another," said Robert Barrett, a spokesman for the Central Arizona Project. "It goes to agricultural use which is also critical in this state as well, and that's generally Pinal County, which is that area between Phoenix and Tucson, a big agricultural area. And then finally, we also recharge water; we store water that is not being used underground to guard against future drought."

"You can't make up all that difference with conservation because right now in Arizona, we're one of the leading states in terms of conservation," Barrett said. "Our population doubled or tripled from 1960 to today but our total water use has gone down during that period. You can only squeeze that lemon so hard before you do not get any more juice out of it, and what we need to do is start looking forward for ways to augment the supply

in the Colorado River. They can do that by cloud seeding when possible, but that's not going to be enough, in and of itself. The CAP is looking at multiple ways to augment our water supply for the future, but for some of the ideas, all seven states are going to have to cooperate on the big picture."

The CAP is examining the possibility of desalination, for which there appears to be two primary options to choose from, Barrett said.

"We could probably partner with somebody in California; we pay for them to desalinate the water and then whatever the volume they get out of it creates a net volume left in the river, and we take it so it would be a trade off that way," he said. "The other thing we are talking about is working with Mexico, and there is a couple of locations in Mexico we are talking about. It is going to be some time before that happens, so right now most of the emphasis is going to be on conservation, you know, what more can people do, but that's a limited fix, you can only take that so far."

USBR is more optimistic.

"We are the water wholesaler, and Arizona, California, and Nevada are doing incredible things in the way of water reuse and recycling, in the way of conservation, in the way of Arizona storing a lot of water in groundwater areas," Davis said. "Some of the planning that Arizona has done, and some of the things that they have implemented over the last decade have truly shown that the water managers have been looking at the horizon."

An excellent model of municipal water management in the Southwest is Las Vegas, for example.

"Almost every drop of the water in Las Vegas is reclaimed water," Davis said. "Everything that you are not drinking, all the toilet water—everything that you are not drinking—is recycled water."

There are many great examples of progressive water use policy at the state and local levels in the Southwest, but when not all cities and agricultural operations are using the most cutting-edge civil engineering and technology, the USBR strongly cautions against resorting to industrial-scale desalination as an everyday solution.

"The states are the water managers, they are the retailers, so to speak, and are the managers of where the water is going within, how it is being used, how its being retreated, reclaimed, and recycled," Davis said. "We're really supportive of states' activities. And while the YDP is a piece of equipment that we are still maintaining, its just not high on the list of alternatives, considering the way the states are cooperating with each other, in augmenting water supplies and conserving water."

Controversial Utah Oil Shale Project Challenged

38,000 Public Comments Opposed Plan Threatening Aquifers, Seeps and Springs
SALT LAKE CITY— Oil shale strip mining atop Utah's Book Cliffs is being challenged by conservation groups. The challenge is a "request for agency action" filed Tuesday, over the ground water discharge permit approved by the Utah Department of Water Quality. The permit, which authorizes Red Leaf Resources to test an oil shale mining facility, lacks measures to prevent or detect surface or groundwater pollution, in violation of state law. More than 38,000 public comments were sent to the Department opposing an earlier draft of the flawed plan.

“The scheme used by Red Leaf Resources is basically the same as it was for failed ventures a century ago: mine it, crush it, sort it, put it in an oven, heat it, gather the liquid into a sump, hope that it doesn’t burn the facility down, and get it to a refinery before it congeals,” said John Weisheit, conservation director with Living Rivers. “It makes far more sense for an energy company to come over to my house and install solar panels on my roof.”

The company plans to strip mine shale from a 385 by 695-foot long, 160-foot deep prototype “capsule,” line it with clay, and then crush, backfill, bury and bake (or “retort”) the shale in it at 725°F for three months in order to extract hydrocarbons. If the prototype proves economical, the company plans to strip mine vast acreages; it has approximately 17,000 acres of state land under lease.

“As light sweet crude becomes more rare, we can choose to develop better and cleaner ways to power our world, or we can turn to ever-dirtier fuels like oil shale,” said Taylor McKinnon director of energy with Grand Canyon Trust. “Regardless of whether this technology proves viable, oil shale is the wrong energy path in an era of drought, waning river flows and worsening climate change.”

Red Leaf plans to leave toxic post-production residues in its experimental capsules. The state permit lacks provisions to detect if or how the capsule would fracture during heating or prevent contaminants from leaching into groundwater, seeps and springs.

“State law requires protection of all waters of the state from contamination. Yet the state has approved a permit for Red Leaf to discharge potentially contaminated water from a first-of-its-kind facility,” said Shelley Silbert, executive director with Great Old Broads for Wilderness. “Amazingly, they are not even requiring monitoring of springs, seeps, or groundwater on site.”

The energy inputs and carbon emissions required by strip mining and retorting oil shale exceed those of conventional oil extraction. Given the size of oil shale deposits in the Colorado River Basin, commercial development, if it takes hold, is likely to result in vast strip mining and greenhouse gas emissions, contributing to climate change, regional droughts and Colorado River drying.

“It’s clearly a misguided state energy policy that encourages heating rocks to find usable oil, especially after a century of similar ventures have failed,” said Tim Wagner of the Sierra Club in Salt Lake City. “It’s this lack of visionary leadership that is putting Utah far behind the curve of other western states that are embracing the clean energy revolution of the 21st century.”

The U.S. Geological Survey estimates that between 353 billion and 1.146 trillion barrels of oil in the Green River Formation “have a high potential for development.” But despite decades of attempts, oil shale’s low energy density and inherent inefficiencies have precluded industry from yielding a commercially viable shale-to-fuel sector. Attorney Rob Dubuc of Western Resource Advocates is representing Living Rivers, Grand Canyon Trust, Southern Utah Wilderness Alliance, Great Old Broads for Wilderness, and Sierra Club in today’s challenge.

Retirement: Pat Mulroy of the Southern Nevada Water Authority

[Click here](#) to read an Interview with Pat Mulroy in the Las Vegas Review Journal by Henry Brean.

###

From the editorial board of the Las Vegas Sun

Whatever it takes to bring water to the valley

Sunday, Feb. 9, 2014 | 2 a.m.

Pat Mulroy retired Feb. 6, leaving a long legacy as head of the Southern Nevada Water Authority. Mulroy helped create the authority in 1991, and then found ways to provide the water that fueled Las Vegas' explosive growth.

A tireless advocate for Southern Nevada, Mulroy negotiated creative deals to maximize Las Vegas' water supply from the Colorado River, which is the source of about 90 percent of the region's water. And that wasn't an easy task.

The laws that regulate the Colorado River are stacked against Nevada; they were written nearly 100 years ago when Southern Nevada's population was counted by the hundreds, not the hundreds of thousands. But Mulroy and her staff found ways to maximize water from the Colorado through conservation efforts and smart agreements that continued to keep the water flowing.

Mulroy not only has provided water but also has provided a strong vision for years to come. There are still serious challenges ahead for her successor, John Entsminger.

Entsminger, who served as Mulroy's top deputy for several years, is well prepared and versed on what lies ahead. The drought on the Colorado River continues to take its toll, leaving a precarious future for Southern Nevada. With water levels continuing to drop at

Lake Mead, there is a very real concern that the region's main water supply could dry up.

Entsminger will have to press ahead on a plan put together by Mulroy that has attracted significant opposition. Mulroy proposed building a 300-mile pipeline to carry water from rural eastern Nevada to Las Vegas.

The plan recently suffered a setback when a judge in White Pine County overruled state approval that gave the authority permission to pump some water. The case is on appeal, and hopefully, the state Supreme Court will see the folly in that ruling. Clark County accounts for nearly three-quarters of the state's population, and it drives the economy. Anything that harms Clark County harms the state itself.

And there aren't many real alternatives to the pipeline.

The state could cap growth in Clark County, but that would effectively cap the state's economic growth as well.

But critics of the pipeline plan say it is unnecessary. They maintain that the water authority could increase conservation efforts, and while that certainly could help, it won't provide enough water, especially if Southern Nevada's take from the Colorado River is limited.

Pipeline opponents also have suggested that the water authority pursue a proposal to build desalination plants along the Pacific Ocean in California. Under such a plan, the water authority would give California the water from the desalination plants in exchange for keeping the same amount of water, which otherwise would go to California, in Lake Mead for our use. Although that might be an idea worth exploring, it's not one to go all in on. If California agreed to the deal, it would be expensive to build and operate the plants. There also are significant environmental issues that go along with a desalination plant that would need to be worked out.

But more importantly, the desalination proposal would further tie Southern Nevada's future to the Colorado River. With the continued drought, and California Gov. Jerry Brown declaring a drought emergency, don't expect Nevada to get more water from the Colorado; California certainly will be flexing its muscle for it.

The answer for the state is simple: a pipeline to rural Nevada. That will have to be more than Mulroy's legacy; it will have to be Entsminger's top priority.

New Oil Shale, Tar Sands Films Focus on the Colorado River Basin

Posted on February 13, 2014 Tar Sands and Oil Shale strip mining in Utah's Book Cliffs.

[Click here](#) to see this post by Taylor McKinnon, Energy Director for the Grand Canyon Trust

The Colorado River Basin is ground zero for high-carbon fuels. The U.S. Geological Survey estimates that its oil shale and tar sands could eventually yield over a trillion equivalent barrels of oil—as much as we’ve burned since the dawn of the industrial revolution.

Spurred by Alberta’s tar sands boom, pressure to develop the Colorado River Basin’s deposits is growing. Over a million federal and state acres are allocated for leasing with industry targeting the shallow deposits in Utah’s Uinta Basin.

Turning rocks into fuel involves energy inputs and greenhouse emissions far beyond conventional oil. The prudence of committing land, water and society to high-carbon fuels in the face of climate change is hotly debated.

Two new movies explore that debate.

The first, titled Uinta Basin, An Unconventional Future, is a series of issue vignettes that gives voice to industry, advocates, agency officials and communities that would be affected by commercial development in the Uinta Basin.

An Unconventional Future dives deep. It’s long, but its careful portrayal of the people, places and issues at hand warrants attention from those concerned about the Colorado River Basin’s energy, climate and water future.

Watch An Unconventional Future [here](#).

The other, titled Last Rush for the Wild West – Tar Sands, Oil Shale and the American Frontier, moves from Alberta’s tar sands to the Uinta Basin. It’s an advocacy piece that interviews some of the region’s leading advocates and, with an eye toward Alberta’s tar sands experience, chronicles the problems and places at the heart of the Colorado River Basin controversy.

Watch Last Rush [here](#).

Supreme Court to hear legal challenge over tar sands strip mine on Tuesday

Landmark case in Utah's Supreme Court will determine the state's obligation to protect groundwater

SALT LAKE CITY - The Supreme Court of Utah is scheduled to hear Living Rivers vs Division of Water Quality at 9:00 AM on Tuesday, March 4th. The location of the hearing is: 450 South State Street in Salt Lake City, UT 84114.

The applicant US Oil Sands, based in Alberta, is poised to begin mining operations on 213 acres near PR Spring, Utah. The PR Spring area is perched at the watershed divides of three major rivers: the Colorado River, the White River and the Green River.

PR Spring is a drinking water source in the White River watershed. Water in the area of the proposed mining site flows toward the Green River, potentially entering the water supply for those who depend upon the Colorado River.

John Weisheit, conservation director of Living Rivers says, "I am very worried this water pollution will in-debt both local communities and larger communities downstream with extensive clean-up costs, as well as making people sick.

"This project is a time bomb. The plume of contaminated water will leach into the Colorado, White and Green Rivers long after the mining companies pack-up and disappear."

Living Rivers is concerned that the untested, experimental mining operation will pollute precious groundwater sources that will one day enter the drinking water supply for Las Vegas, Phoenix, Tucson, Los Angeles, San Diego, and other western communities.

The Division of Water Quality claims the groundwater at the mine site is an insignificant amount of water and harm to water resources will not occur.

Living Rivers understands that wildlife, ranchers, and recreational visitors depend on these freshwater springs, and many are concerned that mining pollution will migrate into drinking and irrigation water for 35 million downstream users of the Colorado River.

US Oil Sands has leased a total of 32,000 acres from the School and Institutional Trust Lands Administration and millions of gallons of accumulated waste water and waste solvents will be absorbed and dispersed into the groundwater systems of the Tavaputs Plateau.

Representing Living Rivers are attorneys Joro Walker and Rob DuBuc of [Western Resource Advocates](#).

[Click here](#) to read the brief prepared by Western Resource Advocates.

[Click here](#) to visit the administrative record of tar sands mining in eastern Utah.

Attorneys for Division of Water Quality
Bridget K. Romano (Utah Solicitor General)

Paul McConkie (Assistant Attorney General)
Kimberlee Sellers McEwan (Assistant Attorney General)

Attorneys for US Oil Sands Inc.

A. John Davis III (Holland & Hart)
Christopher R. Hogle (Holland & Hart)

HIGHLIGHTS OF THE BRIEF

The threshold issue in this matter is whether the State's Water Quality Board and the Executive Secretary used a consistent regulatory definition of groundwater to decide that, in the area of US Oil Sand's proposed strip mining operation for bituminous sand, no groundwater exists above 1,500 to 2,000 feet below the surface. Living Rivers shows that the Executive Secretary did not and, as a result, that the Executive Secretary failed to properly weigh and consider clear record evidence pointing to the presence of groundwater, as defined by the Utah Ground Water Quality Protection regulations (Regulations) and in keeping with the Water Quality Act.

Arguments

1. The Utah Water Quality Act requires the Board to protect from pollution all Waters of the State.
2. For the purposes of groundwater protection, Waters of the State is defined as “all accumulations” of subsurface water.
3. In its Ground Water Quality Protection Regulations, the State's Water Quality Board has narrowed that definition, stating that groundwater is “subsurface water in the zone of saturation including perched ground water.”
4. Water in a zone of saturation must be equated with a subsurface accumulation of water and the Act must be understood to require the Executive Secretary to protect any accumulation of subsurface water located within a zone of saturation.

Utah OKs Oil Refinery Construction Before Examining Impacts on Public Health, Pollution, Iconic National Parks

Refinery, Approved Without Permit, Would Be Utah's First in 30 Years

SALT LAKE CITY— Disregarding laws meant to protect public health, the environment and national parks, the Utah Division of Air Quality has given Emery Refining permission to build Utah's first new oil refinery in 30 years. Approval was given even though the project has not been given a permit, public and environmental reviews have not been conducted, and the agency has not determined whether the refinery complies with pollution laws. The refinery in eastern Utah would be within miles of Canyonlands and Arches national parks, two of the state's most popular tourist destinations.

Conservation groups today called on state officials to prohibit construction pending final permitting.

"State and federal law are clear: Construction must follow permitting, and permitting must follow public and environmental review," said Anne Mariah Tapp with Grand Canyon Trust. "Turning that scheme on its head reveals the deeper problem of Utah heeding oil interests over public and environmental health."

Utah is allowing Emery to proceed with construction under a 2013 permit originally issued for a now-abandoned refinery proposal. After conservation groups challenged that permit over unlawful pollution, Emery proposed a new refinery design. Under Utah law the company should have to wait for a new permit for the new design. Instead the state gave Emery approval to build its new refinery under the inapplicable 2013 permit. The groups' legal challenge to the original permit is still pending before an administrative law judge.

"Air quality for the downwind communities of eastern Utah has been worsening, and it's just a short matter of time before the limits of pollution are exceeded. Energy companies need to invest in a clean-energy economy, because this business-as-usual approach to energy development is destined to damage our health, the water cycle of this important watershed, and the enjoyment of this landscape's superlative scenery," said John Weisheit of Living Rivers.

“Utahns should be outraged at the state fast-tracking Emery’s refinery plans,” said Stephen Bloch with the Southern Utah Wilderness Alliance. “The Division of Air Quality has its priorities backwards when it puts streamlining Emery’s permit ahead of its duty to protect the environment and human health.”

Conservation groups’ comments on Emery’s new design point out several major problems in the state’s draft permit for the new design. The state failed to perform mandatory dispersion modeling and impact analysis of hazardous air pollutants, including benzene, toluene, hexane and ethylbenzene; it sharply underestimated emissions from volatile organic compounds and greenhouse gas emissions; and it failed to analyze visibility impacts to Canyonlands and Arches national parks and impacts to endangered fish like Colorado pikeminnow in the Green River.

“Millions of people flock to Utah for the magnificent public lands, national parks and wildlife,” said Randi Spivak with the Center for Biological Diversity. “Putting a toxic oil refinery smack in the middle of some of America’s most stunning landscapes will pollute the air and endanger the health of park visitors and wildlife.”

Emery’s newest refinery plan comes as Grand County officials promote an oil transportation corridor connecting Green River to the oil, oil shale and tar sands deposits atop the Book Cliffs. Increasingly the refinery appears to be one part of a bigger scheme to industrialize Utah’s wildlands for high-carbon fossil fuel extraction.

“Utah’s biggest draw and economic engine, our majestic wildlands, is being transformed into a dirty energy wasteland before our very eyes,” said Tim Wagner of the Sierra Club. “In spite of recent double-digit growth in Utah’s outdoor recreation and tourism economies and the overwhelming evidence of the impacts to Utah from climate change, Utah’s leaders continually demonstrate their lack of regard for anyone or anything but short-term profits.”

Background Utah’s air-quality rules explicitly provide for a pre-construction public comment period and a public hearing and mandate that “the director will consider all comments received during the public comment period and at the public hearing and, if appropriate, will make changes to the proposal in response to comments before issuing an approval order or disapproval order” (R307-401-7(3)). The rules further require new sources of air pollution to obtain an approval order “prior to initiation of construction,” which is defined as “any physical change or change in the method of operation (including fabrication, erection, installation, demolition, or modification of an emissions unit) that would result in a change of emissions” (R306-401-2).

The rules ensure that the Division of Air Quality will consider and mitigate environmental and public-health effects of emissions before the company commits resources to a project. See R307-401-7 (1), (2) – Public Notice (“prior to issuing an approval or disapproval order...the director’s analysis of the notice of intent proposal, and the proposed approval order conditions will be available for public inspection.”); see also R307-401-7 (3) (“the director will consider all comments received during the public comment period and at the public hearing and, if appropriate, will make changes to the

proposal in response to comments before issuing an approval order or disapproval order”).

Colorado River Researchers Find Signs of Ancient, Devastating Floods

[Click here](#) to read this story by Julia Rosen in the Los Angeles Times (Science Now)

[Click here](#) to read the final report published in Water Resources Research (American Geophysical Union).

The purpose was to provide science to the Department of Energy to ensure that Moab's radioactive waste pile would be removed from the floodplain of the Colorado River, which is indeed happening. So far, 41% of the pile has been removed and taken by railroad to a burial site 30 miles north of town at a place called Crescent Junction adjacent to the I-70 corridor.

Highlights of this report include:

- River: Upper Colorado River (above the Green River confluence and below the Dolores River, the last major tributary)
- Site location: 10.5 miles above the Moab Bridge
- Time frame: The last 2,140 years (+/- 220 years)
- Number of floods: 44
- Range of floods in cfs: 60,036 to 349,616

- 34 to 40 floods have exceeded the magnitude of the USGS 100-year flood determination
- 20 - 25 floods have exceeded the magnitude of the USGS 500-year flood determination
- 5 floods have exceeded a peak discharge of 282,000 cfs The two largest floods were slightly over 349,000 cfs
- Most of these floods have occurred in the last 500-years
- The 100-year flood would have a peak discharge ranging from 156,440 to 179,050 cfs
- The 500-year flood would have a peak discharge ranging from 224,780 to 265,570 cfs
- A 1000-year flood would have a peak discharge ranging from 256,740 to 310,770 cfs

Press Release

Contact: John Weisheit
435-260-2590 (mobile)
435-259-1063 (office)

July 8, 2014

For immediate release

Nevada State Senator Tick Segerblom has announced plans to introduce legislation for an independent scientific and economic probe into the Bureau of Reclamation's current and future management plans for the Colorado River.

Citing deficiencies in Reclamation's response to mounting water scarcity, public safety, and ecological concerns on the Colorado River, the senator fears absent immediate independent intervention, Reclamation's guidance may propel the Southwest into a dangerous cycle of crisis management.

- Reclamation's water supply planning assumes climate change may only reduce river flows by nine percent on average by 2060, despite climate scientists warning that it

could be more than four times that, and that for nearly 15 years average flows of the Colorado River have been dropped 15 percent.

- Reclamation is not addressing the critical interplay between surface water shortages and ground water loss, despite the increasingly rapid depletion of ground water supplies across the Colorado River Basin—recently estimated to be declining at a rate equivalent to 1/3 the Colorado River’s annual flow.
- Findings published last month, and known to Reclamation for several years, presents worrying evidence of Colorado River flood flows of rates and frequencies much greater than what Reclamation has been using in its designs and operations.
- Despite decades of public investment in habitat restoration work, no significant progress is being made toward endangered species recovery, there’s no plan for dedicated flows to the Colorado River Delta, and Reclamation’s much heralded Colorado River Basin Study released in December 2012 made no provisions for the environment.

Such independent scientific review is far from unique, and currently a key aspect to address challenges facing the San Joaquin/Sacramento River system in California, where Reclamation too is a major actor.

“What is unique is a public official stepping outside the box longtime defined by Reclamation’s biases and constraints in order to seek urgently needed independent perspectives on the management of this critical part of the nation’s infrastructure,” says John Weisheit, Living Rivers Conservation Director.

“Thirty five million people and an economy valued at \$1.7 trillion annually, the 12th largest in the world, deserves the truth, not optimistic projections and the potential justification for new infrastructure that renders the system more vulnerable as it wallows from crisis to crisis informed by Reclamation’s short-sightedness,” adds Weisheit.

State Senator Segerblom intends this initiative to also catalyze long overdue cooperation within the legislative bodies of all seven Colorado River Basin states, working toward establishing the type of publicly-accountable, watershed-based governance structure that a river system of this magnitude and importance requires.

“It’s ironic that such leadership is coming from the State of Nevada which consumes just 2% of the Colorado River’s flows,” adds Weisheit. “But then again, the senator was born in the town that built Hoover Dam and led Reclamation’s foray into the Colorado River Basin. Possibly the spirit which launched Colorado River development in the early 20th century is reemerging to push for the river’s sustainable management in the 21st .”

[Click here](#) to read press release by Westinghouse

[Click here](#) to read the testimony of the 4-day trial before the Utah's 7th District Court (This pdf is searchable).

Arnie Gunderson stated under oath that Blue Castle Holdings does not have enough water to cool Westinghouse AP1000 reactors, unless this company changes its business plan to include very expensive upgrades.

The sediment and salinity loads of the Green River will also present water quality and quantity issues and additional expenses for the operation of this proposed nuclear power plant.

Other testimony by Blue Castle Holdings affirms that their business plan has many other issues of infeasibility and risks to the public.

Utah Groups Announce Green River Nuclear Legal Appeal & OpEd

For Immediate Release:

Contacts:

HEAL's Matt Pacenza at 801-864-0264

Uranium Watch's Sarah Fields at 435-260-8384

Attorney John Flitton at 435-940-0842

Living River's John Weisheit at 435-260-2590

Utahns challenging the water rights of the stalled Green River nuclear reactor project announced today they have filed a legal appeal to the state's Court of Appeals.

The plaintiffs – more than a dozen Utah environmental organizations, small business owners and concerned citizens led by HEAL Utah, Uranium Watch and Living Rivers – are challenging the November 2013 verdict from Judge George Harmond upholding the state's decision to approve the transfer of water rights for the nuclear project.

One of the grounds of the appeal is that Blue Castle Holdings – which revealed during last fall's District Court trial that it has raised less than \$20 million of the \$20 billion minimum needed to build two reactors – is engaging in speculation with the water it has leased, which Utah law doesn't allow.

"They've raised less than .1 percent of the total cost of these projects," says Park City attorney John Flitton of Flitton Babalis, who represents the plaintiffs. "What they're trying to do is get a permit to sell to someone else, and while they wait, they're tying up water which is increasingly important. That's the very definition of speculation."

In addition, the plaintiffs will argue that the Colorado River system, which encompasses the Green River, doesn't have the 53,000 acre-feet needed to support the reactors. The

multi-year drought gripping the region certainly suggests there may not be enough water for the reactors, says John Weisheit, conservation director of Living Rivers.

“The Colorado River basin is already over-allocated,” says Weisheit. “Shortages will likely begin next year for lower basin states and there is a strong chance that hydropower stops at Glen Canyon Dam before this decade is even over.”

Lastly, the appeal argues that withdrawing such a massive amount of water – 53,000 acre feet is roughly the amount a city of 200,000 uses in a year– will harm the “natural stream environment,” which Utah law forbids. The plaintiffs say that Judge Harmond ignored expert testimony that the nuclear withdrawal would decrease key fisheries areas by 50 percent. That stretch of the Green River is home to four native endangered species – the razorback sucker, humpback chub, Colorado pikeminnow, and bonytail – which depend upon key eddies, backwater channels and other features threatened by low flows.

Plaintiffs expect a hearing in front of the three-judge Court of Appeals next year.

The Green River nuclear project has made very little progress since it was first announced in 2007. In addition to failing to raise anywhere near the \$100 million plus needed to file for federal permits, let alone the billions needed for construction, Blue Castle Holdings and their CEO former state Rep. Aaron Tilton have found no interest from area utilities, the only possible customers for their nuclear bid. Rocky Mountain Power, Utah’s biggest utility, has repeatedly said that it doesn’t plan to acquire costly nuclear power.

Lastly, while Blue Castle Holdings continues to claim it is preparing a permit application to the U.S. Nuclear Regulatory Commission—their next step if they want to move forward—a search of federal records shows the company has had no formal communication with the agency since 2011.

“It’s past time for Tilton to admit what we all know – his nuclear scheme is all smoke and no fire,” says Christopher Thomas, HEAL Utah’s executive director. “This project costs too much, uses too much water, and produces expensive power the state doesn’t even want to buy. We hope the Court of Appeals will see that under Utah law, it should not proceed.”

Pacenza will be available for interviews on Wednesday at the State Capitol, where the Legislature is holding its monthly interim hearings. In addition, Tilton is scheduled to address the Public Utilities and Technology Interim Committee with an update on the project in Room 215 of the Senate Building at approximately 3:30 pm.

###

OpEd: Don't buy Blue Castle's claims of progress in building nuke plant

By Christopher Thomas of HEAL Utah
September 19, 2014
Salt Lake Tribune

Utah has many annual traditions, such as rushing up the Cottonwood Canyons on powder days or reveling in the lights of Temple Square during the Christmas season. In the past couple years, we're developing a new one: Guffawing when the company that wants to build the Green River nuclear reactors unveils a "big" development. Their periodic news releases are little more than an empty illusion, designed to create the appearance of momentum, even as Blue Castle Holdings' southern Utah nuclear plans remain somewhere between stalled and dead.

Unfortunately, the most recent announcement of a "deal" between Blue Castle and a major nuclear firm apparently snookered The Salt Lake Tribune, which last month ran a story headlined, "Westinghouse to Build Utah Nuclear Plant."

Of course, we know that's not going to happen, not after learning last fall during our trial challenging the project's water rights that Blue Castle has raised just \$500,000 from outside investors since CEO and former state Rep. Aaron Tilton formed the company in 2007. Considering the company needs about \$100 million to apply to federal officials for a federal permit – not to mention the \$20 billion or so they would need to build the reactors – their plan is a bit, um, underfunded.

It's also not going to happen because utilities in the West have universally shunned new nuclear power. Rocky Mountain Power spokespeople periodically make clear that new nuclear is not in their plans. In fact, no utility in the West is planning on investing in new nuclear, leaving Blue Castle with not just no money to build their project – but no hopes of selling the expensive source of power they can't afford to build. Yikes.

Even so, announcing a big contract with a huge nuclear company to build reactors is a big deal, right? Sure, except that's not what actually happened. Read the press release that Westinghouse sent out and what they actually agreed to do was to "work together to develop a scope of activities for enabling the Blue Castle Project under a definitive agreement..."

Let's translate that tortured language: The two companies have decided they'll soon start planning to make a plan. In other words, they're talking. Not investing, or building, or signing a contract, or committing. Talking about planning. Blue Castle's ludicrously positive spin on its stalled project has reared its sad head before. Last spring, the company sought to get the Utah Legislature to force the TransWest transmission company to "tie in" to the Green River nuclear reactors, a move that would have possibly killed that company's serious and important bid to move wind power from Wyoming to southern California.

Thankfully, the adults in the room won out. Far from requiring TransWest to tie transmission into the nuclear project, Blue Castle's bid was whittled down to what amounts to no more than a requirement that TransWest "inform" Blue Castle of its plans.

That less-than-impressive outcome didn't stop Blue Castle from announcing that the legislation "ensures access to new transmission capacity solicitation" in its usual indecipherable hyperbole.

Similarly, in 2013, Blue Castle attempted to force Utah ratepayers to shoulder nuclear power's sky-high costs. This situation ended embarrassingly when the bill's sponsor publicly withdrew his support for the measure on the Senate floor. How did Tilton report this significant setback for Blue Castle? By trumpeting that utilities "must consider nuclear" in their long-term planning ... something they were already doing (and roundly rejecting) for decades.

One has to admire Tilton's moxie, his apparently tireless ability to hype his dying dream, even as evidence to the contrary mounts. One relevant fact: Blue Castle claims it's preparing a permit application to the U.S. Nuclear Regulatory Commission, the next step on the long road to construction. But records show that Blue Castle hasn't even communicated with the NRC since 2011.

It's past time for Blue Castle to admit what we all know: This project is going nowhere fast. It's past time for the rest of us to get back to the hard work of actually planning Utah's energy future, rather than endlessly circling the drain of Tilton's failing nuclear dream.

Christopher Thomas is executive director of HEAL Utah.

New Coalition Launched to Protect Colorado River Headwaters

Epic Drought and Dirty Energy Boom Spotlight Fragility of Water Supply in American Southwest

October 15, 2014

Media Contacts:

Zach Frankel, Utah Rivers Council: zach@utahrivers.org / 801-699-1856

John Weisheit, Colorado Riverkeeper: john@livingrivers.org / 435-260-2590

Tim Wagner, Utah Physicians for the Environment: twagneruphe@gmail.com / 801--502-5450

Dan Mayhew, Utah Chapter of the Sierra Club: drmayhew@comcast.net / 801-712-5353

Pete Nichols, Waterkeeper Alliance: pnichols@waterkeeper.org / 707-845-0832

SALT LAKE CITY, UTAH — A coalition of groups from across the West today announced the formation of a new coalition to inform and engage communities in

California, Nevada, Arizona, and other western states about threats posed to the Colorado River and their water supply.

Colorado River Connected (www.coloradoriverconnected.org) was formed to protect the headwaters of the Colorado River system for the benefit of the 35 million people and thousands of species and natural communities that rely upon it. Currently, the coalition includes Colorado Riverkeeper, Utah Rivers United, Sierra Club, Utah Physicians for a Healthy Environment, Los Angeles Waterkeeper, Glen Canyon Institute, Save the Colorado, and Waterkeeper Alliance. The coalition is inviting hundreds of watershed and community groups to this effort to protect and stand up for a healthy Colorado River. The Colorado River originates in Utah, Colorado and Wyoming, which is the source of drinking water for millions of people in cities including Las Vegas, Tucson, Phoenix, Los Angeles and San Diego. However, the river is threatened by unprecedented dirty energy development, voracious water diversions, and climate change.

Climate scientists have acknowledged for decades that the Southwest will suffer more than many areas of the U.S. as a changing climate lowers snowpack and increases temperatures. In recent years, the Southwest has been gripped by a significant drought, although most residents of California, Nevada, Arizona and New Mexico are not aware of proposed water diversions upstream that are being pursued alongside an increase in pollution generating energy development from tar sands, fracking, and oil shale.

Colorado River Connected is working to engage and activate residents living in downstream urban areas to raise a collective, basinwide voice to prevent devastating projects that will further drain and pollute the Colorado Basin.

“This drought has shown that residents in Phoenix, Las Vegas and Southern California are likely to be heavily impacted by new water diversions proposed upstream, like Utah’s Lake Powell Pipeline,” said Zach Frankel, Executive Director of the Utah Rivers Council. “That’s enough water for nearly one million people’s use for a year and it’s going to impact everything and everyone downstream,” said Frankel.

Thousands of proposed new oil and gas wells are likely to pollute precious water supplies.

“Whether you’re a San Diego mom, a Tucson water manager, or a Las Vegas doctor, if you’re drinking water from the Colorado River, you better pay attention to what is going on in Utah and Colorado,” said Tim Wagner, Executive Director of Utah Physicians for a Healthy Environment. “Between an explosion in fracking for gas and oil, and Utah’s love affair with tar sands and oil shale, the Southwest’s water supply is threatened like never before.”

Colorado River Connected aims to bring the citizens of the basin together to speak with a unified voice for communities who rely on Colorado River water, and to push back against states like Utah and Colorado that are only looking at the Colorado River for

continued development and dirty energy projects. Colorado River Connected will press for changes in water management and seek policies that acknowledge and address these threats for the good of residents and the Colorado River Watershed.

“Between unparalleled dirty energy development and multiple plans for major water diversions, Utah and the upper basin states are demonstrating total disregard for cities such as Phoenix and Las Vegas that depend on Colorado River water for their survival,” said Dan Mayhew, Chair of the Utah Chapter of the Sierra Club. “It’s time downstream users became fully aware of the magnitude of these threats and take action before it’s too late.”

“The issues facing the Colorado River Basin are as vast as the watershed itself,” said Pete Nichols, National Director of Waterkeeper Alliance. “We are excited that Colorado River Connected will be bringing people together from the entire region to heighten awareness and speak with one voice for the river, their communities, and the watershed,” said Nichols.

“Since the dedication of Hoover Dam in 1935, the Colorado River has been the leading model for water governance worldwide. This 80year experiment is about to fail and shortages are eminent because developers continue to plan for water intensive projects without any regard to the watershed’s natural heritage, or the public trust. If concerned citizens don’t unite and turn this pattern of unbridled consumption around, a watershed train wreck will indeed occur,” said John Weisheit, Conservation Director of Living Rivers and Colorado Riverkeeper.

Utah advances hot-button proposal for Lake Powell pipeline

COLORADO RIVER:

Jennifer Yachnin, E&E reporter

Published: Thursday, December 3, 2015

Utah pushed ahead this week on plans to construct its Lake Powell pipeline, a billion-dollar project that could divert more than 86,000 acre-feet of water from the Colorado River to cities in the state's southern end.

The Utah Department of Natural Resources Division of Water Resources filed a preliminary licensing proposal with Federal Energy Regulatory Commission on Tuesday, starting the clock on a 90-day public review of the draft document.

A final application is expected to be filed in April.

Environmentalists who have long criticized the proposed pipeline -- which would stretch from Lake Powell to Sand Hollow Reservoir near Hurricane, Utah -- reiterated their objections this week, asserting that the project would further stress the Colorado River.

"The Lake Powell Pipeline is a complete nightmare," Utah Rivers Council Executive Director Zach Frankel said in a statement. "The biggest proposed diversion of the Colorado River during an epic drought, going to the nation's most wasteful water users, with a staggering price tag, just to keep communities outside Utah from using this water."

The Utah Rivers Council has also disparaged the pipeline based on statistics that show residents of St. George, Utah, who would benefit from the pipeline, currently use about 294 gallons per capita -- about twice the daily water use of people who live in Phoenix; Albuquerque, N.M.; and Denver.

Although the preliminary licensing proposal filed this week does not indicate the final cost of the project -- state officials have suggested it is a \$1 billion project, while environmentalists assert it could cost twice that amount -- critics have also questioned its cost and how the pipeline will be funded.

Washington County Water Conservancy District General Manager Ron Thompson told the Salt Lake Tribune late last month that he is confident water districts will find a way to repay a 50-year loan from the Utah Division of Water Resources by raising either impact fees or water rates.

Thompson also told the newspaper that how and where the pipeline is built -- factors that have yet to be finalized -- could also change the cost of the project by as much as 25 percent.

"Until we know which options they're going to allow us to use, it's a little hard to put a price on this project," Thompson said.

Utah legislators first approved the Lake Powell pipeline project in 2006, and critics note that the Division of Water Resources has already spent \$27 million on the application process.

"Adjusted for inflation, the Lake Powell Pipeline will cost as much as it did to make Hoover Dam operational," Colorado Riverkeeper's executive director, John Weisheit, said in a statement.

Utah Submits Application for Massive Colorado River Diversion

\$2 Billion Pipeline Being Proposed for America's Most Wasteful Water Users

Colorado River, USA: The State of Utah submitted its application today to the federal government for approval of the largest new diversion of water from the Colorado River.

The proposed Lake Powell Pipeline would divert 86,000 acre-feet of Colorado River water for municipal use in Southwest Utah. The multi-billion dollar pipeline would pump this water 2,000 feet uphill across 140 miles of desert to deliver the equivalent annual water usage of 700,000 average Americans to just 180,000 people in St. George, Utah. This water use inequity can be explained by the extremely high water use of St. George lake-powell-pipeline-route residents, who are using 294 gallons per capita/day, roughly twice the water use of Phoenix, Albuquerque and Denver residents, per person.

The proponent of the pipeline, the Utah Division of Water Resources, has spent 8 years and \$27 million on the application and claims the pipeline is needed to prevent St. George from running out of water. Critics are lining up to question this claim:

"The Lake Powell Pipeline is an unnecessary and grotesquely expensive waste of taxpayer money," said former Bureau of Reclamation Commissioner Dan Beard. "Southwest Utah has hundreds of alternatives for addressing their future water problems and the justification for the pipeline is based on fictitious and bloated water consumption figures that even the experts at the Utah Legislature dispute."

"The Lake Powell Pipeline is a complete nightmare," said Zach Frankel, Executive Director of Utah Rivers Council. "The biggest proposed diversion of the Colorado River during an epic drought, going to the nation's most wasteful water users, with a staggering price tag, just to keep communities outside Utah from using this water."

"The Lake Powell Pipeline is a billion-dollar boondoggle that would have disastrous environmental impacts on the Colorado River," said Gary Wockner, Executive Director of Save the Colorado. "The Colorado is already stretched to the breaking point – water supplies are at the brink in Las Vegas, Arizona, and Southern California. Taking more water out of this river is completely nonsensical."

Located immediately upstream of the Grand Canyon, the diversion would reduce flows available for fish and wildlife species over hundreds of miles of the Colorado River and make restoration efforts at the Colorado Delta much more difficult. It would also impact the millions of residents throughout the Southwest who are much more conscientious with their water use.

"The pipeline is unfortunate, and incredibly irresponsible considering drought conditions across the West, for Utah to spend billions of dollars to deliver Colorado River water to America's most wasteful water users," said Pete Nichols, National Director for the Waterkeeper Alliance.

The would-be recipients of pipeline water have some of the cheapest water rates in the nation, paying only a small fraction of the price for water that Los Angeles residents pay. These cheap rates explain why St. George has some of the highest per-person water use in the entire U.S.

“Adjusted for inflation, the Lake Powell Pipeline will cost as much as it did to make Hoover Dam operational,” said John Weisheit, Executive Director of Living Rivers the Colorado Riverkeeper. In 1934, there was about 8 million acre-feet of surplus in the Colorado River basin. That surplus vanished in 2003.”

Critics also point to the inflation of water use data by the Division of Water Resources as one of many reasons why the pipeline isn’t necessary, as well as the many inexpensive alternatives which are being ignored. These alternatives are documented in a May 2015 Legislative Audit which found that water conservation is not being implemented as aggressively as many other western cities, including Las Vegas.

For example, while California is trying to reduce water use by 25% this year, Utah is trying to reduce municipal water use by just 1%, even though Utah residents are America’s biggest users of municipal water (per person), according to the U.S.G.S.

The Division is submitting their application to the Federal Energy Regulatory Commission (FERC) and the decision making process is anticipated to take several years.

“The LPP proposal should be immediately withdrawn. If not, FERC should kill the project,” said Beard.

DropBox Access to Lake Powell Pipeline Preliminary Licensing Proposal Documents

Salt Lake City (Dec. 2, 2015) – The Preliminary Licensing Proposal (PLP) documents for the Lake Powell Pipeline project have been submitted to the Federal Energy Regulatory Commission (FERC), but are not yet available on its website. The Division of Water Resources recognizes that several media entities are interested in accessing these files and have story deadlines. The Division anticipated that the files would have been available on the site by now.

As a result, the PLP and study files are now available via DropBox for review. They will remain available until FERC is able to upload the files to their site. We hope that access to these files now will help reporters cover the story and meet deadlines.

Leading experts call for independent review of Colorado River management program

For immediate release

Contact: John Weisheit - 435-260-2590 (mobile)

Tucson, AZ - As uncertainty mounts surrounding Colorado River water availability, public intellectuals from a wide spectrum of disciplines today called on Interior Secretary Sally Jewell to recruit the National Academy of Sciences to review a six-year old program responsible for informing Colorado River management decisions.

Citing information gaps in surface water variability, water conservation potential, groundwater depletion, ecological deterioration, flood management and water quality, the 23 signatories to the four-page letter warn that absent an independent evaluation, future actions could lead to increased system vulnerability and public expense.

"These experts have devoted considerable time in their careers to improve our understanding of the complexities and fragility of our relationship with the Colorado River, and their recommendation for the National Academy's involvement could pay dividends for generations to come," says John Weisheit, Living Rivers/Colorado Riverkeeper Conservation Director.

The letter's timing comes on the heels of the most recent planning document generated through a joint federal/state, multi-stakeholder process set forth by Congress in 2009. The SECURE Water Act mandates action by Interior as a result of growing climate change concerns. However, as the letter outlines, the work undertaken so far appears to overlook numerous risk factors for this river-dependent society of 36 million people.

The letter further points out that Interior has yet to undertake a sufficient climate change vulnerability assessment for this complex, coupled human-ecological system. Such an assessment should be a prerequisite to the formulation of any climate change response strategies as recommended by the U.S. Global Change Research Program, of which Interior is a partner .

"If ever there was a time to undertake the first basin-wide, independent review of this vital natural resource, that time is now," adds Weisheit. "Decisions should be based on the best available information, and the National Academy is well-positioned to ensure just that."

From The Associated Press

SALT LAKE CITY (AP) — A coalition of scholars across the West is urging the federal government to partner with the National Academy of Sciences to study the future of the Colorado River, including if climate change is leading to reduced stream flow.

Twenty-three scholars from Western universities sent a [LETTER](#) Tuesday to Interior Secretary Sally Jewell detailing their request for more scientific research on a host of issues related to the Colorado River.

Chief among the concerns is if there will be enough water in the river to support 36 million users in seven U.S. states and parts of Mexico over the next 50 years.

The scholars argue the federal government is relying on a projection of a 9-percent stream flow decline by 2060, while skimming over other estimates that suggest it could fall by as much as 45 percent by 2050 due to climate change.

Secretary Jewell was expected to receive the letter early Wednesday. The Bureau of Reclamation this summer issued the results of a nearly three-year study that concluded that there will be significant shortfalls between water supply and demand on the Colorado River over the next 50 years.

But the scholars say in the letter that those conclusions "may be insufficient to accommodate the full range of risks that lie ahead," the letter says.

The scholars who signed the letter include Robert Adler of the University of Utah law school; Victor Baker of the hydrology and water resources department at the University of Arizona; and Tim Barnett at the Scripps Institution of Oceanography in La Jolla, California.

Owen Lammers, executive director of Living Rivers and Colorado Riverkeeper, said the federal government needs to pursue a wider breadth of scientific projections to ensure it is prepared for all water flow scenarios. His group supports the scholars' efforts.

"We're hoping for the best when we should be preparing for the worst," Lammers said. "We are really putting society at risk without looking at some of these scenarios."

Coalition Comment Letter

Rena Brand
Moffat EIS Project Manager
US Army Corps of Engineers
9307 South Wadsworth Blvd, Littleton, CO 80128
By email: moffat.eis@usace.army.mil

June 9, 2015

Re: Moffat Collection System Project (NWO-2002-080762 DEN) FEIS and Section 404 Permit Comments.

Dear Ms. Brand,

I respectfully submit the following comments on the (Permit Application NWO-2002-080762-DEN) Final Environmental Impact Statement (DEIS) and Section 404 Permit, collectively referred to as the "Moffat" project in this document.

I care about the Colorado River. I enjoy visiting the Fraser River and Upper Colorado headwaters in Grand County, Colorado.

There are fatal flaws within the Final Environmental Impact Statement; including inaccurate, inadequate, and misleading analysis that not only skew the potential project environmental and social impacts but, if allowed to happen, could cause irreversible damaging effects to our precious natural resources. Furthermore, this project if allowed to happen, will devastate the Fraser and Upper Colorado Rivers, and cause numerous harms to the fish, people, and businesses that depend on healthy rivers.

The Analysis in the Moffat FEIS Violates NEPA, the National Environmental Policy Act.

The FEIS failed to analyze a reasonable range of alternatives to the proposed Moffat project, and the stated purpose and need statement is unreasonably narrow and foreclosed reasonable alternatives to meet future water demand. The FEIS should fully analyze the available feasible and non-speculative alternatives to fulfill the purpose and need of this project.

The FEIS fails to take a hard look at the proposed Moffat project's environmental impacts.

The "environmental baseline" in the FEIS is inflated. The FEIS does not adequately analyze the proposed Moffat project's direct impacts, indirect impacts, and cumulative impacts but, rather, hides or obfuscates the severity of these impacts under an inflated environmental baseline.

Impacts affecting wildlife and habitat which are either not evaluated or not properly mitigated in the FEIS include: the removal and destruction of 200,000 trees, the potential blasting and quarrying of Winiger Ridge and Windy Point at Gross Reservoir, destruction and inundation of Elk wintering habitat specifically identified in Boulder County's master plan, adverse impacts to threatened and endangered species including Whooping Crane, Piping Plover, Least Tern, Pallid Sturgeon, and Western Prairie Fringed Orchid. severe impacts to aquatic life, wetlands, and stream flow in the Upper Colorado basins.

The Corps will violate Clean Water Act Section 404 if it issues a Clean Water Act Section 404 Permit for the Proposed Moffat Project.

Several practicable alternatives to the Moffat Project exist that would have less damaging environmental impacts. The Moffat project would result in significant degradation of the aquatic ecosystem and the FEIS does not include appropriate and practicable measures to minimize potential harms.

The Corps must conduct additional analysis to make a reasoned decision on the Section 404 permit. Additionally:

The FEIS fails to adequately address climate change impacts. There are still questions regarding the FEIS Bypass Flows. Thank you for your recognizing that I, the undersigned, am a critical part of your decision-making process. I would appreciate confirmation of receipt of this letter.

State approves tar sands mine but requires water monitoring

By BRADY McCOMBS - Associated Press - Monday, July 20, 2015

SALT LAKE CITY (AP) - Utah state officials have given the go-ahead for a tar sands mine under construction on the eastern flank of the state. They will, however, require the company to do water and air quality monitoring in a move environmentalists are calling a victory.

Utah Division of Oil, Gas and Mining director John Baza said Monday that his decision addresses concerns raised by opposition while acknowledging that U.S. Oil Sands Inc., the Canadian company building the mine, has complied with regulations.

Baza's ruling, announced late Friday, comes nearly three weeks after he hosted a public hearing to listen to concerns from opponents and give the company a chance to explain a project under construction on a ridge top in the Book Cliffs area on the border of Uintah County more than 200 miles southeast of Salt Lake City.

U.S. Oil Sands must now submit a plan for the monitoring by Nov. 1, Baza said. As long as the company does that, Baza said it will be cleared to move forward with plans to begin extracting oil sands later this year from a sparsely populated area that is home to many types of wildlife such as deer, beavers and bears.

The company already had permission to begin mining under a previously approved plan, but it resubmitted a new proposal for an expanded operation. The company has invested nearly \$100 million over a decade to get permits, buy equipment and develop a new technology.

The company says its process is starkly different than the one used by the numerous operations in Canada, relying on a citrus solvent and plan that is more environmentally friendly and leaves the earth less disturbed. U.S. Oil Sands CEO Cameron Todd said the company plans to comply with all the state's requirements by coming up with a plan to do the monitoring required.

"I'm glad everyone is happy," said Todd, adding the decision is what they expected.

Company officials have said previously there are no measurable quantities of water in the area and that they have gone beyond what is required to show the mine will have a minimal effect on the environment.

Rob Dubuc, an attorney representing the Living Rivers environmental protection organization that has protested the project, called it a pleasant surprise that Baza heeded their warnings about water issues. The area is not only home to wildlife, it is used by hunters and outdoor recreationalists and is home to a few ranching families.

"This is a big deal and it's a step in the right direction," Dubuc said.

"To expect DOGM (Division of Oil, Gas and Mining) to deny the permit is not realistic in this political environment. But at least they are doing the right thing by requiring the monitoring."

Dubuc said measuring effects on water and air quality could help prove whether the company or environmentalists are correct about possible contamination.

Tar sands mines extract oil from minerals in the earth by digging relatively shallow pits, a process that costs more than pumping liquid oil.

Utah Division of Oil, Gas and Mining Upholds Tentative Approval of PR Spring Mine Expansion with Conditions

Salt Lake City (July 17, 2015) – Following an informal conference and review by the Utah Division of Oil, Gas and Mining (DOGM), the division has upheld its tentative approval of the PR Spring mine expansion proposal, but with two new amended conditions.

DOGM's approval requires U.S. Oil Sands, Inc. to establish a monitoring program and plan for potential effects to the area's subsurface water systems. It must also submit evidence that confirms the mine is in compliance with EPA air quality regulations. Both amendments are to be submitted to DOGM by Nov. 1, 2015 and U.S. Oil Sands, Inc. is not permitted to process ore until the division has approved both conditions.

"The informal conference held last month was extremely helpful. The feedback we received from concerned individuals helped us determine that these two additional amendments were necessary for the expansion to move forward. I believe the direction we've gone helps mitigate their concerns," said DOGM Director John Baza. "We're committed to accessing our state's abundant natural resources in an environmentally responsible manner. To ensure responsible mining at PR Spring, we have asked the mine operator to provide more information."

U.S. Oil Sands, Inc. initially obtained a tar sands mining permit in 2012 to mine ore and extract bitumen, a hydrocarbon used to fuel refineries. The approved mine included 213 acres of land on the border of Uintah and Grand counties near Tavaputs Plateau. Last year, the operator submitted a revision to its existing mining plan that would add another 104 acres to its operation. DOGM held an informal conference late last month under the Utah Mined Land Reclamation Act to hear from those who opposed the expansion.

For Immediate Release

[Colorado River Connected](#) Member Organizations Urging Public Attendance

CONTACT: John Weisheit, Conservation Director, Living Rivers & Colorado Riverkeeper
- 435.260.2590

Salt Lake City, UT - A public hearing on U.S. Oil Sands' proposed expansion of their tar sands strip mining operations near PR Springs in the Book Cliffs is scheduled for tomorrow, Tuesday, June 30. The hearing is being held by Utah's Division of Oil, Gas, and Mining. Member organizations of Colorado River Connected are urging citizens to attend the meeting and share their concerns.

If approved, the total surface disturbance of this revised strip mine would increase 33% from the original large mining application, which was approved previously with little public participation. The new plan proposes to strip mine 235 acres within the corporation's 32,005-acre leased area. Missing from the new operation plan is an acknowledgment of existing springs and seeps in the mining area, which provide drinking water for campers, wildlife, stock animals and nearby local ranchers. The permit application also ignores increasing concerns over air quality within the region. "The approval of this mining operation is a sham," says John Weisheit, conservation director of Living Rivers and Colorado Riverkeeper.

"Ignoring the presence of spring water flowing adjacent to the mining and processing area essentially means U.S. Oil Sands has no regard for public health and safety, and

they are taking advantage of the fact that Utah's regulatory agencies did not mandate them to monitor water pollution in their previously approved large-scale strip mining plan.”

“The degraded air quality in the oil and gas patches of Uintah County is already taking its toll on human health,” says Tim Wagner of Utah Physicians for a Healthy Environment. “This new application by U.S. Oil Sands fails to demonstrate what the total emissions will be from their fuel-intensive operations and fails to explain how their emissions will be mitigated, if at all. How many more infant mortalities and poor birth outcomes in Uintah County have to occur before regulatory officials take action to address this serious and existing air pollution problem?”

“Our staff has to follow agency regulations every day to make sure our operations do not make our guests sick,” says Lauren Wood of Holiday River Expeditions. “In fact, our company has to explain in writing how we will safeguard public health and safety. We want to know why Utah agencies are less strident about regulating a very dangerous tar sands mine.”

“U.S. Oil Sands' claim of 'environmental leadership' is utter nonsense,” said Jennifer Ekstrom, producer of the documentary 'Last Rush for the Wild West: Tar Sands, Oil Shale and the American Frontier.' "I made the film to alert the American public about the magnitude of destruction on the horizon if these practices gain momentum in Utah. The massive proposed tar sands and oil shale strip mines are unprecedented in America, and out of step with the needs of humanity.”

Precipitation and snow melt would percolate through the strip mined open pits of waste sand and rubble, which include hundreds of compounds including known carcinogens. These compounds will be liberated by mixing hot solvents and water with raw bitumen ore, and will leach out into the springs and canyon bottoms. Eventually these compounds will reach the Colorado River system, which is drinking water for nearly 35 million people.

LOCATION: Department of Natural Resources, Auditorium, 1594 West North Temple, Salt Lake City, Utah.

TIME: Tuesday, June 30, 2015, 9:00 to 11:00 A.M. in the auditorium of the

Media Advisory: Public hearing on expansion of tar sands mine near PR Springs

CONTACT: John Weisheit, Conservation Director, Living Rivers & Colorado Riverkeeper 435.260.2590

[PDF of Media Advisory](#)

WHAT: Utah Division of Oil, Gas and Mining (UDOGM) will conduct an informal hearing with interested members of the public concerning the expansion of mining operations by a Canadian corporation called U.S. Oil Sands (USOS). U.S. Oil Sands intends to strip mine and process tar sands near PR Springs in Uintah County. The size of the surface mining operation is 235 acres; the depth of the mine is 150 feet; 2,000 barrels per day of crude will be processed on site. Colorado River Connected coalition members will be present and Western Resource Advocates attorney representing coalition members will testify on the impacts to public health, groundwater, air quality, and wildlife from the proposed expansion and request the Division to reject the permit.

WHEN: Tuesday, June 30, 2015, from 9:00 to 11:00 A.

WHERE: Auditorium of the Department of Natural Resources, 1594 West North Temple, Salt Lake City, Utah.

What's Killing the Babies in Vernal, Utah?

[Click here](#) to read this story by Paul Solotaroff of Rolling Stone Magazine

Related: [Report: \\$28 Million in Methane Gas Escapes Yearly into Utah Air](#)

SALT LAKE CITY – Utah makes a "top five" list for amounts of natural gas being wasted by energy developers working on federal and tribal lands.

A [new report](#) says oil and gas companies need to do a better job of repairing leaks and minimize venting and flaring at well sites, both to conserve natural gas and improve air quality.

Dan Grossman, Rocky Mountain regional director of the Environmental Defense Fund, which commissioned the report, says that's one reason the Bureau of Land Management is releasing new rules this summer for drilling on public land.

"They really haven't been on the forefront in pushing operators to run efficient operations," he maintains. "So, I think it's critical if we're really going to get on top of the emissions problem and the waste problem, that BLM play a critical role in helping us do that."

The report says almost all the oil and gas produced in Utah comes from federal or tribal lands, and values the methane gas wasted in the process at more than \$28 million a year.

In addition to the gas going unsold and the government missing out on royalties from it, the emissions are a major component of ground-level ozone pollution.

Rachel Otto, executive director of the air quality advocacy group Breathe Utah, says the legislature has acknowledged and taken recent action to curb the ozone pollution problems in the state, which are affecting more counties in summer as well as winter.

She sees a push to drill more efficiently as a natural next step.

"Not only would it help clean the air, but also it would create more revenue for these companies and for Utah," she states. "And then, ideally, it would create jobs. So, it seems like a bit of a no-brainer."

Otto says the report brings attention to more rural parts of Utah where air quality is just as bad as along the Wasatch Front but doesn't get the publicity.

The report mentions Duchesne and Uintah counties, both of which made the American Lung Association's list of most smog-polluted areas, along with major cities in California and Texas.

06/12/15

Scientists Call for Moratorium on Oil Sands Development

No new oil sands or related infrastructure projects should proceed unless consistent with an implemented plan to rapidly reduce carbon pollution, safeguard biodiversity, protect human health, and respect treaty rights.

WEBSITE: <https://www.oilsandsmoratorium.org>

The following ten reasons, each grounded in science, support our call for a moratorium. We believe they should be at the center of the public debate about further development of the oil sands, a carbon-intensive source of non-renewable energy.

[The Ten Reasons and the scientists who support this action](#)

05/06/15

Legislative Audit Reveals Flawed Projections on Utah's Water Needs

[Click here](#) to read this story by Amy Joi O'Donoghue in the Deseret News

[Click here](#) to read this story by Brett Prettyman of the Salt Lake Tribune

[Click here](#) to read the legislative audit

[FOX 13 Salt Lake City](#) reported the following:

SALT LAKE CITY – Officials have just released a controversial audit of the Utah Division of Water Resources.

Government officials said legislators from both sides called for the audit after claims the division opposed water conservation for fears it could reduce water revenues for water sellers.

Critics also accuse the division of inflating future water needs to scare the public into spending billions on water projects like the Lake Powell Pipeline and the Bear River Project.

The Utah Rivers Council said the audit comes at a critical time; the Division of Water Resources is asking for billions in tax increases at the Utah legislature for these projects.

A Coalition of groups called for the audit including Utah Rivers Council, Utah Chapter of the Sierra Club, Citizen's for Dixie's Future, Glen Canyon Institute, Taxpayer Association of Kane County, Colorado Riverkeeper Living Rivers, HEAL Utah and Utah Environmental Congress.

The audit from the Utah Legislature found a few key concerns:

1. The division does not have reliable local water use data. The audit stated there were "significant inaccuracies" in the division's data.
2. The division needs an improved process for ensuring water data is reliable. The audit states the Division of Natural Resources should take a leading role in coordinating efforts between the Division of Water Resources and the Division of Water Rights to improve the process of getting accurate water use data.
3. The audit questions the reliability of the division's baseline water use study. The audit states the division's study projecting Utah's future water needs was based on old data from 1992 to 1999, which may not be an accurate representation of Utah's future water needs.
4. Conservation will lead to less water use. The audit questions the division's projected water demand which assumes Utah residents will consume on average 220 gallons per day through the year 2060. The audit says the study used to determine that was based on old data. Also, ongoing water conservation trends will continue which should bring down need.
5. Some regions can reduce water use more than the statewide goal of 25 percent. The audit states that would also lower the projected water need reported by the Water Resources Division.
6. State policies on metering and pricing can affect water demand. According to the audit, Utah's relatively low water cost appears to contribute to higher water use when compared with other states. Unless per capita water use is reduced, new, more costly sources of supply will need to be developed. As pressures on Utah's currently developed supply intensify, local and state policymakers will need to consider policy options to reduce demand, including universal metering and water pricing.

7. Division projections should include expected local water development. The division's projections of future water use do not include growth in the state's water supply beyond what was already developed in 2010, with a few exceptions.

8. Good Basin plans should be the basis for better statewide planning. The audit states most of the division's basin plans do not estimate the growth in the region's water supply. The basin plans also understate the amount of agriculture water available for municipal use. The audit recommends the division update its basin plans on a more regular basis.

The Division of Water Resources sent Fox 13 this response to the audit:

The Utah Department of Natural Resources (DNR) and Division of Water Resources (DWRe) appreciate the Legislative Auditor General's staff and the considerable efforts they took during the audit process to assess the effectiveness of DWRe data practices. We recognize the great lengths they took to gather and analyze the information.

Utah faces a number of complex water-related issues. Not only are we the second driest state in the nation, but our population is expected to double by 2060. Additionally, our water supply is currently used near capacity and will become even more strained moving forward, as our population increases and our climate changes.

The responsibility to ensure Utah's families, environment and businesses have enough water is one DWRe takes seriously. Implementing the audit recommendations will strengthen our processes. State water projections are based on water use and supply data reported from hundreds of water providers throughout Utah. The audit revealed differing levels of accuracy within each water provider's reporting can result in the under- or over-estimating of supply and demand reports.

DWRe is committed to gathering the most comprehensive and accurate data available. The division will work with the Legislature to propose standardized data collection practices, quality control measures and the authority to hold water providers accountable to report accurate data. Requests for additional resources will be made to the Legislature so water use data can be collected annually, instead of every five years. DWRe is also committed to making water conservation one of Utah's long-term ethics. However, the state cannot solve its water challenges through conservation alone. DWRe believes a multifaceted water strategy is necessary to meet future growth and to avoid challenges like those currently affecting California.

Utahns are encouraged to meet Gov. Gary R. Herbert's goal of 25 percent water conservation by 2025 and we anticipate meeting that goal this year, ten years early. This effort has led Utahns to conserve approximately 58 billion gallons of water; enough to more than fill Starvation Reservoir. While these results are considered a success, Utah can conserve more. We challenge Utahns to use recommendations provided at SlowTheFlow.org and ConserveWater.utah.gov.

DWRe is currently building phase two conservation strategies that extend beyond the State's initial goal of 25 percent. Future strategies will continue to promote efficiency, educate families and encourage simple life changes. However, they will also introduce programs that further advance Utah's water conservation efforts, including programs to address needed state water facility upgrades; more robust conservation rebates; metering of secondary water systems and enhancements to county and local development landscaping policies.

Finding solutions to tomorrow's water problems requires our attention and resources today. Thankfully the audit has helped identify some of the areas where we can improve, including how and when DWRe data is collected and the future expansion of Utah's conservation efforts. While we are committed to improving these areas, Utah's water challenges will only be solved through collaborative and cooperative relationships between state agencies, the Legislature and dozens of public, private and special interest organizations concerned about Utah's water challenges. By working together we will find the best solutions.

Earth Week Protest & Events in Moab, Utah Against Threats to Colorado River Watershed Communities & Tribes Up and Down the Colorado River Unite to Protect Our Rivers, Watershed, Health & Environment!

No Green River Nuclear Power Plant and no more Uranium Mining/Milling
Stop Tar Sands Mining in the Book Cliffs & the Oil Industry Onslaught!
FRIDAY APRIL 24, 2015 - 6 pm Community Dinner and Forum (Moab Arts & Recreation Center, 111 E 100 N, Moab, UT)

SATURDAY APRIL 25th - 11 am starting at Multicultural Center, 156N 100W, Moab
Earth Day Parade & Protest to Protect the Colorado River Watershed from Pollution!
Moab, Utah – A large delegation of tribal leaders and Mohave Elders from the Colorado River Indian Tribes will travel hundreds of miles from their home in Parker, Arizona all the way to Moab, Utah to join with local residents during Earth Week to call for a halt to the pollution and water depletion threats to the Green and Colorado Rivers and the entire Colorado River watershed.

Both the Colorado River Indian Tribes and the Fort Mojave Indian Tribe have passed tribal council resolutions opposing the proposed Green River nuclear power plant. These Native Nations who have lived along the Colorado River since time immemorial are alarmed at the prospect of the radioactive threat posed by a nuclear power plant near the Green River which flows directly into the Colorado River. At events in Moab April 24-25, the Colorado River Indian Tribes delegation will join tribal members from the Ute Tribe, White Mesa Ute Community and Navajo Nation and other southern Utah residents who also are threatened by dirty energy production including the explosion of fossil fuel drilling and fracking, the tar sands mine under construction in the Book Cliffs, and uranium mining and milling.

On Friday, April 24th at 6 pm there will be a Community Forum at the Moab Arts and Recreation Center with tribal leaders, Elders, and community organizers confronting dirty energy production and climate change threats to the Colorado River Watershed. On Saturday, April 25th beginning at 11 am at the Multicultural Center there will be an Earth Week rally and parade along Main Street to bring these profound pollution threats to the attention of the thousands of tourists, local residents, businesses and government officials.

Sponsors: Living Rivers, Uranium Watch, Greenaction for Health and Environmental Justice, Colorado River Indian Tribes, White Mesa Concerned Citizens, La Cuna de Aztlan Sacred Sites Protection Circle, Canyon Country Rising Tide, Peaceful Uprising, Sierra Club Glen Canyon Group, Clean Up The Mines

04/15/15

An Earth Day Event: Water is Life (No Nukes)

Community Dinner and Forum

DAY ONE - Friday April 24th 6pm:

At the MARC (111 E 1 00 N)

A Discussion with tribal leaders, Elders, and community organizers confronting dirty energy production and climate change in the Colorado River Watershed.

DAY TWO - Saturday April 25th 11 AM:

Earthday Parade

Meet at the Multicultural Center (56 North 100 West)

Walk with us for protection of the Colorado River Watershed.

There will be speakers from Colorado River Indian Tribes and White Mesa Ute Community

An Event by: Living Rivers, Uranium Watch, Greenaction, Canyon Country Rising Tide, Indigenous Action, SUWA Colorado River Indian Tribes, White Mesa Concerned Citizens, La Cuna de Aztlan Sacred Sites Protection Circle, Peaceful Uprising, Sierra Club Glen Canyon Group

Legal Challenge to Stop Water Pollution by Tar Sands Mine in Utah

Division of Water Quality Allowing Tar Sands Mine Expansion Without Oversight Despite New Studies Showing Water Pollution Likely

SALT LAKE CITY, UT (February 18, 2015) – In the afternoon of February 17th Western Resource Advocates filed a legal challenge on behalf of Living Rivers against the Utah Division of Water Quality (DWQ) for allowing the U.S. Oil Sands' PR Spring Mine, a tar sands strip mine, to proceed with a four-fold expansion of their mining operation without further review. New studies show that the area of the expanded mine is a recharge zone for perennial springs in Main Canyon, below the mine. Additionally, tests conducted by the company show that diesel range organic compounds in the mine tailings will be thousands of times greater than the maximum contaminant levels allowed in drinking water. Despite the expansion of the proposed mine and the new water pollution evidence, DWQ intends to allow the mine to proceed without a new permit.

U.S. Oil Sands is a company from Alberta, Canada that owns the PR Spring mine located near the Book Cliffs in Uintah County. The Division of Water Quality's existing permit-by-rule allows the PR Spring mine to proceed with ridge-top tar sand mining, processing and disposal in this area without pit liners or monitoring. However, recently completed hydrogeochemistry studies by the University of Utah have shown natural springs in the area are recharged from the area where the strip mine will be expanded. In addition, analysis of process wastes from the mine show that organic compounds in those wastes will be thousands of times greater than levels regulated in drinking water. These tailings have the potential to contaminate springs in Main Canyon, an area renowned for wildlife and the water supply for a ranching operation.

"The State of Utah consistently seems to place development of these dirty fuels above protecting public health and the environment," said lead attorney Rob Dubuc of Western Resource Advocates. "With clear evidence showing that the area of the mine is connected to area seeps and springs, there's simply no justification for DWQ to allow the mine to expand operations without appropriate oversight."

"The Utah DWQ assumes an absence of groundwater in the area, and assumes that the organic compounds leached to precipitation and snowmelt are inconsequential", said Dr. William Johnson of the University of Utah. "Our hydrogeochemical data show that the

ridges, including the permitted site, are where snowmelt and precipitation enters the subsurface to feed perennial springs in nearby canyons. Those who depend on these springs include a ranching family, livestock, recreationalists, and wildlife. The measurements made by U.S. Oil Sands themselves show that the leached concentration of diesel range organic compounds will be thousands of times greater than the maximum contaminant levels that are regulated in drinking water. The State of Utah should genuinely consider potential impacts to this water resource over decades of operation.”

“These petrochemicals from the mine tailings will be extremely hazardous,” said John Weisheit, Conservation Director of Living Rivers. “The scientific evidence is very clear on this point. We need action by the State to protect drinking water and wildlife.”

“With the company’s own tests showing dangerous levels of diesel compounds will be in their waste piles, it’s time for the State to step up and require U.S. Oil Sands to protect these waters,” said Rob Dubuc. “DWQ needs to properly regulate this mine.”

Background: The desired product from the tar sands strip mine is bitumen, used for applications such as to boil water at power generating station, a binder for sand and gravel in paving of roads, and a waterproofing materials for roof construction. If refined the bitumen may be upgraded to become transportation fuel. The energy value of this heavy crude is 50% compared to 97% for conventional light crude. The technology that is proposed for the PR Spring mine is unproven.

Blue Castle Holdings Fails to Make First Water Rights Payment

Blue Castle Holdings Inc. (BCH) failed to make their First Pre-Operational Payments to the Kane County Water Conservancy District (\$100,000) and San Juan County Water Conservancy District (\$80,000) for the lease of water rights for the proposed Blue Castle Project nuclear reactor near Green River. The payments were due after the State Engineer's authorization of the use of 53,600 acre-feet of Green River water for the reactor project became final. The authorization became final in September, when plaintiff's did not appeal the Utah Court of Appeals' decision—upholding the State Engineer's decision—to the Utah

Supreme Court. In addition to their failure to make the payments, BCH failed to even notify the Districts that they would not be making the First Pre-Operation Payments on time.

According to the KCWCD, they are renegotiating the lease with BCH. Plaintiffs Living Rivers, Uranium Watch, and HEAL Utah have asserted that BCH does not have the financial resources to move forward with the nuclear reactor project. Plaintiffs stated that they did not believe that BCH would have the financial resources to make the annual payments, which now has been shown to be the case. The last time BCH sent a letter to the NRC was in 2011. Since then there have been no letters to the NRC, pre-application meetings, or efforts to complete an Emergency Response Plan.

On December 20, 2016, Living Rivers, HEAL Utah, and Uranium Watch will participate in a hearing on the KCWCD request for an extension of time to show proof of beneficial use for the water rights leased to Blue Castle Holdings. The hearing will take place at the Green River City Office at 11:00 am.

Protesters to the KCWCD Request have asserted that there is no reasonable assurance that the water rights approved for the proposed reactor will ever be put to beneficial use. KCWCD and BCH have failed to show due diligence within the past 50 years to make use of the water water rights. "It is about time that the State Engineer demand financial and other documentation for the public record to demonstrate support the Water Conservancy District's assertion that the water will be used for a nuclear reactor," says Sarah Fields, Program Director of Uranium Watch.

Adds John Weisheit, Conservation Director of Living Rivers and Colorado Riverkeeper, "In 2013 we heard testimony under oath that Blue Castle Holdings' annual net investment income is 8 million dollars per year. It is not unreasonable to assume the financial viability of this company has changed and the administrative record should be updated before the State Engineer makes his decision."

United States' First Tar Sands Mine Delayed; Companies and investors reject Utah's unconventional fuels

FOR IMMEDIATE RELEASE

United States' First Tar Sands Mine Delayed

Companies and investors reject Utah's unconventional fuels

Vernal, Utah - US Oil Sands Inc., the company attempting to open the United States' first commercial tar sands mine, announced that is putting the project on hold due to an inability to attract investors. Forecasts of worsening climate change and water shortages have compelled the close scrutiny of speculative plans, like those of US Oil Sands, to develop high-carbon, water-intensive tar sands and oil shale deposits in the Colorado River Basin.

"Despite this temporary reprieve, defenders of the Colorado watershed remain aware that the foreign corporation pushing for the first commercial tar sands strip mine in America is chomping at the bit to move forward, and claim they will do so in January of 2017," said Jennifer Ekstrom, director of the award-winning documentary Last Rush for the Wild West: Tar Sands, Oil Shale and the American Frontier. "Under the upcoming Trump Administration, the entire landscape containing tar sands and oil shale, almost a million acres, is at even greater risk of this dirtiest type of strip mining. We will remain vigilant and continue fighting this extraordinary threat."

The company's PR Spring mine is located in a remote landscape behind the Book Cliffs in eastern Utah. US Oil Sands plans to strip mine for the tar sands and then use an industrial strength solvent to access the hydrocarbon. The process results in 100% land destruction, carries a hefty carbon footprint, and threatens to contaminate scarce groundwater resources in the arid high desert.

"We see here that US Oil Sands continues to be stilted up by the few with deep pockets and opposed by the many with clear and steadfast vision for a better future," says Lauren Wood of Green River Action Project, A Colorado Riverkeeper Affiliate. "Even under a Trump administration, it is nonsensical to advance an industry with a carbon and water footprint so extreme that it threatens the very future of the Colorado River Basin."

US Oil Sands' statement comes on the heels of announcements that numerous major companies have ended their attempts to exploit oil shale and tar sands in the Colorado River Basin. ExxonMobil, Shell, American Shale Oil, and Chevron all terminated their oil shale research, demonstration, and development efforts in the Green River Basin. And a pending federal commercial lease for the Asphalt Ridge tar sands mine in Utah's Uinta Basin has been stalled since 2014.

"US Oil Sands has been promising immediate development with breakthrough technology for six years and now, with 98% of the infrastructure in place, all but essential personnel have been laid off. This

clearly indicates that investors have no confidence in this project,” says John Weisheit of Living Rivers and Colorado Riverkeeper.

“The announcement represents yet another example of an oil shale or tar sand project that is unable to make the finances work,” says Lesley Adams of the Waterkeeper Alliance. “Developing unconventional fuels in the Colorado River Basin would fundamentally undermine our national climate goals and threaten scarce water supplies; it is simply not a viable path towards energy independence.”

About Waterkeeper Alliance

Waterkeeper Alliance unites more than 300 Waterkeeper Organizations and Affiliates around the world, focusing citizen advocacy on issues that affect our waterways, from pollution to climate change. Our movement patrols and protects more than 2.4 million square miles of rivers, streams and coastlines on 6 continents. For more information, please visit: www.waterkeeper.org.

Colorado River Managers Snub Climate Change Again: Society and Ecology at Greater Risk

For immediate release:

October 10, 2016

Contacts: John Weisheit, Colorado Riverkeeper: 435-260-2590
Tom Martin, River Runners for Wilderness: 928-556-0742; 928-856-9065
Robin Silver, Center for Biological Diversity: 602-799-3275

(Moab, UT) On October 7, following six years of study, the Bureau of Reclamation [released](#) revised guidelines for operating Glen Canyon Dam. Though the dam is viewed by many as integral to the Colorado's existing water delivery infrastructure, leading Colorado River observers point out that the new operating regime, scheduled to take affect next month, is based on antiquated objectives propped up by outdated science.

"In this era of climate change it's unbelievable that Reclamation continues to employ modeling results that suggest shortages are decades down the road when their reservoirs are at all time lows," says John Weishiet with Living Rivers/Colorado Riverkeeper.

The new guidelines rely entirely on surface water forecasts from Reclamation's widely criticized 2012 Colorado River Water Supply and Demand Study. In October of last year 23 Colorado River scholars [requested](#) Interior Secretary Jewell engage the National Academy of Sciences to review these findings, due numerous deficiencies. And just last week the journal [Science reported](#) that if current trends continue, "We find that regional temperature increases [in the Southwest] alone push megadrought risk above 70, 90, or 99% by the end of the century."

Principally, these new guidelines are to improve habitat conditions for endangered native fish in Grand Canyon National Park, downstream of the dam. However, beyond downplaying climate change, Reclamation stresses its new guidelines are not required to "...create a plan for providing water to the Colorado River in Grand Canyon during extended drought."

"Glen Canyon Dam inflicts the greatest harm on Colorado River native fish, once among the most unique assemblages in the world," says Robin Silver with Center for Biological Diversity. "Interior's cavalier attitude toward providing water for thier recovery is wholly inconsistent with its mandate under the Endangered Species Act."

So too is Reclamation's mismanagement of Colorado River flows, says Tom Martin with River Runners for Wilderness. "The biotic community in the river below the dam has been devastated and is in desperate need of sediment, much more woody material, water temperature and flow regime consistent with the river corridor's historic natural conditions, not just prescriptions for redoing old experiments that perpetuate business as usual."

Lack of complete information on water scarcity is not the only major omission the public should be concerned about. The study also lacks a truthful and up-to-date assessment of the known safety risks associated with the continued operations of Glen Canyon Dam.

“We may be in a drought situation now, but no credible scientist denies the basin won’t again experience a major flood even as climate change persists,” add Weisheit. “New [research](#) reveals that historic flooding on the Colorado River is of a frequency and magnitude twice what Reclamation has planned for, and Glen Canyon Dam almost failed from a comparatively minor flood in 1983.”

“The more we try to work with Glen Canyon Dam, and the complexities of the impacts it creates, the more we really need to address whether it might be best to eliminate it from the system altogether,” stresses Weisheit. “Better we do this in a controlled way then before nature does it for us.” ###

###

ANNOUNCEMENT

Tuesday, October 11

MARCH TO OPPOSE THE WHITE MESA URANIUM MILL
PLEASE JOIN THE WHITE MESA UTE COMMUNITY ON A MARCH FROM THE WHITE MESA TRIBAL COMMUNITY CENTER TO THE MILL.

Meet at 8:00 am at the White Mesa Community Center White Mesa Community Center, 14 Willow St, White Mesa, UT 84511. The Mill is about 4 miles north of the Community Center.

Going South on Hwy. 191, turn Right on the street just before the Mobile Gas Station on White Mesa, about 12 miles south of Blanding. Turn Left on next street, Cowboy Street, to the Community Center, on the Right.

Bring Signs, Water, Warm Clothes

The White Mesa Uranium Mill continues to operate, polluting the air, groundwater, and the land on White Mesa.

For more information call: Sarah Fields Uranium Watch 435-260-8384

Lake Powell Pipeline Repayment: Scam or Incompetence?

From our allies at [Utah Rivers Council](#):

Last week 19 PhD economists from two Utah universities released their analysis of a repayment plan created by the Washington County Water District to support funding for the Lake Powell Pipeline at the 2016 Legislature. The economists found the plan fails to grasp basic economic principles and fails to repay Utah taxpayers the billions of dollars they will pay for the Pipeline. Shockingly, the district plans to repay only 28% of the total cost of the pipeline, leaving taxpayers on the hook for the other 72%.

According to the economists, if the water district truly intended to repay the cost of the pipeline, water rates would have to increase 576% and impact fees 128% in Washington County. Water officials and their lobbyists have been using this flawed model to mislead our legislators and the public by claiming they can repay the debt with little to no increases in water rates or impact fees. Now we know that is a lie. In case you missed it, here is a great article from the Salt Lake Tribune.

Upon the release of the economists' analysis we presented our concerns to the State Water Development Commission. The very same lobbyists who deceived the Legislature are also on the Commission, including the Washington County Water District.

When one of the economists, Gail Blattenberger, tried to outline some of their concerns along with Utah Rivers Council staff, the Commission quickly tried to change the subject. It's clear the lobbyists are running the show and it's time we take this Commission, and our Legislature back so the people can be heard!

We need your help! Please write your legislators and ask that the water lobbyists on the Water Development Commission be removed.

Read the economist's cover letter that they sent to the Governor [HERE](#)

Group drops water battle, still fighting nuclear plant plan

[Click here](#) to read this OpEd by the Salt Lake Tribune Editorial Board

[Click here](#) to read this story by Brian Maffly of the Salt Lake Tribune

Here is the AP story:

By MICHELLE L. PRICE, Associated Press

SALT LAKE CITY — Environmentalists who've spent almost a decade fighting a plan to build Utah's first nuclear power plant said Wednesday that they're dropping a legal battle against the eastern Utah project but are still fighting the facility.

The groups HEAL Utah, Uranium Watch and Living Rivers said they would not contest a Utah Court of Appeals ruling last month allowing the facility to pull water from the Green River to cool nuclear reactors once it's built.

HEAL Utah executive director Matt Pacenza said that by dropping the battle over water rights, the company that wants to build the plant, Blue Castle Holdings, will be forced to start paying hundreds of thousands of dollars on those water rights to local water districts.

"We frankly do not believe they have those resources," Pacenza said. He said the project has not attracted significant investments and no Utah utility companies have stepped up to say they're interested in nuclear power.

"It's a project that we're confident is going nowhere," he said.

David C. Wright, an attorney for Blue Castle Holdings, said he doesn't know specifics about the company's finances but he's confident they'll make the payments. Wright said he's glad to hear the environmental groups won't fight the ruling, but he's confident the state Supreme Court would have ruled in Blue Castle's favor if the case continued.

The 3,000-megawatt plant would occupy a proposed industrial park about five miles from the small city of Green River, about 40 miles upstream from Moab and two national parks, and about 180 miles southeast of Salt Lake City.

Critics argue the nuclear plant would harm endangered fish, swallow a major portion of limited water on the dry Colorado Plateau and hamper outdoor recreation in the area. Green River, a city of about 1,000 people, is known for its melon growing and is a waypoint for hikers venturing out to nearby geologic features and canyons and rafters who are braving the rapids of the Green River and Colorado River. Blue Castle said the fast-growing state will need an additional power source and the plant would be in an area where about 360,000 acre feet of water are unused each year. The project would pull 53,000 acre-feet of water a year from the river.

Wright said the project can move forward now that it's not being bogged down with a court fight. The proposal is a year or two away from getting a site permit from the U.S. Nuclear Regulatory Commission, Wright said.

After that, Blue Castle would need an operational permit from the commission. If approved, construction would take five to seven years, according to Blue Castle, which is headed by former state Rep. Aaron Tilton.

###

Additional information:

Minutes of Kane County Water Conservancy District

1. March 2016 KCWCD Meeting AGENDA ITEM NO. 8: BLUECASTLE HOLDINGS--NUCLEAR POWER PLANT: Mike reported that we had the hearing on January 26th which went very well. There was no new evidence or information brought up from the trial. Attorney John Mabey reported to Mike that he doesn't feel there is any chance that they will be granted an appeal to the Utah Supreme Court on this case. If they decided to appeal this case to the Supreme Court of Utah, there is less than a 10% acceptance rate unless there is new evidence brought up in the appellant court. We should hear back on the decision in June.

2. May 2016 KCWCD Meeting AGENDA ITEM NO. 8: BLUECASTLE HOLDINGS--NUCLEAR POWER PLANT: Mike reported that we are just waiting for the court decision and we believe that we will win the case and will not go to the Supreme Court. We should know by June and at that point we will be getting \$100,000 per year which moves up to \$300,000 and then when the plant is constructed to \$1 million per year.

3. June 2016 KCWCD Meeting AGENDA ITEM NO. 7: BLUECASTLE HOLDINGS--NUCLEAR POWER

PLANT: Mike reported that there is no word on a decision from the Appeals Court. John Mabey reported that there are two cases that will go ahead of us.

4. July 2016 KCWCD Meeting AGENDA ITEM NO. 8: BLUE CASTLE HOLDINGS--NUCLEAR POWER PLANT: Mike reported that we won our court case after 3 years. The decision was unanimous by the appellant court. This is great news and our attorney said the chances for an appeal is almost none. We will have our \$100,000 in 30 days. The next step will be to complete the site plan.

Analysis of the project status:

- 1) Blue Castle Holdings (BCH) will have to start paying \$180,000 per year for the lease of the water rights. In 5 years the lease goes up to \$580,000 per year.
 - 2) BCH has not submitted an application to the Nuclear Regulatory Commission (NRC) for an Early Site Permit (ESP). The ESP process would take about 5 years. It would take between \$50 and \$100 million to finalize the ESP application.
 - 3) In order to actually construct the reactor, they need a construction and operation license, which also costs millions of dollars.
 - 4) No utility has expressed any interest to participate in this project.
 - 5) It will be necessary for BCH to approach the U.S. Fish and Wildlife Service to develop a biological assessment for the project's impact on critical habitat for endangered species.
 - 6) It will be necessary for BCH to apply for a contract with the Bureau of Reclamation to release water from Flaming Gorge Reservoir (upstream).
 - 7) At present, there is a 56% chance the Secretary of Interior will declare water shortages in the Colorado River basin on January 1, 2018 ([news](#) & [presentation](#)).

Groups call for federal investigation of Utah plan to finance Oakland coal export terminal Letter to Attorney General Loretta Lynch cites potential legal and ethical violations of federal law

SALT LAKE CITY?Conservation, health, and good government groups today sent a letter to U.S. Attorney General Loretta Lynch calling for a formal investigation into potential legal and ethical violations in Utah's extraordinary \$53 million taxpayer-funded loan to build a deepwater terminal in Oakland, Calif., to export coal.

The letter, which also was addressed to Gregory J. Gould, director of the Office of Natural Resources Revenue, and Mary Kendall, interim Inspector General of the Department of the Interior, cites Utah's misuse of federal community development funds and the elaborate web of potential conflicts of interest that propelled the scheme through state agency and legislative approval processes with scant public scrutiny.

"It's staggering that the Legislature and Governor were willing to throw tens of millions in taxpayer money at a project so rife with conflicts of interest," said Michael Shea, Policy associate at HEAL Utah. "It is very clear that someone from the outside should take a careful look at this."

The letter lays out the twists and turns in the decades-long effort to export Utah coal overseas through a Pacific port. Several Utah counties began seeking funding to build transport operations to export coal from mines owned by Bowie Resource Holding Partners as early as 2001. In late 2014, in a deal brokered by Jeffrey Holt, a private investment banker, "strategic infrastructure advisor" to the counties and then-chairman of the Utah Transportation Commission, the counties requested a \$53 million loan from Utah's Community Impact Board to finance the terminal.

The Community Impact Board (CIB) is charged with administering proceeds from the royalties to the state under the federal Mineral Leasing Act (MLA). The Act restricts the use of the money to community planning, construction and maintenance of public facilities, and provision of public services to mitigate the adverse impacts of mining on the communities.

The Community Impact Board approved the loan, and then, when questions arose about the misuse of funds, the 2016 legislature gave fast-track approval to Senate Bill 246, a procedure designed to evade the Mineral Leasing Act's funding limitations by swapping state general fund money with Mineral Leasing Act money for the loan.

"It is inconceivable that this is an intended or proper use of \$53 million of MLA, CIB or taxpayer funds and this appears to represent the worst kind of corporate cronyism that members of the Utah legislature are usually so fond of rallying against," said Joshua Kanter, Board Chair, of the Alliance for a Better Utah. "Diverting these funds is not only improper but will leave these communities without the money they really need to help them retool their economic base as the coal industry continues its decline. There has been no showing that there is a shortage of available port capacity for Utah coal or that exporting Utah coal to Asia makes economic sense, either of which is easily addressed by the free-market without this shell-game and abuse of the public trust."

Many of the bill's proponents in the legislature and the governor who signed the bill had received campaign contributions from Bowie, the coal company expected to be the largest beneficiary of the export terminal deal. At the same time, Strategic Infrastructure Advisor Jeffrey Holt and his investment firm could reap millions if the project is completed.

"From the very beginning, the proposal to use Utah taxpayer resources to prop up an out-of-state coal export terminal has never had the best interest of Utahns at heart," said Lindsay Beebe, Utah Organizing Representative for the Sierra Club's Beyond Coal campaign. "We need to develop real solutions to help our communities as our state transitions away from coal. Instead, our public officials have shown that they are more eager to hand out political favors than to help Utah communities across the state that deserve our support."

Meanwhile in California, public records and media reports revealed that Holt and port developer Phil Tagami attempted to conceal the plan to ship coal through the Oakland terminal, instead emphasizing that it would be used to ship agricultural products.

Many residents near the terminal, who already are burdened by significant air pollution, have vocally opposed coal shipments through their communities due to the environmental and public health impacts. The Oakland City Council is meeting June 27 to consider placing “health and safety” restrictions on the operation of any coal terminal in the city. Utah’s legislation to transfer \$53 million in state funds for the project also goes into effect July 1, lending increased urgency to the call for a federal investigation.

VERNAL, Utah—Fourteen conservation groups submitted formal comments to the Bureau of Land Management’s Vernal Field Office Tuesday urging the Obama administration to deny rights-of-way across federal public lands that would allow an Estonian energy giant to sidestep environmental review and pave the way for the first commercial oil shale project in the United States, north of Utah’s scenic Book Cliffs ([map](#)). The groups also delivered more than 35,000 comments from citizens opposed to the project.

The BLM is [moving forward](#) to grant utility rights-of-way to Enefit American Oil, a subsidiary of Estonian government-owned Eesti Energia. Enefit seeks to strip-mine 9,000 acres for oil shale near the Green and White rivers, and ultimately expand its operations to process up to 1.2 billion barrels of kerogen oil.

“The BLM is charged with safeguarding the American public interest and our national inheritance – our federal public lands,” said Anne Mariah Tapp, energy program director for the Grand Canyon Trust. “But instead the BLM is preparing to flip the ‘on’ switch for Enefit’s massive oil shale strip mine and jumpstart development of one of the world’s most polluting industries. The interests of an Estonian mining giant should not trump those of the American public.”

The groups argue the BLM would be allowing Enefit to sidestep critical environmental reviews designed to protect public health, land, air, water, and wildlife. The company has yet to reveal a development plan for its mining project, but requests approval for its rights-of-way nonetheless.

“Enefit’s massive strip-mining and refining operations will unleash significant air and climate pollution in an area that’s already suffering from some of the nation’s most unhealthy wintertime smog,” said Ted Zukoski, an attorney with the pro bono law firm Earthjustice. “But Enefit has refused to provide federal agencies or the public with information about the project’s air and climate pollution until after it gets BLM’s okay to start building access for water, power, and roads. That’s backwards. Enefit can’t be allowed to game the system by getting federal approval first, but only owning up to the project’s damage later.” The groups’ comments assert that the rights-of-way would amount to a federal subsidy.

“The Interior Department is working against President Obama’s climate goals here,” said Taylor McKinnon, with the Center for Biological Diversity. “Subsidizing the development of one of the world’s dirtiest fossil fuels is the opposite of climate leadership. Doing so in the Colorado River Basin is the opposite of prudent water policy. The administration should abandon this project now.”

The BLM lacks critical information it needs to assess whether or not the project is in the public interest, including the long-term air quality and climate impacts of emissions from mining and processing; the quantity and source of water required; water-quality impacts related to the estimated 23 million tons of spent shale waste a year the project would produce; and potential consequences for endangered species.

Amy Mall, a senior policy analyst with the Natural Resources Defense Council’s Land and Wildlife Program, said: “It’s unfathomable—and inconsistent with the administration’s climate goals—for BLM to give Enefit access to public lands so it can damage them, threaten surrounding communities, and worsen both air quality and climate change. Enefit has not provided enough data on the potential impacts of its mining project and BLM shouldn’t make a decision based on an incomplete environmental assessment.”

Local groups draw attention to threats to Utah. “The utility corridor will facilitate a massive oil shale development that will further compound the damage to Utah’s air, water, wildlife, and land,” said Denni Cawley, executive director of Utah Physicians for a Healthy Environment. “This is not the right direction to go to secure a sustainable future for those who live in that area.”

“Shale waste runoff will contaminate Evacuation Creek, the White River, and the Green River, which are all important for the recovery of endangered fish, and for communities downstream,” said John Weisheit, conservation director for Living Rivers.

An Estonian environmental advocate recently stated [in an op-ed](#) in the Salt Lake Tribune that in her country “the oil shale industry has permanently damaged many of our most important natural resources” and warned Utahns against similar harm.

###

BACKGROUND

About Enefit:

Enefit American Oil owns or holds leases to approximately 30,000 acres of federal, state and private lands in eastern Utah. They are seeking to develop oil shale deposits there.

The company:

Filed a 26 million euro impairment loss for activities associated with its Utah holdings in January 2016; holds a 10-year lease for oil shale research on BLM lands; the lease was issued in 2007, has yet to start work.

About the 5 Rights-of-Way:

Rights-of-way across public lands Enefit has applied for include: 19 miles of water supply pipeline; 8 miles of natural gas supply pipeline; 10 miles of oil product line; 29 miles of 138kV powerlines; 5 miles of upgrading a county dirt road.

Enefit’s Plans:

Massive Refinery: Building a half-square mile industrial complex in the desert – the first commercial-scale oil shale-to-shale oil plant in United States history, nearly doubling the oil production in the Uinta Basin, which already has over ten thousand oil and gas wells.

Strip Mining:

Up to 28 million tons of rock per year, resulting in waste rock totaling up to 750 million tons Depleting

Rivers: Removing up to 100 billion gallons of water from the already over-allocated Colorado River Basin during the next three decades.

Air Pollution:

Emitting a toxic soup of air pollutants in an area that already suffers from some of the worst smog in the nation.

The Wrong Way on Carbon:

Using an mining and refining process that requires up to nearly 40% more carbon per unit of energy than conventional oil, and more even than notoriously dirty tar sands.

[this website](#)

Narrative: The Bureau of Land Management has announced that it would pave the way for dirty oil shale development in the Uinta Basin, near Utah's scenic Book Cliffs and the Green and White rivers.

The plan would permit Enefit, a foreign company, to build oil, gas and electric transmission lines across miles of public land to enable up to 9,000 acres of strip mining for oil shale. We have until June 14 to write the BLM and stop this plan from going through!

Oil shale is not oil at all, but a rock that, if superheated to hundreds of degrees for long periods, will release a goo that can be further refined into liquid petroleum.

Current oil shale technology requires that the land be effectively strip mined, which destroys wildlife habitat and requires massive amounts of water—already precious and dwindling in the arid and over-allocated Colorado River basin where oil shale rocks are found. It would likely also require large amounts of energy—and huge amounts of climate pollution—just to process the rock into petroleum.

Enefit hopes to produce 50,000 barrels of petroleum a day, every day, for 30 years. The company estimates that producing and burning this fuel will cause nearly 40% more greenhouse gas emissions than similar amounts of regular oil. To prevent the worst impacts of climate change we need to be moving to cleaner fuels, not dirtier ones.

For years Earthjustice has worked with groups in this region to stop any efforts to move forward with oil shale development. Now the public has an opportunity to send a message to the BLM that it should stop subsidizing dirty fossil fuels and not allow Enefit to use our lands to pollute the climate, poison the air and guzzle water from our shrinking rivers.

Indigenous & Community Voices to Protect the Colorado River, Its Tributaries, People and Sacred Places

What: Upstream Downstream Short Film Festival and Forum

When: Tuesday May 24th at 7pm ?Where: Grand Center (182 N 500 W, Moab, Utah)

Admission: Free (donations welcomed to help cover costs)

Moab, Utah – In the face of ongoing threats to the Colorado River, its tributaries, people and sacred places, the “Upstream – Downstream Film Festival & Forum” will be held in Moab, Utah on Tuesday, May 24th at 7 pm.

The evening will feature four short films as well as speakers from tribes in Utah and Arizona. Concerned about the proposed Green River nuclear power plant and funding cuts in the cleanup of radioactive uranium tailings next to the Colorado River, tribal leaders and Elders from the Colorado River Indian Tribes will be traveling nearly 600 miles to Moab from their home along the river in Parker, Arizona for the film festival and forum.

They will be joined by tribal members from the White Mesa Ute Community, Hopi Tribe, Navajo Nation and Uintah Ouray Ute Tribe who will discuss efforts to protect the rivers, people and sacred sites from

destruction and desecration. Local Moab residents and grassroots groups concerned about pollution, climate change and protection of indigenous sacred sites are organizing the film festival and are working to bring together “upstream and downstream” communities and tribes in Utah and Arizona to strengthen ongoing efforts.

The films to be screened are:?

Half Life - the story of American's last uranium mill? In southeast Utah lies America's last remaining Uranium Mill. The Ute Mountain Ute Tribe worries that lax regulations and the mill's aging infrastructure threaten their water supply and way of life.??

Marking of a Milestone? - The Colorado River Indian Tribes are working to protect the river and sacred sites, and are facing challenges from industrial scale solar power projects in the Mojave Desert.??

Defending the Sacred - ?Story of the long battle by the Colorado River Native Nations Alliance and environmental justice allies that defeated a nuclear waste dump proposed on sacred land at Ward Valley near the Colorado River.??

Bears Ears: The Movement to Protect a Cultural Landscape - ?Hear about the effort by Native Nations to protect the Bear's Ears area, a place rich in indigenous history and culture in a landscape of canyons, mesas, arches, red rocks and the Bear's Ears twin buttes.

SALT LAKE CITY— The Bureau of Land Management announced this week that it is moving toward allowing dirty oil shale development that could be a double whammy for the environment, unleashing nearly a half a billion tons of greenhouse gases and consuming vast amounts Colorado River basin water. It would be the first commercial oil shale production facility in the United States.

The Bureau said that on April 8 it will release a draft environmental impact statement for the “Enefit American Oil Utility Corridor Project.” It would allow Enefit, an Estonian company, to build water, oil, gas and electric transmission across federal public land in Utah to enable oil shale mining on state or private land. Enefit hopes to process up to 1.2 billion barrels of kerogen oil — one of world’s most carbon-polluting fuels — with estimated lifecycle greenhouse gas emissions of up to 450 million tons of carbon dioxide equivalent, about the same as 100 coal-fired power plants emit in a year.

“President Obama was right when he said in his State of the Union that ‘we’ve got to accelerate the transition away from old, dirtier energy sources’,” said Ted Zukoski, an attorney at Earthjustice. “It’s time BLM got the memo and stopped wasting taxpayer money subsidizing companies that would foul our atmosphere and endanger our planet, and our future.”

“The Interior Department is working against President Obama’s climate goals here,” said Taylor McKinnon with the Center for Biological Diversity. “Enabling the development of one of the world’s dirtiest fossil fuels is the opposite of climate leadership. The administration should abandon this project now.”

“We don’t need to take on this environmental disaster that comes with developing the dirtiest fuel on the planet — oil shale,” said Rob Dubuc, senior staff attorney at Western Resource Advocates. “Renewable energy innovations and improvements in energy efficiency make this fuel unnecessary to develop. BLM should not advance this project.”

The draft environmental impact study comes only months after the United States and countries around the world committed, at the Paris climate negotiations, to the goal of limiting global warming to 1.5 degrees Celsius above preindustrial levels. Reaching that goal will require dramatic reductions in carbon pollution — the key driver of climate change — and leaving the vast majority of fossil fuel reserves in the ground. Enefit’s mining facility would expand development and use of one of the world’s highest carbon fuels.

“There is more energy in a similarly sized baked potato than in a chunk of oil shale,” said Steve Bloch, legal director for the Southern Utah Wilderness Alliance. “We know that burning oil shale in a giant oven can produce shale oil; the question that needs to be asked is whether proceeding with this type of project makes any sense in a carbon constrained 21st century. The unequivocal answer is no. The time has come to turn our backs on the carnival barker’s promise that oil shale will be answer to our nation’s energy needs.”

“It is true that Enefit has made the mining and production of oil shale work for the energy needs of Estonia. However, Estonia also produces more greenhouse gas emissions per capita than other European countries, including Russia,” said John Weisheit with Living Rivers and Colorado Riverkeeper. “What Estonia has, that Utah does not, is ample water supplies to process that oil shale. Ironically, the similarity between the governments of Utah and Estonia is their subsidy of dirty energy projects with public money.”

The proposed facility will be located in the Uinta Basin, approximately 12 miles southeast of Bonanza in Uintah County, Utah, near the Green and White Rivers. The project is designed to develop oil shale mining and a shale oil production complex, at full build-out producing about 28 million tons of raw oil shale

ore rock per day and 50,000 barrels per day of refinery-ready shale oil from the Green River Formation. "Oil shale is a thirsty industry," said Anne Mariah Tapp with the Grand Canyon Trust. "The Colorado River Basin is already looking at up to a 27 percent decrease in April to July flows due to climate impacts. At a rate of up to four barrels of water per barrel of oil, Enefit's project poses an unacceptable threat to limited Colorado River Basin water supplies. Both in terms of carbon footprint and water demands, the West's water future would be drastically compromised by this oil shale program."

"The legacy of the Green River will live or die on the decisions we as a country make here and now," said Lauren Wood with Green Riverkeeper. "The Green River watershed cannot survive as a vibrant source of life in a desert if the BLM continues to view the landscape it runs through as a source of death and climate devastation. It's time to close this chapter of our shared history where we strayed into such extreme and dangerous forms of energy; that isn't our legacy, it's our nightmare."

"This oil shale project would be another significant source of pollution in an area that just can't take any more," said Dr. Brian Moench with Utah Physicians for a Healthy Environment. "During the drilling boom of 2013 the air pollution in the Uinta Basin was literally off the charts, as much as would be expected from 100 million cars, eight times more cars than in all of Los Angeles. It would be unconscionable to allow anything that would make that even worse."

"A century's worth of failed efforts has demonstrated that trying to turn rocks into oil is a fool's errand, but somehow Enefit expects a different result this time," said Bobby McEnaney, a senior analyst for the Natural Resources Defense Council. "The last thing this administration should be considering is a proposal that amount to fossil fuel alchemy, particularly when cleaner energy sources are readily available."

Historic Petition Urges Obama to Halt All New Offshore Fossil Fuel Leases

WASHINGTON— More than 45 climate, conservation, indigenous and coastal organizations representing the major coastal regions of the United States filed a legal petition today calling on President Obama to align U.S. energy policy with his climate goals by issuing an executive order to end new oil and gas lease auctions in federally controlled oceans — including the Arctic, Atlantic and Gulf of Mexico.

The order, under the authority of the Outer Continental Shelf Lands Act, would make federally managed waters that have not already been leased to industry unavailable for new leases. Halting new fossil fuel leases on more than 1 billion acres off America's coasts would keep up to 62 billion tons of carbon emissions in the ground — the pollution equivalent of more than 16,000 coal-fired power plants.

The order would be a step toward limiting global warming to 1.5 degrees Celsius above pre-industrial levels, consistent with the 2015 Paris Agreement, by preventing the leasing of new offshore oil and gas. To stay within the 1.5 degree limit, the vast majority of known fossil fuels must remain unburned and kept safely in the ground.

The petition, led by the Center for Biological Diversity, comes on the heels of the administration's proposed five-year plan governing future federal offshore oil and gas leasing. The proposal would expand leasing in the Arctic and Gulf of Mexico, risking more disastrous spills, putting wildlife and communities in harm's way and deepening U.S. dependence on the fossil fuels that are driving the global climate crisis.

Despite its name, leases outlined in the five-year program would allow for oil and gas production over the next 40 to 70 years, long past the point that scientists say fossil fuels should be phased out.

Continuing to rely on fossil fuels decades into the future undermines a rapid and essential transition to renewable energy. The petition calls on President Obama to align federal leasing policy with U.S. climate change goals while promoting a rapid transition to a clean energy economy, starting with a halt in offshore leasing.

Groups joining today's petition are the Center for Biological Diversity, Food and Water Watch, Friends of the Earth, Greenpeace, Oil Change International, Rainforest Action Network, Waterkeeper Alliance, Alaska Inter-Tribal Council, Alaska Rising Tide, Altamaha Riverkeeper, Apalachicola Riverkeeper, Assateague Coastal Trust, Atchafalaya Basinkeeper, Cahaba Riverkeeper, California Coastal Protection Network, Chesapeake Climate Action Network, Clean Ocean Action, Cook Inletkeeper, Courage Campaign, Crystal Coast Waterkeeper, Emerald Coastkeeper, Environmental Defense Center, Environmental Youth Council, Eyak Preservation Council, Friends of Matanzas, Gulf Restoration Network, Institute for Fisheries Resources, Kootenai Environmental Alliance, **Living Rivers**, Louisiana Bucket Brigade, Matanzas Waterkeeper, Miami Waterkeeper, Native Conservancy (Land Trust), Ocean Conservation Research, Pacific Coast Federation of Fishermen's Associations, Preserve Our Wildlife, Prince William Soundkeeper, Resisting Environmental Destruction on Indigenous Lands (REDOIL), Riverkeeper, Sea Turtle Oversight Protection, Seneca Lake Guardian, Suncoast Waterkeeper, Turtle Island Restoration Network, Wabash Riverkeeper Network, Whale and Dolphin Conservation, WILDCOAST and WildEarth Guardians.

Download the [petition](#).

Statements from petition signatories: "President Obama recognized oil drilling off the Atlantic coast was a bad idea. But the same logic — that we must protect our climate, wildlife and coastal communities from oil spills and carbon emissions — holds true for all ocean coasts," said Miyo Sakashita, oceans program director at the Center for Biological Diversity. "So we're calling on the president to honor his climate change pledges and end future fossil fuel leasing from all federal offshore areas."

"President Obama has acknowledged that in order to prevent climate catastrophe, we must transition away from dirty fossil fuels and keep the vast majority of them in the ground. He has the authority to drive that transition by permanently protecting our public waters from oil and gas exploitation," said Marissa Knodel of Friends of the Earth. "To cement his climate legacy and honor his administration's climate goals, President Obama should not offer any new leases in the 2017-2022 offshore drilling program and withdraw all federal offshore areas from future leasing."

"It's time to stop the corporate giveaway of public lands and waters. Obama has the power to create real, lasting change by ending the fossil fuel leasing program. An executive act would cut 25 percent of U.S. climate change emissions and set the stage to transition beyond fossil fuels," said Amanda Starbuck, program director for Rainforest Action Network.

“President Obama must apply a climate test to offshore drilling and the rest of our energy policy. When he does, he’ll see that offshore drilling fails that climate test,” said David Turnbull, campaigns director at Oil Change International.

“Any areas being opened up for leasing now will not even begin producing oil and gas for at least five years. By then we should be well on our way toward ending destructive fossil fuel extraction, not adding new rigs,” said Marc Yaggi, executive director of Waterkeeper Alliance. “By focusing our investments on a clean-energy future, the Obama administration will secure its climate legacy, ensuring economic and environmental resilience for future generations.”

“The recent Refugio Oil Spill off the coast of California reminds us of the inevitable risks of offshore oil and gas development,” said Linda Krop, chief counsel of the Environmental Defense Center. “These risks are compounded by the devastating and long-lasting effects of climate change on our coastlines, communities, wildlife and public health.”

“Alaska stands on the front lines as an Arctic region whose ecosystems and communities are some of the most dramatically affected by climate change,” said Stephen Jolley of Alaska Rising Tide. “If we are committed to social justice and equality for all, we must act as allies to those communities whose social and spiritual health relies on their continued relationship to the land by halting operations that would send our bountiful home into further decline.”

“From sea level rise and extreme storms fueled by climate change, to coastal erosion, to frequent spills and accidents, the people of the Gulf of Mexico are on the frontline of the impacts from the oil and gas industry,” said Cynthia Sarthou, Executive Director of the Gulf Restoration Network.

“Even after the BP disaster, the industry and its political allies continue to actively resist new safety reforms. It is time for the President to end new offshore leasing and promote a transition to a more stable, sustainable and equitable economy for our communities and climate.”

“While we were glad President Obama listened to the communities and citizens of the Atlantic coast and removed that area from offshore leasing, our work is not done,” said Matanzas Riverkeeper Neil A. Armingeon. “We must support those who continue to fight oil and gas development in their communities, and we hope President Obama will once again do what’s right and end new leasing in the Gulf and the Arctic.”

Background

The American public owns nearly 650 million acres of federal public land, and more than 1.7 billion acres of Outer Continental Shelf (the oceans between 3 and 200 miles off the coast) — and the fossil fuels beneath them. This includes sensitive oceans and coastlines, including Alaska’s Chukchi Sea, the Gulf of Mexico and the Eastern Seaboard. These places and fossil fuels, held in trust for the public by the federal government, are administered by the Department of the Interior for potential leasing.

Over the past decade, the combustion of federal fossil fuels has resulted in nearly a quarter of all U.S. energy-related emissions. An August report by EcoShift consulting, commissioned by the Center for Biological Diversity and Friends of the Earth, found that remaining federal oil, gas, coal, oil shale and tar sands that have not been leased to industry contain up to 450 billion tons of potential greenhouse gas pollution.

Burning the recoverable oil and gas under federal waters would release 61.5 billion tons of greenhouse gases into the atmosphere, the equivalent of driving 13 billion passenger cars for one year.

As of this year, 67 million acres of public fossil fuels were already leased to industry, an area more than 55 times larger than Grand Canyon National Park and containing up to 43 billion tons of potential greenhouse gas pollution. Last year Sens. Merkley (D-Ore.), Sanders (D-Vt.) and others introduced legislation to end issuance of new federal fossil fuel leases.

Days later President Obama canceled the Keystone XL tar sands pipeline, saying, "Because ultimately, if we're going to prevent large parts of this Earth from becoming not only inhospitable but uninhabitable in our lifetimes, we're going to have to keep some fossil fuels in the ground rather than burn them and release more dangerous pollution into the sky."

Living Rivers Potash Report

[CLICK HERE](#) to read the report

[Click here](#) to read and listen to the broadcast on KUER (radio).

Executive Summary

The Bureau of Land Management (BLM) is currently preparing a management plan — known as the Moab Master Leasing Plan — to govern oil, gas and potash leasing and development on approximately 750,000 acres of public lands in eastern Utah. In this report, we detail the important environmental and economic risks of increased potash development and outline strategies for mitigating these risks by adopting responsible zoning decisions, best management practices, and other measures.

Definition: Potash is a type of salt used mainly as a fertilizer.

Potash evaporation ponds near Moab

Under its most recent proposed plan, the BLM estimates that each year potash development would require about 2.8 billion gallons of water. These enormous water demands would impose a considerable burden on the Colorado River Basin where existing supplies are already depleted and demand for water is projected to rise.

Water availability is not the only problem. Low potash prices and market volatilities make future development risky. Market downturns, which have been frequent for potash, could halt operations and leave behind abandoned facilities and infrastructure. Potash development could also negatively impact existing, stable economic output. Outdoor recreation on public lands around Moab — hiking, biking, rafting, jeeping, sightseeing, to name a few — continue to provide sustainable and durable economic growth to local communities. These critical economic contributors must be protected as the BLM seeks to increase potash development around Moab.

While the challenges are many, there are a few concrete steps the BLM can follow to mitigate the impacts of proposed potash development. For starters, because of the water demands and the economic risks involved, BLM should carefully regulate any future potash development on the public lands around Moab. Requiring companies to prove the economic viability of their operations before development is initiated would help ensure proposed developments won't result in abandoned operations with a myriad of impacts to air, water and the local economy. Also, imposing robust protections for air and water quality during production activities, along with strict reclamation and mitigation requirements would help alleviate some of the environmental risks. These types of "best management practices," along with others outlined in this report, are critical to any responsible potash development plan for the public lands around Moab.

Legal Protest Challenges Fossil Fuels Auction on 8,000 Acres in Colorado

Fracking Threatens Climate, Endangered Fish, Roadless Forests

For Immediate Release, March 15, 2016

Contact:
Taylor McKinnon, Center for Biological Diversity, (801) 300-2414
John Weisheit, Living Rivers and Colorado Riverkeeper, (435) 259-1063
Matt Sandler, Rocky Mountain Wild, (303) 579-5162

DENVER— Conservation groups filed a formal administrative protest on Monday against a Bureau of Land Management plan to auction off more than 8,000 acres of publicly owned oil and gas in the San Juan National Forest and Little Snake Field Office in western Colorado.

“Each new federal fossil fuel lease takes us closer to climate disaster,” said Taylor McKinnon with the Center for Biological Diversity. “Leaving a livable climate for future generations requires keeping fossil fuels in the ground now, and we should start with the public lands that President Obama controls.”

The protest, filed by the Center for Biological Diversity, Living Rivers, Utah Rivers Council, Rocky Mountain Wild and Sierra Club, calls on the BLM to abandon its auction plans and keep fossil fuels in the ground to protect the climate, wildlife and public lands. The protest identifies the plans’ failure to analyze climate impacts or consider an alternative that would suspend public lands fossil fuel development to protect the climate.

The protest challenges the Bureau’s failure to protect the endangered Colorado pikeminnow and its Colorado River and San Juan River Basin habitat from the impacts of water depletions caused by oil and gas development, toxic spills, climate change and corresponding declines in river flows. It also challenges leasing on four parcels located on U.S. Forest Service lands designated as roadless areas under the 2011 Colorado Roadless Rule. “We understood that when Congress passed the 2005 Energy Policy Act, it was bad news for the Colorado River basin for this one fundamental reason: That water consumption by the energy corporations would increase the demand for water in an over-appropriated system, compounded by the impairment to the water cycle from greenhouse gas emissions,” said John Weisheit with Living Rivers and Colorado Riverkeeper. “The federal government must make the right choice and deny these permits so people and wildlife will have secure and clean water.”

Monday’s protest is part of a rapidly growing national movement calling on President Obama to define his climate legacy by halting new federal fossil fuel leases on public lands and oceans — a step that would keep up to 450 billion tons of potential carbon pollution in the ground. “Keep It in the Ground” rallies opposed to federal fossil fuel auctions have been growing across the country, and have caused several of those auctions to be postponed.

“BLM’s decision to lease thousands of acres within designated roadless areas undercuts the importance of this designation,” said Matt Sandler with Rocky Mountain Wild. “These undeveloped, contiguous areas

are essential for many species like Canada lynx and Columbian sharp-tailed grouse.” Download the protest [here](#).

Background

The American public owns nearly 650 million acres of federal public land and more than 1.7 billion acres of Outer Continental Shelf — and the fossil fuels beneath them. This includes federal public lands like national forests and wildlife refuges that make up about a third of the U.S. land area — and oceans like Alaska’s Chukchi Sea, the Gulf of Mexico and the Eastern Seaboard. These places and fossil fuels beneath them are held in trust for the public by the federal government; federal fossil fuel leasing is administered by the Department of the Interior.

Over the past decade, the combustion of federal fossil fuels has resulted in nearly a quarter of all U.S. energy-related emissions. An August report by EcoShift consulting, commissioned by the Center for Biological Diversity and Friends of the Earth, found that remaining federal oil, gas, coal, oil shale and tar sands that has not been leased to industry contains up to 450 billion tons of potential greenhouse gas pollution. As of earlier this year, 67 million acres of federal fossil fuel were already leased to industry, an area more than 55 times larger than Grand Canyon National Park containing up to 43 billion tons of potential greenhouse gas pollution.

Last year Sens. Merkley (D-Ore.), Sanders (D-Vt.) and others introduced legislation to end new federal fossil fuel leases and cancel non-producing federal fossil fuel leases. Days later President Obama canceled the Keystone XL tar sands pipeline, saying, “Because ultimately, if we’re going to prevent large parts of this Earth from becoming not only inhospitable but uninhabitable in our lifetimes, we’re going to have to keep some fossil fuels in the ground rather than burn them and release more dangerous pollution into the sky.”

Associated Press

Company slows work on controversial Utah tar sands project

Environmentalists are celebrating after the Canadian company behind a controversial tar sands development in eastern Utah announced it is scaling back work on its project.

Calgary-based U.S. Oil Sands Inc. announced plans Thursday to cut back on construction on its PR Spring project, which is located in the Book Cliffs about 170 miles from Salt Lake City and is 85 percent complete. The company said low oil prices forced two of its major contractors to shutter operations in Utah, and said it didn't have all the financing it needed.

"The oil industry is facing one of the most challenging environments it's ever seen and it is prudent for us to adjust our construction plan accordingly," said US Oil Sands CEO Cameron Todd, adding that the cutback would be designed so it can restart quickly when conditions improve. "The company's actions today help ensure US Oil Sands will be a future industry leader."

While companies extract petroleum from sand in Canada and Venezuela, the \$60 million Utah project would be the first commercial effort of its kind in America. U.S. Oil Sands says it uses natural citrus extract to safely process the sand, but opponents say it will contaminate water and destroy wildlife habitat.

Conservation groups have challenged the permits authorizing the project and have been arrested for chaining themselves to equipment in an effort to thwart construction. But the biggest obstacle appears to be crude oil prices that have tumbled to about \$31 a barrel, down from a peak of \$147 a barrel in 2008.

Rob Dubuc, a Utah-based attorney with the environmental group Western Resource Advocates, says the work slowdown was at least a temporary victory.

"That makes my day and everyone's day who likes clean air, clean water and a friendly climate," he wrote in a blog post on the group's website, arguing that tar sands result in up to three times the carbon pollution of conventional oil.

"Mindless of how ridiculous this policy choice is, Utah politicians continue to declare that the state is "open for business" when it comes to development of these very dirty fossil fuels," Dubuc said, calling the endeavor "a bad idea at any price."

01/11/16

CBD & LR Challenge BLM To Frack 45,000 acres in Utah

The Center for Biological Diversity and Living Rivers on Monday filed a formal administrative protest challenging the Bureau of Land Management's decision to auction more than 45,000 acres of public land in Utah for fracking. The sale, which was postponed in November due to impending protests, includes parcels in the BLM's Moab, Price, Vernal and Fillmore field offices in central and eastern Utah and within the Fishlake National Forest in Sevier County.

"If President Obama wants to limit warming to 1.5 degrees Celsius, as he agreed to do at the Paris climate talks, he needs to end the federal fossil fuel leasing program," said the Center's Taylor McKinnon. "Each new auction undermines that goal with more carbon pollution while destroying fragile Utah canyon country and harming air, water and habitat for imperiled species like endangered Colorado River fish, Mexican spotted owls and greater sage grouse."

The filing calls on the BLM and the Obama administration to cancel the fossil fuel auction and "keep it in the ground." A study commissioned by the Center and Friends of the Earth late last year projects that the potential greenhouse gas pollution from unleased federal fossil fuels is incompatible with any U.S. share of global carbon budgets to keep warming below 2 or 1.5 degrees Celsius, a goal world leaders agreed to in the Paris climate pact. It also found that banning new fossil fuel leases on public lands and oceans would keep up to 450 billion tons of greenhouse gas pollution out of the atmosphere.

"With oil companies in liquidation, a warming climate and dwindling Colorado River supplies, committing more Utah canyon country to fossil fuel industrialization makes no sense," said John Weisheit, conservation director at Moab-based Living Rivers. "Now is the time to transition to clean, renewable energy, and to keep climate-destroying fossil fuels in the ground."

Avoiding dangerous warming requires leaving the vast majority of already proved fossil fuels undeveloped. By opening new fossil fuel deposits, federal fossil fuel auctions perpetuate a stark conflict between the Obama administration's climate goals and its "all of the above" energy policy.

Facing growing public support for the "Keep It in the Ground" movement to end new leases for federal oil, gas and coal extraction, federal officials halted oil and gas auctions slated for Utah and Washington, D.C. Hundreds of people turned out for similar protests last fall in Nevada, Wyoming, Colorado and Alaska. More than 400 organizations and leaders working on the "Keep It in the Ground" campaign have called on Obama to end new federal fossil fuel leases following reports that doing so would keep up to 450 billion tons of greenhouse gas pollution in the ground, and that the president has the legal authority to do so now, without Congress. Those emissions would be incompatible with any reasonable U.S. share of global carbon budgets to avoid catastrophic warming.

Preparing For Drier Future Along Colorado River

[Click here](#) to read this story by Ian James of *The Desert Sun*.

This feature is about the procrastination behind Drought Contingency Planning from the seven states of the Colorado River Basin, and that the proposed planning is not robust.

OpEd

2/18/17

Tribune Editorial Board: Bureaucratic kinks may block the Lake Powell Pipeline. Good.

Terry Gilliam's 1985 movie "Brazil" depicts an oppressive society ruled by bureaucrats and red tape. It is so dreary that it doesn't even offer its residents the pleasure of hating a single Big Brother figure, because no one really seems to be in charge.

One scene in particular illustrated how everything just rolls along with seemingly little human agency. That's when poor Archibald Tuttle (Robert De Niro), a man labeled a terrorist because he fixes people's air conditioning systems without authorization, is literally consumed by a storm of paperwork.

In the real world, there was news Tuesday that Utah's proposed Lake Powell Pipeline, a project estimated to cost upwards of \$1 billion, may find itself consumed by federal red tape. But, unlike the tragedy that befell the brave Mr. Tuttle, the sight of this colossal boondoggle disappearing into a blizzard of forms, reports, comment fields and permit applications actually stands to be good news, for Utah and all of the American West.

The Federal Energy Regulatory Commission, aka FERC, Tuesday announced that it had granted the state a permit for one aspect of the plan to pipe water from the rapidly shrinking Lake Powell 140 miles west to the rapidly growing St. George area.

But folks at the Utah Division of Water Resources were somewhat nonplussed to learn that all FERC was permitting was the six hydroelectric generating stations envisioned to be peppered along the pipeline's route — because that's the kind of thing FERC regulates.

All the other stuff — environmental impact concerns for the pipeline and its various water storage facilities — may be sent along to other federal agencies, probably including but not necessarily limited to the National Park Service and the Bureau of Land Management.

Those agencies, and all the public and bureaucratic processes their charters require, may leave the state looking at a cost of much more than the \$30 million it — meaning

state taxpayers — has already laid down on the project. All before a single spade of dirt has been turned.

Whatever delay this turn of events will cause is actually a good thing. Nobody really knows just how much this monstrosity will cost. Whether that cost can reasonably be covered by (possibly staggering) increases in water bills paid by end users or have to be underwritten by the rest of the state. Whether climate change and/or proposed changes in the way the Colorado River is managed will leave enough — or any — water in Lake Powell to be piped.

Ideally, the people who are in charge of managing water in Utah generally and in Washington County in particular would take bureaucratic curve ball as an opportunity to abandon the whole project once and for all and focus all their energies on some extreme conservation measures that are going to be necessary, pipeline or no pipeline.

They can, as Utah politicians are wont to do, blame the feds. We would understand.

OpEd - 12/12/17

Crescendo of crisis on the Colorado

By Richard "Tick" Segerblom

The Nevada Independent

Wow, so this is what it looked like watching Rome burn?

Or in our case, farmers' fields and family taps running dry while Colorado River water managers hole up at Caesars Palace rearranging the deck chairs poolside.

For more than a decade, the crescendo from outside the Palace has been that Southern Nevadans and the other 38 million people reliant on this river should prepare for major shortages. In the past two decades alone, streamflow is nearly 19 percent lower than what we've been taking, and the scientific community warns that we must prepare for shortages of 35 percent or more.

But what will members of the Colorado River Water Users Association be discussing this week under the banner of their "Many Instruments, One Orchestra: The Music of the Basin" conference? A drought contingency plan that at best kicks the can down the road for another year or two, hoping nature decides to dramatically change her tune.

By releasing water from small reservoirs in the uppermost reaches of the basin, combined with some surplus water stored in Lake Mead, they intend to utilize a one-time buffer of some 2.7 million acre feet, which is only equivalent to the current annual supply deficit.

In addition, they propose to add upwards of 1.3 million acre feet in conservation measures in the lower basin. This amount just barely covers the 1.2 million acre feet of

ongoing, annual system losses of seepage and evaporation known as the “structural deficit,” which has never been accounted before, thus adding little in real savings.

We’re still not even treading water here as we watch Lake Powell and Lake Mead recede further. And as these reservoirs drop, what’s going to happen to our water quality as they approach their minimum, “dead pool” levels?

There’s tremendous uncertainty about what will be in that water, and how and if we’ll be able to treat it. And what of the endangered fish, like those in Grand Canyon, that too rely on this diminishing supply. We spend millions each year trying to recover their populations already, and soon they may be exposed to even more precarious conditions.

Most importantly, when are we going to make the indigenous peoples of this basin whole? Sure, some of the tribes who have secured water rights from this system will be presenting to the “orchestra” this week, but there are at least 13 others whose claims amount to a considerable total that are yet to be determined. This includes the Hopi Tribe, which maintains the longest continuous settlement in the entire basin and whose supply is tainted with deadly heavy metals.

Instead of shuffling the deck, these water managers must accept that their house of cards is teetering dangerously. Nonetheless, they want to build more dams and diversions in Colorado and toss a straw into Lake Powell for yet more golf course developments in St. George.

We need to be talking about less, not more. What kind of benefits we might see by operating just one major reservoir on the Colorado as opposed to two. Can storage needs be concentrated in Lake Mead, supplemented by expanded underground, off-stream aquifer recharge such that Lake Powell can be removed from the system? Can we work to recover the high-value ecosystem in Grand Canyon National Park and submerged sacred sites under Lake Powell while we build increased resilience in our own water supply/demand equation?

And Las Vegas, let’s not forget that Glen Canyon Dam nearly failed in 1983, so filling that reservoir remains risky business. Should it fail, our own infrastructure for extracting water will be compromised, and a 70-foot wall of water could be tumbling over Hoover dam for eleven days.

Las Vegas is the community that has its roots at the beginning of the Colorado River’s plumbing system, where bold ideas both settled the West and brought much hardship and suffering to its native peoples. We need bold ideas now that recognize this legacy to correct the problems, not some symphony of soothsayers trying to convince us everything is going to be all right.

###

Richard S. “Tick” Segerblom is an attorney and politician. First elected to the Nevada Legislature to represent Assembly District 9 in 2006, he was elected to the Nevada Senate in 2012 to represent District 3. He intends to leave the Nevada Legislature to

run for a Clark County Commission seat in District E to replace term-limited Commissioner Chris Giunchigliani. District E represents part of the Strip and extends to much of the eastern Las Vegas Valley.

Lake Powell Pipeline Approved for Environmental Analysis (EIS)

Feds give initial OK to Utah's application to build Lake Powell pipeline — but with a major, unexpected twist

Salt Lake Tribune
By Emma Penrod

The Federal Energy Regulatory Commission has given its initial approval to Utah's application to build the controversial Lake Powell Pipeline to pipe Colorado River water from Glen Canyon Dam, above, 140 miles to St. George — but many hurdles remain for the project.

Federal regulators have tentatively approved Utah's application to build the Lake Powell Pipeline, but they've also thrown the state an unexpected curveball.

On Tuesday, the Federal Energy Regulatory Commission (FERC) issued a notice that it had accepted Utah's application to construct the 140-mile pipeline, intended to pump Colorado River water from Glenn Canyon Dam to St. George and 12 other southern Utah communities. That, FERC said, clears the way for a full study of the project's environmental impacts.

"This is a major milestone toward meeting Southern Utah's need to diversify its water supply and develop additional resources to meet anticipated demand," Eric Millis, director of the state Division of Water Resources, said in a statement. "Permitting a water project is a lengthy process and this is a significant step."

But FERC also said it was reviewing just how much jurisdiction it actually has over the project — a move that could slow down ultimate approval for the billion-dollar-plus underground pipeline, which is already running behind schedule.

State officials filed the permit application with FERC in 2016 because the Lake Powell Pipeline — at least as currently proposed — is expected to include hydroelectric generating stations along its route through Arizona and Utah. Officials with the Division of Water Resources had long expected that FERC would also be the lead federal agency on the entire project, giving it a key role in obtaining additional permits.

But in its Tuesday notice, FERC said it may only have jurisdiction over the six hydroelectric sites along the route, not the whole pipeline and network of pumping stations and water storage facilities.

If that proves true, it could put Utah more directly in charge of navigating a lengthy review from a host of other federal agencies, forcing additional work on to the Division of Water Resources, which has already spent more than \$30 million in taxpayer funds to obtain permits for the pipeline so far.

As proposed, the pipeline would pump water from Lake Powell about 50 miles northwest to a high point within the area of the former Grand Staircase-Escalante National Monument, according to the FERC notice. The water would then flow just under 90 miles downhill through a series of six hydroelectric turbines before arriving at Sand Hollow Reservoir, east of St. George.

Officials with the Division of Water Resources have said they expect the pipeline to cost between \$1.1-\$1.8 billion.

FERC spokeswoman Celeste Miller said Tuesday the agency had assumed it would not take jurisdiction over the entire water project — just the hydroelectric turbines. She said the commission still planned to produce documentation required by other agencies, such as the National Park Service and the Bureau of Land Management, that have a say in the pipeline's fate.

A spokesman for the Division of Water Resources said late Tuesday it was unclear exactly what the FERC announcement means, given that state officials had written their application assuming FERC would lead the permitting process.

While a shift in jurisdiction would not necessarily boost the number of permits Utah officials have to obtain before breaking ground, those permits could be subject to new and different kinds of review if FERC does not play the role state leaders thought, raising the potential for further delays.

Zach Frankel, executive director of the Utah Rivers Council and a long-time opponent of the pipeline, noted that if other agencies play a bigger role in the permitting process, that could subject the pipeline to more in-depth review of whether the project is necessary.

Establishing the purpose and need for a pipeline, said Frankel, will be an important part of the environmental assessment study, which FERC said will be conducted according to the National Environmental Policy Act.

"If it isn't properly satisfied," Frankel said, "the courts can rule against an agency" in the event a permitting decision is challenged.

But FERC's move could also allow the agency to evaluate the pipeline solely with

respect to demand for hydroelectricity, and not water — opening the possibility that state officials would not have to prove, as has been asserted, that the pipeline is necessary to prevent southwestern Utah from running out of water.

“By not considering the rest of the project features, it could be easier to approve,” Frankel said in an email. “It’s not a slam dunk for anyone.”

FERC has also asked for public comments regarding the pipeline proposal. Comments are due in early February and may be submitted online at ferc.gov/docs-filing/ecomment.asp

Comments should reference the proposal’s docket number, P-12966-004.

Bureau of Reclamation to negotiate water exchange with State of Utah Plan would divert river water to Lake Powell pipeline

The Times-Independent. Moab, Utah

The U.S. Bureau of Reclamation (USBOR) and State of Utah are initiating negotiations for a water exchange contract, which proposes exchanging the state’s assigned Green River water right for the use of Colorado River Storage Project water released from Flaming Gorge Dam. The negotiation meeting is scheduled for Monday, Dec. 4 at 1 p.m.

at the Dixie Convention Center, located at 1835 South Convention Center Drive in St. George.

According to a press release from USBOR, the exchange will provide Utah with a reliable and certain water supply, while assisting the bureau in meeting its legal obligations. It will enable part of the state's Colorado River apportionment to flow from Flaming Gorge Dam to Lake Powell for diversion into Utah's proposed Lake Powell Pipeline.

The negotiation meeting is open to the public. The public will have the opportunity to ask questions and offer comments pertaining to the exchange during an open house period immediately prior to formal negotiations and during a comment period following the negotiation session.

The proposed exchange contract and other pertinent documents will be available at the negotiation meeting or can be obtained on the bureau's website at:

<https://www.usbr.gov/uc/provo/index.html>, under "News and Highlights."

USBR starts Green River water exchange negotiations with Utah

Clean Technology Business Review

The US Bureau of Reclamation and State of Utah are initiating negotiations for a water exchange contract, which proposes exchanging the state's assigned Green River water right for use of Colorado River Storage Project water from Flaming Gorge Dam.

The first negotiation meeting is scheduled for Monday, October 30, 2017, at 1:00 p.m. at the Uintah Conference Center, 313 East 200 South, Vernal, UT 84078.

The exchange will provide Utah with a more reliable and certain water supply, while assisting Reclamation in meeting its legal obligations.

All negotiation meetings are open to the public as observers, and the public will have the opportunity to ask questions and offer comments pertaining to the exchange during an open house period immediately prior to formal negotiations and a brief comment period following the negotiation session.

"The proposed exchange agreement contract and other pertinent documents will be available at the negotiation meeting, or can be obtained on Reclamation's website at: <https://www.usbr.gov/uc/provo/index.html>, under "Current Focus."

Federal oil and gas leases mired in protests over pollution worries for Utah's Uinta Basin

By Brian Maffly of the Salt Lake Tribune

[Click here](#) to visit the SL Trib web site

Environmental, public health and wilderness advocates warn that Dec. 11 auction of leases on 94,000 acres in eastern Utah threatens to worsen region's ozone crisis.

The Bureau of Land Management's next auction of oil and gas leases in Utah is under fire from a multitude of environmental, public health and wilderness groups. Topping the list of concerns is the likelihood that the Dec. 11 lease sale would worsen Uinta Basin's persistent winter-time ozone levels.

The U.S. Environmental Protection Agency is poised to declare Duchesne and Uintah counties out of compliance for emissions of ozone, a pollutant whose high concentrations are attributed to oil and gas development. That determination, expected as soon as Oct. 15, would trigger emission-reducing measures under the Clean Air Act that are expected to put on a damper on future drilling and require industry to stem the clouds of fumes rising from the oil patch.

Industry representatives say such rules will safeguard air quality, while allowing new oil and gas leases to be issued.

"One of the worst ways to address ozone is to stop economic development in the Basin. That would put the area in a double whammy," said Kathleen Sgamma, president of the oil and gas industry trade group Western Energy Alliance.

But environmental activists argue all federal leasing should be holstered here until the worsening ozone situation is reversed. The upcoming on-line auction will offer 75 leases covering 94,000 acres in the Basin and Emery County.

“The region is suffering a smog crisis and the Bureau of Land Management is turning a blind eye to the problem,” said Jeremy Nichols, climate and energy program manager for the environmental group WildEarth Guardians. “Legally they are not allowed to issue more drilling permits until they can show their actions are solving the problem. This is a public threat. This is what matters more than anything else in northeastern Utah.”

WildEarth is among many groups filing formal protests of the auction in recent days.

Ozone is a corrosive three-atom oxygen molecule formed not far off the ground when volatile organic compounds, also known as VOCs, interact with sunlight. Usually a summer phenomenon, high ozone occurs in winter over the Uinta Basin when snow covers the ground and inversions prevent atmospheric mixing.

Joined by the Center for Biological Diversity, Living Rivers and other environmental groups, Utah Physicians for a Healthy Environment has also highlighted the ozone question its protest.

“A pollution crisis will inevitably lead to a public health crisis, and there is preliminary evidence that one may already be occurring with high rates of perinatal deaths in the Uinta Basin,” said Dr. Brian Moench, president of the physicians group. “The health risks go well beyond ozone and particulate pollution. Although VOCs are not addressed by EPA national standards, they likely represent the greatest toxicity to the population, especially for infants and pregnant mothers.”

In its environmental review released last month, however, the BLM noted that leasing won’t in itself release pollutants that lead to ozone formation and other emissions. Those comes from what happens later—drilling and fracking wells and transporting oil and gas.

“At the leasing stage it is not known how much or even whether development will occur on those leases,” Sgamma said. “Once an implementation plans is in place, there is a process to ensure ozone levels will get down to the health standard. Any new development will have to be permitted accordingly.”

Shaping up to be Utah’s most intensely protested sale in a decade, the leases to be sold Dec. 11 have been controversial since they were first unveiled months ago because they include public lands along the western boundary of Dinosaur National Monument and areas in Emery County rich in rock art and natural beauty in and around San Rafael Swell.

Those concerns are the focus of protests filed by Southern Utah Wilderness Alliance and National Parks Conservation Association.

Inviting drilling in place like Molen Reef along the Swell’s western margins is “dumbfounding,” said SUWA staff attorney Landon Newell, whose protest was joined by The Wilderness Society, Sierra Club’s Utah chapter and the Natural Resources Defense Council.

“The Trump administration’s energy policy is trying to find a home in Utah’s redrock country but we’re not having any of it,” he said

Activists have been concerned with the Trump administration’s willingness to lease in areas previously proposed under President Obama for “master leasing plans.” They fear that in Trump’s push for “American energy dominance,” the Interior Department is walking away from a planning process designed to ensure more careful leasing near national parks and monuments.

But the BLM has deferred leasing decisions on 40 other parcels nominated by the oil and gas industry for this year’s lease auction out of its east-central Utah district, served by the Vernal and Price field offices. Twenty of those parcels were set aside because they fell inside the San Rafael Desert Master Lease Area, and another 20 land tracts were held because they overlap with sage grouse habitat, cultural resources or tar sands leases.

Feds Ask State to Prove It Can Pay for Proposed Lake Powell Pipeline

The Salt Lake Tribune

By Emma Penrod

Feds ask state to prove it can pay for proposed Lake Powell Pipeline Federal Energy Regulatory Commission gives state officials 60 days to produce a financial study, along with more data on water use and cultural riches along proposed pipeline route.

Feds ask state to prove it can pay for proposed Lake Powell Pipeline Officials from the Federal Energy Regulatory Commission (FERC) have given the state of Utah 60 days to provide a financial feasibility study on how the state would pay for the billion-dollar-plus Lake Powell pipeline.

State officials and other proponents of the Lake Powell pipeline may have just two months to convince federal regulators that their project is backed by a robust plan to pay off more than \$1 billion in costs.

The Federal Energy Regulatory Commission has indicated it cannot review the state's yet-to-be-completed application for permission to build the pipeline in southern Utah because it lacks an adequate financial analysis.

In an Aug. 11 letter to the state's Board of Water Resources, federal regulators have given Utah 60 days to submit the financial feasibility study, including estimated costs to new and existing water users in Washington and Kane counties. FERC has also asked for additional water use data and for more details about cultural resources along the proposed route of the pipeline, which would carry Colorado River water from Glen Canyon Dam 140 miles to St. George.

A spokeswoman for the federal agency, Celeste Miller, said Tuesday that state officials had indicated the requested information would be part of Utah's final application. But the study still has not been submitted.

Josh Palmer, a spokesman for the Utah Division of Water Resources, said the division's staff is reviewing FERC's request and plans to submit at least some additional information within 60 days.

Whether or not Utahns can actually afford to build the pipeline — last estimated to cost in the range of \$1.4 billion— has been a central issue in a long-running debate over the proposed project. Zach Frankel, executive director of the Utah Rivers Council and an outspoken opponent of the pipeline, said he was pleasantly surprised to see FERC wading into the issue.

"We're pleased to see they're at least asking the right questions," he said.

According to current state law, the state Division of Water Resources would pay for the construction of the Lake Powell pipeline, with taxpayer money. But the recipients of the water — currently Kane and Washington county water conservancy districts — would be required to repay the state through the purchase of pipeline water over the course of 50 years. How much that water will cost remains a matter of dispute.

Frankel pointed to an analysis by economists at the University of Utah, which concluded that water rates in Washington County would have to rise by more than 500 percent to pay for the water the Washington district would be obligated to buy.

The water district, on the other hand, has contended it has a plan that would enable it to pay for the pipeline by increasing customers' water bills just a few dollars each month. But, when pressed for documentation of its plan, the water district released a series of slides and spreadsheets it said were used in interactive focus groups in 2013 and 2014.

The documents did not represent an actual repayment plan, according to the water district.

The state's Lake Powell pipeline license application, which was initially submitted in March 2016, did not detail the cost of water to end users. The application remains incomplete in other ways as well; shortly after filing it, regulators at the Division of Water Resources indicated that the 6,000-page document contained numerous errors and would require revision.

The state has intermittently filed supplementary material correcting and expanding its application since it was first submitted. Frankel said he believes the state is stalling in order to avoid having to admit it does not know how to pay for the pipeline.

"I think Utah taxpayers are going to pay \$6 of every \$7, or \$8 of every \$10, for the Lake Powell Pipeline and the proponents of the project know it," Frankel said. "They're stalling and they're hiding, and they're pretending like they have a viable repayment plan, but they know it can't be done."

Utah's congressional delegation, as well as Gov. Gary Herbert, have asked FERC to complete its review of the as-yet-unfinished application by 2018.

San Diego Water Authority to take legal dispute to Supreme Court

By Dana Lohr

SAN DIEGO (KUSI) — The San Diego County Water Authority announced Monday that it will take a long-running legal dispute over rates to the state Supreme Court.

The decision comes just over a month after an appellate court issued what amounted to a split decision in the Water Authority's case against the Metropolitan Water District of Southern California.

The SDCWA has sued the MWD multiple times over rates, with the largest issue being how much the MWD was allowed to charge for transporting Colorado River water to San Diego. The MWD is the primary water wholesaler in the southern half of the state and owns the facilities that convey water around the region.

A San Francisco Superior Court judge has consistently ruled in favor of the San Diego water agency, which has been awarded a total of roughly \$232 million. The MWD appealed, and among other things, the appellate justices ordered the damages to be recalculated.

The San Diego water agency contended it was not only billed for moving the water from one place to another, but also for the MWD's costs of maintaining the California Aqueduct -- a system not used for bringing the Colorado River water to San Diego.

"While components of this case appear complex, it essentially boils down to whether MWD can force San Diego County to pay for a State Water Project supply it didn't want to buy and hasn't received," said Mark Muir, chairman of the Water Authority's Board of Directors.

"We are hopeful that the state's highest court will recognize that the Water Authority's Board of Directors did the right thing when it chose to invest billions of dollars to conserve water in Imperial County, rather than continue its heavy reliance on imported water supplies purchased from MWD, a substantial portion of which MWD obtains from the Bay-Delta," Muir said. "We also hope the Supreme Court will grant review in order to preserve bedrock limits on the power of government to impose fees and charges on ordinary Californians."

Lawyer Neal Katyal said the impact of the appellate court ruling will be felt statewide if not reversed by the high court.

MWD officials contend the Water Authority is trying to shift its cost onto ratepayers elsewhere in the state.

The Supreme Court justices have about two months to decide whether to accept the case. If they do, it could take 18 months to two years before a final decision is issued.

An Ecosystem Degraded: Human Impacts on Riparian and Riverine Systems

Mighty though the Colorado may be, it certainly isn't exempt from modern-day ecological issues. Human activities have offered a toe-hold for invasive species such as tamarisk, a fast-growing shrub that thrives along the river's banks, forces out native flora, contributes to salinity issues, and has been the focus of region-wide eradication programs for decades. In the river itself, ecologists are on the lookout for invasive Quagga and Zebra mussels, aquatic invaders that have taken other parts of the country by storm. Meanwhile, changes in flow and temperature mean that warmwater fishes - including some on the endangered species list - are struggling. We floated the river with fish biologists and riparian ecologists to hear what's being done to restore habitat and populations.

Lake Powell: Backup Bathtub or Evaporation Station?

Lake Powell, the nation's second-largest reservoir, was built in 1963 as a backup to Lake Mead, to store enough water to provide a consistent water supply to Lower Basin states in times of drought. The Colorado River Compact stipulates that Upper Basin states must provide 7.5 million acre feet of water annually to the Lower Basin states, and Powell is intended to help make that possible. The reservoir is also host to a 2-million-visitor-per-year recreation industry. Now, however, the cumulative impacts of dry winters, evaporation, and seepage mean that both Mead and Powell are far below

capacity. That has led some to argue for opening up the Glen Canyon Dam and draining Lake Powell -- a prospect that would have wide-ranging implications.

Law professor comments on national monuments review

Leading natural resource and environmental law professors comment on Trump review of national monuments

Eric Biber July 6, 2017

As we've been covering here on Legal Planet, the Trump Administration is conducting a review of national monuments created over the past 20 years, and has indicated it may seek to eliminate or shrink some of those monuments. Part of that process is a public comment period.

A group of 121 environmental, natural resource, and administrative law professors just submitted a comment to the Secretary of Interior arguing that the President does not have power to eliminate or shrink national monuments, and raising some important questions about the review process. (I am one of the signatories.) You can find the comment letter here: [national monuments comment letter from law professors_as filed](#)

The letter draws on a recent on-line law review article that lays out the relevant law about Presidential power to eliminate or shrink national monuments.

A link for that article is provided [HERE](#)

Infrastructure investments must prioritize the Colorado River, one of the hardest-working rivers in the world

by Mike Connor and Lynn Scarlett

Mike Connor is an Environment Program Fellow with the Walton Family Foundation and a former Deputy Secretary of the Interior and Commissioner of the Bureau of Reclamation in the Barack Obama Administration.

Lynn Scarlett is the Global Managing Director for Public Policy at The Nature Conservancy and a former Deputy Secretary of the Interior in the George W. Bush Administration.

[CLICK HERE](#) to read the report called "Colorado River Critical Infrastructure Needs" by the Walton Family Foundation

With the significant prospect of declared shortages in the lower basin of the Colorado River in the next five years and a growing long-term supply-demand imbalance, the situation requires strategic investments that will help maintain both water supply reliability and watershed health. It also requires action, collaboration, and creativity. With the significant prospect of declared shortages in the lower basin of the Colorado River in the next five years and a growing long-term supply-demand imbalance, the situation requires strategic investments that will help maintain both water supply reliability and watershed health. It also requires action, collaboration, and creativity.

With the Trump administration focused on infrastructure this week, the Walton Family Foundation released a white paper to help guide a plan for one of the nation's most critical infrastructure needs. The paper, "Colorado River Critical Infrastructure Needs," highlights 15 projects across the basin that are essential for securing one of the most important – and overlapped – waterways in the country.

In Cadillac Desert, Mark Reisner's 1986 seminal work on water in the West, he noted that "[t]he Colorado River's modern notoriety, stems not from the fact that it is the most legislated, most debated, and most litigated river in the entire world. It also has more people, more industry, and a more significant economy dependent on it than any other comparable river in the world."

Much has changed over the past 31 years, but our dependency on the Colorado River has not. Fortunately, one change has been how states, water users, environmental interests, Indian tribes, and federal agencies collaborate with each other to address pressing challenges and avoid protracted courtroom battles. Indeed, this paper is the result of input from key players in the Basin, including states, water users, Indian tribes, and conservation groups. Stakeholders in the Colorado River basin have led efforts to forge innovative water management agreements between each other and across the international border with Mexico.

Of course, much of this collaboration is driven by necessity. As the paper highlights, the recent 16-year drought, while somewhat alleviated this year, took a toll on the river with a documented 19 percent reduction in average flows compared with the previous 95 years. Looking forward, scientific studies project an additional 20 percent reduction in flows by 2050, which would exacerbate the overallocation of this limited resource.

With the significant prospect of declared shortages in the lower basin in the next five years and a growing long-term supply-demand imbalance, the situation requires strategic investments that will help maintain both water supply reliability and watershed health. It also requires action, collaboration, and creativity.

Building on the spirit of cooperation within the Basin, the Walton Family Foundation and The Nature Conservancy are working with a broad array of constituencies to address the region's water resource challenges. In the Colorado River Basin, we have been working with states, tribes, agricultural interests, municipalities, and other nongovernmental organizations to identify a portfolio of projects to address specific challenges in the basin across a multi-state region.

The white paper, while not an all-inclusive list of needed actions, identifies over a dozen specific projects as well as some basin-wide initiatives that have significant water user support and represent a range of strategies to address water resource challenges, including traditional water supply improvements, habitat and stream restoration actions, and improved data-gathering networks.

Collectively, the projects would, as the white paper notes, "increase water reliability, improve the balance between supply and demand, and enhance the overall environment, while creating jobs and contributing to economic productivity." Furthermore, each project is poised to garner significant cost-share contributions to leverage federal investments.

Perhaps most importantly, the collaboration among multiple partners means that a lot of the hard work necessary to build support for infrastructure development has already been done with most of the projects. As Congress considers how to address infrastructure needs in this country, it's incredibly important to bridge the significant gap between essential water resource investments and identified sources of capital. It's equally important that these investments focus on watersheds where the potential for conflict is high because the stakes are high but where local collaboration is providing opportunities to resolve those conflicts.

The foundation's white paper presents many opportunities worthy of federal support, given the widespread benefits to sustainable management of the Colorado River. These opportunities are exactly the type we would have looked to support during our tenures at the Interior Department in the past two administrations. They are creative and collaborative and represent good progress in sustainable resource management.

Moab March for Science draws large crowd

by Rose Egelhoff

The Times-Independent

Local residents and others march through downtown Moab during the April 22 March on Science. Marches were held in over 600 cities and towns across the country and internationally, including Salt Lake City and Moab.

Moab residents and visitors joined groups across the country and around the world on Earth Day, April 22, in taking to the streets to march in support of science.

More than a hundred people gathered at Swanny City Park for an introduction by organizer Katie Miller of Moab and speeches by teachers, students, scientists and land managers. A banner reading, "May the Facts Be With You," created by local environmental group Canyon Country Rising Tide, was stretched across the pavilion behind the speakers. At tables throughout the park several sponsoring organizations explained how they use science for their work.

Speakers addressed public understanding of science and spoke in support of using science and facts to guide public land management.

Richard Schwartz, known locally as Professor Purple, drew on his background as a high school physics teacher to explain how pure theory and basic research from the 19th century is important in daily life today.

“When your car tells you to turn left, give a hat tip to Albert Einstein’s theory of general relativity, which is essential to GPS,” Schwartz said. “We couldn’t work as a society without being able to use the theoretical, pure research of a hundred years ago. It’s become absolutely essential to the way we work today.”

Several speakers discussed climate change issues. John Weisheit, conservation director at the nonprofit Living Rivers, said that Colorado River users with junior water rights face their water being cut off. He added that scientists predicted today’s water shortages decades ago.

“[Scientists] told the policy people that the Colorado River is in trouble, and what have the water policy people done for the last 71 years? Absolutely nothing,” Weisheit said. “The shortages are here and it’s about to happen.”

He called for policymakers to listen more to scientists.

Rachel Nelson an adjunct professor in the department of environment and society at Utah State University-Moab, gave a demonstration of the scientific method — the way scientists use experiments to find out facts.

“We can all be citizen scientists and I think if we take that mystery out of science that people are more willing to embrace it and understand that it’s attainable for everybody, it’s understandable for everybody,” Nelson said. “It’s not just these super smart people who are telling us what to do.”

After the speeches, the group marched up 100 North and around downtown, carrying signs with messages such as “Science Saves Lives,” “There Is No Planet B,” and “Science Keeps America 1st and Great.”

According to the Southeastern Utah March for Science Facebook page, The March for Science was organized as “a celebration of our passion for science and a call to support and safeguard the scientific community. Recent policy changes have caused heightened worry among scientists, and the incredible and immediate outpouring of support has made clear that these concerns are also shared by hundreds of thousands of people around the world.”

“Speaking up for science is critically important because it is what drives society forward. From the technology we rely on, the medicine we need, the food we eat, science is the driving force for all of it,” local march organizer Katie Miller told The Times-Independent. “It is important right now because despite there being an abundance of information freely available to virtually everyone, there are still people who deny the viability of science.”

Miller said more than 600 cities around the world participated in the April 22 March for Science, and she hopes the connections made in the process of planning and executing the march will lead to more support for science-based policies and science education.

‘The result we want is a better-educated civilization that understands science and understands what is at stake if we do not act accordingly, most perilously in regards to climate change,’ she said.

Miller, a stay at home mother, said she had helped remotely organize national events, but had never organized a local march like this one.

Nationally, the March for Science was organized after several scientists on the website Reddit discussed their concerns that references to climate change had been deleted from the White House website, according to the Washington Post. Scientist Jonathan Berman from the University of Texas set up a March for Science website and social media pages. Other science advocates, concerned about a perceived disregard for science among national politicians, quickly joined. Thousands attended the march in Washington, D.C., according to NBC News.

“The March for Science champions robustly funded and publicly communicated science as a pillar of human freedom and prosperity. We unite as a diverse, nonpartisan group to call for science that upholds the common good and for political leaders and policy makers to enact evidence based policies in the public interest,” according to the national March for Science website.

In Moab, march participants came from the local community, Colorado and around the West.

Sam Foster of Durango, a retired scientist, and Dot Wehrly, also from Durango, came to Moab to participate.

“[Science] is being ignored in too many policy decisions now and we need to listen to science,” Wehrly said.

“It’s not well-funded,” added Foster. “It’s like one of the speakers said, when budgets get tight, they ... stop doing science. The problem is that a lot of science takes years or even decades and if you stopped right in the middle of it, you ruin what you’ve done. It’s got to be a solid investment.”

Another participant from Colorado, David Reed, held a sign that read, “In times of universal deceit, telling the truth is a revolutionary act.”

“I figured if there’s any place I should show up today that needed to support wilderness, it’s in the state of Utah,” Reed said, adding that it is unfortunate that science has become a political issue.

He said he hopes the march will “increase awareness and bring more people to promote the needs of science period that we need to be funding science, that we need to be respecting the findings of science, not just disregarding them.”

The march was followed by a performance by Meander Cat and poetry by Barbara Galler.

Fracking Threatens Colorado River, Endangered Species, Climate, Rocky Mountain National Park and Dinosaur National Monument

DENVER—(ENEWSPP)—April 11, 2017. Conservation groups have filed an administrative protest challenging a federal decision to offer for leasing in June more than 100,000 acres of federal public land in northern Colorado for oil and gas industry fracking. The leasing decision, being pushed by the Trump administration's Bureau of Land Management over local community opposition, threatens some of Colorado's most treasured and scenic landscapes and wildlife species.

"Fracking these pristine public lands would come at the cost of imperiled wildlife, clean air and clean water, meanwhile worsening climate change," said Michael Saul, senior attorney with the Center for Biological Diversity. "This is classic Trump corporate cronyism that sacrifices public values for oil industry profits."

The decision paves the way for thousands of new fracked oil and gas wells in the Piceance Basin, increasing the strain on the already overdrawn Upper Colorado River with water withdrawals and the threat of new oil spills. It would pave the way for fracking in largely untouched Grand County, the headwaters of the Colorado River and a world-famous destination for fishing, hiking and tourism.

"The water quality of the Colorado River headwaters is at an all-time low and water demand is at an all-time high. Awarding leases that allow fossil fuel extraction in the headwaters will not improve the looming water crisis," said John Weisheit, Colorado Riverkeeper with Living Rivers. "Restraint on all forms of consumptive use is the best and wisest solution for improving a damaged watershed. Public land management decisions must be based on this reality and BLM must take the lead in restraining those uses, not open the door to more."

This massive plan, casually dismissed by the BLM as having "no significant environmental impact," will harm a host of sensitive and listed species including Colorado River and greenback cutthroat trout, greater sage grouse, Canada lynx, black-footed ferrets, white-tailed prairie dogs, rare wildflowers, deer, elk and moose. Resulting greenhouse gas pollution would worsen climate change, whose impacts the region is already feeling with reduced Colorado River flows.

"Protecting the quantity and quality of Colorado River flows, which face overwhelming challenges from increased demand and reduced supply, is inextricably linked to management decisions on public lands that cut back on water use and protect water quality," said Kate Hudson, western U.S. advocacy coordinator with Waterkeeper Alliance. "BLM's pending decision to open over 100,000 acres of public lands in the headwaters of the Colorado River to oil and gas leasing, and the inevitable impacts that

fossil fuel extraction will have on the river, its tributaries and our climate, heads us in exactly the wrong direction. It will only hasten the collapse of this critical and fragile resource.”

The giant sale threatens to industrialize lands and pollute air and water at the doorsteps of Rocky Mountain National Park and Dinosaur National Monument. Groups filing today’s protest include the Center for Biological Diversity, Living Rivers, Waterkeeper Alliance, and Sierra Club.

BLM removes 20 parcels from the June 2017 lease sale

News Release Bureau of Land Management Colorado

FOR IMMEDIATE RELEASE

April 17, 2017

Contact: Courtney Whiteman, Public Affairs Specialist, 303-239-3668 BLM modifies parcel list for June 2017 oil and gas lease sale

DENVER – The Bureau of Land Management Colorado has removed 20 parcels totaling 27,529 acres in Grand County from its June 8, 2017, oil and gas lease sale. The BLM will now offer 86 parcels totaling 73,288 acre in Jackson, Routt, Rio Blanco and Moffat counties.

The BLM removed these 20 parcels due to low energy potential and reduced industry interest in the geographic area, as well as concern from local government and the public. The parcels were nominated before the latest revision to the land use plan for the area was completed. “We understand concerns raised by Grand County and other stakeholders about offering these parcels at this time,” said acting BLM Deputy State Director for Energy Lands and Minerals Kent Walter. “We want to be sure they are still appropriate for leasing.”

To find out more about this and other BLM Colorado lease sales, visit

<https://www.blm.gov/programs/energy-and-minerals/oil-and-gas/leasing/regional-lease-sales/colorado>

In Fiscal Year 2016, oil and gas development on public lands directly contributed \$796 million to Colorado’s economy. BLM Colorado received more than \$98 million in federal revenues, including royalties, rents and bonus bids, from oil and gas development on public lands. The state of Colorado receives 49 percent of these revenues. Statewide, more than 22,900 jobs are tied to mineral and energy development on public lands.

Eric Balken - Glen Canyon Institute

John Weisheit - Colorado Riverkeeper

SUBMISSIONS TO THE RECORD

1) ["LIGHT ON THE MEXICAN TREATY" \(of 1944\)](#). This is US Senate Document #249 from 1946. The important page # is 20.

It was originally presented to the Colorado River Water Users' Association in Salt Lake City, Utah by Northcutt Ely.

Northcutt Ely was, during the Hoover administration, the Deputy Secretary of Interior. On page 20 is an updated water budget of the Colorado River, which indicates there would be, in the future, a system-wide deficit of -1.8 million acre-feet.

This is the first document that clarifies that the demand for Colorado River water exceeds the supply. Northcutt Ely recommends to the assembled water governance of the seven states the following, "No sound planning can be done for new projects until the water budget is balanced again in some way."

In other words, 71 years ago the water managers understood that water shortages would occur in the future. This officially happened to the Colorado River basin in 2003 and the deficit today is -1.9 million acre-feet. It also means the plans for infrastructure in 1946 were overestimated and also needed to be revised (not to build redundant dams, for example). Unfortunately the seven states never did adjust their water allocations nor their planning documents to reflect the reality of nature.

2) ["Congressional Testimony of Colorado River Board of California on July 3, 1954 \(Northcutt Ely\)](#).

The state of California asks Congress to treat the upper and lower basins equally, which is the main purpose of the 1922 Compact. The CRSP legislation favors dam construction solely for repaying the construction loans with hydropower revenues. For example, total consumptive use for all CRSP irrigation projects is only 400,000 acre-feet, but reservoir evaporation from all the huge reservoirs is 700,000 acre-feet. Thus, overall, the CRSP projects will waste more water than the lower basin projects, even though lower basin evaporation rates are higher than the upper basin.

Climate Change Is Already Sapping the Colorado River

[Click here](#) to read this story in University of Arizona News by Mari N. Jensen

[Click here](#) to read this blog post by John Fleck

This post is about the release of a hydrology paper authored by Brad Udall and Jonathan Overpeck.

ABSTRACT: Between 2000 and 2014, annual Colorado River flows averaged 19% below the 1906-1999 average, the worst 15-year drought on record. At least one-sixth to one-half (average at one-third) of this loss is due to unprecedented temperatures (0.9°C above the 1906-99 average), confirming model-based analysis that continued warming will likely further reduce flows. Whereas it is virtually certain that warming will continue

with additional emissions of greenhouse gases to the atmosphere, there has been no observed trend towards greater precipitation in the Colorado Basin, nor are climate models in agreement that there should be a trend.

Moreover, there is a significant risk of decadal and multi-decadal drought in the coming century, indicating that any increase in mean precipitation will likely be offset during periods of prolonged drought. Recently published estimates of Colorado River flow sensitivity to temperature combined with a large number of recent climate model-based temperature projections indicate that continued business-as-usual warming will drive temperature-induced declines in river flow, conservatively -20% by mid-century and -35% by end-century, with support for losses exceeding -30% at mid-century and -55% at end-century.

Precipitation increases may moderate these declines somewhat, but to date no such increases are evident and there is no model agreement on future precipitation changes. These results, combined with the increasing likelihood of prolonged drought in the river basin, suggest that future climate change impacts on the Colorado River flows will be much more serious than currently assumed, especially if substantial reductions in greenhouse gas emissions do not occur.

Colorado River losing essential water flow, new research shows
March 21, 2017 By Ty Betts

An increase in temperatures has the ability to reduce the flow of water in the Colorado River by 20 to 30 percent by mid-century, according to new research done by Colorado State University and the University of Arizona.

The research done by Bradley Udall, a senior water and climate scientist for CSU, and UA professor Jonathan Overpeck, found that loss of water is driven by higher temperatures arising from an increase in greenhouse gas emissions.

There are a number of reasons that increased temperatures are leading to less water in rivers, Udall said. The first is that there is now a longer growing season for plants to utilize water. The second is that plants demand more water with increased temperatures. Third, more evaporation is taking place on soil, reservoirs and rivers. Lastly, the atmosphere retains more moisture with higher temperatures.

The water in the Colorado River is relied upon by 40 million people, according to the Bureau of Reclamation. The Colorado River provides water to seven U.S. states and makes up half of the water consumption along Colorado's Front Range, Udall said.

An assessment by the Bureau of Reclamation found that the Colorado River will face little to no change in levels because they anticipate an increase in precipitation to offset higher temperatures. Udall disagrees.

He said that the issue with their model is that they are combining a multitude of factors that are not necessarily certain. The bureau's calculations combine warm and hot projected climates with precipitation decreases and increases as well as varied emission scenarios.

"When you come up with one number and you blend certain and uncertain outcomes, you can get a rosier picture than we think is warranted," Udall said.

Udall and Overpeck's research instead isolated these variables and achieved their estimates with confidence that temperature is increasing.

Udall said with changes in water levels expected, regulations will have to be adapted. The 1922 Colorado River Compact currently regulates the amounts of water that Colorado has rights to. Udall believes that with a 20 percent reduction in flow, it would be difficult for Colorado to meet the output requirements set in place by the act.

The seven states that make up the Colorado River basin – Arizona, California, Colorado, New Mexico, Nevada, Utah and Wyoming have to work together to negotiate new water agreements. Udall said that while negotiations usually take a lot of time, these states are good at coming to agreements.

"I would argue that this basin, perhaps compared to any other basin in the world, has a good track record of settling water disputes," Udall said.

Other considerations Udall mentioned are that less water flow equates to less hydroelectric power. Hydroelectric power does not make up a large portion of total energy generation in the southwest, but is it essential to irrigation. Udall said farmers get inexpensive energy rates while using hydro-power generated from the Colorado River.

"Agriculture often runs on very small margins and increases in energy rates can cripple profits," Udall said.

Udall said he believes new sources of water will not come easily or be feasible. California's desalination work, or the process of extracting minerals from water, is too expensive for agricultural purposes. Furthermore, importing water into the Colorado River from other parts of the country is halted by high costs political push-back.

Udall and Overpeck's research points to one solution to the problem: the reduction of greenhouse gasses.

"The water cycle is driven by heat," Udall said. "When you add extra heat to the Earth as we are now doing because of greenhouse gas emissions, you change the water cycle in fundamental ways."

Scientists discover evidence of devastating floods on the Colorado River above Lake Powell

[Click here](#) to read this story by Julia Rosen in the Los Angeles Times (Science Now)

[Click here](#) to read the final report published in Water Resources Research (American Geophysical Union).

The purpose was to provide science to the Department of Energy to ensure that Moab's radioactive waste pile would be removed from the floodplain of the Colorado River, which is indeed happening. So far, 41% of the pile has been removed and taken by railroad to a burial site 30 miles north of town at a place called Crescent Junction adjacent to the I-70 corridor.

Highlights of this report include:

River: Upper Colorado River (above the Green River confluence and below the Dolores River, the last major tributary)

Site location: 10.5 miles above the Moab Bridge

Time frame: The last 2,140 years (+/- 220 years)

Number of floods: 44

Range of floods in cfs: 60,036 to 349,616

34 to 40 floods have exceeded the magnitude of the USGS 100-year flood determination

20 - 25 floods have exceeded the magnitude of the USGS 500-year flood determination

5 floods have exceeded a peak discharge of 282,000 cfs The two largest floods were slightly over 349,000 cfs

The 100-year flood would have a peak discharge ranging from 156,440 to 179,050 cfs

The 500-year flood would have a peak discharge ranging from 224,780 to 265,570 cfs

A 1000-year flood would have a peak discharge ranging from 256,740 to 310,770 cfs

Tribal Water Study released to the public

[2018 - Tribal Water Study of the Ten-Tribe Partnership](#) (all documents combined and starting with the press release). This study is a new feature of the 2012 Basin Study.

###

WASHINGTON (PRWEB) DECEMBER 13, 2018

Bureau of Reclamation Commissioner Brenda Burman announced today the release of the Colorado River Basin Ten Tribes Partnership Tribal Water Study that was conducted collaboratively with the member tribes of the Ten Tribes Partnership.

The study documents how Partnership Tribes currently use their water, projects how future water development could occur and describes the potential effects of future tribal water development on the Colorado River System. The study also identifies challenges

related to the use of tribal water and explores opportunities that provide a wide range of benefits to both Partnership Tribes and other water users.

"We face a prolonged drought that represents one of the driest 20-year periods on the Colorado River in the last 1,200 years," said Commissioner Burman. "This study is an important step forward that furthers our understanding of the challenges facing the Colorado River Basin and the actions we can take to collaboratively address them."

While not all federally-recognized tribes in the basin are members of the Ten Tribes Partnership, the Partnership Tribes have reserved water rights, including unresolved claims, to potentially divert nearly 2.8 million acre-feet of water per year from the Colorado River and its tributaries. In many cases, these rights are senior to other uses.

The study is the outcome of a commitment between Reclamation and the Partnership Tribes to engage in a joint study to build on the scientific foundation of the Colorado River Basin Water Supply and Demand Study, published by Reclamation in 2012.

"Reclamation recognized the need for additional analyses and work following the 2012 Colorado River Basin Study," said Reclamation Lower Colorado Regional Director Terry Fulp. "Working together, the Ten Tribes Partnership and Reclamation have produced a valuable reference that is the first of its kind in the Colorado River Basin."

The study highlights tribal observations and concerns, including lack of water security, incomplete distribution systems and regulatory and economic challenges to developing water systems in geographically diverse areas. "In light of the importance of tribal water rights in the Colorado River Basin, the Partnership and Reclamation collaborated to contribute crucial tribal-specific information to the discussions regarding Colorado River management," said Lorelei Cloud, Chairman of the Ten Tribes Partnership. "Without the hard work and dedication of Reclamation, tribal leaders, and tribal staff, this critical project would not have been possible."

The Ten Tribes Partnership was formed in 1992 by ten federally recognized tribes with federal Indian reserved water rights in the Colorado River or its tributaries. Five member tribes are located in the Upper Basin (Ute Mountain Ute Tribe, Southern Ute Indian Tribe, Ute Indian Tribe, Jicarilla Apache Nation and Navajo Nation) and five are in the Lower Basin (Fort Mojave Indian Tribe, Colorado River Indian Tribes, Chemehuevi Indian Tribe, Quechan Indian Tribe and Cocopah Indian Tribe).

The study is available at: <https://www.usbr.gov/lc/region/programs/crbstudy/tribalwaterstudy.html>

Final Review Draft of Agreements for Drought Contingency Planning

October 5, 2018 - Final Review Draft Agreements for Drought Contingency Planning. Reclamation.

[CLICK HERE](#)

FROM TONY DAVIS OF ARIZONA DAILY STAR

It was another bad year on the Colorado River, and the numbers prove it.

- River flows into Lake Powell at the Arizona-Utah border were 43 percent of normal in water year 2017-2018, which ended at the end of last month. That's the lowest since the extreme drought year of 2002, when they were 24 percent of normal. It's the third lowest annual flow into Powell since records on river flows started being kept in 1906.

- The river's annual flows were above average in only four of the 19 years since 2000. This was the river's driest 19-year period on record.

- The combined storage of river water in Lake Powell and Lake Mead is about 41 percent of normal. It's the lowest combined storage since Lake Powell was filling during the mid-1960s after the closing of the gates at the newly constructed Glen Canyon Dam.
- This year's flows into Lake Powell were far less than the federal forecast back in April of about 52 percent of normal. One reason is that flows into Powell were 1 percent of normal in September — the driest on record — and 2 percent of normal in August — the second driest on record.

"We had a pretty good year in 2017, with an inflow into Powell of 110 percent of average. But unfortunately we lost that storage and a little bit more in 2018," said Dan Bunk, a U.S. Bureau of Reclamation hydrologist.

He presented these and other figures Wednesday at a meeting of the steering committee working on a proposed Drought Contingency Plan for the river's Lower Basin. "Really that buffer that we saw in Lake Powell, the extra storage that helped protect the Colorado River system, was lost this year," Bunk said.

The bureau predicts a 57 percent chance of the river's first shortage in 2020, with the odds of shortages increasing in future years. That would happen if Lake Mead drops below 1,075 feet at the end of 2019.

Without a formal Drought Contingency Plan in place, under which less water would be used, there's about a 75 percent chance of Mead dropping below 1,050 feet by 2026, which would require deeper cuts in deliveries, the bureau says. That's based on assuming the trends of declining river flows from 1988 to 2015 continues. With a drought plan, the odds of Mead dropping below 1,050 by then fall to a little over 50 percent.

Without a drought plan, there's also at least a 40 percent chance of Mead dropping below 1,025 feet from 2024 through 2026, bureau figures show, based on the same 1988-2015 flow record. With a plan, the odds of such low levels drops to less than 20 percent for all those years and to as low as 10 percent in 2024.

At 1,025 feet, a federal takeover of how the river's flows are divided is possible, as federal officials would want to keep the lake from sinking lower and approaching "dead pool" at 895 feet, when no water could be pulled from Mead.

Soothing words on water, but little else

DENNIS WEBB

Grand Junction Sentinel

Sep 20, 2018

Western Slope water interests received verbal assurances but nothing more formal from the Colorado Water Conservation Board Wednesday in regard to concerns about interstate drought-response negotiations and the implications for agriculture west of the Continental Divide.

CWCB staff and board members sought to ease Western Slope worries that Colorado and other states are moving toward agreement about creating a dedicated account or

pool in Lake Powell or other reservoirs for storing water saved through a potential demand management program. Those worries arise from a lack of any rules that would govern such a program in Colorado.

"Our fear is as Western Slope water users that we may become the target for demand management, and we want to do whatever we can to ensure that doesn't happen," Tom Alvey, a Delta County fruit-grower who is president of the Colorado River District board of directors, told the state board at its meeting in Steamboat Springs.

Alvey was reiterating comments made Friday by the district's general manager, Andy Mueller, at a district forum in Grand Junction focused on contingency planning measures should the region's long-term drought continue. States in the Upper Colorado River Basin are working on ways to try to keep levels in Lake Powell from falling low enough that the states could no longer meet their water-delivery obligations to downstream states under a 1922 agreement, leading to curtailment of water uses in the Upper Basin. Among measures under consideration is a potential demand management program that could involve measures such as temporary fallowing of fields.

Mueller on Friday voiced frustration about not being able to see a demand-management document that James Eklund, Colorado's representative on the Upper Colorado River Commission, may soon be signing. The river district fears the agreement could help facilitate a demand management program in Colorado inconsistent with what criteria the river district believes such a program should have.

Mueller's understanding Friday was that Eklund might be signing such a document within a month, but Eklund told The Daily Sentinel that instead draft documents would likely be made public within a month or so, with the goal of reaching final agreements later.

Eklund also said the point of the interstate demand-management negotiations is to reach an agreement under which conserved water could be stored in a separate account in a location such as Powell without being subject to release under an existing interstate agreement that seeks to help balance water levels in Powell and Lake Mead downstream. He sees the particulars about what a demand-management program would entail within Colorado as something to be determined in separate, in-state discussions.

Karen Kwon, first assistant attorney general with the Colorado Attorney General's Office, reiterated that Wednesday at the CWCB meeting.

"If we did a demand-management program and we had nowhere to put the water, it's for naught. We did nothing," Kwon said.

The river district and other Western Slope entities including the Southwestern Water Conservation District are uncomfortable with the idea of working out the storage side of things without first spelling out what constraints a demand management program should

have. They asked the state board Wednesday to adopt a resolution stating that any such program should comply with a number of principles laid out by the districts, but the board took no action on the matter.

Among principles the Western Slope sought were that any water conserved in a demand-management program should be able to be stored free of charge; that participation by water users in the program should be voluntary, compensated and temporary; that the conserved water shouldn't be subject to release under the Powell-Mead equalization agreement; and that the program should not have disproportionate impacts on any single basin or region in the state.

Principles such as the free storage are ones Colorado officials already are negotiating with other states, according to Kwon.

The river district also was concerned ahead of Wednesday's meeting about a memo from CWCB staff talking about key issues for consideration should Colorado create a demand-management program. Among those issues were whether such a program should be limited to temporary, voluntary and compensated activities "or be expanded to include something more," and the potential for considering a pivot "to something more akin to mandatory curtailment."

CWCB staff member Brent Newman said at Wednesday's meeting that the memo was simply intended to summarize the full spectrum of discussions, concerns and opportunities as identified by water users when it comes to a possible demand management program. He said CWCB and Attorney General's Office staff aren't "assessing, pursuing or recommending to the board any type of involuntary or anticipatory curtailment scenario."

Peter Fleming, the river district's general counsel, told the state board that Newman's clarifications "were very helpful."

Fleming said the issue has resulted in "a little period of unfortunate tension" of the kind that sometimes arises in the state regarding water issues.

"Sometimes it's unavoidable and sometimes it needs to be aired and it happens and we work through it," Fleming said.

But he said the river district remains concerned about that range of options raised by the CWCB staff in the memo. He said the district is worried about the "unfettered use" of a new tool.

"It is demand management. It is a controversial topic and we can't shy away from that. The reduction of consumptive uses is something that is a new thing on the West Slope in particular."

Kathleen Curry, a former state lawmaker whose family in Gunnison runs a cattle and

hay operation, said the Western Slope wants to be part of the solution rather than part of the problem. But she also worried that measures aimed at avoiding compact curtailment could significantly impact the viability of Western Slope agriculture.

"I hope that the treatment isn't worse than the disease," she said.

Jim Lochhead, chief executive officer and manager of Denver Water, said he saw a media account describing the West Slope position as a "manifesto."

"From Denver Water's perspective, I don't believe we need manifestos. What we need is diplomacy and what we need is leadership," he said.

Referring to letters Western Slope and Front Range water entities sent to the CWCB, he said there's actually a lot of common ground in them, which is no coincidence because those groups have been in conversations with each other.

But he added that while Denver Water prefers a voluntary, temporary, compensated demand management program, not talking about the prospect of mandatory curtailment won't make the problem go away

"We need to be thinking about that and we need to be thinking about it proactively," he said.

In choosing against taking any action on the issue Wednesday, CWCB board members voiced a desire to wait to see what's in the draft negotiation documents once they're released. They also referred to what they viewed as the importance of addressing the storage aspect of demand management.

"The storage is vital," said board chair Jim Yahn. "How we use it, we can agree to figure that out."

###

Something more?

Grand Junction Sentinel Editorial Board
September 20, 2018

It's never fun to learn that authorities aren't on the same page about something as critical as water, which is the lifeblood of any Western community.

Over the last several years, we've seen greater harmony between the Front Range and the Western Slope when it comes to water. As the Colorado Water Conservation Board went about finalizing the state's first-ever water plan, entities from both sides of the state met often in public forums and hammered out a consensus that worked for all parties.

But old suspicions die hard. In a departure from this new spirit of collaboration, we got a

dose of old-school saber rattling last week from the Colorado River District. Warranted or not, it's a reminder how communication and transparency can go a long way toward easing long-held tensions.

On Friday, Andy Mueller, the general manager of the Colorado River District took advantage of a public forum to announce his concerns with a "demand-management document" and its implications for Western Slope water users. The states in the Upper Colorado River Basin are supposed to spell out how they intend to deal with falling water levels in Lake Powell.

As the Sentinel's Dennis Webb reported, Mueller said the district hasn't seen documents that would commit the state to a drought contingency plan to fulfill its downstream obligations under the 1922 Colorado River Compact. Mueller said that was "unacceptable."

He's right. It would be unacceptable for the state water board to keep the documents from the district or the public, but that doesn't appear to be the case. James Eklund, Colorado's representative on the Upper Colorado River Commission and a former director of the Colorado Water Conservation Board said the goal is to get documents ready for review by this month, but that the district and other stakeholders would have plenty of time to evaluate and analyze them before they're executed.

Reassuring as that is, Mueller pointed to a memo written by the Colorado Water Conservation Board staff ahead of Wednesday's board meeting asking if a demand-management program should be confined to temporary, voluntary and compensated activities "or be expanded to include something more."

The memo also raised the question of whether the program would be used to help assure continued compliance with the river compact "or something more." The memo later suggests that mandatory curtailment is an option, but Mueller said it's never been discussed by water roundtables around the state.

Clearly, there's enough concerning language in the memo to justify an inquiry about the status of the documents in question. But it seems a simple phone call from the district to the CWCB staff could have cleared up any confusion before it escalated into a public calling-out of Eklund and the board. Perhaps some outreach from the board staff to the district and roundtables might have headed off Mueller's public concerns that conserved water could somehow be co-opted by wealthy Front Range water interests.

###

High and dry irrigators getting a hand

DENNIS WEBB
Grand Junction Sentinel
Sep 19, 2018

The Grand Valley's largest domestic water provider and a leading energy company are stepping in to help area irrigators stretch out their watering season due to western Colorado's severe drought conditions.

The Ute Water Conservancy District board of directors has agreed to donate 4,000 acre-feet of contract water it owns in Ruedi Reservoir above Basalt to help keep water flowing in local canals. Meanwhile, ExxonMobil subsidiary XTO Energy is contributing 5,000 acre-feet that it maintains in Ruedi Reservoir for use downstream of the reservoir, including for irrigation needs in Mesa County and to help protect endangered fish in a crucial 15-mile stretch of the Colorado River in the county.

An acre-foot is about 326,000 gallons. XTO said in a news release that its donation is equivalent to the water needed for 1,500 homes or to irrigate 10,000 acres of farmland for a year.

"Oh man, the whole Grand Valley ought to be very appreciative of that water," Dan Crabtree, who manages the Palisade Irrigation District, said of the donations.

The donations come in a year when much of western Colorado is in extreme and in some areas even exceptional drought, the most extreme category. That drought has come to threaten even Grand Valley irrigation water that involves some of the most senior water rights on the river in Colorado. That makes it some of the last water to get cut off when supplies run out, and also helps protect upstream Colorado River flows that ensure delivery of that water.

Some Grand Valley irrigation water comes from what's called a historic users pool at Green Mountain Reservoir outside Kremmling. This year, Grand Valley irrigation water providers began tapping that 60,000-acre-foot pool earlier than usual due to the drought.

In August, the Colorado River District agreed to release water from Ruedi Reservoir to help trout suffering from low water flows in the Fryingpan and Roaring Fork rivers and help meet Grand Valley irrigation needs while taking pressure off the users pool.

Even with that donation, by Sept. 12, just 8,700 acre-feet remained in the pool, and irrigation providers were anticipating shortages affecting more than 45,000 acres in the Grand Valley.

Ute Water spokesman Joe Burtard said the amount of water in the pool has continued to dwindle since then, prompting Ute Water to step in with the water of its own.

Ute Water owns 12,000 acre-feet of contract water in Ruedi, and in June already agreed to lease half that amount to the state to help endangered fish in the so-called "15-Mile Reach" stretch of the Colorado.

Ute Water held on to the other 6,000 acre-feet for domestic use, in case drought conditions continued to worsen. It now believes the 2,000 acre-feet it is keeping is sufficient as a reserve for domestic use.

"We're being very conservative in maintaining the 2,000 acre-feet for domestic use should we be in a situation where we need it," Burtard said.

So far, Ute Water has been able to meet its water needs from supplies coming off the Grand Mesa.

The donation of the irrigation water could help avert heavier demand on Ute Water and other local domestic water suppliers. Reduced flows in irrigation canals would mean subdivisions would be without irrigation water and homeowners would turn to their domestic water services to water landscaping.

The Ute Water donation will benefit the Palisade Irrigation District, Grand Valley Irrigation Company, Grand Valley Water Users Association, Mesa County Irrigation District and Orchard Mesa Irrigation District.

Burtard said it's hard to put a dollar value on the water Ute Water is donating. It paid \$1,289.90 an acre-foot for the contract water, he said. It is receiving \$7.20 an acre-foot for the 6,000 acre-feet it leased in June to the Colorado Water Conservation Board, an amount intended to cover related operation and maintenance costs for the district.

XTO's water releases will be coordinated with the state's Division of Water Resources, and with the U.S. Bureau of Reclamation and Fish and Wildlife Service in terms of timing to best benefit endangered fish.

"XTO Energy shares the state of Colorado's concerns about the persistent drought that is affecting much of Colorado," Michael Johnson, vice president of XTO's Central Division, said in a news release. "Just as we did during the 2002 drought, we are making an effort to offer our assistance by donating water we would normally use for internal operational purposes to help mitigate drought impacts." Said Crabtree, "The Exxon(Mobil) water, that's to keep water in the river, not only for recreation or aesthetics or the fish. It is just good to keep the ecosystem healthy."

Burtard said the Colorado River District is working with other entities to secure another 1,900 acre-feet for Grand Valley irrigators.

Crabtree said irrigators already have cut back use substantially to extend the historic users pool, which otherwise probably would have run out last week or this week. Without the newly donated water, irrigation providers would have to rely on the river's natural flows, "and there would definitely be some shortages," he said.

Mark Harris, general manager of the Grand Valley Water Users Association, said in the XTO news release that XTO's contribution helps ensure the proper operation of his

association's diversion structures, which also benefit other irrigation districts.

Crabtree, a retired Bureau of Reclamation employee, said he's been doing water work for 40 years and never has seen conditions so bad.

Dennis Clark, owner of Clark Family Orchards in Palisade, said the river is "about as low as I've ever seen it."

He said his farm probably has been irrigating a bit more than normal and will continue to do so this fall "just because we've been so hot and dry."

Another concern is the potential for moss issues developing in the river's low water that could create problems with irrigation filtration systems, he said.

So far, he said, his farm has survived the drought fairly well.

"It's going to be dire straits if we don't have a winter," he said.

Alan Rossi, whose R Ranch in Mack raises hay and cows, said his operation has always had water this year, and has had to irrigate a little more than usual due to this year's hot and windy weather.

"If we don't get any snow this winter that's the big concern, but right now everything seems to be OK," he said.

He said that even in the case of senior water rights, if there's no snow and resulting snowmelt, "then we're out of luck too."

Congress Restores Funds to 'Crucial' Colorado River Programs

Melissa Sevigny

KNAU Radio

September 17, 2018

The U.S. House and Senate have passed an appropriations bill that will restore full funding to environmental programs on the Colorado River for the next fiscal year.

KNAU's Melissa Sevigny reports, the programs were at risk of closing after the White House redirected their funding.

An amendment to the 2019 energy and water bill <https://www.congress.gov/115/crpt/hrpt929/CRPT-115hrpt929.pdf>

restores 21.4 million dollars to the Grand Canyon Monitoring and Research Center in Flagstaff and to other programs related to river management and endangered species recovery. President Trump has yet to sign the bill into law.

U.S. Bureau of Reclamation spokesperson Marlon Duke says he's pleased by the decision. "For us, these programs are crucial along the river. In addition to the science that they provide, it helps us in Reclamation to make sure that we stay compliant with the operation of our facilities along the river."

Duke says Reclamation will continue to work with Congress and stakeholders to find funding for future years. For decades the scientific research programs have been supported by hydropower revenues. The White House Office of Management and Budget ordered that money to go to the U.S. Treasury instead.

Utah launching first comprehensive planning effort for Green, Colorado rivers

To participate in this process, please visit the following web page - [Far Country](#)

By Amy Joi O'Donoghue of Deseret News

Published: March 16, 2018 4:39 pm

SALT LAKE CITY — To ensure the long-term sustainability of the Green and Colorado rivers as they flow through portions of Utah, state sovereign land managers are launching a first-ever effort to craft comprehensive management plans for the waterways.

The plans affect those state-owned sovereign land sections of the rivers as they go through Uintah, Grand, Emery, Wayne, Garfield, Kane and San Juan counties. The beds of navigable waters are owned by the state but held in trust for the public.

Plans will be developed, with public input, under the purview of the Utah Department of Natural Resources' Division of Forestry, Fire and State Lands.

That division is required to regulate all uses on, beneath or above the bed of the rivers, including protecting navigation, fish and wildlife habitat, aquatic beauty, public recreation and water quality.

These first-ever comprehensive management plans will also include an update of mineral leasing plans impacting Green and Colorado river resources.

During March and April, the division — assisted by contractors SWCA Environmental Consultants; CRSA architects, planning and design; and Hansen, Allen & Luce — will present information regarding the plan development process at open house meetings in each county that contains state-owned sovereign land sections of the rivers.

The open houses, all from 6 to 8 p.m., are as follows:

- Uintah County, March 27, at the Uintah County Library in Vernal
- Kane County, April 10, at the Kanab City Library in Kanab
- Garfield County April 11, at the Escalante Senior Center in Escalante
- Wayne County, April 12, at the Hanksville EMS Building in Hanksville
- San Juan County, April 17, at the San Juan County Administration Building in Monticello
- Grand County, April 18, at the Grand County High School Auditorium in Moab

- Emery County, April 19, at the John Wesley Powell Museum in Green River

All residents are encouraged to attend the public open house meeting in their county.

"Public involvement is an important part of the Green and Colorado river planning process," said project manager Laura Vernon, adding "suggestions and concerns about the rivers can help us identify issues and develop management plan objectives."

Vernon said the state developed comprehensive management plans for the Jordan and Bear rivers, two distinctly different waterways facing sharply contrasting issues because Jordan is an urban river, while the Bear River flows through a rural setting.

"It is interesting to see the different issues that come up," she said. "I suspect we will see some here."

Draft plans and a range of management actions and alternatives, in addition to an assessment of each of the river's resources, will be available for review during a second round of meetings a year from now.

In the summer of 2019, those draft plans will be open for public comment.

The drafts should be finalized in December of 2019.

Reclamation announces scoping for Lake Powell Pipeline

DEPARTMENT OF THE INTERIOR

Bureau of Reclamation

[WEBSITE](#)

Notice of Intent to Prepare a Draft Environmental Impact Statement and Public Scoping Period for the Lake Powell Pipeline Project

AGENCY: Bureau of Reclamation, Upper Colorado Basin, Interior Region 7. **ACTION:** Notice of Intent; request for scoping comments. **(SUMMARY:** The Bureau of Reclamation (Reclamation) intends to prepare an Environmental Impact Statement (EIS) on the Lake Powell Pipeline (LPP) Project. Reclamation is requesting public scoping comments to identify significant issues or other alternatives to be addressed in the EIS.

DATES: Submit comments on or before January 10, 2020. (Three scoping meetings will be held during the scoping period from 6:00pm to 8:00pm on January 7-9, 2020.

ADDRESSES: Provide written scoping comments and requests to be added to the mailing list to:

Mr. Rick Baxter, Program Manager
Bureau of Reclamation, Provo Area Office
302 East Lakeview Parkway
Provo, UT 84606

Via submittal form: <https://www.usbr.gov/uc/envdocs/eis/LakePowellPipeline/index.html>

Via eMail: lpp@usbr.gov

The three scoping meetings will be held at the following locations:

- January, 7th 6PM - 8PM; Kanab Center, 20 North 100 East, Kanab, UT, 84741
- January, 8th 6PM - 8PM; Dixie Center, 1835 South Convention Center Dr., St. George, UT, 84790
- January, 9th 6PM - 8PM; Valley High, 325 West 11000 South, South Jordan, UT, 84095

FOR FURTHER INFORMATION CONTACT:

Mr. Rick Baxter, Program Manager, Bureau of Reclamation, Provo Area Office, 302 East Lakeview Parkway, Provo, UT 84606; telephone (801) 379-1078; facsimile (801) 379-1159; e-mail lpp@usbr.gov. Persons who use a telecommunications device for the deaf may call the Federal Relay Service (FedRelay) at 1-800-877-8339 TTY/ASCII to contact the above individual during normal business hours or to leave a message or question after hours. You will receive a reply during normal business hours. Information on this project may also be found at:

<https://www.usbr.gov/uc/envdocs/eis/LakePowellPipeline/index.html>

SUPPLEMENTARY INFORMATION:

Reclamation is issuing this notice pursuant to the National Environmental Policy Act of 1969, as amended (NEPA), 42 U.S.C. 4321 et seq.; the Council on Environmental Quality's regulations for implementing NEPA, 40 CFR parts 1500 through 1508; Department of the Interior's NEPA regulations, 43 CFR part 46; and Bureau of Land Management regulations at 43 CFR 1610.2.(Background.

Reclamation will prepare an EIS for the LPP Project as proposed by the Utah Board of Water Resources (UBWR). The LPP is a proposed 140-mile, 69-inch- diameter water delivery pipeline that begins at Lake Powell near Glen Canyon Dam in Page, Arizona, and ends at Sand Hollow Reservoir near St. George, Utah. The pipeline would deliver up to 86,249 acre-feet of water from Lake Powell to Sand Hollow Reservoir. UBWR proposes building the LPP in order to bring a second source of water to Washington and Kane Counties in Utah to meet future water demands, diversify the regional water supply portfolio, and enhance the water supply reliability.

UBWR previously proposed a pipeline project with an intake at Lake Powell that included a hydroelectric peaking station at Hurricane Cliffs, Utah. The Federal Energy Regulatory Commission (FERC) was the lead Federal agency for that project because it would have required a hydroelectric license issued by the FERC. The UBWR withdrew its application to the FERC on September 25, 2019, and the project was terminated effective October 10, 2019. (https://elibrary.ferc.gov/idmws/file_list.asp?accession_num=20191016-3069)

Reclamation has been designated the lead Federal agency by the Department for the LPP NEPA process. The Bureau of Land Management (BLM), U.S. Fish and Wildlife Service (FWS), Bureau of Indian Affairs (BIA) and National Park Service (NPS) are cooperating agencies. Based on the changes to project design and the lead federal agency, Reclamation is initiating a new public scoping process, which will require interested parties to submit new comments on the current proposal. Reclamation is also reinitiating government to government consultation with Indian tribes under section 106 of the National Historic Preservation Act and in accordance with Executive Order 13175. Two pipeline alignments have been proposed: the Southern Alternative and the Highway Alternative. Both alternatives begin and end in the same locations. The Southern Alternative would travel south of the Kaibab Indian Reservation while the

alignment for the Highway Alternative would cross lands held in trust by the United States for the benefit of the Kaibab Band of Paiute Indians, following Arizona State Route 389. The Southern Alternative would cross land administered by the BLM in Utah and Arizona and would require multiple right-of-way (ROW) grants and an amendment to the Arizona Strip Resource Management Plan (RMP), because a small portion of the pipeline would go outside an approved utility corridor.

The Highway Alternative would cross BLM and Tribal trust lands, which would require the BLM and BIA to issue ROW grants and require a tribal resolution from the Kaibab Band of Paiute Indians. Both alternatives would cross lands administered by Reclamation and the NPS, requiring Reclamation to issue a license agreement and the NPS to issue a ROW permit under either alternative.

In addition, UBWR has requested a water exchange contract with Reclamation. Under the exchange contract, UBWR would forbear the diversion of a portion of the natural flows to which UBWR is entitled and allow these flows to contribute to meeting the Endangered Species Act Upper Colorado River Recovery Implementation Program requirements in the Green River. In exchange, UBWR would deplete an equal amount of water released from Flaming Gorge Dam throughout the year and available at Lake Powell. This exchange contract would not entitle UBWR to call for releases from Flaming Gorge. (Public Disclosure.)

Before including your address, phone number, e-mail address, or other personal identifying information in your comment, you should be aware that your entire comment - including your personal identifying information - may be made publicly available at any time. While you may ask us in your comment to withhold your personal identifying information from public review, we cannot guarantee that we will be able to do so.

Brent Esplin,
Regional Director,(Upper Colorado Basin
Interior Region 7, Bureau of Reclamation.
[FR Doc. 2019-26357
Filed: 12/5/2019 8:45 am
Publication Date: 12/6/2019

Intro and Project Overview

In accordance with the National Environmental Policy Act of 1969, the Bureau of Reclamation will prepare an Environmental Impact Statement for the Lake Powell Pipeline Project proposed by the Utah Board of Water Resources. The LPP is a 140-mile, 69-inch-diameter water delivery pipeline that begins at Lake Powell near Glen Canyon Dam in Page, Arizona, and ends at Sand Hollow Reservoir near St. George, Utah. UBWR proposes building LPP in order to bring a second source of water to Washington and Kane Counties in Utah to meet future water demands, diversify the regional water supply portfolio, and enhance the reliability of the water supply.

A map showing two proposed alternatives for the Lake Powell Pipeline project: The Highway Alternative and the Southern Alternative. Both alternatives begin and end in the same locations. The Southern Alternative would travel south of the Kaibab Indian Reservation. The Highway Alternative would cross lands held in trust by the United States for the benefit of the Kaibab Band of Paiute Indians, following Arizona State Route 389.

This [MAP](#) shows the two proposed alternative water conveyance systems for the Lake Powell Pipeline to carry water from Lake Powell to Sand Hollow Reservoir. The Highway Alternative is shown in blue while the Southern Alternative is shown in green.

UBWR previously proposed a pipeline project with an intake at Lake Powell that included a hydroelectric peaking station at Hurricane Cliffs, Utah. The Federal Energy Regulatory Commission was the lead Federal agency for that project because it would have required a hydroelectric license issued by the FERC. The UBWR withdrew its application to the FERC on September 25, 2019, and the project was terminated effective October 10, 2019. (https://elibrary.ferc.gov/idmws/file_list.asp?accession_num=20191016-3069)

Reclamation has been designated the lead Federal agency by the Department of the Interior for the LPP National Environmental Policy Act process. Based on the changes to project design and the lead federal agency, Reclamation is initiating a new public scoping process, which will require interested parties to submit new comments on the current proposal. Reclamation is also reinitiating government-to-government consultation with Indian tribes under section 106 of the National Historic Preservation Act and in accordance with Executive Order 13175.

EIS Process

General Information

Scoping is the first step in the NEPA process and can include various means of information-gathering activities. It is to be an early and open process for determining the scope of issues to be addressed and for identifying the significant issues related to a proposed action. (40 CFR 1501.7)

Public participation is an integral part of scoping because it gives the public an opportunity to help Reclamation identify issues of special concern and alternatives to the proposed action that may be included in the Environmental Impact Statement. Public scoping period for Reclamation's Notice of Intent to prepare an EIS for the pipeline project was announced in the Federal Register on December 6, 2019, and in a press release from Reclamation. The purpose of soliciting input is to identify relevant issues, alternatives, mitigation measures, and analytical tools so that they can be incorporated into the EIS. Comments may be submitted by 11:59 p.m. MST on January 10, 2020.

Getting input from as many affected and interested parties as possible is an important part of preparing an EIS. These usually include:

Citizens who live, work, or play in the area where the proposed project may occur.

Public interest groups and Native communities that have concerns about possible impacts to environmental, social, or economic resources.

Federal, State, and local government agencies that have responsibilities for managing public resources or services.

Scientists and other technical experts with knowledge of the area's natural resources and the possible impacts of the project development.

Impact Analysis

An EIS analyzes the environmental concerns that were identified for each alternative. The objective of the analysis is to determine the nature, severity, and duration of impacts that might occur and to compare the impacts of the alternatives. Numerous technical aids are used in making the assessment, including 23 ecological and socioeconomic studies that were completed when Federal Energy Regulatory Commission was the lead agency. These studies will be updated and incorporated as appropriate for Reclamation's EIS.

Draft EIS and Public Review

The impact analysis is first documented in a draft EIS. The draft EIS is made available to the public for 45 days for review and comment. The availability of the draft EIS is announced in a Federal Register notice and in press releases. Copies of the document are made available to the public on our web page. Requests for hard copies can also be submitted by email or phone using the "Contact Us" information. In order to make sure Reclamation can adequately respond to issues or concerns raised by the public, we ask that all comments be written and submitted via the methods described in the Notice of Intent or in the "Contact Us" section of this web page.

Final EIS

The principal objective when developing the final EIS is to address public comments on the draft EIS. The final EIS includes a summary of comments and Reclamation's responses.

After the comments on the draft EIS are reviewed, Reclamation will revise the document to correct technical errors and add any relevant new information that became available since the draft EIS was published. Once again, the availability of the final EIS is announced in a Federal Register Notice and press releases.

New paleoflood hydrology research paper: 700-year record of floods on Lower Green River in Stillwater Canyon

[Paleoflood Hydrology on the lower Green River, Upper Colorado River Basin, USA: An example of a naturalist approach to flood-risk analysis](#). 2019, Liu et al.

###

SUMMARY OF FINDINGS

Approach: analysis of physical evidence from past flood phenomena

Physical evidence: slackwater deposits (sediment) and paleostage indicators (perched driftwood is an example)

Year of obtaining samples: 2012

Dating techniques: Accelerator Mass Spectrometry, radiocarbon, optically stimulated luminescence

Number of sites: 6

Location of sites: Stillwater Canyon; lower Green River, Utah. Beginning 21 miles above confluence with the Colorado River, in Canyonlands National Park.

Basin: Colorado River in southwest USA

Time-frame: the last seven centuries

Total number of floods: 27

Magnitude (range in cubic meters per second): 500 to 7,500

Magnitude (range in cubic feet per second): 17,657 to 264,860

Highest peak from gage record: 68,122 cubic feet per second

Number of floods greater than gage record: 14

11/27/19

How the Fossil Fuel Industry Deliberately Misled Americans About Climate Change

"Climate scientists are as sure that burning fossil fuels causes global warming as public health scientists are sure that smoking tobacco causes cancer."

Over the past few decades, the fossil fuel industry has subjected the American public to a well-funded, well-orchestrated disinformation campaign about the reality and severity of human-caused climate change. The purpose of this web of denial has been to confuse the public and decision-makers in order to delay climate action and thereby protect fossil fuel business interests and defend libertarian, free-market conservative ideologies. The fossil fuel industry's denial and delay tactics come straight out of Big Tobacco's playbook. As a result, the American public have been denied the right to be

accurately informed about climate change, just as they were denied the right to be informed about the risks of smoking by the tobacco industry. While fossil fuel companies attacked the science and called on politicians to “reset the alarm,” climate-catalyzed damages worsened, including increased storm intensities, droughts, forest damage and wildfires, all at substantial loss of life and cost to the American people.

This report explores the techniques used to mislead the American public about climate change, and outlines ways of inoculating against disinformation.

Journal of Hydrology: Paleoflood hydrology research at Lower Green River in Stillwater Canyon, Utah

Through a comprehensive paleoflood investigation, employing the abductive mode of inference, we document natural evidence of 70 paleofloods at six sites on the Lower Green River, Utah. Hydraulic analysis, using the Sedimentation and River Hydraulic-2D model (SRH-2D), shows that the responsible peak paleoflood discharges ranged between 507 (18,000 cfs) and 7499 m³/s (264,824 cfs). At least 14 of these paleoflood discharge peaks exceed a level twice that of the maximum systematic gauged flow of 1929 m³/s.

Geochronological analysis, employing optically stimulated luminescence (OSL) and radiocarbon dating techniques, demonstrates that these 14 paleoflood peaks occurred in the past 700 years. Integrated of these paleoflood data into flood frequency analyses (FFA) showed higher values for the upper tails of the flood distribution than did an FFA based only on the systematic record, showing that extreme floods are more frequent than indicated by the relatively short gauged records. Through philosophical examination the three approaches to extreme flood estimation, FFA, probable maximum flood estimation, paleoflood hydrology, we show the significance of the natural evidence for advancing the scientific understanding of extreme floods.

OpEd: Minnesota groundwater should not be sold to Colorado River Basin

https://www.ifallsjournal.com/news/opinion/editorial/our-view-water-not-for-sale/article_b741043a-46c6-5387-ac2a-00cf6f6df6a1.html

OUR VIEW: Water not for sale

Laurel Beager
November 13, 2019

The water that makes up the Land of 10,000 Lakes is a precious and valuable resource. But that value shouldn't come in the form of money to allow other states to use.

The Minnesota Department of Natural Resources was right when it told a company it's not likely Minnesota will grant a permit allowing it to supply 500 million gallons each year of groundwater from Minnesota to the Southwestern United States by rail car.

Empire Builder Investments, based in Lakeville, Minn., submitted a preliminary well assessment request to the state in hopes of drilling two wells in Dakota County. The water produced from the wells would go on to be shipped by train to Southwestern states surrounding the Colorado River. A preliminary well assessment, required under state law, is an early stage review designed to identify potential issues before a proposer invests in equipment or well drilling.

Under Minnesota law, the DNR regulates the use of groundwater and surface water, and must manage public water resources for the benefit of the state of Minnesota, including future generations. The agency said in a statement that it must ensure that water appropriations are reasonable, practical, and adequately protect public safety and promote the public welfare.

The agency did all but outright reject the Empire Builder request after its initial review.

Minnesota DNR Commissioner Sarah Strommen stated “we see virtually no scenario where the DNR would grant a water appropriation permit for the project, as it does not appear it could meet applicable statutory requirements, including significant restrictions on use of the Mt. Simon aquifer.”

State restrictions limit the pumping of that aquifer for only for drinking water, and only when there’s no other feasible source.

The Minnesota Water Well Association, or MWWA, strongly opposes the proposal. The MWWA is a nonprofit organization representing water well drilling and pump contractors, geologists, hydrologists, engineers, state and local government employees, and groundwater industry suppliers and manufacturers.

Don’t get us wrong. Our hearts go out to the residents of drought-stricken states in the Southwest of our nation. We get that those states need water to avoid and fight devastating fires, and produce some of the vegetables and fruit we eat.

But we must join with others who also believe that the water resources in the Land of 10,000 Lakes are too precious and valuable to sell now and in the future.

White paper & story: Now is the time to prepare for shortages, water watchers say

https://www.gjsentinel.com/news/western_colorado/now-is-the-time-to-prepare-for-shortages-water-watchers/article_a5cffe08-069b-11ea-b08d-20677ce07cb4.html

[The Risk of Curtailment under the Colorado River Compact](#). 2019, Anne Castle and John Fleck.

DENNIS WEBB
Grand Junction Daily Sentinel
November 12, 2019

Trying to come up with water demand management programs is hard, but the alternative is a riskier future that could involve a forced curtailment of Colorado River use in Colorado, a speaker said Wednesday at Colorado Mesa University.

Demand management "is a form of insurance," Anne Castle said at the ninth annual Upper Colorado River Basin Water Forum, which continues today and is presented by CMU's Ruth Powell Hutchins Water Center.

Castle was a longtime water attorney and served from 2009-14 as assistant secretary for water and science at the U.S. Department of Interior. She now is a senior fellow at the Getches-Wilkinson Center for Natural Resources, Energy, and the Environment at the University of Colorado.

Castle and John Fleck, director of the University of New Mexico Water Resources Program, recently released a report evaluating the risk of future curtailment of river water use in Upper Colorado River Basin states under a 1922 river basin compact. The report discusses the concept of working to take an insurance-based approach to address the risk of curtailment.

"As with any form of risk, you can insure against it," Castle said.

The new paper's issuance comes amidst concern that potential droughts and a warming climate increase the likelihood of a future compact call on the river. That would force reduction in municipal, agricultural and other uses in the state, at least in the case of some water rights junior to the 1922 compact.

Earlier this year, Congress approved legislation allowing implementation of drought contingency agreements involving both Upper and Lower basin states. The agreements are aimed at helping keep water levels in Lake Powell and Lake Mead from falling so low as to jeopardize hydropower production and force water supply reductions. In the Upper Basin, an agreement allows in part for any water conserved by possible demand management programs to be stored in a separate account in Lake Powell to protect the reservoir's water levels.

Colorado and other Upper Basin states since have begun exploring the possibility of pursuing demand management programs. Becky Mitchell, director of the Colorado Water Conservation Board, said at Wednesday's forum that in Colorado, nearly 100 members of work groups have been meeting as the state begins "to investigate just the feasibility of that program."

Colorado is looking into issues surrounding the idea of a possible program involving temporary, compensated, voluntary reductions in use by agricultural and other water users.

Castle said demand management is complex and "not an easy solution but it does give us the opportunity to plan and we can hedge our bets a little bit."

The other option is going without insurance against the risk of curtailment, or "going bare," Castle said.

"Going bare is rolling the dice. It could work but it also could have very significant adverse economic impact," she said.

The curtailment threat derives from the 1922 compact requirement that Upper Basin states including Colorado not cause the flow of the river at Lee Ferry, which is below Lake Powell, to be depleted below 75 million acre feet over any 10-year period. A treaty with Mexico effectively ups that requirement to 82.5 million acre feet.

Castle said a legal question surrounds whether the 1922 requirement not to deplete water means a requirement to deliver it.

"We don't know the answer and this is the underpinning of risk to the Upper Basin," she said.

If it only means don't deplete, the Upper Basin is fine as long as it doesn't use more than 7.5 million acre feet a year under the 1922 compact, she said. But if it must deliver that much, it bears all the risk of climate change and reduced river flows in future years, she said.

The paper she and Fleck wrote points out that just a repeat of the drought in the first decade of this century could drop Powell levels so low in just four years that its hydropower generation would be threatened, and below those levels not enough water could be pushed through the dam to move 7.5 million acre feet a year downstream.

Meanwhile, climate scientists have projected a 20 to 30% reduction in the river's flows by mid-century, and a 35 to 55% drop by the end of the century.

"Those are conceivable situations that we just don't have any means of dealing with right now," Castle said.

Projected future water development projects in the Upper Basin further add to the concerns about curtailment potentially occurring.

The Upper Basin could go to court to try to deal with river compact issues, but Castle called litigation "not a basket where you want to put all your eggs."

"Litigation is very high-stakes poker. It is lengthy, it is costly and it is uncertain, and the biggest risk in litigation is that you lose," she said.

She said demand management would have costs, including payments to water users and secondary impacts. Some on the Western Slope want to ensure that temporary cutbacks in use aren't borne disproportionately by agricultural users, harming rural economies.

Castle said the costs of curtailment need to be considered as well, and those costs could be greater, could last longer and potentially can't be planned for.

Curtailment would particularly affect municipal transmountain diversions of Colorado River water to the Front Range, because those generally involve more junior water rights.

But Castle and Fleck note in a white-paper, summary version of their report, "While that might sound superficially attractive to West Slope agricultural interests, such a prospect could motivate affected municipal water providers to buy or lease pre-Compact West Slope irrigation water rights, possibly in substantial volume. Although these would almost certainly be market-based, arms-length transactions, the resulting economic impact could be geographically concentrated and tremendously disruptive to commodity supply chains and rural communities."

The white paper says that when it comes to demand management, "There are many barriers — legal, operational, economic, and political — that must be addressed. While it is not clear that a demand management program is the right, or the only, appropriate form of contingency plan, it does seem to be the only viable insurance policy proposed thus far."

Arizona will struggle to find enough water for suburban growth, report says

By Tony Davis of *The Arizona Daily Star*

Oct 19, 2019 Updated 6 hrs ago

https://tucson.com/news/local/arizona-will-struggle-to-find-enough-water-for-suburban-growth/article_570e2de4-f13e-5753-b3c2-38ff731fc221.html

Some suburbs of Tucson and Phoenix will struggle to find enough water to keep growing without damaging underground aquifers by overpumping groundwater, a new report warns.

This could lead to land subsidence, including ground fissures; lower water quality; and even the possibility of wells drying up.

The report from Arizona State University's water institute also warns of potentially catastrophic financial problems for the agency that finds renewable water supplies for development in far-flung suburban areas.

That, in turn, could ratchet up already soaring rates for homeowners there. The state's system for ensuring there's enough water for much of the new suburban growth — in accord with the landmark 1980 Groundwater Management Act — is environmentally unsustainable and needs an overhaul, the report suggests.

- [Click here](#) to read the Kyl Center Report of 2019
- [Click here](#) to read the Pollack Report of 2017
- [Cadillac Desert Revisited: Property Rights, Public Policy and Water Resource Depletion](#). 2001; Holland.

The findings raise questions about how much more growth should continue in areas without renewable supplies such as Central Arizona Project water, said Kathleen Ferris, a former Arizona Department of Water Resources director and chief counsel who co-authored the report. CAP water comes to Arizona's cities and farms from the Colorado River via a 336-mile-long canal system.

"Failure to find solutions to these problems could have devastating consequences down the road. Taking action to address them is the only way to protect Arizona's water supplies for its current and future citizens," said the report, prepared by ASU's Kyl Center for Water Policy.

At issue is where authorities will find enough water to replenish aquifers in fast-growing areas of Pima, Pinal and Maricopa counties where groundwater is or will be pumped to supply new homes, because they don't have access to CAP water.

The report focuses on the work of the Central Arizona Groundwater Replenishment District, a part of the CAP, whose job is to find the renewable supplies for those homes in the three counties. Under state law, the homes in these areas can be built only if renewable supplies can be found to compensate for the water pumped to serve them. In the Tucson area, such development is occurring or is projected to occur over the next few decades in unincorporated areas north, south, northwest and southeast of the city. The areas include the Green Valley and Quail Creek areas south of Tucson, the SaddleBrooke area just north of the Pinal County border, and the Vail area southeast of Tucson.

Far more intense future development and pressure on water supplies is expected for Pinal County closer to Phoenix and for the Buckeye area west of Phoenix.

These supply issues could get worse if climate change continues to reduce Colorado River supplies, said Sarah Porter, the report's co-author and director of the Kyl Center. During a CAP shortage, water earmarked for the suburban areas would be among the first supplies to be cut. So climate change will have a bigger impact on such water users than on cities with their own CAP supplies. Those cities have higher priorities for the water during shortages, Porter said.

Specifically, the report found:

- Because pumping for these subdivisions often occurs far from where renewable supplies are recharged — placed on the ground to seep into the aquifers — groundwater levels under these subdivisions are falling.
- Membership in the water district by homes needing groundwater replenishment has hit 286,000 homes statewide, including more than 24,000 in 122 subdivisions in the Tucson area. By 2024, about 383,000 homes statewide are expected to be district members, far more than previously expected, putting additional pressure on water supplies.
- The potential exists for a huge gap between the amount of renewable water that's available for replenishing aquifers and the amount that new development will need over the next century. Statistics from the report suggest it could be up to 300,000 acre-feet a year —enough to serve Tucson for three years.
- The three-county district says there's plenty of water potentially available for future development. But the report says the availability of these supplies is questionable.
- Various fees and assessments imposed on homeowners living in the areas served by the water district have escalated. The annual charge assessed on homes to pay for water supplies, water rights purchases and administrative costs, for instance, jumped in the Tucson area from \$188 an acre-foot per home in 2000 to \$738 this year. It's expected to hit \$775 by the mid-2020s.

Over the years, the three-county replenishment district has taken considerable criticism from environmentalists and others who say its practices encouraged unsustainable urban sprawl.

But the district isn't to blame for problems outlined in the report, said Ferris, because it has carried out all that state law requires it to do: "The problem is that the statutes are too lenient."

Responding through a spokeswoman, the water district said it won't comment on the report specifically, because it just received it Thursday. In a statement, the district said it's fulfilled its legal duties effectively, "demonstrating fiscal responsibility while securing a robust water supply portfolio that will be available through the mid-2030s."

The district said it conducts thorough analyses of water supplies and costs to monitor their viability and changes. Due to leadership and oversight by its governing board, the

district said, it is positioned as “a strong and stable component in the fabric of Arizona’s water policy.”

Here are details of the problems the new report says have been caused by allowing groundwater pumping for new growth away from where aquifers are recharged:

Despite replenishment, well levels fall

The law sets up a disconnect between groundwater pumping and recharge that’s “problematic.”

Because no CAP is delivered to developing areas such as SaddleBrooke and Green Valley, private water companies and other utilities continue pumping groundwater there. To compensate for that pumping, the water replenishment district recharges aquifers in areas far away, such as the Pima Mine Road Recharge Project south of Tucson, the Avra Valley Recharge Project west of Tucson and the Lower Santa Cruz Recharge Project adjacent to the Santa Cruz River and northwest of Avra Valley Road. So the water table under developing areas keeps falling.

“When replenishment does not take place near the site of groundwater withdrawal, the replenished water will not reduce the local geological impacts of pumping and will do nothing to recharge the aquifers that CAGRD members are counting on to supply groundwater,” the report said, using an acronym for the replenishment district.

One problem is that in some of these areas, it’s highly uncertain whether even enough groundwater is physically available. Just last week, for instance, the Arizona Department of Water Resources released information showing that Pinal County has 8 million acre feet less groundwater than is expected to be demanded over the next 100 years.

An aquifer that keeps falling can trigger land subsidence, or a settlement of the ground that causes earth fissures. Groundwater quality can also worsen and pumping costs invariably rise. Once aquifers collapse from subsidence, they can’t be restored, the report said.

The biggest problem with the pumping is that it’s unsustainable, leading to eventual groundwater depletion, said the report, adding: “This grim reality leads to a crucial question: Who will provide water to homeowners and businesses on CAGRD member lands if their wells run dry?”

Since groundwater may legally be pumped to 1,000 feet below land surface in the Phoenix and Tucson areas and 1,100 feet deep in the Pinal County area, “this is not an academic question. It is a serious likelihood, with major consequences that must be considered.”

Escalating water demands By 2114, the district expects to have legal obligations to recharge 113,000 acre feet of renewable water, nearly three times what it does today. That doesn't account for massive growth expected in Pinal County and in Buckeye in Maricopa County.

Bold predictions, uncertain supplies

The water replenishment district says it has identified up to 980,000 acre-feet of what it calls "potentially available" supplies it expects to have access to by 2114. Even if only half that amount turns out to be realistic, that's still far more than it expects to need by then.

But it's questionable whether many of those supplies will be available, the Kyl Center report said.

A big chunk of that expected supply, for instance, would come from CAP water that other urban and tribal users don't want. But that "excess" supply has rapidly diminished in recent years as cities have used more of their water. It's expected to go away once CAP shortages get worse, the report said.

The replenishment district has also projected it could buy a large amount of Colorado River water from on-river users in places such as Mohave County.

But since then, the district has canceled efforts to buy water rights from there and from Quartzsite in neighboring La Paz County. Residents of Mohave and La Paz counties fought the plan because they didn't want their own water supplies drained.

The district has also projected that it could buy and import groundwater from Western Arizona and buy and recharge treated sewage effluent. But those supplies both look uncertain today, said Porter.

Importing groundwater will be very expensive, in part because it may require some treatment before putting it into the CAP canal. As for effluent, "the (municipal) water providers that have effluent already have a plan for their effluent. A lot of water providers are looking to effluent as an important part of their growth portfolio," Porter said.

The replenishment district did strike a deal last year that virtually doubled its total supply: a \$95 million water rights purchase from the Gila River Indian Community that will bring the district 900,000 acre-feet over 25 years.

But about half that water has lower priority during shortages than what's typical for Indian-owned CAP water. So "the full amount of this supply is not likely to be available every year," the report said.

Runaway costs

As costs escalate for homeowners and subdivisions to join the replenishment district and pay it to recharge renewable water, some water district members — subdivisions and homeowners associations — are finding cheaper alternatives.

They include two types of credits that water rights owners can buy, letting them pump groundwater and avoid having to recharge surface water to compensate for it.

With one, someone who owns a historic “grandfathered” water right can give up that right in exchange for such credits. With another, people or government entities can buy long-term storage credits from others who have recharged CAP water or effluent into the ground. That gives the purchaser the right to pump groundwater.

If these practices continue, declining customers for the water district could force rates to rise further, triggering a painful cycle of rising rates and declining customers, said Ferris. The ultimate result for the district could be catastrophic financially.

Reactions

The Arizona Department of Water Resources, which enforces the 1980 groundwater law, won’t comment until it reviews the report, a spokesman said.

Southern Arizona Home Builders Association President David Godlewski said the link between the groundwater replenishment district and Arizona’s economy is “undeniable,” and that “everything in our power must be done, including acquisitions of additional water resources, to protect and enhance it.”

Efforts to change or weaken it pose serious economic risks, said Godlewski, adding that without the district, “new economic development, as well as the existing economy in Tucson, would be adversely impacted.”

The CAP said it wants to be part of the discussion about appropriate growth, but “it may not be the appropriate agency to lead it because the focus of this debate would go beyond its legal responsibilities,” it said.

Kathy Jacobs, who helped write the 1993 rules to assure Arizona’s growing areas have water supplies for 100 years, called the report “excellent, very well researched and documented.” She agrees with all but one of its recommendations.

She has reservations only about its proposal to require that all pumping of groundwater be done in the same places where recharge occurs. Exceptions to such a rule should definitely be allowed, she said. An example includes recharging water away from pumping areas to restore riparian habitat.

There were practical reasons for creating the groundwater replenishment district, “but with the benefit of hindsight it is clear that certain components of the Assured Water Supply program need to be tightened up,” said Jacobs.

One oversight in past water management, she said, has been its failure to fully acknowledge, until recently, the implications of climate change and the chronic overuse of the Colorado River.

University of Arizona law professor Robert Glennon, who has written two books about water supply issues, gave the report high marks.

“The CAGRDR (water district) has been a house of cards from its inception. Facing the problems with it is long past due,” Glennon said. “I hope our legislators, the Governor’s Office, the Department of Water Resources, and the CAP district pay close attention to the findings in this report and take swift action.”

Lawsuit: Climate change impacts ignored in gas leases

SALT LAKE CITY (Associated Press) — A coalition of environmental organizations allege in a new lawsuit that the U.S. government failed to adequately analyze climate change impacts while approving 130 oil and gas leases in Utah.

The lawsuit filed Thursday accuses Bureau of Land Management officials of violating the National Environmental Policy Act in approving leases on about 274 square miles (710 square kilometers) of land in rural Utah from 2014 to 2018.

Bureau of Land Management spokeswoman Kimberly Finch declined comment since it's a pending lawsuit.

The lawsuit accuses the agency of "dutifully" implementing President Donald Trump's push to ramp up oil and gas drilling on public lands.

For a while in 1983, sheets of plywood were all that kept the mighty Glen Canyon Dam from overflowing

"Lake Powell wasn't always half empty. In 1983, the reservoir filled nearly to overflowing, and saved by resourceful engineers and a lot of concrete."

Living Rivers would like to remind readers that spillways are not how an agency properly manages a big snow melt. Foresight planning and prudent reservoir management is how an agency should manage a flood. This incident was a human mistake that nearly caused an incomprehensible, catastrophic tragedy of epic proportion.

Moab Event on June 22 & 23: “Weaving narratives and policy: storytelling on the Colorado Plateau”

[Click here](#) to read the the news story from the *Moab Sun News*.

Moab is one of the largest communities along the Colorado River, and will serve as the venue for a two-day event sponsored by the [SCREE expedition](#) and Living Rivers on June 22 and 23, 2019. Taking place at the Moab Arts & Recreation Center Dance Hall, the two-day event will feature storytellers, dancers, authors, artists, and academics. As described in detail below, these activities will attract local community members, students, rafters, artists, and water managers.

EVENT LOCATION

Moab Arts and Recreation Center (MARC) The Dance Hall 100 East and 100 North

SCHEDULE FOR SATURDAY

June 22: Public Lands

- 9:30 a.m.: Light breakfast refreshments
- 10:00 a.m.-10:15 a.m.: Introduction to the event and invocation by with Howard Dennis, Hopi Tribe, Second Mesa, AZ.
- Note: This brief introduction will be a welcome, description of themes and events, quick background on SCREE, acknowledgements, etc.
- 10:15-10:45 a.m.: Hopi Dancers
- 10:50 a.m.-11:30 a.m.: USGS – Perspectives of the SCREE trip so far.
- Note: Question and Answers
- 11:30 a.m.-12:30 p.m.: Dan McCool “Climate Change and Public Lands” Note: A legal follow-up to the themes of Bears Ears. 15 minutes of audience questions included.
- 12:30 p.m. – 1:15 p.m.: Light lunch and social hour.
- 1:20 p.m.-2:00 p.m.: Serena Supplee, renowned local artist - “Painting the Colorado Plateau”

Note: A visual presentation of artwork and the process of creation. The artists may describe the adventure in going to sites to paint, what areas spark interest from an artist's perspective, and contrast experiences.

- 2:00 p.m. – 2:20 p.m.: Patrick Kikut – SCREE Lead Artist Note: Art and Inspiration on the SCREE trip so far
- 2:30 p.m. – 3:15 p.m.: Chris Warren of Beatnik Prints – Present his artwork and discuss methods and how landscape as inspired his work
- 3:15-3:45: Hopi Dancers

SCHEDULE FOR SUNDAY

June 23: Water

- 9:30 a.m.: Light breakfast refreshments
- 10:00 a.m. – 11:00 a.m.: John Weisheit & Tom Minckley, Introduction – “Relationship of water and the community of Moab”
- Note: A local connection between the town, economies, and culture of Moab. Potential issues in the future: groundwater, drought, pollution, etc.
- 11:15-11:45: Hopi Dancers
- 11:45 a.m. – 12:30 p.m.: Robert Adler, “Water Law and Climate Change”
- 12:30-1:15: Lunch
- 1:15 p.m. – 2:15 p.m.: Cody Perry, Rig to Flip - The Story of Chicken Raper; the Story Behind One of the Most Infamous Rapids on the Dolores River – Note: Q&A and presentation from the filmmaker.
- 2:15 p.m. – 3:15 p.m.: Taylor Graham, Glen Canyon Rediscovered film showing and Q&A with The filmmaker.

Lawsuit Challenges Utah's New Green River Water Contract

Trump Administration Failed to Consider Other Water Deals, Climate Change

[CLICK HERE](#) to read the complaint

WASHINGTON - Conservation groups sued the Trump administration today to challenge the Interior Department's decision allowing additional water to be taken from the Green River below Utah's Flaming Gorge Dam. The decision was made without a full accounting of reduced Colorado River basin flows or how the region's persistent drought and climate change could harm endangered species and recreation.

Today's lawsuit, filed in U.S. District Court in Washington, D.C., says Interior's Bureau of Reclamation failed to consider other pending water contracts, including the Lake Powell Pipeline, which could further deplete the Green and Colorado rivers.

The agency claimed in its environmental assessment that the new Green River Water Rights Exchange contract, signed Wednesday, would have no significant environmental impact. But it did not consider climate change, drought or over-allocation of water.

“The water resources of the Colorado River Basin are already headed toward irretrievable decline in both quantity and quality,” said John Weisheit of Living Rivers and Colorado Riverkeeper. “The environmental review ignored the reality of declining river flows in the Green River and the rest of the Colorado basin and the connected impacts of this contract and the proposed Lake Powell Pipeline water contract.”

“This review was appalling. The Green and Colorado river systems need a full accounting,” said Robin Silver, a cofounder of the Center for Biological Diversity.

“Drought, climate change and over-allocation are sucking the Colorado River basin dry right in front of our eyes. But officials ignored declining river flows, pretended this new Green River contract stands alone and ignored multiple proposed water projects like the Lake Powell Pipeline. We’ll fight to defend these spectacular rivers.”

Four endangered fish could be harmed by changes to water flows and timing contemplated under the Green River Water Rights Exchange contract and other pending water deals. Changes to Flaming Gorge Dam operations necessary to accommodate the water contracts and drought-contingency planning could be devastating for these fish and other species. Endangered species at risk include the Colorado pikeminnow, razorback sucker, humpback chub and bonytail chub.

The river includes fragile riparian areas and wetlands, as well as breathtaking canyons popular with rafters. It winds through Browns Park National Wildlife Refuge, Dinosaur National Monument, Ouray National Wildlife Refuge and Canyonlands National Park before joining up with the Colorado River.

“The Bureau’s Green River Block environmental review is a disingenuous facade that ignores the agency’s own climate change warnings and myriad scientific studies about water-supply shortfalls to advance the largest new proposed diversion of the Colorado River, the Lake Powell Pipeline,” said Zach Frankel, executive director of Utah Rivers Council.

The groups are represented by attorneys from the Center for Biological Diversity.

Lawsuit Launched Over Massive Utah Oil Shale Development Project Threatens Endangered Species, River Flows, Climate

SALT LAKE CITY— Conservation groups today issued a notice of intent to sue the Trump administration for approving rights-of-way for pipelines and powerlines that pave the way for the nation's first commercial oil shale development. The massive Enefit project in Utah's Uintah Basin would drain billions of gallons of water from the Green River, threaten endangered species and generate enormous amounts of greenhouse gas pollution.

Oil shale is one of world's most carbon-intensive fuels whose strip mining can require several barrels of water for each barrel of oil, or kerogen, produced. At full buildout, Enefit's facility would produce 50,000 barrels per day of oil from the Green River Formation.

"This project would be a disaster for the climate, the Colorado River and endangered species," said Taylor McKinnon, a senior campaigner at the Center for Biological Diversity. "Draining rivers to mine high-carbon fossil fuels will accelerate climate change that's already drying the Colorado River Basin. The West needs to chart a sustainable future, but the Trump administration is paving the road to catastrophe."

Today's notice says the Bureau of Land Management and U.S. Fish and Wildlife Service failed to protect several endangered species when they approved electricity, oil, gas and water lines across public lands. The notice argues that federal agencies violated the law by ignoring the potential harm to imperiled fish, studying only the harm from water depletions necessary to build the pipeline, not to operate it.

"The BLM approved the rights-of-way to service the oil-shale development based on an utterly inadequate analysis of its potentially devastating environmental impacts," said Michael Toll, a staff attorney at the Grand Canyon Trust. "Considering the rights-of-way are a public subsidy of an otherwise economically unfeasible oil-shale facility, the public has a right to know exactly how Enefit's project will impact the environment."

The water pipeline will allow the Estonia-owned Enefit American Oil to drain more than 10,000 acre feet annually from the Green River, harming critical habitat for endangered fish, including the Colorado pikeminnow and the razorback sucker. Mining the oil shale will destroy habitat for two rare wildflower species for which Endangered Species Act protections are proposed. The project comes as western states struggle with record droughts and climate-driven declines in river flows in the Colorado River Basin.

“The water resources of the Colorado River Basin are already headed toward irretrievable decline in both quantity and quality,” said John Weisheit with Living Rivers Colorado Riverkeeper. “Opposing the Enefit Project is a no brainer; it epitomizes exactly what inappropriate development looks like.”

Enefit intends to strip-mine about 28 million tons of rock a year over thousands of acres of high-desert habitat. It will also construct a major production facility to bake the rock at high temperatures. The half-square-mile processing plant, about 45 miles south of Dinosaur National Monument, will turn pre-petroleum stones into refinery-ready oil.

“There are very levelheaded reasons why the United States hasn’t invested in commercial oil shale extraction before – and this project in particular would be uniquely destructive in Utah,” said Alex Hardee, an attorney at Earthjustice. “The Fish and Wildlife Service has a duty to ensure that federal approvals do not drive endangered species off the cliff of extinction. But the agency turned a blind eye to the devastating effects this oil shale project would inflict by only paying attention to the water it would suck up to build this nonsensical pipeline but not to actually operate it.”

“Every resident of the state should be alarmed. This oil shale project would exploit, degrade, and exhaust Utah’s most precious natural resources – our water, our air, and our beautiful natural landscapes,” said Dr. Brian Moench, president of Utah Physicians for a Healthy Environment. “It threatens public health, will tie Utah’s future to dirty energy, and will accelerate climate the crisis. Even worse, the only beneficiary of this scheme is a foreign oil company.”

“BLM is essentially telling the public not to worry because the pipes and power lines themselves won’t have much impact, while turning a blind eye to the large-scale destruction that this infrastructure will enable,” said Ann Alexander, senior attorney with Natural Resources Defense Council.

The project would produce 547 million barrels of oil over three decades, spewing more than 200 million tons of greenhouse gas — as much as 50 coal-fired power plants produce in a year. Those emissions would contribute to global warming and regional drought already afflicting the rivers and their endangered fish.

“Everything related to this project represents a worst case scenario for this severely climate change impacted region and the planet,” said Dan Mayhew, conservation chair of the Utah Chapter of the Sierra Club. “Rampant destruction of public lands and large

scale water dependency while adding pollution to an already challenged airshed. This project needs to be stopped in its tracks now.”

The 60-day notice gives the agencies an opportunity to comply with the Endangered Species Act and avoid a lawsuit.

“The Colorado River is disappearing due to mismanagement, drought and accelerating climate change, putting at risk not only multiple endangered species but also the drinking water for nearly 40 million people,” said Daniel E. Estrin, advocacy director at Waterkeeper Alliance. “In the face of this crisis, FWS and BLM’s approvals could cause 100 billion gallons of water to be removed from the basin over the next three decades, harming government-protected endangered species and hastening the collapse of a critical water supply system already teetering on the brink of failure.”

Proposed Green River Nuclear Reactor Dead in the Water

NEWS RELEASE

Sarah Fields
Program Director
Uranium Watch
PO Box 1306
Monticello, Utah 84535
435-260-8384

Green River Nuclear Reactor Dead in the Water
San Juan Water Conservancy District Terminates Blue Castle Project Water Rights

Moab, Utah. December 11, 2020 - Blue Castle Holdings Inc. (BCH) no longer holds a lease for 24,000 acre feet of water from the Green River for the proposed Blue Castle Project nuclear reactor near Green River, Utah. The 2007 Water Rights Lease Agreement between the San Juan Water Conservancy District (SJWCD) and BCH was terminated on March 25, 2019. BCH also has a Water Rights Lease Agreement with the Kane County Water Conservancy District (KCWCD) for 29,600 acre feet of water, for a total of 53,600 acre feet (~ 87 million gallons per day) for a 2-unit AP-1000 reactor. This means that BCH no longer has a right to 45% of the water appropriated for the Blue Castle Project.

A nuclear reactor at Green River would have had extreme long-term adverse impacts to the Colorado River Basin, the health and well-being of the citizens of Green River and nearby Utah and Colorado communities, the Canyonlands of South East Utah, local recreation and agricultural economies, endangered and threatened fish species, and all aspects of the local and regional environment.

The Lease Agreement was terminated by the SJWCD because BCH defaulted on its payment obligations. Without informing the Districts, BCH failed make the expected lease payments, starting in 2016. BCH finally made payments to the District from 2018 to 2020. The status of the Water Rights Lease Agreement between the KCWCD and BCH for 29,600 acre feet for the Blue Castle Project is unclear.

BCH had no experience in the licensing, construction, or operation of a nuclear reactor. BCH never submitted an Early Site Permit Application (ESPA) to the Nuclear Regulatory Commission (NRC). BCH last contacted the NRC in 2011, informing the NRC that they would submit an ESPA in late 2012.

BCH has never admitted publicly that they defaulted on the Water Rights Lease payments, that one of the lease agreements has been terminated, or that the Blue Castle Project is dead.

According to Sarah Fields, Uranium Watch Program Director, “All along protesters and plaintiffs asserted that the Blue Castle Project was not economically feasible.” “Protestors and plaintiffs questioned whether BCH could raise the money necessary to submit a license application and construct and operate a nuclear reactor.” “It turned out they did not even have the money to pay the Water Conservancy Districts for the Green River water.”

Background

From 2009 to 2016, BCH and the San Juan and Kane County Water Conservancy Districts convinced the State Engineer, Division of Water Rights; the Utah 7th District Court, and the Utah Court of Appeals that the BCH proposal to license, construct, and operate a 2-unit reactor about 4 miles west of Green River was economically feasible.

2007 — Water Rights Lease Agreements:

BCH (formerly Transition Power Development LLC) signed Water Rights Lease Agreements with the San Juan and Kane County Water Conservancy Districts for a total of 53,600 acre feet from the Green River for a proposed 2-unit nuclear reactor. The Agreements required the Districts to submit applications to change the use, place of use, and point of diversion for the Water Rights.

2009 — Water Rights Change Applications

March 30, 2009, and August 27, 2009, the KCWCD and SJWCD, respectively, submitted Applications for Permanent Change to the Division of Water Rights.

2009 — Water Right Change Public Notice and Protests

The proposed Water Rights Change Applications were noticed in September 2009. Protests and hearing requests were filed by Uranium Watch, Living Rivers, HEAL Utah, Center for Water Advocacy, Sierra Club, Grand County, Moki Mac River Expeditions, Holiday River Expeditions, Utah Rivers Council, and others.

2009 — Administrative Hearing

A DWR informal administrative hearing was held in Green River on January 12, 2010. Additional information was filed with the Division by the respective parties.

2012 — State Engineer Approves Change Applications

The State Engineer approved the appropriation of water from the Green River for the Blue Castle Project on January 20, 2012.

2012 — Request for Reconsideration and Denial

Uranium Watch et al. and HEAL Utah et al. requested reconsideration of the State Engineer’s decision In early February 2012. The State Engineer denied the requests for reconsideration on February 28, 2012.

2012 — Appeal of State Engineer’s Decision

Then, on March 27, 2012, attorneys for Uranium Watch, Living Rivers, HEAL Utah, Center for Water Advocacy, Holiday River Expeditions, Utah Rivers Council, and others filed an appeal of the State Engineer's decision regarding the SJWCD and KCWCD Change Applications in the 7th Utah District Court for Emery County.

2013 — District Court Hearing

Starting September 23, 2013, Judge M. George Harmond, Jr. of the Utah 7th District Court held a 5-day hearing in Price, Utah, on the appeal of the State Engineer's appropriation of water from the Green River for the proposed Blue Castle Project. The proceeding was the culmination of a 4-year effort to bring some sense to the allocation of Utah waters for an ill-advised, risky, and speculative energy project.

2013 — 7th District Court Decision

On November 27, 2013, Judge George M. Harmond, Jr. issued a decision upholding the Utah State Engineer's appropriation of 53,600 acre feet from the Green River for the proposed Blue Castle Project.

2014 — Appeal of 7th District Court Decision

On May 16, 2014, attorneys for the Plaintiffs filed a Notice of Appeal of the 7th District Court's decision to the Utah Court of Appeals.

2016 — Oral Arguments and Court of Appeals Decision

Oral arguments were held on January 26, 2016, before the Utah Court of Appeals. The opinion of the Court of Appeals, upholding the 7th District Court's decision was issued on July 21, 2016.

2016 — State Engineer's Decision Becomes Final

Plaintiff's did not file a petition to the Utah Supreme Court for review of the Appeals Court decision within 30 days, finalizing the Appeals Court decision upholding the State Engineer's decision

2016 — Conclusion of Court Challenges

The court challenges concluded in September 2016, when plaintiffs did not appeal the Court of Appeals affirmation to the Utah Supreme Court. Soon after, the first pre-operational payments to the Districts were due: \$80,000 to SJWCD and \$100,000 to KCWCD. Those initial Water Rights Lease Agreement payments were not made. BCH had defaulted on its Water Rights Lease Agreement obligations.

2018 — SJWCD letter to BCH

On March 15, 2018, SJWCD informed BCH that they had 120 days to cure the default, or they would receive a Notice of Termination.

2019 — Notice of Termination

The Notice of Termination was issued on March 25, 2019. BCH did arrange a payment schedule with the District and made payments to the SJWCD over the next year.

2020 — Final BCH Payment to SJWCD

BCH made a final payment to the SJWCD, for a total of \$258,533.69 paid to the District.

Are We Really Past the Point of No Return on Climate? Scientists Respond To Controversial New Study

[Click here](#) to read this climate study from Norway.

A controversial new climate study has found that, even if greenhouse gas emissions were halted tomorrow, it might not be enough to stop temperatures from continuing to rise.

The study, published in Scientific Reports Thursday, was conducted by two researchers at the BI Norwegian Business School. They used the ESCIMO climate model to determine that, even if emissions ceased tomorrow, the permafrost would continue to thaw for hundreds of years.

"According to our models, humanity is beyond the point-of-no-return when it comes to halting the melting of permafrost using greenhouse gas cuts as the single tool," lead author and professor emeritus of climate strategy Jorgen Randers told AFP. "If we want to stop this melting process we must do something in addition – for example, suck CO₂ out of the atmosphere and store it underground, and make Earth's surface brighter."

However, other scientists have pointed to the simplicity of the model Randers and his colleague Ulrich Goluke used and cautioned against misinterpreting their findings as a reason to give up on climate action.

"This paper clearly may be cited in support of a misleading message that it is now 'too late' to avoid catastrophic climate change, which would have the potential to cause unnecessary despair," University of Exeter climate scientist professor Richard Betts said in response. "However, the study is nowhere near strong enough to make such a frightening message credible."

So what exactly does the study say? The researchers used their model to see what would happen by 2500 if emissions stopped today and if they slowly declined to zero by 2100, as AFP explained. In the first scenario, temperatures would still rise to around 2.3 degrees Celsius above pre-industrial levels within the next 50 years, taper off, then rise again starting in 2150. By 2500, the world would be around three degrees Celsius warmer and sea levels would rise by around three meters (approximately 9.8 feet). In

the second, temperature and sea level rise would end up in the same place, but the temperature increase would be much faster.

The reason for the persistent increase comes from three feedback loops, the model found.

1. The melting of sea ice, which means that the sun's heat is absorbed into the darker ocean instead of reflected back by the bright ice.
2. The thawing of permafrost, which releases more greenhouse gases into the atmosphere.
3. Increased moisture in the atmosphere, which in turn raises temperatures.

The only way to have prevented runaway climate change would have been to have stopped burning fossil fuels between 1960 and 1970, the model found, as USA TODAY reported. In order to stop temperatures and sea levels from rising now, we would have to remove at least 33 gigatons of carbon dioxide from the atmosphere every year starting this one.

The study authors were the first to admit their findings were limited to one model.

"We encourage other model builders to explore our discovery in their (bigger) models, and report on their findings," they wrote.

However, Betts noted that their model was not the model used by the Intergovernmental Panel on Climate Change (IPCC) and did not realistically simulate how the climate works.

Penn State University meteorologist Michael Mann agreed. He told USA TODAY that it was not very complex and did not accurately reproduce atmospheric and ocean circulation systems.

"While such models can be useful for conceptual inferences, their predictions have to be taken with great skepticism. Far more realistic climate models that do resolve the large-scale dynamics of the ocean, atmosphere and carbon cycle, do NOT produce the dramatic changes these authors argue for based on their very simplified model," he said. "It must be taken not just with a grain of salt, but a whole salt-shaker worth of salt."

That said, even the models used by the IPCC show that we will need to draw down carbon dioxide from the atmosphere to reach the Paris agreement goal of limiting warming to 1.5 degrees Celsius above pre-industrial levels, even if we achieve zero emissions by 2050.

"What the study does draw attention to is that reducing global carbon emissions to zero by 2050 is just the start of our actions to deal with climate change," University College London climate professor Mark Maslin said in response.

Extension requested of Bureau of Reclamation on Lake Powell Pipeline timeline

[Click here](#) to read this story by Brian Maffly of *The Salt Lake Tribune* called "After Insisting on Expedited Review Utah Now Asks Feds to Delay Lake Powell Pipeline" KUTV story by Jennifer Weaver

The Utah Division of Water Resources and Washington County Water Conservancy District have requested an extended timeline from the Bureau of Reclamation to consider comments received on the Lake Powell Pipeline's draft Environmental Impact Statement (EIS) from the public, tribes, non-government organizations, and fellow Colorado River Basin states.

"The Lake Powell Pipeline is a critical water infrastructure project for Utah," stated Todd Adams, director, Utah Division of Water Resources, in a news release. "The extension will allow more time to consider the comments and complete further analysis, which will contribute to a more comprehensive draft and final EIS."

Thousands of comments expressing both support and questions were received during the recent public comment period, which ended on Sept. 8.

"We're grateful to all those who have participated in the NEPA process," stated Zach Renstrom, general manager, Washington County Water Conservancy District. "Thoughtful comments were submitted, and thoughtful responses are deserved. This is the purpose and process of NEPA."

The Bureau of Reclamation will establish a new timeline for the water delivery project that will provide water to 10 communities in southern Utah in response to this request. The extension will allow the bureau time to prepare a supplement to the draft EIS, which is common during NEPA.

Surrounding states bash Utah's Lake Powell pipeline project

By Brian Maffly of Salt Lake Tribune on September 9, 2020

All of Utah's partner states sharing the Colorado River's water are urging the federal government to halt the Lake Powell pipeline, opening a schism in the interstate compact

that has divvied up the mighty river's flow for the past century.

In a joint letter to Interior Secretary David Bernhardt on Tuesday, those states asked the secretary to block the Bureau of Reclamation from completing its ongoing environmental impact statement (EIS) "until such time the seven Basin States and the Department of the Interior are able to reach consensus regarding outstanding legal and operational concerns raised" by the project.

Lower basin states have agreed to cutbacks needed to stabilize levels at Lake Mead and Lake Powell. But that hasn't deterred Utah from pursuing its plan to suck 86,000 acre-feet a year from Lake Powell to feed further growth around St. George.

On Tuesday, the public comment period expired on Reclamation's draft EIS, paving the way for a final decision in the coming months.

Environmental opponents of the project contend Utah's fast-growing Washington County can meet its water needs from local sources and conservation and its construction costs will lead to crushing tax hikes. Major southwestern cities have achieved sharp reductions in per-capita water use while St. George continues to consume water at some of the fastest rates in the region.

But until Tuesday, Utah's compact partners had remained silent on their opposition, at least publicly. Their letter to Interior contends the project, should it win approval, would be bogged down in litigation for years.

Todd Adams, director of the Utah Division of Water Resources, sounded an optimistic note that the states' differences can be worked out.

"As Colorado River Basin States, we've resolved complex challenges and concerns before, and we will do the same now. We remain committed to working with the other basin states to mitigate their legal and operational concerns raised by Utah's intent to use a portion of its Colorado River allotment to provide water to Washington County," Adams said in a statement.

"We will use the next several months to address their concerns," he promised.

"More than 20 years of planning have gone into the Lake Powell Pipeline to meet the needs of Washington County's growing population and to diversify the area's water supply," Adams said. "Without the project, the county's economic viability and water security will be harmed."

The Salt Lake Tribune will update this story.

PR: Lawsuit Challenges Nearly \$28 Million in Public Funding for Utah Oil Railway

For Immediate Release, August 4, 2020

Contact:

Lawsuit Challenges Nearly \$28 Million in Public Funding for Utah Oil Railway

Project Would Harm Local Communities, Escalate Climate Crisis

SALT LAKE CITY - Conservation groups sued the Utah Permanent Community Impact Fund Board today for granting \$27.9 million in public money to a proposed railway that would move oil from the Uinta Basin to refineries in other states.

Under state law the funds administered by the board must go toward public projects that help communities deal with harms from mineral development on federal public lands. Today's lawsuit, filed in Utah district court in Salt Lake City, says the board broke state law when it transferred money to the Seven County Infrastructure Coalition to advance the Uinta Basin Railway. The coalition, which sought the grant funding, is also named as a defendant in the suit.

"This money is meant to help repair damage done by the fossil fuel industry, not subsidize it," said Wendy Park, an attorney at the Center for Biological Diversity. "The board is supposed to help rural communities build health centers, libraries, and other community facilities. Instead it's giving gifts to private oil companies and buying more pollution."

The proposed 85-mile Uinta Basin Railway would lead to a significant increase in oil extraction in the region. New drilling and fracking would damage roads, strain public facilities and services, worsen the climate crisis and harm public health.

Before the board's June 2019 vote to fully fund the project, a state assistant attorney general [WARNED](#) that issuing the grant would be illegal.

“The Uinta Basin Railway has been designed for one thing only: oil,” said John Weisheit, conservation director at Living Rivers. “The railroad ends at two places, a major oil producer’s doorstep and the middle of a remote drilling field. The basin’s residents would never set foot on this railroad, but their money is being taken to build it.”

In May the Office of the Legislative Auditor General released an audit raising serious concerns about the Community Impact Board, including improper funding of economic development projects. The report found that the board often failed to follow rules and guidelines limiting awards to \$5 million and requiring matching funds. The [AUDIT](#) highlighted the Uinta Basin Railway as one of the projects demonstrating the need to improve the board’s policies and practices.

The railway could lead to a quadrupling of oil production in northeast Utah’s Uinta Basin, worsening smog in an area that already violates federal pollution standards because of oil and gas extraction. The railroad, along with access roads, well pads, pipelines and increased trucking, would also fragment wildlife habitat, strain precious water supplies and cause greenhouse gas emissions.

The Center for Biological Diversity is a national, nonprofit conservation organization with more than 1.7 million members and online activists dedicated to the protection of endangered species and wild places.

Living Rivers is a nonprofit environmental membership organization, based in Moab, Utah. Living Rivers promotes river restoration and seeks to revive natural habitat and the spirit of rivers by undoing the extensive damage done by dams, diversions and pollution on the Colorado Plateau. Water & Tribe Initiative: Making Sense of the Basin (Colorado River Tribes)

About this Report

This report summarizes the results of more than 100 confidential interviews, three workshops, and countless conversations with tribal and other leaders throughout the basin -- all focused on designing a collaborative process to develop the next set of

guidelines for the Colorado River. The Colorado River provides water to more than 40 million people in two countries, seven states, and 29 Indian tribes. The demand for water currently exceeds available supply in any given year and is complicated by chronic drought and the uncertainty of impacts from climate change. The river is governed by a set of laws, policies, and institutions collectively referred to as the “Law of the River.” Several key components of this framework, including the 2007 Interim Guidelines, Minute 323, and the 2019 Drought Contingency Plan all expire in 2026, creating a unique opportunity to revise and update the framework for managing the river. Since 2017, the Water & Tribes Initiatives has pursued two complimentary objectives: to enhance tribal capacity to participate in basin-wide policy decisions and to advance sustainable water management in the basin through collaborative decision-making.

Plan calls for diverting, storing water from Gila River

Project website is here: <https://www.nmuniteis.com/documents>

Comments will be accepted through June 8.

By The Associated Press Friday, April 17, 2020 10:12 PM

SILVER CITY, N.M. – Water from two rivers that span parts of New Mexico and Arizona would be diverted and stored under a project proposed by the New Mexico Central Arizona Project Entity.

The proposal calls for storing water from the Gila and San Francisco rivers at sites in the Virden Valley or along the San Francisco River in New Mexico.

The U.S. Bureau of Land Management [actually, Bureau of Reclamation] and the New Mexico Interstate Stream Commission are gathering public comments on an environmental review of the proposal.

The fight over the Gila River has prompted protests and legal fights over the years. Environmentalists have suggested the effort to divert water would result in a \$1 billion boondoggle, but supporters argue that the project is vital to supplying communities and irrigation districts in southwestern New Mexico with a new source of water as drought persists.

Under the Arizona Water Settlements Act, New Mexico is entitled to 14,000 acre-feet of water a year, or about 4.5 billion gallons. State officials opted to build a diversion

system, as that alternative opened the door to more federal funding. The state would have received less had it pursued other water projects in the region.

It missed a deadline in December to have an environmental review completed and approved by federal officials in order to free up additional funding. Still, the New Mexico Central Arizona Project Entity has more than \$60 million it could spend on a diversion and regional water projects.

The draft environmental review that's up for review now considers four alternatives to construct, operate and maintain the proposed project. Officials don't have a preferred alternative, saying it's likely a "no action" alternative will be selected until funding is secured.

"We need public feedback and encourage commenters to focus on the analysis of costs and benefits of the alternatives to make any future decisions," said Alexander Smith, the deputy area manager for the Bureau of Reclamation's Phoenix office.

Comments will be accepted through June 8.

Water authority won't appeal blocked Nevada pipeline project

By Alex Chhith / Las Vegas Review-Journal April 16, 2020 - 7:03 pm

The Southern Nevada Water Authority said Thursday it would not appeal a recent court ruling that blocked the agency's plans for a controversial eastern Nevada pipeline project.

In March, a District Court judge upheld a 2018 ruling to block the water authority's plans to pump billions of gallons of groundwater from four rural valleys in White Pine and Lincoln Counties. He also overturned older rulings from the state engineer who previously granted the water authority the right to pump out of Spring, Cave, Dry Lake and Delamar valleys.

In a statement, the authority said, "After the current pandemic passes and normal operations are restored, SNWA management will present an update to its 50-year Water Resources Plan for its Board of Directors to consider that focuses on strengthening beneficial partnerships with other Colorado River states as well as further advancing Southern Nevada's world-recognized water conservation efforts."

Organizations opposing the pipeline took the announcement as a win but said more work needs to be done.

“Great Basin residents can breathe a great sigh of relief,” Kyle Roerink, executive director of the Great Basin Water Network, said in a statement following the announcement. “Our attorneys, White Pine County officials, tribes and front-line communities have said this project was illegal for more than three decades. Today’s news vindicates their fierce opposition and years of fighting a David vs. Goliath battle. But SNWA must revoke its remaining water rights applications and withdraw its right-of-way application.”

Patrick Donnelly, the Nevada director for the Center for Biological Diversity, said in a statement that he with “thrilled” with the decision, calling the pipeline project a “boondoggle.”

“Eastern Nevada’s fragile ecosystems and rural communities have won a reprieve, but the fight isn’t over,” he said. “As long as permits are still alive, our struggle continues.”

Las Vegas water officials have been pushing plans to pipe in groundwater from up to 300 miles away since 1989. The proposed multibillion-dollar pipeline project was expected to supply at least 170,000 homes.

Kane County (Utah) Opts Out of Lake Powell Pipeline NEPA Process

FROM THE OFFICIAL INFORMATION SOURCE OF THE PIPELINE PROJECT
(Washington County Water Conservancy District)

At the request of the Kane County Water Conservancy District (KCWCD), the Bureau of Reclamation will not consider Kane County’s future water supply needs in the National Environmental Policy Act (NEPA) review of the Lake Powell Pipeline (LPP).

KCWCD’s decision to opt out of the NEPA process was made after further review of the county’s projected population growth and available water supply, which indicated the county did not currently have a foreseeable need for the water.

“We continue to support the Lake Powell Pipeline and consider it absolutely essential to the future of southwestern Utah,” said Mike Noel, general manager of KCWCD.

A similar review of Washington County’s projected population growth and available water supply deemed the project essential.

“Washington County is the fastest growing and one of the driest regions in Utah,” said Todd Adams, director of the Utah Division of Water Resources. “The county is projected to triple in the next 40 years and is currently dependent on a single river basin that is almost fully developed. A second, reliable water source is vital for Washington County’s growing population and economy.”

KCWCD was anticipated to receive up to 4,000 acre feet of water per year from the LPP, or approximately 5% of the project’s yield. The water rights for the 4,000 acre feet of water remain with the Utah Board of Water Resources. If the need arises, KCWCD can complete a separate NEPA process and connect to the LPP in the future.

KCWCD’s decision will eliminate an approximately 10-mile pipeline from the LPP into Kane County; no other project changes are needed. The project’s timeline and process are unaltered. Reclamation’s work on the Environmental Impact Statement is ongoing with a draft anticipated for public review and comment this summer.

FROM LEXI PEERY OF THE ST. GEORGE SPECTRUM

Kane County pulls out of Lake Powell Pipeline project ahead of federal review

The Kane County Water Conservancy District has decided to pull out of the Lake Powell Pipeline project, leaving Washington County as the sole proposed user of the pipeline going forward.

The decision comes as the federal government continues and environmental review of the project. The Bureau of Reclamation is developing an environmental impact statement (EIS) for the project as required by the National Environmental Policy Act. The NEPA process will determine if the project will go forward and what route it will take.

This one-year review process began in December 2019 and a decision on the pipeline is expected in early 2021. Over 1,000 public scoping comments were submitted until the beginning of January in preparation for the draft EIS, which is expected this summer.

KCWCD made the decision based on “further review” of the county’s population projections and available water, according to the press release announcing the news.

“We continue to support the Lake Powell Pipeline and consider it absolutely essential to the future of southwestern Utah,” Mike Noel, the general manager of KCWCD, said in the release.

Population projections for the state are developed by the University of Utah's Kem C.

Gardner Policy Institute. The latest projections have Kane County growing by more than 50% by 2065, which would put it at about 11,400 people.

“KCWCD’s decision was made after reviewing the population projections and currently available water supply. Kane County is fortunate to have local water resources that they can develop to meet its currently projected growth. If Kane County grows more than currently projected, KCWCD has the option to complete the necessary NEPA and connect to the LPP in the future,” WCWCD spokesperson Karry Rathje stated.

The environmental work for the project began in 2007, and at the time Iron County was part of it. In 2012, the county’s water district decided to leave the project, finding their current water sources would be sustainable for the future.

The plans for the 140-mile pipeline are unchanged, except for a 10-mile pipeline that would have diverted water from the LPP to Kane County. Rathje stated the pipeline to Kane County was estimated to cost \$35 million.

The latest estimated cost of the project is between \$1.1 and \$1.8 billion. The project would be repaid by impact fees, water rates and property taxes, according to the LPP project website.

The pipeline would bring 86,000 acre-feet annually to the region from Lake Powell. KCWCD would have received about 5% of the project’s total or 4,000-acre feet. The water rights that would have been held by KCWCD would now be held by the Utah Board of Water Resources, according to the release.

The WCWCD has done similar population reviews and found the pipeline to be essential given the expected increase in population, according to the release. The larger county, where the St. George metro area makes up most of the population, is forecasted to grow to more than 500,000 people by 2065.

“Washington County is the fastest growing and one of the driest regions in Utah,” said Todd Adams, director of the Utah Division of Water Resources, in the release. “The county is projected to triple in the next 40 years and is currently dependent on a single river basin that is almost fully developed. A second, reliable water source is vital for Washington County’s growing population and economy.”

FROM BRIAN MAFFLY OF THE SALT LAKE TRIBUNE

Kane County Utah does an about-face, pulls out of Lake Powell pipeline project

For the past decade, Kane County leaders have argued that their southern Utah community will need water piped from the Colorado River to meet future needs, but the local water district abruptly announced Thursday it was pulling out of the costly Lake Powell pipeline project, leaving Washington County as the only remaining recipient of the water.

The controversial project would divert 86,000 acre-feet of water a year from the chronically depleted Lake Powell into a 143-mile pipeline terminating in a reservoir near St. George. Along the way, the billion-dollar pipeline was to offload 4,000 acre-feet in Johnson Canyon east of Kanab.

But now the Kane County Water Conservancy District has decided it didn't have a "foreseeable need" for the water after reviewing the county's projected population growth and available water resources, according to a release posted Thursday.

"We continue to support the Lake Powell pipeline and consider it absolutely essential to the future of southwestern Utah," said Mike Noel, the district's general manager and the retired Kanab state lawmaker who has long championed the project.

Zach Frankel, executive director of the Utah Rivers Council, and other critics have long pointed to Kane County's ample groundwater supplies as evidence that there was not much need for the project, which would be financed by Utah taxpayers and tap an already over-allocated Colorado River. More than \$25 million has been spent on environmental reviews, with a new one underway by the U.S. Bureau of Reclamation, which assumed federal oversight of the project after the Federal Energy Regulatory Commission withdrew.

Kane's pullout eliminates the need to construct a 10-mile pipe to direct the county's share of the water to a spot hardly a mile from Noel's extensive ranch properties in Johnson Canyon.

The project has shrunk substantially from its original version, first unveiled in 2006 legislation. Last year, the Utah Division of Water Resources removed the hydroelectric generation components, which would have enlarged the project's costs and environmental footprint. Iron County, another original participant, exited years ago, citing the high cost of delivering the water all the way to Cedar City.

But state officials, pointing to the mushrooming growth in and around St. George, maintained there is still a need for the pipeline.

"Washington County is the fastest growing and one of the driest regions in Utah," said Todd Adams, director of the Utah Division of Water Resources. "The county is projected to triple in the next 40 years and is currently dependent on a single river basin that is almost fully developed. A second, reliable water source is vital for Washington County's growing population and economy."

The project's timeline and process remain unaltered. The Bureau of Reclamation's review is ongoing with a draft environmental impact statement anticipated for public comment this summer.

FROM UTAH RIVERS COUNCIL

Good News: Kane County Backs Out of Lake Powell Pipeline Fiasco

2nd of 3 Utah Counties Have Now Backed Out of Destructive, Unnecessary, Expensive Lake Powell Pipeline

As a glimmer of good news during uncertain times, Utah water agencies announced today that the Kane County Water District is backing out of the proposed \$3 billion Lake Powell Pipeline.

For the last 14 years, the Kane County Water District, claimed that Kane County needed water from the proposed Lake Powell Pipeline. The Kane County Water District is a small water supplier that delivers water to a very small percentage of Kane County's population. Led by former Utah legislator Mike Noel, the water agency was widely criticized for failing to prove its claims for needing the water or coming up with a viable plan to pay for the water.

In 2013, a group of Utah economists performed a lengthy analysis of Pipeline repayment obligations on Kane County residents and found that massive increases to water rates, impact fees and property taxes would be required to pay for the water. The Utah Division of Water Resources and the Kane County Water District claimed they could repay Pipeline costs but provided no substance to their claims.

Then in March 2018, the Utah Rivers Council filed a complaint with the Utah Attorney General's Office seeking an investigation of Rep Noel and what role the Utah Division of Water Resources had in changing the official documents for the proposed Lake Powell Pipeline. Our complaint requested a formal investigation to determine if Mr. Noel used government resources to benefit his own private land holdings. The complaint alleges that Mr. Noel may have used his position as both a legislator and as the Executive Director of the Kane County Water District to advance the proposed Lake Powell Pipeline, which might have delivered water to his land holdings in Kane County, estimated to be valued at roughly \$4-9 million.

The map below shows Mr. Noel's personal properties and the proposed Lake Powell Pipeline alignment, as shown in yellow. Roughly 10 miles before the Pipeline reached Kane County's largest town of Kanab, the Pipeline was slated to make a 90 degree corner and head ~7 miles up Johnson Canyon road, where project documents state the entire Pipeline water supply would be pumped into the ground, just a stone's throw from Mr. Noel's properties.

Roughly 10 miles before the Pipeline reached Kane County's largest town of Kanab, the Pipeline was slated to make a 90 degree corner and head ~7 miles up Johnson Canyon road, where project documents state the entire Pipeline water supply would be pumped into the ground, just a stone's throw from Mr. Noel's properties.

The Division of Water Resources has never responded to why the agency revised the

official Lake Powell Pipeline planning documents to alter the alignment of the Pipeline to travel towards Mr Noel's land holdings.

"Kane County residents dodged the bullet on this costly water project" said Zach Frankel, Executive Director of the Utah Rivers Council. "Too bad Washington County residents are still stuck paying a 500% increase in water rates and a doubling of property taxes for water they don't need and \$3 billion in debt they can't repay" said Frankel.

The Utah Division of Water Resources continues to claim that Washington County needs water from the \$3 billion Pipeline, but its justification for the project is based on bogus water demand projections. The Draft Environmental Impact Statement for the Lake Powell Pipeline is slated to be released in June 2020 by the Bureau of Reclamation.

7D REVIEW BY DEPARTMENT OF INTERIOR

Memo (2/7/20) from Bureau of Reclamation about the Section 7.D review of Interim Guidelines, now underway until December of 2020. In his 12/13/2019 remarks at Annual Conference of Colorado River Water Users Association ([video](#)), Interior Secretary Bernhardt stated:

- 'Section 7.D of the 2007 Guidelines [the update of 12/10/2007, listed below] calls for Reclamation to initiate work prior to Dec. 31, 2020 on a formal review of the effectiveness of the 2007 Guidelines.'
- 'This provision provides an opportunity to take an objective look at where we've been, and where we are, with our operational rules.'
- 'We want to wrap up this effort, culminating in the 'Section 7.D Report,' around this time next year.'
- 'The report will be a Reclamation product but it will rely on important input from the Basin States, Tribes, NGOs and the public, as the report is developed.'

7D DOCUMENTS

- [Updated Draft Guidelines of December 10, 2007](#); [Section 7 only](#) - (pages 34-36)
- [2007 Record of Decision of December 13, 2007](#)
- [2007 Final EIS \(October\)](#)

Approach

- The Section 7.D Review will be retrospective; a '**look-back**' at past operations and not a consideration of future activities.
- The Review will result in a Report that: 1) evaluates the effectiveness of the Guidelines and 2) documents our operational experience with the Guidelines.
- Through this Review, we hope to build a solid foundation that informs decision-makers in future negotiations and bring partners, stakeholders and the public to a common understanding of past operations and their effectiveness.
- Input from the Basin States, Tribes, NGOs, other Federal agencies, and the public will be factored into the Review.
- Outreach with Basin States, Tribes, NGOs, and other Federal agencies will occur at 2 primary milestones: 1) at the start of the Review, with a discussion of the Report scope, approach, and schedule and 2) when the draft Report is ready for review.
- In March, we anticipate holding webinar(s) to present and discuss the Report scope, approach, and schedule with the Basin States, Tribes, and NGOs. Additional meetings with groups of tribes and individual tribes will follow as requested.
- In late summer, we anticipate holding webinar(s) to provide the draft Report to the Basin States, Tribes, and NGOs for review. Received comments will be considered and factored into the draft Report as appropriate. Additional meetings with groups of tribes and individual tribes will follow as requested.
- We anticipate publishing the final Report near the end of 2020.

PUBLIC PARTICIPATION OF 7D REVIEW

- **Public Webinar:** posted at <https://www.usbr.gov/lc/region/programs/strategies.html>
- **Draft Comments:** due May 1, 2020. However, this is not a hard deadline due to the Covid-19 pandemic.
- **Send comments to:** 7DReview@usbr.gov

Divisive Southern Utah Sand Mine Project Will Not Move Forward

[Click here](#) to read this story by David Fuchs of *KUER Radio*

PREVIOUS NEWS

By *Southern Utah News*

<https://www.sunews.net/article.cfm?articleID=2685>

To view the proceedings for the water rights of this mining project, [CLICK HERE](#)

Keep Kanab Unspoiled (KKU), a community-based group that was formed to protect the quality of life in Kanab, a historic western town in southern Utah, filed a protest last week to the city's application to divert water for a frac sand mine and processing plant. There were more than 30 protests filed, including from ranchers worried about their future access to water, as well as Kanab Irrigation Company and Best Friends Animal Society.

The request for the water diversion stems from a contract the City of Kanab signed this summer with Southern Red Sands (SRS), a start-up mining operation backed by Kem Gardner, a Salt Lake City developer. SRS has mining claims on more than 11,000 acres of land on the plateau just above Kanab, just over 10 miles from Zion National Park. Its claims on this scenic plateau go up to tourist attractions like Peekaboo slot canyon and Diana's Throne, as well as the boundaries of Best Friends Animal Sanctuary.

The City of Kanab agreed to sell up to 600 acre-feet of water annually for 20 years, with SRS having the option for three 10-year renewals. SRS has also contracted with the Kane County Water Conservancy District for the same amount of water.

Dean Baker, a member of Keep Kanab Unspoiled, commented, "This frac sand mine threatens the future of Kanab, most immediately by taking away the water we need, but also by ruining an environmental treasure."

The protest was filed with the Utah State Water Engineer, listing a variety of reasons, most importantly that the City of Kanab does not have a surplus of water to sell. Utah state law, as well as the state constitution, prohibits the city from selling water outside its boundaries unless it has a surplus.

Kanab has been widely projected to face water shortfalls in coming decades, as continued growth puts a strain on its water supply. This projected shortfall is the reason many officials in the area have supported the construction of the Lake Powell Pipeline as a future source of water.

The projection of a shortfall was also confirmed in a newly released study commissioned by Best Friends Animal Society, by Dr. Kenneth Kolm. The study projected that if SRS uses all the water contracted, it could cause several lakes and streams in the area to dry up, in addition to reducing the flow of water from the wells owned by Best Friends and the City of Kanab.

The protest was filed by Steven Clyde of Clyde-Snow Law firm in Salt Lake City.

Litigation continues against Gross Dam Reservoir Expansion Project

Save the Colorado, The Environmental Group, WildEarth Guardians, Sierra Club, Waterkeeper Alliance, and Living Rivers/Colorado Riverkeeper remain in litigation against Denver Water to stop the expansion of Gross Reservoir for reasons that the permit application, and especially the climate modeling for the environmental review, does not properly consider the cumulative impacts that global warming has, and will continue to have, on the natural environment.

This is a trans-basin water diversion project from the Colorado River Basin. Since Year 2000 the 30-year average for the Colorado River has decreased by 2.4 million acre-feet. The demand for Colorado River water exceeded the natural supply in Year 2003. Water curtailments in the Colorado River Basin officially begin on January 1, 2022 and the [two-year projection](#) indicate that the curtailments will triple in magnitude in 2023.

Zoom Water Conference ‘Dam the Status Quo’ Today, Monday Dec. 13

Friends of the Colorado River,

We’re delighted to tell you about an event taking place today, Monday, December 13, at 1pm Mountain Time and entitled: “Dam The Status Quo”.

[The Poster](#)

The online event — which you can watch on Zoom — includes Save the Colorado board member, Daniel P. Beard, a former Commissioner of the U.S. Bureau of Reclamation appointed by President Clinton. Dan also wrote the book, *Deadbeat Dams: Why We Need To Abolish the Bureau of Reclamation and Tear Down Glen Canyon Dam*.

Tick Segerblom, a former Nevada State Senator and now Clark County (Las Vegas) Commissioner, is hosting the event.

Additional featured speakers will include Jeff Lukas, lead author of the 2014 report, ‘Climate Change in Colorado’; David Kremer, former Director of the Interdisciplinary Water Resources graduate program at the University of Nevada; Forrest Cuch, Ute Indian Tribe; Nikki Cooley, Diné (navajo) Nation; Timothy Williams, Fort Mojave Indian Tribe; Eric Balkan, Director of Glen Canyon Institute; and others.

The sign-in for the 1pm event is:

<https://us02web.zoom.us/j/84902356675?pwd=MEJpVC9SQVdoTEpSQ2ZnS0pNczhvZz09>

Passcode: 245783

As climate change grips the Colorado River basin, it’s time for consequential and provocative changes to the management of the river that restore the river and the environment. We think you’ll enjoy this two-hour event (which will also be recorded for viewing afterwards).

[The Recording.](#)

White Mesa Ute Community Protest & Spiritual Walk

[CLICK HERE](#) to read the poster for this event.

- **WHEN:** Saturday October 9th at 11 am.
- **WHERE:** White Mesa Community Building adjacent to the gas station (Marathon Oil); Hwy 191 south of Blanding, Utah and north of Bluff, Utah.
- **WHO:** The White Mesa Concerned Community and Ute Mountain Ute Tribe.

- **WHAT:** A Spiritual Walk and Protest against Energy Fuels' uranium mill.

SPECIAL INSTRUCTIONS:

- The walk from the community center to the uranium mill will be Covid-safe, masks please!
- A caravan will be provided for those that cannot make the 4 mile walk) to the entrance to the mill.
- Please spread the word and come down to White Mesa on October 9th.
- Wear comfortable shoes and bring plenty of water!

FOR MORE INFORMATION:

Call White Mesa Concerned Community at (435) 459-2461.

Sponsored by White Mesa Concerned Community

Co-sponsors: Bears Ears Inter-Tribal Coalition, Canyon Country Rising Tide, Earthworks, Greenaction for Health and Environmental Justice, Grand Canyon Trust, Great Old Broads for Wilderness, HEAL Utah, Living Rivers, Multicultural Alliance for a Safe Environment, PANDOS, SLC Air Protectors, Southern Utah Wilderness Alliance, Uranium Watch, Utah Chapter of the Sierra Club.

STAY TUNED:

- For a regional conference.
- The co-sponsors will host this program and virtually on zoom.
- October 7th (5-7 pm)
- October 8th; morning/afternoon.
- We will share the schedule and registration info asap.

Thanks!!

Appeal Filed to Sustain Colorado River Flows and Stop Gross Dam Expansion

[Click here](#) to read this story by Johnson Kuhn of *North Forty News*

###

A coalition of conservation groups filed a notice of appeal recently in the Tenth Circuit Court of Appeals seeking to halt Denver Water's proposed expansion of Gross Dam in Boulder County and to protect sustainable flows in the Colorado River. The appeal challenges the dismissal by the lower court and asks the appeals court to order review of the merits of the case to ensure the health of the Colorado River, its native and

imperiled species, and communities across Colorado that will be negatively impacted by the project.

“We believe the court simply got this wrong, and we’re excited to move forward with the appeal,” said Gary Wockner, the director of Save The Colorado. “This massive dam project would further drain and destroy the Colorado River, as well as cause irrevocable damage in Boulder County, and thus we are firmly committed to defending the river and the environment to the fullest extent of the law.”

The conservation coalition, including Save The Colorado, The Environmental Group, WildEarth Guardians, Living Rivers, Waterkeeper Alliance, and the Sierra Club, originally filed suit on December 19, 2018, in the federal district court of Colorado. The groups’ litigation sought to halt Denver Water’s expansion of Gross Reservoir in Boulder County and prevent an additional diversion of water from the Colorado River through its Moffat Collection System due to violations of federal environmental laws including the Clean Water Act, Endangered Species Act, and the National Environmental Policy Act. The project would triple the storage capacity of Gross Reservoir and the dam would become the tallest dam in the history of Colorado.

On March 31, 2021, the district court dismissed the coalition’s case finding that it was not before the proper court because the Federal Power Act provides the federal court of appeals with sole authority over hydropower licensing by the Federal Regulatory Commission.

“Given the climate, water and biodiversity crises upon us, we need to be restoring river ecosystems, not destroying them,” said Jen Pelz, Wild Rivers Program Director at WildEarth Guardians. “This battle against the powerful water institution is not over and we will continue to fight for water and climate justice by working to reform this broken system of laws and policies.”

“The Sierra Club opposes the Gross Reservoir expansion because of the massive environmental damage it would cause,” said Rebecca Dickson, Chair of the Sierra Club-Indian Peaks Group. “If this project proceeds, hundreds of thousands of trees will be chopped down, countless habitats destroyed, and yet another waterway will be diverted from its natural course to the Front Range. On top of this, immeasurable amounts of greenhouse gasses will be released into the atmosphere during the construction and transportation process.”

“Denver Water’s plan to build the tallest dam in Colorado history will hurt the 40 million people in seven states and two countries who depend on the Colorado River for their water supply,” said Daniel E. Estrin, general counsel and advocacy director at Waterkeeper Alliance. “The basin is slowly dying a proverbial ‘death by a thousand cuts’ as its communities and ecosystems face a water crisis driven by unsustainable demand, prolonged drought, and runaway climate change. We stand with our fellow conservation groups in continuing to oppose this misguided and reckless water grab.”

“The expansion of Gross Dam is a shortsighted response to a long-term problem,” said Beverly Kurtz the President of The Environmental Group. “Denver Water should lead the way in finding sustainable solutions to the challenge of water scarcity, rather than destroying pristine areas of western Boulder County and further threatening the Colorado River with an antiquated dam proposal. Recent data confirm that predicted shortages of water in the Colorado River Basin due to climate change are happening even sooner than expected. Building a bigger dam does not increase the amount of water available. The District Court needs to hear the merits of our case rather than establishing a dangerous precedent by deferring authority to FERC and the federal court of appeals.”

“The year of decision, to not divert more water from the Colorado River, came and went about twenty years ago,” said John Weisheit, conservation director of Living Rivers in Moab, Utah. “We know this is true because the development of contingency planning agreements to avoid water shortages began in 2014 and the urgency to resolve this threat still remains. Yet the contradictions and absurdities to also develop a suite of diversion projects in the Colorado River Basin also remains. If the basin’s water managers will not even adapt to the hydrology they accept, how could they possibly adapt to the hydrology of the future? Our lawsuit is an appeal to accept the truth that the Colorado River has nothing left to give.”

Writers on the Range: Pumping up fear along the Colorado River

Opinion by George Sibley

[The Vail Daily](#)

[Archived here](#)

Some Colorado River tribulations today remind me of a folk story: A young man went to visit his fiancé and found the family trembling and weeping. They pointed to the ceiling, where an axe was embedded in a rafter.

“That could fall,” the father quavered. “It could kill someone!”

Puzzled, the young man climbed onto a chair, and pulled the axe out of the rafter. Everyone fell all over themselves thanking him. But he quickly broke off the engagement, concerned that such inanity might be inheritable.

This resembles ongoing dithering over the 1922 Colorado River Compact, a 99-year-old agreement among the seven states through which the Colorado River meanders, on how the consumptive use of the river’s water should be divided to give each state a fair share. The agreement was necessary to get federal participation (money) to build dams to control the erratic river.

The best they were able to do, given the sketchy information they had about each state’s future development and also about the flow of the river, was to divide the river into two “basins” around the natural divide of the Colorado River canyons: Colorado, Utah, Wyoming and New Mexico in the Upper Basin; and California, Arizona and Nevada in the Lower Basin. Each basin would get to consume 7.5 million acre-feet of the river’s water.

This placed a responsibility on the Upper Basin states to “not cause the flow of the river at Lees Ferry (the measuring point in the canyons) to be depleted” below the Lower Basin’s share.

A generous reading of that lawyerly clause in the Compact would say the upper states should just be careful that their water development doesn’t dip into the lower states’ allocation.

A less generous reading would say that if for any reason the flow at Lees Ferry fell below the average of 7.5 million acre feet — whether due to over-appropriation by the upper states, or to a natural cause like a 20-year headwaters drought — the lower

states would place a call on the upper states, which would have to cut their own uses and send their water downriver, whether they “caused” the shortage or not.

To maintain that flow in a drought, the upper states would bear the full pain of the drought for the whole river.

Guess which interpretation the upper states chose for their own 1948 compact? Never mind that a Compact call led by California for its share of water is nowhere mentioned in the 1922 Compact. The axe was planted in the rafter.

They might better have asked how the 1922 Compact creators themselves envisioned the unknown future. The transcripts of the 27 Compact meetings show that the seven state commissioners and their federal chairman Herbert Hoover were concerned, as late as their twenty-first meeting, that they did not know enough about the river’s flows to make a permanent equitable division of the waters.

Hoover summarized their concern, and their intent: “We make now, for lack of a better word, a temporary equitable division,” leaving the further apportionment of the river’s use “to the hands of those men who may come after us, possessed of a far greater fund of information.” They even included in the Compact (Article VI) instructions for reconvening to consider “claims or controversy... over the meaning or performance of any of the terms of this compact.”

By the drought years of the 1930s, it was already obvious that the 7.5 million-acre feet Compact allocations were unrealistic. That would have been a logical time for the upper states to pull the axe out of the rafter, before the river was so fully developed.

But they didn’t, and as the Compact began to take on the aura of something carved in stone on a holy mountain, the fear of the “Compact call” gradually descended into expensive paranoia.

The vastly expensive 24 million acre-feet of storage in Powell Reservoir just upstream from Lees Ferry was created there to fulfill the Upper Basin’s self-assumed “delivery obligation,” come hell or low water.

But now, hellish low water has come to Powell, and Upper states are developing costly “demand management” programs whereby someone yet unspecified would pay ranchers to fallow fields so their water can be “banked” in Powell against the dreaded “Compact call.”

The seven states are now — finally — initiating negotiations on a more reality-based governance of the Colorado River. Let’s hope they have the good sense to pull that axe out of the rafters before negotiating fair water use under it.

George Sibley is a contributor to Writers on the Range, a nonprofit dedicated to spurring lively discussion about Western issues. He has written extensively about the Colorado River.

Moab's Aquifer May Be Maxed Out, Prompting City To Explore Water Conservation

By Kate Groetzinger of KUER Public Radio

The Glen Canyon Group Aquifer is refilled by snowpack in the La Sal Mountains, located southeast of Moab. New research shows there's less water in the aquifer than previously thought.

The city of Moab is planning to implement water conservation measures in the coming months based on a recent study [new study](#) that found the Moab Valley may hold less water than previously thought.

Researchers from the University of Utah and the U.S. Geological Survey used carbon dating and other modern techniques to determine there are around 2,500 acre feet of unused water flowing into the Colorado River each year from the valley — not 11,000, as a 1971 study reported.

They also found Moab may have less drinking water than previously thought. They determined the Glen Canyon Group aquifer is split into two sections. The lower part is where Moab gets its drinking water, which emerges through natural springs near the city's golf course, while the water in the upper part cannot be easily captured.

The researchers estimate Moab is using around 4,000 acre feet, or 1.3 billion gallons, of water each year from the deep section of the aquifer, which is approximately its recharge rate as well.

"This is a very good time to contemplate the negative impacts of future development," said Vic Heilweil, one of the researchers. "Because we think that any additional development of groundwater from the main aquifer may not be sustainable."

Heilweil said he and his colleagues recommended the city begin monitoring the outflow of the springs, which supply Moab's drinking water, in order to determine exactly how much water is coming out of the aquifer. Using that data, they suggested the city create a numerical model that can be used to simulate the effects of additional pumping. That, Heilweil said, would allow the city to better understand the effects of future development.

Council Member Kalen Jones said he's concerned about the new findings, but it could be worse. "We're in a better position than many places, in that other places have gone into an overdrawn situation and are playing catch up," he said.

Jones added that Moab still has the opportunity to manage its water well, and the city council recently directed staff to draft an ordinance that would limit irrigation to certain times of day to help save water.

But the fate of the aquifer will also depend on other water users in the valley. He said the city will likely participate in a watershed management planning process with the state's Division of Water Resources sometime soon.

"Since currently we have very little of anything incentivizing water conservation, we should be doing basic conservation as we enter conversations about the aquifer with other water users in the valley," he said.

But some residents think conservation measures don't go far enough. John Weisheit is the director of a Moab-based non-profit called Living Rivers and he said the city and county should put a moratorium on all new development until they know exactly how much water is available in the aquifer.

"Water conservation is good, but when water conservation goes from one use to another, it's not water conservation," he said. "That's called demand hardening."

Jones said that's not likely to happen, but the city already has a moratorium on new hotels and is ready to look at creative ways to conserve water without making residents give up things like gardening and landscaping.

Exclusive: Hedge Funds Eye Water Markets That Could Net Billions As Levels Drop In Lake Powell

[Click here](#) to read this story by Zak Podmore of *The Salt Lake Tribune*

Excerpt from Living Rivers:

For John Weisheit, conservation director of the Moab-based nonprofit Living Rivers, initiatives to cut back on water are too often used for more growth, despite declining runoff.

“What really has to happen is you have to balance the water budget,” he said. “All they’re doing is moving water from this place to the other. They call it savings, but it’s not; it’s just transferring uses. You take out a lawn in Las Vegas and then they build 10 more houses. Where are the savings?”

Weisheit, who has also advocated for the decommissioning of Glen Canyon Dam, doesn’t think drought contingency plans will fundamentally alter the trend.

“We knew the Colorado River was going to run out of water 30 years ago,” he said, adding if hedge funds step into the vacuum and offer a new approach, it is only a “consequence of [water managers’] inaction.”

“This system is on its way to crash,” Weisheit continued. “The train is one mile away from going over the cliff.”

Weisheit doesn’t believe creating private markets will help the problem, but he thinks the question water managers should be asking themselves isn’t whether private water markets will be a fix, but why they’re being considered at all as a response to the crisis. “The question isn’t, should this happen? It’s, why did this happen?” he said. “And, what are you going to do?”

Reclamation announces process for Supplemental Environmental Impact Statement (SEIS) for operations at Glen Canyon Dam and Hoover Dam

**FROM THE FEDERAL REGISTER NOTICE: Bureau of Reclamation
Proposed SEIS for 2007 Interim Guidelines**

Notice of Intent to Prepare a Supplemental Environmental Impact Statement (SEIS) for December 2007 Record of Decision Entitled Colorado River Interim Guidelines for Lower Basin Shortages and Coordinated Operations For Lake Powell and Lake Mead.

Federal Register Notice:<https://www.federalregister.gov/documents/2022/11/17/2022-25004/notice-of-intent-to-prepare-a-supplemental-environmental-impact-statement-for-december-2007-record>

Reclamation requests that the public submit comments concerning the scope of the analysis, potential alternatives, and identification of relevant information, and studies on or before December 20, 2022.

Reclamation anticipates utilizing the work of this SEIS to also inform operating guidelines for the 2025-26 period, which will also undergo NEPA analysis in the near future.

The draft supplemental EIS is anticipated to be available for public review in Spring 2023 and the final supplemental EIS is anticipated to be available for with a Record of Decision, as appropriate, in late Summer 2023. This schedule will allow decisions to become effective for 2023-2024 operations.

The Secretary is directing this action because the existing operating guidelines are insufficient given current hydrology and reservoir conditions and in light of plausible low runoff conditions in the Colorado River Basin over the next four years. Through this Federal Register notice, Reclamation is providing an overview of the purpose and need for the SEIS, as well as its anticipated approach and timeframe for decisions on revised operating guidelines for Lake Powell and Lake Mead.

BACKGROUND

NOTE: At the end of this federal narrative, On The Colorado (OTC) will provide additional background materials for our readers; essentially a recommended reading list to help you prepare your SEIS comments to the Bureau of Reclamation.

On August 16, 2022, the Department of the Interior announced: “Prolonged drought and low runoff conditions accelerated by climate change have led to historically low water levels in Lakes Powell and Mead. Over the last two decades, Department leaders have engaged with Colorado River Basin partners on various drought response operations. However, given that water levels continue to decline, additional action is needed to protect the System.” Recognizing that the Colorado River Basin is facing unprecedented risks, the development of revised operating guidelines for Lake Powell and Lake Mead represents one of many Departmental efforts underway to respond to the rapidly changing conditions in the Basin in order to better protect the System.

Available at: <https://www.doi.gov/pressreleases/interior-department-announces-actions-protect-colorado-river-system-seis-2023>

In a Federal Register notice published on June 24, 2022 (87 FR 37884), the Bureau of Reclamation noted the dire circumstances facing the Colorado River Basin: “The Colorado River Basin provides essential water supplies to approximately 40 million people, nearly 5.5 million acres of agricultural lands, and habitat for ecological resources across the Southwestern United States and Northwestern Mexico. The limited water supplies of the Colorado River are declining, and the Colorado River Basin is currently experiencing a prolonged period of drought and record-low runoff conditions resulting in historically low reservoir levels at Lake Powell and Lake Mead. The period from 2000 through 2022 is the driest 23-year period in more than a century and one of the driest periods in the last 1,200 years. Absent a change in hydrologic conditions, water use patterns, or both, Colorado River reservoirs will continue to decline to critically low elevations threatening essential water supplies across nine states in the United States and the Republic of Mexico (Mexico). It is foreseeable that without appropriate responsive actions and under a continuation of recent hydrologic trends, major Colorado River reservoirs could continue to decline to ‘dead pool’—elevations at which water cannot be regularly released from a reservoir—in coming years.” The June 24, 2022, Federal Register notice requested public input prior to initiating a scoping process on the proposed development of post-2026 Colorado River Operational Strategies for Lake Powell and Lake Mead Under Historically Low Reservoir Conditions. The SEIS announced in today’s Federal Register notice does not interfere with, supplant, or supersede that separate post-2026 guidelines development process. Rather, this SEIS will inform and complement the development of post-2026 guidelines. Further, the dire hydrologic and climate conditions described in the June 2022 Federal Register notice also inform the need for the SEIS efforts announced in today’s Federal Register notice.

In the June 2022 Federal Register notice, the Department anticipated the potential for the process initiated in this document: “While previous actions, especially the DCP [in 2019], were intended to preserve Reclamation's ability to undertake post-2026 planning with a stable system and avoid crisis planning, very dry hydrology since the adoption of the DCP has resulted in Lake Powell and Lake Mead nearing critically low elevations. Should the conditions continue or worsen, we recognize that in addition to post-2026 planning under the anticipated NEPA process(es), Reclamation may likely need to also prioritize implementation of near-term actions to stabilize the decline in reservoir storage and prevent system collapse. Reclamation has not yet determined what additional actions or processes may be required to address these near-term operational risks. It is anticipated that near-term response actions and development of post-2026 operations will need to proceed on parallel timelines.” [87 FR 37888 \(June 24, 2022\)](#).

Over the past two years, the Department has undertaken a number of unprecedented actions to respond to the historic drought and low-runoff conditions in the basin that are being exacerbated by higher temperatures and the impacts of climate change. In particular, in both 2021 and 2022, additional releases from upstream reservoirs have

been implemented to enhance water elevations at Lake Powell. In 2022, Reclamation implemented modifications to monthly releases from Glen Canyon Dam, and also reduced downstream annual volume releases by 480,000 acre-feet.

Furthermore, on October 20, 2022, the National Oceanic and Atmospheric Administration's Climate Prediction Center issued its U.S. Winter Outlook for the December 2022-February 2023 period finding: "The greatest chances for drier-than-average conditions are forecast in portions of California, the Southwest, the southern Rockies," and "[w]idespread extreme drought continues to persist across much of the West, the Great Basin, and central-to-southern Great Plains."

Available at <https://www.noaa.gov/news-release/us-winter-outlook-warmer-drier-south-with-ongoing-la-nina>.

The Department currently lacks analyzed alternatives and measures that may be necessary to address such projected conditions. Recognizing the risks facing the Colorado River Basin, the Department has concluded that immediate development of additional operational alternatives and measures for Lake Powell and Lake Mead are necessary to ensure continued "operations that are prudent or necessary for safety of dams, public health and safety, other emergency situations ... 2007 Interim Guidelines at Section 7.D," published at [73 FR 19892 \(April 11, 2008\)](#).

Through this Federal Register notice, Reclamation is initiating efforts to revise operating guidelines for the operation of Glen Canyon and Hoover Dams in 2023 and 2024 operating years in order to address the potential for continued low-runoff conditions in the Colorado River Basin. Reclamation has concluded that the potential impacts of low runoff conditions in the coming winter (2022-23) pose unacceptable risks to routine operations of Glen Canyon and Hoover Dams during the interim period (prior to Jan. 1, 2027) and, accordingly, modified operating guidelines need to be expeditiously developed. Development of modified operating guidelines will also inform potential operations in the 2025 and 2026 operating years; however, due to the critically low current reservoir conditions, and the potential for worsening drought, the Department recognizes that operational strategies for 2023-2024 may need to be further revisited for subsequent operating years. Given the potential risks to infrastructure and public health and safety, the Department will promptly identify and analyze modified operating guidelines to address current and foreseeable hydrologic conditions.

PURPOSE AND NEED

The purpose of the SEIS is to supplement the EIS completed in 2007 for the 2007 Interim Guidelines in order to modify operating guidelines for the operation of Glen Canyon and Hoover Dam to address historic drought and low runoff conditions in the Colorado River Basin. The need for the revised operating guidelines is based on the potential that continued low runoff conditions in the Colorado River Basin could lead Glen Canyon Dam to decline to critically low elevations impacting both water delivery and hydropower operations in 2023 and 2024. In order to ensure that Glen Canyon Dam continues to operate under its intended design, Reclamation may need to modify

current operations and reduce Glen Canyon Dam downstream releases, thereby impacting downstream riparian areas and reservoir elevations at Lake Mead. Accordingly, in order to protect Hoover Dam operations, system integrity, and public health and safety, Reclamation also may need to modify current operations and reduce Hoover Dam downstream releases. Such revised Hoover Dam operations would, among other issues, address Section 7.B.4 of the 2007 Interim Guidelines as well as the commitments set forth in Section V.B.2 of Exhibit 1 to the Lower Basin Drought Contingency Plan Agreement (2019). Both the 2007 Interim Guidelines and the 2019 DCP contemplate the need for additional measures to protect Lake Mead elevations, with the DCP adding the commitment of participating Lower Basin DCP parties to “individual and collective action in the Lower Basin to avoid and protect against the potential for the elevation of Lake Mead to decline to elevations below 1,020 feet.” As noted above, Section 7.D of the 2007 Interim Guidelines contemplates that modified operating provisions may be required if “extraordinary circumstances arise. Such circumstances could include operations that are prudent or necessary for safety of dams, public health and safety, other emergency situations, or other unanticipated or unforeseen activities arising from actual operating experience.” The Department finds that such circumstances exist at this time. Preliminary Proposed Action – Overview Reclamation anticipates proposing modifications for the 2023 and 2024 period, and potentially for subsequent years, to the following sections of the 2007 Interim Guidelines published at [73 FR 19881 \(April 11, 2008\)](#):

Section 2. Determination of Lake Mead Operation During the Interim Period Reclamation anticipates revising Section 2.D (“Shortage Conditions”), including potential modifications to Sections 2.D.1.b and 2.D.1.c to decrease the quantity of water that shall be apportioned for consumptive use in the Lower Division States (Arizona, California, and Nevada). Any modifications to these sections would be based on current and anticipated reservoir and hydrologic conditions in the Colorado River Basin, including any potential modifications to Glen Canyon Dam operations pursuant to this SEIS.

Section 6. Coordinated Operation of Lake Powell and Lake Mead During the Interim Period

Reclamation anticipates revising Sections 6.C (“Mid-Elevation Release Tier”) and 6.D (“Lower Elevation Balancing Tier”) to modify and/or reduce the quantity of water released from Glen Canyon Dam. Any modifications to these sections would be based on current and anticipated reservoir and hydrologic conditions in the Colorado River Basin, including any potential modifications to Hoover Dam operations pursuant to this SEIS. Section 7. Implementation of Guidelines Reclamation anticipates revising Section 7.C (“Mid-Year Review”) to allow for potential determinations in a mid-year review that would allow for reduced deliveries from Lake Mead pursuant to Section 2 of the 2007 Interim Guidelines.

The foregoing potential modifications to the 2007 Interim Guidelines are presented in this Federal Register notice only as a preliminary overview of the Proposed Action. Reclamation will carefully review the 2007 Interim Guidelines and will formally publish a

Proposed Action in its forthcoming Draft SEIS, which is anticipated to be published in Spring 2023.

PRELIMINARY ALTERNATIVES

Overview

For purposes of the NEPA process for the SEIS, Reclamation anticipates three primary alternatives will be considered:

No Action – The No Action Alternative will describe the continued implementation of existing agreements that control operations of Glen Canyon and Hoover Dams. These include the 2007 Interim Guidelines and agreements adopted pursuant to the 2019 Colorado River Drought Contingency Plan Authorization Act (Pub. L. 116-14) (the 2019 Drought Contingency Plan (DCP) Act). Reclamation notes that intensive efforts are underway to facilitate water conservation actions in the Basin under a number of programs, including the recent Congressional prioritization of funding through 2026 for drought mitigation in western states, with priority given to the Colorado River Basin and other basins experiencing comparable levels of long-term drought. Pub. L. 117- 169, at § 50233 (Aug. 16, 2022). The ongoing implementation and effectiveness of these efforts will inform the assessment of existing operations and agreements.

Framework Agreement Alternative – This alternative would be developed as an additional consensus-based set of actions that would build on the existing framework for Colorado River Operations. This Alternative would likely build on commitments and obligations developed by the Basin States, Basin Tribes, and non-governmental organizations that were included in the 2019 DCP. This alternative would facilitate implementation of Section 7.B.2 of the 2007 Interim Guidelines.

Reservoir Operations Modification Alternative – This alternative would be developed by Reclamation as a set of actions and measures adopted pursuant to Secretarial authority under applicable federal law. This alternative would likely be developed based on the Secretary's authority under federal law to manage Colorado River infrastructure, as necessary, and would consider any inadequacies or limitations of the consensus-based framework considered in the above alternative. This alternative would consider how the Secretary's authority could complement a consensus-based alternative that may not sufficiently mitigate current and projected risks to the Colorado River System reservoirs.

This Federal Register notice presents the foregoing potential alternatives only as a preliminary overview of the alternatives that will be analyzed in the DEIS. For planning purposes, Reclamation's analysis will assume that additional releases pursuant to the Drought Response Operating Agreement (DROA) will be administered according to the terms approved in the DCP Act, and that Reclamation will simultaneously pursue system conservation actions in the Upper and Lower Basins. Through the scoping process, Reclamation welcomes public input on how human health and safety considerations can be more expressly integrated into Colorado River operational decision-making, both in this SEIS and other future decision-making processes. Reclamation will carefully review the appropriate range of alternatives for review and will

include appropriate alternatives for consideration in its forthcoming Draft SEIS, which is anticipated to be published in Spring 2023.

SUMMARY OF EXPECTED IMPACTS

The SEIS will evaluate reasonably foreseeable impacts from proposed modifications to the 2007 Interim Guidelines. Impacts are not fully known at this time; impact analysis will build upon and utilize information described in the 2007 Final EIS and subsequent relevant analyses. The analysis in the SEIS may consider potential effects on wildlife, threatened and endangered species habitat, recreation, water supplies (agricultural, municipal, environmental), water resources, air quality, cultural resources, hydropower resources, social and economic conditions, and other resources and uses. Reclamation will use an interdisciplinary approach that incorporates the expertise of specialists in the relevant resource fields.

Schedule for the Decision-Making Process Reclamation will provide additional opportunities for public participation consistent with the NEPA process, including an anticipated 45-day comment period on the draft SEIS. The draft SEIS is anticipated to be available for public review in Spring 2023 and the final SEIS is anticipated to be available with a Record of Decision, as appropriate, in late Summer 2023. This schedule will allow decisions to become effective for 2023-24 operations. During this process, the Secretary retains all applicable authority to operate Colorado River facilities to respond to emergency or other unforeseen conditions.

LEAD AND COOPERATING AGENCIES

The Secretary is responsible for the operation of Glen Canyon Dam and Hoover Dam pursuant to applicable federal law. The Secretary is also vested with the responsibility of managing the mainstream waters of the lower Colorado River pursuant to federal law. This responsibility is carried out consistent with the body of compacts, treaties, statutes and other legal documents commonly referred to as “the Law of the River.” Reclamation, as the agency that is designated to act on the Secretary’s behalf with respect to these matters, is the lead federal agency for the purposes of NEPA compliance for the development and implementation of the proposed SEIS interim guidelines.

During the preparation of the 2007 Interim Guidelines, five federal agencies were cooperating agencies for purposes of assisting with environmental analysis and preparation of the Final EIS. These cooperating agencies were the Bureau of Indian Affairs (BIA), the United States Fish and Wildlife Service (FWS), the National Park Service (NPS), Western Area Power Administration (Western), and the United States Section of the International Boundary and Water Commission (USIBWC). Reclamation anticipates inviting these same five agencies to serve as cooperating agencies for the purpose of this SEIS. Reclamation is committed to continue to work with the USIBWC to ensure that efforts under this SEIS are communicated and coordinated with the Republic of Mexico with the goal of continued alignment of operations and responsive actions in both the U.S. and Mexico.

RESPONSIBLE OFFICIAL

Consistent with the process and final determinations reached for the 2007 Interim Guidelines, the Secretary of the Interior is the deciding official for this undertaking.

NATURE OF DECISION TO BE MADE

The Department anticipates the nature of the decision to be made will be revised reservoir operating guidelines, pursuant to appropriate revisions of the Record of Decision for the 2007 Interim Guidelines, for the operation of Glen Canyon and Hoover Dams in 2023 and 2024 operating years, and potentially subsequent years if necessary and appropriate, in order to address the likelihood for continued low-runoff conditions in the Colorado River Basin based on the best available scientific and technical information.

ADDITIONAL INFORMATION

As noted in the June 2022 Federal Register notice, Reclamation anticipates initiating a NEPA process to develop the post-2026 operational strategies through a Federal Register notice of intent to prepare an EIS in early 2023. Nothing in today's Federal Register notice supersedes or displaces Reclamation's efforts in that upcoming process.

This SEIS addressing modified operating guidelines for the period prior to 2026 is necessary to address the unacceptably high risks facing the Colorado River Basin between now and the post-2026 period. Current conditions warrant the flexibility to modify operations before the post-2026 operational strategies are thoroughly identified, analyzed and ultimately adopted. In addressing operations for 2023-24, Reclamation is committed to using the best available information to develop near-term operating guidelines while longer-term approaches are developed. Reclamation anticipates using the work and analysis from this SEIS process to also inform operating guidelines for the 2025-26 period, which will also undergo any additional NEPA analysis as required. Lastly, separate from the development of the SEIS, Reclamation anticipates publishing an informational report in 2023 addressing potential methodologies to support assessments for evaporation, seepage and other system losses in the Colorado River Basin in future years. This information will assist in development of potential interim measures as well as the post-2026 operational strategies.

PUBLIC DISCLOSURES AND COMMENTS

Before including your address, phone number, email address, or other personal identifying information in your comment, you should be aware that your entire comment – including your personal identifying information – may be made publicly available at any time.

While you can ask us in your comment to withhold your personal identifying information from public review, we cannot guarantee that we will be able to do so.

Tommy P. Beaudreau,

Deputy Secretary, Department of the Interior.

QUOTES FROM CALENDAR YEAR 2018

Brent Gardner-Smith for Vail Daily ([Link](#))

• “After experiencing the fourth driest year on record last year, Lake Powell and Mead’s combined storage sits today at 46 percent (33% as of October 1, 2022). That is the lowest level since 1966, when Lake Powell was initially filling and cutting off water supplies down south. To put it in more personal terms, these are the lowest reservoir levels in my lifetime.” — Brenda Burman, commissioner of the U.S. Bureau of Reclamation, on Dec. 13, at the annual meeting of the Colorado River Water Users Association (CRWUA) at Caesars Palace in Las Vegas.

• “If we were to have a repeat of the 2000-to-2005 drought, with current demands and current levels of operations, we would essentially drain Lake Powell. It would go down to nothing.” — Eric Kuhn, former general manager of the Colorado River District, on Sept. 14, at the district’s annual seminar in Grand Junction.

• “It does not look good. It is a real and present danger for us to be facing the hydrology that we have today, and the 24-month outlook for that.” — Peter Nelson, chairman of the Colorado River Board of California, on Dec. 13 at a CRWUA meeting.

• “Today’s level of risk is unacceptable, and the chance for crisis is far too high.” — Burman, on Dec. 13 at a CRWUA meeting.

• “We’ll be in crisis mode if DCP isn’t completed.” — Pat Tyrrell, state engineer for Wyoming and commissioner on the Upper Colorado River Commission, on Dec. 13, at a CRWUA meeting.

“It’s not a drought-contingency plan, it’s a survival plan due to current conditions.” — Bill Hasencamp, manager of Colorado River resources for the Metropolitan Water District of Southern California, on Aug. 22, at the summer meeting of the Colorado Water Congress in Vail.

- “It’s important to understand that we are looking at giving up a very large amount of Colorado River water in central Arizona, nearly half. That’s a painful conversation. And, of course, everyone thinks that their own water use is justified and no one else’s is.” — Kathryn Sorensen, director of City of Phoenix Water Services, on Dec. 13 at a CRWUA meeting.
 - “We are teetering on the brink of a shortage today, and we see real risk of rapid declines in reservoir elevations, particularly at Lake Mead in the very near future.” — Burman on Dec. 13 at a CRWUA meeting.
 - “If we have the worst-case hydrology, it is possible that our state may need to move to an involuntary (water-curtailment) system. But we want that done through a public process. We want the stakeholders at the table.” — Andy Mueller, general manager of the Colorado River District, on Sept. 14 at a district seminar.
 - “To me, the best way of conserving water is not to use it, is not to grow, is not to continue to drain the Colorado River. But realistically looking at it, that is not going to happen.” — Keith Moses, vice chairman of the Colorado River Indian Tribes, on Dec. 13 at a CRWUA meeting.
 - “As we get hot and dry, we just have less available water and we see more demand.” — Taryn Finnessey, senior climate change specialist for Colorado on Aug. 24, at a CWC meeting.
 - “(The water entities in Arizona) have grasped that concept — that we’re going to be in a drier future with less water.” — Thomas Buschatzke, director of the Arizona Department of Water Resources, on Dec. 13 at a CRWUA meeting.
 - “We see this train that’s coming at us at 5 miles an hour, and if it hits us, it’s our own damn fault, because you can just see that reservoir level going down.” — Jim Lochhead, CEO of Denver Water, on Aug. 23 at a CWC meeting.
 - “We will act, if needed, to protect this basin.” — Burman, on Dec. 13 at a CRWUA meeting.
 - “The law of the river isn’t carved on stone tablets.” — John Entsminger, general manager of the Southern Nevada Water Authority, on Dec. 13 at a CRWUA meeting.
 - “Someone’s going to have to use less water.” — Kuhn on Sept. 14 at a Colorado River District seminar.

9/30/2022

Gross Reservoir Expansion (Moffatt Project): The 10th Circuit Appellate Court rules in favor of citizen activists defending the ecosystem integrity of the Colorado River

On Friday, September 30, the United States Court of Appeals for the Tenth Circuit handed conservation groups — Save the Colorado, The Environmental Group, WildEarth Guardians, Living Rivers, Waterkeeper Alliance, and Sierra Club — a significant victory in their appeal of a U.S. District Court’s dismissal of their challenge to a Clean Water Act permit that is required for the expansion of the Moffat Collection System and Gross Dam in Colorado.

The conservation groups allege in their lawsuit that a “dredge and fill” permit issued for the project by the Army Corps of Engineers was unlawful on several grounds, including violations of the federal Clean Water Act, Endangered Species Act, and National Environmental Policy Act. The District Court had dismissed the groups’ complaint on the grounds that a challenge to the Army Corps permit needed to be brought in the Court of Appeals in the first instance because Denver Water, the permit holder, also holds a FERC hydroelectric license for a portion of its Moffat Collection project. In its ruling on Friday, the Court of Appeals disagreed, concluding that based on the plain language of

the Federal Power Act, the groups correctly brought their case in the District Court. The Court of Appeals remanded the matter to the District Court for further proceedings.

The proposed Gross Reservoir Expansion Project would add an additional 900,000 cubic feet of concrete to the existing dam, effectively tripling the size of the reservoir. If completed, the Gross Dam would be the tallest in Colorado and the tallest roller-compacted concrete dam in the United States. The Colorado River Basin, the main water source for communities across Colorado, Wyoming, New Mexico, Arizona, California, Nevada, Utah and Mexico, is in a crisis of increased demand and reduced supply, magnifying shortfalls of an already over-allocated system and facing forecasts of worsening climate change driven water shortages. In the face of this crisis, putting the water supply for 40 million people at imminent risk of collapse, Denver Water continues to move forward with building the largest dam in Colorado history in order to further drain the Upper Colorado River at the expense of downstream users and ecosystems.

“This important victory will now allow us to prove in court that the Clean Water Act permit for this ill-advised and untenable water grab was unlawfully issued,” said Daniel E. Estrin, General Counsel and Advocacy Director for Waterkeeper Alliance. “The river, its communities, and its ecosystems are dying a proverbial ‘death by a thousand cuts’ as they face unsustainable demand, prolonged drought, and runaway climate change, and cannot afford to be further drained to fill another enormous reservoir. We look forward to presenting our legal challenge to this permit in federal court as soon as possible.”

“We will not stand by and silently watch our rivers be drained and our native fish and wildlife be pushed to extinction,” said Daniel Timmons, Wild Rivers Program Director for WildEarth Guardians. “We will keep fighting for living rivers and the human and non-human communities who depend on clean water and healthy flows.”

The conservation groups are represented by the Washington, DC public interest law firm Eubanks & Associates, PLLC. For more information about their successful track record of precedent-setting legal victories, please visit www.eubankslegal.com.

Utah Advancing Fantasy Lake Powell Pipeline Despite Lack of Water

Water Agency Meets Thursday to advance Pipeline to Divert Water that Doesn't Exist & Utah Doesn't Have a Right to Use

In the face of the lowest Colorado River reservoir levels in history, Utah Governor Spencer Cox's water agency is moving forward with the controversial Lake Powell Pipeline in a meeting at 10:00 a.m., MDT on Thursday, September 15th. The Pipeline will exacerbate the epic megadrought and impair downstream water users. Utah's actions fly in the face of the Bureau of Reclamation's call to cut 2 - 4 million acre-feet of Colorado River water.

"The Lake Powell Pipeline is just one big con game on Utah taxpayers and water users across the Basin," said Zach Frankel, the Executive Director of the Utah Rivers Council. "Utah should be embarrassed for being so out of touch about climate change and the 100 years of agreements on sharing Colorado River water," said Frankel.

Utah's Governor continues to insist there is "surplus" water available for Utah to put in the Lake Powell Pipeline, even though published science demonstrates Utah is overusing its rights to Colorado River water. Lake Powell water levels have dropped so low that boat ramps have been closed and hydropower generation is nearing the end of its useful life. Yet the Utah Board of Water Resources, the official proponent of the Lake Powell Pipeline, will extend a contract with one of the Pipeline contractors. Utah has spent \$45 million on permitting for the destructive diversion.

"This bogus extension exemplifies what Lake Powell Pipeline is all about — making money for a select few interests," said Kyle Roerink, the Executive Director for the Great Basin Water Network. "The motives behind the contract are not in the public interest."

The Bureau of Reclamation has issued dire warnings on the Colorado River, mandating that the states cut 2–4 million-acre feet of Colorado River water to avoid a catastrophe, most notably a water delivery crisis in the lower basin states.

"With the entire Colorado River Basin in crisis mode, it's laughable that Utah would even think about moving forward with a new diversion from the river," said Eric Balken, the Executive Director of the Glen Canyon Institute.

Governor Cox's water agency, the Utah Board of Water Resources, is the official proponent of the Lake Powell Pipeline. Utah has spent \$45 million on permitting for the destructive diversion. While other states in the Colorado River Basin are scrambling to cut their water use, Utah state leaders are misleading the public into believing Utah has a surplus of Colorado River water for the Pipeline.

"In the most critical water year ever, the response from most of the water managers was a state of surrender. Utah, on the other hand, decided to charge into the battlefield of absurdity," said John Weisheit, the co-founder of Living Rivers and Colorado Riverkeeper.

If completed, the 140-mile Lake Powell Pipeline would divert 86,000 acre-feet of water out of Lake Powell and deliver it to Washington County, Utah. Washington County residents use 306 gallons of water per capita per day, which is over double what residents in Las Vegas use. At a cost to taxpayers of \$3 billion, the Pipeline is completely unnecessary since Washington County has enough water to provide for its projected growth without Pipeline water until at least 2060.

The other six states in the Colorado River Basin are widely opposed to the proposed Lake Powell Pipeline because of its impacts on their shrinking water supply. All six other states co-signed a letter to the Secretary of Interior in 2020 noting their opposition to the Pipeline and openly threatening litigation. The Bureau of Reclamation is preparing a Supplemental Draft Environmental Impact Statement for the Pipeline now, even while the same federal agency is asking states to cut their water use by 2 -4 million acre-feet of water because of infrastructure problems at Glen Canyon Dam.

SALT LAKE CITY, UT—Estonian state-owned oil shale company Enefit American Oil is abandoning its lease to mine oil shale on federal public land in northeastern Utah's Uinta Basin. The decision marks the end of the George W. Bush-era federal oil shale leasing program and came just weeks before a settlement agreement cut the oil shale giant's planned strip mine and processing facility off from its water supply. The settlement prevents Enefit from exploring a previous deal to siphon billions of gallons of water from the Green River, above where it flows into the Colorado River, to build the first commercial-scale oil shale mine and processing plant in the U.S. in the Utah desert.

On August 9, 2023, Enefit notified the U.S. Bureau of Land Management (BLM) that it was voluntarily relinquishing its 160-acre oil shale research, development, and demonstration (RD&D) lease in northeastern Utah's Uinta Basin and would not mine for oil shale on federal public land, citing "extensive consideration of business plans regarding federal oil shale leasing and development." Surrendering the RD&D lease, issued in 2007, means the company is also abandoning efforts to mine an adjacent 4,960-acre "preference lease right area" of federal public lands.

"The good news is that the Bush-Cheney nightmare vision of strip mining thousands of acres of wildlife habitat on public lands to produce the most carbon-polluting gasoline in the world appears to finally be ending," said Ted Zukoski, senior attorney at the Center for Biological Diversity. "Enefit was the last company holding an oil shale research lease on BLM land that hadn't expired or been relinquished." Major players Chevron and Shell had pulled out of their leases by 2017."

Just two weeks after Enefit announced it was abandoning its RD&D lease, on August 25, 2023, Deseret Generation & Transmission Cooperative (DG&T), which owns the sizable water right (15 cubic-feet per second, or 3.5 billion gallons per year) that Enefit intended to use to mine and process oil shale on the federal lease and on its 13,000 acres of private land, settled an administrative challenge before the Utah Division of Water Rights. The settlement stipulates that neither DG&T nor any other entity can use the water right for fossil fuel development, including oil shale, effectively cutting Enefit's planned oil shale project off from its water supply.

"It sure looks like DG&T was taking advantage of Utah law to help Enefit develop what would have been an environmentally catastrophic oil shale mine and processing plant. This settlement ensures that this very large water right can't be siphoned from the Upper Colorado River Basin to develop oil shale or other fossil fuels. Between the settlement and the abandonment of the federal lease, we're hopeful that Enefit's oil shale plans may finally be gone for good," said Michael Toll, staff attorney for the Grand Canyon Trust, architect of the water right settlement. Enefit's original plans called for building the nation's first commercial-scale oil shale mine and processing plant on

private and nearby federal land in Utah's Uinta Basin, strip mining hundreds of millions of tons of oil shale rock and churning out more than 18 million barrels of synthetic crude oil every year for more than 30 years, all with well-to-wheel carbon emissions up to 75 percent higher than conventional oil. In the process, Enefit would consume more than 100 billion gallons of water over the next three decades from the upper Colorado River Basin — about as much as is consumed by all existing municipal and industrial users in the Uinta Basin combined. Additionally, massive amounts of pollutants would flow into nearby rivers and degrade the basin's already unhealthy air.

"This oil shale scheme would have been an enormous misuse of dwindling water resources, and an environmental, climate, and public health disaster. We are relieved to see the project has unraveled and the relevant parties have seemingly come to their senses," said Dr. Brian Moench, president of Utah Physicians for a Healthy Environment. "This is a big win for everyone that depends on Colorado River water, and for everyone that has been fighting to prevent more air pollution in Utah."

A lawsuit in federal district court challenging the rights-of-way for the project across federal public land is ongoing.

"Oil shale has never been commercially viable in the United States, and Enefit's decision to abandon its federal lease is further proof of this," said Michael Hiatt, deputy managing attorney at Earthjustice. "It is well past time to end the oil shale pipe dream and instead embrace energy solutions that won't worsen the water and climate crises we face in the intermountain West."

"Enefit's abandonment of its oil shale lease is a major victory for the overstressed Colorado River Basin and the tens of millions of people and imperiled wildlife that this fragile water system supports," said Daniel E. Estrin, general counsel and legal director for Waterkeeper Alliance. "We must immediately end development of all new fossil fuel projects on our public lands and justly transition to low-carbon energy sources and smart water management strategies if we stand any chance of protecting our planet and waters from the harshest impacts of climate change."

"Enefit walking back its plans reinforces what everyone has known for some time—extreme oil is not viable. Besides being hugely destructive, it simply cannot compete economically. It's having its lunch eaten by renewable energy," said Ann Alexander, senior attorney at the Natural Resources Defense Council.

"For decades mining oil shale in Utah has been the quintessential bad idea that just wouldn't go away: an activity that never penciled out and which in every iteration would have hugely damaging environmental consequences for public lands," said Stephen Bloch, legal director at the Southern Utah Wilderness Alliance (SUWA). "We're glad to be finally closing the book on this doomsday proposal."

ADDITIONAL INFORMATION

[Enefit's August 9th relinquishment notification to BLM](#)

[Water Right Settlement Agreement between DG&T and PVR, Inc.](#)

More about the water right settlement: The Grand Canyon Trust recently finalized a settlement agreement to resolve the administrative protest filed in 2021 before the Utah Division of Water Rights challenging the huge water right (15 cubic-feet per second, or 3.5 billion gallons per year) that Enefit, an Estonian state-owned oil shale company, intended to use to supply its planned oil shale mine and processing facility in the Uinta Basin.

The settlement agreement is with Deseret Generation & Transmission Cooperative (DG&T), the owner of the Bonanza power plant in the Uinta Basin. DG&T owns the water right, and under Utah law, it was limited to using the water right for electrical generation to meet the public's future power needs. Yet, DG&T signed a contract entitling Enefit to use the entire amount of the water right to mine and process oil shale. The Trust's administrative protest challenged this unlawful arrangement, hoping to prevent Enefit from using the water right, which it planned to use to supply more than 99 percent of the oil shale project's staggering water needs. Among other things, the settlement agreement ensures that neither DG&T nor any other entity can use the water right for fossil fuel development.

-

During the public scoping meetings for the development of *2007 Interim Guidelines*, the water managers in attendance were emphatic; that reductions greater than 20% would be "impossible" to achieve. This is why the seven states did not participate in the voluntary prescriptions of the original *Guidelines*, until reservoir elevations approached the level where intakes begin to suck air.

Note: *The proposed reductions from the Lower Basin States, as of this date, is about 12% per year. The ask from Reclamation was a range of 14% to 27%. It would appear that the Upper Basin states will not be participating in any reductions at this time. The Upper Basin states are building and enlarging dams at the present time, and other diversion contracts have been proposed. Consequently, the grassroots have intervened by engaging the judicial branch of government.*

At the end of the next decade, reductions of 30% will be necessary; and then 40% in the following decade. Especially if the municipalities continue to sprawl across the deserts of the American Southwest, and fueling that growth by purchasing water from farmers that take the responsibility of feeding the nation very seriously.

Proposed new sources of water, such as constructing desalination facilities, and the electric generating stations that will power them, and the pipelines, and the pump stations, and the transmission wires, will not be operational in the 2030s, nor in the 2040s.

So these are the decades when the system will crash and the assets of 50 to 60 million people become stranded.

If your thinking otherwise, consider that it took parts of four decades to negotiate the Law of the River, and to finish the construction of Hoover Dam, the All American Canal, and the Colorado River Aqueduct.

We can anticipate the depletion of our groundwater supplies as the third and final bad planning decision.

Rather than kicking a rusty can in the wrong direction, let's stop this madness and take a completely different pathway.

Our thoughts on Reclamation's Supplemental EIS process

May 22, 2023: Update from Reclamation about the Supplemental EIS

The Department of the Interior today announced that it is temporarily withdrawing the draft Supplemental Environmental Impact Statement published last month so that it can fully analyze the effects of the proposal under the National Environmental Policy Act.

Reclamation will then publish an updated draft SEIS for public comment with the consensus-based proposal as an action alternative. Accordingly, the original May 30, 2023, deadline for the submission of comments on the draft SEIS is no longer in effect.

The Department plans to finalize the SEIS process later this year.

States issue formal plans on May 22, 2023

- [Deal is reached to keep Colorado River from going dry for now](#). By Christopher Favelle for New York Times.
- [Seven States Final Plan](#)
- [Lower Basin Final Plan](#)
-

OUR ANALYSIS

How the Colorado River Basin is managed in the next three years by this SEIS process, or how it is managed in the next 3 decades by the pending process to develop new guidelines by 2026, the outcomes will not be significantly different. There is only one goal: how will water reduction programs be equitably distributed to humans without ecosystem or societal collapse?

The intent, since 2007, has **always** been about avoiding water shortages due to human accountability errors that have already disrupted the economy and the environment of our homeland inheritance. The collaborative solutions provided since the initiation of 2007 Guidelines were grossly insufficient and the sixteen years of potential progress hence, was squandered.

The narrative of the SEIS does acknowledge that...

- The hydrology of the Colorado River Basin is impacted by heat, evaporation, dry soils and by sublimation (implied); specifically a 20% reduction in annual streamflow, and that this negative consequence will continue to increase.
- Proposed construction projects for water diversions and water augmentation are speculative.
- The characteristics of groundwater resources are important.
-

The narrative of the SEIS does not acknowledge that...

- Human behaviours have become problematic. For example: denial, recalcitrance, procrastination and gradualism.
- Leadership to reduce global greenhouse gas emissions is not a shared responsibility for water managers.
- The decomposition of organic materials in reservoirs do emit greenhouse gases.
- The negative characteristics of vacated reservoirs will compromise the downstream ecosystems of our national parks and wildlife refuges.
- Dams and powerplants have lifespans; a day of reckoning will confront future generations; the cost will exceed the benefits.
-

THE ISSUES OF THE UPPER BASIN

- Previous scenario planning documents predict Upper Basin shortages will range between 2 to 3 million acre-feet between now and Year 2060.
- The first priority to consider are the arrival times of approaching deadlines, as mandated by the 1922 Colorado River Compact and the 1944 Mexican Treaty (a "Compact Call").

- The approaching Lower Basin deadline: When will 75 million acre-feet in a ten-year period **fail** to pass the Compact Point, located one mile below the mouth of the Paria River near Lee's Ferry, Arizona? This is a fixed number set in perpetuity; see Article IIIId of the 1922 Compact.
- The approaching deadline to Mexico: When will half of the annual water treaty allocation to Mexico, which is 750,000 acre-feet per year, **fail** to pass the Compact Point near Lee's Ferry, Arizona? See Article IIIc of the 1922 Compact. This amount must be adjusted down to 675,000 acre-feet, to honor a present-day shortage agreement with Mexico called Minute 323.
- Water demand reduction programs, such as Demand Management and System Conservation, are not producing significant contributions in the range of the required 2 to 3 million acre-feet.
- The accounting systems to measure water consumption is yet to be perfected.
- Glen Canyon Dam was not engineered for the extremes of the natural hydrology, augmented by climate disruptions from greenhouse gas emissions.

THE ISSUES OF THE LOWER BASIN

- Previous scenario planning documents predict Lower Basin shortages will be 3 to 4 million acre-feet between now and Year 2060.
- Not subtracting the evaporation and transit losses from the fixed allocations that happens between Hoover Dam and Morelos Dam (the "structural deficit") and estimated to range as high as 1.5 million acre-feet

THE ISSUES FOR BOTH BASINS

- Efficiency programs are confined by the limits of Nature. Perpetual growth was never an option; there is no physical law that supports such a concept.
- There is a planning and zoning problem, more than a water resource problem.
- Is this river basin based on a prior appropriation system, or not? If not, then the legal foundations must be changed.
- Sustainability, resilience and equity is achieved by respecting the merits of functioning ecosystems; work with Nature.
- The floodplain is occupied by critical infrastructure, which includes an immense structural depression below sea level called the Salton Through.

Comments for smallmouth bass Environmental Assessment and the Adaptive Management Program for operations at Glen Canyon Dam

STATEMENT: US Bureau of Reclamation; Upper Basin Division

The Bureau of Reclamation's Upper Colorado Basin recently prepared a targeted Environmental Assessment to pursue implementation of flow options at Glen Canyon Dam to respond to invasive smallmouth bass below the dam. With the extended drought, water levels in Lake Powell continue to decline to historically low levels, which

has contributed to record high water temperature releases through Glen Canyon Dam. Below the dam, these warm water releases are creating ideal spawning conditions for smallmouth bass, a predatory invasive fish species, which poses a threat to the federally protected humpback chub and other native fish.

To respond to the threat of smallmouth bass establishment below Glen Canyon Dam, a targeted EA was prepared that identified various flow options designed to disrupt and prevent smallmouth bass from spawning in the Colorado River between Glen Canyon Dam and the confluence of the Little Colorado River.

Reclamation appreciates the many comments received on the draft Environmental Assessment. The Comment Analysis Report is available now at the link below. Consistent with the NEPA process, we will transition this analysis to an Environmental Impact Statement process which will be initiated through a Notice of Intent in the Federal Register. Comments received on the Draft EA will be considered in the future EIS.

WASHINGTON — Environmental and public health groups defended the nation's landmark environmental law in a brief filed today with the U.S. Supreme Court in a case challenging the law's scope.

Utah's Seven County Infrastructure Coalition and a Utah railway company are asking the Supreme Court to overturn a federal appeals court decision tossing out the approval of an 88-mile railway through the Uinta Basin in northeastern Utah. The case considers the scope of the National Environmental Policy Act.

The railway's sole purpose is to transport waxy crude oil from the Uinta Basin through the Colorado Rockies to Gulf Coast refineries. If completed, the railway would quintuple oil production in the Uinta Basin, up to an additional 350,000 barrels per day, by linking the Utah oil fields to national rail networks.

"Communities in the Uinta Basin and Gulf Coast will suffer the most from this oil railroad, while oil companies enrich themselves at the expense of the environment and people's health," said Wendy Park, a senior attorney at the Center for Biological Diversity. "It's disgraceful that the railroad's backers want federal agencies to turn a blind eye to those harms. A robust environmental review that takes a hard look at all the train's threats is crucial for protecting communities near and far from this railway."

In August 2023 a federal appeals court ruled that the U.S. Surface Transportation Board — the agency tasked with reviewing the proposed railway's potential environmental harms — violated numerous environmental laws, including the National Environmental Policy Act, by failing to

consider the risks of increased oil extraction in the Uinta Basin and the potential harm from refining to Gulf Coast communities in Texas and Louisiana.

The agency also failed to address the railway's downline threats, such as derailments and wildfires, to wildlife, the Colorado River and public health and safety.

The National Environmental Policy Act, passed by Congress and signed by President Richard Nixon in 1970, requires the government to engage with communities, analyze a project's potential environmental harms, and disclose those potential harms to the public before approving a project.

The railway's backers are asking the court to narrow what environmental impacts federal agencies can review and disclose to the public. That would mean federal agencies could ignore and hide from the public damage to clean air, water and wildlife habitats that destructive projects could cause.

The groups defending NEPA include the Center for Biological Diversity, the Sierra Club, Living Rivers, WildEarth Guardians and Utah Physicians for a Healthy Environment.

"The oil and gas industry in the Uinta Basin already produces an enormous amount of regional air pollution," said Dr. Brian Moench, president of Utah Physicians for a Healthy Environment. "A University of Colorado study from 10 years ago found levels of highly toxic volatile organic compounds in the Basin '200-300 times background levels.' The authors said it was as much as you would expect from '100 million cars.' The whole purpose of this railway is to quintuple oil production in the area. The amount of air pollution would be staggering, a true public health nightmare. The petitioners are even trying to do away with this type of robust impact analysis, leaving communities like ours in the dark about the consequences of these projects."

"Sending billions of gallons of oil for hundreds of miles along the Colorado River would be a disaster waiting to happen for the communities and wildlife that rely on that critical water source," said John Weisheit, conservation director of Moab-based Living Rivers.

"The Uinta Basin Railway will harm the public's quiet enjoyment of the Colorado River for rafting and watching wildlife," said Kelly Fuller, climate and energy program director at WildEarth Guardians. "It's hard to spot beavers and bighorn sheep when heavy oil trains are roaring past the Colorado River, much less if the oil trains overturn and spill oil into the river, contaminating everything in sight."

The Supreme Court will hear arguments on the case on Tuesday, Dec. 10.

The Center for Biological Diversity is a national, nonprofit conservation organization with more than 1.7 million members and online activists dedicated to the protection of endangered species and wild places. www.biologicaldiversity.org

Supreme Court Hears Arguments Over Utah Oil Train in Case Challenging Scope of Nation's Landmark Environmental Law

WASHINGTON— The U.S. Supreme Court will hear arguments today in *Seven County Infrastructure Coalition v. Eagle County*, a case challenging the scope of the National Environmental Policy Act, the nation's landmark environmental law.

[Click here to hear the audio recording](#)

Utah's Seven County Infrastructure Coalition and a Utah railway company are asking the Supreme Court to overturn a federal appeals court decision tossing out the approval of an 88-mile railway through the Uinta Basin in northeastern Utah. That decision said the U.S. Surface Transportation Board violated NEPA by failing to fully analyze the railway's potential harm to the climate, wildlife, the Colorado River and people, including environmental justice communities along the Gulf Coast.

Environmental groups, public-health advocates and communities along the proposed route say the lower court's decision should stand. The groups held a virtual press briefing last week to discuss the stakes of the case.

"This case is bigger than the Uinta Basin Railway," said Earthjustice vice president of programs Sam Sankar. "The fossil fuel industry and its allies are making radical arguments that would blind the public to obvious health consequences of government decisions. The court should stick with settled law instead. If it doesn't, communities will pay the price."

The railway's backers are asking the court to narrow what environmental impacts federal agencies must review and disclose to the public. That would mean federal agencies could ignore — and hide from the public — damage to clean air, water and wildlife habitats that destructive projects could cause.

"Analyzing the Uinta Basin Railway's impacts without considering the air pollution and habitat destruction from pumping billions of additional gallons of oil a year is like diving headfirst into a pool without knowing how deep it is," said Wendy Park, a senior attorney at the Center for

Biological Diversity. “This is a disgraceful attempt to get federal agencies to ignore the many harms the railway will cause to the air and public health of Uinta Basin and Gulf Coast communities. A robust review of all the train’s threats is what the law requires, and it’s crucial for protecting people near and far from this railway.”

NEPA, passed by Congress and signed by President Richard Nixon in 1970, requires the government to engage with communities, analyze a project’s potential environmental harms, and disclose those potential harms to the public before approving that project.

“In 2013 the amount of volatile organic compounds pollution in the Uinta Basin was equal to what you would expect from 100 million cars, eight times more cars than are registered in the Los Angeles Basin. That is unquestionably a public health nightmare,” said Dr. Brian Moench, president of Utah Physicians for a Healthy Environment. “I have been to the basin myself to measure VOCs, in some places the fumes were physically overpowering. That the backers of this project would not only dismiss all that pollution, but propose that it’s okay for them to make it even five times worse, is a stunning disregard for the lives and wellbeing of the people in the basin.”

The proposed Uinta Basin Railway’s undisputed purpose is to transport waxy crude oil from the Uinta Basin through the Colorado Rockies to Gulf Coast refineries. If completed the railway would quintuple oil production in the Uinta Basin, up to an additional 14.7 million gallons per day, by linking the Utah oilfields to national rail networks.

The train would also threaten the health and safety of communities through Colorado and eventually in the Gulf of Mexico region, where the waxy crude oil would eventually arrive for refining. Derailments and other accidents along the route could contaminate the Colorado River, which provides drinking water to 40 million people across the West.

“Sending billions of gallons of oil in railcars along the Colorado River each year without understanding the damage from inevitable spills is a risk we can’t afford,” said John Weisheit, conservation director at Living Rivers. “Conducting a thorough environmental impact study is the bare minimum that must happen to protect wildlife and communities from this catastrophe in waiting.”

“In addition to destroying important wildlife habitat that supports iconic Western critters, including the greater sage-grouse, oil companies and their enablers are working overtime to slash bedrock American environmental laws and sacrifice our planet for their profits,” said Kate Merlin, staff attorney at WildEarth Guardians. “The future of the West’s clean water, healthy communities and abundant wildlife is at stake.”

Earthjustice and the Center of Biological Diversity are representing Utah Physicians for a Healthy Environment, the Sierra Club, Living Rivers, and WildEarth Guardians. Eagle County is representing itself. Attorney Willy Jay of Goodwin Procter LLP will argue the case for Eagle County.

Appeals Court Throws Out Permit for Utah's Uinta Basin Railway

WASHINGTON— A federal appeals court today [rejected](#) the U.S. Surface Transportation Board's permit for the proposed Uinta Basin Railway, designed to quadruple oil production in Utah's Uinta Basin and move crude through the Colorado Rockies to Gulf Coast refineries. Today's ruling by the U.S. Court of Appeals for the D.C. Circuit said the board violated the National Environmental Policy Act by failing to fully analyze the railway's potential harm to the climate, wildlife, the Colorado River and people, including environmental justice communities along the Gulf Coast. The decision strips the railway of the permitting required for its construction.

"This is an enormous victory for our shared climate, the Colorado River and the communities that rely on it for clean water, abundant fish and recreation," said Deeda Seed, a senior campaigner at the Center for Biological Diversity. "The Uinta Basin Railway is a dangerous, polluting boondoggle that threatens people, wildlife and our hope for a livable planet. The Biden administration needs to dismantle this climate bomb and throw it in the trashcan where it belongs."

The proposed 88-mile-long railway would spur increased oil production — estimated at an additional 350,000 barrels a day — by linking Uinta Basin oil fields to national rail networks. Most of the crude would travel through the Colorado Rockies for more than 100 miles and then on to Gulf Coast refineries, increasing the risk of fires and oil spills along the vulnerable Colorado River corridor.

"This ruling is a win for communities across the West and is critical for ensuring a sustainable climate future," said Carly Ferro, executive director of the Utah Sierra Club. "From its onset, this project's process has been reckless and egregious. But today, the people and the planet prevailed. We will continue to advocate for accountable processes to ensure a healthy environment where communities can live safely, and this win will help make that possible."

The appeals court found that the Surface Transportation Board failed to consider harm to the environment and downstream communities, the risk of wildfires and derailments along the drought-stricken route, and the project's "uncertain financial viability."

"The deficiencies here are significant," the ruling said, including failure to "quantify reasonably foreseeable upstream and downstream impacts on vegetation and special-status species of increased drilling in the Uinta Basin and increased oil-train traffic along the Union Pacific Line,

as well as the effects of oil refining on environmental justice communities the Gulf Coast.” The court also said that the agency failed to “take a hard look at wildfire risk as well as impacts on water resources downline; and explain the lack of available information on local accident risk.”

“The court's rejection of this oil railway and its ensuing environmental damage is a victory for the climate, public health and wild landscapes,” said Samantha Ruscavage-Barz, legal director for WildEarth Guardians. “The public shouldn’t have to shoulder the costs of the railway's environmental degradation while the fossil fuel industry reaps unprecedented profits from dirty energy.”

In addition to climate damage, the railway would harm public lands, rare plants and wildlife habitat. According to a now vacated federal [environmental analysis](#), the railway would dig up more than 400 Utah streams and strip bare 10,000 acres of wildlife habitat, including crucial areas that pronghorn and mule deer need to survive. In Emma Park, a remote sagebrush valley known to birdwatchers, bulldozers and train traffic could drive imperiled greater sage grouse out of their mating and nesting grounds.

“When Congress approved the Energy Policy Act of 2005, which became the incentive to exploit the unconventional fuels of the Colorado River Basin, our hope was that this very bad energy policy might incite a popular movement to address and counter the impacts of global warming,” said John Weisheit, conservation director for Living Rivers in Moab, Utah. “Yes, we need to thank the judges for making the right decision today, but this brighter day belongs to the climate justice movement.”

“This decision is a win for public health and the environment,” said Jonny Vasic, executive director for Utah Physicians for a Healthy Environment. “The court ruled the Surface Transportation Board conducted an environmental review that failed to meet the requirements of the law. The people of Utah can breathe a sigh of relief. Hopefully this is the beginning of the end for the Uinta Basin Railway.”

Press Release for immediate release as of June 28, 2025

LIVING RIVERS AND KANE CREEK DEVELOPMENT WATCH CHALLENGE KANE CREEK LUXURY RESORT'S WATER RIGHTS

Note: The developers have recently changed the name of their luxury resort from Kane Creek Preservation and Development, LLC to Echo Canyon, a Preliminary Municipality.

Note: The citizen's group known as Kane Creek Development Watch has a nickname: "The Watch"

- Dave Closser at The Watch: 303-859-1080; daveclosser@gmail.com

Living Rivers and Kane Creek Development Watch (hereafter referenced together as "Watch") have filed a lawsuit in the Seventh Judicial District Court of Grand County challenging the validity of the water rights claimed by Kane Creek luxury resort developers ("Developers"). Watch's lawsuit states that the Developers' groundwater and Colorado River water rights were not put to beneficial use for more than seven years, which, under Utah law, means the water rights are subject to forfeiture. Development, even the preliminary bulldozing, cannot legally continue without a water supply.

Local opposition to the proposed Kane Creek luxury resort has been strong and consistent, with residents voicing concerns at standing-room only public hearings. "This project does nothing to address Grand County's affordable housing crisis—in fact, it makes it worse," said Laura Long, a Watch activist and frequent speaker at the hearings. "It's an exclusive enclave for wealthy investors that would drive up land prices, strain local infrastructure, cost local taxpayers money, and destroy the natural character of the canyon and the Colorado River floodplain." The resort proposal (which has changed several times) calls for over 550 high-end housing units, 70,000 square feet of commercial space, and 100 overnight accommodations in the heart of the Kings Bottom area.

Bob Phillips, a water right owner and Moab Mosquito Abatement District manager for 23 years who frequently observed and assessed the proposed project site, says, "Utah law is very clear that if water rights aren't put to beneficial use for seven years, those water rights are no longer good. Anyone who has spent time in the Kane Creek development area knows that there's barely been any irrigation there for decades. Therefore, the developers have lost their right to this water--and there are plenty of other people who want it."

In their prior protest to the use of these water rights, the U.S. Bureau of Land Management (BLM) noted that several natural springs on public lands adjacent to development could shrink or dry up due to increased groundwater use at the development. The BLM's springs are critical for wildlife and nearby native plants and hanging gardens--places like Moonflower Canyon, Hunter Canyon, Pritchett Canyon, Kane Canyon, and the Behind the Rocks Wilderness Study Area.

John Weisheit, Colorado Riverkeeper and director of Living Rivers agrees: "We need to show respect to the Colorado River and our water supplies in times of prolonged drought, water scarcity, flood events and in land use. The Developers of this luxury resort on the Colorado River fail to do so."

Dave Closser, a Moab resident, has been monitoring the resort's progress from the beginning. He is concerned about safety and delays on Kane Creek Boulevard, a rough and narrow gateway access road for public recreation traversed daily by tourists and Grand County residents alike. "The resort construction and massive infrastructure development will make accessing all of Kane Creek Boulevard, and nearby recreation areas, difficult and dangerous for years. There will be long delays on the narrow road along the River, and there are no go-arounds. Local businesses could be forced to cancel or reduce their operations which will trickle down to their bottom line and the pockets of their employees. And who is going to pay for the road expansion? It's going to cost millions of dollars, and the federal government has already declined to fund it."

Several local tourism business owners submitted statements in support of the lawsuit, noting that the resort and its water use could damage their businesses.

Kane Creek Development Watch is a grassroots citizen's group based in Moab. It sprung up in 2024, in response to this resort proposal. Its strong network of donors and activists have been pushing back against the well-funded and politically-connected Developers, including by funding this lawsuit (which is funded entirely by hundreds of local residents and visitors) and collecting 17,850 signatures from residents and others opposed to this massive resort. Watch is dually focused on (a) mitigating impacts from the development on the unique area it would decimate, the surrounding ecosystem, and adjoining public lands, as well as (b) preventing additional strain on the water supply of the Colorado River and its tributaries, which are over-appropriated.

Legal Intervention Defends Clean Air from Fossil Fuel Industry in Utah's Uinta Basin

DENVER— Environmental and public health groups [filed a motion](#) Thursday to join a federal lawsuit defending the Environmental Protection Agency's efforts to strengthen clean air safeguards in northeastern Utah's Uinta Basin.

"We're fighting back against greedy polluters asking the court for a get-out-of-jail-free pass to keep poisoning the air Utahns breathe," said Ryan Maher, an attorney at the Center for Biological Diversity. "The Trump administration's fixation with dismantling bedrock environmental laws and thrusting the door open for toxic industries means it's up to us to help defend clean, breathable air in court."

In 2024 the EPA found that the Uinta Basin, a large oil and gas extraction region, exceeded health-based limits for toxic ground-level ozone, the key ingredient of smog. The decision requires the state of Utah to develop a stronger clean air plan and reduce pollution in the region.

The Utah Petroleum Association, joined by the state of Utah, several Utah counties and Ute Tribe oil and gas interests, sued in federal appeals court to overturn the EPA's decision. The motion to intervene asks the court to allow the environmental and public health groups to join the EPA in fighting the lawsuit and defending clean air for the Uinta Basin.

"Clean air in the Uinta Basin continues to be undermined by unchecked fossil fuel extraction, putting people and communities at risk. Ozone pollution can have broad adverse health effects, including destroying lung tissue, and even causing failed pregnancies and still births, said Jonny Vasic, executive director of Utah Physicians for a Healthy Environment. "We won't sit back and let the oil and gas industry and its cronies in Utah state government fight to put polluters ahead of our health."

Ozone in the Uinta Basin has soared to levels normally experienced in big cities, the result of unchecked oil and gas extraction. Drilling, fracking, pipelines and tanker trucks in the region release enormous amounts of pollution, including volatile organic compounds and nitrogen oxide gases.

A poisonous gas, even at very low levels ozone is a [serious respiratory irritant](#) that can harm lungs, trigger asthma attacks, worsen lung disease and cause premature death. "This intervention is about defending the Uinta Basin from the oil and gas industry's relentless push to despoil the region's air, waters and lands for its own profit," said John Weisheit, conservation director for Living Rivers. "The Uinta Basin's smog problem won't go away unless and until the industry stops getting a free pass to pollute."

Plans to construct a [new oil railroad](#) in the Uinta Basin could quintuple oil production and worsen air quality. The Uinta Basin railway, which was [blocked](#) by a federal court in 2023, is still under consideration as the [U.S. Supreme Court weighs](#) approval. In 2018 the Uinta Basin was declared a "dirty air" area under the Clean Air Act because of unhealthy ozone. The region has continued to suffer from high pollution. Under the federal Clean Air Act, the EPA was required to find the Uinta Basin failed to comply with ozone health standards, a finding that triggered stronger clean air safeguards.
